Some parts of the old walls of the city are yet ſtanding, and preſent us with a maſterpiece of ancient maſonry. They are flanked with large towers, about 200 paces diſtant from each other, with ſmall ones in the middle. Below are magnificent caſemates, which may ſerve for galleries to walk in. In the lower part of the towers is a large ſquare hall, whoſe roof is ſupported by thick columns of Thebaic ſtone. Above this are ſeveral rooms, over which there are platforms more than 20 paces ſquare. The ancient reſervoirs, vaulted with ſo much art, which extend under the whole town, Alexandria. are almoſt entire at the end of 2000 years.

Of Cæſar's palace there remain only a few porphyry pillars, and the front, which is almoſt entire, and looks very beautiful. The palace of Cleopatra was built upon the walls facing the port, having a gallery on the outſide, ſupported by ſeveral fine columns. Not far from this palace are two obeliſks vulgarly called *Cleopatra's Needles*. They are of Thebaic ſtone, and covered with hieroglyphics. One is overturned, broken, and lying under the ſand; the other is on its pedeſtal. Theſe two obeliſks, each of them of a ſingle ſtone, are about 60 feet high, by ſeven feet ſquare at the baſe. Denon, who went to Egypt along with the French army in 1798, ſuppoſes that theſe columns decorated the entrance of the palace of the Ptolemies, the ruins of which ſtill exiſt at no great diſtance from the place of the obeliſks. Towards the gate of Roſetta, are five columns of marble on the place formerly occupied by the porticoes of the gymnaſium. The reſt of the colonnade, the deſign of which was diſcoverable 100 years ago by Maillet, has ſince been deſtroyed by the barbariſm of the Turks.

But what moſt engages the attention of travellers is the pillar of Pompey, as it is commonly called, ſituated at a quarter of a league from the ſouthern gate. It is compoſed of red granite. The capital is Corinthian, with palm leaves, and not indented. It is nine feet high. The ſhaft and the upper member of the baſe are of one piece of 90 feet long, and nine in diameter. The baſe is a ſquare of about 15 feet on each ſide. This block of marble, 60 feet in circumference, reſts on two layers of ſtone bound together with lead; which, however, has not prevented the Arabs from forcing out ſeveral of them, to ſearch for an imaginary treaſure. The whole column is 114 feet high. It is perfectly well poliſhed, and only a little ſhivered on the eaſtern ſide. Nothing can equal the majeſty of this monument; ſeen from a diſtance, it overtops the town, and ſerves as a ſignal for veſſels. Approaching it nearer, it produces an aſtoniſhment mixed with awe. One can never be tired with admiring the beauty of the capital, the length of the ſhaft, nor the extraordinary ſimplicity of the pedeſtal. This laſt has been ſomewhat damaged by the inſtruments of travellers, who are curious to poſſeſs a relick of this antiquity; and one of the volutes of the column was immaturely brought down about twelve years ago, by a prank of ſome Engliſh captains, which is thus related by Mr Irwin.

Theſe jolly ſons of Neptune had been puſhing about the can on board one of the ſhips in the harbour, until a ſtrange freak entered into one of their brains. The eccentricity of the thought occaſioned it immediately to be adopted; and its apparent impoſſibility was but a ſpur for the putting it into execution. The boat was ordered; and with proper implements for the attempt, theſe enterpriſing heroes puſhed aſhore, to drink a bowl of punch on the top of Pompey's pillar! At the ſpot they arrived; and many contrivances were propoſed to accompliſh the deſired point. But their labour was vain; and they began to deſpair of ſucceſs, when the genius who ſtruck out the frolic happily ſuggeſted the means of performing it. A man was diſ-

Voyage and Route, p. 379.

patched

Alexandria. patched to the city for a paper kite. The inhabitants were by this time apprized of what was going forward, and flocked in crowds to be witneſſes of the addreſs and boldneſs of the Engliſh. The governor of Alexandria was told that theſe ſeamen were about to pull down Pompey's pillar. But whether he gave them credit for their reſpect to the Roman warrior, or to the Turkiſh government, he left them to themſelves; and politely anſwered, that the Engliſh were too great patriots to injure the remains of Pompey. He knew little, however, of the diſpoſition of the people who were engaged in this undertaking. Had the Turkiſh empire riſen in oppoſition, it would not perhaps at that moment have deterred them. The kite was brought, and flown ſo directly over the pillar, that when it fell on the other ſide, the ſtring lodged upon the capital. The chief obſtacle was now overcome. A two-inch rope was tied to one end of the ſtring, and drawn over the pillar by the end to which the kite was affixed. By this rope one of the ſeamen aſcended to the top; and in leſs than an hour a kind of ſhroud was conſtructed, by which the whole company went up, and drank their punch amid the ſhouts of the aſtoniſhed multitude. To the eye below, the capital of the pillar does not appear capable of holding more than one man upon it; but our ſeamen found it could contain no leſs than eight perſons very conveniently. It is aſtoniſhing that no accident befel theſe madcaps, in a ſituation ſo elevated, that would have turned a landman giddy in his ſober ſenſes. The only detriment which the pillar received, was the loſs of the volute before mentioned; which came down with a thundering ſound, and was carried to England by one of the captains, as a preſent to a lady who commiſſioned him for a piece of the pillar. The diſcovery which they made amply compenſated for this miſchief; as without their evidence, the world would not have known at this hour that there was originally a ſtatue on this pillar, one foot and ancle of which are ſtill remaining. The ſtatue muſt have been of a gigantic ſize; to have appeared of a man's proportion at ſo great a height.

There are circumſtances in this ſtory which might give it an air of fiction, were it not demonſtrated beyond all doubt. Beſides the teſtimonies of many eye-witneſſes, the adventurers themſelves have left us a token of the fact, by the initials of their names, which are very legible in black paint juſt beneath the capital.

Learned men and travellers have made many fruitleſs attempts to diſcover in honour of what prince it was erected. The beſt informed have concluded, that it could not be in honour of Pompey, ſince neither Strabo nor Diodorus Siculus have ſpoken of it. The Arabian Abulfeda, in his Deſcription of Egypt, calls it *the Pillar of Severus*. And hiſtory informs us *, that this emperor "viſited the city of Alexandria: That he granted a ſenate to its inhabitants, who until that time, under the ſubjection of a ſingle Roman magiſtrate, had lived without any national council, as under the reign of the Ptolemies, when the will of the prince was their only law: That he did not confine his benefactions there; he changed ſeveral laws in their favour." This column, therefore, Mr Savary concludes to have been erected by the inhabitants as a mark of their gratitude to Severus. And in a Greek inſcription, now half effaced, but viſible on the weſt ſide when the ſun ſhines upon it, and which probably was legible in the time of Abulfeda, he ſuppoſes the name of Severus to have been preſerved. He further obſerves, that this was not the only monument erected to him by the gratitude of the Alexandrians: for there is ſtill ſeen in the midſt of the ruins of Antinoe, built by Adrian, a magnificent pillar, the inſcription on which is ſtill remaining, dedicated to Alexander Severus. Alexandria.

Denon, whom we have already quoted, ſeems to be of a different opinion. "We paſſed (ſays he) near Pompey's pillar. This monument is in the predicament of almoſt every thing famous, which loſes on a near ſcrutiny. It was named Pompey's pillar in the fifteenth century, when learning began to recover itſelf from the torpid ſtate in which it had ſo long languiſhed. At that epoch, men of ſcience, but not obſervers, beſtowed names on all the monuments; and theſe names have been handed down by tradition, and without being diſputed, from century to century. A monument had been raiſed to Pompey at Alexandria: it had diſappeared, and was thought to be recovered in this pillar or column, which has ſince been converted into a trophy erected to the memory of Septimius Severus. It is, however, placed on the ruins of the ancient city; and in the time of Septimius Severus, the city of the Ptolemies was not in a ruinous ſtate. To ſupport this column by a ſolid foundation, an obeliſk has been ſunk in the earth, on which is placed a very clumſy pedeſtal, having a fine ſhaft, and ſurmounted by a Corinthian capital of bad workmanſhip.

"If the ſhaft of this column, ſeparating it from the pedeſtal and the capital, once belonged to an ancient edifice, it is an evidence of its magnificence, and of the ſkill with which it was executed. It ought therefore to be ſaid, that what is called Pompey's pillar, is a fine column, and not a fine monument. It ſhould be ſaid, that the column of St Maria Maggiore, notwithſtanding it is one of the fineſt in exiſtence, has not the character of a monument; that it is merely a fragment; and that, if the columns of Trajan and Antoninus are not in the ſame predicament, it is becauſe they appear as coloſſal cylinders, on which the hiſtory of the glorious expeditions of theſe two emperors is pompouſly diſplayed, and which, if reduced to their ſimple form and dimenſions, would be nothing more than dull and heavy monuments.

"The earth about the foundations of Pompey's pillar having been cleared away by time, two fragments of an obeliſk of white marble, the only monument of that ſubſtance which I have ſeen in Egypt, have been added to the original baſe, to render it more ſolid.

"Excavations made round the circumference of this column, would, no doubt, afford ſome information relative to its origin. The ſhaking of the earth, and the form it takes on treading on it, ſeem to atteſt that theſe reſearches would not be fruitleſs. They would perhaps diſcover the baſe and *atrium* of the portico to which this column belonged, which has been the ſubject of diſſertations made by literati who have ſeen the drawings only, or whoſe information has been limited to the deſcriptions of travellers. Theſe travellers have neglected to apprize them, that fragments of columns of the ſame ſubſtance and diameter are found in the vicinity; and that the ſhaking of the earth indicates the deſtruction of great edifices buried beneath, the forms of which

* Vide Spartian's life of Severus, cap. 17.

Alexandria. which may be diſtinguiſhed on the ſurface, ſuch as a ſquare of a conſiderable ſize, and a large circus, the principal dimenſions of which may be meaſured, notwithſtanding it is covered with ſand and ruins.

" After having obſerved that the column, entitled *Pompey's pillar*, is very chaſte both in ſtyle and execution; that the pedeſtal and capital are not formed of the ſame granite as the ſhaft; that their workmanſhip is heavy, and appears to be merely a rough draught; and that the foundations, made up of fragments, indicate a modern conſtruction; it may be concluded, that this monument is not antique, and that it may have been erected either in the time of the Greek emperors, or of the caliphs; ſince, if the capital and pedeſtal are well enough wrought to belong to the former of theſe periods, they are not ſo perfect but that art may have reached ſo far in the latter." (*Denon's Travels.*)

On the ſouth-weſt ſide of the city, at a mile's diſtance, are ſituated the catacombs, the ancient burial-place of Alexandria; and although they cannot be compared to thoſe of the ancient Memphis, which the Arabs will not permit to be viſited, in order to make the better market of their mummies, it is probable that, the method of embalming being the ſame, the form of theſe catacombs can only differ in their proportions. The Baron de Tott, in deſcribing theſe, obſerves, " that Nature not having furniſhed this part of Egypt with a ridge of rocks, like that which runs parallel with the Nile above Delta, the ancient inhabitants of Alexandria could only have an imitation by digging into a bed of ſolid rock; and thus they formed *Necropolis*, or " City of the Dead." The excavation is from 30 to 40 feet wide, and 200 long, and 25 deep, and is terminated by gentle declivities at each end. The two ſides, cut perpendicularly, contain ſeveral openings, about 10 or 12 feet in width and height, hollowed horizontally; and which form, by their different branches, ſubterranean ſtreets. One of theſe, which curioſity has diſencumbered from the ruins and ſands that render the entrance of others difficult or impoſſible, contains no mummies, but only the places they occupied. The order in which they were ranged is ſtill to be ſeen. Niches, 20 inches ſquare, ſunk ſix feet horizontally, narrowed at the bottom, and ſeparated from each other by partitions in the rock, ſeven or eight inches thick, divided into checkers the two walls of this ſubterranean vault. It is natural to ſuppoſe, from this diſpoſition that each mummy was introduced with the feet foremoſt into the cell intended for its reception; and that new ſtreets were opened, in proportion as theſe dead inhabitants of Necropolis increaſed." This obſervation, he adds, which throws a light on the catacombs of Memphis, may perhaps likewiſe explain the vaſt ſize and multitude, as well as the different elevations, of the pyramids in the Higher and Lower Egypt.

About 70 paces from Pompey's pillar is the khalis or the canal of the Nile, which was dug by the ancient Egyptians, to convey the water of the Nile to Alexandria, and fill the ciſterns under the city. On the ſide of the khalis are gardens full of orange and lemon trees, and the fields are full of caper and palm trees. On the top of a hill is a tower, on which a ſentinel is always placed, to give notice, by means of a flag, of the ſhips that are coming into the port. From this hill may be ſeen the ſea, the whole extent of the city, and the parts round it. Alexandri

In going along the ſea coaſt, there is a large baſon cut out of the rock that lines the ſhore. On the ſides of this baſon, two beautiful ſaloons are hewn out by the chiſel, with benches that run acroſs them. A canal made zig-zag, for the purpoſe of ſtopping the ſand by its different windings, conveys into them the water of the ſea, as pure and tranſparent as cryſtal. Seated on the ſtone-bench, the water riſes a little above the waiſt; while the feet ſoftly repoſe on a fine ſand. The waves of the ſea are heard roaring againſt the rock, and foaming in the canal. The ſwell enters, raiſes you up, and leaves you; and thus alternately entering and retiring, brings a continual freſh ſupply of water, and a coolneſs which is truly delicious under a burning ſky. This place is vulgarly called the *Bath of Cleopatra*. Some ruins announce that it was formerly ornamented.

In 1798 Alexandria was taken by the French under the command of Bonaparte. It fell into the hands of the Britiſh army in the year 1801; but by an article in the treaty of peace, dictated probably by mutual jealouſy, it is to be reſtored to the Ottoman Porte, and again ſubjected to the barbarous policy of the Turkiſh government.

Alexandria is about 50 leagues north of Cairo. E. Long. 31. 15. N. Lat. 31. 12.

ALEXANDRIA, a ſtrong and conſiderable city of Italy belonging to the duchy of Milan, with a good caſtle, built in 1178 in honour of Pope Alexander III. This pope made it a biſhopric, with ſeveral privileges and exemptions. Prince Eugene of Savoy took this city in 1706, after three days ſiege. The French took it in 1745; but the king of Sardinia, to whom it belongs by the treaty of Utrecht, retook it in 1746. The fortifications of the town are trifling, but the citadel is conſiderable. It is 15 miles ſouth-eaſt of Caſſal, 35 north-by-weſt of Genoa, and 40 ſouth-by-weſt of Milan. E. Long. 8. 40. N. Lat. 44. 53. The country about this town is called the *Alexandrin*.

ALEXANDRIA, in *Ancient Geography*, a city of Arachoſia, called alſo *Alexandropolis*, on the river Arachotus (Stephanus, Iſidorus Characenus).—Another *Alexandria* in Gedroſia, built by Leonatus, by order of Alexander (Pliny).—A third *Alexandria* in Aria, ſituated at the lake Arias (Ptolemy); but, according to Pliny, built by Alexander on the river Arius.—A fourth in Bactriana (Pliny).—A fifth *Alexandria*, an inland town of Carmania (Pliny, Ptolemy, Ammian).—A ſixth *Alexandria*, or *Alexandropolis*, in Sogdiana (Iſidorus Characenus).—A ſeventh in India, at the confluence of the Aceſines and Indus (Arrian).—An eighth, called alſo *Alexandretta*, near the Sinus Iſſicus, on the confines of Syria and Cilicia, now *Scanderoon* (ſee ALEXANDRETTA), the port town to Aleppo.—A ninth *Alexandria* of Margiana, which being demoliſhed by the barbarians, was rebuilt by Antiochus the ſon of Seleucus, and called *Antiochia* of Syria (Pliny); watered by the river Margus, which is divided into ſeveral channels, for the purpoſe of watering the country which was called *Zotale*. The city was ſeventy ſtadia in circuit, according to Pliny; who adds, that, after the defeat of Craſſus, the captives were conveyed to this place by Orodes, the king of

the

Alexandrian, Alexicacus.

the Parthians.—A tenth, of the Oxiana, built on the Oxus by Alexander, on the confines of Bactria (Pliny).—An eleventh, built by Alexander at the foot of Mount Paropamiſus, which was called *Caucaſus* (Plinny, Arrian.)—A twelfth *Alexandria* in Troas, called alſo *Troas* and *Antigonia* (Pliny).—A thirteenth on the Iaxartes, the boundary of Alexander's victories towards Scythia, and the laſt that he built on that ſide.

ALEXANDRIAN, in a particular ſenſe, is applied to all thoſe who profeſſed or taught the ſciences in the ſchool of Alexandria. In this ſenſe, Clemens is denominated *Alexandrinus*, though born at Athens. The ſame may be ſaid of Apion, who was born at Oaſis; and Ariſtarchus, by birth a Samothracian. The chief Alexandrian philoſophers were, Amonius, Plotinus, Origen, Porphyry, Jamblicus, Sopater, Maximus, and Dexippus.

ALEXANDRIAN is more particularly underſtood of a college of prieſts, conſecrated to the ſervice of Alexander Severus after his deification. Lampridius relates, that, notwithſtanding Severus was killed by Maximin, the ſenate proſecuted his apotheoſis; and, for regularity of worſhip, founded an order of prieſts, or *ſodales*, under the denomination of *Alexandrini*.

ALEXANDRIAN Manuſcript, a famous copy of the Scriptures, conſiſting of four volumes, in a large quarto ſize; which contains the whole Bible in Greek, including the Old and New Teſtament, with the Apocrypha, and ſome ſmaller pieces, but not quite complete. This manuſcript is now preſerved in the Britiſh Muſeum. It was ſent as a preſent to King Charles I. from Cyrillus Lucaris, patriarch of Conſtantinople, by Sir Thomas Rowe, ambaſſador from England to the Grand Signior, about the year 1628. Cyrillus brought it with him from Alexandria, where probably it was written. In a ſchedule annexed to it, he gives this account: That it was written, as tradition informed them, by Thecla, a noble Egyptian lady, about 1300 years ago, not long after the council of Nice. But this high antiquity, and the authority of the tradition to which the patriarch refers, have been diſputed; nor are the moſt accurate Biblical writers agreed about its age. Grabe thinks that it might have been written before the end of the fourth century; others are of opinion, that it was not written till near the end of the fifth century, or ſomewhat later.

ALEXANDRIAN, or *Alexandrine*, in *Poetry*, a kind of verſe conſiſting of twelve, or of twelve and thirteen ſyllables alternately; ſo called from a poem on the life of Alexander written in this kind of verſe by ſome French poet. Alexandrines are peculiar to modern poetry, and ſeem well adapted to epic poems. They are ſometimes uſed by moſt nations of Europe; but chiefly by the French, whoſe tragedies are generally compoſed of Alexandrines.

ALEXICACUS, ſomething that preſerves the body from harm or miſchief. The word amounts to much the ſame as *alexiterial*.

ALEXICACUS, in antiquity, was an attribute of Neptune, whom the tunny-fiſhers uſed to invoke under this appellation, that their nets might be preſerved from the ξιφίας, or ſword-fiſh, which uſed to tear them; and that he might prevent the aſſiſtance which it was pretended the dolphins uſed to give the tunnies on this occaſion.

ALEXIPHARMICS, in *Medicine*, are properly remedies for expelling or preventing the ill effects of poiſon: but ſome of the moderns having imagined that the animal ſpirits in acute diſtempers were affected by a malignant poiſon, the term has been underſtood to mean medicines adapted to expel this poiſon by the cutaneous pores, in the form of ſweat. In this ſenſe, alexipharmics are the ſame as ſudorifics.

Alexipharmics || Alfet.

ALEXIS, a Piedmonteſe. There is a book of "Secrets," which for a long time has gone under his name. It was printed at Baſil 1536, in 8vo, and tranſlated from Italian into Latin by Wecher; it has alſo been tranſlated into French, and printed ſeveral times with additions. There is a preface to the piece, wherein Alexis informs us, that he was born of a noble family; that he had from his moſt early years applied himſelf to ſtudy; that he had learned the Greek, the Latin, the Hebrew, the Chaldean, the Arabian, and ſeveral other languages; that having an extreme curioſity to be acquainted with the ſecrets of nature, he had collected as much as he could during his travels for 57 years; that he picqued himſelf upon not communicating his ſecrets to any perſon; but that when he was 82 years of age, having ſeen a poor man who had died of a ſickneſs which might have been cured had he communicated his ſecret to the ſurgeon who took care of him, he was touched with ſuch a remorſe of conſcience, that he lived almoſt like a hermit: and it was in this ſolitude that he arranged his ſecrets in ſuch order as to make them fit to be publiſhed. The hawkers generally carry them, with other books, to the country fairs. Theſe, however, contain only the ſelect remedies of Seignior Alexis of Piedmont; the entire collection would make too large a volume for them.

ALEXITERIAL, among phyſicians, a term of much the ſame import with *alexipharmic;* though ſometimes uſed in a ſynonymous ſenſe with amulet.

ALEYN, CHARLES, an Engliſh poet in the reign of Charles I. In 1631, he publiſhed two poems, entitled, "The Battailes of Creſſey and Poictiers, under the fortunes and valour of King Edward of that name, and his ſonne Edward prince of Wales, named *the Black*." He ſucceeded his father as clerk of the ordnance, and was commiſſary-general of the artillery to the king at the battle of Edgehill. The next piece he wrote was a poem in honour of Henry VII. and the victory that gained him the crown of England. In 1639, the year before he died, he tranſlated the hiſtory of Eurialis and Lucretia, from the Latin epiſtles of Æneas Sylvius.

ALFANDIGA, the name of the cuſtomhouſe at Liſbon.

ALFAQUES, among the Moors, the name generally uſed for their clergy, or thoſe who teach the Mahometan religion; in oppoſition to the Morabites, who anſwer to monks among Chriſtians.

ALFATERNA, in *Ancient Geography*, the laſt town of Campania, beyond Veſuvius (Diodorus); the ſame with NOCERA, which ſee. The inhabitants *Alfaterni* (Pliny).

ALFDOUCH, a name given by the Moors to a ſort of vermicelli, which they make of flour and water, and are very fond of in their entertainments.

ALFET, in our old cuſtoms, denotes a caldron full.

Alford, Alfied.

full of boiling water, wherein an accuſed perſon, by way of trial or purgation, plunged his arm up to the elbow.

ALFORD, a town of Lincolnſhire, ſituated on a ſmall brook that runs through the town. A ſalt ſpring was diſcovered here in 1670, from the pigeons which flew thither in great numbers to drink the water; thoſe birds being known to be fond of ſalt. It contains a ſtrong purging ſalt, together with a portion of ſea-ſalt. It is recommended as cooling, cleanſing, and attenuating, as a good remedy in the ſcurvy, jaundice, and other glandular obſtructions. It alſo promotes urine and ſweat, and therefore is good in gravelly and other diſorders of the kidneys and bladder. Alford is ſix miles from the ſea, and 20 north of Boſton. E. Long. 0. 15. N. Lat. 53. 30.

ALFRED, or ÆLFRED, the Great, king of England, was the fifth and youngeſt ſon of Æthelwolf king of the Weſt Saxons, and was born at Wantage in Berkſhire in 849. He diſtinguiſhed himſelf, during the reign of his brother Ethelred, in ſeveral engagements againſt the Danes; and upon his death ſucceeded to the crown, in the year 871, and the 22d of his age. At his aſcending the throne, he found himſelf involved in a dangerous war with the Danes, and placed in ſuch circumſtances of diſtreſs as called for the greateſt valour, reſolution, and all the other virtues with which he was adorned. The Danes had already penetrated into the heart of his kingdom; and before he had been a month upon the throne, he was obliged to take the field againſt thoſe formidable enemies. After many battles gained on both ſides, he was at length reduced to the greateſt diſtreſs, and was entirely abandoned by his ſubjects. In this ſituation, Alfred, conceiving himſelf no longer a king, laid aſide all marks of royalty, and took ſhelter in the houſe of one who kept his cattle. He retired afterwards to the iſle of Æthelingey in Somerſetſhire, where he built a fort for the ſecurity of himſelf, his family, and the few faithful ſervants who repaired thither to him. When he had been about a year in this retreat, having been informed that ſome of his ſubjects had routed a great army of the Danes, killed their chief, and taken their magical ſtandard (A), he iſſued his letters, giving notice where he was, and inviting his nobility to come and conſult with him. Before they came to a final determination, Alfred, putting on the habit of a harper, went into the enemy's camp, where, without ſuſpicion, he was everywhere admitted, and had the honour to play before their princes. Having thereby acquired an exact knowledge of their ſituation, he returned in great ſecrecy to his nobility, whom he ordered to their reſpective homes, there to draw together each man as great a force as he could: and upon a day appointed there was to be a general rendezvous at the great wood called *Selwood*, in Wiltſhire. This affair was tranſacted ſo ſecretly and expeditiouſly, that, in a little time, the king, at the head of an army, approached the Danes, before they had the leaſt intelligence of his deſign. Alfred, taking advantage of the ſurpriſe and terror they were in, fell upon them, and totally defeated them at Æthendune, now Eddington. Thoſe who eſcaped fled to a neighbouring caſtle, where they were ſoon beſieged, and obliged to ſurrender at diſcretion. Alfred granted them better terms than they could expect. He agreed to give up the whole kingdom of the Eaſt-Angles to ſuch as would embrace the Chriſtian religion, on condition they would oblige the reſt of their countrymen to quit the iſland, and, as much as it was in their power, prevent the landing of any more foreigners. For the performance thereof he took hoſtages; and when, in purſuance of the treaty, Guthrum the Daniſh captain came, with 30 of his chief officers, to be baptized, Alfred anſwered for him at the font, and gave him the name of *Æthelſtane;* and certain laws were drawn up betwixt the king and Guthrum for the regulation and government of the Danes ſettled in England. In 884, a freſh number of Danes landed in Kent, and laid ſiege to Rocheſter, but the king coming to the relief of that city, they were obliged to abandon their deſign. Alfred had now great ſucceſs; which was chiefly owing to his fleet, an advantage of his own creating. Having ſecured the ſea-coaſts, he fortified the reſt of the kingdom with caſtles and walled towns; and he beſieged and recovered from the Danes the city of London, which he reſolved to repair, and to keep as a frontier (B).

Alfred.

After ſome years reſpite, Alfred was again called into the field: for a body of Danes, being worſted in the weſt of France, came with a fleet of 250 ſail on the coaſt of Kent; and having landed, fixed themſelves at Apple-tree: ſhortly after, another fleet of 80 veſſels coming up the Thames, the men landed, and built a fort at Middleton. Before Alfred marched againſt the enemy,

(A) "This (ſays Sir John Spelman) was a banner, with the image of a raven magically wrought by the three ſiſters of Hinguar and Hubba, on purpoſe for their expedition, in revenge of their father Lodebroch's murder, made, they ſay, almoſt in an inſtant, being by them at once begun and finiſhed in a noontide, and believed by the Danes to have carried great fatality with it, for which it was highly eſteemed by them. It is pretended, that, being carried in battle, towards good ſucceſs it would always ſeem to clap its wings, and make as if it would fly; but towards the approach of miſhap, it would hang down and not move." (*Life of Alfred*, p. 61.)

(B) The Danes had poſſeſſed themſelves of London in the time of his father; and had held it till now as a convenient place for them to land at, and fortify themſelves in; neither was it taken from them but by a cloſe ſiege. However, when it came into the king's hands, it was in a miſerable condition, ſcarce habitable, and all its fortifications ruined. The king, moved by the importance of the place, and the deſire of ſtrengthening his frontier againſt the Danes, reſtored it to its ancient ſplendour. And obſerving, that through the confuſion of the times, many, both Saxons and Danes, lived in a looſe diſorderly manner, without owning any government, he offered them now a comfortable eſtabliſhment, if they would ſubmit and become his ſubjects. This propoſition was better received than he expected, for multitudes growing weary of a vagabond kind of life, joyfully accepted ſuch an offer. (*Chron. Sax.* p. 88.)

Alfred. enemy, he obliged the Danes, ſettled in Northumberland and Eſſex, to give him hoſtages for their good behaviour. He then moved towards the invaders, and pitched his camp between their armies, to prevent their junction. A great body, however, moved off to Eſſex; and croſſing the river, came to Farnham in Surry, where they were defeated by the king's forces. Mean while the Danes ſettled in Northumberland, in breach of treaty, and, notwithſtanding the hoſtages given, equipped two fleets; and, after plundering the northern and ſouthern coaſts, ſailed to Exeter, and beſieged it. The king, as ſoon as he received intelligence, marched againſt them; but before he reached Exeter, they had got poſſeſſion of it. He kept them, however, blocked up on all ſides; and reduced them at laſt to ſuch extremities, that they were obliged to eat their horſes, and were even ready to devour each other. Being at length rendered deſperate, they made a general ſally on the beſiegers; but were defeated, though with great loſs on the king's ſide. The remainder of this body of Danes fled into Eſſex, to the fort they had built there, and to their ſhips. Before Alfred had time to recruit himſelf, another Daniſh leader, whoſe name was Laf, came with a great army out of Northumberland, and deſtroyed all before him, marching on to the city of Werheal in the weſt, which is ſuppoſed to be Cheſter, where they remained the reſt of that year. The year following they invaded North Wales; and after having plundered and deſtroyed every thing, they divided, one body returning to Northumberland, another into the territories of the Eaſt Angles; from whence they proceeded to Eſſex, and took poſſeſſion of a ſmall iſland called *Mereſig*. Here they did not long remain; for having ſeparated, ſome ſailed up the river Thames, and others up the Lea-road; where drawing up their ſhips, they built a fort not far from London, which proved a great check upon the citizens, who went in a body and attacked it, but were repulſed with great loſs: at harveſt time the king himſelf was obliged to encamp with a body of troops in the neighbourhood of the city, in order to cover the reapers from the excurſions of the Danes. As he was one day riding by the ſide of the river Lea, after ſome obſervations he began to think that the Daniſh ſhips might be laid quite dry: this he attempted, and ſucceeded; ſo that the Danes deſerted their fort and ſhips, and marched away to the banks of the Severn, where they built a fort, and wintered at a place called *Quatbrig* (c). Such of the Daniſh ſhips as could be got off, the Londoners carried into their own road; the reſt they burnt and deſtroyed.

Alfred enjoyed a profound peace during the three laſt years of his reign, which he chiefly employed in eſtabliſhing and regulating his government, for the ſecurity of himſelf and his ſucceſſors, as well as the eaſe and benefit of his ſubjects in general. After a troubleſome reign of 28 years, he died on the 28th of October A. D. 900; and was buried at Wincheſter, in Hyde-abbey, under a monument of porphyry. Alfred

All our hiſtorians agree in diſtinguiſhing him as one of the moſt valiant, wiſeſt, and beſt of kings that ever reigned in England; and it is alſo generally allowed, that he not only digeſted ſeveral particular laws ſtill in being, but that he laid the firſt foundation of our preſent happy conſtitution. There is great reaſon to believe that we are indebted to this prince for trials by juries; and the Doomſday book, which is preſerved in the exchequer, is thought to be no more than another edition of Alfred's book of Wincheſter, which contained a ſurvey of the kingdom. It is ſaid alſo, that he was the firſt who divided the kingdom into ſhires. What is aſcribed to him is not a bare diviſion of the country, but the ſettling a new form of judicature; for after having divided his dominions into ſhires, he ſubdivided each ſhire into three parts, called *trythings*. There are ſome remains of this ancient diviſion in the ridings of Yorkſhire, the laths of Kent, and the three parts of Lincolnſhire. Each trything was divided into hundreds or wapentakes; and theſe again into tythings or dwellings of ten houſeholders: each of theſe houſeholders ſtood engaged to the king, as a pledge for the good behaviour of his family, and all the ten were mutually pledges for each other; ſo that if any one of the tythings was ſuſpected of an offence, if the head-boroughs or chiefs of the tythings would not be ſecurity for him, he was impriſoned; and, if he made his eſcape, the tything and hundred were fined to the king. Each ſhire was under the government of an earl, under whom was the reive, his deputy; ſince, from his office, called *ſhire-reive*, or *ſheriff*. And ſo effectual were theſe regulations, that it is ſaid he cauſed bracelets of gold to be hung up in the highways, as a challenge to robbers; and they remained untouched.

In private life, Alfred was the moſt amiable man in his dominions; of ſo equal a temper, that he never ſuffered either ſadneſs or unbecoming gaiety to enter his mind; but appeared always of a calm yet cheerful diſpoſition, familiar to his friends, juſt even to his enemies, kind and tender to all. He was a remarkable economiſt of his time; and Aſſerius has given us an account of the method he took for dividing and keeping an account of it: he cauſed ſix wax-candles to be made, each of 12 inches long, and of as many ounces weight; on the candles the inches were regularly marked, and having found that one of them burnt juſt four hours, he committed them to the care of the keepers of his chapel, who from time to time gave him notice how the hours went: but as in windy weather the candles were waſted by the impreſſion of the air on the flame, to remedy this inconvenience, he invented lanthorns, there being then no glaſs in his dominions.

This prince, we are told, was 12 years of age before a maſter could be procured in the weſtern kingdom

(c) The king's contrivance is thought to have produced the meadow between Hertford and Bow: for at Hertford was the Daniſh fort, and from thence they made frequent excurſions on the inhabitants of London. Authors are not agreed as to the method the king purſued in laying dry the Daniſh ſhips: Dugdale ſuppoſes that he did it by ſtraightening the channels; but Henry of Huntingdon alleges, that he cut ſeveral canals, which exhauſted its water

Alfred. to teach him the alphabet; such was the state of learning when Alfred began to reign. He had felt the misery of ignorance; and determined even to rival his cotemporary Charlemagne in the encouragement of literature. He is supposed to have appointed persons to read lectures at Oxford, and is thence considered as the founder of that university. By other proper establishments, and by a general encouragement to men of abilities, he did every thing in his power to diffuse knowledge throughout his dominions. Nor was this end promoted more by his countenance and encouragement than by his own example and his writings. For notwithstanding the lateness of his initiation, he had acquired extraordinary erudition; and, had he not been illustrious as a king, he would have been famous as an author. His works are, 1. *Breviarium quoddam collectum ex Legibus Trojanorum*, &c. lib. i. A Breviary collected out of the laws of the Trojans, Greeks, Britons, Saxons, and Danes, in one book. Leland saw this book in the Saxon tongue, at Christ church in Hampshire. 2. *Visi-Saxonum Leges*, lib. i. The laws of the West-Saxons, in one book. Pitts tells us, that it is in Bennet College library, at Cambridge. 3. *Instituta quædam*, lib. i. Certain Institutes, in one book. This is mentioned by Pitts, and seems to be the second capitulation with Guthrum. 4. *Contra Judices iniquos*, lib. i. An invective against Unjust Judges, in one book. 5. *Acta Magistratuum suorum*, lib. i. Acts of his Magistrates, in one book. This is supposed to be the Book of Judgments mentioned by Horne; and was, in all probability, a kind of reports, intended for the use of succeeding ages. 6. *Regum fortunæ variæ*, lib. i. The various Fortunes of Kings, in one book. 7. *Dicta Sapientum*, lib. i. The sayings of Wise Men, in one book. 8. *Parabolæ et Sales*, lib. i. Parables and pleasant Sayings, in one book. 9. *Collectiones Chronicorum*, Collection of Chronicles. 10. *Epistolæ ad Wulfsigium Episcopum*, lib. i. Epistles to Bishop Wulfsig, in one book. 11. *Manuale Meditationum*. A Manual of Meditations.—Besides those original works, he translated many authors from the Latin, &c. into the Saxon language, viz. 1. Bede's History of England. 2. Paulinus Orosinus's History of the Pagans. 3. St Gregory's Pastoral, &c. The first of these, with his prefaces to the others, together with his laws, were printed at Cambridge, 1644. His laws are likewise inserted in Spelman's Councils. 4. *Boethius de Consolatione*, lib. v. Boetius's Consolations of Philosophy, in five books. Dr Plot tells us, King Alfred translated it at Woodstock, as he found in a MS. in the Cotton Library. 5. *Æsopi Fabulæ*, Æsop's Fables: which he is said to have translated from the Greek both into Latin and Saxon. 6. *Psalterium Davidicum*, lib. i. David's Psalter, in one book. This was the last work the king attempted, death surprising him before he had finished it; it was, however, completed by another hand, and published at London in 1640, in quarto, by Sir John Spelman. Several others are mentioned by Malmsbury; and the old history of Ely asserts, that he translated the Old and New Testaments.

The life of this great king was first written by Asserius Menevensis; and first published by Archbishop Parker, in the old Saxon character, at the end of his edition of Hassingham's history, printed in 1674, fol. Alga || Algarva.

ALGA, in *Botany*, the trivial name of the lichen, fucus, and several other plants of the cryptogamia class.

ALGÆ, FLAGS; one of the seven families or natural tribes into which the whole vegetable kingdom is divided by Linnæus, in his *Philosophia Botanica*. They are defined to be plants, whose root, leaf, and stem, are all one. Under this description are comprehended all the sea-weeds, and some other aquatic plants. In the sexual system, they constitute the 3d order of the 24th class, *Cryptogamia*; in Tournefort, the second genus of the second section, *Marinæ, aut Fluviatiles*, of the 17th class, *Aspermæ vulgo habitæ*; and the 57th order in Linnæus's Fragments of a Natural Method. The discoveries made in this part of the vegetable kingdom are uncertain, and imperfect; and the attempts, in particular, to arrange flags by the parts of the fructification, have not been attended with great success. Dillenius has arranged this order of plants from their general habit and structure; Michelius from the parts of fructification.

ALGAGIOLA, a small sea-port town in the island of Corsica, fortified with walls and bastions. It was almost destroyed by the malecontents in 1731, but has since been repaired. E. Long. 9. 45. N. Lat. 42. 20.

ALGAROTH, in *Chemistry*, is a white oxyde of antimony, which is obtained by washing the butter or oxymuriate with pure water. See CHEMISTRY *Index*.

ALGAROTTI, COUNT, a celebrated Italian, was born at Padua; but the year is not mentioned. Led by curiosity, as well as a desire of improvement, he travelled early into foreign countries; and was very young when he arrived in France in 1736. Here he composed his "Newtonian Philosophy for the Ladies;" as Fontenelle had done his Cartesian Astronomy, in the work entitled "The Plurality of worlds." He was noticed by the king of Prussia, who gave him marks of the esteem he had for him. He died at Pisa the 23d of May, 1674; and ordered his own mausoleum, with this inscription to be fixed upon it: "*Hic jacet Algarottus, sed non omnis.*" He is allowed to have been a very great connoisseur in painting, sculpture, and architecture. He contributed much to the reformation of the Italian opera. His works, which are numerous, and upon a variety of subjects, abound with vivacity, elegance, and wit: a collection of them has lately been made, and printed at Leghorn in 1765, in 4 vols. 8vo.

ALGARVA, a province in the kingdom of Portugal, 67 miles in length and 20 in breadth; bounded on the west and south by the sea, on the east by the river Guadiana, and on the north by Alentejo. It is very fertile in figs, almonds, dates, olives, and excellent wines; and, besides, has a very abundant and lucrative fishery. The capital town is Pharo. It contains four cities, 12 towns, 67 parishes, and it is said, above 90,000 inhabitants.

ALGEBRA.

INTRODUCTION.

History. 1. ALGEBRA is a general method of reaſoning, concerning the relations which magnitudes of every kind bear to each other in reſpect of quantity. It is ſometimes called *univerſal arithmetic*; its firſt principles and operations being ſimilar to thoſe of common arithmetic. The ſymbols which it employs to denote magnitudes are, however, more general and more extenſive in their application than thoſe employed in that ſcience; hence, and from the great facility with which the various relations of magnitudes to one another may be expreſſed, by means of a few ſigns or characters, the application of algebra to the reſolution of problems is much more extenſive than that of common arithmetic.

2. There are various opinions as to the etymology of the name *algebra*. It is pretty certain, however, that the word is Arabic, and that from the Arabians the name, as well as the art itſelf, is derived. Lucas de Burgo, the firſt European author whoſe treatiſe on algebra was printed, calls it by the Arabic name *Alghebra e Almucabala*, which is explained to denote the art of *reſtitution* and *compariſon*, or *oppoſition* and *compariſon*, or *reſolution* and *equation*, all which agree well enough with the nature of this art. Beſides this etymology of the name *algebra*, ſeveral others have been imagined; that, however, which we have juſt now given ſeems to be the moſt probable of any hitherto aſſigned.

3. The origin of algebra, as well as that of moſt other branches of mathematical ſcience, is involved in obſcurity; there are indeed traces of it to be found in the works of ſome of the earlieſt philoſophers and mathematicians, the ſubject of whoſe writings muſt neceſſarily have led them to the diſcovery, and, in ſome meaſure, to the application of this ſcience.

4. The oldeſt treatiſe of algebra, which has come down to the preſent times, was written by Diophantus of Alexandria, who flouriſhed about the year 350 after Chriſt, and who wrote 13 books on algebra or arithmetic in the Greek language: though only ſix of theſe have hitherto been printed, and one book, which is imperfect, on multangular numbers. It was not, however, from this author, but from the Moors or Arabians, that this, as well as moſt other ſciences, was received in Europe; and ſome writers are of opinion, that they again received it from the Greeks, while others ſuppoſe that they had it from the Perſians; and that theſe laſt derived algebra, as well as the arithmetical method of computing by ten characters or digits, from the Indians.

5. The Arabians themſelves ſay, that it was invented by Mahomet ben Muſa or ſon of Moſes, who it ſeems flouriſhed about the 8th or 9th century. It ſeems more probable that Mahomet was not the inventor, but only a perſon well ſkilled in the art; and that the Arabians received their knowledge of it from Diophantus, or other Greek writers, as they did that of geometry and ſome other ſciences, which they improved and tranſlated into their own language. History.

6. However this may be, it ſeems to be pretty certain, that the ſcience was firſt brought to Europe about the beginning of the 15th century, by Leonardus Piſanus, who travelled into Arabia and other eaſtern countries for the purpoſe of acquiring mathematical knowledge; and, in a ſhort time, it began to be cultivated in Italy, where it was called *l'Arte Magiore*, "the greater art," to diſtinguiſh it from common arithmetic, which was called *l'Arte Minore*, "the leſſer art." It was alſo known in that country by the name *Regola de la Coſa*, or "rule of the thing," where by *Coſa*, or *the thing*, was meant the firſt or ſimple power of the unknown quantity.

7. Between the years 1470 and 1487, Lucas Paciolus or Lucas de Burgo, a Cordelier, or Minorite friar, publiſhed ſeveral treatiſes on arithmetic, algebra, and geometry; and, in 1494, his principal work, entitled *Summa de Arithmetica Proportioni et Proportionalita* was printed. The part of this work which relates to algebra, and which he calls *l'Arte Magiore; ditta dal vulgo la Regola de la Coſa over Alghebra e Almucabala*, may be conſidered as exhibiting a pretty accurate ſtate of the ſcience, as it was then known in Europe; and probably it was much the ſame in Africa and Aſia, from whence the Europeans derived the knowledge of it. It appears from this work, that their knowledge extended no farther than quadratic equations, of which they uſed only the poſitive roots; that they uſed only one unknown quantity; that they uſed no marks nor ſigns for either quantities or operations, excepting a few abbreviations of the words or names themſelves; and that the art was only employed in the reſolution of certain numeral problems. So that either the Africans had not carried algebra beyond quadratic equations; or elſe (what indeed is not improbable) the Europeans had not learned the whole of the art, as it was then known to the former.

8. After the publication of the books of Lucas de Burgo, algebra became more generally known and improved, eſpecially in Italy; for about the year 1505, Scipio Ferreus, who was then profeſſor of mathematics at Bononia, found out a rule for reſolving one caſe of a compound cubic equation; but, as appears to have been the cuſtom of the times with reſpect to ſuch matters, he kept the rule a profound ſecret from his contemporaries. The ſame thing was afterwards diſcovered in 1535 by Nicolas Tartalea, who then reſided in Venice, and who had five years before found the reſolution of two other caſes of cubic equations.

9. The next work upon algebra which was printed after the books of Lucas de Burgo, was written by Hieronymus Cardan, of Bononia, a very learned man, who publiſhed in 1539 his arithmetical writings, in nine books, at Milan, where he practiſed phyſic, and read public lectures on mathematics. The ſame author in 1545 publiſhed a tenth book, containing the whole doctrine of cubic equations, which had been in part communicated to him under an oath of ſecrecy

History. by Tartalea, but which, notwithſtanding this circumſtance, Cardan thought proper to publiſh, alleging (not altogether without reaſon) that he had made ſo many additions to Tartalea's diſcovery as to render it in a manner his own. Accordingly we find, that even to the preſent times, the common rule for reſolving cubic equations is generally known by the name of Cardan's rule, although it would certainly be more juſt to attribute it to its firſt inventor, Tartalea.

10. Equations of the fourth order appear to have been firſt reſolved by Lewis Ferrari, a diſciple of Cardan's; and different methods of reſolution were afterwards given by Deſcartes and others. This indeed is the greateſt length that mathematicians have been able to carry the reſolution of equations; for, with reſpect to thoſe of the fifth, and all higher degrees, all attempts to reſolve them, except in particular caſes, have hitherto been found impracticable.

11. After this period, writers on algebra became more numerous; and many improvements were gradually made, both in the notation and in the theory of the ſcience. Among other writers who cultivated it with ſucceſs may be reckoned Bombelli, another Italian mathematician; Stifelius and Scheubelius, both of Germany; Robert Recorde, an Engliſh mathematician; and many others.

12. Among the mathematicians to whom algebra is particularly indebted, it is proper to mention Francis Vieta, a native of France, who wrote about the year 1600. Among various improvements in all parts of the ſcience, he firſt introduced the general uſe of the letters of the alphabet, to denote indefinite given quantities, which, before his time, had only been done in ſome particular caſes. The Engliſh mathematician, Harriot, deſerves alſo to be particularly mentioned. His algebra, which was publiſhed after his death, in 1631, ſhews that he cultivated that ſcience with great ſucceſs. For, beſides improving the notation, ſo as to render it nearly the ſame as it is at preſent, he firſt explained clearly a moſt important propoſition in the theory of equations, namely, that an equation of any degree may be conſidered as produced by the continual multiplication of as many ſimple equations as there are units in the exponent of the higheſt power of the unknown quantity in that equation: Hence he ſhewed the relation which ſubſiſts between the coefficients of the terms of an equation and its roots.

13. Without mentioning all the writers on algebra who flouriſhed about this time, and who ſeverally contributed more or leſs to its improvement, we proceed to obſerve, that nothing has contributed more to the advancement of every branch of mathematical knowledge than the happy application which the celebrated philoſopher Deſcartes made of algebra to the ſcience of geometry; for his geometry, firſt publiſhed in 1637, may be conſidered rather as the application of algebra to geometry than as either algebra or geometry taken by itſelf as a ſcience. Beſides this happy union effected between the two ſciences, Deſcartes contributed much to the improvement of both; and indeed he may be conſidered as having paved the way for all the diſcoveries which have ſince been made in mathematics.

14. After the publication of Deſcartes's Geometry, the ſcience of algebra may be conſidered as having attained ſome degree of perfection. It has, however, Notation. received many improvements from later writers, who, purſuing the paths ſtruck out by Harriot and Deſcartes, have produced many new and beautiful theories, both in algebra and geometry. The writers upon algebra from this time became too numerous, and the reſpective improvements made by each too minute, to be particularly noticed in this introduction. It is, however, neceſſary to mention another mathematician, to whom algebra lies under conſiderable obligations, namely, M. Fermat, who may be conſidered as the rival of Deſcartes; for it appears that he was in poſſeſſion of the method of applying algebra to the improvement of geometry before the publication of the celebrated work of the latter philoſopher. Beſides, Fermat appears to have been deeply verſed in the theory of indeterminate problems; and he republiſhed the oldeſt and moſt eſteemed treatiſe upon that ſubject which is known, namely, Diophantus's Arithmetic, to which he added many valuable notes of his own.

15. Having now given a brief account of the origin of algebra, and of the writers who contributed the moſt to bring it to the ſtate of perfection it had attained about the middle of the 16th century, which indeed was conſiderable, we ſhall conclude this introduction, by obſerving, that although its progreſs has ſince been very gradual, it has been upon the whole conſiderably improved; particularly by the labours of theſe foreign mathematicians, Schooten, Hudde, Van-Heuraet, De Witte, Sluſius, Huygens, &c. As to the algebraical writers of our own country, thoſe whoſe labours have been moſt conſpicuous were Wallis, and more eſpecially Sir Iſaac Newton, to whom, among other things, we owe the invention of the binomial theorem: alſo Pell, Barrow, Kerſey, Halley, Raphſon, and many others. We now proceed to explain the ſcience itſelf.

Notation and Explanation of the Signs.

16. In arithmetic there are ten characters, which being variouſly combined, according to certain rules, ſerve to denote all magnitudes whatever. But this method of expreſſing quantities, although of the greateſt utility in every branch of the mathematics (for we muſt always have recourſe to it in the different applications of that ſcience to practical purpoſes), is yet found to be inadequate, taken by itſelf, to the more difficult caſes of mathematical inveſtigation; and it is therefore neceſſary, in many inquiries concerning the relations of magnitude, to have recourſe to that more general mode of notation, and more extenſive ſyſtem of operations, which conſtitute the ſcience of algebra.

17. In algebra quantities of every kind may be denoted by any characters whatever, but thoſe commonly uſed are the letters of the alphabet: And as in every mathematical problem, there are certain magnitudes given, in order to determine other magnitudes, which are unknown, the firſt letters of the alphabet, a, b, c, &c. are uſed to denote known quantities, while thoſe to be found are repreſented by v, x, y, &c. the laſt letters of the alphabet.

18. The ſign $+$ (*plus*) denotes that the quantity before which it is placed is to be added to ſome other quantity. Thus $a+b$ denotes the ſum of a and b; $3+5$ denotes the ſum of 3 and 5, or 8.

19. The ſign $-$ (*minus*) ſignifies that the quantity before

Notation. before which it is placed is to be subtracted. Thus $a-b$ denotes the excess of a above b; $6-2$ is the excess of 6 above 2, or 4.

20. Quantities which have the sign + prefixed to them are called *positive* or *affirmative*; and such as have the sign — are called *negative*.

When quantities are considered abstractedly, the terms *positive* and *negative* can only mean that such quantities are to be added or subtracted; for as it is impossible to conceive a number less than 0, it follows, that a negative quantity by itself is unintelligible. But, in considering the affections of magnitude, it appears, that in many cases, a certain opposition may exist in the nature of quantities. Thus, a person's property may be considered as a positive quantity, and his debts as a negative quantity. Again, any portion of a line drawn to the right hand may be considered as positive, while a portion of the same line, continued in the opposite direction, may be taken as negative.

When no sign is prefixed to a quantity, + is always understood, or the quantity is to be considered as positive.

21. Quantities which have the same sign, either + or —, are said to have like signs. Thus $+a$ and $+b$ have like signs, but $+a$ and $-c$ have unlike signs.

22. A quantity which consists of one *term*, is said to be *simple*; but if it consist of several terms, connected by the signs + or —, it is then said to be compound. Thus $+a$ and $-c$ are simple quantities; and $b+c$, also $a+b-d$, are compound quantities.

23. To denote the product arising from the multiplication of quantities; if they be simple, they are either joined together, as if intended to form a word, or else the quantities are connected together, with the sign × interposed between every two of them. Thus ab, or $a \times b$, denotes the product of a and b; also abc, or $a \times b \times c$ denotes the product of a, b, and c; the latter method is used when the quantities to be multiplied are numbers. If some of the quantities to be multiplied be compound, each of them has a line drawn over it called a vinculum, and the sign × is interposed between as before. Thus $a \times \overline{c+d} \times \overline{e-f}$ denotes that a is to be considered as one quantity, the sum of c and d as a second, and the difference between e and f as a third; and that these three quantities are to be multiplied into one another. Instead of placing a line over such compound quantities as enter a product, it is now common among mathematical writers to enclose each of them between two parentheses, so that the last product may be otherwise expressed thus, $a(c+d)(e-f)$, or thus, $a \times (c+d) \times (e-f)$.

24. A number prefixed to a letter is called a *numeral coefficient*, and denotes how often that quantity is to be taken. Thus, $3a$ signifies that a is to be taken three times. When no number is prefixed, the coefficient is understood to be unity.

25. The quotient arising from the division of one quantity by another is expressed by placing the *dividend* above a line, and the *divisor* below it. Thus $\frac{12}{3}$ denotes the quotient arising from the division of 12 by 3, or 4; $\frac{b}{a}$ denotes the quotient arising from the division of b by a. This expression of a quotient is also called a fraction. Addition.

26. The equality of two quantities is expressed by putting the sign = between them. Thus $a+b=c-d$ denotes that the sum of a and b is equal to the excess of c above d.

27. Simple quantities, or the terms of compound quantities, are said to be *like*, which consist of the same letter or letters. Thus $+ab$ and $-5ab$ are like quantities; but $+ab$ and $+abb$ are unlike.

There are some other characters which will be explained when we have occasion to use them; and in what follows we shall suppose that the operations of common arithmetic are sufficiently understood; for algebra, being an extension of that science, ought not to be embarrassed by the demonstration of its elementary rules.

Sect. I. *Fundamental Operations.*

28. The primary operations in algebra are the same as in common arithmetic, namely, addition, subtraction, multiplication, and division; and from the various combinations of these four, all the others are derived.

Problem I. *To Add Quantities.*

29. In addition there may be three cases: the quantities to be added may be like, and have like signs; or, they may be like, and have unlike signs; or, lastly, they may be unlike.

Case 1. To add quantities which are like, and have like signs.

Rule. Add together the coefficients of the quantities, prefix the common sign to the sum, and annex the letter, or letters, common to each term.

Examples.

Add together	$+7a$	Add together	$-2ax$
	$+3a$		$-ax$
	$+a$		$-5ax$
	$+2a$		$-12ax$
Sum,	$+13a$	Sum,	$-20ax$

Case 2. To add quantities which are like, but have unlike signs.

Rule. Add the positive coefficients into one sum, and the negative ones into another; then subtract the least of these sums from the greatest, prefix the sign of the greatest to the remainder, and annex the common letter, or letters, as before.

Examples.

Add together	$+2ax$	Add together	$+6ab+7$
	$-ax$		$-4ab+9$
	$-3ax$		$+ab-5$
	$+9ax$		$+7ab-13$
Sum of the pos.	$+11ax$	Sum of the pos.	$+14ab+16$
Sum of the neg.	$-4ax$	Sum of the neg.	$-4ab-18$
Sum required,	$+7ax$	Sum required,	$+10ab-2$

$aa+$

Subtraction.

$ac+2ax-xx$	$-4aab$
$-2aa+3ax-4xx$	$+aab$
$6aa-5ax+11xx$	$+3aab$
Sum, $5aa \; o \; + \; 6xx$	Sum, o

Caſe 3. To add unlike quantities.

Rule. Put down the quantities, one after another, in any order, with their ſigns and coefficients prefixed.

EXAMPLES.

$2a$	$ax+2ay$
$3b$	$bb-3bz$
$-4c$	
Sum, $2a+3b-4c$	Sum, $ax+2ay+bb-3bz$

PROB. II. *To Subtract Quantities.*

30. *General Rule.* Change the ſigns of the quantities to be ſubtracted, or ſuppoſe them changed, and then add them to the other quantities, agreeably to the rules of addition.

EXAMPLES.

From $5a-12b$	From $6x-8y+3$
Subtract $2a-5b$	Subtract $2x+9y-2$
Remainder $3a-7b$	Remainder $4x-17y+5$
$5xy-2+8x-y$	$aa-ax-yy$
$3xy-8-8x-3y$	$bb-by+zz$
$2xy+6+16x+2y$	$aa-ax-yy-bb+by-zz$

31. The reaſon of the rule for ſubtraction may be explained thus. Let it be required to ſubtract $2p-3q$ from $m+n$. If we ſubtract $2p$ from $m+n$ there will remain $m+n-2p$; but if we are to ſubtract $2p-3q$, which is leſs than $2p$, it is evident that the remainder will be greater by a quantity equal to $3q$; that is, the remainder will be $m+n-2p+3q$; hence the reaſon of the rule is evident.

PROB. III. *To Multiply Quantities.*

32. *General Rule for the Signs.* If the quantities to be multiplied have like ſigns, the ſign of the product is $+$; but if they have unlike ſigns, the ſign of the product is $-$.

33. The examples of multiplication may be referred to two caſes; the firſt is when both the quantities are ſimple; and the ſecond when one or both of them are compound.

Caſe I. To multiply ſimple quantities.

Rule. Find the ſign of the product by the general rule, and annex to it the product of the numeral coefficients; then ſet down all the letters, one after another, as in one word.

EXAMPLES.

Multiply	$+a$	$+5b$	$-3ax$
By	$+c$	$-4a$	$+7ab$
Product	$+ac$	$-20aab$	$-21aabx$

Multiplication.

$$-2ab$$
$$-3cz$$
$$+6abcz$$

Caſe II. To multiply compound quantities.

Rule. Multiply every term of the multiplicand by all the terms of the multiplier, one after another, by the preceding rule, and collect their products into one ſum, which will be the product required.

EXAMPLES.

Multiply $4a-2b+c$ By $3a$

Product $12aa-6ab+3ac$

Multiply $2x+y$ By $x-2y$

$$2xx+xy$$
$$-4xy-2yy$$
$$2xx-3xy-2yy$$

Multiply $aa-ab+bb$ By $a+b$

$$aaa-aab+abb$$
$$+aab-abb+bbb$$
$$aaa \quad * \quad *+bbb$$

Multiply $a-b+c$ By $a+b-c$

$$aa-ab+ac$$
$$+ab \quad -bb+bc$$
$$-ac \quad +bc-cc$$
$$aa \quad * \quad *-bb+2bc-cc.$$

34. The reaſon of the rules for the multiplication of quantities may be explained in the following manner: Let it be required to multiply $a-b$ by $c-d$; becauſe multiplication is a repeated addition of the multiplicand as often as the multiplier contains unity, therefore, $a-b$ is to be taken as often as there are units in $c-d$, and the ſum will be the product required. Now if $a-b$ be taken as often as there are units in c, the reſult will evidently exceed the product required, and that by a quantity equal to $a-b$, taken as often as there are units in d. But, from the nature of addition $a-b$ taken as often as there are units in c, is $ca-cb$, and for the ſame reaſon, $a-b$ taken as often as there are units in d is $da-db$; therefore, to obtain the product required, we muſt ſubtract $da-db$ from $ca-cb$: but from what has been ſhewn in ſubtraction, the remainder will be $ca-cb-da+db$; therefore the product ariſing from the multiplication of $a-b$ by $c-d$ is $ca-cb-da+db$; hence the reaſon of the general rule for the ſigns, as well as the other rules, is manifeſt.

35. When ſeveral quantities are multiplied together ſo as to conſtitute a product, each of them is called a *factor* of that product; thus a, b, and c are factors of the product abc; alſo $a+x$, and $b-x$, are factors of the product $(a+x)(b-x)$.

36. The products ariſing from the continual multiplication of the ſame quantity are called *powers* of that quantity, which is called the *root*. Thus aa, aaa, $aaaa$, &c. are powers of the root a. Theſe powers are commonly expreſſed, by placing above the root, towards the right hand, a figure, denoting how often the root is repeated. This figure ſerves to denominate the power, and is called its *index* or *exponent*. Thus, the quantity a being conſidered as the root, or as the firſt power of a, we have aa or a^2 for its ſecond power,

Diviſion

power, *aaa* or a^3 for its third power, *aaaa* or a^4 for its fourth power, and ſo on.

37. The ſecond and third powers of a quantity are generally called its *ſquare* and *cube;* and the fourth, fifth, and ſixth powers are ſometimes reſpectively called its *biquadrate*, *ſurſolid*, and *cubocube*.

38. By conſidering the notation of powers, and the rules for multiplication, it appears that powers of the ſame root are multiplied by adding their exponents. Thus $a \times a^3 = a^4$, alſo $x^3 \times x^4 = x^7$; and in general $a^m \times a^n = a^{m+n}$.

Prob. IV. *To Divide Quantities.*

39. *General Rule for the Signs.*—If the ſigns of the diviſor and dividend be like, the ſign of the quotient is +; but if they be unlike, the ſign of the quotient is —.

This rule is eaſily derived from the general rule for the ſigns in multiplication, by conſidering that the quotient muſt be ſuch a quantity as when multiplied by the diviſor ſhall produce the dividend, with its proper ſign.

40. The quotient ariſing from the diviſion of one quantity by another may be expreſſed by placing the dividend above a line and the diviſor below it, (§ 25.); but it may alſo be often expreſſed in a more ſimple manner by the following rules:

Caſe 1. When the diviſor is ſimple, and a factor of every term of the dividend.

Rule. Divide the coefficient of each term of the dividend by the coefficient of the diviſor, and expunge out of each term the letter or letters in the diviſor: the reſult is the quotient.

Ex. 1. Divide $12abc$ by $3ac$.

From the method of notation, the quotient may be expreſſed thus, $\frac{12abc}{3ac}$; but the ſame quotient, by the rule juſt given, is more ſimply expreſſed thus, $4b$.

Ex. 2. Divide $16a^3xy - 28a^3x^2 + 4a^3x^3$ by $4a^3x$.

The quotient is $4ay - 7x^2 + x^3$.

If the diviſor and dividend be powers of the ſame quantity, the diviſion will evidently be performed by ſubtracting the exponent of the diviſor from that of the dividend. Thus a^5, divided by a^3, has for a quotient $a^{5-3} = a^2$.

Caſe 2. When the diviſor is ſimple, but not a factor of the dividend.

Rule. The quotient is expreſſed by a fraction, of which the numerator is the dividend, and the denominator the diviſor.

Thus the quotient of $3ab^2$, divided by $2mbc$, is the fraction $\frac{3ab^2}{2mbc}$.

It will ſometimes happen, that the quotient found thus may be reduced to a more ſimple form, as ſhall be explained when we come to treat of fractions.

Caſe 3. When the diviſor is compound.

Rule. 1. The terms of the dividend are to be arranged according to the powers of ſome one of its letters, and thoſe of the diviſor according to the powers of the ſame letter. Diviſion.

2. The firſt term of the dividend is to be divided by the firſt term of the diviſor, obſerving the general rule for the ſigns; and this quotient being ſet down for a part of the quotient wanted, is to be multiplied by the whole diviſor, and the product ſubtracted from the dividend. If nothing remain, the diviſion is finiſhed; but if there be a remainder, it is to be taken for a new dividend.

3. The firſt term of the new dividend is next to be divided by the firſt term of the dividend, as before, and the quotient joined to the part already found, with its proper ſign. The whole diviſor is alſo to be multiplied by this part of the quotient, and the product ſubtracted from the new dividend; and thus the operation is to be carried on till there be no remainder, or till it appear that there will always be a remainder.

To illuſtrate this rule, let it be required to divide $8a^2 + 2ab - 15b^2$ by $2a + 3b$, the operation will ſtand thus:

$$\begin{array}{l} 2a+3b)\,8a^2+2ab-15b^2(4a-5b \\ \quad 8a^2+12ab \\ \hline \quad -10ab-15b^2 \\ \quad -10ab-15b^2 \\ \hline \end{array}$$

Here the terms of the diviſor and dividend are arranged according to the powers of the quantity a. We now divide $8a^2$, the firſt term of the dividend, by $2a$ the firſt term of the diviſor; and thus get $4a$ for the firſt term of the quotient. We next multiply the diviſor by $4a$, and ſubtract the product $8a^2 + 12ab$ from the dividend; we thus get $-10ab - 15b^2$ for a new dividend.

By proceeding in all reſpects as before, we find $-5b$ for the ſecond term of the quotient, and no remainder; the operation is therefore finiſhed, and the whole quotient is $4a - 5b$.

The following examples will alſo ſerve to illuſtrate the manner of applying the rule.

Ex. 1.

$$\begin{array}{l} 3a-b)\,3a^3-12a^2-a^2b+10ab-2b^2(a^2-4a+2b \\ \quad 3a^3 \quad -a^2b \\ \hline \quad -12a^2 \quad +10ab \\ \quad -12a^2 \quad +4ab \\ \hline \quad +6ab-2b^2 \\ \quad +6ab-2b^2 \\ \hline \end{array}$$

Ex. 2.

$$\begin{array}{l} a+b)\,a^3+b^3(a^2-ab+b^2 \\ \quad a^3+a^2b \\ \hline \quad -a^2b+b^3 \\ \quad -a^2b-ab^2 \\ \hline \quad +ab^2+b^3 \\ \quad +ab^2+b^3 \end{array}$$

Ex. 3.

Ex. 3.

$$a^3-b^3)\,a^6-b^6\,(a^3+b^3$$
$$a^6-a^3b^3$$
$$\overline{\quad +a^3b^3-b^6}$$
$$+a^3b^3-b^6$$

Ex. 4.

$$1-x)\,1\quad(1+x+x^2+, \text{ \&c.}$$
$$1-x$$
$$\overline{+x}$$
$$+x-x^2$$
$$\overline{+x^2}$$
$$+x^2-x^3$$
$$\overline{+x^3.}$$

41. Sometimes, as in this last example, the quotient will never terminate: in such a case it may either be considered as an infinite series, the law according to which the terms are formed being in general sufficiently obvious; or the quotient may be completed as in arithmetical division, by annexing to it a fraction, the numerator of which is the remainder, and denominator the divisor. Thus the quotient in last example may stand thus $1+x+x^2+\frac{x^3}{1-x}$.

42. The reason of the rule for division is sufficiently manifest. For in the course of the operation, all the terms of the quotient obtained by it are multiplied by all the terms of the divisor, and the products successively subtracted from the dividend, till nothing remain; that therefore must evidently be the true quotient.

Sect. II. *Of Fractions.*

43. In the operation of division, the divisor may be sometimes less than the dividend, or may not be contained in it an exact number of times; in either case the quotient is expressed by means of a fraction. There can be no difficulty, however, in estimating the magnitude of such a quotient; if, for example, it were the fraction $\frac{5}{7}$, we may consider it as denoting either that some unit is divided into 7 equal parts, and that 5 of these are taken, or that 5 times the same unit is divided into seven equal parts, and one of them taken.

44. In any fraction the upper number, or the dividend, is called the *numerator*, and the lower number or the divisor is called the *denominator*. Thus in the fraction $\frac{a}{b}$, a is the numerator, and b the denominator.

45. If the numerator be less than the denominator, such a fraction is called a *proper* fraction; but if the numerator be either equal to, or greater than the denominator, it is called an *improper* fraction; and if a quantity be made up of an integer and a fraction, it is called a *mixed* quantity. Thus $\frac{a}{a+x}$ is a proper fraction; $\frac{a}{a}$, also $\frac{a+x}{a}$, are both improper fractions; and $b+\frac{x}{a}$ is a mixed quantity.

46. The *reciprocal* of a fraction is another fraction, having its numerator and denominator respectively equal to the denominator and numerator of the former.

Thus $\frac{b}{a}$ is the reciprocal of the fraction $\frac{a}{b}$.

47. The following proposition is of great importance in the operations relating to fractions.

If the numerator and denominator of a fraction be either both multiplied, or both divided, by the same quantity, the value of that fraction is the same as before.

For let any fraction $\frac{b}{a}=c$; then because c is the quotient arising from the division of b by a, it follows that $b=ac$; and multiplying both by any quantity n, we have $nb=nac$: let these equals be both divided by the same quantity na, and the quotients will be equal, that is $\frac{nb}{na}=c=\frac{b}{a}$; hence the truth of the proposition is manifest.

48. From this proposition, it is obvious that a fraction may be very differently expressed, without changing its value, and that any integer may be reduced to the form of a fraction, by placing the product arising from its multiplication by any assumed quantity as the numerator, and the assumed quantity as the denominator of the fraction. It also appears that a fraction very complex in its form may often be reduced to another of the same value, but more simple, by finding a quantity which will divide both the numerator and denominator, without leaving a remainder. Such a common measure, or common divisor, may be either simple or compound; if it be simple, it is readily found by inspection, but if it be compound, it may be found as in the following problem.

49. Prob. I. *To find the greatest common Measure of two Quantities.*

Rule 1. Range the quantities according to the power of some one of the letters, as taught in division, leaving out the simple divisors of each quantity.

2. Divide that quantity which is of most dimensions by the other one, and if there be a remainder, divide it by its greatest simple divisor; and then divide the last compound divisor by the resulting quantity, and if any thing yet remain, divide it also by its greatest simple divisor, and the last compound divisor by the resulting quantity; proceed in this way till nothing remain, and the last divisor shall be the common measure required.

Note. It will sometimes be necessary to multiply the dividends by simple quantities in order to make the divisions succeed.

Ex. 1. Required the greatest common measure of the quantities a^2x-x^3 and $a^3-2a^2x+ax^2$. The simple divisor x being taken out of the former of these quantities, and a out of the latter, they are reduced to a^2-x^2, and $a^2-2ax+x^2$, and as the quantity a rises to the same dimensions in both, we may take either of them as the first divisor; let us take that which consists of fewest terms, and the operation will stand thus:

Fractions.

$$a^2-x^2)a^2-2ax+x^2(1$$
$$a^2-x^2$$
$$-2ax+x^2 \text{ remainder}$$

which divided by $-2x$ is $a-x)a^2-x^2(a+x$

$$a^2-ax$$
$$+ax-x^2$$
$$+ax-x^2$$
$$* \quad *$$

Hence it appears that $a-x$ is the greateſt common meaſure required.

Ex. 2. Required the greateſt common meaſure of $8a^3b^2-10ab^3+2b^4$, and $9a^4b-9a^3b^2+3a^2b^3-3ab^4$.

It is evident, from inſpection, that b is a ſimple diviſor of both quantities; it will therefore be a factor of the common meaſure required. Let the ſimple diviſors be now left out of each quantity, and they are reduced to $4a^2-5ab+b^2$ and $3a^3-3a^2b+ab^2-b^3$; but as the ſecond of theſe is to be divided by the firſt, it muſt be multiplied by 4 to make the diviſion ſucceed, and the operation will ſtand thus:

$$4a^2-5ab+b^2)12a^3-12a^2b+4ab^2-4b^3(3a$$
$$12a^3-15a^2b+3ab^2$$
$$+3a^2b+ab^2-4b^3.$$

This remainder is to be divided by b, and the new dividend multiplied by 3, to make the diviſion again ſucceed, and the work will ſtand thus:

$$3a^2+ab-4b^2)12a^2-15ab+3b^2(4$$
$$12a^2+4ab-16b^2$$
$$-19ab+19b^2.$$

This remainder is to be divided by $-19b$, which being done, and the laſt diviſor taken as a dividend as before, the reſt of the operation will be as follows:

$$a-b)3a^2+ab-4b^2(3a+4b$$
$$3a^2-3ab$$
$$+4ab-4b^2$$
$$+4ab-4b^2$$
$$* \quad *$$

from which it appears that the compound diviſor ſought is $a-b$, and remarking that the quantities propoſed have alſo a ſimple diviſor b, the greateſt common meaſure which is required will be $b(a-b)$.

50. The reaſon of the rule given in this problem may be deduced from the following conſiderations.

1. If two quantities have a compound diviſor common to both, and they be either multiplied or divided by any ſimple quantities, the reſults will each have the ſame compound diviſor. Thus the quantities $p(a-x)$ and $q(a-x)$ have the common diviſor $a-x$, and the quantities $np(a-x)$, $rq(a-x)$ have each the very ſame diviſor.

2. In the operation of diviſion, whatever quantity meaſures both the diviſor and dividend, the ſame will alſo meaſure the remainder. For let x be ſuch a quantity, then the diviſor and dividend may be repreſented by ax and bx; let q be the quotient, and the remainder will evidently be $bx-qax$, which is evidently diviſible by x. Fractions.

3. Whatever quantity meaſures both the diviſor and remainder, the ſame will alſo meaſure the dividend.

For let the diviſor be ax, and the remainder rx, then, q denoting the quotient, the dividend will be $aqx+rx$, which, as well as the diviſor and dividend, is diviſible by x.

51. Let us apply theſe obſervations to the laſt example. From the firſt obſervation, the reaſon for leaving out the ſimple quantities in the courſe of the operation, as well as for multiplying by certain other quantities, to make the diviſions ſucceed, is obvious; and from the ſecond obſervation it appears, that whatever quantity meaſures $4a^2-5ab+b^2$, and $12a^3-12a^2b+4ab^2-4b^3$, the ſame muſt meaſure $3a^2b+ab^2-4b^3$, the firſt remainder, as alſo $-19ab+19ab^2$ the ſecond remainder; but the only compound diviſor which this laſt quantity can have is $a-b$, which is alſo found to be a diviſor of $3a^2+ab-4b^2$, or of $3a^2b+ab^2-4b^3$ the firſt remainder, therefore, by the third obſervation, $a-b$ muſt alſo be a diviſor of $12a^3-15ab+3b^2$, or of $4a^2-5ab+b^2$, the firſt diviſor, and therefore alſo it muſt be a diviſor of $12a^3-12a^2b+4ab^2-4b^3$ the firſt dividend, ſo that $a-b$ is the greateſt common meaſure as was required.

52. PROB. II. *To Reduce a Fraction to its loweſt Terms.*

Rule. Divide both numerator and denominator by their greateſt common meaſure, which may be found by prob. 1.

Ex. 1. Reduce $\frac{56a^2bc}{24adc^2}$ to its loweſt terms.

It appears from inſpection, that the greateſt common meaſure is $8ac$, and dividing both numerator and denominator by this quantity, we have $\frac{56a^2bc}{24adc^2}=\frac{7ab}{3dc}$.

Ex. 2. Reduce $\frac{a^2x-x^3}{a^3-2a^2x+ax^2}$ to its loweſt terms.

We have already found in the firſt example of prob. 1. that the greateſt common meaſure of the numerator and denominator is $a-x$; and dividing both by this quantity we have

$$\frac{a^2x-x^3}{a^3-2a^2x+ax^2}=\frac{ax+x^2}{a^2-ax}.$$

In like manner we find $\frac{9a^4b-9a^3b^2+3a^2b^3-3ab^4}{8a^4b^2-10ab^3+2b^4}=\frac{9a^3+3ab^2}{8ab-2b^2}$; the common meaſure being $b(a-b)$ as was ſhown in example 2. problem 1.

53. PROB. III. *To Reduce a mixed Quantity to an improper Fraction.*

Rule. Multiply the integer by the denominator of the fraction, and to the product add the numerator, and the denominator being placed under this ſum will give the improper fraction required.

Ex. 1.

Fractions.

Ex. 1. Let $x+\frac{x^2}{a}$, and $x-\frac{a^2-x^2}{x}$ be reduced to improper fractions.

First $x+\frac{x^2}{a}=\frac{ax+x^2}{a}$, the anſwer.

And $x-\frac{a^2-x^2}{x}=\frac{x^2-a^2+x^2}{x}=\frac{2x^2-a^2}{x}$, Anſ.

Ex. 2. Reduce $a-x+\frac{x^2}{a+x}$ to an improper fraction.

$a-x+\frac{x^2}{a+x}=\frac{(a+x)(a-x)+x^2}{a+x}=\frac{a^2}{a+x}$, Anſ.

54. PROB. IV. *To Reduce an improper Fraction to a whole or mixed Number.*

Rule. Divide the numerator by the denominator for the integral part, and place the remainder, if any, over the denominator, and it will be the mixed quantity required.

Ex. 1. Reduce $\frac{ax+a^2}{x}$ to a whole or mixed quantity.

$\frac{ax+a^2}{x}=a+\frac{a^2}{x}$ the anſwer required.

Ex. 2. Reduce $\frac{ax+2x^2}{a+x}$ alſo $\frac{x^2-y^2}{x-y}$ to whole or mixed quantities.

First $\frac{ax+2x^2}{a+x}=x+\frac{x^2}{a+x}$ the anſwer.

And $\frac{x^2-y^2}{x-y}=x+y$ a whole quantity which is the anſwer.

55. PROB. V. *To Reduce Fractions of different Denominators to others of the ſame value which ſhall have a common Denominator.*

Rule. Multiply each numerator ſeparately into all the denominators except its own for the new numerators, and all the denominators together for the common denominator.

Ex. 1. Reduce $\frac{a}{b}$, $\frac{c}{d}$ and $\frac{e}{f}$ to fractions of equal value which have a common denominator.

$$\left.\begin{array}{l} a\times d\times f=adf \\ c\times b\times f=cbf \\ e\times b\times d=ebd \end{array}\right\}\text{New numerators.}$$

$b\times d\times f=bdf$ Common denominator.

Hence we find $\frac{a}{b}=\frac{adf}{bdf}$, $\frac{c}{d}=\frac{cbf}{bdf}$ and $\frac{e}{f}=\frac{ebd}{bdf}$, where the new fractions have a common denominator, as was required.

Ex. 2. Reduce $\frac{ax}{a-x}$ and $\frac{a^2-x^2}{a+x}$ to fractions of equal value and having a common denominator.

$$\left.\begin{array}{l} ax(a+x)=a^2x+ax^2 \\ (a^2-x^2)(a-x)=a^3-a^2x-ax^2+x^3 \end{array}\right\}\text{new numerators.}$$

Fractions.

$a-x)(a+x)=a^2-x^2$ the common denominator.

Hence $\frac{ax}{a-x}=\frac{a^2x+ax^2}{a^2-x^2}$ and $\frac{a^2-x^2}{a+x}=\frac{a^3-a^2x-a^2x+x^3}{a^2-x^2}$.

56. PROB. VI. *To Add or Subtract Fractions.*

Rule. Reduce the fractions to a common denominator, and add or ſubtract their numerators, and the ſum or difference placed over the common denominator, is the ſum or remainder required.

Ex. 1. Add together $\frac{a}{b}$, $\frac{c}{d}$ and $\frac{e}{f}$.

$$\frac{a}{b}=\frac{adf}{bdf}$$
$$\frac{c}{d}=\frac{bcf}{bdf}$$
$$\frac{e}{f}=\frac{bde}{bdf}$$

Hence $\frac{a}{b}+\frac{c}{d}+\frac{e}{f}=\frac{adf+bcf+bde}{bdf}$ the ſum required.

Ex. 2. From $\frac{a+x}{a}$ ſubtract $\frac{a}{a+x}$.

$$\frac{a+x}{a}=\frac{a^2+2ax+x^2}{a^2+ax}$$
$$\frac{a}{a+x}=\frac{a^2}{a^2+ax}$$

Hence $\frac{a+x}{a}-\frac{a}{a+x}=\frac{2ax+x^2}{a^2+ax}$.

Ex. 3. Add together $\frac{x+2}{3}$, $\frac{x}{4}$ and $\frac{x-5}{2}$.

$\frac{x+2}{3}+\frac{x}{4}+\frac{x-5}{2}=\frac{8x+16+6x+12x-60}{24}=\frac{13x-22}{12}$. If it be required to add or ſubtract mixed quantities, they may either be reduced to the form of fractions by prob. 3. and then added, or ſubtracted, or elſe theſe operations may be performed firſt on the integer quantities, and afterwards on the fractions.

57. PROB. VII. *To Multiply Fractions.*

Rule. Multiply the numerators of the fractions for the numerator of the product, and the denominators for the denominator of the product.

Ex. 1. Multiply $\frac{b}{a}$ by $\frac{d}{c}$

$\frac{b}{a}\times\frac{d}{c}=\frac{bd}{ac}$ the product required.

Ex. 2. Multiply $\frac{a+b}{c}$ by $\frac{a-b}{d}$.

$\frac{a+b}{c}\times\frac{a-b}{d}=\frac{a^2-b^2}{cd}$, the product.

If it be required to multiply an integer by a fraction, the integer may be conſidered as having unity for a denominator. Thus $(a+x)\times\frac{3d}{c}=\frac{a+x}{1}\times\frac{3d}{c}=\frac{3ad+3dx}{c}$.

Mixed

Fractions. Mixed quantities may be multiplied after being reduced to the form of fractions by prob. 3. Thus $\left(b+\frac{bx}{a}\right)\times\frac{a}{x}=\frac{ab+bx}{a}\times\frac{a}{x}=\frac{a^2b+abx}{ax}=\frac{ab+bx}{x}$.

58. The reaſon of the rule for multiplication may be explained thus. If $\frac{a}{b}$ is to be multiplied by c, the product will evidently be $\frac{ac}{b}$; but if it is only to be multiplied by $\frac{c}{d}$, the former product muſt be divided by d, and it becomes $\frac{ac}{bd}$ which is the product required. Or let $\frac{a}{b}=m$, and $\frac{c}{d}=n$, then $a=bm$ and $c=dn$ and $ac=bdmn$; hence mn, or $\frac{a}{b}\times\frac{c}{d}=\frac{ac}{bd}$.

59. Prob. VIII. *To Divide Fractions.*

Rule. Multiply the denominator of the diviſor by the numerator of the dividend for the numerator of the quotient. Then multiply the numerator of the diviſor by the denominator of the dividend for the denominator of the quotient.

Or, multiply the dividend by the reciprocal of the diviſor, the product will be the quotient required.

Ex. 1. Divide $\frac{a}{b}$ by $\frac{c}{d}$.

$\frac{c}{d}\Big)\frac{a}{b}\Big(\frac{ad}{bc}$ the quotient required, or $\frac{a}{b}\times\frac{d}{c}=\frac{ad}{bc}$ as before.

Ex. 2. Divide $\frac{a^2+ab}{2x}$ by $\frac{3a^2}{a-b}$.

$\frac{3a^2}{a-b}\Big)\frac{a^2+ab^2}{2x}\Big(\frac{a^3-ab^2}{6a^2x}=\frac{a^2-b^2}{6ax}$ the quotient.

If either the diviſor or dividend be an integer quantity, it may be repreſented as a fraction, by placing unity for a denominator; or if it be a mixed quantity, it may be reduced to a fraction by prob. 3. and the operation of diviſion performed agreeably to the rule.

60. The reaſon of the rule for diviſion may be explained thus, let it be required to divide $\frac{c}{d}$ by $\frac{a}{b}$. If $\frac{c}{d}$ is to be divided by a, the quotient is $\frac{c}{ad}$, but if it is to be divided by $\frac{a}{b}$, then the laſt quotient muſt be multiplied by b; thus we have $\frac{cb}{ad}$ for the quotient required. Or let $\frac{a}{b}=m$, and $\frac{c}{d}=n$, then $a=bm$ and $c=dn$; alſo $ad=bdm$ and $bc=bdn$; therefore $\frac{bdn}{bdm}=\frac{n}{m}=\frac{bc}{ad}$.

Involution and Evolution.

Sect. III. *Of Involution and Evolution.*

61. In treating of multiplication, we have obſerved, that when a quantity is multiplied by itſelf any number of times, the product is called a *power* of that quantity, while the quantity itſelf, from which the powers are formed, is called the *root* (§ 36.) Thus a, a^2, and a^3 are the firſt, ſecond, and third powers of the root a; and in like manner $\frac{1}{a}$, $\frac{1}{a^2}$, and $\frac{1}{a^3}$, denote the ſame powers of the root $\frac{1}{a}$.

62. But before conſidering more particularly what relates to powers and roots, it will be proper to obſerve, that the quantities $\frac{1}{a}$, $\frac{1}{a^2}$, $\frac{1}{a^3}$, &c. admit of being expreſſed under a different form; for, like as the quantities a, a^2, a^3, &c. are expreſſed as *poſitive* powers of the root a, ſo the quantities $\frac{1}{a}$, $\frac{1}{a^2}$, $\frac{1}{a^3}$, &c. may be reſpectively expreſſed thus, a^{-1}, a^{-2}, a^{-3}, &c, and conſidered as *negative* powers of the root a.

63. This method of expreſſing the fractions $\frac{1}{a}$, $\frac{1}{a^2}$, $\frac{1}{a^3}$, as powers of the root a, but with negative indices, is a conſequence of the rule which has been given for the diviſion of powers; for we may conſider $\frac{1}{a}$ as the quotient ariſing from the diviſion of any power of a by the next higher power, for example from the diviſion of the 2d by the 3d, and ſo we have $\frac{1}{a}=\frac{a^2}{a^3}$; but ſince powers of the ſame quantity are divided by ſubtracting the exponent of the diviſor from that of the dividend (§ 40.), it follows, that $\frac{a^2}{a^3}=a^{2-3}=a^{-1}$; therefore the fraction $\frac{1}{a}$ may alſo be expreſſed thus, a^{-1}. By conſidering $\frac{1}{a^2}$ as equal to $\frac{a^2}{a^4}$, it will appear in the ſame manner that $\frac{1}{a^2}=\frac{a^2}{a^4}=a^{-2}$; and, proceeding in this way, we get $\frac{1}{a^3}=\frac{a^2}{a^5}=a^{-3}$, $\frac{1}{a^4}=\frac{a^2}{a^6}=a^{-4}$, &c. and ſo on, as far as we pleaſe. It alſo appears, that unity or 1 may be repreſented by a^0, where the exponent is a cypher, for $1=\frac{a^2}{a^2}=a^{2-2}=a^0$.

64. The rules which have been given for the multiplication and diviſion of powers with poſitive exponents will apply in every caſe, whether the exponents be poſitive or negative, and this muſt evidently take place, for the mode of notation, by which we repreſent fractional quantities as the powers of integers, but with negative exponents, has been derived from thoſe rules. Thus $\frac{1}{a^2}\times a^3$ or $a^{-2}\times a^3=a^{-2+3}=a^{-1}=\frac{1}{a}$, alſo $\frac{1}{x^2}\times\frac{1}{x^3}$

Involution. $\frac{1}{x^3}$ or $x^{-2}\times x^{-3}=x^{-2-3}=x^{-5}=\frac{1}{x^5}$ and $\frac{1}{x^3}\times x^3$ or $x^{-3}\times x^{+3}=x^{-3+3}=x^0=1$.

65. From this method of notation it appears, that any quantity may be taken from the denominator of a fraction, and placed in the numerator, by changing the ſign of its exponent; and hence it follows, that every fraction may alſo be repreſented as an integer quantity. Thus $\frac{a^2}{bc^3}$ denotes the ſame thing as $\frac{a^2b^{-1}}{c^3}$ or as $a^2b^{-1}c^{-3}$, alſo $\frac{a^2}{(x-1)^3}$ may be otherwiſe expreſſed thus, $a^2(x-1)^{-3}$.

Of Involution.

66. Involution is the method of finding any power of any aſſigned quantity, whether it be ſimple or compound; hence its rules are eaſily derived from the operation of multiplication.

Caſe 1. When the quantity is ſimple.

Rule. Multiply the exponents of the letters by the index of the power required, and raiſe the coefficient to the ſame power.

Note. If the ſign of the quantity be + all its powers will be poſitive; but if it be —, then all its powers, whoſe exponents are even numbers, are poſitive, and all its powers whoſe exponents are odd numbers are negative.

Ex. 1. Required the cube, or third power of $2a^2x$.
$(2a^2x)^3=2\times 2\times 2a^2\times 3x^1\times 3=8a^6x^3$, the anſwer.

Ex. 2. Required the fifth power of $-3a^2x^3$.
$(-3a^2x^3)^5=-243a^{10}x^{15}$, the anſwer.

Ex. 3. Required the fourth power of $-\frac{2ax^2}{3b^2y}$.
$\left(\frac{-2ax^2}{3b^2y}\right)^4=\frac{16a^4x^8}{81b^8y^4}$, the anſwer.

Caſe 2. When the quantity is compound.

Rule. The powers muſt be found by a continual multiplication of the quantity by itſelf.

Ex. Required the firſt four powers of the binomial quantity $a+x$.

$a+x$ the root, or firſt power
$a+x$

a^2+ax
$+ax+x^2$

$a^2+2ax+x^2$ the ſquare, or ſecond power
$a+x$

$a^3+2a^2x+ax^2$
$+a^2x+2ax^2+x^3$

$a^3+3a^2x+3ax^2+x^3$ the cube, or third power
$a+x$

$a^4+3a^3x+3a^2x^2+ax^3$
$+a^3x+3a^2x^2+3ax^3+x^4$

$a^4+4a^3x+6a^2x^2+4ax^3+x^4$ the fourth power.

If it be required to find the ſame powers of $a-x$, it Involution. will be found, that

$a-x$ is the root or firſt power;
$a^2-2ax+x^2$ the ſquare, or 2d power;
$a^3-3a^2x+3ax^2-x^3$ the cube, or 3d power;
$a^4-4a^3x+6a^2x^2-4ax^3+x^4$ the 4th power.

Hence it appears, that the powers of $a+x$ differ from the powers of $a-x$, only in this reſpect, that in the former the ſigns of the terms are all poſitive, but in the latter, they are poſitive and negative alternately.

67. Beſides the method of finding the powers of a compound quantity by multiplication, which we have juſt now explained, there is another, more general, as well as more expeditious, by which a quantity may be raiſed to any power whatever without the trouble of finding any of the inferior powers, namely, by means of what is commonly called the *binomial theorem*. This theorem may be expreſſed as follows. Let $a+x$ be a binomial quantity, which is to be raiſed to any power denoted by the number n, then $(a+x)^n=a^n+\frac{n}{1}a^{n-1}x+\frac{n(n-1)}{1\cdot 2}a^{n-2}x^2+\frac{n(n-1)(n-2)}{1\cdot 2\cdot 3}a^{n-3}x^3+\frac{n(n-1)(n-2)(n-3)}{1\cdot 2\cdot 3\cdot 4}a^{n-4}x^4+\frac{n(n-1)(n-2)(n-3)(n-4)}{1\cdot 2\cdot 3\cdot 4\cdot 5}a^{n-5}x^5+$, &c. This ſeries will always terminate when n is any whole poſitive number, by reaſon of ſome one of the factors $n-1$, $n-2$, &c. becoming $=0$; but if n be either a negative, or fractional number, the ſeries will conſiſt of an infinite number of terms; as, however, we mean to treat in this ſection only of the powers of quantities when their exponents are whole poſitive numbers, we ſhall make no farther remarks upon any other; we ſhall afterwards give a demonſtration of the theorem, and ſhew its application to fractional and negative powers in treating of infinite ſeries. The nth power of $a-x$ will not differ from the ſame power of $a+x$, but in the ſigns of the terms which compoſe it, for it will ſtand thus: $(a-x)^n=a^n-\frac{n}{1}a^{n-1}x+\frac{n(n-1)}{1\cdot 2}a^{n-2}x^2-\frac{n(n-1)(n-2)}{1\cdot 2\cdot 3}a^{n-3}x^3+\frac{n(n-1)(n-2)(n-3)}{1\cdot 2\cdot 3\cdot 4}a^{n-4}x^4$ —, &c. where the ſigns are + and — alternately.

Ex. 1. Let it be required to raiſe $a+x$ to the fifth power.

Here n the exponent of the power being 5, the firſt term a^n of the general theorem will be equal to a^5, the ſecond $na^{n-1}x=5a^4x$, the third $\frac{n(n-1)}{1\cdot 2}a^{n-2}x^2=\frac{5\times 4}{1\times 2}a^3x^2=10a^3x^2$, the fourth $\frac{n(n-1)(n-2)}{1\cdot 2\cdot 3}a^{n-3}x^3=\frac{5\times 4\times 3}{1\times 2\times 3}a^2x^3=10a^2x^3$, the fifth $\frac{n(n-1)(n-2)(n-3)}{1\cdot 2\cdot 3\cdot 4}a^{n-4}x^4=\frac{5\times 4\times 3\times 2}{1\times 2\times 3\times 4}ax^4=5ax^4$ and the ſixth and laſt $\frac{n(n-1)(n-2)(n-3)(n-4)}{1\cdot 2\cdot 3\cdot 4\cdot 5}a^{n-5}x^5=\frac{5\times 4\times 3\times 2\times 1}{1\times 2\times 3\times 4\times 5}a^0x^5=x^5$; the remaining terms

of

Evolution. of the general theorem all vaniſh, by reaſon of the factor $n-5=0$ by which each of them is multiplied, ſo that we get $(a+x)^5=a^5+5a^4x+10a^3x^2+10a^2x^3+5ax^4+x^5$.

Ex. 2. It is required to raiſe $2d-\frac{z}{3}$ to the third power.

In this caſe $n=3$, ſo that if we put $a=2d$ and $x=\frac{z}{3}$ we have the firſt term of the general theorem, or $a^n=8d^3$, the ſecond $\frac{n}{1}a^{n-1}x=3\times 4d^2\times\frac{z}{2}=4d^2z$, the third $\frac{n(n-1)}{1\cdot 2}a^{n-2}x^2=3\times 2d\times\frac{z^2}{9}=\frac{2dz^2}{3}$, and the fourth and laſt term $\frac{n(n-1)(n-2)}{1\cdot 2\cdot 3}a^{n-3}x^3=\frac{z^3}{27}$, and ſince the ſigns of the terms of any power of $a-x$ are $+$ and $-$ alternately we have $\left(2d-\frac{z}{3}\right)^3=8d^3-4d^2z+\frac{2dz^2}{3}-\frac{z^3}{27}$.

68. If the quantity to be involved conſiſts of more than two terms, as if $p+q-r$ were to be raiſed to the 2d power, put $p=a$ and $q-r=b$ then $(p+q-r)^2=(a+b)^2=a^2+2ab+b^2=p^2+2p(q-r)+(q-r)^2$ but $2p(q-r)=2pq-2pr$, and by the general theorem $(q-r)^2=q^2-2qr+r^2$, therefore, we get $(p+q-r)^2=p^2+2pq-2pr+q^2-2qr+r^2$; and by a ſimilar method of procedure a quantity conſiſting of four or more terms may be raiſed to any power.

Of Evolution.

69. Evolution is the reverſe of involution, or it is the method of finding the root of any quantity, whether ſimple or compound, which is conſidered as a power of that root; hence it follows that its operations, generally ſpeaking, muſt be the reverſe of thoſe of involution.

70. To denote that the root of any quantity is to be taken, the ſign $\surd$ (called the *radical ſign*) is placed before it, and a ſmall number placed over the ſign to expreſs the denomination of the root. Thus $\sqrt[2]{a}$ denotes the ſquare root of a, $\sqrt[3]{a}$ its cube root, $\sqrt[4]{a}$ its fourth root, and in general, $\sqrt[n]{a}$ its nth root. The number placed over the radical ſign is called the *index* or *exponent* of the root, and is uſually omitted in expreſſing the ſquare root, thus either $\sqrt[2]{a}$ or $\surd a$ denotes the ſquare root of a.

71. *Caſe* 1. When roots of ſimple quantities are to be found.

Rule. Divide the exponents of the letters by the index of the root required, and prefix the root of the numeral coefficient, the reſult will be the root required.

Note 1. The root of any poſitive quantity may be either poſitive or negative, if the index of the root be an even number; but if it be an odd number, the root can be poſitive only. Evolution.

2. The root of a negative quantity is alſo negative when the index of the root is an odd number.

3. But if the quantity be negative, and the index of the root even, then no root can be aſſigned.

Ex. 1. Required the ſquare root of $36a^2x^4$.

Here the index of the root is 2, and the root of the coefficient 6, therefore $\surd 36a^2x^4=+6ax^2$ or $\surd 36a^2x^4=-6ax^2$, for neither of theſe quantities, when multiplied by itſelf, produces $36a^2x^4$; ſo that the root required is $\pm 6ax^2$, where the ſign $\pm$ denotes that the quantity to which it is prefixed may be conſidered either as poſitive or negative.

Ex. 2. Required the cube root of $125a^8x^9$.

Here the index of the root is 3, and the root of the coefficient 5, therefore $\sqrt[3]{125a^6x^9}=5a^2x^3$ the root required; and in like manner the cube root of $-125a^6x^9$ is found to be $-5a^2x^3$.

72. If it be required to extract the ſquare of $-a^2$, it will immediately appear that no root can be aſſigned; for it can neither be $+a$, nor $-a$, ſeeing that each of theſe quantities when ſquared produces $+a^2$, the root required is therefore ſaid to be *impoſſible*, and may be expreſſed thus: $\surd -a^2$.

The root of a fraction is found by extracting that root out of both numerator and denominator. Thus the ſquare root of $\frac{4a^2x^4}{9b^2y^6}$ is $\frac{2xa^2}{3by^3}$.

Caſe 2. When the quantity of which the root is to be extracted is compound.

73. I. To extract the ſquare root.

Range the terms of the quantity according to the powers of the letters, as in diviſion.

Find the ſquare root of the firſt term for the firſt part of the root ſought, ſubtract its ſquare from the given quantity, and divide the remainder by double the part already found, and the quotient is the ſecond term of the root.

Add the ſecond part to double the firſt, and multiply their ſum by the ſecond part, ſubtract the product from the remainder, and if nothing remain, the ſquare root is obtained. But if there is a remainder, it muſt be divided by the double of the parts already found, and the quotient will give the third term of the root, and ſo on.

Ex. 1. Required the ſquare root of $a^2+2ax+x^2$.

$a^2+2ax+x^2(a+x$ the root required.
a^2

$2a+x)+2ax+x^2$
$\times x)+2ax+x^2$

*. *.

Ex. 2.

Evolution.

Ex. 2. Required the ſquare root of $x^4-2x^3+\frac{3}{2}x^2-\frac{x}{2}+\frac{1}{16}$.

$$x^4-2x^3-\frac{3}{2}x^2-\frac{x}{2}+\frac{1}{16}\Big(x^2-x+\frac{1}{4}$$

x^4

$2x^2-x\Big)-2x^3+\frac{3}{2}x^2$

$\times -x-2x^3+x^2$

$2x^2-2x+\frac{1}{4}\Big)\frac{x^2}{2}-\frac{x}{2}+\frac{1}{16}$

$\times\frac{1}{4}\quad\frac{x^2}{2}\quad-\frac{x}{2}+\frac{1}{16}$

* * *

74. To underſtand the reaſon of the rule for finding the ſquare root of a compound quantity, it is only neceſſary to involve any quantity, as $a+b+c$ to the ſecond power, and obſerve the compoſition of its ſquare; for we have $(a+b+c)^2=a^2+2ab+b^2+2ac+2bc+c^2$ but $2ab+b^2=(2a+b)b$ and $2ac+2bc+c^2=(2a+2b+c)c$ therefore,

$(a+b+c)^2=a^2+(2a+b)b+(2a+2b+c)c$

and from this expreſſion the manner of deriving the rule is obvious.

As an illuſtration of the common rule for extracting the ſquare root of any propoſed number, we ſhall ſuppoſe that the root of 59049 is required.

Accordingly we have $(a+b+c)^2=59049$, and from hence we are to find the values of a, b, and c.

$a^2=200\times 200=40000$ | 59049(200=a, 40=b, 3=c } Hence 243 is the root required

$2a=400$ | 19049

$b=40$

$2a+b=440$ | $17600=(2a+b)b$

$2a+2b=480$ | 1449

$c=3$

$2a+2b+c=483$ | $1449=(2a+2b+c)c$

The ſame example when wrought by the common rule (ſee ARITHMETIC) will ſtand thus:

59049(243 the root required.
4

44)190
176

483)1449
1449

and by a compariſon of the two operations, the reaſon of the common rule is obvious.

75. II. To extract the cube root.

Range the terms of the quantity according to the powers of ſome one of the letters.

Find the root of the firſt term, for the firſt part of the root ſought; ſubtract its cube from the whole quantity, and divide the remainder by 3 times the ſquare of the part already found, and the quotient is the ſecond part of the root.

Add together, 3 times the ſquare of the part of the root already found, 3 times the product of that part and the ſecond part of the root, and the ſquare of the ſecond part; multiply the ſum by the ſecond part, and ſubtract the product from the firſt remainder, and if nothing remain, the root is obtained; but if there is a remainder, it muſt be divided by 3 times the ſquare of the ſum of the parts already found, and the quotient is a third term of the root, and ſo on, till the whole root is obtained.

Ex. Required the cube root of $a^3+3a^2x+3ax^2+x^3$.

$a^3+3ax^2+3ax^2+x^1$ ($a+x$ the root required.
a^3

$3a^2+3ax+x^2)3a^2x+3ax^2+x^3$
$3a^2x+3ax^2+x^3$

* * *

76. The reaſon of the preceding rule is evident from the compoſition of a cube, for if any quantity as $a+b+c$ be raiſed to the third power, we have $(a+b+c)^3=a^3+(3a^2+3ab+b^2)b+(3(a+b)^2+3(a+b)c+c^2)c$, and by conſidering in what manner the terms a, b and c are developed from this expreſſion for the cube of their ſum, we alſo ſee the reaſon for the common rule for extracting the cube root in numbers. Let it be required to find the cube root of 13312053, where the root will evidently conſiſt of three figures; let us ſuppoſe it to be repreſented by $a+b+c$, and the operation for finding the numerical values of theſe quantities may ſtand as follows.

$=a^3=$ 13312053(200=a, 30=b, 7=c

$3a^2=120000$ | 5312053

$3ab=18000$

$b^2=900$

237 the root required.

$3a^2+3ab+b^2=138900$ | 4167000$=(3a^2+3ab+b^2)b$

$3(a+b)^2=158700$ | 1145053

$3(a+b)c=4830$

$c^2=49$

$3(a+b)^2+3(a+b)c+c^2=163579$ | $1145053=[3(a+b)^2+3(a+b)c+c^2]c$

Evolution.

The operation as performed by the common rule (see ARITHMETIC) will stand thus:

	13312053(237 the root required.
	8
12 . .	5312
18 .	
9	
1389	4167
1587 . .	1145053
383 .	
49	
163579	1145053

77. III. To extract any other root.

Rule. Range the quantity, of which the root is to be found, according to the powers of its letters, and extract the root of the first term, and that shall be the first member of the root required.

Involve the first member of the root to a power less by unity than the number that denominates the root required, and multiply the power that arises by the number itself; divide the second term of the given quantity by the product, and the quotient shall give the second member of the root required.

Find the remaining members of the root in the same manner by considering those already found as making one term.

Ex. Required the cube root of $x^6+6x^5-40x^3+96x-64$

$$x^6+6x^5-40x^3+96x-64(x^2+2x-4$$
$$(x^2)^3=x^6$$
$$3x^4)6x^5$$
$$(x^2+2x)^3=x^6+6x^5+12x^4+8x^3$$
$$3x^4+, \&c.)-12x^4$$
$$(x^2+2x-4)^3=x^6+6x^5-40x^3+96x-64$$

*

In this example, the cube root of x^6, or x^2, is the first member of the root, and to find a second member the first is raised to the power next lower, or to the second power, and also multiplied by 3, the index of the root required; thus we get $3x^4$ for a divisor, by which the second term $6x^5$ being divided, we find $2x$ for the second member of the root. We must now consider x^2+2x as forming one term; accordingly having subtracted its cube from the quantity, of which the root is sought, we have $-12x^4-$, &c. for a new dividend; and having also raised x^2+2x to the second power, and multiplied the result by 3, we find $3x^4+$, &c. for a divisor. As it is only the terms which contain the highest powers of the dividend and divisor that we have occasion for, the remaining terms are expressed by &c. Having divided $-12x^4$ by $3x^4$, we find -4 for the third term of the root; and because it appears that x^2+2x-4, when raised to the third power, gives a result the very same with the proposed power, we conclude x^2+2x-4 to be the root sought.

Surds.

78. In the preceding examples, the quantities whose roots were to be found have been all such as could have their roots expressed by a finite number of terms; but it will frequently happen, that the root cannot be otherwise assigned than by a series consisting of an infinite number of terms: the preceding rules, however, will serve to determine any number of terms of the series. Thus the square root of a^2+x^2 will be found to be $a+\frac{x^2}{2a}-\frac{x^4}{8a^3}+\frac{x^6}{16a^5}-\frac{5x^8}{128a^7}+$ &c. and the cube root of a^3+x^3 will stand thus, $a+\frac{x^3}{3a^2}-\frac{x^6}{9a^5}+\frac{5x^9}{81a^8}-\frac{10x^{12}}{243a^{11}}+$, &c.; but as the extraction of roots in the form of series can be more easily performed by other methods, we shall refer the reader to sect. 17. which treats of series, where this subject is again resumed.

SECT. IV. *Of Surds.*

79. IT has been already observed (71.), that the root of any proposed quantity is found by dividing the exponent of the quantity by the index of the root; and the rule has been illustrated by suitable examples, in all which, however, the quotient expressing the exponent of the result is a whole number; but there may be cases in which the quotient is a fraction. Thus if the cube root of a^4 were required, it might be expressed, agreeably to the method of notation already explained, either thus $\sqrt[3]{a^2}$, or thus $a^{\frac{2}{3}}$.

80. Quantities which have fractional exponents are called *surds*, or imperfect powers, and are said to be *irrational*, in opposition to others with integral exponents, which are called *rational*.

81. Surds may be denoted by means of the radical sign, but it will often be more convenient to use the notation of fractional exponents; the following examples will shew how they may be expressed either way.

$\sqrt[3]{a}=a^{\frac{1}{3}}$, $\sqrt{4ab^2}=2ba^{\frac{1}{2}}$, $\sqrt[4]{a^3b^2}=a^{\frac{3}{4}}b^{\frac{2}{4}}$, $\sqrt{a^2+b^2}=(a^2+b^2)^{\frac{1}{2}}$, $\sqrt[5]{(a-b)^2}=(a-b)^{\frac{2}{5}}$, $\frac{\sqrt{a+b}}{\sqrt{ab}}=(a+b^{\frac{1}{2}}a^{-\frac{1}{2}}b^{-\frac{1}{2}}$.

82. The operations concerning surds depend on the following principle. If the numerator and denominator of a fractional exponent be either both multiplied, or both divided by the same quantity, the value of the power is the same. Thus $a^{\frac{m}{n}}=a^{\frac{cm}{cn}}$. For let $a^{\frac{m}{n}}=b$, then, raising both to the power n, $a^m=b^n$, and farther raising both to the power c we get $a^{cm}=b^{cn}$; let the root cn be now taken and we find $a^{\frac{cm}{cn}}=b=a^{\frac{m}{n}}$.

83. PROB. I. *To Reduce a rational Quantity to the form of a Surd of any given denomination.*

Rule Reduce the exponent of the quantity to the form of a fraction of the same denomination as the given surd.

Ex. 1.

Surds. *Ex.* 1. Reduce $a^{\frac{2}{3}}$ to the form of the cube root.

Here the exponent 2 muſt be reduced to the form of a fraction having 3 for a denominator, which will be the fraction $\frac{6}{3}$; therefore $a^{\frac{2}{3}}=a^{\frac{6}{3}}=\sqrt[6]{a^3}$.

Ex. 2. Reduce 5 to the form of the cube root, and $3ab^{\frac{2}{3}}$ to the form of the ſquare root.

Firſt $5=5^{\frac{3}{3}}=\sqrt[3]{5\times5\times5}=\sqrt[3]{125}$.

And $3ab^{\frac{2}{3}}=3^{\frac{2}{2}}a^{\frac{2}{2}}b^{\frac{4}{6}}=(3^2a^2b^4)^{\frac{1}{2}}=\sqrt{9a^2b^4}$.

84. Prob. II. *To Reduce Surds of different denominations to others of the ſame value, and of the ſame denominations.*

Rule. Reduce the fractional exponents to others of the ſame value, and having the ſame common denominator.

Ex. 1. Reduce $\sqrt{a}$ and $\sqrt[3]{b^2}$, or $a^{\frac{1}{2}}$ and $b^{\frac{2}{3}}$ to other equivalent ſurds of the ſame denomination.

The exponents $\frac{1}{2}$, $\frac{2}{3}$, when reduced to a common denominator, are $\frac{3}{6}$ and $\frac{4}{6}$; therefore, the ſurds required are $a^{\frac{3}{6}}$ and $b^{\frac{4}{6}}$, or $\sqrt[6]{a^3}$ and $\sqrt[6]{b^4}$.

Ex. 2. Reduce $3^{\frac{1}{2}}$ and $2^{\frac{1}{3}}$ to ſurds of the ſame denomination.

The new exponents are $\frac{3}{6}$ and $\frac{2}{6}$, therefore we have $3^{\frac{1}{2}}=3^{\frac{3}{6}}=\sqrt[6]{3^3}=\sqrt[6]{27}$, and $2^{\frac{1}{3}}=2^{\frac{2}{6}}=\sqrt[6]{2^2}=\sqrt[6]{4}$.

And in the ſame way the ſurds $A^{\frac{1}{m}}$, $B^{\frac{1}{n}}$ are reduced to theſe two $\sqrt[mn]{A^n}$ and $\sqrt[mn]{B^m}$.

85. Prob. III. *To Reduce Surds to their moſt ſimple terms.*

Rule. Reduce the ſurd into two factors, ſo that one of them may be a complete power, having its exponent diviſible by the index of the ſurd. Extract the root of that power, and place it before the remaining quantities, with the proper radical ſign between them.

Ex. 1. Reduce $\sqrt{48}$ to its moſt ſimple terms.

The number 48 may be reſolved into the two factors 16 and 3, of which the firſt is a complete ſquare; therefore $\sqrt{48}=(4^2\times3)^{\frac{1}{2}}=4\times3^{\frac{1}{2}}=4\sqrt{3}$.

Ex. 2. Reduce $\sqrt{98a^4x}$, and $\sqrt[3]{24a^3x}+40a^3x^2$, each to its moſt ſimple terms.

Firſt $\sqrt{98a^4x}=(7^2a^4\times2x)^{\frac{1}{2}}=7a^2\times(2x)^{\frac{1}{2}}=7a^2\sqrt{2x}$.

Alſo $\sqrt[3]{24a^3x+40a^3x^2}=(2^3a^3(3x+5x^2))^{\frac{1}{3}}=2a\sqrt[3]{3x+5x^2}$.

86. Prob. IV. *To Add and Subtract Surds.*

Rule. If the ſurds are of different denominations, reduce them to others of the ſame denomination, by prob. 2.; and then reduce them to their ſimpleſt terms by laſt problem. Then, if the ſurd part be the ſame in them all, annex it to the ſum, or difference of the rational parts, with the ſign of multiplication, and it will give the ſum, or difference required. But if the ſurd part be not the ſame in all the quantities, they can only be added, or ſubtracted by placing the ſigns + or − between them. Surds.

Ex. 1. Required the ſum of $\sqrt{27}$ and $\sqrt{48}$.

By prob. 3. we find $\sqrt{27}=3\sqrt{3}$ and $\sqrt{48}=4\sqrt{3}$, therefore $\sqrt{27}+\sqrt{48}=3\sqrt{3}+4\sqrt{3}=7\sqrt{3}$.

Ex. 2. Required the ſum of $3\sqrt[3]{\frac{1}{4}}$ and $5\sqrt[3]{\frac{1}{16}}$.

$3\sqrt[3]{\frac{1}{4}}=3\sqrt[3]{\frac{2}{8}}=\frac{3}{2}\sqrt[3]{2}$ and $5\sqrt[3]{\frac{1}{16}}=5\sqrt[3]{\frac{2}{32}}=\frac{5}{4}\sqrt[3]{2}$, therefore $3\sqrt[3]{\frac{1}{4}}+5\sqrt[3]{\frac{1}{16}}=\frac{1}{2}\sqrt[3]{2}+\frac{5}{8}\sqrt[3]{2}=\frac{17}{8}\sqrt[3]{2}$.

Ex. 2. Required the difference between $\sqrt{80a^4x}$ and $\sqrt{20a^2x^3}$.

$\sqrt{80a^4x}=(4^2a^4\times5x)^{\frac{1}{2}}=4a^2\sqrt{5x}$, and $\sqrt{20a^2x^3}=(2^2a^2x^2\times5x)^{\frac{1}{2}}=2ax\sqrt{5x}$; therefore $\sqrt{80a^4x}-\sqrt{20a^2x^3}=(4a^2-2ax)\sqrt{5x}$.

86. Prob. V. *To Multiply and Divide Surds.*

Rule. If they are ſurds of the ſame rational quantity, add and ſubtract their exponents.

But if they are ſurds of different rational quantities, let them be brought to others of the ſame denomination, by prob. 2. Then, by multiplying or dividing theſe rational quantities, their product, or quotient, may be ſet under the common radical ſign.

Note. If the ſurds have any rational coefficients, their product or quotient muſt be prefixed.

Ex. 1. Required the product of $\sqrt[3]{a^2}$ and $\sqrt[5]{a^3}$.

$\sqrt[3]{a^2}\times\sqrt[5]{a^3}=a^{\frac{2}{3}}\times a^{\frac{3}{5}}=a^{\frac{2}{3}+\frac{3}{5}}=a^{\frac{19}{15}}=\sqrt[15]{a^{19}}$, Anſ.

Ex. 2. Divide $\sqrt{a^2-b^2}$ by $\sqrt[3]{a+b}$.

Theſe ſurds when reduced to the ſame denomination are $(a^2-b^2)^{\frac{3}{6}}$ and $(a+b)^{\frac{2}{6}}$. Hence $\frac{\sqrt{a^2-b^2}}{\sqrt[3]{a+b}}=\left(\frac{(a^2-b^2)^3}{(a+b)^2}\right)^{\frac{1}{6}}=\left(\frac{(a+b)^3(a-b)^3}{(a+b)^2}\right)^{\frac{1}{6}}=\left((a+b)(a-b)^3\right)^{\frac{1}{6}}=\sqrt[6]{(a+b)(a-b)^3}$.

Ex. 3. Required the product of $5\sqrt{8}$ and $3\sqrt{5}$.

$5\sqrt{8}\times3\sqrt{5}=5\times3\times\sqrt{8}\times\sqrt{5}=15\times\sqrt{40}=15\times\sqrt{4}\times10=30\sqrt{10}$.

Ex. 4. Divide $8\sqrt[3]{56}$ by $4\sqrt[3]{2}$.

$$\frac{8\sqrt[3]{56}}{4\sqrt[3]{2}}=2\frac{\sqrt[3]{56}}{2}=2\sqrt[3]{28}.$$

Ex. 5.

Proportion.

Ex. 5. Required the product of $x^{\frac{1}{m}}$ and $x^{\frac{1}{n}}$; also the quotient arising from the division of $a^{\frac{1}{m}}$ by $b^{\frac{1}{n}}$

First $x^{\frac{1}{m}} \times x^{\frac{1}{n}} = x^{\frac{1}{m}+\frac{1}{n}} = x^{\frac{m+n}{mn}} = \sqrt[mn]{x^{m+n}}$,

And $\frac{a^{\frac{1}{m}}}{b^{\frac{1}{n}}} = \left(\frac{a^n}{b^n}\right)^{\frac{1}{mn}} = \sqrt[mn]{\frac{a^n}{b^m}}$.

88. Prob. VI. *To Involve and Evolve Surds.*

Surds are involved or evolved in the same manner as any other quantities, namely, by multiplying or dividing their exponents by the index of the power, or root required. Thus the square of $3\sqrt{3}$ is $3 \times 3 \times (3)^{\frac{2}{2}} = 9\sqrt[2]{9}$. The nth power of $x^{\frac{1}{m}}$ is $x^{\frac{n}{m}}$. The cube root of $\frac{1}{8}\sqrt{2}$ is $\frac{1}{2}(2)^{\frac{1}{6}} = \sqrt[6]{\frac{2}{2}}$ and the nth root of $x^{\frac{1}{m}}$ is $x^{\frac{1}{mn}}$.

89. If a compound quantity involve one or more surds, its powers may be found by multiplication. Thus the square of $3+\sqrt{5}$ is found as follows:

$$\begin{array}{r} 3+\sqrt{5} \\ 3+\sqrt{5} \\ \hline 9+3\sqrt{5} \\ +3\sqrt{5}+5 \\ \hline \end{array}$$

$9+6\sqrt{5}+5 = 14+6\sqrt{5}$ the square required.

90. The square root of a binomial, or residual surd $A+B$, or $A-B$ may be found thus. Take $\sqrt{A^2-B^2}-D$;

then $\sqrt{A+B} = \sqrt{\frac{A+D}{2}} + \sqrt{\frac{A-D}{2}}$,

and $\sqrt{A-B} = \sqrt{\frac{A+D}{2}} - \sqrt{\frac{A-D}{2}}$.

Thus the square root of $8+2\sqrt{7}$ is $1+\sqrt{7}$; and the square root of $3-\sqrt{8}$ is $\sqrt{2}-1$. With respect to the extraction of the cube or any higher root no general rule can be given.

Sect. V. *Of Proportion.*

91. In comparing together any two quantities of the same kind in respect of magnitude, we may consider how much the one is greater than the other, or else how many times the one contains either the whole, or some part of the other; or, which is the same thing, we may consider either what is the difference between the quantities, or what is the quotient arising from the division of the one quantity by the other; the former of these is called their *arithmetical ratio*, and the latter their *geometrical ratio*. These denominations, however, have been assumed arbitrarily, and have little or no connexion with the relations they are intended to express.

I. *Of Arithmetical Proportion.*

92. When of four quantities the difference between the first and second is equal to the difference between the third and fourth, the quantities are called *arithmetical proportionals*. Such, for example, are the numbers 2, 5, 9, 12; and, in general, the quantities a, $a+d$, b, $b+d$. If the two middle terms are equal, the quantities constitute what are called *three arithmetical proportionals*. Arithmetical Proportion.

93. The most material property of four arithmetical proportionals is the following: If four quantities be arithmetically proportional, the sum of the extreme terms is equal to the sum of the means. Let the quantities be a, $a+d$, b, $b+d$, where d is the difference between the first and second, and also between the third and fourth, the sum of the extremes is $a+b+d$, and that of the means $a+d+b$; so that the truth of the proportion is evident. Hence it follows, that if any three quantities be arithmetically proportional, the sum of the two extremes is double the mean.

94. If any three terms of four arithmetical proportionals be given, the fourth may be found from the preceding proposition. Let a, b, c, be the first, second, and fourth terms, and let x the third term be required; because $a+c=b+x$; therefore $x=a+c-b$. In like manner any two of three arithmetical proportionals being supposed given, the remaining term may be readily found,

95. If a series of quantities be such, that the difference between any two adjacent terms is always the same, these terms form a *continued arithmetical proportion*. Thus the numbers 2, 4, 6, 8, 10, &c. form a series in continued arithmetical proportion, and, in general, such a series may be represented thus:

a, $a+d$, $a+2d$, $a+3d$, $a+4d$, $a+5d$, $a+6d$, &c.

where a denotes the first term and d the common difference.

By a little attention to this series, we readily discover that it has the following properties:

1. The last term of the series is equal to the first term, together with the common difference taken as often as there are terms after the first. Thus, when the number of terms is 7, the last term is $a+6d$; and so on. Hence if z denote the last term, n the number of terms, and a and d express the first term and common difference, we have $z=a+(n-1)d$.

2. The sum of the first and last term is equal to the sum of any two terms at the same distance from them. Thus suppose the number of terms to be 7, then the last term is $a+6d$, and the sum of the first and last, $2a+6d$; but the same is also the sum of the second and last but one, of the third and last but two, and so on till we come to the middle term, which, because it is equally distant from the extremes must be added to itself.

96. From this last mentioned property we derive a rule for finding the sum of all the terms of the series. For if the sum of the first and last be taken, as also the sum of the second and last but one, of the third and last but two, and so on along the series till we come to the sum of the last and first terms, it is evident that we shall have as many sums as there are terms, and each equal to the sum of the first and last terms; but the aggregate of those sums is equal to all the terms of the series taken twice, therefore the sum of the first and last term, taken as often as there are terms, is equal to twice the sum of all the terms, so that if s denote that sum, we have $2s=n(a+z)$, and $s=\frac{n}{2}(a+z)$.

Geometrical Proportion.

Hence the sum of the odd numbers 1, 3, 5, 7, 9, &c. continued to n terms, is equal to the square of the number of terms. For in this case $a=1$, $d=2$, $z=1+(n-1)d=2n-1$, therefore $s=\frac{n}{2}\times 2n=n^2$.

II. *Of Geometrical Proportion.*

97. When of four quantities, the quotient arising from the division of the first by the second is equal to that arising from the division of the third by the fourth, these quantities are said to be in *geometrical proportion*, or are called simply *proportionals*. Thus 12, 4, 15, 5, are four numbers in geometrical proportion; and, in general, na, a, nb, b may express any four proportionals, for $\frac{na}{a}=n$, and also $\frac{nb}{b}=n$.

98. To denote that any four quantities a, b, c, d, are proportional, it is common to place them thus, $a : b :: c : d$, or thus $a : b=c : d$, which notation, when expressed in words, is read thus, a is to b as c to d, or the ratio of a to b is equal to the ratio of c to d.

The first and third terms of a proportion are called the *antecedents*, and the second and fourth the *consequents*.

99. When the two middle terms of a proportion are the same, the remaining terms, and that quantity, constitute three geometrical proportionals; such are 4, 6, 9, and in general na, a, $\frac{a}{n}$. In this case the middle quantity is called a mean proportional between the other two.

100. The principal properties of four proportionals are the following:

1. If four quantities be proportionals, the product of the extremes is equal to the product of the means. Let a, b, c, d, be four quantities, such, that $a : b :: c : d$; then from the nature of proportionals $\frac{a}{b}=\frac{c}{d}$; let these equal quotients be multiplied by bd, and we have $\frac{abd}{b}=\frac{cbd}{d}$, or $ad=bc$. Hence it follows, that when three quantities are proportional, the product of the extremes is equal to the square of the middle term. It also appears, that if any three of four proportionals be given, the remaining one may be found. Thus let a, b, c, the three first be given, and let it be required to find x the fourth term; because $a : b :: c : x$, $ax=bc$, and dividing by a, $x=\frac{bc}{a}$. This conclusion may be considered as a demonstration of what is called the rule of three in arithmetic.

2. If four quantities be such that the product of two of them is equal to the product of the other two, these quantities are proportionals.

Let a, b, c, d, be the quantities, which are such that $ad=bc$, if these equals be divided by bd, we get $\frac{ad}{bd}=\frac{bc}{bd}$ or $\frac{a}{b}=\frac{c}{d}$, hence it follows, from the definition given of proportionals (§ 97.), that $a : b :: c : d$. From this property of proportionals it appears, that if three quantities be such that the square of one of them be equal to the product of the other two, these quantities are three proportionals.

Geometrical Proportion.

101. If four quantities are proportional, that is, if $a : b :: c : d$, then will each of the following combinations or arrangements of the quantities be also four proportionals.

1st, By inversion $b : a :: d : c$

2d, By alternation $a : c :: b : d$ *

3d, By composition $a+b : a :: c+d : c$
or $a+b : b :: c+d : d$

4th, By division $a-b : a :: c-d : c$
or $a-b : b :: c-d : d$

5th, By mixing $a+b : a-b :: c+d : c-d$

6th, By taking any equimultiples of the antecedents, and also any equimultiples of the consequents
$na : pb :: nc : pd$

7th, Or by taking any parts of the antecedents and consequents $\frac{a}{n} : \frac{b}{p} :: \frac{c}{n} : \frac{d}{p}$.

That the preceding combinations of the quantities a, b, c, d are proportionals, may be readily proved, by taking the products of the extremes and means; for from each of them we derive this conclusion, that $ad=bc$, which is known to be true, from the original assumption of the quantities.

102. If four quantities be proportional, and also other four, the product of the corresponding terms will be proportional.

Let $a : b :: c : d$,
and $e : f :: g : h$,
Then $ae : bf :: cg : dh$.

For $ad=bc$, and $eh=fg$ (§ 100.), therefore, multiplying together these equal quantities $adeh=bcfg$, or $ae\times dh=bf\times cg$, therefore by the second property (§ 100.), $ae : bf :: cg : dh$.

103. Hence it follows, that if there be any number of proportions whatever, the products of the corresponding terms will still be proportional.

104. If a series of quantities be so related to each other, that the quotient arising from the division of any term by that which follows it is always the same quantity, these quantities are said to be in *continued geometrical proportion*, such are the numbers 2, 4, 8, 16, 32, &c. also $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{16}$, &c. and in general a series of such quantities may be represented thus, a, ar, ar^2, ar^3, ar^4, ar^5, &c. Here a is the first term, and r the quotient of any two adjoining terms, which is also called the *common ratio*.

105. By inspecting this series we find that it has the following properties:

1. The last term is equal to the first, multiplied by the common ratio raised to a power, the index of which is one less than the number of terms. Therefore, if z denote the last term, and n the number of terms, $z=ar^{n-1}$.

2. The

* The quantities in this case must be all of the same kind, that is, if a and b denote surfaces, then c and d must also denote surfaces, but they cannot represent lines, &c.

Reduction of Equations.

2. The product of the first and last term is equal to the product of any two terms equally distant from them: thus, supposing ar^5 the last term, it is evident that $a \times ar^5 = ar \times ar^4 = ar^2 \times ar^3$, &c.

106. The sum of all the terms may be found thus: let s represent that sum, then, supposing the number of terms to be six, $s = a + ar + ar^2 + ar^3 + ar^4 + ar^5$, and multiplying these equals by r, $sr = ar + ar^2 + ar^3 + ar^4 + ar^5 + ar^6$. If from the lower line, or $sr = ar + ar^2 + \ldots + ar^6$, we subtract the upper line, or $s = a + ar + \ldots + ar^5$, the remainders will evidently be equal; but on the one side of the sign $=$ we have $sr - s$, and on the other $ar^6 - a$: therefore, $sr - s = ar^6 - a$, and dividing by $r - 1$, $s = \frac{ar^6 - a}{r - 1}$. Let us now, instead of 6, substitute n (for the number of terms put down was 6), and we have the following general rule for finding the sum of a series of quantities in continued geometrical proportion, $s = \frac{ar^n - a}{r - 1}$, or $s = \frac{a(r^n - 1)}{r - 1}$.

Sect. VI. *Of the Reduction of Equations involving one unknown quantity.*

107. The general object of algebraic investigation is to discover certain unknown quantities, by comparing them with other quantities which are given, or supposed to be known. The relation between the known and unknown quantities is either that of equality, or else such as may be reduced to equality; and a proposition which affirms that certain combinations of quantities are equal to one another is called an *equation*. Such are the following $\frac{x}{2} + \frac{x}{3} = \frac{24}{x}$, $2x + 3y = xy$; the first of these equations expresses the relation between an unknown quantity x, and certain known numbers; and the second expresses the relation which the two indefinite quantities x and y have to each other.

108. When a quantity stands alone on one side of an equation, the terms on the other side are said to be a *value* of that quantity. Thus in the equation $x = ay + b - c$, the quantity x stands alone on one side, and $ay + b - c$ is its value.

109. The conditions of a problem may be such as to require several equations and symbols of unknown quantities for their complete expression; these, however, by rules hereafter to be explained, may be reduced to one equation, involving only one unknown quantity and its powers, besides the known quantities; and the method of expressing that quantity, by means of the known quantities, constitutes the theory of equations, one of the most important, as well as most intricate branches of algebraic analysis.

110. An equation is said to be *resolved* when the unknown quantity is made to stand alone on one side, and only known quantities on the other side; and the value of the unknown quantity is called a *root* of the equation.

111. Equations containing only one unknown quantity and its powers, are divided into different *orders*, according to the highest power of that quantity contained in any one of its terms. The equation, however, is supposed to be reduced to such a form, that the unknown quantity is found only in the numerators of the terms, and that the exponents of its powers are expressed by positive integers. Reduction of Equations.

112. If an equation contains only the first power of the unknown quantity, it is called a *simple* equation, or an equation of the first order. Such is $ax + b = c$, where x denotes an unknown, and a, b, c known quantities.

113. If the equation contains the second power of the unknown quantity, it is said to be of the second degree, or is called a *quadratic* equation; such is $4x^2 + 3x = 12$, and in general $ax^2 + bx = c$. If it contains the third power of the unknown quantity, it is of the third degree, or is a *cubic* equation. Such are $x^3 - 2x^2 + 4x = 10$, and $ax^3 + bx^2 + ca = d$, and so on, with respect to equations of the higher orders. A simple equation is sometimes said to be *linear*, or to be of one *dimension*. In like manner, quadratic equations are said to be equations of two dimensions, and cubic equations to be of three dimensions.

114. When in the course of an algebraic investigation we arrive at an equation involving only one unknown quantity, that quantity will often be so entangled in the different terms, as to render several previous reductions necessary before the equation can be expressed under its characteristic form, so as to be resolved by the rules which belong to that form.

These reductions depend upon the operations which have been explained in the former part of this treatise, and the application of a few self-evident principles, namely, that if equal quantities be added to, or subtracted from equal quantities, the sums or remainders will be equal; if equal quantities be multipled, or divided by the same quantity, the products or quotients will be equal; and, lastly, if equal quantities be raised to the same power, or have the same root extracted out of each, the results will still be equal.

From these considerations are derived the following rules, which apply alike to equations of all orders, and are alone sufficient for the resolution of simple equations.

115. *Rule* 1. Any quantity may be transposed from one side of an equation to the other, by changing its signs.

Thus, if $x - 3 = 5$
Then $x = 5 + 3$
Or $x = 8$
And if $3x - 10 = 2x + 5$
Then $3x - 2x = 5 + 10$
Or $x = 15$
Again, if $ax + b = cx - dx + e$
Then $ax - cx + dx = e - b$
Or $(a - c + d)x = e - b$

The reason of this rule is evident, for the transposing a quantity from one side of an equation to the other is nothing more than adding the same quantity to each side of the equation, if the sign of the quantity transposed was $-$; or subtracting it, if the sign was $+$.

From this rule we may infer, that if any quantity be found on each side of the equation with the same sign, it may be left out of both. Also, that the signs of all the terms of an equation may be changed into

Reduction of Equations.

the contrary without affecting the truth of the equation.

Thus, if $a+x=b+a-c$
Then $x=b+c$
And if $a-x=b-d$
Then $x-a=d-b$.

116. *Rule* 2. If the unknown quantity in an equation be multiplied by any quantity, that quantity may be taken away, by dividing all the other terms of the equation by it.

If $3x=24$
Then $x=\frac{24}{3}=8$
If $ax=b-c$
Then $x=\frac{b-c}{a}=\frac{b}{a}-\frac{c}{a}$.

Here equal quantities are divided by the same quantity, and therefore the quotients are equal.

117. *Rule* 3. If any term of an equation be a fraction, its denominator may be taken away by multiplying all the other terms of the equation by that denominator.

If $\frac{x}{5}=7$
Then $x=35$
If $\frac{x}{a}=b-c+d$
Then $x=ab-ac+ad$
If $a-\frac{b}{x}=c$,
$ax-b=cx$.

In these examples, equal quantities are multiplied by the same quantity, and therefore the products are equal.

118. The denominators may be taken away from several terms of an equation by one operation, if we multiply all the terms by any number which is a multiple of each of these denominators.

Thus, if $\frac{x}{2}+\frac{x}{3}+\frac{x}{4}=26$.

Let all the terms be multiplied by 12, which is a multiple of 2, 3, and 4, and we have

$\frac{12x}{2}+\frac{12x}{3}+\frac{12x}{4}=312$
Or $6x+4x+3x=312$
Hence $13x=312$,

Universally, if $\frac{x}{a}-\frac{x}{b}+\frac{x}{c}=d-e$.

To take away the denominators a, b, c, let the whole equation be multiplied by abc, their product, and we have

$bcx-acx+abx=abc(d-e)$
Or $(bc-ac+ab)x=abc(d-e)$.

119. From the two last rules it appears that if all the terms of an equation be either multiplied or divided by the same quantity, that quantity may be left out of all the terms.

If $ax=ab-ac$
Then $x=b-c$
And if $\frac{x}{a}=\frac{b}{a}+\frac{c}{a}$
Then $x=b+c$.

Reduction of Equation

120. *Rule*. If the unknown quantity is found in any term which is a surd, let that surd be made to stand alone on one side of the equation, and the remaining terms on the opposite side; then involve each side to a power denoted by the index of the surd, and thus the unknown quantity shall be freed from the surd expression.

If $\sqrt{x}+6=10$
Then by transposition $\sqrt{x}=10-6=4$
And squaring both sides $\sqrt{x}\times\sqrt{x}=4\times4$
Or $x=16$.

Also, if $\sqrt{a^2+x^2}-b=x$
By transp. $\sqrt{a^2+x^2}=b+x$
And squaring, $a^2+x^2=(b+x)^2=b^2+2bx+x^2$
Hence $a^2=b^2+2bx$.

And if $\sqrt[1]{a^2x-b^2x}=a$
Then $a^2x-b^2x=a^1$.

121. *Rule*. If the side of the equation, which contains the unknown quantity, be a perfect power, the equation may be reduced to another of a lower order, by extracting the root of that power out of each side of the equation.

Thus if $x^1=64a^1$
Then, by extracting the cube root, $x=8a$
And if $(a+x)^2=b^2-a^2$
Then $a+x=\sqrt{b^2-a^2}$.

122. The use of the preceding rules will be farther illustrated by the following examples:

Ex. 1. Let $20-3x-8=60-7x$

By rule 1. $7x-3x=60+8-20$
Or $4x=48$
Therefore by rule 2. $x=12$.

Ex. 2. Let $ax-b=cx+d$

By rule 1. $ax-cx=b+d$
Or $(a-c)x=b+d$
And by rule 2. $x=\frac{b+d}{a-c}$.

Ex. 3. Let $\frac{x+1}{2}+\frac{x+2}{3}=16-\frac{x+3}{4}$

By rule 3.
$x+1+\frac{2x+4}{3}=32-\frac{2x+6}{4}$
$3x+3+2x+4=96-\frac{6x+18}{4}$
$12x+12+8x+16=384-6x-18$
Or $20x+28=366-6x$

Hence, by rule 1. $26x=338$
And by rule 2. $x=13$.

In this example, instead of taking away the denominators one after another, they might have been all taken away at once, by multiplying the given equation by

Reduction of Equations.

by 12, which is divisible by the numbers 2, 3, and 4; thus we should have got $6x+6+4x+8=192-3x-9$, and hence, as before, $x=13$.

Ex. 4. Let $6x^3-20x^2=16x^2+2x^3$.

Then dividing by $2x^2$, $3x-10=8+x$
And transposing, $3x-x=8+10$
Or $2x=18$
And therefore $x=9$.

Ex. 5. Let $a-\frac{b^2}{x}=c$

Then $ax-b^2=cx$
And $ax-cx=b^2$
Whence $x=\frac{b^2}{a-c}$.

Ex. 6. Let $x-6=\frac{x^2}{x+24}$.

Then $(x-6)(x+24)=x^2$
That is $x^2+18x-144=x^2$
Therefore $18x=144$
And $x=8$.

Ex. 7. Let $ax+b^2=\frac{ax^2+ac^2}{a+x}$.

Then $(a+x)(ax+b^2)=ax^2+ac^2$
Or $a^2x+ab^2+ax^2+b^2x=ax^2+ac^2$
Hence $a^2x+b^2x=ac^2-ab^2$
And $x=\frac{ac^2-ab^2}{a^2+b^2}$.

Ex. 8. Let $\frac{1-x}{1+a}=a$.

Then $1-x=a+ax$
And $-x-ax=a-1$
Or changing the signs, $x+ax=1-a$
Hence, $x=\frac{1-a}{1+a}$.

Ex. 9. Let $\sqrt{12+x}=2+\sqrt{x}$.

Then by rule 4. $12+x=4+4\sqrt{x}+x$
And by transposition $8=4\sqrt{x}$
And by division $2=\sqrt{x}$
And again by rule 4. $4=x$.

Ex. 10. Let $x+\sqrt{a^2+x^2}=\frac{2a^2}{\sqrt{a^2+x^2}}$.

Then, by rule 3. $x\sqrt{a^2+x^2}+a^2+x^2=2a^2$
And by transposition, &c. $x\sqrt{a^2+x^2}=a^2-x^2$
Therefore, by rule 4. $a^2x^2+x^4=a^4-2a^2x^2+x^4$
Whence $3a^2x^2=a^4$
And $x^2=\frac{a^2}{3}$, therefore, rule 5. $x=\frac{a}{\sqrt{3}}$.

Ex. 11. Let $\frac{1-\sqrt{1-x^2}}{1+\sqrt{1-x^2}}=a$.

Then $1-\sqrt{1-x^2}=a+a\sqrt{1-x^2}$
And $1-a=a\sqrt{1-x^2}+\sqrt{1-x^2}=(1+a)\sqrt{1-x^2}$
Whence $\frac{1-a}{1+a}=\sqrt{1-x^2}$

And, taking the square of both sides, $\frac{(1-a)^2}{(1+a)^2}=1-x^2$
Therefore, by transposition, $x^2=1-\frac{(1-a)^2}{(1+a)^2}$
That is, $x^2=\frac{(1+a)^2-(1-a)^2}{(1+a)^2}=\frac{4a}{(1+a)^2}$
Therefore $x=\frac{2\sqrt{a}}{1+a}$.

Ex. 12. Let $a+x=\sqrt{a^2+x\sqrt{b^2+x^2}}$
Then $(a+x)^2=a^2+x\sqrt{b^2+x^2}$
That is, $a^2+2ax+x^2=a^2+x\sqrt{b^2+x^2}$
Therefore $2ax+x^2=x\sqrt{b^2+x^2}$
And dividing by x, $2a+x=\sqrt{b^2+x^2}$
Again taking the squares of both sides, $4a^2+4ax+x^2=b^2+x^2$
Whence $4a^2+4ax=b^2$
And $4ax=b^2-4a^2$; so that $x=\frac{b^2-4a^2}{4a}$.

123. In all these examples we have been able to determine the value of the unknown quantity by the rules already delivered, because in every case the first, or at most the second power of that quantity, has been made to stand alone on one side of the equation, while the other consisted only of known quantities; but the same methods of reduction serve to bring equations of all degrees to a proper form for solution. Thus if $\frac{1-p+q+r}{x+1}=1-p-x+\frac{r}{x}$; by proper reduction, we have $x^3+px^2+qx=r$, a cubic equation, which may be resolved by rules to be afterwards explained.

Sect. VII. *Of the Reduction of Equations involving more than one unknown quantity.*

124. Having shown in the last section in what manner an equation involving one unknown quantity may be resolved, or at least fitted for a final solution, we are next to explain the methods by which two or more equations, involving as many unknown quantities, may at last be reduced to one equation, and one unknown quantity.

As the unknown quantities may be combined together in very different ways, so as to constitute an equation, the methods most proper for their extermination must therefore be various. The three following, however, are of general application, and the last of them may be used with advantage, not only when the unknown quantity to be exterminated arises to the same power in all the equations, but also when the equations contain different powers of that quantity.

125. *Method* 1. Observe which of the unknown quantities is the least involved, and let its value be found from each equation by the rules of last section.

Let the values thus found be put equal to each other, and hence new equations will arise, from which that

Reduction of Equations.

that quantity is wholly excluded. Let the same operation be now repeated with the same equations, and the unknown quantities exterminated one by one, till at last an equation be found, which contains only one unknown quantity.

Ex. Let it be required to determine x and y from these two equations.

$$2x+3y=23$$
$$5x-2y=10$$

From the first equation $2x=23-3y$

And $x=\frac{23-3y}{2}$

From the second equation $5x=10+2y$

And $x=\frac{10+2y}{5}$

Let these values of x be now put equal to each other,

And we have $\frac{10+2y}{5}=\frac{23-3y}{2}$

Or $20+4y=125-15y$

Therefore $19y=95$

And $y=5$

And since $x=\frac{23-3y}{2}$, or $x=\frac{10+2y}{5}$, from either of these values we find $x=4$.

