BY

BLACKIE AND SON.

M'CULLOCH'S LAND-MEASURER'S READY RECKONER; Being Tables for Ascertaining at Sight the Contents of any Field or Piece of Land, from Three Inches up to Two Thousand Yards Square, &c., &c. Bound in Roan, 2s.

PEDDIE'S PRACTICAL MEASURER; Or, Tradesman and Wood-Merchant's Assistant. With Plates. Roan, 6s. 6d.

RITCHIE'S FARM ENGINEER; A Treatise on Barn Machinery, and the Application of Steam and other Motive Powers for Agricultural Purposes. One Volume, Cloth, 12s.

RHIND'S HISTORY OF THE VEGETABLE KINGDOM; Embracing the Physiology, Classification, and Culture of Plants, with their various Uses to Man and the lower Animals. With numerous Illustrations, many Coloured. One Volume, Cloth. 24s.

GOLDSMITH'S HISTORY OF THE EARTH AND ANIMATED NATURE; With numerous Notes from the Works of the most Eminent British and Foreign Naturalists, and nearly 2400 Illustrations, many of which are coloured. 2 Vols., £2.

ANDREW'S CYCLOPEDIA OF DOMESTIC MEDICINE AND SURGERY; Being an Alphabetical Account of the Various Diseases Incident to the Human Frame; also, Instructions for the Management of the Diseases of Women and Children. Cloth, 18s.

DAVIDSON'S TREATISE ON DIET; Comprising the Properties, Composition, Adulteration, and Uses of the Vegetables, Animals, Fishes, &c., used as Food. Cloth, 2s. 6d.

THE CABINET HISTORY OF ENGLAND: Civil, Military, and Ecclesiastical: from the Invasion of Julius Cæsar to the year 1846, by CHARLES M'FARLANE, 13 vols., cloth gilt, £1, 6s.
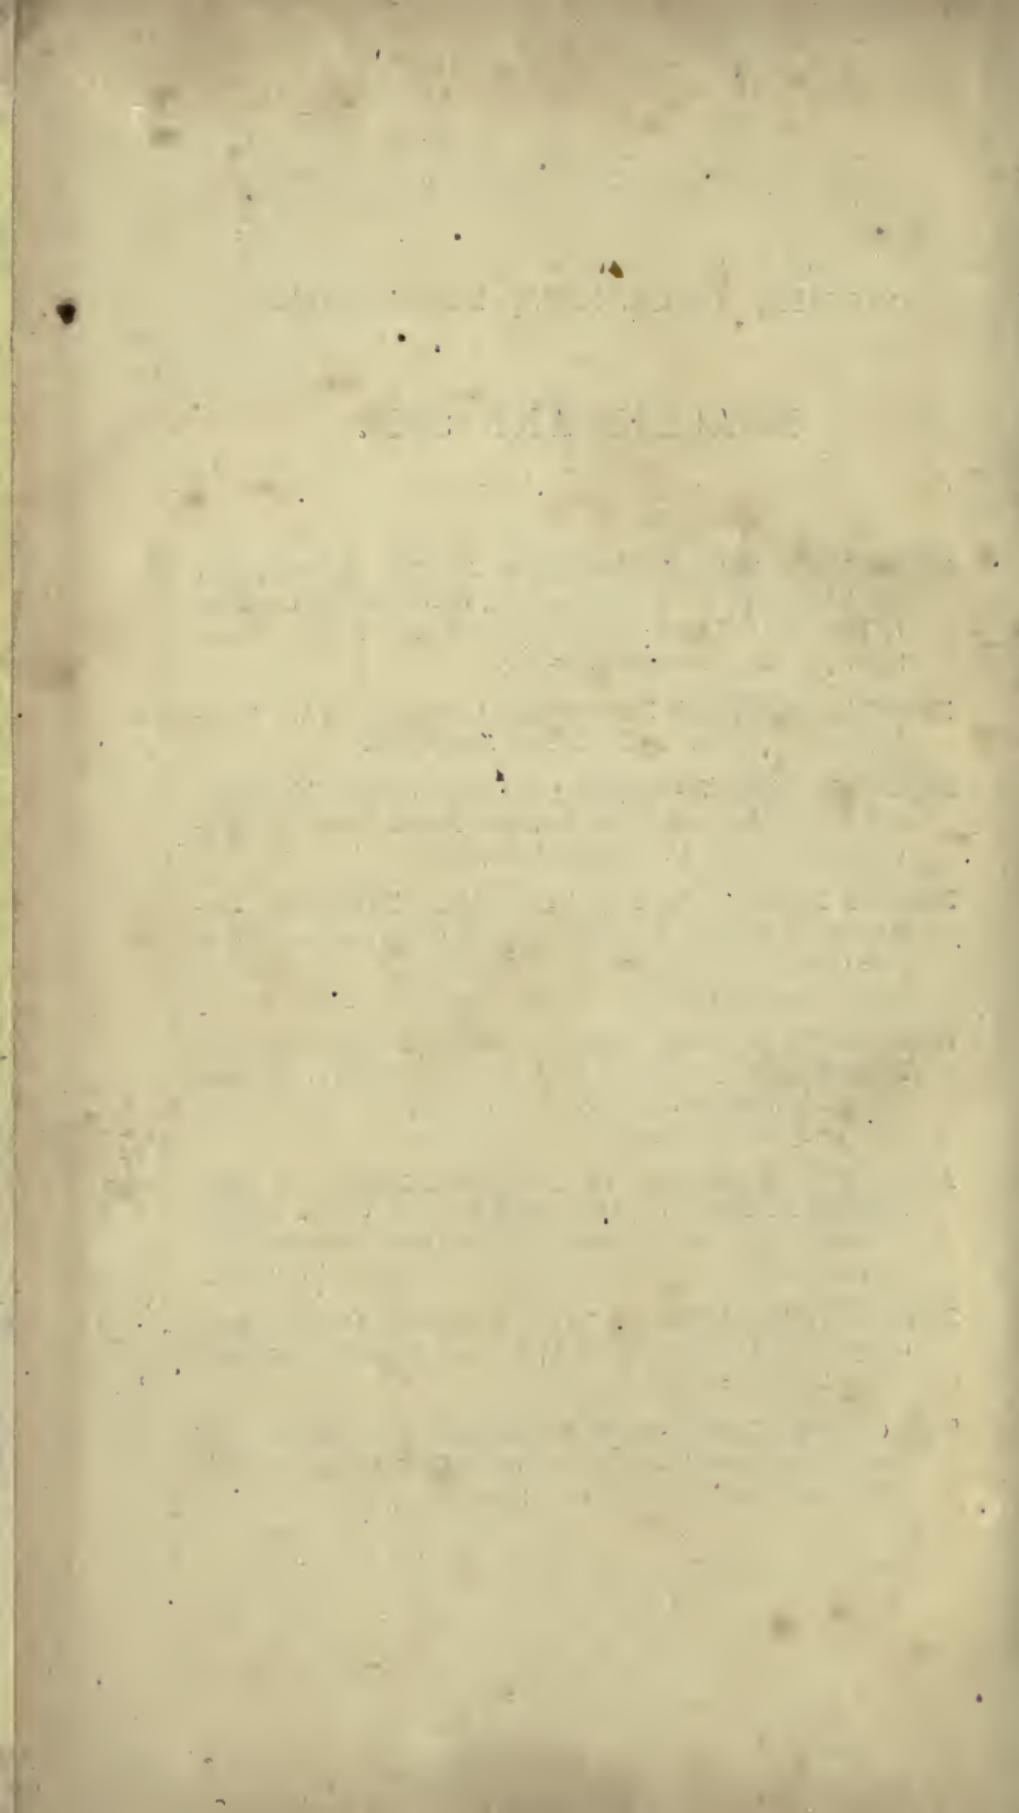

TESTIMONIALS

AGRICULTURIST'S CALCULATOR.

