## P R E F A C E .

---

THE author has again been required to subject his Medical Lexicon to a thorough revision. The progress of Medical Science, and the consequent introduction of new subjects and terms, demanded this; and he has embraced the occasion to render more complete the etymology and accentuation of the terms. On no previous revision has so much time and labor been expended by him. Some idea may be formed of this, from the fact, that although the page has been augmented in all its dimensions, not fewer than between sixty and seventy pages have been added.

As the author has remarked on former occasions, it has ever been his ardent wish to make the work a satisfactory and desirable—if not indispensable—lexicon, in which the inquirer may search, without disappointment, for every term that has been legitimated in the nomenclature of the science; and he confidently presents this edition as having more claims on the attention of the practitioner and student than its predecessors.

Once more the author gladly seizes the opportunity afforded him to express his grateful acknowledgments for the vast amount of favor which has been extended to the Dictionary.

ROBLEY DUNGLISON.

## TO THE SECOND EDITION.

---

THE present undertaking was suggested by the frequent complaints, made by the author's pupils, that they were unable to meet with information on numerous topics of professional inquiry,—especially of recent introduction,—in the medical dictionaries accessible to them.

It may, indeed, be correctly affirmed, that we have no dictionary of medical subjects and terms which can be looked upon as adapted to the state of the science. In proof of this, the author need but remark, that he has found occasion to add several thousand medical terms, which are not to be met with in the only medical lexicon at this time in circulation in the country.

The present edition will be found to contain many hundred more terms than the first, and to have experienced numerous additions and modifications.

The author's object has not been to make the work a mere lexicon or dictionary of terms, but to afford, under each, a condensed view of its various medical relations, and thus to render the work an epitome of the existing condition of medical science. In its preparation he has freely availed himself of the English, French and German works of the same nature, and has endeavored to add every subject and term of recent introduction, which has fallen under his notice; yet, with all his care, it will doubtless be found that subjects have been omitted. The numerous additions, however, which he has made, and his strong desire to be useful, "by removing rubbish and clearing obstructions from the paths through which learning and genius press forward to conquest and glory," will, he trusts, extenuate these and other objections that might be urged against the work; especially when the toil which every compiler of a dictionary must endure, is taken into consideration; a toil which has been so forcibly depicted by the great English Lexicographer, as well as by the distinguished SCALIGER, [in an epigram written after he had made an index to the "Inscriptions" of GRUTER:

"Si quem dura manet sententia Judicis olim,  
    Damnatum ærumnis supplicisque caput;  
Hunc neque fabrili lassent ergastula massâ  
    Nec rigidas vexent fossa metalla manus,  
Lexica contextat; nam cætera quid moror? Omnes  
    Pœnarum facies hic labor unus habet."

Thus freely rendered in French:—]

"Si quelqu'un a commis quelque crime odieux,  
S'il a tué son père, ou blasphémé les Dieux,  
Qu'il fasse un Lexicon: s'il est supplice au monde  
Qui le punisse mieux, je veux que l'on me tonde."

## EXPLANATION.

---

If the simple synonymy of any term be desired, a mere reference to the term may be sufficient; but if farther information, as to meaning or accentuation, be needed, it may be obtained under the term referred to. For instance, under *Cimicifuga*, reference is made to *Actæa racemosa*, as a synonyme. This may be sufficient for the inquirer; but should he desire to know the accentuation and properties of the plant, he must turn to *Actæa racemosa*. In the same manner, the French word *Tronc* is defined *Trunk*. This may be sufficient: should it not, the requisite information may be found under *Trunk*. In terms of more words than one, the definition is generally given under the more significant word; but, if not, it will be found under the other:—*Respiratory murmur*, for example, is defined under *Murmur*; *Shaking palsy*, under *Palsy*; *Musculus succingens*, under *Musculus*; *Ocular spectrum*, under *Spectrum*.

When the orthography of the French term is the same as that of the English, or with the mere difference of an accented vowel in the former, the term is not always repeated.

This aberration in the human eye is corrected by the iris, which does not permit the rays to fall near the circumference of the lens, and also by the crystalline lens itself, which, owing to its structure, serves the purposes of an achromatic glass.

**ABERRATION, SPHERICAL**, *Aberration of sphericity*.

**ABERRATION OF SPHERICITY** or *spherical aberration* takes place, when the rays, as in a common lens, which pass through the centre of the lens, and those which pass near the circumference, are unequally refracted, so that they do not meet at a common focus.

This aberration of sphericity in the human eye is corrected by the iris and lens.

The causes seated in the fœtus are its death, rupture of the membranes, &c. It most frequently occurs between the 8th and 12th weeks of gestation. The symptoms of abortion are:—uterine hemorrhage with or without flakes of decidua, with intermitting pain. When abortion has once taken place, it is extremely apt to recur in subsequent pregnancies about the same period. Some writers have called abortion, when it occurs prior to three months, *Effluxion*. ABSORBENT SYSTEM is the collection of vessels, *Vasa absorbentia* seu *resorbentia*, and glands, which concur in the exercise of absorption.

ABSORPTIO, Absorption— a. Sanguinis, Hæmorrhophesis.

ABSORP'TION, (same etymon as Absorbent), *Absorptio*, *Resorp'tio*, *Inhalat'io*, *Imbibit'io*, *Anar'rhophë*, *Anarrophe'sis*, *Catapno'sis*, *Rhabdë'sis*, *Catarrhophë'sis*, *Catar'rhophë*. The function of absorbent vessels, by virtue of which they take up substances from without or within the body. Two great divisions have been made of this function.

1. *External absorption*, or the *absorption of composition*, which obtains, from without the organs, the materials intended for their composition; and,
2. *Internal absorption*, or the *absorption of decomposition*, which takes up from the organs the materials that have to be replaced.

By *external absorption* is meant not only that which takes place at the external surface of the body, but also that of the mucous membranes of the digestive and respiratory passages. Hence, again, the division of external absorption into *cutaneous*— *resorp'tio cutanea* seu *cutis*, *inhalat'io cutis*.— *intestinal* or *digestive*, and *pulmonary* or *respiratory*.

Internal absorption is also subdivided into, 1. *Molecular* or *interstitial*, *nutritive*, *organic*, or *decomposing*, which takes up from each organ the materials that constitute it, so that the decomposition is always in equilibrio with the deposition. 2. *The absorption of recementitious secreted fluids*, such as the fluid of serous membranes, synovia, &c. As these are constantly exhaled on surfaces which have no external outlet, they would augment indefinitely if absorption did not remove them in the same proportion as that in which they are deposited. 3. *The absorption of a part of the excrementitious secreted fluids*, as they pass over the excretory passages.

The great agents of external absorption are the veins and chyliiferous vessels; of internal absorption, probably the lymphatics. In the chyliiferous vessels and lymphatics the fluid is always found to possess the same general properties. In them, therefore, an action of elaboration or selection must have taken place. The veins, on the other hand, seem to exert no selection. Any fluid, possessing the necessary tenuity, passes through the coats of the vessel readily by imbibition, and proceeds along with the torrent of the circulation. Watery fluids in this manner enter the blood when they are taken into the stomach. Substances that require digestion, on the other hand, may pass through the chyliiferous vessels and thoracic duct.

Its s. g. is about 1.046, and it is very volatile.

It is stimulant, rubefacient, and escharotic, and is applied to the nostrils in syncope, asphyxia, headache, &c. It destroys warts.

tum, is formed of this strong acid, f $\bar{3}$ x; Camphor,  $\bar{3}$ i; Alcohol, f $\bar{3}$ i.

A strong Acetic Acid was ordered by the London pharmacopœia, prepared from wood. It was called *Vinegar of wood*, Improved distilled *Vinegar*, *Pyroligneous Acid*, *Acetum Ligno'rum*, and its strength was such, that 87 gr. of crystallized subcarbonate of soda should saturate 100 grains of the acid.

By others, however, the terms are applied to *Pyroxylic Spirit*. A limpid, colourless liquid, having a peculiarly penetrating and slightly empyreumatic odour. Its density in the liquid state, is almost the same as that of alcohol, 0.7921. Its taste is disagreeable, and analogous to that of peppermint. It is miscible in all proportions with water, alcohol, and ether. It may be prepared by distilling a mixture of two parts of crystallized acetate of lead and one part of quicklime in a salt-glaze jar (gray-beard,) the lower part of the jar being coated with fire-clay; and a bent glass tube, half an inch in diameter, adapted to the mouth by a cork, so as to form a distillatory apparatus. The jar is supported on the mouth of a small furnace, by which the lower part only is heated to redness, and the vapours are conducted into a Liebig's condenser. The product is repeatedly redistilled from quicklime, until its boiling point is constant at 132°.

It was brought forward as a remedy in phthisis pulmonalis; but evidently with unfounded pretensions. It is an excitant, and may be serviceable in chronic bronchitis. The dose is ten to forty drops three times a day, diluted with water.

pimple or tubercle on the face. — Gorraeus. Foësius thinks the word ought to be *Acne*; and, according to Cassius, it is, at all events, derived from *ακμη*, 'vigour'; the disease affecting those in the vigour of life especially.

Willan and Bateman have adopted the term in their Nosology of cutaneous diseases, and placed it in the order TUBERCULA. Acne, with them, is an eruption of distinct, hard, inflamed tubercles, sometimes continuing for a considerable length of time, and sometimes suppurating slowly and partially. They usually appear on the forehead, temples, and chin, and are common to both sexes; but the most severe forms are seen in young men. According to others, the ultimate product of the transformation, in the stomach, of albuminous matters, which renders them fit for assimilation and nutrition. Albuminose is not coagulable by heat, and incompletely so by acids; an excess of acid dissolving the precipitate. Robin and Verdel regard it as synonymous with the *casein* of the small intestine of Tiedemann and Gmelin, the *gelatiniform matter of the intestine* of Prévost and Morin, and the *casein of the blood* of Dumas. This word was formerly synonymous with *Chymistry*; but, from the 7th century it has been applied to the mysterious art of endeavouring to discover a universal remedy, and a mode of transmuting the baser metals into gold: an operation to which they gave the name *O'pus mag'num*, and *Philosop'her's stone*.

Alchymy has also been called *Scientia vel Philosoph'ia Hermet'ica*, from an idea that *Hermes* or *Mercury* was its inventor. Harris has well defined this chimerical art: '*Ars sine arte, cujus principium est mentiri, medium laborare, et finis mendicare.*'

AL'COHOL, gen. *Alcohol'is, Al'cohol, Al'choûl, Al'kol, Al'col, Al'cool, Al'kool*. An Arabic word, formerly used for an impalpable powder, and signifying 'very subtle, much divided.' At the present day it is applied to highly rectified spirit of wine:—see *Spiritus rectificatus* or *rectified spirit*, distilled from dried subcarbonate of po-

tasæ. In the Ph. U. S., Alcohol is rectified spirit of the specific gravity 0.835. The Dublin college has a *spiritus fortior*, used in the preparation of certain essences, whose specific gravity is 0.818, and the Pharmacopœia of the United States an *Alcohol Fortius, strong'er al'cohol*, s. g. 0.817. *Alcohol, absolute alcohol*, of the Edinburgh and Dublin Pharmacopœias, is of specific gravity 0.797.

Alcohol is an inflammable liquor, lighter than water, of a warm, acrid taste, colourless, transparent, and of a pungent, aromatic smell. It is the product of the distillation of vinous liquors; is miscible with water in all proportions, and is the direct solvent of resins, balsams, &c. Various other vegetable principles are soluble in it, and hence it is used, in different states of concentration, in the preparation of *elixirs, tinctures, essences*, &c.

Alcohol acts on the animal body as a powerful stimulus: as such, in a dilute form, it is used in the prevention and cure of disease. Its habitual and inordinate use is the cause of many serious affections, of a chronic character especially, as visceral obstructions, dropsy, &c.

The study of aliments forms one of the most important branches of hygiene. Properly, all substances, organic or inorganic, that enter into the composition of organized beings are aliments.

As regards the immediate principles which predominate in their composition, they have been classed, but imperfectly, as follows:—

TABLE OF ALIMENTS.

|                                 |  |
|---------------------------------|--|
| 1. <i>Feculaceous.</i>          | { Wheat, barley, oats, rye, rice, Indian corn, potato, sago, peas, beans, &c.                                  |
| 2. <i>Mucilaginous.</i>         | { Carrot, salsify, beet, turrip, asparagus, cabbage, lettuce, artichoke, melon, &c.                            |
| 3. <i>Saccharine.</i>           | { Sugar, fig, date, raisin, apricot, &c.   |
| 4. <i>Acidulous.</i>            | { Orange, currant, gooseberry, cherry, peach, strawberry, raspberry, mulberry, prune, pear, apple, sorrel, &c. |
| 5. <i>Oleaginous and Fatty.</i> | { Cocoa, olive, sweet almond, nut, walnut, animal fat, oil, butter, &c.  |
| 6. <i>Caseous.</i>              | { Different kinds of milk, cheese.   |
| 7. <i>Gelatinous.</i>           | { Tendon, aponeurosis, true skin, cellular texture; very young animals.  |
| 8. <i>Albuminous.</i>           | { Brain, nerve, eggs, &c.  |
| 9. <i>Fibrinous.</i>            | { Flesh and blood.   |

Dr. Prout has four great classes — the *aqueous*, *saccharine*, *oleaginous*, and *albuminous*: — Dr. Pereira, twelve — *aqueous*, *mucilaginous* or *gummy*, *saccharine*, *amylaceous*, *ligneous*, *pectinaceous*, *acidulous*, *alcoholic*, *oily* or *fatty*, *proteinaceous*, *gelatinous*, and *saline*. Liebig divides them into two classes: — the **NITROGENIZED OR PLASTIC ELEMENTS OF NUTRITION**, in which he comprises *vegetable fibrin*, *vegetable albumen*, *vegetable casein*, *flesh* and *blood*; and the **NON-NITROGENIZED OR ELEMENTS OF RESPIRATION**, in which he comprises *fat*, *starch*, *gum*, *cane sugar*, *grape sugar*, *sugar of milk*, *pectin*, *bassorin*, *wine*, *beer*, and *spirits*. The former alone, in his view, are inservient to the nutrition of organized tissue: the latter are burnt in respiration, and furnish heat.

The following simple arrangement is, perhaps, as little objectionable as any:—

|                                      |   |
|--------------------------------------|---|
| 1. <i>Nitrogenized Aliments,</i>     | { Fibrinous (Glutinous?)<br>Albuminous.<br>Caseinous, Gelatinous. |
| 2. <i>Non-nitrogenized Aliments,</i> | { Amylaceous.<br>Saccharine.<br>Oleaginous.                       |
| 3. <i>Inorganic.</i>                 |   |

The second division might be still further simplified, inasmuch as amylaceous aliments are convertible into sugar during the digestive process; and, from both, oleaginous matter may be formed.

Aliments are, at times, divided into the *substantive*, and the *adjective* or *accessory*; the former comprising all the nutritive substances, which are used as food; the latter condiments. See *Condiment*.

An instrument for raising invalids, invented by Mr. Jenks, of Rhode Island. It consists of two upright posts, about six feet high, each supported by a pedestal; of two horizontal bars at the top, rather longer than a common bedstead: of a windlass of the same length, placed six inches below the upper bar; of a cog-wheel and handle; of linen belts from six to twelve inches wide; of straps secured at one end of the windlass; and at the other having hooks attached to corresponding eyes in the linen belts, and of a head-piece made of netting. The patient lying on his mattress, the surgeon passes the linen belts beneath his body, attaching them to the hooks on the ends of the straps, and adjusting the whole at the proper distance and length, so as to balance the body exactly, and then raises it from the mattress by turning the handle of the windlass. To lower the patient again, and replace him on the mattress, the windlass must be reversed.

ANÆSTHET'IC, *Anæsthet'ic*, *Anæsthet'icus*, *Anæsthe'tus*, (F.) *Anæsthésique*. Relating to privation of feeling, as an "anæsthetic agent;" one that prevents feeling. The term is, now, almost restricted to agents, which produce such effect by being received into the lungs in the form of vapours or gases, and passing with the blood to the nervous centres on which their action is exerted. Perhaps, as a general rule, the intellectual faculties first feel their influence,—a sort of intoxication supervening, with imperfect power of regulating the movements; the sensory ganglia become afterwards or simultaneously affected, sensation and motion are suspended, and ultimately, if the quantity inhaled be sufficient, the medulla oblongata has its actions suspended or destroyed, respiration ceases, and death is the consequence. Different agents have been used as anæsthetics by way of inhalation—sulphuric ether, chloroform, chloric ether, compound ether, chlorohydric and nitric ethers, bisulphuret of carbon, chloride of olefant gas, benzin, aldehyde, light coal-tar naphtha, &c.; but the first four are alone employed. They have been, and are, greatly used in serious surgical operations, and during parturition; and in such cases, as well as in many diseases, especially of a painful nature, produce the most beneficial results.

ANÆSTHETIZA'TION, *Anæsthetization*, (F.) *Anæsthésisation*. The condition of the nervous system induced by anæsthetics. To *anæsthetize*, or *anæstheticize*, (F.) *anæsthésier*, is to produce such a condition.

ANAT'OMY, (ανατομη,) *Anat'omê*, *Anatom'ia*. *Anathom'ia*, *Prosect'io*, (from ανα, and τεινειν, 'to cut,') (F.) *Anatomie*. The word *Anatomy* properly signifies *dissection*; but it has been appropriated to the study and knowledge of the number, shape, situation, structure, and connection—in a word, of all the apparent properties of organized bodies. *Anatomy* is the science of organization. Some have given the term a still more extended accep-

tation, applying it to every mechanical decomposition, even of inorganic bodies. Thus *Crystallography* has been termed the *Anatomy* of crystallized minerals. Anatomy has also been called *Morphology*, *Somatology*, *Somatology*, *Organology*, etc. It assumes different names, according as the study is confined to one organized being, or to a species or class of beings. Thus, *Andrology*, or *Anthropology*, or *Anthropography*, or *Anthroposomatology*, is the *Anatomy of Man*; *Zoölogy*, that of the other species of the animal kingdom; and *Veterinary Anatomy* is the anatomy of domestic animals; but when the word is used abstractly, it means *Human Anatomy*, and particularly the study of the organs in a physiological or healthy state. *Physiological Anatomy* is occasionally used to signify the kind of anatomy which investigates structure with a special view to function. The Anatomy of the diseased human body is called *Pathological* or *Morbid Anatomy*, and when applied to Medical Jurisprudence, *Forensic Anatomy*. Several of the organs possessing a similarity of structure, and being formed of the same tissues, they have been grouped into Systems or Genera of Organs; and the study of, or acquaintance with, such systems, has been called *General Anatomy*, *Histology*, or *Morphology*, whilst the study of each organ in particular has been termed *Descriptive* or *Special Anatomy*, *Anthropomorphology*. *Histology* is however, more frequently applied to the *Anatomy of the Tissues*, which is called, also, *Textural* and *Microscopic Anatomy*, *Micranotomy*, see *Histology*. Descriptive Anatomy has been divided into *Skeletalogy*, which comprises *Osteology* and *Syn-desmology*; and *Sarcology*, which is subdivided into *Myology*, *Neurology*, *Angiology*, *Adenology*, *Splanchnology*, and *Dermatology*. *Surgical Anatomy*, *Medico-surgical Anatomy*, *Topographical Anatomy*, *Regional Anatomy*, (F.) *Anatomie Chirurgicale*, *A. des Régions*, is the particular and relative study of the bones, muscles, nerves, vessels, etc., with which it is indispensable to be acquainted before performing operations. *Comparative* or *Analogical Anatomy* is the comparative study of each organ, with a view to an acquaintance with the modifications of its structure in different animals, or in the different classes of animals; whilst *Homological Anatomy* examines the relations to each other of the different parts of the same individual. *Transcendental* or *Philosophical Anatomy* inquires into the mode, plan, or model upon which the animal frame or organs are formed; *Artificial Anatomy* is the art of modelling and representing, in wax or other substance, the different organs or different parts, of the human body, in the sound or diseased state; and *Elastic Anatomy* (F.) *Anatomie Clastique*, (κλαω, 'to break,') in the language of Auzons, is the formation of models in such sort, that they can be broken or separated into pieces. *Phytology* and *Phytotomy* is the anatomy of vegetables, and *Pictorial Anatomy*, anatomy artistically illustrated.

Properly, Aneurism signifies a tumour, produced by the dilatation of an artery; but it has been extended to lesions of arteries, as well as to dilata-tions of the heart.

There are various kinds of aneurism. The following are the chief:

I. When the blood, which forms the tumour, is enclosed within the dilated coats of the artery. This is the true *Aneurism*, *Aneurys'ma ve'rum*, *Her'nia Arteriarum*, (F.) *Anévryme vrai*.

II. When the blood has escaped from the opened artery, it is called *spurius* or *false An'eurism*, *Aneuris'ma spu'rium*, *Ruptu'ra Arter'ris*, *Arterior-rhex'is*, *Arteriodial'ysis*, *Echymo'ma arterio'cum*, (F.) *Anévryme faux*. The latter is divided into

three varieties. 1. *Diffused False Aneurism*, (F.) *Àèto gème faux, primitif, diffus, noncirconscrit* ou *par infiltration*, which occurs immediately after the division or rupture of an artery, and consists of an extravasation of blood into the areolar texture of the part. 2. *Circumscribed False Aneurism*, (F.) *Anévrysme faux consécutif, circonscrit* ou *par épanchement, enkysté* ou *sacciforme, tumeur hémorrhagiale circonscrite*, in which the blood issues from the vessel some time after the receipt of the wound, and forms itself a sac in the neighbouring areolar tissue. 3. *Aneurism by Anastomosis*, *Varicose* or *Cirroid Aneurism*, *Phlebartoïdial'ysis, Ancury'sma veno-arterio'sum, A. varico'sum*, (F.) *Anévrysme par anastomose* ou *variqueux, A. par érosion, A. de Pott, A. des plus petites artères*, which arises from the simultaneous wounding of an artery and a vein;—the arterial blood passing into the vein, and producing a varicose state of it.

III. *MIXED ANEURISM*, (F.) *Anévrysme mixte*, is that which arises from the dilatation of one or two of the coats, with division or rupture of the other. Some authors have made two varieties of this:—1. *Mixed external Aneurism*, where the internal and middle coats are ruptured, and the areolar is dilated. 2. *Mixed internal Aneurism*, in which the internal coat is dilated, and protrudes, like a hernial sac, through the ruptured middle and outer coats. This variety has been called *Aneurys'ma Herniam Artèriæ sistens*.

Aneurisms have been termed *traumatic* or *exogenous*, and *spontaneous*, according as they may have been caused by a wound, or have originated spontaneously. The latter, when originating from lesions of the inner coats of arteries, have been termed *endogenous*. They have also been divided into *internal* and *external*.

The *internal aneurisms* are situate in the great splanchnic cavities, and occur in the heart and great vessels of the chest, abdomen, &c. Their diagnosis is difficult, and they are often inaccessible to surgical treatment.

The *external aneurisms* are situate at the exterior of the head, neck, and limbs, and are distinctly pulsatory.

Aneurisms, especially the internal, may be combated by a debilitating treatment, on the plan of Valsalva, which consists in repeated blood-letting, with food enough merely to support life. In external aneurism, the artery can be obliterated. This is usually done by applying a ligature above the aneurismal tumour.

**ANEURISM BY ANASTOMOSIS**, see Aneurism—a. Brador's operation for, see Brador—a. Cirroid, see Aneurism.

**ANEURISM, DISSECTING**, is one in which, owing to rupture of the inner and middle coats of an artery, the blood makes itself a channel between these coats and the outer coat.

In many cases, the lesion appears to consist in a separation of the laminae of the middle coat, between which the blood forms itself a channel.

**ANEURISM, ENDOGENOUS**, see Aneurism, and Endogenous—a. Exogenous, see Aneurism, and Exogenous—a. External, see Aneurism—a. False, see Aneurism—a. False, circumscribed, see Aneurism—a. False, diffused, see Aneurism.

**ANEURISM OF THE HEART**, *Cardion'chus, Cardieury's'ma, Cardianeury's'ma*, (F.) *Anévrysme du cœur*, has been divided into *active* and *passive*. The former can scarcely be esteemed aneurisms, as they most commonly consist of increased thickness of the parietes of the heart, which diminishes its cavity instead of increasing it. The term *Hypertrophy of the heart* better indicates their character. *Passive aneurism, Cardie'ctasis*, on the contrary, is attended with extenuation of the parietes of the organ, and enlargement of the cavities. The physical signs of *dilatation of the heart* are

the following:—The action of the heart is not visible, and no impulse is conveyed to the hand. On percussion, there is a loss of resonance over a larger surface than usual, but the dulness is much less intense than that which accompanies hypertrophy. On auscultation, the action of the heart is only slightly felt, and communicates at once the impression of its diminished power. The impulse is feeble than usual. Both sounds are widely transmitted over the thorax, and are not much fainter at a distance from their point of origin.

*Partial or true aneurism of the Heart*—*Cardie'ctasis parti'al'is, Aneurys'ma consecuti'um cor'dis*—is sometimes seen; rarely, however.

The name *Aneurism of the Valves of the Heart* has been given to pouch-like projections of the valves into the auricles.

**ANEURISM INTERNAL**, see Aneurism—a. Mixed, see Aneurism—a. Mixed, external, see Aneurism—a. Mixed, internal, see Aneurism—a. Spontaneous, see Aneurism—a. Spurious, see Aneurism—a. **ANEURISMA**, gen. *Aneurism'atis*, Aneurism. **ANEURISMAL**, *Aneurys'mal, Aneurismat'ic, Aneurysmat'icus, Aneurisma'lis*, (F.) *Anévrysmal, Anévrysmatique*. That which belongs to Aneurism.

or *Sorethroat*; (*angere*, 'to choke.') Inflammation of the supra-diaphragmatic portion of the alimentary canal, and of the air passages. The Latin writers applied the term to every disease in which deglutition or respiration, separately or united, was affected, provided that such affection was above the stomach and lungs. Boerhaave speaks of the angina of the moribund, which is nothing more than the dysphagia or difficult deglutition preceding death. See *Cynanche*.

A disease, the precise pathology of which is not known. The principal symptoms are, violent pain about the sternum, extending towards the arms, anxiety, dyspnoea, and sense of suffocation. It is an affection of great danger, and is often connected with ossification, or other morbid condition of the heart. It appears to be neuropathic, and has been termed *Neuralgia of the Heart*. Some, however, employ this last term for an acutely painful intermittent affection of the heart, which seems to differ from *angina pectoris* more in regard to the small number of parts which are drawn into morbid consent with the affected cardiac nerves, than in regard either to its nature or appropriate treatment. The most powerful stimulating and narcotic antispasmodics are required during the paroxysm.

ANGLE, *An'gulus*, (αγκυλος, 'a hook.') The space between two lines which meet in a point.

ANGLE, FA'CIAL, pointed out by Camper, is formed by the union of two lines, one of which is drawn from the most prominent part of the forehead to the alveolar edge of the upper jaw, opposite the incisor teeth—the *facial line*—and the other from the meatus auditorius externus to the same point of the jaw. According to the size of the angle it has been attempted to appreciate the respective proportions of the cranium and face, and, to a certain extent, the degree of intelligence of individuals and of animals. In the white varieties of the species, this angle is generally 80°; in the negro not more than 70°, and sometimes only 65°. As we descend the scale of animals, the angle becomes less and less; until, in fishes, it nearly or entirely disappears. Animals which have the snout long, and facial angle small, such as the snipe, crane, stork, &c., are proverbially foolish, at least they are so esteemed; whilst intelligence is ascribed to those in which the angle is more largely developed, as in the elephant and the owl. In these last animals, however, the large facial angle is caused by the size of the frontal sinuses:—so that this mode of appreciating the size of the brain is very inexact, and cannot be depended upon.

The following is a table of the angle in man and certain animals:

|                  |                           |
|------------------|---------------------------|
| Man.....         | from 65° to 85° and more. |

| Guenon.....      | 57                        |
| Mandrill.....    | 30 to 42                  |
| Coati.....       | 28                        |

| Ram.....         | 30                        |
| Horse.....       | 23                        |

ANGLE, OCCIP'ITAL, OF DAUBENTON, is formed by a line drawn from the posterior margin of the foramen magnum to the inferior margin of the orbit, and another drawn from the top of the head to the space between the occipital condyles. In man, these condyles, as well as the foramen magnum, are so situate, that a line drawn perpendicular to them would be a continuation of the spine; but in animals they are placed more or less obliquely; and the perpendicular is necessarily thrown farther forward, and the angle rendered more acute.

The *Anima* of Stahl, *An'ima Stahlia'na*, was a fancied intelligent principle, which he supposed to preside over the phenomena of life,—like the *Archæus* of Van Helmont.

Under the term *Anima Mundi*, the ancient philosophers meant a universal Spirit, which they supposed spread over every part of the universe.

The precise seat of the mind in the brain has given rise to many speculations. The point is unsettled.

With the ancient chemists, *Anima* meant the active principle of a drug separated by some chemical management.

This formation seems to take place over the whole body, in the production of carbonic acid, and in other oxidizing processes, and to be connected with the changes in nutrition.

A table of the natural temperatures of many animals—that of man being 100°—is contained in the author's Human Physiology, vol. 1., Art. Calorification.