126. *Method* 2. Let the value of the unknown quantity, which is to be exterminated, be found from that equation wherein it is least involved. Let this value, and its powers, be substituted for that quantity, and its respective powers in the other equations; and with the new equations thus arising, let the operation be repeated, till there remain only one equation, and one unknown quantity.

Ex. Let the given equations, as in last method, be

$$2x+3y=23$$
$$5x-2y=10$$

From the first equation $x=\frac{23-3y}{2}$

And this value of x being substituted in the second equation, we have $5\times\frac{23-3y}{2}-2y=10$

Or $115-15y-4y=20$

Therefore $95=19y$

And $5=y$

And hence $x=\frac{23-3y}{2}=4$, as before.

127. *Method* 3. Let the given equations be multiplied or divided by such numbers or quantities, whether known or unknown, that the term which involved the highest power of the unknown quantity may be the same in each equation.

Then by adding or subtracting the equations, as occasion may require, that term will vanish, and a new equation emerge, wherein the number of dimensions of the unknown quantity in some cases, and in others the number of unknown quantities, will be diminished; and by a repetition of the same, or similar operations, a final equation may be at last obtained, involving only one unknown quantity.

Reduction of Equations.

Ex. Let the same example be taken, as in the illustration of the two former methods, namely,

$$2x+3y=23$$
$$5x-2y=10$$

and from these two equations we are to determine x and y. To exterminate x, let the first equation be multiplied by 5, and the second by 2, thus we have

$$10x+15y=115$$
$$10x-4y=20$$

Here the term involving x is the same in both equations, and it is obvious that by subtracting the one from the other, the resulting equation will contain only y, and known numbers, for by such subtraction we find $19y=95$, and therefore $y=5$.

Having got the value of y, it is easy to see how x may be found, from either of the given equations; but it may also be found in the same manner as we found y. For let the first of the given equations be multiplied by 2, and the second by 3, and we have

$$4x+6y=46$$
$$15x-6y=30$$

By adding these equations, we find

$$19x=76$$

and therefore $x=4$.

128. The following examples will serve farther to illustrate these different methods of exterminating the unknown quantities from equations.

Ex. 1. Given $\left\{\begin{matrix}\frac{x}{2}+\frac{y}{3}=16\\ \frac{x}{5}-\frac{y}{9}=2\end{matrix}\right\}$ Required x and y.

By Method 1.

From the first equation we find $x=32-\frac{2y}{3}$

And from the second $x=10+\frac{5y}{9}$

Therefore $10+\frac{5y}{9}=32-\frac{2y}{3}$

Or $90+5y=288-6y$

Hence $11y=198$

And $y=18$

The value of y being substituted in either of the values of x, namely, $32-\frac{2y}{3}$ or $10+\frac{5y}{9}$ we find $x=20$.

By Method 2.

Having found from the first given equation $x=32-\frac{2y}{3}$, let this value of x be substituted in the second, thus we have

$$\frac{1}{5}\left(32-\frac{2y}{3}\right)-\frac{y}{9}=2$$

Or $\frac{32}{5}-\frac{2y}{15}-\frac{y}{9}=2$

Hence $198=11y$

And $18=y$

The

The value of y being now ſubſtituted in either of the given equations, we thence find $x=20$ as before.

By Method 3.

The denominators of the two given equations being taken away by rule 3. of laſt ſection, we have

$$3x+2y=96$$
$$9x-5y=90$$

From three times the firſt of theſe equations, or $9x+6y=288$, let the ſecond be ſubtracted, and there remains

$$11y=198$$
And hence $y=18$

The value of y being now ſubſtituted in either of the equations $3x+2y=96$, $9x-5y=90$, we readily find $x=20$.

129. Having now ſhewn in what manner the different methods of exterminating the unknown quantities may be applied, we ſhall, in the remaining examples of this ſection, chiefly make uſe of the laſt method, becauſe it is the moſt eaſy and expeditious in practice.

Ex. 2. Given $\left\{\begin{array}{l}\frac{x}{2}-12=\frac{y}{4}+8\\ \frac{x+y}{5}+\frac{x}{3}-8=\frac{2y-x}{4}+27\end{array}\right\}$

It is required to determine x and y.

From the 1ſt equation we have $4x-96=2y+64$.
And from the ſecond, $12x+12y+20x-480=30y-15x+1620$.
Theſe two equations, when abridged, become

$$4x-2y=160$$
$$47x-18y=2100$$

To exterminate y; from this laſt equation let 9 times the one preceding it be ſubtracted.

Thus we find $11x=660$
And $x=60$
And becauſe $2y=4x-160=80$
Therefore $y=40$.

Ex. 3. Given $\left\{\begin{array}{l}ax+by=c\\ dx+fy=g\end{array}\right\}$ To determine x and y.

To exterminate y, let the firſt equation be multiplied by f, and the ſecond by b, and we have

$$afx+bfy=cf$$
$$bdx+bfy=bg$$

Taking now the difference between theſe equations we find

$$afx-bdx=cf-bg$$
Or $(af-bd)x=cf-bg$
And therefore $x=\frac{cf-bg}{af-bd}$.

In the ſame manner may y be determined, by multiplying the firſt of the given equations by d, and the ſecond by a; for we find

$$adx+bdy=cd$$
$$adx+afy=ag$$

and taking the difference as before, we get

$$bdy-afy=cd-ag$$
And therefore $y=\frac{cd-ag}{bd-af}$.

This laſt example may be conſidered as a general ſolution of the following problem. Two equations expreſſing the relation between the firſt powers of two unknown quantities being given, to determine thoſe quantities. For whatever be the number of terms in each equation, it will readily appear, as in example 2d, that by proper reduction, they may be brought to the ſame form as thoſe given in the 3d example.

130. Let us next conſider ſuch equations as involve three unknown quantities.

Ex. 4. Given $\left\{\begin{array}{l}x+y+z=29\\ x+2y+3z=62\\ \frac{x}{2}+\frac{y}{3}+\frac{z}{4}=10\end{array}\right\}$ To find x, y, and z.

We ſhall in this example proceed according to the rules of the firſt method for exterminating the unknown quantities.

From the firſt equation $x=29-y-z$
From the ſecond $x=62-2y-3z$
From the third $x=20-\frac{2y}{3}-\frac{z}{2}$.

Let theſe values of x be put equal to each other, thus we get the two following equations,

$$29-y-z=62-2y-3z$$
$$29-y-z=20-\frac{2y}{3}-\frac{z}{2}.$$

Again, from theſe two equations, by tranſpoſition, &c. we find

$$y=33-2z$$
$$y=27-\frac{3z}{2}.$$

Therefore $33-2z=27-\frac{3z}{2}$.

And hence, by reduction, $z=12$
Whence alſo $y=33-2z=9$
And $x=29-y-z=8$.

Ex. 5. Given $\left\{\begin{array}{l}\frac{x}{2}+\frac{y}{3}+\frac{z}{4}=62\\ \frac{x}{3}+\frac{y}{4}+\frac{z}{5}=47\\ \frac{x}{4}+\frac{y}{5}+\frac{z}{6}=38\end{array}\right\}$ To find x, y, and z.

Here the given equations, when cleared from fractions, become

$$12x+8y+6z=1488$$
$$20x+15y+12z=2820$$
$$30x+24y+20z=4560$$

To exterminate z by the third method, let the firſt equation be multiplied by 10, the ſecond by 5, and the third by 3, the reſults will be theſe:

$$120x+80y+60z=14880$$
$$100x+75y+60z=14100$$
$$90x+72y+60z=13680$$

Let

Reduction of Equations.

Let the second equation be now subtracted from the first, and the third from the second, and we have

$$20x+5y=780$$
$$10x+3y=420$$

Next to exterminate y, let the first of these equations be multiplied by 3, and the second by 5, hence

$$60x+15y=2340$$
$$50x+15y=2100$$

Subtracting now the latter equation from the former,

$$10x=240$$

Hence $x=24$

Therefore $y=\frac{420-10x}{3}=60$

And $z=\frac{1448-12x-8y}{6}=120.$

131. From the preceding examples, it is manifest in what manner any number of unknown quantities may be determined, by an equal number of equations, which contain only the first power of those quantities, in the numerators of the terms. Such are the following

$$ax+by+cz=n$$
$$dx+ey+fz=p$$
$$gx+hy+kz=q$$

where a, b, c, &c. represent known, and x, y. z, unknown quantities; and in every case of this kind, the unknown quantities may be directly found, for they will be always expressed by whole numbers, or rational fractions, provided that the known quantities a, b, c, &c. are also rational.

132. We shall now add a few examples, in which the equations that result from the extermination of an unknown quantity arise to some of the higher degrees; and therefore their final solution must be referred to the sections which treat of those degrees.

Ex. 6. Let $x-y=2$, and $xy+5x-6y=120$; it is required to exterminate x.

From the first equation $x=y+2$; which value being substituted in the other equation according to the second general method (§ 126.) it becomes

$$(y+2)y+5(y+2)-6y=120$$
that is $y^2+2y+5y+10-6y=120$

therefore the equation required is $y^2+y=110$.

Ex. 7. There is given $x+y=a$; and $x^2+y^2=b$ to exterminate x.

From the first equation $x=a-y$, and $x^2=(a-y)^2$. And from the second $x^2=b-y^2$.

Therefore $(a-y)^2=b-y^2$
That is $a^2-2ay+y^2=b-y^2$.

Hence $2y^2-2ay=b-a^2$; an equation involving only y.

Ex. 8. Given $\left\{\begin{matrix} axy+bx+cy=d \\ fxy+gx+hy=k \end{matrix}\right\}$ To exterminate y.

From the first equation we find $y=\frac{d-bx}{ax+c}$

And from the second $y=\frac{k-gx}{fx+h}$

Therefore $\frac{d-bx}{ax+c}=\frac{k-gx}{fx+h}$, an equation in which the unknown quantity y is not found. Simple Equation

Ex. 9. Given $\left\{\begin{matrix} y^2-3xy+ay=x^2 \\ y^2+2ax-by=4x^2-b^2 \end{matrix}\right\}$ To exterminate y.

As the coefficient of y^2 is unity in both equations, if their difference be taken, the highest power of y will vanish; but to give a general solution, let the terms of the equations be brought all to one side and made equal to 0, thus,

$$y^2-(3x-a)y \quad x^2=0$$
$$y^2-by+2ax-4x^2+b^2=0$$

Let us in the first equation put $1=A$, $-(3x-a)=B$, $-x^2=C$; and in the second, $1=D$, $-b=E$, $2ax-4x^2+b^2=F$, and the two equations become

$$Ay^2+By+C=0$$
$$Dy^2+Ey+F=0$$

To exterminate y^2, let the first equation be multiplied by D, and the second by A, and we have

$$ADy^2+BDy+CD=0$$
$$ADy^2+AEy+AF=0$$

Therefore, taking the difference of these equations,

$$(BD-AE)y+CD-AF=0$$

And $y=\frac{AF-CD}{BD-AE}$

Again, to find another value of y, multiply the first equation by F, and the second by C, then

$$AFy^2+BFy+CF=0$$
$$CDy^2+CEy+CF=0$$

Therefore, subtracting as before, we get

$$(AF-CD)y^2+(BF-CE)y=0,$$

And dividing by $y(AF-CD)y+BF-CE=0$,

Therefore, $y=\frac{CE-BF}{AF-CD}$.

Let this value of y be put equal to the former value, thus we have $\frac{AF-CD}{BD-AE}=\frac{CE-BF}{AF-CD}$

And therefore $(AF-CD)^2=(BD-AE)(CE-BF)$.

Now as y does not enter this equation, if we restore the values of A, B, C, &c. we have the following equation which involves only x, and known quantities. $(b^2+2ax-3x^2)^2=(a+b-3x)(bx^2-(a-3x)(2ax-4x^3+b^2))$; this equation when properly reduced will be of the fourth order, and therefore its final resolution belongs not to this place.

Sect. VIII. *Questions producing Simple Equations.*

133. When a problem is proposed to be resolved by the algebraic method of analysis, its true meaning ought in the first place to be perfectly understood, so that, if necessary, it may be freed from all superfluous and ambiguous expressions; and its conditions exhibited in the clearest point of view possible. The several quantities concerned in the problem are next to be denoted by proper symbols, and their relation to one another expressed agreeably to the algebraic notation. Thus

Simple Equations.

Thus we shall obtain a series of equations, which, if the question be properly limited, will enable us to determine all the unknown quantities required by the rules already delivered in the two preceding sections.

134. In reducing the conditions of a problem to equations, the following rule will be of service. Suppose that the quantities to be determined are actually found, and then consider by what operations the truth of the solution may be verified; then, let the same operations be performed upon the quantities, whether known or unknown, and thus all the conditions of the problem will be reduced to a series of equations, such as is required. For example; suppose that it is required to find two numbers, such, that their sum is 20, and the quotient arising from the division of their difference by the lesser 3; then if we denote the greater of the two numbers by x, and the lesser by y, and proceed as if to prove the truth of the solution, we shall have $x+y$ for the sum of the numbers, and $x-y$ for their difference. Now as the former must be equal to 20, and the latter divided by y equal to 3; the first condition of the problem will be expressed by this equation $x+y=20$, and the second by $\frac{x-y}{y}=3$, and from these, the values of x and y may easily be found.

135. When the conditions of a problem have been expressed by equations, or as it were translated from the common language into that of algebra, we must next consider, whether the problem be properly limited; for in some cases, the conditions may be such as to admit of innumerable solutions; and in others, they may involve an absurdity; and thus render the problem altogether impossible.

136. Now by considering the examples of last section, it will readily appear, that to determine any number of unknown quantities, there must be given as many equations as there are unknown quantities. These equations, however, must be such as cannot be derived from each other; and they must not involve any contradiction; for, in the one case, the problem would admit of an unlimited number of answers; and in the other case, it would be impossible. For example, if it were required to determine x and y from these two equations, $2x-3y=13$, $4x-6y=26$; as the latter equation is a consequence of the former (for each term of the one is the half of the corresponding term of the other) it is evident, that innumerable values of x and y might be found to satisfy both equations. Again, if x and y were to be determined from these equations, $x+2y=8$, $3x+6y=26$, it will quickly appear, that it is impossible to find such values of x and y, as will satisfy both equations; for, from the first of them, we find $3x=24-6y$; and from the second, $3x=26-6y$; and therefore $24-6y=26-6y$, or $24=26$, which is absurd; and so also must have been the conditions from which this conclusion is drawn.

137. But there is yet another case in which a problem may be impossible; and that is, when there are more equations than unknown quantities; for it appears, that in this case, by the rules of last section, we would at last find two equations, each involving the same unknown quantity. Now unless these equations happened to agree, the problem would admit of no solution. Upon the whole, therefore, it appears, that a problem is limited, when the conditions afford just as many independent equations as there are unknown quantities to be determined; if there be fewer equations the problem is indeterminate; but if there be more, the problem in general admits of no solution whatever.

Simple Equations.

138. In expressing the conditions of a problem by equations, it will, in general, be convenient to introduce as few symbols of unknown quantities as possible. Therefore, if two quantities be sought and their sum be given, suppose it $=s$, then if the one quantity be represented by x, the other may be denoted by $s-x$. If again their difference be given $=d$, the quantities may be denoted by x, and $d+x$, or by x, and $x-d$. If their product be given $=p$, the quantities are x, and $\frac{p}{x}$; and so on.

139. We shall now apply the preceding observations to some examples, which are so chosen as to admit of being resolved by simple equations.

Ex. 1. What is that number, to which if there be added its half, its third, and its fourth part, the sum will be 50.

Let x denote the number sought. Then its half will be $\frac{x}{2}$, its third $\frac{x}{3}$, and its fourth $\frac{x}{4}$.

Therefore $x+\frac{x}{2}+\frac{x}{3}+\frac{x}{4}=50$.

Hence we find $24x+12x+8x+6x=1200$,

Or $50x=1200$.

Therefore $x=24$.

Thus it appears, that the number sought is 24, which upon trial will be found to answer the conditions of the question.

Ex. 2. A post is $\frac{1}{4}$ of its length in the mud, $\frac{1}{3}$ in the water, and 10 feet above the water, what is its whole length?

Let its length be x feet, then the part in the mud is $\frac{x}{4}$, and that in the water $\frac{x}{3}$; therefore, from the nature of the question,

$$\frac{x}{4}+\frac{x}{3}+10=x.$$

From which equation we find $7x+120=12x$, and $x=24$.

Ex. 3. Two travellers set out at the same time from London and York, whose distance is 150 miles; one of them goes 8 miles a day, and the other 7; in what time will they meet?

Suppose that they meet after x days.

Then the one traveller has gone $8x$ miles, and the other $7x$ miles; now the sum of the distances they travel is, by the question, equal to the distance from London to York.

Therefore $8x+7x=150$

That is $15x=150$, and $x=10$ days.

Ex. 4. A labourer engaged to serve for 40 days, upon these conditions; that for every day he worked he was to receive 2od. but for every day he played, or was absent, he was to forfeit 8d.; now at the end

Simple Equations.

of the time he had to receive 1l. 11s. 8d. It is required to find how many days he worked, and how many days he was idle.

Let x be the number of days he worked.
Then will $40-x$ be the number of days he was idle.
Alſo $20\times x=20x$=the ſum he earned, in pence.
And $8\times(40-x)=320-8x$=the ſum he forfeited.
Now the difference of theſe two was 1l. 11s. 8d. or 380d.

Therefore $20x-(320-8x)=380$,
That is $28x=700$.
Hence $x=25$= the number of days he worked,
And $40-x=15$= the number of days he was idle.

Ex. 5. A market-woman bought a certain number of eggs at 2 a-penny, and as many at 3 a-penny; and ſold them all out again at 5 for 2d.: but, inſtead of getting her own money for them, as ſhe expected, ſhe loſt 4d. what number of eggs did ſhe buy?

Let x be the number of eggs of each ſort;

Then will $\frac{x}{2}$ be the price of the firſt ſort,

And $\frac{x}{3}$=the price of the ſecond ſort.

Now the whole number being $2x$, we have

$5 : 2x :: 2 : \frac{4x}{5}$= price of both ſorts at 5 for 2d.

Therefore $\frac{x}{2}+\frac{x}{3}-\frac{4x}{5}=4$, by the queſtion.
Hence $15x+10x-24x=120$,
And $x=120$, the number of each ſort.

Ex. 6. A bill of 120l. was paid in guineas and moidores: the number of pieces of both ſorts that were uſed was 100; how many were there of each?

Let the number of guineas be x.
Then the number of moidores will be $100-x$.
Alſo the value of the guineas, reckoned in ſhillings, will be $21x$; and that of the moidores $27(100-x)=2700-27x$.
Therefore, by the queſtion, $21x+2700-27x=2400$.
Hence we find $6x=300$, and $x=50$.
So that the number of pieces of each ſort was 50.

Ex. 7. A footman agreed to ſerve his maſter for 8l. a-year, and livery; but was turned away at the end of 7 months, and received only 2l. 13s. 4d. and his livery; what was its value?

Suppoſe x the value of the livery, in pence.
Then his wages for a year were to be $x+1920$ pence.
But for 7 months he received $x+640$ pence.
Now he was paid in proportion to the time he ſerved.

$m \quad m$
Therefore $12 : 7 :: x+1920 : x+640$.
And taking the product of the extremes and means,
$12x+7680=7x+13440$.
Hence $5x=5760$d. and $x=1152$d.=4l. 16s.

Ex. 8. A perſon at play loſt $\frac{1}{4}$ of his money, and then won 3s.; after which he loſt $\frac{1}{3}$ of what he then had, and then won 2s.; laſtly, he loſt $\frac{1}{7}$ of what he then had; and, this done, found he had only 12s. left; what had he at firſt?

Suppoſe he began play with x ſhillings.

Simple Equations.

He loſt $\frac{1}{4}$ of his money, or $\frac{x}{4}$, and had left $x-\frac{x}{4}=\frac{3x}{4}$.

He won 3s. and had then $\frac{3x}{4}+3=\frac{3x+12}{4}$.

He loſt $\frac{1}{3}$ of $\frac{3x+12}{4}$, or $\frac{x+4}{4}$, and had left $\frac{3x+12}{4}-\frac{x+4}{4}=\frac{2x+8}{4}$.

He won 2s. and had then $\frac{2x+8}{4}+2=\frac{2x+16}{4}$.

He loſt $\frac{1}{7}$ of $\frac{2x+16}{4}$ or $\frac{2x+16}{28}$, and had left $\frac{2x+16}{4}-\frac{2x+16}{28}=\frac{12x+96}{28}$.

And becauſe he had now 12s. left, we have this equation $\frac{12x+96}{28}=12$.

Hence $12x=240$, and $x=20$.

Ex. 9. Two tradeſmen, A and B, are employed upon a piece of work; A can perform it alone in 15 hours, and B in 10 hours: in what time will they do it when working together.

Suppoſe that they can do it in x hours, and let the whole work be denoted by 1.

$h \quad h$
Then $15 : x :: 1 : \frac{x}{15}$= the part of the work done by A.

$h \quad h$
And $10 : x :: 1 : \frac{x}{10}$= the part done by B.

Now, by the queſtion, they are to perform the whole work between them;

Therefore, $\frac{x}{15}+\frac{x}{10}=1$.
Hence $25x=150$, and $x=6$ hours.

Ex. 10. The ſum of any two quantities being given $=s$, and their difference $=d$, it is required to find each of the quantities.

Let x denote the greater of the two quantities, and y the leſſer.
Then $x+y=s$, and $x-y=d$.
Taking the ſum of the equations we get $2x=s+d$,
And ſubtracting the ſecond from the firſt, $2y=s-d$;
Therefore $x=\frac{s+d}{2}$, and $y=\frac{s-d}{2}$.

Ex. 11. A gentleman, diſtributing money among ſome poor people, found he wanted 10s. to be able to give each 5s.; therefore he gave only 4s. to each, and had 5s. left. Required the number of ſhillings and poor people.

Let the number of ſhillings be x, and that of the poor people y, then, from the nature of the queſtion, we have theſe two equations,

$5y=x+10 \qquad 4y=x-5$.
From the firſt equation, $x=5y-10$,
And from the ſecond, $x=4y+5$;
Therefore $5y-10=4y+5$.
Hence $y=15$, and $x=4y+5=65$.

Ex. 12.

Ex. 12. A farmer kept a servant for every 40 acres of ground he rented, and on taking a lease of 104 more acres, he engaged 5 additional servants, after which he had a servant for every 36 acres. Required the number of servants and acres.

Suppose that he had at first x servants, and y acres.

From the first condition of the question $x=\frac{y}{40}$,

And from the second $x+5=\frac{y+104}{36}$.

By comparing the values of x, as found from these equations, we have $\frac{y+104}{36}-5=\frac{y}{40}$.

Hene $40y+4160-7200=36y$, so that $4y=3040$.

Therefore $y=760$, and $x=\frac{y}{40}=19$.

Ex. 13. Two persons, A and B, were talking of their ages; says A to B, seven years ago I was just three times as old as you were then, and seven years hence I shall be just twice as old as you will be. What is their present ages?

Let the ages of A and B be x and y respectively. Their ages seven years ago were $x-7$ and $y-7$, and seven years hence they will be $x+7$ and $y+7$.

Therefore by the question

$x-7=3(y-7)$ and $x+7=2(y+7)$.

From the first equation, $x=3y-14$,

And from the second $x=2y+7$.

Therefore $3y-14=2y+7$; hence $y=21$.

And because $x=2y+7$, therefore $x=49$.

Ex. 14. A hare is 50 leaps before a greyhound, and takes 4 leaps to the greyhound's 3, but 2 of the greyhound's leaps are as much as 3 of the hare's. How many leaps must the greyhound take to catch the hare?

In this example there is only one quantity required, it will, however, be convenient to make use of two letters; therefore let x denote the number of leaps of the greyhound, and y those of the hare; then, by considering the proportion between the number of leaps each takes in the same time, we have

$$3:4::x:y, \text{ hence } 3y=4x.$$

Again, by considering the proportion between the number of leaps each must take to run the same distance, we find $x:50+y::2:3$, hence $100+2y=3x$.

From the first equation we find $6y=8x$,

And from the second $6y=9x-300$.

Hence $9x-300=8x$, and $x=300$.

Ex. 15. To divide the number 90 into 4 such parts, that if the first be increased by 2, the second diminished by 2, the third multiplied by 2, and the fourth divided by 2; the sum, difference, product, and quotient, shall be all equal to each other.

In this question there are four quantities to be determined; but instead of introducing several letters, having put x to denote the first of them, we may find an expression for each of the remaining ones, as follows:

Because $x+2=$second quantity-2,

Therefore $x+4=$the second quantity.

And because $x+2=$third $\times 2$,

Therefore $\frac{x+2}{2}=$the third quantity.

And in like manner $2(x+2)=$the fourth quantity.

Now by the question, the sum of all the four$=90$,

Therefore $x+x+4+\frac{x+2}{2}+2(x+2)=90$;

Hence $9x=162$, and $x=18$.

Therefore the numbers required are 18, 22, 10, and 40.

Ex. 16. A and B together can perform a piece of work in 12 hours, A and C in 20, and B and C in 15 hours; in what time will each be able to perform it when working separately?

That we may give a general solution, let us suppose A and B can perform the work in a hours, A and C in b hours, and B and C in c hours. Let x, y, and z, denote the times in which A, B, and C, could perform it respectively, if each wrought alone; and let the whole work be represented by 1.

H H

Then $x:a::1:\frac{a}{x}=$ the part done by A
$y:a::1:\frac{a}{y}=$ the part done by B
} in a hours.

Also $x:b::1:\frac{b}{x}=$ the part done by A
$z:b::1:\frac{b}{z}=$ the part done by C
} in b hours.

And $y:c::1:\frac{c}{y}=$ the part done by B
$z:c::1:\frac{c}{z}=$ the part done by C
} in c hours.

Now by the question we have the three following equations.

$$\frac{a}{x}+\frac{a}{y}=1,\ \frac{b}{x}+\frac{b}{z}=1,\ \frac{c}{y}+\frac{c}{z}=1.$$

Let the first equation be divided by a, the second by b, and the third by c, thus we have

$$\frac{1}{x}+\frac{1}{y}=\frac{1}{a},\ \frac{1}{x}+\frac{1}{z}=\frac{1}{b},\ \frac{1}{y}+\frac{1}{z}=\frac{1}{c}.$$

If these be added together, and their sum divided by 2, we find

$$\frac{1}{x}+\frac{1}{y}+\frac{1}{z}=\frac{1}{2a}+\frac{1}{2b}+\frac{1}{2c}.$$

From this equation let each of the three last be subtracted in its turn; thus we get

$$\frac{1}{z}=-\frac{1}{2a}+\frac{1}{2b}+\frac{1}{2c}=\frac{+ab+ac-bc}{2abc}$$

$$\frac{1}{y}=\frac{1}{2a}-\frac{1}{2b}+\frac{1}{2c}=\frac{abc-ac+bc}{2abc}$$

$$\frac{1}{x}=\frac{1}{2a}+\frac{1}{2b}-\frac{1}{2c}=\frac{-ab+ac+bc}{2abc}.$$

Hence $z=\frac{2abc}{+ab+ac-bc}=\frac{7200}{120}=60$

$$y=\frac{2abc}{+ab-ac+bc}=\frac{7200}{360}=20$$

$$x=\frac{2abc}{-ab+ac+bc}=\frac{7200}{240}=30.$$

Quadratic Equations.

Sect. IX. *Of Quadratic Equations.*

140. We are next to explain the manner of resolving equations of the second degree, or quadratic equations. These involve the second power of the unknown quantity, as has been already observed (§ 113.) and may be divided into two kinds, *pure* and *affected*.

141. I. *Pure* quadratic equations are such as after proper reduction have the square of the unknown quantity in one term, while the remaining terms contain only known quantities. Thus, $x^2=64$, and $ax^2+b=c$ are examples of pure quadratics.

142. II. *Affected* quadratic equations, contain the square of the unknown quantity in one term, and its first or simple power in another, and the remaining terms consist entirely of known quantities. Such are the following, $x^2+3x=28$, $2x^2=33-5x$, $ax^2+bx-c=d$.

143. The manner of resolving a pure quadratic equation is sufficiently evident; if the unknown quantity be made to stand alone on one side, with unity as a coefficient, while the other side consists entirely of known quantities, and if the square root of each side be taken, we shall immediately obtain the value of the simple power of the unknown quantity as already directed by Rule 5th of Sect. VI.

144. In extracting the square root of any quantity, however, it is necessary to observe, that the sign of the root may be either + or —. This is an evident consequence of the rule for the signs in multiplication; for since by that rule any quantity, whether positive or negative, if multiplied by itself, will produce a positive quantity, and therefore the square of $+a$, as well as that of $-a$ is $+a^2$; so on the contrary, the square root of $+a^2$ is to be considered either as $+a$ or as $-a$, and may accordingly be expressed thus $\pm a$.

145. Having remarked that the square of any quantity, whatever be its sign, is always positive; it evidently follows, that no real quantity whatever, when multiplied by itself, can produce a negative quantity; and therefore, if the square root of a negative quantity be required, no such root can be assigned. Hence it also follows, that if a problem requires for its solution the extraction of the square root of a negative quantity, some contradiction must necessarily be involved, either in the conditions of the problem, or in the process of reasoning by which that solution has been obtained.

146. When an affected quadratic equation is to be resolved, it may always, by proper reduction, be brought to one or other of the three following forms.

1. $x^2+px=q$
2. $x^2-px=q$
3. $x^2-px=-q$

But as the manner of resolving each of the three forms is the very same, it will be sufficient if we consider any one of them.

147. Resuming therefore the first equation, or $x^2+px=q$; let us compare the side of it which involves the unknown quantity x with the square of a binomial $x+a$; that is, let us compare x^2+px with $x^2+2ax+a^2=(x+a)^2$; and it will presently appear, that if we suppose $p=2a$, or $\frac{p}{2}=a$, the quantities x^2+px and x^2+2ax will be equal; and as x^2+2ax is rendered a complete square, by adding to it a^2, so also may x^2+px be completed into a square, by adding to it $\frac{p^2}{4}$, which is equal to a^2; therefore, let $\frac{p^2}{4}$ be added to both sides of the equation $x^2+px=q$, and we have

$$x^2+px+\frac{p^2}{4}=\frac{p^2}{4}+q, \text{ or } \left(x+\frac{p}{2}\right)^2=\frac{p^2}{4}+q;$$

and extracting the square root of each side, $x+\frac{p}{2}=\pm\sqrt{\frac{p^2}{4}+q}$; hence $x=-\frac{p}{2}\pm\sqrt{\frac{p^2}{4}+q}$.

148. From these observations we derive the following general rule for resolving adfective quadratic equations.

1. Transpose all the terms involving the unknown quantity to one side, and the known quantities to the other side, and so that the term involving the square of the unknown quantity may be positive.

2. If the square of the unknown quantity be multiplied by a coefficient, let the other terms be divided by it, so that the coefficient of the square of the unknown quantity may be 1.

3. Add to both sides the square of half the coefficient of the unknown quantity itself, and the side of the equation involving the unknown quantity will now be a complete square.

4. Extract the square root of both sides of the equation, by which it becomes simple with respect to the unknown quantity; and by transposition, that quantity may be made to stand alone on one side of the equation, while the other side consists of known quantities; and therefore the equation is resolved.

Note. The square root of the first side of the equation is always equal to the sum, or difference of the unknown quantity, and half the coefficient of the second term. If the sine of that term be +, it is equal to the sum, but if it be —, then it is equal to the difference.

Ex. 1. Given $x^2+2x=35$, to determine x.

Here the coefficient of the second term is 2, therefore, adding the square of its half to each side, we have

$$x^2+2x+1=35+1=36$$

And extracting the square root $x+1=\sqrt{36}=\pm 6$.

Hence $x=\pm 6-1$, that is $x=+5$, or $x=-7$, and either of these numbers will be found to satisfy the equation for $5\times 5+2\times 5=35$, also $-7\times -7+2\times -7=35$.

Ex. 2. Given $\frac{x^2}{6}-12=x$ to find x.

This equation, when reduced, becomes $x^2-6x=72$.

And by completing the square, $x^2-6x+9=72+9=81$.

Hence, by extracting the square root, $x-3=\pm 9$.

And $x=\pm 9+3$, therefore $x=+12$, or $x=-6$, and upon trial we find that each of these values satisfies

Quadratic Equations.

fies the original equation, for $\frac{12\times12}{6}-12=12$, alſo $-\frac{6\times-6}{6}-12=-6$.

Ex. 3. Given $x^2+28=11x$, to find x.

Then $x^2-11x=-28$.

And, completing the ſquare, $x^2-11x+\frac{121}{4}=\frac{121}{4}-28=\frac{9}{4}$.

Therefore, by extracting the root, $x-\frac{11}{2}=\pm\frac{3}{2}$.

Hence $x=\frac{11}{2}\pm\frac{3}{2}$, that is, $x=+7$, or $x=+4$.

In the firſt two examples, we found one poſitive value for x in each, and alſo one negative value; but in this example both the values of x are poſitive, and, upon trial, each of them is found to ſatisfy the equation; for $7\times7+28=11\times7$, alſo $4\times4+28=11\times4$.

149. As at firſt ſight it appears remarkable, that in every quadratic equation the unknown quantity admits always of two diſtinct values, or roots, it will be proper to conſider a little farther the circumſtances upon which this peculiarity depends. This is the more neceſſary, as the property of the unknown quantity admitting of ſeveral values is not peculiar to quadratics, but takes place alſo in equations of the higher degrees, where the cauſe of the ambiguity requires an explanation ſomewhat different from that which we have already given in the preſent caſe.

150. Let us again conſider the equation $x^2+2x=35$, which forms the firſt of the three preceding examples; by tranſpoſing all the terms to one ſide, the ſame equation may be alſo expreſſed thus, $x^2+2x-35=0$; ſo that we ſhall have determined x, when we have found ſuch a number, as when ſubſtituted for it in the quantity $x^2+2x-35$, will render the reſult equal to 0. But $x^2+2x-35$ is the product of theſe two factors $x-5$, and $x+7$, as may be proved by actual multiplication; therefore, to find x, we have $(x-5)(x+7)=0$; and as a product can only become $=0$, when one of its factors is reduced to 0, it follows, that either of the two factors $x-5$ and $x+7$ may be aſſumed $=0$; if $x-5=0$, then $x=5$; but if $x+7=0$, then $x=-7$, ſo that the two values of x, or two roots of the equation $x^2+2x=35$ are $+5$ and -7, as we have already found in a different manner.

151. What has been juſt now ſhewn in a particular caſe is true of any quadratic equation whatever, that is, if $x^2+px=q$, or by bringing all the terms to one ſide, $x^2+px-q=0$, it is always poſſible to find two factors $x+a$, and $x-b$, ſuch, that $x^2+px-q=(x+a)(x-b)$, where a and b are known quantities, which depend only upon p and q the given numbers in the equation, and ſince that to have $(x-a)(x+b)=0$, we may either aſſume $x-a=0$, or $x+b=0$, it evidently follows, that the conditions of the equation $x^2+px-q=0$, or $x^2+px=q$ are alike ſatisfied, by taking $x=+a$ or $x=-b$.

From theſe conſiderations, it follows, that x can have only two values in a quadratic equation; for if it could be ſuppoſed to have three or more values, then it would be poſſible to reſolve x^2+px-q into as many factors; $x-c$, $x-d$, &c.; but the product of more than two factors muſt neceſſarily contain the third or higher powers of x; and as x^2+px-q contains no higher power than the ſecond; therefore no ſuch reſolution can take place. Quadratic Equations.

152. Since it appears that x^2+px-q may be conſidered as the product of two factors $x-a$, and $x+b$, let us examine the nature of theſe factors; accordingly, taking their product by actual multiplication, we find it $x^2+(b-a)x-ab$; and ſince this quantity muſt be equal to x^2+px-q, it follows, that $b-a=p$ and $ab=q$, or, changing the ſigns of the terms of both equations, $a-b=-p$, $-ab=-q$. Now if we conſider that $+a$, and $-b$, are the roots of the equation $x^2+px=q$; it is evident that $a-b$ is the ſum of the roots, and $-ab$ their product. So that from the equations $a-b=-p$, and $-ab=q$, we derive the following propoſition relating to the roots of any quadratic equation. The ſum of the roots of any quadratic equation $x^2+px=q$ is equal to $-p$, that is, to the coefficient of the ſecond term, having its ſign changed; and their product is equal to $-q$, or to the latter ſide of the equation, having its ſign alſo changed.

153. This propoſition enables us to reſolve ſeveral important queſtions concerning the roots of a quadratic equation, without actually reſolving that equation. Thus we learn from it, that if q, the term which does not involve the unknown quantity, (called ſometimes the abſolute number) be poſitive, the equation has one of its roots poſitive, and the other negative; but if that term be negative, the roots are either both poſitive or both negative. It alſo follows, that in the former caſe the root which is denoted by the leaſt number will have the ſame ſign with the ſecond term, and in the latter caſe, the common ſign of the roots will be the contrary to that of the ſecond term.

154. From this property of the roots we may alſo derive a general ſolution to any quadratic equation $x^2+px=q$; for we have only to determine two quantities whoſe ſum is $-p$, and product $-q$, and theſe quantities ſhall be the two values of x, or the two roots of the equation.

Without conſidering the ſigns of the roots, let us call them v and z, then

$$v+z=-p, \text{ and } vz=-q.$$

From the ſquare of each ſide of the firſt equation let four times the ſecond be ſubtracted, and we have

$$v^2-2vz+z^2=p^2+4q, \text{ or } (v-z)^2=p^2+4q,$$

therefore, by extracting the ſquare root, $v-z=\pm\sqrt{p^2+4q}$; from this equation, and from the equation $v+z=p$, we readily obtain $v=\frac{-p\pm\sqrt{p^2+4q}}{2}$ $z=\frac{-p\mp\sqrt{p^2+4q}}{2}$, that is, if $v=\frac{-p+\sqrt{p^2+4q}}{2}$, then $z=-\frac{p-\sqrt{p^2+4q}}{2}$, and if $v=-\frac{p-\sqrt{p^2+4q}}{2}$, then $z=\frac{-p+\sqrt{p^2+4q}}{2}$.

But the value of v, upon the one ſuppoſition, is the ſame as the value of z upon the other ſuppoſition, and *vice verſa*; therefore, in reality, the only two diſtinct values

Quadratic Equations.

values of the roots v and z are $\frac{-p+\sqrt{p^2+4q}}{2}$ and $\frac{-p-\sqrt{p^2+4q}}{2}$, which agrees with the concluſion we have already found, (§ 148).

155. It appears from what has been already ſhewn, that the roots of a quadratic equation $x^2+px=q$ always involve the quantity $\sqrt{p^2+4q}$; hence it follows, that p^2+4q muſt be a poſitive quantity; for if it were negative, as the ſquare root of ſuch a quantity could not be found, the value of x could not poſſibly be obtained. If for example the value of x were required from this equation $x^2+13=4x$, or $x^2-4x=-13$, we ſhould find $x=2\pm\sqrt{-9}$; and as this expreſſion for the roots requires us to extract the ſquare root of -9, the equation from which it is derived muſt neceſſarily have involved ſome contradiction. It is not difficult to ſee wherein the abſurdity conſiſts, for ſince in this caſe $p=-4$, and $q=-13$, the roots of the equation ought to be both poſitive (§ 154), and ſuch that their ſum $=4$, while their product $=13$, (§ 153), which is impoſſible.

156. Although imaginary quantities ſerve no other purpoſe in the reſolution of quadratic equations, than to ſhew that a particular problem cannot be reſolved, by reaſon of ſome want of conſiſtency in its data; yet they are not upon that account to be altogether rejected. By introducing them into mathematical inveſtigations, many curious theories may be explained, and problems reſolved in a more conciſe way, than can be done without the uſe of ſuch quantities. This is particularly the caſe with reſpect to the higher parts of the mathematics.

157. The method which has been applied to the reſolution of quadratic equations, properly ſo called, namely, ſuch as are of this form $x^2+px=q$, will alſo apply to all equations of this form,

$$x^{2n}+px^n=q.$$

Where the unknown quantity x is found only in two terms, and ſuch, that its exponent in the one term is double that in the other; for let us aſſume $x^n=y$, then $x^{2n}=y^2$, and therefore the equation

$$+x^{2n}+px^n=q \text{ becomes}$$
$$y^2+py=q,$$

a quadratic equation, from which y may be found, and thence x, by conſidering that $x=\sqrt[n]{y}$.

158. Before proceeding to give examples of queſtions producing quadratic equations, it is proper to obſerve, that although every ſuch equation admits of two roots; yet it will frequently happen, that only one of them can be of uſe, the other being excluded by the conditions of the queſtion. This will often be the caſe with reſpect to the negative root; as for example, when the unknown quantity denotes a number of men, a number of days, &c. And hence, in reckoning the caſes of quadratic equations, it is common to neglect this one $x^2+px=-q$, where the roots are both negative; for an equation of this form can only be derived from a queſtion which has ſome fault in its enunciation, and which, by a proper change in its form, will produce another equation having both its roots poſitive.

159. The remainder of this ſection ſhall be employed in ſolving ſome queſtions which produce quadratic equations.

Quadratic Equation

Ex. 1. It is required to divide the number 10 into two ſuch parts, that the ſum of their ſquares may be 58.

Let x be the one number.

Then, ſince their ſum is 10, we have $10-x$ for the other.

And by the queſtion $x^2+(10-x)^2=58$.

That is $x^2+100-20x+x^2=58$

Or $2x^2-20x=58-100=-42$

Hence $x^2-10x=-21$

And completing the ſquare $x^2-10x+25=25-21=4$

Hence, by extracting the root, $x-5=\pm\sqrt{4}=\pm 2$.

And $x=5\pm 2=7$

That is $x=7$ or $x=3$.

If we take the greateſt value of x, viz. 7, then the other number $10-x$ will be 3; and if we take the leaſt value of x, viz. 3, then the other number is 7. Thus it appears, that the greateſt value of the one number correſponds to the leaſt value of the other; and indeed this muſt neceſſarily be the caſe, ſeeing that both numbers are alike concerned in the queſtion. Hence upon the whole, the only numbers that will anſwer the conditions of the queſtion are 7 and 3.

Ex. 2. What two numbers are thoſe whoſe product is 28; and ſuch, that twice the greater, together with thrice the leſſer is equal to 26.

Let x be the greateſt and y the leaſt number, then, from the nature of the queſtion, we have theſe two equations

$$xy=28,\ 2x+3y=26.$$

From the firſt equation we have $y=\frac{28}{x}$.

And from the ſecond $y=\frac{26-2x}{3}$.

Hence, $\frac{26-2x}{3}=\frac{28}{x}$.

And, reducing, $26x-2x^2=84$

Or $2x^2-26x=-84$

Hence $x^2-13x=-42$

And comp. the ſq. $x^2-13x+\frac{169}{4}=\frac{169}{4}-42=\frac{9}{4}$

Hence, by extracting the root $x-\frac{13}{2}=\pm\sqrt{\frac{9}{4}}=\pm\frac{3}{2}$

Therefore $x=\frac{13}{2}\pm\frac{3}{2}$

That is $x=7$, or $x=6$.

And ſince $y=\frac{28}{x}$, we have $y=4$, or $y=\frac{14}{3}$.

Thus we have obtained two ſets of numbers, which fulfil the conditions required, viz.

$$x=7,\ y=4 \ :\ \text{Or } x=6,\ y=\tfrac{14}{3}.$$

And beſides theſe, there can be no other numbers.

Ex. 3. A company dining together at an inn, find their bill amount to 175 ſhillings; two of them were not allowed to pay, and the reſt found, that their ſhares amounted to 10 ſhillings a-man more than if they had all paid. How many were in company?

Suppoſe their number to be x.

Then, if all had paid, the ſhare of each would have been $\frac{175}{x}$.

But,

Quadratic Equations.

But, because only $x-2$ paid, the share of each was $\frac{175}{x-2}$.

Therefore, by the question, $\frac{175}{x-2}-\frac{175}{x}=10$.

And by proper reduction $175x-175x+350=10x^2-20$.

That is $10x^2-20x=350$

Or $x^2-2x=35$

And comp. the sq. $x^2-2x+1=35+1=36$

Hence, by extracting the root, $x^2+1=\pm 6$.

Therefore, $x=+5$, or $x=-7$. But from the nature of the question, the negative root can be of no use; therefore $x=6$.

Ex. 4. A mercer sold a piece of cloth for 24l. and gained as much per cent. as the cloth cost him; what was the price of the cloth?

Suppose that it cost x pounds,

Then the gain was $24-x$,

And by the question $100 : x :: x : 24-x$,

Therefore, taking the product of the extremes and means, $2400-100x=x^2$,

Or $x^2+100x=2400$,

And comp. the sq. $x^2+100x+2500=4900$,

Hence, taking the root, $x+50=\pm 70$,

And $x=+20$ or -120.

Here, as in the last question, the negative root cannot apply; therefore $x=20$ pounds, the price required.

Ex. 5. A grazier bought as many sheep as cost him 60l. out of which he reserved 15, and sold the remainder for 54l. and gained 2s. each upon them. How many sheep did he buy, and what did each cost him?

Suppose that he bought x sheep,

Then each would cost him $\frac{1200}{x}$. shillings.

Therefore, after reserving 15, he sold each of the remaining $x-15$ for $\frac{1200}{x}+2$ shillings.

Hence, he would receive for them $(x-15)(\frac{1200}{x}+2)$ shillings. And, because 54l.$=1080$ shillings, we have by the question $(x-15)(\frac{1200}{x}+2)=1080$.

Which by proper reduction becomes $x^2+45x=9000$.

Or, completing the square, $x^2+45x+\frac{2025}{4}=\frac{38025}{4}$.

Therefore, extracting the root, &c. $x=\pm\frac{195}{2}-\frac{45}{2}$.

And taking the positive root, $x=75$, the number of sheep; and consequently $\frac{1200}{75}=16$ shillings the price of each.

Ex. 6. What number is that, which, when divided by the product of its two digits, the quotient is 3; and if 18 be added to it, the digits are inverted. Let x and y denote the digits; then the number itself will be expressed by $10x+y$; and that number, in which the digits are inverted, by $10y+x$. Thus the conditions of the problem will be expressed by these two equations,

$$\frac{10x+y}{xy}=3,\quad 10x+y+18=10y+x.$$

From the first equation we have $y=\frac{10x}{3x-1}$

Quadratic Equations.

And from the second $y=x+2$

Therefore $x+2=\frac{10x}{3x-1}$

And $3x^2+5x-2=10x$

Hence $x^2-\frac{5}{3}x=\frac{2}{3}$

And comp. sq. $x^2-\frac{5}{3}x+\frac{25}{36}=\frac{24}{36}+\frac{25}{36}=\frac{49}{36}$

Therefore, taking the root $x-\frac{5}{6}=\pm\frac{7}{6}$

So that $x=2$, or $x=-\frac{1}{3}$

Here it is evident that the negative root is useless; hence we have $y=x+2=4$, and 24 for the number required.

Ex. 7. It is required to find two numbers whose product is 100; and the difference of their square roots 3.

Let x be the one number; then $\frac{100}{x}$ must denote the other.

Now by the question $\frac{10}{\sqrt{x}}-\sqrt{x}=3$

Hence we have $10-x=3\sqrt{x}=3x^{\frac{1}{2}}$

Or $x+3x^{\frac{1}{2}}=10$

And comp. the sq. $x+3x^{\frac{1}{2}}+\frac{9}{4}=10+\frac{9}{4}=\frac{49}{4}$

and taking the root $x^{\frac{1}{2}}+\frac{3}{2}=\pm\frac{7}{2}$

So that $x^{\frac{1}{2}}=+5$ or $x^{\frac{1}{2}}=-2$

and therefore $x=25$ or $x=4$.

If $x=4$, the other number is $\frac{100}{4}=25$, and if $x=25$, then the other number is 4; so that, in either case, the two numbers which answer the conditions of the question are 4 and 25.

Ex. 8. It is required to find two numbers, of which the product shall be 6, and the sum of their cubes 35.

Let v be the one number, then $\frac{6}{x}$ will be the other.

Therefore, by the question, $x^3+\frac{216}{x^3}=35$

Hence $x^6+216=35x^3$

Or $x^6-35x^3=-216$

This equation, by putting $x^3=y$, becomes

$y^2-35y=-216$

Hence we find $y=27$, or $y=8$.

And since $x^3=y$; therefore $x=3$, or $x=2$.

If $x=3$, then the other number is 2, and if $x=2$, the other number is 3; so that 2 and 3 are the numbers required.

In general, if it be required to find two numbers, which are exactly alike concerned in a question that produces a quadratic equation; the two numbers sought will be the roots of that equation. A similar observation applies to any number of quantities which require for the determination the resolution of an equation of any degree whatever.

Sect. X. *Of Equations in General.*

165. Before we proceed to the resolution of cubic, and the higher orders of equations, it will be proper to

Equations in general.

to explain ſome general properties, which belong to equations of every degree; and alſo certain operations, which muſt frequently be performed upon equations, before they be fitted for a final ſolution.

161. In treating of equations in general, we ſhall ſuppoſe all the terms tranſpoſed to one ſide, and put equal to 0; this we have already done in explaining the nature of quadratics, and in like manner an equation of the fourth degree will ſtand thus:

$$x^4+px^3+qx^2+rx+s=0,$$

where x denotes an unknown quantity, and p, q, r, s, known quantities, either poſitive or negative. In this equation the coefficient of the higheſt power of x is unity, but if it had been any other quantity, that quantity might have been taken away, and the equation reduced to the above form, by rules already explained, Sect. VI.

162. The terms of an equation being thus arranged, if ſuch a quantity be found, as when ſubſtituted for x, will render both ſides $=0$, and therefore ſatisfy the equation, that quantity whether it be poſitive or negative, or even imaginary, is to be conſidered as a root of the equation. But we have ſeen that every quadratic equation has always two roots, real or imaginary, we may therefore ſuppoſe that a ſimilar diverſity of roots will take place in all equations of a higher degree; and this ſuppoſition we ſhall preſently find to be well founded, by means of the following propoſition which is of great importance in the theory of equations.

If a root of any equation, as $x^4+px^3+qx+r=0$, be repreſented by a, the firſt ſide of that equation is diviſible by $x-a$.

For ſince $x^4+px^3+qx^2+rx+s=0$

And alſo $a^4+pa^3+qa+ra+s=0$

Therefore, by ſubtraction, $x^4-a^4+p(x^3-a^3)+q(x^2-a^2)+r(x-a)=0$.

163. But any quantity of this form x^n-a^n, where n denotes a whole poſitive number, is equal to

$$(x-a)(x^{n-1}+ax^{n-2}+a^2x^{n-3}+\ldots+a^{n-2}x+a^{n-1}),$$

as may be eaſily proved by multiplication; therefore, putting $n=4$, 3 and 2 ſucceſſively, we have

$$\begin{aligned} x^4-a^4&=(x-a)(x^3+ax^2+a^2x+a^3)\\ x^3-a^3&=(x-a)(x^2+ax+a^2)\\ x^2-a^2&=(x-a)(x+a)\\ x-a&=x-a \end{aligned}$$

and by ſubſtitution, and collecting into one term the coefficients of the like powers of x, the equation

$x^4-a^4+p(x^3-a^3)+q(x^2-a^2)+r(x-a)=0$ becomes $(x-a)[x^3+(a+p)x^2+(a^2+pa+q)x+a^3+pa^2+qa+r]=0$, ſo that putting $p'=a+p$, $q'=a^2+pa+q$, $r'=a^3+pa+qa+r$, we have

$$x^4+px^3+qx^2+rx+s=(x-a)(x^3+p'x^2+q'x+r')$$

Hence, if the propoſed equation $x^4+px^3+qx^2+rx-s$ be divided by $x-a$, the quotient will be $x^3+p'x^2+q'x+r'$, an integer quantity, and ſince the ſame mode of reaſoning will apply to any equation whatever; the truth of the propoſition is evident.

164. We have found that $(x-a)(x^3+p'x^2+q'x+r')=0$, and as a product becomes $=0$, when any one of its factors $=0$, therefore, the equation will have its conditions fulfilled, not only when $x-a=0$, but alſo when $x^3+p'x^2+q'x+r'=0$.

Equation in genera

Let us now ſuppoſe that b is a root of this equation, then by reaſoning exactly as in laſt article, and putting $p''=b+p'$, $q''=b^2+p'b+q'$, we ſhall have

$$x^3+p'x^2+q'x+r'=(x-b)(x^2+p''x+q'')=0$$

and therefore

$$x^4+px^3+qx^2+rx+s=(x-a)(x-b)(x^2+p''x+q'').$$

165. By proceeding in the ſame manner with the quadratic equation $x^2+p''x+q''=0$, we ſhall find that if c denote one of its roots, then

$$x^2+p''x+q''=(x-c)(x+c+p'')$$

So that if we put $d'=-(c+p'')$, we at laſt find $x^4+px^3+qx^2+rx+s=(x-a)(x-b)(x-c)(x-d)$; and ſince each of the factors $x-a$, $x-b$, $x-c$, $x-d$ may be aſſumed $=0$; it follows, that there are four different values of x, which will render the equation $x^4+px^3+qx^2+rx+s=0$, namely, $x=a$, $x=b$, $x=c$, $x=d$.

166. The mode of reaſoning which has been juſt now employed in a particular caſe, may be applied to an equation of any order whatever; we may therefore conclude, that every equation may be conſidered as the product of as many ſimple factors, as the number denoting its order contains unity; and therefore, that the number of roots in any equation is preciſely equal to the exponent of the higheſt power of the unknown quantity contained in that equation.

167. By conſidering equations of all degrees as formed from the product of factors $x-a$, $x-b$, $x-c$, &c. we diſcover a number of curious relations, which ſubſiſt between the roots of any equation whatever, and its coefficients. Thus, if we limit the number of factors to four, and ſuppoſe that a, b, c, d, are the roots of this equation of the fourth degree

$$x^4+px^3+qx^2+rx+s=0$$

we ſhall alſo have $(x-a)(x-b)(x-c)(x-d)=0$; and therefore, by actual multiplication

$$\left.\begin{matrix} x^4 \\ -a \\ -b \\ -c \\ -d \end{matrix}\right\} \left.\begin{matrix} x^3 \\ +ab \\ +ac \\ +ad \\ +bc \\ +bd \\ +cd \end{matrix}\right\} \left.\begin{matrix} x^2 \\ -abc \\ -abd \\ -acd \\ -bcd \end{matrix}\right\} x+abcd=0.$$

168. If we compare together the coefficients of the ſame powers of x, we find the following ſeries of equations:

$$\begin{aligned} a+b+c+d&=-p\\ ab+ac+ad+bc+bd+cd&=+q\\ abc+abd+acd+bcd&=-r\\ abcd&=+s \end{aligned}$$

and as a ſimilar ſeries of equations will be obtained for every equation whatever, we hence derive the following propoſitions, which are of the greateſt importance in the theory of equations.

1. The coefficient of the ſecond term of any equation taken with a contrary ſign, is equal to the ſum of all the roots.

2. The coefficient of the third term is equal to the ſum of the products of the roots multiplied together two and two.

3. The coefficient of the fourth term, taken with a contrary

Equations in general.

contrary ſign, is equal to the ſum of the roots multiplied together three and three, and ſo on for the remaining coefficients, till we come to the laſt term of the equation, which is equal to the product of all the roots, having their ſigns changed.

169. Inſtead of ſuppoſing an equation to be produced by multiplying together ſimple equations, we may conſider it as formed by the product of equations of any degree, provided that the ſum of their dimenſions is equal to that of the propoſed equation. Thus, an equation of the fourth degree may be formed either from a ſimple and cubic equation, or from two quadratic equations.

170. If n denote the degree of an equation, we have ſhewn, that by conſidering it as the product of ſimple factors, that equation will have n diviſors of the firſt degree; but if we ſuppoſe the ſimple factors to be combined two and two, they will form quantities of the ſecond degree, which are alſo factors of the equation; and ſince there may be formed $\frac{n(n-1)}{1.2}$ ſuch combinations, any equation will admit of $\frac{n(n-1)}{1.2}$ diviſors of the ſecond degree.

171. For example, the equation $x^4+px^3+qx^2+rx+s=0$, which we have conſidered as equal to

$$(x-a)(x-b)(x-c)(x-d)=0,$$

may be formed by the product of two factors of the ſecond degree, in theſe ſix different ways.

By the product of	$(x-a)(x-b)$ and	$(x-c)(x-d)$
	$(x-a)(x-c)$	$(x-b)(x-d)$
	$(x-a)(x-d)$	$(x-b)(x-c)$
	$(x-b)(x-c)$	$(x-a)(x-d)$
	$(x-b)(x-d)$	$(x-a)(x-c)$
	$(x-c)(x-d)$	$(x-a)(x-b)$

Thus an equation of the fourth degree may have $\frac{4\times 3}{1\times 2}=6$ quadratic diviſors.

172. By combining the ſimple factors three and three, we ſhall have diviſors of the third degree, of which the number for an equation of the nth order will be $\frac{n(n-1)(n-2)}{1.2.3}$; and ſo on.

173. When the roots of an equation are all poſitive, its ſimple factors will have this form $x-a$, $x-b$, $x-c$, &c. and if for the ſake of brevity we take only theſe three, the cubic equation which reſults from their product will have this form

$$x^3-px^2+qx-r=0$$
$$\text{where } p=a+b+c,\ q=ab+ac+bc,\ r=abc,$$

and here it appears that the ſigns of the terms are $+$ and $-$ alternately.

Hence we infer, that when the roots of an equation are all poſitive, the ſigns of its terms are poſitive and negative alternately.

174. If again the roots of the equation be all negative, and therefore its factors $x+a$, $x+b$, $x+c$, then p, q, and r being as before, the reſulting equation will ſtand thus:

$$x^3+px^2+qx+r=0.$$

And hence we conclude, that when the roots are all negative, there is no change whatever in the ſigns.

175. In general, if the roots of an equation be all real, that equation will have as many poſitive roots as there are changes of the ſigns from $+$ to $-$, or from $-$ to $+$; and the remaining roots are negative. This rule, however, does not apply when the equation has imaginary roots, unleſs ſuch roots be conſidered as either poſitive or negative.

Equations in general.

176. That the rule is true when applied to quadratic equations will be evident from Sect. IX. With reſpect to cubic equations, the rule alſo applies when the roots are either all poſitive, or all negative, as we have juſt now ſhewn.

When a cubic equation has one poſitive root, and the other two negative, its factors will be $x-a$, $x+b$, $x+c$, and the equation itſelf

$$\left.\begin{matrix}x^3-a\\+b\\+c\end{matrix}\right\}\left.\begin{matrix}-ab\\-ac\\+bc\end{matrix}\right\}x-abc=0.$$

Here there muſt always be one change of the ſigns, ſince the firſt term is poſitive, and the laſt negative; and there can be no more than one; for if the ſecond term is negative, or $b+c$ leſs than a, then $(b+c)^2$ will be leſs than $(b+c)a$; but $(b+c)^2$ is always greater than bc, therefore bc will be much leſs than $(b+c)a$ or $ab+ac$, ſo that the third term muſt alſo be negative, and therefore in this caſe only one change of the ſigns. If again the ſecond term be poſitive, then becauſe the ſign of the laſt term is negative, whatever be the ſign of the third term, there can ſtill be no more than one change of the ſigns.

When the equation has two poſitive roots and one negative, its factors are $x-a$, $x-b$, $x-c$, and the equation

$$\left.\begin{matrix}x^3-a\\-b\\+c\end{matrix}\right\}\left.\begin{matrix}+ab\\-ac\\-bc\end{matrix}\right\}x+abc=0.$$

Here there muſt always be two changes of the ſigns; for if $a+b$ be greater than c, the ſecond term is negative, and the laſt term being always poſitive, there muſt be two changes, whether the ſign of the third term be poſitive or negative. If again $a+b$ be leſs than c, and therefore the ſecond term poſitive; it may be ſhewn as before, that ab is much leſs than $ac+bc$; and hence the third term will be negative; ſo that in either caſe there muſt be two changes of the ſigns. We may conclude therefore, upon the whole, that in cubic equations there are always as many poſitive roots, as changes of the ſigns from $+$ to $-$, or from $-$ to $+$; and by the ſame method of reaſoning, the rule will be found to extend to all equations whatever.

177. It appears from the manner in which the coefficients of an equation are formed from its roots, that when the roots are all real, the coefficients muſt conſiſt entirely of real quantities. But it does not follow, on the contrary, that when the coefficients are real, the roots are alſo real; for we have already found, that in a quadratic equation, $x^2+px+q=0$ where p and q denote real quantities, the roots are ſometimes both imaginary.

178. When the roots of a quadratic equation are imaginary, they have always this form $a+\sqrt{-b^2}$, $a-\sqrt{-b^2}$, which quantities may alſo be expreſſed thus,

Equations in general.

$a+b\sqrt{-1}$, $a-b\sqrt{-1}$, so that we have these two factors $x-a-b\sqrt{-1}$, $x-a+b\sqrt{-1}$, and taking their product,

$$x^2-2ax+a^2-b^2=0.$$

Thus we see that two imaginary factors may be of such a form as to admit of their product being expressed by a real quantity; and hence the origin of imaginary roots in quadratic equations.

179. It appears by induction, that no real equation can be formed from imaginary factors, unless those factors be taken in pairs, and each pair have the form $x\pm a-b\sqrt{-1}$, $x\pm a+b\sqrt{-1}$; for the product of three, or any odd number of imaginary factors, whatever be their form, is still an imaginary quantity. Thus, if we take the product of any three of these four imaginary expressions $x+a+b\sqrt{-1}$, $x+a-b\sqrt{-1}$, $x+c+d\sqrt{-1}$, $x+c-d\sqrt{-1}$, we may form four different equations, each of which will involve imaginary quantities. If, however, each equation be multiplied by the remaining factor, which had not previously entered into its composition, the product will be found to be rational, and the same for all the four.

180. Hence we may deduce the three following inferences respecting the roots of equations:

1. If an equation have imaginary roots, it must have two, or four, or some even number of such roots.

2. If the degree of an equation be denoted by an odd number, that equation must have at least one real root.

3. If the degree of an equation be denoted by an even number, and that equation have one real root, it will also have another real root.

181. We shall now explain some transformations which are frequently necessary to prepare the higher orders of equations for a solution.

Any equation may have its positive roots changed into negative roots of the same value, and its negative roots into such as are positive, by changing the signs of the terms alternately, beginning with the second. The truth of this remark will be evident, if we take two equations,

$$(x-a)(x-b)(x+c)=0,$$
$$(x+a)(x+b)(x-c)=0,$$

(which are such, that the positive roots of the one have the same values as the negative roots of the other) and multiply together their respective factors, for these equations will stand thus:

$$\left.\begin{matrix}x^3\\-a\\-b\\+c\end{matrix}\right\}\left.\begin{matrix}\\+ab\\-ac\\-bc\end{matrix}\right\}x^2\left.\begin{matrix}\\-ac\\-bc\end{matrix}\right\}x+abc=0$$

$$\left.\begin{matrix}x^3\\+a\\+b\\-c\end{matrix}\right\}\left.\begin{matrix}\\+ab\\-ac\\-bc\end{matrix}\right\}x^2\left.\begin{matrix}\\-ac\\-bc\end{matrix}\right\}x-abc=0$$

where it appears that the signs of the first and third terms are the same in each, but the signs of the second and fourth are just the opposite of each other. And this will be found to hold true, not only of cubic equations, but of all equations to whatever order they belong.

182. It will sometimes be useful to transform an equation into another, that shall have each of its roots greater or less than the corresponding roots of the other equation, by some given quantity.

Equations in general.

Let $(x-a)(x-b)(x+c)=0$ be any proposed equation which is to be transformed into another, having its roots greater or less than those of the proposed equation by the given quantity n; then, because the roots of the transformed equation are to be $+a\pm n$, $+b\pm n$ and $-c\pm n$, the equation itself will be

$$(y\mp n-a)(y\mp n-b)(y\mp n+c)=0.$$

Hence the reason of the following rule is evident.

If the new equation is to have its roots greater than those of the proposed equation, instead of x and its powers, substitute $y-n$ and its powers; but if the roots are to be less, then instead of x substitute $y+n$; and in either case, a new equation will be produced, the roots of which shall have the property required.

183. By means of the preceding rule, an equation may be changed into another, which has its roots either all positive, or all negative; but it is chiefly used in preparing cubic and biquadratic equations for a solution, by transforming them into others of the same degrees, but which want their second term.

Let $x^3+px^2+qx+r=0$ be any cubic equation; if we substitute $y+n$ for x, the equation is changed into the following:

$$\left.\begin{matrix}y^3\\+3n\\+p\end{matrix}\right\}\ y^2\left.\begin{matrix}+3n^2\\+2pn\\+q\end{matrix}\right\}y\left.\begin{matrix}+n^3\\+pn^2\\+qn\\+r\end{matrix}\right\}=0.$$

Now, that this equation may want its second term, it is evident, that we have only to suppose $3n+p=0$, or $n=-\frac{p}{3}$, for this assumption being made, and the value of n substituted in the remaining terms, the equation becomes

$$y^3+(q-\frac{p^2}{3})y+\frac{2p^3}{27}-\frac{pq}{3}+r=0,$$

or, putting $-\frac{p^2}{3}+q=q'$, and $+\frac{2p^3}{27}-\frac{pq}{3}+r=r'$ the same equation may also stand thus,

$$y^3+q'y+r'=0.$$

184. In general, any equation whatever may be transformed into another, which shall want its second term by the following rule.

Divide the coefficient of the second term of the proposed equation by the exponent of the first term, and add the quotient, with its sign changed, to a new unknown quantity; this sum being substituted for the unknown quantity in the proposed equation, a new equation will be produced, which will want the second term, as required.

185. By this rule, any adfected quadratic equation may be readily resolved; for by transforming it into another equation, which wants the second term, we thus reduce its solution to that of a pure quadratic. Thus if the quadratic equation $x^2-5x+6=0$ be proposed; by substituting $y+\frac{5}{2}$ for x, we find

$$\left.\begin{matrix}y^2\\-5y\\+6\end{matrix}\right\}\left.\begin{matrix}+\frac{25}{4}\\-\frac{25}{2}\end{matrix}\right\}=0 \text{ or } y^2-\frac{1}{4}=0.$$

Hence $y=\pm\frac{1}{2}$, and since $x=y+\frac{5}{2}$, therefore $x=\pm\frac{1}{2}+\frac{5}{2}=+3$ or $+2$.

186. It has been shewn (§ 169.) that in any equation, the coefficient of the second term, having its sign changed, is equal to the sum of all the roots, or abstracting

Cubic Equations.

ſtracting from their ſigns, it is equal to the difference between the ſum of the poſitive, and the ſum of the negative roots. Therefore, if the ſecond term be wanting, the ſum of the poſitive roots in that equation muſt neceſſarily be equal to that of the negative roots.

187. Inſtead of taking away the ſecond term from an equation, any other term may be made to vaniſh, by an aſſumption ſimilar to that which has been employed to take away the ſecond term. Thus if in § 183. we aſſume $3n^2+2pn+q=0$, by reſolving this quadratic equation, a value of n will be found, which, when ſubſtituted in the equation, will cauſe the third term to vaniſh; and by the reſolution of a cubic equation the third term might be taken away; and ſo on.

188. Another ſpecies of transformation, of uſe in the reſolution of equations, is that by which an equation, having the coefficients of ſome of its terms expreſſed by fractional quantities, is changed into another, the coefficients of which are all integers.

Let $x^3+\frac{p}{a}x^2+\frac{q}{b}x+\frac{r}{c}=0$ denote an equation to be ſo transformed; and let us aſſume $y=abcx$; and therefore $x=\frac{y}{abc}$, then, by ſubſtitution, our equation becomes

$$\frac{y^3}{a^3b^3c^3}+\frac{p}{a^3b^2c^2}y^2+\frac{q}{ab^2c}y+\frac{r}{c}=0,$$

and multiplying the whole equation by $a^3b^3c^3$, we have

$$y^3+bcpy^2+a^2bc^2qy+a^3b^3c^3r=0.$$

Thus we have an equation free from fractions, while at the ſame time the coefficient of the higheſt power of the unknown quantity is unity, as before.

189. This transformation may always be performed by the following rule. Inſtead of the unknown quantity ſubſtitute a new unknown quantity divided by the product of all the denominators; then, by proper reduction, the equation will be found to have the form required.

190. If, however, the equation have this form,

$$x^3+\frac{p}{a}x^2+\frac{q}{a}x+\frac{r}{a}=0,$$

it will be ſufficient to aſſume $y=ax$, and therefore $x=\frac{y}{a}$; for then we have

$$\frac{y^3}{a^3}+\frac{p}{a^3}y^2+\frac{q}{a^2}y+\frac{r}{a}=0,$$

And $y^3+py^2+aqy+a^2r=0$,

which laſt equation has the form required.

Sect. XI. *Of Cubic Equations.*

191. Cubic equations, as well as equations of every higher degree, are, like quadratics, divided into two claſſes; they are ſaid to be *pure*, when they contain only one power of the unknown quantity; and *adfected*, when they contain two or more powers of that quantity.

192. Pure cubic equations are therefore of this form $x^3=125$, or $x^3=-27$, or, in general, $x^3=r$; and hence it appears, that the value of the ſimple power of the unknown quantity may always be found, without difficulty, by extracting the cube root of each ſide of the equation; thus from the firſt of the three preceding examples we find $x=+5$, from the ſecond $x=-3$, and from the third $x=\sqrt[3]{r}$.

193. It would ſeem at firſt ſight, that the only value which x can have in the cubic equation $x^3=r$, or putting $r=c^3$, $x^3-c^3=0$, is this one, $x=c$; but ſince x^3-c^3 may be reſolved into theſe two factors $x-c$ and x^2+cx+c^2, it follows, that beſides the value of x already found, which reſults from making the factor $x-c=0$, it has yet other two values, which may be found by making the other factor $x^2+cx+c^2=0$; and accordingly by reſolving the quadratic equation $x^2+cx=-c^2$, we find theſe values to be $\frac{-c+\sqrt{-3c^2}}{2}$ and $\frac{-c-\sqrt{-3c^2}}{2}$, or $\frac{-1+\sqrt{-3}}{2}c$ and $\frac{-1-\sqrt{-3}}{2}c$. Thus it appears, that any cubic equation of this form $x^3=c^3$, or $x^3-c^3=0$, has theſe three roots

$$x=c,\quad x=\frac{-1+\sqrt{-3}}{2}c,\quad x=\frac{-1-\sqrt{-3}}{2}c,$$

the firſt of which is real, but the two laſt are imaginary. If, however, each of the imaginary values of x be raiſed to the third power, the ſame reſults will be obtained as from the real value of x; the original equation $x^3-c^3=0$ may alſo be reproduced, by multiplying together the three factors $x-c$, $x-\frac{-1+\sqrt{-3}}{2}c$, and $x-\frac{-1-\sqrt{-3}}{2}c$.

194. Let us now conſider ſuch cubic equations as have all their terms, and which are therefore of this form

$$x^3+Ax^2+Bx+C=0,$$

where A, B, and C denote known quantities, either poſitive or negative.

It has been ſhewn (§ 184. how an equation having all its terms may be transformed into another, which wants the ſecond term; let us therefore aſſume $x=y-\frac{A}{3}$, as directed in that article; then, by proper ſubſtitution, the above equation will be changed into another of this form

$$y^3+qy+r=0,$$

where q and r denote known quantities, whether poſitive or negative; now the roots of this equation being once found, it is evident that thoſe of the former may alſo be readily obtained by means of the aſſumed equation $x=y-\frac{A}{3}$.

195. Reſuming, therefore, the equation $y^3+qy+r=0$, let us ſuppoſe $y=v+z$, and it becomes

$$\left.\begin{matrix} v^3+3v^2z+3vz^2+z^3 \\ +qv+qz \\ +r \end{matrix}\right\}=0.$$

Thus we have got a new equation, which, as it involves two unknown quantities, v and z, may be reſolved into any two other equations, which will ſimplify the determination of thoſe quantities.

Now it appears, that the only way in which we can

Cubic Equations.

divide that equation into two others, ſo as to ſimplify the queſtion, is the following

$$3v^2z+3vz^2+qv+qz=0$$
$$v^3+z^3+r=0$$

The firſt of theſe equations may alſo be expreſſed thus

$$(3vz+q)(v+z)=0.$$

Hence we muſt either ſuppoſe that $v+z=0$, or that $3vz+q=0$; but the former ſuppoſition cannot be admitted, without ſuppoſing alſo that $y=0$, which does not agree with the hypotheſis of the equation $y^3+qy+r=0$; therefore we muſt adopt the latter. So that to determine v and z we have theſe two equations

$$3vz+q=0,\ v^3+z^3+r=0.$$

From the firſt, we find $vz=-\frac{q}{3}$, and $v^3z^3=-\frac{q^3}{27}$; and from the ſecond $v^3+z^3=-r$, ſo that to determine the quantities v^3 and z^3, we have given their ſum, and product: now this is a problem which we have already reſolved when treating of quadratic equations, § 155; and by proceeding in the ſame manner, in the preſent caſe, we ſhall find

$$v^3=-\tfrac{1}{2}r+\sqrt{\tfrac{1}{27}q^3+\tfrac{1}{4}r^2}\quad z^3=-\tfrac{1}{2}r-\sqrt{\tfrac{1}{27}q^3+\tfrac{1}{4}r^2}$$

$$v=\sqrt[3]{-\tfrac{1}{2}r+\sqrt{\tfrac{1}{27}q^3+\tfrac{1}{4}r^2}}\quad z=\sqrt[3]{-\tfrac{1}{2}r-\sqrt{\tfrac{1}{27}q^3+\tfrac{1}{4}r^2}}$$

and $$y=v+z=\sqrt[3]{-\tfrac{1}{2}r+\sqrt{\tfrac{1}{27}q^3+\tfrac{1}{4}r^2}}$$

$$+\sqrt[3]{-\tfrac{1}{2}r-\sqrt{\tfrac{1}{27}q^3+\tfrac{1}{4}r^2}}.$$

Thus we have at laſt obtained a value of the unknown quantity y, in terms of the known quantities q and r; therefore the equation is reſolved.

196. But this is only one of three values which y may have; let us, for the ſake of brevity, put

$$A=-\tfrac{1}{2}r+\sqrt{\tfrac{1}{27}q^3+\tfrac{1}{4}r^2},\ B=-\tfrac{1}{2}r-\sqrt{\tfrac{1}{27}q^3+\tfrac{1}{4}r^2},$$

and denote the imaginary expreſſions

$$\frac{-1+\sqrt{-3}}{2},\ \frac{-1-\sqrt{-3}}{2}$$

by α and β. Then, from what has been ſhewn (§ 193), it is evident that v and z have each theſe three values

$$v=\sqrt[3]{A},\ v=\alpha\sqrt[3]{A},\ v=\beta\sqrt[3]{A}$$
$$z=\sqrt[3]{B},\ z=\alpha\sqrt[3]{B},\ z=\beta\sqrt[3]{B}$$

To determine the correſponding values of v and z, we muſt conſider that $vz=-\frac{q}{3}=\sqrt[3]{AB}$; now if we obſerve that $\alpha\beta=1$, it will immediately appear that $v+z$ has theſe three values

$$v+z=\sqrt[3]{A}+\sqrt[3]{B}$$
$$v+z=\alpha\sqrt[3]{A}+\beta\sqrt[3]{B}$$
$$v+z=\beta\sqrt[3]{A}+\alpha\sqrt[3]{B}$$

Hence the three values of y are alſo theſe

Cubic Equations.

$$y=\sqrt[3]{A}+\sqrt[3]{B}$$
$$y=\alpha\sqrt[3]{A}+\beta\sqrt[3]{B}$$
$$y=\beta\sqrt[3]{A}+\alpha\sqrt[3]{B}$$

The firſt of 'theſe formulæ is commonly known by the name of Cardan's rule; but it is well known that Cardan was not the inventor, and that it ought to be attributed to Nicholas Tartalea, and Scipio Ferreus, who diſcovered it much about the ſame time, and independently of each other (ſee the *Introduction*.)

197. The formulæ given in laſt article for the roots of a cubic equation may be put under a different form, and perhaps better adapted to the purpoſes of arithmetical calculation as follows. Becauſe $vz=-\frac{q}{3}$, therefore $z=-\frac{q}{3}\times\frac{1}{v}=-\frac{q}{3}\times\frac{1}{\sqrt[3]{A}}$, hence $v+z=\sqrt[3]{A}-\frac{\frac{1}{3}q}{\sqrt[3]{A}}$; thus it appears that the three values of y may alſo be expreſſed thus

$$y=\sqrt[3]{A}-\frac{\frac{1}{3}q}{\sqrt[3]{A}}$$
$$y=\alpha\sqrt[3]{A}-\frac{\frac{1}{3}q\beta}{\sqrt[3]{A}}$$
$$y=\beta\sqrt[3]{A}-\frac{\frac{1}{3}q\alpha}{\sqrt[3]{A}}$$

198. To ſhow the manner of applying theſe formulæ, let it be required to determine x from the cubic equation

$$x^3+3x^2+9x-13=0$$

And as this equation has all its terms, the firſt ſtep towards its reſolution is to transform it into another which ſhall want the ſecond term, by ſubſtituting $y-1$ for x as directed (§ 184). The operation will ſtand thus

$$\begin{array}{rrr} x^3=y^3 & -3y^2+3y & -1 \\ +3x^2= & +3y^2-6y & +3 \\ +9x= & +9y & -9 \\ -13= & & -13 \\ \hline \end{array}$$

The transformed equation is $y^3+6y-20=0$

which being compared with the general equation

$$y^3+qy+r=0$$

gives $q=6$, $r=-20$; hence

$$A=\sqrt[3]{-\tfrac{1}{2}r+\sqrt{\tfrac{1}{27}q^3+\tfrac{1}{4}r^2}}=\sqrt[3]{10+\sqrt{108}}$$

Therefore, the firſt formula of laſt article gives $y=\sqrt[3]{10+\sqrt{108}}-\frac{2}{\sqrt[3]{10+\sqrt{108}}}$; but as this expreſſion involves a radical quantity, let the ſquare root of 108 be taken and added to 10, and the cube root of the ſum found; thus we have $\sqrt[3]{10+\sqrt{108}}=2.732$, nearly, and

Cubic Equations.

and therefore $\frac{2}{\sqrt[3]{10+\sqrt{108}}}=\frac{2}{2.732}=.732$; hence we at last find one of the values of y to be $2.732-.732=2$.

In finding the cube root of the radical quantity $\sqrt[3]{10+\sqrt{108}}$ we have taken only its approximate value, so as to have the expression for the root under a rational form, and in this way we can always find, as near as we please, the cube root of any surd of the form $a+\sqrt{b}$ where b is a positive number. But it will sometimes happen that the cube root of such a surd can be expressed exactly by another surd of the same form; and accordingly, in the present case, it appears that the cube root of $10+\sqrt{108}$ is $1+\sqrt{3}$, as may be proved by actually raising $1+\sqrt{3}$ to the third power. Hence we find $\frac{2}{\sqrt[3]{10+\sqrt{108}}}=\frac{2}{1+\sqrt{3}}=\frac{2(1-\sqrt{3})}{(1-\sqrt{3})(1+\sqrt{3})}=-(1-\sqrt{3})$; so that we have $y=1+\sqrt{3}+1-\sqrt{3}=2$, as before.

The other two values of y will be had by substituting $1+\sqrt{3}$ and $1-\sqrt{3}$ for $\sqrt{A}$ and $\frac{\frac{1}{2}q}{\sqrt[3]{A}}$ in the second and third formulæ of last article, also restoring the values of α and β. We thus have

$$y=\frac{-1+\sqrt{-3}}{2}\times(1+\sqrt{3})+\frac{-1-\sqrt{-3}}{2}\times(1-\sqrt{3})=-1+\sqrt{-9}$$

$$y=\frac{-1-\sqrt{-3}}{2}\times(1+\sqrt{3})+\frac{-1+\sqrt{-3}}{2}\times(1-\sqrt{3})=-1-\sqrt{-9}$$

So that the three values of y are

$$+2,\ -1+\sqrt{-9},\ -1-\sqrt{9}$$

and since $x=y+1$, the corresponding values of x are

$$+1,\ -2+\sqrt{-9},\ -2-\sqrt{-9}.$$

Thus it appears that one of the roots of the proposed equation is real and the other two imaginary.

The two imaginary roots might have been found otherwise, by considering that since one root of the equation is 1, the equation must be divisible by $x-1$ (§ 163). Accordingly the division being actually performed, and the quotient put $=0$, we have this quadratic equation

$$x^2+4x+13=0$$

which, when resolved by the rule for quadratics, gives $x=-2\pm\sqrt{-9}$, the same imaginary values as before.

199. In the application of the preceding formulæ (§ 196 and 197) to the resolution of the equation $y^3+qy+r=0$, it is necessary to find the square root of $\frac{1}{27}q^3+\frac{1}{4}r^2$, now when that quantity is positive, as in the equation $y^3+6y-20=0$, which was resolved in last article, no difficulty occurs, for its root may be found, either exactly, or to as great a degree of accuracy as we please.

As, however, the coefficients q and r are independent of each other, it is evident that q may be negative, and such that $\frac{1}{27}q^3$ is greater than $\frac{1}{4}r^2$, in this case the expression $\frac{1}{27}q^3+\frac{1}{4}r^2$ will be negative, and therefore its square root an imaginary quantity. Let us take as an example this equation $y^3-6y+4=0$; here $q=-6$, $r=+4$, $\frac{1}{2}r=2$, $\frac{1}{27}q^3=-8$, $\frac{1}{4}r^2=+4$, $\sqrt{\frac{1}{27}q^3+\frac{1}{4}r^2}=\sqrt{-4}=2\sqrt{-1}$, hence, by recurring to the formulæ (§ 196), we have $A=2+2\sqrt{-1}$, $B=2-\sqrt{-1}$, and therefore the three roots of the equation expressed thus

$$y=\sqrt[3]{2+2\sqrt{-1}}+\sqrt[3]{2-2\sqrt{-1}}$$

$$y=\alpha\sqrt[3]{2+2\sqrt{-1}}+\beta\sqrt[3]{2-2\sqrt{-1}}$$

$$y=\beta\sqrt[3]{2+2\sqrt{-1}}+\alpha\sqrt[3]{2-2\sqrt{-1}}$$

Here all the roots appear under an imaginary form; but we are certain from the theory of equations, as explained in Sect. X. that every cubic equation must have at least one real root. The truth is, as we shall shew immediately, that in this case, so far from any of the roots being imaginary (as in the former example), they are all real; for it appears by actual involution that the imaginary expression $2+2\sqrt{-1}$ is the cube of this other imaginary expression $-1+\sqrt{-1}$, and in like manner, that $2-2\sqrt{-1}$ is the cube of $-1-\sqrt{-1}$, so that we have

$$y=\sqrt[3]{2+2\sqrt{-1}}+\sqrt[3]{2-2\sqrt{-1}}=-1+\sqrt{-1}-1-\sqrt{-1}=-2$$

$$y=\frac{-1+\sqrt{-3}}{2}\times(-1+\sqrt{-1})+\frac{-1-\sqrt{-3}}{2}\times(-1-\sqrt{-1})=1+\sqrt{3}$$

$$y=\frac{-1-\sqrt{-3}}{2}\times(-1+\sqrt{-1})+\frac{-1+\sqrt{-3}}{2}\times(-1-\sqrt{-1})=1-\sqrt{3}.$$

200. We now proceed to prove in general, that as often as the roots of the equation $x^3+qx+r=0$ are real, q is negative, and $\frac{1}{27}q^3$ greater than $\frac{1}{4}r^2$; and, on the contrary, that if $\frac{1}{27}q^3$ be greater than $\frac{1}{4}r^2$ the roots are all real.

Let us suppose a to be a real root of the proposed equation,

Then $x^3+qx+r=0$

And $a^3+qa+r=0$

And therefore by subtraction $x^3-a^3+q(x-a)=0$; hence, dividing x^3-a^3, also $q(x-a)$ by $x-a$, we have

$$x^2+ax+a^2+q=0$$

This quadratic equation is formed from the two remaining roots of the proposed equation, and by resolving it we find

$$x=-\tfrac{1}{2}a\pm\sqrt{-\tfrac{3}{4}a^2-q}$$

And as, by hypothesis, all the roots are real, it is evident that q must necessarily be negative, and greater than $\frac{1}{4}a^2$; for otherwise the expression $\sqrt{-\frac{3}{4}a^2-q}$, would be imaginary. Let us change the sign of q, and put

Cubic Equations.

put $q=\frac{3}{4}a^2+d$; thus the roots of the equation $x^3+qx+r=0$ will be

$$a,\ -\tfrac{1}{2}a+\sqrt{d},\ -\tfrac{1}{2}a-\sqrt{d},$$

and here d is a positive quantity.

To find an expression for r in terms of a and d, let $\frac{3}{4}a^2+d$ be substituted for q in the equation $a^3-qa+r=0$; we thence find $r=-\frac{1}{4}a^3+ad$; so that to compare together the quantities q and r we have these equations,

$$q=\tfrac{3}{4}a^2+d$$
$$r=-\tfrac{1}{4}a^3+ad.$$

In order to make this comparison, let the cube of $\frac{1}{3}q$ be taken, also the square of $\frac{1}{2}r$, the results are

$$\tfrac{1}{27}q^3=\tfrac{1}{64}a^6+\tfrac{1}{16}a^4d+\tfrac{1}{12}a^2d^2+\tfrac{1}{27}d^3$$
$$\tfrac{1}{4}r^2=\tfrac{1}{64}a^6-\tfrac{1}{8}a^4d+\tfrac{1}{4}a^2d^2;$$

and therefore, by subtraction,

$$\tfrac{1}{27}q^3-\tfrac{1}{4}r^2=\tfrac{1}{16}a^4d-\tfrac{1}{6}a^2d^2+\tfrac{1}{27}d^3$$
$$=3d(\tfrac{1}{16}a^4-\tfrac{1}{18}a^2d+\tfrac{1}{108}d^2)$$
$$=3d(\tfrac{1}{4}a^2-\tfrac{1}{9}d)^2.$$

Now the square of any real quantity being always positive, it follows, that $3d(\frac{1}{4}a^2-\frac{1}{9}d)^2$ will be positive when d is positive; hence it is evident that in this case $\frac{1}{27}q^3$ must be greater than $\frac{1}{4}r^2$; and that the contrary cannot be true, unless d be negative, that is, unless that $-\frac{1}{2}a+\sqrt{d}$, $-\frac{1}{2}a-\sqrt{d}$, the two other roots of the equation, are imaginary. If we suppose $d=o$, then $\frac{1}{27}q^3=\frac{1}{4}r^2$; and the roots of the equations, which in this case are also real, are a, $-\frac{1}{2}a$, $-\frac{1}{2}a$.

Upon the whole, therefore, we infer, that since a cubic equation has always one real root, its roots will be all real as often as q is negative, and $\frac{1}{27}q^3$ greater than $\frac{1}{4}r^2$; and consequently, that in this case the formulæ for the roots must express real quantities notwithstanding their imaginary form.

201. Let $y^3-qy+r=0$ denote any equation of the form which has been considered in last article, namely, that which has its roots all real; then, if we put $a=-\frac{1}{2}r$, $b^2=\frac{1}{27}q^3-\frac{1}{4}r^2$, one of the roots, as expressed by the first formula, § 196. will be

$$y=\sqrt[3]{a+b\sqrt{-1}}+\sqrt[3]{a-b\sqrt{-1}}.$$

This expression, although under an imaginary form, must (as we have shewn in last article) represent a real quantity. It will sometimes happen, as in last example, § 199. that the two surds which compose the root are perfect cubes of the form $(A+B\sqrt{-1})^3$ and $(A-B\sqrt{-1})^3$, and then the value of y becomes

$$A+B\sqrt{-1}+A-B\sqrt{-1}=2A.$$

But the rules for determining when this is the case depend upon trials, and are, besides, troublesome in the application; and if we attempt by a direct process to investigate the numerical values of A and B, we are brought to a cubic equation, of the very same form as that whose root is required.

202. This imaginary expression for a real quantity has greatly perplexed mathematicians; and much pains has been taken to obtain the root under another form, but without success. Accordingly, the case of cubic equations, in which the roots are all real, is now called the *irreducible case*.

203. It is remarkable that the expression

$$\sqrt{a+b\sqrt{-1}}+\sqrt{a-b\sqrt{-1}},$$

and in general,

$$\sqrt[n]{a+b\sqrt{-1}}+\sqrt[n]{a-b\sqrt{-1}},$$

where n is any power of 2, admits of being reduced to another form in which no impossible quantity is found. Thus

$$\sqrt{a+b\sqrt{-1}}+\sqrt{a-b\sqrt{-1}}=\sqrt{2a+2\sqrt{a^2+b^2}}$$
$$\sqrt[4]{a+b\sqrt{-1}}+\sqrt[4]{a-b\sqrt{-1}}=$$
$$\sqrt{\left(\sqrt{2a+2\sqrt{a^2+b^2}}+2\sqrt[4]{a^2+b^2}\right)},$$

as is easily proved by first squaring the imaginary formulæ, and then taking the square root of each. But when n is 3, it does not seem that such reduction can possibly take place.

204. If each of the surds be expanded into an infinite series and their sum be taken, the imaginary quantity $\sqrt{-1}$ will vanish; and thus the root may be found by a direct process. There are, however, other methods which seem preferable; and the following, which is derived from the application of algebra to geometry, seems to be the best.

205. It will be demonstrated in Sect. XXV. that if a denote an arch of a circle, the relation between the cosine of the arch and the cosine of $\frac{a}{3}$, one-third of that arch is expressed by the following cubic equation.

$$\text{Cos.}^3\frac{a}{3}-\tfrac{3}{4}\text{ cos.}\frac{a}{3}=\tfrac{1}{4}\text{ cos. }a.$$

Let us assume $\text{cos.}\frac{a}{3}=\frac{y}{n}$, then, by substitution, the equation is transformed into the following:

$$\frac{y^3}{n^3}-\frac{3y}{4n}=\tfrac{1}{4}\text{cos. }a.$$

$$\text{Or}\qquad y^3-\frac{3n^2}{4}y=n^3\times\tfrac{1}{4}\text{cos. }a,$$

and in this cubic equation one of the roots is evidently $y=n\times\text{cos.}\frac{a}{3}$. Now from the arithmetic of sines it appears that cos. a, cos. $(360^\circ-a)$, and cos. $(360^\circ+a)$, are all expressed by the same quantity; therefore the equation must have for a root not only $n\times\text{cos.}\frac{a}{3}$, but also $n\times\text{cos.}\frac{360^\circ-a}{3}$, and $n\times\text{cos.}\frac{360^\circ+a}{3}$. But, from the arithmetic of sines, $\text{cos.}\frac{360^\circ-a}{3}=-\text{sin.}\frac{90^\circ-a}{3}$, and $\text{cos.}\frac{360^\circ+a}{3}=-\text{sin.}\frac{90^\circ+a}{3}$. Therefore the three roots of the equation are

$$n\times\text{cos.}\frac{a}{3},\ -n\times\text{sin.}\frac{90^\circ-a}{3},\ -n\times\text{sin.}\frac{90^\circ+a}{3}.$$

Let us next suppose that $y^3-qy=r$ is a cubic equation

Cubic Equations.

tion whose roots are required, and let us compare it with the former equation $y^3-\frac{3n^2}{4}y=n^3\times\text{cos.}\frac{1}{3}a$; then it is evident that if we assume the quantities n and cos. a, such, that

$$\frac{3n^2}{4}=q,\ n^3\times\text{cos.}\tfrac{1}{3}a=r$$

the two equations will become identical, and thus their roots will be expressed by the very same quantities. But from these two assumed equations we find

$$n=\sqrt{\frac{4q}{3}}=\frac{2\sqrt{q}}{\sqrt{3}},\ \text{cos. } a=\frac{4r}{n^3}=\sqrt{\frac{27r^2}{4q^3}}=\frac{3r\sqrt{3}}{2q\sqrt{q}}$$

and since the cosine of an arch cannot exceed unity, therefore, $\frac{27r^2}{4q^3}$ must be a proper fraction, that is, $4q^3$ must exceed $27r^2$, or $\frac{1}{27}q^3$ must exceed $\frac{1}{4}r^2$; if we now recollect that q is a negative quantity, it will immediately appear that the proposed equation must necessarily belong to the irreducible case.

206. The rule, therefore, which we derive from the preceding analysis for resolving that case is as follows.

Let $y^3-qy=r$ be the proposed equation.

Find in the trigonometrical tables an arch a, whose natural cosine $=\frac{3r\sqrt{3}}{2q\sqrt{q}}$.

The roots of the equation are

$$y=2\sqrt{\frac{q}{3}}\times\text{cos.}\frac{a}{3}$$
$$y=-2\sqrt{\frac{q}{3}}\times\text{sin.}\frac{90^\circ-a}{3}$$
$$y=-2\sqrt{\frac{q}{3}}\times\text{sin.}\frac{90^\circ+a}{3}.$$

These formulæ will apply, whether r be positive or negative, by proper attention to the signs: If, however, r be negative, or the equation have this form, $y^3-qy=-r$, the following will be more convenient:

Find in the tables an arch a, whose sine $=\frac{3r\sqrt{3}}{2q\sqrt{q}}$

Then the roots of the equation are

$$y=2\sqrt{\frac{q}{3}}\times\text{sin.}\frac{a}{3}$$
$$y=2\sqrt{\frac{q}{3}}\times\text{cos.}\frac{90^\circ+a}{3}$$
$$y=-2\sqrt{\frac{q}{3}}\times\text{cos.}\frac{90^\circ-a}{3}.$$

The last formulæ are derived from the equation

$$\text{Sin.}\frac{a}{3}-\frac{3}{4}\text{sin.}\frac{a}{3}=-\text{sin. }a$$

in the same manner as the former were found from the first equation of last article.

Ex. 1. It is required to find the roots of the equation $x^3-3x=1$.

$$\text{Here }\frac{3r\sqrt{3}}{2q\sqrt{q}}=\frac{3\times\sqrt{3}}{6\times\sqrt{3}}=\tfrac{1}{2}=\text{cos. }60^\circ=\text{cos. }a.$$

Biquadratic Equations.

$$\text{Hence}\begin{cases} x=2\text{ cos.}\frac{60^\circ}{3}=2\text{ cos. }20^\circ=1.8793852\\ x=-2\text{sin.}\frac{150^\circ}{3}=-2\text{sin.}50^\circ=-1.5320888\\ x=-2\text{ sin.}\frac{30^\circ}{3}=-2\text{ sin. }10^\circ=.3472964.\end{cases}$$

Ex. 2. It is required to find the roots of the equation x^3-3x-1.

$$\text{Here }\frac{3r\sqrt{3}}{2q\sqrt{q}}=\frac{3\sqrt{3}}{6\sqrt{3}}=\tfrac{1}{2}=\text{sin. }30^\circ=\text{sin. }a.$$
$$x=2\text{ sin.}\frac{30^\circ}{3}=2\text{ sin. }10^\circ=\ .3472964$$
$$x=2\text{ cos.}\frac{120^\circ}{3}=2\text{ cos. }40^\circ=\ 1.5320888$$
$$x=-2\text{cos.}\frac{60^\circ}{3}=-2\text{ cos. }20^\circ=-1.8793852.$$

Sect. XII. *Of Biquadratic Equations.*

207. When a biquadratic equation contains all its terms, it has this form,

$$x^4+Ax^3+Bx^2+Cx+D=0$$

where A, B, C, D, denote any known quantities whatever.

208. We shall first consider pure biquadratics, or such as contain only the first and last terms, and therefore are of this form $x^4=b^4$. In this case it is evident that x may be readily had by two extractions of the square root; by the first we find $x^2=b^2$ and by the second $x=b$. This, however, is only one of the values which x may have; for since $x^4=b^4$, therefore $x^4-b^4=0$; but x^4-b^4 may be resolved into two factors x^2-b^2 and x^2+b^2, each of which admit of a similar resolution; for $x^2-b^2=(x-b)(x+b)$ and $x^2+b^2=(x-b\sqrt{-1})(x+b\sqrt{-1})$. Hence it appears that the equation $x^4-b^4=0$ may also be expressed thus:

$$(x-b)(x+b)(x-b\sqrt{-1})(x+b\sqrt{-1})=0,$$

so that x may have these four values,

$$+b,-b,+b\sqrt{-1},-b\sqrt{-1},$$

two of which are real and the others imaginary.

209. Next to pure biquadratic equations, in respect of easiness of resolution, are such as want the second and fourth terms, and therefore have this form,

$$x^4+qx^2+s=0.$$

These may be resolved in the manner of quadratic equations; for if we put $y^2=x^2$ we have

$$y^2+qy+s=0$$

from which we find $y=\frac{-q\pm\sqrt{q^2-4s}}{2}$, and therefore

$$x=\pm\sqrt{\frac{-q\pm\sqrt{q^2-4s}}{2}}.$$

210. When a biquadratic equation has all its terms, the manner of resolving it is not so obvious as in the two former cases, but its resolution may be always reduced to that of a cubic equation. There are various methods by which such a reduction may be effected; the following, which we select as one of the most ingenious, was first given by Euler in the Petersburg Commentaries, and

Biquadratic Equations.

and afterwards explained more fully in his Elements of Algebra.

We have already explained § 184, in what manner an equation which is complete in its terms may be transformed into another equation of the same degree, but which wants the second term; therefore, any proposed biquadratic equation may be reduced to this form,

$$y^4+py^2+qy+r=0$$

where the second term is wanting, and where p, q, r, denote any known quantities whatever.

211. That we may form any equation similar to the above, let us assume $y=\sqrt{a}+\sqrt{b}+\sqrt{c}$, and let us also suppose that the letters a, b, c, denote the roots of the cubic equation

$$z^3+Pz^2+Qz-R=0$$

then from the theory of equations we have

$$a+b+c=-P,\ ab+ac+bc=Q\ abc=R.$$

Let us now square the assumed formula $y=\sqrt{a}+\sqrt{b}+\sqrt{c}$, and we obtain

$y^2=a+b+c+2(\sqrt{ab}+\sqrt{ac}+\sqrt{bc})$

or substituting $-P$ for $a+b+c$, and transposing,

$y^2+P=2(\sqrt{ab}+\sqrt{ac}+\sqrt{bc})$.

Let this equation be also squared and we have

$y^4+2Py^2+P^2=4(ab+ac+bc)+8(\sqrt{a^2bc}+\sqrt{ab^2c}+\sqrt{abc^2})$, and since $ab+ac+bc=Q$

and $\sqrt{a^2bc}+\sqrt{ab^2c}+\sqrt{abc^2}=\sqrt{abc}(\sqrt{a}+\sqrt{b}+\sqrt{c})=\sqrt{R}y$; the same equation may be expressed thus:

$$y^4+2Py^2+P^2=4Q+8\sqrt{R}y.$$

Thus we have obtained the biquadratic equation

$$y^4+2Py^2-8\sqrt{R}y+P^2-4Q=0,$$

one of the roots of which $y=\sqrt{a}+\sqrt{b}+\sqrt{c}$, and in which a, b, c are the roots of the cubic equation $z^3+Pz^2+Qz-R=0$.

212. That we may apply this resolution to the proposed equation $y^4+py^2+qy+r=0$, we must express the assumed coefficients P, Q, R by means of p, q, r the coefficients of that equation. For this purpose let us compare together the equations

$$y^4+py^2+qy+r=0$$
$$y^4+2Py^2-8\sqrt{R}y+P^2-4Q=0,$$

and it immediately appears that $2P=p$, $-8\sqrt{R}=q$, $P^2-4Q=r$; and from these three equations we find $P=\frac{p}{2}$, $Q=\frac{p^2-4r}{16}$, $R=\frac{q^2}{64}$. Hence it follows, that the roots of the proposed equation are generally expressed by the formula $y=\sqrt{a}+\sqrt{b}+\sqrt{c}$; where a, b, c denote the roots of this cubic equation

$$z^3+\frac{p}{2}z^2+\frac{p^2-4r}{16}z-\frac{q^2}{64}=0.$$

213. But to find each particular root, we must consider, that as the square root of a number may be either positive or negative, so each of the quantities $\sqrt{a}$, $\sqrt{b}$, $\sqrt{c}$ may have either the sign $+$ or $-$ prefixed to it; and hence our formula will give eight different expressions for the root. It is, however, to be observed, that as the product of the three quantities $\sqrt{a}$, $\sqrt{b}$, $\sqrt{c}$, must be equal to $\sqrt{R}$ or to $-\frac{q}{8}$, therefore when q is positive, their product must be a negative quantity; and this can only be effected by making either one or three of them negative; again, when q is negative, their product must be a positive quantity, so that in this case they must either be all positive, or two of them must be negative. These considerations enable us to determine, that four of the eight expressions for the root belong to the case in which q is positive, and the other four to that in which it is negative.

Biquadratic Equation

214. We shall now give the result of the preceding investigation, in the form of a practical rule, for resolving biquadratic equations; and as the coefficients of the cubic equation which has been found, § 212, involve fractions, we shall transform it into another, in which the coefficients are integers, by supposing $z=\frac{v}{4}$. Thus the equation $z^3+\frac{p}{2}z^2+\frac{p^2-4r}{16}z-\frac{q^2}{64}=0$ becomes, after reduction, $v^3+2pv^2+(p^2-4r)v-q^2=0$; it also follows, that since the roots of the former equation are a, b, c, the roots of the latter are $\frac{a}{4}, \frac{b}{4}, \frac{c}{4}$, so that our rule may now be expressed thus:

Let $y^4+py^2+qy+r=0$ be any biquadratic equation wanting its second term. Form this cubic equation

$$v^3+2pv^2+(p^2-4r)v-q^2=0,$$

and find its roots, which let us denote by a, b, c.

Then the roots of the proposed biquadratic equation are

when q is negative	when q is positive
$y=\frac{1}{2}(\sqrt{a}+\sqrt{b}+\sqrt{c})$	$y=\frac{1}{2}(-\sqrt{a}-\sqrt{b}-\sqrt{c})$
$y=\frac{1}{2}(\sqrt{a}-\sqrt{b}-\sqrt{c})$	$y=\frac{1}{2}(-\sqrt{a}+\sqrt{b}+\sqrt{c})$
$y=\frac{1}{2}(-\sqrt{a}+\sqrt{b}-\sqrt{c})$	$y=\frac{1}{2}(\sqrt{a}-\sqrt{b}+\sqrt{c})$
$y=\frac{1}{2}(-\sqrt{a}-\sqrt{b}+\sqrt{c})$	$y=\frac{1}{2}(\sqrt{a}+\sqrt{b}-\sqrt{c})$.

215. This resolution of biquadratic equations suggests the following general remarks upon the nature of their roots.

1. It is evident from the form of the roots, that if the cubic equation

$$v^3+2pv^2+(p^2-4r)v-q^2=0$$

have all its roots real, and positive, those of the biquadratic equation shall be all real.

2. Since the last term of the cubic equation is negative, when its three roots are real, they must either be all positive, or two of them must be negative and one positive; for the last term is equal to the product of all the roots taken with contrary signs, § 169; so that in this last case two of the three quantities a, b, c, must be negative, and therefore all the four roots of the biquadratic equation imaginary. If, however, the two negative roots be equal, they will destroy each other in two of the roots of the biquadratic equation, which will then become real and equal. Let us suppose for example that b and c are negative, and equal; the two first values of y in each column become then imaginary,

Biquadratic Equations.

nary, and the remaining values of y are in the first set of roots $y=-\frac{1}{2}\sqrt{a}$, $y=-\frac{1}{2}\sqrt{a}$, and in the second $y=+\frac{1}{2}\sqrt{a}$, $y=\frac{1}{2}\sqrt{a}$.

3. When the cubic equation has only one real and two imaginary roots, its real root must necessarily be positive. For the imaginary roots can only come from a quadratic equation, having its last term positive, Sect. IX. and therefore of this form $v^2+Av+B=0$, hence, the simple factor which contains the remaining root must have this form $v-\gamma$, otherwise the last term of the cubic equation could not be negative.

By resolving the equation $v^2+Av+B=0$, we find

$$v=-\frac{A}{2}\pm\sqrt{\frac{A^2}{4}-B};$$

here, the roots being supposed imaginary, $\frac{A^2}{4}-B$ must be a negative quantity. That we may simplify the form of the roots, let us put $-\frac{A}{2}=\alpha$ and $\frac{A^2}{4}-B=-\beta^2$, then

$$v=-\alpha\pm\sqrt{-\beta^2}=-\alpha\pm\beta\sqrt{-1}$$

and $v=-\alpha+\beta\sqrt{-1}$, $v=-\alpha-\beta\sqrt{-1}$.

Hence we have

$$a=\alpha+\beta\sqrt{-1},\ b=\alpha-\beta\sqrt{-1},\ c=\gamma;$$

so that in two of the four values of y, we have a quantity of this form

$$\sqrt{\alpha+\beta\sqrt{-1}}+\sqrt{\alpha-\beta\sqrt{-1}}$$

but this quantity, although it appears to be imaginary, is indeed real; for if we first square it, and then take its square root, it becomes

$$\sqrt{2\alpha+2\sqrt{\alpha^2+\beta^2}},$$

which is a real quantity. The two other roots involve this other expression

$$\sqrt{\alpha+\beta\sqrt{-1}}-\sqrt{\alpha-\beta\sqrt{-1}}$$

which, being treated in the same manner as the former, becomes

$$\sqrt{2\alpha-2\sqrt{\alpha^2+\beta^2}}$$

an imaginary quantity, and therefore the roots, into which it enters, are imaginary.

4. We may discover from the coefficients of the proposed biquadratic equation in what case the roots of the cubic equation are all real; for this purpose the latter is to be transformed into another which shall want the second term by assuming $v=u-\frac{2p}{3}$; thus it becomes

$$u^3-\left(\frac{p^2}{3}+4r\right)u-\frac{2p^3}{27}+\frac{8rp}{3}-q^2=0;$$

and in this equation the three roots will be real when $\frac{1}{27}\left(\frac{p^2}{3}+4r\right)^3$ is greater than $\frac{1}{4}\left(\frac{2p^3}{27}-\frac{8rp}{3}+q^2\right)^2$.

216. As an example of the method of resolving a biquadratic equation, let it be required to determine the roots of the following,

$$x^4-25x^2+60x-36=0.$$

By comparing this equation with the general formula, we have $p=-25$, $q=+60$, $r=-36$, hence Reciprocal Equations.

$$2p=-50,\ p^2-4r=769,\ q^2=3600,$$

and the cubic equation to be resolved is

$$v^3-50v^2+769v-3600=0;$$

the roots of which are found, by the rules for cubics, to be 9, 16, and 25, so that we have $\sqrt{a}=3$, $\sqrt{b}=4$, $\sqrt{c}=5$. Now in this case q is positive, therefore

$$x=\tfrac{1}{2}(-3-4-5)=-6$$
$$x=\tfrac{1}{2}(-3+4+5)=+3$$
$$x=\tfrac{1}{2}(+3-4+5)=+2$$
$$x=\tfrac{1}{2}(+3+4-5)=+1.$$

217. We have now explained the particular rules by which the roots of equations belonging to each of the first four orders may be determined; and this is the greatest length mathematicians have been able to go in the direct resolution of equations; for as to those of the fifth, and all higher degrees, no general method has hitherto been found, either for resolving them directly, or for reducing them to others of an inferior degree.

It even appears that the formulæ which express the roots of cubic equations are by no means of universal application; for in one case, that is, when the roots are all real, they become illusory, so that no conclusion can be drawn from them. The same observation will also apply to the formulæ for the roots of biquadratic equations, because, before they can be applied, it is always necessary to find the roots of a cubic equation. But in either cubics or biquadratic equations, even when the formulæ involve no imaginary quantities, and therefore can be always applied, it is more convenient in practice to employ some other methods which we are hereafter to explain.

Sect. XIII. *Of Reciprocal Equations.*

218. Although no general resolution has hitherto been given of equations belonging to the fifth, or any higher degree; yet there are particular equations of all orders, which, by reason of certain peculiarities in the nature of their roots, admit of being reduced to others of a lower degree, and thus, in some cases, equations of the higher orders may be resolved by the rules which have been already explained for the resolution of equations belonging to the first four orders.

219. When the coefficients of the terms of an equation form the same numerical series, whether taken in a direct or an inverted order, as in this example

$$x^4+px^3+qx^2+px+1=0$$

that equation may always be transformed into another of a degree denoted by half the exponent of the highest power of the unknown quantity, if that exponent be an even number, or by half the exponent diminished by unity, if it be an odd number.

The same observation will also apply to any equation of this form

$$x^4+pax^3+qa^2x^2+pa^3x+a^4=0$$

where the given quantity a and the unknown quantity

Reciprocal Equations.

x are precisely alike concerned; for by substituting ay for x, it becomes

$$a^4y^4+pa^4y^3+qa^4y^2+pa^4y+a^4=0;$$

and dividing by a^4,

$$y^4+py^3+qy^2+py+1=0,$$

an equation of the same kind as the former.

220. That we may effect the proposed transformation upon the equation

$$x^4+px^3+qx^2+px+1=0$$

let every two terms which are equally distant from the extremes be collected into one, and the whole be divided by x^2, thus we have

$$x^2+\frac{1}{x^2}+p\left(x+\frac{1}{x}\right)+q=0.$$

Let us assume $x+\frac{1}{x}=z$

Then $x^2+2+\frac{1}{x^2}=z^2$ and $x^2+\frac{1}{x^2}=z^2-2$

Thus the equation $x^2+\frac{1}{x^2}+p\left(x+\frac{1}{x}\right)+q=0$

becomes $z^2+pz+q-2=0$.

And since $z+\frac{1}{x}=z$, therefore $x^2-zx+1=0$.

221. Hence, upon the whole, to determine the roots of the biquadratic equation

$$x^4+px^3+qx^2+px+1=0$$

we have the following rule.

Form this quadratic equation

$$z^2+pz+q-2=0$$

and find its roots, which let us suppose denoted by z' and z''. Then the four roots of the proposed equation will be found by resolving two quadratic equations

$$x^2-z'x+1=0,\ x^2-z''x+1=0.$$

222. It may be observed respecting these two quadratic equations, that since the last term of each is unity, if we put a, a' to denote the roots of the one, and b, b' those of the other, we have from the theory of equations $aa'=1$, and therefore $a'=\frac{1}{a}$, also $bb'=1$, and $b'=\frac{1}{b}$; now a, a', b, b' are also the roots of the equation

$$x^4+px^3+qx^2+px+1=0.$$

Hence it appears that the proposed equation has this peculiar property, that the one half of its roots are the reciprocals of the other half; and to that circumstance we are indebted for the simplicity of its resolution.

223. The following equation

$$x^6+px^5+qx^4+rx^3+qx^2+px+1=0,$$

which is of the sixth order, admits of a resolution in all respects similar to the former; for by putting it under this form

$$x^3+\frac{1}{x^3}+p\left(x^2+\frac{1}{x^2}\right)+q\left(x+\frac{1}{x}\right)+r=0,$$

and putting also $x+\frac{1}{x}=z$, so that $x^2-zx+1=0$, we have $x^2+\frac{1}{x^2}=z^2-2$

Equations with equal Roots.

$$x^3+\frac{1}{x^3}=z^3-3\left(x+\frac{1}{x}\right)=z^3-3z.$$

Hence, by substitution, the proposed equation is transformed into the following cubic equation

$$z^3+pz^2+(q-3)z+r-2p=0.$$

Therefore, putting z', z'', z''' to denote its roots, the six roots of the proposed equation will be had by resolving these three quadratics

$$x^2-z'x+1=0,\ x^2-z''x+1=0,\ x^2-z'''x+1=0,$$

and here it is evident, as in the former case, that the roots of each quadratic equation are the reciprocals of each other, so that the one half of the roots of the proposed equation are the reciprocals of the other half.

224. The method of resolution we have employed in the two preceding examples is general for all equations whatever, in which the terms placed at equal distances from the first and last have the same coefficients, and which are called *reciprocal equations*, because any such equation has the same form when you substitute for x its reciprocal $\frac{1}{x}$.

225. If the greatest exponent of the unknown quantity in a reciprocal equation is an odd number, as in this example

$$x^5+px^4+qx^3+qx^2+px+1=0$$

the equation will always be satisfied by substituting -1 for x; hence -1 must be a root of the equation, and therefore the equation must be divisible by $x+1$. Accordingly, if the division be actually performed, we shall have in the present case

$$x^4+(p-1)x^3-(p-q-1)x^2+(p-1)x+1=0$$

another reciprocal equation, in which the greatest exponent of x is an even number, and therefore resolvable in the manner we have already explained.

SECT. XIV. *Of Equations which have Equal Roots.*

226. WHEN an equation has two or more of its roots equal to one another, those roots may always be discovered, and the equation reduced to another of an inferior degree, by a method of resolution which is peculiar to this class of equations; and which we now proceed to explain.

227. Although the method of resolution we are to employ will apply alike to equations having equal roots, of every degree, yet, for the sake of brevity, we shall take a biquadratic equation

$$x^4+px^3+qx^2+rx+s=0$$

the roots of which may be generally denoted by a, b, c, and d. Thus we have, from the theory of equations,

$$(x-a)(x-b)(x-c)(x-d)=x^4+px^3+qx^2+rx+s$$

Let us put

$A=(x-a)(x-b)(x-c)$ $A''=(x-a)(x-c)(x-d)$
$A'=(x-a)(x-b)(x-d)$ $A'''=(x-b)(x-c)(x-d)$

Then,

Equations with equal Roots.

Then, by actual multiplication, we have

$$A=x^3\left\{\begin{matrix}-a\\-b\\-c\end{matrix}\right\}x^2\left\{\begin{matrix}+ab\\+ac\\+bc\end{matrix}\right\}x-abc$$

$$A'=x^3\left\{\begin{matrix}-a\\-b\\-d\end{matrix}\right\}x^2\left\{\begin{matrix}+ab\\+ad\\+bd\end{matrix}\right\}x-abd$$

$$A''=x^3\left\{\begin{matrix}-a\\-c\\-d\end{matrix}\right\}x^2\left\{\begin{matrix}+ac\\+ad\\+bd\end{matrix}\right\}x-acd$$

$$A'''=x^3\left\{\begin{matrix}-b\\-c\\-d\end{matrix}\right\}x^2\left\{\begin{matrix}+bc\\+bd\\+cd\end{matrix}\right\}x-bcd$$

and taking the sum of these four equations

$$A+A'+A''+A'''=4x^3\left\{\begin{matrix}-3a\\-3b\\-3c\\-3d\end{matrix}\right\}x^2\left\{\begin{matrix}+2ab\\+2ac\\+2ad\\+2bc\\+2bd\\+2cd\end{matrix}\right\}x\left\{\begin{matrix}-abc\\-abd\\-acd\\-bcd\end{matrix}\right.$$

But since a, b, c, d are the roots of the equation

$$x^4+px^3+qx^2+rx+s=0,$$

we have $-3(a+b+c+d)=3p$

$2(ab+ac+ad+bc+bd+cd)=2q$

$-(abc+abd+acd+bcd)=r$

Therefore, by substitution,

$$A+A'+A''+A'''=4x^3+3px^2+2qx+r.$$

228. Let us now suppose that the proposed biquadratic equation has two equal roots, or $a=b$, then $x-a=x-b$, and since one or other of these equal factors enters each of the four products A, A', A'', A''', it is evident that $A+A'+A''+A'''$, or $4x^3+3px^2+2qx+r$ must be divisible by $x-a$, or $x-b$. Thus it appears that if the proposed equation

$$x^4+px^3+qx^2+rx+s=0$$

has two equal roots, each of them must also be a root of this equation

$$4x^3+3px^2+2qx+r=0;$$

for when the first of these equations is divisible by $(x-a)^2$, the latter is necessarily divisible by $x-a$.

229. Let us next suppose that the proposed equation has three equal roots or $a=b=c$, then two at least of the three equal factors $x-a$, $x-b$, $x-c$, must enter each of the four products A', A'', A''', A'''; so that in this case $A+A'+A''+A'''$, or $4x^3+3x^2+2qx+r$ must be twice divisible by $x-a$. Hence it follows, that as often as the proposed equation has three equal roots, two of them must also be equal roots of the equation

$$4x^3+3px^2+2qx+r=0.$$

230. Proceeding in the same manner, it may be shewn that whatever number of equal roots are in the proposed equation

$$x^4+px^3+qx^2+rx+s=0$$

they will all remain except one, in this equation

$$4x^3+3px^2+2qx+r=0,$$

which is evidently derived from the former, by multiplying each of its terms by the exponent of x in that term, and then diminishing the exponent by unity. Equations with equal Roots.

231. If we suppose that the proposed equation has two equal roots or $a=b$, and also two other equal roots, or $c=d$, then, by reasoning as before, it will appear that the equation derived from it must have one root equal to a or b, and another equal to c or d; so that when the former is divisible both by $(x-a)^3$ and $(x-c)^3$, the latter will be divisible by $(x-a)(x-c)$.

232. The same mode of reasoning may be extended to all equations whatever; so that if we suppose

$$x^m+Px^{m-1}+Qx^{m-2}\ldots+Sx^2+Tx+U=0$$

an equation of the mth degree to have a divisor of this form

$$(x-a)^n(x-d)^p(x-f)^q\ldots\text{ \&c.}$$

The equation

$$mx^{m-1}+(m-1)Px^{m-2}+(m-2)Qx^{m-3}\ldots+2Sx+T=0,$$

which is of the next lower degree, will have for a divisor

$$(x-a)^{n-1}(x-d)^{p-1}(x-f)^{q-1}\ldots\text{ \&c.}$$

and as this last product must be a divisor of both equations, it may always be discovered by the rule which has been given (§ 49.) for finding the greatest common divisor of two algebraic quantities.

233. Again, as this last equation must, in the case of equal roots, have the same properties as the original equation; therefore, if we multiply each of its terms by the exponent of x, and diminish that exponent by unity, as before, we have

$$m(m-1)x^{m-2}+(m-1)(m-2)Px^{m-3}+(m-2)(m-3)Qx^{m-4}\ldots+2S=0,$$

a new equation, which will have for a divisor

$$(x-a)^{n-2}(x-d)^{p-2}(x-f)^{q-2},$$

where the exponent of the factors are one less than those of the equation from which it was derived; and as this last divisor is also a divisor of the original equation, it may be discovered in the same manner as the former, namely, by finding the greatest common measure of both equations; and so on we may proceed as far as we please.

234. As a particular example, let us take this equation

$$x^5-13x^4+67x^3-171x^2+216x-108=0,$$

and apply to it the method we have explained, in order to discover whether it has equal roots, and if so, what they are. We must therefore seek the greatest common measure of the proposed equation and this other equation, which is formed agreeably to what has been shewn § 228,

$$5x^4-52x^3+201x^2-342x+216=0,$$

and the operation being performed, we find that they have a common divisor $x^3-8x^2+21x-18$, which is of the third degree, and consequently may have several factors. Let us therefore try whether the last equation and the following,

$$20x^3-156x^2+402x-342=0,$$

which is derived from it, as directed in § 228. have any common divisor; and, by proceeding as before, we

Equations with rational Roots.

find that they admit of this divisor $x-3$, which is also a factor of the last divisor $x^3-8x^2+21x-18$, and therefore the product of remaining factors is immediately found by division to be x^2-5x+6, which is evidently resolvable into $x-2$ and $x-3$.

Thus, it appears upon the whole, that the common divisor of the original equation, and that which is immediately derived from it, is $(x-2)(x-3)^2$; and that the common divisor of the second and third equations is $x-3$. Hence it follows that the proposed equation has $(x-2)^2$ for one factor, and $(x-3)^3$ for another factor; so that the equation itself may be expressed thus, $(x-2)^2(x-3)^3=0$, and the truth of this conclusion may be easily verified by multiplication.

Sect. XV. *Resolution of Equations whose Roots are rational.*

235. It has been shewn in § 169 that the last term of any equation is always the product of its roots taken with contrary signs: Hence it follows that when the roots are rational they may be discovered by the following rule.

Bring all the terms of the equation to one side; find all the divisors of the last term, and substitute them successively for the unknown quantity in the equation. Then each divisor, which produces a result equal to 0, is a root of the proposed equation.

Ex. 1. Let $x^3-4x^2-7x+10=0$ be the proposed equation.

Then, the divisors of 10 the last term are 1, 2, 5, 10, each of which may be taken either positively, or negatively, and these being substituted successively for x, we obtain the following results.

By putting $+1$ for x,	$1-$	$4-$	$7+10=$	0
-1	$-1-$	$4+$	$7+10=$	12
$+2$	$8-$	$16-$	$14+10=$	-12
-2	$-8-$	$16+$	$14+10=$	0
$+5$	$125-$	$100-$	$35+10=$	0

Here the divisors which produce results equal to 0 are $+1$, -2, and $+5$, and therefore these numbers are the three roots of the proposed equation.

236. When the number of divisors to be tried happens to be considerable, it will be convenient to transform the proposed equation into another, in which the last term has fewer divisors. This may, in general, be done by forming an equation, the roots of which are greater or less than those of the proposed equation by some determinate quantity, as in the following example:

Ex. 2. Let $y^4-4y^3-8y+32=0$ be proposed.

Here the divisors to be tried are 1, 2, 4, 8, 16, 32, each taken either positively or negatively; but to prevent the trouble of so many substitutions, let us transform the equation, by putting $x+1$ for y.

Then	$y^4=x^4+$	$4x^3+$	$6x^2+$	$4x+$	1
	$-4y^3=$	$-4x^3-$	$12x^2-$	$12x-$	4
	$-8y=$			$-8x-$	8
	$+32=$				$+32$
Therefore	x^4		$-6x^2-$	$16x+$	$21=0$

is the transformed equation, and the divisors of the last term are $+1$, -1, $+3$, -3, $+7$, -7. These being put successively for x, we get $+1$ and $+3$ for two roots of the equation; and as to the two remaining roots, it is easy to see that they must be imaginary. They may, however, be readily exhibited by considering that the equation $x^4-6x^2-16x+21=0$ is divisible by the product of the two factors $x-1$ and $x-3$, and therefore may be reduced to a quadratic. Accordingly, by performing the division, and putting the quotient equal 0, we have this equation,

Equations with rational Roots.

$$x^2+4x+7+=0,$$

the roots of which are the imaginary quantities $-2+\sqrt{-3}$ and $-2-\sqrt{-3}$; so that since $y=x+1$, the roots of the equation $y^4-4y^3-8y+32=0$ are these, $y=+2$, $y=+4$, $y=-1+\sqrt{-3}$, $y=-1-\sqrt{-3}$.

If this literal equation were proposed

$$x^3-(3a+b)x^2+(2a^2+3ab)x-2a^2b=0,$$

by proceeding as before, we should find $x=a$, $x=2a$, $x=b$ for the roots.

237. To avoid the trouble of trying all the divisors of the last term, a rule may be investigated for restricting the number to very narrow limits as follows:

Suppose that the cubic equation $x^3+px^2+qx+r=0$ is to be resolved. Let it be transformed into another, the roots of which are less than those of the proposed equation by unity: this may be done by assuming $y=x-1$, and the last term of the transformed equation will be $1+p+q+r$. Again, by assuming $y=x+1$ another equation will be formed whose roots exceed those of the proposed equation by unity, and the last term of this other transformed equation will be $-1+p-q+r$. And here it is to be observed, that these two quantities $1+p+q+r$ and $-1+p-q+r$ are formed from the proposed equation x^3+px^2+qx+r by substituting in it successively $+1$ and -1 for x.

Now the values of x are some of the divisors of r, which is the term left in the proposed equation, when x is supposed $=0$; and the values of the y's are some of the divisors of $1+p+q+r$ and $-1+p-q+r$ respectively; and these values are in arithmetical progression, increasing by the common difference unity; because $x-1$, x, $x+1$ are in that progression; and it is obvious, that the same reasoning will apply to an equation of any degree whatever. Hence the following rule.

Substitute in place of the unknown quantity, successively, three or more terms of the progression 1, 0, -1, &c. and find all the divisors of the sums that result, then take out all the arithmetical progressions that can be found among these divisors, whose common difference is 1, and the values of x will be among these terms of the progressions, which are the divisors of the result arising from the substitution of $x=0$. When the series increases, the roots will be positive; and, when it decreases, they will be negative.

Ex. 1. Let it be required to find a root of the equation $x^3-x^2-10x+6=0$.

The

Equations with rational Roots.

The operation.

Subſtit.	*Reſult.*	*Diviſors.*	*Ar. Pro.*
$x=+1$	-4	1. 2. 4.	4
$x=0$	$+6$	1. 2. 3. 6.	3
$x=-1$	$+14$	1. 2. 7. 14.	2

$x^3-x^2-10x+6=$

In this example there is only one progreſſion, 4, 3, 2, the term of which oppoſite to the ſuppoſition of $x=0$ being 3, and the ſeries decreaſing, we try if -3 ſubſtituted for x makes the equation vaniſh, and as it ſucceeds, it follows that -3 is one of its roots. To find the remaining roots, if $x^3-x^2-10x+6$ be divided by $x+3$, and the quotient x^2-4x+2 put $=0$, they will appear to be $2+\sqrt{2}$, and $2-\sqrt{2}$.

Ex. 2. Let the propoſed equation be

$$x^4+x^3-29x^2-9x+180=0.$$

To find its roots.

Sub.	*Ref.*	*Diviſors.*	*Progreſſions.*			
2	70	1. 2. 5. 7. 10. 14. 35. 70.	1	2	5	7
1	144	1. 2. 3. 4. 6. 8. 9. 12, &c.	2	3	4	6
0	180	1. 2. 3. 4. 5. 6. 9. 10, &c.	3	4	3	5
-1	160	1. 2. 4. 5. 8. 10. 16. 20, &c.	4	5	2	4
-2	90	1. 2. 3. 5. 6. 9. 10. 15, &c.	5	6	1	3

Here there are four progreſſions, two increaſing and two decreaſing; hence, by taking their terms, which are oppoſite to the ſuppoſition of $x=0$, we have theſe four numbers to be tried as roots of the equation $+3$, $+4$, -3, -5, all of which are found to ſucceed.

238. If any of the coefficients of the propoſed equation be a fraction, the equation may be transformed into another, having the coefficient of the higheſt power unity, and thoſe of the remaining terms integers by § 189. and the roots of the transformed equation being found, thoſe of the propoſed equation may be eaſily derived from them.

For example, if the propoſed equation be $x^3-\frac{5}{4}x^2+\frac{35}{4}x-6=0$. Let us aſſume $x=\frac{y}{4}$, thus the equation is transformed to

$$\frac{y^3}{64}-\frac{7y^2}{64}+\frac{35y}{16}-6=0,$$

Or $y^3-7y^2+140y-384=0$,

one root of which is $y=3$; hence $x=\frac{y}{4}=\frac{3}{4}$.

The propoſed equation being now divided by $x-\frac{3}{4}$ is reduced to this quadratic $x^2-x+8=0$, the roots of which are both impoſſible.

239. When the coefficients of an equation are integers, and that of the higheſt power of the unknown quantity unity, if its roots are not found among the diviſors of the laſt term, we may be certain that, whether the equation be pure or adfected, its roots cannot be exactly expreſſed either by whole numbers or rational fractions. This may be demonſtrated by means of the following propoſition. If a prime number P be a diviſor of the product of two numbers A and B, it will alſo be a diviſor of at leaſt one of the numbers.

240. Let us ſuppoſe that it does not divide B, and that B is greater than P; then, putting q for the greateſt number of times that P can be had in B, and B′ for the remainder, we have $\frac{B}{P}=q+\frac{B'}{P}$, and therefore

$$\frac{AB}{P}=qA+\frac{AB'}{P}.$$

Hence it appears, that if P be a diviſor of AB, it is alſo a diviſor of AB′. Now B′ is leſs than P, for it is the remainder which is found in dividing B by P; therefore, ſeeing we cannot divide B′ by P, let P be divided by B′, and q' put for the quotient, alſo B″ for the remainder; again, let P be divided by B″, and q'' put for the quotient, and B‴ for the remainder, and ſo on; and as P is ſuppoſed to be a prime number, it is evident that this ſeries of operations may be continued till a remainder be found equal to unity, which will at laſt be the caſe; for the diviſors are the ſucceſſive remainders of the diviſions, and therefore each is leſs than the diviſor which preceded it. By performing theſe operations we obtain the following ſeries of equations,

$$\left.\begin{array}{l} P=q'B'+B'' \\ P=q''B''+B''', \\ \text{\&c.} \end{array}\right\} \text{ and therefore } \left\{\begin{array}{l} B'=\dfrac{P-B''}{q'} \\ B''=\dfrac{P-B'''}{q''}, \\ \text{\&c.} \end{array}\right.$$

Hence we have $AB'=\frac{AP-AB''}{q'}$, and

$$\frac{q'AB'}{P}=\frac{AP-AB''}{P}=A-\frac{AB''}{P}.$$

Now, if AB be diviſible by P, we have ſhewn that AB′, and conſequently $q'AB'$ is diviſible by P; therefore, from the laſt equation, it appears that AB″ muſt alſo be diviſible by P.

Again, from the preceding ſeries of equations, we have $AB''=\frac{AP-AB'''}{q''}$, and therefore

$$\frac{q''AB''}{P}=\frac{AP-AB'''}{P}=A-\frac{AB'''}{P};$$

hence we conclude that AB‴ is alſo diviſible by P.

Proceeding in this manner, and obſerving that the ſeries of quantities B′, B″, B‴, &c. continually decreaſe till one of them $=1$, it is evident that we ſhall at laſt come to a product of this form $A\times 1$, which muſt

Equations with rational Roots.

must be divisible by P, and hence the truth of the proposition is manifest.

241. It follows from this proposition, that if the prime number P, which we have supposed not to be a divisor of B, is at the same time not a divisor of A, it cannot be a divisor of AB the product of A and B.

242. Let $\frac{b}{a}$ be a fraction in its lowest terms, then the numbers a and b have no common divisor; but from what has been just now shewn, it appears, that if a prime number be not a divisor of a it cannot be a divisor of $a \times a$ or a^2, and in like manner, that if a prime number is not a divisor of b, it cannot be a divisor of $b \times b$, or b^2; therefore, it is evident that a^2 and b^2 have no common divisor, and thus the fraction $\frac{b^2}{a^2}$ is also in its lowest terms.

Hence it follows that the square of any fractional quantity is still a fraction, and cannot possibly be a whole number; and, on the contrary, that the square root of a whole number cannot possibly be a fraction; so that all such whole numbers as are not perfect squares can neither have their roots expressed by integers nor by fractions.

243. Since that if a prime number is not a divisor of a, it is also not a divisor of a^2, therefore if it is not a divisor of a, it cannot be a divisor of $a \times a^2$ or a^3, § 241, and by reasoning in this way, it is obvious that if a prime number is not a divisor of a, it cannot be a divisor of a^n; also, that if it is not a divisor of b, it cannot be a divisor of b^n, therefore if $\frac{b}{a}$ is a fraction in its lowest terms $\frac{b^n}{a^n}$ is also a fraction in its lowest terms; so that any power whatever of a fraction is also a fraction, and on the contrary, any root of a whole number is also a whole number. Hence it follows that if the root of a whole number is not expressible by an integer, such root cannot be expressed by a fraction, but is therefore irrational or incommensurable.

244. Let us next suppose that

$$x^n + Px^{n-1} + Qx^{n-2} \ldots + Tx + U = 0$$

is any equation whatever, in which P, Q, &c. denote integer numbers; then if its roots are not integers they cannot possibly be rational fractions. For, if possible, let us suppose $x = \frac{b}{a}$, a fraction reduced to its lowest terms, then, by substitution

$$\frac{a^n}{b^n} + P\frac{a^{n-1}}{b^{n-1}} + Q\frac{a^{n-2}}{b^{n-2}} \ldots + T\frac{a}{b} + U = 0,$$

and, reducing all the terms to a common denominator,

$$a^n + Pa^{n-1}b + Qa^{n-2}b^2 \ldots + Tab^{n-1} + Ub^n = 0,$$

which equation may also be expressed thus

$$a^n + b(Pa^{n-1} + Qa^{n-2}b \ldots + Tab^{n-2} + Ub^{n-1}) = 0,$$

where the equation consists of two parts, one of which is divisible by b. But by hypothesis a and b have no common measure, therefore a^n is not divisible by b, § 243; hence it is evident that the two parts of the equation cannot destroy each other as they ought to do; therefore x cannot possibly be a fraction.

Approximation.

Sect. XVI. *Resolution of Equations by Approximation.*

245. When the roots of an equation cannot be accurately expressed by rational numbers, it is necessary to have recourse to the methods of approximation, and by these we can always determine the numerical values of the roots to as great a degree of accuracy as we please.

246. The application of the methods of approximation is rendered easy by means of the following principles:

If two numbers, either whole or fractional, be found, which, when substituted for the unknown quantity in any equation, produce results with contrary signs; we may conclude that at least one root of the proposed equation is between those numbers, and is consequently real.

Let the proposed equation be

$$x^3 - 5x^2 + 10x - 15 = 0$$

which, by collecting the positive terms into one sum, and the negative into another, may also be expressed thus

$$x^3 + 10x - (5x^2 + 15) = 0$$

then, to determine a root of the equation, we must find such a number as when substituted for x will render

$$x^3 + 10x = 5x^2 + 15.$$

Let us suppose x to have every degree of magnitude from 0 upwards in the scale of number, then $x^3 + 10x$ and $5x^2 + 15$ will both continually increase, but with different degrees of quickness, as appears from the following table.

Successive values of x. 0, 1, 2, 3, 4, 5, 6, &c.
——— of $x^3 + 10x$. 0, 11, 28, 57, 104, 175, 276, &c.
——— of $5x^2 + 15$. 15, 20, 35, 60, 95, 140, 195, &c.

By inspecting this table, it appears that while x increases from 0 to a certain numerical value, which exceeds 3, the positive part of the equation, or $x^3 + 10x$, is always less than the negative part, or $5x^2 + 15$; so that the expression

$$x^3 + 10x - (5x^2 + 15), \text{ or } x^3 - 5x^2 + 10x - 15$$

must necessarily be negative.

It also appears that when x has increased beyond that numerical value, and which is evidently less than 4, the positive part of the equation, instead of being less than the negative part, is now greater, and therefore the expression

$$x^3 - 5x^2 + 10x - 15$$

is changed from a negative to a positive quantity.

247. Hence we may conclude that there is some real and determinate value of x, which is greater than 3, but less than 4, and which will render the positive and negative parts of the equation equal to one another; therefore that value of x must be a root of the proposed equation; and as what has been just now shewn in a particular case will readily apply to any equation whatever, the truth of what has been asserted at § 246 is obvious.

248. Two

Approximation.

248. Two limits, between which all the roots of any equation are contained, may be determined by the following propoſition.

Let N be the greateſt negative coefficient in any equation. Change the ſigns of the terms taken alternately, beginning with the ſecond, and let N′ be the greateſt negative coefficient after the ſigns are ſo changed. The poſitive roots of the equation are contained between 0 and N+1, and the negative roots between 0 and −N′−1.

Suppoſe the equation to be

$$x^4-px^3+qx^2-rx-s=0,$$

which may be alſo expreſſed thus:

$$x^4\left(1-\frac{p}{x}+\frac{q}{x^2}-\frac{r}{x^3}-\frac{s}{x^4}\right)=0.$$

Then, whatever be the values of the coefficients p, q, r, &c. it is evident that x may be taken ſo great as to render each of the quantities $\frac{p}{x}$, $\frac{q}{x^2}$, $\frac{r}{x^3}$, $\frac{s}{x^4}$ as ſmall as we pleaſe, and therefore their ſum, or $-\frac{p}{x}+\frac{q}{x^2}-\frac{r}{x^3}-\frac{s}{x^4}$ leſs than 1; but in that caſe the quantity

$$x^4\left(1-\frac{p}{x}+\frac{q}{x^2}-\frac{r}{x^3}+\frac{s}{x^4}\right),$$

or $x^4-px^3+qx^2-rx+s$

will be poſitive, and ſuch, that the firſt term x^4 is greater than the ſum of all the remaining terms; therefore alſo x^4+qx^2 the ſum of the poſitive terms will be much greater than px^3+rx+s the ſum of the negative terms alone.

Hence it follows, that if a number be found, which when ſubſtituted for x, renders the expreſſion $x^4-px^3+qx^2-rx-s$ poſitive, and which is alſo ſuch that every greater number has the ſame property, that number will exceed the greateſt poſitive root of the equation.

Now, if we ſuppoſe N to be the greateſt negative coefficient, it is evident that the poſitive part of the equation, or x^4+qx^2, is greater than px^3+rx+s, provided that x^4 is greater than Nx^3+Nx^3+Nx+N, or $N(x^3+x^2+x+1)$; but $x^3+x^2+x+1=\frac{x^4-1}{x-1}$, therefore a poſitive reſult will be obtained, if for x there be ſubſtituted a number ſuch that $x^4>\frac{N(x^4-1)}{x-1}$ *, or $x^5-x^4>Nx^4-N$. Now this laſt condition will evidently be fulfilled if we take $x^5-x^4=Nx^4$, and from this equation we find $x=N+1$; but it farther appears that the ſame condition will alſo be fulfilled as often as $x^5-x^4>Nx^4$, or $x-1>N$, that is, $x>N+1$, therefore N+1 muſt be a limit to the greateſt poſitive root of the propoſed equation, as was to be ſhewn.

249. If $-y$ be ſubſtituted for $+x$, the equation $x^4-px^3+qx^2-rx-s=0$ will be transformed into $y^4+py^3+qy^2+ry-s=0$; which equation differs from the former only in the ſigns of the ſecond, fourth, &c. terms; and as the poſitive roots of this laſt equation are the ſame as the negative roots of the propoſed equation, it is evident that their limit muſt be ſuch as has been aſſigned.

Approximation.

250. From the two preceding propoſitions it will not be difficult to diſcover, by means of a few trials, the neareſt integers to the roots of any propoſed numeral equation, and thoſe being found, we may approximate to the roots continually, as in the following example:

$$x^4-4x^3*-3x+27=0.$$

Here the greateſt negative coefficient being 4, it follows, § 248. that the greateſt poſitive root is leſs than 5. If $-y$ be ſubſtituted for x, the equation is tranſformed to

$$y^4+4y^3*+3y+27=0,$$

an equation having all its terms poſitive; therefore, it can have no poſitive roots, and conſequently the propoſed equation can have no negative roots; its real roots muſt therefore be contained between 0 and +5.

251. To determine the limits of each root in particular, let 0, 1, 2, 3, 4, be ſubſtituted ſucceſſively for x; thus we obtain the following correſponding reſults.

Subſtitutions for x	0,	1,	2,	3,	4
Reſults	+27,	+21,	+5,	−9,	+15.

Hence it appears that the equation has two real roots, one between 2 and 3, and another between 3 and 4.