From J. C. MORTON, Esq., *Editor of the "Agricultural Gazette," "The Cyclopedia of Agriculture," &c.*

THE AGRICULTURIST'S CALCULATOR seems to me the most perfect of the agricultural Ready Reckoners I have seen; more comprehensive than any other, and containing all the calculations that any Farmer, in the course of his business, is ever likely to make.

<div align="right">

J. C. MORTON.

</div>

From THOMAS BALMER, Esq., *Commissioner for the Duke of Richmond, Fochabers.*

I HAVE looked over the Tables in your AGRICULTURIST'S CALCULATOR, and, without hesitation, give it as my opinion that the Work will be of the greatest advantage to all connected with land. Every Proprietor, Factor, and Farmer, should have it; and I beg that you will put down my name for a copy, and Mr. Marquis's the factor here, for another.

<div align="right">

THOMAS BALMER.

</div>

From JOHN HAXTON, Esq., *Drumnod, Fifeshire.*

I HAVE carefully inspected the contents of the AGRICULTURIST'S CALCULATOR, and, so far as I can judge, it is decidedly the best Ready Reckoner of the kind I have ever met with. Without being overlaid with useless calculations, it is sufficiently copious in detail for every practical purpose; while, at the same time, the Tables and Examples are so simple, that a single perusal will enable any one to obtain the required information with the utmost ease and accuracy. So far as my own case is concerned, I perceive that I will be able to obtain, in the pages of the CALCULATOR, information and calculated results which, formerly, I was forced to search for through a whole host of less comprehensive authorities. I sincerely hope the AGRICULTURIST'S CALCULATOR may meet that success its merits so well entitle it to.

THE

AGRICULTURIST'S

CALCULATOR:

A SERIES OF TABLES

FOR THE USE OF

ALL ENGAGED IN AGRICULTURE

OR THE

MANAGEMENT OF LANDED PROPERTY.

PREFACE.

Tʜᴇ recent alterations in the laws regulating the admission of agricultural produce into this country, have made a great change in the circumstances and prospects of the British farmer, leaving him to contend against the light taxation and the cheap labour of the foreigner. This being the case, it has become quite indispensable that the landed proprietor and the farmer should call to their aid whatever assistance science and art can furnish in the practical operations of the farm.

The Publishers of this Work having, in Morton's *Cyclopedia of Agriculture*, already furnished a complete manual for the *Work* of the *Farm*, trust that the following extensive set of Tables, which have been prepared with great care, will prove a valuable assistant in all calculations relating to Land-Measuring, Planting, Manuring, Draining, the Weight of Stacks and of Cattle by Measurement, and in a great variety of other matters connected with the *arithmetic* of the Farm. They must thus prove of essential service to the Proprietor, Land-steward, Land-surveyor, &c., no less than to the Farmer, as an unfailing reference in calculations of daily occurrence.

The Tables have been drawn up with special reference to the requirements of the various matters to which they are applicable, and embrace almost every subject connected with agricultural affairs in which calculations are required. Many of the Tables are wholly original, others were suggested by Tables in similar works, but none have been implicitly copied, all having been adapted to the plan of the present Work by extension or re-arrangement, and in every case they have been re-calculated. It is hoped that the entire series will be found better suited to the wants of the practical man than any Tables previously extant.

The explanations prefixed to the Tables show the manner of their construction, and enable any person who consults them to extend or adapt them to the particular purpose he has in view.

To render the Work still more useful, the occasional demands of the landed interest have been attended to, by adding to the portion more particularly designed for the Agriculturist, Tables showing the number of Bricks required for any piece of Work, the Content of Buildings, Slating, Thatching, and Flooring; also, the Solid Content of round or growing Trees, with remarks on their Measurement. A Table is likewise given for Calculating Wages for days and hours, which will be found of much service to those who employ many hands. To the whole is added a brief Treatise on Land-Surveying.

From the number, variety, and extent of the Tables, it is believed that scarcely anything can occur in Farm calculations for which they do not provide valuable assistance; and the care and labour bestowed on their compilation entitle them to the confidence of the agricultural community.

Glasgow *September,* 1851.

CONTENTS.

THE AGRICULTURIST'S CALCULATOR,

ETC.

TABLES OF WEIGHTS AND MEASURES.

IMPERIAL TROY WEIGHT.

.003961 of a cubic inch of water	= 1 grain.	(gr.)
24 grains	= 1 pennyweight.	(dwt.)
20 pennyweights	= 1 ounce.	(oz.)
12 ounces	= 1 pound (lb.) = 5760 grains.	

This weight is used for weighing gold, silver, jewels, &c.; also, for comparing different weights with one another. A silver shilling weighs 3 dwts. $15\frac{3}{11}$ grs.; a gold sovereign 5 dwts. 3.2745 grs.

IMPERIAL AVOIRDUPOIS WEIGHT.

			Troy grains.	Cub. in. of water.
16 drams	(dr.)	= 1 ounce	= $437\frac{1}{2}$ =	1.7329625
16 ounces	(oz.)	= 1 pound	= 7000 =	27.7274
14 pounds	(lb.)	= 1 stone	= 98000 =	388.1836
28 pounds	(lb.)	= 1 quarter	=	776.3672
4 quarters	(qr.)	= { 1 hundred weight }	=	3105.4688
20 hundred weight }	(cwt.)	= 1 ton	=	62109.376

Butcher meat in London is sold by the Smithfield stone of

A

8 lb^s.; but in some counties of England the stone contains 12, in others 14, and in some even 16 lbs. Imperial.

This weight is now used for all articles sold by weight, except the precious metals, &c., which are sold by Troy weight. As there are 5760 grs. in the pound Troy, and 7000 in the pound Avoirdupois, they are to one another in the proportion of 5760 to 7000, or as 144 to 175.

IMPERIAL MEASURES OF CAPACITY.

<table>
<tr><td></td><td></td><td></td><td>cubic inches.</td><td></td><td></td><td></td></tr>
<tr><td>1 gill</td><td>=</td><td>=</td><td>8.6648125</td><td>=</td><td>5 oz.</td><td>of water.</td></tr>

</table>

4 quarters make a chaldron, and 10 quarters a last. In London a chaldron of coals is 36 bushels.

This measure is used both for liquids and dry goods, the measures up to the gallon being used for liquids, and from the peck upwards for dry goods.

<table>
<tr><td></td><td></td><td>cubic in.</td><td></td><td>Imp. galls.</td></tr>

IMPERIAL LONG, OR LINEAL MEASURE.

<table>
<tr><td>12 lines</td><td>= 1 inch.</td><td></td></tr>
<tr><td>12 inches</td><td>= 1 foot.</td><td></td></tr>
<tr><td>3 feet</td><td>= 1 yard.</td><td></td></tr>
<tr><td>5½ yards</td><td>= 1 pole, perch, or rod =</td><td>16½ feet.</td></tr>
<tr><td>40 poles</td><td>= 1 furlong</td><td>= 220 yards.</td></tr>
<tr><td>8 furlongs</td><td>= 1 mile</td><td>= 1760 "</td></tr>
</table>

A Scotch mile is 1976½ yards, an Irish mile is 2240 yards, a

palm is 3 inches, a hand is 4 inches, a span is 9 inches, a cubit is 18 inches, a fathom is 6 feet, an ell English is 45 inches; the length of a pendulum vibrating seconds at London 39.1393 inches.

IMPERIAL SQUARE, OR SUPERFICIAL MEASURE.

144 square inches	= 1 square foot.	
9 square feet	= 1 square yard.	
$30\frac{1}{4}$ square yards	= 1 square pole	= $272\frac{1}{4}$ square feet.
40 square poles	= 1 rood	= 1210 square yards.
4 roods	= 1 acre	= 4840 "
640 acres	= 1 square mile.	