*Stiff Joint*, (*ankylo* and *osis*.) An affection, in which there is great difficulty or even impossibility of moving a diarthrodial articulation. It is so called, because the limb commonly remains in a constant state of flexion, and a joint thus affected is said to be *ankylo'sed*. Anchylosis is said to be *complete* or *true*, when there is an intimate adhesion between the synovial surfaces, with union of the articular extremities of the bones. In the *incomplete* or *false* anchylosis, there is obscure motion, but the fibrous parts around the joint are more or less stiff and thickened. In the treatment of this last state, the joint must be gently and gradually exercised; and oily, relaxing applications be assiduously employed.

ANNULAR LIG'AMENT, *Transverse ligament*, *Cruc'ial ligament*. A strong ligamentous band, which arches across the area of the ring of the atlas, from a rough tubercle upon the inner surface of one articular process to a similar tubercle on the other. It serves to retain the odontoid process of the axis in connexion with the anterior arch of the atlas.

AN'NULAR LIG'AMENT OF THE RA'DIUS, is a very

strong fibro-cartilaginous band, which forms, with the lesser sigmoid cavity of the cubitus, a kind of ring, in which the head of the radius turns with facility.

AN'NULAR LIG'AMENTS OF THE CAR'PUS, *Armillæ manus membranosæ*, are two in number.

The one, *anterior*, is a broad, fibrous, quadrilateral band, extending transversely before the carpus, and forming the gutter, made by the wrist, into a canal. It is attached, externally, to the trapezium and scaphoides; and internally to the os pisiforme and process of the ulniforme. It keeps the tendons of the flexor muscles, median nerve, &c., applied against the carpus.

The *posterior* ligament is situate transversely behind the joint of the hand, and covers the sheaths of the tendons, which pass to the back of the hand. Its fibres are white and shining, and are attached, externally, to the inferior and outer part of the radius; internally, to the ulna and os pisiforme.

ANNULAR LIG'AMENTS OF THE TAR'SUS are two in number. The *anterior* is quadrilateral, and extends transversely above the instep. It is attached to the superior depression of the os calcis, and to the malleolus internus. It embraces the tendons of the extensor muscles of the toes, the *tibialis anticus* and *peroneus anticus*. The *internal* is broader than the last. It descends from the malleolus internus to the posterior and inner part of the os calcis, with which it forms a kind of canal, enclosing the sheaths of the tendons of the *tibialis posticus*, *flexor longus digitorum pedis*, and *F. longus pollicis pedis*, as well as the plantar vessels and nerves.

The filtered liquor is placed on the fire in an iron vessel, and suffered to evaporate, until neither froth nor effervescence occurs, and the liquid presents a smooth surface like oil. To this, levigated coal is added in the proportion of 160 grammes to 192 grammes of potassa. The mixture is stirred, and removed from the fire, and the stirring is continued, until a black homogeneous powder results. A *sulphuretted anthrakokali* is made by mixing accurately 16 grammes of sulphur with the coal, and dissolving the mixture in the potassa, as directed above. The dose of the simple and the sulphuretted preparations is about two grains three times a day.

An inflammation, essentially gangrenous, of the cellular membrane and skin, which may arise from an internal or external cause. The definition by Dr. Good is sufficiently distinctive. Tumour, common to the surface; flat; firm; burning; penetrant; livid and vesicular; or crusty above, with a sordid and gangrenous core below; imperfectly suppurative. It sometimes prevails epidemically; is often owing to a peculiar cachectic condition, and may be induced by the reception of an animal infection into the organism; when it has received the names *Anthrax malign'us*, *Cacan'thrax*, *Anthra'cion*, *Vesic'ula gangrænes'cus*, *Anthraco'phlyctis*, *Pus'tula malign'a*, (F.) *Pustule maligne*, *Bouton malin*, and is characterized at the outset by a vesication or bleb filled with a sero-sanguinolent fluid, under which a small induration is formed, surrounded by an areolar inflammation, which becomes gangrenous. It has been thought by some to be induced altogether by contact with the matter of the carbuncle of animals, or of the exuvia of the bodies of such as had died of the disease, but is now known to arise primarily in the human subject. This form of carbuncle has received different names, many of them from the places where it has prevailed:—*Car'bunculus contagio'sus seu Gall'icus seu Hunga'ricus seu Polon'icus seu Septentrional'is*, *Per'sicus ign'is*, *Mor'bus pustulo'sus Fin'nicus*, *Pus'tula gangræno'sa seu liv'ida Estho'nia*, *Pem'phigus Hunga'ricus*, *Puce de Bourgoque ou maligne*, *Feu Persique*, *Malvat de Languedoc*.

**AP'OPLEXY**, *Apoplexia*, (Sc.) *Poplesy*, (*αποπληξία*, from *αποπληττειν*, 'to strike with violence.') At the present day, the term apoplexy is employed by many writers to signify *interstitial hæmorrhage*, (F.) *Hémorrhagie interstitielle*, or every effusion of blood, which occurs suddenly into the substance of an organ or tissue. Hence, we speak of cerebral apoplexy, pulmonary apoplexy, &c. &c. Formerly it was always—and still is by many—used in a restricted sense, to signify, in other words, the train of phenomena, which characterize cerebral apoplexy. This disease, *Hémorrhag'ia Cerebri*, *Aphro'nia*, *Cærus Apoplex'ia*, *Co'ma Apoplex'ia*, *Apoplex'ia cerebri sanguinea* seu *cerebra'lis*, *Encephalorrhag'ia*, *Sanguinis ic'tus*, *Hæmatenceph'alus*, *Pulpez'ia*, *Sidera'tio*, *Apileps'ia*, *Mor'bus atton'itus*, *Gut'ta*, *Theople'gia*, *Theoplex'ia*, (F.) *Apoplexie*, *A. cérébrale*, *Hématoëcephalie*, *Coup de sang*, is characterized by diminution, or loss of sensation and mental manifestation; by the cessation, more or less complete, of motion; and by a comatose state,—circulation and respiration continuing. It generally consists in pressure upon the brain; either from turgescence of vessels, or from extravasation of blood: hence the terms *Hæmenceph'alus*, *Hémorrhagie cérébrale*, and *Hématoëcephalorrhagie*, applied to it by some. The general prognosis is unfavourable; especially when it occurs after the age of 35. When Apoplexy is accompanied with a hard, full pulse, and flushed countenance, it is called *Apoplex'ia sanguinea*, *Cataph'ora Co'ma*; when with a feeble pulse and pale countenance, and evidences of serous effusion, *Apoplex'ia serosa*, *A. pituitosa*, *Serous Ap'oplexy*, *Cataph'ora hydrocephal'ica*, *Encephaloch'ysis senilis*, *Hydroceph'alus acutus senium*, (F.) *Hydrocephalorrhée* of Piorry, *Hydropisie cérébrale suraigée*, *Hydrorrhagie*.

If the desire for food, occasioned by a real want, be carried to a certain extent, it is called *hunger*, when solid food is concerned; *thirst*, when liquid. *Appetite*, and *hunger* ought not, however, to be employed synonymously: they are different degrees of the same want. They are very generally, however, used synonymously.

of medicine; but these were most flourishing during the 10th, 11th, and 12th centuries. The chief additions made by them to medical science were in the departments of pharmacy and in the description of diseases. Celsus and Galen called thus the membrane of the vitreous humour,—the *tu'nica hyaloïdea*. The moderns use it now for one of the membranes of the brain, situate between the dura mater and pia mater. It is a serous membrane, and composed of two layers; the *external* being confounded, in the greater part of its extent, with the dura mater, and, like it, lining the interior of the cranium and spinal canal; the *other* being extended over the brain, from which it is separated by the pia mater, without passing into the sinuosities between the convolutions, and penetrating into the interior of the brain by an opening at its posterior part under the corpus callosum. It forms a part of the investing sheath of the nerves, as they pass from the encephalic cavities. Its chief uses seem to be:—to envelop, and, in some measure, protect the brain, and to secrete a fluid for the purpose of keeping it in a state best adapted for the proper performance of its functions.

An instrument so called because first employed to take the specific gravity of fluids lighter than water. The *Areometer* of *Baumé*, which is the most used in Pharmacy, particularly in France, consists of a tube of glass, largely expanded towards its inferior extremity, and terminating below by a small ball, containing mercury or lead, which serves it as a balance, so that it may remain upright in the fluid. This tube is furnished with a graduated scale. If the fluid into which the *Areometer* is plunged be heavier than water, the instrument rises; if lighter, it sinks. There are various *Areometers*, as those of the Dutch, of Fahrenheit, Nicholson, &c. The *Areometer* is also called *Hydrom'eter*, (F.) *Hydromètre*, *Aréomètre*, *Pèse-liqueur*.

There are some hydrometers which have a general application for determining the specific gravities of liquids—as Fahrenheit's, Nicholson's, Guyton de Morveau's, and the common glass hydrometers, including *Baumé's*, *Cartier's*, *Twaddle's*, *Zanetti's*, and the specific gravity beads; others intended for special application—as for estimating the comparative strength of spirits; the comparative densities of syrups, oils, &c.—as *Gay Lussac's*, *Sikes's*, and *Dieat's* hydrometers, and the *saccharometer*, *urinometer*, and *elæometer*.

ARGEN'TI NI'TRAS, *A. azo'tas*, *Argentum Nitratum* seu *Nitricum*, *Sal argenti*, (F.) *Nitrate ou Azotate d'Argent*, *Nitrate of Silver*. This preparation is sometimes kept in crystals, the *Nitras Argenti in crystal'los concre'tus*, *Nitrate d'Argent crystallisee* of the Codex of Paris, *Lu'na potab'ilis*, *Crystal'li Lu'ne*, *Argentum nitricum crystallisa'tum*, *Nitras argenti crystallinus*, *Nitrum luna'rè*, *Hydrago'gun* BOYL'EI: generally, however, it is in the fused state: and it is this which is admitted

into most Pharmacopœias, and which, besides the name *Argenti Nitras*, is called *Argenti ni'tras fusus* seu *fusa* (Ph. U. S. 1863) seu *fusum*, *Caus'ticum luna'rè*, *Lapis inferna'lis*, *Argentum nitricum fusum*, and *lunar caustic*, (F.) *Nitrate d'argent foudou*, *Pierre infernale*. It may be prepared as follows:—Take of silver, in small pieces, ℥j; nitric acid, f℥vij, distilled water, f℥ij. Mix the acid with the water, and dissolve the silver in the mixture in a sand bath; then crystallize, or gradually increase the heat, so that the resulting salt may be dried. Melt this in a crucible over a gentle fire, and continue the heat until ebullition ceases; then immediately pour it into suitable moulds.

The virtues of nitrate of silver are tonic, and escharotic. It is given in chorea, epilepsy, &c.: locally, it is used in various cases as an escharotic. Dose, gr. 1–8 to gr. 1–4 in pill, three times a day.

When silver is combined with iodine, it is said to have the same effect as the nitrate, and not to produce the slate colour of the surface, which is apt to follow the protracted use of the latter.

ARGENTI OXIDUM, see Argentum.

ARGENTILLA VULGARIS, *Potentilla anserina*.

AR'GENTINE, *Argento'sus*, (from *argentum*.) Pertaining to silver; as an '*argentine solution*,' or solution of a salt of silver.

ARGEN'TUM, *Ar'gyrus*, (*αργος*, 'white,') *Sil'ver*, *Lu'na*, *Dia'na*, (F.) *Argent*. A solid metal of a shining white appearance; insipid; inodorous; highly sonorous; malleable and ductile; somewhat hard; crystallizable in triangular pyramids; fusible a little above a red heat, and volatilizable; s. g. 10.4. Not used in medicine, unless in some places for silvering pills. SILVER LEAF, *Argentum folia'tum*, is the state in which it is used for this purpose.

The CHLO'RIDE, (*Argenti chlo'ridum*, *Argentum muriat'icum* seu *chlora'tum* seu *sali'tum*, *Chloruretum Argenti*, *Chlor'uret* or *Muri'ate of Silver*, (F.) *Chlorure d'Argent*;) and the CYAN'URET; and the IODIDE (*Argenti Iod'idum*, *Argentum Ioda'tum*, *Iodure'tum Argenti*, *Iod'uret of Silver*, (F.) *Iodure d'Argent*;) the OX'IDE (*Argenti ox'idum*, *Argentum oxyda'tum*, (F.) *Oxide d'Argent*;) and the CHLO'RIDE of AMMO'NIA and SIL'VER (*Argenti et Ammo'niæ chlo'ridum*, *Argentum muriat'icum ammonia'tum*, *Chlorure'tum Argenti et Ammo'niæ*, *Chlor'uret of Silver and Ammonia*, *Ammonio-chloride of Silver*, (F.) *Chlorure d'Argent et d'Ammoniaque*;) have been used in syphilis. At first, these different preparations were administered intraleptically on the gums; the chloride, the cyanide and the iodide in the dose of 1–12th of a grain; the chloride of silver and ammonia in the dose of 1–14th of a grain, and the oxide of silver, and divided silver, in the dose of 1–8th and 1–4th of a grain. M. Serre, of Montpellier, who made many trials with them, soon found that these doses were too small; he therefore raised that of the chloride to 1–10th, and of the iodide to 1–8th of a grain, without any inconvenience resulting. The dose of the other preparations was likewise increased in a similar ratio. M. Serre extols the preparations of silver—used internally as well as intraleptically—as antisyphilitics, but they are not to be depended upon.

The Cy'anide or Cyan'uret, *Argenti Cyanure'tum* seu *Cyan'argentum*, *Argentum cyano'gend'atum*, (F.) *Cyanure d'argent*, is thus directed to be prepared in the Pharmacopœia of the United States.—*Nitrate of Silver*, dissolved in distilled water, is put into a tubulated glass receiver; *Ferrocyanuret of Potassium*, dissolved in distilled water, is put into a tubulated retort, previously adapted to the receiver. Dilute Sulphuric Acid is added to the solution in the retort; and by means of a sand-bath and a moderate heat, distillation is carried on until the liquid that passes over no longer

produces a precipitate in the receiver. The precipitate is then washed with distilled water, and dried.

*Oxide of Silver, Argenti Oxidum*, is made by precipitating a solution of the *Nitrate of Silver* by solution of *Potassa*, drying the precipitate. (Ph. U. S.)

ARSENIC AND MER'CURY, I'ODIDE OF, *Hydrargyri et Arsenici Iodidum, Double Iodide of Mercury and Arsenic, Iodo-arsenite of Mercury.* A compound, which has been proposed as more efficacious than either the iodide of arsenic or the iodide of mercury. It is made by triturating 6.08 grains of arsenic; 14.82 grains of mercury; 49 of iodine, with a fluidrachm of alcohol, until the mass has become dry, and from being deep brown has become pale red. Eight ounces of distilled water are poured on, and, after trituration for a few moments, the whole is transferred to a flask; half a drachm of hydriodic acid, prepared by the acidification of two grains of iodine, is added, and the mixture is boiled for a few moments. When the solution is cold, make the mixture up to ℥ʒiij with distilled water. This is called by Mr. Donovan, the proposer, *Liquor Arsenici et Hydrargyri Iodidi*, each drachm of which, by measure, consists of water, ℥i; arsenious acid, gr. 1-8th; peroxide of mercury, gr. 1-4th; iodine, converted into hydriodic acid, gr. 3-4ths. In the Ph. U. S. it is directed to be made of *Arsenici Iodidum* and *Hydrargyri Iodidum rubrum*, each gr. xxxv; *Aqua destillata*, Oss; dissolving by rubbing, heating to the boiling point, and filtering.

ARTERIAL, *Arteri'acus, Arterio'sus*. Belonging to arteries.

ARTERIAL BLOOD, (F.) *Sang artériel*. Red blood is so called because contained in the arteries. The pulmonary veins, however, also contain red blood: hence the name *arterial veins*, (F.) *Veines artérielles*, applied to them.

ARTERIAL CONSTITUTION, Plethora arteriosa.

ARTERIAL DUCT, *Canalis arterio'sus, Ductus arterio'sus* seu *Botal'i* (F.) *Canal artériel, C. Pulmo-aortique*, is the portion of the pulmonary artery which terminates in the aorta in the fetus. When this duct is obliterated after birth, it is called *Arterial Ligament, Ligamentum arterio'sum*, (F.) *Ligament artériel*.

ARTERIAL SYSTEM includes all the arteries, from their origin in the heart to their termination in the organs. See Vascular System.

ARTERIALIZATION OF THE BLOOD, Hæmatisis.

ARTÉRIARCTIE, (*ἀρτηρία, 'artery,' and ἀρτο, 'I straiten.'*) Contraction of an artery.

ARTERIO' TOMY, *Arteriolo'm'ia*, (*arteria, and τεμνω, 'I cut.'*) This word has been used for the dissection of arteries. Most commonly, however, it means a surgical operation, which consists in opening an artery, to draw blood from it. Arteriotomy is chiefly used in inflammatory affections of the head, when the blood is generally obtained from the temporal artery. See Bloodletting.

ARTERIO'TREP'SIS, (*arteria, and τρεψις, 'torsion.'*) Torsion of an artery with the view of obliterating it.

ARTERITIS, *Arteri'tis, Inflammatio Arteriarum*, (F.) *Artérite, Inflammation des artères, (arteria and itis)*. Inflammation of an artery. Inflammation of the inner coat of an artery is termed *Endo-arteri'tis*, or *Endoarteri'tis*; of the outer, *Ecto-arteri'tis* or *Exarteri'tis*.

ART'ERY, *Arte'ria*, (F.) *Artère*, (from *ἀρτ, 'air,*

and *τηρειν, 'to preserve,' quisi, 'receptacle of air,' because the ancients believed that it contained air. They, at first, gave the name *Artery* to the trachea, *ἀρτηρία τραχεία*, because it is filled with air; and afterwards they used the same term and *αγγεία πνευματικά, αγγεία πνευματικά*, for the arteries, properly so called, probably because they commonly found them empty in the dead body. We find, also, *φλέβες* to designate the arteries, called by the Latins *Venæ micantes pulsatiles*.) Arteries, which do not, however, contract on the application of the galvanic stimulus, formed chiefly of elastic tissue, and also of smooth muscular fibres, and eminently elastic; and, 3. Of an inner coat, *Tu'nica intima* seu *glabra*, which is thin, diaphanous, reddish, and polished.*

The use of the arteries is to carry the blood from the heart to the various parts of the system. It will be obvious, however, that they cannot all convey arterial blood. The pulmonary artery, for example, is destined to convey the venous blood to the lungs, there to be converted into arterial; whilst the pulmonary veins convey arterial blood back to the heart.

#### TABLE OF THE PRINCIPAL ARTERIES OF THE BODY.

All the arteries take their rise from the Pulmonary Artery, or the Aorta; and the names generally indicate the parts to which they are distributed.

#### I. ARTERIA PULMONALIS.

The Pulmonary Artery arises from the right ventricle, and soon divides into a right and left branch, one of which is distributed to each lung.

#### II. ARTERIA AORTA.

The Aorta arises from the left ventricle. It is the common trunk of the arteries of the body, and may be divided into five portions.

##### a. Arteries furnished by the Aorta at its origin.

1. A. Cardiaca or coronaria anterior.
2. A. Cardiaca or coronaria posterior.

##### b. Arteries furnished by the Aorta at its arch.

The arch of the Aorta gives off, to the left, two considerable trunks—the *Arteria carotidea primitiva*, and *A. subclavia*; and, to the right, a single trunk, which is larger—the *A. innominata* or *Brachio-cephalica*, which divides into the primitive carotid and subclavian.

A. ARTERIA CAROTIDEA PRIMITIVA. } Divides into A. Carotidea externa, and A. Carotidea interna.

ARTICULAR ARTERIES OF THE ARM, Circumflex arteries of the arm.

ARTICULAR ARTERIES OF THE KNEE arise from the popliteal artery, and surround the tibio-femoral articulation. Although of a small size, they are important, as they furnish blood to the lower extremity after the operation for popliteal aneurism. They are distinguished into *superior* and *inferior*. The *superior articular arteries, popliteal articular arteries*, are commonly three in number; one of which is *internal*, another *external*, and another *middle*, the *az'gygous articular*. The first, *Ramus anastomot'icus magnus*, anastomoses by

one branch with the external circumflex, and by another with the external superior articular. The second anastomoses with the external circumflex, the superior internal articular, and the inferior external articular; and the third is distributed within the joint. The inferior articular arteries are two in number: an internal and an external. The former anastomoses with the internal superior articular and the external inferior articular. The latter anastomoses with the recurrent branch of the anterior tibial, and the external superior articular. To each articular artery there is an articular nerve.

ARTICULAR FACETTES' are the contiguous surfaces, by means of which the bones are articulated.

By some of the French surgeons and anatomists, *article* is restricted more particularly to a movable articulation. The union of bones with each other, as well as the kind of union. Articulations are generally divided into *Diarthroses* or movable articulations, and *Synarthroses* or immovable.

The articulations are subject to a number of diseases, which are generally somewhat severe. These may be physical, as wounds, sprains, luxations, &c.; or they may be organic, as ankylosis, extraneous bodies, caries, rheumatism, gout, hydrarthroses, arthropoyosis, &c.

**ASPHALTUM**, *Nep'ta*, *Arsal'tos*, (from ἀσφαλίζω, 'to strengthen,' being used as a cement. [?]) With the Greeks, *ασφαλτος* signified any kind of bitumen. *Asphaltum* is now restricted chiefly to the BITUMEN OF JUDEA. B. *Juda'icum*, A. *solidum*, *Jerci' Pitch*, *Ca'ralè*, *Ka'rabè* of Sodom, (F.) *Asphalte*, *Bitume de Judée*, *Poix minérale acoriacée*, *Boume de momie* ou *des funérailles*. It is solid, friable, vitreous, black, shining, inflammable, and of a fetid smell. An oil is obtained from it by distillation. It enters into the composition of certain ointments and plasters.

It is collected on the surface of the water of the Dead Sea or Lake Asphaltites, in Judæa.

**ASPHARINE**, *Galium aparinc*.

**ASPHOD'ELUS**, (ασφιδελος,) A. *Ramo'sus* seu *Al'bus* seu *Ma'ris*, *Has'tula Re'gis*, (F.) *Lis asphodèle*. They have been used as a succedaneum for the squill.

**ASPHYC'TIC**, *Asphyct'icus*, *Asphyct'us*, (same etymon as *Asphyxia*.) Appertaining or relating to asphyxia.

**ASPHYCTUS**, (ασφυκτος,) *Asphyctic*. Pulseless.

For a long time, *Asphyxia* was confined to the sense of 'suspension of circulation or syncope;' *Pulselessness*. It now generally means *suspend'ed anima'tion*, produced by the nonconversion of the venous blood of the lungs into arterial, — *Apno'ea*, *Apneus'tia*, *Apnoeasphyx'ia*, *Anhæmato'sia*, *Éc'lysis pneumocardi'aca*, (F.) *Apnée*, *Anoxémie*, *Hypoxémie*. Owing to the supply of air being cut off, the unchanged venous blood of the pulmonary artery passes into the minute radicles of the pulmonary veins, but their peculiar excitability requiring arterial blood to excite them, more or less stagnation takes place in the pulmonary capillaries, and death occurs chiefly from this cause, and from the want of arterial blood, and not owing to venous blood being distributed through the system, and 'poisoning' it, as was the idea of Bichat. *Car'us asphyx'ia*, *Mors appa'rens*, *Mors putati'va*, *Pseudotha'natus*, *Appa'rent death*, *Death trance*, (F.) *Mort appa'rente*, is characterized by suspension or diminution of respiration and circulation, to such a degree as to be scarcely, or not at all, perceptible.

Several varieties of *Asphyxia* have been designated.

1. **ASPHYXIA OF THE NEWBORN**, A. *neonatorum*, (F.) *Asphyxie des nouveau-nés*. This is often dependent upon the feeble condition of the infant, or on torpor of the medulla oblongata, not permitting respiration to be established.

2. **ASPHYXIA BY INHALATION OF GASES**, some of which cause death by producing a spasmodic closure of the glottis; others by the want of oxygen.

3. **ASPHYXIA, FROM MECHANICAL CAUSES**, as by Strangulation, or Hanging.

4. **ASPHYXIA BY SUBMERSION**, A. *by drown'ing*, A. *Immerso'rum*, *Angiairhydrie* of Piorry, as occurs in the drowned, who perish in consequence of the medium in which they are plunged being unfit for respiration. See Submersion, and Suffocation.

5. **ASPHYXIA FROM TORPOR OF THE MEDULLA OBLONGATA**.

For modes of resuscitation, see Ready method of Marshall Hall, and Sylvester's method.

Great difficulty of breathing, recurring at intervals, accompanied with a wheezing sound and sense of constriction in the chest; cough and expectoration. It is a chronic disease, and not curable with facility. There are no pathognomonic physical signs of it. In some cases, the respiration is universally puerile during the attack. In the spasmodic form, the respiratory murmur is very feeble or absent during the fit; and in all forms percussion elicits a clear pulmonary sound. The disease generally consists in some source of irritation, and occasionally, perhaps, in paralysis of the pneumogastric nerves. *Bronchoparalysis*, *Paralysis nervi vagi in parte thoracica*, more frequently of the former—all the phenomena indicating constriction of the smaller bronchial ramifications. The treatment is one that relieves spasmodic action—anaesthetics, narcotics, counter-irritants, change of air, &c.

A disease of infants, characterized by suspension of respiration at intervals; great difficulty of breathing, with *crowing inspiration*, especially on waking, swallowing, or crying; ending often in a fit of suffocation, with convulsions. These symptoms are often accompanied by rigidity of the fingers and toes; the thumb being frequently drawn forcibly into the palm of the clenched hand, whence the name *Car'po-pe'dal spasm*, applied, at times, to the disease.

The pathology of the disease has been supposed to consist in an enlargement of the thymus gland, or of the glands of the neck pressing on the pneumogastric nerves [?]. The ear, by auscultation, at a distance from the chest, detects an incomplete, acute, hissing inspiration, or rather cry; whilst the expiration and voice are croupal, both at the accession and termination of the paroxysm. The heart's action has been observed to be distinct and feeble.

**AUDITIF**, Auditory.

**AUDIT'ION**, (*audire*, *auditum*, 'to hear,') *Audit'io*, *Audit'us*, *A'coe*, *Acoë'sis*, *Acu'sis*, (F.)

*Oïte*, Hearing. The act of hearing. The sensation arising from an impression made on the auditory nerves by the vibrations of the air, produced by a sonorous body. The physiology of Audition is obscure. It probably takes place:—

1. By the vibrations being communicated from the *membrana tympani* along the chain of small bones to the membrane of the foramen ovale. 2. By means of the air in the cavity of the *tympanum*, the membrane of the foramen rotundum is agitated. 3. The transmission may be made by means of the bony parietes. In these three ways the vibrations produced by a sonorous body may reach the auditory nerve. Audition may be *active* or *passive*: hence the difference between *listening* and simply *hearing*.

**AUDITORY**, *Audit'orius*, *Audit'ivus*, *Acus'ticus*, (F.) *Auditif*. That which relates to audition.

**AUDITORY ARTERIES AND VEINS**, are vessels which enter the auditory canals, and are, like them, distinguished into *internal* and *external*. The *external auditory artery*, *A. Tympanique*—(Ch.), is given off by the styloid, a branch of the external carotid: the *internal* is a branch of the basilar artery, which accompanies the auditory nerve, and is distributed to it. The *Auditory Veins* empty into the internal and external jugulars.

**AUDITORY CANAL, EXTERNAL**, *Meatus audit'orius exter'nus*, *Porus acus'ticus exter'nus*, *Alvea'rium*, *Sca'pha*, *Sca'phus*, (F.) *Conduit auditif externe*, *Conduit auriculaire*, commences at the bottom of the concha, at the *Foramen auditivum exter'num*, passes inwards, forwards, and a little downwards, and terminates at the *membrana tympani*. It is partly cartilaginous, partly osseous, and partly fibrous.

**AUDITORY CANAL, INTERNAL**, *Meatus audit'orius inter'nus*, *Porus seu Si'nus acus'ticus*, *Cyl'ar*, (F.) *Conduit auditif interne*, *C. labyrinthique*, is situate on the posterior surface of the *pars petrosa* of the temporal bone. From the *Foramen auditivum inter'num*, where it commences, it passes forwards and outwards, and terminates by a kind of *cul-de-sac*, *mac'ula cribro'sa*, perforated by many holes, one of which is the orifice of the *Aquæductus Fallopii*; and the others communicate with the labyrinth.

**AUDITORY NERVE**, *Ner'vus audit'orius seu acus'tivus*, *Nerf labyrinthique*—(Ch.), is the *Portio Mollis* of the seventh pair. It arises from the *truncus restiforme*, from the floor of the fourth

ventricle, and by means of white stræ from the sides of the *calamus scriptorius*. As it leaves the *encephalon*, it forms a flattened cord, and proceeds with the facial nerve through the *foramen auditivum internum*, and as far as the bottom of the meatus, where it separates from the facial, and divides into two branches, one going to the cochlea, the *coch'lear*; the other to the vestibule and semi-circular canals, the *vestib'ular*.

**AUGE**, *A'vus*. Some of the older anatomists gave this name to a reservoir, into which liquids flow in an interrupted manner, so that it is alternately full and empty. Such are the ventricles and auricles of the heart.