252. That we may approximate to the firſt root, let us ſuppoſe $x=2+y$, where y is a fraction leſs than unity, and therefore its ſecond and higher powers but ſmall in compariſon to its firſt power; hence, in finding an approximate value of y, they may be rejected. Thus we have

$$\begin{aligned} x^4 &= +16+32y, \text{ \&c.}\\ -4x^3 &= -32-48y, \text{ \&c.}\\ -3x &= -6-3y\\ +27 &= +27\end{aligned}$$

Hence $0 = 5-19y$ nearly,

and $y=\frac{5}{19}=.26$; therefore, for a firſt approximation, we have $x=2.26$.

Let us next ſuppoſe $x=2.26+y'$, then, rejecting as before the ſecond and higher powers of y' on account of their ſmallneſs, we have

$$\begin{aligned} x^4 &= +26.087+46.172y', \text{ \&c.}\\ -4x^3 &= -46.172-61.291y', \text{ \&c.}\\ -3x &= -6.780-3y'\\ +27 &= +27\end{aligned}$$

$$0 = .135 - 18.119y' \text{ nearly.}$$

Hence $y'=\frac{.135}{18.119}=.0075$, and $x=2.26+y'=2.2675$.

This value of x is true to the laſt figure, but a more accurate value may be obtained by ſuppoſing $x=2.675+y''$, and finding the value of y'' in the ſame manner as we have already found thoſe of y' and y; and thus the

* The ſign $>$ denotes that the quantities between which it is placed are unequal. Thus $a>b$, ſignifies that a is greater than b, and $a<c$, that a is leſs than c.

Approxima tion.

the approximation may be continued till any required degree of accuracy be obtained.

The ſecond root of the equation, which we have already found to be between 3 and 4, may be inveſtigated in the ſame manner as the firſt, and will appear to be 3.6797, the approximation being carried on to the fourth figure of the decimal, in determining each root.

253. In the preceding example we have ſhewn how to approximate to the roots of an adfected equation, but the ſame method will alſo apply to pure equations.

For example, let it be required to determine x from this equation $x^3=2$.

Becauſe x is greater than 1, and leſs than 2, but nearer to the former number than to the latter, let us aſſume $x=1+y$, then, rejecting the powers of y which exceed the firſt, we have $x^3=1+3y$, and therefore $2=1+3y$, and $y=\frac{1}{3}=.3$ nearly, hence $x=1.3$ nearly.

Let us next aſſume $x=1.3+y'$, then, proceeding as before, we find $2=2.197+5.07y'$, hence $y'=-\frac{.197}{5.07}$ $=-.039$, and $x=1.3-.039=1.26$ nearly.

To find a ſtill nearer approximation let us ſuppoſe $x=1.26+y'$, then from this aſſumption we find $y=$ $-.000079$, and therefore $x=12.59921$, which value is true to the laſt figure.

254. By aſſuming an equation of any order with literal coefficients, a general formula may be inveſtigated, for approximating to the roots of equations belonging to that particular order.

Let us take for an example the cubic equation

$$x^3+px^2+qx+r=0,$$

and ſuppoſe that $x=a+y$, where a is nearly equal to x, and y is a ſmall fraction. Then, by ſubſtituting $a+y$ for x in the propoſed equation, and rejecting the powers of y which exceed the firſt, on account of their ſmallneſs, we have

$$a^3+pa^2+qa+r+(3a^2+2pa+q)y=0.$$

Hence $y=-\frac{a^3+pa^2+qa+r}{3a^2+2pa+q}$

and $x=a-\frac{a^3+pa^2+qa+r}{3a^2+2pa+q}=\frac{2a^3+pa^2-r}{3a^2+2pa+q}$.

255. Let it be required to approximate to a root of the cubic equation $x^3+2x^2+3x-50=0$. Here $p=2$ $q=3$ and $r=-50$; and by trials it appears that x is between 2 and 3, but neareſt the latter number; therefore for the firſt approximation a may be ſuppoſed $=3$, hence we find

$$x=\frac{2a^3+pa^2-r}{3a^2+2pa+q}=\frac{122}{34}=\frac{61}{17}.$$

By ſubſtituting $\frac{61}{17}$ for a in the formula, and proceeding as before, a value of x would be found more exact than the former, and ſo on we may go as far as we pleaſe.

256. The method we have hitherto employed for approximating to the roots of equations is known by the name of *the method of ſucceſſive ſubſtitutions*, and was firſt propoſed by Newton. It has been ſince improved by Lagrange, who has given it a form which has the advantage of ſhewing the progreſs made in the approximation by each operation. This improved form we now proceed to explain.

Approxima tion.

Let a denote the whole number, next leſs to the root ſought, and $\frac{1}{y}$ a fraction, which, when added to a, completes the root, then $x=a+\frac{1}{y}$. If this value of x be ſubſtituted in the propoſed equation, a new equation involving y will be had, which, when cleared of fractions, will neceſſarily have a root greater than unity.

Let b be the whole number which is next leſs than that root, then, for a firſt approximation, we have $x=$ $a+\frac{1}{b}$. But b being only an approximate value of y, in the ſame manner as a is an approximate value of x, we may ſuppoſe $y=b+\frac{1}{y'}$, then, by ſubſtituting $b+\frac{1}{y'}$, for y, we ſhall have a new equation, involving only y', which muſt be greater than unity; putting therefore b' to denote the next whole number leſs than the root of the equation involving y', we have $y=b+\frac{1}{b'}=\frac{bb'+1}{b'}$, and ſubſtituting this value in that of x the reſult is

$$x=a+\frac{b'}{bb'+1}$$

for a ſecond approximate value of x.

To find a third value we may take $y'=b'+\frac{1}{y''}$, then if b'' denote the next whole number leſs than y', we have $y'=b'+\frac{1}{b''}=\frac{b'b''+1}{b''}$, whence

$$y=b+\frac{b''}{b'b''+1}=\frac{bb'b''+b''+b}{b'b''+1} \text{ and}$$

$$x=a+\frac{b'b''+1}{bb'b''+b''+b}$$

and ſo on to obtain more accurate approximations.

257. We ſhall apply this method to the following example.

$$x^3-7x+7=0.$$

Here the poſitive roots muſt be between 0 and 8, let us therefore ſubſtitute ſucceſſively, 0, 1, 2, . . . to 8 and we obtain reſults as follow:

Subſtitutions.

0, 1, 2, 3, 4, 5, 6, 7, 8,

Reſults.

$+7, +1, +1, +13, +43, +97, +181, +301, +463$;

but as theſe reſults have all the ſame ſign, nothing can be concluded reſpecting the magnitude of the roots from that circumſtance alone. It is, however, obſervable, that while x increaſes from 0 to 1 the reſults decreaſe; but that whatever ſucceſſive magnitudes x has greater than 2, the reſults increaſe; we may therefore reaſonably conclude that if the equation have any poſitive roots they muſt be between 1 and 2. Accordingly by ſubſtituting 1.2, 1.4, 1.6, and 1.8 ſucceſſively for x we find theſe reſults $+.328$, $-.056$, $-.104$, $+.232$, and

Approximation.

and as there are here two changes of the signs, it follows that the equation has two positive roots, one between 1.2 and 1.4, and another between 1.6 and 1.8.

Hence it appears, that to find either value of x, we may assume $x=1+\frac{1}{y}$; thus, by substitution, we have

$$y^3-4y^2+3y+1=0.$$

The limit of the positive roots of this last equation is 5, and by substituting 0, 1, 2, 3, 4, successively for y, it will be found to have two, one of which is between 1 and 2, and the other between 2 and 3. Therefore, for a first approximation, we have

$$x=1+\tfrac{1}{1},\ x=1+\tfrac{1}{2},\ \text{that is, } x=2,\ x=\tfrac{3}{2}.$$

To approach nearer to the first value of y, let us take $y=1+\frac{1}{y'}$, and therefore

$$y'^3-2y'^2-y'+1=0.$$

This last equation will be found to have only one real root between 2 and 3, from which it appears, that $y=1+\frac{1}{2}=\frac{3}{2}$, and $x=1+\frac{2}{3}=\frac{5}{3}$.

Let us next suppose $y'=2+\frac{1}{y''}$; hence we find

$$y''^3-3y''^2-4y''-1=0,$$

and from this equation y'' is found to be between 4 and 5. Taking the least limit, we have

$$y'=2+\tfrac{1}{4}=\tfrac{9}{4},\ y=1+\tfrac{4}{9}=\tfrac{13}{9},\ x=1+\tfrac{9}{13}=\tfrac{22}{13}.$$

It is easy to continue this process by assuming $y''=4+\frac{1}{y'''}$, and so on, as far as may be judged necessary.

We return to the second value of x, which was found $=\frac{3}{2}$ by the first approximation, and which corresponds to $y=2$. Putting $y=2+\frac{1}{y'}$, and substituting this value in the equation $y^3-4y^2+3y+1=0$, which was formerly found, we get

$$y'^3+y'^2-2y'-1=0,$$

this equation, as well as the corresponding equation employed in determining the other value of x, has only one root greater than unity, which root being between 1 and 2, let us take $y'=1$, we thence find

$$y=3,\ \text{and } x=1+\tfrac{1}{3}=\tfrac{4}{3}.$$

Put $y'=1+\frac{1}{y''}$, and we thence find by substitution

$$y''^3-3y''^2-4y''-1=0,$$

an equation which gives y'' between 4 and 5; hence, as before,

$$y'=\tfrac{5}{4},\ y=\tfrac{13}{5},\ x=\tfrac{18}{13}.$$

That we may proceed in the approximation, we have only to suppose $y''=4+\frac{1}{y'''}$, and so on. The equation x^3-7x+7 has also a negative root between -3 and -4, and to find a nearer value we may put $x=-3-\frac{1}{y}$; hence we have $y^3-20y^2-9y-1=0$, and $y>20$, $y<21$; and therefore, for the first approximation, $x=-3-\frac{1}{20}=-\frac{61}{20}$. By putting $y=20+\frac{1}{y'}$, &c. we may obtain successive values of x, each of which will be more exact than that which preceded it.

Infinite Series.

258. The successive equations which involve y, y', y'', &c. have never more than one root greater than unity, unless that two or more roots of the proposed equation are contained between the limits a, and $a+1$; but when that circumstance has place, as in the preceding example, some one of the equations involving y, y', &c. will have more than one root greater than unity, and from each root a series of equations may be derived, by which we may approximate to the particular roots of the proposed equation contained between the limits a and $a+1$.

Sect. XVII. *Of Infinite Series.*

259. The resolving of any proposed quantity into a series, is a problem of considerable importance in the application of algebra to the higher branches of the mathematics; and there are various methods by which it may be performed, suited to the particular forms of the quantities which may become the subject of consideration.

260. Any rational fraction may be resolved into a series, by the common operation of algebraic division, as in the following examples:

Ex. 1. To change $\frac{ax}{a-x}$ into an infinite series.

Operation.

$$\begin{array}{l|l} a-x)ax & (x+\frac{x^2}{a}+\frac{x^3}{a^2}+\frac{x^4}{a^3}+, \text{ \&c.} \\ \quad ax-x^2 & \\ \hline \quad +x^2 & \\ \quad +x^2-\frac{x^3}{a} & \\ \hline \quad +\frac{x^3}{a} & \\ \quad +\frac{x^3}{a}-\frac{x^4}{a^2} & \\ \hline \quad +\frac{x^4}{a^2} & \end{array}$$

Thus it appears, that

$$\frac{ax}{a-x}=x+\frac{x^2}{a}+\frac{x^3}{a^2}+\frac{x^4}{a^3}+, \text{ \&c.}$$

Here the law of the series being evident, the terms may be continued at pleasure.

Ex. 2. It is required to convert $\frac{a^2}{(a+x)^2}$ into an infinite series

Infinite Series.

$$a^2+2ax+x^2)a^2\quad(1-\frac{2x}{a}+\frac{3x^2}{a^2}-\frac{4x^3}{a^3}+,\ \&c.$$

$$\begin{array}{r}a^2+2ax+x^2\\ \hline -2ax-x^2\\ -2ax-4x^2-\frac{2x^3}{a}\\ \hline +3x^2+\frac{2x^3}{a}\\ +3x^2+\frac{6x^3}{a}+\frac{3x^4}{a^2}\\ \hline -\frac{4x^3}{a}-\frac{3x^4}{a^2}\end{array}$$

Therefore $\frac{a^2}{(a+x)^2}=1-\frac{2x}{a}+\frac{3x^2}{a^2}-\frac{4x^3}{a^3}+\frac{5x^4}{a^4}-$, &c. the law of continuation being evident.

261. A ſecond method by which algebraic quantities, whether rational or irrational, may be converted into ſeries, and which is alſo of very extenſive uſe in the higher parts of the mathematics, conſiſts in aſſuming a ſeries with indeterminate coefficients, and having its terms proceeding according to the powers of ſome quantity contained in the propoſed expreſſion. Infinite Series.

That we may explain this method, let us ſuppoſe that the fraction $\frac{a^2}{a^2+ax+x^2}$ is to be converted into a ſeries proceeding by the powers of x; we are therefore to aſſume

$$\frac{a^2}{a^2+ax+x^2}=A+Bx+Cx^2+Dx^3+Ex^4+,\ \&c.$$

where A denotes theſe terms of the ſeries into which x does not at all enter; Bx the terms which contain only the firſt power of x; Cx^2 the terms which contain only the ſecond power, and ſo on. Let both ſides of the equation be multiplied by a^2+ax+x^2 ſo as to take away the denominator of the fraction, and let the numerator a^2 be tranſpoſed to the other ſide, ſo that the whole expreſſion may be $=0$, then

$$\left.\begin{array}{l}a^2A+a^2B\\ -a^2+aA\end{array}\right\}\ x\left\{\begin{array}{l}+a^2C\\ +aB\\ +A\end{array}\right\}x^2\left\{\begin{array}{l}+a^2D\\ +aC\\ +B\end{array}\right\}x^3\left\{\begin{array}{l}+a^2E\\ +aD\\ +C\end{array}\right\}x^4+,\ \&c.\Big\}=0.$$

Now the quantities A, B, C, D, &c. being ſuppoſed to be entirely indepeendent of any particular value of x, it follows that the whole expreſſion can only be $=0$, upon the ſuppoſition that the terms which multiply the ſame powers of x are ſeparately $=0$; for if that were not the caſe, it would follow that x had a certain determinate relation to the quantities A, B, C, &c. which is contrary to what we have all along ſuppoſed. To determine the quantities A, B, C, D, &c. therefore, we have this ſeries of equations

$a^2A-a^2=0$	Hence $A=1$
$a^2B+aA=0$	$B=-\frac{A}{a}=-\frac{1}{a}$
$a^2C+aB+A=0$	$C=-\frac{B}{a}-\frac{A}{a^2}=0$
$a^2D+aC+B=0$	$D=-\frac{C}{a}-\frac{B}{a^2}=\frac{1}{a^3}$
$a^2E+aD+C=0$	$E=-\frac{D}{a}-\frac{C}{a^2}=-\frac{1}{a^4}$
&c.	&c.

Here the law of relation which takes place among the quantities A, B, C, D, &c. is evident, viz. that if P, Q, R, denote any three coefficients which immediately follow each other

$$a^2R+aQ+P=0$$

and from this equation, by means of the coefficients already determined, we find $F=0$, $G=\frac{1}{a^6}$, $H=-\frac{1}{a^7}$, $K=0$, &c.

Therefore, reſuming the aſſumed equation, and ſubſtituting for A, B, C, &c. their reſpective values, we have

$$\frac{a^2}{a^2+ax+x^2}=1-\frac{x}{a}*+\frac{x^3}{a^3}-\frac{x^4}{a^4}*+\frac{x^6}{a^6}-\frac{x^7}{a^7}*+,\ \&c.$$

262. As a ſecond example of the method of indeterminate coefficients, let it be required to expreſs the ſquare root a^2-x^2 by means of a ſeries. For this purpoſe we might aſſume

$$\sqrt{a^2-x^2}=A+Bx+Cx^2+Dx^3+Ex^4+,\ \&c.$$

but as we would find the coefficients of the odd powers of x, each $=0$, let us rather aſſume

$$\sqrt{a^2-x^2}=A+Bx^2+Cx^4+Dx^6+,\ \&c.$$

then, ſquaring both ſides, and tranſpoſing, we have

$$0=\left\{\begin{array}{l}A^2+2AB\\ +\ 1\\ -a^2\end{array}\right\}x^2\left\{\begin{array}{l}+2AC\\ +\ B^2\end{array}\right\}x^4\left\{\begin{array}{l}+2AD\\ +2BC\end{array}\right\}x^6+,\ \&c.$$

Hence $A^2-a^2=0$ and $A=a$

$2AB+1=0$	$B=-\frac{1}{2A}=-\frac{1}{2a}$
$2AC+B^2=0$	$C=-\frac{B^2}{2A}=-\frac{1}{8a^3}$
$AD+BC=0$	$D=-\frac{BC}{A}=-\frac{1}{16a^5}$
&c.	&c.

and ſubſtituting for A, B, C, &c. their values

$$\sqrt{a^2-x^2}=a-\frac{x^2}{2a}-\frac{x^4}{8a^3}-\frac{x^6}{16a^5}-,\ \&c.$$

This method of reſolving a quantity into an infinite ſeries will be found more expeditious than any other, as often as the operations of diviſion and evolution are to be performed at the ſame time, as in theſe expreſſions $\frac{1}{\sqrt{a^2+x^2}}$, or $\frac{\sqrt{a^2-x^2}}{\sqrt[3]{a^3+x^3}}$.

263. The binomial theorem affords a third method of reſolving quantities into ſeries, but before we explain this method it will be proper to ſhew how the theorem itſelf may be inveſtigated.

Let $a+x$ be any binomial quantity, which is to be raiſed

Infinite Series.

raiſed to a power denoted by $\frac{m}{n}$, where m and n denote any numbers either poſitive or negative. Or becauſe $a+x=a\left(1+\frac{x}{a}\right)$, if we put $\frac{x}{a}=y$, then $(a+x)^{\frac{m}{n}}$ $=a^{\frac{m}{n}}\times(1+y)^{\frac{m}{n}}$; therefore inſtead of $a+x$ we may conſider $1+y$, which is ſomewhat more ſimple in its form.

264. By conſidering ſome of the firſt powers of $1+x$, viz.

$(1+x)=1+x$
$(1+x)^2=1+2x+x^2$
$(1+x)^3=1+3x+3x^2+x^3$
$(1+x)^4=1+4x+6x^2+4x^3+x^4$
&c.

it appears that the powers of $1+x$ have this form

$$1+Ax+Bx^2+Cx^3=Dx^4+, \&c.$$

where the coefficients A, B, C, D, &c. are numbers which are altogether independent of any particular value of x. It alſo appears that the ſeries cannot contain any negative power of x; for if any of its terms had this form $\frac{Q}{x^r}$, then, the ſuppoſition of $x=0$ would render that term indefinitely great, whereas the whole ſeries ought in that caſe to be reduced to unity.

265. Let us therefore aſſume

$(1+y)^{\frac{m}{n}}=1+Ay+By^2+Cy^3+Dy^4+$, &c.

Then we have alſo

$(1+z)^{\frac{m}{n}}=1+Az+Bz^2+Cz^3+Dz^4+$, &c.

Let us put $(1+y)^{\frac{1}{n}}=u$, $(1+z)^{\frac{1}{n}}=v$, and therefore $(1+y)^{\frac{m}{n}}=u^m$, $(1+z)^{\frac{m}{n}}=v^m$, then, taking the difference between the two ſeries, we have

$u^m-v^m=A(y-z)+B(y^2-z^2)+C(y^3-z^3)+D(y^4-z^4)+$, &c.

Becauſe $u^n=1+y$ and $v^n=1+z$, by ſubtracting the latter equation from the former, $u^n-v^n=y-z$, hence, and from the laſt ſeries, we have

$$\frac{u^m-v^m}{u^n-v^n}=\frac{A(y-z)}{y-z}+\frac{B(y^2-z^2)}{y-z}+\frac{C(y^3-z^3)}{y-z}+\frac{D(y^4-z^4)}{y-z}+, \&c.$$

Infinite Series.

266. But every expreſſion of the form u^m-v^m is diviſible by $u-v$, when m is a whole number, thus we have

$u^m-v^m=(u-v)(u^{m-1}+u^{m-1}v\ldots+uv^{m-2}+v^{m-1})$
$u^n-v^n=(u-v)(u^{n-1}+u^{n-2}v\ldots+uv^{n-2}+v^{n-1})$

ſo that if we ſubſtitute for $\frac{u^m-v^m}{u^n-v^n}$ its value as found from theſe equations, and divide each term of the ſeries by the denominator $y-z$, we have

$$\frac{u^{m-1}+u^{m-2}v\ldots+uv^{m-2}+v^{m-1}}{u^{n-1}+u^{n-2}v\ldots+uv^{n-2}+v^{n-1}}=$$

$A+B(y+z)+C(y^2+yz+z^2)+D(y^3+y^2z+yz^2+z^3)+E(y^4+y^3z+y^2z^2+yz^3+z^4)+$, &c.

Now as this laſt equation muſt be true, whatever be the values of y and z, we may ſuppoſe $y=z$, but in that caſe $1+y=1+z$ or $u^n=v^n$, and therefore $u=v$. Thus the equation is reduced to

$$\frac{mu^{m-1}}{nu^{n-1}}=A+2By+3Cy^2+4Dy^3+5Ey^4+, \&c.$$

or to the following:

$$\frac{m}{n}u^m=u^n(A+2By+3Cy^2+4Dy^3+5Ey^4+, \&c.),$$

ſo that, putting for u^m and u^n their values $(1+y)^{\frac{m}{n}}$ and $1+y$ we have

$$\frac{m}{n}(1+y)^{\frac{m}{n}}=(1+y)(A+2By+3Cy^2+4Dy^3+5Ey^4+, \&c.$$
$$=\begin{cases}A+2By+3Cy^2+4Dy^3+5Ey^4+, \&c.\\ \quad +Ay+2By^2+3Cy^3+4Dy^4+, \&c.\end{cases}$$

But from the equation originally aſſumed we have

$$\frac{m}{n}(1+y)^{\frac{m}{n}}=\frac{m}{n}+\frac{m}{n}Ay+\frac{m}{n}By^2+\frac{m}{n}Cy^3+\frac{m}{n}y^4+, \&c.$$

therefore

$$\frac{m}{n}+\frac{m}{n}Ay+\frac{m}{n}By^2+\frac{m}{n}Cy^3+\frac{m}{n}Dy^4+, \&c.$$
$$=\begin{cases}A+2By+3Cy^2+4Dy^3+5Ey^4+, \&c.\\ \quad +Ay+2By^2+3Cy^3+4Dy^4+, \&c.\end{cases}$$

And as the coefficients of the terms have no connexion with any particular value of y, it follows, that the coefficient of any power of y on the one ſide of the equation muſt be equal to the coefficient of the ſame power of y on the other ſide. Therefore, to determine A, B, C, &c. we have the following ſeries of equations:

Infinite Series.

$A=\frac{m}{n}$. Hence $A=\frac{m}{n}$

$$2B+A=\frac{m}{n}A \qquad B=\frac{A\left(\frac{m}{n}-1\right)}{2}=\frac{A(m-n)}{2n}$$

$$3C+2B=\frac{m}{n}B \qquad C=\frac{B\left(\frac{m}{n}-2\right)}{3}=\frac{B(m-2n)}{3n}$$

$$4D+3C=\frac{m}{n}C \qquad D=\frac{C\left(\frac{m}{n}-3\right)}{4}=\frac{C(m-3n)}{4n}$$

$$5E+4D=\frac{m}{n}D \qquad E=\frac{D\left(\frac{m}{n}-4\right)}{5}=\frac{D(m-4n)}{5n}$$

&c. &c.

Or, fubſtituting for A, B, C, &c. their values as determined from the preceding equations:

$$A=\frac{m}{n}$$

$$B=\frac{m(m-n)}{1\cdot 2\,n^2}$$

$$C=\frac{m(m-n)(m-2n)}{1\cdot 2\cdot 3\,n^3}$$

$$D=\frac{m(m-n)(m-2n)(m-3n)}{1\cdot 2\cdot 3\cdot 4\,n^4}$$

$$E=\frac{m(m-n)(m-2n)(m-3n)(m-4n)}{1\cdot 2\cdot 3\cdot 4\cdot 5\,n^5}$$

&c.

267. Reſuming now the aſſumed equation

$$(1+y)^{\frac{m}{n}}=1+Ay+By^2+Cy^3+,\ \&c.$$

and obſerving that $\frac{x}{y}=y$ and $(a+x)^{\frac{m}{n}}=a^{\frac{m}{n}}(1+y)^{\frac{m}{n}}$ we have

$$(a+x)^{\frac{m}{n}}=a^{\frac{m}{n}}\left(1+\frac{mx}{na}+\frac{A(m-n)x^2}{2n\ a^2}+\frac{B(m-2n)}{3n}\right.$$

$$\left.\frac{x^3}{a^3}+\frac{C(m-3n)x^4}{4n\ a^4}+,\ \&c.\right)$$

where A, B, C, &c. denote the coefficients of the preceding terms, or

$$(a+x)^{\frac{m}{n}}=a^{\frac{m}{n}}+\frac{m}{n}a^{\frac{m-n}{n}}x+\frac{m(m-n)}{1\cdot 2\ n^2}a^{\frac{m-2n}{n}}x^2+$$

$$\frac{m(m-n)(m-2n)}{1\cdot 2\cdot 3\ n^3}a^{\frac{m-3n}{n}}x^3$$

$$+\frac{m(m-n)(m-2n)(m-3n)}{1\cdot 2\cdot 3\cdot 4\ n^4}a^{\frac{m-4n}{n}}x^4+,\ \&c.$$

and either of theſe formulæ may be conſidered as a general theorem for raiſing a binomial quantity $a+x$ to any power whatever.

268. In determining the value of the expreſſion $\frac{u^m-v^m}{u^n-v^n}$ when $u=v$ it has been taken for granted that $\frac{m}{n}$ is poſitive, but the ſame concluſion will be obtained when $\frac{m}{n}$ is negative. For, changing $+m$ into $-m$, and obſerving that

Infinite Series.

$$u^{-m}-v^{-m}=\frac{1}{u^m}-\frac{1}{v^m}=\frac{v^m-u^m}{u^mv^m}$$

we have

$$\frac{u^{-m}-v^{-m}}{u^n-v^n}=\frac{1}{u^mv^m}\left(\frac{v^m-u^m}{u^n-v^n}\right)=-\frac{1}{u^mv^m}\left(\frac{u^m-v^m}{u^n-v^n}\right).$$

Now we have already found, that when $u=v$, the fraction $\frac{u^m-v^m}{u^n-v^n}$ becomes $\frac{mu^{m-1}}{nu^{n-1}}$; therefore, in the ſame caſe,

$$\frac{u^{-m}-v^{-m}}{u^n-v^n}=\frac{-1}{u^{2m}}\times\frac{mu^{m-1}}{nu^{n-1}}=\frac{-u^{-m-1}}{nu^{n-1}}$$

and from this laſt expreſſion we derive the ſame value for u^{-m} or $(1+y)^{-\frac{m}{n}}$ as before, regard being had to the change of the ſign of the exponent.

269. If we ſuppoſe m to be a poſitive integer, and $n=1$, the ſeries given in laſt article for the powers of $a+x$ will always terminate, as appears alſo from the operation of involution; but if m be negative, or $\frac{m}{n}$ a fraction, the ſeries will conſiſt of an indefinite number of terms. Examples of the application of the theorem have been already given upon the firſt ſuppoſition, when treating of involution; we now proceed to ſhew how it is to be applied to the expanſion of algebraic quantities into ſeries upon either of the two laſt hypotheſes.

270. *Ex.* 1. It is required to expreſs $\frac{r^3}{(r+z)^3}$ by means of a ſeries.

Becauſe $\frac{r}{r+z}=\frac{1}{1+\frac{z}{r}}$,

Therefore $\frac{r^3}{(r+z)^3}=\frac{1}{\left(1+\frac{z}{r}\right)^3}=\left(1+\frac{z}{r}\right)^{-3}$

Let $\left(1+\frac{z}{r}\right)^{-3}$ be compared with $(a+x)^{\frac{m}{n}}$ and we have

$$a=1,\ x=\frac{z}{r},\ m=-3,\ n=1.$$

Hence, by ſubſtituting theſe values of a, x, m, n in the firſt general formula of § 267, we have

$$\frac{r^3}{(r+z)^3}\begin{cases}=1-\frac{3z}{r}+\frac{3\cdot 4z^2}{1.2r^2}-\frac{3\cdot 4\cdot 5z^3}{1.2.3r^3}+,\ \&c.\\ =1-\frac{3z}{r}+\frac{6z^2}{r^2}-\frac{10z^3}{r^3}-\frac{15z^4}{r^4}+,\ \&c.\end{cases}$$

Ex. 2.

Reversion of Series.

Ex. 2. It is required to express $\sqrt[3]{a+b}$ by the form of a series.

Because $a+b=a\left(1+\frac{b}{a}\right)$

Therefore $\sqrt[3]{a+b}=\sqrt[3]{a}\times\sqrt[3]{1+\frac{b}{a}}=a^{\frac{1}{3}}\left(1+\frac{b}{a}\right)^{\frac{1}{3}}$

By comparing $\left(1+\frac{b}{a}\right)^{\frac{1}{3}}$ with $(a+x)^{\frac{m}{n}}$ we have $a=1$, $x=\frac{b}{a}$, $m=1$, $n=3$,

and substituting as in last example

$$\sqrt[3]{a+b}\begin{cases}=a^{\frac{1}{3}}\left(1+\frac{1.b}{3a}-\frac{1.2b^2}{3.6a^3}+\frac{1.2.5b^3}{3.6.9a^3}-\frac{1.2.5.8b^4}{3.6.9.12a^4}+, \&c.\right)\\ =a^{\frac{1}{3}}\left(1+\frac{b}{3a}-\frac{b^2}{9a^2}+\frac{5b^3}{81a^3}-\frac{10b^4}{243a^4}+, \&c.\right)\end{cases}$$

Ex. 3. It is required to resolve $\frac{r^3}{(r^3+z^3)^{\frac{2}{3}}}$ into a series.

Because $\frac{r^3}{(r^3+z^3)^{\frac{2}{3}}}=r^3\times(r^3+z^3)^{-\frac{2}{3}}$ if we raise r^3+z^3 to the $-\frac{2}{3}$ power, and multiply the resulting series by r^3, we shall have the series required. Or the given quantity may be reduced to a more simple form thus; because $r^3+z^3=r^3\times\left(1+\frac{z^3}{r^3}\right)$

Therefore $(r^3+z^3)^{\frac{2}{3}}=r^2\left(1+\frac{z^3}{r^3}\right)^{\frac{2}{3}}$, and

$\frac{r^3}{(r^3+z^3)^{\frac{2}{3}}}=\frac{1}{\left(1+\frac{z^3}{r^3}\right)^{\frac{2}{3}}}=\left(1+\frac{z^3}{r^3}\right)^{-\frac{2}{3}}$. Hence

$$\frac{r^3}{(r^3+z^3)^{\frac{2}{3}}}\begin{cases}=\left(1+\frac{z^3}{r^3}\right)^{-\frac{2}{3}}\\ =1-\frac{2z^3}{3r^3}+\frac{2.5z^6}{3.6r^6}-\frac{2.5.8z^9}{3.6.9r^9}+\frac{2.5.8.11z^{12}}{3.6.9.12r^{12}}-, \&c.\\ =1-\frac{2z^3}{3r^3}+\frac{5z^6}{9}-\frac{40z^9}{81r^9}+\frac{110z^{12}}{243r^{12}}-, \&c.\end{cases}$$

Ex. 4. It is required to find a series equal to $\frac{\sqrt{a^2+x^2}}{\sqrt{a^2-x^2}}$.

First by the binomial theorem we have

$$\sqrt{a^2+x^2}=(a^2+x^2)^{\frac{1}{2}}=a+\frac{x^2}{2a}-\frac{x^4}{8a^3}+\frac{x^6}{16a^5}-, \&c.$$

$$\frac{1}{\sqrt{a^2-x^2}}=(a^2-x^2)^{-\frac{1}{2}}=\frac{1}{a}+\frac{x^2}{2a^3}+\frac{3x^4}{8a^5}+\frac{5x^6}{16a^7}+, \&c.$$

Therefore, by taking the product of the two series, and proceeding in the operation only to such terms as involve the 6th power of x, we find

$$\frac{\sqrt{a^2+x^2}}{\sqrt{a^2-x^2}}=1+\frac{x^2}{a^2}-\frac{x^4}{2a^4}+\frac{x^6}{2a^6}, \&c.$$

Sect. XVIII. *Of the Reversion of Series.*

271. The method of indeterminate coefficients, which we have already employed when treating of infinite series, may also be applied to what is called the reverting of series; that is, having any quantity expressed by an infinite series composed of the powers of another quantity, to express, on the contrary, the latter quantity by means of an infinite series composed of the powers of the former.

272. Let $y=n+ax+bx^2+cx^3+dx^4+, \&c.$

Then to revert the series we must find the value of x in terms of y. For this purpose we shall transpose n, and put $z=y-n$, then

$$z=ax+bx^2+cx^3+dx^4+, \&c.$$

Now when $x=0$, it is evident that $z=0$, therefore we may assume for x a series of this form

$$x=Az+Bz^2+Cz^3+Dz^4+, \&c.$$

where the coefficients A, B, C, D, &c. denote quantities as yet unknown, but which are entirely independent of the quantity x. To determine those quantities let the first, second, third, &c. powers of the series

$$Az+Bz^2+Cz^3+Dz^4+, \&c.$$

be

Of Logarithms, &c.

be found by multiplication, and substituted for x, x^2, x^3, &c. respectively, in the equation

$$0 = -z + ax + bx^2 + cx^3 +, \text{ &c.}$$

thus we have

$$\begin{aligned}
-z &= -z \\
+ax &= aAz + aBz^2 + aCz^3 + aDz^4 + \text{&c.} \\
+bx^2 &= bA^2z^2 + 2bABz^3 + 2bACz^4 + \text{&c.} \\
&\quad + bB^2z^4 \\
+cz^3 &= cA^3z^3 + 3cA^2Bz^4 + \text{&c.} \\
+dz^4 &= dA^4z^4 + \text{&c.} \\
&\text{&c.}
\end{aligned} \Bigg\} = 0$$

and, putting the coefficients of z, z^2, z^3, &c. each $=0$,

$$aA - 1 = 0,\ aB + bA^2 = 0,\ aC + 2bAB + cA^3 = 0$$
$$aD + 2bAC + bB^2 + 3cA^2B + dA^4 = 0, \text{ &c.}$$

these equations give

$$A = \frac{1}{a}$$

$$B = -\frac{b}{a^3}$$

$$C = \frac{2b^2 - ac}{a^5}$$

$$D = -\frac{5b^3 - 5abc + a^2d}{a^7}$$

&c.

Therefore $x = \frac{1}{a}z - \frac{b}{a^3}z^2 + \frac{2b^2 - ac}{a^5}z^3 - \frac{5b^3 - 5abc + a^2d}{a^7}z^4 +$, &c.

273. As an example of the application of this formula, let it be required to determine x from the equation

$$y = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} +, \text{ &c.}$$

In this case we have

$$z = y,\ a = 1,\ b = -\tfrac{1}{2},\ c = \tfrac{1}{3},\ d = -\tfrac{1}{4}, \text{ &c.}$$

Therefore, substituting these values, we have

$$x = y + \frac{y^2}{2} + \frac{y^3}{6} + \frac{y^4}{24} +, \text{ &c.}$$

274. In the equation

$$ay + by^2 + cy^3 +, \text{ &c.} = a'x + b'x^2 + c'x^3 +, \text{ &c.}$$

in which both sides are expressed by series, and it is required to find y in terms of x, we must assume, as before,

$$y = Ax + Bx^2 + Cx^3 + Dx^4 +, \text{ &c.}$$

and substitute this series and its powers for y and its powers in the proposed equation; afterwards, by bringing all the terms to one side, and making the coefficients of each power of y, $=0$, a series of equations will be had by which the quantities A, B, C, D, &c. may be determined.

Sect. XIX. *Of Logarithms and Exponential Quantities.*

275. All positive numbers may be considered as powers of any one given affirmative number. The powers of 2, for instance, may become equal, either exactly, or nearer than by any assignable difference, to all numbers whatever, from 0 upwards. If the exponents be integers, we shall have only the numbers which form the geometrical progression 1, 2, 4, 8, 16, &c.; but the intermediate numbers may be expressed, at least nearly, by means of fractional exponents. Thus the numbers from 0 to 10 may be expressed by the powers of 2 as follows:

2^0	$=1$	$2^{2.585}$	$=6$
2^1	$=2$	$2^{2.807}$	$=7$
$2^{1.585}$	$=3$	2^3	$=8$
2^2	$=4$	$2^{3.170}$	$=9$
$2^{2.322}$	$=5$	$2^{3.322}$	$=10$

In like manner may fractions be expressed by the powers of 2. Thus

$$\cdot 1 = \frac{1}{2^{3.322}} = 2^{-3.322},\ \cdot 2 = \frac{1}{2^{2.322}} = 2^{-2.322},$$

$$\cdot 3 = \frac{1}{2^{1.737}} = 2^{-1.737}, \text{ &c.}$$

where it is observable that the exponents are now negative.

In the same manner may all numbers be expressed by the powers of 10. Thus

10^0	$=1$	10^{-1}	$=\cdot 1$
$10^{.301}$	$=2$	$10^{-.699}$	$=\cdot 2$
$10^{.477}$	$=3$	$10^{-.523}$	$=\cdot 3$
&c.		&c.	

276. Even a fraction might be taken in place of 2, or 10, in the preceding examples; and such exponents might be found as would give its powers equal to all numbers, from 0 upwards. There are therefore no limitations with respect to the magnitude of the number, by the powers of which all other numbers are to be expressed, except that it must neither be equal to unity, nor negative. If it were $=1$, then all its powers would also be $=1$, and if it were negative, there are numbers to which none of its powers could possibly be equal.

277. If therefore y denote any number whatever, and r a given number, a number x may be found, such, that $r^x = y$, and x, that is, the exponent of r which gives a number equal to y, is called the *logarithm* of y.

278. The given number r, by the powers of which all other numbers are expressed, is called the *radical number* of the logarithms, which are the indices of those powers.

279. From the preceding definition of logarithms their properties are easily deduced, as follows:

1. The sum of two logarithms is equal to the logarithm of their product. Let y and y' be two numbers, and x and x' their logarithms, so that $r^x = y$, and $r^{x'} = y'$, then $r^x \times r^{x'} = yy'$, or $r^{x+x'} = yy'$; hence, from the definition, $x + x'$ is the logarithm of yy', that is, the sum of the logarithms of y and y' is the logarithm of yy'.

2. The difference of the logarithms of two numbers is equal to the logarithm of their quotient; for

if $r^x = y$ and $r^{x'} = y'$, then $\frac{r^x}{r^{x'}} = \frac{y}{y'}$ or $r^{x-x'} = \frac{y}{y'}$,

therefore, by the definition, $x-x'$ is the logarithm of $\frac{y}{y'}$; that is, the difference of the logarithms of y and y' is the logarithm of $\frac{y}{y'}$.

3. Let n be any number whatever, then, log. $N^n = n \times$ log. N. For N^n is N multiplied into itself n times, therefore the logarithm of N^n is equal the logarithm of N added to itself n times, or to $n \times$ log. N.

280. From these properties of logarithms it follows, that if we possess tables by which we can assign the logarithm corresponding to any given number, and also the number corresponding to any given logarithm, the operations of multiplication and division of numbers may be reduced to the addition and subtraction of their logarithms, and the operations of involution and evolution to the more simple operations of multiplication and division. Thus, if two numbers x and y are to be multiplied together, by taking the sum of their logarithms we obtain the logarithm of their product, and, by inspecting the table, the product itself. A similar observation applies to the quotient of two numbers, and also to any power or to any root of a number.

281. The general properties of logarithms are independent of any particular value of the radical number, and hence there may be various systems of logarithms, according to the radical number employed in their construction. Thus if the radical number be 10, we shall have the *common* system of logarithms, but if it were 2·7182818 we should have the logarithms first constructed by Lord Napier, which are called *hyperbolic logarithms*.

282. We have already observed (§ 277), that the relation between any number and its logarithm is expressed by the equation $r^x = y$, where y denotes a number, x its logarithm, and r the radical number of the system, and any two of these three quantities being given, the remaining one may be found. If either y or r were the quantity required, the question would involve no difficulty; if, however, the exponent x were considered as the unknown quantity while r and y were supposed given, the equation to be resolved would be of a different form than any that we have hitherto considered. Equations of this form are called *exponential* equations, to resolve such an equation is evidently the same thing as to determine the logarithm of a given number, and this problem we shall now proceed to investigate.

283. We therefore resume the equation $r^x = y$, where r, x, and y denote as before, we are to find a value of x in terms of r and y. Let us suppose $r = 1 + a$ and $y = 1 + v$, then our equation will stand thus

$$(1+a)^x = 1 + v.$$

So that, by raising both sides to the power n, where n denotes an indefinite number, which is to disappear in the course of the investigation, we have $(1+a)^{nx} = (1+v)^n$, and resolving both sides of the equation into series by means of the binomial theorem,

$$1 + nxa + \frac{nx(nx-1)}{1\cdot 2}a^2 + \frac{nx(nx-1)(nx-2)}{1\cdot 2\cdot 3}a^3 + \frac{nx(nx-1)(nx-2)(nx-3)}{1\cdot 2\cdot 3\cdot 4}a^4 +, \text{ &c.}$$

$$= 1 + nv + \frac{n(n-1)}{1\cdot 2}v^2 + \frac{n(n-1)(n-2)}{1\cdot 2\cdot 3}v^3 + \frac{n(n-1)(n-2)(n-3)}{1\cdot 2\cdot 3\cdot 4}v^4 +, \text{ &c.}$$

Therefore, subtracting unity from both sides, and dividing by n, we have

$$xa + \frac{x(nx-1)}{1\cdot 2}a^2 + \frac{x(nx-1)(nx-2)}{1\cdot 2\cdot 3}a^3 + \frac{x(nx-1)(nx-2)(nx-3)}{1\cdot 2\cdot 3\cdot 4}a^4 +, \text{ &c.}$$

$$= v + \frac{n-1}{1\cdot 2}v^2 + \frac{(n-1)(n-2)}{1\cdot 2\cdot 3}v^3 + \frac{(n-1)(n-2)(n-3)}{1\cdot 2\cdot 3\cdot 4}v^4 +, \text{ &c.}$$

and by supposing the factors which constitute the terms of each series to be actually multiplied, and the products arranged according to the powers of n, the last equation will have this form

$$xa + \left(Pn - \frac{x}{2}\right)a^2 + \left(P'n + Qn^2 + \frac{x}{3}\right)a^3 + \left(P''n + Q'n^2 + Rn^3 - \frac{x}{4}\right)a^4 +, \text{ &c.}$$

$$= v + (pn - \tfrac{1}{2})v^2 + (p'n + qn^2 + \tfrac{1}{3})v^3 + (p''n + q'n^2 + rn^3 - \tfrac{1}{4})v^4 +, \text{ &c.}$$

Here the coefficients of the powers of n, viz. P, P′, P″, &c. Q, Q′, &c. R, &c. also p, p', p'', &c. q, q'. &c. r, &c. are expressions which denote certain combinations of the powers of x in the first series, and certain numbers in the second; but as they are all to vanish in the course of the investigation, it is not necessary that they should be expressed in any other way than by a single letter.

284. Now each side of this last equation may evidently be resolved into two parts, one of which is entirely free from the quantity n, and the other involves that quantity, hence the same equation may also stand thus,

$$\left.\begin{array}{l} xa - \frac{x}{2}a^2 + \frac{x}{3}a^3 - \frac{x}{4}a^4 +, \text{ &c.} \\ +Pna^2 + (P'n + Qn^2)a^3 + (P''n + Q'n^2 + Rn^3)a^4 +, \text{ &c.} \end{array}\right\}$$

$$= \left\{\begin{array}{l} +v - \frac{1}{2}v^2 + \frac{1}{3}v^3 - \frac{1}{4}v^4 +, \text{ &c.} \\ +pnv^2 + (p'n + qn^2)v^3 + (p''n^2 + q'n^2 + rn^4)v^4 + \text{&c.} \end{array}\right.$$

This equation must hold true, whatever be the value of n, which is a quantity entirely arbitrary, and therefore ought to vanish from the equation expressing the relation between x and v; hence it follows that the terms on each side of the equation, which involve n, ought to destroy each other, and thus there will remain

Of Logarithms, &c.

main only the part of each ſide, which does not involve n, that is,

$$xa-\frac{xa^2}{2}+\frac{xa^3}{3}-\frac{xa^4}{4}+,\&c.=v-\frac{v^2}{2}+\frac{v^3}{3}-\frac{v^4}{4}+,\&c.$$

$$\text{or } (a-\frac{a^2}{2}+\frac{a^3}{3}-\frac{a^4}{4}+,\&c.)\,x=v-\frac{v^2}{2}+\frac{v^3}{3}-\frac{v^4}{4}+\frac{v^5}{5}-,\&c.$$

Let us now put A to denote the conſtant multiplier

$$a-\frac{a^2}{2}+\frac{a^3}{3}-\frac{a^4}{4}+,\&c.=(r-1)-\frac{(r-1)^2}{2}+\frac{(r-1)^3}{3}-\frac{(r-1)^4}{4}+,\&c.$$

and ſubſtitute for v, its value $y-$, thus we at laſt find

$$x=\log.\,y=\frac{1}{A}(y-1-\frac{(y-1)^2}{2}+\frac{(y-1)^3}{3}-\frac{(y-1)^4}{4}+,\&c.$$

and by this formula the logarithm of any number a little greater than unity may be readily found.

285. If y be nearly $=2$ the ſeries will, however, converge too ſlowly to be of uſe, and if it exceed 2, the ſeries will diverge, and therefore cannot be directly applied to the finding of its logarithm. But a ſeries which ſhall converge faſter and be applicable to every caſe may be inveſtigated as follows:

Becauſe $\log.(1+v)=\frac{1}{A}(v-\frac{v^2}{2}+\frac{v^3}{3}-\frac{v^4}{4}+,\&c.)$ Of Logarithms, &c.

By ſubſtituting $-v$ for $+v$ we have

$$\log.(1-v)=\frac{1}{A}\left(-v-\frac{v^2}{2}-\frac{v^3}{3}-\frac{v^4}{4}-,\&c.\right)$$

Now, $\log.(1+v)-\log.(1-v)=\log.\frac{1+v}{1-v}$ therefore, ſubtracting the latter ſeries from the former we have $\log.\frac{1+v}{1-v}=\frac{1}{A}\left(2v+\frac{2v^3}{3}+\frac{2v^5}{5}+\frac{2v^7}{7}+\&c.\right.$

Put $\frac{1+v}{1-v}=y$, then $v=\frac{y-1}{y+1}$ and the laſt ſeries becomes

$$\log.\,y=\frac{1}{A}\left(2\frac{y-1}{y+1}+\frac{2}{3}\left(\frac{y-1}{y+1}\right)^3+\frac{2}{5}\left(\frac{y-1}{y+1}\right)^5+\&c.\right)$$

This ſeries will always converge whatever be the value of y, and by means of it the logarithms of ſmall numbers may be found with great facility.

286. When a number is compoſite, its logarithm will moſt eaſily be found, by adding together the logarithms of its factors; but if it be a prime number, its logarithm may be derived from that of ſome convenient compoſite number, either greater or leſs, and an infinite ſeries. Let n be a number of which the logarithm is already found; then ſubſtituting $\frac{n+z}{n}$ for y in the laſt formula, we have

$$\log.\frac{n+z}{n}=\frac{1}{A}\left(\frac{2z}{2n+z}+\frac{1}{3}\frac{2z^3}{(2n+z)^3}+\frac{1}{5}\frac{2z^5}{(2n+z)^5}+,\&c.\right.$$

But $\log.\frac{n+z}{n}=\log.(n+z)-\log.n$, therefore

$$\log.(n+z)=\log.n+\frac{1}{A}\left(\frac{2z}{2n+z}+\frac{1}{3}\frac{2z^3}{(2n+z)^3}+\frac{2z^5}{(2n+z)^5}+,\&c.\right)$$

This ſeries gives the logarithm of $n+z$ by means of the logarithm of n, and converges very faſt when n is conſiderable.

287. It appears from the ſeries which have been found for $\log.y$ in § 284 and 285, that the logarithm of a number is always the product of two quantities; one of theſe is variable, and depends upon the number itſelf, but the other, viz. $\frac{1}{A}$ is conſtant, and depends entirely on the radical number of the ſyſtem. This quantity has been called by writers on logarithms the *modulus* of the ſyſtem.

288. The moſt ſimple ſyſtem of logarithms in reſpect to facility of computation is that in which $\frac{1}{A}=1$ or $A=1$. The logarithms of this ſyſtem are the ſame as thoſe firſt invented by Napier, and are alſo called *hyperbolic logarithms*.

The hyperbolic logarithm of any numbers y, is therefore (§ 284)

$$y-1-\frac{(y-1)^2}{2}+\frac{(y-1)^3}{3}-,\&c.$$

and that of r, the radical number of any ſyſtem is

$$r-1-\frac{(r-1)^2}{2}+\frac{(r-1)^3}{3}-,\&c.$$

but this laſt ſeries is the ſame as we have denoted by A; hence it follows, that the *modulus* of any ſyſtem is the reciprocal of the hyperbolic logarithm of the radical number of that ſyſtem. Thus it appears, that the logarithms of numbers, according to any propoſed ſyſtem, may be readily found from the hyperbolic logarithm of the ſame numbers, and the hyperbolic logarithm of the radical number of that ſyſtem.

289. Let L denote the hyp. log. of any number, and l, l' the logarithms of the ſame number according to two other ſyſtems whoſe *moduli* are m and m'; then

$$l=m\mathrm{L},\ l'=m'\mathrm{L}$$

therefore $\frac{l}{m}=\frac{l'}{m'}$ and $m:m'::l:l'$

That is, the logarithms of the ſame number, according to different ſyſtems, are directly proportional to the *moduli* of thoſe ſyſtems, and therefore have a given ratio to one another.

290. We ſhall now apply the ſeries here inveſtigated to the calculation of the hyperbolic logarithm of 10, the reciprocal of which is the *modulus* of the common ſyſtem

Of Logarithms, &c.

system of logarithms; and also to the calculation of the common logarithm of 2. The hyp. log. of 10 may be obtained by substituting 10 for y in the formula

$$\text{hyp. log. } y=\frac{2(y-1)}{y+1}+\frac{2}{3}\left(\frac{y-1}{y+1}\right)^3+\frac{2}{5}\left(\frac{y-1}{y+1}\right)^5+\&c.$$

but the resulting series $\frac{2\cdot 9}{11}+\frac{2\cdot 9^3}{3\cdot 11^3}+\frac{2\cdot 9^5}{5\cdot 11^5}+$, &c. converges too slowly to be of any practical utility, it will therefore be better to derive the logarithm of 10 from those of 2 and 5. By substituting 2 in the formula we have

$$\text{hyp. log. } 2=2\left(\frac{1}{3}+\frac{1}{3\cdot 3^3}+\frac{1}{5\cdot 3^5}+\frac{1}{7\cdot 3^7}+\&c.\right)$$

this series converges very fast, so that by reducing its terms to decimal fractions, and taking the sum of the first seven terms, we find the hyp. log. of 2 to be ·6931472.

The hyp. log. of 5 may be found in the same manner, but more easily from the formula given in § 286. For the log. of 2 being given, that of $4=2^2$ is also given § 279. Therefore, substituting log. $4=2$ log. 2 for log. n, and 1 for z, in the series

$$\text{hyp. log. } (n+z)=\text{hyp. log. } n+2\left(\frac{z}{2n+z}+\tfrac{1}{3}\frac{z^3}{(2n+z)^3}+\tfrac{1}{5}\frac{z^5}{(2n+z)^5}+\&c.\right)$$

we have

$$\text{hyp. log. } 5=2\text{ hyp. log. } 2+2\left(\frac{1}{9}+\frac{1}{3\cdot 9^3}+\frac{1}{5\cdot 9^5}+\&c.\right)$$

The first three terms of this series are sufficient to give the result true to the seventh decimal, so that we have hyp. log. 5=1.6094379, and
hyp. log. 10=hyp. log. 2+hyp. log. 5=2.3025851.
Hence the *modulus* of the common system of logarithms, or $\frac{1}{\text{hyp. log. } 10}$, is found $=.4342945$. The same number, because of its great utility in the construction of tables of logarithms, has been calculated to a much greater number of decimals. A celebrated calculator of the last century, Mr A. Sharp, found it to be

0.434294481903251827651128918916605082294397005803666566114454.

Having found the hyp. log. of 2 to be ·6931472 the common logarithm of 2 is had immediately, by multiplying the hyp. log. of 2 by the modulus of the system, thus we find

com. log. $2=4\cdot 342945\times\cdot 6931472=\cdot 3010300$.

291. We have already observed, § 282, that to determine the logarithm of a given number, is the same problem as to determine the value of x in an equation of this form $a^x=b$, where the unknown quantity is an exponent. But in order to resolve such an equation, it is not necessary to have recourse to series; for a table of logarithms being once supposed constructed, the value of x may be determined thus. It appears, from § 279, that $x\times\text{log. } a=\text{log. } b$. Hence it follows, that $x=\frac{\text{log. } b}{\text{log. } a}$. The use of this formula will appear in next section, which treats of computations relative to annuities.

Of Logarithms, &c.

292. The theory of logarithms requires the solution of this other problem. Having given the radical number of a system, and a logarithm, to determine the corresponding number. Or having given the equation $r^x=y$, where r, x, and y denote, as in § 282, to find a a series which shall express y in terms of r and x.

293. For this purpose, let us suppose $r=1+a$, then our equation becomes $y=(1+a)^x$, which may also be expressed thus:

$$y=[(1+a)^n]^{\frac{x}{n}}$$

where n is an indefinite quantity, which is to disappear in the course of the investigation.

By the binomial theorem we have

$$(1+a)^n=1+na+\frac{n(n-1)}{1\cdot 2}a^2+\frac{n(n-1)(n-2)}{1\cdot 2\cdot 3}a^3+\&c.$$

this equation, by multiplying together the factors which compose the terms of the series, and arranging the results according to the powers of n, may also be expressed thus:

$$(1+a)^n=1+An+Bn^2+Cn^3+\&c.$$

where it will readily appear that

$$A=a-\frac{a^2}{2}+\frac{a^3}{3}-\frac{a^4}{4}+\&c.$$

as to the values of B, C, &c. it is of no importance to know them, for they will all disappear in the course of the investigation. Hence, by substituting for $(1+a)^n$ its value, as expressed by this last series, we have

$$y=(1+An+Bn^2+Cn^3+\&c.)^{\frac{x}{n}}$$

and expanding the latter part of this equation by means of the binominal theorem it becomes

$$y=1+\frac{x}{n}(An+Bn^2+\&c.)+\frac{x(x-n)}{1\cdot 2\,n^2}(An+Bn^2+\&c.)^2+\frac{x(x-n)(x-2n)}{1\cdot 2\cdot 3n^3}(An+Bn^2+\&c.)^3+\&c.$$

But $An+Bn^2+$, &c. $=n(A+Bn+$, &c.) also $(An+Bn^2+$, &c.$)^2=n^2(A+Bn+$, &c.$)^2$, and $(An+Bn^2+$, &c.$)^3=n^3(A+Bn+$, &c.$)^3$, &c. therefore, by leaving out of each term of the series the powers of n, which are common to the numerator and denominator, the equation will stand thus:

$$y=1+x(A+Bn+,\&c.)+\frac{x(x-n)}{1\cdot 2}(A+Bn+,\&c.)^2+\frac{x(x-n)(x-2n)}{1\cdot 2\cdot 3}(A+Bn+,\&c.)^3+\&c.$$

Now n is here an arbitrary quantity, and ought, from the nature of the original equation, to disappear from the value of y; the terms of the equation which are multiplied

Intereſt and Annuities.

multiplied by n ought therefore to deſtroy each other; and this being the caſe, the equation is reduced to

$$r^x=y=1+\frac{xA}{1}+\frac{x^2A^2}{1\cdot 2}+\frac{x^3A^3}{1\cdot 2\cdot 3}+\frac{x^4A^4}{1\cdot 2\cdot 3\cdot 4}+, \text{ \&c.}$$

and ſince we have found

$$A=a-\frac{a^2}{2}+\frac{a^3}{3}-\frac{a^4}{4}+, \text{ \&c.}$$
$$=(r-1)-\frac{(r-1)^2}{2}+\frac{(r-1)^3}{3}-\frac{(r-1)^4}{4}.$$

It is evident from § 288, that A is the hyperbolic logarithm of the radical number of the ſyſtem.

294. If, in the equation $r^x=y$, we ſuppoſe $x=1$, the value of y becomes

$$r=1+\frac{A}{1}+\frac{A^2}{1\cdot 2}+\frac{A^3}{1\cdot 2\cdot 3}+, \text{ \&c.}$$

Here the radical number is expreſſed by means of its hyperbolic logarithm. Again, if we ſuppoſe $x=\frac{1}{A}$, then

$$r^{\frac{1}{A}}=1+\frac{1}{1}+\frac{1}{1\cdot 2}+\frac{1}{1\cdot 2\cdot 3}+\frac{1}{1\cdot 2\cdot 3}+, \text{ \&c.}$$

Thus it appears that the quantity $r^{\frac{1}{A}}$ is equal to a conſtant number, which, by taking the ſum of a ſufficient number of terms of the ſeries, will be found $=2.71828182845904\ldots$ Let us denote this number by e, then $r^{\frac{1}{A}}=e$, and hence $r=e^A$. Now, if we remark that A is the hyp. log. of r, it muſt be evident (§ 277. and 278.), that e is the radical number of the hyperbolic ſyſtem of logarithms.

Again, ſince $r^{\frac{1}{A}}=e$, therefore $\frac{1}{A}\times\log. r=\log. e$ and $A=\frac{\log. r}{\log. e}$, here log. r and log. e denote logarithms, taken according to any ſyſtem whatever.

295. If we now reſume the equation

$$r^x=y=1+\frac{xA}{1}+\frac{x^2A^2}{1\cdot 2}+\frac{x^3A^3}{1\cdot 2\cdot 3}+, \text{ \&c.}$$

and ſubſtitute for A its value $\frac{\log. r}{\log. e}$, we ſhall have the following general expreſſion for any exponential quantity whatever,

$$r^x=1+\frac{x}{1}\left(\frac{\log. r}{\log. e}\right)+\frac{x^2}{1.2}\left(\frac{\log. r}{\log. e}\right)^2+\frac{x^3}{1\cdot 2\cdot 3}\left(\frac{\log. r}{\log. e}\right)^3+, \text{ \&c.}$$

which, by ſuppoſing $r=e$, becomes

$$e^x=1+\frac{x}{1}+\frac{x^2}{1\cdot 2}+\frac{x^3}{1\cdot 2\cdot 3}+, \text{ \&c.}$$

SECT. XX. *Of Intereſt and Annuities.*

296. THE theory of logarithms finds its application in ſome meaſure to calculations relating to intereſt and annuities: theſe we now proceed to explain. There are two hypotheſes, according to either of which money put out at intereſt may be ſuppoſed to be improved. We may ſuppoſe that the intereſt, which is always proportional to the ſum lent, or principal, is alſo proportional to the time during which the principal is employed; and on this hypotheſis the money is ſaid to be improved at *ſimple* intereſt. Or we may ſuppoſe that the intereſt, which ought to be paid to the lender at ſucceſſive ſtated periods, is added to the principal inſtead of being actually paid, and thus their amount converted into a new principal. When money is laid out according to this ſecond hypotheſis, it is ſaid to be improved at *compound* intereſt. Compound Intereſt

297. In calculations relating to intereſt, the things to be conſidered are the *principal*, or ſum lent; the *rate of intereſt*, or ſum paid for the uſe of 100l. for one year; the *time* during which the principal is lent; and the *amount*, or ſum of the principal and intereſt at the end of that time.

Let p denote the principal, 1l. being the unit.
r the intereſt of 1l. for one year, at the given rate.
t the time, one year being the unit.
a the amount.

We ſhall now examine the relations which ſubſiſt between thoſe quantities, according to each of the two hypotheſes of ſimple and compound intereſt

I. *Simple Intereſt.*

298. Becauſe the intereſt of 1l. for one year is r, the intereſt of 1l. for t years muſt be rt, and the intereſt of p pounds for the ſame time prt, hence we have this formula

$$p+prt=a,$$

from which we find

$$p=\frac{a}{1+rt} \qquad r=\frac{a-p}{pt} \qquad t=\frac{a-p}{pr}.$$

As the manner of applying theſe formulæ to queſtions relating to ſimple intereſt is ſufficiently obvious, we proceed to conſider compound intereſt.

II. *Compound Intereſt.*

299. In addition to the ſymbols already aſſumed, let $R=1+r=$ amount of 1l. in one year; then, from the nature of compound intereſt, R is alſo the principal at the beginning of the ſecond year. Now, intereſt being always proportional to the principal, we have

$1 : r :: R : rR=$ the intereſt of R for a year,

and $R+rR=(1+r)R=R^2=$ amount of R in a year,

therefore R^2 is the amount of 1l. in two years, which ſum being aſſumed as a new principal, we find, as before, its intereſt for a year to be rR^2, and its amount $R^2+rR^2=(1+r)R^2=R^3$; ſo that R^3 is the amount of 1l. in three years. Proceeding in this manner, we find, in general, that the amount of 1l. in t years is R^t, and of p pounds pR^t; hence we have this formula

$$pR^t=a,$$

which

Annuities. which from the nature of logarithms may alſo be expreſſed thus:

$$\log. p + t \times \log. R = \log. a.$$

Hence we find

$$p = \frac{a}{R^t} \qquad R = \sqrt[t]{\frac{a}{p}}$$

or, by logarithms,

$$\log. p = \log. a - t \times \log. R. \qquad \log. R = \frac{\log. a - \log. p}{t}$$

$$t = \frac{\log. a - \log. p}{\log. R}.$$

300. As an example of the uſe of theſe formulæ, let it be required to determine what ſum improved at 5 per cent. compound intereſt will amount to 500l. in 42 years. In this caſe we have given $a = 500$ $r = .05$, $R = 1.05$, $t = 42$, to find p.

From	$\log. a = \log. 500 =$	2.6989700
ſubtract	$t \times \log. R = 42 \times \log. 1.05 =$	0.8899506
remains	$\log. p$	1.8090194

therefore $p = 64.42l. = 64l.\ 8s.\ 5d.$ the ſum required.

Ex. 2. In what time will a ſum laid out at 4 per cent. compound intereſt be doubled.

Let any ſum be expreſſed by unity, then we have given $p = 1$, $r = .04$, $R = 1.04$, $a = 2$, to find t.

From the formula $t = \frac{\log. a - \log. p}{\log. R} = \frac{\log. 2}{\log. 1.04}$

we find $t = \frac{.3010300}{.0170333} = 17.7$ years nearly.

301. In treating of compound intereſt, we have ſuppoſed the intereſt to be joined to the principal at the end of every year. But we might have ſuppoſed it to be added at the end of every half year or every quarter, or even every inſtant; and ſuitable rules might have been found for performing calculations according to each hypotheſis. As ſuch ſuppoſitions are, however, never made in actual buſineſs, we ſhall not at preſent ſay any thing more of them.

III. *Annuities.*

302. An annuity is a payment made annually for a term of years; and the chief problem relating to it is to determine its preſent worth, that is, the ſum a perſon ought to pay immediately to another, upon condition of receiving from the latter a certain ſum annually for a given time. In reſolving this problem, it is ſuppoſed that the buyer improves his annuity from the time he receives it, and the ſeller the purchaſe money, in a certain manner, during the continuance of the annuity, ſo that at the end of the time the amount of each may be the ſame. There may be various ſuppoſitions as to the way in which the annuity and its purchaſe money may be improved; but the only one commonly applied to practice is the higheſt improvement poſſible of both, viz. by compound intereſt. As the taking compound intereſt is, however, prohibited by law, the realiſing of this ſuppoſed improvement requires punctual payment of intereſt; and therefore the intereſt in ſuch calculations is uſually made low. Continued Fractions.

303. Let A denote the annuity;
P the preſent worth, or purchaſe money;
t the time of its continuance;

let r and R denote as before.

The ſeller, by improving the price P at compound intereſt during the time t, has PR^t.

The purchaſer is ſuppoſed to receive the firſt annuity A at the end of one year, which, being improved for $t-1$ years, amounts to AR^{t-1}. He receives the ſecond years annuity at the end of the ſecond year, which, being improved for $t-2$ years, amounts to AR^{t-2}. In like manner the third year's annuity becomes AR^{t-3}, and ſo on to the laſt year's annuity, which is ſimply A. Therefore, the whole amount of the improved annuities is the geometrical ſeries

$$A + AR + AR^2 + AR^3 \ldots + AR^{t-1},$$

the ſum of which, by § 106, is $A\frac{R^t - 1}{R - 1} = A\frac{R^t - 1}{r}$;

and ſince this ſum muſt be equal to the amount of the purchaſe money, or PR^t, we have

$$PR^t = A\frac{R^t - 1}{r};$$

and, from this equation, we find

$$P = \frac{A}{r}\left(1 - \frac{1}{R^t}\right). \quad A = \frac{rPR^t}{R^t - 1}. \quad t = \frac{\log. A - \log.(A - rP)}{\log. R}.$$

As to r, it can only be found by the reſolution of an equation of the t order.

304. To find the preſent value of an annuity in *reverſion*, that is, an annuity which is to commence at the end of n years, and continue during t years; firſt find its value for $n+t$ years, and then for n years; and ſubtract the latter from the former, we thus obtain the following formula:

$$P = \frac{A}{rR^n}\left(1 - \frac{1}{R^t}\right).$$

305. If the annuity is to commence immediately, and to continue for ever, then, becauſe in this caſe R^t is infinitely great, and therefore $\frac{1}{R^t} = 0$, the formula $P = \frac{A}{r}\left(1 + \frac{1}{R^t}\right)$ becomes ſimply $P = \frac{A}{r}$.

And if the annuity is to commence after n years, and continue for ever, the formula $P = \frac{A}{rR^n}\left(1 - \frac{1}{R^t}\right)$ becomes $P = \frac{A}{rR^n}$.

Sect. XXI. *Of Continued Fractions.*

306. Every quantity which admits of being expreſſed by a common fraction may alſo be expreſſed in

Continued Fractions.

the form of what is called a *continued fraction*. The nature of such fractions will be easily understood by the following example.

Let the common fraction be $\frac{314159}{100000}$, or, which is the same, $3+\frac{14159}{100000}$. Since $100000=7\times14159+887$, therefore $\frac{14159}{100000}=\frac{14159}{7\times14159+887}=\frac{1}{7+\frac{887}{14159}}$, and

$$\frac{314159}{100000}=3+\frac{1}{7+\frac{887}{14159}}.$$

Now $\frac{887}{14159}=\frac{887}{15\times887+854}=\frac{1}{15+\frac{854}{887}}$, and substituting this for $\frac{887}{15159}$, in the value of $\frac{314159}{100000}$, already found, we have $\frac{314159}{100000}=3+\frac{1}{7+\frac{1}{15+\frac{854}{887}}}$.

Again, $\frac{854}{887}=\frac{854}{854+33}=\frac{1}{1+\frac{33}{854}}$, which being substituted as before, gives $\frac{314159}{100000}=3+\frac{1}{7+\frac{1}{15+\frac{1}{1+\frac{33}{854}}}}$

By operations similar to the preceding, we find $\frac{33}{854}=\frac{1}{25+\frac{29}{33}}$, $\frac{29}{33}=\frac{1}{1+\frac{4}{29}}$, $\frac{4}{29}=\frac{1}{7+\frac{1}{4}}$; therefore, by substitution,

$$\frac{314159}{100000}=3+\frac{1}{7+\frac{1}{15+\frac{1}{1+\frac{1}{25+\frac{1}{1+\frac{1}{7+\frac{1}{4}}}}}}}$$

By an operation, in all respects the same as has been just now performed, may any fraction whatever be reduced to the form

$$a+\frac{1}{b+\frac{1}{c+\frac{1}{d+}}},\ \&c.$$

and it is then called a *continued fraction*.

307. It is easy to see in what manner the inverse of the preceding operation is to be performed, or a continued fraction reduced to a common fraction.

Thus if the continued fraction be

$$a+\frac{1}{b+\frac{1}{c+\frac{1}{d}}}$$

it will evidently be reduced to a common fraction by adding the reciprocal of d to b, and the reciprocal of that sum to b, and again the reciprocal of this last sum to a; now the reciprocal of d, or $\frac{1}{d}$, added to c is $c+\frac{1}{d}=\frac{cd+1}{d}$; again, the reciprocal of this sum, or $\frac{d}{cd+1}$, added to b, is $b+\frac{d}{cd+1}=\frac{bcd+b+d}{cd+1}$, and the reciprocal of this last quantity, viz. $\frac{cd+1}{bcd+b+a}$, when added to a, gives

$$\frac{abcd+ab+ad+cd+1}{bcd+b+d}=a+\frac{1}{b+\frac{1}{c+\frac{1}{d}}}.$$

Continued Fraction

308. This manner of expressing a fraction enables us to find a series of other fractions, that approach in value to any given one, and each of them expressed in the smallest numbers possible. Thus, in the example $\frac{314159}{100000}$, which has been resolved into a continued fraction, § 306, and which is known to express nearly the proportion of the diameter of a circle to its circumference, if we take only the first two terms of the continued fraction, and put π for $\frac{314159}{100000}$, we shall have $\pi=3+\frac{1}{7}=\frac{22}{7}$ nearly; and this is the proportion which was found by Archimedes.

Again, by taking the three first terms, we have

$$\pi=3+\frac{1}{7+\frac{1}{15}}=3+\frac{15}{106}=\frac{333}{106},$$

which is nearer the truth than the former.

And, by taking the first four terms, we have

$$\pi=3+\frac{1}{7+\frac{1}{15+\frac{1}{1}}}=\frac{355}{113},$$

which is the proportion assigned by Metius, and is more exact than either of the preceding. These results are alternately greater and less than the truth.

309. Among continued fractions, those have been particularly distinguished in which the denominators, after a certain number of changes, are continually repeated in the same order. Such, for example, is the fraction

$$1+\frac{1}{2+\frac{1}{3+\frac{1}{2+\frac{1}{3+}}}},\ \&c.$$

The amount of this fraction, though continued, *ad infinitum*, may be easily found; for leaving out the first term, which is an integer, let us suppose

$$x=\frac{1}{2+\frac{1}{3+\frac{1}{2+\frac{1}{3+}}}},\ \&c.$$

Then, since after the second, all the terms return in the

Continued Fractions.

the same order, it follows that their amount is also $=x$, thus we have

$$x=\frac{1}{2}+\frac{1}{3+x}$$

Hence $x=\frac{3+x}{6+2x+1}$ and $x^2+3x=\frac{3}{2}$ and $x=\frac{-3+\sqrt{15}}{2}$

Therefore $x+1$, or the sum of the series, $=\frac{-1+\sqrt{15}}{2}$

In general if $x=\frac{1}{a}+\frac{1}{b}+\frac{1}{a}+$, &c.

we find $x=-\frac{b}{2}\pm\sqrt{\frac{b^2}{4}+\frac{b}{a}}$. Though the denominators did not return in the same order till after a greater interval, the value of the fraction would still be expressed by the root of a quadratic equation. And conversely, the roots of all quadratic equations may be expressed by periodical continued fractions, and may often by that means be very readily approximated in numbers, without the trouble of extracting the square root.

310. The reduction of a decimal into the form of a continued fraction sometimes renders the law of its continuation evident. Thus we know that $\sqrt{2}=1.41421356\cdots$ but from the bare inspection of this decimal we discover no rule for its further continuation. If, however, it be reduced into a continued fraction, it becomes

$$=1+\frac{1}{2}+\frac{1}{2}+\frac{1}{2}+, \&c.$$

and hence we see in what way it may be continued to any degree of accuracy.

311. When the root of any equation is found by the method explained in § 256, the value of the unknown quantity is evidently expressed by a continued fraction.

For if x be the root sought, we have $x=a+\frac{1}{y}$, $y=b+\frac{1}{y'}$, $y'=b'+\frac{1}{y''}$, $y''=b''+\frac{1}{y'''}$, &c. where a, b', b'', b''', &c. denote the whole numbers, which are next less than the true values of x, y, y', y'', &c. If therefore in the value of x we substitute $b+\frac{1}{y'}$ for y, it becomes

$$x=a+\frac{1}{b+\frac{1}{y'}}.$$

Again, if in this second value of x we substitute $b'+\frac{1}{y''}$ for y it becomes

$$x=a+\frac{1}{b+\frac{1}{b'+\frac{1}{y''}}}$$

The next value of x is in like manner found to be

$$x=a+\frac{1}{b+\frac{1}{b'+\frac{1}{b''+\frac{1}{y'''}}}}$$

and so on continually.

Indeterminate Problems.

Sect. XXII. *Of Indeterminate Problems.*

312. When the conditions of a question are such that the number of equations exceeds the number of unknown quantities, that question will admit of innumerable solutions, and is therefore said to be indeterminate. Thus, if it be required to find two numbers subject to no other limitation than that their sum be 10, we have two unknown quantities x and y, and only one equation, viz. $x+y=10$, which may evidently be satisfied by innumerable different values of x and y, if fractional solutions be admitted. It is, however, usual in such questions as this, to restrict the values of the numbers sought to positive integers, and therefore, in this case, we can have only these nine solutions;

$$x=1, 2, 3, 4, 5, 6, 7, 8, 9.$$
$$y=9, 8, 7, 6, 5, 4, 3, 2, 1.$$

which indeed may be reduced to five, for the first four become the same as the last four, by simply changing x into y, and the contrary.

313. Indeterminate problems are of different orders according to the dimensions of the equation which is obtained after all the unknown quantities, but two, have been exterminated by means of the given equations. Those of the first order lead always to equations of this form,

$$ax+by=c,$$

where a, b, c denote given whole numbers, and x, y two numbers to be found, so that both may be integers. That this condition may be fulfilled, it is necessary that the coefficients a, b have no common divisor which is not also a divisor of c, for if $a=md$ and $b=me$, then $ax+by=mdx+mey=c$, and $dx+ey=\frac{c}{m}$; but d, e, x, y are supposed to be whole numbers, therefore $\frac{c}{m}$ is a whole number, hence m must be a divisor of c.

314. We proceed to illustrate the manner of resolving indeterminate equations of the first order by some numerical examples.

Ex. 1. Given $2x+3y=25$, to determine x and y in whole positive numbers.

From the given equation we have $x=\frac{25-3y}{2}=12-y+\frac{1-y}{2}$; now since x must be a whole number it follows that $\frac{1-y}{2}$ must be a whole number. Let us assume $\frac{1-y}{2}=z$, then $1-y=2z$ and $y=1-2z$, and since $x=12-y+\frac{1-y}{2}=12-y+z$, therefore $x=12-1+2z+z$; hence we have

$$x=11+3z, \qquad y=1-2z$$

where

Indeterminate Problems.

where z might be any whole number whatever, if there were no limitation as to the signs of x and y; but since these quantities are required to be positive, it is evident from the value of y, that z must either be 0 or negative, and from the value of x that, abstracting from the sign, it must be less than 4; hence z may have these three values 0, —1, —2, —3.

$$\text{If } z=0,\ z=-1,\ z=-2,\ z=-3.$$
$$\text{Then } \begin{cases} x=11, & x=8, & x=5, & x=2. \\ y=1, & y=3, & y=5, & y=7. \end{cases}$$

Ex. 2. It is required to divide 100 into such parts that the one may be divisible by 7 and the other by 11.

Let $7x$ be the first part, and $11y$ the second, then by the question $7x+11y=100$, and

$$x=\frac{100-11y}{7}=14-y+\frac{2-4y}{7};$$

hence it appears that $\frac{2-4y}{7}$ must be a whole number. Let us assume $\frac{2-4y}{7}=z$, then $x=14-y+z$ and $4y=2-7z$ or $y=\frac{2-7z}{4}=\frac{2-3z}{4}-z$, therefore $\frac{2-3z}{4}$ must be a whole number. Assume $\frac{2-3z}{4}=t$, then $y=t-z$, and $3z=2-4t$, or $z=\frac{2-4t}{3}=\frac{2-t}{3}-t$, therefore $\frac{2-t}{3}$ must be a whole number.

Assume now $\frac{2-t}{3}=v$, then $z=v-t$ and $t=2-3v$, here it is evident v may be any whole number taken at pleasure, so that to determine x and y we have the following series of equations:

$$\begin{aligned} t&=2-3v \\ z&=v-t=4v-2 \\ y&=t-z=4-7v \\ x&=14-y+z=11v+8. \end{aligned}$$

Now from the value of y it appears, that v must either be $=0$, or negative; but from the value of x we find that v cannot be a negative whole number, therefore v can only be $=0$; hence the only values which x and y can have in whole numbers are $x=8$, $y=4$.

Ex. 3. It is required to find all the possible ways in which 60l. can be paid in guineas and moidores only.

Let x be the number of guineas and y the number of moidores. Then the value of the guineas, expressed in shillings, is $21x$, and that of the moidores $27y$, therefore from the nature of the question $21x+27y=1200$, or, dividing the equation by 3, $7x+9=400$, hence $x=\frac{400-9y}{7}=57-y+\frac{1-2y}{7}$, so that $\frac{1-2y}{7}$ must be a whole number.

Assume $\frac{1-2y}{7}=z$, then $x=57-y+z$ and $2y=1-7z$ or $y=\frac{1-7z}{2}=\frac{1-z}{2}-3z$ therefore $\frac{1-z}{2}$ must be a whole number.

Indeterminate Problems.

Assume $\frac{1-z}{2}=v$, then $y=v-3z$ and $z=1-2v$ therefore v may be taken any whole number at pleasure, and x and y may be determined by the following equations

$$\begin{aligned} z&=1-2v \\ y&=v-3z=7v-3 \\ x&=57-y+z=61-9v. \end{aligned}$$

From the value of x, it appears that v cannot exceed 6, and from the value of y, that it cannot be less than 1.

$$\begin{aligned} &\text{Hence if } v=1,\ 2,\ 3,\ 4,\ 5,\ 6, \\ &\text{we have } x=52,\ 43,\ 34,\ 25,\ 16,\ 7, \\ &\qquad\quad y=4,\ 11,\ 18,\ 25,\ 32,\ 39. \end{aligned}$$

315. In the foregoing examples the unknown quantities x and y have each a determinate number of positive values, and this will evidently be the case as often as the proposed equation is of this form $ax+by=c$. If, however, b be negative, that is, if the equation be of this form $ax-by=c$, or $ax=by+c$, we shall have questions of a different kind, admitting each of an infinite number of solutions; these, however, are to be resolved in the same manner as the preceding, as will appear from the following example.

Ex. 4. A person buys some horses and oxen, he pays 31 crowns for each horse, and 20 crowns for each ox, and he finds that the oxen cost him seven crowns more than the horses. How many did he buy of each?

Let x be the number of horses, and y that of the oxen; then by the question

$$20x=31y+7, \text{ and } x=\frac{31y+7}{20}=y+\frac{11y+7}{20}.$$

Therefore $\frac{11y+7}{20}$ must be a whole number.

Let $\frac{11y+7}{20}=v$, then $x=y+v$ and $y=\frac{20v-7}{11}=v+\frac{9v-7}{11}$; hence $\frac{9v-7}{11}$ must be a whole number.

Let $\frac{9v-7}{11}=t$, then $y=v+t$ and $v=\frac{11t+7}{9}=t+\frac{2t+7}{9}$; therefore $\frac{2t+7}{9}$ is a whole number.

Let $\frac{2t+7}{9}=s$, then $v=t+s$ and $t=\frac{9s-7}{2}=4s+\frac{s-7}{2}$; therefore $\frac{s-7}{2}$ is a whole number.

Put $\frac{s-7}{2}=r$, then $t=4s+r$ and $s=2r+7$.

Having now no longer any fractions, we return to the values of x and y by the following series of equations

$$s=$$

Indeterminate Problems.

$s=2r+7$
$t=4s+r=9r+28$
$v=t+s=11r+35$
$y=v+t=20r+63=$ number of oxen,
$x=y+v=31r+98=$ number of horſes.

The leaſt poſitive values of x and y will evidently be obtained by making $r=-3$, and innumerable other values will be had by putting $r=-2$, $r=-1$, $r=0$, $r=+1$, &c. Thus we have

$x=5$, 36, 67, 98, 129, 160, 191, 222, &c.
$y=3$, 23, 43, 63, 83, 103, 123, 143, &c.

each ſeries forming an arithmetical progreſſion, the common difference in the firſt being 31 and in the ſecond 20.

316. If we conſider the manner in which the numbers x, y, in this example, are determined, from the ſucceeding quantities v, t, &c. we ſhall immediately perceive that the coefficients of thoſe quantities are the ſame as the ſucceſſive quotients which ariſe in the arithmetical operation for finding the greateſt common meaſure of 20 and 31, the coefficients of the given equation $20x=31y+7$. The operation performed at length will ſtand thus:

```
20)31(1
   20
   --
   11)20(1
      11
      --
       9)11(1
          9
          --
           2)9(4
              8
              --
               1)2(2
                  2
                  --
                  0
```

Hence we may form a ſeries of numeral equations which, when compared with the ſeries of literal equations expreſſing the relations between x, y, v, &c. as put down in the following table, will render the method of determining the latter from the former ſufficiently obvious.

$31=1\times20+11$	$x=1\times y+v$
$20=1\times11+9$	$y=1\times v+t$
$11=1\times9+2$	$v=1\times t+s$
$9=4\times2+1$	$t=4\times s+r$
$2=2\times2+0$	$s=2\times r+7$

And as every queſtion of this kind may be analyzed in the ſame manner, we may hence form the following general rule for reſolving indeterminate problems of the firſt order.

317. Let $bx=ay+n$ be the propoſed equation, in which a, b, n, are given integers, and x, y numbers to be found. Let a be the greateſt of the two numbers a, b, and let A denote the greateſt multiple of b which is contained in a, and c the remainder; alſo let B denote the greateſt multiple of c contained in b, and d the remainder; and C the greateſt multiple of d contained in c, and e the remainder; and ſo on, till one of the remainders be found equal to 0. The numbers A, B, C afford a ſeries of equations from which another ſeries may be derived as in the following table.

Indeterminate Problems.

$a=Ab+c$ hence we derive	$x=Ay+v$
$b=Bc+d$	$y=Bv+t$
$c=Cd+e$	$v=Ct+s$
$d=De+f$	$t=Ds+r$
$e=Ef+g$	$s=Er+q$
$f=Fg+0$	$r=Fq\pm n$

and in the laſt equation of the ſecond ſeries any number whatever may be put for q: it is alſo to be obſerved that the given number n is to have the ſign + prefixed to it, if the number of equations be odd, but − if that number be even. Having formed the ſecond ſeries of equations, the values of x and y may be thence found as in the foregoing examples. We proceed to ſhew the application of the rule.

Ex. 5. Required a number which being divided by 11 leaves the remainder 3, but being divided by 19 leaves the remainder 5.

Let N be the number, and x, y the quotients which ariſe from the reſpective diviſions, then we have $N=11x+3$, alſo $N=19y+5$, hence $11x+3=19y+5$ and $11x=19y+2$, an equation which furniſhes the following table.

$19=1\times11+8$	$x=y+v$
$11=1\times8+3$	$y=v+t$
$8=2\times3+2$	$v=2t+s$
$3=1\times2+1$	$t=s+r$
$2=2\times1+0$	$s=2r+2$

Here r may be aſſumed of any value whatever.

Hence we have

$s=2r+2$
$t=s+r=3r+2$
$v=2t+s=8r+6$
$y=v+t=11r+8$
$x=y+v=19r+14$

and the number required $N=209u+157$ where it is evident that the leaſt number which can expreſs N is 157.

Ex. 6. Given $\left\{\begin{matrix}3x+5y+7z=560\\9x+25y+49z=2920\end{matrix}\right\}$ To determine x, y, z in whole numbers.

From 7 times the firſt equation ſubtract the ſecond; thus we have $12x+10y=1000$, or $6x+5y=500$; and from this laſt equation by proceeding as in the foregoing example we find

$$x=500-5v, \qquad y=6v-500.$$

Let theſe values of x and y be ſubſtituted in either of the original equations; in the firſt, for example, as being the moſt ſimple, and we find $7z+15v=1560$. This laſt equation being reſolved in the ſame manner we find

$v=$

Indeterminate Problems.

$v=1560-7t$
$x=15t-3120$
$y=8860-42t$
$z=35t-7300$

and hence it appears that the only values which t can have so as to give whole positive numbers for x, y, z are 209 and 210: thus we have

$x=15 \quad y=82 \quad z=15$
or $x=50 \quad y=40 \quad z=30$.

318. If an equation was proposed involving three unknown quantities, as $ax+by+cz=d$, by transposition we have $ax+by=d-cz$, and, putting $d-cz=d'$, $ax+by=d'$. From this last equation we may find values of x and y of this form

$$x=mr+nc', \quad y=m'r+n'c'$$

or $x=mr+n(d-cz)$, $y=m'r+n'(d-cz)$

where z and r may be taken at pleasure, except in so far as the values of x, y, z may be required to be all positive, for from such restriction the values of z and r may be confined within certain limits to be determined from the given equation.

319. We proceed to indeterminate problems of the second degree. These produce equations of the three following forms,

I. $y=\frac{a}{b+cx}$, II. $y=\frac{a+bx}{c+dx}$, III. $y=\sqrt{a+bx+cx^2}$.

In all these equations a, b, c denote given numbers; in the two first x is to be determined so that y may be an integer, and in the third x is to be determined so that y may be a rational quantity.

320. In the equation $y=\frac{a}{b+cx}$ it is evident $b+cx$ must be a divisor of a; let d be one of its divisors, then $b+cx=d$, and $x=\frac{d-b}{c}$: hence, to find x we must search among the divisors of a for one such that if b be subtracted from it the remainder may be divisible by c, and the quotient will be such a value of x as is required.

321. When $y=\frac{a+bx}{c+dx}$, if d be a divisor of b, x will be taken out of the numerator if we divide it by $c+dx$, and this form is then reduced to the preceding. But if d is not a divisor of b, multiply both sides by d, then $dy=\frac{da+dbx}{c+dx}$ or $dy=b+\frac{ad-bc}{c+dx}$, and so x is found by making $c+dx$ equal to a divisor of $ad-bc$.

Example. Given $x+y+2xy=195$, to determine x and y in whole numbers.

From the given equation $y=\frac{195-x}{1+2x}$, therefore

$2y=\frac{390-2x}{1+2x}=-1+\frac{391}{1+2x}$. Now $391=17\times 23$ hence we must assume $1+2x=17$, or $1+2x=23$: the first supposition gives us $x=8$, $y=11$; and the second $x=11$, $y=8$, the same result in effect as the former.

322. It remains to consider the formula $y=\sqrt{a+bx+cx^2}$ where x is to be found so that y may be a rational quantity, but as the condition of having x and y also integers would add greatly to the difficulty of the problem and produce researches of a very intricate nature, we must be satisfied for the most part with fractional values. The possibility of rendering the proposed formula a square depends altogether upon the coefficients a, b, c; and there are four cases of the problem, the solution of each of which is connected with some peculiarity in their nature.

Indeterminate Problems.

323. *Case* 1. Let a be a square number, then, putting g^2 for a, we have $y=\sqrt{g^2+bx+cx^2}$. Suppose $\sqrt{g^2+bx+cx^2}=g+mx$; then $g^2+bx+cx^2=g^2+2gmx+m^2x^2$, or $bx+cx^2=2gmx+m^2x^2$, that is $b+cx=2gm+m^2x$, hence

$$x=\frac{2gm-b}{c-m^2}, \quad y=\sqrt{g^2+bx+cx^2}=\frac{cg-bm+gm^2}{c-m^2}.$$

Here m may be any rational quantity either whole or fractional.

324. *Case* 2. Let c be a square number $=g^2$, then putting $\sqrt{a+bx+g^2x^2}=m+gx$, we find $a+bx+g^2x^2=m^2+2mgx+g^2x^2$, or $a+bx=m^2+2mgx$, hence we find

$$x=\frac{m^2-a}{b-2mg}, \quad y=\sqrt{a+bx+g^2x^2}=\frac{bm-gm^2-ag}{b-2mg}.$$

Here m, as before, may be taken at pleasure.

325. *Case* 3. When neither a nor c are square numbers, yet, if the expression $a+bx+cx^2$ can be resolved into two simple factors as $f+gx$ and $h+kx$ the irrationality may be taken away as follows.

Assume $\sqrt{a+bx+cx^2}=\sqrt{(f+gx)(h+kx)}=m(f+gx)$, then $(f+gx)(h+kx)=m^2(f+gx)^2$, or $h+kx=m^2(f+gx)$, hence we find

$$x=\frac{fm^2-h}{k-gm^2}, \quad y=\sqrt{(f+gx)(h+kx)}=\frac{(fk-gh)m}{k-gm^2}$$

and in these formulæ m may be taken at pleasure.

326. *Case* 4. The expression $a+bx+cx^2$ may be transformed into a square as often as it can be resolved into two parts, one of which is a complete square, and the other a product of two simple factors; for then it has this form p^2+qr, where p, q, and r are quantities which contain no power of x higher than the first. Let us assume $\sqrt{p^2+qr}=p+mq$; thus we have $p^2+qr=p^2+2mpq+m^2q^2$ and $r=2mp+m^2q$, and as this equation involves only the first power of x we may by proper reduction obtain from it rational values of x and y as in the three foregoing cases.

327. If we can by trials discover any one value of x which renders the expression $\sqrt{a+bx+cx^2}$ rational we may immediately reduce the quantity under the radical sign to the above-mentioned form, and thence find a general expression from which as many more values of x may be determined as we please. Thus let us suppose that p is a value of x which satisfies the condition

Indeterminate Problems.

dition required, and that q is the corresponding value of y, then

$$y^2 = a + bx + cx^2$$
$$q^2 = a + bp + cp^2.$$

Therefore, by subtraction,

$$y^2 - q^2 = b(x-p) + c(x^2-p^2) = (b+cp+cx)(x-p)$$

and $y = \sqrt{q^2 + (b+cp+cx)(x-p)}$. The quantity under the radical sign being now reduced to the prescribed form, it may be rendered rational by the substitution pointed out in last article.

328. The application of the preceding general methods of resolution to any particular case is very easy; we shall therefore conclude with a very few examples.

Ex. 1. It is required to find two square numbers whose sum is a given square number.

Let a^2 be the given square number, and x^2, y^2, the numbers required. Then by the question $x^2 + y^2 = a^2$, and $y = \sqrt{a^2 - x^2}$. This equation is evidently of such a form as to be resolvable by the method employed in case 1. Accordingly, by comparing $\sqrt{a^2 - x^2}$ with the general expression $\sqrt{g^2 + bx + cx^2}$, we have $g = a$, $b = 0$, $c = -1$, and substituting these values in the formulæ of § 323. also $-n$ for $+m$, we find

$$x = \frac{2an}{n^2+1}, \quad y = \frac{a(n^2-1)}{n^2+1},$$ hence the numbers required are

$$x^2 = \frac{4a^2n^2}{(n^2+1)^2} \qquad y^2 = \frac{a^2(n^2-1)^2}{(n^2+1)^2}$$

If $a = n^2 + 1$, where n is any number whatever, the square numbers x^2 and y^2 will both be integers, viz. $x^2 = 4n^2$ and $y^2 = (n^2-1)^2$. Let us suppose $n = 2$, then $a = n^2 + 1 = 5$, and $a^2 = 25$. hence $x^2 = 4n^2 = 16$, $y = (n^2-1)^2 = 9$. Thus it appears that the square number 25 may be resolved into two other square numbers 9 and 16.

Ex. 2. It is required to find two square numbers whose difference shall be equal to a given square number b^2.

This question may be resolved in the same manner as the last. Or, without referring to any former investigation, let $(x+n)^2$ and x^2 be the numbers sought, then $(x+n)^2 - x^2 = b^2$, that is, $2nx + n^2 = b^2$, hence $x = \frac{b^2 - n^2}{2n}$ and $x + n = \frac{b^2 + n^2}{2n}$. So that the numbers sought are

$$\frac{(b^2+n^2)^2}{4n^2}, \qquad \frac{(b^2-n^2)^2}{4n^2}$$

where n may be any number whatever. If, for example, $b^2 = 25$ and $n = 1$, then $x = 12$ and $x + n = 13$; so that the numbers required are 144 and 169.

Ex. 3. It is required to determine x, so that $\frac{x^2+x}{2}$ may be a rational square.

Let y be the side of the square required, then $\frac{x^2+x}{2} = y^2$ and $4x^2 + 4x = 8y^2$. Let the first part of this equation be completed into a square by adding 1 to each side, then $4x^2 + 4x + 1 = 1 + 8y^2$, and taking the root $2x + 1 = \sqrt{1 + 8y^2}$, so that we have to make $1 + 8y^2$ a square. Assume

$$1 + 8y^2 = \left(1 + \frac{p}{q}y\right)^2 = 1 + \frac{2p}{q}y + \frac{p^2}{q^2}y^2,$$ then $8y = \frac{2p}{q} + \frac{p^2}{q^2}y$. Hence by proper reduction $y = \frac{2pq}{8q^2 - p^2}$ and since $2x + 1 = \sqrt{1 + 8y^2} = \frac{8q^2 + p^2}{8q^2 - p^2}$, therefore $x = \frac{p^2}{8q^2 - p^2}$ and $\frac{x^2+x}{2} = \frac{4p^2q^2}{(8q^2-p^2)^2}$, a rational square as was required.

Resolution of Geometrical Problems

Sect. XXIII. *Of the Resolution of Geometrical Problems.*

329. When a geometrical problem is to be resolved by algebra, the figure which is to be the subject of investigation must be drawn, so as to exhibit as well the known quantities, connected with the problem, as the unknown quantities, which are to be found. The conditions of the problem are next to be attentively considered, and such lines drawn, or produced, as may be judged necessary to its resolution. This done, the known quantities are to be denoted by symbols in the usual manner, and also such unknown quantities as can most easily be determined; which may be either those directly required, or others from which they can be readily found. We must next proceed to deduce from the known geometrical properties of the figure a series of equations, expressing the relations between the known and unknown quantities; these equations must be independent of each other, and as many in number as there are unknown quantities. Having obtained a suitable number of equations, the unknown quantities are to be determined in the same manner as in the resolution of numerical problems.

330. No general rule can be given for drawing the lines, and selecting the quantities most proper to be represented by symbols, so as to bring out the simplest conclusion; because different problems require different methods of solution. The best way to gain experience in this matter is to try the solution of the same problem in different ways, and then apply that which succeeds best to other cases of the same kind, when they afterwards occur. The following particular directions however may be of some use.

1. In preparing the figure by drawing lines, let them be either parallel or perpendicular to other lines in the figure, or so as to form similar triangles. And if an angle be given, it will be proper to let the perpendicular be opposite to that angle, and to fall from one end of a given line, if possible.

2. In selecting the quantities for which symbols are to be substituted, those are to be chosen, whether required or not, which lie nearest the known or given parts of the figure, and by means of which the next adjacent parts may be expressed by addition and subtraction only, without the intervention of surds.

3. When two lines, or quantities, are alike related to other parts of the figure, or problem, the best way is to substitute for neither of them separately, but to substitute for their sum, or difference, or rectangle, or the sum of their alternate quotients, or some line or lines in the figure, to which they have both the same relation.

Resolution of Geometrical Problems.

4. When the area or the perimeter of a figure is given, or ſuch like parts of it as have only a remote relation to the parts required, it is ſometimes of uſe to aſſume another figure ſimilar to the propoſed one, having one ſide equal to unity, or ſome other known quantity. For, from hence, the other parts of the figure may be found by the known proportions of like ſides or parts, and ſo an equation will be obtained.

351. We ſhall now give the algebraical ſolutions of ſome geometrical problems.

PROB. 1. In a right-angled triangle, having given the baſe, and the ſum of the hypothenuſe and perpendicula, to find both theſe two ſides.

Let ABC (Plate XIV. fig. 1.) repreſent the propoſed triangle, right-angled at B. Let AB, the given baſe, be denoted by b, and AC+BC, the ſum of the hypothenuſe and perpendicular by s; then if x be put for BC the perpendicular, the hypothenuſe AC will be $=s-x$. But from the nature of a right-angled triangle $AC^2=AB^2+BC^2$, that is,

$$b^2+x^2=(s-x)^2=s^2-2sx+x^2.$$

Hence $b^2=s^2-2sx$, and $x=\frac{s^2-b^2}{2s}=$ BC. Alſo $s-x=s-\frac{s^2-b^2}{2s}=\frac{s^2+b^2}{2s}=$AC. Thus the perpendicular and hypothenuſe are expreſſed by means of the known quantities b and s, as required.

If a ſolution in numbers be required, we may ſuppoſe AB$=b=3$, and AC+CB$=s=9$, then

$$\text{BC}=\frac{s^2-b^2}{2s}=4, \text{ and } \text{AC}=\frac{s^2+b^2}{2s}=5.$$

PROB. 2. In a right-angled triangle, having given the hypothenuſe, alſo the ſum of the baſe and perpendicular, it is required to determine both theſe two ſides.

Let ABC (fig. 1.) repreſent the propoſed triangle, right-angled at B. Put $a=$AC the given hypothenuſe, and $s=$AB+BC the given ſum of the ſides, then if x be put for AB, the baſe, $s-x$ will denote BC the perpendicular.

Now, from the nature of right-angled triangles, $AC^2=AB^2+BC^2$; therefore, $x^2+(s-x)^2=a^2$, or $x^2+s^2-2sx+x^2=a^2$; hence we have this quadratic equation $x^2-sx=\frac{a^2-s^2}{2}$, which being reſolved, by completing the ſquare, we find $x=\frac{s\pm\sqrt{2a^2-s^2}}{2}=$ AB, and $s-x=\frac{s\mp\sqrt{2a^2-s^2}}{2}=$BC. Thus it appears, that either of the two quantities $\frac{s+\sqrt{2a^2-s^2}}{2}$, $\frac{s-\sqrt{2a^2-s^2}}{2}$ may be taken for AB; but whichever of the two be taken, the remaining one is neceſſarily equal to BC.

PROB. 3. It is required to inſcribe a ſquare in a given triangle.

Let ABC (fig. 2.) be the given triangle, and EFGH the inſcribed ſquare. Draw the perpendicular AD cutting EF the ſide of the ſquare in K; then, becauſe the triangle is given, the perpendicular AD may be conſidered as given. Let BC$=b$, AD$=p$, and, conſidering AK as the unknown quantity, (becauſe from it the ſquare may be readily determined), let AK$=x$; then KD$=$EF$=p-x$.

The triangles ABC, AEF, are ſimilar; therefore AD : BC :: AK : EF, that is, $p:b::x:p-x$. Hence, by taking the product of the extremes and means, $p^2-px=bx$, and $x=\frac{p^2}{p+b}=$AK. If the ſide of the ſquare be required, it may be immediately found by ſubtracting AK from AD the perpendicular. Thus we have $p-\frac{p^2}{p+b}=\frac{pb}{p+b}=KD=$EF. Hence it appears, that we may either take AK, a third proportional to AD+BC and AD, or take DK, a fourth proportional to AD+BC, AD and BC, and the point K being found, the manner of conſtructing the ſquare is ſufficiently obvious.

PROB. 4. Having given the area of a rectangle inſcribed in a given triangle, it is required to determine the ſides of the rectangle.

Let ABC (fig. 3.) be the given triangle, and EDGF the rectangle whoſe ſides are required. Draw the perpendicular CI cutting DG in H. Put AB$=b$, CI$=p$, DG$=$EF$=x$, DE$=$HI$=y$, then CH$=p-y$. Let a^2 denote the given area.

The triangles CDG, CAB are ſimilar; hence

$$\text{CH} : \text{DG} :: \text{CI} : \text{AB}, \text{ or } p-y : x :: p : b.$$

So that to determine x and y, we have theſe two equations

$$xy=a^2,\ bp-by=px.$$

From the firſt equation we find $y=\frac{a^2}{x}$, and from the ſecond $y=\frac{bp-px}{b}$, therefore $\frac{bp-px}{b}=\frac{a^2}{x}$; hence $x^2-bx=-\frac{a^2b}{p}$, and, from this quadratic equation, by completing the ſquare, &c. we find

$$x=\frac{b}{2}\pm\sqrt{\frac{b^2}{4}-\frac{a^2b}{p}}, \text{ and } y=\frac{a^2}{x}=\frac{p}{2}\mp\sqrt{\frac{p^2}{2}-\frac{pa^2}{b}}.$$

Hence it appears, that if $\frac{a^2b}{p}$ be leſs than $\frac{b^2}{4}$, that is, if a^2 be leſs than $\frac{pb}{4}$, there are two different rectangles, having the ſame area, which may be inſcribed in the given triangle. It alſo appears that, to render the problem poſſible, the given ſpace a^2 muſt not be greater than $\frac{pb}{4}$, that is, than half the area of the given triangle.

PROB. 5. In a triangle, there are given the baſe, the vertical angle, and the ſum of the ſides about that angle, to determine each of theſe ſides.

Let us ſuppoſe that ABC (fig. 4.) is the triangle, of which there is given the baſe AC, the vertical angle ABC,

Resolution of Geometrical Problems.

ABC, and the sum of the sides AB, BC. Put $AC=a$, $AB+BC=b$, cosine of $\angle ABC=c$, and let AB, BC, the sides required, be denoted by x and y.

Let CD be drawn from either of the angles at the base perpendicular to the opposite side AB; then, rad. : cos. B :: CB : BD; therefore $BD=\cos.B\times CB=cy$.

Now, from the principles of geometry, $AC^2=AB^2+BC^2-2AB\times BD$. Hence, and from the question, we have these two equations,

$$x+y=b,\ x^2-2cxy+y^2=a^2.$$

From the square of the first of these equations, viz. $x^2+2xy+y^2=b^2$, let the second be subtracted, thus we have $2(1+c)xy=b^2-a^2$, and $2xy=\frac{b^2-a^2}{1+c}$. Again, from the square of the first equation let the double of this last equation, viz. $4xy=\frac{2(b^2-a^2)}{1+c}$, be subtracted, and the result is $x^2-2xy+y^2=\frac{2a^2-(1+c)b^2}{1+c}$, so that by taking the square root of this last equation we obtain

$$x-y=\sqrt{\frac{2a^2-(1+c)b^2}{1+c}}.$$

Thus we have found the difference between the sides, now their sum is given $=b$, hence, by adding $\frac{1}{2}$ the difference to $\frac{1}{2}$ the sum we find

$$x=\frac{b}{2}+\tfrac{1}{2}\sqrt{\frac{2a^2-(1+c)b^2}{1+c}};$$

and subtracting $\frac{1}{2}$ the difference from $\frac{1}{2}$ the sum

$$y=\frac{b}{2}-\tfrac{1}{2}\sqrt{\frac{2a^2-(1+c)b^2}{1+c}}.$$

If the angle at B be a right angle this problem becomes the same as prob. 2.

332. By a method of investigation, in all respects similar to that which has been employed in these examples, any proposed geometrical problem may be reduced to an algebraic equation, the roots of which will exhibit arithmetical values of that geometrical magnitude which constitutes the unknown quantity in the equation. But the roots of algebraic equations may also be expressed by geometrical magnitudes, and hence a geometrical construction of a problem may be derived from its algebraic solution. For example, quadratic equations, which all belong to one or other of these three forms,

$$x^2+ax=bc,\ x^2-ax=bc,\ x^2-ax=-bc,$$

or $x(x+a)=bc$, $x(x-a)=bc$, $x(a-x)=bc$

may be constructed as follow.

333. *Construction of the first and second forms.* Let a circle EABD (fig. 5.) be described with a radius $=\frac{1}{2}a$, in which, from any point A in the circumference apply a chord $AB=b-c$ (b being supposed greater than c) and produce AB so that $BC=c$; then $AC=b$.

Let H be the centre of the circle, join CH cutting the circumference in D and E, then, in the first case, the positive value of x shall be represented by CD, and in the second by CE. For, by construction $DE=a$, therefore, if CD be called x, then $CE=x+a$, but if CE $=x$, then $CD=x-a$. Now by the elements of geometry $EC\times CD=AC\times CB$, that is, $x(x\pm a)=bc$ or $x^2\pm ax=bc$, which equation comprehends the first and second cases.

Loci of Equations.

If the negative roots be required, that of the first case will be CE and that of the second CD.

When b and c are equal the construction will be rather more simple, for then AB vanishing, AC will coincide with the tangent CF. Therefore if a right-angled triangle HFC be constructed whose legs HF and FC are equal respectively to $\frac{1}{2}a$ and b, then will CD, the value of x in the first case, be equal to CH—HF, and CE, the value of x in the latter, $=$CH+HF.

334. *Construction of the third form.*—Let a circle EADB (fig. 6.) be described with a radius $=\frac{1}{2}a$ as before, in which apply a chord $AB=b+c$, and take $AC=b$. Through C draw the diameter DCE, then either DC or EC will be positive roots of the equation. For since $ED=a$, if either EC or $CD=x$, the remaining part of the diameter shall be $a-x$; now by the nature of the circle $EC\times CD=AC\times CB$, that is $x(a-x)=bc$, or $ax-x^2=-bc$, hence it is evident that the roots are rightly determined.

If b and c are equal, the construction will be the same, only it will then not be necessary to describe the whole circle; for since AC will be perpendicular to the diameter, if a right-angled triangle HCA be constructed, having its hypothenuse $HA=\frac{1}{2}a$ and base $AC=b$, the roots of the equation will be expressed by AH+HC and AH—HC.

335. If b and c be so unequal, that $b-c$ in the first two cases, or $b+c$ in the third, is greater than a, then, instead of these quantities, $\frac{1}{2}b$ and $\frac{1}{2}c$, or in general $\frac{b}{n}$ and nc (where n is any number whatever) may be used. Or a mean proportional may be found between b and c, and the construction performed as directed in each case when b and c are equal.

336. It appears from § 333 and 334, that every geometrical problem which produces a quadratic equation may be constructed by means of a straight line and a circle, or is a *plane* problem, hence on the contrary, if a problem can be constructed by straight lines and circles, its algebraic resolution will not produce an equation higher than a quadratic. Cubic and biquadratic equations may be constructed geometrically by means of any two conic sections, hence it follows that every geometrical problem which requires for its construction two conic sections, will, when resolved by algebra, produce a cubic or biquadratic equation.

Sect. XXIV. *Of the Loci of Equations.*

337. When an equation contains two indeterminate quantities x and y, then for each particular value of x there may be as many values of y as it has dimensions in that equation. So that if in an indefinite line AE (fig. 7.) there be taken a part AP to represent x, and a perpendicular PM be drawn to represent y, there will be as many points M, M', &c. the extremities of these perpendiculars, as there are dimensions of y in the proposed equation. And the values of PM, PM', &c. will be the roots of the equation which are found by substituting for x its value in any particular

Loci of Equations.

case. Hence it appears that in any particular equation we may determine as many points M, as we please, and a line which passes through all these points is called the *locus* of the equation. The line AP which expresses any value of x is called an *abscis*; and PM which expresses the corresponding value of y is called an *ordinate*. Any two corresponding values of x and y are also called *co-ordinates*.

338. When the equation that arises by substituting for x any particular value AP has all its roots positive, the points M, M', &c. will lie all on one side of AE, but if any of them be negative, these must be set off on the other side of AE towards m.

If x be supposed to become negative, then the line Ap which represents it is to be taken in a direction the opposite to that which represents the positive values of x; the points M, m, are to be taken as before, and the *locus* is only complete when it passes through all the points M, m, so as to exhibit a value of y corresponding to every possible value of x.

If in any case one of the values of y vanish, then the point M coincides with P, and the *locus* meets AE in that point. If one of the values of y becomes infinite, then it shews that the curve has an infinite arc, and in that case the line PM becomes an *asymptote* to the curve, or touches it at an infinite distance, if AP itself is finite.

If when x is supposed infinitely great, a value of y vanish, then the curve approaches to AE as an asymptote.

If any values of y become impossible, then so many points M vanish.

339. From these observations and the theory of equations, it appears that when an equation is proposed involving two indeterminate quantities x and y, there may be as many intersections of the curve that is the *locus* of the equation and of the line PM, as there are dimensions of y in the equation; and as many intersections of the curve and the line AE as there are dimensions of x in the equation.

340. A curve line is called *geometrical* or *algebraic*, when the equation which expresses the relation between x and y, any abscis and its corresponding ordinate, consists of a finite number of terms, and contains besides these quantities only known quantities. Algebraic curves are divided into *orders* according to the dimensions of the equations which express the relations between their abscisses and ordinates, or according to the number of points in which they can intersect a straight line.

341. *Straight lines* themselves constitute the first order of lines, and when the equation expressing the relation between x and y is only of one dimension, the points M must be all found in a straight line which contains with AE a given angle. Suppose for example that the given equation is $ay-bx-cd=0$, and that its *locus* is required.

Since $y=\frac{bx+cd}{a}$, it follows that APM (fig. 8.) being a right angle, if AN be drawn making the angle NAP such that its cosine is to its sine as a to b, and drawing AD parallel to the ordinates PM, and equal to $\frac{cd}{a}$, if DF be drawn parallel to AN, then will DF be the *locus* required; where it is to be observed that AD and PN are to be taken on the same side of AE if bx and cd have the same sign, but on opposite sides of AE if they have contrary signs.

Loci of Equations.

342. These curves whose equations are of two dimensions constitute the *second* order of lines, and the *first* kind of curves. Their intersections with a straight line can never exceed two (§ 339.)

The curves whose equations are of three dimensions form the *third* order of lines, and the *second* kind of curves; and their intersections with a straight line can never exceed three, and after the same manner curves of the higher orders are denominated.

Some curves, if they were completely described, would cut a straight line in an infinite number of points, but these belong to none of the orders we have mentioned, for the relation between their ordinates and abscisses cannot be expressed by a finite equation, involving only ordinates and abscisses with determinate quantities. Curves of this kind are called *mechanical* or *transcendental*.

343. As the roots of an equation become impossible always in pairs, so the intersections of a curve and its ordinate PM must vanish in pairs if any of them vanish. Let PM (fig. 9.) cut the curve in the points M and m, and by moving parallel to itself come to touch it in the point N, then the two points of intersection M and m go to form one point of contact N. If PM still move on parallel to itself, the points of intersection will beyond N become imaginary, as the two roots of an equation first become equal, and then imaginary.

344. The curves of the 3d, 5th, 7th orders, and all whose dimensions are odd numbers, have always one real root at least, and consequently for every value of x the equation by which y is determined must have at least one real root; so that as x, or AP, may be increased *in infinitum* on both sides, it follows that M must go off *in infinitum* on both sides without limit.

In curves whose dimensions are even numbers, as the roots of their equations may become all impossible, it follows that the figure of the curve may be like a circle or oval that is limited within certain bounds, beyond which it cannot extend.

345. When two roots of the equation by which y is determined become equal, either the ordinate PM touches the curve, two points of intersection in that case going into a point of contact, or the point M is a *punctum duplex* in the curve, two of its arcs intersecting each other there; or some oval that belongs to that kind of curve becoming infinitely little in M, it vanishes into what is called a *punctum conjugatum*.

If in the equation y be supposed $=0$, then the roots of the equation by which x is determined, will give the distances of the points where the curve meets AE from A, and if two of those roots be found equal, then either the curve touches the line AE, or AE passes through a *punctum duplex* in the curve. When y is supposed $=0$, if one of the values of x vanish, the curve in that case passes through A. If two vanish, then either AE touches the curve in A, or A is a *punctum duplex*.

As a *punctum duplex* is determined from the equality of two roots, so is a *punctum triplex* from the equality of three roots,

346. To

Loci of Equations.

346. To illuſtrate theſe obſervations we ſhall take a few examples.

Ex. 1. It is required to deſcribe the line that is the *locus* of this equation $y^2=ax+ab$, or $y^2-ax-ab=0$, where a and b denote given quantities. Since $y=\pm\sqrt{ax+ab}$, if AP$=x$ (fig. 10). be aſſumed of a known value and PM, Pm ſet off on each ſide equal to $\sqrt{ax+ab}$ the points M, m, will belong to the locus required; and for every poſitive value of AP there may thus be found a point of the locus on each ſide. The greater AP, or x, is taken, the greater does $\sqrt{ax+ab}$ become, and conſequently PM and Pm the greater, and if AP be ſuppoſed infinitely great, PM and Pm will alſo become infinitely great, therefore the locus has two infinite arcs that go off to an infinite diſtance from AE and from AD. If x be ſuppoſed to vaniſh, then $y=\pm\sqrt{ab}$, ſo that y does not vaniſh in that caſe, but paſſes through D and d, taking AD and Ad each $=\sqrt{ab}$.

If P be ſuppoſed to move to the other ſide of A, then x becomes negative, and $y=\pm\sqrt{ab-ax}$, ſo that y will have two values as before, while x is leſs than b; but if AB$=b$, and the point P be ſuppoſed to come to B, then $ab=ax$, and $y=\pm\sqrt{ab-ax}=0$; that is PM and Pm vaniſh, and the curve there meets the line AE. If P be ſuppoſed to move from A beyond B, then x becomes greater than b, and ax greater than ab, ſo that $ab-ax$ being negative, $\sqrt{ab-ax}$ becomes imaginary; that is, beyond B there are no ordinates which meet the curve, and conſequently on that ſide the curve is limited in B.

All this agrees very well with what is known by other methods, that the curve whoſe equation is $y^2=ax+ab$ is a parabola whoſe vertex is B, axis BE, and parameter equal to a. For ſince $b\pm x=$ BP and $y=$PM, from the equation $ab\pm ax=y^2$, or $a(b\pm x)=y^2$, we have $a\times$BP$=$PM^2, which is the well-known property of the parabola.

Ex. 2. It is required to deſcribe the line that is the *locus* of the equation $xy+ay+cy=bc+bx$,

$$\text{or } y=\frac{bc+bx}{a+c+x}.$$

Here it is evident (fig. 11.) that the ordinate PM can meet the curve in one point only, there being but one value of y correſponding to each value of x. When $x=0$, then $y=\frac{bc}{a+c}$ ſo that the curve does not paſs through A. If x be ſuppoſed to increaſe, then y will increaſe, but will never become equal to b, ſince $y=b\times\frac{c+x}{a+c+x}$, and $a+c+x$ is always greater than $c+x$: If x be ſuppoſed infinite, then the terms a and c vaniſh compared with x, and conſequently $y=b\times\frac{x}{x}=b$; from which it appears, that taking AD$=b$, and drawing GD parallel to AE, it will be an *aſymptote*, and touch the curve at an infinite diſtance. If x be now ſuppoſed negative, and AP be taken on the other ſide of A; then $y=b\times\frac{c-x}{a+c-x}$, and if x be taken on that ſide $=c$, then $y=b\times\frac{c-c}{a}=0$, ſo that the curve muſt paſs through B if AB$=c$. If x be ſuppoſed greater than c, then will $c-x$ become negative, and the ordinate will become negative, and lie on the other ſide of AE, till x become equal to $a+c$, and then $y=b\times\frac{-a}{0}$, that is, becauſe the denominator is 0, x becomes *infinite*, ſo that if AK be taken$=a+c$, the ordinate K4 will be an aſſymptote to the curve.

If x be taken greater than $a+c$ or AP greater than AK, then both $c-x$ and $a+c-x$ become negative, and conſequently $y=b\times\frac{x-c}{x-a-c}$ becomes a poſitive quantity; and ſince $x-c$ is always greater than $x-a-c$, it follows that y will be always greater than b or KG, and conſequently the reſt of the curve lies in the angle FGH. And as x increaſes, ſince the ratio of $x-c$ to $x-a-c$ approaches ſtill nearer to a ratio of equality, it follows that PM approaches to an equality with PN, therefore the curve approaches to its aſymptote GH on that ſide alſo.

This curve is the common hyperbola, for ſince $b(c+x)=y(a+c+x)$, by adding ab to both ſides, $b(a+c+x)=y(a+c+x)+ab$, and $(b-y)(a+c+x)=ab$, that is NM$\times$GN$=$GC$\times$BC which is the property of the common hyperbola.

Ex. 3. It is required to deſcribe the *locus* of the equation $ay^2-xy^2=x^3+bx^2$.

Here $y^2=\frac{x^3+bx^2}{a-x}$, and therefore $y=\pm\sqrt{\frac{x^3+bx^2}{a-x}}$, hence PM and PM (fig. 12.) are to be taken on each ſide, and equal to $\sqrt{\frac{x^3+bx^2}{a-x}}$; this expreſſion, by ſuppoſing $x=a$, becomes infinite becauſe its denominator is then $=0$, therefore if AB be taken $=a$ and BK be drawn perpendicular to AB, the line BK ſhall be an aſymptote to the curve. If x be ſuppoſed greater than a, or AP greater than AB, then $a-x$ being negative, the fraction $\frac{x^3+bx^2}{a-x}$ will become negative, and its ſquare root impoſſible; ſo that no part of the locus can lie beyond B. If x be ſuppoſed negative, or P taken on the other ſide of A, then $y=\pm\sqrt{\frac{-x^3+bx^2}{c+x}}$, hence the values of y will be real and equal as long as x is leſs than b, but if $x=b$, then $y=\sqrt{\frac{-x^3+bx^2}{a-x}}=\sqrt{\frac{-b^3+b^3}{a-b}}=0$, and conſequently if AD be taken $=b$, the curve will paſs through D, and there touch the

Loci of Equations.

Arithmetic of Sines.

the ordinate. If x be taken greater than b, then $\pm\sqrt{\frac{-x^3-ax^2}{c+x}}$ becomes imaginary, so that no part of the curve is found beyond D. The portion between A and D is called a *nodus*. If y be supposed $=0$, then will $x^3+bx^2=0$ be an equation whose roots are $-b$, 0, 0, from which it appears that the curve passes twice through A, and has in A a *punctum duplex*. This locus is a line of the 3d order.

If b is supposed to vanish in the proposed equation, so that $ay^2-xy^2=x^3$, then will A and D coincide (fig. 13.) and the *nodus* vanish, and the curve will have in the point A a *cuspis*, the two arcs AM and Am, in this case, touching one another in that point. This is the same curve which the ancients called the *Cissoid of Diocles*.

If instead of supposing b positive, or equal to 0, we suppose it negative, the equation will be $ay^2-xy^2=x^3-bx^2$, the curve will in this case pass through D as before, (fig. 14.) and taking AB$=a$, BK will be its asymptote. It will have a *punctum conjugatum* in A, because when y vanishes two values of x vanish, and the third becomes $=b$ or AD. The whole curve, besides this point, lies between DQ and BK. These remarks are demonstrated after the same manner as in the first case.

347. If an equation have this form,

$$y=ax^n+bx^{n-1}+cx^{n-2}+, \text{ \&c.}$$

and n is an even number, then will the *locus* of the equation have two infinite arcs lying on the same side of AE, (fig. 13.) for if x become infinite, whether positive or negative, x^n will be positive and ax^n have the same sign in either case, and as ax^n becomes infinitely greater than the other terms bx^{n-1}, &c. it follows that the infinite values of y will have the same sign in these cases, and consequently the two infinite arcs of the curve will lie on the same side of AE.

But if n be an odd number, then when x is negative x^n will be negative, and ax^n will have the contrary sign to what it had when x is positive, and therefore the two infinite arcs will in this case lie on different sides of AE, as in fig. 16. and tend towards parts directly opposite.

384. If an equation have this form $yx^n=a^{n+1}$, and n be an odd number, then when x is positive $y=\frac{a^{n+1}}{x^n}$, but when x is negative $y=-\frac{a^{n+1}}{x^n}$, so that this curve must all lie in the vertically opposite angles KAE, ΓAe, (fig. 17.) as the common hyperbola, FK, Ee being asymptotes.

But if n be an even number, then y is always positive whether x be positive or negative, because x^n in this case is always positive, and therefore the curve must all lie in the two adjacent angles KAE and KAe (fig. 18.) and have AK and AE for its asymptotes.

349. If an equation be such as can be reduced into two other equations of lower dimensions, without affecting y or x with any radical sign, then the *locus* shall consist of the two *loci* of those inferior equations. Thus the locus of the equation $y^3-2xy+by+x^2-bx=0$, which may be resolved into these two, $y-y=0$, $y-x+b=0$, is found to be two straight lines cutting the abscis AE (fig. 19.) in angles of 45° in the points A, B, whose distance AB$=b$. In like manner some cubic equations can be resolved into three simple equations, and then the *locus* is three straight lines, or may be resolved into a quadratic and simple equation, and then the locus is a straight line and a conic section. In general, curves of the superior orders include all the curves of the inferior orders, and what is demonstrated generally of any one order is also true of the inferior orders. Thus, for example, any general property of the conic sections holds true of two straight lines as well as a conic section, particularly that the rectangles of the segments of parallels bounded by them will always be to one another in a given ratio.

350. From the analogy which subsists between algebraic equations and geometrical curves, it is easy to see that the properties of the former must suggest corresponding properties of the latter. Hence the principles of algebra admit of the most extensive application to the theory of curve lines. It may be demonstrated, for example, that the *locus* of every equation of the second order is a conic section; and, on the contrary, the various properties of the diameters, ordinates, tangents, &c. of the conic sections may be readily deduced from the theory of equations.

Sect. XXV. *Of the Arithmetic of Sines.*

351. The relations which subsist between the sines and cosines of any arches of a circle, and those of their sums, or differences, &c. constitute what is called the *arithmetic of sines*. This branch of calculation has its origin in the application of algebra to geometry, and is of great importance in the more difficult parts of the mathematics, as well as in their application to physics.

352. In treating this subject, it is necessary to attend to the following observations.

1. If the sines of all arches between 0° and 180° be supposed positive, the sines of arches between 180° and 360° must be considered as negative; again, the sines of arches between 360° and 540° will be positive, and those of arches between 540° and 720° negative, and so on.

2. If the cosines of arches between 0° and 90° be supposed positive, the cosines of arches between 90° and 270° must be considered as negative, and the cosines of arches between 270° and 450° positive, and so on.

3. When an arch changes from + to −, or from − to +, its sine undergoes a like change, but its cosine is the same as before.

The truth of these observations must be evident from this consideration, that when a line, taken in a certain direction, decreases till it becomes $=0$, and afterwards increases, but in a contrary direction; then, if in the former state it was considered as positive, it must be negative in the latter, and contrariwise.

353. The following proposition may be considered as the foundation of the arithmetic of sines.

Let a and b denote any two arches of a circle.

Then, if radius be supposed $=1$.

$$\text{sin. } (a+b) = \text{sin. } a \times \text{cos. } b + \text{cos. } a \times \text{sin. } b.$$

Let

Arithmetic of Sines.

Let C be the centre of the circle, (fig. 20.) and AB, BD the arches denoted by a and b; then AD $=a+b$: draw the radii CA, CB, CD, and the sines BE, BF, DG; then BE, BF, DG are the sines of a, b, and $a+b$, respectively; and CE, CF, CG their cosines. Join EF, and draw FH parallel to DG. Because the angles CEB, CFB are right angles, the points C, E, B, F are in the circumference of a circle, hence, the angle FCB is equal to FEB; that is, to the alternate angle EFH; now CFB, EHF are both right angles, therefore the triangles CFB, EHF are similar, hence CF : CB (= CD) : : FH : FE; but CF : CD : : FH : DG; therefore FH : FE : : FH : DG, hence FE=DG=sin. $(a+b)$. Because EBFC is a quadrilateral inscribed in a circle, from the elements of geometry, we have BC × EF=BE × CF + BF × CE; but BE = sin. a, CF = cos. b, BF = sin. b, CE = cos. a, BC = 1, and EF=DG=sin. $(a+b)$, therefore sin. $(a+b)$=sin. a × cos. b + cos. a × sin. b, as was to be proved.

354. If in the preceding theorem we suppose the arch b to become negative, then sin. b will also become negative. Thus we obtain a second theorem, viz.

$$\text{Sin. } (a-b) = \text{sin. } a \times \text{cos. } b - \text{cos. } a \times \text{sin. } b.$$

Because cos. $(a+b)$=sin. $((90^\circ - a)-b)$, and by the second theorem sin. $((90^\circ-a)-b)$ = sin. $(90^\circ-a)$ × cos. b—cos. $(90^\circ-a)$ × sin. b = cos. a × cos. b—sin. a × sin. b, therefore

$$\text{cos. } (a+b) = \text{cos. } a \times \text{cos. } b - \text{sin. } a \times \text{sin. } b$$

which is the third theorem.

Arithmetic of Sines.

If we now suppose b to become negative, then sin. b becomes also negative; thus we have

Theor. IV. Cos. $(a-b)$ = cos. a × cos. b + sin. a × sin. b.

355. We have found that sin. $(a+b)$ = sin. a × cos. b + cos. a × sin. b; also, that sin. $(a-b)$ = sin. a × cos. b—cos. a × sin. b, therefore, taking the sum of these two equations, we find

Theor. V. Sin. $(a+b)$ + sin. $(a-b)$ = 2 sin. a × cos. b.

In like manner, by taking the difference between the equations, we have

Theor. VI. Sin. $(a+b)$—sin. $(a-b)$ = 2 cos. a × sin. b.

And, by taking the sum and difference of the equations, which constitute the third and fourth theorems, we also have

Theor. VII. Cos. $(a-b)$ + cos. $(a+b)$ = 2 cos. a × cos. b.
Theor. VIII. Cos. $(a-b)$—cos. $(a+b)$ = 2 sin. a × sin. b.

If in the four last theorems we substitute na for a, and a for b, we derive from them these other four:

Theor. IX. 2 Cos. a × sin. na = sin. $(n+1)\,a$ + sin. $(n-1)\,a$
Theor. X. 2 Sin. a × cos. na = sin. $(n+1)\,a$—sin. $(n-1)\,a$
Theor. XI. 2 Cos. a × cos. na = cos. $(n+1)\,a$ + cos. $(n-1)\,a$
Theor. XII. 2 Sin. a × sin. na = —cos. $(n+1)\,a$ + cos. $(n-1)\,a$.

356. By means of the four last theorems, the powers and products of the sines and cosines of arches may be expressed in terms of the sums and differences of certain multiples of those arches.

Thus, if in Theor XII. we suppose $n=1$, it becomes

$$2 \text{ Sin.}^2 a = -\text{cos. } 2a + 1.$$

To find the third power of sin. a, let both sides of this equation be multiplied by 2 sin. a, then 4 sin.^{3} a = 2 sin. a (—cos. $2a$ + 1), but 2 sin. a × cos. $2a$ = sin. $3a$—sin. a, Theor. X. Therefore

$$4 \text{ Sin.}^3 a = -\text{sin. } 3a + 3 \text{ sin. } a.$$

Again, for the fourth power, let both sides of the last equation be multiplied by 2 sin. a, then 8 sin.^{4} a = 2 sin. a (—sin. $3a$ + 3 sin. a); but 2 sin. a × sin. $3a$ = —cos. $4a$ + cos. $2a$; and 2 sin. a × sin. a = —cos. $2a$ + 1, Theor. XII. therefore by substitution

$$8 \text{ Sin.}^4 a = \text{cos. } 4a - 4 \text{ cos. } 2a + 3.$$

Proceeding in this way the successive powers of sin. a may be calculated as in the following table:

Sin. a = sin. a
2 Sin.^{2} a = —cos. $2a$ + 1
4 Sin.^{3} a = —sin. $3a$ + 3 sin. a
8 Sin.^{4} a = cos. $4a$ — 4 cos. $2a$ + 3
16 Sin.^{5} a = sin. $5a$ — 5 sin. $3a$ + 10 sin. a
32 Sin.^{6} a = —cos. $6a$ + 6 cos. $4a$ — 15 cos. $2a$ + 10
64 Sin.^{7} a = —sin. $7a$ + 7 sin. $5a$ — 21 sin. $3a$ + 35 sin. a.
&c.

The

Arithmetic of Sines. The succeſſive powers of the coſines may be found in the ſame manner. Thus

Arithmetic of Sines.

$$\begin{aligned}
&\text{Cof. } a = \text{cof. } a\\
2\ &\text{Cof.}^2 a = \text{cof. } 2a + 1\\
4\ &\text{Cof.}^3 a = \text{cof. } 3a + 3\ \text{cof. } a\\
8\ &\text{Cof.}^4 a = \text{cof. } 4a + 4\ \text{cof. } 2a + 3\\
16\ &\text{Cof.}^5 a = \text{cof. } 5a + 5\ \text{cof. } 3a + 10\ \text{cof. } a\\
32\ &\text{Cof.}^6 a = \text{cof. } 6a + 6\ \text{cof. } 4a + 15\ \text{cof. } 2a + 10\\
64\ &\text{Cof.}^7 a = \text{cof. } 7a + 7\ \text{cof. } 5a + 21\ \text{cof. } 3a + 35\ \text{cof. } a,
\end{aligned}$$

&c.

357. As an example of the products of the ſines and coſines of an arch, let it be propoſed to expreſs $\text{ſin.}^3 a \times \text{cof.}^2 a$ by the ſines or coſines of multiples of a. We have already found $4\ \text{ſin.}^3 a = -3\ \text{ſin. } 3a + 3\ \text{ſin. } a$, therefore

$$16\ \text{ſin.}^3 a \times \text{cof.}^2 a \begin{cases} = 2\ \text{cof. } a \times 2\ \text{cof. } a(-3\ \text{ſin. } 3a + 3\ \text{ſin. } a) \\ = 2\ \text{cof. } a(-\ \text{ſin. } 4a + 2\ \text{ſin. } 2a) \\ = -\text{ſin. } 5a + \text{ſin. } 3a + 2\ \text{ſin. } a. \end{cases}$$

Thus it appears that all poſitive integer powers of the ſine and coſine of an arch, or any product of thoſe powers, may be expreſſed in finite terms by the ſines and coſines of multiples of that arch.

358. On the contrary, the ſine and coſine of any arch may be expreſſed by the powers of the ſine and coſine of an arch whereof it is a multiple. For it appears from the 9th and 11th theorems that

$$\text{Sin.}(n+1)a = 2\ \text{cof. } a \times \text{ſin. } na - \text{ſin. } (n-1)a,$$
$$\text{Cof.}(n+1)a = 2\ \text{cof. } a \times \text{cof. } na - \text{cof. } (n-1)a,$$

therefore, by taking $n = 0, 1, 2, 3$, &c. ſucceſſively, we have

$$\begin{aligned}
&\text{Sin. } a = \text{ſin. } a\\
&\text{Sin. } 2a = 2\ \text{cof. } a \times \text{ſin. } a\\
&\text{Sin. } 3a = 2\ \text{cof. } a \times \text{ſin. } 2a - \text{ſin. } a\\
&\text{Sin. } 4a = 2\ \text{cof. } a \times \text{ſin. } 3a - \text{ſin. } 2a\\
&\text{Sin. } 5a = 2\ \text{cof. } a \times \text{ſin. } 4a - \text{ſin. } 3a,
\end{aligned}$$

&c.

$$\begin{aligned}
&\text{Cof. } a = \text{cof. } a\\
&\text{Cof. } 2a = 2\ \text{cof. } a \times \text{cof. } a - 1.\\
&\text{Cof. } 3a = 2\ \text{cof. } a \times \text{cof. } 2a - \text{cof. } a\\
&\text{Cof. } 4a = 2\ \text{cof. } a \times \text{cof. } 3a - \text{cof. } 2a\\
&\text{Cof. } 5a = 2\ \text{cof. } a \times \text{cof. } 4a - \text{cof. } 3a,
\end{aligned}$$

&c.

So that, putting s for the ſine, and c for the coſine of the arch a, and remarking that $c^2 = 1 - s^2$.

$$\begin{aligned}
&\text{Sin. } a = s\\
&\text{Sin. } 2a = 2cs\\
&\text{Sin. } 3a = 4c^2 s - s = -4s^3 + 3s\\
&\text{Sin. } 4a = 8c^3 s - 4cs = c(-8s^3 + 4s)\\
&\text{Sin. } 5a = 16c^4 s - 12c^2 s + s = 16s^5 - 20s^3 + 5s,
\end{aligned}$$

&c.

$$\begin{aligned}
&\text{Cof. } a = c\\
&\text{Cof. } 2a = 2c^2 - 1\\
&\text{Cof. } 3a = 4c^3 - 3c\\
&\text{Cof. } 4a = 8c^4 - 8c^2 + 1\\
&\text{Cof. } 5a = 16c^5 - 20c^3 + 5c,
\end{aligned}$$

&c.

359. If it be required to find the ſine or coſine of an arch, from having given the ſine or coſine of ſome multiple of that arch, it may be found by reſolving an equation of an order denoted by the numerical coefficient of the multiple arch. Thus if the coſine of an arch be given, to determine the coſine of half the arch, let C denote the given coſine, and x that which is required, then the equation $\text{cof. } 2a = 2c^2 - 1$ becomes $C = 2x^2 - 1$, which equation being reſolved gives $x = \pm\sqrt{\frac{1+C}{2}}$. If the ſine be required, from that of twice the arch being given, it may be found from the equation $\text{ſin. } 2a = 2cs$, which, by putting S for the given ſine, and y for the ſine required, becomes $S = 2y\sqrt{1-y^2}$, or, by ſquaring both ſides, and reducing, $y^4 - y^2 = -\frac{S^2}{4}$; whence $y^2 = \frac{1 \pm \sqrt{1 - S^2}}{2}$ and $y = \pm\sqrt{\frac{1 \pm \sqrt{1 - S^2}}{2}}$.

The two values of x indicate that there are two arches, the one as much leſs than 90°, as the other exceeds 90°, ſuch, that the coſine of the double of each is expreſſed by the ſame number. And the four values of y ſhew that there are four arches, viz. two poſitive and two negative, ſuch, that the ſine of the double of each is expreſſed by the ſame number.

Suppoſe now that the coſine of an arch is given to find the coſine of one-third of that arch, then, putting C to denote the given coſine, and x that which is required, the equation to be reſolved is

$$4x^3 - 3x = C, \text{ or } x^3 - \tfrac{3}{4}x - \frac{C}{4} = 0.$$

By comparing this cubic equation with the general equation $x^3 + qx + r = 0$, it appears that q is negative and ſuch that $4q^3 > 27r^2$, for C is always leſs than unity; hence it follows that the equation belongs to the *irreducibile* caſe, or that which cannot be reſolved by Cardan's rule. The equation $4\ \text{ſin.}^3 - 3\ \text{ſin. } a = -\text{ſin. } 3a$ is alſo of the ſame form; in order, therefore, to find either the ſine or coſine of one-third of a given arch recourſe muſt be had to the methods of approximation explained in Sect. XVI.

360. The ſum of any powers of the ſines or coſines of arches which conſtitute the arithmetical progreſſion a, $a+d$, $a+2d$, $a+3d$, &c. to $a+nd$, may

be

Arithmetic of Sines. be found as follows. We have already found, Theor. V. that

$$\text{Sin. } (p+d) = 2 \text{ cof. } d \times \text{fin. } p - \text{fin. } (p-d);$$

therefore, by fubſtituting a, $a+d$, $a+2d$, &c. ſucceſſively for p, we obtain the following ſeries of equations: Arithmetic of Sines.

$$\begin{aligned}
&\text{Sin. } a = \text{fin. } a\\
&\text{Sin. } (a+d) = 2 \text{ cof. } d \times \text{fin. } a - \text{fin. } (a-d)\\
&\text{Sin. } (a+2d) = 2 \text{ cof. } d \times \text{fin. } (a+d) - \text{fin. } a\\
&\text{Sin. } (a+3d) = 2 \text{ cof. } d \times \text{fin. } (a+2d) - \text{fin. } (a+d,\\
&\quad \&c.\\
&\text{Sin. } (a+nd) = 2 \text{ cof. } d \times \text{fin. } (a+(n-1)d) - \text{fin. } (a+(n-2)d)\\
&\text{Sin. } (a+(n+1)d) = 2 \text{ cof. } d \times \text{fin. } (a+nd) - \text{fin. } (a+(n-1)d);
\end{aligned}$$

Therefore, if we ſubſtitute

$$S = \text{fin. } a + \text{fin. } (a+d) + \text{fin. } (a+2d), \text{ \&c. } + \text{fin. } (a+nd),$$

by taking the ſum of all the equations, it is evident that

$$S + \text{fin. } (a+(n+1)d) = \text{fin. } a + 2 \text{ cof. } d \times S - \text{fin. } (a-d) - (S - \text{fin. } (a+nd)),$$

which equation, by proper reduction, becomes

$$S = \frac{\text{fin. } a - \text{fin. } (a+(n+1)d) + \text{fin. } (a+nd) - \text{fin. } (a-d)}{2(1 - \text{cof. } d)}.$$

By proceeding in the ſame manner with Theor. VII. viz.

$$\text{cof. } (p+d) = 2 \text{ cof. } d \times \text{cof. } p - \text{cof. } (p-d),$$

and ſubſtituting a, $a+d$, $a+2d$, &c. ſucceſſively for p; alſo putting

$$C = \text{cof. } a + \text{cof. } (a+d) + \text{cof. } (a+2d) +, \text{ \&c. } + \text{cof. } (a+nd),$$

we obtain this other theorem

$$C = \frac{\text{cof. } a - \text{cof. } (a+(n+1)d) + \text{cof. } (a+nd) - \text{cof. } (a-d)}{2(1 - \text{cof. } d)}.$$

361. It is worthy of remark, that if the arch d is contained $n+1$ times, either in the whole circumference, or any number of circumferences, that is, if $(n+1)d = q \times 360^\circ$, where q is any whole number; then $nd = q \times 360^\circ - d$. Thus we have fin. $(a+(n+1)d)$ = fin. $(a+q \times 360^\circ)$ = fin. a, alſo fin. $(a+nd)$ = fin. $(a-d+q \times 360^\circ)$ = fin. $(a-d)$; for the ſine of any arch is equal to the ſine of the ſame arch increaſed by any number of circumferences, and the ſame is true alſo of the coſine of an arch. Hence it appears that in theſe circumſtances the terms in the numerators of the fractions, which are equal to S and C, deſtroy one another, and thus S and C are both = 0; that is, the poſitive ſines, and coſines, are equal to the negative ſines, and coſines, reſpectively. Now if the circumference of a circle be divided into $n+1$ equal parts at the points A, A′, A″, A‴, &c. (fig. 21.), and any diameter BC drawn, then, if the arch BA = a, and the arch AA′ = d, the arches BAA′, BAA′A″, &c. will be equal to $a+d$, $a+2d$, &c. reſpectively; and, ſuppoſing the extremity of the diameter to fall between A and A^{iv}, the arch BA, &c. A^{iv} will be equal to $a+nd$. Hence we derive the following remarkable property of the circle. Let the circumference of a circle be divided into any number of equal parts at the points A, A′, A″, &c.; and from the points of diviſion let the ſines AD, A′D′, A″D″, &c. be drawn upon any diameter BCE; then, the ſum of AD, A′D′, &c. the ſines on one ſide of the diameter ſhall be equal to the ſum of A″D″, A‴D‴, &c. the ſines on the other ſide of the diameter. Alſo, the ſum of CD, C^{iv} D^{iv}, the coſines on the ſide of the centre ſhall be equal to the ſum of C′ D′, C″ D″, &c. the coſines on the other ſide of the centre.