The Irish lineal pole or perch is 7 yards, and the square perch 49 square yards; the Imperial square pole being $30\frac{1}{4}$ square yards, the acre is to the Irish as $30\frac{1}{4}$ to 49, or as 121 to 196. 100 square feet = a square of flooring; 36 square yards = a rood of building; $272\frac{1}{4}$ square feet are sometimes reckoned a rood of brick work.

The chain used for measuring land is 4 poles or 22 yards long, and consists of 100 links, each link being $\frac{22}{100}$ of a yard, or 7.92 inches long: 10,000 square links make a square chain; 25,000 square links = a square rood; 100,000 square links = a square acre.

CUBIC, OR SOLID MEASURE.

1728 cubic inches	= 1 cubic foot.
27 cubic feet	= 1 cubic yard = 46656 cubic inches.

A cubic inch of water weighs 252.458 grains, or .0360654 pound Imperial, and a cubic foot 62.321 pounds; a barrel bulk is 5 cubic feet; a ton of shipping is 42 cubic feet; a load of unhewed timber is 40 cubic feet; a load of squared timber is 50 cubic feet.

SCOTCH LINEAL MEASURE.

			ells.	Imp. inches.	
1 ell	=			37.0598 =	3.088316· feet.
6 ells	=1 fall	=		222.3588 =	18.5299 "
4 falls	=1 chain	=	24 =	889.4352 =	74.1196 "
10 chains	=1 furlong	=	240 =	8894.352 =	247.0653· yards.
8 furlongs	=1 mile	=1920	=71154.816		=1976.5226· "

There having been some uncertainty regarding the length of the Scotch ell, a jury was appointed by the Sheriff-Depute of the County of Edinburgh, which met 4th February, 1826, and determined, in conformity to a report by competent persons, that

the standard ell-bed, in the custody of the city of Edinburgh, measured 37.0598 Imp. inches, and the Scotch chain of 24 ells 74.1196 Imp. feet, divided into 100 links, each 8.894352 inches.

Some land measurers, reckoning the Scotch ell at 37 inches, used a chain of 74 Imp. feet, divided into 100 links, each 8.88 inches; others, reckoning the Scotch ell at $37\frac{2}{10}$, used a chain of $74\frac{4}{10}$ feet, divided into 100 links, each 8.928 inches.

SCOTCH LAND MEASURE.

			Square yards.
1 square ell	= 9.5377 Imp.sq.feet =		1.059744425956
36 square ells	= 1 square fall	=	38.150799334·
16 square falls	= 1 square chain	=	610.412789351·
40 square falls, or $2\frac{1}{2}$ chains	= 1 square rood	=	1526.03197337·
4 square roods, or 10 chains	= 1 acre = 5760 ells		6104.12789351·

The Scotch acre is to the Imperial as 1.261183449 is to 1, or as 1 to .79290606, or very nearly as 874 to 693. When the chain is reckoned to be 74 feet, the acre will contain $6084\frac{4}{6}$ yards, and is to the Imperial as 1.25711662 is to 1 ; when it is reckoned to be $74\frac{4}{10}$ feet, the acre will contain $6150\frac{4}{10}$ yards, and is to the Imp. acre as 1.2707438 is to 1.

SCOTCH DRY MEASURE.

			For Wheat. cub. in.	For Barley & Oats. cub. in.
4 lippies or forpats	= 1 peck	=	553.581 ...	807.576
4 pecks	= 1 firlot	=	2214.322 ...	3230.305
4 firlots	= 1 boll	=	8857.289 ...	12921.222
16 bolls	= 1 chalder	=	141716.624 ...	206739.546

The Scotch pint jug was found to contain 26306.982 Imp. Troy grains or 3.7581 pounds of water, and measured 104.2034 cubic inches. The wheat firlot is nearly equal to the Imp. bushel, and contained $21\frac{1}{4}$ Scotch pints = 7.98605 Imp. gallons; and is to the Imp. bushel as .998256 to 1. The barley firlot contained 31 Scotch pints = 11.65024 Imp. gallons, and is to the Imp. bushel as 1.4562794 to 1.

SCOTCH TROYES, OR DUTCH WEIGHT.

16 drops = 1 ounce =   1.09375 ounce Imp.

16 ounces = 1 pound = $17\frac{1}{2}$ ounces Imp. = 7656.25 Imp. grains.

16 pounds = 1 stone = $17\frac{1}{2}$ pounds Imp.

4 lippies, or $\frac{1}{2}$ stone of meal = 1 peck = $8\frac{3}{4}$ lbs. Imp.

16 pecks = 1 boll = 140 lbs. Imp.; 2 bolls = 1 sack or load = 280 lbs. Imp.; and 16 bolls = 1 chalder.

The Scotch Troyes, or Dutch pound, being the 16th part of the Lanark stone, was found, by an Edinburgh jury, to weigh 7608.9496875 Imp. grains, or 17.392 Imp. ounces, in place of $17\frac{1}{2}$, as was usually estimated. But since the verdict here referred to was passed, the Lanark stone has been suspected by the reporters, on whose authority the verdict rests, to be hardly entire, and that for every practical purpose it may be estimated at $17\frac{1}{2}$ ounces $= 7656\frac{1}{4}$ Imp. Troy grains, as in the Table. The pound is then in proportion to the Imp. as $17\frac{1}{2}$ to 16, or 35 to 32; and the stone is to the Imp. stone as $17\frac{1}{2}$ to 14, or 35 to 28.

This weight was used for weighing meal, iron, unwrought pewter and lead, hemp, flax, most Dutch and Baltic goods, and other articles.

SCOTCH TRONE WEIGHT.

16 drops	=	1 ounce.
16 ounces	=	1 pound.
16 pounds	=	1 stone.

This weight was used for weighing butter, cheese, butcher meat, hay, and other home productions, and varied in different counties in Scotland, from 20 to 28 Imp. ounces to the pound. By an Edinburgh jury, in 1826, the Trone pound was found to weigh 9622.67 Imp. grains, or as 1.374667 to 1 pound Imp.; or very nearly 22 Imp. ounces. In Glasgow, and the Lower Ward of Lanarkshire, the pound in general use contained $22\frac{1}{2}$ Imp. ounces, in Berwickshire and Dumbartonshire, 23 ounces; Selkirkshire, $23\frac{1}{2}$ ounces; Ayrshire, Montrose, Brechin, Arbroath, &c., 24 ounces; part of Kirkcudbrightshire, 26 ounces; Kirriemuir, 27 ounces; and Aberdeen, 28 ounces. The *pound* of these weights are in proportion to the Imp. *pound* as the number of the Imp. ounces in their pound is to 16; and their stone contains the same number of Imp. pounds as their pounds contain of Imp. ounces. But as there are 16 pounds to the Trone stone, and only 14 pounds to the Imp. stone, the Trone *stone* is to the Imp. *stone* in the proportion of the number of Imp. pounds in their stone to 14, the number of pounds in the Imp. stone. As the Dutch and Trone weights are similarly divided, they are to one another in the proportion of the number of Imp. ounces in their pounds, or Imp. pounds in their stone.

BREAD AND FLOUR WEIGHT.

4 lbs. $5\frac{1}{2}$ oz. Imp.	=	1 quarter loaf.
8 lbs. 11 oz. "	=	1 half peck do.
17 lbs. 6 oz. "	=	1 peck do.

A peck or stone of flour is 14 lbs., a bushel of flour is 56 lbs., a boll is 140 lbs., a sack or 5 bushels is 280 lbs., or $2\frac{1}{2}$ cwt.