**AURA**, (*αυρα*,) *Pno'ë*, *Pnoë'a*, *Pnous*. A vapour or emanation from any body, surrounding it like an atmosphere. Van Helmont regarded the vital principle as a gas and volatile spirit, which he called *Aur'a vitalis*.

In *Pathology*, *Aura* means the sensation of a light vapour, which, in some diseases, appears to set out from the trunk or limbs; and to rise towards the head. This feeling has been found to precede attacks of epilepsy and hysteria, and hence it has been called *Aur'a Epilep'tica*, and *A. hysterica*.

**AURA EPILEPTICA**, see *Aura*—*a. Hysterica*, see *Aura*.

**AURA SANGUINIS**. The odour exhaled by blood newly drawn. See *Gaz Sanguinis*.

AURICLES OF THE HEART, *Auric'ulæ*, *A'tria*, *Cavita'tes innomina'tæ*, (F.) *Oreillettes*, are two cavities, one right, the other left, each communicating with the ventricle of its side. These two cavities receive the blood from every part of the body. Into the *right auricle*, the two venæ cavæ and coronary vein open: into the *left*, the four pulmonary veins. Chaussier calls the former the *S'i'nus of the Venæ Cavæ*, *S'i'nus dex'ter cor'dis*: the latter, the *Sinus of the Pul'monary Veins*, *S'i'nus sinis'ter cor'dis*. The foliated or dog's ear portion of each auricle is called *Appen'dic Auric'ulæ*. See Sinus.

AURIC'ULAR ARTERIES AND VEINS, *Oreil'loires*—(Ch.), are divided into *anterior* and *posterior*. The *anterior* are of indeterminate number. They arise from the temporal artery and are distributed to the meatus auditorius externus, and to the pavilion of the ear. The *posterior auricular* is given off by the external carotid, from which it separates in the substance of the parotid gland. When it reaches the inferior part of the pavilion of the ear it bifurcates; one of its branches being distributed to the inner surface of the pavilion, the other passing over the mastoid process, and being distributed to the temporal and posterior auris muscles, &c. Before its bifurcation it gives off the *stylo-mastoid artery*. The *Anterior and Posterior Auricular Veins* open into the temporal and external jugular.

AURICULAR FIN'GER, (F.) *Doigt auriculaire*, is the little finger, so called because, owing to its size, it can be more readily introduced into the meatus auditorius.

AURICULAR NERVES are several. 1. The *auricular branch*, *Zygo'mato-auric'ular*, is one of the ascending branches of the cervical plexus. It ramifies and spreads over the two surfaces of the pavilion. 2. The *auricular or superficial temporal*, *Temporal-cutaneous*—(Ch.), is given off from the inferior maxillary. It ascends between the condyle of the jaw and the meatus auditorius externus, sends numerous filaments to the meatus and pavilion, and divides into two twigs, which accompany the branches of the temporal artery, and are distributed to the integuments of the head. There is also a *posterior auricular* furnished by the facial.

On the left side, the *SEMI-AZYGOS, Left bron'chial or left superior intercostal vein, Veina demi-azygos, V. hemi-azyga, Veine petite prêlombo-thoracique—(Ch.),* presents, in miniature, nearly the same arrangement.

BAL'SAM, (*βαλσαμον*), *Bal'samum*, *Bal'samus*, *Bol'son*, *Bel'son*, (F.) *Baume*. This name is given to natural vegetable substances,—concrete or liquid, but very odorous, bitter, and piquant; composed of resin, benzoic acid, and sometimes of an essential oil, — which allow benzoic acid to be disengaged by the action of heat; readily dissolved in volatile oil, alcohol, and ether; and, when treated with alkalis, afford a soluble benzoate, and throw down resin. We know of five balsams—those of Peru, and Tolu, Benzoin, solid *Styrax* or *Storax*, and liquid *Styrax*. (See those different words.) There are, however, many pharmaceutical preparations and resinous substances, possessed of a balsamic smell, to which the name *balsam* has been given; but they differ essentially in composition and properties: hence the distinction of balsams into *natural* and *artificial*. The *natural balsams* include the five before mentioned: the *artificial* the remainder.

**BAND'AGE**, *Des'ma*, *Syndes'mus*, *Hypodes'mis*, *Hypodes'ma*, *Hypodes'mus*, *Hypod'esis*, and *Hypode'sis*, (the last five signify properly "an under bandage"); A *binder*, (Sax. *bindan*, 'to bind.')

This word, with the French, is generally used to express the methodical application of rollers, compresses, &c., *Ban'daging*, *Syn'desis*, to fix an apparatus upon any part,—corresponding to the words *delija'tio*, *fascia'tio*, *fascia'rum applica'tio*, *epid'esis*. With us the noun is usually applied to the result of the application, or to the bandage itself;—a sense in which the French employ the word *Bande*. Bandages are *simple* or *compound*. The simple bandage is *equal*, if the turns are applied circularly above each other; *unequal*, if the turns are not accurately applied upon each other. If each turn of the bandage be only covered one-third, it forms the *doloire* of the French; if the edges touch only slightly, it is the *moussé*; if the turns are very oblique and separated, it is the *spiral*, or *creeping*, (F. *rampant*); if folded upon each other, it is termed the *reversed*, (F. *reversé*). By uniting various kinds of bandaging, we have the *compound*; and these compound bandages have received various names expressive of their figure, or of the parts to which they are applied, as *capistrum*, *spica*, &c. Bandages are divided, also, as regards their uses, into *uniting*, *dividing*, *retaining*, *expelling*, *compressing*, &c.

**BANDAGE OR ROLL'ER**, *Fas'cia*, *Ta'nia*, *Epides'mus*, *Vin'culum*, the *Bande* of the French. It may be made of linen, flannel, or other stuff capable of offering a certain resistance. The two extremities of a bandage are called *tails*, (F.) *chefs*, the rolled part is termed its *head*, (F.) *globe*, and the rest of the bandage is the *body*, (F.) *plein*. If rolled at both extremities, it is called a *double-headed roller* or *bandage*, (F.) *Bande à deux globes*.

**BANDAGE À BANDELETTES SEPARÉES**, Bandage of separate strips.

**BANDAGE, BODY**, *Manti'le*, *Monte'le*, (F.) *Bandage de Corps*, is used for fixing dressings, &c., to the trunk. It is formed of a towel, napkin, or some large compress, folded three or four times; the extremities of which are fastened by pins. This is again fixed by means of the *scapular bandage*, which is nothing more than an ordinary bandage, stitched to the anterior and middle part of the napkin, passing over the clavicles and behind the head, to be attached to the back part of the napkin.

**BANDAGE, COMPOUND**, see Bandage.

**BANDAGE, COMPRESS'ING, or ROLL'ER**, *Fas'cia compressi'va* *seu convolut'a* (F.) *Bandage compressive* or *roulé*, is the simple roller with one head; and is employed in cases of ulcers, varices, &c., of the limbs. Whenever this roller is applied to the lower part of the limbs, it is carried upwards by the *doloire* and *reversed* methods above described.

**BANDAGE, COMPRESSIVE**, see Bandage, compressing—b. *de Corps*, see Bandage—b. *Dividing*, see Bandage—b. *Divisif*, Dividing bandage—b. *à Dix-huit Chefs*, Bandage, eighteen-tailed—b. *en Doloire*, *Doloire*—b. *Double-headed*, see Bandage.

of transverse pieces or tails, to cover as much of the part as is requisite. It is a very useful bandage, inasmuch as it can be undone without disturbing the part.

Syst. *Diœcia Pentandria*. The leaves and flowers of *Cannabis* are narcotic and astringent. They are chewed and smoked. The seeds, mixed with opium, arca, and sugar, produce a kind of intoxication, and are used for this purpose by the people of India. An alcoholic extract of the dried tops, *Chur'rus*—*Ectra'etum Can'nabis* (Ph. U. S.)—has been used in India, and since then in Europe and in this country, as a narcotic and anticonvulsive, in the dose of from half a grain to ten or more. It requires, however, great caution in its administration. The pure resin—*Cannabin*, *Haschischin*—is active in the dose of two-thirds of a grain.

The dried plant, which has flowered, and from which the resin has not been removed, called *Gun'jah*, *Gan'jah*, *Gua'za*, and *Gua'zah*, *Hasch'isch*, *Hasch'ich*, *Hach'isch*, *Hash'ish*, or *Chasch'isch*, of the Arabs, consists of the tops and tender parts only of the plant, collected immediately after inflorescence, and simply dried.

BEDFORD, MINERAL WATERS OF. Bedford is a village, situate on the great Western Turnpike road from Philadelphia to Pittsburg, a few miles east of the chief elevation of the Alleghany mountains. The "Springs" are about a mile and a half from the village. They are saline and sulphureous. The most celebrated—the "Mineral Spring" or "Anderson's Spring"—contains carbonic acid, sulphate of magnesia, chlorides of sodium and calcium, and carbonate of iron, but none of these articles in great quantity; hence, the main action of the water is diuretic. At some distance from the Springs, there is a chalybeate water; and about 10 miles S. W. of Bedford, at Milliken's Cove, a strong sulphureous spring. The climate of Bedford Springs is agreeable. During the heat of summer, the nights are generally cool. In the morning of July 14, 1853, the author marked the thermometer, at five o'clock, A. M., at 45°. Three days before, however, it was 70° at the same hour.

It may be made as follows: Take two pounds and a half of *lean beef*; cut it, in small pieces, into three parts of *water* in an earthen pipkin: let this simmer, but never boil, until the liquor is consumed to a pint and a half: then strain carefully. It ought to be entirely free from fat or grease.

*Ess'ence of Beef*—as it has been called—may be made by putting a pound of good beef, freed from fat, and cut into small pieces, into a porter-bottle, corking lightly. The bottle must be put into boiling water, and kept there until the water has been boiling at least half an hour. As the boiling goes on, the cork may be inserted a little more tightly, to retain the contents of the bottle. The juices

of the beef are thus separated, and constitute the 'essence,' which may be seasoned to the taste. It contains much nutriment.

Some authors have esteemed it rheumatic; others, paralytic; others, to be a kind of chorea. It is a form of cachexia, in which there is great muscular de-

bility and feebleness of the reparatory powers. It is, almost always, incurable; is rarely fatal; and is treated by exercise, stimulant friction, sudorifics, &c. It is sometimes called *Bar'biers*, but this would seem to be a different disease.

A calculous concretion, found in the stomach, intestines, and bladder of animals. Wonderful virtues were formerly attributed to these Bezoars. There were two great varieties: the *Bez'oar orient'al'e*, *Anim'al Bezoar'ticum orient'al'e*, formed in the fourth stomach of the gazelle of India (*Gazella Indica*, or rather *Antilop'us cervica'pra*); and the *Bez'oar occident'al'e*, *Anim'al Bezoar'ticum occident'al'e*, found in the fourth stomach of the wild goat or *chamois* of Peru. These substances were esteemed to be powerful alexipharmics; but the former was the more valued. It was believed that no poison, and no eruptive, pestilential, or putrid disease, could resist its influence. As so many virtues were ascribed to it, other animal concretions were substituted for it; and factitious Bezoards were made of crab's eyes and claws, bruised and mixed with musk, ambergris, &c.

The former, which is distributed from the heart, is nearly the same through its whole extent: the latter is the remains of the arterial blood after the different elements have been taken from it in nutrition, with the addition of the products of absorption. Blood, taken from a vessel and left to itself, becomes solid, and separates into two distinct parts,—the *serum* or watery supernatant

fluid; and the *cruro*, *coagulium*, *crassamentum*, *hepar seu placenta sanguinis*, *placenta cruoris*, *insula*, *thrombus*, or *clot*. The serum is chiefly water holding albumen in solution and the salts of the blood. The clot contains the fibrin, colouring matter—*hæmotosin*, a little serum, and a small quantity of salts. M. Le Canu found the blood to be composed—in 1000 parts—of water, 785.590; albumen, 69.415; fibrin, 3.565; colouring matter, 119.626; crystalizable fatty matter, 4.300; oily matter, 2.270; extractive matter soluble in alcohol and water, 1.920; albumen combined with soda, 2.010; chlorides of sodium and potassium; alkaline phosphates, sulphates, and subcarbonates, 7.304; subcarbonate of lime and magnesia, phosphate of lime, magnesia and iron, peroxide of iron, 1.414; loss, 2.586. The four principal components of the blood are fibrin, albumen, corpuscles, and saline matter. In the circulating blood they are thus combined—

Fibrin, }  
Albumen, } In solution forming *Liquor Sanguinis*.  
Salts, }

Red and white Corpuscles, suspended in the *Liquor Sanguinis*.

In *coagulated blood* they are thus combined:

Fibrin, } Forming the *crassamentum* or *clot*.  
Red and white Corpuscles, }  
Albumen, } Remaining in solution, forming  
Salts, } *serum*.

The following table exhibits the computations of different physiologists regarding the weight of the circulating fluid—arterial and venous.

The estimates of Günther, Bock, and Blake are probably approximations to the truth.

The proportion of arterial blood to venous is about 4 to 9.

Much attention has been paid to the varying condition of the blood in disease. The average proportion of each of the organic elements in 1000 parts of healthy blood is as follows, according to Le Canu, and MM. Andral and Gavarret:—fibrin, 3; red corpuscles, 127; solid matter of the serum, 80; water, 790.

*Dried human blood* was, at one time, considered to be anti-epileptic; that of the goat, dried, *Sanguis hir'ci siccatus*, sudorific and antileptic. The dried blood of the ox—*Extractum Sanguinis Bovini*—and the dried red corpuscles have been given as anæsthetics, especially where there was a deficiency of red corpuscles.

BLOOD LETTING, *Mis'sio* seu *Detractio Sanguinis*, *Hæmæsis*, *Cataschas'mus*, *Blood'ing*, *Bleed'ing*, *Let'ting blood*, (F.) *Saignée*, *Émission sanguine*. A discharge of a certain quantity of blood produced by art: an operation which consists in making an opening into a vessel to draw or let blood from it. When practiced on an artery, it is called *Arterio'tomy*; on a vein, *Phlebotomy*, *Venæsectio*, *Venesectio*, *Breath'ing a vein*, and on the capillary vessels, *local* or *capillary*. In contradistinction to the former, which is termed *general*. Bloodletting is used both during the existence of a disease, as in inflammation, and in the way of prophylaxis. It is employed to fulfil various indications. 1. To diminish the actual mass of blood;—when it is termed, by the French pathologists, *Saignée évacuative*. In such case, fluids ought not to be allowed too freely afterwards. 2. To diminish the turgescence in any particular organ—(F.) *Saignée révulsive*, *Revulsive bloodletting* or *bleeding*, *Venæsectio revulsoria*, when performed far from the part affected; and *Saignée dérivative*, when near. 3. To diminish the corpuscles of the blood, (F.) *Saignée spoliative*, *Spoliative Phlebotomy*. The immediate effects of blood-letting are: diminution of the mass of blood and of heat; retardation of the pulse, and sometimes syncope. Bloodletting from the veins—*phlebotomy*—is practised on the subcutaneous veins of the neck, the face, the fore-arm, and the leg; sometimes on those of the hand or foot. The necessary apparatus consists of a bandage or riband, a compress of rag, and a lancet or fleam.

The veins selected for the operation, are, 1. *In the fold of the arm*, five;—the cephalic, basilic, the two median, and the anterior cubital. 2. *In the hand*, the cephalic and salvatella. 3. *In the foot*, the great and little saphena. 4. *In the neck*, the external jugular. 5. *In the forehead*, the frontal. 6. *In the mouth*, the ramine. The operation of phlebotomy in the limbs is performed by tying a circular bandage round the limb, in order that the subcutaneous veins may become turgid by the course of the blood being obstructed: the bandage not being so tight, however, as to compress the arteries of the limb. A puncture is made into the vein, and the desired quantity allowed to flow. The ligature is now removed, and a compress and retaining bandage applied. *Capillary or local bloodletting*, *arterio-phlebotomy*, is practised on the skin or mucous membranes, by means of leeches, the lancet, or cupping.

Until of late, this office was executed in England by two old women—called 'searchers'; and hence the imperfections of the Bills of Mortality. In plague times, the office was an important one; and, it is stated, that a noted searcher, named Snacks, finding his business increase so much, that he could not transact it alone, offered to any one who would join him in its hazards, half the profits; and they who joined him were said to "go with Snacks." Hence, the saying "to go Snacks," or to divide the spoils.

**BONE**, ([Sax.] *ban*), *Os*, *Os'teon*, *Os'teum*, (F.) *Os*. The bones are the solid and hard parts, which form the basis of the bodies of animals of the superior classes; and the union of which constitutes the skeleton. The human body has, at the adult age, 240 bones, including the 32 teeth, the ossa Wormiana, and excluding scamoid bones. Anatomists divide them, from their shape, into 1. *Long bones*, which form part of the limbs, and represent columns for supporting the weight of the body, or levers of different kinds for the muscles to act upon. 2. *Flat bones*, which form the parietes of splanchnic cavities; and, 3. *Short bones*, met with in parts of the body where solidity and some mobility are necessary. Bones are formed of two different textures; *spong'ly*, *Substantia spongio'sa*; and *compact*, *Substantia compacta*. They afford, on analysis, much phosphate and carbonate of lime, a little phosphate of magnesia, phosphate of ammonia, oxide of iron and manganese, some traces of alumina and silica, gelatin, fat, and water. The uses of the bones are mentioned under each bone. They give shape to the body, contain and defend the viscera, and act as levers to the muscles.

The bones of the ox, *Bos Tau'rus*, are employed in pharmacy.

**BRIGHT'ON**, CLIMATE OF. The air of this fashionable watering-place, on the south coast of England, is dry, elastic, and bracing. Its climate appears to the greatest advantage in the autumn and early part of the winter; when it is somewhat milder and more steady than that of Hastings. Accordingly, it is adapted for all cases in which a dry and mild air at this season of the year proves beneficial. In the spring months, owing to the prevalence of, and its exposure to, north-east winds, the climate is cold, harsh, and exciting to the delicate. It is well adapted for convalescents, and for all who require a dry and bracing sea air.

A simple body, of a very volatile nature, and highly offensive and suffocating odour, whence its name, (*βρωμος*, 'a stench,') It is met with chiefly in sea-water, and in many animal and vegetable bodies that live therein. It has likewise been found in many mineral waters of this and other countries. In its chemical relations, it may be placed between chlorine and iodine. **BRON'CHIA**, pl. of *bronchion*, (*βρογχια*,) *Bron'chie*, *Bron'chi*. The Latins used the term *Bronchus* for the whole of the trachea; whilst they called its ramifications *Bronchia*. *Bronchia*, *Bronchiæ*, and *Bronchi*, (F.) *Bronches*, now mean the two tubes, with their ramifications, which arise from the bifurcation of the trachea, and carry air into the lungs—*Can'nulæ pulmo'nium*, *Syrin'ges* seu *Can'les aërif'eri*.

**BRONCHIA, DILATA'TION OF THE**, *Dila'ted Bron'chia*, *Bronche'ctasis*, *Bronchie'ctasis*, *Dilata'tio bronchio'rum*. The physical signs of this condition are the following: *Percussion* usually clear, but not infrequently less so than natural, although very seldom quite dull. *Auscultation* detects coarse mucous or gurgling ronchi, increased by the cough, combined with, or replaced by, bronchial or cavernous respiration, which is often effected as if by a sudden puff or whiff. The resonance of the voice is increased, but it seldom amounts to perfect pectoriloquy. The most common situations for dilated bronchia are the scapular, mammary, and lateral regions. They are almost always confined to one side.

**BRONCHIA, OBLITERA'TION OR COMPRES'SION OF THE**. The inspiratory murmur on auscultation is weaker or wholly suppressed over a limited portion of the chest; the expiration is generally more distinct and prolonged: all the other conditions are natural.

**BRONCHIAL GLANDS**, *Bronchia'denes*, *Glan'dule Vesalia'næ*, *Glands of Vesal'ius*, (F.) *Glandes bronchiques*, *Ganglions lymphatiques des bronches*, are numerous glands of an ovoid shape; of a reddish hue in the infant, and subsequently brown and black, seated in the course of the bronchia. Their functions are unknown. The bronchial glands may be presumed to be affected by scrofulosis, when, in addition to the existence of tumours in the neck, percussion gives a dull sound under the upper and central part of the sternum, whilst there is no appreciable lesion of the lungs.

**BRONCHIAL NERVES**, (F.) *Nerfs bronchiques*, are furnished by the two pulmonary plexuses.

Inflammation of the lining membrane of the bronchial tubes. This is always more or less present in cases of pulmonary catarrh; and is accompanied by cough, mucous expectoration, dyspnoea, and more or less uneasiness in breathing. The acute form is accompanied with all the signs of internal inflammation, and requires the employment of antiphlogistics followed by revulsives. The chronic form, *Tus'sis seni'lis*, *Catar'rhus seni'lis*, *Rheum'ica catarrh'al'e*, *Peripneumonia no'tha*, *Bronchorrhoe'a acuta*, *Win'ter Cough*, *Chron'ic Catarrh'*, may be confounded with phtthisis; from which it must be distinguished mainly by the absence of hectic fever and of the physical signs that are characteristic of the latter, as well as by the nature of the expectoration, which is generally mucous, although at times mucopurulent. When the expectoration is little or none, the bronchitis is said to be *dry*; *dry catarrh*, (F.) *Catarrhe Sec*; when fetid, the disease is termed *fetid bronchitis*.

When bronchitis affects the smaller tubes, it is termed *capillary bronchitis*, *bronchitis capillaris*, *bronchoc'ac'e infanti'lis* [?], and is often fatal to children. *Vesicular bronchitis* is used by MM. Killiet and Barthez for the *vesicular pneumonia* of children.

This is no rupture, but consists of an enlargement of the thyroid gland. It is common at the base of lofty mountains in every part of the world; and has been supposed to be owing to the drinking of snow-water, but it occurs where there is no snow. The tumour is sometimes very extensive. Iodine has great power over it, and will generally occasion its absorption, when the case has not been of such duration as to have ended in a cartilaginous condition. Shakespeare describes the tumors as '*wallets of flesh*.'—Gonzalo, in *Tempest*, Act III. Scene 3.

**BRUIT DE SOUFFLET**, *Bruit de Souffle*, ('bellows' sound, 'blowing sound,') *Physèche ma*. A sound like that of a bellows, heard occasionally by the ear applied to the chest during the contraction of the ventricles, auricles, or large arteries. It coexists with affections of the heart, but is heard, also, without any disease of that organ,—whenever, indeed, an artery is compressed. An *Encephalic bellows' sound*, (F.) *Bruit de souffle céphalique*, has been described by Drs. Fisher and Whitney. It is heard on applying the ear to the occiput or to the top of the head; and is considered to indicate turgescence of vessels, or inflammation. When such turgescence exists, the vessels are compressed, and the compression gives rise to the sound in question.

**BRUIT DE SOUPAPE**, ('valvular or flapping sound,') A sound heard in respiration, when a foreign body is in the air passages. It somewhat resembles the flapping of a valve; hence its French name.

**BRUIT DE TAFFETAS**, ('sound of taffeta, sarcenet sound,') A respiratory sound, so named, by M. Grisolle, from its resembling the sound caused by the tearing of a piece of taffeta; and which he considers to indicate hepatization of the lung, limited to the surface, in pneumonia.

The solitary intestinal follicles are often known, at the present

day, as the glands of Brunner, although Brunner restricted the latter term to the glands of the duodenum.

To rub the surface of the body, for the purpose of exciting the skin, and favouring transpiration. Westring, a Swedish physician, has recommended metallic brushes for the purpose of conveying galvanism to a part. The moderns apply the term to an inflammatory tumour seated in the groin or axilla, and they generally distinguish—

1. *Simple* or *Sympathetic Bubo*, which is independent of any virus in the economy. 2. *Veneral Bubo*,—of old, *Batton of Naples*, (F.) *Bubon vénérien*, which is occasioned by the venereal virus. 3. *Pestilential Bubo*, or *B. symptomatic of the Plague*. Galbanum, *Chal'banè*, is a gummy-resinous juice. Its odour is fetid, and taste bitter and acrid: the agglutinated tears are of a white colour, on a ground of reddish-brown. It forms an emulsion when triturated with water, and is soluble in proof spirits of wine, and vinegar: sp. gr. 1.212. It has been given as an anti-spasmodic and expectorant, in pill or emulsion. Dose, from gr. 10 to 60. Externally, it is applied as a cataplasin.

*Bubon galbanum* is a South African plant; and is reputed to be an excellent diuretic, under the name of *Wild Cel'ery*. A decoction of the leaves is given in dropsy and gravel. Some surgeons have confined this term to hernia when limited to the groin, and have called the same affection, when it has descended to the scrotum, *Oschéoc'e'l'e*, *Scrotal Her'nia*. The rupture passes through the abdominal ring; and, in consequence of the greater size of the opening in the male, it is more frequent in the male sex.

CALCULI, pl. of *Calculus*, (dim. of *calx*, 'a stone,') *Lithi*, *Lap'ides*, (F.) *Calculs*, *Pièrres*. Calculi are concretions which may form in every part of the animal body, but are most frequently found in the organs that act as reservoirs, and in the excretory canals. They are met with in the tonsils, joints, biliary ducts, digestive passages, lachrymal ducts, mammæ, pancreas, pineal gland, prostate, lungs, salivary, spermatic and urinary passages, and in the uterus. The causes which give rise to them are obscure.

Those that occur in reservoirs or ducts are supposed to be owing to the deposition of the substances, which compose them, from the fluid as it passes along the duct; and those which occur in the substance of an organ are regarded as the product of some nutritive irritation. Their general effect is to irritate, as extraneous bodies, the parts with which they are in contact; and to produce retention of the fluid, whence they have been formed. The symptoms differ, according to the sensibility of the organ and the importance of the particular secretion whose discharge they impede. Their solution is generally impracticable: spontaneous expulsion or extraction is the only way of getting rid of them.

**CALCULI ALTERNATING**, see Calculi, urinary—c. Articular, see Calculi, arthritic, and Concretions, articular.

**CALCULI ARTHRITIC**, *To'phi*, *Tubercula arthritica*, *Calculi arthritici seu podagrici*, *Chalk-stones*, *Gout-stones*, *Nodes*, (F.) *Pierres crayeuses*, *Calculs arthritiques*, *Nœuds*. Concretions, which form in the ligaments, and within the capsules of the joints, in persons affected with gout. They are composed of uric acid, soda, and a little animal matter; very rarely, urate of lime and chloride of sodium are met with. Similar calculi are found in other parts besides the joints.

**CALCULI BILIARY**, *Calculi bilio'si seu fel'ei seu biliar'ii*, *Chololithus*, *Cholelithus*, *Biliary Concretions*, *Gall-stones*, (F.) *Calculs biliaires*, *Pierres au fiel*, *Angichololithes* of Piorry. Some of these contain all the materials of the bile, and seem to be nothing more than that secretion thickened. The greater part are composed of from 88 to 94 parts of *Cholesterin*, and of from 6 to 12 of the yellow matter of the bile. Biliary calculi are most frequently found in the gall-bladder: at other times, in the substance of the liver, in the branches of the *Ductus hepaticus*, or in the *Ductus Communis Choledochus*. The first are called *Cystic*; the second *Hepatic*: and the last, sometimes, *Hepatocystic*. The causes which give rise to them are very obscure. When quiescent they often occasion no uneasiness. At times, they are rejected by the mouth, or by the bowels, along with a considerable quantity of bile, which had accumulated behind them; at other times they occasion violent abdominal inflammation, abscesses, and biliary fistulæ, rupture of the gall-bladder, and fatal effusion into the peritoneum. The passage of a gall-stone is extremely painful; yet the pulse is not at first affected. Antiphlogistics, when there is inflammatory action, and anæsthetics, and strong doses of opium, to allay the pain and spasm, with the warm bath, are the chief remedies. Solvents are not to be depended upon. They cannot reach the calculi.

**CALCULI, BONE EARTH**, see Calculi, urinary—c. Compound, see Calculi, urinary—c. Cystic, see Calculi, urinary.

**CALCULI OF THE EARS**, (F.) *Calculs de l'Oreille*. Hard, light, and inflammable concretions, which occur in the *meatus auditorius externus*, and are merely indurated cerumen. They are a frequent cause of deafness. They can be easily seen, and may be extracted by appropriate forceps, after having been softened by injections of soap and water.

**CALCULI FELLEI**, Calculi, biliary—c. Fusible, see Calculi, urinary.

**CALCULI, LACHRYMAL**, (F.) *Calculs lacrymanæ*. Concretions sometimes, but rarely, form in the lachrymal passages, where they occasion abscess and fistulæ, which do not heal until they are extracted.

**CALCULI, LITHIC**, see Calculi, urinary.

**CALCULI OF THE MAMMÆ**, (F.) *Calculs des Mamelles*. Haller gives a case of a concretion, of a yellowish white colour, which had the shape

of one of the excretory ducts of the mammary gland, having been extracted from an abscess seated in that organ.

**CALCULI, MULBERRY**, see Calculi, urinary.

**CALCULI OF THE PANCREAS**, (F.) *Calculs du Pancréas*. These are but little known. Analogy has induced a belief that they resemble the salivary. Some have supposed that certain transparent calculi, rejected by vomiting, or passed in the evacuations, have proceeded from the pancreas, but there seems to be no sufficient reason for this belief.