362. Let us next inveſtigate the ſum of the ſquares of the ſines of the arches a, $a+d$, $a+2d$, &c. For this purpoſe we may form a ſeries of equations from the theorem

$$2 \text{ fin.}^2 a = 1 - \text{cof. } 2a.$$

Thus we have

$$\begin{aligned}
&2 \text{ fin.}^2 a = 1 - \text{cof. } 2a\\
&2 \text{ fin.}^2 (a+d) = 1 - \text{cof. } 2(a+d)\\
&2 \text{ fin.}^2 (a+2d) = 1 - \text{cof. } 2(a+2d),\\
&\quad \&c.\\
&2 \text{ fin.}^2 (a+nd) = 1 - \text{cof. } 2(a+nd)
\end{aligned}$$

Arithmetic of Sines.

Let $S' = \text{fin.}^2 a + \text{fin.}^2 (a+d') + \text{fin.}^2 (a+2d') +$, &c. $+ \text{fin.}^2 (a+nd')$,

Then, by addition, and obſerving that cof. $2a$+cof. $2(a+d')+$, &c. $+$cof. $2(a+nd')$ is, by § 363,

$$= \frac{\text{cof. } 2a - \text{cof. } 2(a+(n+1)d') + \text{cof. } 2(a+nd') - \text{cof. } 2(a-d')}{2(1-\text{cof. } 2d')},$$

we have

$$2S' = n - \frac{\text{cof. } 2a - \text{cof. } 2(a+(n+1)d') + \text{cof. } 2(a+nd') - \text{cof. } 2(a-d')}{2(1-\text{cof. } 2d')}.$$

In the ſame manner, by forming a ſeries of equations from this theorem, $2\,\text{cof.}^2 a = 1 + \text{cof. } 2a$, and, putting

$$\text{cof.}^2 a + \text{cof.}^2 (a+d') + \text{cof.}^2 (a+2d') +, \text{ &c. } + \text{cof.}^2 (a+nd'),$$

we find

$$2C' = n + \frac{\text{cof. } 2a - \text{cof. } 2(a+(n+1)d') + \text{cof. } 2(a+nd') - \text{cof. } 2(a-d')}{2(1-\text{cof. } 2d')}.$$

363. If we now ſuppoſe d to be ſuch an arch that $(n+1)d =$ the whole circumference $= 360°$, then cof. $2(a+(n+1)d) = \text{cof. } (2a+2\times 360°) = \text{cof. } 2a$, alſo cof. $2(a+nd') = \text{cof.}(2(a-d')+2\times 360°) = \text{cof. } 2(a-d')$. Thus it appears, that in this particular caſe the numerators of the fractional parts of the values of $2S'$ and $2C'$, are each $= 0$; and hence $2S'$ and $2C'$ are each $= n$. We muſt except, however, the caſe of $n=1$, for then $d=180°$, and cof. $2d' = 1$, ſo that the denominator of each fraction vaniſhing, as well as the numerator, it would be wrong to conclude that the fractions themſelves vaniſh.

Now if the circumference of a circle be divided into $n+1$ equal parts at the points A, A′, A″, &c. (fig. 21.), and any diameter BE, as alſo the ſines AD, A′D′, A″D″, &c. be drawn, then, if the arch $BA = a$, and the arch $AA' = d$, we have, as in § 361, $AD = \text{ſin. } a$, $A'D' = \text{ſin. } (a+d)$, $A''D'' = \text{ſin. } (a+2d)$, &c. and, ſuppoſing the point B to fall between A and A^{iv}, $A^{iv}D^{iv} = \text{ſin.}(a+nd')$. Hence we derive the following very elegant and general theorem relating to the circle.

Let the circumference of a circle be divided into n equal parts (where n is any number greater than 2), at the points A, A′, A″, &c.; and from the points of diviſion let the ſines AD, A′D′, A″D″, &c. be drawn perpendicular to any diameter whatever. Twice the ſum of the ſquares of the ſines AD, A′D′, A″D″, &c. is equal to n times the ſquare of the radius of the circle: Alſo twice the ſum of the ſquares of the coſines CD, CD′, CD″, &c. is equal to n times the ſquare of the radius of the circle.

364. We might now proceed to find the ſum of the cubes of the ſines of the arches a, $a+d$, $a+2d$, &c. from the equation

$$4\,\text{ſin.}^3 a = 3\,\text{ſin. } a - \text{ſin. } 3a,$$

and the ſum of the cubes of the coſines from the equation

$$4\,\text{cof.}^3 a = 3\,\text{cof. } a + \text{cof. } 3a,$$

and thence deduce properties of the circle ſimilar to thoſe which we have found in § 361. and § 363.; but as the manner of proceeding, in the caſe of the cubes and higher powers, differs not at all from that which we have employed in finding the ſum of their ſquares, we ſhall, for the ſake of brevity, leave the powers which exceed the ſquare to exerciſe the ingenuity of the reader.

365. The chords of arches poſſeſs properties in all reſpects analogous to thoſe of their ſines. For, from the nature of the chord of an arch,

$$\tfrac{1}{2}\,\text{chord } a = \text{ſin. } \tfrac{1}{2}a, \text{ and } \tfrac{1}{2}\,\text{chord ſupp. } a = \text{cof. } \tfrac{1}{2}a.$$

Therefore, if in the various theorems which we have inveſtigated, relating to the ſines and coſines of arches, we ſubſtitute half the chord of the arch for the ſine of half the arch, and half the chord of its ſupplement for its coſine, we ſhall have a new claſs of theorems relating to the chords of arches and the chords of their ſupplements.

366. For example, the 9th and 11th theorems, which may alſo be expreſſed thus:

$$2\,\text{ſin. } (n+1)\tfrac{1}{2}a = 2\,\text{cof. } \tfrac{1}{2}a \times 2\,\text{ſin. } n\tfrac{1}{2}a - 2\,\text{ſin. } (n-1)\tfrac{1}{2}a.$$
$$2\,\text{cof. } (n+1)\tfrac{1}{2}a = 2\,\text{cof. } \tfrac{1}{2}a \times 2\,\text{cof. } n\tfrac{1}{2}a - 2\,\text{cof. } (n-1)\tfrac{1}{2}a$$

by making the propoſed ſubſtitutions, are transformed to theſe other two theorems,

$$\text{ch. } (n+1)a = \text{ch. ſup. } a \times \text{ch. } na - \text{ch. } (n-1)a$$
$$\text{ch. ſup. } (n+1)a = \text{ch. ſup. } a \times \text{ch. ſup. } na - \text{ch. ſup. } (n-1)a$$

367. Let $x =$ chord of a, and $y =$ chord of its ſupplement, then, putting 0, 1, 2, 3, &c. ſucceſſively for n, and obſerving that ch. $0\,a = 0$, we obtain from the firſt of theſe theorems the following ſeries of equations:

ch. $a = x$
ch. $2a = xy$
ch. $3a = x(y^2-1)$
ch. $4a = x(y^3-2y)$
ch. $5a = x(y^4-y^2+1)$
ch. $6a = x(y^5-2y^3+2y)$
ch. $7a = x(y^6-5y^4+6y^2-1)$,
&c.

Alſo, obſerving that ch. ſup. $0\,a =$ diam. $= 2$, we find from the ſecond theorem that

ch. ſup. $a = y$
ch. ſup. $2a = y^2-2$
ch. ſup. $3a = y^3-3y$
ch. ſup. $4a = y^4-4y^2+2$
ch. ſup. $5a = y^5-5y^3+5y$
ch. ſup. $6a = y^6-6y^4+9y^2-2$,
&c.

If $4-x^2$, and the powers of that quantity be ſubſtituted for y^2, and its powers, in the chords of $3a$, $5a$, $7a$,

Arithmetic of Sines. a, &c. also in the chords of the supplements of $2a$, $3a$, $6a$, &c. we shall obtain the following series of equations, expressing the relations between the chord of any arch, and the chords of the multiples of that arch, if those multiples be odd numbers, or the chords of their supplements, if they be even numbers.

ch. $a = +x$
ch. sup. $2a = -x^2+2$
ch. $3a = -x^3+3x$
ch. sup. $4a = +x^4-4x^2+2$
ch. $5a = +x^5-5x^3+5x$
ch. sup. $6a = -x^6+6x^4-9x^2+2$
ch. $7a = -x^7+7x^5-14x^3+7x$
&c.

These equations are the foundation of the theory of angular sections, or method of dividing a given angle, or arch of a circle, into any proposed number of equal parts; a problem which evidently requires, for its general algebraic solution, the determination of the roots of an equation of a degree equal to the number of parts into which the arch is to be divided. By means of the same series of equations, we may also find the side of any regular polygon inscribed in a circle, and in this case the multiple arch, being equal to the whole circumference, will have its chord = 0.

363. The relation between the tangents of any two arches, and that of their sum, may be readily found by means of the 1st and 3d theorems of this section. For since sin. $(a+b)$=sin. $a \times$ cos. $b+$ cos. $a \times$ sin. b, and cos. $(a+b)$= cos. $a \times$ cos. $b-$sin. $a \times$ sin. b; therefore, dividing the former equation by the latter,

$$\frac{\text{sin. } (a+b)}{\text{cos. } (a+b)} = \frac{\text{sin. } a \times \text{cos. } b + \text{cos. } a \times \text{sin. } b}{\text{cos. } a \times \text{cos. } b - \text{sin. } a \times \text{sin. } b},$$

this equation, by dividing each term in the numerator and denominator of the latter part of it by cos. $a \times$ cos. b, may also be expressed thus: Arithmetic of Sines.

$$\frac{\text{sin. } (a+b)}{\text{cos. } (a+b)} = \frac{\frac{\text{sin. } a}{\text{cos. } a} + \frac{\text{sin. } b}{\text{cos. } b}}{1 - \frac{\text{sin. } a \times \text{sin. } b}{\text{cos. } a \times \text{cos. } b}}$$

But the sine of any arch divided by its cosine is equal to the tangent of that arch, hence the last equation becomes

$$\text{Theor. XIII. tan. } (a+b) = \frac{\text{tan. } a + \text{tan. } b}{1 - \text{tan. } a \times \text{tan. } b}$$

and by supposing the arch b negative, we also find

$$\text{Theor. XIV. tan. } (a-b) = \frac{\text{tan. } a - \text{tan. } b}{1 + \text{tan. } a \times \text{tan. } b}.$$

365. From the first of these two theorems a series of equations may be derived expressing the relations which take place between the tangent of an arch and the tangent of any multiple of that arch. Thus, by assuming $b=a$, $2a$, &c. and putting t for tan. a,

$$\text{tan. } 2a = \frac{2t}{1-t^2}$$

$$\text{tan. } 3a = \frac{3t-t^3}{1-3t^2},$$

&c.

and hence the tangent of an arch being given, the tangent of any part of that arch, as its half, third, &c. may be found by the resolution of an equation.

A L G

Algedo ‖ Algiabarii. ALGEDO, a suppressed gonorrhœa, a name which occurs in old authors. See GONORRHOEA, MEDICINE *Index*.

ALGENEB, a fixed star of the second magnitude, in Perseus's right side. Its longitude is 27° 46′ 12″ of Taurus, and its latitude 32° 50′ 28″ north, according to Mr Flamstead's catalogue.

ALGEZIRA, a town of Andalusia in Spain, with a port on the coast of the straits of Gibraltar. By this city the Moors entered Spain in 713; and it was taken from them in 1344, after a very long siege, remarkable for being the first in which cannon were made use of. It was called *Old Gibraltar*, and is about four leagues from the New. W. Long. 5. 20. N. Lat. 36. 0.

ALGHIER, or ALGERI, a town in Sardinia, with a bishop's see, upon the western coast of the island, between Sasseri and Bosa. Though it is not large, it is well peopled, and has a commodious port. The coral fished for on this coast is in the highest esteem of any in the Mediterranean. W. Long. 4. 2. N. Lat. 36. 0.

ALGIABARII, a Mahometan sect of predestinarians, who attribute all the actions of men, good or evil, to the agency or influence of God. The Algiabarii stand opposed to the ALKADARII. They hold absolute

A L G

decrees and physical promotion. For the justice of God in punishing the evil he has caused, they resolve it wholly into his absolute dominion over the creatures. Algidum, Algiers.

ALGIDUM, a town of Latium, in Italy, between Prenestе and Alba, near the mountains. On the top of one of these mountains was erected a temple of Diana, to which Horace refers, lib. i. ode 21. "*Quæcunque aut gelido prominet Algido*," and lib. iii. ode 23. "*Quæ nivali pascitur Algido*," &c.

ALGIERS, a kingdom of Africa, now one of the states of Barbary.—According to the latest and best computations, it extends 460 miles in length from east to west; but is very unequal in breadth, some places being scarcely 40 miles broad, and others upward of 100. It lies between Long. 0. 16. and 9. 16. W. and extends from Lat. 36. 55. to 44. 50. N.—It is bounded on the north by the Mediterranean, on the east by the river Zaine, the ancient Tusca, which divides it from Tunis; on the west by the Mulvya, and the mountains of Trava, which separate it from Morocco; and on the south by the Sahara, Zaara, or Numidian desert.

The kingdom of Algiers is at present divided into three provinces or districts, viz. the eastern, western, and Division of the kingdom.

Algiers. and ſouthern. The eaſtern or Levantine government, which is by far the moſt conſiderable of the three, and is alſo called *Beylick*, contains the towns of Bona, Conſtantina, Gigeri, Bujeya, Steffa, Tebeſ, Zamoura, Biſcara, and Necanz, in all which the Turks have their garriſons; beſides which, it includes the two ancient kingdoms of Cuco and Labez, though independent of the Algerine government, to whoſe forces their country is inacceſſible; ſo that they ſtill live under their own cheyks choſen by each of their adowars or hordes. To theſe we may add a French factory at Callo, under the direction of the company of the French Baſtion.—The weſtern government hath the towns of Oran, Tremecen, Moſtagan, Tenez, and Secrelly with its caſtle and garriſon.—The ſouthern government hath neither town, village, nor even a houſe, all the inhabitants living in tents, which obliges the dey and his forces to be always encamped.

Inhabitants. The inhabitants along the ſea coaſts are a mixture of different nations; but chiefly Moors and Moreſcos driven out of Catalonia, Arragon, and other parts of Spain. Here are alſo great numbers of Turks, who come from the Levant to ſeek their fortune; as well as multitudes of Jews and Chriſtians taken at ſea, who are brought hither to be ſold for ſlaves. The Berebers are ſome of the moſt ancient inhabitants of the country; and are ſuppoſed to be deſcended from the ancient Sabeans, who came hither from Arabia Felix under the conduct of one of their princes. Others believe them to be ſome of the Canaanites driven out of Paleſtine by Joſhua. Theſe are diſperſed all over Barbary, and divided into a multitude of tribes under their reſpective chiefs: moſt of them inhabit the mountainous parts; ſome range from place to place, and live in tents, or portable huts; others in ſcattered villages: they have nevertheleſs, kept themſelves for the moſt part from intermixing with other nations. The Berebers are reckoned the richeſt of all, go better clothed, and carry on a much larger traffic of cattle, hides, wax, honey, iron, and other commodities. They have alſo ſome artificers in iron, and ſome manufacturers in the weaving branch.—The name of *Bereber* is ſuppoſed to have been originally given them on account of their being firſt ſettled in ſome deſert place. Upon their increaſing in proceſs of time, they divided themſelves into five tribes, probably on account of religious differences, called the *Zinhagians*, *Muſamedins*, *Zeneti*, *Hoares*, and *Gomeres*; and theſe having produced 600 families, ſubdivided themſelves into a great number of petty tribes.—To theſe we may add the *Zwowahs*, by European authors called *Azuagues*, or *Aſſagues*, who are likewiſe diſperſed over moſt parts of Barbary and Numidia. Great numbers of theſe inhabit the mountainous parts of Cuco, Labez, &c. leading a wandering paſtoral life. But the moſt numerous inhabitants are the Moors and Arabians. The former are very ſtout and warlike, and ſkilful horſemen; but ſo addicted to robbing, that one cannot ſafely travel along the country at a diſtance from the towns without a guard, or at leaſt a marahout or ſaint for a ſafeguard. For as they look upon themſelves to be the original proprietors of the country, and not only as diſpoſſeſſed by the reſt of the inhabitants, but reduced by them to the loweſt ſtate of poverty, they make no ſcruple to plunder all they meet by way of repriſal. The inhabitants in general have a pretty fair complexion; they are robuſt and well proportioned. Algiers. People of diſtinction wear their beard; they have rich clothes made of ſilk, embroidered with flowers of gold, and turbans enriched with jewels. The Turks, who compoſe the military force, have great privileges, pay no taxes, are never publicly puniſhed, and rarely in private. The loweſt ſoldier domineers over the moſt diſtinguiſhed Moors at pleaſure. If he finds them better mounted than himſelf, he exchanges horſes without ceremony. The Turks alone have the privilege of carrying fire arms. Many good qualities, however, diſtinguiſh them in ſpite of this exceſs of deſpotiſm. They never game for money, not even for trifles; and they never profane the name of the Deity. They ſoon forget their private quarrels; and after the firſt paroxyſm of reſentment is over, it is infamy for a Turk to keep in remembrance the injuries he has received. In this reſpect certainly they are leſs barbarous than other nations that boaſt of their civilization. See MOORS.

Climate and ſoil. The climate of Algiers is in moſt places ſo temperate, that there is a conſtant verdure; the leaves of the trees being neither parched up by heat in ſummer, nor nipped by the winter's cold. They begin to bud in February; in April the fruit appears in its full bigneſs, and is commonly ripe in May. The ſoil, however, is exceſſively various; ſome places being very hot, dry, and barren, on which account they are generally ſuffered to lie uncultivated by the inhabitants, who are very negligent. Theſe barren places, eſpecially ſuch as lie on the ſouthern ſide, and are at a great diſtance from the ſea, harbour vaſt numbers of wild animals, as lions, tigers, buffaloes, wild boars, ſtags, porcupines, monkeys, oſtriches, &c. On account of their barrenneſs, they have but few towns, and thoſe thinly peopled; though ſome of them are ſo advantageouſly ſituated for trading with Bildulgerid and Negroland, as to drive a conſiderable traffic with them.

Rivers. The moſt conſiderable rivers of Algiers are (1.) the Ziz, which runs acroſs the province of Tremecen and the deſert of Anguid, falling into the Mediterranean near the town of Tabecrita, where it has the name of *Sirut*. (2.) The Haregol, ſuppoſed the *Sign* of Ptolemy, comes down from the great Atlas, croſſes the deſert of Anguid, and falls into the ſea about five leagues from Oran. (3.) The Mina, ſuppoſed the *Chylematis* of Ptolemy, a larger river, which runs through the plains of Bathala, and falls into the ſea near the town of Arzew. This river hath lately received the name of *Cena*, who rebuilt the town of Barthalaw after it had been deſtroyed. (4.) The Shellif, Zilef or Zilif, deſcending from the Mount Guanexeris, runs through ſome great deſerts, the lake Titteri, the frontiers of Tremecen, and Tenez, falling into the ſea a little above the city of Moſtagan. (5.) The Celef, ſuppoſed to be the *Carthena* of the ancients, falls into the ſea about three leagues weſt of Algiers, after a ſhort courſe of 18 or 20 leagues. (6.) The Hued-alquivir, ſuppoſed to be the *Nalobata* or *Naſaba* of the ancients, and called by the Europeans *Zinganir*, runs down with a ſwift courſe through ſome high mountains of Cuco, and falls into the ſea near Bujeyah. Whilſt the city of Bujeyah was in the hands of the Chriſtians, the mouth of this river was ſo choaked up with ſand, that no veſſel could come up into it: but in 1555, Harbour of Bujeyah cleared by accident.

Algiers. 1555, very ſoon after it was taken by the Moors, the great rains ſwelled it to ſuch a degree, that all the ſand and mud was carried off; ſo that galleys and other veſſels have ever ſince entered it with eaſe, where they lie ſafe from ſtorms, and all winds but that which blows from the north. (7.) Suf-Gemar, or Suf-Gimmar al Rumniel, ſuppoſed to be the *Ampſaga* of Ptolemy, hath its ſource in Mount Auras, on the confines of Atlas; thence runs through ſome barren plains, and the fruitful ones of Conſtantina, where its ſtream is greatly increaſed by ſome other rivers it receives; from thence running northward, along the ridges of ſome high mountains, it falls into the ſea a little eaſt of Gigeri. (8.) The Ladag or Ludeg, runs down from Mount Atlas through a part of Conſtantina, and falls into the ſea a little eaſtward of Bona. (9.) Guadi, or Guadel Barbar, ſprings from the head of Orbus, or Urbs, in Tripoli, runs through Bujeyah, and falls into the ſea near Tabarea.

The Algerine kingdom made formerly a conſiderable part of the Mauritania Tingitana (ſee MAURITANIA), which was reduced to a Roman province by Julius Cæſar, and from him alſo called *Mauritania Cæſarienſis*.—In the general account of Africa, it has been noticed, that the Romans were driven out of that continent by the Vandals; theſe by Beliſarius, the Greek emperor Juſtinian's general; and the Greeks in their turn by the Saracens. This laſt revolution happened about the middle of the ſeventh century; and the Arabs continued maſters of the country, dividing into a great number of petty kingdoms or ſtates, under chiefs of their own chooſing, till the year 1051.

Abu-Texefien ſubdues the Arab princes. This year, one Abubeker-ben-Omar, or, as the Spaniſh authors call him, *Abu Texefien*, an Arab of the Zinhagian tribe, being provoked at the tyranny of thoſe deſpots, gathered, by the help of his marabouts or ſaints, a moſt powerful army of malcontents, in the ſouthern provinces of Numidia and Libya. His followers were nicknamed *Marabites* or *Morabites*; by the Spaniards *Almoravides*; probably from their being aſſembled principally by the ſaints who were alſo called *Morabites*. The caliph of Kayem's forces were at this time taken up with quelling other revolts in Syria, Meſopotamia, &c. and the Arabs in Spain engaged in the moſt bloody wars; ſo that Texefien having nothing to fear from them, had all the ſucceſs he could wiſh againſt the Arabian cheyks or petty tyrants, whom he defeated in many battles, and at laſt drove them not only out of Numidia and Libya, but out of all the weſtern parts, reducing the whole province of Tingitania under his dominion.

Texefien was ſucceeded by his ſon Yuſef, or Joſeph, a brave and warlike prince. In the beginning of his reign, he laid the foundation of the city of Morocco, which he deſigned to make the capital of his empire. While that city was building, he ſent ſome of his marabouts ambaſſadors to Tremecen (now a province of Algiers), at that time inhabited by a powerful and inſolent ſect of Mahometans called *Zeneti*. The deſign of this embaſſy was to bring them back to what he called the *true faith*; but the Zeneti, deſpiſing his offers, aſſembled at Amaf, or Amfa, their capital, murdered the ambaſſadors, and invaded Joſeph's dominions with an army of 50,000 men.

Zeneti deſtroyed. The king hearing of their infamous proceedings, ſpeedily muſtered his army, and led it by long marches into their country, deſtroying all with fire and ſword; while the Zeneti, inſtead of oppoſing his progreſs, retired as faſt as poſſible towards Fez, in hopes of receiving aſſiſtance from thence. In this they were miſerably deceived: the Fezzans marched out againſt them in a hoſtile manner, and coming up with the unhappy Zeneti, encumbered with their families and baggage, and ready to expire with hunger and wearineſs, they cut them all to pieces, except a ſmall number who were moſtly drowned in attempting to ſwim acroſs a river, and ſome others who in their flight periſhed by falling from the high adjacent rocks. In the mean time Joſeph reduced their country to a mere deſert: which was, however, ſoon peopled by a numerous colony of Fezzans, who ſettled there under the protection of the reigning kings. In this war it is computed that near a million of the Zeneti, men, women, and children, loſt their lives.

Algiers.

The reſtleſs and ambitious temper of Joſeph did not let him remain long at peace. He quickly declared war againſt the Fezzans, reduced them to become his tributaries, and extended his conqueſts all along the Mediterranean. He next attacked ſome Arabian cheyks who had not yet ſubmitted to his juriſdiction; and purſued them with ſuch fury, that neither the Libyan deſerts, nor ridges of the moſt craggy rocks, could ſhelter them from his arms. He attacked them in ſuch of their retreats, caſtles, and fortreſſes, as were till then deemed impregnable; and at laſt ſubdued them, to the great grief of the other African nations, who were greatly annoyed by the ravages committed by his numerous forces.

Thus was founded the empire of the Morabites; which, however, was of no long duration; that race being in the 12th century driven out by Mohavedin, a marabout. This race of prieſts was expelled by Abdulac governor of Fez; and he, in the 13th century, ſhipped of his new conqueſts by the ſharifs of *Haſcen*, the deſcendants of thoſe Arabian princes whom Abu-Texefien had formerly expelled.

Shariffs of Haſcen, who.

The better to ſecure their new dominions, the ſharifs divided them into ſeveral little kingdoms or provinces; and among the reſt the preſent kingdom of Algiers was divided into four, namely, *Tremecen*, *Tenez*, *Algiers Proper*, and *Bujeyah*. The four firſt monarchs laid ſo good a foundation for a laſting balance of power between their little kingdoms, that they continued for ſome centuries in mutual peace and amity; but at length the king of Tremecen having ventured to violate ſome of their articles, Abul-Farez, king of Tenez, declared war againſt him, and obliged him to become his tributary. This king dying ſoon after, and having divided his kingdom among his three ſons, new diſcords aroſe; which Spain taking advantage of, a powerful fleet and army was ſent againſt Barbary, under the count of Navarre, in 1505. This commander ſoon made himſelf maſter of the important cities of Oran, Bujeyah, and ſome others; which ſo alarmed the Algerines, that they put themſelves under the protection of Selim Eutemi, a noble and warlike Arabian prince. He came to their aſſiſtance with a great number of his braveſt ſubjects, bringing with him his wife Zaphira, and a ſon then about 12 years old. This, however, was not ſufficient to prevent the Spaniards

Algerines in danger from the Spaniards.

Algiers.

niards from landing a number of forces near Algiers that ſame year, and obliging that metropolis to become tributary to Spain. Nor could Prince Selim hinder them from building a ſtrong fort on a ſmall iſland oppoſite to the city, which terrified their corſairs from ſailing either in or out of the harbour.

Invite Barbaroſſa.

To this galling yoke the Algerines were obliged to ſubmit till the year 1516; when, hearing of the death of Ferdinand king of Spain, they ſent an embaſſy to *Aruch Barbaroſſa*, who was at this time no leſs dreaded for his valour than his ſurpriſing ſucceſs, and was then ſent on a cruiſe with a ſquadron of galleys and barks. The purport of the embaſſy was, that he ſhould come and free them from the Spaniſh yoke; for which they agreed to pay him a gratuity anſwerable to ſo great a ſervice. Upon this Barbaroſſa immediately deſpatched 18 galleys and 30 barks to the aſſiſtance of the Algerines: while he himſelf advanced towards the city with 800 Turks, 3000 Jigelites, and 2000 Mooriſh volunteers. Inſtead of taking the neareſt road to Algiers, he directed his courſe towards *Sharſhel*, where *Haſſan*, another famed corſair, had ſettled himſelf. Him he ſurpriſed, and obliged to ſurrender; not without a previous promiſe of friendſhip: but no ſooner had Barbaroſſa got him in his power, than he cut off his head; and obliged all Haſſan's Turks to follow him in his new expedition.

His treachery and cruelty.

On Barbaroſſa's approach to Algiers, he was met by Prince Eutemi, attended by all the people of that metropolis, great and ſmall; who looked for deliverance from this abandoned villain, whom they accounted invincible. He was conducted into the city amidſt the acclamations of the people, and lodged in one of the nobleſt apartments of Prince Eutemi's palace, where he was treated with the greateſt marks of diſtinction. Elated beyond meaſure with this kind reception, Barbaroſſa formed a deſign of becoming king of Algiers; and fearing ſome oppoſition from the inhabitants, on account of the exceſſes he ſuffered his ſoldiers to commit, murdered Prince Eutemi, and cauſed himſelf to be proclaimed king; his Turks and Moors crying out as he rode along the ſtreets, "Long live King Aruch Barbaroſſa, the invincible king of Algiers, *the choſen of God* to deliver the people from the oppreſſion of the Chriſtians; and deſtruction to all that ſhall oppoſe, or refuſe to own him as their lawful ſovereign." Theſe laſt threatening words ſo intimidated the inhabitants, already apprehenſive of a general maſſacre, that he was immediately acknowledged king. The unhappy princeſs Zaphira, it is ſaid, poiſoned herſelf, to avoid the brutality of this new king, whom ſhe unſucceſsfully endeavoured to ſtab with a dagger.

Barbaroſſa was no ſooner ſeated on the throne, than he treated his ſubjects with ſuch cruelty, that they uſed to ſhut up their houſes and hide themſelves when he appeared in public. In conſequence of this, a plot was ſoon formed againſt him; but being diſcovered, he cauſed twenty of the principal conſpirators to be beheaded, their bodies to be buried in a dunghill, and laid a heavy fine on thoſe who ſurvived. This ſo terriſied the Algerines, that they never afterwards durſt attempt any thing againſt either Barbaroſſa or his ſucceſſors.

In the mean time, the ſon of Prince Eutemi having fled to Oran, and put himſelf under the protection of the marquis of Gomarez, laid before that nobleman a plan for putting the city of Algiers into the hands of the king of Spain. Upon this, young Selim Eutemi was ſent to Spain, to lay his plan before Cardinal Ximenes; who having approved of it, ſent a fleet with 10,000 land forces, under the command of *Don Franciſco*, or, as others call him, *Don Diego de Vera*, to drive out the Turks, and reſtore the young prince. But the fleet was no ſooner come within ſight of land, than it was diſperſed by a ſtorm, and the greateſt part of the ſhips daſhed againſt the rocks. Moſt of the Spaniards were drowned; and the few who eſcaped to ſhore were either killed by the Turks or made ſlaves. Algiers.

Though Barbaroſſa had nothing to boaſt on this occaſion, his pride and inſolence were now ſwelled to ſuch a degree, that he imagined himſelf invincible, and that the very elements conſpired to make him ſo. The Arabians were ſo much alarmed at his ſucceſs, that they implored the aſſiſtance of Hamid el Abdes king of Tenez, to drive the Turks out of Algiers. That prince readily undertook to do what was in his power for this purpoſe, provided they agreed to ſettle the kingdom on himſelf and his deſcendants. This propoſal being accepted, he immediately ſet out at the head of 10,000 Moors; and, upon his entering the Algerine dominions, was joined by all the Arabians in the country. Barbaroſſa engaged him, with only 1000 Turkiſh muſqueteers and 500 Granada Moors; totally defeated his numerous army; purſued him to the very gates of his capital, which he eaſily made himſelf maſter of; and having given it up to be plundered by the Turks, obliged the inhabitants to acknowledge him as their ſovereign. This victory, however, was chiefly owing to the advantage which his troops had from their fire-arms; the enemy having no other weapons than arrows and javelins.

No ſooner was Barbaroſſa become maſter of the kingdom of Tenez, than he received an embaſſy from the inhabitants of Tremecen; inviting him to come to their aſſiſtance againſt their then reigning prince, with whom they were diſſatisfied on account of his having dethroned his nephew, and forced him to fly to Oran; offering him even the ſovereignty, in caſe he accepted of their propoſal. The king of Tremecen, not ſuſpecting the treachery of his ſubjects, met the tyrant with an army of 6000 horſe and 3000 foot: but Barbaroſſa's artillery gave him ſuch an advantage, that the king was at length forced to retire into the capital; which he had no ſooner entered, than his head was cut off, and ſent to Barbaroſſa, with a freſh invitation to come and take poſſeſſion of the kingdom. On his approach, he was met with by the inhabitants, whom he received with complaiſance, and many fair promiſes; but beginning to tyrannize as uſual, his new ſubjects ſoon convinced him that they were not ſo paſſive as the inhabitants of Algiers. Apprehending, therefore, that his reign might prove uneaſy and precarious, he entered into an alliance with the king of Fez; after which, he took care to ſecure the reſt of the cities in his new kingdom, by garriſoning them with his own troops. Some of theſe, however, revolted ſoon after; upon which he ſent one of his corſairs, named *Eſcander*, a man no leſs cruel than himſelf, to reduce them. The Tremecenians now began to repent

Algiers. pent in good earneſt of their having invited ſuch a tyrant to their aſſiſtance; and held conſultations on the moſt proper means of driving him away, and bringing back their lawful prince *Abuchen Men;* but their cabals being diſcovered, a great number of the conſpirators were maſſacred in the moſt cruel manner. The prince had the good luck to eſcape to Oran, and was taken under the protection of the marquis of Gomarez, who ſent immediate advice of it to Charles V. then lately arrived in Spain, with a powerful fleet and army. That monarch immediately ordered the young king a ſuccour of 10,000 men, under the command of the governor of Oran; who, under the guidance of Abuchen Men, began his march towards Tremecen; and in their way they were joined by Prince Selim, with a great number of Arabs and Moors. The firſt thing they reſolved upon was, to attack the important fortreſs of *Calau*, ſituated between Tremecen and Algiers, and commanded by the corſair Eſcander at the head of about 300 Turks. They inveſted it cloſely on all ſides, in hopes Barbaroſſa would come out of Tremecen to its relief, which would give the Tremecenians an opportunity of keeping him out. That tyrant, however, kept cloſe in his capital, being embarraſſed by his fears of a revolt, and the politic delays of the king of Fez, who had not ſent the auxiliaries he promiſed. The garriſon of Calau, in the meantime, made a brave defence; and, in a ſally they made at night, cut off near 300 Spaniards. This encouraged them to venture a ſecond time; but they were now repulſed with great loſs, and Eſcander himſelf wounded: ſoon after which, they ſurrendered upon honourable terms; but were all maſſacred by the Arabians, except 16, who clung cloſe to the ſtirrups of the king and of the Spaniſh general.

Barbaroſſa being now informed that Abuchen Men, with his Arabs, accompanied by the Spaniards, were in full march to lay ſiege to Tremecen, thought proper to come out, at the head of 1500 Turks and 5000 Mooriſh horſe, in order to break his way through the enemy; but he had not proceeded far from the city, before his council adviſed him to return and fortify himſelf in it. This advice was now too late; the inhabitants being reſolved to keep him out, and open their gates to their own lawful prince as ſoon as he appeared. In this diſtreſs Barbaroſſa ſaw no way left but to retire to the citadel, and there to defend himſelf till he could find an opportunity of ſtealing out with his men and all his treaſure. Here he defended himſelf vigorouſly; but his proviſions failing him, he took advantage of a ſubterraneous back way, which he had cauſed to be digged up for that purpoſe; and, taking his immenſe treaſure with him, ſtole away as ſecretly as he could. His flight, however, was ſoon diſcovered; and he was ſo cloſely purſued, that to amuſe, as he hoped, the enemy, he cauſed a great deal of his money, plate, jewels, &c. to be ſcattered all the way, thinking they would not fail to ſtop their purſuit to gather it up. This ſtratagem, however, failed, through the vigilance of the Spaniſh commander, who being himſelf at the head of the purſuers, obliged them to march on, till he was come up cloſe to him on the banks of the *Huexda*, about eight leagues from Tremecen. Barbaroſſa had juſt croſſed the river, with his vanguard, when the Spaniards came up with his rear on the other ſide, and cut them all off; and then croſſing the water, overtook him at a ſmall diſtance from it. Here a bloody engagement enſued, in which the Turks fought like as many lions; but, but being at length overpowered by numbers, they were all cut to pieces, and Barbaroſſa among the reſt, in the 44th year of his age, and four years after he had raiſed himſelf to the royal title of *Jigel* and the adjacent country; two years after he had acquired the ſovereignty of Algiers, and ſcarce a twelvemonth after the reduction of Tremecen. His head was carried to Tremecen on the point of a ſpear; and Abuchen Men proclaimed king, to the joy of all the inhabitants. A few days after the fight, the king of Fez made his appearance at the head of 20,000 horſe, near the field of battle; but hearing of Barbaroſſa's defeat and death, marched off with all poſſible ſpeed, to avoid being attacked by the enemy. Algiers. Barbaroſſa defeated and killed by the Spaniards.

The news of Barbaroſſa's death ſpread the utmoſt conſternation among the Turks at Algiers: however, they cauſed his brother Hayradin to be immediately proclaimed king. The Spaniſh commander now ſent back the emperor's forces, without making any attempt upon Algiers; by which he loſt the opportunity of driving the Turks out of that country; while Hayradin, juſtly dreading the conſequences of the tyranny of his officers, ſought the protection of the Grand Signior. This was readily granted, and himſelf appointed baſhaw or viceroy of Algiers; by which means he received ſuch conſiderable reinforcements, that the unhappy Algerines durſt not make the leaſt complaint; and ſuch numbers of Turks reſorted to him, that he was not only capable of keeping the Moors and Arabs in ſubjection at home, but of annoying the Chriſtians at ſea. His firſt ſtep was to take the Spaniſh fort above mentioned, which was a great nuiſance to his metropolis. The Spaniards held out to the laſt extremity; but being all ſlain or wounded, Hayradin eaſily became maſter of the place. Succeeded by Hayradin. He takes the Spaniſh fort.

Hayradin next ſet about building a ſtrong mole for the ſafety of his ſhips. In this he employed 30,000 Chriſtian ſlaves, whom he obliged to work without intermiſſion for three years; in which time the work was completed. He then cauſed the fort he had taken from the Spaniards to be repaired, and placed a ſtrong garriſon in it, to prevent any foreign veſſels from entering the harbour without giving an account of themſelves. By theſe two important works, Hayradin ſoon became dreaded not only by the Arabs and Moors, but alſo by the maritime Chriſtian powers, eſpecially the Spaniards. The viceroy failed not to acquaint the Grand Signior with his ſucceſs, and obtained from him a freſh ſupply of money, by which he was enabled to build a ſtronger fort, and to erect batteries on all places that might favour the landing of an enemy. All theſe have ſince received greater improvements from time to time, as often as there was occaſion for them.

In the mean time the ſultan, either out of a ſenſe of the great ſervices Hayradin had done, or perhaps out of jealouſy leſt he ſhould make himſelf independent, raiſed Hayradin to the dignity of baſhaw of the empire, and appointed Haſſan Aga, a Sardinian renegado, an intrepid warrior, and an experienced officer, to ſucceed him as baſhaw of Algiers. Haſſan had no ſooner taken poſſeſſion of his new government, than he began to purſue his ravages on the Spaniſh coaſt with greater Succeeded by Haſſan Aga.

Algiers.

Charles V.'s expedition againſt Algiers.

greater fury than ever; extending them to the eccleſiaſtical ſtate, and other parts of Italy. But Pope Paul III. being alarmed at this, exhorted the emperor Charles V. to ſend a powerful fleet to ſuppreſs thoſe frequent and cruel piracies; and, that nothing might be wanting to render the enterpriſe ſucceſsful, a bull was publiſhed by his holineſs, wherein a plenary abſolution of ſins, and the crown of martyrdom, was promiſed to all thoſe who either fell in battle or were made ſlaves; the emperor on his part needed no ſpur; and therefore ſet ſail at the head of a powerful fleet conſiſting of 120 ſhips and 20 galleys, having on board 30,000 choſen troops, and an immenſe quantity of money, arms, ammunition, &c. In this expedition many young nobility and gentry attended as volunteers, and among theſe many knights of Malta, ſo remarkable for their valour againſt the enemies of Chriſtianity. Even ladies of birth and character attended Charles in his expedition, and the wives and daughters of the officers and ſoldiers followed them with a deſign to ſettle in Barbary after the conqueſt was finiſhed. All theſe meeting with a favourable wind, ſoon appeared before Algiers; every ſhip diſplaying the Spaniſh colours on the ſtern, and another at the head, with a crucifix to ſerve them for a pilot.

Algiers in great conſternation.

By this prodigious armament, the Algerines were thrown into the utmoſt conſternation. The city was ſurrounded only by a wall with ſcarce any outworks. The whole garriſon conſiſted of 800 Turks and 6000 Moors, without fire-arms, and poorly diſciplined and accoutred; the reſt of their forces being diſperſed in the other provinces of the kingdom, to levy the uſual tribute on the Arabs and Moors. The Spaniards landed without oppoſition, and immediately built a fort, under the cannon of which they encamped, and diverted the courſe of a ſpring which ſupplied the city with water. Being now reduced to the utmoſt diſtreſs, Haſſan received a ſummons to ſurrender at diſcretion, on pain of being put to the ſword with all the garriſon. The herald was ordered to extol the vaſt power of the emperor both by ſea and land, and to exhort him to return to the Chriſtian religion. But to this Haſſan only replied, that he muſt be a madman who would pretend to adviſe an enemy, and that the adviſed muſt ſtill act more madly who would take counſel of ſuch an adviſer. He was, however, on the point of ſurrendering the city, when advice was brought him that the forces belonging to the weſtern government were in full march towards the place; upon which it was reſolved to defend it to the utmoſt. Charles, in the mean time, reſolving upon a general aſſault, kept a conſtant firing upon the town; which, from the weak defence made by the garriſon, he looked upon as already in his hands. But while the *dowan*, or Algerine ſenate,

Prevented by a mad prophet from ſurrendering

were deliberating on the moſt proper means of obtaining an honourable capitulation, a mad prophet, attended by a multitude of people, entered the aſſembly, and foretold the ſpeedy deſtruction of the Spaniards before the end of the moon, exhorting the inhabitants to hold out till that time. This prediction was ſoon accompliſhed in a very ſurpriſing and unexpected manner: for, on the 28th of October 1541, a dreadful ſtorm of wind, rain, and hail, aroſe from the north, accompanied with violent ſhocks of earthquakes, and a diſmal and univerſal darkneſs both by ſea and land; ſo that the ſun, moon, and elements, ſeemed to combine together for the deſtruction of the Spaniards. In that one night, ſome ſay in leſs than half an hour, 86 ſhips and 15 galleys were deſtroyed, with all their crews and military ſtores; by which the army on ſhore was deprived of all means of ſubſiſting in theſe parts. Their camp alſo, which ſpread itſelf along the plain under the fort, was laid quite under water by the torrents which deſcended from the neighbouring hills. Many of the troops, by trying to remove into ſome better ſituation, were cut in pieces by the Moors and Arabs; while ſeveral galleys and other veſſels, endeavouring to gain ſome neighbouring creeks along the coaſts, were immediately plundered, and their crews maſſacred, by the inhabitants.

Algiers.

Spaniſh fleet deſtroyed by ſtorm.

The next morning Charles beheld the ſea covered with the fragments of ſo many ſhips, and the bodies of men, horſes, and other creatures, ſwimming on the waves; at which he was ſo diſheartened, that abandoning his tents, artillery, and all his heavy baggage, to the enemy, he marched at the head of his army, though in no ſmall diſorder, towards Cape *Malabux*, in order to reimbark in thoſe few veſſels which had outweathered the ſtorm. But Haſſan, who had cauſed his motions to be watched, allowed him juſt time to get to the ſhore, when he ſallied out and attacked the Spaniards in the midſt of their hurry and confuſion to get into their ſhips, killing great numbers, and bringing away a ſtill greater number of captives; after which he returned in triumph to Algiers, where he celebrated with great rejoicings his happy deliverance from ſuch diſtreſs and danger.

Siege of Algiers raiſed.

Soon after this, the prophet *Yuſef*, who had foretold the deſtruction of the Spaniards, was not only declared the deliverer of his country, but had a conſiderable gratuity decreed him, with the liberty of exerciſing his prophetic function unmoleſted. It was not long, however, before the marabouts, and ſome interpreters of the law, made a ſtrong oppoſition againſt him; remonſtrating to the baſhaw, how ridiculous and ſcandalous it was to their nation, to aſcribe the deliverance of it to a poor fortune-teller, which had been obtained by the fervent prayers of an eminent ſaint of their own profeſſion. But though the baſhaw and his dowan ſeemed, out of policy, to give into this laſt notion, yet the impreſſion which Yuſef's predictions and their late accompliſhment had made upon the minds of the common people, proved too ſtrong to be eradicated; and the ſpirit of divination and conjuring has ſince got into ſuch credit among them, that not only their great ſtateſmen, but their prieſts, marabouts, and ſantoons, have applied themſelves to that ſtudy, and dignified it with the name of *Mahomet's Revelations*.

The mad prophet rewarded.

The unhappy Spaniards had ſcarcely reached their ſhips, when they were attacked by a freſh ſtorm, in which ſeveral more of them periſhed; one ſhip in particular, containing 700 ſoldiers, beſides ſailors, ſunk in the emperor's ſight, without a poſſibility of ſaving a ſingle man. At length, with much labour, they reached the port of *Bujeyah*, at that time poſſeſſed by the Spaniards, whither Haſſan king of Tunis ſoon after repaired, with a ſupply of proviſions for the emperor, who received him graciouſly, with freſh aſſurances of his favour and protection. Here he diſmiſſed the few remains of the Malteſe knights and their forces, who embarked in three ſhattered galleys, and with much difficulty

Freſh calamities of the Spaniards.

Algiers. ficulty and danger reached their own country. Charles himſelf ſtaid no longer than till the 16th of November, when he ſet ſail for Carthagena, and reached it on the 25th of the ſame month. In this unfortunate expedition upwards of 120 ſhips and galleys were loſt, above 300 colonels and other land and ſea officers, 8000 ſoldiers and marines, beſides thoſe deſtroyed by the enemy on the reimbarkation, or drowned in the laſt ſtorm. The number of priſoners was ſo great, that the Algerines ſold ſome of them, by way of contempt, for an onion per head.

Haſſan reduces Tremecen. Haſſan, elated with this victory, in which he had very little ſhare, undertook an expedition againſt the king of Tremecen, who, being now deprived of the aſſiſtance of the Spaniards, was forced to procure a peace, by paying a vaſt ſum of money, and becoming tributary to him. The baſhaw returned to Algiers, laden with riches; and ſoon after died of a fever, in the 66th year of his age.

Bujeyah taken from the Spaniards. From this time the Spaniards were never able to annoy the Algerines in any conſiderable degree. In 1555, they loſt the city of Bujeyah, which was taken by Salha Rais, Haſſan's ſucceſſor; who next year ſet out on a new expedition, which he kept a ſecret, but was ſuſpected to be intended againſt Oran; but he was ſcarcely got four leagues from Algiers, when the plague, which at that time raged violently in the city, broke out in his groin, and carried him off in 24 hours.

Haſſan Corſo choſen baſhaw by the janizaries. Immediately after his death the Algerine ſoldiery choſe a Corſican renegado, Haſſan Corſo, in his room, till they ſhould receive farther orders from the Porte. He did not accept of the baſhawſhip without a good deal of difficulty; but immediately proſecuted the intended expedition againſt Oran, deſpatching a meſſenger to acquaint the Porte with what had happened. They had hardly begun their hoſtilities againſt the place, when orders came from the Porte, expreſsly forbidding Haſſan Corſo to begin the ſiege, or, if he had begun it, enjoining him to raiſe it immediately. This news was received with great grief by the whole fleet and army, as they thought themſelves ſure of ſucceſs, the garriſon being at that time very weak. Nevertheleſs, as they dared not diſobey, the ſiege was immediately raiſed.

Superſeded by Tekelli, who puts him to a cruel death. Corſo had hardly enjoyed his dignity four months, before news came, that eight galleys were bringing a new baſhaw to ſucceed him; one *Tekelli*, a principal Turk of the Grand Signior's court: upon which the Algerines unanimouſly reſolved not to admit him. By the treachery of the Levantine ſoldiers, however, he was admitted at laſt, and the unfortunate Corſo thrown over a wall in which a number of iron hooks were fixed; one of which catching the ribs of his right ſide, he hung three days in the moſt exquiſite torture before he expired.

Tekelli had no ſooner entered upon his new government, than he behaved with ſuch cruelty and rapaciouſneſs, that he was aſſaſſinated even under the dome of a ſaint, by Yuſef Calabres, the favourite renegado of Haſſan Corſo; who for this ſervice was unanimouſly choſen baſhaw, but died of the plague ſix days after his election.

Haſſan reinſtated. Yuſef was ſucceeded by Haſſan the ſon of Hayradin, who had been formerly recalled from his baſhawſhip, when he was ſucceeded by Salha Rais; and now had the good fortune to get himſelf reinſtated in his employment. Immediately on his arrival, he engaged in a war with the Arabs, by whom he was defeated with great loſs. The next year, the Spaniards undertook an expedition againſt Moſtagan, under the command of the count d'Alcandela; but were utterly defeated, the commander himſelf killed, and 12,000 men taken priſoners. This diſaſter was owing to the inconſiderate raſhneſs, or rather madneſs, of the commander; which was ſo great, that, after finding it impoſſible to rally his ſcattered forces, he ruſhed ſword in hand into the thickeſt of the enemy's ranks, at the head of a ſmall number of men, crying out, "St Jago! St Jago! the victory is ours, the enemy is defeated;" ſoon after which he was thrown from his horſe, and trampled to death.

Algiers. Spaniards defeated with great ſlaughter.

Haſſan having had the misfortune to diſoblige his ſubjects by allowing the mountaineers of Cuco to buy ammunition at Algiers, was ſent in irons to Conſtantinople, while the aga of the janizaries, and general of the land forces, ſupplied his place. Haſſan eaſily found means to clear himſelf; but a new baſhaw was appointed, called Achmet; who had no ſooner arrived than he ſent the two deputy baſhaws to Conſtantinople, where their heads were ſtruck off.—Achmet was a man of ſuch inſatiable avarice, that, upon his arrival at Algiers, all ranks of people came in ſhoals to make him preſents; which he the more greedily accepted, as he had bought his dignity by the money he had amaſſed while head gardener to the Sultan. He enjoyed it, however, only four months; and after his death, the ſtate was governed other four months by his lieutenant: when Haſſan was a third time ſent viceroy to Algiers, where he was received with the greateſt demonſtrations of joy.

Haſſan ſent in irons to Conſtantinople.

Reinſtated.

Siege of Marſalquiver. The firſt enterpriſe in which Haſſan engaged, was the ſiege of Marſalquiver, ſituated near the city Oran, which he deſigned to inveſt immediately after. The army employed in this ſiege conſiſted of 26,000 foot and 10,000 horſe, beſides which he had a fleet conſiſting of 32 galleys and galliots, together with three French veſſels laden with biſcuit, oil, and other proviſions. The city was defended by Don Martin de Cordova, brother of the count d'Alcandela, who had been taken priſoner in the battle where that nobleman was killed, but had obtained his liberty from the Algerines with immenſe ſums, and now made a moſt gallant defence againſt the Turks. The city was attacked with the utmoſt fury by ſea and land, ſo that ſeveral breaches were made in the walls. The Turkiſh ſtandards were ſeveral times planted on the walls, and as often diſlodged; but the place muſt have in the end ſubmitted, had not Haſſan been obliged to raiſe the ſiege in haſte, on the news that the famed Genoeſe admiral Doria was approaching with conſiderable ſuccours from Italy. The fleet accordingly arrived ſoon after; but miſſing the Algerine galleys, bore away for Pennon de Velez, where they were ſhamefully repulſed by a handful of Turks who garriſoned that place; which, however, was taken the following year.

Haſſan again recalled. In 1567, Haſſan was again recalled to Conſtantinople, where he died three years after. He was ſucceeded by Mahomet, who gained the love of the Algerines by ſeveral public ſpirited actions. He incorporated the janiſſaries and Levantine Turks together, and by that means put an end to their diſſenſions, which laid

Algiers. laid the foundation of the Algerine independency on the Porte. He likewiſe added ſome conſiderable fortifications to the city and caſtle, which he deſigned to render impregnable. But while he was thus ſtudying the intereſt of Algiers, one John Gaſcon, a bold Spaniſh adventurer, formed a deſign of ſurpriſing the whole piratic navy in the bay, and ſetting them on fire in the night-time, when they lay defenceleſs, and in their firſt ſleep. For this he had not only the permiſſion of King Philip II. but was furniſhed by him with proper veſſels, mariners, and fireworks, for the execution of his plot. With theſe he ſet ſail for Algiers in the moſt proper ſeaſon, viz. the beginning of October, when moſt, if not all the ſhips lay at anchor there, and eaſily ſailed near enough, unſuſpected, to view their manner of riding, in order to catch them unawares, at a time when the greater part of their crews were diſperſed in their quarters. He came accordingly, unperceived by any, to the very mole-gate, and diſperſed his men with their fireworks; but to their great ſurpriſe, they found them ſo ill mixed, that they could not with all their art make them take fire. In the mean time, Gaſcon took it into his head, by way of bravado, to go to the mole gate, and give three loud knocks at it with the pommel of his dagger, and to leave it fixed in the gate by its point, that the Algerines might have cauſe to remember him. This he had the good fortune to do without meeting with any diſturbance or oppoſition: but it was not ſo with his men; for no ſooner did they find their endeavours unſucceſsful, than they made ſuch a buſtle as quickly alarmed the guard poſted on the adjacent baſtion, from which the uproar quickly ſpread itſelf through the whole garriſon. Gaſcon now finding himſelf in the utmoſt danger, ſailed away with all poſſible haſte: but he was purſued, overtaken, and brought back a priſoner to Mahomet; who no ſooner got him into his power, than he immediately cauſed a gibbet of conſiderable height to be erected on the ſpot where Gaſcon had landed, ordering him to be hoiſted up, and hung by the feet to a hook, that he might die in exquiſite torture; and to ſhow his reſentment and contempt of the king his maſter, he ordered his commiſſion to be tied to his toes. He had not, however, hung long in this ſtate, when the captain who took him, accompanied by a number of other corſairs, interceded ſo ſtrongly in his behalf, that he was taken down, and put under the care of ſome Chriſtian ſurgeons; but two days after, ſome Moors reporting that it was the common talk and belief in Spain, that the Algerines durſt not hurt a hair of Gaſcon's head, &c. the unfortunate Spaniard was hoiſted up by a pulley to the top of the execution wall, and let down again upon the hook, which in his fall catched him by the belly, and gave him ſuch a wound, that he expired without a groan.—Thus ended the expedition of John Gaſcon, which has procured him a place among the Spaniſh martyrs; while, on the other hand, the Algerines look upon his diſappointment to have been miraculous, and owing to the efficacious protection of the powerful ſaint *Sidi Outededda*, whoſe prayers had before raiſed ſuch a terrible ſtorm againſt the Spaniſh fleet.

John Gaſcon's bold attempt to fire the Algerine fleet.

His bravado at the city gate.

Is taken and put to death.

Mahomet, being ſoon after recalled, was ſucceeded by the famous renegado Ochali, who reduced the kingdom of Tunis; which, however, remained ſubject to the vicercy of Algiers only till the year 1586, when a baſhaw of Tunis was appointed by the Porte. Algiers.

The kingdom of Algiers continued to be governed, till the beginning of the ſeventeenth century, by viceroys or baſhaws appointed by the Porte; concerning whom we find nothing very remarkable, further than that their avarice and tyranny were intolerable both to the Algerines and the Turks themſelves. At laſt the Turkiſh janizaries and militia becoming powerful enough to ſuppreſs the tyrannic ſway of theſe baſhaws, and the people being almoſt exhauſted by the heavy taxes laid upon them, the former reſolved to depoſe theſe petty tyrants, and ſet up ſome officer of their own at the head of the realm. The better to ſucceed in this attempt, the militia ſent a deputation of ſome of their chief members to the Porte, to complain of the avarice and oppreſſion of theſe baſhaws, who ſunk both the revenue of the ſtate, and the money remitted to it from Conſtantinople, into their own coffers, which ſhould have been employed in keeping up and paying the ſoldiery; by which means they were in continual danger of being overpowered by the Arabians and Moors, who, if ever ſo little aſſiſted by any Chriſtian power, would hardly fail of driving all the Turks out of the kingdom. They repreſented to the Grand Vizier how much more honourable, as well as eaſier and cheaper, it would be for the Grand Signior to permit them to chooſe their own dey, or governor, from among themſelves, whoſe intereſt it would then be to ſee that the revenue of the kingdom was rightly applied in keeping up its forces complete, and in ſupplying all other exigencies of the ſtate, without any further charge or trouble to the Porte than that of allowing them its protection. On their part, they engaged always to acknowledge the Grand Signiors as their ſovereigns, and to pay them their uſual allegiance and tribute, to reſpect their baſhaws, and even to lodge and maintain them and their retinue, in a manner ſuitable to their dignity, at their own charge. The baſhaws, however, were, for the future, to be excluded from aſſiſting at any but general douwans, unleſs invited to it; and from having the liberty of voting in them, unleſs when their advice was aſked, or the intereſt of the Porte was likely to ſuffer by their ſilence. All other concerns, which related to the government of Algiers, were to be wholly left under the direction of the dey and his douwan.

Theſe propoſals having been accepted by the Porte, the deputies returned highly ſatisfied; and having notified their new privileges, the great *douwan* immediately proceeded to the election of a dey from among themſelves. They compiled a new ſet of laws, and made ſeveral regulations for the better ſupport and maintenance of this new form of government, to the obſervation of which they obliged all their ſubjects to ſwear; and the militia, navy, commerce, &c. were all ſettled pretty early on the footing upon which they now are, and which ſhall be afterwards deſcribed; though the ſubſequent altercations that frequently happened between the baſhaws and deys, the one endeavouring to recover their former power, and the other to curtail it, cauſed ſuch frequent complaints and diſcontents at the Ottoman court, as made them frequently repent their compliance. Algerines allowed to chooſe their own deys.

In

Algiers.

In the year 1601, the Spaniards, under the command of Doria the Genoeſe admiral, made another attempt upon Algiers, in which they were more fortunate than uſual, their fleet being only driven back by contrary winds, ſo that they came off without loſs. In 1609, the Moors being expelled from Spain, flocked in great number to Algiers; and as many of them were very able ſailors, they undoubtedly contributed to make the Algerine fleet ſo formidable as it became ſoon after; though it is probable the frequent attempts made on their city would alſo induce them to increaſe their fleet. In 1616, their fleet conſiſted of 40 ſail of ſhips between 200 and 400 tons, their admiral 500 tons. It was divided into two ſquadrons, one of 18 ſail, before the port of Malaga; and the other at the cape of Santa Maria, between Liſbon and Seville; both of which attacked all Chriſtians ſhips, both Engliſh and French, with whom they pretended to be in friendſhip, as well as Spaniards and Portugueſe, with whom they were at war.

Become formidable to the Europeans.

The Algerines were now become very formidable to the European powers. The Spaniards, who were moſt in danger, and leaſt able to cope with them, ſolicited the aſſiſtance of England, the pope, and other ſtates. The French, however, were the firſt who dared to ſhow their reſentment of the perfidious behaviour of theſe miſcreants; and in 1617, M. Beaulieu was ſent againſt them with a fleet of 50 men of war, who defeated their fleet, took two of their veſſels, while their admiral ſunk his own ſhip and crew, rather than fall into his enemies hands.

An Engliſh ſquadron ſent againſt the Algerines.

In 1620, a ſquadron of Engliſh men of war was ſent againſt Algiers, under the conduct of Sir Robert Manſel; but of this expedition we have no other account, than that it returned without doing any thing; and the Algerines, becoming more and more inſolent, openly defied all the European powers, the Dutch only excepted; to whom, in 1625, they ſent a propoſal directed to the prince of Orange, that in caſe they would fit out 20 ſail of ſhips the following year, upon any good ſervice againſt the Spaniards, they would join them with 60 ſail of their own.

The next year, the *Coulolies*, or *Cologlies* (the children of ſuch Turks as had been permitted to marry at Algiers), who were enrolled in the militia, having ſeized on the citadel, had well nigh made themſelves maſters of the city; but were attacked by the Turks and renegadoes, who defeated them with terrible ſlaughter. Many of them were put to death; and their heads thrown in heaps upon the city walls, without the eaſtern gate. Part of the citadel was blown up; and the remaining Coulolis were diſmiſſed from the militia, to which they were not again admitted till long after.

States of Barbary throw off their dependence on the Porte.

In 1623, the Algerines and other ſtates of Barbary threw off their dependence on the Porte altogether, and ſet up for themſelves. What gave occaſion to this was the 25 years truce which Sultan Amurath IV. was obliged to make with the emperor Ferdinand II. to prevent his being overmatched by carrying on a war againſt him and the ſophi of Perſia at the ſame time. As this put a ſtop to the piratical trade of the Algerines, they proceeded as above mentioned; and reſolved, that whoever deſired to be at peace with them, muſt, diſtinctly and ſeparately, apply to their government.—

Algiers.

No ſooner was this reſolution taken, than the Algerines began to make prizes of ſeveral merchant ſhips belonging to powers at peace with the Porte. Nay, having ſeized a Dutch ſhip and polacre at Scanderoon, they ventured on ſhore; and finding the town abandoned by the Turkiſh aga and inhabitants, they plundered all the magazines and warehouſes, and ſet them on fire.—About this time Louis XIII. undertook to build a fort on their coaſts, inſtead of one formerly built by the Marſilians, and which they had demoliſhed. This, after ſome difficulty, he accompliſhed; and it was called the *Baſtion of France:* but the ſituation being afterwards found inconvenient, the French purchaſed the port of La Calle, and obtained liberty to trade with the Arabians and Moors. The Ottoman court, in the mean time, was ſo much embarraſſed with the Perſian war, that there was no leiſure to check the Algerine piracies. This gave an opportunity to the vizier and other courtiers to compound matters with the Algerines, and to get a ſhare of their prizes, which were very conſiderable. However, for form's ſake, a ſevere reprimand, accompanied with threats, was ſent them; to which they replied, "that theſe depredations deſerved to be indulged to them, ſeeing they were the only bulwark againſt the Chriſtian powers, eſpecially againſt the Spaniards, the ſworn enemies of the Moſſem name; adding, that "if they ſhould pay a punctilious regard to all that could purchaſe peace, or liberty to trade with the Ottoman empire, they would have nothing to do but ſet fire to all their ſhipping, and turn camel-drivers for a livelihood."

Deſperate undertaking of four younger brothers.

In the year 1635, four younger brothers of a good family in France entered into an undertaking ſo deſperate, that perhaps the annals of knight-errantry can ſcarcely furniſh its equal.—This was no leſs than to retort the piracies of the Algerines upon themſelves; and as they indiſcriminately took the ſhips of all nations, ſo were theſe heroes indiſcriminately to take the ſhips belonging to Algiers; and this with a ſmall frigate of ten guns!—In this ridiculous undertaking, 100 volunteers embarked; a Malteſe commiſſion was procured, together with an able maſter, and 36 mariners.—They had the good fortune, on their firſt ſetting out, to take a ſhip laden with wine, on the Spaniſh coaſt: with which they were ſo much elated, that three days after they madly encountered two large Algerine corſairs, one of 20 and the other of 24 guns, both well manned, and commanded by able officers. Theſe two large veſſels having got the ſmall frigate between them, plied her furiouſly with great ſhot, which ſoon took off her mainmaſt: notwithſtanding which, the French made ſo deſperate a reſiſtance, that the pirates were not able to take them, till the noiſe of their fire brought up five more Algerines; when the French veſſel, being almoſt torn to pieces, was boarded and taken. The young knight-errants were puniſhed for their temerity by a dreadful captivity, from which they redeemed themſelves in 1642 at the price of 6000 dollars.

A French admiral carries off the Turkiſh baſhaw.

The Algerines proſecuted their piracies with impunity, to the terror and diſgrace of the Europeans, till the year 1652; when a French fleet being accidentally driven to Algiers, the admiral took it into his head to demand a releaſe of all the captives of his nation, without exception. This being refuſed, the Frenchman without ceremony carried off the Turkiſh vice-

Algiers.

roy, and his cadi or judge, who had juſt arrived from the Porte, with all their equipage and retinue. The Algerines, by way of reprifal, ſurpriſed the Baſtion of France already mentioned, and carried off the inhabitants to the number of 600, with all their effects; which ſo provoked the admiral, that he ſent them word that he would pay them another viſit the next year with his whole fleet.

The Algerines fit out a formidable fleet.

The Algerines, undiſmayed by the threats of the French admiral, fitted out a fleet of 16 galleys and galliots, excellently manned and equipped, under the command of Admiral Hali Pinchinin.—The chief deſign of this armament was againſt the treaſure of Loretto; which, however, they were prevented by contrary winds from obtaining. On this they made a deſcent on Puglia in the kingdom of Naples; where they ravaged the whole territory of Necotra, carrying off a vaſt number of captives, and among them ſome nuns. From thence ſteering towards Dalmatia, they ſcoured the Adriatic; and loading themſelves with immenſe plunder, left thoſe coaſts in the utmoſt conſternation and reſentment.

which is totally deſtroyed by the Venetians.

At laſt the Venetians, alarmed at ſuch terrible depredations, equipped a fleet of 28 ſail, under the command of Admiral Capello, with expreſs orders to burn, ſink, or take, all the Barbary corſairs he met with, either on the open ſeas, or even in the Grand Signior's harbours, purſuant to a late treaty of peace with the Porte. On the other hand, the captain baſhaw, who had been ſent out with the Turkiſh fleet to chaſe the Florentines and Malteſe cruiſers out of the Archipelago, underſtanding that the Algerine ſquadron was ſo near, ſent expreſs orders to the admiral to come to his aſſiſtance. Pinchinin readily agreed; but having firſt reſolved on a deſcent upon the iſland of Liſſa, or Liſina, belonging to the Venetians, he was overtaken by Capello, from whom he retired to Valona, a ſea port belonging to the Grand Signior, whither the Venetian admiral purſued him; but the Turkiſh government refuſing to eject the pirates according to the articles of the peace between the Ottoman court and Venice, Capello was obliged to content himſelf with watching them for ſome time. Pinchinin was ſoon weary of reſtraint, and ventured out; when an engagement immediately enſued, in which the Algerines were defeated, and five of their veſſels diſabled, with the loſs of 1300 men, Turks, and Chriſtian ſlaves; beſides 1600 galley ſlaves who regained their liberty. Pinchinin, after this defeat, returned to Valona, where he was again watched by Capello; but the latter had not long lain at his old anchorage before he received a letter from the ſenate, deſiring him to make no farther attempt on the pirates at that time, for fear of a rupture with the Porte. This was followed by a letter from the governor of Valona, deſiring him to take care leſt he incurred the ſultan's diſpleaſure by ſuch inſults. The brave Venetian was forced to comply; but reſolving to take ſuch a leave of the Algerines as he thought they deſerved, obſerved how they had reared their tents, and drawn their booty and equipage along the ſhore. He then kept firing among their tents, while ſome well manned galliots and brigantines were ordered among their ſhipping, who attacked them with ſuch bravery, that, without any great loſs, they rowed out their 16 galleys, with all their cannon, ſtores, &c.—In this laſt engagement a ball from one of the Venetian galleys happening to ſtrike a Turkiſh moſque, the whole action was conſidered as an inſult upon the Grand Signior. To conceal this, Capello was ordered to ſink all the Algerine ſhips he had taken, except the admiral; which was to be conducted to Venice, and laid up as a trophy. Capello came off with a ſevere reprimand; but the Venetians were obliged to buy, with 500,000 ducats, a peace from the Porte. The Grand Signior offered to repair the loſs of the Algerines by building ten galleys for them, upon condition that they ſhould continue in his ſervice till the end of the enſuing ſummer; but Pinchinin, who knew how little the Algerines choſe to lie under obligations to him, civilly declined the offer. Algiers

Algiers in the utmoſt confuſion at the news.

In the mean time, the news of this defeat and loſs filled Algiers with the utmoſt grief and confuſion. The whole city was on the point of a general inſurrection, when the baſhaw and douwan iſſued a proclamation, forbidding nor only complaints and outcries, under the ſevereſt penalties; but all perſons whatever to *take their thumbs from within their girdles*, while they were deliberating upon this important point. In the mean time they applied to the Porte for an order that the Venetians ſettled in the Levant ſhould make up their loſs. But with this the Grand Signior refuſed to comply, and left them to repair their loſſes, as well as build new ſhips in the beſt manner they could. It was not long, however, before they had the ſatisfaction to ſee one of their corſairs land, with a freſh ſupply of 600 ſlaves, whom he had brought from the coaſt of Iceland, whither he had been directed by a miſcreant native taken on board a Daniſh ſhip.

They ſet out a new fleet.

Our pirates did not long continue in their weak and defenceleſs ſtate; being able, at the end of two years, to appear at ſea with a fleet of 65 ſail. The admiral Pinchinin equipped four galliots at his own expence: with which, in conjunction with the chiayah, or ſecretary of the baſhaw of Tripoli, he made a ſecond excurſion. This ſmall ſquadron, conſiſting of five galleys and two brigantines, fell in with an Engliſh ſhip of 40 guns; which, however, Pinchinin's captains refuſed to engage; but being afterwards reproached by him for their cowardice, they ſwore to attack the next Chriſtian ſhip which came in their way. This happened to be a Dutch merchantman, of 28 guns, which was deeply laden, and unable to uſe her ſails by reaſon of a calm. Pinchinin immediately ſummoned her to ſurrender; but receiving an ironical anſwer, drew up his ſquadron in form of a half moon, that they might pour all their ſhot at once into their adverſary. This, however, the Dutchman avoided, by means of a breeze of wind which fortunately ſprung up and enabled him to turn his ſhip; upon which the galleys ran foul of each other. Upon this, Pinchinin ran his own galley along ſide of the merchantman, the upper deck of which 70 Algerines immediately took poſſeſſion of, ſome of them cutting the rigging, and others plying the hatches with hand grenadoes: but the Dutchmen having ſecured themſelves in their cloſe quarters, began to fire at the Algerines on board, from two pieces of cannon loaded with ſmall ſhot; by which they were all ſoon killed, or forced to ſubmit. Pinchinin, in the mean time, made ſeveral unſucceſsful attempts to relieve his men, as well as to ſurround the Dutchman with his other galleys; but that ſhip lay ſo deep in the

Five of their galleys defeated by a Dutch merchantman

water,

Algiers.

water, that every ſhot did terrible execution among the pirates; ſo that they were obliged to remove farther off. At laſt the Dutch captain, having ordered his guns to be loaded with cartouches, gave them ſuch a parting volley as killed 200 of them, and ſent the reſt back to Algiers in a moſt diſmal plight.

But though Pinchinin thus returned in diſgrace, the reſt of the fleet quickly came back with vaſt numbers of ſlaves, and an immenſe quantity of rich ſpoils; inſomuch that the Engliſh, French, and Dutch, where obliged to cringe to the mighty Algerines, who ſometimes vouchſafed to be at peace with them, but ſwore eternal war againſt Spain, Portugal, and Italy, whom they looked upon as the greateſt enemies to the Mahometan name. At laſt Louis XIV. provoked by the grievous outrages committed by the Algerines on the coaſt of Provence and Languedoc, ordered, in 1681, a conſiderable fleet to be fitted out againſt them, under the marquis du Queſne, vice-admiral of France. His firſt expedition was againſt a number of Tripolitan corſairs; who had the good fortune to outrow him, and ſhelter themſelves in the iſland of Scio belonging to the Turks. This did not, however, prevent him from purſuing them thither, and making ſuch terrible fire upon them as quickly deſtroyed 14 of their veſſels, beſides battering the walls of the caſtle.

Preparations againſt Algiers by Louis XIV.

Algiers bombarded and ſet on fire by the French.

This ſeverity ſeemed only to be deſigned as a check to the piracies of the Algerines; but, finding they ſtill continued their outrages on the French coaſt, he ſailed to Algiers in Auguſt 1682, cannonading and bombarding it ſo furiouſly, that the whole town was in flames in a very little time. The great moſque was battered down, and moſt of the houſes laid in ruins, inſomuch that the inhabitants were on the point of abandoning the place; when on a ſudden the wind turned about, and obliged du Queſne to return to Toulon. The Algerines immediately made repriſals, by ſending a number of galleys and galliots to the coaſt of Provence, where they committed the moſt dreadful ravages, and brought away a vaſt number of captives: upon which a new armament was ordered to be got ready at Toulon and Marſeilles againſt the next year; and the Algerines, having received timely notice, put themſelves into as good a ſtate of defence as the time would allow.

Algerines commit dreadful ravages in France.

The city again bombarded.

In May 1683, du Queſne with his ſquadron caſt anchor before Algiers; where, being joined by the Marquis d'Affranville at the head of five ſtout veſſels, it was reſolved to bombard the town next day. Accordingly 100 bombs were thrown into it the firſt day, which did terrible execution; while the beſieged made ſome hundred diſcharges of their cannon againſt them without doing any conſiderable damage. The following nights the bombs were again thrown into the city in ſuch numbers, that the dey's palace and other great edifices were almoſt deſtroyed; ſome of their batteries were diſmounted, and ſeveral veſſels ſunk in the port. The dey and Turkiſh baſhaw, as well as the whole ſoldiery, alarmed at this dreadful havock, immediately ſued for peace. As a preliminary, the immediate ſurrender was inſiſted on of all Chriſtian captives who had been taken fighting under the French flag; which being granted, 142 of them were immediately delivered up, with a promiſe of ſending him the remainder as ſoon as they could be got from the different parts of the country. Accordingly Du Queſne ſent his commiſſary-general and one of his engineers into the town; but with expreſs orders to inſiſt upon the delivery of all the French captives without exception, together with the effects they had taken from the French: and that Mezomorto their then admiral, and Hali Rais one of their captains, ſhould be given as hoſtages. Algiers.

This laſt demand having embarraſſed the dey, he aſſembled the douwan, and acquainted them with it; upon which Mezomorto fell into a violent paſſion, and told the aſſembly, that the cowardice of thoſe who ſat at the helm had occaſioned the ruin of Algiers: but that, for his part, he would never conſent to deliver up any thing that had been taken from the French. He immediately acquainted the ſoldiery with what had paſſed; which ſo exaſperated them, that they murdered the dey that very night, and on the morrow choſe Mezomorto in his place. This was no ſooner done, than he cancelled all the articles of peace which had been made, and hoſtilities were renewed with greater fury than ever.

The French admiral now kept pouring in ſuch volleys of bombs, that in leſs than three days the greateſt part of the city was reduced to aſhes; and the fire burnt with ſuch vehemence, that the ſea was enlightened with it for more than two leagues round. Mezomorto, unmoved at all theſe diſaſters, and the vaſt number of the ſlain, whoſe blood ran in rivulets along the ſtreet; or rather, growing furious and deſperate, fought only how to wreak his revenge on the enemy; and, not content with cauſing all the French in the city to be cruelly murdered, ordered their conſul to be tied hand and foot, and faſtened alive to the mouth of a mortar, from whence he was ſhot away againſt their navy.—By this piece of inhumanity Du Queſne was ſo exaſperated, that he did not leave Algiers till he had utterly deſtroyed all their fortifications, ſhipping, almoſt all the lower part, and above two thirds of the upper part of the city, by which means it became little elſe than a heap of ruins. Set on fire and almoſt deſtroyed.

The haughty Algerines were now thoroughly convinced that they were not invincible; and therefore immediately ſent an embaſſy into France, begging in the moſt abject terms for peace; which Louis immediately granted, to their inexpreſſible joy. They now began to pay ſome regard to other nations, and to be a little cautious how they wantonly incurred their diſpleaſure. The firſt bombardment by the French had ſo far humbled the Algerines, that they condeſcended to enter into a treaty with England; which was renewed upon terms very advantageous to the latter in 1686. It is not to be ſuppoſed, however, that the natural perfidy of the Algerines would diſappear on a ſudden: notwithſtanding this treaty, therefore, they loſt no opportunity of making prizes of the Engliſh ſhips when they could conveniently come at them. Upon ſome infringement of this kind, Captain Beach drove aſhore and burnt ſeven of their frigates in 1695; which produced a renewal of the treaty five years after; but it was not till the taking of Gibraltar and Port Mahon, that Britain could have a ſufficient check upon them to enforce the obſervation of treaties; and theſe have ſince proved ſuch reſtraints upon Algiers, that they ſtill continue to pay a greater deference to the Engliſh than to any other European power. Algerines ſue for peace.

Seven of their ſhips burnt by Captain Beach.

The

Algiers.

Expulſion of the Turkiſh baſhaw.

The preſent century furniſhes no very remarkable events with regard to Algiers, except the taking of the famed city of Oran from the Spaniards in 1708 (which however they regained in 1737), and the expulſion of the Turkiſh baſhaw, and uniting his office to that of dey in 1710. This introduced the form of government which ſtill continues in Algiers.

Revenues, &c. of the dey.

The dey is now abſolute monarch; and pays no other revenue to the Porte than that of a certain number of fine boys or youths, and ſome other preſents which are ſent thither yearly. His own income probably riſes and falls according to the opportunities he has of fleecing both natives and foreigners; whence it is variouſly computed by different authors. Dr Shaw computes the taxes of the whole kingdom to bring into the treaſury no more than 300,000 dollars; but ſuppoſes that the eighth part of the prizes, the effects of thoſe perſons who die without children, joined to the yearly contributions raiſed by the government, preſents from foreigners, fines and oppreſſions, may bring in about as much more. Both the dey and officers under him enrich themſelves by the ſame laudable methods of rapine and fraud; which it is no wonder to find the common people practiſing upon one another, and eſpecially upon ſtrangers, ſeeing they themſelves are impoveriſhed by heavy taxes and the injuſtice of thoſe who are in authority.

We have already hinted, that the firſt deys were elected by the militia, who were then called the *douwan* or common council. This elective body was at firſt compoſed of 800 militia officers, without whoſe conſent the dey could do nothing; and upon ſome urgent occaſions all the officers reſiding in Algiers, amounting to above 1500, were ſummoned to aſſiſt. But ſince the deys, who may be compared to the Dutch ſtadtholders, have become more powerful, the douwan is principally compoſed of 30 chiah baſhaws or colonels, with now and then the mufti and cadi upon ſome emergencies; and, on the election of a dey, the whole ſoldiery are allowed to come and give their votes. All the regulations of ſtate ought to be determined by that aſſembly, before they paſs into a law, or the dey hath power to put them in execution: but, for many years back, the douwan has been of ſo little account, that it is only convened out of formality, and to give aſſent to what the dey and his chief favourites have concerted beforehand. The method of gathering the votes in this auguſt aſſembly is perfectly agreeable to the character of thoſe who compoſe it. The aga, or general of the janizaries, or the preſident *pro tempore*, firſt propoſes the queſtion; which is immediately repeated with a loud voice by the chiah baſhaws, and from them echoed again by officers called *baſhaldalas;* from theſe the queſtion is repeated from one member of the douwan to another, with ſtrange contortions, and the moſt hideous growlings, if it is not to their liking. From the loudneſs of this growling noiſe, the aga is left to gueſs as well as he can whether the majority of the aſſembly are pleaſed or diſpleaſed with the queſtion; and from ſuch a prepoſterous method, it is not ſurpriſing that theſe aſſemblies ſhould ſeldom end without ſome tumult or diſorder. As the whole body of the militia is concerned in the election of a new dey, it is ſeldom carried on without blows and bloodſhed: but when once the choice is made, the perſon elected is ſaluted with the words ALLA BARICK, "God bleſs you, and proſper you;" and the new dey uſually cauſes all the officers of the douwan who had oppoſed his election to be ſtrangled, filling up their places with thoſe who had been moſt zealous in promoting it. From this account of the election of the deys, it cannot be expected that their government ſhould be at all ſecure; and as they arrive at the throne by tumult, diſorder, and bloodſhed, they are generally deprived of it by the ſame means, ſcarcely one in ten of them having the good fortune to die a natural death.

Algiers.

Strange method of gathering the votes of the douwan.

In this country it is not to be expected that juſtice will be adminiſtered with any degree of impartiality. The Mahometan ſoldiery, in particular, are ſo much favoured, that they are ſeldom put to death for any crime except rebellion: in which caſe they are either ſtrangled with a bow ſtring or hanged to an iron hook. In leſſer offences, they are fined, or their pay ſtopped; and if officers, they are reduced to the ſtation of common ſoldiers, from whence they may gradually raiſe themſelves to their former dignity. Women guilty of adultery, have a halter tied about their necks, with the other end faſtened to a pole, by which they are held under water till they are ſuffocated. The baſtinado is likewiſe inflicted for ſmall offences; and is given either upon the belly, back, or ſoles of the feet, according to the pleaſure of the cadi; who alſo appoints the number of ſtrokes. Theſe ſometimes amount to 200 or 300, according to the indulgence the offender can obtain either by bribery or friends; and hence he often dies under this puniſhment for want of powerful enough advocates. But the moſt terrible puniſhments are thoſe inflicted upon the Jews or Chriſtians who ſpeak againſt Mahomet or his religion; in which caſe, they muſt either turn Mahometans or be impaled alive. If they afterwards apoſtatize, they are burned or roaſted alive, or elſe thrown down from the top of the city walls upon iron hooks, where they are caught by different parts of their body according as they happen to fall, and ſometimes expire in the greateſt torments; though by accident they may be put out of pain at once, as we have already related of the Spaniſh adventurer John Gaſcon. This terrible puniſhment, however, begins now to be diſuſed.

Puniſhments, &c.

The officer next in power to the dey is the aga of the janizaries, who is one of the eldeſt officers in the army, and holds his poſt only for two months. He is then ſucceeded by the chiah, or next ſenior officer.—During the two months in which the aga enjoys his dignity, the keys of the metropolis are in his hands; all military orders are iſſued out in his name; and the ſentence of the dey upon any offending ſoldier, whether capital or not, can only by executed in the court of his palace.—As ſoon as he has gone through this ſhort office, he is conſidered as *mazoul*, or ſuperannuated; receives his pay regularly, like the reſt of the militia, every two moons; is exempt from all further duties, except when called by the dey to aſſiſt at the grand council, to which he hath, however, a right to come at all times, but hath no longer a vote in it. Next to the aga in dignity is the ſecretary of ſtate, who regiſters all the public acts; and after him are the 30 chiahs or colonels, who ſit next to the aga in the douwan, and in the ſame gallery with him. Out of this claſs are generally choſen thoſe who go ambaſſadors to foreign

Aga of the janizaries and other military officers.

Algiers. reign courts, or who diſperſe the dey's orders throughout the realm. Next to them are 800 bolluck baſhaws or eldeſt captains, who are promoted to that of chiah baſhaws according to their ſeniority. The oldack baſhaws or lieutenants are next; who amount to 400, and are regularly raiſed to the rank of captains in their turn, and to other employments in the ſtate, according to their abilities. Theſe, by way of diſtinction, wear a leather ſtrap, hanging down to the middle of their back. One rule is ſtrictly obſerved in the rotation of theſe troops from one degree to a higher, viz. the right of ſeniority; one ſingle infringement of which would cauſe an inſurrection, and probably coſt the dey his life. Other military officers of note are the vekelards or purveyors of the army; the peys, who are the four oldeſt ſoldiers, and conſequently the neareſt to preferment; the foulacks, who are the next in ſeniority to them, and are part of the dey's body-guard, always marching before him when he takes the field, and diſtinguiſhed by their carabines and gilt ſcimitars, with a braſs gun on their caps; the kayts or Turkiſh ſoldiers, each band of whom has the government of one or more adowars or itinerant villages, and collects their taxes for the dey; and the ſagiards or Turkiſh lancemen, 100 of whom always attend the army, and watch over the water appointed for it. To theſe we may add the beys or governors of the three great provinces of the realm. All the above-mentioned officers ought to compoſe the great douwan or council above mentioned; but only the 30 chiah baſhaws have a right to ſit in the gallery next after the dey; the reſt are obliged to ſtand on the floor of the hall or council chamber, with their arms acroſs, and as much as poſſible without motion; neither are they permitted to enter with their ſwords on, for fear of a tumult. As for thoſe who have any matters to tranſact with the douwan, they muſt ſtand without, let the weather be ever ſo bad; and there they are commonly preſented with coffee by ſome of the inferior officers, till they are diſmiſſed.

Account of the corſairs, commerce, &c. It does not appear that the Algerines avail themſelves of the benefit of their internal reſources to the extent they might do; for their genius leads them too much to the piratical trade to mind any real advantage that might be derived from their own country. The corſairs or pirates form each a ſmall republic, of which the rais or captain is the ſupreme baſhaw; who, with the officers under him, form a kind of douwan, in which every matter relating to the veſſel is decided in an arbitrary way. Theſe corſairs are chiefly inſtrumental in importing whatever commodities are brought into the kingdom either by way of merchandiſe or prizes. Theſe conſiſt chiefly of gold and ſilver ſtuffs, damaſks, cloths, ſpices, tin, iron, plated braſs, lead, quickſilver, cordage, ſail-cloth, bullets, cochineal, linen, tartar, alum, rice, ſugar, ſoap, cotton raw and ſpun, copperas, aloes, brazil and logwood, vermilion, &c. Very few commodities, however, are exported from this part of the world: the oil, wax, hides, pulſe, and corn produced, being but barely ſufficient to ſupply the country; though before the loſs of Oran the merchants have been known to ſhip off from one or other of the ports of Barbary ſeveral thouſand tons of corn. The conſumption of oil, though here in great abundance, is likewiſe ſo conſiderable in this kingdom, that it is ſeldom permitted to be ſhipped Algiers. off for Europe. The other exports conſiſt chiefly in oſtriches feathers, copper, rugs, ſilk ſaſhes, embroidered handkerchiefs, dates, and Chriſtian ſlaves. Some manufactures in ſilk, cotton, wool, leather, &c. are carried on in this country, but moſtly by the Spaniards ſettled here, eſpecially about the metropolis. Carpets are alſo a manufacture of the country; which, though much inferior to thoſe of Turkey both in beauty and fineneſs, are preferred by the people to lie upon on account of their being both cheaper and ſofter. There are alſo at Algiers looms for velvet, taffetas, and other wrought ſilks; and a coarſe ſort of linen is likewiſe made in moſt parts of the kingdom. The country furniſhes no materials for ſhip-building. They have neither ropes, tar, ſails, anchors, nor even iron. When they can procure enough of new wood to form the main timbers of a ſhip, they ſupply the reſt from the materials of prizes which they have made; and thus find the ſecret of producing new and ſwift-ſailing veſſels from the ruins of the old. Of all the ſtates on the coaſt of Barbary, the Algerines are the ſtrongeſt at ſea.

Religion. The religion of the Algerines is chiefly diſtinguiſhed from that of the Turks by a greater variety of ſuperſtitious rites. The Koran is their acknowledged rule of faith and practice; but they are not very ſcrupulous in the obſervance of it. The muſti, or high prieſt; the cadi, or chief judge; and the grand marabout, are the three principal officers who preſide in matters of religion. The cadi attends in the court of juſtice once or twice every day, to hear and determine cauſes; but thoſe of ſuperior importance are ſubmitted to the dey himſelf, or, in his abſence, to one of the principal officers of the regency, who ſits in the gate of the palace for that expreſs purpoſe. Of this cuſtom ſome traces are found in ſacred hiſtory, Deut. xx. 11. 15. xxv. 7.

ALGIERS, a city, the capital of the above kingdom, is probably the ancient *Icoſium*: by the Arabians called *Algezair*, or rather *Al-Jezier*, or *Al-Jezerah*, i. e. *the iſland*, becauſe there was an iſland before the city, to which it has ſince been joined by a mole. It is built on the declivity of a hill by the ſea-ſide, in the form of an amphitheatre: at ſea, it looks like the top-ſail of a ſhip. The tops of the houſes are quite flat and white, and have all the appearance of a bleachfield. One houſe riſes above another in ſuch a manner that they do not hinder each other's proſpect. The ſtreets are ſo narrow, that they will ſcarcely admit two perſons to walk abreaſt, and the middle part is lower than the ſides. When any loaded beaſts, ſuch as camels, horſes, mules, or aſſes, paſs along, you are forced to ſtand up cloſe to the wall to let them paſs by. There is but one broad ſtreet, which runs through the city from eaſt to weſt, in which are the ſhops of the principal merchants, and the market for corn and other commodities. The lower part of the walls of the city is of hewn ſtone, and the upper part of brick; they are 30 feet high on the land ſide, and 40 towards the ſea; the foſſes or ditches are 20 feet broad and ſeven deep. There is no ſweet water in the city; and though there is a tank or ciſtern in every houſe, yet they often want water, becauſe it rains but ſeldom: the chief ſupply is from a ſpring on a hill, the water of which is conveyed

Algiers, Algoa.

conveyed by pipes to above a hundred fountains, at which a bowl is faſtened for the uſe of paſſengers. The common reſervoir is at the end of the mole, where the ſhips take in their water. Every one takes his turn at theſe places, except the Turks, who are firſt, and the Jews laſt. There are five gates, which are open from ſunriſing till ſun-ſetting; and ſeven forts or caſtles without the walls, the greateſt of which is on the mole without the gate, all of which are well ſupplied with great guns. There are 10 large moſques and 50 ſmall ones; three great colleges or public ſchools, and a great number of petty ones for children. The houſes are ſquare, and built of ſtone and brick, with a ſquare court in the middle, and galleries all around. There are ſaid to be about 100,000 inhabitants in the city, comprehending 5000 Jewiſh families, beſides Chriſtians. There are four fundics or public inns, ſuch as are in Turkey; and ſix cazernes, or barracks, for the unmarried Turkiſh ſoldiers, which will hold 600 each. There are no inns for Chriſtians to lodge at; but only a few tippling huts kept by ſlaves, for the accommodation of Greeks and the poorer ſort of travellers, where any thing may be had for money. Here are bagnios or public baths, in the ſame manner as in Turkey, at a very moderate rate. The women have baths of their own, where the men dare not come. Without the city there is a great number of ſepulchres, as alſo cells or chapels, dedicated to marabouts or reputed ſaints, which the women viſit every Friday. The Turkiſh ſoldiers are great tyrants; for they not only turn others out of the way in the ſtreets, but will go to the farmhouſes in the country for 20 days together, living at free quarters, and making uſe of every thing, not excepting the women. The Algerines eat, as in Turkey, ſitting croſs-legged round a table about four inches high, and uſe neither knives nor forks. Before they begin, every one ſays *Be iſme Allah*, "In the name of God." When they have done, a ſlave pours water on all their hands as they ſit, and then they waſh their mouths. Their drink is water, ſherbet, and coffee. Wine is not allowed, though drank immoderately by ſome. The proſpect of the country and ſea from Algiers is very beautiful, it being built on the declivity of a mountain; but the city, though for ſeveral ages it has braved ſome of the greateſt powers in Chriſtendom, it is ſaid, could make but a faint defence againſt a regular ſiege; and that three Engliſh fifty-gun ſhips might batter it about the ears of its inhabitants from the harbour. If ſo, the Spaniards muſt have been very deficient either in courage or conduct. They attacked it in the year 1775, by land and by ſea, but were repulſed with great loſs; though they had near 20,000 foot and 2000 horſe, and 47 king's ſhips of different rates and 346 tranſports. In the years 1783 and 1784, they alſo renewed their attacks by ſea to deſtroy the city and galleys; but after ſpending a quantity of ammunition, bombs, &c. were forced to retire without either its capture or extinction. The mole of the harbour is 500 paces in length, extending from the continent to a ſmall iſland where there is a caſtle and large battery. E. Long. 2. 12. N. Lat. 36. 49.

ALGOA BAY, or *Zwart-hops*, in ſouthern Africa, is ſituated in S. Lat. 33. 56. E. Long. 26. 53. and 500 miles diſtant from the Cape of Good Hope. Mr Barrow, who viſited this place, found, in an adjoining valley, a ſpecies of antelope, called the *riet-bok*, or red-goat, previouſly unknown to naturaliſts. He alſo mentions that great advantages might accrue to the Eaſt India Company from the erection of an eſtabliſhment at this place, for the purpoſe of preparing ſalted beef and fiſh, in conſequence of the ſalt-pans, and the abundance of large bullocks in the vicinity; together with great numbers of excellent fiſh, with which the coaſt abounds.

Algoa || Algorithm

ALGOL, a fixed ſtar of the third magnitude, called *Meduſa's Head*, in the conſtellation Perſeus. Its longitude is 21° 50′ 42″ of Taurus, and its latitude 23° 23′ 47″ north; according to Flamſtead's catalogue. For an account of its changes, period, and other circumſtances, ſee ASTRONOMY *Index*.

ALGONQUINS, a nation in North America, who formerly poſſeſſed great tracts of land along the north ſhore of the river St Lawrence. For a long time they had no rivals as hunters and warriors, and were long in alliance with the Iroquois; whom they agreed to protect from all invaders, and to let them have a ſhare of their veniſon. The Iroquois, on the other hand, were to pay a tribute to their allies, out of the culture of the earth; and to perform for them all the menial duties, ſuch as flaying the game, curing the fleſh, and dreſſing the ſkins. By degrees, however, the Iroquois aſſociated in the hunting matches and warlike expeditions of the Algonquins; ſo that they ſoon began to fancy themſelves as well qualified, either for war or hunting, as their neighbours. One winter a large detachment of both nations having gone out a hunting, and ſecured, as they thought, a vaſt quantity of game, ſix young Algonquins and as many Iroquois were ſent out to begin the ſlaughter. The Algonquins, probably become a little jealous of their aſſociates, upon ſeeing a few elks, deſired the Iroquois to return on pretence that they would have ſufficient employment in flaying the game they ſhould kill; but after three days hunting, having killed none, the Iroquois exulted, and in a day or two privately ſet out to hunt for themſelves. The Algonquins were ſo exaſperated at ſeeing their rivals return laden with game, that they murdered all the hunters in the night time. The Iroquois diſſembled their reſentment; but in order to be revenged, applied themſelves to ſtudy the art of war as practiſed among thoſe ſavage nations. Being afraid of engaging with the Algonquins, at firſt they tried their proweſs on other inferior nations, and, when they thought themſelves ſufficiently expert, attacked the Algonquins with ſuch diabolical fury, as ſhowed they could be ſatisfied with nothing leſs than the extermination of the whole race; which, had it not been for the interpoſition of the French they would have accompliſhed.—The few Algonquin nations, that are now to be ſeen, ſeem entirely ignorant of agriculture, and ſubſiſt by fiſhing and hunting. They allow themſelves a plurality of wives; notwithſtanding which, they daily decreaſe in populouſneſs, few or none of their nations containing above 6000 ſouls, and many of them not 2000. Their language is one of the three radical ones in North America, being underſtood from the river St Lawrence to the Miſſiſſippi.

ALGOR, with phyſicians, an unuſual coldneſs in any part of the body.

ALGORITHM, an Arabic word expreſſive of numerical computation.

ALGUAZIL,

Alguazil
Alhambra.

ALCUAZIL, in the *Spaniſh polity*, an officer whoſe buſineſs it is to ſee the decrees of a judge executed.

ALHAMA, a very pleaſant town of the kingdom of Granada, in Spain, ſituated in the midſt of ſome craggy mountains, about 25 miles S. W. of Granada, on the banks of the Rio Frio, in W. Long. 3. 26. N. Lat. 36. 59. and having the fineſt warm baths in all Spain. It was taken from the Moors in 1481. The inhabitants, though ſurpriſed, and the town without a garriſon, made a gallant defence: but being at length forced to ſubmit, the place was abandoned to the pillage of the Chriſtian ſoldiers, who, not ſatisfied with an immenſe quantity of gold, and jewels, made ſlaves of upwards of 3000 of the inhabitants.

ALHAMBRA, the ancient fortreſs and reſidence of the Mooriſh monarchs of Granada. It derives its name from the red colour of the materials which it was originally built with, Alhambra ſignifying a red houſe. It appears to a traveller a huge heap of as ugly buildings as can well be ſeen, all huddled together, ſeemingly without the leaſt intention of forming *one* habitation out of them. The walls are entirely unornamented, all gravel and pebbles, daubed over with plaſter by a very coarſe hand: yet this is the palace of the Mooriſh kings of Granada, indiſputably the moſt curious place within that exiſts in Spain, perhaps in the world. In many countries may be ſeen excellent modern as well as ancient architecture, both entire and in ruins; but nothing to be met with anywhere elſe can convey an idea of this edifice, except the decorations of an opera, or the tales of the genii.

Paſſing round the corner of the emperor's palace, one is admitted at a plain unornamented door in a corner. On my firſt viſit, ſays Mr Swinburne, I confeſs I was ſtruck with amazement, as I ſtept over the threſhold, to find myſelf on a ſudden tranſported into a ſpecies of fairy land. The firſt place you come to is the court called the *communa* or *del meſucar*, that is the *common baths*; an oblong ſquare, with a deep baſon of clear water in the middle; two flights of marble ſteps leading down to the bottom; on each ſide a parterre of flowers, and a row of orange trees. Round the court runs a periſtyle paved with marble; the arches bear upon very ſlight pillars, in proportions and ſtyle different from all the regular orders of architecture. The ceilings and walls are incruſtated with fretwork in ſtucco, ſo minute and intricate, that the moſt patient draughtſman would find it difficult to follow it, unleſs he made himſelf maſter of the general plan. This would facilitate the operation exceedingly; for all this work is frequently and regularly repeated at certain diſtances, and has been executed by means of ſquare moulds applied ſucceſſively, and the parts joined together with the utmoſt nicety. In every diviſion are Arabic ſentences of different lengths, moſt of them expreſſive of the following meanings: "There is no conqueror but God;" or, "Obedience and honour to our lord Abouabdoulah." The ceilings are gilt or painted; and time has cauſed no diminution in the freſhneſs of their colours, though conſtantly expoſed to the air. The lower part of the walls is moſaic, diſpoſed in fantaſtic knots and feſtoons. A work ſo novel, ſo exquiſitely finiſhed, and ſo different from all that he had ever ſeen, muſt afford a ſtranger the moſt agreeable ſenſations while he treads this magic ground. The porches at the ends are more like grotto-work than any thing elſe to which they can be compared. That on the right hand opens into an octagon vault, under the emperor's palace, and forms a perfect whiſpering gallery, meant to be a communication between the offices of both houſes.

Alhambra

Travels in Spain.

Oppoſite to the door of the communa through which you enter, is another leading into the *quarto de los leones*, or apartment of the lions; which is an oblong court, 100 feet in length and 50 in breadth, environed with a colonnade ſeven feet broad on the ſides and 10 at the end. Two porticoes or cabinets about 15 feet ſquare, project into the court at the two extremities. The ſquare is paved with coloured tiles; the colonnade with white marble. The walls are covered five feet up from the ground with blue and yellow tiles, diſpoſed chequerwiſe. Above and below is a border of ſmall eſcutcheons, enamelled blue and gold, with an Arabic motto on a bend; ſignifying, "No conqueror but God." The columns that ſupport the roof and gallery are of white marble, very ſlender, and fantaſtically adorned. They are nine feet high, including baſe and capital, and eight inches and a half diameter. They are very irregularly placed; ſometimes ſingly, at others in groups of three, but more frequently two together. The width of the horſe-ſhoe arches above them is four feet two inches for the large ones, and three for the ſmaller. The ceiling of the portico is finiſhed in a much finer and more complicated manner than that of the communa, and the ſtucco laid on the walls with inimitable delicacy; in the ceiling it is ſo artfully froſted and handled as to exceed belief. The capitals are of various deſigns, though each deſign is repeated ſeveral times in the circumference of the court, but not the leaſt attention has been paid to placing them regularly or oppoſite to each other. Not the ſmalleſt repreſentation of animal life can be diſcovered amidſt the varieties of foliages, groteſques, and ſtrange ornaments. About each arch is a large ſquare of arabeſques, ſurrounded with a rim of characters, that are generally quotations from the Koran. Over the pillars is another ſquare of delightful filligree work. Higher up is a wooden rim, or kind of cornice, as much enriched with carving as the ſtucco that covers the part underneath. Over this projects a roof of red tiles, the only thing that diſfigures this beautiful ſquare. This ugly covering is a modern addition made by a late prime miniſter, who a few years ago gave the Alhambra a thorough repair. In Mooriſh times, the building was covered with large painted and glazed tiles, of which ſome few are ſtill to be ſeen. In the centre of the court are twelve ill-made lions muzzled, their fore parts ſmooth, their hind parts rough, which bear upon their backs an enormous baſon, out of which a leſſer riſes. While the pipes were kept in good order, a great volume of water was thrown up, that, falling down into the baſons, paſſed through the beaſts, and iſſued out of their mouths into a large reſervoir, where it communicated by channels with the jets d'eau in the apartments. This fountain is of white marble, embelliſhed with many feſtoons and Arabic diſtichs, thus tranſlated:

"Seeſt thou not how the water flows copiouſly like the Nile?"

Alhambra. "This resembles a sea washing over its shores threatening shipwreck to the mariner." Alhambra.

"This water runs abundantly, to give drink to the lions."

"Terrible as the lion is our king in the day of battle."

"The Nile gives glory to the king, and the lofty mountains proclaim it."

"This garden is fertile in delights: God takes care that no noxious animal shall approach it."

"The fair princess that walks in this garden, covered with pearls, augments its beauty so much, that thou may'st doubt whether it be a fountain that flows, or the tears of her admirers."

Passing along the colonnade, and keeping on the south side, you come to a circular room occupied by the men as a place for drinking coffee, &c. A fountain in the middle refreshed the apartment in summer. The form of this hall, the elegance of its cupola, the cheerful distribution of light from above, and the exquisite manner in which the stucco is designed, painted, and finished, exceed all power of description. Every thing in it inspires the most pleasing voluptuous ideas: yet in this sweet retreat they pretend that Abouabdoulah assembled the Abencerrages, and caused their heads to be struck off into the fountain. Continuing your walk round, you are next brought to a couple of rooms at the head of the court, which are supposed to have been tribunals or audience chambers.

Opposite to the *Sala de los Abencerrages* is the entrance into the *Torre de las dos hermanas*, or the tower of the two sisters; so named from two very beautiful pieces of marble laid as flags in the pavement. This gate exceeds all the rest in profusion of ornaments, and in beauty of prospect which it affords through a range of apartments, where a multitude of arches terminate in a large window open to the country. In a gleam of sunshine, the variety of tints and lights thrown upon this enfilade are uncommonly rich. The first hall is the concert-room, where the women sat; the musicians played above in four balconies. In the middle is a jet d'eau. The marble pavement is equal to the finest existing, for the size of the flags and evenness of the colour. The two sisters which give name to the room, are slabs that measure 15 feet by seven and a half, without flaw or stain. The walls, up to a certain height, are mosaic, and above are divided into very neat compartments of stucco, all of one design, which is also followed in many of the adjacent halls and galleries. The ceiling is a fretted cove. To preserve this vaulted roof, as well as some of the other principal cupolas, the outward walls of the towers are raised 10 feet above the top of the dome, and support another roof over all, by which means no damage can ever be caused by wet weather or excessive heat and cold. From this hall you pass round the little myrtle garden of Lindaraxa, into an additional building made to the east end by Charles V. The rooms are small and low. His dear motto, *Plus outrè*, appears on every beam. This leads to a little tower, projecting from the line of the north wall, called *el tocador*, or the dressing-room of the sultana. It is a small square cabinet, in the middle of an open gallery, from which it receives light by a door and three windows. The look-out is charming. In one corner is a large marble flag, drilled full of holes, through which the smoke of perfumes ascended from furnaces below; and here, it is presumed, the Moorish queen was wont to sit to fumigate and sweeten her person. The emperor caused this pretty room to be painted with representations of his wars, and a great variety of grotesques, which appear to be copies, or at least imitations, of those in the loggie of the Vatican. From hence you go through a long passage to the hall of ambassadors, which is magnificently decorated with innumerable varieties of mosaics, and the mottos of all the kings of Granada. This long narrow antichamber opens into the communa on the left hand, and on the right into the great audience hall in the tower of Comares; a noble apartment, 36 feet square, 36 high up to the cornice, and 18 from thence to the centre of the cupola. The walls on three sides are 15 feet thick, on the other nine; the lower range of windows 13 feet high. The whole wall is inlaid with mosaic of many colours, disposed in intricate knots, stars, and other figures. In every part various Arabic sentences are repeated.

Having thus completed the tour of the upper apartments, which are upon a level with the offices of the new palace, you descend to the lower floor, which consisted of bedchambers and summer-rooms; the back stairs and passages, that facilitated the intercourse between them, are without number. The most remarkable room below is the king's bedchamber, which communicated by means of a gallery with the upper story. The beds were placed in two alcoves, upon a raised pavement of blue and white tiles; but as it was repaired by Philip V. who passed some time here, it cannot be said how it may have been in former times. A fountain played in the middle, to refresh the apartment in hot weather. Behind the alcoves are small doors, that conduct you to the royal baths. These consist of one small closet with marble cisterns for washing children, two rooms for grown-up persons, and vaults for boilers and furnaces that supplied the baths with water and the stoves with vapours. The troughs are formed of large slabs of white marble; the walls are beautiful with party-coloured earthen ware; light is admitted by holes in the coved ceiling.

Hard by is a whispering gallery, and a kind of labyrinth, said to have been made for the diversion of the women and children. One of the passages of communication is fenced off with a strong iron grate, and called *the prison of the Sultana;* but it seems more probable that it was put up to prevent any body from climbing up into the women's quarter.

Under the council-room is a long slip, called *the king's study;* and adjoining to it are several vaults, said to be the place of burial of the royal family. In the year 1574, four sepulchres were opened; but as they contained nothing but bones and ashes, were immediately closed again.

This description of the Alhambra may be finished by observing how admirably every thing was planned and calculated for rendering this palace the most voluptuous of all retirements; what plentiful supplies of water were brought to refresh it in the hot months of summer; what a free circulation of air was contrived, by the judicious disposition of doors and windows; what shady gardens of aromatic trees; what noble views over the beautiful hills and fertile plains! No-

wonder

Ali. wonder the Moors regretted Granada! no wonder that they ſtill offer up prayers to God every Friday for the recovery of this city, which they regard as a terreſtrial paradiſe!

ALI, the ſon of Abu Taleb, is one of the moſt celebrated characters in Mahometan hiſtory. He was couſin to Mahomet; and at the age of fourteen engaged with youthful ardour in his cauſe. When Mahophet firſt revealed his prophetic character to his friends, and inquired who among them would undertake to be his companion, Ali exclaimed, "O Prophet, I will be thy attendant; the man who dares to riſe againſt thee I will break his legs, pluck out his eyes, daſh out his teeth, and even rip up his belly." Mahomet accepted his ſervices, and honoured him with the titles of brother, vicegerent, and Aaron to a new Moſes. He was remarkable both for eloquence and valour; and the latter obtained him the ſurname of "*the Lion of God, always victorious.*" He ſucceeded to the chief dignity of the renowned houſe of Haſhem, and was alſo hereditary guardian of the temple and city of Mecca. Mahomet gave him his daughter Fatimah in marriage, and the grandfather lived to embrace the children of his daughter. Theſe advantages induced Ali to caſt a wiſhful eye towards the regal ſucceſſion; however, Abubeker, Omar, and Othman reigned before him. But after the death of the latter he was ſaluted caliph by the chiefs of the tribes, and companions of the Prophet, when he was repairing to the moſque of Medina at the hour of prayer, A. D. 655. Hegir. 35.

Ayeſha, the widow of the Prophet, ſtrenuouſly oppoſed his ſucceſſion; and under her influence two powerful chiefs ſoon raiſed the ſtandard of rebellion. Ali greatly increaſed his difficulties by the imprudent removal of all the governors of provinces from their ſtations. Telha and Zobeir, two chiefs of great influence, collected a numerous army, and induced Ayeſha to attend them to the field of battle; but Ali gained a complete victory and took Ayeſha priſoner. Telha fell in the field, and Zobeir was aſſaſſinated after ſurrendering upon promiſe of quarter. This daſtardly action was ſeverely reprehended by Ali. He likewiſe kindly treated the captive widow, and ſent her back to the tomb of the Prophet.

Ali next attacked Moawiyah, who had been proclaimed caliph, and ſtrongly ſupported by a powerful and numerous party. When the two armies approached each other, Ali propoſed to decide the matter by ſingle combat, but to this his opponent would not agree. Several ſkirmiſhes were fought with conſiderable loſs on both ſides; but at length a pious fraud produced a diviſion of ſentiment in the army of Ali. They fixed to the points of lances a number of copies of the Koran, carried them before the troops, and exclaimed, ſaying, "This is the book which forbids Muſſulmans to ſhed each others blood, and ought therefore to decide our diſputes." Ali was conſtrained to yield, and umpires were mutually choſen; on the ſide of Ali, Abu Mouſſa; Amru, the conqueror of Egypt on the part of Moawiyah. The day of final deciſion arrived. Abu Mouſſa aſcended the pulpit, and cried, "As I draw this ring from my finger, ſo I depoſe both Ali and Moawiyah from the caliphate." When Amru aſcended, he cried, "As I put on this ring, ſo I inveſt Moawiyah with the caliphate, and alſo depoſe Ali." Ali. He alſo added, that Othman the former caliph had declared Moawiyah both his ſucceſſor and avenger. Thus began that memorable conteſt among the Mahometans which was long agitated with conſiderable violence by both parties.

Ali was highly enraged at this injuſtice; but conſtrained for the preſent to yield, he retired to Kufa. A ſect of enthuſiaſts called the *Kharejites* revolted againſt Ali; but he quickly reduced them to ſubjection, and again obtained poſſeſſion of Arabia. But Syria, Perſia, and Egypt fell to the ſhare of his rival.

An unexpected event terminated the exiſting diſputes. Three Kharejites one day converſing together concerning the blood which had been ſhed, and the impending calamities, reſolved to aſſaſſinate Ali, Moawiyah, and Amru, the three authors of the preſent diſaſters. They provided themſelves with poiſoned ſwords, and haſtened to accompliſh their purpoſe. Moawiyah was wounded, but the wound did not prove fatal. A friend of Amru fell in his ſtead. Ali was fatally wounded at the door of the moſque, and in the ſixty-third year of his age, he expired on the fifth day after his wound, A. D. 660. A. Hegir. 40.

Ali had eight wives beſides Fatimah, and left a numerous family who were very remarkable for their valour. He alſo roſe to high eminence for learning and wiſdom; and of his works there are ſtill extant a hundred maxims, a collection of verſes, and a prophecy of all the great events which are to happen to the end of time. One of his ſayings may be quoted as an example. "He who would be rich without wealth, powerful without ſubjects, and a ſubject without a maſter, has only to forſake ſin, and ſerve God."

The Muſſulmans term Ali *the heir of Mahomet, and the accepted of God*, and his particular followers have poſſeſſed various ſtates in Africa and Aſia, and the Perſian part of the Uſbec Tartars; and ſome ſovereigns of India are at preſent of the ſect of Ali. A monument is raiſed upon his tomb near Kufa, which the kings of Perſia have ſucceſſively decorated and religiouſly revered. Near the ruins of Kufa a city named *Meſhed Ali* has been built to his memory. Some of his deluded followers imagine that he is ſtill alive, and that he will reviſit the earth and fill the ſame with juſtice. A green turban ſtill continues to diſtinguiſh the deſcendants of Ali. (*Gen. Biog.*)

ALI *Bey*, an eaſtern adventurer, is ſaid to have been a native of Mount Caucaſus, and about the age of twelve or fourteen he was ſold for a ſlave in Cairo. The two Jews who became his maſters preſented him to Ibrahim, then one of the moſt reſpectable men in the kingdom. In the family of this powerful man he received the rudiments of literature, and was alſo inſtructed in the military art. Both in letters and military ſkill he made a rapid improvement. He gradually gained the affection of his patron to ſuch a degree, that he gave him his freedom, permitted him to marry, promoted him to the rank of governor of a diſtrict, and afterwards by election he was raiſed to the elevated ſtation of one of the governors of provinces. Deprived of his protector by death, and engaging in the dangerous intrigues that pave the way to power in that unſtable government, he procured his own baniſhment to Upper Egypt. Here he ſpent two years in maturing

Ali. his ſchemes for future greatneſs, and in 1766, returning to Cairo, he either ſlew or expelled the beys, and ſeized the reins of government.

Emboldened by ſucceſs, he reſcued himſelf from the power of the Porte, coined money in his own name, and boldly aſſumed the rank of ſultan of Egypt. Occupied in more important concerns, the Porte made no vigorous oppoſition to his meaſures, and Ali Bey ſeized this favourable opportunity to recover a part of the Said or Upper Egypt, which had been taken by an Arab ſhaik. Next he ſent out a fleet from Suez, which ſeized upon Djedda, entered the port of Mecca; while a body of cavalry, commanded by Mohammed Bey his favourite, took and plundered Mecca itſelf. A young Venetian merchant laid before him a plan of reviving the ancient trade to the Eaſt Indies through the Mediterranean and Red ſeas. Having formed an alliance, in 1770, with one Shaik Daher, a rebel againſt the Porte in Syria, he aimed at the conqueſt of all Syria and Paleſtine. He firſt endeavoured to ſecure Gaza; then his army forming a junction with that of Daher at a place called Acre, advanced to Damaſcus. On the 6th of June 1771, a battle was fought at this place with the Turkiſh pachas, and Mohamed and Daher the commanders of Ali Bey routed them with great ſlaughter. They inſtantly took poſſeſſion of Damaſcus, and the caſtle itſelf had alſo capitulated, when all on a ſudden Mohammed haſtened back to Egypt with all his Mamelukes. Some aſcribe this ſtrange conduct to an impreſſion made upon Mohammed by the Turkiſh agents, and others to a report of the death of Ali Bey.

Although unſucceſsful, Ali Bey never loſt ſight of his favourite object, and Mohammed loſing his confidence was forced to ſave his life by exile. Mohammed, however, quickly returned with an army and drove Ali Bey from Cairo. In this unfortunate ſtate of affairs Ali Bey fled to Daher, and combining their forces, they attacked the Turkiſh commander at Sidon, and came off victorious, although the Turkiſh army was three times their number. After a ſiege of eight months they next took the town of Jaffa. Deceived by letters from Cairo which were only intended to enſnare him, and ſtimulated with recent victories, he returned to Cairo. Entering the deſerts which divide Gaza from Egypt, he was furiouſly attacked by a thouſand choſen Mamelukes led on by Murad Bey, who was enamoured with the beauty of Ali Bey's wife, and had obtained the promiſe of her, provided that he could take Ali Bey captive. Murad wounded and made Ali Bey priſoner, and carried him up to Mohammed, who received him with affected reſpect: but in three days, either in conſequence of poiſon or the effects of his wounds, Ali breathed his laſt.

Ali Bey was certainly a ſingular production in the ſchool of ignorance and barbarity, and diſplayed a very great degree of original vigour of character and active penetration of mind. He is blamed for engaging in enterpriſes beyond his power to accompliſh; but he is acknowledged to have been very favourable to the Franks, and to have governed Egypt with no ſmall degree of ſteady moderation. He is alſo charged with devolving too much upon his lieutenants, and not being ſufficiently attentive to the exactions made by his officers. Among his failings may alſo be ranked that of an unbounded confidence in his favourite. Generoſity and a ſenſe of juſtice were not wanting in his character, although his morals, under the ſanction of his claſs and country, were ſtrongly tainted with perfidy and murder in the purſuit of his ambitious plans. (*Gen. Biog.*)

Aljameia || Alien.

ALJAMEIA, is a name which the Moriſcoes in Spain give to the language of the Spaniards. Among other articles agreed on by the junto, which was appointed by the emperor Charles V. in 1526, in favour of the Moriſcoes, this was one, That the Moriſcoes ſhould no longer ſpeak Algavareia, i. e. Mooriſh, or Arabic; but ſhould all ſpeak *Aljameia*, i. e. Spaniſh, as it was called by the Moors, and all their writings and contracts ſhould be in that language.

ALIAS, in *Law*, a ſecond or farther writ iſſued from the courts of Weſtminſter, after a *capias*, &c. ſued out without effect.

ALIBI, in *Law*, denotes the abſence of the accuſed from the place where he is charged with having committed a crime; or his being *elſewhere*, as the word imports, at the time ſpecified.

ALICANT, a large ſea-port town in the province of Valencia, and territory of Segura. It is ſeated between the mountains and the ſea, and has a caſtle deemed impregnable. The port is defended by three baſtions furniſhed with artillery. To prevent the viſits of the Algerine pirates, watch-towers were built to give notice of the approach of an enemy's ſhip. It was taken from the Moors in 1264. The caſtle was taken by the Engliſh in 1706, and held out a ſiege of two years before it was retaken by the French and Spaniards, and at laſt ſurrendered upon honourable terms, after part of the rock was blown up on which the caſtle ſtood, and the governor killed. The houſes are high, and well built; and a very great trade is carried on here, particularly in wine and fruit. It is ſeated on the Mediterranean, on a bay of the ſame name, 37 miles north-eaſt of Murcia, and 75 ſouth of Valencia. W. Long. 0. 36. N. Lat. 38. 24.

ALICATA, a mountain of Sicily, near the valleys Mazara and Noto, upon which was ſituated (as is generally thought) the famous Dædalion, where the tyrant Phalaris kept his brazen bull.

ALICATA, a town of Sicily, remarkable for corn and good wine. It was plundered by the Turks in 1543; and is ſeated on a ſort of peninſula near the ſea, 22 miles ſouth-eaſt of Girgenti. E. Long. 15. 20. N. Lat. 37. 11.

Alicata Chlamys, was a ſort of veſt with ſleeves worn by the Roman boys till the age of thirteen, at which time they put on the *pretexta*.

ALIEN, in *Law*, implies a perſon born in a ſtrange country, not within the king's allegiance; in contradiſtinction to a denizen or natural ſubject. The word is formed from the Latin *alius*, "another;" q. d. one born in another country. An alien is incapable of inheriting lands in Britain till naturalized by an act of parliament. No alien is entitled to vote at the election of members of parliament: nor can he enjoy any office, or be returned on any jury, unleſs where an alien is party in a cauſe, when the inqueſt is compoſed of an equal number of denizens and aliens. The reaſons for eſtabliſhing theſe laws were, that every man is preſumed to bear faith and love to that prince and country where he received protection during his infancy;

Alien, Alienation.

cy; and that one prince might not ſettle ſpies in another's country; but chiefly that the rents and revenues of the country might not be drawn to the ſubjects of another. Some have thought that the laws againſt aliens were introduced in the time of Henry II. when a law was made at the parliament of Wallingford, for the expulſion of ſtrangers, in order to drive away the Flemings and Picards introduced into the kingdom by the wars of King Stephen. Others have thought that the origin of this law was more ancient; and that it is an original branch of the feudal law: for by that law no man can purchaſe any lands but he muſt be obliged to do fealty to the lords of whom the lands are holden; ſo that an alien who owed a previous faith to another prince, could not take an oath of fidelity in another ſovereign's dominions. Among the Romans only the *Cives Romani* were eſteemed freemen; but when their territories increaſed, all the Italians were made free under the name of *Latins*, though they had not the privilege of wearing gold rings till the time of Juſtinian. Afterwards all born within the pale of the empire were conſidered as citizens.

Alien-Duty, an impoſt laid on all goods imported by aliens, over and above the cuſtoms paid for ſuch goods imported by Britiſh, and on Britiſh bottoms.

Aliens-Duty is otherwiſe called *petty cuſtoms*, and *navigation duty*.—Fiſh dried or ſalted, and cod-fiſh or herring not caught in Britiſh veſſels and cured by Britiſh ſubjects, pay a double *aliens-duty*.—On what footing aliens are permitted to import foreign commodities into Great Britain, ſee DUTY.

Alien-Priories, a kind of inferior monaſteries, formerly very numerous in England, and ſo called from their belonging to foreign abbeys.

ALIENATION, in *Law*, denotes the act of making over a man's property in lands, tenements, &c. to another perſon.

Alienation in mortmain, is the making over lands, tenements, &c. to a body politic, or to a religious houſe, for which the king's licenſe muſt firſt be obtained, otherwiſe the lands, &c. alienated will be forfeited.

Alienation in fee is the felling the fee-ſimple of any land or other incorporeal right. All perſons who have a right to lands may generally alien them to others: but ſome alienations are prohibited; ſuch as alienations by tenants for life, &c. whereby they incur a forfeiture of their eſtate. By the ſtatute of Edward I. a bar was put to alienations by what we call *entails*, which is an expedient for procuring perpetuities in families; but counter-expedients were deviſed to defeat this intent, and a practice was introduced of cutting off entails by fines, and of barring remainders and reverſions by recoveries. The ſtatute for alienations in Henry VII.'s time had a great effect on the conſtitution of this kingdom; as, among other regulations of that reign, it tended to throw the balance of power more into the hands of the people. By the ſtat. 12 Car. II. cap. 24. fines for alienations are taken away. Crown lands are only alienable under a faculty of perpetual redemption. The council of Lateran, held in 1123, forbids any clerk to alienate his benefice, prebend, or the like. By the laws of the ancient Jews, lands could only be alienated for the ſpace of 50 years. At each return of the jubilee all returned again to the primitive owners, or their deſcendants, to whom the lands were originally allotted at the firſt diſtribution of Canaan.

Alienation, Aliment.

Alienation-Office, is an office to which all writs of covenants and entry, upon which fines are levied, and recoveries ſuffered, are carried, to have fines for alienation ſet and paid thereon.

ALIMENT (from *alo* to nouriſh), implies food both ſolid and liquid: from which, by the proceſs of digeſtion, is prepared a very mild, ſweet, and whitiſh liquor, reſembling milk, and diſtinguiſhed by the name of *chyle*; which being abſorbed by the lacteal veins, by them conveyed into the circulation, and there aſſimilated into the nature of blood, affords that ſupply of nutrition which the continual waſte of the body is found to require.—Next to air, food is the moſt neceſſary thing for the preſervation of our bodies: and as on the choice thereof our health greatly depends, it is of great importance to underſtand, in general, what is the propereſt for our nouriſhment; and, in particular deviations from health, what is the beſt adapted to reſtore us. The blood and fluids naturally incline to waſte and diminiſh: freſh chyle, duly received, prevents this waſte and diminution, and preſerves in them that mild ſtate which alone conſiſts with health. An animal diet affords the moſt of this bland nutritious mucilage; watery fluids dilute the too groſs parts, and carry off what is become unfit for uſe. It is only the ſmall portion of jelly which is ſeparated from the farinaceous parts of vegetables, that, after being much elaborated, is converted into the animal nature; yet the uſe of vegetables prevents both repletion and a too great tendency to a putreſcent acrimony of the blood. In hot climates, as well as againſt the conſtitutional heat of particular perſons, vegetables are demanded in the largeſt proportion. Animal ſubſtances afford the higheſt reliſh while our appetite continues; but will ſate the appetite before the ſtomach is duly filled. Vegetables may be eaten after either fleſh or fiſh: few herbs or fruits ſatiate ſo much as that the ſtomach may not be filled with them, when it is already ſatisfied with fleſh or fiſh; whence it may be obſerved, that no diet which is very nouriſhing can be eaten to fulneſs, becauſe its nutritious parts are oily and ſatiating. Health depends almoſt wholly on a proper craſis of the blood; and to preſerve this a mixture of vegetables in ſome degree is always required, for a loathing is ſoon the conſequence of animal food alone: hot acrid habits, too, receive from milk and vegetables the needful for correcting their exceſſes; but in cold, pituitous, and nervous habits, who want moſt nouriſhment from leaſt digeſtion, and from the ſmalleſt quantity of food, animal diet is to be uſed more freely.

Thus much being offered as general principles with reſpect to the matter and quality of our aliment, the valetudinarian may eaſily regulate his diet with ſome advantage to himſelf by an attention to the few enſuing particulars. In winter, eat freely, but drink ſparingly: roaſt meat is to be preferred, and what is drank ſhould be ſtronger than at other ſeaſons. In ſummer, let thirſt determine the quantity to be drunk; cold ſtomachs never require much: boiled meats and vegetables, if not otherwiſe contraindicated, may now be more freely uſed. Lax habits require the winter's diet to be continued all the year, and rigid ones ſhould be confined to that of ſummer. Fat people ſhould faſt

at

Aliment || Aliquant.

at times, but the lean ſhould never do ſo. Thoſe who are troubled with eructations occaſioned by their food ſhould drink but little, and uſe ſome unaccuſtomed exerciſe. The thirſty ſhould drink freely, but eat ſparingly. In general, let moderation be obſerved; and though no dinner hath been had, a light ſupper is at all times to be preferred. After very high ſeaſoned meats, a glaſs of water acidulated with the acid elixir of vitriol, or in very weak ſtomachs the ſweet elixir of vitriol, is far more aſſiſtant to the work of digeſtion than the common method of taking brandy. See further FOOD and DRINK.

Obligation of ALIMENT, in *Scots Law*, the natural obligation on parents to provide their children with the neceſſaries of life, &c. See LAW *Index*.

Alimentarii Pueri, &c. were certain children maintained and educated by the munificence of the emperors, in a ſort of public places, not unlike our hoſpitals.—Trajan was the firſt who brought up any of theſe alimentary boys. He was imitated by Adrian. Antoninus Pius did the ſame for a number of maids, at the ſolicitation of Fauſtina; and hence, in ſome medals of that empreſs, we read PVELLAE FAVSTINIANAE.—Alexander Severus did the like at the requeſt of Mammæa; and the maids thus educated were called *Mammæanæ*.

Alimentary Duct or *Canal*, is a name given by Dr Tyſon and ſome others to that part of the body through which the food paſſes from its reception into the mouth to its exit at the *anus*; including the *gula*, ſtomach, and inteſtines. See ANATOMY.

This duct has been ſaid to be the true characteriſtic of an animal, or (in the jargon of the ſchools) *in proprium quarto modo*; no animal being without it. Plants receive their nouriſhment by the numerous fibres of their roots; but have no common receptacle for digeſting the food received, or for carrying off the recrements. But in all, even the loweſt degree of animal life, we may obſerve a ſtomach and inteſtines, even where we cannot perceive the leaſt formation of any organ of the ſenſes, unleſs that common one of feeling, as in oyſters. *Phil. Tranſ.* N° 269, p. 776, *et ſeq.*

Dr Wallis brings an argument from the ſtructure of the alimentary tube in man, to prove that he is not naturally carnivorous; to which Dr Tyſon makes ſome objections. *Vid. Phil. Tranſ.* N° 260. p. 777.

Alimentary Law, *lex alimentaria*, was an old law among the Romans, whereby children were obliged to find ſuſtenance for their parents.

ALIMONY, in *Law*, implies that allowance which a married woman ſues for, and is entitled to, upon any occaſional ſeparation from her huſband. See LAW *Index*.

ALIPILARIUS, or ALIPILUS, in Roman antiquity, a ſervant belonging to the baths, whoſe buſineſs it was, by means of waxen plaſters, and an inſtrument called *volſella*, to take off the hair from the arm-pits, and even arms, legs, &c. this being deemed a point of cleanlineſs.

ALIPTERIUM, αλειπτηριον, in antiquity, a place in the ancient *paleſtræ*, where the *athletæ* were anointed before their exerciſes.

ALIQUANT PART, in *Arithmetic*, is that number which cannot meaſure any other exactly without ſome remainder. Thus 7 is an aliquant part of 16; for twice 7 wants two of 16, and three times 7 exceeds 16 by 5. Aliquot || Alkermes.

ALIQUOT PART, is that part of a number or quantity which will exactly meaſure it without any remainder. Thus 2 is an aliquot part of 4, 3 of 9, 4 of 16, &c.

ALISANDERS, or ALEXANDERS, in *Botany*. See SMYRNIUM, BOTANY *Index*.

ALISONTIA, or ALISUNTIA, in *Ancient Geography*, a river of Belgic Gaul, now *Alſitz*; which, riſing on the borders of Lorrain, and running through that duchy, waters the city of Luxemburgh, and, ſwelled by other rivulets, falls into the Sur.

ALITES, in Roman antiquity, a deſignation given to ſuch birds as afforded matter of auguries by their flight.

ALKADARII, a ſect among the Mahometans who deny any eternal, fixed, divine decrees, and are aſſertors of free-will. The word is formed from the Arabic *alkadar*, which ſignifies "decree." The Alkadarii are a branch of Motazalites, and ſtand oppoſed to the Algiabarii. See ALGIABARII.

ALKAHEST, or ALCAHEST, among alchemiſts, derived from a word which ſignifies *ſpirit of ſalt*, or *all-ſpirit*, was ſuppoſed to be an univerſal menſtruum capable of reſolving all bodies into their principles. Van Helmont pretended he was poſſeſſed of ſuch a menſtruum.—It is likewiſe uſed by ſome authors for all fixed ſalts volatilized.

ALKALI, in *Chemiſtry*, denotes a particular claſs of ſalts. The word *alkali* is of Arabian origin, and was introduced into chemiſtry after it had been applied to a plant which ſtill retains the name of *kali*. When this plant is burnt, the aſhes waſhed in water, and the water evaporated to dryneſs, a white ſubſtance remains, which was called *alkali*. According to Albertus Magnus, who uſes the word, it ſignifies *fæx amaritudinis*, "the dregs of bitterneſs." Alkali may be obtained from other ſubſtances beſides kali. Chemiſts gradually diſcovered that bodies, differing from one another in ſeveral of their properties, had been confounded together under the ſame name. The word, in conſequence, became general, and is now applied to all bodies which poſſeſs the following properties: 1. Incombuſtible. 2. A hot cauſtic taſte. 3. Volatilized by heat. 4. Soluble in water even when combined with carbonic acid. 5. Capable of converting vegetable blues to green.

The alkalies at preſent known are three in number: 1. Potaſs; 2. Soda; 3. Ammonia. The two firſt are called *fixed alkalies*, becauſe they require a red heat to volatilize them; the laſt is called *volatile alkali*, becauſe it readily aſſumes a gaſeous form, and conſequently is diſſipated by a very moderate degree of heat. See CHEMISTRY *Index*.

ALKALI, or *Sal Kali*. See SALICORNIA, BOTANY *Index*.

ALKANET. See ANCHUSA, BOTANY *Index*.

ALKEKENGI, the trivial name of a ſpecies of phyſalis. See PHYSALIS, BOTANY *Index*.

ALKENNA. See LAWSONIA, BOTANY *Index*.

ALKERMES, in *Pharmacy*, a compound cordial medicine made in the form of a confection, deriving its name from the kermes berries uſed in its compoſition.

ALKORAN,

Alkoran || Allahabad.

ALKORAN. See ALCORAN.

ALL-HALLOWS. See *All-Saints*.

All Good. See CHENOPODIUM, BOTANY *Index*.

All-Heal. See HERACLEUM and STACHYS, BOTANY *Index*.

All-Saints, in the *Kalendar*, denotes a feſtival celebrated on the firſt of November, in commemoration of all the ſaints in general; which is otherwiſe called *All-Hallows*. The number of ſaints being ſo exceſſively multiplied, it was found too burdenſome to dedicate a feaſt day to each. In reality, there are not days enough, ſcarce hours enough, in the year, for this purpoſe. Hence an expedient was had recourſe to, by commemorating ſuch in the lump as had not their own days. Boniface IV. in the ninth century, introduced the feaſt of *All-Saints* in Italy, which was ſoon after adopted into the other churches.

All-Saints, iſlands near Guadaloupe, in the Weſt Indies.

All-Saints, a pariſh in Georgetown diſtrict, South Carolina, containing 2225 inhabitants, of whom 429 are whites, and 1795 ſlaves. It ſends a member to each houſe of the ſtate legiſlature.

All-Saints Bay, a ſpacious harbour near St Salvador in Brazil, in S. America, on the Atlantic ocean, W. Long. 40°, S. Lat. 12°.

All-Saints Bay, a captainſhip in the middle diviſion of Braſil, ſo called from the harbour of that name, bounded on the north by the Rio Real; on the ſouth by that of Las Ilheos: on the eaſt by the ocean; and on the weſt by three unconquered nations of Indians. It is reckoned one of the richeſt and moſt fertile captainſhips in all Brazil, producing great quantities of cotton and ſugar. The bay itſelf is about two and a half leagues over, interſperſed with a number of ſmall but pleaſant iſlands, and is of prodigious advantage to the whole country. It has ſeveral cities and towns, particularly St Salvador, which is its capital. All-Saints Bay lies in S. Lat. 12. 3. W. Long. 40. 10. See SALVADOR.

All-Souls, in the *Kalendar*, denotes a feaſt-day, held on the ſecond of November, in commemoration of all the faithful deceaſed.—The feaſt of All-Souls was firſt introduced in the eleventh century, by Odilon abbot of Cluny, who enjoined it on his own order; but it was not long before it became adopted by the neighbouring churches.

All-Spice. See MYRTUS and CALYCANTHUS, BOTANY *Index*.

ALLA, or ALLAH, the name by which the profeſſors of Mahometaniſm call the Supreme Being.

The term *alla* is Arabic, derived from the verb *alah*, to adore. It is the ſame with the Hebrew *Eloah*, which ſignifies the *Adorable Being*.

ALLAHABAD, in *Geography*, a province of Hindoſtan, about 160 miles in length, and 120 in breadth. Its eaſtern boundaries meet the province of Bahar, the ſouthern Berar, the weſtern Malwa and Agra, and the northern Oude. According to the diſtribution of the emperor Akbar, recorded in the Ayeen Akberry; it contains 10 circars or counties, which are divided into 177 pergunnahs or hundreds. According to the ſtatement of Maurice, in his Indian Antiquities, it affords a revenue of 3,310,695 ſicca rupees. It contributes to the public ſervice 323 elephants, 237,870 infantry, and 11,375 cavalry. Azuph Dowla, a tributary ally of the Britiſh power, poſſeſſes the greater part of this province. Allahabad, Benares, and Iconpour, are the principal cities. Allahabad || Allatius.

ALLAHABAD, the capital of the above province, is ſituated at the confluence of the great rivers Jumna and Ganges. This city is divided into two parts, called *the Old* and *the New Town*: The old is ſituated upon the Ganges, and the new upon the Jumna. The emperor Akbar erected a ſtrong fortreſs of ſtone, which occupies a large ſpace in this city, and from him it received its preſent name. Of this fortreſs, Mr Hodges, in N° IV. of his ſelect views in India, gives an accurate and elegant delineation. A pillar conſiſting of one ſtone 40 feet high, aſcribed by tradition to Bima, one of the heroes of Mahabarat, wholly covered with illegible inſcriptions, and the elegant tomb of Sultan Khuſru, are excellent ſpecimens of Mahometan architecture. Devotion has fixed her reſidence, and flouriſhes to ſuch a degree in this city, that it hath obtained the appellation of "the king of worſhipped places." According to the evidence of the Ayeen-Akberry, the adjacent territory, to the extent of 40 miles, is deemed holy ground. In ſuch veneration is this place held by the Hindoos, that when a man dies here, they believe he will obtain the utmoſt of his wiſhes in his next regeneration. They deem it a meritorious action for a man to ſlay himſelf, although they teach that ſuicide will be puniſhed with torments in a future ſtate. In and about this city there are various objects of veneration, which immenſe numbers of pilgrims continue to viſit with great devotion. Major Rennel has placed Palibothra on the ſame ſite with Patna; but Dr Robertſon is of opinion that the ancient Palibothra is the modern city of Allahabad. N. Lat. 25. 27. E. Long. 82. 5.

ALLAMANDA, in *Botany*. See BOTANY *Index*.

ALLAN, a river of Perthſhire, in Scotland, which paſſes by Dunblane, and falls into the Forth near Stirling.

ALLANTOIS, or ALLANTOIDES, a thin tranſparent bag inveſting the fœtus of quadrupeds, as cows, goats, ſheep, &c. filled with an urinous liquor conveyed to it from the bladder of the young animals by means of the urachus. See ANATOMY *Index*.

ALLATIUS, LEO, keeper of the Vatican library, a native of Scio, and a celebrated writer of the 17th century. He was of great ſervice to the gentlemen of Port Royal in the controverſy they had with M. Claude touching the belief of the Greeks with regard to the euchariſt. No Latin was ever more devoted to the ſee of Rome, or more inveterate againſt the Greek ſchiſmatics, than Allatius. He never was married; nor did he take orders; and Pope Alexander VII. having aſked him one day, why he did not enter into orders? he anſwered, Becauſe I would be free to marry." The pope rejoined, "If ſo, why do you not marry? "Becauſe," replied Allatius, "I would not be at liberty to take orders." Thus, as Mr Bayle obſerves, he paſſed his whole life, wavering betwixt a pariſh and a wife; ſorry, perhaps, at his death, for having choſen neither of them; when, if he had fixed upon one, he might have repented his choice for 30 or 40 years.—If we believe John Patricius, Allatius had a very extraordinary pen, with which, and no other, he wrote Greek for 40 years; at the loſs of which, he was ſo

grieved

Allay
Alleghany

grieved as to lament it with tears. He publiſhed ſeveral manuſcripts, ſeveral tranſlations of Greek authors, and ſeveral pieces of his own compoſing. In his works he diſcovers more erudition and induſtry than ſound judgement. His manner of writing is diffuſe and perplexed, making frequent digreſſions from one ſubject to another. He died at Rome in 1669, aged 83.

ALLAY. See ALLOY.

ALLECTUS, the prime miniſter and confidential friend of Caraufius, emperor of Britain. In order to avoid the puniſhment due to the ſeveral enormous crimes with which he was chargeable, he fell upon the deſperate expedient of murdering his maſter, and uſurping the imperial dignity, which he maintained for three years. With a deſign of recovering Britain, Conſtantius about this period fitted out a large ſquadron, which being aſſembled in the mouth of the Seine, the command was devolved upon the prefect Aſclepiodotus. The fleet of Allectus was ſtationed off the Iſle of Wight to receive them; but under the cover of a thick fog, the invaders eſcaped their notice, and landed in ſafety on the weſtern coaſt, and, according to Gibbon, convinced the Britons "that a ſuperiority of naval ſtrength will not always protect their country from a foreign invaſion." No ſooner had the intrepid commander diſembarked his forces, than he ſet fire to his ſhips, and marched forward to meet the enemy. In expectation of an attack from Conſtantius, who commanded the fleet off Boulogne, the uſurper had taken his ſtation in the vicinity of London; but informed of the deſcent of Aſclepiodotus, he made forced marches to oppoſe his progreſs. Allectus attacked the imperial troops, and his army being reduced to a ſmall number of fatigued and diſpirited men, he fell in the field, and his forces received a total defeat. Thus, in one day, and by a ſingle battle, the fate of this great iſland was decided; and Britain, after a ſeparation of 10 years, was reſtored to the Roman empire, A. D. 297. Conſtantius landing on the ſhores of Kent, was ſaluted with the loud applauſes and unanimous acclamation of obedient ſubjects, and welcomed to the Britiſh ſoil.

ALLEGATA, a word anciently ſubſcribed at the bottom of reſcripts and conſtitutions of the emperors; as *ſignata*, or *teſtata*, was under other inſtruments.

ALLEGEAS, or ALLEGIAS, a ſtuff manufactured in the Eaſt Indies. There are two ſorts of them: ſome are of cotton, and others of ſeveral kinds of herbs, which are ſpun like flax and hemp. Their length and breadth are of eight ells, by five, ſix, or ſeven eighths; and of twelve ells, by three-fourths or five-eighths.

