DICTIONARY

OF

ARTS, SCIENCES, AND MISCELLANEOUS LITERATURE;

ENLARGED AND IMPROVED.

THE FOURTH EDITION.

Illustrated with nearly six hundred Engravings.

VOL. I.

INDOCTI DISCANT; AMENT MEMINISSE PERITI.

EDINBURGH:
Printed by Andrew Bell, the Proprietor,
FOR ARCHIBALD CONSTABLE AND COMPANY, EDINBURGH;
AND FOR VERNOR, HOOD, AND SHARPE,
LONDON.

1810.

TO

THE KING.

In requesting permission to inscribe to your Majesty the present Edition of the Encyclopædia Britannica, the Proprietor hopes, that this humble testimony of his loyalty and duty will be graciously received. In this expectation he is the more encouraged, when he considers the zeal which your Majesty has uniformly shown for the improvement of Arts and Sciences, and the known benevolence of your Majesty's disposition, which has long made you revered as the Father of your People, and which has always secured a favourable reception to the requests of your subjects.

That, by the wisdom of your Councils, and the vigour of your Fleets and Armies, your Majesty may be enabled soon to restore peace to Europe; that you may again have leisure to

direct your undivided attention to the improvement of Arts, and the advancement of Knowledge; that you may long reign over a free, a happy, and a loyal people; and that the Sceptre of the British Empire may be swayed by your Majesty's descendants to the latest posterity, is the earnest prayer of

Your MAJESTY's

Most dutiful Subject,

And devoted Servant,

ANDREW BELL.

Lauristoun, Edinburgh,
1809.

PREFACE.

In the present improved state of science, of literature, and of all those arts which are connected with the progress and improvement of society, it is surely unnecessary to dwell on the importance of a work, the chief object of which is to exhibit a view of those great and interesting subjects. If science, while its beneficial influence is felt in all the common pursuits of life, affords scope at the same time to the greatest exertions of human genius; if literature is both the delight and ornament of those by whom it is cultivated; and if history, by bringing under our review the great course of human affairs, enables us to draw lessons for our future conduct from the unerring experience of the past, there can be no question as to the importance of a work comprising so many objects of deep and general interest to mankind. It deserves also to be remarked, that many of those great discoveries which have effected a revolution in science, and which have gradually introduced the most striking changes into the affairs of the world, have been the fruit not of accident, but of the most painful and abstruse inquiries; and that the great powers of invention and genius necessary to explore those intricate paths, do not by any means imply the same capacity of plain and familiar illustration;—those who possess those rare endowments being, on the contrary, rather averse to waste their precious talents on what appears to them to be the natural employment of more ordinary minds. It is hardly necessary, however, to point out to the reader how greatly the cause of philosophy must be promoted, when its important truths, in place of being confined to the speculative few, are expounded in popular works, and in this manner diffused among all classes of the community, so as to be the common topics of men's discourse,—thus adding to their innocent and laudable recreations, and setting to work at the same time, in the cause of literature and science, an additional stock of talent and exertion. Such being the obvious advantages arising from a well-digested account of Science, of Literature, and of General History, we shall not enlarge farther on the utility of the present work. As in such an undertaking, however, the execution is of as much importance as the plan, we shall endeavour, as shortly as possible, to satisfy the reader that, in that particular, no pains nor ex-

pence

pence have been spared to render the present edition as perfect as possible, and to give it a fair claim to that share of popularity and reputation, so amply enjoyed by the ENCYCLOPÆDIA BRITANNICA from the first moment of its publication.

In so complicated a work, it is obviously of infinite importance to preserve a clear and accurate arrangement, so as to give unity and consistency to its various parts; for it is evident that, without constant attention to method and order, such a work may be rendered in a great measure useless: and though it may still be an immense and valuable register of knowledge, the reader may search through its pages without any clue to guide him to the object of his inquiries. It is in this particular that the first rude essays towards a compilation of this kind are so extremely defective. The alphabet, in place of being employed in the humble function of an index to the matter contained in the work, was made supreme arbiter of the whole arrangement; and the different sciences, instead of following their natural order, were cut down into detached parts, out of which no great whole could possibly be formed. In this view the alphabet, far from conducing to clearness, became an instrument of disorder; and its only use appeared to be, to save the writers to whom we allude from the trouble of a more accurate or philosophical arrangement. Those obvious defects in all the most popular dictionaries of arts and sciences were observed by Mr Chambers, the compiler of a very valuable work of this kind himself; and, in speaking of the labours of his predecessors, he particularly censures the inattention to method, so visible in every part of their performances. "Former lexicographers (he observes) scarce attempted any thing like structure in their works; they seem not to have been aware that a dictionary is in some measure capable of the advantages of a continued discourse; and hence it is, that we see nothing like a whole in what they have done." For the purpose of remedying this defect in his own work, he informs his readers, that "his view was to consider the several matters, not only in themselves, but relatively, or as they respect each other; both to treat them as so many wholes, and as so many parts of some greater whole; and to point out their connection with each other, and with that whole, by reference: so that by a course of references from generals to particulars, from premises to conclusions, from cause to effect, and *vice versa*, a communication might be opened between the several parts of the work, and the detached articles be in some measure replaced in the natural order of science, out of which the alphabetical order had removed them." With a view of exhibiting a

connected

connected view of the various articles scattered through his dictionary, Mr Chambers has accordingly prefixed to it an analysis, from which may be seen, at one view, the mutual connection and dependence of its various parts.

But although the arrangement of the Cyclopædia of Mr Chambers is much preferable to that of any former work of the kind, it is still liable to many of those objections for which he censures his predecessors. Even if his original plan had been carried into effect with complete success, and all the articles in different parts of his work had been so managed, as, when reunited, to have made so many complete systems, the number of references was still so great that no reader could possibly have submitted to the trouble of combining them (A).

Of

(A) To be convinced of the truth of this assertion, one needs but to cast his eye over the author's table of arrangement. It is as follows.

KNOWLEDGE is either

- *Natural* and *Scientifical*; which is either —
  - *Sensible*; consisting in the perception of phenomena or external objects—called PHYSIOLOGY or NATURAL HISTORY; and which, according to the different kinds of such objects, divides into —
    - METEOROLOGY.
    - HYDROLOGY.
    - MINERALOGY.
    - PHYTOLOGY.
    - ZOOLOGY.
  - OR,
  - *Rational*; consisting in the perception of the intrinsic characters or habitudes of sensible objects — either their — — —
    - *Powers*, and *Properties*—called PHYSICS, and NATURAL PHILOSOPHY.
    - *Abstracts*—called METAPHYSICS, which subdivides into
      - ONTOLOGY.
      - PNEUMATOLOGY.
    - *Quantities*—called PURE MATHEMATICS—which divides, according to the subject of the quantity, into —
      - ARITHMETIC—whence
        - ANALYTICS.
        - ALGEBRA.
      - GEOMETRY—whence
        - TRIGONOMETRY.
        - CONICS.
        - SPHERICS.
      - STATICS —
    - *Relations* to our happiness—called
      - ETHICS, or NATURAL RELIGION, or the doctrine of OFFICES, which subdivides into
        - POLITICS.
        - LAW.
      - RELIGION—whence
        - THEOLOGY, or REVELATION.
- OR,
- *Internal*; employed in discovering their agreement and disagreement; or their relations in respect of truth—called LOGIC.
- *Artificial* and *Technical*, (consisting in the application of natural notices to farther purposes), which is either —
  - *Real*, employed in discovering and applying the
    - *Latent powers* and *properties* of bodies—called CHEMISTRY—whence
      - ALCHEMY.
      - NATURAL MAGIC, &c.
    - *Quantities* of bodies — called MIXED MATHEMATICS; which according to the different subjects, resolves into —
      - OPTICS, CATOPTRICS, DIOPTRICS, —whence
        - PERSPECTIVE.
        - PAINTING.
      - PHONICS—whence MUSIC.
      - HYDROSTATICS, HYDRAULICS.
      - PNEUMATICS.
      - MECHANICS—whence
        - ARCHITECTURE.
        - SCULPTURE.
        - TRADES and MANUFACTURES.
      - PYROTECHNIA—whence
        - The MILITARY *Art*.
        - FORTIFICATION.
      - ASTRONOMY—whence
        - CHRONOLOGY.
        - DIALLING.
      - GEOGRAPHY, HYDROGRAPHY—whence
        - NAVIGATION.
        - COMMERCE.
    - *Structure* and *economy* of organical bodies, called ANATOMY.
    - *Relations* thereof to the preservation and improvement—either of —
      - Animals—called
        - MEDICINE.
        - PHARMACY.
      - Vegetables—called
        - AGRICULTURE.
        - GARDENING.
      - BRUTES—called
        - FARRYING.
        - MANEGE—whence
          - HUNTING.
          - FALCONRY.
          - FISHING, &c.
  - OR,
  - *External*; which is either
  - *Symbolical*, employed in framing and applying
    - *Words*, or articulate signs of ideas—called GRAMMAR.
    - *Armories*—called HERALDRY.
    - *Tropes* and *Figures*—called RHETORIC.
    - *Fables*—called POETRY.

Such

Of this inconveniency, inseparable from a mere *dictionary* of arts and sciences, the original compilers of the Encyclopædia Britannica were fully aware; and they resolved, in the conduct of their work, to adopt such a plan as should completely free it from this objection. They were as fully convinced as their predecessors of the utility of a separate explanation of every technical term, and of the necessity also of noticing, in detail, many topics which it would be proper more fully to illustrate in the general account of the respective sciences to which they belonged. They were sensible, however, at the same time, how greatly the progress of useful knowledge is facilitated by systematical arrangement, and how necessary it is for those to think methodically who expect to benefit mankind by their labours. They have accordingly endeavoured, in place of the awkward expedient of a prefatory analysis, adopted by Mr Chambers, to exhibit a clear and satisfactory account of the several arts and sciences under their proper denominations, and to explain at the same time the subordinate articles under their technical terms. These articles may be divided into three kinds. The first consists of such as, not depending very closely on particular systems, admit of a complete explanation under their proper names; the second of such as require to be considered in the general account of the sciences with which they are connected, and also under their own denominations; and the third, of such as belong to a great whole, from which they cannot be separated, so as to be explained in detail. Articles of the first kind admit, of course, of no references; those of the second sort, being only partially explained under their own denominations, the reader is referred for more complete information to the article where the subject is more fully illustrated; and in articles of the third description, no attempt is made to explain them, except in connection with the subjects to which they severally belong, and to which the reader is therefore always referred.

Such

Such is that great and general analysis of knowledge, which has by some of our correspondents been recommended to us in terms of the highest praise, and to which elegance and accuracy cannot perhaps be refused. Its utility, however, as prefixed to a dictionary of arts and sciences, is not very apparent. From each word, which in this table is printed in capitals, many branches are made to spring, which in the dictionary are all treated as separate articles. Thus, from METEOROLOGY we are referred, in a subordinate analysis, to AIR and the ATMOSPHERE; including, 1st, The history of its contents, ÆTHER, FIRE, VAPOUR, EXHALATION, &c. 2d, METEORS formed therein; as CLOUD, RAIN, SHOWER, DROP, SNOW, HAIL, DEW, DAMP, &c. RAINBOW, PARHELION, HALO, THUNDER, WATERSPOUT, &c. WINDS, MONSOON, HURRICANE, and the like. As every word printed in capitals, as well in this subordinate division as in the general table, is the title of an article treated separately in the Cyclopædia, we must turn backwards and forwards through more than 24 references before we come at the detached topics, which we are directed to unite into a system of METEOROLOGY. The number of articles which must be united in the same manner to constitute the Compiler's system of METAPHYSICS is upwards of 48; and those which are referred to THEOLOGY above 300!

Such is the arrangement adopted in every edition of the ENCYCLOPÆDIA BRITANNICA; and there appears to be no other, by which the great object of such a work would be so easily and so completely attained. The necessary effect of such a plan must be, to give to readers of every description the most easy access to the objects of their various pursuits; for, whilst the philosopher or artist may procure whatever information he is in search of, by turning to the general name of the science to which his attention is directed, those who are desirous of information on particular topics will find them explained with sufficient accuracy under their respective denominations. Considered in this point of view, the ENCYCLOPÆDIA BRITANNICA may vie in the accuracy of its arrangement with the *Encyclopédie Methodique*; for though that voluminous work undoubtedly has an imposing appearance, yet we, who, in the course of our labours, have had to consult it frequently, have never found our object the more readily, for having been obliged to travel in quest of it through different alphabets.

A dictionary, in which the several arts and sciences are digested into distinct treatises or systems, whilst the various detached parts of knowledge are explained in the order of the alphabet, seems indeed to have received the best form of which such a work is susceptible; and may certainly be made to answer one end, which more philosophical arrangements never can accomplish. Under the various letters of the alphabet, it is obvious that the whole circle of the sciences may be completely exhausted; and that every discovery, ancient or recent, may be referred to the particular system which it tends to confute or to confirm, without having recourse to the awkward expedient of employing several alphabets, or the still more inconvenient arrangement by which the systems themselves are broken into fragments.

The truth of these observations is confirmed beyond the possibility of doubt, by the favourable reception which every edition of the ENCYCLOPÆDIA BRITANNICA has hitherto met with; by the still greater encouragement which has been given to the present; and by the circumstance of its plan having been invariably adopted by the editors of all similar works. On this subject, the proprietors of the present edition express themselves with the greater ease and confidence, as they cannot be accused of flattering their own vanity, or of being the publishers of their own praise. The merit of the arrangement, as well as of various other improvements suggested in the course of the work, belongs not so much to them, as to the compilers of the first edition.

To

To a work which proposes as its main object to exhibit a view of the Arts and Sciences, the private history of those eminent persons by whose ingenuity the progress of science has been promoted, seems to be a proper accompaniment. Those who formed the plan of the ENCYCLOPÆDIA BRITANNICA resolved accordingly to improve it, by the addition of one department, not to be found in any former compilation of the kind, with the exception of the French *Encyclopédie*.

Of all the various sorts of narrative-writing, it is acknowledged that none is more worthy of cultivation than Biography, since none can be more delightful or more useful; none can more certainly enchain the heart by irresistible interest, or more widely diffuse instruction to every diversity of condition. Its tendency to illustrate particular passages in general history, and to diffuse new light through such arts and sciences as were cultivated by the persons whose lives are related, are facts too obvious to require proof. It exhibits likewise the human character in every possible form and situation. It not only attends the hero through all the bustle of public life, but pursues him to his most sequestered retirements. It shows how distinguished characters have been involved in misfortunes and difficulties; by what means they were extricated; or with what degree of fortitude and dignity they discharged the various functions, or sustained the vicissitudes, sometimes prosperous and sometimes adverse, of a chequered and a fluctuating life. In such narratives, men of all ranks must feel themselves interested; for the high and the low, as they have the same faculties and the same senses, have no less similitude in their pains and pleasures; and, therefore, in the page of honest biography, those whom fortune or nature has placed at the greatest distance, may mutually afford instruction to each other. For these reasons it is, that every man of learning and taste has esteemed the biographical labours of Plutarch among the most valuable and interesting remains of antiquity.

The lives and characters, therefore, of such persons as have excelled in the arts either of war or of peace, of such as have distinguished themselves either on the theatre of action, or in the recess of contemplation, will be found in the ENCYCLOPÆDIA BRITANNICA alphabetically disposed under their proper names. In former editions of this work, many names are omitted for which the reader will naturally look; some because the work had advanced beyond the initial letters of their names before the editor received intelligence of their deaths; others through inadvertency, and from various mistakes, against which it is difficult to provide in so extensive an undertaking,

taking; and several from the confusion occasioned by the death of the first editor in the midst of his labours. In the present edition, all these defects have been carefully rectified; and the proprietor may safely venture to assert, that it contains a more perfect biographical register than any which has hitherto been offered to the public. Some, indeed, may be disposed to remark, that this department of their work is executed with too great minuteness, and that the names of many persons are dragged from obscurity, who are not proper objects of public regard. To this we shall only reply, with the greatest biographer of modern times, that, in our apprehension, there has rarely passed a life of which a faithful narrative would not be useful; and that, in the lives of the most obscure persons of whom we have given any account, something will be found either connected with recent discoveries and public affairs, or capable of affording a useful lesson to those who may be placed in similar circumstances.

Between eminent achievements and the scenes where they were performed, there is a natural and necessary connexion. The character of the warrior is connected with the fields of his battles; that of the legislator, with the countries which he civilized; and that of the traveller and navigator, with the regions which they explored. Even when we read of the persons by whom, and the occasions on which, any particular branch of knowledge has been improved, we naturally wish to know something of the places where such improvements were made. This curiosity, so natural and so laudable, has been frequently felt by ourselves during the compilation of this work; and to gratify it in others, we have subjoined to the name of every considerable place an account of its situation, its climate, its soil, its peculiarities, its inhabitants, with the manners, customs, and arts; its revolutions, laws, and government, with whatever else appeared necessary for the reader's information, and at the same time admissible into a work of such variety and extent. It is indeed probable, that by many of our readers we shall be thought to have done too much rather than too little in this department; and to have filled our pages with accounts of towns and villages not of sufficient importance to demand general attention. But were it known how many of such places we have excluded from our work, though recommended to us by some of our most obliging correspondents, those who reflect upon the different tastes of mankind, and consider that we wrote for the public at large, would forgive us for having occasionally employed a few sentences in the description of others, which, whatever be their real importance, could not have been omitted without disappointing a very numerous class of readers.

The knowledge of history is so important, not only to the statesman and the legislator, to whom indeed it is absolutely necessary, but likewise to every man who moves in a sphere above that of the lowest vulgar, that a work professing to be a general repository of arts, sciences, and literature, would be exceedingly defective, if it did not contain some information of the transactions of those who have been in possession of the world before us; of the various revolutions of states and empires; and of all the other means which have contributed to bring every thing into the state in which we behold it. Fully aware of this, the compilers of the ENCYCLOPÆDIA BRITANNICA, besides giving a general view of universal history and chronology, have enriched this edition with a short, though they hope luminous, detail of the progress of each particular nation, which from the remotest period to the present time, has acted a conspicuous part on the theatre of the world. The reader therefore will here find a very comprehensive view of Civil History, ancient and modern, in all its branches. Nor have the histories of Nature and Religion been neglected. Of the former, it is not perhaps too much to say, that in all the subdivisions of its three great kingdoms, it will be found more fully, more accurately, and more scientifically, detailed in this work, than in any other dictionary which has yet been published. Of the latter, a brief view is given under the general article History; the unavoidable defects of which are in a great measure supplied by the accounts that will be found, under their proper denominations, of all the considerable sects and opinions which have prevailed in the religious world, from the earliest periods to the present day.

From the original plan of the ENCYCLOPÆDIA BRITANNICA, which hardly seems capable of any improvement, the compilers of the present edition have, except in a very few instances, never deviated; and they can honestly assure their readers, that notwithstanding their adherence to this resolution, they have found ample scope for the exercise both of learning, and diligence in every sort of laborious research. This must necessarily be the case, indeed, in every succeeding edition of such a work as the present, which professes to follow the sciences and the arts through all their changes and refinements, and to present the most accurate view of the state of the world and of all its concerns at the period of each successive publication. This part of their duty, those concerned with the present edition have neither spared labour nor expence faithfully to discharge. Literary journals; the memoirs and transactions of philosophic societies; and all the most valuable dictionaries of arts and sciences, both in our own and in other languages,

guages, have been constantly consulted. The works of the most eminent authors, as well ancient as modern, who have written on any particular art or science, have been collected and compared. Such of them as treat of topics, about which there is no room for controversy, and are at the same time susceptible of abridgement, have been abridged with the greatest care; whilst others, more concise and tenacious of their subjects, have been more closely pursued and more faithfully retained. Upon those branches of science on which the works of other authors furnished nothing fit for the purpose of the Editors, original essays and treatises are inserted, which were composed either by themselves, or by such of their friends as they knew to be intimately acquainted with the subject. On disputed points, whether in the physical or moral sciences, arguments and objections have been displayed in their full force; and of each of the various sects into which the Christian church is divided, the account is generally given by the most eminent clergymen of that sect to whom the Editors could find access.

In executing this part of their task, there were various circumstances connected with the history of the third edition, which greatly added to its difficulties. In so extensive and multifarious a collection, a few mistakes, repetitions, and omissions might naturally be looked for, although the publication were, from the beginning to the end, in the hands of a single individual. When it is known, however, that after the third and last edition of this work was considerably advanced, it was committed to the care of a new editor, ignorant of the contents of what had been already finished and printed, and without any directions from his predecessor to guide him accurately through the remaining part of his task; it will not, perhaps, appear very surprising that inaccuracies, omissions, and repetitions should have occurred. For these defects, the want of an intelligible index to the materials left by the first editor is the best apology, and it was owing to the want of such a necessary guide that Dr Gleig, the second editor, was perpetually liable, notwithstanding the utmost circumspection, to give, under one title, an explanation of subjects which had before been explained under another; and to omit articles altogether, from a persuasion, sufficiently natural in the circumstance in which he was placed, that they had been discussed in some preceding volume under the general system to which they belong.

We are far from wondering at, or from censuring these imperfections in the last edition. At the same time we may be permitted to observe, that they

they contributed greatly to add to the difficulties of the present editor; since it was absolutely necessary, in order to preserve the unity and consistency of the work, diligently to examine and to compare all those parts of the former edition in which there was any thing unsuitable to the general plan, or in which any interesting information was omitted.

In executing this part of his task, the Editor has encountered many difficulties; but he can truly say he has spared no pains, whether by addition or arrangement, to overcome them, and to present to the public a finished work. For this purpose, he has also availed himself of the valuable information contained in the two supplementary volumes to the third edition, conducted under the inspection of Dr Gleig, which, joined to the more recent improvements of science, he has new-modelled and arranged for the present work.

As it may be satisfactory to the reader to learn by whose assistance the ENCYCLOPÆDIA BRITANNICA has been brought to its present state of perfection, the following list is subjoined, which the Editor flatters himself will be found to contain the names of various writers eminent for their proficiency in different departments of literature and science.

For whatever instruction may be contained under the articles Anatomy, the public is indebted to the late Andrew Bell, F. S. S. A., the proprietor, who had devoted a great portion of his time and attention to the study of anatomy, and to the ingenious Mr Fife, who has practised for many years under Dr Monro, as dissecter in the anatomical school of the University; and the whole article Surgery has been written anew by Mr James Wardrope, surgeon in London.

The articles Aerology, Aerostation, Chemistry, Electricity, Gunnery, Hydrostatics, Mechanics, Meteorology, Mineralogy, with most of the separate articles in the various branches of Natural History, we have reason to believe were originally compiled by the late Mr James Tytler, chemist, but many of them have been entirely re-written, and the others accommodated to the present improved state of these sciences, by Dr James Millar, who superintended the editing of the present work, Dr Kirby, and Dr Brewster of Edinburgh, and Professor Muirhead of Glasgow.

The article Blind was furnished by the late Dr Blacklock and Dr Moyes, both men of superior attainments, the former in elegant literature, and the latter in the physical sciences.

Astronomy and Navigation were compiled, the one by Dr Thomas Thomson, and the other by Dr Andrew Mackay; and the articles Algebra, Conic

Sections, Trigonometry, and several others in the mathematical and physical sciences were furnished by Mr William Wallace of the Royal Military College, Great Marlow.

The lives of Johnson and Mary Queen of Scots, with the articles Instinct, Love, Metaphysics, Miracle, the history of Ethics under Moral Philosophy, Oath, Passion, Plastic Nature, Polytheism, Prayer, Slavery, and Supper of the Lord, were contributed by the Right Reverend Bishop Gleig of Stirling, editor of the last six volumes of the former edition; Grammar and Theology by Dr Gleig and the Reverend James Bruce, A. B. late of Emanuel College, Cambridge; and Motion by Dr Gleig. The system of Medicine, which was published in the former edition, was revised and improved for the present by Andrew Duncan, M. D. Fellow of the Royal Society of Edinburgh, and Professor of the Institutes of Physic in the University.

The article Music was furnished by Dr Blacklock for the third edition, and has been considerably improved for the present by Mr George Sandy, writer to the signet, and William Maxwell Morison, Esq. advocate, to the latter of whom the Editor is also indebted for what we have published on the science of Physiognomy. The articles Mysteries, Mythology, and Philology, we owe to the erudition of the late Dr David Doig, master of the grammar school of Stirling, and author of two very ingenious Letters on the Savage State, addressed to the late Lord Kames.

Navigation, Paralax, Pendulum, Projection of the Sphere, and Ship-Building, were furnished by the late Andrew Mackay, L. L. D. long known to the public as an able mathematician; and the article War, including Naval Tactics, by Dr Kirby.

In the former edition, the valuable articles Physics, Pneumatics, Precession of the Equinoxes, Projectiles, Pumps, Resistance of Fluids, River, Rotation, Seamanship, Signals, Sound, Specific Gravity, Statics, Steam and Steam Engine, Strength of Materials, Telescope, Tide, Articulating Trumpet, Variation of the Compass, and Water-Works, were originally written by Professor John Robison. These articles have not been materially altered in the present edition; and to those who are at all acquainted with the various and original acquirements of that author, it is altogether unnecessary to enter particularly into their merits.

Philosophy is the joint production of Professor Robison and Dr Gleig. Physiology was furnished by John Barclay, M. D. of Edinburgh, and Midwifery by Dr James Hamilton, junior. For a continuation of the History

of India, the editor is indebted to Dr William Tennant, who resided long in that country. The articles Political Economy and Taxation are written by Mr Hugh Murray; Gardening by Mr James Williamson; and an account of Boscovich's system of Natural Philosophy by Dr Poole. We know that much useful information had been communicated by Dr Latham of Dartford in Kent, the celebrated ornithologist; by Dr William Wright, physician-general to the forces in the West Indies under the command of Sir Ralph Abercromby; by the Reverend J. Hawkins, vicar of Halsted in Essex; by the late Mr Adams, mathematical instrument maker to his Majesty; and by Mr William Jones, optician in Holborn, London.

With every disposition to acknowledge the very able assistance with which we have been favoured in the prosecution of this important undertaking, we are still sensible, that it is wholly out of our power to particularize every one to whom we are indebted. To enter into any detail of the reasons which prevent us from making this particular acknowledgment is wholly unnecessary. We may mention, however, one circumstance, which would of itself have prevented us from being so minute in this particular as we might have wished, namely, the death of Mr Bell, the late proprietor, before the work was finished; to whose great exertions in forwarding this publication, as well as to his zeal in the general cause of science, all those who had the pleasure of his acquaintance can bear witness. While delicacy, however, prevents us from enlarging on this topic, we hope the reader will excuse this tribute of respect to the memory of an estimable character; and that the apology we have made will, at the same time, be deemed satisfactory by those, whose assistance, in the course of the publication, we are in this manner prevented from properly acknowledging.

Edinburgh, July 1810.

ENCYCLOPÆDIA BRITANNICA.

A.

A, Abbreviat.

A, THE first letter of the alphabet, in all the known languages of the world, that of Ethiopia excepted, in which it is the 13th. It has deservedly the first place in the alphabet, on account of its simplicity, very little more being necessary to its pronunciation than opening the mouth.

In the English language, A is the mark of three different sounds, termed, by our grammarians, the *broad*, the *open*, and the *slender* A. The first resembles that of the German A, is found in several monosyllables, as *wall*, *salt*, &c. and is pronounced as *au* in *cause*. It is probable that the Saxons expressed only this broad sound of the letter, as it is still commonly retained in the northern districts of England, and universally throughout Scotland; as, *tauk* for *talk*, *wauk* for *walk* or *wake*.—The open A resembles that of the Italians in *adagio*, and is the same with that of *a* in *father*, *rather*, &c. The slender sound is peculiar to the English language, and resembles the sound of the French diphthong *ai* in *pais*, or their *a* masculine, or perhaps it is a middle sound between them. This is exemplified in *place*, *waste*, &c. also in *toleration*, *justification*, and all other words ending with *ation*.

A is sometimes added after words in burlesque poetry; in which case it only makes an additional syllable without any alteration of the sense, as the interjection O very often does in our ballads. It is also sometimes redundant, as in the words *arise*, *awake*, &c. which are not different in signification from *rise*, *wake*, &c.

It is sometimes a word, either noun or interjection; in which last case, it is commonly an expression of grief, and joined with the aspirate, as *ah!* When a noun, it is only with respect to itself; as *great* A, *little* a, &c.

A is very frequently used as an article; in which case it has no plural signification, and is used to denote the number *one*, as *a* house, *a* field, &c. When placed as an article before any of the vowels, *y* and *w* only excepted, it is joined with the letter *n*; as *an* island, *an* orator, &c.—In the three following cases it is a preposition: 1. When it goes before a participle, or noun derived from a participle; as, I am *a* doing this or that. 2. When used before local surnames; as Cornelius *a* Lapide, Thomas *a* Kempis, &c. 3. When it is used in composition; as, *a* foot, *a* sleep, &c. In some instances it denotes the proportion of one thing to another; as, so much *a* week, *a* man, *a* head, &c.

A, among the ancients, was a numeral letter, and signified 500; and when a dash was added on the top $\overline{A}$, 5000.

A, Abbreviat.

A, in the Julian calendar, is the first of the seven DOMINICAL letters. It had been in use among the Romans long before the establishment of Christianity, as the first of the eight *nundinales literæ*; in imitation whereof it was that the dominical letters were first introduced.

A is also an abbreviation used with different intentions. Hence,

A, among logicians, is used to denote an universal affirmative proposition; according to the verse,

Affirat A, negat E, verum generaliter ambæ.

Thus, in the first figure, a syllogism consisting of three universal affirmative propositions, is said to be in Bārbā-rā; the *A* thrice repeated, denoting so many of the propositions to be universal, &c. See BARBARA.

A, among the Romans, was used in giving votes or suffrages.—When a new law was proposed, each voter had two wooden ballots put into his hand; the one marked with a capital *A*, signifying *antiquo*, q. d. *antiquam volo*; and the other with *U. R.* for *uti rogas*. Such as were against the law, cast the first into the urn; signifying, I refuse it, I antiquate it; or, I like the ancient law, and desire no innovation.

A, in the trials of criminal causes, also denoted absolution: Whence Cicero, *pro Milone*, calls *A*, *litera salutaris*, a saving letter.—Three ballots were distributed to each judge, marked with the letters, *A* for *absolvo*, I acquit; *C* for *condemno*, I condemn; and *N. L.* for *non liquet*, It is not clear. From the number of each cast into the urn, the prætor pronounced the prisoner's fate. If they were equal in number, he was absolved.

A, in the ancient inscriptions of marbles, &c. occasionally stands for *Augustus*, *ager*, *aiunt*, &c. When double it denotes *Augusti*; when triple *aurum*, *argentum*, *æs*; and sometimes its meaning can only be known by the rest of the inscription. Isidore adds, that when it occurs after the word *miles*, (soldier), it denotes him young. On the reverse of ancients medals, it denotes that they were struck by the city of Argos, sometimes by that of Athens; but on coins of modern date, it is the mark of Paris.

A, as an abbreviation, is also often found in modern writers; as A. D. for *anno Domini*; A. M. *artium magister*, master of arts; *anno mundi*, &c.

A, Abbreviat.

A || Aaron.

A, the letter a, with a line above it, thus ā, is uſed in medical preſcriptions for *ana*, of each; ſometimes it is written thus, āā: e. g. ℞ Mel. Sacchar. et Mann. ā, vel āā, ℥j. i. e. Take of honey, ſugar, and manna, of each, one ounce.

A, put to bills of exchange, is in England an abbreviation of *accepted*, and in France for *accepté*. It is likewiſe uſual among merchants to mark their ſets of books with the letters A, B, C, &c. inſtead of the numbers 1, 2, 3, &c.

A.A.A. The chemical abbreviation for Amalgama, or Amalgamation.

AA, the name of ſeveral rivers in Germany and Swiſſerland.

AACH, a little town of Germany, in the circle of Suabia, near the ſource of the river Aach, and almoſt equally diſtant from the Danube and the lake Conſtance. It belongs to the houſe of Auſtria. E. Long. 9. 0. N. Lat. 47. 55.

AAHUS, a little town of Germany, in the circle of Weſtphalia and biſhopric of Munſter. It is the capital of Aahus, a ſmall diſtrict; has a good caſtle; and lies north-eaſt of Coesfeldt. E. Long. 7. 1. N. Lat. 52. 10.

AAM, or HAAM, a liquid meaſure in common uſe among the Dutch, containing 128 meaſures called *mingles*, each weighing nearly 36 ounces avoirdupois; whence the *Aam* contains 288 Engliſh, and 148⅔ pints Paris meaſure.

AAR, the name of two rivers, one in Swiſſerland, and another in Weſtphalia in Germany. It is alſo the name of a ſmall iſland in the Baltic.

AARASSUS, *in Ancient Geography*, a town of Piſidia, in the Hither Aſia, thought to be the Anaſſus of Ptolemy.

AARON, high-prieſt of the Jews, and brother to Moſes, was by the father's ſide great grandſon, and by the mother's, grandſon of Levi. By God's command he met Moſes at the foot of Mount Horeb, and they went together into Egypt to deliver the children of Iſrael: he had a great ſhare in all that Moſes did for their deliverance. The Scriptures call him the prophet of Moſes, and he acted in that capacity after the Iſraelites had paſſed over the Red ſea. He aſcended Mount Sinai with two of his ſons, Nadab and Abihu, and ſeventy elders of the people; but neither he nor they went higher than half way, from whence they ſaw the glory of God; only Moſes and Joſhua went to the top, where they ſtaid forty days. During their abſence, Aaron, overcome by the people's eager entreaties, ſet up the golden calf, which the Iſraelites worſhipped by his conſent. This calf has given riſe to various conjectures. Some rabbies maintain that he did not make the golden calf, but only threw the gold into the fire, to get rid of the importunities of the people; and that certain magicians who mingled with the Iſraelites at their departure from Egypt, caſt this gold into the figure of a calf. According to ſome authors, the fear of falling a ſacrifice to the reſentment of the people, by giving a refuſal, made Aaron comply with their deſire: and they allege alſo, that he hoped to elude their requeſt, by demanding of the women to contribute their ear rings, imagining they would rather chooſe to remain without a viſible deity, than be deprived of their perſonal ornaments. This affair of the golden calf happened in the third month after the Iſraelites came out of Egypt. In the firſt month of the following year, Aaron was appointed by God high-prieſt; which office he executed during the time that the children of Iſrael continued in the wilderneſs. He died in the fortieth year after their departure from Egypt, upon Mount Hor, being then 123 years old; A. M. 2522, of the Julian period 3262, before the Chriſtian era 1452. Aaron || Aarſens.

AARON, the Caraite, a learned Jew who flouriſhed about the year 1299. He left many works on the Old Teſtament, among which there is one entitled, "A Commentary on the Pentateuch," which has been much valued. It was written in Hebrew, and printed in folio with a Latin tranſlation, at Jena, in 1710.

AARON, another Caraite Jew, who lived in the 15th century, wrote a conciſe Hebrew grammar, entitled *Chelil Jophi*, "the Perfection of Beauty," which was printed at Conſtantinople in 1581.

AARON and JULIUS, Saints, were brothers who ſuffered martyrdom together, during the perſecution under the emperor Dioclefian, in the year 303, about the ſame time with St Alban the firſt martyr of Britain. We are not told what their Britiſh names were, it being uſual with the Chriſtian Britons, at the time of baptiſm, to take new names from the Greek, Latin, or Hebrew. Nor have we any certainty as to the particulars of their death; only that they ſuffered the moſt cruel torments. Two churches were dedicated to the brothers, in which their bodies were interred, at Caer-Leon, the ancient metropolis of Wales.

AARON, or *Harun*, *Al Raſchid*, a celebrated caliph, or Mahometan ſovereign of the Saracen empire; whoſe hiſtory is given under the article BAGDAD.

AARSENS, FRANCIS, Lord of Someldyck and Spyck, was one of the greateſt miniſters for negotiation the United Provinces could ever boaſt of. His father, Cornelius Aarſens, was regiſter to the States; and being acquainted with Mr Pleſſis Mornay, at the court of William prince of Orange, he prevailed upon him to take his ſon under him, with whom he continued ſome years. John Olden Barneveldt, who preſided over the affairs of Holland and all the United Provinces, ſent him afterwards agent into France, where he learned to negotiate under thoſe profound politicians Henry IV. Villeroy, Silleri, Roſſie, Jaonnin, &c. and he acquitted himſelf in ſuch a manner as to obtain their approbation. Soon after, he was inveſted with the character of ambaſſador, and was the firſt who was recognized as ſuch by the French court; at which time Henry IV. declared, that he ſhould take precedence next to the Venetian miniſter. He reſided in France 15 years; during which time he received great marks of eſteem from the king, who created him a knight and baron; and for this reaſon he was received among the nobles of the province of Holland. However, he became at length ſo odious to the French court, that they deſired to have him recalled. He was afterwards deputed to Venice, and to ſeveral German and Italian princes, upon occaſion of the troubles in Bohemia. He was the firſt of three extraordinary ambaſſadors ſent to England in 1620, and the ſecond in 1641; in which latter embaſſy he was accompanied by the lord of Brederode as firſt ambaſſador, and Heemſvliet as third, to negotiate the marriage of Prince William, ſon of the prince of Orange, with a daughter

Aafar || Aba.

daughter of Charles I. He was likewiſe ambaſſador extraordinary at the French court in 1624, at the beginning of Cardinal Richlieu's adminiſtration, who had a high opinion of him. The memoirs which he has left, of the negotiations in which he was engaged, ſhow him to have been one of the ableſt men of his time, and worthy of the confidence and truſt repoſed in him by his country. But his character is not altogether without ſtain. His enmity to the remonſtrants was bitter and unrelenting; and he is ſuppoſed to have greatly encouraged the violent meaſures purſued by Prince Maurice againſt the venerable Barneveldt, and to have been the principal adviſer for aſſembling the famous and perſecuting ſynod of Dordrecht. He died at a very advanced age; and his ſon, who ſurvived him, was reputed the wealthieſt man in Holland.

AASAR, in *Ancient Geography*, a town of Paleſtine, in the tribe of Judah, ſituated between Azotus and Aſcalon. In Jerome's time it was a hamlet.

AB, the eleventh month of the civil year of the Hebrews, and the fifth of their eccleſiaſtical year, which begins with the month Niſan. It anſwers to the moon of July; that is, to part of our month of the ſame name, and to the beginning of Auguſt: it conſiſts of thirty days. The Jews faſt on the firſt of this month, in memory of Aaron's death; and on the ninth, becauſe on that day both the temple of Solomon, and that erected after the captivity, were burnt; the former by the Chaldeans, and the latter by the Romans. The ſame day is alſo remarkable among that people for the publication of Adrian's edict, wherein they were forbidden to continue in Judea, or even to look back when at a diſtance from Jeruſalem, in order to lament the deſolation of that city. The 18th of the ſame month is alſo a faſt among the Jews; becauſe the lamp in the ſanctuary was that night extinguiſhed, in the time of Ahaz.

AB, in the Syriac calendar, is the name of the laſt ſummer month. The firſt day of this month they called *Suum-Miriam*, the faſt of the virgin, becauſe the eaſtern Chriſtians faſted from that day to the fifteenth, which was therefore called *Fathr-Miriam*, the ceſſation of the faſt of the virigin.

ABA (or rather ABAU) HANIFAH or HANFA, ſurnamed Al-Nooma, was the ſon of Thabet, and born at Coufah in the 80th year of the Hegira. This is the moſt celebrated doctor of the orthodox Muſſulmans, and his ſect is held in greateſt eſteem among the four which they indifferently follow. Notwithſtanding this, he was not very well eſteemed during his life; inſomuch that the caliph Almanſor cauſed him to be impriſoned at Bagdad, for having refuſed to ſubſcribe to the opinion of abſolute predeſtination, which the Muſſulmans call Cadha. But afterwards Abou Joſeph, who was the ſovereign judge or chancellor of the empire under the caliph Hadi, brought his doctrine into ſuch credit, that it became a prevailing opinion, That to be a good Muſſulman was to be a Hanifite. He died in the 150th year of the Hegira, in the priſon of Bagdad: and it was not till 335 years after his death, that Melick Schah, a ſultan of the Selgiucidan race, erected to his memory a magnificent monument in the ſame city, and a college for his followers, in the 485th year of the Hegira, and Anno Chriſti 1092. The moſt eminent ſucceſſors of this doctor were Ahmed Benali, Al Giaffas, and Al Razi who was the maſter of Naſſari; and there is a moſque particularly appropriated to them in the temple of Mecca.

Aba | Aback.

ABA, *Abas*, *Abos*, or *Abus*, in *Ancient Geography*, the name of a mountain of Greater Armenia, ſituated between the mountains Niphatos and Nibonis. According to Strabo, the Euphrates and Araxes roſe from this mountain; the former running eaſtward, and the latter weſtward.

ABA. See ABÆ.

ABA, ALBON, or OVON, a king of Hungary. He married the ſiſter of Stephen I. and was elected king on the depoſition of Peter in 1041. The emperor Henry III. preparing to reinſtate Peter on the throne, Aba made an incurſion into his dominions, and returned loaded with booty; but was next year obliged to make reſtitution, by paying a large ſum, in order to prevent a threatened invaſion from the emperor. He indulged in great familiarity with the lower claſs of the people, on account of which, and his ſeverity to their order, he became univerſally odious to the nobility. The fugitive nobles, aided by the emperor, excited a revolt againſt him. After a bloody battle, Aba was put to flight; and was murdered by his own ſoldiers in 1044, having reigned three years.

ABAA, a river in Theſſaly, ſuppoſed by ſome to be the Peneus of the ancients.

ABACÆNA, in *Ancient Geography*, a town of Media, and another of Caria in the Hither Aſia.

ABACÆNUM, in *Ancient Geography*, a town of Sicily, whoſe ruins are ſuppoſed to be thoſe lying near Trippi, a citadel on a high and ſteep mountain not far from Meſſina. The inhabitants were called *Abacænini*.

ABACH, a market town of Germany, in Lower Bavaria, ſeated on the Danube, 12 miles S. W. of Ratiſbon. It is remarkable for Roman antiquities, and for ſprings of mineral waters which are ſaid to be good for various diſtempers. E. Long. 11. 56. N. Lat. 48. 53.

ABACINARE, or ABBACINARE, in writers of the middle age, a cruel ſpecies of puniſhment, conſiſting in the blinding of the criminal, by holding a red-hot baſen or bowl of metal before his eyes.

ABACK (a ſea term), the ſituation of the ſails when the ſurfaces are flatted againſt the maſts by the force of the wind. The ſails are ſaid to be *taken aback* when they are brought into this ſituation, either by a ſudden change of the wind, or by an alteration in the ſhip's courſe. They are *laid aback*, to effect an immediate retreat, without turning to the right or left; or, in the ſea phraſe, to give the ſhip *ſtern-way*, in order to avoid ſome danger diſcovered before her in a narrow channel, or when ſhe has advanced beyond her ſtation in the line of battle, or otherwiſe. The ſails are placed in this poſition by ſlackening their lee braces, and hauling in the weather ones; ſo that the whole effort of the wind is exerted on the fore part of their ſurface, which readily puſhes the ſhip aſtern, unleſs ſhe is reſtrained by ſome counteracting force. It is alſo uſual to ſpread ſome ſail aback near the ſtern, as the mizen-top-ſail, when a ſhip rides with a ſingle anchor in a road, in order to prevent her from approaching it ſo as to entangle the flukes of it with her ſlackened cable, and thereby looſen it from the ground.

Abacot || Abacus.

ABACOT, the name of an ancient cap of ſtate worn by the kings of England, the upper part whereof was in the form of a double crown.

ABACTORS, or ABACTORES, a name given to thoſe who drive away, or rather ſteal, cattle by herds, or great numbers at once; and are therefore very properly diſtinguiſhed from *fures* or thieves.

ABACUS, among the ancients, was a kind of cupboard or buffet. Livy, deſcribing the luxury into which the Romans degenerated after the conqueſt of Aſia, ſays they had their *abaci*, beds, &c. plated over with gold.

ABACUS, among the ancient mathematicians, ſignified a table covered with duſt, on which they drew their diagrams; the word in this ſenſe being derived from the Phœnician *abak*, duſt.

ABACUS, or ABACISCUS, in *Architecture*, ſignifies the ſuperior part or member of the capital of a column, and ſerves as a kind of crowning to both. Vitruvius tells us the abacus was originally intended to repreſent a ſquare tile laid over an urn, or rather over a baſket. See ARCHITECTURE, N° 15.—The form of the abacus is not the ſame in all orders: In the Tuſcan, Doric, and Ionic, it is generally ſquare; but in the Corinthian and Compoſite, its four ſides are arched inwards, and embelliſhed in the middle with ſome ornament, as a roſe or other flower. Scammozzi uſes *abacus* for a concave moulding on the capital of the Tuſcan pedeſtal; and Palladio calls the plinth above the echinus, or boultin, in the Tuſcan and Doric orders, by the ſame name.

ABACUS is alſo the name of an ancient inſtrument for facilitating operations in arithmetic. It is variouſly contrived. That chiefly uſed in Europe is made by drawing any number of parallel lines at the diſtance of two diameters of one of the counters uſed in the calculation. A counter placed on the loweſt line, ſignifies 1: on the 2d, 10; on the 3d, 100; on the 4th, 1000. &c. In the intermediate ſpaces, the ſame counters are eſtimated at one half of the value of the line immediately ſuperior, viz. between the 1ſt and 2d, 5; between the 2d and 3d, 50, &c. See Plate I. fig. 1. where the ſame number, 1802 for example, is repreſented under both diviſions by different diſpoſitions of the counters. A farther illuſtration of this mode of notation is given in fig. 2.

National debt, according to Mr Addington, 1ſt Feb. 1802,		L.400,709,832
According to Mr Tierney,	-	457,154,081
According to Mr Morgan,	-	558.418,628
New ſinking fund,	- -	3,275,143
Old ſinking fund,	- -	2,534,187

ABACUS is alſo uſed by modern writers for a table of numbers ready caſt up, to expedite the operations of arithmetic. In this ſenſe we have *Abaci* of addition, of multiplication, of diviſion. This inſtrument for computation is, under ſome variations, in uſe with moſt nations, as the Greeks, Romans, Germans, French, Chineſe, &c.

Grecian ABACUS, was an oblong frame, over which were ſtretched ſeveral braſs wires, ſtrung with little ivory balls, like the beads of a necklace; by the various arrangements of which all kinds of computations were eaſily made.

Roman ABACUS was a little varied from the Grecian, having pins ſliding in grooves, inſtead of ſtrings or wires and beads.

Abacus || Abaiſſed.

Chineſe ABACUS, or SHWANPAN, like the Grecian, conſiſts of ſeveral ſeries of beads ſtrung on braſs wires, ſtretched from the top to the bottom of the inſtrument, and divided in the middle by a croſs piece from ſide to ſide. In the upper ſpace every ſtring has two beads, which are each counted for 5; and in the lower ſpace every ſtring has five beads, of different values, the firſt being counted as 1, the ſecond as 10, the third as 100, and ſo on, as with us.

Abacus Pythagoricus, the common multiplication table, ſo called from its being invented by Pythagoras.

Abacus Logiſticus, is a rectangled triangle, whoſe ſides, forming the right angle, contain the numbers from 1 to 60; and its area, the facta of each two of the numbers perpendicularly oppoſite. This is alſo called a *canon of ſexageſimals*.

Abacus et Palmulæ, in the *Ancient Muſic*, denote the machinery, whereby the ſtrings of polyplectra, or inſtruments of many ſtrings, were ſtruck with a plectrum made of quills.

Abacus Harmonicus, is uſed by Kircher for the ſtructure and diſpoſition of the keys of a muſical inſtrument, whether to be touched with the hands or the feet.

Abacus Major, in metallurgic operations, the name of a trough uſed in the mines, wherein the ore is waſhed.

ABADDON, is the name which St John in the Revelation gives to the king of the locuſts, the angel of the bottomleſs pit. The inſpired writer ſays, this word is Hebrew, and in Greek ſignifies Απολλυων, i. e. a *deſtroyer*. That angel-king is thought to be Satan or the devil: but Mr le Clerc thinks with Dr Hammond, that by the locuſts which came out of the abyſs, may be underſtood the zealots and robbers, who miſerably afflicted the land of Judea, and laid it in a manner waſte, before Jeruſalem was taken by the Romans; and that Abaddon, the king of the locuſts, may be John of Giſchala, who having treacherouſly left that town a little before it was ſurrendered to Titus, came to Jeruſalem, where he ſoon headed part of the zealots, who acknowledged him as their king, whilſt the reſt would not ſubmit to him. This ſubdiviſion of the zealot party brought a thouſand calamities on the Jews.

ABADIR, a title which the Carthaginians gave to gods of the firſt order. In the Roman mythology, it is the name of a ſtone which Saturn ſwallowed, by the contrivance of his wife Ops, believing it to be his newborn ſon Jupiter: hence it became the object of religious worſhip.

ABÆ, or ABA, in *Ancient Geography*, a town of Phocis in Greece, near Helicon; famous for an oracle of Apollo older than that at Delphi, and for a rich temple which was plundered and burnt by the Perſians.

ABAFT, a ſea term, ſignifying the hinder part of a ſhip, or all thoſe parts both within and without which lie towards the ſtern, in oppoſition to AFORE; which ſee.—*Abaft*, is alſo uſed as a prepoſition, and ſignifies *further aft*, or *nearer the ſtern*: as, the barricade ſtands *abaft* the main-maſt, i. e. behind it, or nearer the ſtern.

ABAISSED, *abaiſſé*, in *Heraldry*, an epithet applied to the wings of eagles, &c. when the tip looks downwards

Abaka || Abantias

downwards to the point of the ſhield, or when the wings are ſhut; the natural way of bearing them being extended.

ABAKA KHAN, the eighth emperor of the Moguls, a wiſe and good prince, aſcended the throne in 1264. He reigned 17 years, and is by ſome authors ſaid to have been a Chriſtian. It may be admitted, indeed, that he joined with the Chriſtians in keeping the feaſt of Eaſter, in the city Hamadan, a ſhort time before his death. But this is no proof of his Chriſtianity; it being common, in times of brotherly love, for Chriſtians and Mahometans to join in keeping the ſame feaſts, when each would compliment the other with doing honour to his ſolemnity.

ABAKANSKOI, a town of Siberia, which was founded by Peter the Great in 1707. It is provided with a garriſon, to protect the hunters who are employed in catching martens and foxes on account of their furs, which are here an important article of commerce. It is ſituated in E. Long. 94. 5. N. Lat. 53. 30.

ABALAK, a ſmall town of Siberia, two miles from Toboliſk, in E. Long. 64. 10. N. Lat. 57. 1. Abalak is famous as the reſort of many pilgrims who viſit an image of the virgin Mary, which is annually carried in proceſſion to Toboliſk.

ABALIENATION, in *Law*, the act of transferring one man's property to another.

ABALLABA, the ancient name of APPLEBY, a town in Weſtmorland, remarkable only for its antiquity, having been a Roman ſtation. W. Long. 1. 4. N. Lat. 55. 38.

ABALUS, in *Ancient Geography*, ſuppoſed by the ancients to be an iſland in the German ocean, called by Timæus *Baſilia*, and by Xenophon Lampſacenus *Baltia*; now the peninſula of Scandinavia. Here, according to Pliny, ſome imagined that amber dropped from the trees.

ABANA, or AMANA, in *Ancient Geography*, a river of Phœnicia, which, riſing from Mount Hermon, waſhed the ſouth and weſt ſides of Damaſcus, and falls into the Phœnician ſea to the north of Tripolis, called *Chryſorrhoas*, by the Greeks.

ABANGA. See ADY.

ABANO, a town of the Paduano, in the republic of Venice, famous among the ancients for its hot baths.

ABANTES, a people who came originally from Thrace, and ſettled in Phocœa, a country of Greece, where they built a town which they called *Aba*, after the name of Abas their leader; and if we may credit ſome ancient authors, the Abantes went afterwards into the iſland Eubœa, now called *Negropont*: others ſay the Abantes of Euhœa came from Athens. The Abantes were a very warlike people, cloſing with their enemies, and fighting hand to hand.

ABANTIAS, or ABANTIS, in *Ancient Geography*, a name of the iſland Eubœa in the Egean ſea, extending along the coaſt of Greece, from the promontory Sunium in Attica to Theſſaly, and ſeparated from Bœotia by a narrow ſtrait called *Euripus*. From its length the iſland was formerly called *Macris*; afterwards *Abantias* or *Abantis*, from the Abantes, a people originally of Thrace, called by Homer οπιστεν Κομοωντες, from wearing their hair long behind, having in a battle experienced the inconvenience of wearing long hair before. From cutting their hair before, they were called *Cureter*.

Abaptiſton || Abaris.

ABAPTISTON, in *Surgery*, the perforating part of the inſtrument called a TREPAN. This inſtrument, which is mentioned by Galen, Fabricius ab Aquapendente, and others, was a conical ſaw with a circular edge. Modern practitioners, however, prefer the cylindrical form; and various contrivances have been recommended to obviate the danger that may ariſe from want of dexterity, or from raſhneſs, in performing the operation of trepanning. A new inſtrument has been lately invented and delineated for this purpoſe, by Mr Rodman, ſurgeon in Paiſley. This inſtrument is ſo contrived, that it can be fitted to cut any thickneſs of bone without danger of injuring the brain; and as no pivot or centre-pin is neceſſary, the dreadful accidents which have ſometimes happened by not removing it, when the inſtrument in common uſe is employed, are completely avoided. (*Philoſoph. Mag. April* 1802.)

ABARA, a town in the Greater Armenia, under the dominion of the Turks; it is often the reſidence of the archbiſhop of Nakſivan. E. Long. 46. 25. N. Lat. 39. 45.

ABARANER, a town of Aſia, in the Greater Armenia, belonging to the Turks: it is ſeated on the river Alingena. E. Long. 46. 30. N. Lat. 39. 50.

ABARCA, an ancient kind of ſhoe uſed in Spain for paſſing the mountains with. It was made of raw hides, and bound with cords, which ſecured the feet of travellers againſt the ſnow.

ABARIM, high mountains of ſteep aſcent, ſeparating the country of the Ammonites and Moabites from the land of Canaan, where Moſes died. According to Joſephus, they ſtood oppoſite to the territory of Jericho, and were the laſt ſtation but one of the Iſraelites coming from Egypt. Nebo and Piſgah were parts of theſe mountains.

ABARIS, the Hyperborean; a celebrated ſage of antiquity, whoſe hiſtory and travels have been the ſubject of much learned diſcuſſion. Such a number of fabulous ſtories * were told of him, that Herodotus himſelf ſeems to ſcruple to relate them. He tells us only †, that this barbarian was ſaid to have travelled with an arrow, and to have taken no ſuſtenance: but this does not acquaint us with the marvellous properties which were attributed to that arrow; nor that it had been given him by the Hyperborean Apollo. With regard to the occaſion of his leaving his native country, Harpocration ‡ tell us, that the whole earth being infeſted with a deadly plague, Apollo, upon being conſulted, gave no other anſwer, than that the Athenians ſhould offer up prayers in behalf of all other nations; upon which, ſeveral countries deputed ambaſſadors to Athens, among whom was Abaris the Hyperborean. In this journey, he renewed the alliance between his countrymen and the inhabitants of the iſland of Delos. It appears that he alſo went to Lacedæmon; ſince, according to ſome writers ||, he there built a temple conſecrated to Proſerpine the Salutary. It is aſſerted, that he was capable of foretelling earthquakes, driving away plagues, laying ſtorms §, &c. He wrote ſeveral books, as Suidas * informs us, viz. Apollo's arrival in the country of the Hyperboreans; The nuptials of the river Hebrus; Θεογονια, or the Generation of the Gods; A collection of oracles, &c.

§ Porphyry in *Vita Pythagor.*

* Under the word Αβαρις.

Himerius

Abarticulation.

Himerius the ſophiſt applauds him for ſpeaking pure Greek; which attainment will be no matter of wonder to ſuch as conſider the ancient intercourſe there was between the Greeks and Hyperboreans.——If the Hebrides, or Weſtern iſlands of Scotland, (ſays Mr Toland †), were the Hyperboreans of Diodorus ‡, then the celebrated Abaris was of that country; and likewiſe a druid, having been the prieſt of Apollo. Suidas, who knew not the diſtinction of the inſular Hyperboreans, makes him a Scythian; as do ſome others, miſled by the ſame vulgar error; though Diodorus has truly fixed his country in an iſland, and not on the continent. Indeed the fictions and miſtakes concerning our Abaris are infinite: however, it is agreed by all that he travelled quite over Greece, and from thence into Italy, where he converſed familiarly with Pythagoras, who favoured him beyond all his diſciples, by inſtructing him in his doctrines (eſpecially his thoughts of nature) in a plainer and more compendious method than he did any other. This diſtinction could not but be very advantageous to Abaris. The Hyperborean, in return, preſented the Samian, as though he equalled Apollo himſelf in wiſdom, with the ſacred arrow, on which the Greeks have fabulouſly related * that he ſat aſtride, and flew upon it, through the air, over rivers and lakes, foreſts and mountains; in like manner as our vulgar ſtill believe, particularly thoſe of the Hebrides, that wizards and witches fly whitherſoever they pleaſe on their broomſticks. The orator Himerius above mentioned, though one of thoſe who, from the equivocal ſenſe of the word *Hyperborean*, ſeem to have miſtaken Abaris for a Scythian, yet deſcribes his perſon accurately, and gives him a very noble character. "They relate (ſays he) "that Abaris the ſage was by nation a Hyperborean, "appeared a Grecian in ſpeech, and reſembled a Scy- "thian in his habit and appearance. He came to A- "thens, holding a bow in his hand, having a quiver "hanging on his ſhoulders, his body wrapt up in a "plaid, girt about the loins with a gilded belt, and "wearing trowſers reaching from his waiſt down- "ward." By this it is evident (continues Mr Toland) that he was not habited like the Scythians, who were always covered with ſkins; but appeared in the native garb of an aboriginal Scot. As to what relates to his abilities, Himerius informs us, that "he "was affable and pleaſant in converſation, in diſpatch- "ing great affairs ſecret and induſtrious, quick-ſight- "ed in preſent exigencies, in preventing future dan- "gers circumſpect, a ſearcher after wiſdom, deſirous "of friendſhip, truſting little to fortune, and having "every thing truſted to him for his prudence." Neither the Academy nor the Lycæum could have furniſhed a man with fitter qualities to travel ſo far abroad, and to ſuch wiſe nations, about affairs no leſs arduous than important. And if we further attentively conſider his moderation in eating, drinking, and the uſe of all thoſe things which our natural appetites inceſſantly crave; joining the candour and ſimplicity of his manners with the ſolidity and wiſdom of his anſwers; all which we find ſufficiently atteſted; it muſt be owned that the world at that time had few to compare with Abaris.

† Account of the Druids, in his *Poſthumous Works*, vol i. p. 161.

‡ Diod. Sic. lib. ii. iii.

* Jamblichi *Vita Pythag.* p. 128.

ABARTICULATION, in *Anatomy*, a ſpecies of articulation, admitting of a manifeſt motion; called alſo *Diarthroſis*, and *Dearticulatio*, to diſtinguiſh it from that ſort of articulation which admits of a very obſcure motion, and is called *Synarthroſis*.

Abas || Abaſſa.

ABAS, a weight uſed in Perſia for weighing pearls. It is one-eighth leſs than the European carat.

ABAS, in heathen mythology, was the ſon of Hypothoon and Meganira, who entertained Ceres, and offered a ſacrifice to that goddeſs; but Abas ridiculing the ceremony, and giving her opprobrious language, ſhe ſprinkled him with a certain mixture ſhe held in her cup, on which he became a newt or water lizard.

ABAS, *Schah*, the Great, was third ſon of Codabendi, 7th king of Perſia of the race of the Sophis. Succeeding to his father in 1585, at the age of 18, he found the affairs of Perſia at a low ebb, occaſioned by the conqueſts of the Turks and Tartars. He regained ſeveral of the provinces they had ſeized: but death put a ſtop to his victories in 1629, after a reign of 44 years. He was the greateſt prince who had reigned in Perſia for many ages; and it was he who made Iſpahan the metropolis of Perſia. His memory is held in the higheſt veneration among the Perſians.

ABAS, *Schah*, his grandſon, 9th king of Perſia of the race of the Sophis, ſucceeded his father Seſi at 13 years of age. He was but 18 when he made himſelf maſter of the city of Candahar, which had ſurrendered in his father's reign to the great Mogul, and all the province about it; and he preſerved it afterwards againſt this Indian emperor, though he beſieged it more than once with an army of 300,000 men. He was a very merciful prince, and openly protected the Chriſtians. He had formed a deſign of extending the limits of his kingdom toward the north, and had for that effect levied a powerful army; but death put a ſtop to all his great deſigns, at 37 years of age, A. D. 1666.

ABASCIA, or ABCASSIA, the northern diſtrict of the weſtern diviſion of Georgia in Aſia, ſituated on the coaſt of the Black ſea, and tributary to the Turks. The inhabitants are poor, thievith, and treacherous, ſo that there is no trading with them without the utmoſt caution. They trade in furs, buck and tyger ſkins, linen yarn, boxwood, and bees wax: but their principal traffic conſiſts in the ſale of their own children to the Turks, and to one another. They are deſtitute of many neceſſaries of life, and have nothing among them that can be called a town; though we find Anacopia, Dandar, and Czekorni, mentioned in the maps. They have the name of Chriſtians; but have nothing left but the name, any more than the Mingrelians their northern neighbours. The men are robuſt and active, and the women are fair and beautiful; on which account the Turks have a great value for the female ſlaves which they purchaſe from among them. Their cuſtoms are much the ſame as thoſe of the MINGRELIANS; which ſee. E. Long. from 39° to 43°. N. Lat. from 43° to 45°.

ABASCUS, a river of Aſiatic Sarmatia, which, riſing from Mount Caucaſus, falls into the Euxine, between Pityus to the eaſt, and Noſis to the weſt.

ABASITIS, in *Ancient Geography*, a tract of Aſiatic Myſia, in which was ſituated the city of Ancyra.

ABASSA, THE GREATER and THE SMALLER, two diſtricts in the vicinity of the Caucaſian mountains. The latter, according to Pallas, is inhabited by ſix tribes who were formerly Chriſtians, but the nobles now profeſs

Abaſſi Abatis.

ſeſs the Mahometan religion. In manners, dreſs, mode of life, and, in ſome degree, in language, they reſemble the Circaſſians. They practiſe agriculture, but chiefly depend on paſturage for their ſubſiſtence. They are celebrated for a fine breed of large horſes. They are frequently haraſſed and plundered by the Circaſſian princes.

ABASSI, or ABASSIS, a ſilver coin current in Perſia, equivalent in value to a French livre, or tenpence halfpenny ſterling. It took its name from Schah Abbas II. king of Perſia, under whom it was ſtruck.

ABASSUS, in *Ancient Geography*, a town of the Greater Phrygia, on the confines of the Toliſtobagii, a people of Galatia in Aſia.

ABATAMENTUM, in *Law*, is an entry to lands by interpoſition, i. e. when a perſon dies ſeized, and another who has no right enters before the heir.

To ABATE, (from the French *abattre*, to pull down, overthrow, demoliſh, batter down, or deſtroy), a term uſed by the writers of the Engliſh common law both in an active and neutral ſenſe; as, To *abate* a caſtle, is to beat it down. To *abate* a writ, is, by ſome exception, to defeat or overthrow it. A ſtranger *abateth*; that is, entereth upon a houſe or land void by the death of him that laſt poſſeſſed it, before the heir takes poſſeſſion, and ſo keepeth him out: wherefore, as he that putteth out him in poſſeſſion is ſaid to diſſeize, ſo he that ſteppeth in between the former poſſeſſor and his heir is ſaid to *abate*. In the neuter ſignification thus: The writ of the demandant ſhall *abate*; that is, ſhall be diſabled, fruſtrated, or overthrown. The appeal *abateth* by covin; that is, the accuſation is defeated by deceit.

ABATE, in the manege, implies the performing any downward motion properly. Thus a horſe is ſaid to *abate* or take down his curvets, when he puts both his hind legs to the ground at once, and obſerves the ſame exactneſs in all the times.

ABATELMENT, in commerce, a term uſed for a prohibition of trade to all French merchants in the ports of the Levant who will not ſtand to their bargains, or refuſe to pay their debts. It is a ſentence of the French conſul, which muſt be taken off before they can ſue any perſon for the payment of their debts.

ABATEMENT, in *Heraldry*, an accidental figure ſuppoſed to have been added to coats of arms, in order to denote ſome diſhonourable demeanour or ſtain, whereby the dignity of coat armour was rendered of leſs eſteem. See HERALDRY.

ABATEMENT, in *Law*. See To ABATE.

ABATEMENT, in the cuſtoms, an allowance made upon the duty of goods, when the quantum damaged is determined by the judgement of two merchants upon oath, and aſcertained by a certificate from the ſurveyor and land waiter.

ABATIS, an ancient term for an officer of the ſtables.

ABATIS, or ABATTIS, in military affairs, a kind of retrenchment made of felled trees. In ſudden emergencies, the trees are merely laid lengthwiſe beſide each other, with the branches pointed outwards to prevent the approach of the enemy, while the trunks ſerve as a breaſtwork to the defendants. When the abatis is employed for the defence of a paſs or entrance, the boughs of the trees are ſtripped of their leaves and pointed, the trunks are planted in the ground, and the branches interwoven with each other.

Abaton Abauzit.

ABATON, a building at Rhodes, erected as a fence to the trophy of Artemiſia, queen of Halicarnaſſus, Coos, &c. raiſed in memory of her victory over the Rhodians; or rather to conceal the diſgrace of the Rhodians from the eyes of the world: for to efface or deſtroy the trophy was with them a point of religion.

ABATOR, in *Law*, a term applied to a perſon who enters to a houſe or lands void by the death of the laſt poſſeſſor, before the true heir.

ABATOS, in *Ancient Geography*, an iſland in the lake Moeris, formerly famous for its papyrus. It was the burial place of Oſiris.

ABAUZIT, FIRMIN, a learned Frenchman, was born at Uſez, in Languedoc, in November 1679. His father died when he was but two years of age. In conſequence of the revocation of the edict of Nantz, in the time of Louis XIV. to avoid the rigours of perſecution to which the Proteſtants of France were expoſed, young Abauzit's mother, who was a Proteſtant, not without difficulty, eſcaped with her ſon to Geneva, where he remained ſecure from danger, and enjoyed the benefit of education. From his 10th to his 19th year, his time was wholly devoted to literature; and having made great progreſs in languages, he ſtudied mathematics, phyſics, and theology. In the year 1698, he travelled into Holland, where he became acquainted with the learned Bayle, with Baſnage and Jurieu. Thence he paſſed over to England, and was introduced to Sir Iſaac Newton, who entertained a very high opinion of his merit. For this philoſopher afterwards ſent him his *Commercium Epiſtolicum*, accompanied with a very honourable teſtimony. "You are well worthy, ſays Newton, to judge between Leibnitz and me." The reputation of Abauzit reached the years of King William, who encouraged him by a very handſome offer to ſettle in England; which he declined, and returned to Geneva. In 1715 he entered into the ſociety formed for the purpoſe of tranſlating the New Teſtament into the French language, and contributed valuable aſſiſtance to this work. The chair of philoſophy in the univerſity was offered to him by that body in 1723, which he refuſed on account of his health and diffidence of his talents. But in 1727 he accepted of the office of librarian to the city, the duties of which were neither burdenſome, nor ſubjected him to any particular reſtraint.

Abauzit, who was deeply converſant in phyſical and mathematical knowledge, was one of the firſt who embraced the grand truths which the ſublime diſcoveries of Newton exhibited to the world. He defended the doctrines of that philoſopher againſt Father Caſtel; and diſcovered an error in the *Principia*, which was corrected by Newton in the ſecond edition of his work. He was a perfect maſter of many languages; he underſtood hiſtory ſo exactly, that he remembered the names of the principal characters and the dates of the events; his knowledge of phyſics was deep and extenſive, and he was well acquainted with medals and ancient manuſcripts. The different ſciences which he had ſtudied, were ſo well digeſted and arranged in his retentive mind, that he could at once bring together all that he ever knew on any ſubject. A remarkable inſtance of this occurred in a converſation with

Rouſſeau

Abavo || Abba.

Rouſſeau on the muſic of the ancients, while the latter was employed in compiling his Dictionary of Muſic. He had been at great pains in giving an accurate account of ancient muſic. But how much was he ſurpriſed to find that Abauzit could give him a full and clear hiſtory of all that he had with much labour collected; and the more ſo, when he was informed that 30 years had elapſed ſince his inquiries led him to conſider that ſubject. It was probably in conſequence of this incident that Rouſſeau addreſſed to Abauzit one of the fineſt panegyrics which he ever wrote.

A very fine compliment is ſaid to have been paid to Abauzit by Voltaire. A ſtranger having addreſſed the poet in a flattering manner, by ſaying he had come to Geneva to ſee a great man, Voltaire aſked him, whether he had ſeen Abauzit?

This excellent man having enjoyed that *otium cum dignitate*, ſo much talked of, and ſo eagerly ſought after, but rarely obtained, having thus lived univerſally reſpected to the great age of 87 years, died in the year 1767. lamented by the republic, and regretted by the learned.

Abauzit was a ſincere Chriſtian; his piety was pure and unaffected; his benevolence was extenſive. Liberal in his opinions, he was indulgent and forbearing to thoſe whoſe ſentiments and opinions were different from his own. Simple and eaſy in his manners, every thing about him, his houſe, his perſon, and his way of life, diſcovered a ſtrong averſion to ſhow and luxury. He carefully avoided the officious obſervances of ceremony, and anxiouſly withdrew from the fulſome praiſe of flattery. His converſation, free from pedantry and oſtentation, inſtructive and entertaining, was always heard with eagerneſs, and liſtened to with attention.

The writings which Abauzit left behind him are chiefly on religious ſubjects. He wrote an "Eſſay on the Apocalypſe," in which be endeavoured to ſhow, that the predictions in that book were to be applied to the deſtruction of Jeruſalem. This work was tranſlated into Engliſh; to which a refutation was added, which ſatisfied Abauzit ſo much that he was miſtaken in his views, that he ordered an edition then ready for publication in Holland to be ſtopped. His other works are, "Reflections on the Euchariſt; On Idolatry; On the Myſteries of Religion; Paraphraſes and Explanations of ſundry parts of Scripture; Several Critical and Antiquarian Pieces; and various Letters."

ABAVO, in *Botany*, a ſynonyme of the ADANSONIA.

ABB, a term among clothiers applied to the yarn of a weaver's warp. They ſay alſo *Abb-wool* in the ſame ſenſe.

ABBA, in *Ancient Geography*, a town of Africa Propria, near Carthage.

ABBA, in the Syriac and Chaldee languages, literally ſignifies *a father*; and figuratively, a ſuperior, reputed as a father in reſpect of age, dignity, or affection. It is more particularly uſed in the Syriac, Coptic, and Ethiopic churches, as a title given to the biſhops. The biſhops themſelves beſtow the title of *Abba* more eminently on the biſhop of Alexandria; which occaſioned the people to give him the title of *Baba*, or *Papa*, that is *Grandfather*; a title which he bore before the biſhop of Rome. It is a Jewiſh title of honour given to certain rabbins called *Tanaites*: and it is alſo particularly uſed, by ſome writers of the middle age, for the ſuperior of a monaſtery, uſually called ABBOT.

Abbadie || Abbaſſides.

ABBADIE, JAMES, an eminent Proteſtant divine, born at Nay in Bern in 1654; firſt educated there under the famous John la Placette, and afterwards at the univerſity of Sedan. From whence he went into Holland and Germany, and was miniſter in the French church of Berlin. He left that place in 1690; came into England; was ſome time miniſter in the French church in the Savoy, London; and was made dean of Killalo in Ireland. He was ſtrongly attached to the cauſe of King William, as appears in his elaborate defence of the Revolution, and his hiſtory of the aſſaſſination-plot. He had great natural abilities, which he improved by true and uſeful learning. He was a moſt zealous defender of the primitive doctrine of the Proteſtants, as appears by his writings; and that ſtrong nervous eloquence for which he was ſo remarkable, enabled him to enforce the doctrines of his profeſſion from the pulpit with great ſpirit and energy. He poſſeſſed uncommon powers of memory. It is ſaid that he compoſed his works without committing any part to writing, till they were wanted for the preſs. He died in London in 1727, after his return from a tour in Holland. He publiſhed ſeveral works in French that were much eſteemed; the principal of which are, A Treatiſe on the Truth of the Chriſtian religion; The Art of Knowing one's Self; A Defence of the Britiſh Nation; the Deity of Jeſus Chriſt eſſential to the Chriſtian Religion; The Hiſtory of the laſt Conſpiracy in England, written by order of King William III.; and The Triumph of Providence and Religion, or the opening the Seven Seals by the Son of God.

ABBAS, ſon of Abdalmotalieb, and Mahomet's uncle, oppoſed his nephew with all his power, regarding him as an impoſtor and traitor to his country; but in the ſecond year of the Hegira, being overcome and made a priſoner at the battle of Beder in 623, a great ranſom being demanded for him, he repreſented to Mahomet, that his paying it would reduce him to beggary, which would bring diſhonour on the family. Mahomet, who knew that he had concealed large ſums of money, ſaid to him, "Where are the purſes of gold that you gave your mother to keep when you left Mecca? Abbas, who thought this tranſaction ſecret, was much ſurpriſed, and conceiving that his nephew was really a prophet, embraced his religion. He became one of his principal captains; and ſaved his life when in imminent danger at the battle of Honain, againſt the Thakefites, ſoon after the reduction of Mecca. But beſides being a great commander, Abbas was one of the firſt doctors of Iſlamiſm, the whole of whoſe ſcience conſiſted in being able to repeat and explain the Koran, and to preſerve in their memory certain apocryphal hiſtories. He is ſaid to have read lectures on every chapter of the Koran, as his nephew pretended to receive them from heaven. He died in 652, and his memory is held in the higheſt veneration among the Muſſulmans to this day.

Abul-Abbas, ſurnamed *Saffah*, one of his grandſons, was proclaimed caliph a century after his death; and in him began the dynaſty of the

ABBASSIDES, who poſſeſſed the caliphate for 524 years. There were 37 caliphs of this race who ſucceeded one another without interruption.

ABBE',

Abbe || Abbey.

ABBE', in a monaſtic ſenſe, the ſame with ABBOT.

ABBE', in a modern ſenſe, the denomination of a claſs of perſons which has been popular in France. They were not in orders; but having received the ceremony of tonſure, were entitled to enjoy certain privileges in the church. The dreſs of abbés was that of academics or profeſſed ſcholars. In colleges they were the inſtructors of youth, and were employed as tutors in private families. Many of them have riſen to a diſtinguiſhed rank in the ſtate, while others have been no leſs eminent in ſcience and literature.

ABBESS, the ſuperior of an abbey or convent of nuns. The abbeſs has the ſame rights and authority over her nuns that the abbots regular have over their monks. The ſex indeed does not allow her to perform the ſpiritual functions annexed to the prieſthood, with which the abbot is uſually inveſted; but there are inſtances of ſome abbeſſes who have a right, or rather a privilege, to commiſſion a prieſt to act for them. They have even a kind of epiſcopal juriſdiction, as well as ſome abbots who are exempted from the viſitation of their dioceſans.

Martene, in his treatiſe on the rights of the church, obſerves, that ſome abbeſſes have formerly confeſſed their nuns. But he adds, that their exceſſive curioſity carried them ſuch lengths, that there aroſe a neceſſity of checking it. However, St Baſil, in his Rule, allows the abbeſs to be preſent with the prieſt at the confeſſion of her nuns.

ABBEVILLE, a conſiderable city of France in Picardy, and the capital of Ponthieu. The river Somme divides it into two parts. It has a collegiate church and twelve pariſh churches, the moſt conſiderable of which are St George's and St Giles's; beſides a great number of monaſteries and nunneries, a bailiwick, and a preſidial court. It is a fortified town; the walls are flanked with baſtions, and ſurrounded by large ditches. It was never taken: from which circumſtance it is ſometimes called the *Maiden Town;* and hence too its motto, *Semper fidelis*. The number of the inhabitants amounts to 36,000. The ſituation in the midſt of a fertile valley is pleaſant and healthy. It is famous for its woollen manufactory eſtabliſhed in 1665 under the auſpices of Colbert. The ſtuffs manufactured here are ſaid to equal in fabric and quality the fineſt in Europe. There is alſo a manufactory of fire arms, and a conſiderable trade in grain, lint, and hemp. It is about fifteen miles eaſt of the Britiſh channel, and ſhips may come from thence by the river Somme to the middle of the town. E. Long. 2. 6. N. Lat. 50. 7.

ABBEY, a monaſtery, or religious houſe, governed by a ſuperior under the title of *abbot* or *abbeſs*.

Abbeys differ only from *priories*, that the former are under the direction of an abbot, and the others of a prior; for abbot and prior (we mean a prior conventual) are much the ſame thing, differing in little but the name.

Fauchet obſerves, that, in the early days of the French monarchy, dukes and counts were called *abbots*, and duchies and counties *abbeys*. Even ſome of their kings are mentioned in hiſtory under the title of *abbots*. Philip I. Louis VI. and afterwards the duke of Orleans, are called *abbots of the monaſtery of St Aignan*. The dukes of Aquitain were called *abbots of the monaſtery of St Hilary at Poictiers;* and the earls of Anjou, *of St Aubin*, &c.

Abbey.

Monaſteries were at firſt eſtabliſhed as religious houſes, to which perſons retired from the buſtle of the world to ſpend their time in ſolitude and devotion. But they ſoon degenerated from their original inſtitution, and obtained large privileges, exemptions, and riches. They prevailed greatly in Britain before the Reformation, particularly in England; and as they increaſed in riches, ſo the ſtate became poor: for the lands which theſe regulars poſſeſſed were *in mortua manu*, i. e. could never revert to the lords who gave them. This inconvenience gave riſe to the ſtatutes againſt gifts in *mortmaine*, which prohibited donations to theſe religious houſes; and Lord Coke tells us, that ſeveral lords, at their creation, had a clauſe in their grant, that the donor might give or ſell his land to whom he would, (*exceptis viris religioſis et Judæis*) excepting monks and Jews.

Theſe places were wholly aboliſhed in England at the time of the Reformation; Henry VIII. having firſt appointed viſitors to inquire into the lives of the monks and nuns, which were found in ſome places to be extremely irregular, the abbots, perceiving their diſſolution unavoidable, were induced to reſign their houſes to the king, who by that means became inveſted with the abbey lands: theſe were afterwards granted to different perſons, whoſe deſcendants enjoy them at this day: they were then valued at 2,853,000l. per annum, an immenſe ſum in thoſe days.

Though the ſuppreſſion of religious houſes, even conſidered in a political light only, was a great national benefit, it muſt be owned, that, at the time they flouriſhed, they were not entirely uſeleſs. Abbeys or monaſteries were then the repoſitories, as well as the ſeminaries, of learning; many valuable books and national records, as well as private hiſtory, having been preſerved in their libraries, the only places in which they could have been ſafely lodged in thoſe turbulent times. Many of thoſe, which had eſcaped the ravages of the Danes, were deſtroyed with more than Gothic barbarity at the diſſolution of the abbeys. Theſe ravages are pathetically lamented by John Bale, in his declaration upon Leland's Journal 1549. "Coveteouſneſs," ſays he, "was at that time ſo buſy about private commodity, that public wealth, in that moſt neceſſary and of reſpect, was not anywhere regarded. A number of them which purchaſed theſe ſuperſtitious manſions, reſerved of the library books, ſome to ſerve their jakes, ſome to ſcour the candleſticks, and ſome to rub their boots; ſome they ſold to the grocer and ſoapſeller; and ſome they ſent over ſea to the bookbinders, not in ſmall numbers, but in whole ſhips full; yea, the univerſities of this realm are not clear of ſo deteſtable a fact. I know a merchant that bought the contents of two noble libraries for 40s. price; a ſhame it is to be ſpoken! This ſtuff hath he occupied inſtead of gray paper, by the ſpace of more than theſe ten years, and yet he hath ſtore enough for as many years to come. I ſhall judge this to be true, and utter it with heavineſs, that neither the Britons under the Romans and Saxons, nor yet the Engliſh people under the Danes and Normans, had ever ſuch damage of their learned monuments as we have ſeen in our time."

In theſe days every abbey had at leaſt one perſon whoſe office it was to inſtruct youth; and the hiſtorians of this country are chiefly beholden to the monks

Abbeyboyle || Abbot.

for the knowledge they have of former national events. In theſe houſes alſo the arts of painting, architecture, and printing, were cultivated. They were hoſpitals for the ſick and poor, and afforded entertainment to travellers at a time when there were no inns. In them the nobility and gentry who were heirs to their founders could provide for a certain number of ancient and faithful ſervants, by procuring them corodies, or ſtated allowances of meal, drink, and clothes. They were likewiſe an aſylum for aged and indigent perſons of good family. The neighbouring places were alſo greatly benefited by the fairs procured for them, and by their exemption from foreſt laws; add to which, that the monaſtic eſtates were generally let at very eaſy rents, the fines given at renewals included.

ABBEYBOYLE, a town of Ireland, in the county of Roſcommon, and province of Connaught. W. Long. 8. 32. N. Lat. 56. 54. It is remarkable for an old abbey.

ABBEYHOLM, a town in Cumberland, ſo called from an abbey built there by David king of Scots. It ſtands on an arm of the ſea. W. Long. 2. 38. N. Lat. 54. 45.

ABBOT, or ABBAT, the ſuperior of a monaſtery of monks erected into an abbey or priory.

The name *Abbot* is originally Hebrew, where it ſignifies father. The Jews call *father*, in their language, *Ab*; whence the Chaldeans and Syrians formed *Abba*; thence the Greeks Ἀββᾶς, which the Latins retained; and hence our *Abbot*, the French *Abbé*, &c. St Mark and St Paul uſe the Syriac *Abba* in their Greek, by reaſon it was then commonly known in the ſynagogues and the primitive aſſemblies of the Chriſtians; adding to it, by way of interpretation, the word *father*, Ἀββᾶ ὁ πατὴρ. "Abba, father;" q. d. Abba, that is to ſay, Father. But the name Ab, or Abba, which at firſt was a term of tenderneſs and affection in the Hebrew and Chaldee, became at length a title of dignity and honour: The Jewiſh doctors affected it; and one of their moſt ancient books, containing the ſayings or apophthegms of divers of them, is entitled Pirke *Abboth* or Avoth; i. e. Chapters of the Fathers. It was in alluſion to this affectation, that Jeſus Chriſt forbade his diſciples to call any man their father on earth; which word St Jerome turns againſt the ſuperiors of the monaſteries of his time, for aſſuming the title of *Abbots*, or Fathers.

The name *Abbot*, then, appears as old as the inſtitution of monks itſelf. The governors of the primitive monaſteries aſſumed indifferently the titles *Abbots*, and *Archimandrites* *. They were really diſtinguiſhed from the clergy; though frequently confounded with them, becauſe a degree above laymen.

* See *Monk* and *Archimandrite*.

In thoſe early days, the abbots were ſubject to the biſhops and the ordinary paſtors. Their monaſteries being remote from cities, built in the fartheſt ſolitudes, they had no ſhare in eccleſiaſtical affairs. They went on Sundays to the pariſh church with the reſt of the people; or, if they were too remote, a prieſt was ſent them to adminiſter the ſacraments; till at length they were allowed to have prieſts of their own body. The abbot or archimandrite himſelf was uſually the prieſt: but his function extended no farther than to the ſpiritual aſſiſtance of his monaſtery; and he remained ſtill in obedience to the biſhop. There being among the abbots ſeveral perſons of learning, they made a vigorous oppoſition to the riſing hereſies of thoſe times; which firſt occaſioned the biſhops to call them out of their deſerts, and fix them about the ſuburbs of cities, and at length in the cities themſelves; from which era their degeneracy is to be dated. Then the abbots threw off their former plainneſs and ſimplicity, aſſumed the rank of prelates, aſpired at being independent of the biſhops, and graſped at ſo much power, that ſevere laws were made againſt them at the council of Chalcedon. Many of them, however, carried the point of independency, obtained the appellation of *lord*, and were diſtinguiſhed by other badges of the epiſcopate, particularly the mitre. Abbot.

Hence aroſe new diſtinctions between the abbots. Thoſe were termed *mitred* abbots, who were privileged to wear the mitre, and exerciſe epiſcopal authority within their reſpective precincts, being exempted from the juriſdiction of the biſhop. Others were called *croſiered* abbots, from their bearing the croſier or paſtoral ſtaff. Others were ſtyled *ecumenical* or univerſal abbots, in imitation of the patriarch of Conſtantinople: while others were termed *cardinal* abbots, from their ſuperiority over all other abbots. In Britain, the mitred abbots were lords of parliament; and called abbots-ſovereign, and abbots general, to diſtinguiſh them from the other abbots. And as there were lords-abbots, ſo there were alſo lords priors, who had exempt juriſdiction, and were likewiſe lords of parliament. Some reckon 26 of theſe lords abbots and priors who ſat in parliament. Sir Edward Coke ſays, that there were 27 parliamentary abbots and two priors. In the parliament 20 Rich. II. there were but 25 abbots and two priors: but in the ſummons to parliament anno 4 Ed. III. more are named.

In Roman Catholic countries, the principal diſtinctions obſerved between abbots are thoſe of *regular* and *commendatory*. The former take the vow and wear the habit of their order; whereas the latter are ſeculars who have received tonſure, but are obliged by their bulls to take orders when of proper age.

Anciently the ceremony of creating an abbot conſiſted in clothing him with the habit called *cucullus*, or cowl; putting the paſtoral ſtaff into his hand, and the ſhoes called *pedales* on his feet: but at preſent, it is only a ſimple benediction, improperly called, by ſome, conſecration.

ABBOT is alſo a title given to others beſide the ſuperiors of monaſteries: thus biſhops whoſe ſees were formerly abbeys, are called abbots. Among the Genoeſe, the chief magiſtrate of the republic formerly bore the title of *abbot* of the people. It was likewiſe uſual, about the time of Charlemagne, for ſeveral lords to aſſume the title of *count-abbots*, *abba-comites*; becauſe the ſuperintendancy of certain abbeys was committed to them.

ABBOT, *George*, archbiſhop of Canterbury, was born October 29. 1562, at Guildford in Surrey. He was the ſon of Maurice Abbot a cloth-worker. He ſtudied at Oxford, and in 1597 was choſen principal of Univerſity college. In 1599, he was inſtalled dean of Wincheſter: the year following, he was choſen vice-chancellor of the univerſity of Oxford, and a ſecond time in 1603. In 1604, the tranſlation of the Bible now in uſe was begun by the direction of King James; and

Abbot. and Dr Abbot was the second of eight divines of Oxford, to whom the care of translating the whole New Testament (excepting the Epistles) was committed. The year following, he was a third time vice-chancellor. In 1608, he went to Scotland with George Hume earl of Dunbar, to assist in establishing an union between the churches of Scotland and England; and in this business he conducted himself with so much address and prudence, that it laid the foundation of all his future preferment. King James ever after paid great deference to his advice and counsel; and upon the death of Dr Overton bishop of Litchfield and Coventry, he named Dr Abbot for his successor, who was accordingly constituted bishop of those two united sees in December 1609. About a month afterwards he was translated to the see of London, and on the second of November following was raised to the archiepiscopal see.

It is not however improbable, that his extravagant adulation of his royal master, in which he went as far as any other court-chaplain could do, contributed not a little to his rapid preferment. In the preface to a pamphlet which he published, the following specimen of ridiculous flattery occurs: Speaking of the king, he says, "whose life hath been so immaculate and unspotted, &c. that even malice itself, which leaves nothing unsearched, could never find true blemish in it, nor cast probable aspersion on it.—Zealous as a David; learned and wise, the *Solomon* of our age; religious as Josias; careful of spreading Christ's faith as Constantine the Great; just as Moses; undefiled in all his ways as a Jehoshaphat and Hezekiah; full of clemency as another Theodosius."—If Mr Walpole had seen this passage, he certainly would not have said, that "honest Abbot could not flatter."

His great zeal for the Protestant religion made him a strenuous promoter of the match between the Elector Palatine and the Princess Elizabeth; which was accordingly concluded and solemnized the 14th of February 1612, the archbishop performing the ceremony on a stage erected in the royal chapel. In the following year happened the famous case of divorce between the lady Frances Howard, daughter of the earl of Suffolk, and Robert earl of Essex; which has been considered as one of the greatest blemishes of King James's reign. The part which the archbishop took in the business, added much to the reputation he had already acquired for incorruptible integrity. It was referred by the king to a court of delegates, whose opinion the king and court wished and expected to be favourable to the divorce. But the archbishop, unawed by royal authority, with inflexible firmness resisted it, and published his reasons for persisting in his opinion, to which the king, disappointed in his views, though fit to reply: Sentence was given in the lady's favour. In 1618, the king published a declaration, which he ordered to be read in all churches, permitting sports and pastimes on the Lord's day: this gave great uneasiness to the archbishop; who, happening to be at Croydon on the day it was ordered to be read, had the courage to forbid it.

Being now in a declining state of health, the archbishop used in the summer to go to Hampshire for the sake of recreation; and being invited by Lord Zouch to hunt in his park at Bramzill, he met there with the greatest misfortune that ever befel him; for he accidentally killed the game-keeper by an arrow from a cross bow which he shot at one of the deer. This fatal accident threw him into a deep melancholy; and he ever afterwards kept a monthly fast on Tuesday, the day on which it happened; and he settled an annuity of 20l. on the widow *. Advantage was taken of this misfortune, to lessen him in the king's favour; but his majesty said, "An angel might have miscarried in this sort." His enemies alleging that he had incurred an irregularity, and was thereby incapacitated for performing the offices of a primate; the king directed a commission to ten persons to inquire into this matter.

Abbot.

* Fuller's *Church Hist.* cent. xxvii. p. 87.

The result, however, was not satisfactory to his Grace's enemies; it being declared, that, as the murder was involuntary, he had not forfeited his archiepiscopal character. The archbishop after this seldom assisted at the council, being chiefly hindered by his infirmities; but in the king's last illness he was sent for, and constantly attended till his Majesty expired on the 27th of March 1662. He performed the ceremony of the coronation of King Charles I. though very infirm and distressed with the gout. He was never greatly in this king's favour; and the duke of Buckingham being his declared enemy, watched an opportunity of making him feel the weight of his displeasure. This he at last accomplished, upon the archbishop's refusing to license a sermon, preached by Dr Sibthorpe to justify a loan which the king had demanded, and pregnant with principles which tended to overthrow the constitution. The archbishop was immediately after suspended from all his functions as primate; and they were exercised by certain bishops commissioned by the king, of whom Laud, the archbishop's enemy, and afterwards his successor, was one: while the only cause assigned for this procedure was, That the archbishop could not at that time personally attend those services which were otherwise proper for his cognizance and direction. He did not, however, remain long in this situation; for a parliament being absolutely necessary, his Grace was sent for, and restored to his authority and jurisdiction. But not proving friendly to certain rigorous measures adopted by the prevailing church party, headed by Laud, whose power and interest at court were now very considerable, his presence became unwelcome there; so that, upon the birth of the prince of Wales, afterwards Charles II. Laud had the honour to baptize him, as dean of the chapel. The archbishop being worn out with cares and infirmities, died at Croydon, the 5th of August 1633, aged 71 years; and was buried at Guildford, the place of his nativity, where he had endowed an hospital with lands to the amount of 300l. per annum. A stately monument was erected over the grave, with his effigy in his robes.

He proved himself, in most circumstances of his life, to be a man of great moderation to all parties; and was desirous that the clergy should gain the respect of the laity by the sanctity and purity of their manners, rather than claim it as due to their function. His opinions and principles, however, have drawn upon him many severe reflections; particularly, from the earl of Clarendon. But Dr Welwood has done more justice to his merit and abilities †. He wrote several tracts upon

† *Memoirs*, 8vo, 1700, p. 38.

Abbot || Abbotſbury.

upon various ſubjects; and, as already mentioned, tranſlated part of the New Teſtament, with the reſt of the Oxford divines, in 1611.

There was another writer of the ſame name, who flouriſhed ſomewhat later. This George Abbot wrote *A Paraphraſe on Job*, *A Vindication of the Sabbath*, and *A Paraphraſe on the Pſalms*.

ABBOT, *Robert*, elder brother to the former, was born at Guildford in 1560, and completed his ſtudies at Baliol college, Oxford. In 1582, he took his degree of maſter of arts, and ſoon became a celebrated preacher; and to this talent he chiefly owed his preferment. Upon the firſt ſermon at Worceſter, he was choſen lecturer in that city, and ſoon after rector of All-ſaints in the ſame place. John Stanhope, Eſq. happened to hear him preach at Paul's-croſs, was ſo pleaſed with him, that he immediately preſented him to the rich living of Bingham in Nottinghamſhire. In 1597, he took his degree of doctor in divinity: and, in the beginning of King James's reign, was appointed chaplain in ordinary to his Majeſty; who had ſuch an opinion of him as a writer, that he ordered the doctor's book *De Antichriſto* to be printed, with his own commentary upon part of the Apocalypſe. In 1609, he was elected maſter of Baliol college; which truſt he diſcharged with the utmoſt care and aſſiduity, by his frequent lectures to the ſcholars, by his continual preſence at public exerciſes, and by promoting temperance in the ſociety. In November 1610, he was made prebendary of Normanton in the church of Southwell; and, in 1612, his majeſty appointed him regius profeſſor of divinity at Oxford. The fame of his lectures became very great; and thoſe which he gave upon the ſupreme power of kings, againſt Bellarmine and Suarez, ſo much pleaſed his majeſty, that when the ſee of Saliſbury became vacant, he named him to that biſhopric, and he was conſecrated by his own brother at Lambeth, December 3. 1615. When he came to Saliſbury, he found the cathedral falling to decay, through the avarice and negligence of the clergy belonging to it; however, he found means to draw five hundred pounds from the prebendaries, which he applying towards repairing it. Here he devoted himſelf to the duties of his function with great diligence and aſſiduity, viſiting his whole dioceſe in perſon, and preaching every Sunday. But his ſedentary life, and cloſe application to ſtudy, brought upon him the gravel and ſtone; of which he died on the 2d of March 1618, in the 58th year of his age; having filled the ſee only two years and three months. Dr Fuller *, ſpeaking of the two brothers, ſays, "that George was the "more plauſible preacher, Robert the greateſt ſcholar; "George the abler ſtateſman, Robert the deeper di- "vine: gravity did frown in George, and ſmile in Ro- "bert." He publiſhed ſeveral pieces; and left behind him ſundry manuſcripts, which Dr Corbet preſented to the Bodleian library.

* Heylin's *Hiſtory of Preſbyterians*, p. 83.

ABBOTSBROMLEY, a town in Staffordſhire. After the diſſolution of the monaſteries, it was given to the Lord Paget; and has ſince been called *Paget's Bromley*. But it retains its old name in the king's books, and with regard to the fairs. W. Long. 1. 2. N. Lat. 52. 45.

ABBOTSBURY, a ſmall town in Dorſetſhire, in W. Long. 1. 17. N. Lat. 50. 40. The abbey near this town was founded by a Norman lady, about the year 1026. Edward the Confeſſor and William the Conqueror were conſiderable benefactors to it.

Abbots-Langley || Abbreviation.

ABBOTS-LANGLEY, a village in Herts, four miles from St Alban's, famous as the birthplace of Pope Adrian IV.

ABBREVIATE *of* ADJUDICATIONS, in *Scots Law*, an abſtract or abridgment of a decreet of adjudication, which is recorded in a regiſter kept for that purpoſe.

ABBREVIATION, or ABBREVIATURE, a contraction of a word or paſſage, made by dropping ſome of the letters, or by ſubſtituting certain marks or characters in their place. A late philoſophical writer on grammar, divides the parts of ſpeech into words which are neceſſary for the communication of thought, as the noun and verb, and *abbreviations* which are employed for the ſake of diſpatch. The latter, ſtrictly ſpeaking, are alſo parts of ſpeech, becauſe they are all uſeful in language, and each has a different manner of ſignification. Mr Tooke, however, ſeems to allow that rank only to the neceſſary words, and to conſider all others as merely ſubſtitutes of the firſt ſort, under the title of abbreviations. They are employed in language in three ways; in terms, in ſorts of words, and in conſtruction. Mr Locke in his Eſſay treats of the firſt claſs; numerous authors have written on the laſt; and for the ſecond claſs of abbreviations, ſee *Diverſions of Purley*. Lawyers, phyſicians, &c. uſe many abbreviations, for the ſake of expedition. But the Rabbins are the moſt remarkable for this practice, ſo that their writings are unintelligible without the Hebrew abbreviatures. The Jewiſh authors and copyiſts do not content themſelves with abbreviating words like the Greeks and Latins, by retrenching ſome of the letters or ſyllables; they frequently take away all but the initial letters. They even take the initials of ſeveral ſucceeding words, join them together, and, adding vowels to them, make a ſort of barbarous words, repreſentative of all thoſe which they have thus abridged. Thus, *Rabbi Moſes ben Maimon*, in their abbreviature is *Rambam*, &c.

Abbreviation || Abb's.

ABBREVIATION of fractions, in *Arithmetic* and *Algebra*, is the reducing them to lower terms.

ABBREVIATOR, in a general ſenſe, a perſon who abridges any large book into a narrower compaſs.

ABBREVIATORS, a college of 72 perſons in the chancery of Rome, who draw up the pope's brieves, and reduce petitions, when granted by him, into proper form for being converted into bulls.

ABB'S (St) HEAD, a promontory of land in the ſouthern extremity of the frith of Forth, in Scotland, 10 miles north of Berwick, and nearly the ſame diſtance

Abbutals

Abdalonymus.

ſtance ſouth of Dunbar. W. Long. 1. 56. N. Lat. 55. 55.

ABBUTALS, ſignify the buttings or boundings of land towards any point. Limits were anciently diſtinguiſhed by artificial hillocks, which were called *botemines*; and hence *butting*. In a deſcription of the ſite of land, the ſides on the breadth are more properly *adjacentes*, and thoſe terminating the length are *abbutantes*; which, in old ſurveys, were ſometimes expreſſed by *capitare*, to head, whence abbutals are now called *head lands*.

ABCEDARY, or ABCEDARIAN, an epithet given to compoſitions, the parts of which are diſpoſed in the order of the letters of the alphabet: thus we ſay, Abcedarian pſalms, lamentations, hymns, &c.; ſuch are Pſal. xxv. xxxiv. cxix. &c.

ABCOURT, a town near St Germains, four leagues from Paris. Here is a briſk chalybeate water, which is alſo impregnated with carbonic acid and ſoda; and reſembling the waters of Spa and Ilmington.

ABDALLA, the ſon of Abalmotalleb, was the father of the prophet Mahomet. He was the moſt beautiful and modeſt of the Arabian youth, and when he married Amina, of the noble race of the Zahrites, 200 virgins are ſaid to have died of jealouſy and deſpair. Several other Arabians of eminence bore the ſame name.

ABDALMALEK, the ſon of Mirvan, and the 5th caliph of the race of the Ommiades. He ſurpaſſed all his predeceſſors in power and dominion; for in his reign the Indies were conquered in the eaſt, and his armies penetrated Spain in the weſt: he likewiſe extended his empire toward the ſouth, by making himſelf maſter of Medina and Mecca. Under his reign the Greek language and character were excluded from the accounts of the public revenue. If this change, ſays Gibbon, was productive of the invention or familiar uſe of the Arabic or Indian cyphers, which are our preſent numerals, a regulation of office has promoted the moſt important diſcoveries of arithmetic, algebra, and the mathematical ſciences. His extreme avarice expoſed him to the contempt and deriſion of his ſubjects, who gave him the appellation of *the ſweat of a ſtone*; and his fetid breath, it is ſaid, poiſoned the flies which accidentally lighted on his lips, whence he was called the *father of flies*. He began his reign in the 65th of the Hegira, A. D. 684; reigned 15 years; and four of his ſons ſucceſſively enjoyed the caliphate.

ABDALMALEK, *Ben Zohar*, an eminent phyſician, commonly called by the Europeans *Avenzoar*. See AVENZOAR.

ABDALMOTALLEB, or ABDOL MOTALLEB, the ſon of Haſhem, the father of Abdalla, and grandfather of Mahomet the prophet of the Muſſulmans, was, it is ſaid, of ſuch wonderful comelineſs and beauty, that all women who ſaw him became enamoured: which may have given occaſion to that prophetic light, which, according to the Arabians, ſhone on the foreheads of him, his anceſtors, and deſcendants; it being certain that they were very handſome and graceful men. He died when Mahomet, of whom he had taken peculiar care, was only eight or nine years old; aged, according to fame, 110, and according to other writers 120.

ABDALONYMUS, or ABDOLONYMUS, in claſſic hiſtory, of the royal family of Sidon, and deſcended from King Cinyras, lived in obſcurity, and ſubſiſted by cultivating a garden, while Strato was in poſſeſſion of the crown of Sidon. Alexander the Great having depoſed Strato, inquired whether any of the race of Cinyras was living, that he might ſet him on the throne. It was generally thought that the whole race was extinct: but at laſt Abdalonymus was thought of, and mentioned to Alexander; who immediately ordered ſome of his ſoldiers to fetch him. They found the good man at work, happy in his poverty, and entirely a ſtranger to the noiſe of arms, with which all Aſia was at that time diſturbed; and they could ſcarcely perſuade him they were in earneſt. Alexander was convinced of his high deſcent by the dignity of his perſon; but was deſirous of learning from him in what manner he bore his poverty. "I wiſh" ſaid Abdalonymus, "I may bear my new condition as well: Theſe hands have ſupplied my neceſſities: I have had nothing, and I have wanted nothing." This anſwer pleaſed Alexander ſo much, that he not only beſtowed on him all that belonged to Strato, but augmented his dominions, and gave him a large preſent out of the Perſian ſpoils.

Abdals

Abdera.

ABDALS, in the eaſtern countries, a kind of ſaints ſuppoſed to be inſpired to a degree of madneſs. The word is perhaps derived from the Arabic, *Abdallah*, the ſervant of God. The Perſians call them *devaneh khoda*, ſimilar to the Latin way of ſpeaking of prophets and ſibyls, q. d. *furentes deo*, raging with the god. Hurried on by exceſs of zeal, eſpecially in the Indies, they often run about the ſtreets, and kill all they meet who are of a different religion. The Engliſh ſailors call this *running a muck*, from the name of the inſtrument, a ſort of poniard, which they employ on thoſe deſperate occaſions. If they are killed, as it commonly happens before they have done much miſchief, they reckon it highly meritorious; and are eſteemed, by the vulgar, martyrs for their faith.

ABDARA, or ABDERA, in *Ancient Geography*, a town of Bætica in Spain, a Phœnician colony; now *Adra*, to the weſt of Almeira in the kingdom of Granada.

ABDERA, in *Ancient Geography*, a maritime town of Thrace, not far from the mouth of the river Neſſus, on the eaſt ſide. The foundation, according to Herodotus, was attempted to be laid by Timeſius the Clazomenian; but he was forced by the Thracians to quit the deſign. The Teians undertook it and ſucceeded, and ſettled in this place, in order to avoid the inſults and oppreſſion of the Perſians.—Several ſingularities are told of Abdera *. The graſs of the country round it was of ſuch a quality, that the horſes which fed on it were ſeized with madneſs. In the reign of Caſſander king of Macedon, this city was ſo infeſted with frogs and rats, that the inhabitants were forced for a time to quit it.—The Abderites, or Abderitani, were very much derided for their want of wit and judgement: yet their city has given birth to ſeveral eminent perſons; as Protagoras, Democritus, Anaxarchus, Hecatæus the hiſtorian, Nicenætus the poet, and many others, who were mentioned among the illuſtrious men.—In the reign of Lyſimachus, Abdera was afflicted for ſome months with a moſt extraordinary diſeaſe†: this was a burning fever, whoſe criſis was always on the ſeventh day, and then it left them; but it ſo diſtracted their imaginations, that they fancied themſelves players. After this, they were ever repeating verſes from ſome tragedy, and particularly

* Plin. lib. xxv. c. 8. Juſt. lib. xxv. c. 2.

† Lucianus, *quomodo Hiſt. ſit conſcribendus initio.*

Abderahma || Abdication.

from the Andromeda of Euripides, as if they had been upon the ſtage; ſo that many of theſe pale meagre actors were pouring forth their tragic exclamations in every ſtreet. This delirium continued till the winter following; which was a very cold one, and therefore fitter to remove it. Lucian, who has deſcribed this diſeaſe, endeavours to account for it in this manner: Archelaus, an excellent player, acted the Andromeda of Euripides before the Abderites, in the height of a very hot ſummer. Several had a fever at their coming out of the theatre; and as their imaginations were full of the tragedy, the delirium which the fever raiſed perpetually repreſented Andromeda, Perſeus, Meduſa, &c. and the ſeveral dramatic incidents, and called up the ideas of thoſe objects, and the pleaſure of the repreſentation, ſo ſtrongly, that they could not forbear imitating Archelaus's action and declamation: And from theſe the fever ſpread to others by infection.

ABDERAHMA, a Saracen viceroy in Spain, who revolted and formed an independent principality at Cordova. He had ſeveral ſucceſſors of the ſame name.

A viceroy and captain-general of this name led the Saracens and their followers into France, ravaging the country wherever they came. At length he was met at Tours by Charles Martel, who had received reinforcements of Germans and Gepidæ; and after many ſkirmiſhes, the Saracen army, in a general action, was totally routed, and Abderahma was killed with 370,000 Moors. This great event, which firſt broke the power of the Saracens, and taught the Europeans that they were not invincible, happened about the year 732 of the Chriſtian era, and of the Hegira 114.

ABDEST, a Perſian word, properly ſignifying the water placed in a baſon for waſhing the hands; but is uſed to imply the legal purifications practiſed by the Mahometans before prayer, entering the moſque, or reading the Alcoran.

ABDIAS OF BABYLON, one of the boldeſt legend writers, who boaſted that he had ſeen Chriſt, that he was one of the 70 diſciples, had been eye-witneſs of the actions and prayers of ſeveral of the apoſtles at their deaths, and had followed into Perſia St Simon and St Jude, who, he ſaid, made him the firſt biſhop of Bābylon. His book, entitled *Hiſtoria Certaminis Apoſtolici*, was publiſhed by Wolfgang Lazius, at Baſil, 1551; and has paſſed through ſeveral editions in other places.

ABDICATION, the action whereby a magiſtrate, or perſon in office, renounces and gives up the ſame before the term of ſervice is expired.

This word is frequently confounded with *reſignation*; but differs from it; for abdication is done purely and ſimply, whereas reſignation is in favour of ſome third perſon. In this ſenſe, Dioclefian is ſaid to have abdicated the crown; Philip IV. of Spain reſigned it. It is ſaid to be a renunciation, quitting, and relinquiſhing, ſo as to have nothing further to do with a thing; or the doing of ſuch actions as are inconſiſtent with the holding of it. On King James's leaving the kingdom, and abdicating the government, the lords propoſed that the word *deſertion* ſhould be employed; but the commons thought that it was not ſufficiently comprehenſive. Among the Roman writers it is more particularly uſed for the act whereby a father diſcarded or diſclaimed his ſon, and expelled him the family. It is diſtinguiſhed from *exhæredatio* or *diſinheriting*, in that the former was done in the father's lifetime; the latter, by will at his death: ſo that whoever was abdicated, was alſo diſinherited; but not *vice verſa*.

Abdollatiph.

ABDOLLATIPH, a phyſician, was born at Bagdad in the 557th year of the Hegira, A. D. 1161. Having been educated with the greateſt care by his father, who was himſelf a man of learning, and reſided in a capital which abounded with the beſt opportunities of inſtruction, he early diſtinguiſhed himſelf not only by proficiency in rhetoric, hiſtory, and poetry, but alſo in the more ſevere ſtudies of Mohammedan theology. To the acquirement of medical knowledge he applied with eſpecial diligence; and it was chiefly with this view that, in his 28th year, he left Bagdad, in order to viſit other countries. At Moſul, in Meſopotamia, whither he firſt directed his courſe, he found the attention of the ſtudents entirely confined to the chemiſtry of that day, with which he was already ſufficiently acquainted. Having ſpent a year at Moſul, he removed to Damaſcus in Syria, where the grammarian Al Kindi then enjoyed the higheſt reputation; and with whom he is ſaid to have engaged in a controverſy on ſome ſubjects of grammar and philology, which terminated in favour of Abdollatiph.

At this time, Egypt had yielded to the arms of Saladin, who was marching againſt Paleſtine for the purpoſe of wreſting that country from the hands of the Chriſtians: yet towards Egypt Abdollatiph was irreſiſtibly impelled by that literary curioſity which ſo ſtrongly marked his character. To the ſucceſsful proſecution of this journey, the conſent and patronage of the ſultan were indiſpenſably neceſſary: but when the Arabian phyſician arrived at the camp near Acca, (the ancient Ptolemais, now Acre) to ſolicit his powerful protection, he found the Saracens bewailing a defeat which they had recently experienced; a defeat ſo honourable to the ſkill and valour of our Engliſh Richard, that nothing leſs than the late matchleſs defence of this fortreſs, by a handful of Britiſh ſeamen and marines, could have detracted from its importance, or eclipſed its glory. Hence the lofty ſpirit of the ſultan was plunged into a morbid melancholy, which excluded the traveller from his preſence; but the favours which he received evinced the munificence of Saladin, and he perſiſted in his deſign of exploring the wonders of Egypt. One ſtrong inducement which influenced him on this occaſion, was the inſtruction which he hoped to derive from the ſociety of the celebrated Maimonides; and by Al Kadi Al Fadel, who had earneſtly but unavailingly ſolicited him to return to Damaſcus, he was furniſhed with ſuch recommendations as procured for him the moſt flattering reception at Cairo. His talents and his virtues confirmed and increaſed the kindneſs with which he was welcomed on his firſt arrival; and the Egyptians of the higheſt rank continued to vie with each other in cultivating his friendſhip.

From this intercourſe, however, with the great and the learned, Abdollatiph withdrew, in order to preſent himſelf before the ſultan; who, having concluded a truce with the Franks, then reſided in the Holy City. Here he was received by Saladin with every expreſſion of eſteem for his character and attainments.

To

Abdomen, Abdominales. To a dignified politeneſs, and condeſcending freedom, this prince is ſaid to have added a munificent liberality in the patronage of ſcience and of art; and of this fact, indeed, we have a laudable inſtance in the penſion which he granted to Abdollatiph, and which amounted to 30 dinars per month. After the death of the ſultan, this ſum was raiſed by his ſons to 100 dinars, till the ambition of their uncle forced them from the throne of Egypt and of Syria; and thus was our traveller compelled to reſort again to Damaſcus, after a ſhort abode at Jeruſalem: where his lectures, and his treatiſes, were equally the objects of general admiration.

In the capital of Syria, his purſuits were of the ſame nature, and attended with ſimilar ſucceſs. His practice as a phyſician was extenſive. To the ſtudents in the college of Al Aziz, he freely communicated the ample ſtores of his cultivated mind; and in the works which he compoſed on the principles of medicine, he diſplayed that depth of reſearch and that felicity of illuſtration, which are the rare effects of genius combined with diligence, judgement, and erudition.

Such is the teſtimony given to the exertions of our author; and it is added that they were rewarded at Damaſcus not with fame alone, but alſo with riches. Yet neither the applauſe of the wiſe nor the patronage of the wealthy had power to detain him, when other ſcenes or other ſociety promiſed to gratify his curioſity, or to increaſe his knowledge. On this account, probably, he left Damaſcus, and, after having viſited Aleppo, reſided ſeveral years in Greece. With the ſame view he travelled through Syria, Armenia, and Aſia Minor, ſtill adding to the number of his works; many of which he dedicated to the princes whoſe courts he viſited, or whoſe ſubjects he laboured to inſtruct.

After having thus enriched his own mind, and contributed ſo ſucceſsfully to the improvement of others, ſentiments of devotion induced him to undertake a pilgrimage to Mecca. In the mean time, however, he ſeems to have experienced the full force of that deſire, which in the native of Switzerland has often been known to ſuperſede every other,—the deſire of once more beholding the place which gave him birth. He wiſhed alſo to preſent the fruits of his travels, and of his ſtudies, to the caliph Al Moſtanſer Billah. He therefore eagerly journeyed towards Bagdad, which, after ſo long an abſence, he no doubt beheld with emotions of tender exultation:—but all his hopes were diſappointed: Scarcely had he reached his native city, when he was ſuddenly taken ill, and died in his 63d year, A. D. 1223. Of 150 treatiſes which he compoſed on various ſubjects of medicine, natural philoſophy and polite literature, only one, entitled *Hiſtoriæ Ægypti Compendium*, has ſurvived the ravages of time. This manuſcript, the only one which has been diſcovered, was brought to Europe by the celebrated orientaliſt Pococke, and is now preſerved in the Bodleian library. Dr White of Oxford publiſhed an edition of the original Arabic, with an elegant Latin verſion in 4to, in 1800. (*Month. Rev.*)

ABDOMEN, in *Anatomy*, is that part of the trunk of the body which lies between the thorax and the bottom of the pelvis. See ANATOMY.

ABDOMINALES, or ABDOMINAL FISHES, conſtitute the Fourth Order of the *Fourth Claſs* of Animals, in the Linnæan ſyſtem. See ICHTHYOLOGY. Abduction || Abelard.

ABDUCTION, in *Logic*, a kind of argumentation, by the Greeks called *apagoge*, wherein the greater extreme is evidently contained in the medium, but the medium not ſo evidently in the leſſer extreme as not to require ſome farther medium or proof to make it appear. It is called *abduction*, becauſe, from the concluſion, it draws us on to prove the propoſition aſſumed. Thus, in the ſyllogiſm, "All whom God abſolves are free from ſin; but God abſolves all who are in Chriſt; therefore all who are in Chriſt are free from ſin,"—the major is evident; but the minor, or aſſumption, is not ſo evident without ſome other propoſition to prove it, as, "God received full ſatisfaction for ſin by the ſufferings of Jeſus Chriſt."

ABDUCTOR, or ABDUCENT, in *Anatomy*, a name given to ſeveral of the muſcles, on account of their ſerving to withdraw, open, or pull back the parts to which they belong.

ABEL, ſecond ſon of Adam and Eve, was a ſhepherd. He offered to God ſome of the firſtlings of his flock, at the ſame time that his brother Cain offered the fruits of the earth. God was pleaſed with Abel's oblation, but diſpleaſed with Cain's; which ſo exaſperated the latter, that he roſe up againſt his brother and killed him. Theſe are the only circumſtances Moſes relates of him; though, were we to take notice of the ſeveral particulars to which curioſity has given birth on this occaſion, they would run to a very great length. But this will not be expected. It is remarkable, that the Greek churches, who celebrate the feaſts of every other patriarch and prophet, have not done the ſame honour to Abel. His name is not to be found in any catalogue of ſaints or martyrs till the 10th century; nor even in the new Roman martyrology. However he is prayed to, with ſome other ſaints, in ſeveral Roman litanies ſaid for perſons who lie at the point of death.

ABEL-Keramim, or *Vinearum*, beyond Jordan, in the country of the Ammonites, where Jephthah defeated them, ſeven miles diſtant from Philadelphia; abounding in vines, and hence the name. It was alſo called *Abela*.

ABEL-Meholah, the country of the prophet Eliſha, ſituated on this ſide Jordan, between the valley of Jezreel and the village Bethmael, in the plains of Jordan, where the Midianites were defeated by Gideon. Judges vii. 22.

ABEL Mizraim, (called alſo the Threſhing-floor of Atad), ſignifying the lamentation of the Egyptians; in alluſion to the mourning for Jacob, Gen. l. 3, 10, 11. Suppoſed to be near Hebron.

ABEL-Moſch, or *Abelmuſch*, in *Botany*, the trivial name of a ſpecies of the HIBISCUS.

ABEL-Sattim, or *Sittim*, a town in the plains of Moab, to the north eaſt of the Dead ſea, not far from Jordan, where the Iſraelites committed fornication with the daughters of Moab: So called, probably, from the great number of ſittim trees there.

ABELARD, PETER, an eminent ſcholaſtic philoſopher of France, the ſon of Berenger, of noble deſcent, was born at Palais near Nantes in Bretagne, in the year 1079. Abelard had received from nature a vigorous and active mind; but it was his lot to live at a period, when logic, metaphyſics, and polemic theo-

Abelard. logy, conſtituted a learned education, when abſtruſe ſpeculations and verbal ſubtleties occupied the ingenuity of literary men, and diſtinguiſhed talents for diſputation led to honour and preferment. Devoted to letters by his father's appointment, and by his own inclination, his literary attainments could at this time only be exhibited in the field of ſcholaſtic philoſophy; and, that he might be fitted for his deſtined career of life, he was placed, after a previous courſe of grammatical ſtudies, under the tuition of Roſceline, a celebrated metaphyſician, and founder of the ſect of the Nominaliſts. Under the inſtructions of this able maſter, at the early age of ſixteen, he furniſhed himſelf with a large ſtore of ſcholaſtic knowledge, and acquired a ſubtlety and quickneſs of thought, a fluency of ſpeech, and facility of expreſſion, which were neceſſary qualifications in ſcholaſtic diſputation.

Having ſpent ſome time in viſiting the ſchools of ſeveral provinces, after the example of the ancient philoſophers who travelled in ſearch of wiſdom, in the twentieth year of his age, he fixed his reſidence in the univerſity of Paris, then the firſt ſeat of learning in Europe. The maſter, William de Champeaux, was at that time in high repute for his knowledge of philoſophy, and his ſkill in the dialectic art; to him he committed the direction of his ſtudies, and was at firſt contented with receiving inſtruction from ſo eminent a preceptor. De Champeaux was proud of the talents of his pupil, and admitted him to his friendſhip. But the aſpiring youth ventured to contradict the opinions of his maſter, and in the public ſchool held diſputations with him, in which he was frequently victorious. The jealouſy of the maſter and the vanity of the pupil naturally occaſioned a ſpeedy ſeparation.

Elated by ſucceſs, and confident of his own powers, Abelard, without heſitation, at the age of twenty-two, opened a public ſchool of his own. "I was young indeed," ſays he; "but confident of myſelf, my ambition had no bounds: I aſpired to the dignity of a profeſſor, and only waited till I could fix on a proper place to open my lectures." Melun, a town ten leagues from Paris, where the court frequently reſided, was the place which he choſe for this bold diſplay of his talents. But it was not without conſiderable difficulty that Abelard executed his plan; for De Champeaux, who regarded him as a rival, openly employed all his intereſt againſt him. Abelard at length prevailed, his ſchool was opened, and his lectures were attended by crowded and admiring auditories. Emboldened by this ſucceſs, and perhaps ſtimulated by unworthy reſentment, Abelard reſolved to maintain an open conteſt with his maſter, and for this purpoſe removed his ſchool to Corbeil near Paris. The diſputants frequently met in each other's ſchools; and the conteſt was ſupported on each ſide with great ſpirit, amidſt crowds of their reſpective ſcholars. The young champion was in the end victorious, and his antagoniſt was obliged to retire.

Conſtant application and violent exertions had now ſo far impaired Abelard's health, that it was become neceſſary for him to interrupt his labours; and, with the advice of his phyſician, he withdrew to his native country. Two years afterwards, he returned to Corbeil, and found that De Champeaux had taken the monaſtic habit among the regular canons in the convent of St Victor; but that he ſtill continued to teach rhetoric and logic, and to hold public diſputations in theology. Returning to the charge, he renewed the conteſt, and his opponent was obliged to acknowledge himſelf defeated; and the ſcholars of De Champeaux deſerted him, and went over in crowds to Abelard. Even the new profeſſor, who had taken the former ſchool of De Champeaux, voluntarily ſurrendered the chair to the young philoſopher, and requeſted to be enrolled among his diſciples. A triumph ſo complete, while it gratified the vanity of Abelard, could not fail to provoke the reſentment of his old maſter, who had influence to obtain the appointment of a new profeſſor, and drive Abelard back to Melun. De Champeaux's motive for this violent proceeding was ſoon perceived; even his friends were aſhamed of his conduct; and he retired from the convent into the country. When Abelard was informed of the flight of his adverſary, he returned towards Paris, and took a new ſtation at the abbey on Mount St Genevieve. His rival, the new profeſſor, was unequal to the conteſt, and was ſoon deſerted by his pupils, who flocked to the lectures of Abelard. De Champeaux too returning to his monaſtery, renewed the ſtruggle; but ſo unſucceſsfully, that Abelard was again victorious. Abelard.

During a ſhort abſence, in which Abelard viſited his native place, De Champeaux was preferred to the ſee of Chalons. The long and ſingular conteſt between theſe philoſophers terminated; and Abelard, perhaps for want of a rival to ſtimulate his exertions, or poſſibly through envy of the good fortune of his rival, determined to exchange the ſtudy and profeſſion of philoſophy for that of theology. He therefore quitted his ſchool at St Genevieve, and removed to Laon, to become a ſcholar of Anſelm. From this celebrated maſter he entertained high expectations; but they were ſoon diſappointed. On attending his lectures, he found that, though he poſſeſſed uncommon fluency of language, he left his auditors without inſtruction. "You would have thought," ſays Abelard, "he was kindling a fire, when inſtantly the whole houſe was filled with ſmoke, in which not a ſingle ſpark was viſible: he was a tree covered with a thick foliage, which pleaſed the diſtant eye; but, on a nearer inſpection, there was no fruit to be found: I went up to this tree in full expectation, but I ſaw that it was the fig tree which the Lord had curſed." (*Hiſt. Calamit.*) Abelard gradually retired from theſe unprofitable lectures, but without offering offence either to the veteran profeſſor, or his ſcholars. In converſation one of them aſked him, what he thought of the ſtudy of the Scriptures? Abelard replied, that he thought the explanation of them a taſk of no great difficulty; and, to prove his aſſertion, he undertook to give a comment, the next day, upon any part of the Scriptures they ſhould mention. They fixed upon the beginning of the prophecy of Ezekiel; and the next morning he explained the paſſage in a theological lecture, which was heard with admiration. For ſeveral ſucceſſive days, the lectures were at the requeſt of the audience continued; the whole town preſſed to hear them; and the name of Abelard was echoed through the ſtreets of Laon. Anſelm, jealous of the riſing fame of this young theologian, prohibited his lectures, under the pretence that ſo young a lecturer might fall into miſtakes, which would

Abelard. would bring discredit upon his master. Abelard, whose ambition required a wider field than that of Laon, obeyed the prohibition, and withdrew. He returned to Paris, whither the fame of his theological talents had arrived before him, and opened his school with his lectures on the prophecy of Ezekiel. His auditors were delighted; his school was crowded with scholars; and he united in his lectures the sciences of theology and philosophy with so much success, that multitudes repaired to his school from various parts of France, from Spain, Italy, Germany, Flanders, and Great Britain.

Hitherto Abelard has appeared with high distinction, as an able disputant, and a popular preceptor: we must now view him under a different character, and, when nearly arrived at the sober age of forty, see him, on a sudden, exchanging the school of philosophy for the bower of pleasure, and even disgracing himself, as will too plainly appear in the sequel, by forming and executing a deliberate plan for the seduction of female innocence. It happened that there was at this time, resident in Paris, Heloise, the niece of Fulbert, one of the canons of the cathedral church, a lady about eighteen years of age, of great personal beauty, and highly celebrated for her literary attainments. Abelard, whose vanity had been satiated with fame, and the vigour of whose mind was now enervated by repose, found himself inclined to listen to the voice of passion. He beheld with ardent admiration the lovely Heloise, and confident that his personal attractions were still irresistible, he determined to captivate her affections. Fulbert, who doubtless thought himself honoured by the visits of so eminent a scholar and philosopher, received him into his house as a learned friend. He was soon afterwards prevailed upon, by a handsome payment which Abelard offered for his board, to admit him into his family; and, apprehending no hazard from a man of Abelard's age and profession, confidentially requested him to undertake the instruction of Heloise. Abelard accepted the trust, but, as it seems, without any other intention than to betray it. The hours of instruction were employed in other lessons than those of learning and philosophy; and to such a master as Abelard, it was not surprising that Heloise was an apt scholar. Fulbert's respectful opinion of the philosopher, and his partiality for his niece, long concealed from him an amour, which was become the subject of general conversation. At length the discovery burst upon him like a clap of thunder. Upon discovering her pregnancy, it was thought necessary for her to quit her uncle's house, and Abelard conveyed her to Bretagne, where his sister was prepared to receive them. Here Heloise was delivered of a son, to whom they gave the whimsical name of Astrolabus. Abelard, upon the birth of the child, proposed to Fulbert to marry his niece, provided the marriage might be kept secret: Fulbert consented, and Abelard returned to Bretagne to fulfill his engagement. Heloise, partly out of regard to the honour of Abelard, whose profession bound him to celibacy, and partly from a romantic notion that love like hers ought not to submit to ordinary restraints, at first gave Abelard a peremptory refusal. He, however, at last prevailed, and they were privately married at Paris. Heloise from this time met with severe treatment from her uncle, which furnished Abelard with a plea for Abelard. removing her from his house, and placing her in the abbey of Benedictine nuns, in which she had been educated. Fulbert concluded, perhaps not without reason, that Abelard had taken this step, in order to rid himself of an incumbrance which obstructed his future prospects. Deep resentment took possession of his soul, and he meditated revenge. He employed several ruffians to enter his chamber by night, and inflict upon his person a disgraceful and cruel mutilation. The deed was perpetrated; the ruffians were taken, and suffered, according to the *Lex Talionis*, the punishment they had inflicted; and Fulbert, for his savage revenge, was deprived of his benefice, and his goods were confiscated. Unable to support his mortifying reflections, Abelard resolved to retire to a convent. At the same time he formed the selfish resolution, that, since Heloise could no longer be his, she should never be another's, and ungenerously demanded from her a promise to devote herself to religion; and even insisted upon her taking the holy vow before him, suspecting, as it seems, that if he first engaged himself, she might violate her promise, and return to the world; a circumstance, with which she afterwards thus tenderly reproached him: "In that one instance, I confess, your mistrust of me tore my heart; Abelard, I blushed for you." Heloise submitted to the harsh injunction, professed herself in the abbey of Argenteuil, and receiving the religious habit, exclaimed in the words of Cornelia:

——————— O maxime conjux!
O thalamis indigne meis! hoc juris habebat
In tantum fortuna caput? cur impia nupsi,
Si miserum factura fui? nunc accipe pœnas,
Sed quas sponte luam. LUCAN.

"Ah! my once greatest lord! Ah! cruel hour!
Is thy victorious head in Fortune's power!
Since miseries my baneful love pursue,
Why did I wed thee, only to undo!
But see, to death my willing neck I bow;
Atone the angry gods by one kind blow." ROWE.

A few days after Heloise had taken her vows, Abelard assumed the monastic habit in the abbey of St Denys, determined as it seems to forget, in hope of being forgotten by, the world. However, his admirers and scholars in Paris were unwilling that the world should lose the benefit of his labours, and sent deputies to entreat him to return to his school. After some deliberation, he again yielded to the call of ambition; and at a small village in the country, he resumed his lectures, and soon found himself surrounded with a numerous train of scholars. The revival of his popularity renewed the jealousy of other professors, who took the first opportunity of bringing him under ecclesiastical censure. A treatise which he published at this time, entitled, "The Theology of Abelard," was supposed to contain some heretical tenets. A synod was called at Soissons in the year 1121; the work was condemned to be burnt, and Abelard was commanded to throw it into the flames. After being involved in other controversies, new charges were brought against him, and he fled to the convent of St Ayoul at Provins in Champagne, the prior of which was his intimate friend. The place of his retreat was soon discovered, and threats

Abelard. threats and perſuaſions were in vain employed to recal him: at laſt he obtained permiſſion to retire to ſome ſolitary retreat, on condition that he ſhould never again become a member of a convent.

The ſpot which he choſe was a vale in the foreſt of Champagne, near Nogent upon the Seine. Here Abelard, in 1122, erected a ſmall oratory, which he dedicated to the Trinity, and which he afterwards enlarged and conſecrated to the Third Perſon, the Comforter, or Paraclete. Here he was ſoon diſcovered, and followed by a train of ſcholars. A ruſtic college aroſe in the foreſt, and the number of his pupils ſoon increaſed to ſix hundred. Jealouſy again provoked the exertions of his enemies, and he was meditating his eſcape, when, through the intereſt of the duke of Bretagne, and with the conſent of the abbot of St Denys, he was elected ſuperior of the monaſtery of St Gildas, in the dioceſe of Vannes, where, though not without frequent and grievous vexations, he remained ſeveral years.

About this time, Suger the abbot of St Denys, on the plea of an ancient right, obtained a grant for annexing the convent of Argenteuil, of which Heloiſe was now prioreſs, to St Denys, and the nuns, who were accuſed of irregular practices, were diſperſed. Abelard, informed of the diſtreſſed ſituation of Heloiſe, invited her, with her companions, eight in number, to take poſſeſſion of the Paraclete.

It was during Abelard's reſidence at St Gildas, that the intereſting correſpondence paſſed between him and Heloiſe, which is ſtill extant. The letters of Heloiſe, in this correſpondence, abound with proofs of genius, learning, and taſte, which might have graced a better age. It is upon theſe letters that Mr Pope has formed his "Epiſtle from Eloiſa to Abelard;" a piece which is entitled to the higheſt praiſe for its poetical merit, but which deviates in many particulars from the genuine character and ſtory of Heloiſe, and culpably violates moral propriety. Here, too, Abelard probably wrote his "Theology," which again ſubjected him to perſecution. His opinions were pronounced heretical by a council; and although he appealed to Rome, the judgement of the council was confirmed by the pope; and he was ſentenced, unheard, to perpetual ſilence and impriſonment. By the interpoſition of ſome friends, however, and by a ſubmiſſive apology, he obtained his pardon, with permiſſion to end his days in the monaſtery of Cluni.

At Cluni he was retired, ſtudious, and devout. The monks of the convent importuned him to reſume the buſineſs of inſtruction. In a few occaſional efforts he complied with their ſolicitation; and his lectures were heard with undiminiſhed applauſe. But his health and ſpirits were much enfeebled, and gradually declined till he died in the 63d year of his age, A. D. 1142. His body was ſent to Heloiſe to be interred in the convent of the Paraclete. Heloiſe ſurvived her huſband 21 years, a pattern of conjugal affection and monaſtic virtue; and was buried in the ſame grave, as appears by the following epitaph:

Hic
Sub eodem marmore, jacent
Hujus Monaſterii
Conditor, Petrus Abelardus,

Et abbatiſſa prima, Heloiſa,
Olim ſtudiis, ingenio, infauſtis nuptiis
Et pœnitentia,
Nunc æterna, ut ſperamus, felicitate,
Conjuncti.

Abelard & Abelians.

Petrus obiit 21 *Aprilis* 1142.
Heloïſa 17 *Maii* 1163.

The amour, which has given Abelard ſo much celebrity, will remain an eternal blot upon his memory. It was not a juvenile indiſcretion of which Abelard was guilty, but, according to his own confeſſion, the ſeduction of innocence, deliberately planned, and reſolutely executed. It was accompanied with breach of confidence, violation of duty, and degradation of character. Except in the grant of the Paraclete as an aſylum to Heloiſe and her ſiſterhood, an uniform ſelfiſhneſs appears in Abelard's conduct. In Heloiſe, the criminality, though not obliterated, was palliated by youthful ardour and inexperience; and extreme ſenſibility, romantic attachment, noble generoſity, and diſintereſted invincible conſtancy, united to throw a veil over human frailty. Conſidered apart from this diſgraceful affair, Abelard appears with more advantage. His writings, indeed, will not give the reader a high idea of his genius or taſte: but it cannot be queſtioned, that the man who could foil the firſt maſters of the age at the weapons of logic, could draw round him crowded and admiring auditories, and could collect ſcholars from different provinces and countries whereever he choſe to form a ſchool, muſt have poſſeſſed extraordinary talents. Had his love of truth been equal to his thirſt of fame, and had his courage in adhering to his principles been equal to his ingenuity in defending them, his ſufferings and perſecutions might have excited more regret, and his title to honourable remembrance would have been better eſtabliſhed. Upon the whole, of Abelard it may perhaps with truth be ſaid, that he was too vain to be truly great, and too ſelfiſh to be eminently good, and that his character is rather adapted to excite admiration than to command reſpect.

His principal works, written in Latin, are, "An Addreſs to the Paraclete on the Study of the Scriptures; Problems and Solutions; Sermons on the Feſtivals; A Treatiſe againſt Hereſies; An Expoſition of the Lord's Prayer; A Commentary on the Romans; A Syſtem of Theology; and his Letters to Heloiſe and to others." (*Gen. Biog.*)

ABEL TREE, or ABELE TREE, an obſolete name for a ſpecies of the poplar. See POPULUS, BOTANY *Index*.

ABELIANS, ABEOLITES, or ABELONIANS, in church hiſtory, a ſect of heretics mentioned by St Auſtin, which aroſe in the dioceſe of Hippo in Africa, and is ſuppoſed to have begun in the reign of Arcadius, and ended in that of Theodoſius. Indeed it was not calculated for being of any long continuance. Thoſe of this ſect regulated marriage after the example of Abel; who, they pretended, was married, but died without ever having known his wife. They therefore allowed each man to marry one woman, but enjoined them to live in continence; and, to keep up the ſect, when a man and woman entered into this ſociety, they adopted a boy and a girl, who were to inherit their goods, and to marry upon the ſame terms of not begetting

Abella || Aberbrothick.

getting children, but of adopting two of different ſexes.

ABELLA, anciently a town of Campania, near the river Clanius. The inhabitants were called Abellani, and ſaid to have been a colony of Chalcidians. The nux Avellana, called alſo *Præneſtina*, or the *hazel nut*, takes its name from this town, according to Macrobius. Now *Avella*.

ABELLINUM, anciently a town of the Hirpini, a people of Apulia; diſtant about a mile from the rivulet Sabatto, between Beneventum and Salernum. Pliny calls the inhabitants *Abellinates*, with the epithet *Protopi*, to diſtinguiſh them from the Abellinates Marſi. Now *Avellino*. E. Long. 15. 20. N. Lat. 21. 0.

ABEN EZRA, ABRAHAM, a celebrated rabbi, born at Toledo in Spain, called by the Jews, The wiſe, great, and admirable Doctor, was a very able interpreter of the Holy Scriptures; and was well ſkilled in grammar, poetry, philoſophy, aſtronomy and medicine. He was alſo a perfect maſter of the Arabic. His principal work is, "Commentaries on the Old Teſtament," which is much eſteemed: theſe are printed in Bomberg's and Buxtorf's Hebrew Bibles. His ſtyle is clear, elegant, conciſe, and much like that of the Holy Scriptures: he almoſt always adheres to the literal ſenſe, and everywhere gives proofs of his genius and good ſenſe: he, however, advances ſome erroneous ſentiments. The ſcarceſt of all his books is entitled "Jeſud Mora;" which is a theological work, intended as an exhortation to the ſtudy of the Talmud. He alſo wrote *Elegantiæ Grammaticæ*, printed in octavo at Venice in 1548. He died in 1174, aged 75.

ABEN MELLER, a learned rabbin, who wrote a commentary on the Old Teſtament in Hebrew, entitled, "The Perfection of Beauty." This rabbin generally follows the grammatical ſenſe and the opinions of Kimchi. The beſt edition is that of Holland.

ABENAS, a town of France, in Languedoc and in the Lower Vivarais, ſeated on the river Ardeſch, at the foot of the Cevennes. E. Long. 4. 43. N. Lat. 44. 40.

ABENEL GAUBY, a fixed ſtar of the ſecond or third magnitude, in the ſouth ſcale of the conſtellation LIBRA.

ABENSPERG, a ſmall town of Germany, in the circle and duchy of Bavaria, and in the government of Munich. It is ſeated on the river Abentz, near the Danube. E. Long. 11. 38. N. Lat. 48. 45.

ABERAVON, a borough town of Glamorganſhire in Wales, governed by a portreeve. It had a market, which is now diſcontinued. The vicarge is diſcharged, and is worth 45l. clear yearly value. It is ſeated at the mouth of the river Avon, 194 miles weſt of London. W. Long. 3. 21. N. Lat. 51. 40.

ABERBROTHICK, or ARBROATH, one of the royal boroughs of Scotland, ſituated in the county of Angus, about 40 miles N. N. E. of Edinburgh, in W. Long. 2. 29. and N. Lat. 56. 36. It is ſeated on the diſcharge of the little river Brothic into the ſea, as the name imports, *Aber* in the Britiſh implying ſuch a ſituation. It is a ſmall but flouriſhing place, well built, and ſtill increaſing. The town has been in an improving ſtate for the laſt forty years, and the number of inhabitants greatly augmented; which is owing to the introduction of manufactures. The population in 1801 was above 7000. The inhabitants conſiſt chiefly of weavers of coarſe brown linens, and ſome ſail cloth; others are employed in making white and coloured threads: the remainder are either engaged in the ſhipping of the place, or in the neceſſary and common mechanic trades. The brown linens, or oſnaburgs, were manufactured here before any encouragement was given by government, or the linen company erected at Edinburgh. It appears from the books of the ſtamp-office in this town, that ſeven or eight hundred thouſand yards are annually made in the place, and a ſmall diſtrict round. Beſides this export and that of thread, much barley and ſome wheat is ſent abroad. The foreign imports are flax, flax-ſeed, and timber, from the Baltic. The coaſting trade conſiſts of coals from Borrowſtounneſs, and lime from Lord Elgin's kilns in Fife. At this place, in default of a natural harbour, a tolerable artificial one of piers has been formed, where, at ſpring tides, which riſe here fifteen feet, ſhips of two hundred tons can come, and of eighty at neap tides; but they muſt lie dry at low water. This port is of great antiquity: there is an agreement yet extant between the abbot and the burghers of Aberbrothick, in 1194, concerning the making of the harbour. Both parties were bound to contribute their proportions; but the largeſt fell to the ſhare of the former, for which he was to receive an annual tax payable out of every rood of land lying within the borough. The glory of this place was the abbey, whoſe very ruins give ſome idea of its former magnificence. It was founded by William the Lion in 1178, and dedicated to our celebrated primate Thomas à Becket. The founder was buried there; but there are no remains of his tomb, or any other, excepting that of a monk of the name of Alexander Nicol. The monks were of the Tyronenſian order; and were firſt brought from Kelſo, whoſe abbot declared thoſe of this place, on the firſt inſtitution, to be free from his juriſdiction. The laſt abbot was the famous Cardinal Beaton, at the ſame time archbiſhop of St Andrew's, and, before his death, as great and abſolute here as Wolſey was in England. King John, the Engliſh monarch, granted this monaſtery moſt uncommon privileges; for, by charter under the great ſeal, he exempted it *à teloniis et conſuetudine* in every part of England, except London. At Aberbrothick is a chalybeate water, ſimilar to thoſe of Peterhead and Glendye.

Aberconway, Abercromby.

ABERCONWAY, or CONWAY, in Caernarvonſhire, North Wales; ſo called from its ſituation at the mouth of the river Conway. It is a handſome town, pleaſantly ſituated on the ſide of a hill, and has many conveniences for trade; notwithſtanding which it is the pooreſt town in the county. It was built by Edward I. and had not only walls, but a ſtrong caſtle which is now in ruins. Here is an inſcription on the tomb of one Nicholas Hooks, importing that he was the one-and-fortieth child of his father, and had twenty-ſeven children himſelf. It is 229 miles from London. W. Long. 3. 47. N. Lat. 53. 20.

ABERCROMBY, THE HONOURABLE ALEXANDER (Lord Abercromby), a judge in the courts of ſeſſion and juſticiary in Scotland, was the youngeſt ſon of George Abercromby, of Tullibody, Eſq. of a reſpectable family in Clackmannanſhire, and was born on the 15th October 1745. Mr Abercromby was early deſtined for the profeſſion of the law, and with this view

Abercromby. view he was educated at the university of Edinburgh, where he passed through the requisite course of languages, philosophy, and law, and was admitted advocate in the year 1766: but neither during the time of his education, or for some years after he entered his professional career, did he give much promise of those eminent abilities and that assiduous application which afterwards distinguished him as a pleader and a judge. The vivacity of his disposition, and the sprightliness of his manners, led him to prefer the gayer amusements of life, and the society of men of fashion and pleasure, to the arduous prosecution of philosophical studies, and to the less inviting and more barren paths of legal disquisitions. When, however, either during his academical course, or the first years of his practice at the bar, occasions required the exertion of his talents, the quickness of his perception, and the acuteness and strength of his understanding, enabled him to display such powers of attention and application to business as are seldom acquired but by regular and uniform habits of industry, and by the force of constant application. But, to attain that distinction and eminence to which he aspired, and to secure that independence which the patrimony of a younger son of a family, more respectable than opulent, could not afford him, he found it necessary to withdraw from those scenes of amusement and pleasure, and to seclude himself from that society which his gaiety and agreeable manners had enlivened and entertained, and to think seriously of applying to the labours of his profession. With much credit to himself, and with undiminished vigour of mind, he threw off the character of the man of fashion, and devoting his time and talents to the toilsome detail of business as a lawyer, by his successful efforts he soon gave solid proofs of the distinguished abilities which he possessed. About this time, he was engaged as counsel in a cause in which public curiosity and opinion were much interested and divided. This cause, which was of a very intricate nature, afforded an opportunity of making a more eminent display of his professional talents. By a speech which he delivered on this occasion, conspicuous for accurate discrimination, strength of argument, and impressive eloquence, he gave a favourable presage of his future celebrity. The marks of approbation which he now received probably taught him to appreciate those talents which had hitherto remained concealed or unemployed, and encouraged him to call them forth into exertion.

In 1780, Mr Abercromby resigned the office of sheriff-depute of Stirlingshire, which he had held for several years, and accepted of that of depute-advocate, with the hope of extending his employment in the line of his profession. In this step he was not disappointed; for his reputation and business rapidly increased, and soon raised him to the first rank of lawyers at the Scotch bar. In the midst of the laborious duties of his profession, Mr Abercromby did not entirely preclude himself from indulging in the elegant amusements of polite literature. He was one of that society who set on foot two periodical papers, the *Mirror* and *Lounger*, published at Edinburgh; the former in 1779, and the latter in 1785. To the *Mirror* he contributed ten papers, and to the *Lounger* nine. The names of the authors have been published in the late editions of these works, which renders it unnecessary to point out those papers of which Mr Abercromby was the author. Abercromby.

In May 1792, he was appointed one of the judges of the court of session, and in December following he was called to a seat in the court of justiciary. Lord Abercromby continued to discharge the arduous duties of these important offices till summer 1795, when he was seized with a pectoral complaint, of which he died on the 17th November the same year, at Exmouth in Devonshire, where he had gone for the recovery of his health.

As a lawyer, Lord Abercromby had acquired great reputation. His papers on law-cases were distinguished for precision and perspicuity. His speeches were elegant, animated, and eloquent. With the most pathetic feeling he pled the cause of the unfortunate; while he could assume the severe tone of virtuous indignation in rebuking injustice and oppression. With such qualifications, added to the strictest attention and punctuality, he could not fail to become an able and respectable judge. In this high station, his deportment was grave, dignified, and decided. His elocution was solemn and deliberate; and his opinions, delivered in this manner, had an impressive effect. Avoiding a detail of circumstances, and never arguing the cause as a lawyer, he pronounced with brevity and precision the opinion of a judge drawn from its striking and prominent features. His only writings are the papers in the periodical publications already alluded to. They are marked by an easy turn of expression, manly and virtuous sentiments, and, when the subject required it, by delicate irony or unaffected tenderness. (*Phil. Trans. Edin.*)

Abercromby, *Sir Ralph*, knight of the Bath, and a lieutenant-general in the British army, an elder brother of the preceding, was born in the year 1738. Being destined for the army, he obtained, in May 1756, a cornet's commission in the 2d dragoon guards; and rose, April 24. 1762, to the rank of a captain in the 3d regiment of horse. Ascending through the intermediate gradations of rank, he was appointed, November 3. 1781, to the colonelcy of the 103d infantry. September 28. 1787, he was promoted to the rank of major-general. November 5. 1795, he obtained the command of the 7th regiment of dragoons. Having been nearly 40 years in the army, having served with honour in two wars, and being esteemed one of the ablest, coolest, and most intrepid officers in the whole British forces, he was employed on the continent under his royal highness the duke of York, in the commencement of the present war. In the action on the heights of Cateau, he commanded the advanced guard; and was wounded at Nimeguen. He conducted the march of the guards from Deventer to Oldensaal, in the retreat of the British out of Holland, in the winter of 1794-5. In August 1795, he was appointed to succeed Sir Charles Grey, as commander in chief of the British forces in the West Indies. March 24. 1796, Grenada was suddenly attacked and taken by a detachment of the army under his orders. He afterwards obtained possession of the settlements of Demarara and Issequibo, in South America. St Lucia was next taken by more difficult exertions, in which the ability of this eminent commander was signally displayed.

Abercromby. played. St Vincent's was, by the middle of June, added to the Britiſh conqueſts. Trinidad, in February 1797, ſhared the ſame fate. He returned the ſame year to Europe, and, in reward for ſuch important ſervices, was inveſted with the red ribbon, appointed to the command of the regiment of Scots Greys, entruſted with the governments of the Iſle of Wight, Fort George, and Fort Auguſtus, and raiſed to the high military rank of lieutenant-general. He held, for a time, the chief command of the forces in Ireland. In that command, he laboured to maintain the diſcipline of the army, to ſuppreſs the riſing rebellion, and to protect the people from military oppreſſion, with a care worthy alike of the great general and the enlightened and beneficent ſtateſman. From that ſtation he was called to the chief command of the forces in Scotland. His conduct in this diſtinguiſhed appointment gave univerſal ſatisfaction. When the great enterpriſe againſt Holland was reſolved upon, Sir Ralph Abercromby was called again to command, under his royal highneſs the duke of York. The difficulties of the ground, the inclemency of the ſeaſon, delays, though inconvenient, yet unavoidable, the diſorderly movements of the Ruſſians, and the timid duplicity of the Dutch, diſappointed our hopes of that expedition. But, by the Dutch, the French, the Britiſh, it was confeſſed, that even victory, the moſt deciſive, could not have more conſpicuouſly proved the talents of this illuſtrious officer. His country applauded the choice, when he was ſent with an army to diſpoſſeſs the French of Egypt. His experience in Holland and Flanders, and in the climate of the Weſt Indies particularly, fitted him for this new command. He accompliſhed ſome of the firſt duties of a general, in carrying his army in health, in ſpirits, and with the requiſite intelligence and ſupplies, to the deſtined ſcene of action. The landing, the firſt diſpoſitions, the attacks, and the courage oppoſed to attack, the ſpirit with which his army appears to have been by confidence in their leader inſpired, the extraordinary ſuperiority which the Britiſh infantry under his command evinced to that which was thought the braveſt and beſt diſciplined infantry in the world, demonſtrate that all the beſt qualities of the greateſt commanders were in Sir Ralph Abercromby united—that they were all ſummoned forth into activity, in the glorious achievements amid which he fell.—In his private character he was modeſt, diſintereſted, benevolent, and honourable. General Lord Hutchinſon, who ſucceeded him in the command, in the diſpatches with the account of his death, has given a fine eulogium on his character as a ſoldier, and ſtrongly expreſſive of the high eſtimation in which he was held by the army.—"We have ſuſtained an irreparable loſs in the perſon of our never ſufficiently to be lamented commander in chief, Sir Ralph Abercromby, who was mortally wounded in the action, and died on the 28th of March. I believe he was wounded early, but he concealed his ſituation from thoſe about him, and continued in the field, giving his orders with that coolneſs and perſpicuity which had ever marked his character, till long after the action was over, when he fainted through weakneſs and loſs of blood. Were it permitted for a ſoldier to regret any one who has fallen in the ſervice of his country, I might be excuſed for lamenting him more than any other perſon; but it is ſome conſolation to thoſe who tenderly loved him, that, as his life was honourable, ſo was his death glorious. His memory will be recorded in the annals of his country—will be ſacred to every Britiſh ſoldier—and embalmed in the recollection of a grateful poſterity." His remains were conveyed on board Admiral Lord Keith's flag ſhip to Malta, attended by Colonel Sir John Dyer, and were interred in the commandery of the grand maſter, with the higheſt military honours. Aberdeen.

A monument to his memory, to be erected in St Paul's church, London, at the public expence, was voted by the houſe of commons. His widow has been created a peereſs, and a penſion of 2000l a-year for her and three lives ſettled on the family. (*Gent. Mag.*)

ABERDEEN, the name of two cities in Scotland, called the *Old* and *New Town*, ſituated on the German ocean, in W. Long. 2. 8. and N. Lat. 57. 8.

ABERDEEN, *Old*, is a place of great antiquity. According to tradition, it was of note in the reign of Gregory, who conferred on it ſome privileges about the year 893. In 1004, Malcolm II. founded a biſhopric at a place called Mortlich in Banffſhire, in memory of a ſignal victory which he there gained over the Danes: which biſhopric was tranſlated to Old Aberdeen by David I.; and in 1163, the then biſhop of Aberdeen obtained a new charter from Malcolm IV. There is extant a charter of Alexander II. by which, in 1217, the king grants to Aberdeen the ſame privileges he had granted to his town of Perth.

The Old Town lies about a mile to the north of the New, at the mouth of the river Don, over which is a fine Gothic bridge, of a ſingle arch, greatly admired, which reſts on a rock on each ſide. This arch, ſaid to have been built by a biſhop of Aberdeen about the year 1290, is 67 feet wide at the bottom, and 34½ feet high above the ſurface of the river, which at ebb tide is here 19 feet deep. The Old Town was formerly the ſeat of the biſhop, and had a large cathedral commonly called *St Machar's*. Two very antique ſpires, and one aiſle, which is uſed as a church, are now the only remains of it. The biſhopric was founded in the time of David I. as above mentioned. The cathedral had anciently two rows of ſtone pillars acroſs the church, and three turrets; the ſteeple, which was the largeſt of theſe turrets, reſted upon an arch, ſupported by four pillars. In this cathedral there was a fine library; but about the year 1560, it was almoſt totally deſtroyed. But the capital building is the King's College on the ſouth ſide of the town, which is a large and ſtately fabric. It is built in form of a ſquare, with cloiſters on the ſouth ſide. The chapel is very ruinous within; but there ſtill remains ſome wood work of exquiſite workmanſhip. This was preſerved by the ſpirit of the principal at the time of the Reformation, who armed his people and checked the blind zeal of the barons of the Mearns; who, after ſtripping the cathedral of its roof, and robbing it of the bells, were going to violate this ſeat of learning. They ſhipped their ſacrilegious booty, with an intention of expoſing it to ſale in Holland: but the veſſel had ſcarcely gone out of port, when it periſhed in a ſtorm with all its ill-gained lading. The ſteeple is vaulted with a double croſs arch; above which is an imperial crown, ſupported by eight ſtone pillars, and cloſed with a globe and two gilded

Aberdeen. croſſes. In the year 1631 this ſteeple was thrown down by a ſtorm, but was ſoon after rebuilt in a more ſtately form. This college was founded in 1494, by William Elphinſton biſhop of this place, lord chancellor of Scotland in the reign of James III. and lord privy ſeal in that of James IV. But James IV. claimed the patronage of it, and it has ſince been called the *King's College*. This college, and the Mariſchal College in the New Town, form one univerſity, called the *Univerſity of King Charles*. The library is large, but not remarkable for many curioſities. Hector Boethius was the firſt principal of the college; and ſent for from Paris for that purpoſe, on an annual ſalary of forty merks Scots, at thirteen pence each. The ſquare tower on the ſide of the college was built by contributions from General Monk and the officers under him then quartered at Aberdeen, for the reception of ſtudents; of which about a hundred attend the college, many of whom lodge in it.

ABERDEEN, *New*, is the capital of the ſhire of Aberdeen. For extent, trade, and beauty, it greatly exceeds any town in the north of Scotland. It is built on a hill or riſing ground, and lies on a ſmall bay formed by the Dee, deep enough for a ſhip of 200 tons, and above two miles in circumference.—The buildings (which are of granite from the neighbouring quarries) are generally four ſtories high; and have for the moſt part, gardens behind them, which give it a beautiful appearance. On the high ſtreet is a large church which formerly belonged to the Franciſcans. This church was begun by Biſhop William Elphinſton; and finiſhed by Gavin Dunbar, biſhop of Aberdeen, about the 1500. Biſhop Dunbar is ſaid likewiſe to have built the bridge over the Dee, which conſiſts of ſeven arches. In the middle of Caſtle-ſtreet is an octagon building, with neat bas-relievos of the kings of Scotland from James I. to James VII. The town-houſe makes a good figure, and has a handſome ſpire in the centre. The grammar ſchool is a low but neat building. Gordon's hoſpital is handſome; in front is a good ſtatue of the founder: it maintains forty boys, who are apprenticed at proper ages. The infirmary is a large plain building, and ſends out between eight and nine hundred cured patients annually. But the chief public building in the New Town is the Mariſchal College, founded by George Keith earl Mariſchal, in the year 1593; but ſince greatly augmented with additional buildings. There are about 140 ſtudents belonging to it. In both the Mariſchal and King's college the languages, mathematics, natural philoſophy, divinity, &c. are taught by very able profeſſors. The convents in Aberdeen were: one of Mathurines or of the order of the Trinity, founded by William the Lion, who died in 1214; another of Dominicans, by Alexander II.; a third of Obſervantines, a building of great length in the middle of the city, founded by the citizens and Mr Richard Vans, &c.; and a fourth of Carmelites, or White Friars, founded by Philip de Arbuthnot in 1540.

Aberdeen, including the Old Town, is ſuppoſed to contain 25,000 inhabitants. Its trade is conſiderable, but might be greatly extended by an attention to the white fiſheries.

The harbour was long a great detriment to its trade, and occaſioned the loſs of many lives and much property. A ſtranger could never depend upon finding it as he left it; while veſſels lay at anchor in the road till the tide ſhould make, they have often been wrecked by ſtorms which ſuddenly aroſe. It was very narrow at the mouth, having the caſterly rocky point of the Grampian mountains on the ſouth, and a flat blowing ſand on the north, extending along the coaſt for many miles. By the eaſterly and north-eaſt ſtorms the ſand was driven in a long ridge acroſs the harbour's mouth, and formed what was called the *bar*. Upon this bar the depth of water at low tide was ſometimes not above three feet. Clearing away the ſand, though but a partial and temporary remedy, was a matter of great expence to the community. If it was cleared one week ſo as to have five or ſix feet of water at ebb, a freſh ſtorm the next week undid all that had been done. The town at laſt came to the reſolution of erecting a ſtrong pier on the north ſide of the harbour. This pier is 1200 feet in length, and gradually increaſes in thickneſs and height as it approaches to the ſea, where the head or rounding is 60 feet diameter at the baſe, and the perpendicular elevation is 38 feet. The whole is built of granite, which is a very durable ſtone: many of the outſide ſtones are above three tons weight, with hewn beds. It was built under the direction of Mr Smeaton; and the expence, amounting to above 17,000l. is defrayed by doubling the harbour dues, which are chiefly paid by the inhabitants. Aberdeen

A little to the ſouth of the bar, they have now a depth of 17 fathoms at low water; and at the harbour's mouth, from eight to nine fathoms, where they had formerly but a few feet.

Aberdeen once enjoyed a good ſhare of the tobacco trade. At preſent, its imports are from the Baltic; and a few merchants trade to the Weſt Indies and North America. Its exports are ſtockings, thread, ſalmon, and oatmeal. The firſt is a moſt important article, as appears by the following ſtate of it: For this manufacture, 20,800l. worth of wool is annually imported, and 1600l. worth of oil. Of this wool are annually made 69,333 dozen pairs of ſtockings; worth, at an average, 1l. 10s. per dozen. Theſe are the work of the country people in almoſt all parts of this great county, who get 4s. per dozen for ſpinning, and 14s. per dozen for knitting; ſo that there is annually paid them 62,329l. 14s. There is, beſides, about 2000l. value of ſtockings manufactured from the wool of the county. The thread manufacture is another conſiderable article, though trifling in compariſon of the woollen. The ſalmon fiſheries on the Dee and the Don are a good branch of trade. About 46 boats and 130 men are employed on the firſt; and in ſome years 167,000lb. of fiſh have been ſent pickled to London, and about 930 barrels of ſalted fiſh exported to France, Italy, &c.—The fiſhery on the Don is far leſs conſiderable. The fiſh of this river are taken in cruives above the bridge; a practice contrary to the ancient laws of the kingdom, unleſs where the nature of the water rendered the net fiſhery impracticable. The inhabitants likewiſe export conſiderable quantities of pickled pork, which they ſell to the Dutch for victualling their Eaſt India ſhips and men of war; the Aberdeen pork having the reputation of being the beſt cured of any in Europe for keeping on long voyages.

"It is however remarkable, Mr Knox obſerves, that there is not a ſingle decked veſſel fitted out from Aberdeen

Aberdeenshire.

Aberdeen for the herring or white fiſheries; where is now an excellent harbour, an active people, converſant in trade, and poſſeſſed of capital; ſeated within ſix hours ſailing of Long Fortys, and two days ſailing of the Shetland iſles. This inattention is the more extraordinary, as the exports of Aberdeen, though very conſiderable, do not balance the imports in value. The herring and white fiſheries, therefore, if proſecuted with vigour, and cured and dried with judgement, would not only extend the ſcale of exports, but alſo furniſh the outward bound veſſels with freights, and better aſſortments for the foreign markets. The ſalmon of the Dee and Don are taken in great abundance, cured in the higheſt perfection, and greatly valued at the European markets. If the merchants, in addition to theſe, ſhould alſo export the cargoes of 50 or 60 veſſels conſtantly employed in the herring and white fiſheries, the port of Aberdeen would in a few years become the moſt celebrated mart of fiſh now exiſting."

From a round hill at the weſt end of the city, flow two ſprings, one of pure water, and the other of a quality reſembling the German Spa. Aberdeen, with Aberbrothick, Brechin, Montroſe, and Inverbervy, returns one member to parliament.

ABERDEENSHIRE, an extenſive county in Scotland, is bounded on the north and eaſt by the German ocean; on the ſouth by the counties of Kincardine, Angus, and Perth; and on the weſt by Banff, Murray, and Inverneſs ſhires. It extends in length about 90 miles, from ſouth-weſt to north-eaſt, and about 46 in breadth, from the mouth of the river Dee to where it is bounded by the ſhire of Banff. Its extent in ſquare miles may be eſtimated at 1170. It comprehends the diſtricts of Marr, Garioch, Aberdeen Proper, and great part of Buchan. The diſtrict of Marr, which may be conſidered as the centre of Scotland, is wild, rugged, and mountainous; ſome of the hills riſing with precipitous ſides, to the height of 2000 feet above the level of the ſea. The ſides of the hills are covered with extenſive natural foreſts; in many places impenetrable to human footſteps. Buchan is leſs hilly; but very barren, bleak, and inhoſpitable to the view. The reſt of the country is more fertile, having a gradual deſcent from the central diſtrict eaſtward, to the ſea. The coaſt is in general very bold and rocky. The Boilers or Bullers of Buchan, arreſt the attention of all ſtrangers, by their ſtupendous craggy precipices. The ſoil, in ſo extenſive a diſtrict, is as various as can be well ſuppoſed. The ſtate of agriculture in the interior pariſhes of the county is very rude; but the example of many patriotic proprietors is producing wonders even in the moſt barren ſoils. Prejudices in huſbandry, when deeply rooted, are with difficulty overcome; but even theſe are yielding to a more regular and modern ſyſtem. The average produce of the farms in the whole county, is eſtimated in proportion to the rent, as five to one. This produce, conſiderable as it is, compared with the produce formerly, is ſcarcely one-half of what may be expected from the improvements which are daily made. The principal rivers of Aberdeenſhire are, the Dee and Don, the Ythan, the Ugie, and the Cruden. The Deveron alſo forms its boundary with Banffſhire for many miles. All the rivers have been long celebrated for the excellence of the ſalmon with which they abound. The rents of the fiſhings are eſtimated at 2480l. per annum, and the produce at upwards of 10,000l. Beſides the fiſhings of the rivers, the ſea coaſt of Aberdeenſhire abounds with all kinds of excellent fiſh; and a number of fiſhing veſſels are fitted out from the ſea ports of the county, particularly Peterhead and Fraſerburgh. Under the article of fiſheries, we may mention the celebrated pearl fiſhing in the river Ythan. In this river ſome pearls have been found, which ſold ſingly ſo high as 2l. and 3l. With regard to mineralogy, little wealth of that deſcription has hitherto been found in this county. The granite quarries are the moſt valuable articles. From thoſe in the neighbourhood of Aberdeen, 12,000 tons and upwards are annually exported to London, the value of which may be eſtimated at about 8400l. There are ſeveral quarries in the pariſh of Aberdour, which yield excellent millſtones. There is a quarry of blue ſlate wrought in the pariſh of Culſalmond, and a vein of manganeſe in the neighbourhood of Old Aberdeen. The county abounds with limeſtone; but, from the want of coal, it cannot be wrought to much advantage, except near a ſea port. In Old Machar and Old Deer pariſhes, about 55,000 bolls of lime are annually burnt, valued at 2750l. Some kelp is made on the coaſt, the value of which muſt be conſiderable. Mr Pennant mentions an exceeding large piece of amber, thrown aſhore on the coaſt of Buchan; and ſmaller pieces are frequently found on the ſame coaſt. In the pariſh of Leſlie, a beautiful green amianthus, with white and gray ſpots, is found in conſiderable quantities. It is eaſily wrought, and formed into ſnuff boxes and other ornaments by the country people. Plumbago is found on the banks of the Deveron. Amethyſts, emeralds, and topazes, are found in the pariſh of Crathie, and on the ſhore at Peterhead. Onyx and agates are frequently to be met with. On the eſtate of Invercauld, there are found large ſpecimens of rock cryſtals. Beſides theſe, aſbeſtos, talc, mica, ſchiſtus, and other curious minerals, are found in many parts of the county. The principal manufacture carried on in the county, is the knitting of ſtockings and hoſe, in which all the women, and moſt of the old men and boys, are employed the greater part of the year. The other manufactures are too trifling to deſerve particular notice. Aberdeenſhire contains three royal boroughs; ABERDEEN, KINTORE, and INVERURY: and ſeveral large and handſome towns; as Peterhead, Fraſerburgh, Huntly, and Old Meldrum. It is divided into 85 pariſhes. Notwithſtanding the remote ſituation of Aberdeenſhire, it is ornamented with many fine ſeats of the nobility and gentry. Slains caſtle, the ſeat of the earl of Errol; Aboyne caſtle, of the earl of Aboyne; Ellon, of the earl of Aberdeen; Inverury, of the earl of Kintore; are the chief reſidences in the county.

The following account of the population of Aberdeenſhire, at two different periods, is taken from the *Statiſt. Hiſt. of Scotland.*

Aberdour & Abernethy

ABERDOUR, a small town in Fifeshire, Scotland, on the frith of Forth, about ten miles north-west of Edinburgh. In old times it belonged to the Viponts; in 1126 it was transferred to the Mortimers by marriage, and afterwards to the Douglases. William, lord of Liddesdale, surnamed the *Flower of Chivalry*, in the reign of David II. by charter conveyed it to James Douglas, ancestor of the present noble owner the earl of Morton. The monks of Inchcolm had a grant for a burial place here from Allan de Mortimer, in the reign of Alexander III. The nuns, usually styled the *Poor Clares*, had a convent at this place.

ABERFORD, a market town in the west riding of Yorkshire, stands in a bottom; and is about a mile in length, and pretty well built. It is near a Roman road, which is raised very high, and not far from the river Cock; between which and the town there is the foundation of an old castle still visible. It is 181 miles north-by-west from London. W. Long. 2. 45. N. Lat. 55. 52.

ABERGAVENNY, a large, populous, and flourishing town in Monmouthshire, seated at the confluence of the rivers Usk and Gavenny. It has a fine bridge over the Usk, consisting of fifteen arches; and being a great thoroughfare from the west part of Wales to Bath, Bristol, Gloucester, and other places, is well furnished with accommodation for travellers. It is surrounded with a wall, and had once a castle. It carries on a considerable trade in flannels, which are brought hither for sale from the other parts of the county. It is 142 miles distant from London. W. Long. 2. 45. N. Lat. 51 50. Abergavenny appears to have been the *Gibbanium* of Antoninus, and the town of Usk his *Burrium*.

ABERNETHY, JOHN, an eminent dissenting minister, was the son of Mr John Abernethy, a dissenting minister in Coleraine, and was born there on the 19th of October 1680. When about nine years of age, he was separated from his parents, his father being obliged

Abernethy liged to attend ſome public affairs in London; and his mother, to ſhelter herſelf from the mad fury of the Iriſh rebels, retiring to Derry, a relation who had him under his care, having no opportunity of conveying him to her, carried him to Scotland; and thus he eſcaped the hardſhips and dangers of the ſiege of Derry, in which Mrs Abernethy loſt all her other children. He afterwards ſtudied at the univerſity of Glaſgow, where he remained till he took the degree of maſter of arts; and, in 1708, he was choſen miniſter of a diſſenting congregation at Antrim, in which ſituation he continued above 20 years. About the time of the Bangorian controverſy (for which ſee HOADLEY), a diſſenſion aroſe among his brethren in the miniſtry at Belfaſt, on the ſubject of ſubſcription to the Weſtminſter confeſſion of faith. In this controverſy he became a leader on the negative ſide, and incurred the cenſure of a general ſynod. The agitation of parties began to be alſo felt among the members of his congregation. Many of them deſerted him; which induced him to accept of an invitation to ſettle in Dublin, where his preaching was much admired. Here he continued for ten years, reſpected and eſteemed. But his labours were terminated by a ſudden attack of the gout in the head, to which he had been ſubject; and he died in December 1740, in the 60th year of his age. His writings, as was his character, are diſtinguiſhed for candour, liberality, and manly ſentiment. He publiſhed a volume of ſermons on the Divine Attributes; after his death a ſecond volume was publiſhed by his friends; and theſe were ſucceeded by four other volumes on different ſubjects: all of which have been greatly admired.

Aberration.

ABERNETHY, a ſmall town in Strathern, a diſtrict of Perthſhire in Scotland, ſituated on the river Tay, a little above the mouth of the Erne. It is ſaid to have been the ſeat of the Pictiſh kings; and was afterwards the ſee of an archbiſhop, which was afterwards transferred to St Andrew's. In the churchyard of Abernethy, there is a tower of ſingular conſtruction. It is of a circular form, is 74 feet in height, and 48 feet in circumference. The tower at Brechin is the only one of a ſimilar ſtructure in Scotland. The reſearches of the antiquarian have hitherto failed in diſcovering the uſes of theſe inſulated buildings. Conjecture, therefore, has ſupplied the place of certainty, by ſuppoſing that they are of Pictiſh origin, and that they were intended as places of confinement for religious devotees in performing penance, and hence they have been denominated towers of repentance.

ABERRATION, in *Aſtronomy*, an apparent motion of the celeſtial bodies, produced by the progreſſive motion of light, and the earth's annual motion in her orbit.

This effect may be explained and familiarized by the motion of a line parallel to itſelf, much after the manner that the compoſition and reſolution of forces are explained.

M. de Maupertuis, in his "Elements of Geography," gives a familiar and ingenious idea of the aberration, in this manner: "It is thus," ſays he, "concerning the direction in which a gun muſt be pointed to ſtrike a bird in its flight; inſtead of pointing it ſtraight to the bird, the fowler will point a little before it, in the path of its flight, and that ſo much the more as the flight of the bird is more rapid, with reſpect to the flight of the ſhot." In this way of conſidering the matter, the flight of the bird repreſents the motion of the earth, and the flight of the ſhot repreſents the motion of the ray of light.

Aberration.

Mr Clairaut too, in the Mem. de l' Acad. des Sciences for the year 1746, illuſtrates this effect in a familiar way, by ſuppoſing drops of rain to fall rapidly and quickly after each other from a cloud, under which a perſon moves with a very narrow tube; in which caſe it is evident that the tube muſt have a certain inclination, in order that a drop which enters at the top, may fall freely through the axis of the tube, without touching the ſides of it; which inclination muſt be more or leſs according to the velocity of the drops in reſpect to that of the tube; then the angle made by the direction of the tube and of the falling drops, is the aberration ariſing from the combination of thoſe two motions.

This diſcovery, which is one of the brighteſt that have been made in the preſent age, we owe to the accuracy and ingenuity of the late Dr Bradley, aſtronomer royal; to which he was occaſionally led by the reſult of ſome obſervations which he had made with a view to determine the annual parallax of the fixed ſtars, or that which ariſes from the motion of the earth in its annual orbit about the ſun.

The annual motion of the earth about the ſun had been much doubted, and warmly conteſted. The defenders of that motion, among other proofs of the reality of it, conceived the idea of adducing an inconteſtable one from the annual parallax of the fixed ſtars, if the ſtars ſhould be within ſuch a diſtance, or it inſtruments and obſervations could be made with ſuch accuracy, as to render that parallax ſenſible. And with this view various attempts have been made. Before the obſervations of M. Picard, made in 1672, it was the general opinion, that the ſtars did not change their poſition during the courſe of a year. Tycho Brahe and Ricciolus fancied that they had aſſured themſelves of it from their obſervations: and from hence they concluded that the earth did not move round the ſun, and that there was no annual parallax in the fixed ſtars. M. Picard, in the account of his *Voyage d' Uranibourg*, made in 1672, ſays that the pole ſtar, at different times of the year, has certain variations, which he had obſerved for about 10 years, and which amounted to about 40″ a year: from whence ſome, who favoured the annual motion of the earth, were led to conclude that theſe variations were the effect of the parallax of the earth's orbit. But it was impoſſible to explain it by that parallax; becauſe this motion was in a manner contrary to what ought to follow only from the motion of the earth in her orbit.

In 1674 Dr Hook publiſhed an account of obſervations which he ſaid he had made in 1669, and by which he had found that the ſtar γ Draconis was 23″ more northerly in July than in October: obſervations which, for the preſent, ſeemed to favour the opinion of the earth's motion, although it be now known that there could not be any truth or accuracy in them.

Flamſteed having obſerved the pole ſtar with this mural quadrant, in 1680 and the following years, found that its declination was 40″ leſs in July than in December; which obſervations, although very juſt, were yet,

Aberration. yet, however, improper for proving the annual parallax; and he recommended the making of an inſtrument of 15 or 20 feet radius, to be firmly fixed on a ſtrong foundation, for deciding a doubt which was otherwiſe not ſoon likely to be brought to a concluſion.

In this ſtate of uncertainty and doubt, then, Dr Bradley, in conjunction with Mr Samuel Molineux, in the year 1725, formed the project of verifying, by a ſeries of new obſervations, thoſe which Dr Hook had communicated to the public almoſt 50 years before. And as it was his attempt that chiefly gave riſe to this, ſo it was his method in making the obſervations, in ſome meaſure, that they followed; for they made choice of the ſame ſtar, and their inſtrument was conſtructed upon nearly the ſame principles: but had it not greatly exceeded the former in exactneſs, they might ſtill have continued in great uncertainty as to the parallax of the fixed ſtars. For this, and many other convenient and uſeful aſtronomical inſtruments, philoſophers are indebted to the ingenuity and accuracy of Mr Graham.

The ſucceſs of the experiment evidently depending ſo much on the accuracy of the inſtrument, this became a leading object of conſideration. Mr Molineux's apparatus then having been completed, and fitted for obſerving, about the end of November 1725, on the third day of December following, the bright ſtar in the head of Draco, marked γ by Bayer, was for the firſt time obſerved, as it paſſed near the zenith, and its ſituation carefully taken with the inſtrument. The like obſervations were make on the fifth, eleventh, and twelfth days of the ſame month; and there appearing no material difference in the place of the ſtar, a farther repetition of them, at that ſeaſon, ſeemed needleſs, it being a time of the year in which no ſenſible alteration of parallax, in this ſtar, could ſoon be expected. It was therefore curioſity that chiefly urged Dr Bradley, who was then at Kew, where the inſtrument was fixed, to prepare for obſerving the ſtar again on the 17th of the ſame month; when, having adjuſted the inſtrument as uſual, he perceived that it paſſed a little more ſoutherly this day than it had done before. Not ſuſpecting any other cauſe of this appearance, it was aſcribed to the uncertainty of the obſervations, and that either this, or the foregoing, was not ſo exact as had been ſuppoſed. For which reaſon they propoſed to repeat the obſervation again, to determine from what cauſe this difference might proceed: and upon doing it, on the 20th of December, the doctor found that the ſtar paſſed ſtill more ſoutherly than at the preceding obſervation. This ſenſible alteration ſurpriſed them the more, as it was the contrary way from what it would have been, had it proceeded from an annual parallax of the ſtar. But being now pretty well ſatisfied, that it could not be entirely owing to the want of accuracy in the obſervations, and having no notion of any thing elſe that could cauſe ſuch an apparent motion as this in the ſtar; they began to ſuſpect that ſome change in the materials or fabric of the inſtrument itſelf might have occaſioned it. Under theſe uncertainties they remained for ſome time; but being at length fully convinced, by ſeveral trials, of the great exactneſs of the inſtrument; and finding, by the gradual increaſe of the ſtar's diſtance from the pole, that there muſt be ſome regular cauſe that produced it; they took care to examine very nicely, at the time of each obſervation, how much the variation was; till Aberration. about the beginning of March 1726, the ſtar was found to be 20″ more ſoutherly than at the time of the firſt obſervation: it now indeed ſeemed to have arrived at its utmoſt limit ſouthward, as in ſeveral trials, made about this time, no ſenſible difference was obſerved in its ſituation. By the middle of April it appeared to be returning back again towards the north; and about the beginning of June, it paſſed at the ſame diſtance from the zenith, as it had done in December, when it was firſt obſerved.

From the quick alteration in the declination of the ſtar at this time, increaſing about one ſecond in three days, it was conjectured that it would now proceed northward, as it had before gone ſouthward, of its preſent ſituation; and it happened accordingly; for the ſtar continued to move northward till September following, when it again became ſtationary; being then near 20″ more northerly than in June, and upwards of 39″ more northerly than it had been in March. From September the ſtar again returned towards the ſouth, till, in December, it arrived at the ſame ſituation in which it had been obſerved twelve months before, allowing for the difference of declination on account of the preceſſion of the equinox.

This was a ſufficient proof that the inſtrument had not been the cauſe of this apparent motion of the ſtar; and yet it ſeemed difficult to deviſe one that ſhould be adequate to ſuch an unuſual effect. A nutation of the earth's axis was one of the firſt things that offered itſelf on this occaſion; but it was ſoon found to be inſufficient; for though it might have accounted for the change of declination in γ Draconis, yet it would not at the ſame time accord with the phenomena obſerved in the other ſtars, particularly in a ſmall one almoſt oppoſite in right aſcenſion to γ Draconis, and at about the ſame diſtance from the north pole of the equator: for though this ſtar ſeemed to move the ſame way, as a nutation of the earth's axis would have made it; yet changing its declination but about half as much as γ Draconis in the ſame time, as appeared on comparing the obſervations of both made on the ſame days, at different ſeaſons of the year, this plainly proved that the apparent motion of the ſtar was not occaſioned by a real nutation; for had this been the caſe, the alteration in both ſtars would have been nearly equal.

The great regularity of the obſervations left no room to doubt, but that there was ſome uniform cauſe by which this unexpected motion was produced, and which did not depend on the uncertainty or variety of the ſeaſons of the year. Upon comparing the obſervations with each other, it was diſcovered that, in both the ſtars above mentioned, the apparent difference of declination from the *maxima*, was always nearly proportional to the verſed ſine of the ſun's diſtance from the equinoctial points. This was an inducement to think that the cauſe, whatever it was, had ſome relation to the ſun's ſituation with reſpect to thoſe points. But not being able to frame any hypotheſis, ſufficient to account for all the phenomena, and being very deſirous to ſearch a little farther into this matter, Dr Bradley began to think of erecting an inſtrument for himſelf at Wanſtead; that, having it always at hand, he might with the more eaſe and certainty inquire into the laws of this new motion. The conſideration likewiſe of being

Aberration. being able, by another inſtrument, to confirm the truth of the obſervations hitherto made with that of Mr Molineux, was no ſmall inducement to the undertaking; but the chief of all was, the opportunity he ſhould thereby have of trying in what manner other ſtars ſhould be affected by the ſame cauſe, whatever it might be. For Mr Molineux's inſtrument being originally deſigned for obſerving γ Draconis, to try whether it had any ſenſible parallax, it was ſo contrived, as to be capable of but little alteration in its direction; not above ſeven or eight minutes of a degree: and there being but few ſtars, within half that diſtance from the zenith of Kew, bright enough to be well obſerved, he could not, with his inſtrument, thoroughly examine how this cauſe affected ſtars that were differently ſituated, with reſpect to the equinoctial and ſolſtitial points of the ecliptic.

Theſe conſiderations determined him; and by the contrivance and direction of the ſame ingenious perſon, Mr Graham, his inſtrument was fixed up the 19th of Auguſt 1727. As he had no convenient place where he could make uſe of ſo long a teleſcope as Mr Molineux's, he contented himſelf with one of but little more than half the length, namely of 12 feet and a half, the other being 24 feet and a half long, judging from the experience he had already had, that this radius would be long enough to adjuſt the inſtrument to a ſufficient degree of exactneſs: and he had no reaſon afterwards to change his opinion; for by all his trials he was very well ſatisfied, that when it was carefully rectified, its ſituation might be ſecurely depended on to half a ſecond. As the place where his inſtrument was hung, in ſome meaſure determined its radius; ſo did it alſo the length of the arc or limb, on which the diviſions were made, to adjuſt it: for the arc could not conveniently be extended farther, than to reach to about 6¼ degrees on each ſide of the zenith. This however was ſufficient, as it gave him an opportunity of making choice of ſeveral ſtars, very different both in magnitude and ſituation; there being more than two hundred, inſerted in the Britiſh Catalogue, that might be obſerved with it. He needed not indeed to have extended the limb ſo far, but that he was willing to take in *Capella*, the only ſtar of the firſt magnitude that came ſo near his zenith.

His inſtrument being fixed, he immediately began to obſerve ſuch ſtars as he judged moſt proper to give him any light into the cauſe of the motion already mentioned. There was a ſufficient variety of ſmall ones, and not leſs than twelve that he could obſerve through all ſeaſons of the year, as they were bright enough to be ſeen in the day time, when neareſt the ſun. He had not been long obſerving, before he perceived that the notion they had before entertained, that the ſtars were fartheſt north and ſouth when the ſun was near the equinoxes, was only true of thoſe ſtars which are near the ſolſtitial colure. And after continuing his obſervations a few months, he diſcovered what he then apprehended to be a general law obſerved by all the ſtars, namely, that each of them became ſtationary, or was fartheſt north or ſouth, when it paſſed over his zenith at ſix of the clock, either in the evening or morning. He perceived alſo that whatever ſituation the ſtars were in, with reſpect to the cardinal points of the ecliptic, the apparent motion of every one of them tended the ſame way, when they paſſed his inſtrument about the ſame hour of the day or night; for they all moved ſouthward when they paſſed in the day, and northward when in the night; ſo that each of them was fartheſt north when it came in the evening about ſix of the clock, and fartheſt ſouth when it came about ſix in the morning. Aberration.

Though he afterwards diſcovered that the maxima, in moſt of theſe ſtars, do not happen exactly when they paſs at thoſe hours; yet, not being able at that time to prove the contrary, and ſuppoſing that they did, he endeavoured to find out what proportion the greateſt alterations of declination, in different ſtars, bore to each other; it being very evident that they did not all change their inclination equally. It has been before noticed, that it appeared from Mr Molineux's obſervations, that γ *Draconis* changed its declination above twice as much as the before-mentioned ſmall ſtar that was nearly oppoſite to it; but examining the matter more nicely, he found that the greateſt change in the declination of theſe ſtars, was as the ſine of the latitude of each ſtar reſpectively. This led him to ſuſpect that there might be the like proportion between the *maxima* of other ſtars; but finding that the obſervations of ſome of them would not perfectly correſpond with ſuch an hypotheſis, and not knowing whether the ſmall difference he met with might not be owing to the uncertainty and error of the obſervations, he deferred the farther examination into the truth of this hypotheſis, till he ſhould be furniſhed with a ſeries of obſervations made in all parts of the year; which would enable him not only to determine what errors the obſervations might be liable to, or how far they might ſafely be depended on; but alſo to judge, whether there had been any ſenſible change in the parts of the inſtrument itſelf.

When the year was completed, he began to examine and compare his obſervations; and having ſatisfied himſelf as to the general laws of the phenomena, he then endeavoured to find out the cauſe of them. He was already convinced that the apparent motion of the ſtars was not owing to a nutation of the earth's axis. The next that occurred to him, was an alteration in the direction of the plumb-line, by which the inſtrument was conſtantly adjuſted; but this, upon trial, proved inſufficient. Then he conſidered what refraction might do; but here alſo he met with no ſatisfaction. At laſt, through an amazing ſagacity, he conjectured that all the phenomena hitherto mentioned, proceeded from the progreſſive motion of light, and the earth's annual motion in her orbit: for he perceived, that if light were propagated in time, the apparent place of a fixed object would not be the ſame when the eye is at reſt, as when it is moving in any other direction but that of the line paſſing through the object and the eye; and that when the eye is moving in different directions, the apparent place of the object would be different. (*Hutton's Math. Dict.*)

ABERRATION, in *Optics*, the deviation or diſperſion of the rays of light, when reflected by a ſpeculum, or refracted by a lens, which prevents them from meeting or uniting in the ſame point, called the geometrical focus, but are ſpread over a ſmall ſpace, and produce a confuſion of images. There are two ſpecies of aberration diſtinguiſhed by their different cauſes; the

Aberration || Abgar.

the one arifes from the figure of the lens or fpeculum, the other from the unequal refrangibility of the rays of light. This laft fpecies is fometimes called the Newtonian, from the name of its difcoverer. See OPTICS.

Aberration of the Planets, is equal to the geocentric motion of the planet, the fpace it appears to move as feen from the earth, during the time that light employs in paffing from the planet to the earth. Thus, in the fun, the aberration in longitude is conftantly 20″, that being the fpace moved by the fun, or, which is the fame thing, by the earth, in the time of 8′ 7″, which is the time in which light paffes from the fun to the earth. In like manner, knowing the diftance of any planet from the earth, by proportion it will be, as the diftance of the fun is to the diftance of the planet, fo is 8′ 7″ to the time of light paffing from the planet to the earth: then computing the planet's geocentric motion in this time, that will be the aberration of the planet, whether it be in longitude, latitude, right afcenfion, or declination. (*Hutton's Math. Dict.*)

ABERYSTWITH, a market town of Cardiganfhire, in Wales, feated on the Ridal, near its confluence with the Iftwith, where it falls into the fea. It is a populous, rich town, and has a great trade in lead, and a confiderable fifhery of whiting, cod, and herrings. It was formerly furrounded with walls, and fortified with a caftle; but both are now in ruins. Its diftance from London is 203 miles W. N. W. W. Long. 4. 15 N. Lat. 52. 30.

ABESTA, or AVESTA, the name of one of the facred books of the Perfian magi, which they afcribe to their great founder Zoroafter. The Abefta is a commentary on two others of their religious books called *Zend* and *Pazend;* the three together including the whole fyftem of the Ignicolæ or worfhippers of fire.

ABETTOR, a law term, implying one who encourages another to the performance of fome criminal action, or who is art and part in the performance itfelf. Treafon is the only crime in which abettors are excluded by law, every individual concerned being confidered as a principal. It is the fame with *art-and-part* in the Scots law.

ABEX, a country of Higher Ethiopia, in Africa, bordering on the Red fea, by which it is bounded on the eaft. It has Nubia or Sennar on the north; Sennar and Abyffinia on the weft; and Abyffinia on the fouth. Its principal towns are Suaquem and Arkeko. It is fubject to the Turks, and has the name of the beglerbeglik of Habeleth. It is about five hundred miles in length and one hundred in breadth; is a mountainous country, fandy, barren, and unhealthy, much infefted with wild beafts; and the forefts abound with ebony trees.

ABEYANCE, in *Law*, the expectancy of an eftate. Thus if lands be leafed to one perfon for life, with reverfion to another for years, the remainder for years is in abeyance till the death of the leffee.

ABGAR, or ABGARUS, a name given to feveral of the kings of Edeffa in Syria. The moft celebrated of them was one who, it is faid, was cotemporary with Jefus Chrift; and who having a diftemper in his feet, and hearing of Jefus's miraculous cures, requefted him by letter to come and cure him. Euſebius *, who believed that this letter was genuine, and alfo an anfwer our Saviour is faid to have returned to it, has tranſlated them both from the Syriac, and aſſerts that they were taken out of the archives of the city of Edeffa. The firft is as follows: "Abgarus, prince of Edeffa, "to Jefus the holy Saviour, who hath appeared in the "flefh in the confines of Jerufalem, greeting. I have "heard of thee, and of the cures thou haft wrought "without medicines or herbs. For it is reported thou "makeft the blind to fee, the lame to walk, lepers to "be clean, devils and unclean fpirits to be expelled, "fuch as have been long diſeaſed to be healed, and "the dead to be raifed; all which when I heard con"cerning thee, I concluded with myſelf, That either "thou waft a God come down from heaven, or the "Son of God fent to do thefe things. I have there"fore written to thee, befeeching thee to vouchſafe to "come unto me, and cure my diſeaſe. For I have "alfo heard that the Jews uſe thee ill, and lay fnares "to deſtroy thee. I have here a little city, pleaſantly "ſituated, and ſufficient for us both. ABGARUS." To this letter, Jefus, it is faid, returned an anfwer by Annanias, Abgarus's courier; which was as follows: "Bleſſed art thou, O Abgarus! who haft believed in "me whom thou haft not feen; for the Scriptures fay "of me, They who have feen me have not believed in "me, that they who have not feen, may, by believing, "have life. But whereas thou writeſt to have me "come to thee, it is of neceſſity that I fulfil all things "here for which I am ſent; and having finiſhed them, "to return to him that ſent me: but when I am re"turned to him, I will then ſend one of my diſciples "to thee, who ſhall cure thy malady, and give life to "thee and thine. JESUS." After Jeſus's aſcenſion, Judas, who is alſo named Thomas, ſent Thaddeus, one of the ſeventy, to Abgarus; who preached the goſpel to him and his people, cured him of his diſorder, and wrought many other miracles: which was done, ſays Euſebius, A. D. 43.—Though the above letters are acknowledged to be ſpurious by the candid writers of the church of Rome; ſeveral Proteſtant authors, as Dr Parker, Dr Cave, and Dr Grabe, have maintained that they are genuine, and ought not to be rejected.

Abgar || Abians.

ABGILLUS, JOHN, ſurnamed Preſter John, was ſon to a king of the Friſcii; and, from the auſterity of his life, obtained the name of *Preſter*, or Prieſt. He attended Charlemagne in his expedition to the Holy Land; but inſtead of returning with that monarch to Europe, it is pretended that he gained mighty conqueſts, and founded the empire of the Abyſſines, called, from his name, the empire of Preſter John. He is ſaid to have written the hiſtory of Charlemagne's journey into the Holy Land, and his own into the Indies; but they are more probably trifling romances, written in the ages of ignorance.

ABIANS, anciently a people of Thrace, or (according to ſome authors) of Scythia. They had no fixed habitations; they led a wandering life. Their houſes were waggons, which carried all their poſſeſſions. They lived on the fleſh of their herds and flocks, on milk and cheeſe, chiefly on that of mare's milk. They were unacquainted with commerce. They only exchanged commodities with their neighbours. They poſſeſſed lands, but they did not cultivate them. They aſſigned their agriculture to any who would undertake it, reſerving only to themſelves

* *Eccl. Hiſt.* lib. i. cap. 13.

Abiathar || Abimelech.

a tribute; which they exacted, not with a view to live in affluence, but merely to enjoy the neceſſaries of life. They never took arms but to oblige thoſe to make good a promiſe to them by whom it had been broken. They paid tribute to none of the neighbouring ſtates. They deemed themſelves exempt from ſuch an impoſition; for they relied on their ſtrength and courage, and conſequently thought themſelves able to repel any invaſion. The Abians, we are told, were a people of great integrity. This honourable eulogium is given them by Homer. (Strabo).

ABIATHAR, high prieſt of the Jews, ſon to Ahimelech, who had borne the ſame office, and received David into his houſe. This ſo enraged Saul, who hated David, that he put Ahimelech to death, and 81 prieſts; Abiathar alone eſcaped the maſſacre. He afterwards was high prieſt; and often gave King David teſtimonies of his fidelity, particularly during Abſalom's conſpiracy, at which time Abiathar followed David, and bore away the ark. But after this, conſpiring with Adonijah, in order to raiſe him to the throne of King David his father; this ſo exaſperated Solomon againſt him, that he diveſted him of the prieſthood, and baniſhed him, A. M. 3021, before Chriſt 1014.

ABIB, ſignifying an ear of corn, a name given by the Jews to the firſt month of their eccleſiaſtical year, afterwards called *Niſan*. It commenced at the vernal equinox; and according to the courſe of the moon, by which their months were regulated, anſwered to the latter part of our March and beginning of April.

ABIDING *by* WRITINGS, in *Scots Law:* When a perſon founds upon a writing alleged to be falſe, he may be obliged to declare judicially, whether he will ſtand or abide by it as a true deed.

ABIES, the FIR-TREE. See PINUS, BOTANY *Index*.

ABIGEAT, an old law term, denoting the crime of ſtealing cattle by droves or herds. This crime was ſeverely puniſhed; the delinquent being often condemned to the mines, baniſhment, and ſometimes capitally.

ABIHU, brother to Nadab, and ſon to Aaron. The two former had the happineſs to aſcend Mount Sinai with their father, and there to behold the glory of God: but afterward putting ſtrange fire into their cenſers, inſtead of the ſacred fire commanded by God, fire ruſhing upon them killed them. Though all the people bewailed this terrible cataſtrophe, Moſes forbade Aaron and his two ſons Eleazar and Ithamar to join in the lamentation.

ABII SCYTHÆ, taken by Strabo to denote the European Sarmatæ, bordering on the Thracians and Baſtanæ: They were commended by Curtius for their love of juſtice, and by Ammieſius for their contempt of earthly things.

ABIMELECH, king of Gerar, a country of the Philiſtines, was cotemporary with Abraham. This patriarch and his family being there, his wife Sarah, though 90 years of age, was not ſafe in it; for Abimelech carried her off, and was ſo enamoured of her, that he reſolved to marry her. Abraham did not declare himſelf Sarah's huſband; but gave out ſhe was his ſiſter. But the king being warned in a dream, that ſhe was married to a prophet, and that he ſhould die if he did not reſtore her to Abraham, the king obeyed; at the ſame time reproving Abraham for his diſingenuity; who thereupon, among other excuſes, ſaid ſhe was really his ſiſter, being born of the ſame father, though of a different mother. Abimelech afterwards gave conſiderable preſents to Abraham; and a covenant, that of Beerſheba, was entered into between them, A. M. 2107. After the death of Abraham, there being a famine in the neighbouring countries, Iſaac his ſon alſo withdrew into Gerar, which was then likewiſe governed by a king called

Abimelech || Abiponians.

ABIMELECH, probably the ſucceſſor of the former. Here Rebekah's beauty forced her huſband to employ Abraham's artifice. Abimelech diſcovering that they were nearly related, chid Iſaac for calling his wife his ſiſter; and at the ſame time forbade all his ſubjects, upon pain of death, to do the leaſt injury to Iſaac or Rebekah. Iſaac's proſperity loſt him the king's friendſhip, and he was deſired to go from among them. He obeyed; but Abimelech afterwards entered into a covenant with him, A. M. 2200.

ABIMELECH, the natural ſon of Gideon, by his concubine. His violent acts and death are recorded in Judges, chap. ix. A. M. 2769.

ABINGDON, a market-town in Berkſhire, ſituated on a branch of the Thames, derives its name from an ancient abbey. The ſtreets, which are well paved, terminate in a ſpacious area, in which the market is held; and in the centre of this area is the market-houſe, which is ſupported on lofty pillars, with a large hall of freeſtone above, in which the ſummer aſſizes for the county are held, and other public buſineſs done, the Lent aſſizes being held at Reading. It has two churches; one dedicated to St Nicholas, and the other to St Helena: the latter is adorned with a ſpire, and both are ſaid to have been erected by the abbots of Abingdon. Here are alſo two hoſpitals, one for ſix, and the other for thirteen poor men, and as many poor women; a free ſchool; and a charity ſchool. The town was incorporated by Queen Mary. It ſends two members to parliament, who are choſen by the inhabitants at large not receiving alms. Its great manufacture is malt, large quantities of which are ſent by water to London. It is ſeven miles ſouth of Oxford, 47 eaſt of Glouceſter, and 55 weſt of London. This town is ſuppoſed by Biſhop Gibſon to be the place called, in the Saxon annals, *Cloveſhoo*, where two ſynods are ſaid to have been held, one in 742, and the other in 822. W. Long. 1. 12. N. Lat. 51. 42.

ABINTESTATE, in *Civil Law*, is applied to a perſon who inherits the right of one who died inteſtate or without making a will. See INTESTATE.

ABIPONIANS, a tribe of American Indians, who formerly inhabited the diſtrict of *Chaks* in Paraguay; but the hoſtilities of the Spaniards have now obliged them to remove ſouthward into the territory lying between Santa Fe and St Jago. The only account we have of them is that publiſhed by M. Dobrizhoffer in 1785. This gentleman, who lived ſeven years in their country, informs us that they are not numerous, the whole nation not much exceeding 5000; for which he aſſigns as a reaſon an unnatural cuſtom among their women of ſometimes deſtroying their own children, from motives of jealouſy leſt their huſbands ſhould take other mates during the long time they give ſuck,

Abiram || Ablactation.

which is not less than two years. They are naturally white, but, by exposure to the air and smoke, become of a brown colour. They are a strong and hardy race of people; which our author attributes to their marrying so late, an Abiponian seldom or never thinking of marriage till 30 years of age. They are greatly celebrated on account of their chastity and other virtues; though, according to our author, they have no knowledge of a Deity. They make frequent incursions into the territories of the Spaniards, mounted on the horses which run wild in those parts. They have a kind of order of chivalry for their warriors; and are so formidable, that 100 of their enemies will fly before ten of these horsemen. The hatred which these savages, whose manners, though rude and uncultivated, are in many respects pure and virtuous, bear to the Spaniards, is invincible. "These pretended Christians," says our author, "who are the scum of the Spanish nation, practise every kind of fraud and villany among these poor barbarians; and their corrupt and vicious morals are so adapted to prejudice the Abiponians against the Christian religion, that the Jesuit missionaries have, by a severe law, prohibited any Spaniard from coming, without a formal permission, into any of their colonies."—From his account of the success of the Jesuits in converting them to Christianity, however, it does not appear that they have been able to do more than bribe them to a compliance with the ceremonies of the Popish superstition; so that in general they are quite ignorant and uncivilized; a most striking instance of which is, that in counting they can go no further than three; and all the art of the Jesuits to teach them the simplest use and expression of numbers has proved unsuccessful.

ABIRAM, a seditious Levite, who, in concert with Korah and Dathan, rebelled against Moses and Aaron, in order to share with them in the government of the people; when Moses ordering them to come with their censers before the altar of the Lord, the earth suddenly opened under their feet, and swallowed up them and their tents; and at the same instant fire came from heaven, and consumed 250 of their followers. Numb. chap. xvi.

ABISHAI, son of Zeruiah, and brother to Joab, was one of the celebrated warriors who flourished in the reign of David: he killed with his own hand 300 men, with no other weapon but his lance; and slew a Philistine giant, the iron of whose spear weighed 300 shekels. 1 Sam. chap. xxvi. 2 Sam. chap. xxiii.

ABJURATION, in our ancient customs, implied an oath, taken by a person guilty of felony, and who had fled to a place of sanctuary, whereby he solemnly engaged to leave the kingdom for ever.

ABJURATION is now used to signify the renouncing, disclaiming, and denying upon oath, the Pretender to have any kind of right to the crown of these kingdoms.

Abjuration of Heresy, the solemn recantation of any doctrine as false and wicked.

ABLACTATION, or weaning a child from the breast. See WEANING.

ABLACTATION, among the ancient gardeners, the same with what is now called *Grafting by approach*, is a method of engrafting, by which the cyon of one tree being for some time united to the stock of another, is afterwards cut off, and, as it were, weaned from the parent tree.

ABLAI, a country of Great Tartary, the inhabitants of which are called *Buchars* or *Buchares*. See ABLAY.

Ablai || Able.

ABLACQUEATION, an old term in *Gardening*, signifies the operation of removing the earth, and baring the roots of trees in winter, to expose them more freely to the air, rain, snows, &c.

ABLANCOURT. See PERROT.

ABLATIVE, in *Grammar*, the sixth case of Latin nouns. The word is formed from *auferre*, "to take away." Priscian also calls it the *comparative case*; as serving among the Latins, for comparing, as well as taking away.

The ABLATIVE is opposite to the DATIVE; the first expressing the action of taking away, and the latter that of giving.

In English, French, &c. there is no precise mark whereby to distinguish the ablative from other cases; and we only use the term in analogy to the Latin. Thus, in the two phrases, *the magnitude of the city*, and *he spoke much of the city*; we say, that *of the city* in the first is *genitive*, and in the latter *ablative*; because it would be so, if the two phrases were expressed in Latin.

The question concerning the Greek ablative has been the subject of a famous literary war between two great grammarians, Frischlin and Crusius; the former maintaining, and the latter opposing, the reality of it. The dispute still subsists among their respective followers. The chief reason alleged by the former is, that the Roman writers often joined Greek words with the Latin prepositions which govern ablative cases, as well as with nouns of the same case. To which their opponents answer, that the Latins anciently had no ablative themselves; but instead thereof, made use, like the Greeks, of the dative case; till at length they formed an ablative, governed by prepositions, which were not put before the dative: that, at first, the two cases had always the same termination, as they still have in many instances: but that this was afterwards changed in certain words. It is no wonder then, that the Latins sometimes join prepositions which govern an ablative case, or nouns in the ablative case, with Greek datives, since they were originally the same; and that the Greek dative has the same effect as the Latin ablative.

ABLATIVE ABSOLUTE, in *Grammar*, is a phrase detached or independent of the other parts of a sentence or discourse. In the Latin language it is frequent, and it has been adopted by the moderns.

ABLAY, in *Geography*, a country of Great Tartary, governed by a Calmuck chief, but subject to Russia, to obtain its protection. It lies east of the river Irtisch, and extends 500 leagues along the southern frontiers of Siberia, from E. Long. 72° to 83°. N. Lat. from 51° to 54°.

ABLE, or ABEL, THOMAS, chaplain to Queen Catharine, consort to Henry VIII. distinguished himself by his zeal in opposing the proceedings against that unfortunate princess for a divorce. For this purpose he wrote a piece, entitled "*Tractatus de non dissolvendo Henrici et Catharinæ matrimonio*, i. e. "A Treatise proving that the marriage of King Henry and Queen Catharine ought not to be dissolved." But the title of the book, according to Bishop Tanner, was

Invicta

Ablecti || Abner.

Invicta Veritas. He took the degree of bachelor of arts at Oxford on the 4th of July 1513, and that of maſter of arts on the 27th of July 1516. In 1534 he fell under a proſecution for being concerned in the affair of Elizabeth Barton, called the *Holy Maid of Kent*. This was an infamous impoſtor, ſuborned by the monks to uſe ſtrange geſticulations, exhibit fictitious miracles, and to feign the gift of prophecy; and ſo well did ſhe act her part, that ſhe drew ſome perſons of reſpectability to her intereſt: but being detected, ſhe was condemned and executed, after diſcovering the names of her principal accomplices and inſtigators. On her account Able was charged with miſpriſion of treaſon, by ſtat. 25. Hen. VIII; and being alſo one of thoſe who denied the king's ſupremacy over the church, he was apprehended and impriſoned; during which time his confinement was ſo rigorous, that the keeper of Newgate was committed to Marſhalſea priſon for ſuffering him to go out upon bail. He was afterwards hanged, drawn, and quartered, at Smithfield in 1540. Bouchier gives him the character of a very learned man; and tells us, that he uſed to teach the queen muſic and the learned languages.

ABLECTI, in Roman antiquity, a ſelect body of ſoldiers choſen from among thoſe called EXTRAORDINARII.

ABLEGMINA, in Roman antiquity, thoſe choice parts of the entrails of victims which were offered in ſacrifice to the gods. They were ſprinkled with flour, and burnt upon the altar; the prieſts pouring ſome wine on them.

ABLOE, in *Geography*, a town of Little Tartary, which lies between the river Dnieper and the Black ſea. E. Long. 33. 15. N. Lat. 46. 20.

ABLUENTS, in *Medicine*, the ſame with diluters or DILUENTS.

ABLUTION, in a general ſenſe, ſignifies the waſhing, or purifying ſomething with water.

ABLUTION, in a religious ſenſe, a ceremony in uſe among the ancients, and ſtill practiſed in ſeveral parts of the world: it conſiſted in waſhing the body, which was always done before ſacrificing, or even entering their houſes. Ablutions appear to be as old as any ceremonies, and external worſhip itſelf. Moſes enjoined them; the heathens adopted them; and Mahomet and his followers have continued them: thus they have got footing among moſt nations, and make a conſiderable part of moſt eſtabliſhed religions.—The Egyptian prieſts had their diurnal and nocturnal ablutions; the Grecians their ſprinklings; the Romans their luſtrations and lavations; the Jews their waſhing of hands and feet, beſide their baptiſms.—The ancient Chriſtians had their ablutions before communion; which the Romiſh church ſtill retain before their maſs, ſometimes after. The Syrians, Copts, &c. have their ſolemn waſhings on Good Friday: the Turks their greater and leſſer ablutions; their Ghaſt and Wodou, their Aman, Taharat, &c.

ABNER, the ſon of Ner, father-in-law to Saul, and general of all his forces, ſerved him on all occaſions with fidelity and courage. After the death of that prince, Abner ſet Iſhboſheth, Saul's ſon, on the throne. A war breaking out between the tribe of Judah, who had elected David king, and Iſrael, Abner marched againſt that prince with the flower of his troops, but was defeated. Abner afterward, being diſguſted, went over to David, and induced the chiefs of the army and the elders of Iſrael to declare for him. He was received by David with every mark of affection, which gave offence to Joab, by whom he was inſidiouſly put to death, A. M. 2956.

Abnoba || Aboccis.

ABNOBA, now ABENOW, in *Geography*, a long range of mountains in Germany, extending from the Rhine to the Necker, and having different names according to the different countries through which they ſtretch. About the river Maine they are called the *Oden* or *Otenwald;* between Heſſe and Franconia, the *Speſſart;* and about the duchy of Wirtemberg, where the Danube takes its riſe, they receive the name of *Baar*.

ABO, a maritime town in Sweden, ſituated on the promontory formed by the gulfs of Finland and Bothnia 120 miles north-eaſt from Stockholm, in E. Long. 21. 28. and N. Lat. 60. 10. It is a ſtapelſtad, or city which has the privilege of a foreign trade, and belongs to the *lane* or government and dioceſe of Abo. It is built on both ſides of the river Aurajocki, which have a communication by a wooden bridge. The ſtreets and lanes of Abo amount to 102; the number of houſes to 1100, which in 1780 contained above 2000 families. In 1791 the number of inhabitants was 8500.

A gymnaſium was eſtabliſhed at Abo by Guſtavus Adolphus in 1626, which was converted by Queen Chriſtina, in 1640, into an academy or univerſity, in which are now taught, anatomy, natural hiſtory, chemiſtry, and economics. The library founded by Queen Chriſtina conſiſts of above 10,000 volumes, beſides manuſcripts, ancient coins, medals, &c. The ſchool of anatomy is in conſiderable repute; and enjoys, it is ſaid, one very extraordinary privilege. By a particular regulation, all perſons who hold lands or penſions from the crown are bound to leave their bodies to be diſſected for the inſtruction of the ſtudents.

The trade of Abo is conſiderable. The exports conſiſt of iron, copper, pitch, tar, deals, &c. The imports are tobacco, coffee, ſugar, wine, ſalt, grain, hemp, and ſpiceries. In Abo are manufactured ſilk ribbands, fuſtian, ſail-cloth, leather, tiles, watches and clocks, paper, ſugar, and tobacco. The plantations of tobacco in this neighbourhood produce not leſs than 152,000 cwt. annually. (*Acerbi's Travels.*)

ABO-HUS, or ABO-SLOT, a very ancient caſtle in Finland, ſituated at the mouth of the river Aura, was the reſidence of Duke John, and the priſon of King Eric in the 16th century. It is at preſent employed as a magazine for corn and gunpowder, and as a priſon for ſtate offenders.

ABOARD, the inſide of a ſhip. Hence any perſon who enters a ſhip is ſaid to *go aboard*: but when an enemy enters in the time of battle, he is ſaid to *board*; a phraſe which always implies hoſtility.—To *fall aboard of*, is to ſtrike or *encounter* another ſhip when one or both are in motion, or to be driven upon a ſhip by the force of the wind or current.—*Aboard-main-tack*, the order to draw the main-tack, i. e. the lower-corner of the main-ſail, down to the CHESS-TREE.

ABOASAR, in *Geography*, a village in Lower Egypt, ſuppoſed to be the ancient Buſiris.

ABOCCIS, in *Ancient Geography*, the Abuncis of Ptolemy, a town of Ethiopia, ſituated on the weſtern ſide of the Nile near the great cataract.

Abocro ‖ Abomaſus.

ABOCRO, or ABORREL, in *Geography*, a town near the river Ankobar or Cobre, on the African Gold coaſt. It gives name to a republican province.

ABOLA, in *Geography*, a diviſion of the Agow, in Abyſſinia, is a narrow valley, through which runs a river of the ſame name, whoſe waters receive many tributary ſtreams from the loſty, rugged, and woody mountains that form the valley. In none of the rivers are any fiſh found, which Bruce aſcribes to their being dried up in the ſummer, and great rapidity in winter.

ABOLITION, implies the act of annulling, deſtroying, making void, or reducing to nothing. In our law, it ſignifies the repealing any law or ſtatute. The leave given by a prince or judge to a criminal accuſer to deſiſt from farther proſecution of the accuſed, is in the moſt appropriate ſenſe denominated *abolition*.

ABOLITION is particularly uſed among civilians, for remitting the puniſhment of a crime. It is, in this ſenſe, a kind of amneſty; the puniſhment, not the infamy, is taken off.

ABOLITION, in the Roman law, is the annulling a proſecution, or legal accuſation: and in this ſenſe, it is different from amneſty; for, in the former, the accuſation might be renewed by the ſame proſecutor, but in the latter, it was extinguiſhed for ever. Within 30 days after a public *abolition*, the ſame accuſer, with the prince's licence, was allowed to renew the charge; after a private *abolition*, another accuſer might renew it, but the ſame could not. *Abolition* was alſo uſed for expunging a perſon's name from the public liſt of the accuſed, hung up in the treaſury. It was either public, as that under Auguſtus, when all the names which had long hung up, were expunged at once; or private, when it was done at the motion of one of the parties. *Abolition* of debts, according to the laws of the Theodoſian code, was ſometimes granted to thoſe who were indebted to the fiſcus. A medal of the emperor Adrian repreſents that prince with a ſceptre in his left hand, and a lighted torch in his right, with which he ſets fire to ſeveral papers in preſence of the people, who teſtify their joy and gratitude by lifting up their hands towards heaven. The legend on the medal is, *Reliqua vetera* H. S. *nummis abolita*.

ABOLLA, in antiquity, a warm kind of garment, lined or doubled, worn by the Greeks and Romans, chiefly out of the city, in following the camp.—Critics and antiquaries are greatly divided as to the form, uſe, kinds, &c. of this garment. Papias makes it a ſpecies of the *toga*, or gown; but Nonnius, and moſt others, ſuppoſe it to be a ſpecies of the *pallium*, or cloak. The *abolla* ſeems rather to have ſtood oppoſed to the *toga*, which was a garment of peace, as the *abolla* was of war; at leaſt Varro and Martial place them in this oppoſite light. There ſeem to have been different kinds of *abollæ*, appropriated to different characters and occaſions. Even kings appear to have uſed the *abolla*: Caligula was offended with King Ptolemy for appearing at the ſhows in a purple *abolla*, the ſplendour of which drew the eyes of the ſpectators from the emperor to himſelf.

ABOMASUS, ABOMASUM, or ABOMASUS, names of the fourth ſtomach of ruminating animals. It is in the abomaſus of calves and lambs that the runnet or earning is formed wherewith milk is curdled. See ANATOMY, Part II.

Abomination ‖ Aborigines.

ABOMINATION, a term uſed in Scripture with regard to the Hebrews, who, being ſhepherds, are ſaid to have been an abomination to the Egyptians, becauſe they ſacrificed the ſacred animals of that people, as oxen, goats, ſheep, &c. which the Egyptians eſteemed as abominations, or things unlawful. The term is alſo applied in the ſacred writings to idolatry and idols, becauſe the worſhip of idols is in itſelf an abominable thing, and at the ſame time ceremonies obſerved by idolaters were always attended with licentiouſneſs and other odious and abominable actions. The *abomination of deſolation*, foretold by the prophet Daniel, is ſuppoſed to imply the ſtatue of Jupiter Olympius, which Antiochus Epiphanes cauſed to be placed in the temple of Jeruſalem. And the *abomination of deſolation*, mentioned by the Evangeliſts, ſignifies the enſigns of the Romans, during the laſt ſiege of Jeruſalem by Titus, on which the figures of their gods and emperors were embroidered, and placed upon the temple after it was taken.

ABON, ABONA, or ABONIS, in *Ancient Geography*, a town and river of Albion. The town, according to Camden, is Abingdon; and the river, Abhon or Avon. But by Antonine's Itinerary, the diſtance is nine miles from the Venta Silurum, or Caer-Went; others, therefore, take the town to be Porſhut, at the mouth of the river Avon, near Briſtol. Abhon or Avon, in the Celtic language, denotes a river.

ABORAS, in *Ancient Geography*, by Xenophon called Araxes, a river of Meſopotamia, which flows into the Euphrates at Circeſium. In the negociation between Diocleſian and Narſes, near the end of the third century, it was fixed as the boundary between the Roman and Perſian empire.

ABORIGINES, in hiſtory, (Dionyſius of Halicarnaſſus, Livy, Virgil); originally a proper name, given to a certain people in Italy, who inhabited the ancient Latium, or country now called *Campagna di Roma*. In this ſenſe the Aborigines are diſtinguiſhed from the Janigenæ, who, according to the falſe Beroſus, inhabited the country before them; from the Siculi, whom they expelled; from the Grecians, from whom they deſcended; from the Latins, whoſe name they aſſumed after their union with Æneas and the Trojans; laſtly, from the Auſonii, Volſci, Oenotrii, &c. neighbouring nations in other parts of the country. Whence this people came by the appellation is much diſputed. St Jerome ſays, they were ſo called, as being, *abſque origine*, the primitive planters of the country after the flood: Dionyſius of Halicarnaſſus accounts for the name, as denoting them the founders of the race of inhabitants of that country: others think them ſo called as being originally Arcadians, who claimed to be earth-born, and not deſcended from any people. Aurelius Victor ſuggeſts another opinion, viz. that they were called *Aborigines*, q. d. *Aberrigines*, from *ab* "from," and *errare* "to wander;" as having been before a wandering people. Pauſanias rather thinks they were thus called απο ορεων, "from mountains"; which opinion ſeems confirmed by Virgil, who, ſpeaking of Saturn, the legiſlator of this people, ſays,

Is genus indocile ac diſperſum montibus altis
Compoſuit, legeſque dedit.——

The Aborigines were either the original inhabitants of the country, ſettled there by Janus, as ſome imagine;

Abortion. ginc; or by Saturn, or Cham, as others; not long after the diſperſion, or even, as ſome think, before it: Or, they were a colony ſent from ſome other nation; who expelling the Siculi, the ancient inhabitants, ſettled in their place. About this mother nation there is great diſpute. Some maintain it to be the Arcadians, parties of whom were brought into Italy at different times; the firſt under the conduct of Oenotrius, ſon of Lycaon, 450 years before the Trojan war; a ſecond from Theſſaly; a third under Evander, 60 years before the Trojan war; beſides another under Hercules; and another of Lacedemonians, who fled from the ſevere diſcipline of Lycurgus: all theſe uniting, are ſaid to have formed the nation or kingdom of the Aborigines. Others will have them of barbarian rather than Grecian origin, and to have come from Scythia; others from Gaul. Laſtly, Others will have them to be Canaanites, expelled by Joſhua.

The term *Aborigines*, though ſo famous in antiquity, is uſed in modern geography only occaſionally as an appellative. It is given to the primitive inhabitants of a country, in contradiſtinction to colonies, or new races of people.

ABORTION, in *Midwifery*, the premature excluſion of a fœtus. See MIDWIFERY.

The practice of procuring abortions was prohibited by the ancient Greek legiſlators Solon and Lycurgus. Whether or not it was permitted among the Romans, has been much diſputed. It is certain the practice, which was by them called *viſceribus vim inferre*, was frequent enough; but whether there was any penalty on it before the emperors Severus and Antonine, is the queſtion. Nodt maintains the negative; and further, that thoſe princes only made it criminal in one particular caſe, viz. of a married woman's practiſing it out of reſentment againſt her huſband, in order to defraud him of the comfort of children: this was ordered to be puniſhed by a temporary exile. The foundation on which the practice is ſaid to have been allowed, was, that the fœtus, while *in utero*, was reputed as a part of the mother, ranked as one of her own viſcera, over which ſhe had the ſame power as over the reſt: beſides, that it was not reputed as a man, *homo;* nor to be alive, otherwiſe than as a vegetable: conſequently, that the crime amounted to little more than that of plucking unripe fruit from the tree. Seneca repreſents it as a peculiar glory of Helvia, that ſhe had never, like other women, whoſe chief ſtudy is their beauty and ſhape, deſtroyed the fœtus in her womb. The primitive fathers, Athenagoras, Tertullian, Minutius Felix, Auguſtin, &c. declaimed loudly againſt the practice as virtual murder. Several councils have condemned it. Yet we are told that the modern Romiſh eccleſiaſtical laws allow of diſpenſations for it. Egane mentions the rates at which a diſpenſation for it may be had.

The practice of artificial abortion is chiefly in the hands of women and nurſes, rarely in that of phyſicians; who, in ſome countries, are not admitted to the profeſſion without abjuring it. Hippocrates, in the oath he would have enjoined on all phyſicians, includes their not giving the *peſſus abortivus*, though elſewhere he gives the formal proceſs whereby he himſelf procured in a young woman a miſcarriage. It may, however, be obſerved, that often all the powers of art prove ineffectual, and no leſs often do the attempts prove the means of puniſhment by their fatal conſequences. Abortion || Abrabanel.

ABORTION, among gardeners, ſignifies ſuch fruits as are produced too early, and never arrive at maturity.

ABORTIVE, is, in general, applied to whatever comes before its legitimate time, or to any deſign which miſcarries.

Abortive Corn, a diſtemper of corn mentioned by M. Tillet, and ſuſpected to be occaſioned by inſects. It appears long before harveſt, and may be known by a deformity of the ſtalk, the leaves, the ear, and even the grain.

Abortive Vellum, is made of the ſkin of an abortive calf.

ABOTRITES, or ABODRITES, in *Hiſtory*, the name of a people bordering on Bulgaria in that part of Dacia contiguous to the Danube. The country of the Abodrites, now called Mecklenburg, was a part of the ancient Vandalia.

ABOUKIR, a ſmall town of Egypt, ſituated in the deſert between Alexandria and Roſetta. It is the ancient Canopus, and is ſituated, according to Mr Savary, ſix leagues from Pharos. Pliny ſays, from the teſtimonies of antiquity, that it was formerly an iſland: and its local appearance makes this credible; for the grounds around it are ſo low, that the ſea ſtill covered a part of them in the days of Strabo. The town is built upon a rock, which forms a handſome road for ſhipping, and was out of the reach of inundations. In the bay of Aboukir, a ſignal victory was obtained in 1798 by the Engliſh fleet over the French fleet. The town was taken from the Turks, after a vigorous defence, by the French in 1799, and retaken by the Engliſh in 1801.

ABOUT, the ſituation of a ſhip immediately after ſhe has tacked, or changed her courſe by going about and ſtanding on the other tack.—*About ſhip!* the order to the ſhip's crew for tacking.

ABOUTIGE, a town of Upper Egypt, in Africa, near the Nile, where they make the beſt opium in all the Levant. It was formerly a large, but now is a mean place. N. Lat. 26. 50.

ABRA, a ſilver coin ſtruck in Poland, and worth about one ſhilling ſterling. It is current in ſeveral parts of Germany, at Conſtantinople, Aſtracan, Smyrna, and Grand Cairo.

ABRABANEL, ABARBANEL, or AVRAVANEL, ISAAC, a celebrated rabbi, deſcended from King David, and born at Liſbon A. D. 1437. He became counſellor to Alphonſo V. king of Portugal, and afterwards to Ferdinand the Catholic; but in 1492 was obliged to leave Spain with the other Jews. In ſhort, after reſiding at Naples, Corfu, and ſeveral other cities, he died at Venice in 1508, aged 71. Abrabanel paſſed for one of the moſt learned of the rabbis; and the Jews gave him the names of the Sage, the Prince, and the Great Politician. We have a commentary of his on all the Old Teſtament, which is pretty ſcarce: he there principally adheres to the literal ſenſe; and his ſtyle is clear, but a little diffuſe. His other works are, A Treatiſe on the Creation of the World; in which he refutes Ariſtotle, who imagined that the world was eternal: A Treatiſe on the Explication of the Prophe-

cies

Abracadabra, Abraham.

cies relating to the Meſſiah, againſt the Chriſtians: A book concerning Articles of Faith; and ſome others leſs ſought after. Though Abrabanel diſcovers his implacable averſion to Chriſtianity in all his writings, yet he treated Chriſtians with politeneſs and good manners in the common affairs of life.

ABRACADABRA, a magical word, recommended by Serenus Samonicus as an antidote againſt agues and ſeveral other diſeaſes. It was to be written upon a piece of paper as many times as the word contains letters, omitting the laſt letter of the former every time, as in the margin †, and repeated in the ſame order; and then ſuſpended about the neck by a linen thread. *Abracadabra* was the name of a god worſhipped by the Syrians; ſo wearing his name was a ſort of invocation of his aid; a practice which, though not more uſeful, yet was leſs irrational, than is the equally heatheniſh practice among thoſe who call themſelves Chriſtians, of wearing various things, in expectation of their operating by a ſympathy, whoſe parents were Ignorance and Superſtition.

ABRAHAM, the father and ſtock whence the faithful ſprung, was the ſon of Terah. He was deſcended from Noah by Shem, from whom he was nine degrees removed. Some fix his birth in the 130th year of Terah's age, but others place it in his father's 70th year. It is highly probable he was born in the city of Ur, in Chaldea, which he and his father left when they went to Canaan, where they remained till the death of Terah; after which, Abraham reſumed his firſt deſign of going to Paleſtine. The Scriptures mention the ſeveral places he ſtopped at in Canaan; his journey into Egypt, where his wife was carried off from him; his going into Gerar, where Sarah was again taken from him, but reſtored, as before; the victory he obtained over the four kings who had plundered Sodom; his compliance with his wife, who inſiſted that he ſhould make uſe of their maid Hagar in order to raiſe up children; the covenant God made with him, ſealed with the ceremony of circumciſion; his obedience to the command of God, who ordered him to offer up his only ſon as a ſacrifice, and how this bloody act was prevented; his marriage with Keturah; his death at the age of 175 years; and his interment in the cave of Machpelah, near the body of Sarah his firſt wife. It would be of little uſe to dwell long upon theſe particulars, ſince they are ſo well known. But tradition has ſupplied numberleſs others, the mention of one or two of which may not be unacceptable.