**CALCULI OF THE PINÆAL GLAND**, (F.) *Calculs de la Glande Pinéale*. Sabulous concretion, as usual in the gland. No phenomena announce their presence during life. They are composed of phosphate of lime.

**CALCULI PODAGRICI**. Calculi, arthritic.

**CALCULI OF THE PROSTATE**. *Prostatic calculi*. These are not very rare. They have generally the same composition as the preceding. They usually present the symptoms common to every tumefaction of the prostate, and sometimes those of calculi in the bladder.

**CALCULI PULMONARY**, (F.) *Calculs pulmonaires*. These concretions are very frequently met with in the dead body, without seeming to have produced unpleasant symptoms during life. At other times, they are accompanied with all the symptoms of phthisis, *Lithophthisis*, *Phthisis calculeuse*, of Bayle. See Lithiasis pulmonum. At times they are expectorated without the supervention of any unpleasant symptom. They are usually formed mainly of carbonate of lime and animal matter.

**CALCULI SALIVARY**, *Calculi Salivales*, *Sialolithi*, (F.) *Calculs salivaires*. Concretions, usually formed of phosphate and carbonate of lime and animal matter, which are developed in the substance of the salivary glands or in their excretory ducts. In the first case, they may be mistaken for a simple swelling of the gland; in the second, they may generally be detected by the touch. They may be extracted by incision in the interior of the mouth. The calculus developed in the sublingual ducts has been called *Calculus sublingualis* and *Rau'ula lapide'a*.

**CALCULI, SPERMATIC**, (F.) *Calculs spermaticques*. These have been sometimes found in the vesiculæ seminales after death. They cannot be detected during life.

**CALCULI OF THE STOMACH AND INTESTINES**, *Enterolithus*, *E. Calculus*, *Coproolithus*, *Concretiones alvine*, (F.) *Calculs de l'estomac*, *C. intestinaux ou stercoraux*, *Pierres stercorales*, *Concretions intestinales*. Calculi of the stomach are rare, and have almost always been carried thither by the antiperistaltic action of the intestines. The symptoms occasioned by them are those of chronic gastritis. It has been imagined that the continued use of absorbent powders, as magnesia, will give occasion to them.

Intestinal concretions, (F.) *Calculs intestinaux*, are not uncommon in animals (see BEZOARD); but they are rare in man. The causes which give rise to them are little known: sometimes a biliary calculus affords them a nucleus. Their composition varies. They are light, hard, very fetid, and are formed, ordinarily, between the valvule of the small intestines, or in the cells of the large, and sometimes in old herniæ. Whilst they do not obstruct the passage of the alimentary mass, they produce no unpleasant symptoms. At times, the movable tumour which they form may be felt through the parietes of the abdomen. They are generally evacuated *per anum*.

**CALCULI OF THE TONSILS**. Calculous concretions, which sometimes form in the tonsils. (F.) *Calculs des Amygdales*. They are easily recognised by the sight and touch: sometimes they

are discharged by spitting, either alone or with the pus of an abscess occasioned by their presence.

CALCULI, TRIPLE, see Calculi, urinary—c. Uric, see Calculi, urinary.

CALCULI, URINARY, *Urolithi*, (F.) *Calculi urinares*, *Pierres urinaires*. Concretions which form from the crystallizable substances in the urine, and are met with not only in the whole course of the urinary passages, but in fistulous openings wherever the urine stagnates naturally or accidentally. Their causes are but little known. They are more common at the two extremities of life than at the middle, and more so in some countries and districts than in others.

At times, a clot of blood, a portion of mucus, &c., form the nucleus. The symptoms and treatment vary according to the seat of the calculus. There is no such thing, probably, as a medical solvent. See Urinary Calculi.

Chymists have demonstrated the existence of several components of urinary calculi, viz., *Lithic Acid* and *lithates*, *Phosphate of Lime*, *Ammoniac-Magnesian Phosphate*, *Oxalate of Lime*, *Cystic Oxide*, and *Xanthic Oxide*, with an animal cementing ingredient. The varieties of calculi, produced by the combination or intermixture of these ingredients, were thus represented by Dr. Paris.

A TABULAR VIEW OF DIFFERENT SPECIES OF URINARY CALCULI.

| SPECIES OF CALCULI.                       | EXTERNAL CHARACTERS.  | CHYMICAL COMPOSITION.  | REMARKS.  |
|---|---|--|---|
| 1. LITHIC OR URIC.                        | Form, a flattened oval. S. G. generally exceeds 1.500. <i>Colour</i> , brownish or fawn-like. <i>Surface</i> , smooth. <i>Texture</i> , laminated.  | It consists principally of <i>Lithic Acid</i> . When treated with nitric acid, a beautiful pink substance results. This calculus is slightly soluble in water, abundantly so in the pure alkalies. | It is the prevailing species; but the surface sometimes occurs finely tuberculated. It frequently constitutes the <i>nuclei</i> of the other species. |
| 2. MULBERRY, (F.) <i>Calculi muraux</i> . | <i>Colour</i> , dark brown. <i>Texture</i> , harder than that of the other species. S. G. from 1.428 to 1.976. <i>Surface</i> , studded with tubercles.   | It is <i>oxalate of lime</i> , and is decomposed in the flame of a spirit lamp swelling out into a white efflorescence, which is <i>quicklime</i> .  | This species includes some varieties, which are remarkably smooth and pale-coloured, resembling <i>hempseed</i> .                                     |
| 3. BONE EARTH.                            | <i>Colour</i> , pale brown or gray; <i>surface</i> , smooth and polished; <i>structure</i> , regularly laminated; the laminae easily separating into concrete crusts.   | Principally <i>phosphate of lime</i> . It is soluble in muriatic acid.   |   |
| 4. TRIPLE.                                | <i>Colour</i> , generally brilliant white. <i>Surface</i> , uneven, studded with shining crystals, less compact than the preceding species. Between its laminae small cells occur, filled with sparkling particles. | It is an <i>ammoniac-magnesian phosphate</i> , generally mixed with phosphate of lime. Pure alkalies decompose it, extracting its ammonia.   | This species attains a larger size than any of the others.  |
| 5. FUSIBLE.                               | <i>Colour</i> , grayish white.  | A compound of the two foregoing species.   | It is very fusible, melting into a vitreous globule.  |
| 6. CYSTIC.                                | Very like the triple calculus, but it is unstratified and more compact and homogeneous.   | It consists of <i>cystic oxide</i> . Under the blowpipe it yields a peculiarly fetid odour. It is soluble in acids, and in alkalies, even if they are fully saturated with carbonic acid.          | It is a rare species.   |
| 7. ALTERNATING.                           | Its section exhibits different concentric laminae.  | Compounded of several species, alternating with each other.  |   |
| 8. COMPOUND.                              | No characteristic form.   | The ingredients are separable only by chymical analysis.   |   |

1. *Renal Calculi*, (F.) *Calculi rénaux*. These have almost always a very irregular shape: at times, there is no indication of their presence: at others, they occasion attacks of pain in the kidneys, sometimes accompanied by bloody or turbid urine. Often, they cause inflammation of the kidneys, with all its unpleasant results. They are generally formed of uric acid, or oxalate of lime, and at times, phosphates with animal matter. The treatment will have to vary, according to the presumed constituents and to the absence or presence of inflammatory signs,—relieving the irritation by opiates. A surgical operation can rarely be applicable.

2. *Calculi of the Ureters*, (F.) *Calculi des Uréters*. These come from the kidneys, and do not produce unpleasant effects, unless they are so large as to obstruct the course of the urine, and to occasion distension of the whole of the ureters above them; or unless their surface is so rough as to irritate the mucous membrane, and occasion pain, hemorrhage, abscesses, &c. The pain, during the passage, is very violent, extend-

ing, at times, to the testicles of the same side in the male; and occasioning a numbness of the thigh in both sexes. The treatment consists in general or local blood-letting, warm bath, and opiates.

3. *Vesical Calculi*; *Stone in the Bladder*, *Lithia vesicalis*, *Lithiasis cystica* seu *vesicalis*, *Cystolithiasis*, *Dysuria calculosa* seu *irritata*, *Calculus vesicæ*, (F.) *Calculi vésicaux*. These are the most common. Sometimes, they proceed from the kidneys; most commonly, they are formed in the bladder itself. Sense of weight in the perinaeum, and sometimes of a body rolling when the patient changes his position; pain or itching at the extremity of the glans in men; frequent desire to pass the urine; sudden stoppage to its flow; and bloody urine—are the chief phenomena, that induce a suspicion of their existence. We cannot, however, be certain of this without sounding the patient. Sometimes, when of a small size, they are expelled: most commonly, they remain in the bladder, the disorganization of which they occasion, unless removed by a surgical operation.

4. *Urethral Calculi*. These almost always proceed from the bladder. The obstruction, which they cause to the passage of the urine, the hard tumour, and the noise occasioned when struck by a sound, indicate their presence. They are removed by incision. They form, at times, in the prostate gland, *Prostatolithi*.

5. *Calculi of Fistulous Passages*. These arise when there is some fistulous opening into the urethra. They can be readily recognised, and may generally be extracted with facility. (F.) *Calculs placés hors des voies urinaires*. See Urinary Calculi.

CALCULI OF THE UTERUS, (F.) *Calculs de l'Utérus*. These are very rare. The signs, which indicate them during life, are those of chronic engorgement of the uterus. Their existence, consequently, cannot be proved till after death.

CANCER, gen. *Canceri*, 'a crab.' *Carcinus*, *Lu'pus Cancro'sus*. A disease, so called either on account of the hideous appearance which the ulcerated cancer presents, or on account of the great veins which surround it, and which the ancients compared to the claws of the crab: called also *Carcino'ma*. It generally consists of a scirrhus, livid tumour, intersected by firm,

whitish, divergent bands; and occurs chiefly in the secretory glands. The pains are acute and lancinating, and often extend to other parts. The tumour, ultimately, terminates in a fetid and ichorous ulcer, — *Ulcus cancro'sum*. It is distinguished, according to its stages, into *occuli*, *Cancer occul'tus*, and *o'pen*, *C. aper'tus*; the former being the scirrhus, the latter the ulcerated condition. At times, there is a simple destruction or erosion of the organ, at others, an *encephaloid* or *cer'ebriform*, and at others, again, a *colloid* degeneration.

For its production, it requires a peculiar dia-  
thesis, or cachexia. The following table, from

| ENCEPHALOID.   | SCIRRHUS.  | COLLOID.   |
|--|--|--|
| <p>Resembles lobulated cerebral matter.<br/>Is commonly opaque from its earliest formation.<br/>Is of a dead white colour.</p>   | <p>Resembles rind of bacon traversed by cellulo-fibrous septa.<br/>Has a semi-transparent glossiness.<br/>Has a clear whitish or bluish yellow tint.<br/>Is comparatively ill-supplied with vessels.<br/>Is exceedingly firm and dense.</p>  | <p>Has the appearance of particles of jelly inlaid in a regular alveolar bed.<br/>The contained matter is strikingly transparent.<br/>Greenish yellow is its predominant hue.<br/>Its vessels have not been sufficiently examined as yet.<br/>The jelly-like matter is exceedingly soft; a colloid mass is, however, firm and resisting.<br/>The pulraceous variety has been detected in the veins.<br/>Is composed of shells in a state of <i>embolement</i>.</p> |
| <p>Contains a multitude of minute vessels.<br/>Is less hard and dense than scirrhus.</p> <p>Is frequently found in the veins issuing from the diseased mass.<br/>The predominant microscopical elements are globular, not always distinctly cellular, and caudate corpuscula.<br/>Occasionally attains an enormous bulk.<br/>Has been observed in almost every tissue of the body.<br/>Very commonly co-exists in several parts or organs of the same subject.</p> | <p>Has not been distinctly detected in this situation.<br/>The main microscopical constituents are juxtaposed nuclear cells; caudate corpuscula do not exist in it.<br/>Rarely acquires larger dimensions than an orange.<br/>Its seat, as ascertained by observation, is somewhat more limited.<br/>Is not unusually solitary.</p>  | <p>Observes a mean in this respect.<br/>Has so far been seen in a limited number of parts only.<br/>Has rarely been met with in more than one organ.<br/>Grows with a medium degree of rapidity.</p>   |
| <p>Is remarkable for its occasional vast rapidity of growth.<br/>Is frequently the seat of interstitial hemorrhage and deposition of black or bistre-coloured matter.<br/>When softened into a pulp, appears as a dead white or pink opaque matter of creamy consistence.<br/>Subcutaneous tumours are slow to contract adhesion with the skin.<br/>Ulcerated encephaloid is frequently the seat of hemorrhage, followed by rapid fungous development.</p>         | <p>Ordinarily grows slowly.</p> <p>Is comparatively rarely the seat of these changes.</p> <p>Resembles, when softened, a yellowish brown semitransparent gelatinous matter.<br/>Scirrhus thus situate usually becomes adherent.<br/>Scirrhus ulcers much less frequently give rise to hemorrhage; and fungous growths (provided they retain the scirrhus character) are now more slowly and less abundantly developed.</p> | <p>Undergoes no visible change of the kind.</p>  |
| <p>The progress of the disease after ulceration is commonly very rapid.</p> <p>It is the most common form under which secondary cancer exhibits itself.<br/>Is the species of cancer most frequently observed in young subjects.</p>   | <p>There is no such remarkable change in the rate of progress of the disease after ulceration has set in.</p> <p>Is much less common before puberty.</p>   | <p>Has so far been observed in adults only.</p>  |

Dr. Walshe, exhibits the characters of the three great species of cancer.

The use of irritants in cancerous affections is strongly to be deprecated. When the disease is so situate that excision can be practised, and the constitution does not exhibit great contamination, the sooner it is removed the better. See *Carcinoma*, and *Thn'foblaste*.

It is much employed in *medicine*, and is the most common vesicatory. Given internally, and even when absorbed from the skin, it affects the urinary organs, exciting strangury. This may be prevented, in cases of blisters, by interposing between the blistering plaster and skin a piece of tissue paper. Diluents relieve the strangury. Dose, half a grain to one grain. If kept dry, the flies will retain their activity for many years. Their active principle—*Can'tharidin*, *Cantharidin'na*—has been separated from them.

**CARBO ANIMA'NIS, C. carnis, An'imal char'coal,** (F.) *Charbon animal*, is usually prepared by subjecting bones to a red heat in close vessels. The result is *Bone black*, commonly called *I'vory black*. (F.) *Noir animal* ou *d'Os*. It is given in the same cases as *Carbo Ligni*, and has been extolled in cancer. Dose, gr. ss to gr. iij.

The Ph. U. S. contains a formula for the preparation of **CARBO ANIMA'NIS PURIFICA'TUS, Pu'rified an'imal char'coal** (*Carbon, animal*, B. j; *Acid muriat.*, *Aquæ* ãã f ʒxij). The muriatic acid, previously mixed with the water, is digested with a gentle heat for two days. The undissolved portion is allowed to subside, the supernatant liquor is poured off, and the charcoal, frequently washed with water until it is entirely free from acid, is dried.

CARPOPEDAL SPASM, *Cerebral spasmodic croup*. A spasmodic affection of the chest and larynx in young children, accompanied by general or partial convulsions. The disease commonly occurs between the third and ninth month, and is characterized by excessive dyspnoea, accompanied by a loud croupy noise on inspiration; the thumbs being locked, and the hands and feet rigidly bent for a longer or shorter period. The seat of the disease is evidently in the cerebro-spinal axis, primarily or secondarily: generally, perhaps, it is owing to erethism seated elsewhere, but communicated to the cerebro-spinal centre, and reflected to the respiratory and other muscles concerned. It seems to be connected with dental irritation; and consequently, in the treatment, where such is the case, the gums should be freely divided; after which, cathartics and revulsives, with the use of narcotics and appropriate diet, will generally remove the affection; for although extremely alarming, it is often not attended with great danger. A deprivation of sight, which comes on as if a veil fell before the eyes. Cataract consists in opacity of the crystalline lens or its capsule, which prevents the passage of the rays of light, and precludes vision. The causes are obscure. *Diagnosis*.—The patient is blind, the pupil seems closed by an opaque body, of variable colour, but commonly whitish:—the pupil contracting and dilating. Cataracts have been divided, by some, into *spu'rious* and *gen'uine*. The former, *Pseudocataract'a*, where the obstacle to vision is between the capsule of the lens and the urea: the latter, where it is in the lens or capsule.

A *lentic'ular cataract* is where the affection is seated in the lens:—a *cap'sular* or *mem'branous*, in the capsule. The *cap'sular* is divided again, by Beer, into the *anterior*, *posterior*, and *complete capsular* cataract. When the capsule is rendered opaque, in consequence of an injury, which cuts or ruptures any part of it, it thickens, becomes leathery, and has been called *Cataract'a ar'ida siliqu'osa*. *Cataract'a Morgagnia'na lactea* seu *purifor'mis* is the *milk'y* variety, in which the crystalline is transformed into a liquid similar to milk, (F.) *Cataracte luiteuse*; or, as generally defined, in which there is opacity of the fluid situated between the lens and its capsule. The *cap'sulolentic'ular* affects both lens and capsule, (*Achry'stallodiaphanie*, *Adiaphanie périchry'stallique* of Pierry,) and Beer conceives the liquor Morgagni, in an altered state, may contribute to it. Cataracts are also called *hard* (*Sclerocataract'a*), *soft* (*Phacomalacia*), *sto'ny* (F. *pierreuse*), *milk'y* or *chee'sy* (*laitéuse* ou *caséuse*), *Galactocataract'a*, *Cataract'a lacte'olor*, according to their density:—white, pearly, yellow, brown, gray,

green, black, (F.) *blanche*, *perlée*, *jaune*, *brune*, *grise*, *verte*, *noire*, according to their colour:—*fix'ed* or *vac'illating*—*cataract'a capsulolentic'ularis fix'a* vel *trem'ula*, (F.) *fixe* ou *branlante*, according as they are fixed or movable behind the pupil. They are likewise called *Cataractæ marmor'ciae*, *fenestra'tæ*, *stella'tæ*, *puncta'tæ*, *dimidia'tæ*, &c., according to the appearances they present.

They may be *sim'ple* or *complicated* with adhesion, amaurosis, specks, &c.; and *prim'ary* or *prim'itive*, when *opake* before the operation;—*sec'ondary*, when the opacity is the result of the operation.

Cataract is commonly a disease of elderly individuals, although, not unfrequently, *congen'ital*. It forms slowly; objects are at first seen as through a mist; light bodies appear to fly before the eyes, and it may not be until after months or years that the sight is wholly lost. No means will obviate the evil except an operation, which consists in removing the obstacle to the passage of the light to the retina. Four chief methods are employed for this purpose. 1. *Couch'ing* or *Depres'sion*, *Hyaloni'z'is*, *Hyalonyx'is*, *Crystallocatopie'sis*, *Crystallocatath'esis*, (F.) *Abaissement* ou *Déplacement de la Cataracte*. This consists in passing a cataract needle through the sclerotica and subjacent membranes, a little above the transverse diameter of the eye; and at about two lines' distance from the circumference of the transparent cornea, until the point arrives in the posterior chamber of the eye. With this the crystalline is depressed to the outer and lower part of the globe of the eye, where it is left. 2. *By absorption*,—by the French termed *broiement* or *bruising*. This is performed in the same manner as the former; except that, instead of turning the crystalline from the axis of the visual rays, it is divided by the cutting edge of the needle, and its fragments are scattered in the humours of the eye, where they are absorbed. 3. *By extraction*, which consists in opening, with a particular kind of knife, the transparent cornea and the anterior portion of the capsule of the crystalline; and causing the lens to issue through the aperture. Each of the processes has its advantages and disadvantages, and all are used by surgeons. 4. Some, again, pass a cataract needle through the transparent cornea and pupil to the crystalline, and depress or cause its absorption. This is called *Ceratonyxis*. See, also, *Reclination*.

A discharge of fluid from a mucous membrane. The ancients considered catarrh as a simple flux, and not as an inflammation. Generally it partakes of this character, however. *Catarrh* is, with us, usually restricted to inflammation of the mucous membrane of the air-passages: the French extend it to that of all mucous membranes; (F.) *Flux muqueux*, *Fluxion catarrhale*.

It is commonly an affection of but little consequence, but apt to relapse and become *chronic*. It is characterized by cough, thirst, lassitude, fever, watery eyes, with increased secretion of mucus from the air-passages. The antiphlogistic regimen and time usually remove it. Sometimes, the inflammation of the bronchial tubes is so great as to prove fatal.

(F.) *Cautère Feu actuel*. A substance, used for 'firing,' burning, or disorganizing the parts to which it is applied. Cauteries were divided by the ancients into *actual* and *potential*. The word is now restricted to the red-hot iron; or to positive burning. It was, formerly, much used for preventing hemorrhage from divided arteries; and also with the same views as a blister. The term *Potential Cautery*, *Cauterium potentialis*, *Ignis potentialis*, (F.) *Feu potentiel*, was generally applied to the *causticum commune*, but it is now used synonymously with *caustic* in general. *Cautère* also means an issue.

The French, amongst whom cauterization is much used, distinguish five kinds: 1. *Cauterisation Inhérente*, which consists in applying the actual cautery freely, and with a certain degree of force, so as to disorganize deeply. 2. *Cauterisation transcurrente*, which consists in passing the edge of the *Cautère cul-tellaire*, or the point of the *Cautère conique*, lightly, so as not to disorganize deeply. 3. *Cauterisation par pointes*, which consists in applying on the skin, here and there, the hot point of the conical cautery, with sufficient force to cauterize the whole thickness of the skin. 4. *Cauterisation lente*, *slow cauterization*, by means of the moxa. 5. *Cauterisation objective*, which consists in holding the cautery at some distance from the part to be acted upon by it.

The *vena cava inferior*, *abdominalis seu ascendens*, arises from the union of the two *primary iliacs*, opposite the fourth or fifth lumbar vertebra, receives the *middle sacral*, *lambar*, *right spermatic*, *hepatic*, and *inferior diaphragmatic*, and opens at the posterior and inferior part of the right auricle.

CAVERNOUS BOD'IES, *Corpora Cavernosa* of the penis, *Corpora Nervosa* seu *Nervicospongia* *Penis*, (F.) *Corps Caverneux*. The *corpus cavernosum* is a kind of cylindrical sac, composed of cells; separated, through its whole extent, by a

vertical, incomplete septum, *Septum pectiniforme*, *Trabecula corporum cavernosorum*, and forming nearly two-thirds of the penis. The *corpus cavernosum*, on each side, arises from the ascending portion of the ischium, and terminates obtusely behind the glans. The arteries of the *corpora cavernosa* come from the internal pudic. See *Hælicine Arteries*. Nerves are found on the surface of the outer membrane, but they do not appear to penetrate the substance, and the smooth muscular fibre has been traced into the fibrous parietes of the cells, as in the case of all erectile tissues.

J. Müller's researches have led him to infer, that both in man and the horse, the nerves of the *corpora cavernosa* are made up of branches proceeding from the organic as well as the animal system, whilst the nerves of animal life alone provide the nerves of sensation of the penis.

CAVERNOUS BODIES (*Corpora Cavernosa*) of the *Clitoris*, are two hollow crura, forming the *clitoris*.

CAVERNOUS BOD'Y OF THE VAG'INA, *Corpus Cavernosum Vaginae*, *Plexus retiformis*, *Sinus of Santorini*, is a substance composed of blood-vessels and cells, similar to those of the penis and clitoris, which covers the outer extremity of the vagina, on each side. It serves to contract the entrance to the vagina during coition. See *Bulbus vestibuli*.

CAVERNOUS GANGLION, see *Carotid* or *Carotic Nerve*.

CAVERNOUS RESPIR'ATION. When a cavity exists in the lungs, and one or more ramifications of the bronchia terminate in it, a loud tubal noise is emitted, provided the cavity be not filled with fluid, which is called *cavernous respiration*. In this condition, the cough likewise is *cavernous*, (F.) *Toux Caverneuse*. When the capacity of the cavern is very great, the sound of the respiration is like that produced by blowing into a decanter, with the mouth at a little distance from the neck. This kind of cavernous respiration has been called *amphoric*, from *amphora*, 'a flask;' (F.) *Respiration amphorique*, *Souffle amphorique*, *S. métallique*.

The *Veiled Puff*, (F.) *Souffle voilé*, is a modification of the cavernous respiration, in which, according to Laënnec, "a sort of movable veil interposed between the excavation and the ear" seems to be agitated to and fro. It is a sign which is not much attended to.

CAVERNOUS RHONCHUS, see *Cavernous Respiration*, and *Gurgling*.

CAVERNOUS SINUS, *Sinus Cavernosus* seu *poly-morphus* seu *sphenoidalis*, *Receptaculum sellæ equinae lateribus oppositum*, (F.) *Sinus caverneux*. The *Cavernous Sinuses* are venous cavities of the dura matter, filled with a multitude of reddish, soft filaments, intersecting each other; and, as it were, reticulated. They commence behind the inner part of the sphenoid fissure, pass backwards on the sides of the fossa pituitaria, and terminate by opening into a cavity, common to the superior and inferior petrosal sinuses. They receive some meningeal veins, the ophthalmic veins, &c. The anterior extremity of each cavernous sinus has been named the *ophthalmic sinus*.

CAVERNOUS TEX'TURE OF TIS'SUE, *Tela cavernosa*, (F.) *Tissu Caverneux*. The spongy substance which forms the greater part of the penis and clitoris. It seems to consist of a very complicated lace-work of arteries and veins; and, probably, of nervous filaments, with small fibrous plates, which form by their decussation numerous cells communicating with each other. This spongy texture produces erection, by dilating and swelling on the influx of blood; and probably, also, by virtue of some property inherent in it.

CAVERNOUS WHIS'PER. A blowing sound, heard over cavities when words are whispered.

It is composed, like the brain, of vesicular and tubular substance, arranged in laminae, as it were; so that, when a section is made of it, it has an arborescent appearance, called *Ar'bor vi'tæ*. The cerebellum is divided into two lobes or hemispheres or lateral masses, *Lobus superior anterior seu quadrangula'ris*, and *Lobus superior posterior seu semiluna'ris*, and each lobe is again subdivided into *Montic'uli* or *Lob'ules*. In the cerebellum are to be observed

the *crura cerebelli*, the *fourth ventricle*, the *valvula magna cerebri*, the *processus vermiculares*, superior and inferior, &c. Its precise functions are not determined. It has been regarded as, but not proved to be, the organ of the instinct of reproduction; and by others as the co-ordinator and regulator of the movements.

Chaussier calls these arteries *lobaires*, because they correspond with the anterior, middle, and posterior lobes, whilst he calls the trunks, whence they originate, *cérébral*.

CEREBRAL NERVES are those which arise within the cranium, (F.) *Nerfs craniens*, all of which, perhaps, not excepting the olfactory, originate from the medulla oblongata. See Nerves.

 CEREBRUM or CEREBRUM, (κα'ρα, 'the head,') The brain. (F.) *Cerveau*, *Cervele*. This term is sometimes applied to the whole of the contents of the cranium: at others, to the upper portion; the posterior and inferior being called cerebellum. The *brain*, properly so called, extends from the os frontis to the superior occipital fossæ. Anteriorly, it rests on the orbitar vault: behind this, on the middle fossæ of the base of the cranium; and, posteriorly, on the *tentorium cerebello superextensum*. The upper surface is divided by a deep median cleft (*Scissure interlobaire*, —Ch.) into two halves, called *hemispheres*, which are united at the base by the *corpus callosum*. At its surface are numerous *convolutions*. The inferior surface exhibits, from before to behind, three lobes, distinguished into *anterior*, *middle*, and *posterior*. The middle is separated from the anterior by the *fissure of SYLVIUS*; and from the posterior, by a shallow furrow which corresponds to the upper portion of the *pars petrosa*. Internally, the brain has, on the median line, the *corpus callosum*, *septum lucidum*, *for'nix*, *pineal gland*, and *third ventricle*:—and, laterally, the *lateral ventricles*, in which are the *corpora striata*, *optic thalami*, &c. It is contained in a triple envelope, (see Meninges.) Its texture is pulpy, and varies according to age. Two substances may be distinguished in it—the *white*, *med'ullary*, *tu'bular* or *f'ibrous*—*medull'a cerebri*, (F.) *Pulpe cérébral*,

*Substance blanche*, and the *cortical*, *cineritious*, *vesicular*, or *gray*, (F.) *Substance grise*. The former is white; and occupies all the interior and base of the brain. The latter is grayish and softer. It is situate particularly at the surface of the organ.

The brain receives several arterial vessels, furnished by the internal carotid and vertebral. Its veins end in the sinuses. It is the material organ of the mental and moral manifestations. According to Gall, each part is the special seat of one of those faculties, and the brain and cerebellum, inclusive, are called by him, '*the nervous system of the mental faculties*.' See Craniology.

The substance of the nervous system—*Neurine*—was analyzed by Vauquelin, and found to contain water, 80·00; white fatty matter, 4·53; red fatty matter, called *cerebrine*, 0·70; osmazome, 1·12; albumen, 7·00; phosphorus, 1·50; sulphur, acid phosphates of potassa, lime, and magnesia, 5·15.