ALLEGHANY, is the moſt weſtern county in Maryland, and has Pennſylvania on the north. The windings of the Patowmac river ſeparate it from Virginia on the ſouth, and Sideling-hill Creek divides it from Waſhington county on the eaſt. It contains 4809 inhabitants, including 258 ſlaves. Cumberland is its chief town.

ALLEGHANY County, in Pennſylvania, extends from the junction of the river of that name with the Ohio, where its chief town, Pittſburgh, is ſituated, to the New-York line. It contains 10,309 inhabitants, including 159 ſlaves.

ALLEGHANY Mountains, between the Atlantic ocean, the Miſſiſſippi river, and the lakes, are a long and broad range of mountains, made up of a great number of ridges, extending north-eaſterly and ſouth-weſterly, nearly parallel to the ſea coaſt, about 900 miles in length, and from 60 to 150 and 200 miles in breadth. Mr Evans obſerves, with reſpect to that part of theſe mountains which he travelled over, viz. in the back parts of Pennſylvania, that ſcarcely one acre in ten is capable of culture. This, however, is far from being the caſe in all parts of this range. Numerous tracts of fine arable and grazing land intervene between the ridges. The different ridges which compoſe this immenſe range of mountains, have different names in the different ſtates, viz. the *Blue Ridge*, the *North mountain*, or *North ridge*, or *Devil's Back-Bone*, *Laurel ridge*, *Jackſon's mountains*, and *Kittatinny mountains*. All theſe different and immenſe ridges, except the *Alleghany*, are broken through by rivers, which appear to have forced their way through ſolid rocks. This principal ridge is more immediately called *Alleghany*, and is deſcriptively named the *Back bone of the United States*. From theſe ſeveral ridges proceed innumerable branches, or ſpurs.

Alleghany, Allegiance

The general name of the whole range, taken collectively, ſeems not yet to have been determined. Mr Evans calls them the *Endleſs mountains*; others have called them the *Appalachian mountains*, from a tribe of Indians who live on a river which proceeds from this mountain, called the *Appalachicola*; but the moſt common name is the *Alleghany mountains*, ſo called, probably, from the principal ridge of the range. Theſe mountains are not confuſedly ſcattered, riſing here and there into high peaks, overtopping each other; but run along in uniform ridges, ſcarcely half a mile high. They ſpread as you proceed ſouth, and ſome of them terminate in high perpendicular bluffs: others gradually ſubſide in a level country, giving riſe to the rivers which run ſoutherly into the gulf of Mexico.

ALLEGHANY River, in Pennſylvania, riſes on the weſtern ſide of the Alleghany mountains, and after running about 200 miles in a ſouth-weſt direction, meets the Monongahela at Pittſburg, and both united form the Ohio. The lands on each ſide of this river, for 150 miles above Pittſburg, conſiſt of white oak and cheſnut ridges, and in many places of poor pitch pines, interſperſed with tracts of good land, and low meadows. This river, and the Ohio likewiſe, from its head waters until it enters the Miſſiſſippi, are known and called by the name of *Alleghany river*, by the Seneka and other tribes of the Six Nations, who once inhabited it.

ALLEGIANCE, in *Law*, is the tie, or *ligamen*, which binds the ſubject to the king, in return for that protection which the king affords the ſubject. The thing itſelf, or ſubſtantial part of it, is founded in reaſon and the nature of government; the name and the form are derived to us from our Gothic anceſtors. Under the feodal ſyſtem, every owner of lands held them in ſubjection to ſome ſuperior or lord, from whom or from whoſe anceſtors the tenant or vaſſal had received them; and there was a mutual truſt or confidence ſubſiſting between the lord and vaſſal, that the lord ſhould protect the vaſſal in the enjoyment of the territory he had granted him; and, on the other hand, that the vaſſal ſhould be faithful to the lord, and defend him againſt all his enemies. This obligation on the part of the vaſſal was called his

fidelitas

Allegiance. *fidelitas* or fealty: and an oath of fealty was required by the feodal law to be taken by all tenants to their landlord, which is couched in almoſt the ſame terms as our ancient oath of allegiance; except that, in the uſual oath of fealty, there was frequently a ſaving or exception of the faith due to a ſuperior lord by name, under whom the landlord himſelf was perhaps only a tenant or vaſſal. But when the acknowledgement was made to the abſolute ſuperior himſelf, who was vaſſal to no man, it was no longer called the oath of fealty, but the oath of allegiance; and therein the tenant ſwore to bear faith to his ſovereign lord, in oppoſition to all men, without any ſaving or exception. Land held by this exalted ſpecies of fealty, was called *feudum ligium*, a liege fee; the vaſſals *homines ligii*, or liege men; and the ſovereign, their *dominus ligius*, or liege lord. And when ſovereign princes did homage to each other for lands held under their reſpective ſovereignties, a diſtinction was always made between *ſimple* homage, which was only an acknowledgement of tenure; and *liege* homage, which included the fealty before mentioned, and the ſervices conſequent upon it. In Britain, it becoming a-ſettled principle of tenure, that all lands in the kingdom are holden of the king as their ſovereign and lord paramount, no oath but that of fealty could ever be taken to inferior lords; and the oath of allegiance was neceſſarily confined to the perſon of the king alone. By an eaſy analogy, the term of *allegiance* was ſoon brought to ſignify all other engagements which are due from ſubjects to their prince, as well as thoſe duties which were ſimply and merely territorial. And the oath of allegiance, as adminiſtered in England for upwards of 600 years, contained a promiſe "to be true and faithful to the king and his heirs, and truth and faith to bear of life and limb and terrene honour, and not to know or hear of any ill or damage intended him, without defending him therefrom." But, at the Revolution, the terms of this oath being thought perhaps to ſavour too much of the notion of non-reſiſtance, the preſent form was introduced by the convention parliament, which is more general and indeterminate than the former; the ſubject only promiſing "that he will be faithful and bear *true* allegiance to the king," without mentioning "his heirs," or ſpecifying in the leaſt wherein that allegiance conſiſts. The oath of ſupremacy is principally calculated as a renunciation of the pope's pretended authority: and the oath of abjuration, introduced in the reign of King William, very amply ſupplies the looſe and general texture of the oath of allegiance; it recogniſing the right of his majeſty, derived under the act of ſettlement; engaging to ſupport him to the utmoſt of the juror's power; promiſing to diſcloſe all traiterous conſpiracies againſt him; and expreſsly renouncing any claim of the deſcendants of the late pretender, in as clear and explicit terms as the Engliſh language can furniſh. This oath muſt be taken by all perſons in any office, truſt, or employment; and may be tendered by two juſtices of the peace to any perſon whom they ſhall ſuſpect of diſaffection. And the oath of allegiance may be tendered to all perſons above the age of twelve years, whether natives, denizens, or aliens.

Blackſt. Comment.

But, beſides theſe *expreſs* engagements, the law alſo holds that there is an *implied*, *original*, and *virtual* allegiance, owing from every ſubject to his ſovereign, antecedently to any expreſs promiſe, and although the ſubject never ſwore any faith or allegiance in form. Thus Sir Edward Coke very juſtly obſerves, that "all ſubjects are equally bounden to their allegiance as if they had taken the oath; becauſe it is written by the finger of the law in their hearts, and the taking of the corporal oath is but an outward declaration of the ſame." Allegiance

Allegiance, both expreſs and implied, is however diſtinguiſhed by the law into two ſorts or ſpecies, the one *natural*, the other *local*; the former being alſo perpetual, the latter temporary.

Natural allegiance is ſuch as is due from all men born within the king's dominions immediately upon their birth. For, immediately upon their birth they are under the king's protection; at a time too, when (during their infancy) they are incapable of protecting themſelves. Natural allegiance is, therefore, a debt of gratitude; which cannot be forfeited, cancelled, or altered, by any change of time, place, or circumſtance, nor by any thing but the united concurrence of the legiſlature. A Briton who removes to France, or to China, owes the ſame allegiance to the king of Britain there as at home, and 20 years hence as well as now. For it is a principle of univerſal law, That the natural-born ſubject of one prince cannot by any act of his own, no, not by ſwearing allegiance to another, put off or diſcharge his natural allegiance to the former: for this natural allegiance was intrinſic and primitive, and antecedent to the other; and cannot be diveſted without the concurrent act of that prince to whom it was firſt due.

Local allegiance is ſuch as is due from an alien, or ſtranger born, for ſo long time as he continues within the king's dominion and protection; and it ceaſes the inſtant ſuch ſtranger transfers himſelf from this kingdom to another. Natural allegiance is therefore *perpetual*, and local *temporary* only; and that for this reaſon, evidently founded upon the nature of government, That allegiance is a debt due from the ſubject, upon an implied contract with the prince; that ſo long as the one affords protection, ſo long the other will demean himſelf faithfully.

The *oath* of allegiance, or rather the *allegiance* itſelf, is held to be applicable, not only to the political capacity of the king, or regal office, but to his natural perſon and blood royal: and for the miſapplication of their allegiance, viz. to the regal capacity or crown, excluſive of the perſon of the king, were the Spencers baniſhed in the reign of Edward II. And from hence aroſe that principle of perſonal attachment and affectionate loyalty, which induced our forefathers (and, if occaſion required, would doubtleſs induce their ſons) to hazard all that was dear to them, life, fortune, and family, in defence and ſupport of their liege lord and ſovereign.

It is to be obſerved, however, in explanation of this allegiance, That it does not preclude reſiſtance to the king, when his miſconduct or weakneſs is ſuch as to make reſiſtance beneficial to the community. It ſeems fairly preſumable, that the convention parliament, which introduced the oath of allegiance in its preſent form, did not intend to exclude all reſiſtance: ſince the

Paley's Moral and Political Philoſophy.

Allegory. very authority by which the members ſat together, was itſelf the effect of a ſucceſsful oppoſition to an acknowledged ſovereign.

Again: The allegiance above deſcribed can only be underſtood to ſignify obedience to lawful commands. If, therefore, the king ſhould iſſue a proclamation, levying money or impoſing any ſervice or reſtraint upon the ſubject, beyond what the law authorized, there would exiſt no ſort of obligation to obey ſuch a proclamation, in conſequence of having taken the oath of allegiance.

Neither can allegiance be ſuppoſed to extend to the king after he is actually and abſolutely depoſed, driven into exile, or otherwiſe rendered incapable of exerciſing the regal office. The promiſe of allegiance implies, that the perſon to whom the promiſe is made continues king; that is, continues to exerciſe the power, and afford the protection, which belong to the office of king; for it is the poſſeſſion of theſe which makes ſuch a particular perſon the object of the oath.

ALLEGORY, in *Compoſition*, conſiſts in chooſing a ſecondary ſubject, having all its properties and circumſtances reſembling thoſe of the principal ſubject, and deſcribing the former in ſuch a manner as to repreſent the latter. The principal ſubject is thus kept out of view, and we are left to diſcover it by reflection. In other words, an allegory is, in every reſpect, ſimilar to a hieroglyphical painting, excepting only that words are uſed inſtead of colours. Their effects are preciſely the ſame: A hieroglyphic raiſes two images in the mind; one ſeen, that repreſents one that is not ſeen: An allegory does the ſame; the repreſentative ſubject is deſcribed, and the reſemblance leads us to apply the deſcription to the ſubject repreſented.

There cannot be a finer or more correct allegory than the following, in which a vineyard is made to repreſent God's own people the Jews:

"Thou haſt brought a vine out of Egypt; thou haſt caſt out the heathen, and planted it. Thou didſt cauſe it to take deep root, and it filled the land. The hills were covered with its ſhadow, and the boughs thereof were like the goodly cedars. Why haſt thou then broken down her hedges, ſo that all that paſs do pluck her? The boar out of the wood doth waſte it, and the wild beaſt doth devour it. Return, we beſeech thee, O God of hoſts: look down from heaven, and behold, and viſit this vine and the vineyard thy right hand hath planted, and the branch thou madeſt ſtrong for thyſelf," Pſal. lxxx.

Nothing gives greater pleaſure than an allegory, when the repreſentative ſubject bears a ſtrong analogy, in all its circumſtances, to that which is repreſented. But moſt writers are unlucky in their choice, the analogy being generally ſo faint and obſcure, as rather to puzzle than to pleaſe. Allegories, as well as metaphors and ſimilies, are unnatural in expreſſing any ſevere paſſion which totally occupies the mind. For this reaſon, the following ſpeech of Macbeth is juſtly condemned by the learned author of the Elements of Criticiſm:

> Methought I heard a voice cry, Sleep no more!
> Macbeth doth murder Sleep; the innocent ſleep;
> Sleep that knits up the ravell'd ſleeve of Care,
> The birth of each day's life, ſore Labour's bath,
> Balm of hurt minds, great Nature's ſecond courſe, Allegri.
> Chief nouriſher in life's feaſt. *Act* ii. *ſc.* 3.

But ſee this ſubject more fully treated under the article *Metaphor and Allegory*.

ALLEGRI, Antonio, called *Correggio* from the place of his birth, an eminent hiſtorical painter, was born in the year 1494. Being deſcended of poor parents, and educated in an obſcure village, he enjoyed none of thoſe advantages which contributed to form the other great painters of that illuſtrious age. He ſaw none of the ſtatues of ancient Greece or Rome; nor any of the works of the eſtabliſhed ſchools of Rome and Venice. But Nature was his guide; and Correggio was one of her favourite pupils. To expreſs the facility with which he painted, he uſed to ſay that he always had his thoughts ready at the end of his pencil.

The agreeable ſmile, and the profuſion of graces, which he gave to his madonas, ſaints, and children, have been taxed with being ſometimes unnatural; but ſtill they are amiable and ſeducing: An eaſy and flowing pencil, an union and harmony of colours, and a perfect intelligence of light and ſhade, give an aſtoniſhing relief to all his pictures, and have been the admiration both of his cotemporaries and his ſucceſſors. Annibal Caracci, who flouriſhed 50 years after him, ſtudied and adopted his manner in preference to that of any other maſter. In a letter to his couſin Louis, he expreſſed with great warmth the impreſſion which was made on him by the firſt ſight of Correggio's paintings: "Every thing which I ſee here (ſays he) aſtoniſhes me; particularly the colouring and the beauty of the children. They live—they breathe—They ſmile with ſo much grace and ſo much reality, that it is impoſſible to reſrain from ſmiling and partaking of their enjoyment. My heart is ready to break with grief when I think on the unhappy fate of poor Correggio—that ſo wonderful a man (if he ought not rather to be called an angel) ſhould finiſh his days ſo miſerably, in a country where his talents were never known!"——

From want of curioſity or of reſolution, or from want of patronage, Correggio never viſited Rome, but remained his whole life at Parma, where the art of painting was little eſteemed, and of conſequence poorly rewarded. This occurrence of unfavourable circumſtances occaſioned at laſt his premature death at the age of 40. He was employed to paint the cupola of the cathedral at Parma, the ſubject of which is an aſſumption of the Virgin: and having executed it in a manner that has long been the admiration of every perſon of good taſte, for the grandeur of deſign, and eſpecially for the boldneſs of the fore-ſhortenings (an art which he firſt and at once brought to the utmoſt perfection), he went to receive his payment. The canons of the church, either through ignorance or baſeneſs, found fault with his work; and although the price originally agreed upon had been very moderate, they alleged that it was far above the merit of the artiſt, and forced him to accept of the paltry ſum of 200 livres; which, to add to the indignity, they paid him in copper money. To carry home this unworthy load to his indigent wife and children, poor Correggio had to travel ſix or eight miles from Parma. The weight

of

Allegri. of his burden, the heat of the weather, and his chagrin at this villanous treatment, immediately threw him into a pleurisy, which in three days put an end to his life and his misfortunes.

For the preservation of this magnificent work the world is indebted to Titian. As he passed through Parma, in the *suite* of Charles V. he run instantly to see the *chef d'œuvre* of Corregio. While he was attentively viewing it, one of the principal canons of the church told him that such a grotesque performance did not merit his notice, and that they intended soon to have the whole defaced. "Have a care of what you do, (replied the other)": If I were not Titian, I would certainly wish to be Corregio."

Corregio's exclamation upon viewing a picture by Raphael is well known. Having long been accustomed to hear the most unbounded applause bestowed on the works of that divine painter, he by degrees became less desirous than afraid of seeing any of them. One, however, he at last had occasion to see. He examined it attentively for some minutes in profound silence; and then with an air of satisfaction exclaimed, *I am still a painter.* Julio Romano, on seeing some of Corregio's pictures at Parma, declared they were superior to any thing in painting he had yet beheld. One of these no doubt would be the famous Virgin and Child, with Mary Magdalen and St Jerome: but whether our readers are to depend upon his opinion, or upon that of Lady Millar, who in her *Letters from Italy* gives a very unfavourable account of it, we shall not presume to determine. This lady, however, speaks in a very different style of the no less famous *Notte* or Night of Corregio, of which she saw only a copy in the duke's palace at Modena, the original having been sold for a great sum of money to the king of Poland. "It surprises me very much (says she), to see how different the characters are in this picture from that which I already have described to you. The subject is a Nativity; and the extraordinary beauty of this picture proceeds from the *clair obscure:* there are two different lights introduced, by means of which the personages are visible; namely, the light proceeding from the body of the child, and the moon light. These two are preserved distinct, and produce a most wonderful effect. The child's body is so luminous, that the superficies is nearly transparent, and the rays of light emitted by it are verified in the effect they produce upon the surrounding objects. They are not rays distinct and separate, like those round the face of a sun that indicates an insurance office; nor linear, like those proceeding from the man in the almanack; but of a dazzling brightness: by their light you see clearly the face, neck, and hands, of the Virgin (the rest of the person being in strong shadow), the faces of the *pastori* who crowd round the child, and particularly one woman, who holds her hand before her face, lest her eyes should be so dazzled as to prevent her from beholding the infant. This is a beautiful natural action, and is most ingeniously introduced. The straw on which the child is laid appears gilt, from the light of his body shining on it. The moon lights up the back ground of the picture, which represents a landscape. Every object is distinct, as in a bright moonlight night; and there cannot be two lights in nature more different than those which appear in the same picture. The virgin and the child are of the most perfect beauty. There is a great variety of character in the different persons present, yet that uniformity common to all herdsmen and peasants. In short, this copy is so admirable, that I was quite sorry to be obliged to lose sight of it so soon; but I never shall forget it. The duke of Modena, for whom Corregio did the original picture, gave him only 600 livres of France for it; a great sum in those days: but at present, what ought it to cost?" This great painter's death happened in 1534. Allegri, Allegro.

ALLEGRI, Gregorio, an ecclesiastic by profession, and a celebrated composer of music of the 17th century, was a native of Rome. He was the disciple of Nanini, the intimate friend and contemporary of Palestrina. His abilities as a singer were not remarkable, but he was deemed an excellent master of harmony; and so much respected by all the musical professors of his time, that the pope, in the year 1629, appointed him to be one of the singers of his chapel. To his uncommon merit as a composer of church music, he united an excellent moral character, exhibiting in his actions the devotion and benevolence of his heart. The poor crowded daily to his door, whom he relieved to the utmost of his ability; and not content with these beneficent actions, he daily visited the prisons of Rome, in order to relieve the most deserving and afflicted objects which were immured in these dreary mansions. With such divine simplicity and purity of harmony, did he compose many parts of the church service, that his loss was severely felt and sincerely lamented by the whole college of singers in the papal service. He died Feb. 18. 1650, and was interred in the Chiesa Nuova, in a vault destined for the reception of deceased singers in the pope's chapel, before the chapel of S. Filippo Neri, near the altar of annunciation.

Among his other musical works preserved in the pontifical chapel, is the celebrated *miserere*, which, for 170 years, has been annually performed at that chapel on Wednesday and Good Friday, in Passion-week, by the choral band, and the best singers in Italy. It is, however, generally believed, that it owes its reputation more to the manner in which it is performed, than to the composition itself. The beauty and effect of the music is not discernible upon paper, but the singers have, by tradition, certain customs, expressions, and graces of convention, which produce wonderful effects. Some of the effects produced may be justly attributed to the time, the place, and the solemnity of the ceremonials observed during the performance. "The pope and conclave are all prostrated on the ground, the candles of the chapel and the torches of the ballustrade are extinguished one by one, and the last verse of this psalm is terminated by two choirs; the *maestra di capello* beating time slower and slower, and the singers diminishing, or rather extinguishing the harmony by little and little, to a perfect point." Padre Martini says, that there were never more than three copies made by authority, "one of which was for the emperor Leopold, one for the late king of Portugal, and the other for himself; but a very complete one was presented by the pope himself to King George III. as an inestimable curiosity." *(Gen. Biog.)*

ALLEGRO, in *Music*, an Italian word, denoting

Allegro, Allein.

that the part is to be played in a ſprightly, briſk, lively, and gay manner.

Piu Allegro, ſignifies, that the part it is joined to ſhou'd be ſung or played quicker; as

Poco piu Allegro intimates, that the part to which it refers ought to be played or ſung only a little more briſkly than allegro alone requires.

ALLEIN, Joseph, the ſon of Tobias Allein, was born in the Devizes, in Wiltſhire, in 1633, and educated at Oxford. In 1655, he became aſſiſtant to Mr Newton, in Taunton Magdalen, in Somerſetſhire; but was deprived for nonconformity. He died in 1668, aged 35. He was a man of great learning, and greater charity; preſerving, though a nonconformiſt, and a ſevere ſufferer on that account, great reſpect for the church, and loyalty to his ſovereign. He wrote ſeveral books of piety, which are highly eſteemed; but his *Alarm to unconverted ſinners* is more famous than the reſt. There have been many editions of this little pious work, the ſale of which has been very great; of the edition 1672, there were 20,000 ſold; of that of 1675, with this title, *A ſure guide to heaven*, 50,000. There was alſo a large impreſſion of it with its firſt title, in 1720.

Allein, *Richard*, an Engliſh nonconformoſt divine, a native of Ditchet, in Somerſetſhire, was born in the year 1611. His father was rector of Ditchet, and conducted the education of his ſon, until he was prepared for the univerſity. There he ſoon obtained the degree of maſter of arts, and after he entered into holy orders, firſt as an aſſiſtant to his father, and afterwards as rector of Batcomb, in Somerſetſhire, he diſcharged the duties of a clergyman with great induſtry and ſingular fidelity. From his education, he conceived an early predilection for the ſentiments of the Puritans, and conſequently, in the conteſt between Charles I. and the parliament, he firmly adhered to the latter. Having adopted theſe ſentiments, he ſometimes received a little diſturbance from the king's forces, but he never carried his oppoſition to any undue length. He, along with ſeveral others, ſigned a paper, entitled "The Teſtimony of the Miniſters of Somerſetſhire to the truth of Chriſt," in which their declared principles and becoming candour were amply diſplayed. Along with his father, he was employed by the commiſſioners appointed by parliament for ejecting ſcandalous miniſters; a commiſſion which was executed with rigour, and originated in intolerance.

Upon the Reſtoration he manifeſted a diſpoſition to loyalty, but unable with a good conſcience to unite in the act of conformity, he reſigned his living after enjoying it for 20 years, and ranked with the meritorious band of ſufferers, to the number of 2000, commonly denominated the *ejected miniſters*. In the houſe of Mr More who had been a member of the parliament, he exerciſed the duties of his miniſterial office under the penalties of that act, and was conſequently reprimanded by the magiſtrates and impriſoned; but his piety and exemplary conduct procured him a mitigation of puniſhment. But no dangers could deter him from duty; for although conſtrained to remove from that place in conſequence of the "five-mile act," he continued in the diſcharge of his miniſterial office at Frome-Selwood. Here he remained until he terminated his labours by death, in 1681.

Allein, Allemand

Piety, boldneſs, activity, and candour, ſhone in the character of Richard Allein. He was admired as a pathetic and practical preacher, and juſtly reſpected for the diligence with which he diſcharged the public and private duties of his profeſſion. Mr Jenkins, the vicar of the pariſh where he reſided, preached his funeral ſermon, and bore an honourable teſtimony to his activity, moderation, and piety. Richard Allein, ſimilar to his nonconformiſt brethren, chiefly confined his ſtudies and publications to ſubjects of religion. His works are ſtrongly marked with the peculiar features of the religious character then prevalent among the nonconformiſts. They have been frequently reprinted, and very much peruſed. His moſt celebrated work is "*Vindiciæ Pietatis*, or a Vindication of Godlineſs in its greateſt Strictneſs and Spirituality, with directions for a godly life;" this book was publiſhed in 1665, without a printer's name; and being unlicenſed, the copies of it were ſeized and ſent to the king's kitchen for waſte paper. The other productions of his pen are, "Heaven opened, or a brief and plain diſcovery of the riches of God's Covenant of Grace;" printed in 1665. "The World Conquered;" publiſhed in 8vo, in 1688. "Godly Fear," printed in 8vo, in 1674. "A Rebuke to Backſliders, and a Spur for Loiterers," printed in 8vo in 1677. "A Companion for Prayer;" in 12mo, 1680. "A brief character of Mr Joſeph Allein;" and "Inſtructions about heart-work, what is to be done on God's part and ours for the cure and keeping of the heart;" a poſthumous piece publiſhed in 8vo, by Dr Anneſley in the year 1681. (*Gen. Biog.*)

ALLELUIAH, or Hallelujah, a word ſignifying, *praiſe the Lord*, to be met with either at the beginning or end of ſome pſalms: ſuch as pſalm cxlv. and thoſe that follow to the end. Alleluiah was ſung upon ſolemn days of rejoicing, Tobit. xiii. 12. St John in the Revelation (xix. 1, 3, 4, 6.) ſays, that he "heard a great voice of much people in heaven, who ſaid, Alleluiah; and the four and twenty elders, and the four beaſts, fell down and worſhipped God that ſat on the throne, ſaying, *Alleluiah*." This hymn of joy and praiſes was transferred from the ſynagogue to the church. St Jerome tells us, that at the funeral of Fabiola ſeveral pſalms were ſung with loud alleluiahs; and that the monks of Paleſtine were awakened at their midnight watchings, with the ſinging of alleluiahs. So much energy has been obſerved in this term, that the ancient church thought proper to preſerve it, without tranſlating it either into Greek or Latin, for fear of impairing the genius and ſoftneſs of it. The fourth council of Toledo has prohibited the uſe of it in times of Lent, or other days of faſting, and in the ceremonies of mourning: and, according to the preſent practice of the Romiſh church, this word is never repeated in Lent, nor in the obſequies of the dead; notwithſtanding which, it is uſed in the maſs for the dead, according to the Moſarabic ritual, at the introit, when they ſing, *Tu es portio mea, Domine, Alleluiah, in terra viventium, Alleluiah, Alleluiah.* The ſinging alleluiah was oftentimes an invitatory or call to each other to praiſe the Lord.

ALLEMAENGEL, a ſmall Moravian ſettlement on Swetara river, in Pennſylvania.

ALLEMAND, a ſort of grave ſolemn muſic, with good

Allemand
ll
[Allen.

good measure, and a slow movement. It is also a brisk kind of dance, very common in Germany and Switzerland.

ALLEMAND, a river which falls into the Mississippi from the south-east, about 43 miles south of the Natches.

ALLEMANNIC, in a general sense, denotes any thing belonging to the ancient Germans. Thus, we meet with Allemannic history, Allemannic language, Allemannic law, &c.

ALLEN, JOHN, archbishop of Dublin in the reign of King Henry VIII. was educated in the university of Oxford; from whence removing to Cambridge, he there took the degree of bachelor of laws. He was sent by Dr Warham, archbishop of Canterbury, to the pope, about certain matters relating to the church. He continued at Rome nine years; and was created doctor of laws, either there or in some other university of Italy. After his return, he was appointed chaplain to Cardinal Wolsey, and was commissary or judge of his court as legate *à latere*: in the execution of which office he was suspected of great dishonesty, and even perjury. He assisted the cardinal in visiting, and afterwards suppressing, 40 of the smaller monasteries, for the erection of his college at Oxford and that at Ipswich. The cardinal procured for him the living of Dalby in Leicestershire, though it belonged to the master and brethren of the hospital of Burton-Lazars. About the latter end of the year 1525 he was incorporated doctor of laws in the university of Oxford. On the 13th of March 1528 he was consecrated archbishop of Dublin, in the room of Dr Hugh Inge deceased; and about the same time was made chancellor of Ireland. He wrote, 1. *Epistola de Pallii significatione activa et passiva*; penned by him at the time when he received the archiepiscopal pall. 2. *De consuetudinibus ac statutis in tuitoriis causis observandis*. He wrote also several other pieces relating to the church. His death, which happened in July 1534, was very tragical: for being taken in a time of rebellion by Thomas Fitzgerald, eldest son to the earl of Kildare, he was by his command most cruelly murdered, being brained like an ox, at Tartaine in Ireland, in the 58th year of his age. The place where the murder was committed was afterwards hedged in, overgrown, and unfrequented, in detestation of the fact.

ALLEN, *Thomas*, a famous mathematician of the 16th century, born at Utoxeter in Staffordshire the 21st of December 1542. He was admitted scholar of Trinity college, Oxford, the 4th of June 1561; and in 1567 took his degree of master of arts. In 1580 he quitted his college and fellowship, and retired to Gloucester-hall; where he studied very closely, and became famous for his knowledge in antiquity, philosophy, and mathematics. Having received an invitation from Henry earl of Northumberland, a great friend and patron of the mathematicians, he spent some time at the earl's house, where he became acquainted with those celebrated mathematicians Thomas Harriot, John Dee, Walter Warner, and Nathaniel Torporley. Robert earl of Leicester had a particular esteem for Mr Allen, and would have conferred a bishopric upon him, but his love of solitude and retirement made him decline the offer. His great skill in the mathematics made the ignorant and vulgar look upon him as a magician or conjuror: the author of a book entitled *Leicester's Commonwealth*, has accordingly accused him with using the art of figuring, to procure the earl of Leicester's unlawful designs, and endeavouring by the black art to bring about a match betwixt him and Queen Elizabeth. But without pretending to point out the absurdity of the charge, it is certain that the earl placed such confidence in Allen, that nothing material in the state was transacted without his knowledge; and the earl had constant information, by letter from Mr Allen, of what passed in the university. Mr Allen was very curious and indefatigable in collecting scattered manuscripts relating to history, antiquity, adronomy, philosophy, and mathematics: these collections have been quoted by several learned authors, &c. and mentioned to have been in the Bibliotheca Alleniana. He published in Latin the second and third books of Claudius Ptolemy of Pelusium, *Concerning the Judgement of the Stars*, or, as it is commonly called, of the *Quadripartite Construction*, with an exposition. He wrote also notes on many of Lilly's books, and some on John Bale's work *De Scriptoribus M. Britanniæ*. Having lived to a great age, he died at Gloucester-hall on the 30th September 1632.

Allendorf
Allerby.

ALLENDORF, a small town in the circle of the Upper Rhine, and in the landgravate of Hesse Cassel, remarkable for its salt works, and three stone-bridges. It is seated on the river Weser, 15 miles east of Cassel. E. Long. 10. 5. N. Lat. 51. 26.

ALLENSTOWN, a town in New Jersey, in Monmouth county, 15 miles north-east from Burlington, and 13 south-by-east from Princeton.

ALLENSTOWN, a township in Rockingham county, New Hampshire, containing 254 inhabitants; situated on the east side of Merrimack river, 25 miles north-west of Exeter, and 40 from Portsmouth.

ALLENTOWN, in Pennsylvania, Northampton county, on the point of land formed by Jordan's creek, and the Little Leheigh. It contains about 90 houses, and an academy.

ALLER, a river which runs through the duchy of Lunenburg, and falls into the Weser a little below Verden.

ALLER, *good*, in our ancient writers. The word *aller* serves to make the expression of superlative signification. So, *aller-good* is the greatest good. Sometimes it is written *alder*.

ALLERION, or ALERION, in *Heraldry*, a sort of eagle without beak or feet, having nothing perfect but the wings. They differ from martlets by having their wings expanded, whereas those of the martlets are close; and denote imperialists vanquished and disarmed: for which reason they are more common in French than in German coats of arms.

ALLESTRY, RICHARD, D. D. was born at Uppington in Shropshire, in 1619, was educated in the grammar school of Coventry, and afterwards at Christ-church in Oxford. His natural talents, which were uncommonly vigorous, he carefully improved by an unwearied application to study. Accordingly, his promotion was rapid. First he obtained the degree of bachelor of arts; next he was chosen moderator in philosophy; then made a canon of Christ church, created doctor of divinity, appointed chaplain in ordinary to the king, and afterwards regius professor of divinity.

But in the early part of life his studies were interrupted

Alleſtry. rupted, and he was called to military ſervice by hoſtile occurrences of the times. In the year 1641, he, along with many other ſtudents of Oxford, entered the royal ſervice, and gave eminent proofs of their courage and loyal attachment. A ſhort interval of hoſtilities permitted them to return to their literary purſuits; but a republican party ſoon after diſturbed their repoſe, and entering Oxford, attempted to plunder the colleges. Having entered the treaſury, and finding nothing but fourpence and a halter, they haſtened to the deanery, and ſeizing many valuable articles, they locked them in an apartment, intending next day to carry them along with them. During the night, however, Alleſtry having a key to that apartment, found means to remove the whole of the articles. Informed that he was the cauſe of their diſappointment, they ſeized him; and had they not been unexpectedly called off by an order of the earl of Eſſex, they would have ſeverely wrecked their indignation upon him. In October following he again took up arms, was preſent at the battle of Keinton-field, and on his way to Oxford to prepare for the reception of the king he was taken priſoner, but ſoon afterwards releaſed by the king's forces.

A violent diſeaſe which then prevailed in the garriſon of Oxford, brought Alleſtry to the brink of the grave; but recovering, he again joined a regiment of volunteers, chiefly conſiſting of Oxford ſtudents. Here he ſerved as a common ſoldier, and was often ſeen with the muſket in one hand and the book in the other. When the republican party prevailed, he returned at the termination of the war to his favourite ſtudies, but ſtill continued true to that ſide of politics which he had adopted. This conduct occaſioned his expulſion from the college; but he was provided with a comfortable retreat, in the families of the honourable Francis Newport, and Sir Anthony Cope.

Such was the confidence repoſed in him, that, when the friends of Charles II. were ſecretly preparing the way for his reſtoration, they entruſted him with perſonal meſſages to the king. In returning from one of theſe interviews, he was ſeized at Dover, and upon examination committed a priſoner to Lambeth-houſe. The earl of Shafteſbury obtained his releaſe in a few weeks. Returning to viſit his friends, and among others the learned Dr Hammond, he met his corpſe at the gate of his houſe, carrying to the grave. This deeply afflicted his mind, and added much to his preſent diſtreſſes. The doctor left him his valuable library, aſſigning as a reaſon that "he well knew that his books in his hands would be uſeful weapons, for the defence of that cauſe he had ſo vigorouſly ſupported." This valuable library along with his own, Alleſtry bequeathed at his death to the univerſity.

During his life he erected at his own private expence the weſt ſide of the outward court of Eton college, the grammar ſchool in Chriſt-church college, and ſettled ſeveral liberal penſions upon individual perſons and families. His original biographer gives him the following character. "Memory, fancy, judgement, elocution, great modeſty, and no leſs aſſurance, a comprehenſion of things, and a fluency of words; an aptneſs for the pleaſant, and ſufficiency for the rugged parts of knowledge; a courage to encounter and an induſtry to maſter all things, make up the character of his happy genius. There was not in the world a man of clearer honeſty and courage; no temptation could bribe him to do a baſe thing, or terror affright him from the doing a good one. This made his friendſhip as laſting and inviolable as his life, without the mean conſiderations of profit, or ſly reſerves of craft; without the pageantry of ceremonious addreſs, the cold civility of ſome, and the ſervile falſeneſs and obſequious flattery of others." He left a volume of ſermons printed at Oxford in 1684, from the peruſal of which poſterity may judge of his literary abilities. Although his lectures gave univerſal ſatisfaction, yet he prohibited their publication. Alleſtry || Alley.

ALLESTRY, *Jacob*, an Engliſh poet of the laſt century. He was the ſon of James Alleſtry, a bookſeller of London who was ruined by the great fire in 1666. Jacob was educated at Weſtminſter ſchool, entered at Chriſt-church, Oxford, in the act-term 1671, at the age of 18, and was elected ſtudent in 1672. He took the degree of arts; was muſic reader in 1679, and terræ filius in 1681; both which offices he executed with great applauſe, being eſteemed a good philologiſt and poet. He had a chief hand in the verſes and paſtorals ſpoken in the theatre at Oxford May 21. 1681, by Mr William Saville ſecond ſon of the marquis of Halifax, and George Cholmondely ſecond ſon of Robert Viſcount Kells (both of Chriſt-church), before James duke of York, his duchefs, and the lady Anne; which verſes and paſtorals, were afterwards printed in the "Examen Poeticum." He died October 15. 1686, and was buried in St Thomas's churchyard.

ALLEVEURE, a ſmall braſs Swediſh coin, worth about ½d. Engliſh money.

ALLEVIATION, denotes the making a thing lighter, and eaſier to bear or endure. It ſtands oppoſed to *aggravation*.

ALLEY, William, biſhop of Exeter in the reign of Queen Elizabeth, was born at Great Wycomb in Buckinghamſhire. From Eton ſchool, in the year 1528, he removed to King's college, Cambridge, where he took the degree of bachelor of arts. He alſo ſtudied ſome time at Oxford; afterwards he married, was preſented to a living, and became a zealous reformer. Upon Queen Mary's acceſſion he left his cure and retired into the north of England; where he maintained his wife and himſelf by teaching a ſchool, and practiſing phyſic. Queen Elizabeth aſcending the throne, he went to London, where he acquired great reputation by reading the divinity lecture at St Paul's, and in July 1560 was conſecrated biſhop of Exeter. He was created doctor of divinity at Oxford in November 1561. He died on the 15th of April 1570, and was buried at Exeter in the cathedral. He wrote, 1. The Poor Man's Library, 2 vols. fol. Lond. 1571. Theſe volumes contain twelve lectures on the firſt epiſtle of St Peter, read at St Paul's. 2. A Hebrew Grammar. Whether it was ever publiſhed is uncertain. He tranſlated the Pentateuch, in the verſion of the Bible which was undertaken by Queen Elizabeth's command.

Alley, in *Gardening*, a ſtraight parallel walk, bounded on both ſides with trees, ſhrubs, &c. and uſually covered with gravel or turf.

Alley, among builders, denotes a narrow paſſage leading from one place to another.

Alley, in *Perſpective*, that which, in order to have

Alley || Alleyn.

a greater appearance of length, is made wider at the entrance than at the termination.

ALLEY, in the new husbandry, implies the vacant space between the outermost row of corn on one bed and the nearest row to it on the next parallel bed; and it is usually about four feet in breadth, exclusive of the partitions between the rows of corn in the beds. The first hoeing of wheat is performed in the beginning of winter, and the earth is ploughed away from the rows into the intervals, which forms small ridges in the middle between the double rows. The second hoeing is in the spring, which turns it back to the rows, leaving a furrow in the middle of the alley. The third hoeing is from the rows, after the wheat has blossomed: this turns the earth into the intervals, forming small ridges there, as at the first hoeing. The fourth hoeing returns the earth to the ridges, which is performed a month or more after the third hoeing. This commonly finishes the horse-hoeings, if the land is in good heart; otherwise one or two more hoeings are necessary.

ALLEYN, EDWARD, a celebrated English actor in the reign of Queen Elizabeth and King James, and founder of the college at Dulwich in Surry, was born at London in the parish of St Botolph, Sept. 1. 1566, as appears from a memorandum of his own writing. Dr Fuller says, that he was bred a stage-player; and that his father would have given him a liberal education, but that he was not turned for a serious course of life. He was, however, a youth of an excellent capacity, a cheerful temper, a tenacious memory, a sweet elocution, and in his person of a stately port and aspect: all which advantages might well induce a young man to take to the theatrical profession. By several authorities we find he must have been on the stage some time before 1592; for at this time he was in high favour with the town, and greatly applauded by the best judges, particularly by Ben Johnson.

Haywood, in his prologue to Marloe's Jew of Malta, calls him Proteus for shapes, and Roscius for a tongue. He usually played the capital parts, and was one of the original actors in Shakespeare's plays; in some of Ben Johnson's he was also a principal performer: but what characters he personated in either of these poets, it is difficult now to determine. This is owing to the inaccuracy of their editors, who did not print the names of the players opposite to the characters they performed, as the modern custom is; but gave one general list of actors to the whole set of plays, as in the old folio edition of Shakespeare; or divided one from the other, setting the dramatis personæ before the plays, and the catalogue of performers after them, as in Johnson's.

It may appear surprising how one of Mr Alleyn's profession should be enabled to erect such an edifice as Dulwich college, and liberally endow it for the maintenance of so many persons. But it must be observed that he had some paternal fortune, which, though small, might lay a foundation for his future affluence; and it is to be presumed, that the profits he received from acting, to one of his provident and managing disposition, and one who by his excellence in playing drew after him such crowds of spectators, must have considerably improved his fortune: besides he was not only an actor, but master of a playhouse built at his own expence, by which he is said to have amassed considerable wealth. He was also keeper of the king's wild beasts, or master of the royal bear-garden, which was frequented by vast crowds of spectators; and the profits arising from these sports are said to have amounted to 500l. per annum. He was thrice married; and the portions of his two first wives, they leaving him no issue to inherit, might probably contribute to this benefaction. Such kind of donations have been frequently thought to proceed more from vanity and ostentation than real piety; but this of Mr Alleyn has been ascribed to a very singular cause, for the devil has been said to be the first promoter of it. Mr Aubrey mentions a tradition, "that Mr Alleyn playing a demon, with six others, in one of Shakespeare's plays, was, in the midst of the play, surprised by an apparition of the devil; which so worked on his fancy, that he made a vow, which he performed by building Dulwich college." He began the foundation of this college, under the direction of Inigo Jones, in 1614; and the buildings, gardens, &c. were finished in 1617, in which he is said to have expended about 10,000l. After the college was built, he met with some difficulty in obtaining a charter for settling his lands in mortmain: for he proposed to endow it with 800l. per annum, for the maintenance of one master, one warden, and four fellows, three whereof were to be clergymen, and the fourth a skilful organist; also six poor men and as many women, besides twelve poor boys to be educated till the age of fourteen or sixteen, and then put out to some trade or calling. The obstruction he met with arose from the lord chancellor Bacon, who wished King James to settle part of those lands for support of two academical lectures; and he wrote a letter to the Marquis of Buckingham, dated August 18. 1618, entreating him to use his interest with his Majesty for that purpose. Mr Alleyn's solicitation was however at last complied with, and he obtained the royal license, giving him full power to lay his foundation, by his Majesty's letters patent, bearing date the 21st of June 1619; by virtue whereof he did, in the chapel at the said new hospital at Dulwich, called *The College of God's Gift*, on the 13th of September following, publicly read and publish a quadripartite writing in parchment, whereby he created and established the said college; he then subscribed it with his name, and fixed his seal to several parts thereof, in presence of several honourable persons, and ordered copies of the writings to four different parishes. He was himself the first master of his college; so that to make use of the words of Mr Haywood, one of his contemporaries, "He was so mingled with humility and charity, that he became his own pensioner, humbly submitting himself to that proportion of diet and clothes which he had bestowed on others." We have no reason to think he ever repented of this distribution of his substance; but, on the contrary, that he was entirely satisfied, as appears from the following memorial in his own writing, found amongst his papers: "May 26. 1620.—My wife and I acknowledged the fine at the common pleas bar, of all our lands to the college: blessed be God that he has given us life to do it." His wife died in the year 1623; and about two years afterwards he married Constance Kinchtoe, who survived him, and received

Alleyn.

remarkable

Alleyn || Alliance.

remarkable proofs of his affection, if at leaſt we may judge of it by his will, wherein he left her conſiderably. He died Nov. 25. 1626, in the 61ſt year of his age, and was buried in the chapel of his new college, where there is a tomb-ſtone over his grave, with an inſcription. His original diary is alſo there preſerved.

The ſubjoining anecdote is entertaining in itſelf, and ſhows the high eſteem in which Mr Alleyn was held as an actor: "Edward Alleyn, the Garrick of Shakeſpeare's time, had been on the moſt friendly footing with our poet, as well as Ben Johnſon. They uſed frequently to ſpend their evenings together at the ſign of the Globe, ſomewhere near Blackfriars, where the playhouſe then was. The world need not be told, that the convivial hours of ſuch a triumvirate muſt be pleaſing as well as profitable, and may be ſaid to be ſuch pleaſures as might bear the reflections of the morning. In conſequence of one of theſe meetings, the following letter was written by G. Peele, a Fellow of Chriſt church college, Oxford, and a dramatic poet, who belonged to the Club, to one Marle, an intimate of his:

'Friend Marle.

'I muſt deſyr that my ſyſter hyr watch, and the 'cookerie book you promyſed, may be ſente bye the 'man.——I never longed for thy company more than 'laſt night: we were all very merrye at the Globe, 'when Ned Alleyn did not ſcruple to affyrme pleaſauntely to thy Friende Will, that he had ſtolen his 'ſpeech about thee Qualityes of an actor's excellencye 'in Hamlet hys Tragedye, from converſations many-'fold whych had paſſed betweene them, and opinyons 'given by Alleyn touchinge the ſubjecte.——Shake-'ſpeare did not take this talke in good ſorte; but 'Johnſon put an ende to the ſtriſe with wittylye re-'markinge, *This affaire needeth no Contentione; you 'ſtole it from Ned, no doubte; do not marvel: Have 'you not ſeen him act tymes out of number?*—Believe 'me moſt ſyncerilie, yours, *G. Peele.*'

ALLIA, a river of Italy, in the Sabine territory, which running down a very deep channel from the mountains of Cruſtuminum, mixes with the Tiber 40 miles from Rome; famous for the great ſlaughter of the Romans by the Gauls, under Brennus, when 40,000 Romans were killed or put to flight; hence *Allienſis dies*, an unlucky day (Virgil, Ovid, Lucan). Our anceſtors, ſays Cicero, deemed the day of the fight of *Allia* more fatal than that of taking the city.

ALLIANCE, in the *Civil and Canon Law*, the relation contracted between two perſons or two families by marriage.

ALLIANCE is alſo uſed for a treaty entered into by ſovereign princes and ſtates, for their mutual ſafety and defence.—In this ſenſe, alliances may be diſtinguiſhed into ſuch as are offenſive, whereby the contracting parties oblige themſelves jointly to attack ſome other power; and into defenſive ones, whereby they bind themſelves to ſtand by and defend each other in caſe they are attacked by others. Alliance with the ancient Romans, though a ſort of ſervitude, was much coveted. Ariarathes, we are told by Polybius, offered a ſacrifice to the gods by way of thankſgiving for having obtained this alliance. The reaſon was, that thenceforward people were ſure not to receive any injuries except from them. There were different ſorts of allies: ſome only united to them by a participation of the privileges of Romans, as the Latini and Hernici; others by their very foundation, as the colonies; others by the benefactions they received from them, as Maſiniſſa, Eumenes, and Attalus, who owed their kingdoms to Rome; others by free treaties, which laſt by a long alliance became ſubjects, as the kings of Bithynia, Cappadocia, Egypt, and moſt of the cities of Greece: Laſtly, others by compulſive treaties, and the law of ſubjection, as Philip and Antiochus. For they never granted peace to an enemy, without making an alliance with him; that is, they never ſubdued any people without uſing it as a means of ſubduing others.

Alliance || Alligation.

The forms or ceremonies of alliances have been various in different ages and countries. Among us, ſigning and ſwearing, ſometimes at the altar, are the chief; anciently eating and drinking together, chiefly offering ſacrifices together, were the cuſtomary rite of ratifying an alliance. Among the Jews and Chaldeans, heifers or calves, among the Greeks bulls or goats, and among the Romans hogs, were ſacrificed on this occaſion. Among the ancient Arabs, alliances were confirmed by drawing blood out of the palms of the hands of the two contracting princes with a ſharp ſtone, dipping herein a piece of their garments, and therewith ſmearing ſeven ſtones, at the ſame time invoking the gods Vrotalt and Alilat, i. e. according to Herodotus, Bacchus and Uranius. Among the people of Colchis, the confirmation of alliances is ſaid to be effected by one of the princes offering his wife's breaſts to the other to ſuck, which he was obliged to do till there iſſued blood.

ALLIANCE, in a figurative ſenſe, is applied to any kind of union or connection; thus we ſay, there is an alliance between the church and ſtate.

ALLIARA, See ERYSIMUM, BOTANY *Index*.

ALLIER, in *Geography*, a river of France, which gives name to a department, has its ſource near Chateau Neuf de Randon, in the department of Lozere, and joins the Loire near Nevers.

ALLIER, a department of France, formerly the province of Bourbonnois, is bounded on the north by the departments of Saone and Loire, Nievre and Cher; on the eaſt by thoſe of Saone and Loire and the Loire; on the ſouth by thoſe of the Loire, Puy de Dome, and Creuſe; and on the weſt by thoſe of Creuſe and Cher. It contains 1,454,341 ſquare acres; the number of inhabitants is about 266,105; and it is divided into four communal diſtricts. The principal town is Moulins.

ALLIGATI, in Roman antiquity, the baſeſt kind of ſlaves, who were uſually kept fettered. The Romans had three degrees, or orders, of ſlaves or ſervants; the firſt employed in the management of their eſtates; the ſecond in the menial or lower functions of the family; the third called *alligati*, above mentioned.

ALLIGATION the name of a method of ſolving all queſtions that relate to the mixture of one ingredient with another. Though writers on arithmetic generally make allegation a branch of that ſcience; yet, as it is plainly nothing more than an application of the common properties of numbers, in order to ſolve a few queſtions

Alligation. queſtions that occur in particular branches of buſineſs, we chooſe rather to keep it diſtinct from the ſcience of arithmetic.

Alligation is generally divided into *medial* and *alternate*.

Alligation Medial, from the rates and quantities of the ſimples given, diſcovers the rate of the mixture.

Rule. As the total quantity of the ſimples,
To their price or value;
So any quantity of the mixture,
To the rate.

Examp. A grocer mixeth 30lb. of currants, at 4d. per lb. with 10lb. of other currants, at 6d. per lb.: What is the value of 1lb. of the mixture? *Anſ.* 4½d.

lb.	d.		d.
30, at	4	amounts to	120
10, at	6	———	60
40			180

lb. d. lb. d.
If 40 : 180 :: 1 : 4½.

Note 1. When the quantity of each ſimple is the ſame, the rate of the mixture is readily found by adding the rates of the ſimples, and dividing their ſum by the number of ſimples Thus,

Suppoſe a grocer mixes ſeveral ſorts of ſugar, and of each an equal quantity, viz. at 50s. at 54s. and at 60s. per cwt. the rate of the mixture will be 54s. 8d. per cwt.; for

s. s. d.
50+54+60=164, and 3)164(54 8

Note 2. If it be required to increaſe or diminiſh the quantity of the mixture, ſay, As the ſum of the given quantities of the ſimples, to the ſeveral quantities given; ſo the quantity of the mixture propoſed, to the quantities of the ſimples ſought.

Note 3. If it be required to know how much of each ſimple is an aſſigned portion of the mixture, ſay, As the quantity of the mixture, to the ſeveral quantities of the ſimples given; ſo the quantity of the aſſigned portion, to the quantities of the ſimples ſought. Thus.

Suppoſe a grocer mixes 10lb. of raiſins with 30lb. of almonds and 40lb. of currants, and it be demanded how many ounces of each ſort are found in every pound, or in every 16 ounces of the mixture, ſay,

oz.
80 : 10 :: 16 : 2 raiſins.
80 : 30 :: 16 : 6 almonds.
80 : 40 :: 16 : 8 currants.

Proof 16

Note 4. If the rates of two ſimples, with the total value and total quantity of the mixture, be given, the quantity of each ſimple may be found as follows: viz. Multiply the leſſer rate into the total quantity, ſubtract the product from the total value, and the remainder will be equal to the product of the exceſs of the higher rate above the lower, multiplied into the quantity of the higher priced ſimple; and conſequently the ſaid remainder, divided by the difference of the rates, will quote the ſaid quantity. Thus, Alligation.

Suppoſe a grocer has a mixture of 400lb. weight, that coſt him 7l. 10s. conſiſting of raiſins at 4d. per lb. and almonds at 6d. how many pounds of almonds were in the mixture?

	lb.	Rates.
	400	6d.
L. s. d.	4	4d.
7 10=1800		
1600	1600d.	2d.

	L. s.
2)200(100lb. of almonds at 6d. is	2 10
And 300lb. of raiſins at 4d. is	5 0
Total 400	Proof 7 10

Alligation Alternate, being the converſe of alligation medial, from the rates of the ſimples, and rate of the mixture given, finds the quantities of the ſimples.

Rules. I. Place the rate of the mixture on the left ſide of a brace, as the root; and on the right ſide of the brace ſet the rates of the ſeveral ſimples, under one another, as the branches. II. Link or alligate the branches, ſo as one greater and another leſs than the root may be linked or yoked together. III. Set the difference betwixt the root and the ſeveral branches right againſt their reſpective yoke-fellows. Theſe alternate differences are the quantities required. Note 1. If any branch happen to have two or more yoke-fellows, the difference betwixt the root and theſe yoke-fellows muſt be placed right againſt the ſaid branch, one after another, and added into one ſum. 2. In ſome queſtions, the branches may be alligated more ways than one: and a queſtion will always admit of ſo many anſwers as there are different ways of linking the branches.

Alligation alternate admits of three varieties, viz. 1. The queſtion may be unlimited, with reſpect both to the quantity of the ſimples and that of the mixture. 2. The queſtion may be limited to a certain quantity of one or more of the ſimples. 3. The queſtion may be limited to a certain quantity of the mixture.

Variety I. When the queſtion is unlimited, with reſpect both to the quantity of the ſimples, and that of the mixture, this is called *Alligation Simple*.

Examp. A grocer would mix ſugars at 5d. 7d. and 10d. per lb. ſo as to ſell the mixture or compound at 8d. per lb.: What quantity of each muſt he take?

lb.
8 { 5 \ 2 | 2
  { 7 / 2 | 2
  { 10 \ 3,1 | 4

Here the rate of the mixture 8 is placed on the left ſide of the brace, as the root; and on the right ſide of the ſame brace are ſet the rates of the ſeveral ſimples, viz. 5, 7, 10, under one another, as the branches; according to Rule I.

The branch 10 being greater than the root, is alligated or linked with 7 and 5, both theſe being leſs than the root; as directed in Rule II.

The difference between the root 8 and the branch 5, viz. 3, is ſet right againſt this branch's yoke-fellow 10. The difference between 8 and 7 is likewiſe ſet right againſt

Alligation

against the yoke-fellow 10. And the difference betwixt 8 and 10. viz. 2, is set right against the two yoke fellows 7 and 5; as prescribed by Rule III.

As the branch 10 has two differences on the right, viz. 3 and 1, they are added; and the answer to the question is, that 2lb. at 5d. 2lb. at 7d. and 4lb. at 10d. will make the mixture required.

The truth and reason of the rules will appear by considering, that whatever is lost upon any one branch is gained upon its yoke-fellow. Thus in the above example by selling 4lb. of 10d. sugar at 8d. per lb. there is 8d. lost: but the like sum is gained upon its two yoke-fellows; for by selling 2lb. of 5d. sugar at 8d. per lb. there is 6d. gained; and by selling 2lb. of 7d. sugar at 8d. there is 2d. gained; and 6d. and 2d. make 8d.

Hence it follows, that the rate of the mixture must always be mean or middle with respect to the rates of the simples; that is, it must be less than the greatest, and greater than the least; otherwise a solution would be impossible. And the price of the total quantity mixed, computed at the rate of the mixture, will always be equal to the sum of the prices of the several quantities cast up at the respective rates of the simples.

Variety II. When the question is limited to a certain quantity of one or more of the simples, this is called *Alligation Partial.*

If the quantity of one of the simples only be limited, alligate the branches, and take their differences, as if there had been no such limitation; and then work by the following proportion:

As the difference right against the rate of the simple, whose quantity is given,
To the other differences respectively;
So the quantity given,
To the several quantities sought.

Examp. A distiller would, with 40 gallons of brandy at 12s per gallon, mix rum at 7s. per gallon, and gin at 4s. per gallon: How much of the rum and gin must he take, to sell the mixture at 8s. per gallon?

Gal.

$$8\left\{\begin{matrix}12\\7\\4\end{matrix}\right.\begin{matrix}\diagdown\\\diagup\\\diagdown\end{matrix}\begin{matrix}14,\\4\\4\end{matrix}\left|\begin{matrix}5\\4\\4\end{matrix}\right|\left.\begin{matrix}40\text{ of brandy.}\\32\text{ of rum.}\\32\text{ of gin.}\end{matrix}\right\}\textit{Anf.}$$

The operation gives for answer, 5 gallons of brandy, 4 of rum, and 4 of gin. But the question limits the quantity of brandy to 40 gallons; therefore say,

If 5 : 4 :: 40 : 32

The quantity of gin, by the operation, being also 4, the proportion needs not be repeated.

Variety III. When the question is limited to a certain quantity of the mixture, this is called *Alligation Total.*

After linking the branches, and taking the differences, work by the proportion following:

As the sum of the differences,
To each particular difference;
So the given total of the mixture,
To the respective quantities required.

Examp. A vintner hath wine at 3s. per gallon, and would mix it with water, so as to make a composition of 144 gallons, worth 2s. 6d. per gallon: How much wine, and how much water, must he take? Alligator ll Alliteration.

Gal.

$$30\left\{\begin{matrix}36\\0\end{matrix}\right)\begin{matrix}30\\6\end{matrix}\left|\begin{matrix}120\text{ of wine}\\24\text{ of water.}\end{matrix}\right\}\textit{Anf.}$$

36 | 144 total.

120 × 36 = 4320

24 × 0 = 0

Proof 144)4320(30

As 36 : 30 :: 144 : 120

As 36 : 6 :: 144 : 24.

There being here only two simples, and the total of the mixture limited, the question admits but of one answer.

ALLIGATOR, in *Zoology*, a synonyme of the lacerta crocodilus. See LACERTA.

Alligator Pear. See LAURUS, BOTANY *Index.*

ALLIONIA. See BOTANY *Index.*

ALLIOTH, a star in the tail of the Greater Bear, much used for finding the latitude at sea.

ALLITERATION, an ornament of language chiefly used in poetry, and consisting in the repetition of the same letter at certain intervals. We do not remember to have ever seen any satisfactory account of alliteration in the writings of the critics. They seem to have passed it over in contemptuous silence; either as a false refinement or as a mere trifle. It perhaps deserves a better fate. Many chapters have been composed on quantity, on the expression resulting from different arrangements of long and short syllables, and on the powers of pauses as they are variously placed, without a word of alliteration. This is the more extraordinary, as one should think it impossible for any man to examine minutely, and, as it were, dissect a number of verses, without perceiving the vast abundance of this ornament. It is as if an anatomist should publish a complete table of the arteries in the human body, and affect never to have seen a vein or a nerve: for it may be affirmed, with small danger of mistake, that if you examine any number of verses, remarkable either for sweetness or for energy, they will be found in some degree alliterative. We do not pretend to say, that the sweetness and energy of versification depends chiefly on this circumstance, yet we cannot help believing that it may claim some share; for it is a constant appearance, as far as we have ever observed, that the poets whose fame is highest for versification, have been attentive to alliteration.

The very trifling appearance of the ornament itself, upon a superficial view, and the frequent abuse of it, are circumstances indeed which give no encouragement to a serious inquiry into its nature and operation. How common is it for writers, who affect to be comic, when in want of other means for raising a smile, to use affected alliteration with success? But, in the fine arts, no beauty or grace is beyond the power of ridicule. The noblest attitudes in painting have been rendered laughable by caricatura. St Paul preaching at Athens, in the design of Raphael, appears elegant, noble, and in some degree awful. The same apostle, represented by Hogarth in nearly the same attitude, pleading before

Alliteration. fore the governor Felix, ſeems altogether ridiculous. So the language and verſification of Milton in the Paradiſe Loſt appear only proper for the moſt elevated ſubjects. In the Splendid Shilling of Philips, they appear equally proper for the loweſt. So fares it alſo with alliteration. Nor ought we to be mortified at the diſcovery, that much of the delight afforded by verſification ariſes from a cauſe ſo pitiful as the repetition of the ſame letter twice, or oftener, on the accented parts of a verſe; for there are many other cauſes of pleaſure, which, when thus detected and taken to pieces, ſeem equally contemptible.

We apprehend the principal operation of this ornament to be quite mechanical. It is eaſier for the organs of ſpeech to reſume, at ſhort intervals, one certain conformation, than to throw themſelves into a number of different ones, unconnected and diſcordant. For example, a ſucceſſion of labials, interſperſed at regular diſtances with dentals and gutturals, will be more eaſily pronounced than the ſucceſſion of all the three at random. Sounds of which the articulation is eaſieſt, are moſt completely in the power of the ſpeaker. He can pronounce them ſlowly or rapidly, ſoftly or with force, at pleaſure. In this we imagine the power and advantage of alliteration are founded; for we would not lay any ſtreſs on the pleaſure which can reſult to the ear from the repetition of the ſame letter. It has been compared to the frequent returns of the key-note in a muſical ſtrain; but that analogy is extremely faint. The ear, we preſume, can be pleaſed with alliteration only in ſo far as it contributes to the ſuperior eaſineſs of recitation; for what is recited with eaſe muſt be heard with pleaſure.

Theſe remarks might be confirmed and illuſtrated by numberleſs paſſages from the beſt poets. Some few lines will ſuffice, taken from Gray, who ſeems to have paid particular attention to this grace. He profeſſed to have learned his verſification from Dryden, as Dryden did from Spenſer; and theſe three abound in alliteration above all the Engliſh poets. We chooſe Gray for another reaſon, in proof of what we mentioned before, that alliteration contributes not only to the *ſweetneſs*, but alſo to the *energy*, of verſification; for he uſes it chiefly when he aims at ſtrength and boldneſs. In the *Siſter Odes* (as Dr Johnſton ſtyles them), almoſt every ſtrophe commences and concludes with an alliterative line. The poet, we ſuppoſe, wiſhed to begin with force, and end with dignity.

" *R*uin ſeize thee, *r*uthleſs king."
" To *h*igh-born *H*oel's *h*arp, or ſoft *L*lewe*l*lyn's *l*ay."
" *W*eave the *w*arp, and weave the *w*oof."
" Stamp we our vengeance *d*eep, and ratify his *d*oom."
" Regardleſs of the *ſ*weeping whirlwind's *ſ*way."
" That huſh'd in grim re*p*oſe, ex*p*ects his ev'ning *p*rey."

It muſt be obſerved here, that we hold a verſe alliterative which has a letter repeated on its accented parts, although thoſe parts do not begin words; the repeated letter bearing a ſtrong analogy to the bars in a muſical phraſe. Gray ſeems to have had a particular liking to theſe ſort of balanced verſes, which divide equally, and of which the oppoſite ſides have an alliterative reſemblance.

" Eyes that *g*low, and fangs that *g*rin."
" Thoughts that *b*reathe, and words that *b*urn."
" *H*auberk craſh, and *h*elmet ring."

Alliteration illuſtrated.

All theſe lines appear to us to have a force and energy, ariſing from alliteration, which renders them eaſy to be recited; or, if the reader pleaſes, *mouthed*. For the ſame reaſon the following paſſage appears ſad and ſolemn, by the repetition of the labial liquid.

" *M*ountains, ye *m*ourn in vain,"
" *M*odred, whoſe *m*agic ſong."—&c.

If alliteration thus contributes to enforce the expreſſion of a poetical ſentiment, its advantages in poetry muſt be conſiderable. It is not, therefore, unworthy a poet's regard in the act of compoſition. If two words offer of equal propriety, the one alliterative, the other not, we think the firſt ought to be choſen. We would compare this to the practice of fuguing in muſic. A compoſer who aims at expreſſion will not hunt after fugues; but if they offer, if they ſeem to ariſe ſpontaneouſly from the ſubject, he will not reject them. So a good poet ought not to ſelect an epithet merely for beginning with a certain letter, unleſs it ſuit his purpoſe well in every other reſpect; for the beauty of alliteration, when happy, is not greater than its deformity when affected. A couplet from Pope will exemplify both; the firſt line being bad, and the ſecond good:

" Eternal beauties grace the *ſ*hining *ſ*cene,
" *F*ields ever *ſ*reſh, and *g*roves for ever green."

ALLIUM (from *αλεω*, " to avoid or ſhun," becauſe many ſhun the ſmell of it), GARLIC. See BOTANY *Index*.

ALLIX, PETER, a French Proteſtant divine, was born at Alençon in France, in the year 1641. He became a learned divine of the Engliſh church, and a ſtrenuous defender of the Proteſtant faith. At the time when the edict of Nantes tolerated and protected the Proteſtants of France, he entered upon his clerical profeſſion, and remained miniſter of Rouen until the thirty-fifth year of his age. In this period he wrote ſeveral pieces upon the controverſy between the Papiſts and the Proteſtants, which obtained him great fame among his own party. He removed to Charenton in the vicinity of Paris, which was the principal church among the reformed, and frequented by perſons of the firſt rank in France, who profeſſed the Proteſtant faith. Here Allix preached a courſe of excellent ſermons in defence of the Proteſtant religion, ſome of which were afterwards printed in Holland, and added to his increaſing fame. The chief object of theſe ſermons was to repel the attack of the biſhop of Meaux, the moſt ingenious and able opponent of the Reformation at that time. The unwiſe revocation of the edict of Nantes drove Allix and many others to ſeek refuge in England. Three years after his arrival in England, he had made himſelf ſo perfectly maſter of the Engliſh language as to be able to write very correctly a " Defence of the Chriſtian Religion." This work he dedicated to James II. in teſtimony of gratitude for his kind reception of the diſtreſſed refugees of France. In juſtice to the memory of James,

Allix, Alloa.

and as a ſpecimen of the talents of Allix, it may be proper to give an extract from this curious dedication. —"As your majeſty continues ſtill to give ſuch illuſtrious inſtances of your clemency and royal protection to thoſe of your nation; ſo I confeſs, Sir, I thought myſelf under an obligation to lay hold upon this opportunity of publiſhing what all thoſe who find ſo ſure a protection in your majeſty's dominions feel and think as much as myſelf upon theſe new teſtimonies of your royal bounty. When your majeſty had taken us into your particular care, and had granted us ſeveral privileges, and ſo made us ſharers in all the advantages which thoſe who live under your government enjoy; your majeſty did yet ſomething more, and inſpired all your ſubjects with the ſame compaſſion towards us, with which your royal breaſt was already touched. You ſaw our miſeries, and reſolved to give us eaſe; and this generous deſign was executed, and your royal clemency diffuſed in the hearts of all your ſubjects. The whole world, Sir, which has received upon all its coaſts ſome remainders of our ſhipwreck, is filled with admiration of the unexampled effects of your majeſty's clemency. I could wiſh, Sir, that this work which I now preſent to your majeſty might be ſo happy as to paſs to poſterity with this character of our acknowledgment, and that it might ſtand as a faithful record for ever to perpetuate the memory of that lively ſenſe of your bounty which is imprinted on all our hearts."

Not long after his arrival in England, he was honoured with the title of doctor of divinity, and alſo received the more ſubſtantial honour of being appointed treaſurer of the church of Saliſbury. Allix ſtill maintained the ſtation of a champion for the Proteſtant cauſe, and in oppoſition to the biſhop of Meaux, proved that the charge of hereſy juſtly belonged to the Papiſts, and not to their opponents, becauſe they had introduced new doctrines into the church.

After having with much induſtry and learning exerciſed his talents in defence of Proteſtantiſm, he employed his pen to ſupport the doctrine of the Trinity againſt the Unitarians, who contended that the idea of Chriſt's divinity could be traced up no higher than the time of Juſtin Martyr. With a great diſplay of erudition, he attempted to prove that the Trinitarian doctrine was believed by the Jewiſh church. But the reputation which he had acquired for learning and ability was ſomewhat diminiſhed by the ridicule which he brought upon himſelf in attempting to fix the preciſe time of Chriſt's ſecond coming to the year 1720, or at the very lateſt, to the year 1736. He died at London in the year 1717, after his ſtudious life had been protracted to the length of 76 years. He left behind him numerous proofs of his great talents, extenſive learning, uncommon induſtry, and zealous attachment to the doctrines of the church of England. (*Gen Biog.*)

ALLOA, or ALLOWAY, a ſea-port town in Scotland, ſeated on the Forth, about 20 miles higher up the river than Leith, and five miles eaſt of Stirling. It is a populous place; has two market days in the week; and is remarkable for its fine caſtle, the ſeat of Mr Erſkine of Mar, and for the coal mines near it. The harbour is extremely commodious, with great depth of water; and veſſels are expeditiouſly loaded with coals from the pits by an uncommon waggon-way, on which one horſe draws with eaſe three waggons at once, each waggon containing a ton and a half. An excellent dry dock has alſo lately been erected here, capable of receiving ſhips of the greateſt burden. There is likewiſe a large glaſs-houſe for blowing bottles, of which veſſels are ſupplied with any quantity upon the ſhorteſt notice. Alloa. Alloa.

The tower and lands of Alloa were exchanged by David II. king of Scots, *anno* 1365, with Thomas Lord Erſkine, for the lands and eſtate of Strathgartney in Perthſhire; and ſince that time the caſtle of Alloa has been the favourite reſidence of the family of Mar. The ſituation is uncommonly beautiful. The gardens here were the firſt that were laid out on a great ſcale in Scotland; and, with the advice of Le Nautre, were indebted to the taſte of John the late earl of Mar, who began to plant them in the year 1706. They contain about forty acres, in which there is ſome very fine timber, near a century old.

The tower of Alloa is 89 feet in height, with walls of 11 feet in thickneſs; and was built in the end of the 13th century. In this reſidence of the family of Erſkine many of the Scottiſh princes received their education, having been for more than two centuries the wards of the Lords Erſkine and Earls of Mar, who held generally the caſtle of Stirling, and frequently the three principal fortreſſes of the kingdom, Edinburgh, Stirling, and Dumbarton. The laſt heir of the Scottiſh monarchy who was nurtured there was Henry prince of Wales; whoſe cradle, golf-clubs, and other infantine and youthful remains, are preſerved by the heir of the earls of Mar, in remembrance of that ſpirited and promiſing prince; of whom Dr Birch has preſerved ſeveral anecdotes, connected with the Erſkines and his reſidence at Alloa. Among other remains of antiquity preſerved at Alloa, in remembrance of the confidence and affection which ſubſiſted always betwixt the Stuarts and the Erſkines, is the private ſignet of the unfortunate Mary, which ſhe gave to the regent Mar, after ſhe was obliged by the treaty of Edinburgh to deſiſt from wearing the arms of England in the firſt quarter; the child's chair of James VI. her ſon; and the feſtive chair of Thomas Lord Erſkine the ſecond earl of Mar of the name, with the faſhionable grace carved on it, *Soli Deo Honor et Gloria.*

ALLOBROGES, (Inſcription, Livy, Velleius, Florus); from *Allobrox* (Horace): a people of Gallia Narbonenſis, ſituated between the rivers Iſara and Rhodanus, and the Lacus Lemanus; commended by Cicero for their fidelity; but reproached by Horace on account of their fondneſs for novelty.

Noviſque rebus infidelis Allobrox. Epod. 16.

ALLOCATION denotes the admitting or allowing of an article of an account, eſpecially in the exchequer. Hence

Allocatione Facienda, is a writ directed to the lord treaſurer, or barons of the exchequer, commanding them to allow an accountant ſuch ſums as he has lawfully expended in the execution of his office.

ALLOCUTIO, an oration or ſpeech of a general addreſſed to his ſoldiers, to animate them to fight, to appeaſe ſedition, or to keep them to their duty. A mount of earth was raiſed upon the occaſion, as it were a kind of a tribunal of turf. From this the general pronounced his harangue to the army, which was ranged

Allodium || Alluſh.

ged in ſeveral ſquadrons round him, with their captains at their head. When the time and circumſtances would not admit of a formal harangue, the general went through the ranks, and called each by his name, putting them in mind of their courage upon former occaſions, mentioning the victories they had won, and making promiſes of plunder.

ALLODIUM, or ALLEUD, denotes lands which are the abſolute property of their owner, without being obliged to pay any ſervice or acknowledgment whatever to a ſuperior or lord. See FEE and *Feodal Syſtem*.

ALLOPHYLLUS, in *Botany*. See BOTANY *Index*.

ALLOTTING, or *Allotment of Goods*, in matters of commerce, is when a ſhip's cargo is divided into ſeveral parts, bought by divers perſons, whoſe names are written on as many pieces of paper, which are applied by an indifferent perſon to the ſeveral lots or parcels; by which means the goods are divided without partiality, every man having the parcel which the lot with his name appropriates.

ALLOWAY CREEK, in Salem county, New Jerſey, empties into the Delaware. It is navigable 16 miles, interrupted, however, by ſeveral draw-bridges.

ALLOY, or ALLAY, properly ſignifies a proportion of a baſer metal mixed with a finer one. The alloy of gold is eſtimated by carats, that of ſilver by pennyweights. In different nations different proportions of alloy are uſed; whence their moneys are ſaid to be of different degrees of fineneſs or baſeneſs, and are valued accordingly in foreign exchanges. The chief reaſons alledged for the alloying of coin are: 1. The mixture of the metals, which, when ſmelted from the mine, are not perfectly pure. 2. The ſaving the expence it muſt otherwiſe coſt if they were to be refined. 3. The neceſſity of rendering them harder, by mixing ſome parts of other metals with them, to prevent the diminution of weight by wearing in paſſing from hand to hand. 4. The melting of foreign gold or coin which is alloyed. 5. The charges of coinage, which muſt be made good by the profit ariſing from the money coined. 6. and laſtly, The duty belonging to the ſovereign, on account of the power he has to cauſe money to be coined in his dominions.

In a more general ſenſe, the word is employed in chemiſtry to ſignify the union of different metallic matters.—As an infinity of different combinations may be made according to the nature, the number, and the proportions of the metallic matters capable of being alloyed, we ſhall not here enter into the detail of the particular alloys, all which are not yet nearly known. Thoſe which are uſed, as *Bronze*, *Tombac*, *Braſs*, *White Copper*, &c. may be found in the article CHEMISTRY, and what is known concerning other alloys will be treated of along with the metals in the ſame article. See CHEMISTRY *Index*.

ALLUM. See ALUM.

ALLUMINOR, from the French *allumer*, "to lighten," is uſed for one who coloureth or painteth upon paper or parchment; and the reaſon is, becauſe he gives light and ornament by his colours to the letters or other figures. Such ornaments are ſtyled *illuminations*. The word is uſed in ſtat. 1 R. III. cap. 9. But now ſuch a perſon is called a *limner*.

ALLUSH, in *Ancient Geography*. The Iſraelites being in the wilderneſs of Shur, departed from Dophkah, and went to Alluſh, from whence they proceeded to Rephidim; Num. xxxiii. 13, 14. Euſebius and St Jerome ſix Alluſh in Idumea, about Gabala or Petra, the capital of Arabia Petræa. In the accounts of the empire, it is ſituated in the third Paleſtine; and by Ptolemy, among the cities of Idumæa.

Alluſion || Almagro

ALLUSION, in *Rhetoric*, a figure by which ſomething is applied to, or underſtood of, another, on account of ſome ſimilitude between them.

ALLUVION, in *Law*, denotes the gradual increaſe of land along the ſea-ſhore, or on banks of rivers.

ALLY, in matters of polity, a ſovereign prince or ſtate that has entered into alliance with others. See ALLIANCE.

ALMACANTARS. See ALMUCANTARS.

ALMACARRON, a ſea-port town of Spain, in the province of Murcia, at the mouth of the river Guadalantin. It is about twenty miles weſt of Carthagena, and is remarkable for the prodigious quantity of alum found in its territory. W. Long. 1. 15. N. Lat. 37. 40.

ALMADEN, a town of Spain, in the province of La Mancha, in the kingdom of Caſtile, ſituated upon the top of a mountain, where are the moſt ancient as well as the richeſt ſilver mines in Europe.

ALMADIE, a kind of canoe, or ſmall veſſel, about four fathoms long, commonly made of bark, and uſed by the negroes of Africa.

ALMADIE is alſo the name of a kind of long boats, fitted out at Calicut, which are eighty feet in length, and ſix or ſeven in breadth. They are exceedingly ſwift, and are otherwiſe called *cathuri*.

ALMAGEST, in matters of literature, is particularly uſed for a collection or book compoſed by Ptolemy, containing various problems of the ancients both in geometry and aſtronomy.

ALMAGEST is alſo the title of other collections of this kind. Thus, Riccioli has publiſhed a book of aſtronomy, which he calls the *New Almageſt*; and Plukenet, a book which he calls *Almageſtum Botanicum*.

ALMAGRA, a fine deep red ochre, with ſome admixture of purple, very heavy, and of a denſe yet friable ſtructure, and rough duſty ſurface. It adheres very firmly to the tongue, melts freely and eaſily in the mouth, is of an auſtere and ſtrongly aſtringent taſte, and ſtains the ſkin in touching. It is the *Sil Atticum* of the ancients; it ferments very violently with acid menſtruums; by which ſingle quality, it is ſufficiently diſtinguiſhed from the *Sil Syricum*, to which it has in many reſpects a great affinity. It is found in immenſe quantities in many parts of Spain; and in Andaluſia there are in a manner whole mountains of it. It is uſed in painting, and in medicine as an aſtringent.

ALMAGRO, a fortreſs of Spain, the capital of one of the diſtricts of La Mancha. It was built by the archbiſhop Roderic of Toledo, who finiſhed it in 1214, and put a conſiderable garriſon into it to reſtrain the incurſions of the Moors. This was hardly done, when the fortreſs was beneged by an army of 5000 horſe and foot, under the command of a Mooriſh officer of great reputation; but the prelate, its founder, took care to ſupply thoſe within with ſuch plenty of neceſſaries, that at length the enemy found themſelves obliged to raiſe the ſiege and retire with great loſs.

ALMAGRO, *Diego de*, a Spaniſh commander, was of

Almagro. of ſuch obſcure birth and mean parentage, that he derived his name from the village where he was born, in 1463. Deprived of the means of early inſtruction, he could neither read nor write, but nevertheleſs, in conſequence of his improvements in the military art, he formed an aſſociation with Pizarro and de Luque, for the purpoſe of diſcoveries and conqueſt upon the Peruvian coaſt. The governor of Panama having ſanctioned their enterpriſe, they devoted their united exertions to that undertaking. Pizarro directed the conqueſt, and Almagro was appointed to conduct the ſupplies, proviſions, and reinforcements. In the two firſt unſucceſsful attempts, he performed this office with perſevering fidelity and uncommon activity. His perſeverance was followed with complete ſucceſs; for they at laſt diſcovered the coaſt of Peru, and landed at Tumbez, diſtinguiſhed by its temple and palace of the incas or ſovereigns, and ſituated about three degrees ſouth of the line. Pizarro was ſent over to Spain to ſolicit farther powers, after the three adventurers had previouſly adjuſted their future preferments, and agreed that Pizarro ſhould be governor, Almagro lieutenant-governor, and Luque biſhop. In this negociation, Pizarro obtained the clerical dignity for Luque; but chiefly concerned about his own intereſt, he neglected the preferment of Almagro. On his return, Almagro was ſo enraged, that he refuſed to act with ſuch a perfidious companion, and reſolved to form a new aſſociation. Pizarro for the preſent artfully endeavoured to avert the indignation of Almagro, and gradually ſoothed the rage and diſappointment of the ſoldier. The union was renewed upon the former terms; and it was ſolemnly ſtipulated that a common expence and a common advantage ſhould take place.

In February 1531, leaving Almagro at Panama, to ſupply proviſions and reinforcements, Pizarro ſet ſail for Peru. He attacked a principal ſettlement of the natives, in the province of Coaque, obtained immenſe ſpoil, and made ſuch ample remittances to Almagro, as enabled him to complete his reinforcement, and in the cloſe of the year 1532, he arrived at St Michael with a body of men, which nearly doubled the number of thoſe which Pizarro had along with him. The Spaniards about this time took captive the unfortunate Inca Atahualpa; and after they had received an immenſe ſum for his ranſom, they barbarouſly put him to death. Pizarro ſailed for Spain with the news of their ſucceſs, and with remittances to a great amount; and conſequently Almagro gained that elevated ſtation he ſo long and eagerly deſired. But no ſooner had Almagro received the intelligence of his promotion by the royal grant, than he attempted to ſeize Cuzco, the imperial reſidence of the incas, under pretence that it lay within his deſtined territory. This produced a new quarrel; but peace was reſtored upon the determination of Almagro to attempt the conqueſt of Chili, and likewiſe to have part of the territory of Peru.

In 1535, he accordingly ſet out at the head of 570 Europeans, and in croſſing the mountains, he ſuffered great hardſhips and loſſes by miſtaking the route, but at length he deſcended into the plains of that devoted region. Here he met with a more vigorous reſiſtance from the natives than the Spaniards had ever experienced in other countries. He had, however, made ſome progreſs, when he was recalled to Peru by the news of the natives having riſen in great numbers, and attacked Lima and Cuzco. He purſued a new route, and marching through the ſandy plains on the coaſt, he ſuffered by heat and drought calamities not inferior to thoſe which he had endured from cold and famine on the ſummit of the Andes. Arriving at a favourable moment, he reſolved to hold the place both againſt the Indians and his Spaniſh rivals. He attacked the Peruvian army with great vigour, and making a great ſlaughter, he proceeded to the gates of Cuzco without any further interruption. The open, affable, and generous temper of Almagro, gained over to his ſide many of the adherents of the Pizarros, who were diſguſted with their harſh and oppreſſive conduct. With their aid, he advanced towards the city by night, ſurpriſed the ſentinels, and ſurrounded the houſe where the two brothers reſided, who were compelled, after an obſtinate defence, to ſurrender at diſcretion. A form of government was ſettled in the name of Almagro, and his juriſdiction over Cuzco was univerſally acknowledged. This was the origin of a civil war; the beginning of which was very advantageous to Almagro, who by ſkilful manœuvres entirely routed a body of Spaniſh troops advancing to the relief of Cuzco, and made Alvarado their commander priſoner. But inſtead of improving theſe advantages, he unwiſely marched back to Cuzco, and there awaited the arrival of Pizarro. Pizarro, convinced of his own feeble reſources, propoſed an accommodation, and with his uſual art protracted the negociation until he found himſelf in a condition to meet his antagoniſt in the field of battle. Meanwhile Alvarado and one of the Pizarros, by bribing their keepers, found means to eſcape, and perſuaded 60 of the men who guarded them to attend them in their flight; and the governor releaſed the other Pizarro. When Pizarro thought himſelf ſufficiently prepared to ſettle the dominion of Peru, he marched with an army of 500 men to Cuzco. Almagro, previous to this, worn out with age and infirmity, reſigned the command to Orgognez. A fierce and bloody battle enſued, in which Almagro was made priſoner, his army defeated, and the commander wounded. About 140 ſoldiers fell in the field, and Orgognez, along with ſeveral others, was maſſacred in cold blood. During that fatal day, Almagro, placed in a litter, which was ſtationed on an eminence, beheld from thence the total defeat of his troops, and felt all the indignation of a ſoldier who had ſeldom experienced defeat. He was taken priſoner, remained ſeveral months in confinement, and afterwards was tried, and condemned to death. In the view of an ignominious death, the courage of the veteran forſook him, and he unſucceſsfully ſupplicated for life, in a manner unworthy of his former character. All the arguments he could employ were ineffectual. The Pizarros remained unmoved by all his entreaties. As ſoon, however, as Almagro ſaw that his fate was inevitable, he reſumed his courage, and exhibited all his uſual dignity and fortitude. In the year 1538, and in the 75th year of his age, he was ſtrangled in priſon, and afterwards beheaded. He left one ſon by an Indian woman of Panama; and in conſequence of a power which the emperor had granted, he declared his ſon his ſucceſſor in

Almamon. in the government, although he was then a priſoner in Lima.

With the qualities of intrepid valour, indefatigable activity, and inſurmountable conſtancy, he blended the more amiable diſpoſitions of frankneſs, generoſity, and candour. Theſe qualities rendered him beloved by his followers; and his misfortunes excited their ſympathy and pity, ſo that his death was univerſally regretted, and particularly by the poor Indians, who deemed him their guardian and protector againſt the cruel and unfeeling Pizarro. Upon the whole review of his character, it appears juſt to conclude, that he was, although of inferior abilities, a more amiable man than his rival. (*Gen. Biog.*)

ALMAGRO the Younger, by his courage, generoſity, and other accompliſhments, was placed at the head of the party after the death of his father. The father, conſcious of his own inferiority from the total want of education, uſed every poſſible mean to improve the mind and embelliſh the manners of his ſon; ſo that he ſoon acquired thoſe accompliſhments which rendered him reſpected by illiterate adventurers, who cheerfully ranged round his ſtandard; and, by his dexterity and ſkill, ſought deliverance from the oppreſſions of Pizarro. Juan de Herrada, an officer of great abilities, continued ſtill to direct his counſels and to regulate his enterpriſes: and, while Pizarro confided in his own ſecurity, a conſpiracy was formed againſt him, which terminated in his death. The aſſaſſins, exulting in their ſucceſs, and waving their bloody ſwords, haſtened to the ſtreet, proclaimed the death of the tyrant, and compelled the magiſtrates and principal citizens of Lima to acknowledge Almagro as lawful ſucceſſor to his father. But his reign was of ſhort duration; for, in 1541, Vaca de Caſtro, arriving at Quito, produced the royal commiſſion, appointing him governor of Peru, together with all the privileges and authority of Pizarro. The talents and influence of the new governor ſoon overpowered the intereſt of Almagro, who, perceiving the rapid decline of his influence, haſtened with his troops to Cuzco, where his opponents had erected the royal ſtandard under the command of Pedro Alvarez Holguin. Herrada the guide of his counſels died during his march; and from that time his meaſures were conſpicuous for their violence, concerted with little ingenuity, and executed with little addreſs. On September 16. 1542 at length the forces of Almagro and Vaca de Caſtro met, and victory long remained doubtful; till at laſt it declared for the new governor. The followers of Almagro diſplayed uncommon valour, and Almagro conducted the military operations of that fatal day with a gallant ſpirit, worthy of a better cauſe and deſerving of a better fate. In proportion to the number of combatants the carnage was very great. Of 1500 men 500 fell in the field, and many more were wounded. Almagro eſcaped, but being betrayed by ſome of his own officers, he was publicly beheaded at Cuzco, and in him the name and ſpirit of the party of Almagro became extinct. (*Gen. Biog.*)

ALMAMON, or MAMON, alſo named *Abdallah*, caliph of Bagdad, was born A. D. 785. His elder brother Al Amin ſucceeded to the caliphate on the death of his father, and Almamon at that time was governor of Choraſan. As by the will of the father it was provided, that his three ſons ſhould ſucceed to the caliphate in order, Almamon ordered his elder brother to be proclaimed caliph throughout his government. But his brother repaid his friendſhip and attachment to his intereſt with open expreſſions of hatred, and unjuſt attempts to exclude him from the deſtined ſucceſſion. Almamon was thus forced to conſult meaſures for his own ſafety and promotion, by cauſing himſelf to be proclaimed caliph. After various ſtruggles, his general, Thaher, in the year 813 took poſſeſſion of Bagdad, purſued Al Amin to his retreat, and cauſed him to be aſſaſſinated, ſo that Almamon remained without a competitor. Various rebellions diſturbed the tranquillity of the firſt years of his reign; but by his prudent adminiſtration and vigorous exertions, theſe were at length extinguiſhed. Inſtigated by the advice of his vizier, he ſoon after raiſed greater commotions, and expoſed his dignity to greater dangers, by countenancing the ſect of Ali. He invited to court Iman Rizza, gave him his daughter in marriage, and even declared him his ſucceſſor in the empire. He aſſumed the green turban, the colour of the houſe of Ali, and obliged his courtiers and ſoldiers to imitate his example. Alarmed at theſe proceedings, the orthodox Muſſulmans, and the houſe of Abbas, excited a great revolt in Bagdad, and proclaimed Ibrahim, Almamon's uncle, caliph. A civil war was juſt about to commence when Fadel the vizier was aſſaſſinated, and Rizza died. The people of Bagdad then depoſed Ibrahim, and returned to their former allegiance. Taking the advantage of Almamon's abſence, Thaher his general ſeized upon the government of Choraſan, where he founded a dynaſty which exiſted during a period of 16 years. Almamon

Almamon employed the period of tranquillity that followed in the introduction and improvement of literature into his dominions, which conſtitutes the greateſt glory of his reign. During the days of his father he diſcovered an ardent thirſt after knowledge, by forming a college in Choraſan, adorned with the moſt eminent men of various countries; and appointed Meſue, a famous Chriſtian phyſician of Damaſcus, for their preſident. When his father remonſtrated againſt conferring ſuch an honour upon a Chriſtian, he reminded him, that the moſt learned men and the moſt ſkilful artiſts in his dominions were Jews and Chriſtians; and added, that he had choſen Meſue as a preceptor in ſcience and uſeful arts, and not as a teacher of religion. Under his auſpices Bagdad became the ſeat of literature, of private and academical inſtruction, and the habitation of men of eminence from all quarters. Many valuable books in the Greek, Perſian, Chaldean, and Coptic languages, among which were the works of Ariſtotle and Galen, were tranſlated into the Arabic at his own expence. The caliph himſelf deemed it an honour to ſet an example to others of the becoming reſpect due to mental cultivation, by viſiting the ſchools, and treating the profeſſors with great regard. In mathematics, aſtronomy, and philoſophy, he made a rapid and extenſive progreſs. He was the author of aſtronomical tables, which on account of their accuracy have been much admired. By theſe various exertions the character of the Saracens was ſuddenly changed from

Almamon. a rude and ferocious to a polite and civilized people, while the moſt powerful and extenſive of the European ſtates were involved in ignorance and barbariſm. Literature has ſuſtained ſome irreparable loſſes from his too great partiality to the Arabic writers, which induced him to deſtroy the originals of the tranſlated manuſcripts. He is repreſented by the Sonnites or orthodox Mahometans as little better than an Infidel, becauſe of his attention to philoſophy and letters. His conduct, however, ſhows that he was not ſufficiently careful to preſerve a philoſophical mean betwixt the different religious parties during the time of his adminiſtration, as he openly manifeſted a predilection to the doctrines of the Motazeli, who aſſerted the free will of man, and denied the eternity of the Koran. Some allege, that on account of the murmurs which aroſe againſt him, he was induced to exhibit too great a zeal by eſtabliſhing a kind of inquiſition, to compel all his ſubjects to profeſs Iſlamiſm. The experiment, however, ſoon terminated in the better and juſter expedient of univerſal toleration; and it is abundantly evident, that the Chriſtians in his dominions never felt the power of his inquiſition.

The public tranſactions of his reign are in themſelves important. In the year 822 he ſent a body of his troops to the aſſiſtance of Thomas, a Greek, who made war on Michael the Stammerer, the emperor of Conſtantinople, and beſieged his capital. This expedition, which on the part of the caliph ſeems to have been founded in injuſtice, proved unſucceſsful; Thomas was taken priſoner, and ſuffered death. In the years 829 and 830, he commenced open hoſtilities upon the Greeks, rendered himſelf maſter of many places, and carried devaſtation into their territories. He was ſucceſsful in ſuppreſſing a revolt in Egypt in the year 831. In this country he was led to diſcover a treaſure buried under two columns by Merwan, the laſt caliph of the houſe of Ommijah. In repairing a decayed *mikias* or meaſuring pillar, and erecting a new one for determining the gradation of the increaſe of the Nile, Almamon diſplayed his love of ſcience. In the year 833 he again viſited Egypt; on his return he penetrated into the territories of the Greek emperor, even into Cilicia. Returning home he encamped on the banks of a river, and excited by thirſt, he drank too freely of the water; and at the ſame time indulged himſelf immoderately in eating a particular kind of dates, which brought on a complaint in his ſtomach, and reduced him to the moſt imminent danger. Senſible of his approaching diſſolution, he wrote letters into all the provinces, announcing his brother Motaſſem his ſucceſſor; and then patiently awaited the event. After a tedious ſtruggle under the preſſure of his diſeaſe, and while uttering this ejaculation; "O thou who never dieſt, have mercy on me, a dying man!" he expired at the age of forty-eight or forty-nine years. He reigned 20 years and ſome months, and was buried at Tarſus, which ſome religious zealots interpreted as a mark of reprobation.

The hiſtory of this caliph affords an illuſtrious inſtance of the meliorating effect of ſcience and literature upon the conduct and temper of rude and uncultivated men. Under the milder features of a liberal, virtuous, and beneficent ſovereign, the uſual cruelty of a Saracen and a deſpot ſeemed entirely loſt. He diſplayed Almamon. an uncommon greatneſs of mind and an unuſual example of clemency in his conduct towards his rival and uncle Ibrahim. After his depoſition, that prince concealed himſelf in ſome ſequeſtered corner of Bagdad. The place of his concealment being at length diſcovered, he was inſtantly brought before the caliph, and informed that the council had unanimouſly condemned him to death. "Your counſellors (ſaid Ibrahim) have judged according to the cuſtomary rules of political government; if you pardon me, you will not, indeed, judge according to precedent, but you will have no equal among ſovereigns." The caliph roſe up and embracing him tenderly, with great emotion, ſaid, "Uncle be of good cheer; I will not do you the leaſt injury;" and he added to forgiveneſs a fortune ſuitable to his birth and former elevated ſtation. When Almamon's courtiers complimented him on this generous action, he exclaimed, "O! did men but know the pleaſure I feel in pardoning, all who have offended me would come and confeſs their faults." To the ſame generoſity of diſpoſition may be aſcribed his ſtrong predilection to the oppreſſed houſe of Ali, which filld the beginning of his reign with political troubles. By his frequent intercourſe with men of enlightened minds, and of different religious ſentiments, he acquired a liberality very unuſual in a Muſſulman; and his preference to ſome particular opinions ſeems to have originated from his own vigour of mind, and his knowledge of theſe opinions. *(Gen. Biog.)*

ALMANACK, a book or table, containing a kalendar of days and months, the riſing and ſetting of the ſun, the age of the moon, the eclipſes of both luminaries, &c.—Authors are divided with regard to the etymology of the word; ſome deriving it from the Arabic particle *al* and *manach*, to count; ſome from *almanach*, new-year's gifts, becauſe the Arabian aſtrologers uſed at the beginning of the year to make preſents of their emphemerides; and others, from the Teutonic *almaen achte*, obſervations on all the months. Dr Johnſon derives it from the Arabic particle *al*, and the Greek μην, a month. But the moſt ſimple etymology appears from the common ſpelling; the word being compoſed of two Arabic ones, *Al Manack*, which ſignify *the Diary*. All the claſſes of Arabs are commonly much given to the ſtudy of aſtronomy and aſtrology; to both which a paſtoral life, and a ſort of huſbandry, not only incline them, but afford time and opportunity to cultivate them. They neither ſow, reap, plant, travel, buy or ſell, or undertake any expedition or buſineſs, without previouſly conſulting the ſtars, or, in other words, their almanacks, or ſome of the makers of them. From theſe people, by their vicinity to Europe, this art, no leſs uſeful in one ſenſe than trifling and ridiculous in another, hath paſſed over hither: and thoſe aſtronomical compoſitions have ſtill everywhere not only retained their old Arabic name; but were, like theirs, for a long while, and ſtill are among many European nations, interſperſed with a great number of aſtrological rules for planting, ſowing, bleeding, purging, &c. down to the cutting of the hair and paring of the nail.—Regiomontanus appears to have been the firſt in Europe, however, who reduced almanacks into their preſent form and method, gave the characters of each

Almanack each year and month, foretold the eclipſes and other phaſes, calculated the motions of the planets, &c. His firſt almanack was publiſhed in 1474.

The eſſential part of an almanack is the kalendar of months and days, with the riſings and ſettings of the ſun, age of the moon, &c. To theſe are added various parerga. aſtronomical, meteorological, chronological, political, rural, &c. as calculations and accounts of eclipſes, ſolar ingreſſes, prognoſtics of the weather, tables of the tides, terms, &c. liſts of ports, offices, dignities, public inſtitutions, with many other articles political as well as local, and differing in different countries. A great variety are annually publiſhed in Britain; ſome for binding, which may be denominated *book almanacks*; others in looſe papers, called *ſheet almanacks*.

The modern almanack anſwers to the *Faſti* of the ancient Romans. See FASTI.

Conſtruction of ALMANACKS. The firſt thing to be done is, to compute the ſun's and moon's place for each day of the year, or it may be taken from ſome ephemerides and entered into the almanack; next, find the dominical letter, and, by means thereof, diſtribute the kalendar into weeks; then, having computed the time of Eaſter, by it fix the other moveable feaſts; adding the immoveable ones, with the names of the martyrs, the riſing and ſetting of each luminary, the length of day and night, the aſpects of the planets, the phaſes of the moon, and the ſun's entrance into the cardinal points of the ecliptic, i. e. the two equinoxes and ſolſtices. (See ASTRONOMY, *paſſim*). By the help of good aſtronomical tables or ephemerides, the conſtruction of almanacks is extremely eaſy.

For every almanack or kalendar for one year or leſs, a ſtamp duty of 8d. muſt be paid. And for every almanack ſerving more than a year, the ſame duty is paid for each year. Perpetual almanacks pay for three years only. All books and pamphlets ſerving chiefly the purpoſe of almanacks, are charged as ſuch. If any almanack contains more than one ſheet, one ſheet only need be ſtamped; and every almanack is required by law to be ſo printed, that ſome part of the print ſhall be upon the ſtamp. Selling unſtamped almanacks incurs the ſame penalty as for ſelling unſtamped newſpapers. Almanacks in bibles and common prayer books are exempted.

ALMANACKS, among *Antiquaries*, is alſo the name given to a kind of inſtrument, uſually of wood, inſcribed with various figures and Runic characters, and repreſenting the order of the feaſts, dominical letters, days of the week, and golden number, with other matters neceſſary to be known throughout the year; uſed by the ancient northern nations, in their computations of time, both civil and eccleſiaſtical. Almanacks of this kind are known by various names, among the different nations wherein they have been uſed; as rimſtocks, primſtaries, runſtocks, runſtaffs, *Scipiones Runici*, *Baculi Annales*, clogs, &c. They appear to have been uſed only by the Swedes, Danes, and Norwegians. From the ſecond of theſe people, their uſe was introduced into England, whence divers remains of them in the counties. Dr Plot has given the deſcription and figure of one of theſe clogs, found in Staffordſhire, under the title of *The Perpetual Staffordſhire Almanack*. The external figure and matter of theſe kalendars appear to have been various. Sometimes they were cut on one or more wooden leaves, Vind. 1. bound together after the manner of books; ſometimes on the ſcabbards of ſwords, or even daggers; ſometimes on tools and implements, as portable ſteelyards, hammers, the helves of hatchets, flails, &c. Sometimes they were made of braſs or horn; ſometimes of the ſkins of eels, which being drawn over a ſtick properly inſcribed, retained the impreſſions of it. But the moſt uſual form was that of walking ſtaves, or ſticks, which they carried about with them to church, market, &c. Each of theſe ſtaves is divided into three regions; whereof the firſt indicates the ſigns, the ſecond the days of the week and year, and the third the golden number. The characters engraven on them are, in ſome, the ancient Runic; in others the latter Gothic characters of Ulfilas. The ſaints days are expreſſed in hieroglyphics, ſignificative either of ſome endowment of the ſaint, the manner of his martyrdom, or the like. Thus againſt the notch for the firſt of March, or St David's day, is repreſented a harp; againſt the 25th of October, or Criſpin's day, a pair of ſhoes; againſt the 10th of Auguſt, or St Lawrence's day, a gridiron; and laſtly, againſt New-year's day, a horn, the ſymbol of liberal potations, which our anceſtors indulged in at that ſeaſon.

ALMANSOR the Victorious, the ſecond caliph of the houſe of Al Abbas, ſucceeded his brother Abul Abbas Al Saffah, in the year 753, of the Hegira 136, and in the following year was inaugurated at Al Haſhemiyah. Although Al Saffah had declared him preſumptive heir of the crown, and he had been proclaimed caliph in the imperial city of Anbar, yet immediately upon his inauguration, his uncle Abdallah ebn Ali had ſufficient intereſt to cauſe himſelf to be proclaimed caliph at Damaſcus. In Arabia, Syria, and Meſopotamia, he collected a numerous army, and arrived at the banks of the Maſius, near Niſibis, where he encamped, ready to diſpute his royal acceſſion by arms. Almanſor collected an immenſe army in Perſia, Khoraſan, and Irak, and gave the command of it to Abu Moſlem, who haraſſed his uncle's troops for five months, and at laſt totally defeated him, A. D. 754. Notwithſtanding the ſervices which Abu Moſlem had rendered to the family of Al Abbas, after this victory he became an object of jealouſy, and was aſſaſſinated in the preſence of Almanſor himſelf, by his expreſs order. After the death of Abu Moſlem, the ſtandard of rebellion was raiſed by Sinon a Magian, who ſeized on the treaſures of the deceaſed governor of Khoraſan, and excited the people of that country to a general revolt; but this inſurrection was ſuddenly quelled by the general of Almanſor, Jambur ebn Morad. The caliph avariciouſly ſeized the ſpoils of this victory, which ſo incenſed Jambur that he immediately turned his arms againſt his royal maſter; but he was ſoon defeated by the caliph's forces. The patriarch of Antioch was about this time detected in an illicit correſpondence with the Grecian emperor, and conſequently was baniſhed into an obſcure part of Paleſtine; and in the mean time the Chriſtians in the dominions of the caliph were prohibited from building or repairing any churches, and alſo were laid under ſeveral other ſevere reſtraints.

Almanſor ſent a large army into Cappadocia in the year 757, fortified the city of Malatia or Me-

Almanſor. litene, and depoſited in it a great part of his treaſures. But in this year he was attacked by a ſect of believers in the metempſychoſis, called the *Rawandians*. This ſect aſſembled at Al Haſhemiyah the reſidence of the caliph, and by the ceremony of going in proceſſion round his palace, intimated their purpoſe of invoking him as a deity, and paying him divine homage. Incenſed by their impiety, the caliph ordered ſeveral of theſe ſectaries to be impriſoned, which rouſed their reſentment, and led them to form the deſign of his aſſaſſination. The generous interpoſition of Maan ebn Zaidet an Ommiyan chief, who had been under the neceſſity of concealing himſelf from the caliph's reſentment, however defeated their intention. This inſult received in his capital, induced him to build the city of Bagdad, and to fix his reſidence there, A. D 762. In the preceding year a plan was formed to dethrone him; but it being diſcovered, he ſeverely puniſhed all who were either directly or indirectly concerned in it. Abdallah his uncle ſhared the fate of other rebels: for being allured to court under the promiſe of pardon and protection, he was placed in a building which was ſo conſtructed that it immediately fell and cruſhed him in its ruins. Not long after his reſidence at Bagdad, he was ſeized with a diſorder of which he was cured by the advice of a famous Chriſtian phyſician, whoſe name was George ebn Baktiſhua Al Jondiſaburi. The caliph, previouſly informed that he was married to a wife old and infirm, as a recompenſe preſented him with three beautiful Greek girls, and a conſiderable ſum of money; the girls, to the caliph's ſurpriſe, were ſent back, with a declaration on the part of George, that it was not lawful for a Chriſtian to have more wives than one at a time. The conduct of the phyſician, on this occaſion, raiſed him in the eſteem of the caliph, and procured him a greater profuſion of favours. In his ſucceeding military tranſactions, Almanſor was generally victorious. His conduct to his Chriſtian ſubjects was rigorous and ſevere. He ſet out on a pilgrimage to Mecca in the year 774, and being ſeized on the road with a dangerous diſeaſe, he ſent for his ſon and intended ſucceſſor Al Mohdi, and gave him ſome ſalutary advice. "I command you" ſaid he, "to treat publicly your relations with the greateſt marks of diſtinction, ſince this conduct will reflect no ſmall degree of honour and glory upon yourſelf. Increaſe the number of your freedmen, and treat them with all kindneſs, as they will be of great ſervice to you in your adverſity; but neither this, nor the other injunction will you fulfil. Enlarge not that part of your capital erected on the eaſtern bank of the Tigris, as you will never be able to finiſh it; but this work I know you will attempt. Never permit any of your women to intermeddle in affairs of ſtate, or to have any influence over your counſels; but this advice I know you will not take. Theſe are my laſt commands; or, if you pleaſe, my dying advice; and to God I now recommend you." In parting they both gave vent to their feelings in a flood of tears. He purſued his journey to Bir-Maimun, *i. e.* the well of Maimun, where he died in the 63d year of his age and the 20th of his reign, and his remains were interred at Mecca.

The character of Almanſor was formed of very different and even contradictory qualities. His temper conciliated affection and attachment in private life, but in his public character his aſpect and demeanour inſpired terror. He was well acquainted with the arts of government; he was prudent and brave, but perfidious, covetous, cruel, and implacable; and amid ſuch a variety of character, it is ſingular that he ſhould have diſplayed a love of ſtudy and literature, and particularly of aſtronomy. *(Gen. Biog.)* Almanza || Almé

ALMANZA, a little town of New Caſtile, on the frontiers of the kingdom of Valencia in Spain, ſituated in W. Long. 1. 19. N. Lat. 38. 54. It is remarkable for the defeat of the allies in 1707, under the marquis de las Minas and the earl of Galway. In the beginning of this action the Engliſh troops penetrated through the centre of the Spaniſh army; but the Portugueſe cavalry being broken by the Spaniſh, and the French infantry making a dreadful fire on their flanks, the allied army was at laſt broken, and began their retreat when it was almoſt dark. Colonel Hill carried off the remains of thirteen battalions towards the river Xucar, which, if they could have paſſed, they might have been ſafe: but being very much fatigued, they were obliged to halt; by which means they were ſurrounded, and forced to ſurrender priſoners of war. In this battle, the allies loſt 120 ſtandards, together with all their artillery and baggage; a great number were killed, and ſeveral thouſands taken priſoners. The Marquis de las Minas was dangerouſly wounded; and his miſtreſs, in the garb of an amazon, killed by his ſide. The earl of Galway had two cuts acroſs the face, which, though not dangerous, had prevented him from ſeeing, or giving orders properly.

HERESY OF ALMARIC, a tenet broached in France by one Almaric, in the year 1209. It conſiſted in affirming, that every Chriſtian was actually a member of Chriſt; and that without this faith no one could be ſaved. His followers went farther, and affirmed, that the power of the Father laſted only during the continuance of the Moſaic law; that the coming of Chriſt introduced a new law; that at the end of this began the reign of the Holy Ghoſt; and that now confeſſion and the ſacraments were at an end, and that every one is to be ſaved by the internal operations of the Holy Spirit alone, without any external act of religion.—Their morals were as infamous as their doctrine was abſurd. Their tenets were condemned by a public decree of the council of Sens, in the year 1209.

ALME, or ALMA, ſinging and dancing girls in Egypt, who, like the Italian *Improviſatori*, can occaſionally pour forth "unpremeditated verſe." They are called *Almé*, from having received a better education than other women. They form a celebrated ſociety in that country. To be received into it, according to M. Savary, it is neceſſary to have a good voice, to underſtand the language well, to know the rules of poetry, and be able to compoſe and ſing couplets on the ſpot, adapted to the circumſtances. The Almé know by heart all the new ſongs. Their memory is furniſhed with the moſt beautiful tales. There is no feſtival without them; no entertainment of which they do not conſtitute the ornament. They are placed in a roſtrum, from whence they ſing during the repaſt. They then deſcend into the ſaloon, and form dances which have no reſemblance to ours. They are pantomime ballets, in which they repreſent the uſual occurrences of life. The myſteries of love, too, generally

Almé
Almehrab.

nerally furniſh them with ſcenes. The ſuppleneſs of their bodies is inconceivable. One is aſtoniſhed at the mobility of their features, to which they give at pleaſure the impreſſion ſuited to the characters they play. The indecency of their attitudes is often carried to exceſs. Their looks, their geſtures, every thing ſpeaks, but in ſo expreſſive a manner, that it is impoſſible to miſtake them. At the beginning of the dance, they lay aſide with their veils the modeſty of their ſex. A long robe of very thin ſilk goes down to their heels, which is ſlightly faſtened with a rich girdle. Long black hair, plaited and perfumed, is flowing on their ſhoulders. A ſhift, tranſparent as gauze, ſcarcely hides their boſom. As they put themſelves in motion, the ſhapes, the contours of their bodies, ſeem to develope themſelves ſucceſſively. Their ſteps are regulated by the ſound of the flute, of caſtanets, the tambour de baſque, and cymbals, which accelerates or retards the meaſure. They are ſtill further animated by words adapted to ſuch ſcenes. They appear in a ſtate of intoxication. They are the bacchants in a delirium. It is when they are at this point, that throwing off all reſerve, they abandon themſelves totally to the diſorder of their ſenſes; it is then that a people far from delicate, and who like nothing hidden, redouble their applauſes. Theſe Almé are ſent for into all the harams. They teach the women the new airs; they amuſe them with amorous tales, and recite in their preſence poems, which are ſo much the more intereſting, as they furniſh a lively picture of their manners. They initiate them into the myſteries of their art, and teach them to contrive laſcivious dances. Theſe girls, who have a cultivated underſtanding, are very agreeable in converſation. They ſpeak their language with purity. The habit of dedicating themſelves to poetry renders the ſofteſt and moſt ſonorous expreſſions familiar to them. They repeat with a great deal of grace. In ſinging, nature is their only guide. Sometimes two of them ſing together, but always with the ſame voice. It is the ſame with an orcheſtra, where all the inſtruments playing in uniſon execute the ſame part.

The Almé aſſiſt at the marriage-ceremonies, and march before the bride, playing on inſtruments. They make a figure likewiſe at funerals, and accompany the proceſſion, ſinging ſorrowful airs. They break forth into groans and lamentations, and give every ſign of grief and deſpair. Theſe women are paid very high, and ſeldom appear but amongſt the grandees and rich men

The common people have alſo their Almé. They are girls of the ſecond claſs, who try to imitate the former; but they have neither their elegance, their graces, nor their knowledge. They are everywhere to be met with. The public places and the walks about Grand Cairo are full of them. As the populace require alluſions ſtill more ſtrongly marked, decency will not permit the relation to what a pitch they carry the licentiouſneſs of their geſtures and attitudes.

ALMEDIA, a frontier town of Portugal, in the province of Tralos Montes, on the confines of Leon, where there was a very briſk action between the French and Portugueſe in 1663; 17 miles north-weſt of Cividad Rodrigo. W. Long. 7. 10. N. Lat. 40. 41.

ALMEHRAB, in the Mahometan cuſtoms, a niche in their moſques, pointing towards the kebla or temple of Mecca, to which they are obliged to bow in praying. See KEBLA.

Almeiſar
Alme ria.

ALMEISAR, a celebrated game among the ancient Arabs, performed by a kind of caſting of lots with arrows, ſtrictly forbidden by the law of Mahomet, on account of the frequent quarrels occaſioned by it.

The manner of the game was thus: A young camel being brought and killed, was divided into a number of parts. The adventurers, to the number of ſeven, being met, 11 arrows were provided without heads or feathers; ſeven of which were marked, the firſt with one notch, the ſecond with two, the third with three, &c. the other four had no marks. Theſe arrows were put promiſcuouſly into a bag, and thus drawn by an indifferent perſon. Thoſe to whom the marked arrows fell, won ſhares in proportion to their lot; the reſt to whom the blanks fell, were entitled to no part of the camel, but obliged to pay the whole price of it. Even the winners taſted not of the fleſh themſelves more than the loſers, but the whole was diſtributed to the poor.

ALMENE, in *Commerce*, a weight of two pounds, uſed to weigh ſaffron in ſeveral parts of the continent of the Eaſt Indies.

ALMERIA, a ſea-port town in the kingdom of Granada in Spain, pleaſantly ſituated on a fine bay at the mouth of the river Almeria, on the Mediterranean. W. Long. 3. 20. N. Lat. 36. 51. This town is by ſome thought to have riſen upon the ruins of the ancient Abdera, and was formerly a place of great conſequence. It was taken from the Moors in 1147, by the emperor Conrad III. in conjunction with the French, Genoeſe, and Piſans. It was at that time the ſtrongeſt place in Spain held by the Infidels; from which their privateers, which were exceedingly numerous, not only troubled the ſea-coaſts inhabited by the Chriſtians, but gave equal diſturbance to the maritime provinces of France, Italy, and the adjacent iſlands. The city being well fortified, having a ſtrong caſtle, a numerous garriſon, and being excellently provided with every thing neceſſary, made a vigorous reſiſtance; but was at laſt taken by ſtorm, when the victor put to the ſword all the inhabitants who were found in arms, diſtributing the beſt part of the plunder among his allies, whom he ſent away thoroughly ſatisfied. The Genoeſe, particularly, acquired here that emerald veſſel which ſtill remains in their treaſury, and is deemed invaluable.

Upon its reduction by the Chriſtians, Almeria became a biſhopric; but is at preſent very little better than a village, indifferently inhabited, and has nothing to teſtify ſo much as the probability of its former greatneſs, except certain circumſtances which cannot be effaced even by the indolence of the Spaniards themſelves. What theſe are, Udal ap Rhys, a Welſhman, thus deſcribes, in his Tour through Spain and Portugal. "Its climate (ſays he) is ſo peculiarly bleſſed, that one really wants words to expreſs its charms and excellence. Its fields and meads are covered with flowers all the year round; they are adorned alſo with palms, myrtles, plane trees, oranges, and olives; and the mountains and promontories near it are as noted for their producing a great variety of precious ſtones, inſomuch that the next promontory to it is called the *Cape of Gates*, which is a corruption from the word *agates*, the

Almiggim || Almohedes.

hills thereabouts abounding in that ſort of precious ſtones, as well as in emeralds and amethyſts, garnets or coarſe rubies, and extreme curious alabaſter in the mountains of Filaures."

ALMIGGIM. See ALMUGGIM.

ALMEYDA, DON FRANCIS, was the ſon of the Count d'Abrantes, a grandee of Portugal, who ſerved with great diſtinction in the war of Ferdinand of Caſtile with Granada; and in conſequence of his important ſervices he became highly eſteemed in the court of his ſovereign. Without any ſolicitation on his part he was nominated the firſt governor general and viceroy of the newly conquered countries in the Eaſt Indies; and ſet ſail from Liſbon in March 1505-6 with a powerful fleet. To give dignity and influence to his elevated ſtation, a body of guards was appointed to attend his perſon, ſeveral chaplains were aſſigned him, together with every other appendage of grandeur. He touched at the Cape Verd iſlands, doubled the cape at a conſiderable diſtance to the ſouth, and arrived at Guiloa. From thence he proceeded to Mombaza, a well fortified city in an iſland, which he reduced, and proceeded to the Angediva iſlands not far from Goa, where he built a fort; he likewiſe erected and garriſoned another fort at Cannanor, and arriving at Cochin, he ſecured it to the Portugueſe intereſt. The iſland of Madagaſcar was diſcovered during his government, and his ſon Don Lorenzo firſt ſurveyed the Maldive iſlands; and about the ſame time diſcovered the fine iſland of Ceylon, the principal ſovereign of which he brought under ſubmiſſion to the crown of Portugal. Returning from this expedition, while employed in the fleet deſtined againſt Calicut, he loſt his life in a ſea-fight againſt the Zamorin. His father ſuſtained his loſs with a heroic firmneſs, ſaying, "that Lorenzo could not die better than in the ſervice of his country." On the arrival of Alphonſo d'Albuquerque, who was deſtined to be his ſucceſſor, Almeyda yielded to the impreſſions of jealouſy; and under the pretence of miſconduct he confined him in the citadel of Cannanor. He engaged in 1508, the whole force of the Mahometans in the port of Diu; and, gaining a complete victory, facilitated the enterpriſes of Albuquerque his ſucceſſor, by contributing to break that formidable league by which the Zamorin was in hopes of being able to compel the Portugueſe to abandon their Indian conqueſts. Returning home with the great riches which he had acquired, he unfortunately touched at Saldanha Point on the coaſt of Africa, where ſome of the ſailors, in queſt of water, quarrelled with the natives, who attacked and drove them to their ſhips. With a view to revenge this pretended affront, they perſuaded Almeyda himſelf to go aſhore, with a body of 150 men, armed only with ſwords and lances. While ſtepping into the boat, Almeyda exclaimed, "whither do you carry my 60 years?" The Portugueſe furiouſly ruſhed on to attack the natives, whoſe numbers were greatly augmented, and Almeyda with 57 of his men were killed in this raſh and unprovoked attempt, (*Gen. Biog.*)

ALMISSA, a ſmall but ſtrong town at the mouth of the Cetina, in Dalmatia, famous for its piracies; ten miles eaſt of Spalatro. E. Long. 18. 14. N. Lat. 43. 56.

ALMOHEDES, the name of a dynaſty, which, in the commencement of the twelfth century, ſucceeded that of the Almoravides in Barbary. It derived its name from an obſcure founder called Al Mohedi, or Al Mohedes, and it roſe into public notice in the 25th year of the reign of Al Abraham, or Brahem, who ſucceeded his father Ali, A. D. 1115. This perſon was a Bereber, and was a famous preacher of the tribe of Muzamada, which was ſettled along Mount Atlas. His ſcheme was the exertion of ingenuity, and it was executed with unremitting activity. In order to obtain attention and ſucceſs, he aſſumed the title of Mohdi or Mohedi, and claimed the honour of leader of the orthodox, or unitarians, and, by his preaching they became ſo numerous, that he even dared to ſet the royal power at defiance. Confident of ſecurity, and immerſed in pleaſure, Brahem looked with a contemptuous eye upon the inſurrection of a party compoſed of ſuch perſons. They increaſed in number and ſtrength, ſo that the king was at laſt rouſed from his indolence, and prepared for his own ſecurity and their ſubjection. In the firſt engagement he was defeated, being overpowered with ſuperior numbers. The artful Abdallah took poſſeſſion of the capital, ſo that Brahem, purſued as a fugitive by Abdolmumen, one of the party, ſought refuge in the city of Fez. The gates were ſhut againſt him; but they were opened to admit his purſuers. He next took refuge in the city of Auran, or Oran; but he was purſued by Abdolmumen, who threatened to deſtroy the city with fire and ſword; and the magiſtrates, unable to defend themſelves, urged him to leave the town, and provide for his own ſafety. Concealed by the darkneſs of the night, he eſcaped with his favourite wife on horſeback behind him; but being cloſely purſued by the enemy, rather than fall into their hands, he ruſhed over a precipice, and, along with his wife, he was daſhed to pieces. Such was the death of this prince, which put a final period to the empire of the Almoravides. When the death of Brahem was known, Abdolmumen was choſen by the chiefs of that party his ſucceſſor, and proclaimed king of the Almohedes, under the title of Al Emir Al Mumin Abdallah Mohammed Abdal Mumin Ebn Abdallah Ibni Ali, i. e. Chief or Emperor of the true Believers of the houſe of Mohammed Abdal Mumin, the ſon of Abdal Mumin, the ſon of Abdallah, of the lineage of Ali. Abdallah, during his reign, enacted prudential laws for the eſtabliſhment of his new kingdom, and the regulation of the conduct of his followers. He appointed a council of forty of his diſciples, all of whom were preachers. Some of theſe were commiſſioned to regulate all public affairs; and at proper ſeaſons they went forth as itinerant preachers for the purpoſe of ſtrengthening their party, and ſpreading their doctrines, and ſixteen of their number acted as ſecretaries. As both the regal and pontifical dignities were united in the ſame perſon, the king was choſen from both of theſe two claſſes. The diſciples of this ſect were denominated Mohameddin, or Ali Mohaddin; but the Arabian writers only ſtyle them preachers, and the Spaniſh Al Mohedes. The deſcendants and ſucceſſors of that tribe continued to retain the appellation of Emir Al Mumenin, or chiefs of the faithful believers, as long as their dynaſty laſted; and they became very powerful both in Africa and Spain. By their invectives againſt the

Almohedes

Almohedes.

the tyranny of the Almoravides, and their loud clamours for liberty, they induced the greater part of the kingdom to revolt, and to embrace their religious doctrines. The chief thing in them was their ſpecious pretence to orthodoxy, and ſtrict adherence to the unity of the Godhead, which they inculcated with the greateſt zeal and diligence.

On his acceſſion to power, the new ſovereign extirpated all the unhappy remains and ſteady adherents of this race, by ſtrangling Iſaac the ſon of Brahem. The Almoravides governor taking advantage of the general tumult and diſtraction that prevailed, conſtituted their governments into independent principalities and petty kingdoms; and they who inhabited the mountainous parts, eſtabliſhed under their own cheyks a variety of lordſhips. The Libyans and Nubians took the lead; and the ſtates of Barbary, Tripoli, Kairwan, Tunis, Algiers, Tremecen, and Bujeyah, followed their example. Abdolmumen, however, ſucceſsfully purſued his conqueſts; and in a few years he reduced to his ſubjection the Numidians and Galatians in the weſt, and the kingdoms of Tunis, Tremecen, and the greater part of Mauritania and Tingitana. He expelled the Chriſtians of Mohedia, the chief city of Africa, and ſome others on the ſame coaſt; and likewiſe made conqueſts both in Spain and Portugal. He died in the ſeventh year of his reign, and was ſucceeded, A. D. 1156, by his ſon Yuſef or Joſeph. Yuſef proved a valiant and martial prince, and in his military court he firſt eſtabliſhed the kings of Tunis and Bujeyah in their reſpective dominions, as his tributaries and vaſſals; and then by earneſt ſolicitation he embarked for Spain to aſſiſt the Mooriſh princes. Yakub or Jacob, or the Conqueror, ſucceeding, him after providing for his own ſafety againſt the revolted and plundering Arabs, purſued his conqueſts with ſuch ſucceſs, that he ſoon became maſter of the whole country lying between Numidia and the entire length of the Barbary coaſts, from Tripoli to the boundaries of the kingdom of Morocco. Thus he was acknowledged as ſovereign by moſt of the Arabian Mooriſh princes in his Spaniſh dominions; but alſo extended his territory above 1200 leagues in length, and 480 in breadth. The remaining part of the hiſtory of this prince is involved in obſcurity. About the year 1206, he quelled a revolt in Morocco, but violated his faith with the governor of the capital, which he reduced, and in a cruel and perfidious manner he extirpated all his adherents. Touched, it is ſaid, with remorſe, he diſappeared, and, according to report, wandered about obſcure and unknown, until he died in the humble condition of a baker at Alexandria. His ſon Mohammed, ſurnamed Al Naker, ſucceeded his father; and, on his acceſſion to the crown, he paſſed over into Spain with an immenſe army of 120,000 horſe and 300,000 foot, and engaging the whole force of the Chriſtians on the plains of Tholoſa, received a total defeat, with the loſs of above 150,000 foot, 30,000 horſe, and 50,000 priſoners. According to Spaniſh and other hiſtorians, this famous battle was fought in 617, A. D. 1220; but according to the Arabian writers, it was in the year of the Hegira 609, A. D. 1212. Returning home to Africa, he was received with coldneſs and diſguſt by his ſubjects, on account of his defeat; and ſoon after died of vexation, having appointed his grandſon Zeyed Arrax his ſucceſſor. A deſcendant of the Abdolwates, ancient monarchs of the kingdom, named Gumarazan Ebn Zeyen, of the tribe of the Zeneti, cauſed him to be aſſaſſinated. With him terminated the dynaſty or government of the Almohedes, having poſſeſſed it for about 170 years, which gave place to that of the Benimerini, another branch of the Zeneti. Theſe having enlarged their conqueſts, and enriched themſelves by frequent inroads, not only into the neighbouring kingdoms, but even Nubia, Libya, and Numidia, were at length loſt in the general prevalence of Mohamediſm, after having exiſted 117 years. (*Mod. Univ. Hiſt.*)

Almond || Almoravides.

ALMOND, the fruit of the almond tree. See AMYGDALUS, BOTANY *Index*.

ALMOND, in *Commerce*, a meaſure by which the Portugueſe ſell their oil: 26 almonds make a pipe.

ALMONDS, in *Anatomy*, a name ſometimes given to two glands, generally called the *tonſils*.

ALMONDS, among lapidaries, ſignify pieces of rock-cryſtal, uſed in adorning branch-candleſticks, &c. on account of the reſemblance they bear to the fruit of that name.

ALMOND Furnace, among refiners, that in which the ſlags of litharge, left in refining ſilver, are reduced to lead again by the help of charcoal.

ALMONDBURY, a village in England, in the weſt riding of Yorkſhire, ſix miles from Halifax.

ALMONER, in its primitive ſenſe, denotes an officer in religious houſes, to whom belonged the management and diſtribution of the alms of the houſe. By the ancient canons, all monaſteries were to ſpend at leaſt a tenth part of their income in alms to the poor. The almoner of St Paul's is to diſpoſe of the moneys left for charity, according to the appointment of the donors, to bury the poor who die in the neighbourhood, and to breed up eight boys to ſinging, for the uſe of the choir. By an ancient canon, all biſhops are required to keep almoners.

Lord ALMONER, or *Lord High ALMONER of England*, is an eccleſiaſtical officer, generally a biſhop, who has the forfeiture of all deodands, and the goods of *felos de ſe*, which he is to diſtribute among the poor. He has alſo, by virtue of an ancient cuſtom, the power of giving the firſt diſh from the king's table to whatever poor perſon he pleaſes, or, inſtead of it, an alms in money.

Great ALMONER, *Grand AUMONIER*, in France, before the revolution, was the higheſt eccleſiaſtical dignity in that kingdom. To him belonged the ſuperintendency of all hoſpitals and houſes of lepers. The king received the ſacrament from his hand; and he ſaid maſs before the king in all grand ceremonies and ſolemnities.

ALMONER is alſo a more faſhionable title given by ſome writers to chaplains. In this ſenſe we meet with almoner of a ſhip, almoner of a regiment.

ALMONRY, or AUMBRY, the office or lodgings of the almoner; alſo the place where alms are given. See AMBRY.

ALMORAVIDES, in *Hiſtory*, the name of an Arab tribe, who took poſſeſſion of a diſtrict of Africa, with the pretence of living in retirement, that their minds might not be diſtracted from the rigid obſervance of the precepts of the Koran. Hence they aſſumed the name of Morabites, which was changed by the

Almoravides.

the Spaniards into that of Almoravides. Abubeker ben Omar, called by the Spaniſh authors Abu Texefien, was the firſt chief of this tribe. Supported by a powerful army of malecontents from the provinces of Numidia and Libya, which was aſſembled by the influence of the Morabites, or Marabouts, he founded the dynaſty of the Almoravides in Barbary, in the year 1051. Texefien was ſucceeded by his ſon Yuſef or Joſeph, who, after having reduced to a ſtate of vaſſalage the kingdoms of Tremecen, Fez, and Tunis, paſſed over into Spain during the time of the civil wars, vigorouſly repulſed the Chriſtians, and ſoon ſaw the greateſt part of the kingdoms of Murcia, Granada, Cordova, Leon, and ſome parts of Valencia, ſubjected to his power. He then returned into Africa, and left his newly acquired dominions, with a conſiderable army, under the government of his nephew Mohammed. On his arrival in Africa, with a view to proſecute and extend his conqueſts in Spain, he announced, in a public declaration, a general *gazie*, or religious war; aſſembled a numerous army, with which he embarked at Ceuta; and rejoining his nephew in Andaluſia, ſoon laid waſte that province with fire and ſword.

In the year 1107, five years afterwards, he undertook another invaſion, penetrated into the kingdom of Portugal, and reduced the city of Liſbon, with a conſiderable part of the kingdom. At this time he loſt the cities of Alguazir and Gibraltar, which he had formerly taken. On his return to Barbary, he was defeated at ſea. This induced him to propoſe a truce, which was agreed to only on condition of his ſubmitting to become the tributary of the Spaniſh king. Indignant at theſe humiliating terms, Yuſef made a vow that he would never deſiſt in his attempts, till he had utterly rooted out the Chriſtian religion in Spain. He made preparations accordingly for a freſh invaſion, embarked his army, and landing at Malaga, marched into the enemy's country. His progreſs was rapid; but his meaſures were inconſiderately planned and raſhly executed. In the famous battle of the Seven Counts, he was indeed victorious, but after a terrible ſlaughter, and the loſs of great part of his army. This diſaſtrous victory obliged him to retrn to Africa; and he died ſoon after at his capital of Morocco. Ali his ſon, ſucceeded to the ſovereignty in 1110. This prince who ſeems to have been of a leſs warlike diſpoſition than his father, neglecting his Spaniſh conqueſts, turned his attention to the arts of peace, and erected many ſumptuous buildings, and in particular the great moſque of Morocco. Alphonſo then king of Arragon, retook from him ſome conſiderable cities; which obliged him to undertake an expedition to Spain in ſupport of the Mooriſh princes. But all his attempts proved unfortunate; and in his laſt enterpriſe, though powerfully aſſiſted by the Mooriſh chiefs, with the loſs of 30,000 men he was defeated and ſlain by Alphonſo, in the ſixth year of his reign.

He was ſucceeded by his ſon Al Abraham, who devoted himſelf entirely to pleaſure. His ſubjects were haraſſed and oppreſſed with heavy taxes, which excited diſcontent and open rebellion. A revolution was ſoon effected, and in the 25th year of his reign, the government transferred from the tribe of the Almoravides to the Almohedes. (*Mod. Univ. Hiſt.*)

ALMS, a general term for what is given out of charity to the poor. Alms || Almuggim.

In the early ages of Chriſtianity, the alms of the charitable were divided into four parts; one of which was allotted to the biſhop, another to the prieſts, and a third to the deacons and ſubdeacons, which made their whole ſubſiſtence; the fourth part was employed in relieving the poor, and in repairing the churches.

No religious ſyſtem is more frequent or warm in its exhortations to almſgiving than the Mahometan. The Alcoran repreſents alms as a neceſſary means to make prayer be heard. Hence that ſaying of one of their caliphs: "Prayer carries us half way to God, faſting brings us to the door of his palace, and alms introduces us into the preſence chamber." Hence many illuſtrious examples of this virtue among the Mahometans. Haſan, the ſon of Ali, and grandſon of Mohammed, in particular, is related to have thrice in his life divided his ſubſtance equally between himſelf and the poor, and twice to have given away all he had. And the generality are ſo addicted to the doing of good, that they extend their charity even to brutes.

ALMS, alſo denotes lands or other effects left to churches or religious houſes, on condition of praying for the ſoul of the donor. Hence,

Free ALMS, that which is liable to no rent or ſervice.

Reaſonable ALMS, a certain portion of the eſtates of inteſtate perſons, allotted to the poor.

ALMS-BOX, or *Cheſt*, a ſmall cheſt, or coffer, called by the Greeks Κιβωτιον, wherein anciently the alms were collected, both at church and at private houſes.

The alms-cheſt, in Engliſh churches, is a ſtrong box, with a hole in the upper part, having three keys, one to be kept by the parſon or curate, the other two by the church-wardens. The erecting of ſuch alms-cheſt in every church is enjoined by the book of canons, as alſo the manner of diſtributing what is thus collected among the poor of the pariſh.

ALMS-Houſe, a petty kind of hoſpital for the maintenance of a certain number of poor, aged, or diſabled people.

ALMUCANTARS, in *Aſtronomy*, an Arabic word denoting circles of the ſphere paſſing through the centre of the ſun or a ſtar, parallel to the horizon, being the ſame as *PARALLELS of Altitude*.

ALMUCANTAR'S-Staff, is an inſtrument uſually made of pear tree or box, having an arch of 15 degrees; uſed to take obſervations of the ſun, about the time of its riſing and ſetting, in order to find the amplitude, and conſequently the variation of the compaſs.

ALMUCIUM denotes a kind of cover for the head, worn chiefly by monks and eccleſiaſtics. It was of a ſquare form, and ſeems to have given riſe to the bonnets of the ſame ſhape ſtill retained in univerſities and cathedrals.

ALMUGGIM, ALMIGGIM, or ALMUG TREE, a certain kind of wood mentioned in the firſt book of Kings (x. 11.), which the Vulgate tranſlates *ligna thyina*, and the Septuagint *wrought wood*. The Rabbins generally render it *coral*; others, *ebony*, *brazil*, or *pine*. But it is obſerved, that the almug tree can by no means be coral, becauſe that is not fit for the purpoſes that the Scripture tells us the almug tree was

Almunecar ‖ Alnwick

was uſed, ſuch as muſical inſtruments, ſtaircaſes, &c. The word *thyinum* is a name for the citron tree, known to the ancients, and very much eſteemed for its ſweet odour and great beauty. It came from Mauritania. The almug tree, or almugim, algumim, or ſimply gummim, taking *al* for a kind of article, is therefore by the beſt commentators underſtood to be an oily and gummy ſort of wood; and particularly that ſort of tree which produces the gum ammoniac, which is alſo thought to be the ſame with the Shittim wood, whereof there is ſuch frequent mention made by Moſes.

ALMUNECAR, a ſea-port town in the kingdom of Granada, ſeated on the Mediterranean, with a good harbour, defended by a ſtrong caſtle, 20 miles ſouth of Alhama. W. Long. 3. 45. N. Lat. 36. 50.

ALNAGE, or AULNAGE, the meaſuring of woollen manufactures with an ell. It was at firſt intended as a proof of the goodneſs of that commodity; and accordingly a ſeal was invented as a mark that the commodity was made according to the ſtatute; but, it being now poſſible to purchaſe theſe ſeals, they are affixed, whenever the vender pleaſes, to all cloths indiſcriminately, to the great prejudice of our woollen manufactures.

ALNAGER, ALNEGER, or AULNEGER, q. d. *meaſurer by the ell*, ſignifies a ſworn public officer, who, by himſelf or deputy, is to look to the aſſize of woollen cloth made throughout the land, i. e. the length, width, and work thereof; and to the ſeals for that purpoſe ordained. The office of king's aulnager ſeems to have been derived from the ſtatute of Richard I. A. D. 1197, which ordained that there ſhould be only one weight and one meaſure throughout the kingdom; and that the cuſtody of the aſſize, or ſtandard of weights and meaſures, ſhould be committed to certain perſons in every city and borough. His buſineſs was, for a certain fee, to meaſure all cloths made for ſale, till the office was aboliſhed by the ſtatute 11 and 12 W. III. cap. 20.

ALNUS, the ALDER TREE. See BETULA, BOTANY *Index*.

ALNUS, in the ancient theatres, that part which was moſt diſtant from the ſtage.

ALNWICK, a thoroughfare town in Northumberland, on the road to Scotland. Here Malcolm, king of Scotland, making an inroad into Northumberland, was killed, with Edward his ſon, and his army defeated by Robert Moubray, earl of this county, anno 1092. Likewiſe William, king of Scotland, in 1174, invading England with an army of 80,000 men, was here encountered, his army routed, and himſelf made priſoner. The town is populous, and in general well built; it has a large town-houſe, where the quarter-ſeſſions and county-courts are held, and members of parliament elected. It has a ſpacious ſquare, in which a market is held every Saturday. Alnwick appears to have been formerly fortified, by the veſtiges of a wall ſtill viſible in many parts, and three gates which remain almoſt entire. It is governed by four chamberlains, who are choſen once in two years out of a common council, conſiſting of 24 members. It is ornamented by a ſtately old Gothic caſtle, which has been the ſeat of the noble family of Piercy, earls of Northumberland. As the audits for receipt of rents have ever been in the caſtle, it has always been kept in tolerable repair; and not many years ago it was repaired and beautified by the duke of Northumberland, who made very conſiderable alterations, upon a moſt elegant plan, with a view to reſide in it ſome part of the ſummer ſeaſon. The manner of making freemen is peculiar to this place, and indeed is as ridiculous as ſingular. The perſons who are to be made free, or, as the phraſe is, leap the well, aſſemble in the market-place, very early in the morning, on the 25th of April, being St Mark's day. They appear on horſeback, with every man his ſword by his ſide, dreſſed in white, and with white nightcaps, attended by the four chamberlains and the caſtle bailiff, mounted and armed in the ſame manner; from hence they proceed, with muſic playing before them, to a large dirty pool, called *Freeman's-well*, where they diſmount, and draw up in a body, at ſome diſtance from the water; and thenruſh into it all at once, and ſcramble through the mud as faſt as they can. As the water is generally very foul, they come out in a dirty condition; but taking a dram, they put on dry clothes, remount their horſes, and ride full gallop round the confines of the diſtrict; then re-enter the town, ſword in hand, and are met by women dreſſed in ribbons with bells and garlands, dancing and ſinging. Theſe are called *timber-waſts*. The houſes of the new freemen are on this day diſtinguiſhed by a great holly buſh, as a ſignal for their friends to aſſemble and make merry with them after their return. This ceremony is owing to King John, who was miſled in this well, and who, as a puniſhment for not mending the road, made this a part of their charter. Alnwick is 310 miles north by weſt from London, 33 north of Newcaſtle, and 29 ſouth of Berwick. Long. 1. 10. Lat. 55. 24.

Alnwick ‖ Aloof.

ALOA, in Grecian antiquity, a feſtival kept in honour of Ceres by the huſbandmen, and ſuppoſed to reſemble our harveſt-home.

ALOE, in *Botany*. See BOTANY *Index*.

American Aloe. See AGAVE, BOTANY *Index*.

ALOGIANS, in *Church Hiſtory*, a ſect of ancient heretics, who denied that Jeſus Chriſt was the Logos, and conſequently rejected the goſpel of St John. The word is compounded of the privative α and λογος, q. d. *Without Logos* or *Word*. Some aſcribe the origin of the name, as well as of the ſect of Alogians, to Theodore of Byzantium, by trade a currier; who having apoſtatized under the perſecution of the emperor Severus, to defend himſelf againſt thoſe who reproached him therewith, ſaid, that it was not God he denied, but only man. Whence his followers were called in Greek αλογοι, becauſe they rejected the Word. But others, with more probability, ſuppoſe the name to have been firſt given them by Epiphanius in the way of reproach. They made their appearance toward the cloſe of the ſecond century.

ALOGOTROPHIA, among phyſicians, a term ſignifying the unequal growth or nouriſhment of any part of the body, as in the rickets.

ALOOF, has frequently been mentioned as a ſea-term: but whether juſtly or not, we ſhall not preſume to determine. It is known in common diſcourſe to imply *at a diſtance*; and the reſemblance of the phraſes *keep aloof*, and *keep a luff*, or *keep the luff*, in all probability gave riſe to the conjecture. If it was really a ſea-

||
Alp Arflan.

ſea-phraſe originally, it ſeems to have referred to the dangers of a lee-ſhore, in which ſituation the pilot might naturally apply it in the ſenſe commonly underſtood, viz. keep *all off*, or quite off: it is, however, never expreſſed in that manner by ſeamen now. See LUFF. It may not be improper to obſerve, that beſides uſing this phraſe in the ſame ſenſe with us, the French alſo call the weather-ſide of a ſhip, and the weather-clue of a courſe, *le lof*.