Many extraordinary particulars have been told relating to his converſion from idolatry. It is a pretty general opinion, that he ſucked in the poiſon with his milk; that his father made ſtatues, and taught that they were to be worſhipped as gods*. Some Jewiſh authors relate †, that Abraham followed the ſame trade with Terah for a conſiderable time. Maimonides ‡ ſays, that he was bred up in the religion of the Sabæans, who acknowledged no deity but the ſtars; that his reflections on the nature of the planets, his admiration of their motions, beauty and order, made him conclude there muſt be a being ſuperior to the machine of the univerſe, a being who created and governed it; however, according to an old tradition, he did not renounce Paganiſm till the 50th year of his age. It is related ||, that his father, being gone a journey, left him to ſell the ſtatues in his abſence; and that a man, who pretended to be a purchaſer, aſked him how old he was: Abraham anſwered, Fifty."—"Wretch that thou art (ſaid the other), for adoring at ſuch an age a being which is but a day old!" Theſe words greatly confounded Abraham. Some time afterwards, a woman brought him ſome flour, that he might give it as an offering to the idols; but Abraham, inſtead of doing ſo, took up a hatchet and broke them all to pieces, excepting the largeſt, into the hand of which he put the weapon. Terah, at his return, aſked whence came all this havock? Abraham made anſwer, that the ſtatues had had a great conteſt which ſhould eat firſt of the oblation; "Upon which (ſaid he), the god you ſee there, being the ſtouteſt, hewed the others to pieces with that hatchet." Terah told him this was bantering; for thoſe idols had not the ſenſe to act in this manner. Abraham retorted theſe words upon his father againſt the worſhipping of ſuch gods. Terah, ſtung with this raillery, delivered up his ſon to the cognizance of Nimrod, the ſovereign of the country: who exhorted Abraham to worſhip the fire; and, upon his refuſal, commanded him to be thrown into the midſt of the flames: "Now let your God (ſaid he) come and deliver you." But (adds the tradition) Abraham eſcaped from the flames unhurt.—This tradition is not of modern date, ſince it is told by St Jerome §; who ſeems to credit it in general, but diſbelieves that part of it which makes Terah ſo cruel as to be the informer againſt his own ſon. Perhaps the ambiguity of the word *Ur* * might have given riſe to the fiction altogether. Such as lay ſtreſs on the following words which God ſays to Abraham (Gen. xv. 7.), *I am the Lord that brought thee out of Ur of the Chaldees*, imagine that he ſaved him from a great perſecution, ſince he employed the very ſame words in the beginning of the decalogue to denote the deliverance from Egypt.

Abraham

§ *Tradit. Hebraic. in Geneſin.*

* It is the proper name of a city, and it alſo ſignified *fire*. The Lat. verſio Eſdras ix. has it thus *Qui eligiſti eum de igne Chaldeorum.*

Abraham is ſaid to have been well ſkilled in many ſciences, and to have wrote ſeveral books. Joſephus † tells us that he taught the Egyptians arithmetic and geometry; and according to Eupolemus and Artapan, he inſtructed the Phœnicians, as well as the Egyptians, in aſtronomy. A work which treats of the creation has been long aſcribed to him: it is mentioned in the Talmud ‡, and the rabbis Chanina and Hoſchia uſed to read it on the eve before the Sabbath. In the firſt ages of Chriſtianity, according to St Epiphanius ||, a heretical ſect, called *Sethinians*, diſperſed a piece which had the title of *Abraham's Revelation*. Origen mentions alſo a treatiſe ſuppoſed to be wrote by this patriarch. All the ſeveral works which Abraham compoſed in the plains of Mamre, are ſaid to be contained in the library of the monaſtery of the Holy Croſs on Mount Amaria in Ethiopia §. The book on the creation was printed at Paris 1552, and tranſlated into Latin by Poſtel: Rittangel, a converted Jew, and profeſſor at Konigſberg, gave alſo a Latin tranſlation of it, with remarks, in 1642.

† *Antiq.* lib. i. cap. 8.

‡ *Heidegger Hiſt. Patriarch.* tom. ii. p. 143.

|| *Adverſ. Har.* p. 236.

§ *Kirchem' Treatiſe of Libraries*, p. 142.

ABRAHAM *Ben Chaila*, a Spaniſh rabbi, in the 13th century, who profeſſed aſtrology, and aſſumed the character of a prophet. He pretended to predict the coming of the Meſſiah, which was to happen in the year 1358; but fortunately he died in 1303, fifty-five years before the time when the prediction was to be fulfilled.

* *Suidas in* Εαρωχ. See Joſ. xxiv. 2.

† *Apud Genebrand. in Chron.*

‡ *More Nevoch.* c. 29.

|| *Heidegger, Hiſt. Patriarch.* tom. iii. p. 36.

Abraham || Abraxas.

fulfilled. He wrote a book, *De Nativitatibus*, which was printed at Rome in 1545.

ABRAHAM USQUE, a Portugueſe Jew, who, in conjunction with Tobias Athias, tranſlated the Hebrew Bible into Spaniſh. It was printed at Ferrara, in 1553, and reprinted in Holland in 1630. This Bible, eſpecially the firſt edition, which is moſt valuable, is marked with ſtars at certain words, which are deſigned to ſhow that theſe words are difficult to be underſtood in the Hebrew, and that they may be uſed in a different ſenſe.

ABRAHAM, *Nicholas*, a learned Jeſuit, born in the diocеſe of Toul, in Lorrain, in 1489. He obtained the rank of divinity profeſſor in the univerſity of Pont-a-Mouſon, which he enjoyed 17 years, and died September 7. 1655. He wrote Notes on Virgil and on Nonnius; A Commentary on ſome of Cicero's Orations, in two vols. folio; an excellent collection of theological pieces in folio, entitled *Pharus Veteris Teſtamenti*; and A Hebrew Grammar in verſe.

ABRAHAMITES, an order of monks exterminated for idolatry by Theophilus in the ninth century. Alſo the name of another ſect of heretics who had adopted the errors of Paulus. See PAULICIANS.

ABRANTES, a town of Portugal, in Eſtremadura, ſeated on an eminence, in the midſt of gardens and olive trees, near the river Tajo, belongs to a marquis of the ſame name. It contains 35,000 inhabitants, four convents, an alms-houſe, and an hoſpital. W. Long. 7. 18. N. Lat. 39. 13.

ABRASAX, or ABRAXAS, the ſupreme god of the Baſilidian heretics. It is a myſtical or cabbaliſtic word, compoſed of the Greek letters α, σ, ρ, α, ξ, α, ς, which together, according to the Grecian mode of numeration, make up the number 365. For Baſilides taught, that there were 365 heavens between the earth and the empyrean; each of which heavens had its angel or intelligence, which created it; each of which angels likewiſe was created by the angel next above it; thus aſcending by a ſcale to the Supreme being, or firſt Creator. The Baſilidians uſed the word *Abraxas* by way of charm or amulet.

ABRASION is ſometimes uſed among medical writers for the effect of ſharp corroſive medicines or humours in wearing away the natural mucus which covs the membranes, and particularly thoſe of the ſtomach and inteſtines. The word is compoſed of the Latin *ab* and *rado*, *to ſhave* or *ſcrape off*.

ABRAVANNUS, in *Ancient Geography*, the name of a promontory and river of Galloway in Scotland, ſo called from the Celtic term *Aber*, ſignifying either the mouth of a river or the confluence of two rivers, and *Avon*, a river.

ABRAUM, in *Natural Hiſtory*, a name given by ſome writers to a ſpecies of red clay, uſed in England by the cabinetmakers, &c. to give a red colour to new mahogany wood. We have it from the iſle of Wight; but it is alſo found in Germany and Italy.

ABRAXAS, an antique ſtone with the word *abraxas* engraven on it. They are of various ſizes, and moſt of them as old as the third century. They are frequent in the cabinets of the curious; and a collection of them, as complete as poſſible, has been deſired by ſeveral. There is a fine one in the abbey of St Genevive, which has occaſioned much ſpeculation. Moſt of them ſeem to have come from Egypt: whence they are of ſome uſe for explaining the antiquities of that country. Sometimes they have no other inſcription beſides the word: but others have the names of ſaints, angels, or Jehovah himſelf annexed; though moſt uſually the name of the Baſilidian god. Sometimes there is a repreſentation of Iſis ſitting on a lotus, or Apis ſurrounded with ſtars; ſometimes monſtrous compoſitions of animals, obſcene images, Phalli and Ithyphalli. The graving is rarely good, but the word on the reverſe is ſometimes ſaid to be in a more modern ſtyle than the other. The characters are uſually Greek, Hebrew, Coptic, or Hetrurian, and ſometimes of a mongrel kind, invented, as it would ſeem, to render their meaning the more inſcrutable. It is diſputed whether the Veronica of Montreuil, or the granite obeliſk mentioned by Gori, be *Abraxaſes*.

Abreaſt || Abridgement.

ABREAST (a ſea term), ſide by ſide, or oppoſite to; a ſituation in which two or more ſhips lie, with their ſides parallel to each other, and their heads equally advanced. This term more particularly regards the line of battle at ſea, where on the different occaſions of attack, retreat, or purſuit, the ſeveral ſquadrons or diviſions of a fleet are obliged to vary their diſpoſitions, and yet maintain a proper regularity by ſailing in right or curved lines. When the line is formed abreaſt, the whole ſquadron advances uniformly, the ſhips being equally diſtant from and parallel to each other, ſo that the length of each ſhip forms a right angle with the extent of the ſquadron or line abreaſt. The commander in chief is always ſtationed in the centre, and the ſecond and third in command in the centres of their reſpective ſquadrons.—*Abreaſt*, within the ſhip, implies on a line with the beam, or by the ſide of any object aboard; as, the frigate ſprung a leak *abreaſt* of the main hatchway, i. e. on the ſame line with the main hatchway, croſſing the ſhip's length at right angles, in oppoſition to AFORE or ABAFT the hatchway.

ABRETENE, or ABRETTINE, in *Ancient Geography*, a diſtrict of Myſia, in Aſia. Hence the epithet *Abrettenus* given to Jupiter (Strabo); whoſe prieſt was Cleon, formerly at the head of a gang of robbers, and who received many and great favours at the hand of Antony, but afterwards went over to Auguſtus. The people were called *Abretteni*; inhabiting the country between Ancyra of Phrygia and the river Rhyndacus.

ABRIDGEMENT, in *Literature*, a term ſignifying the reduction of a book into a ſmaller compaſs.

The art of conveying much ſentiment in few words, is the happieſt talent an author can be poſſeſſed of. This talent is peculiarly neceſſary in the preſent ſtate of literature; for many writers have acquired the dexterity of ſpreading a few trivial thoughts over ſeveral hundred pages. When an author hits upon a thought that pleaſes him, he is apt to dwell upon it, to view it in different lights, to force it in improperly, or upon the ſlighteſt relations. Though this may be pleaſant to the writer, it tires and vexes the reader. There is another great ſource of diffuſion in compoſition. It is a capital object with an author, whatever be the ſubject, to give vent to all his beſt thoughts. When he finds a proper place for any of them, he is peculiarly happy. But rather than ſacrifice a thought he is fond of, he forces it in by way of digreſſion, or ſuperfluous illuſtration.

Abridgement.

illuſtration. If none of theſe expedients anſwer his purpoſe, he has recourſe to the margin, a very convenient apartment for all manner of pedantry and impertinence. There is not an author, however correct, but is more or leſs faulty in this reſpect. An abridger, however, is not ſubject to theſe temptations. The thoughts are not his own; he views them in a cooler and leſs affectionate manner; he diſcovers an impropriety in ſome, a vanity in others, and a want of utility in many. His buſineſs, therefore, is to retrench ſuperfluities, digreſſions, quotations, pedantry, &c. and to lay before the public only what is really uſeful. This is by no means an eaſy employment: To abridge ſome books, requires talents equal, if not ſuperior, to thoſe of the author. The facts, manner, ſpirit, and reaſoning muſt be preſerved; nothing eſſential, either in argument or illuſtration, ought to be omitted. The difficulty of the taſk is the principal reaſon why we have ſo few good abridgements: Wynne's abridgement of Locke's Eſſay on the Human Underſtanding, is perhaps the only unexceptionable one in our language.

Theſe obſervations relate ſolely to ſuch abridgements as are deſigned for the public. But,

When a perſon wants to ſet down the ſubſtance of any book, a ſhorter and leſs laborious method may be followed. It would be foreign to our plan to give examples of abridgements for the public: But as it may be uſeful, eſpecially to young people, to know how to abridge books for their own uſe. after giving a few directions, we ſhall exhibit an example or two, to ſhow with what eaſe it may be done.

Read the book carefully; endeavour to learn the principal view of the author; attend to the arguments employed: When you have done ſo, you will generally find, that what the author uſes as new or additional arguments, are in reality only collateral ones, or extenſions of the principal argument. Take a piece of paper or a common-place book, put down what the author wants to prove, ſubjoin the argument or arguments, and you have the ſubſtance of the book in a few lines. For example,

In the Eſſay on Miracles, Mr Hume's deſign is to prove, That miracles which have not been the immediate objects of our ſenſes, cannot reaſonably be believed upon the teſtimony of others.

Now, this argument (for there happens to be but one) is,

"That experience, which in ſome things is variable, "in others uniform, is our *only* guide in reaſoning "concerning matters of fact. A variable experience "gives riſe to probability only; an uniform experi- "ence amounts to a proof. Our belief of any fact "from the teſtimony of eye witneſſes is derived from "no other principle than our experience in the vera- "city of human teſtimony. If the fact atteſted be "miraculous, here ariſes a conteſt of two oppoſite "experiences, or proof againſt proof. Now, a mi- "racle is a violation of the laws of nature; and as a "firm and unalterable experience has eſtabliſhed theſe "laws, the proof againſt a miracle, from the very na- "ture of the fact, is as complete as any argument "from experience can poſſibly be imagined; and if "ſo, it is an undeniable conſequence, that it cannot be "ſurmounted by any proof whatever derived from hu- "man teſtimony."

Abridgement.

In Dr Campbell's Diſſertation on Miracles, the author's principal aim is to ſhow the fallacy of Mr Hume's argument; which he has done moſt ſucceſsfully by another ſingle argument, as follows:

"The evidence ariſing from human teſtimony *is not* "*ſolely* derived from experience: on the contrary, te- "ſtimony hath a natural influence on belief antecedent "to experience. The early and unlimited aſſent given "to teſtimony by children gradually contracts as they "advance in life: it is, therefore, more conſonant to "truth to ſay, that our *diffidence* in teſtimony is the "reſult of experience, than that our *faith* in it has this "foundation. Beſides, the uniformity of experience, "in favour of any fact, is not a proof againſt its be- "ing reverſed in a particular inſtance. The evidence "ariſing from the ſingle teſtimony of a man of known "veracity will go farther to eſtabliſh a belief in its be- "ing actually reverſed: If his teſtimony be confirmed "by a few others of the ſame character, we cannot "withhold our aſſent to the truth of it. Now, though "the operations of nature are governed by uniform "laws, and though we have not the teſtimony of our "ſenſes in favour of any *violation* of them; ſtill, if in "particular inſtances we have the teſtimony of *thou-* "*ſands* of our fellow-creatures, and thoſe too men of "ſtrict integrity, ſwayed by no motives of ambition or "intereſt, and governed by the principles of common "ſenſe, That they were actually eye witneſſes of theſe "violations, the conſtitution of our nature obliges us to "believe them."

Theſe two examples contain the ſubſtance of about 400 pages.—Making private abridgements of this kind has many advantages: It engages us to read with accuracy and attention; it fixes the ſubject in our minds; and, if we ſhould happen to forget, inſtead of reading the books again, by glancing a few lines, we are not only in poſſeſſion of the chief arguments, but recal in a good meaſure the author's method and manner.

Abridging is peculiarly uſeful in taking the ſubſtance of what is delivered by profeſſors, &c. It is impoſſible, even with the aſſiſtance of ſhort-hand, to take down, *verbatim*, what is ſaid by a public ſpeaker. Beſides, although it were practicable, ſuch a talent would be of little uſe. Every public ſpeaker has circumlocutions, redundancies, lumber, which deſerve not to be copied. All that is really uſeful may be comprehended in a ſhort compaſs. If the plan of the diſcourſe, and arguments employed in ſupport of the different branches, be taken down, you have the whole. Theſe you may afterwards extend in the form of a diſcourſe dreſſed in your own language. This would not only be a more rational employment, but would likewiſe be an excellent method of improving young men in compoſition; an object too little attended to in all our univerſities.

"The mode of reducing, ſays the author of the Curioſities of Literature, what the ancients had written in bulky volumes, practiſed in preceding centuries, came into general uſe about the fifth. As the number of ſtudents and readers diminiſhed, authors neglected literature, and were diſguſted with compoſition; for to write is ſeldom done, but when the writer entertains the hope of finding readers. Inſtead of original authors, there ſuddenly aroſe numbers of *abridgers*. Theſe men, amidſt the prevailing diſguſt

Abrincatarum, Abrogation.

for literature, imagined they ſhould gratify the public by introducing a mode of reading works in a few hours, which otherwiſe could not be done in many months; and, obſerving that the bulky volumes of the ancients lay buried in duſt, without any one condeſcending to examine them, the diſagreeable neceſſity inſpired them with an invention that might bring thoſe works and themſelves into public notice, by the care they took of renovating them. This they imagined to effect by forming abridgements of theſe ponderous volumes.

All theſe Abridgers, however, did not follow the ſame mode. Some contented themſelves with making a mere abridgement of their authors, by employing their own expreſſions, or by inconſiderable alterations. Others compoſed thoſe abridgements in drawing them from various authors, but from whoſe works they only took what appeared to them moſt worthy of obſervation, and dreſſed them in their own ſtyle. Others, again, having before them ſeveral authors who wrote on the ſame ſubject, took paſſages from each, united them, and thus formed a new work. They executed their deſign by digeſting in common places, and under various titles, the moſt valuable parts they could collect, from the beſt authors they read. To theſe laſt ingenious ſcholars, we owe the reſcue of many valuable fragments of antiquity. They happily preſerved the beſt maxims, the characters of perſons, deſcriptions, and any other ſubjects which they found intereſting in their ſtudies.

There have been learned men who have cenſured theſe Abridgers, as the cauſe of our having loſt ſo many excellent entire works of the ancients; for poſterity becoming leſs ſtudious, was ſatisfied with theſe extracts, and neglected to preſerve the originals, whoſe voluminous ſize was leſs attractive. Others on the contrary ſay, that theſe Abridgers have not been ſo prejudicial to literature, as ſome have imagined; and that had it not been for their care, which ſnatched many a periſhable fragment from that ſhipwreck of letters, which the barbarians occaſioned, we ſhould perhaps have had no works of the ancients remaining.

Abridgers, Compilers, and even Tranſlators, in the preſent faſtidious age, are alike regarded with contempt; yet to form their works with ſkill requires an exertion of judgement, and frequently of taſte, of which their contemners appear to have no conception. It is the great misfortune of ſuch literary labours, that even when performed with ability, the learned will not be found to want them, and the unlearned have not diſcernment to appreciate them."

ABRINCATARUM OPPIDUM, in *Ancient Geography*, the town of the *Abrincates* or *Abrincatui*; now *Avranches*, in France, ſituated on an eminence in the ſouth-weſt of Normandy, near the borders of Brittany, on the Engliſh channel. W. Long. 1. 10. N. Lat. 48. 40.

ABROGATION, the act of aboliſhing a law, by authority of the maker; in which ſenſe the word is ſynonymous with abolition, repealing, and revocation.

Abrogation ſtands oppoſed to *rogation*: it is diſtinguiſh from *derogation*, which implies the taking away only ſome part of a law; from *ſubrogation*, which denotes the adding a clauſe to it; from *obrogation*, which implies the limiting or reſtraining it; from *diſpenſation*, which only ſets it aſide in a particular inſtance; and from *antiquation*, which is the refuſing to paſs a law.

Abrokani Abruzzo.

ABROKANI, or MALLEMOLLI, a kind of muſlin, or clear, white, fine cotton cloth, brought from the Eaſt Indies, particularly from Bengal; being in length 16 French ells and 3 quarters, and in breadth 5 eighths.

ABROLHOS, in *Geography*, dangerous ſhoals or banks of ſand, about 20 leagues from the coaſt of Brazil. S. Lat. 18. 22. W. Long. 38. 45.

ABROMA, in *Botany*. See BOTANY *Index*.

ABROTANUM, in *Botany*. See ARTEMISIA, BOTANY *Index*.

ABROTONUM, in *Ancient Geography*, a town and harbour on the Mediterranean, in the diſtrict of Syrtis Parva in Africa; one of the three cities that formed Tripoly.

ABRUG-BANYA, in *Geography*, a populous town of Tranſylvania, in the diſtrict of Weiſſenburg. It is ſituated in a country which abounds with mines of gold and ſilver, and is the reſidence of the mine office, and chief of the metal towns. E. Long. 23. 24. N. Lat. 46. 50.

ABRUS, in *Botany*, the trivial name of the GLYCINE.

ABRUZZO, a province of Naples. The river Peſcara divides it into two parts; one of which is called Ulterior, of which *Aquila* is the capital; and the other Citerior, whoſe capital is *Chieti*. Beſides the Apennines, there are two conſiderable mountains, the one called Monte Cavallo, and the other Monte Majello; the top of which laſt is always covered with ſnow. Abruzzo is a cold country; but the rigour of the climate is not ſo great as to prevent the country from producing in abundance every thing requiſite for the ſupport of life. Vegetables, fruits, animals, and numberleſs other articles of ſuſtenance, not only furniſh ample proviſion for the uſe of the natives, but alſo allow of exportation. It produces ſo much wheat, that many thouſands of quarters are annually ſhipped off. Much Turkey wheat is ſent out, and the province of Teramo ſells a great deal of rice little inferior in quality to that of Lombardy. Oil is a plentiful commodity, and wines are made for exportation on many parts of the coaſt; but wool has always been, and ſtill is, their ſtaple commodity: the flocks, after paſſing the whole ſummer in the fine paſtures of the mountains, are driven for the winter into the warm plains of Puglia, and a few ſpots near their own coaſt, where the ſnow does not lie. There are no manufactures of woollens in the province, except two ſmall ones of coarſe cloth. The greateſt part of the wool is exported unwrought. No ſilk is made here, though mulberry trees would grow well in the low grounds.

Formerly the territory of Aquila furniſhed Italy almoſt excluſively with ſaffron; but ſince the culture of that plant has been ſo much followed in Lombardy, it has fallen to nothing in Abruzzo. In the maritime tracts of country the cultivation of liquorice has been increaſed of late years, but foreigners export the roots in their natural ſtate: in the province of Teramo there is a manufactory of pottery ware, for which there is a great demand in Germany, by the way of Trieſte, as it is remarkably hard and fine; but even this is going

Abruzzo. to decay, by being abandoned entirely to the ignorance of common workmen. It is not to be expected that any improvements will be made in arts and manufactures, where the encouragement and attention of superiors is wanting, and no pains taken to render the commodity more marketable, or to open better channels of sale for it. The only advantages these provinces enjoy, are the gift of benevolent nature; but she has still greater presents in store for them, and waits only for the helping hand of government to produce them. This whole coast, one hundred miles in length, is utterly destitute of sea ports; and the only spots where the produce can be embarked are dangerous inconvenient roads, at the mouths of rivers, and along a lee-shore: the difficulty of procuring shipping, and of loading the goods, frequently causes great quantities of them to rot on hand; which damps industry, and prevents all improvements in agriculture. The husbandman is a poor dispirited wretch, and wretchedness produces emigration: the uneven surface of the country occasions it to be inhabited by retail, if the expression may be used, rather than in large masses; for there is not a city that contains ten thousand people, and few of them exceed three thousand. Villages, castles, and feudatory estates are to be met with in abundance; but the numbers of their inhabitants are to be reckoned by hundreds, not thousands: in a word, the political and social system of the province shows no signs of the vigour which nature so remarkably displays here in all her operations.

The antiquary and the naturalist may travel here with exquisite pleasure and profit; the former will find treasures of inscriptions, and inedited monuments, belonging to the warlike nations that once covered the face of the country; the natural philosopher will have a noble field for observation in the stupendous mountains that rise on all sides. Monte-corno and Majello are among the most interesting. The first is like an aged monument of nature, bald, and horribly broken on every aspect: from various appearances, it is evident that its bowels contain many valuable veins of metallic ore; but the great difficulty of access renders the search of them almost impracticable. Majello has other merits, and of a gayer kind:—nature has clothed its declivities and elevated fields with an infinite variety of plants.

The character of the inhabitants varies a little among themselves, according to situation and climate, but essentially from the disposition of the natives of the more southern provinces. This proceeds from a difference of origin: for the Lombards, who were barbarians, but not cruel; poor, but hospitable; endowed with plain honest sense, though possessed of little acuteness or subtlety; remained peaceable proprietors of these mountainous regions, till the Normans, who were accustomed to a similar climate, came and dispossessed them. The Greeks who retained almost every other part of the kingdom under their dominion, never had any sway here. For this reason the Abruzzesi still bear a great resemblance to their northern progenitors or masters: to this day one may trace in them the same goodness of heart, but great indolence and repugnance to lively exertions; a fault that proceeds rather from a want of active virtue, than a disposition to wickedness. Hence it comes, that in these provinces, where the proximity of the frontier almost ensures impunity, fewer atrocious and inhuman deeds are heard of than in other parts of the realm. Remnants of ancient northern customs existed here so late as the beginning of this century, and, among the mountaineers, very evident traces of the Frank and Teutonic languages may be discovered. Absalom || Absimarus

ABSALOM, in *Scripture History*, the son of David by Maacah, was brother to Tamar, David's daughter, who was ravished by Amnon their eldest brother by another mother. Absalom waited two years for an opportunity of revenging the injury done to his sister: and at last procured the assassination of Amnon at a feast which he had prepared for the king's sons. He took refuge with Talmai king of Geshur; and was no sooner restored to favour, but he engaged the Israelites to revolt from his father. Absalom was defeated in the wood of Ephraim: as he was flying, his hair caught hold of an oak, where he hung till Joab came and thrust him through with three darts: David had expressly ordered his life to be spared, and extremely lamented him. The weight of Absalom's hair, which is stated at "200 shekels after the king's weight," has occasioned much critical discussion. If, according to some, the Jewish shekel of silver was equal to half an ounce avoirdupois, 200 shekels would be $6\frac{1}{4}$ pounds; or, according to Josephus, if the 200 shekels be equal to 5 minæ, and each mina $2\frac{1}{2}$ pounds, the weight of the hair would be $12\frac{1}{2}$ pounds, a supposition not very credible. It has been supposed by others, that the shekel here denotes a weight in gold equal to the value of the silver shekel, or half an ounce, which will reduce the weight of the hair to about 5 ounces; or that the 200 shekels are meant to express the value, not the weight. But it is not improbable, as some have alleged, that the whole difficulty has arisen from an error in transcribing the Hebrew numerals.

ABSCESS, in *Surgery*; from *abscedo*, to separate; a cavity containing *pus*; or a collection of puriform matter in a part: So called, because the parts which were joined are now separated; one part recedes from another, to make way for the collected matter. See SURGERY.

ABSCISSE, in *Conics*, a part of the diameter or transverse axis of a conic section, intercepted between the vertex or some other fixed point and a semiordinate. See CONIC SECTIONS.

ABSCONSA, a dark lantern used by the monks at the ceremony of burying their dead.

ABSENCE, in *Scots Law*: When a person cited before a court does not appear, and judgement is pronounced, that judgement is said to be *in absence*. No person can be tried criminally in absence.

ABSIMARUS, in *History*, having dethroned Leontius, cut off his nose and ears, and shut him up in a monastery, was proclaimed by the soldiers emperor of the East, A. D. 698. Leontius himself was also an usurper. He had dethroned Justinian II. who, afterwards, with the assistance of the Bulgarians, surprised and took Constantinople and made Absimarus prisoner. Justinian, now settled on the throne, and having both Absimarius and Leontius in his power, loaded them with chains, ordered them to lie down on the ground, and with a barbarous pleasure, held a foot on the neck of each for the space of an hour in presence of the people, who with shouts and exclamations sung, *Super aspidem*

Abſinthiated || Abſolute.

dem et baſiliſcum ambulabis, et conculcabis leonem et draconem. "Thou ſhalt walk on the aſp and the baſiliſk, and tread on the lion and the dragon." By the orders of Juſtinian, Abſimarus and Leontius were beheaded, A. D. 705.

ABSINTHIATED, any thing tinged or impregnated with abſinthium or wormwood. Bartholin mentions a woman whoſe milk was become abſinthiated, and rendered as bitter as gall, by the too liberal uſe of wormwood.

Vinum abſinthites, or *poculum abſinthiatum*, "wormwood wine," is much ſpoken of among the ancients as a wholeſome drink, and even an antidote againſt drunkenneſs. Its medical virtues depend on its aromatic and bitter qualities. Infuſed in wine or ſpirits, it may prove beneficial in caſes of indigeſtion or debility of the ſtomach.

ABSINTHIUM, in *Botany*, the trivial name of the common wormwood. See ARTEMISIA, BOTANY *Index*.

ABSIS, in *Aſtronomy*, the ſame with apſis. See APSIS.

ABSOLUTE, in a general ſenſe, ſomething that ſtands free or independent.

ABSOLUTE is more particularly underſtood of a being or thing which does not proceed from any cauſe, or does not ſubſiſt by virtue of any other being, conſidered as its cauſe; in which ſenſe, God alone is *abſolute*. *Abſolute*, in this ſenſe, is ſynonymous with *independent*, and ſtands oppoſed to *dependent*.

ABSOLUTE alſo denotes a thing that is free from conditions or limitations; in which ſenſe, the word is ſynonymous with *unconditional*. We ſay, an *abſolute* decree, *abſolute* promiſe, *abſolute* obedience.

ABSOLUTE Government, that in which the prince is left ſolely to his own will, being not limited to the obſervance of any laws except thoſe of his own diſcretion.

ABSOLUTE Equations, in *Aſtronomy*, is the aggregate of the optic and eccentric equations. The apparent inequality of a planet's motion, ariſing from its not being equally diſtant from the earth at all times, is called its optic equation, and would ſubſiſt even if the planet's real motion were uniform. The eccentric inequality is cauſed by the planet's motion being uniform. To illuſtrate which, conceive the ſun to move, or to appear to move, in the circumference of a circle, in whoſe centre the earth is placed. It is manifeſt, that if the ſun moves uniformly in this circle, it muſt appear to move uniformly to a ſpectator on the earth, and in this caſe there will be no optic nor eccentric equation; but ſuppoſe the earth to be placed out of the centre of the circle, and then, though the ſun's motion ſhould be really uniform, it would not appear to be ſo, when ſeen from the earth; and in this caſe there would be an optic equation, without an eccentric one. Imagine farther, the ſun's orbit to be not circular but elliptic, and the earth in its focus; it will be as evident that the ſun cannot appear to have an uniform motion in ſuch ellipſe: ſo that his motion will then be ſubject to two equations, the optic and the eccentric.

ABSOLUTE Number, in *Algebra*, is any pure number ſtanding in any equation without the conjunction of literal characters; as $2x + 36 = 48$; where 36 and 48 are abſolute numbers, but 2 is not, as being joined with the letter x.

Abſolution || Abſorption.

ABSOLUTION, in *Civil Law*, is a ſentence whereby the party accuſed is declared innocent of the crime laid to his charge.—Among the Romans, the ordinary method of pronouncing judgement was this: after the cauſe had been pleaded on both ſides, the præco uſed the word *dixerunt*, q. d. they have ſaid what they had to ſay; then three ballots were diſtributed to each judge, marked as mentioned under the article A; and as the majority fell of either mark, the accuſed was *abſolved* or condemned, &c. If he were abſolved, the prætor diſmiſſed him with *videtur non feciſſe*, or *jure videtur feciſſe*.

ABSOLUTION, in the *Canon Law*, is a juridical act, whereby the prieſt declares the ſins of ſuch as are penitent remitted.—The Romaniſts hold abſolution a part of the ſacrament of penance; the council of Trent, ſeſſ. xiv. cap. iii. and that of Florence, in the decree *ad Armenos*, declare the form or eſſence of the ſacrament to lie in the words of *abſolution*, I abſolve thee of thy ſins. The *formula* of abſolution, in the Romiſh church, is abſolute: in the Greek church, it is deprecatory; and in the churches of the reformed, declarative.

ABSOLUTION is chiefly uſed among Proteſtants for a ſentence by which a perſon who ſtands excommunicated, is releaſed or freed from that puniſhment.

ABSORBENT, in general, any thing poſſeſſing the faculty of *abſorbing*, or ſwallowing up another.

ABSORBENT Medicines, teſtaceous powders, or ſubſtances into which calcareous earth enters, as chalk, crabs eyes, &c. which are taken inwardly for drying up or abſorbing any acid or redundant humours in the ſtomach or inteſtines. They are likewiſe applied externally to ulcers or ſores with the ſame intention.

ABSORBENTS, or *ABSORBING Veſſels*, in *Anatomy*, a name given promiſcuouſly to the lacteal veſſels, lymphatics, and inhalant arteries, a minute kind of veſſels found in animal bodies, which imbibe fluids that come in contact with them. On account of their minuteneſs and tranſparency, they eſcape obſervation in ordinary diſſection. They have, however, been detected in every tribe of animals, and, in the animals which have been examined, in every part of the body. Thoſe which open into the ſtomach and inteſtines, and convey the chyle, which is a milky fluid, from theſe organs to the blood, have received the name of *lacteals*, or lacteal veſſels; and thoſe which open on the external ſurface, and the ſurface of all the cavities of the body, have been denominated *lymphatics*, from the lymph or colourleſs fluid which they contain. See ANATOMY.

ABSORBING, the ſwallowing up, ſucking up, or imbibing any thing: thus black bodies are ſaid to *abſorb* the rays of light; luxuriant branches, to *abſorb* or waſte the nutritious juices which ſhould feed the fruit of trees, &c.

ABSORPTION, in the animal economy, is the function of the abſorbent veſſels, or that power by which they take up and propel ſubſtances. This power has been aſcribed to the operation of different cauſes, according to the theories which phyſiologiſts have propoſed. Some attribute it to capillary attraction, others to the preſſure of the atmoſphere, and others to

Abſorption || Abſtemious.

an ambiguous or unknown cauſe, which they denominate *fuction*; for this laſt is nothing elſe than the elaſtic power of one part of the air reſtoring the equilibrium, which has been deſtroyed by the removal or rarefaction of another part.

Absorptions of the Earth, a term uſed by Kircher and others for the ſinking in of large tracts of land by means of ſubterranean commotions, and many other accidents.

Pliny tells us, that in his time the mountain Cymbotus, with the town of Curites, which ſtood on its ſide, were wholly abſorbed into the earth, ſo that not the leaſt trace of either remained; and he records the like fate of the city of Tantalis in Magneſia, and after it of the mountain Sypilus, both thus abſorbed by a violent opening of the earth. Galanis and Gamales, towns once famous in Phœnicia, are recorded to have met the ſame fate; and the vaſt promontory, called *Phegium*, in Ethiopia, after a violent earthquake in the night-time, was not to be ſeen in the morning, the whole having diſappeared, and the earth cloſed over it. Theſe and many other hiſtories, atteſted by the authors of greateſt credit among the ancients, abundantly prove the fact in the earlieſt ages; and there have not been wanting too many inſtances of more modern date. (*Kircher's Mund. Subter.* p. 77.)

Picus, a lofty mountain in one of the Molucca iſles, which was ſeen at a great diſtance, and ſerved as a land-mark to ſailors, was entirely deſtroyed by an earthquake; and its place is now occupied by a lake, the ſhores of which correſpond exactly to the baſe of the mountain. In 1556, a ſimilar accident happened in China. A whole province of the mountainous part of the country, with all the inhabitants, ſunk in a moment, and was totally ſwallowed up: The ſpace which was formerly land is alſo covered with an extenſive lake of water. And, during the earthquakes which prevailed in the kingdom of Chili, in the year 1646, ſeveral whole mountains of the Andes ſunk and diſappeared.

ABSORUS, Apsorus, Absyrtis, Absyrtides, Apsyrtides, Apsyrtis, and Absyrtium, (Strabo, Mela, Ptolemy); iſlands in the Adriatic, in the gulf of Carnero; ſo called from Abſyrtus, Medea's brother, there ſlain. They are either one iſland, or two ſeparated by a narrow channel, and joined by a bridge; and are now called *Cherſo* and *Oſero*.

ABSTEINEN, in *Geography*, a diſtrict near the river Memel in Little Lithuania. It is a mountainous country, but is fertile in grain, and abounds with ſheep and excellent horſes.

ABSTEMII, in church hiſtory, a name given to ſuch perſons as could not partake of the cup of the euchariſt on account of their natural averſion to wine. Calviniſts allow theſe to communicate in the ſpecies or bread only, touching the cup with their lip; which, on the other hand, is by the Lutherans deemed a profanation.

ABSTEMIOUS, is properly underſtood of a perſon who refrains abſolutely from all uſe of wine.

The hiſtory of Mr Wood, in the Medic. Tranſ. vol. ii. p. 261. art. 18. is a very remarkable exemplification of the very beneficial alterations which may be effected on the human body by a ſtrict courſe of abſtemiouſneſs.

The Roman ladies, in the firſt ages of the republic, were all enjoined to be abſtemious; and that it might appear, by their breath, whether or no they kept up to the injunction, it was one of the laws of the Roman civility, that they ſhould kiſs their friends and relations whenever they accoſted them. Abſtemiu || Abſtinence

ABSTEMIUS, Laurentius, a native of Macerata, profeſſor of belles lettres, in Urbino, and librarian of Duke Guido Ubaldo, under the pontificate of Alexander VI. He wrote, 1. Notes on moſt difficult paſſages of ancient authors. 2. Hecatomythium, i. e. A collection of an hundred fables, &c. which have been often printed with thoſe of Æſop, Phædrus, Gabrias, Avienus, &c. and a preface to the edition of Aurelius Victor publiſhed at Venice in 1505.

ABSTERGENT medicines, thoſe employed for reſolving obſtructions, concretions, &c. ſuch as ſoap, &c.

ABSTINENCE, in a general ſenſe, the act or habit of refraining from ſomething to which there is a ſtrong propenſity. Among the Jews, various kinds of abſtinence were ordained by their law. The Pythagoreans, when initiated, were enjoined to abſtain from animal food, except the remains of ſacrifices; and to drink nothing but water, unleſs in the evening, when they were permitted to take a ſmall portion of wine. Among the primitive Chriſtians, ſome denied themſelves the uſe of ſuch meats as were prohibited by that law, others regarded this abſtinence with contempt; of which St Paul gives his opinion, Rom. xiv. 1—3. The council of Jeruſalem, which was held by the apoſtles, enjoined the Chriſtian converts to abſtain from meats ſtrangled, from blood, from fornication, and from idolatry. Abſtinence, as preſcribed by the goſpel, is intended to mortify and reſtrain the paſſions, to humble our vicious natures, and by that means raiſe our minds to a due ſenſe of devotion. But there is another ſort of abſtinence, which may be called *ritual*, and conſiſts in abſtaining from particular meats at certain times and ſeaſons. It was the ſpiritual monarchy of the weſtern world which firſt introduced this ritual abſtinence; the rules of which were called *rogations*; but groſsly abuſed from the true nature and deſign of faſting. In England, abſtinence from fleſh has been enjoined by ſtatute ſince the Reformation, particularly on Fridays and Saturdays, on vigils, and on all commonly called *fiſh days*. The like injunctions were renewed under Queen Elizabeth: but at the ſame time it was declared, that this was done not out of motives of religion, as if there were any difference in meats; but in favour of the conſumption of fiſh, and to multiply the number of fiſhermen and mariners, as well as to ſpare the ſtock of ſheep. The great faſt, ſays St Auguſtin, is to abſtain from ſin.

Abstinence is more particularly uſed for a ſpare diet, or a ſlender parſimonious uſe of food. Phyſicians relate wonders of the effects of abſtinence in the cure of many diſorders, and protracting the term of life. The noble Venetian Cornaro, after all imaginable means had proved vain, ſo that his life was deſpaired of at 40, recovered, and lived to near 100, by the mere effect of abſtinence; as he himſelf gives the account. It is indeed ſurpriſing to what a great age the primitive Chriſtians of the eaſt, who retired from the perſecutions into the deſerts of Arabia and Egypt, lived,

Abſtinence

ved, healthful and cheerful, on a very little food. Caſſian aſſures us, that the common rate for 24 hours was 12 ounces of bread, and pure water: with ſuch frugal fare St Anthony lived 105 years; James the Hermit, 104; Arſenius, tutor of the emperor Arcadius, 120; St Epiphanius, 115; Simeon the Stylite, 112; and Romauld, 120. Indeed, we can match theſe inſtances of longevity at home. Buchanan informs us, that one Laurence arrived at the great age of 140 by force of temperance and labour; and Spotſwood mentions one Kentigern, afterwards called St Mongah or Mungo, who lived to 185 by the ſame means. Abſtinence, however, is to be recommended only as it means a proper regimen; for in general it muſt have bad conſequences when obſerved without a due regard to conſtitution, age, ſtrength, &c. According to Dr Cheyne, moſt of the chronical diſeaſes, the infirmities of old age, and the ſhort lives of Engliſhmen, are owing to repletion; and may be either cured, prevented, or remedied by abſtinence; but then the kinds of abſtinence which ought to be obſerved, either in ſickneſs or health, are to be deduced from the laws of diet and regimen.

Among the inferior animals, we ſee extraordinary inſtances of long abſtinence. The ſerpent kind, in particular, bear abſtinence to a wonderful degree. We have ſeen rattle-ſnakes which had lived many months without any food, yet ſtill retained their vigour and fierceneſs. Dr Shaw ſpeaks of a couple of ceraſtes (a ſort of Egyptian ſerpents), which had been kept five years in a bottle cloſe corked, without any ſort of food, unleſs a ſmall quantity of ſand in which they coiled themſelves up in the bottom of the veſſel may be reckoned as ſuch: yet when he ſaw them, they had newly caſt their ſkins, and were as briſk and lively as if juſt taken. But it is natural for divers ſpecies to paſs four, five, or ſix months every year, without either eating or drinking. Accordingly, the tortoiſe, bear, dormouſe, ſerpent, &c. are obſerved regularly to retire, at thoſe ſeaſons, to their reſpective cells, and hide themſelves, ſome in the caverns of rocks or ruins; others dig holes under ground; others get into woods, and lay themſelves up in the clefts of trees; others bury themſelves under water, &c. And theſe animals are found as fat and fleſhy, after ſome months abſtinence, as before.—Sir G. Ent * weighed his tortoiſe ſeveral years ſucceſſively, at its going to earth in October, and coming out again in March; and found, that of four pounds four ounces, it only uſed to loſe about one ounce. Indeed we have inſtances of men paſſing ſeveral months as ſtrictly abſtinent as other creatures. In particular, the records of the Tower mention a Scotchman impriſoned for felony, and ſtrictly watched in that fortreſs for ſix weeks, during which time he did not take the leaſt ſuſtenance; and on this account he obtained his pardon. Numberleſs inſtances of extraordinary abſtinence, particularly from morbid cauſes, are to be found in the different periodical Memoirs, Tranſactions, Ephemerides, &c. It is to be added, that, in moſt inſtances of extraordinary human abſtinence related by naturaliſts, there were ſaid to have been apparent marks of a texture of blood and humours, much like that of the animals above mentioned. Though it is no improbable opinion, that the air itſelf may furniſh ſomething for nutrition, it is certain, there are ſubſtances of all kinds, animal, vegetable, &c. floating in the atmoſphere, which muſt be continually taken in by reſpiration; and that an animal body may be nouriſhed thereby, is evident in the inſtance of vipers; which if taken when firſt brought forth, and kept from every thing but air, will yet grow very conſiderably in a few days. So the eggs of lizards are obſerved to increaſe in bulk, after they are produced, though there be nothing to furniſh the increment but air alone; in like manner as the eggs or ſpawn of fiſhes grow and are nouriſhed with the water. And hence, ſay ſome, it is that cooks, turnſpit dogs, &c. though they eat but little, yet are uſually fat. See FASTING.

Abſtinence
||
Abſtraction.

* *Phil. Tranſ.* N° 194.

ABSTINENTS, or ABSTINENTES, a ſect of heretics that appeared in France and Spain about the end of the third century. They are ſuppoſed to have borrowed part of their opinions from the Gnoſtics and Manicheans, becauſe they oppoſed marriage, condemned the uſe of fleſh meat, and placed the Holy Ghoſt in the claſs of created beings. We have, however, no certain account of their peculiar tenets.

ABSTRACT, in a general ſenſe, any thing ſeparated from ſomething elſe.

Abstract Idea, in *Metaphyſics*, is a partial idea of a complex object, limited to one or more of the component parts or properties, laying aſide or abſtracting from the reſt. Thus, in viewing an object with the eye, or recollecting it in the mind, we can eaſily abſtract from ſome of its parts or properties, and attach ourſelves to others: we can attend to the redneſs of a cherry, without regard to its figure, taſte, or conſiſtence. See ABSTRACTION.

Abstract Mathematics, otherwiſe called *Pure Mathematics*, is that which treats of magnitude or quantity, abſolutely and generally conſidered, without reſtriction to any ſpecies of particular magnitude; ſuch are Arithmetic and Geometry. In this ſenſe, abſtract mathematics is oppoſed to mixed mathematics; wherein ſimple and abſtract properties, and the relations of quantities primitively conſidered in pure mathematics, are applied to ſenſible objects, and by that means become intermixed with phyſical conſiderations: ſuch are Hydroſtatics, Optics, Navigation, &c.

Abstract Numbers, are aſſemblages of units, conſidered in themſelves, without denoting any particular and determinate things. Thus ſix is an abſtract number, when not applied to any thing; but if we ſay 6 feet, 6 becomes a concrete number. See the article NUMBER.

Abstract Terms, words that are uſed to expreſs abſtract ideas, Thus *beauty*, *uglineſs*, *whiteneſs*, *roundneſs*, *life*, *death*, are abſtract terms.

ABSTRACT, in *Literature*, a compendious view of any large work; ſhorter and more ſuperficial than an abridgement.

ABSTRACTION, in general, the art of abſtracting, or the ſtate of being abſtracted.

ABSTRACTION, in *Metaphyſics*, the operation of the mind when occupied by abſtract ideas. A large oak fixes our attention, and abſtracts us from the ſhrubs that ſurround it. In the ſame manner, a beautiful woman in a crowd, abſtracts our thoughts, and engroſſes our attention ſolely to herſelf. Theſe are examples of real abſtraction: when theſe, or any others of a ſimilar kind, are recalled to the mind after the objects themſelves

Abſtruſe
||
Abſyrtus.

themſelves are removed from our ſight, they form what are called *abſtract ideas*, or the mind is ſaid to be employed in abſtract ideas. But the power of abſtraction is not confined to objects that are ſeparable in reality as well as mentally: the ſize, the figure, the colour of a tree, are inſeparably connected, and cannot exiſt independent of each other; and yet we can mentally confine our obſervations to any one of theſe properties, neglecting or abſtracting from the reſt.

Abſtraction is chiefly employed theſe three ways. Firſt, When the mind conſiders any one part of a thing, in ſome reſpect diſtinct from the whole; as a man's arm, without the conſideration of the reſt of the body. Secondly, When we conſider the *mode* of any ſubſtance, omitting the ſubſtance itſelf; or when we ſeparately conſider ſeveral modes which ſubſiſt together in one ſubject. This abſtraction the geometricians make uſe of when they conſider the length of a body ſeparately, which they call *a line*, omitting the conſideration of its breadth and thickneſs. Thirdly, It is by abſtraction that the mind forms general or univerſal ideas: omitting the modes and relations of the particular objects whence they are formed. Thus, when we would underſtand a thinking being in general, we gather from our ſelf-conſciouſneſs what it is to think; and omitting thoſe things which have a particular relation to our own minds, or to the human mind, we conceive a thinking being in general.

Ideas formed in this manner, which are what we properly call *abſtract ideas*, become general repreſentatives of all objects of the ſame kind; and their names applicable to whatever exiſts conformable to ſuch ideas. Thus the idea of colour that we receive from chalk, ſnow, milk, &c. is a repreſentative of all of that kind; and has a name given it, *whiteneſs*, which ſignifies the ſame quality wherever found or imagined.

ABSTRUSE, ſomething deep, hidden, concealed, or far removed from common apprehenſions, and therefore not eaſily underſtood; in oppoſition to what is obvious and palpable. Thus metaphyſics is an abſtruſe ſcience; and the doctrine of fluxions, and the method *de maximis et minimis*, are abſtruſe points of knowledge.

ABSURD, an epithet applied to any thing that is contrary to human apprehenſion, and contradicts a manifeſt truth. Thus, it would be abſurd to ſay that 6 and 6 make only 10, or to deny that twice 6 make 12. When the term *abſurd* is applied to actions, it has the ſame import as *ridiculous*.

ABSURDUM, *reductio ad abſurdum*, is a mode of demonſtration employed by mathematicians when they prove the truth of a propoſition by demonſtrating that the contrary is impoſſible, or leads to an abſurdity. It is in this manner that Euclid demonſtrates the fourth propoſition of the firſt book of the Elements, by ſhowing that the contrary involves a manifeſt abſurdity, viz. "*That two ſtraight lines can incloſe a ſpace.*"

ABSYNTHIUM. See ARTEMISIA, BOTANY *Index*.

ABSYRTUS, in heathen mythology, the ſon of Æetes and Hypſea, and the brother of Medea. The latter running away with Jaſon, after her having aſſiſted him in carrying off the golden fleece, was purſued by her father; when, to ſtop his progreſs, ſhe tore Abſyrtus in pieces, and ſcattered his limbs in his way.

ABTHANES, in *Hiſtory*, a title of honour uſed by the ancient inhabitants of Scotland, who called their nobles *thanes*, which in the old Saxon ſignifies *king's miniſters*; and of theſe the higher rank were ſtyled *abthanes*, and thoſe of the lower *underthanes*.

Abthanes,
Abubeker.

ABUBEKER, or ABU-BECR, the firſt caliph, the immediate ſucceſſor of Mahomet, and one of his firſt converts. His original name was Abdulcaaba, ſignifying, *ſervant of the caaba* or *temple*, which, after his converſion to Mahometaniſm, was changed to Abdallah, *ſervant of God*; and on the marriage of the prophet with his daughter Ayeſha, he received the appellation of Abu Becr, *Father of the virgin*. Illuſtrious by his family, and poſſeſſed of immenſe wealth, his influence and example were powerful means of propagating the faith he had adopted, and in gaining converts to the new religion. Abubeker was a ſound believer, and although he lived in the greateſt familiarity with Mahomet, he had always the higheſt veneration for his character. He vouched for the truth of his revelations after his nightly viſits to heaven, and thus obtained the appellation of the *faithful*. He was employed in every miſſion of truſt or importance, was the conſtant friend of the prophet, and when he was forced to fly from Mecca, was his only companion. But notwithſtanding his blind devotion to Mahometaniſm, his moderation and prudence were conſpicuous in checking the fanatical zeal of the diſciples of the new religion, on the death of Mahomet. This event threatened deſtruction to the doctrines of Iſlamiſm. Its followers could not doubt that it had taken place, and they were afraid to believe it. In this uncertainty and fluctuation of belief, Omar drew his ſword, and threatened to cut in pieces all who dared to aſſert that the prophet was dead. Abubeker, with more coolneſs and wiſdom, addreſſed the people, *Is it*, ſays he, *Mahomet whom you adore, or the God whom he has revealed to you: Know that this God is alone immortal, and that all thoſe whom he has created are ſubject to death.* Appeaſed and reconciled by this ſpeech, they elected him ſucceſſor to Mahomet, and he aſſumed the modeſt title of caliph, which has continued with all his ſucceſſors. Ali, the ſon-in-law of the propiet, regarding the elevation of Abubeker as a violation of his legal rights to the ſucceſſion, refuſed at firſt to recogniſe the appointment, till he was forced by threats into compliance and ſubmiſſion. His partiſans, however, ſtill conſidered him as the legitimate ſucceſſor, and their opinion has prevailed among many Muſſulmans, who believe that the ſovereign authority, both ſpiritual and temporal, remains with his deſcendants.

The firſt part of the reign of Abubeker was unſettled and turbulent. Many of his ſubjects returned to idolatry, ſome embraced Chriſtianity, new impoſtors aroſe. Seduced by the example of Mahomet, they were dazzled with the hope of power and diſtinction, and were thus led on to deſtruction. He alone was received as the true prophet, all others were falſe. Abubeker, with the aſſiſtance of Caled, an able general, ſoon reduced to ſubmiſſion and obedience, or puniſhed with death, all thoſe who diſputed or reſiſted his authority. Tranquillity being eſtabliſhed at home, he ſent out his armies, under the ſame general, to propagate the Mahometan faith in Syria, which, after a bloody battle, was compelled to ſubmit to a new power, and to adopt a new religion. Damaſcus was afterwards beſieged; and

Abucco || Abundant.

and on the very day that it ſurrendered and opened its gates to his victorious arms, Abubeker expired in the 13th year of the Hegira.

The public conduct of this caliph was marked by prudence, equity, and moderation. Mild and ſimple in his manners, frugal in his fare, he diſcovered great indifference to riches and honours. Such was his liberality to the poor and to his ſoldiers, that he beſtowed on them the whole of his revenue. The treaſury being on his account quite exhauſted at his death, made Omar ſay, "that he had left a difficult example for his ſucceſſors to follow." A ſhort time before his death, he dictated his will in the following words: "This is the will of Abubeker, which he dictated at the moment of his departure from this world: At this moment when the infidel ſhall believe, when the impious ſhall no longer doubt, and liars ſhall ſpeak truth, I name Omar for my ſucceſſor. Muſſulmans, hear his voice, and obey his commands. If he rule juſtly, he will confirm the good opinion which I have conceived of him; but if he deviate from the paths of equity, he muſt render an account before the tribunal of the ſovereign judge. My thoughts are upright, but I cannot ſee into futurity. In a word, they who do evil, ſhall not always eſcaped with impunity." Abubeker firſt collected and digeſted the revelations of Mahomet, which had hitherto been preſerved in detached fragments, or in the memories of the Muſſulman believers; and to this the Arabians gave the appellation *Almoſhaf*, or the Book. The firſt copy was depoſited in the hands of Hafeſſa the daughter of Omar and the widow of Mahomet.

ABUCCO, Abocco, or Abochi, a weight uſed in the kingdom of Pegu. One abucco contains 12½ teccalis; two abuccos make a *giro* or *agire*; two *giri*, half a *hiza*; and a *hiza* weighs an hundred teccalis; that is, two pounds five ounces the heavy weight, or three pounds nine ounces the light weight of Venice.

ABUKESO, in *Commerce*, the ſame with Asian.

ABULFARAGIUS, Gregory, ſon of Aaron a phyſician, born in 1226, in the city of Malatia, near the ſource of the Euphrates in Armenia. He followed the profeſſion of his father; and practiſed with great ſucceſs: but he acquired a higher reputation by the ſtudy of the Greek, Syriac, and Arabic languages, as well as by his knowledge of philoſophy and divinity; and he wrote a hiſtory which does great honour to his memory. It is written in Arabic, and divided into dynaſties. It conſiſts of ten parts, being an epitome of univerſal hiſtory from the creation of the world to his own time. The parts of it relating to the Saracens, Tartar Moguls, and the conqueſts of Jenghis Khan, are eſteemed the moſt valuable. He profeſſed Chriſtianity, and was biſhop of Aleppo, and is ſuppoſed to have belonged to the ſect of the Jacobites. His contemporaries peak of him in a ſtrain of moſt extravagant panegyric. He is ſtyled the *king of the learned, the pattern of his times, the phœnix of the age, and the crown of the virtuous*. Dr Pococke publiſhed his hiſtory with a Latin tranſlation in 1663; and added, by way of ſupplement, a ſhort continuation relating to the hiſtory of the eaſtern princes.

ABUNA, the title given to the archbiſhop or metropolitan of Abyſſinia.

ABUNDANT NUMBER, in *Arithmetic*, is a number, the ſum of whoſe aliquot parts is greater than the number itſelf. Thus the aliquot parts of 12, being 1, 2, 3, 4, and 6, they make, when added together, 16. An abundant number is oppoſed to a *deficient* number, or that which is greater than all its aliquot parts taken together; as 14, whoſe aliquot parts are 1, 2, and 7, which make no more than 10: and to a *perfect* number, or one to which its aliquot parts are equal, as 6, whoſe aliquot parts are 1, 2, and 3. Abundantia || Abydos.

ABUNDANTIA, a heathen divinity, repreſented in ancient monuments under the figure of a woman with a pleaſing aſpect, crowned with garlands of flowers, pouring all ſorts of fruits out of a horn which ſhe holds in her right hand, and ſcattering grain with her left, taken promiſcuouſly from a ſheaf of corn. On a medal of Trajan ſhe is repreſented with two cornucopiæ.

ABUSAID Ebn Aljaptu, ſultan of the Moguls, ſucceeded his father, anno 717 of the Hegira. He was the laſt monarch of the race of Jenghis Khan, who held the undivided empire of the Moguls; for after his death, which happened the ſame year that Tamerlane was born, it became a ſcene of blood and deſolation, and was broken into ſeparate ſovereignties.

ABUS, in *Ancient Geography*, a river of Britain, formed by the confluence of the Ure, the Derwent, Trent, &c. falling into the German ſea, between Yorkſhire and Lincolnſhire, and forming the mouth of the Humber.

ABUSE, an irregular uſe of a thing, or the introducing ſomething contrary to the true intention thereof. In grammar, to apply a word *abuſively*, or in an *abuſive* ſenſe, is to miſapply or pervert its meaning.—A permutation of benefices, without the conſent of the biſhop, is termed *abuſive*, and conſequently null.

ABUTILON, in *Botany*, the trivial name of ſeveral ſpecies of the ſida. See Sida, Botany *Index*.

ABYDOS, in *Ancient Geography*, anciently a town built by the Mileſians, in Aſia, on the Helleſpont where it is ſcarce a mile over, oppoſite to Seſtos on the European ſide. Now both are called the *Dardanelles*. Abydos lay midway between Lampſacus and Ilium, famous for Xerxes's bridge, (Herodotus, Virgil); and for the loves of Leander and Hero, (Muſæus, Ovid;) celebrated alſo for its oyſters (Ennius, Virgil). The inhabitants were a ſoft effeminate people, given much to detraction; hence the proverb, *Ne temere Abydum calcare*, when we would caution againſt danger, (Stephanus).

Abydos, in *Ancient Geography*, an inland town of Egypt, between Ptolemais and Dioſpolis Parva, towards Syene; famous for the palace of Memnon and the temple of Oſiris. A colony of Mileſians; (Stephanus). It was the only one in the country into which the ſingers and dancers were forbidden to enter.

The city, reduced to a village under the empire of Auguſtus, now preſents to our view only a heap of ruins without inhabitants; but to the weſt of theſe ruins is ſtill found the celebrated tomb of Oſymandes. The entrance is under a portico 60 feet high, and ſupported by two rows of maſſy colums. The immoveable ſolidity of the edifice, the huge maſſes which compoſe it, the hieroglyphics it is loaded with, ſtamp it a work of the ancient Egyptians. Beyond it is a temple 300 feet long and 145 wide. Upon entering the monument we meet with an immenſe hall, the roof of which

Abydos || Abyſs.

which is ſupported by 28 columns 60 feet high, and 19 in circumference at the baſe. They are 12 feet diſtant from each other. The enormous ſtones that form the ceiling, perfectly joined and incruſted, as it were, one in the other, offer to the eye nothing but one ſolid platform of marble 126 feet long and 26 wide. The walls are covered with hieroglyphics. One ſees there a multitude of animals, birds, and human figures with pointed caps on their heads, and a piece of ſtuff hanging down behind, dreſſed in looſe robes that come down only to the waiſt. The ſculpture, however, is clumſy; the forms of the body, the attitudes and proportions of the members, ill obſerved. Amongſt theſe we may diſtinguiſh ſome women ſuckling their children, and men preſenting offerings to them. Here alſo we meet with the divinities of India. Monſieur Chevalier, formerly governor of Chandernagore, who reſided 20 years in that country, carefully viſited this monument on his return from Bengal. He remarked here the gods *Jaggrenate*, *Gones*, and *Vechnou* or *Wiſtnou*, ſuch as they are repreſented in the temples of Indoſtan. A great gate opens at the bottom of the firſt hall, which leads to an apartment 46 feet long by 22 wide. Six ſquare pillars ſupport the roof of it; and at the angles are the doors of four other chambers, but ſo choked up with rubbiſh that they cannot now be entered. The laſt hall, 64 feet long by 24 wide, has ſtairs by which one deſcends into the ſubterraneous apartments of this grand edifice. The Arabs, in ſearching after treaſure, have piled up heaps of earth and rubbiſh. In the part we are able to penetrate, ſculpture and hieroglyphics are diſcoverable as in the upper ſtory. The natives ſay that they correſpond exactly with thoſe above ground, and that the columns are as deep in the earth as their height above the ſurface. It would be dangerous to go far into thoſe vaults; for the air of them is ſo loaded with a mephitic vapour, that a candle can ſcarce be kept burning in them. Six lions heads, placed on the two ſides of the temple, ſerve as ſpouts to carry off the water. You mount to the top by a ſtaircaſe of a very ſingular ſtructure. It is built with ſtones incruſted in the wall, and projecting ſix feet out; ſo that being ſupported only at one end, they appear to be ſuſpended in the air. The walls, the roof, and the columns of this edifice, have ſuffered nothing from the injuries of time; and did not the hieroglyphics, by being corroded in ſome places, mark its antiquity, it would appear to have been newly built. The ſolidity is ſuch, that unleſs people make a point of deſtroying it, the building muſt laſt a great number of ages. Except the coloſſal figures, whoſe heads ſerve as an ornament to the capitals of the columns, and which are ſculptured *in relievo*, the reſt of the hieroglyphics which cover the inſide are carved in ſtone. To the left of this great building we meet with another much ſmaller, at the bottom of which is a ſort of altar. This was probably the ſanctuary of the temple of Oſiris.

ABYLA (Ptolemy, Mela); one of Hercules's pillars, on the African ſide, called by the Spaniards *Sierra de las Monas*, oppoſite to Calpe in Spain, the other pillar; ſuppoſed to have been formerly joined, but ſeparated by Hercules, and thus to have given entrance to the ſea now called the *Mediterranean*; the limits of the labours of Hercules (Pliny).

ABYSS, in a general ſenſe, denotes ſomething profound, and, as it were, bottomleſs. The word is originally Greek, ἄβυσσος; compounded of the privative α, and βυσσος, q. d. without a bottom. Abyſs.

Abyss, in a more particular ſenſe, denotes a deep maſs or fund of waters. In this ſenſe, the word is particularly uſed in the Septuagint, for the water which God created at the beginning with the earth, which encompaſſed it round, and which our tranſlators render by *deep*. Thus it is that darkneſs is ſaid to have been on the face of the abyſs.

Abyss is alſo uſed for an immenſe cavern in the earth, in which God is ſuppoſed to have collected all thoſe waters on the third day; which, in our verſion, is rendered the *ſeas*, and elſewhere the *great deep*. Dr Woodward, in his Natural Hiſtory of the Earth, aſſerts, That there is a mighty collection of waters encloſed in the bowels of the earth, conſtituting a huge orb in the interior or central parts of it; and over the ſurface of this water he ſuppoſes the terreſtrial ſtrata to be expanded. This, according to him, is what Moſes calls *the great deep*, and what moſt authors render *the great abyſs*. The water of this vaſt abyſs, he alleges, communicates with that of the ocean, by means of certain hiatuſes or chaſms paſſing betwixt it and the bottom of the ocean; and this and the abyſs he ſuppoſes to have one common centre, around which the water of both is placed; but ſo, that the ordinary ſurface of the abyſs is not level with that of the ocean, nor at ſo great a diſtance from the centre as the other, it being for the moſt part reſtrained and depreſſed by the ſtrata of earth lying upon it: but wherever theſe ſtrata are broken, or ſo lax and porous that water can pervade them, there the water of the abyſs aſcends; fills up all the cleſts and fiſſures into which it can get admittance; and ſaturates all the interſtices and pores of the earth, ſtone, or other matter, all around the globe, quite up to the level of the ocean.

The exiſtence of an abyſs or receptacle of ſubterraneous waters, is controverted by Camerarius *; and defended by Dr Woodward chiefly by two arguments: the firſt drawn from the vaſt quantity of water which covered the earth, in the time of the deluge; the ſecond, from the conſideration of earthquakes, which he endeavours to ſhow are occaſioned by the violence of the waters in this abyſs. A great part of the terreſtrial globe has been frequently ſhaken at the ſame moment; which argues, according to him, that the waters, which were the occaſion thereof, were coextended with that part of the globe. There are even inſtances of univerſal earthquakes; which (ſays he) ſhow, that the whole abyſs muſt have been agitated; for ſo general an effect muſt have been produced by as general a cauſe, and that cauſe can be nothing but the ſubterraneous abyſs †.

To this abyſs alſo has been attributed the origin of ſprings and rivers; the level maintained in the ſurfaces of different ſeas; and their not overflowing their banks. To the effluvia emitted from it, ſome even attribute all the diverſities of weather and change in our atmoſphere ‡. Ray ||, and other authors, ancient as well as modern, ſuppoſe a communication between the Caſpian ſea and the ocean by means of a ſubterranean abyſs: and to this they attribute it that the Caſpian does not overflow, notwithſtanding the great number of large rivers it receives, of which Kempfer reckons

Abyſs. Abyſſinia.

kons above 45 in the compaſs of 60 miles; though others ſuppoſe that the daily evaporation may ſuffice to keep the level.

The different arguments concerning this ſubject may be ſeen collected and amplified in "Cockburn's Inquiry into the Truth and Certainty of the Moſaic Deluge," p. 271, &c. After all, however, this amazing theory of a central abyſs is far from being demonſtrated; it will perhaps in ſeveral reſpects appear inconſiſtent with ſound philoſophy, as well as repugnant to the phenomena of nature. In particular, if we believe any thing like elective attraction to have prevailed in the formation of the earth, we muſt believe that the ſeparation of the chaos proceeded from the union of ſimilar particles. It is certain that reſt is favourable to ſuch operations of nature. As, therefore, the central parts of the earth were more immediately quieſcent than thoſe remote from the centre, it [illegible] abſurd to ſuppoſe that the heavier and denſer bodies gave place to the more light and fluid; that the central part ſhould conſiſt of water only, and the more ſuperficial part of a cruſt or ſhell. Vid. "Whitehurſt's Inquiry into the original Formation of the Strata," &c. See DELUGE.

ABYSS is alſo uſed to denote hell; in which ſenſe the word is ſynonymus with what is otherwiſe called *Barathrum*, *Erebus*, and *Tartarus*; in the Engliſh Bible, the *bottomleſs pit*. The unclean ſpirits expelled by Chriſt, begged, *ne imperaret ut in abyſſum irent*, according to the vulgate; εις αβυσσον, according to the Greek, Luke viii. 31. Rev. ix. 1.

ABYSS is more particularly uſed, in *Antiquity*, to denote the temple of Proſerpine. It was thus called on account of the immenſe fund of gold and riches depoſited there; ſome ſay hid under ground.

ABYSS is alſo uſed in *Heraldry* to denote the centre of an eſcutcheon, In which ſenſe a thing is ſaid to be borne in abyſs, *en abyſme*, when placed in the middle of the ſhield, clear from any other bearing: He bears azure, a flower de lis, in abyſs.

ABYSSINIA, ABASSIA, or UPPER ETHIOPIA, in *Geography*, an empire of Africa within the torrid zone, which is comprehended between the 7th and 16th degrees N. Lat. and the 30th and 40th degrees of E. Long. By ſome writers of antiquity the title of *Ethiopians* was given to all nations whoſe complexion was black: hence we find the Arabians, as well as many other Aſiatics, ſometimes falling under this denomination; beſides a number of Africans whoſe country lay at a diſtance from Ethiopia properly ſo called. Thus the Africans in general were divided into the weſtern or Heſperian Ethiopians, and thoſe above Egypt ſituated to the eaſt; the latter being much more generally known than the former, by reaſon of the commerce they carried on with the Egyptians.

Different names.

From this account we may eaſily underſtand why there ſhould be ſuch a ſeeming diſagreement among ancient authors concerning the ſituation of the empire of Ethiopia, and likewiſe why it ſhould paſs under ſuch a variety of names. Sometimes, for example, it was named *India*, and the inhabitants *Indians*; an appellation likewiſe applied to many other diſtant nations. It was alſo denominated *Atlantia* and *Ethria*, and in the moſt remote periods of antiquity *Cephenia*; but more uſually *Abaſene*, a word ſomewhat reſembling *Abaſſia* or *Abyſſinia*, its modern names. On the other hand, we find Perſia, Chaldæa, Aſſyria, &c. ſtyled *Ethiopia* by ſome writers: and all the countries extending along the coaſts of the Red ſea were promiſcuouſly denominated *India* and *Ethiopia*. By the Jews the empire of Ethiopia was ſtyled *Cuſh* and *Ludim*. Abyſſinia.

Notwithſtanding this diverſity of appellations, and vaſt diffuſion of territory aſcribed to the Ethiopians, there was one country to which the title was thought more properly to belong than to any of the reſt; and which was therefore called *Ethiopia Propria*. This was bounded on the north by Egypt, extending all the way to the leſſer cataract of the Nile, and an iſland named *Elephantine*; on the weſt it had Libya Interior; on the eaſt the Red ſea, and on the ſouth unknown parts of Africa; though theſe boundaries cannot be fixed with any kind of preciſion. Situation of *Ethiopia Propria*.

In this country the ancients diſtinguiſhed a great variety of different nations, to whom they gave names either from ſome perſonal circumſtance, or from their manner of living. The principal of theſe were, 1. The *Blemmyes*, ſeated near the borders of Egypt; and who, probably from the ſhortneſs of their necks, were ſaid to have no heads, but eyes, mouths, &c. in their breaſts. Their form muſt have been very extraordinary, if we believe Vopiſcus, who gives an account of ſome of the captives of this nation brought to Rome. 2. The *Nobatæ*, inhabiting the banks of the Nile near the iſland Elephantine already mentioned, ſaid to have been removed thither by Oaſis to repreſs the incurſions of the Blemmyes. 3. The *Troglodytes*, by ſome writers ſaid to belong to Egypt, and deſcribed as little ſuperior to brutes. 4. The *Nubians*, of whom little more is known than their name, 5. The *Pigmies*, by ſome ſuppoſed to be a tribe of Troglodytes; but by others placed on the African coaſt of the Red ſea. 6. The *Aualitæ* or *Abalitæ*, of whom we know nothing more than that they were ſituated near the Abalitic gulf. 7. The *Struthiophagi*, ſo called from their feeding upon oſtriches, were ſituated to the ſouth of the Memnones. 8. The *Acridophagi*; 9. *Chelonophagi*; 10. *Ichthyophagi*; 11. *Cynamolgi*; 12. *Elephantophagi*; 13. *Rhizophagi*; 14. *Spermatophagi*; 15. *Hylophagi*; and, 16. *Ophiophagi*: all of whom had their names from the food they made uſe of, viz. locuſts, tortoiſes, fiſh, bitches milk, elephants, roots, fruits or ſeeds, and ſerpents. 17. The *Hylogones*, neighbours to the Elephantophagi, and who were ſo ſavage that they had no houſes, nor any other places to ſleep in but the tops of trees. 18. The *Pamphagi*, who uſed almoſt every thing indiſcriminately for food. 19. The *Agriophagi*, who lived on the fleſh of wild beaſts. 20. The *Anthropophagi*, or man-eaters, are now ſuppoſed to have been the Caffres, and not any inhabitants of Proper Ethiopia. 21. The *Hippophagi*, or horſe-eaters, who lay to the northward of Libya Incognita. 22. The *Macrobii*, a powerful nation, remarkable for their longevity; ſome of them attaining the age of 120 years. 23. The *Sambri*, ſituated near the city of Tenupſis in Nubia upon the Nile; of whom it is reported that all the quadrupeds they had, not excepting even the elephants, were deſtitute of ears. 24. The *Aſachæ*, a people inhabiting the mountainous parts, and continually employed in hunting elephants. Beſides theſe, there were a num- Different nations according to the ancients.

Abyſſinia.

ber of other nations or tribes, of whom we ſcarce know any thing but the names; as the Gapachi, Ptoemphanes, Catadupi, Pechini, Catadræ, &c.

First ſettlement.

In a country inhabited by ſuch a variety of nations, all in a ſtate of extreme barbariſm, it is rather to be wondered that we have any hiſtory at all, than that it is not more diſtinct. It has already been obſerved, that the Jews, from the authority of the ſacred writers no doubt, beſtowed the name of *Cuſh* upon the empire of Ethiopia: and it is generally agreed that Cuſh was the great progenitor of the inhabitants. In ſome paſſages of Scripture, however, it would ſeem that *Cuſh* was an appellation beſtowed upon the whole peninſula of Arabia, or at leaſt the greater part of it. In others, the word ſeems to denominate the country watered by the Araxes, the ſeat of the ancient Scythians or Cuſhites; and ſometimes the country adjacent to Egypt on the coaſt of the Red ſea.

A number of authors are of opinion, that Ethiopia received its firſt inhabitants from the country lying to the eaſt of the Red ſea. According to them, the deſcendants of Cuſh, having ſettled in Arabia, gradually migrated to the ſouth-eaſtern extremity of that country; whence, by an eaſy paſſage acroſs the ſtraits of Babelmandel, they tranſported themſelves to the African ſide, and entered the country properly called *Ethiopia*: a migration which, according to Euſebius, took place during the reſidence of the Iſraelites in Egypt; but, in the opinion of Syncellus, after they had taken poſſeſſion of Canaan, and were governed by judges.

Peopled originally from Arabia.

Abyſſinian tradition concerning it.

Mr Bruce makes mention of a tradition among the Abyſſinians, which, they ſay, has exiſted among them from time immemorial, that very ſoon after the flood, Cuſh the grandſon of Noah, with his family, paſſed through Atbara, then without inhabitants, till they came to the ridge of mountains which ſeparates that country from the high lands of Abyſſinia. Here, ſtill terrified with the thoughts of the deluge, and apprehenſive of a return of the ſame calamity, they choſe to dwell in caves made in the ſides of thoſe mountains, rather than truſt themſelves in the plains of Atbara; and our author is of opinion, that the tropical rains, which they could not fail to meet with in their journey ſouthward, and which would appear like the return of the deluge, might induce them to take up their habitations in theſe high places. Be this as it will, he informs us that it is an undoubted fact, "that here the Cuſhites, with unparalleled induſtry, and with inſtruments utterly unknown to us, formed to themſelves commodious, yet wonderful habitations in the heart of mountains of granite and marble, which remain entire in great numbers to this day, and promiſe to do ſo till the conſummation of all things."

Original habitations of the Cuſhites.

The Cuſhites having once eſtabliſhed themſelves among theſe mountains, continued to form habitations of the like kind in all the neighbouring ones; and thus following the different chains (for they never choſe to deſcend into the low country), ſpread the arts and ſciences, which they cultivated, quite acroſs the African continent from the eaſtern to the weſtern ocean. According to the tradition above mentioned, they built the city of Axum early in the days of Abraham. This, though now an inconſiderable village, was anciently noted for its ſuperb ſtructures, of which ſome remains are ſtill viſible. Among theſe are ſome belonging to a magnificent temple, originally 110 feet in length, and having two wings on each ſide; a double porch; and an aſcent of 12 ſteps. Behind this ſtand ſeveral obeliſks of different ſizes, with the remains of ſeveral others which have been deſtroyed by the Turks. There is alſo a great ſquare ſtone with an inſcription, but ſo much effaced that nothing can be diſcovered excepting ſome Greek and Latin letters, and the word *Baſilius*. Mr Bruce mentions ſome "prodigious fragments of coloſſal ſtatues of the dog-ſtar" ſtill to be ſeen at this place; and "*Sirr* (adds he), which, in the language of the Troglodytes, and in that of the low country of Meroe, exactly correſponding to it, ſignifies a *dog*, inſtructs us in the reaſon why this province was called *Sirè*, and the large river which bounds it *Sirr*."

Description of the city of Axum.

Abyſſinia.

Soon after building the city of Axum, the Cuſhites founded that of Meroe, the capital of a large iſland or peninſula formed by the Nile, much mentioned by ancient hiſtorians, and where, according to Herodotus, they purſued the ſtudy of aſtronomy in very early ages with great ſucceſs. Mr Bruce gives two reaſons for their building this city in the low country, after having built Axum in the mountainous part of Abyſſinia. 1. They had diſcovered ſome inconveniencies in their caves both in *Sirè* and the country below it, ariſing from the tropical rains in which they were now involved; and which prevented them from making the celeſtial obſervations to which they were ſo much addicted. 2. It is probable that they built this city farther from the mountains than they could have wiſhed, in order to avoid the fly with which the ſouthern parts were infeſted. This animal, according to Mr Bruce, who has given a figure of it, is the moſt troubleſome to quadrupeds that can be imagined. He informs us, that it infeſts thoſe places within the tropical rains where the ſoil is black and loamy, and no other place whatever. It is named *zimb* (by whom we are not informed), and has not been deſcribed by any other naturaliſt. It is of a ſize ſomewhat larger than a bee, thicker in proportion, and having broader wings, placed ſeparate like thoſe of a fly, and quite colourleſs, or without any ſpots. The head is large, with a ſharp upper jaw; at the end of which is a ſtrong pointed hair about a quarter of an inch long; and the lower jaw has two of theſe hairs: all of which together make a reſiſtance to the finger equal to that of a ſtrong hog's briſtle. One or all of theſe hairs are uſed as weapons of offence to the cattle; but what purpoſe they anſwer to the animal itſelf, our author does not ſay. So intolerable, however, are its attacks to the cattle, that they no ſooner hear its buzzing, than they forſake their food, and run about till they fall down with fright, fatigue, and hunger. Even the camel, though defended by a thick and ſtrong ſkin with long hair, cannot reſiſt the punctures of this inſect; which ſeem to be poiſonous, as they produce large putrid ſwellings on the body, head, and legs, which at laſt terminate in death. To avoid this dreadful enemy, the cattle muſt all be removed as quick as poſſible to the ſandy parts of Atbara, where they ſtay as long as the rains laſt, and where this dreadful enemy never ventures to follow them. The elephant and rhinoceros, who, on account of the quantity of food they require, cannot remove to theſe barren places, roll themſelves in the mud, which when dry, coats them over ſo hard, that

Meroe why founded.

Deſcription of a peſtilential fly.

Abyſſinia. that they are enabled to reſiſt the punctures of the inſect; though even on theſe ſome tubercles are generally to be met with, which our author attributes to this cauſe. Mr Bruce is of opinion, that this is the fly mentioned by Iſaiah, chap. vii. 18. 19. "And it ſhall come to paſs, in that day, that the Lord ſhall *hiſs* for the fly that is in the uttermoſt part of the rivers of Egypt; and they ſhall come and ſhall reſt all of them in the deſolate valleys, and in the holes of the rocks, and upon all thorns, and upon all buſhes." 'That is (ſays Mr Bruce), they ſhall cut off from the cattle their uſual retreat to the deſert, by taking poſſeſſion of theſe places, and meeting them there, where ordinarily they never come, and which therefore are the refuge of the cattle.'

Meroe, which lay in N. Lat. 16°, the exact limit of the tropical rains, was without the bounds aſſigned by nature to theſe deſtructive inſects; and conſequently a place of refuge for the cattle. Mr Bruce, on his return through the deſert, ſaw at Gerri, in this latitude, ruins, ſuppoſed to be thoſe of Meroe, and caves in the mountains immediately above them; for he is of opinion, that they did not abandon their caverns immediately after they began to build cities. As a proof of this, he mentions that Thebes, in Upper Egypt, was built by a colony of Ethiopians; and that near the ruins of that city, a vaſt number of caves are to be ſeen even up to the top of a mountain in the neighbourhood: all of which are inhabited at this day. By degrees, however, they began to exchange theſe ſubterraneous habitations for the cities they built above ground; and thus became farmers, artificers, &c. though originally their ſole employment had been commerce.

Magnificence of the ancient Indians and Egyptians.

On this ſubject Mr Bruce has given a very curious diſſertation; though how far the application of it to the Ethiopians may be juſt, we cannot pretend to determine. He begins with obſerving, that the magnificence of the Indians and Egyptians has been celebrated from the moſt remote antiquity, without any account of the ſources from whence all this wealth was derived: and indeed it muſt be owned, that in all hiſtories of theſe people, there is a ſtrange deficiency in this reſpect. The kings, we are to ſuppoſe, derived their ſplendour and magnificence from their ſubjects; but we are quite at a loſs to know whence their ſubjects had it: and this ſeems the more ſtrange, that in no period of their hiſtory are they ever repreſented in a poor or mean ſituation. Nor is this difficulty confined to theſe nations alone. Paleſtine, a country producing neither ſilver nor gold, is repreſented by the ſacred writers as abounding in the early ages with both thoſe metals in a much greater proportion than the moſt powerful European ſtates can boaſt of, notwithſtanding the vaſt ſupplies derived from the lately diſcovered continent of America. The Aſſyrian empire, in the time of Semiramis, was ſo noted for its wealth, that M. Monteſquieu ſuppoſes it to have been obtained by the conqueſt of ſome more ancient and richer nation; the ſpoils of which enriched the Aſſyrians, as thoſe of the latter afterwards did the Medes. This, however, Mr Bruce very juſtly obſerves, will not remove the difficulty, becauſe we are equally at a loſs to know whence the wealth was derived to that former nation; and it is very unuſual to find an empire or kingdom of any extent enriched by conqueſt. The kingdom of Macedon, for inſtance, though Alexander the Great overran and plundered in a very ſhort time the richeſt empire in the world, could never vie with the wealth of Tyre and Sidon. Theſe laſt were commercial cities; and our author juſtly conſiders commerce as the only ſource from whence the wealth of a large kingdom ever was or could be derived. The riches of Semiramis, therefore, were accumulated by the Eaſt India trade centering for ſome time in her capital. While this was ſuffered to remain undiſturbed, the empire flouriſhed: but by an abſurd expedition againſt India itſelf, in order to become miſtreſs at once of all the wealth it contained, ſhe loſt that which ſhe really poſſeſſed; and her empire was ſoon after entirely ruined. To the ſame ſource he attributes the riches of the ancient Egyptians; and is of opinion, that Seſoſtris opened up to Egypt the commerce with India by ſea; though other authors ſpeak of that monarch in very different terms. As the luxuries of India have ſomehow or other become the objects of deſire to every nation in the world, this eaſily accounts for the wealth for which Egypt has in all ages been ſo much celebrated, as well as for that with which other countries abounded; while they ſerved as a medium for tranſmitting thoſe luxuries to other nations, and eſpecially for the riches of thoſe which naturally produced the Indian commodities ſo much ſought after. This was the caſe particularly with Arabia, ſome of the productions of which were very much coveted by the weſtern nations; and being, beſides, the medium of communication between the Eaſt Indies and weſtern nations, it is eaſy to ſee why the Arabian merchants ſoon became poſſeſſed of immenſe wealth.

Beſides the territories already mentioned, the Cuſhites had extended themſelves along the mountains which run parallel to the Red ſea on the African ſide; which country, according to Mr Bruce, has "in all times been called *Sabo*, or *Azabo*, both which ſignify *South;* an epithet given from its lying to the ſouthward of the Arabian gulf, and which in ancient times was one of the richeſt and moſt important countries in the world. "By that acquiſition (ſays our author), they enjoyed all the perfumes and aromatics in the eaſt; myrrh, and frankincenſe, and caſſia; all which grow ſpontaneouſly in that ſtripe of ground from the bay of Bilur weſt of Azab to Cape Gardafui, and then ſouthward up in the Indian ocean, to near the coaſt of Melinda, where there is cinnamon, but of an inferior kind." As the Cuſhites or Troglodytes advanced ſtill farther ſouth, they met not only with mountains, in which they might excavate proper habitations, but likewiſe with great quantities of gold and ſilver furniſhed by the mines of Sofala, which, our author ſays, furniſhed "large quantities of both metals in their pure and unmixed ſtate, lying in globules without any alloy or any neceſſity of preparation or ſeparation." In other parts of his work, he labours to prove Sofala to have been the *Ophir* mentioned in Scripture.

Thus the Ethiopians, for ſome time after their ſettlement, according to Mr Bruce, muſt have been a nation of the firſt importance in the world. The northern colonies from Meroe to Thebes built cities, and made improvements in architecture; cultivated commerce, agriculture, and the arts; not forgetting

The Ethiopians at firſt a civilized and learned people.

Abyſſinia.

the ſcience of aſtronomy, for which they had an excellent opportunity by reaſon of the clearneſs of the ſky in the Thebaid. Their brethren farther to the ſouth, or thoſe who inhabited Ethiopia properly ſo called, were confined for ſix months to their caves by reaſon of the tropical rains, whence they were naturally led to purſuits of another kind. "Letters *, at leaſt one kind of them, and arithmetical characters (we are told), were invented by this middle part of the Cuſhites; while trade and aſtronomy, the natural hiſtory of the winds and ſeaſons, were what neceſſarily employed that part of the colony eſtabliſhed at Sofala moſt to the ſouthward."

* *Bruce's Travels.*

Account of the Ethiopian Shepherds.

While the Cuſhites were thus employed at home in collecting gold, gathering and preparing ſpices, &c. theſe commodities were ſent abroad into other countries by another ſet of people, named *Shepherds*, who acted as carriers to them, and who afterwards proved ſo formidable to the Egyptians. Theſe differed in their appearance from the Ethiopians, having long hair, and the features of Europeans; and were of a very dark complexion, though not at all like the blackmoors or negroes. They lived in the plain country in huts or moveable habitations, attending their cattle, and wandering up and down as various circumſtances required. By acting as carriers to the Cuſhites, they became a great and powerful people, poſſeſſing vaſt numbers of cattle, as well as a very conſiderable extent of territory. They poſſeſſed a ſtripe of land along the Indian ocean; and to the northward of that another along the Red ſea: but their principal habitation was the flat part of Africa between the northern tropic and the mountains of Abyſſinia, which country is now called *Beja*. This reaches from Maſuah along the ſea-coaſt to Suakem; then turns weſtward, and continues in that direction, having the Nile on the ſouth, the tropic of Cancer on the north, with the deſerts of Selima and Libya on the weſt. The next diſtrict belonging to theſe people was Meroe, now called *Atbara*, lying between the rivers Nile and Aſſaboras. A third diſtrict, now called *Derkin*, is a ſmall plain lying between the river Mareb on the eaſt, and Atbara on the weſt. But the moſt noble and warlike of all the Shepherds were thoſe who poſſeſſed the mountains of Habab, reaching from the neighbourhood of Maſuah to Suakem; which diſtrict is ſtill inhabited by them.

Different claſſes of them.

Theſe Shepherds, according to our author, were diſtinguiſhed by ſeveral different appellations, which may be ſuppoſed to denote different degrees of rank among them. Thoſe called ſimply *Shepherds*, our author ſuppoſes to have been the common ſort who attended the flocks. Another ſet were called *Hycſos* or *Agſos*, ſignifying "armed ſhepherds," who are ſuppoſed to have been the ſoldiers. A third were named *Agag*, ſuppoſed to be the chiefs or nobles of theſe armed ſhepherds; whence the title of *king of kings*, according to Mr Bruce, is derived; and he ſuppoſes *Agag* killed by Samuel to have been an Arabian ſhepherd.

The building of Carthage augmented the power of the Shepherds to a conſiderable degree, by reaſon of the vaſt quantity of carriage naturally belonging to a place of ſuch extenſive commerce, and which fell into the hands of the Lehabim, Lubim, or Libyan peaſents. An immenſe multitude of camels, in the early ages, anſwered the purpoſe of navigation: and thus we find that commerce was carried on by the Iſhmaelites as early as the days of Joſeph, from the ſouthern extremity of the Arabian peninſula. Theſe Shepherds, however, though generally the friends and allies of the Egyptians, who were alſo Cuſhites, ſometimes proved very bitter enemies to them, as is related in the hiſtory of that country. The reaſon of this may be deduced from the great oppoſition betwixt their manners and cuſtoms. The Egyptians worſhipped black cattle, which the Shepherds killed and uſed as food; the latter worſhipped the heavenly bodies, while the Egyptians were the groſſeſt idolaters, and worſhipped idols of all kinds that can be imagined. Hence a mere difference in religion might occaſion many bloody quarrels; though, if the above account can be depended upon as authentic, it is natural to imagine that the mutual connection of intereſts ſhould have cemented their friendſhip, whatever difference there might happen to be in opinions of any kind.

Abyſſinia.

Reaſon of the enmity between the Shepherds and Egyptians.

Beſides the Cuſhites and Shepherds, however, we muſt now ſeek for the origin of thoſe different nations which have already been mentioned. Mr Bruce allows that there are various nations inhabiting this country, who are fairer than either the Cuſhites or the Shepherds, and which, though they have each a particular name, are all known by the general title of *Habeſk*; which may be tranſlated by the Latin word *convenæ*, ſignifying a number of diſtinct people meeting accidentally in one place; and which our author maintains againſt Scaliger, Ludolf, and a number of others, to be a very juſt tranſlation, and quite conſonant to the hiſtory of the country.

Origin of the different Ethiopian nations.

The moſt authentic ancient hiſtory of this country, according to Mr Bruce, is the chronicle of Axum; the character of which, among the modern Abyſſinians, ſtands next to the ſacred writings themſelves; and conſequently muſt be eſteemed the higheſt Abyſſinian authority we have on the ſubject. According to this book, there was an interval of 5500 years between the creation of the world and the birth of Chriſt; 1808 years before which laſt event the empire of Abyſſinia or Ethiopia received its firſt inhabitants. Two hundred years after its ſettlement, it was ſo deſtroyed by a flood that it received the name of *Curé Midra*, or a country laid waſte; "or (ſays our author) as it is called in Scripture, *a land which the waters or floods had ſpoiled*," (Iſaiah xviii. 2.) The peopling of the country was finiſhed about 1400 years before Chriſt, by the ſettlement of a great number of people, ſpeaking different languages, who ſat down peaceably in the high lands of Tigré, in the neighbourhood of the Shepherds, with whom they were in friendſhip. Theſe people, according to tradition, came from Paleſtine; and our author is inclined to believe the whole of the relation to be true, as the time coincides with the expulſion of the Canaanitiſh nations by Joſhua, which happened about 1490 B. C. ten years before which there had been, according to Pauſanias, a flood in Ethiopia, which occaſioned prodigious deva ſtation. Ethiopia, he thinks, would afford the moſt ready aſylum for the fugitive Canaanites, as they muſt have long had a commercial intercourſe with that country; and he ſupports the opinion likewiſe from what Procopius mentions of two pillars extant in his time, on the coaſt

First ſettlement of Ethiopia, according to the Abyſſinian hiſtory.

The country laid waſte by a deluge.

Abyſſinia.

coaſt of Mauritania, with the following inſcription in the Phœnician language: "We are Canaanites, flying from the face of Joſhua the ſon of Nun, the robber." The authenticity of theſe inſcriptions, however, is much diſputed, and therefore it cannot go a great way in eſtabliſhing any hiſtorical point. The firſt and moſt conſiderable of the colonies above mentioned ſettled in the province of Amhara; the ſecond in Damot, one of the ſouthern provinces; the third in another province called *Laſta*, or *Tcheratza-Agow*, from *Tchera* their principal habitation; and a fourth in the territory of Galat.

Our author goes on to prove, that the Ethiopians in ancient times were not only the moſt learned people in the world, but that they ſpoke the original language, and were the inventors of writing. In what manner they came to degenerate from this character, and into their preſent ſtate of barbarity, cannot be known; this being a phenomenon equally unaccountable with the degeneracy of the Egyptians. Ethiopia conquered by Moſes.

According to ſome authors, the Ethiopians were conquered by Moſes; of which tranſaction we have the following account. Before the time of that legiſlator, the Ethiopians poſſeſſed the country of Thebais in Egypt: but, not content with this, they made an irruption into Lower Egypt, and penetrated as far as Memphis; where, having defeated the Egyptians, they threatened the kingdom with total deſtruction. The Egyptians, by the advice of their oracles, put Moſes at the head of their forces; who immediately prepared for invading the enemy's country. The Ethiopians imagined that he would march along the banks of the Nile; but Moſes choſe rather to paſs through ſome of the interior countries, though greatly infeſted with ſerpents, and where conſequently his march muſt be attended with much danger. To preſerve his men, he conſtructed a number of cheſts or panniers of the Egyptian reed papyrus, which he filled with the birds named *Ibis*, celebrated for their antipathy to ſerpents. As ſoon as he approached the tract abounding with theſe reptiles, a ſufficient number of the birds were let out, who preſently cleared the way for the army by deſtroying the ſerpents. Thus the Ethiopians were ſurpriſed in their own country, where they had dreaded no invaſion; their forces, being defeated in the field, were at laſt ſhut up in the capital Meroe, a city almoſt impregnable, by being ſurrounded with three rivers, the Nile, Aſtapus, and Aſtaboras. The daughter of the Ethiopian monarch, however, having an opportunity of ſeeing Moſes from the walls, fell in love with him, and offered to deliver up the city, provided he would ſwear to marry her. With this requiſition the Jewiſh legiſlator complied; but treated the inhabitants with great ſeverity, plundering the city, and putting many of the inhabitants to death. After this he ravaged the whole country, diſmantled all the places of ſtrength; and having thus rendered the Ethiopians incapable of attempting any thing againſt other nations for a conſiderable time, he returned in triumph to Egypt, after an abſence of ten years.

From the time of Moſes to that of Solomon, there is a chaſm in the Ethiopic hiſtory. After this, however, we are furniſhed with ſome kind of regular accounts. The hiſtory commences with the queen of Sheba, who came to viſit the Jewiſh monarch, and whom the Abyſſinians ſuppoſe to have been ſovereign of Ethiopia Propria; but Mr Bruce is of opinion that ſhe was only ſovereign of that territory on the eaſtern coaſt of Africa named *Saba*, which he ſays ought to be her title inſtead of *Sheba*. In favour of this opinion, he likewiſe urges, that it was cuſtomary for the Sabeans, or inhabitants of the African diſtrict named *Saba*, to be governed by women; whereas thoſe who inhabited the oppoſite ſide of the Arabian gulf, and who were named *Sabæan Arabs* or *Homerites*, were not only governed by kings, but would not allow their ſovereigns to go abroad anywhere under pain of being ſtoned to death. The Abyſſinians, as has been already hinted, claimed her for their ſovereign; and he informs us, that having received an account from Tamerin, an Ethiopian merchant, of the ſurpriſing wiſdom and wealth of Solomon, ſhe undertook the journey mentioned in Scripture, to aſcertain the truth of the report. In this ſhe was attended by a great many of her nobility, carrying along with her alſo magnificent preſents for the monarch ſhe intended to viſit. According to the Abyſſinian hiſtorians, ſhe was a Pagan at the time this journey was undertaken; but being ſtruck with admiration at the ſight of Solomon's grandeur, and the wiſdom he diſplayed, ſhe became a convert to the true religion. Another part of her hiſtory, by no means inconſiſtent with the character of Solomon, is, that ſhe returned in a ſtate of pregnancy; and within a year was delivered of a ſon, named *David* by Solomon; but by his mother *Menilek*, *Menelech*, or *Menelelheck*; that is, *another ſelf*. When he grew up, he was ſent to be educated at the court of his father Solomon; where having ſtaid ſome time, he was accompanied home by many doctors of the law, and other Iſraelites of diſtinction, particularly Azariah the ſon of Zadoc the high-prieſt. By theſe the Jewiſh religion was eſtabliſhed in Abyſſinia, where it continued till the introduction of Chriſtianity. The princeſs we ſpeak of is named *Makeda*, *Balkes*, or *Bulkis*, by the Abyſſinians. By our Saviour, and in the Ethiopic verſion of the Scripture, ſhe is ſtyled *The Queen of the South*, and is ſaid to have come from the uttermoſt parts of the earth, or of the habitable world. Hence the compilers of the Univerſal Hiſtory have inferred, that the princeſs ſtyled *The Queen of Sheba* in Scripture was really ſovereign of Ethiopia. "Ethiopia (ſay they) is more to the ſouth of Judæa than the territory or kingdom of Saba in Arabia Felix; conſequently has a better claim than that country for the dominions of the princeſs whom our Saviour calls *The Queen of the South*. Ethiopia is ſtyled *the remoteſt part of the habitable world* by Herodotus and Strabo; and therefore better agrees with what our Saviour has ſaid of the queen of Sheba, that ſhe came from 'the uttermoſt parts of the earth,' than Arabia. Nor can it be deemed a ſufficient reply to this argument, that Arabia Felix was the uttermoſt part of the earth in reſpect to Judæa, ſince it was bounded by the Red ſea: for that not only Egypt, but even Ethiopia, regions beyond that ſea, were known to and had a communication with the Jews, both before and in our Saviour's time, is indiſputably clear. Laſtly, From what has been ſuggeſted, it appears no improbable conjecture, that Judaiſm was not only known, at leaſt in a part of Ethiopia, Abyſſinia. Of the queen of Sheba.

Abyſſinia. Ethiopia, but nearly related to the eſtabliſhed religion there, at the beginning of the apoſtolic age, if not much earlier. After all, theſe two opinions, ſo contrary in appearance, may be made conſiſtent without great difficulty; ſince it is agreed, that Arabia and Ethiopia have anciently borne the ſame name, been included during certain intervals in one empire, and governed by one prince. Part of the Arabs and Ethiopians had the ſame origin, and very conſiderable numbers of the Abaſeni tranſported themſelves from Arabia Felix into Ethiopia; a circumſtance which ſufficiently proves the intercourſe that formerly ſubſiſted between the Cuſhites or Ethiopians of Aſia and Africa.

The Abyſſinian hiſtorians farther inform us, that the young prince Menilek was anointed and crowned king in the temple of Jeruſalem, before he returned to his own country; that Azariah was conſtituted high-prieſt; that he brought with him a Hebrew tranſcript of the law; and though this book is now loſt, having been burnt along with the church of Axum, the office is ſtill continued in the line of Azariah, whoſe ſucceſſors are ſtyled *Nebrits*, *high prieſts*, or *keepers of the church*, in that city; both church and ſtate being modelled exactly after that of Jeruſalem. Makeda continued to enjoy the ſovereignty for 40 years; and the laſt act of her reign was to ſettle the ſucceſſion to the throne. By this act the crown was declared hereditary in the family of Solomon for ever; it was alſo determined, that after her no woman ſhould be entitled to wear the crown or act as ſovereign of the country; but that the ſovereignty ſhould deſcend to the moſt diſtant heirs male, rather than to the females, however near; which two articles were to be conſidered as fundamental laws of the empire, not to be aboliſhed. Laſtly, That the male heirs of the royal family ſhould always be ſent priſoners to a high mountain, where they were to be confined till they ſhould be called to the throne, or as long as they lived. This cuſtom, according to Mr Bruce, was peculiar to Abyſſinia; the neighbouring Shepherds being accuſtomed to have women for their ſovereigns, which prevailed in the laſt century, and perhaps does ſo at preſent.

Makeda having eſtabliſhed theſe laws in ſuch a manner as not to be revocable, died in the year 986 B. C. The tranſactions of her ſon Menilek after his acceſſion are not pointed out, farther than that he removed his capital to Tigré. His reign can by no means be accounted proſperous; ſince in his time the empire was invaded by Shiſhak or Seſak the king of Egypt, who plundered the temple of Jeruſalem under Rehoboam. The like fate attended a rich temple which had been built at Saba the capital of the Ethiopian empire, and which might very probably occaſion the removal of the imperial ſeat to Tigré, as already mentioned. It is indeed pretty plain from Scripture, that Ethiopia, or great part of it, was ſubject to this monarch; as the Ethiopians or Cuſhites, mentioned in his army which invaded Judea, are joined with the Lubim or Libyans, and muſt therefore be accounted inhabitants of Ethiopia Proper. This is indeed no ſmall confirmation of the opinion of Sir Iſaac Newton, who agrees with Joſephus in ſuppoſing Shiſhak to have been the celebrated Seſoſtris of profane hiſtorians. Thus far we are certain, that in the paſſage of Scripture juſt now alluded to, the ſacred hiſtorian indirectly aſcribes the ſovereignty of Ethiopia to Shiſhak; and we do not find it anywhere hinted that another Egyptian monarch was poſſeſſed of this ſovereignty. Herodotus alſo plainly tells us, that Seſoſtris was maſter of Ethiopia, and that no other Egyptian but himſelf ever poſſeſſed that empire.

Ethiopia conquered by Shiſhak.

During the reign of Shiſhak, we know no particulars concerning the Ethiopians; but after his death, Sir Iſaac Newton is of opinion, that they defended Egypt againſt the Libyans, who had taken an opportunity of invading the country during the civil war which took place on the death of that great conqueror. In about ten years afterwards, however, according to the ſame author, they became aggreſſors; drowned the ſucceſſor of Shiſhak in the Nile, and ſeized on the whole kingdom; at which time Libya alſo fell into their hands. In the time of Aſa king of Judah, we find the combined hoſt of the Ethiopians and Lubim or Libyans, making an attack on the territories of that prince, to the number of more than a million. This may be reckoned a conſiderable confirmation of the piece of hiſtory juſt mentioned; as it is not eaſy to conceive how the two ſhould combine in ſuch a manner, unleſs Zerah was maſter of both. The total overthrow which the allied army received from Aſa, gave the inhabitants of Lower Egypt an opportunity of revolting; who being ſuſtained by an army of 20,000 auxiliaries from Phœnicia and Paleſtine, obliged Memnon, ſuppoſed to be the ſame with Amenophis, to retire to Memphis. Soon after this he was forced to leave Egypt altogether, and to retire into Ethiopia; but in about 13 years he returned with his ſon Ramaſſes at the head of a powerful army, and obliged the Canaanitiſh forces to retire out of Lower Egypt; a tranſaction denominated by the Egyptian writers the *ſecond expulſion of the Shepherds*.

Revolution after the time of Shiſhak.

Defeat of Zerah by Aſa king of Judah.

Sir Iſaac Newton is of opinion, that the Egyptian princes Menes, Memnon, and Amenophis, were the ſame perſon; and that by him Memphis was either originally built or firſt fortified, in order to prevent the Egyptians from entering Ethiopia. He is alſo ſuppoſed to have been the ſon of Zerah, and to have died at a very advanced age about 90 years after the deceaſe of Solomon. Thus, according to Sir Iſaac Newton's chronology, the moſt remarkable tranſactions of antiquity will be brought lower by ages than by the uſually received computations. According to this, the Argonautic expedition happened in the time of Amenophis; though ſome Greek writers inform us, that the ſame prince aſſiſted Priam king of Troy with a body of forces. He was ſucceeded by Ramaſſes, already mentioned, who built the northern portico of the temple of Vulcan at Memphis. The next was Moeris; who adorned Memphis, and made it the capital of his empire, about two generations after the Trojan war. Cheops, Caphrenus, and Mycerinus, ſucceeded in order to Moeris; the laſt being ſucceeded by his ſiſter Nitocris. In the reign of Aſychis her ſucceſſor, both Ethiopia and Aſſyria revolted from Egypt; which, being now divided into ſeveral ſmall kingdoms, was quickly ſubdued by Sabacon or So, the emperor of Ethiopia. This monarch, ſoon after his acceſſion to the throne of Egypt, allied himſelf with Hoſhea king of Iſrael; by which means the latter was induced to revolt

Of Menes and his ſucceſſors.

Abyſſinia. revolt from the Aſſyrians; and in conſequence of this, an end was put to the kingdom of Iſrael by Shalmaneſer king of Aſſyria, in the 24th year of the era of Nabonaſſar, and 720th before the commencement of the Chriſtian era. According to Herodotus, this monarch voluntarily reſigned the crown of Egypt after he had enjoyed it 50 years; but Africanus relates, that after a reign of eight years, he died in Egypt, in the ninth year of Hezekiah king of Judah. His ſucceſſor Sethon, ſuppoſed to be the Sevechus of Manetho, advanced to Peluſium with a powerful army againſt Sennacherib king of Aſſyria; when the bowſtrings of the Aſſyrians were gnawed in pieces by a great number of rats or mice, and thus they were eaſily defeated with great ſlaughter by the Egyptians. Hence Herodotus informs us, that the ſtatue of Sethon which he ſaw in Egypt had a mouſe in its hand. Sir Iſaac Newton, however, explains the whole in an allegorical manner. As the mouſe among the Egyptians was a ſymbol of deſtruction, he conjectures, that the Aſſyrians were on this occaſion overthrown with great ſlaughter; and that Sethon, in conjunction with Terhakah, either king of the Arabian Cuſhites, or a relation of Sethon, and his vicercy in Ethiopia Proper, ſurpriſed and defeated Sennacherib betwixt Libnah and Peluſium, making as great ſlaughter among his troops as if their ſhield-ſtraps and bowſtrings had been deſtroyed by mice.

nnacherib defeated by Sethon.

Ethiopia ubdued by Iſarhaddon.

In the 78th year of the era of Nabonaſſar, the empire of Ethiopia was ſubdued by Eſarhaddon king of Aſſyria; who held it three years, committing enormous cruelties both in that country and in Egypt. After his death the Ethiopians ſhook off the yoke, and maintained their independency till the time of Cyrus the Great, the firſt king of Perſia; who, according to the Greek hiſtorian Xenophon, ſeems to have alſo been ſovereign of Ethiopia. After his death they revolted, and his ſon Cambyſes unſucceſsfully attempted to reduce them. Herodotus informs us, that before he undertook this expedition, he ſent ſome of the Ichthyophagi ambaſſadors to the king of the Macrobii or long-lived Ethiopians, under pretence of ſoliciting his friendſhip, but in reality to obſerve the ſtrength of the country. Of this the Ethiopian prince was aware, and told the ambaſſadors that he knew their deſign, reproached Cambyſes with his injuſtice and ambition, and gave them his bow; telling them at the ſame time, that the Perſians might think of invading Ethiopia when they could eaſily bend it; and in the mean time, that their maſter ought to thank the gods who had never inſpired the Ethiopians with a deſire of extending their territories by conqueſt. Cambyſes had ſent by the ambaſſadors a rich purple robe, gold bracelets, a box of precious ointment, a veſſel full of palm wine, and other things, which he imagined would be acceptable to the Ethiopian monarch. But all theſe, excepting the wine, were deſpiſed. This, he owned, was ſuperior to any liquor produced in Ethiopia; and he did not ſcruple to intimate, that the Perſians, ſhort-lived as they were, owed moſt of their days to the uſe of this excellent liquor. Being informed by the ambaſſadors that a conſiderable part of the food made uſe of by the Perſians was bread, he ſaid that it was no wonder to find people who lived on *dung* unable to attain the longevity of the Macrobian Ethiopians. In ſhort, the whole of his anſwer was ſo contemptuous and diſguſting, that Cambyſes was filled with the greateſt indignation; in conſequence of which, he inſtantly began his march without taking time to make the neceſſary preparations, or even to procure proviſions of any kind for his army. Thus a famine enſued among them; which at laſt became ſo grievous, that the ſoldiers were obliged to eat one another: and Cambyſes himſelf, finding his life in great danger, was obliged to give orders for marching back again; which was not accompliſhed without the loſs of a great number of men. Another army which he ſent on an expedition againſt Ammonia, in order to deſtroy the celebrated oracle of Jupiter Ammon, periſhed entirely in the deſerts, being overwhelmed with the vaſt clouds of ſand frequently raiſed there by the wind.

Unſucceſsful expedition of Cambyſes againſt this country.

Abyſſinia.

At this time, it is doubtful whether Cambyſes would have accompliſhed his purpoſe even if he had found it practicable to march into the heart of Ethiopia. This empire had but a ſhort time before received a very conſiderable acceſſion of ſtrength by the deſertion of 240,000 Egyptians who had been poſted by Pſammenitus in different places on the frontiers. Theſe not having been relieved for three years, had gone over at once to the emperor of Ethiopia, who placed them in a country diſaffected to him; ordering them to expel the inhabitants, and take poſſeſſion of their lands. Notwithſtanding this, however, Sir Iſaac Newton hints, that Cambyſes conquered Ethiopia, about the 223d or 224th year of the era of Nabonaſſar; but his opinion in this reſpect does not appear to be well founded. We are told, indeed, that the Perſian monarch, notwithſtanding the misfortunes he met with in the expedition above mentioned, did really make himſelf maſter of ſome of the Ethiopic provinces which bordered on Egypt; and that theſe, together with the Troglodytes, ſent him an annual preſent of two chœnixes of unrefined gold, 200 bundles of ebony, five Ethiopian boys, and 20 elephants teeth of the largeſt ſize: but it appears improbable to the laſt degree, that even though Cambyſes had employed the whole of his reign in the attempt, he could have conquered the vaſt regions of Ethiopia Proper, Sennaar, and Abaſſia, which were all included in the Ethiopia of the ancients.

Ethiopia at this time a powerful empire.

Ethiopia ſuppoſed by Sir Iſaac Newton to have been conquered by Cambyſes.

When Xerxes invaded Greece, we find his army, according to Herodotus, was partly compoſed of Ethiopians, of whom Herodotus mentions two diſtinct races of people. One of theſe inhabited the Aſiatic coaſt, and differed from the Indians only in their hair and language. Their arms were the ſame with thoſe of India; they wore helmets made of the ſkins of horſes, the ears and manes of which ſerved them for tufts and plumes of feathers; their ſhields being made of the ſkins of cranes. The hair of the Aſiatic Ethiopians was long, but that of the weſtern tribes was frizzled. The latter were alſo differently armed, having darts lighted at one end and covered with leather. We are not informed particularly from what nations theſe troops were brought, nor whether they were natural ſubjects of the king of Perſia, or only auxiliaries: of conſequence we can conclude nothing certain concerning the dominion of the Perſian monarchs at this time over Ethiopia, further than that they might poſſeſs ſome of the provinces next to Egypt; while the main body

Ethiopians employed by Xerxes.

Abyſſinia. body of the empire being in a ſtate of independence, and unconnected with other parts of the world, is not taken notice of by the hiſtorians of thoſe times.

Though Alexander the Great had a deſire to know the ſources of the Nile, he did not ſuffer himſelf to be diverted by this curioſity from purſuing his grand expedition into Perſia. Ptolemy Euergetes, however, appears to have carried this curioſity to ſuch an extremity as to invade Ethiopia for no other purpoſe. It is ſurpriſing that the particulars of this expedition are not recorded by any hiſtorian, as it appears by an inſcription that he penetrated to the fartheſt parts of the empire, and conquered the moſt powerful nations in it. Of this we have the following account, which is looked upon by the beſt hiſtorians to be authentic. It was copied on the ſpot (being the weſtern entrance to Adule, one of the cities of Ethiopia) by Coſmas Egyptius, or, as ſome call him, Coſmas Indicopleuſtes, in the time of the emperor Juſtin I. by order of Eleibaan king of the Axumites, and of which the following account is given by the perſon who copied it. "Here (ſays he), facing the road to Axuma, ſtood a chair of white marble, conſiſting of a ſquare baſe, a ſmall thin column at each angle of this baſe, with a larger wreathed one in the middle, a ſeat or throne upon theſe, a back and two ſides. Behind this chair there was a large ſtone three cubits high, which had ſuſtained conſiderable injury from time. This ſtone and chair contained an inſcription to the following purpoſe: 'Ptolemy Euergetes penetrated to the fartheſt parts of Ethiopia. He ſubdued Gaza, Agame, Signe, Ava, Tiamo or Tziamo, Gambela, Zingabene, Angabe, Tiama, Athagaos, Calaa, Semene, Laſine, Zaa, Gabala, Atalino, Bega, the Tangaitæ, Anine, Metine, Sefea, Rauſo, Solate, the territory of Rauſo, and ſeveral other kingdoms. Among the nations he reduced, were ſome inhabiting mountains always covered with a deep ſnow; and others ſeated upon the ridges of hills, from whence iſſued boiling ſteams, and craggy precipices, which therefore ſeemed inacceſſible. Having finally, after all theſe conqueſts, aſſembled his whole army at Adule, he ſacrificed to Mars, Neptune, and Jupiter; for his great ſucceſs, he dedicated this chair or throne to Mars."

Ethiopia conquered by Ptolemy Euergetes.

Conqueſt of Ethiopia by the Romans.

From the time of this conqueror to that of the emperor Auguſtus, we meet with nothing of any conſequence relating to Ethiopia Proper. The Roman forces having about this time been drawn out of Egypt, in order to invade Arabia, Candace queen of Ethiopia, or perhaps rather of the iſland or peninſula of Meroe, took the opportunity of their abſence to make an irruption, with a numerous army, into the province of Thebais. As there was at that time no force to oppoſe her, ſhe met for ſome time with great ſucceſs; but hearing at laſt that Petronius, governor of Egypt, was in full march to attack her, ſhe retired into her own dominions. Petronius purſued her as far as Pſelcha, where with 10,000 men he gained an eaſy victory over 30,000 undiſciplined Ethiopian ſavages, armed only with poles, hatchets, and other clumſy or inſignificant weapons of a ſimilar nature. This victory was ſoon followed by the reduction of ſeveral fortreſſes; however, as the Roman ſoldiers were exceſſively incommoded by the heat of the climate, Petronius, notwithſtanding his ſucceſs, was obliged at laſt to retire. Soon after, Candace ſent ambaſſadors to Auguſtus himſelf with ſuch magnificent preſents, that the emperor is ſaid to have been thereby induced to grant her a peace on her own terms. From this time the Romans accounted themſelves maſters of Ethiopia. Auguſtus was complimented on the great glory he had acquired; and that he had, by reducing a country till that time unknown even to the Romans, finiſhed the conqueſt of Africa. No material alteration, however, took place in the affairs of Meroe, in conſequence of this conqueſt, whether real or pretended. Pliny informs us that it had been governed by queens, who bore the title of Candace, for ſeveral generations before that time; and ſo it continued to be afterwards, as we learn from Scripture, where we are informed that, in the reign of Tiberius, the ſovereign of Ethiopia was ſtill named Candace. Some indeed are of opinion that the Candace mentioned in the Acts of the Apoſtles was the ſame with her who had been conquered by Auguſtus; but this ſeems by no means probable, as the interval of time is by far too long to be allowed for the reign of a ſingle princeſs. Abyſſinia

From an anecdote of the debauched emperor Heliogabalus who was accuſtomed to confine his favourites, by way of diverſion, with old Ethiopian women, we may learn that ſome intercourſe took place between the two empires, and probably that the Ethiopians owned ſome kind of ſubjection to the Romans. The Blemmyes, a gang of monſtrous banditti, who inhabited the frontiers of Thebais, were vanquiſhed by the emperor Probus: but, towards the cloſe of the third century, we find them again become ſo powerful, that in conjunction with another nation called *Nobatæ*, who inhabited the banks of the Nile near Upper Egypt, they committed ſuch depredations in the Roman territories, that Diocleſian was obliged to aſſign lands to the latter, and to pay both of them a conſiderable ſum annually, to deſiſt from their former practices. Theſe expedients did not anſwer the purpoſe; the ſavages continued their depredations till the time of the emperor Juſtinian, who treated them with more ſeverity, and obliged them to remain at peace. We are told by Procopius, that before the time of Diocleſian, the Roman territories extended ſo far into Ethiopia, that their boundaries were not 23 days journey from the capital, ſo that probably the whole empire had been in a ſtate of dependence on them. Account of the Blemmyes.

From the time of this emperor to that of their converſion to Chriſtianity, we find nothing remarkable in the hiſtory of the Ethiopians. Three hundred and twenty ſeven years are counted from the time of our Saviour to that of Abreha and Atzbeha, or from Abra and Aſba, who enjoyed the kingdom when the goſpel was preached in Ethiopia by Frumentius. This man was a kinſman and companion of a philoſopher named Meropius, a native of Tyre; who having travelled all over India, died on an iſland of the Red ſea. After his death Frumentius, with another named Ædeſius, who had alſo been his companion, were brought before the king of Ethiopia, to whom that iſland was ſubject. He took them into his ſervice; making the one his treaſurer and the other his butler. On the death of this prince, the queen conceived ſuch a favour for them, that ſhe refuſed to allow them to depart out of the kingdom; but committed the management of her Ethiopia converted to Chriſtianity by Frumentius.

Abyſſinia.

her affairs entirely to Frumentius, who made uſe of his influence to diffuſe the Chriſtian religion throughout the country, and at laſt was appointed biſhop of Axuma. It is ſaid, however, that the court and principal people, if not the nation in general, relapſed into idolatry, which continued to prevail till the year 521, when they were again converted by their king Adad or Aidog.

The two princes Abra and Aſba, who reigned jointly in Ethiopia in the time of Frumentius, lived in ſuch harmony together, that their friendſhip became almoſt proverbial. After being converted to Chriſtianity, they adhered ſtrictly to the orthodox doctrine, refuſing to admit an Arian biſhop into their country. In the time of the emperor Conſtantius, however, this hereſy was introduced, and greatly favoured by that monarch; and an attempt was made to depoſe Frumentius on account of his refuſal to embrace it.

The two kings refuſe to admit Arianiſm.

The reign of theſe princes is remarkable for an expedition into Arabia Felix, called by the Mohammedan writers the war of the elephant, and which was undertaken on the following occaſion: The temple of Mecca, ſituated nearly in the middle of the Arabian peninſula, had been held in the greateſt veneration for near 1400 years; probably from the notion entertained by the people in the neighbourhood, that Adam pitched his tent on that ſpot. Here alſo was a black ſtone ſuppoſed to poſſeſs extraordinary ſanctity, as being that on which Jacob laid his head when he had the viſion of angels. The moſt probable account of the real origin of this temple, according to Mr Bruce, is, that it was built by Seſoſtris, and that he himſelf was worſhipped there under the name of Oſiris.

Account of the war of the elephant.

On account of the veneration in which this tower and idol were held by the Arabians, Mr Bruce ſuppoſes that the thought was firſt ſuggeſted of making it the emporium of the trade between India and Africa; but Abra, in order to divert it into another channel, built a very large temple near the Indian ocean in the country of the Homerites; and, to encourage the reſort of people to this new temple, he beſtowed upon it all the privileges of the former which ſtood in the city of Mecca. The tribe of Arabians named *Koreiſh*, in whoſe country Mecca ſtood, being exceedingly alarmed at the thoughts of having their temple deſerted, entered the new one in the night, burned all that could be conſumed, and beſmeared the remains with human excrements. Abra, provoked at this ſacrilege, aſſembled a conſiderable army, with which he inveſted Mecca, himſelf appearing on a white elephant, from whence the war took its name already mentioned. The termination of the war, according to the Arabian hiſtorians, was miraculous. A vaſt number of birds named *Ababil* came from the ſea, having faces like lions; each carrying in its claws a ſmall ſtone about the ſize of a pea, which they let fall upon the Ethiopian army in ſuch numbers, that every one of them was deſtroyed. At this time it is ſaid that the ſmall-pox firſt made its appearance; and the more probable account of the deſtruction of the Ethiopian army is, that they periſhed by this diſtemper.

Miraculous deſtruction of the Ethiopian army.

First appearance of the ſmallpox

The war of the elephant is ſuppoſed to have terminated in the manner above mentioned about the year 360; from which time to that of Eleſbaan, named alſo *Caleb*, and probably the ſame with the Adad or Adag already mentioned, we meet with nothing remarkable in the Ethiopic hiſtory. He engaged in a war with the Homerites or Sabæans in Arabia Felix, whom he overthrew in battle, and put an end to their kingdom; after which he embraced the Chriſtian religion in token of gratitude for the ſucceſs he had met with. In the time of this prince a violent perſecution of the Chriſtians took place in Arabia. The Jewiſh religion had now ſpread itſelf far into that peninſula; and in many places the profeſſors of it were become abſolute maſters of the country, inſomuch that ſeveral Jewiſh principalities had been erected, the ſovereigns of which commenced a ſevere perſecution againſt the Chriſtians. Among the reſt, one Phineas diſtinguiſhed himſelf by his cruelty, having prepared a great number of furnaces or pits filled with fire, into which he threw thoſe who refuſed to renounce Chriſtianity. The Chriſtians applied for relief to the emperor Juſtin; but he being at that time engaged in a war with the Perſians, could not interfere: however, in the year 522, he ſent an embaſſy to Eleſbaan, who was now alſo a member of the Greek church, intreating him to exert himſelf for the relief of the Chriſtians of Arabia. On this the emperor commanded his general Abreha, governor of the Arabian province Yemen, to march to the aſſiſtance of Aretas, ſon to a prince of the ſame name whom Phineas had burnt; while he himſelf prepared to follow with a more conſiderable force. But before the arrival of the Ethiopian monarch, young Aretas had marched againſt Phineas, and entirely defeated him. In a ſhort time afterwards the emperor himſelf arrived, and gave Phineas a ſecond defeat; but notwithſtanding theſe misfortunes, it does not appear that either the principality of Phineas or any of the other Jewiſh ones, was at this time overturned, though it ſeems to be certain, that at the time we ſpeak of, the Ethiopians poſſeſſed part of the Arabian peninſula. According to the Arabian hiſtorians, the war of the elephant, with the miraculous deſtruction of the Ethiopian army, already mentioned, took place in the reign of Eleſbaan.

Alyſſinia.

Reconverſion to Chriſtianity under Eleſbaan.

Chriſtians perſecuted in Arabia.

Cruelty of Phineas a Jewiſh prince.

He is defeated.

Some hiſtorians mention, that the Ethiopian monarchs embraced the doctrines of Mahomet ſoon after the impoſtor made his appearance; but this ſeems not to be well-founded; though it is certain that the *Najaſhi* or Ethiopian governor of Yemen embraced Mahometaniſm, and that he was related to the royal family. On this occaſion, however, the Ethiopians loſt all the footing they once had in Arabia; the governors being expelled by Mahomet and his ſucceſſors. They fled to the African ſide of the Red ſea with numbers of their ſubjects, where they erected ſeveral ſmall kingdoms, as Adel, Wypo, Hadea, Mara, and others, which ſtill continue.

Ethiopians driven out of Arabia.

During the conqueſts of the caliphs, the Jews were for ſome time everywhere driven out of their dominions, or oppreſſed to ſuch a degree that they voluntarily left them. Ethiopia offered them an aſylum: and in this country they became ſo powerful, that a revolution in favour of Judaiſm ſeemed ready to take place. One family had always preſerved an independent ſovereignty on a mountain called Samen, the royal reſidence being on the top of a high rock; and ſeveral other high and rugged mountains were uſed by that people as natural fortreſſes. Becoming by degrees

Number of Jews in Ethiopia increaſed.

Abyſſinia. grees more and more powerful, Judith the daughter of one of their kings formed a deſign of overturning the Ethiopian government, and ſetting aſide the family of Solomon, who had hitherto continued to enjoy the ſovereignty. This deſign was facilitated by ſeveral circumſtances. The empire had been weakened by an unſucceſsful war, famine, and plague; the throne was poſſeſſed by an infant; and the abſurd cuſtom of confining the whole royal family on a rock named *Damo*, gave her an opportunity of cutting them all off at once by ſurpriſing that place. Fortunately, however, the king himſelf eſcaped the general cataſtrophe, and was conveyed by ſome of the nobility of Amhara to the province of Xoa or Shoa; by which means the line of Solomon was preſerved, and afterwards reſtored, though not till after a very conſiderable interval.

Royal family of Ethiopia maſſacred by Judith.

The king eſcapes.

Judith having by this maſſacre eſtabliſhed her own power, aſſumed the imperial dignity, though in direct oppoſition to an eſtabliſhed and fundamental law of the empire already mentioned, that no woman ſhould enjoy the ſovereign authority. The people, however, ſeem to have ſubmitted quietly to her government, as ſhe ſat on the throne for 40 years, and afterwards tranſmitted the ſovereignty to her poſterity; five of whom reigned ſucceſſively in this country. We are not furniſhed with any particulars concerning their reigns; farther than that, during them, the people were greatly oppreſſed. By ſome means, of which hiſtorians have not given any account, another revolution took place; and a new ſet of uſurpers, related to the family of Judith, but not their direct lineal deſcendants, ſucceeded to the throne. Theſe were Chriſtians, and governed with much greater lenity than the Jewiſh ſovereigns had done; but ſtill, being uſurpers, none of their tranſactions are recorded in the Abyſſinian annals, excepting thoſe of Lalibala, who was accounted a ſaint. He lived in the end of the 12th or beginning of the 13th century, and proved a great prince. At that time the Chriſtians in Egypt were grievouſly perſecuted by the Saracens, who had a particular abhorrence at maſons, builders, and ſtone-cutters; looking upon them as the chief promoters of idolatry by the ornaments they put upon their works. Theſe were joyfully received by Lalibala; who, by affording them an aſylum in his dominions, ſoon collected a great number. They were employed by him in hewing churches out of the ſolid rock, after the example of the ancient Troglodytic habitations; and many works of this kind remain in the country to this day. He undertook, however, a ſtill more difficult and arduous taſk; no leſs than that of leſſening the ſtream of the Nile, and thus ſtarving the whole kingdom of Egypt, now in the hands of his enemies, and who perſecuted thoſe of his religion. From the account given by Mr Bruce of this project, it appears that there really is a poſſibility in nature of accompliſhing it; not indeed by turning the courſe of the Nile itſelf, but by diverting that of many of its branches, which are the means of conveying into it the water ſupplied by the tropical rains, and by which it overflows its banks annually. We are likewiſe aſſured by the ſame author, that Lalibala ſucceeded in his enterpriſe ſo far as to divert the courſe of two large rivers from the Nile, and that they have ever ſince flowed into the Indian ocean. He next proceeded to carry a level towards a lake named *Zaccia*, into which many rivers, whoſe ſtreams contribute to increaſe that of the Nile, empty themſelves; and had this been accompliſhed, there is no doubt that the loſs of ſo much water would have been very ſenſibly felt by the Egyptians. According to moſt hiſtorians, this enterpriſing monarch was prevented by death from putting his deſign in execution; though Mr Bruce informs us of a written account at Shoa, in which it was aſſerted, that he was diſſuaded from it by certain monks, who told him, that by ſending down ſuch a quantity of water to the eaſtern and dry parts of Africa, theſe countries would ſoon become ſo fertile and populous that they would rival the empire of Ethiopia, or at leaſt withdraw their allegiance from it entirely. The remains of theſe works were ſeen by the Portugueſe ambaſſador in 1522.

Judith uſurps the throne.

A new revolution.

Chriſtians perſecuted in Egypt fly to Ethiopia.

Lalibala undertakes to diminiſh the ſtream of the Nile.

All this time the princes of the line of Solomon had been obliged to content themſelves with the ſovereignty of the province of Xoa or Shoa, without making any attempt to regain their former dignity; but they were unexpectedly reſtored without bloodſhed or diſturbance by Naacueto Laeb the grandſon of Lalibala. This prince, who was of a gentle and pacific diſpoſition, was perſuaded by a monk named *Tecla Haimanout*, much celebrated for his ſanctity, to reſign the crown, to which, though he received it from his father, he could not pretend any abſolute right. In conſequence of the mediation of this monk, therefore, it was agreed that Naacueto ſhould give up the empire to Icon Amlac the lineal deſcendant of Solomon, who then poſſeſſed the ſovereignty of Shoa. In conſequence of this a portion of lands ſhould be irrevocably and irredeemably aſſigned to him and his heirs; and he ſhould likewiſe be allowed ſome marks of ſovereignty as a teſtimony of his former grandeur. In this treaty, however, the good monk did not forget his own intereſt. He had founded a famous monaſtery in Shoa, and was primate of the whole empire under the title of *Abuna*. He now inſiſted that one third of the kingdom ſhould be abſolutely ceded to himſelf for the maintenance of his own dignity, and the ſupport of the clergy, convents, &c. throughout the country; he alſo inſiſted that no native Abyſſinian ſhould ever enjoy the ſame dignity with himſelf, even though he ſhould have been choſen and ordained at Cairo, as was the cuſtom with the Abyſſinian prelates.

Reſtoration of the line of Solomon.

Theſe extraordinary terms were complied with, and Icon Amlac raiſed to the throne of Ethiopia. He did not, however, remove the ſeat of government from the province of Shoa; but continued at Tegulat the capital of that province during the whole of his lifetime, which continued 15 years after his acceſſion to the throne. We are ignorant of the tranſactions of his reign, as well as that of ſeveral of his ſucceſſors; five of whom aſcended the throne in as many years. From this quick ſucceſſion Mr Bruce is of opinion, that a civil war had taken place among the candidates for the throne: but the Abyſſinian annals make no mention of this; neither have we any particular account of the tranſactions of the empire till the time of Amda Sion, who began to reign in 1312. He was the ſon of Wedem Araad, the youngeſt brother of Icon Amlac, and ſucceeded to the throne on the death of his father. He profeſſed the Chriſtian religion; but his practice ſeems.

Uncertainty of the Abyſſinia hiſtory.

Reign of Amda Sion

Abyſſinia.

He is excommunicated for inceſt.

The monks baniſhed.

His expedition againſt the Mahometans.

They attack his camp in the night without ſucceſs.

They ſubmit, but quickly revolt again.

ſeems to have been very oppoſite to its precepts. He began his reign with living publicly with a concubine of his father's; and quickly after committed inceſt with his two ſiſters. On this he was firſt exhorted to repentance, and then excommunicated, by Honorius, a monk greatly celebrated for his ſanctity, and who has ſince been canonized. The prince, enraged at this indignity, cauſed the ſaint to be ſeverely whipped through every ſtreet of his capital. That night the town was by ſome unknown means ſet on fire and reduced to aſhes: the clergy perſuaded the people, that the blood of Honorius had turned to fire as it dropped on the ground, and thus occaſioned the cataſtrophe; but the king ſuſpecting that the monks themſelves had been the incendiaries, baniſhed or impriſoned them all, ſo that their hopes of exciting an inſurrection were diſappointed; and being diſperſed into thoſe provinces where the inhabitants were moſtly Jews or Pagans, they were now obliged to apply to what was certainly more incumbent upon them, viz. the diffuſion of the knowledge of the goſpel.

While the king was buſied with the monks, one of the factors, who had been entruſted with ſome of his commercial intereſts, was aſſaſſinated by the Moors in the province of Ifat; on which, without making the leaſt compiaint or expoſtulation, he aſſembled his troops, and with *ſeven* horſemen (A) fell upon the neareſt Mahometan ſettlements, maſſacring all he met without exception. Putting himſelf then at the head of his army, he proceeded in the moſt rapid career of deſolation, laying waſte the whole country with fire and ſword, and carrying off an immenſe booty.

For ſome time the Moors were ſo ſurpriſed, that they did not think of making oppoſition; but at laſt they took up arms, and attempted to ſurpriſe the Abyſſinian monarch in his camp, hearing that he had ſent out moſt of his army in detachments. With this view they approached the camp in the night time, expecting to have found the king and his few ſoldiers immerſed in ſleep. Unexpectedly, however, he had been joined by a conſiderable part of his army, whom he drew up in battle array to receive his enemies. An engagement enſued, in which the king behaved with great valour, killed the Mocriſh general with his own hand, and gained a complete victory. He then commanded ſuch of his ſoldiers as could not find houſes ready built, to build huts for themſelves, and a large tract of land to be plowed and ſown, as if he meant to ſtay in the country of the enemy during the rainy ſeaſon. The Mahometans now perceiving that they were in danger of being totally exterminated, willingly ſubmitted to the terms he pleaſed to impoſe upon them; while the monarch conciliated the affections of his people by dividing among them the vaſt plunder he had acquired in this expedition.

The Moors no ſooner found themſelves freed from any apprehenſions of immediate danger, than they prepared for a new revolt. The king having intelligence of their deſigns, ſecretly prepared to ſubdue them before they could have time to bring their matters to a ſufficient bearing. The Moors, however, being better prepared than he expected, began hoſtilities by ſurpriſing and plundering ſome villages belonging to the Chriſtians, and deſtroying their churches. A moſt formidable combination had taken place; and as the conſequence of allowing the confederate rebels to join their forces might have been very dangerous, the king uſed his utmoſt endeavours to prevent it. This deſign was in ſome meaſure facilitated by the ſuperſtition of Amano king of Hadea, one of the principal rebels. This man, by the advice of a conjurer in whom he put great confidence, inſtead of marching his troops to the aſſiſtance of his allies, remained at home with them, where he was defeated and taken priſoner by a detachment of the king's army. The governor of Amhara was next deſpatched againſt Saber-eddin the revolted governor of Fatigar, with orders to lay waſte the country, and uſe every method to force him to a battle, if he ſhould be diſinclined to venture it himſelf. Theſe orders were punctually executed; Saber-eddin was compelled to ſtand an engagement, in which he was defeated; the victors plundered his houſe, and took his wife and children priſoners. But in the mean time intelligence was received of a new revolt among the Falaſha, who had aſſembled a great army, and threatened to become very formidable; their chief keeping a cloſe correſpondence with Saber-eddin, as well as with the king of Adel. Theſe, however, ſhared the ſame fate with the reſt, being entirely defeated by Tzaga Chriſtos another Abyſſinian general, who ſoon after joined the king with his whole army. This proved fatal to the rebel cauſe: Saber-eddin, no longer able to ſupport himſelf againſt the royal forces, was obliged to ſurrender at diſcretion, and all the reſt were quickly reduced; ſo that the king was at leiſure to march againſt the kings of Adel and Mara, who having now united their forces, reſolved to give him battle. At this the Abyſſinian monarch was ſo exaſperated, that he determined to take a moſt ample vengeance on his enemies. In the preſence of his whole army, therefore, and a monk of uncommon ſanctity dreſſed in the ſame habit in which he uſually performed divine ſervice, the king made a long ſpeech againſt the Mahometans. He recounted the many violences which they had committed; and of which the kings of Adel and Mara had been principal promoters. He enumerated many examples of murder, ſacrilege, &c. of which they had been guilty; ſetting forth alſo that they had carried off great numbers of Chriſtians into ſlavery, and that the view of making ſlaves was now a great motive with them for making war. He diſclaimed every idea of commencing hoſtilities from any avaricious motive; as a proof of which, he denied that he would accept of any part of the plunder for his own uſe; concluding with a declaration, that he was now about to ſwear on the holy euchariſt, that, "though

His ſpeech and oath in preſence of his army.

(A) On this Mr Bruce remarks, that "it has been imagined the number ſhould be increaſed to 70; but there would be little difference in the raſhneſs of the action." The word in the Abyſſinian annals which he tranſlates is *ſeven*; but if we increaſe the number at all, it ought more probably to be *ſeven hundred* than ſeventy.

Abyſſinia. but 20 of his army ſhould join him, he would not turn his back upon Adel or Mara, till he had either forced them to tribute and ſubmiſſion, or entirely extirpated them and annihilated their religion." After this ſpeech, he took the oath in the preſence of the whole army; who not only applauded him with loud ſhouts, but proteſted that they looked upon themſelves to be all bound by the oath he had taken. As he had mentioned in his ſpeech that the plunder had been purchaſed by the lives of their Chriſtian brethren, they determined to ſhow their abhorrence at keeping any of it on theſe terms. Taking lighted torches in their hands, therefore, they ſet fire to the whole plunder that had been amaſſed ſince the beginning of the war; and having thus reduced themſelves to a ſtate of poverty, they prepared to ſhow their Chriſtianity by thirſting, not after the wealth, but the blood of their enemies.

Enthuſiaſm of his troops.

Notwithſtanding the enthuſiaſm of the whole army on this occaſion, the expedition was attended with great difficulties. Theſe aroſe principally from ſuperſtition; and as, on the one hand, the Abyſſinians were by this principle laid under conſiderable diſadvantages, their adverſaries on the other enjoyed equal advantages from no better cauſe. The Abyſſinians, according to Mr Bruce, are very credulous with reſpect to genii or ſpirits which go about doing miſchief in the dark. Hence they are afraid of travelling, but eſpecially of fighting, in the night-time; becauſe they imagine that the world is then entirely given up to theſe beings, who are put out of humour by the motions of men, or of any other terreſtrial creature. In the night-time therefore an Abyſſinian dares not even throw a little water out of a baſon, leſt it ſhould fall upon ſome ſpirit and provoke it to vengeance. The Moors, on the other hand, though equally fearful, ſecure themſelves againſt theſe inviſible enemies by means no leſs ridiculous than the fears themſelves. A verſe of the Koran, ſewed up in leather, and worn round their neck or arm, is ſufficient to defy the power of the moſt miſchievous ſpirit. Under ſuch powerful protection, therefore, they laugh at the terrors of the Abyſſinians, and are on all occaſions ready to attack them in the night-time, and even prefer that ſeaſon rather than any other for coming to an engagement. Senſible of this advantage, and encouraged by the little loſs which attended even a defeat in theſe nocturnal encounters, they determined on the preſent occaſion to avoid any pitched battles, and to content themſelves with haraſſing the king's army with continual ſkirmiſhes of this kind. Thus, though the Abyſſinian monarch had always the advantage, his troops ſoon began to complain; and, on the commencement of the rainy ſeaſon, inſiſted on being allowed to return. This was by no means agreeable to a prince of ſuch a martial diſpoſition as Amda Sion. He therefore told them, that, if they were afraid of rains, he would conduct them to a country where there were none; meaning Adel, which, though likewiſe within the limits of the tropical rains, has them at another ſeaſon than that in which they fall in Abyſſinia. Thus he perſuaded his army again to ſet forward: but was ſo grievouſly haraſſed by the nocturnal attacks of the Moors, that he was once more in danger of being deſerted; and when by his eloquence he had found means to diſſipate the apprehenſions of the ſoldiers, he was ſeized with a violent fever which threatened his life. The ſoldiers now expected that they were ſoon to return; but while they indulged themſelves in the careleſſneſs which uſually attends an expectation of this kind, they accidentally received intelligence that the Moors, having aſſembled an army of 40,000 men, were in full march to attack them, and at a very ſmall diſtance. The king was now free from fever, but ſo weak that he fainted on attempting to put himſelf in readineſs for going out to battle. Still, however, his reſolution continued firm and unalterable; having recovered from his faint, waſhed and refreſhed himſelf, he made a ſpeech to his ſoldiers, filled with the moſt enthuſiaſtic expreſſions of confidence in the juſtice and goodneſs of the cauſe in which he was engaged, and in the continuance of the divine favour and protection. "As it never was my opinion (ſaid he), that it was my own ſtrength and valour, or their want of it, which has ſo often been the cauſe of preſerving me from their hands; ſo I do not fear at preſent that my accidental weakneſs will give them any advantage over me, as long as I truſt in God's power as much as I have ever done." By this ſpeech the drooping ſpirits of the Abyſſinians were revived; and they only begged that their monarch would now truſt to the valour of his troops, and not expoſe his perſon to ſuch danger as he had uſually done. He promiſed to comply with their requeſt; but matters were ſoon thrown into confuſion by a report that the Moors had poiſoned the wells and enchanted all the running water in the front of the army. The poiſoned wells, however, were eaſily avoided; and a prieſt of vaſt ſanctity was diſpatched a day's journey before the army to diſenchant the waters by his bleſſings; which, having the advantage of the good qualities of the element itſelf on their ſide, were doubtleſs more powerful than the ſpells of the infidels. Not content with this, the king cauſed a river to be conſecrated by the name of *Jordan*; but while his men were employed in bathing themſelves in this holy water, the *Fits-Auraris*, an officer who had been diſpatched with a party of men who always go before the Abyſſinian armies, was attacked and driven back on the main body by a detachment of the enemy, who had along with them a number of women provided with drugs to poiſon and ſpells to enchant the waters. A dreadful panic now ſeized the whole army. Unmindful of the promiſes made to their king, they not only refuſed to advance, but for the moſt part reſolved to leave the camp, and return homewards without delay. The king, ſenſible that all was loſt if this pernicious ſcheme ſhould be adopted, did his utmoſt to encourage and perſuade them to return to their duty; but perceiving that nothing was to be gained by reaſoning with men ſo much terrified, he only requeſted that ſuch as could not be induced to fight, would not leave their places, but ſtand quiet ſpectators of the battle. Even this had very little effect: ſo that, finding the enemy now ready to make an attack, he ordered his maſter of the horſe, with only five others, to attack the left wing of the enemy; while he, with a ſmall party of his ſervants, made an attack on the right. This deſperate action was attended with ſucceſs. The king, notwithſtanding the weakneſs he yet laboured under, killed with his own hand two of the commanding officers of the enemy's right wing; while his ſon diſpatched another

Abyſſinia. ther of conſiderable rank belonging to the left. This had ſuch an effect upon the whole Mooriſh army, that they began evidently to loſe courage; while the Abyſſinians, aſhamed of their conduct, now ruſhed furiouſly on to reſcue their prince from danger. The battle continued for ſome time with great obſtinacy; but at laſt the centre and left wing of the Moors were entirely defeated. The right wing, compoſed principally of Arabians, retired in a body; but not knowing the country, they entered a deep valley ſurrounded by perpendicular rocks entirely covered with wood. The Abyſſinians, imagining they had nothing more to do, began to ſtrip and mangle the bodies of the killed and wounded; but the king, perceiving that the Arabians had brought themſelves into a ſituation from whence they never could be extricated, obliged his ſoldiers to deſiſt from this barbarous employment, and even killed two of them who diſobeyed his orders. The army was then divided into two parts, one of which ſurrounded the devoted Arabians, while the other was ſent a day's journey after the remainder of the Moors. Both parties proved equally ſucceſsful. The king, with part of his diviſion, attacked the Arabians in front, while the reſt rolled great ſtones down from the tops of the rocks upon them. By this they were thrown into ſuch confuſion, that being neither able to fly nor reſiſt, they were all killed to a man. The fate of the Moors was little better. The other diviſion of the Abyſſinian army found them lying round a large pool of water, which they lapped like as many dogs. In this helpleſs ſituation there was nothing requiſite but to order them to be ſlaughtered; and this cruel order was punctually executed. The ſoldiers imagining they ſhould now diſcharge their vow to heaven, wearied themſelves with ſlaughter; till at laſt, being almoſt ſatiated with blood, they made a few priſoners, among whom was Saleh king of Mara, with his queen; the former of whom was hanged by order of Amda Sion, and the latter cut in pieces, and her body given to the dogs by the ſoldiers.

he Moors feated,

d almoſt tirely cut F.

This ſignal victory was gained in the end of July 1316; but as the rains at that ſeaſon ſet in with violence, moſt of the army now again inſiſted on their returning home without delay. The king and principal officers, however, were of opinion, that the advantages ſo dearly purchaſed ought by all means to be purſued till they had either reduced the Mahometans to ſubjection, or at leaſt deprived them of all power to make attacks on the empire with any proſpect of ſucceſs. This opinion being adopted, the king ſent back the baggage, women, and others who could be of no uſe to the army; retaining only the veteran ſoldiers, who were able to encounter more than ſix times the number of ſuch enemies as he could expect to meet with.

mda Sion urſues his dvantage.

Advancing farther into the Mahometan territories, he took up his reſidence in a large town called *Zeyla*; from whence he, that very night, ſent out a detachment to ſurpriſe a large village in the neighbourhood named *Taraca*. This was executed with ſucceſs; the men were maſſacred, and the women kept to ſupply the places of thoſe who had been ſent away. Continuing ſtill to advance, he detached parties to lay waſte the countries all round; and in this expedition he had the good fortune to cut off two of the principal authors of the conſpiracy againſt him. He then proceeded to

is further nquests.

invade Talab and Abalge in the territories of the king of Adel. That monarch, now rendered deſperate by the view of approaching ruin, had aſſembled all the troops he could raiſe, in order to make one laſt effort againſt the enemy; but conducted himſelf with much leſs prudence than he ought to have done when contending with ſuch an experienced and vigilant adverſary. Amda Sion, confident of ſucceſs, took no leſs care how to prevent the enemy from eſcaping than how to gain the victory. For this purpoſe he deſpatched parties of horſe to lie in wait in all thoſe avenues by which he ſuppoſed that the Moors might attempt to make their eſcape; after which, falling furiouſly on the Adelians himſelf, and being well ſupported by his troops, he gained a complete victory; the king of Adel, with great numbers of his men, being killed on the ſpot, and almoſt all the reſt by the parties of horſe whom the Abyſſinian monarch had poſted in ambuſh to intercept them.

Abyſſinia. Adel invaded.

The king of Adel defeated and killed.

As the loſs of this battle rendered the affairs of the Adelians quite deſperate, the three young princes, ſons of the late king, with their uncle, waited upon Amda Sion with rich preſents, which they laid at his feet in the moſt humble manner, putting their foreheads in the duſt, and intreating his pardon; profeſſing their ſubjection and readineſs to obey his commands, provided that he would ſpare the remainder of their country and property. To this the king made a very unfavourable reply, reproaching them with indignities done to himſelf; but eſpecially with the ſacrilege they had committed in burning churches and murdering prieſts, deſtroying alſo defenceleſs people in villages, merely becauſe they imagined that he could not protect them. To puniſh theſe and other crimes, he ſaid, he was now in the heart of their country; and he was determined never to turn his back upon Adel while he had ten men capable of drawing their ſwords; for which reaſon he commanded them to return and expect the approach of his army.

The princes of Adel ſubmit.

By this fierce ſpeech the brother and two eldeſt children of the king of Adel were ſo diſheartened, that they could not ſpeak; but the youngeſt ſon made a very ſpirited ſpeech, in which he attempted to ſoften the king by complimenting his valour, and, ſhowing that it was unworthy of his character to puſh the war againſt a people who were already conquered and defenceleſs. All the anſwer he could obtain, however, was, that unleſs the queen with the reſt of the royal family, and the principal people of the nation, would come by to-morrow evening and ſurrender themſelves as the princes had done, he would lay waſte the territory of Adel, from the place where he ſat to the Indian ocean. On this the princes earneſtly requeſted their mother to ſubmit without reſerve to the clemency of the Abyſſinian monarch, and to wait upon him next morning; but ſhe was prevented from this by ſome of the nobility who had formerly adviſed the war, and who juſtly ſuſpected danger to themſelves if they ſhould be obliged to ſubmit unconditionally to the conqueror. They reſolved, therefore, once more to venture a battle; and the better to enſure ſucceſs, they bound themſelves by an oath to ſtand by each other to the laſt extremity. At the ſame time they diſpatched meſſengers to the princes, requeſting them to make their eſcape with all manner of expedition, and to head the army themſelves;

Are unfavourably received.

The war continues.

all

Abyſſinia. all of whom were determined to conquer or die as ſoon as the royal family ſhould be out of the enemy's hands. By this conduct the Abyſſinian monarch was ſo much irritated, that he divided his army into three parts; two of which he commanded to enter the territory of the enemy by different routes, and to exterminate both man and beaſt wherever they came; while he himſelf, with the third, took the ſtraight road to the place where the new Adelian army was encamped. Here he found a number of infantry drawn up and ready to engage him; but, beſides theſe, there was a multitude of old men, women, and even children, all armed with ſuch weapons as they could procure. Surpriſed at this ſight, he ordered a party of horſe to diſperſe them; but this was found impoſſible; ſo that he was obliged to call in the detachments he had ſent out, with orders to fall upon the enemy by the neareſt way they could advance. The engagement was for a long time very doubtful; and in oppoſition to Amda Sion appeared the young king of Wypo, who everywhere encouraged his troops, and made the moſt obſtinate reſiſtance. The Abyſſinian monarch having obſerved him, ſheathed his ſword, and arming himſelf with a bow, choſe the broadeſt arrow he could find, and took ſo juſt an aim, that he ſhot the young prince through the ſide of the neck, and his head inclining to one ſhoulder he ſoon fell down dead. On this the ſpirit of the Adelians entirely forſook them, and they betook themſelves to flight; but unluckily falling in with two Abyſſinian detachments coming to the king's relief, they were ſo completely deſtroyed, that only three of them are ſaid to have made their eſcape. On the ſide of the Abyſſinians, however, the victory was dearly purchaſed; many of the principal officers being killed, and ſcarcely one of the cavalry eſcaping without a wound.

An obſtinate battle.

The Moorish army entirely cut off.

Dreadful devaſtations.

The remainder of this expedition conſiſted only in the deſtruction and burning of towns and villages, and maſſacres of helpleſs people, on pretence of retaliating the injuries committed by the Mahometans againſt the Chriſtians. At laſt, weary of conqueſt and of carnage, this victorious monarch, who never ſuffered a defeat in any battle, returned in triumph to his capital, where he ended his days after a reign of 30 years. In his time we find that the royal family were not confined, as had been the uſual practice from the time of the queen of Sheba to the maſſacre by Judith; for Saif Araad, the ſon and ſucceſſor of Amda Sion, diſtinguiſhed himſelf in one of the battles in which his father was engaged.

The royal family not confined as formerly.

Though the new prince, as appears from what has been juſt now obſerved, was by no means deſtitute of military talents, the Abyſſinian empire enjoyed a profound peace during his reign. The only remarkable tranſaction was the relief given by him to the Coptic patriarch, whom the ſultan of Egypt had thrown into priſon. At this time a great trade was carried on through the deſert by caravans between Cairo and Abyſſinia, as well as from Cairo to Suakem on the Red ſea; but the Ethiopic monarch having ſeized the merchants from Cairo, and ſent parties of horſe to interrupt the caravans in their paſſage, the ſultan was ſoon content to releaſe the patriarch, whom he had impriſoned only with a view to extort money.

Reign of Saif Araad.

In the reign of Theodorus, who held the crown of Ethiopia from the year 1409 to 1412, we find an infringement made on the treaty between Icon Amlac and the Abuna Tecla-Haimanout formerly mentioned. By that treaty the Abuna was to have a full third of the whole empire for the ſupport of his own dignity and that of the church: but Theodorus, juſtly conſidering this as an unreaſonable acquiſition, reduced it very conſiderably, though he ſtill allowed a very ample revenue out of every province of the empire; and even this has been conſidered by ſeveral of his ſucceſſors as far too large, and conſequently has been frequently abridged by them. The annals of this prince's reign are very defective, and Mr Bruce ſuppoſes that they have been mutilated by the eccleſiaſtics; which, conſidering what we have juſt now related of his reducing their revenues, is by no means improbable. By his ſubjects he was conſidered as ſuch a ſaint, that to this day the people believe he is to riſe again and to reign a thouſand years in Abyſſinia; during which period war is to ceaſe, and happineſs to be univerſally diffuſed.

Of Theodorus.

Abyſſinia.

Is celebrated as a ſaint.

From the time of Theodorus to that of Zara Jacob, who began his reign in 1434, the Abyſſinian annals furniſh us with little or nothing of any conſequence. The character of this prince is repreſented as by no means inferior to that of Theodorus, or indeed of any monarch that ever ſat on the throne of Ethiopia, or any other kingdom in the world. He is, in ſhort, ſet forth as another Solomon, and a model of what ſovereigns ought to be; though, from ſome particulars of his reign, his character ſhould ſeem to be rather exaggerated. The firſt remarkable tranſaction of this great monarch was his ſending an embaſſy to the council of Florence. The ambaſſadors were certain prieſts from Jeruſalem, who in that aſſembly adhered to the opinions of the Greek church; and the embaſſy itſelf was judged to be of ſuch conſequence as to be the ſubject of a picture in the Vatican. This prince obtained alſo a convent at Rome from the pope for the uſe of the Abyſſinians; which is ſtill preſerved, though very ſeldom viſited by thoſe for whom it was deſigned. He ſeems to have been very deſirous of keeping up a correſpondence with the Europeans as well as the Aſiatics; and in his time we firſt read of a diſpute in Abyſſinia with the *Frangi* or Franks on the ſubject of religion. This was carried on in preſence of the king between one Abba George and a Venetian painter, Franciſco de Branco Lone, in which the former confuted and even convinced his antagoniſt; but from this time we find a party formed for the church of Rome, and which probably took its riſe from the embaſſy to the council of Florence.

Zara Jacob ſaid to equal Solomon.

Sends an embaſſy to the council of Florence

A party for the church of Rome formed.

The prince of whom we now treat was the firſt who introduced perſecution on a religious account into his dominions; and for this reaſon, moſt probably, he is ſo highly commended by the eccleſiaſtics. The ſtate of religion in Abyſſinia was now indeed very corrupt. The Greek profeſſion had been originally eſtabliſhed from the church of Alexandria; but in the low provinces bordering on the coaſt of Adel, the Mahometan ſuperſtition prevailed. Many of that perſuaſion had alſo diſperſed themſelves through the towns and villages in the internal parts of the empire, while in not a few places the groſſeſt idolatry ſtill took place; ſuch as the worſhip of the heavenly bodies, the wind, trees, cows, ſerpents, &c. All this had hitherto paſſed unnoticed; but in the reign of Zara Jacob, ſome families

Religious perſecution introduced.

Abyſſinia.

lies being accuſed of worſhipping the cow and ſerpent, were brought before the king, who pronounced ſentence of death upon them. Their execution was followed by a royal proclamation, that whoever did not carry on his right hand an amulet with theſe words upon it, "I renounce the devil for Chriſt our Lord," ſhould not only forfeit his perſonal eſtate, but be liable to corporeal puniſhment. The ſpirit of perſecution thus begun, quickly diffuſed itſelf, and an inquiſitor was appointed to ſearch for criminals. This was one Amda Sion, the king's chief confidant, who pretended to all that abſurd and auſtere devotion common to religious hypocrites. In this he was flattered with uncommon parade and attendance, the uſual rewards of people of that ſtamp; as he never appeared abroad but with a great number of ſoldiers, trumpets, drums, and other enſigns of military dignity waiting upon him. He kept alſo a number of ſpies, who brought him intelligence of thoſe who were ſecretly guilty of any idolatrous or treaſonable practices; after which, proceeding with his attendants to the houſe of the delinquent, he cauſed the family firſt ſupply himſelf and his party with refreſhments, and then ordered the unhappy wretches to be all put to death in his preſence. Among thoſe who ſuffered in this barbarous manner were the two ſons-in-law of the king himſelf, who had been accuſed by their wives, the one of adultery, and the other of inceſt; on which ſlight ground they were both put to death in their own houſes, in ſuch a manner as deſervedly threw an odium on the king. His conduct was afterwards ſo ſeverely condemned by a certain clergyman from Jeruſalem, that a reformation ſeems to have been produced; and no mention is afterwards made of the inquiſitor or perſecution during this reign.

Amda Sion a cruel inquiſitor.

Murder of the king's ſon-in law.

Perſecution ſuppreſſed.

The attention of the king was now called off from religion to the ſtate of his affairs in the different provinces of the kingdom. As the Moorish provinces were very rich, by reaſon of the extenſive trade they carried on, and frequently employed their wealth in exciting rebellion, it became neceſſary that the ſovereign himſelf ſhould examine into the circumſtances and diſpoſitions of the ſeveral governors, which was likewiſe proper on another account, that he might aſſign to each the ſum to be paid. On this occaſion he divided the empire more diſtinctly, and increaſed the number of governments conſiderably; which being done, he ſet about repairing the churches throughout the country, which had fallen into decay, or been deſtroyed in the war with the Mahometans. So zealous was he in this reſpect, that having heard of the deſtruction of the church of the Virgin in Alexandria by fire, he inſtantly built another in Ethiopia, to repair the loſs which Chriſtianity might have ſuffered.

Affairs of the kingdom regulated.

Churches repaired.

The laſt public tranſaction of this prince's reign was the quaſhing of a rebellion which ſome of his governors had entered into; but whatever glory he might acquire from this or any other exploit, his behaviour with regard to his domeſtic affairs muſt certainly place him in a very diſadvantageous light. In the decline of the king's life, the mother of the heir-apparent conceived ſuch an extreme deſire to behold her ſon in poſſeſſion of the throne, that ſhe began to form ſchemes for obliging his father to take him into partnerſhip with him in the government. Theſe being diſcovered, her huſband cruelly cauſed her to be whipped to death: and finding that his ſon afterwards performed certain ſolemnities at her grave in token of regard for her, he cauſed him to be loaded with irons and baniſhed to the top of a mountain; where he would probably have been put to death, had not the monks interfered. Theſe having invented prophecies, dreams, and revelations, that none but the young prince Bæda Mariam was to poſſeſs the throne, the old king ſubmitted to the decrees of Heaven, and relaxed in his ſeverity.

The queen put to a cruel death

Abyſſinia.

On the acceſſion of the new king in 1468, the old law for impriſoning all the royal family was revived, and a mountain named *Geſhen* choſen for the purpoſe. Having thus ſecured himſelf from any danger of a rival in caſe he ſhould undertake a foreign expedition, he proclaimed a pardon to all thoſe who had been baniſhed during the former reign, and thus ingratiated himſelf with his people: after which he began to prepare for war. At this the neighbouring princes, particularly the king of Adel, being alarmed, ſent ambaſſadors requeſting the continuance of peace. The Abyſſinian monarch told them, that his deſign was to deſtroy the Dobas; a race of ſhepherds very wealthy, but extremely barbarous, profeſſing the Pagan religion, and greatly reſembling the Gallas. The reaſon of his commencing hoſtilities againſt them was, that they made continual inroads into his country, and committed the greateſt cruelties; on which account he determined not to make war as with a common enemy, but to exterminate and deſtroy them as a nuiſance. The king of Adel was no ſooner poſſeſſed of this piece of intelligence, than he communicated it to the Dobas; deſiring them to ſend their women and children, with their moſt valuable effects, into his country, till the invaſion ſhould be over. This propoſal was readily embraced; but Bæda having got notice of it, ſeized an avenue through which they muſt neceſſarily paſs, and maſſacred every one of the company. After this, entering their country, he committed ſuch devaſtations, that they were glad to ſubmit, and even to renounce their religion in order to free themſelves from ſuch a dreadful enemy. The king then turned his arms againſt Adel, where he was attended with his uſual ſucceſs; a moſt complete victory being gained over the Moors by the Abyſſinian general: but while the king himſelf was advancing towards that country, with a full reſolution to reduce it to the moſt abject ſtate of miſery, he was ſeized with a pain in his bowels, which occaſioned his death.

The royal family again confined.

War with the Dobas reſolved on.

They are maſſacred.

Death of the king.

The diſcovery of the kingdom of Ethiopia or Abyſſinia by the Europeans took place about this time. It has already been obſerved, that ſome intercourſe by means of individuals had been carried on betwixt this country and Italy; but the knowledge conveyed to Europeans in this manner was very imperfect and obſcure. Even the ſituation of the country had been forgot; and though ſome confuſed notions were entertained of a diſtant Chriſtian prince who was likewiſe a prieſt, Marco Paulo, the famous Venetian traveller, aſſures that he had met with him in Tartary; and it was univerſally agreed, that his name was *Joannes Preſbyter*, *Prete Janni*, or *Preſter John*. When the Portugueſe began to extend their diſcoveries along the coaſt of Africa, more certain intelligence concerning this prince was obtained. Bemoy, one of the kings of the

Diſcovery of Abyſſinia by the Europeans.

Of Preſter John.

Abyſſinia. the Juloffes, a nation on the weſtern coaſt of Africa, had aſſured the Portugueſe navigators of the exiſtence of ſuch a prince ſo ſtrongly, that the king determined to ſend ambaſſadors to him; and the diſcovery was of the greater conſequence, that a paſſage to the Eaſt Indies was now attempted both by land and ſea. The ambaſſadors were named *Peter Covillan* and *Alphonſo de Paiva*. Theſe were ſent to Alexandria in Egypt, from whence they were to ſet out on their journey; the intent of which was, to explore the ſources of the Indian trade, the principal markets for the ſpice, &c. but above all, to diſcover whether it was poſſible to arrive at the Eaſt Indies by ſailing round the continent of Africa.

Ambaſſadors ſent from the king of Portugal.

Account of their travels. In the proſecution of this ſcheme our two travellers went from Alexandria to Cairo; from thence to Suez at the bottom of the Red ſea; from Suez they took their route to Aden, a wealthy and commercial city beyond the ſtraits of Babel Mandel. Covillan now ſet ſail for India, and De Paiva for Suakem. The latter loſt his life without making any diſcovery; but Covillan paſſed over to Calicut and Goa. From thence he returned to the continent of Africa, viſiting the gold mines of Sofala, and paſſing from thence to Aden and Cairo; at which place he was informed of the death of his companion. In this city he was met by two Jews with letters from the king of Abyſſinia. One of theſe Jews was ſent back with letters to the Abyſſinian monarch; but with the other he proceeded to the iſland of Ormus in the Perſian gulf. Here they ſeparated; the Jew returning home, and Covillan repaſſing the ſtraits of Babel Mandel, whence he proceeded to Aden, and afterwards entered the Abyſſinian dominions.

The reigning prince at this time was named *Alexander*; and when Covillan arrived, he was employed in levying contributions upon his rebellious ſubjects. He met with a kind reception; and was conveyed to the capital, where he was promoted to the higheſt poſts of honour, but never allowed to return to Europe again. The intelligence, however, which he tranſmitted to the court of Portugal proved of much importance. He not only deſcribed all the ports of India he had ſeen, with the ſituation and wealth of Sofala, but adviſed the king to proſecute the diſcovery of the paſſage round Africa with the utmoſt diligence; affirming, that the cape at the ſouthern extremity of the continent was well known in India; and accompanying the whole with a chart which he had obtained from a Moor, and which ſhowed exactly the ſituation of the cape and neighbouring countries.

Important intelligence conveyed to Portugal by Covillan.

Reign of Alexander. Covillan arrived in Ethiopia about the year 1490; and the prince to whom he addreſſed himſelf was Alexander the ſon of Bæda Mariam, a prince endowed with many good qualities, and no leſs verſed in military affairs than any of his predeceſſors. His reign was diſturbed by plots and rebellions, which at laſt proved fatal to him. From his early years he manifeſted a great deſire to make war on the king of Adel, who ſeems to have been the natural rival of the Ethiopic princes. But the Adelian monarch, having now become ſenſible that he was not able to cope with ſuch powerful adverſaries, took the moſt effectual way of ſecuring himſelf; viz. by gaining over a party at the court of Abyſſinia. In this he had now ſucceeded ſo well, that when Alexander was about to invade Adel, Za Saluce the prime miniſter, with many of the principal nobility, were in the intereſt of his adverſary. Not being apprized of this treachery, however, Alexander intruſted this miniſter with the command of a great part of his forces; and with theſe the latter abandoned him in the heat of an engagement. Alexander and the few troops who remained with him, however, were ſo far from being diſheartened by this treachery, that they ſeemed to be inſpired with freſh courage. The king having killed the ſtandard-bearer of the enemy, and thus become maſter of the green enſign of Mahomet, the enemy began to give way; and on his killing the king of Adel's ſon, immediately after, they quitted the field altogether. The victory was not by any means complete; neither was Alexander in a ſituation to purſue the advantage he had gained. Having therefore challenged the Moors to a ſecond engagement, which they declined, he returned with a deſign to puniſh his perfidious miniſter Za Saluce, who had endeavoured to excite the governors of all the provinces to revolt as he went along. The traitor, however, had laid his plots too well; ſo that his ſovereign was murdered in two days after his arrival in the capital. Za Saluce did not enjoy the rewards he expected from his treachery: for having attempted to excite a revolt in the province of Amhara, he was attacked by the nobility there; and his troops deſerting him, he was taken priſoner without any reſiſtance, his eyes were put out, and himſelf expoſed on an aſs, to the curſes and deriſion of the people.

Abyſſin He is de- ſerted by his prime miniſter and moſt his army battle, h gains a tory.

Alexand murdere

Alexander was ſucceeded by an infant ſon, who reigned only ſeven months; after which his younger brother Naod was choſen king by the unanimous voice of the people. He proved a wiſe and virtuous prince; but the late misfortunes, together with the corruption introduced at court by the Mahometans, had ſo unhinged the government, that it became very difficult to know how to manage matters. Judging very properly, however, that one of the moſt effectual methods of quieting the minds of the people would be an offer of a general pardon; he not only proclaimed this, but likewiſe, "That any perſon who ſhould upbraid another with being a party in the misfortunes of paſt times, or ſay that he had been privy to this or that conſpiracy, had received bribes from the Moors, &c. ſhould be put to death without delay." On his entering upon government, he found it neceſſary to prepare againſt an enemy whom we have not heretofore mentioned, viz. Maſſudi, prince of a diſtrict named *Arar*, which lay in the neighbourhood of Adel. This chieftan being a man of a very enterpriſing and martial diſpoſition, and a moſt violent enthuſiaſt in the Mahometan cauſe, had made a vow to ſpend 40 days annually in ſome part of the Abyſſinian dominions during the time of Lent. For this purpoſe he kept a ſmall body of veteran troops, with whom he fell ſometimes on one part, and ſometimes on another of the frontiers, putting to death without mercy ſuch as made reſiſtance, and carrying off for ſlaves thoſe who made none. For 30 years he continued this practice; beginning exactly on the firſt day of Lent, and proceeding gradually up the country as the term advanced. His progreſs was greatly facilitated by the ſuperſtition of the people themſelves, who kept that faſt with ſuch rigour as almoſt

Reign of Naod.

Maſſudi ravages Abyſſinia territorie

Meditates a war againſt Adel.

Abyſſinia. moſt entirely to exhauſt their ſtrength; ſo that Maſſudi having never met with any oppoſition, was always ſure of ſucceſs, and thus came to be reckoned invincible. On the preſent occaſion, however, he experienced a prodigious reverſe of fortune. Naod having enjoined his ſoldiers to live in the ſame full and free manner during the faſt as at any other time, and having ſet the example himſelf, marched out againſt his enemy; who, being ignorant of the precaution he had taken, advanced with his uſual confidence of ſucceſs. The Abyſſinian monarch, ſtill pretending fear, as if on account of the weakneſs of his men, pitched his camp in very ſtrong ground, but left ſome paſſages open to it, that the enemy might make an attack. This was done contrary to the advice of their leader; and the conſequence was, that almoſt every one of them was cut off. On this the king of Adel ſent ambaſſadors to ſolicit a continuance of the peace with himſelf; which was granted, upon condition that he reſtored all the ſlaves whom Maſſudi had carried off in his laſt year's expedition; with which the Mahometan chief thought proper to comply rather than engage in ſuch a dangerous war.

He is defeated.

Naod having thus freed his country from the danger of any foreign invaſion, applied himſelf to the cultivation of the arts of peace, and reforming the manners of his ſubjects, in which he ſpent the remainder of his days. He died in 1508, after a reign of 13 years; and was ſucceeded by his ſon David III. a child of 11 years of age. Though the affairs of the empire were at preſent in ſuch a ſtate as required a very prudent and active adminiſtration, the empreſs Helena, widow of Bæda Mariam, had intereſt enough to get the crown ſettled on the infant juſt mentioned. This proceeded partly from her deſire of engroſſing all the power into her own hands, and partly from a wiſh to keep peace with Adel her native country. Theſe ends could not be accompliſhed but by keeping a minor on the throne of Abyſſinia; which was therefore her conſtant object as long as ſhe lived. But though this might not have been attended with any very bad conſequence had the two nations been left to decide the quarrel by themſelves, the face of affairs was now quite changed by the interference of the Turks. That people having now conquered almoſt the whole of Arabia to the Indian ocean, being likewiſe on the point of reducing Egypt, and having a great advantage over their adverſaries in uſing fire-arms, now projected the conqueſt of India alſo. In this indeed they were always diſappointed by the ſuperior valour of the Portugueſe; but as this conqueſt remained a favourite object with them, they did not abandon their attempts. In the countries which they had conquered, they exacted ſuch enormous contributions from the merchants, that vaſt numbers of them fled to the African ſide of the Red ſea, and ſettled on the coaſt of Adel. The Turks ſurpriſed at the increaſe of trade in this country, which they themſelves had occaſioned, reſolved to ſhare in the profits. For this purpoſe they took poſſeſſion of Zeyla, a ſmall iſland in the Red ſea, directly oppoſite to the coaſt of Adel; and erected a cuſtomhouſe in it, where they oppreſſed and ruined the trade as in other places. Thus both Adel and Abyſſinia were threatened with a moſt formidable enemy, which it would have been utterly out of their power to have reſiſted, had not the deſire of poſſeſſing India conſtantly prevented the Turks from directing their ſtrength againſt theſe countries. Helena was ſenſible enough of the dangerous ſituation of the empire, but preferred the gratification of her ambition to the good of her country; however, that ſhe might preſerve herſelf from the attacks of ſuch a formidable enemy, it was now thought proper to enter into an alliance with the Portugueſe. The ambaſſador from Portugal, Peter Covillan, was denied the liberty of returning to his own country, as has been already related; and as, for ſome time paſt, it had not been obvious how he could be of much uſe, he had begun to fall into oblivion. The preſent emergency, however, recovered his importance. The empreſs was ſenſible of the neceſſity ſhe lay under of having ſome perſon who underſtood both the Abyſſinian and Portugueſe languages before ſhe could open any correſpondence with that nation, and who might likewiſe inform her of the names of the perſons to whom her letters ought to be addreſſed. By him ſhe was now inſtructed in every thing neceſſary to the ſucceſs of her embaſſy. The meſſage was committed to one Matthew an Armenian merchant, with whom a young Abyſſinian was joined; but the latter died by the way. The letters they carried are by Mr Bruce ſuppoſed to have been partly the work of Covillan and partly of the leſs experienced Abyſſinian confidants of the empreſs. They began with telling the king, that Matthew would give him information of her whole purpoſe, and that he might depend on the truth of what he ſaid: but in the latter part the whole ſecret of the embaſſy was diſcloſed, and a force ſufficient to deſtroy the Turkiſh power was expreſsly ſolicited. Among the other particulars of this embaſſy alſo it is ſaid, that a third part of Abyſſinia was offered in caſe her requiſitions were complied with; but this, as well as the embaſſy itſelf, was always denied by David when he came of age.

Abyſſinia.

An embaſſy ſent to Portugal.

David III.

Abyſſinia in danger from the Turks.

Matthew, though raiſed from the rank of merchant to that of an ambaſſador, could not, it ſeems, act according to his new dignity in ſuch a manner as to ſcreen himſelf from the moſt mortifying and dangerous imputations. Having arrived at Dabul in the Eaſt Indies, he was ſeized as a ſpy, but relieved by Albuquerque the viceroy of Goa; and that not out of any regard to his character as ambaſſador, but becauſe he himſelf had a deſign upon Abyſſinia. This viceroy uſed his utmoſt endeavours to induce Matthew to deliver his commiſſions to him; but the ambaſſador conſtantly refuſed to ſhow any letter he had, except to the king of Portugal in perſon, and in his own kingdom. This put him out of favour with the viceroy; while his attendants, diſpleaſed at the mean appearance of the man, inſiſted ſometimes that he was a ſpy from the ſultan, at others that he was a cook, an impoſtor, or a menial ſervant. Matthew, however, perceiving that he was now out of danger, maintained that his perſon was ſacred, and inſiſted on being treated as the repreſentative of a ſovereign. He let the viceroy, biſhop, and clergy know, that he had with him a piece of the wood of the true croſs, ſent as a preſent to the king of Portugal: and he required them, under pain of ſacrilege, to pay reſpect to the bearer of ſuch a precious relic, and to celebrate its arrival as a feſtival. This was inſtantly complied with, and a ſolemn proceſſion inſtituted; but very little re-

The ambaſſador ill uſed.

Abyſſinia. gard appears to have been paid to this ambaſſador either in his temporal or ſpiritual character, as he could not obtain leave to depart for Portugal till 1513, which was three years after he arrived in India. In his paſſage he was extremely ill-treated by the ſhipmaſters with whom he ſailed: but of this they ſoon had cauſe to repent; as on their arrival at Lisbon they were all put in irons, and would probably have died in confinement, had not Matthew made interceſſion for them with the king.

Maſſudi renews his depredations.

In the mean time, Maſſudi having recovered from the defeat given him by Naod, and formed alliances with the Turks in Arabia, had renewed his depredations on the Abyſſinian territories with more ſucceſs than ever. Such a number of ſlaves had been, by his aſſiduity, ſent to Mecca, that he was honoured with a green ſilk ſtandard (an emblem of the true Mahometan faith), with a tent of black velvet embroidered with gold, and he was likewiſe made Sheykh of Zeyla; ſo that, as this iſland was properly the key to the Abyſſinian empire, he could neither be rewarded with greater honour nor profit. This happened when David had attained the age of 16; and in conſequence of ſuch ſurpriſing ſucceſs, the king of Adel, never a hearty friend to Abyſſinia, determined to break the peace with that empire and make an alliance with Maſſudi. Having taken this reſolution, the two princes invaded Abyſſinia with their joint forces, and in one year carried off 19,000 Chriſtian ſlaves, ſo that a general terror was ſpread over the whole empire. David, already impatient of the injuries his people had ſuſtained, determined to raiſe an army, and to head it in perſon as his anceſtors had done, contrary to the advice of the empreſs, who conſidering only his youth and inexperience in military affairs, wiſhed him to have employed ſome of his veteran officers. A very powerful army was raiſed, and ample ſupplies of all kinds were procured. With one part of his forces the emperor took the road to Auſſa the capital of Adel; ſending the other under the command of an officer named the *Betwudet*, to meet the Mooriſh army, which was then ravaging part of Abyſſinia. It was natural to be imagined, that the Moors, on hearing that an army was marching to deſtroy the capital of their country, would abandon the thoughts of conqueſt or plunder to preſerve it. In doing this, David knew that they had certain defiles to paſs before they could reach Adel. He ordered the Betwudet therefore to allow them to enter theſe defiles; and before they could get through, he himſelf, with the main body of the army, marched to attack them at the other end. Thus the Moors were completely hemmed in by a ſuperior army: but beſides this unfavourable ſituation, they were farther diſpirited by Maſſudi. That hero came, on the morning of the engagement, to the king of Adel, informing him that his own time was now come; that he had been certainly told by a prophet, long ago, that if this year (1516) he ſhould fight the king of Abyſſinia in perſon, he ſhould loſe his life. He was aſſured that the Abyſſinian monarch was then preſent, having ſeen the ſcarlet tent which was uſed only by the ſovereigns of that country; and therefore adviſed the king of Adel to make the beſt of his way over the leaſt ſteep part of the mountain before the engagement began. The Adelian monarch, who had at any rate no great inclination to fight, was not inſpired with courage by this ſpeech: he therefore followed the advice given him; and, with a few of his friends, paſſed the mountain, leaving his troops to their fate. The Moors, in the mean time, being abandoned by one leader, and having another devoted to deſtruction, ſhowed an uncommon backwardneſs to engage, which was taken notice of by their enemies. Maſſudi, however, as ſoon as he ſuppoſed the king of Adel to be out of danger, ſent a trumpet to the Abyſſinian camp, with a challenge to any man of quality in the army to fight him; on condition that the party of the victorious champion ſhould be accounted conquerors, and that the armies ſhould immediately ſeparate without further bloodſhed. The challenge was inſtantly accepted by a monk named *Gabriel Andreas*; who, in the reign of Bæda Mariam, had been condemned to loſe the tip of his tongue for ſpeaking ſlightly of the king's proclamation of amneſty. Maſſudi ſhowed no reluctance to preſent himſelf; but received ſuch a ſtroke from his antagoniſt with a two-handed ſword as almoſt cut his body in two, and he immediately fell down dead. Andreas cut off his head; and throwing it at the king's feet, cried out, "There is the Goliath of the infidels." This became the ſignal for a general engagement, notwithſtanding the terms ſtipulated by Maſſudi before the combat. The Moors were quickly repulſed by the king's troops, and driven backward through the defile. At the other end they were met by the Betwudet (B), who drove them back to the king's forces; ſo that at laſt being forced to fly to the mountains, they were all ſlaughtered by the peaſants, or periſhed with hunger and thirſt.

Abyſſinia.

He is killed.

The Moors defeated and deſtroyed.

David marches againſt him.

Maſſudi propheſies his own death.

The ſame day that this victory was gained over the Moors by David, being in the month of July 1516, the iſland of Zeyla in the Red ſea was taken and the town burnt by the Portugueſe fleet under Lopez Suarez de Alberguiera. The Abyſſinian ambaſſador, Matthew, in the mean time, had been received with the greateſt marks of eſteem in Portugal. The utmoſt attention was paid to his embaſſy; he was lodged in the moſt ſplendid manner; and his maintenance was ſuitable to his lodging. The king prepared an embaſſy on his part, and ſent home Matthew on board the Indian fleet commanded by Lopez. The ambaſſador ordered for Abyſſinia was one Edward Galvan, a man who had filled many ſtate departments with the utmoſt applauſe; but who by reaſon of his age, being now 86, was certainly very unfit for ſuch a diſtant and perilous voyage. He died accordingly on the iſland of Camaran in the Red ſea, where Suarez had imprudently landed, and paſſed the winter in the utmoſt diſtreſs for want of proviſions of every kind. This admiral was ſucceeded by Lopez de Seguyera; who ſailed firſt to the iſland of Goa in the Eaſt Indies, where he fitted out a ſtrong fleet; after which he returned to the Red ſea, and landed on the iſland of Maſuah, having

Zeyla taken by the Portugueſe.

Embaſſy from the king of Portugal.

(B) This is the title of one of the officers in Abyſſinia, not the proper name of a man.

Abyſſinia. ing along with him Matthew, about the authenticity of whoſe miſſion there had been ſuch diſputes. At his firſt approach the inhabitants fled; but at laſt he was accoſted by a Chriſtian and a Moor from the continent, who informed him that the coaſt oppoſite to Maſuah was part of the kingdom of Abyſſinia, and that it was governed by an officer named the *baharnagaſh*; that all the inhabitants of the iſland were Chriſtians; that the reaſon of their flying at the ſight of the Portugueſe fleet was that they took them for Turks, who frequently made deſcents, and ravaged the iſland, &c. The admiral diſmiſſed them with preſents; and ſoon after had a viſit from the governor of Arkeeko, a town on the continent; who informed him, that about 24 miles up the country there was a monaſtery, ſeven of the members of which were now deputed to wait upon him. Theſe inſtantly knew Matthew, and congratulated him in the warmeſt manner upon his return from ſuch a long voyage. An interview ſoon took place between the baharnagaſh himſelf and Lopez. The Abyſſinian informed him, that the coming of the Portugueſe had been long expected, in conſequence of certain ancient prophecies; and that he himſelf and all the officers of the emperor were ready to ſerve him. They parted with mutual preſents; and all doubt about Matthew being now removed, he prepared to ſet out for the emperor's court; while Roderigo de Lima was nominated ambaſſador in place of Galvan who died. Along with them were 15 Portugueſe; all men of the moſt determined courage, and who would heſitate at nothing which they thought might contribute to the glory of their king, their own honour, or the advantage of their country. Their preſent journey indeed was much more perilous than their voyage from Portugal to Abyſſinia. The emperor was at this time in the ſouthern part of his dominions, but the Portugueſe had landed on the northern part; ſo that they had almoſt the whole breadth of the empire to paſs before they could meet with him. The very firſt journey they attempted was through a wood ſo thick that it could ſcarce afford a paſſage either to man or beaſt, while the interſtices of the trees were ſo interwoven with briers and thorns of various kinds, that their paſſage was rendered almoſt impracticable. This was rendered ſtill more terrible by the vaſt numbers of wild beaſts they ſaw, and which ſeemed only to be prevented from devouring them by the appearance of ſo many men together. The rainy ſeaſon was alſo now begun; ſo that they were expoſed to inceſſant deluges of water deſcending from the clouds, beſides frequent and violent ſtorms of wind, thunder, and lightning, &c. To add to their misfortunes, an epidemic fever broke out among them, which carried off Matthew and one of the ſervants of Don Roderigo. At laſt, after a moſt tedious and toilſome journey, from the 16th of April to the 18th of October 1520, the Portugueſe ambaſſador, with his retinue, came within ſight of the Abyſſinian camp at the diſtance of about three miles. His reception was by no means favourable; for inſtead of being immediately admitted to the preſence of the emperor, he was waited on by one of the officers of ſtate, ſtyled, in token of humility, *Hadug Ras*, or *commander of aſſes*; who cauſed him pitch his tent three miles farther off from the camp: and it was not till five years afterwards that he was enabled to finiſh the buſineſs of his embaſſy, and obtained leave to depart for Portugal. Abyſſinia.

During all this time, not a ſingle word had paſſed relating to the affairs of the two nations; ſo that it is difficult to imagine what might have been the deſign of the Abyſſinian emperor. At laſt, having reſolved to ſend an embaſſy to Portugal, he allowed Roderigo to depart, but detained two of his people; appointing Zaga Zaab, an Abyſſinian monk, his ambaſſador to Portugal.

This long intercourſe betwixt two ſuch diſtant nations, however, could not but greatly alarm the Mahometan powers, who were natural enemies to both. Selim, the Turkiſh ſultan, having been conſtantly defeated by the Portugueſe in the eaſt, and alarmed at the thoughts of having a fleet of that nation in the Red ſea, where they might greatly annoy his ſettlements on the coaſt of Arabia, determined to carry his arms to the African ſide; while the king of Adel, having ſtrengthened himſelf by alliances with the Turkiſh officers in Arabia, was now become a much more formidable enemy than before. This was ſoon experienced in a battle with the Adelians; in which the Abyſſinian monarch was overthrown with the loſs of almoſt all his great officers and principal nobility, beſides a vaſt number of private men. The victory was principally owing to the aſſiſtance given by the Turks; for the army was commanded by Mahomet ſurnamed *Gragné*, i. e. *left-handed*, governor of Zeyla, which had now received a Turkiſh garriſon. This man, having the conqueſt of Abyſſinia greatly at heart, reſolved, as ſoon as poſſible, to effect ſomething deciſive; and therefore having ſent to Mecca all the priſoners taken in his late expedition, he obtained in return a conſiderable number of janizaries, with a train of portable artillery. Thus the fortune of the war was entirely decided in favour of the Adelians and Turks; the emperor was defeated in every battle, and frequently hunted from place to place like a wild beaſt. The Moors, finding at laſt no neceſſity for keeping up an army, overran the whole empire in ſmall parties, everywhere plundering and burning the towns and villages, and carrying off the people for ſlaves.

This deſtructive war continued till the year 1537; when Gragné ſent a meſſage to the emperor, exhorting him not to fight any longer againſt God, but to make peace while it was in his power, and give him his daughter in marriage: on which condition he would withdraw his army; but otherwiſe he would reduce his empire to ſuch a ſtate that it ſhould be capable of producing nothing but graſs. David, however, ſtill refuſed to ſubmit; replying, that he put his confidence in God, who at preſent only chaſtiſed him and his people for their ſins; but that Gragné himſelf, being an infidel, and enemy to the true religion, could not fail of coming in a ſhort time to a miſerable end. This unſucceſsful negotiation was followed by ſeveral encounters, in which the emperor was conſtantly defeated; in one of them his eldeſt ſon was killed, and in another his youngeſt was taken priſoner; ſo that he now ſeemed entirely deſtitute, being obliged to wander on foot, and all alone, hiding himſelf throughout the day among the buſhes on the mountains.

The invincible conſtancy with which this forlorn monarch bore his misfortunes, proved a matter of ſurpriſe

At laſt allowed to depart with an ambaſſador from the emperor.

Bad effects of this delay.

The emperor defeated by the Moors.

The Adelians, aſſiſted by the Turks, defeat the emperor.

He refuſes to ſubmit.

Abyſſinia

priſe both to friends and enemies. Many of his veteran ſoldiers, compaſſionating the diſtreſſes of their ſovereign, ſought him out in his hiding places; ſo that he once more found himſelf at the head of a ſmall army, with which he gained ſome advantages that ſerved to keep up his own ſpirits and thoſe of his adherents. His greateſt enemy was Ammer, one of Gragné's officers, who headed the rebellious Abyſſinians, and who had formed a ſcheme of aſſaſſinating the king; but, inſtead of accompliſhing his purpoſe, he himſelf was aſſaſſinated in 1538 by a common ſoldier, on what account we are not informed.

By the death of Ammer and the ſmall ſucceſſes which David himſelf had obtained, the affairs of Abyſſinia ſeemed to revive; but ſtill there was no probability of their being ever brought to a fortunate iſſue.

A new embaſſy to Portugal.

An embaſſy to Portugal was therefore thought of in good earneſt, as the miſchievous effects of ſlighting the proffered friendſhip of that power were now ſufficiently apparent. One of the attendants of Roderigo, named John Bermudes, who had been detained in Abyſſinia, was choſen for this purpoſe; and to his temporal character of ambaſſador was added that of Abuna, primate or patriarch. John, who was not a clergyman originally, had received all the inferior eccleſiaſtical orders at once, that the ſupreme one might be thus conferred upon him; but happening to be a great bigot to the popiſh religion, he would not accept of his new dignity but with a proviſo, that his ordination ſhould be approved by the pope. This was indirectly ſubmitting the church of Abyſſinia to that of Rome; to which David would never have agreed, had it not been for the deſperate ſituation of his affairs at that time. John was therefore allowed to do as he thought proper: when paſſing through Arabia and Egypt to Italy, he had his confirmation confirmed by the pope; after which he ſet out on the buſineſs of his embaſſy. On his arrival at Lisbon, he was acknowledged by the king as patriarch of Alexandria, Abyſſinia, and of the ſea; for this laſt title had alſo been conferred upon him by his Holineſs. Entering then upon the purpoſe of his embaſſy, he began by putting Zaga Zaab in irons for having waſted ſo much time, and done nothing effectual ſince he had left Abyſſinia. Then he repreſented to the king the diſtreſſes of the Abyſſinians in ſuch a ſtrong light, and inſiſted ſo violently for relief to them, that an order was very ſoon procured for 400 muſketeers to be ſent by Don Garcia de Noronha to their relief. To accelerate the progreſs of the intended ſuccours, John himſelf propoſed to ſail in the ſame fleet with Don Garcia; but his voyage was delayed for a whole year by ſickneſs, occaſioned, as he ſuppoſed, by poiſon given him by Zaga Zaab, the monk whom he had impriſoned, and who had been ſet at liberty by the king. After his recovery, however, he ſet ſail for India, where he arrived in ſafety. The death of Don Garcia, which happened in the mean time, occaſioned another delay; but at laſt it was reſolved, that Don Stephen de Gama, who had ſucceeded to Don Garcia, ſhould undertake an expedition to the Red ſea, in order to burn ſome Turkiſh galleys which then lay at Suez. But intelligence having in the mean time been received of the intended voyage, theſe veſſels had withdrawn themſelves. Anchoring then in the port of Maſuah, Don Stephen ſent over to

A body of Portugueſe ordered to aſſiſt the emperor.

Arkeeko on the continent to procure freſh water and other proviſions; but the Turks and Moors being now entirely maſters of that coaſt, the goods he had ſent in exchange were ſeized without any thing being given in return. A meſſage was brought back, importing, that the king of Adel was now maſter of all Ethiopia, and conſequently that no trade could be carried on without his leave; but if Don Stephen would make peace with him, the goods ſhould be reſtored, a plentiful ſupply of water and all kinds of proviſions granted, and amends likewiſe made for 60 Portugueſe who had been killed at Zeyla. Theſe had run away from the fleet on its firſt arrival in the Red ſea, and landed on the coaſt of Adel, where they could procure no water; of which the barbarians took advantage to decoy them up the country; where, having perſuaded them to lay down their arms, they murdered them all. To this Don Stephen returned a ſmooth anſwer, ſent more goods, obtained proviſions, and promiſed to come aſhore as ſoon as a Mahometan feſtival, which the ſavages were then celebrating, ſhould be over. This treaty was carried on with equal bad faith on both ſides; but Don Stephen had now the advantage by obtaining the proviſions he ſtood in need of. Theſe were no ſooner brought on board, than he ſtrictly forbade all intercourſe with the land; and chooſing out 600 men, he attacked the town of Arkeeko, killed the governor, and ſent his head to the Abyſſinian court; maſſacring at the ſame time all the people in the town he met with.

Abyſſinia

The ſuccours arrive and take the town Arkeeko.

During this long interval, a conſiderable change had taken place in the Abyſſinian affairs. We have already ſeen that David had been reduced to great diſtreſs; but afterwards met with ſome little ſucceſſes, which ſeemed to indicate an approaching change of fortune. In theſe, however, he was ſoon diſappointed. A Mahometan chief called *Vizir Mugdid* made an attack upon the rock Geſhen, where the royal family were kept; and finding it entirely unguarded, aſcended without oppoſition, and put every perſon to the ſword. This laſt diſaſter ſeems to have been too great for the reſolution even of this heroic prince, as he died the ſame year 1540. He was ſucceeded by his ſon Claudius, who, though then but about 18 years of age, was endowed with all the great qualities neceſſary for managing the affairs of the empire in ſuch a dreadful criſis, and had made conſiderable progreſs before the arrival of the Portugueſe.

Affairs of Abyſſinia during this interval.

Royal family maſſacred.

Death of David, and acceſſion of Claudius to the empire.

On his acceſſion, the Moors, deſpiſing his youth, inſtantly formed a league among themſelves to cruſh him at once; but, like almoſt all others too confident of victory, they neglected to take the proper precautions againſt a ſurpriſe. This was not unobſerved by Claudius; who falling upon one party which lay next to him, gave them a total defeat. The king purſued them the whole day of the engagement, the enſuing night, and part of the following day; putting to death without mercy every one who fell into his hands. This exceſſive ardour very much damped the ſpirits of his enemies, and at the ſame time inſpired his own party with the moſt ſanguine hopes of ſucceſs; whence he ſoon appeared at the head of ſuch an army as convinced his enemies that he was by no means to be deſpiſed. They now found it neceſſary to deſiſt from the practice they had ſo long continued, of plundering and ravaging

A powerful league formed againſt the new emperor.

The Moors defeated.

Abyſſinia. ravaging the country; to call in their ſcattered parties, unite their troops, and ſpend the rainy ſeaſon in ſuch parts of Abyſſinia as they had conquered, without returning into Adel, as had hitherto been uſual with them. They now came to a reſolution to force the king to a general engagement, in which they hoped to prove victorious by dint of numbers. For this purpoſe all the rebel chiefs in Abyſſinia were called in, and a formidable army collected. They waited only for one very experienced chief named *Jonathan*; after whoſe junction they determined to attack the royal army without delay. But Claudius took his poſts at all times with ſuch judgement, that any attempt upon his camp would have been almoſt deſperate; and getting intelligence where Jonathan lay with his forces, he marched out in the night time, came upon him quite unprepared, defeated and killed him, ſending his head to the reſt of the confederacy by a priſoner, the only one he had ſpared out of all thoſe who were taken. By the ſame meſſenger a defiance was ſent to the Moors, and many opprobrious epithets were beſtowed upon them; but though the armies approached one another, and continued for ſeveral days under arms, the Moors were ſo much intimidated that they would by no means venture an engagement.

Jonathan, a rebel chief, defeated and killed.

By this victory the ſpirits of the Abyſſinians were ſo much elevated, that they flocked in from all parts to join their prince; and even many of the Mahometans, having experienced the lenity of the Chriſtian government, choſe rather to ſubmit to Claudius than to the Turks and Adelians. The king, however, was in danger of being aſſaſſinated by one Ammer, a treacherous governor; who knowing that he had retired to ſome diſtance from his army to celebrate the feſtival of Eaſter, attempted to ſurpriſe him when almoſt deſtitute of attendants; but Claudius having timely notice of his deſigns, laid an ambuſh for him with a conſiderable part of his army which he headed in perſon. The rebel, not being equally well informed, fell into the ſnare, was defeated, and almoſt his whole army cut off on the 24th of April 1541.

Unſucceſsful attempt to aſſaſſinate Claudius.

Such was the ſituation of affairs when the Portugueſe arrived. The head of the governor of Arkeeko had been received by the queen, who regarded it as a happy inſtance of the valour of her allies, and as a preſage of future victories. The Portugueſe admiral, Don Stephen de Gama, loſt no time in employing the men allowed by the king to aſſiſt the Abyſſinians. Theſe were in number 450; but as the officers who commanded them were all noblemen of the firſt rank, the army was conſiderably increaſed by the number of their ſervants. The ſupreme command was given to Don Chriſtopher de Gama the admiral's youngeſt brother. Almoſt every man on board, however, was ambitious to ſhare in the glory of this enterpriſe; whence great complaints were made by thoſe who were not allowed to go: and hence, Mr Bruce informs us, the bay in the iſland of Maſuah, where the admiral's galley rode, had the name of *Bahia dos Agravados*; the bay of the *injured*, not of the *ſick*, as has been erroneouſly ſuppoſed.

Derivation of the name of a bay in Maſuah.

The Portugueſe under Don Chriſtopher de Gama ſet out to meet the emperor.

This gallant army inſtantly ſet forward by the moſt eaſy road through the Abyſſinian territories, in order to join the emperor. Still, however, the way was ſo rugged, that the carriages of their artillery gave way, and they were therefore obliged to conſtruct new ones as they went along ſplitting the barrels of old muſkets to furniſh them with iron, which was extremely ſcarce in Abyſſinia. In this journey the general was met by the empreſs, attended with her two ſiſters and a great many others of both ſexes, whom he ſaluted with drums beating and colours flying, accompanied by a general diſcharge of the fire-arms, to their great confuſion and terror. Her majeſty, whoſe perſon was entirely covered, indulged the Portugueſe general with a view of her face; and after a mutual exchange of civilities, the queen returned with 100 muſketeers appointed by him as her guard. After eight days-march, through a very rugged country, Don Chriſtopher received a defiance in very inſulting terms from Gragné the Mahometan general, which was returned in the ſame ſtyle. An engagement took place on the 25th of March 1542; in which little was done by either party beſides wounding both the commanders: however, Gragné, though greatly ſuperior in horſe, had already felt ſo much of the Portugueſe valour, that he did not chooſe to venture a ſecond battle.

Abyſſinia.

Interview with the empreſs.

Battle between the Portugueſe and the Moors.

As the ſeaſon was now far advanced, the Portugueſe put themſelves into winter-quarters; while Gragné remained in their neighbourhood, in hopes of forcing them to a battle before they could be joined by the king, who advanced for the purpoſe as faſt as poſſible. This being the caſe, it was to the laſt degree imprudent in Don Chriſtopher to think of venturing an engagement without previouſly forming a junction with his royal ally; eſpecially as Gragné had now doubled the number of his horſe, increaſed his train of artillery, and otherwiſe received conſiderable reinforcements. Unfortunately, however, the Portugueſe general ſuffered himſelf to be hurried away by the impetuoſity of his own temper; and paying regard to the defiances and reproaches of a barbarian whom he ought to have deſpiſed, was induced, contrary to all advice that could be given, to venture an engagement at a vaſt diſadantage. Yet when the armies encountered each other, the ſuperiority of the Portugueſe was ſo great, that victory ſeemed likely to be decided in their favour. On this Gragné ordered ſome artillery to be pointed againſt the Abyſſinian allies. Theſe, entirely unaccuſtomed to fire arms, fled almoſt at the firſt diſcharge. Gragné, well knowing that it was his intereſt to deſtroy the Portugueſe, who were only 400 in number, ordered no purſuit againſt the Abyſſinians, but fell with his whole force upon the Europeans. Even yet his ſucceſs was doubtful, till Don Chriſtopher, expoſing himſelf too much, was ſingled out and ſhot through the arm. This produced ſuch confuſion, that a total defeat, with the loſs of the camp, enſued; when the barbarians, according to cuſtom, put to death all the wounded, and began to abuſe the women, who had all retired into the tent of the general. This being obſerved by a noble Abyſſinian lady married to one of the Portugueſe, ſhe ſet fire to ſome barrels of gunpowder which happened to be in the tent, and thus periſhed along with her raviſhers.

Don Chriſtopher raſhly engages at a diſadvantage.

He is wounded and defeated.

Don Chriſtopher, who by his raſhneſs had occaſioned this diſaſter, obſtinately refuſed to fly, till he was put into a litter by force, and ſet off along with the queen and patriarch, who happened to be preſent. The two latter had ſet off before the battle; but Don Chriſto-

pher

Abyſſinia.

pher ſent ſome horſemen in purſuit of them, by whom they were brought back, and reproached by the general for the bad example they had ſhown to the army. Arriving at the approach of night in a wood where there was a cave, Don Chriſtopher entered it to have his wound dreſſed, but obſtinately refuſed to proceed farther. Next day he was taken; betrayed, as is moſt probable, by a woman whom he loved; who is ſaid to have pointed out this cave to him, and promiſed to ſend ſome friends to convey him into a place of ſafety. Inſtead of this, a party of the enemy entered the cave; and on his readily informing them of his name, they inſtantly carried him in triumph to Gragné. Here, after ſeveral inſults had paſſed on both ſides, the barbarian, in a fit of paſſion, cut off his head; which was ſent to Conſtantinople, and his body cut in pieces and diſperſed through Abyſſinia.

Takes ſhelter in a cave, is taken, and put to death.

Gragne, abandoned by his allies, is defeated and killed.

This cruelty of Gragné proved more detrimental to his cauſe than a complete victory gained by the other party could have been. On the one hand, the Portugueſe were ſo exaſperated by the loſs of their leader, that they were ready to embark in the moſt deſperate undertakings, in order to revenge his death; on the other, the Turks, on whom he principally depended, were irritated to the laſt degree at the diſappointment of ſharing his ranſom, which they imagined would have been an immenſe ſum; and therefore abandoned their leader to return to their own country. Gragné, thus left to decide the quarrel with his Africans, was quickly defeated by Claudius; and in another engagement which took place on the 10th of February 1543, his troops were defeated and himſelf killed. This laſt misfortune was owing to his boldneſs in advancing before his army which was giving way, ſo that he became known to the Portugueſe. On this he was ſingled out by a Portugueſe named *Peter Lyon*, who had been valet de chambre to Don Chriſtopher. This man, to make his aim more ſure, crept for a conſiderable way along the bank of a river towards the place where Gragné was; and when come ſufficiently near, ſhot him quite through the body. Finding himſelf mortally wounded, he quitted the field of battle; and was followed by Lyon, who in a ſhort time ſaw him fall from his horſe. He then came up to him, and cut off one of his ears, which he put in his pocket, and returned to the battle to do what further ſervice he could. The next day Gragné's body was found by an Abyſſinian officer, who cut off his head and claimed the merit of killing him; but Lyon having pulled out the ear which he carried in his pocket, vindicated his own right to the reward which was to be given to the other. On this occaſion the Mooriſh army was almoſt entirely deſtroyed; Gragne's wife and ſon were taken priſoners, with Nur the ſon of Mugdid, who deſtroyed the royal family; and it had been happy for Claudius, as we ſhall afterwards ſee, that he had put theſe priſoners to death. Very ſoon after this engagement, the emperor had intelligence that Joram, a rebel chief who had once reduced his father David to great diſtreſs, was advancing rapidly in hopes of being ſtill able to be preſent at the battle. This was the laſt of his father's enemies on whom Claudius had to revenge himſelf; and this was effectually done by a detachment of his army, who poſted themſelves in his way, fell upon him unexpectedly, and cut him in pieces with all his men.

Joram a rebel chief defeated and killed.

Abyſſinia.

Claudius being now freed from all apprehenſion of foreign enemies, began to turn his thoughts towards the reparation of the damages occaſioned by ſuch a long war, and the ſettlement of religious affairs. We have already mentioned, that John Bermudes was appointed by the Pope, as he ſaid, patriarch of Alexandria, Abyſſinia, and of the ſea. This however, is ſaid by others to have been a falſehood; that John was originally ordained by the old patriarch of Abyſſinia; and that the Pope did no more than give his ſanction to this ordination, without adding any new one of his own. But whether this was ſo or not, certain it is, that John, who was very inſolent in his behaviour, and of a turbulent diſpoſition, now began to inſiſt that Claudius ſhould not only embrace the doctrines of the church of Rome, but eſtabliſh that religion throughout the empire, which he ſaid his father David had engaged to do; and which, conſidering the extreme diſtreſs in which he was involved, it is very probable that he did. Claudius, however, was of a different opinion, and refuſed to alter the religion of the country; upon which a contention began, which was not ended but by the total expulſion of the Catholics, and the cutting off all communication with Europeans. At that time the Portugueſe and Abyſſinians intermarried, and attended religious worſhip promiſcuouſly in each others churches: ſo that the two nations might have continued to live in harmony, had it not been for the miſbehaviour of Bermudes. Claudius, perceiving the violence and overbearing diſpoſition of the man, took every opportunity of ſhowing his attachment to the Alexandrian or Greek church; denying that he had made any promiſe of ſubmitting to the ſee of Rome. On this Bermudes told him that he was accurſed and excommunicated; the king in return called him a Neſtorian heretic; to which Bermudes replied by calling him a liar, and threatened to return to India, and carry all the Portugueſe along with him. To this inſolent ſpeech Claudius anſwered, that he wiſhed indeed that Bermudes would return to India; but that he would not allow the Portugueſe, nor any perſon, to leave his territories without permiſſion.

Diſturbances on affairs of religion.

Altercation betwixt the emperor and the patriarch Bermudes.

Thus matters ſeemed likely to come to an open rupture; and there can be no doubt that the worſt extremities would have followed, had not the emperor been reſtrained by the fear of the Portugueſe valour on the one hand if he ſhould attempt any thing againſt them, and the hopes of further advantages ſhould he retain them in his ſervice. For theſe reaſons he bore with patience the inſults of the patriarch; attempting to gain the reſt of the Portugueſe over to his ſide. He ſucceeded perfectly with their commander Arius Dias, who privately renounced the church of Rome, and was baptized into that of Abyſſinia by the name of *Marcus* or *Marco*; in conſequence of which, the emperor, looking upon him as a naturalized ſubject, ſent him a ſtandard with the Abyſſinian arms to be uſed inſtead of thoſe of Portugal. This, however, was not delivered; for a Portugueſe named *James Brito*, meeting the page who carried it, took it from him and killed him with his ſword. The apoſtaſy of Arius is ſaid to have been owing to the great honours which had been conferred upon

The Portugueſe commander renounces the Romiſh religion.

Abyſſinia. upon him by the Abyſſinian monarch: for having, in an expedition againſt Adel, defeated and killed the king, and taken the queen priſoner, he beſtowed her in marriage on Arius; and that the match might be equal, he raiſed him alſo to the royal dignity, by giving him the kingdoms of Doar and Belwa.

He is inſted with oyal dig-ity.

The altercation on the ſubject of religion becoming every day more violent, Bermudes was prohibited by the emperor from ſending any farther orders to the Portugueſe, they being now under the command of Marco the Abyſſinian captain-general; meaning Arius Dias, to whom the name of Marco had been lately given. To this the patriarch replied, that being ſubjects of the king of Portugal, they were under no obligation to obey a traitor to his king and religion; and that ſince his majeſty ſtill perſiſted in refuſing to ſubmit to the pope, he was reſolved to leave the empire with his forces. The emperor, however, ſtill inſiſted that he was abſolute in his own dominions; and he expected the Portugueſe to pay obedience to his general, and none elſe. The Portugueſe, enraged at this declaration, reſolved to die ſword in hand rather than ſubmit to ſuch terms; and therefore began to fortify their camp in caſe of any attack. The emperor on this, thinking a defiance was given him in his own territories, ordered the camp to be inſtantly attacked. The attempt was accordingly made, but with very little ſucceſs; the Portugueſe having ſtrewed the ground with gunpowder, ſet fire to it as the Abyſſinians marched along, which deſtroyed great numbers, and intimidated the reſt to ſuch a degree that they inſtantly fled. Finding it in vain to think of reducing them by force, the emperor is then ſaid to have been adviſed by Marco to conſult his own ſafety, and break the power of the Portugueſe by artifice. With this view he ſent for the patriarch, pretended to be very ſorry for his frequent breach of promiſe, and deſirous to make what amends for it he could. Inſtead of complying with the patriarch's demands, however, he firſt ordered his ſubjects to ſupply them with no proviſions: then he ſtopped the mouths of the Portugueſe by a conſiderable quantity of gold, giving the patriarch himſelf a very valuable preſent; adding to all this a large ſupply of proviſions; but at the ſame time taking proper methods to diſperſe their leaders into different parts of the empire, ſo that they ſhould find it impoſſible ever to reunite in a body.

Hoſtilities etween he Abyſinians and Portugueſe

Such is the account given of this tranſaction by the Portugueſe hiſtorians; but that of Mr Bruce, who ſays that he tranſlated his from the Abyſſinian annals, is ſomewhat different. He only informs us, that the quarrel betwixt the Portugueſe and Abyſſinians was inflamed by the "incendiary ſpirit of the brutiſh Bermudes: from reproaches they came to blows; and this proceeded ſo far, that one night the Portugueſe aſſaulted the king's tent, where they ſlew ſome and grievouſly wounded others." The event, however, was that no abſolute quarrel ever took place betwixt this emperor and any of the Portugueſe, excepting this patriarch, whom he was on the point of baniſhing to one of the rocks uſed as priſons in Abyſſinia. This was diſpenſed with on the interpoſition of Gaſpar de Suza the new Portugueſe commander (who had ſucceeded Arius Dias), and another named *Kaſmati Robel*, both of whom were in great favour with the emperor; and Bermudes perſuaded to withdraw to India. According to Mr Bruce he repaired to Dobarwa, where he remained two years quite neglected and forlorn, ſaying maſs to no more than ten Portugueſe who had ſettled there after the defeat of Don Chriſtopher. He then went to Maſuah; and the wind ſoon becoming favourable, he embarked in a Portugueſe veſſel, carrying with him the ten perſons to whom he had officiated as prieſt. From Goa he returned to Portugal, and continued there till his death. On the other hand, the Portugueſe writers inform us, that he was narrowly watched by order of the emperor; and that Gaſpar de Suza, the Portugueſe commander, had orders to put him to death if he ſhould attempt to make his eſcape. Bermudes, however, being determined at all events to make his eſcape, pretended to be ill of the gout, and that a change of air was neceſſary for his recovery; for which reaſon he went to the town above mentioned, where there was a monaſtery. On this pretence he was allowed to croſs the kingdom of Tigré, accompanied by eight faithful ſervants, with whom he reached Dobarwa unſuſpected. Here he remained concealed in a monaſtery for two years before he could find an opportunity of getting to the iſland of Maſuah, from whence he proceeded to Goa.

Abyſſinia. Bermudes leaves Abyſſinia.

The emperor was ſcarce freed from this troubleſome prieſt, when he was in danger of being involved in new difficulties by the intruſion of others into his dominions. Ignatius Loyola, founder of the order of the Jeſuits, was at that time at Rome; and ſo much attached to the cauſe of the pope, that he propoſed to go in perſon to Abyſſinia, in order to make a thorough converſion of both prince and people. His holineſs, however, who, from what he had already ſeen of Ignatius, conceived that he might be of greater uſe to him by ſtaying in Europe, ſent in his ſtead Nugnez Barretto, one of the ſociety of Jeſuits, whom he inveſted with the dignity of patriarch, and honoured with a letter to Claudius. With theſe commiſſions, and a number of prieſts, Baretto ſailed for Goa in the Eaſt Indies; by which, however diſtant, the only paſſage to Abyſſinia was at that time. On his arrival at that place he was informed that the Abyſſinian monarch had ſuch a ſteady averſion to the church of Rome, that there was no probability of his meeting with a favourable reception. For this reaſon it was judged more proper to ſend ſome clergymen of inferior dignity, with proper credentials, as ambaſſadors to the emperor from the governor of India, without running the riſk of having any affront put upon the patriarch. Theſe were Oviedo biſhop of Hierapolis, Carneyro biſhop of Nice, and ſeveral others, who arrived ſafely at Maſuah in the year 1558. Claudius, on hearing of their arrival, was greatly pleaſed, as ſuppoſing that a new ſupply of Portugueſe ſoldiers was arrived. Finding, however, that they were only prieſts, he was very much mortified, but ſtill reſolved to give them a civil reception. But a more important conſideration, and which concerned the welfare of the empire in the higheſt degree, now claimed his attention. This was the appointment of a ſucceſſor to the throne, Claudius himſelf having no ſon. A project was therefore ſet on foot for ranſoming Prince Menas, the emperor's youngeſt brother, who had been taken priſoner by the Moors in the time of David, and hitherto detained in captivity on a high mountain in Adel.

A new deputation from the Pope,

Prince Menas is redeemed from captivity.

This

Abyſſinia. This was not likely to be accompliſhed; for the Moors would not willingly part with one who they knew was their mortal enemy, that he might be raiſed to the ſovereignty of a great empire. By detaining him priſoner alſo, they might reaſonably hope for diſputes concerning the ſucceſſion to the Abyſſinian throne; which would enable them to attack the empire with advantage. In theſe circumſtances, it is probable that Claudius would have found great difficulty in procuring his brother's liberty, had it not been that the ſon of the famous Gragné had been taken in that battle in which his father was killed, and in like manner confined on a mountain in Abyſſinia. A propoſal was then made to his mother, who had eſcaped into Atbara, that her ſon ſhould have his liberty, provided the king's brother ſhould be reſtored. This was accepted; and by means of the Baharnagaſh of Maſuah, an exchange was made. Four thouſand ounces of gold were given for the ranſom of Menas, which were divided between the Moors and the baſhaw of Maſuah; while on his part Claudius ſet at liberty Ali Gerad the ſon of Gragné without any farther demand.

According to Bermudes's account of theſe times, the widow of Gragné was taken priſoner at the battle in which her huſband was killed, and was afterwards married to Arius Dias. In this caſe we muſt ſuppoſe her to have been the ſame with the *queen of Adel*, mentioned as his conſort by other hiſtorians: but Mr Bruce treats this account as a mere fable; and informs us, that by means of Nur the ſon of Mugdid, murderer of the royal family as already related, ſhe made her eſcape into Atbara. On that occaſion Nur fell in love with her; but ſhe refuſed to marry any man unleſs he brought her the head of Claudius, who had killed her former huſband. To attain his wiſhes, therefore, Nur, now governor of Zeyla, undertook the taſk; and when Claudius marched towards Adel, ſent him a challenge to fight; telling him that there was yet a particular inſtrument for ſhedding the blood of the Abyſſinian princes, and deſiring him to be prepared, as he was very ſoon to ſet out to attack him. The emperor did not decline the combat, but is ſaid to have been adviſed againſt this expedition by all his friends. This advice ſeems to have proceeded from a number of prophecies, probably trumped up by the clergy, that he ſhould be unfortunate, and loſe his life in the campaign. Theſe prophecies ought no doubt to have had weight with him, as they moſt certainly indicated a ſpirit of diſaffection among his troops; and the event accordingly evinced that it was ſo. The Abyſſinians fled almoſt on the firſt fire, leaving the king in the midſt of his enemies, attended only by 18 Portugueſe and 20 horſemen of Abyſſinia, who continued faithful to the laſt. All theſe were killed after the moſt deſperate reſiſtance; the king himſelf receiving upwards of 20 wounds before he fell. His head was cut off, and brought by Nur to his miſtreſs, who hung it up on a tree before her door. Here it remained for three years, when it was at laſt bought by an Armenian merchant, who buried it at Antioch in the ſepulchre of a ſaint of the ſame name. Nur gained on this occaſion a very complete victory; the king and moſt of the principal nobility being killed, a great number made priſoners, and the camp taken with an immenſe booty. On his return to Adel, he refuſed to accept of any

Nur determines to deſtroy Claudius.

Defeat and death of the emperor.

congratulations, or to allow rejoicings to be made for his victory, but paſſed along in the habit of a common ſoldier mounted on an aſs; ſaying, that he owed the victory to the mercy of God alone, who had immediately interpoſed for the deſtruction of the Chriſtian army. Abyſſinia.

This fatal engagement took place on the 22d of March 1559; and as the ſucceſſion had been already ſettled, Menas aſcended the throne without any oppoſition. On his acceſſion he found his affairs in great confuſion, and he had ſtill to contend with foreign and domeſtic enemies. The firſt of theſe was Radaet the king of the Jews, who had a territory in the empire of Abyſſinia, the capital of which was on a rock named *Samen*. The cauſe of this quarrel is not known, but the event was unfortunate; the king being obliged to abandon the enterpriſe, after having beſtowed a conſiderable time upon it. This was followed by an attempt to aſſaſſinate him, which had very near taken place; and this again by a conſpiracy among his principal nobles headed by Iſaac the Baharnagaſh. He had been a very faithful ſervant of the late emperor Claudius; but ill uſed by Menas, who was of a very haughty and moroſe diſpoſition. In attempting to ſuppreſs this rebellion, the firſt attempts of the emperor were likewiſe ineffectual, his forces being attacked by ſurpriſe and entirely defeated. Soon after this, Iſaac proclaimed Taſcar the nephew of Menas, who was then at liberty, king of Abyſſinia; hoping thereby to ſtrengthen his cauſe, and enable him to cope with the emperor, who was aſſembling a powerful army againſt him. This expedient did not anſwer the purpoſe. His army was entirely defeated by Menas; Taſcar taken priſoner, and thrown headlong from the top of a precipice; and Iſaac himſelf eſcaped with great difficulty to the confines of his own government in the neighbourhood of Maſuah. Here he entered into an alliance with the Turkiſh baſhaw of Maſuah; whoſe friendſhip he gained by putting him in poſſeſſion of the town of Dobarwa, with the flat country adjacent, which abounds with the proviſions wanted at Maſuah, and is looked upon as the key to the province of Tigré and the high lands of Abyſſinia. Beſides this, Iſaac ſtrengthened himſelf alſo by an alliance with the Portugueſe; which, had their numbers been at all conſiderable, muſt have been very formidable. Their inclination to deſert their former protector and ally the emperor, proceeded entirely from the ſhameful behaviour of their prieſts, who never would be ſatisfied without enſlaving the emperor as well as his ſubjects to the tyranny of Rome. We have already ſeen that Bermudes had proceeded ſo far on this ſubject, that he narrowly eſcaped with his life. His ſucceſſor Oviedo (for the patriarch Nugnez died by the way) fared ſtill worſe. On his introduction to the emperor Claudius, he informed him, that the pope and king of Portugal now expected no leſs than an immediate fulfilment of his engagements of ſubmiſſion to the ſee of Rome. This requiſition was made with ſuch an air of inſolence, that the prince could ſcarce conceal his reſentment; but reſtraining his paſſion, he promiſed to conſider of it, and to call meetings of the learned in theſe matters to debate the point. This was a very fruitleſs taſk; and therefore Oviedo thought proper to quit the court towards the end of December 1558; leaving behind him an inſolent letter addreſſed to the

Reign of Menas.

Portugueſe

Abyſſinia. Portugueſe and ſuch converts as they had made; in which he exhorted them not to converſe with ſchiſmatics, and the Abyſſinians to forſake their errors. Being now debarred from acceſs to the emperor, he began to entertain the people with ſeditious diſcourſes; which practice he continued during the remaining part of the reign of Claudius and the beginning of that of Menas. The latter, perceiving the pernicious tendency of his diſcourſes, poſitively commanded him to deſiſt; which the patriarch refuſing, the emperor fell upon him with his own hands, beat him ſeverely, tore his clothes and beard, and took his chalice from him that he might thus be diſabled from ſaying maſs: after which he baniſhed him, with Francis Lopez another of his aſſociates, to a barren mountain, where they remained ſeven months in great miſery. Not content with this, he iſſued many ſevere edicts againſt the Portugueſe; prohibited them from intermarrying with the Abyſſinians; and ſuch of the Abyſſinian women as were already married to Portugueſe huſbands, he commanded not to accompany them to their churches. His next ſtep was to call Oviedo again into his preſence, and command him, under pain of death, inſtantly to leave his dominions. The inſolent and fooliſh prieſt refuſed obedience to this expreſs command: he declared that he would obey God rather than man; and preſenting his bare neck to the emperor, deſired him to ſtrike and put an end to his life at once. Menas drew his ſword, but was prevented by the queen and officers who ſtood near him from giving the fatal ſtroke. A ſecond beating and baniſhment to the mountain ſucceeded; and in the latter part of the ſentence all the Portugueſe prieſts as well as others were included. The Portugueſe, however, determined not to ſubmit to ſuch an indignity; and therefore, to a man, joined Iſaac; who, in expectation of more auxiliaries from India, profeſſed a great deſire of embracing the Romiſh religion. The king was very apprehenſive, and not without reaſon, of the arrival of more Portugueſe; but it appears that Oviedo had not ſufficient intereſt to procure the ſupply he promiſed. An engagement, therefore, took place without them, in which Menas was again victorious; though the battle was not ſo deciſive as to put an end to the rebellion.

Oviedo baniſhed to a mountain.

s commanded to eave the mpire, but efuſes.

entence of aniſhment aſſed on all he Portuueſe, who hereupon oin the ebels.

ſaac again efeated.

The emperor died a ſhort time after his victory, and was ſucceeded in 1563 by his ſon Sertza Denghel, then only 12 years of age. The beginning of his reign was diſturbed by new rebellions; which, however, were happily ſuppreſſed. Iſaac, with his allies the baſhaw and the Portugueſe, ſeem to have remained for ſome time unmoleſted; and in the year 1569, a kind of accommodation took place. It is by no means eaſy to ſay how the Portugueſe were again received into favour after ſuch flagrant treachery and rebellion. Mr Bruce only ſimply tells us that "Oviedo and the Portugueſe did not appear at court." This indeed is not to be wondered at, as they had been ſo lately at open war with the emperor. Other accounts ſay, that after the laſt battle with Iſaac, "their name became ſo odious to all the Abyſſinians, eſpecially to their monarchs, that they would never ſuffer any of them to be in their army from that time." Some of theſe accounts ſay alſo, that Menas was defeated and killed in another battle; others, that he was driven to ſome high mountains, where he wandered about till death put an end to his miſery. Accounts of this kind, however, are by Mr Bruce treated as mere falſehoods, and expreſsly contradictory to the annals of thoſe times. All we can ſay upon the ſubject therefore is, that after the defeat of Iſaac, the Portugueſe, not excepting Oviedo himſelf, remained in Abyſſinia, where they were more favourably dealt with by the new emperor than they had been by his father; though he was no friend to their religion, as ſuppoſing it to be deſtructive of monarchy and all civil government. It is probable alſo, that the various diſturbances which happened, together with his own tender age during the beginning of his reign, would prevent him from paying that attention to them which he would otherwiſe have done. The Galla, a very barbarous nation, and who have at laſt greatly reduced the power of the Ethiopian monarchs, made frequent inroads during this reign; and in the year 1576, a league was formed by Mahomet king of Adel, with Iſaac and the Turkiſh baſhaw, who had either continued their hoſtilities or renewed them about this time. The emperor, however, marched with ſuch expedition, that he did not allow them time to join their forces; and attacking them ſeparately, gained a complete victory over them all. Almoſt the whole Mooriſh army was deſtroyed; but while the emperor entered Adel with a deſign to make a full end of his enemies on the eaſt, he received information that the Galla had invaded his dominions on the weſt. Traverſing the whole breadth of the empire therefore with the utmoſt expedition, he came up with theſe enemies, who were afraid to encounter him. On this he turned his arms againſt the Falaſha, obliging them to deliver up their king, whom he baniſhed to a mountain. Then invading the country of the Galla and Falaſha, he ravaged it for four years ſucceſſively, protecting at the ſame time the kingdom of Narea from the inroads of theſe barbarians.

Iſaac and the baſhaw league with the king of Adel;

but are entirely defeated.

The emperor invades and ravages the country of the Galla and Falaſha.