OLD ENGLISH DRY MEASURE,

				Cub. in.		Imp. gal.
2 pints	= 1 quart	=		67.2	=	0.24236
4 quarts	= 1 gallon	=		268.8	=	0.96944
2 gallons	= 1 peck	=		537.6	=	1.93889
4 pecks	= 1 bushel	=		2150.42	=	7.75558
4 bushels	= 1 coom	=		8601.68	=	31.02231
2 cooms	= 1 quarter	=		17203.36	=	62.04462
5 quarters	= 1 wey or load	=		86016.80	=	310.22310
2 weys	= 1 ton	=		172033.60	=	620.44620

WOOL WEIGHT.

7 lbs. avoirdupois	=	1 clove
14 lbs. or 2 cloves	=	1 stone
28 lbs. or 2 stones	=	1 tod
182 lbs. or 6½ tods	=	1 wey
364 lbs. or 2 weys	=	1 sack
4368 lbs. or 12 sacks	=	1 last

20 lbs. = 1 score, and 240 lbs. or 12 scores = 1 pack.
Wool is frequently sold in Scotland by a stone of 24 lbs. Imp.

HAY AND STRAW WEIGHT.

36 lbs. Imp. of straw	=	1 truss.
56 lbs. of old hay	=	1 do.
60 lbs. of new hay	=	1 do.
36 trusses	=	1 load.

A load of straw weighs 11 cwt. 2 qrs. and 8 lbs., a load of old hay 18 cwt., and a load of new hay 19 cwt. and 32 lbs. Each truss of hay sold between 1st June and 31st August, being new hay of that year's growth, must weigh 60 lbs., and every truss sold between 31st August and 1st June, in the succeeding year, must weigh 56 lbs.

THE QUARTERLY TERMS.

In England.	In Scotland.
Lady-day, 25th March.	Candlemas, 2d February.
Midsummer, 24th June.	Whitsunday, 15th May.
Michaelmas, 29th September.	Lammas, 1st August.
Christmas, 25th December.	Martinmas, 11th November.

TABLE I.

LAND MEASURING.

This table shows the content of any field or piece of land from 6 inches, or $\frac{1}{6}$ of a yard, to 1100 yards, or 50 chains long, and from 3 inches to 2000 yards broad, imperial measure.

Each page is divided into 4 columns: the column on the left contains the various lengths in yards and 6ths of a yard; on the tops of the other 3 columns are placed the breadths, rising in succession; under which, and opposite any required length in the first column, stands the content of each in acres, roods, poles, yards, and feet; fractions under a square foot being omitted.

In calculating the content of a field, as the exact dimensions may not be found in the Table, the length or breadth may require to be divided into two or more portions, the content of each taken severally from the Table, and the results added together.

EXAMPLES.

1. Required the content of a field 300 yards long and 139 yards broad?

Find 139 yards broad on the top of page 56, under which, and opposite 300 yards in the left hand column, stands 8 acres, 2 roods, 18 poles, 15 yards, and 4 feet, the content of the field.

2. Required the content of a piece of ground 721 yards, 1 foot, long, by 398 yards broad?

As 721 yards, 1 foot, in length, are not to be found at once in the Table, they must be taken in portions, as follows, viz., 700 yards, 21 yards, and 1 foot:

Find 398 yards, the breadth, on the top of page 143,

			ac.	ro.	po.	yds.	ft.
under which, and opposite }	700 yards,	{ in the left hand column, stands }	57	2	9	27	6
"	21 yards,	"	1	2	36	9	0
"	1 foot, or $\frac{1}{3}$ yard,	"	0	0	4	11	6

Content of the ground,   59   1   10   18   0$\frac{2}{4}$

It will be observed in adding the above, that in the two columns

on the right hand there are 47 yards, 12 feet = 48 yards, 3 feet;
and as $30\frac{1}{4}$ yards, or 30 yards, $2\frac{1}{4}$ feet, make a pole, that quan-
tity is subtracted from 48 yards, 3 feet, leaving a remainder of
18 yards, $0\frac{3}{4}$ foot, and 1 to carry to the next column, making 50
poles, subtracting 40 from which, set down 10, and carry 1 to the
next column, making 5 roods, from which subtract 4, the roods
in an acre, set down 1, and carry 1 to the column of acres, which
makes 59, as above.

On inspecting the Table, it will be observed that the *feet column*
consists almost exclusively of the figures 2, 4, 6, and cyphers:
these may be understood to be $2\frac{1}{4}$, $4\frac{1}{2}$, and $6\frac{3}{4}$, which are equal to
$\frac{1}{4}$, $\frac{1}{2}$, and $\frac{3}{4}$ *yard;* and, in an addition such as the foregoing, it
would facilitate the operation were they so set down, as in the
following example:—

3. Required the content of a field 480 yards, 2 feet, 6 inches,
in length, and 228 yards in breadth?

Find 228 yards, the breadth, on the top of page 86, and
divide the length into portions of 400 yards, 80 yards, 2 feet,
and 6 inches; then,

			ac.	ro.	po.	yds.
under the breadth, and opposite } 400 yards { in the left hand column, stands }			18	3	14	$26\frac{1}{2}$
" 80 yards "			3	3	2	$29\frac{1}{2}$
" 2 feet "			0	0	5	$0\frac{1}{4}$
" 6 inches "			0	0	1	$7\frac{3}{4}$

Content of the field, 22 2 24 4

In the column of yards there are $64\frac{1}{2}$, from which subtract
twice $30\frac{1}{4}$, or $60\frac{1}{2}$ = 2 poles, set down the remainder 4, and
carry 2 to the next column, making 24 poles, which set down,
there being nothing to carry as it is less than a rood, the next
column contains 6 roods, set down 2, and carry 1 to the acres,
making 22 acres, as above.

TABLE II.

TO CONVERT YARDS, FEET, AND INCHES, INTO CHAINS AND LINKS, IMPERIAL MEASURE.

WHEN the dimensions of any field or piece of land are taken in yards, feet, and inches, and it be required to turn the same into chains and links, imperial measure ; the following Table will show the chains and links in any measurement from one-sixth of a yard, or 6 inches, to 1100 yards ; the equivalent in chains and links being found opposite any given number of yards. Suppose it is required to know the number of chains and links in 355 yards Look in the column under yards for 355, opposite which, under the column of chains and links, stands 16 13.63, or 16 chains, 13 links, and 63 hundredths of a link. It may be observed, that the decimal fraction in the links column is what is termed a circulating one, that is to say, the two figures composing it may be repeated indefinitely to the right, their values consequently diminishing in a tenfold ratio ; it is evident therefore that the fraction set down is a little under the true value. To find its exact value make it the numerator of a vulgar fraction whose denominator is 99 ; as $.\dot{7}\dot{5} = \frac{75}{99} = \frac{25}{33}$. Suppose it be required to find the chains and links equivalent to 128 yards, 1 foot :—

	Chains.	Links.
Opposite 128 yards in the Table, stands	5	81.8̇1̇
And opposite $\frac{1}{3}$ of a yard, or 1 foot, stands	0	1.5̇1̇
	5	83.33

It will be observed that the carriage from the left hand figures of the circle, viz., 8 and 5, is added to the right hand figures, 1 and 1 making 3.

TABLE III.

THIS Table shows the number of yards, feet, and inches, in any number of links of the imperial chain, from 1 to 2200 links; the equivalent in yards, &c., being found opposite any given number of links. Suppose the equivalent of 486 links is required in yards, &c.; look in the column under links for 400:—

	Yds.	Ft.	In.
Opposite which stands	80	0	0
And opposite 86, stands	18	2	9.12
	98	2	9.12

It may be observed that the decimal fractions in this Table, are terminate decimals, and show the true value of the links; and it may also be remarked, that as every 100 links are equal to a chain, consequently 200 = 2 chains, 300 = 3 chains, &c., and the number of links taken in the above example = 4 chains, 86 links.