ALOPECE, ALOPECIA, in *Ancient Geography*, an iſland placed by Ptolemy at the mouth of the Tanais, and called the iſland *Tanais*, now *l'Iſle des Renards*. (Baudrand). Alſo an iſland of the Boſphorus Cimmerius (Pliny); and another in the Ægean ſea, over againſt Smyrna.

ALOPECIA, a term uſed among phyſicians to denote a total falling off of the hair from certain parts, occaſioned either by the defect of nutricious juice, or by its vicious quality corroding the roots of it, and leaving the ſkin rough and colourleſs.

The word is formed from αλωπηξ, *vulpes*, "a fox;" whoſe urine, it is ſaid, will occaſion baldneſs, or becauſe it is a diſeaſe which is common to that creature. It is directed to waſh the head every night at going to bed with a ley prepared by boiling the aſhes of vine branches in red wine. A powder made by reducing hermodactyls to fine flour is alſo recommended for the ſame purpoſe.

In caſes where the baldneſs is total, a quantity of the fineſt burdock roots are to be bruiſed in a marble mortar, and then boiled in white wine until there remains only as much as will cover them. This liquor, carefully ſtrained off, is ſaid to cure baldneſs, by waſhing the head every night with ſome of it warm. A ley made by boiling aſhes of vine branches in common water is alſo recommended with this intention. A freſh cut onion, rubbed on the part until it be red and itch, is likewiſe ſaid to cure baldneſs.

A multitude of ſuch remedies are everywhere to be found in the works of Valeſcus de Taranta, Rondeletius, Hallerius, Trincavellius, Celſus, Senertay, and other practical phyſicians.

ALOPECURUS, or FOXTAIL-GRASS. See BOTANY *Index*.

ALOPEX, in *Zoology*, a ſpecies of the canis, with a ſtraight tail and black tip. It is commonly called the *fiſh fox*.

ALOSA, the-ſhad, or mother of herrings, a ſpecies of the clupea. See CLUPEA, ICHTHYOLOGY *Index*.

ALOST, a town in Flanders, belonging to the houſe of Auſtria, ſituated on the river Dender, in the midway between Bruſſels and Ghent. It has but one pariſh; but the church is collegiate, and has a provoſt, a dean, and 12 canons. Here is a convent of Carmelites, another of Capuchines, another of barefooted Carmelites, three nunneries, an hoſpital, and a convent of Guillemins, in which is the tomb of Theodore Martin, who brought the art of printing out of Germany into the Low Countries. He was the friend of Eraſmus, and wrote his epitaph. Aloſt was taken and diſmantled by Marſhal Turenne in 1667; and after the battle of Ramillies in 1706, was abandoned to the allies. E. Long. 3. 56. N. Lat. 49. 55.

ALP ARSLAN, the ſecond ſultan of the dynaſty of Seljuk in Perſia, was the ſon of David, and great grandſon of Seljuk the founder of the dynaſty. He was born in the year 1030, of the Hegira 421. In place of Iſhael, which was his original name, he aſſumed that of Mohammed, when he embraced the Muſſulman faith, and he obtained the ſurname *Alp Arſlan*, which in the Turkiſh language ſignifies *a valiant lion*, on account of his military proweſs. Having held the chief command in Khoraſan for ten years as lieutenant of his uncle Togrul Beg, he ſucceeded him in the year 1063, and at the commencement of his reign ſaw himſelf ſole monarch of Perſia, from the river Amu to the Tigris. When he aſſumed the reins of government, faction and open rebellion prevailed in his dominions, in ſubduing of which he was ably aſſiſted by Nadham al Molk his viſir, one of the moſt diſtinguiſhed characters of his time, whoſe prudence and integrity in the adminiſtration of the affairs of the kingdom proved of moſt eſſential ſervice to this prince and to his ſucceſſor. Peace and ſecurity being eſtabliſhed in his dominions, he convoked an aſſembly of the ſtates; and having declared his ſon Malek Shaw his heir and ſucceſſor, ſeated him on a throne of gold, and exacted an oath of fidelity to him from the principal officers of the empire. With the hope of acquiring immenſe booty in the rich temple of St Baſil in Cæſarea, the capital of Cappadocia, he placed himſelf at the head of the Turkiſh cavalry, croſſed the Euphrates, and entered and plundered that city. He then marched into Armenia and Georgia, which in the year 1065 he finally conquered. In the former country, the very name of a kingdom and the ſpirit of a nation were totally extinguiſhed. But the native Georgians, who had retired to the woods and valleys of Mount Caucaſus, made a more vigorous reſiſtance. They too, however, overpowered by the arms of the ſultan and his ſon Malek, were forced to ſubmiſſion, and reduced to ſlavery. To puniſh them for the brave defence which they had made, and as a badge of their humiliating condition, Alp Arſlan obliged them to wear at their ears horſe ſhoes of iron. Some, to eſcape this mark of cruelty and ignominy, profeſſed to embrace the religion of Mahomet.

Alp Arſlan

In the year 1068 Alp Arſlan invaded the Roman empire, the ſeat of which was then at Conſtantinople. Eudocia, the reigning empreſs, ſaw and dreaded the progreſs of his arms. To avert the threatened danger, ſhe married Romanus Diogenes, a brave ſoldier, who was accordingly aſſociated with her in the government, and raiſed to the imperial dignity. The new emperor, during the exhauſted ſtate of their reſources, ſuſtained the Roman power with ſurpriſing valour and invincible courage. His ſpirit and ſucceſs animated his ſoldiers in the field to act with fortitude and firmneſs, inſpired his ſubjects with hope, and ſtruck terror in his enemies. In three ſevere campaigns his arms were victorious; and the Turks were forced to retreat beyond the Euphrates. In the fourth he advanced with an army of 100,000 men into the Armenian territory for the relief of that country. Here he was met by Alp Arſlan with 40,000 cavalry, or, according to ſome authors, a much ſmaller number; and the ſultan having propoſed terms of peace, which were inſultingly rejected by the emperor, a bloody and deciſive engagement took place. Alp Arſlan, it is ſaid, when he ſaw that a battle was inevitable, wept at the thought that ſo many of his faithful followers muſt fall

Alp Arſlan in the ſtruggle; and after offering up a devout prayer, granted free permiſſion to all who choſe it to retire from the field. Then with his own hand he tied up his horſe's tail, exchanged his bow and arrows for a mace and ſcymitar, and robing himſelf in a white garment perfumed with muſk, reſolved to periſh on the ſpot unleſs he came off victorious. The ſkilful movements of the Turkiſh cavalry ſoon made an impreſſion on the ſuperior numbers of the Greeks, who were thrown into great diſorder, and after a terrible ſlaughter, were totally routed. Romanus, deſerted by the main body of his army, with unſhaken courage kept his ſtation, till he was recognized by a ſlave, taken priſoner, and conducted into the preſence of Alp Arſlan. In the Turkiſh divan, the captive emperor was commanded to kiſs the ground as a degrading mark of ſubmiſſion to the power and authority of the ſultan, who, it is ſaid, leapt from his throne and ſet his foot on his neck. But this is ſcarcely probable or conſiſtent with the generous and reſpectful treatment which he otherwiſe experienced. For the ſultan inſtantly raiſed him from the ground, embraced him tenderly, and aſſured him that his life and dignity ſhould remain inviolate under the protection of a prince who had not forgotten the reſpect due to the majeſty of his equals, and the viciſſitudes of fortune. When the terms of his ranſom were about to be ſettled, Romanus was aſked by Alp Arſlan what treatment he expected to receive. To this queſtion the emperor, with ſeeming indifference, replied, "If you are cruel, you will take my life; if you follow the dictates of pride, you will drag me at your chariot wheels; if you conſult your intereſt, you will accept a ranſom, and reſtore me to my country." "But what," ſays the ſultan, "would you have done in ſuch circumſtances?" "Had I been victorious," ſaid the inſolent Romanus, "I would have inflicted on thy body many a ſtripe." The conqueror ſmiled at the fierce and unſubdued ſpirit of his captive; obſerved that the Chriſtian precepts ſtrongly inculcated the love of enemies and the forgiveneſs of injuries; and, with a noble greatneſs of mind, declared that he would never imitate an example which he diſapproved. A ranſom of a million, an annual tribute of 3000 pieces of gold, an intermarriage between the families, and the deliverance of all the captive Muſſulmans in the power of the Greeks, were at laſt agreed to as the terms of peace and the liberty of the emperor. Romanus was now diſmiſſed loaded with preſents, and reſpectfully attended by a military guard. But the diſtracted ſtate of his dominions, the conſequence of a revolt of his ſubjects, precluded him from fulfilling the terms of the treaty, and remitting the ſtipulated price of his ranſom. The ſultan ſeemed diſpoſed to favour and ſupport the declining fortunes of his ally; but the defeat, impriſonment, and death of Romanus interrupted the accompliſhment of his generous, or rather ambitious, deſign.

As this time the dominion of Alp Arſlan extended over the faireſt part of Aſia; 1200 princes, or ſons of princes, ſurrounded his throne; and 200,000 ſoldiers were ready to execute his commands. He now meditated a greater enterpriſe, and declared his purpoſe of attempting the conqueſt of Turkeſtan, the original ſeat of his anceſtors. After great preparations for the expedition, he marched with a powerful army, and arrived at the banks of the Oxus. Before he could paſs the river with ſafety, it was neceſſary to gain poſſeſſion of ſome fortreſſes in its vicinity; one of which was for ſeveral days vigorouſly defended by the governor, Joſeph Cothual, a Carizmian. He was, however, obliged to ſurrender, and was carried a priſoner before the ſultan, who, being enraged at his obſtinacy and preſumption, addreſſed him in very reproachful terms. Joſeph replied with ſo much ſpirit, that he rouſed the reſentment of Alp Arſlan, and was commanded inſtantly to be faſtened by the hands and feet to four ſtakes, to ſuffer a painful and cruel death. Joſeph, on hearing this ſentence, became furious and deſperate; and drawing a dagger which he had concealed in his boots, ruſhed towards the throne to ſtab the ſultan; the guards raiſed their battle-axes, and moved forward to defend their ſovereign; but Alp Arſlan, the moſt expert archer of his age, checking their zeal, forbade them to advance, and drew his bow: his foot ſlipped, and the arrow miſſed Joſeph, who ruſhed forward, and plunging his dagger in the breaſt of the ſultan, was himſelf inſtantly cut in pieces. The wound proved mortal, and the ſultan expired in a few hours after he received it, in the year 1072. When he found his end approaching, he addreſſed himſelf in theſe words to his attendants: "In my youth," ſaid he, "I was adviſed by a wiſe man to humble myſelf before God, never to confide in my own ſtrength, or to deſpiſe the moſt contemptible enemy. Theſe leſſons I have neglected, for which I have now met deſerved puniſhment. Yeſterday, when I beheld from an eminence the number and diſcipline of my troops, I ſaid in the confidence of my heart, 'What power on earth can oppoſe me? what man dares to attack me?' To day, vainly truſting to my own ſtrength and dexterity, I fooliſhly checked the prompt zeal and alacrity of my guards for my ſafety, and now I have fallen by the hand of an aſſaſſin! But I perceive that no force or addreſs can reſiſt fate." He died in the 10th year of his reign, at the age of 44. He was buried at Maru, one of the four cities of Khoraſan, in the tomb of the Seljukian dynaſty. On his tomb was inſcribed the following epitaph: "All you who have beheld the grandeur of Alp Arſlan exalted to the heavens, come to Maru, and you will ſee it buried in the duſt."

This prince was diſtinguiſhed for his valour, liberality, and piety. He was patient, juſt, and ſincere. His ſtature, aſpect, and voice, commanded the reſpect of all who approached him. He had long whiſkers, and uſually wore a high turban in the form of a crown. He was ſucceeded by his ſon Malek Shaw, who had been proclaimed and acknowledged ſultan of the Turks during his life. (*Mod. Univ. Hiſt. Gibbon's Hiſt.*)

Alp Arſlan, Alpha.

ALPHA, the name of the firſt letter of the Greek alphabet, anſwering to our A. As a numeral, it ſtands for one, or the firſt of any thing. It is particularly uſed, among ancient writers, to denote the chief or firſt man of his claſs or rank. In this ſenſe, the word ſtands contradiſtinguiſhed from *beta*, which denotes the ſecond perſon. Plato was called the *Alpha* of the the wits: Eratoſthenes, keeper of the Alexandrian library, whom ſome called a *Second Plato*, is frequently named *Beta*.

ALPHA is alſo uſed to denote the beginning of any thing. In which ſenſe it ſtands oppoſed to *omega*,

Alphabet. which denotes the end. And these two letters were made the symbol of Christianity; and accordingly were engraven on the tombs of the ancient Christians, to distinguish them from those of idolaters. Moralez, a Spanish writer, imagined that this custom only commenced since the rise of Arianism; and that it was peculiar to the orthodox, who hereby made confession of the eternity of Christ: but there are tombs prior to the age of Constantine whereon the two letters were found, besides that the emperor just mentioned bore them on his labarum before Arius appeared.

ALPHABET, the natural or customary series of the several letters of a language (see LANGUAGE and WRITING). The word is formed from *alpha* and *beta*, the first and second letters of the Greek alphabet. The number of letters is different in the alphabets of different languages. The English alphabet contains 24 letters; to which if we add *j* and *v* consonant, the sum will be 26: the French contains 23; the Hebrew, Chaldee, Syriac, and Samaritan 22 each; the Arabic 28; the Persian 31; the Turkish 33; the Georgian 36; the Coptic 32; the Muscovite 43; the Greek 24; the Latin 22; the Sclavonic 27; the Dutch 26; the Spanish 27; the Italian 20; the Ethiopic and Tartarian, each 202; the Indians of Bengal 21; the Barames 19. The Chinese have, properly speaking, no alphabet, except we call their whole language by that name; their letters are words, or rather hieroglyphics, amounting to about 80,000.

It has been a matter of considerable dispute whether the method of expressing our ideas by visible symbols called *letters* be really a human invention; or whether we ought to attribute an art so exceedingly useful to an immediate revelation from the Deity.—In favour of the latter opinion it has been urged,

Arguments for writing being a divine revelation. 1. The five books of Moses are universally acknowledged to be the most ancient compositions as well as the most early specimens of alphabetical writing we have. If, therefore, we suppose writing to be the result of human ingenuity, it must be different from all other arts, having been brought to perfection at once; as it seems impossible to make any real improvement on the Hebrew alphabet. It may indeed be replied, that alphabetical characters perhaps have existed many ages before the writings of Moses, though the more ancient specimens have perished. This, however, being a mere unsupported assertion, without any historical testimony to corroborate it, cannot be admitted as a proof. Again, Setting aside the evidence to be derived from Scripture on this subject, the simplicity of manners predominant in the early ages, the small extent of the intellectual powers of mankind, and the little intercourse which nations had with one another, which would seem more particularly to render writing necessary, can scarcely allow us to suppose that such a complex and curious contrivance as alphabetical writing could be invented by a race of men whose wants were so few, their advantages so circumscribed, and their ideas so limited.

2. If alphabetical writing were a mere human invention, it might be expected that different nations would have fallen upon the same expedient independent of each other during the compass of so many ages. But no such thing has taken place; and the writing of every people on earth may be referred to one common original. If this can be proved, the argument from successive derivation, without a single instance of independent discovery, must be allowed to amount to the very highest degree of probability in favour of our hypothesis, which will now rest on the evidence for or against this fact; and which may be summed up in the following manner. Alphabet.

Among the European nations we find none who can pretend any right to the discovery of letters. All of them derived the art from the Romans, excepting only the Turks, who had it from the Arabians. The Romans never laid claim to the discovery; but confessed that they derived their knowledge from the Greeks, and the latter owned that they had it from the Phœnicians; who, as well as their colonists the Carthaginians, spoke a dialect of the Hebrew scarcely varying from the original. The Coptic, or Egyptian, resembles the Greek in most of its characters, and is therefore to be referred to the same original. The Chaldee, Syriac, and latter Samarian, are dialects of the Hebrew, without any considerable deviation, or many additional words. The Ethiopic differs more from the Hebrew, but less than the Arabic; yet these languages have all issued from the same stock, as the similarity of their formation, and the numberless words common to them, all sufficiently evince: and the Persic is very nearly allied to the Arabic. Alterations indeed would naturally be produced, in proportion to the civilization of the several nations, and their intercourse with others; which will account for the superior copiousness of some above the rest. It appears then, that all the languages in use amongst men that have been conveyed in alphabetical characters, have been the languages of people connected ultimately or immediately with the Hebrews, who have handed down the earliest specimens of writing to posterity; and we have therefore the greatest reason to believe, that their method of writing, as well as their language, was derived from the same source.

This proposition will be farther confirmed from considering the sameness of the artificial denominations of the letters in the Oriental, Greek, and Latin languages, accompanied also by a similar arrangement, as *alpha*, *beta*, &c. It may still be objected, however, that the characters employed by the ancients to discriminate their letters are entirely dissimilar. Why should not one nation, it may be urged, adopt from the other the mode of expressing the art as well as the art itself? To what purpose did they take the trouble of inventing other characters? To this objection it may be replied, 1. From the instance of our own language we know what diversities may be introduced in this respect merely by length of time and an intercourse with neighbouring nations. And such an effect would be more likely to take place before the art of printing had contributed to establish an uniformity of character: For when every work was transcribed by the hand, we may easily imagine how many variations would arise from the fancy of the scribe, and the mode of writing so constantly different in individuals. 2. This diversity might sometimes arise from vanity. When an individual of another community had become acquainted with this wonderful art, he might endeavour to recommend himself as the inventor; and, to avoid detection, might invent other characters. 3. The characters

Alphabet. racters of the alphabet might ſometimes be accommodated as much as poſſible to the ſymbolical marks already in uſe amongſt a particular people. Theſe having acquired a high degree of ſanctity by the uſe of many generations, would not eaſily be ſuperſeded without the aid of ſome ſuch contrivance. 4. This is ſupported by the teſtimony of Herodotus; who informs us, "that thoſe Phœnicians who came with Cadmus introduced many improvements among the Greeks, and alphabetical writing too, not known among them before that period. At firſt they uſed the Phœnician character; but in proceſs of time, as the pronunciation altered, the ſtandard of the letters was alſo changed. The Ionian Greeks inhabited at the time the parts adjacent to Phœnicia: who having received the art of alphabetical writing from the Phœnicians, uſed it, with an alteration of ſome few characters, and confeſſed ingenuouſly, that it was called Phœnician from the introducers of it." He tells us that he had himſelf ſeen the characters of Cadmus in the temple of Iſmenian Apollo at Thebes in Bœotia, engraven upon tripods, and very much reſembling the Ionian characters. 5. The old Samaritan is preciſely the ſame as the Hebrew language: and the Samaritan Pentateuch does not vary by a ſingle letter in twenty words from the Hebrew: but the characters are widely different: for the Jews adopted the Chaldaic leters during their captivity at Babylon inſtead of the characters of their forefathers.

3. What we know of thoſe nations who have continued for many centuries unconnected with the reſt of the world, ſtrongly militates againſt the hypotheſis of the human invention of alphabetical writing. The experiment has been fairly made upon the ingenuity of mankind for a longer period than that which is ſuppoſed to have produced alphabetical writing by regular gradations; and this experiment determines peremptorily in their favour. The Chineſe, a people famous for their diſcoveries and mechanical turn of genius, have made ſome advances towards the delineation of their ideas by arbitrary ſigns, but have nevertheleſs been unable to accompliſh this exquiſite device; and after ſo long a trial to no purpoſe, we may reaſonably infer, that their mode of writing, which is growing more intricate and voluminous every day, would never terminate in ſo clear, ſo comparatively ſimple, an expedient as that of alphabetical characters. The Mexicans, too, had made ſome rude attempts of the ſame kind; but with leſs ſucceſs than the Chineſe. We know alſo, that hieroglyphics were in uſe among the Egyptians poſterior to the practice of alphabetical writing by the Jews; but whether the epiſtolography, as it is called, of the former people, which was in vogue during the continuance of the hieroglyphics, might not poſſibly be another name for alphabetical writing, cannot be decided.

4. We ſhall conſider the argument on which the commonly received ſuppoſition entirely depends: that is, the natural gradation, through the ſeveral ſpecies of ſymbols acknowledged to have been in uſe with various people, terminating at laſt, by an eaſy tranſition, in the detection of alphabetical characters. The ſtrength of this argument will be beſt underſtood from the following repreſentation.

"1. The firſt method of embodying ideas would be by drawing a repreſentation of the objects themſelves. The imperfection of this method is very obvious, both on account of its tedioufneſs and its inability of going beyond external appearances to the abſtract ideas of the mind. Alphabet.

"2. The next method would be ſomewhat more general, and would ſubſtitute two or three principal circumſtances for the whole tranſaction. So two kings, for example, engaging each other with military weapons, might ſerve to convey the idea of a war between the two nations. This abbreviated method would be more expeditious than the former; but what it gained in conciſeneſs would be loſt in perſpicuity. It is a deſcription more compendious indeed, but ſtill a deſcription of outward objects alone, by drawing their reſemblance. To this head may be referred the picture-writing of the Mexicans.

"3. The next advance would be to the uſe of ſymbols: the incorporation, as it were, of abſtract and complex ideas in figures more or leſs generalized, in proportion to the improvement of it. Thus, in the earlier ſtages of this device, a circle might ſerve to expreſs the ſun, a ſemicircle the moon; which is only a contraction of the foregoing method. This ſymbol writing in its advanced ſtate would become more refined, but enigmatical and myſterious in proportion to its refinement. Hence it would become leſs fit for common uſe, and therefore more particularly appropriated to the myſteries of philoſophy and religion. Thus, two feet ſtanding upon water ſerved to expreſs an impoſſibility; a ſerpent denoted the oblique trajectories of the heavenly bodies; and the beetle, on account of ſome ſuppoſed properties of that inſect, ſerved to repreſent the ſun. The Egyptian hieroglyphics were of this kind.

"4. This method being ſtill too ſubtle and complicated for common uſe, the only plan to be purſued was a reduction of the firſt ſtage of the preceding method. Thus a dot, inſtead of a circle, might ſtand for the ſun; and a ſimilar abbreviation might be extended to all the ſymbols. On this ſcheme every object and idea would have its appropriated mark: theſe marks, therefore, would have a multiplicity proportionable to the works of nature and the operations of the mind. This method was likewiſe practiſed by the Egyptians; but has been carried to greater perfection by the Chineſe. The vocabulary of the latter is therefore infinite, or at leaſt capable of being extended to any imaginable length. But if we compare this tedious and awkward contrivance with the aſtoniſhing brevity and perſpicuity of alphabetical writing, we muſt be perſuaded that no two things can be more diſſimilar; and that the tranſition from a ſcheme conſtantly enlarging itſelf, and growing daily more intricate, to the expreſſion of every poſſible idea by the modified arrangement of four-and-twenty marks, is not ſo very eaſy and perceptible as ſome have imagined. Indeed this ſeems ſtill to be rather an expreſſion of things in a manner ſimilar to the ſecond ſtage of ſymbol writing than the notification of ideas by arbitrary ſigns."

To all this we ſhall ſubjoin the following remarks, which ſeem to give additional force to the foregoing reaſoning. Additional remarks in confirmation of theſe arguments.

"1. Pliny aſſerts the uſe of letters to have been eternal;

Alphabet

nal; which ſhows the antiquity of the practice to extend beyond the era of authentic hiſtory.

" 2. The cabaliſtical doctors of the Jews maintain, that alphabetical writing was one of the ten things which God created on the evening of the Sabbath.

" 3. Moſt of the profane authors of antiquity aſcribe the firſt uſe of alphabetical characters to the Egyptians, who, according to ſome, received them from Mercury; and, according to others, from their god Teuth.

" 4. There is very little reaſon to ſuppoſe that even language itſelf is the effect of human ingenuity and invention."

Anſwers to the above arguments.

Thus we have ſtated the arguments in favour of the revelation of alphabetical writing; which are anſwered, by thoſe who take the contrary ſide, in the following manner.

1. Moſes nowhere ſays that the alphabet was a new thing in his time; nor does he give the leaſt hint of his being the inventor of it. The firſt mention we find of *writing* is in the 17th chapter of Exodus; where Moſes is commanded to *write in a book*; and which took place before the arrival of the Iſraelites at Sinai. This ſhows that writing did not commence with the delivery of the two tables of the law, as ſome have ſuppoſed. Neither are we to conclude that the invention had taken place only a ſhort time before; for the *writing in a book* is commanded as a thing commonly underſtood, and with which Moſes was well acquainted. It is plain, from the command to engrave the names of the twelve tribes of Iſrael upon ſtones *like the engravings of a ſignet*, that writing had been known and practiſed among them, as well as other nations, long before. We muſt alſo remember, that the people were commanded to write the law on their door poſts, &c. ſo that the art ſeems not only to have been known, but univerſally practiſed among them. But had writing been a new diſcovery in the time of Moſes, he would probably have commemorated it as well as the other inventions of muſic, &c.: Nor is there any reaſon to ſuppoſe that God was the immediate revealer of the art; for Moſes would never have omitted to record a circumſtance of ſuch importance, as the memory of it would have been one of the ſtrongeſt barriers againſt idolatry.

Again, Though ſeveral profane writers attribute the origin of letters to the gods, or to ſome divine perſon, yet this is no proof of its being actually revealed; but only that the original inventor was unknown. The learned biſhop of Glouceſter obſerves, that the ancients gave nothing to the gods of whoſe original they had any records; but where the memory of the invention was loſt, as of ſeed-corn, wine, writing, civil ſociety, &c. the gods ſeized the property, by that kind of right which gives ſtrays to the lord of the manor.

As neither the ſacred nor profane hiſtorians, therefore, have determined any thing concerning the invention of letters, we are at liberty to form what conjectures we think moſt plauſible concerning the origin of them; and this, it is thought, might have taken place in the following manner.

" 1. Men, in their rude uncultivated ſtate, would have neither leiſure, inclination, nor inducement, to cultivate the powers of the mind to a degree ſufficient for the formation of an alphabet: but when a people arrived at ſuch a pitch of civilization as required them to repreſent the conceptions of the mind which have no corporeal forms, neceſſity would occaſion further exertions, and urge them to find out a more expeditious manner of tranſacting their buſineſs than by picture-writing. Alphabet.

" 2. Theſe exertions would take place whenever a nation began to improve in arts, manufactures, and commerce; and the greater genius ſuch a nation had, the more improvements would be made in the notation of their language; whilſt thoſe people who had made leſs progreſs in civilization and ſcience, would have a leſs perfect ſyſtem of elementary characters; and perhaps advance no farther for many ages than the marks or characters of the Chineſe. Hence we may ſee, that the buſineſs of princes, as well as the manufactures and commerce of each country, would produce the neceſſity of deviſing ſome expeditious manner of communicating information to one another."

The art of writing, however, is of ſo great antiquity, and the early hiſtory of moſt nations ſo full of fable, that it muſt be extremely difficult to determine what nation or people may juſtly claim the honour of the invention. But as it is probable that letters were the produce of a certain degree of civilization among mankind, we muſt therefore have recourſe to the hiſtory of thoſe nations who ſeem to have been firſt civilized.

Claim of the Egyptians to the invention of letters.

The Egyptians have an undoubted title to a very early civilization; and many learned men have attributed the invention of letters to them. The late biſhop of Glouceſter contends, that Egypt was the parent of all the learning of Greece, and was reſorted to by all the Grecian legiſlators, naturaliſts, and philoſophers; and endeavours to prove that it was one of the firſt civilized countries on the globe. Their writing was of four kinds: 1. *Hieroglyphic;* 2. *Symbolic;* 3. *Epiſtolic;* and, 4. *Hierogrammatic.* In the moſt early ages they wrote, like all other infant nations, by pictures; of which ſome traces yet remain among the hieroglyphics of Horapollo, who informs us, that they repreſented a *fuller* by a man's two feet in water; *fire*, by ſmoke aſcending, &c. But to render this rude invention leſs incommodious, they ſoon deviſed the method of putting one thing of ſimilar qualities for another.

The former was called the *curiologic*, the latter the *tropical* hieroglyphic; which laſt was a gradual improvement on the former. Theſe alterations in the manner of delineating hieroglyphic figures produced and perfected another character, called the *running-hand of the hieroglyphics*, reſembling the Chineſe writing; which having been firſt formed by the outlines of each figure, became at length a kind of *marks;* the natural effects of which were, that the conſtant uſe of them would take off the attention from the ſymbol and fix it on the thing ſignified. Thus the ſtudy of ſymbolic writing would be much abbreviated; becauſe the writer or decypherer would have then little to do but to remember the power of the ſymbolic mark; whereas before, the properties of the thing or animal delineated were to be learned. This, together with the other marks by inſtitution, to denote mental conceptions, would reduce the characters to a ſimilar ſtate with the preſent Chineſe; and theſe were properly what the ancients called *hieroglyphical.* We are informed by Dr Robert Huntingdon, in his account of the Porphyry pillars,

Alphabet. pillars, that there are ſome ancient monuments of this kind yet remaining in Egypt.

The ſacred book or ritual of the Egyptians, according to Apuleius, was written partly in ſymbolic, and partly in theſe hieroglyphic characters, in the following manner: "He (the hierophant) drew out certain books from the ſecret repoſitories of the ſanctuary, written in unknown characters, which contained the words of the ſacred formula compendiouſly expreſſed, partly by figures of animals, and partly by certain marks or notes intricately knotted, revolving in the manner of a wheel, crowded together, and curled inward like the tendrils of a vine, ſo as to hide the meaning from the curioſity of the profane."

Letters not invented in Egypt.

But though letters were of great antiquity in Egypt, there is reaſon to believe that they were not firſt invented in that country. Mr Jackſon, in his Chronological Antiquities, has endeavoured to prove, that they were not invented or carried into Egypt by *Taaut* or *Thoth*, the firſt Hermes, and ſon of Miſraim, who lived about 500 years after the deluge; but that they were introduced into that country by the ſecond Hermes, who lived about 400 years after the former. This ſecond Hermes, according to Diodorus, was the inventor of grammar and muſic, and added many words to the Egyptian language. According to the ſame author alſo, he invented letters, rhythm, and the harmony of ſounds. This was the Hermes ſo much celebrated by the Greeks, who knew no other than himſelf. On the other hand, Mr Wiſe aſſerts that Moſes and Cadmus could not learn the alphabet in Egypt; and that the Egyptians had no alphabet in their time. He adduces ſeveral reaſons to prove that they had none till they received what was called the *Coptic*, which was introduced either in the time of the Ptolemies or under Pſammitichus or Amaſis; and the oldeſt alphabetic letters which can be produced as Egyptian, appear plainly to have been derived from the Greek. Herodotus confeſſes, that all he relates before the reign of Pſammitichus is uncertain; and that he reports the early tranſactions of that nation on the credit of the Egyptian prieſts, on which he did not greatly depend; and Diodorus Siculus is ſaid to have been greatly impoſed upon by them. Manetho, the oldeſt Egyptian hiſtorian, tranſlated the ſacred regiſters out of Egyptian into Greek, which are ſaid by Syncellus to have been written in the ſacred letters, and to have been laid up by the ſecond Mercury in the Egyptian temples. He allows the Egyptian gods to have been mortal men; but his hiſtory was very much corrupted by the Greeks, and hath been called in queſtion by ſeveral writers from the account which he himſelf gave of it. After Cambyſes had carried away the Egyptian records, the prieſts, to ſupply their loſs, and to keep up their pretenſions to antiquity, began to write new records; wherein they not only unavoidably made great miſtakes, but added much of their own invention, eſpecially as to diſtant times.

Claim of the Phœnicians.

The Phœnicians have likewiſe been ſuppoſed the inventors of letters; and we have the ſtrongeſt proofs of the early civilization of this people. Their moſt ancient hiſtorian, Sanchoniatho, lived in the time of Abibalus, father of Hiram king of Tyre. He informs us, that letters were invented by *Taaut*, who lived in Phœnicia in the 12th and 13th generations after the creation. "Miſor (ſays he) was the ſon of Hamyn; the ſon of Miſor was *Taaut*, who invented the firſt letters for writing." The Egyptians call him *Thoth*; the Alexandrians *Thoyth*; and the Greeks *Hermes*, or *Mercury*. In the time of this Taaut or Mercury, (the grandſon of Ham the ſon of Noah), Phœnicia and the adjacent country was governed by Uranus, and after him by his ſon Saturn or Cronus. He invented letters either in the reign of Uranus or Cronus; and ſtaid in Phœnicia with Cronus till the 32d year of his reign. Cronus, after the death of his father Uranus, made ſeveral ſettlements of his family, and travelled into other parts; and when he came to the ſouth country, he gave all Egypt to the god Taautus, that it ſhould be his kingdom. Sanchoniatho began his hiſtory with the creation, and ended it with placing Taautus on the throne of Egypt. He does not mention the deluge, but makes two more generations in Cain's line from Protagonus to Agrovenus (or from Adam to Noah than Moſes. As Sanchoniatho has not told us whether Taaut invented letters either in the reign of Uranus or Cronus, "we cannot err much (ſays Mr Jackſon) if we place his invention of them 550 years after the flood, or 20 years after the diſperſion, and 2619 years before the Chriſtian era, and ſix, or perhaps ten years, before he went into Egypt." This prince and his poſterity reigned at Thebes in Upper Egypt for 15 generations. Alphabet.

Several Roman authors attribute the invention of letters to the Phœnicians. Pliny ſays (A), the Phœnicians were famed for the invention of letters, as well as for aſtronomical obſervations and novel and martial arts. Curtius informs us, that the Tyrian nation are related to be the firſt who either taught or learned letters; and Lucan ſays, that they were the firſt who attempted to expreſs ſounds or words by letters. Euſebius alſo tells us from Porphyry, that "Sanchoniatho ſtudied with great application the writings of Taaut, knowing that he was the firſt who invented letters."

The Greeks, as we have already obſerved, knew no older Hermes than the ſecond, who lived about 400 years after the Mezrite Taaut or Hermes. This ſecond Hermes is called by Plato *Theuth*, and counſellor or ſacred ſcribe to King Thanius; but it is not ſaid that he ever reigned in Egypt: but the former Taaut, or Athothes, as Manetho calls him, was the immediate ſucceſſor of Menes the firſt king of Egypt. This ſecond Mercury, if we may believe Manetho, compoſed ſeveral books of the Egyptian hiſtory, and having improved both the language and letters of that nation, the Egyptians attributed the arts and inventions of the former to the latter. The Phœnician language is generally allowed to have been a dialect of the Hebrew; and though their alphabet does not entirely agree with the

(A) he ſays in another place, that the knowledge of letters is eternal. What dependance can we put in the opinion of a writer who thus contradicts himſelf?

Alphabet. the Samaritan, yet there is a great ſimilarity between them. Aſtronomy and arithmetic were much cultivated among them in the moſt early ages; their fine linen, purple, and glaſs, were much ſuperior to thoſe of other nations; and their extraordinary ſkill in architecture and other arts was ſuch, that whatever was great, elegant, or pleaſing, whether in buildings, apparel, or toys, was diſtinguiſhed by the epithet of Tyrian or Sidonian; theſe being the chief cities of Phœnicia. Their great proficiency in learning and arts of all kinds, together with their engroſſing all the commerce of the weſtern world, are likewiſe thought to give them a juſt claim to the invention of letters.

Of the Chaldeans. The Chaldeans alſo have laid claim to the invention of letters; and with regard to this, there is a tradition among the Jews, Indians, and Arabians, that the Egyptians derived their knowledge from Abraham, who was a Chaldean. This tradition is in ſome degree confirmed by moſt of the weſtern writers, who aſcribe the inventions of arithmetic and aſtronomy to the Chaldeans. Joſephus poſitively aſſerts, that the Egyptians were ignorant of the ſciences of arithmetic and aſtronomy before they were inſtructed by Abraham; and Sir Iſaac Newton admits, that letters were known in the line of that patriarch for many centuries before Moſes. The Chaldaic letters appear to have been derived from the Hebrew or Samaritan; which are the ſame, or nearly ſo, with the old Phœnician. Ezra is ſuppoſed to have exchanged the old Hebrew characters for the more beautiful and commodious Chaldee, which are ſtill in uſe. Beroſus, the moſt ancient Chaldean hiſtorian, who was born in the minority of Alexander the Great, does not ſay that he believed his countrymen to have been the inventors of letters.

Of the Syrians. The Syrians have alſo laid claim to the invention of letters. It is certain indeed, that they yielded to no nation in knowledge and ſkill in the fine arts. Their language is ſaid to have been the vernacular of all the oriental tongues, and was divided into three dialects. 1. The Aramean, uſed in Meſopotamia, and by the inhabitants of Roha and Edeſa of Harram, and the Outer Syria. 2. The dialect of Paleſtine; ſpoken by the inhabitants of Damaſcus, Mount Libanus, and the Inner Syria. 3. The Chaldee or Nabathean dialect, the moſt unpoliſhed of the three; and ſpoken in the mountainous parts of Aſſyria, and the villages of Irac or Babylonia. It has been generally believed, that no nation of equal antiquity had a more conſiderable trade than the Syrians: they are ſuppoſed to have firſt brought the commodities of Perſia and India into the weſt of Aſia; and they ſeem to have carried on an inland trade by engroſſing the navigation of the Euphrates, whilſt the Phœnicians traded to the moſt diſtant countries. Notwithſtanding theſe circumſtances, however, which might ſeem to favour the claim of the Syrians, the oldeſt characters they have are but about three centuries before Chriſt. Their letters are of two ſorts. 1. The Eſtrangelo, which is the more ancient; and, 2. The Eſhito, the ſimple or common character, which is the more expeditious and beautiful.

Of the Indians. We muſt next examine the claims of the Indians, whoſe pretenſions to antiquity yield to no other nation on earth. Mr Halhed, who has written a grammar of the Shanſcrit langurge, informs us, that it is not only the grand ſource of Indian literature, but the parent of almoſt every dialect from the Perſian gulf to the Chineſe ſeas, and which is ſaid to be a language of the moſt venerable antiquity. At preſent it is appropriated to religious records of the Bramins, and therefore ſhut up in their libraries; but formerly it appears to have been current over the greateſt part of the eaſtern world, as traces of its extent may be found in almoſt every diſtrict of Aſia. Alphabet.

Mr Halhed informs us, that "there is a great ſimilarity between the Shanſcrit words and thoſe of the Perſian and Arabic, and even of Latin and Greek; and theſe not in technical or metaphorical terms, but in the main ground-works of language; in monoſyllables, the names of numbers, and the appellations of ſuch things as would be firſt diſcriminated on the immediate dawn of civilization. The reſemblance which may be ſeen of the characters on the medals and ſignets of different parts of Aſia, the light they reciprocally throw upon one another, and the general analogy which they all bear to the grand prototype, affords another ample field for curioſity. The coins of Aſſam, Napaul, Caſhmiria, and many other kingdoms, are all ſtamped with Shanſcrit letters, and moſtly contain alluſions to the old Shanſcrit mythology. The ſame conformity may be obſerved in the impreſſions of ſeals from Boutan and Thibet."

The country between the Indus and Ganges ſtill preſerves the Shanſcrit language in its original purity, and offers a great number of books to the peruſal of the curious; many of which have been handed down from the earlieſt periods of human civilization.

There are ſeven different ſorts of Indian hand-writings, all compriſed under the general term of *Naagoree*, which may be interpreted *writing*. The Bramins ſay that letters were of divine original; and the elegant Shanſcrit is ſtyled *Daeb-naagoree*, or the writings of the Immortals, which might not improbably be a refinement from the more ſimple *Naagoree* of former ages. The Bengal letters are another branch of the ſame ſtock. The Bramins of Bengal have all their Shanſcrit books copied in their national alphabet, and they tranſpoſe into them all the Daeb-naagoree manuſcripts for their own peruſal. The Mooriſh dialect is that ſpecies of Hindoſtanic which we owe to the conqueſts of the Mahometans.

The Shanſcrit language contains about 700 radical words; the fundamental part being divided into three claſſes, viz. 1. *Dhaat*, or roots of verbs; 2. *Shubd*, or original nouns; 3. *Evya*, or particles. Their alphabet contains 50 letters; viz. 34 conſonants and 16 vowels. They aſſert that they were in poſſeſſion of letters before any other nation in the world; and Mr Halhed conjectures, that the long-boaſted original civilization of the Egyptians may ſtill be a matter of diſpute. The rajah of Kiſhinagur affirms, that he has in his poſſeſſion Shanſcrit books, where the Egyptians are conſtantly deſcribed as diſciples, not as inſtructors; and as ſeeking in Hindoſtan that liberal education, and thoſe ſciences, which none of their own countrymen had ſufficient knowledge to impart. Mr Halhed hints alſo, that the learning of Hindoſtan might have been tranſplanted into Egypt, and thus have become familiar to Moſes. Several authors, however, are of opinion, that the ancient Egyptians poſſeſſed themſelves of the trade of the Eaſt by the Red ſea, and that they carried

Alphabet. carried on a conſiderable traffic with the Indian nations before the time of Seſoſtris; whom they ſuppoſe to have been cotemporary with Abraham, though Sir Iſaac Newton conjectures him to have been the Shiſhak who took Jeruſalem in the time of Rehoboam.

In the year 1769, one of the ſacred books of the Gentoos called *Bagavadam*, tranſlated by Meridas Poule, a learned man of Indian origin, and chief interpreter to the ſupreme council of Pondicherry, was ſent by him to M. Berten in France. In his preface he ſays, that it was compoſed by Viaſſar the ſon of Brahma, and is of ſacred authority among the worſhippers of Viſchnow. This book claims an antiquity of 5000 years; but M. de Guines has ſhown, that its pretenſions to ſuch extravagant antiquity are entirely inconcluſive and unſatisfactory: whence we may conclude, ſays Mr Aſtle, that though a farther inquiry into the literature of the Indian nations may be laudable, yet we muſt by no means give too eaſy credit to their relations concerning the high antiquity of their manuſcripts and early civilization.

Letters not invented in Perſia; It is not pretended that the Perſians had any great learning among them till the time of Hyſtaſpes the father of Darius. The former, we are told, travelled into India, and was inſtructed by the Bramins in the ſciences for which they were famed at that time. The ancient Perſians deſpiſed riches and commerce, nor had they any money among them till after the conqueſt of Lydia. It appears by ſeveral inſcriptions taken from the ruins of the palace of Perſepolis, which was built near 700 years before the Chriſtian era, that the Perſians ſometimes wrote in perpendicular columns like the Chineſe. This mode of writing was firſt made uſe of on the ſtems of trees, pillars, or obeliſks. As for thoſe ſimple characters found on the weſt ſide of the ſtaircaſe of Perſepolis, ſome have ſuppoſed them to be alphabetic, ſome hieroglyphic, and others antediluvian. Dr Hyde pronounces them to have been mere whimſical ornaments, though the author of Conjectural Obſervations on Alphabetic Writing ſuppoſes them to be fragments of Egyptian antiquity brought by Cambyſes from the ſpoils of Thebes. The learned are generally agreed, that the Perſians were later in civilization than many of their neighbours; and they are not ſuppoſed to have any pretenſions to the invention of letters.

As the Arabians have been in poſſeſſion of the country they now inhabit for upwards of 3700 years, without being intermixed with foreign nations, or ſubjugated by any other power, their language muſt be very ancient. The two principal dialects of it were that ſpoken by the Hamyarites and other genuine Arabs; and that of the Koreiſh, in which Mahomet wrote the Alcoran. The former is named by oriental writers, the *Arabic of Hamyar*; the latter, *the pure* or *defecated Arabic*. Mr Richardſon obſerves, as a proof of the richneſs of this language, that it conſiſts of 2000 radical words.

nor by the Arabians.

The old Arabic characters are ſaid to have been of very high antiquity; for Ebn Haſhem relates, that an inſcription in it was found in Yaman as old as the days of Joſeph. Hence ſome have ſuppoſed, that the Arabians were the inventors of letters; and Sir Iſaac Newton is of opinion, that Moſes learned the alphabet from the Midianites, who were Arabians.

The alphabet of the Arabs conſiſts of 28 letters ſimilar to the ancient Cufic, in which the firſt copies of the Alcoran were written. The preſent Arabic characters were formed by Ebn Moklah, a learned Arabian who lived about 300 years after Mahomet. The Arabian writers themſelves inform us, that their alphabet is not very ancient, and that they received it only a ſhort time before the introduction of Iſlamiſm. Alphabet.

On this account of the pretenſions of different nations to the invention of letters, Mr Aſtle makes the following reflections: "The vanity of each nation induces them to pretend to the moſt early civilization; but ſuch is the uncertainty of ancient hiſtory, that it is difficult to determine to whom the honour is due. It ſhould ſeem, however, that the conteſt may be confined to the Egyptians, the Phœnicians, and the Chaldeans. The Greek writers, and moſt of thoſe who have copied them, decide in favour of Egypt, becauſe their information is derived from the Egyptians themſelves. The poſitive claim of the Phœnicians does not depend entirely upon the teſtimony of Sanchoniatho; the credit of his hiſtory is ſo well ſupported by Philo of Byblus his tranſlator, Porphyry, Pliny, Curtius, Lucan, and other ancient writers, who might have ſeen his works entire, and whoſe relations deſerve at leaſt as much credit as thoſe of the Egyptian and Greek writers. It muſt be allowed, that Sanchoniatho's hiſtory contains many fabulous accounts; but does not the ancient hiſtory of the Egyptians, the Greeks, and moſt other nations, abound with them to a much greater degree? The fragments which we have of this moſt ancient hiſtorian are chiefly furniſhed by Euſebius, who took all poſſible advantages to repreſent the Pagan writers in the worſt light, and to render their theology abſurd and ridiculous. Letters moſt probably invented in Phœnicia.

"The Phœnician and Egyptian languages are very ſimilar; but the latter is ſaid to be more large and full, which is an indication of its being of a later date. The opinion of Mr Wiſe, however, that the ancient Egyptians had not the knowledge of letters, ſeems to be erroneous; as they had commercial intercourſe with their neighbours the Phœnicians, they probably had the knowledge of letters, if their policy, like that of the Chineſe at this day, did not prohibit the uſe of them.

"The Chaldeans, who cultivated aſtronomy in the moſt remote ages, uſed ſymbols or arbitrary marks in their calculations; and we have ſhewn that theſe were the parents of letters. This circumſtance greatly favours their claim to the invention: becauſe Chaldea, and the countries adjacent, are allowed by all authors, both ſacred and profane, to have been peopled before Egypt; and it is certain, that many nations ſaid to be deſcended from Shem and Japheth, had their letters from the Phœnicians, who were deſcended from Ham.

"It is obſervable that the Chaldeans, the Syrians, Phœnicians, and Egyptians, all bordered upon each other; and as the Phœnicians were the greateſt as well as the moſt ancient commercial nation, it is very probable that they communicated letters to the Egyptians, the ports of Tyre and Sidon being not far diſtant from each other.

"Mr Jackſon is evidently miſtaken when he ſays that letters were invented 2619 years before the birth of Chriſt. The deluge recorded by Moſes was 2349 years

Alphabet. years before that event; and if letters were not invented till 550 years after, as he asserts, we must date their discovery only 1799 years before the Christian era, which is 410 years after the reign of Menes, the first king of Egypt, who, according to Syncellus and others, is said to have been the same person with the Misor of Sanchoniatho, the Mizraim of the Scriptures, and the Osiris of the Egyptians; but whether this be true or not, Egypt is frequently called in Scripture *the land of Mizraim*.

"This Mizraim, the second son of Amyn or Ham, seated himself near the entrance of Egypt at Zoan, in the year before Christ 2188, and 160 years after the flood. He afterwards built Thebes, and some say Memphis. Before the time that he went into Egypt, his son Taaut had invented letters in Phœnicia; and if this invention took place ten years before the migration of his father into Egypt, as Mr Jackson supposes, we may trace letters as far back as the year 2178 before Christ, or 150 years after the deluge recorded by Moses; and beyond this period, the written annals of mankind, which have been hitherto transmitted to us, will not enable us to trace the knowledge of them; though this want of materials is no proof that letters were not known until a century and a half after the deluge. As for the pretensions of the Indian nations, we must be better acquainted with their records before we can admit of their claim to the first use of letters; especially as none of their manuscripts of any great antiquity have as yet appeared in Europe. That the Arabians were not the inventors of letters, has appeared by their own confession. Plato somewhere mentions Hyperborean letters very different from the Greek; these might have been the characters used by the Tartars, or ancient Scythians.

Of Antediluvian writing. "It may be expected that something should be said concerning those books mentioned by some authors to have been written before the deluge. Amongst others, Dr Parsons, in his Remains of Japheth, p. 346, 359, supposes letters to have been known to Adam; and the Sabeans produce a book, which they pretend was written by Adam. But concerning these we have no guide to direct us any more than concerning the supposed books of Enoch; some of which, Origen tells us, were found in Arabia Felix, in the dominions of the queen of Saba. Tertullian affirms, that he saw and read several pages of them: and, in his treatise *De Habitu Mulierum*, he places those books among the canonical: but St Jerome and St Austin look upon them to be apocryphal. William Postellus pretended to compile his book, *De Originibus*, from the book of Enoch; and Thomas Bangius published at Copenhagen, in 1657, a work which contains many singular relations concerning the manner of writing among the Antediluvians, which contains several pleasant stories concerning the books of Enoch.

"With regard to this patriarch, indeed, St Jude informs us that he *prophesied*, but he does not say that he *wrote*. The writings, therefore, attributed to the Antediluvians, must appear quite uncertain; though it might be improper to assert that letters were unknown before the deluge recorded by Moses." Alphabet.

Our author proceeds to show, that all the alphabets in the world cannot be derived from one original; because there are a variety of alphabets used in different parts of Asia, which vary in name, number, figure, order, and power, from the Phœnician, ancient Hebrew, or Samaritan. In several of these alphabets also, there are marks for sounds peculiar to the languages of the East, which are not necessary to be employed in the notation of the languages of Europe. All the alphabets in the world cannot be proved to arise from one original.

None of the alphabets to the east of Persia have any connexion with the Phœnician or its derivatives, except where the Arabic letters have been introduced by the conquests of the Mahometans. The foundation of all the Indian characters are those called *Shanscrit* or *Sungscrit*. This signifies something brought to perfection, in contradistinction to *Prakrit*, which signifies vulgar or unpolished. Hence the refined and religious language and characters of India are called *Sungscrit*, and the more vulgar mode of writing and expression *Prakrit*. From this Shanscrit are derived the sacred characters of Thibet, the Cashmirian, Bengalese, Malabaric, and Tamoul; the Singalese, Siamese, Maharattan, Concanee, &c. From the same source we may derive the Tangutic or Tartar characters, which are similar in their great outlines to the Shanscrit; though it is not easily determined which is derived from the other. The common Tartar is generally read, like the Chinese, from top to bottom.

There are, however, several alphabets used in different parts of Asia, entirely different not only from the Shanscrit and all those derived from it, but also from the Phœnician and those which proceed from it. Some of these are the alphabet of Pegu, the *Batta* characters used in the island of Sumatra, and the *Barman* or *Boman* characters used in some parts of Pegu. The names and powers of the letters of which these alphabets are composed, differ entirely from the Phœnician, or those derived from them. It is impossible to assimilate their forms; and indeed it is by no means easy to conceive how the 50 letters of the Shanscrit language could be derived from the Phœnician alphabet, which consisted originally only of 13; though it is certain, that by far the greater number of alphabets now in use are derived from the ancient Hebrew, Phœnician, or Samaritan.

Mr Astle next proceeds to consider what alphabets are derived from the Phœnician. These he supposes to have been immediately the ancient Hebrew or Samaritan; the Chaldaic; the Bastulian (A) or Spanish Phœnician; the Punic, Carthaginian, or Sicilian; and the Pelasgian. From the ancient Hebrew proceeded the Chaldaic or square Hebrew; the round Hebrew; and what is called the *running hand of the Rabbins*. The Pelasgian gave birth to the Etruscan, Eugubian or Umbrian, Oscan, Samnic, and Ionic Greek, written from the left. From the Chaldaic or square Hebrew are derived the Syriac, and the ancient and modern Arabic. The Syriac is divided into the Estrangelo and Alphabets derived from the Phœnician.

(A) The Bastuli are said to have been a Canaanitish or Phœnician people who fled from Joshua, and settled afterwards in Spain.

Alphabet. and Mendæan, and the modern Arabic has given riſe to the Perſian and Turkiſh. From the ancient Arabic are derived the Cufic or Oriental, the Mauritanic or Occidental, the African or Saracen, and the Mooriſh. The Ionic Greek gave riſe to the Arcadian, Latin, ancient Gauliſh, ancient Spaniſh, ancient Gothic, Coptic, Ethiopic, Ruſſian, Illyrian, or Sclavonic, Bulgarian, and Armenian. From the Roman are derived the Lombardic, Viſigothic, Saxon, Gallican, Franco-Gallic or Merovingian, German, Caroline, Capetian, and modern Gothic.

The Punic letters are alſo called *Tyrian*, and were much the ſame with the Carthaginian or Sicilian. The Punic language was at firſt the ſame with the Phœnician; it is nearly allied to the Hebrew, and has an affinity with the Chaldee and Syriac. Some remains of it are to be met with in the Malteſe. To make a complete Punic, Carthaginian, or Sicilian alphabet, we muſt admit ſeveral pure Phœnician letters.

The Pelaſgi were likewiſe of Phœnician original; and, according to Sanchoniatho, the Dioſcuri and Cabiri wrote the firſt annals of the Phœnician hiſtory, by order of Taaut, the inventor of letters. They made ſhips of burthen; and being caſt upon the coaſt near Mount Caſius, about 40 miles from Peluſium, where they built a temple in the ſecond generation after the deluge related by Moſes, they were called *Pelaſgi*, from their paſſing by ſea, and wandering from one country to another. Herodotus informs us, that the Pelaſgi were deſcendants of the Phœnician Cabiri, and that the Samothracians received and practiſed the Cabiric myſteries from them. The Pelaſgic alphabet prevailed in Greece till the time of Deucalion, when the Pelaſgi were driven out of Theſſaly or Oenotria by the Hellenes; after which ſome of them ſettled at the mouth of the Po, and others at Croton, now *Cortona* in Tuſcany. Their alphabet conſiſted of 16 letters, and the Tyrrhenian alphabet, brought into Italy before the reign of that prince conſiſted of no more than 13. Deucalion is ſaid to have reigned about 820 years after the deluge, and 1529 before the Chriſtian era.

That the Tyrrheni, Tyrſeni or Hetruſci, ſettled in Italy long before this period, appears from the teſtimony of Herodotus, who informs us, that a colony went by ſea from Lydia into Italy under Tyrrhenus; and Dionyſius of Halicarnaſſus proves that many authors called them Pelaſgi. He then cites Hellanicus Leſbicus, an author ſomewhat more ancient than Herodotus, to prove, that they were firſt called *Pelaſgi Tyrrheni*; and when they paſſed into Italy, they ſettled in that part of it called *Etruria*. Their emigration took place about the year of the world 2011, or 1993 years before the Chriſtian era, which is 350 years before the Pelaſgi left Greece. Biſhop Cumberland adduces many proofs to ſhow that the Tyrrhenians originally came out of Lydia into Italy. Several Roman authors alſo ſpeak of this Lydian colony; and Horace compliments his patron Mæcenas upon his Lydian deſcent:

Lydorum quicquid Etruſcos
Incoluit fines, nemo generoſior eſt te.

The Etruſcan letters are Pelaſgic, and ſeveral of the Etruſcan inſcriptions are written in the Pelaſgic language. The Roman letters are Ionic. The Oſcan language was a dialect of the Etruſcan; their characters are nearer the Ionic or Roman than the Etruſcan. There is alſo very little difference between the Pelaſgian, Etruſcan, and moſt ancient Greek letters, which are placed from right to left. The Arcadians were ancient Greeks, and uſed the Ionic letters; but at what time they began to write from left to right is not known, as their chronology is very uncertain. The Etruſcan, Oſcan, and Samnite alphabets, are derived from the Pelaſgic; they differ from each other more in name than in form; but a far greater number are derived from the Ionic Greek, namely, the Arcadian, the Latin or Roman, and the others already enumerated.—The Runic is immediately derived from the Gothic. Alphabet.

According to Dionyſius of Halicarnaſſus, the firſt Greek colony which came into Italy conſiſted of Arcadians, under the conduct of Oenotrus, the ſon of Lycaon, and fifth in deſcent from Phoroneus, the firſt king of Argos, who reigned about 566 years before the taking of Troy, and 1750 years before the Chriſtian era. Theſe Oenotrians were called *Aborigines*; and after they had been engaged for many years in a war with the Siculi, entered into an alliance with a colony of the Pelaſgi, who came out of Theſſaly into Italy, after having been driven from the former country. About 1476 B. C. another colony of the Pelaſgi, who had been driven out of Theſſaly by the Curetes and Leleges, arrived in Italy, where they aſſiſted the Aborigines to drive out the Siculi, poſſeſſing themſelves of the greateſt part of the country between the Tiber and the Liris, and building ſeveral cities. Solinus and Pliny tell us, that the Pelaſgi firſt carried letters into Italy; and the latter diſtinguiſhes between the Pelaſgi and the Arcades; ſo the letters firſt carried into Italy were not the Ionic Greek, but thoſe more ancient Pelaſgic characters which the Pelaſgi carried with them before Deucalion and Cadmus are ſaid to have come into Bœotia and Theſſaly. The ſtory of Cadmus is much involved in fable; but it is agreed by moſt of the ancients, that the children of Agenor, viz. Cadmus, Europa, Phœnix, and Cilix, carried with them a colony, compoſed of Phœnicians and Syrians, into Aſia Minor, Crete, Greece, and Libya, where they introduced letters, muſic, poetry, and other arts, ſciences, and cuſtoms, of the Phœnicians.

Dionyſius enumerates the following Greek colonies which came into Italy: 1. The Aborigines under Oenotrus, from Arcadia. 2. The Pelaſgic colony, which came from Hœmonia or Theſſaly. 3. Another Arcadian colony, which came with Evander from Palantium. 4. Thoſe who came from Peloponneſus with Hercules; and, 5. Thoſe who came with Æneas from Troy. It is not eaſy to diſcover when the Ionic way of writing from left to right was introduced into Italy; but it is certain, that it did not univerſally prevail even in Greece till ſeveral ages after it was found out. The Athenians did not comply with it till the year of Rome 350; nor was it practiſed by the Samnites even in the 6th century of that city, or 230 years before Chriſt: for M. Gœbelin, vol. vi. Pl. 2. gives us the Samnite alphabet of that century, wherein the letters are placed from right to left; although the Ionic way of writing prevailed in ſome parts of Italy in the third century of Rome. "In time (ſays Pliny) the tacit conſent of all

Alphabet

nations agreed to uſe the Ionic letters. The Romans conſented to this mode about the time of Tarquinius Priſcus, their fifth king." The letters brought by Demaratus the Corinthian, the father of Tarquin, Mr Wiſe thinks, muſt have been the new or Ionic alphabet, and not the ſame with that brought by Evander 500 years before. After the Romans had eſtabliſhed the uſe of the Ionic letters, they ſeem not to have acknowledged the Pelaſgian and Etruſcan to have been Greek alphabets: the moſt learned of them knew none older than the Ionic, as appears from the Greek Farneſe inſcriptions of Herodes Atticus. This learned man, out of a regard to antiquity, cauſed the oldeſt orthography to be obſerved in the writing, and the letters to be delineated after the moſt antique forms that could be found; and they are plainly no other than the Ionic or right-handed characters.

See Plates XV. and XVI. for ſpecimens of the ancient alphabets here enumerated.

The ancient Gauliſh letters are derived from the Greek, and their writing approaches more nearly to the Gothic than that of the Romans: this appears by the monumental inſcription of Gordian, meſſenger of the Gauls, who ſuffered martyrdom in the third century, with all his family. Theſe ancient Gauliſh characters were generally uſed by the people before the conqueſt of Gaul by Cæſar; but after that time the Roman letters were gradually introduced. The ancient Spaniards uſed letters nearly Greek before their intercourſe with the Romans. The ancient Gothic alphabet was very ſimilar to the Greek, and is attributed to Ulphilas, biſhop of the Goths, who lived in Mæſia about 370 years after Chriſt. He tranſlated the Bible into the Gothic tongue. This circumſtance might have occaſioned the tradition of his having invented theſe letters; but it is probable that theſe characters were in uſe long before this time. The Runic alphabet is derived from the ancient Gothic.

The Coptic letters are derived immediately from the Greek. Some have confounded them with the ancient Egyptian; but there is a very material difference between them. The Ethiopic alphabet is derived from the Coptic.

The alphabet proceeding from that of the Scythians eſtabliſhed in Europe, is the ſame with what St Cyril calls the *Servien*. The Ruſſian, Illyrian, or Sclavonic, and the Bulgarian, are all derived from the Greek. The Armenian letters differ very much from the Greek, from which they are derived, as well as from the Latin.

Alphabets derived from the Latin.

With regard to the alphabets derived from the Latin, the Lombardic relates to the manuſcripts of Italy; the Viſigothic to thoſe of Spain; the Saxon to thoſe of England; the Gallican and Franco-Gallic or Merovingian to the manuſcripts of France; the German to thoſe of that country; and the Caroline, Capetian, and Modern Gothic, to all the countries of Europe who read Latin. The firſt ſix of theſe alphabets are before the age of Charlemagne, the laſt three poſterior to it. They are more diſtinguiſhed by their names than the forms of their characters; and the former indicate all of them to have been of Roman extraction. Each nation, in adopting the letters of the Romans, added a taſte and manner peculiar to itſelf; which obviouſly diſtinguiſhed it from the writings of all other people; whence aroſe the differences between the writings of the Lombards, Spaniards, French, Saxons, Germans, and Goths, and all the ſtrange terms obſervable in the writings of the Francic Gauls or Merovingians; and thoſe of the Carlovingians, their ſucceſſors, may be traced from the ſame ſource. From theſe diſtinctions the name of *national writing* was derived. Alphabet.

The writing of Italy was uniform till the irruption of the Goths, who diſfigured it by their barbarous taſte. In 569, the Lombards, having poſſeſſed themſelves of all Italy, excepting Rome and Ravenna, introduced that form of writing which goes under their name; and as the popes uſed the Lombardic manner in their bulls, the name of *Roman* was ſometimes given to it in the 11th century; and though the dominion of the Lombards continued no longer than 206 years, the name of their writing continued in Italy from the 7th to the 13th century, and then ceaſed; when learning having declined in that as well as in other countries, the manner of writing degenerated into the modern Gothic.

The Viſigoths introduced their form of writing into Spain, after having overrun that country; but it was aboliſhed in a provincial ſynod, held at Leon in 1091, when the Latin characters were eſtabliſhed for all public inſtruments, though the Viſigothic were uſed in private writings for three centuries afterwards.

The Gauls, on being ſubjected by the Romans, adopted their manner of writing; but by ſubſequent additions of their own, their characters were changed into what is called the *Gallican* or *Roman Gallic* mode. This was changed by the Franks into the *Franco-Gallic* or *Merovingian* mode of writing, being practiſed under the kings of the Merovingian race. It took place towards the cloſe of the ſixth century, and continued till the beginning of the ninth.

The German mode of writing was improved by Charlemagne; and this improvement occaſioned another diſtinction in writing, by introducing the alphabet named *Caroline*, which declined in the 12th century, and was ſucceeded in the 13th by the modern Gothic. In France it had degenerated by the middle of the 10th century, but was reſtored in 987 by Hugh Capet, whence it obtained the name of *Capetian*. It was uſed in England, as well as Germany and France.

The modern Gothic, which ſpread itſelf all over Europe in the 12th and 13th centuries, is improperly named, as not deriving its origin from the writing anciently uſed by the Goths. It is, however, the worſt and moſt barbarous way of writing, and originated among the ſchoolmen in the decline of the arts; being indeed nothing elſe than Latin writing degenerated. It began in the 12th century, and was in general uſe, eſpecially among monks and ſchoolmen, in all parts of Europe, till the reſtoration of arts in the 15th century, and continued longer in Germany and the northern nations. Our ſtatute books are ſtill printed in Gothic letters. The moſt barbarous writing of the ſeventh, eighth, and ninth centuries, was preferable to the modern Gothic. It is diverſified in ſuch a manner as can ſcarce admit of deſcription; and the abbreviations uſed by the writers were ſo numerous, that it became very difficult to read it; which was one of the great cauſes of the ignorance of thoſe times. Along with this, however,

Alphabet. however, the Lombardic, Gothic, Roman, Caroline, and Capetian modes of writing, were occaſionally uſed by individuals.

The idea that all the alphabets above mentioned are derived from the Roman, tends to prove the diſtinction of national writing, and is of great uſe in diſcovering the age of manuſcripts: for though we may not be able exactly to determine the time when a manuſcript was written, we may be able nearly to aſcertain its age. For example, if a writing is Merovingian, it may be declared not to be poſterior to the 9th, nor prior to the 5th, century. If another be Lombardic, it may be affirmed to be poſterior to the middle of the 6th, and prior to the 13th. Should it be Saxon, it cannot be of an earlier date than the 7th, nor later than about the middle of the 12th.

Letters could not take place but from a decompoſition of language.

Having conſidered whence the alphabets now in uſe throughout the various nations of the world are derived, it remains to ſay ſomething concerning them as the elements of words, or how far they are capable of expreſſing thoſe ſounds which, by proper combination and arrangement, conſtitute articulate language. The number of ſimple ſounds in any language cannot be very numerous; and it is plainly theſe ſimple ſounds alone that we have occaſion to repreſent by alphabetical characters. Hence the perſon who firſt invented letters muſt have been capable of analyzing language in a manner which ſeems by no means eaſy to do, and concerning which even the learned among ourſelves are not yet agreed. It is this difficulty which has produced the great diverſity in the number of alphabetical characters uſed by different nations; and where we ſee a vaſt number of them uſed, we may account the writing not the better, but much the worſe for it; and whoever the pretended inventor was, it is more reaſonable to ſuppoſe that he diſfigured an alphabet already invented, by unneceſſary additions, than that he was the author of one himſelf.

Probably not the reſult of a progreſſive revolution of the human powers.

When we conſider alphabetical characters as thus reſulting from an analyſis of language, it will by no means appear probable that it was derived from a gradual and progreſſive operation of the human mind through many ages. There is not the leaſt affinity betwixt repreſenting any object by a picture and finding out the ſounds which compoſe the word by which it is expreſſed: nor, though a nation had been in uſe to repreſent things either in this method, or by any kind of arbitrary marks, for thouſands of years, could the one ever have led to the other. Arbitrary marks muſt always be the ſame with pictures in this reſpect, that they muſt always be fixed to particular objects, and thus be increaſed *ad infinitum*. Letters, on the other hand, are indifferent to all objects; and therefore, by their combinations, which are more numerous than as many arbitrary marks as we could remember, may expreſs all the objects in nature. This might furniſh an argument of ſome ſtrength for the divine revelation of writing, were it not that other arts, ſeemingly as uſeful, and as difficult to be invented, had not been expreſsly aſcribed to particular perſons whom we cannot ſuppoſe to have been divinely inſpired. Thus metallurgy, muſic, the keeping of cattle, and uſe of tents, are all aſcribed to a ſingle family; and though writing be not expreſsly mentioned as an invention in Scripture, there is Alphabet. no reaſon to have recourſe to a revelation for it as long as the human faculties are known to have been ſufficient for the invention of it. Nevertheleſs, if we take a review of the different arts which mankind have invented, we ſhall find, that few of them reſulted from any gradual progreſs or evolution of the powers of the human mind, but rather by ſome ſudden and almoſt unaccountable turn of thought in an individual. Thus, the art of printing, little inferior in its utility to that of writing, lay hid for ages, and was at laſt invented we ſcarce know how; ſo that if one inclined to ſuppoſe this a divine revelation, he could be at little loſs for arguments to ſupport his hypotheſis. This was what all the inventions and evolutions of human powers ſince the creation had never been able to accompliſh; yet nobody believes that it required ſupernatural abilities to be the author of this art, becauſe we ſee plainly that it might have occurred to the human mind from various ſources, and are ſurpriſed that it did not occur long before. In like manner, the method of accounting for the celeſtial motions by the united forces of projection and gravitation, was no reſult of the progreſs that mankind had made in ſcience, but luckily occurred to Mr Horrox, without any thing that we know to direct him, or perhaps from cauſes almoſt unknown to himſelf. Thus, alſo, the ſteam engine, aeroſtation, &c. were ſuddenly invented only by a ſlight review of principles well known before, and which had been a thouſand times overlooked by thoſe who might have invented both. Alphabetic writing, therefore, might have been no deduction from hieroglyphic or picture writing, from which it is eſſentially different; and it ſeems to be ſome confirmation of this, that all nations who ever pretended to the invention of letters, have aſcribed it to the labours of one particular perſon, without taking notice of the progreſs made towards it in preceding ages.

Of the elementary ſounds of language.

The learned author of Hermes informs us, that to about 20 plain elementary ſounds we owe that variety of articulate voices which have been ſufficient to explain the ſentiments of ſuch an innumerable multitude as all the paſt and preſent generations of men. Mr Sheridan ſays, that the number of ſimple ſounds in our tongue is 28; while Dr Kenrick ſays, that we have only 11 diſtinct ſpecies of articulate ſounds, which even by contraction, prolongation, and compoſition, are increaſed only to the number of 16; every ſyllable or articulate ſound in our language being one of the number. Biſhop Wilkins and Dr William Holder ſpeak of 33 diſtinct ſounds.

After the analyſis or decompoſition of language into the elementary ſounds, the next ſtep towards the notation of it by alphabetical characters, would be the delineation of a ſeparate mark or letter to repreſent each ſound; which marks, though few in number, would admit of ſuch a variety of arrangements and combinations, as might be capable of producing that infinity of articulate ſounds which compoſe language. The ingenious Wachter, in his *Naturæ et Scripturæ Concordia*, p. 64. endeavours to ſhow, that ten marks or characters are ſufficient for this purpoſe. His ſcheme is as follows:

Alphabet.

Genus.	*Figura.*	*Poteſtas.*
Vocal.	O	a. e. i. o. u.
Guttural.	O |	k. c. ch. q. g. h.
Lingual.	<	l.
Lingual.	Z	d. t.
Lingual.	⊃	r.
Dental.	⊓	f.
Labial.	3	b. p.
Labial.	ᗰ	m.
Labial.	⊏	s. ph. v. w.
Naſal.	ᴬ	n.

If this is the caſe, then the moſt ſimple alphabet, which conſiſted only of 13 letters, muſt have been abundantly ſufficient to anſwer all the purpoſes of mankind, and much of our twenty-four letter alphabet may appear ſuperfluous. That able mathematician Tacquet has calculated the various combinations of the 24 letters, even without any repetition, to amount to no fewer than 620,448,401,733,239,439,360,000; while Clavius makes them only 5,852,616,738,497,664,000. Either of theſe numbers, however, is *infinite* to the human conceptions, and much more than ſufficient to expreſs all the ſounds that ever were articulated by man.

Number of letters in different alphabets.

As there are more ſounds in ſome languages than in others, it follows of courſe that the number of elementary characters or letters muſt vary in the alphabets of different languages. The Hebrew, Samaritan, and Syriac alphabets, have 22 letters; the Arabic 28; the Perſian, and Egyptian or Coptic, 32; the preſent Ruſſian 41; the Shanſcrit 50; while the Caſhmirian and Malabaric are ſtill more numerous. The following is the ſcheme of the Engliſh alphabet, as given by Mr Sheridan in his Rhetorical Grammar, p. 9.

Number of ſimple ſounds in our tongue 28.

Mr Sheridan obſerves, that our alphabet is ill calculated for the notation of the Engliſh tongue, as there are many ſounds for which we have no letters or marks: and there ought to be nine more characters or letters to make a complete alphabet, in which every ſimple ſound ought to have a mark peculiar to itſelf. The reaſon of the deficiency is, that the Roman alphabet was formerly adopted for the notation of the Engliſh language, though by no means ſuited to the purpoſe.

Imperfection in the Engliſh alphabet.

It now remains only to take ſome notice of the forms of the different letters; ſome knowledge of which is abſolutely neceſſary for aſcertaining the age and authenticity of inſcriptions, manuſcripts, charters, and ancient records. Many authors are of opinion, that letters derive their forms from the poſitions of the organs of ſpeech in their pronunciation. Van Helmont has taken great pains to prove, that the Chaldaic characters are the genuine alphabet of nature; becauſe, according to him, no letter can be rightly ſounded without diſpoſing the organs of ſpeech into an uniform poſition with the figure of each letter; and in ſupport of this ſyſtem, he has anatomized the organs of articulation.

Of the forms of letters.

Mr Nelme has endeavoured to ſhow, that all elementary characters or letters derive their forms from the line and the circle. His alphabet conſiſts of 13 radical letters, four diminiſhed and four augmented.—The radicals are L, O, S, A, B, C, D, N, U, I, E, M, R. —H, according to him, is derived from A; P from B; T from D; and F from U: theſe are called diminiſhed letters. The augmented ones are, Z from S; G from C; W from U; and Y from I. He proves that his characters are very ſimilar to thoſe of the ancient Etruſcans: but all characters are compoſed either of lines and circles of the former, or of parts of the latter.—Mr Gebelin deduces them from hieroglyphic repreſentations; and has given ſeveral delineations of human figures, trees, &c. in confirmation of his hypotheſis.

One of the moſt ſimple alphabets has been formed by making two perpendicular and two horizontal lines:

a|b|c
d|e|f.
g|h|i.

Thus, From which may be deduced nine different characters or letters: Thus,

Nine

; and as many more as may be ſufficient for the notation of any language, by adding two or more points to each character. Though theſe ſquare characters are not calculated for deſpatch; yet they may be made as expeditiouſly, or more ſo, than the Tartar, the Bramin, the Caſhmirian, or many others. Writing compoſed of theſe characters, is at firſt ſight ſomewhat like the Hebrew.—Mr Dow, author of the Hiſtory of Indoſtan, lately formed a new language and alphabet. This language, and the characters formed for its notation, were ſo eaſy, that a female of his acquaintance acquired the knowledge of them in three weeks, and correſponded with him therein during their intimacy.

New language invented by Mr Dow.

ALPHÆNIX, white barley-ſugar, to which is given an extraordinary name, to render it more valuable. This ſugar, which is thought good for colds, is made of common ſugar, which is boiled until it becomes eaſy to crack, when they pour it upon a marble table, greaſed with oil of ſweet almonds, and mould it into various figures with a braſs crotchet. It is eaſily falſified with ſtarch.

ALPHERY, Mikiphlr, an Engliſh divine, was born in Ruſſia, and of the imperial line. When that country was diſtracted by inteſtine commotions, in the latter end of the 16th century, and the royal houſe particularly was ſo ſeverely perſecuted by impoſtors, this gentleman and his two brothers were ſent over to England, and recommended to the care of Mr Joſeph Bidell a Ruſſia merchant. Mr Bidell, when they were of age fit for the univerſity, ſent them to Oxford, where the ſmallpox unhappily prevailing, two of them died of it. We know not whether this ſurviving brother took any degrees or not, but it is very probable he did, ſince he entered into holy orders; and in the year 1618, was preſented to the rectory of Wooley in Huntingdonſhire, a living of no very conſiderable value, being rated under 10l. in the king's books. Here he did his duty with great cheerfulneſs and alacrity; and although he was twice invited back to his native country by ſome who would have ventured their utmoſt to have ſet him on the throne of his anceſtors, he choſe rather to remain with his flock, and to ſerve God in the humble ſtation of a pariſh prieſt. Yet in 1643, he underwent the ſevereſt trials from the rage of the fanatics; who, not ſatisfied with depriving him of his living, inſulted him in the moſt barbarous manner; for, having procured a file of muſqueteers to pull him out of his pulpit, as he was preaching on a Sunday, they turned his wife and ſmall children into the ſtreet, into which alſo they threw his goods. The poor man in this diſtreſs raiſed a tent under ſome trees in the churchyard, over againſt his houſe, where he and his family lived for a week. One day having gotten a few eggs, he picked up ſome rotten wood and dry ſticks, and with theſe made a fire in the church porch, in order to boil them; but ſome of his adverſaries, to ſhow how far they could carry their rage againſt the church (for this poor man was ſo harmleſs they could have none againſt him), came and kicked about his fire, threw down his ſkillet, and broke his eggs. After this, having ſtill a little money, he made a ſmall purchaſe in that neighbourhoud, built a houſe, and lived there ſome years. He was encouraged to this by the Preſbyterian miniſter, who came in his room, who honeſtly paid him the fifth part of the annual income of the living, which was the allowance made by parliament to ejected miniſters, treated him with great humanity, and did him all the ſervices in his power. It is a great misfortune that this gentleman's name is not preſerved, his conduct in this reſpect being the more laudable, becauſe it was not a little ſingular. Afterwards, probably on the death or removal of this gentleman, Mr Alphery left Huntingdonſhire, and came and reſided at Hammerſmith till the Reſtoration put him in poſſeſſion of his living again. He returned on this occaſion to Huntingdonſhire, where he did not ſtay long; for being upwards of 80, and withal very infirm, he could not perform the duties of his function. Having, therefore, ſettled a curate, he retired to his eldeſt ſon's houſe at Hammerſmith, where ſoon after he died, much honoured and reſpected, and affording a remarkable inſtance of the viciſſitudes of the world.

Alpheus, Alphonſin.

ALPHEUS, (Strabo); Alphius, (Ptolemy); a noted and large river of the Peloponneſus; which, riſing in, and after ſeveral windings running through, Arcadia, and by Olympia in Elis, with a ſouth-weſt courſe, falls into the Sinus Chelonites, about ten miles to the ſouth of Olympia. It has a common ſpring with the Eurotas, at the foot of Mount Parthenius, near the village Aſea, (Strabo). The Alpheus and Eurotas mix and run together for 20 ſtadia; after which, they enter a ſubterraneous paſſage at Mantinea; then again emerge, the Eurotas in Laconia, and the Alpheus in the territory of Megalopolis, (Pauſanias). The poets fable ſtrange things of this river, particularly, that out of love to the nymph *Arethuſa*, it runs under the ſea to Sicily, and burſts out at the fountain of that name in Syracuſe, (Virgil). Its waters were reckoned good in the leproſy, which is called Αλφος by the Greeks; and hence the name *Alpheus*. On the banks of this river the Olympic games were celebrated, to which Pindar alludes.

> "Alpheus, thy immortal flood,
> On his lord's triumphant brows
> The Olympic wreath beſtow'd."
>
> West's Pindar.

Pauſanias adds, that the Eleans had a law, which condemned any woman to death that ſhould either appear at the Olympic games, or even croſs this river during that ſolemnity: and the Eleans add, that the only woman who tranſgreſſed it, had diſguiſed herſelf in the habit of a maſter or keeper of theſe games, and conducted her ſon thither; but when the ſaw him come off victorious, her joy made her forget her diſguiſe, ſo that her ſex was diſcovered. She was pardoned; but from that time a law was made that the keepers ſhould appear there naked.

ALPHONSIN, in *Surgery*, an inſtrument for extracting bullets out of gunſhot wounds. This inſtrument derives its name from the inventor Alphonſus Ferrier, a phyſician of Naples. It conſiſts of three branches, which are cloſed by a ring. When cloſed and introduced into the wound, the operator draws back the ring towards the handle, upon which the branches

Alphonſo. branches opening take hold of the ball; and then the ring is puſhed from the haft, by which means the branches graſp the ball ſo firmly as to extract it from the wound.

ALPHONSO I. king of Portugal, ſon of Henry of Burgundy, count of Portugal, grandſon of Don Alonſo king of Leon and Caſtile, who, as the dowry of his wife Thereſa, received part of the kingdom of Portugal. One Egas Munitz had the charge of his education from his father, the duties of which he executed with fidelity and ſucceſs. In the year 1112 his father died, leaving him a boy only three years of age, when the reins of government and the care of the infant ſon fell to his mother Thereſa. At the age of 18 he aſſumed the ſovereign authority by the advice of the nobles of Portugal, who were highly offended at the growing partiality of his mother for Don Ferdinand Perez, count of Traſtemara; for it was ſuſpected that ſhe intended to marry him. But Thereſa was little diſpoſed to reſign the reins of government. Her party raiſed an army which took the field to oppoſe the nobility who ſupported Alphonſo; but her adherents were defeated, herſelf taken priſoner, and kept in confinement during the remainder of her life. Not long after his acceſſion to the throne, his abilities both to govern and to conquer received a ſevere trial, in ſeveral arduous enterpriſes, as well againſt the king of Leon and Caſtile as againſt the Mooriſh princes, who then poſſeſſed great part of Spain and Portugal. The Mooriſh emperor in Barbary having ſent a ſtrong reinforcement to the princes, they were enabled to take the field with an army far ſuperior to that of Alphonſo's; yet he valiantly met them in the plains of Ourique, and totally defeated their forces. Thus Providence conferred ſuch a ſignal favour on the Chriſtian arms as procured a reſidence for Chriſtianity in thoſe parts. The ambitious king of Leon and Caſtile aſſumed the title of emperor of the Spaniards, and entered Portugal to waſte and deſtroy; but after the emperor had received a temporary check, the matter was accommodated, and he withdrew his army. In conſequence of the victory obtained on the plains of Ourique, Alphonſo was inſtantly proclaimed king; but the form and conſtitution of the monarchy was not ſettled until the nobility, prelates, and commons had aſſembled at Lamago for that purpoſe in the year 1145. The conqueſt of Santaren preceded this event, and was ſanctioned by the unanimous concurrence of the ſtates. The honour of crowning the king was conferred upon the archbiſhop of Braga; and it was legally provided, that the regal ſucceſſion ſhould deſcend with an uninterrupted ſucceſſion to the heirs male of Alphonſo. The prelates and nobility, with the concurrence of the people, inſtituted a code of laws conſiſting of 18 ſtatutes, for the government of the kingdom. It being propoſed whether it was their pleaſure that the king ſhould go to Leon and do homage to that prince or to any other, every man drawing his ſword, exclaimed, "We are free, and our king is free, and we owe our liberty to our courage; and if he ſhall at any time ſubmit to ſuch an act, he deſerves death, and ſhall not either reign over us or among us." The year after his coronation he was married to Matilda, daughter of Amadeus, count of Maurienne and Savoy; and he recovered Liſbon from the hands of the Moors, in the year 1147. A multitude of adventurers being aſſembled at the mouth of the Tagus in their progreſs to the Holy Land, greatly aſſiſted him in this conqueſt. After having added ſix other provinces to his dominions, he wiſely began with induſtrious activity to regulate the affairs of his kingdom. In all his great and benevolent deſigns he was vigorouſly ſeconded by Matilda, a princeſs equally celebrated for her great beauty, mental vigour, and ſingular piety. With the prudence of the ſtateſman, and the benevolence of the man, he laboured as much for the population of his acquired territories as for their increaſe. The conjugal felicity of this prince and princeſs was greatly enhanced by a numerous offſpring, which enabled him, by great alliances, to ſtrengthen his intereſts. His ſecond daughter was married to Don Ferdinand, king of Leon, who, notwithſtanding of this alliance, ungenerouſly made war on his father-in law, and took him priſoner in the field of battle; but releaſed him, on the humiliating condition of coming in perſon to do homage for his dominions at Leon. In the latter part of his reign, his ſon Don Sancho, who inherited all his father's military talents, took the lead on ſeveral occaſions; and in the year 1180, Joſeph, king of Morocco, and emperor of the Almohedes, advancing with an army as far as Santaren, he there gained a glorious victory over him. Such was the conſternation of the infidels, in conſequence of this defeat, that they left the Portugueſe at liberty to improve the interior part of the country, and to fortify their frontiers during the whole of the next year. Worn out with care and intenſe application, Alphonſo needed repoſe, and had retired to Coimbra, where, after a reign of 57 years, and in the 76th year of his age, he died. In the church of the holy croſs at Coimbra his remains were depoſited with great funeral ſolemnity. He was no leſs than ſeven feet high; and his gigantic ſize and his martial ardour have given occaſion to many abſurd and incredible ſtories concerning his military achievements, ſo that, in the annals of chivalry, as well as in the records of martial exertions, he ſuſtains a very high rank. Two orders of knighthood, that of the Wings, and that of the Avis, were inſtituted by him; and they ſtill continue to flouriſh in that kingdom. At the age of 31, when all the faculties of the human mind are in full vigour, Don Sancho, his ſon, ſucceeded him. (*Mod. Univ. Hiſt.*).

Alphonſo. ALPHONSO II. diſtinguiſhed by the ſurname of the *Fat*, was the third king of Portugal, and ſucceeded his father at the age of 27 years, in 1212. His accompliſhed education and his military and political talents were tarniſhed by his great neglect and hatred of his brothers and ſiſters, which involved him in many troubles. He, however, commenced his reign with two very popular actions. The one was, ſending a body of infantry to the aſſiſtance of the king of Caſtile, who fought with uncommon bravery in the renowned battle of Navas de Toloſa. The other was, his donation of the caſtle of Avis to the knights of that order, when the grand-maſter removed from Evora, and took up his habitation in that caſtle. During the life of his father, he diſcovered his averſion to the reſt of the family, which induced him to ſecure the right of his children from the effects of his reſentment

Alphonſo. as much as in his power, by conferring upon them large ſums of money and jewels, and ſome of the beſt parts of the kingdom. After the death of his father, however, Alphonſo ſtrenuouſly laboured to convince them that it was not in the power of his father to ſeparate or give away any part of his dominions; but all his urgent eloquence proving unſucceſsful, he had recourſe to arms. The two princeſſes, his ſiſters, who had received by the grant of their father very extenſive and valuable property, upon being attacked by their brother, implored the interference of the pope, and alſo applied to the king of Leon, to grant his protection, ſo that they made a very vigorous defence. The pope granted the requeſt of the young princeſſes, and threatened to excommunicate Alphonſo; and from Galicia, Don Ferdinand entered the dominions of Portugal to ravage and deſtroy; but the king prepared to defend himſelf againſt the arms of the king of Leon, and by ſpecious pretences to evade the excommunication of the pope.

Authors are not agreed with reſpect to the ſucceſs of this war, but it is generally ſuppoſed that, by the interference of theſe two powerful perſons, the domeſtic affairs of that houſe were reſtored to a certain degree of tranquillity; however, the departure of the infant Don Ferdinand to the court of Caſtile, and of Don Pedro to another place, ſtrongly indicate that the reconciliation was far from being perfect. The conduct of the king, however, produced much diverſity of opinion among the common people of Portugal. Some were induced, by the arguments of the king, to conclude that it was not in the power of Don Sancho, the late king, to diſmember his kingdom; and others very properly ſuſpected the kindneſs of a prince to his people who diſplayed ſuch uncommon and ſuch unjuſtifiable hatred to his own relations; at the ſame time, thoſe nobles whom the father had ſolemnly ſworn to carry his will into execution, regarded the ſacred nature of their oaths to ſuch a degree as induced them to operate againſt the reigning prince.

The diſpleaſure of the pope, however, was not to be endured. The mind of Alphonſo ſeemed indeed to be of that quality which little regarded the diſpleaſure or thunders of his holineſs; but the effects of his threatenings were very different upon the public mind, conſequently the king was conſtrained to ſeek the favour of the pope, to retain the obedience of his ſubjects. The king therefore ſent deputies to Rome, who argued, that the crown his father wore was the purchaſe of the blood and valour of the Portugueſe nation, and therefore not in his power to alienate; that it was a dangerous precedent, and obviouſly tended to ſubvert the ſovereignty of a ſtate; that the diſuniting of the kingdom would tend to promote the cauſe of the infidels; and, in fine, that his diſputes with his ſiſters had no connexion with eccleſiaſtical matters. The pope, however, was as well qualified to diſcern the nature of theſe ſpecious arguments as the prince was qualified to urge them, conſequently he remained unmoved; and Alphonſo, in order to have the ſentence of excommunication removed which had been pronounced upon him, was reluctantly induced to be reconciled to his ſiſters. His holineſs informed of the reconciliation, with great ceremony revoked his curſe and excommunication from the king and his ſubjects.

But the reign of this prince was deſtined to troubles; Alphonſo. for no ſooner was this domeſtic broil terminated, than the Moors ruſhed into the plain country in ſuch prodigious numbers, that the king found it very difficult to repel them, or to drive them back to their own country. A favourable occurrence, however, enabled him to complete his object, by the taking of a fortreſs ſeated on a rock which was deemed impregnable, in the following manner. The Germans and Flemings had equipped an immenſe fleet deſtined for the Holy Land, conſiſting of 300 ſail, with a numerous army on board. In conſequence of tempeſtuous weather, their fleet was ſo diſabled, that they were forced to put into the harbour of Liſbon to refit, juſt at the time when Alphonſo was preparing an army to attack the Moors. The king inſtantly ſent ſome of the moſt reſpectable men of his court to ſolicit their aid againſt the Moors, alleging, that it was perfectly conſiſtent with their vows to fight againſt the Moors in Portugal, as well as in the Holy Land. William earl of Holland, and many other generals, were convinced by this argument, and cheerfully engaged to join him againſt the infidels; but about a third part of the fleet refuſed to join, and proceeded on their voyage. It happened, however, that they were driven by a violent ſtorm into Italy, where they wintered. The greater part of the nobility and gentry landed under the conduct of William earl of Holland; and it was reſolved that they ſhould proceed by ſea, and block up Alcaçar-do-Sal, the fortreſs already mentioned, while the army of Alphonſo, reinforced by a conſiderable number, ſhould march by land; and thus attack the place both by land and ſea at once. The Moors, convinced of the importance of this place, brought an army into the field conſiſting of 50,000 men; but the Chriſtians raiſed the ſiege, gave them battle, and routed them with great ſlaughter; and ſome of the chiefs of the Moors fell in the field. The fortreſs ſurrendered on the 21ſt of October 1217, and was conferred upon the order of St James; but notwithſtanding of very urgent entreaties, the pope would not permit the army to winter in Portugal. He was deſirous of having theſe troops and their generals removed to a greater diſtance. The writers of that nation affirm that the ſoldiers experienced ſupernatural aid in this battle, and that the banner of the croſs was actually diſplayed by angels.

But civil animoſity ſucceeded to infidel war. The archbiſhop of Braga was highly offended that the clergy were forced to pay money and furniſh troops to carry on the war againſt the infidels; and the people ſeverely complained of the ſtrictneſs of the laws. To chaſtiſe the rebellious clergy, the king ſeized upon the revenues of the biſhop, and forced him to fly from his dominions. Enraged at this impious conduct, the pope excommunicated the king, and laid his kingdom under an interdict. The natural conſequence was, that all things were thrown into confuſion and conſternation, and perplexity univerſally prevailed; ſo that Alphonſo was obliged to conſult meaſures to quell the riſing diſcontent. It happened, however, that in the midſt of theſe negociations he was removed by death, and not only died under the papal malediction, but left his kingdom under the ſame curſe. He was interred without royal honours in the conventual church

Alphonſo. church of Alcobaça. His perſon was above the common ſize; he was brave and ſtrong, but not devoid of many qualities worthy of blame. *(Mod. Univ. Hiſt.)*.

Alphonſo.

Alphonſo III. *Don*, king of Portugal, ſucceeded his brother Don Sancho II. in the year 1248. In the courſe of a war with the Moors, which he engaged in at the beginning of his reign, he conſiderably extended the Portugueſe dominions. He took poſſeſſion of the city of Fara, the capital of the Mooriſh kingdom, in the province of Algarve. Loula, another Mooriſh town, which was carried by ſtorm, alſo fell into his hands. His power was thus extended abroad by the ſucceſs of his arms, and the adminiſtration of his affairs at home became proſperous and popular by his wiſdom and prudence. But the tranquillity and proſperity of the kingdom were ſomewhat diſturbed by an interdict which it was put under by Pope Alexander IV. whoſe diſpleaſure he had incurred by marrying Donna Beatrix, the natural daughter of Don Alonſo the Wiſe, king of Caſtile, while his firſt wife was living. In 1262, when his firſt queen died, the interdict was removed by Pope Urban, a diſpenſation was granted, and the children of Donna Beatrix were legitimated. Hitherto frequent diſputes had occurred between the kings of Portugal and Caſtile relating to the boundaries of the two kingdoms. To terminate all differences on this ſubject, and to prevent them in future, commiſſioners were appointed to define and ſettle the limits of their reſpective dominions; and theſe were agreed to and acknowledged by a ſolemn deed.

Encouraged by the proſperity of his kingdom, and by the ſucceſs which had attended his enterpriſes, Alphonſo made an attempt to extend the influence of the crown, by obliging the clergy to contribute to the welfare of the ſtate. But this meaſure, as might have been expected, was not quietly ſubmitted to. It occaſioned the revival of old diſputes, the pope interfered, and in 1268 the kingdom was again laid under an interdict. He ſucceeded, by the wiſdom of his negociations, in obtaining from Caſtile an exemption of all claims upon the crown of Portugal, and in procuring an acknowledgement that its monarchs were entirely relieved from the performance of every kind of homage. He died in the year 1279, in the 69th year of his age, and in the 31ſt of his reign. Before his death, he was reconciled to the pope and clergy, having made a full and ample ſubmiſſion. The prince was tall in ſtature, of a prepoſſeſſing aſpect, and of engaging manners. Alike removed from a diſpoſition to extravagant expence or ſordid avarice, in times of peace and proſperity, he could indulge in magnificence; but when his affairs required it, he failed not to regulate them by frugality and economy. To the poor he was a ſincere friend. In a time of ſcarcity, he pawned his crown to provide them with bread. His ſteady and vigorous adminiſtration ſecured to him the reſpect of the nobles and the obedience of the clergy. *(Mod. Univ. Hiſt.)*.

Alphonſo IV. king of Portugal, ſurnamed the *Brave*, was the ſon of King Denis. Inſtigated, it is ſaid, by the queen dowager of Caſtile, and moved with jealouſy againſt his natural brother Alphonſo Sanchez, he revolted againſt his father, and commenced a civil war. In this unnatural and baſe war, he was juſtly unſucceſsful; but although he was reduced to ſubjection, yet his haughty and ungovernable temper broke out in many occurrences, until he ſucceeded his father in 1324. Hunting was his favourite amuſement at the time when he aſcended the throne; and one day entertaining his counſellors with a narrative of his ſporting adventures during a month, one of them ventured to remonſtrate againſt his conduct, and even proceeded to threaten, that if the grievances of his ſubjects were not ſpeedily redreſſed, they would be forced to look out for a better king. Alphonſo was greatly enraged; but ſuddenly recollecting himſelf, he ſaid, "I perceive the truth of your remark; he cannot long have ſubjects who will not be a king. Remember that from this day, you have nothing to do with Alphonſo the ſportſman, but with Alphonſo the king of Portugal." To this reſolution he ſtrictly adhered, and exerciſing the power of a deſpot, he overawed his ſubjects, without conciliating their favour or procuring their eſteem. He diſplayed a conduct very ſingular in a young man, regarding thoſe who had ſo vigorouſly oppoſed him when at war with his father, as friends to the crown, although enemies to the young ambitious prince. He commenced his reign with deviſing plans for the ſecurity of his family in the government, and the good of the kingdom; he likewiſe manifeſted a ſtrong benevolence of heart, in his affection for his conſort Queen Beatrix, and his dutiful conduct towards his mother. Notwithſtanding all theſe amiable qualities, he perſecuted his brother Alonzo Sanchez, and wiſhed to inflict the puniſhment due to him as a proſcribed traitor; which drove the deſperate Alonzo to open rebellion. But, however, the natural good qualities of the heart of the king roſe ſuperior; ſo that his perſecuted brother was again received into favour. Not long after he engaged in war with Alonzo XI. king of Caſtile, and which, after ſeveral ſevere ſtruggles with various ſucceſs on both ſides, terminated in an alliance, and in effectual aſſiſtance againſt the Moors. The artful and cruel part which he acted towards Donna Agnes de Caſtro, the miſtreſs and concealed wife of his ſon, reflected the greateſt diſgrace upon his character. It is proper, however, to remark, that he was inſtigated to the murder of this princeſs by his courtiers. It was not therefore to be wondered at if his ſon was induced by this act to riſe up in open rebellion againſt him, but the arms of his father were too formidable; and after his ſubmiſſion, his father treated him with particular marks of attention. Inſtructed by the growing infirmities of years, he ſaw the termination of his reign and his life approaching. He began to compenſate for his paſt errors and faults, by eſtabliſhing acts of piety and benevolence, by redreſſing grievances, by reſtraining immorality through the eſtabliſhment of pious laws, by dictating ſalutary maxims for the government of the ſtate, by removing thoſe from the ſeats of power, who were the moſt likely to become the objects of reſentment after his death: he thus laboured to efface from the remembrance of his ſon the inſult which he had received. While concerting theſe conciliating meaſures, he died in May 1357, in the 32d year of his reign, and the 67th of his age, "with the character of an undutiful ſon, an unnatural brother, and a cruel father." But in many reſpects he deſerves the character "of a great man and a great king, brave and fortunate in war, but artful and indirect in his political meaſures, attached to his ſubjects,

Alphonſo. ſubjects, ſtrict in the adminiſtration of juſtice, attentive to the public welfare, and aſſiduous in encouraging induſtry, and enriching his people." But after all, it muſt be acknowledged, that though he was feared, and even eſteemed, he was not much honoured nor beloved, but was rather reverenced for a proper uſe of power, than relied upon as a public parent. His character is perhaps expreſſed in his device, which was an eagle on the wing, with the following motto, *altiora peto*, "I aim at higher things." Alphonſo.

ALPHONSO V. *Don*, king of Portugal, was born in 1432, and on account of his heroic deeds, obtained the ſurname of the *African*. At the age of ſix years, he ſucceeded his father King Edward. The adminiſtration of the affairs of the kingdom during his minority, was entruſted to his uncle Don Pedro, who, although his public conduct met with general approbation, was perſecuted as a traitor at the expiration of his regency, and with ſeveral perſons who were attached to his intereſt, and involved in his misfortunes, was put to death. The young king had married the daughter of the regent; but even his influence, which was overpowered by the regent's enemies, could not ſave him from perſecution. Afterwards indeed he did juſtice to his memory, and diſcovered an unuſual mark of reſpect and attachment to his queen, by abſtaining from all connexion with the ſex after her death, which happened in 1455, and it has been ſuppoſed, was occaſioned by poiſon, adminiſtered by the enemies of her father.

Alphonſo aſpired to the acquiſition of military glory. In the year 1458, he made great preparations to attack the Moors in Barbary. He aſſembled an army of 20,000 men, and equipped a fleet of 200 ſail. He firſt directed his arms againſt Alcazer, which ſoon fell into his hands; and to maintain the footing which he had gained, he furniſhed this place with a ſtrong garriſon. For 12 years he proſecuted the war in Barbary with various ſucceſs, in that time reduced Arzila and Tangier, and in 1740 returned to Portugal loaded with honours. It was then he obtained the ſurname of *African*, and to the titles which he derived from his anceſtors, added that of *lord of the coaſts on both ſeas*. And with a view to perpetuate the memory of theſe exploits and conqueſts, he cauſed a repreſentation of them to be wrought in tapeſtry, a monument ſurely conſtructed of very frail materials, but not leſs durable than many which have been erected by ambition and vanity. During the war in Africa, a military order denominated *the knights of the ſword* was founded.

Alphonſo was leſs ſucceſsful in ſupporting the claim of his niece Donna Joanna to the crown of Caſtile againſt Ferdinand and Iſabella. Finding his own reſources unequal to the conteſt in which he was engaged, he took a journey to France to ſolicit the aid of Lewis XI. But his ſolicitations proved fruitleſs; and the mortification which he experienced from this faithleſs monarch, filled him with melancholy, and induced him to reſign his crown for the purpoſe of making a pilgrimage to the Holy Land. The adminiſtration of affairs during his abſence, was committed to the hands of his ſon Don Juan, who governed the kingdom with great ability. When the king returned, he was joyfully received by the prince, and reinſtated in his authority. But the mind of Alphonſo had loſt its wonted vigour, and was unfit to reſume the arduous duties of government. Oppreſſed ſtill with a deep melancholy, he determined at length to withdraw from the cares of a kingdom, and to end his days in the repoſe and quiet of a monaſtery. But on his journey to the place of his retirement, he was ſeized with the plague at Cintra, where he died in the year 1481, in the 43d year of his reign, and the 49th of his age. The moderation, the prudence and wiſdom which this prince exhibited in his public conduct, were not more powerful in conciliating the love and veneration of his ſubjects, and of all good men, than were the amiable virtues of his private character. He was diſtinguiſhed for his affability and condeſcenſion, his benignity and bounty, and eſpecially for his unbounded charity. In the exerciſe of this latter virtue, he was honoured with the title of *redeemer of the captives*, in conſequence of his having procured the freedom of many priſoners, whoſe ranſom he cheerfully paid. Nor was he leſs eminent for his chaſtity and temperance, his attachment to letters, and his love and encouragement of learning. The firſt library in the palace of the kings of Portugal was founded in his time. He eſtabliſhed and vindicated againſt the pretenſions and hoſtile attempts of the Spaniards, a very profitable trade on the coaſt of Guinea, which country was diſcovered during his reign, under the auſpices of his uncle Don Henry, a celebrated character of that age. (*Mod. Univ. Hiſt.*). Alphonſo.

ALPHONSO VI. *Don Enriquez*, king of Portugal, aſcended the throne when only a child of thirteen years of age. It is not eaſy to conceive a kingdom in a more perilous ſituation than this at the death of Don John. The young king was remarkable for weakneſs of body, and imbecility of mind; the regency in the hands of a woman, and that woman a Caſtilian; the nation involved in war, and this reſpecting the title to the crown; many of the nobility engaged in feuds and contentions with each other, and ſome of them ſecretly diſaffected to the reigning family; ſo that the queen ſcarcely knew to whom ſhe could truſt, or by whom ſhe was to be obeyed. A very indecent joy was manifeſted by the people on the king's death, as if his death was the diſſolution of government: but the great abilities of the queen, and the vigorous meaſures which ſhe adopted, ſoon changed the face of affairs. For her own ſafety, and the proſperity of the kingdom, ſhe appointed Don Franciſco de Faro, count of Odemira, of the houſe of Braganza, governor to the king, and one of her principal miniſters of ſtate; and ſhe made choice of Don Antonio de Meneſes, count de Caſtenheda, to be his coadjutor. The former was a perſon in high repute among the nobility, in great favour with the people, entirely devoted to the intereſts of the queen, poſſeſſed of a large eſtate, and far advanced in years; the latter was alſo an aged man of great talents, and equally capable to preſide in the cabinet, and to command in the field. As might naturally be expected, theſe men ſometimes differed in opinion; but this difference never hurt the cauſe of the queen. Seconded, protected, and counſelled by ſuch able men, the nation began to feel the effects of the queen's firmneſs and ſuperior talents.

The firſt important exertion of the queen was, to

Alphonſo. ſend expreſs orders to the count de San Lorenzo, who commanded on the frontiers, to act offenſively; but the meaſure, though prudent in itſelf, was not attended with the deſired ſucceſs. About this time, however, the duke de St Germain, an Italian officer in the ſervice of Spain, entered Portugal, beſieged and took Olivenza and the caſtle of Moran. In conſequence of this, the general was diſmiſſed, and his place was filled by Juan Mendez Vaſconcelles, a man in great favour with the troops, and univerſally popular. He engaged to act alſo upon the offenſive, but being unſucceſsful, he was only ſaved from puniſhment, by his ſimple and candid defence; in which he ſays, "that he had undertaken the ſiege in obedience to the order of the queen, and for the honour of the nation; and that he had raiſed it without orders, for the preſervation of the army; that he knew the hazard he run when he did it, but that it gave him pleaſure to think, that at the hazard, or even the loſs, of his reputation and life, the troops of Portugal had been ſaved." He was declared innocent and worthy of the queen's favour, by the council of war who preſided. Don Sancho Manuel, who commanded in Elvas, and defended it with equal bravery and conduct, ſhowed himſelf to be an officer of a conſiderable degree of judgement, by his hazarding nothing more when he had performed his ſervice, upon which the very being of the ſtate depended; but it was the count de Caſtanheda who raiſed that ſiege, and forced the army of Spain in their lines. After ſome other political meaſures, ſome of them more and ſome of them leſs importance; the queen regent finiſhed in a manner, her adminiſtration, with the marriage of her only daughter, the princeſs Catharine, once intended for Lewis XIV. with Charles II. king of Great Britain, one of the moſt fortunate events that ever happened for Portugal; ſince it immediately procured them the protection of the Engliſh fleets, reinforcements of ſome thouſands of horſe and foot; beſides adding much reputation to their affairs throughout Europe; which was the reaſon that the Spaniſh court oppoſed it with ſo much heat, or rather paſſion. By the vigorous exertions and fortunate victories of Monteſclaros, the war was ſoon terminated to the honour of Portugal. The ſixth and laſt victory in the courſe of 28 years, was obtained by the Marquis de Marialva, which was chiefly owing to unforeſeen accidents, and the determined courage of foreign troops, and to the great abilities of Schomberg. This victory determined the fate of the kingdom, though not of the ſovereign; and it was eaſy to be ſeen by the more intelligent ſort of people in Portugal, that the king would ſooner or later be depoſed.

Alphonſo being ſtruck with the palſy while a child, rendered it neceſſary to treat him with indulgence, on account of his weak ſtate of health; conſequently, as he roſe to maturity, his want of parts, and the defects in his education, were very perceptible. It is alleged that a greater affection was ſhown by the queen his mother, to the infant Don Pedro, and that ſhe endeavoured at the time of their father's deceaſe, to inſinuate into the nobles an idea of preferring him; but they univerſally declined to make a breach in the ſucceſſion, declaring it was difficult to make an eſtimate of the powers of a king who was then only a child. The queen yielded, and endeavoured by every proper means to make him worthy of a crown, which, by Alphonſo. birth, he was entitled to wear. The count de Odemira, who was charged with his education, found it a very difficult taſk to manage the young prince, who, forgetful of his birth and deſtination, was prone only to thoſe amuſements which the youth of his age were accuſtomed to. His guardian and preceptor ſtruggled with this diſpoſition, and even ventured to take ſome pretty ſevere meaſures; but to his great mortification, it proved entirely abortive. Education can only improve, but can never confer mental abilities. Yet he was quick enough to perceive he was a king, which proved very fatal to him. Thoſe who approached his perſon complied with his follies, and, even commended the moſt abſurd actions; and thoſe who were independent of the court inveighed againſt him in the ſtrongeſt terms, and, becauſe guilty of ſome childiſh actions, they aſcribed to him all the cruel and fooliſh accidents which happened in Liſbon. Unfortunately, however, for his adverſaries, many of theſe actions, ſuch as fighting of dogs, ſcouring the ſtreets, encountering three men alone, running at a bull, and ſuch like, indicate no want of ſtrength or courage. A variety of facts that might be mentioned, are ſufficient evidence that his natural diſpoſitions were weak, wild, refractory, and unteacheable; and that although he was born to reign, yet he was deſtitute of the qualities abſolutely neceſſary in a prince. The direful conſequences of this having been for ſome time experienced by the nation, the nobles at laſt were driven to the reſolution of depoſing the king, and exalting Don Pedro to the regency. In the morning of the next day after the determination, the marquis de Caſcaes, at the head of the council, went to the palace to propoſe the reſignation to the king. The king was in bed and faſt aſleep: the marquis ordered him to be awakened, and knocked violently at the door for that purpoſe; and when he had obtained admiſſion, he is ſaid to have upbraided him in very coarſe terms for his lazineſs and inattention to public affairs at ſo critical a conjuncture; adding, that ſince he muſt be ſenſible of his want of abilities to govern a kingdom, the wiſeſt method he could adopt was, to reſign it in favour of his brother. The king abſolutely refuſed to conſent; but not long after, Don Pedro coming to the palace, ordered him to be confined in his apartment, where one of his favourites perſuaded him, in the hope of being ſet at liberty, to make a ſhort renunciation of the crown in favour of his brother Don Pedro, and his lawful iſſue, reſerving the houſe of Braganza and its dependencies, together with 100,000 crowns out of the revenue of the crown. Nor was this deemed ſufficient: for a paper was preſented to him, making him avow, that for want of conſummation, his marriage was null. This he at firſt declined; but, by the advice of ſome divines, he was prevailed on to ſubſcribe the deed. When evening drew on, the unhappy king then perceived he was a priſoner; upon which he ſent to requeſt his brother to let him have John, who managed his dog-kennel, to keep him company. When Don Pedro heard it, loſing his uſual calmneſs, he burſt into a violent fit of paſſion, and inſtantly gave orders, that thoſe who were the moſt agreeable to him, ſhould remain in his apartment. Such was the ſituation of affairs until the meeting of the ſtates. But

in

Alphonſo. in the mean time, the unfortunate Don Alonzo died, after he had been a priſoner near fifteen years, ſuddenly in the caſtle of Cintra, on the 12th of September, when he had borne the title of king almoſt twenty-ſeven, and had lived about forty, years. It is reported, that he ſaid in his laſt agonies, "I am now going; but it will not be long before the queen ſhall follow me, to give an account, at the moſt awful tribunal, of the wrongs ſhe has done me." (*Mod. Univ. Hiſt.*)

Alphonſo.

Alphonso III. the Great, king of Aſturias, was born in 847, and ſucceeded his father Ordogno in 865. In conſequence of the rebellion of Don Frolia, not long after his acceſſion to the throne, he was forced to leave his kingdom; but that uſurper being aſſaſſinated, with univerſal applauſe he returned to his throne. In many ſucceſsful enterpriſes againſt the Moors, in which he greatly enlarged his territories, he ſoon diſplayed the talents of a warlike and able prince. He formed a powerful alliance againſt the Moors, by marrying Ximene or Chimene, deſcended from the houſe of Navarre, which paved the way for a long ſeries of victories. The great attention which he paid to the comfort and welfare of the common people, greatly diſguſted his haughty nobles; which excited them to revolt againſt him in the advanced part of his life. Enjoying a ſmall interval of tranquillity from the diſtraction and tumults of war, he called a general council of the clergy and nobility, enacted ſome uſeful regulations, and directed their attention to ſeveral other ſubjects, which contributed to the honour and happineſs of his kingdom. Whilſt he was buſily occupied in repairing ſome of thoſe towns which he had taken from the Moors, he was ſuddenly interrupted by them, and was under the neceſſity of defending himſelf with a conſiderable army, which he did with ſuch ſucceſs, that they were defeated with great loſs. The unnatural rebellion of his ſon Don Garcias, at this time, greatly diſturbed his government; but by the diligence of the father, this unnatural rebellion was ſoon quelled. The confinement of Garcias, and the new impoſition of taxes, produced general murmurs among the people; which induced Alphonſo, now worn out with years and inceſſant contentions, to aſſemble the ſtates, and reſign the reins of government into the hands of his ſon Don Garcias. He gave to his other ſon Don Ordogno the province of Galicia. The ambitious and military ſpirit which Don Garcias diſcovered in his father's reign, ſoon diſplayed itſelf in an attack on the Moors. By the advice of his father, to which he prudently liſtened, he was taught that theſe new conqueſts tended more to enrich the ſoldiers, than to the advantage of the crown. Alphonſo, although far advanced in years, took upon himſelf the command of the army raiſed for new operations, and returned to Zamora loaded with ſpoils, and with increaſed reputation and fame, in the year 912. He died December 20. 912, two years after his abdication, 49 years from the time of his being aſſociated with his father in the government, and when he was about 63 or 65 years of age. His great learning, and the patronage he gave to literature, his diſtinguiſhed piety and virtue, and other princely qualities, raiſed this king high in the eſtimation of mankind. Some writers affirm that he compoſed a chronicle of the Spaniſh affairs, from the death of Receſuintho, to that of his own father Don Ordogno, which has been incorrectly publiſhed by Sandovel, and the later editions have ſuſtained conſiderable injury. The biſhop of Orenſa, at whoſe requeſt it was originally compoſed, publiſhed it in his own name to the world. (*Gen. Biog.*)

Alphonſo.

Alphonso X. the Wiſe, king of Leon and Caſtile, ſucceeded his father Ferdinand in the year 1252. He obtained the appellation of wiſe, not for his political knowledge as a king, but his erudition as a philoſopher. In conſequence of the general opinion of his princely qualities, and his uncommon generoſity, he aſcended the throne with univerſal approbation. The ill concerted projects of his ambition, however, diſturbed the proſperity of his reign. Pretending a better right than Henry III. of England to that territory, he directed his firſt attempt againſt Gaſcony. The arms of England, however, proved too formidable; and he was compelled to renounce his claim, on condition that Henry's ſon, afterwards King Edward I. ſhould marry his ſiſter Eleonora. At an expence which drained his treaſures, and obliged him to debaſe his coin, he prepared for an expedition againſt the Moors in Barbary; but his maternal right to the duchy of Swabia, which he was called to defend, diverted him from it. Thus he formed a connexion with the German princes; and became a competitor, with Richard earl of Cornwall, for the imperial crown, in queſt of which they both expended immenſe ſums of money. The claims of ſeveral of the princes of the blood, gave exerciſe to his military talents; and he was ſucceſsful both in oppoſing and defeating them. He formed the romantic deſign of viſiting Italy in the year 1268; but the ſtates firmly remonſtrating, he was obliged to relinquiſh it. But, although he abandoned the deſign, yet it produced ſuch diſcontents both among the common people and conſpiracy among the nobles, that it required conſiderable exertion before the king could allay the ferment. Alphonſo, ſtill anxious of aſcending the imperial throne, attempted it after the death of Richard earl of Cornwall, and even after Rodolph of Hapſburg was actually elected emperor of Germany, and for that purpoſe took a journey to Beaucaire to obtain an interview with the pope, in order to prevent him from confirming the election. The Moors, ever ready to draw the ſword againſt him, took this opportunity of entering his dominions for the purpoſe of ravaging them. This ambitious journey, undertaken at ſo vaſt an expence, and productive of ſo much confuſion in his kingdom, proved unſucceſsful: for the pope would not realize his claim, or alter the former election. But his exceſſive ambition was ſoon puniſhed by domeſtic calamity; for his eldeſt ſon died in this interval, and his ſecond ſon Don Sanchez, having obtained great reputation in oppoſing the infidels, to the prejudice of his brother's children, laid claim to the crown. This claim was admitted by the ſtates of the kingdom; but Philip king of France, ſupporting the cauſe of the children, whoſe mother was his ſiſter Blanche of France, involved Alphonſo in a war; and it occaſioned the retreat of his own queen Yolande or Violante to the court of her father, the king of Arragon. While thus haraſſed with diſſenſions, he proclaimed war againſt France, and by the authority of the pope he renewed the war with the Moors, which proved ſo unfortunate, that he reluctantly concluded a truce with them, and engaged in a conteſt

Alphonſo. with the king of Granada. Theſe various meaſures exhauſted his treaſure, taxes were multiplied, and the affairs of the kingdom were in ſuch confuſion, that he was under the diſagreeable neceſſity of calling an aſſembly of the ſtates, which was held at Seville in the year 1281, where, on the king's propoſal, the ſtates conſented to give a currency to copper money. In conſequence of the intrigues of Don Sanchez his ſon, another aſſembly of the ſtates was held at Valladolid, A. D. 1282, which deprived Alphonſo of the regal dignity, and appointed Sanchez regent. Reduced to almoſt inſurmountable difficulties, Alphonſo ſolemnly curſed and diſinherited his ſon, and by his laſt will, in the year 1283, confirmed the act of excluſion, and appointed, for the ſucceſſion, the infants de la Cerda, and upon the failure of their heirs the kings of France; and at the ſame time ſupplicated the aſſiſtance of the king of Morocco againſt the power of his ſon. At the commencement of the next year, when Alphonſo received information from Salamanca, that Sanchez was dangerouſly ill, his heart relented. He pardoned his ſon, revoked his curſes, and then died on the 4th of April 1284 in the 81ſt year of his age. His remains were interred in the cathedral of Seville; and he left behind him the character of a learned man, but a weak king. Alphonſo has been charged with irreligion and impiety, chiefly on account of a well-known ſaying of his, viz. "if he had been of God's privy-council when he created the world he could have adviſed him better." The various contradictory accounts, given by different writers, render the truth of this doubtful; but if ever ſuch a horrible ſaying dropt from his lips, it muſt unqueſtionably be declared inconſiſtent with the character of an enlightened philoſopher, and that reverence of the Creator which an enlarged contemplations of his works naturally inſpires.

"An indevout aſtronomer is mad." YOUNG.

He was an eminent proficient in ſcience, and a patron of literature. He concluded that book of laws, known by the title of *Las Partides*, which his father had begun; and in that work diſplayed the abilities of a politician as well as thoſe of a legiſlator. By obliging his ſubjects to uſe their own language, he redreſſed the confuſion in law proceedings occaſioned by intermixing Latin with the vulgar tongue. Under his patronage a general hiſtory of Spain was compoſed, which he took great pains in poliſhing; he alſo corrected many errors in the ſtatutes of the univerſity of Salamanca. Aſtronomy being his favourite ſtudy, he chiefly directed his attention to the improvement of that ſcience; ſo that, even during the life of his father, he aſſembled at Toledo a number of the moſt celebrated aſtronomers of his time, Chriſtians, Jews, and Arabians, from all parts of Europe, for the purpoſe of examining the aſtronomical tables of Ptolemy, and correcting their errors. The completion of theſe tables employed them about four years, and in 1252, the firſt year of Alphonſo's reign, they were completed; and they were called *Alphonſine Tables* from the name of this prince, who encouraged the conſtruction of them by his unbounded liberality. It is reported that 400,000 ducats were expended on them, or, according to others, 40,000. Some have aſcribed the principal management of this work to the Jewiſh Rabbi Iſaac Aben-Said; others, pretending to derive information from the MSS. of Alphonſo, refer it to Aben-Ragee and Alcabitius. The other aſtronomers who were employed on this occaſion were Aben-Muſa Mohammed, Joſeph Ben-Ali, and Jacob Abuena, Arabians: if there were any Chriſtians, their names are unknown. The 30th of May 1252, which was the day of his acceſſion to the throne, was fixed as the epoch of theſe tables. A book, entitled "The Treaſure," is alſo aſcribed to him, containing treatiſes of rational philoſophy, phyſics, and ethics. He is likewiſe ſaid to have been well acquainted with aſtrology and chemiſtry; in which laſt ſcience, he is ſaid to have compiled two volumes in cipher, which are extant, and to be found ſtill in his Catholic majeſty's library. But this work muſt be more curious than uſeful, if we conſider the ſtate of this ſcience at that period. (*Gen. Biog.*) Alphonſo

ALPHONSO V. king of Arragon and Naples, ſucceeded his father in the year 1416. As the father had formerly been honoured with the appellation of *Juſt*, ſo the ſon was honoured with that of *Magnanimous*. The conſpiracy of ſome of his own nobles againſt his life, together with the inſolence of Pope Benedict XIII. greatly diſturbed the tranquillity of his reign. Fortunately this conſpiracy was diſcovered juſt when it was about to be carried into execution; and inſtead of proceeding with rigour againſt the conſpirators, he generouſly tore a paper containing their names without reading, and added, "that he would at leaſt force them to acknowledge, that he had a greater regard for their lives than they had for his." After quelling a diſturbance in Sardinia, he was juſt making preparations to advance to Sicily, when Joan of Naples offered, if he would aſſiſt her againſt the pope, the duke of Anjou, and the conſtable Sforza, who had formed a confederacy to depoſe her, to adopt him as her ſon and heir. He readily accepted the propoſal, and with a powerful army ſoon raiſed the ſiege of Naples, and was immediately declared heir apparent of her kingdom, and duke of Calabria. But as the queen was unfaithful, and did not fulfil her engagements, Alphonſo took poſſeſſion of Naples, and expelled her from it; but when the duke of Anjou again entered her territories, and made himſelf maſter of great part of them, ſhe was obliged to renew her ſolicitations to Alphonſo; who, in the year 1434, involved himſelf in a quarrel with the duke of Milan and the republic of Genoa, by beſieging Gæta in a ſecond attempt to conquer Naples. The Genoeſe fleet engaged Alphonſo; and all his ſhips were diſperſed or deſtroyed, and himſelf taken priſoner. But ſuch was the addreſs of this prince, that when carried to Milan a priſoner, he there ingratiated himſelf ſo much into the duke's favour, that he became his friend and ally, and ſoon roſe to greater power than formerly.

He got poſſeſſion of Naples in 1443; and in an aſſembly of the ſtates held at Beneventum, and then transferred to Naples, his ſovereignty was recognized, and his ſon, Don Ferdinand, declared ſucceſſor to the throne, and in conſequence of this elevation he was deemed the ſole arbiter of peace and war through all Italy. Naples became the reſidence of Alphonſo during the remainder of his life; but his declining years were much diſquieted by political diſſenſions and intrigues. The natural attendant of jealous old age at laſt

Alphonſo, Alphonſus.

laſt ſeized him; and in conſternation and dread, he was removed from one caſtle of Naples to another, until he breathed his laſt on the 22d of June 1468, bequeathing to his natural ſon Ferdinand the kingdom of Naples, and to his brother Don Juan, king of Navarre, the kingdoms of Arragon, Valencia, Majorca, Sardinia, Sicily, and the principality and dependencies of Catalonia. Alphonſo was not only deemed the ableſt ſtateſman, and the moſt renowned military commander in that age, but alſo the greateſt prince that ever occupied the throne of Arragon. He was a diſtinguiſhed patron of learning, and opened an aſylum for the Greek literati expelled from Conſtantinople. His device was an open book. He frequently uttered this expreſſion, "That an unlettered prince was but a crowned aſs." He was brave and liberal; and in all his negotiations he diſdained the mean artifices of intrigue and diſſimulation. It is reported that his peruſal of Quintus Curtius cured him of a diſorder with which he was attacked at Capua. Such was his familiar intercourſe with his ſubjects, and his affection towards them, that he walked unarmed and unaccompanied in his capital; and was wont to ſay, "that a father has nothing to fear in the midſt of his children." While he was beſieging Gæta he diſmiſſed the women and children that were turned out of the town without any injury, ſaying, "That he had rather loſe any city in his dominions than loſe the reputation of humanity." He leaped into a ſhallop for the relief of one of his galleys, which with its whole crew and ſoldiers was juſt about to periſh, exclaiming, "I had rather ſhare than witneſs their calamity." Such was his generoſity, that upon hearing an officer who ſaw his treaſurer bringing him 10,000 ducats, exclaiming, "I ſhould only wiſh that ſum to make me happy." "You ſhall be ſo," ſaid Alphonſo, and gave him the money in a preſent. He deemed dancing a certain degree of madneſs; but was ſtrongly addicted to women, which involved him in many diſhonourable intrigues, and juſtly entailed upon him the diſgrace of an unfaithful huſband to a kind and affectionate queen. (*Mod. Univ. Hiſt.*)

ALPHONSUS TOSTATUS, biſhop of Avila, a learned and voluminous Spaniſh writer. He flouriſhed about the middle of the 15th century, and by his uncommon abilities roſe to the higheſt offices both in the civil and eccleſiaſtical departments of the ſtate. At the age of 22 years he finiſhed his ſtudies at the univerſity of Salamanca, having made great progreſs in every branch of learning then in eſtimation. He was preſent at the council of Baſil, and was afterwards promoted to the biſhopric of Avila. He died at the age of 40 years, in 1454, and was buried in the church of Avila. The following epitaph, expreſſive of his great erudition, was inſcribed on his tomb.

Hic ſtupor eſt mundi qui ſcibile diſcutit omne.

"This is the wonder of the world who treated of every thing that could be known."

The numerous productions of Alphonſus are ſufficient proofs of his laborious induſtry: during his life he wrote no leſs than 27 volumes in folio, of which 24 are commentaries on the Scriptures; the reſt are on theological ſubjects. By the order of Cardinal Ximenes they were printed at Venice in 1530, and in 1596; and at Cologne in 1612. Several of his pieces on eccleſiaſtical hiſtory, ſcience, and literature in general, were ſeparately printed at Salamanca in 1506, and alſo his commentary upon the Chronicon of Euſebius. Although high encomiums have been beſtowed upon his works, they have nevertheleſs in the current of time and human improvement fallen into oblivion. (*Dupin.*)

Alpini.

ALPINI, PROSPERO, in Latin, *Proſper Alpinus*, a celebrated phyſician and botaniſt, was born at Maroſtica in the republic of Venice in November 1553. In his early years his inclination led him to the profeſſion of arms, and he ſerved ſome time in the Milaneſe. By the encouragement and perſuaſion of his father, who was a phyſician, he retired from the army, and devoted his attention to literature. To proſecute his ſtudies with more advantage, he went to the univerſity of Padua, where he was ſoon after elected deputy to the rector and ſyndic to the ſtudents. But in the diſcharge of his official duties which was diſtinguiſhed by prudence and addreſs, he was not prevented from purſuing the ſtudy of phyſic which he had choſen. He continued his medical ſtudies with zeal and ſucceſs; and after having acquired the neceſſary qualifications, he was admitted to the degree of doctor of medicine in 1578. Soon after he left the univerſity, and ſettled as a phyſician in conſequence of an invitation from the citizens in Campo San Pietro, a ſmall town in the Paduan territory.

In the courſe of his ſtudies he had paid particular attention to plants, and had become an enthuſiaſt in botanical ſcience. The ſphere of his preſent practice was too limited to afford him much opportunity of proſecuting his favourite ſtudy. He wiſhed particularly to extend his knowledge of exotic plants; and the only means to attain this, he thought, was to ſtudy their economy and habits in their native ſoil. And to gratify this laudable curioſity an opportunity ſoon preſented itſelf. George Emo, the conſul for the Venetian republic in Egypt, appointed Alpini his phyſician. They ſailed from Venice in September 1580; and after having experienced a tedious and dangerous voyage, arrived at Grand Cairo in the beginning of July the following year. Alpini ſpent three years in Egypt, and, by his induſtry and aſſiduity, greatly improved his botanical knowledge. With this view he travelled along the banks of the Nile, viſited every place, and conſulted every perſon from whom he expected any new information. From a practice in the management of date trees which he obſerved in this country, Alpini ſeems to have deduced the doctrine of the ſexual difference of plants which was adopted as the foundation of the celebrated ſyſtem of Linnæus. He ſays, "That the female date trees, or palms, do not bear fruit, unleſs the branches of the male and female plants are mixed together; or, as is generally done, unleſs the duſt found in the male ſheath, or male flowers, is ſprinkled over the female flowers."

When Alpini returned to Venice in 1586 he was appointed phyſician to Andrea Doria prince of Melfi, and during his reſidence at Genoa, acquired ſo great a name as to be eſteemed the firſt phyſician of his age. The Venetians became jealous that the Genoeſe ſtate ſhould number among its citizens a perſon of ſuch diſtinguiſhed merit and reputation, whoſe ſervices might be

Alpini
ll
Alps.

be eſſentially beneficial, and whoſe fame might be highly honourable, to his native country. In the year 1593, he was recalled to fill the botanical chair in the univerſity of Padua, with a ſalary of 200 florins, which was afterwards augmented to 750. He diſcharged the duties of his profeſſorſhip for many years with great reputation, till his declining health interrupted his labours. He died in the year 1617, in the 64th year of his age, and was ſucceeded as botanical profeſſor by one of his ſons. Alpini wrote the following works in Latin: 1. *De Medicina Ægyptiorum, libri* iv. "Of the Phyſic of the Egyptians, in four books;" printed at Venice, 1592, in 4to. 2. *De Plantis Ægypti liber:* "A treatiſe concerning the plants of Egypt;" printed at Venice, 1592, in 4to. 3. *De Balſamo Dialogus:* "A dialogue concerning the Balm of Gilead;" printed at Venice, 1592, in 4to. 4. *De Præſagienda vita et morte ægrotantium libri* vii: "Seven books concerning the method of forming a judgment of the life or death of patients;" printed at Venice, 1691, in 4to. 5. *De Medicina methodica, libri* xiii: "Thirteen books concerning methodical Phyſic;" Padua, 1611, folio; Leyden, 1719, in 4to. 6. *De Rhapontico Diſputatio:* "A diſputation held in the ſchool at Padua concerning the Rhaponticum;" Padua, 1612, and 1629, in 4to. 7. *De Plantis Exoticis, libri* ii: "Of exotic plants, in two books;" Venice, 1699, in 4to. He left ſeveral other works, which have never been printed; particularly, 8. The fifth book concerning the phyſic of the Egyptians. 9. Five books concerning the natural hiſtory of things obſerved in Egypt, adorned with figures of plants, ſtones, and animals. (*Biog. Dict.*)

ALPINIA. See BOTANY *Index*.

ALPINUS. See ALPINI.

ALPISTE, or ALPIA, a ſort of ſeed uſed to feed birds with, eſpecially when they are to be nouriſhed for breeding. The alpiſte ſeed is of an oval figure, of a pale yellow, inclining to an iſabel colour, bright and gloſſy. It is an article of the corn-chandlers and ſeedſmen's trade.

ALPS, in *Ancient Geography*, a range of high mountains, ſeparating Italy from Gaul and Germany, in the form of a creſcent. They take their riſe from the Vada Sabatia, or Savona; and reach to the Sinus Flanaticus (now Golfo di Carnaro of the Adriatic), and the ſprings of the river Colapis (now the Kulpe); extending, according to Livy, 2000 ſtadia in length, or 250 miles: they are divided into ſeveral parts, and accordingly have different names. From Savona to the ſprings of the Varus, where the Alps lie againſt the ſea of Genoa, they are called *Maritime*, now *le Montagne di Tenda*. Theſe extend from ſouth to north, between Gaul to the weſt, and Genoa to the eaſt, beginning at Monaco on the Mediterranean; then running out through the eaſt of the county of Nice, and between that and the marquiſate of Saluzzo, terminate at length at Mount Viſo, between Dauphiné and Piedmont. Hence to Suſa run the *Alpes Cottiæ* (Sueton.) *Cottanæ* (Tacitus); mountains extremely high, ſeparating Dauphiné from Piedmont, and extending from Mount Viſo to Mount Cenis, between the *Alpes Maritimæ* to the ſouth, and the *Graiæ* to the north. The *Alpes Graiæ* (Pliny), ſo called from the paſſage of Hercules, begin from Mount Cenis, where the *Cottiæ* terminate; and run out between Savoy and the Tarenteſe to the weſt, and Piedmont and the duché d'Aouſte to the eaſt, quite to the Great St Bernard, where the *Alpes Penninæ* begin. They are alſo called by ſome *Graiæ Alpes*, and *Graius Mons* (Tacitus); which extend from weſt to eaſt, between St Bernard and the Adula, or St Gothard; and thus they run out between the Valaiſe to the north, and the Milaneſe to the ſouth. With theſe are continued the *Alpes Rheticæ*, to the head of the river Piave; a part of which are the *Alpes Tridentina*, to the north of Trent. To theſe join the *Alpes Noricæ*, reaching to Doblach in Tyrol, to the north of the river Tajamento: thence begin the *Alpes Carnicæ*, or of *Carniola*, extending to the ſprings of the Save: and the laſt, called *Alpes Pannonicæ*, and *Juliæ*, extend to the ſprings of the Kulpe. Some, however, extend the Alps to the north of Dalmatia; others, again, to Thrace and the Euxine. But their termination at the Kulpe, as above, is more generally received. They were formerly called *Albia*, and *Alpionia* (Strabo). Through theſe mountains Hannibal forced his paſſage into Italy, by pouring vinegar on the rocks, heated by burning large piles of wood on them, by which means they became crumbled, (Livy). They are covered with perpetual ſnow. Alps.

The Alps are the higheſt mountains in Europe; being, according to ſome geometricians, about two miles in perpendicular height. They begin at the Mediterranean; and ſtretching northward, ſeparate Piedmont and Savoy from the adjacent countries; whence directing their courſe to the eaſt, they form the boundary between Switzerland and Italy, and terminate near the extremity of the Adriatic ſea, north-eaſt of Venice. It was over the weſtern part of thoſe mountains, towards Piedmont, that Hannibal forced his paſſage into Italy.

The proſpect from many parts of this enormous range of mountains is extremely romantic, eſpecially towards the north-weſt. One of the moſt celebrated is the Grande Chartreuſe, where is a monaſtery founded by St Bruno about the year 1084. From Echelles, a little village in the mountains of Savoy, to the top of the Chartreuſe, the diſtance is ſix miles. Along this courſe, the road runs winding up, for the moſt part not ſix feet broad. On one hand is the rock, with woods of pine trees hanging over head; on the other a prodigious precipice almoſt perpendicular; at the bottom of which rolls a torrent, that, ſometimes tumbling among the fragments of ſtone which have fallen from on high, and ſometimes precipitating itſelf down vaſt deſcents with a noiſe like thunder, rendered yet more tremendous by the echo from the mountains on each ſide, concurs to form one of the moſt ſolemn, the moſt romantic, and moſt aſtoniſhing ſcenes in nature. To this deſcription may be added the ſtrange views made by the crags and cliffs, and the numerous caſcades which throw themſelves from the very ſummit down into the vale. On the top of the mountain is the convent of St Bruno, which is the ſuperior of the whole order. The inhabitants conſiſt of 100 fathers, with 300 ſervants, who grind their corn, preſs their wine, and perform every domeſtic office, even to the making of their clothes. In the Album of the fathers is an admired alcaic ode, written by the late ingenious Mr Gray when he viſited the Chartreuſe, and which has ſince been publiſhed among his works.

The glaciers of Savoy are alſo juſtly reckoned among the

Alps. the moſt ſtupendous works of nature. Theſe are immenſe maſſes of ice, lodged upon the gentler declivities amidſt the Alps, and exhibiting repreſentations beyond conception fantaſtic and picturesque. In the extraordinary narrative of M. Bourrit's journey hither, we meet with the following account of the Prieuré, in the valley of Chamouni. "We had (ſays he) the magnificent proſpect of a chain of mountains, equally inacceſſible, and covered with ice: and above the reſt that of Mount Blanc, whoſe top ſeemed to reach, and even pierce, the higheſt region of the clouds. The chain upon which this mountain looks down like a giant, is compoſed of maſſes of rocks, which terminate in pikes or ſpires, called the *Needles*, and which are ranged like tents in a camp. Their ſides appear lighter and more airy, from the ornament of ſeveral hollow breaks and furrows fretted in the rock itſelf, as well as from the different ſtreaks and panes of ice and ſnow, which, without changing the general character of their form, or the majeſty of their appearance, give them a picturesque variety. Lower down, the eye ſurveys with raviſhment, the gills of ice, and the ſeveral glaciers, extending almoſt into the plain, whilſt this appears like an artificial garden, embelliſhed with the mixture of a variety of colours. We have a picturesque oppoſition to this chain, which is formed by innumerable mountains at the diſtance of near 50 leagues, between whoſe tops we have a glimpſe of thoſe ſeveral plains which they environ."

M. de Sauſſure, who had viſited thoſe mountains about two months before M. Bourrit, felt himſelf naturally electrified in this place. This extraordinary phenomenon ſeems not to have been experienced by the latter or his company; but they heard a long-continued rumbling noiſe like that of thunder, which was rendered more awful by the ſilence of the place where they ſtood. This noiſe proceeded from the ſubſequent cauſes, viz. the avalanches of ſnow, which ſeparated from the tops of the mountains, and rolled down to the bottom; conſiderable fragments of the rocks which followed them, overturning others in their fall; and maſſy blocks of ice, which precipitated from the ſummits.

The valley of Montanvert appears to be peculiarly romantic. "Here (ſays M. Bourrit) we beheld a ſpacious icy plain entirely level. Upon this there roſe a mountain all of ice, with ſteps aſcending to the top, which ſeemed the throne of ſome divinity. It likewiſe took the form of a grand caſcade, whoſe figure was beyond conception beautiful; and the ſun, which ſhone upon it, gave a ſparkling brilliance to the whole. The valley on our right hand was ornamented with prodigious glaciers, that, ſhooting up to an immeaſurable height between the mountains, blend their colours with the ſkies, which they appear to reach."

Alps, beſides its proper ſignification, by which it denotes a certain chain of mountains which ſeparate Italy from France and Germany, is frequently uſed as an appellative to denote any mountains of extraordinary height or extenſive range. In this ſenſe, Auſonius and others call the Pyrenean mountains *Alps;* and Gellius the Spaniſh Alps, *Alpini Hiſpani*.

Hence alſo we ſay, the *Britiſh Alps*, the *Aſiatic Alps*, the *Alps of America*.

The *Scottiſh Alps* terminate in a moſt ſublime and abrupt manner, at the great promontory, the *Alta Ripa* of Ptolemy, the *Ord* or *Aird*, i. e. the *Height of Caithneſs*. The upper part is covered with gloomy heath; the lower is a ſtupendous precipice, excavated into vaſt caverns, the haunt of ſeals and different ſea fowl. On the eaſtern ſide of the kingdom, this is the ſtriking termination of the vaſt mountains of Scotland which form its Highlands, the habitation of the original inhabitants, driven from their ancient ſeats by the anceſtors of Lowland Scots, deſcendants of Saxons, French, and Normans; congenerous with the Engliſh, yet abſurdly and invidiouſly diſtinguiſhed from them. Language, as well as ſtriking natural boundaries, mark their place. Their mountains face on the weſt the Atlantic ocean; wind along the weſt of Caithneſs; among which Morven and Scaraben, Ben Hop, and Ben Lugal, ariſe pre-eminent. Sutherland is entirely alpine, as are Roſsſhire and Inverneſsſhire. Their *Summæ Alpes* are, Meal-Fourvounich, the Coryariſh, Benewich, and Beneviſh near Fort William; the laſt of which is reported to be 1450 yards in height. Great part of Aberdeenſhire lies in this tract. It boaſts of another Morven, ſoaring far beyond the others. This is the centre of the Grampian hills, and perhaps the higheſt from the ſea of any in Great Britain. They again comprehend the eaſtern part of Perthſhire, and finiſh on the magnificent ſhores of Lochlomond; on the weſtern ſide of which Benlomond riſes, diſtinguiſhed among its fellows. From hence the reſt of North Britain forms a chain of humbler hills; but in Cumberland, part of Weſtmorland, Yorkſhire, Lancaſhire, and Derbyſhire, the Alps reſume their former majeſty. A long and tame interval ſucceeds. The long ſublime tract of Wales ariſes, the ancient poſſeſſion of the ancient Britiſh race. From the Ord, the great mountains recede inland, and leave a vaſt flat between their baſes and the ſea, fronting the waves with a ſeries of lofty rocky precipices, as far as the little creek of Staxigo; the whole a bold, but moſt inhoſpitable ſhore for ſhipping. Wick and Staxigo have indeed their creeks, or rather chaſms, which open between the cliffs, and may accidentally prove a retreat, unleſs in an eaſtern gale.

The *Aſiatic Alps* are deſcribed under the articles *ALTAIC Chain* and *WERTURIAN Mountains*.

The *American Alps* are, the ANDES or *Cordilleras*, in South America; and the APALACHIAN or *Allegany* mountains in North America.

The higheſt ground in North America is placed by Captain Carver in lat. 47°, W. Long. from London 98°, between a lake from which the Oregon flows, and another called *White-bear Lake*, from which ariſes the Miſſiſſippi.