A cutaneous affection, characterized by one or more broad, irregular-shaped patches, of a yellow or yellowish-brown colour, occurring most frequently on the front of the neck, breast, abdomen, and groins. The patches do not generally rise above the surface. There is usually some degree of itching. A cryptogamous growth has been found in it, to which M. Robin gives the name *Microsporion furfur*.  
 The causes are not very evident. Sulphur externally—in any and every form—generally removes it speedily. Should there be difficulty, the external use of the remedy in baths or fumigations may succeed.

So far as we know, this is an elementary substance. It is a greenish, yellow gas, of a strong suffocating smell, and disagreeable taste; incapable of maintaining combustion and respiration, and very soluble in water. One of its characteristics is, that of destroying, almost immediately, all vegetable and animal colours. It is employed in fumigations as a powerful disinfecting agent. A dilute solution, *A'qua seu Li'quor Chlo'rini*, *Chlorin'ii Li'quor*, *Chlorin'ei aqua*, *Aqua Chlorin'ii* (Ph. U. S., 1863), *Liquor Chlo'ri*, *Chlorine water*, *Solution of Chlorine*, (F.) *Chlore liquide*, has been administered internally, in certain cases of diarrhœa and chronic dysentery. A formula for its preparation, by disengaging chlorine from black oxide of manganese, by means of *muriatic acid*; and causing it to pass into water, has been admitted into the Pharmacopœia of the United States for 1863.  
 Immersion of the hands and arms in chlorine has often removed itch and other cutaneous affections. It has also been inhaled in a dilute state in the early stage of phthisis, but it is of doubtful efficacy, and is better adapted for chronic bronchitis.  
 CHLORINE, BISULPHURET OF, Sulphur, chloride of.  
 CHLOROÂNEMIA, (*χλωρος*, 'green,' and *anæmia*.) Chlorosis.  
 CHLO'RODYNE. A secret preparation, proposed, in 1848, by a Dr. Browne of India; and said, by him, to consist of "perchloric acid with a new alkaloid." It has been given as an anodyne chiefly; but being a nostrum, is only worthy of mention for its notoriety.  
 CHLO'ROFORM, *Chloroform'um*, *Chloroform'ium*, (from *chlorine*, and *formyl*.) *Carbo'nium seu For'mylum chlorat'um*, *Superchlor'idium formyl'icum*, *Perchloride and Terchloride of For'myl*, *Chloroform'yl*, called also, but not correctly, *Terchloride of Carbon*, and *Chloric ether*, *Æ'ther chloricus*;—(F.) *Chloroforme*, *Chloréthéride*, is a colourless, oleaginous liquid, of a sweetish ethereal odour, hot, aromatic, and peculiar taste. The specific gravity of that of the Ph. U. S., *Chloroform'um vena'le*, is 1.45 to 1.49. It may be obtained by distilling from a mixture of chlorinated lime and alcohol,—rectifying the product by redistillation, first from a great excess of chlorinated lime, and afterwards from strong sulphuric acid. It has been used with advantage in asthma, and in diseases in which a grateful soothing agent is required. Dose, gtt. x to fʒss or more, diluted with water. It is largely prescribed, and with great success, as an anæsthetic agent in painful diseases; and to obtund sensibility in surgical operations and in parturition,—especially in the way of inhalation; but its use requires caution. The usual quantity with this view is from fʒss to fʒij. See *Anæsthetic*.  
 The Pharmacopœia of the United States (1863) has a *Chloroformum purificat'um*, which is made by adding sulphuric acid to commercial chloroform; decanting the lighter liquid, and mixing it with stronger alcohol; adding carbonate of potassa, previously heated to redness, and rubbed, while warm, into powder. The mixture is, then, thoroughly agitated, and, by means of a water bath,

distilled to dryness. Its s. g. varies from 1.490 to 1.494.—s. g. (Ph. B., 1864) 1.496.

A disease which affects young females, more particularly those who have not menstruated. It is characterized by a pale, lurid complexion, languor, listlessness, depraved appetite and digestion, palpitation, &c. The disease generally goes off on the occurrence of the menstrual flux; but sometimes it is long before this is established, and, at times, the catamenia are in much larger quantity than usual. To this last form M. Trousseau has given the name *chlorosæ hæmorrhagique*.

The blood of chlorosis is generally thin, light-coloured and deficient in red corpuscles, and in iron,—*achalybhémie* of Piorry, and the clot is in less proportion to the serum than in health. On auscultation, a bellows' sound has been almost invariably detected over the heart, and a continuous blowing sound in the larger arteries, (especially the carotids and subclavians,) reinforced by each systole of the ventricle, and resembling the buzzing of a humming-top, the cooing of doves, the whistling of air through a key-hole, &c., (see *Bruit*.) Very similar sounds are heard in the arteries after copious hemorrhage: they seem, therefore, to coincide with enfeebled circulation.

Tonics—as iron—are usually required in the treatment,—the disease most commonly occurring in those in whom there is considerable torpor of the system.

(Dr. Alston says, that this word is compounded from two East Indian words:—*choco*, 'sound,' and *atte*, 'water,' because of the noise made in its preparation [?] Another derivation is from *Choco*, a province in Mexico, where the tree abounds, and whence it was imported into Europe about 1520.) An alimentary paste prepared from the kernels of *Theobroma cacao* or *Cacao*, with sugar, and often aromatics. (See *Cacao*.) The chocolate thus simply prepared—as it is met with, indeed, in commerce—is called in France, *Chocolat de santé*, *Chocola'ta simplex* seu *Salutis*. It is not very easy of digestion.

In temperate climates, common cholera is not usually a disease of much consequence. It requires that the stomach and bowels should be cleared, and afterwards the irritation be allayed by full doses of opium. In *malignant cholera*, large doses of calomel, with opiates, form the great reliance of many practitioners. In the worst forms, however, it runs its course, unmodified by treatment.

CHOLERA INFAN'TUM, *Choleric Fever of Infants*; *Cholera of Infants*, (F.) *Cholera infantile*. A disease so termed by American physicians. It occurs, generally, in the middle states of the Union, in June or July, and continues during the hot weather, hence called the 'summer complaint.' The chief symptoms are vomiting, purging of green

or yellow matter, slime or blood, attended with pain or uneasiness, and swelling of the abdomen, with some pyrexia, generally. The heat of the weather seems to be the predisposing, if not the exciting, cause. It is a fatal disease in towns; differing little, if at all, from what is vulgarly called the *Wa'tery Gripes* in England. Clearing, gently, the alimentary canal, so as to remove the offending matter, and then exhibiting chalk mixture and laudanum, with counter-irritants, as spice cataplasms to the abdomen, is the most satisfactory plan of treatment.

The characteristics are:—irregular and involuntary motions of one or more limbs, and of the face and trunk. It is a disease which usually occurs before puberty; and is generally connected with torpor of the system, and of the digestive organs in particular. Its duration is long, but it is usually devoid of danger; although frequently but little under the control of medicine. The spasms do not continue during sleep. The indications of treatment are: to strengthen the general system, and stimulate the intestinal canal. Purgatives, once or twice a week, and chalybeates, with appropriate regimen, will fulfil these.

CHO'RION, (χοριον, 'skin,' from χορειν, 'to contain,' (include); [?]) *Camis'ia Fœ'tus*. A thin, transparent membrane, formerly confounded with the decidua, which surrounds the fœtus in utero on every side, and appears to be developed

from nucleated cells formed in the Fallopian tube. Some histologists, however, consider, that it exists in the ovary. The general opinion is, that it is formed as above described; and perhaps, also, from the zona pellucida, which disappears in the tube. In the uterus, villous prolongations are formed on its surface, which have given it, with more recent writers, the name 'shaggy chorion.' These villi are probably the agents of the absorption of nutritive matter furnished from the lining membrane of the uterus.

By many anatomists, the chorion is considered to be formed of two layers; the outer, called by Burdach *Exochorion*; the inner, *Endochorion*. By others, the distinction of laminae is denied. It is exterior to the amnion.

CHORION also means the true skin. See *CUTIS*. By some, the Zona pellucida is so called.

CHOROÏDEA TE'LA, *Plex'us choroï'deus me'dius*, *Velum interpos'itum*, (F.) *Toile choroï'dienne*. A kind of vasculo-membranous prolongation of the pia mater, which lines the lower surface of the for-nix united with the corpus callosum. It is stretched above the third ventricle, and covers the posterior commissure and corpora quadrigemina. Anteriorly, the tela choroïdea is continuous with the plexus choroïdes.

CHOROÏDEA SEU CHOROÏDEA TU'NICA, *Ch. Membra'na*, or simply the *Choroid*, *Tu'nica vasculo'sa seu aciniform'is seu rhyoïdes Oculi*, (F.) *Membrane choroïde*, *Choroïde*. A thin membrane, of a very dark colour, which lines the sclerotic internally. The part behind the iris is called *Uvea*. It is situate between the sclerotic and retina, has an opening, posteriorly, for the passage of the optic nerve; and terminates, anteriorly, at the great circumference of the iris, where it is continuous with the ciliary processes. Its outer surface is pretty intimately attached to the sclerotic by bloodvessels and nerves, as well as by a delicate brown tissue, which has been called *Lam'ina fus'ca*.

According to Ruysch, the choroid consists of two layers, to the innermost of which his son gave the name *Tu'nica* seu *Membra'na Ruyschia'na*, *M. choriocapilla'ris*, (F.) *Membrane Ruyschienne*. The internal surface of the membrane is covered with a dark pigment, consisting of several layers of pigment cells, called *Pigmen'tum ni'grum*, *Strat'um pigmen'ti*, *Ophthalmochroï'tes*, *Æ'thiops ani'mal*, *Mélanine*, *Mélanine*, *Matière ou Principe de la Mélanose*, (F.) *Enduit choroïdien*. Its use seems to be, to absorb the rays of light after they have traversed the retina.

CHOROÏDEE VE'NE, *Ve'næ Gale'ni*, (F.) *Veines choroïdiennes*. Two veins, that creep along the tela choroïdea; into which almost all those of the lateral ventricles, of the upper part of the cerebellum, of the pineal gland, and the corpora quadrigemina open. **CHYLE**, *Chylus*, *Sac'cus nutritiv'us*, (χυλος, 'juice,' from χυω, 'I pour,') The word, in Hippocrates, means *Tisane* or *Decoction of Barley*, *Chylarion*. Galen first used it in its present sense;—i. e. for a nutritive fluid, extracted by intestinal absorption, from food which has been subjected to the action of the digestive organs. It is of a whitish appearance; and is formed from the chyme in the duodenum, and the rest of the small intestines, by the chyliferous vessels, which arise at the mucous surface of the intestine. Along these it passes through the mesenteric glands to the thoracic duct, and is finally poured into the left subclavian. It is composed, like the blood, of a fluid—*liquor chyli*—and of *chyle corpuscles* or *globules*, the average size of which is about 1-4600th of an inch. They, who regard the chyle to be nothing more than fatty matter of the food, apply the term to the emulsified oil in the intestinal canal even before it is taken up by the chyliferous vessels. See *Chyme*.

Castelli asserts, that *Chyme* and *Chyle* were used in an inverse sense by the ancients to that accepted at present.

A branch of the natural sciences, whose object is to investigate the nature and properties of bodies, simple and compound, inorganic and organized; and to study the force or power, by virtue of which every combination is effected. It investigates the action between the integrant molecules or atoms of bodies.

*Organic Chemistry, Chym'ia organ'ica, Organochem'ia*, is the chymistry of organized substances, — animal and vegetable. *Animal Chym'istry, Zoöch'emy* or *Zoöch'ymy, Zoöchem'ia*, is the chymistry of substances afforded by the dead or living animal body. This branch of chymistry has been farther subdivided into *physiolog'ical*, when it considers the changes produced in organized bodies in health,—*patholog'ical*, when it regards those produced by organic or other diseases. *Anthropoch'ymy, Anthrochem'ia*, is the chymistry of the human body. Chymistry is called *Therapeut'ical* or *Pharmaceut'ical, Pharmacochem'ia, Chym'ia pharmaceut'ica*, when it is engaged in the analysis of simple medicines; in improving the prescribing and preparing of chemical and Galenic medicines; in the means of preparing them, and detecting adulterations, &c. *Hygien'ic Chym'istry* is that which is applied to the means of rendering habitations healthy, of analyzing the air we breathe, preventing the occurrence of disease, pointing out healthy aliments, and appreciating the influence of professions, &c., on the health of man. All these different subdivisions, with vegetable chymistry, *Phytochymistry*, are, at times, included under the head of *Med'ical Chym'istry*; at others, the term comprehends only the *Animal, Veg'etable*, and *Pharmaceut'ical* subdivisions. *Vital Chemistry, Biochym'ia*, is that which is exerted under the influence of vitality. *Histochem'y, Histochem'ia, Histochem'istry*, is the chemistry of the tissues, and *Phlegmatoch'emy*, that of the animal humours.

A knowledge of chemistry is of great importance to the physician. Many of the functions are of a chemical nature: many diseases require a chemical mode of treatment; and, without an acquaintance with it, two or more substances might be given in combination, which, by forming a chemical union, might give rise to other

compounds, possessing very different virtues from the components taken singly, and thus the prescriber be disappointed in the results.

CIL'IA (singular *Cil'ium*), *Blephar'ides*, *Epice'rides*, *Pili palpebra'rum*, *Eyelashes*, (Sc.) *Wink'ers*. The hairs on the eyelids. (F.) *Cils*. Their use seems to be, to prevent the entrance into the eye of light bodies flying in the atmosphere; and to diminish, in certain cases, the intensity of light. Also, the tarsi, eyelids. Likewise, a peculiar sort of moving organs, resembling small hairs, *vibratory* or *vibratile cil'ia*, *Cil'ia vibrato'ria*, (F.) *Cils vibratils*, *Tromyles*, which are visible with the microscope in many animals. These organs are found on parts of the body which are habitually in contact with water, or other more or less fluid matters, and produce motion in these fluids, impelling them along the surface of the parts. Cilia have been found to exist in all vertebrated animals except fishes, having been discovered on the respiratory, uterine, and other membranes of mammalia, birds, and reptiles.

The terms '*vibratory motion*' and '*ciliary motion*' have been used to express the phenomena exhibited by the moving cilia; and it is probable, that this motion is concerned in the progression of fluids along the membranes. As yet, the motion has only been observed in the direction of the outlets of canals.

CILIAIRE, *Ciliary*.

CIL'IARY, *Ciliaris*, (F.) *Ciliaire*. Relating to the eyelashes, or to *cilia*. This epithet has, also, been applied to different parts, which enter into the structure of the eye; from the resemblance between some of them (the *ciliary processes*) and the eyelashes.

CILIARY ARTERIES, *Arte'rie cilia'res*, (F.) *Ar'tères ciliaires*. These are furnished by the ophthalmic artery. They are distinguished into, 1. *Short or poste'rior* (*Art. uéales*—Chauss.), 30 or 40 in number, which are distributed to the ciliary processes. 2. *Long*, (*Art. Iriames* of Chauss.,) two in number, which, by the anastomosis of their branches, form two arterial circles at the anterior surface of the iris: and, 3. The *ante'rior*, *Arte'rie cilia'res anterior'es* of Haller, the number of which is variable. These pierce the sclerotic a few lines from its union with the cornea; and are principally distributed to the iris.

CILIARY BODY, *Cor'pus Cilia're*, *Nex'us Stamin'us Ocul'i*, *Coro'na Ciliaris*, *Cil'ary Disc*, (F.) *Corps ciliaire*. A ring of the choroid surrounding the crystalline in the manner of a crown, placed behind the iris and the ciliary circle. It resembles the disk of a radiated flower, and is formed by the union of the ciliary processes. See *Ciliary Muscle*.

CILIARY CANAL, *Canal of Fonta'na*. A small, extremely narrow circular space, formed between the ciliary circle, the cornea, and the sclerotic. It can be filled with injection, and it is not certain that it is not the cavity of a blood-vessel.

CILIARY CIRCLE, *Ciliary ligament*—c. *Disc*, *Ciliary body*—c. *Ganglion*, *Ophthalmic ganglion*.

A species of greyish ring, of a pulpy consistence, situate between the choroid, iris, and scleroticæ. The internal surface of the choroid is uniform, until it approaches within ten lines and a half of the edge of the cornea; here a dentated line is observed, termed *o'ra serrata*. The outer surface presents the *anulus albidus* seu *gangliiformis*, the anterior edge of which unites to the inner surface of the scleroticæ and constitutes the *ciliary ligament*.

CILIARY or TAR'SAL MAR'GIN of the eyelids; (F.) *Bord ciliaire*. The edge in which the cilia or eyelashes are situate.

CILIARY MOTION, see Ciliary.

CILIARY MUS'CLE, *Musculus ciliaris*. The part of the orbicularis palpebrarum in the vicinity of the ciliary margin. Also, the greyish, semi-transparent structure behind the ciliary ligament, and covering the outside of the ciliary body. By its contraction the ciliary processes, and with them the lens, must be drawn towards the cornea. It appears to be the same muscle as the *Ten'sor choroidæ*, *Pro'trahens lentis*, *Choroid muscle* of some anatomists.

CILIARY NERVES. (F.) *Nerfs ciliaires, Nerfs Iriens*. These are 12 to 16 in number. They arise from the nasal nerve, and particularly from the anterior part of the ophthalmic ganglion; and unite in two fasciculi, which pass around the optic nerve, and pierce the scleroticæ near the entrance of that nerve into the eye. They are lost in the ciliary ligament.

CILIARY PLEXUS, C. Ligament.

CILIARY PROC'ESSES, *Processus seu Radii seu Striæ ciliares*, (F.) *Process ciliaires, Rayons sous-iriens*—(Ch.). Triangular folds, sixty or eighty in number, placed at the side of each other, and radiating so as to resemble the disk of a radiated flower. They are lodged in depressions at the anterior part of the vitreous humour. The uses of these processes are not known.

CILIARY RING, Ciliary ligament.

CILIARY STRIÆ are numerous pale, radiated striæ in the posterior portion of the *Corpus ciliare*, but so covered by the *Pigmentum nigrum* as not to be distinctly seen till the paint is removed. The ciliary processes are formed by these striæ.

CILIARY VEINS, (F.) *Veines ciliaires*, follow nearly the same course as the arteries. In the choroid they are so tortuous, that they have received the name *Vasa vortico'sa*. They open into the ophthalmic vein.

CILIARY ZONE, *Zo'na seu Zo'nula seu Lam'ina Ciliaris, Membran'ula Coro'næ Ciliaris*. Under the corpus ciliare, the capsule of the vitreous humour sends off an external lamina, which accompanies the retina, and is inserted, with it, into the forepart of the capsule of the lens, a little before its anterior edge. This is the *Zo'nula ciliaris, Zo'nula Zinnii* or *Zo'nula of Zinn, Coro'na Ciliaris, Orbic'ulus Ciliaris*. It is of a striated appearance and circular form, and assists in fixing the lens to the vitreous humour.

Called also *Cor'tex seu Pul'vis Jesuit'icus, Jesuit's Bark* or *Pow'der, Cor'tex Patritium*, because it was introduced into Europe by the Jesuits; also *Pul'vis Comitissæ* or the *Countess's Pow'der*, and *Cardinal del Lu'go's Pow'der, Cor'tex Cardinalis de Lu'go*, because he introduced it at Rome; and in France, *Tal'bor's Pow'der* and *English remedy*, because successfully used there by Sir Robert Talbor, who kept it a secret. It is the pharmacopoeial name of several kinds of barks from various species of Cinchona, from the western coast of South America. *Order, Cinchonaceæ. Sex. Syst. Pentandria Monogynia*. The richest in the antiperiodic alkaloids is said to be the bark of *Cinchona succir'bra* of Ecuador, which, with other species, has been transplanted to India and other countries. These are the most important spurious barks. They contain neither quinia nor cinchonia.

CINCHONÆ CORDIFOLLE COR'TEX, *Cor'tex flavus, Cincho'næ officinalis cor'tex flavus, Chiv'na*

*re gia seu Calisaya*, *Cortex Ch'uz re'gius seu fl'a'rus seu lu'teus*, Yellow. Royal or *Calisaya's cinchona Bark*, (F.) *Quinquina jaune ou jaune royal*, *Calasaya*. Odour aromatic; taste strong, bitter, astringent. Not rolled; often without the epidermis, which is very thick and inert; light, friable; fracture fibrous. Active principle *Qui'nia*. The false or *spurious Calisaya* barks are those of *Cinchona Colisaya*, variety *Josephia'na*; *C. Bolivia'na*, *C. ova'ta*, variety *rufiner'via*, called, in Peru, *Cascarilla Carabaya*—the *Carabay'a bark* of commerce;—of *C. scrobiculata*, two varieties, *Cus'co bark* and *Bark of St. Ann*; of *C. pubes'cens*, which furnishes the *Cus'co* or *Ar'i'ca bark*, and of *C. amygdalifolia*.

CINCHONÆ LANCIFOLIE CORTEX, *Cortex Peruvia'nus seu pallidus*, *Cincho'næ officina'lis cortex commun'is*, *Cincho'na pallida*, *Pale Cincho'na Bark*, *Pale*, *Loxa* or *Croen Bark*, (F.) *Quinquina gris de Loxa*, *Quinquina Orange*. The bark of *Cincho'na Condamine'a* and *C. micran'tha*. Its odour is aromatic; taste pleasant, bitter, and astringent. The pieces are rolled in double or single quills. Epidermis brown, cracked; fracture resinous. Internally of a cinnamon colour. Its active principle is *Cincho'nia*.

CINCHONÆ OBLONGIFOLIE CORTEX, *Cortex ruber*, *Cincho'næ officina'lis cortex ruber*, *Red Cinchona Bark*, *Red Bark*, (F.) *Quinquina rouge*, (S.) *Cascarilla roxa* and *C. colorada*, of S. America. Odour and taste the same as the pale, but more intense: in large flat pieces, solid, heavy, dry; fracture short and smooth; of a deep brownish-red colour. Although this variety of bark is assigned to the *Cinchona oblongifolia* and *C. Succirubra* by some, it would seem, that nothing is certainly known as to its source. Active principles, *Cincho'nia* and *Qui'nia*.

The last three are the only official varieties in the Pharmacopœia of the United States. There are many other varieties, however, which are genuine cinchona barks, and yet have not been considered worthy of an official position. The Edinburgh Pharmacopœia admitted, indeed, *Cincho'na cine'rea*, *Grey bark*, *Sil'ver bark* or *Huanuco* or *Lima bark*, which is obtained around Huanuco in Peru, and, with the *Jen* or *Ash bark* and the *Huamillies bark*, belongs to the class of pale or Loxa barks. Amongst the genuine but inferior barks are those brought from the northern Atlantic ports of South America, which, in commerce, are variously called *Pitay'a*, *Bogota'*, *Carthage'na*, *Maracay'bo*, and *Sau'ta Mar'tha barks*. The *Bogota* is also called *Fusagasuga* and *Coquetta bark*.

All these barks are bitter, astringent, tonic, and eminently febrifuge. The yellow bark has been thought equal to any of the others, but the red contains more active principle. The discovery of their alkaloids is one of the most important gifts of modern chemistry. Still, in pernicious intermittents, the bark, in substance, is often demanded. It is employed in every disease in which there is deficient tone; but in cases where the stomach is much debilitated, the powder had better be avoided, in consequence of the woody fibre, which might disagree. Externally, it is used in enema, gargles, &c., and in gangrenous ulcerations. When it excites nausea, an aromatic may be added to it; if purging, opium; if costiveness, rhubarb, &c. Dose, ℥ss to ʒj or more.

ESSENTIAL SALT OF BARK, as it is called, is an extract, prepared by macerating the bruised substance of bark in cold water, and submitting the infusion to a very slow evaporation.

CINCH'ONINE, *Cincho'ni'na*, *Cincho'ni'n*, *Cincho'ni'a*. The active principle of *Cincho'na lancifolia*. An organic, crystalline alkali; of a white colour, and bitter, slightly astringent taste; very soluble in alcohol and ether, but almost insoluble in water.

*Cincho'niæ Sulphas*, *Sul'phate of Cincho'ni'a*,—which is formed directly from cinchona, by dissolving cinchona, obtained from the mother-water remaining after the crystallization of sulphate of quinia by precipitation by means of solution of soda; treating it frequently with alcohol to remove other alkaloids; adding sulphuric acid to saturation, and crystallizing,—is soluble in water and alcohol. The action of the sulphate of cinchona is similar to that of the sulphate of quinia; but it is less energetic, and consequently requires to be given in a larger dose.

The *Flowers of the Orange*, *Aurantii flores*, *Flores Nophae*, are highly odoriferous, and used as a perfume. On distillation, they yield a small quantity of essential oil—

They were once used in convulsive and epileptic cases. The leaves, *Fo'lia Aurantii*, have a bitterish taste, and furnish an essential oil. They have been used for the same purposes as the flowers. The yellow rind of the fruit, *Aurantii Cor'tex* (Ph. U. S. 1842), *Citrus Bigaradia* (Ph. L.), *Bigarade'* or *Bitter Or'ange*, *Or'ange Peel*, is an aromatic bitter, and is used in dyspepsia, and where that class of remedies is required. The *Juice*, *Sucus Aurantii*, *Or'ange juice*, is a grateful acid, and used as a beverage in febrile and scorbutic affections.

The Ph. U. S. 1863 has *Aurantii amariorum*, *Bitter or'ange peel*, the rind of the fruit of *Citrus vulgaris*; and *Aurantii dulciorum*, *Sweet or'ange peel*, the rind of the fruit of *Citrus Aurantium*.

Limonia* *Ac'ida*, *Citrea Malus*, *Citrus*, (F.) *Citron*, *Cédrat*, has a fragrant odour, depending upon the essential oil, *O'leum Limo'nis*, of the rind. The outer rind, *Cor'tex Limo'num*, *Limo'nis Cor'tex*, *Lem'on Peel*, *Zest*, *Flave'do Cor'ticum Citri*, is used in the same cases as the *Cortex Aurantii*.

The *juice*, *Cit'rium*, *Sucus Limo'nis*, *Limo'num Sucus* (Ph. L.), (F.) *Suc du Limon*, *Suc de Citron*, is sharp, but gratefully acid, the acidity depending upon the citric acid it contains, and is given as a refrigerant beverage in febrile affections. In doses of half an ounce to an ounce, three times a day, it has appeared to some to exert a sedative influence on the circulation, and has been given, apparently with benefit, in acute rheumatism and rheumatic gout. Alone, or combined with wine, it is prescribed in scurvy, putrid sore throat, &c. Its general properties are refrigerant and antiseptic. Sweetened and diluted, it forms *Lemonade*. *Artificial lemonjuice* is made by dissolving an ounce of citric acid in fourteen fluidounces of water; adding a few drops of essence of lemon.

*Lemon-peel tea* or *wa'ter* is made by paring the rind of one lemon, previously rubbed with half an ounce of *sugar*: the peelings and sugar are then put into a jar, and a quart of boiling water is poured over them. When cold, the fluid must be poured off, and a tablespoonful of lemon juice be added.

It is an agreeable drink in fevers.

*Cit'ron Tree* is likewise considered to belong to the same species—*Citrus Medica*. Its fruit is called *cedromela*. It is larger and less succulent than the lemon. *Cit'ron juice*, when sweetened with sugar, is called by the Italians *Agro di Cedro*.

CLIMACTERIC or CLIMACTERIC, *Climacter'icus*, *Climat'er'icus*, *Climat'er'ic*, *Climat'er'icus*, (*κλιμακτηρ*, 'a step,')

(F.) *Climactérique* ou *Climatérique*. A word, which properly signifies 'by degrees.' It has been applied to certain times of life, regarded to be critical; but is now chiefly applied to certain periods of life, at which great changes occur, independently of any numerical estimate of years. Such are the period of puberty in both sexes; that of the cessation of the menses in women, &c.

CLIMACTERIC YEARS, *Anni Climacter'iai*, are, according to some, all those in the life of man, which are multiples of the number 7, *Septen'niads*.

Others have applied the term to years, resulting from the multiplication of 7 by an odd number. Some have admitted only three *climacterics*; others, again, have extended them to multiples of 9. Most, however, have considered the 63d year to be the *Grand Climacteric*;—63 being the product of the multiplication of 7 by 9, and all have thought that the period of three, seven, or nine, which they respectively adopted, was necessary to the entire renewal of the body; so that there was, at these times, in the economy, none of the parts of which it had previously consisted. The climacteric years have also been called, *Anni hebdomad'ici, scala' res, grad' rii, scan' siles, genethli' aci, natalit' ii, fata' les, erit' ici, decreto' rii, hero' ici*, &c. All the notions on the subject are essentially allied to the doctrine of numbers of Pythagoras.

CLIMATAL, Climatic.

CLIMATE, *Cli'ma, Inclina'tio cœli*, (F.) *Climat*, (κλίμα, 'a region.') In geography, the word *climate* is applied to a space on the terrestrial globe, comprised between two circles parallel to the equator, and arbitrarily measured according to the length of the days. In a hygienic point of view, it means, since Hippocrates, a country or region, which may differ from another in respect to season, qualities of the soil, heat of atmosphere, &c. Climate, indeed, embraces, in a general manner, all the physical circumstances belonging to each region,—circumstances which exert considerable influence on living beings. The dark complexion of the inhabitants of the torrid zone is easily distinguishable from the paleness of those of the frigid,—so are the diseases. They are all modified, more or less, by climate or locality. Hot climates predispose to abdominal complications in febrile affections; cold climates to thoracic, &c.