Links	Yd.	Ft.	In.	Links.	Yd.	Ft.	In.	Links.	Yd.	Ft.	In.
1	0	0	7.92	48	10	1	8.16	95	20	2	8.4

TABLE IV.

TO ASCERTAIN THE CONTENT OF LAND IN DRILLS.

───────────────

This Table shows the content or quantity of land in drills, &c., from 12 inches to 12 feet wide, and from 6 inches, or ⅙ of a yard, to 1100 yards long.

EXAMPLE I.—Required the content of 8 drills, 28 inches wide and 102½ yards long?

102½ × 8 = 820 yards, length of the 8 drills; and in the Table, under 28 inches, look first for 800 yards,

	Po.	Yd.	Ft.
Opposite which stands . . .	20	17	2
And opposite 20 yards stands .	0	15	5
	21	2	4¾

It will be observed in adding the above, that as 30¼ yards, or 30 yards 2¼ feet, are equal to 1 pole, that number is subtracted from the 32 yards 7 feet, leaving 2 yards 4¾ feet, and 1 is carried to the poles column, making 21 poles, 2 yards, 4¾ feet, the content of the 8 drills.

EXAMPLE II.—Required the content of 12 drills, 34 inches wide and 160¾ yards long?

160¾ × 12 = 1929 yards, length of the 12 drills; and having found 34, the width in the Tables, the most convenient method to take for the length in this case is to add the contents at 900 and 1000, which can be easily done, without copying them separately from the Table; and in like manner add 14 and 15 for the remaining 29 yards, thus:

	Ro.	Po.	Yds.	Ft.
Opposite the lengths of 900 and 1000 yards=1900, stands . . .	1	19	9	6
And opposite the lengths of 14 and 15 yards=29, stands . . .	0	0	27	3
	1	20	6	6¾

As there are 40 poles in a road, the 59 poles found in the Table opposite 1900, is 1 rood 19 poles; and, in the addition of the two contents, 27 yards 3 feet added to 9 yards 6 feet is 37 yards, from which subtracting 30¼ yards, leaves 6 yards 6¾ feet, and 1 to carry to the poles, making 1 rood, 20 poles, 6 yards, 6¾ feet, the content of the 12 drills.

To find by calculation the quantity of land in drills.

Rule.—Multiply the length of the drill in yards by the breadth in inches, and divide the product by 36, the quotient is the number of square yards in the drill; which reduce to higher denominations if required, dividing the yards by 30¼ to give poles, the poles by 40 to give roods, and the roods by 4 to give acres.

Example.—Required the content of a drill 225½ yards long and 28 inches wide?

$$225\tfrac{1}{2}$$
$$28$$

$$1804$$
$$451$$

36)6314(175 3½, or 175 yds. 3½ ft.=5 po. 24 yds. 1¼ ft.
$$36$$

$$271$$
$$252$$

$$194$$
$$180$$

$$14$$
$$9$$

$$126$$
$$108$$

$$18$$
$$\overline{36}=\tfrac{1}{2}$$

This gives the content a trifle greater than the Table, fractions under a foot being omitted therein.

In the neighbourhood of large towns, farmers sometimes dispose of their growing turnip and potato crop in lots of a certain number of drills, at a certain price per acre.   When the average

TABLE IV.—CONTENT OF LAND IN DRILLS, &c.   171

width of the drills is taken correctly, and the length of the whole drills found, by measuring one and multiplying its length by the number of drills, the content of each lot is found by the Table.

In order to demonstrate the necessity of accuracy in taking the width of the drills, to prevent injustice to either buyer or seller, the following comparative table will show the different lengths required to make a pole Imperial measure, and also a Scotch fall, at 36, 34, 32, 30, and 28 inches width of drill :—

Inches wide.	Length to make a pole.	Length to make a fall.
36	$30\frac{1}{4}$ yards.	$38\frac{1}{10}$ yards.
34	$32\frac{1}{34}$ "	$40\frac{13}{34}$ "
32	$34\frac{1}{32}$ "	$42\frac{29}{32}$ "
30	$36\frac{1}{10}$ "	$45\frac{23}{30}$ "
28	$38\frac{26}{28}$ "	$49\frac{1}{28}$ "

As there are 160 poles in an acre, it is evident that a small inaccuracy in the measurement, either greater or less than the truth, will be a loss to one of the parties, increasing in proportion to the extent of the transaction.

TABLE V.

THIS Table shows the breadths which make an acre, of any field or piece of land of a rectangular figure, from 6 inches to 2200 yards in length ; the lengths rising by inches to 36 inches, then by 6 inches to 12 feet or 4 yards, thence by yards to 500, and thence by 100 yards to 2200 yards. In the first column on the left headed *length*, are to be found the various lengths rising in succession; and in the adjoining columns headed *breadth*, opposite each several length, stands the breadth, or width, which makes an acre, in yards, feet, and inches.

EXAMPLE.—In a rectangular field, the length of whose side is 345 yards, what breadth is required to make an acre ?

Look in the column headed *length*, for 345 yards, opposite which, in the column adjoining headed *breadth*, stands 14 yards, 1 inch, the breadth required to make an acre.

Any required number of acres may be set off from the side of a rectangular field, by first finding from the Table the breadth required for 1 acre, and then multiplying that breadth by the number of acres to be set off. If there are roods or poles in the quantity required to be set off, take a proportional part of the acre for these, which add to the breadth already found.

EXAMPLE.—What breadth of a rectangular field, the side of which is 198 yards in length, is required to contain a portion measuring 3 acres, 1 rood, 5 poles ?

	Yd.	Ft.	In.
Find in the Table 198 yards the length,			
Opposite which, stands the breadth for 1 acre =	24	1	4
This multiplied by . . .			3
Gives the breadth for 3 acres, =	73	1	0
To which add for 1 rood, one-fourth of breadth for 1 acre =	6	0	4
And for 5 poles, one-eighth of the breadth for 1 rood =	0	2	3½
Breadth required =	80	0	7½

TABLE V.—LENGTHS AND BREADTHS WHICH GIVE AN ACRE. 181

To find the breadth required by calculation. Reduce the quantity to be set off, to the same denomination as the given length, divide the quantity so reduced, by the length, and the quotient will be the breadth required, and in the same name or denomination as the two factors.

The following is an arithmetical solution of the last example.

$$
\begin{array}{l}
\text{Ac. Ro. Po.} \\
\quad 3 \quad 1 \quad 5 \\
\quad 4 = \text{square roods in an acre.} \\
\overline{\quad} \\
\quad 13 \\
\quad 40 = \text{square poles in a rood.} \\
\overline{\quad} \\
\quad 525 \\
\quad 30\tfrac{1}{4} = \text{square yards in a pole.} \\
\overline{\quad} \\
15750 \\
\;131\tfrac{1}{4}
\end{array}
$$

198)15881¼(80 0 7½, or 80 yards, 7½ inches, the breadth.
   1584

$$
\begin{array}{l}
\quad 41\tfrac{1}{4} \\
\quad 3 = \text{lineal feet in a yard.} \\
\overline{\quad} \\
\;123\tfrac{3}{4} \\
\quad 12 = \text{lineal inches in a foot.} \\
\overline{\quad} \\
1479 \\
1386
\end{array}
$$

   93 = a half inch very nearly.

If it be required to set off a certain quantity from the side of a field, the side boundary being irregular, but the two ends of the field parallel; the content of the irregular portion or off set, must first be found in the usual manner, and deducted from the given quantity; the width for the remaining portion will be found from the Table as directed above.

EXAMPLE.—It is required to set off 2¾ acres from the irregular side of a field, of which the end boundaries are parallel; the length between the two parallel ends being 133 yards, and the content of the off-set, or irregular portion, having been ascertained to be 35 poles; what width of the rectangular portion of the field will be necessary to contain along with the off-set the required 2¾ acres?