While Sertza Denghel employed himſelf in repreſſing the incurſions of the Galla, one Cadward Baſha, a Turkiſh officer of great valour and experience, who had been inveſted with the office of baſhaw of Maſuah, began to make inroads into the province of Tigré. The emperor haſtened to oppoſe him; but in his paſſage committed great devaſtations in the country of the Falaſha, in order to provoke them to deſcend from their mountains and come to an engagement. Theſe Falaſha profeſs the Jewiſh religion, and were then governed by a king named *Geſhen*. This monarch, provoked at the ravages and deſtruction he beheld, deſcended with vaſt numbers of his ſubjects, in order to revenge it; but was killed, and his army utterly defeated by the Abyſſinians, on the 19th of January 1594. The victorious Sertza then haſtened to encounter the baſhaw; who, confident of the ſuperiority of his own troops, not only waited for him patiently, but gave him every advantage he could deſire. A very deſperate battle enſued; the event of which was doubtful, till Robel, commander of part of the king's houſehold troops, who were armed with pikes, attacked that part of the Turkiſh horſe where he ſaw the baſhaw, and killed the officer who carried the ſtandard. In doing this he broke his pike; but though then deſtitute of any other weapon than a ſhort crooked knife which the Abyſſinians always carry in their girdles, he inſtantly puſhed up to the baſhaw, and with it wounded him mortally

Tigre invaded by Cadward Baſhaw.

The baſhaw defeated and killed.

Abyſſinia.

tally in the throat. This unexpected event inſtantly decided the victory; the Turkiſh horſe betook themſelves to flight, and the reſt of the army ſoon followed their example. A dreadful ſlaughter enſued among the Moors, who were purſued to the iſland of Maſuah; and many were driven into the deſerts, where they periſhed with thirſt. After this, marching back to the weſtern part of his territories, the emperor proceeded to Narea, deſtroying the Galla as he went along. His laſt expedition was towards Damot to chaſtiſe ſome rebels there. Before he ſet out, a prieſt of great ſanctity and talent for divination, is ſaid to have warned him not to undertake the war; but his advice was rejected with contempt: on which he requeſted him only not to eat the fiſh taken out of a certain river; but this advice was alſo neglected, and the fiſh being really of a poiſonous nature, the king died in conſequence of eating them.

Death of the emperor.

Two ſucceſſors nominated.

On the death of Sertza Denghel a diſpute enſued about the ſucceſſion. In the beginning of his ſickneſs the late king had named for his ſucceſſor his ſon Jacob, a boy of only ſeven years of age; but finding death approaching, he named his nephew Za Denghel, as being come to the years of manhood, and more fit for the government of ſuch a numerous and turbulent people. This laſt reſolution proved highly diſagreeable to the queen and ſome of the principal nobility, who wiſhed for a minority, during which they might engroſs the power into their own hands. In conjunction with her two ſons in-law, Keſla Wahad and Ras Athanaſius, therefore, the empreſs determined to raiſe Jacob to the throne, notwithſtanding the final determination of the late king above mentioned. This was put in execution immediately after the death of Sertza Denghel; Jacob was raiſed to the throne, and Za Denghel confined in an iſland of the lake Dembea or Tzana. An attempt was likewiſe made to ſeize Socinios, natural ſon to Facilidas grandſon of the unfortunate David, who had likewiſe a claim to the throne; for his not being born of a lawful marriage was no objection in Abyſſinia. Socinios, however, no ſooner ſaw the fate of his couſin Za Denghel, than he withdrew himſelf from the power of his enemies; and Za Denghel himſelf, after being a ſhort time confined in the iſland above mentioned, found means to eſcape, and took refuge among the inacceſſible mountains of Gojam.

Jacob raiſed to the throne.

Thus diſappointed in their attempts on the princes, the empreſs, with her two ſons-in-law, were obliged to pretend loyalty to Jacob, whom they governed till he was 17 years of age. The young king then perceiving that his tutors were taking ſome ſteps to prolong their dominion over him, took the government into his own hands, and baniſhed one Za Selaſſe, whom they had employed in the execution of their projects, to the kingdom of Narea. The conſpirators, alarmed at this bold exertion of royal prerogative, determined inſtantly to depoſe Jacob, and raiſe Za Denghel, whom they had baniſhed, to the throne. This, however, was now a matter of ſome difficulty, as he had concealed himſelf ſo effectually among the mountains of Gojam, that he could ſcarce be found out. His retreat being at laſt diſcovered, Ras Athanaſius took an opportunity of inſulting Jacob, even while ſitting on the throne; called him an obſtinate, ſtubborn, and fooliſh boy; declared him degraded from the imperial dignity, and that Za Denghel was coming to ſupplant him. Jacob perceiving by the inſolence of this ſpeech, that he was entirely in the power of his enemies, left his palace in the night, in order to fly to the mountains of Samen, where his mother's relations were, from whom he expected protection. He got to the borders of that country, but was there diſcovered, ſeized, and brought back to his rival, who was now ſeated on the throne. Za Denghel, however, with a clemency not very uſual in Abyſſinia, did not either put him to death, or mutilate him in ſuch a manner, as to render him incapable of afterwards enjoying the kingdom; but contented himſelf with baniſhing him for life, to Narea.

Za Denghel raiſed to the throne.

Abyſſinia.

Jacob baniſhed.

Za Denghel was no ſooner ſettled on the throne, than he unluckily behaved in ſuch a manner as to alienate the affections of his people from him entirely. This was occaſioned by his attachment to the church of Rome. Ever ſince the time that the Portugueſe had joined Iſaac the Baharnagaſh, the entrance into Abyſſinia had been ſhut up by the Turks, ſo that no new miſſionaries could have acceſs; and all thoſe who came with Oviedo being dead, the Romiſh religion had languiſhed for want of preachers to ſupport it. The laſt of theſe died in 1596; and all the reſt having been dead ſome time before, little could be expected from the labours of a ſingle perſon. Next year Melchior Sylvanus, a vicar of the church at Goa, was ſent on a miſſion to Abyſſinia; being ſuppoſed to be a proper perſon for this work, on account of his language and complexion which might baffle the vigilance of the Turks. He entered without being ſuſpected; but the great defeat given the Turks by Sertza Denghel, already mentioned, had reduced their power ſo much, that leſs danger now attended this expedition than formerly, and other miſſionaries quickly followed.

Decline of the Romiſh religion in Abyſſinia.

The moſt learned, as well as the beſt qualified for the undertaking in every reſpect, was *Peter Paez*, who came to this country in the year 1600; and on his taking upon him the whole charge of the miſſion, Sylvanus returned to India. The new miſſionary did not at firſt affect to intrude himſelf on the emperor; but taking up his reſidence at the convent of Fremona in the province of Tigré, he firſt applied to the ſtudy of the learned language of the Abyſſinians called *Geez*, and in which their books are uſually written. In this he made ſuch progreſs as quickly to ſurpaſs the natives themſelves; after which he ſet up a ſchool, where the children of the Portugueſe and Abyſſinians were taught promiſcuouſly. The progreſs made by his ſcholars was ſo great, that he was ſpoken of at court, and recommended in the warmeſt terms to the emperor Jacob before his depoſition. On this he was ſent for, and appeared before the court in 1604; where, to the great diſſatisfaction of the Abyſſinian monks, he received ſuch honours as are uſually beſtowed on men of the firſt quality. Next day, in a diſpute before the king, two of his ſcholars, whom he had brought along with him, fairly vanquiſhed the beſt theologians that could be found to oppoſe them. Maſs was then ſaid in the Romiſh manner; and this was followed by a ſermon, which in the purity and elegance of its diction (whatever the ſubſtance might be) excelled any thing that had ever been compoſed in the Abyſſinian language.

Peter Paez reſtores it.

He arrives at court.

Though Paez had been called to court by Jacob, yet Za Denghel was on the throne before he arrived, and

it

Abyſſinia.

The emperor embraces the Catholic religion.

it was he who witneſſed the diſpute and heard the ſermon. He was ſo much charmed with the latter, that he inſtantly reſolved to embrace the religion of the church of Rome; which reſolution he ſoon after communicated to ſeveral of his friends, and even to Pacz himſelf; but under an oath of ſecrecy. The emperor's own zeal, however, rendered this oath of no uſe; for in a little time he iſſued proclamations forbidding the obſervation of the Jewiſh Sabbath, and wrote letters to Pope Clement VIII. and Philip III. of Spain, deſiring a ſupply of mechanics to inſtruct his people in the uſeful arts, and Jeſuits to teach them religion.

His imprudent conduct occaſions a rebellion.

This precipitate conduct had the effect which might have been expected. The Abyſſinians were generally diſaffected to the church of Rome, and no pains had been taken to gain them over: they were alſo turbulent, ſavage, and rebellious; ever ready to revolt; and now had a ſavourable opportunity of excuſing their treaſons upon pretence of zeal for religion. This opportunity was quickly made uſe of by Za Selaſſe, whom, as we have already mentioned, Jacob had baniſhed; but who, on the advancement of Za Denghel, had probably been ſet at liberty. This traitor having

The emperor excommunicated.

firſt held many ſeditious meetings in private, prevailed on the Abuna, or Abyſſinian patriarch, to excommunicate the king, and abſolve his ſubjects from their allegiance. He then ſet out for the territory of Gojam, where the people had always been remarkable for their averſion to the church of Rome. In this place, therefore, he found no difficulty in raiſing an army to fight againſt his ſovereign. Za Denghel, who was an expert warrior, did not fail to go in queſt of him with

An army raiſed againſt him.

what forces he could raiſe; but ſoon found, by the great deſertion among his troops as he paſſed along, how much the excommunication pronounced by the Abuna had availed. This was ſo alarming, that John Gabriel, an experienced Portugueſe officer, adviſed him to decline an engagement for the preſent, and take ſhelter in ſome fortreſs until his ſubjects ſhould return to a ſenſe of their duty. This ſalutary advice was rejected, from the abſurd notion that it was a diſhonour not to fight a rebel who had deſied his ſovereign. In the beginning of the engagement, victory ſeemed to favour the royal cauſe. The Portugueſe carried every thing before them, and routed that wing of the enemy which oppoſed them. In the other wing, however, the cowardly and treacherous Abyſſinians deſerted their king, who was quickly ſurrounded by his

He is abandoned by his troops and killed.

enemies, and left in a deſperate ſituation. A body of nobility, with his own officers and domeſtics, attended him and fought deſperately in his defence. Za Denghel himſelf, being an excellent horſeman, and admirably ſkilled in the uſe of arms, performed aſtoniſhing feats of valour. At laſt he was thrown to the ground, grievouſly wounded in the breaſt by a lance. Notwithſtanding this, he inſtantly recovered himſelf, drew his ſword, and reſiſted his aſſailants ſo violently, that they were fain to keep at a diſtance and annoy him with miſſile weapons. In this ſituation he ſtood till almoſt fainting with fatigue and loſs of blood; when the traitor Za Selaſſe, puſhing up his horſe violently againſt him, threw him to the ground by a blow on the forehead, and a multitude then ruſhing upon him he was diſpatched with many wounds.

Abyſſinia.

His death univerſally lamented.

The news of Za Denghel's death were received with ſuch general indignation throughout the Abyſſinian empire, that the rebels durſt not name any ſucceſſor. As it ſeemed natural to think, however, that Jacob would now be re-elected, meſſengers were diſpatched to acquaint him of his good fortune; but during this

The empire claimed by Socinios.

interval Socinios appeared, not as a candidate, but as already in poſſeſſion of the empire, and ready to ſupport his rights by force of arms. His firſt ſtep was to let Ras Athanaſius know his pretenſions to the throne, and deſire his aſſiſtance with his army, promiſing to reward him as ſoon as it ſhould be in his power. Without waiting for any anſwer, he advanced ſo rapidly, that Athanaſius had ſcarce time to conſider what he ſhould reply, when a ſecond meſſage was ſent, importing that Socinios was in the neighbourhood, and ordering preparations to be made for receiving him as his ſovereign. This expeditious mode of action ſo much confounded Athanaſius, that he complied with the requiſitions, ſaluting him king, and joining his troops to his. Thus ſucceſsful in his firſt attempt, Socinios made a ſimilar one on Za Selaſſe. In this, however, he was diſappointed. Za Selaſſe having firſt ſent an equivocal anſwer, marched againſt him with his whole army; while Socinios, happening to fall ſick, and putting little confidence in Athanaſius, withdrew to the mountains of Amhara. Athanaſius likewiſe, not knowing to whom he ſhould attach himſelf,

He is obliged to retire.

withdrew his forces, and ſtood neuter.

Za Selaſſe had refuſed to join Socinios, in expectation that Jacob would make his appearance, whom he rather wiſhed to enjoy the crown than Socinios; as under the former he might hope to engroſs all the power to himſelf. For a long time, however, no anſwer was returned to his meſſages; his troops became impatient; ſo that fearing leſt a mutiny or general deſertion ſhould take place, he diſpatched a meſſenger to Socinios, acknowledging him for emperor. But ſcarce

Jacob ſet up in oppoſition to him.

was this done, when a meſſenger arrived from Jacob, informing him that he was then in Dembea, and promiſing Za Selaſſe great honours if he would acknowledge him for his ſovereign. With theſe terms the traitor inſtantly complied, and his example was followed by Athanaſius; while Socinios, not as yet able to reſiſt all his enemies, retired again to Amhara. This, however, he was not long of accompliſhing. Jacob was by no means poſſeſſed of equal military ſkill; and though Za Selaſſe was an experienced officer, yet his extreme perfidy, pride, and obſtinacy, rendered it very dangerous to have any concern with him. This

Bad conduct and defeat of Za Selaſſe

appeared remarkably in the preſent caſe. His pride in the firſt place would not allow him to join his forces to thoſe of Jacab, leſt the latter, who was inferior in military ſkill, ſhould have a ſhare in the victory he was

Jacob's general.

to gain. Then, intoxicated with his opinion of himſelf, he neglected to behave with the caution neceſſary in the neighbourhood of ſuch an experienced general as Socinios, which gave the latter an opportunity of cutting off almoſt his whole army. Being now obliged to fly with a few attendants to Jacob's camp, he met with an indifferent reception on account of his defeat; for which reaſon he made propoſals to join Socinios. The latter accepted his offer, though he could put no confidence in one who had been guilty of ſuch complicated treachery; only he thought it would be an

Abyſſinia.

Jacob defeated and killed.

advantage to put it out of his power to join his antagoniſt. Jacob, on the other hand, confident in his numbers, which are ſaid to have been almoſt 30 to 1, advanced boldly to give his antagoniſt battle. Socinios declined the engagement till he had drawn him into a ſituation where his forces could not act with advantage. A dreadful carnage enſued, Jacob himſelf perithed among the multitude, and his body was never afterwards found. In this battle alſo was killed the wicked prieſt Abuna Petros, who was the occaſion of Za Denghel's death, as we have already related. Ras Athanaſius eſcaped by the ſwiftneſs of his horſe, and took refuge in a neighbouring monaſtery. He was afterwards pardoned at the interceſſion of Peter Paez; but his goods and eſtate being confiſcated on various occaſions, he fell into univerſal contempt, was abandoned by his wife, and died at laſt of want. According to the Abyſſinian accounts, Socinios ordered the purſuit to be ſtopped as ſoon as he ſaw the head of Abuna Petros; but the Portugueſe writers inform us, that he kept it up with the utmoſt vigour throughout the whole day and part of the night. They particularly mention, that a number of Portugueſe, who had joined the army of Jacob, loſt their lives on this occaſion, by falling over a precipice which they could not avoid in the dark. One of theſe named *Manual Gonſalvez* had the good fortune to light on a tree, where he ſat till morning in great terror, but at laſt was relieved and made his eſcape.

By this victory Socinios was fully eſtabliſhed on the throne, though his ſituation might ſtill be accounted precarious by reaſon of the rebellious diſpoſition of many of the provinces. He began with making a general proclamation of pardon, excepting only the murderers of Za Denghel, with whom he had been in terms of intimate friendſhip. Being informed therefore, that one *Mahardin*, a Moor, had given him the firſt wound in that battle in which he was killed, he ordered his head to be inſtantly ſtruck off with an axe before the gate of the palace.

Socinios favours the Portugueſe.

The Portugueſe were much favoured by this prince; and they were become very numerous by continual intermarriages with the Abyſſinians; the male children were always trained to the uſe of fire arms by their parents, and incorporated as ſoldiers with them; and they were now all united in one body under an experienced officer named *John Gabriel*, whom we have already had occaſion to mention. As their numbers and valour made them objects of conſideration, Socinios determined to attach them to himſelf as much as poſſible; and the beſt means to do this he knew was by favouring their prieſts. Peter Paez was therefore ſent for to court; where a diſpute concerning the ſupremacy of the pope and the two natures of Chriſt (the great ſubjects of debate in Abyſſinia), took place, and a ſermon was preached with as great ſucceſs as that in Za Denghel's time. The king firſt enlarged the territory poſſeſſed by the Jeſuits at Fremona; after which he declared to Paez his reſolution of embracing the Catholic religion; giving him at the ſame time two letters, one to the king of Portugal, the other to the pope, the purport of which was to requeſt a number of more Portugueſe to deliver Abyſſinia from the incurſions of the Galla, as they had formerly done from the yoke of the Moors.

He reſolves to embrace the Catholic religion

Before any thing of importance could be done in matters of religion, the king was called forth to ſuppreſs a rebellion which had already taken place. An impoſtor had appeared, who called himſelf *Jacob* the late king, and pretended to have eſcaped from the battle; but ſo much wounded in the face that he kept one ſide of it conſtantly covered to conceal the deformity. He made his appearance among the mountains of Habab near Maſuah; and being joined by great numbers of people, Sela Chriſtos, brother to the king, and governor of Tigré, marched againſt him. The impoſtor's troops, though numerous, fled at the firſt onſet; but he eſcaped to the mountains, where it was very difficult to follow him. This, however, was attempted; and a great many of the poſts he had taken were ſtormed like as many forts; but ſtill the impoſtor himſelf, though driven from place to place, found means to make good his retreat to the country lying between the mountains of Habab and the territory of the Baharnagaſh. Thither he was purſued by Sela Chriſtos; but that general, finding the rebellion likely to ſpread through the whole province of Tigré, thought proper now to acquaint his brother Socinios with the ſtate of affairs, and to deſire his aſſiſtance. The king, though at that time he had ſent away moſt of his troops in an expedition againſt the Shangalla and Gongas, who dwell on the north-weſt of Abyſſinia, ſet out immediately with ſuch troops as he could collect. Theſe were but few in number; his cavalry, particularly, amounting to no more than 530, beſides a ſmall reinforcement brought by his brother Emana Chriſtos, governor of Amhara. As he proceeded, he was informed that a party of Galla were lodged on a hill at no great diſtance from him. Determining to cut them off, he ſurrounded the hill where they were poſted; but having cauſed his cavalry to advance before, and paſs a deep ravine, they were almoſt entirely deſtroyed, while the reſt of the army were ſeized with ſuch a panic that they refuſed to ſtir. In this extreme danger, the Galla paſſed the ravine to attack them; but the king having advanced ſingly, and killed the firſt of them, his troops, aſhamed of their cowardice, ruſhed forward on the enemy, and gained a complete victory, which obliged the ſavages to leave the province they infeſted at that time.

Abyſſinia.

An impoſtor pretending to be the late emperor Jacob appears.

Is defeated

The Galla defeated.

The misfortune of the cavalry on this occaſion quickly occaſioned a report that the king had been defeated; of which the impoſtor Jacob did not fail to take advantage; and deſcending from his mountains, committed great devaſtations in the low country. But though attended by a great multitude, who likewiſe fought with more obſtinacy than formerly, he was ſtill defeated by Sela Chriſtos with a force greatly inferior. But before any thing effectual could be done for his reduction, the Galla made a dreadful irruption into the ſouthern provinces, murdering all who fell into their hands, and burning and deſtroying towns, churches, and villages, in the moſt dreadful manner. The king bore thoſe exceſſes for ſome time with patience, till at laſt he drew them into ſuch a diſadvantageous ſituation, that being ſurrounded by his forces, and inferior in number as well as in valour, they were all cut off to a man, with the loſs of only 400 on the part of the Abyſſinians. Soon after this victory the king underwent the ceremony of coronation. He then marched

An army of Galla cut off.

Coronation of the king

Abyſſinia

ed againſt the impoſtor Jacob; but the latter was too ſenſible of the ſuperiority of his rival to face him in the field. He therefore retired again to his mountains, while the king left the ſuppreſſion of the rebellion to an experienced officer named Amſala Chriſtos; who employed two young men, who had been outlawed for murder, to aſſaſſinate the impoſtor. This being done, it was found that the pretended Jacob was no other than a herdſman among thoſe mountains to which he ſo conſtantly fled for refuge; and that he had neither wound nor ſcar on his face, but had kept one half of it covered to conceal the little reſemblance he bore to Jacob whom he perſonated.

The impoſtor Jacob aſſaſſinated.

The king being now freed from this rebellion, began again to turn his thoughts towards religion. His firſt ſtep was to make a handſome preſent to the Jeſuits; but he ſoon ſhowed his inexperience in religious matters, by attempting to reconcile the two contending parties in his empire. Before he could ſee the folly of this attempt, however, his attention was called by a moſt dangerous rebellion, which was begun by one Melchizedec, a ſervant of the late Sertza Denghel, but a man of great experience in war. He was firſt oppoſed by Sanuda, a brave officer; but being totally deſtitute of troops, he was obliged to apply to the attendants of the king of Sennaar, who had been depoſed by his ſubjects, and was at that time in Abyſſinia. Theſe readily joined him; and a bloody battle enſued, in which Sanuda was ſo totally defeated, that he alone had the good fortune to eſcape, and that grievouſly wounded, his men being all killed on the ſpot. On this misfortune Socinios ſent his brother Emana Chriſtos with a conſiderable force to reduce the rebels. Melchizedec finding himſelf oppoſed by ſuch an able general, exerted himſelf to the utmoſt, in order to raiſe a force ſufficient to reſiſt him; and in this he ſucceeded ſo well, that his army ſoon ſtruck terror into all the neighbouring country, notwithſtanding the preſence and known valour of the king's brother. A prince of the blood-royal, named *Arzo*, was likewiſe found out and proclaimed king, in order to give ſome ſanction to the rebels; ſoon after which they boldly marched to meet the royal army. The engagement took place on the 9th of March 1611, and was fought with great obſtinacy on both ſides; the advantage even appeared for ſome time on that of the rebels; till Emana Chriſtos, perceiving that all was at ſtake, puſhed deſperately forward to the place where Melchizedec himſelf was. The latter ſeeing no probability of avoiding a ſingle combat, which he did not chooſe to try, inſtantly turned his horſe and fled; and the reſt of the army ſoon followed his example. Melchizedec, however, did not much avail himſelf of this cowardice; for he was cloſely purſued by the peaſants, taken priſoner, and executed as a traitor, together with ſeveral of his principal officers. The fate of Prince Arzo, whom, to ſupport their cauſe, the rebels had proclaimed king, is not known.

Dangerous rebellion begun by Melchizedec.

Defeats one of the king's generals.

Cauſes Arzo be proclaimed king.

Is defeated, taken priſoner, and put to death.

This victory, ſo far from extinguiſhing the ſpirit of rebellion, ſeemed to have inflamed it beyond all bounds: for news were now received that the whole country round the head of the Nile to the province of Tigré had revolted; ſo that there was a neceſſity for the immediate preſence of the emperor himſelf; and even this was inſufficient, as the rebels were diſperſed over

The rebellion continues.

ſuch a large tract of territory. His two brothers, Emana and Sela Chriſtos, were therefore both employed againſt different rebel chiefs, while the king marched againſt thoſe who were moſt formidable. The principle on which this war was carried on ſeems to have been very cruel, viz. that of killing all the men, and carrying off the women and children for ſlaves. This was rigidly executed, firſt upon the inhabitants of a mountainous diſtrict named *Guſman* on the Nile; though, at the interceſſion of the miſſionary Peter Paez, the women and children, inſtead of being ſold for ſlaves, were given to the Jeſuits to be educated in the Catholic religion. The Gongas and Agows were next attacked with equal ſucceſs, and ſtill greater cruelty; one of their tribes named *Zalabaſſa*, being almoſt entirely exterminated: but this, inſtead of having any good effect, ſeemed to multiply the rebels ſtill more. The Agows and Galla invaded the provinces in the neighbourhood; and another impoſtor, whoſe true name was *Amdo*, but who pretended to be the unfortunate emperor Jacob, appeared as a competitor for the crown. This laſt rebel proved much more formidable than any of the reſt. He was indeed ſurpriſed before he had time to collect any forces; but Gideun, king of the Jews of Samen, having killed the guards who watched him, ſet the impoſtor at liberty, and ſupported his cauſe. Thus he ſoon collected a very formidable army, with which he defeated and killed an officer named *Abram*, who oppoſed him with a conſiderable force. This brought Socinios himſelf againſt him, who inſtantly attacked the Jewiſh monarch Gideon, as being the principal ſupport of his cauſe. As the country of the Jews was naturally ſtrong, and very full of fortified places, the reduction of it was evidently a very difficult taſk. The firſt place attacked was a fortreſs named *Maſſiraba*; which, though very ſtrongly fortified and garriſoned, was ſoon taken by ſtorm, and every one in it put to the ſword without diſtinction. Hotchi and Amba Za Hancaſſe, two other ſtrong fortreſſes, ſhared the ſame fate. A fourth, named *Senganat*, no leſs ſtrong than any of the former, was alſo taken; Gideon himſelf narrowly eſcaping with his life in the attack. Diſcouraged therefore by ſo many misfortunes, and apprehending the total ruin of his country, this prince at laſt was content to ſue for peace; which was granted on condition that Amdo ſhould be delivered up. This traitor was condemned to a puniſhment very unuſual among Chriſtians, viz. that of being crucified; but in nailing him to the croſs, his cries and groans ſo much affected the king, that he ordered him to be taken down and beheaded.

Abyſſinia.

Cruel manner of carrying on the war.

Amdo, another impoſtor, aſſiſted by the Jews.

War with Gideon.

Amdo delivered up and put to death.

The war was now reſumed againſt the Gongas and Guba; whom the king annually invaded for the purpoſe of making ſlaves. In this expedition his officers not only executed their commiſſion againſt theſe ſavages, but likewiſe carried off a great number of cattle from the Agows, who were then at peace with the emperor. This conduct was highly reſented by Socinios, who obliged them to make reſtitution of what they had taken away; and the doing them juſtice in this particular, had more effect in reducing the reſt of theſe people to obedience, than all the cruelties which had been committed ſince the beginning of the war.

Other military expeditions.

In 1616, the emperor ſet out on an expedition againſt the Galla: but this was laid aſide on the death

Abyſſinia. of his eldeſt ſon, for whom he entertained a great affection. It was ſucceeded by a very cruel order againſt the Jews, whom Socinios now determined to exterminate without any apparent occaſion. His commands, however, were executed with the utmoſt punctuality, ſo that very few eſcaped; and among the reſt periſhed their prince Gideon lately mentioned. He was ſuppoſed to be immenſely rich, and to have concealed his riches, which have been ſought for in vain by the Abyſſinians from that time to the preſent. The children of the murdered Jews were ſold for ſlaves; and ſuch of the profeſſion as were ſcattered through the empire, had orders to renounce their religion and be baptized, under pain of death. Thus almoſt the whole Jewiſh religion was extinguiſhed at once, as moſt of them choſe rather to embrace Chriſtianity than ſuffer death. In token of the ſincerity of their converſion, they were all ordered to plough and harrow on the Sabbath day.

The Jews exterminated.

Succeſsful expedition againſt the Galla.

After this maſſacre, the expedition againſt the Galla was reſumed, and carried on with the uſual cruelty: while the Galla never once appeared to prevent the deſolation of their country. Next year, however, a new aſſociation was made among theſe ſavages, and the empire invaded by them in two different parts at once. One of their armies was cut off to a man before they had time to begin their ravages; while the other fled on the firſt approach of the royal army, leaving their wives, children, and baggage, to the mercy of the enemy. Thus the king was left for a ſhort time at reſt from rebellions or foreign invaſions; and this interval he determined to make uſe of in making war on his neighbour the king of Sennaar, from whom he had formerly received an affront. In this expedition he was aſſiſted by one Wed Ageeb, a prince of the Arabs, who lived on the frontiers of Abyſſinia. The allies proceeded with their uſual cruelty, killing all the men, and ſelling the women and children for ſlaves. Vaſt numbers of cattle were carried off; and the victorious armies returned with an immenſe booty. The next expedition was againſt Fatima queen of the Shepherds, otherwiſe called *queen of the Greeks*, who reſided on the north-eaſt of Atbara. In this alſo the king proved ſucceſsful, though leſs blood was ſhed than uſual: but it was not long before this extraordinary ſucceſs met with a ſevere check by the entire loſs of an Abyſſinian army; the favourite ſon of the emperor himſelf being killed in the engagement, with ſome of the beſt officers in the empire.

War with Sennaar, &c.

Progreſs of the Romiſh religion.

All this time Peter Paez had applied himſelf with the utmoſt aſſiduity to the converſion of the Abyſſinians to the Catholic faith; and in this undertaking he had been attended with wonderful ſucceſs. He was indeed ſingularly qualified for an undertaking of this kind among a rude and barbarous people: for beſides an uncommon ſhare of learning, he poſſeſſed an eminent degree of ſkill in the mechanical arts; by which he was enabled to teach the Abyſſinians how to build houſes of ſtone and lime, which they had never known before. In theſe he was at firſt maſon, carpenter, ſmith, and architect, himſelf; and thus, to the aſtoniſhment of the whole empire, he built ſome churches and a palace for the king. His univerſal genius prepared the people for the reception of his opinions; while the barbarous ignorance and ſavage manners of his antagoniſts tended to prejudice every one againſt their tenets, though ever ſo juſt in themſelves. Sela Chriſtos, the king's brother, is ſaid to have been converted by only reading the Abyſſinian books with attention; in which, it ſeems, the ignorance of the prieſts had been diſplayed in an extraordinary manner. We have already ſeen how well the emperor himſelf was diſpoſed towards the Romiſh church; and his example was followed by many of the principal people of the kingdom. At laſt the Abyſſinian patriarch, named *Simon*, made a complaint that irregularities in religion had been committed, and diſputes held on matters of faith, without calling him, or permiſſion granted him, to ſupport the clergy in theſe controverſies. As Socinios had no high opinion of this prieſt's learning or eloquence, he did not imagine that any harm could enſue to the cauſe from granting what he wanted. A public diſpute was accordingly appointed; in which Simon's inferiority was ſo apparent, that Socinios now publicly declared his belief in the two natures of Chriſt.

Excellent character of Peter Paez.

Abyſſinia.

While the converſion was in this proſperous way, letters arrived from the pope and king of Spain, but without any promiſe of the temporal aſſiſtance which had been ſolicited; though they aſſured him of an ally far ſuperior, the Holy Spirit himſelf, provided the emperor continued firm in his reſolutions of embracing the Catholic faith. Socinios would probably have been as well ſatisfied with an account of a reinforcement of ſoldiers; but as matters ſtood, he was obliged to be content, and reſolved to ſubmit in form to the pope, renouncing for ever his connexion with the Greek church. As it was improper, however, to ſend letters on a ſubject of ſuch importance by a common meſſenger, proper perſons were to be appointed who might occaſionally aſſume the character of ambaſſadors, and act accordingly. This being reſolved on, the next thing was to determine the way by which the ambaſſadors were to reach Europe. The uſual track by Maſuah was now ſhut up on account of the rebellion which exiſted in the neighbouring provinces; ſo that the more eligible way ſeemed to be through Narea and the provinces to the ſouthward, by which they might reach Melinda, and from thence embark for Goa.

Letters from the pope and king of Spain.

Determine to ſubmit to the pope.

The ambaſſadors were choſen by lot; which falling firſt on Antonio Fernandez, he named Fecur Egzie as his companion; and, all things being ſettled, theſe two ſet out for Gojam in the beginning of March 1613. It ſeems ſurpriſing that the Abyſſinian monarch ſhould have ſent ambaſſadors on ſuch a dangerous expedition through barbarous countries, without being accompanied by a proper guard. This, however, ſeems undoubtedly to have been the caſe; as we hear of no other attendants than ten Portugueſe, whom Fecur Egzie took with him, ſix of whom were to go no farther than Narea, but the other four were to proceed to India: forty men armed with ſhields and javelins were alſo granted, but this force was much too ſmall to anſwer any uſeful purpoſe. Sela Chriſtos indeed furniſhed them with guides from the barbarous nations in the neighbourhood of Narea, taking hoſtages for the ſecurity of the travellers; but the inſufficiency of theſe precautions ſoon appeared. Our travellers had proceeded but two days journey into the country

Ambaſſadors ſet out for Europe.

Account of their journey.

Abyſſinia. country of the Gongas, when they were treated in ſuch a hoſtile manner, that one of the Portugueſe was obliged to return with Fernandez to complain of the treatment of the ſavages. On this information Sela Chriſtos inſtantly diſpatched three officers, with a proper number of troops, to chaſtiſe them; by which means the ambaſſadors got ſafe to Mine, the name of ſome miſerable villages on a ford of the Nile. Here they croſſed the river on ſkins blown up, and next day entered the country of the Pagan Galla; and ſoon after, though not without great difficulty, they reached the kingdom of Narea, the moſt ſouthern province of the Abyſſinian empire, but quite ſurrounded by the Galla. Here they were received with great kindneſs by the commanding officer of the firſt fortified place they came to; but on being introduced to the king himſelf, they met with a very indifferent reception. This was owing to the inſinuations of an Abyſſinian monk, that they were to bring Portugueſe ſoldiers that way into Abyſſinia; which would be deſtructive to his kingdom. On calling a council, it was reſolved to ſend them into the kingdom of Bali; ſo that they would be obliged to paſs through a much more difficult and dangerous road than what was firſt intended. Having thus, as he ſuppoſed, provided againſt the danger which threatened his kingdom, he made them a preſent of 50 pieces of gold, recommending them at the ſame time to the ambaſſador from the ſovereign of Gingiro, through which they were next to paſs.

On leaving Narea, they received a convoy of 80 ſoldiers to conduct them ſafely to their next ſtage; after which they paſſed four days through countries totally laid waſte by the Galla, and where they were obliged to hide themſelves for fear of meeting with theſe ſavages. Proceeding ſtill through woods and vaſt chains of mountains, they came to the river Zebee, or more properly *Kibbee*, from its white colour reſembling melted butter, as the word imports. Fernandez deſcribes this river as larger than the Nile, and vaſtly more rapid. They paſſed it by a kind of bridge, but certainly a moſt tremendous one. The channel of the river is full of rocks; and betwixt every two of theſe a ſingle tree was laid, ſo elaſtic that it would bend with the weight of one perſon; while the vaſt height of the precipice, and the ſight of the roaring current below, was ſufficient to ſtrike the boldeſt with terror. At a ſmall diſtance from this bridge was a ford, through which it was neceſſary that their mules ſhould paſs; which being accompliſhed without any accident, though with difficulty and danger, they entered the territory of Gingiro. Here they were hoſpitably received by the ſovereign, and after a mutual exchange of preſents proceeded to Sangara, the capital of another ſmall kingdom named *Cambat*, which was at this time governed by a Moor named *Amelmal*. During the time of their reſidence here, one Manquer, a ſchiſmatic Abyſſinian, arrived, who inſinuated to the king that the recommendations they had brought along with them were falſe. This reduced them to the neceſſity of ſtaying there till meſſengers could be ſent to Socinios to know whether it was ſo or not; which occaſioned a delay of three months. At laſt orders were brought to ſend them off immediately. This favourable anſwer procured the diſmiſſion of the ambaſſadors with preſents; while the malicious Manquer was detained priſoner. He eſcaped, however, and overtook them in the next kingdom, named *Alaba*, which was governed by a Moor named *Aliko*. Here he acuſed them of a deſign to overturn the Mahometan religion altogether: which ſo exaſperated the barbarian, that he threatened them all with death; and actually put them in priſon, where ſome of the Portugueſe died. At laſt, after holding a council, in which Manquer gave his voice for putting them to death, it was reſolved that they ſhould be ſent back to Amelmal; which was accordingly done, and from his dominions they returned to Abyſſinia. Thus ended this memorable embaſſy, by which the pope was deprived of any authentic documents which might ſhow that any Abyſſinian emperor had ever voluntarily ſubmitted to him; and there can be no doubt that this miſcarriage, more than any thing elſe, prevented the eſtabliſhment of Popery in this country.

Abyſſinia.

Deſcription of the river Zebee.

The ambaſſadors are obliged to return.

Socinios had now gone ſo far in favour of the Catholic party, that he began to ſhare in ſome meaſure the fate of Za Denghel; numberleſs conſpiracies being formed againſt him, which it was undoubtedly owing only to the altered ſituation of affairs by the preaching and aſſiduity of Peter Paez, that he was able to withſtand. The conſpirators were at this time ſupported, not only by the Abuna, but by Emana Chriſtos himſelf, the king's brother, whom we have frequently had occaſion to mention. Their firſt ſtep was the very ſame which had been ſo ſucceſsfully taken by Za Selaſſe in the time of Za Denghel, viz. to pronounce ſentence of excommunication on the emperor. He was at that time abſent on an expedition againſt the Agows; but returned immediately on hearing what was tranſacted in his abſence; informing the Abuna, that if he did not recal the excommunication without delay, his head ſhould pay the forfeit. This ſpirited declaration had ſuch an effect, that the anathema was annulled, and the conſpiracy diſſolved for that time. It was next reſolved between Emana Chriſtos the king's brother, Julius his ſon-in-law, and Kella Wahad maſter of the houſehold, to aſſaſſinate the king in his palace. To accompliſh this purpoſe it was concerted that they ſhould deſire an audience; that Julius ſhould enter firſt, and preſent a petition of ſuch a nature as would probably be refuſed: on this he was to begin an altercation; and during the continuance of it the other two aſſaſſins were to come up, and ſtab their ſovereign before he had time to put himſelf in a poſture of defence. Happily for Socinios, however, he was informed of his danger by a page juſt before Julius made his appearance: on which, inſtead of refuſing the petition, he granted it immediately; ſo that there was no room for diſpute. He then got up to walk; which was ſcarce done when Emana Chriſtos alſo came; on which Socinios invited them all to the terrace to walk with him. This prevented their falling upon him at that moment; and as they ſuppoſed they would have ſtill a better opportunity on the terrace, they readily conſented. But Socinios having opened a private door, at which he entered firſt, drew it quickly after him, and as this door had a ſpring-lock made by Peter Paez, which ſhut it in the inſide, but could not be opened from without, the conſpirators were diſappointed. Being alſo ſenſible that their deſign had been diſcovered, they were obliged for ſome time to keep at a diſtance, but did not for that reaſon abandon their wicked pro-

jects.

Abyſſinia.

The rebellious ſpirit of the conſpirators continues.

jects. Their next ſcheme was to be put in execution when the king was abſent on an expedition againſt the people of Sennaar, who had made a violent irruption into the Abyſſinian territories. The object now was not the aſſaſſination of the emperor, but of his brother Sela Chriſtos; becauſe the emperor had taken the government of Gojam from Emana Chriſtos, who was a ſchiſmatic, to give it to Sela Chriſtos, who was a violent Catholic. The enterpriſe was begun by Julius; who iſſued a proclamation, that all thoſe who believed two natures in Chriſt ſhould leave the province of Tigré, where he was governor; and that ſuch as were true friends to the Alexandrian faith ſhould repair to his ſtandard to fight for it. He then ordered the goods of all the Catholics in Tigré to be confiſcated; and marched without delay into Gojam, in hopes to ſurpriſe Sela Chriſtos. But here the whole ſcheme was baffled by the vigilance and activity of the emperor; for he having received information of what was going forward, returned into that province before the conſpirators had received certain intelligence of his having left it. This ſo much damped the ardour of Emana Chriſtos and Keſla Wahad, that they ſtood aloof without attempting any thing till Julius ſhould try his fortune. That rebel was at firſt very much diſconcerted; but ſoon recovering his courage, advanced to the place where the Nile iſſues out of the lake of Dembea, where he met with the Abuna. Being confirmed by that prieſt in his wicked deſigns, he reſolved, by his advice, to fall upon the king before he could be joined by Sela Chriſtos, Simon himſelf (the Abuna) offering to ſhare his fortune: and to confirm all, a new and ſolemn excommunication was pronounced againſt the king and all his adherents. Socinios, alarmed at theſe proceedings, ſent a meſſage to Sela Chriſtos, deſiring him to come to his aſſiſtance as faſt as poſſible. In the mean time he himſelf advanced to meet Julius; but choſe his poſts ſo judiciouſly, that he could not be forced to an engagement without great diſadvantage on the part of the enemy. Notwithſtanding this, Julius pitched his camp cloſe to that of the king, with a deſign to force him to a battle at all events. This raſh action was followed by one ſtill worſe, Simon had perſuaded him, that as ſoon as the royal army ſhould ſee him, they would abandon the ſtandard of the emperor to join his. On this, without farther conſideration, he ruſhed into the camp of Socinios with a very few attendants, and reached the emperor's tent. Here he was known by the guards, and inſtantly diſpatched with all his followers; the whole army betook themſelves to flight after his death, and were purſued with great ſlaughter by the royaliſts. The plunder of the camp was immenſe, Julius having brought all his riches, which he had amaſſed by a long courſe of extortion, into the field along with him; and all of theſe were diſtributed among the ſoldiers. A vaſt number of cattle were likewiſe taken, which Socinios diſtributed among the prieſts, judges and lay-officers. By this complete victory the whole ſcheme of the conſpirators was overthrown. Emana Chriſtos having no forces capable of coping with his brother, and unwilling, as we have ſaid, to aſſiſt Julius openly, had retired to a high mountain named *Melca Amba*, in the territory of Gojam. Here he was inveſted by Af Chriſtos, an experienced general, whom Sela Chriſtos had left governor when he joined the emperor. Emana, who was likewiſe an expert commander, would have made a vigorous defence; but unfortunately the mountain was ſo deſtitute of water, that in three days he was delivered up by his own men, to ſave themſelves from periſhing with thirſt. On being brought to the king, he was tried in a full aſſembly of judges, and condemned to death; but the king pardoned and ſet him to Amhara.

Julius the emperor's ſon-in-law firſt appears in arms.

Is deſerted by his aſſociates.

Socinios excommunicated a ſecond time.

Raſhneſs and death of Julius.

Emana Chriſtos taken, but pardoned.

Abyſſinia.

This terrible conſpiracy had been occaſioned by the diſpute concerning the two natures of our Saviour: another quickly followed on account of the diſpute concerning the Sabbath-day; the Abyſſinian church inſiſting on the obſervance of the ſeventh day of the week as a Sabbath, and the Romiſh church on the obſervance of the firſt day. The author of this rebellion was one Jonael, who had been concerned in the expedition formerly mentioned, in which the Agows cattle were driven away, and afterwards reſtored by the king. It is more than probable that his reſentment on this account contributed much to increaſe his zeal on the preſent occaſion; but whatever was the real cauſe, religion was the ſole pretence. He began with a moſt inſolent but anonymous letter to the king; in which the arguments of the Alexandrians for the obſervance of the Jewiſh Sabbath were ſtated, and the contrary doctrine condemned with the utmoſt virulence of expreſſion. The king himſelf was reviled in the moſt opprobrious manner, compared to another Diocleſian, the Jeſuits ſaid to be relations of Pontius Pilate, and all of them devoted to hell without redemption. By this ſtupid performance the king was ſo much offended, that he added a clauſe to the former proclamation, commanding that "all out-door work, ſuch as plowing and ſowing, ſhou'd be publicly followed by the huſbandman on the Saturday, under penalty of paying a web of cotton cloth for the firſt omiſſion, the value of the cloth to be 5s.; the ſecond offence to be puniſhed by a confiſcation of moveables, and the offence not to be pardoned for ſeven year." To this Socinios added a ſpeech from the throne in vindication of himſelf, concerning the part he had taken in religious matters; and to ſhow that he was in earneſt, cauſed the tongue of a monk to be cut out for denying the two natures of Chriſt, and one of his generals to be whipt for obſerving the Jewiſh Sabbath.

Another rebellion by Jonael.

In the mean time Jonael having collected what forces he could, openly declared againſt his ſovereign; but not daring to meet him in the field, he retired into the country of the Galla, on hearing that Socinios was approaching him with an army. On this the king entered their territories, and laid them waſte; which created a diſſenſion among the ſavages themſelves; one party being for affording him protection, the other for delivering him up. This being made known to the king, he ſent a few preſents to the faithleſs barbarians of Jonael's party; who returned his kindneſs by ſending him the head of the rebel, though but a ſhort time before they had fought with their brethren for his reſcue.

He is murdered by the Galla.

A more formidable enemy than Jonael, however, ſtill remained. The province of Damot was one of the moſt diſaffected to Socinios in the whole empire; and to this place the greateſt part of the religious fa-

natics

Abyſſinia.

natics in other provinces had retired. They now muſtered up an army of more than 12,000 men, among whom were 400 monks, all of them armed with ſhields, lances, and ſwords; inſpired, beſides, with ſuch a degree of religious enthuſiaſm, that they expected to be rendered invulnerable by all terreſtrial weapons, and that armies of angels would fight in their cauſe. Againſt theſe Sela Chriſtos was diſpatched with about 7000 excellent ſoldiers; and as the general himſelf was a zealous Roman Catholic, as well as moſt of his men, we need not doubt that both parties imagined themſelves ſure of the protection of heaven, and conſequently that the encounter would be very violent. The two armies met on the 16th of October 1620; but Sela Chriſtos was unwilling to deſtroy the infatuated people, who he knew would be unable to reſiſt his veteran troops. He therefore firſt ſhowed them his ſuperiority in ſome ſkirmiſhes; and then ſent a pathetic meſſage, offering a general pardon if they would lay down their arms. The meſſengers, however, were not allowed to approach, ſo that an engagement became unavoidable. The numbers of the rebels, as Sela Chriſtos had foreſeen, availed very little againſt the diſcipline of the veterans he commanded. The 400 monks made a moſt obſtinate reſiſtance; and did not yield till after 180 of them had been killed on the ſpot.

Deſperate enthuſiaſm of the monks.

The emperor publicly renounces the Alexandrian faith.

Socinios, having once more vanquiſhed his enemies, now determined to ſhow his attachment to the church of Rome more openly. Having therefore ſent for Peter Paez, he told him his final reſolution to embrace the Catholic religion in its full extent; after which he renounced the Alexandrian church in the moſt explicit manner. His renunciation was followed by a proclamation vindicating his conduct; in which, beſides the arguments uſed for the pope's ſupremacy, &c. he inſiſted much on the bad lives of the clergy of the oppoſite party, and for which it appeared that there was in reality too much foundation. This was the laſt work of the excellent miſſionary Peter Paez, who died of a fever immediately after his leaving the king. The example of the ſovereign, however, had very little effect upon his ſubjects. The proclamation was followed by a new rebellion in Amhara. Unluckily the enemies of his brother Sela Chriſtos had perſuaded Socinios to deprive him of his government: and there was no other in the kingdom who could be intruſted with ſuch an important commiſſion; ſo that the king ſoon found himſelf under a neceſſity of replacing and committing to him the charge of the war againſt the rebels. In this he was attended with his uſual ſucceſs: for the rebel chief, finding himſelf unable to contend with his enemy, repaired for aſſiſtance to the Galla; who no ſooner had him in their power than they killed him on the firſt offer of the imperial general, mangling his body in ſuch a manner that ſcarce a bit of it remained to be ſent to his antagoniſt.

A new rebellion breaks out.

The rebel chief murdered by the Galla.

In the mean time news of the revolution in religious matters which had taken place in Abyſſinia, arrived in Europe. Though the embaſſy to the pope and king of Spain could not paſs, as has already been related, yet frequent accounts had been otherwiſe tranſmitted; which produced ſuch an effect, that a new ſet of miſſionaries, with a patriarch (Alphonſo Mendez) at their head, were ſent to Abyſſinia. They arrived at Gorgora, the ſeat of royal reſidence, in the beginning of the year 1626; and at the very firſt audience of the emperor, it was agreed that he ſhould take an oath of ſubmiſſion to the pope. The ceremony was performed with all the ſplendour that could be contrived: the patriarch then preached a ſermon on the pope's ſupremacy in the Portugueſe language, intermixed with Latin quotations; which is reported to have greatly confirmed the faith of the emperor and his brother, though neither of them underſtood a word of the languages in which it was preached. An anſwer to this unintelligible diſcourſe was made in the Amharic language, which was equally unintelligible to the patriarch and his attendants; and to this the patriarch added a few words of a reply equally ill underſtood. At the concluſion of the diſpute, an oath of the pope's ſupremacy was taken by the emperor himſelf on his knees, then by the princes, and afterwards by all preſent, according to their different ſtations. Sela Chriſtos, not contented with taking the oath, drew his ſword, and in words not eaſily underſtood, denounced vengeance on "thoſe who fell from their duty:" and he likewiſe added to the oath of ſupremacy another to the emperor and Facilidas the prince royal; but if the latter ſhould fail in the defence of the Catholic faith, he ſwore to be his greateſt enemy: nor would he be ſatisfied without impoſing this clauſe upon all the officers, whether civil or military, then preſent.

Abyſſinia.

Socinios takes an oath of ſubmiſſion to the pope.

Violent conduct of Sela Chriſtos,

This violent conduct of Sela Chriſtos procured him a number of enemies, and at laſt was the occaſion of his deſtruction; but that of the king and patriarch ſet the whole empire in a flame. An excommunication was firſt pronounced upon all who did not keep the oath: a proclamation was next iſſued, that all prieſts ſhould previouſly embrace the Catholic religion under pain of death; and that every one, under the ſame penalty, ſhould obſerve Lent and Eaſter, according to the rules of the Romiſh church. The patriarch proceeded in the ſame ſtyle; reordaining the clergy, conſecrating the churches over again, rebaptizing the people, even ſuch as were full grown, abrogating circumciſion, polygamy, and divorce (for theſe had been allowed by the Alexandrian church), and reducing the moveable feaſts entirely to the rules of the church of Rome.

and of the emperor and patriarch.

Though polygamy and divorce are no doubt inconſiſtent with the pure doctrines of the goſpel, yet it was very improper to meddle with theſe practices at once in ſuch a violent manner. Beſides the confuſion that this would naturally occaſion in private families, theſe practices gave occaſion to many queſtions in law, which it belonged to the civil judges to decide; but now theſe were all ſubjected to the authority of the patriarch: and from ſome other ſteps taken by this prelate, it appeared that he intended to encroach much farther upon the civil authority. One of theſe related to the church lands; which in Ethiopia are granted by the king, and reſumed at his pleaſure; others being granted in their place, ſo that neither prieſts nor monks have any property in them. On the preſent occaſion, an Abyſſinian nobleman had poſſeſſed ſome lands belonging to a Catholic monk; for which he was called before the patriarch. On his refuſing to ſubmit to this new tribunal, he was inſtantly condemned to reſtore the lands; but refuſing this alſo, the patri-

An Abyſſinian nobleman excommunicated.

A new patriarch and miſſionaries arrive in Abyſſinia.

Abyſſinia.

arch took an opportunity, as he was attending the emperor at church, to pronounce ſentence of excommunication againſt him, giving him over at once, ſoul and body, to the devil.—On hearing this terrible ſentence pronounced, the nobleman fainted away, and was with difficulty recovered. On the interceſſion of the emperor, however, the curſe was taken off; but the incident produced a very diſagreeable effect on the minds of the people, who from that day began to entertain a greater averſion than ever to the Roman Catholics and their prieſts. This averſion was greatly increaſed by the abſurd conduct of the patriarch, in ordering the body of an Abyſſinian ſaint to be taken up, and thrown out of the grave in an ignominious manner, becauſe it had been buried under the altar of a church, which he imagined was thus defiled. In all other reſpects, the patriarch behaved in ſuch an inſolent and overbearing manner, that the effects of his oppreſſion ſoon began to be univerſally felt, and the Catholic religion began very quickly to decline.—The firſt ſtroke given to it was the alteration of the liturgy; which was done at the deſire of the emperor. Ever ſince the eſtabliſhment of the Catholic religion, the Latin maſs book, &c. had been made uſe of according to the practice of the church of Rome; but as it ſeemed very unreaſonable to impoſe this at once upon the Ethiopians, Socinios ordered the patriarch to make ſuch alterations in the old Abyſſinian liturgies as he thought proper, that the people might thus have an opportunity of paying their devotions in a language they underſtood. The patriarch, not being able to aſſign any ſolid reaſon to the contrary, was obliged to comply; but no ſooner was this done than the people made uſe of their old liturgies entirely, without the leaſt regard to the innovations of the patriarch. In the midſt of the confuſion which daily took place from theſe cauſes, the Galla made a dreadful invaſion, and cut off one of the emperor's generals with his whole army: nor were all the abilities of Sela Chriſtos, who had ſo often diſtinguiſhed himſelf, ſufficient to retrieve matters; ſo that the ſavages, after having ravaged the country for ſome time at pleaſure, returned home loaded with booty. This misfortune was followed by the revolt of Tecla Georgis the king's ſon-in-law; who not only made religion the pretence for taking up arms, but inſulted the Catholics in the moſt outrageous manner; collecting their images and other religious trinkets into a heap, and then publicly ſetting fire to them. After this he called before him his own chaplain, named *Abba Jacob*, who was a Catholic, ſtripped him of his pontificals, and killed him with his own hand. A reconciliation with Socinios was now impoſſible; ſo that he had no reſource but in arms. In this however, he was equally unſucceſsful with the other rebels in this reign; being defeated, taken priſoner, and put to death along with his ſiſter Abdeſa, notwithſtanding the interceſſion of a Catholic miſſionary for him, and that of the queen and ladies of the court for his ſiſter.

Body of an Abyſſinian ſaint thrown out of the grave.

Catholic liturgy altered.

An army cut off by the Galla.

Tecla Georgis, the king's ſon-in-law, revolts.

Is defeated, taken, and executed.

As the reaſons given by the king for refuſing ſuch powerful interceſſion were purely religious, the people became more and more averſe to a profeſſion ſo extremely oppreſſive and ſanguinary as that of Rome ſeemed to be. A revolt of the Agows quickly followed; not that religion had really any ſhare in their determinations, but that they were exaſperated by the ſlavery and oppreſſion to which they ſaw themſelves ſubjected. They now therefore ſet up Melcha Chriſtos, a prince of the royal blood, as a pretender to the crown; and ſoon put on ſuch a formidable appearance, that the king himſelf thought proper to march againſt them with an army of 30,000 fighting men, which with the ſervants and other attendants amounted to more than 80,000. Melcha Chriſtos retired with his troops to the craggy mountains of the country; and being imprudently followed by the emperor, rolled down ſuch quantities of ſtones from the precipices, that Socinios was obliged to retreat with great precipitation, after having loſt almoſt one half of his army.

Revolt of the Agows, who ſet up Melcha Chriſtos.

On this defeat the emperor found himſelf obliged to apply to Sela Chriſtos, whom he had again diſgraced and deprived of his government. He ſucceeded in giving the rebels a dreadful overthrow, which for ſome time entirely broke their power; but this ſucceſs was quickly followed by the revolt of Læca Mariam, a near relation of the king. He alſo was defeated, and obliged to retire to a mountain ſo ſteep, that though he aſcended it in ſafety, he was dathed in pieces with many of his followers in attempting to deſcend; the reſt, who eſcaped this danger, being killed by their purſuers. Still, however, the rebel Melcha Chriſtos was unſubdued; againſt whom Prince Facilidas, the heir-apparent to the throne, was ſent, having under him a nobleman of moſt diſtinguiſhed character named *Keba Chriſtos*. The latter was defeated and killed, without its being in the power of Facilidas to do any thing towards the ſuppreſſion of the rebellion. This misfortune was followed by the death of Fecur Egzie, formerly ambaſſador with Antonio Fernandes to the pope, but now lieutenant general to Sela Chriſtos. He was cut off with a ſmall body of troops by the Galla; and from many misfortunes befalling the imperial troops the power of Melcha Chriſtos was augmented to ſuch a degree, that he now began to act as a king, and appointed a deputy-governor to one of the provinces. His opinion of his own importance, however, had almoſt proved his ruin; for the new governor having appointed a great feſtival on a Saturday, in oppoſition to the royal edict, he was attacked by a party of the king's troops, and entirely routed with the loſs of 4000 of his men. This defeat was revenged by an overthrow given to Prince Facilidas himſelf; the blame of which was laid upon Sela Chriſtos. The latter, as we have often had occaſion to obſerve, was not only a moſt valiant commander, but a rigid Catholic; and theſe two qualities might naturally have been thought to ſecure him in favour with the emperor. His violent conduct in regard to the Catholic religion, however, had raiſed him ſo many enemies, that accuſations were perpetually brought againſt him; and one diſgrace conſtantly followed another, notwithſtanding all his ſervices. The preſent accuſation was brought by one Leſana Chriſtos, whom Sela Chriſtos had formerly condemned to death. For this offence he had received a pardon from Socinios; and he now revenged himſelf upon his former judge by accuſing him to his ſovereign. Sela Chriſtos was not unmindful of this conduct; and therefore, as ſoon as he had him in his power, put him to death without regarding the pardon he had received. The emperor

Deprived of the government of Gojam. Revolt of the new governor.

on this deprived him of the government of Gojam, which he gave to Serca Chriſtos, who was ſuppoſed to be a dependent on Prince Facilidas, and was beſides couſin to the emperor himſelf. The new governor, on his entering upon office, promiſed ſolemnly to ſupport the Catholic religion; but no ſooner did he arrive in Gojam than he ſolicited Prince Facilidas to rebel againſt his father, and re-eſtabliſh the Alexandrian faith. This was not the only inſtance in which he ſhowed his diſobedience. He had received the charge of a caravan which came annually from Narea; but inſtead of acting properly in this reſpect, he employed himſelf in driving off the cattle of the Agows and Damots, who expected no harm, and were conſequently quite unprepared. Such numbers of them were carried off on this occaſion, that 100,000 are ſaid to have been ſent to the Abyſſinian market. Socinios, when informed of ſuch an atrocious robbery, ordered him to reſtore the cattle, and to ſurrender himſelf priſoner; but inſtead of complying with this order, he again ſolicited Facilidas to revolt againſt his father. For this he was ſharply reproved; but now, determined to make the world believe that the prince had entered into his ſchemes, he ſent a public meſſage to him, in which he was deſired to come and take poſſeſſion of the kingdom. Facilidas impriſoned the perſon who brought this treaſonable meſſage, and ſoon after ſent him to Socinios; but Serca Chriſtos ſtill perſiſted in his mad attempts. He now propoſed to aboliſh the Romiſh religion throughout the kingdom; and with that view attacked a convent which Sela Chriſtos had built in Gojam: but the fathers having been furniſhed with ſome fire-arms, made ſo good a defence, that he was obliged to give over the enterpriſe. He then took the laſt ſtep to complete his folly, by openly revolting againſt the emperor, and ſetting up a prince of the blood-royal in oppoſition to him, whom he had found living in obſcurity among his mother's relations. To cut off all poſſibility of reconciliation with the emperor, he renewed the ſacrilegious practices of Georgis, and put to death a prieſt for refuſing to deny the two natures of Chriſt. Thus he procured a multitude of enthuſiaſts to join him; but when the affair came to a deciſion, and Prince Facilidas with a well-diſciplined army was ſent againſt him, it then became evident how little the fanaticiſm of a tumultuous rabble availed againſt the ſkill of a regular army. The rebels fought, however, with great obſtinacy till moſt of them were killed, their commander being obliged to take refuge on a mountain; from whence, being unable to make his eſcape, he at laſt came down and ſurrendered at diſcretion. We need not doubt of his fate; but notwithſtanding the execution of this rebel, another ſtill remained. This was Melcha Chriſtos, againſt whom the emperor next prepared to march. He now found, however, the bad conſequences of having acted ſo violently in favour of the Catholic religion. His army was ſo diſaffected, that he could ſcarcely put any confidence in them. For this reaſon he iſſued a proclamation, that ſuch as choſe to obſerve the Wedneſday as a faſt inſtead of Saturday, had liberty to do ſo. This and ſome other indulgencies being reported to the patriarch, the latter ſharply reproved him as committing an encroachment on the prieſthood; and put him in mind of the puniſhment of leproſy inflicted upon Uzziah for aſſuming the prieſt's office. Thus an altercation commenced; and it was evident, from the behaviour of Socinios, that his extreme favour for the Romiſh religion began to decline. After this he ſet out for the country of Laſta, where Melcha Chriſtos was, and the entrance to which was guarded by very high and rugged mountains. Among theſe the rebels had ſtrongly fortified themſelves; but were driven from four poſts by the king's troops, ſo that the latter imagined a complete victory had been gained. Aſſembling themſelves, however, on the top of another high mountain, the rebels watched their opportunity; and deſcending ſuddenly upon them, cut off great numbers, and obliged the reſt to make a precipitate retreat. Another campaign was therefore neceſſary; but now the army loſt all patience. They were become weary of making war on their countrymen, and, after ſlaughtering them in the field, ſeeing the intervals between the campaigns filled up with numerous executions of thoſe who had eſcaped the ſword. A deputation was therefore ſent from the ſoldiers by Prince Facilidas, who, though he had never declared his ſentiments openly, was ſtrongly ſuſpected of being no friend to the Catholics. The purport of the deputation was, that they did not mean to ſay that the Romiſh profeſſion was a bad one, but it was ſuch as they could not underſtand; and conſequently there could be no merit on their part in profeſſing it. They were ready, however, to lay down their lives for the public good, provided their ancient religion was reſtored; but this was a point they would not give up, and without which they would neither concern themſelves in the quarrel, nor even wiſh ſucceſs to the emperor's arms. With regard to the Romiſh religion, they added this declaration, perhaps the ſtrongeſt poſſible mark of averſion, that they did not *wiſh* to know any thing about it. Socinios, therefore, according to the Abyſſinian accounts, promiſed to reſtore the Alexandrian faith, on condition that he returned victorious from Laſta. The army then readily agreed to follow him wherever he pleaſed; while the rebels, having left their fortreſſes in Laſta, probably from a confidence in their own ſtrength, boldly marched towards the royal army. In the engagement, however, they did not ſhow their uſual alacrity, and were ſoon defeated with the loſs of 8000 men. Many of their beſt officers were killed on the ſpot, and Melcha Chriſtos himſelf eſcaped only by the ſwiftneſs of his horſe.

Abyſſinia.

The emperor defeated.

The army requires the reſtoration of the Alexandrian faith.

Melcha Chriſtos defeated.

He is defeated, taken, and put to death.

The emperor relaxes in his ſeverity concerning religion, which is reſented by the patriarch.

By this victory the power of the rebels was broken; but it was not attended with the ſame ſatisfaction to the people with which other victories were wont to be accompanied. On viewing the field of battle along with Facilidas next day, the prince is ſaid to have made a pathetic ſpeech to his father; in which he told him, that the bodies of the men he ſaw dead on the field of battle were neither thoſe of Pagans nor Mahometans, but of his own Chriſtian ſubjects; and that victories of this kind were like driving a ſword into his own entrails. "* How many men (ſays he) have you ſlaughtered? how many more have you yet to kill? We are become a proverb even to the Pagans and Moors for carrying on this war; and for apoſtatizing, as they ſay, from the faith of our anceſtors." The king did not make any reply at that time; but the effects of the

Pathetic ſpeech of Prince Facilidas to his father concerning the war.

* *Bruce's Travels*, vol ii. 4° p. 943.

Abyſſinia. prince's words were ſoon apparent. The patriarch took the firſt opportunity of upbraiding him with his ingratitude to the Catholics, and deſerting the religion whoſe profeſſors had by their prayers obtained ſuch a ſignal victory. To this Socinios replied in general, that he had done every thing in his power to eſtabliſh the Catholic religion; for which he had ſhed the blood of thouſands, and had ſtill as much more to ſhed: but that he ſhould conſider of the matter, and acquaint him with his final reſolution. This was by no means favourable; for next day, in a meſſage to the patriarch, he recounted the many rebellions which had been excited on account of religion; and concluded with telling him, that though the faith of Rome was not a bad one, yet the people of Abyſſinia did not underſtand it. For this reaſon he was determined to grant a toleration, by allowing ſuch as profeſſed the Catholic faith to do ſo in peace, and ſuch as rather choſe that of Alexandria to do the ſame. The patriarch replied, that he had no objection to grant this indulgence to ſuch as had not yet embraced the Catholic faith; but thoſe who had done ſo could not be permitted to renounce it without a grievous ſin. Thus a new ſyſtem of perſecution would have commenced: but the emperor, underſtanding well the purport of his diſcourſe, replied, that if this was the caſe, he was no longer maſter of his own kingdom; and immediately afterwards iſſued a proclamation, wherein he declared the Alexandrian faith reſtored, with the altars for the ſacrament, liturgy, and every other thing belonging to it; at the ſame time, that being now old and infirm, he himſelf reſigned the crown and empire to Facilidas.

An univerſal toleration granted.

Oppoſed by the patriarch.

The emperor reſtores the Alexandrian faith, and reſigns the kingdom.

This remarkable proclamation was made on the 14th of June 1632; after which Socinios took no farther care of public affairs; nor did he long ſurvive this tranſaction. He died on the 7th of September this year, and with him fell all the hopes of the Jeſuits. Facilidas, as had been rightly conjectured, was an inveterate enemy to the Catholic faith. As ſoon therefore as he had obtained the government, even before he took upon himſelf the title of king, the Catholics were everywhere diſplaced from offices of truſt and honour; but as ſoon as he found himſelf eſtabliſhed on the throne, a letter was ſent to the patriarch, informing him, that as the Alexandrian faith was now reſtored, it was become indiſpenſably neceſſary for him to leave the kingdom, eſpecially as the new Abuna was on the way, and only deferred his journey till the Romiſh prieſts ſhould be out of the country. For this reaſon he commanded the patriarch, with all his brethren, to leave their convents throughout the empire, and retire to Fremona in the kingdom of Tigré, there to wait his further pleaſure. The patriarch attempted to ſoften him by many conceſſions, but in vain; on the 9th of March 1633 he was ordered, with the reſt of the fathers, to proceed immediately for Fremona. This they were obliged to comply with; but the emperor, underſtanding that they were about to eſtabliſh themſelves, and to ſolicit ſuccours from Spain to accompliſh their purpoſes by force, he ſent orders to the patriarch, inſtantly to deliver up all the gunpowder they had at that place, and to prepare, without delay, to ſet out for Maſuah. Still the infatuated and obſtinate prieſt determined not to comply with the emperor's orders. At laſt he thought proper to deliver up the gunpowder; but reſolved to leave his companions behind him, and to diſperſe them as much as poſſible through the empire, in caſe he himſelf ſhould be obliged to embark at Maſuah; which, however, he did not by any means intend. For this purpoſe he applied to the Baharnagaſh, named *John Akay*, then in rebellion againſt the emperor; who carried them all off from Fremona in the night time, under a guard of ſoldiers, and lodged them ſafely in a ſtrong fortreſs named *Adicotta*. Here the patriarch imagined that he might remain in ſafety till he ſhould be able to procure ſuccours from India. In this, however, he was deceived. John conveyed them from place to place, through many unwholeſome ſituations, till their ſtrength as well as their patience was exhauſted. At laſt, on receiving a preſent of gold, he allowed them to return to their old habitation Adicotta. Facilidas, then, being determined at all events to get rid of ſuch troubleſome gueſts, endeavoured to prevail upon John by bribes to deliver them into his hands. John was too delicate to comply with this requeſt, which he ſuppoſed would be a violation of hoſpitality; but he conſented, on receiving a proper compenſation, to ſell them to the Turks. Two were left in Abyſſinia, in hopes of ſoon ſharing the crown of martyrdom; and this indeed Facilidas did not delay to put them in poſſeſſion of, both being ordered for execution as ſoon as he got them into his power. Not content with this, and being perpetually apprehenſive of freſh invaſions from Europe, he entered into a treaty with the Turkiſh baſhaws to keep the ports of Maſuah and Suakem ſhut againſt them; by which their entrance into Abyſſinia would be effectually prevented.

Abyſſinia.

He applies for protection to the Baharnagaſh, then in rebellion.

The patriarch and other miſſionaries ſold to the Turks.

During theſe tranſactions, the emperor took the moſt effectual methods otherwiſe to eradicate the Romiſh religion, by cutting off the principal perſons who profeſſed it, or obliging them to renounce their profeſſion. The principal of theſe was his uncle Sela Chriſtos, who had deſerved ſo well of the late emperor Socinios, and of the whole empire in general. His exceſſive bigotry in religious matters proved the cauſe of his deſtruction, as has formerly been hinted. When it was propoſed to him to renounce his faith, he abſolutely refuſed to do ſo, either to avoid the greateſt puniſhment the king could inflict, or to obtain the greateſt gift he had in his power to beſtow. On this he was baniſhed to an unhealthy diſtrict among the mountains of Samen; but as even here he kept up a correſpondence with the Jeſuits, and wiſhed to facilitate the introduction of more Portugueſe from India, he was ſentenced to be hanged on a cedar tree.

Sela Chriſtos put to death.

The new emperor an enemy to the Catholics.

The patriarch commanded to quit Abyſſinia.

The expulſion of the preſent race of miſſionaries did not entirely diſcourage the Europeans from attempting to introduce a freſh miſſion into Abyſſinia. The obſtinate, haughty, and rebellious ſpirit of the Jeſuits was univerſally condemned, and regarded as the cauſe of the extreme averſion ſhowed by the emperor and the whole empire againſt the doctrines they profeſſed. It was therefore hoped, and not without ſome appearance of reaſon, that the point might ſtill be gained, provided the miſſion were undertaken by others leſs violent and inſidious in their behaviour. After the execution of thoſe who remained in Abyſſinia, ſix Capuchins, the reformed order of St Francis, were ſent with protections from the Grand Signior to facilitate their paſſage into

A new miſſion undertaken by ſix Franciſcan Capuchins.

Abyſſinia. into Abyſſinia, where they hoped to revive the drooping, or rather loſt, cauſe of the Catholic religion. The event of this undertaking was truly unfortunate. The Galla murdered two who attempted to enter Abyſſinia by the way of Magadoxa. Two who arrived ſafely in the country were ſtoned to death; while the remaining two, hearing at Maſuah of the fate of their companions, returned home with the melancholy account of it. This bad ſucceſs did not deter three others from making the ſame attempt a ſhort time afterwards; but they having imprudently informed Facilidas of their intention, were murdered by the baſhaw of Maſuah, who had received orders from him to this purpoſe. So particular was the emperor with regard to the execution of this order, that he cauſed the baſhaw to ſend him the ſkin of their faces and heads; that he might know by their faces that they were Europeans, and by their ſhaved heads that they were prieſts.

Four of them murdered, and the other two return.

Three others murdered by order of Facilidas.

The Catholic faith was now totally ſuppreſſed, but the ſpirit of rebellion ſtill prevailed; and Melcha Chriſtos continued as much in oppoſition to his ſovereign as when he firſt took up arms on pretence of religion. At firſt he met with extraordinary ſucceſs; totally defeated the royal army, though commanded by Facilidas in perſon; after which, purſuing his good fortune, he made himſelf maſter of the capital, entered the palace, and was formally crowned king. This, however, was the laſt of his good fortune. Facilidas having quickly recruited his army, ſent three able generals to attack his rival, who was now acting the ſovereign in his palace. The rebels were attacked and ſurrounded before they expected an enemy, were almoſt entirely cut off, and Melcha Chriſtos himſelf was killed in the engagement.

Melcha Chriſtos ſtill continues in rebellion.

Is defeated and killed.

The victory over Melcha Chriſtos was followed by ſeveral ſucceſsful expeditions againſt the Agows and Galla; but in the 6th year of the reign of this emperor, the rebels of Laſta, who ſeemed determined not to yield while there remained a poſſibility of reſiſtance, choſe the ſon of Melcha Chriſtos for their king, and again began their depredations on the neighbouring provinces. Facilidas marched againſt them with his uſual activity; but had the misfortune to loſe the greateſt part of his army by cold among the mountains of Laſta, though it was then the time of the equinox, and conſequently the ſun was only 12° from being vertical, the latitude of Laſta being no more than 12°, and the ſun 12 hours in the day above the horizon.—Before this rebellion could be ſuppreſſed, another was begun, at the head of which was Claudius the king's brother. He had not the ſame good fortune with the rebels of Laſta; but was quickly defeated, taken priſoner, and baniſhed to a mountain called *Wechnè*; which ſerved from that time for the impriſonment of the princes of the blood royal. The ſuppreſſion of one rebellion, however, ſeemed to have no other effect than that of giving riſe to another. A new expedition was to be undertaken againſt the Agows and Shangalla; but they had poſted themſelves ſo advantageouſly, that the royal army was entirely defeated without being able to make any impreſſion on their enemies. Facilidas, however, knowing that this defeat could be attended with no other bad conſequence than the loſs of the men, which had already happened, marched directly againſt the rebels of Laſta without attempting to revenge the defeat he had ſuſtained. The rebel general, weary of a contention, in which he probably ſaw that he would be finally unſucceſsful, choſe to ſubmit unconditionally to the emperor; who, though he at firſt affected to treat him with ſeverity, ſoon after releaſed him from priſon, beſtowing upon him large poſſeſſions in Begemder, with his daughter Theoclea in marriage.

The rebels choose his ſon for their leader.

The emperor's army periſhes with cold.

Princes of the blood again impriſoned on a mountain.

Facilidas defeated by the Agows and Shangalla.

Abyſſinia.

The rebels of Laſta ſubmit.

Facilidas died in the month of October 1665, and was ſucceeded by his ſon Hannes. This prince was ſuch an enthuſiaſt for Chriſtianity, that in the very beginning of his reign he iſſued a proclamation, forbidding the Mahometans to eat any fleſh but what was killed by Chriſtians; but ſo far was he from any inclination to favour the Catholics, that he ordered all their books which could be found in the empire to be collected and burnt. Much of his time was ſpent in regulations of church matters, and in contentions and trifling diſputes with the clergy; which conduct ſo diſguſted his ſon Yaſous, that he fled twice from the capital, but was purſued and brought back. The laſt time was in the year 1680, when he found his father ill of the diſtemper of which he died. Hannes expired on the 19th of July that year, having lived at peace during the whole of his reign, excepting ſome trifling expeditions againſt the Shangalla and rebels of Laſta.

Reign of Hannes.

Yaſous, who ſucceeded to the throne with the approbation of the whole kingdom, was of a very different diſpoſition from his father. Generous, active, and brave, he was leſs bigotted, and differed from him conſiderably in religious principles. Having ſettled church matters as he thought proper, his next ſtep, and the moſt glorious action of his whole reign, was to pay a viſit to thoſe of the royal family who were confined on the mountain of Wechnè. He found them in the moſt miſerable condition; all in tatters, and many almoſt naked; their revenue having been ill paid by his father, who was of a ſordid diſpoſition, and the little they received having been embezzled by their keepers. Yaſous was greatly moved at this ſpectacle, ordered a large ſum of money to be divided among them for preſent relief, clothed them according to their rank, and ſettled matters ſo that no part of their revenue could ever afterwards be improperly applied. To the governor of the mountain he aſſigned a large tract of territory, to make amends for the profit he had been accuſtomed to derive from the revenue of the princes; and finally, he left all the priſoners at the foot of the mountain, at perfect liberty either to take up their reſidence again on it or any where elſe. By theſe extraordinary inſtances of royal munificence the emperor ſo effectually gained the affection of his relations, that they unanimouſly determined to return to their former ſtate of confinement: and during the whole time of his reign not one of them ever appeared as a competitor for the crown.

Reign of Yaſous.

His generoſity to the baniſhed princes.

Though Yaſous is ſaid to have poſſeſſed all the qualities which conſtitute a great and good monarch, the natural turbulence of his ſubjects, and the reſtleſs diſpoſition of the monks, ſoon began to ſhow themſelves by new ſeditions. Theſe were preceded by a violent irruption of the Galla, who were overthrown, as uſual, with great ſlaughter; but ſoon after, being ſolicited by ſome monks who had drawn over a party of the

Irruption of the Galla, ſeditions of the monks, rebellion, &c.

Agows

Abyſſinia. Agows to their ſide, the diſturbances were renewed. A grandſon of Socinios, who had fled to the Galla when Facilidas firſt baniſhed the princes to Wechnè, was proclaimed king. A multitude of ſavages immediately flocked to his ſtandard, ſo that he was ſoon at the head of a very formidable army, while the Agows and other malecontents were ready to join him as ſoon as he ſhould repaſs the Nile. The king, however, entirely diſconcerted the ſcheme by his activity; for, advancing with the utmoſt celerity, he reached the banks of the Nile before the Galla on the other ſide were ready to join their allies on this ſide of it. The Agows were ſo confounded at his preſence, that they allowed him to paſs the river unmoleſted. The Galla were equally ſurpriſed at ſeeing the war transferred into their own country; and, with their uſual fickleneſs, deſerted the prince whoſe cauſe they had pretended to eſpouſe. A few remained faithful, but were utterly defeated by the forces of Yaſous; the unhappy prince himſelf, whoſe name was *Iſaac*, being taken priſoner, and put to death in the preſence of his rival. After this, many great exploits were performed againſt the rebellious Agows, Galla, and other ſavages: but which, as they produced no other conſequence than that of eſtabliſhing the emperor's character for perſonal valour and military ſkill, we ſhall here paſs over; only remarking, that, in the opinion of his ſubjects, one of his campaigns was the moſt glorious ever recorded in the annals of Abyſſinia. The moſt memorable events in the preſent reign regarded religion, and a renewal of the correſpondence betwixt Europe and Abyſſinia; of which we have a particular account from Mr Bruce, to the following purpoſe. About the end of the 17th century, a number of Franciſcans from Italy ſettled at Cairo in Egypt, and were maintained at the expence of the fathers in Paleſtine, though pretending to be independent of their ſuperior the guardian of Jeruſalem. The latter, diſpleaſed at this method of proceeding, offered to ſupply the miſſion to Egypt entirely at the expence of Paleſtine, and likewiſe to furniſh from thence miſſionaries capable of inſtructing the people in the Chriſtian religion. This propoſal meeting with a favourable reception at Rome, a new ſet of miſſionaries from Jeruſalem, called by our author *Capuchins*, appeared at Cairo; from whence the Franciſcans were baniſhed, only two of them being allowed to remain in that city. The others returned to Rome; where, finding that they could not re-eſtabliſh themſelves by fair means, they had recourſe to artifice and fiction. It was now pretended, that, on the expulſion of the Jeſuits from Abyſſinia, a great number of Catholic Chriſtians had fled into the neighbouring countries of Nubia and Sennaar, where they found themſelves ſo grievouſly oppreſſed by the Mahometans, that, without ſome ſpiritual aſſiſtance, they would be under the neceſſity of renouncing their religion. This ſtory being confirmed by the two Franciſcans who remained at Cairo, the cauſe of theſe ſuppoſed Chriſtians was eagerly eſpouſed by the religious in Italy, and a new miſſion ſet on foot at the expence of the pope for their relief, which continues to this day under the title of the *Ethiopic Miſſion*. The miſſionaries had it alſo in charge to penetrate if poſſible into Abyſſinia; and to keep up, as far as was in their power, the Catholic faith, until a better opportunity

Quelled by the emperor.

Attempt to revive the religious miſſions from Europe.

ſhould offer of making an attempt to convert the whole empire. For this purpoſe a convent was procured for them at Achmim in Upper Egypt; and permiſſion was granted, notwithſtanding their former baniſhment, to ſettle two of their order at Cairo independent of the fathers of Paleſtine. Abyſſinia.

While theſe tranſactions paſſed in Italy and Egypt, Louis XIV. of France was in the height of his glory. He had attempted to rival the ancient Greeks and Romans in the magnificence of his works; but his conduct with regard to religion, his perſecution of the Proteſtants, and revocation of the edict of Nantz, had ſtigmatized him throughout the greateſt part of Europe as a bloody and mercileſs tyrant. To wipe off this ſtain, the Jeſuits, his great ſpiritual directors, formed a ſcheme of inducing the emperor of Abyſſinia to ſend an embaſſy to France; after which they hoped that they might get themſelves replaced in the Ethiopic miſſion, to the excluſion of the Franciſcans. The king, whoſe pride was very much flattered by the propoſal, readily embraced it; but the pope's conſent was ſtill neceſſary. His holineſs was by no means pleaſed with this intruſion of a temporal prince into ſpiritual affairs: nevertheleſs, he did not chooſe to enter into any conteſt; but that he might undo with one hand what he did with the other, he appointed ſix Jeſuits, of whom Verſeau, the ambaſſador of Louis to himſelf, was one, to be miſſionaries to Abyſſinia, but the ſuperior of the Franciſcans to be his legate *à latere* at that court; providing him with ſuitable preſents for the emperor and principal nobility.

The Jeſuits now finding themſelves in danger of being ſupplanted by the Franciſcans, applied to the pope to know which of the two orders ſhould make the firſt attempt to enter Abyſſinia; but received no other anſwer than that thoſe who were moſt expert ſhould do ſo. Verſeau, probably diſpleaſed at this conduct of the pope, went to a convent in Syria of which he was ſuperior, without making any attempt to enter Ethiopia: therefore the miſſion remained in the hands of two perſons of oppoſite profeſſions, a Jeſuit and a Franciſcan; the name of the latter being *Paſchal*, an Italian; and of the former *Brevedent*, a Frenchman. The latter was accounted a man of learning and probity, zealous in the cauſe of his religion, but by no means imprudent or raſh in his attempts to promote it.

In the mean time an unforeſeen accident procured admittance to the miſſionaries into Abyſſinia more readily than could have been expected in the preſent ſituation of affairs. Yaſous and his ſon had both been attacked by a ſcorbutic diſorder which threatened to turn to a leproſy; on which one Hagi Ali, a Mahometan factor at Cairo, received orders to bring with him an European phyſician on his return to Abyſſinia. It happened that this man had formerly been acquainted with Friar Paſchal, who had adminiſtered ſome medicines to him. He now propoſed that Paſchal ſhould accompany him to Abyſſinia in the character of a phyſician; and that Friar Anthony, another of his own order, ſhould go with him as his companion. But this ſcheme was fruſtrated by Maillet the French conſul, who had the charge of the whole from Louis XIV. and wiſhed that the Jeſuits alone ſhould have the conduct of the miſſion. For this purpoſe he repreſented to

Yaſous falls ſick, and ſends for a European phyſician.

Friar Paſchal and another Friar undertake the office.

Abyſſinia. to Hagi Ali, that Friar Paſchal underſtood nothing of medicine; but he promiſed to furniſh him with another, whoſe ſkill he extolled above all thoſe of ancient or modern times. Hagi Ali, who knew nothing of the matter, readily agreed to Maillet's propoſal; and Charles Poncet a Frenchman, who had been bred a chemiſt and apothecary, was appointed to the office of phyſician, with Father Brevedent to attend him as his ſervant. Thus the ſcheme of the Franciſcans was for the preſent overthrown: but unluckily Maillet employed one Ibrahim Hanna, a Syrian, to write letters to the Abyſſinian monarch and ſome of his principal nobility, which he deſired him to ſubmit to the inſpection of one Francis, a Capuchin or monk of the Holy Land, and conſequently an enemy to the Franciſcans. Ibrahim, not being acquainted with the monk he mentioned, and thinking any other would anſwer as well, carried the letters to one of the ſame name, but of the Franciſcan order. Thus the whole ſecret was divulged at once; and the Franciſcans, with the malevolence eſſential to ſuch religious miſcreants, reſolved on the deſtruction of Poncet and his attendants. At preſent, however, their ſanguinary intentions were defeated; Poncet ſet out immediately after he had received his commiſſion, and arrived ſafe at Gondar the capital of Abyſſinia, with his attendant Father Brevedent, on the 21ſt of July 1699. Brevedent died on the 9th of Auguſt; but Poncet lived to execute his commiſſion, by making a full cure of his royal patient. On the 2d of May 1700, he ſet out on his return for Europe, and arrived at Maſuah without any bad accident.

It has been already obſerved, that the main end of this undertaking was to procure an embaſſy from Abyſſinia to the French monarch; and this end alſo was gained. An ambaſſador was procured, but unluckily not ſuch a one as M. Maillet the chief manager of the whole project deſired. This man intoxicated with abſurd notions of nobility and diſtinctions of rank, could not make allowance for the difference between the appearance of an ambaſſador from a barbarous monarch, however powerful, and one from the ſovereign of a civilized and polite nation. The ambaſſador ſent by Yaſous, therefore, having been originally no other than a cook, could not be agreeable to a man of ſuch a diſpoſition. The preſents ſent by the Abyſſinian monarch indeed, had they arrived, would have probably conciliated matters. Theſe were, an elephant, ſome Abyſſinian young women, &c. but unluckily the elephant died, and the ambaſſador was robbed of all the reſt by a Turkiſh baſhaw. Maillet, therefore, naturally proud, imperious, and covetous, thought proper to call in queſtion the authenticity of Morat the ambaſſador's miſſion, to call Poncet himſelf a liar, and not to allow the former to proceed to France. The tranſactions on this occaſion are ſet forth at length by Mr Bruce, greatly to the diſgrace of Maillet; but as details of this kind would ſwell the preſent article beyond due bounds, we muſt refer the curious reader to the work juſt mentioned.

Thus the ſcheme of procuring an embaſſy from Abyſſinia having proved abortive, the next project of the Jeſuits was to get an embaſſy ſent from France, whoſe object was to be the cementing a perpetual peace betwixt the two nations, and to eſtabliſh a laſting and commercial intercourſe; though, whatever friendſhip or good-will might take place, it was evident that there was not a ſingle article that could be exchanged between them, nor was there any ready communication betwixt the two countries either by ſea or land. The perſon pitched upon as ambaſſador was M. de Roule, vice-conſul at Damietta. He is characterized by Mr Bruce as "a young man of ſome merit, who had a conſiderable degree of ambition, and a moderate ſkill in the common languages ſpoken in the eaſt: but abſolutely ignorant of that of the country to which he was going, and, what was worſe, of the cuſtoms and prejudices of the nations through which he was to paſs. Like moſt of his countrymen, he had a violent predilection for the dreſs, carriage, and manners of France, and a hearty contempt for thoſe of all other nations: this he had not addreſs enough to diſguiſe; and this endangered his life." Beſides theſe diſadvantages, he had the misfortune to be under the diſpleaſure of all thoſe of his own nation who reſided at Cairo; ſo that the merchants were very much averſe to his embaſſy; and, as the Franciſcans and Capuchins were his mortal enemies, he had not a ſingle friend in the world except Maillet and the Jeſuits. Unluckily the conſul miſſed him in one of the moſt material articles, and which was undoubtedly of the utmoſt conſequence to him in the accompliſhment of his purpoſe, viz. the preſents neceſſary to be taken with him for the barbarous people through whoſe country he was to paſs. Brocades, ſatins, and trinkets of various kinds, according to Mr Bruce, were the proper wares; but inſtead of this, he had taken along with him mirrors of various kinds, with the pictures of the king and queen of France, wearing crowns upon their heads. The former of theſe ſubjected him to the imputation of being a magician: while the latter, if ſhown to a Mahometan, would bring upon him the charge of idolatry. The worſt misfortune of all was the malice and treachery of the Franciſcans, who had already prejudiced againſt him the people of the caravan with whom he was to go, the governors of the provinces through which his road lay, and the brutal and barbarous inhabitants of Sennaar, who lie in the way betwixt Egypt and Abyſſinia. The conſequence of all this was, that he was murdered at the laſt-mentioned place with all his retinue. The Franciſcan friars, who had preceded him to Sennaar, left it before his arrival, and returned immediately after. There cannot therefore be the leaſt doubt that they were the authors of his murder; though the bigotted diſpoſition of Louis XIV. prevented all inquiry into the matter; ſo that the particular ſteps they took to accompliſh their deſigns were never publiſhed to the world.

The aſſaſſination of De Roule was preceded by that of Yaſous emperor of Abyſſinia, who fell by a conſpiracy of his wife and ſon, occaſioned by a fit of jealouſy in the former. He was ſucceeded by his ſon Tecla Haimanout, who had conſpired againſt him. Before his death, he had diſpatched a meſſage to the king of Sennaar, requiring him to afford M. de Roule protection at his court, and a ſafe conduct from it; but when the meſſenger was within three days journey of the capital of that kingdom, he received news of the aſſaſſination of Yaſous. On this he returned

Yaſous aſſaſſinated.

Abyſſinia

turned in great haſte to Gondar, in order to have the letters of protection renewed by Tecla Haimanout the reigning prince. This was readily done: but before the meſſenger could reach Sennaar, he was informed that De Roule was already aſſaſſinated; on which he returned with ſtill greater haſte than before. The Abyſſinian monarch, provoked at ſuch a ſcandalous violation of the law of nations, declared his intention of commencing hoſtilities againſt the king of Sennaar; and for this purpoſe aſſembled his army. But this was ſcarce done, before he was informed that a rival, named Amda Sion, had been ſet up againſt him by the friends of his father Yaſous, and had been for ſome time privately collecting troops to ſurpriſe him before he could be ready to make any oppoſition. It was therefore neceſſary to employ the army deſtined againſt Sennaar to reduce this rebel to obedience; and ſcarce was this done, when the emperor himſelf was aſſaſſinated; ſo that all thoughts of revenging the death of M. Roule were laid aſide.

The new emperor intends to revenge his death;

but is himſelf murdered.

Reign of Theophilus.

Tecla Haimanout periſhed in 1706, and was ſucceeded by his uncle Tiffilis, or Theophilus; whoſe firſt care was to apprehend all thoſe ſuſpected to have been concerned in the death of his predeceſſor. Thus the murderers of Yaſous, whom Tecla Haimanout had inſtigated, imagined themſelves ſecure, and came to court without any fear of danger: but no ſooner did Theophilus get them into his power, than he cauſed them all to be put to death without exception; the queen herſelf being publicly hanged on a tree. Not ſatisfied with avenging the death of Yaſous by the execution of his murderers, he did the ſame with thoſe of Tecla Haimanout; putting to death all who were immediately in his own power, and commanding the governors of the provinces to do the ſame with thoſe whom they could find within their juriſdiction. One of theſe named Tigi, who had been formerly Betwudet, having eſcaped into the country of the Galla, raiſed a very conſiderable army, with which he invaded Abyſſinia, where he committed the moſt dreadful cruelties. Theophilus engaged him on the 28th of March 1709; when, with a force greatly inferior, he gained a complete victory. A number of the Galla fled to a church, hoping to be protected by the ſanctity of the place; but the emperor telling his ſoldiers that it was defiled by thoſe who were in it, commanded it to be ſet on fire, ſo that every one periſhed. Tigi, with his two ſons, were taken priſoners, and put to death. The king himſelf did not long ſurvive his victory; falling ſick of a fever, of which he died in September 1709.

Execution of the queen and other regicides.

Tigi revolts, but is defeated, taken and put to death.

Line of Solomon ſet aſide.

After the death of Theophilus, the line of Solomon by the queen of Sheba was ſuperſeded a ſecond time, and a ſtranger of the name of *Ouſtas* ſeated on the Abyſſinian throne. The extreme ſeverity of Theophilus in puniſhing the murderers of both Yaſous and Tecla Haimanout gave occaſion to this; for as both princes had been aſſaſſinated in conſequence of conſpiracies formed by the principal people of the nation, the number of conſpirators was ſo great, that the parties concerned had intereſt ſufficient to influence the election of the new monarch, even in this moſt capital reſpect, of his not being a deſcendant of Solomon. Excepting this ſingle defect, he was in every reſpect worthy of the kingdom, and was already the higheſt ſubject in it. Scarce was he ſeated on the throne, however, when a dangerous conſpiracy was formed againſt him by the very perſons by whom he had been placed upon it. Ouſtas baffled their deſigns, by ſeizing the principal conſpirators before they had time to bring their ſchemes to a bearing: and ſeveral people of the firſt rank were condemned to loſe their noſes, or to be put to death. After this, the emperor undertook an expedition againſt the Shangalla, according to the barbarous cuſtom of the Abyſſinian monarchs, who hunt theſe poor people merely for the ſake of making ſlaves; ſlaughtering the men without mercy as well as many of the women, and carrying off only the boys and girls into captivity. In this he met with perfect ſucceſs; and was about to attempt the conqueſt of the whole country, when he was called back by the news that his prime miniſter Teſa Chriſtos was dead. While the emperor remained in his capital at Gondar, he was taken ſuddenly ill; which he at firſt imputed to witchcraft, and therefore uſed ſome antidotes; among which the ſmoking of the palace with gunpowder was one. But this was done ſo careleſsly by the ſervants, that the whole building was conſumed; an accident looked upon by the people in general as a very bad omen, eſpecially as the king's complaint increaſed every day. At laſt the principal officers came to pay him a viſit of condolence, as they pretended; but in reality to obſerve the nature of his diſtemper, and to conſult whether or not it was likely to continue till they could fall upon means to deprive him of the government. Ouſtas underſtood their intentions, and therefore ſummoned all his ſtrength to aſſume for a moment the appearance of health; ſo that the officers found him as uſual engaged in buſineſs. Being thus diſconcerted, it became neceſſary to make ſome apology for a viſit ſo extraordinary and formal; for which they were at firſt ſomewhat at a loſs: on recollection, however, they told him, that, hearing he had been ſick, which they happily found was not the caſe, they had come to make a propoſal concerning the ſucceſſion; profeſſing a deſire that he would quiet the minds of his own family, and of the people in general, by appointing his ſon Faſil ſucceſſor to the throne after his deceaſe. Ouſtas gave them an equivocal anſwer; but the diſcourſe concerning Faſil happening to be overheard by the ſoldiers, a violent mutiny enſued, and all the officers who had come to viſit Ouſtas were killed. Part of the town was ſet on fire in the confuſion; and at laſt a proclamation was made, that David ſon of Yaſous was king of Abyſſinia. The prince was then ſent for from the mountain, and arriving at Gondar, was crowned on the 30th of January 1714. The diſtemper of Ouſtas in the mean time continuing to increaſe, he died on the 10th of February the ſame year.

Abyſſinia

The emperor falls ſick.

Ouſtas depoſed, and David proclaimed emperor.

Death of Ouſtas.

The new emperor was a rigid Alexandrian in principle; but Ouſtas had been ſo far favourable to the Catholics, as to entertain ſome of their prieſts, though in a private manner. As it was the cuſtom, however, to call a convocation of the clergy on the acceſſion of every new emperor, the monks and others inſiſted upon one being called on the preſent occaſion; the more eſpecially that a new Abuna was come from Egypt, and the lenity ſhown to the Catholics by Ouſtas had excited the jealouſy of the Abyſſinian clergy in the higheſt

Reign of David.

Abyſſinia. highest degree. This assembly proved fatal to three Romish priests, whom Ouſtas had protected and supported for some time. They were brought before the king and Abyſſinian clergy; who shortly asked them, whether they believed that the council of Chalcedon was to be accepted as a rule of faith, and that Pope Leo lawfully presided in it? To both these questions they answered in the affirmative: on which, without farther trial, they were condemned to be stoned; and the sentence was instantly put in execution by the furious and ignorant multitude, only one person in the whole assembly exclaiming against it as unjust. The priests being thus gratified in one instance, insisted that Abba Gregorius, who had acted as an interpreter to the three just mentioned, should also be put to death; but this was prevented by David, who found, upon inquiry, that he had only done so in obedience to the express commands of Ouſtas his sovereign.

Three Romish priests put to death.

Here we must take notice, that though the faith of Abyſſinia is always said to be the same with that of Alexandria, it is not for that reason to be imagined that the clergy are all of the same mind. On the contrary, many different parties exist among them, who hate one another no less than all of them do the church of Rome. The principal of these in the time we speak of were the monks of Debra Libanos and those of St Eustathius, to which last the emperor himself belonged. On the arrival of a new abuna, it is customary to interrogate him before the emperor and assembly of the clergy, which of the two opinions he adheres to. The emperor at present, not thinking his presence necessary, sent the betwudet with the principal persons of both parties to hear the profession of the new abuna, which was afterwards to be proclaimed to the people. The latter, probably not willing to contend with either party, gave an equivocal answer. But with this the king himself was dissatisfied; and therefore, without consulting the abuna farther, he caused it to be proclaimed, that the new abuna's profession was the same with that of the monks of St Eustathius. This was highly resented by the monks of Debra Libanos, who instantly ran to the abuna, and from him received a profession directly contrary to what had been proclaimed by the king's order. Not satisfied with this, they continued their tumult, disregarding the imminent danger they were in of falling under the king's displeasure. One of their number was so infatuated as to cry out, that he saw a cherub with a flaming sword guarding the door of the house where they were. Unluckily, however, they continued their assembly so long, and behaved in such a seditious manner, that the emperor sent against them a body of Pagan Galla; who fell upon them sword in hand, killed upwards of 100 of the ringleaders, and then sallying out into the street, destroyed indiscriminately every one they met.

Dissensions among the Abyssinian clergy.

Great massacre of the clergy and heirs.

The massacre continued till the next day at noon, when a stop was put to it by the king's proclamation. The vast quantity of blood so wantonly shed, however, could not but occasion great discontent throughout the capital, and the bad effects of it soon appeared. The king was universally hated, and numberless conspiracies were talked of; but before any pretender to the crown appeared, David himself fell sick, the cause of which was found to be poison. The perpetrators of this crime being known, were instantly put to death; but nothing could save the life of the emperor, who died the 9th of March 1719 in great agony. Abyssinia.

The king poisoned.

David was succeeded by his brother Bacuffa; who in the beginning of his reign proved very severe and cruel, cutting off almost all the nobility who could be supposed to have had any share in the conspiracies and seditions of former reigns. In the latter part of it he became much more mild, and was beloved by his subjects. He was succeeded in 1729 by his son Yasous II. who continued long under the regency of his mother; and as soon as he took the management of affairs upon himself, was disturbed with continual seditions and rebellions. In one of these the city of Gondar was made a field of battle, and was so frequently set on fire, as to be almost entirely reduced to ruins. Having at last succeeded in reducing all his enemies to obedience, he encouraged and promoted the arts of peace, repairing and ornamenting his palaces, in which he employed some Greek artists. For this he renounced the diversion of hunting, and the barbarous expeditions against the Shangalla: but this way of life proved so disagreeable to his turbulent subjects, that a severe satire was published against him, under the title of "The expeditions of Yasous the Little." Indignant at this reproach, he determined on an expedition against the kingdom of Sennaar; and having made the necessary preparations, invaded it with a formidable army, without the least pretence of provocation, or making any declaration of war. As he proceeded into the country of the enemy, he allowed his soldiers everywhere to exercise the greatest cruelties, to destroy every living creature with the sword, and every thing combustible with fire. Some of the Arabs joined him as he went along; many more fled from his presence; and a body of them tried to oppose him. These last were utterly defeated; and Yasous without delay prepared to march to Sennaar the capital of the kingdom. As he still went on, the king Baady, being assisted by Hamis prince of a territory named *Dar Foor*, surprised one division of his army so effectually, that they were all cut off to the number of 18,000. Yasous, however, still continued his destructive progress; though he gave over all thoughts of reducing the capital, or subduing the kingdom. He returned triumphant to Gondar, making a great show of the plunder he had acquired; though the dejected countenances of many of his army showed that they were by no means pleased with expeditions of this kind. The king himself was supposed to behold the distress of his subjects on this occasion with a malicious pleasure, on account of their impatience and turbulence in times of peace, and their forcing him into a war when he had no inclination for it. In a short time, however, the people were perfectly comforted for the loss of their brethren. In the late unfortunate action they had lost all those holy utensils, which it is usual in Abyssinia to carry into the field of battle in order to ensure victory. Among these was a picture of the crown of thorns which was put upon our Saviour's head; some pieces of the true cross upon which he suffered; a crucifix which had spoken on many occasions; with many other sacred relics of equal value. Soon after the battle all these were redeemed by the priests at an extravagant rate; no less than 8000 ounces of gold having been given

Abyſſinia

for the ſpeaking crucifix; and for the reſt, we are to ſuppoſe a proportional price had been paid. On the arrival of this trumpery at Gondar, the greateſt rejoicings were made, and Yaſous was aſtoniſhed at the people having ſo ſoon forgot the loſs of their countrymen and relations.

Soon after theſe tranſactions the abuna died; but though it was cuſtomary for the Abyſſinian monarchs to advance the money neceſſary to bring a new one from Alexandria, Yaſous found himſelf obliged to lay a tax upon the churches for defraying it at this time, having ſpent all his ready money in repairing and ornamenting his palaces. Three prieſts, conſigned to the care of as many Mahometan factors, were ſent to Egypt for the new patriarch; but they were detained for ſome time by the naybe or prince of Maſuah, who extorted from them one half of the money given by the emperor for bringing the abuna from Cairo. Yaſous no ſooner heard that they were detained at Maſuah, than he ſent orders to Suhul Michael governor of Tigré to refuſe proviſions to the inhabitants of Maſuah, which would ſoon reduce the naybe to obedience: but as Michael intended ſoon to quarrel with the king himſelf, he was not in any haſte to obey the orders he received. The travellers were therefore detained ſo long, that on their arrival at Jidda, they found they had loſt the monſoon; and, what was worſe, the ſcheriff of Mecca would not allow them to paſs without a freſh extortion. Their money was now exhauſted; but the rapacious ſcheriff put one of their number in priſon; where he continued for a twelvemonth till the money arrived: and from this time theſe extortions were changed into a ſtated tribute; 75 ounces of gold (about 186l. ſterling) being granted for leave of paſſage to Cairo for the abuna; 90 ounces to the ſcherif, and as many to the naybe, for allowing the abuna to paſs from Cairo: an agreement which ſubſiſts to this day. Several other inſults of this kind being received from the naybe, Yaſous at laſt diſcovered that there was a ſtrict alliance betwixt him, the governor of Tigré, and the Baharnagaſh; any one of whom, had he thought proper, could have cruſhed this pitiful prince with the ſmalleſt effort. On this the emperor determined to march againſt him in perſon; but was prevented by a rebellion which had been purpoſely excited in the country of Azab and that of the Dobas. The rebels were eaſily overthrown: but thus the expedition againſt the naybe was delayed for a year; during which interval the emperor ſent for Michael to Gondar. This order was poſitively refuſed, and a war enſued. Michael, unable to contend with the emperor to the open field, took to a high mountain, the uſual refuge of Abyſſinian rebels. Here alſo his bad fortune purſued him; all his poſts were taken by ſtorm excepting one, which, it was evident, would likewiſe have been carried, though not without a very great expence of men. Here Michael requeſted a capitulation; and to enſure favourable terms, he deſired to put into the hands of Yaſous a great quantity of treaſure, which would otherwiſe be diſſipated among the common ſoldiers. This being done, Michael deſcended with a ſtone upon his head, as confeſſing himſelf guilty of a capital crime, with a deſign to make ſubmiſſion to the emperor. This was prevented for one day by a violent ſtorm of wind and rain; from which moment the Abyſſinians believe he began converſe with the devil: but Mr Bruce informs us, that he has often heard him ſay it was Michael the archangel who was his correſpondent.

Abyſſinia

The meſſengers ſent for the new abuna inſulted and robbed.

A ſtated tribute for the paſſage of the abuna.

The emperor determines to puniſh the naybe of Maſuah, but is prevented.

War with Michael governor of Tigre.

Michael obliged to capitulate.

Yaſous was firmly determined to put this rebel to death, notwithſtanding the quantity of gold he had received; nevertheleſs a promiſe was extorted from him that he would ſpare his life. As ſoon as Michael came into his preſence, the emperor was filled with indignation, retracted his promiſe, and ordered him to be carried out and put to death before his tent door. The execution of the ſentence, however, was prevented by the interceſſion of all the officers of any conſideration in the court or army. Such univerſal ſolicitation could not be withſtood: Michael was pardoned; but with theſe remarkable words, that the emperor waſhed his hands of all the innocent blood which Michael ſhould ſhed before he brought about the deſtruction of his country, which he knew he had been long meditating.

Yaſous is obliged to act on his contrary to his own inclination.

Michael continued for ſome time in priſon; but was afterwards ſet at liberty, and even reſtored to his government of Tigré. No ſooner was he reinſtated in this dignity, than, collecting an army, he attacked Kaſmati Woldo governor of Amhara, defeated him in two battles, and forced him to take refuge among the Galla, whom he ſoon after bribed to murder him. In other reſpects he behaved as a moſt dutiful ſubject, gave the king the beſt intelligence, and ſupplied him with ſoldiers better accoutred than he had ever before beheld. He was alſo more humble than before his misfortune; nor did an increaſe of his favour and influence make him deviate from the line he had preſcribed. Having begun to gain friends by bribery, he continued to add one bribe to another to ſecure the old, and to gain new ones by the ſame means, pretending all the while to no kind of dignity or honour, not even to ſuch as was juſtly due to his own rank. Thus he became ſuch a favourite with the emperor, that he beſtowed upon him the governments of Enderta and Siré, in addition to that of Tigré; ſo that he was now maſter of almoſt one half of Abyſſinia. During the reign of Yaſous, however, he attempted nothing. The foundations of the diſturbances which ſucceeded were laid by the queen-mother, towards the end of the reign of Yaſous. This emperor had been married when very young to a lady of Amhara, by whom he had two ſons named Adigo and Aylo; but as his wife pretended to interfere in matters of ſtate, he was perſuaded by his mother to baniſh both her and her children to Wechné. After this his mother choſe a wife for him from among the Galla; a people of all others the moſt obnoxious to the Abyſſinians, both on account of the horrid barbarity of their manners, and the continual wars which from time immemorial had taken place between the two nations. The new queen was the daughter of one Amitzo, a prince who had once hoſpitably entertained Bacuffa before he became emperor; and his people were eſteemed the leaſt barbarous of the whole. A prejudice againſt her, however, againſt her offſpring, and the emperor himſelf, never to be effaced, now took place among the Abyſſinians; but this did not ſhow itſelf during the reign of Yaſous. The emperor died on the 21ſt of June 1753, being the 24th year of his reign, not without ſuſpicion of being poiſoned by his mother's relations, who were now attempting

He is ſet at liberty and raiſed to the higheſt honours.

Cauſe of the great civil war in Abyſſinia.

Death of Yaſous.

Abyſſinia. tempting to engroſs the whole power of the empire into their hands.

eign of as. On the death of Yaſous, his ſon Ioas by the Galla princeſs juſt mentioned ſucceeded to the throne without any oppoſition. The diſcontent which had taken place in the former reign about the power aſſumed by the relations of the old queen, now began to ſhow itſelf more openly; and it was complained that a relationſhip to her was the only way to preferment, by which means the old families, whoſe merit had often ſaved the ſtate, were totally excluded from every ſhare of favour.

he Galla troduced to Abyſſinia. On the acceſſion of the young king, a party of Galla horſe, ſaid to be about 1200 in number, were ſent as the portion of his mother; and theſe were quickly followed by a number of private perſons from motives of curioſity, or hopes of preferment, who were embodied to the number of 600 into a troop of infantry, the command of which was given to Wooſheka. The great favour in which theſe people were at court ſoon induced many others to make their appearance. Two

wo of e king's ncles arre, and groſs all e power. of the king's uncles were ſent for by his expreſs deſire; and they brought along with them a troop of 1000 horſe. By the time they arrived the queen was dead; but her two brothers, named *Brulhe* and *Lubo*, finding that the king put an entire confidence in them, determined to make a party at court. This was eaſily effected; every thing was governed by Gallas; even the king himſelf affected to ſpeak their language; while the Abyſſinians were to the laſt degree mortified at ſeeing their inveterate enemies thus eſtabliſhing a dominion over them in the heart of their own country. At laſt the king thought proper to appoint his uncle Lubo to the government of Amhara; but this produced ſuch exceſſive diſcontent, that he was fain to retract his nomination, leſt a civil war ſhould have enſued. While the empire was thus divided into two parties, Suhul

hul Michael arrives at art. Michael came to Gondar in a very ſplendid manner, on an application from the exiled prince of Senaar to be reſtored to his kingdom. This prince, when conducted into the preſence of the emperor, proſtrated himſelf before him, owned himſelf his vaſſal, and was put in poſſeſſion of the government of Ras el Feel upon the frontiers, with a large revenue, where he was adviſed to ſtay till the diſputes which ſubſiſted at that time ſhould ſubſide. This ſalutary advice, however, he had

ng of nnaar rdered. not prudence to comply with; but ſuffering himſelf to be decoyed from his aſylum in Atbara, was taken priſoner and murdered.

In the mean time the Abyſſinian prime miniſter Welled de l'Oul, died. He had hitherto moderated the fury of the oppoſite parties by his wiſe and prudent conduct; but no ſooner was he taken out of the way, than a moſt dreadful ſcene of confuſion and civil war took place, which raged with the utmoſt violence while

te of the erent ties. Mr Bruce was in Abyſſinia, and ſeemed not likely to come to any termination when he left it. The whole empire was divided into two great factions: at the head of the one was the old queen, mother of Yaſous; and at the head of the other, Ioas himſelf the emperor, with his Galla relations. Matters were firſt brought to a criſis by the imprudence of the emperor himſelf in beſtowing the government of Begemder upon Brulhe one of his Galla uncles. The government of this province had been lately reſigned into the hands of the queen by an old officer named *Ayo*; and it was ſuppoſed that his ſon named *Mariam Barea*, univerſally allowed to be one of the moſt accompliſhed noblemen of the kingdom, was to ſucceed him in this government. This opinion was farther confirmed by the marriage of Mariam himſelf with Ozoro Eſther, a daughter of the old queen by her ſecond huſband. Unfortunately a quarrel had happened between Kaſmati Ayo, the old governor of Begemder, and Suhul Michael, a little before the reſignation of the former, and continued undecided till Mariam took the office upon him. The occaſion was quite trifling; nevertheleſs, as Mariam had refuſed to ſubmit to the deciſion of the judges, whom he ſtigmatized as partial and unjuſt, inſiſting that the king ſhould either decide the affair in perſon, or that it ſhould be referred to the deciſion of the ſword, he thus fell under the imputation of being a diſobedient and rebellious ſubject. In conſequence of this, Ioas looked upon him ever afterwards with an evil eye; and now deprived him, by proclamation, of the government of Begemder, giving it to his own Galla uncle Brulhe, of whom we have already made ſo much mention. This unexpected promotion threw the whole empire into a ferment. As Begemder was a frontier province bordering on the country of the Galla, there was not the leaſt doubt, that, immediately on the acceſſion of Brulhe to his new office, it would be overrun by that race of barbarians, remarkable for their ſavage manners almoſt beyond all the other nations in Africa. This was the more dangerous as there was not above a day's journey betwixt the frontiers of Begender and Gondar, the capital of the whole empire. Mariam Barea himſelf, who had a high ſenſe of honour, was particularly hurt at the manner in which he was deprived of his dignity, and condemned with his family to be ſubject to a race of Pagans, whom he had often defeated in battle, and obliged to acknowledge him as their ſuperior. All remonſtrance, however, was vain. Brulhe, under the ſanction of the imperial command, advanced with an army to take poſſeſſion of his new dignity: but ſo exceedingly averſe were the Abyſſinians to follow him in this expedition, that the army diſbanded itſelf ſeveral times after it had been collected; and it took up almoſt a year before he could proceed from the place where his camp was, at the lake Tzana or Dembea, to the frontiers of Begemder, though ſcarce a day's journey diſtant. Mariam Barea beheld his operations with great contempt, employing his time in the diſpatch of ordinary buſineſs, and endeavouring to reconcile himſelf to the king, but without ſucceſs. As his laſt effort, he ſent a remonſtrance to the emperor; in which, after many proteſtations of duty and obedience, he reminded him, that, at his inveſtiture into the office of governor of Begemder, he had ſworn not to allow any of the Galla to enter his province: that, ſhould he deviate from the obſervance of this oath, the ſafety of the princes in Wechnè would be endangered; they would conſtantly be liable to the invaſions of the Pagans, and probably be extirpated, as had already happened at two different times; and he begged of the emperor, if he was determined to deprive him of his government, to beſtow it rather upon ſome Abyſſinian nobleman; in which caſe he promiſed to retire, and live in private with his old father. He had, however, formed a reſolution, which he thought it his duty to ſubmit to the emperor, that if his ma-

Brulhe made governor of Begemder. An univerſal ferment enſues.

Is oppoſed by Mariam Barea.

Abyſſinia. jeſty ſhould think proper to come, at the head of a Galla army, to invade his province, he would retire to the farthest extremity of it, till he was ſtopped by the country of the Galla themſelves; and, ſo far from moleſting the royal army, he might be aſſured, that though his own men might be ſtraitened, every kind of proviſion ſhould be left for his majeſty. But if an army of Galla, commanded by one of that nation, ſhould enter the province, he would fight them at the well of Fernay, on the frontiers, before one of them ſhould drink there, or advance the length of a pike into the province.

This remonſtrance had no effect upon the emperor. He returned a ſcoffing anſwer, announcing the ſpeedy arrival of Brulhe, whom he thought ſure of victory: but, at the ſame time, to ſhow that he did not put his confidence entirely in his proweſs, he created Suhul Michael governor of Samen, which lay next to Tigré in the way to Begemder, ſo that no obſtruction might lie in the way of that officer's march to Gondar, in caſe there ſhould be any occaſion for him. Mariam, provoked at the manner in which he was undervalued in the king's meſſage, gave an ironical reply, in which he alluded to the name of *Brulhe*, in the Abyſſinian language ſignifying a kind of *bottle;* this he told him would be broken on the rocks of Begemder, if ſent into that country.

Farther promotion of Michael.

Brulhe defeated and killed.

On receiving this laſt meſſage from Mariam, he king inſtantly ordered the army to be put in motion; but the Abyſſinians had unanimouſly determined not to act offenſively againſt their countrymen. Brulhe therefore was left to decide the affair with his Galla. Mariam kept exactly to his word in the declaration he had made to the king, not ſtirring out of his province, nor allowing the leaſt attempt to be made to haraſs his enemy, till they were drawn up at the well above mentioned, where he met them with his army. The Galla, unſupported by the Abyſſinian troops, were utterly unable to bear the ſhock of Mariam's army, and therefore ſoon betook themſelves to flight; but a part of them, who were ſurrounded by the cavalry, fought valiantly till they were all cut to pieces. Mariam had given the moſt expreſs orders to take Brulhe alive; or, if that could not be done, to allow him to make his eſcape. One of his ſervants, however, obſerving him in the field, puſhed up through the enemy to the place where he was, and running him twice through with a lance, left him dead on the ſpot.

Mariam Barea was no ſooner informed of the death of his rival, than he cried out in great emotion, that Suhul Michael, with the whole army from Tigré, would attack him before autumn. In this he was not deceived. Ioas inſtantly diſpatched an expreſs for Michael, ordering his attendance, and inveſting him with the dignity of Ras, by which he became poſſeſſed of unlimited power both civil and military. Michael himſelf had for a long time ſeen that matters would come to this criſis at laſt, and had provided for it accordingly. He now ſet out with an army of 26,000 men, all of them the beſt ſoldiers in the empire, and 10,000 of them armed with muſkets. As he paſſed along, his troops deſolated the country wherever they came, but he encumbered his army by nothing uſeleſs; allowing his men to carry along with them neither women, tents, beaſts of burden, nor even proviſions.

Michael created Ras.

Commits great devaſtations.

The ſubſiſtence of his troops was abundantly provided for by the miſerable inhabitants of the provinces through which he paſſed; and, not ſatisfied with this, he inſiſted on a contribution in money from all the diſtricts within a day's march of thoſe places where he was; the leaſt delay was followed by the ſlaughter of the inhabitants and deſtruction of their houſes. Towns, villages, and buildings of every kind, were ſet on fire as he paſſed along; the people fled from all quarters to the capital for refuge, as from the face of the moſt inveterate enemy; and Ioas himſelf was now ſenſible of his having been in the wrong to inveſt him with ſuch unlimited power. On his arrival at the capital, Michael took poſſeſſion of all the avenues, as if he meant to beſiege it; ſo that an univerſal conſternation enſued. Inſtead of offering any hoſtility, however, he waited with the utmoſt reſpect on the emperor, proceeding immediately from the royal preſence to his own houſe, where he ſat in judgement, as the nature of his office required him to do. No ſooner had he taken upon him this new office, however, than he executed juſtice in ſuch a rigorous and impartial manner as made the boldeſt offenders tremble. Some parties of his own ſoldiers, preſuming upon the licence that had hitherto been granted them, entered Gondar and began to plunder as they had done in other places; but, on the very firſt complaint, their commander cauſed 12 of them to be apprehended and hanged. Their execution was followed by 50 others in different quarters of the city; after which he gave the charge of the capital to three officers who were to preſide over three quarters, himſelf taking care of the fourth. Two civil judges were appointed to aſſiſt each officer in a diſtrict, two were left in the king's houſe, and four of them held a court of judicature in his own. Thus the inhabitants, finding, that inſtead of bloodſhed and maſſacre, they were to expect nothing but ſtrict equity and moderation, became reconciled to Michael the day after his arrival, and lamented only that he had not come ſooner to relieve them from the anarchy and confuſion in which they had been held ſo long. To ſo great a degree of perfection indeed did he bring his legiſlation, that a very ſhort time after he entered the city, a loaf of bread, a bottle of water, and an ounce of gold, were expoſed in the market-place on the head of a drum night and day for ſome time, without any one offering to take them away. This was the more remarkable as there was then a ſcarcity of proviſions, and Michael himſelf would allow but a very ſcanty ſupply of water to be carried into the city; thereby giving the inhabitants to underſtand, that if he ſhould ſet fire to it as he had done to other places, it would not be in their power to quench the flames.

Abyſſinia

Arrives at Gondar.

Executes juſtice impartially.

The capital being thus ſecured in perfect obedience, Michael next prepared to ſet out on his expedition againſt Mariam Barea. Senſible, however, that the deſtruction of this worthy nobleman would be attended with a great degree of odium, he was reſolved that none of it, or at leaſt as little as poſſible, ſhould fall upon himſelf. For this purpoſe, he inſiſted that the emperor ſhould march in perſon from Gondar, and carry all his ſoldiers along with him. Thus he had an opportunity of throwing the whole blame upon Ioas, and repreſenting himſelf as no more than a paſſive inſtrument in the affair. He alſo took every occaſion of

Marches againſt Mariam Barea

praiſing

Abyſſinia

praiſing his antagoniſt for his virtues, and cenſuring the emperor for attempting to cut off ſuch an excellent officer.

In the mean time Mariam Barea keeping exactly to the terms of the laſt remonſtrance he had ſent to Ioas, retired before him to the extremity of the province. Ioas and Michael advanced furiouſly, burning and deſtroying every thing as they went along. An engagement at laſt enſued at a place called *Nefas Muſa*, on the extreme borders of Begemder, when Mariam could not retreat without going out of the province. As the royal army was more than twice the number of the other, and commanded by an officer of ſuperior ſkill, victory was not long of being decided in its favour. Mariam with 12 of his officers, took refuge in the country of the Galla; but were immediately delivered up by that faithleſs people. He was put to death by Lubo the brother of Brulhe, who is ſaid with his own hands to have cut his throat as a ſheep is commonly killed in this country, and afterwards to have diſfigured the body in a ſhocking manner. The head was cut off, and carried to Michael's tent, who would not allow it to be uncovered in his preſence. It was afterwards ſent to the family of Brulhe in the country of the Galla, to ſhow them what attention had been given to revenge his death; and this diſpleaſed the Abyſſinians even more than any thing that had yet happened ſince the beginning of the conteſt. The 12 officers, who were taken along with him, ſought protection in the tent of Ras Michael, to which they were ſuffered to eſcape by Wooſheka their keeper. Lubo, however, intended likewiſe to have ſacrificed them as he had done Mariam, and therefore ſent Wooſheka to demand them: but no ſooner had he unfolded his errand, than Michael in a rage, called to his attendants to cut him in pieces before the tent door; which would certainly have been done, had he not fled with the utmoſt precipitation.

Mariam defeated.

Betrayed by the Galla, and cruelly murdered.

Some o his officers protected by Michael.

The ſcandalous aſcendency which the Galla always manifeſted over the king, had greatly diſpleaſed Michael; who expreſſed himſelf ſo freely on the ſubject, that a coolneſs took place between them. Another officer named *Waragna Faſil*, a Galla by birth, had inſinuated himſelf into the king's favour, and greatly diſtinguiſhed himſelf at the battle of Nefas Muſa. It was no wonder, therefore, that he ſoon became a rival to Michael; and this rivalſhip was greatly augmented by the following circumſtance. Near the field of battle at Nefas Muſa was a houſe of Mariam Barea, where Ozoro Eſther his widow now was. Being ſurrounded by pleaſant and verdant meadows, Faſil encamped there for the ſake of his cavalry. No other deſign was at that time apparent; however, his preſence greatly alarmed the princeſs. She had along with her at that time a nobleman named *Ayto Aylo*, who had been at the battle of Sennaar; but had there been terrified to ſuch a degree, that he reſolved to renounce the world ever after and turn monk. In this character he was now with Ozoro Eſther: and though he refuſed to be concerned in any military affairs, he was ſtill conſulted by both parties as a kind of oracle. In the preſent emergency, therefore, he told the princeſs that there was only one way by which ſhe could ſecure herſelf from the cruelty of the Galla, and becoming a prey to one or other of the murderers of her huſband; and that was by immediately eſpouſing Ras Michael. Ozoro was perfectly ſenſible of the propriety of the advice, and therefore ſet out next morning in company with Aylo to Michael's tent. Here ſhe threw herſelf at his feet on the ground; and refuſing to riſe, Aylo explained her errand, informing the Ras that ſhe intended to beſtow herſelf upon him in marriage, as being the only perſon not guilty of her former huſband's death capable of affording her protection in her preſent ſituation. Michael ſaw clearly the advantages attending ſuch a match; and therefore having cauſed the army to be drawn up in order of battle, as if for a review, he ſent for a prieſt, and was married to the princeſs in the ſight of all his men. The ceremony was followed by the loud acclamations of the whole army; and Ioas was ſoon informed of the reaſon. He expreſſed his diſpleaſure at the match, however, in ſuch unequivocal terms, that a mutual hatred from that moment commenced. This was ſoon made public by a very trifling accident. One day while the army was marching, Michael being much incommoded by the ſun which affected his eyes, threw a white handkerchief over his head to keep off the heat. This was inſtantly told the king, who took it as an affront offered to himſelf; for in Abyſſinia it is unlawful to cover the head on any occaſion whatever in preſence of the emperor, or even within ſight of the palace where he lodges. Ioas was no ſooner informed of the ſuppoſed affront, than he ſent to the Ras to know upon what account he preſumed to cover his head in his preſence; but though the covering was inſtantly taken off, it was thought that no atonement could ever be made for ſuch a grievous offence. Soon after this a quarrel happening between Faſil and a perſon named *Guſho*, likewiſe a man of great conſequence, complaint was made to the Ras, who, as civil judge, ſummoned both parties before him. Faſil abſolutely refuſed to obey any ſuch juriſdiction; and the affair being laid before the other judges, it was given in favour of Michael, and Faſil declared to be in rebellion. This was followed by a proclamation depriving him of his government of Damot, and every other public office he held. Faſil, however, had no mind to ſubmit to this diſgrace; and therefore, after holding a long conference with the king, departed with his army, encamping on the high road betwixt Damot and Gondar, where he intercepted the proviſions coming from the ſouthward to the capital. This was followed by an attempt to aſſaſſinate the Ras. A ſhot was fired from one of the windows of the palace into the houſe where he ſat in judgement; the diſtance being ſo ſmall, that he could eaſily be ſeen from the palace while thus employed. The ball, however, miſſed Michael, but killed a dwarf who was ſtanding before him fanning the flies from his face. As it was evident that this ſhot muſt have been fired with the knowledge of the king, it was rightly judged to be the commencement of hoſtilities. Ioas inſtantly removed to a diſtance, but ſent Wooſheka with orders to the Ras to return to Tigré without ſeeing his face; declaring, at the ſame time his own uncle Lubo governor of Begemder and Amhara. Michael could ſcarcely be prevailed upon to ſee Wooſheka, and told him that he ſhould certainly be put to death the next time he appeared in his preſence. Next day Ioas ſent a meſſage to the Ras by four judges, commanding him to return to Tigré without

Abyſſinia.

Michael marries the princeſs Ozoro Eſther.

Diſagreement between the king and Michael.

Final quarrel betwixt Michael and Faſil.

A ſhot fired at Michael from the palace window.

Abyſſinia. without the leaſt delay, under pain of his higheſt diſpleaſure. Michael returned a formal anſwer, concluding, that he expected the king himſelf to be ready to march againſt Faſil to-morrow. To this an abſolute refuſal was given: on which Michael iſſued a proclamation, commanding all the Galla to leave the capital next day under pain of death: in caſe of diſobedience they were declared outlaws, and liable to be killed by the firſt that met them if they were found 24 hours after the proclamation in the capital, or to the ſame penalty if they were found in the kingdom after ten days. An engagement took place a ſhort time after, in which Faſil was totally defeated, and obliged to retire into Damot. In this engagement ſome of the king's black horſe were taken. Theſe are all ſlaves, and ſubject to no other commands but thoſe of his majeſty himſelf. Their appearance clearly ſhowed that they muſt have been ſent by the king to fight againſt the Ras. All of them were therefore brought before the latter, and interrogated by whoſe orders they had come to the battle. Two refuſed to give any anſwer, and had their throats cut in preſence of their companions. A third plainly told him that they had been ſent by the king; who had likewiſe ordered an Armenian to fire out of the palace window at Ras Michael. On this the priſoners were diſmiſſed; but aſſaſſins inſtantly diſpatched to put an end to the king's life; which they accompliſhed, and buried him in a church dedicated to St Raphael.

Faſil defeated by Michael.

Ioas aſſaſſinated.

On the death of Ioas, Michael, now abſolute maſter of Abyſſinia, ſet up for emperor Hannes, brother to the late king Bacuffa, an old man who had reſided almoſt all his lifetime on the mountain of Wechnè, and being entirely unacquainted with the affairs of the world was on this account probably ſuppoſed by Michael to be the more proper for his purpoſes. Hannes had been maimed by the loſs of his hand, on purpoſe to incapacitate him for the throne; but this objection was laughed at by the Ras. He found him, however, poſſeſſed of a quality much more inimical to his own purpoſes; and that was, an abſolute averſion at meddling with the affairs of government: ſo that he could not by any means be induced to take the field againſt Faſil. Michael therefore was obliged to ſet out by himſelf; but thinking it improper to leave a king of any kind behind him in the capital, he had the old man poiſoned before his departure; putting his ſon Tecla Haimanout in his place.

Hannes ſet up by Michael, and ſoon after poiſoned.

The young emperor, according to Mr Bruce's account, was of a fair complexion, leſs tawny than a Neapolitan or Portugueſe, owing to his having been born in the mountain. He was endowed with many princely accompliſhments; and ſo much attached to Michael Ras, that he called him *Father* from the time of his acceſſion, waiting upon him when indiſpoſed with the affection of a ſon. There being now no objection therefore, Michael marched againſt Faſil without delay, and entirely defeated him on the 3d of December 1769. On this occaſion Wooſheka was taken priſoner, and afterwards flead alive, notwithſtanding the interceſſion of ſome of Michael's officers for him; his ſkin being afterwards formed into a bottle. This piece of cruelty was attributed to Ozoro Eſther; whom Mr Bruce repreſents as the moſt humane and merciful of women; though he is obliged to allow, that on the preſent occaſion, as well as on every other which regarded her former huſband, ſhe entirely forgot her character. The night on which this miſerable victim was deſtroyed, ſhe appeared in the king's tent dreſſed like a bride; and in a little time returned in triumph to Gondar.

Reign of Tecla Haimanout.

Faſil defeated.

Abyſſinia.

Soon after theſe tranſactions, Mr Bruce entered Abyſſinia. He arrived at Maſuah when there was only a report of Hannes's being ill, and Mr Bruce was ſuppoſed to be his phyſician, though in truth that emperor was already dead. Here he was ill-treated by the naybe, with a deſign to extort money, and afterwards probably to put him to death, as was his cuſtom with other ſtrangers. He eſcaped the danger, however, by the protection of Achmet, nephew and heir apparent to the nayhe; and by his own prudent and reſolute behaviour, threatening his adverſaries with the arrival of a Britiſh man of war in caſe of any injury; ſhowing the Grand Signior's protection; making uſe of the name of Ras Michael, now ſo formidable, and to whom he had obtained a recommendation, &c. After many vexations and delays, he was at laſt allowed to depart; and a guide, by name *Saloome*, was ſent along with him. This man was brother in-law to the naybe, and a profeſſed Chriſtian; but a traitor in his heart, and who wiſhed to do every thing in his power to hurt our traveller. He was furniſhed with another guide, however, by his friend Achmet, to inform him where to pitch his tent, and other neceſſary particulars.

Mr Bruce's arrival and adventures in Abyſſinia.

On the 15th of November 1769 Mr Bruce left Arkeeko, on the eaſtern coaſt of Africa, and proceeded ſouthwards for Gondar the capital of Abyſſinia. After an hour's journey, he pitched his tent near a pit full of rain water, where he remained all day; and in the evening a meſſenger arrived from the naybe, who took away the guide *Saloome*. Next day the latter returned in company with Achmet the naybe's nephew, already mentioned. The latter cauſed him depoſite in his hands Saloome's full hire, as though he had gone the whole length he had promiſed. Four of the men were commanded to go back to Arkeeko, and others put in their place: after which Achmet told Mr Bruce, that he was not to take the road through Dobarwa, though near, becauſe it belonged to the naybe; but that Saloome knew another by a place called *Dixan*, which belonged to himſelf, and where he could enſure him of a good reception. In this journey he told him that he would be obliged to croſs the mountain of Taranta, the higheſt in Abyſſinia; but the fatigue of this would be more than recompenſed by the aſſurance of ſafety and the curioſity of the place. Taking leave of Achmet in a very friendly manner, therefore, Mr Bruce with his company finally ſet out on their journey the evening of the 16th. For the ſhort ſpace they had travelled, the ground was covered with graſs broader in the leaf than ours; but in a little time the ſoil became hard, dry, gravelly, and full of acacia or Egyptian thorn. Next day (the 17th) they changed their courſe from ſouth to weſt; and ſoon arrived at a range of mountains ſtanding ſo cloſe to one another, that there was no paſſage between them excepting what was worn by torrents of water; the bed of one of which conſequently now became their road. In the evening they pitched their tent at ſome diſtance from this torrent, which had ſcarcely any water in it when they left it; but all the afternoon there had been an appearance of rain, with much

Sets out from Arkeeko.

Account of the country through which he paſſed.

Abyſſinia.

much thunder and lightning, at a diſtance. On a ſudden they heard a noiſe among the mountains louder than thunder; and inſtantly ſaw the torrent, ſwelled immenſely by the diſtant rains, now running like a rapid river, and the foremoſt part of it advancing in its bed in a body of water about the height of a man. Having run for ſome time in this violent manner, the current, no longer ſupplied by the rains, began to diminiſh, and by the next morning was quite gone. Among theſe mountains the nights are cold even in ſummer.

Sudden ſwell of a torrent.

On the 18th the journey was reſumed in the bed of the torrent, which now ſcarcely had any water: though the ſtones were rendered very ſlippery by the quantity of rain which had fallen. Leaving this diſagreeable road, they came to a fine rivulet; which being the firſt clear water they had ſeen from the time Mr Bruce left Syria, was exceedingly agreeable. They proceeded along the banks of this river for ſome time; and ſoon after leaving it, they came to another of the ſame kind: but next day were obliged to reſume their courſe in the bed of a torrent. The mountains in this part of the world are exceſſively rugged and full of precipices, entirely deſtitute of ſoil, and covered with looſe ſtones of a black colour. On the ſide of the torrent in which they marched, however, there grew very large ſycamore trees, ſome of them little leſs than 7½ feet in diameter. Their branches afforded ſhelter to an infinite number of birds; many of them without ſong; but others having notes very different from the European kinds, and peculiar to the continent of Africa. Moſt of thoſe which had very beautiful colours were of the jay or magpie kind. The trees were loaded with figs; but they came to nothing, by reaſon of the ignorance of the ſavages, who knew not the proceſs of caprification. The ſtreams of water themſelves, which at this ſeaſon were found ſo delightful, run only after October: they appear on the other ſide of the mountains when the ſummer rains in Abyſſinia are ceaſing; at other times, no water is to be met with, excepting what is contained in ſtagnant pools.

Notes of the African birds different from thoſe of Europe.

On the 20th of November they began to aſcend the high mountain of Taranta. Their road was now exceſſively rugged and uneven, interſected with monſtrous gullies and holes made by the torrents, as well as by huge fragments of rocks which had tumbled down. It was with the utmoſt difficulty that they could carry the aſtronomical inſtruments up the hill; in which work Mr Bruce himſelf, and one of his attendants named *Yaſine*, a Moor, bore a principal ſhare. The only misfortune they met with was, that their aſſes being unloaded, and committed to the care of a ſingle perſon, refuſed to aſcend this barren mountain; and in ſpite of all that their drivers could do, ſet off at a briſk trot for the fertile plains below. Luckily, however, they were afterwards recovered by four Moors ſent after them, and the journey reſumed without any material interruption. The beaſts were now become much more tractable, having been ſeen and purſued by the hyænas with which that mountain abounds.

Account of the mountain Taranta.

Taranta is ſo deſtitute of earth, that there was no poſſibility of pitching a tent upon it; ſo that our travellers were obliged to take up their lodging in one of the caves with which it abounds. The under part of the mountain produces in great plenty the tree called *kolquall*, which was here obſerved in greater perfection than in any other place throughout the whole journey. The middle part produced olives which carried no fruit; and the upper part was covered with the oxycedras or Virginia cedar, called *arze* in the language of the country. On the top is a ſmall village named *Halai*, inhabited by poor ſhepherds, who keep the flocks of the rich people of the town of Dixan below. They are of dark complexion, inclining to yellow; their hair black, and curled artificially by means of a ſtick, and which our author ſuppoſes to be the ſame with the *criſping-pin* mentioned, Iſa. iii. 22. The men have a girdle of coarſe cotton cloth, ſwathed ſix times round their middle; and they carry along with them two lances, and a ſhield made of bulls hides. Beſides theſe weapons, they have in their girdles a crooked knife with a blade about 16 inches in length, and three in breadth at the lower part. There is here great plenty of cattle of all kinds; the cows generally of a milk white, with dewlaps hanging down to their knees; their horns wide like thoſe of the Lincolnſhire cattle; and their hair like ſilk. The ſheep are all black both here and throughout the province of Tigré; having hair upon them inſtead of wool, like the reſt of the ſheep within the tropics; but remarkable for its luſtre and ſoftneſs, without any briſtly quality. On the top of the mountain is a plain, which, at the time our author was there, they had ſown with wheat. The air ſeemed exceſſively cold, though the barometer was not below 59° in the evening. On the weſt ſide the cedars, which on other parts are very beautiful, degenerate into ſmall ſhrubs and buſhes.

Abyſſinia.

Of the village Halai, and inhabitants of the mountains.

Beautiful cattle, &c.

The road down this mountain was for ſome time nothing inferior in ruggedneſs to what they had met with in aſcending it; but as they approached Dixan, it became conſiderably better. This is the firſt town on the Abyſſinian ſide of Taranta. It is ſeated on the top of a hill of a form exactly conical, ſurrounded by a deep valley like a ditch; and no acceſs to it but by a path which winds round the hill. The inhabitants were formerly exterminated by Michael Ras; and the ſucceeding race, in Mr Bruce's time, were of a very indifferent character, being, as he ſays, compoſed of the worſt people from the territories of the Baharnagaſh and the province of Tigré, on both of which it borders. Here he was in danger from the treachery of Saloome, who wiſhed to have decoyed him into the power of ſome aſſaſſins. Finding that this could not be done, he ſurrounded Mr Bruce and his retinue with a body of armed men; but they were diſperſed by the authority of Hagi Abdelcarder, the friend of Achmet, who had received orders to provide for the ſafety of the travellers. The only trade carried on here is that of buying and ſelling ſlaves; who are ſtolen from Abyſſinia, chiefly by the prieſts, and ſent into Arabia and India.

Town of Dixan deſcribed.

The next ſtage was from Dixan to Adowa, capital of the province of Tigré. Leaving Dixan on the 25th of November, they pitched their tent the firſt night under a large ſpreading tree called *daroo*, which Mr Bruce ſays was one of the fineſt he ſaw in Abyſſinia, being about 7½ feet in diameter. They had been joined by ſome Moors driving 20 loaded aſſes and two bulls, which in that country are likewiſe uſed as beaſts of burden,

Journey to Adowa, the capital of Tigré.

Abyſſinia. burden. Here, our author ſays, he recovered a tranquillity of mind which he had not enjoyed ſince his arrival at Maſuah; but they were now entirely without the dominions of the naybe, and entered into thoſe of the emperor. Saloome attended them for ſome way, and ſeemed diſpoſed to proceed; but one of the company, who belonged to the Abyſſinian monarch, having made a mark in the ground with his knife, told him, that if he proceeded one ſtep beyond that, he would bind him hand and foot, and leave him to be devoured by wild beaſts.

His treacherous guide obliged to return.

The country becomes more fertile as he paſſes along.

Being now in a great meaſure delivered from their fears and embarraſſments, the company proceeded on their journey with pleaſure, through a much better country than they had hitherto paſſed. In ſome places it was covered with wild oats, wood, high bent graſs, &c. but, in not a few places, rocky and uneven. Great flocks of a bird as large as a turkey, called, in the Amharic language, *erkoom*, were ſeen in ſome places. A large animal of the goat kind, called *agazan*, was found dead and newly killed by a lion. It was about the ſize of a large aſs, and afforded a plentiful repaſt. Numbers of kolquall trees were alſo ſeen; and the ſides of the river Habeſh were adorned with a beautiful tree of the ſame name with the ſtream. There were in this place alſo many flowers of various kinds, particularly jeſſamine. The mountains of Adowa, which they came in ſight of on the 5th of December, are totally unlike any thing to be met with in Europe; their ſides being all perpendicular rocks, like ſteeples or obeliſks of many different forms.

Adowa deſcribed.

Adowa, though the capital of an extenſive province or kingdom, does not contain above 300 houſes; but occupies nevertheleſs a large ſpace, by reaſon of the incloſures of a tree called *wanzey*, which ſurround each of the houſes. It ſtands on the declivity of a hill, ſituated on the weſt ſide of a ſmall plain ſurrounded by mountains. It is watered by three rivulets which never become dry even in the greateſt heats. A manufacture is carried on here of a kind of coarſe cotton cloth, which paſſes for money throughout all Abyſſinia. The houſes are built of rough ſtone cemented with mud; lime being only uſed in the conſtruction of thoſe at Gondar, and even there it is very bad.

Our traveller was very hoſpitably entertained at Adowa by one Janni, with whom he reſided during his ſtay there. Leaving it on the 17th of December, he viſited the ruins of Axum, once the capital of the empire. Here are 40 obeliſks, but without any hieroglyphics. A large one ſtill remains, but the two largeſt are fallen. There is alſo a curious obeliſk, of which he gives a figure, with other antiquities which our limits will not allow us to enlarge upon. The town has at preſent about 600 houſes, and carries on manufactures of the coarſe cotton cloth already mentioned. It is watered by a ſmall ſtream which flows all the year, and it is received into a fine baſon 150 feet ſquare, where it is collected for the uſe of the neighbouring gardens. Its latitude was found by Mr Bruce to be 14° 6′ 36″ north.

Viſits the ruins of Axum.

On the 20th of January 1770, our traveller ſet out from Axum. The road was at firſt ſmooth and pleaſant, but afterwards very difficult; being compoſed of ſtones raiſed one above another, the remains of a magnificent cauſeway, as he conjectures. As they paſſed farther on, however, the air was everywhere perfumed by a vaſt number of flowers of different kinds, particularly jeſſamine. One ſpecies of this, named *agam*, was found in ſuch plenty, that almoſt all the adjacent hills were covered by it; the whole country had the moſt beautiful appearance; the weather was exquiſitely fine, and the temperature of the air agreeable. In this fine country, however, Mr Bruce had the firſt opportunity of beholding the horrible barbarity of the Abyſſinians, in cutting off pieces of fleſh from the bodies of living animals, and devouring them raw; but notwithſtanding this extreme cruelty, they have the utmoſt horror and religious averſion at pork of every kind; inſomuch that Mr Bruce durſt not venture to taſte the fleſh of a wild boar, juſt after having aſſiſted in the deſtruction of five or ſix. Abyſſinia.

Monſtrous barbarity of the Abyſſinians.

During the remaining part of the journey from Adowa to Sirè, the country continued equally beautiful, and the variety of flowers and trees greatly augmented; but as a report was propagated that Ras Michael had been defeated by Faſil, they now met with ſome inſults. Theſe, however, were but trifling; and on the 22d in the evening they arrived ſafely at Sirè, ſituated in N. Lat. 14° 4′ 35″.

Sirè deſcribed.

This town is ſtill larger than Axum; but the houſes are built of no better materials than clay, and covered with thatch; the roofs being in the form of cones, which indeed is the ſhape of all thoſe in Abyſſinia. It ſtands on the brink of a very ſteep and narrow valley, through which the road is almoſt impaſſable. It is famous for a manufacture of cotton cloth, which, as we have already obſerved, paſſes for money throughout the whole empire. At ſome times however, beads, needles, antimony, and incenſe, will paſs in the ſame way. The country in the neighbourhood is extremely fine; but the inhabitants are ſubject, by reaſon of the low ſituation, to putrid fevers. On leaving it on the 24th, our travellers paſſed through a vaſt plain, where they could diſcern no hills as far as the eye could reach, excepting ſome few detached ones ſtanding on the plain, covered with high graſs, which the inhabitants were then burning. The country to the northward is flat and open. In the way to Gondar, however, lies that ridge of mountains called *Samen*; of which one named *Lamalmon* is the moſt remarkable, and by ſome ſuppoſed to be the higheſt in Abyſſinia. Betwixt Sirè and theſe mountains the river Tacazze runs, which, next to the Nile, is the largeſt in Abyſſinia. Mr Bruce informs us that it carries near one third of the water which falls on the whole empire; and when paſſing it, he ſaw the marks of its ſtream, the preceding year, 18 feet perpendicular above the bottom; nor could it be aſcertained whether this was the higheſt point to which it had reached. It has its ſource in the diſtrict of Angot, riſing from three ſources like the Nile, in a flat country, about 200 miles to the S. E. of Gondar. It is extremely pleaſant; being ſhaded with fine lofty trees, the water extremely clear, and the banks adorned with the moſt fragrant flowers. At the ford where they croſſed, this river was fully 200 yards broad, and about three feet deep; running very ſwiftly over a bottom of pebbles. At the very edge of the water the banks were covered with tamariſks, behind which grew tall and ſtately trees, that never loſe their leaves. It abounds with fiſh; and is inhabited by crocodiles and hippopotami; Tacazze river deſcribed.

Abyſſinia. hippopotami; the former of which frequently carry off people who attempt to croſs the river upon blown up ſkins. The neighbouring woods are full of lions and hyænas. The Tacazze is marked by Mr Bruce in his map as a branch of the Aſtaboras, which falls into the Nile. The latitude of the ford was found to be 13° 42′ 45″.

Mountainous country of Samen deſcribed. This river was paſſed on the 26th of January; after which our travellers entered into the country of Samen; the governor of which, Ayto Teſfos, had never acknowledged the authority of Ras Michael, nor any of the emperors ſet up by him ſince the death of Ioas. The country therefore was hoſtile; but the uncertainty of the event of the war, and the well-known ſeverity of Michael's diſpoſition, preſerved our traveller and his company from any inſult, excepting a feeble and unſucceſsful attempt to extort money. Here Mr Bruce obſerves that the people were more flat-noſed than any he had hitherto ſeen in Abyſſinia. The path among the mountains was for the moſt part exceedingly dangerous, having a precipice of vaſt height cloſe by it which way ſoever you turn. The mountains appeared of very extraordinary ſhapes; ſome being like cones; others high and pointed like columns, pyramids, or obeliſks. In one place a village was obſerved in ſuch a dangerous ſituation, that ſcarce the diſtance of a yard intervened between the houſes and a dreadful precipice. Below it is a plain of about a mile ſquare, covered with citron and lemon trees. A river named *Mai-Lumi* riſes above this village, and falls into the wood, where it divides in two; one branch ſurrounding the north and the other the ſouth part of the plain; then falling down a rock on each ſide, they unite; and having run about a quarter of a mile farther, the ſtream is precipitated in a cataract 150 feet high. The lions and hyænas were very numerous among theſe mountains, and devoured one of the beſt mules our travellers had. The hyænas were ſo bold, that they ſtalked about as familiarly as dogs, and were not intimidated by the diſcharge of fire arms. Their voracity was ſuch, that they ate the bodies of thoſe of their own ſpecies which our travellers had killed in their own defence.

Extreme voracity of the hyænas.

Lamalmon mountain deſcribed. On the 7th of February they began to aſcend Lamalmon by a winding path ſcarcely two feet broad, on the brink of a dreadful precipice, and frequently interſected by the beds of torrents, which produced vaſt irregular chaſms in it. After an aſcent of two hours, attended with incredible toil, up this narrow path, they came to a ſmall plain named *Kedus* or *St Michael*, from a church of that name ſituated there. This plain is ſituated at the foot of a ſteep cliff, terminating the weſtern ſide of the mountain, which is as perpendicular as a wall, with a few trees on the top. Two ſtreams of water fall down this cliff into a wood at the bottom; and as they continue all the year round, the plain is thus preſerved in continual verdure. The air is extremely wholeſome and pleaſant. On aſcending to the very top of the mountain, where they arrived on the 9th of February, our travellers were ſurpriſed to find, that though from below it had the appearance of being ſharp-pointed, it was in reality, a large plain, full of ſprings, which are the ſources of moſt rivers in this part of Abyſſinia. Theſe ſprings boil out of the earth, ſending forth ſuch quantities of water as are ſufficient to turn a mill. A perpetual verdure prevails; and it is entirely owing to indolence in the huſbandman if he has not three harveſts annually. Lamalmon ſtands on the north-weſt part of the mountains of Samen; but though higher than the mountains of Tigré, our author is of opinion that it is conſiderably inferior to thoſe which are ſituated on the ſouth-eaſt. The plain on the top is altogether impregnable to an army, both by reaſon of its ſituation and the plenty of proviſions it affords for the maintenance of its inhabitants; even the ſtreams on the top are full of fiſh. Here the mercury in the barometer ſtood at 20$\frac{7}{8}$ inches. Abyſſinia.

Journey to Gondar. During the time our travellers remained at Lamalmon, a ſervant of Ras Michael arrived to conduct them ſafely to the capital, bringing a certain account of the victory over Faſil: ſo that now the difficulties and dangers of their journey were over. The country appeared better cultivated as they approached the capital; and they ſaw ſeveral plantations of ſugar canes which there grow from the ſeed. In ſome places, however, particularly in Woggora, great damage is done by ſwarms of ants, rats, and mice, which deſtroy the fruits of the earth. Mr Bruce had already experienced the miſchief ariſing from a ſmall ſpecies of ant, whoſe bite was not only more painful than the ſting of a ſcorpion, but which iſſued out of the ground in ſuch numbers as to cut in pieces the carpets and every thing made of ſoft materials to which they could have acceſs.

Miſchief done by ants.

Arrival at Gondar. When Mr Bruce approached the capital, he was dreſſed like a Moor: and this dreſs he was adviſed to keep until he ſhould receive ſome protection from government; his greateſt, indeed his only, danger ariſing from the prieſts, who were alarmed at hearing of the approach of a Frank to the capital. This was the more neceſſary, as the emperor and Michael Ras were both out of town. For this reaſon alſo he took up his reſidence in the Mooriſh town at Gondar; which is very large, containing not fewer than 3000 houſes. The only inconvenience he underwent here was the not being allowed to eat any fleſh: for we have already taken notice of a law made by one of the emperors, that none of his ſubjects ſhould eat fleſh but ſuch as had been killed by Chriſtians; and a deviation from this would have been accounted equal to a renunciation of Chriſtianity itſelf. Here he remained till the 15th of February; when Ayto Aylo waited upon him, and addreſſed him in the character of phyſician, which he had aſſumed. By this nobleman he was carried to the palace of Koſcam, and introduced to the old queen. His advice was required for one of the royal family who was ill of the ſmallpox; but a ſaint had already undertaken his cure. The event, however, proved unfortunate; the patient died, and the ſaint loſt his reputation. Our limits will not allow us to give any particular account of the ſteps by which Mr Bruce arrived at the high degree of reputation which he enjoyed in Abyſſinia. In general, his ſucceſs in the practice of medicine; his ſkill in horſemanſhip and the uſe of fire-arms, which by his own account muſt have been very extraordinary; his prudence in evading religious diſputes; as well as his perſonal intrepidity and preſence of mind, which never once failed him, even in the greateſt emergencies; all conſpired to render him agreeable to people of every denomination. By the king he was promoted to the government of Ras-el-Feel, was his

Mr Bruce introduced to the queen.

Is promoted and held in great eſtimation.

Abyſſinia. conſtant attendant on all occaſions, and was with him in ſeveral military expeditions; but never met with any opportunity of diſtinguiſhing his perſonal valour, though he had the command of a body of horſe at one of the battles fought at a place named *Serbraxos*. Thus honoured and employed, he had an ample opportunity of exploring the ſources and cataracts of the Nile, as well as the geography and natural products of the whole country; obtaining alſo leave at laſt to return home. We cannot, however, praiſe the benevolence of his ſpirit at his departure. It has already been obſerved, that he was in ſome danger from the prieſts on his firſt arrival, on account of their ſuſpecting him to be a Jeſuit; for that is the meaning which they affix to the word *Frank* or *European*. As he conſtantly attended the eſtabliſhed worſhip of the country, however, and carefully avoided all diſputes on the ſubject of religion, he became at laſt not only unſuſpected, but very intimate with many of the principal eccleſiaſtics. From one of theſe named *Tenſa Chriſtos*, he aſked a benediction immediately before he departed; which piece of unexpected humility ſo affected the prieſt, that it brought tears in his eyes. The benediction was conveyed in the ſimple form, "God bleſs you." A troop of inferior prieſts who attended would needs bleſs him alſo; and probably were pleaſed at having it in their power to beſtow a benediction publicly on a man of ſuch conſequence: but to the bleſſings of theſe poor monks Mr Bruce replied *in Engliſh*, "Lord ſend you all a halter, as he did Abba Salama!" This Abba Salama had been an eccleſiaſtic of great conſequence; but of a very diſſolute life, and at laſt hanged for his crimes. The monks imagined he had been recommending them to their patriarch Abba Salama, and with great devotion anſwered "Amen."

His departure from the country.

Event of the war before he left the country.

The hiſtory of the war after Mr Bruce's arrival is related at great length in his work. The king Tecla Haimanout ſtill kept his ground, and was at laſt acknowledged by almoſt the whole empire, though ſucceſs did not always attend his arms. An uſurper, named *Socinios*, was reduced and made a ſervant in the king's kitchen; but was afterwards hanged for theft. Ras Michael, notwithſtanding all his ſkill in military affairs, was not able to get the better of Faſil; and his exceſſive cruelty, avarice, and ambition, diſguſted every one. An attempt was even made to aſſaſſinate him; and his ſpiritual friend (Michael the archangel, according to his own report, or the devil, according to that of the Abyſſinians) at laſt forſook him; ſo that he was carried off priſoner by a party of the rebels. After this misfortune he was much dejected, imputing it to the want of the ſpiritual aſſiſtance juſt mentioned, and which it ſeems had withdrawn itſelf ſome time before. His wife Ozoro Eſther, whom Mr Bruce characterizes as the handſomeſt woman he ever ſaw, was in great favour with the king at the time our traveller left Abyſſinia. As the king himſelf was a handſome young man, there is no improbability in ſuppoſing with Mr Bruce, that "they were not inſenſible to each other's merits;" and as ſhe was ſometimes honoured with a *private audience*, where Michael himſelf "bore no part in the converſation," we ſhall conclude our hiſtory of this ſingular empire by a conjecture, that ſoon after Mr Bruce's departure, Michael either died by courſe of nature, he being then very old, or was cut off by his enemies; on which Tecla Haimanout, having fully ſettled the affairs of his empire, became poſſeſſed of the beautiful Ozoro Eſther, and commenced his reign with great glory. Abyſſinia.

Geography of ancient Ethiopia.

With regard to the geographical deſcription of ancient Ethiopia, little can be ſaid; as not even the boundaries of the empire itſelf, much leſs thoſe of the particular diſtricts which compoſed it, were known. The ancient writers, however, agreed that it was very mountainous: but they mention no mountains of any conſequence excepting Garbata and Elephas, whoſe ſituation is not well aſcertained, though it is generally ſuppoſed that they anſwer to the mountains of Tigré. The moſt noted cities were Axum, Napata, Premnis or Premnis, Melis, Mondus, Abalis, Meſylon, Caloe, Opone, &c.

Cuſtoms of the inhabitants.

The nations which inhabited ancient Ethiopia have already been enumerated; and it is not to be ſuppoſed that all, or indeed any two of them, would agree in many reſpects. The ancient hiſtorians, however, give the following information. They had many laws which were very different from thoſe of other nations; eſpecially their laws relating to the election of kings. The prieſts choſe the moſt reputable men of their body, and drew a large circle around them, which they were not to paſs. A prieſt entered the circle, running and jumping like an *Egipan* or a ſatyr. He of thoſe that were encloſed in the circle who firſt catched hold of the prieſt, was immediately declared king; and all the people paid him homage, as a perſon intruſted with the government of the nation by Divine Providence. The new-elected king immediately began to live in the manner which was preſcribed to him by the laws. In all things he exactly followed the cuſtoms of the country; he paid a moſt rigid attention to the rules eſtabliſhed from the origin of the nation, in diſpenſing rewards and puniſhments. The king could not order a ſubject to be put to death, though he had been capitally convicted in a court of juſtice; but he ſent an officer to him, who ſhowed him the ſignal of death. The criminal then ſhut himſelf up in his houſe, and was his own executioner. It was not permitted him to fly to a neighbouring country, and ſubſtitute baniſhment for death; a relaxation of the rigour of the law, with which criminals were indulged in Greece. *Diod. Sic.* p. 131, 132.

We have the following extraordinary information with regard to the death of many of their kings: The prieſts of Meroè, who had acquired great power there, when they thought proper diſpatched a courier to the king to order him to die. The courier was commiſſioned to tell him, that it was the will of the gods, and that it would be the moſt heinous of crimes to oppoſe an order which came from *them*. Their firſt kings obeyed theſe groundleſs deſpotical ſentences, though they were only conſtrained to ſuch obedience by their own ſuperſtition. Ergamenes, who reigned in the time of Ptolemy the ſecond, and who was inſtructed in the philoſophy of the Greeks, was the firſt who had the courage to ſhake off this iniquitous and ſacerdotal yoke. He led an army againſt Meroè, where, in more ancient times, was the Ethiopian temple of gold; when he put all the prieſts to the ſword, and inſtituted a new worſhip.

The friends of the king had impoſed on themſelves a very ſingular law, which was in force in the time of Diodorus Siculus. When their ſovereign had loſt the uſe

Abyſſinia. uſe of any part of his body, by malady, or by any other accident, they inflicted the ſame infirmity on themſelves; deeming it, for inſtance, ſhameful to walk ſtraight after a lame king. They thought it abſurd not to ſhare with him corporeal inconveniences; ſince we are bound by the ties of mere friendſhip to participitate the misfortunes and proſperity of our friends. It was even cuſtomary among them to die with their kings, which they thought a glorious teſtimony of their conſtant loyalty. Hence the ſubjects of an Ethiopian king were very attentive to *his* and their common preſervation; and therefore it was extremely difficult and dangerous to form a conſpiracy againſt him.

The Ethiopians had very particular ceremonies in their funerals. According to Cteſias, after having ſalted the bodies, they put them into a hollow ſtatue of gold which reſembled the deceaſed; and that ſtatue was placed in a niche on a pillar which they ſet up for that purpoſe. But it was only the remains of the richeſt Ethiopians that were thus honoured. The bodies of the next claſs were contained in ſilver ſtatues; the poor were enſhrined in ſtatues of earthen ware.

* *Lib.* iii. *c.* 24. Herodotus * informs us, that the neareſt relations of the dead kept the body a year in their houſes, and offered ſacrifices and firſt fruits during that time to their deceaſed friend; and at the end of the year, they fixed the niche in a place ſet apart for the purpoſe near their town.

The Ethiopians made uſe of bows and arrows, darts, lances, and ſeveral other weapons, in their wars, which they managed with great ſtrength and dexterity. Circumciſion was a rite obſerved among them, as well as among the Egyptians, from very early antiquity; though which of theſe nations firſt received it, cannot certainly be known. The Ethiopian ſoldiers tied their arrows round their heads, the feathered part of which touched their foreheads, temples, &c. and the other projected out like ſo many rays, which formed a kind of crown. Theſe arrows were extremely ſhort, pointed with ſharp ſtones inſtead of iron, and dipped in the *virus* of ſerpents, or ſome other lethiferous poiſon, inſomuch that all the wounds given by them were attended with immediate death. The bows from which they ſhot theſe arrows were four cubits long; and required ſo much ſtrength to manage them, that no other nation could make uſe of them. The Ethiopians retreated fighting, in the ſame manner as the Parthians; diſcharging volleys of arrows with ſuch dexterity and addreſs, whilſt they were retiring full ſpeed, that they terribly galled the enemy. Their lances or darts were of an immenſe ſize, which may be deemed a farther proof of their vaſt bodily ſtrength.

Thus far chiefly with regard to the Ethiopians who lived in the capital, and who inhabited the iſland of Meroè, and that part of Ethiopia which was adjacent to Egypt.

There were many other Ethiopian nations, ſome of which cultivated the tracts on each ſide of the Nile, and the iſlands in the middle of it; others inhabited the provinces bordering on Arabia; and others lived more towards the centre of Africa. All theſe people, and among the reſt thoſe who were born on the banks of the river, had flat noſes, black ſkins, and woolly hair. They had a very ſavage and ferocious appearance; they were more brutal in their cuſtoms than in their nature. They were of a dry aduſt temperament; their nails in length reſembled claws: they were ignorant of the arts which poliſh the mind: their language was hardly articulate; their voices were ſhrill and piercing. As they did not endeavour to render life more commodious and agreeable, their manners and cuſtoms were very different from thoſe of other nations. When they went to battle, ſome were armed with bucklers of ox hides, with little javelins in their hands; others carried crooked darts; others uſed the bow; and others fought with clubs. They took their wives with them to war, whom they obliged to enter upon military ſervice at a certain age. The women wore rings of copper at their lips. Abyſſinia.

Some of theſe people went without clothing. Sometimes they threw about them what they happened to find, to ſhelter themſelves from the burning rays of the ſun. With regard to their food, ſome lived upon a certain fruit, which grew ſpontaneouſly in marſhy places; ſome ate the tendereſt ſhoots of trees, which were defended by the large branches from the heat of the ſun; and others ſowed Indian corn and lotos. Some of them lived only on the roots of reeds. Many ſpent a great part of their time in ſhooting birds; and as they were excellent archers, their bows ſupplied them with plenty. But the greater part of this people were ſuſtained by the fleſh of their flocks.

The people who inhabited the country above Meroè made remarkable diſtinctions among their gods. Some, they ſaid, were of an eternal and incorruptible nature, as the ſun, the moon, and the univerſe; others having been born among men, had acquired divine honours by their virtue, and by the good which they had done to mankind. They worſhipped Iſis, Pan, and particularly Jupiter and Hercules, from whom they ſuppoſed they had received moſt benefits. But ſome Ethiopians believed that there were no gods; and when the ſun roſe, they fled into their marſhes, execrating him as their cruelleſt enemy.

Theſe Ethiopians differed likewiſe from other nations in the honours which they paid to their dead. Some threw their bodies into the river, thinking that the moſt honourable ſepulchre. Others kept them in their houſes in niches: thinking that their children would be ſtimulated to virtuous deeds by the ſight of their anceſtors; and that grown people, by the ſame objects, would retain their parents in their memory. Others put their dead bodies into coffins of earthen ware, and buried them near their temples. To ſwear with the hand laid upon a corpſe, was their moſt ſacred and inviolable oath.

The ſavage Ethiopians of ſome diſtricts gave their crown to him who of all their nation was beſt made. Their reaſon for that preference was, that the two firſt gifts of heaven were monarchy and a fine perſon. In other territories, they conferred the ſovereignty on the moſt vigilant ſhepherd; for he, they alleged, would be the moſt careful guardian of his ſubjects. Others choſe the richeſt man for their king; for he, they thought, would have it moſt in his power to do good to his ſubjects. Others, again, choſe the ſtrongeſt; eſteeming thoſe moſt worthy of the firſt dignity who were ableſt to defend them in battle.

Diod. Sic. p. 102. The Jeſuit miſſionaries were the firſt who gave any information to the Europeans concerning this country; Account of the miſſionaries.

Abyſſinia. and indeed, excepting them and the late accounts by Mr Bruce, we have no other ſource of information concerning it. Louis XIV. of France appointed ſix Jeſuits to this miſſion, and furniſhed them with ſuitable preſents for the emperor and the principal nobility. The admiſſion of theſe miſſionaries was facilitated by a dangerous ſcorbutic diſorder, which had attacked Yaſous and his ſon, and for which they wiſhed to have the advice of an European phyſician. Maillet, the French conſul at Cairo, wiſhing the Jeſuits to have the honour of the miſſion, diſappointed the views of Friars Paſchal and Anthony, two Franciſcans, who were firſt thought of, and recommended Charles Poncet, a Frenchman, who had been bred a chemiſt and apothecary, and Father Brevedent as his ſervant, to Hagi Ali, a Mahometan factor at Cairo, for the deſired purpoſe. The Franciſcans attempted the deſtruction of Poncet and his attendants; but Poncet arrived ſafe at Gondar on the 21ſt of July, 1699, and having perfectly cured his royal patient, ſet out on the 2d of May, 1700, on his return for Europe, and arrived in ſafety at Maſuah. Brevedent died at Gondar ſoon after their arrival. An embaſſy on the part of the Abyſſinian monarch was defeated by the interference of Maillet; but the Jeſuits concerted another miſſion from France, and the perſon appointed as ambaſſador was M. de Roule, vice-conſul at Damietta. This miſſion was very improperly conducted; the merchants at Cairo oppoſed it; the Franciſcans obſtructed it, and it terminated in the murder of the ambaſſador in the province of Sennaar.

The miſſionaries confirm what is ſaid by the ancients, that Abyſſinia is a very mountainous country. The provinces of Begemder, Gojam, Waleka, Shoa, &c. according to them, are only one continued chain of mountains. Many of them were ſaid to be of ſuch enormous height, that the Alps and Pyrenees are but mole-hills in compariſon of them. Thoſe called *Aorni* were ſaid to be of this kind; but Mr Bruce informs us, that theſe accounts are greatly exaggerated. Amongſt thoſe mountains, and even frequently in the plains, there are many ſteep and craggy rocks to be met with of various and whimſical ſhapes; ſome of them ſo ſmooth, that men and oxen are raiſed to the top by means of engines. The tops of theſe rocks are covered with woods and meadows, full of ſprings and ſtreams of water; of which Mr Bruce has given us an account in his deſcription of Lamalmon. The moſt remarkable of theſe, according to the authors we are now ſpeaking of, is that called *Amba Geſhen*, mentioned in the courſe of this article as one of the mountains uſed for a priſon to the princes of the blood. Its top is deſcribed as only half a league in breadth, though it is ſaid that it would require near half a day to go round it.

Mr Bruce's account of its diviſions. Modern Ethiopia, or *Abyſſinia*, as it is now called, is divided, according to Mr Bruce, into two parts, named *Tigré* and *Amhara;* though this rather denotes a difference in the language than the territory of the people. The moſt eaſterly province properly ſo called is Maſuah. It is of conſiderable length, but no great breadth; running parallel to the Indian ocean and Red ſea, in a zone of about 40 miles broad, as far as the iſland MASUAH. The territories of the Baharnagaſh include this province as well as the diſtricts of Azab and Habab. In the former are mines of foſſil ſalt, which ſubſtance in Abyſſinia paſſes current inſtead of money. For this purpoſe the mineral is cut into ſquare ſolid pieces about a foot in length. Here alſo is a kind of mint from which great profits are derived. The Habab is likewiſe called the land of the *Agaazi* or Shepherds; who ſpeak the language called *Geez*, and have had the uſe of letters from the moſt early ages. This province was formerly taken by the Turks, when the rebellious Baharnagaſh Iſaac called them to his aſſiſtance againſt the emperor Menas. From that time the office fell into diſrepute, and the Baharnagaſh at preſent has much leſs power than formerly. The province of Maſuah is now governed by a Mahometan prince or officer called a *naybe*. Abyſſinia

Tigré is bounded on the eaſt by the territories of the Baharnagaſh, of which the river Mareb is the boundary on the eaſt, and the Tacazze on the weſt. It is about 200 miles long from north to ſouth, and 120 broad from weſt to eaſt. All the merchandiſe ſent acroſs the Red ſea to Abyſſinia, or from Abyſſinia acroſs the Red ſea, muſt paſs through this province, ſo that the governor has his choice of it as it goes along. Thus the province itſelf is very wealthy; and as the Abyſſinian fire-arms are brought from Arabia, the governors of Tigré, by purchaſing quantities of them, may eaſily render themſelves very powerful. No arms of this kind can be ſent to any perſon without his permiſſion; nor can any one buy till the governor has firſt had an offer.

Sirè was ſome time ago united to Tigré, on account of the miſconduct of its governor; but was diſjoined from it at the time Mr Bruce was in Abyſſinia, with the conſent of Ras Michael, who beſtowed the government of it upon his ſon. It is about 25 miles long, and as much in breadth. Its weſtern boundary is the Tacazze.

Samen is a very mountainous province lying to the weſtward of the river Tacazze, about 80 miles long, and in ſome places 30 broad, though in moſt it is much narrower. It is moſtly inhabited by Jews.

Begemder lies to the north-eaſt of Tigré. It is about 180 miles long and 60 broad; bounded by the river Nile on the weſt. It comprehends the mountainous country of Laſta; and there are now ſeveral ſmall governments diſmembered from it. The inhabitants are fierce and barbarous, but reckoned the beſt ſoldiers in Abyſſinia; and it is ſaid that this province with Laſta can furniſh 45,000 horſemen. It abounds with iron mines, which in Abyſſinia would be very valuable if properly managed. It is alſo well ſtored with beautiful cattle. Near the ſouth end it is cut into vaſt gullies, ſeemingly by floods, of which we have no account. This province is reckoned the great barrier againſt the incurſions of the Galla; and though they have often endeavoured to make a ſettlement in it, they have never yet found it practicable. Several of their tribes have been cut off in the attempt.

Next to Begemder is the province of Amhara, in length about 120 miles, and ſomewhat more than 40 in breadth. It is very mountainous; and the men are reckoned the handſomeſt in all Abyſſinia. In this province is the mountain or rock Geſhen, formerly the reſidence of the royal family. This province is parallel to Begemder on the ſouth; being ſeparated from it by the river Baſhilo. On the weſt it is bounded by the Nile. The river Geſhen is another boundary.

Walaka.

Abyſſinia. Walaka lies between the rivers Geſhen and Samba. It is a low unwholeſome province, having Upper Shoa to the ſouthward. It was in this province that the only ſurviving prince of the family of Solomon was preſerved after the maſſacre by Judith, formerly mentioned; and on this account great privileges were conferred upon the inhabitants, which in ſome degree continue to this day. The governor is conſidered as an ally, rather than a ſubject, of the emperor of Abyſſinia; and to preſerve his independency, he has allowed the Galla to ſurround his province entirely, yielding up to them the territory of Walaka above mentioned. Truſting to the valour of his own people, he is under no apprehenſion of his barbarous neighbours the Galla. This province is alſo remarkable for the monaſtery of Debra Libanos, where the famous ſaint Tecla Haimanout, the founder of the power of the clergy, was bred.

Gojam is remarkable for having in it ſome of the ſources of the Nile. It is bounded on the north by the high mountains of Amid Amid, on the ſouth by the river Nile, on the weſt by another river named *Gult*, and on the eaſt by the river Temci; on the north-eaſt it has the kingdom of Damot. It is about 40 miles long from north to ſouth, and ſomewhat more than 20 in breadth from eaſt to weſt. It is very populous, but the men are accounted the worſt ſoldiers in Abyſſinia. There is great plenty of very beautiful cattle.

Beyond the mountains of Amid Amid on the eaſt lies the country of the Agows; on the weſt it has Buré, Umbarma, and the country of the Gongas; on the ſouth, thoſe of Damot and Gafat: and Dingleber on the ſouth.

Dembea occupies all the ſpace along the lake of the ſame name from Dingleber below the mountains bounding Gueſque and Kuara. Mr Bruce is of opinion, that the lake has formerly overflowed the whole of it; and the decreaſe of this lake he brings as an inſtance of the decreaſe of large pools throughout the world.

To the ſouth of Dembea is the country of Kuara bordering on that of the Shangalla, the Macrobii of the ancients. The neighbouring countries, inhabited by Pagan ſavages, produce gold, which is introduced in plenty into this province. None is produced in the province itſelf, nor indeed does Mr Bruce mention any part of Abyſſinia where gold is naturally found. In the lower part of this country is a colony of Pagan blacks named *Ganjar;* derived, according to our author, from the black ſlaves who came into the country with the Arabs after the invaſion of Mahomet. Theſe deſerting their maſters, formed the colony we ſpeak of; but it is now more increaſed by vagabonds from other parts than by the multiplication of the inhabitants themſelves. The governor of this country is one of the great officers of ſtate: he has kettle-drums of ſilver, which he is allowed to beat through the ſtreets of Gondar; a privilege allowed to none but himſelf. This privilege was conferred upon the firſt governor by David II. who conquered the country.

The frontier countries of Narea, Ras-el-Feel, Tchelga, &c. are wholly inhabited by Mahometans, and the government of them is uſually given to ſtrangers. The country is very hot, unwholeſome, and covered with thick woods. The people are fugitives from all nations, but excellent horſemen; making uſe of no other weapon but the broadſword, with which, however inadequate we might ſuppoſe the weapon to be, they will attack the elephant or rhinoceros. Abyſſinia.

According to Mr Bruce the empire of Abyſſinia is bounded on the ſouth by a vaſt chain of mountains, extending with very little interruption from 34° to 44° E. Long. and between 8° and 9° N. Lat. In more proſperous times it extended beyond theſe ſouthward, particularly into the kingdom of Adel; but the mountains juſt mentioned are undoubtedly to be reckoned its natural boundaries on this ſide. On the eaſt and north-eaſt it has the Red ſea, and on the ſouth-eaſt the kingdom of Adel. On the weſt and north its boundaries are leſs diſtinctly marked; having on both theſe quarters the barbarous kingdom of Sennaar, whoſe limits will no doubt frequently vary according to the fortune of war betwixt the two princes. From Arkeeko, ſituated near the foot of the baſaltes mountains, in about 15° 30′ N. Lat. it extends to near 7° N. Lat. where the mountains of Caffa, the moſt ſoutherly province of Abyſſinia, terminate. Along the coaſt of the Red ſea lie the territories inhabited by the Hazorta Shiho, the diſtrict of Engana. Shiho, and the kingdom of Dancali, including the territory of Azab and the ſalt pits already mentioned. To the weſtward of theſe is the province or kingdom of Tigré, including the country of the Dobas, part of the kingdom of Bali, and that of Dawaro. Still farther weſt are thoſe of Sirè, Laſta, Amhara, the greateſt part of Bali, and part of Fatigar, which laſt reaches beyond the mountains. Proceeding ſtill in the ſame direction, we come to Tcherkin, Tchelga, Abargale, Salao, Begemder, Shoa, and Ifat; reckoning always from north to ſouth; Tcherkin, for inſtance, being to the northward of Tchelga, &c. Shoa extends a conſiderable way to the weſtward; ſo that, beſides Ifat, it has to the ſouth of it alſo the kingdoms of Hade and Cambut; the latter extending beyond the ſouthern ridge of mountains. To the weſtward are Ras-el-Feel, Dembea, Gojam, and Damot; and beyond theſe are the kingdoms of Bembea, Bizamo, Gooderoo, and Guraque; thoſe of Narea or Enarea and Caffa occupying the ſouth-weſt corner of the empire.

The climate of Abyſſinia, though, like other parts of the torrid zone, it was formerly thought to be uninhabitable, is not only tolerable, but in general temperate and healthy. In this reſpect, however, the uneven ſurface of the country expoſes different ſituations to the effects of heat and cold, of dryneſs and moiſture, and of a free circulation or a ſtagnation of the atmoſphere, in very various degrees. On the mountains, and in the higher parts of the country, the ſky is clear and ſerene, the air is cool and refreſhing, and the people are healthy and ſprightly; whilſt thoſe who live in ſome of the valleys, in the vicinity of marſhes, and in ſandy deſerts, experience the pernicious influence of exceſſive heat, and of a moiſt, ſtagnant, and ſuffocating air; ſo that the climate depends upon ſoil and ſituation as much almoſt as upon the latitude. Mr Bruce obſerves, that on the higheſt mountain of the ridge called Lamalmon, the thermometer ſtood at 32° in the depth of winter, the wind being north-weſt; clear and cold, but attended only with hoar froſt. This, he adds, vaniſhed into dew Climate.

after

Abyſſinia. after a quarter of an hour's ſun; nor did he ever ſee any ſign of congelation of water upon the top of the higheſt mountains. The barometer ſtood at 19° 9′ at noon of the ſame day, and the thermometer was at 78°. He obſerved hail to lie for three hours in the forenoon on the mountains of Amid Amid. The range of the barometer and thermometer, according to Mr Bruce's regiſter kept at Gondar from February 19. 1770, to May 31. 1771, will appear from the following table.

	Barom.	Thermom.	Wind.
April 29. 6½ A. M.	22.11	69°	S.
Mar. 29 2¾ P. M.	20.11	75°	E.
April 19. 12 Noon.		91°	W. N. W.
July 7. 12 Noon.	21.6	54¼°	W.

The rainy ſeaſon commences in April or the beginning of May, when the ſun becomes vertical, and ends in September. The rains generally ceaſe about the 8th of September; a ſickly ſeaſon follows till they begin again, about the 20th of October; they then continue conſtant, but moderate, till the 8th of November. All epidemic diſeaſes ceaſe with the end of theſe rains. In order to avoid the inconveniences that attend the overflowing of their rivers during this ſeaſon, as well as on account of the greater ſalubrity of elevated ſituations, the Abyſſinians have built many of their towns and villages on the mountains. Their houſes are generally very mean, conſiſting only of one ſtory, and conſtructed with ſtraw and laths, earth and lime; though there are ſome of ſtone and better materials. It is a miſtaken notion, however, that they live in tents, and not in houſes. In a climate like that of Abyſſinia, ſubject to ſcorching weather for ſix months, and to deluges of rain, ſtorms of wind, thunder and lightning, and hurricanes, ſuch as are unknown in Europe, for the other ſix, it is not probable that they ſhould chooſe to live in tents, after having known how to build ſuch cities as Axum. In many of the towns and villages, the houſes are ſeparated by hedges, which being always green, and intermixed with flowers and fruit trees at certain diſtances, afford an agreeable proſpect, and contribute alſo to their ſalubrity.

Diſeaſes. The inhabitants of Abyſſinia are ſubject to violent fevers, which commonly prove fatal on the third day. Thoſe who ſurvive to the fifth day often recover, merely by drinking cold water, and by repeatedly throwing cold water upon them in their beds. The bark is the moſt effectual remedy; which in critical caſes, ſays Bruce, ſhould be frequently repeated in ſmall doſes, and perfect abſtinence obſerved, unleſs from copious draughts of cold water. Another common diſeaſe in Abyſſinia, is the tertian fever, which is in no reſpect different from our tertian, and is ſucceſsfully treated in the ſame manner. All fevers terminate in intermittents, and if they continue long, in dyſenteries, which are always tedious, and very frequently mortal. Bark and ipecacuanha, in ſmall quantities, water, and fruit not over ripe, have been found the moſt effectual remedies. The dyſentery, commencing with a conſtant diarrhœa, is ſeldom cured, if it begins with the rainy ſeaſon; otherwiſe, ſmall doſes of ipecacuanha either remove it, or change it into an intermittent fever, which yields to the bark. Another endemial diſeaſe is called *hanzeer*, the hogs or the ſwine, and is a ſwelling of the glands of the throat, and under the arms, which by ineffectual attempts for producing ſuppuration, and opening the tumours, becomes a running ſore, and reſembles the evil. In connection with this diſorder, we may mention thoſe ſwellings, to which the whole body is ſubject, but more particularly the arms, thighs, and legs, ſometimes accompanied with ulcers in the noſe and mouth, which deface the ſmoothneſs of the ſkin, and which on this account are much dreaded by the Abyſſinians. The two laſt diſeaſes ſometimes yield to mercurials; but the laſt is ſpeedily and completely cured by antimonials. Another complaint afflicts thoſe who are in the habit of drinking ſtagnant water. It is called *farenteit*, or the worm of Pharaoh, and appears in all parts of the body, but moſt frequently in the legs and arms. It is a worm with a ſmall black head and a hooked beak, of a whitiſh colour, and a white body of a ſilky texture, reſembling a ſmall tendon. The natives ſeize it by the head and wind it gently round a piece of ſilk, or a bird's feather, and thus by degrees they extract it without any inconvenience or permanent ſcar. Mr Bruce ſuffered much from this complaint, and the breaking of the worm in the operation of extracting it. The moſt terrible of all the diſeaſes of this climate is the elephantiaſis. The cicuta, mercury, and tar-water, were unſucceſsfully tried in this complaint: the greateſt benefit was derived from whey made of cows milk. To the alternation of ſcorching heat and chilling cold, thin clothing, the uſe of ſtagnant putrid water for four months, and other ſuch cauſes, theſe diſeaſes may be partly, if not wholly, aſcribed. The ſmallpox was introduced into Abyſſinia at the time of the ſiege of Mecca, about the year 356, and the Abyſſinian army was the firſt victim to it. Abyſſinia.

Soil and vegetable productions. The great difference of climate, owing to the vaſt extent and variety of elevation in different parts of this empire, is very perceptible in its ſoil and productions. The mountains in many places are not only barren, but altogether inacceſſible, except by thoſe who make it their conſtant practice to climb amongſt them: and even by them they cannot be aſcended without great difficulty and danger. The ſhapes of theſe mountains, as we have already had occaſion to obſerve, are very ſtrange and fantaſtical: exceedingly different from thoſe of Europe; ſome reſembling towers and ſteeples, while others are like a board or ſlate ſet up on end; the baſe being ſo narrow, and the whole mountain ſo high and thin, that it ſeems wonderful how it can ſtand. In the valleys, however, and flat parts of the country, the ſoil is exceſſively fruitful, though in the warmeſt places grain cannot be brought to perfection. Wine is alſo made only in one or two places; but the greateſt profuſion of fruits of all kinds is to be met with everywhere, as well as many vegetables not to be found in other countries. There is a vaſt variety of flowers, which adorn the banks of the rivers in ſuch a manner as to make them reſemble fine gardens. Among theſe a ſpecies of roſe is met with, which grows upon trees, and is much ſuperior in fragrance to thoſe which grow on buſhes. Sena, cardamom, ginger, and cotton,

Abyſſinia. cotton, are likewiſe produced here in great quantities. Among the variety of rare plants to be met with in Abyſſinia, Mr Bruce particularly deſcribes the following.

Plants described by Mr Bruce.

1. The papyrus, the ancient material for paper: which our author ſuppoſes to have been a native of Ethiopia, and not of Egypt as has been ſuppoſed. 2. Baleſſan, balm, or balſam plant; a tree growing to the height of 14 or 15 feet, and uſed for fuel along with other trees in the country. It grows on the coaſt of the Red ſea, among the myrrh trees behind Azab, all the way to Babelmandel. This is the tree producing the balm of Gilead mentioned in Scripture. 3. The laſſa, myrrh, and opocalpaſum trees. Theſe grow likewiſe along the coaſt of the Red ſea. The laſſa or opocalpaſum is uſed in manufactures; and, according to our author, reſembles gum *adragant*, probably tragacanth. The tree which produces it grows to a great ſize, and has a beautiful flower, ſcarce admitting of deſcription without a drawing. 4. The ergett, a ſpecies of the mimoſa, is of two kinds; one called *ergett y'dimmo*, or the bloody ergett, from the pink colour of its filaments; the other *ergett el krone*, or the horned ergett, with a flower reſembling the acacia vera or Egyptian thorn. Theſe were both found on the banks of a river named *Amo*, near the great lake Dembea. 5. Enſete, an herbaceous plant, growing in Narea, in ſwampy places; but it is ſuppoſed to grow equally well in any other part of the empire where there is heat and moiſture ſufficient. It forms a great part of the vegetable food of the Abyſſinians. It produces a kind of figs, but theſe are not eatable. When uſed for food, it is to be cut immediately above the ſmall detached roots, or perhaps a foot or two higher, according to the age of the plant. The green is to be ſtripped from the upper part till it becomes white; and when ſoft, is affords an excellent food when eaten with milk or butter. 6. Kolquail, a kind of tree, only the lower part of which is woody, the upper part being herbaceous and ſucculent. The flowers are of a beautiful golden colour, and the fruit turns to a deep crimſon; ſo that the trees make a very beautiful appearance. The whole plant is full of a very acrid and cauſtic milk. 7. Rack is a large tree, growing not only in Abyſſinia but in many places of Arabia Felix. Its wood is ſo hard and bitter, that no worm will touch it; for which reaſon it is uſed by the Arabs for conſtructing their boats. It grows, like the mangrove, among the ſalt water of the ſea, or about ſalt ſprings. 8. Gir-gir, or Geſhe-el-aube a kind of graſs found about Ras-el-Feel, growing to the height of about three feet four inches. 6. The kantuffa, a very noxious ſpecies of thorn, much more troubleſome than any with which we are acquainted, and growing to the height of eight or more feet. The flowers have a ſtrong ſmell like the flower mignionet. 10. The gaguedi, is a ſhort tree only about nine feet high, a native of Lamalmon. The flowers, which are yellow and very beautiful, turn towards the ſun like thoſe of the helianthus. 11. The wanſey, a tree common throughout all Abyſſinia, flowers exactly on the firſt day the rains ceaſe. It grows to the height of 18 or 20 feet; having a thick bark and cloſe heavy wood; the firſt part of which is white, but the reſt of a dark colour. The flowers are of a beautiful white colour; but it does not appear to poſſeſs any other remarkable property, though it is held in great eſtimation by the Abyſſinians, and is even worſhipped by the Galla. 12. The ſarek, or *Bauhinia acuminata*, grows in the country immediately adjacent to the ſources of the Nile; being found by Mr Bruce ſcarce 400 yards diſtant from the fountain. 13. Kuara, is a beautiful tree, growing in the ſouth and ſouth-weſt parts of Abyſſinia. It has a fruit like a bean, of a red colour, which in the early ages was made uſe of as a weight for gold and diamonds; and hence Mr Bruce is of opinion that the name of the imaginary weight *carat* is derived. 14. The walkuffa, grows in the hotteſt parts of Ethiopia. It is a flowering tree, with beautiful white bloſſoms, which do not appear till towards the middle of January. The flowers have no ſmell, and are accounted pernicious to bees. The wood is very heavy. 15. The wooginoos, or *Brucea antidyſenterica*, is common throughout the whole empire, but principally on the ſides of the valleys. It is a ſovereign remedy againſt the dyſentery, a very common and fatal diſeaſe in hot countries. Mr Bruce had experimental proof of its antidyſenteric virtue. 16. Cuſſo or *Baukſia anthelmintica*, is a very beautiful and uſeful tree, being a ſtrong anthelmintic, and uſed as ſuch by the Abyſſinians. Every perſon there, whether male or female, is troubled with that kind of worm called *aſcarides*; a great number of which are evacuated every month, and the evacuation is promoted by an infuſion of this plant. While taking this medicine, the patients ſequeſtrate themſelves from all their acquaintance, and keep cloſe at home. It is ſaid that the want of this medicine in other countries is the reaſon why the Abyſſinians do not go out of their own country; or, if they do, that they are ſhort-lived. Teff, is a kind of grain ſown generally throughout Abyſſinia; and conſtituting the bread commonly made uſe of by the inhabitants. They have indeed plenty of wheat, and are as ſkilful in forming it into bread as the Europeans; but this is only made uſe of by people of the firſt rank: however, the teff is ſometimes of ſuch an excellent quality, that the bread made from it is held in equal eſtimation with the fineſt wheat. From the bread made of this grain a ſouriſh liquor called *bouza* is prepared, which is uſed for common drink like our ſmall beer. A liquor of the ſame kind, but of inferior quality, is made from barley cakes. Some have been of opinion, that the uſe of teff occaſions the worms above mentioned; but this is controverted by Mr Bruce. Nook, a plant not to be diſtinguiſhed from our marigold, either in ſhape, ſize, or foliage, is alſo ſown very generally over the country, and furniſhes all Abyſſinia with oil for the kitchen and other uſes.

Abyſſinia. Abyſſinia abounds with a vaſt variety of quadrupeds both wild and tame. Immenſe numbers of cattle everywhere preſent themſelves, ſome of them the moſt beautiful in the world. Some have monſtrous horns, ſaid to be capable of holding 10 quarts each; but this, as our author informs us, is a diſeaſe which proves fatal to them. Buffaloes are here met with in great numbers, and are very fierce and untractable; but there are no ſuch animals as carnivorous bulls, which have been ſaid to exiſt in this and other internal parts of Africa. Antelopes and other wild animals are met with in great numbers in the uncultivated parts; feeding chiefly on the leaves of trees. They abound moſt of all, however, in thoſe parts which have been one

Quadrupeds.

cultivated

Abyſſinia. cultivated, but ſince deſolated by the calamities of war; and where wild oats abound in ſuch quantities as to hide them from purſuit. Hyænas, lions, foxes, jackals, wild boars, &c. are alſo found, as well as the elephant, rhinoceros, camelopard, and others of the larger and more uncommon kinds. Great havock is made in the cultivated fields by multitudes of baboons, apes, rats, and mice. There is plenty of hares; but theſe being reckoned unclean, as well as wild boars, are not uſed as food. The rivers abound with crocodiles and hippopotami, at leaſt the Nile, and thoſe large ſtreams which flow into it; but a great number have water in them only during the rainy ſeaſon, and theſe have neither fiſh nor any animal that feeds upon them.

Birds. The number of birds in this country is immenſe; nor are thoſe of the carnivorous kind at all deficient. Great numbers of eagles, vultures, hawks, and others of that kind are met with, and come punctually every year after the tropical rains have ceaſed. They feed at firſt upon the ſhell-fiſh which are met with in great quantities on the edges of the deſerts, where they had lived in the ſalt ſprings; but, being forced from their natural habitations when theſe ſprings were ſwelled by the rains, are afterwards left to periſh on dry land. When theſe fail, their next reſource is from the carcaſes of the large animals, ſuch as the elephant and rhinoceros, which are killed in the flat country by the hunters. Their next ſupply is the multitude of rats and field-mice which infeſt the country after harveſt. The vaſt ſlaughter of cattle made by the Abyſſinian armies, the multitude of perſons killed whoſe bodies are allowed to rot on the field of battle, &c. furniſh them alſo with another reſource. Theſe ſupplies, however, all fail at the beginning of the rainy ſeaſon, when the hunters and armies return home, and the vaſt quantity of water which continually overflows the ground renders it impoſſible for them to find any other food.

There are other birds which feed upon inſects, and multitudes which live on grain or ſeeds of various kinds; all of which are amply ſupplied by the immenſe quantity of fruits and berries which grow in Abyſſinia, and are ripe at all ſeaſons of the year. A very remarkable particular concerning this is, that the trees which bear fruit all the year round do not carry it always in the ſame place. The weſt ſide is that which bloſſoms firſt, and where of conſequence the fruit firſt comes to perfection; the ſouth ſide ſucceeds, and goes though the ſame proceſs: after which, the north bloſſoms in like manner; and laſt of all is the eaſt ſide, which produces flowers and fruit towards the beginning of the rainy ſeaſon. All the trees of Abyſſinia are ever-green; and their leaves are of a thick leathery conſiſtence, and highly varniſhed to enable them to reſiſt the violent rains which fall during a certain ſeaſon. The granivorous birds have likewiſe this advantage, that the rains do not fall at the ſame time all over the country. It is interſected by a chain of mountains that divide the ſeaſons alſo; ſo that they have but a ſhort way to fly in order to become birds of paſſage, and ſupply themſelves with ſuch food as is neceſſary for them beyond the mountains. All the pigeons, of which there are many ſpecies, are birds of paſſage, excepting one kind. The owls are extremely large and beautiful, but few in number. There Abyſſinia. is a great variety of ſwallows, ſeveral kinds of which are unknown in Europe; but ſays our author, "thoſe that are common in Europe appear in paſſage at the very ſeaſon when they take their flight from thence. We ſaw the greateſt part of them in the iſland of Maſuah, where they lighted and tarried two days, and then proceeded with moon-light nights to the ſouth-weſt." The large birds which reſide conſtantly among the mountains of Samen and Taranta have all their feathers tubular, the hollow part being filled with a kind of yellow duſt which iſſues out in great abundance on hunting them. This was particularly obſerved by Mr Bruce in a ſpecies of eagle which he calls the *golden eagle*; and the duſt being viewed through a microſcope with a very ſtrong magnifying power, appeared like fine feathers. The crows are ſpotted white and black, almoſt in equal proportions. The raven has his feathers intermixed with brown, the tip of his beak white, and a figure like a cup or chalice of white feathers upon his head. Our author ſaw no ſparrows, magpies, nor bats; neither are there many water-fowl, eſpecially of the web-footed kind: but there are vaſt numbers of ſtorks, which cover the plains in May, when the rains become conſtant. There are no geeſe, excepting one ſpecies called the *golden gooſe* or *gooſe of the Nile*, which is common all over Africa; but there are ſnipes in all the marſhes.

Our author deſcribes very few fiſhes; though he Fiſhes. ſays that an account of theſe, and other marine productions of the Red ſea, which he has painted and collected, would occupy many large volumes, and the engraving coſt a ſum which he could not by any means afford. Among others, he mentions the *torpedo* and the *binny*, which latter is good food, and grows to a large ſize; that from which he took the drawing was about 32 pounds weight. Its whole body is covered with beautiful ſcales reſembling ſilver ſpangles.

Locuſts and a ſpecies of ants are extremely troubleſome and pernicious in Abyſſinia, but the fly by the natives called *tſaltſalya* is moſt deſtructive to cattle. Mr Bruce gives a particular deſcription of a kind of Few ſerpents in Abyſſinia. lizard, and of the ceraſtes or horned ſerpent; but denies that ſerpents are numerous in Abyſſinia, as almoſt all authors have ſuppoſed, and as we ſhould be led naturally to ſuſpect. He vouches alſo for the power that ſome perſons have of enchanting ſerpents and ſcorpions, which in ſome is natural, in others communicated artificially by certain medicines. He prevailed upon thoſe who knew the ſecret to prepare him by theſe means as they had done others; but, notwithſtanding this aſſiſtance, he acknowledges, that when it came to the trial his heart always failed him.

The crown is hereditary in the line of Solomon, but Method of ſettling the ſucceſſion to the crown. it depends on the miniſter to chooſe the particular perſon who is to enjoy it; and as it is always his inclination to have the government in his own hands, he never fails to chooſe an infant, who is ſeldom ſuffered to live after he comes to the years of maturity. Thus perpe- The cauſe of civil wars. tual wars and commotions take place, inſomuch that the ravenous birds, as has been obſerved, find one great ſupply of food in the ſlaughters made by the Abyſſinians of one another. All authors indeed agree that the de- Exceſſive deſtruction by their armies. vaſtations committed by the armies of this country are exceſſive; inſomuch, that after a long encampment is removed,

Abyſſinia. removed, nothing is to be ſeen all around the place where it was but bare earth. When an army marches through the country, ſays Mr Bruce, "an inconceivable number of birds and beaſts of prey, eſpecially the former, follow it from the firſt day of its march to its return; increaſing always in proportion the more it advances into the country. An army there leaves nothing living behind, not even the veſtige of a habitation; but fire and the ſword reduce every thing to a wilderneſs and ſolitude. The beaſts and birds unmoleſted have the country to themſelves, and increaſe beyond all poſſible conception. The ſlovenly manners of this ſavage people, who, after a battle, bury neither friends nor enemies; the quantity of beaſts of burthen that die perpetually under the load of baggage, and variety of miſmanagement; the quantity of offal, and half-eaten carcaſes of cows, goats, and ſheep, which they conſume in their march for ſuſtenance; all furniſh a ſtock of carrion ſufficient to occaſion contagious diſtempers, were there not ſuch a prodigious number of voracious attendants who conſume them almoſt before putrefaction. There is no giving the reader any idea of their number, unleſs by comparing them to the ſand of the ſea. While the army is in motion, they are a black canopy which extends over it for leagues. When encamped, the ground is diſcoloured with them beyond the ſight of the eye; and all the trees are loaded with them."

nmenſe umber of irds which ollow iem.

The prodigious number of criminals executed for high treaſon, whoſe bodies are cut in pieces and thrown about the ſtreets, invite the hyænas to the capital, in the ſame manner that the carrion of the camp invites the birds of prey to follow it. The method of keeping off theſe voracious animals is certainly very curious. "An officer (ſays Mr Bruce) called *Serach Maſſery*, with a long whip, begins cracking and making a noiſe worſe than 20 French poſtilions at the door of the palace before the dawn of day. This chaſes away the hyænas and other wild beaſts: this too is the ſignal for the king's riſing, who ſits in judgement every morning faſting; and after that, about 8 o'clock, he goes to breakfaſt."

urious ıethod of eeping off ıe hyænas om the ing's pa- ıce.

From theſe and other circumſtances we ſhould be apt to imagine that the Abyſſinians, inſtead of becoming more civilized, were daily improving in barbarity. The king is anointed at his election with plain oil of olives; "which (ſays Mr Bruce) being poured upon the crown of his head, he rubs into his long hair indecently enough with both his hands, pretty much as his ſoldiers do with theirs when they get acceſs to plenty of butter." In former times, however, matters ſeem to have been conducted with more decency. Socinios, the greateſt monarch that ever ſat on the Abyſſinian throne, was crowned, after having gained a great victory over the Galla, in a very different manner, and with the ceremonies which we are told were in uſe among the ancient kings of Tigré. At that time he had with him an army of about 30,000 men; and was beſides attended by all the great officers dreſſed in the gayeſt manner, as well as by the ladies of the firſt quality in the empire. The king himſelf, dreſſed in crimſon damaſk, with a great chain of gold about his neck, his head bare, and mounted on a horſe richly capariſoned, advanced at the head of his nobility, paſſed the outer court, and came to the paved way before the church. Here he was met by a number of young girls, daughters of the *ambares* or ſupreme judges, together with many noble virgins ſtanding on the right and left of the court. Two of the nobleſt of theſe held in their hands a crimſon cord of ſilk, ſomewhat thicker than common whip-cord, ſtretched acroſs from one company to another, as if to ſhut up the road by which the king was approaching the church. When this cord was prepared and drawn tight about breaſt-high by the girls, the king entered; advancing moderately quick, and ſhowing his ſkill in horſemanſhip as he went along. Being ſtopped by the tenſion of the ſtring, the damſels aſked, Who he was? To this he anſwered, "I am your king, the king of Ethiopia." But they replied, "You ſhall not paſs; you are not our king." He then retired ſome paces, and again preſented himſelf. The queſtion was again put, "Who he was?" To which he anſwered, "I am your king, the king of Iſrael." But the ſame reply was ſtill given by the girls. The third time, on being aſked, "Who he was?" he anſwered, "I am your king, the king of Sion:" and drawing his ſword, he cut the cord aſunder. The damſels then cried out, "It is a truth, you are our king; truly you are the king of Sion." On this they began to ſing Hallelujah, and were joined by the whole army and the reſt of the king's attendants. Amidſt theſe acclamations the king advanced to the foot of the ſtair of the church, diſmounted, and ſat down upon a ſtone; which, in Mr Bruce's opinion, was plainly an altar of Anubis or the Dog-ſtar. After the king, came a number of prieſts in proper order. The king was firſt anointed, then crowned, and accompanied half up the ſteps by the ſinging prieſts. He ſtopped at a hole made on purpoſe in one of the ſteps, where he was fumigated with myrrh, aloes, and caſſia: after which divine ſervice was celebrated; and he returned to the camp, where 14 days were ſpent in feaſting and rejoicing.

Abyſſinia.

Ceremonies of this kind are now given over on account of the expence. Our author was informed by Tecla Haimanout, that when he was obliged to retire into Tigré from his enemies, Ras Michael had ſome thoughts of having him crowned in contempt of his enemies; but by the moſt moderate calculations that could be made, it would have coſt 20,000 ounces of gold, about 80,000l. ſterling; on which all thoughts of it were laid aſide.

Iethod of nointing nd crown- ng the ing.

The Abyſſinians compute time by the ſolar year. Thirty days conſtitute their month, to which they add five days and a quarter, and thus they complete the year. The five days are added to the month of Auguſt, and to every fourth year they add a ſixth day. They begin their year with the 29th or 30th of Auguſt, i. e. the kalends of September; the 29th of Auguſt being the firſt of their month Maſcaram. The common epoch which the Abyſſinians uſe is from the creation of the world, and they reckon 5500 years from the creation to the birth of Chriſt, rejecting the odd eight years of the Greeks, who make this period 5508 years. They have alſo many other epochs, ſuch as from the council of Nice and Epheſus. In their eccleſiaſtical computations they make uſe of the golden number and epact. The firſt uſe of epacts amongſt them was not earlier, according to Scaliger, than the time of Diocleſian; but Mr Bruce obſerves, that this is contrary to the poſitive evidence of Abyſſinian hiſtory, which ſays expreſsly, that the epact was invented by

Mode of computing time.

Abyſſinia. Demetrius of Alexandria. This Demetrius was the 12th patriarch of Alexandria, and elected about the 190th year of Chriſt, or in the reign of Severus, and conſequently long before the time of Dioclesian. The Abyſſinians have another mode of computing time, that is peculiar to themſelves. They read the whole of the evangeliſts, in order, every year in their churches; and when they ſpeak of an event, they write or ſay, it happened in the days of Matthew; that is, in the firſt quarter of the year, whilſt they were reading the goſpel of St Matthew in their churches. They compute the time of the day in a very arbitrary manner. The twilight being very ſhort, is ſelected for the beginning of their day; this they call Naggé, which comprehends the duration of twilight. Méſet expreſſes the moment when the evening twilight begins. Mid-day is called Kater, which ſignifies culmination. All the other parts of time they deſcribe, in converſation, by pointing at the place in the heavens where the ſun was, when the event, which they are deſcribing, happened.

With regard to the manners of the Abyſſinians, they are repreſented by Mr Bruce as highly barbarous. Their continual warfare inures them to blood from their infancy; ſo that even children would not have the leaſt ſcruple at killing one another or grown up perſons if they were able. Many ſhocking inſtances of hardneſs of heart are related by our author in Teela Haimanout himſelf, though otherwiſe an accompliſhed prince. Their cruelty diſplays itſelf abundantly in the puniſhments inflicted upon criminals, one of which is flaying alive, as has been already related of Wooſheka. Cutting in pieces with a ſabre is another; and this is performed, not by executioners, whoſe employment is reckoned diſgraceful as in this country, but by officers and people of quality. So little is this thought of indeed in Gondar, the capital of the empire, that Mr Bruce happening to paſs by an officer employed in this work, who had three men to diſpatch, the officer called to him to ſtop till he had killed them all, as he wanted to ſpeak to him upon a matter of conſequence. Stoning to death is a capital puniſhment likewiſe common in this country; and uſually inflicted on Roman Catholics if they happen to be found, or upon other heretics in religion.

Manners of the Abyſſinians. Their horrid manner of feeding.

It is not to be ſuppoſed that people who regard the lives of one another ſo little, will ſhow much compaſſion to the brute creation. In this reſpect, however, the Abyſſinians are cruel and ſavage beyond all people on the face of the earth. There are many inſtances of people eating raw fiſh or fleſh, and we call them barbarous that do ſo; but what name ſhall we give to thoſe who cut off pieces of fleſh from animals while ſtill living, and eat it not only raw but ſtill quivering with life! Mr Bruce labours much to prove, that the way of eating not raw, but *living* fleſh, was cuſtomary among the nations of antiquity: but whatever be in this, he is the only author who mentions it directly; and it is on his ſingle teſtimony that the fact is eſtabliſhed. The Jeſuits mention in their books, that the Abyſſinians eat raw fleſh, but not a word of eating it in this manner; and indeed there are ſome circumſtances which he himſelf relates ſeemingly very difficult to be reconciled with known and indubitable facts. He informs us, for inſtance, that when at no great diſtance from Axum, the capital of Tigré, he fell in with three ſoldiers "driving a cow. They halted at a brook, threw down the beaſt, and one of them cut a pretty large collop of fleſh from its buttock; after which they drove the cow gently on as before." In another place he tells us, that the fleſh was taken from the upper part of the buttock; that the ſkin was flapped over the wound, faſtened with a ſkewer, and a cataplaſm of clay put over all. Now it is known to anatomiſts, that no piece of fleſh can be cut off without deſtroying a muſcle; and that the muſcles of the buttocks are ſubſervient to the motion of the legs. The Abyſſinians therefore muſt have been expert anatomiſts to know how to cut off ſuch muſcles as would allow the creature ſtill to go on; and if their repaſt had been two or three times repeated, it is plainly impoſſible that the cow could at any rate have ſtirred a ſtep. In his deſcription of their feaſts there is more conſiſtency; for there the animal is tied ſo that it cannot move: after ſtripping off the ſkin, the fleſh of the buttocks is cut off in ſolid ſquare pieces, without bones or much effuſion of blood; and the prodigious noiſe the animal makes is a ſignal for the company to ſit down to table. Every man ſits between two women, having a long knife in his hand. With this he cuts the fleſh, while the motion of its fibres is yet viſible, into pieces like dice. Theſe are laid upon pieces of bread made of the grain called *teff*, already mentioned, after being ſtrongly powdered with Cayenne pepper and foſſil ſalt. They are then rolled up like as many cartridges; the men open their mouths, ſtooping and gaping like idiots, while the women cram them ſo full of theſe cartridges, that they ſeem every moment in danger of being choked; and in proportion to the quantity their mouths can hold, and the noiſe they make in chewing, they are held in eſtimation by the company. All this time the animal bleeds but little: but when the large arteries are cut and it expires, the fleſh becomes tough; and the wretches who have the reſt to eat, gnaw it from the bones like dogs!

Abyſſinia. Abyſſinia.

ABYSSINIAN, in *Eccleſiaſtical Hiſtory*, is the name of a ſect, in the Chriſtian church, eſtabliſhed in the empire of Abyſſinia. The Abyſſinians are a branch of the Copts or Jacobites; with whom they agree in admitting but one nature in Jeſus Chriſt, and rejecting the council of Chalcedon: whence they are alſo called *Eutychians* or *Monophyſites*, and ſtand oppoſed to the Melchites. They are only diſtinguiſhed from the Copts, and other ſects of Jacobites, by ſome peculiar national uſages.—The Abyſſinian ſect or church is governed by a biſhop or metropolitan ſtyled *Abuna*, ſent them by the Coptic patriarch of Alexandria reſiding at Cairo, who is the only perſon that ordains prieſts. The next dignity is that of Komos, or Hegumenos, who is a kind of arch-preſbyter. They have canons alſo, and monks: the former of whom marry; the latter, at their admiſſion, vow celibacy, but with a reſervation: theſe, it is ſaid, make a promiſe aloud, before their ſuperior, to keep chaſtity; but add in a low voice, *as you keep it*. The emperor has a kind of ſupremacy in eccleſiaſtical matters. He alone takes cognizance of all eccleſiaſtical cauſes, except ſome ſmaller ones reſerved to the judges; and confers all benefices, except that of Abuna.

There are two claſſes of monks among the Abyſſinians; thoſe of Debra Libanos, and thoſe of St Euſtathius.

The

Abyſſinian. The latter are groſsly ignorant. Their head is the ſuperior of the convent of Mahebar Selaſſé, in the north-weſt part of Abyſſinia, near Kuara and the Shangalla, towards Sennaar and the river Dender. The chief of the former is the Itchegué, who is ordained in the following manner. Two chief prieſts hold a white cloth or veil, over his head, a third repeats a prayer, and then they all lay their hands on his head, and join together in ſinging pſalms. In turbulent times this Itchegué has more extenſive influence than even the Abuna.—The monks do not live in convents, but in ſeparate houſes round their church; and each cultivates for himſelf a portion of the land which is aſſigned them as their property.—The churches are built on eminences, in the vicinity of running water, for the advantage of purifications and ablutions, according to the Levitical law, and are ſurrounded with rows of Virginia cedar. They are circular buildings with conical ſummits and thatched roofs, and encompaſſed on the outſide with pillars of cedar, to which the roof projecting eight feet beyond the wall is fixed, and forms an agreeable walk in the hot or rainy ſeaſon. The internal partition and arrangement of the church, is that preſcribed by the Moſaic law; and many of the ceremonies and obſervances in their mode of worſhip, are obviouſly derived from the ceremonial rites of the Jewiſh religion.

The Abyſſinians have at different times expreſſed an inclination to be reconciled to the ſee of Rome; but rather out of intereſt of ſtate than any other motive. The emperor David, or the queen regent on his behalf, wrote a letter on this head to Pope Clement VII. full of ſubmiſſion, and demanding a patriarch from Rome to be inſtructed by: which being complied with, he publicly abjured the doctrine of Eutychius and Dioſcorus in 1626, and allowed the ſupremacy of the pope. Under the emperor Sultan Seghed all was undone again; the Romiſh miſſionaries ſettled there had their churches taken from them, and their new converts baniſhed or put to death. The congregation *de propaganda* have made ſeveral attempts to revive the miſſion, but to little purpoſe.—The doctrines and ritual of this ſectary form a ſtrange compound of Judaiſm, Chriſtianity, and ſuperſtition. They practiſe circumciſion; and are ſaid to extend the practice to the females as well as males: They obſerve both Saturday and Sunday as Sabbaths: they eat no meats prohibited by the law of Moſes: women are obliged to the legal purifications; and brothers marry their brothers wives, &c. On the other hand, they celebrate the epiphany with peculiar feſtivity, in memory of Chriſt's baptiſm; when they plunge and ſport in ponds and rivers; which has occaſioned ſome to affirm that they were baptized anew every year. Among the ſaints days is one conſecrated to Pilate and his wife; becauſe Pilate waſhed his hands before he pronounced ſentence on Chriſt, and his wife deſired him to have nothing to do with the blood of that juſt perſon. They have four lents: the great one commences ten days earlier then ours, and is obſerved with much ſeverity, many abſtaining therein even from fiſh, becauſe St Paul ſays there is one kind of fleſh of men, and another of fiſhes. They allow of divorce, which is eaſily granted among them, and by the civil judge; nor do their civil laws prohibit polygamy itſelf. They have at leaſt as many miracles and legends of ſaints as the Romiſh church; which proved no ſmall embarraſſment to the Jeſuit miſſionaries, to whom they produced ſo many miracles, wrought by their ſaints, in proof of their religion, and thoſe ſo well circumſtantiated and atteſted, that the Jeſuits were obliged to deny miracles to be any evidence of a true religion; and in proof hereof, to allege the ſame arguments againſt the Abyſſinians which Proteſtants in Europe allege againſt Papiſts. They pray for the dead, and invoke ſaints and angels; have ſo great a veneration for the virgin, that they charged the Jeſuits with not rendering her honour enough. They venerate images in painting; but abhor all thoſe in relievo, except the croſs. They hold that the ſoul of man is not created; becauſe, ſay they, God finiſhed all his works on the ſixth day. They admit the apocryphal books, and the canons of the apoſtles as well as the apoſtolical conſtitutions, for genuine. Their liturgy is given by Alvarez, and in Engliſh by Pagit; and their calendar by Ludolph.

Aca
||
Acacia.

ACA, Ace, or Acon, in *Ancient Geography*, a town of Phœnicia, on the Mediterranean; afterwards called *Ptolemais*; now *Acre*. See Acre.

ACACALOTL, the Braſilian name of a bird called by ſome *corvus aquaticus*, or the water raven: properly, the pelicanus carbo, or corvorant. See Ornithology *Index*.

ACACIA, Egyptian Thorn, or Binding Beantree, in *Botany*, a ſpecies of mimoſa, according to Linnæus; though other botaniſts make it a diſtinct genus. See Mimosa, Botany *Index*.

The flowers of a ſpecies of the acacia are uſed by the Chineſe in making that yellow which we ſee hears waſhing in their ſilks and ſtuffs, and appears with ſo much elegance in their painting on paper. The method is this:

They gather the flowers before they are fully open; theſe they put into a clean earthen veſſel over a gentle heat, and ſtir them continually about as they do the tea leaves, till they become dryiſh and of a yellow colour; then to half a pound of the flowers they add three ſpoonfuls of fair water, and after that a little more, till there is juſt enough to hold the flowers incorporated together; they boil this for ſome time, and the juice of the flowers mixing with the water, it becomes thick and yellow; they then take it from the fire, and ſtrain it through a piece of coarſe ſilk. To the liquor they add half an ounce of common alum, and an ounce of calcined oyſter ſhells reduced to a fine powder. All is then well mixed together; and this is the fine laſting yellow they have ſo long uſed.

The dyers of large pieces uſe the flowers and ſeeds of the acacia for dying three different ſorts of yellow. They roaſt the flowers, as before obſerved; and then mix the ſeeds with them, which muſt be gathered for this purpoſe when full ripe: by different admixture of theſe, they give the different ſhades of colour, only for the deepeſt of all they add a ſmall quantity of Brazil wood.

Mr Geoffroy attributes the origin of bezoar to the ſeeds of this plant; which being bruiſed by certain animals, and vellicating the ſtomach by their great ſourneſs and aſtringency, cauſe a condenſation of the juices, till at length they become coated over with a ſtony matter, which we call Bezoar.

Acacia || Acacius.

False Acacia. See Robinia, Botany *Index.*

Three-thorned Acacia, or *Honey-locuſt.* See Gleditsia, Botany *Index.*

Acacia, in the *Materia Medica*, the inſpiſſated juice of the unripe fruit of the *Mimosa Nilotica.*

The juice is brought to us from Egypt, in roundiſh maſſes, wrapt up in thin bladders. It is outwardly of a deep brown colour, inclining to black; inwardly of a reddiſh or yellowiſh brown; of a firm conſiſtence, but not very dry. It ſoon ſoftens in the mouth, and diſcovers a rough, not diſagreeable taſte, which is followed by a ſweetiſh reliſh. This inſpiſſated juice entirely diſſolves in watery liquors; but is ſcarce ſenſibly acted on by rectified ſpirit.

Acacia is a mild aſtringent medicine. The Egyptians give it in ſpitting of blood, in the quantity of a drachm, diſſolved in any convenient liquor; and repeat this doſe occaſionally: they likewiſe employ it in collyria for ſtrengthening the eyes, and in gargariſms for quinſeys. Among us, it is little otherwiſe uſed than as an ingredient in mithridate and theriaca, and is rarely met with in the ſhops. What is uſually ſold for the Egyptian acacia, is the inſpiſſated juice of unripe ſloes; this is harder, heavier, of a darker colour, and ſomewhat ſharper taſte, than the true ſort. See the next article.

German Acacia, the juice of unripe ſloes inſpiſſated nearly to dryneſs over a gentle fire, care being taken to prevent its burning. It is moderately aſtringent, ſimilar to the Egyptian acacia, for which it has been commonly ſubſtituted in the ſhops. It is given in fluxes, and other diſorders where ſtyptic medicines are indicated, from a ſcruple to a drachm.

Acacia, among antiquaries, ſomething reſembling a roll or bag, ſeen on medals, as in the hands of ſeveral conſuls and emperors. Some take it to repreſent a handkerchief rolled up, wherewith they made ſignals at the games; others a roll of petitions or memorials; and ſome, a purple bag full of earth, to remind them of their mortality.

ACACIANS, in eccleſiaſtical hiſtory, the name of ſeveral ſects of heretics; ſome of which maintained, that the Son was only a ſimilar, not the ſame, ſubſtance with the Father; and others, that he was not only a diſtinct but a diſſimilar ſubſtance. Two of theſe ſects had their denominations from Acacius biſhop of Cæſarea, who lived in the fourth century, and changed his opinions, ſo as, at different times, to be head of both. Another was named from Acacius patriarch of Conſtantinople, who lived in the cloſe of the fifth century.

ACACIUS, ſurnamed Luscus, becauſe he was blind of one eye, was biſhop of Cæſarea in Paleſtine, and ſucceeded the famous Euſebius: he had a great ſhare in the baniſhment of Pope Liberius, and bringing Felix to the ſee of Rome. He gave name to a ſect, and died about the year 365. He wrote the life of Euſebius, which is loſt, and ſeveral other works.

Acacius, *Saint*, biſhop of Amida in Meſopotamia, in 420, was diſtinguiſhed by his piety and charity. He ſold the plate belonging to his church, to redeem ſeven thouſand Perſian ſlaves who were periſhing with hunger. He gave each of them ſome money and ſent them home. Veranius their king was ſo affected with this noble inſtance of benevolence, that he deſired to ſee the biſhop; and this interview procured a peace between that prince and Theodoſius I.

Acad || Academic

There have been ſeveral other eminent perſons of the ſame name; particularly, a martyr under the emperor Decius: a patriarch of Antioch, who ſucceeded Baſil in 458, and died in 459: a biſhop of Miletum in the fifth century: a famous rhetorician in the reign of the emperor Julian: and, a patriarch of Conſtantinople in the fifth century; who was ambitious to draw the whole power and authority of Rome by degrees to Conſtantinople, for which he was excommunicated by Pope Felix II. He in his turn paſſed ſentence of excommunication againſt the pope. Still, however, he held his patriarchate till his death in 488.

ACAD, or Achad, in *Ancient Geography*, the town in which Nimrod reigned, called *Archad* by the Seventy; ſituated in Babylonia, to the eaſtward of the Tigris.

ACADEMICIAN, or Academist, a member of an academy. See Academy in the modern ſenſe.

ACADEMICS, or Academists, a denomination given to the cultivators of a ſpecies of philoſophy originally derived from Socrates, and afterwards illuſtrated and enforced by Plato, who taught in a grove near Athens, conſecrated to the memory of Academus, an Athenian hero; from which circumſtance this philoſophy received the name of *Academical.* Before the days of Plato, philoſophy had in a great meaſure fallen into contempt. The contradictory ſyſtems and hypotheſes which had ſucceſſively been urged upon the world were become ſo numerous, that, from a view of this inconſtancy and uncertainty of human opinions, many were led to conclude, that truth lay beyond the reach of our comprehenſion. Abſolute and univerſal ſcepticiſm was the natural conſequence of this concluſion. In order to remedy this abuſe of philoſophy and of the human faculties, Plato laid hold of the principles of the academical philoſophy; and, in his Phædo, reaſons in the following manner: "If we are "unable to diſcover truth (ſays he), it muſt be owing "to two circumſtances: either there is no truth in "the nature of things; or the mind, from a defect "in its powers, is not able to apprehend it. Upon the "latter ſuppoſition, all the uncertainty and fluctuation "in the opinions and judgements of mankind admit of "an eaſy ſolution: Let us therefore be modeſt, and "aſcribe our errors to the real weakneſs of our own "minds, and not to the nature of things themſelves. "Truth is often difficult of acceſs: in order to come "at it, we muſt proceed with caution and diffidence, "carefully examining every ſtep; and, after all our "labour, we will frequently find our greateſt efforts "diſappointed, and be obliged to confeſs our ignorance and weakneſs."

Labour and caution in their reſearches, in oppoſition to raſh and haſty deciſions, were the diſtinguiſhing characteriſtics of the diſciples of the ancient academy A philoſopher, poſſeſſed of theſe principles, will be ſlow in his progreſs; but will ſeldom fall into errors, or have occaſion to alter his opinion after it is once formed. Vanity and precipitance are the great ſources of ſcepticiſm: hurried on by theſe, inſtead of attending to the cool and deliberate principles recommended by the academy, ſeveral of our modern philoſophers have plunged themſelves into an abſurd and ridiculous kind of ſcepticiſm. They pretend to diſcredit ſubjects that

are.

Academy. are plain, ſimple, and eaſily comprehended: but give peremptory and deciſive judgements upon things that evidently exceed the limits of our capacity. Of theſe, Berkeley and Hume are the moſt conſiderable. Berkeley denied the exiſtence of every thing, excepting his own ideas. Mr Hume has gone a ſtep further, and queſtioned even the exiſtence of ideas; but at the ſame time has not heſitated to give determined opinions with regard to eternity, providence, and a future ſtate, miraculous interpoſitions of the Deity, &c. ſubjects far above the reach of our faculties. In his eſſay on the academical or ſceptical philoſophy, he has confounded two very oppoſite ſpecies of philoſophy. After the days of Plato, indeed, the principles of the firſt academy were groſsly corrupted by Arceſilas, Carneades, &c. This might lead Mr Hume into the notion that the *academical* and *ſceptical* philoſophy were ſynonymous terms. But no principles can be of a more oppoſite nature than thoſe which were inculcated by the old academy of Socrates and Plato, and the ſceptical notions which were propagated by Arceſilas, Carneades, and the other diſciples of the ſucceeding academies.

ACADEMY, in antiquity, a garden, villa, or grove, ſituated within a mile of Athens, where Plato and his followers held their philoſophical conferences. It took its name from one Academus, or Ecademus, who was the original owner of it, and made it a kind of gymnaſium. He lived in the time of Theſeus; and, after his death, it retained his name, and was conſecrated to his memory. Cimon embelliſhed it with fountains, trees, and walks; but Sylla, during the ſiege of Athens, employed theſe very trees in making battering engines againſt the city. Cicero too had his villa, or place of retirement, near Puzzuoli, which he alſo named an *academy*, where he compoſed his *Academical Queſtions*, and his book *De Natura Deorum*.

ACADEMY, among the moderns, is moſt commonly uſed to ſignify a SOCIETY of learned men, eſtabliſhed for the improvement of any art or ſcience, and generally under the protection of a prince. Ptolemy Soter, for the encouragement and improvement of the liberal arts in his dominions, founded an academy at Alexandria, and provided it with a collection of books which was the foundation of the Alexandrian library.

Theodoſius the younger eſtabliſhed an academy at Conſtantinople, and appointed profeſſors of every ſcience, with the view of making it a rival inſtitution to that at Rome; which, with the other literary ſeminaries, had been deſtroyed by the Goths about the end of the fourth and the beginning of the fifth centuries.

The firſt academy we read of was eſtabliſhed by Charlemagne, at the inſtigation of ALCUIN. It was compoſed of the chief wits of the court, the emperor himſelf being a member. In their academical conferences, every perſon was to give an account of what ancient authors he had read; and each even aſſumed the name of ſome ancient author who pleaſed him moſt, or ſome celebrated perſon of antiquity. Alcuin, from whoſe letters we learn theſe particulars, took that of Flaccus, the ſurname of Horace: a young lord, named Augilbert took that of Homer: Adelard, biſhop of Corbie, was called Auguſtine: Ricul'e, biſhop of Mentz, was Dametas; and the king himſelf, David. This ſhows the miſtake of ſome modern writers, who relate, that it was in conformity with the genius of the learned men of thoſe times, who were great admirers of Roman names, that Alcuin took the name of Flaccus Albinus. Academy.

Moſt nations have now their academies; but Italy has the greateſt number. Many flouriſhing academies exiſted in France before the revolution. Moſt of them were eſtabliſhed by Louis XIV. We have but few in Britain; and thoſe of chiefeſt note go by a different name, viz. SOCIETY.

In giving an account of the principal academies, it ſeems moſt proper to arrange them according to their ſubjects.

I. *MEDICAL Academies*, as that of the Naturæ Curioſi in Germany; that founded at Palermo in 1645; another at Venice in 1701, which meets weekly in a hall near the grand hoſpital; another at Geneva in 1715, in the houſe of M. le Clerc. The colleges of phyſicians at London and Edinburgh, are alſo, by ſome, ranked in the number of *academies*.