This exalted ſituation is part of the Shining Mountains, which are branches of the vaſt chain which pervades the whole continent of America. It may be fairly taken from the ſouthern extremity, where Staten Land and Terra del Fuego riſe out of the ſea as inſulated links to an immenſe height, black, rocky, and marked with rugged ſpiry tops, frequently covered with ſnow. New Georgia may be added as another horribly congenial, riſing detached farther to the eaſt. The mountains about the ſtraits of Magellan ſoar to an amazing height, and infinitely ſuperior to thoſe of the northern hemiſphere under the ſame degree of latitude. From the north ſide of the ſtraits of Magellan;

Alps. lan, they form a continued chain through the kingdoms of Chili and Peru, preſerving a courſe not remote from the Pacific ocean. The ſummits, in many places, are the higheſt in the world. There are not leſs than 12, which are from 2400 toiſes high to above 3000. Pichincha, which impends over Quito, is about 35 leagues from the ſea; and its ſummit is 2430 toiſes above the ſurface of the water. Cayambe, immediately under the equator, is above 3000; and Chimborazo higher than the laſt by 200. Moſt of them have been volcanic, and in different ages marked with eruptions far more horrible than have been known in other quarters of the globe. They extend from the equator through Chili; in which kingdom is a range of volcanoes, from lat. 26. ſouth, to 45. 30. and poſſibly from thence into Terra del Fuego itſelf; which, forming the ſtraits of Magellan, may have been rent from the continent by ſome great convulſion, occaſioned by their labourings, and New Georgia forced up from the ſame cauſe. An unparalleled extent of plain appears on their eaſtern ſide. The river of Amazons runs along a level clothed with foreſts, after it burſts from its confinement at the Pongo of Borjas, till it reaches its ſea-like diſcharge into the Atlantic ocean.

In the northern hemiſphere, the Andes paſs through the narrow iſthmus of Darien into the kingdom of Mexico, and preſerve a majeſtic height and their volcanic diſpoſition. The mountain Popocatepec made a violent eruption during the expedition of Cortez, which is moſt beautifully deſcribed by his hiſtorian Antonio de Solis. This is probably the ſame with the volcano obſerved by the Abbé d'Auteroche, in his way from Vera Cruz to Mexico; which, from the nakedneſs of the lavas, he conjectured to have been but lately extinguiſhed. From the kingdom of Mexico, this chain is continued northward, and to the eaſt of California; then verges ſo greatly towards the weſt, as to leave a very inconſiderable ſpace between it and the Pacific ocean; and frequently detached branches jut into the ſea, and form promontories; which, with parts of the chain itſelf, were often ſeen by our navigators in the courſe of their voyages. Some branches, as we have before obſerved, extend towards the eaſt, but not to any great diſtance. A plain, rich in woods and ſavannahs, ſwarming with biſons or buffaloes, ſtags, and Virginian deer, with bears, and a great variety of game, occupies an amazing tract, from the great lakes of Canada, as low as the gulf of Mexico; and eaſtward to the other great chain of mountains, the Apalachian, which are the Alps of that ſide of northern America. Its commencement is ſuppoſed to be about Lake Champlain and Lake George, with branches pointing obliquely to the river St Lawrence eaſtward, and riſing on its oppoſite coaſts; others extending as far as Nova Scotia, but in their progreſs eaſtward diminiſh in height. The main chain paſſes through the province of New York, where it is diſtinguiſhed by the name of the *Highlands*, and lies within 40 miles of the Atlantic. From thence it recedes from the ſea, in proportion as it advances ſouthward; and near its extremity in South Carolina is 300 miles diſtant from the water. It conſiſts of ſeveral parallel ridges divided by moſt enchanting valleys, and generally clothed with variety of woods. Theſe ridges riſe gradually from the eaſt, one above the other, to the central; from which they gradually fall to the weſt, into the vaſt plains of the Miſſiſſippi. The middle ridge is of an enormous bulk and height. The whole extends in breadth about 70 miles; and in many places leaves great chaſms for the diſcharge of the vaſt and numerous rivers which riſe in the boſoms of the mountains, and empty themſelves into the Atlantic ocean, after yielding a matchleſs navigation to the provinces they water. Alps. Alpuxarras

Beyond the branch of the Apalachian mountains called *The Endleſs*, is another of amazing extent, nearly as high as the mountains themſelves. This plain (called the *Upper Plain*) is exceedingly rich land; begins at the Mohocks river; reaches to within a ſmall diſtance of Lake Ontario; and to the weſtward forms part of the extenſive plains of the Ohio, and reaches to an unknown diſtance beyond the Miſſiſſippi. Vaſt rivers take their riſe, and fall to every point of the compaſs; into Lake Ontario, into Hudſon's river, and into the Delaware and Suſquehanna. The tide of Hudſon's river flows through its deep-worn bed far up, even to within a ſmall diſtance of the head of the Delaware; which, after a furious courſe down a long deſcent, interrupted with rapids, meets the tide not very remote from its diſcharge into the ocean.

Lower ALPS, *Department of*, in France. This department is one of four into which the former Provence is divided. It is bounded on the north by the department of the Upper Alps; on the eaſt by Piedmont, and the department of the Maritime Alps; on the ſouth, by the department of the Var, and the north-eaſt extremity of that of the Mouths of the Rhone; and on the weſt, by the departments of Vaucluſe and the Drome: the chief town is Digne; its ſuperficies is about 1,459,699 ſquare acres; population 144,436 individuals. It is divided in five communal diſtricts.

Upper ALPS, *Department of*. This department makes a part of Dauphiné, which contains three. It is bounded on the north by the departments of Mont Blanc and Iſere; on the eaſt by Piedmont; on the ſouth, by the department of the Lower Alps; on the weſt, by that of the Drome, and part of that of Iſere: Embrun is the principal town; its ſuperficies is about 1,084,614 ſquare acres; population 116,764 individuals. It is divided into three communal diſtricts.

Maritime ALPS, *Department of*. This department is formed of the county of Nice. It is bounded on the north by the Apennines and the department of the Lower Alps; on the eaſt, by the republic of Genoa: on the ſouth, by the Mediterranean; and on the weſt, by the departments of the Var and Lower Alps: the principal town is Nice; its ſuperficies is about 632,619 ſquare acres; population 93,366 ſouls. It is divided into three communal diſtricts.

ALPUXARRAS, or ALPAXARES, mountains of Spain, in the province of Granada, on the coaſt of the Mediterranean ſea. They are about 17 leagues in length and 11 in breadth, reaching from the city of Velez to Almeria. They are inhabited by Moors, who are the remains of the diſperſion and ruin of their empire. They embraced the Chriſtian religion; but preſerve their own manner of living, and their language, though much corrupted. Here is a rivulet between

Alquier || Alface.

Pitros and Portugos, which dyes linen that is dipped in it black in an inſtant. Near this rivulet is a cavern, from which proceeds ſo malignant a ſteam, that it deſtroys ſuch animals as come near it. The Moriſcos cultivate the ſoil extremely well, and plant fruit trees; ſome of which grow to a prodigious height and thickneſs, and give the mountains a very agreeable aſpect.

ALQUIER, a liquid meaſure uſed in Portugal to meaſure oil, two of which make an almond. See ALMOND.

ALQUIFOU, or ARQUIFOU, is a ſort of lead ore, which, when broken, looks like antimony. It is uſed by the potters to give a green varniſh to their works, and thence is called *potters ore*. It is met with in Cornwall, &c. The potters mix a ſmall portion of manganeſe with the alquifou, and then the varniſh or glazing on their ware is of a blackiſh hue.

ALREDUS, ALURED, or ALUREDUS, of Beverley, one of the moſt ancient Engliſh hiſtorians, was born at Beverley in Yorkſhire. He wrote in the reign of Henry I. There are no circumſtances of his life known with any degree of certainty. It is generally believed that he was educated at Cambridge, and that he afterwards became one of the canons and treaſurer of St John's at Beverley. And we learn in a note of Biſhop Tanner's, that, for the ſake of improvement, he travelled through France and Italy; and at Rome became domeſtic chaplain to Cardinal Othoboni. He died in the year 1128 or 1129, leaving behind him the following works: 1. The Annals of Alured of Beverley; which was publiſhed at Oxford in 1716, by Mr Hearne, from a manuſcript which belonged to Thomas Rawlinſon, Eſq. It contains an abridgment of our hiſtory from Brutus to Henry I. written in Latin, and with great accuracy, elegance, and perſpicuity. 2. *Libertates eccleſiæ S. Johannis de Beverlac*, &c. a manuſcript in the Cottonian library. It is a collection of records relative to the church of Beverley, tranſlated from the Saxon language. Theſe are the only works which were written by Alredus. (*Biog. Dict.*).

ALRESFORD, a town of Hampſhire, ſeated on the road from London to Southampton, cloſe by the river Itching, which feeds a great pond to the left of the town. Part of a Roman highway runs from hence to Alton. It conſiſts of about 200 houſes; has one church, and two principal ſtreets, which are large and broad; and has a ſmall manufacture of linens. It is 57 miles diſtant from London.

ALSA, in *Ancient Geography*, a river of Carniola (Pliny), now the *Auſa*, running by Aquileia, with a ſhort courſe from north to ſouth, into the Adriatic; where Conſtantine, the ſon of Conſtantine the Great, fighting againſt Conſtans his brother, loſt his life.

ALSACE, formerly a province of France, bounded on the eaſt by the Rhine, on the ſouth by Switzerland, on the weſt by Lorraine, and on the north by the palatinate of the Rhine. It was formerly a part of Germany, but was given to France by the treaty of Munſter. It is one of the moſt fruitful and plentiful provinces of Europe, abounding in corn, wine, wood, flax, tobacco, pulſe, fruits, &c. The mountains which divide it from Lorraine are very high; and generally covered with fir, beech, oak, and hornbeam. Thoſe on the ſide of Switzerland are leſs high; and furniſhed with all ſorts of wood, as well for fuel as building. The country itſelf is diverſified with riſing hills and fertile vales, beſides large foreſts; but that between the rivers Ill, Hart, and the Rhine, as far as Straſburg, is inferior to the reſt, on account of the frequent overflowing of the Rhine. In High Alſace there are mines of ſilver, copper, and lead. They however work none but thoſe of Giromany, from which are annually drawn 1600 marks of ſilver, each mark being eight ounces; and 24,000 pounds of copper: but the expence of working them is almoſt equal to the profit. There are iron works in ſeveral parts of Alſace, and particularly at Betford. There is a mineral ſpring at Sultſbach, near Munſter, in High Alſace; which is in great reputation for the palſy, weakneſs of the nerves, and the gravel.—The original inhabitants of Alſace are honeſt and good-natured, but wedded to their own manners and cuſtoms. The fruitfulneſs of their country renders them indolent and inactive; for the Swiſs make their hay and reap their corn, as well as manage the vintage of High Alſace, which ſends a great deal of money out of the province. The common language is the German; but the better ſort of people in the towns ſpeak French; and, even in the country, they ſpeak French well enough to be underſtood. Alface.

The number of inhabitants was formerly computed at about half a million, who are moſtly Lutherans and Roman Catholics. By the late diviſion of France this province forms two departments, viz. thoſe of the Upper and Lower Rhine; the capital of the former being Colmar, and that of the latter Straſburg; but formerly it was divided into Upper and Lower Alſace, the former contained 32 large and ſmall towns, and the latter 39, and in both there are upwards of 1000 market towns and villages. The Rauraci, Sequani, and Mediomatrici, were the ancient inhabitants of this province. Under the Merovingian kings its name firſt occurs in the hiſtory of France, and it moſt probably is derived from the river Ell or Ill, the inhabitants on the borders of which were called *Elſaſſon*, from whom the country itſelf was afterwards denominated *Elſas*, in Latin *Eliſatia*, *Aliſatia*, and *Alſatia*. The Romans wreſted it from the Celtæ; from them it paſſed into the hands of the Germans; and after the famous battle of Tolbiac, gained by Clovis in 496, it paſſed into the poſſeſſion of the Franks. It was incorporated at a future period with the kingdom of Auſtraſia; and, in 1752, it was ſubjected, like the reſt of the monarchy, to the laws of Pepin and his ſucceſſors. Lotharius, the eldeſt ſon of Lewis Debonnaire, at the deceaſe of his father in 840, obtained it and united it to that part of the empire of the Franks which fell to him, and was generally known by the name of *Lotharingia*, or *Lorraine*. Afterwards it fell to his youngeſt ſon Lotharius by inheritance, and after him, in 869, it became a province of Germany, and was governed by dukes.

About a century before the title of dukes was aboliſhed, the provincial counts who governed under them in Alſace, aſſumed the title of *Landgraves*, and the countries over which they preſided, obtained the name of *Landgravates*, the one ſuperior and the other inferior. The beſt part of the inferior was conveyed to the biſhops of Straſburg in 1375, who aſſumed the

Alſen
||
Alſirat.

title of *Landgrave of Alſace*. In after times, the government was given by the emperors to ſeveral families, until at laſt Ferdinand I. beſtowed it upon the German line of his own family, and conſequently it remained in the houſe of Auſtria. The property of the town of Briſac, the landgravate of the Upper and Lower Alſace, Sundgau, and the diſtricts of the ten united imperial cities in Alſace, with the whole ſovereignty belonging to them, was for ever ceded by the emperor to the crown of France, at the peace of Munſter in 1648. The perpetual ſovereignty of the city of Straſburg, together with all its dependencies on the left of the Rhine, were ceded to France by the peace of Ryſwick in 1697.

ALSEN, an iſland of Denmark, ſituated in the Leſſer Belt, or entrance into the Baltic ſea, between Sleſwick and Funen, 100 miles weſt of Copenhagen. It extends in length ſix leagues, and about two in breadth. The ſoil is fertile, producing abundance of fruit and variety of grain, with large crops of aniſeeds, a carminative much uſed in ſeaſoning the food and mixing with the bread all over the Daniſh dominions. E. Long. 10. 12. N. Lat. 55. 12.

ALSFIELD, a town of Germany, in the landgravate of Heſſe Caſſel, ten miles north-weſt of Marpurg, and 35 ſouth of Heſſe Caſſel. It is an ancient town, and well built; and the inhabitants were the firſt of this country who embraced the Reformation. E. Long. 9. 5. N. Lat. 50. 40.

ALSHASH, a very beautiful city in Buckharia, ſuppoſed to be the ſame with that which is now called *Taſhcant*, the capital of the eaſtern part of Turkeſtan, poſſeſſed by the Kaſſats. It is ſituated on the river *Sihun*, now *Sir*, and had a well watered garden for every houſe; but was ruined by Jenghiz Khan, who took the city, and cauſed a great number of its inhabitants to be maſſacred.

ALSHEDA, a pariſh in the province of Smaland, in Sweden, where a gold mine was diſcovered in 1738.

ALSINA, in *Botany*, a ſynonyme of the theligonum. See THELIGONUM. BOTANY *Index*.

ALSINASTRUM, in *Botany*, the trivial name of the elatine. See ELATINE, BOTANY *Index*.

ALSINE, or CHICKWEED. See BOTANY *Index*.

The common chickweed affords a remarkable inſtance of what is called the *ſleep of plants*; for, every night, the leaves approach in pairs, ſo as to include within their upper ſurfaces the tender rudiments of the new ſhoots; and the uppermoſt pair but one at the end of the ſtalk are furniſhed with longer leaf-ſtalks than the others; ſo that they can cloſe upon the terminating pair, and protect the end of the branch.

ALSIRAT, in the *Mahometan Theology*, denotes a bridge laid over the middle of hell, finer than a hair, and ſharper than the edge of a ſword, over which people are to paſs, after their trial, on the day of judgement. To add to the difficulty of the paſſage, Mahomet aſſures, that the alſirat, narrow as it is, is beſet with briars and thorns; none of which, however, will be any impediment to the good, who ſhall fly over it like the wind, Mahomet and his Muſſulmans leading the way; whereas the wicked, by the narrowneſs of the path, the entangling of the thorns, and extinction of the light which directed the former to paradiſe, will ſoon miſs their footing, and tumble headlong into hell, which is gaping beneath to receive them.

Alſium,
Alſop.

ALSIUM, in *Ancient Geography*, a city of ancient Etruria, occupying (according to Cluverius) the ſpot on which *Pala* now ſtands. We are told by Dionyſius Halicarnaſſenſis, that Alſium was built by the Aborigines, long before the Tyrrhenians invaded Italy. In this caſe it muſt have been founded not long after the diſperſion in the days of Peleg. Its founder is ſaid to have been one *Alæſus*, *Aleſus*, or *Aliſa*; whom ſome conjecture to have been Aliſah, or Eliſha, the ſon of Javan, mentioned in Scripture.

ALSOP, ANTHONY, an Engliſh divine and poet, was educated at Weſtminſter ſchool, and from thence elected to Chriſt-church, Oxford, where he took the degree of M. A. in March 1696, and of B. D. in December 1706. On his coming to the univerſity, he was very ſoon diſtinguiſhed by Dean Aldrich, and publiſhed *Fabularum Æſopicarum Delectus*, Oxon. 1698, 8vo, with a poetical dedication to Lord Viſcount Scudamore, and a preface in which he took part againſt Dr Bentley in the famous diſpute with Mr Boyle. He paſſed through the uſual offices in his college to that of cenſor with conſiderable reputation; and for ſome years had the principal noblemen and gentlemen belonging to the ſociety committed to his care. In this employment he continued till his merit recommended him to Sir Jonathan Trelawney, biſhop of Winchelſer, who appointed him his chaplain, and ſoon after gave him a prebend in his own cathedral, together with the rectory of Brightwell in the county of Berks, which afforded him ample proviſion for a learned retirement, from which he could not be drawn by the repeated ſolicitations of thoſe who thought him qualified for a more public character and a higher ſtation. In 1717 an action was brought againſt him by Mrs Elizabeth Aſtrey of Oxford, for a breach of a marriage contract; and a verdict obtained againſt him for 2000l. which probably occaſioned him to leave the kingdom for ſome time. His death, which happened June 10. 1726, was occaſioned by his falling into a ditch that led to his garden door. A quarto volume was publiſhed in 1752, under the title of *Antonii Alſopi, Ædis Chriſti olim Alumni, Odarum libri duo*. Four Engliſh poems of his are in Dodſley's Collection, one in Pearch's, ſeveral in the early volumes of the Gentleman's Magazine, and ſome in "The Student." Mr Alſop is reſpectfully mentioned by the facetious Dr King of the Commons (Vol. i. p. 236), as having enriched the commonwealth of learning, by "Tranſlations of Fables from Greek, Hebrew, and Arabic;" and not leſs detractingly by Dr Bentley, under the name of "Teny Alſop, a late editor of the Æſopean Fables." (*Biog. Dict.*)

ALSOP, *Vincent*, an Engliſh nonconformiſt divine, was born in Northamptonſhire, and educated at St John's college, Cambridge, where he took the degree of Maſter of Arts. When he received deacon's orders, he went to Rutlandſhire, and ſettled at Oakham, where he was an aſſiſtant to the maſter of the free-ſchool. As he was a man of a ſprightly turn, he fell into indifferent company; but was reclaimed by the frequent admonitions of the Reverend Mr Benjamin King. He afterwards married that gentleman's daughter, and becoming a convert to his principles, receiv-

ed

Alſop, Alſtedius.

ed ordination in the Preſbyterian way, not being ſatisfied with that which he had from the biſhop. He was ſettled at Wilbec in the county of Northampton, whence he was ejected in 1662, for nonconformity. After this he ventured to preach ſometimes at Oakham, and at Wellingborough where he lived, and was once ſix months in priſon for praying by a ſick perſon. A book he wrote againſt Dr Sherlock in a humorous ſtyle, made him well known to the world, and induced Mr Cawton, an eminent nonconformiſt in Weſtminſter, to recommend him to his congregation for his ſucceſſor. On receiving this call he quitted Northamptonſhire, and came to London, where he preached conſtantly, and wrote ſeveral pieces which were extremely well received by the public. His living in the neighbourhood of the court expoſed him to many inconveniences; but theſe ended with the reign of Charles II. or at leaſt in the beginning of the next reign, when Mr Alſop's ſon engaging in treaſonable practices was freely pardoned by King James. After this our divine went frequently to court, and is generally ſuppoſed to have been the perſon who drew the Preſbyterians addreſs to that prince for his general indulgence. After the Revolution, Mr Alſop gave public teſtimonies of his attachment to government; yet upon all occaſions he ſpoke very reſpectfully of King James, and retained a very high ſenſe of his clemency in ſparing his only ſon. The remainder of his life he ſpent in the exerciſe of his miniſtry, preaching once every Lord's day; beſides which he had a Thurſday lecture, and was one of the lecturers at Pinner's hall. He lived to a great age, and preſerving his ſpirits to the laſt, died in May 1703. On grave ſubjects he wrote with a becoming ſeriouſneſs: but where wit might properly be ſhown, he diſplayed it to great advantage. His funeral ſermon was preached by Mr Slater, and his memory will be always preſerved by his own learned and elegant writings. Of theſe the moſt remarkable, beſides his ſermons, are, 1. *Antiſozzo;* in vindication of ſome great truths onpoſed by Dr William Sherlock, 8vo, 1675. 2. *Melius Inquirendum;* in anſwer to Dr Goodman's Compaſſionate Inquiry, 8vo, 1679. 3. The Miſchief of Impoſitions; in anſwer to Dr Stillingfleet's Miſchief of Separation, 1680. 4. A faithful Reproof to a Falſe Report, with reference to the Differences among the United Miniſters in London, 8vo. (*Biog. Brit.*).

ALSTEDIUS, John Henry, a German Proteſtant divine, and one of the moſt indefatigable writers of the 17th century. He was ſome time profeſſor of philoſophy and divinity at Herborn in the county of Naſſau: From thence he went into Tranſylvania, to be profeſſor at Alba Julia; where he continued till his death, which happened in 1638, in the 50th year of his age. His *Encyclopædia* has been much eſteemed even by the Roman Catholics; it was printed at Lyons, and ſold very well throughout all France. His *Theſaurus Chronologicus* is by ſome conſidered as one of his beſt works, and has gone through ſeveral editions. He alſo wrote *Triumphus Biblicus*, to ſhow that the principles of all arts and ſciences are to be found in the ſcriptures. He was a Millenarian; and publiſhed, in 1627, a treatiſe *De mille annis*, in which he aſſerted that the reign of the ſaints on earth was to begin in 1694.

ALSTON, Charles, M. D. a botanical and medical writer, was born in the weſt of Scotland in the year 1683. He began his ſtudies at the univerſity of Glaſgow, and about this period he had the good fortune to be taken under the patronage of the ducheſs of Hamilton, which afforded him an opportunity of purſuing the bent of his inclination, by attaching himſelf to the ſtudy of phyſic. About the age of 33, along with his friend and companion the celebrated Alexander Monro, he went to Leyden, and ſtudied three years under Boerhaave. On their return to their native country, they, in conjunction with Rutherford, Sinclair, and Plummer, undertook departments in the college of Edinburgh, and by their abilities and induſtry, laid the foundation of that ſchool of phyſic. The branches of botany and materia medica, were long the favourite ſtudies of his life, conſequently he undertook that department, and continued to lecture on them with increaſing reputation until his death, which happened in November 1760, at the age of 77 years. His talents appear to have been naturally ſtrong, which he improved and ſtrengthened with great aſſiduity and induſtry, and employed them ſucceſsfully in the ſervice of ſcience. In the year 1753, his diſſertation on the ſexes of plants, in which he combats the doctrine of Linnæus, was publiſhed in the firſt volume of the Edinburgh Phyſical and Literary Eſſays. The general plan of the work is conducted with much ingenuity, ſupported by ſome ſtrong experiments, and although in the opinion of the learned, it has failed in its principal deſign, yet it muſt be acknowledged to be one of the beſt argued pieces on that ſide of the queſtion. An aſperity of language is ſometimes uſed, very unſuitable to a ſcientific topic; but however, it is proper to remark, that Linnæus had given ſome reaſons for this conduct by the nature of ſome of his deſcriptions. In the fifth volume of the Edinburgh Medical Eſſays, we have a ſhort paper by Dr Alſton on the efficacy of the powder of tin, to deſtroy or expel worms from the bowels. He informs us, that he received the preſcription from an empyric, who was renowned for his ſkill in curing perſons afflicted with that diſeaſe. The patient received the firſt morning one ounce of tin reduced to powder, and half an ounce each of the two following mornings, and was then purged with the infuſion of ſenna and manna. He ſpeaks with great certainty upon the efficacy of this medicine, which certainly has conſiderable power in theſe caſes, and may be given to the moſt delicate ſubjects with perfect ſafety. Dr Alſton alſo engaged in a chemical controverſy reſpecting quicklime with Dr Whytt. But the moſt valuable of all his works, are his lectures on the Materia Medica, which were publiſhed in the year 1770, in two volumes 4to. The number of curious and uſeful facts contained in this book, will tend to ſecure its reputation, although conſiderable additions and improvements have been made, ſince that period, in this branch of ſcience. (*Gen. Biog.*).

Alſton ‖ Alſtonia.

ALSTON-MOOR, a town in Cumberland, ſeated on a hill, at the bottom of which runs the river Tyne, with a ſtone bridge over it. Near this place is plenty of lead ore. W. Long. 2. 4. N. Lat. 54. 45.

ALSTONIA. See Botany *Index*.

Alſtroemeria ALSTROEMERIA. See BOTANY *Index*.

ALT, in *Muſic*, a term applied to the high notes in the ſcale.

Altar. ALTAI MOUNTAINS, an extenſive range of mountains in the northern parts of Aſia. It begins at the vaſt mountain Bogdo, paſſes above the head of the Irtiſch, and then takes a courſe rugged, precipitous, clothed with ſnow, and rich in minerals, between the Irtiſch and Oby; then proceeds by the lake Telezkoi, the riſe of the Oby; after which it retires, in order to comprehend the great rivers which form the Jeneſei, and are locked up in theſe high mountains; finally under the name of the *Sainnes*, it is uninterruptedly continued to the lake of Baikal. A branch inſinuates itſelf between the ſources of the rivers Onon and Ingoda, and thoſe of Ichikoi, accompanied with very high mountains, running without interruption to the north-eaſt, and dividing the river Amur, which diſcharges itſelf into the eaſt, in the Chineſe dominions, from the river Lena and lake Baikal. Another branch ſtretches along the Oleema, croſſes the Lena below Jakouſk, and is continued between the two rivers Tonguſka to the Jeneſei, where it is loſt in wooded and moraſſy plains. The principal chain, rugged with ſharp-pointed rocks, approaches and keeps near the ſhores of the ſea of Ockhotz, and paſſing by the ſources of the rivers Outh, Aldan, and Maia, is diſtributed in ſmall branches, which range between the eaſtern rivers which fall into the Icy ſea; beſides two principal branches, one of which, turning ſouth, runs through all Kamtſchatka, and is broken, from the Cape Lopatka, into the numerous Kurile iſles, and to the eaſt forms another marine chain, in the Aleutian iſlands which range from Kamtſchatka to America; moſt of them, as well as Kamtſchatka itſelf, diſtinguiſhed by volcanoes, or the traces of volcanic fires. The laſt chain forms chiefly the great Cape Tſchutſki, with its promontories and rocky broken ſhores.

The ſummits of the higheſt of the Altai mountains are covered with perpetual ſnow. The loftieſt range of this extenſive chain, is compoſed of granite. Another range of inferior height conſiſts of thiſtus, which lies on the ſides of the granite mountains. Beſide theſe rocks, there are ſtrata of chalkſtone, limeſtone, and marble. The Altai mountains abound in metallic ores. Gold, ſilver, and lead mines, have been diſcovered in them, with great abundance of copper and iron. The two latter have been wrought to a conſiderable extent, and have been found productive.

ALTAMONT, a very handſome town of Italy, in the kingdom of Naples, and in Calabria Citerior, 15 miles north-weſt of Baſigniano. E. Long. 16. 22. N. Lat. 39. 40.

ALTAMURA, a town of Naples, in the territory of Bari, with the title of a principality, ſeated on the foot of the Apennine mountains. E. Long. 16. 54. N. Lat. 41. 0.

ALTAR, a place upon which ſacrifices were anciently offered to ſome deity.

The heathens at firſt made their altars only of turf; afterwards they were made of ſtone, of marble, of wood, and even of horn, as that of Apollo in Delos.

Altars differed in figure as well as in materials. Some were round, others ſquare, and others triangular. All of them were turned towards the eaſt, and ſtood lower than the ſtatues of the gods; and were generally adorned with ſculpture, repreſenting either the gods to whom they were erected, or their ſymbols. See the PAGAN ALTARS repreſented on Plate XVII. Upon the ſides of fig. 1. a trident and two dolphins are exhibited, which denote it to have been dedicated to Neptune. Fig. 2. a four-ſquare altar, was dedicated to the Nymphs, as the inſcription imports. Fig. 3. exhibits a Bacchanal holding a thyrſus in his hand, a mark of the altar's being built to Bacchus; it had two other ſides, which made it appear triangular. Of fig. 4. which was alſo triangular, each face or ſide exhibited a genius, one of whom (on the ſide repreſented) carries an oar upon his neck, which ſeems to denote it an altar of Neptune. Fig. 5. an altar of a round ſhape, is inſcribed *Ara Neptuni*: the god himſelf is there repreſented, all naked, ſaving the pallium upon his ſhoulder; and holding in his left hand a trident, and in his right a dolphin. Altar.

The height of altars alſo differed according to the different gods to whom they ſacrificed. According to Servius, thoſe altars ſet apart for the honour of the celeſtial gods, and gods of the higher claſs, were placed on ſome pretty tall pile of building; and for that reaſon were called *altaria*, from the words *alta* and *ara*, "a high elevated altar." Thoſe appointed for the terreſtrial gods were laid on the ſurface of the earth, and called *aræ*. And, on the contrary, they dug into the earth and opened a pit for thoſe of the infernal gods, which they called βοθροι λακκοι, *ſcrobiculi*. But this diſtinction is not everywhere obſerved: the beſt authors frequently uſe *ara* as a general word, under which are included the altars of the celeſtial and infernal, as well as thoſe of the terreſtrial gods. Witneſs Virgil, Ecl. 5.

——*En quatuor aras*,

where *aræ* plainly includes *altaria*; for whatever was make of Daphnis, Phœbus was certainly a celeſtial god. So Cicero, pro Quint. *Aras delubraque Hecates in Græcia vidimus*. The Greeks alſo diſtinguiſhed two ſorts of altars; that whereon they ſacrificed to the gods was called βωμος, and was a real altar, different from the other whereon they ſacrificed to the heroes, which was ſmaller, and called εσχαρα. Pollux makes this diſtinction of altars in his Onomaſticon; he adds, however, that ſome poets uſed the word εσχαρα for the altar whereon ſacrifice was offered to the gods. The Septuagint verſion does ſometimes alſo uſe the word εσχαρα for a ſort of little low altar, which may be expreſſed in Latin by *craticula*; being a hearth rather than an altar.

Before temples were in uſe, altars were erected ſometimes in groves, ſometimes in the highways, and ſometimes on the tops of mountains; and it was a cuſtom to engrave upon them the name, enſign, or character of the deity to whom they were conſecrated.

In the great temples of ancient Rome there were ordinarily three altars: The firſt was placed in the ſanctuary, at the foot of the ſtatue of the divinity, upon which incenſe was burnt and libations offered; the ſecond was before the gate of the temple, and upon it they ſacrificed the victims; and the third was a portable altar, upon which were placed the offering and the ſacred veſſels.

Altar. Beſides theſe uſes of altars, the ancients ſwore upon them, and ſwore by them, in making alliances, confirming treaties of peace, and other ſolemn occaſions. Altars alſo ſerved as places of refuge to all thoſe who fled to them, whatever crime they had committed.

Altars are doubtleſs as ancient as ſacrifices themſelves; conſequently their origin is not much later than that of the world, Gen. ch. iv. Some attribute their origin to the Egyptians; others to the Jews; others to the patriarchs before the flood. Some carry them as far back as Adam, whoſe altar is much ſpoken of by Jewiſh, and even Chriſtian writers. Others are contented to make the patriarch Enoch the firſt who conſecrated a public altar. Be this as it will, the earlieſt altars we find any expreſs teſtimony of are thoſe erected by Abraham.

Altars, in the patriarchal times, were very rude. The altar which Jacob ſet up at Bethel was nothing but a ſtone, which ſerved him inſtead of a bolſter; that of Gideon, a ſtone before his houſe: and the firſt which God commanded Moſes to erect was probably of earth or unpoliſhed ſtones, without any iron; for if any uſe was made of that metal, the altar was declared impure.

The principal altars of the Jews were, The altar of *incenſe*; that of *burnt-offering*; and the *altar*, or *table*, *for the ſhew bread*.

The *altar of incenſe* was a ſmall table of ſhittim wood, covered with plates of gold, of one cubit in length, another in width, and two in height. At the four corners were four kinds of horns, and all round a little border or crown over it. This was the altar hidden by Jeremiah before the captivity; and upon it the officiating prieſt offered, every morning and evening, incenſe of a particular compoſition. See Plate XVII.

The *altar of burnt-offerings* was made of ſhittim wood, and carried upon the ſhoulders of the prieſts by ſtaves of the ſame wood overlaid with braſs. In the time of Moſes, this altar was five cubits ſquare and three high; but in Solomon's temple it was much larger, being 20 cubits ſquare and 10 in height. It was covered with braſs; and at each corner was a horn or ſpire, wrought out of the ſame wood with the altar, to which the ſacrifices were tied. Within the hollow was a grate of braſs, on which the fire was made; through it fell the aſhes, which were received in a pan below. At the four corners of the grate were four rings and four chains, which kept it up at the horns. This altar was placed in the open air, that the ſmoke of the burnt-offerings might not ſully the inſide of the tabernacle. See Plate XVII.

The *altar* or *table* for the *ſhew-bread* was likewiſe of ſhittim wood, covered with plates of gold, having a little border round it, adorned with ſculpture. It was two cubits long, one wide, and one and a half in height. Upon this table, which ſtood in the holy of holies, were put, every Sabbath day, 12 loaves, with ſalt and incenſe.

The Jewiſh altars, after their return from the captivity, and the building of the ſecond temple, were in ſome reſpects different from thoſe deſcribed above. That of burnt-offerings was a large pile, built of unhewn ſtone, 32 cubits ſquare at the bottom, and 24 ſquare at the top. The aſcent was by a gentle riſing, 32 cubits in length, and 16 in breadth.

ALTAR, is alſo uſed among Chriſtians for the communion-table. Altar || Altenberg.

In the primitive church, the altars were only of wood; as being frequently to be removed from place to place. But the council of Paris, in 509, decreed that no altar ſhould be built but of ſtone. At firſt there was but one altar in each church; but the number ſoon increaſed; and from the writings of Gregory the Great, who lived in the ſixth century, we learn, that there were ſometimes in the ſame church twelve or thirteen. In the cathedral of Magdeburg there are no leſs than 49 altars.

The altar is ſometimes ſuſtained on a ſingle column, as in the ſubterraneous chapels of St Cecilia, at Rome, &c.; and ſometimes by four columns, as the altar of St Sebaſtian of Crypta Arenaria; but the cuſtomary form is, to be a maſſive of ſtone work, ſuſtaining the altar table. Theſe altars bear a reſemblance to tombs: to this purpoſe, we read in church-hiſtory, that the primitive Chriſtians chiefly held their meetings at the tombs of the martyrs, and celebrated the myſteries of religion upon them: for which reaſon, it is a ſtanding rule to this day in the church of Rome, never to build an altar, without incloſing the relics of ſome ſaint in it.

ALTAR-THANE, or ALTARIST, in old law-books, an appellation given to the prieſt or parſon of a pariſh, to whom the altarage belonged. See ALTARAGE.

ALTARAGE, in *Law*, altars erected in virtue of donations, before the Reformation, within a parochial church, for the purpoſe of ſinging of maſs for deceaſed friends.

ALTARAGE likewiſe ſignifies the profits ariſing to the prieſt on account of the altar.

AL-TAYEFF, a town of Hejaz, a diſtrict of Arabia Felix. It is ſituated about 60 miles eaſt of Mecca, behind Mount Gazwan, where the cold is more intenſe than in any other part of the diſtrict, but the air very wholeſome. Its territory abounds in fountains, and produces excellent raiſins. The town is ſurrounded with a wall, but is not very large.

ALTDORF, a large handſome town in Switzerland, and the chief of the canton of Uri. It is ſituated below the lake of the Four Cantons, in a plain, at the foot of a mountain whoſe paſſages are difficult, and ſerve inſtead of fortifications. It has four churches and two convents; St Martin's church and that of the Holy Croſs are the fineſt. The town-houſe and the arſenal are alſo worth ſeeing. E. Long. 8. 30. N. Lat. 46. 50.

ALTEA, a ſea-port town of Valencia in Spain. It was taken in 1705, in favour of the archduke Charles; but loſt after the battle of Almanza. W. Long. 0. 15. N. Lat. 46. 34.

ALTEMBURG, a town of Tranſylvania, 17 miles ſouth-weſt of Wiſemburg, and 35 ſouth of Clauſenbourg. E. Long. 23. 5. N. Lat. 46. 25.

ALTENA, or ALTONA, a ſea-port town of Germany, in the duchy of Holſtein in Lower Saxony. It is a modern town, built by the king of Denmark, and was burnt by the Swedes in 1712; but has ſince been beautifully rebuilt. The merchandiſe brought from Aſia by the Daniſh Eaſt India Company is ſold here. E. Long. 10. 0. N. Lat. 53. 51.

ALTENBERG, an ancient town of Germany, ſituated

Altenburg || Alternate.

situated on the river Pleiſs, with a good caſtle placed on a rock, in Miſnia, in the circle of Upper Saxony. It was formerly an imperial city, but at preſent belongs to the houſe of Saxony. Here is a college which has always been in a flouriſhing condition. In 1705, there was a nunnery founded for women of a high rank, who are Proteſtants. E. Long. 15. 8. N. Lat. 50. 59.

ALTENBURG, a ſmall fortified town of Hungary, in the territory of Moſon, near the Danube, about fifty-five miles from Vienna. E. Long. 35. 30. N. Lat. 48. 15.

ALTENBURG, or OWAR, a ſmall but ſtrong town of Hungary, ſeated in a marſh, with wide ſtreets. It is near the river Danube, and is ſurrounded with deep ditches. It is 15 miles ſouth of Preſburg, 40 ſouth-eaſt of Vienna, and 65 ſouth-weſt of Buda. E. Long. 17. 56. N. Lat. 44. 0.

ALTERANTS, or *ALTERATIVE Medicines*, ſuch as correct the bad qualities of the blood and other humours, without occaſioning any ſenſible evacuation.

ALTERATION, in *Phyſics*, the act of changing the circumſtances and manner of a thing; its general nature and appearance remaining the ſame. Or, it is an accidental and partial change in a body; without proceeding ſo far as to make the ſubject quite unknown, or to take a new denomination thereupon. Or, it may be defined, the acquiſition or loſs of ſuch qualities as are not eſſential to the form of the body. Thus, a piece of iron, which before was cold, is ſaid to be *altered*, when it is made hot; ſince it may ſtill be perceived to be iron, is called by that name, and has all the properties thereof. By this *alteration* is diſtinguiſhed from *generation* and *corruption*; thoſe terms expreſſing an acquiſition or loſs of the eſſential qualities of a thing. The modern philoſophers, after the ancient chemiſts and corpuſcularians, hold all *alteration* to be effected by means of local motion. According to them, it always conſiſts either in the emiſſion, acceſſion, union, ſeparation, or tranſpoſition, of the component particles.

ALTERCATION, a debate or conteſt between two friends or acquaintance. The word comes from *altercari*, which anciently ſignified to converſe or hold diſcourſe together. Thus we ſay, They never come to an open quarrel, but there is continually ſome little *altercation* or other.

ALTERN-BASE, in *Trigonometry*, a term uſed in contradiſtinction to the true baſe. Thus in oblique triangles, the true baſe is either the ſum of the ſides, and then the *difference* of the ſides is called the *altern baſe*; or the true baſe is the difference of the ſides, and then the *ſum* of the ſides is called the *altern baſe*.

ALTERNATE, in a general ſenſe, a term applied to ſuch perſons or things as ſucceed each other by turns. Thus, two who command each his day, are ſaid to have an alternate command, or to command alternately.

ALTERNATE, in *Heraldry*, is ſaid in reſpect of the ſituation of the quarters. Thus the firſt and fourth quarters, and the ſecond and third, are uſually of the ſame nature, and are called *alternate quarters*.

ALTERNATE, in *Botany*, when the leaves or branches of plants ariſe higher on oppoſite ſides alternately.

Alternatic || Aiting.

ALTERNATION, in its primary ſenſe, denotes a ſucceſſion by turns.

ALTERNATION is ſometimes uſed to expreſs the different changes or alterations of orders in any number of things propoſed. This is alſo called *permutation*, &c. and is eaſily found by a continual multiplication of all the numbers, beginning at unity. Thus, if it be required to know how many changes or alternations can be rung on ſix bells, multiply the numbers 1, 2, 3, 4, 5, 6, continually into one another; and the laſt product gives the number of changes.

ALTERNATIVE, is particularly uſed for the choice of two things propoſed. In this ſenſe we ſay, to take the *alternative* of two propoſitions.

ALTHÆA, MARSHMALLOW. See BOTANY *Index*.

ALTHÆA Frutex. See HIBISCUS, BOTANY *Index*.

ALTIMETRY, the art of meaſuring altitudes or heights, whether acceſſible or inacceſſible. See GEOMETRY.

ALTIN, a money of account in Muſcovy, worth three *copecs*; 100 of which make a ruble, worth about 4s. 6d. ſterling.

ALTIN, a lake in Siberia, from whence iſſues the river Ob, or Oby, in N. Lat. 52. 0. E. Long. 85. 55. This lake is called by the Ruſſians *Teloſkoi Oſero*, from the Teleſſi, a Tartarian nation, who inhabit the borders of it, and who give it the name of *Altin-Kul*. By the Calmucks it is called *Altinnor*. It is near 90 miles long and 50 broad, with a rocky bottom. The north part of it is ſometimes frozen ſo hard as to be paſſable on foot, but the ſouthern part is never covered with ice. The water in the Altin lake, as well as in the rivers which run through the adjacent places, only riſes in the middle of ſummer, when the ſnows on the mountains are melted by the heat of the ſun.

ALTINCAR, among mineraliſts, a ſpecies of factitious ſalt uſed in the fuſion and purification of metals.

The altincar is a ſort of flux powder. Divers ways of preparing it are given by Libavius.

ALTING, HENRY, a German divine, was born at Embden, in 1583. His father was miniſter of the church of Embden, and early deſtined his ſon to the ſame profeſſion. In the year 1602, after a grammatical courſe he was ſent to the univerſity of Herborn: there he ſtudied with ſo much aſſiduity and ſucceſs, that he ſoon had the honour of being a preceptor. Qualified by the vigorous exertions of his talents, he was appointed tutor to the three young counts of Naſſau, Solms, and Iſenburg, who ſtudied with the elector prince palatine, firſt at Sedan, and afterwards at Heidelberg. A proper diſcharge of the duties of a lower ſtation generally paves the way for a higher. For he was appointed preceptor to the prince in 1608: and in conſequence of his aſſiduity and ſucceſs, he was choſen to accompany the elector into England. Among the number of celebrated men to whoſe acquaintance he was introduced in England, was the famous Dr Abbot, archbiſhop of Canterbury. In 1613, Alting returning to Heidelberg after the marriage of the elector with the princeſs of England, received his degree of doctor of divinity, and was appointed director of the college of Wiſdom. The increaſed knowledge and invigorated talents of Alting, were always receiving renewed opportunities of exertion; thus his elo-

quence

Alting. quence and learning obtained full ſcope in the ſynod of Dort, to which he had been deputed by the Palatinate, along with two other divines.

It was but reaſonable for Alting to expect high preferment and high advantages from the avowed patronage of the elector; but in this he was greatly diſappointed, and he had only to participate in his misfortunes. In 1622, Count Tilly took the city of Heidelberg, and devoted it to plunder. In order to eſcape the fury of the ſoldiers, Alting endeavoured to paſs by a back door into the chancellor's houſe, which was put under a ſtrong guard; but the officer who guarded the houſe, as he was entering ſaid to him, "With this battle-axe I have to-day killed ten men, and Alting, if I knew where to find him, ſhould be the eleventh: who are you?" Alting with a ſingular preſence of mind returned an evaſive anſwer, which ſaved his life. "I am (ſaid he) a teacher in the college of Wiſdom." The officer took him under his protection, but the Jeſuits unfortunately taking poſſeſſion of the houſe, the next day, left the generous officer no time at his departure to take care of the teacher of the college of Wiſdom. Alting evaded the hands of the Jeſuits, by hiding himſelf in a garret, and a cook of the electoral court ſupplied him with food, who happened to be employed by Count Tilly in the kitchen occupied by him in the chancellor's houſe. In this perilous ſituation he remained until an opportunity offered of making his eſcape to Heilbron, whither his family had been conducted before.

But eccleſiaſtical intolerance haraſſed Alting, as much as he was formerly endangered by military hoſtility. With the permiſſion of the duke of Wirtemberg he retired for a few months to Schorndorf after the deſolation of the Palatinate by the victorious forces of Count Tilly. It was reaſonable to expect that a welcome and hoſpitable reception might have been given, among Proteſtants, to one who had juſt eſcaped the flames of a Popiſh war. But the doctrine of mutual forbearance and candour ſeems to have been little attended to by the Proteſtants at this period, whatever was their progreſs in the knowledge of the other doctrines of Chriſtianity. The palatinate being in the vicinity of the duchy of Wirtemberg, the profeſſors of Tubingen and Heidelberg frequently attacked each other in polemic writings and theological diſputations. The natural conſequence was, that a ſettled jealouſy and enmity exiſted between the two ſchools and their reſpective vicinities. The injuries which Alting had ſuffered from the common enemy were not ſufficient to ſecure him a friendly reception among the Lutheran miniſters of Schorndorf, who were involved in theſe feuds, and therefore murmured at the permiſſion which the duke had given to a profeſſor of Heidelberg to reſide there. The miſchievous effects of religious diſſenſions have been univerſally felt.

In 1623, Alting retired with his family to Embden, and afterwards followed to the Hague his late pupil, now king of Bohemia. Such was the unfeigned attachment of his maſter to him, that he ſtill retained him as a preceptor to his eldeſt ſon; and prevented him from accepting the charge of the church at Embden, and likewiſe of a profeſſorſhip at the univerſity of Franeker. In 1627 his importunity prevailed upon his patron, and he obtained leave to remove to Groningen, and there aſcended the divinity chair; and continued to lecture with increaſing reputation until the day of his death. The ardent deſire and repeated endeavours of ſeveral univerſities to appropriate to themſelves the honour and benefit of his ſervices, is the moſt unequivocal proof of the general eſteem in which his character was held. The ſtates of Groningen poſitively refuſed to give their conſent to his removal, when the univerſity of Leyden ſolicited him to come and labour among them. But ſome time after, the proſpect of extenſive uſefulneſs in re-eſtabliſhing the univerſity of Heidelberg, and reſtoring the churches of the Palatinate, determined him to accept the office of profeſſor of divinity and eccleſiaſtical ſenator, preſented to him by Prince Lewis Philip. In the year 1634, amidſt numerous hardſhips, to which the exiſting war expoſed him, he ſet out for Heidelberg, and purſued his journey as far as Francfort; when the battle of Norlingen, in which the imperialiſts were victorious, rendered his farther progreſs impracticable, and therefore with great difficulty he returned to Groningen. Alting.

Domeſtic affliction and perſonal ſufferings embittered the remaining years of this excellent man's life. Deprived of his eldeſt daughter by death, ſuch was his great affection for her that it brought on a ſettled melancholy, attended with a bodily diſeaſe which was with great difficulty removed; but after an interval of four years a ſettled and irrecoverable melancholy ſeized him, in conſequence of the loſs of an amiable and beloved wife, which, together with the return of his bodily diſeaſe, in a few months put a period to his uſeful life in the year 1644.

Alting was a man of eminent talents and extenſive learning, poſſeſſed of amiable diſpoſitions, which induced him to be more ſolicitous to ſerve the public than to benefit himſelf. The amiable character and extenſive learning of Alting, cannot fail deeply to intereſt every reader, in conſequence of his misfortunes. He was averſe to quarrels and diſputes about trifles, although no friend to the innovations introduced at this period by the Socinians. According to his own judgment, adhering to the plain doctrine of Scripture, he was equally deſirous to avoid fanatical ſcrupuloſity and ſophiſtical ſubtility. The productions of his pen are: *Notæ in Decadem Problematum Johannis Behm*, Heidelbergæ, 1618; "Notes on a Decad of Jacob Behmen's Problems." *Loci Communes*; "Common places." *Problemata*; "Problems." *Explicatio Catacheſeos Palatinat.*; "Explanation of the Palatine Catechiſm." *Exegeſis Auguſtanæ Confeſſionis*, &c. Amſt. 1647; "Commentary on the Auguſtan Confeſſion." *Methodus Theologiæ Didacticæ et Catacheticæ*, Amſt. 1650; "A method of Didactic and Catechetic Theology." The *Medulla Hiſtoriæ Prophanæ*, "Marrow of Profane Hiſtory," publiſhed under the name of Paræus, was written by Alting. (*Gen. Biog.*)

Alting, *James*, ſon of Henry Alting, was born at Heidelberg in 1618. After the uſual courſe of grammatical ſtudies he became a ſtudent, and ſoon after profeſſor of divinity in the univerſity of Groningen. The Oriental languages were his favourite ſtudies at an early period of his life; and in 1638 he put himſelf under the tuition of a Jewiſh rabbi at Embden. Determining to take up his reſidence in England, he arrived there in 1640, and was admitted to clerical orders by Doctor Prideaux biſhop of Worceſter. By an

Alting. Altitude.

an offer of the Hebrew profeſſorſhip in the univerſity of Groningen, he was ſoon induced to alter his plan of life, and conſequently again returned to Germany in 1643. His active aſſiduity in theſe languages, and his knowledge in other ſciences, procured him univerſal eſteem, and great reputation as a ſcholar. About this time he received many academic honours; he was admitted doctor of philoſophy, academic preacher, and at laſt, in conjunction with a colleague, Samuel des Marets, was choſen profeſſor of divinity. Theſe profeſſors followed different methods of teaching, and adopted different ſyſtems. Des Marets was an admirer and follower of the ſubtilities of the ſcholaſtics; and by the ingenuity with which he purſued the ſcholaſtic plan of inſtruction had acquired great reputation and conſiderable influence. Alting ſpent his time in the ſtudy of the Scriptures, and in the purſuit of Rabbinical learning; and he delivered a courſe of lectures on divinity, which gained him great popularity. As it might naturally be expected, a mutual jealouſy aroſe between the two profeſſors; and their reſpective partiſans in the univerſity carried their animoſity to an undue height. Eſtabliſhed opinion, and the weight of authority, marſhalled on the ſide of Des Marets. By the permiſſion of the curators of the univerſity he appeared as public accuſer of Alting, and produced a long liſt of erroneous propoſitions to the divines of Leyden for their opinion. The judgment of the divines upon the diſpute ſhows a great degree of moderation and good ſenſe: they pronounced Alting innocent of hereſy, but imprudently fond of innovation; and they declared Des Marets deficient in modeſty and candour. If the ſuperiors had not prohibited the farther diſcuſſion of theſe ſubjects in the conſiſtories, claſſes, and ſynods, they would have occaſioned as much miſchief as they had excited general attention. Such was the protection given to Alting, that whenever any of the order of eccleſiaſtics propoſed any further meaſures againſt him, they were immediately rejected by the civil power; nay, the penalty of deprivation was decreed againſt thoſe clergy who ſhould revive the *Mareſio-Altingian* controverſy. Whatever might be the advantages reſulting to Alting from this protection, the magiſtrates certainly did wrong in proceeding ſo far in prohibiting a free diſcuſſion from the preſs, either for or againſt the judgments of the divines of Leyden. Although a kind of reconciliation was attempted by their common friends while Des Marets lay upon his death-bed, yet the breach between Des Marets and Alting was never perfectly healed. Dr Alting died of a fever in 1679. The fondneſs which he ſhewed for Rabbinical learning gave birth to the general report, that he was inclined to become a Jew. His opinions which ſeem to have excited more general attention than they deſerve, may be ſeen at large in his writings, which were collected a few years after his death, and publiſhed in five volumes folio by his couſin Menſo Alting, who wrote a good deſcription of the Low Countries, under the title of *Notitia Germaniæ Inferioris*. (*Gen. Biog.*)

ALTITUDE, acceſſible and inacceſſible. See GEOMETRY.

The method of taking conſiderable terreſtrial altitudes, of which thoſe of mountains are the greateſt, by means of the barometer, is very eaſy and expeditious. It is done by obſerving, on the top of the mountain, how much the mercury has fallen below what it was at the foot of the mountain. See BAROMETER.

Altitude || Alton

ALTITUDE of the Eye, in *Perſpective*, is a right line let fall from the eye, perpendicular to the geometrical plane.

ALTITUDE, in *Aſtronomy*, is the diſtance of a ſtar, or other point, in the mundane ſphere, from the horizon.

This altitude may be either *true* or *apparent*. If it be taken from the rational or real horizon, the altitude is ſaid to be true or real; if from the apparent or ſenſible horizon, the altitude is apparent. Or rather, the apparent altitude is ſuch as it appears to our obſervation; and the *true* is that from which the refraction has been ſubtracted.

The true altitudes of the ſun, fixed ſtars, and planets, differ but very little from their apparent altitudes; becauſe of their great diſtance from the centre of the earth, and the ſmallneſs of the earth's ſemidiameter, when compared thereto. But the difference between the true and apparent altitude of the moon is about 52. This ſubject is further explained under ASTRONOMY.

ALTITUDE Inſtrument, or *Equal Altitude Inſtrument*, is that uſed to obſerve a celeſtial object when it has the ſame altitude on the eaſt and weſt ſides of the meridian. See ASTRONOMY.

ALTKIRK, a town of France, in the department of the Upper Rhine, ſituated on the river Ill, in N. Lat. 47. 40. E. Long. 7. 15.

ALTMORE, a town of Ireland, in the county of Tyrone, and province of Ulſter, ſituated in N. Lat. 54. 34. W. Long. 7. 2.

ALTON, a town in Hampſhire, ſeated on the river Wey; W. Long. 0. 46. N. Lat. 51. 5. It is governed by a conſtable; and conſiſts of about 300 houſes, indifferently built, chiefly laid out in one pretty broad ſtreet. It has one church, a Preſbyterian, and a Quaker meeting, a famous free ſchool, a large manufacture of plain and figured baragons, ribbed druggets, and ſerges de Niſmes; and round the town is a large plantation of hops.

ALTON, or AVELTON, a village in Staffordſhire, five miles north of Utoxeter. There are the ruins of a caſtle here, which ſome would have to be built before the Norman conqueſt; but Dr Plott is pretty certain that it was erected by Theobald de Verdun, in the beginning of the reign of Edward II. A great part of the walls are ſtill ſtanding, but they are in a very ruinous condition.

ALTO *et* BASSO, or *in* ALTO *et in* BASSO, in *Law*, ſignifies the abſolute reference of all differences, ſmall and great, high and low, to ſome arbitrator or indifferent perſon. *Pateat univerſis per præſentes, quod Willielmus Tylar de Yetton, et Thomas Gower de Almeſtre, poſuerunt ſe in* Alto *et in* Baſſo, *in arbitrio quatuor hominum; viz. de quadam querela pendente inter eos in curia. Nos et terram noſtram* altè *et* baſsè *ipſius domini Regis ſuppoſuimus voluntati.*

ALTO-Relievo. See RELIEVO.

ALTO Repieno, in *Muſic*, the tenor of the great chorus, which ſings and plays only now and then in ſome particular places.

ALTORF, a town of the circle of Franconia, in Germany.

Alt ranſtadt
ll
Alvar

Germany. It has a botanical garden, with a great variety of plants, an anatomical theatre, and a handſome library. It is ſubject to the houſe of Brandenburg; and is ſeated on the confines of Bavaria, 15 miles from Nuremberg. E. Long. 11. 7. N. Lat. 49. 25.

ALT-RANSTADT, a town in Saxony, famous for the treaty between Charles XII. king of Sweden and Auguſtus elector of Saxony, in 1706, wherein the latter reſigned the kingdom of Poland.

ALTRINGHAM, a town of Cheſhire in England, upon the borders of Lancaſhire, ſeven miles from Mancheſter. W. Long. 1. 30. N. Lat. 53. 25.

ALTZEG, a town of Germany in the Lower Palatinate, the capital of a territory of the ſame name, with an old caſtle. W. Long. 7. 25 N. Lat. 49. 44.

ALVA DE TORMES, a conſiderable town in Spain, in the kingdom of Leon, and territory of Salamanca, with a very handſome caſtle. It is ſeated on the north bank of the river Tormes. W. Long. 6. 1. N. Lat. 41. 0.

ALVA, *Ferdinand Alvarez of Toledo, duke of*, was born in 1508, and deſcended from one of the moſt illuſtrious families of Spain. His grandfather, Frederick de Toledo, was his preceptor in the military and political arts, and he diſplayed his valour at the battle of Pavia and at the ſiege of Tunis. The ambitious Charles V. ſelected Alva as a proper inſtrument for conducting his military enterpriſes, and he made him his general in 1538; and, after ſeveral operations, in which he both diſplayed his valour and military knowledge, in 1542 he ſucceſsfully defended Perpignan againſt the dauphin of France.

In 1546, Alva was made general in chief of the army which marched againſt the German Proteſtants, who were marſhalled under the banners of the elector of Saxony. Francis, the king of France, died at Rambouillet, and by his death a conſiderable change was made in the ſtate of Europe. Inſtantly, therefore, Charles began his march from Egra on the borders of Bohemia, and entered the ſouthern frontier of Saxony, and attacked Altorf upon the Elſter. Inceſſantly puſhing forward, he arrived the evening of the 23d of April on the banks of the Elbe, oppoſite to Muhlberg. The river, at that place, was three hundred paces in breadth, about four feet in depth; its current rapid; and the bank poſſeſſed by the Saxons was higher than that which he occupied. In oppoſition to the opinion of the duke of Alva and his other officers, Charles, with undaunted courage, and with inexpreſſible difficulties, led his army through the river, and engaged the Saxons. The elector diſplayed great perſonal courage and military knowledge, but having received a wound in the face, he at laſt ſurrendered himſelf priſoner. When he approached the emperor, he ſaid, "The fortune of war has made me your priſoner, moſt gracious emperor, and I hope to be treated"—— Here Charles harſhly interrupted him, "And am I then at laſt acknowledged to be emperor; Charles of Ghent was the only title you lately allowed me. You ſhall be treated as you deſerve." The elector made no reply; but, with an unaltered countenance, which diſcovered neither aſtoniſhment nor dejection, accompanied the Spaniſh ſoldiers appointed to guard him. The emperor proceeded towards Wittemberg, whither the remains of the Saxon army had fled, carrying along with him the captive prince, as a ſpectacle of conſternation and amazement to his own ſubjects. But when he approached the town, he found it defended by the vigorous efforts of the elector's wife, along with the inhabitants. He ſummoned Sibylla once and a ſecond time to open the gates, informing her, that if ſhe perſiſted in her obſtinacy, the elector ſhould anſwer for it with his head. Accordingly he brought his priſoner to an immediate trial. The proceedings againſt him were as irregular as the ſtratagem was barbarous. Inſtead of conſulting the ſtates of the empire, or remitting the cauſe to any court, which, according to the German conſtitution, might have legally taken cognizance of the elector's crime, he ſubjected the greateſt prince in the empire to the juriſdiction of a court martial. The emperor ſelected the unrelenting duke of Alva as a proper inſtrument to carry into effect any meaſure of violence and oppreſſion, and therefore made him preſident of that court, compoſed of Spaniſh and Italian officers. Moved more by the intreaties of his wife than by a ſenſe of his own danger, the elector ſubmitted to all the rigorous and unjuſt meaſures that were propoſed in order to ſave his life; but when it was added, that he ſhould alſo renounce the Proteſtant faith and become a Roman Catholic, he refuſed to act in oppoſition to his conſcience, and bravely fell a ſacrifice to the cauſe of truth.

Alva.

In 1552, Alva was intruſted with the command of the army intended to invade France, and was conſtrained by the opinion and authority of the emperor to lay ſiege to Metz, in oppoſition to his own military knowledge; but notwithſtanding all his valour and abilities, the duke of Guiſe ſucceſsfully defended the place. In conſequence of the ſucceſs of the French arms in Piedmont, he was made commander in chief of all the emperor's forces in Italy, and at the ſame time inveſted with unlimited power. Succeſs did not, however, attend his firſt attempts, and after ſeveral unfortunate attacks, he was obliged to retire into winter quarters. The next year he was ſent into the pope's territories, and, had he not been reſtrained by his maſter, he would have taken poſſeſſion of all his fortified places, and deterred Henry from entering into any new connexion with him, and have thereby prevented the renewal of the war. Philip was ſtrongly inclined to peace, but Alva was inclined to ſevere meaſures: he, however, yielded to the inſtructions of his maſter, until being deluded, and ſometimes haughtily anſwered, he at length ſent Pino de Loffredo with a letter to the college of cardinals, and another to Paul, in which, after enumerating the various injuries which his maſter had received, and renewing his former offers of peace and friendſhip, he concluded with proteſting that, if his offers were again rejected, the pope ſhould be chargeable with all the calamities that might follow. The pope threw Loffredo into priſon; and, had not the college of cardinals interpoſed, he would have even put him to death; and on account of Philip's failing to pay tribute for Naples, he deprived him of the ſovereignty of that kingdom. This violent conduct of Paul gave great offence throughout all Europe, and greatly leſſened his influence in Italy; but Philip, though a young, ambitious, powerful monarch, and of a temper of mind impatient of injuries and affronts,

Alva. moved with a religious veneration, discovered an amazing reluctance against proceeding to extremities. After much time spent in negotiation, Philip was at last forced to give orders for Alva to take the field. He cheerfully obeyed, and began his march in the beginning of September 1556, with a well-disciplined army, which reducing several towns in the Campagna di Roma, he pursued his conquests to the very gates of Rome. The circumstances, however, in which Alva found his army, induced him to make a truce of 40 days, and, after several negotiations, he yielded to peace. One of its terms was, that the duke of Alva should in person ask forgiveness of the haughty pontiff whom he had conquered. Proud as the duke was by nature, and accustomed to treat with persons of the highest dignity, yet such was the superstitious veneration then entertained for the papal character, that he confessed his voice failed him at the interview, and his presence of mind forsook him. Not long after this, he was sent at the head of a splendid embassy to Paris, to espouse, in the name of his master, Elizabeth, daughter of Henry king of France.

Philip II. his new master, being strongly devoted to the Roman see, and determined to reclaim rebels to his government, and dissenters from his faith, by the most unrelenting severity and unbounded cruelty, he pitched upon Alva as the fittest person to carry this system into practice: with this design, therefore, he was sent into the Low Countries in 1567. Having received his orders, armed with such power as left only the shadow of authority to the natural governor, and provided with 10,000 veterans, he marched towards that devoted country. When he arrived, he soon shewed how much he merited the confidence which his master reposed in him, and instantly erected a bloody tribunal, to try all persons who had been engaged in the late commotions which the civil and the religious tyranny of Philip had excited. The depraved enormities of the mind of Alva raged with unexampled violence. He imprisoned the counts Egmont and Horn, the two popular leaders of the Protestants, and soon brought them to an unjust trial, and condemned them to death. In a little time he totally annihilated every privilege of the people, and with uncontrolled fury and cruelty, put multitudes of them to death. Beholding herself deprived of all authority, and her subjects devoted to destruction, the duchess of Parma resigned her office, disdaining to hold the nominal, while the actual reins of power were in the hands of Alva. This event increased the general tide of wretchedness, and every place was filled with scenes of horror and dismay. Unable for the present to administer the least aid, the prince of Orange saved his life by flight. This noble prince suddenly collected an army in Germany, and returned to the relief of his countrymen; and at the same time Prince Lewis, his brother, marched with an army into Friesland. Although success at first attended Lewis, yet the activity and experience of Alva prevailed, and he was totally defeated. The prince of Orange proved a more formidable foe; and it gave exertion to the united talents of Alva, and his son Frederick of Toledo, to prevent the prince from making a descent upon the Netherlands. But notwithstanding all the address and military skill of the prince of Orange, this was effected; and the glory remained to Alva to baffle that great leader, and to compel him, after great loss of men, to disband the remainder of his army. Now the cruelty of Alva had unrestrained vent. Instantly the executioner was employed in removing all those friends of freedom whom the sword had spared. Uncontrolled, the base and unrelenting heart of Alva began to reduce all the provinces to utter slavery, and to extirpate Protestantism in that country. In most of the considerable towns, Alva built citadels. He erected a statue of himself, which was no less a monument of his vanity than his tyranny, in the city of Antwerp: he was figured trampling on the necks of two smaller statues, representing the two estates of the Low Countries. By his unusual and arbitrary requisition of new supplies from the states, he greatly aggravated this haughty insult. The human mind displays unusual vigour when rendered desperate by oppression. The exiles from the Low Countries, roused to action, fitted out a kind of piratical fleet, and, after strengthening themselves by successful depredations, ventured upon the bold exploit of seizing the town of Briel. Thus, unintended by him, the cruelty of Alva was the instrument of the future independence of the seven Dutch provinces. The fleet of the exiles having met the Spanish fleet, totally defeated it, and reduced North Holland and Mons; and numbers of cities hastened to throw off the yoke; while the states-general assembling at Dordrecht, openly declared against Alva's government, and marshalled under the banners of the prince of Orange. This situation of affairs opened the eyes of Alva to behold the instability of a power founded on terror and oppression; he therefore began in vain to use more lenient measures. He prepared, however, with vigour to oppose the gathering storm, and afterwards recovered Mons, Mechlin, and Zutphen, under the conduct of his son Frederick, where his soldiers more than retaliated upon the prince of Orange. With the exception of Zealand and Holland, he regained all the provinces; and at last his son stormed Waerden, and, massacring its inhabitants with the most savage cruelty, he then proceeded to invest the city of Haerlem. Fully convinced of the miseries that waited their surrender, this city stood an obstinate siege; and nothing less than the inflexible and persevering spirit of Alva could have opposed difficulties almost insurmountable. Despairing of success, Frederick was at one time disposed to raise the siege, but the stern reproaches of his father urged him on; and at length the inhabitants, overcome with fatigue and resistance, surrendered. The victorious Frederick gave tolerable conditions to the town; but his cruel father arriving on the third day after the surrender, sacrificed numerous victims, who had been led to expect mercy, and satiated his vengeance to the full. Their next attack was upon Alkmaar; but the spirit of desperate resistance was raised to such a height in the breasts of the Hollanders, that the Spanish veterans were repulsed with great loss, and Frederick constrained reluctantly to retire. Alva now resolved to try his fortune by sea, and with great labour and expence fitted out a powerful fleet, and proceeded to attack the Zealanders, but was entirely defeated, and the commander taken prisoner. About the same period, the prince of Orange proceeded to attack the town of Gertruydenburg. Alva's feeble Alva.

state

Alva. state of health and continued disasters induced him to solicit his recal from the government of the Low Countries; a measure which, in all probability, was not displeasing to Philip, who was now resolved to make trial of a milder administration. In December 1573, that devoted country was freed from the presence and oppressions of the duke of Alva, who, accompanied by his son, returning home, gave out the inglorious boast, that he had, during the course of six years, besides the multitudes destroyed in battle and massacred after victory, consigned 18,000 persons to the executioner. Requesens, who succeeded him in the command, in his first act of administration, pulled down his insolent effigies at Antwerp, so that nothing might remain of him in that much injured country but the remembrance of his injustice and cruelty.

Returning from this scene of oppression and blood, he was treated for some time with great distinction by his master. Justice, however, soon overtook the crimes of Alva: for his son having debauched one of the king's attendants, under promise of marriage, he was committed to prison; and being aided in his escape by his father, and married by him to a cousin of his own, this procured Alva's banishment from court, and confinement in the castle of Uzeda. He remained two years in this disgraceful situation, until the success of Don Antonio, in assuming the crown of Portugal, determined Philip to turn his eyes towards a person, in whose fidelity and abilities he could on this occasion most confide. A secretary was instantly dispatched to Alva, to make inquiries concerning the state of his health, and whether or not it was sufficiently vigorous to undertake the command of an army. The aged chief returned an answer full of loyal zeal, and was immediately appointed to the supreme command in Portugal. It is a singular fact, however, that the enlargement and elevation of Alva was not followed by forgiveness. It is a characteristic mark of the unrelenting temper of Philip, and, at the same time, a noble testimony to the honour and loyalty of Alva, that although placed in this important trust, he did not procure his pardon. In 1581, Alva entered Portugal, defeated Antonio, drove him from the kingdom, and soon reduced the whole under the subjection of Philip. Entering Lisbon, he seized an immense treasure; and with their accustomed violence and rapacity, he suffered his soldiers to sack the suburbs and vicinity. It is reported, that Alva being requested to give an account of the money expended on that occasion, he sternly replied, "If the king asks me for an account, I will make him a statement of kingdoms preserved or conquered, of signal victories, of successful sieges, and of sixty years service." Philip deemed it proper to make no farther inquiries. Alva, however, did not enjoy the honours and rewards of his last expedition, for in 1582, at the age of 74, he was removed by death to the impartial tribunal of heaven, to receive the just rewards of his iniquitous life.

The actions already enumerated give such an ample idea of his character, that little more is necessary to complete it. In him a variety of extremes concentred. Some of the best qualities of a commander were blended with some of the worst that ever exalted in a man or in a general. The Spanish severity, little tempered by the spirit of generosity, appeared in all its horrible deformity in Alva. A strict impartial discipline was his greatest military virtue, and vanity was his greatest weakness. In consequence of this strict discipline, he sometimes punished the unlicensed barbarities of his soldiers; and there is an instance recorded, that when his favourite son Frederick, thinking he could attack the prince of Orange with advantage, sent a request to his father for permission, he received a stern reprimand, for presuming to exercise his judgment on a point already determined by his superior, with a threatening in case of repetition. (*Gen. Biog.*)

Alvah, Alvares.

ALVAH, the wood wherewith Moses sweetened the waters of Marah, Exod. ch. xv. ver. 25.—The name of this wood is not found in Scripture; but the Mahometans give it that of *alvah*, and pretend to trace its history from the patriarchs before the flood. Josephus, on the contrary, says, that Moses used the wood which he found next lying before him.

ALVARES DE LUNA, treasurer, and a great favourite of John II. king of Castile, was famous for the prodigious ascendency he gained over this prince, and for the punishment which at length overtook him. He was a natural son of Don Alvaro de Luna, lord of Canete in Arragon, and of a woman of infamous character. He was born in 1388, and named Peter; but Pope Benedict XIII. who was charmed with his wit though yet a child, changed Peter to Alvares. He was introduced to court in 1408, and made a gentleman of the bedchamber to King John, with whom he grew into the highest favour. In 1427 he was obliged to retire: the courtiers exerted all their endeavours to ruin him: they complained, that a man of no military skill, of no virtues whatever, should by mere artifice and dissimulation, be advanced to the highest authority; and they could not bear, that by the assistance of a few upstart men, whom he had raised and fixed to his interest, he should reign as absolutely as if he were king.

They prevailed against him, and Alvares was banished from court a year and a half: but this was the greatest affliction imaginable to the king; who showed all marks of distress the moment he was removed from his presence, and now thought and spoke of nothing but Alvares. He was therefore recalled; and, being invested with his usual authority, revenged himself severely upon his enemies, by persuading the king to banish them. Of the 45 years he spent at court, he enjoyed for 30 of them so entire an ascendency over the king, that nothing could be done without his express orders: nay, it is related by Mariana, that the king could not change an officer or servant, or even his clothes or diet, without the approbation of Alvares. In short he wanted nothing to complete his grandeur but the name of king: he had all the places in the kingdom at his disposal; he was master of the treasury, and by bounties had so gained the hearts of the subjects, that the king, though his eyes were now opened, and his affections sufficiently turned against him, durst not complain.

But the day of reckoning was approaching, and at length he was seized; yet not directly, openly, and violently, but with some of that management which upon a similar occasion was formerly employed by Tiberius against Sejanus. During his confinement, he made

Alvares. Alvarez. several attempts to speak to the king in perſon; but not being able to effect this, he ſent the following letter, from which, as well as from the reſt of Alvares's hiſtory, all court favourites may draw abundant matter for edification and inſtruction. "Sir, It is five "and forty years ſince I was admitted into your ſer- "vice. I do not complain of the rewards I have "received: they were greater than my merits or ex- "pectation, as I ſhall not deny. There was but one "thing wanting to complete my happineſs; and that "was, to have fixed proper limits in time to this great "fortune of mine. While, inſtead of chooſing retire- "ment, after the example of the greateſt men, I ſtill "continued in the employment, which I thought not "only my duty, but neceſſary for your intereſt, I fell "into this misfortune. It is very hard that I ſhould "be deprived of liberty, when I have riſked life and "fortune more than once to reſtore it to you. Grief "prevents me from ſaying more. I know that the "Deity is provoked againſt me by my ſins; but it will "be ſufficient for me, if his anger is appeaſed by the "calamities I now ſuffer. I can no longer bear that "prodigious maſs of riches, which it was wrong in "me to have heaped together. I ſhould willingly "reſign them, but that every thing I have is in your "power; and I am denied the opportunity of ſhowing "mankind, that you have raiſed a perſon to the height "of greatneſs, who can contemn wealth as well as pro- "cure it, and give it back to him from whom he re- "ceived it. But I deſire you in the ſtrongeſt terms, "that, as I was obliged, by the lowneſs of the trea- "ſury, to raiſe 10,000 or 12,000 crowns by methods "I ought not to have taken, you will reſtore them to "the perſons from whom they were extorted. If you "will not grant this on account of the ſervices I have "done, yet I think it neceſſary to be done from the rea- "ſon of the thing."

This letter, however, produced no effect in his favour: Alvares was tried, and condemned to loſe his head. After condemnation, he was removed to Vailadolid; and having confeſſed himſelf, and received the ſacrament, he was carried upon a mule to the market-place, in the middle of which a large ſcaffold was erected. Mounting the ſcaffold, he paid reverence to the croſs, and preſently gave his hat and ſignet to his page, ſaying, "Theſe are the laſt gifts you will ever receive from me." He then ſubmitted himſelf to the axe with the utmoſt intrepidity.

ALVAREZ, Francis, a Portugueſe prieſt, and almoner to Emanuel, king of Portugal, flouriſhed about the beginning of the 16th century. He was ſent ambaſſador from Portugal to David prince of Abyſſinia; and after a reſidence of ſix years in that country, returned with letters of friendſhip from David to Juan, who had ſucceeded Emanuel, and of ſubmiſſion to Pope Clement VII. At Bologna, in the year 1523, he gave a narrative of his expedition to the pope, in the preſence of the emperor Charles V. In the year 1540, he publiſhed the relation of his journey in one volume folio, in the Portugueſe language. He gives a plain and accurate deſcription of this empire; and we are indebted to him for the firſt of the kind that ever was publiſhed. This work was tranſlated into Latin, under the title of *De Fide, Regione, Moribus Ethiopum*, by Damien Goez, a Portugueſe gentleman; and it has often been reprinted and tranſlated into other languages. The information of Alvarez is not, however, to be received with implicit credit, becauſe he does not always ſpeak from his own obſervation, and he frequently exaggerates. (*Dict. Hiſt.*)

Aludels. Alviano.

ALUDELS, in the older and more complicated chemical apparatus, were earthen pots without bottoms, inſerted into each other, and uſed in ſublimations.

ALVEARIUM, in *Anatomy*, the bottom of the *concha*, or hollow of the outer ear.

Alvearium alſo ſignifies a bee-hive. The word is formed of *alveus*, "a channel or cavity," in alluſion to the *alveoli* or cells in bee-hives.

Some of the ancients uſe alſo the word *alvearium* for a bee-houſe, more uſually called among us *apiary*.

Alvearium is ſometimes alſo uſed figuratively, to denote a collection; in which ſenſe, *alvearium* amounts to much the ſame with what we otherwiſe called *theſaurus*, *cornucopia*, or the like. Vinc. Boreus has publiſhed an alvearium of law.

ALVEOLUS, in *Natural Hiſtory*, the name of the waxen cells in bee-hives. Alſo the name of a ſea foſſil of a conic figure, compoſed of a number of cells like bee-hives, joined into each other with a pipe of communication.

Alveolus, in *Anatomy*, the ſockets in the jaws wherein the teeth are fixed. Some writers ſpeak of teeth growing without alveoli. Pliny mentions a perſon who had a tooth in his palate. Euſtachius relates, that he ſaw a man at 60 had a tooth growing out of the middle of his fauces. Haller gives an inſtance of a perſon whoſe teeth were of a piece with his jaws, without any inſertion into alveoli.

ALVIANO, Bartholomew, a Venetian general, flouriſhed in the beginning of the 16th century. His talents were well calculated for the conduct of military affairs, and in an early part of his life, raiſed him to great reputation. In the year 1508, he gained ſuch ſignal victories over the emperor Maximilian, that he was decreed triumphal honours by the republic. During the famous league of Venice, he was ſecond in command along with Count Pitigliano. It was, however, unfavourable to the cauſe in which they had engaged, that the tempers of the two commanders were very different. The commander in chief was heſitating and cautious; the other was bold and intrepid. Alviano commanded the rear-guard at the famous battle of Aignadel, and after diſplaying the greateſt exertions of valour, was wounded, overpowered, and at laſt taken priſoner. An increaſing tribute was paid to the military talents of Alviano; for after the Venetians had become the allies of France, he was intruſted with the command of their army. When the emperor attacked Padua, he defended it againſt him, and diſplayed numerous acts of valour in repulſing the imperial troops. But the current of human life runs not equally ſmooth on its attendance upon any character; for he loſt the great battle of La Motte, in which, however, his exertions were ſo conſpicuous, that the ſenate gave him the moſt honourable aſſurance of the continuance of their eſteem. Fortune, however, ſoon became propitious to this great man, and he defeated the enemy in Friuli. In the deſperate battle of Marignano, he afforded ſuch timely aid to Francis I. that it greatly contributed to his ſucceſs. But the moſt vigorous

Alum. gorous conſtitution muſt one day yield to the force of conſtant exertions, and the moſt inceſſant fatigue; he had incurred ſuch hardſhips in ſuperintending the works at the ſiege of Breccia, that he was ſeized with a fever, of which he died at the advanced age of 62. His character ſtands high in the annals of military fame. By a ſtrict obſervance of diſcipline, and a profuſe liberality to his ſoldiers, he ſecured their eſteem. As an unequivocal proof of this, they kept his body unburied twenty-five days, carrying it about with them during their marches, with all funeral pomp. His loſs was deeply regretted by the ſtate, and, as a proof thereof, his body was buried at the public charge, his unprovided family was ſupported by a liberal penſion, and his daughters were portioned by the ſtate. (*Gen. Biog.*).

ALUM, in *Chemiſtry*, a clear and tranſparent ſaline matter, uſually ſold in large maſſes, of a very auſtere and aſtringent taſte, uſeful in medicine and in various arts.

Moſt of the alum to be met with is artificially prepared by the methods related in their proper place under the article CHEMISTRY, or by others ſimilar to them: though ſometimes a ſmall quantity is produced naturally. This native alum is mixed with heterogeneous matters, or efflorefces in various forms upon the ores during calcination. It rarely occurs in a cryſtallized ſtate, though thus it is ſaid to be met with in Egypt, Sardinia, Spain, Bohemia, and other places. It is alſo found in waters impregnated with fixed airs, but very ſeldom in fountains or hot medicated waters.

There are ſeveral kinds of alum to be met with; but theſe differ from one another only in being mixed with ſome ſalts which are not of the aluminous kinds. That called the Roman alum has been conſidered as preferable to any other. This is uſually met with in ſmall cryſtals, and has a reddiſh colour, moſt probably owing to a ſmall quantity of calx of iron, which, however, does not in the leaſt impair its qualities. The other kinds of alum contain a portion either of vitriolated tartar or ſal ammoniac, according to the nature of the alkali uſed in its preparation. Mr Bergman informs us, that the vegetable alkali, if pure, does not hurt the alum, though it be added in the preparation; but that the volatile alkali, by adulterating it with a portion of vitriolic ſal ammoniac, renders it unfit for ſome purpoſes. The alum, made by adding a portion of clay to the liquor at the beginning of the boiling, he conſiders as equal, if not ſuperior, to Roman alum. He informs us alſo, that a kind of alum ſome time ago began to be manufactured at Brunſwick, which was equal in quality to the Roman alum. On a chemical analyſis of this alum he found it mixed with cobalt.

This ſalt is extremely uſeful in the art of dyeing; as by means of it a great number of colours are fixed and rendered permanent upon cloth, which otherwiſe would either not adhere in any degree, or only for a very ſhort time. In what manner this is accompliſhed, we are very much ignorant; the conjectures and theories on this ſubject are related under the article DYEING. It conſtitutes the baſis of crayons, which generally conſiſt of the earth of alum finely powdered and tinged for the purpoſe. In the preparation of Pruſſian blue, it prevents the baſis of martial vitriol, which is ſoluble in acids, from being precipitated by the ſuperfluous alkali employed in the preparation of that pigment; that is, the alkali which is not coloured by the ſaturating matter. As this baſis adheres more ſtrongly than the clay to the vitriolic acid, and would form a green by the mixture of its yellowneſs, the white earth of alum likewiſe according to its quantity, dilutes the darker colours, even black itſelf, and produces an infinite number of ſhades. It is alſo of uſe in the making of candles: for, being mixed with the tallow, it gives it a hardneſs and conſiſtence which it has not naturally. Wood ſufficiently ſoaked in a ſolution of alum does not eaſily take fire; and the ſame is true of paper impregnated with it; which, for that reaſon, is very properly employed in preſerving gunpowder, as it alſo excludes the moiſture of the air. Paper impregnated with alum is uſeful in whitening ſilver, and ſilvering braſs without heat. Alum is alſo of uſe in tanning, where it aſſiſts in reſtoring the coheſion of the ſkins almoſt entirely deſtroyed by the lime. Vintners fine down their wines, &c. with alum; fiſhers uſe it to dry cod fiſh with; and bakers have mixed it with the flour to make their bread compact and white: to this laſt uſe of it great objections have been made; but unjuſtly, for it is entirely innocent. It is now ſeldom uſed.

In medicine it is of conſiderable uſe as an aſtringent and tonic. It is reckoned particularly ſerviceable for reſtraining hemorrhages, and immoderate ſecretions from the blood: but leſs proper in inteſtinal fluxes. In violent hemorrhages, it may be given in doſes of 15 or 20 grains, and repeated every hour or half hour till the bleeding abates: in other caſes, ſmaller doſes are more adviſable; large ones are apt to nauſeate the ſtomach, and occaſion violent conſtipations of the bowels. It is uſed alſo externally, in aſtringent and repellent lotions and collyria. Burnt alum taken internally has been highly extolled in caſes of colic. In ſuch inſtances, when taken to the extent of a ſcruple for a doſe, it has been ſaid gently to move the belly, and give very great relief from the ſevere pain. Its officinal preparations are, for internal uſe, *pulvis ſtypticus*, and *aqua ſtyptica*; for external applications, the *aqua aluminis*, and *coagulum aluminis* and *alumen uſtum*; which laſt is no other than the alum dried by fire, or freed from the watery moiſture, which, like other ſalts, it always retains in its cryſtalline form. By this loſs of its water it becomes ſharper, ſo as to act as a ſlight eſcharotic; and it is chiefly with this intention that it is employed in medicine, being very rarely taken internally. For theſe preparations, ſee PHARMACY.

ALUM Mines are ſaid to have been firſt found in Italy in the year 1460; and in 1506 King Henry VII. made a monopolizing grant of this commodity to Auguſtine Chigi, a merchant of Sienna. In the year 1608, the manufacture of alum was firſt invented, and ſucceſsfully practiſed in England, meeting with great encouragement in Yorkſhire, where it was firſt made, from Lord Sheffield, and the other gentlemen of that county. King James I. by advice of his miniſtry, aſſumed the monopoly of it to himſelf, and therefore prohibited the importation of foreign alum; and in 1625 the importation of it was further prohibited by the proclamation of Charles I.

ALUM Works, places where alum is prepared, and manufactured in quantities for ſale. They differ from

alum

Aluntium ‖ Alypius.

alum mines, as in the former an artificial alum, and in the latter natural alum, is produced.

ALUNTIUM, ALONTIUM, in *Ancient Geography*, a town in the north of Sicily, situated on a steep eminence, at the mouth of the Chydas; said to be as old as the war of Troy. It is now in ruins; and from these has arisen the hamlet *St Philadelfo*, in the Val di Demona. The inhabitants were called *Haluntini*.

ALVUS, in *Anatomy*, a term used for the belly in general, but more frequently applied to the bowels.

ALWAIDII, a sect of Mahometans who believe all great crimes to be unpardonable.—The Alwaidii stand in opposition to the Morgii. They attribute less efficacy to the true belief in the salvation of men than the rest of the Mussulmans.

ALYPIUS of Antioch, a geographer of the fourth century. He was sent deputy-governor by the emperor Julian into Britain; and after he remained in this situation for some time, he received orders from the emperor to rebuild the temple of Jerusalem. Ammianus Marcellinus, the Roman historian, informs us, that during the progress of the work, whilst it was proceeding with great rapidity, huge balls of fire issued forth in the vicinity of the foundations, which interrupted the men at their labour, and even sometimes consumed them with its violence. Thus the place being rendered inaccessible, they were reluctantly constrained to desist from their undertaking. Different sentiments have been entertained of this phenomenon; but the reader may consult, for his own satisfaction, what has been written by Lardner and Gibbon concerning it. In the evening of his life, after he had retired from the service of the public, Alypius, in conjunction with several other persons, was formally accused of the crime of practising magic. In consequence of which, he was punished with banishment and confiscation of property, and Hierocles his son was condemned to capital punishment. Ammianus Marcellinus, whilst he mentions that the crime for which they suffered, was that of administering poison to others, at the same time freely delivers his opinion, that they were the victims of the general injustice and oppression which reigned at that period, and extended their sway even to the most retired habitations. The emperor Julian himself honoured Alypius with his confidence, and speaks of him with great respect. "As to your conduct in public affairs (says the emperor), it gives me pleasure to observe the assiduity and humanity which appear in all your transactions; for so to temper lenity and moderation with firmness and fortitude, that the good may experience the benefit of the former, and the bad may be corrected by the latter, requires no small share of ability and virtue." Alypius composed a geographical work which is said to have gained the approbation of the emperor, but this work has shared the same fate as many other productions of antiquity. Some have ascribed the work which Godfrey published under the title of "A Description of the Old World;" printed in 4to, at Geneva, to Alypius; but since that author speaks of Britain, not merely from report, but his own observation; this, together with the testimony of some writers, leads to the conclusion, that this "Description" is an anonymous work, published in the reigns of Constantius and Constans. *(Gen. Biog.)*.

Alypius.

ALYPIUS, one of the seven Greek writers on music, which Meibomius has industriously collected and published, with a commentary and explanatory notes. The time in which he flourished cannot be precisely ascertained. He is said to have wrote before Euclid and Ptolemy: and Cassiodorus arranges his work, entitled, "Introduction to Music," between that of Nicomachus and Gaudentius. In this work is to be found the most complete nomenclature of all the sounds of the different scales and modes of the ancient Greek music, which have escaped the wreck of time. So complex was the science of music in Greece at this period, that the characters used for sounds were 1620 in number. The 24 letters of the alphabet furnished these notes, sometimes in an entire, sometimes in a mutilated, and sometimes in an altered form; and numerous discriminations of these took place by means of the accents and varied positions of letters.

From the MS. of Joseph Scaliger, Meursius first published this tract in 1616; but according to the testimony of Fabricius, it is by no means correct. Extracts have been published from Alypius, by Kircher, in his Musurgia, 1650, alleging that he translated the whole into Latin; but this table of ancient musical notation is so inaccurate, which he has inserted from him, that Meibomius, who consulted not only the Greek MS. of Scaliger, but that of Belejanus, Barocus, Barberitti, and Selden, affirms, that he found in it more than 200 errors. The learned Meibomius, with incredible industry, decyphered those characters, which previous to his time were so much confounded, disfigured, and corrupted, either through the ignorance or inattention of the transcribers of ancient MSS. This advantage resulted to the science of music, chiefly by his commentaries on Greek musicians, and particularly on the works of Alypius.

ALYPIUS of Tagasta, a Christian divine who flourished in the fourth century. In the year 388, he was baptized along with Augustine, and, in consequence of a similarity of dispositions and religious sentiments, they became strongly attached to each other. In quest of information and improvement, he took a journey into Palestine; and returning home, he soon acquired such general esteem, that he was appointed bishop of his native city. He had adopted in the early part of his life the opinions of the Manichees; but in consequence of farther information and matured experience, he became a powerful advocate for the Catholic faith. The Donatists flourished about this period, and arrogantly claimed the exclusive honour of being the true church; but he, along with his friend Augustine, united his exertions in opposing the tenets of that sect. In the council of Carthage in the year 403, the erudition and talents of Alypius, along with several other eminent divines, were unsuccessfully employed in endeavouring to reclaim them, and to bring them again into the bosom of the church. In 411 Alypius was one of the seven who held a friendly and theological conference with seven of the Donatist bishops. But all the eloquence and strength of argument made use of by these divines, although seconded by the penal decrees of the emperor Honorius, were unsuccessful in producing a recantation of their errors, or a peaceful union with their brethren. In support of the Catholic faith, Alypius appears to have vigorously exerted

Alyſſum ‖ Amadabat.

erted his talents; and it is much to be regretted that the means he employed for that purpoſe were not at all times the moſt honourable; for in the violence of his zeal he went as deputy from the churches of Africa to the emperor Honorius, in order to obtain ſevere decrees againſt the ſect of the Pelagians. Although Alypius failed in his attempts to reclaim the Donatiſts from error, yet he was ſucceſsful with the emperor in obtaining penal decrees againſt the Pelagians; in conſequence of which their miniſters were baniſhed, their churches demoliſhed, and their aſſemblies diſcontinued. Alypius died about the year 430, and his diſpoſitions appear to have participated more of the violence of zeal, than of the meekneſs of charity. *(Gen. Biog.)*

ALYSSUM, ALYSSON, or ALYSOIDES, *Madwort*; (from *αλυσσω*, *to be mad*; becauſe it was believed to have the property of curing madneſs). See BOTANY *Index*.

ALYTARCHA, a prieſt of Antioch in Syria, who, in the games inſtituted in honour of the gods, preſided over the officers who carried rods to clear away the crowd and keep order.

In the Olympic games, the alytarches had the ſame command, and obliged every perſon to preſerve order and decency.

ALZIRA, a town of Spain, in the kingdom of Valencia, ſeated on the river Xucar. E. Long. 0. 20. N. Lat. 39. 10.

AMA, in eccleſiaſtical writers, denotes a veſſel wherein wine, water, or the like, were held, for the ſervice of the euchariſt. In this ſenſe the word is alſo written amula; ſometimes alſo hama, and hamula.

AMA is ſometimes alſo uſed for a wine meaſure, as a caſk, pipe, or the like.

AMABYR, a barbarous cuſtom which formerly prevailed in ſeveral parts of England and Wales, being a ſum of money paid to the lord when a maid was married within his lordſhip. The word is old Britiſh, and ſignifies "the price of virginity."

AMACK. See AMAK.

AMADABAT, a corruption from AHMED ABAD, or *Ahmed's city* (ſo called from a king of that name); a large and populous city of Indoſtan, and the capital of the province of Guzerat. It is ſituated in E. Long. 72. 12. N. Lat. 23. 0. Amadabat was formerly called *Guzerat*; and by Shah Jehân nicknamed *Gherd-abâd*, or "the habitation of duſt," becauſe it was much incommoded therewith. It was the ſeat of the Guzerat kings, as it is now of the Mogul governor. The city ſtands in a beautiful plain, and is watered by the little river Sabremetti, which, though not deep, in time of rains overflows the plains prodigiouſly. The walls are built with ſtone and brick, flanked at certain diſtances with great round towers and battlements. It has twelve gates; and, including the ſuburbs, is about four miles and a half long. The ſtreets are wide. The *meydân ſhâh*, or king's ſquare, is 700 paces long, and 400 broad, planted round with trees. On the weſt ſide is the caſtle, well walled with freeſtone, and as ſpacious as a little city; but its inward appearance is not conformable to it's external magnificence. The caravanſera is on the ſouth of the ſquare, and its chief ornament. Near the meydan alſo is the king's palace, whoſe apartments are richly ornamented: and in the midſt of the city is the Engliſh factory, where they purchaſe fine chintz, callicoes, and other Indian merchandiſe. The place is ſo full of gardens ſtored with fruit trees, that from an eminence it looks like a wood. The Hindoos have here an hoſpital for ſick beaſts, and another for ſick birds, which they take great care of. According to ſome late accounts, this city is little inferior to the beſt in Europe, and is thought to yield ten times as much revenue as Surat.

Amadan ‖ Amadeus.

AMADAN, or HAMADAN, a town of Perſia, between Taurus and Iſpahan. E. Long. 47. 4. N. Lat. 35. 15. It is ſeated at the foot of a mountain, where there are a great many ſprings, which water the adjacent country. The extent of the city is very large; but there are a great many waſte ſpots within it, as well as cultivated land. The houſes are built of brick hardened in the ſun, and have but a very indifferent aſpect. There is but one tolerable ſtreet; and that is where ſtuffs, garments, and the like, are expoſed to ſale: it is ſtraight, long, and wide; and the ſhops are very well furniſhed. The adjacent parts are fruitful in corn and rice, inſomuch that the neighbouring provinces are ſupplied from hence. It is ſaid to enjoy a very ſalubrious air; but the cold in winter is intenſe. The Armenians have a church in this town; but it is a very ill contrived ſtructure. The Jews have a ſynagogue near a tomb, where they pretend Eſther and Mordecai lie interred. To this place they come in pilgrimage from ſeveral parts of the Levant. About a league from Amadan, there is a mountain called *Nalbana*, which abounds with all ſorts of curious herbs. In the ſpring, people flock to this mountain from all parts to recover their health, by ſucking in the ſalutary effluvia with their breath.

Amadan is a very ancient city. It is ſaid to have been deſtroyed by Nebuchadnezzar, and rebuilt by Darius, who brought hither all his riches. The kings of Perſia frequently retired to this place on account of its delightful ſituation; for which reaſon it obtained the name of the *Royal City*. It was conquered by the caliph Othman, and narrowly eſcaped being deſtroyed by Jenghiz Khan in 1220. It had then ſtrong walls and a good caſtle, which are now in ruins. Its preſent beauty conſiſts in its gardens and ſprings.

AMADANAGER, a town in the hither peninſula of India, in the province of Decan. E. Long. 74. 15. N. Lat. 18. 10. It was taken by the Moguls in 1598, after a ſiege of ſix months; being at that time defended by a ſtrong caſtle, ſituated on an eminence, and ſurrounded with deep ditches, into which ſeveral ſprings diſcharged their waters.

AMADEUS V. count of Savoy, aroſe to that dignity in the year 1285. In him it appeared, that mental excellence can riſe ſuperior to riches or extent of territory; for although his dominions were by no means extenſive, nor his riches great, yet, in conſequence of his wiſdom and ſucceſs, he obtained the ſurname of *Great*. The cautious prudence of Amadeus, however, enabled him greatly to increaſe his territory by means of marriage, purchaſe, and donations. In this ſituation, with extended dominion, and diſtinguiſhed for wiſdom and prudence, he roſe to ſuch eminence among the European powers, that he was conſtituted their umpire to ſettle their differences; and in that ſtation acquitted himſelf with much reputation and gene-

ral

Amadeus. neral utility. But in his character valour and wiſdom were combined; for when the Turks attempted to retake the iſle of Rhodes from the knights of St John of Jeruſalem, he boldly defended it, and acquired great renown. A Malteſe croſs with the letters F. E. R. T. in future became the arms of Amadeus and his ſucceſſors, in memory of this ſignal victory. The explanation of this motto is ſaid to be *Fortitudo ejus Rhodum tenuit* —" His valour kept Rhodes." For this important ſervice the grandmaſter conferred on him the grant of a palace at Lyons. Andronicus the emperor of the eaſt had married his daughter; and in order to promote the views of his ſon-in-law, Amadeus took a journey to Avignon to perſuade Pope John XXII. to preach a cruſade in favour of Andronicus. In the year 1323 the famous Amadeus died at that place. Deep penetration, keen diſcernment, conſummate prudence, great valour, together with no ſmall portion of the religious ſuperſtition of his time, appear to have been the reigning features in his character. (*Mod. Univ. Hiſt.*)

Amadeus VIII. count of Savoy, in 1391, ſucceeded his father Amadeus VII. With the large ſum of 45,000 florins of gold he purchaſed the country of Genevois from its laſt earl. Anxious to extend his territories, he purchaſed the city of Rumilli, upon the lake of Geneva, from the widow of the count of Genevois, and thus the houſe of Savoy became ſo illuſtrious that the emperor Sigiſmund erected Savoy into a duchy in the year 1426. Hiſtorians relate, that he aſſiſted John Paleologus againſt the duke of Milan, who endeavoured to wreſt from him the duchy of Montferrat. Deeply ſenſible of the ſervices which he had received, Paleologus not only reſigned to the duke, Chivas, Brandis, and ſeveral other eſtates, but ſubmitted to hold all the marquiſate of Montferrat as a fief from the houſe of Savoy. Theſe fortunate acquiſitions of territory were not yet limited; for upon the marriage of his daughter with Philip Maria, duke of Milan, he received Vercelli, and about the ſame time the count of Creſcentino ſubmitted to become his feodary. In his ambitious purſuit, he laid claim to the ſovereignty of the city of Geneva; but that claim, though enforced by the pope, was rejected by the citizens with diſdain, and the emperor Sigiſmund taking it under his protection, declared it an imperial city. After ſuch an extenſive acquiſition of dominion, and amaſſing ſuch ſums of money, he formed the ſingular ſcheme of abandoning his throne and family; and for that purpoſe retired to a religious houſe at a place called *Ripaille*. But although he reſigned the dukedom of Savoy to his eldeſt ſon Lewis, and made his youngeſt ſon Philip, count of Genevois; yet their honours were merely nominal, for he conſtrained them to live on a very ſcanty allowance, while he in his retirement received all the revenues, and collected ſuch ſums of money, that he is ſaid to have purchaſed the papal honours. During the previous part of his life, having adopted great ſanctity of manners, the motives for his retirement were generally reckoned religious; but what was the aſtoniſhment of mankind to behold the ſeat of his hermitage become the habitation of every rare delicacy, and of the moſt refined luxury. The local ſituation of the place was truly delightful, and was enriched with every thing that could afford gratification to the ſenſes; and his retinue conſiſted of ſome of his moſt intimate friends, along with 20 faithful ſervants, who were the guardians of his voluptuous ſecrets. Neither did he aſſume a religious habit, but wore purple robes, and upon his mantle was embroidered a golden croſs. His table groaned under the weight of luxurious daintics, and the moſt excellent muſic cheered the daily feaſt; in ſhort, ſuch was the voluptuouſneſs of that place, that in the French language the phraſe, *faire ripailles*, ſignifies to make exquiſite good cheer. Amadeus.

He inſtituted a ſecular knighthood in that place under the appellation of St Maurice. The brethren aſſumed the name of hermits, wore beards, and excluded women from their community; and in other reſpects compoſed the character of decent epicures.

When he obtained the papal dignity, and was crowned by the cardinal of Arles at Baſil, all Europe was filled with aſtoniſhment in conſequence of his elevation; for he had never entered into holy orders. But he had found means to remove every objection, the council confirmed his election, and with pretended reluctance he put on the pontifical ornaments, and was conſecrated in the church of St Maurice. It ſeemed good to Amadeus to aſſume the title of Felix V. As might naturally be expected in ſuch circumſtances, the papal dignity was ſeverely conteſted between him and Eugenius; and notwithſtanding all the importunities of the council, the emperor refuſed to acknowledge his elevation. This religious diſpute involved all Europe in contention. Hiſtorians relate that Germany remained neutral, and France, England, Italy, Spain, and Hungary, declared for Eugenius; but Arragon, Poland, and Bretagne, recogniſed the council only; at the ſame time that Savoy, Switzerland, Baſil, Straſburg, Pomerania, and one of the duchies of Bavaria, recogniſed Felix. The emperor Frederick III. held a council at Frankfort, before which both the popes urged their reſpective rights by means of deputies. This attempt, however, to regain peace to Europe was unſucceſsful; therefore the emperor repaired to the vicinity of Baſil, and had a perſonal interview with Felix. The mind of Amadeus was now ſo confirmed in the enjoyment of pleaſure, that he had again returned to his favourite retreat; and after the fathers of the council had frequently ſolicited him in vain to reſide at Baſil, he prevailed upon them to remove to Lyons, which was near the ſeat of his pleaſures. During the conteſt, Eugenius had excommunicated Felix, the council, and ſeveral of the German princes, ſo that the whole church was then filled with confuſion and diſorder. The death of Eugenius, however, terminated the ſtruggle; for upon his death the cardinals at Rome elected Thomas de Sarzan, who aſſumed the name of Nicholas V. In this ſituation of affairs, Amadeus deemed it prudent to enter into a negotiation for the reſignation of his papal crown. In this tranſaction he diſplayed the profoundeſt policy and addreſs, which induced Nicholas to annul all that Eugenius had done to his diſhonour, or that of his aſſociates; to confirm the determination of the council of Baſil to appoint him perpetual apoſtolical legate in Savoy, Piedmont, and the other places of his own dominions, and even added to theſe the honour of being biſhop of Baſil, Lauſanne, Amadeus.

Amadeus II. Amadow.

Strafburg, and Conſtance. Nor did his vanity forſake him even in this political tranſaction, for he provided that he ſhould continue to wear the pontifical dreſs unleſs in a very few particulars. In order to gratify the ſame haughty diſpoſition, he ſtipulated that he ſhould not be obliged to go to Rome, to attend any general council; and that when he had occaſion to approach the pope, he ſhould riſe to receive him, and inſtead of kiſſing his toe, he ſhould be permitted to kiſs his cheek. Amadeus retired to Lauſanne, and died there at the age of 60, in the year 1451.

As the time in which he lived is fertile in memorable events, ſo the character of Amadeus was one of the moſt diſtinguiſhed of his time. The verſatility of his genius has led writers to differ in the delineation of his character. Some have repreſented him as a perſon of ſingular ſanctity of manners, and poſſeſſed of uncommon moderation and virtue; others have repreſented him as a confirmed bigot, and a violent enthuſiaſt; and a third claſs of authors have magnified his talents far above the general ſtandard, and extolled him as one of the moſt accompliſhed princes in Europe. His real character appears to be a compound of extravagancies, in which virtue, genius, caprice, and vanity were blended. (*Mod. Univ. Hiſt.*).

Amadeus IX. count of Savoy, ſucceeded his father Lewis, in his dominion and honours. The prince who exerts his talents to promote the happineſs of his ſubjects, is worthy of more fame than the prince who increaſes the number of his ſubjects by unjuſt and unneceſſary wars. In this view Amadeus IX. deſerves a place in the annals of his nation. His bodily conſtitution was weak, and he was afflicted with the falling-ſickneſs, yet, in conſequence of his piety, virtue, benevolence, and juſtice, he was ſurnamed the *Happy*. The clemency of his temper was ſuch that he readily pardoned thoſe who offended him, and in few inſtances was he induced to puniſh. In his character, however, the virtue of benevolence ſhone with peculiar ſplendour among the other virtues of the Chriſtian. A foreign miniſter one day uſed the freedom to inquire at Amadeus, if he kept any hounds. The duke replied, "a great number, and you ſhall ſee them to-morrow at noon." The miniſter attended at that hour in expectation of ſeeing a numerous pack of hounds; but the duke led him to a window which looked into an extenſive ſquare, and directing his view to a multitude of poor people eating and drinking, he exclaimed, "Theſe are my hounds with whom I go in chaſe of heaven." In all theſe pious and benevolent labours he was ſeconded by his wife Iolande of France. When one of his parſimonious courtiers reminded him that he would ſpend all his revenues, he generouſly replied, "Here is the collar of my order, let them ſell it and relieve my people." In the ſeventh year of his reign, and the thirty-ſeventh of his life, he died univerſally lamented by all his loyal ſubjects, in the year 1472. In high eſteem for his virtuous qualities, his ſubjects conferred on him the appellation of *The Bleſſed*. (*Mod. Univ. Hiſt.*).

AMADIA, a trading town of Aſia, in Curdiſtan, belonging to the Turks; ſeated on a high mountain. E. Long. 43. 1. N. Lat. 36. 25.

AMADOW, a kind of black match, tinder, or touchwood, which comes from Germany. It is made of a ſort of large muſhrooms or ſpongy excreſcences, which commonly grow on old trees, eſpecially oaks, aſh, and firs. This ſubſtance being boiled in common water, and afterwards dried and well beaten, is then put into a ſtrong ley prepared with ſaltpetre, after which it is again put to dry in an oven. The druggiſts ſell this match wholeſale in France, and ſeveral hawkers retail it. Some give to the amadow the name of *pyrotechnical ſponge*, becauſe of its aptneſs to take fire.

Amadowry II. Amalaric.

AMADOWRY, a kind of cotton which comes from Alexandria by the way of Marſeilles.

AMAIN, in the ſea language, a term importing to lower ſomething at once. Thus, *to ſtrike amain*, is to lower or let fall the topſails; *to wave amain*, is to make a ſignal, by waving a drawn ſword, or the like, as a demand that the enemy ſtrike their topſails.

AMAK, a ſmall iſland in the Baltic ſea, near Copenhagen, from which it is ſeparated by a canal over which there is a drawbridge. Amak is about four miles long and two broad; and is chiefly peopled by the deſcendants of a colony from Eaſt Frieſland, to whom the iſland was conſigned by Chriſtian II. at the requeſt of his wife Elizabeth, ſiſter of Charles V. for the purpoſe of ſupplying her with vegetables, cheeſe, and butter. From the intermarriages of theſe coloniſts with the Danes, the preſent inhabitants are chiefly deſcended; but as they wear their own dreſs, and enjoy peculiar privileges, they appear a diſtinct race from the natives. The iſland contains about ſix villages, and between 3000 and 4000 ſouls. It has two churches, in which the miniſters preach occaſionally in Dutch and Daniſh. The inhabitants have their own inferior tribunals; but in capital offences are amenable to the king's court of juſtice at Copenhagen. The old national habit, brought by the original colony when they firſt migrated to the iſland, is ſtill in uſe amongſt them. It reſembles the habit of the ancient Quakers, as repreſented in the pictures of the Dutch and Flemiſh painters. The men wear broad-brimmed hats, black jackets, full glazed breeches of the ſame colour, looſe at the knee, and tied round the waiſt. The women were dreſſed chiefly in black jackets and petticoats, with a piece of blue glazed cloth bound on their heads. The iſland is laid out in gardens and paſtures; and ſtill, according to the original deſign, ſupplies Copenhagen with milk, butter, and vegetables. E. Long. 12. 10. N. Lat. 55. 20.

AMAL, a town of Sweden, in the province of Daland, ſeated on the river Weſer. It has a good harbour, and carries on a great trade, eſpecially in timber, deals, and tar. E. Long. 12. 40. N. Lat. 58. 50.

AMALARIC, was the ſon of Alaric II. and king of the Viſigoths. Deprived of his father when an infant, he would have been bereft of his crown, had not his grandfather Theodoric king of the Oſtrogoths interpoſed in his behalf. In defence of the royal infant, he expelled from the throne his natural brother, who had uſurped the government and ruled the kingdom during his life, and preſerved the crown to the natural heir. In 526 the grandfather died, and Amalaric aſſumed the royal authority. In 517 he married Clotilda, the daughter of Clovis, an amiable lady, who inherited both the piety and orthodoxy of her mother, who was of the ſame name. The Catholic hiſto-

Amalaric, Amalafontha.

rians relate, that the king being violently attached to the Arian cauſe, uſed means to compel his queen to embrace the ſame opinions; which participated more of cruelty than piety. With all the firmneſs of a great mind, and the amiable patience of a Chriſtian, ſhe endured her wrongs for a conſiderable period; but at length, worn out with injurious treatment, ſhe was forced to apply to her brothers for aſſiſtance, and ſent them a handkerchief ſtained with her blood in proof of her cruel uſage. In order to relieve their ſiſter, one of them, Childebert king of Paris, entered the territories of Amalaric, who then reſided with his court at Narbonne; and their different forces having joined battle, the troops of Amalaric were totally defeated, and the king himſelf forced to ſave his life by flying into Spain, A. D. 531. It is reported that, when endeavouring to regain Narbonne, he was ſlain either by an aſſaſſin, employed by Theudis his ſucceſſor, or that he fell in battle. Some hiſtorians again ſay, that he died in Barcelona. (*Gen. Biog.*).

AMALASONTHA, youngeſt daughter of Theodoric the Great, king of the Oſtrogoths, was born about the year 498. The ſiſter of Clovis was her mother, and in 515, ſhe married Eutharic the only remaining heir of the legal race of the Amali. Her father having formed the deſign of making him his ſucceſſor, he ſent to bring him from Spain for that purpoſe. But he never arrived at the deſtined honour; for Eutharic died previous to his father-in-law, and his only ſon Athalaric, was alſo bereft of his grandfather at the age of eight years. The well known abilities of Amalaſontha induced Theodoric to place Athalaric, to whom he had left the kingdom of Italy, under the care of his mother. This princeſs inherited an ample ſhare of her father's talents; and her father had been exceedingly careful to improve theſe natural endowments by means of a liberal education. She became a great proficient in the philoſophy and morals of that age, and with equal elegance and grace ſhe could converſe in the Greek, Latin, and Gothic languages. Nor were her talents merely qualified to adorn private life: ſhe diſplayed them in the adminiſtration of public juſtice, and political diſcuſſion. Her firſt efforts were in behalf of the injured children of Boethius and Symmachus, whom ſhe reinſtated in the poſſeſſion of their inheritance. When the chiefs of the Goths were ſtrongly inclined to treat the Romans as a conquered people, ſhe mildly reſtrained their violent oppreſſion and their ungovernable rapacity. Adorning the female character ſhe relieved her ſubjects from ſome of the ſeverer impoſitions of her father; but carefully retained all his laws, magiſtrates, and political inſtitutions. Having herſelf taſted of the ſweets of literature, and experienced its advantages, ſhe patronized learning with an aſſiduous care, by regularly paying the ſalaries of public teachers, and giving every encouragement to the improvement of genius. Her peaceable deportment towards the neighbouring princes forms an amiable feature in her character. Both with the imperial court, and with all the other powers, ſhe lived upon agreeable terms, and thus univerſal honour and proſperity prevailed. Both in conſequence of maternal affection and the high cultivation of her mind, ſhe exerted all her ingenuity in the education of her orphan ſon. Unfortunately, however, both for the mother and the ſon, neither the general character of the Gothic nation, nor the wayward inclinations of the boy, ſeconded her laudable endeavours. The Gothic nobles had juſt commenced their murmurings againſt the ſoft effeminate manner in which their prince was educating, when, upon a certain day, the youth having undergone ſome kind maternal chaſtiſement, ruſhed into the room where ſome of the nobles were aſſembled, with the tears ſtreaming from his eyes. Informed of the cauſe of his diſtreſs, the wrath of the nobles ſuddenly aroſe, and in a violent burſt of paſſion they inſiſted upon the immediate releaſe of their prince from the bondage of learning and from the reſtraints of a mother. The unfortunate youth was thus dragged from the habitation of learning, prudence, and virtue; and plunged into all the extravagancies of diſſolute pleaſure, and his mind inſpired with contempt and averſion to his virtuous mother.

Amalaſontha, Amalek.

It was impoſſible for humanity to bear this inſult and high injury without oppoſition; therefore, in the firſt effuſions of her reſentment ſhe ſeized three of the principal perſons concerned in this tranſaction, and confined them in one of the remoteſt parts of Italy. But the efforts of one, or of a few individuals, are never adequate to the taſk of counteracting the general efforts of a nation, for the party whoſe ſentiments were oppoſed to hers, grew daily in magnitude and ſtrength, to ſuch a degree that Amalaſontha formed ſerious reſolutions of ſheltering herſelf under the protection of Juſtinian. After a correſpondence had been carried on to prepare for this event, and when ſhe was about to ſail for that place, ſhe determined to make one bold effort to regain her abſolute power. With this view, ſhe cauſed the three perſons who were in confinement to be ſecretly aſſaſſinated; and this action re-eſtabliſhed her authority, although it augmented the public hatred. But another cauſe of diſquiet ſoon aroſe. At the early age of ſixteen, her ſon fell a victim to his debaucheries and follies, and ſhe was left devoid of any legal claim to the crown. The accompliſhed and ambitious Amalaſontha ſpurned the idea of retiring to a private ſtation, and formed the bold deſign of ſharing the throne with Theodotus her couſin. She had ſufficient penetration to perceive that the diſpoſitions of that youth were indolent and weak, and conſequently ſhe hoped ſtill to remain at the helm of government. But the future fortune of that accompliſhed woman, demonſtrates to poſterity the danger of confiding in human weakneſs, where the principles of honour and juſtice and virtue are wanting. Theodotus iſſued an order for her confinement in an iſland in the lake Bolſena; and in the year 535 ſhe was ſtrangled in the bath. Some hiſtorians aſcribe this action to the influence of the empreſs Theodora, who was ſeized with jealouſy in conſequence of the reſpect ſhown her by Juſtinian. (*Gen. Biog.*).

AMALEK, the ſon of Eliphaz, by Timna his concubine, and the grandſon of Eſau, Gen. xxxvi. 12. and 1 Chr. i. 36. Amalek ſucceeded Gatam in the government of Edom. He was the father of the Amalekites; a powerful people who dwelt in Arabia Petræa, between the Dead ſea and the Red ſea, or between Havila and Shûr (1 Sam. xv 7); ſometimes in one canton and ſometimes in another. It does not appear that they

Amalek. they had cities; for there is no mention of any but one in the Scriptures (*id. ib.* 5.); they living generally in hamlets, caves, or tents.

The Iſraelites had ſcarcely paſſed the Red ſea on their way to the wildnerneſs before the Amalekites came to attack them in the deſerts of Rephidim (Ex. xvii. 8. &c.); and put thoſe cruelly to the ſword who were obliged, either through fatigue or weakneſs, to remain behind. Moſes, by divine command, directed Joſhua to fall upon this people; to record the act of inhumanity which they had committed in a book, in order to have it always before their eyes; and to revenge it in the moſt remarkable manner. Joſhua therefore fell upon the Amalekites and defeated them, while Moſes was upon the mountain, with Aaron and Hur in company. Moſes, during the time of the engagement, held up his hands, to which the ſucceſs of the battle was owing; for as often as he let them down, Amalek prevailed. But Moſes's hands being tired, Aaron and Hur ſupported his arms, and held them extended, while the battle laſted, which was from morning till the approach of night, when the Amalekites were cut in pieces. This happened in the year of the world 2513, before Chriſt 1491.

The ground of the enmity of the Amalekites againſt the Iſraelites is generally ſuppoſed to have been an innate hatred, from the remembrance of Jacob's depriving their progenitor both of his birthright and bleſſing. Their falling upon them, however, and that without any provocation, when they ſaw them reduced to ſo low a condition by the fatigue of their march, and the exceſſive drought they laboured under, was an inhuman action, and juſtly deſerved the defeat which Joſhua gave them. Under the Judges (v. 3.), we ſee the Amalekites united with the Midianites and Moabites, in a deſign to oppreſs Iſrael; but Ehud delivered the Iſraelites from Eglon king of the Moabites (Judges iii.), and Gideon (chap. viii.) delivered them from the Midianites and Amalekites. About the year of the world 2930, Saul marched againſt the Amalekites, advanced as far as their capital, and put all the people of the country to the ſword; but ſpared the beſt of all the cattle and moveables, contrary to a divine command; which act of diſobedience was the cauſe of Saul's future misfortunes.

After this war, the Amalekites ſcarcely appear any more in hiſtory. However, about the year of the world 2949, a troop of Amalekites came and pillaged Ziklag, which belonged to David (1 Sam. xxx.), where he had left his two wives Ahinoam and Abigail; but he returning from an expedition which he had made in the company of Achiſh into the valley of Jezreel, purſued them, overtook and diſperſed them, and recovered all the booty which they had carried off from Ziklag.

The Arabians maintain Amalek to have been the ſon of Ham, and grandſon of Noah; that he was the father of Ad, and grandfather of Schedad. Calmet thinks that this opinion is by no means to be rejected, as it is not very probable that Amalek, the ſon of Eliphaz, and grandſon of Eſau, ſhould be the father of a people ſo powerful and numerous as the Amalekites were when the Iſraelites departed out of Egypt. Moſes in the book of Geneſis (xiv. 7.) relates, that in Abraham's time, long before the birth of Amalek the ſon of Eliphaz, the five confederate kings carried the war into Amalek's country, about Kadeſh; and into that of the Amorites, about Hazezon-tamar. The ſame Moſes (Num. xxiv. 20.) relates, that the diviner Balaam, obſerving at a diſtance the land of Amalek, ſaid, in his prophetic ſtyle, "Amalek is the firſt, the head, the original of the nations; but his latter end ſhall be, that he periſh for ever." Our commentator obſerves, that this epithet of the firſt of nations cannot certainly agree with the Amalekites deſcended from the ſon of Eliphaz, becauſe the generation then living was but the third from Amalek. Beſides, Moſes never reproaches the Amalekites with attacking their brethren the Iſraelites; an aggravating circumſtance, which he would not have omitted were the Amalekites deſcended from Eſau; in which caſe they had been the brethren of the Iſraelites. Laſtly, We ſee the Amalekites almoſt always joined in the Scripture with the Canaanites and Philiſtines, and never with the Edomites; and when Saul made war upon the Amalekites, and almoſt utterly deſtroyed them, we do not find that the Edomites made the leaſt motion towards their aſſiſtance, nor to revenge them afterwards. Thence it is thought probable, that the Amalekites, who are ſo often mentioned in Scripture, were a free people deſcended from Canaan, and devoted to the curſe as well as the other Amorites, and very different from the deſcendants of Amalek, the grandſon of Eſau. Amalek, Amalfi.

The accounts which the Arabians give us of the Amalekites deſtroyed by Saul are as follow: Amalek was the father of an ancient tribe in Arabia, exterminated in the reign of Saul. This tribe contained only the Arabians who are called *Pure*; the remains whereof were mingled with the poſterity of Joktan and Adnan, and ſo became Moſarabes or Moſtaarabes; that is to ſay, Arabians blended with foreign nations. They further believe, that Goliath, who was overcome by David, was king of the Amalekites; and that the giants who inhabited Paleſtine in Joſhua's time were of the ſame race. That at laſt part of the Amalekites retired into Africa while Joſhua was yet living, and ſettled upon the coaſts of Barbary, along the Mediterranean ſea. The ſon of Amalek was Ad, a celebrated prince among the Arabians. Some make him the ſon of Uz, and grandſon of Aram the ſon of Shem. Let this be as it will, the Mahometans ſay that Ad was the father of an Arabian tribe called *Adites*; who were exterminated, as they tell us, for not hearkening to the patriarch Eber, who preached the unity of God to them. Ad had two ſons, Schedad and Schedid.

AMALFI, an ancient city of Italy, ſituated in E. Long. 15. 20. N. Lat. 40. 35. It is ſaid to have derived its origin from a number of Roman families, who, about the middle of the fourth century, either from private views of emolument, or in conſequence of compulſory orders from the emperor, had left Rome, and embarked for Conſtantinople; but meeting with ſtorms on their paſſage, were caſt away on the ſhores of Salerno, and deprived of the means of purſuing their voyage. In this ſtate of perplexity they long remained; but at laſt came to the reſolution of ſettling on the preſent ſite of Amalfi, where they expected to enjoy ſecurity, and ſufficient plenty of the neceſſaries of life. The earlieſt notice of them in this ſettlement dates no higher than the latter end of the ſixth century. Im-

Amalfi. pervious mountains and inacceſſible coaſts preſerved their infant ſtate from the firſt fury of the Lombards, who ſeldom attempted the conqueſt of a maritime people.

In the year 825, when this little republic had, under the patronage of the eaſtern emperors, attained a degree of wealth and reputation ſufficient to excite the ambition of its neighbours, Sico, prince of Salerno, marched a body of troops by night, ſurpriſed Amalfi; and, carrying off the greateſt part of the inhabitants, compelled them to fix at Salerno, which had lately ſuffered a great loſs of people by an epidemical diſorder. But before the fourth year of their captivity was expired, the Amalfitans took advantage of the abſence of the Salernitan chiefs, who were then carrying on a war with the Beneventans; armed themſelves; and, after burning and plundering Salerno, marched in triumph back to their own country.

Here they framed a better ſyſtem of government, and reformed many abuſes in their former legiſlation; adopting various meaſures, that were likely to promote internal concord, and defeat the evil intentions of foreign enemies. Their firſt plan was to veſt the ſupreme authority in a temporary prefect; but the experience of a few years cauſed them to prefer lodging that power in the hands of a duke elected for the term of his natural life. Under theſe governors Amalfi attained the ſummit of her military and commercial glory. It extended its territory, which reached eaſtward from Vico Vecchio, and weſtward to the promontory of Minerva, including likewiſe the iſland of Caprea, and the two iſlands of the Galli. Towards the north, it comprehended the cities of Lettere, Gragnans, Pimontio, and Capule di Franchi; towards the ſouth, thoſe of Scala, Ravelli, Minori, Majuri, Atrani, Tramonti, Agerula, Citara, Prajano, and Roſilano.

Leo IV. found the Amalfitans an uſeful ally in his wars with the Infidels, and honoured the commonwealth with the title of *Defender of the Faith*. The Neapolitans, with whom, as Greek vaſſals, they were united in ſtrict bonds of friendſhip, experienced many ſignal favours at their hands; and the Muſſulmans themſelves found it expedient to court their alliance, and to enter into treaty with them. Their ſituation had from the beginning given them a turn to commerce, and their attention to naval affairs ſo much conſequence in the eyes of their protector, the emperor of Conſtantinople, that by his orders a court was eſtabliſhed at Amalfi, for the deciſion of all controverſies ariſing in maritime tranſactions. Its code and reports became the general rule in thoſe caſes throughout this part of Europe; its precedents and decrees were allowed to be good authority to found judgment upon even in foreign tribunals. To crown the mercantile and naval glory of the republic, it was reſerved to the lot of an Amalfitan to make, or at leaſt to perfect, the moſt important diſcovery ever made for the improvement of navigation. Paſitano, a village which ſtands on the ſhore a few miles weſt of Amalfi, boaſts of having given birth to Flavius Gioia, the inventor of the mariner's compaſs.

The merchants of this town engroſſed the trade of the Levant, and tranſacted the commercial buſineſs of the world in a lucrative and excluſive manner. The Piſans, Venetians, and Genoeſe, roſe upon their ruin; and, after monopolizing the emoluments of trade for ſome ages, made way for the more comprehenſive and daring ſpirit of the preſent maritime powers. Amalgam || Amalthæa.

At preſent Amalfi is ſubject to Naples, and is the ſee of an archbiſhop. It is but a ſhadow of what it was in its flouriſhing ſtate, when it extended over the ſtupendous rocks that hang on each ſide, ſtill crowned with battlemented walls and ruined towers. Its buildings, Mr Swinburne ſays, are not remarkable for elegance or ſize; and contain at moſt 4000 inhabitants, who ſeem to be in a poor line of life. The cathedral is an uncouth building. Under the choir is the chapel and tomb of the apoſtle St Andrew; to whoſe honour the edifice was dedicated, when Cardinal Capuano, in 1208, brought his body from Conſtantinople.

AMALGAM, mercury united with ſome metal.

AMALGAMATION, the operation of making an amalgam, or mixing mercury with any metal.

For the combination of one metal with another, it is generally ſufficient that one of them be in a ſtate of fluidity. Mercury being always fluid, is therefore capable of amalgamation with other metals without heat; nevertheleſs, heat conſiderably facilitates the operation.

To amalgamate without heat requires nothing more than rubbing the two metals together in a mortar; but the metal to be united with the mercury ſhould be previouſly divided into very thin plates or grains. When heat is uſed (which is always moſt effectual, and with ſome metals indiſpenſably neceſſary), the mercury ſhould be heated till it begins to ſmoke, and the grains of metal made red hot before they are thrown into it. If it be gold or ſilver, it is ſufficient to ſtir the fluid with an iron rod for a little while, and then throw it into a veſſel filled with water. This amalgam is uſed for gilding or ſilvering on copper, which is afterwards expoſed to a degree of heat ſufficient to evaporate the mercury.

Amalgamation with lead or tin is effected by pouring an equal weight of mercury into either of theſe metals in a ſtate of fuſion, and ſtirring with an iron rod. Copper amalgamates with great difficulty, and iron not at all.

AMALTHÆA, the name of the Cumæan Sibyl, who offered to Tarquinius Superbus nine books, containing the Roman deſtinies, and demanded 300 pieces of gold for them. He derided her; whereupon ſhe threw three of them into the fire; and returning, aſked the ſame price for the other ſix; which being denied, ſhe burnt three more; and returned, ſtill demanding the ſame price. Upon which Tarquin conſulting the pontiffs, was adviſed to buy them. Theſe books were in ſuch eſteem, that two magiſtrates were created to conſult them upon extraordinary occaſions.

AMALTHÆA, in *Pagan Mythology*, the daughter of Meliſſus, king of Crete, and the nurſe of Jupiter, whom he fed with goats milk and honey. According to others, Amalthæa was a goat, which Jupiter tranſlated into the ſky, with her two kids, and gave one of her horns to the daughters of Meliſſus, as a reward for the pains they had taken in attending him. This horn had the peculiar property of furniſhing them with whatever they wiſhed for; and was thence called the *cornucopiæ* or horn of plenty.

AMALTHÆUS,

Amalthæus ‖ Amand.

AMALTHÆUS, Jerome, John Baptista, and Corneille, three celebrated Latin poets of Italy, who flouriſhed in the 16th century. Their compoſitions were printed at Amſterdam in 1685. One of the prettieſt pieces in that collection is an epigram on two children, whoſe beauty was very extraordinary, though each of them was deprived of an eye:

Lumine Acon dextro, capta eſt Leonilla ſiniſtro:
Et poterat forma vincere uterque Deos,
Parve puer, lumen quod habes concede ſorori;
Sic tu cæcus Amor, ſic erit illa Venus.

AMAMA, Sixtinus, profeſſor of the Hebrew tongue in the univerſity of Franeker, a man of great learning, was born in Frieſland, and had ſtudied under Druſius. He publiſhed a criticiſm upon the tranſlation of the Pentateuch; collated the Dutch tranſlation of the Bible with the original and the moſt accurate tranſlations; and wrote a cenſure of the Vulgate tranſlation of the hiſtorical books of the Old Teſtament, Job, the Pſalms, and Canticles. It is impoſſible to anſwer the reaſons whereby he ſhows the neceſſity of conſulting the originals. This he recommended ſo earneſtly, that ſome ſynods, being influenced by his reaſons, decreed, that none ſhould be admitted into the miniſtry, but ſuch as had a competent knowledge of the Hebrew and Greek text of the Scriptures. He died in 1629.

AMANCE, a town in the duchy of Lorraine, upon a rivulet of the ſame name. E. Long. 6. 10. N. Lat. 48. 45.

AMAND, Mark Anthony Gerard, Sieur de St, a French poet, was born at Rouen in Normandy in 1594. In the epiſtle dedicatory to the third part of his works, he tells us, that his father commanded a ſquadron of ſhips in the ſervice of Elizabeth queen of England for 22 years, and that he was for three years priſoner in the Black Tower at Conſtantinople. He mentions alſo that two brothers of his had been killed in an engagement againſt the Turks. His own life was ſpent in a continual ſucceſſion of travels, which was of no advantage to his fortune. There are miſcellaneous poems of this author, the greateſt part of which are of the comic or burleſque, and the amorous kind. Though there are many blemiſhes in his poems, yet he had the talent of reading them in ſo agreeable a manner, that every one was charmed with them. In 1650, he publiſhed *Stances ſur la groſſeſſe de la reine de Pologne et de Suede.* There are ſix ſtanzas of nine verſes each. In 1653, he printed his *Moiſe ſauve, idyle heroique.* This poem had at firſt many admirers; M. Chapelein called it a *ſpeaking picture;* but it has ſince fallen into contempt. Amand wrote alſo a very devout piece, entitled, *Stances à M. Corneille, ſur ſon imitation de Jeſus Chriſt*, which was printed at Paris in 1656. M. Broiſette ſays, that he wrote alſo a poem upon the moon, wherein he paid a compliment to Lewis XIV. upon his ſkill in ſwimming, in which he uſed often to exerciſe himſelf when he was young, in the river Seine; but the king could not bear this poem to be read to him, which is ſaid to have affected the author to ſuch a degree, that he did not ſurvive it long. He died in 1661, being 67 years of age. He was admitted a member of the French academy, when it was firſt founded by Cardinal Richelieu, in the year 1633; and Mr Peliſſon informs us, that in 1637, at his own deſire, he was excuſed from the obligation of making a ſpeech in his turn, on condition that he would compile the comic part of the dictionary which the academy had undertaken, and collect the burleſque terms. This was a taſk well ſuited to him; for it appears by his writings, that he was extremely converſant in theſe terms, of which he ſeems to have made a complete collection from the markets, and other places where the lower people reſort.

Amand ‖ Amarante.

Amand, *Saint*, a city of France, in the department of Cher, formerly Bourbonois, on the confines of Berry, ſeated on the river Cher. It was built in 1410, on the ruins of Orval. E. Long. 9. 30. N. Lat. 46. 32.

Amand, *Saint*, a city of France, in the department of the North, ſeated on the river Scarpe. It contains about 600 houſes, and 3000 or 4000 inhabitants. The abbot of the place is the temporal lord, and diſpoſes of the magiſtracy. It was given to France by the treaty of Utrecht. E. Long. 2. 35. N. Lat. 50. 27.

AMANICÆ PYLÆ (Ptolemy); Amanides Pylæ. (Strabo); Amani Portæ (Pliny); ſtraits or defiles in Mount Amanus, through which Darius entered Cilicia; at a greater diſtance from the ſea than the Pylæ Ciliciæ or Syriæ, through which Alexander paſſed.

AMANTEA, a ſea-port town and biſhop's ſee of the kingdom of Naples, ſituated near the bay of Euphemia, in the province of Calabria, in E. Long. 16. 20. N. Lat. 39. 15.

AMANUS, a mountain of Syria, ſeparating it from Cilicia; a branch of Mount Taurus (Cicero, Strabo, Pliny); extending chiefly eaſtward, from the ſea of Cilicia to the Euphrates: Now called *Monte Negro*, or rather *Montagna Neres*, by the inhabitants; that is, the watery mountain, as abounding in ſprings and rivulets.

AMAPALLA, a city and port town of North America, in the province of Guatimala, ſeated on the gulf of the ſame name, in the Pacific ocean. W. Long. 63. 20. N. Lat. 12. 30.

AMARANTE, an order of knighthood, inſtituted in Sweden by Queen Chriſtina, in 1653, at the cloſe of an annual feaſt, celebrated in that country, called *Wirtſchaft*. This feaſt was ſolemnized with entertainments, balls, maſquerades, and the like diverſions, and continued from evening till the next morning.—That princeſs, thinking the name too vulgar, changed it into that of the *feaſt of the gods*, in regard each perſon here repreſented ſome deity as it fell to his lot. The queen aſſumed the name of *Amarante;* that is, unfading, or immortal. The young nobility, dreſſed in the habit of nymphs and ſhepherds, ſerved the gods at the table. At the end of the feaſt, the queen threw off her habit, which was covered with diamonds, leaving it to be pulled in pieces by the maſques; and in memory of ſo gallant a feaſt, founded a military order, called in Swediſh *Geſchilfſchaft*, into which all that had been preſent at the feaſt were admitted, including 16 lords and as many ladies, beſides the queen. Their device was the cypher of *Amarante*, compoſed of two A's, the one erect, the other inverted, and interwoven together; the whole encloſed by a laurel crown, with this motto, *Dolce nella memoria.*

Bulſtrode

Amaranthoides || Amafis.

Bulſtrode Whitlock, the Engliſh ambaſſador from Cromwell to the court of Sweden, was made a knight of the order of *Amarante*: on which account it ſeems to be, that we ſometimes find him ſtyled *Sir Bulſtrode Whitlock*.

AMARANTHOIDES, in *Botany*, the trivial name of a ſpecies of illecebrum. See ILLECEBRUM, BOTANY *Index*.

AMARANTHUS (of α privative, and μαραινω, *to wither*, becauſe the flower of this plant, when cropped, does not ſoon wither), AMARANTH, or FLOWER GENTLE. See BOTANY *Index*.

AMARGURA, an iſland in the Southern Pacific ocean, diſcovered by Maurell in 1781. It is quite barren, and inacceſſible even to boats. S. Lat. 17. 57. W. Long. 175. 17.

AMARYLLIS, LILY-ASPHODEL. See BOTANY *Index*.

AMARYNTHUS, in *Ancient Geography*, a hamlet of Eretrias, in the iſland of Eubœa, about ſeven ſtadia diſtant from its walls. Here Diana was worſhipped in an annual ſolemnity, at which thoſe of Caryſtus aſſiſted; hence the title of the goddeſs was *Amarynthis* and *Amarysia*.

AMASIA, in *Ancient Geography*, now *Marpurg*, a city in the landgravate of Heſſe, on the Lahn. According to others, it is Embden in Weſtphalia.

AMASIA, an ancient town of Turkey, in Natolia, remarkable for the birth of Strabo the geographer. It is the reſidence of a baſhaw, and gives its name to the province it ſtands in, where there are the beſt wines and the beſt fruits in Natolia. It is ſeated near the river Iris or Caſalmack; and was anciently the reſidence of the king of Cappadocia. E. Long. 36. 10. N. Lat. 39. 33.

AMASIA, the name of the northern diviſion of Leſſer Aſia, lying on the ſouth ſhore of the Euxine ſea, in Natolia. It takes its name from Amaſia the capital, mentioned in the preceding article.

AMASIS, king of Egypt, aſcended the throne B. C. 569, and commenced his reign with the death of his former maſter Apries. King Apries having ſent an army to the aſſiſtance of the Libyans, which was totally routed, and great multitudes put to death, the common people conceived the idea, that the tyrannical prince had ſent them to the field of battle, for no other purpoſe but to deſtroy great numbers of them, that ſo he might reign over the remainder with uncontrolled oppreſſion. The conſequence was, that a general inſurrection aroſe, and all the multitude were in an uproar. Informed of this tumult, Apries ſent Amaſis, whom he deemed one of his moſt faithful adherents; but inſtead of endeavouring to reconcile the diſaffected people to their prince, he ſecured them to his own intereſt; and while he was pretending to reproach their diſloyalty, and endeavouring to recal them to duty, a ſoldier ſtepped in behind him, and, placing a helmet upon his head, ſaluted him king of Egypt. Amaſis inſtantly took the field againſt his royal maſter, and prepared to drive him from his throne. Appriſed of the treachery of Amaſis, he ſent another in whom he confided, to bring Amaſis before him, to give an account of his conduct. This meſſenger met him on horſeback, and having delivered his meſſage, Amaſis after ſome inſolent behaviour, replied, that he was preparing to viſit the king, but thought it proper to bring a ſuitable equipage to attend him. When the meſſenger haſtened back to inform his maſter, that he might conſult for himſelf, his only reward was to have his ears and noſe cut off, by the order of the tyrant, becauſe he brought not Amaſis along with him. In this, as in numerous other inſtances, tyranny procured its own deſtruction; for the reſt of the nobles who ſtill remained obedient to the king, ſeeing the barbarous manner in which he had treated the meſſenger, they all went over to the ſtandard of the uſurper. Now all the nation was in commotion. The uſurper on the one hand, with the whole body of the natives marſhalled under his banner, and the tyrant on the other hand, with a body of foreigners and mercenaries, which he had engaged in his ſervice. The two armies met in a field in the vicinity of Memphis, and the tyrant was made captive and his forces defeated. The uſurper treated the captive tyrant with great lenity and reſpect, and aſſigned him the palace of Saïs for his confinement. But the hatred of the people was too violent towards their old king, to permit him to live; Amaſis was therefore forced to deliver him into their hands, and they inſtantly put him to death by ſtrangling him. Amaſis.

The plebeian extraction of Amaſis deprived him for ſome time of that reſpect, to which he was entitled as a prince; but obſerving this, he contrived a ſtratagem to induce them to pay him ſuitable honour. He ordered a golden ciſtern, in which his viſitants were accuſtomed to waſh their feet, to be melted and caſt in the form of a god, and ſet it up in the moſt frequented part of the city, and all the inhabitants did it homage. He then called an aſſembly of the people, and reminded them, that the gold they now venerated in the form of a god, was once a ciſtern, and conſequently that although he was formerly a perſon of low rank, yet now that he was their king, they ought to give him the reſpect and homage due to his ſtation.

Having by this means provided for the gratification of his vanity, he began to exert himſelf to act for the general good of his people. It was his conſtant practice to attend to buſineſs in the mornings, and in the evenings he indulged in amuſement and pleaſure; but in theſe he ſometimes tarniſhed the dignity of a king. Indeed Amaſis loved his wine and his companion ſo much, previous to his elevation, that it is reported that he lived by theft, and when denying upon detection, he was carried to the oracle of the place, who ſometimes condemned and ſometimes acquitted him. Recollecting the conduct of the oracles after he aſcended the throne, he conceived a diſreſpect for them, becauſe they were not able at all times to detect his robberies.

To prevent the evil conſequences of an indolent populace, he enacted a law, that every perſon, under the penalty of capital puniſhment, ſhould appear before the governor of his reſpective province, and declare by what occupation he acquired his ſubſiſtence. Thus, under the prudent government of Amaſis, Egypt enjoyed for many years, great fertility and extenſive population. He alſo employed his induſtry in the erection of ſeveral public works; among which were a portico to the temple of Minerva at Saïs, and the removal of a houſe, all of one ſtone, to the temple. He

Amaſis ‖ Amatorii.

alſo built the great temple of Iſis at Memphis. He likewiſe erected a coloſſus before the temple of Vulcan, 75 feet in length, reſting on its back, and on the baſis he erected two ſtatues, each 20 feet high, cut out of the ſame ſtone. Beſides theſe he raiſed ſeveral monuments in Greece.