	Ac.	Ro.	Po.
From the required quantity of $2\frac{3}{4}$ acres = .	2	3	0
Deduct content of irregular portion or off-set=	0	0	35
	2	2	5

Then look in the Table for the length 133 yards ;

	Yd.	Ft.	In.
Opposite which stands the width for 1 acre =	36	1	2
Set down the same quantity for the other acre = .	36	1	2
For the 2 roods take half of 1 acre = .	18	0	7
And for the 5 poles take a sixteenth of the half acre =	1	0	5
Width required of the rectangular portion of the field = .	92	0	4

To set off a certain quantity in the form of a triangle, from the side of a field whose boundaries are straight and perpendicular to each other.

RULE.—1. Since the area of a triangle is equal to half the area of a parallelogram of the same altitude and base, take half the length of the side which you propose to make the perpendicular for the length, and find the width from the Table as formerly ; measure off the width thus found along the adjoining side, for the ength of the base of the triangle, a straight line from the end of which to the corner of the field or summit of the triangle will be the boundary setting off the quantity required.

2. The same result will be obtained by operating with the whole length of the perpendicular, for the length, and finding the width for twice the given quantity to be set off.

If the field from which it is proposed to set off a certain quantity in a triangular form, has its boundaries straight, but is not rectangular, let fall a perpendicular from the point which is to be the summit of the triangle on the side which is proposed to be the base, the measurement of which perpendicular is to be taken for the length, and used to find the width or base of the triangle, as directed in the case of the rectangular field.

EXAMPLE.—It is required to set off 1 acre, 20 poles, in the form of a triangle, from the side of a field the length of the perpendicular, from the summit to the base of the triangle, being 160 yards. Required the length of the base ?

By the first method in the Rule, viz., halving the perpendicular for the length.

Look in the Table for 80 yards, equal half the length of the perpendicular.

TABLE V.—LENGTHS AND BREADTHS WHICH GIVE AN ACRE. 183

		Yd.	Ft.	In.
Opposite which stands the width for 1 acre =		60	1	6

For the 20 poles, or $\frac{1}{8}$ of an acre, take an eighth of the above = ... 7 1 8$\frac{1}{4}$

Base of the triangle required, . . 68 0 2$\frac{1}{4}$

By the second method, viz., by taking the whole length of the perpendicular, = 160 yards, and twice the quantity to be set off, = 2 acres, 40 poles, or 1 rood.

Look in the Table for 160 yards, the length of the perpendicular.

	Yd.	Ft.	In.
Opposite which, stands width for 1 acre =	30	0	9
Set down for the other acre =	30	0	9
For the rood, take one-fourth of the acre =	7	1	8$\frac{1}{4}$

Base of the triangle required, as above, . 68 0 2$\frac{1}{4}$

This Table shows the space or length passed over in ploughing an acre, at any given width of furrow. Thus with a furrow 9 inches wide, the distance passed over is 19360 yards, or 11 miles; with a furrow of 10 inches wide, 17424 yards, or 9 miles, 7 furlongs, 8 poles, exclusive of turnings, &c. And when the average rate or speed at which the cattle proceed is known, the time necessary to plough a field, or any portion of it, of which the content has been ascertained may be calculated. The Table also shows what length of a drill or ridge, at any width, is required to make an acre.

TABLE VI.

SHOWING THE VALUE OF LAND, OF GROWING CROP, OR OF WORK
DONE, AT ANY RATE PER ACRE, FROM 3D. TO £100; AND FOR
ANY QUANTITY, FROM 1 POLE TO 10 ACRES.

———

THE left hand column of the Table headed *land*, contains the
quantity of land, rising by poles from 1 to 39, thence by roods to
1 acre, and then 5 and 10 acres. The rate per acre is placed on
the top of the other columns, rising by 1 penny from 3d. to 1s.,
thence by 6d. to £1, thence by 1s. to £20, thence by £1 to £29,
and then £50, £75, and £100. Under these rates, and opposite
each quantity in the left hand column, is found the value of that
quantity, at the required rate per acre.

Note.—As the Scotch and Imperial roods are similarly divided,
that is to say, the Scotch into 40 falls and the Imperial into 40
poles, and there are the same number of roods in an acre of each,
the Table will suit equally well for both Measures, and the left
hand column will denote *falls* instead of *poles*, when the measure
is Scotch.

EXAMPLES.—1. Required the value of a lot of growing turnips,
measuring 3 roods, 25 poles, at £5 12s. per acre?

Look in the Table for £5 12s. the rate,
-Under which and opposite 3 roods, is . £4 4 0
And opposite 25 poles, is . . . 0 17 6
                                                        ————————
                                  Value of the lot, £5 1 6

2. Required the cost of digging 1 acre, 1 rood, 15 falls, at
rate of £2 7s. per acre?

Look in the Table for £2 7s. the rate per acre,
And set down for 1 acre, . . . £2 7 0
Opposite 1 rood, stands . . . 0 11 9
And opposite 15 falls (or poles), stands . 0 4 4¾
                                                        ————————
                                  Cost of digging, £3 3 1¾

TABLE VI.—VALUE OF LAND, CROP, OR WORK, AT PER ACRE. 189

3. Required the value of 15 acres, 27 poles, of growing wheat, at £9 17s. 6d. per acre?

This may be found by two methods, either by finding the value for £9 17s., and then for 6d.; or by finding the value for £9, and then for 17s. 6d.; as follow:—

		£	s.	d.
For 15 acres at £9 17s. add the value for 5 and 10 acres, =		147	15	0
" 27 poles at £9 17s. =		1	13	2¾
" 15 acres at 6d. add the value for 5 and 10 acres, =		0	7	6
" 27 poles at 6d. =		0	0	1
Value of the 15 acres, 27 poles,		£149	15	9¼

		£	s.	d.
For 15 acres at £9, add the value for 5 and 10 acres, =		135	0	0
" 27 poles at £9, =		1	10	4½
" 15 acres at 17s. 6d. add the value for 5 and 10 acres, =		13	2	6
" 27 poles at 17s. 6d. =		0	2	11½
Value of the 15 acres, 27 poles, as above,		£149	15	9¾

4. A potatoe field measures 5 acres, 3 roods, 12 poles; what is its value at £35 10s. per acre?

As £35 10s. is not to be found in the Table, either halve the rate, or divide it into two parts, say of £20, and £15 10s.; find the value of each separately, and add their sums together, for the value of the field. Both these methods may be shown.

And first by halving £35 10s. = £17 15s.

	£	s.	d.
5 acres at £17 15s. per acre, =	88	15	0
3 roods at ditto, =	13	6	3
12 poles at ditto, =	1	6	7½
	103	7	10½
Which multiply by			2
Value of the field at £35 10s. per acre,	£206	15	9

By dividing £35 10s. into parts of £20 and £15 10s.

	£	s.	d.
5 acres at £20 per acre, =	100	0	0
3 roods at ditto, =	15	0	0
12 poles at ditto, =	1	10	0
5 acres at £15 10s. per acre, =	77	10	0
3 roods at ditto, =	11	12	6
12 poles at ditto, =	1	3	3
Value of the field, as above,	£206	15	9

Instead of a half, as in the first method, the third, fourth, or any other convenient proportion of the rate may be used in a similar manner, and the result, multiplied by the number of equal parts into which the rate was divided, will give the value sought.

5. Required the value of a piece of land, measuring 10 acres, 3 roods, 17 poles, at £125 per acre?

As this sum exceeds the limits of the Table, the values at £100 and £25, will require to be taken separately, and added together.