The *Academy of Naturæ Curioſi*, called alſo the *Leopoldine Academy*, was founded in 1652 by Jo. Laur. Bauſchius, a phyſician; who, in imitation of the Engliſh, publiſhed an invitation to all phyſicians to communicate their extraordinary caſes; and, meeting with ſucceſs, was elected preſident. Their works were at firſt publiſhed ſeparately; but in 1670 a new ſchēme was laid for publiſhing a volume of obſervations every year. The firſt volume appeared in 1684, under the title of *Ephemerides*, and the work has been continued with ſome interruptions and variations of the title, &c. In 1687, the emperor Leopold took the ſociety under his protection, granting the members ſeveral privileges, particularly that their preſidents ſhould be counts palatine of the holy Roman empire. This academy has no fixed reſidence, or regular aſſemblies: inſtead of theſe, there is a kind of bureau, or office, firſt eſtabliſhed at Breſlau, and afterwards removed to Nuremberg, where letters, obſervations, &c. from correſpondents or members are taken in. The academy conſiſts of a preſident, two adjuncts or ſecretaries, and colleagues or members without reſtriction. The colleagues, at their admiſſion, oblige themſelves to two things; firſt, to chuſe ſome ſubject out of the animal, vegetable, or mineral kingdom, for diſcuſſion, provided it had not been treated of by any colleague before; the ſecond, to apply themſelves to furniſh materials for the Annual Ephemerides. Each member to bear a ſymbol of the academy; viz. a gold ring; whereon, inſtead of a ſtone, is a book open, and, on the face thereof, an eye; on the other ſide the motto of the academy, *Nunquam otioſus*.

II. *CHIRURGICAL Academies*; as that inſtituted ſome years ago, by public authority, at Paris: the members of which were not only to publiſh their own and correſpondents obſervations and improvements; but to give an account of all that is publiſhed on ſurgery, and to compoſe a complete hiſtory of the art, by their extracts from all the authors ancient and modern who have wrote on it. A queſtion in ſurgery was annually propoſed by the academy, and a gold medal of 200 livres value was given to the ſucceſsful competitor.

Academy of Surgery at Vienna, was inſtituted ſome years ago by the preſent emperor, under the direction

of

Academies of the celebrated Brambilla. In this there were at first only two profeſſors; and to their charge the inſtruction of 130 young men was committed, 30 of whom had formerly been ſurgeons in the army. But of late the number both of the teachers and pupils has been conſiderably increaſed. Gabrieli has been appointed to teach pathology and practice; Boecking, anatomy, phyſiology, and phyſics; Streit, medical and pharmaceutical ſurgery; Hunczowſky, ſurgical operations, midwifery, and the chirurgia forenſis; and Plenk, chemiſtry and botany. To theſe alſo has been added, Beindl as profector and extraordinary profeſſor of ſurgery and anatomy. Beſides this, the emperor, with his uſual liberality, has provided a large and ſplendid edifice in Vienna, which affords habitation both for the teachers, the ſtudents, pregnant women, patients for clinical lectures, and ſervants. He has alſo purchaſed for the uſe of this academy a medical library, which is open every day; a complete ſet of chirurgical inſtruments; an apparatus for experiments in natural philoſophy; a collection of natural hiſtory; a number of anatomical and pathological preparations; a collection of preparations in wax brought from Florence; and a variety of other uſeful articles. Adjoining to the building alſo there is a good botanical garden.

Among other parts of this inſtitution, three prize medals, each of the value of 40 florins, are to be annually beſtowed on thoſe ſtudents who return the beſt anſwer to queſtions propoſed the year before. Theſe prizes are not entirely founded by the emperor, but are in part owing to the liberality of Brendellius, the protochirurgus at Vienna.

III. *Ecclesiastical Academies*; as that at Bologna in Italy, inſtituted in 1687, employed in the examination of the doctrine, diſcipline, and hiſtory, of each age of the church.

IV. *Cosmographical Academies*; as that at Venice, called the *Argonauts*. This was inſtituted at the ſolicitation of F. Coronelli, for the improvement of geographical knowledge. Its deſign was to publiſh exact maps, both celeſtial and terreſtrial, as well particular as general, together with geographical, hiſtorical, and aſtronomical deſcriptions. Each member, in order to defray the expence of ſuch a publication, was to ſubſcribe a proportional ſum, for which they were to receive one or more copies of each piece publiſhed. For this end three ſocieties are ſettled; one under F. Moro, provincial of the Minorites in Hungary; another under the Abbot Laurence au Ruy Payenne au Marais; the third under F. Baldigiani, Jeſuit profeſſor of mathematics in the Roman college. The device of this academy is the terraqueous globe, with the motto *Plus ultra*; and at its expence all the globes, maps and geographical writings, of F. Coronelli have been publiſhed.

V. *Academies of Sciences*—Theſe comprehend ſuch as are erected for improving natural and mathematical knowledge. They are otherwiſe called *Philoſophical* and *Phyſical* academies.

The firſt of theſe was inſtituted at Naples, about the year 1560, in the houſe of Baptiſta Porta. It was called the Academy *Secretorum Naturæ*; and was ſucceeded by the Academy of *Lyncei*, founded at Rome by Prince Frederic Ceſi, towards the end of that century. Several of the members of this academy rendered it famous by their diſcoveries; among theſe was the celebrated Galileo. Several other academies were inſtituted about that time, which contributed greatly to the advancement of the ſciences; but none of them comparable to that of the *Lyncei*. Academies.

Some years after the death of Torricelli, the *Academy del Cemento* made its appearance, under the protection of Prince Leopold, afterwards Cardinal de Medicis. Redi was one of its chief members: and the ſtudies purſued by the reſt may be collected from thoſe curious experiments publiſhed in 1667, by their ſecretary Count Laurence Magulotti, under the title of *Saggi di Naturali Eſperienze*; a copy of which was preſented to the Royal Society, tranſlated into Engliſh by Mr Waller, and publiſhed at London in 4to.

The *Academy degl'Inquieti*, afterwards incorporated into that of Della Tracia in the ſame city, followed the example of that of Del Cimento. Some excellent diſcourſes on phyſical and mathematical ſubjects, by Geminiano Montenari, one of the chief members, were publiſhed in 1667, under the title of *Penſieri Fiſico-Matematici*.

The *Academy of Roſſano*, in the kingdom of Naples, was originally an academy of belles lettres, founded in 1540, and transformed into an academy of ſciences in 1695 at the ſolicitation of the learned abbot Don Giacinto Gimma; who being made preſident, under the title of Promoter General thereof, gave them a new ſet of regulations. He divided the academiſts into the following claſſes: Grammarians, Rhetoricians, Poets, Hiſtorians, Philoſophers, Phyſicians, Mathematicians, Lawyers, and Divines, with a claſs apart for cardinals and perſons of quality. To be admitted a member, a man muſt have ſome degrees in the faculty. The members are not allowed to take the title of *Academiſts* in the beginning of their books, without a written permiſſion from their preſident, which is not granted till the work has been examined by the cenſors of the academy; and the permiſſion is the greateſt honour the academy can confer, as they thereby adopt the work, and are anſwerable for it againſt all criticiſms that may be made upon it. To this law the preſident or promoter himſelf is ſubject; and no academiſt is allowed to publiſh any thing againſt the writings of another without leave from the ſociety.

Several other academies of *Sciences* have been founded in Italy; but, for want of being ſupported by princes, did not continue long. The loſs of them, however, was abundantly repaired by the inſtitution of others ſtill ſubſiſting: ſuch as, the *Academy of Filarmonici* at Verona; of *Ricovatri* at Padua, where a learned diſcourſe on the origin of ſprings was delivered by Sig. Vallifnieri, firſt profeſſor of phyſic in the univerſity of that city, and which was afterwards printed. To the Academy of the *Muti de Reggio*, at Modena, the ſame Sig. Vallifnieri preſented an excellent diſcourſe on the ſcale of created beings, ſince inſerted in his hiſtory of the generation of man and animals, printed at Venice in the year 1721.

F. Merſenne is ſaid to have given the firſt idea of a philoſophical academy in France, towards the beginning of the 17th century, by the conferences of naturaliſts and mathematicians occaſionally held at his lodgings; at which Gaſſendi, Des Cartes, Hobbes, Roberval, Paſcal, Blondel, and others aſſiſted. F. Merſenne

Academies. ſenne propoſed to each certain problems to examine, or certain experiments to be made. Theſe private aſſemblies were ſucceeded by more public ones, formed by Mr Montmort, and Mr Thevenot the celebrated traveller. The French example animated ſeveral Engliſhmen of diſtinction and learning to erect a kind of philoſophical academy at Oxford, towards the cloſe of Oliver Cromwell's adminiſtration; which, after the Reſtoration, was erected into a Royal Society. See SOCIETY. The Engliſh example, in its turn, animated the French. Louis XIV. in 1666, aſſiſted by the counſels of M. Colbert, founded an academy of ſciences at Paris, with a ſufficient revenue to defray the charge of experiments, and ſalaries to the members.

Royal Academy of Sciences. After the peace of the Pyrenees, Louis XIV. being deſirous of eſtabliſhing the arts, ſciences, and literature, upon a ſolid foundation, directed M. Colbert to form a ſociety of men of known abilities and experience in the different branches, who ſhould meet together under the king's protection, and communicate their reſpective diſcoveries. Accordingly M. Colbert, having conferred with thoſe who were at that time moſt celebrated for their learning, reſolved to form a ſociety of ſuch perſons as were converſant in natural philoſophy and mathematics, to join to them other perſons ſkilled in hiſtory and other branches of erudition, along with thoſe who were entirely engaged in what are called the *Belles Lettres*, grammar, eloquence, and poetry. The geometricians and natural philoſophers were ordered to meet on Tueſdays and Saturdays, in a great hall of the king's library, where the books of mathematics and natural philoſophy were contained; the learned in hiſtory to aſſemble on Mondays and Thurſdays, in the hall where the books of hiſtory were contained; and the claſs of belles lettres to aſſemble on Wedneſdays and Fridays. All the different claſſes were likewiſe ordered to meet together upon the firſt Thurſday of every month; and, by their reſpective ſecretaries, make a report of the proceedings of the foregoing month.

In a ſhort time, however, the claſſes of hiſtory, belles lettres, &c. were united to the *French* Academy, which was originally inſtituted for the improvement and refining the French language: ſo that the Royal Academy contained only two claſſes, viz. that of natural philoſophy and mathematics.

In the 1696, the king, by a proclamation dated the 26th of January, gave this academy a new form, and put it upon a more reſpectable footing. It was now to be compoſed of four kinds of members, viz. *honorary*, *penſionary*, *aſſociates*, and *eleves*. Theſe laſt were a kind of pupils, or ſcholars, one of whom was attached to each of the penſionaries. The firſt claſs to contain ten perſons, and each of the reſt twenty. The honorary academiſts to be all inhabitants of France; the penſionaries all to reſide at Paris: eight of the aſſociates allowed to be foreigners; and the eleves all to live at Paris. The officers to be, a preſident named by the king, out of the claſs of honorary academiſts; and a ſecretary and treaſurer to be perpetual. Of the penſionaries, three to be geometricians, three aſtronomers, three mechanics, three anatomiſts, three chemiſts, three botaniſts, and the remaining two to be ſecretary and treaſurer. Of the twelve aſſociates, two to apply themſelves to geometry, two to botany, and two to chemiſtry. The eleves to apply themſelves to the ſame kind of ſcience with the penſionaries they were attached to; and not to ſpeak, except when called by the preſident. No regular or religious to be admitted, except into the claſs of honorary academiſts; nor any perſon to be admitted either for aſſociate or penſionary, unleſs known by ſome conſiderable printed work, ſome machine, or other diſcovery. The aſſemblies were held on Wedneſdays and Saturdays, unleſs either of them happened to be a holiday, and then the aſſembly was held on the preceding day. To encourage the members to purſue their labours, the king engaged not only to pay the ordinary penſions, but even to give extraordinary gratifications according to the merit of their reſpective performances; furniſhing withal the expence of the experiments and other inquiries neceſſary to be made. If any member gave in a bill of charges of experiments he had made, or deſired the printing of any book, and brought in the charges of graving, the money was immediately paid by the king, upon the preſident's allowing and ſigning the bill. So if an anatomiſt required live tortoiſes, for inſtance, for making experiments about the heart, &c. as many as he pleaſed were brought him at the king's charge. Their motto was *Invenit et perfecit.* Academies.

In the year 1716, the duke of Orleans, then regent, made an alteration in their conſtitution; augmenting the number of honoraries, and of aſſociates capable of being foreigners, to 12; admitting regulars among ſuch aſſociates; and ſuppreſſing the claſs of eleves, as it appeared to be attended with ſome inconveniences, particularly that of making too great an inequality among the academiſts, and being productive of ſome miſunderſtandings and animoſities among the members. At the ſame time he created other two claſſes; one conſiſting of 12 adjuncts, who, as well as the aſſociates, were allowed a deliberative voice in matters relative to ſcience; and the other ſix free aſſociates, who were not attached to any particular ſcience, nor obliged to purſue any particular work.

Since its re-eſtabliſhment in 1699, this academy has been very exact in publiſhing, every year, a volume containing either the works of its own members, or ſuch memoirs as have been compoſed and read to the academy during the courſe of that year. To each volume is prefixed the hiſtory of the academy, or an extract of the memoirs, and, in general, of whatever has been read or ſaid in the academy; at the end of the hiſtory, are the eulogiums on ſuch academiſts as have died that year. M. Rouille de Meſlay, counſellor to the parliament of Paris, founded two prizes, one of 2500, and the other of 2000 livres, which were alternately diſtributed by the parliament every year: the ſubject for the firſt muſt relate to phyſical aſtronomy, and thoſe for the latter to navigation and commerce.

Notwithſtanding the advantages which the members of this academy enjoyed over others, in having their expences defrayed, and even being paid for their time and attendance, they had fallen under ſome imputations, particularly that of plagiariſm, or borrowing their neighbours inventions; but with what juſtice we do not ſay. This academy was ſuppreſſed and aboliſhed by the convention in 1793; and other inſtitutions have been eſtabliſhed. See INSTITUTE.

The French had alſo conſiderable academies in moſt of

Academies. of their great cities: as, at Montpelier, a royal academy of ſciences on the like footing as that at Paris, being as it were a counterpart thereof; at Thouloufe, an academy under the denomination of Lanterniſts; others at Niſmes, Arles, Lyons, Dijon, Bourdeaux, &c. Academie

The Royal Academy of Sciences at Berlin was founded in 1700, by Frederic II. king of Pruſſia, on the model of that of England; excepting that, beſides natural knowledge, it likewiſe comprehends the belles lettres. In 1710, it was ordained that the preſident ſhall be one of the counſellors of ſtate, and nominated by the king. The members were divided into four claſſes; the firſt for proſecuting phyſics, medicine, and chemiſtry; the ſecond for mathematics, aſtronomy, and mechanics; the third for the German language and the hiſtory of the country; the fourth for oriental learning, particularly as it may concern the propagation of the goſpel among infidels. Each claſs to elect a director for themſelves, who ſhall hold his poſt for life. The members of any of the claſſes have free admiſſion into the aſſemblies of any of the reſt.

The great promoter of this inſtitution was the celebrated Mr Leibnitz, who accordingly was made the firſt director. The firſt volume of their tranſactions was publiſhed in 1710, under the title of *Miſcellanea Berolinenſia;* and though they received but few marks of the royal favour for ſome time, they continued to publiſh new volumes in 1723, 1727, 1734, and 1740. At laſt, however, Frederic III. the late king of Pruſſia, gave new vigour to this academy, by inviting to Berlin ſuch foreigners as were moſt diſtinguiſhed for their merit and literature, and encouraged his ſubjects to proſecute the ſtudy and cultivation of the ſciences by giving ample rewards; and thinking that the academy, which till that time had had ſome miniſter or opulent nobleman for its preſident, would find an advantage in having a man of letters at its head, he conferred that honour on M. Maupertuis. At the ſame time, he gave a new regulation to the academy, and took upon himſelf the title of its protector.

The academiſts hold two public aſſemblies annually; one in January, on the late king's birth day; and the other on May, on the day of his acceſſion to the throne. At the latter of theſe is given, as a prize, a gold medal of 50 ducats value: the ſubject for this prize is ſucceſſively natural philoſophy, mathematics, metaphyſics, and erudition.

The Imperial Academy of Sciences at Peterſburgh was projected by Czar Peter the Great. That great monarch having, during his travels, obſerved the advantage of public ſocieties for the encouragement and promotion of literature, formed the deſign of founding an academy of ſciences at St Peterſburgh. By the advice of Wolf and Leibnitz, whom he conſulted on this occaſion, the ſociety was regulated, and ſeveral learned foreigners were invited to become members. Peter himſelf drew the plan, and ſigned it on the 10th of February 1724; but was prevented, by the ſuddenneſs of his death, from carrying it into execution. His deceaſe, however, did not prevent its completion: for on the 21ſt of December 1725, Catharine I. eſtabliſhed it according to Peter's plan; and on the 27th of the ſame month the ſociety was firſt aſſembled. On the 1ſt of Auguſt 1726, Catharine honoured the meeting with her preſence, when Profeſſor Bulfinger, a German naturaliſt of great eminence, pronounced an oration upon the advances made by the loadſtone and needle for the diſcovery of the longitude.

The empreſs ſettled a fund of 4982l. *per annum* for the ſupport of the academy; and fifteen members, all eminent for their learning and talents, were admitted and penſioned, under the title of Profeſſors in the various branches of literature and ſcience. The moſt diſtinguiſhed of theſe profeſſors were Nicholas and Daniel Bernoulli, the two De Liſles, Bulfinger, and Wolf.

During the ſhort reign of Peter II. the ſalaries of the members were diſcontinued, and the academy was utterly neglected by the court; but it was again patroniſed by the empreſs Anne, who even added a ſeminary for the education of youth, under the ſuperintendence of the profeſſors. Both inſtitutions flouriſhed for ſome time under the direction of Baron Korf; but upon his death, towards the latter end of Anne's reign, an ignorant perſon being appointed preſident, many of the moſt able members quitted Ruſſia. At the acceſſion of Elizabeth, new life and vigour were again reſtored to the academy: the original plan was enlarged and improved; ſome of the moſt learned foreigners were again drawn to Peterſburgh; and, what was conſidered as a good omen for the literature of Ruſſia, two natives, Lomonoſof and Rumovſky, men of genius and abilities, who had proſecuted their ſtudies in foreign univerſities, were enrolled among its members. The annual income was increaſed to 10,659l. and ſoon afterwards the new inſtitution took place.

The late empreſs Catharine II. with her uſual zeal for promoting the diffuſion of knowledge, took this uſeful ſociety under her more immediate protection. She altered the court of directors greatly to the advantage of the whole body; corrected many of its abuſes, and infuſed a new vigour and ſpirit into their reſearches. By her majeſty's particular recommendation the moſt ingenious profeſſors viſited the various provinces of her vaſt dominions; and as the fund of the academy was not ſufficient to ſupply the whole expence of theſe ſeveral expeditions, the empreſs beſtowed a largeſs of 2000l. which ſhe renewed as occaſion required.

The purpoſe and intent of theſe travels will appear from the inſtructions given by the academy to the ſeveral perſons who were engaged in them. They were ordered to purſue their inquiries upon the different ſorts of earths and waters; upon the beſt methods of cultivating the barren and deſert ſpots; upon the local diſorders incident to men and animals, and the moſt efficacious means of relieving them; upon the breeding of cattle, and particularly of ſheep; on the rearing of bees and ſilk worms; on the different places and objects for fiſhing and hunting; on minerals; on the arts and trades, and on forming a *Flora Ruſſica*, or collection of indigenous plants; they were particularly inſtructed to rectify the longitude and latitude of the principal towns; to make aſtronomical, geographical, and meteorological obſervations; to trace the courſe of the rivers; to take the moſt exact charts; and to be very diſtinct and accurate in remarking and deſcribing the manners and cuſtoms of the different people, their dreſſes, languages, antiquities, traditions, hiſtory, religion;

Academies. gion; and, in a word, to gain every information which might tend to illuſtrate the real ſtate of the whole Ruſſian empire.

In conſequence of theſe expeditions, perhaps no country can boaſt, within the ſpace of ſo few years, ſuch a number of excellent publications on its internal ſtate, on its natural productions, on its topography, geography, and hiſtory, on the manners, cuſtoms, and languages of the different people, as have iſſued from the preſs of this academy.

The firſt tranſactions of this ſociety were publiſhed in 1728, and entitled *Commentarii Academiæ Scientiarum Imperialis Petropolitanæ ad ann.* 1726, with a dedication to Peter II. The publication was continued under this form until the year 1747, when its tranſactions were called *Novi Commentarii Academiæ*, &c. In 1777 the academy again changed the title into *Acta Academiæ Scientiarum Imperialis Petropolitanæ*, and likewiſe made ſome alteration in the arrangement and plan of the work. The papers, which had been hitherto publiſhed in the Latin tongue, are now written either in that language or French; and a preface is added, ſtyled *Partie Hiſtorique*, which contains an account of its proceedings, meetings, admiſſion of new members, and other remarkable occurrences. Of the Commentaries, 14 volumes were publiſhed: the firſt of the New Commentaries made its appearance in 1750, and the twentieth in 1776. Under the new title of *Acta Academiæ*, ſeveral volumes have been given to the public, and two are printed every year. Theſe tranſactions abound with ingenious and elaborate diſquiſitions upon various parts of ſcience and natural hiſtory, and which reflect the greateſt honour upon their authors; and it may not be an exaggeration to aſſert, that no ſociety in Europe has more diſtinguiſhed itſelf for the excellence of its publications, and particularly in the more abſtruſe parts of the pure and mixed mathematics.

The academy is ſtill compoſed, as at firſt, of fifteen profeſſors, beſides the preſident and director. Each of theſe profeſſors has a houſe and an annual ſtipend from 200l. to 600l. Beſide the profeſſors, there are four adjuncts, who are penſioned, and who are preſent at the ſittings of the ſociety, and ſucceed to the firſt vacancies. The direction of the academy is at preſent conſigned to the princeſs Daſhkof.

The building and apparatus of this academy are extraordinary. There is a fine library, conſiſting of 36,000 curious books and manuſcripts. There is an extenſive muſeum, in which the various branches of natural hiſtory, &c. are diſtributed in different apartments: it is extremely rich in native productions, having been conſiderably augmented with a variety of ſpecimens collected by Pallas, Gmelin, Guldenſtaedt, and other learned profeſſors, during their late expeditions through the Ruſſian empire. The ſtuffed animals and birds occupy one apartment. The chamber of rarities, the cabinet of coins, &c. contain innumerable articles of the higheſt curioſity and value. The ſociety has this modeſt motto, *Paulatim*.

The Academy of Sciences at Bologna, called the *Inſtitute of Bologna*, was founded by Count Marſigli in 1712, for the cultivating of phyſics, mathematics, medicine, chemiſtry, and natural hiſtory. Its hiſtory is written by M. de Limiers, from memoirs furniſhed by the founder himſelf. Academies.

The Academy of Sciences at Stockholm, or *Royal Swediſh Academy*, owes its inſtitution to ſix perſons of diſtinguiſhed learning, amongſt whom was the celebrated Linnæus: they originally met on the 2d of June 1739; formed a private ſociety, in which ſome diſſertations were read; and in the latter end of the ſame year their firſt publication made its appearance. As the meetings continued and the members increaſed, the ſociety attracted the notice of the king, and was, on the 31ſt of March 1741, incorporated under the name of the Royal Swediſh Academy. Not receiving any penſion from the crown, it is only under the protection of the king, being directed, like our Royal Society, by its own members. It has now a large fund, which has chiefly ariſen from legacies and other donations; but a profeſſor of experimental philoſophy, and two ſecretaries, are ſtill the only perſons who receive any ſalaries. Each of the members reſident at Stockholm becomes preſident by rotation, and continues in office during three months. There are two ſpecies of members, native and foreign: the election of the former is held in April, and of the latter in July: no money is paid at the time of admiſſion. The diſſertations read at each meeting are collected and publiſhed four times in the year; they are written in the Swediſh language, and printed in octavo; and the annual publications make a volume. The firſt 40 volumes, which were finiſhed in 1779, are called the Old Tranſactions; for in the following year the title was changed into that of New Tranſactions. The king is ſometimes preſent at the ordinary meetings, and particularly at the annual aſſembly in April for the election of members. Any perſon who ſends a treatiſe which is thought worthy of being printed, receives the Tranſactions for that quarter *gratis*, and a ſilver medal, which is not eſteemed for its value, being worth only three ſhillings, but for its rarity and the honour conveyed by it. All the papers relating to agriculture are publiſhed ſeparately under the title of *Oeconomica Acta*. Annual premiums, in money and gold medals, principally for the encouragement of agriculture and inland trade, are alſo diſtributed by the academy. The fund for theſe prizes is ſupplied from private donations.

The Royal Academy of Sciences at Copenhagen owes its inſtitution to the zeal of ſix literati, whom Chriſtian VI. in 1742, ordered to arrange his cabinet of medals. The count of Holſtein was the firſt preſident; and the ſix perſons who firſt formed the deſign, were John Gram, Joachim Frederic Ramus, Chriſtian Louis Scheid, Mark Woldickey, Eric Pontopidan, and Bernard Moelman. Theſe perſons occaſionally meeting for that purpoſe, extended their deſigns; aſſociated with them others who were eminent in ſeveral branches of ſcience; and forming a kind of literary ſociety, employed themſelves in ſearching into, and explaining the hiſtory and antiquities of their country. The count of Holſtein warmly patronized this ſociety, and recommended it ſo ſtrongly to Chriſtian VI. that, in 1743, his Daniſh majeſty took it under his protection, called it the Royal Academy of Sciences, endowed it with a fund, and ordered the members to join to their former purſuits, natural hiſtory, phyſics, and mathe-

Academies. matics. In consequence of the royal favour, the members engaged with fresh zeal in their pursuits; and the academy has published 15 volumes in the Danish language, some of which have been translated into Latin.

The *American Academy of Sciences*, was established in 1780 by the council and house of representatives in the province of Massachuset's Bay, for promoting the knowledge of the antiquities of America, and of the natural history of the country; for determining the uses to which its various natural productions might be applied; for encouraging medicinal discoveries, mathematical disquisitions, philosophical inquiries and experiments, astronomical, meteorological, and geographical observations, and improvements in agriculture, manufactures, and commerce; and, in short, for cultivating every art and science which may tend to advance the interest, honour, dignity, and happiness of a free, independent, and virtuous people. The members of this academy are never to be more than 200, nor less than 40.

Royal Irish Academy arose out of a society established at Dublin, about the year 1782, and consisting of a number of gentlemen, most of whom belonged to the university. They held weekly meetings, and alternately read essays on various subjects. The members of this society afterwards formed a more extensive plan, and admitting only such names as might add dignity to their new institution, became the founders of the *Royal Irish Academy*, which professes to unite the advancement of science with the history of mankind and polite literature. The first volume of their transactions for 1787 appeared in 1788, and seven volumes have been since published. A society was formed in Dublin, similar to the Royal Society in London, as early as the year 1683; but the distracted state of the country was unpropitious to the cultivation of philosophy and literature. The plan was resumed about the beginning of the present century, and the earl of Pembroke, then lord lieutenant, was president of a philosophical society established in Dublin college. In the year 1740, there was instituted a Physico-historical Society; of which two volumes of minutes are extant: but this society soon declined.

VI. *Academies or Schools of Arts*; as that at Peterfburgh, which was established by the empress Elizabeth, at the suggestion of Count Shuvalof, and annexed to the Academy of Sciences: the fund was 4000l. per annum, and the foundation for 40 scholars. The late empress formed it into a separate institution, enlarged the annual revenue to 12,000l. and augmented the number of scholars to 300; she also constructed, for the use and accommodation of the members, a large circular building, which fronts the Neva. The scholars are admitted at the age of six, and continue until they have attained that of 18: they are clothed, fed, and lodged, at the expence of the crown. They are all instructed in reading and writing, arithmetic, the French and German languages, and drawing. At the age of 14 they are at liberty to choose any of the following arts, divided into four classes: 1. Painting in all its branches, of history, portraits, battles, and landscapes; architecture; mosaic; enamelling, &c. 2. Engraving on copperplates, seal-cutting, &c. 3. Carving on wood, ivory, and amber. 4. Watch making, turning, instrument-making, casting statues in bronze and other metals, imitating gems and medals in paste and other compositions, gilding, and varnishing. Prizes are annually distributed to those who excel in any particular art; and from those who have obtained four prizes, twelve are selected, who are sent abroad at the charge of the empress. A certain sum is paid to defray their travelling expences; and when they are settled in any town, they receive an annual salary of 60l. which is continued during four years. There is a small assortment of paintings for the use of the scholars; and those who have made great progress are permitted to copy the pictures in the empress's collection. For the purpose of design, there are models in plaster of the best antique statues in Italy, all done at Rome, of the same size with the originals, which the artists of the academy were employed to cast in bronze. Academ

The *Royal Academy of Arts in London*, was instituted for the encouragement of *Designing*, *Painting*, *Sculpture*, &c. &c. in the year 1768. This academy is under the immediate patronage of the king, and under the direction of 40 artists of the first rank in their several professions. It furnishes, in winter, living models of different characters to draw after; and in summer, models of the same kind to paint after. Nine of the ablest academicians are annually elected out of the 40, whose business is to attend by rotation, to set the figures, to examine the performance of the students, and to give them necessary instructions. There are likewise four professors, of *Painting*, of *Architecture*, of *Anatomy*, and of *Perspective*, who annually read public lectures on the subjects of their several departments; beside a president, a council, and other officers. The admission to this academy is free to all students properly qualified to reap advantage from the studies cultivated in it; and there is an annual exhibition of paintings, sculptures, and designs, open to all artists of distinguished merit.

The Academy of Painting and Sculpture at Paris. This took its rise from the disputes that happened between the master painters and sculptors in that capital; in consequence of which, M. le Brun, Sarazin, Corneille, and others of the king's painters, formed a design of instituting a particular academy; and, having presented a petition to the king, obtained an arrêt dated January 20. 1648. In the beginning of 1655, they obtained from Cardinal Mazarine a brevet, and letters patent, which were registered in parliament; in gratitude for which favour, they chose the cardinal for their protector, and the chancellor for their vice-protector. In 1663, by means of M. Colbert, they obtained a pension of 4000 livres. The academy consisted of a protector; a vice protector; a director; a chancellor; four rectors; adjuncts to the rectors; a treasurer; four professors, one of which was professor of anatomy, and another of geometry; several adjuncts and counsellors, a historiographer, a secretary, and two ushers.

The Academy of Painting held a public assembly every day for two hours in the afternoon, to which the painters resorted either to design or to paint, and where the sculptors modelled after a naked person. There were 12 professors, each of whom kept the school for a month: and there were 12 adjuncts to supply them in case of need. The professor upon duty placed the naked man

as

Academies. as he thought proper, and ſet him in two different attitudes every week. This was what they called *ſetting the model.* In one week of the month he ſet two models together, which was called *ſetting the group.* The paintings, and models made after this model, were called *academics*, or *academy figures.* They had likewiſe a woman who ſtood for a model in the public ſchool. Every three months, three prizes for deſign were diſtributed among the *eleves* or diſciples; two others for painting, and two for ſculpture, every year.

There was alſo an Academy of Painting, Sculpture, &c. at Rome, eſtabliſhed by Lewis XIV. wherein thoſe who had gained the annual prize at Paris were entitled to be three years entertained at the king's expence, for their further improvement.

Muſical Academy, conſiſts of the managers and directors of the opera.

The *Academy of Ancient Muſic* was eſtabliſhed in London in 1710, by ſeveral perſons of diſtinction, and other gentlemen, in conjunction with the moſt eminent maſters of the time, with a view to the ſtudy and practice of vocal and inſtrumental harmony. This inſtitution, which had the advantage of a library, conſiſting of the moſt celebrated compoſitions both foreign and domeſtic, in manuſcript and in print, and which was aided by the performances of the gentlemen of the chapel royal, and the choir of St Paul's, with the boys belonging to each, continued to flouriſh for many years. In 1731, a charge of plagiariſm brought againſt Bononcini, a member of the academy, for claiming a madrigal of Lotti of Venice as his own, threatened the exiſtence of the inſtitution. Dr Greene, who had introduced the madrigal into the academy, took part with Bononcini, and withdrew from the ſociety, taking with him the boys of St Paul's. In 1734 Mr Gates, another member of the ſociety, and maſter of the children of the royal chapel, retired in diſguſt; and it was thus deprived of the aſſiſtance which the boys afforded it in ſinging the ſoprano parts. From this time the academy became a ſeminary for the inſtruction of youth in the principles of muſic, and the laws of harmony. Dr Pepuſch, who was one of its founders, was active in accompliſhing this meaſure; and by the expedients of educating boys for their purpoſe, and admitting auditor members, the ſubſiſtence of the academy was continued. The *Royal Academy of Muſic* was formed by the principal nobility and gentry of the kingdom for the performance of operas, compoſed by Mr Handel, and conducted by him at the theatre in the Haymarket. The ſubſcription amounted to 50,000l. and the king, beſides ſubſcribing 1000l. allowed the ſociety to aſſume the title of *Royal Academy.* It conſiſted of a governor, deputy governor, and twenty directors. A conteſt between Handel and Seneſino, one of the performers, in which the directors took the part of the latter, occaſioned the diſſolution of the academy, after it had ſubſiſted with reputation for more than nine years.

The Academy of Architecture, eſtabliſhed by M. Colbert in 1671, conſiſted of a company of ſkilful architects, under the direction of the ſuperintendant of the buildings.

The Academy of Dancing, erected by Lewis XIV. with privileges above all the reſt.

VII. *Academies of Law*; as that famous one at Academies. Beryta, and that of the Sitientes at Bologna.

VIII. *Academies of History*; as the *Royal Academy of Portugueſe Hiſtory at Liſbon.* This academy was inſtituted by King John V. in 1720. It conſiſts of a director, four cenſors, a ſecretary, and 50 members; to each of whom is aſſigned ſome part of the eccleſiaſtical or civil hiſtory of the nation, which he is to treat either in Latin or Portugueſe. In the church-hiſtory of each diocese, the prelates, ſynods, councils, churches, monaſteries, academies, perſons illuſtrious for ſanctity or learning, places famous for miracles or relics, muſt be diſtinctly related in twelve chapters. The civil hiſtory compriſes the tranſactions of the kingdom from the government of the Romans down to the preſent time. The members who reſide in the country are obliged to make collections and extracts out of all the regiſters, &c. where they live. Their meetings to be once in 15 days

A medal was ſtruck by this academy in honour of their prince: the front of which was his effigy, with the inſcription *Johannes* V. *Luſitanorum Rex*; and, on the reverſe, the ſame prince is repreſented ſtanding, and raiſing Hiſtory almoſt proſtrate before him, with the legend *Hiſtoria Reſurges.* Underneath are the following words in abbreviature: REGia ACADemia HISToriæ LUSITanæ, INSTITuta VI. Idus Decembris MDCCXX.

Academy of Suabian Hiſtory at Tubingen was lately eſtabliſhed by ſome learned men, for publiſhing the beſt hiſtorical writings, the lives of the chief hiſtorians, and compiling new memoirs on the ſeveral points and periods thereof.

IX. *Academies of Antiquities*; as that at Cortona in Italy, and at Upſal in Sweden. The firſt is deſigned for the ſtudy of Hetrurian antiquities; the other for illuſtrating the northern languages, and the antiquities of Sweden, in which notable diſcoveries have been made by it. The head of the Hetrurian academy is called *Lucomon*, by which the ancient governors of the country were diſtinguiſhed. One of their laws is to give audience to poets only one day in the year; another is to fix their ſeſſions, and impoſe a tax of a diſſertation on each member in his turn.

The Academy of Medals and Inſcriptions at Paris was ſet on foot by M. Colbert, under the patronage of Lewis XIV. in 1663, for the ſtudy and explanation of ancient monuments, and perpetuating great and memorable events, eſpecially thoſe of the French monarchy, by coins, relievos, inſcriptions, &c. The number of members at firſt was confined to four or five, choſen out of thoſe of the French academy; who met in the library of M. Colbert, from whom they received his majeſty's orders. The days of their meetings were not determined; but generally they met on Wedneſdays, eſpecially in the winter ſeaſon; but, in 1691, the king having given the inſpection of this academy to M. de Pontchartrain comptroller general, &c. he fixed their meetings on Tueſdays and Saturdays.

By a new regulation, dated the 16th of July 1701, the academy was compoſed of ten *honorary* members; ten *aſſociates*; each of whom had two declarative voices; ten *penſionaries*; and ten *eleves*, or pupils. They then

Academies. met every Tuesday and Wednesday, in one of the halls of the Louvre; and had two public meetings yearly, one the day after Martinmas, and the other the 16th after Easter. The class of *elèves* was suppressed, and united to the associates. The king nominated their president and vice-president yearly; but their secretary and treasurer were perpetual. The rest were chosen by the members themselves, agreeably to the constitutions on that behalf given them.

One of the first undertakings of this academy, was to compose, by means of medals, a connected history of the principal events of Louis XIV's reign: but in this design they met with great difficulties, and of consequence it was interrupted for many years; but at length it was completed down to the advancement of the duke of Anjou to the crown of Spain.

In this celebrated work, the establishment of the academy itself was not forgotten. The medal on this subject represents Mercury sitting, and writing with an antique stylus on a table of brass; he leans with his left hand upon an urn full of medals, and at his feet are several others placed upon a card: the legend, *Rerum gestarum fides;* and on the exergue, *Academia regia inscriptionum et numismatum, instituta* M.DC.LXIII. signifying that the Royal Academy of Medals and Inscriptions, founded in 1663, ought to give to future ages a faithful testimony of all great actions. Besides this work, we have several volumes of their memoirs; and their history, written and continued by their secretaries.

X. *Academies of* Belles Lettres, are those wherein eloquence and poetry are chiefly cultivated. These are very numerous in Italy, and were not uncommon in France.

The Academy of Umidi at Florence has contributed greatly to the progress of the sciences by the excellent Italian translations given, by some of its members, of the ancient Greek and Latin historians. Their chief attention is to the Italian poetry, at the same time that they have applied themselves to the polishing of their language, which produced the *Academy della Crusca.*

The Academy of Humorists, Umoristi, had its origin at Rome from the marriage of Lorenzo Marcini, a Roman gentleman, at which several persons of rank were guests; and, it being carnival time, to give the ladies some diversion, they took themselves to the reciting of verses, sonnets, speeches, first *extempore*, and afterwards premeditately; which gave them the denomination of *Belli Humori.* After some experience, coming more and more into the taste of these exercises, they resolved to form an academy of belles lettres; and changed the title of *Belli Humori* for that of *Humoristi:* choosing for their device a cloud, which, after being formed of exhalations from the salt waters of the ocean, returns in a gentle sweet shower; with this motto from Lucretius, *Redit agmine dulci.*

In 1690, the *Academy of Arcadi* was established at Rome, for reviving the study of poetry and of the belles lettres. Besides most of the politer wits of both sexes in Italy, this academy comprehends many princes, cardinals, and other ecclesiastics; and, to avoid disputes about pre-eminence, all appear masked after the manner of Arcadian shepherds. Within ten years from its first establishment, the number of *Academists* amounted to six hundred. They hold assem- Academies.
blies seven times a-year in a mead or grove, or in the gardens of some nobleman of distinction. Six of these meetings are employed in the recitation of poems and verses of the Arcadi residing at Rome; who read their own compositions; except ladies and cardinals, who are allowed to employ others. The seventh meeting is set apart for the compositions of foreign or absent members.

This academy is governed by a custos, who represents the whole society, and is chosen every four years, with a power of electing 12 others yearly for his assistance. Under these are two sub-custodes, one vicar or pro-custos, and four deputies or superintendants, annually chosen. The laws of the society are immutable, and bear a near resemblance to the ancient model.

There are five modes of electing members. The first is by *acclamation.* This is used when sovereign princes, cardinals, and ambassadors of kings, desire to be admitted; and the votes are then given *viva voce:* The second is called *annumeration.* This was introduced in favour of ladies and academical colonies, where the votes are taken privately. The third, *representation*, was established in favour of colonies and universities, where the young gentry are bred; who have each a privilege of recommending one or two members privately to be ballotted for. The fourth, *surrogation;* whereby new members are substituted in the room of those dead or expelled. The last, *destination;* whereby, when there is no vacancy of members, persons of poetical merit have the title of Arcadi conferred upon them till such time as a vacancy shall happen. All the members of this body, at their admission, assume new pastoral names, in imitation of the shepherds of Arcadia. The academy has several colonies of Arcadi in different cities of Italy, who are all regulated after the same manner.

XI. *Academies of* Languages; called, by some, *Grammatical Academies:* as,

The Academy della Crusca at Florence, famous for its vocabulary of the Italian tongue, was formed in 1582, but scarce heard of before the year 1584, when it became noted for a dispute between Tasso and several of its members. Many authors confound this with the Florentine academy. The discourses which Torricelli, the celebrated disciple of Galileo, delivered in the assemblies, concerning levity, the wind, the power of percussion, mathematics, and military architecture, are a proof that these academies applied themselves to things as well as words.

The Academy of Fructiferi had its rise in 1617 at an assembly of several princes and nobility of the country, who met with a design to refine and perfect the German tongue. It flourished long under the direction of princes of the empire, who were always chosen presidents. In 1668, the number of members arose to upwards of 900. It was prior in time to the French academy, which only appeared in 1629, and was not established into an academy before the year 1635. Its history is written in the German tongue by George Neumarck.

The French Academy, which had its rise from a meeting of men of letters in the house of M. Conrart, in 1629. In 1635, it was erected into an academy, by Cardinal Richlieu,

Academies. Richlieu, for refining and aſcertaining the French language and ſtyle.—The number of its members was limited to 40; out of whom a director, chancellor, and ſecretary, were to be choſen: the two former held their poſts for two months, the latter was perpetual. The members of this academy enjoyed ſeveral privileges and immunities, among which was that of not being obliged to anſwer before any court but that of the king's houſehold. They met three times a-week in the Louvre; at breaking up, 40 ſilver medals were diſtributed among them, having on one ſide the king of France's head, and on the reverſe, *Protecteur de l'Academie*, with laurel, and this motto, *A l'Immortalité*. By this diſtribution, the attendance of the *Academiſts* was ſecured: thoſe who were preſent received the ſurplus otherwiſe intended for the abſent. To elect or expel a member, at leaſt 18 were required; nor could any be choſen unleſs he petitioned for it: by this expedient, the affront of refuſals from perſons elected was avoided. Religious were not admitted; nor could any nobleman, or perſon of diſtinction, be admitted on another footing than as a man of letters. None were to be expelled, except for baſe and diſhoneſt practices; and there were but two inſtances of ſuch expulſions, the firſt of M. Granier for refuſing to return a depoſite, the other of the Abbè Furetiere for plagiariſm. The deſign of this academy was to give not only rules, but examples, of good writing. They began with making ſpeeches on ſubjects taken at pleaſure, about 20 of which were printed. They met with great oppoſition from the parliament at their firſt inſtitution; it being two years before the patents granted by the king could be regiſtered. They have been ſeverely ſatirized, and their ſtyle has been ridiculed as enervating inſtead of refining the French language. They are alſo charged with having ſurfeited the world by flattery, and having exhauſted all the topics of panegyric in praiſe of their founder; it being a duty incumbent on every member, at his admiſſion, to make a ſpeech in praiſe of the king, the cardinal, the chancellor Seguier, and the perſon in whoſe place he is elected. The moſt remarkable work of this academy is a dictionary of the French tongue; which, after 50 years ſpent in ſettling the words and phraſes to be uſed in writing, was at laſt publiſhed in 1694.

The foundation of an *Academy* ſimilar to the above has been propoſed at Peterſburg by the learned Princeſs Daſhkof: it is to conſiſt of 60 members. The plan was approved by the late empreſs, who gave a fund for its ſupport and eſtabliſhment.

The Royal Spaniſh Academy at Madrid held its firſt meeting in July 1713, in the palace of its founder, the Duke d'Eſcalona. It conſiſted at firſt of eight academiſts, including the duke; to which number 14 others were afterwards added, the founder being choſen preſident or director. In 1714, the king granted them his confirmation and protection. Their device is a crucible in the middle of the fire, with this motto, *Limpia, Fya, y da Eſplendor;* "It purifies, fixes, and gives brightneſs." The number of members is limited to 24; the Duke d'Eſcalona to be director for life, but his ſucceſſors choſen yearly, and the ſecretary to be perpetual. Their object, as marked out by the royal declaration, was to cultivate and improve the national language: they were to begin with chooſing carefully ſuch words and phraſes as have been uſed by the beſt Spaniſh writers; noting the low, barbarous, or obſolete ones; and compoſing a dictionary wherein theſe may be diſtinguiſhed from the former. Academy || Acalzike.

XII *Academies of Politics;* as that at Paris, which conſiſted of ſix perſons, who met at the Louvre, in the chamber where the papers relating to foreign affairs were lodged. But this academy proved of little ſervice, as the kings of France were unwilling to truſt any but their miniſters with the inſpection of foreign affairs.

For a further account of ſimilar eſtabliſhments, ſee the article SOCIETY.

ACADEMY is alſo a term for ſchools and other ſeminaries of learning among the Jews, where their rabbins and doctors inſtructed their youth in the Hebrew language, and explained to them the Talmud and the ſecrets of the Cabbala: Thoſe of Tiberias and Babylon have been the moſt noted.

The Romans had a kind of military academies, eſtabliſhed in all the cities of Italy, under the name of *Campi Martis*. Here the youth were admitted to be trained for war at the public expence. The Greeks, beſide academies of this kind, had military profeſſors called *Tactici*, who taught all the higher offices of war, &c. &c.

ACADEMY is often uſed with us to denote a kind of collegiate ſeminary, where youth are inſtructed in arts and ſciences. There is one at Portſmouth for teaching navigation, drawing, &c. which was founded by George I. in 1722; another at Woolwich, for fortification, gunnery, &c.; eſtabliſhed by George II. in 1741.—Beſides theſe, there are numerous academies, eſpecially in London, for teaching mathematics, languages, writing, accounts, drawing, and other branches of learning.

The nonconformiſt miniſters, &c. are bred up in private academies; as not approving the common univerſity education. There are ſeveral academies of this deſcription in different parts of England.

ACADEMY is likewiſe a name given to a riding-ſchool, where young gentlemen are taught to ride the great horſe, &c. and the ground allotted is uſually called the *Manege*.

ACADEMY Figure, a drawing of a naked man or woman, taken from the life; which is uſually done on paper with red or black chalk, and ſometimes with paſtils or CRAYONS.

ACADIE, or ACADY, in *Geography*, a name formerly given to Nova Scotia, or New Scotland, in America. See *NOVA-Scotia*.

ACÆNA, in *Antiquity*, a Grecian meaſure of length, being a ten-feet rod, uſed in meaſuring their lands.

ACENÆ, in *Botany*. See BOTANY *Index*.

ACAJOU, or CASHEW-NUT TREE. See ANACARDIUM, BOTANY *Index*.

ACALANDRUS, a river falling into the bay of Tarentum, not far from the Metapontum (Pliny, Strabo); now called *Fiume de Roſeto*.

ACALEPTIC, in ancient proſody, a complete verſe.

ACALYPHA, the THREE-SEEDED MERCURY. See BOTANY *Index*.

ACALZIKE, a town and fortreſs of Aſiatic Tartary, ſituated in N. Lat. 41. 30. E. Long. 44. 14.

ACAMANTIS,

Acamantis || Acapulco.

ACAMANTIS, the ancient name of the iſland of Cyprus, taken from one of its promontories ſituated to the weſt, and called *Acamas*. Teos in Ionia was alſo called thus from Acamas the founder.

ACAMAS, Acamantis, in *Ancient Geography*, the weſt promontory of the iſland of Cyprus, from whence it took its ancient name; now Cape *Piſano*, or *Epiſanio*, where formerly was a town of the ſame name, now a village called *Cruſocco*.

Acamas, ſon of Theſeus, followed the reſt of the Grecian princes to the ſiege of Troy; and was deputed, with Diomedes, to the Trojans, in order to get Helen reſtored. Laodice, Priam's daughter, fell in love with him, ſtole a night with him, and had a ſon by him called *Munitus*. He was one of the heroes who concealed themſelves in the wooden horſe. One of the tribes of Athens was called *Acamantides* from him, by the appointment of the oracle; and he founded a city in Phrygia Major, called *Acamantium*. Homer mentions two other heroes of this name; one a Thracian prince who came to ſuccour Priam, another a ſon of Antenor.

ACANGIS, that is, *Ravagers* or *Adventurers*; a name which the Turks give their huſſars or light troops, who are generally ſent out in detachments to procure intelligence, haraſs the enemy, or ravage the country.

ACANTHA, in *Botany*, the prickle of any plant; in *Zoology*, a term for the ſpine or prickly fins of fiſhes.

ACANTHABOLUS, in *Surgery*, an inſtrument for pulling thorns, or the like, out of the ſkin.

ACANTHINE, any thing reſembling or belonging to the herb acanthus. Acanthine garments, among the ancients, are ſaid to be made of the down of thiſtles; others think they were garments embroidered in imitation of the acanthus.

ACANTHOPTERYGIOUS fishes, a term uſed by Linnæus and others for thoſe fiſhes whoſe back fins are hard, oſſeous, and prickly.

ACANTHOS, Acanthus, a town of Egypt, near Memphis, (Pliny); now *Biſalta*. Alſo a maritime town of Macedonia, to the weſt of Mount Athos; a colony of Andrians (Thucydides, Ptolemy); now *Eriſſo*; near which was ſhown Xerxes's ditch, of ſeven ſtadia, in order to ſeparate Mount Athos from the continent, and convey his ſhips, without doubling Athos, into the Singitic bay. *Acanthos* is alſo a town of Epirus.

ACANTHUS, bear's breech, in *Botany*. See Botany *Index*.

Acanthus, in *Architecture*, an ornament repreſenting the leaves of the acanthus, uſed in the capitals of the Corinthian and Compoſite orders.

ACAPALA, or Acapula, a town in the province of Chiapa, in New Spain, which is ſituated on Tabaſco river, about five leagues north-weſt from Chiapa.

ACAPAM, a town of Aſia on the Euxine ſea.

ACAPULCO, a conſiderable town and port in Mexico, on a bay of the South ſea, diſtant from the city of Mexico ſouth-eaſt 210 miles. It has a fine harbour, from whence a ſhip annually ſails to Manilla in the Philippine iſlands, near the coaſt of China in Aſia; and another returns annually from thence with all the treaſures of the Eaſt Indies, ſuch as diamonds, rubies, ſapphires, and other precious ſtones; the rich carpets of Perſia; the camphire of Borneo; the benjamin and ivory of Pegu and Cambodia; the ſilks, muſlins, and calicoes, of the Mogul's country; the gold duſt, tea, china ware, ſilk, and cabinets, of China and Japan; beſides cinnamon, cloves, mace, nutmegs, and pepper; inſomuch that this ſingle ſhip contains more riches than many whole fleets. The goods brought to Acapulco are carried to the city of Mexico by mules and pack horſes; and from thence to Vera Cruz on the North ſea, in order to be ſhipped for Europe. Acapulco itſelf is a ſmall place, conſiſting of about 200 or 300 thatched houſes. Ships arrive at the port by two inlets, ſeparated from each other by a ſmall iſland; the entrance into them in the day time is by means of a ſea breeze, as the ſailing out in the night time is effected by a land breeze. A wretched fort, 42 pieces of cannon, and a garriſon of 60 men, defend it. It is equally extenſive, ſafe, and commodious. The baſon which conſtitutes this harbour is ſurrounded by lofty mountains, which are ſo dry, that they are even deſtitute of water. The air here is hot, heavy, and unwholeſome; to which none can habituate themſelves, except certain negroes that are born under a ſimilar climate, or ſome mulattoes. This feeble and miſerable colony is crowded with a vaſt acceſſion to its numbers upon the arrival of the galleons; traders flocking here from all the provinces of Mexico, who come to exchange European toys, their own cochineal, and about ten millions of ſilver (437,500l. Sterling) for ſpices, muſlins, printed linens, ſilk, perfumes, and the gold works of Aſia. W. Long. 102. 20. N. Lat. 17. 22.

Acarai || Acaſtus.

ACARAI, a town of Paraguay in South America, built by the Jeſuits in 1624. W. Long. 51. 5. S. Lat. 26.

ACARAUNA, a ſmall American fiſh, called by our ſailors *the old wife*. See Labrus, Ichthyology *Index*.

ACARI, Port, in *Geography*, lies on the coaſt of Peru, in S. Lat. 15. 50. W. Long. 54. 40.

ACARNANIA, the firſt country of Free Greece, or Greece Proper, bounded on the weſt by the Sinus Ambracius, and ſeparated from Ætolia by the river Achelous on the eaſt, and by the Sinus Ambracius from Epirus. The people were called *Acarnanes*, denoting perſons unſhorn; other Etolians, to the eaſt of the Achelous, being called *Curetes* (Homer) from being ſhorn. According to Lucian, they were noted for effeminacy and incontinence; hence the proverb *Porcellus Acarnanius*. This country was famous for an excellent breed of horſes; ſo that Ακαρνικος ιππος, is a proverbial ſaying for a thing excellent in its kind. It is now called *il Carnia* and *il Deſpotato*.

ACARON, or Accaron, a town of Paleſtine, called *Ekron* in Scripture. It was the boundary of the Philiſtines to the north; ſtood at ſome diſtance from the ſea, near Bethſhemeſh; and was famous for the idol of Baalzebub.

ACARUS, the Tick or Mite. See Entomology *Index*.

ACASTUS, in *Claſſic Hiſtory*, the ſon of Pelias, king of Theſſaly, and one of the moſt famous hunters of his time, married Hippolita, who falling deſperately

in

Acatalectic in love with Peleus her ſon-in-law, and he refuſing to gratify her wiſhes, ſhe accuſed him to her huſband of a rape: on which he ſlew them both.

Accedas.

ACATALECTIC, a term in ancient poetry for ſuch verſes as have all their feet or ſyllables, in contradiſtinction to thoſe that have a ſyllable too few. The firſt verſe of the two following from Horace is *acatalectic* or complete, the laſt is *catalectic* or deficient.

Solvitur acris hyems, grata vice veris et Favoni:
Trahuntque ſiccas machinæ carinas——

ACATALEPSY, ſignifies the impoſſibility of comprehending ſomething. The diſtinguiſhing tenet of the Pyrrhoniſts was their aſſerting an abſolute acatalepſy in regard to every thing.

ACATERY, or ACCATRY, anciently an officer of the king's houſehold, deſigned for a check betwixt the clerks of the kitchen and the purveyors.

ACATHARSIA, in *Medicine*, an impurity of the blood or humours.

ACATHISTUS, the name of a ſolemn hymn or vigil, anciently ſung in the Greek church on the Saturday of the fifth week of Lent, in honour of the Virgin, for having thrice delivered Conſtantinople from the invaſions of the barbarous nations. It was denominated ἀκαθίστος, i. e. *without ſitting*, becauſe, in the celebration of the praiſes of the virgin, the people ſtood all night ſinging.

ACATIUM, in *Ancient Navigation*, a kind of boat or pinnace uſed for military purpoſes. The *acatium* was a ſpecies of thoſe veſſels called *naves actuariæ*, i. e. ſuch as were wrought with oars. It was ſometimes made uſe of in battle. Strabo deſcribes it as a privateer or pirate ſloop, and Suidas, as a fiſhing veſſel.

ACAULIS, in *Botany*, a term applied to certain plants, the flowers of which have no pedicle or ſtalk to ſupport them, but reſt immediately on the ground, ſuch as the carline thiſtle, &c.

ACCA, SAINT, biſhop of Hagunſtaldt, or Hexham, in Northumberland, ſucceeded Wilfrid in that ſee in 709. He ornamented his cathedral in a moſt magnificent manner; furniſhed it with plate and holy veſtments; and erected a noble library, conſiſting chiefly of eccleſiaſtical learning, and a large collection of the lives of the ſaints, which he was at great pains to procure. He was accounted a very able divine, and was famous for his ſkill in church muſic. He wrote ſeveral books: particularly, *Paſſiones Sanctorum*, The Sufferings of the Saints: *Pro illuſtrandis Scripturis, ad Bedam*, For explaining the Scriptures, addreſſed to Bede. He died in 740, having enjoyed the ſee of Hexham 31 years, under Egbert king of the Northumbrians.

ACCALIA, in Roman antiquity, ſolemn feſtivals held in honour of Acca Laurentia, Romulus's nurſe: they were otherwiſe called LAURENTALIA.

ACCAPITARE, in *Law*, the act of becoming vaſſal of a lord, or of yielding him homage and obedience. Hence,

ACCAPITUM ſignifies the money paid by a vaſſal upon his admiſſion to a feu.

ACCAPITUM, in our *Ancient Law*, was uſed alſo to expreſs the relief due to the chief lord. See RELIEF.

ACCEDAS AD CURIAM, in *Engliſh Law*, a writ lying where a man has received, or fears, falſe judgement in an inferior court. It lies alſo for juſtice delayed, and is a ſpecies of the writ RECORDARE.

Acceleration.

ACCELERATION, in *Mechanics*, the increaſe of velocity in a moving body. Accelerated motion is that which continually receives freſh acceſſions of velocity. Acceleration ſtands directly oppoſed to *retardation*, which denotes a diminution of velocity.

ACCELERATION is chiefly uſed, in *Phyſics*, in reſpect of falling bodies, i. e. of heavy bodies tending towards the centre of the earth by the force of gravity. That natural bodies are accelerated in their deſcent, is evident from various conſiderations, both *à priori* and *poſteriori*.—Thus, we actually find, that the greater height a body falls from, the greater impreſſion it makes, and the more vehemently does it ſtrike the ſubject plane, or other obſtacle.

Various were the ſyſtems and opinions which philoſophers produced to account for this acceleration. But the immediate cauſe of acceleration is now ſufficiently obvious; the principle of gravitation, which determines the body to deſcend, determining it to be accelerated by a neceſſary conſequence.

Suppoſe a body let fall from on high: the primary cauſe of its beginning to deſcend is doubtleſs the power of gravity; but when once the deſcent is commenced, that ſtate becomes in ſome meaſure natural to the body; ſo that if left to itſelf, it would perſevere in it for ever, even though the firſt cauſe ſhould ceaſe: as we ſee in a ſtone caſt with the hand, which continues to move after it is left by the cauſe that gave it motion. But, beſide the propenſity to deſcend impreſſed by the firſt cauſe, and which of itſelf were ſufficient to continue the ſame degree of motion, once begun, *in infinitum*; there is a conſtant acceſſion of ſubſequent efforts of the ſame principle, gravity, which continues to act on the body already in motion, in the ſame manner as if it were at reſt. Here, then, being a double cauſe of motion; and both acting in the ſame direction, viz. directly towards the centre of the earth; the motion they jointly produce muſt neceſſarily be greater than that of any one of them.—And the velocity thus increaſed having the ſame cauſe of increaſe ſtill perſiſting, the deſcent muſt neceſſarily be continually accelerated.

The motion of a body aſcending, or impelled upwards, is diminiſhed or retarded from the ſame principle of gravity acting in a contrary direction, in the ſame manner as a falling body is accelerated: See RETARDATION. A body thus projected upwards, riſes till it has loſt all its motion: which it does in the ſame time that a body falling would have acquired a velocity equal to that wherewith the body was thrown up. Hence the ſame body thrown up, will riſe to the ſame height from which falling it would have acquired the velocity wherewith it was thrown up: and hence the heights which bodies thrown up with different velocities do aſcend to, are to one another as the ſquares of theſe velocities.

ACCELERATION of Bodies on inclined Planes. The ſame general law obtains here as in bodies falling perpendicularly: the effect of the plane is to make the motion ſlower; but the inclination being everywhere equal, the retardation ariſing therefrom will proceed equally in all parts, at the beginning and the ending of the motion. See MECHANICS.

Acceleration.

Acceleration of the Motion of Pendulums—The motion of pendulous bodies is accelerated in their deſcent; but in a leſs ratio than that of bodies falling perpendicularly. See MECHANICS and PENDULUM.

Acceleration of the Motion of Projectiles. See PROJECTILES.

ACCELERATION is alſo applied in the ancient aſtronomy, in reſpect of the fixed ſtars. This acceleration was the difference between the revolution of the *primum mobile* and the ſolar revolution; which was computed at 3 minutes and 56 ſeconds.

Acceleration of the Moon, a term uſed to expreſs the increaſe of the moon's mean motion from the ſun, compared with the diurnal motion of the earth; ſo that it is now a little ſwifter than it was formerly. Dr Halley was the firſt who made this diſcovery; and he was led to it by comparing the ancient eclipſes obſerved at Babylon with thoſe obſerved by Albatennius in the ninth century, and ſome of his own time. He was not able to aſcertain the quantity of this acceleration, becauſe the longitudes of Bagdad, Alexandria, and Aleppo, where the obſervations were made, had not been accurately determined. But ſince his time, the longitude of Alexandria has been aſcertained by Chazelles; and Babylon, according to Ptolemy's account, lies 30′ eaſt from Alexandria. From theſe *data*, Mr Dunthorn compared ſeveral ancient and modern eclipſes, with the calculations of them, by his own tables, and hereby verified Dr Halley's opinion; for he found that the ſame tables repreſent the moon's place more backward than her true place in ancient eclipſes, and more forward than her true place in later eclipſes; and thence juſtly inferred, that her motion in ancient times was ſlower, in later times quicker, than the tables give it. But he did not content himſelf with merely aſcertaining the fact; he proceeded to determine the quantity of the acceleration; and by means of the moſt ancient eclipſe of which any authentic account remains, obſerved at Babylon in the year before Chriſt 721, he concluded, that the obſerved beginning of this eclipſe was not above an hour and three quarters before the beginning by the tables; and therefore the moon's true place could precede her place by computation but little more than 50′ of a degree at that time. Admitting the acceleration to be uniform, and the aggregate of it as the ſquare of the time, it will be at the rate of about 10′ in 100 years.

Dr Long attributes the acceleration above deſcribed to one or more of theſe cauſes: either, 1. The annual and diurnal motion of the earth continuing the ſame, the moon is really carried round the earth with a greater velocity than heretofore: or, 2. The diurnal motion of the earth, and the periodical revolution of the moon, continuing the ſame, the annual motion of the earth round the ſun is a little retarded; which makes the ſun's apparent motion in the ecliptic a little ſlower than formerly; and, conſequently, the moon in paſſing from any conjunction with the ſun, ſpends leſs time before ſhe again overtakes the ſun, and forms a ſubſequent conjunction: in both theſe caſes, the motion of the moon from the ſun is really accelerated, and the ſynodical month actually ſhortened. Or, 3. The annual motion of the earth, and the periodical revolution of the moon continuing the ſame, the rotation of the earth round its axis is a little retarded: in this caſe, days, hours, minutes, ſeconds, &c. by which all periods of time muſt be meaſured, are of a longer duration; and conſequently the ſynodical month will appear to be ſhortened, though it really contains the ſame quantity of abſolute time as it always did. If the quantity of matter in the body of the ſun be leſſened by the particles of light continually ſtreaming from it, the motion of the earth round the ſun may become ſlower: if the earth increaſes in bulk, the motion of the moon round the earth may be quickened thereby. See ASTRONOMY.

Acceleration of Accenſi.

Acceleration of a Planet. A planet is ſaid to be accelerated in its motion when the real diurnal motion exceeds the mean diurnal motion. On the other hand, a planet is ſaid to be retarded in its motion when the mean motion exceeds the real diurnal motion. This inequality ariſes from the change in the diſtance of the planet from the ſun, which is continually varying; the planet moving always quicker in its orbit when nearer the ſun, and ſlower when farther off.

ACCELERATOR, in *Anatomy*, the name of two muſcles of the penis, which ſerve for ejecting the urine or ſemen. See ANATOMY, *Table of the Muſcles.*

ACCENDENTES, a lower order of miniſters in the Romiſh church, whoſe office is to light and trim the candles.

ACCENDONES, in Roman antiquity, a kind of gladiators, whoſe office was to excite and animate the combatants during the engagement. The orthography of the word is conteſted: the firſt edition of Tertullian, by Rhenanus, has it *accedones;* an ancient manuſcript, *accendones.* Aquinas adheres to the former, Pitiſcus to the latter. The origin of the word, ſuppoſing it *accendones*, is from *accendo*, I kindle; ſuppoſing it *accedones*, from *accedo*, I accede, am added to. The former places their diſtinguiſhing character in enlivening the combat by their exhortations and ſuggeſtions: the latter ſuppoſes them to be much the ſame with what among us are called *ſeconds*, among the Italians *patroni;* excepting that theſe latter only ſtand by to ſee the laws of the ſword duly obſerved, without intermeddling to give advice or inſtruction.

ACCENSI, in the Roman armies, certain ſupernumerary ſoldiers, deſigned to ſupply the places of thoſe who ſhould be killed or anywiſe diſabled. They were thus denominated, *quia accenſebantur*, or *ad cenſum adjiciebantur.* Vegetius calls them *ſupernumerarii legionum.* Cato calls them *ferentarii*, in regard they furniſhed thoſe engaged in battle with weapons, drink, &c. Though Nonnius ſuggeſts another reaſon of that appellation, viz. becauſe they fought with ſtones, ſlings, and weapons *quæ feruntur*, ſuch as are thrown, not carried in the hand. They were ſometimes alſo called *velites*, and *velati*, becauſe they fought clothed, but not in armour; ſometimes *adſcriptitii*, and *adſcriptivi;* ſometimes *rorarii.* The *accenſi*, Livy obſerves, were placed at the rear of the army, becauſe no great matter was expected from them; they were taken out of the fifth claſs of citizens.

ACCENSI, in antiquity, denotes an inferior order of officers, appointed to attend the Roman magiſtrates, ſomewhat in the manner of uſhers, ſerjeants, or tipſtaves among us. They were thus called from *accire*, to ſend for; one part of their office being to call aſſemblies of

Accenſi || Accent.

of the people, ſummon parties to appear and anſwer before the judges, &c.

ACCENSI was alſo an appellation given to a kind of adjutants, appointed by the tribune to aſſiſt each centurion and decurion. In which ſenſe *accenſus* is ſynonymous with *optio*. In an ancient inſcription, given by Torre, we meet with ACCENSUS EQUITUM ROMANORUM; an office nowhere elſe heard of. That author ſuſpects it for a corruption; and inſtead thereof reads, A CENSIBUS.

ACCENSION, the action of ſetting a body on fire: thus the accenſion of tinder is effected by ſtriking fire with flint and ſteel.

ACCENT, in *reading* or *ſpeaking*, an inflection of the voice, which gives to each ſyllable of a word its due pitch in reſpect of height or lowneſs. See READING. The word is originally Latin, *accentus*; a compound of *ad*, to; and *cano*, to ſing. *Accentus, quaſi ad-cantus*, or *juxta cantum*. In this ſenſe, accent is ſynonymous with the Greek τονος; the Latin *tenor*, or *tonor*; and the Hebrew טעם, *guſtus*, taſte.—For the doctrine of *Accents* in *Compoſition*, ſee POETRY, Part III.

ACCENT, among *Grammarians*, is a certain mark or character placed over a ſyllable to direct the ſtreſs of its pronunciation. We generally reckon three grammatical accents in ordinary uſe, all borrowed from the Greeks, viz. the *acute accent*, ('), which ſhows when the tone of the voice is to be raiſed. The *grave accent* (`). when the note or tone of the voice is to be depreſſed. The *circumflex accent*, (^), is compoſed of both the acute and the grave, and points out a kind of undulation of the voice. The Latins have made the ſame uſe of theſe three accents.

The Hebrews have a grammatical, a rhetorical, and muſical accent: though the firſt and laſt ſeem, in effect, to be the ſame; both being compriſed under the general name of *tonic accents*, becauſe they give the proper tone to ſyllables; as the rhetorical accents are ſaid to be euphonic, becauſe they tend to make the pronunciation more ſweet and agreeable. There are four euphonic accents, and 25 tonic; of which ſome are placed above, and others below the ſyllables; the Hebrew accents ſerving not only to regulate the riſings and fallings of the voice, but alſo to diſtinguiſh the ſections, periods, and members of periods, in a diſcourſe; and to anſwer the ſame purpoſes with the points in other languages. Their accents are divided into *emperors*, *kings*, *dukes*, &c. each bearing a title anſwerable to the importance of the diſtinction it makes. Their emperor rules over a whole phraſe, and terminates the ſenſe completely; anſwering to our point. Their king anſwers to our colon; and their duke to our comma. The king, however, occaſionally becomes a duke, and the duke a king, as the phraſes are more or leſs ſhort. It muſt be noted, by the way, that the management and combination of theſe accents differ in Hebrew poetry from what they are in proſe. The uſe of the tonic or grammatical accents has been much controverted; ſome holding that they diſtinguiſh the ſenſe; while others maintain that they are only intended to regulate the muſic, or ſinging; alleging that the Jews ſing, rather than read, the Scriptures in their ſynagogues*. Be this, however, as it will, it is certain the ancient Hebrews were not acquainted with theſe accents. The opinion which prevails amongſt the learned is, that they were invented about the fifth century, by the Jewiſh doctors of the ſchool of Tiberias, called the *Maſſorets*. Accent.

As to the Greek accents, now ſeen both in manuſcripts and printed books, there has been no leſs diſpute about their antiquity and uſe than about thoſe of the Hebrews. Iſaac Voſſius endeavours to prove them of modern invention; aſſerting, that anciently they had nothing of this kind, but only a few notes in their poetry, which were invented by Ariſtophanes the grammarian, about the time of Ptolemy Philopater; and that theſe were of muſical, rather than grammatical uſe, ſerving as aids in the ſinging of their poems, and very different from thoſe introduced afterwards. He alſo ſhows from ſeveral ancient grammarians, that the manner of writing the Greek accents in theſe days was quite different from that which appears in our books. The author of *La Methode Greque*, p. 546, obſerves, that the right pronunciation of the Greek language being natural to the Greeks, it was needleſs for them to mark it by accents in their writings: ſo that, according to all appearance, they only began to make uſe of them about the time when the Romans, willing to learn the Greek tongue, ſent their children to ſtudy at Athens, thinking thereby to fix the pronunciation, and to facilitate it to ſtrangers; which happened, as the ſame author obſerves, a little before Cicero's time. Wetſtein, Greek profeſſor at Baſil, in a learned diſſertation, endeavours to prove the Greek accents of an older ſtanding. He owns that they were not always formed in the ſame manner by the ancients; but thinks that difference owing to the different pronunciation which obtained in the different parts of Greece. He brings ſeveral reaſons, *à priori*, for the uſe of accents, even in the earlieſt days: as that they then wrote all in capital letters equidiſtant from each other, without any diſtinction either of words or phraſes, which without accents could ſcarce be intelligible; and that accents were neceſſary to diſtinguiſh ambiguous words, and to point out their proper meaning: which he confirms from a diſpute on a paſſage in Homer, mentioned by Ariſtotle in his *Poëtics*, chap. v. Accordingly, he obſerves, that the Syrians, who have tonic, but no diſtinctive accents, have yet invented certain points, placed either below or above the words, to ſhow their mood, tenſe, perſon, or ſenſe.

Mr Browne of Trinity College, Dublin, has entered more deeply into this inveſtigation; and as he had an opportunity of converſing with the crew of a Greek ſhip from Patraſs, a town ſituated not far diſtant from the ancient Corinth, which had been driven by ſtreſs of weather into the port of Dingle in Ireland, the reſult of his inquiries was, that the practice of the modern Greeks is different from any of the theories that have been delivered in books. "It is true, he obſerves, they have not two pronunciations for proſe and for verſe, and in both they read by accent, but they make accent the cauſe of quantity; they make it govern and controul quantity; they make the ſyllable long on which the acute accent falls, and they allow the acute accent to change the real quality. They always read poetry as well as proſe by accent. Whether any inference can hence be drawn as to the pronunciation of the ancients, I muſt leave, after what I have premiſed above, to men of more learning, but I think it at leaſt ſo probable as to make it worth while to mention the inſtance:

* Cooper on Muſic. Claz. § 1.

Accent. inſtances which occurred in proof of this aſſertion more particularly. Of the two firſt perſons whom I met, one, the ſteward of the ſhip, an inhabitant of the iſland of Cephalonia, had had a ſchool education: he read Euripides, and tranſlated ſome eaſier paſſages without much difficulty. By a ſtay in this country of near two years, he was able to ſpeak Engliſh very tolerably, as could the captain and ſeveral of the crew; and almoſt all of them ſpoke Italian fluently. The companion however of the ſteward could ſpeak only modern Greek, in which I could diſcover that he was giving a deſcription of the diſtreſs in which the ſhip had been, and though not able to underſtand the context, I could plainly diſtinguiſh many words, ſuch as δενδρα—ξυλον, and amongſt the reſt the ſound of Ανθρωπος, pronounced ſhort; this awoke my curioſity, which was ſtill more heightened when I obſerved that he ſaid Ανθωπων long, with the ſame attention to the alteration of the accent with the variety of caſe, which a boy would be taught to pay at a ſchool in England. Watching therefore more cloſely, and aſking the other to read ſome ancient Greek, I found that they both uniformly pronounced according to accent, without any attention to long or ſhort ſyllables where accent came in the way; and on their departure, one of them having bade me good day, by ſaying Καωημερα, to which I anſwered Καλημεωα, he with ſtrong marks of reprobation ſet me right, and repeated Καλημερα; and with like cenſure did the captain upon another occaſion obſerve upon my ſaying Socrātes inſtead of Socrātes.

"I now had a ſtrong wiſh to know whether they obſerved the diſtinction in this reſpect uſually between verſe and proſe, but from the little ſcholarſhip of the two men with whom I had converſed, from the ignorance of a third whom I afterwards met, (who however read Lucian with eaſe, though he did not ſeem ever to have heard of the book), and on account of my imperfect mode of converſing with them all, I had little hopes of ſatisfaction on the point, nor was I clear that they perfectly knew the difference between and verſe proſe. At length having met with the commander of the ſhip, and his clerk Athanaſius Κονομος, and finding that the latter had been a ſchoolmaſter in the Morea, and had here learnt to ſpeak Engliſh fluently, I put the queſtion to them in the preſence of a very learned college friend, and at another time, to avoid any error, with the aid of a gentleman who is perfectly maſter of the Italian language. Both the Greeks repeatedly aſſured us that verſe as well as proſe was read by accent, and not by quantity, and exemplified it by reading ſeveral lines of Homer, with whoſe name they ſeemed perfectly well acquainted.

"I ſhall give an inſtance or two of their mode of reading:

Βῆ δ' ἀκέων παρὰ θῖνα πολυφλοίσβοιο θαλάσσης,
Τὸν δ' ἀπαμειβόμενος προσέφη πόδας ὠκὺς Ἀχιλλεύς,
Ἐς δ' ἑξῆς ἐπίηδες ἀγειρόμεν, ἐς δ' ἑκατόμβην.

They made the ε in ακέων, προσέφη, and εξῆς long.

But when they read.

Κλῦθί μεν, Ἀργυρότοξ', ὃς Χρύσην ἀμφιβέβηκας,

they made the ſecond ſyllable of the firſt word Κλυθι ſhort, notwithſtanding the acute accent: on my aſking why, they deſired me to look back on the circumflex on the firſt ſyllable, and ſaid it thence neceſſarily followed; for it is impoſſible to pronounce the firſt ſyllable with the great length which the circumflex denotes and not to ſhorten the ſecond. The teſtimony of the ſchoolmaſter might be vitiated, but what could be ſtronger, than that of theſe ignorant mariners as to the vulgar common practice of modern Greece; and it is remarkable that this confirms the opinion of Biſhop Horſley, that the tones of words in connexion are not always the ſame with the tones of ſolitary words, though in thoſe of more than one ſyllable the accentual marks do not change their poſition. I muſt here add that theſe men confirmed an obſervation which I have heard made, that we are much miſtaken in our idea of the ſuppoſed lofty ſound of πολυφλοισβοιο θαλασσης; that the borderers on the coaſt of the Archipelago take their ideas from the gentle laving of the ſhore by a ſummer wave, and not from the roaring of a winter ocean, and they accordingly pronounced it *Polyphliſvoo thalaſſes*.

"I own that the obſervations made by me on the pronunciation of theſe modern Greeks brought a perfectly new train of ideas into my mind. I propoſe them, with humility, for the conſideration of the learned; but they have made a ſtrong impreſſion upon me, and approached, when compared with other admitted facts, nearly to conviction. In ſhort, I am ſtrongly inclined to believe, that what the famous treatiſe ſo often mentioned on the proſodies of the Greek and Latin languages mentions as the peculiarity of the Engliſh, that we always prolong the ſound of the ſyllable on which the acute accent falls, is true, and has been true of every nation upon earth. We know it is true of the modern Italians—they read Latin in that reſpect juſt as we do, and ſay, *Arma virūmqŭe cānŏ*, and, *In nōvă fert animus*, as much as we. And when we find the modern Greeks following the ſame practice, ſurely we have ſome cauſe to ſuppoſe that the ancients did the ſame. In the Engliſh language, indeed, quantity is not affected, becauſe accent and quantity always agree. Biſhop Horſley endeavoured to prove that they did ſo in Greek, but this is on the bold ſuppoſition that the accent doth not fall where the mark is placed. The objection to this hypotheſis, which ſeems to have been admitted by all writers, and conſidered as deciſive by ſome as to proſe, by all as to verſe, is that ſuch a mode of pronunciation or reading muſt deſtroy metre, or *rhythmos*. From this poſition, however, univerſal, or however it may have been taken for granted, I totally diſſent. That it will oppoſe the metre or quantity I readily agree, but that it will deſtroy the rhythmos, by which, whatever learned deſcriptions there may have been of its meaning, I underſtand nothing more than the melody or ſmooth flowing of the verſes, or their harmony if you pleaſe, if harmony be properly applied to ſucceſſive and not ſynchronal ſounds. On the contrary, nothing can be more diſagreeable or unmelodious than the reading verſe by quantity, or ſcanning of it, as it is vulgarly called. Let us try the line ſo often quoted—

Armă vĭrūmqŭe cănō, Trōjæ qui prīmŭs ăb ōris.

inſtead of

Armă vĭrūmqŭe cānŏ, Trōjæ qŭi prīmŭs ăb ōris.

"No

Accent. " No man ever defined rhythmos better than Plato, *ordinem quendam qui in motibus cernitur*; the motion or meaſure of the verſe may be exact, and yet the order, arrangement, and diſpoſition of the letters and ſyllables, ſuch as to be grating and unmelodious to the ear. In like manner the feet of the verſe may be exact, but the ſtreſs laid upon particular ſyllables of it which follows the quantity may totally deſtroy the melody: in ſhort, the radical error ſeems to be the confuſion of quantity with melody, and the ſuppoſition that whatever is at war with quantity and metre muſt be at war with melody.

" It will be aſked then what is the uſe of metre or meaſure in verſe, if we are not to read by it; and here is the grand difficulty, and I own with candour I cannot anſwer it with perfect ſatisfaction to my own mind: to thoſe indeed who ſay we are to read by accent in proſe, it may be equally aſked what is the uſe of long or ſhort ſyllables in proſe, if we are not to attend to them when accent comes in the way: but to thoſe who think otherwiſe, I can only anſwer, that in the firſt place accent doth not always interfere, and then quantity is our guide, and accent often accords with quantity. Secondly, Metre determines the number of feet or meaſures in each verſe, and thereby produces a general analogy and harmony through the whole; and it is to be obſerved, that, as I apprehend, accent doth not change the number of feet, though it doth the nature or ſpecies of them. Thus when we read

Arma virumque cāno, Trōjæ qui primus ab oris,

we do not make more feet than when we ſcan the line, nor employ more time than in pronouncing the next line in which the accent happens to accord with the quantity, viz.

Italiam fato profugus, Lavinaque venit.

Thirdly, The poet in meaſuring his verſe certainly muſt be confined to ſome certain number and order of long and ſhort ſyllables, in order to produce a concordance through the whole, and even to regulate the poſition of accent, which though not ſubdued by quantity will certainly have ſome relation to it, *euphoniæ gratia*; but ſurely the length or ſhortneſs of a ſyllable cannot determine where emphaſis ſhall be placed—that muſt depend on the meaning and the thought; and it would be moſt abſurd for the poet to ſay to the reader, you ſhall not reſt upon this emphatic and ſignificative word becauſe its ſyllables are ſhort, and wherever there is a reſt, there muſt be length and intonation." (*Iriſh Tranſ.* vol. vii.)

The uſe of accents, to prevent ambiguities, is moſt remarkably perceived in ſome eaſtern languages, particularly the Siameſe and Chineſe. Among the people of China, every word, or (which is the ſame thing) ſyllable, admits of five accents, as ſpoken more acutely or remiſsly; and thus ſtands for many different things. The ſame ſound *ya*, according to the accent affixed to it, ſignifies *God*, *a wall*, *excellent*, *ſtupidity*, and a *gooſe*. The Chineſe have but 330 ſpoken words in their language; but theſe being multiplied by the different accents or tones, which affect the vowel, furniſh a language tolerably copious. By means hereof, their 330 ſimple ſounds come to denote 1650 things; but this being hardly ſufficient, they are increaſed further by aſpirates added to each word to double the number. The Chineſe only reckon four *accents*: for which the miſſionaries uſe the following marks, *aá*, *á*, *à*, *ā*; to which they have added a fifth, thus *ă*. They make a kind of modulation; wherein, prolonging the duration of the ſound of the vowel, they vary the tone, raiſing and ſinking it by a certain pitch of voice: ſo that their talking is a ſort of muſic or ſinging. Attempts have been made to determine the quantity of the riſe or fall in each accent by means of muſical notes; but this is hard to effect, as being different in different perſons. Hence the great difficulty of the language to foreigners, they are forced to ſing moſt ſcrupulouſly: if they deviate ever ſo little from the accent, they ſay quite a different thing from what was intended. Thus, meaning to compliment the perſon you are talking to with the title *Sir*, you call him a beaſt with the ſame word, only a little varied in the tone. Magalhon makes the language the eaſier to learn on this account. The Siameſe are alſo obſerved to ſing rather than talk. Their alphabet begins with ſix characters, all only equivalent to a K, but differently accented. For though in the pronunciation the accents are naturally on the vowels, yet they have ſome to diverſify ſuch of their conſonants as are in other reſpects the ſame.

Accent, in *Muſic*, is a certain enforcement of particular ſounds, whether by the voice or inſtruments, generally uſed at the beginning of bars.

ACCEPTANCE, in *Law*, a perſon's agreeing to offers made in bargaining, by which the bargain is concluded.

Acceptance, in the church of Rome, is put for receiving the pope's conſtitutions.

Acceptance, in *Commerce*, is the ſubſcribing, ſigning, and making one's ſelf debtor for the ſum contained in a bill of exchange or other obligation.

ACCEPTATION, in *Grammar*, the ſenſe or meaning in which any word is taken.

ACCEPTER, or Acceptor, the perſon who accepts a BILL of exchange, &c.

ACCEPTILATION, among civilians, an acquittance or diſcharge given by the creditor to the debtor without the payment of any value.

ACCESSIBLE, ſomething that may be approached, or that acceſs may be had to. Thus we ſay, Such a place is acceſſible on one ſide, &c.

ACCESSION, in *Law*, is a method of acquiring property, by which, in things that have a cloſe connection or dependence upon one another, the property of the principal thing draws after it the property of the acceſſory: Thus, the owner of a cow becomes likewiſe the owner of the calf. It ſometimes likewiſe ſignifies conſent or acquieſcence.

Accession, among phyſicians, is uſed for a paroxyſm of a diſeaſe; among politicians, is ſignifies a prince's ſucceeding to the government upon the death of his predeceſſor.

ACCESSORY, or Accessary, ſomething that accedes, or is added to another more conſiderable thing; in which ſenſe the word ſtands oppoſed to PRINCIPAL.

Accessory, or *Acceſſary*, in *Common Law*, is chiefly uſed for a perſon guilty of a felonious offence, not principally, but by participation: as by advice, command, or concealment.

There are two kinds of *acceſſories: before* the fact,

Acceſſory and Acciaioli.

and *after* it. The *firſt* is he who commands, or procures another to commit felony, and is not preſent himſelf; for if he be preſent, he is a principal. The *ſecond* is he who receives, aſſiſts, or comforts any man that has done murder or felony, whereof he has knowledge. A man may alſo be acceſſory to an acceſſory, by aiding, receiving, &c. an acceſſory in felony.

An acceſſory in felony ſhall have judgement of life and member, as well as the principal who did the felony; but not till the principal be firſt attainted, and convict, or outlawed thereon. Where the principal is pardoned without attainder, the acceſſory cannot be arraigned; it being a maxim in law, *Ubi non eſt principalis, non poteſt eſſe acceſſorius:* but if the principal be pardoned, or have his clergy after attainder, the acceſſory ſhall be arraigned; 4 and 5 W. et M. cap. 4. And by ſtat. 1 Anne, cap. 9. it is enacted, that where the principal is convicted of felony or ſtands mute, or challenges above 20 of the jury, it ſhall be lawful to proceed againſt the acceſſory in the ſame manner as if the principal had been attainted; and notwithſtanding ſuch principal ſhall be admitted to his clergy, pardoned, or delivered before attainder. In ſome caſes alſo, if the principal cannot be taken, then the acceſſory may be proſecuted for a miſdemeanour, and puniſhed by fine, impriſonment, &c. In the loweſt and higheſt offences there are no acceſſories, but all are principals: as in riots, routs, forcible entries, and other treſpaſſes, which are the loweſt offences. So alſo in the higheſt offence, which is, according to the Engliſh law, high treaſon, there are no acceſſories.

Acceſſories, in petty treaſon, murder, and in felonies of ſeveral kinds, are not to have their clergy. There can be no acceſſory before the fact in manſlaughter; becauſe that is ſudden and unprepenſed.

Accessory Nerves, in *Anatomy*, a pair of nerves, which, ariſing from the medulla in the vertebræ of the neck, aſcend, and enter the ſkull, and paſs out of it again with the par vagum, wrapped up in the ſame common integument, and after quitting them, are diſtributed into the muſcles of the neck and ſhoulders. See Anatomy.

Accessory, among painters, an epithet given to ſuch parts of a hiſtory-piece as ſerve chiefly for ornament, and might have been wholly left out: ſuch as vaſes, armour, &c.

ACCI, in *Ancient Geography*, a town of Tarraconenſis, formerly called *Aeti;* ſuppoſed to be *Guadix*, to the eaſt of the city of Granada in Spain, at the foot of a mountain, near the ſource of the rivulet Guadalantin; now greatly decayed. It is the Colonia Accitana Gemella, and was of ſome repute among the Roman colonies. The people were called Gemellenſes, becauſe the colony conſiſted of coloniſts from the third and ſixth legions.

ACCIAIOLI, Donato, a native of Florence, was born in 1428, and was famous for his learning and the honourable employments which he held. He wrote, a Latin tranſlation of ſome of Plutarch's Lives; Commentaries on Ariſtotle's Ethics and Politics; and the Lives of Hannibal, of Scipio, and of Charlemagne. He was ſent to France by the Florentines, to ſolicit aid from Louis XI. againſt Pope Sixtus IV. but on his journey died at Milan in 1478; his body was carried to Florence, and buried in the church of the Carthuſians at the public expence. The ſmall fortune he left his children is a proof of his probity and diſintereſtedneſs. His daughters, like thoſe of Ariſtides, were portioned by his fellow-citizens, as an acknowledgement of his ſervices. His funeral eulogium was ſpoken by Chriſtopher Landini; and an elegant epitaph, by Politian, was inſcribed on his tomb.

Accident || Accidental

ACCIDENT, in a general ſenſe, denotes any caſual event.

Accident, among *Logicians*, is uſed in a threefold ſenſe. 1. Whatever does not eſſentially belong to a thing; as the clothes a man wears, or the money in his pocket. 2. Such properties in any ſubject as are not eſſential to it; thus whiteneſs in paper is an accidental quality. 3. In oppoſition to ſubſtance, all qualities whatever are called accidents; as ſweetneſs, ſoftneſs, &c.

Accident, in *Grammar*, implies a property attached to a word, without entering into its eſſential definition; for every word, notwithſtanding its ſignification, will be either primitive, derivative, ſimple, or compound, which are the accidents of words. A word is ſaid to be primitive, when it is taken from no other word in the language in which it is uſed: thus *heaven*, *king*, *good*, are primitive words. It is ſaid to be derivative, when it is taken from ſome other word: thus *heavenly*, *kingdom*, *goodneſs*, &c. are derivatives. A ſimple word is eaſily diſtinguiſhed from a compound: thus *juſt*, *juſtice*, are ſimple words; *unjuſt*, *injuſtice*, are compound: *res* is a ſimple word, as well as *publica;* but *reſpublica* is a compound. Beſides theſe accidents which are common to all ſorts of words, each particular ſpecies has its accidents: thus the accidents of the noun ſubſtantive are the gender, declenſion, and number; and the adjective has another accident, namely, the compariſon. See the articles Grammar and Language.

Accident, in *Heraldry*, an additional point or mark in a coat of arms, which may be either omitted or retained without altering the eſſence of the armour; ſuch as abatement, difference, and tincture.

ACCIDENTAL, in a general ſenſe, implies ſomething that happens by accident, or that is not eſſential to its ſubject

Accidental, in *Philoſophy*, is applied to that effect which flows from ſome cauſe intervening by accident, without being ſubject, or at leaſt without any appearance of being ſubject, to general laws or regular returns. In this ſenſe, *accident* is oppoſed to *conſtant* and *principal*. Thus the ſun's place is, with reſpect to the earth, the conſtant and principal cauſe of the heat in ſummer, and the cold in winter; whereas winds, ſnows, and rains, are the accidental cauſes which often alter and modify the action of the principal cauſe.

Accidental Colours, are thoſe which depend upon the affections of the eye, in contradiſtinction to thoſe which belong to the light itſelf. The impreſſions made upon the eye by looking ſtedfaſtly on objects of a particular colour are various, according to the ſingle colour or combination of colours in the object; and they continue for ſome time after the eye is withdrawn, and give a falſe colouring to other objects. M. Buffon has endeavoured to trace the connections which theſe accidental colours have with ſuch as are natural, in a variety of inſtances. The ſubject has alſo been conſidered

Acciſmus || Accius.

Accius, Acclamation.

conſidered by De la Hire and M. Æpinus; and M. d'Arcy has contrived a machine for determining the duration of thoſe impreſſions on the eye; and from the reſult of ſeveral experiments, he inferred, that the effect of the action of light on the eye continued about eight thirds of a minute.

Accidental Point, in *Perſpective*, is that point in the horizontal line where the projections of two lines parallel to each other meet the perſpective plane.

ACCIPENSER. See Ichthyology *Index*.

ACCIPITER, among the Romans, ſignified a hawk, which, from its being very carnivorous, they conſidered as a bird of bad omen:

Odimus accipitrem, quia ſemper vivit in armis. Ovid.

Pliny, however, tells us, that in ſome caſes, particularly in marriage, it was eſteemed a bird of good omen, becauſe it never eats the hearts of other birds; intimating thereby, that no differences in a married ſtate ought to reach the heart. The accipiter was worſhipped as a divinity by the inhabitants of Tentyra, an iſland in the Nile, being conſidered by them as the image of the ſun; and hence we find that luminary repreſented, in hieroglyphics, under the figure of a hawk.

ACCIPITRES, the name of Linnæus's firſt order of birds. See Ornithology.

ACCISMUS denotes a feigned refuſal of ſomething which a perſon earneſtly deſires. The word is Latin; or rather Greek, Ακκισμος; ſuppoſed to be formed from *Acco*, the name of a fooliſh old woman noted in antiquity for an affectation of this kind.

Acciſmus is ſometimes conſidered as a virtue; ſometimes as a vice, which Auguſtus and Tiberius practiſed with great ſucceſs. Cromwell's refuſal of the crown of England may be brought as an inſtance of an acciſmus.

Accismus is more particularly uſed, in *Rhetoric*, as a ſpecies of irony.

ACCITUM, in *Ancient Geography*, a town of Hiſpania Bætica, now *Finiana*, as appears from an ancient inſcription; ſituated on an eminence of the mountains Alpuxaras, in the province of Granada in Spain.

ACCIUS, Lucius, a Latin tragic poet, the ſon of a freedman, and, according to St Jerome, born in the conſulſhip of Hoſtilius Mancinus and Attilius Serranus, in the year of Rome 583; but there appears ſomewhat of confuſion and perplexity in this chronology. He made himſelf known before the death of Pacuvius, by a dramatic piece which was exhibited the ſame year that Pacuvius brought one upon the ſtage, the latter being then eighty years of age, and Accius only thirty. We do not know the name of this piece of Accius's, but the titles of ſeveral of his tragedies are mentioned by various authors. He wrote on the moſt celebrated ſtories which had been repreſented on the Athenian ſtage; as Andromache, Andromeda, Atreus, Clytemneſtra, Medea, Meleager, Philoctetes, the civil wars of Thebes, Tereus, the Troades, &c. He did not always, however, take his ſubjects from the Grecian ſtory; for he compoſed one dramatic piece wholly Roman: it was entitled *Brutus*, and related to the expulſion of the Tarquins. It is affirmed by ſome that he wrote alſo comedies; which is not unlikely, if he was the author of two pieces, the Wedding and the Merchant, which have been aſcribed to him. He did not confine himſelf to dramatic writing; for he left other productions, particularly his annals, mentioned by Macrobius, Priſcian, Feſtus, and Nonnius Marcellus. He has been cenſured for writing in too harſh a ſtyle, but in all other reſpects has been eſteemed a very great poet. He was ſo much eſteemed by the public, that a comedian was puniſhed, for only mentioning his name on the ſtage. Cicero ſpeaks with great deriſion of one Accius who had written a hiſtory; and, as our author had wrote annals, ſome inſiſt that he is the perſon cenſured: but as Cicero himſelf, Horace, Quintilian, Ovid, and Paterculus, have ſpoken of our author with ſo much applauſe, we cannot think it is the ſame perſon whom the Roman orator cenſures with ſo much ſeverity.

There was alſo in this age a pretty good orator of the ſame name, againſt whom Cicero defended Cluentius. He was born in Piſaurum, and perhaps was a relation of our poet.

Accius, a poet of the 16th century, to whom is attributed A Paraphraſe of Æſop's Fables, on which Julius Scaliger beſtows great encomiums.

ACCLAMATION, a confuſed noiſe or ſhout of joy, by which the public expreſs their applauſe, eſteem, or approbation.

Acclamation, in a more proper ſenſe, denotes a certain form of words, uttered with extraordinary vehemence, and in a peculiar tone ſomewhat reſembling a ſong, frequent in the ancient aſſemblies. Acclamations were uſually accompanied with applauſes, with which they are ſometimes confounded: though they ought to be diſtinguiſhed; as acclamation was given by the voice, applauſe by the hands: add, that acclamation was alſo beſtowed on perſons abſent, applauſe only on thoſe preſent. Acclamation was alſo given by women, whereas applauſe ſeems to have been confined to men.

Acclamations are of various kinds; eccleſiaſtical, military, nuptial, ſenatorial, ſynodical, ſcholaſtical, theatrical, &c. We meet with loud acclamations, muſical and rhythmical acclamations; acclamations of joy and reſpect, and even of reproach and contumely. The former, wherein words of happy omen were uſed, were alſo called *Laudationes*, *et bona vota*, or good wiſhes; the latter, *Execrationes et convicia*. Suetonius furniſhes an inſtance of this laſt kind in the Roman ſenate, on occaſion of the decree for demoliſhing the ſtatues of Domitian, when the fathers, as the hiſtorian repreſents it, could not refrain from contumelious acclamations of the deceaſed. The like were ſhown after the death of Commodus, where the acclamations run in the following ſtrain: *Hoſti patria honores detrahantur, parricidæ honores detrahantur: hoſtis ſtatuas undique, parricidæ ſtatuas undique, gladiatoris ſtatuas undique*, &c.—The formula, in acclamations, was repeated ſometimes a greater, ſometimes a leſſer, number of times. Hence we find in Roman writers, *acclamatum eſt quinquies, et vicies;* five times, and twenty times: ſometimes alſo *ſexagies*, and even *octuagies;* ſixty and eighty times.

Acclamations were not unknown on the theatres in the earlieſt ages of the Roman commonwealth; but they were artleſs then, and little other than confuſed ſhouts. Afterwards they became a ſort of regular concerts. That mentioned by Phædrus, *lætare incolumis Roma ſalvo principe*, which was made for Auguſtus, and proved the occaſion of a pleaſant miſtake of a flute-

player.

Acclamation

player called *Princeps*, shows that musical acclamations were in use in that emperor's reign. *Reverentem ex Provincia modulatis carminibus prosequebantur*, says Suetonius, who gives another instance in the time of Tiberius: a false report of Germanicus's recovery being spread through Rome, the people ran in crowds to the capitol with torches and victims, singing, *Salva Roma, Salva Patria, Salvus es! Germanicus*.—Nero, passionately fond of music, took special care to improve and perfect the music of acclamations. Charmed with the harmony with which the Alexandrians, who came to the games celebrated at Naples, had sung his praises, he brought several over to instruct a number of youth, chosen from among the knights and people, in the different kinds of acclamations practised at Alexandria. These continued in use as long as the reign of Theodoric. But the people did not always make a single chorus; sometimes there were two, who answered each other alternately: thus, when Nero played on the theatre, Burrhus and Seneca, who were on either hand, giving the signal by clapping, 5000 soldiers called *Augustals*, began to chant his praise, which the spectators were obliged to repeat. The whole was conducted by a music-master called *mesochorus* or *pausarius*.—The honour of acclamations was chiefly rendered to emperors, their children, and favourites; and to the magistrates who presided at the games. Persons of distinguished merit also sometimes received them, of which Quintilian gives us instances in Cato and Virgil. The most usual forms were, *Feliciter*, *Longiorem vitam*, *Annos felices*. The actors themselves, and they who gained the prizes in the games of the circus, were not excluded the honour of acclamations.

To theatrical acclamations may be added those of the soldiery and the people in time of triumph. The victorious army accompanied their general to the capitol; and, among the verses they sung in his praises, frequently repeated Io Triumphe, which the people answered in the same strain. It was also in the way of acclamation, that the soldiers gave their general the title of *Imperator*, after some notable victory: a title which he only kept till the time of his triumph.

The acclamations of the senate were somewhat more serious than the popular ones; but arose from the same principle, viz. a desire of pleasing the prince or his favourites; and aimed likewise at the same end, either to express the general approbation and zeal of the company, or to congratulate him on his victories, or to make him new protestations of fidelity. These acclamations were usually given after a report made by some senator, to which the rest all expressed their consent by crying Omnes, Omnes; or else, Æquum est, Justum est. Sometimes they began with acclamations, and sometimes ended with them without other debates. It was after this manner that all the elections and proclamations of emperors, made by the senate, were conducted; something of which practice is still retained at modern elections of kings and emperors, where *Vivat Rex*, and *Long live the King*, are customary forms of acclamation.

The Greeks borrowed the custom of receiving their emperors in the public places from the Romans. Luitprand relates, that at a procession where he was present, they sung to the emperor Nicephorus, πολλα ετης; that is, Many years: which Cuddon expresses thus, by το ψαλλειν το πολυχρονιον, or by το πολυχρονιζειν, and the wish or salutation by πολυχρονισμα. And at dinner, the Greeks then present wished with a loud voice to the emperor and Bardas, *Ut Deus annos multiplicet*; as he translates the Greek. Plutarch mentions an acclamation so loud, upon occasion of Flaminius's restoring liberty to Greece, that the very birds fell from heaven with the shout. The Turks practise something like this on the sight of their emperors and grand viziers to this day. Acclamation

For the acclamations with which authors, poets, &c. were received, who recited their works in public; it is to be observed, the assemblies for this purpose were held with great parade in the most solemn places, as the capitol, temples, the Athenæum, and the houses of great men. Invitations were sent everywhere, in order to get the greater appearance. The chief care was, that the acclamations might be given with all the order and pomp possible. Men of fortune who pretended to wit, kept able applauders in their service, and lent them to their friends. Others endeavoured to gain them by presents and treats. Philostratus mentions a young man named Vavus, who lent money to the men of letters, and forgave the interest to such as applauded his exercises. These acclamations were conducted much after the same manner as those in the theatre, both as to the music and the accompaniments: they were to be suited both to the subject and to the person. There were particular ones for the philosophers, for orators, for historians, and for poets. It would be difficult to rehearse all the forms of them; one of the most usual was *Sophos*, which was to be repeated three times. Martial comprehends several other usual forms in this verse:

Graviter, Citò, Nequiter, Euge, Beatè.

Neither the Greeks nor Romans were barren on this head. The names of gods and heroes were given those whom they would extol. It was not enough to do it after each head of discourse, chiefly after the exordium; but the acclamations were renewed at every fine passage, frequently at every period.

The acclamations with which the spectators honoured the victories of the athletæ, were a natural consequence of the impetuous motions which attended the gymnastic games. The cries and acclamations of the people, sometimes expressing their compassion and joy, sometimes their horror and disgust, are strongly painted by different poets and orators.

Acclamations made also a part of the ceremony of marriage. They were used for the omen's sake; being the *Læta Omina*, sometimes spoken of before marriage in Roman writers.

Acclamations, at first practised in the theatre, and passing thence to the senate, &c. were in process of time received into the acts of councils, and the ordinary assemblies of the church. The people expressed their approbation of the preacher variously; the more usual forms were, *Orthodox! Third Apostle*, &c. These acclamations being sometimes carried to excess, and often misplaced, were frequently prohibited by the ancient doctors, and at length abrogated; though they appear to have been in some use about the time of St Bernard.

Declivity || Accolti.

Acclamation Medals, among *Antiquaries*, such as represent the people expressing their joy in the posture of acclamation.

ACCLIVITY, the rise or ascent of a hill, in opposition to the declivity or descent of it. Some writers on fortification use it for the talus of a rampart.

ACCOLA, among the Romans, signified a person who lived *near* some place; in which sense, it differed from *incola*, the *inhabitant* of such a place.

ACCOLADE, a ceremony anciently used in the conferring of knighthood.

Antiquaries are not agreed wherein the accolade properly consisted. The generality suppose it to be the embrace, or kiss, which princes anciently gave the new knight, as a token of their affection: whence the word *accolade*; q. d. a clasping, or taking round the neck. Others will rather have it to be a blow on the chine of the neck, given on the same occasion. The Accolade is of some antiquity, in whichsoever of the two senses it be taken. Greg. de Tours writes, that the kings of France, even of the first race, in conferring the gilt shoulder-belt, kissed the knights on the left cheek. For the *accolée*, or blow, John of Salisbury assures us, it was in use among the ancient Normans: by this it was that William the Conqueror conferred the honour of knighthood on his son Henry. At first it was given with the naked fist; but was afterwards changed into a blow with the flat of the sword on the shoulder of the knight.

ACCOLE'E, sometimes synonymous with Accolade, which see.—It is also used in various senses in heraldry; sometimes it is applied to two things joined; at other times, to animals with crowns or collars about their necks, as the lion in the Ogilvy's arms; and, lastly, to kews, battons, maces, swords, &c. placed saltierwise behind the shield.

ACCOLTI, Benedict, the younger, grandson of Benedict Accolti the elder, who flourished about the year 1376, was born at Arezzo in 1415. About the year 1450, he was appointed secretary to the republic of Florence, when he was greatly distinguished. He wrote "Four Books concerning the War which the Christians carried on against the Infidels to recover Judæa and the Holy Sepulchre." This work was printed at Venice in 1532, and it is the ground-plot of Tasso's Jerusalem Delivered. He wrote also an account of the "Excellent Personages of his Time," in the form of dialogue. He died in 1466.

Accolti, *Benedict*, was nephew, or according to some, grandson of Peter Accolti, and was born at Florence in 1497. He was much distinguished for his knowledge of law, and a most retentive memory; and was such a master of the Latin language, that he obtained the flattering appellation of *the Cicero of the age*. He enjoyed very high ecclesiastical honours: Leo X. bestowed on him the bishopric of Cadiz; Adrian the VI. gave him that of Cremona, and the archbishopric of Ravenna; and Clement VII. raised him to the rank of cardinal. At the request of Clement, he wrote a treatise in vindication of the pope's right to the kingdom of Naples. He left several other works, and particularly some pieces of poetry. He died at Florence in 1549.

Accolti, *Francis*, brother of the former, was born about the year 1418. He was professor of jurisprudence in several universities, and was styled the *prince of lawyers*. His understanding was vigorous, his knowledge was extensive, and his eloquence powerful; but he was so sordidly parsimonious that he amassed immense treasures. He died about the year 1470; and left behind him several works on law, and some translations of the works of Chrysostom. Accommodation || Accompaniment.

Accolti, *Peter*, the son of Benedict the younger, was born at Arezzo about the year 1455. He was a professor of law, and taught with great reputation. He was successively raised to several bishoprics, and at last to the rank of cardinal in 1511. He was created by Pope Leo X. prince of the state of Nepi. He wrote a comedy entitled "Virginia," and some other poems which were much applauded by his contemporaries. He died at Rome in 1532.

ACCOMMODATION, the application of one thing, by analogy, to another; or the making two or more things agree with one another.

To know a thing by *accommodation*, is to know it by the idea of a similar thing referred thereto.

A prophecy of scripture is said to be fulfilled various ways; properly, as when a thing foretold comes to pass; and improperly, or by way of *accommodation*, when an event happens to any place or people, like to what fell out some time before to another.—Thus, the words of Isaiah, spoken to those of his own time, are said to be fulfilled in those who lived in our Saviour's; and are *accommodated* to them: "Ye hypocrites, well did Esaias prophecy of you," &c. which same words St Paul afterwards *accommodates* to the Jews of his time.

The primitive church *accommodated* multitudes of Jewish, and even heathen ceremonies and practices, to Christian purposes; but the Jews had before done the same by the Gentiles: some will even have circumcision, the tabernacle, brazen serpent, &c. to have been originally of Egyptian use, and only *accommodated* by Moses to the purposes of Judaism *. Spencer maintains, that most of the rites of the old law were in imitation of those of the Gentiles, and particularly of the Egyptians; that God, in order to divert the children of Israel from the worship they paid to their false deities, consecrated the greatest part of the ceremonies performed by those idolaters, and had formed out of them a body of the ceremonial law; that he had indeed made some alterations therein, as barriers against idolatry; and that he thus *accommodated* his worship to the genius and occasions of his ancient people. To this condescension of God, according to Spencer †, is owing the origin of the tabernacle, and particularly that of the ark. These opinions, however, have been controverted by later writers.

* *Saurin, Diss. O. Tom.* i.

† *De legib. Hebr.* diss. i. l. 3. p. 32.

ACCOMPANIMENT, something attending or added as a circumstance to another, either by way of ornament, or for the sake of symmetry.

Accompaniment, Accompagnamento, Accompagnatura, in *Music*, denotes the instruments which accompany a voice, in order to sustain it, as well as to make the music more full. The accompaniment is used in recitative, as well as in song; on the stage, as well as in the choir, &c. The ancients had likewise their accompaniments in the theatre; they had even different kinds of instruments to accompany the chorus, from those which accompanied the actors in the recitation.

The

Accompaniment || Accords.

The accompaniment, among the moderns, is frequently a different part or melody from the ſong it accompanies. It is diſputed whether it was ſo among the ancients. It is generally alleged, that their accompaniments went no farther than the playing in octave, or in antiphony to the voice. The Abbé Fraguier, from a paſſage in Plato, pretends to prove, that they had actual ſymphony, or muſic in parts: but his arguments ſeem far from being concluſive.

ACCOMPANIMENT, in *Painting*, denotes ſuch objects as are added, either by way of ornament or fitneſs to the principal figures; as dogs, guns, game, &c. in a hunting piece.

ACCOMPANIMENT, in *Heraldry*, any thing added to a ſhield by way of ornament; as the belt, mantling, ſupporters, &c. It is alſo applied to ſeveral bearings about a principal one; as a ſaltier, bend, feſs, chevron, &c.

ACCOMPLICE, one that has a hand in a buſineſs; or is privy in the ſame deſign or crime with another. See ACCESSORY.

By the law of Scotland, the *accomplice* can only be proſecuted after the conviction of the *principal* offender, unleſs the acceſſion of the *accomplice* is immediate, in *ipſo actu*, ſo as in effect to render them *co-principal*. By the general rule, the *accomplice* ſuffers the ſame puniſhment with the *principal* offender; yet if he be remarkably leſs guilty, juſtice will not permit equal puniſhment.

The council of Sens, and ſeveral other ſynodical ſtatutes, expreſsly prohibit the revealing of *accomplices*.

ACCOMPLISHMENT, the entire execution or fulfilling of any thing.

ACCOMPLISHMENT is principally uſed in ſpeaking of events foretold by the Jewiſh prophets in the Old Teſtament, and fulfilled under the New. We ſay a literal accompliſhment, a myſtical or ſpiritual accompliſhment, a ſingle accompliſhment, a double accompliſhment, a Jewiſh accompliſhment, a Chriſtian, a heathen accompliſhment. The ſame prophecy is ſometimes accompliſhed in all, or in ſeveral of thoſe different ways. Thus, of ſome of the prophecies of the Old Teſtament, the Jews find a literal accompliſhment in their own hiſtory, about the time when the prophecy was given: the Chriſtians find another in Chriſt, or the earlieſt days of the church; the heathens another, in ſome of their emperors; the Mahometans another, in their legiſlator, &c. There are two principal ways of accompliſhing a prophecy, *directly*, and by *accommodation*. See ACCOMMODATION, and PROPHECY.

ACCOMPLISHMENT, is alſo uſed for any mental or perſonal endowment.

ACCORD, in *Painting*, is the harmony that reigns among the lights and ſhades of a picture.

ACCORDS, STEPHEN TABOUROT, SEIGNEUR DES, advocate in the parliament of Dijon in France, and king's advocate in the bailiwick and chancery of that city, was born in 1549. He was a man of genius and learning; but too much addicted to trifles, as appears from his piece, entitled, "Les Bigarrures," printed at Paris in 1582. This was not his firſt production, for he had before printed ſome ſonnets. His work, entitled *Les Touches*, was publiſhed at Paris in 1585; which is indeed a collection of witty poems, but worked up in a looſe manner, according to the licentious taſte of that age. His Bigarrures are written in the ſame ſtrain. He was cenſured for this way of writing, which obliged him to publiſh an apology. The lordſhip of Accords is an imaginary fief or title from the device of his anceſtors, which was a drum, with the motto *à tous accords*, "chiming with all." He had ſent a ſonnet to a daughter of M. Begat, the great and learned preſident of Burgundy, "who (ſays he) did me the honour to love me: And inaſmuch (continues he), I had ſubſcribed my ſonnet with only my device *à tous accords*, this lady firſt nicknamed me, in her anſwer, *Seigneur des Accords*; by which title her father alſo called me ſeveral times. For this reaſon I choſe this ſurname, not only in all my writings compoſed at that time, but even in theſe books." He died in 1595, in the 46th year of his age.

Accorſo.

ACCORSO (in Latin *Accurſius*), FRANCIS, the elder, an eminent lawyer, was born at Bagnolo, near Florence, in 1182. He began the ſtudy of law at a late period of life; but ſuch were his aſſiduity and proficiency, that he ſoon diſtinguiſhed himſelf. He was appointed profeſſor at Bologna, and became a very eminent teacher. He undertook the great work of uniting and arranging into one body the almoſt endleſs comments and remarks upon the Code, the Inſtitutes, and Digeſts, which, he obſerved, only tended to involve the ſubjects in obſcurity and contradiction. When he was employed in this work, it is ſaid, that hearing of a ſimilar one propoſed and begun by Odofred, another lawyer of Bologna, he feigned indiſpoſition, interrupted his public lectures, and ſhut himſelf up, till he had, with the utmoſt expedition, accompliſhed his deſign. His work, entitled "A Perpetual Commentary," was much eſteemed. It was printed with the "Body of Law," publiſhed at Lyons in 1627. He died in 1260, and left very great riches. His ſon, the younger Francis Accorſo, ſucceeded him in his profeſſorſhip, and accompanied Edward I. to England, on his return from the cruſade in 1237. (*Gen. Biog*).

ACCORSO, *Mariangelo*, a learned and ingenious critic, was a native of Aquila, in the kingdom of Naples, and lived about the beginning of the ſixteenth century. To a perfect knowledge of Greek and Latin, he added an intimate acquaintance with ſeveral modern languages. Claſſical literature was much improved and promoted by his labours. In diſcovering and collating ancient manuſcripts he diſplayed uncommon aſſiduity and diligence. His work, entitled "*Diatribæ*," printed at Rome, in folio, in 1524, is a ſingular monument of erudition and critical ſkill. He beſtowed, it is ſaid, unuſual pains on Claudian, and made above ſeven hundred corrections in the works of that poet, from different manuſcripts. Unfortunately the world has been deprived of the advantage of theſe criticiſms; for they were never publiſhed. Theſe corrections were made while he travelled on horſeback during a tour through Germany, a circumſtance which is ſtrongly characteriſtic of his induſtry and aſſiduity. An edition of *Ammianus Marcellinus*, which he publiſhed at Augſburg in 1533, contains five books more than any former one. He was the firſt editor of the "Letters of Caſſiodorus," with his "Treatiſe on the Soul." The affected

uſe

Account || Accretion.

uſe of antiquated terms introduced by ſome of the Latin writers of that age, is humouroufly ridiculed in a dialogue publiſhed in 1531, entitled, "*Oſco, Volſco, Romanoque, Eloquentia, Interlocutoribus, Dialogus Ludis Romanis actus.* He compoſed a book on the invention of printing. On the firſt leaf of a grammar of Donatus, printed on vellum, there is written with his own hand: "This Donatus, with another book entitled "*Confeſſionalia*," were the firſt books printed; and John Fauſtus, citizen of Mentz, inventor of the art, had put them to the preſs in the year 1450." He had been accuſed of plagiariſm in his notes on Auſonius; and the ſolemn and determined manner in which he repelled this charge of literary theft, preſents us with a ſingular inſtance of his anxiety and care to preſerve his literary reputation unſtained and pure. It is in the following oath: "In the name of gods and men, of truth and ſincerity, I ſolemnly ſwear, and if any declaration be more binding than an oath, I in that form declare, and I deſire that my declaration may be received as ſtrictly true, that I have never read or ſeen any author, from which my own lucubrations have received the ſmalleſt aſſiſtance or improvement; nay, that I have even laboured, as far as poſſible, whenever any writer has publiſhed any obſervations which I myſelf had before made, immediately to blot them out of my own works. If in this declaration I am forſworn, may the pope puniſh my perjury; and may an evil genius attend my writings, ſo that whatever in them is good, or at leaſt tolerable, may appear to the unſkilful multitude exceedingly bad, and even to the learned trivial and contemptible; and may the ſmall reputation I now poſſeſs be given to the winds, and regarded as the worthleſs boon of vulgar levity." (*Gen. Biog.*)

ACCOUNT, or ACCOMPT, in a general ſenſe, a computation or reckoning of any thing by numbers.—Collectively it is uſed to expreſs the books which merchants, traders, bankers, &c. uſe for recording their tranſactions in buſineſs. See BOOK-KEEPING.

Chamber of Accounts, in the French polity, a ſovereign court of great antiquity, which took cognizance of and regiſtered the accounts of the king's revenue; nearly the ſame with the Engliſh *Court of Exchequer*.

ACCOUNT is taken ſometimes, in a particular ſenſe, for the computation of time: thus we ſay, the Julian Account, the Gregorian Account, &c. in which ſenſe it is equivalent to *ſtyle*.

ACCOUNTANT, or ACCOMPTANT, in the moſt general ſenſe, is a perſon ſkilled in accounts. In a more reſtricted ſenſe, it is applied to a perſon, or officer, appointed to keep the accounts of a public company or office: as the South Sea, the India Company, the Bank, the Exciſe, &c.

ACCOUNTANTSHIP, the art of keeping and balancing accounts. See BOOK-KEEPING.

ACCOUNTANT-GENERAL, a new officer in the court of chancery, appointed by act of parliament to receive all monies lodged in court inſtead of the maſters, and convey the ſame to the bank of England for ſecurity.

ACCOUTREMENT, an old term applied to the furniture of a ſoldier, knight, or gentleman.

ACCRETION, in *Phyſics*, the increaſe or growth of an organical body, by the acceſſion of new parts. See NUTRITION, PLANTS, and VEGETABLES.

ACCRETION, among civilians, the property acquired in a vague or unoccupied thing, by its adhering to or following another already occupied: thus, if a legacy be left to two perſons, one of whom dies before the teſtator, the legacy devolves to the ſurvivor by right of accretion.

Accroche || Accurſed.

ACCROCHE, in *Heraldry*, denotes a thing's being hooked with another.

ACCUBATION, a poſture of the body, between ſitting and lying. The word comes from the Latin *accubare*, compounded of *ad*, to, and *cubo*, I lie down. *Accubation*, or *Accubitus*, was the table poſture of the Greeks and Romans; whence we find the words particularly uſed for the lying, or rather (as we call it) ſitting down to meat. The Greeks introduced this poſture. The Romans, during the frugal ages of the republic, were ſtrangers to it; but as luxury got footing, this poſture came to be adopted, at leaſt by the men; for as to women, it was reputed an indecency in them to lie down among the men: though, afterwards, this too was got over. Children did not lie down, nor ſervants, nor ſoldiers, nor perſons of meaner condition. They took their meals ſitting, as a poſture leſs indulgent. The Roman manner of diſpoſing themſelves at table was this: A low round table was placed in the *cœnaculum*, or dining room, and, about this, uſually three, ſometimes only two, beds or couches; and according to their number, it was called *biclinium* or *triclinium*. Theſe were covered with a ſort of bedclothes, richer or plainer according to the quality of the perſon, and furniſhed with quilts and pillows, that the gueſts might lie the more commodiouſly. There were uſually three perſons on each bed; to crowd more, was eſteemed ſordid. In eating, they lay down on their left ſides, with their heads reſting on the pillows, or rather on their elbows. The firſt lay at the head of the bed, with his feet extended behind the back of the ſecond; the ſecond lay with the back of his head towards the navel of the firſt, only ſeparated by a pillow, his feet behind the back of the third; and ſo of the third or fourth. The middle place was eſteemed the moſt honourable. Before they came to table, they changed their clothes, putting on what they called *cœnatoria veſtis*, the dining garment; and pulled off their ſhoes, to prevent ſoiling the couch.

ACCUBITOR, an ancient officer of the emperors of Conſtantinople, whoſe buſineſs was to lie near the emperor. He was the head of the youth of the bedchamber, and had the *cubicularius* and *procubitor* under him.

ACCUMULATION, in a general ſenſe, the act of heaping or amaſſing things together. Among lawyers, it is uſed in ſpeaking of the concurrence of ſeveral titles to the ſame thing, or of ſeveral circumſtances to the ſame proof.

Accumulation of Degrees, in a univerſity, is the taking ſeveral of them together, or at ſhorter intervals than uſual or than is allowed by the rules of the univerſity.

ACCURSED, ſomething that lies under a curſe, or ſentence of excommunication.

In the Jewiſh idiom, *accurſed* and *crucified* were ſynonymous. Among them, every one was accounted *accurſed* who died on a tree. This ſerves to explain the difficult paſſage in Rom. ix. 3. where the apoſtle

Accuſation ‖ Accuſative.

Paul wiſhed himſelf *accurſed after the manner of Chriſt*, i. e. crucified, if happily he might by ſuch a death ſave his countrymen. The prepoſition απο here made uſe of, is uſed in the ſame ſenſe, 2. Tim. i. 3. where it obviouſly ſignifies *after the manner of*.

ACCUSATION, the charging any perſon with a criminal action, either in one's own name, or in that of the public. The word is compounded of *ad*, to; and *cauſari* to plead.

Writers on politics treat of the benefit and the inconveniencies of public accuſations. Various arguments are alleged, both for the encouragement and diſcouragement of accuſations againſt great men. Nothing, according to Machiavel, tends more to the preſervation of a ſtate, than frequent accuſations of perſons truſted with the adminiſtration of public affairs. This, accordingly, was ſtrictly obſerved by the Romans, in the inſtances of Camillus, accuſed of corruption by Manlius Capitolinus, &c. Accuſations, however, in the judgement of the ſame author, are not more beneficial than calumnies are pernicious; which is alſo confirmed by the practice of the Romans. Manlius not being able to make good his charge againſt Camillus, was caſt into priſon.

By the Roman law, there was no public accuſer for public crimes; every private perſon, whether intereſted in the crime or not, might accuſe, and proſecute the accuſed to puniſhment or abſolution. Cato, the moſt innocent perſon of his age, had been accuſed 42 times, and as often abſolved. But the accuſation of *private* crimes was never received but from the mouths of thoſe who were immediately intereſted in them: None (*e. g.*) but the huſband could accuſe his wife of adultery.

The ancient Roman lawyers diſtinguiſhed between *poſtulatio*, *delatio*, and *accuſatio*. For, firſt, leave was deſired to bring a charge againſt one, which was called *poſtulare*: then he againſt whom the charge was laid was brought before the judge; which was called *deferre*, or *nominis delatio*: laſtly, the charge was drawn up and preſented; which was properly the *accuſatio*. The accuſation properly commenced, according to Pœdianus, when the *reus* or party charged, being interrogated, denied he was guilty of the crime, and ſubſcribed his name to the *delatio* made by his opponent.

In the French law, none but the procureur general, or his deputies, can form an accuſation, except for high treaſon and coining, where accuſation is open to every body. In other crimes, private perſons can only act the part of denouncers, and demand reparation for the offence, with damages.

In Britain, by Magna Charta, no man ſhall be impriſoned or condemned on any accuſation, without trial by his peers, or the law; none ſhall be vexed with any accuſation, but according to the law of the land; and no man may be moleſted by petition to the king, &c. unleſs it be by indictment or preſentment of lawful men, or by proceſs at common law. Promoters of ſuggeſtions, are to find ſurety to purſue them; and if they do not make them good, ſhall pay damages to the party accuſed, and alſo a fine to the king. No perſon is obliged to anſwer upon oath to a queſtion whereby he may accuſe himſelf of any crime.

ACCUSATIVE, in *Latin Grammar*, is the fourth caſe of nouns, and ſignifies the relation of the noun on which the action implied in the verb terminates; and hence, in ſuch languages as have caſes, theſe nouns have a particular termination, called *accuſative*, as, *Auguſtus vicit Antonium*, Auguſtus vanquiſhed Antony. Here *Antonium* is the noun on which the action implied in the word *vicit* terminates; and, therefore, muſt have the accuſative termination. Ovid, ſpeaking of the palace of the ſun, ſays, *Materiem ſuperabat opus*, The work ſurpaſſed the materials. Here *materiem* has the accuſative termination; becauſe it determines the action of the verb *ſuperabat*.—In the Engliſh language there are no caſes, except the genitive; the relation of the noun being ſhown by the aſſiſtance of prepoſitions, as *of*, *to*, *from*, &c.

Accuſiorum Colonia ‖ Acephalous.

ACCUSIORUM COLONIA, in *Ancient Geography*, an inland town in the Cavares, in Gallia Narbonenſis; now *Grenoble*, in Dauphiné. See GRENOBLE.

ACE, among gameſters, a card or die marked only with one point.

ACELDAMA, in Scripture hiſtory, a place without the ſouth wall of Jeruſalem, beyond the brook of Siloam, was called the Potters field, becauſe clay of which pots were made was dug out of it. It was afterwards bought with the money with which the high prieſts and rulers of the Jews purchaſed the blood of Jeſus Chriſt, and hence it was called *Aceldama*, the field of blood.

ACELUM, or ACELIUM, in *Ancient Geography*, a town of the Venetian territory, now called *Azolo*, ſituated to the weſt of Trevigi, at the ſource of the rivulet Muſone. E. Long. 13°. N. Lat. 45°.

ACENTETUM, or ACANTETA, in *Natural Hiſtory*, a name given by the ancients to the pureſt and fineſt kind of rock cryſtal: They uſed the cryſtal in many ways; ſometimes engraving on it, and ſometimes forming it into vaſes and cups, which were held next in value to the *vaſa murrhina* of thoſe times. The cryſtal they obtained from the iſland of Cyprus was much eſteemed; but often faulty in particular parts, having hairs, cracks, and foulneſſes, which they called *falts*, in the middle of the large pieces. Pliny tells us, that when it was uſed for engraving on, the artiſt could conceal all theſe blemiſhes among the ſtrokes of his work; but when it was to be formed into cups or precious vaſes, they always choſe the acentetum which had no flaws or blemiſhes.

ACEPHALI, or ACEPHALITÆ, a term applied to ſeveral ſects who refuſed to follow ſome noted leader. Thus the perſons who refuſed to follow either John of Antioch, or St Cyril, in a diſpute that happened in the council of Epheſus, were termed *Acephali*, without a head or leader. Such biſhops, alſo, as were exempt from the juriſdiction and diſcipline of their patriarch, were ſtyled *Acephali*.

ACEPHALI, the levellers in the reign of King Henry I. who acknowledged no head or ſuperior. They were reckoned ſo poor, that they had not a tenement by which they might acknowledge a ſuperior lord.

ACEPHALOUS, or ACEPHALUS, in a general ſenſe; without a head.

The term is more particularly uſed in ſpeaking of certain nations, or people, repreſented by ancient naturaliſts and coſmographers, as well as by ſome modern travellers,

Acephalous travellers, as formed without heads; their eyes, mouth, &c. being placed in other parts.

Acerra.

Such are the Blemmyes, a nation of Africa near the head of the Niger, represented to be by Pliny and Solinus; *Blemmyes traduntur capita abesse, ore et oculis pectore affixis.* Ctesias and Solinus mention others in India near the Ganges, *sine cervice, oculos in humeris habentes.* Mela also speaks of people, *quibus capita et vultus in pectore sunt.* And Suidas, Stephanus Byzantinus, Vopiscus, and others after them, relate the like. Some modern travellers still pretend to find acephalous people in America.

Several opinions have been framed as to the origin of the fable of the Acephali. The first is that of Thomas Bartholin, who turns the whole into a metaphor; being convinced, that the name Acephali was anciently given to such as had less brain, or conducted themselves less by the rules of prudence than others. Olearius rather apprehends, that the ancient voyagers, viewing certain barbarous people from the coasts, had been imposed on by their uncouth dress; for that the Samogitians, being short of stature, and going in the severity of winter with their heads covered in hoods, seem at a distance as if they were headless. F. Lafitau says, that by Acephali are only meant people whose heads are sunk below their shoulders. In effect, Hulsius, in his epitome of Sir Walter Raleigh's voyage to Guiana, also speaks of a people which that traveller found in the province of Irvipanama, between the lakes of Panama and Cassipa, who had no head or neck; and Hondius, in his map, marks the place with the figures of these monsters. Yet De Laet * rejects the story; being informed by others, that the inhabitants of the banks of the Caora, a river that flows out of the lake of Cassipa, have their heads so far sunk between their shoulders, that many believed they had their eyes in their shoulders, and their mouths in their breasts.

Descript. Amer. l. 17. c. 22.

But though the existence of a nation of Acephali be ill warranted, naturalists furnish several instances of individuals born without heads, by some lusus or deviation of nature. Wepfer gives † a catalogue of such acephalous births, from Shenckius, Licetus, Paræus, Wolfius, Mauriceau, &c.

† *In Eph. Ger.* dec. 1. an. 3. obs. 129. p. 184. Dec. 2. an. 9. obser. 148. p. 258.

Acephalus, an obsolete term for the tænia or tape-worm, which was long supposed to be acephalous. The first who gave it a head was Tulpius; and after him, Fehr: The former even makes it *biceps*, or two-headed.

Acephalus, is also used to express a verse defective in the beginning.

ACER, the Maple or Sycamore tree. See Botany *Index.*

ACERB, a sour rough astringency of taste, such as that of unripe fruit.

ACERINA, in *Ichthyology*, a name given by Pliny and other of the old naturalists, to the fish we at this time call the *ruffe*. See Perca, Ichthyology *Index.*

ACERNO, in *Geography*, a town of Italy, in the citerior principality of Naples, with a bishop's see. It is situated 12 miles north-east of Saluno, in E. Long. 15. 46. N. Lat. 40. 45.

ACERRA, in antiquity, an altar erected, among the Romans, near the bed of a person deceased, on which his friends daily offered incense till his burial.—The real intention probably was to overcome any offensive smell that might arise about the corpse. The Chinese have still a custom like this: they erect an altar to the deceased in a room hung with mourning; and place an image of the dead person on the altar, to which every one that approaches it bows four times, and offers oblations and perfumes.

Acerra ‖ Acetabulum

The *acerra* also signified a little pot wherein were put the incense and perfumes to be burnt on the altars of the gods and before the dead. It appears to have been the same with what was otherwise called *thuribulum*, and *pyxis*.

We find mention of *acerræ* in the ancient church. The Jews had also their *acerræ*, in our version rendered *censers*; and the Romanists still retain them under the name of *incense pots*. In Roman writers, we frequently meet with *plena acerra*, a full acerra: to understand which, it is to be observed, that people were obliged to offer incense in proportion to their estate and condition; the rich in larger quantities, the poor only a few grains; the former poured out full *acerræ* on the altar, the latter took out two or three bits with their fingers.

Acerra, a town of Italy, in the kingdom of Naples, and in the Terra di Lavoro; seated on the river Agno, seven miles north-east of Naples. E. Long. 14. 30. N. Lat. 40. 55.

ACERRÆ, in *Ancient Geography*, the name of a town on the Clanius, in Campania, not far from Naples; now Acerra.—The name also of another town, now called *la Girola*, in the territory and to the south-east of Lodi, where the rivulet Serio falls into the Adda, to the west of Cremona and north of Placentia.

ACESINES, in *Ancient Geography*, a large and rapid river of India which Alexander passed in his expedition into that country. The kingdom of Porus, which was conquered by Alexander, lay between the Hydaspes and this river, which, uniting with the former and other considerable rivers, pours its waters into the Indus. According to Major Rennell, the modern Jenaub is the Acesines of the ancients.

ACESIUS, a bishop of Constantinople in the reign of Constantine, was a rigid adherent to the Novatian doctrines, according to which those whom persecutions had shaken from the faith, or who were guilty of any mortal sin after baptism, could not be admitted to the communion of the church, even after exhibiting the most convincing proofs of sincere repentance. Constantine, who was extremely displeased with the severity of this rigid sect, in discouraging and rejecting repentance, is said to have thus expressed himself: "Then, Acesius, make a ladder for yourself, and go up to heaven alone." (*Gen. Biog.*)

ACESCENT, a word used to denote any thing which is turning sour, or which is slightly acid. It is only applied properly to the former of these two meanings. The second may be expressed by either of the two words, *acidulous*, or *sub-acid.*

ACETABULUM, in antiquity, a measure used by the ancients, equal to one-eighth of our pint. It seems to have acquired its name from a vessel in which acetum or vinegar was brought to their tables, and which probably contained about this quantity.

Acetabulum, in *Anatomy*, a cavity in any bone

Acetabulum || Achæans.

for receiving the protuberant head of another, and thereby forming that ſpecies of articulation called ENARTHROSIS.

ACETABULUM, in *Botany*, the trivial name of a ſpecies of the peziza, or cup peziza, a genus belonging to the cryptogamia fungi of Linnæus. It has got the name of *acetabulum*, from the reſemblance its leaves bear to a cup. See PEZIZA, Botany *Index*.

ACETARY. Grew, in his anatomy of plants, applies this term to a pulpy ſubſtance, in certain fruits, e. g. the pear, which is encloſed in a congeries of ſmall calculous bodies towards the baſe of the fruit, and is always of an acid taſte.

ACETOSA, SORREL; by Linnæus joined to the genus *Rumex*. See BOTANY *Index*.

ACETOSELLA, in *Botany*, a ſpecies of OXALIS. See BOTANY *Index*.

ACETOUS, an epithet applied to ſuch ſubſtances as are ſour, or partake of the nature of vinegar.

ACETUM, VINEGAR, the vegetable ACID of the chemiſts. See AGETOUS ACID, CHEMISTRY *Index*.

ACHABYTUS, in *Ancient Geography*, a high mountain in Rhodes, on the top of which ſtood a temple of Jupiter.

ACHÆA, in *Ancient Geography*, a town of the iſland of Rhodes, in the diſtrict of Jalyſus, and the firſt and moſt ancient of all, ſaid to be built by the Heliades, or grandſons of the ſun.

ACHÆA, a hamlet of Aſiatic Sarmatia, on the Euxine. The inhabitants were called *Achæi*, a colony of the Orchomenians.

ACHÆANS, the inhabitants of ACHAIA Propria, a Peloponneſian ſtate. This republic was not conſiderable in early times, for the number of its troops, nor for its wealth, nor for the extent of its territories; but it was famed for its probity, its juſtice, and its love of liberty. Its high reputation for theſe virtues was very ancient. The Crotonians and Sybarites, to re-eſtabliſh order in their towns, adopted the laws and cuſtoms of the Achæans. After the famous battle of Leuctra, a difference aroſe betwixt the Lacedemonians and Thebans, who held the virtue of this people in ſuch veneration, that they terminated the diſpute by their deciſion. The government of the Achæans was democratical. They preſerved their liberty till the time of Philip and Alexander: But in the reign of theſe princes, and afterwards, they were either ſubject to the Macedonians, who had made themſelves maſters of Greece, or oppreſſed by cruel tyrants. The Achæan commonwealth conſiſted of twelve inconſiderable towns in Peloponneſus. Its firſt annals are not marked by any great action, for they are not graced with one eminent character. After the death of Alexander, this little republic was a prey to all the evils which flow from political diſcord. Zeal for the good of the community was now extinguiſhed. Each town was only attentive to its private intereſt. There was no longer any ſtability in the ſtate; for it changed its maſters with every revolution in Macedonia. Towards the 124th Olympiad, about the time when Ptolemy Soter died, and when Pyrrhus invaded Italy, the republic of the Achæans recovered its old inſtitutions and unanimity. The inhabitants of Patræ and of Dymæ were the firſt aſſertors of ancient liberty. The tyrants were baniſhed, and the towns again made one commonwealth. A public council was then held, in which affairs of importance were diſcuſſed and determined. A regiſter was appointed to record the tranſactions of the council. This aſſembly had two preſidents, who were nominated alternately by the different towns. But inſtead of two preſidents, they ſoon elected but one. Many neighbouring towns which admired the conſtitution of this republic, founded on equality, liberty, the love of juſtice, and of the public good, were incorporated with the Achæans, and admitted to the full enjoyment of their laws and privileges.—The arms which the Achæans chiefly uſed were ſlings. They were trained to the art from their infancy, by ſlinging from a great diſtance, at a circular mark of a moderate circumference. By long practice they took ſo nice an aim, that they were ſure, not only to hit their enemies on the head, but on any part of the face they choſe. Their ſlings were of a different kind from thoſe of the Balearians, whom they far ſurpaſſed in dexterity.

Achæi || Achaia.

ACHÆI, ACHÆANS, the inhabitants of Achaia Propria. In Livy, the people of Greece; for the moſt part called *Achivi*, by the Roman poets. In Homer, the general name for Grecians. See ACHÆANS.

ACHÆORUM PORTUS, (Pliny); now *Portu Buon*, a harbour of the Cherſoneſus Taurica, on the Euxine: Another near Sigæum, into which the Xanthus, after being joined by the Simois, falls.

ACHÆMENES, according to Herodotus, was grandfather of Cambyſes, and great-grandfather of Cyrus the firſt, king of Perſia. Moſt of the commentators of Horace are of opinion, that the Achæmenes whom that poet mentions, ode xii. of his 2d book, was one of the Perſian monarchs; but, if that were true, he muſt have reigned before the Medes ſubdued the Perſians; for we do not hear of any king of that name from the time that the Perſians founded that great monarchy, which is looked upon as the ſecond univerſal one. However this be, the epithet *Achæmenians* is frequently given to the Perſians, in the old Latin poets.

ACHÆMENES, ſon of Darius I. king of Perſia, and brother of Xerxes, had the government of Egypt beſtowed on him, after Xerxes had forced the Egyptians to return to their allegiance. He ſome time after commanded the Egyptian fleet in the celebrated expedition which proved ſo fatal to all Greece. The Egyptians having again taken up arms after the death of Xerxes, Achæmenes was ſent into Egypt to ſuppreſs the rebellion; but was vanquiſhed by Inarus, chief of the rebels, ſuccoured by the Athenians.

ACHÆUS, couſin-german to Seleucus Ceraunus and Antiochus the Great, kings of Syria, became a very powerful monarch, and enjoyed the dominions he had uſurped for many years; but at laſt he was puniſhed for his uſurpations in a dreadful manner, in the 140th year of Rome, as related by Polybius*.

* Lib. vii. cap. 56.

ACHAIA, a name taken for that part of Greece which Ptolemy calls *Hellas;* the younger Pliny, *Græcia;* now called *Livadia:* bounded on the north by Theſſaly, the river Sperchius, the Sinus Maliacus, and Mount Oëta; on the weſt by the river Achelous; on the eaſt, turning a little to the north, it is waſhed by the Archipelago, down to the promontory of Sunium; on the ſouth, joined to Peloponneſus, or the Morea, by the iſthmus of Corinth, five miles broad.

ACHAIA

Achaia ‖ Acheen.

Achaia Propria, anciently a ſmall diſtrict in the north of Peloponneſus, running weſtward along the bay of Corinth, and bounded on the weſt by the Ionian ſea, on the ſouth by Elis and Arcadia, and on the eaſt by Sicyonia: inhabitants, the *Achæans*, properly ſo called; its metropolis, *Patræ*. It is now called *Romania Alta*, in the Morea.

Achaia was alſo taken for all thoſe countries that joined in the Achæan league, reduced by the Romans to a province. Likewiſe for Peloponneſus.

Achaiæ Preſbyteri, or the Preſbyters of Achaia, were thoſe who were preſent at the martyrdom of St Andrew the apoſtle, A. D. 59; and are ſaid to have written an epiſtle in relation to it. Bellarmin, and ſeveral other eminent writers in the church of Rome, allow it to be genuine; while Du Pin, and ſome others, expreſsly reject it.

ACHAIUS, ſon of Ethwin, was raiſed to the crown of Scotland, A. D. 788. The emperor Charlemagne ſent an embaſſy to this prince to requeſt an alliance with him againſt the Engliſh, whoſe pirates ſo infeſted the ſeas, that the merchants could not carry on their trade. This alliance was concluded in France upon conditions ſo advantageous to the Scots, that Achaius, to perpetuate the memory of it, added to the arms of Scotland a double field fowed with lilies. He died in 819.

ACHALALACTLI, a ſpecies of king's-fiſher. See Alcedo, Ornithology *Index*.

ACHAN, the ſon of Carmi, of the tribe of Judah, at the taking of Jericho concealed two hundred ſhekels of ſilver, a Babyloniſh garment, and a wedge of gold, cuntrary to the expreſs command of God. This ſin proved fatal to the Iſraelites, who were repulſed at the ſiege of Ai. In this dreadful exigence, Joſhua proſtrated himſelf before the Lord, and begged that he would have mercy upon his people. Achan was diſcovered by caſting lots, and he and his children were ſtoned to death. This expiation being made, Ai was taken by ſtratagem. Joſh. vii. 8, 9.

ACHANE, an ancient Perſian corn meaſure, containing 45 Attic medimni.

ACHARACA, anciently a town of Lydia, ſituated between Tralles and Nyſa; in which were the temple of Pluto, and the cave Charonium, where patients ſlept in order to obtain a cure.

ACHAT, in *Law*, implies a purchaſe or bargain. And hence probably purveyors were called *Achators*, from their making bargains.

ACHATES, the companion of Æneas, and his moſt faithful friend, celebrated in Virgil.

Achates, in *Natural Hiſtory*, the ſame as Agate.

Achates, in *Ancient Geography*, a river of Sicily, now the *Drillo*; which runs from north to ſouth, almoſt parallel with, and at no great diſtance from, the Gela; and riſes in the north of the territory of Noto. It gave name to the achates, or agate, ſaid to be firſt found there.

ACHAZIB, or Aczib, in *Ancient Geography*, a town of Galilee, in the tribe of Aſher, nine miles from Ptolemais.—Alſo a town in the more ſouthern parts of the tribe of Judah.

ACHEEN, Ache', or Achen, a kingdom of Sumatra in the Eaſt Indies, ſituated on the north-weſtern part of the iſland.

Acheen.

The capital is ſituated on a river which empties itſelf near the north-weſt point, or Acheen head, about two miles from the mouth. It lies in a wide valley, formed like an amphitheatre by two lofty ranges of hills. The river is not large, and by emptying itſelf in ſeveral channels is rendered very ſhallow at the bar. In the dry monſoon, it will not admit boats of any burthen, much leſs large veſſels, which lie without, in the road formed by the iſlands off the point. Though no longer the great mart of eaſtern commodities, it ſtill carries on a conſiderable trade with the natives of that part of the coaſt of Indoſtan called *Tellinga*, who ſupply it with the cotton goods of their country, and receive in return, gold duſt, ſapan wood, betel-nut, patch-leaf, a little pepper, ſulphur, camphire, and benzoin. The country is ſupplied with Bengal opium, and alſo with iron, and many other articles of merchandiſe, by the European traders.

Acheen is eſteemed comparatively healthy, being more free from woods and ſwamps than moſt other portions of the iſland; and the fevers and dyſenteries to which theſe are ſuppoſed to give occaſion, are there ſaid to be uncommon. The ſoil is light and fertile; and the products, beſide thoſe already enumerated as articles of export trade, and a variety of fine fruits, are chiefly rice and cotton. There is likewiſe ſome raw ſilk procured in the country, of very inferior quality. Gold duſt is collected in the mountains near Acheen, but the greateſt part is brought from the ſouthern ports of Nalaboo and Sooſoo. The ſulphur is gathered from a volcanic mountain in the neighbourhood, which ſupplies their own conſumption for the manufacture of gunpowder, and admits of a large exportation.

In their perſons, the Acheneſe differ from the reſt of the Sumatrans, being taller, ſtouter, and darker complexioned. They appear not to be a genuine people; but are thought, with great appearance of reaſon, to be a mixture of Battas, Malays, and Moors, from the weſt of India. In their diſpoſitions they are more active and induſtrious than their neighbours: they poſſeſs more penetration and ſagacity; have more general knowledge; and, as merchants, they deal upon a more extenſive and liberal footing. Their religion is Mahometaniſm; and having a great number of moſques and prieſts, its forms and ceremonies are ſtrictly obſerved.

The appearance of the town, and the nature of the buildings, are much the ſame as are found in the generality of Malay bazars, excepting that the ſuperior wealth of this place has occaſioned a great number of public edifices, but without the ſmalleſt pretenſions to magnificence. The king's palace, if it deſerves the appellation, is a very rude and uncouth piece of architecture, deſigned to reſiſt the force of an enemy, and ſurrounded for that purpoſe by ſtrong walls, but without any regular plan, or view to the modern ſyſtem of military attack. The houſes in common are built of bamboos and rough timber, and raiſed ſome feet from the ground on account of the place being overflowed in the rainy ſeaſon.

A conſiderable fabric of a thick ſpecies of cotton cloth, and of ſtuff for the ſhort drawers worn both by Malays and Acheneſe, is eſtabliſhed here, and ſupplies an extenſive demand. They weave alſo very handſome ſilk pieces, of a particular form, for that part of the dreſs which is called by the Malays *cayen ſerrong*.

The

Acheen. The Acheneſe are expert and bold navigators, and employ a variety of veſſels, according to the voyages they undertake, and the purpoſes for which they deſign them. The river is covered with a multitude of fiſhing ſampans or canoes, which go to ſea with the morning breeze, and return in the afternoon, with the ſea wind, full laden.

Having no convenient coins, though moſt ſpecies of money will be taken here at a valuation, they commonly make their payments in gold duſt, and for that purpoſe are all provided with ſcales or ſmall ſteelyards. They carry their gold about them, wrapped up in pieces of bladder, and often purchaſe to ſo ſmall an amount, as to make uſe of grain or ſeeds for weights.

The monarchy is hereditary; and the king uſually maintains a guard of 100 ſepoys about his palace.

According to Mr Marſden, "the grand council of the nation conſiſts of the king or *ſultan*, four *ooloobballangs*, and eight of a lower degree, who ſit on his right hand, and ſixteen *cajoorangs*, who ſit on his left. At the king's feet ſits a woman, to whom he makes known his pleaſure: by her it is communicated to an eunuch, who ſits next to her; and by him to an officer named *cajoorang gondong*, who then proclaims it aloud to the aſſembly. There are alſo preſent two other officers, one of whom has the government of the *bazar* or market, and the other the ſuperintending and carrying into execution the puniſhment of criminals. All matters relative to commerce and the cuſtoms of the port come under the juriſdiction of the *ſhabandar*, who performs the ceremony of giving the *chap* or licenſe for trade; which is done by lifting a golden-hafted creeſe over the head of the merchant who arrives, and without which he dares not to land his goods. Preſents, the value of which are become pretty regularly aſcertained, are then ſent to the king and his officers. If the ſtranger be in the ſtyle of an ambaſſador, the royal elephants are ſent down to carry him and his letters to the monarch's preſence; theſe being firſt delivered into the hands of an eunuch, who places them in a ſilver diſh, covered with rich ſilk, on the back of the largeſt elephant, which is provided with a machine (*houder*) for that purpoſe. Within about an hundred yards of an open hall where the king ſits, the cavalcade ſtops, and the ambaſſador diſmounts, and makes his obeiſance by bending his body, and lifting his joined hands to his head. When he enters the palace, if an European, he is obliged to take off his ſhoes; and having made a ſecond obeiſance, is ſeated upon a carpet on the floor, where *betel* is brought to him. The throne was ſome years ago of ivory and tortoiſeſhell; and when the place was governed by queens, a curtain of gauze was hung before it, which did not obſtruct the audience, but prevented any perfect view. The ſtranger, after ſome general diſcourſe, is then conducted to a ſeparate building, where he is entertained with the delicacies of the country by the officers of ſtate, and in the evening returns in the manner he came, ſurrounded by a prodigious number of lights. On high days (*aree ryah*) the king goes in great ſtate, mounted on an elephant richly capariſoned, to the great moſque, preceded by his *ooloo-ballangs*, who are armed nearly in the European manner."

The country under the immediate juriſdiction of Acheen, is divided into three diſtricts, named *Duo-pooloo duo*, *Duo pooloo leemo*, and *Duo-pooloo anam*. Each diſtrict is governed by a *pangleemo*, and under him an *imaum* and four *pangeeches* to each moſque. Acheen, Achelous

"Acheen has ever been remarkable for the ſeverity with which crimes are puniſhed by their laws: the ſame rigour ſtill ſubſiſts, and there is no commutation admitted, as is regularly eſtabliſhed in the ſouthern countries. There is great reaſon, however, to conclude, that the poor alone experience the rod of juſtice; the nobles being ſecure from retribution in the number of their dependants. Petty theft is puniſhed by ſuſpending the criminal from a tree, with a gun or heavy weight tied to his feet; or by cutting off a finger, a hand, or leg, according to the nature of the theft. Many of theſe mutilated and wretched objects are daily to be ſeen in the ſtreets. Robbery on the highway and houſe-breaking are puniſhed by drowning, and afterwards expoſing the body on a ſtake for a few days. If the robbery is committed upon an imaum or prieſt, the ſacrilege is expiated by burning the criminal alive. A man who is convicted of adultery is ſeldom attempted to be ſcreened by his friends, but is delivered up to the friends and relations of the injured huſband. Theſe take him to ſome large plain, and forming themſelves in a circle, place him in the middle. A large weapon called a *gadoobong*, is then delivered to him by one of his family; and if he can force his way through thoſe who ſurround him, and make his eſcape, he is not liable to further proſecution; but it commonly happens that he is inſtantly cut to pieces. In this caſe his relations bury him as they would a dead buffalo, refuſing to admit the corpſe into their houſe, or to perform any funeral rites." Theſe diſcouragements to vice might ſeem to beſpeak a moral and virtuous people: yet all travellers agree in repreſenting the Acheneſe as one of the moſt diſhoneſt and flagitious nations of the Eaſt.

Acheen was viſited by the Portugueſe in 1509, only 12 years after they had diſcovered the paſſage to the Eaſt Indies by the Cape of Good Hope. They made various attempts to eſtabliſh themſelves in the country, but were expelled with diſgrace. See SUMATRA.

ACHELOUS, in fabulous hiſtory, wreſtled with Hercules, for no leſs a prize than Deianira, daughter of King Œneus: but as Achelous had the power of aſſuming all ſhapes, the conteſt was long dubious: at laſt, as he took that of a bull, Hercules tore off one of his horns; ſo that he was forced to ſubmit, and to redeem it by giving the conqueror the horn of Amalthea, the ſame with the cornucopiæ or horn of plenty; which Hercules having filled with a variety of fruits, conſecrated to Jupiter. Some explain this fable, by ſaying, That Achelous is a winding river of Greece, whoſe ſtream was ſo rapid, that it roared like a bull, and overflowed its banks; but Hercules, by bringing it into two channels, broke off one of the horns, and ſo reſtored plenty to the country. See the next article.

ACHELOUS, a river of Acarnania; which riſes in Mount Pindus, and, dividing Ætolia from Acarnania, falls from north to ſouth into the Sinus Corinthiacus. It was formerly called *Thoas* from its impetuoſity, and *king of rivers*, (Homer). The epithet *Acheloius* is uſed for *Aqueus*, (Virgil); the ancients calling all water *Achelous*, eſpecially in oaths, vows, and ſacrifices, according to Ephorus: Now called *Aſpro Potamo*. Rivers are by the ancient poets called *Taurifor.nes*,

either

Acheri || Achiar.

either from the bellowing of their waters, or from their ploughing the earth in their courſe: Hercules, reſtraining by dikes and mounds the inundations of the *Achelous*, is ſaid to have broken off one of his horns, and to have brought back plenty to the country. See the preceding article.

ACHERI, Luke d', a learned Benedictine of the congregation of St Maur, was born at St Quintin, in Picardy, in 1609; and made himſelf famous by printing ſeveral works, which till then were only in manuſcript: particularly, the epiſtle attributed to St Barnabas; the works of Lanfranc, archbiſhop of Canterbury; a collection of ſcarce and curious pieces, under the title of *Spicilegium*, i. e. Gleanings, in thirteen volumes, quarto. The prefaces and notes, which he annexed to many of theſe pieces, ſhow him to have been a man of genius and abilities. He had alſo ſome ſhare in the pieces inſerted in the firſt volumes of The acts of the Saints of the order of St Benedict; the title whereof acquaints us that they were collected and publiſhed by him and Father Mabillon. After a very retired life, till the age of 73, he died at Paris the 29th of April 1685, in the abbey of St Germain in the Fields, where he had been librarian.

ACHERNER, or Acharner, a ſtar of the firſt magnitude in the ſouthern extremity of the conſtellation Eridanus, but inviſible in our latitude.

ACHERON, in mythology, a river of Epirus. The poets feigned it to have been the ſon of Ceres, whom ſhe hid in hell for fear of the Titans, and turned into a river, over which ſouls departed were ferried in their way to Elyſium.

Acheron, in *Ancient Geography*, a river of Theſprotia, in Epirus; which, after forming the lake Acheruſia, at no great diſtance from the promontory of Chimerium, falls into the ſea to the weſt of the Sinus Ambracius, in a courſe from north to ſouth.

Acheron, or Acheros, a river of the Bruttii in Italy, running from eaſt to weſt; where Alexander king of Epirus was ſlain by the Lucani, being deceived by the oracle of Dodona, which bade him beware of Acheron.

ACHARSET, an ancient meaſure of corn, conjectured to be the ſame with our quarter, or eight buſhels.

ACHERUSIA palus, a lake between Cumæ and the promontory Miſenum, now *il Lago della Collucia*. (Cluverius). Some confound it with the *Lacus Lucrinus*, and others with the *Lacus Averni*. But Strabo and Pliny diſtinguiſh them. The former takes it to be an effuſion, exundation, or waſhes of the ſea, and therefore called by Lycophron, Αχηρουσια χυσις.—Alſo a lake of Epirus, through which the Acheron runs.—There is alſo an *Acheruſia*, a peninſula of Bithynia on the Euxine, near Heraclea; and a cave there of the ſame name, through which Hercules is fabled to have deſcended to hell to drag forth Cerberus.

ACHIAR, is a Malayan word, which ſignifies all ſorts of fruits and roots pickled with vinegar and ſpice. The Dutch import from Batavia all ſorts of achiar, but particularly that of Bamboo, a kind of cane, extremely thick, which grows in the Eaſt Indies. It is preſerved there, whilſt it is ſtill green, with very ſtrong vinegar and ſpice; and is called *bamboo achiar*. The name changes according to the fruit with which the achiar is made.

ACHICOLUM, is uſed to expreſs the *fornix*, *tholus*, or *ſudatorium* of the ancient baths; which was a hot room where they uſed to ſweat. It is alſo called *architholus*. Achicolum || Achiluni.

ACHILLÆA, Yarrow, Milfoil, Nosebleed, or Sneezewort. See Botany *Index*.

ACHILLEID, Achilleis, a celebrated poem of Statius, in which that author propoſed to deliver the whole life and exploits of Achilles; but being prevented by death, he has only treated of the infancy and education of his hero. See Statius.

ACHILLES, one of the greateſt heroes of ancient Greece, was the ſon of Peleus and Thetis. He was a native of Phthia, in Theſſaly. His mother, it is ſaid, in order to conſume every mortal part of his body, uſed to lay him every night under live coals, anointing him with ambroſia, which preſerved every part from burning but one of his lips, owing to his having licked it. She dipped him alſo in the waters of the river Styx; by which his whole body became invulnerable, except that part of his heel by which ſhe held him. But this opinion is not univerſal, nor is it a part of his character as drawn by Homer; for in the Iliad (B. xxi. 161.) he is actually wounded in the right arm, by the lance of Aſteropeus, in the battle near the river Scamander. Thetis afterwards intruſted him to the care of the centaur Chiron, who, to give him the ſtrength neceſſary for martial toil, fed him with honey and the marrow of lions and wild boars. To prevent his going to the ſiege of Troy, ſhe diſguiſed him in female apparel, and hid him among the maidens at the court of King Lycomedes: but Ulyſſes diſcovering him, perſuaded him to follow the Greeks. Achilles diſtinguiſhed himſelf by a number of heroic actions at the ſiege. Being diſguſted, however, with Agamemnon for the loſs of Briſeïs, he retired from the camp. But returning to avenge the death of his friend Patroclus, he ſlew Hector, faſtened his corpſe to his chariot, and dragged it round the walls of Troy. At laſt Paris, the brother of Hector, wounded him in the heel with an arrow, while he was in the temple treating about his marriage with Philoxena, daughter of King Priam. Of this wound he died, and was interred on the promontory of Sigæum; and after Troy was taken, the Greeks ſacrificed Philoxena on his tomb, in obedience to his deſire, that he might enjoy her company in the Elyſian fields. It is ſaid, that Alexander, ſeeing this tomb, honoured it by placing a crown upon it; at the ſame time crying out, that "Achilles was happy in having, during his life, ſuch a friend as Patroclus; and, after his death, a poet like Homer." Achilles is ſuppoſed to have died 1183 years before the Chriſtian era.

Achilles *Tatius*. See Tatius.

Tendo Achillis, in *Anatomy*, is a ſtrong tendinous cord formed by the tendons of ſeveral muſcles, and inſerted into the os calcis. It has its name from the fatal wound Achilles is ſaid to have received in that part from Paris the ſon of Priam.

ACHILLINI, Alexander, born at Bologna, and doctor of philoſophy in that univerſity. He flouriſhed in the 15th and 16th centuries, and by way of eminence was ſtyled the Great Philoſopher. He was a ſtedfaſt follower and accurate interpreter of Averroes upon Ariſtotle, but moſt admired for his acuteneſs and ſtrength of arguing in private and public diſputations.

He,

Achillini | Achmet.

He made a ſurpriſing quick progreſs in his ſtudies, and was very early promoted to a profeſſorſhip in the univerſity; in which he acquitted himſelf with ſo much applauſe that his name became famous throughout all Italy. He continued at Bologna till the year 1506; when the univerſity of Padua made choice of him to ſucceed Antonio Francatiano in the firſt chair of philoſophy, and his fame brought vaſt numbers of ſtudents to his lectures at Padua: but the war, wherein the republic of Venice was engaged againſt the league of Cambray, putting a ſtop to the lectures of that univerſity, he withdrew to his native country, where he was received with the ſame marks of honour and diſtinction as before, and again appointed profeſſor of philoſophy in Bologna. He ſpent the remainder of his life in this city, where he died, and was interred with great pomp in the church of St Martin the Great, which belongs to the Carmelite friars. Jovius, who knew Achillini, and heard his lectures, ſays, that he was a man of ſuch exceeding ſimplicity, and ſo unacquainted with addreſs and flattery, that he was a laughing ſtock to the pert and ſaucy young ſcholars, although eſteemed on account of his learning. He wrote ſeveral pieces on philoſophical ſubjects, which he publiſhed, and dedicated to John Bentivogli.

Achillini, *Claudius*, grandſon of the former, read lectures at Bologna, Ferrara, and Parma; where he was reputed a great philoſopher, a learned divine, an excellent lawyer, an eloquent orator, a good mathematician, and an elegant poet. He accompanied Cardinal Ludovino, who went as legate into Piedmont; but being afterward neglected by this cardinal, when he became pope under the name of Gregory XV. he left Rome in diſguſt, and retired to Parma; where the duke appointed him profeſſor of law, with a good ſalary. A canzone which he addreſſed to Louis XIII. on the birth of the dauphin, is ſaid to have been rewarded by Cardinal Richlieu, with a gold chain of the value of 1000 crowns. He publiſhed a volume of Latin letters, and another of Italian poems, which gained him great reputation. He died in 1640, aged 66.

ACHIOTTE, or Achiotl, a foreign drug, uſed in dying, and in the preparation of chocolate. It is the ſame with the ſubſtance more uſually known by the name of Arnotto. See Bixa, Botany *Index*.

ACHIROPŒTOS, a name given by ancient writers to certain miraculous pictures of Chriſt and the Virgin, ſuppoſed to have been made without hands.—The moſt celebrated of theſe is the picture of Chriſt, preſerved in the church of St John Lateran at Rome; ſaid to have been begun by St Luke, but finiſhed by the miniſtry of angels.

ACHMET, ſon of Seerim, an Arabian author, has left a book concerning the interpretation of dreams according to the doctrine of the Indians, Perſians, and Egyptians, which was tranſlated into Greek and Latin. The original is now loſt. He lived about the 4th century.

Achmet I. emperor of the Turks, the third ſon and ſucceſſor of Mahomet III. aſcended the throne before he reached the age of fifteen. During the period of his reign, the Turkiſh empire enjoyed at one time great proſperity, and at another was depreſſed by adverſity. The Aſiatic rebels, who took refuge in Perſia, involved the two empires in a war, during which the Turks loſt Bagdad, to recover which every effort proved unſucceſsful. In his reign Tranſylvania and Hungary were the ſcenes of war between the Turks and Germans. In addition to the calamities and diſtreſſes of war abroad, and internal tumults and broils, a pretender to his throne diſturbed his repoſe, and made attempts on his life. He was much devoted to amuſements; and ſpent his time chiefly in the haram and in the ſports of the field. His ſeraglio conſiſted of 3000 women; and his hunting eſtabliſhment was compoſed of 40,000 falconers, and an equal number of huntſmen, in different parts of his dominions. He expended great ſums of money in building, and particularly on a magnificent moſque which he erected in the Hippodrome. Achmet was leſs cruel than ſome of his predeceſſors; but he was haughty and ambitious. He died in 1617 at the age of 29. His three ſons ſucceſſively aſcended the throne after him. (*Gen. Biog.*) Achmet

Achmet II. emperor of the Turks, ſon of Sultan Ibrahim, ſucceeded his brother Solyman in 1691. The adminiſtration of affairs during his reign was feeble and unſettled. The Ottoman territory was overrun by the imperialiſts; the Venetians ſeized the Morea, took the iſle of Chios, and ſeveral places in Dalmatia; and the Arabs attacked and plundered a caravan of pilgrims, and even laid ſiege to Mecca. Though he never diſcovered the vigour and ſagacity that are eſſentially requiſite in the character of a ſovereign, in private life he was mild, devout, and inoffenſive. He was fond of poetry and muſic; and to thoſe about his perſon, he was chearful and amiable. He died in 1695 at the age of 50.

Achmet III. emperor of the Turks, ſon of Mahomet IV. ſucceeded his brother Muſtapha II. who was depoſed in 1703. After he had ſettled the diſcontents of the empire, his great object was to amaſs wealth. With this view he debaſed the coin, and impoſed new taxes. He received Charles XII. of Sweden, who took refuge in his dominions, after the battle of Pultowa in 1709, with great hoſpitality; and, influenced by the ſultana mother, he declared war againſt the Czar Peter, Charles's formidable rival. Achmet recovered the Morea from the Venetians; but his expedition into Hungary was leſs fortunate, for his army was defeated by Prince Eugene at the battle of Peterwaradin in 1716. As the public meaſures of Achmet were influenced by miniſters and favourites, the empire during his reign was frequently diſtracted by political ſtruggles and revolutions. The diſcontent and ſedition of his ſoldiers at laſt drove him from the throne. He was depoſed in 1730, and ſucceeded by his nephew Mahomet V. He was confined in the ſame apartment which had been occupied by his ſucceſſor previous to his elevation to the throne, and died of an apoplexy in 1736, at the age of 74. The intentions of this prince, it is ſaid, were upright; but his talents were moderate, never diſcovering that vigour of mind and ſteadineſs of action which are ſo neceſſary in the character of a ſovereign. Exceſſive confidence in his vizier diminiſhed the ſplendour of his reign, and probably tended to ſhorten the period of it. (*Gen. Biog.*)

Achmet Geduc, a famous general under Mahomet II. and Bajazet II. in the 15th century. When Mahomet II. died, Bajazet and Zezan both claimed the throne: Achmet ſided with the former, and by his bravery

Achmetschet, Achmim.

bravery and conduct fixed the crown on his head. But Bajazet took away his life; shining virtue being always an unpardonable crime in the eyes of a tyrant.

ACHMETSCHET, a town of the peninsula of the Crimea, the residence of the sultan Galga, who is eldest son of the khan of Tartary. E. Long. 52. 20. N. Lat. 45. 35.

ACHMIM, a large town of Upper Egypt, situated on the eastern bank of the Nile. 'One admires there (says Abulfeda, as quoted by M. Savary) a temple which is comparable to the most celebrated monuments of antiquity. It is constructed with stones of a surprising size, on which are sculptured innumerable figures.' Though this town be fallen from its ancient splendour, it is still one of the most beautiful of Upper Egypt. According to M. Savary, an Arab prince commands there, and the police is well attended to. The streets are wide and clean, and commerce and agriculture flourish. It has a manufacture of cotton stuffs, and pottery, which are conveyed over all Egypt. It is the same that Herodotus calls *Chemmis*, and Strabo *Panopolis*, or the city of Pan, who was worshipped there. Herodotus says, that Perseus was a native of this city, and that his descendants had established festivals there in his honour. It has lost its ancient edifices, and much of its extent; the ruins of the temple, described by Abulfeda, being without its limits to the north. Nothing remains of it but some stones, of such magnitude that the Turks have not been able to move them. They are covered with hieroglyphics. On one of them are traced four concentric circles, in a square. The innermost of these contains a sun. The two succeeding ones, divided into 12 parts, contain, one, 12 birds, the other, 12 animals, almost effaced, which appear to be the signs of the zodiac. The fourth has no divisions, and presents 12 human figures: which Mr Savary imagines to represent the 12 gods, the 12 months of the year, and the 12 signs of the zodiac. The Egyptians, says Herodotus, were the first who divided the year into 12 months, and employed the names of the 12 gods. The four seasons occupy the angles of the square, on the side of which may be distinguished a globe with wings. M. Savary thinks it probable that this stone belonged to a temple dedicated to the sun, that the whole of these hieroglyphics mark his passage into the signs of the zodiac, and his course, whose revolution forms the year. The columns of this temple have been partly broken to make lime and millstones. Some of them have been transported into one of the mosques of Achmim, where they are placed without taste; others are heaped up in the squares of the town.

M. Savary tells us of a serpent which is worshipped here, and is the wonder of the country. "Upwards of a century ago (says he), a religious Turk called *Scheik Haridi* died here. He passed for a saint among the Mahometans; who raised a monument to him, covered with a cupola, at the foot of the mountain. The people flocked from all parts to offer up their prayers to him. One of their priests, profiting by their credulity, persuaded them that God had made the soul of Scheik Haridi puts into the body of a serpent. Many of these are found in the Thebais, which are harmless; and he had taught one to obey his voice. He appeared with his serpent, dazzled the vulgar by his surprising tricks, and pretended to cure all disorders. Some lucky instances of success, due to nature alone, and sometimes to the imagination of the patients, gave him great celebrity. He soon consigned his serpent Haridi to the tomb, producing him only to oblige princes and persons capable of giving him a handsome recompense. The successors of this priest, brought up in the same principles, found no difficulty in giving sanction to so advantageous an error. They added to the general persuasion of his virtue that of his immortality. They had the boldness even to make a public proof of it. The serpent was cut in pieces in presence of the emir, and placed for two hours under a vase. At the instant of lifting up the vase, the priests, no doubt, had the address to substitute one exactly resembling it. A miracle was proclaimed, and the immortal Haridi acquired a fresh degree of consideration. This knavery procures them great advantages. The people flock from all quarters to pray at this tomb; and if the serpent crawls out from under the stone, and approaches the suppliant, it is a sign that his malady will be cured. It may be imagined, that he does not appear till an offering has been made proportioned to the quality and riches of the different persons. In extraordinary cases, where the sick persons cannot be cured without the presence of the serpent, a *pure virgin* must come to solicit him. To avoid inconveniences on this head, they take care to choose a *very young girl indeed*. She is decked out in her best clothes, and crowned with flowers. She puts herself in a praying attitude; and as the priests are inclined, the serpent comes out, makes circles round the young suppliant, and goes and reposes on her. The virgin, accompanied by a vast multitude, carries him in triumph amidst the general acclamation. No human reasoning would persuade these ignorant and credulous Egyptions that they are the dupes of a few impostors; they believe in the serpent Haridi as firmly as in the prophet."

Achomy || Achromatic.

ACHONRY, a small town of Ireland, in the province of Connaught and county of Sligo, seated on the river Shannon.

ACHOR, a valley of Jericho, lying along the river Jordan, not far from Gilgal; so called from Achan, the troubler of Israel, being there stoned to death.

ACHOR, in *Medicine*, a species of HERPES.

ACHOR, in *Mythology*, the god of flies; to whom, according to Pliny, the inhabitants of Cyrene sacrificed, in order to obtain deliverance from the insects and the disorders occasioned by them.

ACHRADINA, in *Ancient Geography*, one of the four cities or divisions of Syracuse, and the strongest, largest, and most beautiful part of it; separated by a very strong wall from the outer town, *Tycha* and *Neapolis*. It was adorned with a very large forum, with beautiful porticoes, a most elegant prytaneum, a spacious senate-house, and a superb temple of Jupiter Olympius.

ACHRAS, or SAPOTA PLUM. See BOTANY *Index*.

ACHOMATIC, an epithet expressing want of colour. The word is Greek, being compounded of α privative, and $\chi\rho\omega\mu\alpha$, *colour*. This term was first introduced into astronomy by De la Lande.

ACHROMATIC Telescopes, are telescopes contrived to remedy the aberrations in colours. They were invent-

Achteling || Acidalus.

ed by Mr John Dollond, optician, and have been ſince improved by his ſon and others. See ABERRATION. —A more particular account of the invention and conſtruction of theſe inſtruments will be found under OPTICS.

ACHTELING, a meaſure for liquids uſed in Germany. Thirty-two *achtelings* make a *heemer;* four *ſciltins* or *ſciltins* make an *achteling*.

ACHYR, a ſtrong town and caſtle of the Ukrain, ſubject to the Ruſſians ſince 1667. It ſtands on the river Uorſkla, near the frontiers of Ruſſia, 127 miles weſt of Kiow. E. Long. 36. 0. N. Lat. 49. 32.

ACHYRANTHES, in *Botany*. See BOTANY *Index*.

ACICANTHERA, in *Botany*, the trivial name of a ſpecies of RHEXIA.

ACICULÆ, the ſmall pikes or prickles of the hedgehog, echinus marinus, &c.

ACIDALIUS, VALENS, would, in all probability, have been one of the greateſt critics in theſe latter ages, had he lived longer to perfect thoſe talents which nature had given him. He was born at Witſtock, in Brandenburg; and having viſited ſeveral academies in Germany, Italy, and other countries, where he was greatly eſteemed, he afterwards took up his reſidence at Breſlaw, the metropolis of Sileſia. Here he remained a conſiderable time, in expectation of ſome employment; but nothing offering, he turned Roman Catholic, and was choſen rector of a ſchool at Nieſſa. It is related, that about four months after, as he was following a proceſſion of the hoſt, he was ſeized with a ſudden phrenſy; and being carried home, expired in a very ſhort time. But Thuanus tells us, that his exceſſive application to ſtudy was the occaſion of his untimely death; and that his ſitting up in the night compoſing his Conjectures on Plautus, brought upon him a diſtemper which carried him off in three days, on the 25th of May 1595, being juſt turned of 28. He wrote a Commentary on Quintus Curtius; alſo, Notes on Tacitus, on the twelve Panegyrics; beſides ſpeeches, letters, and poems. His poetical pieces are inſerted in the *Deliciæ* of the German poets, and conſiſt of epic verſes, odes, and epigrams. A little work printed in 1595, under the title of *Mulieres non eſſe homines*, "That women were not of the human ſpecies," was falſely aſcribed to him. But the fact was, that Acidalius happening to meet with the manuſcript, and thinking it very whimſical, tranſcribed it, and gave it to the bookſeller, who printed it. The performance was highly cenſured, ſo that the bookſeller being ſeized, he diſcovered the perſon who gave him the manuſcript, and a terrible outcry was made againſt Acidalius. A ſtory goes, that being one day to dine at a friend's houſe, there happened to be ſeveral ladies at table; who ſuppoſing him to be the author, were moved with ſo much indignation, that they threatened to throw their plates at his head. Acidalius, however, ingeniouſly diverted their wrath. In his opinion, he ſaid the author was a judicious perſon, the ladies being certainly more of the ſpecies of *angels* than of *men*.—Mr Baillet has given him a place among his *Enfans Celebres;* and ſays, that he wrote a comment upon Plautus when he was but 17 or 18 years old, and that he compoſed ſeveral Latin poems at the ſame age.

ACIDALUS, a fountain in Orchomenus, a city of Bœotia, in which the Graces, who are ſacred to Venus, bathed. Hence the epithet *Acidalia*, given to Venus. (Virgil.)

Acidity || Acids.

ACIDITY, that quality which renders bodies acid.

ACIDOTON, in *Botany*, the trivial name of a ſpecies of ADELIA.

ACIDS, in *Chemiſtry*, a claſs of ſubſtances which are diſtinguiſhed by the following properties:

1. When applied to the tongue, they excite that ſenſation which is called *ſour* or *acid*.

2. They change the blue colours of vegetables to a red. The vegetable blues employed for this purpoſe are generally tincture of litmus and ſyrup of violets or of radiſhes, which have obtained the name of *reagents* or *teſts*. If theſe colours have been previouſly converted to a *green* by alkalies, the acids reſtore them again.

3. They unite with water in almoſt any proportion.

4. They combine with all the alkalies, and moſt of the metallic oxides and earths, and form with them thoſe compounds which are called *ſalts*.

It muſt be remarked, however, that every acid does not poſſeſs all theſe properties; but all of them poſſeſs a ſufficient number of them to diſtinguiſh them from other ſubſtances. And this is the only purpoſe which artificial definition is meant to anſwer.

The acids are by far the moſt important claſs of bodies in chemiſtry. It was by their means indeed, by ſtudying their properties, and by employing them as inſtruments in the examination of other bodies, that men of ſcience laid the foundation of chemiſtry, and brought it to that ſtate in which we find it at preſent. The nature and compoſition of acids, therefore, became a very important point of diſcuſſion, and occupied the attention of the moſt eminent cultivators of the ſcience.

Paracelſus believed that there was only one acid principle in nature which communicated taſte and ſolubility to the bodies in which it was combined. Beccher embraced the ſame opinion; and added to it, that this acid principle was a compound of earth and water, which he conſidered as two elements. Stahl adopted the theory of Beccher, and endeavoured to prove that his acid principle is ſulphuric acid; of which, according to him, all the other acids are mere compounds. But his proofs were only conjectures or vague experiments, from which nothing could be deduced. Nevertheleſs, his opinion, like every other which he advanced in chemiſtry, continued to have ſupporters for a long time, and was even countenanced by Macquer. At laſt its defects began to be perceived; Bergman and Scheele declared openly againſt it; and their diſcoveries, together with thoſe of Lavoiſier, demonſtrated the falſehood of both parts of the theory, by ſhewing that ſulphuric acid does not exiſt in the other acids, and that it is not compoſed of water and earth, but of ſulphur and oxygen.

The opinion, however, that acidity is owing to ſome principle common to all the ſalts, was not abandoned. Wallerius, Meyer, and Sage, had advanced different theories in ſucceſſion about the nature of this principle; but as they were founded rather on conjecture and analogy than direct proof, they obtained but few advocates. At laſt M. Lavoiſier, by a number of ingenious and accurate experiments, proved that ſeveral combuſtible

Acids. combuſtible ſubſtances, when united with oxygen, form acids; that a great number of acids contain oxygen; and that when this principle is ſeparated from them, they loſe their acid properties. He concluded, therefore, that the acidifying principle is oxygen, and that acids are nothing elſe but combuſtible ſubſtances combined with oxygen, and differing from one another according to the nature of the combuſtible baſe.

This concluſion, as far as regards the greater number of acids, is certainly true. All the ſimple combuſtibles, except hydrogen, are convertible into acids; and theſe acids are compoſed of oxygen and the combuſtible body combined: this is the caſe alſo with four of the metals. It muſt not, however, be admitted without ſome limitation.

1. When it is ſaid that oxygen is the acidifying principle, it is not meant ſurely to affirm that oxygen poſſeſſes the properties of an acid, which would be contrary to truth; all that can be meant is, that it enters as a component part into acids, or that acids contain it as an eſſential ingredient.

2. But, even in this ſenſe, the aſſertion cannot be admitted: for it is not true that oxygen is an eſſential ingredient in all acids, or that no body poſſeſſes the property of an acid unleſs it contains oxygen. Sulphurated hydrogen, for inſtance, poſſeſſes all the characters of an acid, yet it contains no oxygen.

3. When it is ſaid that oxygen is the acidifying principle, it cannot be meant ſurely to affirm that the combination of oxygen with bodies produces in all caſes an acid, or that whenever a body is combined with oxygen, the product is an acid; for the contrary is known to every chemiſt. Hydrogen, for inſtance, when combined with oxygen, forms not an acid, but water, and the greater number of metallic bodies form only oxides.

All that can be meant, then, when it is ſaid that oxygen is the acidifying principle, is merely that it exiſts as a component part in the greater number of acids; and that many acids are formed by combuſtion, or by ſome equivalent proceſs. The truth is, that the claſs of acids is altogether arbitrary; formed when the greater number of the bodies arranged under it were unknown, and before any preciſe notion of what ought to conſtitute the characteriſtic marks of an acid had been thought of. New bodies, when they were diſcovered, if they poſſeſſed any properties analogous to the known acids, were referred without ſcruple to the ſame claſs, how much ſoever they differed from them in other particulars. Hence we find, under the head of acids, bodies which have ſcarcely a ſingle property in common except that of combining with alkalies and earths. What ſubſtances, for inſtance, can be more diſſimilar than ſulphuric, pruſſic and uric acids? Hence the difficulty of aſſigning the general characters of the claſs of acids, and the diſputes which have ariſen about the propriety of claſſing certain bodies among acids. If we lay it down as an axiom that oxygen is the acidifying principle, we muſt either include among acids a great number of bodies which have not the ſmalleſt reſemblance to thoſe ſubſtances which are at preſent reckoned acids, or exclude from the claſs ſeveral bodies which have the properties of acids in perfection. The claſs of acids being perfectly arbitrary, there cannot be ſuch a thing as an acidifying principle in the moſt extenſive ſenſe of the word. Acidulous

The acids at preſent known amount to about 30; and all of them, eight excepted, have been diſcovered within theſe laſt 40 years. They may be arranged under two general heads: 1. Acids compoſed of two ingredients. 2. Acids compoſed of more than two component parts. (*Thomſon's Chemiſtry*). See CHEMISTRY. Acis.

ACIDULOUS, denotes a thing that is ſlightly *acid*: it is ſynonymous with the word *ſub-acid*.

ACIDULÆ. Mineral waters that are briſk and ſparkling without the action of heat are thus named; but if they are hot alſo, they are called THERMÆ.

ACIDULATED, a name given to medicines that have an acid in their compoſition.

ACIDUM AEREUM, the ſame with *fixed air*; or, in modern chemiſtry, *carbonic acid*.

Acidum pingue, an imaginary acid, which ſome German chemiſts ſuppoſed to be contained in fire, and by combining with alkalies, lime, &c. to give them their cauſtic properties; an effect which is found certainly to depend on the loſs of their carbonic acid.

ACILA, in *Ancient Geography*, a ſtaple or mart town in Arabia Felix, on the Arabian gulf, from which, according to Pliny, the Scenitæ Sabæi ſet ſail for India. Now *Ziden*.

ACILISENE, in *Ancient Geography*, a diſtrict of the leſſer Armenia towards the head of the Euphrates, having that river on the weſt, and on the ſouth a river to which Xenophon and Pliny ſeem to have given the ſame name.

ACILIUS GLABRIO, MARCUS, conſul in the year of Rome 562, and 211 years before the Chriſtian era, diſtinguiſhed himſelf by his bravery and conduct in gaining a complete victory over Antiochus the Great, king of Syria, at the ſtraits of Thermopylæ in Theſſaly, and on ſeveral other occaſions. He built the temple of Piety at Rome, in conſequence of a vow which he made before this battle. He is mentioned by Pliny, Valerius Maximus, and others.

ACINASIS, in *Ancient Geography*, a river of Aſia, at the ſouthern extremity of Colchis, which diſcharges itſelf into the Euxine ſea, between the Bathys and the Iſis. It is mentioned by Arrian in his Periplus.

ACINIPPO, in *Ancient Geography*, a town of Bætica: its ruins, called *Ronda la Viega*, are to be ſeen near Arunda, in the kingdom of Granada.

ACINODENDRUM, in *Botany*, the trivial name of a ſpecies of MELASTOMA.

ACINOS, in *Botany*, the trivial name of a ſpecies of THYMUS. See BOTANY *Index*.

ACINUS, or ACINI, the ſmall protuberances of mulberries, ſtrawberries, &c. and by ſome applied to grapes. Generally it is uſed for thoſe ſmall grains growing in branches, after the manner of grapes, as *liguſtrum*, &c.

ACIS, in *Mythology*, the ſon of Faunus and the nymph Simaethis, was a beautiful ſhepherd of Sicily, who being beloved by Galatea, Polyphemus the giant was ſo enraged, that he daſhed out his brains againſt a rock; after which Galatea turned him into a river, which was called by his name.

The Sicilian authors ſay, that Acis was a king of

Acknowledgment || Acœmetæ.

this part of the iſland, who was ſlain by Polyphemus, one of the giants of Ætna, in a fit of jealouſy.

ACIS, a river of Sicily, celebrated by the poets, running from a very cold ſpring, in the woody and ſhady foot of Mount Ætna, for the ſpace of a mile eaſtward into the ſea, along green and pleaſant banks, with the ſpeed of an arrow, from which it takes its name. Its waters are now impregnated with ſulphureous vapours, though formerly they were celebrated for their ſweetneſs and ſalubrity, and were held ſacred by the Sicilian ſhepherds:

Quique per Ætnæos Acis petit æquora fines,
Et dulci gratam Nereïda perluit unda. SIL. ITAL.

It is now called *Il Fiume Fredda*, *Aci*, *Iaci*, or *Chiaci*, according to the different Sicilian dialects: Antonine calls it *Acius*. It is alſo the name of a hamlet at the mouth of the *Acis*.

ACKNOWLEDGMENT, in a general ſenſe, is a perſon's owning or confeſſing a thing; but, more particularly, is the expreſſion of gratitude for a favour.

ACKNOWLEDGMENT-Money, a certain ſum paid by tenants, in ſeveral parts of England, on the death of their landlords, as an acknowledgment of their new lords.

ACLIDES, in *Roman Antiquity*, a kind of miſſile weapon, with a thong affixed to it, by which it was drawn back. Moſt authors deſcribe it as a ſort of dart or javelin; but Scaliger makes it roundiſh or globular, and full of ſpikes, with a ſlender wooden ſtem to poiſe it by. Each warrior was furniſhed with two.

ACLOWA, in *Botany*, a barbarous name of a ſpecies of COLUTEA. It is uſed by the natives of Guinea, to cure the itch: They rub it on the body as we do unguents. See COLUTEA, BOTANY *Index*.

ACME, the top or height of any thing. It is uſually applied to the maturity of an animal juſt before it begins to decline; and phyſicians have uſed it to expreſs the utmoſt violence or criſis of a diſeaſe.

ACMELLA, in *Botany*, the trivial name of a ſpecies of SPILANTHUS. See BOTANY *Index*.

ACMODÆ, in *Ancient Geography*, ſeven iſlands in the Britiſh ſea, ſuppoſed by ſome to be the Scilly iſlands, but by others thoſe of Shetland near the Orkneys, on the northern coaſt of Scotland.

ACMONIA, and AGMONIA, in Peutinger's map, a town of Phrygia Major, now in ruins. The inhabitants are called *Acmonenſes* by Cicero, and the city *Civitas Acmonenſis*. Alſo a city of Dacia (Ptolemy), on the Danube, near the ruins of Trajan's bridge, built by Severus, and called *Severicum*; diſtant 12 German miles from Temeſwar, to the ſouth-eaſt.

ACNIDA, VIRGINIAN HEMP. See BOTANY *Index*.

ACNUA, in *Roman Antiquity*, ſignified a certain meaſure of land, about an Engliſh rood, or fourth part of an acre.

ACO, in *Geography*, a town of Peru in South America. It is alſo the name of a river in Africa, which riſes in the Abyſſinian mountains, runs in a ſouth eaſt courſe, and diſcharges itſelf into the Indian ocean.

ACOEMETÆ, or ACOEMETI, in *Church Hiſtory*, or, Men who lived without ſleep; a ſet of monks who chanted the divine ſervice night and day in their places of worſhip. They divided themſelves into three bodies, who alternately ſucceeded one another, ſo that the ſervice in their churches was never interrupted. This practice they founded upon the precept, *Pray without ceaſing*. They flouriſhed in the eaſt about the middle of the 5th century. There are a kind of acoemeti ſtill ſubſiſting in the Romiſh church, viz. the religious of the holy ſacrament, who keep up a perpetual adoration, ſome one or other of them praying before the holy ſacrament day and night.

Acola || Aconiti.

ACOLA, in *Ancient Geography*, a town in Media, on the borders of the Hyrcanian ſea.

ACOLUTHI, or ACOLUTHISTS, in antiquity, was an appellation given to thoſe perſons who were ſteady and immoveable in their reſolutions; and hence the Stoics, becauſe they would not forſake their principles, nor alter their reſolutions, acquired the title of *acoluthi*. The word is Greek, and compounded of α privative, and κολευθος, way; as never turning from the original courſe.

ACOLUTHI, among the ancient Chriſtians, implied a peculiar order of the inferior clergy in the Latin church, for they were unknown to the Greeks for above 400 years. They were next to the ſubdeacon; and we learn from the fourth council of Carthage, that the archdeacon, at their ordination, put into their hands a candleſtick with a taper, giving them thereby to underſtand that they were appointed to light the candles of the church; as alſo an empty pitcher, to imply that they were to furniſh wine for the euchariſt. Some think they had another office, that of attending the biſhop wherever he went. The word is Greek, and compounded of α privative, and κωλυω, to hinder or diſturb.

ACOLYTHIA, in the Greek church, denotes the office or order of divine ſervice; or the prayers, ceremonies, hymns, &c. whereof the Greek ſervice is compoſed.

ACOMA, a town of New Mexico, ſeated on a hill with a ſtrong caſtle. To reach the town, you walk up 50 ſteps cut out of the rock. It is the capital of that province, and was taken by the Spaniards in 1599. W. Long. 104. 15. Lat. 35. 0.

ACOMAC, the name of a county in Virginia. It is on the eaſtern ſide of Cheſapeak bay, on a ſlip of land, by the Virginians called the *eaſtern ſhore*. It contains 13,959 inhabitants.

ACOMINATUS, NICETAS, was ſecretary to Alexius Comnenus and to Iſaacus Angelus ſucceſſively: he wrote a hiſtory from the death of Alexius Comnenus in 1118, where Zonaras ended his, to the year 1203, which has gone through many editions, and has been much applauded by the beſt critics.

ACONCROBA, in *Botany*, the indigenous name of a plant which grows wild in Guinea, and is in great eſteem among the natives for its virtues in the ſmall-pox. They give an infuſion of it in wine. The leaves of this plant are opaque, and as ſtiff as thoſe of the philyrea: they grow in pairs, and ſtand on ſhort foot-ſtalks; they are ſmall at each end, and broad in the middle; and the largeſt of them are about three inches in length, and an inch and a quarter in breadth in the middle. Like thoſe of our bay, they are of a duſky colour on the upper ſide, and of a pale green underneath.

ACONITE. See ACONITUM, BOTANY *Index*.

Winter ACONITE. See HELLEBORUS, BOTANY *Index*.

ACONITI, in antiquity, an appellation given to ſome

Aconitum || Acoſta.

ſome of the ATHLETÆ, but differently interpreted. Mercurialis underſtands it of thoſe who only anointed their bodies with oil, but did not ſmear themſelves over with duſt, as was the uſual practice.

ACONITUM, ACONITE, WOLFSBANE, or MONKSHOOD. See BOTANY *Index*.

ACONTIAS, in *Zoology*, an obſolete name of the anguis jaculus, or dart-ſnake, belonging to the order of amphibia ſerpentes. See ANGUIS.

ACONTIUM, ἀκόντιον, in Grecian antiquity, a kind of dart or javelin, reſembling the Roman pilum.

ACONTIUS, a young man of the iſland Cea, who having gone to Delos, to ſee the ſacred rites which were performed there by a crowd of virgins in the temple of Diana, fell deſperately in love with Cydippe; but not daring to aſk her in marriage, on account of the meanneſs of his birth, inſidiouſly threw down at her feet an apple, on which were inſcribed theſe words, *Me tibi nupturam, (ſelix eat omen,) Aconti, Juro, quam colimus, numina magna Deae.* Or according to others, *Juro tibi ſacrae per myſtica ſacra Dianae, Me tibi venturam comitem, ſponſamque futuram.* The virgin having taken up the apple, inadvertently read the words, and thus apparently bound herſelf by a promiſe; for by law, every thing uttered in that temple was held to be ratified. When her father, a little after, ignorant of what had happened, betrothed her to another man, ſhe was ſuddenly ſeized with a fever. Whereupon Acontius ſent her a letter, (expreſſed by Ovid, Ep. 20.) to perſuade her that her fever was cauſed by Diana for not having fulfilled the promiſe which ſhe had made to him in the temple of that goddeſs. Cydippe therefore reſolved to comply with the wiſhes of Acontius, even againſt the inclination of her father. Her anſwer is the ſubject of Ovid's 21ſt epiſtle. (*Adam's Claſ. Biog.*)

ACONTIUS, *James*, a philoſopher, civilian, and divine, born at Trent in the 16th century. He embraced the reformed religion; and coming into England in the reign of Queen Elizabeth, he was favourably received and much honoured by that princeſs, which he acknowledges in a book dedicated to her. This work is his celebrated Collection of the Stratagems of Satan, which has been ſo often tranſlated, and paſſed through ſo many editions.

ACORN, the fruit of the oak tree. See QUERCUS, BOTANY *Index*.

ACORN, in ſea language, a little ornamental piece of wood, faſhioned like a cone, and fixed on the uppermoſt point of the ſpindle, above the vane, on the maſthead. It is uſed to keep the vane from being blown off from the ſpindle in a whirlwind, or when the ſhip leans much to one ſide under ſail.

ACORUS, CALAMUS AROMATICUS, SWEET FLAG, or SWEET RUSH. See BOTANY *Index*.

ACORUS, in the *Materia Medica*, a name ſometimes given to the great galangal. See KEMPFERIA.

ACORUS, in *Natural Hiſtory*, blue coral. The true ſort is very ſcarce; ſome, however, is fiſhed on the coaſts of Africa, particularly from Rio del Re to the river of the Camarones. This coral is part of the merchandiſe which the Dutch trade for with the Camarones: that of the kingdom of Benin is alſo very much eſteemed. It grows in form of a tree on a rocky bottom.

ACOSTA, URIEL, a Portugueſe, born at Oporto towards the cloſe of the 16th century. He was educated in the Romiſh religion, which his father alſo profeſſed, though deſcended from one of thoſe Jewiſh families who had been in a manner forced to receive baptiſm. Uriel had a liberal education. He was inſtructed in ſeveral ſciences; and at laſt he ſtudied law. He had by nature a good temper and mild diſpoſition; and religion had made ſo deep an impreſſion on his mind, that he ardently deſired to conform to all the precepts of the church, to avoid eternal death, which he dreaded. He applied with great aſſiduity to reading the Scriptures and other religious books, carefully conſulting alſo the creed of the confeſſors; but the more he ſtudied, the more difficulties occurred, which perplexed him at length to ſuch a degree, that, being unable to ſolve them, he fell into the moſt terrible agonies of mind. He thought it impoſſible to fulfil his duty with regard to the conditions required for abſolution; ſo that he deſpaired of ſalvation, if he could find no other means of attaining it; and it proved difficult to abandon a religion in which he had been bred up from his infancy, and which had been deeply rooted in his mind. However he began to inquire, whether ſeveral particulars mentioned about the other life were agreeable to reaſon; and, upon inquiry and deliberation, he imagined that reaſon ſuggeſted many arguments againſt them. Acoſta was about two and twenty, when he was thus perplexed with doubts; and the reſult of his reflections was, that he could not be ſaved by the religion which he had imbibed in his infancy. Nevertheleſs he proſecuted his ſtudies in the law; and at the age of five and twenty, was made treaſurer in a collegiate church. Being naturally of a religious diſpoſition, and now made uneaſy by the popiſh doctrines, he began to ſtudy Moſes and the prophets; where he thought he found more ſatisfaction than in the goſpel, and at length became convinced that Judaiſm was the true religion: and, as he could not profeſs it in Portugal, he reſolved to leave the country. He accordingly reſigned his place, and embarked for Amſterdam with his mother and brothers; whom he had ventured to inſtruct in the principles of the Jewiſh religion, even when in Portugal. Soon after their arrival in Amſterdam, they became members of the ſynagogue; were circumciſed according to cuſtom; and he changed his name of Gabriel for that of Uriel. A little time was ſufficient to ſhew him, that the Jews did neither in their rites nor morals conform to the law of Moſes, of which he could not but declare his diſapprobation: but the chiefs of the ſynagogue gave him to underſtand, that he muſt exactly obſerve their tenets and cuſtoms; and that he would be excommunicated, if he deviated in the leaſt from them. This threat, however, had no effect; for he thought it would be a moſt mean behaviour in him, who had left the ſweets of his native country purely for liberty of conſcience, to ſubmit to a ſet of Rabbis without any proper juriſdiction; and that it would ſhew both want of courage and piety, if he ſhould ſtifle his ſentiments on this occaſion. He therefore perſiſted in his invectives, and in conſequence was excommunicated: the effect of which was ſuch, that his own brothers durſt not ſpeak to him, nor ſalute him when they met him in the ſtreets. Finding himſelf thus ſituated, he wrote a book in his juſtification; wherein he endeavours to ſhew, that the rites and traditions

Acoſta.

Acoſta, Acouſtics.

ditions of the Phariſees are contrary to the writings of Moſes, and ſoon after adopted the opinion of the Sadducees: for he had worked himſelf up to a belief, that the rewards and puniſhments of the old law relate only to this life; and this, becauſe Moſes nowhere mentions the joys of heaven, or the torments of hell. His adverſaries were overjoyed at his embracing this tenet; foreſeeing, that it would tend greatly to juſtify, in the ſight of Chriſtians, the proceedings of the ſynagogues againſt him. Before his book was printed, there appeared a piece upon the immortality of the ſoul, written by a phyſician, who omitted nothing he could ſuggeſt to make Acoſta paſs for an Atheiſt. The very children were encouraged to inſult him in the ſtreets, and to batter his houſe with ſtones; all which however did not prevent him from writing a treatiſe againſt the phyſician, wherein he endeavoured to confute the doctrine of the ſoul's immortality. The Jews now made application to the magiſtrates of Amſterdam; and informed againſt him, as one who wanted to undermine the foundation of both Jewiſh and Chriſtian religions. He was thrown into priſon, but bailed out within a week or ten days after; however all the copies of his works were ſeized, and he himſelf fined in 300 florins. Nevertheleſs, he proceeded ſtill farther in his ſcepticiſm. He now began to examine, whether the law of Moſes came from God; and he ſuppoſed he had at length found reaſons to convince him, that it was only a political invention. Yet, inſtead of drawing this inference from thence, "I ought not to return to the Jewiſh communion," he thus argued with himſelf, Why ſhould I continue all my life cut off from the communion, expoſed to ſo many inconveniencies, eſpecially as I am in a country where I am a ſtranger, and unacquainted with the language? Had I not better play the ape amongſt apes?" He accordingly returned to the Jewiſh church, after he had been excommunicated 15 years; and, after having made a recantation of what he had written, ſubſcribed every thing as they directed. A few days after, he was accuſed by a nephew, who lived in his houſe, that he did not, as to his eating and many other points, conform to the laws of the ſynagogue. This accuſation was attended with very bad conſequences; for a relation of Acoſta, who had got him reconciled to the ſynagogue, thought he was in honour bound to perſecute him with the utmoſt violence. The Rabbis and the reſt of the Jews were animated with the ſame ſpirit; eſpecially, when they found that Acoſta had diſſuaded two Chriſtians, who had come from London to Amſterdam, from turning Jews. He was ſummoned before the grand council of the ſynagogue; when it was declared to him, that he muſt again be excommunicated, if he did not give ſuch ſatisfaction as ſhould be required. He found the terms ſo hard, that he could not comply. The Jews thereupon again expelled him from their communion; and he afterwards ſuffered various hardſhips and great perſecutions, even from his own relations. After remaining ſeven years in a moſt wretched ſituation, he at length declared he was willing to ſubmit to the ſentence of the ſynagogue, having been told that he might eaſily accommodate matters; for, that the judges, being ſatisfied with his ſubmiſſion, would ſoften the ſeverity of the diſcipline. Acoſta, however, was caught in a ſnare; for they made him undergo the moſt rigorous penance. Theſe particulars relating to the life of Acoſta, are taken from his work, entitled, "*Exemplar humanæ Vitæ*," publiſhed and refuted by Limborch. It is ſuppoſed that he compoſed it a few days before his death, after having determined to lay violent hands on himſelf. He executed this horrid reſolution, a little after he had failed in his attempt to kill his principal enemy; for the piſtol, with which he intended to have ſhot him as he paſſed his houſe, having miſſed fire, he immediately ſhut the door, and ſhot himſelf with another piſtol. This happened at Amſterdam, but in what year is not exactly known.

Acoſta Acouſtics.

ACOSTAN, a mountainous iſland in the north ſeas between Aſia and America, obſerved by Captain Cook.

ACOUSMATICI, ſometimes alſo called *Acouſtici*, in Grecian antiquity, ſuch of the diſciples of Pythagoras as had not completed their five years probation.

ACOUSTIC, in general, denotes any thing that relates to the ear, the ſenſe of hearing, or the doctrine of ſounds.

Acouſtic Duct, in *Anatomy*, the ſame with *meatus auditorius*, or the external paſſage of the ear. See ANATOMY.

Acouſtic Inſtrument, or auricular tube. See ACOUSTICS.

Acouſtic Veſſels, in the ancient theatres, were a kind of veſſels, made of braſs, ſhaped in the bell faſhion, which being of all tones within the pitch of the voice or even of inſtruments, rendered the ſounds more audible, ſo that the actors could be heard through all parts of theatres which were even 400 feet in diameter.

Acouſtic Diſciples, among the ancient Pythagoreans, thoſe more commonly called ACOUSMATICI.

A C O U S T I C S,

Preliminary Obſervations.

IN *Phyſics*, is that ſcience which inſtructs us in the nature of ſound. It is divided by ſome writers into *Diacouſtics*, which explains the properties of thoſe ſounds that come directly from the ſonorous body to the ear; and *Catacouſtics*, which treats of reflected ſounds: but ſuch diſtinctions do not appear to be of any real utility.

Sound is a term of which it would be prepoſterous to offer any definition, as it may almoſt be ſaid to expreſs a ſimple idea: But when we conſider it as a SENSATION, and ſtill more when we conſider it as a PERCEPTION, it may not be improper to give a deſcription of it; becauſe this muſt involve certain relations of external things, and certain trains of events in the material world, which make it a proper object of philoſophical diſcuſſion. Sound is that primary information which we get of external things by means of the ſenſe of hearing. This, however, does not explain it; for were we in like manner to deſcribe our ſenſe of hearing, we ſhould find ourſelves obliged to ſay, that it is the faculty by which we perceive ſound. Languages are not the invention of philoſophers; and we muſt not expect

Preliminary Obſervations.

Preliminary Observations.

expect precision, even in the simplest cases. Our methods of expressing the information given us by our different senses are not similar, as a philosopher, cautiously contriving language, would make them. We have no word to express the primary or generic object of our sense of seeing; for we believe, that even the vulgar consider light as the medium, but not the object. This is certainly the case (how justly we do not say) with the philosopher. On the other hand, the words smell, sound, and perhaps taste, are conceived by most persons as expressing the immediate objects of the senses of smelling, hearing, and tasting. Smell and sound are hastily conceived as separate existences, and as mediums of information and of intercourse with the odoriferous and sounding bodies; and it is only the very cautious philosopher who distinguishes between the smell which he feels and the perfume which fills the room. Those of the ancients, therefore, who taught that sounds were beings wafted through the air, and felt by our ears, should not, even at this day, be considered as awkward observers of nature. It has required the long, patient, and sagacious consideration of the most penetrating geniuses, from Zeno the Stoic to Sir Isaac Newton, to discover that what we call sound, the *immediate* external object of the sense of hearing, is nothing but a particular agitation of the parts of surrounding bodies, acting by mechanical impulse on our organs; and that it is not any separate being, nor even a specific quality inherent in any particular thing, by which it can affect the organ, as we suppose with respect to a perfume, but merely a mode of existence competent to every atom of matter. And thus the description which we proposed to give of sound must be a description of that state of external contiguous matter which is the *cause* of sound. It is not therefore prefatory to any theory or set of doctrines on this subject; but, on the contrary, is the sum or result of them all.

To discover this state of external body by which, without any farther intermedium of substance or of operation, it affects our sensitive faculties, must be considered as a great step in science. It will show us at least one way by which mind and body may be connected. It is supposed that we have attained this knowledge with respect to sound. Our success, therefore, is a very pleasing gratification to the philosophic mind. It is still more important in another view: it has encouraged us to make similar attempts in other cases, and has supplied us with a fact to which an ingenious mind can easily fancy something analogous in many abstruse operations of nature, and thus it enables us to give some sort of explanation of them. Accordingly this use has been most liberally made of the mechanical theory of sound; and there is now scarcely any phenomenon, either of matter or mind, that has not been explained in a manner somewhat similar. But we are sorry to say that these explanations have done no credit to philosophy. They are, for the most part, strongly marked with that precipitate and self-conceited impatience which has always characterized the investigations conducted solely by ingenious fancy. The consequences of this procedure have been no less fatal to the progress of true knowledge in modern times than in the schools of ancient Greece; and the ethereal philosophers of this age, like the followers of Aristotle of old, have filled ponderous volumes with nonsense and error. It is strange, however, that this should be the effect of a great and a successful step in philosophy: But the fault is in the philosophers, not in the science. Nothing can be more certain than the account which Newton has given of the propagation of a certain class of undulations in an elastic fluid. But this procedure of nature cannot be seen with distinctness and precision by any but well-informed mathematicians. They alone can rest with unshaken confidence on the conclusions legitimately deduced from the Newtonian theorems; and even they can insure success only by treading with the most scrupulous caution the steps of this patient philosopher. But few have done this; and we may venture to say, that not one in ten of those who employ the Newtonian doctrines of elastic undulations for the explanation of other phenomena have taken the trouble, or indeed were able, to go through the steps of the fundamental proposition (Prin. II. 50, &c.) But the *general* results are so plain, and admit of such impressive illustration, that they draw the assent of the most careless reader; and all imagine that they understand the explanation, and perceive the whole procedure of nature. Emboldened therefore by this successful step in philosophy, they, without hesitation, *fancy* similar intermediums in other cases; and as air has been found to be a vehicle for sound, they have supposed that something which they call ether, somehow resembling air, is the vehicle of vision. Others have proceeded farther, and have held that ether, or another something like air, is the vehicle of sensation in general, from the organ to the brain: nay, we have got a great volume called A THEORY OF MAN, where all our sensations, emotions, affections, thoughts, and purposes or volitions, are said to be so many vibrations of another something equally unseen, gratuitous, and incompetent; and, to crown all, this exalted doctrine, when logically prosecuted, must terminate in the discovery of those vibrations which pervade all others, and which constitute what we have been accustomed to venerate by the name DEITY. Such *must* be the termination of this philosophy; and a truly philosophical dissertation on the attributes of the Divine Being *can be nothing else* than an accurate description of these vibrations!

Preliminary Observations.

This is not a needless and declamatory rhapsody. If the explanation of sound can be legitimately transferred to those other classes of phenomena, these are certain results; and if so, all the discoveries made by Newton are but the glimmerings of the morning, when compared with this meridian splendour. But if, on the other hand, sound logic forbids us to make this transference of explanation, we must continue to believe, for a little while longer, that mind is something different from vibrating matter, and that no kind of oscillations will constitute infinite wisdom.

It is of immense importance therefore to understand thoroughly this doctrine of sound, that we may see clearly and precisely in what it consists, what are the phenomena of sound that are fully explained, what are the data and the assumptions on which the explanations proceed, and what is the *precise mechanical fact* in which it terminates. For this, or a fact perfectly similar, must terminate every explanation which we derive from this by analogy, however perfect the analogy may be. This *previous* knowledge must be completely possessed;

Preliminary Observations.

ſeſſed by every perſon who pretends to explain other phenomena in a ſimilar manner. Then, and not till then, he is able to ſay what claſſes of phenomena will admit of the explanation: and, when all this is done, his explanation is ſtill an *hypotheſis*, till he is able to prove, from other indiſputable ſources, the exiſtence and agency of the ſame thing analogous to the elaſtic fluid, from which all is borrowed.

At preſent therefore we ſhall content ourſelves with giving a ſhort hiſtory of the ſpeculations of philoſophers on the nature of ſound, tracing out the ſteps by which we have arrived at the knowledge which we have of it. We apprehend this to be of great importance; becauſe it ſhows us what kind of evidence we have for its truth, and the paths which we muſt ſhun if we wiſh to proceed farther: and we truſt that the progreſs which we have made will appear to be ſo real, and the object to be attained ſo alluring to a truly philoſophical mind, that men of genius will be incited to exert their utmoſt efforts to paſs the preſent boundaries of our real progreſs.

First notions of ſound.

In the infancy of philoſophy, ſound was held to be a ſeparate exiſtence, ſomething which would be, although no hearing animal exiſted. This was conceived as waſted through the air to our organ of hearing, which it was ſuppoſed to affect in a manner reſembling that in which our noſtrils are affected when they give us the ſenſation of ſmell. It was one of the Platonic SPECIES, fitted for exciting the intellectual ſpecies, which is the immediate object of the ſoul's contemplation.

Yet, even in thoſe early years of ſcience, there were ſome, and, in particular, the celebrated founder of the Stoic ſchool, who held that ſound, that is, the cauſe of ſound, was only the particular motion of external groſs matter, propagated to the ear, and there producing that agitation of the organ by which the ſoul is immediately affected with the ſenſation of ſound. Zeno, as quoted by Diogenes Laertius *, ſays, "Hearing is produced by the air which intervenes between the thing ſounding and the ear. The air is agitated in a ſpherical form, and moves off in waves; and falls on the ear, in the ſame manner as the water in a ciſtern undulates in circles when a ſtone has been thrown into it." The ancients were not remarkable for preciſion, either of conception or argument, in their diſcuſſions, and they were contented with a general and vague view of things. Some followed the Platonic notions, and many the opinion of Zeno, but without any further attempts to give a diſtinct conception of the explanation, or to compare it with experiment.

* B. vii. § 158. Zeno's opinion.

But in later times, during the ardent reſearches in the laſt century into the phenomena of nature, this became an intereſting ſubject of inquiry. The invention of the air-pump gave the firſt opportunity of deciding by experiment whether the elaſtic undulations of air were the cauſes of ſound: and the trial fully eſtabliſhed this point; for a bell rung *in vacuo* gave no ſound, and one rung in condenſed air gave a very loud one. It was therefore received as a doctrine in general phyſics that air was the vehicle of ſound.

Air the vehicle of ſound proved by the air-pump.

Galileo's diſcovery of the nature of muſical chords.

The celebrated Galileo, the parent of mathematical philoſophy, diſcovered the nature of that connection between the lengths of muſical chords and the notes which they produced, which had been obſerved by Pythagoras, or learned by him in his travels in the eaſt, and which he made the foundation of a refined and beautiful ſcience, the theory of muſic. Galileo ſhowed, that the real connection ſubſiſted between the tones and the vibrations of theſe chords, and that their different degrees of acuteneſs correſponded to the different frequency of their vibrations. The very elementary and familiar demonſtration which he gave of this connection did not ſatisfy the curious mathematicans of that inquiſitive age; and the mechanical theory of muſical chords was proſecuted to a great degree of refinement. In the courſe of this inveſtigation, it appeared that the chord vibrated in a manner preciſely ſimilar to a pendulum vibrating in a cycloid. It muſt therefore agitate the air contiguous to it in the ſame manner; and thus there is a particular kind of agitation which the air *can* receive and maintain, which is very intereſting.

Preliminary Obſervations.

Sir Iſaac Newton took up this queſtion as worthy of his notice; and endeavoured to aſcertain with mathematical preciſion the mechaniſm of this particular claſs of undulations, and gave us the fundamental theorems concerning the undulations of elaſtic fluids, which make the 47th, &c. propoſitions of Book II. of the Principles of Natural Philoſophy. They have been (perhaps haſtily) conſidered as giving the fundamental doctrines concerning the propagation of ſound. A variety of facts are narrated in the article PNEUMATICS, to ſhow that ſuch undulations *actually obtain* in the air of our atmoſphere, and are accompanied by a ſet of phenomena of ſound which preciſely correſpond to all the mechanical circumſtances of theſe undulations.

Newton's theory of undulation correſpond with the phenomena of ſound.

In the mean time, the anatomiſts and phyſiologiſts were buſily employed in examining the ſtructure of our organs of hearing. Impreſſed with the validity of this doctrine of aerial undulations being the cauſe of ſound, their reſearches were always directed with a view to diſcover thoſe circumſtances in the ſtructure of the ear which rendered it an organ ſuſceptible of agitations from this cauſe; and they diſcovered many which appeared as contrivances for making it a drum, on which the aerial undulations from without muſt make very forcible impulſes, ſo as to produce very ſonorous undulations in the air contained in it. Theſe therefore they conſidered as the *immediate* objects of ſenſation, or the immediate cauſes of ſound.

Reſearches of anatomiſts.

But ſome anatomiſts ſaw that this would not be a full account of the matter: for after a drum is agitated, it has done all that it can do; it has produced a noiſe. But a farther proceſs goes on in our ear: There is behind the membrane, which is the head of this drum, a curious mechaniſm, which communicates the agitations of the membrane (the only thing acted on by the undulating air) to another chamber of moſt ſingular conſtruction, where the auditory nerve is greatly expanded. They conceive, therefore, that the organ called the *drum* does not act as a drum, but in ſome other way. Indeed it ſeems bad logic to ſuppoſe that it acts as a drum merely by producing a noiſe. This is in no reſpect different from the noiſe produced out of the ear; and if it is to be heard as a noiſe, we muſt have another ear by which it may be heard, and this ear muſt be another *ſuch* drum; and this muſt have another, and ſo on for ever. It is like the inaccurate notion that viſion is the contemplation of the picture on the retina. Theſe anatomiſts attended therefore to the ſtructure. Here they obſerved

Structure of the ear

Preliminary Observations.

observed a prodigious unfolding of the auditory nerve of the ear, which is curiously distributed through every part of this cavity, lining its sides, hung across it like a curtain, and sending off fibres in every direction, so as to leave hardly a point of it unoccupied. They thought the machinery contained in the drum peculiarly fitted for producing undulations of the air contained in this labyrinth, and that by these agitations of the air the contiguous fibres of the auditory nerve are impelled, and that thus we get the sensation of sound.

Of the human.

The cavity intervening between the external ear and this inner chamber appeared to these anatomists to have no other use than to allow a very free motion to the *stapes* or little piston that is employed to agitate the air in the labyrinth. This piston condenses on a very small surface the impulse which it receives from a much larger surface, strained by the malleus on the entry of the tympanum, on purpose to receive the gentle agitations of the external air in the outer canal. This membranous surface could not be agitated, unless completely detached from every thing round it; therefore all animals which have this mechanism have it in a cavity containing only air. But they held, that nature had even taken precautions to prevent this cavity from acting as a drum, by making it of such an irregular rambling form; for it is by no means a cavity of a symmetrical shape, like a vessel, but rather resembles the rambling holes and blebs which are often seen in a piece of bread, scattered through the substance of the cranium, and communicating with each other by small passages. The whole of these cavernulæ are lined with a softish membrane, which still farther unfits this cavity for producing sound. This reasoning is specious, but not very conclusive. We might even assert, that this anfractuous form, with narrow passages, is well fitted for producing noise. If we place the ear close to the small hole in the side of a military drum, we shall hear the smallest tap of the drumstick like a violent blow. The lining of the cavernulæ is nervous, and may therefore be strongly affected in the numerous narrow passages between the cells.

Of other animals.

While these speculations were going on with respect to the ear of the breathing animals, observations were occasionally made on other animals, such as reptiles, serpents, and fishes, which give undoubted indications of hearing; and many very familiar facts were observed or recollected, where sounds are communicated through or by means of solid bodies, or by water: therefore, without inquiring how or by what kind of mechanism it is brought about, it became a very general belief among physiologists, that all fishes, and perhaps all animals, hear, and that water in particular is a vehicle of sound. Many experiments are mentioned by Kircher and others on the communication of sound through solid bodies, such as masts, yards, and other long beams of dry fir, with similar results. Dr Monro has published a particular account of very curious experiments on the propagation of sound through water in his Dissertation on the Physiology of Fishes; so that it now appears that air is by no means the only vehicle of sound.

Water discovered in the internal ear

In 1762 Cotunni published his important discovery, that the labyrinth or inmost cavity of the ear in animals is completely filled with water. This, after some contest, has been completely demonstrated (see in particular Meckel Junior *de Labyrinthi Auris Contentis*, Argentor. 1777), and it seems now to be admitted by all.

Preliminary Observations.

This being the case, our notions of the immediate cause of sound must undergo a great revolution, and a new research must be made into the way in which the nerve is affected: for it is not enough that we substitute the undulations of water for those of air in the labyrinth. The well-informed mechanician will see at once, that the vivacity of the agitations of the nerve will be greatly increased by this substitution; for if water be perfectly elastic through the whole extent of the undulatory agitation which it receives, its effect will be greater in proportion to its specific gravity: and this is confirmed by an experiment very easily made. Immerse a table-bell in water contained in a large thin glass vessel. Strike it with a hammer. The sound will be heard as if the bell had been immediately struck on the sides of the vessel. The filling of the labyrinth of the ear with water is therefore an additional mark of the wisdom of the Great Artist. But this is not enough for informing us concerning the ultimate mechanical event in the process of hearing. The manner in which the nerve is exposed to these undulations must be totally different from what was formerly imagined. The filaments and membranes, which have been described by former anatomists, must have been found by them in a state quite unlike to their situation and condition in the living animal. Accordingly the most eminent anatomists of Europe seem at present in great uncertainty as to the state of the nerve, and are keenly occupied in observations to this purpose. The descriptions given by Monro, Scarpa, Camper, Comparetti, and others, are full of most curious discoveries, which make almost a total change in our notions of this subject, and will, we hope, be productive of most valuable information.

Increases the force of the undulations.

Scarpa has discovered that the solid cavity called the *labyrinth* contains a threefold expansion of the auditory nerve. One part of it, the cochlea, contains it in a fibrillous state, ramified in a most symmetrical manner through the whole of the *zona mollis* of the *lamina spiralis*, where it anastomoses with another production of it diffused over the general lining of that cavity. Another department of the nerve, also in a fibrous state, is spread over the external surface of a membranaceous bag, which nearly fills that part of the vestibule into which the semicircular canals open, and also that orifice which receives the impressions of the stapes. This bag sends off tubular membranaceous ducts, which, in like manner, nearly fill these semicircular canals. A third department of the nerve is spread over the external surface of another membranaceous bag, which lies between the one just now mentioned and the cochlea, but having no communication with either, almost completely filling the remainder of the vestibule. Thus the vestibule and canals seem only a case for protecting this sensitive membranaceous vessel, which is almost, but not altogether, in contact with the osseous case, being separated by a delicate and almost fluid cellular substance. The fibrillous expansion of the nerve is not indiscriminately diffused over the surface of these sacculi, but evidently directed to certain foci, where the fibres are constipated. And this is the last appearance of the fibrous state of the nerve; for when the inside of these sacculi is inspected, no fibres appear, but a pulp (judged to be nervous

Scarpa's discovery of the expansion of the nerve in the labyrinth.

Preliminary Obſervations.

from its ſimilarity to other pulpy productions of the brain) adhering to the membranaceous coat, and not ſeparable from it by gently waſhing it. It is more abundant, that is, of greater thickneſs, oppoſite to the external fibrous foci. No organical ſtructure could be diſcovered in this pulp, but it probably is organized; for, beſides this adhering pulp, the water in the ſacculi was obſerved to be clammy or mucous; ſo that in all probability the vaſcular or fibrous ſtate of the nerve is ſucceeded by an uninterrupted production (perhaps columnar like baſalt, though not cohering); and this at laſt ends in ſimple diſſemination, ſymmetrical however, where water and nerve are alternate in every direction.

Comparetti's, of a tympanum in the foramen rotundum.

To theſe obſervations of Scarpa, Comparetti adds the curious circumſtance of another and regular tympanum in the foramen rotundum, the cylindric cavity of which is encloſed at both ends by a fine membrane. The membrane which ſeparates it from the cochlea appears to be in a ſtate of variable tenſion, being drawn up to an umbo by a cartilaginous ſpeck in its middle, which he thinks adheres to the lamina ſpiralis, and thus ſerves to ſtrain the drumhead, as the malleus ſtrains the great membrane known to all.

Theſe are moſt important obſervations, and muſt greatly excite the curioſity of a truly philoſophical mind, and deſerve the moſt careful inquiry into their juſtneſs. If theſe are accurate deſcriptions of the organ, they ſeem to conduct us farther into the ſecrets of nature than any thing yet known.

We think that they promiſe to give us the greateſt ſtep yet made in phyſiology, viz. to ſhow us the laſt mechanical fact which occurs in the long train interpoſed between the external body and the incitement of our ſenſitive ſyſtem. But there is, as yet, great and eſſential differences in the deſcriptions given by thoſe celebrated naturaliſts. It cannot be otherwiſe. The containing labyrinth can be laid open to our view in no other way than by deſtroying it; and its moſt delicate contents are the firſt ſufferers in the ſearch. They are found in very different ſituations and conditions by different anatomiſts, according to their addreſs or their good fortune. Add to this, that the natural varieties are very conſiderable. Faithful deſcriptions muſt therefore give very different notions of the ultimate action and reaction between the unorganized matter in the labyrinth and the ultimate expanſion of the auditory nerve.

Deſcriptions of naturaliſts different.

The progreſs which has been made in many parts of natural ſcience has been great and wonderful; and perhaps we are not too ſanguine, when we expreſs our hopes that the obſervations and experiments of anatomiſts and mechanicians will ſoon furniſh us with ſuch a collection of facts reſpecting the ſtructure and the contents of the organ of hearing, as might enable us to give a juſter theory of ſound than is yet to be found in the writings of philoſophers. There ſeems to be no abatement of ardour in the reſearches of the phyſiologiſts: and they will not remain long ignorant of the truth or miſtake in the accounts given by Scarpa and Comparetti. A collection of accurate obſervations on the ſtructure of the ear would give us principles on which to proceed in explaining the various methods of producing external ſounds. The nature of *continued ſounds* might then be treated of, and would appear, we believe, very different from what it is commonly ſuppoſed. Under this head animal voices might be particularly conſidered, and the elements of human ſpeech properly aſcertained. When the production of continued ſounds is once ſhown to be a thing regulated by principle, it may be ſyſtematically treated, and this principle may be conſidered as combined with every mechanical ſtate of body that may be pointed out. This will ſuggeſt to us methods of producing ſound which have not yet been thought of, and may therefore give us ſounds with which we are unacquainted.. Such an acquiſition is not to be deſpiſed nor rejected. The bountiful Author of our being and of all our faculties has made it an object of moſt enchanting relish to the human mind. The Greeks, the moſt cultivated people who have ever figured on the ſtage of life, enjoyed the pleaſures of muſic with rapture. Even the poor negro, after toiling a whole day beneath a tropical ſun, will go ten miles in the dark to dance all night to the ſimple muſic of the balafoe, and return without ſleep to his next day's toil. The penetrating eye of the anatomiſt has diſcovered in the human larynx an apparatus evidently contrived for tempering the great movements of the glottis, ſo as to enable us to produce the intended note with the utmoſt preciſion. There is no doubt therefore that the conſummate Artiſt has not thought it unworthy of his attention. We ought therefore to receive with thankfulneſs this preſent from our Maker—this *laborum dulce lenimen;* and it is ſurely worthy the attention of the philoſopher to add to this innocent elegance of life.

Preliminary Obſervations.

Chap. I. *Different Theories of Sound.*

Of the vehicles of ſound.

Moſt ſounds, we all know, are conveyed to us on the boſom of the air. In whatever manner they either float upon it, or are propelled forward in it, certain it is, that, without the vehicle of this or ſome other fluid, we ſhould have no ſounds at all. Let the air be exhauſted from a receiver, and a bell ſhall emit no ſound when rung in the void; for, as the air continues to grow leſs denſe, the ſound dies away in proportion, ſo that at laſt its ſtrongeſt vibrations are almoſt totally ſilent.

Air not the only one.