One of the most important considerations with regard to climates is their comparative fitness for the residence of invalids, and especially of those who are liable to, or suffering under, bronchitic or consumptive affections. The great object, in such cases, is to select a climate which will admit of regular and daily exercise in the open air, so that the invalid may derive every advantage which this form of revulsion is capable of effecting. To an inhabitant of the northern and middle portions of the United States—and the same applies to Great Britain, France, and the northern parts of the old world—a more southern climate alone has generally been considered to afford these advantages in an eminent degree. During the summer months there are few, if any, diseases, which require a milder climate than that of the United States, or of the milder districts of Europe. The temperature of the winter months is, consequently, the most important object of attention. Equability of temperature

is essential, inasmuch as all sudden changes interfere with the great desideratum—exercise in the open air. In the whole continent of North America the changes are very sudden and extensive. It is not uncommon for the range to be 40°, between two successive days. So far, therefore, as this applies, the American climate is not well adapted to the invalid. In the southern portions, however, of the Union, this objection is counterbalanced by many advantages; and in the North there are many situations which afford a favorable residence to the valetudinarian during the winter. Observation has, indeed, shown, that in Minnesota, at Mackinac, and in Canada, where the air, although very cold, is dry, a sojourn there has proved at least as efficacious as in the warmer climate of the southern portion of the United States, or of Cuba; and hence, many invalids, instead of subjecting themselves to the inconveniences of temporary expatriation, pass the winter, often advantageously, in Minnesota, for example. From the Army Reports it would seem, that the dry air of New Mexico is especially favorable to those who are threatened with consumption.

The following tables exhibit the mean temperature of the year, and of the different seasons—with the mean temperature of the warmest and coldest months at different places in America, Europe, Africa, &c., as deduced from the excellent paper of Von Humboldt on Isothermal Lines, the Meteorological Registers kept by the surgeons of the United States army, under the direction of Surgeon-generals Lovell and Lawson, 1822 to 1860, the work of Sir James Clark on Climate, &c., &c. Recent, full, and, doubtless, accurate details, as regards the climate of different portions of the United States, are contained in the "Army Meteorological Register for Five Years, from January, 1855, to January, 1860"—an appendix to the "Statistical Report on the Sickness and Mortality in the Army of the United States," from January, 1855, to January, 1860: prepared under the direction of Surgeon-general Lawson, by Dr. R. H. Coolidge.

Certain of the following tables show the mean monthly temperature, maximum, minimum, and range, as well as the greatest daily, and mean daily range during the corresponding months—but of different years—at some of the prominent retreats for the valetudinarian in Great Britain, on the continent of Europe, and in the African islands. It is proper, however, to remark, that in no situations, except in those to which an asterisk is affixed, was the register thermometer used. In the others, the observations were made during the *day* only, and consequently the numbers given are far below the real range throughout the twenty-four hours. The places are ranged in the order of their mean temperature.

In the United States, one of the most favourable regions for the phthisical invalid was considered to be Florida. St. Augustine was frequently chosen, but it is liable to north-east storms, which interfere with the out-door movements of the valetudinarian, and are the source of much discomfort. Still, great benefit has often been derived from it as a winter residence. Of the Atlantic Isles, Madeira appears to be best adapted for the consumptive, and those affected with chronic bronchitis. In Italy, Rome, and Pisa,—and in England, Torquay and Undercliff, are to be preferred. Chronic rheumatism and gout are benefited by a warm climate, which, again, is unfavourable to those who are predisposed to cerebral diseases, especially to such as are characterized by debility and mobility of the nervous system—as paralysis, epilepsy, mania, &c. Hypochondriasis and dyspepsia require rather change of climate and travelling exercise than a sojourn in any one. (See the Author's Human Health, Philada., 1844).

CO'COS BUTYRA'CEA. The name of the plant which affords the palm oil, *O'leum pal'mæ*, obtained chiefly from the fruit, by bruising and mixing the kernels with water, without the aid

of heat, by which the oil is separated and rises to the surface. It is of the consistence of an ointment, with little taste, and a strong, though not disagreeable, smell. It is applied to sprains, &c. : but has no advantage over other oils. It has been used as the excipient for suppositories, and has been called, also, *O'leum Pal'mæ seba'ceum*, *O. fir'mum nu'cum co'cos butyra'ceæ* and *Mackaw' fat*. It is procured likewise from the *Ela'is Guineen'sis*, and *Ela'is Occidentalis*, two species of palms. (Cocos is said to be contracted from (*P.*) *macoco* or *macoco*, 'a monkey,' the three holes at the end of the cocoa-nut shell causing it to resemble somewhat a monkey's head.)

**COCOS NUCIF'ERA**, *Pal'ma cocos*, (F.) *Cocotier*. Order, Palmæ. The systematic name of the plant whose fruit is in the *co'coa-nut*. (F.) *Coco*. It has an agreeable kernel, but not easy of digestion. *Emulsions*, *orgeat'*, &c., are made from it. The *juice* of the cocoa, *Tod'dy*, when fermented, forms wine, and arrack is distilled from it. It meant a preparation from its *crude* state. 2. It expressed the *maturation* or *change*, which the humoral pathologists believed morbid matter experiences before elimination. COFFĒA ARAB'ICA, (*Caff'e'a*, Ph. U. S. 1863.)

*C. vulgar'is*, *Jas'minum Arab'icum*, (F.) *Caffier*, *Caffier*, and *Caffeyer*. Order. Rubiacee. Ser. Syst. Pentandria Monogynia. The plant which affords coffee, *Choana*, *Bon*, *Buna*, (F.) *Café*. Originally from Yemen.

The infusion of coffee is an agreeable and wholesome article of diet. It is, to a certain extent, a tonic, and is employed as such in convalescence, especially from fevers, &c. In cases of poisoning by opium, and in old asthma, its use has been extolled. For this purpose the *Moka* is the best. It ought to be newly torrefied, but not too much

burnt; should be strong, and drunk soon after grinding.

A highly nitrogenized alkaloid was first found in coffee, and called *Caf'ein* or *Caff'ein*. It was afterwards discovered in the leaves of the tea plant, and called *Thein*, and in the Guarana of Brazil, and called *Guaranin*. In doses of from 2 to 10 grains, it induces violent nervous and vascular excitement. Caffein—as well as its various salts—the *citrate, lactate, malate, and muriate*, has been given as an antiperiodic in grain doses.

*Facit'ious Coffees* have been, from time to time, recommended, but they are infinitely inferior to the genuine. Various substitutes have been proposed; *wheat, barley, hollyberries, acorns, sun-flower seeds, beech-mast, peas, beans, succory-root, seeds of gooseberries and currants* left in making wine, and washed,—*sliced turnips*, &c. These have been roasted, with the addition of a little butter or oil; but they have not the aroma of coffee. The best substitute is said to be the seeds of the *Yellow water flag, Gladiolus luteus* or *Iris pseudac'orus*.

*Hunt's Economical Break'fast Powder* consisted of rye, roasted with a little butter.

Under this head is generally described the colic produced by lead, as well as the other colics mentioned in the synonymy; and they certainly resemble each other greatly, although some of them are more like bilious colic. There is not much to distinguish this variety of colic from others. The same violent pain about the navel is present, with retraction of the abdomen towards the spine. It is apt also to occasion palsy. The only difference of treatment is in the necessity for employing more opium along with the purgative. The paralytic sequela must be met by change of air, rubbing the spine, exercise, &c. Treating the disease upon general principles is infinitely more philosophical, and more successful than the former empirical management at *La Charité*, Paris, which it is unnecessary to detail.

The *Colic of Madrid*, of *Poitou*, *Devonshire*, *Normandy*, &c., has been called *vegetable colic*, (F.) *Colique végétale*, because ascribed to the use of new wine or cider, unripe fruit, &c., although really, perhaps, owing to the adulteration of wines and cider by litharge. All the symptoms, indeed, are those of *Colica metallica*.

COLICA NEPHRETICA, *Nephrocolica*, *Colica renalis*, *Nephretic* or *Renal Colic*, (F.) *Colique Néphrétique*. Acute pains, which accompany nephritis, and especially calculous nephritis, or the passage of a calculus into the ureter.

COLICA SCORTORUM, *Colic of Prostitutes*. A form of colic said, by Dr. Martin Hassing, of Copenhagen, to have been frequently observed by him amongst that unfortunate class of beings. It may well be doubted whether any special affection of the kind appertains to them.

COLICA STERCO'REA, *Colica Stipitata*, *Stereoraceous Colic*, (F.) *Colique stercorale*. A species of colic, ascribed to the retention of fecal matters in the intestines. The retention is itself, however, an effect, that may be caused in the same manner as the colic pains themselves.

The *collateral—superior* or *external* (*Grandes musculaires du bras*—Ch.) which arise from the inner part of the brachial, and extend as far as the inferior and external part of the arm. 2. The *collateral—inferior* or *internal* (*Collatérales du Conde*—Ch.) which arise from the brachial, near the elbow-joint, and descend towards the upper part of the fore-arm.

In the British Pharmacopœia (1864) it is prepared of *Pyrox'ylin*, ℥j; *Ether*, f̄℥xxxvj; *Rectified spirit*, f̄℥xij. When applied to a part, the ether evaporates, and the solid adhesive material is left, which contracts. Hence it is used in cases of wounds, to keep their edges together. It forms, also, a coating, and has been applied in abrasions, and in cases of burns. In various chronic cutaneous diseases, it has been applied with advantage; and has been employed to give a coating to pills, which it deprives of their taste, without interfering with their action.

The ancients designed, by this term, a solid medicine, of a long, cylindrical shape; proper to be introduced into the vagina, anus, or nostril. They are said to have given it this name because it was shaped like a *Roi's Tail*, and because there entered into its composition powders and glutinous matters.—At the present day, *Collyrium* means an application to the eye. COLOURS, ACCIDENTAL, *Op'posite colours, Complen'tary or Harmon'ic colours*, (F.) *Color'is Complémentaires*. If the eye has been for some time regarding a particular colour, the retina becomes insensible to this colour; and if, afterwards, it is turned to a sheet of white paper, the paper will not seem to be white, but will be of the colour that arises from the union of all the rays of the solar spectrum, except the one to which the retina has become insensible. Thus, if the eye be directed for some time to a red wafer, the sheet of paper will seem to be of a bluish-green, in a circular spot of the same dimensions as the wafer. This bluish-green image is called an *ocular spectrum*, because it is impressed upon the eye and may be retained for a short time; and the colour bluish-green, is said to be the *accidental colour of the red*. If this experiment be made with wafers of different colours, other accidental colours will be observed, varying with the colour of the wafer employed, as in the following table:—

If this experiment be made with wafers of different colours, other accidental colours will be observed, varying with the colour of the wafer employed, as in the following table:—

Colour of the Wafer.                      Accidental colour, or colour of the ocular spectrum.

Red.....Bluish green.

Orange.....Blue.

Yellow.....Indigo.

Green.....Violet with a little red.

Blue.....Orange red.

Indigo.....Orange yellow.

Violet.....Yellow green.

Black.....White.

White.....Black.

If all the colours of the spectrum be ranged in a circle, in the proportions they hold in the spectrum itself, the accidental colour of any particular colour will be found directly opposite. Hence, the two colours have been termed *opposite colours*. It will follow from what has been said, that if the primary colour, or that to which the eye has been first directed, be added to the accidental colour, the result must be the same impression as that produced by the union of all the rays of the spectrum—white light. The accidental colour, in other words, is what the primitive colour requires to make it white light. The primitive and accidental colours are, therefore, *complements* of each other; and hence accidental colours have also been called *complementary colours*. They have likewise been termed *harmon'ic*, because the primitive and its accidental colour *harmonize* with each other in painting.

These terms have been applied to the extraordinary phenomenon of a rapid destruction of the human body, by being reduced to ashes either spontaneously or by the contact of an ignited substance. It is said to have occurred in the aged, and in those that were fat and hard drinkers. In such, Dr. Traill has found a considerable quantity of oil in the serum of the blood. Vieq d'Azyr, Lair, and Dupuytren think it necessary, that the body should be placed in contact with an ignited substance. Le Cat, Kopp, and Marc are of opinion that this is not necessary. The former appears to be the more probable view.

**COMPRESSIF**, *Compressive*.

**COMPRESSIO**, (same etymon as *Compress*,) *Compression*, *Thlipsis*.

**COMPRESS'ION**, *Compressio*, (same etymon.) Pressure; methodical compression. An agent frequently had recourse to in surgery. We compress a limb, affected with *œdema*, *varices*, *hydrops articuli*, *callous ulcer*, &c. The abdomen is compressed after delivery, after *paracentesis abdominis*, &c. The compression is produced by means of the roller, laced stocking, &c., according to the part, and to the particular case. *Moderate pressure* aids the contractility of parts, and modifies their nutritive action; so that large tumours at times disappear after it has been used for some time. A greater degree of pressure occasions, still more, the emaciation of the part, but it is apt to impede the circulation. *Pressure* is often used to stop or moderate the flow of blood in cases of aneurism or wounds of arteries and veins. In such cases, the compression may be *immediate*, when applied upon the artery itself, or it may be *mediate*, when applied through the integuments and soft parts. The French use the term *Compression immédiate latérale* for that which is exerted perpendicularly to the axis of a vessel, so as to flatten its sides. It is practised with the finger, forceps, tourniquet, &c.

*Methodical Compression* is pressure applied *secundum artem*. *Dig'ital Compression* is pressure made by the fingers.

**COMPRESSION OF THE BRAIN**. This may arise either from coagula of blood, a soft tumour, a bony excrescence, a depressed portion of the skull, or the presence of some foreign body. The effects vary, according as the compression takes place *suddenly* or *gradually*. When *suddenly*, the symptoms are of the comatose or apoplectic character. When *gradually*, mania, convulsions, &c., are more likely to occur. Compression, arising from a depressed portion of skull, requires the use of the trephine.

**COMPRES'SIVE**, *Compress'ivus*, (F.) *Compressif*. That which compresses. A *compressive bandage* is one that compresses the parts to which it is applied.

**COMPRESSOR** or **COMPRESSORIUM** OF DUPUYTREN, (F.) *Compresseur de Dupuytren*. An instrument for compressing the femoral artery, invented by Dupuytren. It is constructed on the same principles as the tourniquet of J. L. Petit, from which it only differs in this respect;—that, instead of being maintained in its place by a strap, which always compresses more or less the circumference of the limb, the two pads are placed at the extremities of a semicircle of steel, which, by passing from one to the other without touching the parts, limits the pressure to two opposite points of the thigh, and permits the collateral circulation to go on.

**COMPRESSOR NA'RIS**, *Rina'us, Nasa'lis, Tra'nersa'lis Na'si, Myrtiform'is, Dilato'res Ala'rum Na'si, Constrictor Na'si seu Na'rimum seu Na'riss, Triangula'ris Na'si*, (F.) *Mozillo-narinal, Sus-mazillo-nasal*—(Ch.) *Compresseur du nez, Trans-versal du nez*. **COMPRESSOR URE'THRE**. A muscle consisting of two portions—one of which is *transverse* in its direction, and, in consequence of its having been particularly described by Mr. Guthrie, has been called *Guthrie's muscle*. It arises from the ramus of the ischium, and passes inwards to embrace the membranous urethra. The other portion is *perpendicular*, descending from the pubis and passing down to be inserted into the transverse portion of the muscle;—*Pubio-urethra'lis*. This portion has been considered by many to be only the anterior fibres of the levator ani; and having been described by Mr. Wilson, it has been called *Wilson's muscle*.

**COMPRESSOR VE'NÆ DORSALIS PE'NIS**. A small muscle, distinctly seen in animals, less distinctly in man, which arises from the ramus of the pubis, and ascending in a direction forwards is inserted above the vena dorsalis, joining with its fellow of the opposite side on the mesial line. The impregnation of the ovum by the positive contact of the male sperm, whence results a new being. The whole subject of conception is most mysterious. It seems to occur as follows. During the sexual union, the male sperm passes along the uterus and Fallopian tubes: the fimbriated extremities of the latter seize hold of the ovum; and the sperm in this manner comes in contact with a matured ovum, and impregnates it. The fecundated ovum remains some time in the ovarium, but at length bursts its covering, is laid hold of by the fimbriated extremity of the Fallopian tubes, and passes along the tube into the cavity of the uterus, where it remains for the full period of utero-gestation. Some are of opinion, that the ovum is not impregnated until it has entered the Fallopian tube, or uterus.

CONCRE'TION, *Concre'tio*, *Concreme'tum*, (*concre'scere*, *concre'tum*, (*con*, and *cre'scere*,) 'to condense, thicken, become solid,') *Pec'ia*, *Sympex'is*, (F.) *Coner'etion*. The act of becoming thick or solid. It was once used synonymously with adhesion or growing together—as '*concretion of the toes*.' Most commonly, it is applied to extraneous and inorganic bodies, of a solid character, met with in different textures, after certain chronic inflammations; or which make their appearance in the joints or in the reservoirs for excremental fluids. *Concretion* is, therefore, frequently synonymous with *Calculus*, and is then rendered, in Latin, by the word *Concrementum*. But *Concretion* has a more extensive signification than *Calculus*; thus, accidental ossifications or deposits of phosphates of lime in certain organs, and especially in the liver and lungs, are properly called *osseous concretions*. They could not well be called *osseous calculi*.

CONCRETION, FIBRINOUS, SANGUINEOUS, POLYPIFORM, or POLYPOUS, OF THE HEART, see *Polypos*—c. *Intestinalis*, *Calculus of the Stomach and Intestines*—c. *Ossi'forme*, see *Osteoid*.

In *Surgery*, it is used for the agitation often communicated to one organ by a fall upon another; as to the brain from a fall on the breech, &c.

In all severe injuries, in sudden encephalic hemorrhage, and in overwhelming emotions, a *concussion or shock* is felt to a greater or less extent in the nervous system, which requires the careful attention of the physician.

CONCUSSION OF THE BRAIN, *Commo'tio Cer'ebr'i*,

*Apoplex'ia nerv'osa traum'atica*, *Encephalosis' mus*, (F.) *Commotio du Cerveau*, sometimes gives rise to alarming symptoms, even to abolition of the functions of the brain, yet without any sensible organic disease. Slight concussion of the brain, called *stunning*, consists in vertigo, tinnitus aurium, loss of memory, and stupefaction; all these being temporary. When more severe, there is instant loss of sensation and volition, vomiting, the patient being as if in a sound sleep, but there is no stertorous breathing. Pulse variable, generally more rapid and feeble than in compression; extremities cold. Little can be done here, till reaction has occurred: after this, the case must be treated according to general principles,—by bleeding, blisters, cold applied to the head, &c. After severe concussion, a patient, although apparently well, is not safe till some time after the accident.

CONDENSAN'TIA, (*con*, and *densare*, *densatum*, 'to thicken,') *Lacrossan'tia*, *Synerit'ica*. Medicines esteemed proper for inspissating the humours.

CONDIMENT, *Condime'tum*, *Ar'tyma*, *Hedys'ma*, *Conditu'ra*, (*condire*, *conditum*, 'to season,') (F.) *Assaisonnement*. Some substances are called, at times, *aliments*, and at others, *condiments*, according as they constitute the basis or the accessory to any dish: such are cream, butter, mushrooms, olives, &c. Others are always *condiments*, as they are only used to improve the savour of food, and contain little or no nutritive matter. Such are pepper, salt, cinnamon, &c. Almost all condiments are possessed of stimulant properties.

CONDIT, Confectio.

CONDITUM. A pharmaceutical compound of wine, honey, and some aromatics, especially pepper. Also, a confection.

The intestine cæcum of a sheep, soaked for some hours in water, turned inside out, macerated again in weak, alkaline ley, changed every twelve hours, and scraped carefully to abstract the mucous membrane, leaving the peritoneal and muscular coats exposed to the vapour of burning brimstone, and afterwards washed with soap and water. It is then blown up, dried, cut to the length of seven or eight inches, and bordered at the open end with a riband. It is drawn over the penis prior to coition, to prevent venereal infection and pregnancy.

**CONDYLE**, *Con'dylè*, *Con'dylus*, *Capitulum*, (κόνυλος, 'a knot, eminence.') An articular eminence, round in one direction, flat in the other. A kind of process, met with more particularly in the ginglymoid joints,—such as the condyles of the occipital, inferior maxillary bone, &c. Some anatomists have applied the term, however, to eminences that are not articular,—as to the lateral tuberosities at the inferior extremity of the *os humeri*, and even to certain depressions,—as to the concave articular surfaces at the upper extremity of the tibia. Chaussier calls the transverse root of the zygomatic process *Condyle of the temporal bone*.

They are four in number, seated in the occipital bone;—two anterior, and two posterior to the *condyles* or *condyloid processes* of the same bone, and to depressions, which are called *Fossæ Condyloïdes*.

As the word *Condyloïdien* means, 'that which has the shape of a condyle,' it has been judiciously proposed by some French anatomists that *condylien* should be used in preference, in the cases of the foramina and fossæ.

**CONDYLOIDIEN**, see Condyloid Foramina.

**CONDYLOMA**, gen. *Condylo'matis*, (κόνυλωμα.) *Condyloïsis*, *Con'dylus*, *Verruca carno'sa*, (κόνυλος, 'a knot,' 'an eminence,' and the termination *oma*.) part of the pharynx. It is triangular, and attached anteriorly to the great and little cornu of the os hyoides; to the stylohyoid ligament; and terminates, posteriorly, by joining its fellow of the opposite side. 3. CONTACT, *Contactus*, (con, and *tangere*, *tactum*, 'to touch,') The state of two bodies that touch each other. In the theory of contagious diseases, we distinguish *immediate or direct contact*, as when we touch a patient labouring under one of those diseases; and *mediate or indirect*

contact, when we touch, not the patient himself, but objects that have touched or emanated from him. The air is, most commonly, the medium by which this last kind of contact is effected.

CONTA'GION, *Contag'io*, *Contag'ies*, *Contagium*, *Aporrhœa*, *Apoc'rysis*. The transmission of a disease from one person to another by direct or indirect contact. The term has, also, been applied, by some, to the action of miasmata arising from dead animal or vegetable matter, bogs, fens, &c., but in this sense it is now abandoned. Contagious diseases are produced either by a virus, capable of causing them by inoculation, as in small-pox, cow-pox, hydrophobia, syphilis, &c., or by miasmata, proceeding from a sick individual, as in plague, typhus gravior, and in measles and scarlatina. [?] Scrofula, phthisis pulmonalis, and cancer, have, by some, been esteemed contagious, but apparently without foundation. Physicians are, indeed, by no means unanimous in deciding what diseases are contagious, and what not. The contagion of plague and typhus, especially of the latter, is denied by many. It seems probable, that a disease may be contagious under certain circumstances and not under others. A case of common fever, arising from *common causes*, as from cold, if the patient be kept in a close, foul situation, may be converted into a disease, capable of producing emanations, which may excite a similar disease in those exposed to them. *Contagion* and *infection* are generally esteemed synonymous. Frequently, however, the former is applied to diseases not produced by contact; as measles, scarlet fever, [?] &c., whilst *infection*, (Prov.) *Smit*, is used for those that require positive contact; as itch, syphilis, &c., and conversely. Diseases which cannot be produced in any other way than by contagion, are said to have their origin in *specific contagion*; as small-pox, cow-pox, measles, hydrophobia, syphilis, &c. Those which are produced by contagion, and yet are supposed to be sometimes owing to other causes, are said to arise from *common contagion*; as typhus, cyncanche parotidæa, &c.

CONTA'GIONIST, (F.) *Contagioniste*. One who believes in the contagious character of a particular disease,—as of yellow fever.

CONTA'GIOUS, *Contagiosus*, (F.) *Contagieux*. Capable of being transmitted by mediate or immediate contact, *Communicable*,—as a *contagious disease*, *contagious fever*, *contagious effluvia*, &c. Commonly, the epithet *infectious*, (F.) *Infectieux*, (Prov.) *To'king*, *Smit'te*, *Catch'ing*, is applied to those that are communicated by immediate contact, as itch, syphilis, &c.

CONTAGIUM, Contagion, Miasm.

It may be considered synonymous with proximate cause. A *continent fever*, *Feb'ris continens*, is one which preserves during its whole course, the same degree of intensity, without any remission or sensible exacerbation. A disease which continues uninterruptedly, has been also called *Ætiopathœa*, *Ætiopathœa* or *Ætiopathœa*.

CONTINUED FEVER, *Feb'ris continua* seu *continens* seu *anabatica* seu *assidua*. A fever which presents no interruption in its course. Continued fevers form a division in the class *Pyrexie* of Cullen, and include three genera,—*Synocha*, *Synochus*, and *Typhus*. It is proper to remark, that some of the older writers make a distinction between the continual fever, *συνεχης*, *feb'ris continua*, and the *synochus* or *feb'ris continens*. Thus, Rhases states that the *synochus* or *continens* is a fever, which consists of one paroxysm from beginning to end; whilst the *continna* is allied to intermittents.

CONTINUITY, *Continuitas*. An adhesion of two things between each other, so that they cannot be separated without fracture or laceration.

CONTINUITY, DIARTHROSES OF, (F.) *Diarthroses de Continuité*, are movable joints, in which the bones are continuous, but do not touch immediately, there being between them a ligamentous substance, whose flexibility permits motion. The vertebral articulations are examples of this. DIARTHROSES OF CONTIGUITY, *Diarthroses de Contiguité*, on the other hand, are movable articulations, in which the bones are not continuous, but touch by surfaces covered with a cartilaginous layer, which is always moistened by synovia.

CONTINUITY, LESION OF, see Continuity, solution of.

CONTINUITY, SOLUTION OF, *Solutio continuitatis*, is any division of parts, previously continuous. Wounds and fractures are *solutions of continuity*. The word *Continuity* is opposed to *Contiguity*: the latter meaning the condition of two things which are near each other, or touch without uniting. There is *contiguity* between the head of the humerus and the glenoid cavity of the scapula, but not *continuity*.

A *lesion of continuity*, *Læsio continuitatis*, is a destruction of continuity caused by disease.

CONTRACTILE, *Contractilis*, (*contrahere*, (*con*, and *trahere*, *tractum*,) 'to draw together,') Capable of contracting. The fibre of muscles is *contractile*.

CONTRACTILITÉ, Contractility—c. *par Défaute d'Extension*, Elasticity—c. *de Tissu*, Elasticity.

**CONTRACTILITY**, *Contractilitas*, (F.) *Contractilité*. That vital property, which gives, to certain parts, the power of contracting. The muscles of locomotion are endowed with a power of *voluntary contractility*, or one dependent immediately on the action of the brain:—the muscles of the viscera of digestion, and other internal organs, enjoy an *involuntary contractility*. *Contractility* and *irritability* are frequently used synonymously to signify the property possessed by any tissue of *contracting* on the application of an appropriate stimulus.

On dissection, they are found converted into tendinous fibres, the fleshy fibres having almost disappeared, when the disease has been of any duration. It frequently succeeds other diseases, particularly rheumatism, neuralgia, convulsions, syphilis, colica pictonum, &c. The warm bath, vapour bath, or thermal waters, oleaginous embrocations, mechanical extension of the limbs, &c., are the chief means of treatment.

A fracture, contusion, or injury, produced, by a blow, in a part distant from that which is struck. Five species of *contrafissuræ* or *contre-coups* may occur in the skull. 1. When the internal table yields and fractures. 2. When the bone breaks in any other part than the one struck. 3. When a bone, which has been struck, remains uninjured, and its neighbour is fractured. 4. When the bone is fractured in a place diametrically opposite to that struck, as in fractures at the base of the cranium, from a fall on the vertex; and lastly, when the violence of the blow produces a separation of the neighbouring or distant sutures. These fractures of the skull are also called *Fractures par résonance*.

**CONTRÖSTIMULANT**, *Contraestimulans*, *Hyposthen'ic*, (F.) *Hyposthe'uique*, (*contra*, and *stimulus*, 'that which excites:'), A substance that possesses a particular debilitating property, acting upon the excitability in a manner of posite to stimulus. A name given to therapeutical agents, which, according to the Italian theory of *contro-stimulus*, are endowed with the property of diminishing excitement by a specific action. These agents are by no means clearly defined.

**CONTRÖSTIMULUS** or **CONTRASTIMULUS**, *DOCTRINE OF*, (F.) *Contrestimulisme*. Same etymon. The name given by Rasori, half a century ago, to a new medical doctrine, of which he was the originator—*La uoceza Dottrina Medica Italiana*. It is founded on the *contro-stimulant*—*Rasorian*—property attributed to a certain number of medicines. In this doctrine, as in that of Brown, under the name *excitability* a fundamental principle of physiology is admitted, by virtue of which living beings are endowed with an aptitude for feeling the action of external agents or exciting influences, and of reacting on these influences. When this excitability is too great, there is excess of stimulus or *Hypersthen'ia*: when too little, there is deficiency or *Hyposthen'ia*. Diseases, *general* and *local*, are divided into three great classes, or into, 1. *Hypersthen'ic*; 2. *Hyposthen'ic*; 3. *Irritative*. The *contro-stimulant* physicians admit only two classes of medicines—*stimulants* and *contro-stimulants*.