The liberality and reſpect for ſcience which Amaſis diſplayed, and the encouragement he gave to learned ſtrangers, particularly to the Greeks, to viſit his country, manifeſted an enlightened mind. And to encourage Grecian ſtrangers to remain in Egypt, he marked out ſettlements for them on the ſea-coaſt, permitted them to build temples, and to obſerve all the rites of their religion unmoleſted. Solon, the celebrated lawgiver, condeſcended to viſit Amaſis. In a ſhort time, the fame of Amaſis for his generoſity and humanity was ſo extenſive, that when the Delphians were going about from city to city, collecting ſums to enable them to rebuild their conſumed temple, they applied to Amaſis, who gave them 1000 talents. Either to gratify the vanity, or ſecure the alliance of the Greeks, he married a Grecian lady, named Laodice, the daughter of Battus. But in the evening of his reign his proſperity was greatly clouded, by the report of the vaſt preparations that Cambyſes was making to invade Egypt. Phanes, who was captain of the Greek auxiliaries in the ſervice of Amaſis, being offended at his maſter, deſerted his cauſe, and went over to Cambyſes. A ſtrong affection had long ſubſiſted betwixt Polycrates, the tyrant of Samos, and Amaſis; yet he, deſerting his cauſe, became his enemy. Whether the forebodings of the impending ſtorm tended to impair his health or not is not related; but about this time he died, in 525 B. C. after a reign of 44 years. It is reported that, after interment, his body was dug up by his enemies, and conſumed by fire, which, according to the ſuperſtition of the Egyptians, conſtituted a ſingular calamity. (*Anc. Univ. Hiſt.*).

AMASONIA. See Botany *Index*.

AMATHUS, a very ancient town in the ſouth of Cyprus (Strabo, Ptolemy): ſo called from Amathus the founder; or, according to others, from Amath, a Phœnician town ſacred to Venus, with a very ancient temple of Adonis and Venus: and hence Venus is denominated *Amathuſia* (Tacitus). According to Ovid, it was a place rich in copper ore, and where the inhabitants became *Ceraſtæ*, or horned. Now called *Limiſſo*.

Amathus, in *Ancient Geography*, a town of the tribe of Gad, beyond Jordan; but whether at a greater or leſs diſtance from it, is not ſo eaſy to determine. Euſebius places it in the lower Peræa; Reland, in Ramoth Gilead. Gabinius, proconſul of Syria, eſtabliſhed five juridical conventions in Judæa; two of which were on the other ſide Jordan; one at Gadara, the other at Amathus (Joſephus).

AMATIQUES, a ſea-port town, in the province of Vera Paz in Mexico, at the mouth of the river Guanacos, which flows into the gulf of Honduras. The inhabitants are chiefly employed in cutting logwood. N. Lat. 15. 23. W. Long. 89. 0.

Amatorii muſculi, in *Anatomy*, a term ſometimes uſed for the obliquus ſuperior and obliquus inferior muſcles of the eye, as theſe muſcles aſſiſt in oggling or drawing the eye ſidewiſe.

AMATRICE, a city of the kingdom of Naples in the farther Abruzzo, upon the confines of the pope's territories, and the marquiſate of Ancona.

Amatrice ‖ Amaziah.

AMATTA Foa, an iſland in the Southern Pacific ocean, which was diſcovered by Captain Cook in 1774. It is about five leagues in circumference, and conſiderably elevated; it is inhabited, but not very fertile; and it lies about twelve leagues diſtant, and north north-weſt from Anamooka.

AMAUROSIS, in *Medicine*, a deprivation of ſight, the eye remaining fair and ſeemingly unaffected. A perfect amauroſis is when the blindneſs is total; when there is ſtill a power of diſtinguiſhing light from darkneſs, the diſeaſe is called by M. de St Ives an *imperfect amauroſis*. There is a periodical ſort which comes on inſtantaneouſly, continues for hours, or days, and then diſappears.

AMAZIAH, one of the kings of Judah, aſcended the throne of his father Joaſh in the 25th year of his age. His mother's name was Jehoddan, a native of Jeruſalem. In conſequence of his wavering virtue, and his mingling foreign idolatry with the worſhip of the true God, he is ſaid, according to Scripture, to have done that which was right in the ſight of the Lord, but "not with a perfect heart." His father had been ungenerouſly murdered by his own ſervants, therefore his ſon, on his elevation to the throne, put to death the murderers of his father. In this act of remunerative juſtice, however, he ſhowed a becoming reſpect to the law of Moſes, which prohibited the puniſhing of the children for the crimes of their guilty fathers. He gave early proofs of his military talents, by making a general muſter of all his ſubjects able to bear arms; and likewiſe hired a numerous army from the neighbouring kingdom of Iſrael; and with this increaſed multitude he haſtened to attack Edom. The two kindred armies met together in the valley of Salt, and, after an obſtinate engagement, the Edomites were put to flight; and Amaziah from thence proceeded to take the town of Selah. But the ſpirit of jealouſy aroſe between the two armies, ſo that Amaziah thought it prudent not to make uſe of the arms of the Iſraelitiſh auxiliaries, conſequently iſſued an order for their returning home; but this treatment rouſed the martial ſpirit and indignant temper of the Iſraelites to ſuch a height, that, on their return, they turned their arms againſt the cities of Judah, and ravaged and deſtroyed them. The imperfection of the heart of Amaziah was fully diſplayed on this occaſion; for he is related to have brought home the gods of the children of Seir, who were unable to protect their own votaries, and in the folly of his heart to have paid them divine honours. Fluſhed with the ſucceſs of his arms in the valley of Salt, he ſent a hoſtile challenge to Jehoaſh king of Iſrael, expreſſed in the phraſeology of thoſe times, that they ſhould "look one another in the face. Pride goeth before deſtruction, and a haughty ſpirit before a fall." In vain the prudent and peaceful ſpirit of Jehoaſh endeavoured to perſuade him from his bold attempt. They ſaw one another in the face at Bethſhemeth, and Amaziah was made priſoner, and the men of Judah put to flight. Jehoaſh advanced to the capital, carrying the vanquiſhed king along with him; and he entered the city by breaking a large portion of the wall; and, after plundering the temple and the

King's

Amazonia. king's palace, he returned home in triumph to Samaria. This misfortune seems to have damped the military ardour of Amaziah; for, although he swayed the sceptre over Judah for many years after, yet he never engaged in any hostile contentions with his neighbours. Whether, through the oppressive conduct of Amaziah or whatever cause, it is certain that a conspiracy was formed against him in Jerusalem, which compelled him to fly to the city of Lachish for shelter; but the confederacy was so strong and numerous, that his enemies pursued him thither; and there he fell by their hands, in the 29th year of his reign. (2 Kings xiv. 2. Chron. xxv.).

AMAZONIA, or the country of the American Amazons, is situated between 50 and 70 degrees of west longitude; and between the equator and 15 degrees of south latitude; being bounded on the south by La Plata, on the west by Peru, on the north by the province of Terra Firma, and on the east by Brazil.

With respect to the Amazons said to have given name to this territory, they have been represented as governed and led to war only by their queen. No men were suffered to live among them; though those of some neighbouring nations were suffered to visit them, at a certain season, for the sake of procreation. The females issuing from this commerce were bred up with care, and instructed in what relates to war and government; as to the males, they were sent away into the country of their fathers. But no such nation is at present to be found, any more than the giants and cannibals mentioned by the first adventurers thither.

Amazonia is generally a flat region, abounding in woods, lakes, rivers, bogs, and morasses. The chief river, and one of the largest in the world, is that called the river of Amazons, or the Orellana, which is formed by two large rivers, the one rising in the province of Quito, a little south of the equator, in 73 degrees of west longitude, and the other, named *Xauxa*, rising in the lake of Bourbon, near the Andes, in 10 degrees of south latitude. These two rivers uniting on the confines of Peru and Amazonia, in three degrees odd minutes of south latitude, assume the name of Amazon; whence running eastward upwards of 200 miles, and afterwards inclining to the north, they fall into the Atlantic ocean by 84 channels, which in the rainy season overflow the adjacent country. Besides the two streams mentioned, a multitude of others, both on the north and south side, contribute to the formation of this extraordinary river. As it runs almost across the broadest part of South America, it is computed to be between 4000 and 5000 miles in length, including all its windings. Its channel from Junta de los Reyos, about 60 degrees from its head, to the river Maragnon, is from one to two leagues broad; it then widens from three to four, and becomes gradually broader as it approaches the ocean. Between the places last mentioned, its depth is from five to ten fathoms; but from Maragnon to Rio Negro it increases to 20 fathoms; after which it is sometimes 30, and sometimes 50 fathoms, or more, till it comes near the end of its course. It has no sand banks, nor does the shore shelve so as to render it dangerous for vessels. The manatu and tortoise abound both upon the banks of this and the other rivers; and the fishermen must be upon their guard against the crocodiles, alligators, and water serpents, which also swarm here. Amazoni Amazon

The air, as in the countries under the same parallel, is observed to be nearly as cool under the equator as about the tropics, on account of the rains continuing longer, and the sky in that season being clouded. Besides, an easterly wind sets from the Atlantic up the river so strong, that vessels are carried by it against the stream.

The produce of the country is Indian corn and the cassava root, of which they make flour and bread; tobacco, cotton, sugar, sarsaparilla, yams, potatoes, and other roots. They have also plenty of venison, fish, and fowl. Among the latter are vast flocks of parrots of all colours, the flesh of which serves for food and the feathers for ornament. All the trees here are evergreens; and fruits, flowers, and herbage, are in perfection all the year round. The principal fruits are cocoa nuts, ananas or pine apples, guavas, bananas, and such others as are usually found between the tropics. The forest and timber trees are cedar, Brazil wood, oak, ebony, logwood, ironwood, so called from its weight and hardness, and several sorts of dyeing wood.

The natives are of the common stature, with good features, a copper complexion, black eyes and hair. It is computed that there are of them about 150 different tribes or nations, and the villages are so numerous as to be within call of one another. Among those the Homagues, a people near the head of the river, are famous for their cotton manufactures; the Jurines, who live between five and ten degrees of latitude, for their joiners work; and the Wrofiffares for their earthen ware. The Topinambes, who inhabit a large island in the river, are remarkable for their strength. Some of those nations frequently make war upon each other. Their armour consists of darts, javelins, bows and arrows; and they wear targets of cane or fish-skin. They make slaves of their prisoners, whom they otherwise use very well. Every tribe is governed by its respective chief or king, the marks of whose dignity are a crown of parrots feathers, a chain of lions teeth or claws hung round his neck, or girt about his waist, and a wooden sword which he carries in his hand.

Most of those nations, except the Homagues, go naked. The women thrust pieces of cane through their ears and under lips, as well as through the skin of the pudenda. At the gristle of their noses they also hang glass beads, which wag to and fro when they speak. They are such skilful markmen, that they will shoot fish as they swim; and what they catch they eat without either bread or salt. They worship images, which they always carry with them on their expeditions; but they neither have temples nor any order of priests; and permit both polygamy and concubinage.

The country affords neither gold nor silver mines; only a small quantity of the former is found in the rivulets which fall into the Amazon near its sources in Peru. When the Spaniards imagined that it contained those metals, they made great efforts from Peru to reduce this territory to subjection; till being at length undeceived, they abandoned the design.

AMAZONS, in antiquity, a nation of female warriors, who founded an empire in Asia Minor, upon the river Thermodoon, along the coasts of the Black sea. They

Amazons. They are said to have formed a state, out of which men were excluded. What commerce they had with that sex, was only with strangers; they killed all their male children; and they cut off the right breasts of their females, to make them more fit for the combat. From which last circumstance it is that they are supposed to take their name, viz. from the privative α, and μαζος, *mamma*, "breast." But Dr Bryant, in his Analysis of Ancient Mythology, explodes this account as fabulous; and observes, that they were in general Cuthite colonies from Egypt and Syria, who formed settlements in different countries, and that they derived their name from ωον, "the sun," which was the national object of worship, vol. iii. p. 463. It has indeed been controverted, even among ancient writers, whether ever there really was such a nation as that of the Amazons. Strabo, Palæphatus, and others, deny it. On the contrary, Herodotus, Pausanias, Diodorus Siculus, Trogus Pompeius, Justin, Pliny, Mela, Plutarch, &c. expressly assert it.

M. Petit, a French physician, published a Latin dissertation in 1685, to prove that there was really a nation of Amazons. It contains abundance of curious inquiries relating to their habit, their arms, the cities built by them, &c. Others of the moderns also maintain, that their existence is sufficiently proved by the testimony of such of the historians of antiquity as are most worthy of credit; by the monuments which many of them have mentioned; and by medals, some of which are still remaining; and that there is not the least room to believe that what is said of them is fabulous.

The Amazons are mentioned by the most ancient of the Greek writers. In the third book of the Iliad, Homer represents Priam speaking of himself as having been present in the earlier part of his life, in a battle with the Amazons; and some of them afterwards came to the assistance of that prince during the siege of Troy.

The Amazons are particularly mentioned by Herodotus. That historian informs us, that the Grecians fought a battle with the Amazons on the river Thermodoon, and defeated them. After their victory, they carried off all the Amazons they could take alive in three ships. But whilst they were out at sea, these Amazons conspired against the men, and killed them all. Having, however, no knowledge of navigation, nor any skill in the use of the rudder, sails, or oars, they were driven by wind and tide till they arrived at the precipices of the lake Mæotis, in the territories of the Scythians. Here the Amazons went ashore, and, marching into the country, seized and mounted the first horses they met with, and began to plunder the inhabitants. The Scythians at first conceived them to be men; but after they had had skirmishes with them, and taken some prisoners, they discovered them to be women. They were then unwilling to carry on hostilities against them; and by degrees a number of the young Scythians formed connexions with them, and were desirous that these gentle dames should live with them as wives, and be incorporated with the rest of the Scythians. The Amazons agreed to continue their connexion with their Scythian husbands, but refused to associate with the rest of the inhabitants of the country, and especially with the women of it. They afterwards prevailed upon their husbands to retire to Sarmatia, where they settled. "Hence," says Herodotus, "the wives of the Sarmatians still continue their ancient way of living. They hunt on horseback in the company of their husbands, and sometimes alone. They march with their armies, and wear the same dress with the men. The Sarmatians use the Scythian language, but corrupted from the beginning, because the Amazons never learned to speak correctly. Their marriages are attended with this circumstance: no virgin is permitted to marry till she has killed an enemy in the field; so that some always grow old before they can qualify themselves as the law requires." Amazons.

Diodorus Siculus says, "There was formerly a nation who dwelt near the river Thermodoon, which was subjected to the government of women, and in which the women, like men, managed all the military affairs. Among these female warriors, it was said, was one who excelled the rest in strength and valour. She assembled together an army of women, whom she trained up in military discipline, and subdued some of the neighbouring nations. Afterwards, having by her valour increased her fame, she led her army against the rest; and being successful, she was so puffed up, that she styled herself the daughter of Mars, and ordered the men to spin wool, and do the work of the women within doors. She also made laws, by which the women were enjoined to go to the wars, and the men to be kept at home in a servile state, and employed in the meanest offices. They also debilitated the arms and thighs of those male children who were born of them, that they might be thereby rendered unfit for war. They seared the right breasts of their girls, that they might be no interruption to them in fighting: whence they derived the name of Amazons. Their queen, having become extremely eminent for skill and knowledge in military affairs, at length built a large city at the mouth of the river Thermodoon, and adorned it with a magnificent palace. In her enterprises she adhered strictly to military discipline and good order; and she added to her empire all the adjoining nations, even to the river Tanais. Having performed these exploits, she at last ended her days like a hero, falling in a battle, in which she had fought courageously. She was succeeded in the kingdom by her daughter, who imitated the valour of her mother, and in some exploits excelled her. She caused the girls from their very infancy to be exercised in hunting, and to be daily trained up in military exercises. She instituted solemn festivals and sacrifices to Mars and Diana, which were named Tauropoli. She afterwards carried her arms beyond the river Tanais, and subdued all the people of those regions, even unto Thrace. Returning then with a great quantity of spoils into her own kingdom, she caused magnificent temples to be erected to the deities before mentioned; and she gained the love of her subjects by her mild and gentle government. She afterwards undertook an expedition against those who were on the other side of the river, and subjected to her dominion a great part of Asia, extending her arms as far as Syria."

Diodorus also mentions another race of Amazons who dwelt in Africa; and whom he speaks of as being of greater antiquity than those who lived near the river Thermodoon. "In the western parts of Libya,"

Amazons. says he, "upon the borders of those tracts that are habitable, there was anciently a nation under the government of women, and whose manners and mode of living were altogether different from ours. It was the custom of those women to manage all military affairs; and for a certain time, during which they preserved their virginity, they went out as soldiers into the field. After some years employed in this manner, when the time appointed for this purpose was expired, they associated themselves with men, in order to obtain children. But the magistracy, and all public offices, they kept entirely in their own hands. The men, as the women are with us, were employed in household affairs, submitting themselves wholly to the authority of their wives. They were not permitted to take any part in military affairs, or to have any command, or any public authority, which might have any tendency to encourage them to cast off the yoke of their wives. As soon as any child was born, it was delivered to the father, to be fed with milk, or such other food as was suitable to its age. If females were born, they seared their breasts, that they might not be burdensome to them when they grew up; for they considered them as great hinderances in fighting.

Justin represents the Amazonian republic to have taken its rise in Scythia. The Scythians had a great part of Asia under their dominion upwards of 400 years, till they were conquered by Ninus, the founder of the Assyrian empire. After his death, which happened about 1150 years before the Christian era, and that of Semiramis and their son Ninyas, Ilinus and Scolopites, princes of the royal blood of Scythia, were driven from their country by other princes, who like them aspired to the crown. They departed with their wives, children, and friends; and being followed by a great number of young people of both sexes, they passed into Asiatic Sarmatia, beyond Mount Caucasus, where they formed an establishment, supplying themselves with the riches they wanted, by making incursions into the countries bordering on the Euxine sea. The people of those countries, exasperated by the incursions of their new neighbours, united, surprised, and massacred the men.

The women then resolving to revenge their death, and at the same time to provide for their own security, resolved to form a new kind of government, to choose a queen, enact laws, and maintain themselves, without men, even against the men themselves. This design was not so very surprising as at first sight appears: for the greatest number of the girls among the Scythians had been inured to the same exercises as the boys; to draw the bow, to throw the javelin, to manage other arms; to riding, hunting, and even the painful labours that seem reserved for men; and many of them, as among the Sarmatians, accompanied the men in war. Hence they had no sooner formed their resolution, than they prepared to execute it, and exercised themselves in all military operations. They soon secured the peaceable possession of the country; and not content with showing their neighbours that all their efforts to drive them thence or subdue them were ineffectual, they made war upon them, and extended their own frontiers. They had hitherto made use of the instructions and assistance of a few men that remained in the country; but finding at length that they could stand their ground, and aggrandize themselves, without them, they killed Amazons. all those whom flight or chance had saved from the fury of the Sarmatians, and for ever renounced marriage, which they now considered as an insupportable slavery. But as they could only secure the duration of their new kingdom by propagation, they made a law to go every year to the frontiers, to invite the men to come to them; to deliver themselves up to their embraces, without choice on their part, or the least attachment; and to leave them as soon as they were pregnant. All those whom age rendered fit for propagation, and were willing to serve the state by breeding girls, did not go at the same time in search of men: for in order to obtain a right to promote the multiplication of the species, they must first have contributed to its destruction; nor was any thought worthy of giving birth to children till she had killed three men.

If from this commerce they brought forth girls, they educated them; but with respect to the boys, if we may believe Justin, they strangled them at the moment of their birth: according to Diodorus Siculus, they twisted their legs and arms, so as to render them unfit for military exercises; but Quintus Curtius, Philostratus, and Jordanus, say, that the less savage sent them to their fathers. It is probable, that at first, when their fury against the men was carried to the greatest height, they killed the boys; that when this fury abated, and most of the mothers were filled with horror at depriving the little creatures of the lives they had just received from them, they fulfilled the first duties of a mother; but, to prevent their causing a revolution in the state, maimed them in such a manner as to render them incapable of war, and employed them in the mean offices which these warlike women thought beneath them. In short, that, when their conquests had confirmed their power, their ferocity subsiding, they entered into political engagements with their neighbours; and the number of the males they had preserved becoming burdensome, they, at the desire of those who rendered them pregnant, sent them the boys, and continued still to keep the girls.

As soon as the age of the girls permitted, they took away the right breast, that they might draw the bow with the greater force. The common opinion is, that they burnt that breast, by applying to it, at eight years of age, a hot brazen instrument, which insensibly dried up the fibres and glands; some think that they did not make use of so much ceremony, but that when the part was formed they got rid of it by amputation: some again, with much greater probability, affirm, that they employed no violent measures; but, by a continual compression of that part from infancy, prevented its growth, at least so far as to hinder its ever being incommodious in war.

Plutarch, treating of the Amazons in his life of Theseus, considers the accounts which had been preserved concerning them as partly fabulous and partly true. He gives some account of a battle which had been fought between the Athenians and the Amazons at Athens; and he relates some particulars of this battle which had been recorded by an ancient writer named Clidemus. He says, "That the left wing of the Amazons moved towards the place which is yet called Amazonium, and the right to a place called Pnyx, near Chrysa; upon which the Athenians, issuing from behind

Amazons

hind the temple of the Muſes, fell upon them; and that this is true, the graves of thoſe that were ſlain, to be ſeen in the ſtreets that lead to the gate Piraica, by the temple of the hero Chalcodue, are a ſufficient proof. And here it was that the Athenians were routed, and ſhamefully turned their backs to women, as far as to the temple of the Furies. But freſh ſupplies coming in from Palladium, Ardettus, and Lyceum, charged their right wing, and beat them back into their very tents; in which action a great number of the Amazons were ſlain." In another place he ſays, "It appears that the paſſage of the Amazons through Theſſaly was not without oppoſition; for there are yet to be ſeen many of their ſepulchres near Scotuſſæa and Cynocephalæ." And in his life of Pompey, ſpeaking of the Amazons, Plutarch ſays, "They inhabit thoſe parts of Mount Caucaſus that look towards the Hyrcanian ſea (not bordering upon the Albanians, for the territories of the Getæ and the Leſgæ lie betwixt): and with theſe people do they yearly, for two months only, accompany and cohabit, bed and board, near the river Thermodoon. After that they retire to their own habitations, and live alone all the reſt of the year."

Quintus Curtius ſays, "The nation of the Amazons is ſituated upon the borders of Hyrcania, inhabiting the plains of Thermiſcyra, near the river Thermodoon. Their queen was named Thaleſtris, and ſhe had under her ſubjection all the country that lies between Mount Caucaſus and the river Phaſis. This queen came out of her dominions, in conſequence of an ardent deſire ſhe had conceived to ſee Alexander; and being advanced near the place where he was, ſhe previouſly ſent meſſengers to acquaint him, that the queen was come to have the ſatisfaction of ſeeing and converſing with him. Having obtained permiſſion to viſit him, ſhe advanced with 300 of her Amazons, leaving the reſt of her troops behind. As ſoon as ſhe came within ſight of the king, ſhe leaped from her horſe, holding two javelins in her right hand. The apparel of the Amazons does not cover all the body, for their left ſide is naked down to the ſtomach; nor do the ſkirts of their garments, which they tie up in a knot, reach below their knees. They preſerve their left breaſt entire, that they may be able to ſuckle their female offſpring; and they cut off and ſear their right, that they may draw their bows, and caſt their darts, with the greater eaſe. Thaleſtris looked at the king with an undaunted countenance, and narrowly examined his perſon; which did not, according to her ideas, come up to the fame of his great exploits: For the barbarians have a great veneration for a majeſtic perſon, eſteeming thoſe only to be capable of performing great actions on whom nature has conferred a dignified appearance. The king having aſked her whether ſhe had any thing to deſire of him, ſhe replied, without ſcruple or heſitation, that ſhe was come with a view to have children by him, ſhe being worthy to bring him heirs to his dominions. Their offſpring, if of the female ſex, ſhe would retain herſelf; and if of the male ſex, it ſhould be delivered to Alexander. He then aſked her, whether ſhe would accompany him in his wars? But this ſhe declined, alleging, That ſhe had left nobody to take care of her kingdom. She continued to ſolicit Alexander, that he would not ſend her back without conforming to her wiſhes; but it was not till after a delay of 13 days that he complied. She then returned to her own kingdom." Amazons

Juſtin alſo repeatedly mentions this viſit of Thaleſtris to Alexander; and in one place he ſays, that ſhe made a march of 25 days, in order to obtain this meeting with him. The interview between Alexander and Thaleſtris is likewiſe mentioned by Diodorus Siculus. The learned Goropius, as he is quoted by Dr Petit, laments, in very pathetic terms, the hard fate of Thaleſtris, who was obliged to travel ſo many miles, and to encounter many hardſhips, in order to procure this interview with the Macedonian prince; and, from the circumſtances, is led to conſider the whole account as incredible. But Dr Petit, with equal erudition, with equal eloquence, and with ſuperior force of reaſoning, at length determines, that her journey was not founded upon irrational principles, and that full credit is due to thoſe grave and venerable hiſtorians by whom this tranſaction has been recorded.

The Amazons are repreſented as being armed with bows and arrows, with javelins, and alſo with an axe of a particular conſtruction, which was denominated the axe of the Amazons. According to the elder Pliny, this axe was invented by Penthefilea, one of their queens. On many ancient medals are repreſentations of the Amazons, armed with theſe axes. They are alſo ſaid to have had bucklers in the ſhape of a half moon.

The Amazons are mentioned by many other ancient authors, beſides thoſe which have been enumerated; and if any credit be due to the accounts concerning them, they ſubſiſted through ſeveral ages. They are repreſented as having rendered themſelves extremely formidable; as having founded cities, enlarged the boundaries of their dominions, and conquered ſeveral other nations.

That at any period there ſhould have been women, who, without the aſſiſtance of men, built cities and governed them, raiſed armies and commanded them, adminiſtered public affairs, and extended their dominion by arms, is undoubtedly ſo contrary to all that we have ſeen and known of human affairs, as to appear in a very great degree incredible; but that women may have exiſted ſufficiently robuſt, and ſufficiently courageous, to have engaged in warlike enterpriſes, and even to have been ſucceſsful in them, is certainly not impoſſible, however contrary to the uſual courſe of things. In ſupport of this ſide of the queſtion, it may be urged, that women who have been early trained to warlike exerciſes, to hunting, and to a hard and laborious mode of living, may be rendered more ſtrong, and capable of more vigorous exertions, than men who have led indolent, delicate, and luxurious lives, and who have ſeldom been expoſed even to the inclemencies of the weather. The limbs of women, as well as of men, are ſtrengthened and rendered more robuſt by frequent and laborious exerciſe. A nation of women, therefore, brought up and diſciplined as the ancient Amazons are repreſented to have been, would be ſuperior to an equal number of effeminate men, though they might be much inferior to an equal number of hardy men, trained up and diſciplined in the ſame manner.

That much of what is ſaid of the Amazons is fabulous, there can be no reaſonable doubt; but it does not

Amazons. therefore follow, that the whole is without foundation. The ancient medals and monuments on which they are repreſented are very numerous, as are alſo the teſtimonies of ancient writers. It ſeems not rational to ſuppoſe that all this originated in fiction, though it be much blended with it. The abbé Guyon ſpeaks of the hiſtory of the Amazons as having been regarded by many perſons as fabulous, "rather from prejudice than from any real and ſolid examination;" and it muſt be acknowledged, that the arguments in favour of their exiſtence, from ancient hiſtory, and from ancient monuments, are extremely powerful. The fact ſeems to be, that truth and fiction have been blended in the narrations concerning theſe ancient heroines.

Inſtances of heroiſm in women have occaſionally occurred in modern times, ſomewhat reſembling that of the ancient Amazons. The times and the manners of chivalry, in particular, by bringing great enterpriſes, bold adventurers, and extravagant heroiſm, into faſhion, inſpired the women with the ſame taſte. The women, in conſequence of the prevailing paſſion, were now ſeen in the middle of camps and of armies. They quitted the ſoft and tender inclinations, and the delicate offices of their own ſex, for the toils and the toilſome occupations of ours. During the cruſades, animated by the double enthuſiaſm of religion and of valour, they often performed the moſt romantic exploits; obtained indulgencies on the field of battle, and died with arms in their hands, by the ſide of their lovers or of their huſbands.

In Europe, the women attacked and defended fortifications; princeſſes commanded their armies, and obtained victories. Such was the celebrated Joan de Montfort, diſputing for her duchy of Bretagne, and fighting herſelf. Such was that ſtill more celebrated Margaret of Anjou, that active and intrepid general and ſoldier, whoſe genius ſupported a long time a feeble huſband; which taught him to conquer; which replaced him upon the throne; which twice relieved him from priſon; and, oppreſſed by fortune and by rebels, which did not bend till after ſhe had decided in perſon twelve battles.

The warlike ſpirit among the women, conſiſtent with ages of barbariſm, when every thing is impetuous becauſe nothing is fixed, and when all exceſs is the exceſs of force, continued in Europe upwards of 400 years, ſhowing itſelf from time to time, and always in the middle of convulſions, or on the eve of great revolutions. But there were eras and countries in which that ſpirit appeared with particular luſtre. Such were the diſplays it made in the 15th and 16th centuries in Hungary, and in the iſlands of the Archipelago and the Mediterranean, when they were invaded by the Turks.

Among the ſtriking inſtances of Amazonian conduct in modern ladies, may be mentioned that of Jane of Belleville, widow of Monſ. de Cliſſon, who was beheaded at Paris in the year 1343, on a ſuſpicion of carrying on a correſpondence with England and the count de Montfort. This lady, filled with grief for the death of her late huſband, and exaſperated at the ill treatment which ſhe conſidered him as having received, ſent off "her ſon ſecretly to London; and when her apprehenſions were removed with reſpect to him, ſhe ſold her jewels, fitted out three ſhips, and put to ſea, to revenge the death of her huſband upon all the French with whom ſhe ſhould meet. This new corſair made ſeveral deſcents upon Normandy, where ſhe ſtormed caſtles; and the inhabitants of that province were ſpectators more than once, whilſt their villages were all in a blaze, of one of the fineſt women in Europe, with a ſword in one hand and a torch in the other, urging the carnage, and eyeing with pleaſure all the horrors of war." Amazons.

We read in Mezeray (under the article of the Croiſade, preached by St Bernard in the year 1147), "That many women did not content themſelves with taking the croſs, but that they alſo took up arms to defend it, and compoſed ſquadrons of females, which rendered credible all that has been ſaid of the proweſs of the Amazons."

In the year 1590, the League party obtained ſome troops from the king of Spain. Upon the news of their being diſembarked, Barri de St Aunez, Henry IV.'s governor at Leucate, ſet out to communicate a ſcheme to the duke de Montmorenci, commander in that province. He was taken in his way by ſome of the troops of the League, who were alſo upon their march with the Spaniards towards Leucate. They were perſuaded, that by thus having the governor in their hands, the gates of that place would be immediately opened to them, or at leaſt would not hold out long. But Conſtantia de Cecelli, his wife, after having aſſembled the garriſon, put herſelf ſo reſolutely at their head, pike in hand, that ſhe inſpired the weakeſt with courage; and the beſiegers were repulſed wherever they preſented themſelves. Shame, and their great loſs, having rendered them deſperate, they ſent a meſſenger to this courageous woman, acquainting her, that if ſhe continued to defend herſelf, they would hang her huſband. She replied, with tears in her eyes, "I have riches in abundance: I have offered them, and I do ſtill offer them, for his ranſom; but I would not ignominiouſly purchaſe a life which he would reproach me with, and which he would be aſhamed to enjoy. I will not diſhonour him by treaſon againſt my king and country." The beſiegers having made a freſh attack without ſucceſs, put her huſband to death, and raiſed the ſiege. Henry IV. afterwards ſent to this lady the brevet of governeſs of Leucate, with the reverſion for her ſon.

The famous maid of Orleans, alſo, is an example known to every reader.

The abbé Arnaud, in his memoirs, ſpeaks of a counteſs of St Balmont, who uſed to take the field with her huſband, and fight by his ſide. She ſent ſeveral Spaniſh priſoners of her taking to Marſhal Feuquiers; and, what was not a little extraordinary, this Amazon at home was all affability and ſweetneſs, and gave herſelf up to reading and acts of piety.

Dr Johnſon ſeems to have given ſome credit to the accounts which have been tranſmitted down to us concerning the ancient Amazons; and he has endeavoured to ſhow, that we ought not haſtily to reject ancient hiſtorical narrations becauſe they contain facts repugnant to modern manners, and exhibit ſcenes to which nothing now occurring bears a reſemblance. "Of what we know not (ſays he) we can only judge by what we know. Every novelty appears more wonderful, as it is more remote from any thing with which

experience

Amazons

experience or teſtimony have hitherto acquainted us; and, if it paſſes farther, beyond the notions that we have been accuſtomed to form, it becomes at laſt incredible. We ſeldom conſider that human knowledge is very narrow; that national manners are formed by chance; that uncommon conjunctures of cauſes produce rare effects; or, that what is impoſſible at one time or place may yet happen in another. It is always eaſier to deny than to inquire. To refuſe credit confers for a moment an appearance of ſuperiority which every little mind is tempted to aſſume, when it may be gained ſo cheaply as by withdrawing attention from evidence, and declining the fatigue of comparing probabilities. Many relations of travellers have been ſlighted as fabulous, till more frequent voyages have confirmed their veracity; and it may reaſonably be imagined that many ancient hiſtorians are unjuſtly ſuſpected of falſehood, becauſe our own times afford nothing that reſembles what they tell. Few narratives will, either to men or women, appear more incredible than the hiſtories of the Amazons; of female nations, of whoſe conſtitution it was the eſſential and fundamental law, to exclude men from all participation, either of public affairs or domeſtic buſineſs; where female armies marched under female captains, female farmers gathered the harveſt, female partners danced together, and female wits diverted one another. Yet ſeveral ages of antiquity have tranſmitted accounts of the Amazons of Caucaſus; and of the Amazons of America, who have given their name to the greateſt river in the world, Condamine lately found ſuch memorials as can be expected among erratic and unlettered nations, where events are recorded only by tradition, and new ſwarms ſettling in the country from time to time confuſe and efface all traces of former times.

No author has taken ſo much pains upon this ſubject as Dr Petit. But, in the courſe of his work, he has given it as his opinion, that there is great difficulty in governing the women even at preſent, though they are unarmed and unpractiſed in the art of war. After all his elaborate inquiries and diſcuſſions, therefore, this learned writer might probably think, that it is not an evil of the firſt magnitude that the race of Amazons now ceaſes to exiſt.

Rouſſeau ſays, "The empire of the woman is an empire of ſoftneſs, of addreſs, of complacency. Her commands are careſſes, her menaces are tears." But the empire of the Amazons was certainly an empire of a very different kind. Upon the whole, we may conclude with Dr Johnſon: "The character of the ancient Amazons was rather terrible than lovely. The hand could not be very delicate that was only employed in drawing the bow, and brandiſhing the battleaxe. Their power was maintained by cruelty, their courage was deformed by ferocity; and their example only ſhows, that men and women live beſt together."

AMAZONS, *the river of*, in America. See AMAZONIA.

AMAZONIAN Habit, in *Antiquity*, denotes a dreſs formed in imitation of the Amazons. Marcia the famous concubine of the emperor Commodus, had the appellation of *Amazonian*, becauſe ſhe charmed him moſt in a habit of this kind. Hence alſo that prince himſelf engaged in combat in the amphitheatre in an Amazonian habit; and of all titles the *Amazonius* was one of thoſe he moſt delighted in. In honour either of the gallant or his miſtreſs, the month December was alſo denominated *Amazonius*. Some alſo apply *Amazonian* habit to the hunting-dreſs worn by many ladies among us.

Amba ‖ Ambarvalia.

AMBA, an Abyſſinian or Ethiopic word, ſignifying a *rock*. The Abyſſinians give names to each of their rocks, as *Amba-Dorho*, the rock of a hen, &c. Some of theſe rocks are ſaid to have the name of *Aorni*; and are of ſuch a ſtupendous height, that the Alps and Pyrenees are but low hills in compariſon of them. Amongſt the mountains, and even frequently in the plains, of this country, ariſe ſteep and craggy rocks of various forms, ſome reſembling towers, others pyramids, &c. ſo perpendicular and ſmooth on the ſides, that they ſeem to be works of art; inſomuch, that men, cattle, &c. are craned up by the help of ladders and ropes: and yet the tops of theſe rocks are covered with woods, meadows, fountains, fiſh-ponds, &c. which very copiouſly ſupply the animals ſeated thereon with all the conveniencies of life. The moſt remarkable of theſe rocks is called *Amba-Geſhen*. It is prodigiouſly ſteep, in the form of a caſtle built of freeſtone, and almoſt impregnable. Its ſummit is about half a Portugueſe league in breadth, and the circumference at the bottom about half a day's journey. The aſcent at firſt is eaſy; but grows afterwards ſo ſteep, that the Abaſſine oxen, which will otherwiſe clamber like goats, muſt be craned up, and let down with ropes. Here the princes of the blood were formerly confined, in low cottages amongſt ſhrubs and wild cedars, with an allowance barely ſufficient to keep them alive. There is, according to Kircher, in this country, a rock ſo curiouſly hollowed by nature, that at a diſtance it reſembles a looking-glaſs; and oppoſite to this another, on the top of which nothing can be ſo ſoftly whiſpered but it may be heard a great way off. Between many of theſe rocks and mountains are vaſt abyſſes, which appear very dreadful to the eye.

AMBACHT, is a word which denotes a kind of juriſdiction or territory, the profeſſor whereof has the adminiſtration of juſtice, both in *alto* and *baſſo*; or of what is called, in the Scots law, *a power of pit and gallows*, i. e. a power of drowning and hanging. In ſome ancient writers, ambacht is particularly uſed for the juriſdiction, government, or chief magiſtracy of a city. The word is very ancient, though uſed originally in a ſenſe ſomewhat different. Ennius calls a mercenary, or ſlave hired for money, *ambactus*; and Cæſar gives the ſame appellation to a kind of dependents among the Gauls, who, without being ſlaves, were attached to the ſervice of great lords.

AMBAGES. See CIRCUMLOCUTION.

AMBARVALIA, in *Antiquity*, a ceremony among the Romans, when, in order to procure from the gods a happy harveſt, they conducted the victims thrice round the corn fields in proceſſion, before ſacrificing them.—*Ambarvalia* were either of a private or public nature: the private were performed by the maſter of a family, and the public by the prieſts who officiated at the ſolemnity, called *fratres ovales*. The prayer preferred on this occaſion, the formula of which we have in Cato *de Re Ruſtica*, cap. cxlii. was called *carmen ambervale*. At theſe feaſts they ſacrificed to Ceres a ſow, a ſheep, and a bull or heifer, whence they took

the

Ambaſſador || Amber.

the name of *ſuovetaurilia*. The method of celebrating them was, to lead a victim round the fields, while the peaſants accompanied it, and one of their number, crowned with oak, hymned forth the praiſes of Ceres, in verſes compoſed on purpoſe. This feſtival was celebrated twice a-year; at the end of January, according to ſome, or in April, according to others; and for the ſecond time, in the month of July.

AMBASSADOR, or EMBASSADOR, a public miniſter ſent from one ſovereign prince, as a repreſentative of his perſon, to another.

Ambaſſadors are either ordinary or extraordinary. Ambaſſador *in ordinary*, is he who conſtantly reſides in the court of another prince, to maintain a good underſtanding, and look to the intereſt of his maſter. Till about two hundred years ago, ambaſſadors in ordinary were not heard of: all, till then, were ambaſſadors *extraordinary*; that is, ſuch as are ſent on ſome particular occaſion, and who retire as ſoon as the affair is deſpatched.

By the law of nations, none under the quality of a ſovereign prince can ſend or receive an ambaſſador. At Athens, ambaſſadors mounted the pulpit of the public orators, and there opened their commiſſion, acquainting the people with their errand. At Rome, they were introduced to the ſenate, and delivered their commiſſions to the fathers.

Ambaſſadors ſhould never attend any public ſolemnities, as marriages, funerals, &c. unleſs their maſters have ſome intereſt therein: nor muſt they go into mourning on any occaſions of their own, becauſe they repreſent the perſon of their prince. By the civil law, the moveable goods of an ambaſſador, which are accounted an acceſſion to his perſon, cannot be ſeized on, neither as a pledge, nor for payment of a debt, nor by order or execution of judgement, nor by the king's or ſtate's leave where he reſides, as ſome conceive; for all actions ought to be far from an ambaſſador, as well that which toucheth his neceſſaries, as his perſon: if therefore, he hath contracted any debt, he is to be called upon kindly; and if he refuſes, then letters of requeſt are to go to his maſter. Nor can any of the ambaſſador's domeſtic ſervants that are regiſtered in the ſecretaries of ſtate's office be arreſted in perſon or goods; if they are, the proceſs ſhall be void, and the parties ſueing out and executing it ſhall ſuffer and be liable to ſuch penalties and corporal puniſhment as the lord chancellor or either of the chief juſtices ſhall think fit to inflict. Yet ambaſſadors cannot be defended when they commit any thing againſt that ſtate, or the perſon of the prince, with whom they reſide; and if they are guilty of treaſon, felony, &c. or any other crime againſt the law of nations, they loſe the privilege of an ambaſſador, and may be ſubject to puniſhment as private aliens.

AMBE, in *Surgery*, the name of an inſtrument for reducing diſlocated bones. In *Anatomy*, a term for the ſuperficial jutting out of a bone.

AMBER (*Succinum*), in *Natural Hiſtory*, a ſolid, hard, ſemipellucid, bituminous ſubſtance of a particular nature, of uſe in medicine and in ſeveral of the arts. It has been called *ambra* by the Arabians, and *electrum* by the Greeks.

Amber has been of great repute in the world from the earlieſt times. Many years before Chriſt it was in eſteem as a medicine; and Plato, Ariſtotle, Herodotus, Æſchylus, and others, have commended its virtues. In the times of the Romans, it became in high eſteem as a gem; and in the luxurious reign of Nero, immenſe quantities of it were brought to Rome, and uſed for ornamenting works of various kinds. Amber.

The moſt remarkable property of this ſubſtance is, that when rubbed it draws or attracts other bodies to it: and this, it is obſerved, it does even to thoſe ſubſtances which the ancients thought it had an antipathy to; as oily bodies, drops of water, human ſweat, &c. Add, that, by the friction it is brought to yield light pretty copiouſly in the dark; whence it is reckoned among the native phoſphori.

The property which amber poſſeſſes of attracting light bodies was very anciently obſerved. Thales of Miletus, 600 years before Chriſt, concluded from hence, that it was animated. But the firſt perſon who expreſsly mentions this ſubſtance is Theophraſtus, about the year 300 before Chriſt. The attractive property of amber is likewiſe occaſionally taken notice of by Pliny and other later naturaliſts, particularly by Gaſſendus, Kenelm Digby, and Sir Thomas Brown; but it was generally apprehended that this quality was peculiar to amber and jet, and perhaps agate, till Gilbert publiſhed his treatiſe *de Magnete*, in the year 1600. From ηλεκτρον, the Greek name for amber, is derived the term *Electricity*, which is now very extenſively applied, not only to the power of attracting light bodies inherent in amber, but to other ſimilar powers, and their various effects in whatever bodies they reſide, or to whatever bodies they may be communicated.

Amber aſſumes all figures in the ground; that of a pear, an almond, a pea, &c. In amber there have been ſaid to be letters found very well formed; and even Hebrew and Arabic characters.—Within ſome pieces, leaves, inſects, &c. have likewiſe been found included; which ſeems to indicate either that the amber was originally in a fluid ſtate, or that having been expoſed to the ſun it was once ſoftened, and rendered ſuſceptible of the leaves, inſects, &c. which came in its way. The latter of theſe ſuppoſitions ſeems the more agreeable to the phenomenon; becauſe thoſe inſects, &c. are never found in the centre of the pieces of amber, but always near the ſurface. It is obſerved by the inhabitants of thoſe places where amber is produced, that all animals, whether terreſtrial, aerial, or aquatic, are extremely fond of it, and that pieces of it are frequently found in their excrements. The bodies of inſects, found buried in amber, are viewed with admiration by all the world; but of the moſt remarkable of theſe, many are to be ſuſpected as counterfeit, the great price at which beautiful ſpecimens of this kind ſell, having tempted ingenious cheats to introduce animal bodies in ſuch artful manners, into ſeemingly whole pieces of amber, that it is not eaſy to detect the fraud.

Of thoſe inſects which have been originally incloſed in amber, ſome are plainly ſeen to have ſtruggled hard for their liberty, and even to have left their limbs behind them in the attempt; it being no unuſual thing to ſee, in a maſs of amber that contains a ſtout beetle, the animal wanting one, or perhaps two of its legs; and thoſe legs left in different places, nearer that part of the maſs from which it has travelled. This alſo may account for the common accident of finding legs

Amber. or wings of flies, without the reſt of their bodies, in pieces of amber; the inſects having, when entangled in the yet ſoft and viſcid matter, eſcaped, at the expence of leaving theſe limbs behind them. Drops of clear water are ſometimes alſo preſerved in amber. Theſe have doubtleſs been received into it while ſoft, and preſerved by its hardening round them. Beautiful leaves of a pinnated ſtructure, reſembling ſome of the ferns, or maidenhairs, have been found in ſome pieces; but theſe are rare, and the ſpecimens of great value. Mineral ſubſtances are alſo found at times lodged in maſſes of amber. Some of the pompous collections of the German princes boaſt of ſpecimens of native gold and ſilver in maſſes of amber; but as there are many ſubſtances of the marcaſite, and other kinds, that have all the glittering appearance of gold and ſilver, it is not to be too haſtily concluded, that theſe metals are really lodged in theſe beds of amber. Iron is found in various ſhapes immerſed in amber; and as it is often ſeen eroded, and ſometimes in the ſtate of vitriol, it is not impoſſible but that copper, and the other metals, may be alſo ſometimes immerſed in it in the ſame ſtate; hence the bluiſh and greeniſh colours, frequently found in the recent pieces of amber, may be owing, like the particles of the gem colours, to thoſe metals; but as the gems, by their denſe texture, always retain their colours, this lighter and more lax bitumen uſually loſes what it gets of this kind by keeping ſome time. Small pebbles, grains of ſand, and fragments of other ſtones, are alſo not unfrequently found immerſed in amber.

Naturaliſts have been greatly divided as to the origin of this ſubſtance, and what claſs of bodies it belongs to; ſome referring it to the vegetable, others to the mineral, and ſome even to the animal kingdom. Pliny deſcribes it as "a reſinous juice, oozing from aged pines and firs (others ſay from poplars, whereof there are whole foreſts on the coaſts of Sweden), and diſcharged thence into the ſea, where undergoing ſome alteration, it is thrown, in this form, upon the ſhores of Pruſſia, which lie very low: he adds, that it was hence the ancients gave it the denomination *ſuccinum*; from *ſuccus*, juice.

Some ſuppoſe amber a compound ſubſtance. Pruſſia, ſay they, and the other countries which produce amber, are moiſtened with a bituminous juice, which mixing with the vitriolic ſalts abounding in thoſe places, the points of thoſe ſalts fix its fluidity, whence it congeals; and the reſult of that congelation makes what we call amber; which is more or leſs pure, tranſparent, and firm, as thoſe parts of ſalt and bitumen are more or leſs pure, and are mixed in this or that proportion.

Mr Brydone, in his tour to Sicily and Malta, ſays, that the river Gearetta, formerly celebrated by the poets under the name of Simetus, throws up near its mouth great quantities of amber. He mentions alſo a kind of artificial amber, not uncommon there, made, as he was told, from copal, but very different from the natural.

According to Hartman, amber is formed of a bitumen, mixed with vitriol and other ſalts. But though this were allowed him in regard to the foſſil amber, many diſpute whether the ſea amber be ſo produced. It is, however, apparent, that all amber is of the ſame origin, and probably that which is found in the ſea has been waſhed thither out of the cliffs; though Hartman thinks it very poſſible, that ſome of it may be formed in the earth under the ſea, and be waſhed up thence. The ſea amber is uſually finer to the eye than the foſſil; but the reaſon is, that it is diveſted of that coarſe coat with which the other is covered while in the earth. Amber.

Upon the whole, it ſeems generally agreed upon, that amber is a true bitumen of a foſſil origin. In a late volume of the *Journal de Phyſique*, however, we find it aſſerted by Dr Girtanner to be an animal product, a ſort of honey or wax formed by a ſpecies of large ant called by Linnæus *formica rufa*. Theſe ants, our author informs us, inhabit the old pine foreſts, where they ſometimes form hills about ſix feet in diameter: and it is generally in theſe ancient foreſts, or in places where they have been, that foſſil amber is found. This ſubſtance is not hard as that which is taken up in the ſea at Pruſſia, and which is well known to naturaliſts. It has the conſiſtence of honey or of half melted wax, but it is of a yellow colour like common amber; it gives the ſame product by chemical analyſis, and it hardens like the other when it is ſuffered to remain ſome time in a ſolution of common ſalt. This accounts for the inſects that are ſo often found incloſed in it. Among theſe inſects ants are always the moſt prevailing; which tends farther, Mr Girtanner thinks, to the confirmation of his hypotheſis. Amber, then, in his opinion, is nothing but a vegetable oil rendered concrete by the acid of ants, juſt as wax is nothing but an oil hardened by the acid of bees; a fact inconteſtably proved, we are told, ſince Mr Metherie has been able to make artificial wax by mixing oil of olives with the nitrous acid, and which wax is not to be diſtinguiſhed from the natural.

There are ſeveral indications which diſcover where amber is to be found. The ſurface of the earth is there covered with a ſoft ſcaly ſtone: and vitriol in particular always abounds there, which is ſometimes found white, ſometimes reduced into a matter like melted glaſs, and ſometimes figured like petrified wood.

Amber of the fineſt kind has been found in England. It is frequently thrown on the ſhores of Yorkſhire, and many other places, and found even in our clay pits; the pits dug for tile-clay between Tyburn and Kenſington gravel pits, and that behind St George's Hoſpital at Hyde-park corner, have afforded fine ſpecimens.

Poland, Sileſia, and Bohemia, are famous for the amber dug up there at this time. Germany affords great quantities of amber, as well dug up from the bowels of the earth, as toſſed about on the ſhores of the ſea and rivers there. Saxony, Miſnia, Sweden, and many other places in this tract of Europe, abound with it. Denmark has afforded, at different times, ſeveral quantities of foſſil amber; and the ſhores of the Baltic abound with it. But the countries lying on the Baltic afford it in the greateſt abundance of all; and of theſe the moſt plentiful country is Pruſſia, and the next is Pomerania. Pruſſia was, as early as the time of Theodoric the Goth, famous for amber; for this ſubſtance coming into great repute with this prince, ſome natives of Pruſſia, who were about his court, offered their ſervice to go to their own country, where that

Amber. that ſubſtance, they ſaid, was produced, and bring back great ſtores of it. They accordingly did ſo; and from this time Pruſſia had the honour to be called the country of amber, inſtead of Italy, which had before undeſervedly that title. This article alone brings his Pruſſian majeſty a revenue of 26,000 dollars annually. The amber of Pruſſia is not only found on the ſea coaſts, but in digging; and though that of Pomerania is generally brought from the ſhores, yet people who dig, on different occaſions, in the very heart of the country, at times find amber.

Junker deſcribes, after Neumann, the Pruſſian amber mines, which are the richeſt known. Firſt, At the ſurface of the earth is found a ſtratum of ſand. Immediately under this ſand is a bed of clay, filled with ſmall flints of about an inch diameter each. Under this clay lies a ſtratum of black earth or turf, filled with foſſil wood, half decompoſed and bituminous: this ſtratum is extended upon a bank of minerals, containing little metal except iron, which are conſequently pyrites. Laſtly, Under this bed the amber is found ſcattered about in pieces, or ſometimes accumulated in heaps.

Amber has a ſubacrid reſinous taſte, and fragrant aromatic ſmell, eſpecially when diſſolved. It differs from the other bituminous ſubſtances in this, that it yields by diſtillation a volatile acid ſalt, which none of the others do; otherwiſe it affords the ſame ſort of principles as them, viz. an acid phlegm, an oil which gradually becomes thicker as the diſtillation is continued; and when the operation is finiſhed, there remains a black caput mortuum in the retort. When boiled in water, it neither ſoftens nor undergoes any ſenſible alteration. Expoſed to the fire in an open veſſel, it melts into a black maſs very like a bitumen: It is partly ſoluble in ſpirit of wine, and likewiſe in ſome eſſential oils; but it is with difficulty that the expreſſed ones are brought to act upon it. The ſtronger ſorts of fixed alkaline lixivia almoſt totally diſſolve it.

This ſubſtance is principally of two colours, white and yellow. The white is the moſt eſteemed for medicinal purpoſes, as being the moſt odoriferous, and containing the greateſt quantity of volatile ſalt; though the yellow is moſt valued by thoſe who manufacture beads and other toys with it, by reaſon of its tranſparency.

Amber is the baſis of all varniſhes, by ſolution in the ways deſcribed under the article VARNISH.

Amber, when it has once been melted, irrecoverably loſes its beauty and hardneſs. There have been ſome, however, who pretended they had an art of melting ſome ſmall pieces of amber into a maſs, and conſtituting large ones of them: but this ſeems ſuch another undertaking as the making of gold; all the trials that have yet been made by the moſt curious experimenters, proving, that the heat which is neceſſary to melt amber is ſufficient to deſtroy it. (*Phil. Tranſ.* N° 248. p. 25.)

Could amber indeed be diſſolved without impairing its tranſparency, or one large maſs be made of it by uniting ſeveral ſmall ones, it is eaſy to ſee what would be the advantages of ſuch a proceſs. The art of embalming might poſſibly be alſo carried to a great height by this, if we could preſerve the human corpſe in a tranſparent caſe of amber, as the bodies of flies, ſpiders, graſhoppers, &c. are to a great perfection.— Something of a ſubſtitute of this kind we have in fine roſin; which being diſſolved by heat, and the bodies of ſmall animals ſeveral times dipped in it, they are thus coated with colophony, that in ſome degree reſembles amber; but this muſt be kept from duſt. Amber-tree ‖ Ambergris

Amber in ſubſtance has been much recommended as a nervous and cordial medicine; and alleged to be very efficacious in promoting the menſtrual diſcharge, and the excluſion of the fœtus and ſecundines in labour: but as in its crude ſtate it is quite inſoluble by our juices, it certainly can have very little effect on the animal ſyſtem, and therefore it is now ſeldom given in ſubſtance. The forms in which amber is prepared are, a tincture, a ſalt, and an oil; the preparations and uſes of which are deſcribed in the proper place under the article PHARMACY.

AMBER-Tree, the Engliſh name of a ſpecies of ANTHOSPERMUM.

AMBERG, a city of Germany, the capital of the palatinate of Bavaria, with a good caſtle, ramparts, baſtions, and deep ditches. It is ſeated near the confines of Franconia, on the river Wils. It has a great trade in iron and other metals, which are found in the neighbouring mountains. E. Long. 12. 0. N. Lat. 49. 25.

AMBERG, a lofty mountain of Eaſt Gothland in Sweden. Near the Wetter lake on this mountain, antimony has been found. On its top is the burying place of one of the ancient kings of the country. The ſpot is marked by a flat ſtone.

AMBERGRIS, AMBERGREASE, or GRAY-AMBER, in *Natural Hiſtory*, is a ſolid, opaque, aſh-coloured, fatty, inflammable ſubſtance, variegated like marble, remarkably light, rugged, and uneven in its ſurface, and has a fragrant odour when heated. It does not effervеſce with acids: it melts freely over the fire into a kind of yellow roſin; and is hardly ſoluble in ſpirit of wine.

It is found ſwimming upon the ſea, or the ſea coaſt, or in the ſand near the ſea coaſt; eſpecially in the Atlantic ocean, on the ſea coaſt of Brazil, and that of Madagaſcar; on the coaſt of Africa, of the Eaſt Indies, China, Japan, and the Molucca iſlands: but moſt of the ambergris which is brought to England comes from the Bahama iſlands, from Providence, &c. where it is found on the coaſt. It is alſo ſometimes found in the abdomen of whales by the whale fiſhermen, always in lumps of various ſhapes and ſizes, weighing from half an ounce to a hundred and more pounds. The piece which the Dutch Eaſt India Company bought from the king of Tydore, weighed 182 pounds. An American fiſherman from Antigua found ſome years ago, about fifty-two leagues ſouth-eaſt from the Windward iſlands, a piece of ambergris in a whale which weighed about a hundred and thirty pounds, and ſold for 500l. ſterling.

There have been many different opinions concerning the origin of this ſubſtance.

It has been ſuppoſed to be a foſſil bitumen or naphtha, exuding out of the bowels of the earth in a fluid form, and diſtilling into the ſea, where it hardens and floats on the ſurface. But having been frequently found in the bellies of whales, it has by others been conſidered as entirely an animal production.

Cluſius aſſerted it to be a phlegmatic recrement, or indurated

Ambergris. indurated indigeſtible part of the food, collected and found in the ſtomach of the whale, in the ſame manner as the BEZOARS are found in the ſtomachs of other animals.

In an account communicated by Paul Dudley, Eſq. in the 23d volume of the Philoſophical Tranſactions, the ambergris found in whales is repreſented as a kind of animal product, like muſk, and caſtoreum, &c. ſecreted and collected in a particular bag or bladder, which is furniſhed with an excretory duct or canal, the ſpout of which runs tapering into and through the length of the penis; and that this bag, which lies juſt over the teſticles, is almoſt full of a deep orange-coloured liquor, not quite ſo thick as oil, of the ſame ſmell as the balls of ambergris, which float and ſwim looſe in it; which colour and liquor may alſo be found in the canal of the penis; and that therefore ambergris is never to be found in any female, but in the male only. But theſe circumſtances are not only deſtitute of truth, but alſo contrary to the laws of the animal economy: For, in the firſt place, ambergris is frequently found in females as well as males; although that found in females is never in ſuch large pieces, nor of ſo good a quality, as what is found in males. Secondly, No perſon who has the leaſt knowledge in anatomy or phyſiology, will ever believe that organized bodies, ſuch as the beaks of the ſepia, which are ſo conſtantly found in ambergris taken out of the whale, can have been abſorbed from the inteſtines by the lacteals or lymphatics, and collected with the ambergris in the precluded bag above mentioned.

Kæmpfer, who has given us ſo many other faithful accounts in natural hiſtory, ſeems to come nearer the truth with regard to the origin of ambergris, when he ſays, that it is the dung of the whale; and that the Japaneſe for this reaſon call it *kuſura no fuu*, i. e. whale's dung. This account, howevever, though founded on obſervation, has never obtained credit; but has been conſidered rather as a fabulous ſtory, with which the Japaneſe impoſed upon him, who had himſelf no direct obſervation to prove the fact.

This matter, therefore, remained a ſubject of great doubt; and it was generally thought to be more probable, that ambergris, after having been ſwallowed and ſomehow or other changed in the ſtomach and bowels of the whale, was found among its excrements.

But the moſt ſatisfactory account of the real origin of ambergris, is that given by Dr Swediaur in the 73d volume of the Philoſophical Tranſactions, art. 15.

We are told by all writers on ambergris, that ſometimes claws and beaks of birds, feathers of birds, parts of vegetables, ſhells, fiſh, and bones of fiſh, are found in the middle of it, or variouſly mixed with it. Of a very large quantity of pieces, however, which the Doctor examined, he found none that contained any ſuch thing; though he allows that ſuch ſubſtances may ſometimes be found in it: but in all the pieces of any conſiderable ſize, whether found on the ſea or in the whale, he conſtantly found a conſiderable quantity of black ſpots, which, after the moſt careful examination, appeared to be the beaks of the *Sepia Octopodia*; and theſe beaks, he thinks, might be the ſubſtances which have hitherto been always miſtaken for claws or beaks of birds, or for ſhells.

The preſence of theſe beaks in ambergris proves evidently, that all ambergris containing them is in its origin, or muſt have been once, of a very ſoft or liquid nature, as otherwiſe thoſe beaks could not ſo conſtantly be intermixed with it throughout its whole ſubſtance. Ambergris.

That ambergris is found either upon the ſea and ſea-coaſt, or in the bowels of whales, is a matter of fact univerſally credited. But it has never been examined into and determined whether the ambergris found upon the ſea and ſea-coaſt, is the ſame as that found in the whale, or whether they are different from one another; whether that found on the ſea or ſea-coaſt has ſome properties or conſtituent parts which that found in the whale has not; and laſtly, whether that found in the whale is ſuperior or inferior in its qualities and value to the former.

It is likewiſe a matter of conſequence to know, whether ambergris is found in all kinds of whales, or only in a particular ſpecies of them; whether it is conſtantly and always to be met with in thoſe animals; and, if ſo, in what part of their body it is to be found?

All theſe queſtions we find very ſatisfactorily diſcuſſed by Dr Swediaur.

According to the beſt information that he could obtain from ſeveral of the moſt intelligent perſons employed in the ſpermaceti whale fiſhery, and in procuring and ſelling ambergris, it appears, that this ſubſtance is ſometimes found in the belly of the whale, but in that particular ſpecies only which is called the *ſpermaceti whale*, and which, from its deſcription and delineation, appears to be the *PHYSETER Macrocephalus* Linnæi.

The New England fiſhermen, according to their account, have long known that ambergris is to be found in the ſpermaceti whale; and they are ſo convinced of this fact, that whenever they hear of a place where ambergris is found, they always conclude that the ſeas in that part are frequented by that ſpecies of whale.

The perſons who are employed in the ſpermaceti whale fiſhery, confine their views to the phyſeter macrocephalus. They look for ambergris in all the ſpermaceti whales they catch, but it ſeldom happens that they find any. Whenever they hook a ſpermaceti whale, they obſerve, that it conſtantly not only vomits up whatever it has in its ſtomach, but alſo generally diſcharges its fæces at the ſame time; and if this latter circumſtance takes place, they are generally diſappointed in finding ambergris in its belly. But whenever they diſcover a ſpermaceti whale, male or female, which ſeems torpid and ſickly, they are always pretty ſure to find ambergris, as the whale in this ſtate ſeldom voids its fæces upon being hooked. They likewiſe generally meet with it in the dead ſpermaceti whales, which they ſometimes find floating on the ſea. It is obſerved alſo, that the whale in which they find ambergris often has a morbid protuberance, or, as they expreſs it, a kind of gathering in the lower part of its belly, in which, if cut open, ambergris is found. It is obſerved, that all thoſe whales in whoſe bowels ambergris is found, ſeem not only torpid and ſick, but are alſo conſtantly leaner than others; ſo that, if we may judge from the conſtant union of theſe two circumſtances, it would ſeem that a larger collection of ambergris in the belly of the whale is a ſource of diſeaſe, and probably ſometimes the cauſe of its death. As ſoon as they

Ambergris. hook a whale of this deſcription, torpid, ſickly, emaciated, or one that does not dung on being hooked, they immediately either cut up the above-mentioned protuberance, if there be any, or they rip open its bowels from the orifice of the anus, and find the ambergris ſometimes in one ſometimes in different lumps, of generally from three to twelve and more inches in diameter, and from one pound to twenty or thirty pounds in weight, at the diſtance of two, but moſt frequently of about ſix or ſeven feet from the anus, and never higher up in the inteſtinal canal; which, according to their deſcription, is in all probability the inteſtinum cæcum, hitherto miſtaken for a peculiar bag made by nature for the ſecretion and collection of this ſingular ſubſtance. That the part they cut open to come at the ambergris is no other than the inteſtinal canal is certain, becauſe they conſtantly begin their inciſion at the anus, and find the cavity everywhere filled with the fæces of the whale, which from their colour and ſmell it is impoſſible for them to miſtake. The ambergris found in the inteſtinal canal is not ſo hard as that which is found on the ſea or ſea coaſt, but ſoon grows hard in the air: when firſt taken out it has nearly the ſame colour, and the ſame diſagreeable ſmell, though not ſo ſtrong, as the more liquid dung of the whale has; but on expoſing it to the air, it by degrees not only grows grayiſh, and its ſurface is covered with a grayiſh duſt like old chocolate, but it alſo loſes its diſagreeable ſmell, and, when kept for a certain length of time, acquires the peculiar odour which is ſo agreeable to moſt people.

The gentlemen the Doctor converſed with confeſſed, that if they knew not from experience that ambergris thus found will in time acquire the above-mentioned qualities, they would by no means be able to diſtinguiſh ambergris from hard indurated fæces. This is ſo true, that whenever a whale voids its fæces upon being hooked, they look carefully to ſee if they cannot diſcover among the more liquid excrements (of which the whale diſcharges ſeveral barrels) ſome pieces floating on the ſea, of a more compact ſubſtance than the reſt. Theſe they take up and waſh, knowing them to be ambergris.

In conſidering whether there be any material difference between the ambergris found upon the ſea or ſea-coaſt, and that found in the bowels or among the dung of the whale, the Doctor refutes the opinion, that all ambergris found in whales is of an inferior quality, and therefore much leſs in price. Ambergris, he obſerves, is only valued for its purity, lightneſs, compactneſs, colour, and ſmell. There are pieces of ambergris found on different coaſts, which are of a very inferior quality; whereas there are often found in whales pieces of it of the firſt value; nay, ſeveral pieces found in the ſame whale, according to the above-mentioned qualities, are more or leſs valuable. All ambergris found in whales has at firſt, when taken out of the inteſtines, very near the ſame ſmell as the liquid excrements of that animal have; it has then alſo nearly the ſame blackiſh colour: they find it in the whale ſometimes quite hard, ſometimes rather ſoftiſh, but never ſo liquid as the natural fæces of that animal. And it is a matter of fact, that after being taken out and kept in the air, all ambergris grows not only harder and whiter, but alſo loſes by degrees its ſmell, and aſſumes ſuch an agreeable one, as that in general has which is Ambergr found ſwimming upon the ſea; therefore the goodneſs of ambergris ſeems rather to depend on its age. By being accumulated after a certain length of time in the inteſtinal canal, it ſeems even then to become of a whiter colour, and leſs ponderous, and to acquire its agreeable ſmell. The only reaſon why ambergris found floating on the ſea generally poſſeſſes the above-mentioned qualities in a ſuperior degree is, becauſe it is commonly older, and has been longer expoſed to the air. It is more frequently found in males than females; the pieces found in females are in general ſmaller, and thoſe found in males ſeem conſtantly to be larger and of a better quality; and therefore the high price in proportion to the ſize is not merely imaginary for the rarity's ſake, but in ſome reſpects well founded, becauſe ſuch large pieces appear to be of a greater age, and poſſeſs the above-mentioned qualities in general in a higher degree of perfection, than ſmaller pieces.

It is known, that the ſepia octopodia, or cuttle-fiſh, is the conſtant and natural food of the ſpermaceti whale, or phyſeter macrocephalus. Of this the fiſhers are ſo well perſuaded, that whenever they diſcover any recent relics of it ſwimming on the ſea, they conclude that a whale of this kind is, or has been, in that part. Another circumſtance which corroborates the fact is, that the ſpermaceti whale, on being hooked, generally vomits up ſome remains of the ſepia. Hence it is eaſy to account for the many beaks, or pieces of beaks, of the ſepia, found in all ambergris. The beak of the ſepia is a black horny ſubſtance, and therefore paſſes undigeſted through the ſtomach into the inteſtinal canal, where it is mixed with the fæces; after which it is either evacuated with them, or if theſe latter be preternaturally retained, forms concretions with them, which render the animal ſick and torpid, and produce an obſtipation, which ends either in an abſceſs of the abdomen, as has been frequently obſerved, or becomes fatal to the animal; whence, in both the caſes, on the burſting of its belly, that hardened ſubſtance known under the name of *ambergris*, is found ſwimming on the ſea or thrown upon the coaſt.

From the preceding account, and his having conſtantly found the above-mentioned beaks of the ſepia in all pieces of ambergris of any conſiderable ſize, Dr Swediaur concludes with great probability, that all ambergris is generated in the bowels of the phyſeter macrocephalus or ſpermaceti whale; and there mixed with the beaks of the ſepia octopodia, which is the principal food of that whale. He therefore defines ambergris to be the preternaturally hardened dung or fæces of the phyſeter macrocephalus, mixed with ſome indigeſtible relics of its food.

The opinion of Dr Swediaur, with regard to the origin of ambergris, has been confirmed by the information of Captain J. Coffin, maſter of a ſhip employed in the ſouthern whale fiſhery, given to a committee of privy council in the year 1791. According to Mr Coffin's information, American ſhips had ſometimes found ſmall quantities of ambergris; but none, that he knew of, had ever been found by Britiſh ſhips. The quantity which he had brought home amounted to 362 ounces; and it was taken from the body of a female ſpermaceti whale on the coaſt of Guinea, which

was

Ambergris. was lean, ſickly, and old; and yielded but a ſmall proportion of oil. While the people were employed in cutting up the blubber, ambergris was diſcovered coming from the fundament of the whale, and a piece of it was ſeen floating on the ſurface of the ſea. More was obſerved in the ſame paſſage, and the reſt was found in a bag a little below the paſſage and communicating with it. Mr Coffin ſuppoſes, that the ſpermaceti whale feeds almoſt wholly on the ſepia or *ſquid*: for when the whale is dying, a quantity of this fiſh, ſometimes whole, ſometimes in pieces, is thrown up. The bills of the ſquid were found, ſome on the outſide adhering to it, and ſome mixed with it. The ſpermaceti whale, when ſtruck, generally voids her excrement, and if ſhe does not, Mr Coffin conjectures, that ſhe has no ambergris; for he ſuppoſes, that the production of it is the cauſe or the effect of ſome diſorder; and that it is moſt likely to be found in a ſickly fiſh. The ambergris of the whale taken by Mr Coffin was moſtly ſold at 19s. 9d. per ounce; and a ſmall part of it, when it was ſcarce, at 25s. It was bought partly for home conſumption, and partly for exportation to Turkey, Germany, and France. (*Phil. Tranſ.* vol. lxxxi.)

The uſe of ambergris in Europe is now nearly confined to perfumery, though it has formerly been recommended in medicine by ſeveral eminent phyſicians. Hence the Eſſentia Ambræ Hoffmanni, Tinctura Regia Cod. Pariſini, Trochiſci de Ambra Ph. Wurtemberg, &c.

If we wiſh to ſee any medicinal effects from this ſubſtance, the Doctor obſerves, we muſt certainly not expect them from two or three grains, but give rather as many ſcruples of it for a doſe; though even then, he thinks, there would not be reaſon to expect much effect from it, as he had himſelf taken of pure unadulterated ambergris in powder 30 grains at once without obſerving the leaſt ſenſible effect from it. A ſailor, however, who had the curioſity to try the effect of recent ambergris upon himſelf, took half an ounce of it melted upon the fire, and found it a good purgative; which proves that it is not quite an inert ſubſtance.

In Aſia and part of Africa ambergris is not only uſed as a medicine and a perfume; but conſiderable uſe is alſo made of it in cookery, by adding it to ſeveral diſhes as a ſpice. A great quantity of it is alſo conſtantly bought by the pilgrims who travel to Mecca; probably to offer it there, and make uſe of it in fumigations, in the ſame manner as frankincenſe is uſed in Catholic countries. The Turks make uſe of it as an aphrodiſiac. Our perfumers add it to ſcented pillars, candles, balls, bottles, gloves, and hairpowder; and its eſſence is mixed with pomatums, for the face and hands, either alone or mixed with muſk, &c. though its ſmell is to ſome perſons extremely offenſive.

Ambergris may be known to be genuine by its fragrant ſcent when a hot needle or pin is thruſt into it, and its melting like fat of an uniform conſiſtence; whereas the counterfeit will not yield ſuch a ſmell, nor prove of ſuch a fat texture. One thing, however is very remarkable, that this drug, which is the moſt ſweet of all the perfumes, ſhould be capable of being reſembled in ſmell by a preparation of one of the moſt odious of all ſtinks. Mr Homberg found, that a veſſel in which he had made a long digeſtion of human faeces, acquired a very ſtrong and perfect ſmell of ambergris, inſomuch that any one would have thought a great quantity of eſſence of ambergris had been made in it. The perfume was ſo ſtrong and offenſive, that the veſſel was forced to be removed out of the laboratory. Ambert ‖ Ambient.

AMBERT, a ſmall town of France, in the department of Puy de Dome, formerly Lower Auvergne. It is the chief place of a ſmall territory called *Livradois*. Paper and playing cards, camblets, and woollen ſtuffs are manufactured here. E. Long. 5. 15. N. Lat. 45. 58.

AMBETTUWAY, a barbarous name of a tree, the leaves of which, when boiled in wine, are ſaid to create an appetite, and are uſed by the people in Guinea with that intention.

AMBIANI, or AMBIANENSIS CIVITAS, now *Amiens*, a city of Picardy. It is called *Samarobriva* by Cæſar and Cicero: which, according to Valeſius, ſignifies the bridge of the *Samara*, or *Somme*. *Ambiani* is a later name, taken from that of the people, after the uſual manner of the lower age. This people, according to Cæſar, furniſhed 5000 men for the ſiege of Aleſia.

AMBIDEXTER, a perſon who can uſe both hands with the ſame facility, and for the ſame purpoſes, that the generality of people do their right hands. As to the natural cauſe of this faculty, ſome, as Hœfer, attribute it to an extraordinary ſupply of blood and ſpirits from the heart and brain, which furniſhes both hands with the neceſſary ſtrength and agility; others, as Nicholas Maſſa, to an erect ſituation of the heart, inclining neither to the right hand nor left; and others to the right and left ſubclavian arteries being of the ſame height, and the ſame diſtance from the heart, by which the blood is propelled with equal force to both hands. But theſe are only conjectures, or rather chimeras. Many think, that were it not for education and habit, all mankind would be ambidexters; and in fact, we frequently find nurſes obliged to be at a good deal of pains before they can bring children to forego the uſe of their left hands. How far it may be an advantage to be deprived of half our natural dexterity, may be doubted. It is certain, there are infinite occaſions in life, when it would be better to have the equal uſe of both hands. Surgeons and oculiſts are of neceſſity obliged to be ambidexters; bleeding, &c. in the left arm or left ancle, and operations on the left eye, cannot be well performed but with the left hand. —Various inſtances occur in hiſtory, where the left hand has been exerciſed preferably to the right. But by the laws of the ancient Scythians, people were enjoined to exerciſe both hands alike; and Plato enjoins ambidexterity to be obſerved and encouraged in his republic.

AMBIDEXTER, among *Engliſh Lawyers*, a juror or embracer, who accepts money of both parties, for giving his verdict: an offence for which he is liable to be impriſoned, for ever excluded from a jury, and to pay ten times the ſum he accepted.

AMBIENT, a term uſed for ſuch bodies, eſpecially

Ambierle || Ambitus.

fluids, as encompaſs others on all ſides: thus, the air is frequently called an ambient fluid, becauſe it is diffuſed round the earth.

AMBIERLE, a town of France, in the department of the Rhone and Loire. It is the chief place of a canton in a diſtrict of Roanne.

AMBIGENÆ OVES, in the *Heathen Sacrifices*, an appellation given to ſuch ewes as, having brought forth twins, were ſacrificed, together with their two lambs, one on each ſide. We find them mentioned among other ſacrifices to Juno.

AMBIGENAL HYPERBOLA, a name given by Sir Iſaac Newton to one of the triple hyperbolas of the ſecond order, having one of its infinite legs falling within an angle formed by the aſſymptotes, and the other without.

AMBIGUITY, a defect of language, whereby words are rendered ambiguous. See the next article.

AMBIGUOUS, a term applied to a word or expreſſion which may be taken in different ſenſes. An anonymous writer has publiſhed a dictionary of ambiguous words: *Lexicon Philoſophicum de Ambiguitate Vocabulorum*, Francof. 1597, 4to.—The reſponſes of the ancient oracles were always ambiguous.

AMBIT, in *Geometry*, is the ſame with what is otherwiſe called the perimeter of a figure. See PERIMETER.

AMBIT was particularly uſed, in antiquity, to denote a ſpace of ground to be left vacant betwixt one building and another. By the laws of the twelve tables, houſes were not to be built contiguous, but an ambit or ſpace of 2½ feet was to be left about each for fear of fire.—The ambitus of a tomb or monument denoted a certain number of feet, in length and breadth, around the ſame, within which the ſanctity aſſigned to it was limited. The whole ground wherein a tomb was erected was not to be ſecreted from the common uſes; for this reaſon, it was frequent to inſcribe the ambit on it, that it might be known how far its ſanctity extended: thus, *in fronte pedes tot, in agrum pedes tot.*

AMBITION (*ambitio*) is generally uſed in a bad ſenſe, for an immoderate or illegal purſuit of power.

In the ſtrict meaning, however, of the word, it ſignifies the ſame with the *ambitus* of the Romans. See the next article.

Ambition, in the former and more uſual ſenſe, is one of thoſe paſſions that is never to be ſatisfied. It ſwells gradually with ſucceſs; and every acquiſition ſerves but as a ſpur to further attempts.

"If a man (it has been well obſerved) could at once accompliſh all his deſires, he would be a miſerable creature; for the chief pleaſure of this life is to wiſh and deſire. Upon this account, every prince who aſpires to be deſpotic aſpires to die of wearineſs. Searching every kingdom for the man who has the leaſt comfort in life, Where is he to be found?—In the royal palace.—What! his Majeſty? Yes, eſpecially if he be deſpotic."

AMBITUS, in *Roman Antiquity*, the ſetting up for ſome magiſtracy or office, and formally going round the city to ſolicit the intereſt and votes of the people.

Ambitus differed from *ambition*, as the former lies in the act, the latter in the mind.

Ambitus was of two kinds; one lawful, the other infamous. The firſt, called alſo *ambitus popularis*, was when a perſon offered his ſervice to the republic frankly, leaving it to every body to judge of his pretenſions as they found reaſonable. The means and inſtruments here made uſe of were various. 1. *Amici*, or friends, under different relations, including *cognati*, *affines*, *neceſſarii*, *familiares*, *vicini*, *tributes*, *clientes*, *municipes*, *ſodales*, *collegæ*. 2. *Nomenclatura*, or the calling and ſaluting every perſon by his name; to which purpoſe, the candidates were attended by an officer, under the denomination of *interpres*, or *nomenclator*. 3. *Blanditia*, or obliging perſons, by ſerving them, or their friends, patrons, or the like, with their vote and intereſt on other occaſions. 4. *Preníatio*, the ſhaking every perſon by the hand, offering him his ſervice, friendſhip, &c. The ſecond kind was that wherein force, cajoling, money, or other extraordinary influence, was made uſe of. This was held infamous, and ſeverely puniſhed, as a ſource of corruption and other miſchiefs.

Ambitus was practiſed, not only at Rome, and in the forum, but in the meetings and aſſemblies of other towns in Italy, where numbers of citizens were uſually found, on account of trade and buſineſs. The practice ceaſed in the city from the time of the emperors, by reaſon poſts were not then to be had by courting the people, but by favour from the prince.

Perſons who had cauſes depending practiſed the ſame, going about among the judges to implore their favour and mercy. They who practiſed this were called *Ambitioſi*. Hence we alſo meet with *ambitioſa decreta*, and *ambitioſa juſta*, uſed for ſuch ſentences and decrees as were thus procured from the judges, contrary to reaſon and equity, either gratuitouſly or for money.

AMBLE, in *Horſemanſhip*, a peculiar pace by which a horſe's two legs of the ſame ſide move at the ſame time. See HORSEMANSHIP.

Amble || Ambo.

AMBLESIDE, a town in Weſtmorland, ſeated at one end of Winandermeer. W. Long. 0. 49. N. Lat. 54. 30.

AMBLETEUSE, a ſea-port town of France, in the department of the Straits of Calais, in the Engliſh Channel, twelve miles ſouth-weſt from Calais, and eight north from Boulogne. At this port Cæſar embarked his cavalry when he invaded England; and James II. when he abdicated the crown landed. It is defended with a battery of cannon. E. Long. 1. 37. N. Lat. 50. 48.

AMBLYGON, in *Geometry*, denotes an obtuſe-angled triangle, or a triangle one of whoſe angles conſiſts of more than 90 degrees.

AMBLYOPY, among *Phyſicians*, ſignifies an obſcuration of the ſight, ſo that objects at a diſtance cannot be clearly diſtinguiſhed.

AMBO, or AMBON, a kind of pulpit or deſk, in the ancient churches, where the prieſts and deacons ſtood to read or ſing part of the ſervice, and preach to the people; called alſo *Analogium*. The term is derived from ἀναβαίνειν, "to mount." The ambo was mounted upon two ſides; whence ſome alſo derive the appellation from the Latin *ambo*, "both."

The ambo was aſcended by ſteps; which occaſioned that

Ambohitsmene || Amboise.

that part of the office performed there to be called the *Gradual*. See GRADUAL.

Beſides the goſpel, which was read at the top of the ambo, and the epiſtle, which was read a ſtep lower, they likewiſe publiſhed from this place the acts of the martyrs, the commemoration of departed ſaints, and the letters of peace and communion ſent by one church to another: here, too, converts made a public profeſſion of their faith; and biſhops their defence, when accuſed: treaties alſo were ſometimes concluded, and the coronations of emperors and kings performed, in the ſame place.

The modern reading-deſks and pulpits have been generally ſubſtituted for the ancient ambos; though, in ſome churches remains of the ambos are ſtill ſeen. In that of St John de Lateran at Rome, there are two moveable ambos.

AMBOHITSMENE, or VOHITSANGHOMBE, a province of the iſland of Madagaſcar, ſo called from ſome red mountains of the ſame name, lying in S. Lat. 20°. Theſe mountains are very high, reſembling the Tafelberg of the Cape of Good Hope. On one ſide of this ridge the ſea extends into the country for fifteen leagues; on the other is a flat country, abounding in ponds and marſhes. Here is alſo a lake of 15 leagues in length, and the ſame in breadth, containing many ſmall iſlands. The inhabitants of the mountains are called *Zaferahongs*; and have plenty of gold, iron, cattle, ſilk, &c.

AMBOISE, a town of France, in the former province of Touraine, now the department of the Indre and Loire, ſeated at the confluence of the rivers Loire and Maſſe. The town is the capital of a diſtrict, and has been rendered famous in hiſtory by the conſpiracy of the Proteſtants in 1560, which opened the fatal wars of religion in France. The caſtle is ſituated on a craggy rock, extremely difficult of acceſs, and the ſides of which are almoſt perpendicular. At its foot flows the Loire, which is divided into two ſtreams by a ſmall iſland. To this fortreſs the duke of Guiſe, when he expected an inſurrection among the Huguenots, removed Francis II. as to a place of perfect ſecurity. Only two detached parts of the ancient caſtle now remain, one of which was conſtructed by Charles VIII. and the other by Francis I. The former of theſe princes was born and died at Amboiſe. The town is ſituated in E. Long. 1. 10. N. Lat. 47. 25.

AMBOISE, *D'*, *Francis*, ſon of a ſurgeon to Charles IX. of France. He very early obtained the patronage of that prince, and was ſupported by his liberality in the proſecution of his ſtudies at the univerſity of Navarre, where he devoted his talents to rhetoric and philoſophy with great aſſiduity and ſucceſs. His eloquence and extenſive information raiſed him in 1572 to the place of ſolicitor of the French nation. He afterwards applied to the ſtudy of the law, and became one of the moſt accompliſhed advocates of the parliament of Paris. He was next advanced to be counſellor in the parliament of Bretagne, and next to be a maſter of requeſts and counſellor of ſtate. He viſited different countries, and publiſhed the hiſtory of his travels, with ſeveral poetical pieces. He prefixed an apologetical preface to the edition of Abelard's works in 1616, and with much induſtry collected many of his manuſcripts. His brother Adrian roſe to conſiderable conſequence in the church; and his brother James was not leſs eminent as a phyſician. *(Gen. Dict.)*. Amboiſe.

AMBOISE, *D'*, *George*, a French cardinal and miniſter of ſtate, was born in the year 1462. His father was a deſcendant of the renowned houſe of Amboiſe, and, through the influence of his powerful connexions, he beheld the path of church preferment open before his ſon; therefore he deſtined him to the clerical order. In theſe ſanguine expectations he was not diſappointed; for he had ſufficient influence to procure for him the biſhopric of Montauban at the early age of fourteen. Louis XI. appointed him one of his almoners; and in the courſe of political events, he became ſtrongly attached to the duke of Orleans, and ſuffered impriſonment in his cauſe. When this prince, however, had regained his favour at court, he was elevated to the archbiſhopric of Narbonne. After he had remained there for ſome time, he changed that ſtation for the archbiſhopric of Rouen. When the duke of Orleans was governor of Normandy, he made him lieutenant general; and in that ſituation he was of eſſential ſervice to the province, in reſtoring juſtice and order. When the duke of Orleans became Louis XII. Amboiſe was ſuddenly raiſed to the elevated ſtation of firſt miniſter and one of the cardinals. The ſame regard to equity, which characterized his conduct when lieutenant general induced him to diminiſh the impoſts, which rendered him very popular as firſt miniſter of France. In 1499, by his advice, the king undertook the conqueſt of the Milaneſe, and, on their revolt, the firſt miniſter was ſent to quell the rebellion. The great confidence which Louis had repoſed in him, induced the pope to make him his legate in France; and, in that ſtation, he piouſly laboured to reform the eccleſiaſtical orders. He enforced his doctrine by precept, not only in ſetting them an example of holding no more benefices than one at a time, but alſo by devoting two-thirds of the revenue of the ſame to the poor, and to the repair of religious edifices. According to his own account he was ambitious of the papal chair, "merely for the purpoſe of effecting the reformation of abuſes and the correction of manners." It is reported that, upon the death of Pius III. he would have been elected pope had he not been deceived by the Italian cardinals. Diſappointed in his views with regard to the papal honours, he perſuaded his maſter to declare war againſt the Venetians, to whoſe influence he ſuppoſed his failure was owing. But this imprudent undertaking was ſuddenly interrupted; for in the proſecution of his journey for the Venetian war, he was ſeized with an illneſs, and confined in the city of Lyons. Affliction rouſes the reflecting powers of the mind, and calls to remembrance the paſt actions of life. From the conſciouſneſs of his paſt errors and faults he was induced to expreſs his contrition to a brother of the infirmary who attended him at the convent of the Celeſtines. In the year 1510, and in the 50th of his age, he breathed his laſt in that place. Induſtry, ſteadineſs, and good intention, characterized his conduct as a prime miniſter. He ſhone with peculiar brightneſs as a man of literature. By his liberality and patronage, the arts and ſciences flouriſhed under his adminiſtration. It may be proper to add, that, aſſiſted by ſome

of

Amboule, Amboyna. of the ableſt lawyers in the kingdom, he formed a code of laws to reform the reigning abuſes in the nation. Thus, by ſteadily purſuing the general welfare, he obtained the appellation of the "father of the people." (*Gen. Biog.*).

AMBOULE, a province of Madagaſcar, ſomewhat to the northward of S. Lat. 23°. It is a fertile and agreeable country, watered by the river Manampani, whoſe mouth lies in S. Lat. 23. 30. The country produces plants and fruits in plenty. Iron mines are alſo found here. The black cattle are extremely fat, and their fleſh excellent. In this province ſtands a large town of the ſame name; near which is a fountain of hot water, within 20 feet of a ſmall river whoſe ſand is almoſt burning. The water of the fountain is ſaid to boil an egg hard in two hours; and the inhabitants affirm it to be a ſovereign remedy againſt the gout. The people here are employed in different preparations of iron and ſteel, which they have from their own mines, and forge ſeveral inſtruments with tolerable ſkill. Their governor is honoured with the title of *Rabertau*, or *Great Lord*. He exerciſes ſovereign authority and abſolute power; but is frequently, in times of diſtreſs, ſurpriſed by his ſubjects, who aſſemble in great numbers, ſeize his perſon, and threaten him with death unleſs they are relieved. To extricate himſelf from this dilemma he is inſtantly obliged to iſſue orders for diſtributing proviſions among them; but is uſually repaid with intereſt, a quadruple return being made in a plentiful harveſt. The people of Amboule live in great licentiouſneſs with their ſuperiors, and their country is generally a retreat for the roguiſh and lazy.

AMBOYNA, one of the Molucca iſlands in the Eaſt Indies. It lies in S. Lat. 3. 36. and E. Long. 126. 20. and is remarkable for being the centre of the commerce for nutmegs and cloves, which is entirely monopolized by the Dutch Eaſt India Company. It is about 24 leagues in circumference. Beſides cloves, it likewiſe abounds in moſt of the tropical fruits and fiſh; nor is there here any deficiency of good water; but fleſh is very ſcarce. This ſcarcity, however, proceeds more from the policy of the Dutch than either the intemperature of the climate, or the barrenneſs of the ſoil: For, excepting cloves, they have in Amboyna, as well as the Moluccas, induſtriouſly diſcouraged the cultivation of every eſculent commodity, with the view of withholding ſubſiſtence from thoſe who might be tempted to invade them.

Of the natives, the men wear large whiſkers, but leave little hair upon the chin; and have only a ſlight piece of ſtuff wrapped round their middle. The women tie their hair in knots: the maids are bought of their fathers before they are married; and if the wife proves barren, the marriage is diſſolved. Some of the natives are Mahometans, and ſome Chriſtians: but they are all ſaid to be lazy, deceitful, and treacherous. They make war with ſmall ſwift veſſels, in ſhape like dragons with regard to the head and tail. Their houſes are built of bamboo canes and ſago trees. They ſleep on mats. Their weapons are bows and arrows, javelins, ſcimitars, and targets.

Amboyna was firſt diſcovered by the Portugueſe, who built a fort upon it, which was taken from them by the Dutch in 1605. They did not, however, become maſters of the whole iſland at once. The Engliſh had here five factors, who lived under the protection of the Dutch caſtle; holding themſelves ſafe, in reſpect of the friendſhip between the two nations. Great differences had ariſen between the Dutch and Engliſh coloniſts in this part of the world; till at laſt, the Engliſh Eaſt India Company applying to King James, a treaty was concluded in 1619, by which the concerns both of the Engliſh and Dutch were regulated, and certain meaſures agreed upon for preventing future diſputes. This was an additional ſecurity to the Engliſh; and, by virtue of the treaty, they continued two years in Amboyna, trading with the Dutch. During this time, however, ſeveral diſputes happened; which occaſioning mutual diſcontents, the complaints were ſent to Jacatra, in the iſland of Java Major, to the council of defence of both nations reſident there: but they not agreeing, a ſtate of the matter was ſent over to Europe, to be decided by the Eaſt India Companies of both nations; or, in caſe they could not agree, by the king of England and the ſtates of Holland, according to an article in the treaty of 1619.—But before theſe diſputes could be decided in a legal way, the Dutch, in order to give the more ſpecious colouring to the violent ſeizure which they meditated of the iſland of Amboyna, made uſe of the ſtale pretext of a conſpiracy being formed by the Engliſh and Japaneſe to diſpoſſeſs them of one of their forts in this place. The plot, it was alleged, had been confeſſed by a Japaneſe and Portugueſe in the Engliſh ſervice, who were moſt inhumanly tortured till they ſhould anſwer in the affirmative ſuch interrogatories as might favour the ſecret deſign of thoſe cruel inquiſitors. Upon the injurious evidence of this conſtrained declaration, they immediately accuſed the Engliſh factors of the pretended conſpiracy. Some of them they impriſoned, and others they loaded with irons, and ſent on board their ſhips; ſeizing at the ſame time all the Engliſh merchandiſe, with their writings and books. Amboyna.

Theſe acts of violence were followed by a ſcene of horror unexampled in the puniſhment of the moſt atrocious offenders. Some of the factors they tortured, by compelling them to ſwallow water till their bodies were diſtended to the utmoſt pitch; then taking the miſerable victims down from the boards to which they had been faſtened, and cauſing them to diſgorge the water: if they did not acknowledge the imputed guilt, the proceſs of torture was repeated. Others of the Engliſh they conſumed by burning them gradually from the feet upwards, in order to extort the confeſſion of a conſpiracy, which was only pretended by the infernal policy of thoſe ſavage tormentors. Some had the nails of the fingers and toes torn off; and in ſome they made holes in their breaſts, filling the cavities with inflammable materials, to which they afterwards put fire. Thoſe who did not expire under the agonies of torture were conſigned to the hands of the executioner.

The allegation of this pretended conſpiracy was equally void of probability and truth. The Dutch had a garriſon of 300 men in the fort, beſides the burghers in the town, and ſeveral other forts and garriſons in the iſland, while the number of the Engliſh did not amount to 20 men; nor were even thoſe provided with arms or ammunition to effect ſuch a deſign as that with which they were charged. There likewiſe was not one

Engliſh

Amboyna. English veſſel in the harbour, whereas the Dutch had eight ſhips riding near the town: neither, when the Dutch broke open the deſks and trunks of the factors, was there found a ſingle paper or letter which could be conſtrued into the moſt diſtant relation to any conſpiracy. Add to all this, that ſuch of the unhappy ſufferers as could ſpeak to be heard, declared in the moſt ſolemn manner their innocence of the plot with which they were charged.

The whole of the tranſaction affords the moſt irrefragable teſtimony, that it was founded entirely upon a political fiction of the Hollanders, who had themſelves formed the deſign of monopolizing the trade of the Spice Iſlands; for the accompliſhment of which they perpetrated, about the ſame time, a ſimilar tragedy at Pooleron, where they put to the torture 162 of the natives, whom they likewiſe charged with a pretended conſpiracy. It may juſtly be reckoned ſingular in the fortune of this commercial republic, that they have ever ſince been permitted to enjoy in peace thoſe invaluable iſlands, which were originally obtained by ſuch atrocious infringements of humanity and the laws of nations, as will ſtain the Dutch annals, to the lateſt ages, with indelible infamy.

The more effectually to preſerve this trade, the Dutch have had all the clove trees in the adjacent iſlands grubbed up. Sometimes alſo, when the harveſt is very large, part of the produce of Amboyna itſelf is burnt.—To prevent the rearing of cloves in any of the neighbouring iſlands, or the inhabitants from ſelling them to ſtrangers, the governor of Amboyna makes the tour of his government with a fleet of curricurries, conſiſting ſometimes of 20, and at others of 30, 40, or 50 ſail. This expedition is made with all the pomp imaginable, in order to gratify the pride and folly of the Indian chiefs. The true reaſon of their taking all this pains is, becauſe experience has ſhown, that no contracts, however ſolemn, can prevent the inhabitants of thoſe iſlands from ſelling their ſpice to ſtrangers: and even now, frauds are ſo frequently practiſed by the Dutch themſelves, though the Company is inexorable in puniſhing them, that the common people call the cloves *galken-kruid*, that is, the gallows ſpice.

Beſides the cloves, coffee is alſo cultivated here by the Dutch, and a gold mine has been lately found out. This was diſcovered by the quantities of gold duſt that were waſhed from ſome mountains by the torrents. Here alſo grow ſeveral kinds of valuable wood, of which they make tables, chairs, eſcrutoires, &c. for the principal perſons in the government; and the reſt is ſold all over the Indies at a very extravagant rate.

Amboyna is divided into two parts, viz. a greater and leſſer peninſula. The former, called *Hiton*, is 12 leagues in length, and two and a half broad. In this the Dutch have no leſs than five forts, or rather ſtrong redoubts, mounted with cannon. The other is called *Leytimor*, five leagues in length, and one and a half broad, which is the ſouthern part of the iſland; on this ſtands the fort of Victoria, which is the reſidence of the governor and his council, compoſed of 15 gentlemen or merchants. The fortreſs is a ſquare, the ramparts mounted with 60 pieces of braſs cannon, and the garriſon uſually compoſed of 600 men. It is ſo ſtrong by nature and art, as to be in a manner impregnable; and ſo effectually does it command the harbour, that no veſſel could come in or go out without being ſunk by the cannon, if the governor choſe. The inhabitants of Amboyna are computed at 70,000 or 80,000, of whom but a ſmall number are Dutch: and this obliges the latter to be continually upon their guard, and to keep a competent number of troops in each of their forts, particularly in that of Middleburgh, which ſtands upon the iſthmus that connects theſe peninſulas. There are alſo redoubts and garriſons in all the iſlands of this government. Amboyna, Ambracia.

AMBRACIA, one of the moſt conſiderable cities of ancient Epirus, ſituated on the river Arachthus, at a ſmall diſtance from the ſea. At firſt it was a free city; but was afterwards reduced by the Æacidæ kings of Epirus, who choſe it for the place of their reſidence. In proceſs of time, the Ætolians made themſelves maſters of it, and held it till the year before Chriſt 189, when it fell into the hands of the Romans.

At this time Ambracia was a place of great ſtrength. It was defended on one ſide by the river Arachthus, and on the other by ſteep and craggy hills; and ſurrounded with a high and thick wall, above three miles in compaſs. The Roman conſul Fulvius began the ſiege by forming two camps, ſeparated by the river, but with a communication between them; the Romans were poſted in one, and the Epirots their allies in the other. He then threw up two lines, one of circumvallation, the other of contravallation; and built a wooden tower in form of a caſtle, over againſt the citadel, which ſtood on a hill. The Ætolians, however, before the lines were quite finiſhed, found means to throw about 1000 men into the place.

The lines being completed, the city was attacked in five different places at once. The battering rams ſhook the wall on all ſides: and the Romans, from their moveable towers, pulled down the battlements with a kind of ſcythes, which they faſtened to long beams. The beſieged made a vigorous defence. They were night and day on the walls, and indefatigable in preventing the effects of the rams and ſcythes. The ſtrokes of the former they deadened, by letting down beams, large ſtones, lumps of lead, &c. by means of pulleys, upon them when they were in motion: the others they rendered uſeleſs, by pulling the beams to which they were faſtened into the city with hooks contrived for the purpoſe.

While Fulvius was carrying on the ſiege, Nicander the Ætolian prætor, found means to throw 500 men into the city, under the command of one Nicodamus, with whom Nicander agreed to attack the Roman camp in the night-time; not doubting, that, if the garriſon from within, and the army from without, fell upon them at the ſame time, they would be obliged to raiſe the ſiege. Nicodamus narrowly watched the time at which he was ordered to ſally; and though Nicander did not appear, marched out at the head of the garriſon, armed with firebrands and torches. The Roman ſentinels, ſurpriſed at this ſight, ran to wake the legionaries, and ſoon ſpread a general alarm all over the camp. The legionaries marched in ſmall bodies as they happened to meet, to repulſe the enemy, whom they engaged in three different places. Two parties of the garriſon were driven back; but the third, commanded

by

Ambracia, Ambreada.

by two Ætolian generals, made a great ſlaughter of the Romans, and not finding themſelves ſeconded by Nicander, retired in good order into the city.

Though the beſieged were thus abandoned and had no hopes of aſſiſtance, they continued to defend themſelves with incredible vigour and reſolution. The Romans had no ſooner made a breach in the wall, but it was repaired, and a new one built behind it. The conſul, therefore, altered his meaſures; and, inſtead of making breaches with the ram, began to undermine the wall, in hopes of throwing down great part of it at once, and entering the city before the beſieged could have time to build a new wall. The miners being covered, were not obſerved by the garriſon, till the great quantities of earth brought out of the mine gave the alarm. The Ætolians immediately began to countermine; and having dug a trench of the depth they ſuppoſed the mine to be, they carried it along the wall where they heard the ſtrokes of the pickaxes of the Romans. When the two mines met, a battle enſued, firſt with pickaxes and ſpades, and then with ſwords and ſpears: but this attack did not laſt long, each party making themſelves a kind of rampart with the looſe earth. The Ætolians, in order to drive their enemies quite out of the mine, invented a machine which they brought to the place where the two mines met: this was a hollow veſſel with an iron bottom, bored through in many places, and armed with ſpikes at proper diſtances, to prevent the enemy from approaching it: this veſſel they filled with feathers, which they ſet on fire, and with bellows driving the ſmoke on the beſiegers, obliged them to leave the mine half ſuffocated. This interval the Ætolians made uſe of in repairing the foundations of the wall.

The vigorous reſiſtance made by the Ambracians, however, did not raiſe the courage of the nation in general, who were determined on a peace with Rome at all events. Fulvius, in the mean time, being deſirous of getting poſſeſſion of Ambracia before the concluſion of the peace, employed Amynander, king of the Athamanes, to perſuade the inhabitants to ſurrender. As Amynander had great intereſt in Ambracia, having long reſided there, he eaſily perſuaded them to capitulate on the following terms, viz. That the Ætolian garriſon ſhould have leave to march out of the city; that the inhabitants ſhould pay 500 talents, 200 down, and the reſt at ſix equal payments; and that they ſhould deliver to the conſul all the priſoners and deſerters that were in the city. The gates were then opened to Fulvius; and he was preſented with a crown of gold, together with many fine ſtatues and pictures, of which there were great numbers in the city, it having been the capital of Pyrrhus, who had enriched it with many valuable monuments.

From this time the city of Ambracia made no figure in hiſtory. It is ſcarcely known at preſent where the city ſtood; but that called *Arba*, in Upper Albania, ſeems beſt to agree with what is ſaid of the ancient ſituation of this city. The river Araethus, on which Ambracia was ſituated, is now called by the natives *Spagmagmuriſi*.

AMBREADA, thus they call the falſe or fictitious amber, which the Europeans uſe in their trade with the negroes on the coaſt of Africa, and particularly on the river Senegal. There are ſome large and red pieces of it, a thouſand of which making twenty ropes or ſtrings, weigh three pounds. There are others ſmall, and alſo red, which weigh but two pounds and a half.

Ambreſbury

Ambroſe.

AMBRESBURY, or AMESBURY, a market town in Wiltſhire, about ſix miles north of Salisbury, and ſituated in W. Long. 1. 40. and N. Lat. 51. 20.

AMBRONES, a Gauliſh people who lived near the foot of the Alps, between Switzerland and Provence. They invaded the Roman territories in conjunction with the Cimbri and Teutones; but were defeated with great ſlaughter by Marius, about 101 years before Chriſt. Their women, who had ſtaid during the engagement in a kind of fortification made with their carts, on ſeeing their huſbands flying, and the Romans at their heels, armed themſelves with axes, and, gnaſhing with their teeth, fell with fury on the purſuers and the purſued. Their firſt rage being ſpent, they deſired to ſurrender themſelves, upon the ſingle condition, that their chaſtity ſhould not be violated; but this equitable requeſt being denied, they firſt killed their children, and then themſelves, not one remaining alive out of the whole multitude.

AMBROSE, SAINT, an iſland in the South Pacific ocean, on the coaſt of Chili, four or five leagues due weſt from St Felix iſland. At firſt view, it appears like two ſmall iſlands; but after a nearer approach, it is found they are joined by a reef. It lies in S. Lat. 26. 13. W. Long. 80. 55. from Greenwich. There is a large rock four miles to the northward of the iſland, called, from its appearance, *Sail-rock*. Captain Roberts, who was here in 1792, found St Felix iſland inacceſſible. On St Ambroſe iſland, his crew killed and cured 13,000 ſeal ſkins of the beſt quality, in ſeven weeks. The iſland has little elſe to recommend it. Fiſh and crawfiſh abound. The beſt ſeaſon for ſealing is from the 1ſt of April to the 1ſt of Auguſt.

AMBROSE of Alexandria, lived in the beginning of the third century, and was the intimate friend of Origen. Jerome and Euſebius differ in the account they give of this man. The one denominates him a Marcionite, the other a Valentinian; but they both agree that he was converted to the orthodox faith, through means of the preaching of Origen. As is generally the caſe with new proſelytes, he became very zealous, and was appointed deacon either at Alexandria, or at Cæſarea, where Proteſtetus was preſbyter. Origen dedicated many of his works, and among others his book on martyrdom, to Ambroſe; at whoſe deſire and expence they were publiſhed. Origen and Ambroſe were alike indefatigable in their application to ſtudy, and lived in terms of the moſt intimate friendſhip. Origen being poor, Ambroſe aſſiſted him, by providing notaries and amanuenſes to copy his works.

In that period of ſociety, when the increaſe of copies was a work of immenſe labour and great expence, theſe were not only inſtances of private friendſhip, but of public utility. Ambroſe is thus juſtly entitled to rank among the patrons of learning. Ambroſe has been blamed by ſome, for having made no proviſion at his death for the poor infirm Origen. The friends of Ambroſe excuſe this part of his conduct, by ſaying, that Origen choſe to live poor, and daily dependant on

Ambroſe. a divine Providence. According to ſome hiſtorians, Ambroſe died as a martyr, along with his friend Protectetus, in the perſecution under Maximin, about the year 236; but the dedication of Origen's eight books againſt Celſus ſhews, that though he died before Origen, yet he lived to the year 250, or near that period. Origen ſpeaks of him as a man of great piety, and much devoted to the ſtudy of the ſacred Scriptures. (*Gen. Biog.*)

Ambroſe.

Ambrose, biſhop of Milan, was one of the moſt eminent fathers of the church in the fourth century. He was a citizen of Rome, and born in France; ſome hiſtorians ſay in the year 334, but others ſay in the year 340. The birth of Ambroſe is ſaid to have been attended with a remarkable preſage of his future eloquence, by a ſwarm of bees coming and ſettling upon his mouth as he lay in his cradle. At the period of his birth, his father was Prætorian prefect of Gallia Narbonenſis; but upon his death, the widow repaired to Rome with her family. Ambroſe received a religious education, and was reared in the habits of virtuous conduct by his mother, who was an accompliſhed woman, and eminent for piety. The names of thoſe maſters who inſtructed him in the rudiments of the Greek and Roman literature have not been tranſmitted to poſterity: but in theſe branches he made early proficiency; and, having directed his attention to the law, he employed his eloquence with ſuch reputation in the Prætorian court of Anicius Probus, that he was ſoon deemed worthy of a place in the council. After he had continued in this ſtation for ſome time, Probus appointed him conſular of Liguria and Emilia, comprehending the territories of Milan, Liguria, Turin, Genoa, and Bologna. Milan was choſen for the place of his reſidence, and by the prudent and gentle uſe of his power, he conducted the affairs of the province with general approbation and growing popularity.

In the year 374, Auxentius the biſhop of that city died, and his death gave a ſudden change to the fortune and literary purſuits of Ambroſe. At that period, the tide of religious contention ran high between the Catholics and the Arians, and there enſued a ſtrong conteſt concerning the choice of a new biſhop. When the people were aſſembled in the church to elect, Ambroſe, in the character of governor of the place, went into the aſſembly, and, in a grave, eloquent, and pathetic addreſs, admoniſhed the multitude to lay aſide their contentions, and, in the ſpirit of religious meekneſs, to proceed to the important work of chooſing a biſhop. It is reported, that when Ambroſe had finiſhed his addreſs, a child cried out, "Ambroſe is biſhop." The agitated multitude ſuddenly caught the ſuperſtitious flame, and regarding this as a miraculous intimation, they unanimouſly elected Ambroſe biſhop of Milan. Some ſuppoſe that this was entirely a device of Ambroſe or his friends, and others aſcribe it to mere accident. Ambroſe ſtrongly affected reluctance, and even pretended to fly from the city in order to avoid the intended honour. It is, however, unfortunate for the artifice of the governor that the place of his concealment was ſoon diſcovered, when the will of the emperor was known concerning the confirmation of his election. Finding it inconvenient any longer to reſiſt the public choice, he exchanged the enſigns of civil for thoſe of eccleſiaſtical dignity; and, after being baptized, he was ordained biſhop of Milan, about the end of the year 374.

Ambroſe.

But whatever may be the ſentiments of mankind concerning the ſingular conduct of Ambroſe in accepting an office for which he was certainly unqualified in reſpect of previous ſtudies, habits, and employments, yet it muſt be admitted, that he immediately betook himſelf to the neceſſary ſtudies, and with ability, boldneſs, and integrity, acquitted himſelf in his new elevation. Having appropriated his money to the poor, ſettled his lands upon the church, with the exception of making his ſiſter tenant during life, and having committed the care of his family to his brother, he entered upon a regular courſe of theological ſtudy, under the care of Simplician, a preſbyter of Rome, and devoted himſelf to the labours of the church.

Compelled by the irruption of the Goths and the northern barbarians, who ruſhed down upon the Roman empire, ſpreading terror and deſolation all around, Ambroſe, along with ſeveral others, fled to Illyricum; but he remained only a ſhort period in exile, for the northern invaders were quickly defeated by the forces of the emperor, and driven back with conſiderable loſs into their own dominions; therefore, he and his companions returned to their reſpective habitations.

After he returned to his eccleſiaſtic ſtation, the eloquence and abilities of that zealous biſhop found ample ſcope in the diſpute between the Arians and the Catholics. About this era, the doctrine of Arius concerning the perſon of Chriſt had been extenſively received, and had many powerful defenders, both among the clergy and the common people. Ambroſe eſpouſed the cauſe of the Catholics. Gratian, the ſon of the elder Valentinian, marſhalled on the ſame ſide. But the younger Valentinian, who was now become his colleague in the empire, adopted the opinions of the Arians; and all the arguments and eloquence of Ambroſe were inſufficient to reclaim the young prince to the orthodox faith. Theodoſius, the emperor of the eaſt, alſo profeſſed the orthodox faith, yet there were numerous adherents to Arius ſcattered throughout his dominions. In this general ſtate of religious opinions in the empire, two leaders of the Arians, Palladius and Secundianus, confident of numbers, prevailed upon Gratian to call a general council from all parts of the empire. This requeſt appeared ſo equitable that he complied without heſitation, but Ambroſe, aware of the conſequence, had the eloquence to perſuade the emperor that a general council was improper, and that the matter could be determined by a council of the weſtern biſhops. The reſult was, that a ſynod, compoſed of 32 biſhops, was held at Aquileia in the year 381. Ambroſe was elected preſident, and Palladius being called upon to defend his opinions, declined; inſiſting that the meeting was a partial one, and that the whole biſhops of the empire not being preſent, the ſenſe of the Chriſtian church could not be obtained concerning the queſtion in diſpute. Ambroſe mentioned ſeveral precedents in favour of the authority of the court, and added, that the oriental biſhops being acquainted with the place and nature of the meeting, might have been preſent, if they had deemed the matter in diſcuſ-

Ambroſe. ſion worthy of their attention; therefore, the court, although Palladius perſiſted in his refuſal to plead his cauſe, put the vote, and he, along with his aſſociate Secundianus, was ejected from the epiſcopal office. If Ambroſe diſplayed great zeal in oppoſing the errors of Arius, he diſplayed equal zeal in oppoſing the heathen ſuperſtitions. Many of the ſenators remaining ſtrongly attached to the heathen idolatry, upon Valentinian II. aſcending the throne, they made a vigorous effort to reſtore the worſhip of the heathen deities. Symmachus, a very opulent man, and a great orator, who was at that time prefect of the city, was entruſted with the management of the Pagan cauſe, and drew up a petition, praying that the altar of Victory might be reſtored to its ancient ſtation in the hall of the ſenate, and for the proper ſupport of ſeven veſtal virgins, and the regular obſervance of the other Pagan ceremonies. Great eloquence and peculiar inſinuation characterized the petition. He argued that this form of religion had long been profitable to the Roman ſtate, reminded the emperor how much Rome had been indebted to victory, and that it had been the uniform cuſtom of the ſenators to ſwear fidelity to the government upon that altar. He likewiſe produced many facts to prove the advantages derived to the ſtate from its ancient religious inſtitutions, and inſinuated that it was one divinity that all men worſhipped under different forms, ſo that ancient practice ſhould not be raſhly laid aſide. He even proceeded ſo far as to ſtate the injuſtice of increaſing the public revenue by robbing the church, and attributed the late famine which had overtaken the empire to the neglect of the ancient worſhip.

To this petition, Ambroſe replied in a letter to Valentinian, arguing that the devoted worſhippers of idols had often been forſaken by their deities; that the native valour of the Roman ſoldiers had gained her victories, and not the pretended influence of Pagan prieſts; that theſe idolatrous worſhippers requeſted for themſelves what they refuſed to Chriſtians; that willing virginity was more honourable than that procured by the public money; that as the Chriſtian miniſters declined taking temporal emoluments, they ſhould alſo be denied to Pagan prieſts; that it was abſurd to ſuppoſe that God would ſend a famine upon the empire for neglecting to ſupport a religious ſyſtem contrary to his revealed will in the Scriptures; that the whole proceſs of nature encouraged innovations; and that all nations had permitted theſe, even in religion; that heathen ſacrifices were exceedingly offenſive to Chriſtians; and that every Chriſtian prince ſhould ſuppreſs theſe Pagan ceremonies.

In the epiſtles of Symmachus and of Ambroſe, both the petition and the reply are preſerved, in which ſophiſtry, ſuperſtition, ſound ſenſe, and ſolid argument, are ſtrangely blended. It is ſcarcely neceſſary to add that the petition was unſucceſsful.

The increaſing ſtrength of the Arians proved too formidable for the zealous Ambroſe. The young emperor and Juſtina, along with a conſiderable number of clergy and laity profeſſing the Arian faith, requeſted from the biſhop the uſe of two churches, one in the city, the other in the ſuburbs of Milan. The prelate believing the biſhops to be the guardians, both of the temporal and ſpiritual intereſts of the church, and that Ambroſe. the religious edifices were the unqueſtionable property of the church, poſitively refuſed to deliver up the temples of the Lord into the impious hands of heretics. Filled with indignation, Juſtina reſolved to employ the imperial authority of her ſon in procuring by force what ſhe could not by perſuaſion. Ambroſe was required to anſwer for his conduct before the council. He went, attended by a numerous crowd of people, whoſe impetuous zeal ſo overawed the miniſters of Valentinian, that he was permitted to retire without making the ſurrender of the churches. The day following, when he was performing divine ſervice in the Baſilica, the prefect of the city came to perſuade him to give up at leaſt the Portian church in the ſuburbs. Still continuing obſtinate, the court proceeded to violent meaſures. The officers of the houſehold were commanded to prepare the Baſilica and the Portian churches to celebrate divine ſervice upon the arrival of the emperor and his mother at the enſuing feſtival of Eaſter. The order reſpecting one of them was carried into effect, but the court perceiving the growing ſtrength of the prelate's intereſt, deemed it prudent to uſe ſofter meaſures; but all meaſures proved in vain: the biſhop boldly replied, "If you demand my perſon, I am ready to ſubmit: carry me to priſon or to death, I will not reſiſt; but I will never betray the church of Chriſt. I will not call upon the people to ſuccour me; I will die at the foot of the altar, rather than deſert it. The tumult of the people I will not encourage, but God alone can appeaſe." This ſtrong declaration was followed by a torrent of eloquence from the pulpit, purſuing his ſcheme with the moſt violent zeal. But the court remained unconvinced, and another attempt being made, under a ſtrong guard of ferocious Goths, to ſeize the church of Baſilica; when they were about to enter, Ambroſe thundered the ſentence of excommunication againſt them, and ſo overawed them that they retired; and Ambroſe and his friends remained in poſſeſſion of the churches. About this time, alſo, an Arian biſhop challenged Ambroſe o a diſpute before the emperor; but he declined, ſaying that matters of faith ſhould be determined by a council of biſhops.

Many circumſtances in the hiſtory of Ambroſe are ſtrongly characteriſtic of the general ſpirit of the times. The chief cauſes of his victory over his opponents were, his great popularity, and the ſuperſtitious reverence paid to the epiſcopal character at that period of ſociety. But it muſt alſo be admitted, that he uſed ſeveral indirect means to obtain and ſupport his popular authority. Many indigent perſons were ſupported by his liberal bounty; in his explanations of Scripture he made conſtant and ſevere alluſions to exiſting and public characters; the alternate mode of ſinging had no ſmall effect upon the minds of the vulgar. At a time when the influence of Ambroſe required vigorous ſupport, he fortunately was admoniſhed in a dream to ſearch for the remains of Gervaſius and Protaſius, two martyrs who had quietly repoſed under the pavement of the church. The ſkeletons were found entire, were ſtained with blood, and the head of one of them ſeparated from the body. The vulgar crowded in thouſands to behold theſe venerable relics. According to report,

Ambroſe. report, a blind man was reſtored to ſight, ſeveral demons were expelled, and ſick perſons healed by touching theſe bones. Ambroſe exulted in theſe miracles, and appealed to them in his eloquent ſermons; whilſt the court derided and called in queſtion their exiſtence. The biſhop continued firm in his opinions; the people believed; and the exiſtence of the miracles was eſtabliſhed. And it is a very ſingular fact, that theſe, and many other miracles, obtained current credit among the Chriſtian hiſtorians of the ſecond, third, and fourth centuries. Dr Cave in ſpeaking of them ſays, "I make no doubt but God ſuffered them to be wrought, at this time, on purpoſe to confront the Arian impieties."

Although the court were diſpleaſed with the religious principles and conduct of Ambroſe, yet they reſpected his great political talents; and when neceſſity required, they ſolicited his aid, which he generouſly granted. When Maxentius uſurped the ſupreme power in Gaul, and was meditating a deſcent upon Italy, Valentinian ſent Ambroſe to him, who prevailed upon him to deſiſt from the undertaking. On a ſecond attempt of the ſame kind Ambroſe was employed; and, although he was unſucceſsful, yet, if his advice had been followed upon his return, the ſchemes of the uſurper would have proved abortive; but indifferent to his counſels, the enemy was permitted to enter Italy, and Milan was taken. Juſtina and her ſon fled; but Ambroſe remained in his ſtation, and proved beneficial to many of the ſufferers, by cauſing the plate of the church to be melted for their relief. Theodoſius, the emperor of the Eaſt, eſpouſed the cauſe of Juſtina, and by force of arms regained the kingdom.

In the year 390, a tumult happened at Theſſalonica, in which Botheric, one of the officers of Theodoſius was ſlain; and he was ſo greatly enraged, that he iſſued a royal mandate for the promiſcuous maſſacre of the inhabitants of that place: and about ſeven thouſand perſons were aſſaſſinated, without diſtinction or mercy. The courageous Ambroſe, informed of this deed, wrote to the emperor a ſevere reproof, and an earneſt admonition, charging him not to approach the holy communion with his hands ſtained with innocent blood. When the emperor was about to enter the church of Milan to attend upon the ſervice, the biſhop met him, and with a ſtern countenance prohibited him from approaching the temple of God. The emperor reminded him that David had been guilty of murder and of adultery. The biſhop replied, You have "imitated David in his guilt; go and imitate him in his repentance." The prince obeyed the prieſt, and, by a courſe of penitential ſorrow, during the ſpace of eight months, he laboured to regain the favour of the church. After the termination of this period, he was abſolved, but at the ſame time was made to ſign an edict that an interval of thirty days ſhould intervene before the ſentence of death or confiſcation ſhould be put in execution. When the mind reflects upon the numerous bad effects of inſtant and violent paſſion, this meaſure was certainly fraught with policy and humanity. If the reader laments the weakneſs which ſubjected the conſcience to the clerical power, he muſt be gratified that a moderate uſe was made of that authority.

The undaunted courage of Ambroſe received another ſevere trial in the year 393, after the aſſaſſination Ambroſe. of Valentinian, and the baſe Eugenio had uſurped the empire of the weſt. Rather than join the ſtandard of the uſurper, he fled from Milan. But after the army of Theodoſius was victorious, he generouſly ſupplicated the emperor for the pardon of thoſe who had ſupported the cauſe of Eugenio. Theodoſius, ſoon after he had acquired the uncontrolled poſſeſſion of the Roman empire, died at Milan. The biſhop did not long ſurvive the emperor; but died in the year 397. In his laſt illneſs he preſerved perfect compoſure of mind, informing his friends that he had endeavoured ſo to conduct himſelf that he might neither be aſhamed to live nor to die.

On many accounts the character of the biſhop of Milan ſtands high among the fathers of the ancient church. With unvarying ſteadineſs he delivered his religious ſentiments on all occaſions; with unwearied aſſiduity he diſcharged the duties of his office; with unabated zeal and boldneſs he defended the orthodox cauſe, in oppoſition to the Arians; with a liberal hand he fed the numerous poor who flocked to his dwelling; with uncommon generoſity he manifeſted kindneſs to his adverſaries; and with Chriſtian affection he ſought the happineſs of all men. His general habits were amiable and virtuous, and his powers of mind were uncommonly vigorous and perſevering. Ambition and bigotry were the chief blemiſhes in his character.

The writings of Ambroſe are voluminous, although little more than adulterated editions of Origen and other Greek fathers. The great deſign of his writings was to defend and propagate the Catholic faith. In ſome of theſe he recommends perpetual celibacy as the perfection of Chriſtian virtue. Modern judgment and taſte may perhaps induce ſome to eſteem the writings of Ambroſe abſurd, trivial, and even ludicrous; but there is a ſmartneſs and vigour in his ſtyle, and there are excellent ſentiments interſperſed, which render the writings of the biſhop of Milan worthy of a peruſal. With his uſual ſeverity and acrimony, Gibbons too ſeverely cenſures this prelate. "Ambroſe (ſays he) could act better than he could write; his compoſitions are deſtitute of taſte or genius, without the ſpirit of Tertullian, the copious elegance of Lactantius, the lively wit of Jerome, or the grave energy of Auguſtin." The moſt accurate and complete edition of his works, is that publiſhed by the Benedictine monks, printed at Paris in two volumes in 1682. (*Gen. Biog.*)

AMBROSE, *Iſaac*, an eminent Preſbyterian miniſter, was educated at Brazen noſe college Oxford, where he took the degree of bachelor of arts, and became miniſter of Preſton, and afterwards of Garſtang in Lancaſhire, whence he was in 1662 ejected for nonconformity. It was uſual for him to retire every year for a month into a little hut in a wood, where he ſhunned all ſociety, and devoted himſelf to religious contemplation. Dr Calamy obſerves, that he had a very ſtrong impulſe on his mind of the approach of death, and took a formal leave of his friends at their houſes a little before his departure; and the laſt night of his life he ſent his diſcourſe concerning *angels* to the preſs. The next day he ſhut himſelf up in his parlour, where to the great ſurpriſe and regret of all who ſaw him, he

Ambroſe. Ambroſius. was found juſt expiring. He died in 1663-4, in the 72d year of his age. He wrote ſeveral other books; as the *Prima*, *Media*, *et Ultima*, or the Firſt, Middle, and Laſt Things; War with Devils; Looking unto Jeſus, &c.

AMBROSE, or *St Ambroſe in the Wood*, an order of religious, who uſe the Ambroſian office, and wear an image of that ſaint engraven on a little plate: in other reſpects they conform to the rule of the Auguſtins. See *AMBROSIAN Office* and AUGUSTINS.

AMBROSIA, in *Heathen Antiquity*, denotes the ſolid food of the gods, in contradiſtinction from their drink, which was called *nectar*. It had the appellation *ambroſia* (compounded of the particle α privative, and βροτος *mortal*), as being ſuppoſed to render thoſe immortal who fed on it.

AMBROSIA is alſo a ſplendid kind of title, given by ſome phyſicians to certain alexipharmic compoſitions of extraordinary virtue. The name was particularly given to a famous antidote of Philip of Macedon againſt all poiſons, bites, and ſtings of venomous creatures, as well as many internal diſeaſes.

AMBROSIA. See BOTANY *Index*.

AMBROSIAN OFFICE or RITE, in *Church Hiſtory*, a particular formula of worſhip in the church of Milan, which takes its name from St Ambroſe, who inſtituted that office in the fourth century. Each church originally had its particular office; and when the Pope, in after times, took upon him to impoſe the Roman office upon all the weſtern churches, that of Milan ſheltered itſelf under the name and authority of St Ambroſe; from which time the Ambroſian ritual has prevailed.

AMBROSIN, in middle-age writers, denotes a coin ſtruck by the lords or dukes of Milan, whereon was repreſented St Ambroſe on horſeback, with a whip in his right hand. The occaſion of this coinage is ſaid to have been a viſion of that ſaint, who appeared to the Milaneſe general in 1339, during the time of a battle.

AMBROSINIA. See BOTANY *Index*.

AMBROSIUS AURELIANUS, or AURELIUS AMBROSIUS, a famous general of the ancient Britons, of Roman extraction. He was educated at the court of Aldroen of Armorica; who, at the requeſt of the Britons, ſent him over with 10,000 men, to aſſiſt them againſt the Saxons, whom Vortigern had invited into Britain. Ambroſius had ſuch ſucceſs againſt the Saxons, that the Britons choſe him for their king, and compelled Vortigern to give up to him all the weſtern part of the kingdom divided by the Roman highway called *Watling-ſtreet*. Some time after, the Britons being diſcontented with Vortigern, and having withdrawn their allegiance from him, he retired to a caſtle in Wales, where being beſieged by Ambroſius, and the caſtle taking fire, he periſhed in the flames, and left his rival ſole monarch of Britain; who now took upon him the imperial purple, after the manner of the Roman emperors. Geoffrey of Monmouth tells us, that Ambroſius built Stonehenge near Saliſbury in Wiltſhire. Ambroſius, according to this hiſtorian, coming to a monaſtery near Caercaradoc, now Saliſbury, where three hundred Britiſh lords, maſſacred by Hengiſt, lay buried, and reſolving to perpetuate the memory of this action, he ordered his workmen to prepare a large quantity of ſtones and other materials. But having, at the inſtigation of Tremounus archbiſhop of Caerleon, conſulted the famous Merlin, this magician adviſed him to ſend over to Ireland for certain great ſtones, called *chorea gigantum*, the giant's dance, placed in a circle on a hill called *Killair*, which were brought thither by giants from the fartheſt borders of Africa. A body of forces was accordingly ſent into Ireland, under Pendragon, Ambroſius's brother, to fetch theſe ſtones; but were oppoſed in their attempt by Gilliomanus king of the country, who derided the folly of the Britons in undertaking ſo ridiculous an expedition. Nevertheleſs, the Britons having vanquiſhed this prince in battle, brought away the ſtones; and by the direction and aſſiſtance of Merlin, who had accompanied them, theſe wonderful ſtones, by order of Ambroſius, were placed over the graves of the Britiſh lords, and are now what is called *Stonehenge*. Alexander Mecham celebrates this fable in his poem *De divinæ ſapientiæ laudibus*. Polydore Virgil aſſigns another origin of Stonehenge: he tells us it was erected by the Britons as a monument to their general Ambroſius, on the place where he fell in battle, to perpetuate the memory of his glorious actions and ſervices done to his country. Both theſe ſtories are rejected by our beſt antiquaries; who, however, are by no means agreed as to the true origin of this famous piece of antiquity. See STONEHENGE.

Ambroſius. Ambubajæ

After the Britons had defeated the Saxons, and obliged them to retire northward, Ambroſius is ſaid to have convened the princes and great men at York, where he gave orders for repairing the churches deſtroyed by the Saxons, and reſtoring the exerciſe of religion to its former luſtre. This is confirmed by Matthew of Weſtminſter; who highly applauds the great zeal of Ambroſius in repairing the churches, encouraging the clergy, and reſtoring the honour of religion. The Monmouth hiſtorian gives this prince a very high character. "He was a man (ſays he) of ſuch bravery and courage, that when he was in Gaul no one durſt enter the liſts with him; for he was ſure to unhorſe his antagoniſt, or to break his ſpear into ſhivers. He was, moreover, generous in beſtowing, careful in performing religious duties, moderate in all things, and more eſpecially abhorred a lie. He was ſtrong on foot, ſtronger on horſeback, and perfectly qualified to command an army." The ſame author tells us he was poiſoned at Wincheſter by one Eopa a Saxon, diſguiſed as a phyſician, and hired for that purpoſe by Paſcentius one of the ſons of Vortigern: but the generally received opinion is, that he was killed in a battle which he loſt in the year 508, againſt Cerdic, one of the Saxon generals.

AMBRY, a place in which are depoſited all utenſils neceſſary for houſe-keeping. In the ancient abbeys and priories, there was an office under this denomination, wherein were laid up all charities for the poor.

AMBUBAJÆ, in *Roman Antiquity*, were immodeſt women, who came from Syria to Rome, where they lived by proſtitution, and by playing on the flute. The word is derived from the Syriac *abub*, which ſignifies a flute; although others make it to come from *am* and *Baiæ*, becauſe theſe proſtitutes often retired to Baiæ.

According

Ambulant || Ambuscade.

According to Cruquius, these women used likewise to sell paint for ornamenting the face, &c.

AMBULANT, or AMBULATORY. They gave in France the name of *Ambulant commissioners* to those commissioners, or clerks of the king's farms, who had no settled office; but visited all the offices within a certain district, to see that nothing was done in them against the king's right and the interest of the farm.

AMBULANT is also used to denote those brokers at Amsterdam, or exchange agents, who have not been sworn before the magistrates. They transact brokerage business, but their testimony is not received in the courts of justice.

AMBULATORY, a term anciently applied to such courts, &c. as were not fixed to any certain place; but held sometimes in one place, and sometimes in another: in opposition to stationary courts.—The court of parliament was anciently ambulatory; so also were the courts of king's bench, &c.

AMBURBIUM, in Roman antiquity, a procession made by the Romans round the city and pomœrium, in which they led a victim, and afterwards sacrificed it, in order to avert some calamity that threatened the city.

AMBURY, or ANBURY, among *Farriers*, denotes a tumour, wart, or swelling, which is soft to the touch, and full of blood.

This disorder of horses is cured by tying a horse-hair very hard about its root: and, when it has fallen off, which commonly happens in about eight days, strewing some powder of verdigris upon the part, to prevent the return of the complaint. If the tumour be so low that nothing can be tied about it, they cut it out with a knife, or else burn it off with a sharp hot iron; and, in sinewy parts, where a hot iron is improper, they eat it away with oil of vitriol, or white sublimate.

Many of our farriers boast of a secret which infallibly cures all protuberances of this kind; the preparation of which is this: Take three ounces of green vitriol and one ounce of white arsenic; beat them to a coarse powder, and put them into a crucible; place the crucible in the midst of a charcoal fire, stirring the substance, but carefully avoiding the poisonous steams: when the whole grows reddish, take the crucible out of the fire, and when cool, break it and take out the matter at the bottom; beat this to powder in a mortar, and add to four ounces of this powder five ounces of *album rhosis*; make the whole into an ointment, and let it be applied cold to warts; rubbing them with it every day. They will by this means fall off gently and easily, without leaving any swellings. It is best to keep the horse quiet, and without working, during the cure. What sores remain on the parts from which the swellings fall off, may be cured with the common application called the *Countess's ointment*.

AMBUSCADE, or AMBUSH, in the *Military Art*, properly denotes a place where soldiers may lie concealed till they find an opportunity to surprise the enemy.

In the language of Scripture, these terms are not always taken in their proper signification, for laying ambushes for any one, attacking him in secret, laying snares for him. They sometimes signify no more than attacking a man who has no distrust of such a thing; attacking one behind, concealing one's self in some particular place in order to surprise any one. See the book of Judges, ch. ix. 25, 32, 34, 35. Abimelech, who lay lurking with his people in the heights of Sichem, so, however, as to rob and treat those who passed that way very ill, came and attacked the city of Sichem with his troops divided into three bodies: *Tetendit insidias juxta Sichimam in quatuor locis.* Literally, according to the Hebrew, "They prepared ambuscades against Sichem in four heads or companies." And a little farther, verse 43. "Abimelech, being informed that the Sichemites had marched, took his army and divided it into three bodies, and laid wait for them in the field." It seems certain, that in these passages ambushes, properly so called, were not the things in question. In the first book of Samuel Saul complains that David laid ambuscades for him: *Insidiator usque hodie permanens.* Now nothing could be worse grounded than this accusation, if we understand the word *insidiari* in its proper signification; but he might say, though unjustly, that David was his secret enemy. And in the Chronicles it is said, that God turned the ambushes laid by the enemies of Israel upon themselves; that is to say, their endeavours, their malice, their arms, he turned against themselves; for the enemies there mentioned came not in private or by stratagem; they marched openly in arms against Israel.

Amby || Amelot.

AMBY, a town of the Austrian Netherlands, in the province of Limburg, situated opposite to Maestricht, on the east side of the river Maese, in E. Long. 5. 45. N. Lat. 50. 57.

AMEDIANS, in *Church History*, a congregation of religious in Italy, so called from their professing themselves *amantes Deum*, "lovers of God;" or rather *amati Deo*, "beloved of God." They wore a gray habit and wooden shoes, had no breeches, and girt themselves with a cord. They had 28 convents; and were united by Pope Pius V. partly with the Cistercian order, and partly with that of the Soccolanti, or wooden shoe wearers.

AMELIA, an episcopal city of Italy, in the state of the church, seated on a mountain, in the duchy of Spoletto. E. Long. 13. 20. N. Lat. 42. 33.

AMELIA, a county in Virginia, situated between the Blue-ridge and the tide waters, having Cumberland county on the north, Prince George county on the east, and Lunenburg county on the south and west. Amelia, including Nottaway, a new county, contains 18,097 inhabitants, of whom 11,037 are slaves.

AMELIA *Isle*, on the coast of East Florida, lies about seven leagues north of St Augustine, and very near Talbot island on the south, at the mouth of St John's river. It is 13 miles long and two broad, is very fertile, and has an excellent harbour. Its north end lies opposite Cumberland island, between which and Amelia isle is the entry into St Mary's river, in N. Lat. 30. 52. W. Long. 67. 23.

AMELLUS, STARWORT. See BOTANY *Index*.

AMELOT DE LA HOUSSAI, *Nicholas*, born at Orleans in 1634, was much esteemed at the court of France, and

Amelot, Amelotte.

and appointed secretary of an embassy which that court sent to the commonwealth of Venice, as appears by the title of his Translation of Father Paul's History of the Council of Trent; but he afterwards published writings which gave such offence, that he was imprisoned in the Bastile. The first works he printed were the History of the Government of Venice, and that of the Uscoks, a people of Croatia. In 1683 he published his translations into French of Machiavel's Prince, and Father Paul's History of the Council of Trent, and Political Discourses of his own upon Tacitus. These performances were well received by the public. He did not prefix his own name to the two last mentioned works, but concealed himself under that of La Mothe Josseval. His translation of Father Paul was attacked by the partisans of the pope's unbounded power and authority. In France, however, it met with great success; all the advocates for the liberty of the Gallican church promoting the success of it to the utmost of their power, though at the same time there were three memorials presented to have it suppressed. When the second edition of this translation was published, it was violently attacked by the Abbé St Real, in a letter he wrote to Mr Bayle, dated October 17. 1685. Amelot defended himself in a letter to the same gentleman. In 1684, he printed, at Paris, a French translation of Baltasar Gracian's *Oracula Manual*, with the title of *l'Homme de Cour*. In 1686, he printed *La Morale de Tacite de la Flatterie;* in which work he collected several particular facts and maxims, which represent in a strong light the artifices of court flatterers, and the mischievous effect of their poisonous discourses. Frederick Leonard, a bookseller at Paris, having proposed, in the year 1692, to print a collection of all the treaties of peace between the kings of France and all the other princes of Europe, since the reign of Charles VII. to the year 1690, Amelot published a small volume in duodecimo, containing a preliminary discourse upon these treaties; wherein he endeavours to show, that most princes, when they enter into a treaty, think more how to evade than how to perform the terms they subscribe to. He published also an edition of Cardinal d'Ossat's letters in 1697, with several observations of his own; which, as he tells us in his advertisement, may serve as a supplement to the history of the reigns of Henry III. and Henry IV. kings of France. He wrote several other works; and died at Paris in 1706, at the age of 73. Amelot was at one time confined in the Bastile, probably on account of his political writings.

AMELOTTE, Denis, a celebrated French writer, was born at Saintonge in 1606. He maintained a close correspondence with the fathers of the Oratory, a congregation of priests founded by Philip of Neri. He wrote the life of Charles of Gendron, second superior of this congregation, and published it at Paris in 1643. In this work he said something of the famous abbot of St Cyran, which greatly displeased the gentleman of Port Royal, who, out of revenge, published a libel against him, entitled *Idée générale de l'esprit et de livre de P. Amelotte*. He was so much provoked by this satire, that he did all in his power to injure them. They had finished a translation of the New Testament, and were desirous to have it published; for which purpose they endeavoured to procure an approbation from the doctors of the Sorbonne, and a privilege from the king. But Amelotte, by his influence with the chancellor, prevented them from succeeding. In this he had also a view to his own interest; for he was about to publish a translation of his own. Amelotte's translation with annotations, in four volumes octavo, was printed in the years 1666, 1667, and 1668. It was not very accurate, according to F. Simon, who tells us that it contains some very gross blunders. Amelotte wrote also an Abridgement of Divinity, a Catechism for the Jubilee, and a kind of Christian Manual for every day. Towards the end of his life, he entered into the congregation of the Oratory in 1650; and continued amongst them till his death, which happened in 1678.

Amen || Amentum.

AMEN, אמן, signifies *true, faithful, certain*. It is made use of likewise to affirm any thing, and was a sort of affirmation used often by our Saviour: Αμην, Αμην, λεγω υμιν, i. e. *Verily, verily, I say unto you*. Lastly, It is understood as expressing a wish; as *Amen, So be it* (Numb. v. 22.), or an affirmation, *Amen, yes I believe it*, 1 Cor. xiv. 16. The Hebrews end the five books of Psalms, according to their way of distributing them, with the words *Amen, amen;* which the Septuagint have translated γενοιτο, γενοιτο; and the Latins, *Fiat, fiat*. The Greek and Latin churches have preserved this word in their prayers, as well as *alleluiah* and *hosannah;* because they observed more energy in them than in any terms which they could use in their own languages. At the conclusion of the public prayers, the people answered with a loud voice, Amen; and St Jerome says, that at Rome, when the people answered Amen, the sound of their voices was like a clap of thunder: *In similitudinem cœlestis tonitrui Amen reboat*. The Jews assert, that the gates of heaven are opened to him who answers *Amen* with all his might.

AMEND, or Amende, in the *French Customs*, a pecuniary punishment imposed by a judge for any crime, false prosecution, or groundless appeal.

Amende Honorable, a species of punishment formerly inflicted in France upon traitors, parricides, or sacrilegious persons, in the following manner: The offender being delivered into the hands of the hangman, his shirt is stripped off, a rope put about his neck, and a taper in his hand; then he is led into court, where he must beg pardon of God, the king, the court, and his country. Sometimes the punishment ends here; but sometimes it is only a prelude to death, or banishment to the galleys.

Amende Honorable, is a term also used for making recantation in open court, or in presence of the person injured.

AMENDMENT, in a general sense, denotes some alteration or change made in a thing for the better.

Amendment, in *Law*, the correction of an error committed in a process, which may be amended after judgment, unless the error lies in giving judgment; for in that case it is not amendable, but the party must bring a writ of error. A bill may be amended on the file at any time before the plea is pleaded; but not afterwards, without motion and leave of the court.

Amendment of a Bill, in parliament, is some alteration made in the first draught of it.

AMENTUM, in *Botany*, the name of a species of calyx, consisting of valves, and hanging down in different

Amentum, Amerade. ferent directions from the caulis. Common oats afford a good example of the amentum.

AMENTUM, in *Roman Antiquity*, a thong tied about the middle of a javelin or dart, and faltened to the fore-finger, in order to recover the weapon as ſoon as it was diſcharged. The ancients made great uſe of the amentum, thinking it helped to enforce the blow. It alſo denotes a latchet that bound their ſandals.

AMERADE, a kind of officers among the Saracens, anſwering to the governors of provinces among the Europeans. The name is originally the ſame with that of Emir. Amercement.

AMERCEMENT, or AMERCIAMENT, in *Law*, a pecuniary puniſhment impoſed on offenders at the mercy of the court. It differs from a fine in being impoſed arbitrarily, in proportion to the fault; whereas a fine is a certain puniſhment ſettled expreſsly by ſome ſtatute.