10 acres at £100, =	.	.	.£1000	0	0
3 roods at do. =	.	.	. 75	0	0
17 poles at do. =	.	.	. 10	12	6
10 acres at £25, =	.	.	. 250	0	0
3 roods at do. =	.	.	. 18	15	0
17 poles at do. =	.	.	. 2	13	$1\frac{1}{3}$
			£1357	0	$1\frac{1}{2}$

Note.—It will very seldom be required to find the value of any quantity less than a pole, but if such a case should occur, $\frac{1}{4}$, $\frac{1}{2}$, or $\frac{3}{4}$, of the value of the pole at the rate sought, can easily be taken, and added along with the portion already found by the Table.

Fractions in the calculations, of less value than $\frac{1}{4}$d., are not set down in the Table.

TABLE VII.

———————

THE distance of the plants from each other is found on the top of the columns, commencing with 3 inches, and rising by 1 inch to 1 foot, thence by 3 inches to 2 feet, thence by 6 inches to 9 feet, and thence by 1 foot to 24 feet; $10\frac{1}{2}$, $13\frac{1}{2}$, $16\frac{1}{2}$, $19\frac{1}{2}$, and $22\frac{1}{2}$ feet, are also given to facilitate the calculation by half yards. The quantity of land is found in the left hand column of the page, rising by 1 pole from 1 to 40 poles, or 1 rood; then 2 roods, 3 roods, 1 acre, 5 acres, and 10 acres; and opposite any given quantity in that column, and under any given distance, is found the number of plants, trees, &c., required for that quantity of land, at that distance.

Note.—In calculating this Table, fractions of $\frac{1}{2}$ and upwards are reckoned 1, and those less than $\frac{1}{2}$ are disregarded.

EXAMPLE 1. What number of cabbages are required to plant 1 acre, 3 roods, and 35 poles, of land, at the distance of 2 feet, 6 inches, from each other?

Look in the Table for $2\frac{1}{2}$ feet, under which,

Opposite 1 acre, stands	6970
Opposite 3 roods, stands	5227
And opposite 35 poles, stands . . .	1525

Which added together gives the number required = 13722

EXAMPLE 2. What number of trees will be required to plant a piece of land, measuring 12 acres, 1 rood, 30 poles, at a distance of 4 feet, 6 inches, asunder?

Look in the Table for $4\frac{1}{2}$ feet, the distance, under which,

Opposite 10 acres, stands	21511
Opposite 1 acre, stands 2151, which double for	
2 acres, = ...	4302
And opposite 1 rood, stands . . .	538
And opposite 30 poles, stands . . .	403

Which gives the number required = 26754

This Table, it may be observed, is calculated on the principle that the plants, &c., are supposed to be placed at equal distances

from each other in every direction, but it will be easy, from the Table, to find the number of plants required for a given piece of ground, when the distance between the rows or drills exceeds the distance between the plants in the row.

For example, if the width between the rows is twice the distance between the plants in the row, divide the number found in the Table by 2 ; if 3 times the distance, divide by 3, and so on with any other required proportion. Or, the number may be found for the width between the rows, and if the distance between the plants in the row is $\frac{1}{2}$, or $\frac{1}{3}$, or $\frac{1}{4}$, &c., multiply the number found by 2, 3, or 4, as the case may be. If a proportion cannot be conveniently taken, proceed by the following Rule :—

RULE.—First find from the Table the number of plants that would be necessary for the given piece of land, at the given distance of the plants from *each other in the rows or drills ;* then multiply the number thus found by the same distance, and divide the product by the given distance between the rows, the quotient is the number of plants required. Or, find from the Table the number of plants that would be required for the given *width between the rows,* then multiply this number by the same width, and divide the product by the given distance between the plants in the rows, the quotient is the number of plants required.

EXAMPLE 3. How many potato sets are required to plant a field, measuring 1 acre, 36 poles, the distance between each set being 9 inches, and the width of the drills 30 inches?
Look in the Table for 9 inches, the width between
    each set in the row, under which,

And opposite 1 acre, is	77440
And opposite 36 poles, is	17424
	94864
This multiplied by the distance in the row .	9
And the product, divided by the width of the rows, 3,0)85377,6	
Gives the number of sets required = . . .	28459$\frac{6}{30}$

For an exercise, the solution of the same question may be shown by taking the width between the rows from the Table.—Thus—

Under 30 inches, and opposite 1 acre, stands . .	6970
And opposite 36 poles, stands . .	1568
	8538
This multiplied by the width of the rows = .	30
And the product divided by the distance between the sets in the row	9)256140
Number of sets required, = ...	28460

TABLE VII.—NO. OF TREES, ETC., REQUIRED TO PLANT LAND.   301

The trifling difference between the two results, arises from a fraction in one of the numbers being counted 1 in the Table.

EXAMPLE 4. What number of turnips will grow on 5 acres, 1 rood, 24 poles, of land, the width of the drills being 28 inches, and the distance in the rows being 12 inches ?

As 28 inches is not in the Table, we must find the number for 12 inches—the distance of the turnips from one another in the drills. Under 12 inches in the Table, and opposite 5 acres,

stands	217800
Opposite 1 rood, stands	10890
And opposite 24 poles, stands . . .	6534

235224

By the rule this number is to be multiplied by   12

And the product divided by 28 $\begin{cases} 4)2822688 \\ 7)\ 705672 \end{cases}$

Gives the number of turnips required = . . 100810$\frac{8}{28}$

EXAMPLE 5. What number of carrots will grow on 1 acre, 2 roods, 14 poles, of land, the width of the drills being 13 inches, and the distance of the carrots in the rows 10 inches?

In this example we must find for the distance of the carrots in the rows, viz.—10 inches ; 13 inches, the width of the drills, not being in the Table.

Opposite 1 acre, and under 10 inches, stands .	62726
Opposite 2 roods stands	31363
And opposite 4 poles stands . . .	5489

99578

Which multiply by 10

And divide by . . . . 13)995780(76598,$\frac{6}{13}$
91   Number of
——   carrots.
85
78
——
77
65
——
128
117
——
110
104
——
6

It may be observed, that the above operations would be shortened by reducing the multipliers and divisors to their lowest terms ; thus, for 9 and 30 inches, 3 and 10 may be used ; and for 12 and 28 inches, 3 and 7 may be used,—with the same results as above.

To find the number of plants, trees, &c., required for any piece of land by calculation.

RULE 1. When the plants, &c., are to be at equal distances from each other.—Reduce the given piece of land to the same denomination as the given distance between the plants, and divide the numbers so found by the square of the distance, the quotient is the number of plants required.

2. When the plants, &c., are in rows or drills, the width between the rows or drills being greater than the distance between each plant in the drill.—Reduce the given piece of land to the same denomination as the given distances ; multiply the distance of the plants in the drill by the width of the drill, and divide the land, reduced as above directed, by the product, the quotient is the number of plants required.

Take for illustration the 1st and 4th examples given above :—

1. What number of cabbages are required to plant 1 acre, 3 roods, and 35 poles, of land, at a distance of 30 inches?

Acres.	roods.	poles.

TABLE VIII.

IN the left hand column of the page are found the lengths, rising by 1 yard to 22 yards, by 10 yards from 30 to 100 yards, by 100 yards to 1500 yards, then 2000 yards; the distances apart run along the top of the pages, rising by 1 inch to 15 inches, and under each is the number of thorns, &c., required for a fence, at any of the opposite lengths in the left hand column.

Note.—Fractions of $\frac{1}{2}$ and upwards are counted as 1, and those under $\frac{1}{2}$ are omitted altogether, in calculating this Table.

The Table may also be used for finding the number of anything placed in rows or drills, the distance apart and the length of the row being given. The number of tiles required for any length of drain may also be found by this Table, the length of the tile being given.