Thus air is a vehicle for ſound. However, we muſt not, with ſome philoſophers, aſſert, that it is the only vehicle; that, if there were no air, we ſhould have no ſounds whatſoever: for it is found by experiment, that ſounds are conveyed through water with the ſame facility with which they move through air. A bell rung in water returns a tone as diſtinct as if rung in air. This was obſerved by Derham, who alſo remarked that the tone came a quarter deeper. It appears from the experiments of naturaliſts, that fiſhes have a ſtrong perception of ſounds, even at the bottom of deep rivers. From hence, it would ſeem not to be very material in the propagation of ſounds, whether the fluid which conveys them be elaſtic or otherwiſe. Water, which, of all ſubſtances that we know, has the leaſt elaſticity, yet ſerves to carry them forward; and if we make allowance for the difference of its denſity, perhaps the ſounds move in it with a proportional rapidity to what they are found to do in the elaſtic fluid of air. But though air and water are both vehicles of ſound, yet neither of them according to ſome philoſophers ſeems

to

Different Theories of Sound.

to be ſo by itſelf, but only as it contains an exceedingly ſubtle fluid capable of penetrating the moſt ſolid bodies. Hence, by the medium of that fluid, ſounds can be propagated through wood, or metals, even more readily than through the open air. By the ſame means, deaf people may be made ſenſible of ſounds if they hold a piece of metal in the mouth, one end of which is applied to the ſounding body. And as it is certain, that air cannot penetrate metals, the medium of ſound, ſay they, muſt be of a more ſubtle nature; and thus the electrical fluid will naturally occur as the proper one. But why then is ſound no longer heard in an exhauſted receiver, if the air is not the fluid by which it is conveyed, ſeeing the electrical matter cannot be excluded? The reply to this is obvious: The electrical fluid is ſo exceedingly ſubtle, and pervades ſolid bodies with ſo much eaſe, that any motion of a ſolid body in a quantity of electric matter by itſelf, can never excite a degree of agitation in it ſufficient for producing a ſound; but if the electric fluid is entangled among the particles of air, water, wood, metal, &c. whatever affects their particles will alſo affect this fluid, and produce an audible noiſe. In the experiment of the air pump, it is alleged there may be an ambiguity, as the gradual exhauſting of the air creates an increaſing difference of preſſure on the outſide, and may occaſion in the glaſs a difficulty of vibrating, ſo as to render it leſs fit to communicate to the air without the vibrations that ſtrike it from within. From this cauſe the diminution of ſound in an exhauſted receiver may be ſuppoſed to proceed, as well as from the diminution of the air. But if any internal agitation of its parts ſhould happen to the electrical fluid, exceeding loud noiſes might be propagated through it, as has been the caſe when large meteors have kindled at a great diſtance from the earth. It is alſo difficult, they ſuppoſe, to account for the amazing velocity of ſound, upon the ſuppoſition that it is propagated by means of air alone; for nothing is more certain, than that the ſtrongeſt and moſt violent gale is, in its courſe, inert and ſluggiſh, compared with the motion of ſound.

One thing however is certain, that whether the fluid which conveys the note be elaſtic, or nonelaſtic, whatever ſound we hear is produced by a ſtroke, which the ſounding body makes againſt the fluid, whether air or water. The fluid being ſtruck upon, carries the impreſſion forward to the ear, and there produces its ſenſation. Philoſophers are ſo far agreed, that they all allow that ſound is nothing more than the impreſſion made by an elaſtic body upon the air or water, and this impreſſion carried along by either fluid to the organ of hearing. But the manner in which this conveyance is made, is ſtill diſputed: Whether the ſound is diffuſed into the air, in circle beyond circle, like the waves of water when we diſturb the ſmoothneſs of its ſurface by dropping in a ſtone; or whether it travels along, like rays diffuſed from a centre, ſomewhat in the ſwift manner that electricity runs along a rod of iron; theſe are the queſtions which have divided the learned.

What ſound is, and how propagated.

Newton was of the firſt opinion. He has explained the progreſſion of ſound by an undulatory, or rather a vermicular, motion in the parts of the air. If we have an exact idea of the crawling of ſome inſects, we ſhall have a tolerable notion of the progreſſion of ſound upon this hypotheſis. This inſect, for inſtance, in its motion, firſt carries its contractions from the hinder part, in order to throw its fore part to the proper diſtance, then it carries its contractions from the fore part to the hinder to bring that forward. Something ſimilar to this is the motion of the air when ſtruck upon by a ſounding body. To be a little more preciſe, ſuppoſe ABC, Plate I. fig. 1. the ſtriking of a harpſichord ſcrewed to a proper pitch, and drawn out of the right line by the finger at B. We ſhall have occaſion elſewhere to obſerve, that ſuch a ſtring would, if let go, vibrate to E; and from E to D, and back again; that it would continue thus to vibrate like a pendulum, for ever, if not externally reſiſted, and, like a pendulum, all its little vibrations would be performed in equal times, the laſt and the firſt being equally long in performing; alſo that, like a pendulum, its greateſt ſwiftneſs would always be when it arrived at E, the middle part of its motion. Now then, if this ſtring be ſuppoſed to fly from the finger at B, it is obvious, that whatever be its own motion, ſuch alſo will be the motion of the parts of air that fly before it. Its motion, as is obvious, is firſt uniformly accelerated forward from B to E, then retarded as it goes from E to D, accelerated back again as it returns from D to E, and retarded from E to B. This motion being therefore ſucceſſively produced through a range of elaſtic air, it muſt happen, that the parts of one range of air will be ſent forward with accelerated motion, and then with a retarded motion. This accelerated motion reaching the remoteſt end of the firſt range will be communicated to a ſecond range, whilſt the neareſt parts of the firſt range being retarded in their motion, and falling back with the receſſion of the ſtring, retire firſt with an accelerated, then with a retarded motion, and the remoteſt parts will ſoon follow. In the mean time, while the parts of the firſt range are thus falling back, the parts of the ſecond range are going forward with an accelerated motion. Thus there will be an alternate condenſation and relaxation of the air, during the time of one vibration; and as the air going forward ſtrikes any oppoſing body with greater force than upon retiring, ſo each of theſe accelerated progreſſions have been called by Newton a *pulſe* of ſound.

Thus will the air be driven forward in the direction of the ſtring. But now we muſt obſerve, that theſe pulſes will move every way; for all motion impreſſed upon fluids in any direction whatſoever, operates all around in a ſphere: ſo that ſounds will be driven in all directions, backwards, forwards, upwards, downwards, and on every ſide. They will go on ſucceeding each other, one on the outſide of the other, like circles in diſturbed water; or rather, they will lie one without the other, in concentric ſhells, ſhell above ſhell, as we ſee in the coats of an onion.

Newton's theory.

All who have remarked the tone of a bell, while its ſounds are decaying away, muſt have an idea of the pulſes of ſound, which, according to Newton, are formed by the air's alternate progreſſion and receſſion. And it muſt be obſerved, that as each of theſe pulſes is formed by a ſingle vibration of the ſtring, they muſt be equal to each other; for the vibrations of the ſtring are known to be ſo.

Again, As to the velocity with which ſounds travel, this Newton determines, by the moſt difficult calcula-

Different Theories of Sound.

tion that can be imagined, to be in proportion to the thickneſs of the parts of the air, and the diſtance of theſe parts from each other. From hence he goes on to prove, that each little part moves backward and forward like a pendulum; and from thence he proceeds to demonſtrate, that if the atmoſphere were of the ſame denſity everywhere as at the ſurface of the earth, in ſuch a caſe, a pendulum, that reached from its higheſt ſurface down to the ſurface of the earth, would by its vibrations diſcover to us the proportion of the velocity with which ſounds travel. The velocity with which each pulſe would move, he ſhows, would be as much greater than the velocity of ſuch a pendulum ſwinging with one complete vibration, as the circumference of a circle is greater than the diameter. From hence he calculates, that the motion of ſound will be 979 feet in one ſecond. But this not being conſonant to experience, he takes in another conſideration, which deſtroys entirely the rigour of his former demonſtration, namely, vapours in the air; and then finds the motion of ſound to be 1142 feet in one ſecond, or near 13 miles in a minute; a proportion which experience had eſtabliſhed nearly before.

Preceding theory oppoſed.

This much will ſerve to give an obſcure idea of a theory which has met with numerous oppoſers. Even John Bernouilli, Newton's greateſt diſciple, modeſtly owns that he did not pretend to underſtand this part of the *Principia*. He attempted therefore to give a more perſpicuous demonſtration of his own, that might confirm and illuſtrate the Newtonian theory. The ſubject ſeemed to reject elucidation; his theory is obviouſly wrong, as D'Alembert has proved in his Theory of Fluids.

The objections.

Various have been the objections that have been made to the Newtonian ſyſtem of ſounds. It is urged, that this theory can only agree with the motion of ſound in an elaſtic fluid, whereas ſounds are known to move forward through water that is not elaſtic. To explain their progreſs therefore through water, a ſecond theory muſt be formed: ſo that two theories muſt be made to explain a ſimilar effect; which is contrary to the ſimplicity of true philoſophy, for it is contrary to the ſimplicity of nature. It is further urged, that this ſlow vermicular motion but ill repreſents the velocity with which ſounds travel, as we know by experience that it is almoſt 13 miles in a minute. In ſhort, it is urged, that ſuch undulations as have been deſcribed, when coming from ſeveral ſonorous bodies at once, would croſs, obſtruct, and confound each other; ſo that, if they were conveyed to the ear by this means we ſhould hear nothing but a medley of diſcord and broken articulations. But this is equally with the reſt contradictory to experience, ſince we hear the fulleſt concert, not only without confuſion, but with the higheſt pleaſure. Theſe objections, whether well founded or not, have given riſe to another theory: which we ſhall likewiſe lay before the reader; though it too appears liable to objections, which ſhall be afterwards mentioned.

Another theory.

Every ſound may be conſidered as driven off from the ſounding body in ſtraight lines, and impreſſed upon the air in one direction only: but whatever impreſſion is made upon a fluid in one direction, is diffuſed upon its ſurface into all directions: ſo that the ſound firſt driven directly forward ſoon fills up a wide ſphere, and is heard on every ſide. Thus, as it is impreſſed, it inſtantaneouſly travels forward with a very ſwift motion, reſembling the velocity with which we know electricity flies from one end of a line to another.

Different Theories of Sound.

Now, as to the pulſes, or cloſe ſhakes as the muſicians expreſs it, which a ſounding body is known to make, each pulſe (ſay the ſupporters of this theory) is itſelf a diſtinct and perfect ſound, and the interval between every two pulſes is profoundly ſilent. Continuity of ſound from the ſame body is only a deception of the hearing; for as each diſtinct ſound ſucceeds at very ſmall intervals, the organ has no time to tranſmit its images with equal ſwiftneſs to the mind, and the interval is thus loſt to ſenſe: juſt as in ſeeing a flaming torch, whirled rapidly round, it appears as a ring of fire. In this manner a beaten drum, at ſome ſmall diſtance, preſents us with the idea of continuing ſound. When children run with their ſticks along a rail, a continuing ſound is thus repreſented, though it need ſcarce be obſerved that the ſtroke againſt each rail is perfectly diſtinct and inſulated.

According to this theory, therefore, the pulſes are nothing more than diſtinct ſounds repeated by the ſame body, the firſt ſtroke or vibration being ever the loudeſt, and travelling farther than thoſe that follow; while each ſucceeding vibration gives a new ſound, but with diminiſhed force, till at laſt the pulſes decay away totally, as the force decays that gives them exiſtence.

All bodies whatſoever that are ſtruck return more or leſs a ſound: but ſome, wanting elaſticity, give back no repetition of the ſound; the noiſe is at once produced and dies: while other bodies, however, there are, which being more elaſtic and capable of vibration, give back a ſound, and repeat the ſame ſeveral times ſucceſſively. Theſe laſt are ſaid to have a tone; the others are not allowed to have any.

This tone of the elaſtic ſtring, or bell, is notwithſtanding nothing more than a ſimilar ſound of what the former bodies produced, but with the difference of being many times repeated, while their note is but ſingle. So that, if we would give the former bodies a tone, it will be neceſſary to make them repeat their ſound, by repeating our blows ſwiftly upon them. This will effectually give them a tone; and even an unmuſical inſtrument has often had a fine effect by its tone in our concerts.

Let us now go on then to ſuppoſe, that by ſwift and equably continued ſtrokes we give any nonelaſtic body its tone: it is very obvious, that no alterations will be made in this tone by the quickneſs of the ſtrokes, though repeated ever ſo faſt. Theſe will only render the tone more equal and continuous, but make no alteration in the tone it gives. On the contrary, if we make an alteration in the force of each blow, a different tone will then undoubtedly be excited. The difference will be ſmall, it muſt be confeſſed; for the tones of theſe inflexible bodies are capable but of ſmall variation; however, there will certainly be a difference. The table on which we write, for inſtance, will return a different ſound when ſtruck with a club, from what it did when ſtruck only with a ſwitch. Thus nonelaſtic bodies return a difference of tone, not in proportion to the ſwiftneſs with which their ſound is repeated, but in proportion to the greatneſs of the blow which produced it; for in two equal nonelaſtic bodies, that body produced

Different Theories of Sound.

produced the deepeſt tone which was ſtruck by the greateſt blow.

We now then come to a critical queſtion, What is it that produces the difference of tone in two elaſtic ſounding bells or ſtrings? or, what makes one deep and the other ſhrill? This queſtion has always been hitherto anſwered by ſaying, that the depth or height of the note proceeded from the ſlowneſs or ſwiftneſs of the times of the vibrations. The ſloweſt vibrations, it has been ſaid, are qualified for producing the deepeſt tones, while the ſwifteſt vibrations produce the higheſt tones. In this caſe, an effect has been given for a cauſe. It is in fact the force with which the ſounding ſtring ſtrikes the air when ſtruck upon, that makes the true diſtinction in the tones of ſounds. It is this force, with greater or leſs impreſſions, reſembling the greater or leſs force of the blows upon a nonelaſtic body, which produces correſpondent affections of ſound. The greateſt forces produce the deepeſt ſounds; the high notes are the effect of ſmall efforts. In the ſame manner a bell, wide at the mouth, gives a grave ſound; but if it be very maſſy withal, that will render it ſtill graver; but if maſſy, wide, and long or high, that will make the tone deepeſt of all.

Thus, then, will elaſtic bodies give the deepeſt ſound, in proportion to the force with which they ſtrike the air: but if we ſhould attempt to increaſe their force by giving them a ſtronger blow, this will be in vain; they will ſtill return the ſame tone; for ſuch is their formation, that they are ſonorous only becauſe they are elaſtic, and the force of this elaſticity is not increaſed by our ſtrength, as the greatneſs of a pendulum's vibrations will not be increaſed by falling from a greater height.

Now as to the frequency with which elaſtic ſtrings vibrate the deepeſt tones, it has been found, that the longeſt ſtrings have the wideſt vibrations, and conſequently go backward and forward ſloweſt; while, on the contrary, the ſhorteſt ſtrings vibrate the quickeſt, or come and go in the ſhorteſt intervals. From hence thoſe who have treated of ſounds, have aſſerted, as was ſaid before, that the tone of the ſtring depended upon the length or the ſhortneſs of the vibrations. This, however, is not the caſe. One and the ſame ſtring, when ſtruck, muſt always, like the ſame pendulum, return preciſely ſimilar vibrations: but it is well known, that one and the ſame ſtring, when ſtruck upon, does not always return preciſely the ſame tone: ſo that in this caſe the vibrations follow one rule, and the tone another. The vibrations muſt be invariably the ſame in the ſame ſtring, which does not return the ſame tone invariably, as is well known to muſicians in general. In the violin, for inſtance, they can eaſily alter the tone of the ſtring an octave or eight notes higher, by a ſofter method of drawing the bow; and ſome are known thus to bring out the moſt charming airs imaginable. Theſe peculiar tones are by the Engliſh fiddlers called *flute-notes*. The only reaſon, it has been alleged, that can be aſſigned for the ſame ſtring thus returning different tones, muſt certainly be the different force of its ſtrokes upon the air. In one caſe, it has double the tone of the other; becauſe upon the ſoft touches of the bow, only half its elaſticity is put into vibration.

Different Theories of Sound.

This being underſtood (continue the authors of this theory), we ſhall be able clearly to account for many things relating to ſounds that have hitherto been inexplicable. Thus, for inſtance, if it be aſked, When two ſtrings are ſtretched together of equal lengths, tenſions, and thickneſs, how does it happen, that one of them being ſtruck, and made to vibrate throughout, the other ſhall vibrate throughout alſo? the anſwer is obvious: The force that the ſtring ſtruck receives is communicated to the air, and the air communicates the ſame to the ſimilar ſtring; which therefore receives all the force of the former; and the force being equal, the vibrations muſt be ſo too. Again: Put the queſtion, If one ſtring be but half the length of the other, and be ſtruck, how will the vibrations be? The anſwer is, The longeſt ſtring will receive all the force of the ſtring half as long as itſelf, and therefore it will vibrate in proportion, that is, through half its length. In the ſame manner, if the longeſt ſtring were three times as long as the other, it would only vibrate in a third of its length; or if four times, in a fourth of its length. In ſhort, whatever force the ſmaller ſtring impreſſes upon the air, the air will impreſs a ſimilar force upon the longer ſtring, and partially excite its vibrations.

Eolian Lyre.

From hence alſo we may account for the cauſe of thoſe charming melancholy gradations of ſound in the Eolian lyre, Plate I. fig. 2.; an inſtrument (ſays Sir John Hawkins) lately obtruded upon the public as a new invention, though deſcribed above a century ago by Kircher *. This inſtrument is eaſily made, being nothing more than a long narrow box of thin deal, about 30 inches long, 5 inches broad, and 1¼ inches deep, with a circle in the middle of the upper ſide or belly about 1¼ inch diameter pierced with ſmall holes. On this ſide are ſeven, ten, or (according to Kircher) fifteen or more ſtrings of very fine gut, ſtretched over bridges at each end, like the bridge of a fiddle, and ſcrewed up or relaxed with ſcrew-pins (B). The ſtrings are all tuned to one and the ſame note; and the inſtrument is placed in ſome current of air, where the wind can bruſh over its ſtrings with freedom. A window with the ſaſh juſt raiſed to give the air admiſſion, will anſwer this purpoſe exactly. Now when the entering air blows upon theſe ſtrings with different degrees of force, there will be excited different tones of ſound; ſometimes the blaſt brings out all the tones in full concert; ſometimes it ſinks them to the ſofteſt murmurs; it feels for every tone, and by its gradations of ſtrength ſolicits thoſe gradations of ſound which art has taken different methods to produce.

* Vide *Kircher's Muſurgia*, lib. ix.

It remains, in the laſt place, to conſider (by this theory) the loudneſs and lowneſs, or, as the muſicians ſpeak, the ſtrength and ſoftneſs of ſound. In vibrating elaſtic ſtrings, the loudneſs of the tone is in proportion to the deepneſs of the note; that is, in two ſtrings, all things in other circumſtances alike, the deepeſt tone will be loudeſt. In muſical inſtruments upon a different principle, as in the violin, it is otherwiſe;

(B) The figure repreſents the inſtrument with ten chords; of which ſome direct only eight to be tuned uniſons, and the two outermoſt octaves below them. But this ſeems to be not material.

Different Theories of Sounds.

wife; the tones are made in ſuch inſtruments, by a number of ſmall vibrations crowded into one ſtroke. The roſined bow, for inſtance, being drawn along a ſtring, its roughneſſes catch the ſtring at very ſmall intervals, and excite its vibrations. In this inſtrument, therefore, to excite loud tones, the bow muſt be drawn quick, and this will produce the greateſt number of vibrations. But it muſt be obſerved, that the more quick the bow paſſes over the ſtring, the leſs apt will the roughneſs of its ſurface be to touch the ſtring at every inſtant; to remedy this, therefore, the bow muſt be preſſed the harder as it is drawn quicker, and thus its fulleſt ſound will be brought from the inſtrument. If the ſwiftneſs of the vibrations in an inſtrument thus rubbed upon, exceed the force of the deeper ſound in another, then the ſwift vibrations will be heard at a greater diſtance, and as much farther off as the ſwiftneſs in them exceeds the force in the other.

The nature of muſical ſounds illuſtrated according to the ſame theory.

By the ſame theory (it is alleged) may all the phenomena of muſical ſounds be eaſily explained.—The fables of the ancients pretend, that muſic was firſt found out by the beating of different hammers upon the ſmith's anvil. Without purſuing the fable, let us endeavour to explain the nature of muſical ſounds by a ſimilar method. Let us ſuppoſe an anvil, or ſeveral ſimilar anvils, to be ſtruck upon by ſeveral hammers of different weights or forces. The hammer, which is double that of another, upon ſtriking the anvil will produce a ſound double that of the other: this double ſound muſicians have agreed to call an octave. The ear can judge of the difference or reſemblance of theſe ſounds with great eaſe, the numbers being as one and two, and therefore very readily compared. Suppoſe that a hammer, three times leſs than the firſt, ſtrikes the anvil, the ſound produced by this will be three times leſs than the firſt: ſo that the ear, in judging the ſimilitude of theſe ſounds, will find ſomewhat more difficulty; becauſe it is not ſo eaſy to tell how often one is contained in three, as it is to tell how often it is contained in two. Again, Suppoſe that a hammer four times leſs than the firſt ſtrikes the anvil, the ear will find greater difficulty ſtill in judging preciſely the difference of the ſounds; for the difference of the numbers four and one cannot ſo ſoon be determined with preciſion as three and one. If the hammer be five times leſs, the difficulty of judging will be ſtill greater. If the hammer be ſix times leſs, the difficulty ſtill increaſes, and ſo alſo of the ſeventh, ſo that the ear cannot always readily and at once determine the preciſe gradation. Now, of all compariſons, thoſe which the mind makes moſt eaſily, and with leaſt labour, are the moſt pleaſing. There is a certain regularity in the human ſoul, by which it finds happineſs in exact and ſtriking, and eaſily made compariſons. As the ear is but an inſtrument of the mind, it is therefore moſt pleaſed with the combination of any two ſounds, the difference of which it can moſt readily diſtinguiſh. It is more pleaſed with the concord of two ſounds which are to each other as one and two, than of two ſounds which are as one and three, or one and four, or one and five, or one and ſix or ſeven. Upon this pleaſure, which the mind takes in compariſon, all harmony depends. The variety of ſounds is infinite: but becauſe the ear cannot compare two ſounds ſo as readily to diſtinguiſh their diſcriminations when they exceed the proportion of one and ſeven, muſicians have been content to confine all harmony within that compaſs, and allowed but ſeven notes in muſical compoſition. Of Muſic: Sounds.

Let us now then ſuppoſe a ſtringed inſtrument fitted up in the order mentioned above. For inſtance: Let the firſt ſtring be twice as long as the ſecond; let the third ſtring be three times ſhorter than the firſt; let the fourth be four times, the fifth ſtring five times, and the ſixth ſix times as ſhort as the firſt. Such an inſtrument would probably give us a repreſentation of the lyre as it came firſt from the hand of the inventor. This inſtrument will give us all the ſeven notes following each other, in the order in which any two of them will accord together moſt pleaſingly; but yet it will be a very inconvenient and a very diſagreeable inſtrument: inconvenient, for in a compaſs of ſeven ſtrings only, the firſt muſt be ſeven times as long as the laſt; and diſagreeable, becauſe this firſt ſtring will be ſeven times as loud alſo; ſo that when the tones are to be played in a different order, loud and ſoft ſounds would be intermixed with moſt diſguſting alternations. In order to improve the firſt inſtrument, therefore, ſucceeding muſicians very judiciouſly threw in all the other ſtrings between the two firſt, or, in other words, between the two octaves, giving to each, however, the ſame proportion to what it would have had in the firſt natural inſtrument. This made the inſtrument more portable, and the ſounds more even and pleaſing. They therefore diſpoſed the ſounds between the octave in their natural order, and gave each its own proportional dimenſions. Of theſe ſounds, where the proportion between any two of them is moſt obvious, the concord between them will be moſt pleaſing. Thus octaves, which are as two to one, have a moſt harmonious effect; the fourth and fifth alſo ſound ſweetly together, and they will be found, upon calculation, to bear the ſame proportion to each other that octaves do. "Let it not be ſuppoſed (ſays M. Sauveur), that the muſical ſcale is merely an arbitrary combination of ſounds; it is made up from the conſonance and differences of the parts which compoſe it. Thoſe who have often heard a fourth and fifth accord together, will be naturally led to diſcover their difference at once; and the mind unites itſelf to their beauties." Let us then ceaſe to aſſign the coincidences of vibrations as the cauſe of harmony, ſince theſe coincidences in two ſtrings vibrating at different intervals, muſt at beſt be but fortuitous; whereas concord is always pleaſing. The true cauſe why concord is pleaſing, muſt ariſe from our power, in ſuch a caſe, of meaſuring more eaſily the differences of the tones. In proportion as the note can be meaſured with its fundamental tone by large and obvious diſtinctions, then the concord is moſt pleaſing; on the contrary, when the ear meaſures the diſcriminations of two tones by very ſmall parts, or cannot meaſure them at all, it loſes the beauty of their reſemblance: the whole is diſcord and pain (c).

But

(c) It is certain, that in proportion to the ſimplicity of relations in ſound, the ear is pleaſed with its combinations; but this is not to be admitted as the cauſe why muſicians have confined all harmony to an octave.

Diſcriminated

Of Musical Sounds.

But there is another property in the vibration of a musical ſtring not yet taken notice of, and which is alleged to confirm the foregoing theory. If we ſtrike the ſtring of a harpſichord, or any other elaſtic ſounding chord whatever, it returns a continuing ſound. This till of late was conſidered as one ſimple uniform tone; but all muſicians now confeſs, that inſtead of one tone it actually returns four tones, and that conſtantly. The notes are, beſide the fundamental tone, an octave above, a twelfth above, and a ſeventeenth. One of the baſs notes of a harpſichord has been diſſected in this manner by Rameau, and the actual exiſtence of theſe tones proved beyond a poſſibility of being controverted. In fact, the experiment is eaſily tried; for if we ſmartly ſtrike one of the lower keys of a harpſichord, and then take the finger briſkly away, a tolerable ear will be able to diſtinguiſh, that, after the fundamental tone has ceaſed, three other ſhriller tones will be diſtinctly heard; firſt the octave above, then the twelfth, and laſtly the ſeventeenth: the octave above is in general almoſt mixed with the fundamental tone, ſo as not to be eaſily perceived, except by an ear long habituated to the minute diſcriminations of ſounds. So that we may obſerve, that the ſmalleſt tone is heard laſt, and the deepeſt and largeſt one firſt: the two others in order.

In the whole theory of ſounds, nothing has given greater room for ſpeculation, conjecture, and diſappointment, than this amazing property in elaſtic ſtrings. The whole ſtring is univerſally acknowledged to be in vibration in all its parts, yet this ſingle vibration returns no leſs than four different ſounds. They who account for the tones of ſtrings by the number of their vibrations, are here at the greateſt loſs. Daniel Bernouilli ſuppoſes, that a vibrating ſtring divides itſelf into a number of curves, each of which has a peculiar vibration; and though they all ſwing together in the common vibration, yet each vibrates within itſelf. This opinion, which was ſupported, as moſt geometrical ſpeculations are, with the parade of demonſtration, was only born ſoon after to die. Others have aſcribed this to an elaſtic difference in the parts of the air, each of which, at different intervals, thus received different impreſſions from the ſtring, in proportion to their elaſticity. This is abſurd. If we allow the difference of tone to proceed from the force, and not the frequency, of the vibrations, this difficulty will admit of an eaſy ſolution. Theſe ſounds, though they ſeem to exiſt together in the ſtring, actually follow each other in ſucceſſion: while the vibration has greateſt force, the fundamental tone is brought forward: the force of the vibration decaying, the octave is produced, but almoſt only inſtantaneouſly; to this ſucceeds, with diminiſhed force, the twelfth; and, laſtly, the ſeventeenth is heard to vibrate with great diſtinctneſs, while the three other tones are always ſilent. Theſe ſounds, thus excited, are all of them the harmonic tones, whoſe differences from the fundamental tone are, as was ſaid, ſtrong and diſtinct. On the other hand, the diſcordant tones cannot be heard. Their differences being but very ſmall, they are overpowered, and in a manner drowned in the tones of ſuperior difference: yet not always neither; for Daniel Bernouilli has been able, from the ſame ſtroke, to make the ſame ſtring bring out its harmonic and its diſcordant tones alſo (D). So that from hence we may juſtly infer, that every note whatſoever is only a ſucceſſion of tones; and that thoſe are moſt diſtinctly heard, whoſe differences are moſt eaſily perceivable.

Of Muſical Sounds.

To this theory, however, though it has a plauſible appearance, there are ſtrong and indeed inſuperable objections. The very fundamental principle of it is falſe. No body whatever, whether elaſtic or nonelaſtic, yields a graver ſound by being ſtruck with a larger inſtrument, unleſs either the ſounding body, or that part of it which emits the ſound, is enlarged. In this caſe, the largeſt bodies always return the graveſt ſounds.

Objections to the preceding theory.

In ſpeaking of elaſtic and nonelaſtic bodies in a muſical ſenſe, we are not to puſh the diſtinction ſo far as when we ſpeak of them philoſophically. A body is *muſically* elaſtic, all of whoſe parts are thrown into vibrations ſo as to emit a ſound when only part of their ſurface is ſtruck. Of this kind are bells, muſical ſtrings, and all bodies whatever that are conſiderably hollow. Muſical nonelaſtics are ſuch bodies as emit a ſound only from that particular place which is ſtruck: thus, a table, a plate of iron nailed on wood, a bell ſunk in the earth, are all of them nonelaſtics in a muſical ſenſe, though not philoſophically ſo. When a ſolid body, ſuch as a log of wood, is ſtruck with a ſwitch, only that part of it emits a ſound which comes in contact with the ſwitch; the note is acute and loud, but would be no leſs ſo though the adjacent parts of the log were removed. If, inſtead of the ſwitch, a heavier or larger inſtrument is made uſe of, a larger portion of its ſurface then returns a ſound, and the note is conſequently more grave; but it would not be ſo if the large inſtrument was ſtruck with a ſharp edge, or a ſurface only equal to that of the ſmall one.

In ſounds of this kind, where there is only a ſingle thwack, without any repetition, the immediate cauſe of the gravity or acuteneſs ſeems to be the quantity of air diſplaced by the ſounding body; a large quantity of air diſplaced, produces a grave ſound, and a ſmaller quantity a more acute one, the force wherewith the air is diſplaced ſignifying very little. What we here advance is confirmed by ſome experiments made by Dr Prieſtley, concerning the *muſical tone* of electrical diſcharges. The paſſage being curious, and not very long, we ſhall here tranſcribe it.

"As the courſe of my experiments has required a great variety of electrical explo\ſions, I could not help obſerving a great variety in the muſical tone made by the reports. This excited my curioſity to attempt to reduce this variation to ſome meaſure. Accordingly, by

---

Diſcriminated ſounds, whoſe vibrations either never coincide, or at leaſt very rarely, do not only ceaſe to pleaſe, but violently grate the ear. Harmony and diſcord, therefore, are neither diſcriminated by the judgement of hearers, nor the inſtitution of muſicians, but by their own eſſential and immutable nature.

(D) Vid. Memoires de l'Academie de Berlin, 1753, p. 153.

Of Muſical Sounds

by the help of a couple of ſpinets, and two perſons who had good ears for muſic, I endeavoured to aſcertain the tone of ſome electrical diſcharges; and obſerved, that every diſcharge made ſeveral ſtrings, particularly thoſe that were chords to one another, to vibrate; but one note was always predominant, and ſounded after the reſt. As every exploſion was repeated ſeveral times, and three of us ſeparately took the ſame note, there remained no doubt but that the tone we fixed upon was at leaſt very near the true one. The reſult was as follows:

"A jar containing half a ſquare foot of coated glaſs ſounded F ſharp, concert pitch. Another jar of a different form, but equal ſurface, ſounded the ſame.

"A jar of three ſquare feet ſounded C below F ſharp. A battery conſiſting of ſixty-four jars, each containing half a ſquare foot, ſounded F below the C.

"The ſame battery in conjunction with another of thirty-one jars, ſounded C ſharp. So that a greater quantity of coated glaſs always gave a deeper note.

"Differences in the degree of a charge in the ſame jar made little or no difference in the tone of the exploſion; if any, a higher charge gave rather a deeper note."

Theſe experiments ſhow us how much the gravity or acuteneſs of ſounds depends on the quantity of air put in agitation by the ſounding body. We know that the noiſe of the electric exploſion, ariſes from the return of the air into the vacuum produced by the electric flaſh. The larger the vacuum, the deeper was the note: for the ſame reaſon, the diſcharge of a muſket produces a more acute note than that of a cannon; and thunder is deeper than either.

Beſides this, however, other circumſtances concur to produce different degrees of gravity or acuteneſs in ſounds. The ſound of a table ſtruck upon with a piece of wood, will not be the ſame with that produced from a plate of iron ſtruck by the ſame piece of wood, even if the blows ſhould be exactly equal, and the iron perfectly kept from vibrating. Here the ſounds are generally ſaid to differ in their degrees of acuteneſs, according to the ſpecific gravities or denſities of the ſubſtances which emit them. Thus gold, which is the moſt denſe of all metals, returns a much graver ſound than ſilver; and metalline wires, which are more denſe than therms, return a proportionably graver ſound. But neither does this appear to be a general rule in which we can put confidence. Bell metal is denſer than copper, but it by no means appears to yield a graver ſound: on the contrary, it ſeems very probable, that copper will give a graver ſound than bell metal, if both are ſtruck upon in their nonelaſtic ſtate; and we can by no means think that a bell of pure tin, the leaſt denſe of all the metals, will give a more acute ſound than one of bell metal, which is greatly more denſe. In ſome bodies hardneſs ſeems to have a conſiderable effect. Glaſs, which is conſiderably harder than any metal, gives a more acute ſound; bell metal is harder than gold, lead, or tin, and therefore ſounds much more acutely: though how far this holds with regard to other ſubſtances, there is not a ſufficient number of experiments for us to judge.

In bodies muſically elaſtic, the whole ſubſtance vibrates with the ſlighteſt ſtroke, and therefore they always give the ſame note whether they are ſtruck with a large or with a ſmall inſtrument; ſo that ſtriking a part of the ſurface of any body muſically elaſtic is equivalent, in it, to ſtriking the whole ſurface of a nonelaſtic one. If the whole ſurface of a table was ſtruck with another table, the note produced would be neither more nor leſs acute whatever force was employed; becauſe the whole ſurface would then yield a ſound, and no force could increaſe the ſurface: the ſound would indeed be louder in proportion to the force employed, but the gravity would remain the ſame. In like manner, when a bell, or muſical ſtring, is ſtruck, the whole ſubſtance vibrates, and a greater ſtroke cannot increaſe the ſubſtance. Hence we ſee the fallacy of what is ſaid concerning the Pythagorean anvils. An anvil is a body muſically elaſtic, and no difference in the tone can be perceived whether it is ſtruck with a large or with a ſmall hammer; becauſe either of them are ſufficient to make the whole ſubſtance vibrate, provided nothing but the anvil is ſtruck upon: ſmiths, however, do not ſtrike their anvils, but red hot iron laid upon their anvils; and thus the vibrations of the anvil are ſtopped, ſo that it becomes a nonelaſtic body, and the differences of tone in the ſtrokes of different hammers proceed only from the ſurface of the large hammers covering the whole ſurface of the iron, or at leaſt a greater part of it than the ſmall ones. If the ſmall hammer is ſufficient to cover the whole ſurface of the iron as well as the large one, the note produced will be the ſame, whether the large or the ſmall hammer is uſed.

Laſtly, The argument for the preceding theory, grounded on the production of what are called *flute-notes* on the violin, is built on a falſe foundation; for the bow being lightly drawn on an open ſtring, produces no *flute-notes*, but only the harmonies of the note to which the ſtring is tuned. The *flute-notes* are produced by a particular motion of the bow, quick and near the bridge, and by fingering very gently. By this management, the ſame ſounds are produced, though at certain intervals only, as if the vibrations were tranſferred to the ſpace between the end of the finger-board and the finger, inſtead of that between the finger and the bridge. Why this ſmall part of the ſtring ſhould vibrate in ſuch a caſe, and not that which is under the immediate action of the bow, we muſt own ourſelves ignorant: nor dare we affirm that the vibrations really are transferred in this manner, only the ſame ſounds are produced as if they were.

Though theſe objections ſeem ſufficiently to overturn the foregoing theory, with regard to acute ſounds being the effects of weak ſtrokes, and grave ones of ſtronger impulſes, we cannot admit that longer or ſhorter vibrations are the occaſions of gravity or acuteneſs in ſound. A muſical ſound, however lengthened, either by a ſtring or bell, is only a repetition of a ſingle one, whoſe duration by itſelf is but for a moment, and is therefore termed *inappretiable*, like the ſmack of a whip, or the exploſion of an electrical battery. The continuation of the ſound is nothing more than a repetition of this inſtantaneous inappretiable noiſe after the manner of an echo, and it is only this echo that makes the ſound agreeable. For this reaſon, muſic is much more agreeable when played in a large hall where the ſound is reverberated, than in a ſmall room where there is no ſuch reverberation. For the ſame reaſon, the ſound of a ſtring is more agreeable when put on a hollow

Propagation of Sound.

low violin than when fastened to a plain board, &c.—In the sound of a bell we cannot avoid observing this echo very distinctly. The sound appears to be made up of distinct pulses, or repetitions of the same note produced by the stroke of the hammer. It can by no means be allowed, that the note would be more acute though these pulses were to succeed one another more rapidly; the sound would indeed become more simple, but would still preserve the same tone.—In musical strings the reverberations are vastly more quick than in bells; and therefore their sound is more uniform or simple, and consequently more agreeable than that of bells. In musical glasses*, the vibrations must be inconceivably quicker than in any bell or stringed instrument: and hence they are of all others the most simple and the most agreeable, though neither the most acute nor the loudest.—As far as we can judge, quickness of vibration contributes to the uniformity, or simplicity, but not to the acuteness, nor to the loudness, of a musical note.

See *Harmonica.*

It may here be objected, that each of the different pulses, of which we observe the sound of a bell to be composed, is of a very perceptible length, and far from being instantaneous; so that it is not fair to infer that the sound of a bell is only a repetition of a single instantaneous stroke, seeing it is evidently the repetition of a lengthened note.—To this it may be replied, that the inappretiable sound which is produced by striking a bell in a non-elastic state, is the very same which, being first propagated round the bell, forms one of these short pulses that is afterwards re-echoed as long as the vibrations of the metal continue, and it is impossible that the quickness of repetition of any sound can either increase or diminish its gravity.

Chap. II. *Of the Propagation of Sound. Newton's Doctrine explained and vindicated.*

Propagation of Sound.

The writers on sound have been betrayed into these difficulties and obscurities, by rejecting the 47th proposition, B. II. of Newton, as inconclusive reasoning. Of this proposition, however, the late ingenious Dr Matthew Young bishop of Clonfert, formerly of Trinity college, Dublin, has given a clear, explanatory, and able defence. He candidly owns that the demonstration is obscurely stated, and takes the liberty of varying, in some degree, from the method pursued by Newton.

"1. The parts of all sounding bodies (he observes), vibrate according to the law of a cycloidal pendulum: for they may be considered as composed of an indefinite number of elastic fibres; but these fibres vibrate according to that law. *Vide Helsham*, p. 270.

"2. Sounding bodies propagate their motions on all sides *in directum*, by successive condensations and rarefactions, and successive goings forward and returnings backward of the particles. *Vide Prop.* 43. B. II. *Newton. Princip.*

"3. The pulses are those parts of the air which vibrate backwards and forwards; and which, by going forward, strike (*pulsant*) against obstacles. The latitude of a pulse is the rectilineal space through which the motion of the air is propagated during one vibration of the sounding body.

"4. All pulses move equally fast. This is proved by experiment; and it is found that they describe 1070 Paris feet, or 1142 London feet in a second, whether the sound be loud or low, grave or acute.

Propagation of Sound.

"5. Prob. To determine the latitude of a pulse. Divide the space which the pulse describes in a given time (4) by the number of vibrations performed in the same time by the sounding body, (*Cor.* 1. *Prop.* 24. *Smith's Harmonics*), the quotient is the latitude.

"M. Sauveur, by some experiments on organ pipes, found that a body, which gives the gravest harmonic sound, vibrates 12 times and a half in a second, and that the shrillest sounding body vibrates 51.100 times in a second. At a medium, let us take the body which gives what Sauveur calls his *fixed sound*: it performs 100 vibrations in a second, and in the same time the pulses describe 1070 Parisian feet; therefore the space described by the pulses whilst the body vibrates once, that is, the latitude, or interval of the pulse, will be 10.7 feet.

"6. Prob. To find the proportion which the greatest space, through which the particles of the air vibrate, bears to the radius of a circle, whose perimeter is equal to the latitude of the pulse.

"During the first half of the progress of the elastic fibre, or sounding body, it is continually getting nearer to the next particle; and during the latter half of its progress, that particle is getting farther from the fibre, and these portions of time are equal (*Helsham*): therefore we may conclude, that at the end of the progress of the fibre, the first particle of air will be nearly as far distant from the fibre as when it began to move, and in the same manner we may infer, that all the particles vibrate through spaces nearly equal to that run over by the fibre.

"Now M. Sauveur (*Acad. Scienc. ann.* 1700, p. 141.) has found by experiment, that the middle point of a chord which produces his *fixed sound*, and whose diameter is $\frac{1}{6}$th of a line, runs over in its smallest sensible vibrations $\frac{1}{18}$th of a line, and in its greatest vibrations 72 times that space; that is, $72 \times \frac{1}{18}$ of a line, or 4 lines, that is $\frac{1}{3}$ of an inch.

"The latitude of the pulses of this fixed sound is 10.7 feet (5); and since the circumference of a circle is to its radius as 710 is to 113, the greatest space described by the particles will be to the radius of a circle, whose periphery is equal to the latitude of the pulse as $\frac{1}{3}$d of an inch is to 1.7029 feet, or 20.4348 inches, that is, as 1 to 61.3044.

"If the length of the string be increased or diminished in any proportion, *cæteris paribus*, the greatest space described by its middle point will vary in the same proportion. For the inflecting force is to the tending force as the distance of the string from the middle point of vibration to half the length of the string (see *Helsham* and *Martin*); and therefore the inflecting and tending forces being given, the string will vibrate through spaces proportioned to its length; but the latitude of the pulse is inversely as the number of vibrations performed by the string in a given time (5), that is, directly as the time of one vibration, or directly as the length of the string (*Prop.* 24. *Cor.* 7. *Smith's Harmonics*); therefore the greatest space through which the middle point of the string vibrates will vary in the direct ratio of the latitude of the pulse, or of the radius of a circle whose circumference is equal

Propagation of Sound.

to the latitude, that is, it will be to that radius as 1 to 61.3044.

" 7. If the particles of the aerial pulſes, during any part of their vibration, be ſucceſſively agitated, according to the law of a cycloidal pendulum, the comparative elaſtic forces ariſing from their mutual action, by which they will afterwards be agitated, will be ſuch as will cauſe the particles to continue that motion, according to the ſame law, to the end of their vibration.

" Let AB, BC, CD, &c. fig. 3. denote the equal diſtances of the ſucceſſive pulſes; ABC the direction of the motion of the pulſes propagated from A towards B; E, F, G, three phyſical points of the quieſcent medium, ſituated in the right line AC at equal diſtances from each other; E*e*, F*f*, G*g*, the very ſmall equal ſpaces through which theſe particles vibrate; ε, φ, γ, any intermediate places of theſe points. Draw the right line PS, fig. 4. equal to E*e*, biſect it in O, and from the centre O with the radius OP deſcribe the circle SIP*h*. Let the whole time of the vibration of a particle and its parts be denoted by the circumference of this circle and its proportional parts. And ſince the particles are ſuppoſed to be at firſt agitated according to the law of a cycloidal pendulum, if at any time PH or PHS*h*, the perpendicular HL or *hl*, be let fall on PS, and if E*e* be taken equal to PL or P*l*, the particle E ſhall be found in ε. Thus will the particle E perform its vibrations according to the law of a cycloidal pendulum. *Prop.* 52. B. I. *Principia.*

" Let us ſuppoſe now, that the particles have been ſucceſſively agitated, according to this law, for a certain time, by any cauſe whatſoever, and let us examine what will be the comparative elaſtic forces ariſing from their mutual action, by which they will afterwards continue to be agitated.

" In the circumference PHS*h* take the equal arches HI, IK in the ſame ratio to the whole circumference which the equal right lines EF, FG, have to BC the whole interval of the pulſes; and let fall the perpendiculars IIL, IM, KN. Since the points E, F, G are ſucceſſively agitated in the ſame manner, and perform their entire vibrations of progreſs and regreſs while the pulſe is propagated from B to C, if PH be the time from the beginning of the motion of E, PI will be the time from the beginning of the motion of F, and PK the time from the beginning of the motion of G; and therefore Eε, Fφ, Gγ will be reſpectively equal to PL, PM, PN in the progreſs of the particles. Whence εφ or EF+Fφ—Eε is equal to EF—LM. But εφ is the expanſion of EF in the place εφ, and therefore this expanſion is to its mean expanſion as EF—LM to EF. But LM is to IH as IM is to OP; and IH is to EF, as the circumference PHS*h* is to BC; that, is as OP is to V, if V be the radius of a circle whoſe circumference is BC; therefore, *ex æquo*, LM is to EF as IM is to V; and therefore the expanſion of EF in the place εφ is to its mean expanſion as V—IM is to V; and the elaſtic force exiſting between the phyſical points E and F is to the mean elaſtic force as

$\frac{1}{V-IM}$ is to $\frac{1}{V}$ (*Cotes Pneum. Lect.* 9.) By the ſame argument, the elaſtic force exiſting between the phyſical points F and G is to the mean elaſtic force as $\frac{1}{V-KN}$ is to $\frac{1}{V}$; and the difference between theſe forces is to the mean elaſtic force as $\frac{IM-KN}{V^2-V.IM-V.KN+IM.KN}$ is to $\frac{1}{V}$; that is, as $\frac{IM-KN}{V^2}$ is to $\frac{1}{V}$; or as IM—KN is to V; if only (upon account of the very narrow limits of the vibration) we ſuppoſe IM and KN to be indefinitely leſs than V. Wherefore ſince V is given, the difference of the forces is as IM—KN, or as HL—IM (becauſe KH is biſected in I); that is, (becauſe HL—IM is to IH as OM is to OI or OP, and IH and OP are given quantities) as OM; that is, if F*f* be biſected in Ω as Ωφ.

" In the ſame manner it may be ſhown, that if PHS*h* be the time from the beginning of the motion of E, PHS*i* will be the time from the beginning of the motion of F, and PHS*k* the time from the beginning of the motion of G; and that the expanſion of EF in the place εφ is to its mean expanſion as EF+Γφ—Eε, or as EF+*lm* is to EF, or as V+*hl* is to V in its regreſs: and its elaſtic force to the mean elaſtic force as $\frac{1}{V+hl}$ is to $\frac{1}{V}$; and that the difference of the elaſtic forces exiſting between E and F, and between F and G is to the mean elaſtic force as *kn—im* is to V; that i, directly as Ωφ.

" But this difference of the elaſtic forces, exiſting between E and Γ, and between F and G, is the comparative elaſtic force by which the phyſical point φ is agitated: and therefore the comparative accelerating force, by which every phyſical point in the medium will continue to be agitated both in progreſs and regreſs, will be directly as its diſtance from the middle point of its vibration; and conſequently will be ſuch as will cauſe the particles to continue their motion undiſturbed, according to the law of a cycloidal pendulum. *Prop.* 38. l. 1. *Newton. Principia.*

" Newton rejects the quantity $= V \times \overline{IM+KN} + IM \times KN$, on ſuppoſition that IM and KN are indefinitely leſs than V. Now, although this may be a reaſonable hypotheſis, yet, that this quantity may be ſafely rejected, will, I think, appear in a more ſatisfactory manner from the following conſiderations derived from experiment: PS, in its greateſt poſſible ſtate, is to V as 1 is to 61.3044 (6); and therefore IM, or KN, in its greateſt poſſible ſtate, (that is, when the vibrations of the body are as great as poſſible, and the particle in the middle point of its vibration) is to V as 1 is to 122.6. Hence $V^2 = 15030.76$, $\overline{V \times \overline{IM+KN}} = 245.2$ and $IM \times KN = 1$; therefore V^2 is to $V^2 - \overline{V \times \overline{IM+KN}} + IM \times KN$ as 15.03076 is to 14786.56; that is, as 61 is to 60 nearly.

" Hence it appears, that the greateſt poſſible error in the accelerating force, in the middle point, is the $\frac{1}{61}$ſt part of the whole. In other points it is much leſs; and in the extreme points the error entirely vaniſhes.

" We ſhould alſo obſerve, that the ordinary ſounds we hear are not produced by the greateſt poſſible vibrations of which the ſounding body is capable; and that in general IM and KN are nearly evaneſcent with reſpect

Propagation of Sound.

respect to V. And very probably the disagreeable sensations we feel in very loud sounds, arise not only from IM or KN bearing a sensible proportion to V, by which means the cycloidal law of the pulses may be in some measure disturbed, but also from the very law of the motion of the sounding body itself being disturbed. For the proof of this law's being observed by an elastic fibre is founded on the hypothesis that the space, through which it vibrates, is indefinitely little with respect to the length of the string. See *Smith's Harmonics*, p. 237. *Helsham*, p. 270.

" 8. If a particle of the medium be agitated according to the law of a cycloidal pendulum, the comparative elastic force, acting on the adjacent particle, from the instant in which it begins to move, will be such as will cause it to continue its motion according to the same law.

" For let us suppose, that three particles of the medium had continued to move for times denoted by the arches PK, PI, PH, the comparative elastic force, acting on the second during the time of its motion, would have been denoted by HL—IM, that is, would have been directly as MO (7). And if this time be diminished till I becomes coincident with P, that is, if you take the particles in that state when the second is just beginning to move, and before the third particle has yet been set in motion; then the point M will fall on P, and MO become PO; that is, the comparative elastic force of the second particle, at the instant in which it begins to move, will be to the force with which it is agitated in any other moment of time, before the subsequent particle has yet been set in motion, directly as its distance from the middle point of vibration. Now this comparative elastic force, with which the second particle is agitated in the very moment in which it begins to move, arises from the preceding particle's approaching it according to the law of a pendulum; and therefore, if the preceding particle approaches it in this manner, the force by which it will be agitated, in the very moment it begins to move, will be exactly such as should take place in order to move it according to the law of a pendulum. It therefore sets out according to that law, and consequently the subsequent elastic forces generated in every successive moment, will also continue to be of the just magnitude which should take place, in order to produce such a motion.

" 9. The pulses of the air are propagated from sounding bodies, according to the law of a cycloidal pendulum. The point E, fig. 3. of any elastic fibre producing a sound, may be considered as a particle of air vibrating according to the law of a pendulum (1). This point E will therefore move according to this law for a certain time, denoted by the arch IH, fig. 4. before the second particle begins to move; for sound is propagated in time through the successive particles of air (4). Now from that instant, the comparative elastic force which agitates F, is (8) directly as its distance from the middle point of vibration. F therefore sets out with a motion according to the law of a pendulum: and therefore the comparative elastic force by which it will be agitated until G begins to move, will continue that law (8). Consequently F will approach G in the same manner as E approached F, and the comparative elastic force of G, from the instant in which it begins to move will be directly as its distance from the middle point of vibration; and so on in succession. Therefore all the particles of air in the pulses successively set out from their proper places according to the law of a pendulum, and therefore (7) will finish their entire vibrations according to the same law.

" *Cor.* 1. The number of pulses propagated is the same with the number of vibrations of the tremulous body, nor is it multiplied in their progress; because the little physical line *ey*. fig. 3. as soon as it returns to its proper place, will there quiesce; for its velocity which is denoted by the line IM, then vanishes, and its density becomes the same with that of the ambient medium. This line, therefore, will no longer move, unless it be again driven forwards by the impulse of the sounding body, or of the pulses propagated from it.

" *Cor.* 2. In the extreme points of the little space through which the particle vibrates, the expansion of the air is in its natural state; for the expansion of the physical line is to its natural expansion as V $\mp$ IM is to V; but IM is then equal to nothing. In the middle point of the progress the condensation is greatest: for IM is then greatest, and consequently the expansion V—IM least. In the middle of the regress, the rarefaction is greatest for im, and consequently V$+im$, is then greatest.

" 10. To find the velocity of the pulses, the density and elastic force of the medium being given.

" This is the 49th Prop. B. II. Newton, in which he shows, that whilst a pendulum, whose length is equal to the height of the homogeneous atmosphere, vibrates once forwards and backwards, the pulses will describe a space equal to the periphery of a circle described with that altitude as its radius.

" *Cor.* 1. He thence shows, that the velocity of the pulses is equal to that which a heavy body would acquire in falling down half the altitude of that homogeneous atmosphere; and therefore, that all pulses move equally fast, whatever be the magnitude of PS, or the time of its being described; that is, whether the tone be loud or low, grave or acute. See *Hales de Sonis*, § 49.

" *Cor.* 2. And also, that the velocity of the pulses is in a ratio compounded of the direct subduplicate ratio of the elastic force of the medium, and the inverse subduplicate of its density. Hence sounds move somewhat faster in summer than in winter. See *Hales de Sonis*, p. 141.

" 11. The strength of a tone is as the moment of the particles of air. The moment of these particles (the medium being given) is as their velocity; and the velocity of these particles is as the velocity of the string which sets them in motion (9). The velocities of two different strings are equal when the spaces which they describe in their vibrations are to each other as the times of these vibrations: therefore, two different tones are of equal strength, when the spaces, through which the strings producing them vibrate, are directly as the times of their vibration.

" 12. Let the strength of the tones of the two strings AB, CD, which differ in tension only (fig. 5. 6.) be equal. Quere the ratio of the inflecting forces F and f? From the hypothesis of the equality of the strength of the tones, it follows (11), that the space

Velocity of Sound.

GE must be to the space HF as $f^{\frac{1}{2}}$ to $F^{\frac{1}{2}}$ (*Smith's Harm.* Prop. 24. Cor. 4.). Now the forces inflecting AB, CD, through the equal spaces GE, HP, are to each other as the tending forces, that is, as F to *f*, (*Malcom's Treatise on Music*, p. 52.). But the force inflecting CD through HP is to the force inflecting it through HF as HP or GE to HF (*ib.* p. 47.), that is, by the hyp. as $f^{\frac{1}{2}}$ to $F^{\frac{1}{2}}$. Therefore, *ex æquo*, the forces inflecting AB and CD, when the tones are equally strong, are to each other as $F \times f^{\frac{1}{2}}$ to $f \times F^{\frac{1}{2}}$, or as $F^{\frac{1}{2}}$ to $f^{\frac{1}{2}}$. That is, the forces necessary to produce tones of equal strength in various strings which differ only in tension, are to each other in the subduplicate ratio of the tending forces, that is, inversely as the time of one vibration, or directly as the number of vibrations performed in a given time. Thus, if CD be the acute octave to AB, its tending force will be quadruple that of AB, (*Malcom's Treatise on Music*, p. 53.): and therefore to produce tones of equal strength in these strings, the force impelling CD must be double that impelling AB; and so in other cases.

"Suppose, now, that the strings AB, CD (fig. 6. 7.) differ in length only. The force inflecting AB through GE is to the tending force, which is given, as GE to AG; and this tending force is to the force inflecting CD through the space HP equal to GE, as HD to HP. Therefore, *ex æquo*, the forces inflecting AB and CD through the equal spaces GE and HP, are to each other as HD to AG, or as CD to AB. But the force inflecting CD through HP is to the force inflecting it through HF, as HP or GE to HF, that is, because these spaces are as the times (11), as AB to CD. Therefore, *ex æquo*, the forces inflecting AB and CD, when the tones are equally strong, are to each other in a ratio of equality. Hence we should suppose, that in this case, an equal number of equal impulses would generate equally powerful tones in these strings. But we are to observe, that the longer the string, the greater, *cæteris paribus*, is the space through which a given force inflects it (*Malcom*); and therefore whatever diminution is produced in the spaces through which the strings move in their successive vibrations, arising either from the want of perfect elasticity in the strings, or from the resistance of the air, this diminution will bear a greater proportion to the less space, through which the shorter string vibrates. And this is confirmed by experience; for we find that the duration of the tone and motion of the whole string exceeds that of any of its subordinate parts. Therefore, after a given interval of time, a greater quantity of motion will remain in the longer string; and consequently, after the successive equal impulses have been made, a greater degree of motion will still subsist in it. That is, a given number of equal impulses being made on various strings differing in length only, a stronger sound will be produced in that which is the longer."

Chap. III. *Of the Velocity, &c. of Sound. Axioms.*

Velocity of sound.

By the experiments of some philosophers it has been proved, that sound travels at about the rate of 1142 feet in a second, or near 13 miles in a minute; nor do any obstacles hinder its progress, a contrary wind only a small matter diminishing its velocity. The method of calculating its progress is easily made known. When a gun is discharged at a distance, we see the fire long before we hear the sound. If then we know the distance of the place, and know the time of the interval between our first seeing the fire and then hearing the report, this will shew us exactly the time the sound has been travelling to us. For instance, if the gun is discharged a mile off, the moment the flash is seen, you take a watch and count the seconds till you hear the sound; the number of seconds is the time the sound has been travelling a mile. Again, By the above axiom, we are enabled to find the distance between objects that would be otherwise immeasurable. For example, suppose you see the flash of a gun in the night at sea, and tell seven seconds before you hear the report, it follows therefore that the distance is seven times 1142 feet, that is, 24 yards more than a mile and a half. In like manner, if you observe the number of seconds between the lightning and the report of the thunder, you know the distance of the cloud from whence it proceeds.

Reverberated Sounds.

Its progress calculated.

Distances calculated by means of sound.

But according to another philosopher, Dr Thomas Young, the velocity of sound is not quite so great. "It has been demonstrated, he observes, by M. de la Grange and others, that any impression whatever communicated to one particle of an elastic fluid, will be transmitted through that fluid with an uniform velocity, depending on the constitution of the fluid, without reference to any supposed laws of the continuation of that impression. Their theorem for ascertaining this velocity is the same as Newton has deduced from the hypothesis of a particular law of continuation: but it must be confessed, that the result differs somewhat too widely from experiment, to give us full confidence in the perfection of the theory. Corrected by the experiments of various observers, the velocity of any impression transmitted by the common air, may, at an average, be reckoned 1130 feet in a second." (*Phil. Trans.* vol. xc. p. 116.).

All sound travel at the same rate.

Derham has proved by experiment, that all sounds whatever travel at the same rate. The sound of a gun and the striking of a hammer, are equally swift in their motions; the softest whisper flies as swiftly, as far as it goes, as the loudest thunder.

To these axioms we may add the following:

Smooth and clear sounds proceed from bodies that are homogeneous, and of an uniform figure; and harsh or obtuse sounds, from such as are of a mixed matter and irregular figure.

The velocity of sounds is to that of a brisk wind as fifty to one.

The strength of sounds is greatest in cold and dense air, and least in that which is warm and rarefied.

Every point against which the pulses of sound strike, becomes a centre from which a new series of pulses are propagated in every direction.

Sound describes equal spaces in equal times.

Chap. IV. *Of Reverberated Sounds.*

Sound, like light, after it has been reflected from several places, may be collected in one point, as into a focus; and it will be there more audible than in any other part, even than at the place from whence it proceeded. On this principle it is that a whispering gallery is constructed.

The

Reverberated Sounds.

Whiſpering gallery.

The form of a whiſpering gallery muſt be that of a concave hemiſphere (E), as ABC fig. 8.; and if a low ſound or whiſper be uttered at A, the vibrations expanding themſelves every way will impinge on the points DDD, &c. and from thence be reflected to EEE, and from thence to the points F and G, till at laſt they all meet in C, where, as we have ſaid, the ſound will be the moſt diſtinctly heard.

Speaking trumpet.

The augmentation of ſound by means of ſpeaking-trumpets, is uſually illuſtrated in the following manner: Let ABC fig. 9. be the tube, BD the axis, and B the mouth-piece for conveying the voice to the tube. Then it is evident when a perſon ſpeaks at B in the trumpet, the whole force of his voice is ſpent upon the air contained in the tube, which will be agitated through its whole length, and, by various reflections from the ſide of the tube to the axis, the air along the middle part of the tube will be greatly condenſed, and its *momentum* proportionably increaſed, ſo that when it comes to agitate the air at the orifice of the tube AC, its force will be as much greater than what it would have been without the tube, as the ſurface of a ſphere, whoſe radius is equal to the length of the tube, is greater than the ſurface of the ſegment of ſuch a ſphere whoſe baſe is the orifice of the tube. For a perſon ſpeaking at B, without the tube, will have the force of his voice ſpent in exciting concentric ſuperficies of air all round the point B; and when thoſe ſuperficies or pulſes of air are diffuſed as far as D every way, it is plain the force of the voice will there be diffuſed through the whole ſuperficies of a ſphere whoſe radius is BD; but in the trumpet it will be ſo confined, that at its exit it will be diffuſed through ſo much of that ſpherical ſurface of air as correſponds to the orifice of the tube. But ſince the force is given, its intenſity will be always inverſely as the number of particles it has to move; and therefore in the tube it will be to that without, as the ſuperficies of ſuch a ſphere to the area of the large end of the tube nearly.

" But it is obvious, Dr M. Young obſerves, that the confinement of the voice can have little effect in increaſing the ſtrength of the ſound, as this ſtrength depends on the velocity with which the particles move. Were this reaſoning concluſive, the voice ſhould iſſue through the ſmalleſt poſſible orifice; cylindrical tubes would be preferable to any that increaſed in diameter; and the leſs the diameter, the greater would be the effect of the inſtrument; becauſe the plate or maſs of air to be moved, would, in that caſe, be leſs, and conſequently the effect of the voice the greater; all which is contradicted by experience.

" The cauſe of the increaſed of ſound in theſe tubes muſt therefore be derived from ſome other principles: and among theſe we ſhall probably find, that what the ingenious Kircher has ſuggeſted in his Phonurgia is the moſt deſerving of our attention. He tells us, that " the augmentation of the ſound depends on its reflection from the tremulous ſides of the tube; which reflections, conſpiring in propagating the pulſes in the ſame direction, muſt increaſe its intenſity." Newton alſo ſeems to have conſidered this as the principal cauſe, in the ſcholium of Prop. 50. B. II. Princip. when he ſays, " we hence ſee why ſounds are ſo much increaſed in ſtentorophonic tubes, for every reciprocal motion is, in each return, increaſed by the generating cauſe.

Reverberated Sounds.

" Farther, When we ſpeak in the open air, the effect on the tympanum of a diſtant auditor is produced merely by a ſingle pulſe. But when we uſe a tube, all the pulſes propagated from the mouth, except thoſe in the direction of the axis, ſtrike againſt the ſides of the tube, and every point of impulſe becoming a new centre, from whence the pulſes are propagated in all directions, a pulſe will arrive at the ear from each of thoſe points; thus, by the uſe of a tube, a greater number of pulſes are propagated to the ear, and conſequently the ſound increaſed. The confinement too of the voice may have a little effect, though not ſuch as is aſcribed to it by ſome; for the condenſed pulſes produced by the naked voice, freely expand every way; but in tubes, the lateral expanſion being diminiſhed, the direct expanſion will be increaſed, and conſequently the velocity of the particles, and the intenſity of the ſound. The ſubſtance alſo of the tube has its effect; for it is found by experiment, that the more elaſtic the ſubſtance of the tube, and conſequently the more ſuſceptible it is of theſe tremulous motions, the ſtronger is the ſound.

" If the tube be laid on any nonelaſtic ſubſtance, it deadens the ſound, becauſe it prevents the vibratory motion of the parts. The ſound is increaſed in ſpeaking-trumpets, if the tube be ſuſpended in the air; becauſe the agitations are then carried on without interruption. Theſe tubes ſhould increaſe in diameter from the mouth-piece, becauſe the parts vibrating in directions perpendicular to the ſurface will conſpire in impelling forward the particles of air, and conſequently, by increaſing their velocity, will increaſe the intenſity of the ſound: and the ſurface alſo increaſing, the number of points of impulſe and of new propagation will increaſe proportionally. The ſeveral cauſes therefore, of the increaſe of ſound in theſe tubes, Dr Young concludes to be, 1. The diminution of the lateral, and conſequently the increaſe of the direct, expanſion and velocity of the included air. 2. The increaſe of the number of pulſes, by increaſing the points of new propagation. 3. The reflections of the pulſes from the tremulous ſides of the tube, which impel the particles of air forward, and thus increaſe their velocity." (*Enquiry into the principal Phenomena of Sound*, p. 56.)

Echoes.

An echo is a reflection of ſound ſtriking againſt ſome object, as an image is reflected in a glaſs: but it has been diſputed what are the proper qualities in a body for thus reflecting ſounds. It is in general known, that caverns, grottoes, mountains, and ruined buildings, return this reflection of ſound. We have heard of a very extraordinary echo, at a ruined fortreſs near Louvain, in Flanders. If a perſon ſung, he only heard his own voice, without any repetition: on the contrary, thoſe who ſtood at ſome diſtance heard the echo but not the voice; but then they heard it with ſurpriſing variations, ſometimes louder, ſometimes ſofter, now more near,

(E) A cylindric or elliptic arch will anſwer ſtill better than one that is circular.

Reverberated Sounds.

near, then more distant. There is an account in the memoirs of the French Academy, of a similar echo near Rouen.

It has been already observed that every point against which the pulses of sound strike becomes the centre of a new series of pulses, and sound describes equal distances in equal times; therefore, when any sound is propagated from a centre, and its pulses strike against a variety of obstacles, if the sum of the right lines drawn from that point to each of the obstacles, and from each obstacle to a second point, be equal, then will the latter be a point in which an echo will be heard. "Thus let A fig. 10. be the point from which the sound is propagated in all directions, and let the pulses strike against the obstacles C, D, E, F, G, H, I, &c. each of these points becomes a new centre of pulses by the first principle, and therefore from each of them one series of pulses will pass through the point B. Now if the several sums of the right lines $\overline{AC+CB}$, $\overline{AD+DC}$, $\overline{AE+EB}$, $\overline{AG+GB}$, $\overline{AH+HB}$, $\overline{AI+IB}$, &c. be all equal to each other, it is obvious that the pulses propagated from A to these points, and again from these points to B, will all arrive at B at the same instant, according to the second principle; and therefore, if the hearer be in that point, his ear will at the same instant be struck by all these pulses. Now it appears from experiment (see *Musschenbroek*, vol. ii. p. 210.), that the ear of an exercised musician can only distinguish such sounds as follow one another at the rate of 9 or 10 in a second, or any slower rate: and therefore, for a distinct perception of the direct and reflected sound, there should intervene the interval of $\frac{1}{9}$th of a second; but in this time sound describes $\frac{1142}{9}$ or 127 feet nearly. And therefore, unless the sum of the lines drawn from each of the obstacles to the points A and B exceeds the interval AB by 127 feet, no echo will be heard at B. Since the several sums of the lines drawn from the obstacles to the points A and B are of the same magnitude, it appears that the curve passing through all the points C, D, E, F, G, H, I, &c. will be an ellipse, (*Prop.* 14. b. ii. *Ham. Con.*). Hence all the points of the obstacles which produce an echo, must lie in the surface of the oblong spheroid, generated by the revolution of this ellipse round its major axis.

"As there may be several spheroids of different magnitudes, so there may be several different echoes of the same original sound. And as there may happen to be a greater number of reflecting points in the surface of an exterior spheroid than in that of an interior, a second or a third echo may be much more powerful than the first, provided that the superior number of reflecting points, that is, the superior number of reflected pulses propagated to the ear, be more than sufficient to compensate for the decay of sound which arises from its being propagated through a greater space. This is finely illustrated in the celebrated echoes at the lake of Killarney in Kerry, where the first return of the sound is much inferior in strength to those which immediately succeed it.

"From what has been laid down it appears, that for the most powerful echo, the sounding body should be in one focus of the ellipse which is the section of the echoing spheroid, and the hearer in the other. However, an echo may be heard in other situations, though not so favourably; as such a number of reflected pulses may arrive at the same time at the ear as may be sufficient to excite a distinct perception. Thus a person often hears the echo of his own voice; but for this purpose he should stand at least 63 or 64 feet from the reflecting obstacle, according to what has been said before. At the common rate of speaking, we pronounce not above three syllables and a half, that is, seven half syllables in a second; therefore, that the echo may return just as soon as three syllables are expressed, twice the distance of the speaker from the reflecting object must be equal to 1000 feet; for as sound describes 1142 feet in a second, $\frac{7}{8}$ths of that space, that is, 1000 feet nearly, will be described while six half or three whole syllables are pronounced; that is, the speaker must stand near 500 feet from the obstacle. And in general, the distance of the speaker from the echoing surface, for any number of syllables, must be equal to the seventh part of the product of 1142 feet multiplied by that number.

"In churches we never hear a distinct echo of the voice, but a confused sound when the speaker utters his words too rapidly; because the greatest difference of distance between the direct and reflected courses of such a number of pulses as would produce a distinct sound, is never in any church equal to 127 feet, the limit of eches.

"But though the first reflected pulses may produce no echo, both on account of their being too few in number, and too rapid in their return to the ear; yet it is evident, that the reflecting surface may be so formed, as that the pulses which come to the ear after two reflections or more, may, after having described 127 feet or more, arrive at the ear in sufficient numbers, and also so nearly at the same instant, as to produce an echo, though the distance of the reflecting surface from the ear be less than the limit of echoes. This is confirmed by a singular echo in a grotto on the banks of the little brook called the Dinan, about two miles from Castlecomber, in the county of Kilkenny. As you enter the cave, and continue speaking loud, no return of the voice is perceived; but on your arriving at a certain point, which is not above 14 or 15 feet from the reflecting surface, a very distinct echo is heard. Now this echo cannot arise from the first course of pulses that are reflected to the ear, because the breadth of the cave is so small, that they would return too quickly to produce a distinct sensation from that of the original sound: it therefore is produced by those pulses, which, after having been reflected several times from one side of the grotto to the other, and having run over a greater space than 127 feet, arrive at the ear in considerable numbers, and not more distant from each other, in point of time, than the ninth part of a second."

To what has been said of reflected sounds, we shall add an extract on the same subject from the ingenious paper which we have already quoted.

"M. de la Grange has also demonstrated, that all impressions are reflected by an obstacle terminating an elastic fluid, with the same velocity with which they arrived at that obstacle. When the walls of a passage, or

Amuſing Experiments, &c.

or of an unfurniſhed room, are ſmooth and perfectly parallel, any exploſion, or a ſtamping with the foot, communicates an impreſſion to the air, which is reflected from one wall to the other, and from the ſecond again towards the ear, nearly in the ſame direction with the primitive impulſe: this takes place as frequently in a ſecond, as double the breadth of the paſſage is contained in 1130 feet; and the ear receives a perception of a muſical ſound, thus determined in its pitch by the breadth of the paſſage. On making the experiment, the reſult will be found accurately to agree with this explanation. If the ſound is predetermined, and the frequency of vibrations ſuch as that each pulſe, when doubly reflected, may coincide with the ſubſequent impulſe proceeding directly from the ſounding body, the intenſity of the ſound will be much increaſed by the reflection; and alſo, in a leſs degree, if the reflected pulſe coincides with the next but one, the next but two, or more, of the direct pulſes. The appropriate notes of a room may readily be diſcovered by ſinging the ſcale in it; and they will be found to depend on the proportion of its length or breadth to 1130 feet. The ſound of the ſtopped diapaſon pipes of an organ is produced in a manner ſomewhat ſimilar to the note from an exploſion in a paſſage; and that of its reed pipes to the reſonance of the voice in a room: the length of the pipe in one caſe determining the ſound; in the other, increaſing its ſtrength. The frequency of the vibrations does not at all immediately depend on the diameter of the pipe. It muſt be confeſſed, that much remains to be done in explaining the preciſe manner in which the vibration of the air in an organ pipe is generated. M. Daniel Bernouilli has ſolved ſeveral difficult problems relating to the ſubject; yet ſome of his aſſumptions are not only gratuitous, but contrary to matter of fact." (*Phil. Tranſ.* vol. xc. p. 118.)

We ſhall now cloſe this article with deſcribing a few inventions founded on ſome of the preceding principles, which may perhaps amuſe and not be altogether uninſtructive to a number of our readers.

Amuſing Experiments and Contrivances.

The converſing ſtatue.

I. Place a concave mirror of about two feet diameter, as AB, fig. 11. in a perpendicular direction. The focus of this mirror may be at 15 or 18 inches diſtance from its ſurface. At the diſtance of about five or ſix feet let there be a partition, in which there is an opening EF, equal to the ſize of the mirror; againſt this opening muſt be placed a picture, painted in water colours, on a thin cloth, that the ſound may eaſily paſs through it (G).

Behind the partition, at the diſtance of two or three feet, place another mirror GH, of the ſame ſize as the former, and let it be diametrically oppoſite to it (H).

At the point C let there be placed the figure of a man ſeated on a pedeſtal, and let his ear be placed exactly in the focus of the firſt mirror: his lower jaw muſt be made to open by a wire, and ſhut by a ſpring; and there may be another wire to move the eyes: theſe wires muſt paſs through the figure, go under the floor, and come up behind the partition.

Amuſing Experiments, &c.

Let a perſon, properly inſtructed, be placed behind the partition near the mirror. You then propoſe to any one to ſpeak ſoftly to the ſtatue, by putting his mouth to the ear of it, aſſuring him that it will anſwer inſtantly. You then give the ſignal to the perſon behind the partition, who, by placing his ear to the focus I, of the mirror GH, will hear diſtinctly what the other ſaid; and, moving the jaw and eyes of the ſtatue by the wires, will return an anſwer directly, which will in like manner be diſtinctly heard by the firſt ſpeaker.

This experiment appears to be taken from the Century of Inventions of the Marquis of Worceſter; whoſe deſigns, at the time they were publiſhed, were treated with ridicule and neglect as being impracticable, but are now known to be generally, if not univerſally, practicable. The words of the marquis are theſe: "How to make a brazen or ſtone head in the midſt of a great field or garden, ſo artificial and natural, that though a man ſpeak ever ſo ſoftly, and even whiſper into the ear thereof, it will preſently open its mouth, and reſolve the queſtion in French, Latin, Welſh, Iriſh, or Engliſh, in good terms, uttering it out of its mouth, and then ſhut it until the next queſtion be aſked."—The two following, of a ſimilar nature, appear to have been inventions of Kircher, by means of which (as he informs us *) he uſed to "utter feigned and ludicrous conſultations, with a view to ſhow the fallacy and impoſture of ancient oracles."

* *Phonurgia Nova*, ſect. vi. c. 1.

The communicative buſts.

II. Let there be two heads of plaſter of Paris, placed on pedeſtals, on the oppoſite ſides of a room. There muſt be a tin tube of an inch diameter, that muſt paſs from the ear of one head, through the pedeſtal, under the floor, and go up to the mouth of the other. Obſerve, that the end of the tube which is next the ear of the one head, ſhould be conſiderably larger than that end which comes to the mouth of the other. Let the whole be ſo diſpoſed that there may not be the leaſt ſuſpicion of a communication.

Now, when a perſon ſpeaks, quite low, into the ear of one buſt, the ſound is reverberated through the length of the tube, and will be diſtinctly heard by any one who ſhall place his ear to the mouth of the other: It is not neceſſary that the tube ſhould come to the lips of the buſt.—If there be two tubes, one going to the ear, and the other to the mouth of each head, two perſons may converſe together, by applying their mouth and ear reciprocally to the mouth and ear of the buſts; and at the ſame time other perſons that ſtand in the middle of the chamber, between the heads, will not hear any part of their converſation.

The oracular room, ſpeaking head.

III. Place a buſt on a pedeſtal in the corner of a

(G) The more effectually to conceal the cauſe of this illuſion, the mirror AB may be fixed in the wainſcot, and a gauze or any other thin covering thrown over it, as that will not in the leaſt prevent the ſound from being reflected. An experiment of this kind may be performed in a field or garden, between two hedges, in one of which the mirror AB may be placed, and in the other an opening artfully contrived.

(H) Both the mirrors here uſed may be of tin or gilt paſteboard, this experiment not requiring ſuch as are very accurate.

Amuſing Experiments, &c.

room, and let there be two tubes, as in the foregoing amuſement, one of which muſt go from the mouth and the other from the ear of the buſt, through the pedeſtal and the floor, to an under apartment. There may be likewiſe wires that go from the under jaw and the eyes of the buſt, by which they may be eaſily moved.

A perſon being placed in the under room, and at a ſignal given applying his ear to one of the tubes, will hear any queſtion that is aſked, and immediately reply; moving at the ſame time, by means of the wires, the mouth and the eyes of the buſt, as if the reply came from it.

A ſolar ſonata.

IV. In a large caſe, ſuch as is uſed for dials and ſpring clocks, the front of which, or at leaſt the lower part of it, muſt be of glaſs, covered on the inſide with gauze, let there be placed a barrel organ, which, when wound up, is prevented from playing, by a catch that takes a toothed wheel at the end of the barrel. To one end of this catch there muſt be joined a wire, at the end of which there is a flat circle of cork, of the ſame dimenſion with the inſide of a glaſs tube, in which it is to riſe and fall. This tube muſt communicate with a reſervoir that goes acroſs the front part of the bottom of the caſe, which is to be filled with ſpirits, ſuch as is uſed in thermometers, but not coloured, that it may be the better concealed by the gauze.

This caſe being placed in the ſun, the ſpirits will be rarefied by the heat; and riſing in the tube, will lift up the catch or trigger, and ſet the organ in play: which it will continue to do as long as it is kept in the ſun; for the ſpirits cannot run out of the tube, that part of the catch to which the circle is fixed being prevented from riſing beyond a certain point by a check placed over it.

When the machine is placed againſt the ſide of a room on which the ſun ſhines ſtrong, it may conſtantly remain in the ſame place, if you encloſe it in a ſecond caſe, made of thick wood, and placed at a little diſtance from the other. When you want it to perform, it will be only neceſſary to thrown open the door of the outer caſe, and expoſe it to the ſun.

But if the machine be moveable, it will perform in all ſeaſons by being placed before the fire; and in the winter it will more readily ſtop when removed into the cold.

A machine of this ſort is ſaid to have been invented by Cornelius Dreble, in the laſt century. What the conſtruction of that was, we know not; it might very likely be more complex, but could ſcarcely anſwer the intention more readily.

Automatous harpſichord.

V. Under the keys of a common harpſichord let there be fixed a barrel, ſomething like that in a chamber organ, with ſtops or pins correſponding to the tunes you would have it play. Theſe ſtops muſt be moveable, ſo that the tunes may be varied at pleaſure. From each of the keys let there go a wire perpendicular down: the ends of theſe wires muſt be turned up for about one-fourth of an inch. Behind theſe wires let there be an iron bar, to prevent them from going too far back. Now, as the barrel turns round, its pins take the ends of the wires, which pull down the keys, and play the harpſichord. The barrel and wires are to be all encloſed in a caſe.

Amuſing Experiments, &c.

In the chimney of the ſame room where the harpſichord ſtands, or at leaſt in one adjacent, there muſt be a ſmoke jack, from whence comes down a wire, or cord, that, paſſing behind the wainſcot adjoining the chimney, goes under the floor, and up one of the legs of the harpſichord, into the caſe, and round a ſmall wheel fixed on the axis of that firſt mentioned. There ſhould be pulleys at different diſtances, behind the wainſcot and under the floor, to facilitate the motion of the cord.

This machinery may be applied to any other keyed inſtrument as well as to chimes, and to many other purpoſes where a regular continued motion is required.

An inſtrument of this ſort may be conſidered as a perpetual motion, according to the vulgar acceptation of the term; for it will never ceaſe going till the fire be extinguiſhed, or ſome parts of the machinery be worn out.

A ventoſal ſymphony.

VI. At the top of a ſummer-houſe, or other building, let there be fixed a vane AB, fig. 12. on which is the pinion C, that takes the toothed wheel D, fixed on the axis EF, which at its other end carries the wheel G, that takes the pinion H. All theſe wheels and pinions are to be between the roof and the ceiling of the building. The pinion H is fixed to the perpendicular axis IK, which goes down very near the wall of the room, and may be covered after the ſame manner as are bell-wires. At the lower end of the axis IK there is a ſmall pinion L, that takes the wheel M, fixed on the axis of the great wheel NO. In this wheel there muſt be placed a number of ſtops, correſponding to the tunes it is to play. Theſe ſtops are to be moveable, that the tunes may be altered at pleaſure. Againſt this wheel there muſt hang 12 ſmall bells, anſwering to the notes of the gamut. Therefore, as the wheel turns round, the ſtops ſtriking againſt the bells play the ſeveral tunes. There ſhould be a fly to the great wheel, to regulate its motion when the wind is ſtrong. The wheel NO, and the bells, are to be encloſed in a caſe.

There may be ſeveral ſets of bells, one of which may anſwer to the tenor, another to the treble, and a third to the baſs; or they may play different tunes, according to the ſize of the wheel. As the bells are ſmall, if they are of ſilver, their tone will be the more pleaſing.

Inſtead of bells, glaſſes may be here uſed, ſo diſpoſed as to move freely at the ſtroke of the ſtops. This machinery may likewiſe be applied to a barrel-organ; and to many other uſes.

A C Q

Acqs.

ACQS, in *Geography*, a town at the foot of the Pyrenean mountains, in the department of Arriege and late province of Foix in France. It take its name from the hot waters in theſe parts. E. Long. 1. 40. N. Lat. 43. 0.

A C Q

Acquapendente.

ACQUAPENDENTE, a pretty large town of Italy, in the territory of the church, and patrimony of St Peter, with a biſhop's ſee. It is ſeated on a mountain, near the river Paglia, ten miles W. of Orvietto, and 57 N. by W. of Rome. It takes its name from a fall

fall of water near it, and is now almoſt deſolate. E. Long. 11. 53. N. Lat. 42. 43.

ACQUARIA, a ſmall town of Italy, in Frigana, a diſtrict of Modena, which is remarkable for its medicinal waters. It is 12 miles ſouth of the city of Modena. E. Long. 11. 17. N. Lat. 44. 24.

ACQUEST, or ACQUIST, in *Law*, ſignifies goods got by purchaſe or donation. See CONQUEST.

ACQUI, a town of Italy, in the duchy of Montferrat, with a biſhop's ſee and commodious baths. It was taken by the Spaniards in 1745, and retaken by the Piedmonteſe in 1746; but after this it was taken again and diſmantled by the French, who afterwards forſook it. It is ſeated on the river Bormia, 25 miles N. W. of Genoa, and 30 S. of Caſal. E. Long. 8. 30. N. Lat. 44. 40.

ACQUISITION, in general, denotes the obtaining or procuring ſomething. Among lawyers, it is uſed for the right or title to an eſtate got by purchaſe or donation.

ACQUITTAL, a diſcharge, deliverance, or ſetting of a perſon free from the guilt or ſuſpicion of an offence.

ACQUITTANCE, a releaſe or diſcharge in writing for a ſum of money, witneſſing that the party has paid the ſaid ſum.—No man is obliged to pay a ſum of money if the demandant refuſes to give an acquittance, which is a full diſcharge, and bars all actions, &c. An acquittance given by a ſervant for a ſum of money received for the uſe of his maſter, ſhall be a good diſcharge for that ſum, provided the ſervant uſed to receive his maſter's rents, debts, &c.

ACRA, a town of Africa, on the coaſt of Guinea, where the Engliſh, Dutch, and Danes, have ſtrong forts, and each fort has its particular village. W. Long. 0. 2. N. Lat. 5. 0.

ACRA, in *Ancient Geography*, one of the hills of Jeruſalem, on which ſtood the lower town, which was the old Jeruſalem; to which was afterwards added Zion, or the city of David. Probably called *Acra*, from the fortreſs which Antiochus built there in order to annoy the temple, and which Simon Maccabæus took and razed to the ground.

ACRA Japygia, in *Ancient Geography*, called *Salentia* by Ptolemy; now *Capo di San Maria di Leuca*: A promontory in the kingdom of Naples, to the ſouth-eaſt of Otranto, where formerly was a town, now lying in ruins, on the Ionian ſea, over againſt the *Montes Acroceraunii* of Epirus.

ACRÆ, in *Ancient Geography*, a town of Sicily, whoſe inhabitants were called *Acrenſes*. It ſtood to the ſouth of Syracuſe, at the diſtance of 24 miles, near the place now called the monaſtery of *Santa Maria d'Arcia*, on an eminence, as appears from Silius Italicus. The Syracuſans were the founders of it, according to Thucydides, 70 years after the building of Syracuſe, or 665 before Chriſt. Hence the epithet *Acræus*.

ACRAGAS, or AGRAGAS, in *Ancient Geography*, ſo called by the Greeks, and ſometimes by the Romans, but more generally *Agrigentum* by the latter; a town of Sicily. In Greek medals the inhabitants are called AKPITANTINOI, and *Agrigentini* by Cicero. The town ſtood upon a mountain, at the confluence of the Acragas and Hypſa, near the port called Εμπορίον by Ptolemy, but Εμπειον, or the Dock, by Strabo; and in the time of the latter, ſcarce a trace of all that ſide remained. In the year before Chriſt 584, the people of Gela built Acragas, 108 years after building their own city. It took its name from the river running by it; and being but two miles from the ſea, enjoyed the conveniences of a ſea port. It was a place of great ſtrength, ſtanding on the top of a very ſteep rock, and waſhed on the ſouth ſide by the river Acragas, now called *Fiume di Gergenti*, and on the ſouth-weſt by the Hypſa, with a citadel to the ſouth-eaſt, externally ſurrounded by a deep gulf, which made it inacceſſible but on the ſide next the town. It was famous for the tyrant Phalaris and his brazen bull. The Agrigentines were a people luxurious in their tables, and magnificent in their dwellings; of whom Empedocles, in Diogenes Laërtius, ſays, that they lived to day as if they were to die tomorrow, and built as if they were to live forever. The country round the city was laid out in vine and olive yards, in the produce of which they carried on a great and profitable commerce with Carthage. E. Long. 13. 30. N. Lat. 37. 20.

Acra || Acre.

ACRAMAR, or VAN, in *Geography*, a town and lake of the greater Armenia in Aſia. The town, which is large, populous, and commercial, is the capital of the government of Van, is ſituated at the foot of the mountains of Diarbekir, and is ſaid to have been built by Semiramis. The lake abounds with fiſh. There are two iſlands in it which are inhabited by religious Armenians. E. Long. 44. 14. N. Lat. 36. 30.

ACRASIA, among phyſicians, implies the predominancy of one quality above another, either with regard to artificial mixtures, or the humours of the human body. The word is Greek, and compounded of α privative, and κεράννυμι, to *mix*; *q. d.* not mixed in a juſt proportion.

ACRASUS, in *Ancient Geography*, a town of Aſia Minor in Lydia. Some imperial Greek medals of this city ſtill exiſt, which were ſtruck under the prætors, in honour of Severus, and ſeveral other emperors.

ACRATH, in *Ancient Geography*, a place in Mauritania Tingitana, now ſuppoſed to be *Velez de Gomara*: A fortified town in the kingdom of Fez, with a citadel and commodious harbour on the Mediterranean, ſcarce a mile diſtant from Penon de Velez, a Spaniſh fort. W. Long. 5. N. Lat. 34. 45.

ACRE, or ACRA, in *Geography*, a ſea-port town in Syria. It was formerly called *Ptolemais*, from one of the Ptolemys: and Acra on account of its fortifications; whence the knights of St John of Jeruſalem called it St John d'Acre. This city was ſucceſſively under the dominion of the Romans and the Moors; and was famous in the time of the cruſades, and underwent ſeveral ſieges both by the Chriſtians and Saracens. It is ſituated at the north angle of a bay, which extends in a ſemicircle of three leagues, as far as the point of Carmel.

During the cruſades, the poſſeſſion of this town was long diſputed by the Chriſtians and Saracens. In 1192 it was taken from the latter by Richard I. of England and Philip of France, after a ſiege of two years, and the ſlaughter of 100,000 Chriſtians, beſide a greater number who periſhed by ſhipwreck or diſeaſe, who gave it to the knights of St John of Jeruſalem. They kept poſſeſſion of it 100 years, when it was retaken by the Saracens, and almoſt entirely deſtroyed. This

Acre. event is rendered memorable by an act of singular resolution with which it was accompanied. A number of beautiful young nuns, terrified at the prospect of being exposed to the brutal lust of the infidels, determined to avoid the violation of their chastity, by rendering themselves objects of aversion. With this view they cut off their noses and mangled their faces. The Saracens, inflamed with resentment at a spectacle which prevented the gratification of their appetites, immediately put them all to the sword. After the expulsion of the crusaders, it remained almost deserted till about the year 1750, when it was fortified by Daher, an Arabian scheik who maintained his independence against the Ottoman power, till the year 1775, when he was basely assassinated by the emissaries of that government at the age of 86 years. He was adored by his people whom his prudence and valour had through life protected against the tyranny and oppression of the pacha. More lately the works erected by Djezzar, within the last ten years, have rendered it one of the principal towns upon the coast. The mosque of this pacha is boasted as a masterpiece of eastern taste. The bazar, or covered market, is not inferior even to those of Aleppo; and its public fountain surpasses in elegance those of Damascus, though the water is of a very indifferent quality. The pacha has derived the more honour from these works, as he was himself both the engineer and architect: he formed the plans, drew the designs, and superintended the execution.

The port of Acre is one of the best situated on the coast, as it is sheltered from the north and north-west winds by the town itself; but it is greatly choked up since the time of Fakr-el-din. Djezzar contented himself with making a landing place for boats. The fortifications, though more frequently repaired than any other in all Syria, are of no importance: there are only a few wretched low towers near the port, on which cannon are mounted; and these rusty iron pieces are so bad, that some of them burst every time they are fired. Its defence on the land side is merely a garden wall without any ditch.

In the year 1799 Acre was again the scene of war, when it was bravely defended by our gallant countryman Sir Sidney Smith, against the military skill and extraordinary exertions of Bonaparte, and some of his ablest generals. The pacha Djezzar was preparing to evacuate the place, and make good his retreat with his women and treasure, when Sir Sidney with his squadron anchored in the road of Caiffa. The fortifications were repaired under the direction of a skilful engineer, which, with the assistance of the English marines, encouraged and animated the pacha to hold out. After the French had renewed and varied the attack, and being as often repulsed with great slaughter, Bonaparte, despairing of success, raised the siege on the 20th of May, the 61st day after breaking ground.

Corn and cotton form the basis of the commerce of Acre, which is becoming more flourishing every day. Of late, the pacha, by an abuse common throughout all the Turkish empire, has monopolized all the trade in his own hands; no cotton can be sold but to him, and from him every purchase must be made. In vain have the European merchants claimed the privileges granted them by the sultan; Djezzar replied, that he was the sultan in his country, and continued his monopoly. The merchants were generally French, and they had six houses at Acre, with a consul: an imperial agent too was lately settled there; also a resident for Russia. Acre.

That part of the bay of Acre in which ships anchor with the greatest security lies to the north of Mount Carmel, below the village of Haifa (commonly called *Caiffa*). The bottom is good holding ground, and does not chafe the cables; but the harbour is open to the north-west wind, which blows violently along all this coast. Mount Carmel, which commands it to the south, is a flattened cone, and very rocky; it is about 2000 feet high. We still find among the brambles wild vines and olive trees, which prove that industry has formerly been employed even in this ungrateful soil: on the summit is a chapel dedicated to the prophet Elias, which affords an extensive prospect over the sea and land. It is 20 miles south of Tyre, and 37 north of Jerusalem. E. Long. 39. 25. N. Lat. 32. 40.

Acre, in the Mogul's dominions, the same with lack, and signifies the sum of 100,000 rupees; the rupee is of the value of the French crown of three livres, or 30 sols of Holland; 100 lacks of rupees make a couron in Indostan, or 10,000,000 rupees: the pound sterling is about eight rupees; according to which proportion, a lack of rupees amounts to 12,500 pounds sterling.

Acre, the universal measure of land in Britain. The word (formed from the Saxon *acher*, or the German *aker*, a field), did not originally signify a determinate quantity of land, but any open ground, especially a wide champaign; and in this antique sense it seems to be preserved in the names of places, as Castleacre, West-acre, &c. An acre in England contains four square roods, a rood 40 perches or poles of $16\frac{1}{2}$ feet each by statute. Yet this measure does not prevail in all parts of England, as the length of the pole varies in different counties, and is called *customary measure*, the difference running from the $16\frac{1}{2}$ feet to 28. The acre is also divided into 10 square chains, of 22 yards each, that is, 4840 square yards. An acre in Scotland contains four square roods; one square rood is 40 square falls; one square fall, 36 square ells; one square ell, nine square feet and 73 square inches; one square foot, 144 square inches. The Scots acre is also divided into 10 square chains; the measuring chain should be 24 ells in length, divided into 100 links, each link $8\frac{928}{1000}$ inches; and so one square chain will contain 10,000 square links. The English statute acre is about three roods and six falls standard measure of Scotland.

The French acre, *arpent*, contains $1\frac{1}{4}$ English acre, or 54,450 square English feet, whereof the English acre contains only 43,560.—The Strasburg acre is about half an English acre.—The Welsh acre contains commonly two English ones.—The Irish acre is equal to one acre two roods and 19 perches $\frac{27}{121}$ English.

Acre-Fight, an old sort of duel fought by English and Scottish combatants, between the frontiers of their kingdoms, with sword and lance: it was also called *camp-fight*, and the combatants *champions*, from the open field being the stage of trial.

Acre-Tax, a tax laid on land at so much per acre. In some places this is also called *acre-shot*. Impositions on lands in the great level are to be raised by a proportionable

Acribeia || Acridophagi.

portionable acre-tax, 20 Car. II. cap. 8.—An acre-tax of 2s. 6d. per acre, for draining Hadenham-level, 13 Geo. I. cap. 18.

ACRIBEIA, a term purely Greek, literally denoting an exquiſite or delicate accuracy; ſometimes uſed in our language, for want of a word of equal ſignification.

ACRID, a name for any thing that is of a ſharp or pungent taſte. See MATERIA MEDICA.

ACRIDOPHAGI, in *Ancient Geography*, an Ethiopian people, repreſented as inhabiting near the deſerts, and to have fed on locuſts. This latter circumſtance their name imports; the word being compounded of the Greek ακρις *locuſt*, and φαγω to *eat*. We have the following account of them by Diodorus Siculus *. Their ſtature was lower than that of other men; they were meagre, and extremely black. In the ſpring, high weſt winds drove from the deſert to their quarter locuſts of an extraordinary ſize, and remarkable for the ſqualid colour of their wings. So great was the number of theſe inſects, that they were the only ſuſtenance of the barbarians, who took them in the following manner: At the diſtance of ſome ſtadia from their habitations there was a wide and deep valley. They filled this valley with wood and wild herbs, with which their country abounded. When the cloud of locuſts appeared, which were driven on by the wind, they ſet fire to the fuel which they had collected. The ſmoke which aroſe from this immenſe fire was ſo thick, that the locuſts, in croſſing the valley, were ſtifled by it, and fell in heaps on the ground. The paſſage of the locuſts being thus intercepted for many days, they made a large proviſion of thoſe inſects. As their country produced great quantities of ſalt, they ſalted them, to render them more palatable, and to make them keep till the next ſeaſon. This peculiar ſupply was their ſole food: they had neither herds nor flocks. They were unacquainted with fiſhing; for they lived at a diſtance from the ſea. They were very active, and ran with great ſwiftneſs. But their life was not of long duration; it exceeded not forty years. The cloſe of their life was extremely miſerable; for in their old age, winged lice of different, but all of ugly forms, bred in their bodies. This malady, which began in the breaſt and belly, ſoon ſpread through the whole frame. The patient at firſt felt an itching; and the agreeable ſenſation produced by his ſcratching of himſelf, preceded a moſt deplorable calamity. For when thoſe lice, which had bred in his body, forced their way out, they cauſed effuſions of corrupt blood, with excruciating pains in the ſkin. The unhappy man, with lamentable cries, was induſtrious himſelf to make paſſages for them with his nails. In ſhort, theſe lice iſſued forth ſucceſſively from the wounds made by the hands of the patient, as from a veſſel full of holes, and in ſuch numbers that it was impoſſible to exterminate them.—Whether this extraordinary and dreadful diſtemper was occaſioned by the food of the inhabitants of this country, or by a peſtilential quality of their climate, it is difficult to determine. Indeed, as to the credibility of the whole account, we muſt leave the reader to judge.

* Lib. iii. and xxxix. Alſo *Strabo*, lib. xvi.

But though the circumſtances of theſe people ſhould be deemed fabulous, yet may the *acridophagia* be true. It is well known, that to this day the inhabitants of Ethiopia, Arabia, &c. frequently uſe locuſts as food. The reader will not be diſpleaſed if we lay before him the reſult of Dr Haſſelquiſt's inquiries as to this particular, who travelled in Syria and Egypt ſo late as the year 1752. This ingenious gentleman, who travelled with a view to improve natural hiſtory, informs us, that he aſked Franks, and many other people who had lived long in theſe countries, whether they had ever heard that the inhabitants of Arabia, Ethiopia, &c. uſed locuſts as food? They anſwered, that they had. He likewiſe aſked the ſame queſtion of Armenians, Copts, and Syrians, who lived in Arabia, and had travelled in Syria and near the Red ſea; ſome of whom ſaid they heard of ſuch a practice, and others that they had often ſeen the people eat theſe inſects. He at laſt obtained complete ſatisfaction on this head from a learned ſcheik at Cairo, who had lived ſix years in Mecca. This gentleman told him, in preſence of M. le Grand the principal French interpreter at Cairo, and others, that a famine frequently rages at Mecca when there is a ſcarcity of corn in Egypt, which obliges the inhabitants to live upon coarſer food than ordinary: That when corn is ſcarce, the Arabians grind the locuſts in hand mills, or ſtone mortars, and bake them into cakes, and uſe theſe cakes in place of bread: That he has frequently ſeen locuſts uſed by the Arabians, even when there was no ſcarcity of corn; but then they boil them, ſtew them with butter, and make them into a kind of fricaſſee; which he ſays is not diſagreeably taſted, for he had ſometimes taſted theſe locuſt fricaſſees out of curioſity.

Acridophagi

A later traveller, Dr Sparrman, informs us *, "That locuſts ſometimes afford a high treat to the more unpoliſhed and remote hordes of the Hottentots; when, as ſometimes happens, after an interval of 8, 10 15, or 20 years, they make their appearance in incredible numbers. At theſe times they come from the north, migrating to the ſouthward, and do not ſuffer themſelves to be impeded by any obſtacles, but fly boldly on, and are drowned in the ſea whenever they come to it. The females of this race of inſects, which are moſt apt to migrate, and are chiefly eaten, are ſaid not to be able to fly; partly by reaſon of the ſhortneſs of their wings, and partly on account of their being heavy and diſtended with eggs; and ſhortly after they have laid theſe in the ſand, they are ſaid to die. It is particularly of theſe that the Hottentots make a brown coffee-coloured ſoup, which at the ſame time, acquires from the eggs a fat and greaſy appearance. The Hottentots are highly rejoiced at the arrival of theſe locuſts, though they are ſure to deſtroy every bit of verdure on the ground: but the Hottentots make themſelves ample amends for this loſs, by falling foul on the animals themſelves, eating them in ſuch quantities as in the ſpace of a few days to get viſibly fatter and in better condition than before."

* *Voyage to the Cape*, vol. i. p. 36.

The Abbé Poiret, alſo, in his Memoir on the Inſects of Barbary and Numidia, informs us, "That the Moors make locuſts a part of their food; that they go to hunt them; fry them in oil and butter; and ſell them publicly at Tunis, at Bonne," &c.

From theſe accounts, we may ſee the folly of that diſpute among divines about the nature of St John's food in the wilderneſs: ſome maintaining the original word to ſignify the fruits of certain trees; others, a kind

Acrii
||
Acrobates.

of birds, &c.: but those who adhered to the literal meaning of the text were at least the most orthodox, although their arguments were perhaps not so strong as they might have been, had they had an opportunity of quoting such authors as the above.

ACRII MONTES, in *Ancient Geography*, mountains in the island of Sicily which are also called *Heræi*.

ACRILLÆ, a city of Sicily between Acræ and Agrigentum, not far from Syracuse, supposed to be the same with Acila which is mentioned by Plutarch.

ACRISIUS, in *Fabulous History*, king of Argos, being told by the oracle that he should be killed by his grand child, shut up his only daughter Danaë in a brazen tower: but Jupiter coming down in a golden shower, begot Perseus upon her. After Perseus had slain the Gorgons, he carried Medusa's head to Argos; which Acrisius seeing, was turned into a statue.

ACRISTIA, in *Geography*, a town of Sicily, 23 miles west-north-west of Magara. It is built on the ruins of the ancient town of Schritea.

ACRITAS, in *Ancient Geography*, a promontory of Messenia, running into the sea, and forming the beginning of the bay of Messene. Now called *Capo de Gallo*, between Methone to the west, and Corone to the east, where the Sinus Coronæus begins.

ACROAMATIC, or ACROATIC, in general, denotes a thing sublime, profound, or abstruse.

ACROAMATICI, a denomination given to the disciples or followers of Aristotle, &c. who were admitted into the secrets of the inner or acroamatic philosophy.

ACROATHOUM, or ACROTHOUM, in *Ancient Geography*, a town situated on the top of Mount Athos, where the inhabitants, according to Mela, were longer lived by half than in any other country; called by the modern Greeks, Αγιον ορος; by the Italians *La Cima di Monte Santo*.

ACROATIC is a name given to Aristotle's lectures to his disciples, which were of two kinds, *exoteric* and *acroatic*. The acroatic were those to which only his own disciples and intimate friends were admitted; whereas the exoteric were public and open to all. But there are other differences. The acroatic were set apart for the higher and more abstruse subjects; the exoteric were employed in rhetorical and civil speculations. Again, The acroatics were more subtle and exact, evidence and demonstration being here aimed at; the exoterics chiefly aimed at the probable and plausible. The former were the subject of the morning exercises in the Lyceum, the latter of the evenings. Besides, the exoterics were published: whereas the acroatics were kept secret; being either entirely concealed, or, if they were published, it was in such obscure terms, that few but his own disciples could be the wiser for them. Hence, when Alexander complained of his preceptor for publishing his acroatics, and thus revealing what should have been reserved to his disciples, Aristotle answered, that they were made public and not public; for that none who had not heard them explained by the author *viva voce*, could understand them.

ACROBATES, in *Antiquity*, were rope-dancers who performed various feats by vaulting or tumbling on a rope; sliding down on a rope from a lofty station with arms and legs extended, in imitation of flying; and running, dancing, and leaping, on a rope stretched horizontally.

Acrobatica
||
Acronius.

ACROBATICA, or ACROBATICUM, from ακρος, *high*, and βαλλω, or βαινω, *I go*; an ancient engine whereby people were railed aloft, that they might see more conveniently about them. The *acrobatica* among the Greeks amounted to the same with what they call *scansorium* among the Latins. Authors are divided as to the use of this engine. Turnebus and Barbarus take it to have been of the military kind, raised by besiegers, high enough to overlook the walls, and discover the state of things on the other side. Baldus rather supposes it a kind of movable scaffold, or cradle, contrived for raising painters, plasterers, and other workmen, to the tops of houses, trees, &c. Some suspect that it might have been used for both purposes; which is the opinion of Vitruvius and Aquinas.

ACROCERAUNIA, or MONTES CERAUNII, in *Ancient Geography*, mountains running out into the sea (so called from their being often thunderstruck), separating the Ionian sea from the Adriatic; where Illyria ends and Epirus begin: now called *Monti della Chimera*.

ACROCHERISMUS, among the Greeks, a sort of gymnastic exercise, in which the two combatants contended with their hands and fingers only, without closing or engaging the other parts of the body.

ACROCORINTHUS, in *Ancient Geography*, a high and steep hill, hanging over the city of Corinth, which was taken within the walls, as an acropolis, or citadel. On its top stood a temple of Venus; and lower down issued the fountain Priene.

ACROMION, in *Anatomy*, the upper part of the scapula or shoulder blade. See ANATOMY.

ACROMONOGRAMMATICUM, in *Poetry*, a kind of poem, wherein every subsequent verse begins with the letter wherewith the immediately preceding one terminated.

ACRON, a celebrated physician of Agrigentum, in Sicily, who lived about the middle of the fifth century before Christ. He first thought of lighting large fires, and purifying the air with perfumes, to put a stop to the pestilence that ravaged Athens, and which was attended with success. He wrote two treatises, according to Suidas, in the Doric dialect; the one on physic, and the other on abstinence or diet.

ACRON, in *Geography*, a territory on the Gold coast of Guinea, in Africa, bordering on the Fantynean country. The Dutch have a fort here called Fort Patience; and under it is a village, inhabited only by fishermen. The other inhabitants are addicted to husbandry, and sell their corn to other countries. There is plenty of game, which is very commodious for the Dutch factory. The people are very ignorant, and go naked like the rest of the negroes. This is called Little Acron; for Great Acron is farther inland, and is a kind of a republic.

ACRONICAL, ACHRONYCAL, or ACHRONICAL, in *Astronomy*, is a term applied to the rising of a star, when the sun is set in the evening: but has been promiscuously used to express a star's rising at sunset, or setting at sunrise.

ACRONIUS LACUS (Mela); a small lake formed by the Rhine, soon after its rise out of the Alps, and after

Acropolis & Aristotanum.

after passing the greater lake at Constance, called *Venetus*, and now the *Bodengee*, or lake of Constance.

ACROPOLIS, in *Ancient Geography*, the citadel, and one of the divisions of Athens; called *Polis*, because constituting the first and original city; and the *Upper* Polis, to distinguish it from the lower, which was afterwards built round it in a large open plain, the Acropolis standing on a rock or eminence in the heart of this plain; and hence its name: To the north it had a wall, built by the Pelasgi, and therefore called *Pelasgic;* and to the south a wall, by Cimon the son of Miltiades, out of the Persian spoils, many ages after the building of the north wall. It had nine gates, and was therefore called *Enneapylon;* yet but one principal gate or entrance, the ascent to which was by a flight of steps of white marble, built in a magnificent manner by Pericles, (Plutarch).

ACROPOLITA, GEORGE, one of the writers in the Byzantine history, was born at Constantinople, in the year 1220, and educated at the court of the emperor John Ducas at Nice. He was employed in the most important affairs of the empire; being sent ambassador to Larissa, to establish a peace with Michael of Epirus; and was constituted judge to try Michael Comnenus, who was suspected of engaging in a conspiracy. Theodorus Lascaris, the son of John, whom he had taught logic, appointed him governor of all the western provinces in his empire. In 1255, he was taken prisoner in a war with Michael Angelus; but gaining his liberty in 1260, by means of the emperor Palæologus, he was sent by him ambassador to Constantine prince of Bulgaria: and was employed in several other negotiations. He wrote, A Continuation of the Greek History, from the taking of Constantinople by the Latins till it was recovered by Michael Palæologus in 1261, which makes part of the Byzantine history; A Treatise concerning Faith, Virtue, and the Soul; An Exposition of the Sermons of St Gregory Nazianzen, and other pieces. Gregory Cyprian, patriarch of Constantinople, in his encomium upon him, prefixed to Acropolita's history, is perhaps somewhat extravagant in his praise, when he says he was equal to Aristotle in philosophy, and to Plato in the knowledge of divine things and Attic eloquence.

ACROSPIRE, a vulgar term for what botanists call the *plumes*.

ACROSPIRED, in malt-making, is the grain's shooting both at the root and blade end.

ACROSTIC, in *Poetry*, a kind of poetical composition, disposed in such a manner, that the initial letters of the verses form the name of some person, kingdom, place, motto, &c. The word is compounded of the Greek ακρος, *extremity*, and στιχος, *verse*. The acrostic is considered by the critics as a species of false wit, and is therefore very little regarded by the moderns.

ACROSTICHUM, RUSTYBACK, WALL-RUE, or FORK-FERN. See BOTANY *Index*.

ACROSTOLIUM, in ancient naval architecture, the extreme part of the ornament used on the prows of ships, which was sometimes in the shape of a buckler, helmet, animal, &c. but more frequently circular, or spiral. It was usual to tear them from the prows of vanquished vessels, and fix them to the conquerors, as a signal of victory. They were frequently represented on the reverse of ancient medals.

Acroteleutic & Act.

ACROTELEUTIC, among ecclesiastic writers, an appellation given to any thing added to the end of a psalm; as the Gloria Patri, or Doxology.

ACROTERI, in *Geography*, a small town in the island of Santorin. N. Lat. 36. 25. E Long. 26. 1.

ACROTERIA, in *Architecture*, small pedestals, usually without bases, anciently placed at the middle or two extremes of pediments or frontispieces, serving to support the statues, &c. It also signifies the figures placed as ornaments on the tops of churches, and the sharp pinnacles that stand in ranges about flat buildings with rails and balusters.

Among ancient physicians, it signified the larger extremities of the body, as the head, hands, and feet. It has also been used for the tips of the fingers, and sometimes for the eminences or processes of bones.

ACROTHYMION, from ακρος, *extreme*, and θυμος, *thyme*. A sort of wart described by Celsus as hard and rough, with a narrow basis and broad top; the top is of the colour of thyme, it easily splits and bleeds. This tumour is also called *thymus*.

ACT, in general, denotes the exertion of power; and differs from power, as the effect from the cause.

ACT, in *Logic*, is particularly understood of an operation of the human mind. Thus to discern and examine, are acts of the understanding; to judge and affirm, are acts of the will. There are voluntary and spontaneous acts; the former are produced by the operation of the soul, the latter without its privity or participation.

ACT, in the universities, signifies a thesis maintained in public by a candidate for a degree; or to show the capacity and proficiency of a student. The candidates for a degree of bachelor and master of arts are to hold philosophical acts; and those for bachelor of divinity, theological acts, &c. At Oxford, the time when masters or doctors complete their degrees, is also called the *act;* which is held with great solemnity. At Cambridge, they call it the *commencement*.

Act of Faith, *Auto da Fe*, in the Romish church, is a solemn day held by the inquisition, for the punishment of heretics, and the absolution of the innocent accused *. They usually contrive the *Auto* to fall on some great festival, that the execution may pass with the more awe and regard; at least it is always on a Sunday.

* See *Inquisition*.

The Auto da Fe may be called the last act of the inquisitorial tragedy; it is a kind of gaol-delivery, appointed as oft as a competent number of prisoners in the inquisition are convicted of heresy, either by their own voluntary or extorted confession, or on the evidence of certain witnesses. The process is thus: In the morning they are brought into a great hall, where they have certain habits put on, which they are to wear in the procession. The procession is led up by Dominican friars; after which come the penitents, some with san-benitoes, and some without, according to the nature of their crimes; being all in black coats without sleeves, and barefooted, with a wax candle in their hands. These are followed by the penitents who have narrowly escaped being burnt, who over their black coats have flames painted with their points turned downwards,

Act. wards, *Fuego revolto*. Next come the negative and relapſed, who are to be burnt, having flames on their habits pointing upwards. After theſe come ſuch as profeſs doctrines contrary to the faith of Rome, who, beſides flames pointing upwards, have their picture painted on their breaſts, with dogs, ſerpents, and devils, all open-mouthed, about it. Each priſoner is attended with a familiar of the inquiſition; and thoſe to be burnt have alſo a Jeſuit on each hand, who are continually preaching to them to abjure. After the priſoners comes a troop of familiars on horſeback; and after them the inquiſitors, and other officers of the court, on mules; laſt of all, the inquiſitor-general on a white horſe, led by two men with black hats and green hat-bands. A ſcaffold is erected in the *Terriero de Paco*, big enough for two or three thouſand people; at one end of which are the priſoners, at the other the inquiſitors. After a ſermon made up of encomiums of the inquiſition, and invectives againſt heretics, a prieſt aſcends a deſk near the middle of the ſcaffold, and having taken the abjuration of the penitents, recites the final ſentence of thoſe who are to be put to death; and delivers them to the ſecular arm, earneſtly beſeeching at the ſame time the ſecular power not to touch their blood, or put their lives in danger. The priſoners being thus in the hands of the civil magiſtrate, are preſently loaded with chains, and carried firſt to the ſecular gaol, and from thence in an hour or two brought before the civil judge; who, after aſking in what religion they intend to die, pronounces ſentence, on ſuch as declare they die in the communion of the church of Rome, that they ſhall be firſt ſtrangled, and then burnt to aſhes; on ſuch as die in any other faith, that they be burnt alive. Both are immediately carried to the Ribera, the place of execution; where there are as many ſtakes ſet up as there are priſoners to be burnt, with a quantity of dry furze about them. The ſtakes of the profeſſed, that is, ſuch as perſiſt in their hereſy, are about four yards high, having a ſmall board towards the top for the priſoner to be ſeated on. The negative and relapſed being firſt ſtrangled and burnt, the profeſſed mount their ſtakes by a ladder; and the Jeſuits, after ſeveral repeated exhortations to be reconciled to the church, part with them, telling them they leave them to the devil, who is ſtanding at their elbow to receive their ſouls, and carry them with him into the flames of hell. On this a great ſhout is raiſed; and the cry is, Let the dogs *beards be made;* which is done by thruſting flaming furzes faſtened to long poles againſt their faces, till their faces are burnt to a coal, which is accompanied with the loudeſt acclamations of joy. At laſt, fire is ſet to the furze at the bottom of the ſtake, over which the profeſſed are chained ſo high, that the top of the flame ſeldom reaches higher than the ſeat they ſit on; ſo that they rather ſeem roaſted than burnt. There cannot be a more lamentable ſpectacle; the ſufferers continually cry out, while they are able, *Miſericordia per amor de Dios*, "Pity for the love of God!" yet it is beheld by all ſexes and ages with tranſports of joy and ſatisfaction.

Act, in dramatic poetry, ſignifies a certain diviſion or part of a play, deſigned to give ſome reſpite both to the actors and ſpectators. The Romans were the firſt who divided their theatrical pieces into acts; for no ſuch diviſions appear in the works of the firſt dramatic poets. Their pieces indeed conſiſted of ſeveral parts or diviſions, which they called *protaſis*, *epitaſis*, *cataſtaſis*, and *cataſtrophe;* but theſe diviſions were not marked by any real interruptions in the theatre. Nor does Ariſtotle mention any thing of acts in his Art of Poetry. But, in the time of Horace, all regular and finiſhed pieces were divided into five acts. Act, Acta.

> *Neve minor, neu ſit quinto productior actu*
> *Fabula, quæ poſci vult, et ſpectata reponi.*
>
> If you would have your play deſerve ſucceſs,
> Give it five acts complete, nor more nor leſs.
> FRANCIS.

The firſt act, according to ſome critics, beſides introducing upon the ſtage the principal characters of the play, ought to propoſe the argument or ſubject of the piece; the ſecond, to exhibit this to the audience, by carrying the fable into execution; the third, to raiſe obſtacles and difficulties; the fourth, to remove theſe, or raiſe new ones in the attempt; and the fifth, to conclude the piece, by introducing ſome accident that may unravel the whole affair. This diviſion, however, is not eſſentially neceſſary; but may be varied according to the humour of the author, or the nature of the ſubject. See POETRY.

Act of Grace. See GRACE.

ACT, among lawyers, is an inſtrument in writing for declaring or juſtifying the truth of any thing. In which ſenſe, records, decrees, ſentences, reports, certificates, &c. are called *acts*.

ACTS alſo denote the deliberations and reſolutions of an aſſembly, ſenate, or convention; as acts of parliament, &c. Likewiſe matters of fact tranſmitted to poſterity in certain authentic books and memoirs.

Acta Conſiſtorii, the edicts or declarations of the council of ſtate of the emperors. Theſe edicts were generally expreſſed in ſuch terms as theſe: "the auguſt emperors, *Diocleſian* and *Maximin*, in council declared, That the children of decurions ſhould not be expoſed to wild beaſts in the amphitheatre."

The ſenate and ſoldiers often ſwore, either through abject flattery or by compulſion, upon the *edicts* of the emperor, as we do upon the *Bible*. And the name of *Apidius Merula* was eraſed by Nero out of the regiſter of ſenators, becauſe he refuſed to ſwear upon the edicts of the emperor Auguſtus.

Acta Diurna, was a ſort of Roman gazette, containing an authorized narrative of the tranſactions worthy of notice which happened at Rome. Petronius has given us a ſpecimen of the *acta diurna* in his account of Trimalchis; and as it may not perhaps be unentertaining to ſee how exactly a Roman newſpaper runs in the ſtyle of an Engliſh one, the following is an article or two out of it:

"On the 26th of July, 30 boys and 40 girls were born at Trimalchi's eſtate at Cuma.

"At the ſame time a ſlave was put to death for uttering diſreſpectful words againſt his lord.

"The ſame day a fire broke out in Pompey's gardens, which began in the night, in the ſteward's apartment."

Acta Populi, among the Romans, were journals or regiſters of the daily occurrences; as aſſemblies, trials, executions, buildings, births, marriages, deaths, &c.

Acts. of illuſtrious perſons, and the like. Theſe were otherwiſe called *Acta Publica* and *Acta Diurna*, or ſimply *Acta*. The Acta differed from Annals, in that only the greater and more important matters were in the latter, and thoſe of leſs note were in the former. Their origin is attributed to Julius Cæſar, who firſt ordered the keeping and making public the acts of the people. Some trace them higher, to Servius Tullius; who, to diſcover the number of perſons born, dead, and alive, ordered that the next of kin, upon a birth, ſhould put a certain piece of money into the treaſury of Juno Lucina; upon a death, into that of Venus Libitina: the like was alſo to be done upon aſſuming the toga virilis, &c. Under Marcus Antoninus, this was carried further: perſons were obliged to notify the births of their children, with their names and ſurnames, the day, conſul, and whether legitimate or ſpurious, to the prefects of the *Ærarium Saturni*, to be entered in the public acts; though before this time the births of perſons of quality appear thus to have been regiſtered.

Acta Senatus, among the Romans, were minutes of what paſſed and was debated in the ſenate houſe. Theſe were alſo called *Commentarii*, and by a Greek name ὑπομνήματα. They had their origin in the conſulſhip of Julius Cæſar, who ordered them both to be kept and publiſhed. The keeping them was continued under Auguſtus, but the publication was abrogated. Afterwards all writings, relating to the decrees or ſentences of the judges, or what paſſed and was done before them, or by their authority, in any cauſe, were alſo called by the name *Acta*: In which ſenſe we read of civil acts, criminal acts, intervenient acts; *acta civilia, criminalia, intervenientia, &c.*

Public Acts. The knowledge of public acts forms part of a peculiar ſcience, called the DIPLOMATIC, of great importance to an hiſtorian, ſtateſman, chronologer, and even critic. The preſervation of them was the firſt occaſion of erecting libraries. The ſtyle of acts is generally barbarous Latin. Authors are divided as to the rules of judging of their genuineneſs, and even whether there be any certain rules at all. F. Germon will have the greater part of the acts of former ages to be ſpurious. Fontanini aſſerts, that the number of forged acts now extant is very ſmall. It is certain there were ſevere puniſhments inflicted on the forgers and falſifiers of acts.—The chief of the Engliſh acts, or public records, are publiſhed by Rymer, under the title of *Fœdera*, and continued by Saunderſon; an extract whereof has been given in French by Rapin, and tranſlated into Engliſh under the title of *Acta Regia*. Great commendations have been given this work: alſo ſome exceptions made to it; as that there are many ſpurious acts, as well as errors, in it; ſome have even charged it with falſifications.—The public acts of France fell into the hands of the Engliſh after the battle of Poictiers, and are commonly ſaid to have been carried by them out of the country. But the tradition is not ſupported by any ſufficient teſtimony.

Acts of the Apoſtles, one of the ſacred books of the New Teſtament, containing the hiſtory of the infant church, during the ſpace of 29 or 30 years from the aſcenſion of our Lord to the year of Chriſt 63.—It was written by St Luke; and addreſſed to Theophilus, the perſon to whom the evangeliſt had before dedicated his Goſpel. We here find the accompliſhment of ſeveral of the promiſes made by our Saviour; his aſcenſion; the deſcent of the Holy Ghoſt; the firſt preaching of the apoſtles, and the miracles whereby their doctrines were confirmed; an admirable picture of the manners of the primitive Chriſtians; and, in ſhort, every thing that paſſed in the church till the diſperſion of the apoſtles, who ſeparated themſelves in order to propagate the goſpel throughout the world. From the period of that ſeparation, St Luke quits the hiſtory of the other apoſtles, who were then at too great a diſtance from him, and confines himſelf more particularly to that of St Paul, who had choſen him for the companion of his labours. He follows that apoſtle in all his miſſions, and even to Rome itſelf; for it appears that the Acts were publiſhed in the ſecond year of St Paul's reſidence in that city, or the 36th year of the Chriſtian era, and in the 9th or 10th year of Nero's reign. The ſtyle of this work, which was originally compoſed in Greek, is much purer than that of the other canonical writers; and it is obſervable, that St Luke, who was much better acquainted with the Greek than with the Hebrew language, always, in his quotations from the Old Teſtament, makes uſe of the Septuagint verſion. The council of Laodicea places the Acts of the Apoſtles among the canonical books, and all the churches have acknowledged it as ſuch without any controverſy.

Acts.

There were ſeveral *Spurious* ACTS OF THE APOSTLES; particularly, 1. *Acts*, ſuppoſed to be written by Abdias *, the pretended biſhop of Babylon, who gave out that he was ordained biſhop by the apoſtles themſelves when they were upon their journey into Perſia. 2. *The Acts of St Peter*: this book came originally from the ſchool of the Ebionites. 3. *The Acts of St Paul*; which is entirely loſt. Euſebius, who had ſeen it, pronounces it of no authority. 4. *The Acts of St John the Evangeliſt*; a book made uſe of by the Encratites, Manichæans, and Priſcillianiſts. 5. *The Acts of St Andrew*; received by the Manichæans, Encratites, and Apotactics. 6. *The Acts of St Thomas the Apoſtle*; received particularly by the Manichæans. 7. *The Acts of St Philip*. This book the Gnoſtics made uſe of. 8. *The Acts of St Matthias*. Some have imagined that the Jews for a long time had concealed the original acts of the life and death of St Matthias written in Hebrew; and that a monk of the abbey of St Matthias at Treves, having got them out of their hands, procured them to be tranſlated into Latin, and publiſhed them; but the critics will not allow them to be authentic.

* See *Abdias*.

Acts of Pilate; a relation ſent by Pilate to the emperor Tiberius, concerning Jeſus Chriſt, his death, reſurrection, aſcenſion, and the crimes of which he was convicted before him †. It was a cuſtom among the Romans, that the proconſuls and governors of provinces ſhould draw up acts, or memoirs, of what happened in the courſe of their government, and ſend them to the emperor and ſenate. The genuine *acts* of Pilate were ſent by him to Tiberius, who reported them to the ſenate; but they were rejected by that aſſembly, becauſe not immediately addreſſed to them: as is teſtified by Tertullian, in his Apol. cap. 5. and 20, 21. The heretics forged acts in imitation of them: in the reign of the emperor Maximin, the Gentiles, to throw an odium on the Chriſtian name, ſpread about ſpurious Acts of Pilate; which the emperor, by a ſolemn edict, ordered

† *Euſebii Hiſt. Eccleſ.* lib. ii. cap. 2. and ix. 5.

Act II. Actio.

ordered to be ſent into all the provinces of the empire, and enjoined the ſchoolmaſters to teach and explain them to their ſcholars, and make them learn them by heart. Theſe acts, both the genuine and the ſpurious, are loſt. There is indeed extant, in the Pſeudo-Hegeſippus, a letter from Pilate to the emperor Claudius, concerning Jeſus Chriſt *; but it diſcovers itſelf at firſt ſight not to be authentic.

*Cave Hiſt Lit rar. ac. Apoſtol.

Act of Parliament is a poſitive law, conſiſting of two parts, the words of the act, and its true ſenſe and meaning; which being joined, make the law. The words of acts of parliament ſhould be taken in a lawful ſenſe. Caſes of the ſame nature are within the intention, though without the letter, of the act; and ſome acts extend by equity to things not mentioned therein. See PARLIAMENT.

ACTÆ, were meadows of remarkable verdure and luxuriancy near the ſea-ſhore, where the Romans uſed to indulge themſelves to a great degree in ſoftneſs and delicacy of living. The word is uſed in this ſenſe by Cicero and Virgil; but Voſſius thinks it can only be uſed in ſpeaking of Sicily, as theſe two authors did.

ACTÆA, HERB-CHRISTOPHER, or BANE-BERRIES: See BOTANY *Index*.

ACTÆON, in fabulous hiſtory, the ſon of Ariſtæus and Autonoe; a great hunter. He was transformed by Diana into a ſtag, becauſe he looked on her while bathing; and was devoured by his own dogs. The effects of impertinent curioſity and expenſive pleaſures ſeem to be the moral of the fable.

ACTANIA, an iſland, according to Pliny, in the North ſea. It lies to the weſt of Holſtein and Ditmerſch, not far from the mouth of the Eyder and Elbe, and is now called *Heyligland*.

ACTE. See SAMBUCUS.

ACTIAN GAMES, in Roman antiquity, were ſolemn games inſtituted by Auguſtus, in memory of his victory over Mark Antony at Actium, held every fifth year, and celebrated in honour of Apollo, ſince called *Actius*. Hence *Actian* Years, an era commencing from the battle of Actium, called the *Era* of *Auguſtus*.

Virgil inſinuates them to have been inſtituted by Æneas; from that paſſage, Æn. III. v. 280.

Actiaque Iliacis celebramus littora ludis.
ÆN. III. 280.

But this he only does by way of compliment to Auguſtus: attributing that to the hero from whom he deſcended, which was done by the emperor himſelf; as is obſerved by Servius.

ACTINIA, in *Zoology*, a genus belonging to the order of Vermes molluſca, called *Animal Flowers*, and *Sea Anemonies*. See VERMES.

ACTINOLITE, in *Mineralogy*. See MINERALOGY *Index*.

ACTIO, in Roman antiquities, an action at law in a court of juſtice. The formalities uſed by the Romans, in judicial actions, were theſe: If the difference failed to be made up by friends, the injured perſon proceeded *in jus reum vocare*, to ſummon the offending party to the court, who was obliged to go, or give bond for his appearance.

The offending party might be ſummoned into court *viva voce*, by the plaintiff himſelf meeting the defendant, declaring his intention to him, and commanding him to go before the magiſtrate and make his defence. If he would not go willingly, he might drag and force him along, unleſs he gave ſecurity for his appearance on ſome appointed day. If he failed to appear on the day agreed on, then the plaintiff, whenſoever he met him, might take him along with him by force, calling any by-ſtanders to bear witneſs, by aſking them *viſne anteſtari?* the by-ſtanders upon this turned their ear toward him in token of their conſent: To this Horace alludes in his ſatire againſt the impertinent, Lib. i. Sat. 9. See this further explained under the article ANTESTARI.

Actio, Action.

Both parties being met before the prætor, or other ſupreme magiſtrate preſiding in the court, the plaintiff propoſed the action to the defendant, in which he deſigned to proſecute him. This they termed *edere actionem;* and was commonly performed by writing it in a tablet, and offering it to the defendant, that he might ſee whether he had better ſtand the ſuit or compound.

In the next place came the *poſtulatio actionis*, or the plaintiff's petition to the prætor, for leave to proſecute the defendant in ſuch an action. The petition was granted by writing at the bottom of it *actionem do*, or refuſed by writing in the ſame manner *actionem non do*.

The petition being granted, the plaintiff *vadabatur reum*, i. e. obliged him to give ſureties for his appearance on ſuch a day in the court; and this was all that was done in public, before the day fixed upon for the trial.

In the mean time, the difference was often made up, either *tranſactione*, by letting the cauſe fall as dubious; or *pactione*, by compoſition for damages amongſt friends.

On the day appointed for hearing, the prætor ordered the ſeveral bills to be read, and the parties ſummoned by an *accenſus*, or beadle. See ACCENSI.

Upon the nonappearance of either party, the defaulter loſt his cauſe: if they both appeared, they were ſaid *ſe ſtetiſſe;* and then the plaintiff proceeded *litem ſive actionem intendere*, i. e. to prefer his ſuit, which was done in a ſet form of words, varying according to the difference of the actions. After this the plaintiff deſired judgment of the prætor, that is, to be allowed a *judex* or *arbiter*, elſe the *recuperatores* or *centumviri*. Theſe he requeſted for the hearing and deciding the buſineſs; but none of them could be deſired but by the conſent of both parties.

The prætor having aſſigned them their judges, defined and determined the number of witneſſes to be admitted, to hinder the protracting of the ſuit; and then the parties proceeded to give their caution, that the judgement, whatever it was, ſhould ſtand and be performed on both ſides. The judges took a ſolemn oath to be impartial; and the parties took the *juramentum calumniæ*. Then the trial began with the aſſiſtance of witneſſes, writings, &c. which was called *diſceptatio cauſæ*.

ACTION, in a general ſenſe, implies nearly the ſame thing with ACT.—Grammarians, however, obſerve ſome diſtinction between *action* and *act;* the former being generally reſtricted to the common or ordinary tranſactions, whereas the latter is uſed to expreſs thoſe which are remarkable. Thus, we ſay it is a good

action

Action. *action* to comfort the unhappy; it is a generous *act* to deprive ourſelves of what is neceſſary for their ſake. The wiſe man propoſes to himſelf an honeſt end in all his actions; a prince ought to mark every day of his life with ſome act of greatneſs. The abbé Girard makes a further diſtinction between the words *action* and *act*. The former, according to him, has more relation to the power that acts than the latter; whereas the latter has more relation to the effect produced than the former: and hence the one is properly the attribute of the other. Thus we may properly ſay, "Be ſure to preſerve a preſence of mind in all your actions; and take care that they be all acts of equity."

ACTION, in *Mechanics*, implies either the effort which a body or power makes againſt another body or power, or the effect itſelf of that effort.

As it is neceſſary, in works of this kind, to have a particular regard to the common language of mechanics and philoſophers, we have given this double definition: but the proper ſignification of the term is the motion which a body really produces, or tends to produce, in another; that is, ſuch is the motion it would have produced, had nothing hindered its effect.

All power is nothing more than a body actually in motion, or which tends to move itſelf; that is, a body which would move itſelf if nothing oppoſed it. The action therefore of a body is rendered evident to us by its motion only; and conſequently we muſt not fix any other idea to the word action, than that of actual motion, or a ſimple tendency to motion. The famous queſtion relating to *vis viva* and *vis mortua*, owes, in all probability, its exiſtence to an inadequate idea of the word action; for had Leibnitz and his followers obſerved, that the only preciſe and diſtinct idea we can give to the word force or action, reduces it to its effect, that is, to the motion it actually produces or tends to produce, they would never have made that curious diſtinction.

Quantity of ACTION, a name given by M. de Maupertuis, in the Memoirs of the Pariſian Academy of Sciences for 1744, and thoſe of Berlin for 1746, to the product of the maſs of a body by the ſpace which it runs through, and by its celerity. He lays it down as a general law, "that, in the changes made in the ſtate "of a body, the quantity of action neceſſary to pro-"duce ſuch change, is the leaſt poſſible." This principle he applies to the inveſtigation of the laws of refraction, of equilibrium, &c. and even to the ways of acting employed by the Supreme Being. In this manner M. de Maupertuis attempts to connect the metaphyſics of final cauſes with the fundamental truths of mechanics, to ſhow the dependence of the colliſion of both elaſtic and hard bodies upon one and the ſame law, which before had always been referred to ſeparate laws; and to reduce the laws of motion, and thoſe of equilibrium, to one and the ſame principle.

ACTION, in *Ethics*, denotes the external ſigns or expreſſions of the ſentiments of a moral agent. See *Active Power*, *infra*.

ACTION, in *Poetry*, the ſame with ſubject or fable. Critics generally diſtinguiſh two kinds, the principal and the incidental. The principal action is what is generally called the *fable*; and the incidental an *epiſode*. See POETRY.

ACTION, in *Oratory*, is the outward deportment of the orator, or the accommodation of his countenance, voice, and geſture, to the ſubject of which he is treating. See ORATORY. Action ſi Active.

ACTION, in a theatrical ſenſe. See DECLAMATION.

Action for the Pulpit. See DECLAMATION.

ACTION, in *Painting* and *Sculpture*, is the attitude or poſition of the ſeveral parts of the face, body, and limbs, of ſuch figures as are repreſented, and whereby they ſeem to be really actuated by paſſions. Thus we ſay, the action of ſuch a figure finely expreſſes the paſſions with which it is agitated: we alſo uſe the ſame expreſſion with regard to animals.

ACTION, in *Phyſiology*, is applied to the functions of the body, whether vital, animal, or natural.

The vital functions, or actions, are thoſe which are abſolutely neceſſary to life, and without which there is no life; as the action of the heart, lungs, and arteries. On the action and reaction of the ſolids and fluids on each other, depend the vital functions. The pulſe and reſpiration are the external ſigns of life. Vital diſeaſes are all thoſe which hinder the influx of the venous blood into the cavities of the heart, and the expulſion of the arterial blood from the ſame.—The natural functions are thoſe which are inſtrumental in repairing the ſeveral loſſes which the body ſuſtains; for life is deſtructive of itſelf, its very offices occaſioning a perpetual waſte. The manducation of food, the deglutition and digeſtion thereof, alſo the ſeparation and diſtribution of the chyle and excrementitious parts, &c. are under the head of natural functions, as by theſe our aliment is converted into our nature. They are neceſſary to the continuance of our bodies.—The animal functions are thoſe which we perform at will, as muſcular motion, and all the voluntary actions of the body: they are thoſe which conſtitute the ſenſes of touch, taſte, ſmell, ſight, hearing, perception, reaſoning, imagination, memory, judgement, affections of the mind. Without any, or all of them, a man may live, but not ſo comfortably as with them.

ACTION, in *Commerce*, is a term uſed abroad for a certain part or ſhare of a public company's capital ſtock. Thus, if a company has 400,000 livres capital ſtock, this may be divided into 400 actions, each conſiſting of 1000 livres. Hence a man is ſaid to have two, four, &c. actions, according as he has the property of two, four, &c. 1000 livres capital ſtock. The tranſferring of actions abroad is performed much in the ſame manner as ſtocks are with us. See STOCKS.

ACTION, in *Law*, is a demand made before a judge for obtaining what we are legally entitled to demand, and is more commonly known by the name of *law ſuit* or *proceſs*. See SUIT.

ACTIONARY, or ACTIONIST, a proprietor of ſtock in a trading company.

ACTIONS, among merchants, ſometimes ſignify moveable effects; and we ſay the merchant's creditors have ſeized on all his actions, when we mean that they have taken poſſeſſion of all his active debts.

ACTIVE, denotes ſomething that communicates action or motion to another; in which acceptation it ſtands oppoſed to paſſive.

ACTIVE, in *Grammar*, is applied to ſuch words as expreſs action; and is therefore oppoſed to paſſive. The active performs the action, as the paſſive receives it.

Active || Acton.

Thus we say, a verb *active*, a conjugation *active*, &c. or an *active* participle.

Active Verbs, are such as do not only signify doing, or acting, but have also nouns following them, to be the subject of the action or impression: Thus, *To love, to teach*, are verbs *active*; because we can say, *To love a thing, to teach a man*. Neuter verbs also denote an action, but are distinguished from active verbs, in that they cannot have a noun following them: such are, *To sleep, to go*, &c. Some grammarians, however, make three kinds of active verbs: the *transitive*, where the action passes into a subject different from the agent; *reflected*, where the action returns upon the agent; and *reciprocal*, where the action turns mutually upon the two agents who produced it.

Active Power, in *Metaphysics*, the power of executing any work or labour; in contradistinction to *speculative* powers*, or the powers of seeing, hearing, remembering, judging, reasoning, &c.

* Dr Reid *on the Active Powers of Man*, p. 12.

The exertion of active power we call *action*; and as every action produces some change, so every change must be caused by some effect, or by the cessation of some exertion of power. That which produces a change by the exertion of its power, we call the *cause* of that change; and the change produced, the *effect* of that cause. See Metaphysics.

Active Principles, in *Chemistry*, such as are supposed to act without any assistance from others; as mercury, sulphur, &c.

ACTIVITY, in general, denotes the power of acting, or the active faculty. See Active.

Sphere of Activity, the whole space in which the virtue, power, or influence, of any object is exerted.

ACTIUM, in *Ancient Geography*, a town situated on the coast of Acarnania, in itself inconsiderable, but famous for a temple of Apollo, a safe harbour, and an adjoining promontory of the same name, in the mouth of the Sinus Ambracius, over against Nicopolis, on the other side of the bay: it afterwards became more famous on account of Augustus's victory over Antony and Cleopatra; and for quinquennial games instituted there, called *Actia* or *Ludi Actiaci*. Hence the epithet *Actius*, given to Apollo (Virgil). *Actiaca æra*, a computation of time from the battle of Actium. The promontory is now called *Capo di Figalo*. The medals of Actium were silver, gold and bronze; and the ordinary type is a flying pegasus.

ACTIUS, in mythology, a surname of Apollo, from Actium, where he was worshipped.

ACTON, a town near London, where is a well that affords a purging water, which is noted for the pungency of its salt. This water is whitish; to the taste it is sweetish, with a mixture of the same bitter which is in the Epsom water. The salt of this water is not quite so soft as that of Epsom; and is more calcareous than it, having more of the salt of lime: for a quantity of the Acton water being boiled high, and mixed with a solution of sublimate in pure water, threw down a yellow sediment. The salt of the Acton water is more nitrous than that of Epsom; it strikes a deep red, or purple, with the tincture of logwood in brandy, as is usual with nitrous salts; it does not precipitate silver out of the spirit of nitre, as common salt does: 1½lb. of this water yields 48 grains of salt.

Actor, Actorum.

ACTOR, in general, signifies a person who acts or performs something.

Actor, among civilians, the proctor or advocate in civil courts or causes; as, *Actor ecclesiæ* has been sometimes used for the advocate of the church; *actor dominicus* for the lord's attorney; *actor villæ*, the steward or head bailiff of a village.

Actor, in the drama, is a person who represents some part or character in the theatre. The drama consisted originally of nothing more than a simple chorus, who sung hymns in honour of Bacchus; so that the primitive actors were only singers and musicians. Thespis was the first that, in order to ease this unformed chorus, introduced a declaimer, who repeated some heroic or comic adventure. Æschylus, finding a single person tiresome, attempted to introduce a second, and changed the ancient recitals into dialogues. He also dressed his actors in a more majestic manner, and introduced the cothurnus or buskin. Sophocles added a third, in order to represent the various incidents in a more natural manner: and here the Greeks stopped, at least we do not find in any of their tragedies above three persons in the same scene. Perhaps they looked upon it as a rule of the dramatic poem never to admit more than three speakers at a time on the stage; a rule which Horace has expressed in the following verse:

Nec quarta loqui persona laboret.

This, however, did not prevent their increasing the number of actors in comedy. Before the opening of a play, they named their actors in full theatre, together with the parts they were to perform. The ancient actors were masked, and obliged to raise their voice extremely, in order to make themselves heard by the innumerable crowd of people who filled the amphitheatres: they were accompanied with a player on the flute, who played a prelude, gave them the tone, and played while they declaimed. Horace speaks of a kind of secondary actors in his time, whose business was to imitate the first; and lessen themselves, to become better foils to their principals.

The moderns have introduced an infinite number of actors upon the stage. This heightens the trouble and distress that should reign there, and makes a diversity, in which the spectator is sure to be interested.

Actors were highly honoured at Athens. At Rome they were despised, and not only denied all rank among the citizens, but even when any citizen appeared upon the stage, he was expelled his tribe and deprived of the right of suffrage by censors. Cicero, indeed, esteems the talents of Roscius: but he values his virtues still more; virtues which distinguished him so remarkably above all others of his profession, that they seemed to have excluded him from the theatre. The French have, in this respect, adopted the ideas of the Romans; and the English those of the Greeks.

Actor, the name of several persons in fabulous history. One *Actor* among the Aurunci is described by Virgil as a hero of the first rank. *Æn.* xii.

ACTORUM tabulæ, in antiquity, were tables instituted by Servius Tullius, in which the births of children were registered. They were kept in the treasury of Saturn.

ACTRESS,

Actreſs || Actuarius.

ACTRESS, in a general ſenſe, a female who acts or performs ſomething.

ACTRESS, in the *Drama*, a female performer. Women actors were unknown to the ancients, among whom men always performed the female character; and hence one reaſon for the uſe of maſks among them.

Actreſſes are ſaid not to have been introduced on the Engliſh ſtage till after the reſtoration of King Charles II. who has been charged with contributing to the corrupting of our manners by importing this uſage from abroad. But this can be but partly true: the queen of James I. acted a part in a paſtoral; and Prynn, in his Hiſtriomaſtix, ſpeaks of women actors in his time as proſtitutes; which was one occaſion of the ſevere proſecution brought againſt him for that book.

There are ſome very agreeable and beautiful talents, of which the poſſeſſion commands a certain ſort of admiration; but of which the exerciſe for the ſake of gain is conſidered, whether from reaſon or prejudice, as a ſort of public proſtitution. The pecuniary recompenſe, therefore, of thoſe who exerciſe them in this manner, muſt be ſufficient, not only to pay for the time, labour, and expence of acquiring the talents, but for the diſcredit which attends the employment of them as the means of ſubſiſtence. The exorbitant rewards of players, opera-ſingers, opera-dancers, &c. are founded upon theſe two principles; the rarity and beauty of the talents, and the diſcredit of employing them in this manner. It ſeems abſurd at firſt ſight, that we ſhould deſpiſe their perſons, and yet reward their talents with the moſt profuſe liberality. While we do the one, however, we muſt of neceſſity do the other. Should the public opinion or prejudice ever alter with regard to ſuch occupations, their pecuniary recompenſe would quickly diminiſh. More people would apply to them, and the competition would quickly reduce the price of their labour. Such talents, though far from being common, are by no means ſo rare as is imagined. Many people poſſeſs them in great perfection, who diſdain to make this uſe of them; and many more are capable of acquiring them, if any thing could be made honourably by them.

ACTUAL, ſomething that is real and effective, or that exiſts truly and abſolutely. Thus philoſophers uſe the terms *actual* heat, *actual* cold, &c. in oppoſition to *virtual or potential*. Hence, among phyſicians, a red hot iron, or fire, is called an actual cautery; in diſtinction from cauteries, or cauſtics, that have the power of producing the ſame effect upon the animal ſolids as actual fire, and are called *potential* cauteries. Boiling water is actually hot; brandy, producing heat in the body, is potentially hot, though of itſelf cold.

Actual Sin, that which is committed by the perſon himſelf; in oppoſition to *original ſin*, or that which he contracted from being a child of Adam.

ACTUARIÆ NAVES, a kind of long and light ſhips among the Romans, thus denominated, becauſe they were chiefly deſigned for ſwiftneſs and expedition. They correſpond to what the French call *brigantines*.

ACTUARIUS, a celebrated Greek phyſician of the 13th century, and the firſt Greek author who has treated of mild purgatives, ſuch as caſſia, manna, ſena, &c. He is the firſt alſo who mentions diſtilled waters. His works were printed in one volume folio, by Henry Stephens in 1567. Actuate || Acuna.

ACTUARIUS, or ACTARIUS, a notary or officer appointed to write the acts or proceedings of a court, or the like. In the Eaſtern empire, the actuarii were properly officers who kept the military accounts, received the corn from the *ſuſceptores* or ſtorekeepers, and delivered it to the ſoldiers.

ACTUATE, to bring into act, or put a thing in action. Thus an agent is ſaid, by the ſchoolmen, to *actuate* a power, when it produces an act in a ſubject. Thus the mind may be ſaid to *actuate* the body; and thus a medicine is ſaid by ſome ancient phyſicians to be actuated or brought into action, when by means of the vital heat it is made to produce its effect.

ACTUS, in *Ancient Architecture*, a meaſure in length equal to 120 Roman feet. In *Ancient Agriculture*, the word ſignified the length of one furrow, or the diſtance a plough goes before it turns.

Actus Minimus was a quantity of land 120 feet in length, and four in breadth.

Actus Major, or *Actus Quadratus*, a piece of ground in a ſquare form, whoſe ſide was equal to 120 feet, equal to half the jugerum.

Actus Intervicinalis, a ſpace of ground four feet in breadth, left between the lands as a path or way.

ACUANITES, in *Eccleſiaſtical Hiſtory*, the ſame with thoſe called more frequently MANICHEES. They took the name from Acuas, a diſciple of Thomas one of the twelve apoſtles.

ACULEATE, or ACULEATI, a term applied to any plant or animal armed with prickles.

ACULEI, the prickles of animals or of plants.

ACULER, in the *Manege*, is uſed for the motion of a horſe, when, in working upon volts, he does not go far enough forward at every time or motion, ſo that his ſhoulders embrace or take in too little ground, and his croupe comes too near the centre of the volt. Horſes are naturally inclined to this fault in making demi-volts.

ACUMINA, in *Antiquity*, a kind of military omen, moſt generally ſuppoſed to have been taken from the points or edges of darts, ſwords, or other weapons.

ACUNA, CHRISTOPHER DE, a Spaniſh Jeſuit, born at Burgos. He was admitted into the ſociety in 1612, being then but 15 years of age. After having devoted ſome years to ſtudy, he went to America, where he aſſiſted in making converts in Chili and Peru. In 1640 he returned to Spain, and gave the king an account how far he had ſucceeded in the commiſſion he had received to make diſcoveries on the river of the Amazons; and the year following he publiſhed a deſcription of this river at Madrid. Acuna was ſent to Rome, as procurator of his province. He returned to Spain with the title of Qualificator of the Inquiſition; but ſoon after embarked again for the Weſt Indies, and was at Lima in 1675, when Father Southwell publiſhed at Rome the Bibliotheque of the Jeſuit writers. Acuna's work is entitled, *Nuevo deſcubrimento del gran rio de las Amazonas*; i. e. "A new diſcovery of the great river of the Amazons." He was 10 months together upon this river, having had inſtructions to inquire into every thing with the greateſt exactneſs, that his majeſty might thereby be enabled to render the navigation more eaſy and commodious. He

Acupuncture || Ad.

went aboard a ſhip at Quito with Peter Texiera, who had already been ſo far up the river, and was therefore thought a proper perſon to accompany him in this expedition. They embarked in February 1639, but did not arrive at Para till the December following. It is thought that the revolution of Portugal, by which the Spaniards loſt all Brazil, and the colony of Para at the mouth of the river of the Amazons, were the cauſe that the relation of this Jeſuit was ſuppreſſed; for, as it could not be of any advantage to the Spaniards, they were afraid it might prove of great ſervice to the Portugueſe. The copies of this work became extremely ſcarce, ſo that the publiſhers of the French tranſlation at Paris aſſerted, that there was not one copy of the original extant, excepting one in the poſſeſſion of the tranſlator, and perhaps that in the Vatican library. M. de Gomberville was the author of this tranſlation: it was publiſhed after his death, with a long diſſertation. An account of the original may be ſeen in the Paris Journal, in that of Leipſic, and in Cheverau's Hiſtory of the World.

ACUPUNCTURE, the name of a ſurgical operation among the Chineſe and Japaneſe, which is performed by pricking the part affected with a ſilver needle. They employ this operation in headachs, lethargies, convulſions, colics, &c.

ACUS, in *Ichthyology*, the trivial name of a ſpecies of ſyngnathus. See SYNGNATHUS.

ACUSIO COLONIA, now ANCONE, according to Holſtenius, between Orange and Valence, near Montelimart, on the banks of the Rhone.

ACUTE, an epithet applied to ſuch things as terminate in a ſharp point or edge. And in this ſenſe it ſtands oppoſed to obtuſe.

ACUTE Angle, in *Geometry*, is that which is leſs than a right angle, or which does not ſubtend 90 degrees.

ACUTE-angled Triangle, is a triangle whoſe three angles are all acute.

ACUTE-angled Cone, is, according to the ancients, a right cone, whoſe axis makes an acute angle with its ſide.

ACUTE, in *Muſic*, is applied to a ſound or tone that is ſharp or high in compariſon of ſome other tone. In this ſenſe, *acute* ſtands oppoſed to *grave*.

ACUTE Accent. See ACCENT.

ACUTE Diſeaſes, ſuch as come ſuddenly to a criſis. This term is uſed for all diſeaſes which do not fall under the head of chronic diſeaſes.

ACUTIATOR, in writers of the barbarous ages, denotes a perſon that whets or grinds cutting inſtruments; called alſo in ancient gloſſaries *acutor*, *ακονητης*, *famiarius*, *coharius*, &c. In the ancient armies there were acutiatores, a kind of ſmiths, retained for whetting or keeping the arms ſharp.

AD, a Latin prepoſition, originally ſignifying *to*, and frequently uſed in compoſition both with and without the *d*, to expreſs the relation of one thing to another.

AD Beſtias, in antiquity, is the puniſhment of criminals condemned to be thrown to wild beaſts.

AD Hominem, in *Logic*, a kind of argument drawn from the principles or prejudices of thoſe with whom we argue.

AD Ludos, in antiquity, a ſentence upon criminals among the Romans, whereby they were condemned to entertain the people by fighting either with wild beaſts or with one another, and thus executing juſtice upon themſelves. Adage || Adam.

AD Metalla, in antiquity, the puniſhment of ſuch criminals as were condemned to the mines, among the Romans; and therefore called *Metallici*.

AD Valorem, a term chiefly uſed in ſpeaking of the duties or cuſtoms paid for certain goods: The duties on ſome articles are paid by the number, weight, meaſure, tale, &c.; and others are paid *ad valorem*, that is, according to their value.

ADAGE, a proverb, or ſhort ſentence, containing ſome wiſe obſervation or popular ſaying. Eraſmus has made a very large and valuable collection of the Greek and Roman adages; and Mr Ray has done the ſame with regard to the Engliſh. We have alſo Kelly's Collection of Scots Proverbs.

ADAGIO, in *Muſic*. Adverbially, it ſignifies *ſoftly*, *leiſurely*: and is uſed to denote the ſloweſt of all times. Uſed ſubſtantively, it ſignifies a ſlow movement. Sometimes this word is repeated, as *adagio*, *adagio*, to denote a ſtill greater retardation in the time of the muſic.

ADALIDES, in the Spaniſh policy, are officers of juſtice, for matters touching the military forces. In the laws of King Alphonſus, the adalides are ſpoken of as officers appointed to guide and direct the marching of the forces in time of war. Lopez repreſents them as a ſort of judges, who take cognizance of the differences riſing upon excurſions, the diſtribution of plunder, &c.

ADAM, the firſt of the human race, was formed by the Almighty on the ſixth day of the creation. His body was made of the duſt of the earth: after which, God animated or gave it life, and Adam then became a rational creature. His heavenly Parent did not leave his offspring in a deſtitute ſtate to ſhift for himſelf; but planted a garden, in which he cauſed to grow not only every tree that was proper for producing food, but likewiſe ſuch as were agreeable to the eye, or merely ornamental. In this garden were aſſembled all the brute creation; and, by their Maker, cauſed to paſs before Adam, who gave all of them names, which were judged proper by the Deity himſelf.—In this review Adam found none for a companion to himſelf. This ſolitary ſtate was ſeen by the Deity to be attended with ſome degree of unhappineſs; and therefore he threw Adam into a deep ſleep, in which condition he took a rib from his ſide, and healing up the wound formed a woman of the rib he had taken out. On Adam's awaking, the woman was brought to him; and he immediately knew her to be one of his own ſpecies, called her his bone and his fleſh, giving her the name of *woman* becauſe ſhe was taken out of man.

The firſt pair being thus created, God gave them authority over the inferior creation, commanding them to ſubdue the earth, alſo to increaſe and multiply and fill it. They were informed of the proper food for the beaſts and for them; the graſs, or green herbs, being appointed for beaſts; and fruits, or ſeeds, for man. Their proper employment alſo was aſſigned them; namely, *to dreſs the garden, and to keep it*.

Though Adam was thus highly favoured and inſtructed by his Maker, there was a ſingle tree, which grew in

Adam. in the middle of the garden, of the fruit of which they were not allowed to eat; being told, that they ſhould ſurely die in the day they ate of it. This tree was named *the Tree of the Knowledge of Good and Evil*. This prohibition, however, they ſoon broke through. The woman having entered into converſation with *the Serpent*, was by him perſuaded, that by eating of the tree ſhe ſhould become as wiſe as God himſelf: and accordingly, being invited by the beauty of the fruit, and its deſirable property of imparting wiſdom, ſhe plucked and eat; giving her huſband of it at the ſame time, who did likewiſe eat.

Before this tranſgreſſion of the divine command, Adam and his wife had no occaſion for clothes, neither had they any ſenſe of ſhame; but immediately on eating the forbidden fruit, they were aſhamed of being naked, and made aprons of fig leaves for themſelves. On hearing the voice of God in the garden, they were terrified, and hid themſelves: but being queſtioned by the Deity, they confeſſed what they had done, and received ſentence accordingly; the man being condemned to labour; the woman to ſubjection to her huſband, and to pain in child-bearing. They were now driven out of the garden, and their acceſs to it prevented by a terrible apparition. They had clothes given them by the Deity made of the ſkins of beaſts. In this ſtate Adam had ſeveral children; the names of only three of whom we are acquainted with, viz. Cain, Abel, and Seth. He died at the age of 930 years.

Theſe are all the particulars concerning Adam's life, that we have on divine authority: but a vaſt multitude of others are added by the Jews, Mahometans, and Papiſts; all of which muſt be at beſt conjectural; moſt of them, indeed, appear downright falſehoods or abſurdities. The curioſity of our readers, it is preſumed, will be ſufficiently gratified by the few which are here ſubjoined.

According to the Talmudiſts, when Adam was created, his body was of immenſe magnitude. When he ſinned, his ſtature was reduced to a hundred ells, according to ſome; to nine hundred cubits, according to others; who think this was done at the requeſt of the angels, who were afraid of ſo gigantic a creature. In the iſland of Ceylon is a mountain, called the *Peak* or mountain of Adam, from its being, according to the tradition of the country, the reſidence of our firſt parents. Here the print of his footſteps, above two palms in length, are ſtill pointed out.

Many reveries have been formed concerning the perſonal beauty of Adam. That he was a handſome well-ſhaped man is probable; but ſome writers, not content with this, affirm, that God, intending to create man, clothed Himſelf with a perfectly beautiful human body, making this his model in the formation of the body of Adam.

Nor has the imagination been leſs indulged concerning the formation of the human ſpecies male and female.—It would be endleſs to recount all the fancies that have been wrote on this ſubject; but as Madame Bourignon has made a conſiderable figure in the *religious*, or rather *ſuperſtitious*, world, we cannot help inſerting ſome of her opinions concerning the firſt man, which are peculiarly marvellous. According to the *revelations* of this lady, Adam before his fall poſſeſſed in himſelf the principles of both ſexes, and the virtue or power of producing his like, without the concurrent aſſiſtance of woman. The diviſion into two ſexes, ſhe imagined *, was a conſequence of man's ſin; and now, ſhe obſerves, mankind are become ſo many *monſters in nature*, being much leſs perfect in this reſpect than plants or trees, which are capable of producing their like alone, and without pain or miſery. She even imagined, that, being in an ecſtacy, ſhe ſaw the figure of Adam before he fell, with the manner how, by himſelf, he was capable of procreating other men. "God," ſays ſhe, "repreſented to my mind the beauty of the firſt world, and the manner how he had drawn it from the chaos: every thing was bright, tranſparent, and darted forth life and ineffable glory. The body of Adam was purer and more tranſparent than cryſtal, and vaſtly fleet; through this body were ſeen veſſels and rivulets of light, which penetrated from the inward to the outward parts, through all his pores. In ſome veſſels ran fluids of all kinds and colours, vaſtly bright, and quite diaphanous. The moſt ravithing harmony aroſe from every motion; and nothing reſiſted, or could annoy him. His ſtature was taller than the preſent race of men; his hair was ſhort, curled, and of a colour inclining to black; his upper lip covered with ſhort hair: and inſtead of the beſtial parts which modeſty will not allow us to name, he was faſhioned as our bodies will be in the life eternal, which I know not whether I dare reveal. In that *region* his noſe was formed after the manner of a *face*, which diffuſed the moſt delicious fragrancy and perfumes; whence alſo men were to iſſue, all whoſe principles were inherent in him: there being in his belly a veſſel, where little eggs were formed; and a ſecond veſſel filled with a fluid, which impregnated thoſe eggs: and when man heated himſelf in the love of God, the deſire he had that other creatures ſhould exiſt beſides himſelf, to praiſe and love God, cauſed the fluid above mentioned (by means of the fire of the love of God), to drop on one or more of theſe eggs, with inexpreſſible delight; which being thus impregnated, iſſued, ſome time after, out of man, by this canal †, in the ſhape of an egg, whence a perfect man was hatched by inſenſible degrees. Woman was formed by taking out of Adam's ſides the veſſels that contained the eggs; which the ſtill poſſeſſes, as is diſcovered by anatomiſts."

Many others have believed, that Adam at his firſt creation was both male and female: others, that he had two bodies joining together at the ſhoulders, and their faces looking oppoſite ways like thoſe of Janus. Hence, ſay theſe, when God created Eve, he had no more to do than to ſeparate the two bodies from one another ‡. Of all others, however, the opinion of Paracelſus ſeems the moſt ridiculous ||. *Negabat primos parentes ante lapſum habuiſſe partes generationi hominis neceſſarias; credebat poſtea acceſſiſſe, ut ſtruman gutturi.*

Extravagant things are aſſerted concerning Adam's knowledge. It is very probable that he was inſtructed by the Deity how to accompliſh the work appointed him, viz. to dreſs the garden, and keep it from being deſtroyed by the brute creatures; and it is alſo probable that he had likewiſe every piece of knowledge communicated to him that was either neceſſary or pleaſing: but that he was acquainted with geometry, mathematics, rhetoric, poetry, painting, ſculpture, &c. is too ridiculous to be credited by any ſober perſon. Some rabbies,

Adam.

* Preface to a book, entitled *Le nouveau Ciel et la nouvelle Terre*, Amſt. 1679.

† *I.e.* the *naſal* canal ſituated as above deſcribed.

‡ See *Androgynes.*

|| Paracelſus *apud* Voſſium *de Philoſophia*, c. ix. p. 71.

Adam. rabbies, indeed, have contented themſelves with equalling Adam's knowledge to that of Moſes and Solomon; while others, again, have maintained that he excelled the angels themſelves. Several Chriſtians ſeem to be little behind theſe Jews in the degree of knowledge they aſcribe to Adam, nothing being hid from him, according to them, except contingent events relating to futurity. One writer indeed (Pinedo) excepts politics; but a Carthuſian friar, having exhauſted in favour of Ariſtotle, every image and compariſon he could think of, at laſt aſſerted that Ariſtotle's knowledge was as extenſive as that of *Adam*.—In conſequence of this ſurpriſing knowledge with which Adam was endued, he is ſuppoſed to have been a conſiderable author. The Jews pretend that he wrote a book on the creation, and another on the Deity. Some rabbies aſcribe the 92d pſalm to Adam; and in ſome manuſcripts the Chaldee title of this pſalm expreſsly declares that this is the ſong of praiſe which the firſt man repeated for the Sabbath day.

Various conjectures have been formed concerning the place where man was firſt created, and where the garden of Eden was ſituated; but none of theſe have any ſolid foundation. The Jews tell us, that Eden was ſeparated from the reſt of the world by the ocean; and that Adam, being baniſhed therefrom, walked acroſs the ſea, which he found every way fordable, by reaſon of his enormous ſtature *. The Arabians imagined paradiſe to have been in the air; and that our firſt parents were thrown down from it on their tranſgreſſion, as Vulcan is ſaid to have been thrown down headlong from heaven by Jupiter.

* This is juſt the picture of the Orion or Polyphemus of the poets. *Æneid.* iii. 663, 664. x. 763.

Strange ſtories are told concerning Adam's children. That he had none in the ſtate of innocence, is certain from Scripture; but that his marriage with Eve was not conſummated till after the fall, cannot be proved from thence. Some imagine, that, for many years after the fall, Adam denied himſelf the connubial joys by way of penance; others, that he cohabited with another woman, whoſe name was LILLITH. The Mahometans tell us, that our firſt parents having been thrown headlong from the celeſtial paradiſe, Adam fell upon the iſle of Serendib, or Ceylon, in the Eaſt Indies; and Eve on Iodda, a port of the Red ſea, not far from Mecca. After a ſeparation of upwards of 200 years, they met in Ceylon, where they multiplied: according to ſome Eve had twenty, according to others only eight, deliveries; bringing forth at each time twins, a male and a female, who afterwards married. The rabbins imagine that Eve brought forth Cain and Abel at a birth; that Adam wept for Abel a hundred years in the valley of tears near Hebron, during which time he did not cohabit with his wife; and that this ſeparation would probably have continued longer, had it not been forbid by the angel Gabriel. The inhabitants of Ceylon affirm, that the ſalt lake on the mountain of Colombo conſiſts wholly of the tears which Eve for one hundred years together ſhed becauſe of Abel's death.

Some of the Arabians tell us, that Adam was buried near Mecca on Mount Abukobeis; others, that Noah, having laid his body in the ark, cauſed it to be carried after the deluge to Jeruſalem by Melchiſedeck the ſon of Shem: of this opinion are the eaſtern Chriſtians; but the Perſians affirm that he was interred in the iſle of Serendib, where his corpſe was guarded by lions at the time the giants warred upon one another. Adam.

St Jerome imagined that Adam was buried at Hebron; others, on Mount Calvary. Some are of opinion that he died on the very ſpot where Jeruſalem was afterwards built; and was buried on the place where Chriſt ſuffered, that ſo his bones might be ſprinkled with the Saviour's blood.

ADAM, *Melchior*, lived in the 17th century. He was born in the territory of Grotkaw in Sileſia, and educated in the college of Brieg, where the dukes of that name, to the utmoſt of their power, encouraged learning and the reformed religion as profeſſed by Calvin. Here he became a firm Proteſtant; and was enabled to purſue his ſtudies by the liberality of a perſon of quality, who had left ſeveral exhibitions for young ſtudents. He was appointed rector of a college at Heidelberg, where he publiſhed his firſt volume of illuſtrious men in the year 1615. This volume, which conſiſted of philoſophers, poets, writers on polite literature, and hiſtorians, &c. was followed by three others: that which treated of divines was printed in 1619; that of the lawyers came next; and, finally, that of the phyſicians: the two laſt were publiſhed in 1620. All the learned men, whoſe lives are contained in theſe four volumes, lived in the 16th, or beginning of the 17th century, and are either Germans or Flemings; but he publiſhed in 1618 the lives of twenty divines of other countries in a ſeparate volume. All his divines are Proteſtants. The Lutherans were not pleaſed with him, for they thought him partial; and will not allow his work to be a proper ſtandard of the learning of Germany. He was the author of ſeveral other works beſides his lives. His induſtry as a biographer is commended by Bayle, who acknowledges his obligations to his labours. He died in 1622.

ADAM, *Robert*, an eminent architect, was born at Edinburgh in the year 1728. He was the ſecond ſon of William Adam, Eſq. of Maryburgh, in the county of Fife, who has alſo left ſome reſpectable ſpecimens of his genius and abilities as an architect in Hopetoun houſe, and the Royal Infirmary of Edinburgh, which were erected from deſigns executed by him. And it was perhaps owing to the fortunate circumſtance of his father's example that young Adam firſt directed his attention to thoſe ſtudies, in the proſecution of which he afterwards roſe to ſuch diſtinguiſhed celebrity. He received his education at the univerſity of Edinburgh, where he had an opportunity of improving and enlarging his mind, by the converſation and acquaintance of ſome of the firſt literary characters of the age who were then riſing into reputation, or have ſince eſtabliſhed their fame as hiſtorians and philoſophers. Among theſe were Mr Hume, Dr Robertſon, Dr Smith, and Dr Ferguſon, who were the friends and companions of the father, and who continued through life their friendſhip and attachment to the ſon.

In the year 1754 Mr Adam travelled to the continent, with a view to extend his knowledge and improve his taſte in architecture, and reſided in Italy for three years. Here he ſurveyed and ſtudied thoſe noble ſpecimens of ancient grandeur which the magnificent public edifices of the Romans, even in ruins, ſtill exhibit. But he ſaw with regret, that the public buildings, conſtructed with more durable materials and

Adam. greater ſtrength and ſolidity, had alone been able to reſiſt, during the lapſe of ages, the injuries of time, and the more deſtructive hand of the northern barbarians, whoſe progreſs was marked with ruin and deſolation. Not a veſtige of any of the private buildings of the wealthy citizens, which have been deſcribed and celebrated by their writers for their magnificence, now remains; and even the ſituation of ſome of the ſplendid villas of the luxurious Romans is ſcarcely known. In tracing the progreſs of architecture and the other fine arts among the Romans, Mr Adam obſerved that they had viſibly declined previous to the time of Diocleſian; but he was alſo convinced that the liberal patronage and magnificence of that emperor had revived during his reign a better taſte for architecture, and had formed artiſts who were capable of imitating the more elegant ſtile of a purer age. He had ſeen this remarkably exemplified in the public baths at Rome, which were erected by him, the moſt entire and the nobleſt of the ancient buildings. Admiring the extent and fertility of genius of the artiſts, from whoſe deſigns ſuch magnificent ſtructures had been executed, he was anxious to ſee and ſtudy any remains that yet exiſted of thoſe maſters whoſe works are ſtriking monuments of an elegant and improved taſte, but whoſe names, amid the wrecks of time, have ſunk into oblivion. It was with this view that he undertook a voyage to Spalatro, in Dalmatia, to viſit and examine the private palace of Diocleſian, in which that emperor reſided for nine years previous to his death, and to which he retired in the year 305, when he reſigned the government of the empire. Mr Adam ſailed from Venice in July 1754, accompanied by M. Cleriſſeau, a French artiſt and antiquarian, and two experienced draughtſmen. On their arrival at Spalatro, they found that though the palace had ſuffered much from the injuries of time, yet it had ſuſtained no leſs from the dilapidations of the inhabitants to procure materials for building, and even the foundations of the ancient ſtructure were covered with modern houſes. With high expectations of ſucceſs, they commenced their labours, but were ſoon interrupted by the jealous vigilance of the government. Suſpecting that their object was to view and make plans of the fortifications, an immediate and peremptory order was iſſued by the governor, commanding them to deſiſt. This order, however, was ſoon counteracted through the mediation of General Græme, the commander in chief of the Venetian forces; and they were permitted to proceed in their undertaking. They reſumed their labours with double ardour, and in five weeks finiſhed plans and views of the fragments which remain, from which they were enabled to execute perfect deſigns of the entire building.

Mr Adam now returned to England, and ſoon roſe to very conſiderable profeſſional eminence. In 1762 he was appointed architect to the king, and the year following he preſented to the public the fruit of his voyage to Spalatro, in a ſplendid work dedicated to his majeſty, which contains engravings and deſcriptions of the ruins of the palace. A later traveller, the Abbé Fortis, ſpeaking of the ruins of this palace, ſays, "I will not pretend to mention the great Roman remains, for which this noble city is chiefly known and celebrated. The lovers of architecture and antiquity are ſufficiently acquainted with them by the work of Mr Adam, who has done full juſtice to theſe ſuperb veſtiges by his elegant drawings and engravings. In general, however, the coarſeneſs of the work, and the bad taſte of the age are equal to the magnificence of the buildings. For all this, I do not mean to detract from the merit of the auguſt remains of Diocleſian's palace. I count them among the moſt reſpectable monuments of antiquity now extant." And the hiſtorian of the Decline and Fall of the Roman Empire, in conſequence of this obſervation, after having expreſſed a high commendation of the work, has thrown out a ſuſpicion of the accuracy of the repreſentations and deſcriptions. "For the account of Diocleſian's palace, ſays Mr Gibbon, we are indebted to an ingenious artiſt of our own time and country, whom a very liberal curioſity had carried into the heart of Dalmatia. But there is room to ſuſpect that the elegance of his deſigns and engravings has ſomewhat flattered the objects which it was their purpoſe to repreſent. We are informed by a more recent and very judicious traveller, that the awful ruins of Spalatro are not leſs expreſſive of the decline of the arts, than of the greatneſs of the Roman empire in the time of Diocleſian." Mr Gibbon's criticiſm is ſcarcely ſupported by the obſervation of the Abbé Fortis; and what the latter has advanced on this ſubject is not perfectly conſiſtent with itſelf: for while he cenſures the coarſeneſs of the work and the bad taſte of the age, he beſtows ſomething like indirect praiſe, when he adds that, he means not to detract from the merit of the auguſt remains of this edifice, and regards it as one of the moſt reſpectable monuments of antiquity now extant. The apparent coarſeneſs of the work is probably owing to the effects of the weather, which have deſtroyed the ſmooth poliſh of the chiſſel which it originally received; and Mr Adam allows, that, previous to this period of the Roman empire, the arts had viſibly declined, but at the ſame time contends, that the buildings erected in the reign of Diocleſian, exhibit convincing proofs of the ſtile and manner of a purer age. But of this, the admirer of this elegant art may judge for himſelf, by conſulting the engravings and deſcriptions, the accuracy and faithfulneſs of which there ſeems to be no reaſon to doubt. Adam.

In the year 1768 Mr Adam obtained a ſeat in parliament. He was choſen to repreſent the county of Kinroſs; and about the ſame time he reſigned his office of architect to the king. But he continued his profeſſional career with increaſing reputation: and about the year 1773, in conjunction with his brother James, who alſo roſe to conſiderable eminence as an architect, he publiſhed another ſplendid work, conſiſting of plans and elevations of public and private buildings which were erected from their deſigns. Among theſe are Lord Mansfield's houſe at Caenwood, Luton houſe in Bedfordſhire belonging to Lord Bute, the new Gateway of the Admiralty Office, the Regiſter Office at Edinburgh &c. which are univerſally admired as precious monuments of elegant deſign and correct taſte. The Adelphi buildings at London, which are alſo ſtriking examples of the inventive genius of the Meſſrs Adam, proved an unſucceſsful ſpeculation. The wealth and power of a nation were perhaps only equal to ſo extenſive an undertaking: it was too great to be attempted by private citizens.

The buildings which have been more lately erected from

Adam. from the designs of Mr Adam, afford additional proofs of the unlimited extent of his invention, and the amazing fertility of his genius. Those parts of the new University of Edinburgh which have been completed, and the Infirmary at Glasgow, need only be mentioned in proof of our remark. The latter edifice we have often beheld and contemplated with those feelings of admiration, elevated to a kind of rapturous enthusiasm, which the rare union of perfect symmetry and elegant disposition of parts combined with inexpressible beauty and lightness into one whole seldom fails to inspire. We have also seen and admired elegant designs executed by Mr Adam, which were intended for the South Bridge and South Bridge Street of Edinburgh, and if they had been adopted, would have added much to the decoration of that quarter of the town; but being considered unsuitable to the taste or economy of the times, they were rejected.

Strange incongruities appear in buildings which have been erected from designs by Mr Adam. But of these it must be observed, that they have been altered and mutilated in the execution, according to the capricious fancy and vulgar taste of the owners; and it is well known that a slight deviation changes the character and mars the effect of the general design. A lady of rank was furnished by Mr Adam with a design of a house, which, after being executed, he was astonished to find out of all proportion. On inquiring the cause, he was informed that the pediment which he had designed would not admit a piece of rude sculpture which represented the arms of the family, and by the date which it bore incontestably proved its antiquity. It was therefore absolutely necessary to enlarge the dimensions of the pediment, to receive this ancient badge of family honour, and sacrifice the beauty and proportion of the whole building. We have seen a large public edifice which was also designed by Mr Adam; but when it was erected, the length was curtailed of the space of two windows, while the other parts remained according to the original plan. It now presents a heavy unsightly pile, instead of that elegance of proportion and correctness of style which the faithful execution of Mr Adam's design would have probably exhibited.

To the last period of his life, Mr Adam displayed an increasing vigour of genius and refinement of taste; for, in the space of one year preceding his death, he designed eight great public works, besides twenty-five private buildings, so various in their style, and beautiful in their composition, that they have been allowed by the best judges, sufficient of themselves to establish his fame unrivalled as an artist. The present improved taste, which now pretty generally prevails in our public and private edifices, undoubtedly owes much to the elegant and correct style introduced by Mr Adam. His fertile genius was not confined merely to the external decoration of buildings; it displayed itself with equal effect in the internal arrangement and disposition of the apartments, and in the varied, elegant, and beautiful ornaments of chimney pieces and ceilings. But not only did he introduce a total change in the architecture of the country, the manufactures also which are in any way connected with decoration, experienced a considerable degree of improvement by the exercise of his inventive powers. His talents extended beyond the line of his own profession; he displayed in his numerous drawings in landscape, a luxuriance of composition, and an effect of light and shadow which have rarely been equalled. Adam || Adami.

He died on the 3d of March 1792, by the bursting of a blood vessel, in the 64th year of his age, and was buried in Westminster Abbey. His funeral was attended by a select number of friends, some of them of distinguished rank, who esteemed him while living, and who wished to express this last mark of regard. The many elegant buildings, public and private, erected in various parts of the kingdom, from the designs of Mr Adam, will remain lasting monuments of his taste and genius; and the natural suavity of his manners, joined to the excellence of his moral character, secured to him the affectionate regard of his friends, and the esteem of all who enjoyed his acquaintance.

James Adam, whom we have already mentioned as associated with his brother in many of his labours, died on the 20th October 1794.

Adam's Apple, a name given to a species of Citrus. See Botany *Index*.

Adam's Bridge, or *Rama's Bridge*, in *Geography*, a ridge of sands and rocks, extending across the north end of Manara gulf, from the island of that name, on the north-west coast of Ceylon, to Ramencote or Ramankoil island, off Raman point.

Adam's Needle. See Yucca, Botany *Index*.

Adam's Peak, a high mountain of the East Indies, in the island of Ceylon, on the top of which it is believed the first man was created. It is in the form of a sugar loaf, and terminates in a circular plain about 200 paces in diameter. The summit is covered with trees, and has a deep lake which supplies the principal rivers of the island. The mountain is seen at the distance of twenty leagues from sea. It is situated in N. Lat. 5. 55. E. Long. 80. 39. See Adam.

Adam, or Adom, a town in the Peræa or on the other side the Jordan, over against Jericho, where the Jordan began to be dried up on the passage of the Israelites, (Joshua).

ADAMA, or Admah, one of the towns that were involved in the destruction of Sodom; (Moses).

ADAMANT, a name sometimes given to the diamond. (See Diamond). It is likewise applied to the scoriæ of gold, the magnet, &c.

ADAMARA, in *Geography*, a district of Abyssinia, near the province of Waldubba, containing several considerable villages, that are inhabited by Mahometans; who by their number and strength contribute to the safety of the monks in that part of the country. It is so called from *Adama*, which in the Amharic dialect signifies *pleasant*, the name of an adjacent mountain. The river Anzo runs in a contiguous valley. (*Bruce's Travels*, 4to, vol. iii. p. 179.)

ADAMIC earth, a name given to common red clay, alluding to that species of earth of which the first man is supposed to have been made.

ADAMI pomum, in *Anatomy*, a protuberance in the fore-part of the throat, formed by the os hyoides. It is thought to be so called upon a strange conceit, that a piece of the forbidden apple, which Adam ate stuck by the way, and occasioned it.

ADAMITES,

Adamites || Adamſon.

ADAMITES, or ADAMIANS, in eccleſiaſtical hiſtory, the name of a ſect of ancient heretics, ſuppoſed to have been a branch of the Baſilidians and Carpocratians.

Epiphanius tells us, that they were called Adamites from their pretending to be re-eſtabliſhed in the ſtate of innocence, and to be ſuch as Adam was at the moment of his creation, whence they ought to imitate him in his nakedneſs. They rejected marriage; maintaining, that the conjugal union would never have taken place upon earth had ſin been unknown.

This obſcure and ridiculous ſect did not at firſt laſt long; but it was revived, with additional abſurdities, in the twelfth century, by one Tandamus, ſince known by the name of *Tanchelin*, who propagated his errors at Antwerp, in the reign of the emperor Henry V. He maintained, that there ought to be no diſtinction between prieſts and laymen, and that fornication and adultery were meritorious actions. Tanchelin had a great number of followers, and was conſtantly attended by 3000 of theſe profligates in arms. His ſect did not, however, continue long after his death; but another appeared under the name of *Turlupins*, in Savoy and Dauphiny, where they committed the moſt brutal actions in open day.

About the beginning of the fifteenth century, one Picard, a native of Flanders, ſpread theſe errors in Germany and Bohemia, particularly in the army of the famous Ziſca, notwithſtanding the ſevere diſcipline he maintained. Picard pretended that he was ſent into the world as a new Adam, to re-eſtabliſh the law of nature; and which, according to him, conſiſted in expoſing every part of the body, and having all the women in common. This ſect found alſo ſome partizans in Poland, Holland, and England: they aſſembled in the night; and it is aſſerted, that one of the fundamental maxims of their ſociety was contained in the following verſe:

Jura, perjura, ſecretum prodere noli.

ADAMS, in *Geography*, a townſhip of Berkſhire county, in the ſtate of Maſſachuſets in North America. It is 140 miles north weſt of Boſton, and contains 2040 inhabitants. In the northern part of this diſtrict, a ſtream called Hudſon's brook, has worn a channel through a ſtratum of white marble, and over the channel the rocks form a fine natural bridge, which is 12 or 15 feet long, 10 feet broad, and more than 60 feet above the water.

ADAMSHIDE, a diſtrict of the circle of Raſtenburg, belonging to the king of Pruſſia, which, with Dombroſken, was bought, in 1737, for 42,000 dollars.

ADAMSON, PATRICK, a Scottiſh prelate, archbiſhop of St Andrew's, was born in the year 1543 in the town of Perth, where he received the rudiments of his education; and afterwards ſtudied philoſophy, and took his degree of maſter of arts at the univerſity of St Andrew's. In the year 1566, he ſet out for Paris, as tutor to a young gentleman. In the month of June of the ſame year, Mary queen of Scots being delivered of a ſon, afterwards James VI. of Scotland and I. of England, Mr Adamſon wrote a Latin poem on the occaſion. In this poem he gave the prince the title of king of France and England, and this proof of his loyalty involved him in difficulties; for the French court was offended, and ordered him to be arreſted; and he was confined for ſix months. He was releaſed only through the interceſſion of Queen Mary, and ſome of the principal nobility, who intereſted themſelves in his behalf. As ſoon as he recovered his liberty, he retired with his pupil to Bourges. He was in this city during the maſſacre at Paris; and the ſame perſecuting ſpirit prevailing among the Catholics at Bourges as at the metropolis, he lived concealed for ſeven months in a public houſe, the maſter of which, upwards of 70 years of age, was thrown from the top thereof, and had his brains daſhed out, for his charity to heretics. Whilſt Mr Adamſon lay thus in his ſepulchre, as he called it, he wrote his Latin poetical verſion of the book of Job, and his Tragedy of Herod in the ſame language. In the year 1573, he returned to Scotland; and, having entered into holy orders, became miniſter of Pailley. In the year 1575, he was appointed one of the commiſſioners, by the general aſſembly, to ſettle the juriſdiction and policy of the church; and the following year he was named, with Mr David Lindſay, to report their proceedings to the earl of Morton, then regent. About this time the earl appointed him one of his chaplains; and, on the death of Biſhop Douglas, promoted him to the archiepiſcopal ſee of St Andrew's, a dignity which brought upon him great trouble and uneaſineſs: for now the clamour of the Preſbyterian party roſe very high againſt him, and many inconſiſtent abſurd ſtories were propagated concerning him. Soon after his promotion, he publiſhed his catechiſm in Latin verſe, a work highly approved even by his enemies; but, nevertheleſs, they ſtill continued to perſecute him with great violence. In 1578, he ſubmitted himſelf to the general aſſembly, which procured him peace but for a very little time; for the year following, freſh accuſations were brought againſt him. In the year 1582, being attacked with a grievous diſeaſe, in which the phyſicians could give him no relief, he happened to take a ſimple medicine from an old woman, which did him ſervice. The woman, whoſe name was Aliſon Pearſon, was thereupon charged with witchcraft, and committed to priſon, but eſcaped out of her confinement; however, about four years afterwards, ſhe was again found and burnt for a witch. In 1583, King James came to St Andrews; and the archbiſhop, being much recovered, preached before him, and diſputed with Mr Andrew Melvil, in preſence of his majeſty, with great reputation; which drew upon him freſh calumny and perſecution. The king, however, was ſo well pleaſed with him, that he ſent him ambaſſador to Queen Elizabeth, at whoſe court he reſided for ſome years. His conduct, during his embaſſy, has been variouſly reported by different authors. Two things he principally laboured, viz. the recommending the king his maſter to the nobility and gentry of England, and the procuring ſome ſupport for the epiſcopal party in Scotland. His eloquent preaching drew after him ſuch crowds of people, and raiſed in their minds ſuch a high idea of the young king his maſter, that Queen Elizabeth forbade him to enter the pulpit during his ſtay in her dominions. In 1584, he was recalled, and ſat in the parliament held in Auguſt at Edinburgh. The Preſbyterian party was ſtill very violent againſt the archbiſhop. A provincial ſynod was held at St Andrew's in April 1586: the archbiſhop

Adamſon.

Adamſon || Adanſon.

biſhop was here accuſed and excommunicated: he appealed to the king and the ſtates, but this availed him little; for the mob being excited againſt him, he durſt ſcarcely appear in public. At the next general aſſembly, a paper being produced, containing the archbiſhop's ſubmiſſion, he was abſolved from the excommunication. In 1588, freſh accuſations were brought againſt him. The year following, he publiſhed the Lamentations of the prophet Jeremiah in Latin verſe; which he dedicated to the king, complaining of his hard uſage. In the latter end of the ſame year, he publiſhed a tranſlation of the Apocalypſe in Latin verſe; and a copy of Latin verſes, addreſſed alſo to his majeſty, deploring his diſtreſs. The king, however, was not moved by his application; for the revenue of his ſee was granted to the duke of Lennox; ſo that the prelate and his family were literally reduced to the want of bread. During the remaining part of his unfortunate life he was ſupported by charitable contribution, and he died in 1591. The character of this prelate has been variouſly repreſented, according to the ſentiments of religion and politics which prevailed. But there is little doubt that he encouraged and ſupported, under the authority of the king, oppreſſive and injurious meaſures. Bigotted and timid, he wanted that firmneſs and intrepidity, which promiſe ſteadineſs and uniformity of conduct in the conſpicuous characters of turbulent times. His learning was unqueſtioned; and he acquired great reputation as a popular preacher. In his adverſity he ſubmitted with pious reſignation to his hard fate. The panegyric of the editor of his works, Mr Wilſon, is extravagant and abſurd. He ſays, that "he was a miracle of nature, and rather ſeemed to be the immediate production of God Almighty, than born of a woman."

ADAMUS. The philoſopher's ſtone is ſo called by alchemiſts; they ſay it is an animal, and that it has carried its inviſible *Eve* in its body, ſince the moment they were united by the Creator.

ADANA, in *Geography*, a town of Aſia Minor, in Natolia, and in the province of Caramania. It is ſituated on the river Choquen; on the banks of which ſtands a ſmall but ſtrong caſtle built on a rock. It has a great number of beautiful fountains brought from the river by means of water-works. Over the river there is a ſtately bridge of fifteen arches, which leads to the water-works. The climate is pleaſant and healthy, and the winter mild and ſerene: but the ſummer is ſo hot as to oblige the principal inhabitants to retire to the neighbouring mountains, where they ſpend ſix months among ſhady trees and grottos, in a moſt delicious manner. The adjacent country is rich and fertile, and produces melons, cucumbers, pomegranates, pulſe, and herbs of all ſorts, all the year round; beſides corn, wine, and fruits in their proper ſeaſon. It is 30 miles north-eaſt of Tarſus, on the road to Aleppo. E. Long. 36. 12. N. Lat. 38. 10.

ADANSON, MICHAEL, a celebrated naturaliſt, was born at Aix in Provence in the year 1727. He was ſent to Paris in early life, and devoted his ſtudies with great aſſiduity to medicine, botany, and aſtronomy, and was a pupil of the celebrated Reaumur. He went to Senegal in the year 1738, where he remained ſix years examining the natural productions of that country. He preſented the fruits of his diſcoveries in geography and natural hiſtory to the Royal Academy; and in conſequence of theſe communications he was appointed one of their correſponding members. In the year 1759, on the death of Reaumur he was elected a member in his place; and about the ſame time he was admitted an honorary member of the Royal Society of London. Having ſpent ſix years in Senegal, he returned to Paris, where he publiſhed a work entitled, *Hiſtoire Naturelle du Senegal*, in 4to; and in 1763 his *Familles des Plantes*, 2 vols 8vo. In the year 1775 he preſented to the academy the plan of a natural hiſtory, which he did not live to execute. He died ſoon after; but the time of his death is not exactly known.

Adanſonia || Adder.

ADANSONIA, ETHIOPIAN SOUR-GOURD, MONKEYS BREAD, or AFRICAN CALABASH TREE. See BOTANY *Index*.

ADAR, the name of a Hebrew month, anſwering to the end of February and beginning of March, the 12th of their ſacred, and 6th of their civil year. On the 7th day of it, the Jews keep a faſt for the death of Moſes; on the 13th, they have the feaſt of Eſther: and on the 14th, they celebrate the feaſt of Purim, for their deliverance from Haman's conſpiracy. As the lunar year, which the Jews followed in their calculations, is ſhorter than the ſolar by about 11 days, which at the end of three years make a month, they then intercalate a 13th month, which they call *Veadar*, or the *ſecond Adar*.

ADARCE, a kind of concreted ſalts found on reeds and other vegetables, and applied by the ancients as a remedy in ſeveral cutaneous diſeaſes.

ADARCON, in Jewiſh antiquity, a gold coin mentioned in Scripture, worth about 15s. ſterling.

ADARME, in *Commerce*, a ſmall weight in Spain, which is alſo uſed at Buenos Ayres, and in all Spaniſh America. It is the 16th part of an ounce, which at Paris is called the *demi-gros*. But the Spaniſh ounce is ſeven per cent. lighter than that of Paris. Stephens renders it in Engliſh by a *drachm*.

ADATAIS, ADATSI, or ADATYS, in *Commerce*, a muſlin or cotton cloth, very fine and clear, of which the piece is ten French ells long, and three quarters broad. It comes from the Eaſt Indies; and the fineſt is made in Bengal.

ADCORDABILIS DENARII, in old law books, ſignify money paid by the vaſſal to his lord, upon the ſelling or exchanging of a fend.

ADCRESCENTES, among the Romans, denoted a kind of ſoldiery, entered in the army, but not yet put on duty; from theſe the ſtanding forces were recruited. See ACCENSI.

ADDA, in *Geography*, a river of Switzerland and Italy, which riſes in Mount Branlio, in the country of the Griſons, and, paſſing through the Valteline, traverſes the lake Como and the Milaneſe, and falls into the Po, near Cremona.

ADDEPHAGIA, in *Medicine*, a term uſed by ſome phyſicians, for gluttony, or a voracious appetite.

ADDER, in *Zoology*, a name for the VIPER. See COLUBER.

ADDER Bolts, or *Adder-flies*. See LIBELLULA.

Sea ADDER, the Engliſh name of a ſpecies of SYNGNATHUS.

Water ADDER, a name given to the COLUBER *Natrix*.

Adder || Addiſon.

Adder-ſtung, is uſed in reſpect of cattle, when ſtung by any kind of venomous reptiles, as adders, ſcorpions, &c. or bit by a hedgehog or ſhrew.—For the cure of ſuch bites, ſome uſe an ointment made of dragon's blood, with a little barley meal, and the whites of eggs.

Adder-Wort, or *Snakeweed*. See POLYGONUM.

ADDEXTRATORES, in the court of Rome, the pope's mitre-bearers, ſo called, according to Ducange, becauſe they walk at the pope's right hand when he rides to viſit the churches.

ADDICE, or ADZE, a kind of crooked axe uſed by ſhipwrights, carpenters, coopers, &c.

ADDICTI, in antiquity, a kind of ſlaves, among the Romans, adjudged to ſerve ſome creditor whom they could not otherwiſe ſatisfy, and whoſe ſlaves they became till they could pay or work out the debt.

ADDICTION, among the Romans, was the making over goods to another, either by ſale, or by legal ſentence; the goods ſo delivered were called *bona addicta*. Debtors were ſometimes delivered over in the ſame manner; and thence called *ſervi addicti*.

ADDICTIO IN DIEM, among the Romans, the adjudging a thing to a perſon for a certain price, unleſs by ſuch a day the owner, or ſome other, give more for it.

ADDISON, LANCELOT, ſon of Lancelot Addiſon a clergyman, was born in the pariſh of Croſby-Ravenſworth in Weſtmorland, in the year 1632. He was educated at Queen's College, Oxford; and at the reſtoration of King Charles II. accepted of the chaplainſhip of the garriſon of Dunkirk: but that fortreſs being delivered up to the French in 1662, he returned to England, and was ſoon after made chaplain to the garriſon of Tangier; where he continued ſeven years, and was greatly eſteemed. In 1670, he returned to England, and was made chaplain in ordinary to the king; but his chaplainſhip of Tangier being taken from him on account of his abſence, he found himſelf ſtraitened in his circumſtances, when he ſeaſonably obtained the rectory of Milſton in Wiltſhire, worth about 120l. per annum. He afterwards became a prebendary of Sarum; took his degree of doctor of divinity at Oxford; and in 1683 was made dean of Litchfield, and the next year archdeacon of Coventry. His life was exemplary; his converſation pleaſing, and greatly inſtructive; and his behaviour as a gentleman, a clergymen, and a neighbour, did honour to the place of his reſidence. He wrote, 1. A Short Narrative of the Revolutions of the Kingdoms of Fez and Morocco: 2. The preſent hiſtory of the Jews: 3. A Diſcourſe on Catechiſing: 4. A Modeſt Plea for the Clergy: 5. An Introduction to the Sacrament: 6. The firſt State of Mahometiſm: and ſeveral other pieces. This worthy divine died on the 20th of April 1703, and left three ſons: Joſeph, the ſubject of the next article; Gulſton, who died while governor of Fort St George; Lancelot, maſter of arts, and fellow of Magdalen college in Oxford: and one daughter, firſt married to Dr Sarte prebendary of Weſtminſter, and afterwards to Daniel Combes, Eſq.

ADDISON, *Joſeph*, the ſon of the preceding Dean Addiſon was born at Milſton, near Amesbury, in Wiltſhire, on the 11th of May 1672; and not being thought likely to live, was baptized the ſame day. He received the firſt rudiments of his education at the place of his nativity, under the reverend Mr Naiſh; but was ſoon removed to Saliſbury, under the care of Mr Taylor; and from thence to the Charter-houſe, where his acquaintance with Sir Richard Steele commenced. About the age of fifteen, he was entered at Queen's college, Oxford, where he applied very cloſely to the ſtudy of claſſical learning, in which he made a ſurpriſing proficiency. Addiſon.

In the year 1687, Dr Lancaſter, dean of Magdalen college, having, by chance, ſeen a Latin poem of Mr Addiſon's, was ſo pleaſed with it, that he immediately got him elected into that houſe, where he took up his degrees of bachelor and maſter of arts. His Latin pieces in the courſe of a few years, were exceedingly admired in both univerſities; nor were they leſs eſteemed abroad, particularly by the celebrated Boileau, who is reported to have ſaid, that he would not have written againſt Perrault, had he before ſeen ſuch excellent pieces by a modern hand. He publiſhed nothing in Engliſh before the twenty-ſecond year of his age; when there appeared a ſhort copy of verſes written by him, and addreſſed to Mr Dryden, which procured him great reputation from the beſt judges. This was ſoon followed by a tranſlation of the Fourth Georgic of Virgil, (omitting the ſtory of Ariſtæus), much commended by Mr Dryden. He wrote alſo the Eſſay on the Georgics, prefixed to Mr Dryden's tranſlation. There are ſeveral other pieces written by him about this time; amongſt the reſt, one dated the 3d of April 1694, addreſſed to H. S. that is, Dr Sacheverel, who became afterwards ſo famous, and with whom Mr Addiſon lived once in the greateſt friendſhip; but their intimacy was ſome time after broken off by their diſagreement in political principles. In the year 1695, he wrote a poem to King William on one of his campaigns, addreſſed to Sir John Somers lord keeper of the great ſeal. This gentleman received it with great pleaſure, took the author into the number of his friends, and beſtowed on him many marks of his favour.

Mr Addiſon had been cloſely preſſed, while at the univerſity, to enter into holy orders; and had once reſolved upon it: but his great modeſty, his natural diffidence, and an uncommonly delicate ſenſe of the importance of the ſacred function, made him afterwards alter his reſolution; and having expreſſed an inclination to travel, he was encouraged thereto by his patron above mentioned, who by his intereſt procured him from the crown a penſion of 300l. per annum to ſupport him in his travels. He accordingly made a tour to Italy in the year 1699; and, in 1701, he wrote a poetical epiſtle from Italy to the earl of Halifax, which has been univerſally eſteemed as a moſt excellent performance. It was tranſlated into Italian verſe by the abbot Antonio Maria Salvini, Greek profeſſor at Florence. In the year 1705, he publiſhed an account of his travels, dedicated to Lord Somers; which, though at firſt but indifferently received, yet in a little time met with its deſerved applauſe.

In the year 1702, he was about to return to England, when he received advice of his being appointed to attend Prince Eugene, who then commanded for the emperor in Italy; but the death of King William happening ſoon after, put an end to this affair as well as his penſion; and he remained for a conſiderable time unemployed.

Addiſon. employed. But an unexpected incident at once raiſed him, and gave him an opportunity of exerting his fine talents to advantage: for in the year 1704, the lord treaſurer Godolphin happened to complain to Lord Halifax, that the duke of Marlborough's victory at Blenheim had not been celebrated in verſe in the manner it deſerved; and intimated, that he would take in kindly, if his lordſhip, who was the known patron of the poets, would name a gentleman capable of doing juſtice to ſo elevated a ſubject. Lord Haliſax replied, ſomewhat haſtily, that he did know ſuch a perſon, but would not mention him; adding, that long had he ſeen, with indignation, men of no merit maintained in luxury at the public expence, whilſt thoſe of real worth and modeſty were ſuffered to languiſh in obſcurity. The treaſurer anſwered very coolly, that he was ſorry there ſhould be occaſion for ſuch an obſervation, but that he would do his endeavour to wipe off ſuch reproaches for the future; and he engaged his honour, that whoever his lordſhip named, as a perſon capable of celebrating this victory, ſhould meet with a ſuitable recompenſe. Lord Halifax thereupon named Mr Addiſon; inſiſting, however, that the treaſurer himſelf ſhould ſend to him: which he promiſed. Accordingly he prevailed on Mr Boyle (afterwards Lord Carlton) then chancellor of the exchequer, to make the propoſal to Mr Addiſon; which he did in ſo polite a manner, that our author readily undertook the taſk. The lord-treaſurer had a ſight of the piece, when it was carried no farther than the celebrated ſimile of the angel; and was ſo pleaſed with it, that he immediately appointed Mr Addiſon a commiſſioner of appeals, vacant by the promotion of Mr Locke, choſen one of the lords commiſſioners for trade. The Campaign is addreſſed to the duke of Marlborough; it gives a ſhort view of the military tranſactions in 1704, and contains a noble deſcription of the two great actions at Schellemberg and Blenheim. In 1705, he attended Lord Halifax to Hanover; and the enſuing year was appointed under ſecretary to Sir Charles Hedges ſecretary of ſtate; in which office he acquitted himſelf ſo well, that the earl of Sunderland, who ſucceeded Sir Charles in December, continued Mr Addiſon in his employment.

A taſte for operas beginning at this time to prevail in England, and many perſons having ſolicited Mr Addiſon to write one, he complied with their requeſt, and compoſed his Roſamond. This, however, whether from the defect of the muſic, or from the prejudices in favour of the Italian taſte, did not ſucceed upon the ſtage; but the poetry of it has been, and always will be juſtly admired. About this time, Sir Richard Steele compoſed his comedy of the Tender Huſband, to which Mr Addiſon wrote a prologue. Sir Richard ſurpriſed him with a dedication of this play, and acquainted the public, that he was indebted to him for ſome of the moſt excellent ſtrokes in the performance. The marquis of Wharton, being appointed lord lieutenant of Ireland in 1709, took Mr Addiſon with him as his ſecretary. Her majeſty alſo made him keeper of the records of Ireland, and, as a farther mark of her favour, conſiderably augmented the ſalary annexed to that place. Whilſt he was in this kingdom, the Tatler was firſt publiſhed; and he diſcovered his friend Sir Richard Steele to be the author, by an obſervation on Virgil, which he had communicated to him. He afterwards aſſiſted conſiderably in carrying on this paper, which the author acknowledges. The Tatler being laid down, the Spectator was ſet on foot, and Mr Addiſon furniſhed great part of the moſt admired papers. The Spectator made its firſt appearance in March 1711, and was brought to a concluſion in September 1712. Addiſon.

His celebrated Cato appeared in 1713. He formed the deſign of a tragedy upon this ſubject when he was very young, and wrote it when on his travels: he retouched it in England, without any intention of bringing it on the ſtage; but his friends being perſuaded it would ſerve the cauſe of liberty, he was prevailed on by their ſolicitations, and it was accordingly exhibited on the theatre, with a prologue by Mr Pope, and an epilogue by Dr Garth. It was received with the moſt uncommon applauſe, having run thirty-five nights without interruption. The Whigs applauded every line in which liberty was mentioned, as a ſatire on the Tories; and the Tories echoed every clap, to ſhow that the ſatire was unfelt. When it was printed, notice was given that the queen would be pleaſed if it was dedicated to her; "but as he had deſigned that compliment elſewhere, he found himſelf obliged," ſays Tickell, "by his duty on the one hand, and his honour on the other, to ſend it into the world without any dedication." It was no leſs eſteemed abroad, having been tranſlated into French, Italian, and German; and it was acted at Leghorn, and ſeveral other places, with vaſt applauſe. The Jeſuits of St Omers made a Latin verſion of it, and the ſtudents acted it with great magnificence.

About this time, another paper called the Guardian was publiſhed by Steele, to which Addiſon was a principal contributor. It was a continuation of the Spectator, and was diſtinguiſhed by the ſame elegance and the ſame variety; but, in conſequence of Steele's propenſity to politics, was abruptly diſcontinued in order to write the Engliſhman.

The papers of Addiſon are marked in the Spectator by one of the letters in the name of *Clio*, and in the Guardian by a *Hand*. Many of theſe papers were written with powers truly comic, with nice diſcrimination of characters, and accurate obſervation of natural or accidental deviations from propriety: but it was not ſuppoſed that he had tried a comedy on the ſtage, till Steele, after his death, declared him the author of "The Drummer." This, however, he did not know to be true by any cogent teſtimony: for when Addiſon put the play into his hands, he only told him it was the work of a gentleman in the company; when it was received, as is confeſſed, with cold diſapprobation, he was probably leſs willing to claim it. Tickell omitted it in his collection; but the teſtimony of Steele, and the total ſilence of any other claimant, has determined the public to aſſign it to Addiſon, and it is now printed with his other poetry. Steele carried "The Drummer" to the playhouſe, and afterwards to the preſs, and ſold the copy for 50 guineas. To Steele's opinion may be added the proof ſupplied by the play itſelf, of which the characters are ſuch as Addiſon would have delineated, and the tendency ſuch as Addiſon would have promoted.

It is ſaid that Mr Addiſon intended to have compoſed an Engliſh dictionary upon the plan of the Italian,

(Della

Addiſon. (Della Cruſca); but, upon the death of the queen, being appointed ſecretary to the lords juſtices, he had not leiſure to carry on ſuch a work. When the earl of Sunderland was appointed lord lieutenant of Ireland, Mr Addiſon was again made ſecretary for the affairs of that kingdom; and, upon the earl's being removed from the lieutenancy, he was choſen one of the lords of trade.

Not long afterwards an attempt was made to revive the Spectator, at a time indeed by no means favourable to literature, when the acceſſion of a new family to the throne filled the nation with anxiety, diſcord, and confuſion; and either the turbulence of the times or the fatiety of the readers put a ſtop to the publication, after an experiment of 80 numbers, which were afterwards collected into an eighth volume, perhaps more valuable than any of thoſe that went before it: Addiſon produced more than a fourth part.

In 1715, he began the Freeholder, a political paper, which was much admired, and proved of great uſe at that juncture. He publiſhed alſo, about this time, verſes to Sir Godfrey Kneller upon the king's picture, and ſome to the princeſs of Wales with the tragedy of Cato.

Before the arrival of King George he was made ſecretary to the regency, and was required by his office to ſend notice to Hanover that the queen was dead, and that the throne was vacant. To do this would not have been difficult to any man but Addiſon, who was ſo overwhelmed with the greatneſs of the event, and ſo diſtracted by choice of expreſſion, that the lords, who could not wait for the niceties of criticiſm, called Mr Southwell, a clerk in the houſe, and ordered him to deſpatch the meſſage. Southwell readily told what was neceſſary, in the common ſtyle of buſineſs, and valued himſelf upon having done what was too hard for Addiſon.

In 1716, he married the counteſs dowager of Warwick, whom he had ſolicited by a very long and anxious courtſhip. He is ſaid to have firſt known her by becoming tutor to her ſon. The marriage, if uncontradicted report can be credited, made no addition to his happineſs; it neither found them nor made them equal. She always remembered her own rank, and thought herſelf entitled to treat with very little ceremony the tutor of her ſon. It is certain that Addiſon has left behind him no encouragement for ambitious love. The year after, 1717, he roſe to his higheſt elevation, being made ſecretary of ſtate; but is repreſented as having proved unequal to the duties of his place. In the houſe of commons he could not ſpeak, and therefore was uſeleſs to the defence of the government. In the office he could not iſſue an order without loſing his time in queſt of fine expreſſions. At laſt, finding by experience his own inability for public buſineſs, he was forced to ſolicit his diſmiſſion, with a penſion of 1500l. a year. Such was the account of thoſe who were inclined to detract from his abilities; but by others his relinquiſhment was attributed to declining health, and the neceſſity of receſs and quiet.

In his retirement, he applied himſelf to a religious work *, which he had begun long before; part of which, ſcarce finiſhed, has been printed in his works. He intended alſo to have given an Engliſh paraphraſe of ſome of David's pſalms. But his ailments increaſed, and cut ſhort his deſigns. He had for ſome time been oppreſſed by an aſthmatic diſorder, which was now aggravated by a dropſy, and he prepared to die conformably to his precepts and profeſſions. He ſent, as Pope relates, a meſſage by the earl of Warwick to Mr Gay, deſiring to ſee him: Gay, who had not viſited him for ſome time before, obeyed the ſummons, and found himſelf received with great kindneſs. The purpoſe for which the interview had been ſolicited was then diſcovered: Addiſon told him, that he had injured him; but that, if he recovered, he would recompenſe him. What the injury was he did not explain, nor did Gay ever know: but ſuppoſed that ſome preferment deſigned for him had by Addiſon's intervention been withheld.—Another deathbed interview, of a more ſolemn nature, is recorded: Lord Warwick was a young man of very irregular life, and perhaps of looſe opinions. Addiſon, for whom he did not want reſpect, had very diligently endeavoured to reclaim him; but his arguments and expoſtulations had no effect: One experiment, however, remained to be tried. When he found his life near its end, he directed the young lord to be called; and when he deſired, with great tenderneſs, to hear his laſt injunctions, told him, "I have ſent for you that you may ſee how a Chriſtian can die." What effect this awful ſcene had on the earl's behaviour is not known: he died himſelf in a ſhort time. Having given directions to Mr Tickell for the publication of his works, and dedicated them on his deathbed to his friend Mr Craggs, he died June 17. 1719, at Hollandhouſe, leaving only one child, a daughter, by his marriage.

Addiſon's courſe of life before his marriage has been detailed by Pope. He had in the houſe with him Budgell, and perhaps Philips. His chief companions were Steele, Budgell, Philips, Carey, Davenant, and Colonel Brett. With one or other of theſe he always breakfaſted. He ſtudied all morning; then dined at a tavern, and went afterwards to Button's. From the coffeehouſe he went again to the tavern, where he often ſat late, and drank too much wine.

Dr Johnſon, in delineating the character of Addiſon, obſerves with Tickell, that he employed wit on the ſide of virtue and religion. He not only made the proper uſe of wit himſelf, but taught it to others; and from his time it has been generally ſubſervient to the cauſe of reaſon and truth. He has diſſipated the prejudice that had long connected gaiety with vice, and eaſineſs of manners with laxity of principles. He has reſtored virtue to its dignity, and taught innocence not to be aſhamed. This is an elevation of literary character, "above all Greek, above all Roman fame." No greater felicity can genius attain than that of having purified intellectual pleaſure, ſeparated mirth from indecency, and wit from licentiouſneſs; of having taught a ſucceſſion of writers to bring elegance and gaiety to the aid of goodneſs; and, to uſe expreſſions yet more awful, of having "turned many to righteouſneſs." As a deſcriber of life and manners, he muſt be allowed to ſtand perhaps the firſt of the firſt rank. His humour, which, as Steele obſerves, is peculiar to himſelf, is ſo happily diffuſed as to give the grace of novelty to domeſtic ſcenes and daily occurrences. He never "outſteps the modeſty of nature," nor raiſes merriment or wonder by the violation of truth.

* *Evidences of the Chriſtian Religion.*

Addiſon. truth. His figures neither divert by diſtortion, nor amaze by aggravation. He copies life with ſo much fidelity, that he can hardly be ſaid to invent; yet his exhibitions have an air ſo much original, that it is difficult to ſuppoſe them not merely the product of imagination. As a teacher of wiſdom he may be confidently followed. His religion has nothing in it enthuſiaſtic or ſuperſtitious; he appears neither weakly credulous nor wantonly ſceptical; his morality is neither dangerouſly lax nor impracticably rigid. All the enchantment of fancy and all the cogency of argument are employed to recommend to the reader his real intereſt, the care of pleaſing the Author of his being. Truth is ſhown ſometimes as the phantom of a viſion, ſometimes appears half-veiled in an allegory; ſometimes attracts regard in the robes of fancy, and ſometimes ſteps forth in the confidence of reaſon. She wears a thouſand dreſſes, and in all is pleaſing.

The doctor, however, has related the following anecdote, which every admirer of Addiſon, every man of feeling, muſt be reluctant to believe. "Steele (ſays the doctor), whoſe imprudence of generoſity, or vanity of profuſion, kept him always incurably neceſſitous, upon ſome preſſing exigence, in an evil hour; borrowed a hundred pounds of his friend, probably without much purpoſe of repayment; but Addiſon, who ſeems to have had other notions of a hundred pounds, grew impatient of delay, and reclaimed his loan by an execution. Steele felt, with great ſenſibility, the obduracy of his creditor; but with emotions of ſorrow rather than of anger." It is much to be wiſhed, ſays Dr Kippis, that Dr Johnſon had produced his authority for this narration. It is very poſſible, that it may be only a ſtory the doctor had ſomewhere heard in converſation, and which is entirely groundleſs: "and this I am the rather inclined to believe, as I have been aſſured, by one of the moſt reſpectable characters in the kingdom, that the fact hath no foundation in truth." Mr Potter, in a late publication, hath informed us, that he is told by the beſt authority that the ſtory is an abſolute falſehood.

Mr Tyers, in "A hiſtorical Eſſay on Mr Addiſon," printed, but not publiſhed, has mentioned ſome facts concerning him, with which we were not before acquainted. Theſe are, That he was laid out for dead as ſoon as he was born: that, when he addreſſed his verſes on the Engliſh poets to Henry Sacheverell, he courted that gentleman's ſiſter; that, whenever Jacob Tonſon came to him for the Spectator, Bayle's French Hiſtorical and Critical Dictionary lay always open before him: that, upon his return to England, after his travels, he diſcharged ſome old debts he had contracted at Oxford, with the generoſity of good intereſt: that he was put into plentiful circumſtances by the death of a brother in the Eaſt Indies: that, having received encouragement from a married lady, of whom he had been formerly enamoured, he had the integrity to reſiſt the temptation: that he refuſed a gratification of a three hundred pounds bank-note, and afterwards of a diamond-ring of the ſame value, from a Major Dunbar, whom he had endeavoured to ſerve in Ireland by his intereſt with Lord Sunderland: and that his daughter by Lady Warwick died a few years ago unmarried, reſiding at Bilton near Rugby, and poſſeſſing an income of more than twelve hundred a-year. Addiſon, Addition.

The following letter, which probably relates to the caſe of Major Dunbar, reflects great honour on Mr Addiſon's integrity. "*June* 26. 1715. SIR, I find there is a very ſtrong oppoſition formed againſt you; but I ſhall wait on my lord lieutenant this morning, and lay your caſe before him as advantageouſly as I can, if he is not engaged in other company. I am afraid what you ſay of his grace does not portend you any good. And now, Sir, believe me, when I aſſure you I never did, nor ever will, on any pretence whatſoever, take more than the ſtated and cuſtomary fees of my office. I might keep the contrary practice concealed from the world, were I capable of it, but I could not from myſelf; and I hope I ſhall always fear the reproaches of my own heart more than thoſe of all mankind. In the mean time, if I can ſerve a gentleman of merit, and ſuch a character as you bear in the world, the ſatisfaction I meet with on ſuch an occaſion is always a ſufficient, and the only reward to, Sir, your moſt obedient, humble ſervant, J. ADDISON."—The anecdote which follows was told by the late Dr Birch. Addiſon and Mr Temple Stanyan were very intimate. In the familiar converſations which paſſed between them, they were accuſtomed freely to diſpute each other's opinions. Upon ſome occaſion, Mr Addiſon lent Stanyan five hundred pounds. After this, Mr Stanyan behaved with a timid reſerve, deference, and reſpect; not converſing with the ſame freedom as formerly, or canvaſſing his friend's ſentiments. This gave great uneaſineſs to Mr Addiſon. One day they happened to fall upon a ſubject, on which Mr Stanyan had always been uſed ſtrenuouſly to oppoſe his opinion. But, even upon this occaſion, he gave way to what his friend advanced, without interpoſing his own view of the matter. This hurt Mr Addiſon ſo much, that he ſaid to Mr Stanyan, "Either contradict me, or pay me the money."

In Tickell's edition of Mr Addiſon's works there are ſeveral pieces hitherto unmentioned, viz. The Diſſertation on Medals; which, though not publiſhed till after his death, yet he had collected the materials, and began to put them in order, at Vienna, in 1702. A pamphlet, entitled, The preſent State of the War, and the Neceſſity of an Augmentation, conſidered. The late Trial and Conviction of Count Tariff. The Whig Examiner came out on the 14th of September 1716; there were five of theſe papers attributed to Mr Addiſon, and they are the ſevereſt pieces he ever wrote. He is ſaid alſo to have been the author of a performance entitled *Diſſertatio de inſignioribus Romanorum Poetis*, and of a Diſcourſe on Ancient and Modern Learning.

ADDITAMENT, ſomething added to another. Thus phyſicians call the ingredients added to a medicine already compounded, *additaments*.

ADDITION, is the joining together or uniting two or more things, or augmenting a thing by the acceſſion of others thereto.

ADDITION, in *Arithmetic*, *Algebra*, &c. See theſe articles.

ADDITION, in *Muſic*, a dot marked on the right ſide of a note, ſignifying that it is to be ſounded or lengthened

Addition || Adel.

ened half as much more as it would have been without such mark.

ADDITION, in *Law*, is that name or title which is given to a man over and above his proper name and surname, to show of what estate, degree, or mystery he is; and of what town, village, or country.

Additions of Estate, or *Quality*, are, Yeoman, Gentleman, Esquire, and such like.

Additions of Degree, are those we call names of dignity; as Knight, Lord, Earl, Marquis, and Duke.

Additions of Mystery, are such as Scrivener, Painter, Mason, and the like.

Additions of Place, are, of Thorp, of Dale, of Woodstock.—Where a man hath household in two places, he shall be said to dwell in both; so that his addition in either may suffice. Knave was anciently a regular addition. By Stat. 1. Hen. V. cap. 5. it was ordained, that in such suits or actions where process of outlawry lies, such addition should be made to the name of the defendant, to show his estate, mystery, and place where he dwells; and that the writs not having such additions should abate if the defendant take exception thereto; but not by the office of the court. The reason of this ordinance was, that one man might not be troubled by the outlawry of another; but by reason of the certain addition, every person might bear his own burden.

ADDITIONS, in distilling, a name given to such things as are added to the wash, or liquor, while in a state of fermentation, in order to improve the vinosity of the spirit, procure a larger quantity of it, or give it a particular flavour. All things, of whatever kind, thus added in the time of fermentation, are called by those of the business who speak most intelligently *additions*; but many confound them with things of a very different nature, under the name of *ferments*. See DISTILLING.

ADDITIONS, in *Heraldry*, some things added to a coat-of-arms, as marks of honour; and therefore directly opposite to abatements. Among additions we reckon BORDURE, QUARTER, CANTON, GYRON, PILE, &c. See these articles.

ADDRESS, in a general sense, is used for skill and good management, and of late has been adopted from the French. It is used also in commerce, as synonymous with direction to a person or place. The word is formed of the French verb, *addresser*, *To direct any thing to a person*.

ADDUCENT MUSCLES, or ADDUCTORS, in *Anatomy*, those muscles which pull one part of the body towards another. See ANATOMY, *Table of the Muscles*.

ADEB, in *Commerce*, the name of a large Egyptian weight, used principally for rice, and consisting of 210 okes, each of three rotolos, a weight of about two drams less than an English pound. But this is no certain weight; for at Rosetto the adeb is only 150 okes.

ADEL, a kingdom on the eastern coast of Africa, which reaches as far as the straits of Babelmandel, which unite the Red sea to the sea of Arabia. This country produces corn, and feeds a great number of cattle. The inhabitants carry on a trade in gold, silver, ivory, oil, frankincense, a sort of pepper, and other merchandises of Arabia and the Indies. The king was formerly a vassal to the grand negus of Abyssinia: but being Mahometans, and the Abyssinians a sort of Christians, they could not agree; and in 1535 came to an open rupture, when the Adelians threw off the yoke, seeking protection from the Grand Signior. The principal places are, Adela, seated in the centre of the country, and the town where the king resides: Zeila, near the Arabian sea, is a rich town, and has a good trade: Barbora, near the sea-coast, is an ancient trading town. It rains very seldom in this country.

Adelia || Aderno.

ADELIA. See BOTANY *Index*.

ADELME, or ALDHELM, son to Kenred, nephew to Ina king of the West Saxons, after having been educated abroad, was abbot of Malmsbury 30 years. He was the first Englishman who wrote in Latin, the first who brought poetry into England, and the first bishop of Sherburn. He lived in great esteem till his death, which happened in 709. He was canonized, and many miracles were ascribed to him. He is mentioned with great honour by Camden and Bayle, and his life was written by William of Malmsbury.

ADELPHIANI, in church history, a sect of ancient heretics, who fasted always on Sundays.

ADELSCALC, in ancient customs, denotes a servant of the king. The word is also written *adelscalche*, and *adelscalus*. It is compounded of the German *ancl*, or *edel*, "noble," and *scalc*, "servant." Among the Bavarians, *adelscalcs* appear to have been the same with royal *thanes* among the Saxons, and those called *ministri regis* in ancient charters.

ADEMPTION, in the *Civil Law*, implies the revocation of a grant, donation, or the like.

ADEN, formerly a rich and considerable town of Arabia the Happy. It is seated by the sea side, a little eastward of the straits of Babelmandel. N. Lat. 12. 40. E. Long. 46. 13.

ADENANTHERA, BASTARD FLOWER-FENCE. See BOTANY *Index*.

ADENBURG, or ALDENBURG, a town of Westphalia, and in the duchy of Burg, subject to the Elector Palatine. It is 12 miles north-east of Cologne, and 17 west of Bonn. E. Long. 7. 25. N. Lat. 51. 2.

ADENIA. See BOTANY *Index*.

ADENOGRAPHY, that part of anatomy which treats of the glandular parts. See ANATOMY.

ADENOIDES, glandulous, or of a glandular form; an epithet applied to the PROSTATÆ.

ADENOLOGY, the same with Adenography.

ADENOS, a kind of cotton; otherwise called *marine cotton*. It comes from Aleppo by the way of Marseilles, where it pays 20 per cent. duty.

ADEONA, in mythology, the name of a goddess invoked by the Romans when they set out upon a journey.

ADEPHAGIA, in mythology, the goddess of gluttony, to whom the Sicilians paid religious worship.

ADEPS, in *Anatomy*, the fat found in the abdomen. It also signifies animal fat of any kind.

ADEPTS, a term among alchemists for those who pretended to have found the panacea and philosophers stone. "Such is the nature, says Paracelsus, of this higher philosophy, that one mortal can no more communicate it to another, than the paper on which letters are traced can of itself declare their meaning. It originates not from man, but from heaven."

ADERBIJAN. See ADIRBEITSAN.

ADERNO, a small place in the Val di Demona in the

Ade || Adhoa.

the kingdom of Sicily. E. Long. 15. 25. N. Lat. 38. 5. Anciently ADRANUM, at the foot of Mount Gibel. The ruined walls of this ancient city ſtill exhibit an air of its former grandeur.

ADES, or HADES, denotes the inviſible ſtate. In the heathen mythology, it comprehends all thoſe regions that lie beyond the river Styx, viz. Erebus, Tartarus, and Elyſium. See HELL.

ADESSENARIANS, ADESSENARII, in church hiſtory, a ſect of Chriſtians who hold the real preſence of Chriſt's body in the euchariſt, though not by way of tranſubſtantiation. They differ conſiderably as to this preſence; ſome holding that the body of Chriſt is in the bread; others, that it is about the bread; and others that is under the bread.

ADFILIATION, a Gothic cuſtom, whereby the children of a former marriage are put upon the ſame footing with thoſe of the ſecond. This is alſo called *unio prolium*, and ſtill retained in ſome parts of Germany, though Heineccius obſerves that this is not adoption.

ADFINES, (Antonine), a town of Swiſſerland, ſuppoſed to be the modern *Pfin*, in the north of the diſtrict of Turgow, on the rivulet Thur, not far from the borders of Suabia, about half-way between Conſtance and Frauenfield. So called, becauſe when Cecinna, general of the emperor Vitellius, with the auxiliary Rhetians, defeated the Helvetii, the former extended their borders thus far, their territory ending here; and, in the time of the Romans, it was the laſt town in this quarter, and of ſome repute.

ADHA, a feſtival which the Mahometans celebrate on the 10th day of the month *Dhoulhegiat*, which is the 12th and laſt of their year. This month being particularly deſtined for the ceremonies which the pilgrims obſerve at Mecca, it takes its name from thence, for the word ſignifies *the month of Pilgrimage*. On that day they ſacrifice with great ſolemnity, at Mecca, and nowhere elſe, a ſheep, which is called by the ſame name as the feſtival itſelf. The Turks commonly call this feſtival the *Great Bairam*, to diſtinguiſh it from the leſſer, which ends their faſt, and which the Chriſtians of the Levant call the *Eaſter of the Turks*. The Mahometans celebrate this feſtival, out of the city of Mecca, in a neighbouring valley; and ſometimes they ſacrifice there a camel. See BAIRAM.

ADHATODA, in *Botany*. See JUSTICIA, BOTANY *Index*.

ACTION of ADHERENCE, in *Scots Law*; an action competent to a huſband or wife, to compel either party to adhere, in caſe of deſertion.

ADHESION, in a general ſenſe, implies the ſticking or adhering of bodies together.

ADHESION, in *Philoſophy*. See COHESION.

ADHESION, in *Anatomy*, a term for one part ſticking to another, which in a natural ſtate are ſeparate. For the moſt part, if any of thoſe parts in the thorax or belly lie in contact, and inflame, they grow together. The lungs very frequently adhere to the pleura.

ADHIL, in *Aſtronomy*, a ſtar of the ſixth magnitude, upon the garment of Andromeda, under the laſt ſtar in her foot.

ADHOA, in ancient cuſtoms, denotes what we otherwiſe call *relief*. In which ſenſe we ſometimes alſo find the word written *adoha*, *adhoamentum*, and *adhogamentum*. Adhoa || Adiantum

ADIANTUM, MAIDEN-HAIR; in *Botany*. See BOTANY *Index*. Adiantum || Adit.