(Same etymon as *Contunding*.) An injury or lesion—arising from the impulse of a body with a blunt surface—which presents no loss of substance, and no apparent wound. If the skin be divided, the injury takes the name of *contused wound*. The differences of contusions, as to extent, are of course infinite. When slight, the blood stagnates in the capillaries of the skin, or is effused into the subcutaneous areolar tissue. Time and cold applications remove it. When the texture has been lacerated, there is effusion of blood, with more or less torpor in the part affected. Cooling applications, general or topical bleeding, emollients, poultices, &c., are here necessary, according to circum-

stances. In the severest kinds of contusion, all the soft and solid parts, except the skin, are bruised, and, at times, reduced to a kind of pap. When the disorganization is to this extent, there is no hope except in amputation. A deep contusion of the soft parts has been called *Sarcothylasis*, and *Sarcothylasis*.

Cullen uses the word synonymously with *Dysæccæa*, and Pinel with *Paraco'u'sia* or *Paraco'œ*. According to Sauvages, *Cophosis* differs from both,—from *Dysæccæa*, because in it the sonorous rays cannot reach the labyrinth; and from *Paraco'u'sia*, which consists in a confused state of hearing.

CORACOBRA'CHIAL, *Cor'acobrachia'lis*. Belonging both to the coracoid process and arm.

CORACOBACHIA'LIUS (Muscle), *Coracobrachie'us*, *Coraco-humeral* — (Ch.), *Perfor'atus CASSE'RII*, *Perfor'atus*, is situated at the inner and upper part of the arm. It arises from the coracoid process of the scapula, and is inserted at the middle part of the inner side of the humerus. It carries the arm forwards and inwards, raising the humerus a little. It can, also, by acting inversely, depress the shoulder.

**CORACOCALVICULAR**, *Coracocalvicularis*. Belonging to the coracoid process and clavicle.

**CORACOCALVICULAR LIG'AMENT**—called, also, *Omoacalvicular*—serves to unite the clavicle to the coracoid process. It is very irregular, and formed of two fasciculi, which the greater part of anatomists have described as particular ligaments, under the names *Coinoid* and *Trapezoid*.

One of the most beautiful productions of the deep. It is fixed to submarine rocks, in the form of a shrub, and is of a bright red colour. It is the habitation of a multitude of animals, of the Zoophyta order, and is formed of a calcareous substance, secreted by the animals themselves. It is in very hard, concentric layers; covered, externally, by a species of porous bark full of cellulæ, each of which contains one of these animals. Linnaeus calls the red coral *I'sis nobilis*, and M. de Lamarck, *Corallium rubrum*. It is much fished for on the coasts of Barbary and Sicily. Coral was formerly esteemed tonic, absorbent, astringent, &c.; but analysis has shown, that it contains only carbonate of lime and a little gelatin. *Corallium album* is a hard, white, calcareous, brittle substance, the nidus of the *Madrep'ora oculata*. It has been given as an absorbent.

The production of an animal, which belongs to the class *Pol'ypi*, and which is found in all the seas of Europe;—particularly in the Mediterranean. It has the appearance of a plant, is homogeneous, an inch or two in height, of a white, reddish, or greenish colour, salt taste, and marine smell. It contains gelatin, albumen, chloride of sodium, phosphate, carbonate, and sulphate of lime, carbonate of magnesia, silica, oxide of iron, and a colouring principle. **CORIUM PHLOGIS'TICUM**, *Crus'ta pleuret'ica* seu *inflammato'ria* seu *phlogis'tica*, *Peg'min*, *Inflam'matory Crust* or *Buff*, *Buffy Coat*, (F.) *Couenne*, *C. Pleurétique*, *C. Inflammatoire*. The grayish crust or buff, varying in thickness, observed on blood drawn from a vein during the existence of violent inflammation, pregnancy, &c. It is particularly manifest in pleurisy, and hence one of its names. For its production, it appears to be requisite that there should be an increase in the proportion of the fibrinous element of the blood over that of the red corpuscles, with augmented aggregation of those corpuscles. The blood is then longer in coagulating, and the red corpuscles have time to subside. In highly inflammatory conditions, the buffy coat assumes a concave appearance on its upper surface, and the blood is, therefore, said to be *cupped*. Polli gave to the coagulative substance the name *brad'yji'brin*. It is the ordinary fibrin of the blood,—the only self-coagulable ingredient in it.

When the blood presents the above appearance, it is said to be *buffy* or *sizy*.

**CORN**, (Saxon *corn*.) (G.) *Kern*. In England, this word means the *Cerealia*, or those seeds which grow in ears, not in pods. In the United States *Corn* always means *Indian Corn*. Its English sense corresponds to the French *Blé* or *Bled*.

**CORN**, (from *cornu*, 'a horn,') *Cla'vus*, *Cla'vus Pe'dis*, *Ecphy'ma Cla'vus*, *Gemur'sa*, (F.) *Cor*, *Ognon*. A small, hard, corneous tumour, which forms upon the foot, generally on the toes; and is commonly produced on the most projecting parts by the pressure of too tight shoes. A part of the corn is raised above the skin, and forms a round tumour, like the head of a nail: the other portion, which serves as its base, is buried more or less deeply in the integuments, and occasionally extends as far as the tendons and periosteum. Corns may, sometimes, be removed, by immersing the feet in warm water, but commonly they return. They can, likewise, be destroyed by the knife or caustic, or by paring them down and pulling them out by the roots; but these operations are not always as simple as they seem. In the way of palliation, they must be constantly pared; and for the purpose of preventing pressure, any soft plaster, spread upon linen or leather, may be applied, with a hole in the centre to receive the corn; and layer after layer of plaster be added, until they attain the level of the corn. When very irritable, lunar caustic, rubbed over the surface, will generally diminish irritability surprisingly, and in a mode not easy of explanation.

It is termed *transparent* to distinguish it from the *opaque*—*Cornica opa'ca* or *Sclero'tica*. It is convex, anteriorly; concave, posteriorly; forming nearly one-fifth of the anterior part of the eye, and representing a segment of a sphere, about seven lines and a half, or in. 0.625 in diameter. *calcinée, Phosphate de chaux*, which consists of 57.5 per cent. of phosphate of lime. It has been used as an antacid, but is wholly inert, as its composition would indicate. It contains only 1 per cent. of carbonate of lime.

Phosphate of lime has also been given in osteomalacia, from a presumption that the disease is owing to a deficiency of earthy matter in the blood, which is doubtless an error—the fault being in the agents of assimilation or the cells of nutrition. With as little propriety, it has been proposed as an excitant to the healthy action of the cells in tuberculosis.

*Bone earth* is usually sold in the shops for burnt hartshorn.

The British Pharmacopœia (1864), and the Pharmacopœia of the United States, have a *Cornu Phosphas Præcipitata*, *Præcipitated Phosphate of Lime*, prepared by dissolving burnt ox bones in muriatic acid, and precipitating by solution of ammonia. They have also been found sparingly and inconstantly in nerves at the wrist and elbow, the upper arm, fore-arm, and thigh, and in the inter-costal nerve, the sacral plexus, solar plexus and the plexuses adjacent to it. CORTEX OVI, *Cortical mem'brane*. This membrane, so called by Boer and Granville, is usually regarded as a uterine production, and designated *Decidua reflex'a*. They consider it to surround the ovule, when it descends into the uterus, and

to enclose the shaggy chorion. It is absorbed during the first months of utero-gestation, so as to expose the next membrane to the contact of the decidua, with which a connexion takes place at the part where the placenta is to be formed. In that part, Boer and Granville consider, that the Cortex Ovi is never altogether obliterated, but only made thinner, and in process of time is converted into a mere pellicle or envelope, which not only serves to divide the filiform vessels of the chorion into groups or cotyledons, in order to form the placenta, but also covers those cotyledons. This, Dr. Granville calls *membra'na propria*. See Decidua membrana.

(F.) *Craniologie*, *Cranioscopie*. Words introduced, since Gall, into medical language. (The first two terms are respectively derived from *crânio*, *λογος*, 'a discourse,' and *σκοπειν*, 'to examine,') They signify a description, or simply an examination, of the different parts of the external surface of the cranium, in order to deduce from it a knowledge of the different intellectual and moral dispositions. Strictly speaking, it is by *Crâniology* or *Organology* that we acquire a knowledge of *Craniology*, *Organology*, or *Craniology*, as it has been variously termed. These words are generally, however, used in the same sense. The cranium being moulded to the brain, there are as many prominences on the bone as there are projections at the surface of the brain. According to Gall, each projection, which he calls an *organ*, is the seat of a particular intellectual or moral faculty, and all persons endowed with the same faculty, have, at the same part of the brain, a prominence, which is indicated, externally, by a bump or projection in the bony case. The *System* of Gall is made to comprise 27 prominences, which answer to 27 primary faculties.

A fundamental principle with the *Craniologists* or *Phrenologists* is,—that the brain does not act as a single organ, but that it consists of a plurality of organs; but, were we able to admit this, the assignment of the seat of different faculties could not but be considered premature.

The collection of bones which form the case for lodging the brain and its membranes, as well as their vessels, and some of the nerves. These bones are eight in number,—the *frontal*, *occipital*, *two parietal*, *two temporal*, the *sphenoid*, and *ethmoid*. Besides these, there might be considered, as belonging to the cranium, the *cornua sphenoidalia*, the bones of the ear. and the *ossa Wormiana*. By the action of strong acids, creatine is converted into *Cre'atinia* or *Kre'atinia*, a substance which has a strong alkaline reaction, and forms crystallizable salts with acids. It preëxists to a small extent in the juice of flesh; and is found in conjunction with creatin in urine.

The cremaster is a very thin muscular fascia—sometimes hardly perceptible—which de-

taches itself from the internal oblique muscle; passes through the abdominal ring, and vanishes around the tunica vaginalis; serving to draw up the testicle, and to move it slightly. It has been, also, called *Tu'nica Erythroï'des* and *Suspendo-rium Testis*.

*Râle Crépitant Sec de Laënnec, R. vésiculaire*. The *crep'itant râle, Crepita'tio vésicula'ris*, heard, during respiration, in severe pneumonia and in œdema of the lung; so termed on account of the analogy between the sound and that occasioned by pressing a healthy lung between the fingers. It resembles the sound produced by rubbing slowly and firmly between the finger and thumb a lock of hair near the ear. The *Rhou'chus crep'itans redux*, (F.) *Râle crépitant re'dux*, is the sound heard in respiration coexistent with the resolution of pneumonia. CRITICAL DAYS, *Dies Critici* seu *Judicatorii* seu *Decretorii* seu *Principes* seu *Radicales* seu *Contemplabiles* seu *Interimicci*, (F.) *Jours critiques*, are those on which a crisis, it is imagined, is most likely to happen. According to Hippocrates and Galen, the greatest number of fevers terminate favourably on the 7th day; and many on the 14th;—these two days being the most propitious. Next to these come, in order of efficiency, the 9th, 11th, 20th or 21st, 17th, 5th, 4th, 3d, 18th, 27th, and 28th. The sixth day was called, by Galen, the *Tyrant*, τυραννος, because the crises that happened then were generally unfavourable. After this, the most unfavourable were the 8th, 10th, 12th, 16th, and 19th. The 13th was a sort of neutral day; the crises which happened on it being neither favourable nor unfavourable. Days were, also, divided into *Intercalary*, on which the crises happened less frequently, and were less complete than on the *critical* or *indicatory*;—and into *vacant* and *non-decretory*, on which a crisis hardly ever occurred. According to this division, they were enumerated as follows:—

Critical days.....7th, 14th, 20th, 27th, 34th,  
40th, 60th, &c.

Indicatory days.....4th, 11th, 17th, 24th, &c.

Intercalary days.....3d, 5th, 6th, 9th, &c.

Non-decretory days....2d, 8th, 10th, 12th, 13th, &c.

Fortunate crises were considered to be indicated by favourable signs appearing three days before.

CRURÆUS, *Cruralis*.

CRURAL, *Cruralis*, (*crus*, gen. *cruris*, 'the thigh, and lower limb,') What belongs to the thigh or lower limb.

CRURAL, *Triceps cruris*.

CRURAL ARCH, *Inguinal* or *Femoral Arch*, (F.) *Arcade crurale* ou *inguinale*, (Ch.) *Poupart's Ligament*, *L. of Fallopius*. This arch is formed by the internal portion of the inferior edge of the aponeurosis of the obliquus externus muscle, which is attached, at one end, to the pubis; at the other, to the anterior and superior spinous process of the ilium. At its posterior and inner part, the aponeurosis, forming the arch, sends off a fasciform reflection, which is attached along the crest of the pubis, and is known under the name of *GIMBERNAT'S Ligament*. Beneath this arch, the vessels, nerves, and muscles make their exit from the pelvis to the thigh.

CRURAL ARTERY, *Arteria Cruralis*, *Femoral Artery*, (F.) *Artère crurale*, is the continuation of the external iliac. It extends from the crural arch to the aperture in the triceps, or to the ham. *Chaussier* applies the name *Artère crurale* to the trunk, which extends from the primitive or common iliac to the tibial arteries—embracing, of course, the external iliac, femoral, and popliteal.

CRURAL CANAL, *Crural Ring*, *Femoral canal* or *ring*. *M. Jules Cloquet* has described this canal with minuteness, and given it the name *Anneau crural*, *Anneau fémoral*. It is nearly an inch long, triangular, more spacious above than below, and shorter and broader in the female than in the male. Its upper orifice is bounded, anteriorly, by the crural arch; posteriorly, by the crista of the pubis; on the outer side by the psoas and iliacus muscles, covered by the iliac aponeurosis, and, at the inner, by *Gimbernat's ligament*. This orifice is covered by the peritoneum, and, according to *M. Cloquet*, is closed by a more or less resisting septum, which he has named *Septum crurale*, *Crural Septum*. In its course, the crural canal has its anterior parietes formed by the superficial expansion of the fascia lata: the posterior by the pectineus, covered by the deep-seated expansion of the fascia; and more externally by the psoas and iliacus muscles, covered by an expansion of the *fascia iliaca*. Its inferior orifice is formed by the foramen of the fascia lata, which gives passage to the vena saphæna. It is at the upper orifice of this canal, that *Femoral* or *Crural Hernia*, *Hernie inguinale* of *Chaussier*, occurs; which would be more common, were it not for the fibrous cellular septum there situated.

CRURAL NERVE proceeds from the lumbar plexus, and is situate at the outer side of the psoas muscle and crural artery. After it has passed under the crural arch, it divides into cutaneous and muscular branches. One of the branches, which is larger than the rest, is called the *Saphæna nerve*. It gives off filaments to the integuments of the knee, to the inner part of the leg, and to the dorsal surface of the foot. The remainder of the branches of the *crural* are distributed to the anterior and inner part of the thigh. The *Accessory of the Crural Nerve* is a term given to the 4th and 5th pairs of lumbar nerves.

CRURAL PLEXUS of *Chaussier* is the union of the anterior branches of the last four pairs of lumbar nerves, and the first four sacral; forming the *lumbar* and *sacral* plexuses of most anatomists.

CRURAL RING, *Crural canal*—c. *Septum*, see *Crural canal*.

CRURAL VEIN, *Femoral vein*, has the same arrangement as the artery. It receives only one great branch, the saphæna.

CRURALIS, *Cruræus*. A part of the *Triceps*

*crural* of the French, or of the *Trifemorotulien* of Chaussier. The *crural* is situate at the anterior, outer, and inner part of the thigh. It arises, fleshy, from between the two trochanters, adheres firmly to most of the fore part of the os femoris, and is inserted, tendinous, into the upper part of the patella, behind the rectus. Its use is to assist the vasti and rectus in the extension of the leg. Under *Muscle Triceps Crural*, the French describe the *cruralis* and the two vasti. Some small muscular slips, sometimes found under the *cruræus* muscle, and inserted into the capsular ligament of the knee-joint, have been called *Sub-cruræi*.

CUBITAL ARTERY, *Arteria cubitalis*, *A. ulnaris*, arises from the humeral a little below the bend of the elbow; proceeds along the anterior and inner part of the forearm; passes anterior to the ligamentum annulare of the carpus, and goes to form, in the palm of the hand, the superficial palmar arch. Besides the numerous muscular branches, which it gives off in its course, it sends posteriorly the common trunk of the *interosseous arteries*, and internally, the two *cubital recurrents*, anterior and posterior,—articular branches, which anastomose on the inside of the elbow with the divisions of the humeral artery.

The *Cubitalis anterior* seu *inter'us*, *Flex'or car'pi ulnaris*, *Ulnaris inter'us*, *Epitrochlo-cubito-carp'ien*, *Cubito-carp'ien*—(Ch.), is a long muscle, situate at the anterior and inner part of the forearm. An ointment composed of one drachm of finely-powdered verdigris, with an ounce of lard or spermaceti ointment, is used in psoriasis, tetter, &c.

In its metallic state, it exerts no action on the system. When swallowed, it undergoes no deleterious change. Copper cannot be dissolved whilst tin is in the mixture, and hence the utility of tinning copper vessels. Copper culinary vessels are harmless under ordinary cleanliness, provided the substances be not suffered to remain in them till cold. The salts of copper are very deleterious.

The juice of *Echites subere'ta*, another apocynaceous plant, is said to enter into its composition. Dr. Brainard thinks it contains the venom of serpents as its main ingredient. Two new varieties of Curare have been investigated by Dr. Hammond of the United States Army, and Dr. S. W. Mitchell,—*carrov'al* and *vao*,—the latter of which is less energetic, but both appear to contain the same active alkaloid—*carrov'al'ia*. CUTANEOUS EXHALATION AND ABSORPTION are those which take place from the skin.

CUTANEOUS, MIDDLE POSTERIOR, see Sciatic nerve, lesser.

CUTANEOUS NERVES, *Cuta'neal Nerves* so called, of the upper extremity, are two in number. They are given off from the brachial plexus. The *internal cutaneous*, *Cubito-cutané*—(Ch.)—descends along the inner part of the arm, and divides above the elbow into two branches; the outermost of which follows the outer edge of the biceps, and spreads over the anterior and inner part of the forearm; and the innermost accompanies the basilic vein, passing to the corresponding side of the hand and little finger. The *external cutaneous*, *Radio-cutané* (Ch.) *Musculo-Cuta'neus*, *Perforans CASSE'RII*, passes outwards; perforates the coraco-brachialis; descends along the anterior and outer part of the arm; passes as far as the middle fold of the elbow under the median cephalic; and descends along the anterior and outer edge of the forearm. At some distance above the wrist, it divides into two branches; an *outer*, which is distributed on the back of the hand, the thumb and index finger; and an *inner*, which descends on the muscles of the thumb into the palm of the hand, and divides into fine filaments, which may be traced to the fingers.

*Cutanens nerves*, *Mid'dle cut'aneous*, two in number, are branches of the crural or femoral nerve. They are distributed to the integument of the middle and lower part of the thigh and of the knee.

*Nervus Cuta'neus Mi'nor*, *Les'ser inter'nal cut'aneous nerve*, *Nerve of Wris'berg*, takes its origin from the axillary plexus, but is more particularly connected with the ulnar nerve. It soon separates from the ulnar, running afterwards between it and the inner side of the arm. A little below the axilla it divides into two branches, which are distributed to the arm.

Chaussier calls the *cephalic* and *basilic veins* the *Ra'dial* and *Cu'bital Cuta'neous*.

A dense, resisting membrane, of a flexible and extensible nature, which forms the general envelope of the body; and is continuous with the mucous membranes, through the different natural apertures. It is generally considered to be formed of three distinct layers—the *epidermis*, *rete*, or more properly *corpus mucosum*, and *corium* (*cutis vera*, *derma*). Some anatomists, however, separate it into several others. Its outer surface is covered by a number of small eminences, called papillæ, which are generally regarded as essentially nervous and vascular. The skin is a medium of communication with external bodies. It protects the subjacent parts; is the seat of touch; and through it are exhaled the watery parts of the blood, which are not needed in the nutrition of the body. The state of the skin, as regards heat and dryness, affords useful information in pathological investigations. Its colour, too, requires attention: the paleness of disease is as characteristic as the rosy complexion of health. The colour of the skin varies according to the age, sex, &c. As a general rule, it is finer in the female and child than in the male and adult. In old age it becomes light-coloured, thin, and dry. It likewise varies according to races, &c.

munication remaining between the cavities of the right and left side of the heart; *Patency of the foramen ovale*, *Acleitocardie* of Piorry. Such communication does not, however, always occasion the *blue disease*, but it is generally thought that the disease never exists without this state of parts; or without some obstacle to the circulation in the right side of the heart. The blueness does not seem to be owing to the admixture of black and red blood. A child affected with blueness is said to be *cyanoœd*, (F.) *Cyanoœd*.

It is characterized by crimson redness of the mucous membrane of the fauces and tonsils; ulcerations, covered with mucus; and spreading sloughs, of an ash or whitish hue; the accompanying fever typhus. It is often epidemic, and fancied to be contagious [?]; and is frequently found accompanying scarlet fever, giving rise to the variety, *Scarlat'ina mali'na*, *Canker rash*. *Cynanche maligna* has been made to include both diphtheritic and gangrenous pharyngitis. See *Pharyngitis*, *diphtheritic*.

The general treatment is the same as in typhus; and stimulant antiseptic gargles must be used, consisting, for example, of the decoction of bark and muriatic acid, a solution of chlorate of potassa, &c.

CYNANCHE MAXILLARIS, c. *Parotidæa*—c. *Æsophagea*, *Æsophagitis*.

CYNANCHE PAROTIDÆA, *C. Parotid'is* seu *exter'na* seu *maxilla'ris*, *Empres'ma Parotit'is*, *Parotit'is*, *P. epidem'ica* seu *erysipelato'sa* seu *contagio'sa* seu *spu'ria* seu *sero'so glutin'è tumens*, *Parot'ia*, *Parotidit'is*, *Angi'na maxilla'ris* seu *exter'na* seu *parotid'ea exter'na*, *Gis'sa*, *Erythroch'æras*, *Genocynanch'æ*, *Gnathocynanch'æ*, *Inflammat'io parotidum*, *Inflat'io parotidum*, *Catar'rh'us Bellinsul'dnus*, *Mumps*, *Branks* (Scotch), (F.) *Inflammation de la Parotidē*, *Oreillons*, *Ourtles*. The characteristic symptoms are:—a painful tumor of the parotid gland, or of the areolar tissue surrounding it, or of both, not of the suppurative kind; frequently extending to the maxillary gland. It is very conspicuous externally, and is often accompanied with swelling of the testis in the male, and of the mammæ in the female; the testes being sometimes absorbed afterwards. It is generally epidemic, and apparently contagious. [?] The treatment is very simple; the adoption merely of the antiphlogistic plan, under which it usually soon disappears. When inflammation of the mammæ or testes supervenes, it must be treated as if idiopathic.

*Epidem'ic Parotit'is* or *Mumps* is also termed *Parotit'is polymor'pha* seu *epidem'ica* seu *specif'ica*.

CYNANCHE PHARYNGE'A, *Empres'ma Paristhm'itis* *Pharyng'ea*, *Isthm'itis*, *Pharyngit'is*, *Inflammat'io Pharyng'is*, *Parasyan'chē*, *Angi'na inflammat'oria*, Sp. iv. of Boerhaave. (F.) *Angine Pharyng'æ*, *Catarrhe pharyngi'æ*. Inflammation of the pharynx.

This disease can hardly be said to differ, in pathology or treatment, from *Cynanche tonsillar'is*. The same may be remarked of *Cyan'chē* *Æsophage'a*, *Æsophagit'is*.

CYNANCHE PRUNELLA, *C. Tonsillar'is*—c. *Purpuro-parotidæa*, *Cynanche maligna*—c. *Simplex*, *Isthmitis*—c. *Stridula*, *C. trachealis*.

The characteristic symptoms of this affection are, swelling and florid redness of the mucous membrane of the fauces, and especially of the tonsils; painful and impeded deglutition, accompanied with inflammatory fever. It is generally ascribed to cold, and is one of the most common affections of cold and temperate climates. It usually goes off by resolution, but frequently ends in suppuration.

Common sore throat is an affection of no consequence. It requires merely rest, and the observance of the antiphlogistic regimen. When more violent,—in addition to this,—bleeding, local or general, or both,—purgatives, inhalation of the steam of warm water; acid, or emollient gargles; rubefacients externally, or sinapisms or blisters. When suppuration must inevitably occur, the continued use of the inhaler must be advised, and an opening be made into the abscess as soon as pus shall have formed. If the patient be likely to be suffocated by the tumefaction, bronchotomy may be necessary.

A disease characterized by sonorous and suffocative breathing; harsh voice; cough, ringing, or like the barking of a dog; fever, highly inflammatory. It is apt to be speedily attended with the formation of a false membrane, which lines the trachea beneath the glottis, and occasions violent dyspnoea and suffocation, but is sometimes expectorated. The dyspnoea, as in all other affections of the air-passages, has evident exacerbations. It differs in its character in different situations; being infinitely more inflammatory in some than in others,

and hence the success obtained from different modes of treatment. It chiefly affects children, and is apt to recur, but the subsequent attacks are usually less and less severe.

As a general rule, it requires the most active treatment; bleeding from the arm or neck, so as to induce paleness; leeches applied to the neck, &c., according to the age,—the warm bath, blisters to the neck or chest, and purgatives. Formidable as the disease may be, if this plan be followed early, it will generally be successful. Many specifics have been recommended, but the search has been idle and fruitless. The majority of cases of what are called croup are not of this inflammatory cast; but are more of a spasmodic character, and have been termed by the French *faux croup*, *false croup*, and with us are occasionally termed *spasmodic croup*. They generally yield to an emetic and the warm bath.

It is commonly dependent upon an inflammatory or subinflammatory condition of the lining membrane.

Some of the turpentes may, at times, be given with advantage; and astringent or other appropriate injections be thrown into the bladder.

Definitive cessation of all the functions, the aggregate of which constitute life. *Real Death*, *Apothanasia*, is distinguished from *asphyxia* or *apparent death*—the latter being merely a suspension of those same functions. But it is often difficult to judge of such suspension, and the only certain sign of *real death* is the commencement of putrefaction. At times, therefore, great caution is requisite to avoid mistakes. Death is commonly preceded by some distressing symptoms, which depend on lesion of respiration, circulation, or of the cerebral functions, and which constitute the *ag'ony*. That which occurs suddenly, and without any, or with few, precursory signs, is called *sud'den death*. It is ordinarily caused by disease of the heart, apoplexy, the rupture of an aneurism, or by some other organic affection. Death is *natural*, (Sc.) *Strae-death*, when it occurs as the result of dis-

case violent, when produced by some forcible agency. It may likewise affect the whole body, or a part only; hence the difference between somatic and molecular death.

The chief varieties of the modes of death usually admitted may be thus given

|  |   |
|--|---|
| Death beginning at the heart,          | { sudden — Syncope: gradual — Asthenia. |
| “ “ in the lungs                       | — Apnoea.                               |
| “ “ in the brain                       | — Apoplexy.                             |
| “ “ in the gray matter of the medulla, | { Paralysis of pneumogastriacs, &c.     |
| “ “ in the blood                       | [?] — necræmia.                         |

As it was at one time conceived, with Bichat, that death must commence in the heart, lungs, or brain, these organs were called *a'tria mortis*, 'the halls of death.'

DEATH, APPARENT, Asphyxia.

DEATH, BLACK, *Melanothan'atus*, *Pestis nigra*, *Black Plague*, (F.) *Peste noire*. The plague of the 14th century was so called, which is supposed to have proved fatal in Europe to 25,000,000 of people.

DEATH OF MAN, *Cicuta maculata*—d. Rate, see Mortality—d. Stiffening, Rigor mortis—d. Trance, see Asphyxia.

DEAURENTUR PILULÆ, 'let the pills be gilded.' Formerly it was the practice to coat pills with silver or gold leaf, and this is still done occasionally.

DÉBANDER (F.), (*de* and *bande*, 'a bandage.') To remove a bandage or dressing,—as *débander une plaie*.

DEBILIS, ('weak,') Infirm. See the next word.

DEBILITANTS, *Debilitan'tia*, *Antidynam'ica*, *Philadynam'ica*, (*debilitare*, itself from *debilis*, quasi *dehábilis*, 'weak,' 'to weaken.') Remedies exhibited for the purpose of reducing excitement. Antiphlogistics are, hence, debilitants.

DEBILITAS, gen. *Debilitatis*, Debility — d. Erethisica, see Irritable — d. Nervosa, Neurasthenia, see Irritable — d. Visûs, Asthenopia.

DEBILITY, *Debilitas*, *Asthen'ia*, *Hyposthen'ia*, *Blaci'a*, *Anenerge'sia*, *Anenergi'a*, *Weakness*, (F.) *Faiblesse*. A condition, which may be induced by a number of causes. It must not be confounded with *fatigue*, which is temporary, whilst debility is generally more permanent.

Debility may be *re'al*, or it may be *apparent*; and, in the management of disease, it is important to attend to this. At the commencement of fever, for example, there is often a degree of apparent debility, which prevents the use of appropriate means, and thus is the cause of much evil. Excitement is more dangerous than debility.

DÉBOITEMENT, (*de*, and *boiter*, 'to be lame,') Luxation.

DEBORDEMENT (F.), *Déborde*, (*déborder*, 'de, and border,') 'to overflow.' A popular term for one or more sudden and copious evacuations from the bowels. It is chiefly applied to bilious evacuations of this kind.—*Débordement de Bile*.

DÉBRIDEMENT (F.) *Fræno'rum solutio*, (*débrider*, (*de*, and *brider*,) 'to unbridle,') The removal of filaments, &c., in a wound or abscess, which prevent the discharge of pus. In a more general acceptation, it means the cutting of a soft membranous, or aponeurotic part, which interferes with the exercise of any organ whatever; thus, in paraphimosis, *débridement* of the prepuce is practised to put an end to the inflammation of the glans; in strangulated hernia, *débridement* of the abdominal ring is had recourse to, to remove the stricture of the intestine, &c.

DEC'AGRAMME, (*δεκα*, 'ten,' and *γραμμα*, 'a gramme,') The weight of ten grammes, 154.34 grains Troy.

DECAM'YRON, (*δεκα*, 'ten,' and *μυρον*, 'ointment,') An ancient cataplasm, composed of *mullabathrum*, *mastich*, *euphorbium*, *spikenard*, *styrac calamita*, carbonate of lime, common pepper, *unguentum nardi*, *opobalsamum*, and wax.

DECANTA'TION, *Decanta'tio*, (from *decantare*, (*de*, and *cantare*,) 'to sing or repeat over and over,' or from *de*, and (D.) *kant*, 'a corner; hence 'to cant,' 'to set on edge in order to decant or pour off,' [?] *Defu'sio*, *Metangism'us*, *Cutuch'ysis*. A pharmaceutical operation, which consists in pouring off, gently, by inclining the vessel, any fluid which has a deposit.

DECAPITATIO, Decollation—d. *Articulorum*, see Resection.

DECAPITATION, (*de*, and *caput*, gen. *capitis*, 'head,') Decollation.

DECARBONIZATION, Hæmatisis.

DECEASE, (*decedere*, *decessum*, (*de*, and *cedo*,) 'to depart,') Death.

DECESSIO, Ectipiesma.

DÉCHAPÉLLEMENT, (*de*, and *chapeau*, from *caput*, 'head,') An old French term, employed by Paré and others for the operation of cutting and removing, with a strong forceps, the corona of a carious tooth, where it is desired to preserve the fang.

DÉCHARNÉ, (*de*, and *chair*, 'flesh,') Demusculatus.

DÉCHAUSSEMENT (F.), (*de*, and *chausser*, 'to put on shoes and stockings,') The state in which the gums have fallen away from the teeth, as in those affected by mercury, in old persons, &c. Also, the operation of lancing the gums. See Gum lancet.

DÉCHAUSSOIR, Gum lancet.

DÉCHIRÉ, Lacerum.

DÉCHIREMENT, (from *dilacerare*, (*di*, and *lacerare*, 'to tear,') 'to tear to pieces,') Laceration.

DÉCHIRURE, Wound, lacerated—d. *de l'Utérus*, Uterus, rupture of the.

DECIDENTIA, (*decidere*, 'to fall off,' *de*, and *cadere*, 'to fall,') Catapostis, Epilepsy.

DECIDUA, *Decidua membrana*.

DECID'UA MEMBR'NA, *Decid'na*, *Decid'uons Mem'brane*. So called on account of its being considered to fall off from the uterus at parturition. A membrane, formerly defined to be the outermost membrane of the fetus in utero; and still so defined by some—as by Dr. Lee. Chaussier calls it *Perio'na*, *Membra'na cadu'ca Hunteri*, *M. flocculent'a* seu *cellulo'sa* seu *sinuo'sa* seu *communis* seu *præexistens*, *Decid'na exter'na* seu *spongio'sa*, *Tu'nica exter'ior o'vi* seu *cadu'ca seu eras'o'sa*, *Membra'na cribro'sa seu o'vi mater'na* seu *muco'sa* seu *u'teri intern'a evolu'ta*, *Epio'né*, *Placen'ta u'teri succenturiat'a*, *Subplacen'ta*, *Nidamentum*, *Anhisto'us mem'brane*, (F.) *Caduque*, *C. vraie*, *Membrane caduque*, *Épione*, *Périone*;—prior to the time of the Hunters, called *Cho'rium spongio'sum*, seu *tomento'sum* seu *sungo'sum* seu *reticulatum*, *Tu'nica filamento'sa*, *Shag'gy Cho'rium*, *Spon'gy Cho'rium*, &c. Great diversity has prevailed regarding this membrane and its reflected portion. It exists before the germ arrives in the uterus—and it has been met with in tubal and ovarian pregnancies; and is occasioned by a new action, assumed by the uterine vessels at the moment of conception. Chaussier, Lobstein, Gardien, Velpeau, and others, consider it to be a sac, without apertures, completely lining the uterus, and that when the ovum descends through the tube it, pushes the decidua before it, and becomes envel-

oped in it, except at the part destined to form the placenta. That portion of the membrane which covers the ovum, forms the *Membra'na decid'ua reflex'a*, (F.) *Caducque réfléchie*, *Membrane caducque réfléchie*, according to them; and the part lining the uterus being the *Decid'ua uteri*, (F.) *Caducque utérine*. Towards the end of the fourth month, the decidua reflex disappears. The very existence of a *Tu'nica decid'ua reflex'a* has, however, been denied. This last membrane has received various names. Dr. Granville, regarding it as the external membrane of the ovum, has termed it *Cort'x o'vi*. It has also been termed *Involv'crum membrana'ceum*, *Membra'na retiform'is cho'r'ii* seu *filamento'sa* seu *adventit'ia* seu *cras'sa*, *O'vuline* and *Decid'ua protr'u'sa*. To the membrane which, according to Bojanus and others, is situate between the placenta and the uterus, and which he considers to be produced at a later period than the decidua vera, he gave the name *membra'na decid'ua sero'tina*, (F.) *Membrane utéroëpichoriale Caducque sérotine* ou *secondaire*.

Histological researches seem to show, that the decidua is an altered condition of the lining membrane of the uterus, with a whitish secretion filling the uterine tubular glands. The decidua reflexa is probably formed by the agency of nucleated cells from the plastic materials thrown out from the decidua uteri; in the same manner as the chorion is formed in the Fallopian tube from plastic materials thrown out from its lining membrane. That the decidua reflexa is not a mere inverted portion of the decidua uteri is shown by the fact, that the texture of the two is by no means identical.

DECIDUA PROTRUSA, Decidua reflexa.

DECIDUOUS MEMBRANE, Decidua (membrana).

DEC'GRAMME, *Decigram'ma*, (*decimus*, 'the tenth part,' and *γραμμα*, 'gramme.')

The tenth part of the gramme in weight; equal to a little less than two grains, French; 1.543 Troy.

DECIMA'NA FE'BRIS, (*decem*, 'ten.')

An intermittent, whose paroxysms return every 10th day or every 9 days. It is supposititious.

DECLAMA'TION, *Declama'tio*, (*de*, and *clamare*, *clamatus*, 'to cry out.')

The art of depicting the sentiments by inflections of the voice, accompanied by gestures, which render the meaning of the speaker more evident, and infuse into the minds of the auditors the emotions with which he is impressed. Declamation may become the cause of disease; the modification, produced in the pulmonary circulation,—accompanied by the great excitement, sometimes experienced,—is the cause of many morbid affections; particularly of pneumonia, hæmoptysis, and apoplexy. In moderation, it gives a healthy excitement to the frame.

DÉCLIN, Decline.

DECLINATIO, (*de*, and *clinare*, *clinatum*, 'to bend.')

Decline.

DECLINE', *Declina'tio*, *Inclina'tio*, *Decrementum*, *Remis'sio*, *Parac'mē*, *Parac'masis*, (F.) *Déclin*. That period of a disorder or paroxysm, at which the symptoms begin to abate in violence, (F.) *Décours*. We speak, also, of the decline of life, or of the powers, (F.) *Déclin de l'age*, *L'age de déclin*, when the physical and moral faculties lose a little of their activity and energy. See Phthisis, and Tabes.

DÉCLIVE (F.), *Decl'vis*, (*de*, and *clivis*, 'acclivity.')

Inclining downwards. This epithet is applied to the most depending part of a tumour or abscess.

DÉCOCTÉ, Decoction.

DECOCT'ION, *Decoc'tio*, (*decoquere*, (*de*, and *coquere*, *coctum*), 'to boil.')

*Eps'e'sis*, *Apoz'e'sis*, *Ze's'tis*, *Heps'e'sis*, *Aphep'sis*, (F.) *Décoction*. The

operation of boiling certain ingredients in a fluid, for the purpose of extracting the parts soluble at that temperature. Decoction, likewise, means the product of this operation, to which the terms *Decoc'tum*, *Ze'ma*, *Apheps'e'ma*, *Ap'ozem*, *Apoz'e'ma*, *Heps'e'ma*, *Chyl'us*, and *Eps'e'ma*, (F.) *Décocté*, *Hydro'lé*, *Hydro'lite*, have been applied according to ancient custom, in order to avoid any confusion between the operation and its product;—as *præparat'io* is used for the act of preparing; *præparat'um*, for the thing prepared.

The feces generally accumulate in the colon, being prevented by the annulus at the top of the rectum from descending freely into that intestine. In producing evacuations, therefore, in obstinate constipation, it is well, by means of a long tube, to throw the injection, into the colon.

Thus, *Apium* was warm in the *first* degree, *Agrimony* in the *second*, *Roche Alum* in the *third*, and *Garlic* in the *fourth*. *Bedegar* was cold in the *first*, the flower of the *Pomegranate* in the *second*, the *Sempervivum* in the *third*, *Opium* in the *fourth*, &c. The French use the term *degré* to indicate, 1. The in-

tensity of an affection: as a burn of the *first*, *second*, *third*, *degree*, &c. 2. The particular stage of an incurable disease, as the *third degree* of phtthisis, cancer of the stomach, &c.

It is called, there, *Arungzebé*, owing to the emperor of that name having died with it. The treatment is chiefly local, and consists of the ordinary eutrophic ointments. Eutrophics may, also, be given internally.

DELHI ULCER, see Delhi Boil.

DELIERET, Delirious.

DELIGATIO, Deligation, Ligature, see Bandage.

DELIGA'TION, *Deliga'tio*, *Epid'esis*, *Deligatu'ra*, *Vul'nerum deliga'tio* seu *vinctu'ra*, *Fascia'rum Applica'tio*, *Plaga'rum Vinctu'ra*, *Fascia'tio*, (from *deligare*, *deligatum*, (*de*, and *ligo*), 'to bind.')

The deligation of wounds formerly embraced the application of apparatus, dressings, &c.,—the denomination *Deliga'tor Plaga'rum* being synonymous with *Med'icus Vulnera'rius*, and in derivation, with the *Wundarzt*, 'wound physician' or surgeon, of the Germans. Deligation is hardly ever used now as an English word. In France, it is applied to the regular and methodical application of bandages, and to the ligature of arteries, and, occasionally, in the latter sense, with us.

DELIGATURA, Deligation.

DELIQUESCENT, *Deliques'cens*, (*deliquescere*, (*de*, and *lignescere*.) 'to melt,' 'to dissolve.') Any salt which becomes liquid by attracting moisture from the air. The deliquescent salts require to be kept in bottles, well stopped. Chloride of lime, acetate of potassa, and carbonate of potassa, are examples of such salts. The ancient chemists expressed the condition of a body, which had become liquid in this manner, by the word *Deliquim*.

Straying from the rules of reason; wandering of the mind. Hippocrates used the word *mania*, for *delirium si'ne fe'bre*, and the Greek words given above for *delirium cum fe'bre*. In different authors, also, we find the words, *Paraph'ora*, *Paraphrene'sis*, *Paraphren'ia*, *Phrene'sis*, *Phreneti'asis*, &c., for different kinds of delirium. Delirium is usually symptomatic.

A state of delirium and agitation, — often termed 'the horrors'—peculiar to those addicted to spirituous liquors, with great sleeplessness. It is preceded by indisposition, lassitude, watchfulness, headache, and anorexia; the delirium and tremors, *Tremor potato'rum*, most commonly recurring in paroxysms. It is caused by the habitual and intemperate use of ardent spirits or of opium or tobacco; or by abandoning them after prolonged use. The treatment is various. Many have regarded stimulants, with large doses of

opium to induce rest, to be indispensable. It is certain, however, that the expectant system will often, if not generally, be successful; and, it is probable, a cure effected in this manner will be more permanent than when produced by excitants.

DELIRIUM SENILE, see *Dementia*—*d. Tremefaciens*, *D. tremens*.

DELIVERY, Parturition—*d. False*, *False water*.

DELIVRANCE (F.). An expression, which, in common language, signifies the action of delivering, *libera'tio*, but in the practice of obstetrics means the extrusion of the secundines, either spontaneously or by the efforts of art. This completion of delivery—*partus secundar'ius*, *secundinarum expul'sio* seu *extra'ctio*—is produced by the same laws as the expulsion of the fœtus. Sometimes, the after-birth follows the child immediately; at others, it is retained; and requires manual interference to remove it. The following are the chief cases in which it has been practised. 1. Intimate adhesion between the placenta and paries of the uterus. 2. Spasmodic contraction of the orifice of the uterus. 3. Hour-glass contraction. 4. Torpor or hemorrhage after the expulsion of the child, and,—5. Insertion of the placenta at the orifice of the uterus.

The seeds, *Staphisa'gria*, (Ph. L. and E.) have a disagreeable smell; a nauseous, bitterish, hot taste; and are cathartic, emetic, and vermifuge: owing, however, to the violence of their operation, they are seldom given internally, and are chiefly used in powder, mixed with hair powder, to destroy lice. An alkaloid of this plant has been separated, and received the name of *Delphin'ia*, *Delphia*, (F.) *Delphine*, *Delphi'vine*. It is extremely acrid, and has been recently used, like verataria, in tic douloureux, paralysis and rheumatism. It is used in the form of ointment, or in solution in alcohol, (gr. x to xxx, or more, to ℥j.) applied externally.

shoulder, and covering the shoulder-joint. It extends from the outer third of the clavicle, from the acromion and spine of the scapula to near the middle and outer part of the os humeri, where it is inserted by means of a strong tendon. This muscle raises the arm directly upwards, when the shoulder is fixed, and carries it anteriorly or posteriorly, according to the direction of the fibres, which are thrown into action. If the arm be rendered immovable, the deltoid acts inversely and depresses the shoulder.

*DELTOIDE*, Deltoid.

In common parlance, and even in legal language, this word is synonymous with insanity. Physicians, however, have applied it to those cases of unsound mind which are characterized by a total loss of the faculty of thought, or by such an imbecility of intellect that the ideas are extremely incoherent, there being at the same time a total loss of the power of reasoning. Mania and melancholy are apt to end in this, if possible, more deplorable state. *Do'tage* is the *Dementia* of the aged—*Mo'ria de'mens leve'ma*, *Lere'ma*, *Lere'sis*, *L'erum*, *Delir'io Se'nium*, *Amen'tia Sen'ilia*, *Pueril'itas*, *Delir'ium Sen'ile*, *Anil'itas*, *Se'nile Insan'ity*, *Se'nile Dementia*, *Insan'ity of the aged*, (Sc.) *Doitrie*,—a form of insanity, in which there is a hopeless decandency or loss of the mental faculties.

Medicines supposed to be capable of correcting certain acrid conditions imagined to exist in the humours. Substances of a mucilaginous or saccharine nature belong to this class. Demulcents may act *directly* on the parts with which they come in contact; but in other cases, as in catarrh, their effect is produced by contiguous sympathy; the top of the larynx being soothed by them first, and *indirectly* the inflamed portion of the air-passages. In diseases of the urinary organs, they have no advantage over simple diluents.—See *Diluents* and *Emollients*. The following are demulcents;—*Acacia Gummi*; *Althæa Folia et Radix*; *Amygdalæ*; *Amylum*; *Avena Farina*; *Cera*; *Cetaceum*; *Cydonia Semina*; *Fucus Crispus*; *Glycyrrhiza*; *Hordeum*; *Lichen*; *Linum*; *Olivæ Oleum*; *Sassafras Medulle*; *Sezameum*; *Sevum*; *Tragacantha*, and *Ulmus*.

A disease, which first appeared in the years 1827 and 1828, in the West Indies, and in the southern states of North America. It was extremely violent in its symptoms, but not often fatal. It usually commenced with great languor, chilliness, and pain in the tendons about the smaller joints. To these symptoms succeeded burning heat and redness of the skin, pains in the muscles of the limbs or in the forehead, with vomiting or nausea. The fever continued for one, two or three days, and usually terminated by copious perspiration. In different places, it put on different appearances; but seems in all to have been a singular variety of rheumatic fever. The usual antiphlogistic treatment was adopted, and successfully.

**DENTITION**, *Teeth'ing*, *Dentit'io*, *Dentit'is*, *Odontophy'ia*, *Odont'asis*, *Odonto'sis*, (*dentire*, *dentitum*, 'to breed teeth.') The exit of the teeth from the alveoli and gums; or rather the phenomena which characterize the different periods of their existence. The germs of the first teeth, *dentis lactei* or *milk teeth*, (F.) *dents de lait*, are visible in the fœtus about the end of the second month; and they begin to be ossified from the end of the third to that of the sixth month. At birth, the corona of the incisors is formed, but that of the canine is not completed; and the tubercles of the molares are not yet all united. Gradually, the fang becomes developed; and at about six or eight months begins, what is commonly called, the *first dentition*, *Odontia dentitio'nis lactantium*. The two middle incisors of the lower jaw commonly appear first; and, some time afterwards, those of the upper jaw; afterwards, the two lateral incisors of the lower jaw; and then those of the upper, followed by the four anterior molares; the *canine*, or *eye-teeth*, at first, those of the lower, and, afterwards, those of the upper jaw, next appear; and, subsequently and successively, the first 4 molares—2 above and 2 below, 1 on each side. The whole number of the *primary*, *temporary*, *deciduous*, *shedding* or *milk-teeth*, (*dentis temporarij*), (F.) *Dents de lait*, is now 20.

The eruption of the milk teeth takes place, approximately, in the following order:

- Central incisors.....6th to 8th month.
- Lateral incisors .....7th to 10th month.
- First molar .....12th to 14th month.
- Canines.....15th to 20th month.
- Second molar .....20th to 30th month.

The *second dentition* or *shedding of the teeth*, *odontia dentitio'nis puerilis*, *Dedentit'ion*, begins about the age of 6 or 7. The germs or membranous follicles of these second teeth—to the number of 32—as well as the rudiments of the teeth themselves, are visible, even in the fœtus, with the exception of those of the small molares, which do not appear till after birth. They are contained in alveoli of the same shape as those of the first dentition. Their ossification commences at from 3 to 6 months after birth, in the incisors and first molares; at eight or nine months, in the canine; about three years, in the molares; 3½ in the second great molares, and about 10 years in the last. As the alveolus of a new tooth becomes gradually augmented, the septum between it and that of the corresponding milk tooth is absorbed, and disap-

pears. The root of the milk tooth is likewise absorbed; its corona becomes loose and falls out, and all the first teeth are gradually replaced by the *permanent teeth*, *Den'tes serotini*. This second dentition becomes necessary in consequence of the increased size of the jaws. The new teeth have neither the same direction nor the same shape as the old; and they are more numerous, amounting until the age of 25, (sooner or later,) to 28. About this period, a small molaris appears at the extremity of each jaw, which is called *wisdom tooth*, *wit tooth*, *Dens sapien'tiæ* seu *serotinus* seu *sophorot'icus* seu *sophronis'tus* seu *sophronis'ter* seu *opsi'gonus*, *Ops'iodous*, (F.) *Arrière dent*, *Dent de sagesse*, making the whole number of permanent teeth 32.

The eruption of the permanent teeth is remarkable for its general regularity; so that it constitutes an important means for ascertaining the age of the individual during the early period of life.

- First molars.....7th year.
- Central incisors .....8th year.
- Lateral incisors .....9th year.
- First bicuspids.....10th year.
- Second bicuspids .....11th year.
- Canines.....12th year.
- Second molars .....13th year.

The teeth of the lower jaw generally precede by a few weeks those of the upper.

During the period of dentition, that is, of the first dentition, the infant is especially liable to disease;—the irritation, produced by the pressure of the tooth on the superincumbent gum, sometimes occasioning pyrexia, convulsions, diarrhœa, &c., which symptoms are often strikingly relieved by a free division of the distended gum. This disordered condition is called *Teeth'ing*, *Odontia dentitio'nis*, *Odont'asis*, *Odontal'gia dentitio'nis*, *Odaxis'mus*.

Depilatories are usually caustic applications, in which quicklime or some other alkaline substance, sulphuret of iron, &c., enter.

DEPILATORY, COL'LEY'S, seems to consist of quicklime and a portion of sulphuret of potassa.

*Delcroix's depilatory*, and *Pleuck's depilatory*, have a similar composition. They all, probably, contain arsenic, in the form of orpiment. The following formula has been given for that of Colley: quicklime, 30 parts; soap lees, 125 parts; sulphur, 4 parts; nitre, 4 parts; orpiment, 12 parts. Another depilatory by F. Boudet is formed of sulphuret of sodium, 3 parts; quicklime, in powder, 10; starch, 10; mix. Rub a little of this powder with water; apply it to the part, and remove the hair in a minute or two with a wooden knife. Dorvault recommends the *Depilatory of Martins*, which is a sulphuretted sulphuret of calcium; made by passing sulphohydric acid into quicklime to saturation. A little of this is applied to the part, and in eight or ten minutes it becomes solid. It must then be washed off with cold or hot water, when the skin will be found denuded. Another, given by Redwood, is a strong solution of the sulphuret of barium, made into a paste with starch powder. It is used like the one advised by Boudet. Those that do not contain arsenic are, of course, safer.

A pitch plaster, *Pitcheap*, *Drapax*, is sometimes used as a depilatory. It of course pulls the hair out by the roots. Depilation by it has been termed *Drapacism'us*, *Pisso'sis*, *Pitto'sis*, *Picacism'us*, and *Pica'tio*.

*rhe'a, Dip'sacus, Diarrhe'a in Urinâ seu urino'sa, (F.) Diabète, Flux' d'Urinæ.* A disease characterized by great augmentation, and often manifest alteration in the secretion of urine; with excessive thirst and progressive emaciation. Cullen has described two species—*Diabètes insip'idus* and *D. Mellitus*; the former, (F.) *Diabète faux* ou *insipide*, *Diabète* being, simply, a superabundant discharge of limpid urine, of its usual, urinary taste; the latter, *D. Mellitus*, called, also, *Paru'ria Mellita, Diabètes Anglicus seu ve'rus, Melit'urica, Melithyper'urica, Glucou'rica, Glycy'rhe'a urino'sa, Uroze'mia mellita, Saccharorhe'a urino'sa, Phthiu'ria, U'rophthi'sis, Ta'bes diuret'ica seu diab'etica, Dysp'ysia saccharig'ena, Apoceno'sis Diab'etes Mellitus, Sac'charine diab'etes, (F.) Diabète sucré, Hyperurorrhée saccharine, Phthisurie sucrée,—falls under the definition given above. The quantity of urine, discharged in the 24 hours, is sometimes excessive, amounting to 30 pints and upwards; each pint containing sometimes 2½ oz. saccharine matter. This replaces the urea, which is not found in quantity in the urine of those laboring under diabetes. Where the disease is situate is not clear. The whole system of nutrition, however, seems to be morbidly implicated. A part of the urine must be formed at the expense of the system, as the egesta frequently far exceed the solid and liquid ingesta. On dissection, no morbid appearance is met with sufficient to enable us to fix on the seat of this distressing affection.*

All the remedies that have been tried have usually been found insufficient in *D. Mellitus*.

the internal mammary, and descend along the phrenic nerve, to be distributed on the upper surface of the diaphragm. The latter or *infradiaphragmatic* are also two in number. They arise from the upper part of the abdominal aorta, or from the cœliac artery, and divide into two principal branches, which are distributed on the lower surface of the diaphragm and in its substance.

The *superior diaphragmatic veins* follow the same course as the arteries, and empty themselves—the *right*, into the vena cava superior; the *left*, into the corresponding subclavian vein. The two *inferior diaphragmatic veins* open into the vena cava inferior.

A disease characterized by frequent liquid alvine evacuations, and generally owing to inflammation or irritation of the mucous membrane of the intestines. It is commonly caused by errors in regimen, the use of food noxious by its quality or quantity, &c., constituting the *Diarrhœa stercora'ria*, *D. Crapulo'sa* of writers. It may be acute or chronic. Many varieties have been made by some nosologists—e. g. mucous,—*Diarrhœa mucos'a*, *Blennorrhœ'ia*, *Blennorrhœ'ia*, *Mycodiarrhœ'a*; bilious,—*Neo-cholo'sis*, *Cholodiarrhœ'a*, *Diarrhœ'a bilio'sa*; serous,—*Hydrochœ'ia*, *Hydrodiarrhœ'a*, *Orrhochœ'ia*; dependent upon the matters evacuated. Diarrhœa requires different treatment, according to its nature. If caused, as it often is, by improper matters in the intestinal canal, these must be evacuated; and the astringent plan of treatment must not be adopted, unless the discharges seem kept up by irritability of the intestines, or unless they are colligative. The indiscriminate use of astringents is to be deprecated.

A very fatal diarrhœa prevails amongst the native inhabitants of India, to which Mr. Tytler has given the name *Diarrhœa hec'tica*, because, like hectic fever, it seems to obtain habitual possession of the constitution, to operate upon it with scarcely any perceptible intermission, and in general, to defy the most powerful remedies.

The day is, properly, the period during which the solar light illumines our horizon; but commonly, also, we designate by the word *day* the period of 24 hours, *Nycthemeron*, which is frequently divided into four parts—morning, midday, evening, and midnight. In antiquity, great importance was attached to the observation of days in disease. The medical day is usually reckoned at 24 hours,—universally, in estimating the duration of a disease. In parts of the United States, it comprises only the time when the sun is above the horizon, as regards the administration of medicine, so that if a medicine be ordered to be taken four times a day, it is understood to mean during the 12 hours of day.

At the present day, it usually signifies a particular kind of food and drink. Also, abstinence:—to put any one upon diet, (F.) *mettre quelqu'un à la diète*, means to deprive him of his usual nourishment. The terms *milk diet*, *Diæ'ta lac'tis*; *flesh or meat diet*, *Diæ'ta car'nis*; *soup or broth diet*, *Diæ'ta ju'ris vel jus-culi*, &c., explain themselves. See *Aliment*, *Hygiene*, and *Regimen*.

Every large hospital, military or civil; every prison and eleemosynary institution of every kind, has certain dietetic regulations, and many of them have *Tables of Dietary* or *Diet Scales*, which are more or less implicitly followed. See *Diet*.

The Diet Scale of the British Navy allowed from 31 to 35½ ounces of dry nutritious matter daily; of which 26 ounces were vegetable, and the rest animal—9 ounces of salt meat, or 4½ ounces of fresh. That of the Navy of the United States has been as follows:—*Three days in the week*—Pork, 16 oz.; beans or peas, 7 oz.; biscuit,

14 oz.; pickles or cranberries, 1 oz.; sugar, 2 oz.; tea, ¼ oz.;—40½ oz. *Two days in the week*—Beef, 16 oz.; flour, 8 oz.; fruit, dried, 4 oz.; biscuit, 14 oz.; tea and sugar, 2½ oz.; pickles or cranberries, 1 oz.;—45½ oz. *Two days in the week*—Beef, 16 oz.; rice, 8 oz.; butter, 2 oz.; cheese, 2 oz.; biscuit, 14 oz.; tea and sugar, 2½ oz.; pickles or cranberries, 1 oz.;—45½ oz. The daily Diet allowance to the British soldier has been one pound of bread, and three-quarters of a pound of meat. In the Army of the United States, the quantity of beef, salt or fresh, issued per day, is a pound and a quarter; of pork or of bacon, three-quarters of a pound. Ordinarily, the soldiers have fresh meat four days in the week, and salt meat the other three days; but every diet scale is subject to mutations in the individual articles. It must combine, however, a due admixture of nitrogenized, nonnitrogenized, and inorganic materials. See *Aliment*. The work of Dr. Pereira on 'Food and Diet,' and the Treatise on Hygiene by Dr. W. A. Hammond, of the United States Army, 1863, contain numerous Dictaries, civil and military. See, also, *Ration*.

It is an important part of Hygiene. A well regulated system of diet has great power in checking disease, and likewise in preventing it. A proper knowledge of dietetics is, indeed, as important as that of the *Materia Medica*, strictly so called.

Dietetics has been used, also, synonymously with Hygiene.

(F.) *Mastoidohyogénien*, *Mastoidogénien*—(Ch.), *Digastrique*, *Abaisseur de la machoire inférieure*. The name *Digastricus* was formerly given to several muscles. It is now restricted to one of the muscles of the superior hyoid

region. The digastricus is thick and fleshy at its extremities, thin and tendinous at its middle. It is attached to the mastoid groove of the temporal bone, and to a fossa on the side of the symphysis menti. Its tendon passes through an aponeurotic ring, which is attached to the os hyoides.

The use of the digastricus is to depress the lower jaw, or to raise the os hyoides, and to carry it forwards or backwards, as in deglutition.

The strong double-bellied muscle, which forms the gizzard of birds, is also called *Digastricus*.