ADIAPHORISTS, in church hiſtory, a name importing lukewarmneſs, given, in the 16th century, to the moderate Lutherans, who embraced the opinions of Melanchthon, whoſe diſpoſition was much more pacific than that of Luther.

ADJAZZO, ADRAZZO, or AJACCIO, in *Geography*, a handſome town and caſtle of Corſica in the Mediterranean, with a biſhop's ſee, and a good harbour. It is populous, and fertile in wine. It is 27 miles ſouth-weſt of Corte. E. Long. 41. 54. N. Lat. 38. 5.

ADJECTIVE, in *Grammar*, a kind of noun joined with a ſubſtantive, either expreſſed or implied, to denote its qualities or accidents. See GRAMMAR.

ADIGE, a river in Italy, which taking its riſe ſouth of the lake Glace among the Alps, runs ſouth by Trent, then eaſt by Verona in the territory of Venice, and falls into the gulf of Venice, north of the mouth of the Po.

ADJOURNMENT, the putting off a court, or other meeting, till another day. There is a difference between the adjournment and the prorogation of the parliament; the former not only being for a ſhorter time, but alſo done by the houſe itſelf; whereas the latter is an act of royal authority.

ADIPOCIRE, derived from *adeps*, fat, and *cera*, wax, denotes a ſubſtance which has been lately examined by chemiſts. It is formed by a certain change which the ſoft parts of animal bodies undergo, when kept for ſome time in running water, or when a great number of dead bodies are heaped together in the ſame place. Great quantities of this ſubſtance were found on removing the animal matters from the burial ground of the *Innocens* at Paris in the year 1787. In this burial-ground, 1200 or 1500 bodies were thrown together into the ſame pit, and being decompoſed, were converted into this ſubſtance. It has ſome of the properties of wax or ſpermaceti. See CHEMISTRY *Index*.

ADIPOSE, a term uſed by anatomiſts for any cell, membrane, &c. that is remarkable for its fatneſs.

ADIRBEITSAN, in *Geography*, a province of Perſia, in Aſia, and part of the ancient Media. It is bounded on the north by the province of Schirvan, on the ſouth by Irac-Agemi and Curdiſtan, on the eaſt by Ghilan and the Caſpian ſea, and on the weſt by Turcomania. E. Long. 42°. to 48°. N. Lat. 36°. to 39°.

ADIT, in a general ſenſe, the paſſage to, or entrance of, any thing.

Adit of a Mine, the hole, or aperture, whereby it is entered and dug, and by which the water and ores are carried away. The term amounts to the ſame with *cuniculus* or *drift*, and is diſtinguiſhed from *air-ſhaft*. The adit is uſually made on the ſide of a hill, towards the bottom thereof, about four, five, or ſix feet high, and eight wide, in form of an arch; ſometimes cut in the rock, and ſometimes ſupported with timber, ſo conducted as that the ſole or bottom of the adit may anſwer to the bottom of the ſhaft, only ſomewhat lower, that the water may have a ſufficient current to paſs away without the uſe of the pump. Damps and the impurity of the air are the great impediments againſt driving

Adit || Adjuncts.

driving adits above 20 or 30 fathoms, by reaſon of the neceſſity, in this caſe, of letting down air-ſhafts from the day to meet the adit, which are often very expenſive, both on account of the great depth of mines, and the hardneſs of the mineral ſtrata to be cut through. The beſt remedy againſt this is that practiſed in the coal mines near Liege, where they work their adits without air ſhafts; the manner of which is deſcribed by Sir James Moray. (*Phil. Tranſ.* vol. i. p. 79.)

Adit of a Mine is ſometimes uſed for the air-ſhaft itſelf, being a hole driven perpendicularly from the ſurface of the earth into ſome part of a mine, to give entrance to the air. To draw off the ſtanding water in winter, in deep mines, they drive up an adit, or air-ſhaft, upon which the air diſengages itſelf from the water, when it begins to run with ſuch violence as produces a noiſe equal to the burſting of a cannon, daſhes every thing in the way againſt the ſides of the mine, and looſens the very rocks at a diſtance. (*Ibid*).

ADJUDICATION, implies the act of adjudging, or determining, a cauſe in favour of ſome perſon.

Adjudication, in *Scots Law*, the name of that action by which a creditor attaches the heritable eſtate of his debtor, or his debtor's heir, in order to appropriate it to himſelf, either in payment or ſecurity of his debt; or that action by which the holder of an heritable right, labouring under any defect in point of form, may ſupply that defect.

ADJUNCT, among philoſophers, ſignifies ſomething added to another, without being any neceſſary part of it. Thus water abſorbed by cloth or a ſponge, is an adjunct, but no neceſſary part of either of theſe ſubſtances.

Adjunct, in *Metaphyſics*, ſome quality belonging to either the body or mind, whether natural or acquired. Thus thinking is an adjunct of the mind, and growth an adjunct of the body.

Adjunct, in *Muſic*, a word which is employed to denominate the connexion or relation between the principal mode and the modes of its two-fifths, which, from the intervals that conſtitute the relation between them and it, are called its *adjuncts*.

Adjunct is alſo uſed to ſignify a colleague, or ſome perſon aſſociated with another as an aſſiſtant.

Adjunct Gods, or *Adjuncts of the Gods*, among the Romans, were a kind of inferior deities, added as aſſiſtants to the principal ones, to eaſe them in their functions. Thus, to Mars was adjoined Bellona and Nemeſis; to Neptune, Salacia; to Vulcan, the Cabiri; to the Good Genius, the Lares; to the Evil, the Lemures, &c.

Adjuncts, in *Rhetoric* and *Grammar*, ſignify certain words or things added to others, to amplify or augment the force of the diſcourſe.

Adjuncts, or Adjoints, in the Royal Academy of Sciences at Paris, denoted a claſs of members, attached to the purſuit of particular ſciences. The claſs of *Adjuncts* was created in 1716, in lieu of the *Eleves*: they were twelve in number; two for geometry, two for mechanics, two for aſtronomy, two for anatomy, two for chemiſtry, and two for botany. The *Eleves* not taken into this eſtabliſhment were admitted on the footing of ſupernumerary *Adjuncts*.

ADJUTANT, in the military art, is an officer whoſe buſineſs it is to aſſiſt the major. Each battalion of foot and regiment of horſe has an adjutant, who receives the orders every night from the brigade-major; which, after carrying them to the colonel, he delivers out to the ſerjeants. When detachments are to be made, he gives the number to be furniſhed by each company or troop, and aſſigns the hour and place of rendezvous. He alſo places the guards; receives and diſtributes the ammunition to the companies, &c.; and, by the major's orders, regulates the prices of bread, beer, and other proviſions. The word is ſometimes uſed by the French for an *aid du-camp*.

Adjutant || Admeaſurement.

Adjutants-general, among the Jeſuits, a ſelect number of fathers, who reſided with the general of the order, each of whom had a province or country aſſigned him, as England, Holland, &c. and their buſineſs was to inform the father general of ſtate occurrences in ſuch countries. To this end they had their correſpondents delegated, emiſſaries, viſitors, regents, provincials, &c.

ADJUTORIUM, a term uſed by phyſicians for any medicine in a preſcription but the capital one.

ADLE EGGS, ſuch as have not received an impregnation from the ſemen of the cock.

ADLEGATION, in the public law of the German empire, a right claimed by the ſtates of the empire of adjoining plenipotentiaries, in public treaties and negotiations, to thoſe of the emperor, for the tranſacting of matters which relate to the empire in general. In which ſenſe *adlegation* differs from *legation*, which is the right of ſending ambaſſadors on a perſon's own account.—Several princes and ſtates of the empire enjoy the right of *legation*, who have not that of *adlegation*, and *vice verſa*. The biſhops, for inſtance, have the right of *adlegation* in the treaties which concern the common intereſt, but no right of *legation* for their own private affairs. The like had the duke of Mantua.—The emperor allows the princes of Germany the privilege of *legation*, but diſputes that of *adlegation*. They challenge it as belonging to them *jure regni*, which they enjoy in common with the emperor himſelf.

ADLOCUTION, Adlocutio, in *Antiquity*, is chiefly underſtood of ſpeeches made by Roman generals to their armies, to encourage them before a battle. We frequently find theſe adlocutions expreſſed on medals by the abbreviature Adlocut. Coh.—The general is ſometimes repreſented as ſeated on a tribunal, often on a bank or mound of turf, with the cohorts ranged orderly round him, in *manipuli* and *turmæ*. The uſual formula in adlocutions was, *Fortis eſſet ac fidus*.

ADMANUENSES, in ancient law books, denote perſons who ſwore by laying their hands on the book.—In which ſenſe, *admanuenſes* amount to the ſame with laymen; and ſtand oppoſed to clerks, who were forbid to ſwear on the book, their word being reputed as their oath; whence they were alſo denominated *fide digni*.

ADMEASUREMENT, Admensuratio, in *Law*, a writ which lies for the bringing thoſe to reaſon, or mediocrity, who uſurp more of any thing than their ſhare. This writ lies in two caſes; termed,

Admeasurement of Dower, *Admenſuratio dotis*, where the widow of the deceaſed holds more from the heir, or his guardian, on account of her dower, than of right belongs to her. And,

Admeasurement || Administrator.

ADMEASUREMENT *of Pasture*, *Admensuratio pasturæ*; this lies between those who have COMMON of pastures appendant to their freehold, or common by vicinage, in case any of them surcharge the common with more cattle than they ought.

ADMINICLE, a term used chiefly in old law-books, to imply an aid, help, assistance, or support. The word is Latin, *adminiculum*; and derived from *adminiculor*, to prop or support.

ADMINICLE, in *Scots Law*, signifies any writing or deed referred to by a party, in an action of law, for proving his allegations.

ADMINICULATOR, an ancient officer of the church, whose business it was to attend to and defend the cause of the widows, orphans, and others destitute of help.

ADMINISTRATION, in general, the government, direction, or management of affairs, and particularly the exercise of distributive justice. Among ecclesiastics, it is often used to express the giving or dispensing the sacraments, &c.

ADMINISTRATION, is also the name given by the Spaniards in Peru to the staple magazine, or warehouse, established at Callao, a small town on the South sea, which is the port of Lima, the capital of that part of South America, and particularly of Peru. The foreign ships which have leave to trade along that coast are obliged to unload here, paying 13 per cent. of the price they sell for, if the cargo be entire, and even 16 per cent. if otherwise; besides which, they pay 3 per 1000, duty, for consulship and some other small royal rights and claims.

ADMINISTRATOR, in *Law*, he to whom the ordinary commits the administration of the goods of a person deceased, in default of an executor.—An action lies for or against an administrator, as for or against an executor; and he shall be accountable to the value of the goods of the deceased, and no farther:—unless there be waste, or other abuse chargeable on him. If the administrator die, his executors are not administrators; but the court is to grant a new administration.—If a stranger, who is neither administrator nor executor, take the goods of the deceased and administer, he shall be charged and sued as an executor, not as an administrator. The origin of administrators is derived from the civil law. Their establishment in England is owing to a statute made in the 31st year of Edward III. Till then, no office of this kind was known beside that of executor: in case of a want of which, the ordinary had the disposal of goods of persons intestate, &c.

ADMINISTRATOR, in *Scots Law*, a person legally empowered to act for another whom the law presumes incapable of acting for himself. Thus tutors or curators are sometimes styled *administrators in law* to pupils, minors, or fatuous persons. But more generally the term is used to imply that power which is conferred by the law upon a father over the persons and property of his children during their minority. See LAW.

ADMINISTRATOR is sometimes used for the president of a province: for a person appointed to receive, manage, and distribute, the revenues of an hospital or religious house; for a prince who enjoys the revenues of a secularized bishop; and for the regent of a kingdom during the minority of a prince, or a vacancy of the throne.

Admirabilis, Admiral.

ADMIRABILIS SAL, the same with GLAUBER'S salt.

ADMIRAL, a great officer or magistrate, who has the government of a navy, and the hearing of all maritime causes.

Authors are divided with regard to the origin and denomination of this important officer, whom we find established in most kingdoms that border on the sea. But the most probable opinion is that of Sir Henry Spelman, who thinks, that both the name and dignity were derived from the Saracens, and, by reason of the holy wars, brought amongst us; for *admiral*, in the Arabian language, signifies a prince, or chief ruler, and was the ordinary title of the governors of cities, provinces, &c. and therefore they called the commander of the navy by that name, as a name of dignity and honour. And indeed there are no instances of admirals in this part of Europe before the year 1284, when Philip of France, who had attended St Lewis in the wars against the Saracens, created an admiral. Du Cange assures us, that the Sicilians were the first, and the Genoese the next, who gave the denomination of *admiral* to the commanders of their naval armaments; and that they took it from the Saracen or Arabic *emir*, a general name for every commanding officer. As for the exact time when the word was introduced among us, it is uncertain; some think it was in the reign of Edward I. Sir Henry Spelman is of opinion that it was first used in the reign of Henry III. because neither the laws of Oleron, made in 1266, nor Bracton, who wrote about that time, make any mention of it; and that the term *admiral* was not used in a charter in the eighth of Henry III. where he granted this office to Richard de Lacy, by these words *Maritimam Angliæ*; but in the 56th year of the same reign, not only the historians, but the charters themselves, very frequently used the word *admiral*.

Anciently there were generally three or four admirals appointed in the English seas, all of them holding the office *durante bene placeto*; and each of them having particular limits under their charge and government; as admirals of the fleet of ships, from the mouth of the Thames, northward, southward, or westward. Besides these, there were admirals of the Cinque Ports, as in the reign of Edward III. when one William Latimer was styled *admiralis quinque portuum*: and we sometimes find that one person has been admiral of the fleets to the southward, northward, and westward: but the title of *admiralis Angliæ* was not frequent till the reign of Henry IV. when the king's brother had that title given him, which in all commissions afterwards was granted to the succeeding admirals. It may be observed, that there was a title above that of admiral of England, which was, *locum tenens regis super mare*, the king's lieutenant general of the sea; this title we find mentioned in the reign of Richard II. Before the use of the word *admiral* was known, the title of *custos maris* was made use of.

Lord High ADMIRAL *of England*, in some ancient records called *capitanus maritimarum*, an officer of great antiquity and trust, as appears by the laws of Oleron, so denominated from the place at which they were made by Richard I. The first title of *admiral of England*, expressly

Admiral. preſsly conferred upon a ſubject, was given by patent of Richard II. to Richard Fitz-Allen, jun. earl of Arundel and Surrey; for thoſe who before enjoyed this office were ſimply termed *admirals*, though their juriſdiction ſeems as extenſive, eſpecially in the reign of Edward III. when the court of admiralty was firſt erected.

This great officer has the management of all maritime affairs, and the government of the royal navy, with power of deciſion in all maritime caſes both civil and criminal: he judges of all things done upon or beyond the ſea, in any part of the world; upon the ſea coaſts, in all ports and heavens, and upon all rivers below the firſt bridge from the ſea. By him, vice-admirals, rear admirals, and all ſea captains, are commiſſioned: all deputies for particular coaſts, and coroners to view dead bodies found on the ſea coaſts, or at ſea: he alſo appoints the judges for his court of admiralty, and may impriſon, releaſe, &c. All ports and havens are *infra corpus comitatus*, and the admiral hath no juriſdiction of any thing done in them. Between high and low water mark, the common law and the high admiral have juriſdiction by turns, one upon the water, and the other upon the land.

The lord admiral has power, not only over the ſeamen ſerving in his ſhips of war, but over all other ſeamen, to arreſt them for the ſervice of the ſtate; and, if any of them run away, without leave of the admiral, he hath power to make a record thereof, and certify the ſame to the ſheriffs, mayors, bailiffs, &c. who ſhall cauſe them to be apprehended and impriſoned.

To the lord high admiral belong all penalties and amercements of all tranſgreſſions at ſea, on the ſea ſhore, in ports and havens, and all rivers below the firſt bridge from the ſea; the goods of pirates and felons condemned or enſlaved, ſea wrecks, goods floating on the ſea, or caſt on the ſhore (not granted to lords of manors adjoining to the ſea), and a ſhare of lawful prizes; alſo all great fiſhes, commonly called *royal fiſhes*, except whales and ſturgeons: to which add, a ſalary of 7000l. a-year.

In ſhort, this is ſo great an office, in point of truſt, honour, and profit, that it has been uſually given to princes of the blood, or the moſt eminent perſons among the nobility. We have had no high admiral for ſome years; the office being put in commiſſion, or under the adminiſtration of the lords commiſſioners of the admiralty, who by ſtatute have the ſame power and authority as the lord high admiral.

Lord High ADMIRAL *of Scotland*, one of the great officers of the crown, and ſupreme judge in all maritime caſes within that part of Britain. See LAW.

ADMIRAL alſo implies the commander in chief of any ſingle fleet or ſquadron; or, in general, any flag-officer whatever. The commander of a fleet carries his flag at the main-top-maſt head. Thus we ſay, *admiral* of the *red*, of the *white*, of the *blue*.

Vice ADMIRAL, is the commander of the ſecond ſquadron, and carries his flag at the fore-top-maſt head.

Rear ADMIRAL, is the commander of the third ſquadron, and carries his flag at the mizen-top-maſt head.

Vice ADMIRAL, is alſo an officer appointed by the lords commiſſioners of the admiralty. There are ſeveral of theſe officers eſtabliſhed in different parts of Great Britain, with judges and marſhals under them, for executing juriſdiction within their reſpective limits. Their decrees, however, are not final, an appeal lying to the court of admiralty in London. Admiral, Admiralty.

ADMIRAL is alſo an appellation given to the moſt conſiderable ſhip of a fleet of merchantmen, or of the veſſels employed in the cod fiſhery of Newfoundland. This laſt has the privilege of chooſing what place he pleaſes on the ſhore to dry his fiſh; gives proper orders, and appoints the fiſhing places to thoſe who come after him; and as long as the fiſhing ſeaſon continues, he carries a flag on his main-maſt.

ADMIRAL, in *Conchology*, the Engliſh name of a ſpecies of the voluta, a ſhell fiſh belonging to the order of vermes teſtacea. See CONCHOLOGY *Index*.

ADMIRALTY properly ſignifies the office of lord high admiral, whether diſcharged by one ſingle perſon, or by joint commiſſioners called *lords of the admiralty*.

Court of ADMIRALTY, is a ſovereign court, held by the lord high admiral, or lords of the admiralty, where cognizance is taken in all maritime affairs, whether civil or criminal.—All crimes committed on the high ſeas, or on great rivers below the firſt bridge next the ſea, are cognizable in this court only, and before which they muſt be tried by judge and jury. But in civil caſes the mode is different, the deciſions being all made according to the civil law. From the ſentences of the admiralty judge an appeal always lay, in ordinary courſe, to the king in chancery, as may be collected from ſtatute 25 Hen. VIII. c. 19. which directs the appeal from the archbiſhop's courts to be determined by perſons named in the king's commiſſion, "like as in caſe of appeal from the admiral court." But this is alſo expreſsly declared by ſtatute 8 Eliz. c. 5. which enacts, that upon an appeal made to the chancery, the ſentence definitive of the delegates appointed by commiſſion ſhall be final.

Appeals from the vice-admiralty courts in America, and our other plantations and ſettlements, may be brought before the courts of admiralty in England, as being a branch of the admiral's juriſdiction, though they may alſo be brought before the king in council. But in caſe of prize veſſels, taken in time of war, in any part of the world, and condemned in any courts of admiralty or vice-admiralty as lawful prize, the appeal lies to certain *commiſſioners of appeals* conſiſting chiefly of the privy council, and not to judges delegates. And this by virtue of divers treaties with foreign nations, by which particular courts are eſtabliſhed in all the maritime countries of Europe for the deciſion of this queſtion, Whether lawful prize or not? for this being a queſtion between ſubjects of different ſtates, it belongs entirely to the law of nations, and not to the municipal laws of either country, to determine it.

Court of ADMIRALTY, in Scotland. See LAW.

Admiralty Bay, in *Geography*, a ſpacious bay with good anchorage on the weſt coaſt of Cook's ſtraits, in the ſouthern iſland of New Zealand. S. Lat. 40. 37. E. Long. 174. 54.

There is a bay of the ſame name on the north-weſt coaſt of America, in N. Lat. 59. 31. W. Long. 140. 18.

Admiralty Inlet, the entrance to the ſuppoſed ſtraits of Juan de Fuca, on the weſt coaſt of New Georgia,

Admiralty Islands ‖ Adolescence.

in N. Lat. 48. 30. W. Long. 124. 15. It was visited by Captain Vancouver in 1792, who found the soil on the shores rich and fertile, well watered, and clothed with luxuriant vegetation.

Admiralty Islands, lie in about 2° 18′ S. Lat. and 146° 44′ E. Long. There are between 20 and 30 islands said to be scattered about here, one of which alone would make a large kingdom. Captain Carteret, who first discovered them, was prevented from touching at them, although their appearance was very inviting, on account of the condition of his ship, and of his being entirely unprovided with the articles of barter which suit an Indian trade. He describes them as clothed with a beautiful verdure of woods, lofty and luxuriant, interspersed with spots that have been cleared for plantations, groves of cocoa nut trees, and houses of the natives, who seem to be very numerous. The largest of these islands is 18 leagues long in the direction of east and west. The discoverer thinks it highly probable that these islands produce several valuable articles of trade, particularly spices, as they lie in the same climate and latitude as the Moluccas.

ADMIRATION, in ethics, is that passion of the mind which is excited by the contemplation of superior and rare excellence, as superior or uncommon wisdom, ingenuity, or benevolence.

ADMONITION, in ecclesiastical affairs, a part of discipline much used in the ancient church. It was the first act, or step, towards the punishment or expulsion of delinquents. In case of private offences, it was performed, according to the evangelical rule, privately: in case of public offence, openly, before the church. If either of those sufficed for the recovery of the fallen person, all further proceedings in the way of censure ceased: if they did not, recourse was had to excommunication.

Admonitio Fustium, a military punishment among the Romans, not unlike our whipping, but it was performed with vine branches.

ADMORTIZATION, in the feudal customs, the reduction of the property of lands or tenements to mortmain. See Mortmain.

ADNATA, in *Anatomy*, one of the coats of the eye, which is also called *conjunctiva* and *albuginea*.

Adnata is also used for any hair, wool, or the like, which grows upon animals or vegetables.

Adnata, or *Adnascentia*, among gardeners, denote those offsets, which by a new germination under the earth, proceed from the lily, narcissus, hyacinth, and other flowers, and afterwards become true roots.

ADNOUN, is used by some grammarians to express what we more usually call an adjective.—The word is formed by way of analogy to adverb; in regard adjectives have much the same office and relation to nouns that adverbs have to verbs. Bishop Wilkins uses the word *adname* in another sense, viz. for what we otherwise call a preposition.

ADOLESCENCE, the state of growing youth; or that period of a person's age, commencing from his infancy, and terminating at his full stature or manhood. The word is formed of the Latin *adolescere*; "to grow."—The state of adolescence lasts so long as the fibres continue to grow, either in magnitude or firmness. The fibres being arrived at the degree of firmness and tension sufficient to sustain the parts, no longer yield or give way to the efforts of the nutritious matter to extend them; so that their farther accretion is stopped, from the very law of their nutrition. Adolescence is commonly computed to be between 15 and 25, or even 30 years of age; though in different constitutions its terms are very different.—The Romans usually reckoned it from 12 to 25 in boys; and to 21 in girls, &c. And yet, among their writers, *juvenis* and *adolescens* are frequently used indifferently for any person under 45 years.

Adollam ‖ Adonia.

ADOLLAM, or Odollam, in *Ancient Geography*, a town in the tribe of Judah, to the east of Eleutheropolis. David is said to have hid himself in a cave near this town, (Bible).

ADOM, in *Geography*, a state or principality of the Gold coast, in Africa. It is a populous, rich, and fertile country, abounding with corn and fruits.

ADON, a populous village in the province of Stuhl-Weissemberg, belonging to Hungary. It lies in a fruitful country, towards the river Danube. E. Long. 19. 20. N. Lat. 47. 30.

ADONAI, one of the names of the Supreme Being in the Scriptures. The proper meaning of the word is *my lords*, in the plural number; as *Adoni* is *my lord*, in the singular. The Jews, who either out of respect, or superstition, do not pronounce the name of *Jehovah*, read *Adonai*, in the room of it, as often as they meet with Jehovah in the Hebrew text. But the ancient Jews were not so scrupulous; nor is there any law which forbids them to pronounce the name of God, (Calmet.)

ADONIA, in antiquity, solemn feasts in honour of Venus, and in memory of her beloved Adonis. The Adonia were observed with great solemnity by most nations; Greeks, Phœnicians, Lycians, Syrians, Egyptians, &c. From Syria, they are supposed to have passed into India. The prophet Ezekiel * is understood to speak of them. They were still observed at Alexandria in the time of St Cyril; and at Antioch in that of Julian the Apostate, who happened to enter that city during the solemnity, which was taken for an ill omen. The Adonia lasted two days: on the first of which certain images of Venus and Adonis were carried, with all the pomp and ceremonies practised at funerals: the women wept, tore their hair, beat their breasts, &c. imitating the cries and lamentations of Venus for the death of her paramour. This lamentation they called Ἀδωνιασμος. The Syrians were not contented with weeping, but subjected themselves to severe discipline, shaved their heads, &c. Among the Egyptians, the queen herself used to carry the image of Adonis in procession. St Cyril mentions an extraordinary ceremony practised by the Alexandrians: A letter was written to the women of Byblus, to inform them that Adonis was found again: this letter was thrown into the sea, which (it was pretended) did not fail punctually to convey it to Byblus in seven days; upon the receipt of which, the Byblian women ceased their mourning, sung his praises, and made rejoicings as if he were raised to life again: Or rather, according to Meursius, the two offices of mourning and rejoicing made two distinct feasts, which were held at different times of the year, the one six months after the other, Adonis being supposed to pass half the year with Proserpine, and half with Venus.—The Egyptian Adonia are said to have been held in memory

* Ch. viii. xiv.

Adonides & Adoptiani.

memory of the death of Oſiris; by others, of his ſickneſs and recovery. Biſhop Patrick dates their origin from the ſlaughter of the firſt born under Moſes.

ADONIDES, in *Botany*, a name given to botaniſts who deſcribed or made catalogues of plants cultivated in any particular place.

ADONIS, ſon of Cynaras king of Cyprus, the darling of the goddeſs Venus: being killed by a wild boar, in the Idalian woods, he was turned into a flower of a blood colour, ſuppoſed to be the anemone. Venus was inconſolable; and no grief was ever more celebrated than this, moſt nations having perpetuated the memory of it by a train of anniverſary ceremonies *. Among Shakeſpeare's poems, is a long one on the ſubject of Venus's affection for Adonis.

* See *Adonia*.

The text of the vulgate in Ezekiel viii. 14. ſays, that this prophet ſaw women ſitting in the temple, and weeping for Adonis: but, according to the reading of the Hebrew text, they are ſaid to weep for Thammuz, or the *hidden one*. Among the Egyptians, Adonis was adored under the name of Oſiris the huſband of Iſis. But he was ſometimes called by the name of Ammuz, or Thammuz, *the concealed*, to denote probably his death or burial. The Hebrews, in deriſion, call him ſometimes *the dead*, Pſal. cvi. 28. and Lev. xix. 28. becauſe they wept for him, and repreſented him as one dead in his coffin; and at other times, they call him the *image of jealouſy*, Ezek. viii. 3. 5. becauſe he was the object of the god Mars's jealouſy. The Syrians, Phœnicians, and Cyprians, called him Adonis; and F. Calmet is of opinion, that the Ammonites and Moabites gave him the name of Baal-peor. See BAAL-PEOR.

ADONIS, *Adonius*, in *Ancient Geography*, a river of Phœnicia, riſing in Mount Lebanon, and falling into the ſea, after a north-weſt courſe, at Byblus; famous in fable, as a beautiful ſhepherd youth (Virgil); ſon of Cynaras, king of the Cyprians, loved by Venus, ſlain by a boar, and turned into a river. Theocritus laments him dead in an idyllion, or rather ode, as did the women yearly, when, in flood time, the river rolled down a red earth, which tinged its waters, deemed to be his wound bleeding afreſh. In the Phœnician language Adan ſignifies a willow, and Adon lord, with the ſame radical letters. Hence Ἰτυιος Ἀδωνις, *Saligna*, and Κυριος or Κυριε Ἀδωνις for Κυριος, *Adonidis horti*, are gardens beautifully arranged, but more adapted for pleaſure than profit.

ADONIS, *Bird's eye*, or *Pheaſant's eye*, in *Botany*. See BOTANY *Index*.

ADONISTS, a ſect or party among divines and critics, who maintain, that the Hebrew points ordinarily annexed to the conſonants of the word Jehovah, are not the natural points belonging to that word, nor expreſs the true pronunciation of it; but are the vowel points, belonging to the words *Adonai* and *Elohim*, applied to the conſonants of the ineffable name Jehovah, to warn the readers, that inſtead of the word Jehovah, which the Jews were forbidden to pronounce, and the true pronunciation of which had been long unknown to them, they are always to read *Adonai*. They are oppoſed to *Jehoviſts*: of whom the principal are Druſius, Capellus, Buxtorf, Alting, and Reland, who has publiſhed a collection of their writings on this ſubject.

ADOPTIANI, in church hiſtory, a ſect of ancient heretics, followers of Felix of Urgel, and Elipand of Toledo, who, towards the end of the eighth century, advanced the notion, that Jeſus Chriſt, in his human nature, is the Son of God, not by nature, but by adoption.

Adoption.

ADOPTION, an act by which any one takes another into his family, owns him for his ſon, and appoints him for his heir.

The cuſtom of adoption was very common among the ancient Greeks and Romans; yet it was not practiſed, but for certain cauſes expreſſed in the laws, and with certain formalities uſual in ſuch caſes. It was a ſort of imitation of nature, intended for the comfort of thoſe who had no children: wherefore he that was to adopt was to have no children of his own, and to be paſt the age of getting any; nor were eunuchs allowed to adopt, as being under an actual impotency of begetting children; neither was it lawful for a young man to adopt an elder, becauſe that it would have been contrary to the order of nature: nay, it was even required that the perſon who adopted ſhould be eighteen years older than his adopted ſon, that there might at leaſt appear a probability of his being the natural father.

Among the Greeks it was called ὑιοτης, *filiation*. It was allowed to ſuch as had no iſſue of their own; excepting thoſe who were not κυριοι ἑαυτων, *their own maſters*, e. g. ſlaves, women, madmen, infants, or perſons under twenty years of age; who being incapable of making wills, or managing their own eſtates, were not allowed to adopt heirs to them. Foreigners being incapable of inheriting at Athens, if any ſuch were adopted, it was neceſſary firſt to make them free of the city. The ceremony of adoption being over, the adopted had his name enrolled in the tribe and ward of his new father; for which entry a peculiar time was allotted, viz. the feſtival Ἀπατουρια. To prevent raſh and inconſiderate adoptions, the Lacedemonians had a law, that adoptions ſhould be tranſacted, or at leaſt confirmed, in the preſence of their kings. The children adopted were inveſted with all the privileges, and obliged to perform all the duties, of natural children; and being thus provided for in another family, ceaſed to have any claim of inheritance, or kindred, in the family which they had left, unleſs they firſt renounced their adoption; which, by the laws of Solon, they were not allowed to do, unleſs they had firſt begotten children, to bear the name of the perſon who had adopted them: thus providing againſt the ruin of families, which would otherwiſe have been extinguiſhed by the deſertion of thoſe who had been adopted to preſerve them. If the children adopted happened to die without children, the inheritance could not be alienated from the family into which they had been adopted, but returned to the relations of the adopter. It ſhould ſeem, that by the Athenian law, a perſon, after having adopted another, was not allowed to marry without permiſſion from the magiſtrate: in effect, there are inſtances of perſons, who being ill uſed by their adoptive children, petitioned for ſuch leave. However this be, it is certain ſome men married after they had adopted ſons: in which caſe, if they begat legitimate children, their eſtates were equally ſhared between the begotten and adopted.

The Romans had two forms of adoption; one be-

fore:

Adoption. fore the prætor; the other at an aſſembly of the people, in the times of the commonwealth, and afterwards by a reſcript of the emperor. In the former, the natural father addreſſed himſelf to the prætor, declaring that he emancipated his ſon, reſigned all his authority over him, and conſented he ſhould be tranſlated into the family of the adopter. The latter was practiſed, where the party to be adopted was already free; and this was called *adrogation*. The perſon adopted changed all his names; aſſuming the prename, name, and ſurname, of the perſons who adopted him.

Beſides the formalities preſcribed by the Roman law, various other methods have taken place; which have given denominations to different ſpecies of adoption, among the Gothic nations, in different ages. As,

Adoption by arms, was when a prince made a preſent of arms to a perſon, in conſideration of his merit and valour. Thus it was that the king of the Heruli was adopted by Theodoric; Athalaric by the emperor Juſtinian; and Coſroes, nephew of the king of Perſia, by the emperor Juſtin.—The obligation here laid on the adoptive ſon was, to protect and defend the father from injuries, affronts, &c. And hence, according to Selden, the ceremony of dubbing knights took its origin as well as name.

Adoption by baptiſm, is that ſpiritual affinity which is contracted by god fathers and god-children in the ceremony of baptiſm. This kind of adoption was introduced into the Greek church, and came afterwards into uſe among the ancient Franks, as appears by the Capitulars of Charlemagne.

In reality, the god-father was ſo far conſidered as adoptive father, that his god-children were ſuppoſed to be entitled to a ſhare in the inheritance of his eſtate.

Adoption by hair, was performed by cutting off the hair of a perſon, and giving it to the adoptive father. It was thus that Pope John VIII. adopted Boſon king of Arles; which, perhaps, is the only inſtance in hiſtory, of adoption, in the order of the eccleſiaſtics; a law that profeſſes to imitate nature, not daring to give children to thoſe in whom it would be thought a crime to beget any.

Adoption by matrimony, is the taking the children of a wife or huſband, by a former marriage, into the condition of proper or natural children; and admitting them to inherit on the ſame footing with thoſe of the preſent marriage. This is a practice peculiar to the Germans: among whom, it is more particularly known by the name of *einkindſchaft*; among their writers in Latin, by that of *unio prolium*, or *union of iſſues*. But the more accurate writers obſerve, that this is no adoption. See AFFILIATION.

Adoption by teſtament, that performed by appointing a perſon heir by will, on condition of his aſſuming the name, arms, &c. of the adopter. Of which kind we meet with ſeveral inſtances in the Roman hiſtory.

Among the Turks, the ceremony of adoption is performed by obliging the perſon adopted to paſs through the ſhirt of the adopter. Hence, among that people to adopt, is expreſſed by the phraſe, *to draw another through my ſhirt*. It is ſaid, that ſomething like this has alſo been obſerved among the Hebrews; where the prophet Elijah adopted Eliſha for his ſon and ſucceſſor, and communicated to him the gift of prophecy, by letting fall his cloak or mantle on him. But adoption, properly ſo called, does not appear to have been practiſed among the ancient Jews: Moſes ſays nothing of it in his laws; and Jacob's adoption of his two grandſons, Ephraim and Manaſſeh, is not ſo properly an adoption, as a kind of ſubſtitution, whereby thoſe two ſons of Joſeph were allotted an equal portion in Iſrael with his own ſons. Adoption Adoration.

ADOPTION is alſo uſed, in *Theology*, for a federal act of God's free grace; whereby thoſe who are regenerated by faith, are admitted into his houſehold, and entitled to a ſhare in the inheritance of the kingdom of heaven.

ADOPTION is ſometimes alſo uſed, in ſpeaking of the ancient clergy, who had a cuſtom of taking a maid or widow into their houſes, under the denomination of an *adoptive* or *ſpiritual ſiſter* or *niece*.

ADOPTION is alſo uſed in ſpeaking of the admiſſion of perſons into certain hoſpitals, particularly that of Lyons, the adminiſtrators whereof have all the power and rights of parents over the children admitted.

ADOPTION is alſo uſed for the reception of a new academy into the body of an old one.—Thus

The French academy of Marſeilles was adopted by that of Paris: on which account, we find a volume of ſpeeches extant, made by ſeveral members of the academy of Marſeilles, deputed to return thanks to that of Paris for the honour.

In a ſimilar ſenſe, adoption is alſo applied by the Greeks, to the admitting a monk, or brother, into a monaſtic community; ſometimes called *ſpiritual adoption*.

ADOPTIVE, denotes a perſon or thing adopted by another.

Adoptive children, among the Romans, were on the ſame footing with natural ones; and accordingly were either to be inſtituted heirs, or expreſsly diſinherited, otherwiſe the teſtament was null. The emperor Adrian preferred adoptive children to natural ones; becauſe we chooſe the former, but are obliged to take the latter at random.

M. Menage has publiſhed a book of eloges, or verſes addreſſed to him; which he calls *Liber Adoptivus*, an adoptive book; and adds it to his other works.—Heinſius, and Furſtemburg of Munſter, have likewiſe publiſhed adoptive books.

In eccleſiaſtical writers we find adoptive women, or ſiſters, (*adoptivæ fœminæ* or *ſorores*), uſed for thoſe handmaids of the ancient clergy, otherwiſe called *ſubintroductæ*.

Adoptive arms, are thoſe which a perſon enjoys by the gift or conceſſion of another, and to which he was not otherwiſe entitled. They ſtand contradiſtinguiſhed from arms of alliance.

We ſometimes meet with adoptive heir, by way of oppoſition to natural heir; and adoptive gods, by way of contradiſtinction to domeſtic ones. The Romans, notwithſtanding the number of their domeſtic, had their adoptive gods, taken chiefly from the Egyptians: ſuch were Iſis, Oſiris, Anubis, Apis, Harpocrates, and Canopus.

ADORATION, the act of rendering divine honours; or of addreſſing a being, as ſuppoſing it a god. The word is compounded of *ad*, "to;" and *os*, *oris*, "mouth;" and literally ſignifies to apply the hand

to

Adoration. to the mouth; *Manum ad os admovere, q. d.* "to kiss the hand;" this being, in the eastern countries, one of the great marks of respect and submission.—The Romans practised adoration at sacrifices, and other solemnities; in passing by temples, altars, groves, &c. at the sight of statues, images, or the like, whether of stone or wood, wherein any thing of divinity was supposed to reside. Usually there were images of the gods placed at the gates of cities, for those who went in or out, to pay their respects to.—The ceremony of adoration among the ancient Romans was thus: The devotee having his head *covered*, applied his right hand to his lips, the fore finger resting on this thumb, which was erect, and thus bowing his head, turned himself round from left to right. The kiss thus given was called *osculum labratum*; for ordinarily they were afraid to touch the images of their gods themselves with their profane lips. Sometimes, however, they would kiss their feet, or even knees, it being held an incivility to touch their mouths; so that the affair passed at some distance. Saturn, however, and Hercules, were adored with the head *bare;* whence the worship of the last was called *institutum peregrinum*, and *ritus Græcanicus*, as departing from the customary Roman method, which was to sacrifice and adore with the face veiled, and the clothes drawn up to the ears, to prevent any interruption in the ceremony by the sight of unlucky objects.—The Jewish manner of adoration was by prostration, bowing, and kneeling.—The Christians adopted the Grecian rather than the Roman method, and adored always *uncovered*. The ordinary posture of the ancient Christians was kneeling, but on Sundays standing: and they had a peculiar regard to the east, to which point they ordinarily directed their prayers.

ADORATION is more particularly used for the act of praying, or preferring our requests or thanksgivings to Almighty God.

ADORATION is also used for certain extraordinary civil honours or respects which resemble those paid to the deity, yet are given to men.

The Persian manner of adoration, introduced by Cyrus, was by bending the knee, and falling on the face at the prince's feet, striking the earth with the forehead, and kissing the ground. This ceremony, which the Greeks called προσκυνειν, Conon refused to perform to Artaxerxes, and Callisthenes to Alexander the Great, as reputing it impious and unlawful.

The adoration performed to the Roman and Grecian emperors consisted in bowing or kneeling at the prince's feet, laying hold of his purple robe, and presently withdrawing the hand and clapping it to the lips. Some attribute the origin of this practice to Constantius. It was only persons of some rank or dignity that were entitled to the honour. Bare kneeling before the emperor to deliver a petition, was also called *adoration*.

The practice of adoration may be said to be still subsisting in England, in the ceremony of kissing the king's or queen's hand, and in serving them at table, both being performed kneeling.

ADORATION is more particularly used for kissing one's hand in presence of another, as a token of reverence. The Jews adored by kissing their hands and bowing down their heads; whence, in their language, *kissing* is properly used for *adoration*.

ADORATION is also used among Roman writers for a high species of applause given to persons who had spoken or performed well in public. (See ACCLAMATION.) We meet with adoration paid to orators, actors, musicians, &c. The method of expressing it was, by rising, putting both hands to their mouth, and then returning them towards the person intended to be honoured. Adoration, Adorea.

ADORATION is also used, in the court of Rome, for the ceremony of kissing the pope's feet.—The introduction of adoration among the Romans is ascribed to the low flattery of Vitellius, who, upon the return of C. Cæsar from Syria, would not approach him otherwise than with his head covered, turning himself round, and then falling on his face. Heliogabalus restored the practice, and Alexander Severus again prohibited it. Diocletian redemanded it; and it was, in some measure, continued under the succeeding princes, even after the establishment of Christianity, as Constantine, Constantius, &c. It is particularly said of Diocletian, that he had gems fastened to his shoes, that divine honours might be more willingly paid him, by kissing his feet. The like usage was afterwards adopted by the popes, and is observed to this day. These prelates, finding a vehement disposition in the people to fall down before them and kiss their feet, procured crucifixes to be fastened on their slippers; by which stratagem, the adoration intended for the pope's person is supposed to be transferred to Christ. Divers acts of this adoration we find offered even by princes to the pope.

ADORATION is also used for a method of electing a pope. The election of popes is performed two ways; by *adoration* and by *scrutiny*. In election by adoration, the cardinals rush hastily, as if agitated by some spirit, to the adoration of some one among them, to proclaim him pope. When the election is carried by scrutiny, they do not adore the new pope till he is placed on the altar.

Barbarous ADORATION is a term used, in the laws of King Canute, for that performed after the manner of the Heathens who adored idols. The Romish church is charged with the adoration of saints, martyrs, images, crucifixes, relics, the virgin, and the host; all which by Protestants are generally aggravated into idolatry on a supposition, that the honour thus paid to them is absolute and supreme, called by way of distinction *Latria*, which is due only to God. Roman Catholics, on the contrary, explain them, as only a relative or subordinate worship, called *Dulia* and *Hyperdulia*, which terminates ultimately in God alone. But may not the same be said of the idol worship of the heathens? The Phœnicians adored the winds, on account of the terrible effects produced by them; the same was adopted by most of the other nations, Persians, Greeks, Romans, &c. The Persians chiefly paid their adorations to the sun and fire; some say also to rivers, the wind, &c. The motive of adoring the sun was the benefits they received from that glorious luminary, which of all creatures has doubtless the best pretensions to such homage.

ADOREA, in Roman antiquity, a word used in different senses; sometimes for all manner of grain, sometimes for a kind of cakes made of fine flour, and offered in sacrifice; and finally for a dole or distribution of corn, as a reward for some service; whence by metonymy it is put for praise or rewards in general.

ADOSCULATION,

Adoſculation ‖ Adramum.

ADOSCULATION, a term uſed by Dr Grew, to imply a kind of impregnation, without intromiſſion; and in this manner he ſuppoſes the impregnation of plants is effected by the falling of the farina fœcundans on the piſtil.

ADOSSEE', in *Heraldry*, ſignifies two figures or bearings being placed back to back.

ADOUR, the name of a river of France, which riſes in the mountains of Bigorre, in the department of the Upper Pyrenees, and running north by Tarbes through Gaſcony, afterwards turns eaſt, and paſſing by Dax, falls into the bay of Biſcay, below Bayonne.

ADOWA, the capital of Tigré in Abyſſinia, is ſituated on the declivity of a hill, on the weſt ſide of a ſmall plain, which is ſurrounded on every ſide by mountains. The name, ſignifying *paſs* or *paſſage*, is characteriſtic of its ſituation; for the only road from the Red ſea to Gondar paſſes by Adowa. The town conſiſts of 300 houſes, is the reſidence of the governor, and has a manufactory of coarſe cotton cloth which circulates in Abyſſinia as the medium of exchange in place of money. N. Lat. 14. 7. E. Long. 38. 50.

ADOXA, Tuberous Moschatel, Hollow-root, or Inglorious, in *Botany*. See Botany *Index*.

AD pondus omnium, among phyſicians, an abbreviation in their preſcriptions, ſignifying that the laſt mentioned ingredient is to weigh as much as all the reſt together.

Ad Quod Damnum, in the *Engliſh Law*, a writ directed to the ſheriff, commanding him to inquire into the damage which may ariſe from granting certain privileges to a place, as a fair, a market, or the like.

ADRA, in *Geography*, a ſea-port town of the province of Granada, in Spain, 47 miles ſouth-eaſt of Granada. N. Lat. 36. 42. E. Long. 2. 37.

ADRACHNE, in *Botany*, a ſpecies of the ſtrawberry tree. See Arbutus, Botany *Index*.

ADRAMMELECH, one of the gods of the inhabitants of Sepharvaim, who were ſettled in the country of Samaria, in the room of thoſe Iſraelites who were carried beyond the Euphrates. The Sepharvaites made their children paſs through the fire, in honour of this idol and another called *Anamelech*. It is ſuppoſed, that Adrammelech meant the ſun, and Anamelech the moon: the firſt ſignifies *the magnificent king*; the ſecond *the gentle king*.

ADRAMYTTIUM, in *Ancient Geography*, now *Andramiti*, a town of Myſia Major, at the foot of Mount Ida, an Athenian colony, with a harbour and dock near the Caïcus. *Adramyttenus* the epithet; as, *Adramyttenus Sinus*, a part of the Egean ſea, on the coaſt of Myſia; *Adramyttenus Conventus*, ſeſſions or aſſizes, the eighth in order of the nine *Conventus Juridici* of the province of Aſia.

ADRANA, a river of Germany (Polybius); now the Eder, riſing on the borders of the county of Naſſau, to the north-eaſt of, and not far from Dillenburg, running through the landgraviate of Heſſe, the county of Waldeck, by Fritzlar, and then again through the landgraviate, and, together with the Fulda, falling into the Weſer, to the ſouth of, and not far from Caſſel.

ADRANUM, or Hadranum, in *Ancient Geography*, now Aderno, which ſee.

Adraſtea ‖ Adrian.

ADRASTEA, in *Mythology*, was the daughter of Jupiter and Neceſſity, and, according to Plutarch, the only fury who executed the vengeance of the gods. The name is derived from King Adraſtus, who firſt erected a temple to that deity.

Adrastea Certamina, in antiquity, a kind of Pythian games, inſtituted by Adraſtus king of Argos, in the year of the world 2700, in honour of Apollo, at Sicyon. Theſe are to be diſtinguiſhed from the Pythian games celebrated at Delphi.

ADRASTUS, in ancient hiſtory, king of Argos, ſon of Talaus and Lyſianiſſa, daughter of Polybius king of Sicyon, acquired great honour in the famous war of Thebes, in ſupport of Polynices his ſon-in-law, who had been excluded the ſovereignty of Thebes by Eteocles his brother, notwithſtanding their reciprocal agreement. Adraſtus, followed by Polynices, and Tydeus his other ſon-in-law, by Capaneus and Hippomedon his ſiſter's ſons, by Amphiaraus his brother-in-law, and by Parthenopæus, marched againſt the city of Thebes; and this is the expedition of the Seven Worthies, which the poets have ſo often ſung. They all loſt their lives in this war except Adraſtus, who was ſaved by his horſe called *Arion*. This war was revived ten years after by the ſons of thoſe deceaſed warriors, which was called the *war of the Epigones*, and ended with the taking of Thebes. None of them loſt their lives except Ægialeus ſon of Adraſtus; which afflicted him ſo much that he died of grief in Megara, as he was leading back his victorious army.

ADRAZZO, or Ajaccio. The ſame with Adjazzo, which ſee.

ADRIA, or Hadria, in *Ancient Geography*, the name of two towns in Italy. One in the country of the Veneti, on the river Tartarus, between the Padus and the Atheſis, called *Atria* by Pliny and Ptolemy, but *Adrias* by Strabo. Another on the river Vomanus, in the territory of the Piceni (to which Antonine's Itinerary from Rome is directed), the country of the anceſtors of the emperor Adrian. From which of theſe the Adriatic ſea is denominated, is matter of doubt. A third opinion is, that it is ſo called from Adrias the ſon of Joan, of Italian origin; (Euſtathius in Dionyſium).

ADRIAN, or Hadrian, Publius Ælius, the Roman emperor. He was born at Rome the 24th of January, in the 76th year of Chriſt, A. U. C. 829. His father left him an orphan, at ten years of age, under the guardianſhip of Trajan, and Cœlius Tatianus a Roman knight. He began to ſerve very early in the armies, having been tribune of a legion before the death of Domitian. He was the perſon choſen by the army of Lower Mœſia, to carry the news of Nerva's death to Trajan, ſucceſſor to the empire. Trajan, however, conceived ſome prejudices againſt him, and Adrian perceiving that he was no favourite with the emperor, endeavoured to ingratiate himſelf with the empreſs Plotina, by which means he ſucceeded in obtaining for his wife, Sabina, the emperor's grand-niece and next heireſs. This was probably the firſt ſtep to his future advancement, and facilitated his aſcent to the throne. As quæſtor he accompanied Trajan in moſt of his expeditions, and particularly diſtinguiſhed himſelf in the ſecond war againſt the Dacians. Afterwards he was ſucceſſively tribune of the people, prætor,

governor

Adrian. governor of Pannonia, and conſul. After the ſiege of Atra in Arabia was raiſed, Trajan, who had already given him the government of Syria, left him the command of the army: and at length, when he found death approaching, it is ſaid he adopted him. Adrian, who was then in Antiochia, as ſoon as he received the news thereof, and of Trajan's death, declared himſelf emperor, on the 11th of Auguſt, A. D. 117.

No ſooner had he arrived at the imperial dignity, than he made peace with the Perſians, to whom he yielded up great part of the conqueſts of his predeceſſors; and from generoſity, or policy, he remitted the debts of the Roman people, which, according to the calculation of thoſe who have reduced them to modern money, amounted to 22,500,000 golden crowns; and he burnt all the bonds and obligations relating to theſe debts, that the people might be under no apprehenſion of being called to an account for them afterwards. There are medals in commemoration of this fact, in which he is repreſented holding a flambeau in his hand, to ſet fire to all thoſe bonds which he had made void. He went to viſit all the provinces; and did not return to Rome till the year 118, when the ſenate decreed him a triumph, and honoured him with the title of *Father of his country*; but he refuſed both, and deſired that Trajan's image might triumph. No prince travelled more than Adrian; there being hardly one province in the empire which he did not viſit. In 120 he went into Gaul; from thence he went over to Britain, in order to ſubdue the Caledonians, who were making continual inroads into the provinces. Upon his arrival they retired towards the north: he advanced, however, as far as York, where he was diverted from his intended conqueſt by the deſcription ſome old ſoldiers he found there, who had ſerved under Agricola, gave him of the country. In hopes, therefore, of keeping them quiet by enlarging their bounds, he delivered up to the Caledonians all the lands lying between the two friths and the Tyne; and, at the ſame time, to ſecure the Roman province from their future incurſions, built the famous wall which ſtill bears his name (A). Having thus ſettled matters in Britain, he returned to Rome, where he was honoured with the title of Reſtorer of Britain, as appears by ſome medals. He ſoon after went into Spain, to Mauritania, and at length into the Eaſt, where he quieted the commotions raiſed by the Parthians. After having viſited all the provinces of Aſia, he returned to Athens in 125, where he paſſed the winter, and was initiated in the myſteries of Eleuſinian Ceres. He went from thence to Sicily, chiefly to view Mount Ætna, contemplate its phenomena, and enjoy the beautiful and extenſive proſpect afforded from its top. He returned to Rome the beginning of the year 129; and, according to ſome, he went again, the ſame year, to Africa; and, after his return from thence, to the eaſt. He was in Egypt in the year 132, reviſited Syria the year following, returned to Athens in 134, and to Rome in 135. The perſecution againſt the Chriſtians was very violent under his reign; but it was at length ſuſpended, in conſequence of the remonſtrances of Quadratus biſhop of Athens, and Ariſtides, two Chriſtian philoſophers, who preſented the emperor with ſome books in favour of the Chriſtian religion. He conquered the Jews; and, by way of inſult, erected a temple to Jupiter on Calvary, and placed a ſtatue of Adonis in the manger of Bethlehem; he cauſed alſo the images of ſwine to be engraven on the gates of Jeruſalem. At laſt he was ſeized with a dropſy, which vexed him to ſuch a degree, that he became almoſt raving mad. A great number of phyſicians were ſent for, and to the multitude of them he aſcribed his death. He died at Baiæ in the 63d year of his age, having reigned 21 years. The Latin verſes he addreſſed to his ſoul, which he compoſed a ſhort time before his death, in a ſtrain of tender levity, have been much criticiſed, and have been the ſubject of numerous tranſlations and imitations. Adrian.

Animula vagula, blandula,
Hoſpes, comeſque corporis,
Quæ nunc abibis in loca
Pallidula, rigida, nudula,
Nec, ut ſoles, dabis jocos?

Ah! fleeting ſpirit! wand'ring fire,
That long haſt warm'd my tender breaſt,
Muſt thou no more this frame inſpire?
No more a pleaſing cheerful gueſt?
Whither, ah whither art thou flying?
To what dark undiſcover'd ſhore?
Thou ſeem'ſt all trembling, ſhiv'ring, dying,
And wit and humour are no more!

POPE.

Some fragments of his Latin poetry are ſtill extant, and there are Greek verſes of his in the Anthology. He alſo wrote the hiſtory of his own life; to which, however, he did not chooſe to put his name; but that

(A) This work, though called by the Roman hiſtorians *murus*, which ſignifies a wall of ſtone, was only compoſed of earth covered with green turf. It was carried on from the Solway frith, a little weſt of the village of Burgh on the Sands, in as direct a line as poſſible, to the river Tyne on the eaſt, at the place where the town of Newcaſtle now ſtands; ſo that it muſt have been above 60 Engliſh, and near 70 Roman miles in length. It conſiſted of four parts: 1. The principal *agger*, mound of earth, or rampart, on the brink of the ditch. 2. The ditch on the north ſide of the rampart. 3. Another rampart on the ſouth ſide of the principal one, about five paces diſtant from it. 4. A large rampart on the north ſide of the ditch.—This laſt was probably the military way to the line of forts on this work: it was ſo to thoſe formerly built by Agricola: and if it did not ſerve the ſame purpoſe in this, there muſt have been no military way attending it.—The ſouth rampart might ſerve for an inner defence in caſe the enemy ſhould beat them from any part of the principal rampart, or it might be deſigned to protect the ſoldiers from any ſudden attack of the provincial Britons.—For many ages, this work hath been in ſo ruinous a condition, that it is impoſſible to diſcover its original dimenſions with certainty. From their appearance, it ſeems probable that the principal rampart was at leaſt 10 or 12 feet high,

Adrian. of Phlegon, one of his freed-men, a very learned perſon, was prefixed to it *. He had great wit and a retentive memory, and he diſtinguiſhed himſelf in the various branches of literature and ſcience. In his natural diſpoſition he was ſuſpicious, envious, cruel, and laſcivious. In his character there was a ſtrange compoſition of virtues and vices. He was affable, courteous, and liberal; but he was capricious and unſteady in his attachments, and violent in his reſentment. Thus he was diſtruſted by his friends, and dreaded by his enemies. Antoninus his ſucceſſor obtained his apotheoſis; and prevented the reſciſſion of his acts, which the ſenate once intended.

* Vide *Spartian, in Adriano.*

Adrian I. *Pope*, aſcended the papal throne, A. D. 772. He was the ſon of Theodore, a Roman nobleman, and poſſeſſed conſiderable talents for buſineſs. He maintained a ſteady attachment to Charlemagne, which provoked Deſiderius, a king of the Lombards, to invade the ſtate of Ravenna, and to threaten Rome itſelf. Charlemagne rewarded his attachment, by marching with a great army to his aid; and having gained many conſiderable advantages over Deſiderius, he viſited the pope at Rome, and expreſſed his piety, by the humiliating ceremony of kiſſing each of the ſteps, as he aſcended to the church of St Peter. The affairs of the church now claimed Adrian's particular attention: for Irene, who, in 780, aſſumed the regency at Conſtantinople, during the minority of her ſon Conſtantine, wiſhing to reſtore the worſhip of images, applied to Adrian for his concurrence. The pontiff readily acquieſced in her propoſal for calling a council, and commiſſioned two legates to attend it. The firſt council, however, was diſperſed by an inſurrection of the citizens; but at the next meeting in the city of Nice, in 787, which was protected by a military force, a decree was paſſed for reſtoring the worſhip of images. Adrian approved the decree, but in the weſtern church it was deemed heretical and dangerous. Charlemagne condemned the innovation, and the French and Engliſh clergy concurred in oppoſing it. A treatiſe, containing 120 heads of refutation, was circulated, as the work of Charlemagne, under the title of "The Caroline Books," in oppoſition to the decree of the council. This work was preſented to the pope by the king's ambaſſador, and the pope wrote a letter to Charlemagne by way of reply. The king, and alſo the Gallican and Engliſh churches, retained their ſentiments; and, in 794, a council was held at Frankfort on the Maine, conſiſting of about 300 weſtern biſhops, by which every kind of image-worſhip was condemned. Adrian did not live to ſee a termination of this conteſt; for after a pontificate of nearly twenty-four years, he died in 795. Adrian ſeems to have directed his chief attention to the embelliſhment of the churches, and the improvement of the city of Rome; and he was probably furniſhed by Charlemagne, out of the plunder of his conqueſts, with ample means for this purpoſe.

Adrian II. *Pope*, ſucceeded Nicholas I. A. D. 867. Having twice refuſed the dignity, he accepted it in the 76th year of his age, at the united requeſt of the clergy, nobility, and people. The conteſt for power between the Greek and Latin churches had been very violent ſome years before his acceſſion to the papal chair. Adrian.

Adrian, during this conteſt with the eaſtern patriarch, was extending his authority over the kings and princes of the weſt. He employed his whole intereſt to induce Charles the Bald, who had taken poſſeſſion of the kingdom of Lorraine, and who had been crowned at Rheims by the archbiſhop Hincmar, to relinquiſh it in favour of the emperor; and he even ſent legates to the king, after having attempted to engage Hincmar, the clergy, and the nobility to deſert him, ordering him to ſurrender to the emperor's right. The king was invincible; and the pope was obliged to give up the conteſt. He alſo farther interfered in the concerns of princes, by taking Charles's rebellious ſon Carloman, and the younger Hincmar, biſhop of Laon, under the protection of the Roman ſee. He proceeded in this buſineſs ſo far, that he was under a neceſſity of ſubmitting without gaining his point. Death terminated his ambitious projects and his life of inquietude, A. D. 872, after a pontificate of five years.

Adrian IV. *Pope*, the only Engliſhman who ever had the honour of ſitting in the papal chair. His name was Nicholas Brekeſpere; and he was born at Langley, near St Alban's, in Hertfordſhire. His father having left his family, and taken the habit of the monaſtery of St Alban's, Nicholas was obliged to ſubmit to the loweſt offices in that houſe for daily ſupport. After ſome time, he deſired to take the habit in that monaſtery, but was rejected by the abbot Richard. Upon this he reſolved to try his fortune in another country, and accordingly went to Paris; where, though in very poor circumſtances, he applied himſelf to his ſtudies with great aſſiduity, and made a wonderful proficiency. But having ſtill a ſtrong inclination to a religious life, he left Paris, and removed to Provence, where he became a regular clerk in the monaſtery of St Rufus. He was not immediately allowed to take the habit; but paſſed ſome time, by way of trial, in recommending himſelf to the monks by a ſtrict attention to all their commands. This behaviour, together with the beauty of his perſon, and prudent converſation, rendered him ſo acceptable to thoſe religious, that after ſome time they entreated him to take the habit of the canonical order. Here he diſtinguiſhed himſelf ſo much by his learning and ſtrict obſervance of the monaſtic diſcipline, that upon the death of the abbot, he was choſen ſuperior of that houſe; and we are told that he rebuilt the convent. Pope Eugenius III. being appriſed of the great merit of Nicholas, and thinking he might be ſerviceable to the church in a higher ſtation, created him cardinal-biſhop of Alba in 1146. In 1148, his holineſs ſent him legate to Denmark and Norway; where, by his fervent preaching

high, and the ſouth one not much leſs; but the north one was conſiderably lower. From the dimenſions of the ditch, taken as it paſſes through a lime-ſtone quarry near Harlow hill, it appears to have been 9 feet deep, and 11 wide at the top, but ſomewhat narrower at the bottom. The north rampart was about 20 feet diſtant from the ditch.

Adrian. ing and diligent inſtructions, he converted thoſe barbarous nations to the Chriſtian faith, and erected Upſal into an archiepiſcopal ſee. When he returned to Rome, he was received by the pope and cardinals with great marks of honour; and Pope Anaſtaſius, who ſucceeded Eugenius, happening to die at this time, Nicholas was unanimouſly choſen to the holy ſee, in November 1154, and he took the name of *Adrian*. When the news of his promotion reached England, King Henry II. ſent Robert abbot of St Alban's, and three biſhops, to Rome, to congratulate him on his election; upon which occaſion Adrian granted very conſiderable privileges to the monaſtery of St Alban's, particularly an exemption from all epiſcopal juriſdiction, excepting to the ſee of Rome. Adrian, in the beginning of his pontificate, boldly withſtood the attempts of the Roman people to recover their ancient liberty under the conſuls, and obliged thoſe magiſtrates to abdicate their authority, and leave the government of the city to the pope. In 1155, he drove the heretic Arnaud of Breſſe, and his followers, out of Rome. The ſame year he excommunicated William king of Sicily, who ravaged the territories of the church, and abſolved that prince's ſubjects from their allegiance. About the ſame time, Frederick king of the Romans, having entered Italy with a powerful army, Adrian met him near Sutrium, and concluded a peace with him. At this interview, Frederick conſented to hold the pope's ſtirrup whilſt he mounted on horſeback. After which, his holineſs conducted that prince to Rome, and in St Peter's church placed the imperial crown on his head, to the great mortification of the Roman people, who aſſembled in a tumultuous manner, and killed ſeveral of the Imperialiſts. The next year a reconciliation was brought about between the pope and the Sicilian king, that prince taking an oath to do nothing farther to the prejudice of the church, and Adrian granting him the title of *King of the two Sicilies*. He built and fortified ſeveral caſtles, and left the papal dominions in a more flouriſhing condition than he found them. But notwithſtanding all his ſucceſs, he was extremely ſenſible of the diſquietudes attending ſo high a ſtation; and declared to his countryman John of Saliſbury, that all the former hardſhips of his life were mere amuſement to the miſfortunes of the popedom; that he looked upon St Peter's chair to be the moſt uneaſy ſeat in the world; and that his crown ſeemed to be clapped burning on his head *. He died September 1. 1159, in the fourth year and tenth month of his pontificate; and was buried in St Peter's church, near the tomb of his predeceſſor Eugenius. There are extant ſeveral letters, and ſome homilies, written by Pope Adrian.

* *Baronius Annal.* tom. xii. an. 1154.

ADRIAN V. *Pope*, a Genoeſe, whoſe name was Ottoboni Fieſci, ſucceeded Innocent V. A. D. 1276. He was by his uncle Innocent IV. created cardinal deacon of St Adrian, and in 1254 ſent by him to England, to ſettle the diſputes between Henry III. and his barons. He was employed again for the ſame purpoſe, by Clement III. when he iſſued a ſentence of excommunication againſt the king's enemies. When he was congratulated on his acceſſion to the papal chair, he ſaid, "I wiſh you had found me a healthy cardinal, rather than a dying pope." After his election he went to Viterbo to meet the emperor Rodolphus, for the purpoſe of oppoſing the uſurpation of Charles, king of the Two Sicilies; but died ſoon after his arrival, having enjoyed his dignity only thirty-eight days. He zealouſly encouraged the cruſade to the Holy Land, and upon his election ſent a large ſum to Conſtantinople towards building galleys. Adrian, Adriani.

ADRIAN, cardinal prieſt, of the title of St Chryſogonus, was a native of Cornetto in Tuſcany. Innocent VIII. ſent him nuncio into Scotland and into France; and after he had been clerk and treaſurer of the apoſtolic chamber, Pope Alexander VI. whoſe ſecretary he had been, honoured him with the cardinal's hat. His life was a continued ſcene of odd alterations. He narrowly eſcaped death the day Alexander VI. poiſoned himſelf by miſtake. Afterward he drew upon himſelf the hatred of Julius II. ſo that he was obliged to go and hide himſelf in the mountains of Trent. Having been recalled by Leo X. he was ſo ungrateful, that he engaged in a conſpiracy againſt him. The pope pardoned his fault; but the cardinal, not caring to truſt to this, made his eſcape, and it could never be known exactly what was become of him. He was one of the firſt who effectually reformed the Latin ſtyle. He ſtudied Cicero with great ſucceſs, and made many excellent obſervations on the propriety of the Latin tongue. The treatiſe he compoſed *De Sermone Latino*, is a proof of this. He had begun a Latin tranſlation of the Old Teſtament. He wrote *De Vera Philoſophia*: This treatiſe was printed at Cologn 1548.

ADRIAN VI. *Pope*, was born at Utrecht in 1459. His father was not able to maintain him at ſchool, but he got a place at Louvain, in a college in which a certain number of ſcholars were maintained *gratis*. It is reported that he uſed to read in the night time by the light of the lamps in the churches or ſtreets. He made a conſiderable progreſs in all the ſciences; led an exemplary life; and there never was a man leſs intriguing and forward than he was. He took his degree of doctor of divinity at Louvain; was ſoon after made canon of St Peter's, and profeſſor of divinity at Utrecht, and then dean of St Peter's and vice-chancellor of the univerſity. He was obliged to leave an academical life, to be tutor to the archduke Charles. This young prince made no great progreſs under him: however, never was a tutor more conſiderably rewarded; for it was by Charles V.'s credit he was raiſed to the papal throne. Leo X. had given him the cardinal's hat in 1517. After this pope's death, ſeveral cabals in the conclave ended in the election of Adrian, with which the people of Rome were very much diſpleaſed. He would not change his name, and in every thing he ſhowed a great diſlike for all oſtentation and ſenſual pleaſures, though ſuch an averſion had been long ago out of date. He was very partial to Charles V. and did not enjoy much tranquillity under the triple crown. He lamented much the wicked morals of the clergy, and wiſhed to eſtabliſh a reformation of manners among them. He died September 14. 1523.

ADRIANI, JOANNI BATTISTA, was born of a patrician family at Florence in 1511. He wrote a Hiſtory of his own Times in Italian; which is a continuation of Guicciardini, beginning at the year 1536; to which Thuanus acknowledges himſelf greatly indebted: beſides which, he compoſed ſix funeral ora-

Adrianists || Adrianum.

tions, on the emperor Charles V. and other noble perſonages; and is thought to have been the author of a long letter on ancient painters and ſculptors, prefixed to the third volume of Vaſari. He died at Florence in 1579.

ADRIANISTS, in eccleſiaſtical hiſtory, a ſect of heretics divided into two branches, the firſt were diſciples of Simon Magus, and flouriſhed about the year 34. Theodoret is the only perſon who has preſerved their name and memory; but he gives us no account of their origin. Probably this ſect, and the ſix others which ſprung from the Simonians, took their name from the particular diſciples of Simon. The ſecond were the followers of Adrian Hamſtead the anabaptiſt; and held ſome particular errors concerning Chriſt.

ADRIANOPLE, a city of Turkey in Europe, in the province of Romania, and the ſee of an archbiſhop under the patriarch of Conſtantinople. It is about ſeven or eight miles in circumference, including the old city and ſome gardens. The houſes are low, moſtly built of mud and clay, and ſome of brick: and the ſtreets are exceedingly dirty. The walls and towers are in a great meaſure fallen to decay. However, there is a beautiful bazar, or market, half a mile long, called Ali Baſſa. It is a vaſt arched building, with ſix gates, and 365 well furniſhed ſhops, kept by Turks, Armenians, and Jews, who pay five crowns a month for each ſhop. The number of inhabitants of all nations and religions may be about 100,000; but it is dear living here, becauſe the proviſions are brought from diſtant places. The air is wholeſome, and the country very pleaſant in the ſummer time, on account of the river and ſtreams that run near and about the city; the chief of which is the Mariza. Theſe promote and preſerve the verdure of the gardens, meadows, and fields, for a conſiderable part of the year. In the winter there is plenty of game. Near the principal bazar there is another, about a mile in length, covered with boards, with holes on each ſide to let in the light. It is full of good ſhops, which contain all kinds of commodities. Sultan Selim's moſque ſtands on the ſide of a hill, in the midſt of the city; and hence this magnificent ſtructure may be ſeen on all ſides. Every thing made of gold and ſilver, jewels, piſtols, ſcimitars, &c. are ſold in another part of the city, called by travellers the *bizeſtein*, though it differs little from a bazar. This contains about 200 ſhops, and is covered like the former: but the covering is ſupported by two rows of large pillars. The grand vizier's palace is nothing more than a convenient houſe, after the Turkiſh manner of building. The emperor's ſeraglio is a regular ſtructure, in a plain near the river Tungia. It is two miles in compaſs, and has ſeven gates, beſides thoſe of the gardens, which are ſeveral miles in circumference. The city is governed by a mullah cadi, who has an abſolute authority both in civil and criminal matters. In the time of the plague; or war, the grand ſignior ſometimes reſides here. The Turks took this city from the Greeks in 1362, and made it the capital of empire, till Mahomet II. took Conſtantinople in 1453. E. Long. 26. 27. N. Lat. 41. 41.

ADRIANUM (or ADRIATICUM) MARE, in *Ancient Geography*, now the gulf of Venice, a large bay in the Mediterranean, between Dalmatia, Sclavonia, Greece, and Italy. It is called by the Greeks Ἀδριας Κολπος; and *Adria* by the Romans, (as *Arbiter Adriæ Notus*, Hor.) Cicero calls it *Hadrianum Mare*; Virgil has *Hadriaticas Undas*. It is commonly called *Mare Adriaticum*, without an aſpiration; but whether it ought to have one, is a diſpute: if the appellation is from *Hadria*, the town of the Piceni, it muſt be written *Hadriaticum*, becauſe the emperor's name, who thence derives his origin, is on coins and ſtones *Hadrianus*; but if from the town in the territory of Venice, as the more ancient, and of which that of the Piceni is a colony, this will juſtify the common appellation *Adriaticum*.

Adrogation || Advent.

ADROGATION, in Roman antiquities, a ſpecies of adoption, whereby a perſon who was capable of chooſing for himſelf was admitted by another into the relation of a ſon. The word is compounded of *ad*, "to," and *rogare*, "to aſk;" on account of a queſtion put in the ceremony of it, Whether the adopter would take ſuch a perſon for his ſon? and another to the adoptive, Whether he conſented to become ſuch a perſon's ſon?

ADSIDELLA, in antiquity, the table at which the flamens ſat during the ſacrifices.

ADSTRICTION, among phyſicians, a term uſed to denote the rigidity of any part.

ADUACA, or ATUACA, anciently a large and famous city of the Tungri; now a ſmall and inconſiderable village, called *Tongeren*, in the biſhopric of Liege, to the north-weſt of the city of Liege, in the territory of Haſpengow, on the rivulet Jecker, that ſoon after falls into the Maeſe. E. Long. 5. 52. N. Lat. 50. 54.

ADVANCE, in the mercantile ſtyle, denotes money paid before goods are delivered, work done, or buſineſs performed.

ADVANCED, in a general ſenſe, denotes ſomething poſted or ſituated before another. Thus,

ADVANCED Ditch, in *Fortification*, is that which ſurrounds the glacis or eſplanade of a place.

ADVANCED Guard, or *Vanguard*, in the art of war, the firſt line or diviſion of an army, ranged or marching in order of battle; or, it is that part which is next the enemy, and marches firſt towards them.

ADVANCED Guard, is more particularly uſed for a ſmall party of horſe ſtationed before the main guard.

ADVANCER, among ſportſmen, one of the ſtarts or branches of a buck's attire, between the back antler and the palm.

ADUAR, in the Arabian and Mooriſh cuſtoms, a kind of ambulatory village, conſiſting of tents, which theſe people remove from one place to another, as ſuits their conveniency.

ADVENT, in the calendar, properly ſignifies the approach of the feaſt of the nativity. It includes four Sundays, which begins on St Andrew's day, or on the Sunday before or after it. During advent, and to the end of the octaves of epiphany, the ſolemnizing of marriage is forbidden without a ſpecial licenſe. It is appointed to employ the thoughts of Chriſtians on the firſt advent or coming of Chriſt in the fleſh, and his ſecond advent or coming to judge the world. The primitive Chriſtians practiſed great auſterity during this ſeaſon.

AD VENTREM INSPICIENDUM, in *Law*, a writ by which a woman is to be ſearched whether ſhe be with child by

Adventure. by a former huſband, on her withholding of lands from the next, failing iſſue of her own body.

ADVENTURE, in a general ſenſe, ſome extraordinary or accidental event. It alſo denotes a hazardous or difficult undertaking.

Bill of ADVENTURE, among *Merchants*, a writing ſigned by a merchant, teſtifying the goods mentioned in it to be ſhipped on board a certain veſſel belonging to another perſon, who is to run all hazards; the merchant only obliging himſelf to account to him for the produce.

Adventure Bay, in Van Diemen's land. "There is a beautiful ſandy beach, about two miles long, at the bottom of Adventure bay, formed to all appearance by the particles which the ſea waſhes from a fine white ſand-ſtone. This beach is very well adapted for hauling a ſeine. Behind it is a plain, with a brackiſh lake, out of which we caught, by angling, ſome bream and trout. The parts adjoining the bay are moſtly hilly, and are an entire foreſt of tall trees, rendered almoſt impaſſable by brakes of fern, ſhrubs, &c. The ſoil on the flat land, and on the lower part of the hills, is ſandy, or conſiſts of a yelloviſh earth, and in ſome parts of a reddiſh clay; but further up the hills, it is of a gray tough caſt. This country, upon the whole, bears many marks of being very dry, and the heat appears to be great. No mineral bodies, nor ſtones of any other kind than the white ſand-ſtone, were obſerved by us; nor could we find any vegetables that afforded ſubſiſtence for man. The foreſt trees are all of one kind, and generally quite ſtraight: they bear cluſters of ſmall white flowers. The principal plants obſerved, are wood-ſorrel, milkwort, cudweed, bell-flower, gladiolus, ſamphire, and ſeveral kinds of fern; the only quadruped, a ſpecies of opoſſum, about twice the ſize of a large rat. The kangooroo, found further northward in New Holland, may alſo be ſuppoſed to inhabit here, as ſome of the inhabitants had pieces of the ſkin of that animal.

"The principal ſorts of birds in the woods are brown hawks or eagles, crows, large pigeons, yelloviſh parroquets, and a ſpecies which they called *motacilla cyanea*, from the beautiful azure colour of its head and neck. On the ſhore were ſeveral gulls, black oyſtercatchers, or ſea pies, and plovers of a ſtone colour.

"The inhabitants ſeemed mild and cheerful, with little of that wild appearance that ſavages in general have. They are almoſt totally devoid of perſonal activity or genius, and are nearly upon a par with the wretched natives of Terra del Fuego. They diſplay, however, ſome contrivance in their method of cutting their arms and bodies in lines of different directions, raiſed above the ſurface of the ſkin. Their indifference for preſents, their general inattention and want of curioſity, were very remarkable, and teſtified no acuteneſs of underſtanding. Their complexion is a dull black, which they ſometimes heighten by ſmutting their bodies, as was ſuppoſed, from their leaving a mark behind on any clean ſubſtance. Their hair is perfectly woolly, and is clotted with greaſe and red ochre, like that of the Hottentots. Their noſes are broad and full, and the lower part of the face projects conſiderably. Their eyes are of a moderate ſize; and though they are not very quick or piercing, they give the countenance a frank, cheerful, and pleaſing caſt. Their teeth are not very white, nor well ſet, and their mouths are too wide: they wear their beards long, and clotted with paint. They are, upon the whole, well proportioned, though their belly is rather protuberant. Their favourite attitude is to ſtand with one ſide forward, and one hand graſping, acroſs the back, the oppoſite arm, which on this occaſion hangs down by the ſide that projects." *Cook's Voyages.* Adventurer of Adult.

ADVENTURER, in a general ſenſe, denotes one who hazards ſomething.

ADVENTURERS, is particularly uſed for an ancient company of merchants and traders, erected for the diſcovery of lands, territories, trades, &c. unknown. The ſociety of adventurers had its riſe in Burgundy, and its firſt eſtabliſhment from John duke of Brabant in 1248, being known by the name of *The brotherhood of St Thomas à Becket.* It was afterwards tranſlated into England, and ſucceſſively confirmed by Edward III. and IV. Richard III. Henry IV. V. VI. and VII. who gave it the appellation of *Merchant Adventurers.*

ADVERB, in *Grammar*, a particle joined to a verb, adjective, or participle, to explain their manner of acting or ſuffering; or to mark ſome circumſtance or quality ſignified by them. The word is formed from the prepoſition *ad*, "to," and *verbum*, "a verb;" and ſignifies literally a word joined to a verb, to ſhow how, when, or where, one is, does, or ſuffers; as, the boy paints *neatly*, writes *ill;* the houſe ſtands *there*, &c. See GRAMMAR.

ADVERSARIA, among the ancients, a book of accounts, not unlike our journals, or day books. It is more particularly uſed for a kind of common-place book. See COMMON-PLACE BOOK.

ADVERSATIVE, in *Grammar*, a word expreſſing ſome difference between what goes before and what follows it. Thus, in the phraſe, *he is an honeſt man, but a great enthuſiaſt*, the word *but* is an adverſative conjunction.

ADVERSATOR, in *Antiquity*, a ſervant who attended the rich in returning from ſupper, to give them notice of any obſtacles in the way, at which they might be apt to ſtumble.

ADVERTISEMENT, in a general ſenſe, denotes any information given to perſons intereſted in an affair; and is more particularly uſed for a brief account of an affair inſerted in the public papers, for the information of all concerned.

ADULA, in *Ancient Geography*, a mountain in Rhætia, or the country of the Griſons, part of the Alps, in which are the fountains of the Rhine; now *St Gothards.*

ADULE, or ADULIS, in *Ancient Geography*, a town of Egypt built by fugitive ſlaves, diſtant from its port on the Red ſea 20 ſtadia. Pliny calls the inhabitants *Adulitæ.* The epithet is either *Adulitanus;* as, *Monumentum Adulitanum*, on the pompous inſcription of the ſtatue of Ptolemy Euergetes, publiſhed by Leo Alatius, at Rome in 1631, and to be found in Spon and Thevenot: or, *Adulicus;* as *Adulicus Sinus*, a part of the Red ſea.

ADULT, an appellation given to any thing that is arrived at maturity: Thus we ſay, an adult perſon, an adult plant, &c. Among civilians, it denotes a youth between 14 and 25 years of age.

ADULTERER,

Adulterer || Adulterine.

ADULTERER, a man who commits adultery. See ADULTERY.

ADULTERESS, a woman guilty of ADULTERY. An adulteress, by our law, undergoes no temporal punishment whatever, except the loss of her dower; and she does not lose even that, if her husband is weak enough to be reconciled to her, and cohabit with her after the offence committed. 13 Ed. I. cap. 34.

But it is to be observed, that adulteresses are such either by the canon or civil law. According to the former, a woman is an adulteress who, either being herself married, converses carnally with another man; or being single herself, converses with a man that is married. According to the latter, she is not an adulteress, if she be not herself in the married state, though she converses with a man that is. The crime, in this case, was more properly called *stuprum* than *adulterium*. Hence, among the Romans the word *adultera*, "adulteress," differed from *pellex*, which denoted a single woman who cohabited with a married man: and *pellex* differed from *concubina*, which signified her who had only intercourse with an unmarried man. The former was reputed infamous, and the other innocent.

ADULTERATION, the act of debasing, by an improper mixture, something that was pure and genuine.

The word is Latin, formed of the verb *adulterare*, "to corrupt," by mingling something foreign to any substance. We have laws against the adulteration of coffee, tea, tobacco, snuff, wine, beer, bread, wax, hairpowder, &c.

ADULTERATION of coin, properly imports the making or casting of a wrong metal, or with too base or too much alloy.

Adulterations of coins are effected divers ways: as, by forging another stamp or inscription; by mixing impure metals with the gold or silver: most properly, by making use of a wrong metal, or an undue alloy, or too great an admixture of the baser metals with gold or silver. Counterfeiting the stamp, or clipping and lessening the weight, do not so properly come under the denomination of *adulterating*.—Evelyn gives rules and methods, both of adulterating and detecting adulterated metals, &c.—*Adulterating* is somewhat less extensive than *debasing*, which includes diminishing, clipping, &c.

To adulterate or debase the current coin, is a capital crime in all nations.—The ancients punished it with great severity: among the Egyptians both hands were cut off: and by the civil law, the offender was thrown to wild beasts. The emperor Tacitus enacted, That counterfeiting the coin should be capital; and under Constantine it was made treason, as it is also among us. The adulterating of gems is a curious art, and the methods of detecting it no less useful. Nichols Lapid. p. 18.

ADULTERINE, in the *Civil Law*, is particularly applied to a child issued from an adulterous amour or commerce. Adulterine children are more odious than the illegitimate offspring of single persons.—The Roman law even refuses them the title of natural children; as if nature disowned them.—Adulterine children are not easily dispensed with for admission to orders. Those are not deemed adulterine, who are begotten of a woman openly married, through ignorance of a former wife being alive.—By a decree of the parliament of Paris, adulterine children are declared not legitimated by the subsequent marriage of the parties, even though a papal dispensation be had for such marriage, wherein is a clause of legitimation. Adultery.

ADULTERINE Marriages, in St Augustine's sense, denote second marriages, contracted after a divorce.

ADULTERY, an unlawful commerce between one married person and another, or between a married and unmarried person.

Punishments have been annexed to adultery in most ages and nations, though of different degrees of severity. In many it has been capital; in others venial, and attended only with slight pecuniary mulcts. Some of the penalties are serious, and even cruel; others of a jocose and humorous kind. Even contrary things have been enacted as punishments for adultery. By some laws, the criminals are forbidden marrying together, in case they became single; by others, they are forbidden to marry any besides each other; by some, they are incapacitated from ever committing the like crime again; by others, they are glutted with it till it becomes downright nauseous.

Among the rich Greeks, adulterers were allowed to redeem themselves by a pecuniary fine; the woman's father, in such cases, returned the dower he had received from her husband, which some think was refunded by the adulterer. Another punishment among those people was, putting out the eyes of adulterers.

The Athenians had an extraordinary way of punishing adulterers, called παραλιλμος ανασαιδωσις, practised at least on the poorer sort who were not able to pay the fines. This was an awkward sort of empalement, performed by thrusting one of the largest radishes up the anus of the adulterer, or, in defect thereof, a fish with a large head, called *mugil*, "mullet." Alcæus is said to have died this way, though it is doubted whether the punishment was reputed mortal. Juvenal and Catullus speak of this custom as received also among the Romans, though not authorized by an express law as it was among the Greeks.

There are various conjectures concerning the ancient punishment of adultery among the Romans. Some will have it to have been made capital by a law of Romulus, and again by the twelve tables. Others, that it was first made capital by Augustus; and others, not before the emperor Constantine. The truth is, the punishment in the early days was very various, much being left to the discretion of the husband and parents of the adulterous wife, who exercised it differently, rather with the silence and countenance of the magistrate than any formal authority from him. Thus we are told, the wife's father was allowed to kill both parties, when caught in the fact, provided he did it immediately, killed both together, and as it were with one blow. The same power ordinarily was not indulged the husband, except the crime were committed with some mean or infamous person; though, in other cases, if his rage carried him to put them to death, he was not punished as a murderer. On many occasions, however, revenge was not carried so far; but mutilating, castrating, cutting off the ears, noses, &c. served the turn. The punishment allotted by the *lex Julia*, was not, as many have imagined, death; but rather banishment, or deportation, being interdicted fire and water: though

Adultery. Octavius appears, in ſeveral inſtances, to have gone beyond his own law, and to have put adulterers to death. Uader Macrinus, many were burnt at a ſtake. Conſtantine firſt by law made the crime capital. Under Conſtantius and Conſtans, adulterers were burnt, or ſewed in ſacks and thrown into the ſea. Under Leo and Marcian, the penalty was abated to perpetual baniſhment, or cutting off the noſe. Under Juſtinian, a farther mitigation was granted, at leaſt in favour of the wife, who was only to be ſcourged, loſe her dower, and be ſhut up in a monaſtery: after two years, the huſband was at liberty to take her back again; if he refuſed, ſhe was ſhaven, and made a nun for life: But it ſtill remained death in the huſband. The reaſon alleged for this difference is, that the woman is the weaker veſſel. Matthæus declaims againſt the empreſs Theodora, who is ſuppoſed to have been the cauſe of this law, as well as of others procured in favour of that ſex from the emperor.

Under Theodoſius, women convicted of this crime were puniſhed after a very ſingular manner, viz. by a public conſtupration; being locked up in a narrow cell, and forced to admit to their embraces all the men that would offer themſelves. To this end, the gallants were to dreſs themſelves on purpoſe, having ſeveral little bells faſtened to their clothes, the tinkling of which gave notice to thoſe without of every motion. This cuſtom was again aboliſhed by the ſame prince.

By the Jewiſh law, adultery was puniſhed by death in both parties, where they were both married, or only the woman. The Jews had a particular method of trying, or rather purging, an adultereſs, or a woman, ſuſpected of the crime, by making her drink the bitter waters of jealouſy; which, if ſhe were guilty, made her ſwell.

Among the Mingrelians, according to Chardin, adultery is puniſhed with the forfeiture of a hog, which is uſually eaten in good friendſhip between the gallant, the adultereſs, and the cuckold. In ſome parts of the Indies, it is ſaid any man's wife is permitted to proſtitute herſelf to him who will give an elephant for the uſe of her; and it is reputed no ſmall glory to her to have been rated ſo high. Adultery is ſaid to be ſo frequent in Ceylon, that not a woman but practiſes it, notwithſtanding its being puniſhable with death. Among the Japaneſe, and divers other nations, adultery is only penal in the woman. Among the Abyſſinians, the crime of the huſband is ſaid to be only puniſhed on the innocent wife. In the Marian iſlands, on the contrary, the woman is not puniſhable for adultery; but if the man go aſtray he pays ſeverely: the wife and her relations waſte his lands, turn him out of his houſe, &c. Among the Chineſe, there is reaſon to conclude that adultery is not capital; for it is ſaid that fond parents will make a contract with their daughters future huſbands to allow them the indulgence of a gallant.

In Spain, they puniſhed adultery in men by cutting off that part which had been the inſtrument of the crime. In Poland, before Chriſtianity was eſtabliſhed, they puniſhed adultery and fornication in a very particular manner: the criminal they carried to the market-place, and there faſtened him by the teſticles with a nail; laying a razor within his reach, and leaving him under a neceſſity, either of doing juſtice upon himſelf, or of periſhing in that condition.

The Saxons formerly burnt the adultereſs, and over her aſhes erected a gibbet, whereon the adulterer was hanged. In this kingdom, likewiſe, adultery, by the ancient laws, was ſeverely puniſhed. King Edmund the Saxon ordered adultery to be puniſhed in the ſame manner as homicide; and Canute the Dane ordered that a man who committed adultery ſhould be baniſhed, and that the woman ſhould have her noſe and ears cut off. In the time of Henry I. it was puniſhed with the loſs of eyes and genitals. Adultery.

In Britain, adultery is reckoned a ſpiritual offence, that is, cognizable by the ſpiritual courts, where it is puniſhed by fine and penance. The common law takes no farther notice of it, than to allow the party grieved an action and damages. This practice is often cenſured by foreigners, as making too light of a crime, the bad conſequences of which, public as well as private, are ſo great. It has been anſwered, that perhaps this penalty, by civil action, is more wiſely calculated to prevent the frequency of the offence, which ought to be the end of all laws, than a ſeverer puniſhment. He that by a judgement of law is, according to circumſtances, ſtripped of great part of his fortune, thrown into priſon till he can pay it, or forced to fly his country, will, no doubt, in moſt caſes, own that he pays dearly for his amuſement.

As to the moral turpitude of this offence, ſome have vainly endeavoured to deny or explain it away by various arguments, and even by an appeal to Scripture. On the part of the *man* who ſolicits the chaſtity of a married woman, it certainly includes the crime of SEDUCTION, and is attended with miſchief ſtill more complicated and extenſive: It creates a new ſufferer, the injured huſband, upon whoſe ſimplicity and affection is inflicted a wound the moſt painful and incurable that human nature knows. The infidelity of the *woman* is aggravated by cruelty to her children, who are generally involved in their parents ſhame, and always made unhappy by their quarrel.

It has been argued, that theſe conſequences ought leſs to be attributed to the crime than to the diſcovery. But, in the firſt place, the crime could not be diſcovered unleſs it were committed, and the commiſſion is never ſecure from diſcovery. 2dly, If adulterous connections were allowable whenever the parties could hope to eſcape detection, which is the concluſion to which this argument leads, the huſband would be left no other ſecurity for his wife's chaſtity, than in her want of opportunity or temptation; which would probably deter moſt men from marrying; or render marriage a ſtate of continual jealouſy and alarm to the huſband, which would end in the ſlavery and confinement of the wife.

The marriage vow is "witneſſed before God," and accompanied with circumſtances of ſolemnity and religion which approach to the nature of an oath. The married offender, therefore, incurs a crime little ſhort of perjury, and the ſeduction of a married woman is little leſs than ſubornation of perjury:—and this guilt is independent of the diſcovery.

But the uſual apology for adultery is the prior tranſgreſſion of the other party; and ſo far, indeed, as the bad effects of adultery are anticipated by the conduct of the huſband or wife who offends firſt, the guilt of the ſecond offender is extenuated. But this can never

amount

Adultery.

amount to a justification; unless it could be shown that the obligation of the marriage vow depends upon the condition of reciprocal fidelity; a construction which appears founded neither in expediency, nor in the terms of the vow, nor in the design of the legislature which prescribed the marriage rite. The way of considering the offence upon the footing of *provocation and retaliation*, is a childish trifling with words.

"Thou shalt not commit adultery," was an interdict delivered by God himself; yet Scripture has been adduced as giving countenance to the crime. As Christ told the woman taken in adultery, "Neither do *I condemn thee*," we must believe, it is said, that he deemed her conduct either not criminal, or at least not a crime of the heinous nature we represent it to be. But from a more attentive examination of the case, it will be evident that nothing can be concluded from it favourable to such an opinion. The transaction is thus related *: 'Early in the morning Jesus came again into the temple, and all the people came unto him; and he sat down and taught them. And the Scribes and Pharisees brought unto him a woman taken in adultery; and when they had set her in the midst, they say unto him, Master, this woman was taken in adultery in the very act. Now Moses in the law commanded us that such should be stoned, but what sayest thou? This they said, tempting him, that they might have to accuse him. But Jesus stooped down, and with his finger wrote on the ground, as though he heard them not. So when they continued asking him, he lifted up himself, and said unto them, He that is without sin amongst you, let him first cast a stone at her; and again he stooped down and wrote on the ground: and they which heard it, being convicted by their own conscience, went out one by one, beginning at the eldest, even unto the last; and Jesus was left alone, and the woman standing in the midst. When Jesus had lifted up himself, and saw none but the woman, he said unto her, Woman, where are those thine accusers? Hath no man condemned thee? She said, No man, Lord: and Jesus said unto her, *Neither do I condemn thee;* go and sin no more.'

* *St John's Gospel*, chap. viii.

'This they said tempting him, that they might have to accuse him;' that is, to draw him into an exercise of judicial authority, that they might have to accuse him before the Roman governor of usurping or intermeddling with the civil government.

Paley's Moral and Political Philosophy, p. 258 3d edit. 4to.

"This was their design; and Christ's behaviour throughout the whole affair proceeded from a knowledge of this design, and a determination to defeat it. He gives them at first a cold and sullen reception, well suited to the insidious intention with which they came: 'he stooped down, and with his finger wrote on the ground as though he heard them not.' 'When they '*continued* asking him,' when they teased him to speak, he dismissed them with a rebuke, which the impertinent malice of their errand, as well as the secret character of many of them, deserved: 'he that is without sin (that is, this sin) among you, let him first 'cast a stone at her.' This had its effect. Stung with the reproof, and disappointed of their aim, they stole away one by one, and left Jesus and the woman alone. And then follows the conversation, which is the part of the narrative most material to our present subject. 'Jesus saith unto her, Woman, where are 'those thine accusers? Hath no man condemned thee? 'She said, No man, Lord. And Jesus said unto her, 'Neither do I condemn thee; go and sin no more.' Now, when Christ asked the woman, 'Hath no man '*condemned* thee?" he certainly spoke, and was understood by the woman to speak, of a legal and judicial condemnation; otherwise her answer, 'No man, Lord,' was not true. In every other sense of condemnation, as blame, censure, reproof, private judgement, and the like, many had condemned her; all those, indeed, who brought her to Jesus. If then a judicial sentence was what Christ meant by *condemning* in the question, the common use of language requires us to suppose that he meant the same in his reply, 'Neither do I con'demn thee:' i. e. I pretend to no judicial character or authority over thee; it is no office or business of mine to pronounce or execute the sentence of the law. When Christ adds, 'Go and sin no more,' he in effect tells her that she had sinned already; but as to the degree or quality of the sin, or Christ's opinion concerning it, nothing is declared, or can be inferred, either way."

Adultery.

It has been controverted, whether adultery may be lawfully committed in war, with the enemies wives? The answer is in the negative, and the authorized practice of civilized nations is agreeable to this. It has also been a famous question, whether it be lawful for a woman to commit adultery with the consent of her husband, and for the procuring some great good to him? St Austin apparently allows of it; at least, does not condemn it *.

* *De Serm. Dom. in Mont.* lib. i. cap. 16. § 49. *et De Civ. Dei*, lib. xvi. cap. 25.

It has likewise been a dispute, whether it be lawful for one of the parties married to commit adultery, with the consent of the other, for the sake of having children? Of which we have instances in Abraham, who, on this account, conversed with Hagar; and likewise among the Greeks and Romans. Pollman, a German professor, has a dissertation on the husband's right to alienate his wife's body to another's use.

It is much disputed, whether adultery dissolves the bond of matrimony, and be a sufficient cause of divorce, so that the parties may marry again. This was allowed in the ancient church, and is still continued in the Greek, as well as the Lutheran and Calvinist churches. Romanists, however, disallow of it, and the council of Trent even anathematized those who maintain it; though the canon of anathematization was mitigated in deference to the republic of Venice, in some of whose dominions, as Zant, Cephalonia, &c. the contrary usage obtains. The ecclesiastical courts in England so far agree with the Papists, that they only grant a divorce *à mensa et thoro*, in case of adultery; so that a complete divorce, to enable the parties to marry again, cannot be had without an act of parliament.

ADULTERY is also used in ancient customs, for the punishment or fine imposed for that offence, or the privilege of prosecuting for it. In which sense, *adulterium* amounts to the same with what the Saxons call *legerwita*.

ADULTERY is sometimes used in a more extensive sense, for any species of impurity or crime against the virtue of chastity; and in this sense divines understand the seventh commandment.

Adultery, Advocate.

ADULTERY is alſo uſed, eſpecially in Scripture, for idolatry, or departing from the true God to the worſhip of a falſe one.

ADULTERY is alſo uſed, in eccleſiaſtical writers, for a perſon's invading or intruding into a biſhopric during the former biſhop's life. The reaſon of the appellation is, that a biſhop is ſuppoſed to contract a kind of ſpiritual marriage with his church. The tranſlation of a biſhop from one ſee to another was alſo reputed a ſpecies of adultery; on the ſuppoſition of its being a kind of ſecond marriage, which, in thoſe days, was eſteemed a degree of adultery. This concluſion was founded on that text of St Paul, *Let a biſhop be the huſband of one wife*, by a forced conſtruction of church for wife, and of biſhop for huſband. (Du Cange).

ADULTERY is alſo uſed by ancient naturaliſts, for the act of ingrafting one plant upon another. In which ſenſe, Pliny ſpeaks of the adulteries of trees, *arborum adulteria*, which he repreſents as contrary to nature, and a piece of luxury or needleſs refinement.

ADVOCATE, among the Romans, a perſon ſkilled in their law, who undertook the defence of cauſes at the bar. The Roman advocates anſwered to one part of the office of a barriſter in England, viz. the pleading part; for they never gave counſel, that being the buſineſs of the *juriſconſulti*.

The Romans, in the firſt ages of their ſtate, held the profeſſion of an advocate in great honour; and the ſeats of their bar were crowded with ſenators and conſuls; they, whoſe voices commanded the people, thinking it an honour to be employed in defending them. They were ſtyled *comites*, *honorati*, *clariſſimi*, and even *patroni*; as if their clients were not leſs obliged to them than freed men to their maſters. The bar was not at that time venal. Thoſe who aſpired to honours and offices took this way of gaining an intereſt in the people, and always pleaded *gratis*. But no ſooner were luxury and corruption introduced into the commonwealth, than the bar became a ſharer in them. Then it was that the ſenators let out their voices for pay, and zeal and eloquence were ſold to the higheſt bidder. To put a ſtop to this abuſe, the tribune Cincius procured a law to be paſſed, called from him *Lex Cincia*, whereby the advocates were forbid to take any money of their clients. It had before this been prohibited the advocates to take any preſents or gratuities for their pleading. The emperor Auguſtus added a penalty to it: notwithſtanding which, the advocates played their part ſo well, that the emperor Claudius thought it an extraordinary circumſtance, when he obliged them not to take above eight great ſeſterces, which are equivalent to about 64l. ſterling, for pleading each cauſe.

ADVOCATE is ſtill uſed in countries and courts where the civil law obtains, for thoſe who plead and defend the cauſes of clients truſted to them.

ADVOCATE of a city, in the German polity, a magiſtrate appointed in the emperor's name to adminiſter juſtice.

ADVOCATE is more particularly uſed in church hiſtory, for a perſon appointed to defend the rights and revenues of a church or religious houſe. The word *advocatus*, or *advowee*, is ſtill retained for what we uſually call the *patron*, or he who has the advowſon, or right of preſentation in his own name.

Advocate.

Conſiſtorial ADVOCATES; officers of the conſiſtory at Rome, who plead in all oppoſitions to the diſpoſal of benefices in that court: they are ten in number.

Elective ADVOCATES, thoſe choſen by the abbot, biſhop, or chapter; a particular licenſe being had from the king or prince for that purpoſe. The elections were originally made in the preſence of the count of the province.

Feudal ADVOCATES. Theſe were of the military kind, who, to make them more zealous for the intereſt of the church, had lands granted them in fee, which they held of the church, and did homage, and took an oath of fidelity to the biſhop or abbot. Theſe were to lead the vaſſals of the church to war, not only in private quarrels of the church itſelf, but in military expeditions for the king's ſervice, in which they were the ſtandard-bearers of their churches.

Fiſcal ADVOCATE, *fiſci advocatus*, in Roman antiquity, an officer of ſtate under the Roman emperors, who pleaded in all cauſes wherein the *fiſcus*, or private treaſury, was concerned.

Juridical ADVOCATES, in the middle age, were thoſe who from attending cauſes in the court of the *comes*, or count of the province, became judges themſelves, and held courts of their vaſſals thrice a-year, under the name of the *tria placita generalia*. In conſideration of this further ſervice, they had a particular allowance of one-third part of all fines, or mulcts, impoſed on defaulters, &c. beſides a proportion of diet for themſelves and ſervants.

Matricular ADVOCATES, were the advocates of the mother or cathedral churches.

Military ADVOCATES, thoſe appointed for the defence of the church, rather by arms and authority than by pleading and eloquence. Theſe were introduced in the times of confuſion, when every perſon was obliged to maintain his own property by force; biſhops and abbots not being permitted to bear arms, and the ſcholaſtic or gowned advocates being equally unacquainted with them, recourſe was had to knights, noblemen, ſoldiers, or even to princes.

Nominative ADVOCATES, thoſe appointed by a king or pope. Sometimes the churches petitioned kings, &c. to appoint them an advocate: at other times this was done of their own accord. By ſome regulations, no perſon was capable of being elected advocate, unleſs he had an eſtate in land in the ſame county.

Regular ADVOCATES, thoſe duly formed and qualified for their profeſſion, by a proper courſe of ſtudy, the requiſite oath, ſubſcription, licenſe, &c.

Subordinate ADVOCATES, thoſe appointed by other ſuperior ones, acting under them, and accountable to them. There were various reaſons for the creation of theſe ſubordinate advocates; as, the ſuperior quality of the principal advocate, his being detained in war, or being involved in other affairs; but chiefly the too great diſtance of ſome of the church lands, and their lying in the dominions of foreign princes.

Supreme or *Sovereign* ADVOCATES, were thoſe who had the authority in chief; but acted by deputies or ſubordinate advocates. Theſe were called alſo *principal*, *greater*, and ſometimes *general* advocates. Such in many caſes were kings, &c. when either they had been choſen advocates, or became ſuch by being founders or endowers of churches. Princes had alſo

Advocate, Advocation.

another title to advocateſhip, ſome of them pretending to be *advocati nati* of the churches within their dominions.

Advocates, in the Engliſh courts, are more generally called *counſel*. See Counsel.

Faculty of Advocates, in Scotland, a reſpectable body of lawyers, who plead in all cauſes before the courts of ſeſſion, juſticiary, and exchequer. They are alſo entitled to plead in the houſe of peers, and other ſupreme courts in England.

In the year 1680, the faculty founded a library upon a very extenſive plan, ſuggeſted by that learned and eminent lawyer Sir George M'Kenzie of Roſehaugh, advocate to King Charles II. and King James VII. who enriched it with many valuable books. It has been daily increaſing ſince that time, and now contains not only the beſt collection of law books in Europe, but a very large and ſelect collection of books in all ſubjects. Beſides, this library contains a great number of original manuſcripts, and a vaſt variety of Jewiſh, Grecian, Roman, Scots, and Engliſh coins and medals.

A candidate for the office of an advocate undergoes three ſeveral trials: The firſt is in Latin, upon the civil law and Greek and Roman antiquities; the ſecond, in Engliſh, upon the municipal law of Scotland; and, in the third, he is obliged to defend a Latin theſis, which is impugned by three members of the faculty. Immediately before putting on the gown, the candidate makes a ſhort Latin ſpeech to the lords, and then takes the oaths to the government and *de fideli*.

The faculty at preſent conſiſts of above 200 members. As an advocate or lawyer is eſteemed the genteeleſt profeſſion in Scotland, many gentlemen of fortune take the degree of advocate, without having any intention of practiſing at the bar. This circumſtance greatly increaſes their number, gives dignity to the profeſſion and enriches their library and public fund. It is from this reſpectable body that all vacancies on the bench are generally ſupplied.

Lord Advocate, or *King's Advocate*, one of the eight great officers of ſtate in Scotland, who as ſuch ſat in parliament without election. He is the principal crown lawyer in Scotland. His buſineſs is to act as a public proſecutor, and to plead in all cauſes that concern the crown; but particularly in ſuch as are of a criminal nature. The office of king's advocate is not very ancient: It ſeems to have been eſtabliſhed about the beginning of the 16th century. Originally he had no power to proſecute crimes without the concurrence of a private party; but, in the year 1597, he was empowered to proſecute crimes at his own inſtance. He has the privilege of pleading in court with his hat on. This privilege was firſt granted to Sir Thomas Hope; who having three ſons lords of ſeſſion, it was thought indecent that the father ſhould plead uncovered before the ſons, who as judges ſat covered.

Bill of ADVOCATION, in *Scots Law*, a writing drawn up in the form of a petition; whereby a party, in an action before an inferior court, applies to the ſupreme court, or court of ſeſſion, for calling the action from the inferior court before itſelf.

Letters of Advocation, in *Scots Law*, the decree or warrant of the court of ſeſſion upon cognizance of the facts ſet forth in the bill, drawn up in the form of a ſummons, and paſſing under the ſignet, diſcharging the inferior judge and all others from further procedure in the cauſe, and advocating it to itſelf. Advowee.

ADVOWEE, in ancient cuſtoms and law books, denotes the advocate of a church, religious houſe, or the like. There were advowees of cathedrals, abbeys, monaſteries, &c. Thus, Charlemagne had the title of advowee of St Peters; King Hugh, of St Riquier; and Bolandus mentions ſome letters of Pope Nicholas, by which he conſtituted King Edward the Confeſſor, and his ſucceſſors, advowees of the monaſtery at Weſtminſter, and of all the churches in England. Theſe advowees were the guardians, protectors, and adminiſtrators of the temporal concerns of the churches, &c. and under their authority were paſſed all contracts which related to them. It appears alſo, from the moſt ancient charters, that the donations made to churches were conferred on the perſons of the advowees. They always pleaded the cauſes of the churches in court, and diſtributed juſtice for them, in the places under their juriſdiction. They alſo commanded the forces furniſhed by their monaſteries, &c. for the war; and even were their champions, and ſometimes maintained duels for them.

This office is ſaid to have been firſt introduced in the fourth century, in the time of Stillico; though the Benedictines do not fix its origin before the eighth century. By degrees, men of the firſt rank were brought into it, as it was found neceſſary either to defend with arms or to protect with power and authority. In ſome monaſteries they were only called *conſervators*; but theſe, without the name, had all the functions of advowees. There were alſo ſometimes ſeveral ſub-advowees, or ſub-advocates, in each monaſtery, who officiated inſtead of the advowees themſelves; which, however, proved the ruin of monaſteries; thoſe inferior officers running into great abuſes.

Hence alſo, huſbands, tutors, and every perſon in general, who took upon him the defence of another, were denominated *advowees*, or advocates. Hence ſeveral cities had their advowees; which were eſtabliſhed long after the eccleſiaſtical ones, and doubtleſs from their example. Thus we read in hiſtory of the advowees of Augſburg, of Arras, &c.

The *vidames* aſſumed the quality of advowees; and hence it is, that ſeveral hiſtorians of the eighth century confound the two functions together. Hence alſo it is, that ſeveral ſecular lords in Germany bear mitres for their creſts, as having anciently been advowees of the great churches.

Spelman diſtinguiſhes two kinds of eccleſiaſtical advowees.—The one, of cauſes or proceſſes, *advocati cauſarum*; the other, of territory or lands, *advocati ſoli*. The former were nominated by the king, and were uſually lawyers, who undertook to plead the cauſes of the monaſteries. The other, which ſtill ſubſiſt, and are ſometimes called by their primitive name, *advowees*, though more uſually *patrons*, were hereditary; as being the founders and endowers of churches, &c. or their heirs.

Women were ſometimes advowees, *advocatiſſæ*. And, in effect, the canon law mentions ſome who had this title, and who had the ſame right of preſentation, &c. in their churches which the advowees themſelves had.

In

Advowſon, Aduſt.

In a ſtat. 25 Edw. III. we meet with *advowee paramount* for the higheſt patron; that is, the king.

ADVOWSON, or ADVOWZEN, in *Common Law*, ſignifies a right to preſent to a vacant benefice. Advowſon is ſo called, becauſe the right of preſenting to the church was firſt gained by ſuch as were founders, benefactors, or maintainers of the church.

Though the nomination of fit perſons to officiate in every dioceſe was originally in the biſhop, yet they were content to let the founders of churches have the nomination of the perſons to the churches ſo founded, reſerving to themſelves a right to judge of the fitneſs of the perſons nominated.

Advowſons formerly were moſt of them appendant to manors, and the patrons were parochial barons: the lordſhip of the manor and patronage of the church were ſeldom in different hands, until advowſons were given to religious houſes. But of late times the lordſhip of the manor and advowſon of the church have been divided.

Advowſons are *preſentative*, *collative*, or *donative*: *preſentative*, where the patron preſents or offers his clerk to the biſhop of the dioceſe, to be inſtituted in his church; *collative*, where the benefice is given by the biſhop, as original patron thereof, or by means of a right he has acquired by lapſe; *donative*, as where the king or other patron does, by a ſingle donation in writing, put the clerk into poſſeſſion, without preſentation, inſtitution, or induction.

Sometimes, anciently, the patron had the ſole nomination of the prelate, abbot, or prior; either by inveſtiture (*i. e.* delivery of a paſtoral ſtaff), or by direct preſentation to the dioceſan; and if a free election was left to the religious, yet a *congé d'elire*, or licenſe of election, was firſt to be obtained of the patron, and the perſon elected was confirmed by him. If the founder's family became extinct, the patronage of the convent went to the lord of the manor. Unleſs the ſeveral colleges in the univerſities be reſtrained in the number of advowſons they may receive, it is argued they will in time acquire ſuch a ſtock as to fruſtrate the deſign of their foundation (which is the education of youth), by creating too quick a ſucceſſion of fellows; ſo that there will not be in the colleges a ſufficient number of perſons of competent age, knowledge, and experience, to inſtruct and form the minds of the youth. In ſome colleges the number of advowſons is ſaid to be already two-thirds, or more, of the number of fellows. It is objected, on the other ſide, that the ſucceſſion of fellows may be too ſlow as well as too quick; whereby perſons well qualified may be detained ſo long in colleges as not to have ſtrength or activity enough left for the diſcharge of parochial functions.

Colleges holding more advowſons in number than a moiety of the fellows, are not capable of purchaſing more. Grants of advowſons by Papiſts are void. 9 Geo. II. c. 36. § 5. 11 Geo. II. c. 17. § 5.

Advowſons are temporal inheritances and lay fees; they may be granted by deed or will, and are aſſets in the hands of heirs or executors. Preſentations to advowſons for money, or other reward, are void. 31 Eliz. cap. 6.

In Scotland, this right is called *patronage*. See PATRONAGE.

ADUST, ADUSTUS, among phyſicians, &c. is applied to ſuch humours as by long heat become of a hot and fiery nature. Such is choler ſuppoſed to be. Melancholy is uſually conſidered as black and aduſt bile. Blood is ſaid to be aduſt, when, by reaſon of ſome extraordinary heat, its more ſubtle parts are all evaporated, leaving the groſſer, with all the impurities therein, half torrified,

Ady
ſi
Æacus.

ADY, in *Natural Hiſtory*, a name given to the palm tree of the iſland of St Thomas. It is a tall tree with a thick, bare, upright ſtem, growing ſingle on its root, of a thin light timber, and full of juice. The head of this tree ſhoots into a vaſt number of branches, which being cut off, or an inciſion being made therein, afford a great quantity of ſweet juice, which fermenting ſupplies the place of wine among the Indians. The fruit of this tree is called by the Portugueſe *caryoces* and *carioſſe*; and by the black natives, *abanga*. This fruit is of the ſize and ſhape of a lemon; and contains a kernel, which is good to eat. The fruit itſelf is eaten roaſted, and the raw kernels are often mixed with mandioc meal. Theſe kernels are ſuppoſed very cordial. An oil is alſo prepared from this fruit, which anſwers the purpoſe of oil or butter. This oil is alſo uſed for anointing ſtiff and contracted parts of the body.

ADYNAMIA, in *Medicine*, of α privative, and δυναμις *ſtrength*, want of power, debility, or weakneſs, from ſickneſs.

ADYNAMIÆ, the ſecond claſs of Dr Cullen's noſological arrangement, which includes thoſe diſeaſes in which the involuntary motions, whether vital or natural, are diminiſhed.

ADYNAMON, among ancient phyſicians, a kind of weak factitious wine, prepared from muſt boiled down with water; to be given to patients to whom genuine wine might be hurtful.

ADYTUM, in Pagan antiquity, the moſt retired and ſacred place of temples, into which none but the prieſts were allowed to enter. The *Sanctum Sanctorum* of the temple of Solomon was of the nature of the pagan adytum, none but the high prieſt being admitted into it, and he but once a-year.

ADZE, or ADDICE, a cutting tool of the axe kind; having its blade made thin and arching, and its edge at right angles to the handle; chiefly uſed for taking off thin chips of timber or boards, and for paring away certain irregularities which the axe cannot come at. The adze is uſed by carpenters, but more by coopers, as being convenient for cutting the hollow ſides of boards, &c. It is ground from a baſe on its inſide to its outer edge; ſo that, when it is blunt, they cannot conveniently grind it without taking its helve out of the eye.

AE, or Æ, a diphthong compounded of A and E. Authors are by no means agreed as to the uſe of the *æ* in Engliſh words. Some, out of regard to etymology, inſiſt on its being retained in all words, particularly technical ones, borrowed from the Greek and Latin; while others, from a conſideration that it is no proper dipbthong in our language, its ſound being no other than that of the ſimple *e*, contend that it ought to be entirely diſuſed; and, in fact, the ſimple *e* has of late been adopted inſtead of the Roman *æ*, as in the word *equator*, &c.

ÆACEA, in Grecian antiquity, ſolemn feſtivals and games celebrated at Ægina, in honour of Æacus.

ÆACUS, the ſon of Jupiter by Ægina. When

Ædile
||
Ægagropila.

Æbudæ
||
Ædile.

the isle of Ægina was depopulated by a plague, his father, in compassion to his grief, changed all the ants upon it into men and women, who were called *Myrmidones*, from μυρμηξ, *an ant*. The foundation of the fable is said to be, that when the country had been depopulated by pirates, who forced the few that remained to take shelter in caves, Æacus encouraged them to come out, and by commerce and industry recover what they had lost. His character for justice was such, that, in a time of universal drought, he was nominated by the Delphic oracle to intercede for Greece, and his prayer was answered. See the article ÆGINA. The Pagans also imagined that Æacus, on account of his impartial justice, was chosen by Pluto one of the three judges of the dead; and that it was his province to judge the Europeans.

ÆBUDÆ, a name anciently given to the Western islands of Scotland.

ÆBURA, in *Ancient Geography*, a town of Spain, in Estremadura, on the river Guadiana, to the west of Merida; now called *Talavera*. W. Long. 7. 15. N. Lat. 38. 40.

ÆCHMALOTARCHA, in Jewish antiquity, a title given to the principal leader or governor of the Hebrew captives residing in Chaldea, Assyria, and the neighbouring countries. This magistrate was called by the Jews, *rosch-galath*, i. e. the chief of the captivity: but the above term, of like import in the Greek, is that used by Origen and others who wrote in the Greek tongue.

The Jewish writers assure us, that the *æchmalotarchæ* were only to be chosen out of the tribe of Judah. The eastern Jews had their princes of the captivity, as the western Jews their patriarchs. The Jews are still said to have an *æchmalotarcha* at Babylon, but without the authority of the ancient ones. (*Basnage Hist. Jews*, and *Prideaux's Connection.*)

ÆCIDIUM, in *Botany*. See BOTANY *Index*.

ÆCULANUM, in *Ancient Geography*, a town of the Hirpini in Italy, at the foot of the Apennines, to the east of Abellinum, contracted *Æclanum*, situated between Beneventum and Tarentum. The inhabitants are called *Æculani* by Pliny; and *Æclanenses*, in an ancient inscription (Gruter). The town is now called *Fricento*, (Cluverius), 43 miles east of Naples. E. Long. 15. 28. N. Lat. 41. 15.

ÆDES, in Roman antiquity, besides its more ordinary signification of a house, likewise signified an inferior kind of temple, consecrated to some deity.

ÆDICULA, a term used to denote the inner part of the temple, where the altar and statue of the deity stood.

ÆDILATE, the office of ædile, sometimes called *Ædility*. See the next article.

ÆDILE (*ædilis*), in Roman antiquity, a magistrate whose chief business was to superintend buildings of all kinds, but more especially public ones, as temples, aqueducts, bridges, &c. To the ædiles likewise belonged the care of the highways, public places, weights and measures, &c. They also fixed the prices of provisions, took cognizance of debauches, punished lewd women, and such persons as frequented gaming houses. The custody of the plebiscita, or orders of the people, was likewise committed to them. They had the inspection of comedies and other pieces of wit; and were obliged to exhibit magnificent games to the people, at their own expence, whereby many of them were ruined. To them also belonged the custody of the plebiscita, and the censure and examination of books. They had the power, on certain occasions, of issuing edicts; and, by degrees, they procured to themselves a considerable jurisdiction, the cognizance of various causes, &c. This office ruined numbers by its expensiveness; so that, in Augustus's time, even many senators declined it on that account.

All these functions which rendered the ædiles so considerable belonged at first to the ædiles of the people, *ædiles plebeii*, or *minores*: these were only two in number, and were first created in the same year as the tribunes: for the tribunes, finding themselves oppressed with the multiplicity of affairs, demanded of the senate to have officers, to whom they might intrust matters of less importance: and accordingly two ædiles were created; and hence it was that the ædiles were elected every year at the same assembly as the tribunes. But these plebeian ædiles having refused, on a signal occasion, to treat the people with shows, as pleading themselves unable to support the expence thereof, the patricians made an offer to do it, provided they would admit them to the honours of the *ædilate*. On this occasion there were two new ædiles created, of the number of the patricians, in the year of Rome 388; they were called *ædiles curules*, or *majores*; as having a right to sit on a curule chair, enriched with ivory, when they gave audience; whereas the plebeian ædiles only sat on benches.—Besides that the curule ædiles shared all the ordinary functions with the plebeian, their chief employ was, to procure the celebration of the grand Roman games, and to exhibit comedies, shows of gladiators, &c. to the people; and they were also appointed judges in all cases relating to the selling or exchanging estates.

To ease these four first ædiles, Cæsar created a new kind, called *ædiles cerealis*, as being deputed chiefly to take care of the corn, which was called *donum Cereris*; for the Heathens honoured Ceres as the goddess who presided over corn, and attributed to her the invention of agriculture. These ædiles cereales were also taken out of the order of patricians. In the municipal cities there were ædiles, and with the same authority as at Rome.

We also read of an *ædilis alimentarius*, expressed in abbreviature by *Ædil. alim.* whose business seems to have been to provide diet for those who were maintained at the public charge, though others assign him a different office.—In an ancient inscription we also meet with *ædile* of the camp, *ædilis castrorum*.

ÆDILITIUM EDICTUM, among the Romans, was that whereby a remedy was given to a buyer in case a vicious or unsound beast, or slave, was sold to him. It was called *ædilitium*, because the preventing of frauds in sales and contracts belonged especially to the curule ædiles.

ÆDITUUS, in Roman antiquity, an officer belonging to the temple, who had the charge of the offerings, treasure, and sacred utensils. The female deities had a female officer of this kind called *Æditua*.

ÆGAGROPILA, a ball composed of hair, generated in the stomach of the chamois goat, which is similar to those found in cows, hogs, &c. There is another

Ægæ ‖ Ægilops.

another ſpecies of ball found in ſome animals, particularly horſes, which is a calculous concretion.

ÆGÆ, or ÆGÆA, in *Ancient Geography*, the name of *Ædeſſa*, ſo called from the following adventure: Caranus, the firſt king of Macedonia, being ordered by the oracle to ſeek out a ſettlement in Macedonia, under the conduct of a flock of goats, ſurpriſed the town of Ædeſſa, during a thick fog and rainy weather, in following the goats that fled from the rain; which goats ever after, in all his military expeditions, he cauſed to precede his ſtandard; and in memory of this he called Ædeſſa *Ægea*, and his people *Ægeadæ*. And hence probably, in the prophet Daniel, the he-goat is the ſymbol of the king of Macedon.

ÆGEAN SEA, in *Ancient Geography*, now the *Archipelago*, a part of the Mediterranean, ſeparating Europe from Aſia; waſhing, on the one hand, Greece and Macedonia; on the other, Caria and Ionia. The origin of the name is greatly diſputed. Feſtus advances three opinions: one, that it is ſo called from the many iſlands therein, at a diſtance appearing like ſo many goats; another, becauſe Ægea queen of the Amazons periſhed in it: a third opinion is, becauſe Ægeus, the father of Theſeus, threw himſelf headlong into it.

ÆGEUS, in fabulous hiſtory, was king of Athens, and the father of Theſeus. The Athenians having baſely killed the ſon of Minos king of Crete, for carrying away the prize from them, Minos made war upon the Athenians; and being victorious, impoſed this ſevere condition on Ægeus, that he ſhould annually ſend into Crete ſeven of the nobleſt of the Athenian youths, choſen by lot, to be devoured by the Minotaur. On the fourth year of this tribute, the choice fell on Theſeus; or, as others ſay, he himſelf entreated to be ſent. The king, at his ſon's departure, gave orders, that as the ſhip ſailed with black ſails, it ſhould return with the ſame in caſe he periſhed; but, if he became victorious, he ſhould change them into white. When Theſeus returned to Crete, after killing the Minotaur, and forgot to change the ſails in token of his victory, according to the agreement with his father; the latter, who watched the return of the veſſel, ſuppoſing by the black ſails that his ſon was dead, caſt himſelf headlong into the ſea, which afterwards obtained the name of the *Ægean ſea*. The Athenians decreed Ægeus divine honours; and ſacrificed to him as a marine deity, the adopted ſon of Neptune.

ÆGIAS, among phyſicians, a white ſpeck on the pupil of the eye, which occaſions a dimneſs of ſight.

ÆGIDA, (Pliny); now *Capo d'Iſtria*, the principal town on the north of the territory of Iſtria, ſituated in a little iſland, joined to the land by a bridge. In an inſcription, (Gruter), it is called *Ægidis Inſula*. E. Long. 14. 20. N. Lat. 45. 50. It was afterwards called *Juſtinopolis*, after the emperor Juſtinus.

ÆGILOPS, the name of a tumour in the great angle of the eye; either with, or without, an inflammation. The word is compounded of αἴξ *goat*, and ὤψ, *eye*; as goats are ſuppoſed extremely liable to this diſtemper.

Authors frequently uſe the words *ægilops*, *anchilops*, and *fiſtula lachrymalis*, promiſcuouſly; but the more accurate, after Ægineta, make a difference.—The tumour, before it becomes ulcerous, is properly called *anchilops*; and, after it is got into the lachrymal paſſages, and has rendered the os lachrymale carious, *fiſtula lachrymalis*.

If the ægilops be accompanied with an inflammation, it is ſuppoſed to take its riſe from the abundance of blood which a plethoric habit diſcharges on the corner of the eye. If it be without an inflammation, it is ſuppoſed to proceed from a viſcous pituitous humour, thrown upon this part.

The method of cure is the ſame as that of the ophthalmia. But before it has reached the lachrymal paſſages, it is managed like other ulcers. If the ægilops be neglected, it burſts, and degenerates into a fiſtula, which eats into the bone.

ÆGILOPS, in *Botany*. See BOTANY *Index*.

ÆGIMURUS, in *Ancient Geography*, an iſland in the bay of Carthage, about 30 miles diſtant from that city, (Livy); now the *Goletta*: This iſland being afterwards ſunk in the ſea, two of its rocks remained above water, which were called *Aræ*, and mentioned by Virgil, becauſe the Romans and Carthaginians entered into an agreement or league to limit their reſpective boundaries by theſe rocks.

Ægimurus ‖ Ægina.

ÆGINA, in fabulous hiſtory, the daughter of Æſopus, king of Bœotia, was beloved by Jupiter, who debauched her in the ſimilitude of a lambent flame, and then carried her from Epidaurus to a deſert iſland called *Oenope*, which afterwards obtained her own name.

ÆGINA, in *Ancient Geography*, an iſland in the Saronic bay, or bay of Engia, 20 miles diſtant from the Piræus, formerly vying with Athens for naval power, and at the ſea-fight of Salamis diſputing the palm of victory with the Athenians. It was the country and kingdom of Æacus, who called it *Ægina* from his mother's name, it being before called *Oenopia*, (Ovid.) The inhabitants were called *Æginetæ*, and *Æginenſes*. The Greeks had a common temple dedicated to Jupiter in Ægina. The Æginetæ applied to commerce; and were the firſt who coined money called Νομισμα Αἰγινητικον; hence *Æginetieum æs*, formerly in great repute. The inhabitants were called *Myrmidones*, or a nation of ants, from their great application to agriculture. See ÆACUS.

The iſland was ſurrounded by Attica, the territory of Megara, and the Peloponneſus, each diſtant about 100 ſtadia, or 12 miles and a half. In circumference it was reckoned 180 ſtadia, or 22 miles and a half. It was waſhed on the eaſt and ſouth by the Myrtoan and Cretan ſeas.

It is now called *Æyina*, or *Ægina*, the *g* ſoft and the *i* ſhort. The temple above mentioned is ſituated upon the ſummit of a mountain called *Panhellenius*, at ſome diſtance from the ſhore. The Æginetans affirmed it was erected by ÆACUS; in whoſe time Greece being terribly oppreſſed by drought, the Delphic oracle was conſulted; and the reſponſe was, That Jupiter muſt be rendered propitious by Æacus. The cities entreated him to be their mediator: He ſacrificed and prayed to Jupiter Panhellenius, and procured rain.

The temple was of the Doric order, and had ſix columns in front. Twenty one of the exterior columns are yet ſtanding, with two in the front of the pronaos and of the poſticum, and five of the number which formed the ranges of the cell. The entablature, except the

Ægina. the architrave, is fallen. The ſtone is of a light brownish colour, much eaten in many places, and indicating a very great age. Some of the columns have been injured by boring to their centres for the metal. In ſeveral, the junction of the parts is ſo exact, that each ſeems to conſiſt of one piece. This ruin Mr Chandler conſiders as ſcarcely to be paralleled in its claim to a remote antiquity. The ſituation on a lonely mountain, at a diſtance from the ſea, has preſerved it from total demolition, amid all the changes and accidents of numerous centuries.

Near the ſhore is a barrow, raiſed, it is related, for Phocus upon the following occaſion. Telamon and Peleus, ſons of Æacus, challenged their half brother Phocus to contend in the Pentathlum. In throwing the ſtone, which ſerved as a quoit, Peleus hit Phocus, who was killed; when both of them fled. Afterwards Telamon ſent a herald to aſſert his innocence. Æacus would not ſuffer him to land, or to apologize, except from the veſſel; or, if he choſe rather, from a heap caſt up in the water. Telamon, entering the private port by night, raiſed a barrow, as a token, it is likely, of a pious regard for the deceaſed. He was afterwards condemned, as not free from guilt; and ſailed away again to Salamis. The barrow in the ſecond century, when ſeen by Pauſanias, was ſurrounded with a fence, and had on it a rough ſtone. The terror of ſome dreadful judgement to be inflicted from heaven had preſerved it entire and unaltered to his time; and in a country depopulated and neglected, it may ſtill endure for many ages.

The ſoil of this iſland is, as deſcribed by Strabo, very ſtony, eſpecially the bottoms, but in ſome places not unfertile in grain. Beſides corn, it produces olives, grapes, and almonds; and abounds in pigeons and partridges. It has been related, that the Æginetans annually wage war with the feathered race, carefully collecting or breaking their eggs, to prevent their multiplying, and in conſequence a yearly famine. They have no hares, foxes, or wolves. The rivers in ſummer are all dry. The waiwode or governor farms the revenue of the Grand Signior for 12 purſes, or 6000 piaſtres. About half this ſum is repaid yearly by the caratch-money, or poll tax.

ÆGINA, the capital of the above iſland. Its ſite has been long forſaken. Inſtead of the temples mentioned by Pauſanias, there are 13 lonely churches, all very mean; and two Doric columns ſupporting their architrave. Theſe ſtand by the ſea-ſide toward the low cape; and, it has been ſuppoſed, are a remnant of a temple of Venus, which was ſituated by the port pricipally frequented. The theatre, which is recorded as worth ſeeing, reſembled that of the Epidaurians both in ſize and workmanſhip. It was not far from the private port; the ſtadium, which, like that at Priene, was conſtructed with only one ſide, being joined to it behind, and each ſtructure mutually ſuſtaining and propping the other. The walls belonging to the ports and arſenal were of excellent maſonry, and may be traced to a conſiderable extent, above, or nearly even with, the water. At the entrance of the mole, on the left, is a ſmall chapel of St Nicholas; and oppoſite, a ſquare tower with ſteps before it, detached from which a bridge was laid acroſs, to be removed on any alarm. This ſtructure, which is mean, was erected by the Venetians, while at war with the Turks in 1693. Ægineta || Ægis.

ÆGINETA, PAULUS, a celebrated ſurgeon of the iſland of Ægina, for whence he derived his name. According to Mr Le Clerc's calculation, he lived in the fourth century; but Abulpharagius the Arabian, who is allowed to give the beſt account of thoſe times, places him with more probability in the ſeventh. His knowledge in ſurgery was very great, and his works are deſervedly famous. Fabricius ab Aquapendente has thought fit to tranſcribe him in a great variety of places. Indeed the doctrine of Paulus Ægineta, together with that of Celſus and Albucaſis, make up the whole text of this author. He is the firſt writer who takes notice of the cathartic quality of rhubarb; and, according to Dr Milward, is the firſt in all antiquity who deſerves the title of man-midwife.

ÆGINHARD, the celebrated ſecretary and ſuppoſed ſon-in-law of Charlemagne. He is ſaid to have been carried through the ſnow on the ſhoulders of the affectionate and ingenious Imma, to prevent his being tracked from her apartments by the emperor her father: a ſtory which the elegant pen of Addiſon has copied and embelliſhed from an old German chronicle, and inſerted in the 3d volume of the Spectator.—This happy lover (ſuppoſing the ſtory to be true) ſeems to have poſſeſſed a heart not unworthy of ſo enchanting a miſtreſs, and to have returned her affection with the moſt faithful attachment; for there is a letter of Æginhard's ſtill extant, lamenting the death of his wife, which is written in the tendereſt ſtrain of connubial affliction; it does not, however, expreſs that this lady was the affectionate princeſs; and indeed ſome late critics have proved that Imma was not the daughter of Charlemagne.—But to return to our hiſtorian: He was a native of Germany, and educated by the munificence of his imperial maſter, of which he has left the moſt grateful teſtimony in his preface to the life of that monarch. Æginhard, after the loſs of his lamented wife, is ſuppoſed to have paſſed the remainder of his days in religious retirement, and to have died ſoon after the year 840. His life of Charlemagne, his annals from 741 to 889, and his letters, are all inſerted in the 2d volume of Ducheſne's *Scriptores Francorum*. There is an improved edition of this valuable hiſtorian, with the annotations of Hermann Schmincke, in 4to, 1711.

ÆGIPAN, in *Heathen Mythology*, a denomination given to the god Pan, becauſe he was repreſented with the horns, legs, feet, &c. of a goat.

ÆGIPHILA, GOAT-FRIEND, in *Botany*. See BOTANY *Index*.

ÆGIS, in the *Ancient Mythology*, a name given to the ſhield or bucker of Jupiter and Pallas.

The goat Amalthea, which had ſuckled Jove, being dead, that god is ſaid to have covered his buckler with the ſkin; whence the appellation *ægis*, from αιξ, αιγος, *the-goat*. Jupiter, afterwards reſtored the animal to life, covered it with a new ſkin, and placed it among the ſtars. He made a preſent of his buckler to Minerva: whence that goddeſs's buckler is alſo called *ægis*.

Minerva, having killed the Gorgon Meduſa, nailed her head in the middle of the ægis, which henceforth had

Ægiſthus || Ægopodium.

had the faculty of converting into ſtone all thoſe who looked upon it; as Meduſa herſelf had done during her life.

Others ſuppoſe the ægis not to have been a buckler, but a cuiraſs, or breaſtplate; and it is certain the ægis of Pallas, deſcribed by Virgil, Æn. lib. viii. ver. 435, muſt have been a cuiraſs; ſince that poet ſays expreſsly, that Meduſa's head was on the breaſt of the goddeſs. But the ægis of Jupiter, mentioned a little higher, ver. 354, ſeems to have been a buckler: the words

Cum ſæpe nigrantem
Ægida *concuteret dextra*,

are deſcriptive of a buckler; but not at all of a cuiraſs or breaſtplate.

Servius makes the ſame diſtinction on the two paſſages of Virgil; for on verſe 354, he takes the ægis for the buckler of Jupiter, made, as above mentioned, of the ſkin of the goat Amalthea; and on verſe 435, he deſcribes the ægis as the armour which covers the breaſt, and which in ſpeaking of men is called *cuiraſs*, and *ægis* in ſpeaking of the gods. Many authors have overlooked theſe diſtinctions for want of going to the ſources.

ÆGISTHUS, in ancient hiſtory, was the ſon of Thyeſtes by his own daughter Pilopeia, who, to conceal her ſhame, expoſed him in the woods; ſome ſay he was taken up by a ſhepherd, and ſuckled by a goat, whence he was called *Ægiſthus*. He ſeduced Clytemneſtra the wife of Agamemnon, and lived with her during the ſiege of Troy. Afterwards with her aſſiſtance he ſlew her huſband, and reigned ſeven years in Mycenæ. He was, together with Clytemneſtra, ſlain by Oreſtes. Pompey uſed to call Julius Cæſar *Ægiſthus*, on account of his having ſeduced his wife Mutia, whom he afterwards put away, though he had three children by her.

ÆGITHALLUS, in *Ancient Geography*, a promontory and citadel of Sicily, between Drepanum and the Emporium Ægiſtanum, afterwards called *Acellus*; corruptly written *Ægitharſos*, in Ptolemy; ſituated near Mount Eryx, and now called *Capo di Santo Teodoro*.

ÆGIUM, in *Ancient Geography*, a town of *Achaia Propria*, five miles from the place where Helice ſtood, and famous for the council of the Acheans, which uſually met there on account either of the dignity or commodious ſituation of the place. It was alſo famous for the worſhip of Ομαγυριος Ζευς, *Conventional Jupiter*, and of *Panachæan Ceres*. The territory of Ægium was watered by two rivers, viz. the Phœnix and Meganites. The epithet is *Ægienſis*. There is a coin in the cabinet of the king of Pruſſia, with the inſcription AIΓI, and the figure of a tortoiſe, which is the ſymbol of Peloponneſus, and leaves no doubt as to the place where it was ſtruck.

ÆGOBOLIUM, in antiquity, the ſacrifice of a goat offered to Cybele. The ægobolium was an expiatory ſacrifice, which bore a near reſemblance to the taurobolium and criobolium, and ſeems to have been ſometimes joined with them.

ÆGOPODIUM, SMALL WILD ANGELICA, GOUTWORT, GOATSFOOT. See BOTANY *Index*.

ÆGOPRICON. See BOTANY *Index*. Ægopricon,

ÆGOSPOTAMOS, in *Ancient Geography*, a river in the Thracian Cherſoneſus, falling with a ſouth-eaſt courſe into the Helleſpont, to the north of Seſtos; alſo a town, ſtation, or road for ſhips at its mouth. Here the Athenians, under Conon, through the fault of his colleague Iſocrates, received a ſignal overthrow from the Lacedemonians under Lyſander, which was followed by the taking of Athens, and put an end to the Peloponneſian war. The Athenian fleet having followed the Lacedemonians, anchored in the road, over againſt the enemy, who lay before Lampaſcus. The Helleſpont is not above two thouſand paces broad in that place. The two armies ſeeing themſelves ſo near each other, expected only to reſt that day, and were in hopes of coming to a battle on the next. Ægoſpotamos.

But Lyſander had another deſign in his view. He commanded the ſeamen and pilots to go on board their galleys, as if they were in reality to fight the next morning at break of day, to hold themſelves in readineſs, and to wait his orders with profound ſilence. He commanded the land army in like manner to draw up in order of battle upon the coaſt, and to wait the day without noiſe. On the morrow, as ſoon as the ſun was riſen, the Athenians began to row towards them with their whole fleet in one line, and to bid them defiance. Lyſander, though his ſhips were ranged in order of battle, with their heads towards the enemy, lay ſtill without making any movement. In the evening, when the Athenians withdrew, he did not ſuffer his ſoldiers to go aſhore, till two or three galleys, which he had ſent out to obſerve them, were returned with advice that they had ſeen the enemy land. The next day paſſed in the ſame manner, as did the third and fourth. Such a conduct, which argued reſerve and apprehenſion, extremely augmented the ſecurity and boldneſs of the Athenians, and inſpired them with an extreme contempt for an army, which fear, in their ſenſe, prevented from ſhowing themſelves, and attempting any thing.

Whilſt this paſſed, Alcibiades, who was near the fleet, took horſe, and came to the Athenian generals: to whom he repreſented, that they kept upon a very diſadvantageous coaſt, where there were neither ports nor cities in the neighbourhood; that they were obliged to bring their proviſions from Seſtos with great danger and difficulty; and that they were very much in the wrong to ſuffer the ſoldiers and mariners of the fleet, as ſoon as they were aſhore, to ſtraggle and diſperſe themſelves at their own pleaſure, whilſt they were faced in view by the enemy's fleet, accuſtomed to execute the orders of their general with the readieſt obedience, and upon the ſlighteſt ſignal. He offered alſo to attack the enemy by land with a ſtrong body of Thracian troops, and to force them to a battle. The generals, eſpecially Tydeus and Menander, jealous of their command, did not content themſelves with refuſing his offers, from the opinion, that if the event proved unfortunate, the whole blame would fall on them, and if favourable, that Alcibiades alone would have the honour of it; but rejected alſo with inſult his wiſe and ſalutary counſel, as if a man in diſgrace loſt his ſenſe and abilities with the favour of the commonwealth. Alcibiades withdrew.

The fifth day the Athenians preſented themſelves again,

Ægospotamos || Ægytilla

again, and offered battle; retiring in the evening according to cuſtom with more inſulting airs than the days before. Lyſander, as uſual, detached ſome galleys to obſerve them, with orders to return with the utmoſt diligence when they ſaw the Athenians landed, and to put up a brazen buckler at each ſhip's head as ſoon as they reached the middle of the channel. He in the mean time ran through the whole line in his galley, exhorting the pilots and officers to hold the ſeamen and ſoldiers in readineſs to row and fight on the firſt ſignal.

As ſoon as the bucklers were put up in the ſhips heads, and the admiral galley had given the ſignal by the ſound of trumpet, the whole fleet ſet forward in good order. The land army at the ſame time made all poſſible haſte to the top of the promontory to ſee the battle. The ſtrait that ſeparates the two continents in this place is about fifteen ſtadia, or three quarters of a league in breadth; which ſpace was preſently cleared through the activity and diligence of the rowers. Conon the Athenian general was the firſt who perceived from ſhore, that fleet advance in good order to attack him; upon which he immediately cried out for the troops to embark. In the height of ſorrow and trouble, ſome he called to by their names, ſome he conjured, and others he forced to go on board their galleys; but all his endeavours and emotions were ineffectual, the ſoldiers being diſperſed on all ſides. For they were no ſooner come on ſhore, than ſome ran to the ſutlers, ſome to walk in the country, ſome to ſleep in their tents, and others had begun to dreſs their ſuppers. This proceeded from the want of vigilance and experience in their generals, who, not ſuſpecting the leaſt danger, indulged themſelves in their taking repoſe, and gave their ſoldiers the ſame liberty.

The enemy had already fallen on with loud cries and a great noiſe of their oars, when Conon, diſengaging himſelf with nine galleys, of which number was the ſacred ſhip called the *Paralian*, ſtood away for Cyprus, where he took refuge with Evagoras. The Peloponneſians, falling upon the reſt of the fleet, took immediately the galleys which were empty, and diſabled and deſtroyed ſuch as began to fill with men. The ſoldiers, who ran without order or arms to their relief, were either killed in the endeavour to get on board, or flying on ſhore were cut to pieces by the enemy, who landed in purſuit of them. Lyſander took 3000 priſoners, with all the generals, and the whole fleet. After having plundered the camp, and faſtened the enemy's galleys to the ſterns of his own, he returned to Lampſacus amidſt the ſound of flutes and ſongs of triumph. It was his glory to have achieved one of the greateſt military exploits recorded in hiſtory with little or no loſs, and to have terminated a war in the ſmall ſpace of an hour, which had already laſted 27 years, and which, perhaps, without him, had been of much longer continuance.

ÆGYPT. See EGYPT.

ÆGYPTIACUM, in *Pharmacy*, the name of ſeveral detergent ointments; as black, red, white, ſimple, and compound.

ÆGYPTILLA, in *Natural Hiſtory*, the name of a ſtone deſcribed by the ancients, and ſaid, by ſome authors, to have the remarkable quality of giving water the colour and taſte of wine. This ſeems a very imaginary virtue, as are indeed too many of thoſe in former ages attributed to ſtones. The deſcriptions left us of this remarkable foſſil tell us, that it was variegated with, or compoſed of, veins of black and white, or black and bluiſh, with ſometimes a plate or vein of whitiſh red. The authors of theſe accounts ſeem to have underſtood by this name the ſeveral ſtones of the onyx, ſardonyx, and cameo kind; all which we have at preſent common among us, but none of which poſſeſſes any ſuch ſtrange properties.

Ægyptus || Ælian.

ÆGYPTUS, in fabulous hiſtory, was the ſon of Belus, and brother of Danaus. See BELIDES.

ÆINAUTÆ, in antiquity, αἰναυται, *always mariners*, a denomination given to the ſenators of Miletus, becauſe they held their deliberations on board a ſhip, and never returned to land till matters had been agreed on.

ÆLFRIC, an eminent eccleſiaſtic of the 10th century, was the ſon of an earl of Kent, and a monk of the Benedictine order in the monaſtery of Abingdon. In 963, he was ſettled in the cathedral of Wincheſter, under Athelwold the biſhop, and undertook the inſtruction of the youth of the dioceſe, for which purpoſe he compiled a Latin Saxon vocabulary, and ſome Latin colloquies. He alſo tranſlated from the Latin into Saxon many of the hiſtorical books of the Old Teſtament. While he reſided at Wincheſter he drew up Canons, which are a kind of charge to be delivered by the biſhops to their clergy. He was afterwards abbot of St Alban's, biſhop of Wilton, and, finally, in 994, tranſlated to the ſee of Canterbury. Here he had a hard ſtruggle for ſome years in bravely defending his dioceſe againſt the incurſions of the Danes. He died in 1005, and was buried at Abingdon; but his remains were removed to Canterbury in the reign of Canute. Ælfric is held up as one of the moſt diſtinguiſhed prelates of the Saxon church. His learning, for the times, was conſiderable, his morals were pure, and his religious ſentiments were untainted with many of the corruptions of the age in which he lived. Beſide the works already mentioned, he tranſlated two volumes of Homilies from the Latin Fathers.

ÆLFRIC, ſurnamed *Bata*, pupil of the former, was promoted to the archbiſhopric of York in 1023, and died in 1051.

ÆLFRIC, an abbot of Malmeſbury in 974, was created biſhop of Crediton in 977, and died in 981.

ÆLIA *Capitolina*, a name given to the city built by the emperor Adrian, A. D. 134, near the ſpot where the ancient Jeruſalem ſtood, which he found in ruins when he viſited the eaſtern parts of the Roman empire. A Roman colony was ſettled here, and a temple, in place of that of Jeruſalem, was dedicated to Jupiter Capitolinus. Hence the name is derived, to which he prefixed that of his own family.

ÆLIAN, CLAUDIUS, born at Præneſte in Italy. He taught rhetoric at Rome, according to Perizonius, under the emperor Alexander Severus. He was ſurnamed Μελιγλωσσος, *Honey-mouth*, on account of the ſweetneſs of his ſtyle in his diſcourſes and writings. To this excellence the poet alludes:

O jocunda, Covine, ſolitudo,
Carrucâ magis, eſſedoque gratum,
Facundi mihi munus Æliani. MARTIAL.

He

Ælii Ænaria.

He was likewiſe honoured with the title of *Sophiſt*, an appellation in his days given only to men of learning and wiſdom. He loved retirement, and devoted himſelf to ſtudy. He greatly admired and ſtudied Plato, Ariſtotle, Iſocrates, Plutarch, Homer, Anacreon, Archilochus, &c. and, though a Roman, gives the preference to the writers of the Greek nation. His two moſt celebrated works are, his Various Hiſtory, and Hiſtory of Animals. He compoſed likewiſe a book on Providence, mentioned by Euſtathius; and another on Divine Appearances, or The Declarations of Providence. There have been ſeveral editions of his Various Hiſtory.

ÆLII PONS, in *Ancient Geography*, one of the fortreſſes near the wall or rampart, or, in the words of the Notitia, through the line of the hither wall; built, as is thought, by Adrian, now named Portland, in Northumberland, between Newcaſtle and Morpeth, (Camden.)

ÆLIUS PONS, now *il Ponte St Angelo*, a ſtone bridge at Rome, over the Tiber, which leads to the Burgo and Vatican from the city, along Adrian's mole, built by the emperor Adrian.

ÆLFRED. See ALFRED.

ÆLURUS, in *Egyptian Mythology*, the deity or god of cats; repreſented ſometimes like a cat, and ſometimes like a man with a cat's head. The Egyptians had ſo ſuperſtitious a regard for this animal, that the killing it, whether by accident or deſign, was puniſhed with death; and Diodorus relates, that, in the time of extreme famine, they choſe rather to eat one another than touch theſe ſacred animals.

AEM, AM, or AME, a liquid meaſure uſed in moſt parts of Germany; but different in different towns: the aem commonly contains 20 vertils, or 80 maſſes; that of Heidelberg is equal to 48 maſſes; and that of Wirtemberg to 160 maſſes. See AAM.

ÆMILIUS PAULUS, the ſon of Æmilius Paulus who was killed at the battle of Cannæ. He was twice conſul. In his firſt conſulate he triumphed over the Ligurians; and in the ſecond ſubdued Perſeus king of Macedonia, and reduced that country to a Roman province, on which he obtained the ſurname of Macedonicus. He returned to Rome loaded with glory, and triumphed for three days. He died 168 years before Chriſt.

ÆMILIUS, *Paulus*, a celebrated hiſtorian, born at Verona, who obtained ſuch reputation in Italy, that he was invited into France by the cardinal of Bourbon, in the reign of Louis XII. in order to write the hiſtory of the kings of France in Latin, and was preſented to a canonry in the cathedral of Paris. He was near 30 years in writing that hiſtory, which has been greatly admired; and died at Paris on the 5th of May 1529.

ÆMOBOLIUM, in antiquity, the blood of a bull or ram offered in the ſacrifices, called *taurobolia* and *criobolia*; in which ſenſe the word occurs in ancient inſcriptions.

ÆNARIA, in *Ancient Geography*, an iſland in the bay of Cumæ, or over-againſt Cumæ in Italy, (Pliny). It is alſo called *Inarime* (Virgil); and now *Iſchia*: ſcarce three miles diſtant from the coaſt, and the promontory Miſenus to the weſt; 20 miles in compaſs; called *Pithecuſa* by the Greeks. It is one of the Oenotrides, and fenced round by very high rocks, ſo as to be inacceſſible but on one ſide: it was formerly famous for its earthen ware. See ISCHIA.

Æneas Ænigma.

ÆNEAS, in fabulous hiſtory, a famous Trojan prince, the ſon of Anchiſes and Venus. At the deſtruction of Troy, he bore his aged father on his back, and ſaved him from the Greeks; but being too ſolicitous about his ſon and houſehold gods, loſt his wife Creüſa in the eſcape. Landing in Africa, he was kindly received by Queen Dido: but quitting her coaſt, he arrived in Italy, where he married Lavinia the daughter of King Latinus, and defeated Turnus, to whom ſhe had been contracted. After the death of his father-in-law, he was made king of the Latins, over whom he reigned three years: but joining with the Aborigines, he was ſlain in a battle againſt the Tuſcans. Virgil has rendered the name of this prince immortal, by making him the hero of his poem. See ÆNEID.

ÆNEAS SYLVIUS, *Pope*. See PIUS II.

ÆNEATORES, in antiquity, the muſicians in an army, including thoſe who played trumpets, horns, &c, The word is formed from *æneus*, on account of the brazen inſtruments uſed by them.

ÆNEID, the name of Virgil's celebrated epic poem. The ſubject of the Æneid, which is the eſtabliſhment of Æneas in Italy, is extremely happy. Nothing could be more intereſting to the Romans than to look back to their origin from ſo famous a hero. While the object was ſplendid itſelf, the traditionary hiſtory of his country opened intereſting fields to the poet; and he could glance at all the future great exploits of the Romans, in its ancient and fabulous ſtate. *Blair's Lectures.*

As to the unity of action, it is perfectly well preſerved in the Æneid. The ſettlement of Æneas, by the order of the gods, is conſtantly kept in view. The epiſodes are linked properly with the main ſubject. The nodus, or intrigue of the poem, is happily managed. The wrath of Juno, who oppoſes Æneas, gives riſe to all his difficulties, and connects the human with the celeſtial operations throughout the whole poem.

One great imperfection of the Æneid, however, is, that there are almoſt no marked characters in it. Achates, Cloanthes, Gyas, and other Trojan heroes who accompanied Æneas into Italy, are inſipid figures. Even Æneas himſelf is without intereſt. The character of Dido is the beſt ſupported in the whole Æneid.

The principal excellency of Virgil is tenderneſs. His ſoul was full of ſenſibility. He muſt have felt himſelf all the affecting circumſtances in the ſcenes he deſcribes; and he knew how to touch the heart by a ſingle ſtroke. In an epic poem this merit is the next to ſublimity. The ſecond book of the Æneid is one of the greateſt maſterpieces that ever was executed. The death of old Priam, and the family-pieces of Æneas, Anchiſes, and Creüſa, are as tender as can be conceived. In the fourth book, the unhappy paſſion and death of Dido are admirable. The epiſodes of Pallas and Evander, of Niſus and Euryalus, of Lauſus and Mezentius, are all ſuperlatively fine.

In his battles, Virgil is far inferior to Homer. But in the important epiſode, the deſcent into hell, he has outdone Homer by many degrees. There is nothing in antiquity to equal the ſixth book of the Æneid.

ÆNGINA, one of the iſlands of the Archipelago.

Ænigma. It lies in the bay of Engia, and the town of that name contains about 800 houſes and a caſtle; and near it are the ruins of a magnificent ſtructure, which was probably a temple.

ÆNIGMA, denotes any dark ſaying, wherein ſome well known thing is concealed under obſcure language. The word is Greek, Αἴνιγμα, formed of *αἰνίτεσθαι, obſcurè innuere*, to hint a thing darkly, and of *αἶνος*, an obſcure ſpeech or diſcourſe. The popular name is *riddle*; from the Belgic *raeden*, or the Saxon *araethan*, to interpret. F. Bouhours, in the memoirs of Trevoux, defines an ænigma, a diſcourſe or painting, including ſome hidden meaning, which is propoſed to be gueſſed.

Painted ÆNIGMAS, are repreſentations of the works of nature or art, concealed under human figures, drawn from hiſtory or fable.

A Verbal ÆNIGMA, is a witty, artful, and abſtruſe deſcription of any thing.—In a general ſenſe, every dark ſaying, every difficult queſtion, every parable, may paſs for an *ænigma*. Hence obſcure laws are called *Ænigmata Juris*. The alchemiſts are great dealers in the ænigmatic language, their proceſſes for the philoſophers ſtone being generally wrapped up in riddles: e. g. *Fac ex mare et fœmina circulum, inde quadrangulum, hinc triangulum, fac circulum, et habebis lapidem philoſophorum.*—F. Meneſtrier has attempted to reduce the compoſition and reſolution of ænigmas to a kind of art, with fixed rules and principles, which he calls the philoſophy of *ænigmatic* images.

The Subject of an ÆNIGMA, or the thing to be concealed and made a myſtery of, he juſtly obſerves, ought not to be ſuch in itſelf; but, on the contrary, common, obvious, and eaſy to be conceived. It is to be taken, either from nature, as the heavens or ſtars; or from art, as painting, the compaſs, a mirror, or the like.

The form of ÆNIGMAS conſiſts in the words, which, whether they be in proſe or verſe, contain either ſome deſcription, a queſtion, or a proſopopœia. The laſt kind are the moſt pleaſing, inaſmuch as they give life and action to things which otherwiſe have them not. To make an ænigma, therefore, two things are to be pitched on, which bear ſome reſemblance to each other, as the ſun and a monarch; or a ſhip and a houſe; and on this reſemblance is to be raiſed a ſuperſtructure of contrarieties to amuſe and perplex. It is eaſier to find great ſubjects for ænigmas in figures than in words, inaſmuch as painting attracts the eyes and excites the attention to diſcover the ſenſe. The ſubjects of ænigmas in painting, are to be taken either from hiſtory or fable: the compoſition here is a kind of metamorphoſis, wherein, e. g. human figures are changed into trees, and rivers into metals. It is eſſential to ænigmas, that the hiſtory or fable, under which they are preſented, be known to every body; otherwiſe it will be two ænigmas inſtead of one; the firſt of the hiſtory or fable, the ſecond of the ſenſe in which it is to be taken. Another eſſential rule of the ænigma is, that it only admits of one ſenſe. Every ænigma which is ſuſceptive of different interpretations, all equally natural, is ſo far imperfect. What gives a kind of erudition to an ænigma, is the invention of figures in ſituations, geſtures, colours, &c. authorized by paſſages of the poets, the cuſtoms of artiſts in ſtatues, baſſo relievos, inſcriptions, and medals.—In foreign colleges, Ænigma.

The Explication of ÆNIGMAS makes a conſiderable exerciſe; and that one of the moſt difficult and amuſing, where wit and penetration have the largeſt field. —By explaining an ænigma, is meant the finding a motto correſponding to the action and perſons repreſented in a picture, taken either from hiſtory or mythology. The great art of this exerciſe conſiſts in the choice of a motto, which either by itſelf, or the circumſtances of time, place, perſon who ſpeaks, or thoſe before whom he is ſpeaking, may divert the ſpectators, and furniſh occaſion for ſtrokes of wit; alſo in ſhowing to advantage the conformities between the figure and thing figured, giving ingenious turns to the reaſons employed to ſupport what is advanced, and in artfully introducing pieces of poetry to illuſtrate the ſubject and awaken the attention of the audience.

As to the ſolution of enigmas, it may be obſerved, that thoſe expreſſed by figures are more difficult to explain than thoſe conſiſting of words, by reaſon images may ſignify more things than words can; ſo that to fix them to a particular ſenſe, we muſt apply every ſituation, ſymbol, &c. and without omitting a circumſtance.—As there are few perſons in hiſtory, or mythology, but have ſome particular character of vice or virtue, we are, before all things, to attend to this *character*, in order to divine what the figure of a perſon repreſented in a painting ſignifies, and to find what agreement this may have with the ſubject whereof we would explain it. Thus, if Proteus be repreſented in a picture, it may be taken to denote *inconſtancy*, and applied either to a phyſical or moral ſubject, whoſe character is to be changeable, e. g. an almanack, which expreſſes the weather, the ſeaſons, heat, cold, ſtorms, and the like. The *colours* of figures may alſo help to unriddle what they mean: for *white*, inſtance, is a mark of innocence, *red* of modeſty, *green* of hope, *black* of ſorrow, &c. When figures are accompanied with *ſymbols*, they are leſs precarious; theſe being, as it were, the ſoul of ænigmas, and the key that opens the myſtery of them. Of all the kinds of ſymbols which may be met with in thoſe who have treated profeſſedly on the ſubject, the only true ænigmatical are thoſe of Pythagoras, which, under dark proverbs, hold forth leſſons of morality; as when he ſays *Stateram ne tranſilias*, to ſignify, Do no injuſtice.

But it muſt be added, that we meet with ſome ænigmas in hiſtory, complicated to a degree which much tranſcends all rules, and has given great perplexity to the interpreters of them. Such is that celebrated ancient one, *Ælia Lelia Criſpis*, about which many of the learned have puzzled their heads. There are two exemplars of it: one found 140 years ago, on a marble near Bologna; the other in an ancient MS. written in Gothic letters, at Milan. It is controverted between the two cities, which is to be reputed the more authentic.

The Bononian *Ænigma*.

D. M.
Ælia Lælia Criſpis,
Nec vir, nec mulier,
Nec androgyna;
Nec puella, nec juvenis,

Nec anus ;
Nec caſta, nec meretrix,
Nec pudica ;
Sed omnia :
Sublata
Neque fame, neque ferro,
Neque veneno ;
Sed omnibus :
Nec cælo, nec terris,
Nec aquis,
Sed ubique jacet.
Lucius Agatho Priſcius,
Nec maritus, nec amator,
Nec neceſſarius ;
Neque mœrens, neque gaudens,
Neque flens ;
Hanc,
Nec molem, nec pyramidem,
Nec ſepulchrum,
Sed omnia,
Scit et neſcit, cui poſuerit.

That is to ſay, *To the gods manes, Ælia Lælia Criſpis, neither man, nor woman, nor hermaphrodite; neither girl, nor young woman, nor old; neither chaſte, nor a whore; but all theſe: killed neither by hunger, nor ſteel, nor poiſon; but by all theſe: reſts neither in heaven, nor on earth, nor in the waters; but everywhere. Lucius Agatho Priſcius, neither her huſband, nor lover, nor friend; neither ſorrowful, nor joyful, nor weeping, certain, or uncertain, to whom he rears this monument, neither erects her a temple, nor a pyramid, nor a tomb, but all theſe.* In the MS. at Milan, inſtead of *D. M.* we find *A. M. P. P. D.* and at the end the following addition :

Hoc eſt ſepulchrum intus cadaver non habens,
Hoc eſt cadaver ſepulchrum extra non habens,
Sed cadaver idem eſt et ſepulchrum.

We find near 50 ſeveral ſolutions of this ænigma advanced by learned men. Marius Michael Angelo maintains *Ælia Lælia Criſpis* to ſignify rain water falling into the ſea. Ri. Vitus firſt explained it of Niobe turned to a ſtone, afterwards of the rational ſoul, and afterwards of the Platonic idea; Jo. Turrius, of the *materia prima;* Fr. Schottus, of an eunuch; Nic. Bernardus, of the philoſopher's ſtone, in which he is followed by Borrichius; Zach. Pontinus, of three human bodies in the ſame ſituation, and buried by three different men at the ſame time; Neſmondius, of a law-ſuit; Jo Gaſ. Gerartius, of love; Zu. Boxhornius, of a ſhadow; P. Terronus, of muſic; Fort. Licetus, of generation, friendſhip, and privation; M. Ov. Montalbanus, of hemp; Car. Cæſ. Malvaſia, of an abortive girl promiſed in marriage; Pet. Mengulus, of the rule of chaſtity, preſcribed by the founder of the military religion of St Mary; M. de Ciconia, of Pope Joan; Heumannus, of Lot's wife; and laſtly, J. C. S. an anonymous writer in the Leipſic Acts, of the Chriſtian church.

ÆNIGMATOGRAPHY, or ÆNIGMATHOLOGY, the art of reſolving or making ænigmas.

ÆNONA, in *Ancient Geography*, a city of Liburnia, called by Pliny *Civitas Praſini*, the reaſon of which is unknown; alſo *Enona*, and is now called *Nona*; on the Adriatic, by which it is for the greater part ſurrounded; over againſt the iſland Giſſa, from which it is diſtant four miles to the weſt. E. Long. 16°. N. Lat. 28°.

ÆNUS, in *Ancient Geography*, now the *Inn*, a river of Germany, which, riſing in the country of the Griſons, out of the Alps, in the diſtrict called Gotteshaus-punt, runs through the Griſons, the county of Tyrol, the duchy of Bavaria, and through Paſſau into the Danube.

ÆNUS, *Ænos*, or *Ænum*, in *Ancient Geography*, a town of Thrace, ſituated on the eaſtmoſt mouth of the Hebrus, which has two mouths; and ſaid to be built by the Cumeans. It was a free town, in which ſtood the tomb of Polydorus, (Pliny); *Ænius* is the epithet. Here the brother of Cato Uticenſis died, and was honoured with a monument of marble in the forum of the Ænii, (Plutarch); called *Ænei*, (Stephanus). Livy ſays that the town was otherwiſe called *Abſynthus*. Now *Eno*.

ÆNITHOLOGIUS, in *Poetry*, a verſe of two dactyls and three trochæi; as *Præſia dira placent truci juventæ*.

ÆOLIÆ INSULÆ, now *Iſoli Lipari*, in *Ancient Geography*, ſeven iſlands, ſituated between Sicily and Italy, ſo called from Æolus, who reigned there about the time of the Trojan war. The Greeks call them *Hephæſtiades;* and the Romans *Vulcaniæ*, from their fiery eruptions. They are alſo called *Liparæorum Inſulæ*, from their principal iſland Lipara. Dionyſius Periegetes calls them πλαῦαι, becauſe circumnavigable.

ÆOLIC, in a general ſenſe, denotes ſomething belonging to Æolis.

ÆOLIC, or ÆOLIAN, in *Grammar*, denotes one of the five dialects of the Greek tongue. It was firſt uſed in Bœotia; whence it paſſed into Æolia, and was that which Sappho and Alcæus wrote in. The Æolic dialect generally throws out the aſpirate or ſharp ſpirit, and agrees in ſo many things with the DORIC dialect, that the two are uſually confounded together.

The *Æolic digamma* is a name given to the letter Ϝ, which the Æolians uſed to prefix to words beginning with vowels, as Ϝοινος, for οινος; alſo to inſert between vowels, as οϜις, for οις.

Æolic Verſe, in *Proſody*, a verſe conſiſting of an iambus, or ſpondee; then of two anapeſts, ſeparated by a long ſyllable; and, laſtly, of another ſyllable. Such as, *O ſtelliferi conditor orbis.* This is otherwiſe called *eulogic* verſe; and, from the chief poets who uſed it, *Archilochian* and *Pindaric*.

ÆOLIPILE, in *Hydraulics*, is a hollow ball of metal, generally uſed in courſes of experimental philoſophy, in order to demonſtrate the poſſibility of converting water into an elaſtic ſteam or vapour by heat. The inſtrument, therefore, conſiſts of a ſlender neck, or pipe, having a narrow orifice inſerted into the ball by means of a ſhouldered ſcrew. This pipe being taken out, the ball is filled almoſt full of water, and the pipe being again ſcrewed in, the ball is placed on a pan of kindled charcoal, where it is well heated, and there iſſues from the orifice a vapour, with prodigious violence and great noiſe, which continues till all the included water is diſcharged. The ſtronger the fire is, the more elaſtic and violent will be the ſteam; but care muſt be taken that the ſmall orifice of the pipe be not,

Æolis || Æon.

by any accident, ſtopped up; becauſe the inſtrument would in that caſe infallibly burſt in pieces, with ſuch violence as might greatly endanger the lives of the perſons near it. Another way of introducing the water is to heat the ball red hot when empty, which will drive out almoſt all the air; and then by ſuddenly immerging it in water, the preſſure of the atmoſphere will force in the fluid, till it is nearly full. Des Cartes and others have uſed this inſtrument to account for the natural cauſe and generation of the wind: and hence it was called *Æolipila*: q. d. *pila Æoli*, the ball of Æolus or of the god of the winds.

ÆOLIS, or ÆOLIA, in *Ancient Geography*, a country of the Hither Aſia, ſettled by colonies of Æolian Greeks. Taken at large, it comprehends all Troas, and the coaſt of the Helleſpont to the Propontis, becauſe in thoſe parts there were ſeveral Æolian colonies: more ſtrictly, it is ſituated between Troas to the north, and Ionia to the ſouth. The people are called *Æoles* or *Æolii*.

ÆOLIUM MARE, in *Ancient Geography*, a part of the Egean ſea, waſhing Æolis; called alſo *Myſium*, from Myſia. Now called *Golfo di Smyrna*.

ÆOLUS, in heathen mythology, the god of the winds, was ſaid to be the ſon of Jupiter by Acaſta, or Sigeſia, the daughter of Hippotus: or, according to others, the ſon of Hippotus by Meneclea, daughter of Hyllus king of Lipara. He dwelt in the iſland Strongyle, now called *Strombolo*, one of the ſeven iſlands called *Æolian* from their being under the dominion of Æolus. Others ſay, that his reſidence was at Rhegium, in Italy; and others again place him in the iſland Lipara. He is repreſented as having authority over the winds, which he held enchained in a vaſt cavern, to prevent their continuing the devaſtations they had been guilty of before they were put under his direction. Mythologiſts explain the original of theſe fables, by ſaying, that he was a wiſe and good prince; and, being ſkilled in aſtronomy, was able, by the flux and reflux of the tides, and the nature of the volcano in the iſland Strongyle, to foretel ſtorms and tempeſts.

Harp of ÆOLUS, or the Æolian lyre. See ACOUSTICS.

ÆON, a Greek word, properly ſignifying the age or duration of any thing.

ÆON, among the followers of Plato, was uſed to ſignify any virtue, attribute, or perfection: hence they repreſented the deity as an aſſemblage of all poſſible æons; and called him *pleroma*, a Greek term ſignifying *fulneſs*. The Valentinians, who, in the firſt ages of the church, blended the conceits of the Jewiſh cabaliſts, the Platoniſts, and the Chaldean philoſophers, with the ſimplicity of the Chriſtian doctrine, invented a kind of Theogony, or Genealogy of Gods (not unlike that of Heſiod), whom they called by ſeveral glorious names, and all by the general appellation of ÆONS: among which they reckoned Ζωη, *Life*; Λογος, *Word*; Μονογενης, *Only-begotten*; Πληρωμα, *Fulneſs*; and many other divine powers and emanations, amounting in number to thirty: which they fancied to be ſucceſſively derived from one another; and all from one ſelf-originated deity, named *Bythus*, i. e. *profound* or *unfathomable*; whom they called likewiſe, *The moſt high and ineffable Father*. See VALENTINIANS.

ÆORA, among ancient writers on medicine, is uſed for geſtation; which ſort of exerciſe was often preſcribed by the phyſicians of thoſe days. Other exerciſes conſiſted principally in the motion of the body; but in the *æora* the limbs were at reſt, while the body was carried about and moved from place to place, in ſuch a manner as the phyſician preſcribed. It had therefore the advantages of exerciſe, without the fatigue of it.—This exerciſe was promoted ſeveral ways: ſometimes the patient was laid in a ſort of hammock, ſupported by ropes, and moved backward and forward; ſometimes his bed run nimbly on its feet. And beſide theſe, the ſeveral ways of travelling were accounted ſpecies of the *æora*, whether in the litter, in a boat or ſhip, or on even ground in a chariot.—Aſclepiades was the firſt who brought geſtation into practice, which was uſed as a means to recover ſtrength after a fever, &c.

Æora || Æra.

ÆQUANA JUGA, in *Ancient Geography*, mountains of Picenum, in the kingdom of Naples, now called *Montagna di Sorrento*, denominated from the town Æqua, which being deſtroyed, was replaced by Vicus, now *Vico di Sorrento*: called alſo *Æquana*, (Sil. Italicus).

ÆQUIMELIUM, in antiquity, a place in Rome, where ſtood the houſe of Spurius Melius, who, by largeſſes corrupting the people, affected the ſupreme power: refuſing to appear before the dictator Cincinnatus, he was ſlain by Servilius Ahala, maſter of the horſe; his houſe was razed to the ground; and the ſpot on which it ſtood was called *Area Equimelii*, (Livy).

ÆRA, in chronology, a fixed point of time from whence any number of years is begun to be counted.

It is ſometimes alſo written in ancient authors *Era*. The origin of the term is conteſted, though it is generally allowed to have had its riſe in Spain. Sepulveda ſuppoſes it formed from A. ER. A. the notæ or abbreviatures of the words, *annus erat Auguſti*, occaſioned by the Spaniards beginning their computation from the time their country came under the dominion of Auguſtus, or that of receiving the Roman calendar. This opinion, however ingenious, is rejected by Scaliger, not only on account that in the ancient abbreviatures *A* never ſtood for *annus*, unleſs when preceded by *V* for *vixit*; and that it ſeems improbable they ſhould put ER for *erat*, and the latter A, without any diſcrimination, both for *annus* and *Auguſtus*. Voſſius nevertheleſs favours the conjecture, and judges it at leaſt as probable, as either that of Iſidore, who derives *æra* from *æs*, the "tribute-money," wherewith Auguſtus taxed the world: or that of Scaliger himſelf, who deduces it likewiſe from *æs*, though in a different manner. *Æs*, he obſerves, was uſed among the ancients for an *article* or *item* in an account; and hence it came alſo to ſtand for a ſum or number itſelf. From the plural *æra*, came by corruption *æra*, *æram*, in the ſingular: much as *Oſtia*, *Oſtiam*, the name of a place, from *Oſtia*, the mouths of the Tyber.

The difference between the terms *æra* and *epoch* is, that the æras are certain points fixed by ſome people, or nation; and the epochs are points fixed by chronologiſts and hiſtorians. The idea of an æra comprehends alſo a certain ſucceſſion of years proceeding from a fixed point of time, and the epoch is that point itſelf. Thus the

Ærarium ‖ Aeria.

the Chriſtian æra began at the epoch of the birth of Jeſus Chriſt. See CHRONOLOGY, where the different Eras, &c. are enumerated and explained.

ÆRARIUM, the treaſury or place where the public money was depoſited amongſt the Romans.

Ærarium Sanctius contained the monies ariſing from the twentieth part of all legacies: this was kept for the extreme neceſſities of the ſtate.

Ærarium Privatum was the emperor's privy purſe, or the place where the money ariſing from his private patrimony was depoſited.

Ærarium Viceſimarum, the place where the money ariſing from the taxes levied from foreign countries was laid up, ſo called becauſe it moſt commonly conſiſted of a twentieth part of the produce.

Ærarium Ilithyæ, or *Junonis Lucinæ*, was where the monies were depoſited which parents paid for the birth of each child.

There are ſeveral other treaſuries mentioned in hiſtory, as the *ærarium Juventutis*, *Veneris*, &c. The temple of Saturn was the public treaſury of Rome, either becauſe Saturn firſt taught the Italians to coin money, or, which is moſt likely, becauſe this temple was the ſtrongeſt and moſt ſecure, and therefore the fitteſt, place for that purpoſe.

Ærarium differs from *fiſcus*, as the firſt contained the public money, the ſecond that of the prince. The two are, however, ſometimes indiſcriminately uſed for each other.

ÆRARIUS, a name given by the Romans to a degraded citizen, who had been ſtruck off the liſt of his century. Such perſons were ſo called becauſe they were liable to all the taxes (*æra*), without enjoying any of its privileges.

The *ærarii* were incapable of making a will, of inheriting, of voting in aſſemblies, of enjoying any poſt of honour or profit; in effect, were only ſubject to the burdens, without the benefits of ſociety; yet they retained their freedom, and were not reduced to the condition of ſlaves. To be made an *ærarius* was a puniſhment inflicted for ſome offence, and reputed one degree more ſevere than to be expelled a tribe, *tribu moveri*.

ÆRARIUS was alſo an officer inſtituted by Alexander Severus, for the diſtribution of the money given in largeſſes to the ſoldiery or people.

ÆRARIUS was alſo uſed for a perſon employed in coining or working braſs.

Theſe are ſometimes called *ærarii fuſores*: at other times, *ærarius* is diſtinguiſhed from *fuſor*; the former anſwering to what we now call copperſmiths, the latter to founders.

ÆRARIUS was likewiſe applied to a ſoldier who receives pay.

AERIA, or EERIA, in *Ancient Geography*, the ancient name of Egypt. The ſcholiaſt on Apollonius Rhodius, ſays, that not only Theſſaly, but Egypt, was called Ἠερίη by the Greeks, which Euſebius alſo confirms: and hence Apollinarius, in his tranſlation of the 114th Pſalm, uſes it for Egypt. Heſychius applies this name to Ethiopia.

AERIAL, in a general ſenſe, denotes ſomething partaking of the nature of air; thus aerial ſubſtances, aerial particles, &c.

Aerial ‖ Aerophylacea.

Aerial Perſpective. See PERSPECTIVE and PAINTING.

AERIANS, in church hiſtory, a branch of Arians, who, to the doctrines of that ſect, added ſome peculiar dogmas of their own; as, that there is no difference between biſhops and prieſts; a doctrine maintained by many modern divines, particularly of the preſbyterian and reformed churches. The ſect received its denomination from Aerius an Armenian prieſt of the fourth century. He founded his doctrine chiefly upon ſome paſſages in St Paul; and, among others, upon that in 1 Tim. iv. 14. where the apoſtle exhorts him not to neglect *the gift he had received by the laying on of the hands of the Preſbytery*. Here, obſerves Aerius, is no mention of biſhops: on the contrary, Timothy evidently received his ordination from the preſbyters or prieſts.—Epiphanius zealouſly maintains the ſuperiority of biſhops againſt the Aerians. The word *preſbytery*, uſed by the apoſtle, he obſerves, includes both biſhops and prieſts; the whole ſenate or aſſembly of the eccleſiaſtics of the place.

FLOS ÆRIS, among alchemiſts, ſmall ſcales procured from copper melted by a ſtrong heat; it is ſometimes uſed for ærugo or verdigris.

AEROGRAPHY, from ἀηρ, *air*, and γραφω, *I deſcribe*; a deſcription of the air, or atmoſphere, its limits, dimenſions, properties, &c. This amounts to much the ſame with aerology, unleſs we ſuppoſe the latter to enter into the rational, and the former to confine itſelf to a deſcription of the more obvious affections thereof. See METEOROLOGY.

AEROMANCY, a ſpecies of divination performed by means of air, wind, &c. See DIVINATION.

AEROMETRY, the ſcience of meaſuring the air. It comprehends not only the doctrine of the air itſelf, conſidered as a fluid body; but alſo its preſſure, elaſticity, rareſaction, and condenſation. But the term is at preſent not much in uſe, this branch of natural philoſophy being more frequently called Pneumatics. See PNEUMATICS.

AERONAUT, a perſon who navigates or floats in the air by means of an air balloon. See AEROSTATION.

AERONAUTICA, from ἀηρ, and ναυτικος, derived from ναυς, *ſhip*; the art of ſailing in a veſſel or machine through the atmoſphere, ſuſtained as a ſhip in the ſea. See AEROSTATION.

AEROPHYLACEA, a term uſed by naturaliſts for caverns or reſervoirs of air, ſuppoſed to exiſt in the bowels of the earth. Kircher ſpeaks much of aerophylacea, or huge caverns replete with air, diſpoſed under ground; from whence, through numerous occult paſſages, that element is conveyed either to ſubterraneous receptacles of water, which, according to him, are hereby raiſed into ſprings or rivers, or into the funds of ſubterraneous fire, which are hereby fed and kept alive for the reſtoration of metals, minerals, and the like.

AEROSTATION,

IN its primitive ſenſe, denotes the ſcience of weights ſuſpended in the air; but in its modern acceptation, it ſignifies *aerial navigation*, or the art of navigating through the atmoſphere. Hence alſo the machines which are employed for this purpoſe are called *aeroſtats*, or *aeroſtatic* machines; and from their globular ſhape, *air balloons*.

The romances of almoſt every nation have recorded inſtances of perſons being carried through the air, both by the agency of ſpirits and by mechanical inventions; but till the time of Friar Bacon, who died in 1292, no rational principle appears ever to have been thought of by which this might be accompliſhed. He had written upon the ſubject, and not only aſſures us of the practicability of the art, but that he knew how to conſtruct a machine in which a man might tranſport himſelf through the air like a bird; and he affirms that the experiment had been ſucceſsfully made by another perſon. The machine conſiſted of two large thin ſhells, or hollow globes of copper, which were exhauſted of air; and thus being lighter than air, would ſupport a chair on which a perſon might ſit.

Friar Bacon firſt publiſhed the true principles of aeroſtation.

Many had been of opinion, that, by means of artificial wings, fixed to the arms or legs, a man might fly as well as a bird: but theſe opinions were thoroughly refuted by Borelli in his treatiſe *De Motu Animalium*, where, from a compariſon between the power of the muſcles which move the wings of a bird, and thoſe which move the arms of a man, he demonſtrates that the latter are utterly inſufficient to ſtrike the air with ſuch force as to raiſe him from the ground. It cannot be denied, however, that wings of this kind, if properly conſtructed, and dexterouſly managed, might be ſufficient to break the fall of a human body from a high place, ſo that ſome adventurers in this way might poſſibly come off with ſafety; though by far the greateſt number of thoſe who have raſhly adopted ſuch ſchemes, have either loſt their lives or limbs in the attempt.

Impoſſibility of flying by mechanical means.

Scheme of Biſhop Wilkins and Albertus de Saxonia.

In the year 1672, Biſhop Wilkins publiſhed a treatiſe, entitled, The Diſcovery of the New World; in which he mentions, though in a very indiſtinct and confuſed manner, the true principle on which the air is navigable; quoting, from Albertus de Saxonia and Francis Mendoza, "that the air is in ſome part of it navigable: and upon this ſtatic principle, any braſs or iron veſſel (ſuppoſe a kettle), whoſe ſubſtance is much heavier than that of water, yet being filled with the lighter air, it will ſwim upon it and not ſink. So ſuppoſe a cup or wooden veſſel upon the outward borders of this elementary air, the capacity of it being filled with fire, or rather ethereal air, it muſt neceſſarily, upon the ſame ground, remain ſwimming there, and of itſelf can no more fall than an empty ſhip can ſink." This idea, however, he did not by any means purſue, but reſted his hopes entirely upon mechanical motions, to be accompliſhed by the mere ſtrength of a man, or by ſprings, &c. and which have been demonſtrated incapable of anſwering any uſeful purpoſe.

The only perſon who brought his ſcheme of flying to any kind of rational principle was the Jeſuit Francis Lana, cotemporary with Biſhop Wilkins. His method was ſimilar to Friar Bacon's. He was acquainted with the real weight of the atmoſphere, and, juſtly concluded, that if a globular veſſel were exhauſted of air, it would weigh leſs than before; and conſidering that the ſolid contents of veſſels increaſe in much greater proportion than their ſurfaces; he ſuppoſed that a metalline veſſel might be made ſo large, that, when emptied of its air, it would be able not only to raiſe itſelf in the atmoſphere, but to carry up paſſengers along with it: and he made a number of calculations neceſſary for putting the project in execution. But though the theory was here unexceptionable, the means propoſed were certainly inſufficient to accompliſh the end: for a veſſel of copper, made ſo thin as was neceſſary to make it float in the atmoſphere, would be utterly unable to reſiſt the external preſſure; which being demonſtrated by thoſe ſkilled in mechanics, no attempt was made on that principle.

Biſhop Lana's ſcheme.

In the year 1709, however, as we are informed by a letter publiſhed in France in 1784, a Portugueſe projector, Friar Guſman, applied to the king for encouragement to his invention of a flying machine. The principle on which his was conſtructed, if indeed it had any principle, ſeems to have been that of the paper kite. The machine was conſtructed in form of a bird, and contained ſeveral tubes through which the wind was to paſs, in order to fill a kind of ſails, which were to elevate it; and when the wind was deficient, the ſame effect was to be performed by means of bellows concealed within the body of the machine. The aſcent was alſo to be promoted by the electric attraction of pieces of amber placed in the top, and by two ſpheres encloſing magnets in the ſame ſituation.

Strange propoſal of Friar Guſman.

Theſe childiſh inventions ſhow the low ſtate of ſcience at that time in Portugal, eſpecially as the king, in order to encourage him to farther exertions in ſuch an uſeful invention, granted him the firſt vacant place in his college of Barcelos or Santarem, with the firſt profeſſorſhip in the univerſity of Coimbra, and an annual penſion of 600,000 reis during his life. Of this De Guſman, it is alſo related, that, in the year 1736, he made a wicker baſket of about ſeven or eight feet diameter, and covered with paper, which raiſed itſelf about 200 feet in the air, and the effect was generally attributed to witchcraft.

In the year 1766, Mr Henry Cavendiſh aſcertained the weight and other properties of inflammable air, determining it to be at leaſt ſeven times lighter than common air. Soon after which it occurred to Dr Black, that perhaps a thin bag filled with inflammable air might be buoyed up by the common atmoſphere, and he thought of having the allantois of a calf prepared for this purpoſe: but his other avocations prevented him from proſecuting the experiment. The ſame thought occurred ſome years afterwards to Mr Cavallo; and he has the honour of being the firſt who made experiments

Poſſibility of bodies riſing in the air thought of by Dr Black and Mr Cavallo.

periments on the ſubject. He firſt tried bladders; but the thinneſt of theſe, however well ſcraped and prepared, were found too heavy. He then tried Chineſe paper; but that proved ſo permeable, that the vapour paſſed through it like water through a ſieve. His experiments, therefore, made in the year 1782, proceeded no farther than blowing up ſoap bubbles with inflammable air, which aſcended rapidly to the ceiling, and broke againſt it.

Aeroſtation diſcovered by Monſ. Montgolfier.

But while the diſcovery of the art of aeroſtation ſeemed thus on the point of being made in Britain, it was all at once announced in France, and that from a quarter whence nothing of the kind was to have been expected. Two brothers, Stephen and John Montgolfier, natives of Annonay, and maſters of a conſiderable paper manufactory there, had turned their thoughts towards this project as early as the middle of the year 1782. The idea was firſt ſuggeſted by the natural aſcent of the ſmoke and clouds in the atmoſphere; and their deſign was to form an artificial cloud, by encloſing the ſmoke in a bag, and making it carry up the covering along with it. Towards the middle of November that year the experiment was made at Avignon with a fine ſilk bag of a parallelopiped ſhape. By applying burning paper to the lower aperture, the air was rarefied, and the bag aſcended in the atmoſphere, and ſtruck rapidly againſt the ceiling. On repeating the experiment in the open air, it roſe to the height of about 70 feet.

Account of his experiments.

An experiment on a more enlarged ſcale was now projected; and a new machine, containing about 650 cubic feet, was made, which broke the cords that confined it, and roſe to the height of about 600 feet. Another of 35 feet in diameter roſe about 1000 feet high, and fell to the ground three quarters of a mile from the place where it aſcended. A public exhibition was next made on the 5th of June 1783, at Annonay, where a vaſt number of ſpectators aſſembled. An immenſe bag of linen, lined with paper, and containing upwards of 23,000 cubic feet, was found to have a power of lifting about 500 pounds, including its own weight. The operation was begun by burning chopped ſtraw and wool under the aperture of the machine, which immediately began to ſwell: and after being ſet at liberty aſcended into the atmoſphere. In ten minutes it had aſcended 6000 feet; and when its force was exhauſted, it fell to the ground at the diſtance of 7668 feet from the place from whence it ſet out.

Soon after this, one of the brothers arrived at Paris, where he was invited by the Academy of Sciences to repeat his experiments at their expence. In conſequence of this invitation, he conſtructed, in a garden in the fauxbourg of St Germain, a large balloon of an elliptical form. In a preliminary experiment, this machine lifted up from the ground eight perſons who held it, and would have carried them all off if more had not quickly come to their aſſiſtance. Next day the experiment was repeated in preſence of the members of the academy; the machine was filled by the combuſtion of 50 pounds of ſtraw made up in ſmall bundles, upon which about 12 pounds of chopped wool were thrown at intervals. The uſual ſucceſs attended this exhibition: the machine ſoon ſwelled; endeavoured to aſcend; and immediately after ſuſtained itſelf in the air, together with the charge of between 400 and 500 pounds weight. It was evident that it would have aſcended to a great height; but as it was deſigned to repeat the experiment before the king and royal family at Verſailles, the cords by which it was tied down were not cut. But in conſequence of a violent rain and wind which happened at this time, the machine was ſo far damaged, that it became neceſſary to prepare a new one for the time that it had been determined to honour the experiment with the royal preſence; and ſuch expedition was uſed, that this vaſt machine, of near 60 feet in height and 43 in diameter, was made, painted with water colours both within and without, and finely decorated, in no more than four days and four nights. Along with this machine was ſent up a wicker cage, containing a ſheep, a cock, and a duck, which were the firſt animals ever ſent through the atmoſphere. The full ſucceſs of the experiment was prevented by a violent guſt of wind which tore the cloth in two places near the top before it aſcended; however, it roſe to the height of 1440 feet; and after remaining in the air about eight minutes, fell to the ground at the diſtance of 10,200 feet from the place of its ſetting out. The animals were not in the leaſt hurt.

Some animals ſafely ſent thro' the air.

M. Pilatre de Rozier the firſt aerial navigator.

The great power of theſe aeroſtatic machines, and their very gradual deſcent in falling to the ground, had originally ſhowed that they were capable of tranſporting people through the air with all imaginable ſafety; and this was further confirmed by the experiment already mentioned. As M. Montgolfier, therefore, propoſed to make a new aeroſtatic machine of a firmer and better conſtruction than the former, M. Pilatre de Rozier offered himſelf to be the firſt aërial adventurer.

This new machine was conſtructed in a garden in the fauxbourg of St Antoine. It was of an oval ſhape, about 48 feet in diameter, and 74 in height, elegantly painted on the outſide with the ſigns of the zodiac, cyphers of the king's name, and other ornaments. A proper gallery, grate, &c. were appended in the manner afterwards deſcribed; ſo that it was eaſy for the perſon who aſcended to ſupply the fire with fuel, and thus keep up the machine as long as he pleaſed. The weight of the whole apparatus was upwards of 1600 pounds. The experiment was performed on the 15th of October 1783. M. Pilatre having placed himſelf in the gallery, the machine was inflated, and permitted to aſcend to the height of 84 feet, where he kept it afloat for about four minutes and a half: after which he deſcended very gently: and ſuch was its tendency to aſcend, that it rebounded to a conſiderable height after touching the ground. Two days after, he repeated the experiment with the ſame ſucceſs as before; but the wind being ſtrong, the machine did not ſuſtain itſelf ſo well as formerly. On repeating the experiment in calmer weather, he aſcended to the height of 210 feet. His next aſcent was 262 feet; and in the deſcent, a guſt of wind having blown the machine over ſome large trees of an adjoining garden, M. Pilatre ſuddenly extricated himſelf from ſo dangerous a ſituation, by throwing ſome ſtraw and chopped wool on the fire, which raiſed him at once to a ſufficient height. On deſcending again, he once more raiſed himſelf to a proper height by throwing ſtraw on the fire. Some time after, he aſcended in company with

Account of his different voyages.

M. Girond

M. Girond de Villette to the height of 330 feet; hovering over Paris at leaſt nine minutes in ſight of all the inhabitants, and the machine keeping all the while perfectly ſteady.

Theſe experiments had ſhown, that the aeroſtatic machines might be raiſed or lowered at the pleaſure of the perſons who aſcended: they had likewiſe diſcovered, that the keeping them faſt with ropes was no advantage; but, on the contrary, that this was attended with inconvenience and hazard. On the 21ſt of November 1783, therefore, M. Pilatre determined to undertake an aerial voyage in which the machine ſhould be fully ſet at liberty. Every thing being got in readineſs, the balloon was filled in a few minutes; and M. Pilatre placed himſelf in the gallery, counterpoiſed by the marquis d'Arlandes, who occupied the other ſide. It was intended to make ſome preliminary experiments on the aſcending power of the machine; but the violence of the wind prevented this from being done, and even damaged the balloon eſſentially; ſo that it would have been entirely deſtroyed had not timely aſſiſtance been given. The extraordinary exertions of the workmen, however, repaired it again in two hours, and the adventurers ſet out. They met with no inconvenience during their voyage, which laſted about 25 minutes; during which time they had paſſed over a ſpace of above five miles.—From the account given by the marquis d'Arlandes, it appears that they met with ſeveral different currents of air; the effect of which was, to give a very ſenſible ſhock to the machine, and the direction of the motion ſeemed to be from the upper part downwards. It appears alſo that they were in ſome danger of having the balloon burnt altogether; as the marquis obſerved ſeveral round holes made by the fire in the lower part of it, which alarmed him conſiderably, and indeed not without reaſon. However, the progreſs of the fire was eaſily ſtopped by the application of a wet ſponge, and all appearance of danger ceaſed in a very ſhort time.

Montgolfier's machines ſuperſeded by thoſe filled with inflammable air.

This voyage of M. Pilatre and the marquis d'Arlandes may be ſaid to conclude the hiſtory of thoſe aeroſtatic machines which are elevated by means of fire; for though many other attempts have been made upon the ſame principle, moſt of them have either proved unſucceſsful or were of little conſequence. They have therefore given place to the other kind filled with inflammable air (*hydrogen gas*); which, by reaſon of its ſmaller ſpecific gravity, is both more manageable and capable of performing voyages of greater length, as it does not require to be ſupplied with fuel like the others. This was invented a very ſhort time after the diſcovery had been made by M. Montgolfier. This gentleman had indeed deſigned to keep his method in ſome degree a ſecret from the world; but as it could not be concealed, that a bag filled with any kind of fluid lighter than the common atmoſphere would riſe in it, inflammable air was naturally thought of as a proper ſuccedaneum for the rarefied air of M. Montgolfier. The firſt experiment was made by two brothers Meſſrs Roberts, and M. Charles a profeſſor of experimental philoſophy. The bag which contained the gas was compoſed of luteſtring, varniſhed over with a ſolution of the elaſtic gum called *caoutchouc;* and that with which they made their firſt eſſay was only about 13 Engliſh feet in diameter. Many difficulties occurred in filling it with the inflammable air, chiefly owing to their ignorance of the proper apparatus; inſomuch, that, after a whole day's labour from nine in the morning, they had got the balloon only one-third part full. Next morning they were ſurpriſed to find that it had fully inflated of itſelf during the night; but, upon inquiry, it was found, that they had inadvertently left open a ſtop-cock connected with the balloon, by which the common air gaining acceſs, had mixed itſelf with the inflammable air; forming a compound ſtill lighter than the common atmoſphere, but not ſufficiently light to anſwer the purpoſes of aeroſtation. Thus they were obliged to renew their operation; and, by ſix o'clock in the evening of next day, they found the machine conſiderably lighter than the common air; and, in an hour after, it made a conſiderable effort to aſcend. The public exhibition, however, had been announced only for the third day after; ſo that the balloon was allowed to remain in an inflated ſtate for a whole day; during which they found it had loſt a power of aſcent equal to about three pounds, being one-ſeventh part of the whole. When it was at laſt ſet at liberty, after having been well filled with inflammable air, it was 35 pounds lighter than an equal bulk of common air. It remained in the atmoſphere only three quarters of an hour, during which it had traverſed 15 miles. Its ſudden deſcent was ſuppoſed to have been owing to a rupture which had taken place when it aſcended into the higher regions of the atmoſphere.

In what manner a balloon partly filled may inflate itſelf.

Loſs of power in their balloon.

The ſucceſs of this experiment, and the aerial voyage made by Meſſrs Rozier and Arlandes, naturally ſuggeſted the idea of undertaking ſomething of the ſame kind with a balloon filled with inflammable air. The machine uſed on this occaſion was formed of gores of ſilk, covered over with a varniſh made of *caoutchouc*, of a ſpherical figure, and meaſuring 27½ feet in diameter. A net was ſpread over the upper hemiſphere, and was faſtened to a hoop which paſſed round the middle of the balloon. To this a ſort of car, or rather boat, was ſuſpended by ropes, in ſuch a manner as to hang a few feet below the lower part of the balloon: and, in order to prevent the burſting of the machine, a valve was placed in it; by opening of which, ſome of the inflammable air might be occaſionally let out. A long ſilken pipe communicated with the balloon, by means of which it was filled. The boat was made of baſket work, covered with painted linen, and beautifully ornamented; being 8 feet long, 4 broad, and 3½ deep; its weight 130 pounds. At this time, however, as at the former, they met with great difficulties in filling the machine with inflammable air, owing to their ignorance of the moſt proper apparatus. But at laſt, all obſtacles being removed, the two adventurers took their ſeats at three quarters after one in the afternoon of the firſt of December 1783. Perſons ſkilled in mathematics were conveniently ſtationed with proper inſtruments to calculate the height, velocity, &c. of the balloon. The weight of the whole apparatus, including that of the two adventurers, was found to be 604½ pounds, and the power of aſcent when they ſet out was 22 pounds; ſo that the whole difference betwixt the weight of this balloon and an equal bulk of common air was 624 pounds. But the weight of common atmoſphere diſplaced by the inflammable gas

First aerial voyage of Meſſrs Charles and Roberts.

Experiment of Meſſrs Charles and Roberts.

was

was calculated to be 771 pounds, so that there remains 147 for the weight of the latter; and this calculation makes it only 5¼ times lighter than common air.

Specific gravity of the inflammable air in this first voyage.

At the time the balloon left the ground, the thermometer stood at 59° of Fahrenheit's scale; and the quicksilver in the barometer at 30.18 inches; and, by means of the power of ascent with which they left the ground, the balloon rose till the mercury fell to 27 inches, from which they calculated their height to be about 600 yards. By throwing out ballast occasionally as they found the machine descending by the escape of some of the inflammable air, they found it practicable to keep at pretty near the same distance from the earth during the rest of their voyage; the quicksilver fluctuating between 27 and 27.65 inches, and the thermometer between 53° and 57°, the whole time. They continued in the air for the space of an hour and three quarters, when they alighted at the distance of 27 miles from Paris: having suffered no inconvenience during their voyage, nor experienced any contrary currents of air, as had been felt by Messr. Pilatre and Arlandes. As the balloon still retained a great quantity of inflammable gas, Mr Charles determined to take another voyage by himself. Mr Robert accordingly got out of the boat, which was thus lightened by 130 pounds, and of consequence the aerostatic machine now had nearly as much power of ascent. Thus he was carried up with such velocity, that in twenty minutes he was almost 9000 feet high, and entirely out of sight of terrestrial objects. At the moment of his parting with the ground, the globe had been rather flaccid; but it soon began to swell, and the inflammable air escaped from it in great quantity through the silken tube. He also frequently drew the valve that it might be the more freely emitted, and the balloon effectually prevented from bursting. The inflammable gas being considerably warmer than the external air, diffused itself all round, and was felt like a warm atmosphere; but in ten minutes the thermometer indicated a variation of temperature as great as that between the warmth of spring and the ordinary cold of winter. His fingers were benumbed by the cold, and he felt a violent pain in his right ear and jaw, which he ascribed to the dilatation of the air in these organs as well as to the external cold. The beauty of the prospect which he now enjoyed, however, made amends for these inconveniences. At his departure the sun was set on the valleys; but the height to which Mr Charles was got in the atmosphere, rendered him again visible, though only for a short time. He saw, for a few seconds, vapours rising from the valleys and rivers. The clouds seemed to ascend from the earth, and collect one upon the other, still preserving their usual form; only their colour was gray, and monotonous for want of sufficient light in the atmosphere. By the light of the moon, he perceived that the machine was turning round with him in the air; and he observed that there were contrary currents which brought him back again. He observed also, with surprise, the effects of the wind, and that the streamers of his banners pointed upwards; which, he says, could not be the effect either of his ascent or descent, as he was moving horizontally at the time. At last, recollecting his promise of returning to his friends in half an hour, he pulled the valve, and accelerated his descent. When within 200 feet of the earth, he threw out two or three pounds of ballast, which rendered the balloon again stationary; but, in a little time afterwards, he gently alighted in a field about three miles distant from the place whence he set out; though, by making allowance for all the turnings and windings of the voyage, he supposes that he had gone through nine miles at least. By the calculations of M. de Meunier, he rose at this time not less than 10,500 feet high; a height somewhat greater than that of Mount Ætna. A small balloon, which had been sent off before the two brothers set out on their voyage, took a direction opposite to that of the large one, having met with an opposite current of air, probably at a much greater height.

Mr Charles ascends by himself.

Has a pain in his ear and jaw when in the higher regions.

Various currents of wind and eddies in these regions.

Streamers of his banners turn upwards.

The subsequent aerial voyages differ so little from that just now related, that any particular description of them seems to be superfluous. It had occurred to Mr Charles, however, in his last flight, that there might be a possibility of directing the machine in the atmosphere; and this was soon attempted by Mr Jean Pierre Blanchard, a gentleman who had, for several years before, amused himself with endeavours to fly by mechanical means, though he had never succeeded in the undertaking. As soon as the discovery of the aerostatic machines was announced, however, he resolved to add the wings of his former machine to a balloon, and made no doubt that it would then be in his power to direct himself through the air at pleasure. In his first attempt he was frustrated by the impetuosity of a young gentleman, who insisted, right or wrong, on ascending along with him. In the scuffle which ensued on this occasion, the wings and other apparatus were entirely destroyed; so that M. Blanchard was obliged to commit himself to the direction of the wind; and in another attempt it was found, that all the strength he could apply to the wings was scarce sufficient to counteract the impression of the wind in any degree. In his voyage, he found his balloon, at a certain period, acted upon by two contrary winds; but, on throwing out four pounds of ballast, he ascended to a place where he met with the same current he had at setting out from the earth. His account of the sensations he felt during this voyage, was somewhat different from that of Mr Charles; having, in one part of it, found the atmosphere very warm, in another cold; and having once found himself very hungry, and at another time almost overcome by a propensity to sleep. The height to which he arose, as measured by several observations with mathematical instruments, was thought to be very little less than 10,000 feet; and he remained in the atmosphere an hour and a quarter.

Attempts to guide aerostatic machines in the atmosphere.

Two first voyages of M. Blanchard.

His sensations while in the atmosphere.

The attempts of Mr Blanchard to direct his machine through the atmosphere, were repeated in the month of April 1784 by Messr. Morveau and Bertrand, at Dijon, who raised themselves with an inflammable air balloon to the height, as it was thought, of 13,000 feet; passing through a space of 18 miles in an hour and 25 minutes. Mr Morveau had prepared a kind of oars for directing the machine through the air; but they were damaged by a gust of wind, so that only two of them remained serviceable; by working these, however, they were able to produce a sensible effect on the motion of the machine. In a third aerial voyage performed by Mr Blanchard, he seemed to produce

Voyage of Messr. Morveau and Bertrand.

Third voyage of M. Blanchard.

duce ſome effect by the agitation of his wings, both in aſcending, deſcending, moving ſideways, and even in ſome meaſure againſt the wind; however, this is ſuppoſed, with ſome probability, to have been a miſtake, as, in all his ſucceeding voyages, the effects of his machinery could not be perceived.

Second voyage of Meſſrs Charles and Robert.

The ſucceſs of Meſſrs Charles and Robert in their former experiments, encouraged them ſoon to repeat them, with the addition of ſome machinery to direct their courſe. Having enlarged their former balloon to the ſize of an oblong ſpheroid 46½ feet long and 27½ in diameter, they made it to float with its longeſt part parallel to the horizon. The wings were made in the ſhape of an umbrella without the handle, to the top of which a ſtick was faſtened parallel to the aperture of the umbrella. Five of theſe were diſpoſed round the boat, which was near 17 feet in length. The balloon was filled in three hours, and, with the addition of 450 pounds of ballaſt, remained *in æquilibrio* with the atmoſphere. About noon, on the 19th of September 1784, they began to aſcend very gently in conſequence of throwing out 24 pounds of ballaſt, but were ſoon obliged to throw out eight pounds more, in order to avoid running againſt ſome trees. Thus they roſe to the height of 1400 feet, when they perceived ſome thunder clouds near the horizon. On this they aſcended and deſcended, to avoid the danger, as the wind blew directly towards the threatening clouds; but, from the height of 600 feet to that of 4200 above the ſurface of the earth, the current was quite uniform and in one direction. During their voyage they loſt one of their oars; but found, that by means of thoſe which remained, they conſiderably accelerated their courſe. From the account of their voyage, it would ſeem that they had paſſed ſafely through the thunder clouds; as we are informed, that, about 40 minutes after three they heard a loud clap of thunder; and three minutes after, another much louder; at which time the thermometer ſunk from 77 to 59 degrees. This ſudden cold, occaſioned by the approach of the clouds, condenſed the inflammable air ſo that the balloon deſcended very low, and they were obliged to throw out 40 pounds of ballaſt; yet on examining the heat of the air within the balloon, they found it to be 104°, when that of the external atmoſphere was only 63°. When they had got ſo high that the mercury in the barometer ſtood only at 23.94 inches, they found themſelves becalmed; ſo that the machine did not go even at the rate of two feet in a ſecond, though it had before gone at the rate of 24 feet in a ſecond. On this they determined to try the effect of their oars to the utmoſt; and, by working them for 35 minutes, and marking the ſhadow of the balloon on the ground, they found, in that time, that they had deſcribed the ſegment of an ellipſis whoſe longeſt diameter was 6000 feet. After having travelled about 150 miles, they deſcended, only on account of the approach of night, having ſtill 200 pounds of ballaſt left.

Are in danger of running into thunder clouds.

Heat of the air within their balloon.

Effect of their oars in moving the machine.

Their concluſion, with regard to the effect of their wings, is as follows: "Thoſe experiments ſhow, that far from going againſt the wind, as is ſaid by ſome perſons to be poſſible in a certain manner, and ſome aeronauts pretend to have actually done, we only obtained, by means of two oars, a deviation of 22 degrees: it is certain, however, that if we could have uſed our four oars, we might have deviated about 40 degrees from the direction of the wind; and as our machine would have been capable of carrying ſeven perſons, it would have been eaſy for five perſons to have gone, and to have put in action eight oars, by means of which a deviation of about 80 degrees would have been obtained.

"We have already obſerved (ſay they), that if we did not deviate more than 22 degrees, it was becauſe the wind carried us at the rate of 24 miles an hour; and it is natural to judge, that, if the wind had been twice as ſtrong as it was, we ſhould not have deviated more than one-half of what we actually did; and, on the contrary, if the wind had been only half as ſtrong, our deviation would have been proportionably greater."

Having thus related all that has been done with regard to the conducting of aeroſtatic machines through the atmoſphere, we ſhall now relate the attempts that have been made to leſſen their expence, by falling upon ſome contrivance to aſcend without throwing out ballaſt, and to deſcend without loſing any of the inflammable air. The firſt attempt of this kind was made by the duke de Chartres; who, on the 15th of July 1784, aſcended with the two brothers, Roberts, and a fourth perſon, from the park of St Cloud. The balloon was of an oblong form, made to aſcend with its longeſt diameter horizontally, and meaſured 55 feet in length and 24 in breadth. It contained within it a ſmaller balloon filled with common air; by blowing into which with a pair of bellows, and thus throwing in a conſiderable quantity of common air, it was ſuppoſed that the machine would become ſufficiently heavy to deſcend, eſpecially as, by the inflation of the internal bag, the inflammable air in the external one would be condenſed into a ſmaller ſpace, and thus become ſpecifically heavier. The voyage, however, was attended with ſuch circumſtances as rendered it impoſſible to know what would have been the event of the ſcheme. The power of aſcent with which they ſet out, ſeems to have been very great; as, in three minutes after parting with the ground, they were loſt in the clouds, and involved in ſuch a denſe vapour that they could ſee neither the ſky nor the earth. In this ſituation they ſeemed to be attacked by a whirlwind, which, beſides turning the balloon three times round from right to left, ſhocked and beat it ſo about, that they were rendered incapable of uſing any of the means propoſed for directing their courſe, and the ſilk ſtuff of which the helm had been compoſed was even torn away. No ſcene can be conceived more terrible than that in which they were now involved. An immenſe ocean of ſhapeleſs clouds rolled one upon another below them, and ſeemed to prevent any return to the earth, which ſtill continued inviſible, while the agitation of the balloon became greater every moment. In this extremity they cut the cords which held the interior balloon, and of conſequence it fell down upon the aperture of the tube that came from the large balloon into the boat, and ſtopped it up. They were then driven upwards by a guſt of wind from below, which carried them to the top of that ſtormy vapour in which they had been involved. They now ſaw the ſun without a cloud; but the heat of his rays, with the diminiſhed denſity of the atmoſphere had ſuch an effect on the inflammable air, that the balloon ſeemed

Contrivances uſed to prevent the waſte of inflammable air.

Voyage of the duke de Chartres.

Is involved in dark clouds and attacked by a whirlwind.

every

every moment ready to burſt. To prevent this, they introduced a ſtick through the tube, in order to puſh away the inner balloon from its aperture: but the expanſion of the inflammable air puſhed it ſo cloſe, that all attempts of this kind proved ineffectual. It was now, however, become abſolutely neceſſary to give vent to a very conſiderable quantity of the inflammable air; for which purpoſe the duke de Chartres himſelf bored two holes in the balloon, which tore open for the length of ſeven or eight feet. On this they deſcended with great rapidity: and would have fallen into a lake, had they not haſtily thrown out 60 pounds of ballaſt, which enabled them juſt to reach the water's edge.

The ſucceſs of the ſcheme for raiſing or lowering aeroſtatic machines by means of bags filled with common air being thus rendered dubious, another method was thought of. This was to put a ſmall aeroſtatic machine with rarefied air under an inflammable air balloon, but at ſuch a diſtance that the inflammable air of the latter might be perfectly out of the reach of the fire uſed for inflating the former; and thus, by increaſing or diminiſhing the fire in the ſmall machine, the abſolute weight of the whole would be conſiderably diminiſhed or augmented. This ſcheme was unhappily put in execution by the celebrated M. Pilatre de Rozier, and another gentleman named Mr Romaine. Their inflammable air balloon was about 37 feet in diameter, and the power of the rarefied air one was equivalent to about 60 pounds. They aſcended without any appearance of danger or ſiniſter accident: but had not been long in the atmoſphere when the inflammable air balloon was ſeen to ſwell very conſiderably, at the ſame time that the aeronauts were obſerved, by means of teleſcopes, very anxious to get down, and buſied in pulling the valve and opening the appendages to the balloon, in order to facilitate the eſcape of as much inflammable air as poſſible. A ſhort time after this the whole machine was on fire, when they had then attained the height of about three quarters of a mile from the ground. No exploſion was heard; and the ſilk which compoſed the air balloon continued expanded, and ſeemed to reſiſt the atmoſphere for about a minute; after which it collapſed, and the remains of the apparatus deſcended along with the two unfortunate travellers ſo rapidly, that both of them were killed. Mr Pilatre ſeemed to have been dead before he came to the ground; but Mr Romaine was alive when ſome perſons came up to the place where he lay, though he expired immediately after.

nfortu- te voy- e and ath of eſſrs Ro- er and omaine.

Theſe are the moſt remarkable attempts that have been made to improve the ſcience of aeroſtation; though a great number of other expeditions through the atmoſphere have taken place. But of all the voyages which had been hitherto projected or put in execution, the moſt daring was that of Mr Blanchard and Dr Jeffries acroſs the ſtraits of Dover, which ſeparate Britain from France. This took place on the 7th of January 1785, being a clear froſty morning, with a wind, barely perceptible, at N. N. W. The operation of filling the balloon began at 10 o'clock, and, at three quarters after 12, every thing was ready for their departure. At one o'clock Mr Blanchard deſired the boat to be puſhed off, which now ſtood only two feet diſtant from that precipice ſo finely deſcribed by Shakeſpeare in his tragedy of King Lear. As the balloon was ſcarcely ſufficient to carry two, they were obliged to throw out all their ballaſt except three bags of 10 pounds each; when they at laſt roſe gently; though making very little way on account of there being ſo little wind. At a quarter after one o'clock, the barometer, which on the cliff ſtood at 29.7 inches, was now fallen to 27.3, and the weather proved fine and warm. They had now a moſt beautiful proſpect of the ſouth coaſt of England, and were able to count 37 villages upon it. After paſſing over ſeveral veſſels, they found that the balloon, at 50 minutes after one, was deſcending, on which they threw out a ſack and a half of ballaſt; but as they ſaw that it ſtill deſcended, and with much greater velocity than before, they now threw out all the ballaſt. This ſtill proving ineffectual, they next threw out a parcel of books they carried along with them, which made the balloon aſcend, when they were about midway betwixt France and England. At a quarter paſt two, finding themſelves again deſcending, they threw away the remainder of their books, and, ten minutes after, they had a moſt enchanting proſpect of the French coaſt. Still, however, the machine deſcended; and as they had now no more ballaſt, they were obliged to throw away their proviſions, the wings of their boat, and every thing they could poſſibly ſpare. "We threw away (ſays Dr Jeffries) our only bottle, which, in its deſcent caſt out a ſteam like ſmoke, with a ruſhing noiſe; and when it ſtruck the water, we heard and felt the ſhock very perceptibly on our car and balloon." All this proving inſufficient to ſtop the deſcent of the balloon, they next threw out their anchors and cords, and at laſt ſtripped off their clothes, faſtening themſelves to certain ſlings, and intending to cut away the boat as their laſt reſource. They had now the ſatisfaction, however, to find that they were riſing; and as they paſſed over the high lands between Cape Blanc and Calais the machine roſe very faſt, and carried them to a greater height than they had been at any former part of their voyage. They deſcended ſafely among ſome trees in the foreſt of Guiennes, where there was juſt opening enough to admit them.

It would be tedious as well as unneceſſary to recount all the other aerial voyages that have been performed in our own or other countries: It appeared ſufficient for the purpoſe of this article to notice thoſe which were moſt remarkable and intereſting; and therefore an account of the ingenious Mr Baldwin's excurſion from Cheſter, alluded to above, muſt not be omitted in our enumeration.

yage of ſſrs nchard d Jeffries oſs the ſits of ver.

On the 8th of September 1785, at forty minutes paſt one P. M. Mr Baldwin aſcended from Cheſter in Mr Lunardi's balloon. After traverſing in a variety of different directions, he firſt alighted, at 28 minutes after three, about twelve miles from Cheſter, in the neighbourhood of Frodſham; then reaſcending and purſuing his excurſion, he finally landed at Rixton moſs, five miles N. N. E. of Wavington, and 25 miles from Cheſter. Mr Baldwin has publiſhed his Obſervations and remarks made during his voyage, and taken from minutes. Our limits will not admit of relating many of his obſervations; but the few following are ſome of the moſt important and curious. "The ſenſation of aſcending is compared to that of a ſtrong preſſure from the bottom of the car upwards againſt Baldwin's voyage.

the ſoles of his feet. At the diſtance of what appeared to him ſeven miles from the earth, though by the barometer ſcarcely a mile and a half, he had a grand and moſt enchanting view of the city of Cheſter and its adjacent places below. The river Dee appeared of a red colour; the city very diminutive; and the town entirely blue. The whole appeared a perfect plain, the higheſt building having no apparent height, but reduced all to the ſame level; and the whole terreſtrial proſpect appeared like a coloured map. Juſt after his firſt aſcent, being in a well watered and maritime part of the country, he obſerved a remarkable and regular tendency of the balloon towards the ſea; but ſhortly after riſing into another current of air, he eſcaped the danger: this upper current he ſays, was viſible to him at the time of his aſcent, by a lofty ſound ſtratum of clouds flying in a faſe direction. The perſpective appearance of things to him was very remarkable. The loweſt bed of vapour that firſt appeared as cloud was pure white, in detached fleeces, increaſing as they roſe: they preſently coaleſced, and formed, as he expreſſes it, a ſea of cotton, tufting here and there by the action of the air in the undiſturbed part of the clouds. The whole became an extended white floor of cloud, the upper ſurface being ſmooth and even. Above this white floor he obſerved, at great and unequal diſtances, a vaſt aſſemblage of thunder clouds, each parcel conſiſting of whole acres in the denſeſt form: he compares their form and appearance to the ſmoke of pieces of ordnance, which had conſolidated as it were into maſſes of ſnow, and penetrated through the upper ſurface or white floor of common clouds, there remaining viſible and at reſt. Some clouds had motions in ſlow and various directions, forming an appearance truly ſtupendous and majeſtic." He endeavours to convey ſome idea of the ſcene by a figure; (and from this fig. 1. Plate II. is copied). *A* repreſents a circular view he had from the car of the balloon, himſelf being over the centre of the view, looking down on the white floor of clouds, and ſeeing the city of Cheſter through an opening, which diſcovered the landſcape below, limited by ſurrounding vapour to leſs than two miles in diameter. The breadth of the outer margin defines his apparent height in the balloon (viz. 4 miles) above the white floor of clouds. Mr Baldwin alſo gives a curious deſcription of his tracing the ſhadow of the balloon over tops of volumes of clouds. At firſt it was ſmall, in ſize and ſhape like an egg; but ſoon increaſed to the magnitude of the ſun's diſc, ſtill growing larger, and attended with a moſt captivating appearance of an iris encircling the whole ſhadow at ſome diſtance round it, the colours of which were remarkably brilliant. The regions did not feel colder, but rather warmer than below. The ſun was hotteſt to him when the balloon was ſtationary. The diſcharge of a cannon, when the balloon was at a conſiderable height, was diſtinctly heard by the aeronaut; and a diſcharge from the ſame piece when at the height of thirty yards, ſo diſturbed him as to oblige him for ſafety to lay hold firmly of the cords of the balloon. At a conſiderable height he poured down a pint bottle full of water; and as the air did not oppoſe a reſiſtance ſufficient to break the ſteam into ſmall particles, it moſtly fell down in large drops. In the courſe of the balloon's track it was found much affected by the water (a circumſtance obſerved in former aerial voyages). At one time the direction of the balloon kept continually over the water, going directly towards the ſea, ſo much as to endanger the aeronaut; the mouth of the balloon was opened, and in two minutes he deſcended into an under current blowing from the ſea: he kept deſcending, and landed at Bellair farm in Rinſley, 12 miles from Cheſter. Here he lightened his car by 31 pounds, and inſtantly reaſcending, was carried into the interior part of the country, performing a number of different manœuvres. At his greateſt altitude he found his reſpiration free and eaſy. Several bladders which he had along with him crackled and expanded very conſiderably. Clouds and land, as before, appeared on the ſame level. By way of experiment, he tried the upper valve two or three times, the neck of the balloon being cloſe; and remarked, that the eſcape of the gas was attended with a growling noiſe like millſtones, but not near ſo loud. Again, round the ſhadow of the balloon, on the clouds he obſerved the iris. A variety of other circumſtances and appearances he met with, is fancifully deſcribed; and at 53 minutes paſt three he finally landed.

View from the balloon.

Appearance of the clouds.

The following is an account of an eſtabliſhment formed in France during the late war for the improvement of aerial navigation:

"The aeroſtatic inſtitute, founded by the committee of public ſafety, and enveloped in the moſt profound ſecrecy at Meudon, to which alſo was added a camp for the exerciſe of the artillery, is even yet looked upon as a ſecret arrangement of the republic, reſpecting which the greateſt precautions are taken; the doors being ſhut againſt the public and all foreigners. Aeroſtatic inſtitute in France.

It was impoſſible to have ſelected a more convenient ſpot for the eſtabliſhment of the aeronautic inſtitute than the royal lodge of Meudon. From its elevated ſite on a mountain, it commands a beautiful and extenſive proſpect over a plain covered with villages and cultivated fields, interſected by the Seine, and terminated by the city of Paris.

The perfection and the rational application of aeronautics are the objects of the labours of this eſtabliſhment, to which the celebrated natural philoſopher Guyton Morveau has in particular rendered the moſt important ſervices. But the inſtitution ſtood in need of ſuch a director as Conté, for whom Guyton Morveau has procured the appointment. With a love of the ſcience Conté unites a penetrating genius for reſearch and invention, accompanied by indefatigable aſſiduity. Objects of it.

The corps of aeronauts, intended to ſerve in the armies of the republic, and conſiſting of fifty courageous youths, is trained at the ſchool of Meudon: it is there the balloons are prepared which are ſent off to the armies; and every day in ſummer the pupils are employed, at one time in performing their exerciſes, at another in making reſearches, in natural philoſophy, with a balloon which is kept conſtantly filled for the purpoſe. Employment of the pupils.

The improvement in the preparation of the balloon, the diſcovery of a new mode of filling it with inflammable air from the ſubſtance of water (hydrogen gas), diſcovered by Lavoiſier, the invention of a new telegraph, connected with the balloon, are the principal advances which have been made in aeroſtatics at Meudon under the direction of Conté.

The

The old lodge of Meudon ſerves as a manufactory for the preparation of the balloons, and of all the apparatus neceſſary to accompany them to the armies. The new lodge is appropriated to the inſtitute, and to the accommodation of the pupils, and of the director and his family. There were prepared the *Entreprenant* for the army of the north, by means of which the hoſtile army was reconnoitred at the battle of Fleurus; the *Céleſte* for the army of the Sambre and Maeſe; the *Hercule* and the *Intrépide* for the army of the Rhine and Moſelle.

Mode of preparing the balloons.

The ſilk for the balloons is manufactured at Lyons, and is very thick and ſtrong: and Conté has rendered them much more durable by the precaution of only varniſhing the outer ſurface. The varniſh is of an excellent quality; it ſufficiently hardens the outſide, and does not make the ſilk ſtick together when the balloon is folded. Moreover, experience has proved that the inner coat of varniſh cannot reſiſt the operation of filling the balloon, that it is corroded by the gas, and that this friction renders the ſilk flabby.

The filling of the balloon with hydrogen gas is the reſult of the diſcoveries made by the great Lavoiſier, and has for its baſis his important experiment of the decompoſition of water. The gas is prepared by the following ſimple and unexpenſive proceſs.

The gas.

Six or more hollow iron cylinders are ſet in brick work, beſide and over each other, in a furnace which may be conſtructed in twelve hours; and both ends of each cylinder are made to project from the furnace. The openings of theſe cylinders are ſtopped with ſtrong iron covers, through which metal tubes are let in. The tube at one end ſerves for pouring water, previouſly heated, into the cylinders when red hot; that on the oppoſite ſide is deſtined to conduct the air which firſt preſents itſelf, through a reſervoir filled with a cauſtic lixivium, and to convey it into the balloon. The cylinders are partly filled with coarſe iron filings, which the exceſſive heat of the furnace, kept up with pit coal during the whole time of the operation, reduces to a ſtate of excandeſcence. At this ſtage of the proceſs, the valve of one of the tubes of each cylinder is opened, and a ſmall quantity of boiling water is gently poured into the heated cylinder. As ſoon as the vapour of the water touches the heated iron, the two ſubſtances which compoſe the water are ſeparated: the one (the oxygen) attaches itſelf to the iron, which it calcines, and which, after the operation, is found partly cryſtallized, after the manner of volcanic productions: the other of the component ſubſtances of the water (the hydrogen) combines with a quantity of the igneous ſubſtance termed *calorique*, and becomes inflammable air (hydrogen gas), which continues in a permanent ſtate of elaſtic fluidity, and weighs ſeven or eight times leſs than the atmoſpheric air.

As the water contains a ſmall portion of the ſubſtance of *carbone* (*carbonique*) which would render the air in the balloon heavy, the air, as it firſt ruſhes out of the cylinders is made to paſs through a reſervoir of water impregnated with a cauſtic alkali. This fluid attracts to itſelf all the *carbonique*, and nothing riſes into the balloon but very pure and inflammable air.

During the operation, it has ſometimes happened that the cylinders, heated to excandeſcence, melted. To guard againſt this accident, the projecting end of the cylinder is furniſhed with a pyrometer, and a ſcale, which, by means of an iron rod, indicates the degrees of rarefaction of the air. A particular point on the ſcale announces the moment when the cylinders are heated in the degree neareſt to fuſion: when ſuch is the caſe, the fire is immediately diminiſhed. The operation of filling a balloon of thirty feet diameter employs one third of a day.

The exerciſing balloon at Meudon is of a ſpherical form, and thirty-two feet in diameter. Its upper half is covered with a linen caſe to keep off the rain from the balloon and its netting. This netting, woven with ſtrong cords, embraces the upper part of the balloon, and is deſtined to ſupport the car for the reception of the aeronauts. The balloon, kept conſtantly full and ready for aſcent, and expoſed in the open air in all weathers, preſerves its buoyant ſtation in the atmoſphere, being faſtened on the great terrace of the lodge. When the weather is favourable, the aeronautic exerciſes are begun. The balloon is ſet free from its faſtenings, and elevated to a certain height; when the car is made faſt to the cords which hang down from the net: the whole of this is done in five minutes. A colonel then mounts the car with one of the pupils, and the balloon riſes to the height, generally, of from a hundred and ſixty to two hundred and forty yards. The pupils ſeparate into diviſions, for the purpoſe of holding the balloon in the air, ſuffering it to mount, and drawing it down, by means of three principal ropes faſtened to the net, and ramified with ſeveral others: in theſe manœuvres they employ the aid of a capſtern. When the balloon has been newly filled, has yet ſuffered no evaporation, and ſtill retains all its force, it requires the ſtrength of twenty perſons to hold it; and in that ſtate it will bear eight hundred weight. After a ſpace of two months, though much evaporated, it is ſtill capable of bearing two perſons with their inſtruments, and even a conſiderable ballaſt, at the ſame height in the air: but then ten perſons are ſufficient to hold it.

Exerciſes of the pupils.

The car is conſtructed of a light lattice work of wood, lined with prepared leather, and hangs about ſixteen feet beneath the balloon: it affords convenient room for two perſons ſeated oppoſite each other, with the neceſſary inſtruments for making obſervations.

Form of the car.

The balloon aſcends as often in the day as is requiſite for the ſucceſſion of obſervations which are to be made; but theſe aſcents take place only in calm and ſerene weather. Whenever any unforeſeen accident occurs, the aerial machine is hauled down in five minutes. In ſtrong guſts of wind which ſuddenly ariſe, the aeronauts are always expoſed to ſome danger: the balloon, held by the ropes, cannot riſe freely; and its vibrations and fluctuation reſemble thoſe of a paper kite which has not yet reached a certain degree of altitude. This ſpectacle, nevertheleſs, is more terrific to the ſpectator than to the aeronaut, who, ſeated in his car, which its own weight preſerves in a perpendicular poſition under the balloon, is but ſlightly affected by its deſultory motion. No inſtance of any unfortunate accident has yet occurred at Meudon.

All fear, all idea of danger, vaniſhes on examining the ſolidity of the whole apparatus, the precautionary meaſures adopted with the moſt prudent foreſight and the utmoſt ſecurity, and eſpecially when we are more

particularly,

particularly acquainted with the cool unaffuming ſteadineſs of Conté, the director of the whole.

When the return of peace ſhall allow more leiſure, and ſhall favour the employment of this apparatus in other experiments than thoſe immediately connected with the military ſervice, we may expect to derive from it the moſt important and diverſified advantages to natural ſcience. The experiments will then be conducted under the direction of a committee of naturaliſts from the national inſtitute, with a view of making diſcoveries in natural philoſophy, meteorology, and other branches. When the labours of the aeroſtatic inſtitute ſhall have accompliſhed ends ſo important to the arts, and of ſo great general utility, there will be printed a particular account of the eſtabliſhment, and of the courſe of experiments purſued: at preſent, theſe matters are kept from the knowledge of the public.

Utility of aeroſtatic experiments.

Aeroſtatic telegraph.

The moſt recent invention of Conté, admirable for its ſimplicity and preciſion, is the aeroſtatic telegraph. It conſiſts of eight cylinders of varniſhed black ſilk, ſtretched on hoops, and reſembling thoſe little pocket lanterns of crimped paper, which draw out and fold down again on themſelves. Theſe eight moveable cylinders, each three feet in diameter, and of a proportionate length, are ſuſpended from the bottom of the car, connected together with cords, and hanging one above another, at the diſtance of four feet. By means of cords paſſing through the bottom of the car, the aeronautic obſervers direct thoſe cylinders, give them different poſitions at will, and thus carry on their telegraphic correſpondence from the regions of the air.

Conté has further applied his thoughts to the invention of a ſimilar aeroſtatic telegraph, which, without the aſſiſtance of a great balloon, or an aerial correſpondent, ſhould be managed by a perſon ſtanding on the ground, by means of cords; the apparatus being ſuſpended to a ſmall balloon, of only twelve feet diameter.

Aſcent of a balloon at the battle of Fleurus.

Coutel, captain of the aeronautic corps, was the man who aſcended with the *Entreprenant* balloon on the 26th of June, 1794, and who conducted the wonderful and important ſervice of reconnoitring the hoſtile armies at the battle of Fleurus, accompanied by an adjutant and a general. He aſcended twice on that day, to obſerve, from an elevation of four hundred and forty yards, the poſition and manœuvres of the enemy. On each occaſion he remained four hours in the air, and, by means of preconcerted ſignals with flags, carried on a correſpondence with General Jourdan, the commander of the French army.

His intended aſcent had been made known to the enemy, who, at the moment when the balloon began to take its flight, opened the fire of a battery againſt the aeronauts. The firſt volley was directed too low: one ball, nevertheleſs, paſſed between the balloon and the car, and ſo near to the former, that Coutel imagined it had ſtruck it. When the ſubſequent diſcharges were made, the balloon had already reached ſuch a degree of altitude, as to be beyond the reach of cannon ſhot, and the aeronauts ſaw the balls flying beneath the car. Arrived at their intended height, the obſervers, remote from danger, and undiſturbed, viewed all the evolutions of the enemies, and, from the peaceful regions of the air, commanded a diſtinct and comprehenſive proſpect of two formidable armies engaged in the work of death." (*Month. Mag.* vol. vi. p. 337.)

Garnerin's voyage in England remarkable for its rapidity.

On the 28th of June, 1802, M. Garnerin, a French aeronaut, in company with an Engliſh gentleman, aſcended in a balloon of 20 feet diameter from Ranelagh gardens. They paſſed over London, roſe to the height of 10,000 feet, and landed in three quarters of an hour from the time of their aſcent on a common near Colcheſter, a diſtance of near 60 miles from London. The temperature of the air when they aſcended to the clouds was 15 degrees lower than on the ſurface of the earth; but when they roſe above the clouds, it became ſenſibly milder. The rapidity of M. Garnerin's voyage is unequalled in the hiſtory of aeroſtation.

Uſes of aeroſtation.

The frequency of aerial voyages, accompanied with particular details of trifling and unintereſting circumſtances, and apparently made with a view to promote the intereſt of particular perſons, regardleſs of any advancement in knowledge, had ſunk the ſcience of aeroſtation ſo low in the opinion of moſt people, that before we give an account of the moſt proper methods of conſtructing theſe machines, it is neceſſary to premiſe ſomething concerning the uſes to which they may poſſibly be applied. Theſe, according to Mr Cavallo, are the following:—

"The ſmall balloons, eſpecially thoſe made of paper, and raiſed by means of ſpirit of wine, may ſerve to explore the direction of the winds in the upper regions of the atmoſphere, particularly when there is a calm below; they may ſerve for ſignals in various circumſtances, in which no other means can be uſed; and letters or other ſmall things may be eaſily ſent by them, as for inſtance from ſhips that cannot ſafely land on account of ſtorms, from beſieged places, iſlands, or the like. The larger aeroſtatic machines may anſwer all the above mentioned purpoſes in a better manner; and they may, beſides, be uſed as a help to a perſon who wants to aſcend a mountain, a precipice, or to croſs a river; and perhaps one of theſe machines tied to a boat by a long rope, may be, in ſome caſes, a better ſort of ſail than any that is uſed at preſent. The largeſt ſort of machines, which can take up one or more men, may evidently be ſubſervient to various economical and philoſophical purpoſes. Their conveying people from place to place with great ſwiftneſs, and without trouble, may be of eſſential uſe, even if the art of guiding them in a direction different from that of the wind ſhould never be diſcovered. By means of thoſe machines the ſhape of certain ſeas and lands may be better aſcertained; men may aſcend to the tops of mountains they never viſited before; they may be carried over marſhy and dangerous grounds; they may by that means come out of a beſieged place, or an iſland; and they may, in hot climates, aſcend to a cold region of the atmoſphere, either to refreſh themſelves, or to obſerve the ice, which is never ſeen below; and, in ſhort, they may be thus taken to ſeveral places, to which human art hitherto knew of no conveyance.

"The philoſophical uſes, to which theſe machines may be ſubſervient, are numerous indeed: and it may be ſufficient to ſay, that hardly any thing which paſſes in the atmoſphere is known with preciſion, and that principally for want of a method of aſcending into it. The formation of rain, of thunder ſtorms, of vapours, hail,

hail, ſnow, and meteors in general, require to be attentively examined and aſcertained. The action of the barometer, the refraction and temperature of the air in various regions, the deſcent of bodies, the propagation of ſound, &c. are ſubjects which all require a ſeries of obſervations and experiments, the performance of which could never have been properly expected before the diſcovery of aeroſtatic machines."

To theſe uſes we may add the gratification of curioſity and pleaſure, as a very ſtrong inducement to the practice of an art, in which, with any tolerable degree of caution, there appears not to be the ſmalleſt danger. Every one who has tried the experiment teſtifies, that the beauty of the proſpect afforded by an aſcent, or the pleaſure of being conveyed through the atmoſphere, cannot be exceeded. No one has felt the leaſt of that giddineſs conſequent upon looking from the top of a very high building or of a precipice, nor have they any of the ſickneſs ariſing from the motion of a veſſel at ſea. Many have been carried by balloons at the rate of 30, 40, or even 50 miles an hour, without feeling the leaſt inconvenience, or even agitation of the wind; the reaſon of which is, that as the machine moves with nearly the velocity of the wind itſelf, they are always in a calm, and without uneaſineſs. Some have apprehended danger from the electricity of the atmoſphere; and have thought, that a ſtroke of lightning, or the ſmalleſt electric ſpark, happening near a balloon, might ſet fire to the inflammable air, and deſtroy both the machine and the adventurers. Mr Cavallo has ſuggeſted ſeveral conſiderations for diminiſhing apprehenſions of this kind. Balloons have been already raiſed in every ſeaſon of the year, and even when thunder has been heard, without injury. In caſe of danger, the aeronauts may either deſcend to the earth, or aſcend above the region of the clouds and thunder ſtorms. Beſides, as balloons are formed of materials that are not conductors of electricity, they are not like to receive ſtrokes, eſpecially as by being encompaſſed with air, they ſtand inſulated. Moreover, inflammable air by itſelf, or unmixed with a certain quantity of common air, will not burn; ſo that if an electric ſpark ſhould happen to paſs through the balloon, it would not ſet fire to the inflammable air, unleſs a hole was made in the covering.

Principles of aeroſtation.

The general principles of aeroſtation are ſo little different from thoſe of hydroſtatics, that it may ſeem ſuperfluous to inſiſt much upon them. It is a fact univerſally known, then when a body is immerſed in any fluid, if its weight be leſs than an equal bulk of that fluid, it will riſe to the ſurface; but if heavier, it will ſink; and if equal, it will remain in the place where it is left. For this reaſon ſmoke aſcends into the atmoſphere, and heated air in that which is colder. The aſcent of the latter is ſhown in a very eaſy and ſatisfactory manner by bringing a red-hot iron under one of the ſcales of a balance, by which the latter is inſtantly made to aſcend; for as ſoon as the red hot iron is brought under the ſcale, the hot air being lighter than that which is colder, aſcends, and ſtrikes the bottom, which is thus impelled upwards, and the oppoſite ſcale deſcends, as if a weight had been put into it.

Experiments ſhowing the impulſe of heated air.

Upon this ſimple principle depends the whole theory of aeroſtation; for it is the ſame thing whether we render the air lighter by introducing a quantity of heat into it, or encloſing a quantity of gas ſpecifically lighter than the common atmoſphere in a certain ſpace; both will aſcend, and for the ſame reaſon. A cubic foot of air, by the moſt accurate experiments, has been found to weight about 554 grains, and to be expanded by every degree of heat, marked on Fahrenheit's thermometer, about $\frac{1}{500}$th part of the whole. By heating a quantity of air, therefore, to 500 degrees of Fahrenheit, we ſhall juſt double its bulk when the thermometer ſtands at 54 in the open air, and in the ſame proportion we ſhall diminiſh its weight; and if ſuch a quantity of this hot air be encloſed in a bag, that the exceſs of the weight of an equal bulk of common air weighs more than the bag with the air contained in it, both the bag and air will riſe into the atmoſphere, and continue to do ſo until they arrive at a place where the external air is naturally ſo much rarefied that the weight becomes equal: and here the whole will float.

The power of hot air in raiſing weights, or rather that by which it is itſelf impelled upwards, may be ſhown in the following manner: Roll up a ſheet of paper into a conical form, and, by thruſting a pin into it near the apex, prevent it from unrolling. Faſten it then, by its apex, under one of the ſcales of a balance by means of a thread, and, having properly counterpoiſed it by weights, put it into the oppoſite ſcale; apply the flame of a candle underneath, you will inſtantly perceive the cone to ariſe, and it will not be brought into equilibrium with the other but by a much greater weight than thoſe who have never ſeen the experiment would believe. If we try this experiment with more accuracy, by getting proper receptacles made which contain determinate quantities of air, we ſhall find that the power of the heat depends much more on the capacity of the bag which contains it than could well be ſuppoſed. Thus, let a cubical receptacle be made of a ſmall wooden frame covered with paper capable of containing one foot of air, and let the power of a candle be tried with this as above directed for the paper cone. It will then be found that a certain weight may be raiſed; but a much greater one will be raiſed by having a receptacle of the ſame kind which contains two cubic feet; a ſtill greater by one of three feet; a yet greater by one of four feet, &c. and this even though the very ſame candle be made uſe of; nor is it known to what extent even the power of this ſmall flame might be carried.

Rarefied air balloons ought to be made as large as poſſible.

From theſe experiments it appears, that in the aeroſtatic machines conſtructed on Montgolfier's plan, it muſt be an advantage to have them as large as poſſible; becauſe a ſmaller quantity of fire will then have a greater effect in raiſing them, and the danger from that element, which in this kind of machine is chiefly to be dreaded, will be in a great meaſure avoided. On this ſubject it may be remarked, that as the cubical contents of a globe, or any other figure of which balloons are made, increaſe much more rapidly than their ſurfaces, there muſt ultimately be a degree of magnitude at which the ſmalleſt imaginable heat would raiſe any weight whatever. Thus, ſuppoſing any aeroſtatic machine capable of containing 500 cubic feet, and the air within it to be only one degree hotter than the external atmoſphere; the tendency of this machine to riſe, even without the application of artificial heat, would

How balloons might riſe by the common heat of the atmoſphere.

be near an ounce. Let its capacity be increaſed 16 times; and the tendency to ariſe will be equivalent to a pound, though this may be done without making the machine 16 times heavier than before. It is certain, however, that all aeroſtatic machines have a tendency to produce or preſerve heat within them, which would by no means be imagined by thoſe who have not made the experiment. When Meſſrs Charles and Roberts made their longeſt aerial voyage of 150 miles, they had the curioſity to try the temperature of the air within their balloon, in compariſon with that of the external atmoſphere; and at this time they found, that, when the external atmoſphere was 63°, the thermometer within the balloon ſtood at 104°. Such a difference of temperature muſt have given a machine of the magnitude which carried them a conſiderable aſcending power independent of any other cauſe, as it amounted to 41 grains on every cubic foot; and therefore in a machine containing 50,000 ſuch feet would have been almoſt 200 pounds. Hence we may eaſily account for what happened at Dijon, and is recorded by Mr Morveau. "A balloon, intended to be filled with inflammable air, being completed, was, by way of trial, filled with common air, and in that ſtate expoſed to the atmoſphere. Now it was obſerved, and indeed a ſimilar obſervation had been made before, that the air within the balloon was much hotter than the circumambient air: the thermometer in the former ſtood at 120°; whereas in the latter, even when the ſun ſhone upon it, the thermometer ſtood at 84°. This ſhowed a conſiderable degree of rarefaction within the balloon; and conſequently it was ſuſpected, that, by means of this rarefaction alone, eſpecially if it were to increaſe a little, the balloon might aſcend. On the 30th of May, about noon, the wind being rather ſtrong, agitated the balloon ſo that two men were employed to take care of it; but, notwithſtanding all their endeavours, it eſcaped from its confinement; and, lifting up about 65 pounds weight of cords, equatorial circle, &c. roſe many feet high, and, paſſing over ſome houſes, went to the diſtance of 250 yards, where at length it was properly ſecured."

A balloon at Dijon riſes thus into the atmoſphere.

This difference between the external and internal heat being ſo very conſiderable, muſt have a great influence upon aeroſtatic machines, and will undoubtedly influence thoſe filled with inflammable air as well as the other kind. Nor is it unlikely, that the ſhort time which many aerial voyagers have been able to continue in the atmoſphere may have been owing to the want of a method of preſerving this internal heat. It may naturally be ſuppoſed, and indeed it has always been found, that balloons, in paſſing through the higher regions of the atmoſphere, acquire a very conſiderable quantity of moiſture, not only from the rain or ſnow they ſometimes meet with, but even from the dew and vapour which condenſes upon them. On this an evaporation will inſtantly take place; and, as it is the property of this operation to produce a very violent cold, the internal heat of the balloon muſt be ſoon exhauſted in ſuch a manner as to make it become ſpecifically heavier than the common atmoſphere, and conſequently deſcend in a much ſhorter time than it would have done by the mere loſs of air. To this, in all probability, we are to aſcribe the deſcent of the balloon which carried Meſſrs Blanchard and Jeffries; and which ſeemed ſo extraordinary to many people, that they were obliged to have recourſe to an imaginary attraction in the waters of the ocean, in order to ſolve the phenomenon. This ſuppoſition is rejected by Mr Cavallo; who explains the matter, by remarking, that in two former voyages made with the ſame machine, it could not long ſupport two men in the atmoſphere; ſo that we had no occaſion to wonder at its weakneſs on this occaſion. "As for its riſing higher (ſays he), juſt when it got over the land, that may be eaſily accounted for. In the firſt place, the two travellers threw out their clothes juſt about that time; ſecondly, in conſequence of the wind's then increaſing, the balloon travelled at a much greater rate than it had done whilſt over the ſea; which increaſe of velocity leſſened its tendency to deſcend: beſides which, the viciſſitudes of heat and cold may produce a very conſiderable effect; for if we ſuppoſe, that the air over the land was colder than that over the ſea, the balloon coming into the latter from the former, continued to be hotter than the circumambient air for ſome time after; and conſequently, it was comparatively much lighter when in the cold air over the land, than when in the hotter air over the ſea; hence it floated eaſier in the former than in the latter caſe."

Internal heat of the balloons has great influence on aerial voyages.

Great tendency of Mr Blanchard's balloon to deſcend accounted for.

It ſeems indeed very probable, that there was ſomething uncommon in the caſe of Mr Blanchard's balloon while paſſing over the ſea; for, as it roſe higher after reaching the land than in any former period of the voyage, and likewiſe carried them to a diſtance over land more than half of that which they had paſſed over water, we can ſcarce avoid ſuppoſing, that it had a tendency to deſcend when over the water more than when over land, independent of any loſs of air. Now, it does not appear that the air over the ſea is at all warmer than that above land: on the contrary, there is every reaſon to believe, that the ſuperior reflective power of the land renders the atmoſphere above it warmer than the ſea can do: but it is very natural to ſuppoſe, that the air above the ſea is more moiſt than that above land; and conſequently, by letting fall its moiſture upon the balloon, muſt have occaſioned an evaporation that would deprive the machine of its internal heat, which it would partly recover after it entered the warmer and drier atmoſphere over land.

We ſhall now proceed to the conſtruction of aeroſtatic machines; of which the ſmaller are only for amuſement, or ſome ſlight expetiments, and are very eaſily made. As in all of them, however, it is of the utmoſt conſequence to have the weight as little as poſſible, the ſhape becomes an object of great conſideration. For this purpoſe a ſpherical figure has been mathematically demonſtrated to be the beſt; as capable of containing a greater quantity under a ſmaller ſurface than any other. Thus a perfect ſphere contains leſs ſurface in proportion to its ſolidity than a ſpheroid; a ſpheroid leſs than a cylinder; the latter leſs than a cube; and a cube ſtill leſs than a parallelopiped. In all caſes, therefore, where we can fill the whole capacity of the balloon with air equally light, the ſpherical figure is undoubtedly to be preferred: and this holds good with regard to all inflammable air balloons, whether their ſize be great or ſmall: but in the rarefied air ones, where the under part muſt neceſſarily be much colder than the upper, the globular ſhape ſeems not ſo proper.

Conſtruction of aeroſtatic machines.

Of their ſhape.

proper. An inverted cone, or truncated pyramid, with the ſmaller part undermoſt, ſeems then to be moſt proper, as it allows the heated air (which has a great tendency to expand as well as to aſcend) to collect in the wide part at the top, while the uſeleſs ſurface, in the lower part, and which, in any other figure, would contain only the colder and heavier air, is thus thrown aſide. In fact it has been found, that aeroſtatic machines, raiſed by means of rarefied air, when made of the ſhape of a parallelopiped, or even one deviating ſtill more from the ſhape of a globe, have anſwered the purpoſe as well as they could have been ſuppoſed to do, had ever ſo much care been taken in forming them exactly to that ſhape. The very firſt machine made by Mr Montgolfier was in form of a parallelopiped; and though it contained only 40 cubic feet, ſhowed a very conſiderable power of aſcent. A very large one, 74 feet high, which Mr Montgolfier had deſigned to exhibit before the royal family, had the middle part of it priſmatic for about the height of 25 feet; its top was a pyramid of 29 feet; and its lower part was a truncated cone of near 20 feet. It weighed 1000 pounds; and, notwithſtanding its ſhape, in a very ſhort time manifeſted a power of aſcent equal to 500 pounds. Another aeroſtatic machine of a ſmall ſize, but of the figure of a parallelopiped, being ſuffered to aſcend with 30 ſheets of oiled paper fixed in a wire frame, and ſet on fire, roſe to a great height, and in 22 minutes could not be ſeen. It ſeems therefore, that, with regard to the ſhape of theſe machines, it is by no means neceſſary to adhere rigidly to that of a ſphere; but that any oblong form anſwers very well.

Materials. For experimental purpoſes, both the inflammable and rarefied air balloons may be made of paper; the former being made of that kind called *thin poſt*, varniſhed over with linſeed oil; the latter either of that or any other kind, without varniſh. In order to avoid the danger of burning, however, it has been propoſed to impregnate the paper of which theſe ſmall rarefied air balloons are made with a ſolution of ſal ammoniac, alum, or ſome other ſalt: but this does not ſeem to be neceſſary. Thoſe filled with inflammable air have been made of gold-beaters ſkin or peeled bladders; but the cheaper material of paper is undoubtedly preferable.

Beſt varniſh for inflammable air balloons. For aeroſtatic machines of a larger ſize; the material univerſally employed is varniſhed ſilk; and for thoſe of the rarefied air kind, linen painted over with ſome ſize colour, or lined with paper. The beſt varniſh for an inflammable air balloon is that made with birdlime, and recommended by Mr Faujas de Saint Fond, in a treatiſe publiſhed on the ſubject. The following is his method of preparing it: "Take one pound of birdlime, put it into a new proper earthen pot that can reſiſt the fire, and let it boil gently for about one hour, viz. till it ceaſe to crackle; or, which is the ſame thing, till it is ſo far boiled, as that a drop of it being let fall upon the fire will burn: then pour upon it a pound of ſpirit of turpentine, ſtirring it at the ſame time with a wooden ſpatula, and keeping the pot at a good diſtance from the flame, leſt the vapour of this eſſential oil ſhould take fire. After this, let it boil for about ſix minutes longer: then pour upon the whole three pounds of boiling oil of nuts, linſeed, or poppy, rendered drying by means of litharge; ſtir it well, let it boil for a quarter of an hour longer, and the varniſh is made. After it has reſted for 24 hours, and the ſediment has gone to the bottom, decant it into another pot; and when you want to uſe it, warm, and apply it with a flat bruſh upon the ſilk ſtuff, whilſt that is kept well ſtretched. One coat of it may be ſufficient; but if two are neceſſary, it will be proper to give one on each ſide of the ſilk, and to let them dry in the open air while the ſilk remains extended."

Mr Cavallo's method. Mr Cavallo gives the following method of preparing this varniſh, which he prefers to that of M. de St Fond.—"In order to render linſeed oil drying, boil it with two ounces of ſaccharum ſaturni and three ounces of litharge, for every pint of oil, till the oil has diſſolved them, which will be accompliſhed in half an hour; then put a pound of birdlime and half a pint of the drying oil into a pot (iron or copper pots are the ſafeſt for this purpoſe), the capacity of which may be equal to about one gallon, and let it boil very gently over a ſlow charcoal fire till the birdlime ceaſes to crackle, which will be in about half or three quarters of an hour; then pour upon it two pints and a half more of drying oil, and let it boil for one hour longer, ſtirring it very frequently with an iron or wooden ſpatula. As the varniſh, whilſt boiling, and eſpecially when it is nearly done, ſwells very much, care ſhould be had to remove, in thoſe caſes, the pot from the fire, and to replace it when the varniſh ſubſides, otherwiſe it will boil over. Whilſt the ſtuff is boiling, the operator ſhould, from time to time, examine whether the varniſh has boiled enough; which is thus known:—Take ſome of it upon the blade of a knife, and then, after rubbing the blade of another knife upon it, ſeparate the knives; and when, on this ſeparation, the varniſh begins to form threads between the two, you may conclude that it is done; and, without loſing time, it muſt be removed from the fire. When it is almoſt, though not quite, cold, add about an equal quantity of ſpirit of turpentine: mix it well together, and let it reſt till the next day; when, having warmed it a little, ſtrain and bottle it. If it is too thick, add ſome more ſpirit of turpentine. When this varniſh is laid upon the ſilk, the ſtuff ſhould be made perfectly dry, and ſtretched; ſo that the varniſh, which ought to be uſed lukewarm, may fill up the pores of the ſtuff. The varniſh ſhould be laid once very thin upon one ſide of the ſtuff; and, about 12 hours after, two other coats of it ſhould be laid on, one on each ſide; and, 24 hours after, the ſilk may be uſed, though, in cold weather, it may be left to dry ſome time longer."

Much has been ſaid in France of their elaſtic gum varniſh, and its compoſition kept a ſecret; but Mr Baldwin, after many expenſive trials, declares to the world what he conſiders as the ſecret; and it is merely this: "Take any quantity of caoutchouc, as two ounces avoirdupois; cut it into ſmall bits with a pair of ſciſſars; put a ſtrong iron ladle (like that uſed by plumbers) over a common pitcoal or other fire. The fire muſt be gentle, glowing, and without ſmoke. When the ladle is hot, much below a red heat, put a ſingle bit into the ladle. If *black* ſmoke iſſues, it will preſently flame and diſappear, or it will evaporate without flame: the ladle is then too hot. When the ladle is leſs hot, put in a ſecond bit, which will pro-

duce a *white* ſmoke. This *white* ſmoke will continue during the operation, and evaporate the caoutchouc: therefore no time is to be loſt; but little bits are to be put in, a few at a time, till the whole are melted. It ſhould be continually and gently ſtirred with an iron or braſs ſpoon. Two pounds or one quart of the beſt drying oil (or of raw linſeed oil, which together with a few drops of neats foot oil, has ſtood a month, or not ſo long, on a lump of quicklime, to make it more or leſs drying), is to be put into the melted caoutchouc, and ſtirred till hot, and the whole poured into a glazed veſſel through a coarſe gauze or fine ſieve. When ſettled and clear, which will be in a few minutes, it will be fit for uſe either hot or cold." Mr Baldwin is not at liberty, he obſerves, to publiſh the art of laying on the varniſh: but ſays, that it conſiſts in making no *inteſtine motion* in the varniſh, which would create minute bubbles; that therefore bruſhes are improper. Mr Blanchard's method of making elaſtic gum varniſh for the ſilk of a balloon, is the following. "Diſſolve elaſtic gum (caoutchouc) cut ſmall in five times its weight of ſpirit of turpentine, by keeping them ſome days together; then boil one ounce of this ſolution in eight ounces of drying linſeed oil for a few minutes; laſtly, ſtrain it. It muſt be uſed warm." The pieces of ſilk for the balloon muſt be cut out of a proper ſize, according to the dimenſions, after the varniſh is ſufficiently dry. They may be joined by laying about half an inch of the edge of one piece over the edge of the other, and ſewing them by a double ſtitching. Mr Blanchard uſes expeditiouſly the following method: He lays about half an inch of the edge of one piece flat over the edge of the other, and paſſes a hot iron over it; in doing which a piece of paper ought to be laid both under and over the ſilk. The joining may be rendered more ſecure by running it with a ſilk thread, and ſticking a ribband over it. The ribbands laid over ſeams may be ſtuck with common glue, provided the varniſh of the ſilk is properly dried. When the glue is quite dry, the ribbands ſhould be varniſhed over, to prevent their being unglued by the rain.

Of cutting the gores for a globe.

The beſt method of cutting the pieces of ſilk that are to form a balloon, is to deſcribe a pattern of wood or ſtiff card-paper, and then to cut the ſilk upon it. As the edges of ſuch a pattern are not perfect circles, they cannot be deſcribed by a pair of compaſſes; but the beſt method of drawing them is as follows. Firſt, Draw on a flat ſurface two right lines AE and BC, fig. 2. perpendicular to each other. Secondly, Find the circumference anſwering to the given diameter of the balloon in feet and decimals of a foot; and make AD and DE each equal to a quarter of the circumference, ſo that the whole length AE of the pattern may be equal to half the circumference. Thirdly, Divide AD into 18 equal parts; and to the points of diviſion apply the lines *fg*, *hi*, *kl*, &c, parallel to each other, and perpendicular to AD. Fourthly, Divide the whole circumference in twice the given number of pieces, and make DC and BB each equal to the quotient of this diviſion: ſo that the whole, BC, is equal to the greateſt breadth of one of theſe pieces. Fifthly, Multiply the above mentioned quotient by the decimals annexed to *fg*, viz. 0.99619, and then the product expreſſes the length of *fg*; again, multiply the ſame length of DE by the decimals annexed to *hi*, and the product expreſſes the length of *hi*; and, in ſhort, the product ariſing from the multiplication of the length of DC by the decimals annexed to each of the parallel lines, gives the length of that line. Laſtly, Having found the lengths of all theſe lines, draw by hand a curve line paſſing through all the extremities of the ſaid lines, and that is the edge of one quarter of the pattern. The other quarters may be eaſily deſcribed, by applying to them a piece of paper cut according to that already found. Suppoſe, for example, that the diameter of the balloon to be conſtructed is 20 feet, and that it is required to make it of 12 pieces; then, in order to draw the pattern for thoſe pieces, find the circumference of the balloon, which is 62.85 feet, and dividing it by four, the quotient is 15.7 feet; make therefore AD equal to 15.7 feet, and DE likewiſe of the ſame length. Divide the circumference 62.83 by 24, which is double the number of pieces that are to form the balloon, and the quotient, 2.618 feet, is the length of DC and likewiſe of BD; ſo that BC is equal to 5.236 feet. Then having divided the line AD into 18 equal parts, and having drawn the parallel lines from thoſe points of diviſion, find the length of each of thoſe lines by multiplying 2.618 by the decimals annexed to that line. Thus, 2.618 multiplied by 0.99619, gives 2.608 feet for the length of *fg*; and again, multiplying 2.618 by 0.98481, gives 2.578 feet for the length of *hi*; and ſo of the reſt. In cutting the pieces after ſuch a pattern, care ſhould be taken to leave them about three quarters of an inch all round larger than the pattern, which will be taken up by the ſeams.

To the upper part of the balloon there ſhould be adapted, and well fitted in, a valve, opening inwards; to which ſhould be faſtened a ſtring paſſing through a hole made in a ſmall piece of round wood fixed in the loweſt part of the balloon oppoſite to the valve, and the end of this ſtring faſtened in the car below, ſo that the aeronaut may open the valve when occaſion requires. The action of this valve may be underſtood from fig. 3. A round braſs plate AB has a round hole CD, about two or three inches diameter, covered on both ſides with ſtrong ſmooth leather. On the inſide there is a ſhutter E, alſo of braſs, covered with leather, which is to cloſe the hole CD; being about two inches larger in diameter than the hole. It is faſtened to the leather of the plate AB; and by a ſpring, which need not be very ſtrong, it is kept againſt the hole. The elaſticity of the gas itſelf will help to keep it ſhut. To this ſhutter the ſtring is faſtened, by which it is occaſionally opened for the eſcape of gas. A ſmall ſtring or other ſecurity ſhould be fixed to the ſhutter and the plate, ſo as not to admit the ſhutter to be opened beyond a certain ſafe diſtance. To the lower part of the balloon two pipes ſhould be fixed, made of the ſame ſtuff as the envelope; 6 inches diameter for a balloon of 30 feet, and proportionably larger for balloons of a greater capacity. They muſt be long enough for the car. For balloons of 18 feet and leſs diameter, one neck or pipe will be ſufficient. Theſe pipes are the apertures through which the inflammable gas is introduced into the balloon.

The car or boat is beſt made of wicker-work, covered with leather, and well painted or varniſhed over; and the proper method of ſuſpending it, is by ropes proceeding

ceeding from the net which goes over the balloon. This net ſhould be formed to the ſhape of the balloon, and fall down to the middle of it, with various cords proceeding from it to the circumference of a circle about two feet below the balloon; and from that circle other ropes ſhould go to the edge of the boat. This circle may be made of wood, or of ſeveral pieces of ſlender cane bound together. The meſhes of the net may be ſmall at top, againſt which part of the balloon the inflammable air exerts the greateſt force; and increaſe in ſize as they recede from the top. A hoop has ſometimes been applied round the middle of the balloon to faſten the net. This, though not abſolutely neceſſary, is beſt made of pieces of cane bound together, and covered with leather.

With regard to the rarefied-air machines, Mr Cavallo recommends firſt to ſoak the cloth in a ſolution of ſal ammoniac and common ſize, uſing one pound of each to every gallon of water; and when the cloth is quite dry, to paint it over in the inſide with ſome earthy colour, and ſtrong ſize or glue. When this paint has dried perfectly, it will then be proper to varniſh it with oily varniſh, which might dry before it could penetrate quite through the cloth. Simply drying linſeed oil will anſwer the purpoſe as well as any, provided it be not very fluid.

Of filling aeroſtatic machines.

It now only remains to give ſome account of the method by which aeroſtatic machines may be filled with their proper gas, in order to give them their power of aſcending into the atmoſphere; and here we are enabled to determine with much greater preciſion concerning the inflammable air balloons than the others.

Methods of procuring inflammable air.

With regard to them, a primary conſideration is, the moſt proper method of procuring the inflammable air. It may be obtained in various ways, as will be ſhown under the article CHEMISTRY. But the moſt advantageous methods are, by applying acids to certain metals; by expoſing animal, vegetable, and ſome mineral ſubſtances, in a cloſe veſſel to a ſtrong fire; or by tranſmitting the vapour of certain fluids through red-hot tubes.

1. In the firſt of theſe methods, iron, zinc, and ſulphuric acid are the materials moſt generally uſed. The ſulphuric acid muſt be diluted with five or ſix parts of water. Iron may be expected to yield in the common way 1700 times its own bulk of gas; or one cubic foot of inflammable air to be produced by $4\frac{1}{2}$ ounces of iron, the like weight of ſulphuric acid, and $22\frac{1}{2}$ ounces of water. Six ounces of zinc, an equal weight of ſulphuric acid, and 30 ounces of water, are neceſſary for producing the ſame quantity of gas. It is more proper to uſe the turnings or chippings of great pieces of iron, as of cannon, &c. than the filings of that metal, becauſe the heat attending the effervescence will be diminiſhed; and the diluted acid will paſs more readily through the interſtices of the turnings when they are heaped together, than through the filings, which ſtick cloſer to one another. The weight of the inflammable air thus obtained by means of ſulphuric acid, is, in the common way of procuring it, generally one ſeventh part of the weight of common air; but with the neceſſary precautions for philoſophical experiments, leſs than one-tenth of the weight of common air. Two other ſorts of elaſtic fluids are ſometimes generated with the inflammable air. Theſe may be ſeparated from it by paſſing the inflammable air through water in which quicklime has been diſſolved. The water will abſorb theſe fluids, cool the inflammable air, and prevent its over-heating the balloon when introduced into it.

Fig. 4. of Plate II. repreſents an apparatus deſcribed by Mr Cavallo as proper for filling balloons of the ſize of two or three feet in diameter with inflammable air, after paſſing it through water.—A is the bottle with the ingredients; BCD a tube faſtened in the neck at B, and paſſing through C, the cork of the other bottle, in which there is another hole made to receive the tube on which the balloon is tied. Thus it is plain, that the inflammable air coming out of the tube D will paſs firſt through the water of the bottle E and then into the balloon. Two ſmall caſks may be uſed inſtead of the bottles A and E.

2. Inflammable air may be obtained at a much cheaper rate by the action of fire on various ſubſtances; but the gas which theſe yield is not ſo light as that produced by the effervescence of acids and metals. The ſubſtances proper to be uſed in this way are, pitcoal, aſphaltum, amber, rock-oil, and other minerals; wood, and eſpecially oak, camphor-oil, ſpirits of wine, æther, and animal ſubſtances, which yield air in different degrees, and of various ſpecific gravities; but pitcoal is the preferable ſubſtance. A pound of this expoſed to a red heat, yields about three cubic feet of inflammable air, which, whether it be paſſed through water or not, weighs about one-fourth of the weight of common air. Dr Prieſtley found, as we have elſewhere noticed, that animal or vegetable ſubſtances will yield ſix or ſeven times more inflammable air when the fire is ſuddenly increaſed than when it is gently raiſed, though it be afterwards made very ſtrong. Mr Cavallo obſerves, that the various ſubſtances above enumerated generally yield all their inflammable air in about one hour's time. The general method is, to encloſe the ſubſtances in iron or earthen veſſels, and thus expoſe them to a ſtrong fire ſufficient to make the veſſels red hot: the inflammable air proceeding from the aperture of the veſſel is received into a tube or refrigeratory, and, paſſing through the tube or worm, is at laſt collected in a balloon or other veſſel. A gun-barrel has often been uſed for eſſays of this kind. The ſubſtance is put into it ſo as to fill ſix or eight inches of its loweſt part, the remainder filled with dry ſand: a tube, adapted to the mouth of the barrel, is brought into a baſon of water under an inverted receiver; and the part of the barrel containing the ſubſtance being put into the fire and made red-hot, the inflammable air is collected in the inverted receiver. As the gun-barrel cannot ſerve for producing a large quantity of inflammable air, Mr Cavallo recommends, as the moſt advantageous ſhape, the following contrivance: Let the veſſel be made of clay, or rather of iron, in the ſhape of a Florence flaſk, ſomewhat larger, and whoſe neck is longer and larger (See ABC, fig. 5.) Put the ſubſtance to be uſed into this veſſel, ſo as to fill about four-fifths or leſs of its cavity AB. If the ſubſtance is of ſuch a nature as to ſwell much by the action of the fire, lute a tube of braſs, or firſt a braſs and then a leaden tube, to the neck C of the veſſel; and let the end D of the tube be ſhaped as in the figure, ſo that going into the water of a tube HI, it may terminate under a ſort of inverted veſ-

fel EF, to the upper aperture of which the balloon G is adapted. Things thus prepared, if the part AB of the veſſel is put into the fire, and made red hot, the inflammable air produced will come out of the tube CD, and paſſing through the water will at laſt enter into the balloon G. Previous to the operation, as a conſiderable quantity of common air remains in the inverted veſſel EF, which it is more proper to expel, the veſſel EF ſhould have a ſtop-cock K, through which the common air may be ſucked out, and the water aſcend as high as the ſtop cock. The dimenſions of ſuch an apparatus Mr Cavallo gives thus: Diameter of largeſt part of the veſſel ABC ſeven inches, length of whole veſſel 16 inches; diameter of its aperture one inch, diameter of the cavity of the tube CD three-fourths of an inch; lower aperture of the veſſel EF ſix inches, leaſt height of the veſſel EF 24 inches; its aperture F about two inches. The aperture of the veſſel EF ſhould be at leaſt one foot below the ſurface of the water in HI. Care muſt be taken that the fire uſed in this proceſs be at a ſufficient diſtance, otherwiſe it may happen to fire the inflammable air which may eſcape out of the veſſel EF.

3. The laſt method of obtaining inflammable air was diſcovered by Mr Lavoiſier, and alſo by Dr Prieſtley. Mr Lavoiſier made the ſteam of boiling water paſs through the barrel of a gun, kept red hot by burning coals. Dr Prieſtley uſes, inſtead of the gun-barrel, a tube of red-hot braſs, upon which the ſteam of water has no effect, and which he fills with the pieces of iron which are ſeparated in the boring of cannon. By this method he obtains an inflammable air, the ſpecific gravity of which is to that of common air as 1 to 13. In this method, not yet indeed reduced to general practice, a tube about three quarters of an inch in diameter, and about three feet long, is filled with iron turnings; then the neck of a retort, or cloſe boiler, is luted to one of its ends, and the worm of a refrigeratory is adapted to its other extremity. The middle part of the tube is then ſurrounded with burning coals, ſo as to keep about one foot in length of it red hot, and a fire is always made under the retort or boiler ſufficient to make the water boil with vehemence. In this proceſs a conſiderable quantity of inflammable air comes out of the worm of the refrigeratory. It is ſaid that iron yields one-half more air by this means than by the action of ſulphuric acid.

For filling large balloons, a greater apparatus is neceſſary; and the only materials that can, with any certainty of ſucceſs, be employed for producing the proper gas, are, ſulphuric acid, and iron filings or turnings.

It has indeed been recommended to uſe zinc inſtead of iron filings, becauſe white vitriol, the ſalt produced by the union of the ſulphuric acid and zinc, is much more valuable than the green ſort produced by the union of the ſame acid with iron. But though this is undoubtedly the caſe, it will as certainly be found, upon trial, that the ſuperior price of the zinc will be more than an equivalent for all the advantage that can be derived from the additional price of the white vitriol.

Mr Cavallo's receipt. For a balloon of 30 feet diameter, Mr Cavallo recommends 3900 pounds of iron turnings, as much ſulphuric acid, and 19,500 pounds of water. Theſe proportions, however, appear too great with reſpect to the acid and metal, and too little with reſpect to the water. Sulphuric acid will not exert its power upon iron unleſs it be diluted with five or ſix times its quantity of water; in which caſe, a much ſmaller quantity of both acid and metal will ſerve.

Mr Lunardi's method. Mr Lunardi, who from the number of his voyages had certainly much practical knowledge in aeroſtation, filled his balloon at Edinburgh and Glaſgow with about 2000 pounds of iron (the borings of cannon procured from Carron), as much ſulphuric acid, and 12,000 pounds of water. The iron was placed in his veſſels in layers, with ſtraw between them, in order to increaſe the ſurface. His apparatus was not materially different from that of Mr Cavallo, fig. 6. where AA are two tubs, about three feet in diameter and nearly two feet deep, inverted in large tubs BB filled with water. In the bottom of each of the inverted tubs a hole is made, and a tube E of tin adapted, which is about ſeven inches in diameter, and ſeven or eight long. To theſe tubes the ſilken ones of the balloon are to be tied. Round each of the tubs B, five, ſix, or more ſtrong caſks are placed; in the top of each two holes are made, and to one of theſe holes a tin tube is adapted, and ſo ſhaped, that, paſſing over the edge of the tub B, and through the water, it may terminate with its aperture under the inverted tub A. The other hole of theſe caſks ſerves for the introduction of materials, and is ſtopped with a wooden plug. When the balloon is to be filled, put the net over it, and let it be ſuſpended as ſhown by CDF; and having expelled all the common air from it, let the ſilken tube be faſtened round the tin ones EE; and the materials being put into the caſks, the inflammable air, paſſing into the balloon, will ſoon diſtend, and render it capable of ſupporting itſelf; after which the rope GH may be ſlipped off. As the balloon continues to be filled, the net is adjuſted properly round it; the cords that ſurround it are faſtened to the hoop MN; then the boat IK being placed between the two ſets of caſks, is faſtened to the hoop MN, and every thing that is required to be ſent up, as ballaſt, inſtruments, &c. is placed in it. At laſt, when the balloon is little more than three quarters full, the ſilken tubes are ſeparated from the tin ones of the inverted tubs, and their extremities being tied up, are placed in the boat. Laſtly, The aeronauts being ſeated in the boat, the lateral ropes are ſlipped off, and the machine is abandoned to the air. (See *Blanchard's Balloon*, Plate III.) This apparatus was at laſt reduced by Mr Lunardi to its utmoſt ſimplicity, by uſing only two large caſks, and ſuffering the vapour to go into the balloon without paſſing through water. Thus his balloon was filled in leſs than half an hour, when before, it had required two hours at leaſt. The ſinking of his caſks in the ground was alſo an additional convenience, as it created no confuſion, and rendered the materials much more eaſily conveyed into them.

Of filling rarefied balloons. With regard to the rarefied air balloons, the method of filling them is as follows. A ſcaffold ABCD, fig. 7. the breadth of which is at leaſt two-thirds of the diameter of the machine, is elevated about ſix or eight feet above the ground. From the middle of it deſcends a well E, riſing about two or three feet above it, and reaching to the ground, furniſhed with a door or two, through which the fire in the well is ſupplied with fuel. The well ſhould be conſtructed of brick or of plaſtered wood.

wood, and its diameter ſhould be ſomewhat leſs than that of the machine. On each ſide of the ſcaffold are erected two maſts HI, KL, each of which has a pulley at the top, and rendered firm by means of ropes KG, KP, HP, HG. The machine to be filled is to be placed on the ſcaffold, with its neck round the aperture of the well. The rope paſſing over the pullies of the two maſts, ſerves, by pulling its two ends, to lift the balloon about 15 feet or more above the ſcaffold; and the reſt of the machine is repreſented by the dotted lines in the figure MNO. The machine is kept ſteady, and held down, whilſt filling, by ropes paſſing through loops or holes about its equator; and the ropes may eaſily be diſengaged from the machine, by ſlipping them through the loops when it is able to ſuſtain itſelf. The proper combuſtibles to be lighted in the well, are thoſe which burn quick and clear, rather than ſuch as produce much ſmoke; becauſe it is hot air, and hot ſmoke, that is required to be introduced into the machine. Small wood and ſtraw have been found to be very fit for this purpoſe. Mr Cavallo obſerves, as the reſult of many experiments with ſmall machines, that ſpirit of wine is upon the whole the beſt combuſtible; but its price may prevent its being uſed for large machines. As the current of hot air aſcends, the machine will ſoon dilate, and lift itſelf above the ſcaffold and gallery which was covered by it. The paſſengers, fuel, inſtruments, &c. are then placed in the gallery. When the machine makes efforts to aſcend, its aperture muſt be brought, by means of the ropes annexed to it, towards the ſide of the well a little above the ſcaffold; the fire-place is then ſuſpended in it, the fire lighted in the grate, and the lateral ropes being ſlipped off, the machine is abandoned to the air. (See *Montgolfier's balloon*, Plate III.) It has been determined by accurate experiments, that only one-third of the common air can be expelled from theſe large machines: and therefore the aſcending power of the rarefied air in them can be eſtimated as only equal to half an ounce avoirdupois for every cubic foot.

The conduct of balloons, when conſtructed, filled, and actually aſcending in the atmoſphere, is an object of great importance in the practice of aeroſtation. The method generally uſed for elevating or lowering the balloons with rarefied air, has been the increaſe or diminution of the fire: and this is entirely at the command of the aeronaut, as long as he has any fuel in the gallery. The inflammable air balloons have been generally raiſed or lowered by diminiſhing the weight in the boat, or by letting out ſome of the gas through the valve: but the alternate eſcape of the air in deſcending, and diſcharge of the ballaſt for aſcending, will by degrees render the machine incapable of floating; for in the air it is impoſſible to ſupply the loſs of ballaſt, and very difficult to ſupply that of inflammable air. Theſe balloons will alſo riſe or fall by means of the rarefaction or condenſation of the encloſed air, occaſioned by heat and cold. It has been propoſed to aid a balloon in its alternate motion of aſcent and deſcent, by annexing to it a veſſel of common air, which might be condenſed for lowering the machine, and rarefied again, by expelling part of it, for raiſing the machine: But a veſſel adapted to this purpoſe muſt be very ſtrong; and, after all, the aſſiſtance afforded by it would not be very conſiderable. M. Meunier, in order to attain this end, propoſes to encloſe one balloon filled with common air in another filled with inflammable air: as the balloon aſcends, the inflammable air is dilated, and of courſe compreſſes the internal balloon containing the common air: and by diminiſhing its quantity, leſſens its weight. If it ſhould be neceſſary to ſupply this loſs, he ſays it may be eaſily done by a pair of bellows fixed in the gallery. Others have propoſed to annex a ſmall machine with rarefied air to an inflammable air balloon by ropes, at ſuch a diſtance that the fire of the former might not affect the inflammable air of the latter: the whole apparatus, thus combined, of balloons formed on the two principles of heated and inflammable air, might be raiſed or lowered by merely increaſing or diminiſhing the fire in the lower balloon.

Wings or oars are the only means of this ſort that have been uſed with ſome ſucceſs: and, as Mr Cavallo obſerves, they ſeem to be capable of conſiderable improvement; although great effects are not to be expected from them, when the machine goes at a great rate. The beſt methods of moving thoſe wings are by the human ſtrength applied ſimilarly to the oars of a waterman. They may be made in general of ſilk ſtretched between wires, tubes, or ſticks; and when uſed, muſt be turned edgewiſe when they are moved in the direction in which the machine is intended to be impelled, but flat in the oppoſite direction. Fig. 8. is the repreſentation of one of Mr Blanchard's wings. Fig. 9. is one of thoſe uſed by Mr Lunardi, which conſiſts of many ſilk ſhutters or valves, ABCD, DECF, &c. every one of which opens on one ſide only, viz. ADBC opens upon the line AB, DECF opens upon the line DC, &c. In conſequence of this conſtruction, this ſort of oars does not need being turned edgewiſe. Fig. 10. repreſents one of the wings uſed by the brothers Roberts in the aerial voyage of the 19th September 1784; and fig. 11. repreſents one of the wings conſtructed by Count Zambeccari, which conſiſts of a piece of ſilk ſtretched between two tin tubes ſet at an angle; but theſe wings are ſo contrived as to turn edgewiſe by themſelves when they go on one direction. Other contrivances have been made to direct aeroſtatic machines, but they have moſtly been invented to effect a power upon them as upon a ſhip. It appears, however, that they can have no effect when a machine is only moved by the wind alone, becauſe the circumambient air is at reſt in reſpect to the machine. The caſe is quite different with a veſſel at ſea, becauſe the water on which it float ſtands ſtill whilſt the veſſel goes on; but it muſt be time and experience that can realize the expectations ſuggeſted by theſe contrivances.

Aerſchot || Æſchines.

AERSCHOT, a town of the Auſtrian Netherlands, in the duchy of Brabant, and capital of the duchy of Aerſchot. It is ſeated on the river Demur, ten miles eaſt of Malines or Mechlin, and eight north of Louvain. E. Long. 5. 44. N. Lat. 51.

ÆRUGINOUS, an epithet given to ſuch things as reſemble or partake of the nature of the ruſt of copper.

ÆRUGO, in *Natural Hiſtory*, properly ſignifies the ruſt of copper, whether natural or artificial. The former is found about copper mines, and the latter, called *verdigris*, made by corroding copper plates with acids.

ÆRUSCATORES, in *Antiquity*, a kind of ſtrolling beggars, not unlike gypſies, who drew money from the credulous by fortune-telling, &c. It was alſo a denomination given to gripping exactors, or collectors of the revenue. The Galli, or prieſts of Cybele, were called *æruſcatores magnæ matris*; and μητραγυρται, on account of their begging or collecting alms in the ſtreets; to which end they had little bells to draw people's attention, ſimilar to ſome orders of mendicants abroad.

AERY, or AIRY, among ſportſmen. See AIRY.

ÆS UXORIUM, in *Antiquity*, a ſum paid by bachelors, as a penalty for living ſingle to old age. This tax for not marrying ſeems to have been firſt impoſed in the year of Rome 350, under the cenſorſhip of M. Furius Camillus and M. Poſthumus. At the cenſus, or review of the people, each perſon was aſked, *Et tu ex anima ſententia uxorem habes liberum quærendorum cauſa?* He who had no wife was hereupon fined after a certain rate, called *æs uxorium*.

Æs per et libram was a formula in the Roman law, whereby purchaſes and ſales were ratified. Originally the phraſe ſeems to have been only uſed in ſpeaking of things ſold by weight, or by the ſcales; but it afterwards was uſed on other occaſions. Hence even in adoptions, as there was a kind of imaginary purchaſe, the formula thereof expreſſed, that the perſon adopted was bought *per æs et libram*.

Æs Flavum, yellow copper, among the Romans, an appellation given to the coarſer kinds of braſs.

The ancients had different kinds of braſs, as *æs candidum*, *æs Corinthium*, denoting probably different metallic alloys or mixtures.

Æs Caldarium, a term uſed by the German mineraliſts, for a ſubſtance which ſometimes occurs to thoſe who work upon cobalt, and is uſed for making the fine blue colour called *ſmalt*.

Æs Uſtum, a chemical preparation, made of thin leaves of copper, ſulphur, and nitre, placed *ſtratum ſuper ſtratum* in a crucible, and ſet in a charcoal fire till all the ſulphur is conſumed; after which, the copper is taken out of the crucible, and reduced to powder. Some quench the leaves of copper in vinegar, and repeat the calcination.—Its principal uſe is in colouring glaſs, to which it gives a beautiful tincture. The ſurgeons uſe it as a deterſive, and ſome have given it internally; but it is certainly a very dangerous medicine, and ſhould be avoided.

ÆSCHINES, an Athenian, a Socratic philoſopher, the ſon of Charinus a ſauſage-maker. He was continually with Socrates; which occaſioned this philoſopher to ſay, that the ſauſage maker's ſon was the only perſon who knew how to pay a due regard to him. It is ſaid that poverty obliged him to go to Sicily to Dionyſius the Tyrant; and that he met with great contempt from Plato, but was extremely well received by Ariſtippus; to whom he ſhowed ſome of his dialogues, and received from him a handſome reward. He would not venture to profeſs philoſophy at Athens, Plato and Ariſtippus being in ſuch high eſteem; but he opened a ſchool in which he taught philoſophy to maintain himſelf. He afterwards wrote orations for the forum. Phrynicus, in Photius, ranks him amongſt the beſt orators, and mentions his orations as the ſtandard of the pure Attic ſtyle. Hermogenes has alſo ſpoken very highly of him. He wrote beſides ſeveral Dialogues, of which there are only three extant: 1. Concerning virtue, whether it can be taught. 2. Eryxias, or Eraſiſtratus; concerning riches, whether they are good. 3. Axiochus; concerning death, whether it is to be feared. Mr Le Clerc has given a Latin tranſlation of them, with notes and ſeveral diſſertations, entitled *Sylvæ Philologicæ*. Æſchines.

ÆSCHINES, a celebrated Grecian orator, was born at Athens 327 years before the Chriſtian era. According to his own account, he was of diſtinguiſhed birth; according to that of Demoſthenes, he was the ſon of a courtezan, and a humble performer in a company of comedians. But whatever was the true hiſtory of his birth and early life, his talents, which were conſiderable, procured him great applauſe, and enabled him to be a formidable rival to Demoſthenes himſelf. The two orators, inſpired probably with mutual jealouſy and animoſity, became at laſt the ſtrenuous leaders of oppoſing parties. Æſchines was accuſed by Demoſthenes of having received money as a bribe when he was employed on an embaſſy to Philip of Macedon. He indirectly retaliated this charge, by bringing an accuſation againſt Cteſiphon the friend of Demoſthenes for having moved a decree, contrary to the laws, to confer on Demoſthenes a golden crown, as a mark of public approbation. A numerous aſſembly of judges and citizens met to hear and decide the queſtion: each orator employed all his powers of eloquence; but Demoſthenes, with ſuperior talents, and with juſtice on his ſide, was victorious; and Æſchines was ſent into exile. The reſentment of Demoſthenes was now ſoftened into generous kindneſs; for when Æſchines was going into baniſhment, he requeſted him to accept of a ſum of money; which made him exclaim, "How do I regret leaving a country where I have found an enemy ſo generous, that I muſt deſpair of ever meeting with a friend who ſhall be like him!"

Æſchines opened a ſchool of eloquence at Rhodes, which was the place of his exile, and he commenced his lectures by reading to his audience the two orations which had been the cauſe of his baniſhment. His own oration received great praiſe; but that of Demoſthenes was heard with boundleſs applauſe. In ſo trying a moment, when vanity muſt be ſuppoſed to have been deeply wounded, with a noble generoſity of ſentiment, he ſaid, "What would you have thought if you had heard him thunder out the words himſelf."—Æſchines afterwards removed to Samos, where he died, in the 75th year of his age. Three of his orations only are extant. His eloquence is not without energy,

Æschylus. energy, but it is diffuse and ornamented, and more calculated to please than to move the passions. (*Gen. Biog.*)

ÆSCHYLUS, the tragic poet, was born at Athens. The time of his birth is not exactly ascertained; some suppose that it was in the 65th, others in the 70th Olympiad; but according to Stanley, who follows the Arundelian marbles, he was born in the 63d Olympiad. He was the son of Euphorian, and brother to Cynegirus and Aminias, who distinguished themselves in the battle of Marathon, and the sea fight of Salamis, at which engagements Æschylus was likewise present. In this last action, according to Diodorus Siculus, Aminias, the younger of the three brothers, commanded a squadron of ships, and fought with so much conduct and bravery, that he sunk the admiral of the Persian fleet, and signalized himself above all the Athenians. To this brother our poet was, upon a particular occasion, obliged for saving his life: Ælian relates, that Æschylus being charged by the Athenians with certain blasphemous expressions in some of his pieces, was accused of impiety, and condemned to be stoned to death: They were just going to put the sentence in execution, when Aminias, with a happy presence of mind, throwing aside his cloak, showed his arm without a hand, which he had lost at the battle of Salamis in defence of his country. This sight made such an impression on the judges, that, touched with the remembrance of his valour, and with the friendship he showed for his brother, they pardoned Æschylus. Our poet, however, resented the indignity of this prosecution, and resolved to leave a place where his life had been in danger. He became more determined in this resolution when he found his pieces less pleasing to the Athenians than those of Sophocles, though a much younger writer. Some affirm, that Æschylus never sat down to compose but when he had drank liberally. He wrote a great number of tragedies, of which there are but seven remaining: and notwithstanding the sharp censures of some critics, he must be allowed to have been the father of the tragic art. In the time of Thespis, there was no public theatre to act upon; the strollers driving about from place to place in a cart. Æschylus furnished his actors with masks, and dressed them suitably to their characters. He likewise introduced the buskin, to make them appear more like heroes.—The ancients gave Æschylus also the praise of having been the first who removed murders and shocking sights from the eyes of the spectators. He is said likewise to have lessened the number of the chorus. M. Le Fevre has observed, that Æschylus never represented women in love in his tragedies; which, he says, was not suited to his genius; but, in representing a woman transported with fury, he was incomparable. Longinus says, that Æschylus has a noble boldness of expression; and that his imagination is lofty and heroic. It must be owned, however that he affected pompous words, and that his sense is too often obscured by figures: this gave Salmasius occasion to say, that he was more difficult to be understood than the Scripture itself. But notwithstanding these imperfections, this poet was held in great veneration by the Athenians, who made a public decree that his tragedies should be played after his death. He was killed in the 69th year of his age, by an eagle letting fall a tortoise upon his head as he was walking in the fields. He had the honour of a pompous funeral from the Sicilians, who buried him near the river Gela; and the tragedians of the country performed plays and theatrical exercises at his tomb.—The best edition of his plays is that of London, 1663, folio, with a Latin translation and a learned commentary by Thomas Stanley.

Æschynomene || Æsop.

ÆSCHYNOMENE, BASTARD SENSITIVE PLANT, in *Botany*. See BOTANY *Index*.

ÆSCULAPIUS, in the heathen mythology, the god of physic, was the son of Apollo and the nymph Coronis. He was educated by the centaur Chiron, who taught him physic; by which means Æsculapius cured the most desperate diseases. But Jupiter, enraged at his restoring to life Hippolitus, who had been torn in pieces by his own horses, killed him with a thunderbolt. According to Cicero, there were three deities of this name: the first, the son of Apollo, worshipped in Arcadia, who invented the probe, and bandages for wounds; the second, the brother of Mercury, killed by lightning; and the third, the son of Arisippus and Arsince, who first taught the art of tooth drawing and purging. At Epidaurus, Æsculapius's statue was of gold and ivory, with a long beard, his head surrounded with rays, holding in one hand a knotty stick, and the other entwined with a serpent; he was seated on a throne of the same materials as his statue, and had a dog lying at his feet. The Romans crowned him with laurel, to represent his descent from Apollo; and the Phaliasins represented him as beardless. The cock, the raven, and the goat, were sacred to this deity. His chief temples were at Pergamus, Smyrna, Trica a city in Ionia, and the isle of Coos; in all which votive tablets were hung up, showing the diseases cured by his assistance. But his most famous shrine was at Epidaurus; where, every five years, games were instituted to him, nine days after the Isthmian games at Corinth.

ÆSCULUS, the HORSE CHESNUT, in *Botany*. See BOTANY *Index*.

ÆSOP, the Phrygian, lived in the time of Solon, about the 50th Olympiad, under the reign of Crœsus the last king of Lydia. As to genius and abilities, he was greatly indebted to nature; but in other respects not so fortunate, being born a slave and extremely deformed. St Jerome, speaking of him, says he was unfortunate in his birth, condition in life, and death; hinting thereby at his deformity, servile state, and tragical end. His great genius, however, enabled him to support his misfortunes; and in order to alleviate the hardships of servitude, he compose those entertaining and instructive fables which have acquired him so much reputation. He is generally supposed to have been the inventor of that kind of writing; but this is contested by several, particularly Quintilian, who seems to think that Hesiod was the first author of fables. Æsop, however, certainly improved this art to a very great degree; and hence it is that he has been accounted the author of this sort of productions:

Æsopus auctor quam materiam reperit,
Hanc ego polivi versibus senariis. PHÆD.

Mine is the task, in easy verse,
The tales of Æsop to rehearse.

The

Æſop. The firſt maſter whom Æſop ſerved, was one Caraſius Demarchus, an inhabitant of Athens, and there, in all probability, he acquired his purity in the Greek tongue. After him he had ſeveral maſters; and at length came under a philoſopher named Idmon or Iadmon, who enfranchiſed him. After he had recovered his liberty, he ſoon acquired a great reputation amongſt the Greeks; ſo that, according to Meziriac, the report of his wiſdom having reached Crœſus, he ſent to inquire after him, and engaged him in his ſervice. He travelled through Greece, according to the ſame author; whether for his own pleaſure, or upon the affairs of Crœſus, is uncertain; and paſſing by Athens ſoon after Piſiſtratus had uſurped the ſovereign power, and finding that the Athenians bore the yoke very impatiently, he told them the fable of the frogs who petitioned Jupiter for a king. The images made uſe of by Æſop are certainly very happy inventions to inſtruct mankind; they poſſeſs all that is neceſſary to perfect a precept, having a mixture of the uſeful with the agreeable. "Æſop the fabuliſt (ſays Aulus Gellius) was deſervedly eſteemed wiſe, ſince he did not, after the manner of the philoſophers, rigidly and imperiouſly dictate ſuch things as were proper to be adviſed and perſuaded; but framing entertaining and agreeable apologues, he thereby charms and captivates the human mind."—Æſop was put to death at Delphi. Plutarch tells us, that he came there with a great quantity of gold and ſilver, being ordered by Crœſus to offer a ſacrifice to Apollo, and to give a conſiderable ſum to each inhabitant: but a quarrel ariſing betwixt him and the Delphians, he ſent back the money to Crœſus; for he thought thoſe for whom the prince deſigned it, had rendered themſelves unworthy of it. The inhabitants of Delphi brought an accuſation of ſacrilege againſt him; and pretending they had convicted him, threw him headlong from a rock. For this cruelty and injuſtice, we are told they were viſited with famine and peſtilence; and conſulting the oracle, they received for anſwer, that the god deſigned this as a puniſhment for their treatment of Æſop: they endeavoured to make an atonement, by raiſing a pyramid to his honour.

Æsop, *Clodius*, a celebrated actor, who flouriſhed about the 670th year of Rome. He and Roſcius were cotemporaries, and the beſt performers who ever appeared upon the Roman ſtage; the former excelling in tragedy, the latter in comedy. Cicero put himſelf under their direction to perfect his action. Æſop lived in a moſt expenſive manner, and at one entertainment is ſaid to have had a diſh which coſt above eight hundred pounds; this diſh, we are told, was filled with ſinging and ſpeaking birds, ſome of which coſt near 50l. The delight which Æſop took in this ſort of birds proceeded, as Mr Bayle obſerves, from the expence. He did not make a diſh of them becauſe they could ſpeak, according to the refinement of Pliny upon this circumſtance, this motive being only by accident; but becauſe of their extraordinary price. If there had been any birds that could not ſpeak, and yet more ſcarce and dear than theſe, he would have procured ſuch for his table. Æſop's ſon was no leſs luxurious than his father, for he diſſolved pearls for his gueſts to ſwallow. Some ſpeak of this as a common practice of his; but others mention his falling into this exceſs only on a particular day, when he was treating his friends. Horace * ſpeaks only of one pearl of great value, which he diſſolved in vinegar, and drank. Æſop, notwithſtanding his expences, is ſaid to have died worth above 160,000l. When he was upon the ſtage, he entered into his part to ſuch a degree, as ſometimes to be ſeized with a perfect ecſtacy: Plutarch mentions it as reported of him, that whilſt he was repreſenting Atreus deliberating how he ſhould revenge himſelf on Thyeſtes, he was ſo tranſported beyond himſelf in the heat of action, that with his truncheon he ſmote one of the ſervants croſſing the ſtage, and laid him dead on the ſpot.

Æſtimatio ‖ Æther.

* Sat II. lib. ii. 239.

ÆSTIMATIO CAPITIS, a term met with in old law books for a fine anciently ordained to be paid for offences committed againſt perſons of quality, according to their ſeveral degrees.

ÆSTIVAL, in a general ſenſe, denotes ſomething connected with, or belonging to, ſummer. Hence, æſtival ſign, æſtival ſolſtice, &c.

ÆSTUARIA, in *Geography*, denotes an arm of the ſea, which runs a good way within land. Such is the Briſtol channel, and many of the friths of Scotland.

ÆSTUARIES, in ancient baths, were ſecret paſſages from the hypocauſtum into the chambers.

ÆSTUARY, among phyſicians, a vapour bath, or any other inſtrument for conveying heat to the body.

ÆSYMNIUM, in antiquity, a monument erected to the memory of the heroes by Æſymnus the Megarean. He, conſulting the oracle in what manner the Megareans might be moſt happily governed, was anſwered, *If they held conſultation with the more numerous:* whom he taking for the dead, built the ſaid monument, and a ſenate-houſe that took within its compaſs the monument; imagining, that thus the dead would aſſiſt at their conſultations. (Pauſanias).

AETH, or Ath, a ſtrong little town in the Auſtrian Netherlands and province of Hainault, ſituated on the river Dender, about twenty miles ſouth-weſt of Bruſſels.

ÆTHALIA, or Ilua, in *Ancient Geography*, now *Elba;* an iſland on the coaſt of Etruria, in compaſs an hundred miles, abounding in iron. It was ſo called from αἰθάλη, ſmoke, which iſſued from the ſhops of Vulcan.

ÆTHELSTAN, ſee Athelstan.

ÆTHER, is uſually underſtood of a thin, ſubtile matter, or medium, much finer and rarer than air; which commencing from the limits of our atmoſphere, poſſeſſes the whole heavenly ſpace.—The word is Greek, αἰθὴρ, ſuppoſed to be formed from the verb αἴθειν, "to burn, to flame;" ſome of the ancients, particularly Anaxagoras, ſuppoſing it to be of the nature of fire.

The philoſophers cannot conceive that the largeſt part of the creation ſhould be perfectly void; and therefore they fill it with a ſpecies of matter under the denomination of *æther*. But they vary extremely as to the nature and character of this æther. Some conceive it as a body *ſui generis*, appointed only to fill up the vacuities between the heavenly bodies; and therefore confined to the regions above our atmoſphere. Others ſuppoſe it of ſo ſubtile and penetrating a nature, as to pervade the air and other bodies, and poſſeſs the pores and intervals thereof. Others deny the exiſtence of any ſuch ſpecific matter; and think the air itſelf, by that immenſe tenuity and expanſion it is found capable

Æther. of, may diffuſe itſelf through the interſtellar ſpaces, and be the only matter found therein.

In effect, æther, being no object of our ſenſe, but the mere work of imagination, brought only upon the ſtage for the ſake of hypotheſis, or to ſolve ſome phenomenon, real or imaginary; authors take the liberty to modify it how they pleaſe. Some ſuppoſe it of an elementary nature, like other bodies; and only diſtinguiſhed by its tenuity, and the other affections conſequent thereon: which is the philoſophical æther. Others will have it of another ſpecies, and not elementary; but rather a ſort of fifth element, of a purer, more refined, and ſpirituous nature, than the ſubſtances about our earth; and void of the common affections thereof, as gravity, &c. The heavenly ſpecies being the ſuppoſed region or reſidence of a more exalted claſs of beings, the medium muſt be more exalted in proportion. Such is the ancient and popular idea of æther, or æthereal matter.

The term *æther* being thus embarraſſed with a variety of ideas, and arbitrarily applied to ſo many different things, the later and ſeverer philoſophers chooſe to ſet it aſide, and in lieu thereof ſubſtitute other more determinate ones. Thus, the Carteſians uſe the term *materia ſubtilis*; which is their æther: and Sir Iſaac Newton, ſometimes a *ſubtile ſpirit*, as in the cloſe of his *Principia*; and ſometimes a *ſubtile* or *æthereal medium*, as in his *Optics*.

Heat, Sir Iſaac Newton obſerves, is communicated through a vacuum almoſt as readily as through air: but ſuch communication cannot be without ſome interjacent body, to act as a medium. And ſuch body may be ſubtile enough to penetrate the pores of glaſs, and may permeate thoſe of all other bodies, and conſequently be diffuſed through all the parts of ſpace.

The exiſtence of ſuch an æthereal medium being ſettled, that author proceeds to its properties; inferring it to be not only rarer and more fluid than air, but exceedingly more elaſtic and active: in virtue of which properties he ſhows, that a great part of the phenomena of nature may be produced by it. To the weight, e. g. of this medium, he attributes gravitation, or the weight of all other bodies; and to its elaſticity the elaſtic force of the air and of nervous fibres, and the emiſſion, refraction, reflection, and other phenomena of light; as alſo, ſenſation, muſcular motion, &c. In fine, this ſame matter ſeems the *primum mobile*, the firſt ſource or ſpring of phyſical action in the modern ſyſtem.

The Carteſian æther is ſuppoſed not only to pervade, but adequately to fill, all the vacuities of bodies: and thus to make an abſolute plenum in the univerſe.

But Sir Iſaac Newton overturns this opinion, from divers conſiderations; by ſhowing, that the celeſtial ſpaces are void of all ſenſible reſiſtance: and, hence it follows, that the matter contained therein muſt be immenſely rare, in regard the reſiſtance of bodies is chiefly as the denſity; ſo that if the heavens were thus adequately filled with a medium or matter, how ſubtile ſoever, they would reſiſt the motion of the planets and comets much more than quickſilver or gold. But it has been ſuppoſed that what Newton has ſaid of æther is to be conſidered only as a conjecture, and eſpecially as no new proofs of its exiſtence have been adduced ſince his time.

The late diſcoveries in electricity have thrown great light upon this ſubject, and rendered it extremely probable that the æther ſo often talked of is no other than the electric fluid, or ſolar light, which diffuſes itſelf throughout the whole ſyſtem of nature. Æther || Ætites.

ÆTHER, in *Chemiſtry*, a light, volatile, and very inflammable liquid, produced by diſtillation of acids with rectified ſpirit of wine. See CHEMISTRY *Index*.

ÆTHEREAL, *Ætherevs*, ſomething that belongs to, or partakes of, the nature of ÆTHER. Thus we ſay, the *æthereal ſpace*, *æthereal regions*, &c.

Some of the ancients divided the univerſe, with reſpect to the matter contained therein, into elementary and æthereal.

Under the æthereal world was included all that ſpace above the uppermoſt element, viz. fire. This they ſuppoſed to be perfectly homogeneous, incorruptible, unchangeable, &c. The Chaldees placed an æthereal world between the empyreum and the region of the fixed ſtars. Beſides which, they ſometimes alſo ſpeak of a ſecond æthereal world, meaning by it the ſtarry orb: and a third æthereal world, by which is meant the planetary region.

ÆTHIOPS, *Mineral*, *Martial*, and *Antimonial*. See CHEMISTRY *Index*.

ÆTHUSA, FOOL'S PARSLEY, in *Botany*. See BOTANY *Index*.

AETIANS, in church hiſtory, a branch of Arians, who maintained that the Son and Holy Ghoſt are in all things diſſimilar to the Father. See AETIUS.

ÆTIOLOGY, is that part of pathology which is employed in exploring the cauſes of diſeaſes.

AETION, a celebrated painter, who has left us an excellent picture of Roxana and Alexander, which he exhibited at the Olympic games; it repreſents a magnificent chamber, where Roxana is ſitting on a bed of a moſt ſplendid appearance, which is rendered ſtill more brilliant by her beauty. She looks downwards, in a kind of confuſion, being ſtruck with the preſence of Alexander ſtanding before her. A number of little Cupids flutter about, ſome holding up the curtain, as if to ſhow Roxana to the prince, whilſt others are buſied in undreſſing the lady; ſome pull Alexander by the cloak, who appears like a young baſhful bridegroom, and preſent him to his miſtreſs: he lays his crown at her feet, being accompanied by Epheſtion, who holds a torch in his hand, and leans upon a youth, who repreſents Hymen. Several other little Cupids are repreſented playing with his arms; ſome carry his lance, ſtooping under ſo heavy a weight; others bear along his buckler, upon which one of them is ſeated, whom the reſt carry in triumph; another lies in ambuſh in his armour, waiting to frighten the reſt as they paſs by. This picture gained Aetion ſo much reputation, that the preſident of the games gave him his daughter in marriage.

ÆTITES, or EAGLE-STONE, in *Natural Hiſtory*, a flinty or cruſtated ſtone, hollow within, and containing a *nucleus*, which, on ſhaking, rattles within. It was formerly in repute for ſeveral extraordinary magical as well as medical powers; ſuch as preventing abortion, diſcovering thieves, and other ridiculous properties. The word is formed from ἀετος, "eagle," the popular tradition being, that it is found in the eagle's neſt, whither it is ſuppoſed to be carried while the fe-

Aetius, Ætna.

male fits, to prevent her eggs from being rotten. It is found in feveral parts: near Trevoux in France, one can fcarcely dig a few feet, without finding confiderable ſtrata or beds of the coarſer or ferruginous kind. They are originally ſoft, and of the colour of yellow ochre. But the fineſt and moſt valued of all the eagle-ſtones, are accidental ſtates of one or other of our common pebbles.

AETIUS, one of the moſt zealous defenders of Arianiſm, was born in Syria, and flouriſhed about the year 336. After being ſervant to a grammarian, of whom he learned grammar and logic, he was ordained deacon, and at length biſhop, by Eudoxus patriarch of Conſtantinople. Aetius was baniſhed into Phrygia on account of his religious opinions; but was recalled from exile on the acceſſion of Julian, and was much eſteemed by that emperor. He died, it is ſuppoſed, at Conſtantinople, about the year 366. St Epiphanius has preſerved 47 of his propoſitions againſt the Trinity. His followers were called AETIANS.

AETIUS, a famous phyſician, born at Amida in Meſopotamia, and the author of a work entitled *Tetrabiblos*, which is a collection from the writings of thoſe phyſicians who went before him. He lived, according to Dr Freind, at the end of the 5th or the beginning of the 6th century.

AETIUS, governor of Gallia Narbonenſis in the reign of Valentinian III. forced the Franks who were paſſing into Gaul to repaſs the Rhine. He defeated the Goths; and routed Attila king of the Huns, who invaded Gaul with an army of 700,000 men. But the emperor, jealous of the merit of this great man, killed him in 454, with his own hand, under the pretence that he had permitted the invaſion of the Huns, after Attila's defeat.

ÆTNA, (in the Itineraries *Æthana*, ſuppoſed from *αἴθω*, "to burn;" according to Bochart, from *athuna*, a furnace, or *atuna*, darkneſs), now *Monte Gibello*: a volcano or burning mountain of Sicily, ſituated in N. Lat. 38°. E. Long. 15°.

This mountain, famous from the remoteſt antiquity, both for its bulk and terrible eruptions, ſtands in the eaſtern part of the iſland, in a very extenſive plain, called *Val di Demoni*, from the notion of its being inhabited by devils, who torment the ſpirits of the damned in the bowels of this volcano.

Inconſiſtent accounts concerning the magnitude of Ætna.

Concerning the dimenſions of Mount Ætna, we can ſcarcely extract any thing conſiſtent, even from the accounts of the lateſt and moſt ingenious travellers. Pindar, who lived about 435 years before Chriſt, calls it the *Pillar of Heaven*, on account of its great height. All modern writers likewiſe agree, that this mountain is very high, and very large; but differ much both as to its height and magnitude: ſome making it no leſs than twelve miles high, others eight, others ſix, ſome four; while Mr Brydone, and Sir William Hamilton, who lately aſcended to its higheſt ſummit, reduce its height to little more than two miles; nay, by ſome it is reduced to 10,036 feet, ſomewhat leſs than two miles. No leſs remarkable are the differences concerning its circumference: ſome making it only 60 miles round, others 100; and Signior Recupero, from whom Mr Brydone had his information in this reſpect, affirms it to be no leſs than 183 miles in circuit.

Ætna.

We are ſorry to detract from the merit of Mr Brydone, or to involve in obſcurity what he has been at ſo much pains to elucidate; but every perſon who compares the account of Mount Ætna's circumference, given by Signior Recupero, and to which Mr Brydone ſeems to have aſſented, with its apparent circumference on the map prefixed to that gentleman's tour through Sicily and Malta, muſt at once be ſtruck with the prodigious diſparity. Indeed, it is plain, that in the map, the geographer has not left room for any ſuch mountain: nor can we help thinking, that, by comparing the diſtances of ſome of the Sicilian towns from one another, Signior Recupero's dimenſions will be found enormouſly exaggerated.—Certain it is, that where the geographer has placed Catania, which ſtands at the foot of Mount Ætna, on one ſide, there is no more than 28 miles from the moſt diſtant point of the river Alcantara, which forms the boundary on the oppoſite ſide; ſo that a circle, whoſe radius is 14 or 15 miles, muſt encompaſs as much ſpace as we can poſſibly think is occupied by the baſis of Mount Ætna. Thus we ſhall reduce the circumference of this famous mountain to between 80 and 90 miles; and even when we do ſo, it is perhaps too great.

But if we are embarraſſed with the circumference of Ætna, we are much more ſo with the accounts relating to its height; and one circumſtance, particularly, creates almoſt unſurmountable difficulties. It is agreed upon by all travellers, and among the reſt by Sir William Hamilton, that, from Catania, where the aſcent firſt begins, to the ſummit, is not leſs than 30 miles. The deſcent on the other ſide we have no account of; but whatever ſuppoſition we make, the height of the mountain muſt be prodigious. If we ſuppoſe it likewiſe to be 30 miles, and that Mount Ætna can be repreſented by an equilateral triangle, each of whoſe ſides is 30 miles, we will have an amazing elevation indeed, no leſs than 26 miles perpendicular! Such a height being beyond all credibility, we muſt contract the ſides of our triangle, in proportion to its baſis. We ſhall begin with allowing ten miles for the difference between a ſtraight line from Catania to the ſummit, and the length of the road, occaſioned by the inequalities of the mountain; and ſuppoſing the deſcent on the other ſide to be ſomewhat ſhorter, we may call it 15 miles. Mount Ætna will now be repreſented by a ſcalene triangle, whoſe baſe is 30 miles, its longeſt ſide 20, and its ſhorteſt 15; from which proportions we will ſtill find its height to be betwixt eight and nine miles.—This is ſtill incredible; and when all the various relations concerning the height of Ætna are compared, we hope it will not be thought preſumptuous in us to give it as our opinion, that the true dimenſions of this mountain are as yet unknown. The following meaſures are given by different authors.

Dimenſ uncerta

Height above the ſurface of the ſea, 10,036 feet.

One hundred and eighty miles circumference at the baſe.—Faujas de St Fond, in his Volcans du Vivarais.

Height 12,000 feet.—Brydone. Tour to Sicily.

Height 2500 toiſes.—La Platrière, ſaid as from Recupero.

Height 1950 toiſes.—Diameter 30 miles.—Mentelle Geogr. comp.

Others make its height only 2000 toiſes, and its ſuperficies 300 ſquare miles.

Concerning

Ætna. Concerning the products and general appearance of this volcano, authors are much better agreed.—The journey from Catania to its summit has been lately described by several travellers, M. D'Orville, Mr Brydone, Sir William Hamilton, M. Houel, and the abbé Spallanzani. They all agree, that this single mountain affords an epitome of the different climates throughout the whole world: towards the foot, it is extremely hot; farther up, more temperate; and grows gradually more and more cold the higher we ascend. At the very top, it is perpetually covered with snow: from thence the whole island is supplied with that article, so necessary in a hot climate, and without which the natives say Sicily could not be inhabited. So great is the demand for this commodity, that the bishop's revenues, which are considerable, arise from the sale of Mount Ætna's snow; and he is said to draw 1000l. a-year from one small portion lying on the north side of the mountain. Great quantities of snow and ice are likewise exported to Malta and Italy, making a considerable branch of commerce. On the north side of this snowy region, Mr Brydone was assured, that there are several small lakes which never thaw; and that the snow mixed with the ashes and salt of the mountain are accumulated to a vast depth. The quantity of salts contained in this mountain, he, with great probability, conjectures to be one reason of the preservation of its snows; for salt increases the coldness of snow to a surprising degree.

General appearance, &c.

In the middle of the snowy region stands the great *crater*, or mouth of Ætna; from which, though contrary to the usual method of travellers, we shall begin our particular account of this mountain. Sir William Hamilton describes the crater as a little mountain, about a quarter of a mile perpendicular, and very steep, situated in the middle of a gently inclining plain, of about nine miles in circumference. It is entirely formed of stones and ashes; and, as he was informed by several people of Catania, had been thrown up about 25 or 30 years before the time (1769) he visited Mount Ætna. Before this mountain was thrown up, there was only a prodigious large chasm, or gulf, in the middle of the above-mentioned plain; and it has been remarked, that about once in 100 years the top of Ætna falls in; which undoubtedly must be the case at certain periods, or the mountain behoved continually to increase in height. As this little mountain, though emitting smoke from every pore, appeared solid and firm, Sir William Hamilton and his companions went up to the very top. In the middle is a hollow, about two miles and a half in circumference, according to Sir William Hamilton; three miles and a half, according to Mr Brydone; and three or four, according to Mr D'Orville. The inside is crusted over with salts and sulphur of different colours. It goes shelving down from the top, like an inverted cone; the depth, in Sir W. Hamilton's opinion, nearly corresponding to the height of the little mountain. From many places of this space issue volumes of sulphureous smoke, which being much heavier than the circumambient air, instead of ascending in it, roll down the side of the mountain, till, coming to a more dense atmosphere, it shoots off horizontally, and forms a large track in the air, according to the direction of the wind; which, happily for our travellers, carried it exactly to the side opposite to which they were placed. In the middle of this funnel is the tremendous and unfathomable gulf, so much celebrated, in all ages, both as the terror of this life, and the place of punishment in the next. From this gulf continually issue terrible and confused noises, which in eruptions are increased to such a degree as to be heard at a prodigious distance. Its diameter is probably very different at different times: for Sir W. Hamilton observed, by the wind clearing away the smoke from time to time, that the inverted hollow cone was contracted almost to a point; while Mr D'Orville and Mr Brydone found the opening very large. Both Mr Brydone and Sir W. Hamilton found the crater too hot to descend into it; but Mr D'Orville was bolder: and accordingly he and his fellow traveller, fastened to ropes which two or three men held at a distance for fear of accidents, descended as near as possible to the brink of the gulf; but the small flames and smoke which issued from it on every side, and a greenish sulphur, and pumice stones, quite black, which covered the margin, would not permit them to come so near as to have a full view. They only saw distinctly, in the middle, a mass of matter which rose, in the shape of a cone, to the height of above 60 feet, and which towards the base, as far as their sight could reach, might be 600 or 800 feet. While they were observing this substance, some motion was perceived on the north side, opposite to that whereon they stood; and immediately the mountain began to send forth smoke and ashes. This eruption was preceded by a sensible increase of its internal roarings; which, however, did not continue; but after a moment's dilatation, as if to give it vent, the volcano resumed its former tranquillity; but as it was by no means proper to make a long stay in such a place, our travellers immediately returned to their attendants.

Ætna.

Crater described.

On the summit of Mount Ætna, Sir W. Hamilton observes, that he was sensible of a difficulty in respiration from the too great subtility of the air, independent of what arose from the sulphureous smoke of the mountain. Mr Brydone takes no notice of this: which probably arose from the air being in a more rarefied state at the time of Sir W. Hamilton's observation than of Mr Brydone's; the barometer, as observed by the former, standing at 18 inches and 10 lines, by the latter at 19 inches $6\frac{1}{2}$ lines.

In these high regions there is generally a very violent wind, which, as all our travellers found it constantly blowing from the south, is perhaps most frequently directed from that point. Here Mr Brydone's thermometer fell to 25°.

The top of Ætna being above the common region of vapours, the heavens appear with exceeding great splendour.—Mr Brydone and his company observed, as they ascended in the night, that the number of stars seemed to be infinitely increased, and the light of each of them appeared brighter than usual; the whiteness of the milky-way was like a pure flame which shot across the heavens; and, with the naked eye, they could observe clusters of stars that were invisible from below. Had Jupiter been visible, he is of opinion that some of his satellites might have been discovered with the naked eye, or at least with a very small pocket glass. He likewise took notice of several of those meteors called *falling stars*; which appeared as much elevated as when viewed from the plain; a proof, according to Mr Brydone,

Splendour of the stars seen from the top of Ætna.

Ætna.

done, that "these bodies move in regions much beyond the bounds that some philosophers have assigned to our atmosphere."

Extensive prospect.

To have a full and clear prospect from the summit of Mount Ætna, it is necessary to be there before sunrise; as the vapours raised by the sun, in the day time, will obscure every object: accordingly, our travellers took care to arrive there early enough; and all agree, that the beauty of the prospect from thence cannot be expressed.—Here Mr Brydone and Sir W. Hamilton had a view of Calabria in Italy, with the sea beyond it; the Lipari islands, and Stromboli, a volcano, at about 70 miles distance, appeared just under their feet; the whole island of Sicily, with its rivers, towns, harbours, &c. appeared distinct, as if seen on a map. Massa, a Sicilian author, affirms, that the African coast, as well as that of Naples, with many of its islands, have been discovered from the top of Ætna. The visible horizon here is no less than 800 or 900 miles in diameter. The pyramidal shadow of the mountain reaches across the whole island, and far into the sea on the other side, forming a visible track in the air, which as the sun rises above the horizon, is shortened, and at last confined to the neighbourhood of Ætna. The most beautiful part of the scene, however, in Mr Brydone's opinion, is the mountain itself, the island of Sicily, and the numerous islands lying round it. These last seem to be close to the skirts of Ætna; the distances appearing reduced to nothing.

Division into three zones.

This mountain is divided into three zones, which might properly enough be distinguished by the names of *torrid*, *temperate* and *frigid*: they are, however, known by the names of the *Piedmontese*, or *Regione culta*, the cultivated or fertile region; the *sylvosa*, woody, or temperate zone; and the *Regione deserta*, the frigid or desert zone or region. All these are plainly distinguished from the summit. The *Regione deserta* is marked out by a circle of snow and ice, which extends on all sides to the distance of about eight miles, beginning at the foot of the crater. Great part of this region is smooth and even. This is immediately succeeded by the *sylvosa*, or woody region; which forms a circle of the most beautiful green, surrounding the mountain on all sides. This region is variegated with a vast number of mountains of a conical form, thrown up by Ætna in those eruptions which burst out from its sides. Sir W. Hamilton counted 44 on the Catania side, each having its crater, many with large trees flourishing both within and without the crater. All these, except a few of late date, have acquired a wonderful degree of fertility. The circumference of this zone, or great circle, according to Recupero, is not less than 70 or 80 miles. It is everywhere succeeded by the *Regione culta;* which is much broader than the rest, and extends on all sides to the foot of the mountain. Here terrible devastations are sometimes committed by the eruptions; and the whole region is likewise full of conical mountains thrown up by them. The circumference of this region is, by Recupero, reckoned 183 miles; but we have already given our reasons for rejecting these dimensions.—This region is bounded by the sea to the south and south-east; and on all other sides, by the rivers Semeto and Alcantara, which form the boundaries of Mount Ætna.

Regione deserta.

Regione sylvosa.

Ætna.

The woody region descends eight or nine miles below the *Regione deserta*, but differs greatly in the temperature of its climate. Sir W. Hamilton observed a gradual decrease of the vegetation as he advanced; the under part being covered with large timber trees, which grew gradually less as he approached the third region, and at last degenerated into the small plants of the northern climates. He also observed quantities of juniper and tansy; and was informed by his guide, that later in the season (he visited Ætna in June 1769) there are a great many curious plants, and in some places rhubarb and saffron in great plenty. In Carrera's history of Catania, there is a list of all the plants and herbs of Ætna.

This region is extolled by Mr Brydone as one of the most delightful spots on earth. He lodged for a night in a large cave near the middle, formed by one of the most ancient lavas. It is called *La Spelonca del Capriole*, or the goats cavern; because it is frequented by those animals, which take refuge there in bad weather. Here his rest was disturbed by a mountain thrown up in the eruption 1766. It discharged great quantities of smoke, and made several explosions like heavy cannon fired at a distance; but they could observe no appearance of fire.

This gentleman likewise visited the eastern side of the *Regione sylvosa*, intending to have ascended that way to the summit, and descended again on the south side to Catania, but found it impracticable. On this side, part of the woody region was destroyed in 1755, by an immense torrent of boiling water, which issued from the great crater. Its traces were still very visible, about a mile and a half broad, and in some places more. The soil was then only beginning to recover its vegetative power, which it seems this torrent had destroyed for 14 years. Near this place are some beautiful woods of cork, and evergreen oak, growing absolutely out of the lava, the soil having hardly filled the crevices; and not far off, our traveller observed several little mountains that seemed to have been formed by a late eruption. Each of these had a regular cup, or crater, on the top; and, in some, the middle gulf, or *voragine*, as the Sicilians call it, was still open. Into these gulfs Mr Brydone tumbled down stones, and heard the noise for a long time after. All the fields round, to a considerable distance, were covered with large burnt stones discharged from these little volcanoes.

Eruption of boiling water.

The woody region, especially the east side, called *Carpinetto*, abounds with very large chesnut trees; the most remarkable of which has been called, from its size, *Castagno di Cento Cavalli*, or chesnut tree of a hundred horse. Mr Brydone was greatly disappointed at the sight of this tree, as it is only bush of five large ones growing together: but his guides assured him, that all these five were once united into one item; and Signior Recupero told him, that he himself had been at the expence of carrying up peasants with tools to dig round it, and found all the stems united below ground in one root. The circumference, as measured by Messr. Brydone and Glover who accompanied him, amounted to 204 feet. Here the barometer stood at 26 inches 5 lines and a half, indicating an elevation of near 4000 feet.

Overgrown chesnut trees.

The Piedmontese district is covered with towns, villages,

Regio Culta.

Ætna. lages. monaſteries, &c. and is well peopled, notwithſtanding the danger of ſuch a ſituation; but the fertility of the ſoil tempts people to inhabit that country; and their ſuperſtitious confidence in the ſaints, with the propenſity mankind have to deſpiſe danger which they do not ſee. render them as ſecure there as in any other place. Here, Sir William Hamilton obſerves, they keep their vines low, contrary to the cuſtom of thoſe who inhabit Mount Veſuvius; and they produce a ſtronger wine, but not in ſuch abundance: here alſo many terrible eruptions have burſt forth; particularly one in 1699. At the foot of the mountain raiſed by that eruption, is a hole, through which Sir William Hamilton deſcended, by means of a rope, into ſeveral ſubterraneous caverns, branching out, and extending much farther than he choſe to venture; the cold there was exceſſive, and a violent wind extinguiſhed ſome of the torches. Many other caverns are known in this and the other regions of Ætna; particularly one near this place called *La Spelonca della Palumba*, (from the wild pigeons building their neſts there.) Here Mr Brydone was told that ſome people had loſt their ſenſes, from having advanced too far, imagining they ſaw devils and damned ſpirits.

Subterraneous caverns.

River Acis. In this region the river *Acis*, ſo much celebrated by the poets, in the fable of Acis and Galatea, takes its riſe. It burſts out of the earth at once in a large ſtream, runs with great rapidity, and about a mile from its ſource throws itſelf into the ſea. Its water is remarkably clear; and ſo extremely cold, that it is reckoned dangerous to drink it; it is ſaid, however, to have a poiſonous quality, from being impregnated with vitriol; in conſequence of which cattle have been killed by it. It never freezes, but is ſaid often to contract a greater degree of cold than ice.

Houel's obſervations. The following additional particulars relating to the eruptions, magnitude, ſcenery, and products of this celebrated volcano, are chiefly collected from the *Voyage Pittoreſque* of M. Houel, who appears to have ſurveyed it with greater accuracy than any former traveller.

The form of Mount Ætna is that of a cone, very broad at the baſe, which is more than 40 miles in circumference. From the bottom you aſcend ten leagues before reaching its ſummit on the ſouth ſide; and on any of the other ſides, the way being not ſo ſtraight, would be conſiderably longer. Ætna is entirely compoſed of ſubſtances that have been diſcharged from the volcano in its various exploſions.

It appears from the quantities of marine bodies depoſited all over the under part of Ætna, that it muſt have been once covered by the ſea to at leaſt one half of its preſent height. The whole iſland of Sicily, and the greateſt part of Mount Ætna, have been, in our author's opinion, formed under water. But the period when the eruptions from this volcano firſt commenced, the manner in which the ſea ſubſided, and the preciſe time at which it fell ſo low as its preſent level on the ſhores of Sicily, are facts concerning which we have no certain knowledge.

The general principle, however, Mr Houel thinks may be regarded as undeniable. When this mountain ſtood half under water, the currents of the ocean would gradually accumulate upon it large maſſes, both of its own productions, ſuch as ſhells, and bones of fiſhes, and of various other matters, which would be intermixed with the volcanic matters diſcharged from the focus of the burning mount. In a long ſeries of ages theſe ſtrata of heterogeneous matters would naturally become ſo conſiderable as to form the enormous maſs of mountains with which the volcano is now ſurrounded. The currents of the ocean might often convey the volcanic matters to a conſiderable diſtance from the volcanic focus. And there are mountains at no ſmall diſtance from Ætna, which ſeem to have been produced in this manner. Thoſe of Carlintini, at the diſtance of 15 leagues, conſiſt chiefly of a mixture of pozzolana with calcareous matters. At Lintini, and in places around it, there are diſtinct beds of pozzolana, ſcoriæ, and real lava, as well as others in which all theſe matters are blended together in a maſs of calcareous matter. At Palazzolo, about 24 miles from the city of Syracuſe, the ſides of the hills having been cut by the ſtreams which run down them, in many places to a conſiderable depth, diſplay huge maſſes of lava, and extenſive beds of pozzolana. In the neighbourhood of Noto there are alſo volcanic productions to be found. Ætna.

At Pachino, where the iſland of Sicily forms an angle, there is a range of hills extending for ſeveral miles, which conſiſt all of pozzolana.

The province of Val di Noto is more homogeneous in the matters of which its ſoil conſiſts, than the two other dales of Sicily. Theſe, in every hill which they contain, exhibit a vaſt variety of different matters. So amazing, indeed, is that variety, that they may be conſidered as exhibiting a collection of ſpecimens of all the different materials which enter into the compoſition of the globe. In thoſe two dales few volcanic productions have been yet obſerved. But it is not to be inferred for this reaſon that they contain but few. They may be hereafter diſcovered in great plenty. In the volcano of water at Maccalubbe, between Aragona and Girginti; in the baths of Caſtellamare, near Alcamo and Segeſte; in the baths of Termini; in the iſles of Lipari; in the hot waters of Ali, between Meſſina and Taormina, by the lake in the valley of Caltagirone; in all theſe places, which comprehend the whole circumference of Sicily, the influence of the volcano of Ætna is, in ſome meaſure, felt. Nay, it would even ſeem, that in theſe places there are ſo many volcanic craters. All of theſe are ſo diſpoſed as to ſhow that they exiſted prior not only to the volcanic matters, but to the other ſubſtances intermixed with them.

The waters of the ſea have, in former times, riſen much higher than at preſent. But how they retreated, or whether they are to continue ſtationary at their preſent height, we know not. For more than 2000 years, during which Sicily has been inhabited, and has had cities and harbours, the ſea has not been obſerved either to recede or encroach in any conſiderable degree.

When the ſea ſubſided from Mount Ætna, the mountain muſt have been covered over with ſuch matters as the ſea uſually depoſites; conſequently with calcareous matters. A part of thoſe matters would be indurated by the action of the atmoſphere, while the reſt would be carried down by the rain waters, and again conveyed into the ocean. The torrents of rain

waters.

Ætna. water which pour down the ſides of Mount Ætna have furrowed its ſides, by cutting out for themſelves channels; and they have removed from its ſummit, and are ſtill removing to a further diſtance, all the extraneous bodies upon it. In many places, they flow at preſent over a channel of lava, having cut through all the matters which lay above it: ſtill, however, there remain in many places both calcareous matter and other marine productions, which ſhow that this volcano has been once covered by the waters of the ocean. But theſe are daily waſting away; not only the rains, but men likewiſe, who carry them off as materials for lime and for building, conſpire to deface them.

No fewer than 77 cities, towns, and villages, are ſcattered over the ſides of Ætna. They are moſt numerous on the ſouth ſide, where the temperature of the air is milder than on the north. Reckoning thoſe cities, towns, and villages, one with another, to contain each 1200 or 1500 ſouls, the whole number of the inhabitants of Mount Ætna will then be 92,400, or 115,500. But it is certainly much more conſiderable.

Account of the north-eaſt ſide of the mountain.

Plate IV. fig. 1. exhibits a view of the north eaſt ſide of the mountain, taken at ſea. The lower part preſents to the eye very extenſive plains entirely covered with lava of different thickneſs, on which vegetation has not yet made any progreſs. The nearer the ſhore the more barren is the ground; while the fertility of the ſoil increaſes as we advance farther inwards. The mountain is everywhere full of vaſt excavations; which our author conſiders as a proof, that inſtead of increaſing in bulk, it is actually in a ſtate of decay and diminution. The vaſt torrents of lava, which overſpread the ſides of it from time to time, he conſiders as inſufficient to repair the waſte occaſioned by rains, rivulets, and torrents flowing down from the ſummit. Unleſs the eruptions, therefore, become more frequent than they have been for ſome time paſt, he ſuppoſes that, by degrees, the height of the mountain muſt be reduced to that of the ſurrounding beds of lava. He had not an opportunity of meaſuring the altitude of Ætna himſelf; but he obſerves, that it had been done by the celebrated M. de Sauſſure, who found the elevation to be 10,036 feet. This was done on the 5th of June 1773, at 20 minutes after ſeven in the morning. The height of the barometer on the moſt elevated part at the brink of the crater was 18 inches $11\frac{1}{4}$ lines; which, by the neceſſary corrections, is reduced to 18 inches $10\frac{1}{10}$ lines. At the ſame time the mercury at Catania, placed only one foot above the level of the ſea, ſtood at 28 inches $2\frac{1}{10}$ lines; which muſt be reduced to 28 inches $1\frac{1}{8}$ lines, on account of the neceſſary correction for the thermometer.

Suppoſed to be in a ſtate of decay.

Sauſſure's account of the height of Ætna.

Mountains of calcareous matter.

From Giana our author had an opportunity of contemplating the vaſt number of calcareous mounts ſcattered over that part of Ætna; which (he ſays) "are nothing more than fragments, the ſlender remains of thoſe enormous maſſes which have been depoſited all around the baſe of Mount Ætna; and are a very curious monument of the revolutions which this mountain has undergone." They are of a true calcareous nature; and the inhabitants are accuſtomed to ſupply themſelves with limeſtone from them. They alſo uſe ſtones of which theſe mounts are compoſed for the purpoſes of building; as the lava is ſo hard that it cannot be cut without the greateſt difficulty, and they have no other ſtone in theſe parts. Ætna.

Leaving this place, our author travelled over ſeveral extenſive plains of lava, covered on each ſide of the way with ſtunted trees, but without any cultivation: the lava being of that kind which is very unfavourable to the growth of vegetables. Arriving at St Leonardo, he obſerved the courſe of the eruption of water which happened in 1755.

Particular account of the eruption of water in 1755.

This water took its courſe down the weſt ſide of the mountain: and the channel which it cut for itſelf is ſtill viſible. The eruption of water from burning mountains is ſtill much leſs frequent than that of lava or half vitrified ſolid matters, aſhes, &c. though that of water, and even mixed with the ſhells of marine animals (though we are not told whether it was ſalt or not), has ſometimes been obſerved in other volcanoes, particularly Veſuvius. The eruption we now ſpeak of happened in the month of February 1755. It was preceded by an exceedingly thick black ſmoke iſſuing from the crater, intermixed with flaſhes of fire. This ſmoke gradually became thicker, and the burſts of flame more frequent. Earthquakes and ſubterraneous thunder convulſed the mountain, and ſtruck the inhabitants of the adjacent parts with the utmoſt terror. On Sunday the ſecond of March, the mountain was ſeen to emit a huge column of ſmoke, exceedingly denſe and black, with a dreadful noiſe in the bowels of the earth, accompanied alſo with violent flaſhes of lightning. From time to time there were loud cracks, like the exploſions of cannon; the mountain appeared to ſhake from its foundations; the air on that ſide next Maſcali became very dark, and loud peals of thunder were heard. Theſe ſeemed to iſſue from two caverns, conſiderably below the ſummit, on the ſide of the mountain, and were accompanied with violent blaſts of wind like a tempeſt.

Theſe terrible phenomena continued and increaſed; Ætna ſeemed ready to ſwallow up at once all thoſe materials which it had been for ſo many years diſgorging, or rather about to ſink at once into the bowels of the earth from whence it appeared to have been elevated. The proſpect was far beyond any idea that can be given by deſcription of this tremendous ſcene. The inhabitants were alarmed beyond meaſure; the ſight of the flames driven by the winds againſt the ſides of the mountain, the ſhocks of the earthquake, and the fall of rocks, ſtruck the imagination with a horror not to be conceived. During this dreadful commotion, an immenſe torrent of water was emitted from the higheſt crater of the mountain. The whole ſummit of Ætna was at that time covered with a thick coating of ſnow. Through this the boiling water directed its courſe eaſtward; and, in its paſſage, met with frightful precipices. Over theſe it daſhed with the utmoſt violence, adding its tremendous roaring to the complicated horrors of this awful ſcene. The ſnow, melting inſtantaneouſly as the boiling torrent advanced, increaſed its deſtructive power by augmenting its quantity, while the miſchievous effects of the heat were ſcarce diminiſhed, by reaſon of the immenſe quantity of boiling liquid which continued to pour from the ſummit of the mountain.

This boiling torrent having daſhed its awful cataracts from one chain of rocks to another, at length reached

Ætna. reached the cultivated plains, which it overflowed for a number of miles. Here it divided itſelf into ſeveral branches, forming as many deep and rapid rivers; which, after ſeveral other ſubdiviſions, diſcharged themſelves into the ſea.

Though the mountain continued to diſcharge water in this manner only for half an hour, the ravages of it were very terrible. Not only thoſe of common inundations, ſuch as tearing up trees, hurrying along rocks and large ſtones, took place here, but the ſtill more dreadful effects of boiling water were felt. Every cultivated ſpot was laid waſte, and every thing touched by it was deſtroyed. Even thoſe who were placed beyond the reach of the torrent, beheld with inexpreſſible horror the deſtruction occaſioned by it; and though the alarming noiſes which had ſo long iſſued from the mountain now ceaſed in a great meaſure, the ſhocks of earthquakes and the violent ſmoke which continued to iſſue from the mountains, ſhowed that the danger was not over. Two new openings were now obſerved, and two torrents of lava began to make their way through the ſnow.

On the 7th of March a dreadful noiſe was again heard in the bowels of the mountain, and a new column of very thick and black ſmoke began to iſſue from it. A horrid exploſion of ſmall ſtones ſucceeded; ſome of which were carried as far as the hills of Maſcali, and great quantities of black ſand to Meſſina, and even quite over the ſtrait to Reggio in Calabria. On the ſhifting of the wind to the northward this ſand reached as far as the plains of Agoſta. Two days after the mountain opened again, and a new torrent of lava was diſcharged; which, however, advanced very ſlowly towards the plain, moving only at the rate of a mile in a day. It continued to flow in this manner for ſix days, when every thing appeared ſo quiet, that the Canon Recupero ſet out to view the changes which had taken place.

ourſe of he current aced by ecupero. That gentleman's deſign was to trace the courſe of the dreadful torrent of water above-mentioned. This he was very eaſily enabled to do by the ravages it had made; and, by following the channel it had cut all the way from the ſea to the ſummit of the volcano, he found that this immenſe quantity of water had iſſued from the very bowels of the mountain. After iſſuing from the crater, and increaſing its ſtream by paſſing through and melting the ſnow which lay immediately below the ſummit, it deſtroyed in an inſtant a fine and extenſive foreſt of fir-trees. All of theſe were torn up by the violence of the current, though many were no leſs than 24 or 30 inches in diameter. He obſerved that the great ſtream had, in its deſcent, divided itſelf into four branches; and theſe had again ſubdivided themſelves into ſeveral ſmaller ones, eaſily diſtinguiſhable by the quantity of ſand they had depoſited. Afterwards reuniting their ſtreams, they formed many iſlands, and rivers 900 feet in breadth, and of a depth which could not eaſily be determined. Proceeding farther down, and ſtill forcing its way among the beds of old lava, the channel of the waters was widened to 1500 feet, until it was again contracted in the valleys as before. Every object which ſtood in the way of this tremendous torrent was moved from its place. Enormous rocks were not only hurried down, but ſeveral of them moved to more elevated ſituations than thoſe they formerly occupied. Whole hills of lava had been removed and broken to pieces, and their fragments ſcattered along the courſe of the river, and the valleys were filled up by vaſt quantities of ſand which the waters had depoſited. Our author obſerved, that even at the time he viſited the mountain, about ten years after the eruption, the whole ſide of it ſtill bore the marks of this deluge. Ætna.

On M. Houel's arrival at Jaci Catena, he inquired for the phyſician of the place; it being cuſtomary for ſtrangers to do ſo who want to learn any thing concerning the curioſities of the country, as the phyſicians there are generally thoſe who have any pretenſions to literature. By this guide he was ſhown a well which they call *Holy Water*. There is a flight of ſteps from the ſurface of the ground to that of the water. The well itſelf is 20 feet wide and 40 feet deep. It is ſupplied by three different ſprings, each of which is ſaid to have a peculiar taſte. The phyſician informed our author, that one of them reſembled milk in its taſte; another taſted like ſoap; and the third had the taſte of common water: but our author, after taſting each of them, could not find any remarkable difference. Account of a remarkable well.

In his way to La Trizza, our author diſcovered ſome very ancient baths with ſtoves. They had been built here on account of a ſpring of warm ſulphureous water, ſuppoſed to be excellent for the cure of cutaneous diſorders; and for which purpoſe they are ſtill made uſe of. They are now called the *Springs of St Venera*, of whom there is an image here. The fountain from which they flow is on a level with the ſurface of the ground. The water taſtes very diſagreeably of ſulphur; and depoſites a quantity of white impalpable powder, adhering to herbs and ſtones, over which it paſſes. This ſubſtance our author calls the *cream of ſulphur*; though it is probably a ſelenitic ſubſtance formed by the decompoſition of the ſulphur, and the union of its acid with ſome calcareous matter which held it in ſolution before. Ancient baths diſcovered. Springs of St Venera.

From this place our author proceeded to the ſea-port of Trizza, a ſmall place, which with the adjacent country contains only about 300 inhabitants. Off the harbour of this place is a baſaltic rock, which ſeems to be only the remains of a much larger one deſtroyed by the action of the air. All around are long ranges of baſaltes, the ſpecies of which are very various. Baſaltic rocks about Trizza.

The rocks of the Cyclops ſtand round the ſmall harbour of La Trizza; and from this view we perceive a number of rocks of very different heights. All of them appear more or leſs above water, though ſome are ſo low that they cannot be ſeen without approaching very near; and this circumſtance renders the harbour inacceſſible to veſſels of any conſiderable burden, at the ſame time that, by reaſon of the depth of the ſea, it is impoſſible either to cut or unite them by a mole. The principal of theſe rocks is the extremity of an iſland, one half of which is compoſed of lava placed on a baſaltic baſe; over this is a cruſt of pozzolana, combined with a kind of white calcareous matter of a pretty hard and compact conſiſtence; and which, by the action of the air, aſſumes the appearance of knotty porous wood. On this ſubject our author obſerves, that "the rock at ſome former period, had become ſo hard as to ſplit, and the clefts were then filled up with Rocks of the Cyclops.

Ætna. with a very hard matter which was porous on all ſides like ſcoriæ. That matter afterwards ſplit alſo; leaving large interſtices, which in their turn have been filled up with a kind of compound yellow matter. The iſland appears to have been formerly inhabited, but is at preſent deſtitute both of inhabitants and of culture, only the people of La Trizza feed a few goats upon it."

Different kinds of baſaltes. To the ſouthward of the harbour of La Trizza we obſerve ſeveral fragments of baſaltes, both in the form of needles, and in that of priſmatic columns of a very regular form, and which may be eaſily ſeparated from one another. From the poſition in which theſe fragments are diſpoſed, it appears that the maſs to which they belong muſt have ſuffered ſome very violent ſhock; otherwiſe ſuch huge rocks could never have been broken, overturned, and ſcattered in directions ſo very different from their original poſitions. In one of theſe ruins there are ſome parts harder than the reſt, which withſtand the action of the air, while the intervening ſpaces yield to it, and appear to be thus deſtroyed. In ſome others this effect is much more remarkable; becauſe the column happens to be much farther advanced towards a ſtate of diſſolution, the parts of which they conſiſt being already disjointed; and in each of thoſe which project we perceive a fiſſure: which ſhows that each of theſe parts may be divided into two. "They are indeed (ſays our author) actually divided, and diſplay a convexity iſſuing from a concavity, like a pile of hats placed one upon another, when they are removed one by one; which is a very curious ſingularity."

Promontory of the Caſtel d'Aci deſcribed. Continuing his journey ſtill ſouthward, our author arrived at the promontory of the Caſtel d'Aci. This is the moſt ſingularly curious of all that are in the neighbourhood of Ætna. The ancient maſs of it is enclosed between two bodies of lava of a more modern origin. Theſe compoſe the rocks on which Caſtel d'Aci is ſituated, and which lie under the ſoil of the adjacent country. Beyond that city are the immenſe plains of the lower part of Ætna. Theſe gradually riſe till they reach the ſummit, which is hid among the clouds. The promontory is almoſt entirely compoſed of baſaltes, the interſtices of which are filled up with a yellowiſh matter, which ſeems to be a clay nearly of the ſame nature with that formerly taken notice of in the iſland of La Trizza. It alſo covers the maſs of baſaltes, and has produced both the ſuperior and anterior parts of the promontory. Here our author ſaw a number of women employed in waſhing webs of cloth in the ſea: and takes notice of the dexterous method they have of lifting it up in folds, and packing it on their heads in bundles, without receiving any aſſiſtance. At the foot of this promontory are many curious baſaltic rocks.

Great quantity of baſaltes found on Ætna. All along the eaſtern ſide of Mount Ætna the ſoil is broken, but filled with beautiful varieties of baſaltes, highly worthy of obſervation. Indeed, according to our author's opinion, there is no volcano in Europe ſo rich as Ætna in baſaltes, nor where ſo many curious figures of it are to be ſeen.

M. Houel's journey to the great cheſnut tree. M. Houel having ſpent ſome more time in viſiting the baſaltic columns around the foot of the mountain, ſet out from Aci to viſit the famous *cheſnut tree for an hundred horſes* which we have already mentioned. In his way thither he paſſed through the villages of Fortezza, Mangamo, St Leonardo, St Matteo, and La Macchia. The landſcapes of each of theſe places by itſelf are extremely beautiful; but the country between them is a frightful wild deſert, preſenting to the eye nothing but extenſive plains of black lava, which at a diſtance have the appearance of vaſt quantities of pit-coal. The roads became rougher as they advanced; but the adjoining fields aſſumed a more ſmiling aſpect. The reaſon of this is, that the torrents of lava (by which the plains are rendered unfit for vegetation for a great number of years) have rolled rapidly down the more ſteep ſides of the mountain without deſtroying the fertility of the ſoil. Ætna.

Travelling through very difficult roads, and often incommoded with dangerous precipices, our author at laſt arrived at the celebrated cheſnut tree, which was the chief object of this journey. He obſerves, that, all over this ſide of the mountain the cheſnut trees thrive very well, and are carefully cultivated by the inhabitants. They are worked into hoops for caſks, and a conſiderable trade is carried on in this article. The great one which he came to viſit, exceeds the ſize of other trees ſo much that it cannot fail to excite the greateſt admiration. It has its name from the following circumſtance. Jean of Arragon ſpent ſome time in Sicily on her way from Spain to Naples. While here, ſhe viſited Mount Ætna, attended by her principal nobility; and happening to be overtaken by a ſtorm, they took ſhelter under this tree, whoſe branches were ſufficiently extenſive to cover them all. By others, however, this ſtory is treated as a mere fable. Great numbers of cheſnut trees. Particular account of the great tree.

According to our author's account, this cheſnut tree is 160 feet in circumference, which is leſs than Mr Brydone's account of it, but quite hollow within: which, however, affects not its verdure; for the cheſnut tree, like the willow, depends upon its bark for ſubſiſtence, and by age loſes its internal part. As the cavity of this enormous maſs is very conſiderable, the people have built a houſe in it, where they have an oven for drying nuts, almonds, and cheſnuts, &c. of which they make conſerves. They frequently ſupply themſelves with wood from the tree which encircles their houſe, ſo that it ſeems likely, in a ſhort time, to go to ruin through the thoughtleſs ingratitude of its inhabitants, to whom it gives protection. A houſe and oven built in the hollow of it.

It has been thought that this tree was compoſed of a number of others grown together; but our author is of a different opinion. For he ſuppoſes that the bark and outer part of the wood have been rent aſunder, and that by a natural motion the divided parts of the bark ſeeking to reunite, or rather to ſhelter themſelves from the action of the external air, are bent inwards ſo as to form circular arcs, which may indeed be taken for ſo many different trees, though they appear properly to belong to the ſame trunk. Is not compoſed of a number of trees grown together.

Beſides this, there is abundance of other trees in the neighbourhood very remarkable for their ſize. Our traveller was ſhown a number of young trees of the ſame ſpecies, all very beautiful and ſtraight, and almoſt as ſmooth as poliſhed marble. One of theſe was 38 feet in circumference, and there was a number of others nearly of the ſame ſize. Among theſe there were ſeven ſtanding together, which have received the name of the *ſeven brethren*. Another is denominated Other trees of vaſt dimenſion.

Ætna.

minated *the ſhip*, from the general figure of its top, which has ſome ſlight reſemblance to a ſhip. Its diameter is 25 feet, ſo that the circumference cannot be leſs than 75. In theſe extenſive foreſts, however, there are cheſnut trees of every age and ſize.

now grot- deſcrib- l.

Our author's next viſit was paid to a ſnow grotto, being one of thoſe magazines where that article, ſo neceſſary in the hot climate of Sicily, is preſerved for uſe.

oreſt of nes in the ay to it.

In his way thither he viſited the foreſt of pines; which is ſo much ſurrounded by rocks and precipices, that it is ſcarce acceſſible; and vaſt numbers of the trees are dying of old age. Some of the neighbouring peaſants, however, now and then attempt to carry them off. Our author ſaw one of them at this work. It was drawn by oxen, who were yoked to it by a chain connected with the beam by an iron cramp. But the extreme roughneſs of the road made the tree leap and bound in ſuch a manner, that the poor creatures were every moment in danger of having their legs broken, or being hurried over precipices along with their driver; accidents which happen not unfrequently, and which render this occupation leſs generally practiſed than otherwiſe it would be.

The ſnow grotto is but lately formed, by the action of the waters under the beds of lava carrying away the ſtratum of pozzolana below them. It is ſituated on a mount named *Finocchio*, which, though of very conſiderable ſize, is only a protuberance on the ſide of Ætna. It has been repaired in the inſide at the expence of the knights of Malta, who have hired this as well as ſeveral other caverns in the mountain for the purpoſe of holding ſnow, which they have ſtill more occaſion for in their iſland than the inhabitants of Sicily. There are two openings above, at which they throw in the ſnow; and flights of ſteps have been cut to theſe as well as in the internal parts. A conſiderable extent of ground is levelled and encloſed with high walls above the grotto; ſo that when the wind, which at this elevation blows with great violence, carries the ſnow down from the higher parts of the mountain, it is ſtopped and detained by the walls of this encloſure. It is then thrown into the grotto, where the thickneſs of the beds of lava which cover it prevents any impreſſion from the ſummer heat. When the ſeaſon for exportation comes on, the ſnow is put into large bags, and preſſed into them as cloſe as poſſible. Thus it is rendered compact and heavy, and likewiſe runs leſs riſk of being affected by the heat. It is then carried out upon men's ſhoulders, and conveyed to the ſhore on mules. Before it is put into the bags, the lumps of ſnow are carefully wrapped up in leaves, which is another preſervative; at the ſame time that the freſh congelation of the little which melts, unites the maſſes ſo together, that our author informs us he has ſeen pieces of the ſnow preſerved in this manner which looked like the faireſt and moſt tranſparent cryſtal.

low the now is pre- ented from elting uring ex- ortation.

ccount Mount offo.

Our author's next excurſion was to Mount Roſſo, or the Red Mountain, which is one of the mouths of Ætna, and through which it diſcharges from time to time great quantities of lava, ſand, aſhes, &c. It is the moſt celebrated of all the numerous mouths which have opened on the ſide of the mountain, though it has become ſo noted only for having poured forth the matter of the great eruption in 1669, and which is the moſt remarkable of any recorded in hiſtory.

"When a new crater (ſays our author) is formed on Mount Ætna, it is always in conſequence of ſome ſhock that is powerful enough to break the arches of its caverns. Doubtleſs it is inconceivable that there ſhould be any agent endowed with ſuch force; but when ſuch a fracture is once made, it is neceſſarily very large, and the ſurface of the ground above cannot but be broken in ſeveral different places at conſiderable diſtances from one another. The matter which is diſcharged always iſſues from the principal opening and thoſe adjoining to it. None of theſe mouths, however, continue open, excepting that which is directly in the line in which the matter is diſcharged; the lava ſoon choking up thoſe which are in a more oblique direction." Ætna. New craters how formed.

Our author went down one of theſe openings with torches; but could not reach the bottom, and was obliged to return on account of the extreme cold. The deſcent was extremely difficult, and became more ſo in proportion as he advanced. This crater is of an oval form, and the opening through which he deſcended was in one extremity: but he was tempted to think that the crater which riſes above it had been formed of matter diſcharged by another mouth: or perhaps it might have had a more centrical opening, through which the ſtones, ſand, &c. which form the crater were diſcharged.

Four of the mouths of this mount appear to be compoſed of a reddiſh pozzolana, which has procured it the name of the *Red Mountain;* but when we aſcend the pyramids, or rather funnels which they form, we find them compoſed of different coloured layers of ſand. Some of theſe are of a bluiſh-gray colour, others of a fine yellow, and ſome of a kind of green formed by a mixture of gray and yellow, while others are of a red colour. A great number of ſmall cryſtals, black ſchoerls, and granites, are found among them, as well as pieces of ſcoria, which had been diſcharged by the volcano in the form of a thick and glutinous matter. All theſe mouths have internally the form of a funnel, and their ſhape is nearly that of a mutilated cone or round pyramid. This is the natural and unavoidable conſequence of the perpendicular fall of the pulverized matter which the volcano diſcharges from the orifice at the bottom. The ſides of the craters are not all of one height; the parts to the eaſt and weſt being conſiderably higher than the intermediate ſummits, becauſe the currents of the aſhes paſſed alternately from eaſt to weſt, and fell upon theſe ſides in greater quantities than on the others; which circumſtance has given to the volcano the appearance of having two ſummits.

M. Houel, having finiſhed his obſervations on Monte Roſſo, returned to the convent of Nicoloſi, which is now only a houſe for the entertainment of travellers. The Benedictines of Catana, to whom it belongs, viſit this place only when in an ill ſtate of health, as the purity of the air renders it very ſalutary to the human conſtitution. A ſolitary brother, however, reſides here to take care of the houſe, and to ſuperintend the cultivation of the neighbouring plains. Thoſe fathers once poſſeſſed an extenſive and very fertile tract of land in this neighbourhood; but the eruptions of Ætna have rendered it totally incapable of cultivation. This houſe ſtands at a very conſiderable height, being no leſs than 2,396 feet above the level of the ſea. Setting Convent of Nicoloſi deſcribed.

Ætna.

Grotto of the goats described.

ting out from this place three hours before day, our traveller directed his courſe towards the grotto of the goats. In his way thither, he paſſed over ſeveral plains of lava, ſome of them ancient and others more modern: but the roads were extremely rough and dangerous; or rather, as our author expreſſes himſelf, there was no track or path meriting the name of a road. In two hours they reached the Regione Sylvoſa, where an immenſe foreſt ſurrounds the mountain, and which has undoubtedly been planted by the hand of nature: for there the ground is ſo high, ſo full of precipices, and ſo entirely uninhabitable, that no human being could ever think of making plantations on it; nor is it to be ſuppoſed that the winds could take up ſeeds from the plains to ſow them on ſuch a lofty ſituation.

Beautiful appearance of the foreſts of Ætna.

Theſe majeſtic foreſts of Ætna afford a ſingular ſpectacle, and bear no reſemblance to thoſe of other countries. Their verdure is more lively, and the trees of which they conſiſt are of a greater height. Theſe advantages they owe to the ſoil whereon they grow; for the ſoil produced by volcanoes is particularly favourable to vegetation, and every ſpecies of plants grows here with great luxuriance. In ſeveral places, where we can view their interior parts, the moſt enchanting proſpects are diſplayed. The hawthorn trees are of an immenſe ſize. Our author ſaw ſeveral of them of a regular form, and which he was almoſt tempted to take for large orange trees cut artificially into the figures they repreſented. The beeches appear like as many ramified pillars, and the tufted branches of the oak like cloſe buſhes impenetrable to the rays of the ſun. The appearance of the woods in general is exceedingly picturesque, both by reaſon of the great number and variety of the trees, and the inequality of the ground, which makes them riſe like the ſeats in an amphitheatre, one row above another; diſpoſing them alſo in groups and glades, ſo that their appearance changes to the eye at every ſtep; and this variety is augmented by accidental circumſtances, as the ſituation of young trees among others venerable for their antiquity; the effects of ſtorms, which have often overturned large trees, while ſtems ſhooting up from their roots, like the Lernæan hydra, ſhow a number of heads newly ſprung to make up that which was cut off.

Grotto of the goats, how formed.

About three hours after the departure of our travellers from St Nicholas, they reached the grotto of the goats. It is formed by a bed of lava, which having flowed over a pile of ſand and pozzolana while in a fluid ſtate, ſettled and cooled in that ſituation; and the ſand or pozzolana being afterwards carried off by the filtration of water through the lava, a void ſpace has been left, which the torrents have gradually enlarged to its preſent ſize.

This grotto ſtands about 5054 feet above the level of the ſea, according to the calculations of M. de Sauſſure. It affords a retreat for thoſe travellers who viſit the ſummit of Ætna, who generally refreſh themſelves by taking a repaſt and making a fire at the entry, for which there is plenty of dry wood at hand; while the ſand ſerves for a bed to repoſe on. Here our author and his company ſupped, and about midnight ſet off for the ſummit. They had the advantage of the moon light; and our author adviſes all theſe who intend to viſit the top of Ætna to take ſuch a time for their journey as may enable them to enjoy this advantage. As they advanced beyond the grotto of the goats, the trees became gradually thinner. In a ſhort time they were ſo thin, that they might readily be counted; and, proceeding ſtill farther, only a very few were ſeen ſcattered here and there, whoſe beauty and ſize were diminiſhed ſeemingly in proportion to their numbers. A few clumps of trees and ſome tufts of odoriferous herbs were now only to be ſeen; and in a little time theſe alſo became thinner, aſſuming a withered or ſtunted appearance. Then they are nothing but the languiſhing remains of an abortive vegetation; and a few paces further even this diſappeared, and the eye was preſented only with barren ſand.

Ætna.

Account of the highe parts of Ætna.

Having now got above the region of the trees, they entered the third, which our author denominates the region of ſnow and ſterility. The wind became more briſk and keen as they advanced, ſo that they could ſcarce keep their hats upon their heads; and our author loſt his, though tied on with a handkerchief. Here they were frequently obliged to croſs conſiderable ſtreams of water formed by the melting of the ſnow. In general the ſurface was ſufficiently hard to bear them; but our author's mule once ſunk up to her belly, and was not extricated without great difficulty.

Snowy and barren region deſcribed.

Having at laſt overcome all difficulties, they arrived at the large plain on the ſummit of Ætna, and in the midſt of which is the crater of the volcano. It is entirely compoſed of lava, cinders, ice, and ſnow; and has been ſtyled, ironically as our author thinks, *Monte Frumente*. Here the wind continued to blow with exceſſive violence; and our author informs us, that in order to have any notion of its keenneſs, we muſt be accuſtomed to feel it on ſome very elevated ſtation, as it is impoſſible to judge from what we feel at inferior altitudes. They took ſhelter behind a lump of lava, the only one which appeared in the whole plain, and, which our author ſays, would ſeem deſigned expreſsly for the ſhelter of travellers. Here they lay, wrapped up in their cloaks, for an hour: but as ſoon as it was day, ſo that they could diſtinguiſh the place where the ſun was to riſe, they got up and advanced towards the ruins of the building known by the name of the *Philoſopher's Tower*. The wind ſtill blew ſo violently, that after an effort of four minutes they fell down exhauſted: but the extreme cold obliging them again to get up, they made a ſecond attempt; and after ſeveral intermiſſions of this kind, at laſt accompliſhed their deſign. They were ſurpriſed, however, to find nothing but the corner of a wall not more than two feet high, conſiſting of two rows of unpoliſhed ſtones; great part of it having been probably buried by the ſand and other matters diſcharged by the mountain. Here, being ſheltered from the wind, and the day advancing, they began to enjoy the glorious proſpect which every moment became more extenſive. At the riſing of the ſun, the horizon was ſerene, without a ſingle cloud. "The coaſt of Calabria (ſays our author) was as yet undiſtinguiſhable from the adjoining ſea; but in a ſhort time a fiery radiance began to appear from behind the Italian hills, which bounded the eaſtern part of the proſpect. The fleecy clouds, which generally appear early in the morning, were tinged with purple: the atmoſphere became ſtrongly illuminated, and, reflecting the rays of the riſing ſun, appeared filled with a bright effulgence

Plain on the ſumm of Ætna.

Wind exceſſively violent here.

Extenſiv proſpect

of

Etna. of flame. The immenſe elevation of the ſummit of Ætna made it catch the firſt rays of the ſun's light, whoſe vaſt ſplendour, while it dazzled the eyes, diffuſed a moſt cheriſhing and enlivening heat, reviving the ſpirits, and diffuſing a pleaſant ſenſation throughout the ſoul. But though the heavens were thus enlightened, the ſea ſtill retained its dark azure, and the fields and foreſts did not yet reflect the rays of the ſun. The gradual riſing of this luminary, however, ſoon diffuſed his light over the hills which lie below the peak of Ætna. This laſt ſtood like an iſland in the midſt of the ocean, with luminous points every moment multiplying around, and ſpreading over a wider extent with the greateſt rapidity. It was as if the univerſe had been obſerved ſuddenly ſpringing from the night of non-exiſtence. The tall foreſts, the lofty hills, and extenſive plains of Ætna, now preſented themſelves to view. Its baſe, the vaſt tracts of level ground which lie adjacent, the cities of Sicily, its parched ſhores, with the daſhing waves and vaſt expanſe of the ocean, gradually preſented themſelves, while ſome fleeting vapours, which moved ſwiftly before the wind, ſometimes veiled part of this vaſt and magnificent proſpect." In a ſhort time every thing was diſplayed ſo diſtinctly, that they could plainly recognize all thoſe places with which they were before acquainted. On the ſouth were ſeen the hills of Camerata and Trapani; on the north, the mounts Pelegrino and Thermini, with the celebrated Enna once crowned with the temples of Ceres and Proſerpine. Among theſe mountains were ſeen a great many rivers running down, and appearing like as many lines of glittering ſilver winding through a variety of rich and fertile fields, waſhing the walls of 28 cities, while their banks were otherwiſe filled with villages, hamlets, &c riſing among the ruins of the moſt illuſtrious republics of antiquity. On the ſouth and north were obſerved the rivers which bound by their courſe the vaſt baſe of Mount Ætna, and afford a delightful proſpect to the eye; while at a much greater diſtance were ſeen the iſles of Lipari, Alicudi, Felicocide, Parinacia, and Stromboli.

Having enjoyed for ſome time the beauty of this magnificent proſpect, our author ſet about making a draught of the place from which the view was taken; and at length accompliſhed it, notwithſtanding the great impediments he met with from the wind. Among the objects which he delineated on this occaſion, the Philoſopher's Tower was one. It ſeems, he ſays, not to be very ancient; neither the materials of which it conſiſts, nor the mode of architecture, bearing any reſemblance to thoſe of the Greeks and Romans. The ſurrounding plain ſeems to conſiſt entirely of a black ſand intermixed with pieces of ſcoria, which have been formerly thrown out by the volcano. Beyond that plain, which riſes gently, appears a cone, the ſummit of which is the volcanic crater. When viewed from the ſouth ſide, on which they ſtood, this crater ſeems to conſiſt of a number of ſmall hills. Into theſe it was broken by the emiſſion of the boiling torrent in the year 1755. When diſcharged from the crater, theſe waters ſpread towards the right, and at the diſtance of a mile eaſtward fell in a caſcade from a prodigious height.

eſcription
the great
ater.

The violence of the wind beginning now to abate a little, the travellers ſet out for the very ſummit, in order to take a view of the great crater; in which journey (our author ſays) it would be difficult to make people, who have never engaged in ſuch enterpriſes, comprehend all the obſtacles they had to encounter. This cone (the little mountain mentioned by Sir William Hamilton) is compoſed of aſhes, ſand, and pozzolana, thrown up at different times by the volcano. The materials are ſo looſe, that the adventurous traveller ſinks about mid-leg at every ſtep, and is in conſtant terror of being ſwallowed up. At laſt, when the ſummit is reached, the ſulphureous exhalations, which are continually emitted from the pores of the mountain, threaten ſuffocation, and irritate the fauces and lungs in ſuch a manner as to produce a very troubleſome and inceſſant cough. The looſeneſs of the ſoil, which gives way under the feet, obliges the traveller, every now and then, to throw himſelf flat on his belly, that ſo he may be in leſs danger of ſinking. In this poſture our author viewed the wide unfathomable gulf in the middle of the crater; but could diſcover nothing except a cloud of ſmoke, which iſſued from a number of ſmall apertures ſcattered all around, and accompanied with a kind of noiſe. Another and more dreadful ſound, however, iſſues from the bowels of the volcano, and which, according to our author, "ſtrikes the heart with terror, ſo that all the ſtrength of reaſon is neceſſary to prevent the obſerver from flying with precipitation from ſuch a dreadful place." Several travellers who had viſited this cone before him, were ſo terrified by theſe dreadful ſounds, that they fled with the utmoſt haſte till they arrived at the foot of the mountain. Horrid noiſes iſſue from the burning gulf.

Our author compares theſe ſounds to a diſcharge of cannon in the wide abyſs; the noiſe of which is rebellowed throughout all the caverns, and produces a ſound perhaps the moſt alarming that can be imagined; and during the ſhort ſpace in which he liſtened, ſeveral of theſe diſcharges were heard to follow one another almoſt uninterruptedly.

This dreadful noiſe, our author, with very great probability, ſuppoſes to be occaſioned by the exploſions of the internal fire, or, as he calls it, the *focus* of the volcano; which, ſtriking againſt the ſides of theſe immenſe caverns, the ſounds produced are re-echoed through their cavities, and probably multiplied in an extraordinary manner; ſo that what would be only a ſlight exploſion in the open air, occaſions a ſound more tremendous than the loudeſt thunder. To ſuch as are convinced of this, and have ſufficient courage to reſiſt the firſt impreſſions which theſe ſounds muſt unavoidably occaſion, they will in a ſhort time not only appear exceedingly ſublime, but, by their variety, even ſomewhat agreeable. "They enable us (ſays our author) to form ſome conception of the ſpace through which they muſt paſs before they reach the ear, and of the vaſt extent and width of the hollows of the mountain."

Having for ſome time contemplated this awful ſpectacle, our author wiſhed to meaſure the crater by walking round it, but found this impoſſible. On the north ſide the ſurface is hard and ſmooth, the aſhes having been ſo far diſſolved by the moiſture depoſited by the ſmoke as to cement into one uniform maſs. This is ſometimes diſſolved even into a fluid ſtate, in ſuch a Impoſſible to walk round the crater.

Ætna.

manner as to run down the ſides of the cone; ſo that after ſeveral attempts, he was at laſt obliged to abandon his deſign.

Figure of the crater.

Fig. 2. exhibits a view of the crater of Ætna taken on the brink of the eaſt ſide. The fore ground (*aa*) of the figure is one diviſion of the crater. Beyond it are two eminences *b* and *c*, higher than that on which ſome human figures are repreſented. All the three form a triangle nearly equilateral; but, when viewed from any conſiderable diſtance, only two of them can be ſeen; for which reaſon the Sicilians have termed the mountain *bicorne*, or double-horned.

The ſmoke, as repreſented in the figure, iſſues from all quarters, either from chinks or holes ſcattered over the whole crater. But the ſituation of the principal mouth is in the midſt of the three eminences. Its diameter, when our author viſited this mountain, was only about 60 feet, and ſo filled with ſmoke that nothing remarkable could be diſcovered. From the height *d*, the rock ſituated on the left ſide of the print, and on which the human figures are repreſented, all the way to the rock *e* on the right, the diſtance is no more than 900 feet. Our author obſerved, that the cone is not exactly in the middle of the plain, but is ſituated more towards the north than the ſouth. He did not attempt to croſs the central valley *f*, on account of the looſeneſs of the ground, and that there was no object apparently worthy of the riſk he muſt run in ſo doing. At the neareſt view he took, it was only obſerved that there was ſnow lying in ſeveral parts of it, though the heat which otherwiſe prevailed ſeemed to be very intenſe.

The ſmoke which iſſues from the crater of Ætna is generally carried in a direction from ſouth to north; and, as it brings along with it a conſiderable quantity of water, the latter, condenſed by the cold winds, runs down the ſide of the mountain in plentiful ſtreams, and often leaves pretty permanent marks of its courſe.

Eruption of water in 1755 accounted for.

In this manner he accounts for the great eruption of water in 1755, which he ſuppoſes to have been occaſioned only by an unuſual quantity of water falling into the burning focus of the mountain, there rarefied into ſteam, and afterwards condenſed by the coldneſs of the atmoſphere.

South wind generally prevalent on the top of Ætna.

Like other travellers to Mount Ætna, this gentleman found the wind blowing from the ſouth; and he is of opinion, that a ſouth wind blows here more frequently than any other, as he did not obſerve any channels cut by the water on any other ſide than the north. He had ſeveral opportunities of making this obſervation, having frequently viſited the top of Ætna, and always paid attention to the crater. The ſand on the eaſt and weſt ſides was always looſe, while that on the north was compacted into a ſolid body. The three ſummits were of a later date than the reſt of the crater, having been probably thrown up by ſome eruption which had burſt it aſunder. The black ſpots on the fore-ground repreſent a number of hillocks about the ſize of mole-hills from which a ſulphureous vapour conſtantly iſſues, and by which the adjacent ground is tinged of an ochrey colour. This vapour iſſues from the crevices with a kind of hollow whiſtling noiſe; which, with the volcanic thunder, ſmoke, and noxious ſmell, render it very diſagreeable to ſtay here even for a few moments.

The ſmoke is repreſented in the figure preciſely as it appeared on the day that he aſcended, which was very warm. But it does not always riſe in this manner; for when the cold is very intenſe, it collects into a body, and thickens around the edge of the crater: on which occaſion it is condenſed into water, which diffuſes itſelf around the edge of the crater, and mixing with the aſhes converts them into a kind of clay. The cold on the top of this mountain is ſo intenſe, that travellers very often find their clothes inſufficient to protect them; and it is remarkable that ſuch intenſe cold is always produced by a ſouth wind. The day that our author took his draught, the wind blew faintly from the north.

Ætna.

Intenſe cold produced by a ſouth wind.

Account of the ſtrata at the foot of Mount Ætna.

The baſe of Mount Ætna, according to M. Houel's obſervations, conſiſt of alternate layers of lava and marine ſubſtances, which have been depoſited ſucceſſively one upon another. Theſe alternate layers extend to an unknown depth. They muſt needs go as far down as the level of the ſtratum of lava which was diſcharged by the volcano at its firſt origin. The laſt depoſited by the ſea is a range of calcareous mountains of a conſiderable height, and which are placed on a baſis of lava. Beneath that layer of lava is another of ſea pebbles, which are well known to be rounded by their attrition againſt one another by the motion of the waves. This layer is of a conſiderable depth, and lies upon a yelloviſh rock conſiſting of a ſpecies of indurated ſand. The river Simeto flows over this rock, which it has cut away conſiderably. That part which is at preſent the bed of the river is much higher than the baſe of Ætna that is on a level with the ſea; and not the leaſt thing occurs to ſuggeſt an idea of what has been the primary baſe of the volcano. The marine ſubſtances, already taken notice of, lie nearly in a horizontal direction, more or leſs ſo according to the nature of the ſurface on which they have been depoſited.

Great number of ſprings on Mount Ætna.

Ætna abounds very much with ſprings, fountains, and even rivers of conſiderable magnitude. Our author has computed, that if all the water flowing down the ſides of this mountain were collected, it would fill the channel of a river 36 feet broad and 6 in depth. Many of the ſprings afford fine ſalt; ſome are very pure, and others are impregnated with noxious ſubſtances; while others are remarkable for their uſe in dyeing particular colours.

Whence ſuch a large quantity of water is derived.

"It is worthy of notice (ſays our author), that ſtreams of water, ſome of them more copious, others more ſcanty, are ſeen to iſſue at all different degrees of height, from the baſe to the ſummit of the mountain. Even in ſummer, when very little rain falls for three or four months, or when perhaps for that ſpace there is no rain at all, and for three of which, at leaſt, there is not an ounce of ſnow melted; even then a great number of rivulets continue to flow down the ſides of Ætna; and at the ſame time a number of ſtreams, external and ſubterraneous, each of them ſeveral feet wide, are, according to the accounts of the country people, plentifully ſupplied with water.

"As the trifling quantity of ſnow which is melted here even in the midſt of ſummer, and the ſtill ſmaller quantity depoſited by the clouds, would be totally inſufficient to ſupply thoſe ſtreams, and muſt be all abſorbed by the earth for the ſupport of vegetation, thoſe ſtreams muſt proceed from ſome other cauſe, whoſe effects are more copious and permanent.

Fig. 1.

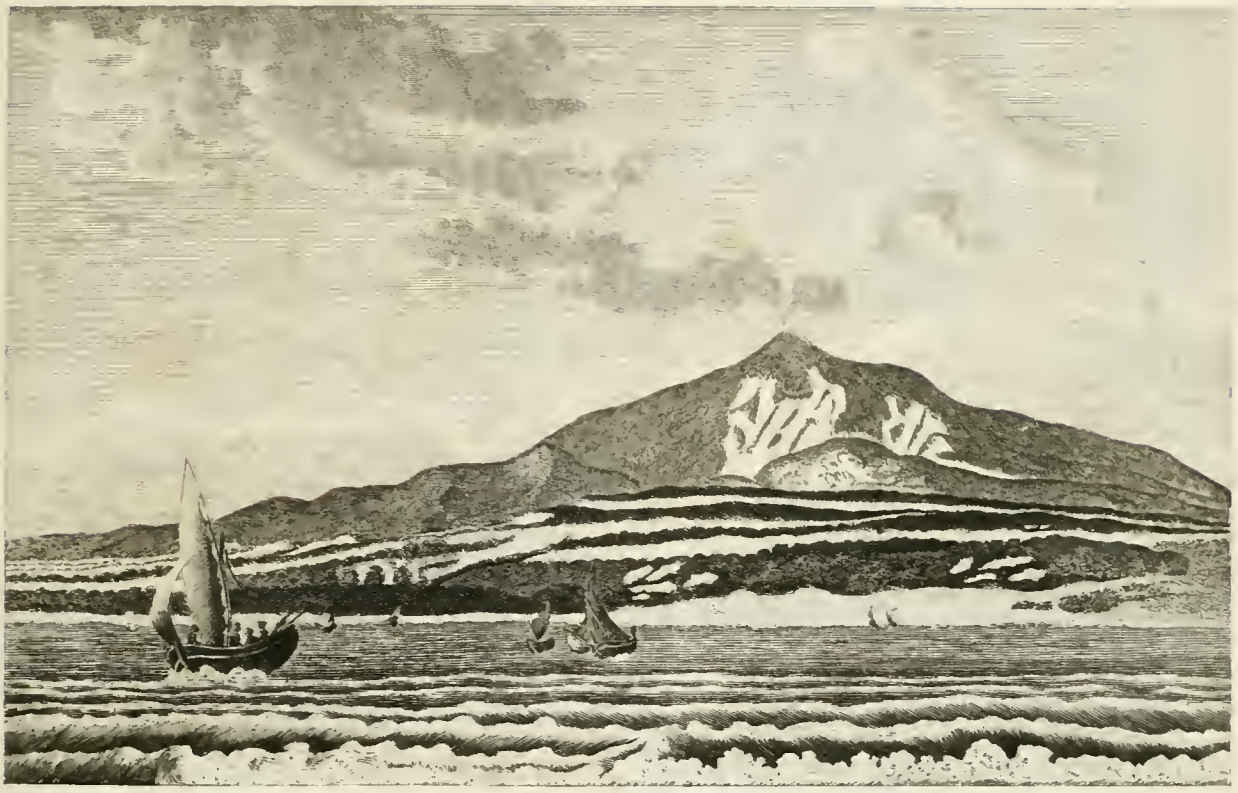

Fig. 2.

J. Hall & Pupil, Hall's sculptor, fecit.

Ætna. Produced by the internal evaporation of the mountain.

nent. This cauſe is the evaporation of thoſe aqueous particles which ariſe from the conſtant ebullition at the bottom of the volcanic focus. Theſe iſſuing out at the great crater, and at innumerable chinks in the ſides of the mountain, are ſoon condenſed by the cold of that elevated region of the atmoſphere, and, percolating through the earth, give birth to thoſe numerous ſtreams in queſtion.

"A volcano, according to my ideas, cannot ſubſiſt without water; nor can water occupy a place in any volcanic focus without being changed into vapour. But before that water can make its appearance, except in the form of ſmoke, it muſt have filled the whole volcanic cavern, and muſt have been forcibly preſſed by the action of the fire againſt its ſides: it muſt next have condenſed, and aſſumed the form of water; in which ſtate it muſt have penetrated through the inclined layers of ſand and pozzolano which intervene betwixt the different ſtrata of lava; for theſe ſtrata lie one above another, and are full of chinks, in ſuch a manner as to preſent to the eye an appearance pretty much reſembling that of the inſide of a tiled roof."

Eruptions of Ætna more frequent anciently than now.

It has been a queſtion, Whether the eruptions of Mount Ætna were more frequent in ancient than in modern times? At firſt it ſeems impoſſible to give a preciſe anſwer to ſuch a queſtion; but when we conſider, that the matter in the volcanic focus was then greater in quantity than at preſent, in proportion to the ſpace which it occupied; that the cavities were then ſooner filled with vapour; and that the centre of the focus was then leſs remote, we will not heſitate to pronounce, that in earlier times the eruptions were more frequent as well as more copious.

Signs of an approaching eruption.

The firſt ſymptom of an approaching eruption is an increaſe of the ſmoke in fair weather: after ſome time, a puff of black ſmoke is frequently ſeen to ſhoot up in the midſt of the white, to a conſiderable height. Theſe puffs are attended with conſiderable exploſions: for while Veſuvius was in this ſtate, Sir William Hamilton went up to its top, which was covered with ſnow: and perceiving a little hillock of ſulphur, about ſix feet high, which had been lately thrown up, and burnt with a blue flame on the top, he was examining this phenomenon, when ſuddenly a violent report was heard, a column of black ſmoke ſhot up with violence, and was followed by a reddiſh flame. Immediately a ſhower of ſtones fell; upon which he thought proper to retire. Phenomena of this kind, in all probability, precede the eruptions of Ætna in a much greater degree.—The ſmoke at length appears wholly black in the daytime, and in the night has the appearance of flame; ſhowers of aſhes are ſent forth, earthquakes are produced, the mountain diſcharges volleys of red-hot ſtones to a great height in the air. The force by which theſe ſtones are projected, as well as their magnitude, ſeems to be in proportion to the bulk of the mountain. Signior Recupero aſſured Mr Brydone, that he had ſeen immenſely large ones thrown perpendicularly upwards to the height of 7000 feet, as he calculated from the time they took to arrive at the earth after beginning to deſcend from their greateſt elevation. The largeſt ſtone, or rather rock, that was ever known to be emitted by Veſuvius, was 12 feet long and 45 in circumference. This was thrown a quarter of a mile; but much larger ones have been thrown out by Mount Ætna, almoſt in the proportion in which the latter exceeds Veſuvius in bulk. Along with theſe terrible ſymptoms, the ſmoke that iſſues from the crater is ſometimes in a highly electrified ſtate. In this caſe, the ſmall aſhes which are continually emitted from the crater, are attracted by the ſmoke, and riſe with it to a great height, forming a vaſt, black, and to appearance denſe, column; from this column continual flaſhes of forked or zig-zag lightning iſſue, ſometimes attended with thunder, and ſometimes not, but equally powerful with ordinary lightning. This phenomenon was obſerved by Sir William Hamilton in the ſmoke of Veſuvius, and has alſo been taken notice of in that of Ætna; and where this electrified ſmoke hath ſpread over a tract of land, much miſchief hath been done by the lightning proceeding from it. Ætna. Thunder and lightning from the ſmoke.

When theſe dreadful appearances have continued ſometimes four or five months, the *lava* begins to make its appearance. This is a ſtream of melted mineral matters, which in Veſuvius commonly boils over the top, but very ſeldom does ſo in Ætna; owing to the great weight of the lava, which long before it can be raiſed to the vaſt height of Mount Ætna, burſts out through ſome weak place in its ſide. Upon the appearance of the lava, the violent eruptions of the mountain generally, though not always, ceaſe; for if this burning matter gets not ſufficient vent, the commotions increaſe to a prodigious degree.—In the night-time the lava appears like a ſtream of fire, accompanied with flame; but in the day-time it has no ſuch appearance: its progreſs is marked by a white ſmoke, which by the reflection of the red-hot matter in the night aſſumes the appearance of flame.

We ſhall cloſe this article with an enumeration of all the different eruptions from Mount Ætna which are found upon record.

List of eruptions from the earlieſt period.

1. The firſt mentioned in hiſtory, is that of which Diodorus Siculus ſpeaks, but without fixing the period at which it happened. That eruption, ſays he, obliged the Sicani, who then inhabited Sicily, to forſake the eaſtern, and retire to the ſouthern, part of the iſland. A long time after that, the Sicilians, a people of Italy, migrated into Sicily, and took up their abode in that part of the iſland which had been left deſert by the Sicani.

2. The ſecond eruption known to have iſſued from this volcano, is the firſt of the three mentioned by Thucydides; of none of which he fixes the date, mentioning only in general, that from the arrival of the firſt Greek colonies that ſettled in Sicily (which was in the 11th Olympiad, and correſponds to the 734th year before the Chriſtian era), to the 88th Olympiad, or the year 425 before Chriſt, Ætna at three different times diſcharged torrents of fire. This ſecond eruption happened, according to Euſebius, in the days of Phalaris, in the 565th year before the Chriſtian era. The aſſertion of Euſebius is confirmed by a letter from that tyrant to the citizens of Catania, and the anſwer of the Catanians (if, after Bentley's Diſſertations againſt their authenticity, any credit be due to the Epiſtles of Phalaris). But Diodorus gives both theſe pieces.

3. The third, which is the ſecond of the three mentioned by Thucydides, happened in the 65th Olympiad,

Ætna piad, in the 477th year before the Chriſtian era, when Xantippus was archon at Athens. It was in this ſame year the Athenians gained their boaſted victory over Xerxes's general Mardonius near Platæa. Both the eruption of the volcano and the victory of the Athenians are commemorated in an ancient inſcription on a marble table which ſtill remains. An ancient medal exhibits a repreſentation of an aſtoniſhing deed to which that eruption gave occaſion. Two heroic youths boldly ventured into the midſt of the flames to ſave their parents. Their names, which well deſerved to be tranſmitted to future ages, were Amphinomus and Anapius. The citizens of Catania rewarded ſo noble a deed with a temple and divine honours. Seneca, Silius Italicus, Valerius Maximus, and other ancient authors, mention the heroiſm of the youths with juſt applauſe.

4. The fourth eruption, the third and laſt of thoſe mentioned by Thucydides, broke out in the 88th Olympiad, in the 425th year before the Chriſtian era. It laid waſte the territory of Catania.

5. The fifth is mentioned by Julius Obſequens and Oroſius, who date it in the conſulſhip of Sergius Fulvius Flaccus and Quintus Calpurnius Piſo, nearly 133 years before the Chriſtian era. It was conſiderable; but no peculiar facts are related concerning it.

6. In the conſulſhip of Lucius Æmilius Lepidus and Lucius Aurelius Oreſtes, in the 125th year before the Chriſtian era, Sicily ſuffered by a violent earthquake. Such a deluge of fire ſtreamed from Ætna as to render the adjoining ſea into which it poured abſolutely hot. Oroſius ſays, that a prodigious quantity of fiſhes were deſtroyed by it. Julius Obſequens relates, that the inhabitants of the iſles of Lipari ate ſuch a number of thoſe fiſhes, as to ſuffer, in conſequence of it, by a diſtemper which proved very generally mortal.

7. Four years after the laſt mentioned, the city of Catania was deſolated by another eruption, not leſs violent. Oroſius relates, that the roofs of the houſes were broken down by the burning aſhes which fell upon them. It was ſo dreadfully ravaged, that the Romans found it neceſſary to grant the inhabitants an exemption from all taxes for the ſpace of ten years, to enable them to repair it.

8. A ſhort time before the death of Cæſar, in the 43d year before Jeſus Chriſt, there was an eruption from Mount Ætna. Livy mentions it. It was not diſtinguiſhed by any thing extraordinary. It was afterwards conſidered as an omen of the death of Cæſar.

9. Suetonius, in the life of Caligula, mentions an eruption from Mount Ætna which happened in the 40th year after the Chriſtian era. The emperor fled on the very night on which it happened, from Meſſina, where he at that time happened to be.

10. Carrera relates, that in the year 253, there was an eruption from Mount Ætna.

11. He ſpeaks of another in the year 420; which is alſo mentioned by Photius.

12. In the reign of Charlemagne, in the year 812, there was an eruption from Ætna. Geoffroy of Viterbo mentions it in his Chronicle.

13. In the year 1169, on the 4th February, about day-break, there was an earthquake in Sicily, which was felt as far as Reggio, on the oppoſite ſide of the ſtrait. Catania was reduced by it to ruins; and in that city more than 15,000 ſouls periſhed. The biſhop, with 44 monks of the order of St Benedict, were buried under the ruins of the roof of the church of St Agatha. Many caſtles in the territories of Catania and Syracuſe were overturned; new rivers burſt forth, and ancient rivers diſappeared. The ridge of the mountain was obſerved to ſink in on the ſide next Taormino. The ſpring of Arethuſa, ſo famous for the purity and ſweetneſs of its waters, then became muddy and brackiſh. The fountain of Ajo, which riſes from the village of Saraceni, ceaſed to flow for two hours; at the end of which the water guſhed out more copiouſly than before. Its waters aſſumed a blood colour, and retained it for about an hour. At Meſſina, the ſea, without any conſiderable agitation, retired a good way within its ordinary limits; but ſoon after returning, it roſe beyond them, advanced to the walls of the city, and entered the ſtreets through the gates. A number of people who had fled to the ſhore for ſafety were ſwallowed up by the waves. Ludovico Aurelio relates, that the vines, corn, and trees of all ſorts, were burnt up, and the fields covered over with ſuch a quantity of ſtones as rendered them unfit for cultivation. Ætna.

14. Twelve years after this, in the year 1181, a dreadful eruption iſſued from Ætna on the eaſt ſide. Streams of fire ran down the declivity of the mountain, and encircled the church of St Stephen, but without burning it.

Nicolas Speciale, who relates, though he did not ſee, this event, was witneſs to another conflagration on Ætna 48 years after this, in the year 1329, on the 23d of June, of which he has given a deſcription.

15. On that day, ſays he, about the hour of veſpers, Ætna was ſtrongly convulſed, and uttered dreadful noiſes; not only the inhabitants of the mountain, but all Sicily, were ſtruck with conſternation and alarm. On a ſudden, a terrible blaze of fire iſſued from the ſouthern ſummit, and ſpread over the rocks of Mazarra, which are always covered with ſnow. Together with the fire, there appeared a great deal of ſmoke. After ſunſet, the flames and the ſtones that iſſued out with them were ſeen to touch the clouds. The fire making way for itſelf with the moſt furious impetuoſity, burnt up or reduced to ruins all thoſe ſtructures which the piety of former times had conſecrated to the Deity. The earth yawning, ſwallowed up a great many ſprings and rivulets. Many of the rocks on the ſhore of Maſcali were ſhaken and daſhed into the ſea. A ſucceſſion of theſe calamities continued till the 15th of July, when the bowels of Ætna were again heard to rebellow. The conflagration of Mazarra ſtill went on unextinguiſhed. The earth opened near the church of St John, called *Il Paparineeca;* on the ſouth ſide fire iſſued from the gap with great violence: to add to the horrors of the day, the ſun was obſcured from morning to evening with clouds of ſmoke and aſhes, as entirely as in an eclipſe. Nicolas Speciale went towards the new-opened crater, to obſerve the fire and the burning ſtones which were iſſuing from the volcano. The earth rebellowed and tottered under his feet; and he ſaw red-hot ſtones iſſue four times ſucceſſively in a very ſhort ſpace from the crater, with a thundering noiſe, the like of which, he ſays, he had never before heard.

In

Ætna. In a few days after this, all the adjacent fields were burnt up by a ſhower of fire and ſulphureous aſhes; and both birds and quadrupeds being thus left deſtitute of food, died in great numbers. A great quantity of fiſhes likewiſe died in the rivers and the contiguous parts of the ſea. "I cannot think (ſays he) that either Babylon or Sodom was deſtroyed with ſuch awful ſeverity."—The north winds, which blew at the time, carried the aſhes as far as Malta. Many perſons of both ſexes died of terror.

16. Scarce had four years elapſed after this terrible event, when Ætna made a new exploſion, and diſcharged vollies of ſtones, cauſing the neighbouring fields to tremble. This happened in the year 1333.

17. Forty-eight years after this, on the 25th of Auguſt 1381, an eruption from Ætna ſpread its ravages over the confines of the territory of Catania, and burnt up the olive yards in the neighbourhood of that city.

18. In the year 1444, 63 years after the laſt eruption, a torrent of lava iſſued from Ætna and ran towards Catania. The mountain ſhook; and the ſhocks were ſo violent, that ſeveral huge maſſes of rock were broken from its ſummit, and hurled into the abyſs with a tremendous noiſe.

19. After this Ætna was ſcarce at reſt for 18 months or two years. On Sunday the 25th of September 1446, about an hour after ſunſet, an eruption iſſued from the place called *La Pietra di Mazarra*. This eruption was ſoon over.

20. On the following year, 1447, on the 21ſt of September, there was another, with a good deal of fire; but this eruption was likewiſe of ſhort duration.

21. Ætna now ceaſed to emit fire, and that for a conſiderable time. The neighbouring inhabitants not only aſcended to the ſummit of the mountain, but even, if we may credit accounts, went down into the fiery gulf, and believed the volcanic matter to be now exhauſted: But on the 25th of April 1536, near a century from the ſlight eruption in 1447, a ſtrong wind aroſe from the weſt, and a thick cloud, reddiſh in the middle, appeared over the ſummit of the mountain. At the very ſame inſtant a large body of fire iſſued from the abyſs, and fell with the noiſe and rapidity of a torrent along the eaſtern ſide of the mountain, breaking down the rocks, and deſtroying the flocks and every other animal that was expoſed to its fury. From the ſame crater, on the ſummit of the mountain, there iſſued at the ſame time a ſtream of fire more terrible than the other, and held its courſe towards the weſt. It ran over Bronte, Adrans, and Caſtelli. It conſiſted entirely of ſulphur and bitumen. On the ſame day the church of St Leon, which ſtood in a wood, was firſt demoliſhed by the ſhocks of the earthquake, and its ruins after that conſumed by the fire. Many chaſms were opened in the ſides of the mountain; and from thoſe iſſued fire and burning ſtones, which darted up into the air with a noiſe like that produced by a ſmart diſcharge of artillery. Francis Negro de Piazza, a celebrated phyſician, who lived at Lentini, wiſhing to have a nearer view of the eruptions, and to make ſome obſervations which he thought might be of conſequence, was carried off and burnt to aſhes by a volley of the burning ſtones. This conflagration of Ætna laſted ſome weeks. Ætna.

22. In leſs than a year, on the 17th of April 1537, the river Simeto ſwelled ſo amazingly as to overflow the adjacent plains, and carry off the country people and their cattle and other animals. At the ſame time, the country around Paterno, the neighbouring caſtles, and more than 500 houſes, were deſtroyed by the ravages of the river; and moſt of the wood was torn up by the roots by violent blaſts of wind. Theſe ravages of the elements were occaſioned by Ætna, which on the 11th of the following month was rent in ſeveral places, diſcloſing fiery gulfs, and pouring out a deluge of fire in more terrible torrents than thoſe of the preceding year. They directed their courſe towards the monaſtery of St Nicholas d'Arena; deſtroyed the gardens and vineyards; and proceeding onwards towards Nicoloſi, burnt Montpellieri and Fallica, and deſtroyed the vineyards and moſt of the inhabitants. When the conflagration ceaſed, the ſummit of the mountain ſunk inwards with ſuch a noiſe, that all the people in the iſland believed the laſt day to be arrived, and prepared for their end by extreme unction. Theſe dreadful diſturbances continued through the whole year, more eſpecially in the months of July and Auguſt, during which all Sicily was in mourning. The ſmoke, the noiſe, and the ſhocks of the earthquake, affected the whole iſland; and if Filotes may be believed, who relates this event, many of the Sicilians were ſtruck deaf by the noiſe. Many ſtructures were demoliſhed; and among others the caſtle of Corleone, though more than 25 leagues diſtant from the volcano.

23. During the ſucceeding 30 years there was no diſturbance of this nature. At the end of that ſpace, Sicily was alarmed by a new eruption from the mountain. Ætna diſcharged new ſtreams of fire, and covered the adjacent country with volcanic aſhes, which entirely ruined the hopes of the huſbandman.

24. In the year 1579, Ætna renewed its ravages; but no particular account of the damage which it did upon this occaſion has been tranſmitted to us.

25. Twenty-five years had elapſed, when Ætna, in the month of June 1603, flamed with new fury. Peter Carrera affirms, that it continued to emit flames for the ſpace of 33 years, till 1636, without interruption, but not always with the ſame violence. In 1607, the ſtreams of lava which flowed from it deſtroyed the woods and vineyards on the weſt ſide of the mountain. In 1609, they turned their courſe towards Aderno, and deſtroyed a part of the foreſt del Pino, and a part of the wood called *la Sciambrita*, with many vineyards in the diſtrict Coſterna. Theſe torrents of lava continued to flow for three months. In the year 1614, a new effort of the ſubterraneous fire opened another crater, from which fire was diſcharged on Randazzo, in the diſtrict called *il Piro*. The fire continued to flame for 10 or 12 years longer.

26. The ſame Peter Carrera relates, that a dreadful conflagration happened in the year 1664, of which he himſelf was witneſs. It happened on the 13th of December, and laſted without interruption, but with different degrees of violence, till the end of May 1678. But in 1669 the inhabitants of Nicoloſi were obliged

to

Ætna. to forſake their houſes, which tumbled down ſoon after they left them. The crater on the ſummit of Ætna had not at this time a threatening aſpect, and every thing there continued quiet till the 25th of March: but on the 8th of that month, an hour before night, the air was obſerved to become dark over the village la Pedara and all that neighbourhood; and the inhabitants of that country thought that an almoſt total eclipſe was taking place. Soon after ſunſet, frequent ſhocks of earthquakes began to be felt; theſe were at firſt weak, but continued till day-break to become more and more terrible. Nicoloſi was more affected than any other tract of country on that ſide of Ætna; about noon every houſe was thrown to the ground; and the inhabitants fled in conſternation, invoking the protection of heaven. On the 10th of March a chaſm ſeveral miles in length, and five or ſix feet wide, opened in the ſide of the mountain; from which, about two hours before day, there aroſe a bright light, and a very ſtrong ſulphureous exhalation was diffuſed through the atmoſphere.

About 11 in the forenoon of the ſame day, after dreadful ſhocks of earthquake, a crater was opened in the hill called *des Noiſettes*, from which there iſſued huge volumes of ſmoke, not accompanied with fire, aſhes, or ſtones, but with loud and frequent claps of thunder, diſplaying all the different phenomena with which thunder is at different times attended. And what was very remarkable, the chaſm was formed on the ſouth ſide, between the top and the bottom of the mountain. On the ſame day another chaſm was formed two miles lower, from which iſſued a great deal of ſmoke, accompanied with a dreadful noiſe and earthquake. Towards the evening of the ſame day, four other chaſms were opened towards the ſouth, in the ſame direction, accompanied during their formation with the ſame phenomena, and extending all the way to the hill called *la Puſara*.

About 12 paces beyond that, another of the ſame kind was formed. On the ſucceeding night, a black ſmoke, involving a quantity of ſtones, iſſued from this laſt chaſm; it diſcharged at the ſame time flakes of a dark earth-coloured ſpongy matter, which became hard after they fell. There iſſued from the ſame gulf a ſtream of lava, which held its courſe into a lake called *la Hardia*, ſix miles from Montpellieri, and on its way thither deſtroyed many dwelling-houſes and other buildings in the neighbouring villages.

On the next day, March 12th, this ſtream of fire directed its courſe towards the tract of country called *Malpaſſo*, which was inhabited by 800 people: in the ſpace of 20 hours it was entirely depopulated and laid waſte. The lava then took a new direction, in which it deſtroyed ſome other villages.

The mount of Montpellieri was next deſtroyed with all the inhabitants upon it.

On the 23d of the ſame month the ſtream of fire was in ſome places two miles broad. It now attacked the large village of Mazzalucia; and on the ſame day a vaſt gulf was formed, from which were diſcharged ſand or aſhes, which produced a hill with two ſummits, two miles in circumference and 150 paces high. It was obſerved to conſiſt of yellow, white, black, gray, red, and green ſtones.

The new mount of Nicoloſi continued to emit aſhes for the ſpace of three months; and the quantity diſcharged was ſo great as to cover all the adjoining tract of country for the ſpace of 15 miles: ſome of theſe aſhes were conveyed by the winds as far as Meſſina and Calabria; and a north wind ariſing, covered all the ſouthern country about Agoſta, Lentini, and even beyond that, in the ſame manner. Ætna.

While at that height on Nicoloſi ſo many extraordinary appearances were paſſing, the higheſt crater on the ſummit of Ætna ſtill preſerved its uſual tranquillity.

On the 25th of March, about one in the morning, the whole mountain, even to the moſt elevated peak, was agitated by a moſt violent earthquake. The higheſt crater of Ætna, which was one of the loftieſt parts of the mountain, then ſunk into the volcanic focus; and in the place which it had occupied, there now appeared nothing but a wide gulf more than a mile in extent, from which there iſſued enormous maſſes of ſmoke, aſhes, and ſtones. At that period, according to the hiſtorian of this event, the famous block of lava on Mount Frumento was diſcharged from the volcanic focus.

In a ſhort time after, the torrent of fire, which ſtill continued to flow, directed its courſe towards Catania with redoubled noiſe, and accompanied with a much greater quantity of aſhes and burning ſtones than before. For ſeveral months many moſt alarming ſhocks of earthquakes was felt; and the city was threatened with deſtruction by the torrent of fire. In vain they attempted to turn or divert its courſe; the lava roſe over the walls, and entered by an angle near the Benedictine convent on the 11th of June following. This awful event is related by Francis Monaco, Charles Mancius, Vincent Auria, and Thomas Thedeſchi.

Lord Winchelſea's account of the eruption in 1669.

A deſcription of the lava iſſuing from Mount Ætna in 1669 was ſent to the court of England by Lord Winchelſea, who at that time happened to be at Catania in his way home from an embaſſy at Conſtantinople. Sir W. Hamilton gives the following extract of it. "When it was night, I went upon two towers in divers places; and I could plainly ſee, at ten miles diſtance, as we judged, the fire begin to run from the mountain in a direct line, the flame to aſcend as high and as big as one of the greateſt ſteeples in your Majeſty's kingdoms, and to throw up great ſtones into the air; I could diſcern the river of fire to deſcend the mountain of a terrible fiery or red colour, and ſtones of a paler red to ſwim thereon, and to be ſome as big as an ordinary table. We could ſee this fire to move in ſeveral other places, and all the country covered with fire, aſcending with great flames in many places, ſmoking like to a violent furnace of iron melted, making a noiſe with the great pieces that fell, eſpecially thoſe that fell into the ſea. A cavalier of Malta, who lives there, and attended me, told me, that the river was as liquid, where it iſſues out of the mountain, as water, and came out like a torrent with great violence, and is five or ſix fathom deep, and as broad, and that no ſtones ſink therein."

The account given in the Philoſophical Tranſactions is to the ſame purpoſe. We are there told, that the lava is "nothing elſe than diverſe kinds of metals and minerals, rendered liquid by the fierceneſs of the fire in the bowels of the earth, boiling up and guſhing forth

Ætna. forth as the water doth at the head of ſome great river; and having run in a full body for a ſtone's caſt or more, began to cruſt or curdle, becoming, when cold, thoſe hard porous ſtones which the people call *ſciarri*. Theſe, though cold in compariſon of what firſt iſſues from the mountain, yet retained ſo much heat as to reſemble huge cakes of ſea-coal ſtrongly ignited, and came tumbling over one another, bearing down or burning whatever was in their way.—In this manner the lava proceeded ſlowly on till it came to the ſea, when a moſt extraordinary conflict enſued betwixt the two adverſe elements. The noiſe was vaſtly more dreadful than the loudeſt thunder, being heard through the whole country to an immenſe diſtance; the water ſeemed to retire and diminiſh before the lava, while clouds of vapour darkened the ſun. The whole fiſh on the coaſt were deſtroyed, the colour of the ſea itſelf was changed, and the tranſparency of its waters loſt for many months.

While this lava was iſſuing in ſuch prodigious quantity, the merchants, whoſe account is recorded in the Philoſophical Tranſactions, attempted to go up to the mouth itſelf; but durſt not come nearer than a furlong, leſt they ſhould have been overwhelmed by a vaſt pillar of aſhes, which to their apprehenſion exceeded twice the bigneſs of St Paul's ſteeple in London, and went up into the air to a far greater height; at the mouth itſelf was a continual noiſe, like the beating of great waves of the ſea againſt rocks, or like diſtant thunder, which ſometimes was ſo violent as to be heard 60, or even 100 miles off; to which diſtance alſo part of the aſhes was carried. Some time after, having gone up, they found the mouth from whence this terrible deluge iſſued to be only a hole about 10 feet diameter. This is alſo confirmed by Mr Brydone; and is probably the ſame through which Sir William Hamilton deſcended into the ſubterranean caverns already mentioned.

27. Some years after this conflagration, a new burning gulf opened in the month of December 1682 on the ſummit of the mountain, and ſpread its lava over the hill of Mazarra.

28. On the 24th of May 1686, about ten in the evening, a new eruption burſt out from the ſummit of the mountain, on the ſide contiguous to the hill del Bue. Such a quantity of inflamed matter was thrown out as conſumed woods, vineyards, and crops of grain, for four leagues round. It ſtopped its courſe in a large valley near the caſtle of Maſcali. Several people from the neighbourhood had aſcended a hill between the wood of Catania and the confines of Cirrita, to obſerve the progreſs of the lava: but the hill, on a ſudden, ſunk inwards, and they were buried alive.

29. Ætna was now long quiet; for no leſs a ſpace of time indeed than one half of the preſent age. In the year 1755 its eruptions were renewed. It opened near Mount Lepra, and emitted as uſual fire and ſmoke; after which it remained quiet only for eight years.

30. In the year 1763, there was an eruption which continued three months, but with intervals. Ætna was at firſt heard to rebellow. Flames and clouds of ſmoke were ſeen to iſſue out, ſometimes ſilver coloured, and at other times, when the rays of the ſun fell upon them, of a purple radiance: at length they were carried off by the winds, and rained, as they were driven before them, a ſhower of fire all the way to Catania and beyond it. An eruption ſoon burſt out; the principal torrent divided into two branches, one of which ran towards the eaſt, and fell into a deep and extenſive valley. Ætna.

The flames which iſſued from this new crater afforded a noble ſpectacle. A pyramid of fire was ſeen to riſe to a prodigious height in the air, like a beautiful artificial fire-work, with a conſtant and formidable battery, which ſhook the earth under thoſe who were ſpectators of the ſcene. Torrents of melted matter running down the ſides of the mountain, diffuſed a light bright as day through the darkneſs of night.

At ſunriſing the burning lava was obſerved to have run round ſome oaks that were ſtill ſtanding unburnt. Their leaves were all withered. Some birds had fallen from their branches, and been burnt to death. Some people caſt wood upon the lava, and it was immediately burnt. This lava continued hot, and exhaled ſmoke for two years. For five years after this, no ſnow appeared on the ſummit of Ætna.

31. In the year 1764 a new crater was opened at a great diſtance from Mount Ætna.

32. In the year 1766 another was opened at the grotto of Paterno: fire, ſmoke, and an inconſiderable torrent of lava iſſued out of it.

33. On the 27th of January 1780 a new opening was formed two miles under the laſt-mentioned crater. On the 28th of February, and the 14th of March, the earthquake was renewed on the north ſide, and accompanied with terrible noiſes.

Between the 6th of April and the 7th of May the convulſions were again renewed, accompanied with noiſe as before; a quantity of pumice ſtones and fine ſand was diſcharged from it.

On the 18th of May the ſhocks were renewed: on the 23d a new crater was formed on the ſide of Mount Frumento on the ſummit of Ætna: and from it a torrent of lava diſcharged, which ſpread through the valley of Laudunza. It was 200 paces in breadth. Two other chinks were opened in the mountain near Paterno, and very near one another. The lava iſſuing from them proceeded, in the ſpace of ſeven days, ſix miles; on the 25th it had run nine miles.

A new crater was likewiſe opened on the 25th; from which a quantity of red-hot ſtones continued to iſſue for half an hour, and fell at a very great diſtance: there proceeded likewiſe from it a ſtream of lava; which, in the ſame ſpace of time, ran over a tract of country two miles in extent.

Several parts of thoſe ſtreams of lava were obſerved to be cool on the ſurface, and formed into ſolid maſſes, but melted again by a new ſtream of burning lava, which however did not melt the old lava.

34. The laſt eruption happened in 1787. From the 1ſt to the 10th of July, there were ſigns of its approach. On the 11th, after a little calm, there was a ſubterraneous noiſe, like the ſound of a drum in a cloſe place, and it was followed by a copious burſt of black ſmoke. It was then calm till the 15th, when the ſame prognoſtics recurred. On the 17th, the ſubterraneous noiſe was heard again: the ſmoke was more abundant, ſlight ſhocks of an earthquake followed, and the lava flowed from behind one of the two little mountains which form Account of the late eruption. 1787.

Ætna. the double head of Ætna. On the 18th, while the ſpectators were in anxious expectation of a more ſevere eruption, all was quiet, and continued ſo more than 12 hours: ſoon after they perceived ſome new ſhocks, accompanied with much noiſe; and the mountain threw out a thick ſmoke, which, as the wind was weſterly, ſoon darkened the eaſtern horizon: two hours afterwards a ſhower of fine black brilliant ſand deſcended: on the eaſt ſide it was a ſtorm of ſtones; and, at the foot of the mountain, a deluge of flaſhes of fire, of ſcoria and lava.

Theſe appearances continued the whole day: at the ſetting of the ſun the ſcene changed. A number of conical flames roſe from the volcano; one on the north, another on the ſouth, were very conſpicuous, and roſe and fell alternately. At three in the morning, the mountain appeared cleft, and the ſummit ſeemed a burning maſs. The cones of light which aroſe from the crater were of an immenſe extent, particularly the two juſt mentioned. The two heads ſeemed to be cut away: and at their ſeparation was a cone of flame, ſeemingly compoſed of many leſſer cones. The flame ſeemed of the height of the mountain placed on the mountain; ſo that it was probably two miles high, on a baſe of a mile and a half in diameter. This cone was ſtill covered with a very thick ſmoke, in which there appeared very brilliant flaſhes of lightning, a phenomenon which Ætna had not before afforded. At times, ſounds like thoſe from the exploſion of a large cannon were heard ſeemingly at a leſs diſtance than the mountain. From the cone, as from a fountain, a jet of many flaming volcanic matters was thrown, which were carried to the diſtance of ſix or ſeven miles: from the baſe of the cone a thick ſmoke aroſe, which, for a moment, obſcured ſome parts of the flame, at the time when the rivers of lava broke out. This beautiful appearance continued three quarters of an hour. It began the next night with more force; but continued only half an hour. In the intervals, however, Ætna continued to throw out flames, ſmoke, ignited ſtones, and ſhowers of ſand. From the 20th to the 22d, the appearances gradually ceaſed. The ſtream of lava was carried towards Bronte and the plain of Lago.

After the eruption, the top of the mountain on the weſtern ſide was found covered with hardened lava, ſcoria, and ſtones. The travellers were annoyed by ſmoke, by ſhowers of ſand, mephitic vapours, and exceſſive heat. They ſaw that the lava which came from the weſtern point divided into two branches, one of which was directed towards Libeccio; the other, as we have already ſaid, towards the plain of Lago. The lava on the weſtern head of the mountain, had from its various ſhapes been evidently in a ſtate of fuſion; from one of the ſpiracula, the odour was ſtrongly that of liver of ſulphur. The thermometer, in deſcending, was at 40 degrees of Fahrenheit's ſcale; while near the lava, in the plain of Lago, it was 140 degrees. The lava extended two miles; its width was from 13½ to 21 feet, and its depth 13¼ feet.

Theſe are the moſt remarkable circumſtances we have been able to collect, that might ſerve to give an adequate idea of this famous mountain. Many things, however, concerning the extent, antiquity, &c. of the lavas, remain to be diſcuſſed, as well as the opinions of philoſophers concerning the origin of the internal fire which produces ſo much miſchief: but the conſideration of theſe belongs to the general article VOLCANO, to which the reader is referred. Ætolarcha Ætolia

ÆTNA ſalt, *Sal Ætnæ*, a name given by ſome authors to the ſal ammoniac which is found on the ſurface and ſides of the openings of Ætna, and other burning mountains, after their eruptions; and ſometimes on the ſurface of the ferruginous matter which they throw out. This ſalt makes a very various appearance in many caſes: it is ſometimes found in large and thick cakes; ſometimes only in form of a thin powder, ſcattered over the ſurface of the earth and ſtones. Some of this ſalt is yellow, ſome white, and ſome greeniſh.

ÆTOLARCHA, in Grecian antiquity, the principal magiſtrate or governor of the Ætolians.

ÆTOLIA, a country of ancient Greece, comprehending all that tract now called the *Deſpotat*, or *Little Greece*. It was parted on the eaſt by the river Evenus, now the Fidari, from the Locrenſes Ozolæ; on the weſt, from Acarnania, by the Achelous: on the north, it bordered on the country of the Dorians and part of Epirus; and, on the ſouth, extended to the bay of Corinth.

The Ætolians were a reſtleſs and turbulent people; ſeldom at peace among themſelves, and ever at war with their neighbours; utter ſtrangers to all ſenſe of friendſhip or principles of honour; ready to betray their friends upon the leaſt proſpect of reaping any advantage from their treachery: in ſhort, they were looked upon by the other ſtates of Greece no otherwiſe than as outlaws and public robbers. On the other hand, they were bold and enterpriſing in war; inured to labour and hardſhips; undaunted in the greateſt dangers; jealous defenders of their liberties, for which they were, on all occaſions, willing to venture their lives, and ſacrifice all that was moſt dear to them. They diſtinguiſhed themſelves above all the other nations of Greece, in oppoſing the ambitious deſigns of the Macedonian princes; who, after having reduced moſt of the other ſtates, were forced to grant them a peace upon very honourable terms. The conſtitution of the Ætolian republic was copied from that of the Achæans, and with a view to form, as it were, a counter alliance; for the Ætolians bore an irreconcileable hatred to the Achæans, and had conceived no ſmall jealouſy at the growing power of that ſtate. The Cleomenic war, and that of the allies, called the *ſocial war*, were kindled by the Ætolians in the heart of Peloponneſus, with no other view but to humble their antagoniſts the Achæans. In the latter, they held out, with the aſſiſtance only of the Eleans and Lacedemonians for the ſpace of three years, againſt the united forces of Achaia and Macedon; but were obliged at laſt to purchaſe a peace, by yielding up to Philip all Acarnania. As they parted with this province much againſt their will, they watched all opportunities of wreſting it again out of the Macedonian's hand; for which reaſon they entered into an alliance with Rome againſt him, and proved of great ſervice to the Romans in their war with him; but growing inſolent upon account of their ſervices, they made war upon the Romans themſelves. By that warlike nation they were overcome, and granted a peace on the following ſevere terms: 1. The majeſty of the Roman people

Ætolia. people shall be revered in all Ætolia. 2. Ætolia shall not suffer the armies of such as are at war with Rome to pass through her territories, and the enemies of Rome shall be likewise the enemies of Ætolia. 3. She shall, in the space of 100 days, put into the hands of the magistrates of Corcyra all the prisoners and deserters she has, whether of the Romans or their allies, except such as have been taken twice, or during her alliance with Rome. 4. The Ætolians shall pay down in ready money, to the Roman general in Ætolia, 200 Euboic talents, of the same value as the Athenian talents, and engage to pay 50 talents more within the six years following. 5. They shall put into the hands of the consul 40 such hostages as he shall choose; none of whom shall be under 12, or above 40 years of age: the prætor, the general of the horse, and such as have been already hostages at Rome, are excepted out of this number. 6. Ætolia shall renounce all pretensions to the cities and territories which the Romans have conquered, though these cities and territories had formerly belonged to the Ætolians. 7. The city of Oenis, and its district, shall be subject to the Acarnanians.

After the conquest of Macedon by Æmilius Paulus, they were reduced to a much worse condition; for not only those among them who had openly declared for Perseus, but such as were only suspected to have favoured him in their hearts, were sent to Rome, in order to clear themselves before the senate. There they were detained, and never afterwards suffered to return into their native country. Five hundred and fifty of the chief men of the nation were barbarously assassinated by the partisans of Rome, for no other crime but that of being suspected to wish well to Perseus. The Ætolians appeared before Æmilius Paulus in mourning habits, and made loud complaints of such inhuman treatment; but could obtain no redress: nay, ten commissioners, who had been sent by the senate to settle the affairs of Greece, enacted a decree, declaring that those who were killed had suffered justly, since it appeared to them that they had favoured the Macedonian party. From this time those only were raised to the chief honours and employments in the Ætolian republic who were known to prefer the interest of Rome to that of their country; and as these alone were countenanced at Rome, all the magistrates of Ætolia were the creatures and mere tools of the Roman senate. In this state of servile subjection they continued till the destruction of Corinth, and the dissolution of the Achæan league; when Ætolia, with the other free states of Greece, was reduced to a Roman province, commonly called the *province of Achaia*. Nevertheless, each state and city was governed by its own laws, under the superintendency of the prætor whom Rome sent annually into Achaia. The whole nation paid a certain tribute, and the rich were forbidden to possess lands anywhere but in their own country.

In this state, with little alteration, Ætolia continued under the emperors, till the reign of Constantine the Great, who, in his new partition of the provinces of the empire, divided the western parts of Greece from the rest, calling them *New Epirus*, and subjecting the whole country to the *præfectus prætorii* for Illyricum. Under the successors of Constantine, Greece was parcelled out into several principalities, especially after the taking of Constantinople by the Western princes. At that time, Theodorus Angelus, a noble Grecian, of the imperial family, seized on Ætolia and Epirus. The former he left to Michael his son, who maintained it against Michael Palæologus, the first emperor of the Greeks, after the expulsion of the Latins. Charles, the last prince of this family, dying in 1430 without lawful issue, bequeathed Ætolia to his brother's son, named also *Charles*; and Acarnania to his natural sons Memmon, Turnus, and Hercules. But, great disputes arising about this division, Amurath II. after the reduction of Thessalonica, laid hold of so favourable an opportunity, and drove them all out in 1432. The Mahometans were afterwards dispossessed of this country by the famous prince of Epirus, George Castriot, commonly called *Scanderbeg*; who, with a small army, opposed the whole power of the Ottoman empire, and defeated these barbarians in 22 pitched battles. That hero, at his death, left great part of Ætolia to the Venetians; but, they not being able to make head against such a mighty power, the whole country was soon reduced by Mahammed II. whose successors hold it to this day.

AFER, Domitius, a famous orator, born at Nismes, flourished under Tiberius, and the three succeeding emperors. Quintilian makes frequent mention of him, and commends his pleadings. But he disgraced his talents, by turning informer against some of the most distinguished personages in Rome. Quintilian, in his youth, cultivated the friendship of Domitius very assiduously. He tells us that his pleadings abounded with pleasant stories, and that there were public collections of his witty sayings, some of which he quotes. He also mentions two books of his "*On Witnesses*." Domitius was once in great danger from an inscription he put upon a statue erected by him in honour of Caligula, wherein he declared that this prince was a second time consul at the age of 27. This he intended as an encomium, but Caligula taking it as a sarcasm upon his youth, and his infringement of the laws, raised a process against him, and pleaded himself in person. Domitius, instead of making a defence, repeated part of the emperor's speech with the highest marks of admiration; after which he fell upon his knees, and, begging pardon, declared, that he dreaded more the eloquence of Caligula than his imperial power. This piece of flattery succeeded so well, that the emperor not only pardoned, but also raised him to the consulship. Afer died in the reign of Nero, A. D. 59.

AFFA, a weight used on the Gold Coast of Guinea. It is equal to an ounce, and the half of it is called *eggeba*. Most of the blacks on the Gold Coast give these names to these weights.

AFFECTION, in a general sense, implies an attribute inseparable from its subject. Thus magnitude, figure, weight, &c. are affections of all bodies; and love, fear, hatred, &c. are affections of the mind.

Affection. Affection, signifying *a settled bent of mind towards a particular being or thing*, occupies a middle space between *disposition* on the one hand, and *passion* on the other *. It is distinguishable from Disposition, which being a branch of one's nature, originally, must exist before there can be an opportunity to exert it upon any particular object; whereas Affection can never be original,

* See *Disposition* and *Passion*.

Afferers
Affinity

ginal, because, having a special relation to a particular object, it cannot exist till the object have once at least been presented. It is also distinguishable from Passion, which, depending on the real or ideal presence of its object, vanishes with it: whereas Affection is a lasting connection; and, like other connections, subsists even when we do not think of the person. A familiar example will illustrate this. There may be in one person's mind a disposition to gratitude, which, through want of an object, happens never to be exerted; and which therefore is never discovered even by the person himself. Another, who has the same disposition, meets with a kindly office that makes him grateful to his benefactor: An intimate connection is formed between them, termed *affection*; which, like other connections, has a permanent existence, though not always in view. The affection, for the most part, lies dormant, till an opportunity offer for exerting it: in that circumstance, it is converted into the passion of gratitude; and the opportunity is eagerly seized of testifying gratitude in the warmest manner.

AFFECTION, among *Physicians*, signifies the same as disease. Thus the hysteric *affection* is the same with the hysteric disease.

AFFERERS, or AFFERORS, in *Law*, persons appointed in courts-leet, courts baron, &c. to settle, upon oath, the fines to be imposed upon those who have been guilty of faults arbitrarily punishable.

AFFETTUOSO, or *Con Affetto*, in the *Italian Music*, intimates that the part to which it is added ought to be played in a tender moving way, and consequently rather slow than fast.

AFFIANCE, in *Law*, denotes the mutual plighting of troth between a man and woman to marry each other.

AFFIDAVIT, signifies an oath in writing, sworn before some person who is authorized to take the same.

AFFINITY, among *Civilians*, implies a relation contracted by marriage; in contradistinction to consanguinity, or relation by blood.—Affinity does not found any real kinship; it is no more than a kind of fiction, introduced on account of the close relation between husband and wife. It is even said to cease when the cause of it ceases: hence a woman who is not capable of being a witness for her husband's brother during his lifetime, is allowed for a witness when a widow, by reason the affinity is dissolved. Yet with regard to the contracting marriage, affinity is not dissolved by death, though it be in every thing else.

There are several degrees of affinity, wherein marriage was prohibited by the law of Moses: thus, the son could not marry his mother, nor his father's wife (Lev. xviii. 7. et seq.): the brother could not marry his sister, whether she were so by the father only or by the mother only, and much less if she was his sister both by the same father and mother: the grandfather could not marry his grand-daughter, either by his son or daughter. No one could marry the daughter of his father's wife, nor the sister of his father or mother; nor the uncle his niece; nor the aunt her nephew; nor the nephew the wife of his uncle by the father's side. The father-in law could not marry his daughter-in-law; nor the brother the wife of his brother, while living; nor even after the death of his brother, if he left children. If he left not children, the surviving brother was to raise up children to his deceased brother, by marrying his widow. It was forbidden to marry the mother and the daughter at one time, or the daughter of the mother's son, or the daughter of her daughter, or two sisters together. It it true the patriarchs before the law married their sisters, as Abraham married Sarah, who was his father's daughter by another mother; and two sisters together, as Jacob married Rachel and Leah; and their own sisters by both father and mother, as Seth and Cain. But these cases are not to be proposed as examples: because in some they were authorized by necessity, in others by custom; and the law as yet was not in being. If some other examples may be found, either before or since the law, the Scripture expressly disapproves of them, as Reuben's incest with Bilhah his father's concubine, and the action of Amnon with his sister Tamar; and that of Herod-Antipas, who married Herodias his sister-in-law, his brother Philip's wife, while her husband was yet living. Affinity

AFFINITY is also used to denote conformity or agreement: Thus we say, the *affinity* of languages, the *affinity* of words, the *affinity* of sounds, &c.

AFFINITY, in *Chemistry*, is a term employed to express that peculiar propensity which the particles of matter have to unite and combine with each other exclusively, or in preference to any other connection.

The attractions between bodies at insensible distances, and which of course are confined to the particles of matter, have been distinguished by the name of *affinity*, while the term *attraction* has been more commonly confined to cases of sensible distance. And as the particles of matter are of two kinds, either *homogeneous* or *heterogeneous*, so there are two kinds of affinity.

"Homogeneous affinity urges the homogeneous particles towards each other, and keeps them at insensible distances from each other; and consequently is the cause why bodies almost always exist united together, so as to constitute masses of sensible magnitude. This affinity is usually denoted by the term *cohesion*, and sometimes by *adhesion* when the surfaces of bodies are only referred to. Homogeneous affinity is nearly universal; as far as is known, caloric and light only are destitute of it.

Heterogeneous affinity urges heterogeneous particles towards each other, and keeps them at insensible distances from each other, and of course is the cause of the formation of new integrant particles composed of a certain number of heterogeneous particles. These new integrant particles afterwards unite by cohesion, and form masses of compound bodies. Thus an integrant particle of water is composed of particles of hydrogen and oxygen, urged towards each other, and kept at an insensible distance by heterogeneous affinity; and a mass of water is composed of an indefinite number of integrant particles of that fluid, urged towards each other by homogeneous affinity. Heterogeneous affinity is universal, as far as is known; that is to say, there is no body whose particles are not attracted by the particles of some other body; but whether the particles of all bodies have an affinity for the particles of all other bodies, is a point which we have no means of ascertaining. It is, however, exceedingly probable, and has been generally taken for granted; though it

is

Affirmation || Afforage.

is certainly aſſuming more than even analogy can warrant." (*Thomſon's Chemiſtry.*)

AFFIRMATION, in *Logic*, the aſſerting the truth of any propoſition.

AFFIRMATION, in *Law*, denotes an indulgence allowed to the people called *Quakers:* who, in caſes where an oath is required from others, may make a ſolemn affirmation that what they ſay is true; and if they make a falſe affirmation, they are ſubject to the penalties of perjury. But this relates only to oaths taken to the government, and on civil occaſions; for Quakers are not permitted to give their teſtimony in any criminal caſe, &c.

AFFIRMATION is alſo uſed for the ratifying or confirming the ſentence or decree of ſome inferior court: Thus we ſay, the houſe of lords affirmed the decree of the chancellor, or the decree of the lords of ſeſſion.

AFFIRMATIVE, in *Grammar*. Authors diſtinguiſh affirmative particles; ſuch as, *yes*.—The term *affirmative* is ſometimes alſo uſed ſubſtantively. Thus we ſay, the affirmative is the more probable ſide of the queſtion: there were ſo many votes, or voices, for the affirmative.

AFFIX, in *Grammar*, a particle added at the cloſe of a word, either to diverſify its form or alter its ſignification. We meet with *affixes* in the Saxon, the German, and other northern languages; but more eſpecially in the Hebrew, and other oriental tongues. The Hebrew *affixes* are ſingle ſyllables, frequently ſingle letters, ſubjoined to nouns and verbs; and contribute not a little to the brevity of that language. The oriental languages are much the ſame as to the *radicals*, and differ chiefly from each other as to *affixes* and *prefixes*.

AFFLATUS, literally denotes a blaſt of wind, breath, or vapour, ſtriking with force againſt another body. The word is Latin, formed from *ad* "to," and *flare* "to blow." Naturaliſts ſometimes ſpeak of the afflatus of ſerpents. Tully uſes the word figuratively, for a divine inſpiration; in which ſenſe, he aſcribes all great and eminent accompliſhments to a divine afflatus. The Pythian prieſteſs being placed on a tripod or perforated ſtool, over a holy cave, received the divine afflatus, as a late author expreſſes it, in her belly; and being thus inſpired, fell into agitations, like a phrenetic; during which ſhe pronounced, in hollow groans and broken ſentences, the will of the deity. This afflatus is ſuppoſed, by ſome, to have been a ſubterraneous fume, or exhalation, wherewith the prieſteſs was literally inſpired. Accordingly, it had the effects of a real phyſical diſeaſe; the paroxyſm of which was ſo vehement, that Plutarch obſerves it ſometimes proved mortal. Van Dale ſuppoſes the pretended enthuſiaſm of the Pythia to have ariſen from the fumes of aromatics.

AFFLICTION is not itſelf, in propriety of medical ſpeech, a diſeaſe, but it is the cauſe of many: for whatever excites envy, anger, or hatred, produces diſeaſes from tenſe fibres; as whatever excites fear, grief, joy, or delight, begets diſeaſes from relaxation.

AFFORAGE, in the French cuſtoms, a duty paid to the lord of a diſtrict, for permiſſion to ſell wine, or other liquors, within his ſeigniory. Afforage is alſo uſed for the rate or price of proviſions laid and fixed by the provoſt or ſheriffs of Paris.

Afforeſting || Afghans.

AFFORESTING, AFFORESTATIO, the turning ground into foreſt. The Conqueror, and his ſucceſſors, continued afforeſting the lands of the ſubject for many reigns; till the grievance became ſo notorious, that the people of all degrees and denominations were brought to ſue for relief; which was at length obtained, and commiſſions were granted to ſurvey and perambulate the foreſt, and ſeparate all the new afforeſted lands, and reconvert them to the uſes of their proprietors, under the name and quality of *purlieu* or *pourallee land*.

AFFRAY, or AFFRAYMENT, in *Law*, formerly ſignified the crime of affrighting other perſons, by appearing in unuſual armour, brandiſhing a weapon, &c. but at preſent, *affray* denotes a ſkirmiſh or fight between two or more.

AFFRONTEE, in *Heraldry*, an appellation given to animals facing one another on an eſcutcheon; a kind of bearing which is otherwiſe called *confrontee*, and ſtands oppoſed to *addorſee*.

AFFUSION, the act of pouring ſome fluid ſubſtance on another body. Dr Grew gives ſeveral experiments of the luſtation ariſing from the affuſion of divers menſtruums on all ſorts of bodies. Divines and church hiſtorians ſpeak of baptiſm by affuſion; which amounts to much the ſame with what we now call *ſprinkling*.

AFGHANS, in *Hiſtory*, a people who inhabit a province of CABUL or CABULISTAN, in the northern parts of India. They boaſt of being deſcended of Saul the firſt king of Iſrael, and that their great anceſtor was raiſed from the rank of a ſhepherd, not on account of his princely qualities, but becauſe his ſtature was exactly equal to the length of a rod which the angel Gabriel had given to the prophet Samuel as the meaſure of the ſtature of him whom God had deſtined to fill the throne of Iſrael.

Saul, whoſe deſcent, according to ſome of them, was of Judah, and according to others of Benjamin, had, they ſay, two ſons, Berkia and Irmia, who ſerved David, and were beloved by him. The ſons of Berkia and Irmia were Afghan and Ulbec, who, during the reigns of David and Solomon, diſtinguiſhed themſelves, the one for ſtrength of body, and the other for learning. The ſtrength of Afghan, we are told, ſtruck terror even into the demons and genii.

This hero uſed frequently to make excurſions to the mountains, where his progeny, after his death, formed eſtabliſhments, lived in a ſtate of independence, fortified themſelves, and exterminated infidels. When Mahomet appeared upon earth, his fame reached the Afghans, who fought him in multitudes under their leaders Khalid and Abdul Reſpid, ſons of Walid; and the prophet honouring them with this reception—"Come, O *Muluc*, or Kings!" they aſſumed the title of *Melic*, which they retain to this day.

The Afghans are ſometimes called *Solaimani*, either becauſe they were formerly the ſubjects of Solomon king of Iſrael, or becauſe they inhabit the mountains of Solomon. They are likewiſe called Patans, a name derived from the Hindû verb *paitna*, "to ruſh," which was given to them by a ſultan, in conſequence of the alacrity with which they had attacked and conquered his enemies. The province which they occupy at preſent was formerly called Roh; and hence is derived the

name

Afghans
Africa.

name of the Rohillas. The city which was eſtabliſhed in it by the Afghans was called by them Paithwer or Paither, and is now the name of the whole diſtrict. The ſects of the Afghans are very numerous, and they are Muſſulmans, partly of the Sunni, and partly of the Schiek perſuaſion.

They are divided into four claſſes. The firſt is the *pure* claſs, conſiſting of thoſe whoſe fathers and mothers were Afghans. The ſecond claſs conſiſts of thoſe whoſe fathers were Afghans and mothers of another nation. The third claſs contains thoſe whoſe mothers were Afghans and fathers of another nation. The fourth claſs is compoſed of the children of women whoſe mothers were Afghans and fathers and huſbands of a different nations. Perſons who do not belong to one of theſe claſſes are not called Afghians.

This people have at all times diſtinguiſhed themſelves by their courage. They have conquered for their own princes and for foreigners, and have always been conſidered as the ſtrength and ſupport of the army in which they ſerved. As they have been applauded for virtues, they have alſo been reproached for vices, having ſometimes been guilty of treachery, and of acting the baſe part even of aſſaſſins.

Sir William Jones ſeems to have had no doubt but the Afghans are deſcendants of Iſrael. "We learn (ſays he) from Eſdras, that the ten tribes, after a wandering journey, came to a country called Arſareth, where we may ſuppoſe they ſettled: now the Afghans are ſaid by the beſt Perſian hiſtorians to be deſcended from the Jews. They have traditions among themſelves of ſuch a deſcent; and it is even aſſerted, that their families are diſtinguiſhed by the names of Jewiſh tribes, although, ſince their converſion to Iſlam, they ſtudiouſly conceal their origin from all whom they admit not to their ſecrets. The Puſhto language, of which I have ſeen a dictionary, has a manifeſt reſemblance to the Chaldaic; and a conſiderable diſtrict under their dominion is called Hazareh or Hazaret, which might eaſily have been changed into the word uſed by Eſdras. I ſtrongly recommend an inquiry into the literature and hiſtory of the Afghans." (*Aſiatic Reſearches.*)

AFRANIUS, Lucius, a Latin comic poet, who lived about a century before Chriſt. He wrote comedies in imitation of Menander; and is commended by Tully and Quintilian for his acute genius and fluent ſtyle. Some fragments of his works only are now extant.

AFRICA, (derived according to Bochart from a Punic word ſignifying *ears of corn*), was repreſented by the ancients as one of the three great diviſions or continents of which they believed the world to conſiſt.—By them it was alſo called *Libya*. Since the diſcovery of America, it has been conſidered by the moderns as one of the four quarters of the globe.

Excepting at its north-eaſt corner, called the *Iſthmus of Suez*, which is a neck of land, about ſixty miles over, that unites it to Aſia, Africa is entirely ſurrounded by water. On the north it is bounded by the Mediterranean ſea, which divides it from Europe. Its whole weſtern coaſt is waſhed by the waters of the Atlantic ocean, by which it is divided from America; and on the eaſt, the Red ſea and the Indian ocean ſeparate it from Aſia. From the Mediterranean ſea on the north, to the Cape of Good Hope, which conſtitutes its ſouthern extremity, is no leſs than 4300 miles. Its broadeſt part, from Cape Verd, in the Atlantic ocean, to Cape Guarda-fui, near the ſtraits of Babel-Mandel, at the mouth of the Red ſea, is 3500 miles from weſt to eaſt. In ſhape it ſomewhat reſembles a triangle, of which the Mediterranean ſea and the Atlantic ocean form two ſides, while the third ſide conſiſts of the Red ſea and the Indian ocean. Africa.

The greater part of this vaſt peninſula has in all ages remained unknown to the other inhabitants of the world. The general aſpect however of its ſituation, repreſents it as well ſituated for maintaining a commercial intercourſe with the other quarters of the globe. It ſtands as it were in the centre between Europe, Aſia, and America; and therefore has a much nearer communication with each of them than they can have with one another. It is oppoſite to Europe, on its northern boundary, the Mediterranean ſea, for almoſt 1000 miles in a line from eaſt to weſt; the diſtance ſeldom 100 miles, never 100 leagues. It is oppoſite to Aſia the whole length of the Red ſea; the diſtance ſometimes only 15 miles, ſeldom 50 leagues. Its coaſt, for about 2000 miles, lies oppoſite to America, at the diſtance of from 500 to 700 leagues, including the iſlands; whereas America is nowhere nearer Europe than 1000 leagues, and excepting at its north-weſt corner, where it is yet little known, is not nearer to Aſia than 2500 leagues. Africa little known.

The knowledge of the ancients concerning Africa ſeems to have been, in a great degree, limited to the countries adjoining to the Mediterranean or to the Red ſea. The ideas, however, which Herodotus entertained of this great continent are by no means incorrect upon the whole: and it has been reſerved for our own times to verify a part of the deſcription which he has given of the interior of Africa. Previous to his time, the whole ſea coaſt of this continent had been explored by the conductors of an expedition fitted out by Necho, one of the kings of Egypt. It is to be obſerved that this Necho took Sidon, and reduced Phœnicia and Paleſtine. He muſt therefore have poſſeſſed conſiderable maritime power: Nor was he leſs powerful by land; for he marched through Paleſtine and Syria to attack the Aſſyrians near the Euphrates, and, in his way, defeated and ſlew Joſiah the king of Judah, who oppoſed his march at Megiddo (2 Kings xxiii. 29.) Having defeated the Aſſyrians (or Babylonians) he placed a ſtrong garriſon in Carchemiſh, a fortified city on the Euphrates which he had taken; and, in his return, he took poſſeſſion of Jeruſalem, called Cadytis by Herodotus. This enterpriſing prince employed a body of Phœnician mariners to circumnavigate Africa, an undertaking which they accompliſhed with ſucceſs. The following is the ſhort narrative given by Herodotus of this remarkable tranſaction: "Except in that particular part which is contiguous to Aſia, the whole of Africa is ſurrounded by the ſea. The firſt perſon who has proved this, was, as far as we are able to judge, Necho king of Egypt. When he had deſiſted from his attempt to join by a canal the Nile with the Arabian gulf, he diſpatched ſome veſſels, under the conduct of Phœnicians, with directions to paſs by the Columns of Hercules, and, after penetrating the Northern ocean, to return to Egypt. Theſe Phœnicians, taking their courſe from the Red ſea, entered into the Southern ocean. On the approach of autumn they Expedition of Necho king of Egypt againſt Phœnicia. Circumnavigates Africa. Africa. they landed at Libya, and planted some corn in the place where they happened to find themselves: when this was ripe, and they had cut it down, they again departed. Having thus consumed two years, in the third they passed the Columns of Hercules, and returned to Egypt. Their relation may obtain attention from others, but to me it seems incredible; for they affirmed that, having sailed round Africa, *they had the sun on their right hand*. Thus was Africa, for the first time known."

Many of the most eminent of the ancient historians and geographers regarded this account of the circumnavigation of Africa as altogether fabulous, chiefly in consequence of the story concerning the appearance assumed by the great celestial bodies in the course of the voyage, which was then unintelligible, from the imperfect state of the science of astronomy. But the very circumstances which, among the ancients, excited a doubt about the existence or success of such a voyage, must now be regarded as affording the most satisfactory internal evidence of the veracity of the ancient Phœnician navigators.

The Carthaginians were the rivals of the Egyptians in commerce, and must undoubtedly have explored a great part of the coast of Africa; but, according to the usual cautious and monopolizing spirit of commercial states, it is probable that they concealed their discoveries from other nations. As almost no monuments of their literature now exist, we are deprived of the means of investigating the full extent of their geographical knowledge. One important document has, however, reached our times, which demonstrates the enterprising spirit of that people. This is, an apparently abridged journal of a voyage to the western coast of Africa, undertaken by Hanno the Carthaginian, about 30 or 40 years after the expedition above mentioned under Necho king of Egypt. Herodotus does not seem to have been informed of this undertaking of Hanno; nor does Pliny appear to have seen the journal of the voyage, though he is no stranger to its contents.

Voyage of Hanno. Hanno is said to have deposited, at his return, the journal of his voyage in the temple of Saturn; which may perhaps account for the means of its preservation. It begins by stating, that "it was decreed by the Carthaginians that Hanno should undertake a voyage beyond the Pillars of Hercules, and found Libyphœnician cities. He sailed, accordingly, with 60 ships of 50 oars each, and a body of men and women to the number of 30,000, and provisions and other necessaries." From the extent of this plan of colonization, or rather of establishing permanent garrisons, upon the western coasts of Africa, it is evident that these coasts must, in some measure, have been previously examined. Major Rennel, who has investigated the subject with great accuracy, with a reference to the journal of the voyage, is of opinion that the Carthaginian or Libyphœnician cities founded by Hanno, were all situated to the south of the strait of Gibraltar, and to the northward of the river Senegal; and that all of them, excepting one at Cernè, now called Arguin, were placed to the north of Cape Bojador. To the southward of Cernè, Hanno during his voyage made two expeditions; but it does not appear that he made any attempt to fix an establishment beyond the limits now mentioned. On his first expedition, he seems to have sailed into the river Senegal, as may be supposed from the description given; for it is said to be "large and broad, and full of crocodiles and river horses." During the same voyage, Hanno made a second expedition southward, apparently for the sake of discovery. He appears to have doubled Cape Verd, and to have sailed across the mouth of the Gambia. His voyage is said to have terminated at a place which he calls the Southern Horn, supposed to be either at Sierra Leona, or, at a little distance to the south of it, at Sherbro. It is evident, from the general style of the journal, that the Carthaginians, at the time of this voyage, were altogether unacquainted with the interior state of the country on this western quarter of Africa. Excepting the mere description of the coast, and its windings and bays, every thing is marvellous, and apparently fabulous. They talk of having caught two women covered with hair, whose skins they brought to Carthage, meaning, in all probability, two monkeys of some of the unknown species which abound in the country of the Negroes. They also talk of streams of fire, and of rivers of fire which seemed to be running into the sea. At one place, during the night, they saw a country which was on fire: and afterwards they saw another country full of fires; in the middle of which was a lofty fire, larger than the others, which seemed to touch the stars. When day came, they discovered this elevated fire to be a large hill, which they called *the chariot of the gods*. These wonders have been explained to us by later travellers; who remark that it is the custom, at certain seasons of the year, in the country of the Negroes, to set fire to the dry grass; and that on these occasions, during the night, the whole territory seems to be a sheet of flame.

Africa. Description of Africa by Herodotus. With regard to Africa in general, Herodotus describes it in this summary way: "All that part of Libya towards the northern sea (Mediterranean), from Egypt to the promontory of Soloeis (now Cape Cantin on the coast of Morocco) which terminates the third division of the earth, is inhabited by the different nations of the Libyans; that district alone excepted in possession of the Greeks and Phœnicians. The remoter parts of Libya beyond the sea coast, and the people who inhabit its borders, are infested by various beasts of prey.—The country *yet more distant* is a parched and *immeasurable desert*." Here this ancient historian clearly distinguishes three belts or regions parallel to the Mediterranean, the northernmost of which we must conceive to have been that which extended along the sea coast, and was bounded on the south by Mount Atlas, and other ridges. The middle one is now called the Country of Dates, because the inhabitants chiefly live on that fruit; and the third is the great African desert. Beyond these, however, Herodotus had heard of a fourth region, belonging to the negroes; for, in another place he divides the inhabitants of Africa generally into two races (with the exception of strangers, viz. the Phœnicians and the Greeks). The natives (says he) are the Africans and Ethiopians, one of which possesses the northern, and the other the southern part of Africa."—By these nations are evidently intended the Moors and the Negroes, which two classes are as distinct at the present day as they were in ancient times.

This author, whose account of the ancient nations will always be a matter of much curiosity, because he has justly been called *the Father of History*, as being the earliest authentic historian whose writings have

Africa.

been tranſmitted to us, gives a detailed account of the tribes that in his time inhabited the northern coaſt of Africa, upon the borders of the Mediterranean; beginning with Egypt and proceeding weſtward to the leſſer Syrtis, mentioning only in general terms, the reſt of the country to the promontory of Soloeis, (Cape Cantin), which was erroneouſly regarded by him as the moſt weſterly point of the coaſt of Africa. The people of this coaſt he repreſents generally as Nomades, from Egypt weſtward to the lake Tritonis, by which he means the leſſer Syrtis, or gulf of Kabes; and the country, he ſays juſtly, is low and ſandy. The country farther to the weſt, called *Africa Proper*, or *Numidia* by the Romans, including the preſent ſtates of Morocco, Algiers, and Tunis, he deſcribes as mountainous and interſperſed with wood, and infeſted by wild beaſts and ſerpents of an enormous ſize. Within this tract, however, he repreſents the inhabitants as huſbandmen who cultivate the ground and live in houſes. Mount Atlas is mentioned by him in the ſame magnificent terms in which all the ancient writers ſpeak of it. "At every approach it appears round and ſteep, and ſo lofty that its ſummit can never be diſtinguiſhed by reaſon of the clouds that envelope it."

Egypt was, in the days of Herodotus, a rich and populous ſtate, from which the Greeks had derived a great part of their arts and of their religion. Beginning from Egypt and proceeding weſtward, he enumerates the Africans in the following manner. The firſt are the *Adyrmachidæ*, whoſe manners were in every reſpect Egyptian, that is to ſay, civilized. He imputes to them, however, a barbarous cuſtom, that their king poſſeſſed the privilege of ſleeping the firſt night with every new married woman. They inhabited the coaſt between Egypt and the port of Pleunos, adjoining to what is now called the *deſert of Barca*. Next to the Adyrmachidæ were the *Gilligammæ*, who occupied the coaſt as far as the iſland of Aphrodiſias, ſuppoſed to be near Derna. The *Aſbyſtæ* were a ſmall inland tribe, ſituated between the Gilligammæ on the eaſt, and the Auſchicæ on the weſt, having no communication with the ſea. They were accounted remarkable beyond all the Africans for the uſe of chariots drawn by four horſes; and, it is to be obſerved, that Herodotus ſays the Greeks borrowed from Africa the cuſtom of harneſſing four horſes to a chariot. The *Auſchicæ*, who bordered on the weſt of the Aſbyſtæ extended from above Barca to the neighbourhood of the Heſperides on the ſea coaſt. The *Cabales*, an inconſiderable tribe, occupied the coaſt oppoſite to the centre of the Auſchicæ, and extended themſelves along the coaſt near Tauchira, a town belonging to Barca.

Inhabitants of Africa according to Herodotus.

The province of Cyrenaica, (now Kairoan or Kurin), was ſituated within the tract of the Nomades. It was the moſt elevated part of it, and wonderfully fertile. It contained the firſt Grecian colony, and was alſo named *Libya Pentapolis*, from its having five towns of note in it, Cyrene, Barce, Ptolemais, Berenice, and Tauchira; all of which not only ſtill exiſt as towns or villages, but it is remarkable that their names are ſcarcely altered, being called *Kurin*, *Barca*, *Tollamata*, *Bernic*, and *Taukera*. The celebrated gardens of the Heſperides were ſituated upon this coaſt on the weſtern border of the deſert of Barca.

The *Naſamones*, according to Herodotus, were the moſt powerful of the Nomadic tribes upon this coaſt. They bordered upon the greater Syrtis, now called the *gulf of Sort*. He ſays, that during the ſummer ſeaſon they leave their cattle on the coaſt, and go up into the country to gather dates at a place called *Augela*, which will be afterwards noticed. The Naſamones are ſaid to have ſeized upon the territories of the Pſylli. Theſe were a people who poſſeſſed the reputation of being able to charm ſerpents, and to cure the wounds occaſioned by their ſtings. Cato is ſaid by Plutarch to have carried ſome of the Pſylli with him for that purpoſe, in his memorable march round the greater Syrtis. It is certain that, in modern times, in Egypt, Abyſſinia, and India, certain perſons are believed to poſſeſs the power of completely ſubduing ſerpents of the moſt venomous kinds, ſo as to have them entirely under their command. They are ſaid to ſeize on them with their naked hands, without apprehenſion of miſchief, and this, not only on ſerpents they have already been accuſtomed to, but on ſuch as they never ſaw before.

Beyond the Naſamones to the ſouthward, Herodotus mentions the *Garamantes*, whom he repreſents as a numerous nation, ſituated ten journeys from Augela, between the Naſamones and the Macæ. The *Macæ* appear to have been the next tribe upon the coaſt after the Naſamones. The preſent towns of Meſurata and Lebida are ſituated within the territory that belonged to them. The *Gindanes*, *Lotophagi*, and *Machlyes*, in the order here mentioned, occupied the remainder of the ſpace between the Macæ and the lake Tritonis, or gulf of Kabes; for Herodotus appears to have underſtood by the lake Tritonis, either the gulf alone, or the gulf and an adjoining lake *collectively*, which in his time very probably had a communication, though they are now ſeparated by a neck of land, and the lake receives the name of *Lowdeah*. It is to be obſerved, that the Lotophagi derived their name from the fruit of a tree or ſhrub called the *lotus*, upon which they ſubſiſted, ſuppoſed to be the *rhamnus lotus* of Linnæus. It is not only found in this territory, but alſo upon the whole northern coaſt of Africa, and on many ſpots of the deſert, and even in the country of the Negroes. To the weſtward of the lake Tritonis, Herodotus mentions the *Auſes*, the *Maxyes*, the *Zaveces*, and the *Zygantes*; which laſt appear to have been the inhabitants of the province that contained the city of Carthage: of the territories of this laſt ſtate Herodotus gives no deſcription, though he ſays, that he is able to name all the nations that inhabit the country as far as the Atlantes, beyond which he knows nothing. Some other poſitions in the north of Africa that were known in the times of Herodotus, will be afterwards mentioned.

With regard to the interior of Africa, the knowledge of Herodotus was very indiſtinct. He mentions Ethiopia in a way that in ſome meaſure correſponds with Nubia, and Abyſſinia: "Ethiopia, (ſays he), "which is the extremity of the habitable world, is contiguous to Arabia on the ſouth weſt. It produces gold in great quantities, elephants with their prodigious teeth, trees and ſhrubs of every kind, as well as ebony. Its inhabitants are alſo remarkable for their ſize, their beauty, and their length of life." To Ethiopia, however, he gives a wide extent, ſo as to include

Africa.

clude the whole region inhabited by men of a black complexion, as he calls it, the "extremity of the habitable world." The remoteſt ſource of the Nile was unknown in his days; and after all the efforts that have been made for its diſcovery, it may be regarded as having hitherto been viſited by no European. He ſuppoſes, however, that the courſe of the Nile, "without reckoning that part of it which flows through Egypt, was known to the extent of four months journey, partly by land, partly by water;" but beyond this its courſe was unknown, though he ſays "it is certain that the Nile riſes in the weſt." The moſt remarkable fact, however, mentioned by Herodotus concerning the inveſtigation of the interior of Africa, conſiſts of the adventures of certain *Naſamones* who came from the neighbourhood of Cyrene, now called *Kairin*. He ſays that they made an expedition into the interior of Africa, with a view to extend their diſcoveries beyond all preceding adventurers. No attempt is made to ſtate the diſtance to which they penetrated; but it muſt have been very great: "firſt proceeding through the region which was inhabited, they next came to that which was infeſted by wild beaſts; leaving which, they directed their courſe weſtward through the deſert, and were finally taken priſoners by black men of a diminutive ſtature, and carried to a city waſhed by a great river, which flowed from weſt to eaſt, and abounded in crocodiles." Of this great river nothing farther was ever diſcovered by the ancients. Herodotus thought that it was probably the Nile, and Pliny calls it the river Niger, or the river of the blacks or Ethiopians.

The Romans were not a commercial people, and troubled themſelves little about the diſcoveries of the Egyptians and Carthaginians whom they vanquiſhed. The fertile diſtricts, however, in the north of Africa adjoining to the ſhores of the Mediterranean, formed the chief granary of the empire during its moſt proſperous period. Beyond theſe diſtricts they puſhed their conqueſts only ſo far as was neceſſary to ſecure their poſſeſſions againſt the barbarians of the deſert. Both Auguſtus and Nero, however, ſent perſons to attempt to diſcover the ſource of the Nile, but without ſucceſs; and the Romans were never remarkable for inveſtigating the ſtate of foreign countries when they had no ſcheme of conqueſt in view. In the decline of the Roman empire A. D. 426, Bonifacius, the governor of Africa, revolted, and called in the aid of Genſeric, the chief of a horde of barbarians called *Vandals*, who had penetrated from the north of Europe into Spain. Theſe barbarians croſſed the ſtraits of Gibraltar, and ſoon became maſters of the country. About a century thereafter; their deſcendants, in a fertile and enervating climate, having loſt their military character, were vanquiſhed by the celebrated Beliſarius under Juſtinian, then at the head of the eaſtern diviſion of the Roman empire. At a later period, when Mahomet had rouſed his countrymen to war and conqueſt, under the influence of a furious fanaticiſm, Egypt and the reſt of the north of Africa were overrun by the Arabs, or, as they are called, the *Saracens*, A. D. 647. In a few centuries thereafter, the empire of the Saracens in Africa, where they were called *Moors*, was gradually divided into a variety of petty ſtates called the *States of Barbary*, which acknowledged rather a nominal than a real dependence upon the Turkiſh empire.

Africa.

The reſt of Africa was forgotten till the fifteenth century, when the diſcovery of the mariners compaſs enabled the Europeans to extend their maritime enterpriſes to all the quarters of the globe, with a facility that was formerly unknown. In theſe enterpriſes the Portugueſe took the lead. They had never failed along the weſtern coaſt of Africa, beyond Cape Non, in 27° north latitude till A. D. 1412, when they ventured 160 miles farther to Cape Bojador, whoſe rocky cliffs ſtretching out to a conſiderable diſtance into the Atlantic ocean, intimidated them from advancing farther. In 1419, when attempting to double this cape, they diſcovered the Madeira iſles. Afterwards in 1433, they paſſed Cape Bojador, penetrated between the tropics, and diſcovered the river Senegal and the Cape de Verd iſles ſituated between 14° and 18° north latitude. In 1471, they croſſed the equator, and were aſtoniſhed to find that the torrid zone contained fertile and populous regions, inſtead of being burnt up by perpetual heat as had been formerly believed. In 1484, the Portugueſe navigators, now become ambitious of the reputation of diſcoverers of new countries, penetrated 1500 miles beyond the equator; and two years thereafter Bartholomew de Diaz diſcovered the Cape of Good Hope. In 1497, this cape, being the ſouthern extremity of Africa, was paſſed by Vaſquez de Gama.

Diſcoveries by the Portugueſe.

Of the Madeira iſles.

Cape de Verd iſles.

Of the Cape of Good Hope.

At this time the European nations were faſt emerging from barbariſm. The feudal ariſtocracies, by which they had been kept in a ſtate of perpetual anarchy, were gradually ſubdued by different princes, and a few powerful ſtates or monarchies were raiſed upon their ruins. Theſe ſtates enjoying greater domeſtic tranquillity, were become capable of directing the energy and ſuperior intelligence, which began to prevail in the European character, to enterpriſes requiring united and ſucceſſive efforts. The diſcoveries of the Portugueſe, by pointing out a very fertile region in the centre of Africa, in which gold and ivory could be obtained in exchange for the manufactures of Europe, and in which ſettlements could be eaſily formed, would in all probability have directed to this quarter the whole activity of the moſt enterpriſing of the European ſtates, had not other events diverted them to different quarters. The events now alluded to, were the diſcovery of America by Columbus in 1492, and the eaſy communication with the Eaſt Indies, opened up by the diſcovery of the paſſage round the Cape of Good Hope. Hence it has happened, that during theſe three centuries Africa has been much neglected; and, in the moſt enterpriſing period of the hiſtory of the world, the European nations, though the moſt enterpriſing of mankind, have left in a great meaſure unexplored this immenſe continent, though ſituated in their vicinity, and abounding in valuable productions. A few factories for the purpoſe of procuring ſlaves have been eſtabliſhed by the Engliſh, French, and Spaniards, upon the weſtern coaſt, to the north of the equator. From thence to the tropic of Capricorn, the Portugueſe have a few ſettlements, upon the eaſt and the weſt coaſt, for the ſame purpoſe; and the Dutch ſettlement at the Cape of Good Hope,

Cauſes that interrupted the diſcoveries in Africa.

European ſettlements.

Africa. Hope, is the only eſtabliſhment at all worthy of the name of a European colony, retaining the language and ſomewhat of the manners of the parent ſtate.

What is known of the interior of Africa, is chiefly the reſult of the efforts of particular travellers, who have penetrated into different quarters of that great continent, impelled by the ambition of extending the limits of human knowledge; or it is the fruit of the exertions of a private ſociety of perſons of rank in England, inſtituted in 1788, bearing the name of the *African Aſſociation*, who have employed, at their expence, various individuals to enter Africa at different points, and to proceed by ſuch routes as have been thought moſt likely to lead to important diſcoveries.

African Aſſociation.

We ſhall now give a conciſe account of the great continent of Africa, ſo far as a knowledge of it has been obtained from theſe different ſources. In the ſtatement now to be given, however, we ſhall avoid taking any farther notice of that fertile ſtripe of territory on the north of Africa, which borders upon the Mediterranean ſea, or upon the Atlantic ocean, ſouthward to the mountains of Atlas, conſtituting the ſtates of Egypt, Tripoli, Tunis, Algiers, Fez, and Morocco. Neither ſhall we take any notice of the country of Abyſſinia at the head of the Nile, or of the Dutch ſettlement of the Cape of Good Hope, as each of theſe will be ſeparately diſcuſſed under their proper names.

Diviſions of Africa. Africa, to the ſouth of the ſtates on the Mediterranean and of Morocco, conſiſts of two great diviſions, the *Sahara*, or great deſert, which is the country of the Moors or Arabs; and *Nigritia*, *Negroland* or the country of the Negroes or Æthiopians. The limits of theſe two diviſions, though not in all caſes accurately defined, depend on the ſoil and climate, and appear to have remained permanent from the days of Herodotus.

Sahara, or great deſert. The Sahara, or great deſert, extends from the ſouth of Morocco and of the ſtates on the Mediterranean, commonly called the Barbary States, to the rivers Senegal and Niger, or to a line drawn acroſs the continent of Africa, from Cape Verd to the Red ſea. Beyond the Sahara or deſert, to the ſouthward, is the country of the Negroes.

The Sahara preſents a ſurface equal in extent to nearly one half of Europe. It is upwards of 800 miles in breadth from north to ſouth, and more than double that extent in length from the Atlantic ocean on the weſt, to the frontiers of Abyſſinia on the eaſt. Its general deſcription is that of a vaſt wilderneſs of lifeleſs ſand, parched by the intolerable heat of an almoſt vertical ſun. Its chief varieties conſiſt of immenſe plains covered with naked pebbles, or of barren rocks towering towards an unclouded and burning ſky. The ſterility of the ſoil is rather marked than alleviated by ſome ſcattered plants, and by the verdure of a few valleys in which water either ſtagnates or ſprings up.

This general deſcription, however, of the great African wilderneſs, is by no means to be underſtood as univerſal or without exception. The deſert is here and there interſperſed with ſpots of aſtoniſhing fertility, which are crowded with inhabitants. Every thing in the climate of Africa is in extremes. No cold is indeed experienced in that vaſt continent; but barrenneſs and fertility of ſoil border upon each other with a degree of ſuddenneſs, of which, in the temperate climates of Europe, we have no conception. The traveller paſſes in an inſtant from burning ſands to a rich landſcape, in which flocks and herds, and towns and villages abound. The ſame vicinity of a tropical ſun which renders the wilderneſs intolerable, rears up all vegetable productions in the utmoſt luxuriance and perfection, in every ſpot in which water and a tolerable depth of ſoil are to be found. Theſe ſequeſtered ſituations in this great deſert were called *Oaſes*, or *Iſlands*, by the ancients. Under the Roman empire it was not unuſual to baniſh ſtate criminals to an iſland in the great Libyan deſert. The continent of Africa, like that of South America, is higheſt on its weſtern ſide, and its greater rivers the Senegal, the Gambia, and the Niger, riſe in a chain of mountains ſituated nearer to the Atlantic than the Indian ocean. As the Sahara extends towards the eaſt, and alſo towards the ſhores of the Mediterranean on the north, its iſlands abound moſt in theſe regions. But the leſſer iſlands are not always permanent. A furious wind from the deſert, bringing along with it an immenſe quantity of ſand, ſometimes overwhelms a whole fertile diſtrict, and reduces it to barrenneſs. We ſhall here take notice, however, of ſuch of the ſequeſtered iſlands of this deſert as are now known to be moſt important.

Africa.

Oaſes, iſlands or fertile ſpots in the deſert. The ancients mention very particularly under the name of Oaſis three ſituations, called *the Greater Oaſis*, *the Leſſer Oaſis*, and *the Oaſis of Ammon*. Of theſe the Greater Oaſis is at preſent the beſt known to the Egyptians and the Arabs, becauſe the caravans from Cairo to Darfur paſs along it. It is named *Al-Wah*, or *the Oaſis*, by way of excellence. It appears to conſiſt of a number of detached fertile ſpots or iſlands, extending in a line parallel to the courſe of the Nile, and of the mountains that border the valley of Upper Egypt. The iſlands of the Greater Oaſis are ſeparated from each other by deſerts of from two to 14 hours travelling. The whole extent of the chain is about 100 Engliſh miles, but by far the greateſt part of it is deſert. The whole Oaſis is ſubject to Egypt, and has ever been reckoned an appendage to it, being diſtant from it about 90 miles. This Oaſis contains abundance of date trees, and plenty of good water. The principal village in it is called *Chagré*, and is ſituated in 26° 25′ N. Lat. and 29° 40′ E. Long.

The Leſſer Oaſis does not lie in any of the tracks of the caravans, and is therefore little known. It is underſtood, however, to begin at the diſtance of about 40 miles to the northward of the Greater Oaſis, and to proceed to a conſiderable diſtance in a direction towards the north. It is called by the neighbouring Arabs *Al Wah-el-Gherbi*, which appears to mark poverty or inferiority, perhaps in compariſon with the other. It conſiſts, like the Greater Oaſis, of a chain of narrow iſlands running parallel to the Nile.

Temple Jupiter Ammon. The third Oaſis contained the celebrated temple and oracle of Jupiter Ammon, which was viſited by Alexander the Great. Though in its dimenſions it is perhaps leſs than the two former Oaſes, it is undoubtedly the greateſt, ſo far as hiſtorical importance is concerned. In the time of Herodotus, the ſtate or kingdom of Ammon occupied a conſiderable ſpace betwixt Egypt on the eaſt and the deſert of Barca on the weſt, and between the Nomadic tribes along the coaſt of the Mediterranean on the north, and the great

Libyan

Africa.

Libyan deſert on the ſouth.—As the ancient Perſians worſhipped one ſupreme deity whom they repreſented by the ſun, and as they had a regular and well diſciplined prieſthood, they were taught to regard with indignation the idolatry of the Greeks. Hence the Perſian monarch Cambyſes ſent an army againſt the Ammonians, with orders to burn the temple from whence the oracles of Jupiter were delivered. The expedition was unſucceſsful, the army having been overwhelmed with ſand, or left by their guides to periſh in the deſert; ſo that no remnant of them ever returned.—The poſition of the Oaſis of Ammon has lately been aſcertained by our countryman Mr Brown, who travelled into that quarter with a view to its diſcovery. It appears to correſpond with the modern Siwah, in 29° 12′ N. Lat. and 26° 18′ E. Long. As a building of ſuch antiquity muſt be an object of great curioſity, we ſhall tranſcribe Mr Brown's deſcription of the ſmall part of the temple that remains, the reſt having been deſtroyed by the modern inhabitants of the country to build their houſes and garden walls. "It is a ſingle apartment," ſays Mr Brown, "built of many ſtones of the ſame kind as thoſe of which the pyramids conſiſt, and covered originally with ſix large and ſolid blocks that reach from one wall to the other. The length I found 32 feet in the clear, the height about 18, the width 15. A gate ſituated at one extremity forms the principal entrance, and two doors alſo near that extremity open oppoſite to each other. The other end is quite ruinous; but, judging from circumſtances, it may be imagined that the building has never been much larger than it now is. There is no appearance of any other edifice having been attached to it, and the leſs ſo, as there are remains of ſculpture on the exterior of the walls. In the interior are three rows of emblematical figures, apparently deſigned to repreſent a proceſſion; and the ſpace between them is filled with hieroglyphic characters, properly ſo called. The ſoffit is alſo adorned in the ſame manner; but one of the ſtones which formed it is fallen within, and breaks the connection. The other five remain entire. The ſculpture is ſufficiently diſtinguiſhable; and even the colours in ſome places remain."

Mr Brown's deſcription of the temple.

Mr Horneman, a native of Germany, a traveller employed by the African Aſſociation, has ſtill more recently viſited Siwah on his way from Cairo to Fezzan along with a caravan, in which he travelled under the character of a Mahometan merchant. He ſeems to think, that the total circumference of the ruins of the ancient temple of Jupiter Ammon may be ſeveral hundred yards, though in many places the outward wall has been entirely carried away. He ſeems to have meaſured the outſide of the ſame building whoſe inſide appears to have been meaſured by Mr Brown, and accordingly deſcribes the length as from 30 to 36 feet, the width 24, and the height 27; but he was interrupted in taking his meaſurements by the jealouſy of the natives. He alſo deſcribes the ceiling as formed of vaſt blocks of ſtone of four feet in breadth, and three feet in depth, which extend acroſs the whole building; and this roof ſeems to have preſerved this part of the fabric entire, as the preſent barbarous inhabitants dare not attempt to demoliſh the walls, leſt they themſelves ſhould be overwhelmed by the fall of the ſtones which form the roof. One of theſe ſtones of the roof has fallen in, and is broken; "but the people, ſays Mr Horneman, have not been able to remove the large fragments fallen from the roof, which their anceſtors were enabled to bring from the quarry, and to raiſe entire to the ſummit of the edifice: ſuch are the viciſſitudes of art, of knowledge, and of human powers and means, as well as of human happineſs and fortunes."

Mr Horneman's.

Africa.

The fertile part of the territory of Siwah appears to be about 18 miles in circumference, containing ſeveral ſmall villages beſides Siwah the capital. It is an independent ſtate, acknowledging the Grand Seignior as lord paramount, but paying no tribute. It affords abundance of vegetable productions, with corn and oil; and is copiouſly ſupplied with water from ſprings and ſmall ſtreams, but none of them flow beyond its territory. They are either evaporated on approaching the ſurrounding deſert, or, if they reach it, are loſt in the ſterile ſand. Its government is veſted in about 32 wealthy citizens, who aſſume the title of *ſcheiks*. Juſtice is adminiſtered according to ancient uſage and general notions of equity. Fines, which are paid in dates, conſtitute the puniſhment. The dreſs of the men conſiſts of a white cotton ſhirt and breeches, and a large piece of callico cloth ſtriped white and blue, manufactured at Cairo, which is thrown over the left ſhoulder, and is called *melaye*. On their heads they wear a cap of red worſted or cotton, which is the diſtinction of a Muſſulman, no Jew or Chriſtian being permitted to uſe it. The women of Siwah wear wide blue ſhifts, uſually of cotton, which reach to the ancles, and a melaye, above deſcribed, which they wrap round their head, and which falls over the body like a cloak. They plait their hair into three treſſes one above the other, and faſten little bells to the loweſt. They wear ear-rings and necklaces of glaſs beads. Thoſe of the higher claſs wear round their necks a ſolid ring of ſilver thicker than the collar uſually worn by criminals in ſome parts of the continent of Europe. There are many catacombs in the neighbourhood of Siwah, which formed the burying places of the ancient inhabitants, which ſhow great labour and neatneſs of work.

State of Siwah.

Government.

Dreſs.

The ſame traveller, Mr Horneman, on his way towards Fezzan, paſſed through Augila, an iſland or oaſis in the deſert, that was well known in the days of Herodotus. It is ſituated in 33° 3′ N. Lat. and 22° 46′ E. Long. The territory contains three towns, Augila the capital, Mojabra, and Meledila. Many of the inhabitants engage in the caravan trade. Thoſe who do ſo, very frequently have three houſes, one at Cairo, one in the territory of Augila, and a third in Fezzan, with a wife and family eſtabliſhment at each. The country is level, and the ſoil ſandy, but being well watered it is tolerably fertile. After a march of 16 days from Augila, Mr Horneman reached Temiſſa, in the territory of the important oaſis Fezzan, of which we ſhall now give ſome account upon the authority of the journal which he has very recently tranſmitted to Europe.

Oaſis of Augila.

Fezzan, the country of the ancient Garamantes of Herodotus, called by Pliny *Phazania Regio*, is upwards of 1100 miles weſt from Grand Cairo, and conſiſts of an extenſive plain amidſt a ſurrounding wilderneſs of ſand and of naked rocks.

Oaſis of Fezzan.

The greateſt length of the cultivated part of Fezzan

Africa. is about 300 Engliſh miles from north to ſouth, and its greateſt breadth from eaſt to weſt is 200 miles. It contains 101 towns and villages, of which Mourzouk is the capital, ſituated according to Rennel, in 27° 48′ N. Lat. and 15° 3′ E. Long. The principal towns to the northward of the capital are Sochna, Sibha, Hun, and Wadon; Gatron to the ſouth; and Quila to the eaſt. The climate is never temperate. During ſummer the heat is intenſe, and the ſouth wind is ſcarcely ſupportable even by the natives. A penetrating north wind prevails during winter, which drives to the fire even the natives of a northern country. Tempeſts of wind are frequent, which whirl up the ſand and duſt ſo as to give a tinge of yellow to the atmoſphere. Rain falls ſeldom, and in ſmall quantities. There is no river, nor even a rivulet deſerving notice, throughout the whole country. The ſoil is what in Europe would be called a light ſand, covering calcareous rock or earth, and ſometimes a bottom of clay.

Productions of Fezzan. Dates are the ſtaple produce of Fezzan, and in the weſtern parts ſome ſenna of a good quality is cultivated. Pot herbs are plentiful. Wheat and barley are ſuited to the ſoil and to the climate: but from the indolence of the people, and the oppreſſion of the government, enough is not raiſed for the ſupply of the inhabitants, and they rely for a part of their ſubſiſtence on importations from the north. Horned cattle are only found in the moſt fertile diſtricts. They are employed in drawing water from the wells, and are only ſlaughtered in caſes of extreme neceſſity. The goat is the ordinary domeſtic animal, though ſheep are bred in the ſouthern parts. The wool is manufactured into coarſe cloths, and along with the meat the ſkin is roaſted and eaten. Horſes are few. Aſſes are the beaſts of general uſe, whether for draught or burden. Camels are exceſſively dear, and only kept by the chief people.

Mechanics of Fezzan. There are no other tradeſmen in Fezzan than ſhoemakers and ſmiths, the latter of whom work every metal; and the ſame man forges ſhoes for the ſultan's horſe, and makes rings for his princeſſes. The value of the woollen cloth, which is manufactured by the women, may be eſtimated from this circumſtance, that the weavers ſhuttle is unknown, and that the woof is inſerted into the warp thread by thread, and the whole worked ſolely by the hand. Hence it happens, that though the commerce of Fezzan is conſiderable, it conſiſts merely of foreign merchandiſe, brought by caravans from various quarters, which are here diſpoſed

Trade. of as at a centrical market. Cairo ſends ſilks, calicoes, woollen cloths, glaſs, imitations of coral, beads, and Eaſt India goods. From Tripoli, a caravan brings paper, falſe corals, fire arms, ſabres, knives, cloths called *abbés*, and red worſted caps. From Bornou, on the ſouth-eaſt, copper is imported in great quantities, and the caravans from the ſouth or weſt bring ſlaves of both ſexes, oſtrich feathers, zibette, tigers ſkins, and gold, partly in duſt, partly in native grains, to be manufactured into ornaments for the people of interior Africa. The ſmaller caravans of the tribes of the deſert import oil, butter, fat, and corn, and thoſe from the more ſouthern diſtricts bring ſenna, oſtrich feathers, and camels for the ſlaughter-houſe.

Government. Fezzan is governed by a ſultan, deſcended from the family of the ſhereefs; but he pays 4000 dollars annually, as a tribute to the baſha of Tripoli; and in his correſpondence with that baſha, he aſſumes only the Africa. title of ſcheik, inſtead of ſultan. The throne is hereditary, but the eldeſt prince of the family ſucceeds, though a brother or a nephew, to the excluſion of the children of the laſt ſultan, if they are younger. This law gives riſe to many civil wars between the ſons of their ſultans and the collateral branches of the family.

Palace and harem. The ſultan's houſe or palace is within the fortreſs of Mourzouk. He has no other inmates than eunuchs. His harem is contiguous. It conſiſts of about 40 ſlaves, who are often ſold and replaced by others if they have no children, and of a ſultana, who muſt be of the family of the ſhereefs of Wadan or Zuila. The ſultan never enters the harem, but any female whom he wiſhes to ſee is conducted to his apartment.

Ceremonies. The ſultan gives audience three times a-day, in a particular apartment, ſeated on an old-faſhioned elbow chair, raiſed ſome ſteps, which forms his throne. Perſons introduced kiſs the hand of the ſultan, then raiſe it ſo as to touch their foreheads, and then kneel before him. The ſultan goes on Fridays to the great moſque on horſeback, and on other days of ſolemnity he rides on a plain near the town, attended by his courtiers, who exhibit their ſkill in equeſtrian exerciſes and in ſhooting. His official attendants conſiſt of two miniſters, and of a number of black and a few white ſlaves, termed Mamelukes. All the intereſt and power reſt with theſe Mamelukes, who are moſtly Europeans, or their immediate deſcendants. The apparel of the Dreſs of the ſultan. ſultan, on days of ceremony, conſiſts of the Tripolitan dreſs, over which he wears a large white embroidered ſhirt, made after the faſhion of the Negroes. His turban extends a full yard from the front to the hinder part, and is two thirds of a yard in breadth. His re- Revenue. venues conſiſt of aſſeſſments on all cultivated lands, and of arbitrary requiſitions, which are collected by his ſlaves in an oppreſſive manner, if they are not bribed. He alſo derives an income from duties on foreign trade, from certain territorial domains, and from ſalt pools and natron lakes. The preſent ſultan has added to his treaſures by predatory expeditions againſt the weaker tribes in the neighbourhood of his country. The chief booty upon theſe occaſions conſiſts of men and women, who are ſold as ſlaves. The princes of the royal family are ſupported from certain territories allotted to them, together with a weekly diſtribution of corn from the ſultan's ſtores, and occaſional exactions from the people.

The clergy, and the cadi or chief judge, are ſupported by the produce of certain woods and gardens; and they poſſeſs great authority with the people. The dignity of cadi is hereditary in a certain family; but the ſultan, upon every vacancy, appoints to the office that individual of the family who can beſt read and write, accompliſhments which here ſeem to be ſomewhat unuſual, and therefore much valued.

Population. The population of Fezzan amounts to about 70,000 or 75,000 ſouls. In the ſouthern diſtricts they have mixed with the natives of the deſert, whom they reſemble; but the original Fezzanians are a people of ordinary ſtature, of a deep brown complexion, with ſhort black hair and regular features. They poſſeſs little energy Character. either of mind or body. Almoſt their only food conſiſts of dates, or of a kind of farinaceous pap, with no butcher's meat. The men who can afford it are much addicted

Africa.

addicted to drunkenneſs. They uſe a very intoxicating liquor prepared from dates. The women have a great fondneſs for dancing, which they practiſe publicly, not only in the day time but after ſunſet. The amuſement is thus deſcribed by Mr Horneman: "Two or three men ſtand together with their tambourins; the women immediately form a circle round the men, beat a tune, and thoſe in the circle accompany it with ſinging and clapping of hands. A girl then advances dancing towards the drummers; the men, as ſhe approaches near them, join in the dance, and preſs towards her; on which ſhe makes ſome ſteps backwards, and then falls on her back with her body and limbs ſtiff and perfectly ſtraight; when the women behind catch her in the fall, a few ſpans from the ground, and toſs her in the air, whence ſhe deſcends on her feet. The men then reſume their ſtation in the centre, and a ſecond female dancer repeats the ſport, which is ſucceſſively engaged in by each briſk damſel of the circle."

Habits and amuſements.

Dancing.

Muſical inſtruments

In Fezzan there are great numbers of looſe women, and alſo of ſinging girls whoſe ſong is Sudanic, that is derived from the country of the Negroes. Their muſical inſtrument is called *rhababe;* it is an excavated hemiſphere, made from a ſhell of the gourd kind, and covered with leather; to this a long handle is fixed, on which is ſtretched a ſtring of horſe hairs longitudinally, cloſed and compact as one cord, about the thickneſs of a quill. This is played with a bow.

Diſeaſes.

Various ſorts of venereal diſorders prevail in Fezzan; but it is worthy of remark, that, for the cure of all the ſpecies, they only uſe ſalts and the fruit *handal* (colycinth) as powerful cathartics; the ſores, if any, are at the ſame time waſhed with a ſolution of ſoda; and theſe remedies ſeldom fail. Other maladies prevalent there are the ague and hæmorrhoids, for neither of which have they any other remedy than amulets, conſiſting of certain ſentences of the Koran written on a ſlip of paper, which the patient wears about his neck, and in bad caſes is made to ſwallow. It is ſaid, however, that their knowledge of ſurgery is ſufficient to enable them to cure a ſimple fracture.

Empire of Caſſina.

South from Fezzan a variety of other iſlands are ſcattered, which have been united by conqueſt under one chief, and receive the name of the empire of Caſſina or Kaſſeena. The territories of this empire, therefore, conſiſt of a conſiderable quantity of land of amazing fertility, interſperſed with arid waſtes, where the rays of the ſun, reflected from the ſand or the rocks, produce the moſt intenſe and ſuffocating heat. Caſſina, the capital, is ſituated in N. Lat. 16° 20′. W. Long. 11° 45′. Agadez, which is an iſland, or province as it may be called, of the empire of Caſſina, ſends annually a caravan of 1000 camels to certain ſalt lakes in the deſert, at a place called Domboo; and the ſalt is diſtributed among the other iſlands or provinces of this empire.

Trade in ſalt.

Bornou.

A ſimilar empire, as travellers are pleaſed to call it, conſiſting of a number of fertile ſpots of this immenſe deſert, is called Bornou. Mathan, the capital, is ſituated in N. Lat. 24° 32′. E. Long. 22° 57′. It is ſurrounded by a ditch, and a wall 14 feet in height. The king is ſaid to be more powerful than the emperor of Morocco. His dominions extend beyond the deſert into the fertile country of the Negroes, of which he poſſeſſes a large portion. He is elected by three of the principal chiefs; but the choice is reſtricted to the royal family. The military force of the ſtate conſiſts of cavalry armed with the ſabre, the pike, and the bow. Fire arms are not unknown, but they are too difficult to be procured.

Africa.

Beſides theſe, there is a variety of other diſtricts in this deſert, of which ſome ſlight intelligence has been obtained; ſuch as Gadamis, north-weſt from Fezzan, about N. Lat. 32°; ſouth-eaſt from which is another iſland, called *Tuat*, at the diſtance about 400 miles. On the ſouth-eaſt of Fezzan is Tibeſti, at the diſtance of 200 miles: eaſtward of which, and 500 miles from the Nile, is Bardoa. Zegzeg and Kuar are in the ſame vicinity. Farther to the ſouth is Bergoo and Darfoor. This laſt lies to the ſouthward of the general latitude of the great deſert. It has of late years been made known by Mr Brown, the firſt diſcoverer of the Oaſis of Ammon. He penetrated into Darfoor in 1792, and remained there a conſiderable time. Its chief town, Cobbé, is ſituated in 14° 11′ N. Lat. and 28° 8′ E. Long. and the country contains about 200,000 inhabitants, conſiſting of native tribes of a deep black complexion and woolly hair, though with features different from thoſe of the Negroes, and of Arabs of various tribes. The wild animals are, the lion, the leopard, the hyæna, the wolf, and the wild buffalo. The domeſtic animals are, the camel, the ſheep, the goat, and horned cattle. Conſiderable quantities of grain of different ſorts are reared, and, as the country is within the tropics, after the periodical rains the fertility is very ſudden and great. The people are very barbarous. The practice of polygamy is not only eſtabliſhed, but the intercourſe of the ſexes is totally deſtitute of delicacy or decency. The moſt ſevere labours of the field are left to the women; and the houſes, which are of clay covered with thin boards, are chiefly built by them. Salt is the general medium of commerce at Darfoor, as gold duſt is in many other places of Africa. This territory is governed by a chief, who calls himſelf ſultan, and aſſumes the moſt extravagant titles. He appears in public on a ſplendid throne, while an officer proclaims, "See the buffalo, the offspring of a buffalo, the bull of bulls, the elephant of ſuperior ſtrength, the powerful ſultan Abd-el-rachman-el-raſhid. May God preſerve thy life! O maſter, may God aſſiſt, and render thee victorious!"

Darfoor.

Sultan of Darfoor.

Extraordinary titles.

Theſe iſlands of the African deſert are too little known to render valuable any attempt at a more minute deſcription of them. They all reſemble each other in the fertility of their ſoil and the barbarous ſtate of their inhabitants, who are Mahometans, unleſs where they approach the country of the Negroes. Though they maintain towards each other the maxims of apparent hoſpitality, yet a Chriſtian is everywhere odious; and they account it meritorious to perſecute or enſlave him. Their language is chiefly a dialect of the Arabic, and their literature is in a great meaſure confined to reading the Koran. Their only intercourſe with other nations is carried on by the caravans which periodically traverſe theſe immenſe deſerts: and the ſmaller iſlands that are neglected by the caravans are ſometimes abſolutely forgotten by the reſt of the world for many years; and their inhabitants, left to themſelves and to their native ignorance, at laſt imagine

Africa.

gine, that except their own little territory, the whole earth reſembles the great deſert which they ſee around them.

Tribe of Monſelemines in Weſtern Africa.

It is to be obſerved, that the Sahara, or great wilderneſs, does not on its weſtern boundary all at once attain its utmoſt degree of barrenneſs. Immediately to the ſouth of Morocco and of the mountains called Mount Atlas, is a conſiderable extent of territory inhabited by a tribe called the *Monſelemines*. In their manners, they differ conſiderably from the Moors on the coaſts of the Mediterranean, and alſo from the Moors or Arabs of the deſert. Their civil government is republican, as they chooſe new chiefs every year, who are accountable to the aged men of the community. It is probable, however, that order is preſerved among them chiefly by the influence of their prieſts, who are greatly reſpected; and the influence of the high prieſt amounts almoſt to deſpotic power. The people are chiefly engaged in a ſort of paſtoral life, to which agriculture is occaſionally united. They have alſo villages in which various tradeſmen reſide, chiefly weavers, ſhoemakers, ſmiths, and potters, who have no cattle: But ſome opulent perſons reſiding in the towns have flocks and herds of cows, horſes, camels, ſheep, and goats, beſides poultry, kept by ſlaves at a diſtance in the country. The ſoil poſſeſſes conſiderable fertility, and produces the neceſſaries of life with little cultivation. The plains abound with date, fig, and almond trees; and grapes are cultivated. Oil, wax, and tobacco, are alſo produced, and ſold in the villages. Their agriculture is very rude. The chiefs of families, or ſmall tribes, chooſe the ground moſt fit for cultivation. Its ſurface is ſlightly turned over with a kind of paddle, for the plough is unknown; and then the ſeed is ſown upon it. The ſpot is then deſerted by the inhabitants, who wander in all directions with their cattle, and do not return till harveſt, when the corn is cut down and threſhed. Magazines are then formed, conſiſting of holes in the earth, into which the corn is put. Planks are laid over it, which are covered with a layer of earth, made level with the ſoil, to prevent its being diſcovered by enemies. Theſe magazines belong to every chief of a family or tribe, in proportion to the number of men he employed in the common labour.

Government.

Productions.

Rude agriculture.

Wars.

The Monſelemines are almoſt conſtantly engaged in war againſt the emperor of Morocco. They are extremely jealous of their independence and freedom; and their country is the retreat of all the diſcontented Moors. No ſooner does the emperor of Morocco take the field againſt them, than the whole inhabitants of the country diſtricts mount their horſes; and, while a part of them eſcort the women and ſlaves, and cattle, to places of ſafety, or even into the deſert if they are cloſe preſſed, the reſt of them occupy the paſſes of the mountains, and meet the enemy. During peace, parties of them often undertake to eſcort caravans, by which means there is preſerved among them a conſiderable military ſpirit. In other reſpects, they bear a great reſemblance to the ancient Arabs. They permit polygamy, but their women are not ſo much ſecluded from ſociety as among the Moors on the ſea-coaſt. Their children are brought up with care; and are not conſidered as men till they exhibit ſome proofs of their courage. Jews are permitted to live among them in their villages, but they are not allowed to cultivate the earth, or to carry arms. Chriſtians are much hated; but a Chriſtian ſlave is better treated than among the other Arabs, becauſe the avarice of the Monſelemines is greater than their fanaticiſm. As their ſlaves conſtitute their riches, they treat them tolerably well from a principle of prudence.

Manners.

To the ſouth of the country of the Monſelemines, upon the coaſt of the Atlantic, is the wandering tribe of *Wadelims*; to the ſouth of whom are the *Labdeſſebas*: And next to theſe are the *Traſarts*, who border with the country of the Negroes. Eaſtward along the northern frontier of the Negroes lie the Mooriſh ſtates of *Jaffnoo*, *Ludamar*, and others. With the exception of theſe ſmall ſtates, it is to be obſerved, that the great deſert, or Sahara, reaching from the Atlantic ocean to the frontiers of Abyſſinia, and from the vicinity of the Mediterranean to the country of the Negroes, is poſſeſſed by two great Mooriſh nations called the *Tuarick* and the *Tibbo*. Of theſe the Tuarick is the moſt powerful: It conſiſts of the whole deſert weſtward from the meridian of Fezzan. The deſert, of Sahara, eaſtward from the ſame meridian belongs to the Tibbo. The manners and character of the whole of theſe tribes, whether great or ſmall, is nearly or altogether ſimilar. The deſert which they inhabit is parched and uncultivated. Many places of it have the appearance of being capable of cultivation, as ſhrubs grow in various ſituations; and palms, or dates, riſe at diſtant intervals. But the flying ſand is the great obſtacle to cultivation, by rendering the reſult of it uncertain. The ſand drifts with every gale, and is at times accumulated into high mountains, which diſappear as the winds blow. Thus it is ſhifted about with every change of the blaſt, excepting when the air is entirely ſtagnant. When the ſand ſhower becomes formidable, the Moors are obliged to load their camels, turn their backs to the gale, and haſten away, to avoid being buried alive.

Tuarick and Tibbo.

As water is very ſcarce in the deſert, the Arabs or Moors form large holes for refervoirs to collect the rain water, which, though it ſoon becomes putrid and diſguſting, is the only drink of man or beaſt. From the ſcarcity of water, they have few horned cattle; and their flocks conſiſt chiefly of ſheep, goats, and camels, animals which are patient of thirſt. None but the wealthieſt Arabs, who poſſeſs numerous herds, are able to maintain horſes, as it is often neceſſary to give them milk to drink inſtead of water. The urine of the camels is carefully preſerved to waſh the veſſels uſed to contain food; and the Arabs are frequently under the neceſſity of drinking it, mixed with milk, for the purpoſe of allaying thier thirſt. As their riches conſiſt of their herds and flocks, they attend them with the greateſt care. If a beaſt be ſick, it is attended with more anxiety than a man; but if it ſeem likely to die, they kill and eat it. If it die before its blood be ſhed, it is accounted unclean, and is never eaten.

Animals of the deſert.

The Sahara or deſert, abounds in antelopes, wild boars, leopards, apes, and ſerpents. The Arabs or Moors are expert hunters, and, as the leopard's ſkin is an article of commerce, that animal from being frequently attacked, learns to keep at a diſtance from their habitations. Hunting the oſtrich is a favourite amuſement. It is undertaken by about twenty horſemen who

Africa.

who advance in a line againſt the wind, at the interval of a quarter of a league behind each other. As ſoon as the foremoſt perceives an oſtrich, he ruſhes upon it. The oſtrich cannot fly; but with the aſſiſtance of its wings, it runs in the direction of the wind, and, though it may avoid a few of the Arabs ſucceſſively, cannot eſcape the whole number. In their hordes, the Moors or Arabs lodge by families in tents covered with a cloth of camels hair, which the women ſpin and weave. The furniture of the tent conſiſts of two large ſacks of leather, in which they keep their clothes and pieces of old iron, a few goat ſkins for holding milk and water, two large ſtones for grinding their barley, a mattreſs of oſier which ſerves for a bed, a carpet for a covering, a ſmall kettle and ſome wooden diſhes, with pack ſaddles for their camels. They often aſſociate to convey ſalt, which abounds in the deſert, into the country of the Negroes; for which, in return, they bring back proviſions and blue cotton cloth and ſlaves. They alſo aſſociate for war and for hunting; and in moſt caſes, where the property acquired conſiſts of goods which can be packed up into parcels, they divide it into ſhares, which they cover up, and fix upon a woman, a child, or a ſtranger, who knows nothing of the contents of the various parcels, to diſtribute them by hazard to the different aſſociates of the enterpriſe.

Hunting the oſtrich.

The Arabs live in tents.

Furniture.

Diviſion of ſpoil.

Artificers.

The only artificers among the Moors of the deſert, are ſmiths, or a kind of tinkers, who go among them from the country of the Monſelemines to mend their broken veſſels, or repair their arms, and are paid in ſkins, goats and camels hair, or oſtrich feathers, according to agreement. All of them are more attentive to their arms than to their dreſs; the latter of which often conſiſts only of a long blanket which they wrap round them, with a cloak of camels hair, and more frequently of goats ſkins. They wear looſe frocks or ſhirts, however, of blue cotton cloth, if they can procure them from the Negroes, by whom this cloth is manufactured. Their arms conſiſt of daggers and clubs, with ſabres and muſkets if they can obtain them. To this general deſcription of poverty, however, ſome of the Moors of the great inland nation or tribe of Tuarick form an exception, in that part of the deſert which borders upon Fezzan, where they have an opportunity of acquiring wealth by engaging in the caravan trade. Mr Horneman ſaw at Fezzan many individuals of the Hagara, one of the tribes of the Tuarick, and deſcribes them thus: "The Hagara are yellowiſh, like the Arabs; near Soudan, there are tribes entirely black. The clothing of this nation conſiſts of wide dark blue breeches, a ſhort narrow ſhirt of the ſame colour, with wide ſleeves, which they bring together and tie on the back of their neck, ſo that their arms are at liberty. They wind a black cloth round their head in ſuch a manner, that at a diſtance it appears like a helmet, for their eyes only are ſeen. Being Mahometans, they cut off their hair, but leave ſome on the top of the head, round which thoſe who wear no cap contrive to fold their black cloth, ſo that it appears like a tuft on their helmet. Round their waiſt they wear a girdle of a dark colour. From ſeveral cords which fall from their ſhoulders hangs a Koran in a leather pouch, and a row of ſmall leather bags containing amulets. They always carry in their hands a ſmall lance neatly worked, about five feet long. Above the left elbow, on the upper part of the arm, they wear their national badge, a thick black or dark-coloured ring of horn or ſtone. Their upper dreſs is a Soudanian (Negro) ſhirt, over which a long ſword hangs from the ſhoulder. The travelling merchants of this nation carry fire arms, though others uſe only the ſword, the lance, and the knife, which they carry on their left arm; but the handle is finely worked; for they have the art of giving to copper as bright a colour as the Engliſh artiſts, and this art they keep very ſecret. They carry on a commerce between Soudan, (i. e. Nigritia), Fezzan and Gadamis. Their caravans give life to Mourzouk, which without them is a deſert; for they, like the Soudanians (Negroes) love company, ſong, and muſic. The Tuarick are not all Mahometans. In the neighbourhood of Soudan and Tombuctoo live the Tagama, who are white, and of the Pagan religion."

Dreſs.

Africa.

Hoſpitality is the moſt remarkable virtue of the Moors, or Arabs of the deſert. The chief of a horde is by cuſtom bound or entitled to entertain all ſtrangers; but every tent contributes to his ſtock of proviſions. When a ſtranger reaches an Arab horde, the firſt perſon who perceives him points out the tent of the chief. If the maſter is not preſent, the wife or the ſlave comes forth to meet him, and brings him milk to drink. His camels are then unloaded and his effects ranged around him. His arms are depoſited near thoſe of the maſter of the tent. The Arab, who in the field is a rapacious plunderer, in his tent is generous and hoſpitable; and the perſon of an enemy is inviolable, though he ſhould have killed the near kinſman of its maſter. All this, however, is chiefly to be applied to perſons of their own religion; for towards Chriſtians and Jews, their fanaticiſm renders them extremely intolerant. A Jew, more eſpecially, if diſcovered, can ſcarcely eſcape alive from among them.

Hoſpitality.

Polygamy is allowed among the Arabs of the deſert, as among other Mahometans; but it is very effectually reſtrained by the poverty of the people. Divorce is permitted at the will of either party; but if a male child is born, the marriage becomes indiſſoluble. In the education of children force is never employed. The prieſts, who are the teachers, inſtruct them to read the Arabic characters and ſentences of the Koran; but if the child become weary of the ſchool, he quits or returns to it at pleaſure, without being reproached.

Manners.

Education.

Property deſcends by inheritance in equal ſhares to the male children; but the females have no ſhare, and are obliged to reſide with their eldeſt brother. The chief of the horde becomes the guardian of the children who are left orphans. Property is ill ſecured by their cuſtoms. If a thief is caught in the fact he may be puniſhed; but if he eſcape with his booty, it cannot afterwards be claimed.

Mode of ſucceſſion to property.

The abſtinence and hardſhips which the Moors of the deſert are frequently under the neceſſity of encountering, and their habits of predatory war againſt paſſing caravans, or hoſtile tribes, bellow upon them an evident ſuperiority over the more peaceful tribes of Negroes who inhabit the fertile regions of the ſouth. They poſſeſs alſo the knowledge of writing, and of the Arabic language, which inſpires them with no ſmall confidence of the importance of their own character

Character of the Moors.

and

Africa. and accomplishments. Hence, they assume a haughtiness of gait, and a ferocity of aspect, which distinguishes them no less than their complexion from the Negroes in their neighbourhood. Such is the presumption resulting from these sentiments, that though a small party of Negroes would never risk themselves in the desert, one or two Moors will travel with impunity through all Africa, and plunder the Negroes by whom they have been entertained.

As the equator passes almost through the centre of Africa, by far the largest portion of that great continent is situated within the torrid zone, and is possessed by the Ethiopians and Negroes, who are called by the Arabs *Biled-al Soudan*, or *Biled al-Abiad*, the land of blacks, or the land of slaves. In all countries within the tropics, excessive rains fall twice every year about the time of the vernal and of the autumnal equinoxes. Periodical rains. At these periods every river is swelled into a mighty flood, and if the country be level it is completely inundated. From this circumstance, along with the heat of the climate, arises the extreme fertility of the middle regions of the globe.

Though the *Sahara*, or great Africa desert, extends a few degrees beyond the tropic of Cancer, yet its boundaries begin to be ill defined; fertile spots become more frequent: and at last, in the latitude of the Cape de Verd isles, and in the neighbourhood of the first rivers, the Senegal and the Niger, the gum forests mark the commencement of the land of the Negroes. Negroeland. About 600 miles from the western coast, in the mountains of Kong, the river Senegal takes its rise, and River Senegal. flows westward into the Atlantic ocean. The same mountains are the source of the great river of the Ethiopians, the Niger, the knowledge of which, from Niger. the time of Herodotus, seems to have been lost by the European nations, and has only been recently restored in consequence of the intrepid and persevering exertions of our countryman Mungo Park, who had been employed by the African Association to endeavour to discover whether its existence ought to be regarded as a reality or as an error of the ancient geographers. It runs eastward; but its termination, as will be afterwards noticed, is still unknown.

To the south of these rivers, all Africa belongs to various nations of Negroes, among whom considerable varieties of appearance and of character exist. In general, however, they are distinguished by short woolly hair, flat noses, thick lips, and black complexion, while their intellectual powers have been supposed by some to be inferior to those of the civilized European or Asiatic nations. Some modern writers, however, such as Bruce and Volney, are of opinion, that the elements of the arts and sciences came originally from Upper Egypt and Abyssinia, and the ancients appear to have ascribed to the Ethiopians the commencement of civilization among mankind. "The Thebans (says Diodorus) consider themselves as the most ancient people on the earth; and assert, that with them originated philosophy and the science of the stars. Their situation, it is true, is infinitely favourable to astronomical observation, and they have a more accurate division of time into months and years than other nations." The same opinion he attributes to the Ethiopians. "The Ethiopians conceive themselves to be of greater antiquity than any other nation; and it is probable that, born under the sun's path, its warmth may have ripened them sooner than other men. They suppose themselves also to be the inventors of divine worship, of festivals, of solemn assemblies, of sacrifices, and every other religious practice. They affirm that the Egyptians are one of their colonies; and that the Delta, which was formerly sea, became land by the conglomeration of the earth of the higher country, which was washed down by the Nile. They have, like the Egyptians, two species of letters, hieroglyphics and the alphabet; but among the Egyptians, the first was known only to the priests, and by them transmitted from father to son, whereas both species are common among the Ethiopians." "The Ethiopians (says Lucian) were the first who invented the science of the stars, and gave names to the planets, not at random, and without meaning, but descriptive of the qualities which they conceived them to possess; and it was from them that this art passed in an imperfect state to the Egyptians."

Africa.

But though the antiquity of the civilization of Egypt cannot be disputed, there is little reason to believe that the middle regions of Africa ever exhibited the human character in a higher state of cultivation than it now possesses there. In all ages its inhabitants were engaged No traces of former refinement found in Africa. in the barbarous practice of selling each other into slavery to distant nations. No remains of ancient magnificence are to be found in their country, nor any instruments of art which mark the genius of an improved people. Even the plough is still unknown, and the ingenuity of man is only exerted to supply his most simple wants.

A great part of the country of the Negroes receives among Europeans the name of Guinea, a term as old Ancient name. as the time of Ptolemy, who applies it to the maritime districts, though this name is said to be utterly unknown to the natives of the country themselves, excepting where they have learned it from European traders. It would appear, however, to have originated from one of the central states or empires of Africa, upon the banks of the Niger, which though once possessed of great power, has now fallen into decay, and is lost in the empire of Tombuctoo, and some neighbouring states.

The middle regions of Africa bring to maturity all Productions of the middle regions. the tropical productions or fruits in their utmost perfection and abundance. With the slightest cultivation, rice, maize, millet, sugar, cotton, indigo, &c. are raised, along with some fruits peculiar to itself, among which may be mentioned the shea-tree, from which the vegetable butter is prepared, which forms a principal article of commerce in all the interior districts. The shea tree is said to resemble the American oak; the Vegetable butter. butter is prepared from the kernel of the fruit. This kernel resembles a Spanish olive, and is enclosed in a sweet pulp under a thin green rind. It is dried in the sun, and then boiled in water. Travellers tell us that the butter produced from it is white, firm, and better flavoured than that of milk. If this account of it be correct, which we have no reason to doubt, measures ought certainly to be taken for conveying this tree to the European settlements in the West Indies, and for cultivating it there, as it would undoubtedly be very valuable when reared in the vicinity of the *bread fruit tree*, which has lately been brought from Otaheite.

Various

Africa.

Various ſpecies of wild beaſts inhabit this country, as lions, leopards, hyænas, elephants, buffaloes, wild boars, rhinoceroſes, with great variety of the ſpecies of deer, and various kinds of monkeys. Innumerable ſpecies of ſnakes are alſo to be found here; one of the moſt remarkable of which, called the *ſinyacki*, is of a pale green colour with black ſpots, about a foot in length, and as thick as a man's finger. It poſſeſſes the power of ejecting a ſubtile vapour into the eyes of any animal that approaches within the diſtance of two or three feet, ſo as to occaſion extreme pain for ſeveral days, and even incurable blindneſs. Another ſpecies of ſnake, ſaid to be found alſo in Ceylon, grows here to the enormous ſize of 50 feet in length; the colour of the back is dark gray, with lines of a duſky yellow: part of the belly is of a lighter colour and ſpotted: it lurks, in moiſt ſituations, wreathed into curls, which include a ſpace of about five feet diameter, and give it at a diſtance ſome reſemblance to the mouth of a well. Over theſe curious rings it rears its head and part of its body, and remains immoveable till ſome animal approach within its reach, when it darts upon it; and, if the animal is large, twiſts its body round it, and with an immenſe force cruſhes all its bones; and having lubricated it with ſaliva, ſwallows it entire. After having devoured in this manner a large animal, the ſnake remains as if lifeleſs for many days during the proceſs of digeſtion, and in this ſituation may be eaſily deſtroyed. The cameleon is alſo found in this country, along with an immenſe variety of reptiles. Of theſe, ants are the moſt formidable and deſtructive to man. They differ in ſize from an inch in length to a minuteneſs that is almoſt imperceptible to the naked eye. They ſometimes burſt from their neſts in ſuch innumerable myriads as to deſtroy every thing on the ſurface of the earth, and to oblige the natives to deſert their habitations. They often extinguiſh fires by their numbers, and form bridges of their own dead bodies over ſhallow waters which impede their progreſs.—One ſpecies forms ſwarms like bees, and erects round pyramids of clay which becomes extremely hard. Theſe pyramids are uſually eight or ten feet high. Their interior conſiſts of galleries ſuited to the ſize of the animal, interwoven like a labyrinth, having a ſmall opening as a door or entry to the dwelling.

Wild animals.

Snakes very deſtructive,

and of immenſe ſize.

The cameleon.

Immenſe myriads of ants.

Monſtrous ſpiders alſo exiſt in this country, a ſingle thread of whoſe web, it is ſaid, will ſupport a weight of ſeveral ounces.

Spiders.

The natives of this country have too little art or induſtry to take much advantage of the metals with which the earth is ſuppoſed in many places to abound. In ſome ſituations, however, they produce iron of a tolerable quality, but gold is the chief object of their ſearch. It does not appear, however, that they have ever wrought the mines of it which they have diſcovered to any depth, and it is chiefly procured from the ſands of the rivers or of torrents after violent rains. It is then collected in ſome diſtricts in conſiderable quantities, and forms an important article of commerce. Women chiefly engage in this employment, and an individual may collect in general during the dry ſeaſon, as much as is equal to the value of two ſlaves. The gold obtained is either uſed in commerce or wrought into ornaments for the women. The ſtandard of value is called *mankalli*, which is equal in value to about 10s.

Metals.

Iron and gold.

Africa.

In general, however, it may be remarked, with regard to all the natural productions of this continent, whether animal, vegetable, or mineral, that they ſtill remain in great obſcurity, and preſent a vaſt field for the inveſtigation of the natural hiſtorian.

Natural productions little known.

The general character of the Negroes, who are the inhabitants of theſe fertile regions, is that of extreme levity. It is ſaid, that they will dance for almoſt 24 hours together, and they do not ſuffer their gaiety to be diſturbed by events, which, in other countries, are productive of much unhappineſs. They do not appear to want the feelings of humanity, nor are they more deſtitute of ſagacity than other men and women of an equal degree of education; but the general fertility of their country, which ſupplies them with food in conſequence of the exertion of a very ſlight degree of induſtry, and the little occaſion they have for clothing amidſt the heat of their climate, produces an indolent and general habit of ſeeking preſent pleaſure, and of baniſhing from their minds all care for the future.

Character of the Negroes.

The kind of government that exiſts among the Negro nations is by no means uniform. In many diſtricts the country is governed by an immenſe multitude of independent petty chiefs, who are engaged in frequent wars with each other. In other places the talents of individual chieftans have been able to reduce conſiderable tracts of territory under their dominion. In ſuch caſes, in conſequence of the internal tranquillity produced by the extenſion of the prince's power, flouriſhing towns have grown up. Thus upon the Niger ſtands the town of Sego the capital of Bambara, which was viſited by Mungo Park, and which lies in N. Lat. 14° 10′, and W. Long. 2° 26′, containing about 30,000 inhabitants. Two hundred miles below this upon the ſame river ſtands Tombuctoo, the great centre of the commerce of Fezzan, Cairo, and the countries on the north of Africa, with the land of the Negroes. Farther down the ſame river ſtands Houſſa, which is underſtood to be a city of ſtill greater extent. Many of the Negro towns are fortified with ditches and walls, built like the houſes of the natives of clay and ſtone. The trenches are ſometimes flanked with ſquare towers like a regular fortification, and the walls are very high.

Government.

Town of Sego.

Tombuctoo.

Houſſa.

Domeſtic ſlavery prevails in a very great degree among all the Negro ſtates. As the tropical rains ſometimes fail or are deficient in quantity, the ſcorching heat of the ſun burns up the face of the country, and produces a moſt frightful barrenneſs. On theſe occaſions it is not uncommon for parents to ſell their children, and even themſelves, for bread. A freeman may alſo loſe his liberty by being taken priſoner in war, or on account of the real or ſuppoſed crimes of murder and ſorcery. He alſo forfeits it in conſequence of inſolvency. From theſe cauſes domeſtic ſlavery prevails to ſuch a degree, that in many places three-fourths of the natives are ſlaves. Theſe ſlaves, however, form in ſome meaſure a part of the community; and, by the cuſtom of the country, the maſter cannot ſell one who is born his ſlave, without accuſing him of a crime, a circumſtance, which, in conſequence

Slavery.

Africa. of the ſlave trade, at times gives riſe to much diſſenſion, and to wars which reſemble, in ſome meaſure, the ſanguinary conteſts which exiſted in various countries in Europe, during the feudal times, between the villains and their lords. Thus, in 1785, a general inſurrection took place in many diſtricts on the weſtern coaſt: the ſlaves attacked their maſters, maſſacred great numbers of them, ſet fire to the ripe rice, blockaded the towns, and obliged them to ſue for peace.

Arts in a rude ſtate. Few arts have been brought to much perfection by the Negroes, becauſe the diviſion of labour has been little known among them. The ſame individual ſpins, weaves, ſews, hunts, fiſhes; forms baſkets, fiſhing-tackle, inſtruments of agriculture; makes ſoap, dyes cloth with indigo, and makes canoes. In all theſe, the neatneſs of the work excites the aſtoniſhment of ſtrangers, who know the diverſity of occupations in which the ſame individuals engage, and the imperfection of the tools with which they labour. They are no ſtrangers, however, to that ordinary diviſion of labour to which nature herſelf ſeems to have given riſe in conſequence of the diſtinction of the ſexes. The women ſpin, and the men weave the cotton cloth of which their dreſſes are compoſed. The cotton is prepared for ſpinning by rolling it with an iron ſpindle upon a ſmooth ſtone or board. The thread is well twiſted though coarſe, but the loom is ſo narrow that the web is only about four inches broad. The women dye this cloth with the leaves of indigo, pounded freſh, and mixed with a ſtrong alkaline ley, formed by the lixiviation of wood aſhes. The colour thus produced is a rich and durable blue with a purple gloſs.

Weaving.

Dyeing.

The workers in metals and the manufacturers of leather appear to be almoſt the only inſtances of what may be called a ſeparate profeſſion exiſting among the Negroes. The manufacturers of leather ſeparate the hair by ſteeping the hides in a mixture of wood aſhes and water, and uſe the pounded leaves of a tree called *goo*, as we do the oak bark, for the purpoſe of tanning. They dye the ſkins of ſheep and goats red with powdered millet ſtalks, and yellow with a root which abounds in their country. The manufacturers of iron ſmelt that metal in ſome of the interior diſtricts; but it is generally hard and brittle. They form their weapons and tools of it, however, with conſiderable ingenuity. In ſmelting gold they uſe fixed alkaline ſalt, obtained by waſhing with water the aſhes of burned corn ſtalks, and evaporating the ley to dryneſs. It muſt alſo be remarked, that, in the interior of the country, Mungo Park found a negro who manufactured gunpowder from nitre collected from the reſervoirs of water frequented by the cattle, and ſulphur ſupplied by the Moors, who obtain it from the Mediterranean. He pounded the ingredients in a wooden mortar, and granulated it; but the grains were unequal, and the ſtrength of the gunpowder was very inferior to that of Europe.

Tanning.

Gunpowder.

The only neceſſary of life in which the country of the Negroes appears to be extremely deficient is ſalt, which is the more wanted among them in conſequence of their ſubſiſting chiefly upon vegetable food. A child cries for a piece of ſalt as for a great delicacy; and it is a proverbial expreſſion of a man's riches, to ſays, that he eats ſalt to his food. This important article they receive from the great deſert by caravans of trading Moors. They alſo receive arms, hardware, glaſſes, and trinkets of all ſorts, on the weſtern coaſt from the Europeans, and, in the interior, from the caravans of Cairo, Fezzan, and Morocco. For theſe they give in return, gold, ivory, and ſlaves. With regard to the ivory, the Negroes cannot comprehend for what reaſon it is ſo much valued by ſtrangers. It is in vain to tell them that ſhips are built, and long voyages undertaken, to procure it to make handles for knives. They are ſatisfied that a piece of wood might ſerve the purpoſe as well, and imagine that it is applied to ſome important uſe which is concealed from the Negroes, leſt they ſhould raiſe the price of it. The trade of the Negroes is conducted by barter; and to adjuſt the value of their different articles of commerce, they appeal to a nominal ſtandard, conſiſting of a certain quantity of any commodity for which there is a great demand. Thus on the Gambia, that quantity of ivory or of gold-duſt which is eſtimated as equal in value to a bar of iron, is denominated a *bar* of ivory, or a *bar* of gold-duſt.

Africa. Trade.

Medium of commerce

A marvellous ſtory has, in all ages, been told of a ſtrange mode of conducting commerce that exiſts among certain African tribes who live in the wildeſt mountainous diſtricts: they are ſaid to engage annually in trade, but at the ſame time to ſeclude themſelves from all perſonal intercourſe with the traders who viſit them: They traffic chiefly in gold-duſt, which they bring to particular places, and there leave it upon the approach of the traders, who depoſite quantities of goods which they are willing to give for the gold-duſt, and thereafter retire. The natives then approach and carry off the goods, or the gold-duſt, according as they think fit to accept or reject the bargain. From the days of Herodotus down to our own times, this ſtory has been repeated by various writers, and in particular by Wadſtrom, upon the authority of the chevalier de la Touch, vice-governor of Goree, in 1788, who is ſaid to have viſited the diſtricts inhabited by theſe inviſible traders.

Singular mode of trading.

The knowledge of the Negroes with regard to all ſpeculative ſubjects, is extremely limited. Their notions of geography and aſtronomy, like thoſe of other rude nations, are altogether puerile. They regard the earth as a vaſt plain, the boundaries of which are covered with clouds and darkneſs. The ſea is a great river of ſalt water; beyond which is the land of the white people; and at a ſtill greater diſtance, is the land to which the ſlaves are carried, which is inhabited by giants, who are cannibals. Eclipſes are aſcribed to enchantment, or to the interpoſition of a great cat, which puts its paw between the moon and the earth. They divide the year by moons, and calculate the years by the number of rainy ſeaſons. They ſeem to believe in one God, who has power over all things; but their religious opinions are extremely undefined, ſo that it is in vain to expect to find among them any ſyſtem of belief that is either univerſally received or even conſiſtently adhered to by the ame individuals. They in general ſeem to think, that the god of the blacks or Negroes is different from the god of the whites: When they are pleaſed with their own condition and their country, they repreſent the black deity as a good being, and the white deity as a kind of devil, who ſends the white people to makes ſlaves of the

Knowle of the N groes ex tremely mited.

Religio opinion

Africa.

the Negroes: But when they are in ill humour, they complain of their black deity as miſchievous and cruel; while they ſay that the white deity gives his people the Europeans brandy and fine clothes, and other good things which are denied to the Negroes. Their notions of a future ſtate are of the ſame fluctuating nature. They have a confuſed idea that the exiſtence of the human mind does not terminate with this life; and they ſeem to venerate the ſpirits of the dead, regarding them as protectors, and placing victuals at the graves of their anceſtors upon ſtated occaſions. In general, however, they regard death with great horror; and in Whidah it was a law, than no perſon, on pain of death, ſhould mention it in preſence of the king. Some of them have a notion of a future ſtate as connected with rewards and puniſhments of their conduct in this life. They imagine that the deceaſed are conveyed to a mighty river in the interior regions of Africa, where God judges of their paſt lives, and particularly of the regularity with which they have celebrated the new moons, which among the Negroes are kept as feſtivals; and of the fidelity with which they have adhered to their oaths. If the judgement is in their favour, they are gently wafted over the great river to a happy country, reſembling in deſcription the paradiſe of Mahomet, where they enjoy plenty of all thoſe things which they were accuſtomed to value in this world: But if the judgement is unfavourable, they are plunged into the river, and never heard of more. They alſo believe, like the vulgar of moſt other countries, that the ghoſts of perſons who have been guilty of great and unexpiated crimes, find no reſt after death, but haunt or wander about thoſe places in which their crimes were committed. The Aſiatic doctrine of the tranſmigration of the ſouls of men after death into the bodies of other animals, is alſo entertained by ſome of them.

ſions of future are.

the cre. on of a.

The opinions of the Negroes concerning the creation of man are not more fixed or definite than their ideas of his future exiſtence. In general, they aſcribe his original creation to the deity; but ſome of them pretend that he emerged, they know not how, from the caves and holes of the earth, or was produced by a monſtrous ſpider. A curious fiction upon this ſubject is alſo ſaid to prevail in ſome of the Negro ſtates:—That God originally created both black men and white men; that he meant to beſtow one gift upon each of them, gold or wiſdom; that he gave the black men their choice, and that they preferred gold, and left wiſdom or ingenuity to the whites; that God was offended with them on account of this improper choice, and ordained them to be ſlaves for ever to the white men.

provi- ce.

They alſo believe in a divine providence which ſends rain to give fertility to the earth and the trees, and to waſh down gold from the mountains. Accordingly, they pray fervently to God to give them thoſe things upon which they ſet the greateſt value, ſuch as rice and yams, and gold, and ſlaves, and health, and activity. At the ſame time, from their inaccuracy of thinking upon this ſubject, they readily ſay, when converſed with, that it is not God but the earth that gives them rice; that their cattle produce young without the aſſiſtance of God; and that, if they did not labour for themſelves, they might ſtarve before God would help them.

Africa.

From this looſe and inaccurate mode of reaſoning, the religion of the Negroes ſits very light upon them. They ſeem to have a ſort of prieſts, who perform ſome ceremonies at the new moons, and on certain occaſions, ſuch as, at marriages, or on giving names to young children; but theſe prieſts having no ſettled ſyſtem of doctrine, and not being united into a diſciplined body, poſſeſs very little influence. Hence it is extremely eaſy to induce the Negroes to adopt the religion of any more intelligent people. Accordingly, the Moors have made many converts among them; and ſome of the moſt conſiderable Negro ſtates upon the northern frontier, that is, upon the Senegal and the Niger, are Mahometan.

Superſti- tion.

But though the Negroes have little ſpeculative religion, they have much ſuperſtition, as appears from the great uſe which they make of what are called *fetiches*, or charms termed *obi* by the Africans in our Weſt India iſlands. The fetiche conſiſts of any natural object, which chances to catch hold of the fancy of a Negro. One ſelects the tooth of a dog, of a tiger, or of a cat, or the bone of a bird; while another fixes on the head of a goat, a monkey, or parrot, or even upon a piece of red or yellow wood, or a thorn branch. The fetiche thus choſen, becomes to its owner a kind of divinity, which he worſhips, and from which he expects aſſiſtance on all occaſions. In honour of his fetiche, it is common for a Negro, to deprive himſelf of ſome pleaſure, by abſtaining from a particular kind of meat or drink. Thus one man eats no goats fleſh, another taſtes no beef, and a third no brandy or palm wine. By a continual attention to his fetiche, a Negro ſo far impoſes upon himſelf, as to repreſent it to his imagination as an intelligent being, or ruling power, inſpecting his actions, rewarding his virtues, and puniſhing his crimes. Hence he covers it up carefully whenever he performs any action that he accounts improper. The importance or value of a fetiche is always eſtimated according to the ſucceſs of its owner, and the remarkable proſperity of an individual brings his fetiche ſo much into faſhion, as to induce others to adopt it. On the contrary, when a Negro ſuffers any great misfortunes, he infallibly attributes it to the weakneſs of his fetiche, which he relinquiſhes, and adopts another that he hopes will prove more powerful. A fortunate fetiche is uſually adopted by the whole family of its poſſeſſor, to which it becomes an object of reverence, or a guardian like the houſehold gods, *dii lares* and *penates*, of the ancient Romans. Sometimes a whole tribe or a large diſtrict has its fetiche, which is regarded as a kind of palladium upon which the ſafety of their country depends. Thus at Acra the national fetiche was a lake, which the people accounted ſacred. This lake was converted into a ſalt pit by the Portugueſe, and the natives regarded this profanation as the cauſe of the conqueſt of their country by a neighbouring tribe called the *Aquamboans*. Thus alſo at Whidah, although the people believe in one ſupreme god, they worſhip as their national fetiche a kind of ſerpent of monſtrous ſize, which they call the *grandfather of the ſnakes*. They ſay that it formerly deſerted ſome other country, on account of its wickedneſs, and came to them, bringing good fortune and proſperity along with it. From this account of the fetiches of the Negroes, the intelligent reader will naturally remark that even idolatry itſelf remains in an

Africa

imperfect ſtate among the people; and he will obſerve the difference between the poliſhed ſuperſtition of ancient Greece and Rome, and the vulgar and unadorned credulity of theſe rude and artleſs tribes. In the vicinity of their ſettlements, the Moors have prevailed with the illiterate Negroes, to adopt as fetiches or charms, certain ſentences of the Koran, which they write out and ſell to them, under the name of *ſaphies*. Mungo Park, when travelling among them, ſometimes ſold ſaphies, which uſually conſiſted of the Lord's prayer.

Singular cuſtoms.

Among the Negroes ſome ſingular cuſtoms prevail, which are not unworthy of notice, on account of their having ſome ſimilarity to certain practices that have ſubſiſted among other nations. Perſons accuſed of any crime, more eſpecially of poiſoning, are frequently required to prove their innocence, by drinking what is called the *red water*. This is a poiſonous liquor formed from the roots of certain plants, and the barks of trees, of a very narcotic quality. The accuſed is placed on a high chair, and ſtript of his clothes, having only a quantity of plantain leaves wrapt round his waiſt. He then, in preſence of the whole village, eats a little rice, and drinks about an Engliſh gallon of the red water, which is extremely apt to find the accuſed perſon guilty. If he eſcape unhurt, however, and without vomiting, he is judged innocent. Much dancing and ſinging takes place on account of his eſcape, and he is allowed to demand that ſome puniſhment be inflicted on his accuſers on account of the defamation. Among the ſuperſtitious cuſtoms of the Negroes, may be mentioned the practice of circumciſion, which is univerſal among them. It is not regarded as a religious rite, but as a kind of charm for preventing barrenneſs. It is not performed till the age of puberty.

Secret ſocieties of men.

In ſeveral Negro ſtates certain ſecret ſocieties or fraternities exiſt, which poſſeſs great political influence, and in ſome places abſolute power. One of theſe ſocieties, called the ſociety of the *Belli*, is appropriated to men, to the excluſion of women. It ſupports itſelf by the uſe of myſtical ſymbols, a pretence to the knowledge of important ſecrets, and by ſubjection to an imaginary being called the *Belli*, who is ſaid to be capable of changing his form at pleaſure. This ſociety monopolizes all public offices, to the excluſion of the uninitiated. The young men are introduced into it by a noviciate which laſts ſome years. A ſpace is marked out of eight or nine miles in circumference in a fertile ſpot, in which huts are built, and proviſions raiſed. The young men reſort thither, and are taught by inſtructors pitched upon by the ſociety, to fight, to fiſh, to hunt, and to ſing certain ſongs peculiar to the fraternity; they alſo receive new names as a mark of their new birth, and certain ſcars are imprinted upon their bodies, with heated inſtruments of iron, to point them out as belonging to the fraternity. On returning home after their initiation, they are received with great ceremony by their relations, as perſons now introduced into public life.

Of women.

There is a kind of counterpart of this aſſociation, though of leſs political importance, called the ſociety of the *Neſſoge* or *Sandi*, which is confined to females. In a remote wood, which men are prohibited to approach, a number of huts are conſtructed, and the young marriageable girls are conducted thither during the night. They remain in this ſolitude, under the care of certain matrons during four months, and are taught a variety of religious cuſtoms and ſuperſtitions. When their noviciate is expired, they return by night to their villages, where they are received by all the women both old and young quite naked, who parade about with them, playing upon ſome rude muſical inſtruments till daybreak. If any man ſhould approach this proceſſion, he would ſuffer death, or be compelled to redeem himſelf by a very heavy fine.

Africa.

There is a third kind of ſociety, which is much more univerſal than thoſe now mentioned, and ſeems to exiſt in all the Negro ſtates. This ſociety does not appear to have any ſpecial name, but it conducts the myſteries of a ſtrange imaginary being, called *Mumbo Jumbo*. As the practice of polygamy exiſts very univerſally among the Negroes, they often find great difficulty in preſerving the peace of their families amidſt a variety of rival wives. When the huſband finds his authority altogether contemned, he has recourſe to the aſſiſtance of *Mumbo Jumbo*. The dreſs of this ſtrange miniſter of juſtice uſually hangs upon a tree in a foreſt in the neighbourhood of every Negro village. It is made of bark, and forms a figure of about eight or nine feet high, with a tuft of ſtraw on its head. When Mumbo is about to appear, he announces his approach in the evening by diſmal ſcreams from the adjacent woods, and as ſoon as it is dark he enters the village and proceeds immediately to the public place, where all the inhabitants both male and female are obliged to aſſemble at his call; for this phantom has abſolute power. Nobody muſt appear covered in its preſence, and every perſon is bound implicitly to execute its commands. As the women know that the viſit is intended againſt ſome of them, they can have no great reliſh for the ſolemnity, but they dare not refuſe to attend. The ceremony commences with ſongs and dances. Theſe continue till midnight, when Mumbo Jumbo fixes upon the individual on whoſe account he comes. She is immediately ſeized by his command, ſtripped naked, tied to a poſt, and ſcourged with Mumbo's rod, to the great entertainment of the whole aſſembly, and eſpecially of the reſt of the women, who are always loudeſt in their deriſion and cenſure of the culprit. The ſociety that conducts the appearance of this myſterious perſonage make uſe of a peculiar or cant language, which is not underſtood by the uninitiated. They pretend that Mumbo Jumbo is a wild man, or ſome ſtrange being that knows every body's thoughts. They bind themſelves by oaths never to reveal their ſecrets to a woman or a boy. The fraternity is ſo powerful, that when one of the Negro kings was weak enough to reveal the ſecret of Mumbo Jumbo's character to a favourite wife, who communicated it to the other females of the houſehold, he and his whole family were immediately aſſaſſinated, in the preſence, and by the command, of Mumbo Jumbo; and nobody dared to diſpute the propriety of their puniſhment.

Strange myſteries.

Like all rude nations, the different tribes of Negroes are implicit believers in witchcraft and magic, and in the exiſtence of various kinds of ſorcerers. Theſe ſorcerers they regard with the utmoſt terror and abhorrence. They believe that ſome of them have power to controul the ſeaſons, and to prevent the rice from arriving at maturity. Others of them are ſuppoſed to ſuck

Magic & ſorcery.

Africa. ſuck the blood of men and beaſts, and to occaſion all kinds of diſeaſes. When they ſuſpect a perſon to have died in conſequence of ſorcery, they interrogate the corpſe, which they believe gives anſwers in the affirmative, by forcibly impelling forward the perſons who bear it, and in the negative by a rolling motion. If an anſwer is given in the affirmative, they inquire concerning the murderer, beginning with the relations of the deceaſed and naming the ſuſpected perſons. When the guilty perſon is named, they ſay, that the corpſe impels the bearers forward; and upon the authority of this evidence, the perſon accuſed is ſeized and ſold into ſlavery, and ſometimes alſo his whole family. It is evident that a trial of this kind may be ſo managed, as on all occaſions to ſecure the condemnation of the accuſed perſon. Accordingly, in proportion to the demand for ſlaves, accuſations of ſorcery are more frequently brought forward againſt their ſubjects by the Negro chiefs. Theſe accuſations, however, are ſometimes alſo brought againſt perſons of importance, who cannot be ſold on account of their rank, or againſt aged perſons, whom nobody will purchaſe. In theſe caſes, the perſon convicted is compelled to dig his own grave; and being placed at the foot of it, one from behind ſtrikes him a violent blow upon the back of the head or neck, which cauſes him to fall upon his face into the grave. Some looſe earth is then thrown upon him; a ſtake of hard wood is driven through his body, and the grave is filled up.

Tenacious of their cuſtoms. Of theſe and all their other cuſtoms, the Negroes are extremely tenacious; and this tenacity of their cuſtoms, down to the minuteſt trifles, forms the principal obſtacle to their civilization or improvement. Thus it is the cuſtom to cut the rice, ſix or eight inches below the ear, by two or three ſtalks at a time, according as they can be graſped between the thumb of the right hand and a knife, which is held in the ſame hand. The ſtalks are leiſurely transferred to the left hand, and when it is almoſt full, they are tied like a noſegay and put into a baſket. A Negro chief who had ſeen the Engliſh mode of reaping, ſaid, that it would coſt an African his life, ſhould he attempt to introduce it into his country, as he would be accuſed of intending to overturn the ancient cuſtoms, and would be compelled to drink the red water. By means of their cuſtoms, alſo, property is rendered leſs valuable than in other countries, which operates as a diſcouragement to induſtry. Their agriculture is carried on in concert by the inhabitants of every diſtrict, who ſhare in common the products of their harveſt. Hence the idea of excluſive property is rendered very vague, while the unlimited exerciſe of the law or cuſtom of hoſpitality, renders the poſſeſſion of it uncertain; as the induſtrious are forced to ſhare their wealth with the indolent. Begging is not reckoned diſgraceful; and if a perſon has been negligent in providing the neceſſaries of life, he has only to diſcover where proviſions are to be found, and he muſt obtain a ſhare; for if he enter a houſe during a repaſt, the maſter, by cuſtom, cannot avoid inviting him to partake. As domeſtic ſlavery, however, and the traffic in ſlaves, conſtitutes a moſt profitable branch of the African cuſtoms, it is not wonderful that their chiefs adhere to them with peculiar obſtinacy.

The labours of the field performed in common. Hoſpitality unlimited. Encourages indolence.

With regard to the private or domeſtic economy of the Negroes, it may be obſerved, that their houſes Africa. conſiſt uſually of a circular wall, built of mud, or of clay and ſtone, about four feet high, with a conical roof of bamboos, covered or thatched with hay. As houſes of this ſtructure cannot well be divided into ſeparate apartments; where there is a plurality of wives, each has a hut appropriated to herſelf, and the whole huts belonging to a family are ſurrounded by a fence of bamboos formed into a kind of wicker work. A number of theſe encloſures, with intermediate paſſages or ſtreets, which have no regular arrangement, form a town or village. The furniture of their houſes uſually conſiſts of a bed, formed of a frame of canes, covered with a bullock's ſkin or with a mat, and of one or two wooden ſtools, and a few wooden diſhes and pots for dreſſing food. The dreſs of both ſexes is formed Houſes. Dreſs. of cotton cloth; that of the men uſually conſiſts of a looſe ſhirt or frock with wide ſleeves, together with drawers or trowſers, which reach to the middle of the leg. Some of the Negroes add to theſe a cap and ſandals. The dreſs of the women conſiſts of two pieces of cloth, each of which is about ſix feet long, and three feet broad. The one is wrapt round the waiſt and hangs down to the ankles, and the other is negligently thrown over the ſhoulders.

The ſtate of the women, as among other barbarous State of nations, is by no means favourable. It is in general women. accounted altogether unneceſſary for a lover to make propoſals to his intended bride. She is conſidered as the property of her father, from whom he purchaſes her, and to whom he generally pays a price equal to the value of about two ſlaves. When he has agreed with the parents, therefore, with whom he eats a few nuts to ratify the contract, the propoſed bride muſt give her conſent, or remain for ever unmarried; for if ſhe is given to another, the lover is entitled to ſeize her for a ſlave. On the day of marriage the bride is con- Marriages. ducted with great ceremony to the houſe of the bridegroom, who muſt furniſh abundance of liquor and refreſhments to her attendants. On approaching the houſe, the bride is covered all over with a robe of white cotton, and is carried on the back of a woman to the houſe of her huſband. She is then placed amidſt a circle of matrons, who give her many inſtructions about her future life. The day is concluded with dances, ſongs, and feaſting, and the validity of the marriage is confirmed by exhibiting tokens of virginity according to the Moſaic law.

A man is allowed to have as many wives as he can Polygamy. afford to purchaſe, and they are treated in a great meaſure as ſlaves, being in general compelled to take the whole charge of the agriculture abroad, as well as of the preparation of food for the family at home. When the huſbands, however, are contented with one or two wives, inſtances of conjugal infidelity are uncommon; but when they have a greater number, they are often under the neceſſity of overlooking the accidental gallantries of their wives, in conſequence of the impoſſibility of ſubjecting them to rigid confinement in the ſimple ſtate of ſociety in which they live. The Negro women ſuckle their children till they are able to walk, and ſometimes till they are three years old, and during that period have no connection with their huſbands.

After this account of the Negroes in general, we

ſhall

Africa.

Particular tribes. Mandingoes.

shall proceed to take notice of some of the more remarkable tribes into which they are divided, and with which we have been made acquainted by the latest travellers. Of these the tribe of *Mandingoes* is the most important. They derive their name from a district in the interior of Africa, called *Manding*. This territory is situated in the most elevated northern tract of the country of the Negroes, near the sources of the rivers Senegal and Gambia, which flow into the Atlantic on the west, and of the Niger, which proceeds towards the east. Kamaliah, which is one of its towns, and was visited by Mr Park, lies in 12° 46′ N. Lat. Though Manding is in so high a level, and abounds in gold, it is not mountainous or barren. The tribe that has issued from it, and assumes the name of *Mandingoes*, forms by far the most numerous race of Negroes through the whole western quarter of the continent of Africa. Their territories intermingle in various situations with the possessions of other states, and they even form the bulk of the population where other tribes enjoy the sovereign power. Their language is by far the most universally understood of all the Negro tongues, and it appears to be more polished than any other. The Mandingoes are a tall slender race, of a colour moderately black. Their eyes are remarkably small, and they wear their beards. They are more industrious, and engage more extensively in commerce than the other Negroes, so that they are frequently employed as agents in making bargains by persons of other tribes. In the character of travelling merchants, and instructors of youth, they have insinuated themselves into all the Negro countries, where they are distinguished by wearing more regularly than others a red or white cotton cap, and sandals. Some of them who have learned to read and write Arabic, and who profess Mahometanism, erect schools in the Pagan villages, and instruct the youth gratis. They assume a great appearance of sanctity, abstain from strong liquors, and pretend to the power of counteracting magic. Thus they acquire a most extensive influence, and few affairs of importance are transacted without their advice. In almost every district, troops of Mandingo merchants are to be met with; and as their intellectual powers are more developed than those of the other Negroes, they have been able to extend their language, as a kind of learned tongue, second only to the Arabic, along the Senegal and the Niger.

Language polished, and extensively known.

Industrious as merchants,

and instructors of youth.

In most of the Mandingo towns there are two public buildings; a mosque for public prayers, and what is called the *bentang*, which is a large stage formed of interwoven bamboos erected under a spreading tree. At the bentang all public affairs are transacted, and idle persons assemble to smoke tobacco, and hear news. In every village there is a magistrate, who preserves public order, levies the duties on merchants, and presides at the palavers or courts held by the old men, where justice is administered. At these courts civil questions between parties are debated. In the Pagan states the decisions are pronounced according to the customs of their fathers; but where Mahometanism is more generally received, which is usually the case among the Mandingoes, the Koran is the rule of judgement, or the *Sharra*, which contains a digest of Mahometan laws both civil and criminal. Certain Mahometan Negroes, who make the laws of the prophet their particular study, are frequently retained in causes, as professional pleaders, and they are said to exhibit great dexterity in perplexing the judges.

Courts of justice.

Africa.

The Pagan Mandingoes believe in one God, the creator of all things; but they consider him as of a nature too much exalted above human affairs, to give much attention to their prayers. They address him, however, at the new moons, and imagine every new moon to be a new creation. They fancy that certain subordinate spirits rule the world, and that these spirits are influenced by enchantments and fetiches. They believe in a future state, but most of them admit that they know nothing about it. Their funerals consist of a tumultuous procession, in which they make dismal howlings; and after burying the body beside some large tree, the solemnity terminates in a revel of drinking, and at last of dancing and singing.

Religion.

Next to the Mandingoes, the *Foulahs* are the most numerous race of Negroes on the western quarter of the continent of Africa. Their original country is called *Fooladoo*. It is a small state, situated near the sources of the Senegal and the Niger. From thence they have emigrated in powerful clans, and have acquired extensive territories, especially along these rivers, and along the Gambia. The Foulahs also possess the sovereignty of various insulated tracts southwards, towards Sierra Leona. Besides the fixed settlements in which they enjoy the sovereignty, they have introduced themselves in many places along the banks of the Gambia, and to the southward along what is called the gulf of Guinea, to a great distance, into the greater part of the Negro states, in the character of shepherds and cultivators of the ground. They obtain admission by paying a tax or rent to the chiefs of the territory for whatever lands they occupy, and emigrate at pleasure. In consequence of this mode of life, the sovereignty frequently fluctuates in the small states, between them and the Mandingoes, and other tribes, according to the proportion of the population, which often alters, from the emigrations of the Foulahs.

Foulahs.

The features of the Foulahs are very different from those of the other Negroes. They have a Roman nose, a thin face, and small features, with long glossy soft hair, so as to resemble in a great degree the East Indian Lascars. Their complexion is by no means of the permanent jetty colour of the other Negroes, but varies with the districts they inhabit, approaching to yellow in the vicinity of the Moors, and deepening into a moderate black towards the equator. Their stature is of the middle size, their form graceful, and their air insinuating. Their women are well shaped, and have regular features; but neither men nor women are so robust in their make as the other Negroes. Hence, they are accounted by the Negroes an intermediate race between themselves and the Moors; but the Foulahs consider themselves as superior to the Negroes, and class themselves among white nations. Their natural disposition is mild and humane, and they are extremely hospitable where the Mahometan religion has not taught them to treat infidels with reserve. They support with great care the aged and infirm of their own tribe, and frequently relieve the necessities of persons of other tribes. There are few instances of one Foulah being insulted by another, and they never sell their countrymen for slaves; on the contrary, if a Foulah

Features.

Character.

Africa. Foulah have the misfortune to be enſlaved, his whole clan or village contributes to pay his ranſom.

Occupations. The Foulahs engage more extenſively than the other Negroes in the raiſing of corn, and the breeding of cattle, but eſpecially in the latter occupation. Hence, the Mandingoes frequently entruſt their cattle to the care of the Foulahs. They render them tractable by familiarity; feed them by day in the woods and open meadows, and ſecure them by night in folds, which they fence very ſtrongly. Not ſatisfied with this precaution, the herdſmen, whoſe huts are erected in the middle of the fold, keep fires during the night burning around the folds, for the protection of the cattle againſt wild beaſts, and to ſhow that they are in a ſtate of preparation againſt robbers. From the neceſſity of guarding their cattle they become intrepid hunters, and kill lions, tigers, elephants, and other wild beaſts, with poiſoned arrows, or with muſkets which they purchaſe from the whites upon the coaſt. To poiſon their arrows, they boil the leaves of a particular ſhrub in water, and dip in the black juice a cotton thread, which they faſten round the barbs of the arrow.

From the milk of their cattle the Foulahs make conſiderable quantities of butter; but like all the Negro nations, they are entirely ignorant of the art of preſerving milk by making it into cheeſe. This art is probably prevented from being introduced by the heat of the climate, and by the extreme ſcarcity of ſalt, which can be obtained in no other way but by purchaſing it from the ſea coaſt, or from caravans of trading Arabs, who bring it on the backs of camels from the great deſert. They entertain a ſingular ſuperſtition, that to boil the milk of a cow prevents her from having any more. Hence, they will ſell no milk to any perſon whom they have once diſcovered to have boiled it.

Amuſements. Like the other Negro tribes, the Foulahs are exceſſively fond of dancing. They have alſo a ſtrong paſſion for muſic, and their chiefs account a practical ſkill in it a moſt reſpectable accompliſhment. Their national airs have a peculiar character, and are tender and pleaſing.

Though the Foulahs do not enſlave each other, they do not heſitate to make war upon the neighbouring tribes for the purpoſe of obtaining ſlaves, chiefly with a view of ſelling them to the Europeans upon the coaſt for fire-arms and gunpowder. Such at leaſt is the account of the matter, which was obtained in 1794 by Meſſrs Watt and Winterburn, who viſited Foota-jallo, an extenſive Foulah kingdom in the interior of Sierra Leona. This kingdom extends about 300 miles from eaſt to weſt, and 200 from north to ſouth. Temboo, the capital, contains 7000 inhabitants. The power of their king is in a great meaſure arbitrary. On an emergency, he can bring to the field 16,000 cavalry. The markets and all kinds of trade are regulated by him and his officers. The ſoil is in many places extremely fertile, producing rice and maize, which are cultivated by the women, and carried to market by the men. In general, however, the ground is dry and ſtony, but affords paſture for all kinds of cattle. Their women dig a ſpecies of iron ſtone from mines of conſiderable depth. The ore is afterwards manufactured into a very malleable metal. In this kingdom of Foota-jallo there are ſchools in every town; and the majority of the people can read. The Mahometan religion is profeſſed, but the mild character of the Foulahs prevents it from exhibiting that aſpect of intolerance towards ſtrangers which characterizes the profeſſors of this religion in other countries. Africa.

On the weſtern coaſt, a great part of the diſtrict between the rivers Senegal and Gambia, or, as it is often called, *Senegambia*, is inhabited by a nation called the *Jaloffs*, which differs conſiderably from the other tribes of the Negroes. Their ſtature is tall and robuſt, and, though their complexion is of the deepeſt black, their noſes are not ſo much depreſſed, nor their lips ſo protuberant, as thoſe of the Mandingoes. They excel their neighbours in the manufacture and dying of cotton cloth, which they form of a finer thread and a broader web. They uſe their toes with the ſame dexterity as their fingers in many operations. Hence when they perceive a pair of ſciſſars, a knife, or a toy which they covet, they turn their backs upon it, and, having engaged the owner in converſation, they ſeize it artfully with their toes, and throw it into a pouch which they wear behind. In this way, ſtrangers trading in their towns are amazed to find their goods vaniſhing before their eyes, while they cannot perceive the thief. The Jaloffs are very warlike, and equal the Moors in the management of horſes; but, as they are divided into a number of petty ſtates, which are continually engaged in war with each other, they have little power as a nation. In the ſucceſſion to their leaders or chiefs, they follow the female line as the ſureſt; and therefore, the eldeſt ſon of the eldeſt ſiſter of the chief is preferred. Jaloffs.

On the coaſt to the ſouth of the river Gambia, there exiſts a rude but induſtrious tribe, called the *Feloops*, who have little intercourſe with their neighbours. They poſſeſs conſiderable energy of character, and have reſiſted ſucceſsfully the attacks of the Mandingoes, even when aſſiſted by the Portugueſe. They are very faithful in friendſhip, and their enmity is equally permanent, as they tranſmit their family feuds from generation to generation. When a man is killed in a quarrel, his eldeſt ſon procures his ſandals, which he wears, on the anniverſary of the murder of his father, till he can revenge his death. In thoſe parts of their country in which the Europeans have committed any ravages, they give no quarter to a white man. They ſell to the Europeans, however, rice, goats, poultry, wax, and honey. Feloops.

Beſides theſe, a variety of tribes inhabit the ſame coaſt, and are known to Europeans under the appellation of *Nalloes*, *Biafaras*, *Biſſagoes*, *Balantes*, *Papels*, and *Banyans*, of whom it is unneceſſary to take particular notice, as they appear to be diſtinguiſhed by no peculiarity from the other Negro tribes.

Proceeding eaſtward in the country between the Senegal and the Gambia is *Bambouk*, a region of conſiderable extent. The natives were originally termed *Malinkups*; but, by intermingling with the Mandingoes, they have gradually ſo much aſſimilated to that people, as to loſe the character of a diſtinct tribe. The country is mountainous, but is unwholeſome and full of minerals. It abounds in mines of gold, ſilver, copper, tin, and iron, but is neither well ſuited for agriculture nor for paſturage. The working of the mines is regulated by the caprice or the wants of the Bamboulk. Mines of gold &c.

Africa

chiefs of the different diſtricts. The miners are indolent and unſkilful: They never penetrate beyond 10 feet in depth, though the quantity of gold increaſes with the depth of the mine. They regard gold as a capricious and malevolent being, who delights in deluding the miners; on which account they never attempt to recover a vein when it diſappears. The government of Bambouk fluctuates, like that of many of the Negro ſtates, between monarchy and ariſtocracy, and the power of the king or ſupreme chief is extremely limited.

The frontiers of the Negro kingdoms uſually conſiſt of a wild or deſert tract. Thus the kingdom of Woolli, which is on the north-weſt of Bambouk, is ſeparated on its eaſtern boundary, by a wilderneſs filled with wild beaſts, from the kingdom of Bondou, which lies to the north of Bambouk. Fattecondi is the capital of Bondou, at which the king reſides. The king cauſed Major Houghton, an Engliſh traveller employed by the African Aſſociation, to be plundered; and he begged from Mr Mungo Park his blue coat, which that traveller was under the neceſſity of giving him, to avoid bad uſage. His revenues, however, are conſiderable. His authority is firmly eſtabliſhed, and his power is formidable to his neighbours. He was ſo well pleaſed with obtaining Mr Park's blue coat, adorned as it was with yellow buttons, that, on the following day he preſented to him ſomewhat more than half an ounce of gold, exempted his baggage from examination by the tax-gathers, and allowed him to pay a viſit to the women of his ſeraglio. The country at large is covered with wood, and, as it is in an elevated ſituation, and conſequently ſomewhat leſs expoſed than elſewhere to the burning heat of the climate, it is abundantly fertile. The frontier town of the kingdom eaſtward is called *Joag*. It contains 2000 inhabitants, is ſurrounded by a high wall with holes for muſkets, and is in 14° 25′ N. Lat. and 9° 12′ W. Long.

To the north-eaſt of Bondou is the Mandingo kingdom of Kaſſon, in which this peculiar cuſtom or ſuperſtition prevails, that no woman is allowed to eat an egg. Kooniakary, the capital, lies in N. Lat. 14° 34′, about 59½ geographical miles to the eaſt of Joag. To the ſouth-eaſt of Kaſſon is the kingdom of Kaarta, which is bordered on the eaſt by Bambara, between which and Kaarta there are very frequent wars; a circumſtance which renders travelling through theſe and other Negro ſtates not a little difficult. The people are induſtrious: The cultivation of corn is carried on to a great extent, eſpecially in Bambara. They are Mahometans, without the intolerant fanaticiſm of that religion; and accordingly, they are hoſpitable to ſtrangers, though of a different faith. The neighbourhood of the Moors, however, renders the country unſafe; and, to guard againſt their incurſions, the Negroes, when employed in agriculture, are under the neceſſity of carrying their arms to the field.

Sego.

Sego, the capital of Bambara, lies in N. Lat. 14° 10′, and W. Long. 2° 26′; and contains about 30,000 inhabitants. It was here that Mungo Park at laſt beheld the long-ſought majeſtic river Niger glittering to the morning ſun, as broad as the Thames at Weſtminſter, and flowing ſlowly from weſt to eaſt. This river is here called the *Joliba* by the natives. From the times of the Naſamonian explorers prior to the days of Herodotus, during 2300 years, no certain intelligence concerning this river had been obtained by the European nations, and its very exiſtence had been doubted by the moſt intelligent writers. Mr Park is the only European traveller who ſince that period can boaſt of having reached it. Sego conſiſts of four diſtinct towns; two of which are on the north and two on the ſouthern part of the Niger. They are ſurrounded by high mud walls. The houſes are of a ſquare form; they are built of clay, and have flat roofs. The ſtreets are narrow; and, as the Moors form a conſiderable proportion of the inhabitants, their moſques appear in every quarter. The language, however, is a dialect of the Mandingo. The authority of the Negro king of Bambara is not a little reſtrained here by the influence of the Moors; and, to avoid giving offence to their intolerant ſpirit, he was under the neceſſity of ſending Mr Park immediately out of the city to a village in the neighbourhood. The weather was ſtormy, but ſome Negro women conducted him into a hut, gave him food, and thereafter began to their accuſtomed labour of ſpinning cotton. During their work they amuſed themſelves with a ſong, compoſed upon the occaſion, which one of them ſung to a plaintive air. The tranſlation of the ſong is in theſe terms: "The wind roared and the rains fell; the poor white man, faint and weary, came and ſat under our tree. He has no mother to bring him milk, no wife to grind his corn. *Chorus.* Let us pity the white man, no mother has he," &c.

The current money of this place conſiſts of cowries, a kind of ſhells (*cypræa moneta Lin.*) which are alſo employed in the ſame way in Bengal. A man and his horſe can ſubſiſt during 24 hours upon the proviſions that 100 of them will purchaſe. The king of Bambara preſented Mr Park with 5000 cowries, and deſired him to leave the neighbourhood of his capital, that he might not be deſtroyed by the Moors. This traveller perſevered in advancing eaſtward down the river to another town called *Silla*, ſituated in N. Lat. 14° 48′, and W. Long. 1° 24′, about 1090 Britiſh miles eaſt of Cape Verd. This formed the utmoſt limit to which he was able to advance, and therefore remains the boundary of our certain knowledge of the countries in that direction. He learned, however, that Silla ſtands within 200 miles of the city of Tombuctoo, which is upon the ſame river, and had long been an object of ſearch of the Portugueſe, the French, and Engliſh. He was informed, that the country is very populous in that direction. He was alſo told, that about two days journey below Silla, where he ſtopped, there is a larger town than Sego, called *Jenné*, which ſtands on a ſmall iſland in the Niger; and that two days journey below Jenné, the river expands into a large lake called *Dibbie*, from which the water iſſues in two large branches, inſulating a fertile and ſwampy country called *Ginbala*; and that the two great branches of the river reunite at Kabra, which is one day's journey to the ſouth of the city of Tombuctoo, of which it is the port. The government of Tombuctoo is ſaid to be in the hands of the Moors; and that place is the principal emporium of the Mooriſh commerce in Africa. Below Tombuctoo, to the eaſtward, is the Negro city of Houſſa, the capital of a great kingdom, and poſſeſſed of extenſive commerce. The Niger paſſes to the ſouth of Houſſa at the diſtance of two days journey; but Mr

Silla.

Africa. Park could learn nothing further concerning its courſe, as the traders who arrive at Tombuctoo and Houſſa from the coaſt can ſay nothing more of it, than that *it runs towards the riſing of the ſun to the end of the world.* Any farther intelligence that has hitherto been obtained, concerning Soudan or Nigritia to the eaſtward of the route of Mr Park, is extremely uncertain, being merely the reſult of inquiries made by Mr Horneman among the merchants of Fezzan during his reſidence there. In the preſent imperfect ſtate of our knowledge, however, this information is entitled to attention. He obſerves, that "the Houſſa are certainly Negroes, but not quite black; they are the moſt intelligent people in the interior of Africa; they are diſtinguiſhed from their neighbours by an intereſting countenance; their noſe is ſmall and not flattened; and their ſtature is not ſo diſagreeable as that of the Negroes, and they have an extraordinary inclination for pleaſure, dancing, and ſinging. Their character is benevolent and mild. Induſtry and art, and the cultivation of the natural productions of the land, prevail in their country; and in this reſpect they excel the Fezzanians, who get the greateſt part of their clothes and houſehold implements from the Soudanians. They can dye in this country any colours but ſcarlet. The culture of their land is as perfect as that of the Europeans, although the manner of doing it is very troubleſome. In ſhort, ſays Mr Horneman, we have very unjuſt ideas of this people, not only with reſpect to their cultivation and natural abilities, but alſo of their ſtrength and the extent of their poſſeſſions, which are by no means ſo inconſiderable as they have been repreſented. Their muſic is imperfect, compared to the European; but the Houſſanian women have ſkill enough to affect their huſbands thereby even to weeping, and to inflame their courage to the greateſt fury againſt their enemies. The public ſingers are called *Kadanka.*"

oudan and Nigritia.

Houſſa.

The ſame traveller informs us, that to the eaſtward of Houſſa are ſituated the dominions of the ſultan of Bornou. The people are blacker than the Houſſanians, and completely Negroes. They are ſtrong, patient of labour, and phlegmatic. Their food is a paſte made of flour and fleſh, and their liquor is an intoxicating but nouriſhing kind of beer. Their beſt natural production is copper. The low country of Wangara is ſaid to be ſubject to Bornou. It is periodically overflowed by the Niger; but the courſe of that river farther eaſtward is not known. Mr Horneman was informed that it has at leaſt a periodical communication with the longer branch of the Nile, called the *Bahr Abiad* or White river, which riſes in the mountains Al Komeri, or mountains of the Moon, about the ſeventh degree of N. Lat. To the eaſtward of Wangara, at the diſtance of about ſix degrees of longitude is the country of Dartoor already mentioned; beyond which lies Kordafan, another barbarous ſtate; and ſtill farther to the eaſtward is the country of Abyſſinia, in which the ſhorter branch of the Nile, the *Bahr Azrac* or Blue river, takes its riſe, which was viſited and traced to its ſource by our countryman Mr Bruce. That traveller conſidered the Bahr Azrac as the Nile, whereas in truth it is only one of its tributary ſtreams.

Bornou.

Dartoor.

The belt or ſtripe of territory of which we have hitherto taken notice is ſituated between the 12th and 17th degrees of N. Lat. To the ſouthward of this line the interior of Africa is ſtill unknown, as it has hitherto been viſited by no European traveller. We only know that it contains various nations or tribes of Negroes, of different characters and degrees of civilization. It may be obſerved, however, that to the ſouth of Tombuctoo and Houſſa lies the kingdom of Gago, near a ridge of mountains which run from weſt to eaſt, and give riſe to many ſtreams that flow northward into the Niger. It produces much gold, and the people are warlike. Their armies are compoſed of cavalry; and no warrior is permitted to take an enemy priſoner before he has obtained, by the mutilation of perſons whom he has ſlain, an hundred bloody trophies, ſimilar to thoſe which, in the Jewiſh hiſtory, David is ſaid to have won from the Philiſtines and preſented to King Saul as the price of his daughter Michal (1 Samuel xviii. 25.) In Gago, when the general takes the field he ſpreads a buffalo's hide upon the ground; and, pitching a ſpear at each ſide, he cauſes the ſoldiers to march over it till a hole be worn through the hide, when the army is underſtood to be ſufficiently numerous. The king is abſolute; but, when they are offended with his conduct, his ſubjects ſometimes rebel and ſend him a preſent of parrots eggs, with a meſſage, importing that "his ſubjects, conſidering that he muſt be fatigued with the trouble of government, are of opinion that it is time for him to indulge in a little ſleep." If the rebellion appear too formidable to be reſiſted, his majeſty takes the hint, and deſires his women to ſtrangle him; upon which he is immediately ſucceeded by his ſon. Africa. Gago.

To the ſouth of Gago, and near to the gulf of Guinea, is the kingdom of Dahomy. The capital, called Abomy, ſtands in N. Lat. 7° 57′. The country is fertile and cultivated, bearing every kind of grain, as well as indigo, cotton, and ſugar. The character of the people is ſtrongly marked, and ſome of their cuſtoms are ſingular. In their wars they are bold, and even ferocious; but towards ſtrangers they are hoſpitable, without any mixture of rudeneſs. Their king poſſeſſes abſolute power in the moſt complete ſenſe of the word. All children, whether male or female, are conſidered as his property. They are early ſeparated from their parents, and receive a ſort of public education, with a view to deſtroy from their minds all family connections. The king's dwelling occupies a ſpace of about a mile ſquare. It conſiſts of a multitude of huts formed of mud walls with bamboo roofs; and the whole is encloſed by a mud wall of 20 feet in height. The entrance of the king's apartment is paved with human ſkulls, and the ſide walls are ornamented with the jaw bones of men. On the thatched roofs numerous human ſkulls are ranged on wooden ſtakes; and he declares war by announcing that his houſe wants thatch. He has commonly about 3000 females immured in this dwelling; and about 500 are appropriated to each of the principal officers. When a man wants a wife he muſt purchaſe her from the king or ſome of theſe officers. He muſt firſt lay down the price, which is 20,000 cowries; and muſt then be contented with the wife that is allotted to him. At his acceſſion the king proclaims that he knows nobody, and is not inclined to make any new acquaintance; that he will adminiſter juſtice rigorouſly and impartially, but will liſten to no repreſentations againſt his will; and that he will receive no preſents except from his officers, who approach him Dahomy.

Africa. with the moſt abject ſubmiſſion. His whole ſubjects acknowledge themſelves his ſlaves, and admit his right to the abſolute diſpoſal of their property and perſons. Their character is nevertheleſs active and intrepid; and they ſacrifice themſelves in war without heſitation, in obedience to his commands. Thus the Dahomans appear to form a ſort of exception to the general mildneſs of the Negro character.

In addition to what has been here ſtated concerning the black inhabitants of the ſouthern regions of Africa, it may be remarked, that a French traveller, Vaillant, proceeding northward from the Cape of Good Hope, has made repeated efforts to inveſtigate the character and ſtate of the natives in that quarter. He has extended his reſearches into what is called the *country of the Caffres*, far beyond the limits that had been reached by any other traveller, and has given us the names of various African tribes under the appellation of *Gueſſiquas*, *Nimiquas*, *Koraquas*, *Kahobiquas*, and *Houzouanas*. Theſe tribes differ conſiderably in their features and make of body from the general Negro race, which we have already deſcribed. In their moral and intellectual character, however, they are not a little inferior: Their wants are extremely few, and are ſupplied by their flocks and herds without the neceſſity of agriculture; and their lives paſs away in a routine of liſtleſs inactivity, or of ſimple and unintereſting occupations, the detail of which would afford little amuſement or inſtruction.

European eſtabliſhments. We have already mentioned, that the European nations, during theſe three laſt centuries, have eſtabliſhed ſmall ſettlements or garriſons upon different parts of the Negro coaſt, chiefly for the purpoſe of obtaining ſlaves by trading with the natives. The number of people that are annually exported from that country, in conſequence of this trade, by Europeans or Moors, is very great. The Europeans have frequently carried from the weſt coaſt above 100,000 ſlaves a year; and the caravans of Egypt and Fezzan carry off about 20,000 annually. The very great extent to which this traffic is carried on the weſtern coaſt, undoubtedly gives riſe to many abuſes among the native ſtates in that neighbourhood, and is productive of frequent wars among them. Unfortunately, the nations of Europe have hitherto made few efforts to compenſate theſe evils by any attempts to introduce their arts, their civilization, or their ſcience, among the natives. Till lately, the Portugueſe were the only nation that attempted the improvement of the Negroes. They did not confine themſelves to garriſons or trading factories, but formed conſiderable colonies on the coaſts. They attempted to inſtruct the natives in the better cultivation of their ſoil; and introduced their own religion among them. It is even ſaid, that in Loango, Congo, Angola, and Benguela, they have been ſo ſedulous in the converſion of the Negroes, that they have made them better Chriſtians than themſelves. It is worthy of notice, as a fact of ſome importance in natural hiſtory, that ſuch of the deſcendants of the Portugueſe in theſe climates as have adopted the manners of the Negroes, and their modes of life, are hardly to be diſtinguiſhed in colour from the darkeſt Negroes. From the weakneſs of the parent ſtate, the Portugueſe ſettlements, in many places, are greatly decayed; and their efforts for the civilization of the natives have not been ſufficiently extenſive or perſevering: ſtill, however, they are ſaid to carry on the ſlave-trade with more mildneſs and humanity than other nations. The ſlaves are catechiſed and baptized before they are ſhipped; which tends to diminiſh the terrors attending tranſportation. The ſlave-ſhips of the Portugueſe are never crowded, and they are chiefly navigated by black mariners. Africa.

Slave trade.

In 1779, a Swediſh ſociety formed the project of ſettling a European colony on the weſtern coaſt of Africa, with the view of diſſeminating the general principles of civilization. This project was, at a later period, eagerly preſſed by Charles Berns Wadſtrom, a native of that country, but without ſucceſs. Afterwards the Danes eſtabliſhed a ſmall colony with the ſame view, near the mouth of the river Volta, under the ſuperintendence of Doctor Iſert. In the mean time, the univerſity of Cambridge in England, in 1785, propoſed, as the ſubject of a prize-eſſay, a queſtion concerning the lawfulneſs of the ſlavery and commerce of the human ſpecies. The prize was won by Mr J. Clarkſon; and the queſtion began to attract public notice: Vaſt numbers of pamphlets were written; and in a few years the whole nation intereſted itſelf in the ſubject, and the ſlave-trade became an object of popular indignation. Some legiſlative attempts were made towards its abolition, which were probably fruſtrated by the convulſive ſtate into which Europe was plunged by the French revolution. In the mean time, as early as 1783, Doctor H. Smeathman had propoſed a ſpecific plan for the colonization of Africa. This plan was not immediately attended to; but in the year 1787, after the ſubject had aſſumed a greater degree of importance, an attempt was made to carry it into execution, by ſending about four hundred blacks and ſixty whites, chiefly people of abandoned characters, collected about London, to Sierra Leona. In conſequence of the kind of perſons choſen as coloniſts, this firſt attempt did not ſucceed. But in July 1791, a number of perſons who had contributed money for the purpoſe of making a ſettlement with a view to the inſtruction and civilization of the Africans, were incorporated by act of parliament under the name of the *Sierra Leona Company*. At the termination of the American war, many black loyaliſts had been conveyed to Nova Scotia, which they diſliked, in conſequence of the ſterility of the lands allotted to them, and the ſeverity of the climate. The new Sierra Leona Company made propoſals to theſe blacks to form a ſettlement upon the coaſt of Africa, to which they were to be conveyed at the expence of the Company. The propoſal was accepted by 1200 blacks, who arrived at Sierra Leona in March 1792. After experiencing conſiderable difficulties, the colony began to enjoy tolerable proſperity, and received ambaſſadors from the neighbouring Negro ſtates; but on the 28th September 1794 a French ſquadron ſuddenly plundered and deſtroyed the colonial town. This ſquadron had been fitted out for the purpoſe of diſturbing the trade of the Engliſh ſlave-factories on the coaſt, and is ſaid to have been inſtigated by an American ſlave captain, who had taken ſome offence at the governor, to make the attack now mentioned. The damage was repaired. The ſettlement has ſince been viſited by various miſſionaries from different religious ſects in Britain, with the Sierra Leona.

Africa || Afwestad.

the view of extending the Chriſtian religion. The colony, however, ſtill languiſhes. It has been engaged in ſome unfortunate conteſts with the natives; and it has lately been found neceſſary to aſſiſt the Company with the public money. It ſeems doubtful how far it is likely ever to fulfil the purpoſe for which it was inſtituted, chiefly in conſequence of the difficulty of maintaining a very ſteady intercourſe with the country which founded it, and from the unfavourable nature of the climate to the health of the natives of Europe. Without ſuch an intercourſe, it is nearly impoſſible for any infant colony to preſerve its own civilization, and much leſs to confer it upon others. The firſt coloniſts, from the neceſſity of engaging in agriculture, ſoon forget the arts and the ſciences of the parent ſtate; and unleſs new ſettlers, from time to time, revive among them, and keep up the improvements of their anceſtors, the whole ſettlement is apt to ſink into a ſemibarbarous ſtate, or into a reſemblance of the natives of the country into which they have come. This has been the fate of moſt of the Portugueſe colonies that were intended for the civilization of the Africans; and muſt prove the deſtiny of our own ſettlement of Sierra Leona, unleſs the ordinary courſe of events ſhall be counteracted by extraordinary efforts.

AFRICAN COMPANY. See COMPANY.

African Aſſociation. See ASSOCIATION.

AFRICANUS, JULIUS, an excellent hiſtorian of the third century, the author of a chronicle which was greatly eſteemed, and in which he reckons 5500 years from the creation of the world to Julius Cæſar. This work, of which we have now no more than what is to be found in Euſebius, ended at the 221ſt year of the vulgar æra. Africanus alſo wrote a letter to Origen on the hiſtory of Suſanna, which he reckoned ſuppoſititious: and we have ſtill a letter of his to Ariſtides, in which he reconciles the ſeeming contradictions in the two genealogies of Chriſt recorded by St Matthew and St Luke.

AFSLAGERS, perſons appointed by the burgomaſters of Amſterdam to preſide over the public ſales made in that city. They muſt always have a clerk of the ſecretary's office with them, to take an account of the ſale. They correſpond to our brokers, or auctioneers.

AFT, in the ſea language, the ſame with ABAFT.

AFTERBIRTH, in *Midwifery*, ſignifies the membranes which ſurround the infant in the womb, generally called the ſecundines. See MIDWIFERY.

AFTERMATH, in *Huſbandry*, ſignifies the graſs which ſprings or grows up after mowing.

AFTERNOON, the latter half of the artificial day, or that ſpace between noon and night.

AFTER-PAINS, in *Midwifery*, exceſſive pains felt in the groin, loins, &c. after the woman is delivered.

AFTER-SWARMS, in the management of bees, are thoſe which leave the hive ſome time after the firſt has ſwarmed. See BEE.

AFWESTAD, a large copper-work belonging to the crown of Sweden, which lies on the Dala, in the province of Dalecarlia, in Sweden. It looks like a town, and has its own church. Here they make copper plates; and have a mint for ſmall ſilver coin, as well as a royal poſt-houſe. E. Long. 14. 10. N. Lat. 58. 10.

AGA, in the Turkiſh language, ſignifies a great lord or commander. Hence the aga of the janizaries is the commander in chief of that corps; as the general of horſe is denominated *ſpachiclar aga*. The aga of the janizaries is an officer of great importance. He is the only perſon who is allowed to appear before the Grand Signor without his arms acroſs his breaſt in the poſture of a ſlave. Eunuchs at Conſtantinople are in poſſeſſion of moſt of the principal poſts of the ſeraglio: The title *aga* is given to them all, whether in employment or out. This title is alſo given to all rich men without employ, and eſpecially to wealthy landholders.

Aga || Aganippe.

We find alſo *agas* in other countries. The chief officers under the khan of Tartary are called by this name. And among the Algerines, we read of *agas* choſen from among the *boluk baſhis* (the firſt rank of military officers), and ſent to govern in the chief towns and garriſons of that ſtate. The *aga* of Algiers is the preſident of the divan, or ſenate. For ſome years, the *aga* was the ſupreme officer; and governed the ſtate in place of the baſhaw, whoſe power dwindled to a ſhadow. But the ſoldiery riſing againſt the *boluk baſhis*, or *agas*, maſſacred moſt of them, and transferred the ſovereign power to the caliph, with the title of *Dey* or King.

AGADES, a kingdom and city of Negroland in Africa. It lies nearly under the tropic of Cancer, between Gubur and Cano. The town ſtands on a river that falls into the Niger; it is walled, and the king's palace is in the midſt of it. The king has a retinue, who ſerve as a guard. The inhabitants are not ſo black as other Negroes, and conſiſt of merchants and artificers. Thoſe that inhabit the fields are ſhepherds or herdſman, whoſe cottages are made of boughs, and are carried about from place to place on the backs of oxen. They are fixed on the ſpot of ground where they intend to feed their cattle. The houſes in the city are ſtately, and built after the Barbary faſhion. This kingdom was, and may be ſtill, tributary to the king of Tombuctoo. It is well watered; and there is great plenty of graſs, cattle, ſenna, and manna. The prevailing religion is the Mahometan, but it is not rigidly practiſed. N. Lat. 26. 10. E. Long. 9. 10.

AGALLOCHUM, a very fragrant medicinal wood brought from the Eaſt Indies. See EXCÆCARIA, BOTANY *Index*.

AGALMATA, in antiquity, a term originally uſed to ſignify any kind of ornaments in a temple; but afterwards for the ſtatues only, which were moſt conſpicuous.

AGAMEMNON, the ſon of Atreus by Erope, was captain general of the Trojan expedition. It was foretold to him by Caſſandra, that his wife Clytemneſtra would be his death: yet he returned to her; and accordingly was ſlain by Ægiſthus, who had gained upon his wife in his abſence, and by her means got the government into his own hands.

AGAN, in *Geography*, one of the Ladrone iſlands. The circumnavigator, Magellan, was aſſaſſinated here in the year 1525.

AGANIPPIDES, in ancient poetry, a deſignation given to the Muſes, from a fountain of Mount Helicon, called *Aganippe*.

AGANIPPE, in antiquity, a fountain of Bœotia,

Agape || Agard.

at Mount Helicon, on the borders between Phocis and Bœotia, facred to the Muſes, and running into the river Permeſſus; (Pliny, Pauſanias.) Ovid ſeems to make *Aganippe* and *Hippocrene* the ſame. Serenus more truly diſtinguiſhes them, and aſcribes the blending them to poetical licenſe.

AGAPE, in eccleſiaſtical hiſtory, the love-feaſt, or feaſt of charity, in uſe among the primitive Chriſtians; when a liberal contribution was made by the rich to feed the poor. The word is Greek, and ſignifies *love*. St Chryſoſtom gives the following account of this feaſt, which he derives from the apoſtolical practice. He ſays, "The firſt Chriſtians had all things in common, as we read in the Acts of the Apoſtles; but when that equality of poſſeſſions ceaſed, as it did even in the Apoſtles time, the *agape*, or love-feaſt, was ſubſtituted in the room of it. Upon certain days, after partaking of the Lord's ſupper, they met at a common feaſt; the rich bringing proviſions, and the poor who had nothing being invited." It was always attended with receiving the holy ſacrament; but there is ſome difference between the ancient and modern interpreters as to the circumſtance of time, viz. whether this feaſt was held before or after the communion. St Chryſoſtom is of the latter opinion; the learned Dr Cave of the former.—Theſe love-feaſts, during the three firſt centuries, were held in the church without ſcandal or offence; but, in after times, the heathens began to tax them with impurity. This gave occaſion to a reformation of theſe *agapæ*. The kiſs of charity, with which the ceremony uſed to end, was no longer given between different ſexes; and it was expreſsly forbidden to have any beds or couches, for the conveniency of thoſe who ſhould be diſpoſed to eat more at their eaſe. Notwithſtanding theſe precautions, the abuſes committed in them became ſo notorious, that the holding of them (in churches at leaſt) was ſolemnly condemned, at the council of Carthage, in the year 307.

AGAPETÆ, in eccleſiaſtical hiſtory, a name given to certain virgins and widows, who, in the ancient church, aſſociated themſelves with, and attended on, eccleſiaſtics, out of a motive of piety and charity.

In the primitive days there were women inſtituted DEACONESSES; who, devoting themſelves to the ſervice of the church, took up their abode with the miniſters, and aſſiſted them in their functions. In the fervour of the primitive piety, there was nothing ſcandalous in theſe ſocieties: but they afterwards degenerated into libertiniſm; inſomuch, that St Jerome aſks, with indignation, *unde agapetarum peſtis in eccleſias introiit?* This gave occaſion to councils to ſuppreſs them.—St Athanaſius mentions a prieſt, named Leontius, who, to remove all occaſion of ſuſpicion, offered to mutilate himſelf, to preſerve his beloved companion.

AGARD, ARTHUR, a learned Engliſh antiquarian, born at Toſton in Derbyſhire in the year 1540. His fondneſs for Engliſh antiquities induced him to make many large collections; and his office as deputy chamberlain of the exchequer, which he held 45 years, gave him great opportunities of acquiring ſkill in that ſtudy. Similarity of taſte brought him acquainted with Sir Robert Cotton, and other learned men, who aſſociated themſelves under the name of *The Society of Antiquarians*, of which ſociety Mr Agard was a conſpicuous member. He made the Doomſday book his peculiar ſtudy; and compoſed a work purpoſely to explain it, under the title of *Tractatus de uſu et obſcuribus verbis libri de Domeſday*: he alſo compiled a book for the ſervice of his ſucceſſors in office, which he depoſited with the officers of the king's receipt, as a proper index for ſucceeding officers. All the reſt of his collections, containing at leaſt twenty volumes, he bequeathed to Sir Robert Cotton; and died in 1615.

Agarie || Agate.

AGARIC, FEMALE. See BOLETUS, BOTANY *Index*.

AGARIC *Mineral*, a marly earth, reſembling the vegetable of that time in colour and texture. It is found in the fiſſures of rocks, and on the roofs of caverns; and is ſometimes uſed as an aſtringent in fluxes, hemorrhagies, &c.

AGARICUS, MUSHROOM. See AGARICUS, BOTANY *Index*.

AGATE, or ACHAT, (among the Greeks and Latins, Αχατης and *Achates*, from a river in Sicily, on the banks of which it was firſt found), a very extenſive genus of the ſemipellucid gems.

Theſe ſtones are variegated with veins and clouds, but have no zones like thoſe of the onyx. They are compoſed of cryſtal debaſed by a large quantity of earth, and not formed, either by repeated incruſtations round a central nucleus, or made up of plates laid evenly on one another; but are merely the effect of one ſimple concretion, and variegated only by the diſpoſition given by the fluid they were formed in to their differently coloured veins or matters.

Agates are arranged according to the different colours of their ground. Of thoſe with a *white* ground there are three ſpecies. (1.) The *dendrachates*, *mocoa ſtone*, or *arboreſcent agate*. This ſeems to be the ſame with what ſome authors call the achates with roſemary in the middle, and others achates with little branches of black leaves. (2.) The *dull milky-looking agate*. This, though greatly inferior to the former, is yet a very beautiful ſtone. It is common on the ſhores of rivers in the Eaſt Indies, and alſo in Germany and ſome other parts of Europe. Our lapidaries cut it into counters for card-playing, and other toys of ſmall value. (3.) The *lead-coloured agate*, called the *phaſſachates* by the ancients.

Of the agates with a *reddiſh* ground there are four ſpecies. (1.) An impure one of a fleſh-coloured white, which is but of little beauty in compariſon with other agates. The admixture of fleſh-colour is but very ſlight; and it is often found without any clouds, veins, or other variegations; but ſometimes it is prettily veined or variegated with ſpots of irregular figures, having fimbriated edges. It is found in Germany, Italy, and ſome other parts of Europe; and is wrought into toys of ſmall value, and often into the German guhflints. It has been ſometimes found with evident ſpecimens of the perfect moſſes bedded deep in it. (2.) That of a pure blood colour, called *hæmachates*, or the *bloody agate*, by the ancients. (3.) The clouded and ſpotted agate, or a pale fleſh colour, called by the ancients the *carnelian achates* or *ſardachates*. (4.) The red-lead coloured one, variegated with yellow, called the *coral agate*, or *coralla-achates*, by the ancients.

Of the agates with a *yellowiſh* ground there are only two known ſpecies; the one of the colour of yellow wax, called *cerachates* by the ancients; the other a very

Agate. very elegant ſtone, of a yellow ground, variegated with white, black, and green, called the *leonina*, and *leonteſeres*, by the ancients.

Laſtly, Of the agates with a *greeniſh* ground, there is only one known ſpecies, called by the ancients *jaſpachates*.

Of all theſe ſpecies there are a great many varieties; ſome of them having upon them natural repreſentations of men and different kinds of animals, &c. Thoſe repreſentations are not confined to the agates whoſe ground is of any particular colour, but are occaſionally found on all the different ſpecies. Velſchius had in his cuſtody a fleſh coloured agate, on one ſide of which appeared a half moon in great perfection, repreſented by a milky ſemicircle; on the other ſide, the phaſes of *veſper*, or the evening ſtar: whence he denominated it an *aphrodiſian agate*. An agate is mentioned by Kircher *, on which was the repreſentation of a heroine armed; and one in the church of St Mark in Venice has the repreſentation of a king's head adorned with a diadem. On another, in the muſeum of the prince of Gonzaga, was repreſented the body of a man with all his clothes in a running poſture. A ſtill more curious one is mentioned by De Boot †, wherein appears a circle ſtruck in brown, as exactly as if done with a pair of compaſſes, and in the middle of the circle the exact figure of a biſhop with a mitre on: but inverting the ſtone a little, another figure appears; and if it is turned yet further, two others appear, the one of a man, and the other of a woman. But the moſt celebrated agate of this kind is that of Pyrrhus, wherein were repreſented the nine Muſes, with their proper attributes, and Apollo in the middle playing on the harp ‡. In the emperor's cabinet is an oriental agate of a ſurpriſing bigneſs, being faſhioned into a cup, whoſe diameter is an ell, abating two inches. In the cavity is found delineated in black ſpecks, B. XRISTOR. S. XXX. Other agates have alſo been found, repreſenting the numbers 4191, 191; whence they were called *arithmetical* agates, as thoſe repreſenting men or women have obtained the name of *anthropomorphous*.

* *Ephem. German.* dec. i. an. 1. obſ. 151.

† *De gem.* l. ii. c. 95.

‡ *Pliny*, l. xxxvii. c. 3.

Great medicinal qualities were formerly attributed to the agate, ſuch as reſiſting poiſons, eſpecially thoſe of the viper, ſcorpion, and ſpider; but they are now very juſtly rejected from medicinal practice. The oriental ones are all ſaid to be brought from the river Gambay. A mine of agates was ſome time ago diſcovered in Tranſylvania, of divers colours; and ſome of a large ſize, weighing ſeveral pounds.

Agates may be ſtained artificially with ſolution of ſilver in ſpirit of nitre, and afterwards expoſing the part to the ſun; and though theſe artificial colours diſappear on laying the ſtone for a night in aquafortis, yet a knowledge of the practicability of thus ſtaining agates, muſt render theſe curious figures above mentioned ſtrongly ſuſpected of being the work not of nature, but of art. Some account for theſe phenomena from natural cauſes. Thus Kircher, who had ſeen a ſtone of this kind in which were depicted the four letters uſually inſcribed on crucifixes, I. N. R. I. apprehends that ſome real crucifix had been buried under ground, among ſtones and other rubbiſh, where the inſcription happening to be parted from the croſs, and to be received among a ſoft mould or clay ſuſceptible of the impreſſion of the letters, came afterwards to be petrified. In the ſame manner he ſuppoſes the agate of Pyrrhus to have been formed. Others reſolve much of the wonder into fancy, and ſuppoſe thoſe ſtones formed in the ſame manner with the *camaieux* * or Florentine ſtones. Agate.

* See *Camaieux*.

The agate is uſed for making cups, rings, ſeals, handles for knives and forks, hilts for ſwords and hangers, beads to pray with, ſmelling boxes, patch-boxes, &c. being cut or ſawed with no great difficulty. At Paris none have a right to deal in this commodity except the wholeſale mercers and goldſmiths. The ſword cutlers are allowed to ſell it, but only when made into handles for couteaux de chaſſe, and ready ſet in. The cutlers have the ſame privilege for their knives and forks.

Conſiderable quantities of theſe ſtones are ſtill found near the river Achates in Sicily. There are found in ſome of theſe the ſurpriſing repreſentations above mentioned, or others ſimilar to them. By a dexterous management of theſe natural ſtains, medals have been produced, which ſeem maſterpieces of nature: for this ſtone bears the graver well; and as pieces of all magnitudes are found, they make all ſorts of work of it. The high altar of the cathedral of Meſſina is all over encruſted with it. The lapidaries pretend that the Indian agates are finer than the Sicilian; but Father Labat * informs us, that in the ſame quarries, and even in the ſame block, there are found pieces much finer than others, and theſe fine pieces are ſold for Indian agates in order to enhance their prices.

* *Voyage d'Ital.* tom. v. p. 156.

AGATE, among *antiquaries*, denotes a ſtone of this kind engraven by art. In this ſenſe, agates make a ſpecies of antique gems; in the workmanſhip whereof we find eminent proofs of the great ſkill and dexterity of the ſculptors. Several agates of exquiſite beauty are preſerved in the cabinets of the curious; but the facts or hiſtories repreſented on theſe antique agates, however well executed, are now become ſo obſcure, and their explications ſo difficult, that ſeveral diverting miſtakes and diſputes have ariſen among thoſe who undertook to give their true meaning.

The great agate of the apotheoſis of Auguſtus, in the treaſury of the holy chapel, when ſent from Conſtantinople to St Lewis, paſſed for a triumph of Joſeph. An agate, which was in the French king's cabinet †, had been kept 700 years with great devotion, in the Benedictine abbey of St Evre at Toul, where it paſſed for St John the Evangeliſt carried away by an eagle, and crowned by an angel; but the Heatheniſm of it having been lately detected, the religious would no longer give it a place among their relicks, but preſented it in 1684 to the king. The antiquaries found it to be the apotheoſis of Germanicus. In like manner the triumph of Joſeph was found to be a repreſentation of Germanicus and Agrippina, under the figures of Ceres and Triptolemus. Another was preſerved, from time immemorial, in one of the moſt ancient churches of France, where it had paſſed for a repreſentation of paradiſe and the fall of man; there being found on it two figures repreſenting Adam and Eve, with a tree, a ſerpent, and a Hebrew inſcription round it, taken from the third chapter of Geneſis, "The woman ſaw that the tree was good," &c. The French academiſts, inſtead of our firſt parents, found Jupiter and Minerva repreſented by the two figures: the inſcription was of

† *Hiſt. Acad. R. Inſcrip.* tom. i. p. 337—344.

Agathias || Agde.

a modern date, written in a rabbinical character, very incorrect, and poorly engraven. The prevailing opinion was, that this agate represented simply the worship of Jupiter and Minerva at Athens.

AGATE is also the name of an instrument used by gold-wire drawers; so called from the agate in the middle of it which forms its principal part.

AGATHIAS, or, as he calls himself in his epigrams, AGATHIUS, distinguished by the title of *Scholasticus*, a Greek historian in the 6th century under Justinian. He was born at Myrina, a colony of the ancient Æolians, in Asia the Less, at the mouth of the river Phythicus. He was an advocate at Smyrna. Though he had a taste for poetry, he was yet more famous for his history, which begins with the 26th year of Justinian's reign, where Procopius ends. It was printed in Greek and Latin by Vulcanius, at Leyden, 1594, in 4to; and at Paris at the king's printing house, 1660, in folio.

AGATHO, the Athenian, a tragic and comic poet, was the disciple of Prodicus and Socrates, and applauded by Plato in his Dialogues for his virtue and beauty. His first tragedy obtained the prize; and he was crowned in the presence of upwards of 30,000 persons in the 4th year of the 90th Olympiad. There is nothing now extant of his works, excepting a few quotations, in Aristotle, Athenæus, and others.

AGATHOCLES, the famous tyrant of Sicily, was the son of a potter at Reggio. He was a thief, a common soldier, a centurion, a general, and a pirate, all in regular succession. He defeated the Carthaginians several times in Sicily, and was once defeated himself. He first made himself tyrant of Syracuse, and then of all Sicily; after which he vanquished the Carthaginians again both in Sicily and Africa. But at length having ill success, and being in arrears with his soldiers, they mutinied, forced him to fly his camp, and cut the throats of his children, whom he left behind. Recovering himself again, he relieved Corfu, besieged by Cassander; burnt the Macedonian fleet; returned to Sicily; murdered the wives and children of those who had murdered his: afterwards meeting with the soldiers themselves, he put them all to the sword; and, ravaging the seacoast of Italy, took the city of Hipponium. He was at length poisoned by his grandson Archagathus, in the 72d year of his age, 290 years before Christ, having reigned 28 years.

AGATHYRNA, or AGATHYRNUM, AGATHYRSA, or AGATHYRSUM, in *Ancient Geography*, a town of Sicily; now *St Marco;* as old as the war of Troy, being built by Agathyrnus, son of Æolus, on an eminence. The gentilitious name is *Agathyrnæus;* or, according to the Roman idiom, *Agathyrnensis.*

AGAVE, AMERICAN ALOE, in *Botany*. See BOTANY *Index.*

AGDE, a city of France, in the department of Herault, formerly the province of Languedoc, in the territory of Agadez, with a bishop's see. The diocese is small, but is one of the richest countries in the kingdom. It produces fine wool, wine, oil, corn, and silk. It is seated on the river Herault, a mile and a quarter from its mouth, where it falls into the gulf of Lyons, and where there is a fort built to guard its entrance. It is well peopled; the houses are built of black stone, and there is an entrance into the city by four gates. The greatest part of the inhabitants are merchants or seamen. The public buildings are but mean: the cathedral is small, and not very handsome: the bishop's palace is an old building, but convenient. The city is extended along the river, where it forms a little port, wherein small craft may enter. There is a great concourse of pilgrims and other devout people to the chapel of Notre Dame de Grace. It is a little without the city, between which and the chapel there are about thirteen or fourteen oratories, which they visit with naked feet. The convent of the Capuchins is well built, and on the outside are lodgings and apartments for the pilgrims who come to perform their *neuvaine* or nine days devotion. The chapel, which contains the image of the Virgin Mary, is distinct from the convent. E. Long. 3. 28. N. Lat. 43. 19.

Age.

AGE, in the most general sense of the word, signifies the duration of any being, from its first coming into existence to the time of speaking of it, if it still continues; or to its destruction, if it has ceased to exist some time before we happen to mention it.

Among the ancient poets, this word was used for the space of 30 years; in which sense, *age* amounts to much the same with *generation*. Thus, Nestor is said to have lived *three ages* when he was 90 years old.—By ancient Greek historians, the time elapsed since the beginning of the world is divided into three periods, which they called *ages*. The first reaches from the creation to the deluge which happened in Greece during the reign of Ogyges; this they called the *obscure* or *uncertain* age, because the history of mankind is altogether uncertain during that period. The second they call the *fabulous* or *heroic* age, because it is the period in which the fabulous exploits of their gods and heroes are said to have been performed. It began with the Ogygian deluge, and continued to the first Olympiad; where the third or *historical* age commenced.—This division, however, it must be observed, holds good only with regard to the Greeks and Romans, who had no histories earlier than the first Olympiad; the Jews, Egyptians, Phœnicians, and Chaldees, not to mention the Indians and Chinese, who pretend to much higher antiquity, are not included in it.

The interval since the first formation of man has been divided by the poets into four *ages*, distinguished by the epithets of *golden*, *silver*, *brazen*, and *iron*. During the *golden* age, Saturn reigned in heaven, and justice and innocence in this lower world. The earth then yielded her productions without culture; men held all things in common, and lived in perfect friendship. This period is supposed to have lasted till the expulsion of Saturn from his kingdom. The *silver* age commenced when men began to deviate from the paths of virtue; and, in consequence of this deviation, their lives became less happy. The *brazen* age commenced on a farther deviation, and the *iron* age took place in consequence of one still greater. A late author, however, reflecting on the barbarism of the first ages, will have the order which the poets assign to the four ages inverted; the first being a time of rudeness and ignorance, more properly denominated an *iron* than a *golden* age. When cities and states were founded, the *silver* age commenced; and since arts and sciences, navigation and commerce, have been cultivated, the *golden* age has taken place.

Age. In ſome ancient northern monuments, the *rocky* or *ſtony* age correſponds to the *brazen* age of the Greeks. It is called *rocky*, on account of Noah's ark, which reſted on Mount Ararat; whence men were ſaid to be deſcended or ſprung from mountains: or from Deucalion and Pyrrha reſtoring the race of mankind, by throwing ſtones over their heads. The northern poets alſo ſtyle the fourth age of the world the *aſken* age, from a Gothic king Madenis, or Mannus, who on account of his great ſtrength was ſaid to be made of aſh, or becauſe in his time people began to make uſe of weapons made of the wood.

Among the Jews, the duration of the world is alſo divided into three ages. 1. The *ſeculum inane*, or *void age*, was the ſpace of time from the creation to Moſes. 2. The *preſent* age, denotes all the ſpace of time from Moſes to the coming of the Meſſiah; and, 3. The *age to come*, denotes the time from the coming of the Meſſiah to the end of the world.

Various other diviſions of the duration of the world into *ages* have been made by hiſtorians.—The Sibylline oracles, wrote, according to ſome, by Jews acquainted with the prophecies of the Old Teſtament, divide the duration of the world into ten *ages*; and according to Joſephus, each age contained ſix hundred years. It appears, by Virgil's fourth eclogue, and other teſtimonies, that the age of Auguſtus was reputed the end of thoſe ten *ages*, conſequently as the period of the world's duration.

By ſome, the ſpace of time commencing from Conſtantine, and ending with the taking of Conſtantinople by the Turks in the 15th century, is called the *middle age*: but others chooſe rather to date the middle age from the diviſion of the empire made by Theodoſius at the cloſe of the 4th century, and extend it to the time of the emperor Maximilian I. in the beginning of the 16th century, when the empire was firſt divided into circles.—The *middle* is by ſome denoted the *barbarous* age, and the latter part of it the *loweſt* age. Some divide it into the *non-academical* and *academical* ages. The firſt includes the ſpace of time from the 6th to the 9th century, during which ſchools or academies were loſt in Europe. The ſecond from the 9th century, when ſchools were reſtored, and univerſities eſtabliſhed, chiefly by the care of Charlemagne.

The ſeveral *ages* of the world may be reduced to three grand epochs, viz. the *age* of the law of nature, called by the Jews the *void age*, from Adam to Moſes; the *age* of the Jewiſh law, from Moſes to Chriſt; and the *age* of grace, from Chriſt to the preſent year.

Age is alſo frequently uſed in the ſame ſenſe with *century*, to denominate a duration of 100 years.

Age likewiſe ſignifies a certain period of the duration of human life; by ſome divided into four ſtages, namely, infancy, youth, manhood, and old age; the firſt extending to the 15th year, the ſecond to the [illegible]th, the third to the 50th, and the fourth to the end of life; by others divided into infancy, childhood, youth, manhood, and old age.

Age, in *Law*, ſignifies a certain period of life, when perſons of both ſexes are enabled to do certain acts. Thus, one at twelve years of age of [illegible]t to take the oath of allegiance to the king in a [illegible]; at fourteen he may marry, chooſe his guardian, and claim his lands held in ſoccage. Twenty-one is called *full age*, a man or woman being then capable of acting for themſelves, of managing their affairs, making contracts, diſpoſing of their eſtates, and the like.

Age of a Horſe. See Horse.

Age of Trees. Theſe after a certain age waſte. An oak at a hundred years old ceaſes to grow. The uſual rule for judging of the age of wood, is by the number of circles which appear in the ſubſtance of a trunk or ſtock cut perpendicularly, each circle being ſuppoſed the growth of a year; though ſome reject this method as precarious, alledging, that a ſimple circle is ſometimes the produce of ſeveral years; beſides that, after a certain age, no new circles are formed.

Age-prior, in *Law*, is when an action being brought againſt a perſon under age, for lands deſcended to him, he, by motion or petition, ſhows the matter to the court, praying the action may be ſtaid till his full age, which the court generally agrees to.

AGELNOTH, Egelnoth, or Æthelnoth, in Latin *Achelnotus*, archbiſhop of Canterbury, in the reign of Canute the Great, ſucceeded Livingus in that ſee in the year 1020. This prelate, ſurnamed the *Gebd*, was ſon of Earl Agiimer, and at the time of his election dean of Canterbury. After his promotion he went to Rome and received his pall from Pope Benedict VIII. In his way thither, as he paſſed through Pavia, he purchaſed, for an hundred talents of ſilver and one of gold, St Auguſtin's arm, which was kept there as a relic; and ſent it over to England as a preſent to Leofric earl of Coventry. Upon this return, he is ſaid to have raiſed the ſee of Canterbury to its former luſtre. He was much in favour with King Canute, and employed his intereſt with that monarch to good purpoſes. It was by his advice the king ſent over large ſums of money for the ſupport of the foreign churches; and Malmſbury obſerves, that this prince was prompted to acts of piety, and reſtrained from exceſſes, by the regard he had for the archbiſhop. Agelnoth, after he had ſat 17 years in the ſee of Canterbury, departed this life on the 29th of October 1038, and was ſucceeded by Eadſius, King Harold's chaplain. This archbiſhop was an author, having written, 1. A Panegyric on the bleſſed Virgin Mary. 2. A Letter to Earl Leofric concerning St Auguſtin. 3. Letters to ſeveral perſons.

Agelnoth or Aſgen.

AGEMA, in Macedonian antiquity, was a body of ſoldiers not unlike the Roman legion.

AGEMOGLANS, Agiamoglans, or Azamoglans, in the *Turkiſh Polity*, are children purchaſed from the Tartars, or raiſed every third year, by way of tribute, from the Chriſtians tolerated in the Turkiſh empire. Theſe, after being circumciſed and inſtructed in the religion and language of their tyrannical maſters, are taught the exerciſes of war, till they are of a proper age for carrying arms; and from this corps the janizaries are recruited. With regard to thoſe who are thought unfit for the army, they are employed in the loweſt offices of the ſeraglio. Their appointments alſo are very ſmall, not exceeding ſeven aſpers and a half per day, which amount to about threepence-halfpenny of our money.

AGEN, a city of France, on the river Garonne, the capital of Agenois, in the province of Guienne, now the department of the Garonne, and the ſee of a biſhop. The gates and old walls, which are yet remaining, ſhow that

Agenda || Agentes.

that this city is very ancient, and that its former circuit was not ſo great as the preſent. The palace, wherein the preſidial holds his ſeſſions at this day, was heretofore called the caſtle of Montravel, and is ſeated without the walls of the old city, and on the ſide of the foſſé. There are likewiſe the ruins of another caſtle, called *La Sagne*, which was without the walls, cloſe by a brook. Though the ſituation of Agen is convenient for trade and commerce, the inhabitants are ſo extremely indolent that there is very little; of which the neighbouring cities take the advantage. It is ſeated on the bank of the river Garonne, in a pleaſant country; but is itſelf a very mean and diſagreeable place, the houſes being ill-built, and the ſtreets narrow, crooked, and dirty. E. Long. 0. 30. N. Lat. 44. 12.

AGENDA, among philoſophers and divines, ſignifies the duties which a man lies under an obligation to perform: thus we meet with the *agenda* of a Chriſtian, or the duties he ought to perform; in oppoſition to the *credenda*, or things he is to believe.

AGENDA, among merchants, a term ſometimes uſed for a memorandum-book, in which is ſet down all the buſineſs to be tranſacted during the day, either at home or abroad.

AGENDA, among eccleſiaſtical writers, denotes the ſervice or office of the church. We meet with *agenda matutina et veſpertina*, "the morning and evening prayers;" *agenda diei*, "the office of the day," whether feaſt or faſt; *agenda mortuorum*, called alſo ſimply *agenda*, "the ſervice of the dead."

AGENDA, is alſo applied to certain church-books, compiled by public authority, preſcribing the order and manner to be obſerved by the miniſters and people in the principal ceremonies and devotions of the church. In which ſenſe *agenda* amounts to the ſame with what is otherwiſe called *ritual*, *liturgy*, *acaloutthia*, *miſſal*, *formulary*, *directory*, &c.

AGENHINE, in our old writers, ſignifies a gueſt that has lodged at an inn for three nights, after which time he was accounted one of the family; and if he offended the king's peace, his hoſt was anſwerable for him. It is alſo written HOGENHINE and HOGENHYNE.

AGENOIS, in *Geography*, a country of France, in the department of the Garonne, formerly the province of Guienne. It contains about one hundred and twenty ſquare leagues; is fertile and healthy; and, according to Cæſar, was inhabited by the Nitiobriges. It conſtituted part of the kingdom of Aquitania; was held by the counts of Toulouſe, and ſucceſſively by the Engliſh and French.

AGENORIA, in mythology, the goddeſs of courage and induſtry, as *Vacuna* was of indolence.

AGENT, in a general ſenſe, denotes any active power or cauſe. Agents are either natural or moral. Natural agents are ſuch inanimate bodies as have a power to act upon other bodies in a certain and determinate manner; as gravity, fire, &c. Moral agents, on the contrary, are rational creatures, capable of regulating their actions by a certain rule.

AGENT, is alſo uſed to denote a perſon intruſted with the management of an affair, whether belonging to a ſociety, company, or private perſon.

AGENTES in rebus, one of the ranks of officers in the court of the Conſtantinopolitan emperors, whoſe buſineſs was to collect and convey the corn both for the army and houſehold; to carry letters and meſſages from court to all parts of the empire; to regulate couriers, and their vehicles; to make frequent journeys and expeditions through the provinces, in order to inſpect any motions, diſturbances, or machinations tending that way, and to give early notice thereof to the emperor.

Agel. || Ageſilaus.

The *agentes in rebus*, are by ſome made ſynonymous with our poſt-maſters, but their functions were of great extent. They correſpond to what the Greeks call *πυξοφοροι*, and the Latins *veredarii*.

There were various orders or degrees of *agentes in rebus*; as *tribuni*, *primiceriі*, *ſenatores*, *ducenariі*, *biarchi*, *circitores*, *equites*, *tyrones*, &c. through all which they roſe *gradatim*. Their chief, who reſided at Conſtantinople, was denominated *princeps*; which was a poſt of great dignity, being reckoned on a level with that of proconſul. They were ſettled in every part of the empire; and are alſo ſaid to have ſerved as interpreters.

AGER, in Roman antiquity, a certain portion of land allowed to each citizen. See AGRARIAN LAW.

AGER PICENUS, or *Picenum*, in *Ancient Geography*, a territory of Italy to the ſouth-eaſt of Umbria, reaching from the Apennines to the Adriatic. The people are called *Picentes* (Cicero, Livy,) diſtinct from the Picentini on the Tuſcan ſea, though called by Greek writers *Πικεντινοι*. This name is ſaid to be derived from the bird *picus*, under whoſe conduct they removed from the Sabines, of whom they were a colony.

AGERATUM, BASTARD HEMP-AGRIMONY, in *Botany*. See BOTANY *Index*.

AGESILAUS, king of the Lacedæmonians, the ſon of Archidamus, was raiſed to the throne in oppoſition to the ſuperior claim of his nephew Leotychides. As ſoon as he came to the throne, he adviſed the Lacedæmonians to anticipate the king of Perſia, who was making great preparations for war, and to attack him in his own dominions. He was himſelf choſen for this expedition; and gained ſo many advantages over the enemy, that if the league which the Athenians and the Thebans formed againſt the Lacedæmonians had not obliged him to return home, he would have carried his victorious arms into the very heart of the Perſian empire. He gave up, however, all theſe triumphs readily, to come to the ſuccour of his country, which he happily relieved by his victory over the allies in Bœotia. He obtained another near Corinth; but to his great mortification, the Thebans afterward gained ſeveral over the Lacedæmonians. Theſe misfortunes at firſt raiſed a clamour againſt him. He had been ſick during the firſt advantages which the enemy gained; but as ſoon as he was able to act in perſon, his valour and prudence prevented the Thebans from reaping the advantages of their victories; ſo that it was generally believed had he been in health at the beginning, the Lacedæmonians would have ſuſtained no loſſes, and that all would have been loſt had it not been for his aſſiſtance. It cannot be denied but he loved war more than the intereſt of his country required; for if he could have lived in peace, he had ſaved the Lacedæmonians ſeveral loſſes, and they would not have been engaged in many enterpriſes which in the end contributed much to weaken their power. He died in the

third

Ageſilaus || Agger.

third year of the 104th Olympiad, being the 84th year of his age and 41ſt of his reign, and was ſucceeded by his ſon Archidamus. Ageſilaus would never ſuffer any picture or ſculpture to be made of him, and prohibited it alſo by his will: this he is ſuppoſed to have done from a conſciouſneſs of his own deformity; for he was of a ſhort ſtature, and lame of one foot, ſo that ſtrangers uſed to deſpiſe him at the firſt ſight. His fame went before him into Egypt, and there they had formed the higheſt idea of Ageſilaus. When he landed in that country, the people ran in crowds to ſee him: but great was their ſurpriſe when they ſaw an ill dreſſed, ſlovenly, mean-looking little fellow, lying upon the graſs: they could not forbear laughing, and applied to him the fable of the mountain in labour. He was, however, the firſt to jeſt upon his own perſon; and ſuch was the gaiety of his temper, and the ſtrength with which he bore the roughеſt exerciſes, that theſe qualities made amends for his corporeal defects. He was remarkable for plainneſs and frugality in his dreſs and mode of life. "This (ſays Cornelius Nepos) is eſpecially to be admired in Ageſilaus: when very great preſents were ſent him by kings, governors, and ſtates, he never brought any of them to his own houſe; he changed nothing of the diet, nothing of the apparel of the Lacedæmonians. He was contented with the ſame houſe in which Euriſthenes, the founder of his family, had lived: and whoever entered there, could ſee no ſign of debauchery, none of luxury; but on the contrary, many of moderation and abſtinence; for it was furniſhed in ſuch a manner, that it differed in nothing from that of any poor or private perſon." Upon his arrival in Egypt, all kinds of proviſions were ſent to him; but he choſe only the moſt common, leaving the perfumes, the confections, and all that was eſteemed moſt delicious, to his ſervants. Ageſilaus was extremely fond of his children, and would often amuſe himſelf by joining in their diverſions: one day when he was ſurpriſed riding upon a ſtick with them, he ſaid to the perſon who had ſeen him in this poſture, "Forbear talking of it till you are a father."

AGGA, or AGGONNA, a Britiſh ſettlement on the Gold coaſt of Guinea. It is ſituated under the meridian of London, in 6 degrees of N. Lat.

AGGER, in the ancient military art, a work of fortification, uſed both for the defence and the attack of towns, camps, &c. In which ſenſe it is the ſame with what was otherwiſe called *vallum*, and in later times *aggeſtum*; and among the moderns *lines*, ſometimes *cavaliers*, *terraſſes*, &c. The agger was uſually a bank, or elevation of earth or other matter, bound and ſupported with timber; having ſometimes turrets on the top, wherein the workmen, engineers, and ſoldiery, were placed. It was alſo accompanied with a ditch, which ſerved as its chief defence. The uſual materials of which it was made were earth, boughs, faſcines, ſtakes, and even trunks of trees, ropes, &c. variouſly croſſed, and interwoven ſomewhat in the figure of ſtars; whence they were called *ſtellati axes*. When theſe were wanting, ſtones, bricks, tiles, ſupplied the office: on ſome occaſions, arms, utenſils, pack ſaddles, were thrown in to fill it up. We even read of aggers formed of the carcaſes of the ſlain; ſometimes of dead bones mixed with lime; and even with the heads of ſlaughtered citizens. For want of due binding, or ſolid materials, aggers have ſometimes tumbled down, with infinite miſchief to the men. The beſiegers uſed to carry on a work of this kind nearer and nearer towards the place, till at length they reached the very wall. The methods taken on the other ſide to defeat them were, by fire, eſpecially if the agger were of wood; by ſapping and undermining, if of earth; and in ſome caſes, by erecting a counter agger.

Aggerhuys || Aggregate.

The height of the agger was frequently equal to that of the wall of the place. Cæſar tells us of one he made, which was 30 feet high and 330 feet broad. Beſides the uſe of aggers before towns, the generals uſed to fortify their camps with ſuch works; for want of this precaution, armies have often been ſurpriſed and ruined.

There were vaſt aggers made in towns and places on the ſea-ſide, fortified with towers, caſtles, &c. Thoſe made by Cæſar and Pompey at Brunduſium, are famous. Sometimes aggers were even built acroſs arms of the ſea, lakes, and moraſſes; as was done by Alexander before Tyre, and by M. Antony and Caſſius.—The wall of Severus, in the north of England, may be conſidered as a grand agger, to which belong ſeveral leſſer ones.

AGGER, in ancient writers, likewiſe denotes the middle part of a military road, raiſed into a ridge, with a gentle ſlope on either ſide, to make a drain for the water, and keep the way dry.

The term is alſo uſed for the whole road, or military way. Where highways were to be made in low grounds, as between two hills, the Romans uſed to raiſe them above the adjacent land, ſo as to make them of a level with the hills. Theſe banks they called *aggeres*. Bergier mentions ſeveral in Gallia Belgica, which were thus raiſed, ten, fifteen, or twenty feet above ground. —They are ſometimes alſo called *aggeres calceati*; and now generally known by the name *chauſſees* or *cauſeways*.

AGGERHUYS, a city of Norway, capital of the province of the ſame name, ſubject to Denmark, and ſituated in E. Long. 28. 35. N. Lat. 59. 30.

AGGERS-HERRED, a diſtrict of Chriſtianſand, and a dioceſe of Norway. It conſiſts of three juridical places: namely, Aſcher, Weſt Barm, and Agger.

AGGLUTINANTS, in *Pharmacy*, a general name for all medicines of a glutinous or viſcid nature; which, by adhering to the ſolids, were ſuppoſed to contribute to repair their loſs.

AGGLUTINATION, in a general ſenſe, denotes the joining two or more things together, by means of proper glue or cement.

AGGLUTINATION, among *Phyſicians*, implies the action of reuniting the parts of a body, ſeparated by a wound, cut, &c. It is alſo applied to the action of ſuch internal medicines as are ſuppoſed to be of an agglutinating quality.

AGGREGATE, in a general ſenſe, denotes the ſum of ſeveral things added together, or the collection of them into one whole. Thus a houſe is an aggregate of ſtones, wood, mortar, &c. It differs from a mixed or compound; for, in the latter, the union is more intimate than between the parts of an aggregate.

AGGREGATE, in *Botany*, is a term uſed to expreſs thoſe flowers which are compoſed of parts or florets, ſo united, by means either of the receptacle or calyx,

Aggregation || Agincourt.

that no one of them can be taken away without deſtroying the form of the whole. They are oppoſed to ſimple flowers, which have no ſuch common part. See BOTANY *Index*.

AGGREGATION, in phyſics, ſpecies of union, whereby ſeveral things which have no natural dependence or connexion with one another are collected together, ſo as in ſome ſenſe to conſtitute one. Thus, a heap of ſand, or a maſs of ruins, are bodies by aggregation.

AGHER, a town of Ireland, ſituated in the ſouthern part of Ulſter, not far from Clogher.

AGHRIM, a town of Ireland, in the county of Wicklow, and province of Leinſter, ſituated about 31 miles ſouth-weſt of Wicklow.

AGHRIM, in Galway; a ſmall village, diſtant about 32 miles from Dublin, and rendered memorable by a deciſive battle fought there, and at Kilcommodon-hill, the 12th of July 1691, between General Ginkle and Monſieur St Ruth, the commanders under King William III. and James II. when St Ruth, the general of the Iriſh army, with 7000 of his men, was ſlain; but of the Engliſh only 600. The victory was the more conſiderable, as the Engliſh army conſiſted of no more than 18,000 men; whereas the Iriſh were computed at 20,000 foot and 5000 horſe and dragoons. They loſt likewiſe nine pieces of braſs cannon; all their ammunition, tents, and baggage; moſt of their ſmall arms, which they threw away to expedite their flight; with 11 ſtandards, and 32 pair of colours.

AGIADES, in the Turkiſh armies, a kind of pioneers employed in fortifying camps, ſmoothing of roads, and the like offices.

AGILITY, an aptitude of the ſeveral parts of the body to motion. The improving of agility was one of the chief objects of the inſtitution of games and exerciſes. The athletæ made particular profeſſion of the ſcience of cultivating and improving agility. Agility of body is often ſuppoſed peculiar to ſome people; yet it ſeems leſs owing to any thing peculiar in their frame and ſtructure than to practice.

AGINCOURT, a village of the French Netherlands, ſituated in E. Long. 2. 10. N. Lat. 50. 35.; famous on account of the victory obtained by Henry V. of England over the French, in 1415.

The army of Henry, after landing in France, was by various accidents reduced to 10,000 men, of whom not a few were ſick, or ſlowly recovering from ſickneſs; —they had to traverſe a long tract of country, inhabited by exaſperated enemies, from whom they were to procure proviſions, lodging, guides, intelligence, and every thing they wanted;—that country was defended by many ſtrong towns, interſected by deep rivers, and guarded by an army of 100,000 or (according to ſome contemporary writers) 140,000 men.

Henry, undaunted by all theſe dangers and difficulties, departed from Harfleur, marching his army in three lines, with bodies of cavalry on the wings. He proceeded by very eaſy journeys, that he might not fatigue his troops, or diſcourage them by the appearance of a flight; obſerving the ſtricteſt diſcipline, and paying generouſly for every thing he received; which induced the country people to bring proviſions to his camp, in ſpite of all the commands they had received to the contrary. To keep his men in ſpirits, and from repining, the king fared as ill as the meaneſt ſoldier, always appearing with a cheerful countenance, and addreſſing them in the moſt friendly and encouraging language. They arrived at the village of Agincourt in the county of St Pol, on the evening of October 24th; and there beheld the whole French army, at a ſmall diſtance, directly in their route. The king took an attentive view of it from an eminence; and being fully convinced that it was impoſſible to proceed any further on his way to Calais without a battle, and equally impoſſible to return to Harfleur with ſo great an army in his rear, reſolved to hazard an action next morning, as the only means of preſerving himſelf and his little army from deſtruction. Agincourt.

The Engliſh army lodged that night in the villages of Agincourt, Maiſoncelle, and ſome others; where they met with better accommodation than they had been accuſtomed to for ſome time paſt, and ſpent part of their time in mutual exhortations to fight bravely in the approaching battle. The king, overhearing ſome of his nobles expreſſing a wiſh, that the many brave men who were idle in England were preſent to aſſiſt them, is ſaid to have cried out—"No! I would not have one man more:—if we are defeated, we are too many—if it ſhall pleaſe God to give us the victory, as I truſt he will, the ſmaller our number the greater our glory." The moon happening to ſhine very bright, Henry, with ſome of his beſt officers, carefully examined the ground, and pitched upon a field of battle, admirably calculated to preſerve a ſmall army from being ſurrounded by a great one. It was a gentle declivity from the village of Agincourt, of ſufficient extent for his ſmall army, defended on either ſide by hedges, trees, and bruſh-wood. Having placed guards and kindled fires on all ſides, the king and his army betook themſelves to reſt; except ſuch as were of a more ſerious turn of mind, who, conſidering that as the laſt night of their lives, ſpent it in devotion.

The French, exulting in their numbers, confident of victory, and abounding in proviſions, ſpent the night in noiſy feſtivity, and in forming fanciful ſchemes about the diſpoſal of their priſoners and their booty. It was in general reſolved to put all the Engliſh to the ſword, except the king and the chief nobility, who were to be taken priſoners for the ſake of their ranſoms.

On the morning of Friday the memorable 25th of October, A. D. 1415, the day of Criſpin and Criſpianus, the Engliſh and French armies were ranged in order of battle, each in three lines, with bodies of cavalry on each wing. The conſtable d'Albert, who commanded the French army, fell into the ſnare that was laid for him, by drawing up his army in the narrow plain between the two woods. This deprived him, in a great meaſure, of the advantage he ſhould have derived from the prodigious ſuperiority of his numbers; obliged him to make his lines unneceſſarily deep, about 30 men in file; to crowd his troops, particularly his cavalry, ſo cloſe together, that they could hardly move or uſe their arms; and, in a word, was the chief cauſe of all the diſaſters that followed. The French, it is ſaid, had a conſiderable number of cannon of different ſizes in the field; but we do not hear that they did any execution, probably for want of room. The firſt line of the French army, which conſiſted of 8000 men.

at-arms

Agincourt. at arms on foot mixed with 4000 archers, with 500 men at-arms mounted on each wing, was commanded by the conſtable d'Albert, the dukes of Orleans and Bourbon, and many other nobles; the dukes of Alençon, Brabant, and Bar, &c. conducted the ſecond line; and the earls of Marle, Damartine, Fauconberg, &c. were at the head of the third line. The king of England employed various arts to ſupply his defect of numbers. He placed 200 of his beſt archers in ambuſh, in a low meadow, on the flank of the firſt line of the French. His own firſt line conſiſted wholly of archers, four in file; each of whom, beſides his bow and arrows, had a battle-axe, a ſword, and a ſtake pointed with iron at both ends, which he fixed before him in the ground, the point inclining outwards, to protect him from cavalry. This was a new invention, and had a happy effect. That he might not be encumbered, he diſmiſſed all his priſoners, on their word of honour to ſurrender themſelves at Calais, if he obtained the victory; and lodged all his baggage in the village of Agincourt, in his rear, under a ſlender guard. The command of the firſt line was, at his earneſt requeſt, committed to Edward duke of York, aſſiſted by the Lords Beaumont, Willoughby, and Fanhope; the ſecond was conducted by the king, with his youngeſt brother Humphry duke of Glouceſter, the earls of Oxford, Marſhal, and Suffolk; and the third was led by the duke of Exeter, the king's uncle. The lines being formed, the king, in ſhining armour, with a crown of gold adorned with precious ſtones on his helmet, mounted on a fine white horſe, rode along them, and addreſſed each corps with a cheerful countenance and animating ſpeeches. To inflame their reſentment againſt their enemies, he told them, that the French had determined to cut off three fingers of the right hand of every priſoner: and to rouſe their love of honour, he declared, that every ſoldier in that army who behaved well, ſhould from henceforth be deemed a gentleman, and entitled to bear coat armour.

When the two armies were drawn up in this manner, they ſtood a conſiderable time gazing at one another in ſolemn ſilence. But the king, dreading that the French would diſcover the danger of their ſituation and decline a battle, commanded the charge to be ſounded, about ten o'clock in the forenoon. At that inſtant, the firſt line of the Engliſh kneeled down, and kiſſed the ground; and then ſtarting up, diſcharged a flight of arrows, which did great execution among the crowded ranks of the French. Immediately after, upon a ſignal being given, the archers in ambuſh aroſe, and diſcharged their arrows on the flank of the French line, and threw it into ſome diſorder. The battle now became general, and raged with uncommon fury. The Engliſh archers, having expended all their arrows, threw away their bows, and, ruſhing forward, made dreadful havock with their ſwords and battle-axes. The firſt line of the enemy was, by theſe means, defeated; its leaders being either killed or taken priſoners. The ſecond line, commanded by the duke d'Alençon, (who had made a vow either to kill or take the king of England, or to periſh in the attempt), now advanced to the charge, and was encountered by the ſecond line of the Engliſh, conducted by the king. This conflict was more cloſe and furious than the former. The duke of Glouceſter, wounded and unhorſed, was protected by his royal brother till he was carried off the field. The duke d'Alençon forced his way to the king, and aſſaulted him with great fury; but that prince brought him to the ground, where he was inſtantly diſpatched. Diſcouraged by this diſaſter, the ſecond line made no more reſiſtance; and the third fled without ſtriking a blow; yielding a complete and glorious victory to the Engliſh, after a violent ſtruggle of three hours duration.

Agio || Agis.

The king did not permit his men to purſue the fugitives to a great diſtance, but encouraged them to take as many priſoners as they could on or near the field; in which they were ſo ſucceſsful, that, in a little time, his captives were more numerous than his ſoldiers. A great proportion of theſe priſoners were men of rank and fortune; for many of the French nobleſſe being on foot, and loaded with their heavy armour, could not make their eſcape. Among theſe were the dukes of Orleans and Bourbon, the marſhal Boucicaut, the counts d'Eu, Vendome, Richemont, and Harcourt; and 7000 barons, knights, and gentlemen. The French left dead on the field of battle, the conſtable d'Albert, the three dukes of Alençon, Brabant, and Bar, the archbiſhop of Sens, one marſhal, 13 earls, 92 barons, 1500 knights, and a far greater number of gentlemen, beſides ſeveral thouſands of common ſoldiers. Even the French hiſtorians acknowledge, that the loſs of the Engliſh was inconſiderable: thoſe of our own cotemporary writers who make it the greateſt, affirm, that it did not exceed 100, and that the duke of York and the earl of Suffolk were the only great men who fell on that ſide in this memorable action.

AGIO, in commerce, is a term chiefly uſed in Holland, and at Venice, to ſignify the difference between the value of bank ſtock and the current coin. The agio in Holland is generally three or four per cent. and at Rome it is from 15 to 25 per cent. but at Venice the agio is fixed at 20 per cent.

AGIOSYMANDRUM, a wooden inſtrument uſed by the Greek and other churches under the dominion of the Turks, to call together aſſemblies of the people. The *agioſymandrum* was introduced in the place of bells, which the Turks prohibited their Chriſtian ſubjects the uſe of, leſt they ſhould make them ſubſervient to ſedition.

AGIS, king of Lacedæmon, was deſcended from Ageſilaus II. in a right line. He projected the reformation of his kingdom, by the reſtoring of the laws of Lycurgus; but he fell under the weight of an enterpriſe that could not but be diſagreeable to all thoſe who had great poſſeſſions, and had been long accuſtomed to the ſweets of a voluptuous life. Agis being in the flower of his age, and having a very refined deſire of glory, practiſed the ancient diſcipline firſt in his own perſon: his clothes and his table were according to the manners of former times; which is ſo much the more to be admired, becauſe Ageſiſtrata his mother and Archidamia his grandmother had brought him up voluptuouſly. When he ſounded his people's minds, he found the younger ſort oppoſed his project leſs than thoſe who had enjoyed a relaxation of diſcipline ſeveral years. The greateſt difficulty was expected to ariſe from the women. They had at that time more credit than ever; for their power is never greater than when luxury is in faſhion. Ageſilaus's mother did not at all

reliſh the propoſed reformation. She muſt have loſt her riches, which gave her a ſhare in a thouſand ſorts of intrigues; ſo ſhe oppoſed the deſign at once, and treated it as a chimera. But her brother Ageſilaus, whom Agis had engaged in his intereſts, knew how to manage her in ſuch a manner, that ſhe promiſed to ſecond the enterpriſe. She endeavoured to gain the women: but inſtead of ſuffering themſelves to be perſuaded, they applied to Leonidas the other king of Lacedæmon, and humbly beſought him to fruſtrate the deſigns of his colleague. Leonidas durſt not oppoſe it openly, for fear of irritating the people; to whom the reformation was agreeable, becauſe they found their account in it. He contented himſelf with countermining it by intrigues, and ſowing ſuſpicions as if Agis had aſpired to tyranny, by pulling down the rich and raiſing the poor. Agis did not fail to propoſe his new laws to the ſenate, relating to the diſcharge of debts, and a new diviſion of the lands. Leonidas, being ſupported by the rich, oppoſed this project ſo ſtrongly, that there was one voice more againſt it than for it. He paid dear for his ſucceſs in this affair. Lyſander, one of the Ephori, who had been the grand promoter of the reformation, called him to account; alleged the celeſtial ſigns; and put to death Cleombrotus, a prince of the royal blood and ſon-in-law to Leonidas, to make ſure of the kingdom. Leonidas being frightened at this, took refuge in a temple; whither his daughter, the wife of Cleombrotus, followed him. He was ſummoned; and becauſe he did not appear, he was degraded of his dignity, which was conferred on Cleombrotus. He obtained leave to retire to Tegæa. The new Ephori had Lyſander and Mandroclidas tried for innovation: theſe perſuaded the two kings to unite and turn out theſe Ephori. The thing was brought about; but not without a great uproar in the city. Ageſilaus, one of the Ephori that ſucceeded thoſe who were juſt turned out, would have cauſed Leonidas to be killed on the way to Tegæa, if Agis had not ſent him a ſtrong guard. The reformation might then have been eſtabliſhed, if Ageſilaus had not found means to elude the good intentions of the two kings. Whilſt this was tranſacting, the Achaians aſked aſſiſtance; which was given them, and Agis had the command of the troops. He acquired a good deal of reputation in this campaign. At his return, he found his affairs ſo embroiled by the ill conduct of Ageſilaus, that it was impoſſible for him to maintain himſelf. Leonidas was recalled to Lacedæmon: Agis retired into one temple and Cleomenes into another. The wife of the latter behaved herſelf in ſuch a manner that ſhe became the admiration of every body. Leonidas was contented with baniſhing his ſon-in-law; after which he applied himſelf entirely to the ruin of Agis. One of the Ephori, who had no mind to return what Ageſiſtrata had lent him, was the principal inſtrument of the misfortune of this family. Agis never went out of his ſanctuary but to bathe. One day, as he was returning from thence to the temple, he was ſeized by that Ephorus and carried to priſon. Then he was brought to his trial and condemned to death, and delivered to the executioner. His mother and grandmother uſed all the intreaty and importunity imaginable, that, as he was king of Lacedæmon, he might at leaſt be permitted to plead his cauſe before the people. But they were apprehenſive leſt his words would make too great an impreſſion, and therefore they ordered him to be ſtrangled that very hour. The Ephorus who was in debt to Ageſiſtrata permitted that princeſs to go into the priſon; which he granted likewiſe to Agis's grandmother: but he gave orders to ſtrangle them one after another. Ageſiſtrata died in a manner that was extremely to her honour. The wife of Agis, who was a princeſs of great fortune and prudence, and one of the fineſt ladies in Greece, was forced away from her apartment by King Leonidas, and obliged to marry his ſon, who was then very young, and hardly fit for marriage. Agiſtment, Agitator.

AGISTMENT, AGISTAGE, or AGISTATION, in *Law*, the taking in other people's cattle to graze at ſo much per week. The term is peculiarly uſed for the taking cattle to feed in the king's foreſts, as well as for the profits ariſing from that practice.—It is alſo uſed, in a metaphorical ſenſe, for any tax, burden, or charge; thus, the tax levied for repairing the banks of Romney-marſh was called *agiſtamentum*.

AGISTOR, or AGISTATOR, an officer belonging to foreſts, who has the care of cattle taken in to be grazed, and levies the monies due on that account. They are generally called *queſt takers* or *gift-takers*, and are created by letters-patent. Each royal foreſt has four agiſtors.

AGISYMBA, in *Ancient Geography*, a diſtrict of Libya Interior, according to Agathemerus, ſituated to the ſouth-eaſt of the Æthiopes Anthropophagi; the parallel paſſing through which, at 16° to the ſouth of the equator, was the utmoſt extent of the knowledge of the ancients to the ſouth (Ptolemy).

AGITATION, the act of ſhaking a body, or toſſing it backwards and forwards.

AGITATION, in *Phyſic*, is often uſed for an inteſtine commotion of the parts of a natural body. Fermentation and effervescence are attended with a briſk agitation of the particles.

AGITATION is one of the chief cauſes or inſtruments of mixtion: by the agitation of the parts of the blood and chyle, in their continual circulation, ſanguification is in a good meaſure effected. Butter is made out of milk by the ſame means: in which operation, a ſeparation is made of the oleous parts from the ſerous, and a conjunction of the oleous together. Digeſtion itſelf is only ſuppoſed to be an inſenſible kind of agitation.

AGITATION is reputed one of the ſymptoms of inſpiration. Petit informs us *, that in the laſt century, there aroſe in a church of Italy, for the ſpace of a year, a vapour of an extraordinary kind, which put all the people into trembling and agitations, and unleſs they got away betimes, ſet them a dancing, with ſtrange contortions and geſticulations. This ſeems to verify what has been related of the temple of Delphi.

* *Petit de Sibylla*, l. *Nouv. Re. Lett.* tom. viii. p. 111

AGITATION is alſo uſed in *Medicine* for a ſpecies of exerciſe popularly called *ſwinging*. Maurice prince of Orange found this method a relief againſt the ſevere pains of the gout and ſtone. Bartholine mentions fits of the toothach, deafneſs, &c. removed by vehement agitations of the body.

AGITATOR, in antiquity, a term ſometimes uſed for a charioteer, eſpecially thoſe who drove in the circus at the cutule games.

AGITATORS,

Agitators || Agnoetæ

AGITATORS, in the Engliſh hiſtory, certain officers ſet up by the army in 1647, to take care of its intereſts. —Cromwell joined the agitators, only with a view to ſerve his own ends; which being once accompliſhed, he found means to get them abolithed.

AGLAIA, the name of the youngeſt of the three Graces, eſpouſed to Vulcan.

AGLIONBY, JOHN, an Engliſh divine, chaplain in ordinary to King James I. was born in Cumberland, and admitted a ſtudent at Oxford in 1583. He was a man of univerſal learning, and had a very conſiderable hand in the tranſlation of the New Teſtament appointed by King James I. in 1604. He died in 1609.

AGMEN, in antiquity, properly denotes a Roman army in march: in which ſenſe, it ſtands contradiſtinguiſhed from *acies*, which denoted the army in battle array; though, on ſome occaſions, we find the two words uſed indifferently for each other. The Roman armies, in their marches, were divided into *primum agmen*, anſwering to our van-guard; *medium agmen*, our main-guard; and *poſtremum agmen*, the rear-guard. The order of their march was thus: After the firſt ſignal with the trumpets, &c. the tents were taken down, and the baggage packed up; at the ſecond ſignal the baggage was to be loaded on the horſes and carriages; and, at the third ſignal, they were to begin their march. Firſt came the *extraordinarii*; then the auxiliaries of the firſt wing, with their baggage; theſe were followed by the legions. The cavalry marched either on each ſide or behind.

AGNATE, in *Law*, any male relation by the father's ſide.

AGNEL, an ancient French gold coin, firſt ſtruck under the reign of St Louis, worth about twelve ſols ſix deniers. The agnel is alſo called ſometimes *mouton d'or*, and *agnel d'or*. The denomination is ſuppoſed to have ariſen from the figure of a lamb (*agnus*), or ſheep, ſtruck on one ſide.

AGNES, SAINT, in *Geography*, one of the Scilly iſles, on the weſt of England, which is of ſmall extent, but well cultivated, and fertile in corn and graſs. On the moſt elevated part of the iſland ſtands the light-houſe, built of ſtone, which is 51 feet high. The whole inhabitants conſiſt of about 50 families. It is ſituated in N. Lat. 49. 56. W. Long. 6. 46.

AGNO, a river of Naples, which, taking its riſe in the mountainous parts of Terra di Lavora, waſhes the town of Acerra; and, paſſing between Capua and Averſa, falls into the Mediterranean, about ſeven miles north of Puzzuoli.

AGNOETÆ (from ἀγνοέω, to be *ignorant* of), in church hiſtory, a ſect of ancient heretics, who maintained that Chriſt, conſidered as to his human nature, was ignorant of certain things, and particularly of the time of the day of judgement. Eulogius, patriarch of Alexandria, aſcribes this hereſy to certain ſolitaries in the neighbourhood of Jeruſalem, who built their opinion upon the text Mark xiii. 32. "Of that day and hour knoweth no man, no not the angels who are in heaven, neither the Son, but the Father only."—The ſame paſſage was made uſe of by the Arians; and hence the orthodox divines of thoſe days were induced to give various explications thereof. Some allege, that our Saviour here had no regard to his divine nature, but only ſpoke of his human. Others underſtand it thus, That the knowledge of the day of judgement does not concern our Saviour conſidered in his quality of Meſſiah, but God only: which is the moſt natural ſolution.

Agnomen || Agon.

AGNOMEN, in Roman antiquity, a kind of fourth or honorary name, given to a perſon on account of ſome extraordinary action, virtue, or other accompliſhment. Thus the agnomen *Africanus* was bellowed upon Publius Cornelius Scipio, on account of his great achievements in Africa.—The agnomen was the third in order of the three Roman names: thus, in Marcus Tullius Cicero, Marcus is the prænomen, Tullius the nomen, and Cicero the *agnomen*.

AGNUS, or LAMB, in *Zoology*, the young of the ovis or ſheep. See OVIS.

AGNUS Caſtus, in *Botany*, the trivial name of a ſpecies of the vitex. See VITEX, BOTANY *Index*. The Greeks call it ἄγνος, *chaſte*; to which has ſince been added the reduplicative *caſtus*, q. d. chaſte, chaſte. It was famous among the ancients as a ſpecific for the preſervation of chaſtity. The Athenian ladies, who made profeſſion of chaſtity, lay upon leaves of *agnus caſtus* during the feaſts of Ceres.—From the time of Dioſcorides the ſeeds of *agnus caſtus* have been much celebrated for their antiaphrodiſiac virtue. Modern writers aſcribe to them an oppoſite effect; but they are ſeldom uſed in practice.

AGNUS Dei, in the church of Rome, a cake of wax ſtamped with the figure of a lamb ſupporting the banner of the croſs. Theſe being conſecrated by the pope with great ſolemnity, and diſtributed among the people, are ſuppoſed to have great virtues; as, to preſerve thoſe who carry them worthily, and with faith, from all manner of accidents; to expel evil ſpirits, &c. The name literally ſignifies *Lamb of God*; this being ſuppoſed an image or repreſentation of the Lamb of God who took away the ſins of the world. They cover it up with a piece of ſtuff cut in form of a heart, and carry it very devoutly in their proceſſions.—The Romiſh prieſts and religious derive conſiderable pecuniary advantage from ſelling theſe *Agnus Dei's* to ſome, and preſenting them to others. The pope provides a regular ſupply, by conſecrating once in ſeven years: they are diſtributed by the maſter of the wardrobe, and received by the cardinals and other prelates, with great reverence, in their caps and mitres.—This ceremony they pretend to derive from an ancient cuſtom of the church, wherein part of the paſchal taper conſecrated on Holy Thurſday was diſtributed among the people, to perfume their houſes, fields, &c. in order to drive away devils, and to preſerve them from ſtorms and tempeſts. The *Agnus Dei* is forbidden to be brought into England under pain of incurring a *præmunire*; 13 Eliz. cap. 2.

AGNUS Dei is alſo a popular name for that part of the maſs wherein the prieſt, ſtriking his breaſt three times, rehearſes, with a loud voice, a prayer beginning with the words *Agnus Dei*.—It is ſaid to have been firſt brought into the miſſal by Pope Sergius I.

AGOGE, among ancient muſicians, a ſpecies of modulation, wherein the notes proceed by continuous degrees.

AGON, among the ancients, implied any diſpute or conteſt, whether it had regard to bodily exerciſes or the accompliſhments of the mind; and therefore poets, muſicians,

Agon ‖ Agonothe-ta.

muſicians, painters, &c. had their agones, as well as the athletæ. Games of this kind were celebrated at moſt of the heathen feſtivals with great ſolemnity, either annually, or at certain periods of years. Among the latter were celebrated at Athens, the *agon gymnicus*, the *agon Nemeus* inſtituted by the Argives in the 53d Olympiad, and the *agon Olympius* inſtituted by Hercules 430 years before the firſt Olympiad.—The Romans alſo, in imitation of the Greeks, inſtituted conteſts of this kind. The emperor Aurelian eſtabliſhed one under the name of *agon ſolis*, the conteſt of the ſun; Dioclefian another, which he called *agon capitolinus*, which was celebrated every fourth year, after the manner of the Olympic games. Hence the years, inſtead of *luſtra*, are ſometimes numbered by *agones*.

AGON alſo ſignified one of the miniſters employed in the heathen ſacrifices, and whoſe buſineſs it was to ſtrike the victim. The name is ſuppoſed to have been derived from hence, that ſtanding ready to give the ſtroke, he aſked, *Agon*? or *Agone*? Shall I ſtrike.

AGONALES, an epithet given to the SALII.

AGONALIA, in Roman antiquity, feſtivals celebrated in honour of Janus or the god Agonius, whom the Romans invoked before undertaking any affair of importance.

AGONALIS CIRCUS, now *La Piazza Navona*, a long, large, beautiful ſtreet in the heart of Rome, adorned with fountains, and the obeliſk of Caracalla, ſtill retaining the form of that circus. The reaſon of the name *Agonalis* is either unknown or doubtful. Ovid ſeems to derive it from the *agones*, or ſolemn games, there celebrated; ſuppoſed to have been the *Ludi Apollinares*, or *Actiaci*, inſtituted by Auguſtus; whence the circus was called *Apollinaris*; alſo *Alexandrinus*, from the emperor Alexander Severus, who either encloſed or repaired it.

AGONISMA, in antiquity, denotes the prize given to the victor in any combat or diſpute.

AGONISTARCHA, from ἀγὼν "combat," and ἄρχος "chief," in *antiquity*, ſeems to have been much the ſame with *agonotheta*; though ſome ſuggeſt a difference, making it the office of the former to preſide at and direct the private exerciſes of the athletæ, which they went through by way of practice, before they made their appearance on the public theatres or amphitheatres.

AGONISTICI, in church hiſtory, a name given by Donatus to ſuch of his diſciples as he ſent to fairs, markets, and other public places, to propagate his doctrine; for which reaſon they were alſo called *Circutores*, *Circelliones*, *Catropitæ*, *Coropitæ*, and at Rome *Montenſes*. They were called *Agoniſtici*, from the Greek ἀγὼν, "combat," in regard they were ſent as it were to fight and ſubdue the people to their opinions.

AGONIUM, in Roman antiquity, was uſed for the day on which the *rex ſacrorum* ſacrificed a victim, as well as for the place where the games were celebrated, otherwiſe called *agon*.

AGONOTHETA, or AGONOTHETES, in Grecian antiquity, was the preſident or ſuperintendant of the ſacred games; who not only defrayed the expence attending them, but inſpected the manners and diſcipline of the athletæ, and adjudged the prizes to the victors.

AGONY, any extreme pain. It is alſo uſed for the pangs of death. Much of the terror of death conſiſts in the pangs and convulſions wherewith the agony ſeems attended; though we have reaſon to believe that the pain in ſuch caſes is ordinarily not extremely acute; a courſe of pain and ſickneſs having uſually ſtupified and indiſpoſed the nerves for any quick ſenſations. However, various means have been thought of for mitigating the agony of death. Lord Bacon conſiders this as part of the province of a phyſician; and that not only where ſuch a mitigation may tend to a recovery, but alſo when, there being no further hope of a recovery, it can only tend to make the paſſage out of life more calm and eaſy. Complacency in death, which Auguſtus ſo much deſired, is certainly no ſmall part of happineſs. Accordingly, the author laſt cited ranks *euthanaſia*, or the art of dying eaſily, among the deſiderata of ſcience; and does not even ſeem to diſapprove of the courſe Epicurus took for that end,

Agonyclit ‖ Agrarian

——*Hinc ſtygias ebrius hauſit aquas.*

Opium has been applied for this purpoſe, with the applauſe of ſome, but the condemnation of more.

AGONYCLITÆ, or AGONYCLITES, in church hiſtory, a ſect of Chriſtians, in the 7th century, who prayed always ſtanding, as thinking it unlawful to kneel.

AGORÆUS, in heathen antiquity, an appellation given to ſuch deities as had ſtatues in the market-places; particularly Mercury, whoſe ſtatue was to be ſeen in almoſt every public place.

AGORANOMUS, in Grecian antiquity, a magiſtrate of Athens, who had the regulation of weights and meaſures, the prices of proviſions, &c.—The *agoranomi*, at Athens, were ten in number, five belonging to the city, and as many to the Piræus; though others make them 15 in all, of whom they aſſign 10 to the city. To theſe a certain toll or tribute was paid by all who brought any thing to ſell in the market.

AGOUTI, or AGUTI. See MUS.

AGRA, the capital town of a province of the ſame name, in Hindoſtan, and in the dominions of the Great Mogul. It is looked upon as the largeſt city in theſe parts, and is in the form of a half moon. A man on horſeback can hardly ride round it in a day. It is ſurrounded with a wall of red ſtone, and with a ditch 100 feet wide. The palace is prodigiouſly large, and the ſeraglio commonly contains above 1000 women. There are upwards of 800 baths in this town; but that which travellers moſt admire, is the mauſoleum of one of the Mogul's wives, which was 20 years in building. The indigo of Agra is the moſt valuable of all that comes from the Eaſt Indies. This town is ſeated on the river Jemma, about 50 miles above its confluence with the Tehemel, and is 300 miles N. E. of Surat. E. Long. 76. 44. N. Lat. 26. 43.

AGRARIAN LAWS, among the Romans, thoſe relating to the diviſion and diſtribution of lands; of which there were a great number; but that called the *Agrarian Law*, by way of eminence, was publiſhed by Spurius Caſſius, about the year of Rome 268, for dividing the conquered lands equally among all the citizens, and limiting the number of acres which each citizen might enjoy.—The Roman lands were of ſeveral kinds; ſome conquered from the enemies, and not yet brought to the public account; others brought indeed

Agrela || Agricola.

deed to the public, but clandeſtinely uſurped by private great men; laſtly, others purchaſed with the public money, in order to be divided. Agrarian laws, either for dividing lands taken from the enemy, or the public lands, or thoſe purchaſed with the public money, were eaſily paſſed without diſturbance; but thoſe whereby private rich men were to be deprived of their lands, and the common people put in poſſeſſion of what had been held by the nobility, were never attempted without great diſturbances.

Several have pleaded for the neceſſity of agrarian laws among us: but no author has entered ſo deeply into the ſubject as Mr Harrington in his *Oceana;* which the reader may conſult.

AGREDA, a town of Spain, in Old Caſtile, near the frontiers of Arragon, and about three leagues ſouth-weſt of Taracon.

AGRIA, called by the Germans *Eger*, is a ſmall but ſtrong town in Upper Hungary, and is a biſhop's ſee. It is ſituated on a river of the ſame name, and has a citadel called *Eriaw*. It was beſieged by the Turks in 1552, with 70,000 men: but they loſt 8000 in one day, and were obliged to raiſe the ſiege, though the garriſon conſiſted only of 2000 Hungarians, aſſiſted by the women, who performed wonders on this occaſion. However, it was afterwards taken by Mahomet III. in 1596; but was retaken by the emperor in 1687: ſince which time it has continued under the dominion of the houſe of Auſtria. It is 47 miles north-eaſt of Buda, and 55 ſouth-weſt of Caſſovia. E. Long. 20. 10. N. Lat. 48. 10.

AGRICOLA, Cnæus Julius, born at Frejus in Provence, was, in Veſpaſian's time, made lieutenant to Vettius Bolanus in Britain; and upon his return, was ranked by that emperor among the patricians, and made governor of Aquitania. This poſt he held three years; and upon his return was choſen conſul, and afterward appointed governor of Britain, where he greatly diſtinguiſhed himſelf. He reformed many abuſes occaſioned by the avarice or negligence of former governors, put a ſtop to extortion, and cauſed juſtice to be impartially adminiſtered. Veſpaſian dying about this time, his ſon Titus, knowing the great merit of Agricola, continued him in the government. In the ſpring, he marched towards the north, where he made ſome new conqueſts, and ordered forts to be built for the Romans to winter in. He ſpent the following winter in concerting ſchemes to bring the Britons to conform to the Roman cuſtoms. He thought the beſt way of diverting them from riſing and taking arms, was to ſoften their rough manners, by propoſing to them new kinds of pleaſure, and inſpiring them with a deſire of imitating the Roman manners. Soon after this, the country was adorned with magnificent temples, porticoes, baths, and many other fine buildings. The Britiſh nobles had at length their ſons educated in learning; and they who before had the utmoſt averſion to the Roman language, now began to ſtudy it with great aſſiduity: they wore likewiſe the Roman habit; and, as Tacitus obſerves, they were brought to conſider thoſe things as marks of politeneſs, which were only ſo many badges of ſlavery. Agricola, in his third campaign, advanced as far as the Tweed; and in his fourth, he ſubdued the nations betwixt the Tweed and the friths of Edinburgh and Clyde, into which the rivers Glotta and Bodotria diſcharge themſelves; and here he built fortreſſes to ſhut up the nations yet unconquered. In his fifth, he marched beyond the friths; where he made ſome new acquiſitions, and fixed garriſons along the weſtern coaſts, over againſt Ireland. In his ſixth campaign he paſſed the river Bodotria; ordering his fleet, the firſt which the Romans ever had in thoſe parts, to row along the coaſts, and take a view of the northern parts. In the following ſpring, the Britons raiſed an army of 30,000 men; and the command was given to Galgacus, who, according to Tacitus, made an excellent ſpeech to his countrymen on this occaſion. Agricola likewiſe addreſſed his men in very ſtrong and eloquent terms. The Romans gained the victory, and 10,000 of the Britons are ſaid to have been killed. This happened in the reign of the emperor Domitian; who, growing jealous of the glory of Agricola, recalled him, under pretence of making him governor of Syria. Agricola died ſoon after; and his death is ſuſpected to have been occaſioned by poiſon given him by that emperor. Tacitus the hiſtorian married his daughter, wrote his life, and laments his death in the moſt pathetic manner. Agricola.

Agricola, *George*, a German phyſician, famous for his ſkill in metals. He was born at Glaucha, in Miſnia, the 24th of March 1494. The diſcoveries which he made in the mountains of Bohemia, gave him ſo great a deſire of examining accurately into every thing relating to metals, that though he had engaged in the practice of phyſic at Joachimſtal by advice of his friends, he ſtill proſecuted his ſtudy of foſſils with great aſſiduity; and at length removed to Chemnitz, where he entirely devoted himſelf to this ſtudy. He ſpent in purſuit of it the penſion he had of Maurice duke of Saxony, and part of his own eſtate; ſo that he reaped more reputation than profit from his labours. He wrote ſeveral pieces upon this and other ſubjects; and died at Chemnitz the 21ſt of November 1555, a very firm Papiſt. In his younger years he ſeemed not averſe to the Proteſtant doctrine; and he highly diſapproved of the ſcandalous traffic of indulgences, and ſeveral other things in the church of Rome. The following lines of his were poſted up in the ſtreets of Zwickaw, in the year 1719:

Si nos injecta ſalvebit ciſtula nummo,
Heu nimium infelix tu mihi, pauper, eris!
Si nos, Chriſte, tua ſervatos morte beâſti,
Tam nihil infelix tu mihi, pauper, eris.

If wealth alone ſalvation can procure,
How ſad a ſtate for ever waits the poor!
But if thou, Chriſt, our only ſaviour be,
Thy merits ſtill may bleſs ev'n poverty!

In the latter part of his life, however, he had attacked the Proteſtant religion: which rendered him ſo odious to the Lutherans, that they ſuffered his body to remain unburied for five days together; ſo that it was obliged to be removed from Chemnitz to Zeits, where it was interred in the principal church.

Agricola, *John*, a Saxon divine, born at Eiſleben in 1492. He went as chaplain to Count Mansfeld, when that nobleman attended the elector of Saxony to the diet of Spire in 1526, and that of Augſbourg in 1530. He was of a reſtleſs, ambitious temper, rivalled and wrote

Agricola. wrote againſt Melancthon, and gave Count Mansfeld occaſion to reproach him ſeverely. He obtained a profeſſorſhip at Wittemberg, where he taught particular doctrines, and became founder of the ſect of Antinomians; which occaſioned warm diſputes between him and Luther, who had before been his very good friend. But though he was never able to recover the favour either of the elector of Saxony or of Luther, he received ſome conſolation from the fame he acquired at Berlin: where he became preacher at court; and was choſen in 1548, in conjunction with Julius Phlug and Michael Heldingus, to compoſe the famous *Interim*, which made ſo much noiſe in the world. He died at Berlin in 1566. Agricola.

AGRICULTURE.

1 Definition. AGRICULTURE in general, or in the abſtract, may be defined to be, The art of making the earth to produce in large quantities, and in the greateſt perfection of which their nature is capable, thoſe vegetables which are neceſſary to the ſubſiſtence, or uſeful for the accommodation, of mankind. Agriculture differs from gardening in this reſpect, that the gardener is chiefly occupied in rearing ſmall quantities of the nicer and more delicate vegetables, which are rather valued as objects of luxury than as articles of food; whereas the agriculturiſt labours upon a larger ſcale, with a view to ſupply himſelf and his countrymen with the neceſſaries of life.

2 Differs from gardening.

3 Is a ſeparate art. In civilized ſocieties agriculture, or the cultivation of the ſoil, becomes a ſeparate buſineſs or employment; and agriculturiſts, or the perſons engaged in agriculture, receive the appellation of *farmers* or *huſbandmen*.

4 Includes the rearing of cattle. To enable the agriculturiſt or huſbandman to conduct his buſineſs with ſucceſs, it is neceſſary that he ſhould not confine his attention to the mere cultivation of the ſoil, or the rearing of vegetables. The vegetables which are capable of affording a comfortable ſubſiſtence to the human conſtitution are few in number; and it has been found by experience, that they cannot be profitably ſown and reproduced year after year upon the ſame ſpot of ground. Hence it becomes neceſſary at times to rear upon it graſſes or other vegetables which are unfit for affording nouriſhment to man. But although men cannot eat graſs, they may, nevertheleſs, contrive to obtain ſubſiſtence from it in an indirect manner. They may give it to cattle, whoſe ordinary and natural food it is; and having thus, as it were, converted the graſs into the fleſh of animals, they can devour theſe animals; and in this way, obtain a richer and more ſtimulating food than any vegetable production can poſſibly afford: It is therefore a part of the buſineſs of the huſbandman to rear and to feed thoſe animals which are uſed as food in the ſociety of which he is a member, that he may be enabled at all times to derive profit from the portion of territory that he cultivates. It is alſo neceſſary towards conducting his operations with ſucceſs, that he ſhould rear and feed other animals, not as a ſource of human ſubſiſtence, but for the ſake of the ſervices which they are capable of affording; for it has pleaſed the beneficent Contriver of this world, to place upon it beings of a ſubordinate nature, capable of aſſiſting mankind in their labours without being degraded by the ſtate of ſervitude in which they are placed. To the cultivators of the ſoil, theſe animals, from their ſtrength and patience of labour, are particularly uſeful, and even abſolutely neceſſary in our cold and barren climates. They muſt therefore be fed and lodged with the greateſt care.

5 Importance of the art. Hence, the employment of the huſbandman is of an extenſive nature, requiring much foreſight, and a conſiderable knowledge of the relations that ſubſiſt between the moſt important objects in nature—the ſoil, the ſeaſons, the animals, and the plants, ſo far as they are connected with the ſubſiſtence of mankind. It is by bringing to perfection this art that man becomes truly the lord of the univerſe. He ſubdues by his operations every part of the ſurface of the earth, and acquires over the animals which inhabit it, a ſolid right of dominion or of property, in conſequence of having reared, and afforded them ſubſiſtence by his ſkill and his labour. He uſes them indeed as food; but before he can do ſo, he muſt firſt beſtow upon them ſubſiſtence, attend to their multiplication, and to their health and welfare. As they poſſeſs no foreſight, the purpoſe to which they are deſtined, is to them no evil.

It is only in proportion to the degree in which this important art of agriculture has flouriſhed, that nations have been, or ever can be, permanently proſperous. Every improvement that is made in it is a moral benefit conferred upon mankind; for by increaſing the quantity of human food, or facilitating the production of it, one of two things muſt always happen: Either the number of our ſpecies will be increaſed, that is to ſay, a greater multitude of rational and intelligent beings will exiſt in the creation; or a greater number of thoſe who already exiſt, will find leiſure for the improvement of their intellectual characters by ſtudying and carrying to perfection the ſciences and arts. Thus, the ſtrength of nations is increaſed in proportion to the degree in which their ſoil is ſkilfully cultivated, and their independence is ſecured by finding upon the ſpot which they inhabit all that is neceſſary for their ſubſiſtence.

6 Its advantages to thoſe who practiſe it. It is a fortunate circumſtance, that the art of the huſbandman, which is the foundation of all others, and at all times indiſpenſable to human exiſtence, is in every reſpect conducive to the welfare of thoſe engaged in it. The practice of it beſtows health upon the body; and by the variety of occupations which it affords, it alſo beſtows a conſiderable degree of reflection upon the minds of the loweſt perſons occupied in it; while, at the ſame time, it prevents their acquiring that ſpirit of artifice and of cunning, which in all countries is apt to degrade the character of thoſe engaged in the inferior branches of commercial employment. Nor does it fail, in all ranks and conditions of life, to produce a more candid and liberal character than any other employment,

ployment. No Britiſh huſbandman has ever refuſed, or even heſitated to allow to be communicated to the public every branch of his art, and every improvement which he and his forefathers may have made in it; whereas, in all the branches of manufacture or of commerce, every tranſaction, as far as poſſible, is covered with a myſterious veil of ſecrecy, and every improvement, as far as poſſible, is concealed by its inventor, and ſometimes undoubtedly periſhes with him.

7 Hiſtory. The antiquity of this art is undoubtedly beyond that of all others; for we are informed by Scripture, that Adam was ſent from the garden of Eden *to till the ground;* and, this being the caſe, he certainly muſt have known how to do ſo.—It would be ridiculous, however, to imagine that he was acquainted with all the methods of plowing, harrowing, fallowing, &c. which are now made uſe of; and it would be equally ſo to ſuppoſe, that he uſed ſuch clumſy and unartful inſtruments as wooden hooks, horns of oxen, &c. to dig the ground, which were afterwards employed for this purpoſe by certain ſavages: but as we know nothing of the particular circumſtances in which he was ſituated, we can know as little concerning his method of agriculture.

The prodigious length of life which the antediluvians enjoyed, muſt have been very favourable to the advancement of arts and ſciences, eſpecially agriculture, to which it behoved them to apply themſelves in a particular manner, in order to procure their ſubſiſtence. It is probable, therefore, that even in the antediluvian world, arts and ſciences had made great progreſs, nay, might be farther advanced in ſome reſpects than they are at preſent. Of this, however, we can form no judgement, as there are no hiſtories of thoſe times, and the Scripture gives us but very ſlight hints concerning theſe matters.

No doubt, by the terrible cataſtrophe of the flood, which overwhelmed the whole world, many ſciences would be entirely loſt, and agriculture would ſuffer; as it was impoſſible that Noah or his children could put in practice, or perhaps know, all the different methods of cultivating the ground that were formerly uſed. The common methods, however, we cannot but ſuppoſe to have been known to him and his children, and by them tranſmitted to their poſterity: ſo that as long as mankind continued in one body without being diſperſed into different nations, the arts, agriculture eſpecially, would neceſſarily advance; and that they did ſo, is evident from the undertaking of the tower of Babel. It is from the diſperſion of mankind conſequent upon the confuſion of tongues, that we muſt date the origin of ſavage nations. In all ſocieties where different arts are cultivated, there are ſome perſons who have a kind of general knowledge of moſt of thoſe practiſed through the whole ſociety, while others are in a manner ignorant of every one of them. If we ſuppoſe a few people of underſtanding to ſeparate from the reſt, and become the founders of a nation, it will probably be a civilized one, and the arts will begin to flouriſh from its very origin; but, if a nation is founded by others whoſe intellects are in a manner callous to every human ſcience (and of this kind there are many in the moſt learned countries), the little knowledge or memory of arts that was among the original founders will be loſt, and ſuch a people will continue in a ſtate of barbariſm for many ages, unleſs the arts be brought to them from other nations.

From this, or ſimilar cauſes, all nations of equal antiquity have not been equally ſavage, nor is there any ſolid reaſon for concluding that all nations were originally unſkilled in agriculture; though, as we know not the original inſtruments of huſbandry uſed by mankind when living in one ſociety, we cannot fix the date of the improvements in this art. Different nations have always been in a different ſtate of civilization; and agriculture, as well as other arts, has always been in different degrees of improvement among different nations at the ſame time.

From the earlieſt accounts of the eaſtern nations, we have reaſon to think, that agriculture has at all times been underſtood by them in conſiderable perfection; ſeeing they were always ſupplied not only with the neceſſaries, but the greateſt luxuries of life.

As ſoon as the deſcendants of Abraham were ſettled in Paleſtine, they generally became huſbandmen, from the chiefs of the tribe of Judah to the loweſt branch of the family of Benjamin. High rank or birth did not at that time make any diſtinction, for agriculture was conſidered as the moſt honourable of all employments; witneſs the illuſtrious examples of Gideon, Saul, and David.

The Chaldeans, who inhabited the country where agriculture had its birth, carried that valuable art to a degree of excellence unknown in former times. They cultivated their lands with great aſſiduity, and ſeem to have found out ſome means of reſtoring fertility to an exhauſted ſoil, by having plentiful harveſts in ſucceſſion; on which account they were not obliged, as their predeceſſors had been, to change their ſituations, in order to obtain a ſufficiency for themſelves and their numerous flocks and herds.

The Egyptians, who, from the natural fertility of their country by the overflowing of the Nile, raiſed every year vaſt quantities of corn, were ſo ſenſible of the bleſſings reſulting from agriculture, that they aſcribed the invention of that art to Oſiris. They alſo regarded Iſis, their ſecond deity, as the diſcoverer of the uſe of wheat and barley, which before grew wild in the fields, and were not applied by that people to the purpoſes of food. Their ſuperſtitious gratitude was carried ſo far, as to worſhip thoſe animals which were employed in tillage; and even the produce of their lands, as leeks, onions, &c.

The divine honours paid to Bacchus in India were derived from the ſame ſource, he being conſidered in that country as the inventor of planting vineyards, and the other arts attendant upon agriculture.

It is alſo related of the ancient Perſians, on the moſt reſpectable authority, that their kings laid aſide their grandeur once every month to eat with huſbandmen. This is a ſtriking inſtance of the high eſtimation in which they held agriculture; for at that time arts were practiſed among that people in great perfection, particularly thoſe of weaving, needle-work, and embroidery. The precepts of their religion taught by their ancient magi, or prieſts, included the practice of agriculture. The *ſaint* among them was obliged to work out his ſalvation by purſuing all the labours of agriculture: And it was a maxim of the Zendaveſta, that he who ſows the ground with care and diligence, acquires a greater

degree of religious merit, than he could have gained by the repetition of ten thouſand prayers.

The Phœnicians, ſo well known in Scripture by the name of *Philiſtines*, were alſo remarkable for their attention to, and ſkill in agriculture. But finding themſelves too much diſturbed and confined by the incurſions and conqueſts of the Iſraelites, they ſpread themſelves throughout the greateſt part of the Mediterranean iſlands, and carried with them their knowledge in the arts of cultivation.

Mago, a famous general of the Carthaginians, is ſaid to have written no leſs than 28 books on the ſubject; which Columella tells us were tranſlated into Latin by the expreſs order of the Roman ſenate. We are informed by the ancient writers, that Ceres was born in Sicily, where ſhe firſt invented the arts of tillage and of ſowing corn. For this eſſential ſervice, ſhe was, agreeably to the ſuperſtition of thoſe ages, deified and worſhipped as the goddeſs of plenty. The truth of this is, that in the time of Ceres, the iſland, through her endeavours and the induſtry of the people, became very fruitful in corn; and agriculture was there eſteemed ſo honourable an employment, that even their kings did not diſdain to practiſe it with their own hands.

But time, which at firſt gave birth to arts, often cauſed them to be forgotten when they were removed from the place of their origin. The deſcendants of Noah, who ſettled in Europe, doubtleſs carried their knowledge of agriculture with them into the regions which they ſucceſſively occupied. But thoſe who took poſſeſſion of Greece were ſuch an uncivilized race, that they fed on roots, herbs, and acorns, after the manner of beaſts. Pelaſgus had taught them the culture of the oak, and the uſe of acorns as food; for which ſervice, we are told, divine honours were paid him by the people.

The Athenians, who were the firſt people that acquired any tincture of politeneſs, taught the uſe of corn to the reſt of the Greeks. They alſo inſtructed them how to cultivate the ground, and to prepare it for the reception of the ſeed. This art, we are told, was taught them by Triptolemus. The Greeks ſoon perceived that bread was more wholeſome, and its taſte more delicate, than that of acorns and the wild roots of the fields; accordingly they thanked the gods for ſuch an unexpected and beneficial preſent, and honoured their benefactor.

As the arts of cultivation increaſed, and the bleſſings they afforded became generally experienced, the people ſoon preferred them to whatever the ravages of conqueſt, and the cruel depredations of ſavage life, could procure. And accordingly we find, that the Athenian kings, thinking it more glorious to govern a ſmall ſtate wiſely, than to aggrandize themſelves, and enlarge the extent of their dominions by foreign conqueſts, withdrew their ſubjects from war, and moſtly employed them in cultivating the earth. Thus, by continued application, they brought agriculture to a conſiderable degree of perfection, and ſoon reduced it to an art.

Heſiod was the firſt we know of among the Greeks who wrote on this intereſting ſubject. According to the cuſtom of the oriental authors, he wrote in poetry, and embelliſhed his poem with luxuriant deſcription and ſublime imagery. He calls his poem *Works and Days*, becauſe agriculture requires exact obſervations on times and ſeaſons.

Xenophon has alſo, in his Oeconomics, remarked, that agriculture is the nurſing mother of the arts. For, ſays he, "where agriculture ſucceeds proſperouſly, there the arts thrive; but where the earth neceſſarily lies uncultivated, there the other arts are deſtroyed."

Other eminent Greek writers upon agriculture were, Democritus of Abdera, Socraticus, Archytas Tarentinus, Ariſtotle, and Theophraſtus, from whom the art received conſiderable improvements.

The ancient Romans eſteemed agriculture ſo honourable an employment, that the moſt illuſtrious ſenators of the empire, in the intervals of public concerns, applied themſelves to this profeſſion; and ſuch was the ſimplicity of thoſe ages, that they aſſumed no appearance of magnificence and ſplendour, or of majeſty, but when they appeared in public. At their return from the toils of war, the taking of cities, and the ſubduing of hoſtile nations, their greateſt generals were impatient till they were again employed in the arts of cultivation.

Regulus, when in Africa, requeſted of the ſenate to be recalled, leſt his farm might ſuffer, for want of proper cultivation, in his abſence; and the ſenate wrote him for anſwer, that it ſhould be taken care of at the public expence, while he continued to lead their armies.

Cato the cenſor, after having governed extenſive provinces, and ſubdued many warlike nations, did not think it below his dignity to write a Treatiſe on Agriculture. This work (as we are told by Servius) he dedicated to his own ſon, it being the firſt Latin treatiſe written on this important ſubject; and it has been handed down to us in all its purity, in the manner that Cato wrote it.

Varro compoſed a treatiſe on the ſame ſubject, and on a more regular plan. This work is embelliſhed with all the Greek and Latin erudition of that learned author, who died 28 years before the commencement of the Chriſtian æra. Virgil who lived about the ſame time, has, in his Georgics, adorned this ſubject with the language of the Muſes, and finely illuſtrated the precepts and rules of huſbandry left by Heſiod, Mago, and Varro.

Columella, who flouriſhed in the reign of the emperor Claudius, wrote 12 books on huſbandry, replete with important inſtruction.

From this period to that of the reign of Conſtantine Poganatus, huſbandry continued in a declining ſtate; but that wiſe emperor cauſed a large collection of the moſt uſeful precepts relating to agriculture to be extracted from the beſt writers, and publiſhed them under the title of *Geoponics*. It has been aſſerted, that he made this collection with his own hand; and the truth of the aſſertion is not improbable, as it is well known, that after he had conquered the Saracens and the Arabians, he not only practiſed and encouraged, but ſtudied the arts of peace, fixing his principal attention on agriculture, as their beſt foundation.

After the death of Conſtantine, however, the increaſing attention of the people to commerce, and the ignorance and groſs ſuperſtition of the ages which ſucceeded, ſeem to have rendered agriculture an almoſt neglected

glected ſcience. The irruptions of the northern nations ſoon aboliſhed any improved ſyſtem. Theſe innumerable and enterpriſing barbarians, who overran all Europe, were originally ſhepherds or hunters, like the preſent Tartars and the ſavages of America. They contented themſelves with poſſeſſing, without labour or trouble, thoſe vaſt countries rendered deſerts by their own ravages, cultivating only a very ſmall ſpot near their habitations; and in this trifling huſbandry only the meaneſt ſlaves were employed: ſo that the art itſelf, which formerly was thought worthy of the ſtudy of kings, was now looked upon as mean and ignoble; a prejudice which is ſcarcely effaced at preſent, or at leaſt but very lately.—During this period, therefore, we find no veſtiges of any thing tolerably written on the ſubject. No new attempts were made to revive it, or to improve it, till the year 1478. when Creſcenzio publiſhed an excellent performance on the ſubject at Florence. This rouſed the ſlumbering attention of his countrymen, ſeveral of whom ſoon followed his example. Among theſe, Tatti, Steffano Auguſtino Gallo, Sanſovino, Lauro, and Tarello, deſerve particular notice.

At what time agriculture was introduced into Britain, is uncertain. When Julius Cæſar firſt invaded this iſland, it was not wholly unknown That conqueror was of opinion, that agriculture was firſt introduced by ſome of thoſe colonies from Gaul which had ſettled in the ſouthern parts of Britain, about 100 years before the Roman invaſion*.

*æ ſar de ell. Gall. b. v. c. 12.

It is not to be expected that we can now be acquainted with many of the practices of theſe ancient huſbandmen. It appears, however, that they were not unacquainted with the uſe of manures, particularly marl. This we have on the authority of Pliny†, who tells us, that it was peculiar to the people of Gaul and of Britain; that its effects continued 80 years; and that no man was ever known to marl his field twice, &c.—It is highly probable, too, that lime was at this time alſo uſed as a manure in Britain, it being certainly made uſe of in Gaul for this purpoſe at the time of Julius Cæſar's invaſion.

Plin. at. Hiſt. . xvii. p. 6.

The eſtabliſhment of the Romans in Britain produced great improvements in agriculture, inſomuch that prodigious quantities of corn were annually exported from the iſland; but when the Roman power began to decline, this, like all the other arts, declined alſo, and was almoſt totally deſtroyed by the departure of that people. The unhappy Britons were now expoſed to frequent incurſions of the Scots and Picts, who deſtroyed the fruits of their labours, and interrupted them in the exerciſe of their art. After the arrival of the Saxons in the year 449, they were involved in ſuch long wars, and underwent ſo many calamities, that the huſbandmen gradually loſt much of their ſkill, and were at laſt driven from thoſe parts of their country which were moſt proper for cultivation.

After the Britons retired into Wales, though it appears from the laws made relative to this art, that agriculture was thought worthy of the attention of the legiſlature, yet their inſtruments appear to have been very unartful. It was enacted that no man ſhould undertake to guide a plough who could not make one; and that the driver ſhould make the ropes of twiſted willows, with which it was drawn. It was uſual for ſix or eight perſons to form themſelves into a ſociety for fitting out one of theſe ploughs, providing it with oxen and every thing neceſſary for ploughing; and many minute and curious laws were made for the regulation of ſuch ſocieties. If any perſon laid dung on a field with the conſent of the proprietor, he was by law allowed the uſe of that land for one year. If the dung was carried out in a cart in great abundance, he was to have the uſe of the land for three years. Whoever cut down a wood, and converted the ground into arable, with the conſent of the owner, was to have the uſe of it for five years. If any one folded his cattle, for one year, upon a piece of ground belonging to another, with the owner's conſent, he was allowed the uſe of that field for four years.

Thus, though the Britons had in a great meaſure loſt the knowledge of agriculture, they appear to have been very aſſiduous in giving encouragement to ſuch as would attempt a revival of it; but, among the Anglo-Saxons, things were not at preſent in ſo good a ſtate. Theſe reſtleſs and haughty warriors, having contracted a diſtaſte and contempt for agriculture, were at pains to enact laws to prevent its being followed by any other than women and ſlaves. When they firſt arrived in Britain, they had no occaſion for this art, being ſupplied by the natives with all the neceſſaries of life. After the commencement of hoſtilities, the Saxons ſubſiſted chiefly by plunder: but having driven out or extirpated moſt of the ancient Britons, and divided their lands among themſelves, they found themſelves in danger of ſtarving, there being now no enemy to plunder: and therefore they were obliged to apply to agriculture.

The Saxon princes and great men, who, in the diviſion of the lands, had received the greateſt ſhares, are ſaid to have ſubdivided their eſtates into two parts, which were called the *in-lands* and the *out-lands*. The inlands were thoſe which lay moſt contiguous to the manſion-houſe of their owner, which he kept in his own poſſeſſion, and cultivated by his ſlaves, under the direction of a bailiff, for the purpoſe of raiſing proviſions for the family. The out lands were thoſe at a greater diſtance from the houſe, and were let to the *ceorls*, or farmers of thoſe times, at very moderate rents. By the laws of Ina king of the Weſt Saxons, who reigned in the end of the ſeventh and beginning of the eighth century, a farm conſiſting of ten hides, or plough-lands, was to pay the following rent: "Ten caſks of honey; three hundred loaves of bread; twelve caſks of ſtrong ale; thirty caſks of ſmall ale; two oxen; ten wedders; ten geeſe; twenty hens; ten cheeſes; one caſk of butter; five ſalmon; twenty pounds of forage; and one hundred eels." From this low rent, the imperfection of agriculture at that time is eaſily diſcoverable; but it is ſtill more ſo from the low prices at which land was then ſold. In the ancient hiſtory of the church of Ely, publiſhed by Dr Gale, there are accounts of many purchaſes of lands by Ædelwold the founder of that church, and by other benefactors, in the reign of Edgar the Peaceable, in the tenth century. By a compariſon of theſe accounts it appears, that the ordinary price of an acre of the beſt land in that part of England, in thoſe times, was no more than 16 Saxon pennies, or about four ſhillings of our money: a very trifling price, even in compariſon with that of other commodities at the ſame time: for, by

comparing other accounts, it appears, that four ſheep were then equal in value to an acre of the beſt land, and one horſe of the ſame value with three acres. The frequent and deplorable famines which afflicted England about this time, are further inſtances of the wretched ſtate of agriculture. In 1043, a quarter of wheat ſold for 60 Saxon pennies (15 of our ſhillings), at that time equal in value to ſeven or eight pounds of our money now.

The invaſion of the Normans, in 1066, contributed very much to the improvement of agriculture; for, by that event, many thouſands of huſbandmen from Flanders, France, and Normandy, ſettled in Britain, obtained eſtates or farms, and cultivated them after the manner of their country. The implements of huſbandry, uſed at this time, were of the ſame kind with thoſe employed at preſent; but ſome of them were leſs perfect in their conſtruction. The plough, for example, had but one ſtilt or handle, which the ploughman guided with one hand, having in his other hand an inſtrument which ſerved both for cleaning and mending the plough, as well as for breaking the clods. The Norman plough had two wheels; and in the light ſoil of Normandy was commonly drawn by one or two oxen; but, in England, a greater number was often neceſſary. In Wales, the perſon who conducted the oxen in the plough walked backwards. Their carts, harrows, ſcythes, ſickles, and flails, from the figures of them ſtill remaining, appear to have been nearly of the ſame conſtruction with thoſe that are now uſed. In Wales, they did not uſe a ſickle for reaping their corns, but an inſtrument like the blade of a knife, with a wooden handle at each end.—Their chief manure next to dung, ſeems ſtill to have been marl. Summer fallowing of lands deſigned for wheat, and ploughing them ſeveral times, appear to have been frequent practices of the Engliſh farmers in this period.

We are, after all, very much in the dark with reſpect to the ſtate and progreſs of agriculture in Great Britain previous to the fourteenth century. That it was pretty generally practiſed, eſpecially in the eaſtern, ſouth, and midland parts of England, is certain; but of the mode, and the ſucceſs, we are left almoſt totally ignorant. In the latter end of the fifteenth century, however, it ſeems to have been cultivated as a ſcience, and received very great improvement.

At this time our countryman Fitzherbert, judge of the common-pleas, ſhone forth with diſtinguiſhed eminence in the practical parts of huſbandry. He appears to have been the firſt Engliſhman who ſtudied the nature of ſoils and the laws of vegetation with philoſophical attention. On theſe he formed a theory confirmed by experiments, and rendered the ſtudy pleaſing as well as profitable, by realizing the principles of the ancients, to the honour and advantage of his country. Accordingly, he publiſhed two treatiſes on this ſubject: the firſt, entitled *The Book of Huſbandry*, appeared in 1534; and the ſecond, called *The Book of Surveying and Improvements*, in 1539. Theſe books, being written at a time when philoſophy and ſcience were but juſt emerging from that gloom in which they had long been buried, were doubtleſs replete with many errors; but they contained the rudiments of true knowledge, and revived the ſtudy and love of an art, the advantages of which were obvious to men of the leaſt reflection. We therefore find that Fitzherbert's books on agriculture ſoon raiſed a ſpirit of emulation in his countrymen; and many treatiſes of the ſame kind ſucceſſively appeared, which time has however deprived us of, or at leaſt they are become ſo very ſcarce as only to be found in the libraries of the curious.

About the year 1600, France made ſome conſiderable efforts to revive the arts of huſbandry, as appears from ſeveral large works, particularly *Les Moyens de devenir Riche;* and the *Coſmopolite*, by Bernard de Paliſſy, a poor porter, who ſeems to have been placed by a fortune in a ſtation for which nature never intended him; *Le Theatre d'Agriculture*, by Deferres; and *L'Agriculture et Maiſon Ruſtique*, by Meſſrs Etienne, Liebault, &c.

Nearly in the ſame period, the ſkilful practice of huſbandry became more prevalent among this people and the Flemings than the publiſhing of books on the ſubject. Their intention ſeemed to be that of carrying on a private lucrative employment, without inſtructing their neighbours. Whoever therefore became deſirous of copying their method of agriculture, was obliged to viſit that country, and make his own remarks on their practice.

The principal idea they had of huſbandry was, by keeping the lands clean and in fine tilth, to make a farm reſemble a garden as nearly as poſſible.

Such an excellent principle, at firſt ſetting out, led them of courſe to undertake the culture of ſmall farms only, which they kept free from weeds, continually turning the ground, and manuring it plentifully and judiciouſly. When they had by this method brought the ſoil to a proper degree of cleanlineſs, health, and ſweetneſs, they chiefly cultivated the more delicate graſſes, as the ſureſt means of obtaining a certain profit upon a ſmall eſtate, without the expence of keeping many draught horſes and ſervants. A few years experience was ſufficient to convince them, that ten acres of the beſt vegetables for feeding cattle, properly cultivated, would maintain a larger ſtock of grazing animals than forty acres of common farm graſs on land badly cultivated. They alſo found, that the beſt vegetables for this purpoſe were lucerne, ſaintfoin, trefoil of moſt kinds, field-turnips, &c.

The grand political ſecret of their huſbandry, therefore, conſiſted in letting farms on improvement. They are ſaid alſo to have diſcovered nine ſorts of manure; but what they all were, we are not particularly informed. We find, however, that marl was one of them; the uſe and virtues of which appear alſo to have been well known in this kingdom two hundred years ago, although it was afterwards much neglected. They were the firſt people among the moderns who ploughed in green crops for the ſake of fertilizing the ſoil; and who confined their ſheep at night in large ſheds built on purpoſe, the floors of which were covered with ſand or virgin earth, &c. which the ſhepherd carted away each morning to the compoſt dunghill.

In England, during the civil wars, though the operations and improvements in huſbandry ſuffered ſome temporary checks, there flouriſhed ſeveral excellent writers on the ſubject, and the art itſelf received conſiderable encouragement. Sir Hugh Platt was one of the moſt ingenious huſbandmen of the age in which he lived; yet ſo great was his modeſty, that all his works

except

except his Paradiſe of Flora, ſeem to be poſthumous. He held a correſpondence with moſt of the lovers and patrons of agriculture and gardening in England; and ſuch was the juſtice and modeſty of his temper, that he always named the author of every diſcovery communicated to him. Perhaps no man in any age diſcovered, or at leaſt brought into uſe, ſo many new kinds of manure. This will be evident to thoſe who read his account of the compoſt and covered dunghills, and his judicious obſervations on the fertilizing qualities lodged in ſalt, ſtreet dirt, and the ſullage of ſtreets in great cities, clay, fullers earth, mooriſh earths, dunghills made in layers, fern, hair, calcination of all vegetables, malt duſt, willow tree earth, ſoapers aſhes, urine, marl, and broken potherds.

Gabriel Plattes may be ſaid to have been an original genius in huſbandry. He began his obſervations at an earlier period, in the reign of Queen Elizabeth, and continued them down to the Commonwealth. But notwithſtanding the great merit of this writer, and the eſſential ſervice he had rendered his country by his writings, the public ungratefully ſuffered him to ſtarve and periſh in the ſtreets of London; nor had he a ſhirt on his back when he died.

Samuel Hartlib, a celebrated writer on agriculture in the laſt century, was highly eſteemed and beloved by Milton, and other great men of his time. In the preface to his work entitled his *Legacy*, he laments that no public director of huſbandry was eſtabliſhed in England by authority; and that we had not adopted the Flemiſh method of letting farms upon improvement. This remark of Hartlib's procured him a penſion of 100l. a year from Cromwell; and the writer afterwards, the better to fulfil the intention of his benefactor, procured Dr Beatti's excellent annotation on the Legacy, with other valuable papers from his numerous correſpondents.

The time in which Hartlib flouriſhed ſeems to have been an era when the Engliſh huſbandry roſe to great perfection, compared with that of former ages; for the preceding wars had impoveriſhed the country gentlemen, and of courſe made them induſtrious. They found the cultivation of their own lands to be the moſt profitable ſtation they could fill. But this wiſe turn was not of long continuance. At the Reſtoration, they generally became infected with that intoxication and love of pleaſure which ſucceeded. All their induſtry and knowledge were exchanged for neglect and diſſipation; and huſbandry deſcended almoſt entirely into the hands of common farmers.

Evelyn was the firſt writer who inſpired his countrymen with a deſire of reviving the ſtudy of agriculture; and he was followed by the famous Jethro Tull. The former, by his admirable treatiſes on earth and on planting, and the latter, by ſhowing the ſuperior advantages of the drill huſbandry, excited numbers to bring their theory to the teſt of fair experiment.

Many valuable and capital improvements have ſince that period been made in Engliſh huſbandry: and theſe great men have been ſucceeded by a variety of writers, many of whom have done eſſential ſervice, by enlightening the minds of their countrymen, and exciting them to emulation.

About the middle of the laſt century, Ireland began to make a conſiderable figure in the art of huſbandry. It muſt indeed be confeſſed, that the Iriſh had very ſtrong prejudices in favour of a wretched method of agriculture, till Blyth opened their eyes by his excellent writings. Since that time, a ſpirit of improvement has more or leſs been promoted, and in many inſtances carried on with great zeal, by the nobility, clergy, and gentry of that kingdom. In proof of this, it will be ſufficient to obſerve, that the Tranſactions of the Dublin Society for encouraging Huſbandry are now cited by all foreigners in their memoirs relating to that ſubject. And the obſervations of that diſcerning and judicious writer Arthur Young, Eſq. in his Tour through that kingdom, ſhow, that in many reſpects improvements there have of late years made a progreſs nearly as rapid as in England.

After the peace of Aix-la-Chapelle, moſt of the nations of Europe, by a ſort of tacit conſent, applied themſelves to the ſtudy of agriculture, and continued to do ſo, more or leſs, amidſt the univerſal confuſion that ſucceeded.

The French found, by repeated experience, that they could never maintain a long war, or procure a tolerable peace, unleſs they could raiſe corn enough to ſupport themſelves in ſuch a manner as not to be obliged to ſubmit to harſh terms on the one hand, or to periſh by famine on the other. This occaſioned the king to give public encouragement to agriculture, and even to be preſent at the making of ſeveral experiments. The great, and the rich of various ranks and ſtations, followed his example; and even the ladies were candidates for a ſhare of fame in this public-ſpirited and commendable undertaking.

During the hurry and diſtreſſes of France in the war of 1756, conſiderable attention was paid to agriculture. Prize queſtions were annually propoſed in their rural academies, particularly thoſe of Lyons and Bourdeaux; and many judicious obſervations were made by the Society for improving agriculture in Britanny.

After the concluſion of that war in 1763, matters were carried on there with great vigour. The univerſity of Amiens made various propoſals for the advancement of huſbandry; and the marquis de Tourbilly (a writer who proceeded chiefly on experience) had the principal direction of a georgical ſociety eſtabliſhed at Tours.

The ſociety at Rouen alſo deſerves notice; nor did the king and his miniſters think it unworthy their attention. There ſoon exiſted about fifteen ſocieties in France, eſtabliſhed by royal approbation, for the promoting of agriculture; and theſe had twenty co operating ſocieties belonging to them.

About this time vigorous exertions began to be made in Ruſſia to introduce the moſt approved ſyſtem of huſbandry which had taken place in other parts of Europe. The late empreſs ſent ſeveral gentlemen into Britain and other countries to ſtudy agriculture, and gave it all poſſible encouragement in her own dominions.

The art of agriculture has alſo been for many years publicly taught in the Swediſh, Daniſh, and German univerſities, where the profeſſors may render effectual ſervice to their reſpective countries, if they underſtand the practical as well as the ſpeculative part, and can converſe with as much advantage with the farmer as with Virgil and Columella.

Even

Even Italy has not been totally inactive. The Neapolitans of this age have condeſcended to recur to the firſt rudiments of revived huſbandry, and begun to ſtudy anew the Agricultural Syſtem of Creſcenzio, firſt publiſhed in 1478. The people of Bergamo have purſued the ſame plan, and given a new edition of the Ricordo d'Agriculturæ de Tarello, firſt publiſhed in 1577. The duchy of Tuſcany has imbibed the ſame ſpirit of improvement. A private gentleman, above 40 years ſince, left his whole fortune to endow an academy of agriculture. The firſt eccleſiaſtic in the duchy was preſident of this ſociety, and many of the chief nobility were members.

His Sardinian majeſty alſo ſent perſons to learn the different modes of practice in foreign countries; and made ſome ſpirited attempts to eſtabliſh a better method of agriculture among his ſubjects.

In Poland, alſo, M. de Bieluſki, grand marſhal of the crown, made many ſucceſsful attempts to introduce the new huſbandry among his countrymen; and procured the beſt inſtruments for that purpoſe from France, England, and other parts of Europe.

The Hollanders are the only people now in Europe who ſeem to look upon agriculture with indifference. Except the ſingle collateral inſtance of draining their fens and moraſſes, they have ſcarcely paid any attention to it; and even this ſeems to have proceeded more from the motive of ſelf-preſervation, than any love of, or diſpoſition to, huſbandry.

In the year 1759, a few ingenious and public-ſpirited men at Berne in Switzerland eſtabliſhed a ſociety for the advancement of agriculture and rural economics. In that ſociety were many men of great weight in the republic, and moſt of them perſons of a true caſt for making improvements in huſbandry, being enabled to join the practice with the theory.

Nor muſt we here omit to mention, that the juſtly celebrated Linnæus and his diſciples have performed great things in the north of Europe, particularly in diſcovering new kinds of profitable and well-taſted food for cattle. About the ſame time, Sweden beſtowed ſucceſsful labours on a ſoil which had before been looked upon as cold, barren, and incapable of melioration. Of this the Stockholm Memoirs will be a laſting monument.

Denmark, and many of the courts in Germany, followed the ſame example. Woollen manufactures were encouraged, and his Daniſh majeſty ſent three perſons into Arabia Felix to make remarks, and bring over ſuch plants and trees as would be uſeful in huſbandry, building, and rural affairs.

The duchy of Wirtemburg, alſo, a country by no means unfertile, but even friendly to corn and paſturage, has contributed its aſſiſtance towards the improvement of agriculture, having more than 50 years ſince publiſhed 14 economical relations at Stutgard.

Neither muſt we forget the very aſſiduous attention of the learned in Leipſic and Hanover to this important object. During the rage and devaſtation of a long war, they cultivated the arts of peace; witneſs the *Journal d'Agriculture* printed at Leipſic, and the *Recueils d'Hanover* printed in that city.

Even Spain, conſtitutionally and habitually inactive on ſuch occaſions, in ſpite of all their natural indolence, and the prejudices of bigotry, invited Linnæus, with the offer of a large penſion, to ſuperintend a college founded for the purpoſe of making new inquiries into the hiſtory of nature and the art of agriculture.

Among the Japaneſe, agriculture is in great repute; and among the Chineſe it is diſtinguiſhed and encouraged by the court beyond all other ſciences. The emperor of China yearly, at the beginning of ſpring, goes to plough in perſon, attended by all the princes and grandees of the empire. The ceremony is performed with great ſolemnity; and is accompanied with a ſacrifice, which the emperor, as high-prieſt, offers to Chang-Ti, to enſure a plentiful crop in favour of his people.

But, without any improper partiality to our own country, we are fully juſtified in aſſerting, that Britain alone exceeds all modern nations in huſbandry; and from the ſpirit which for the laſt twenty years has animated many of our nobility and gentry, to become the liberal patrons of improvement, there is reaſon to hope that this moſt uſeful of arts will, in a few years, be carried to a greater pitch of perfection than it has ever yet attained in any age or country.—The Royal Society, the Bath Society, and the Society of Arts, &c. in particular, have been ſignally uſeful in this reſpect; and the other aſſociations, which are now eſtabliſhed in many parts of the kingdom, co-operate with them in forwarding their laudable deſign.

It is, not however, to the exertion of public ſocieties, excellent and honourable as they are, that all our modern improvements in agriculture owe their origin. To the natural genius of the people have been added the theory and practice of all nations in ancient and modern times. This accumulated maſs of knowledge has been arranged, divided, and ſubdivided; and after paſſing the teſt of practical experiments, the eſſential and moſt valuable parts of it have been preſerved, improved, and amply diffuſed in the works of Lord Kames, Mr Young, Stillingfleet, Dr Hunter, Anderſon, Dickſon, Ellis, Randal, Liſle, Marſhal, Mortimer, Duhamel, Bradley, Kent, Mills, and a few other writers upon this great art of rendering mankind happy, wealthy, and powerful.

The board of agriculture.