EXAMPLE 1. How many thorns are required to make a fence 2916 yards long, and 6 inches distant from each other?
Look in the Table under 6 inches, and opposite

2000 yards stands	.	.	.	.	12000
Opposite 900 yards stands		.	.	.	5400
And opposite 16 yards stands	.	.	.	96

Number of thorns required . 17496

EXAMPLE 2. How many paling stakes are required to enclose a plantation, the circumference of which is 1490 yards, and the distance between each stake is 9 inches?
Under 9 inches in the Table, and opposite 1400

yards, stands	.	.	.	.	.	5600
And opposite 90 yards stands	.	.	.	360

Number required . 5960

TABLE IX.

DESCRIPTION OF THE TABLE.

THE weight per yard is found in the left hand column of the
Table, rising by $\frac{1}{2}$ ounce to 4 ounces, thence by $\frac{1}{4}$ pound to 1 pound,
and thence by $\frac{1}{2}$ pound to the end of each dimension in the
Table. In the columns to the right hand, opposite any given
weight per yard, under their respective denominations, is found
the weight per Imperial, Scotch, and Irish acre, in tons, hundred-
weights, quarters, and pounds. At the top of each dimension or
breadth in the Table is stated the number of yards in length
of that breadth which are contained in an acre.

In order to get a fair average weight per yard to use with the
Table, it will be necessary to measure off 6 or 8 yards, and find
the weight of the produce thereon, which must be divided by
the number of yards measured off, to give the average weight
per yard. If the crop on the land seems to be unequal, several
parts of the field may be treated in the manner above mentioned,
the whole weights being added together, and divided by the
whole number of yards, which, if gone about correctly, may now
be considered a fair average weight per yard. It must be kept
in mind, that a small error in the weight of the average yard,
either over or under, becomes considerable, when multiplied, as
it will be, into every yard in the acre. In measuring for the
average of turnips, cabbages, and other plants in drills or rows,
care must be taken to begin and end the measurement in the
middle of the space between the first and last plant.

To find the average weight of each turnip, cabbage, &c., weigh
any number taken from the row or drill, in succession and with-
out selection, and divide the weight by the number; the quotient
is the average weight of each.

To find the number of turnips or plants of any kind on an
acre, ascertain the number on a yard at any of the dimensions
in the Table, and multiply that number by the number at the
top of the Table of the given dimension; the product is the
number of plants, &c., per acre. If there is only one plant per

TABLE IX.—WEIGHT OF PRODUCE PER ACRE.   315

yard in the given dimension, the number at the top of the Table is the number per acre.

EXAMPLE 1. The average produce of a drill of potatoes has been ascertained to be 4¼ pounds per yard, and the width of the drill is 30 inches ; required the weight of the crop per Imperial, Scotch, and Irish acre ?

Look in the Table under 30 inches, and

	Tons	cwt.	qr.	lbs.	Tons	cwt.	qr.	lbs.	Tons	cwt.	qr.	lbs.
Opposite 4¼ lbs. stands	11	13	1	12	14	14	1	5½	18	18	0	0
And opposite 4 oz. stands	0	12	3	2¼	0	16	1	11¼	1	1	0	0
Weight of crop per Imp. Scotch and Irish acre.	12	6	1	8	15	10	2	16½	19	19	0	0

EXAMPLE 2. A field of carrots is in drills 15 inches wide, and the plants 10 inches apart in the drills ; the average weight of the carrots in a yard in length of the drill, is 4 pounds; required the number of carrots on an acre Imperial, Scotch and Irish, also the weight of the crop per acre ?

To find the number of carrots, divide the inches in a yard = 36 by 10 inches, the distance between each = $3\frac{6}{10} = 3\frac{3}{5}$ = the number of carrots in a yard of the drill; then multiply the numbers of each denomination at the head of the Table at 15 inches by $3\frac{3}{5}$; the product is the number of carrots per acre.

	Imp.	Scotch.	Irish.
	11616	14649⅗	18816
	3⅗	3⅗	3⅗
	34848	43948⅘	56448
	6969⅗	8789⅗	11289⅗
Number of carrots,	41817⅗	52738⅖	67737⅗

To find the weight per acre, look in the same Table, and opposite 4 lbs., the weight per yard, stands

Tons	cwt.	qr.	lbs.	Tons	cwt.	qr.	lbs.	Tons	cwt.	qr.	lbs.
20	14	3	12	26	3	0	22½	33	12	0	0

The weight per acre, Imperial, Scotch, and Irish.

EXAMPLE 3. In a field of wheat, the produce of a yard square, after being cut and properly dried, was found to weigh, the grain 8½ ounces, and the straw 17½ ounces ; required the weight of the grain and the straw per Imperial acre, also the number of bushels of wheat, at the rate of 64 lbs. per bushel ?

To find the weight of the wheat, look in the Table at 36 inches, and opposite

	Tons	cwt.	qr.	lbs.
8 ounces stands	1	1	2	12
And opposite ½ ounce stands . . .	0	1	1	11¼
Weight of grain .	1	2	3	23¼

To find the weight of the straw, look in
the same Table, and opposite 1 pound
or 16 ounces, stands   .   .   .   .
And opposite 1½ ounce, stands   .   .

	Tons	cwt.	qr.	lbs.
	2	3	0	24
	0	4	0	5¾

Weight of the straw   .   2   7   1   1¾

To find the number of bushels of wheat, we must reduce the
weight to pounds, and divide by 64, the weight per bushel.

Weight of grain as above   .   .   .

	Tons	cwt.	qrs.	lbs.

40   11¼

Or 40 bushels, 11¼ lbs.

EXAMPLE 4. It is proposed to manure a field of potatoes with
guano, at the rate of 4 cwt. per Imperial acre; the width of each
drill is 30 inches; how much must be distributed on each running
yard of the drills to use the proposed quantity?

Look in the Table under 30 inches for the nearest weight to
4 cwt. which is—

	Cwt.	qrs.	lbs.			
	3	0	27	opposite 1 ounce	in the left hand column	
And	0	3	6¾	,,	¼ ounce	,, ,,

4   0   5¾   gives   1¼ ounce to distribute per yard.

TABLE X.

SHOWING THE NUMBER OF BUSHELS OF BEANS, BARLEY, AND OATS PER ACRE, WHICH ARE EQUAL IN VALUE TO A CROP OF WHEAT, OF FROM 16 TO 40 BUSHELS PER ACRE, EACH KIND OF GRAIN BEING CALCULATED AT THE AVERAGE PRICES OF ENGLAND AND WALES FOR TWENTY YEARS.

THIS Table is calculated at the nearest whole numbers of bushels of each kind of grain, that are equivalent to the number of bushels of wheat in the opposite left hand column, at the average prices on the top of the columns. Let it be supposed, for example, that an acre grows 30 bushels of wheat worth 7s. per bushel, the Table shows that it will require 47 bushels beans, or 53 bushels barley, or 70 bushels oats, per acre, at the prices on the top of the columns, to realize the same amount of money.

TABLE XI.

Shows, from any given weight of a bushel, the weight of a quarter of wheat, &c. in stones of 14 pounds, and the value of the quarter according to its weight, at rates from ⅝d. to 1¾d. per pound, also the value of a cwt. at the same rates per pound.

In the first column on the left hand is placed the weight per bushel, in the second column the weight per quarter at the opposite rates per bushel, and in the other columns the value of the quarter, at the rates per pound placed on the tops of these columns, rising from ⅝d. up to 1¾d. The last line of the Table shows the value of a cwt. at the same rates per pound.

Example. Suppose a bushel of wheat weighs 60 pounds, and it is desired to know the weight of a quarter at that rate, and the price per pound at 50s. per quarter. Look along the line opposite 60 pounds in the left hand column; and the weight of the quarter is found to be 34 stones, 4 pounds; and the price on the top of the column at 50s. is 1¼d. per pound.

TABLE XIII.

DESCRIPTION OF THE TABLE.

In the left-hand column of the page is placed the distance from each other at which the heaps are to be laid down, rising by a half foot from 6 feet to 12 feet or 4 yards, thence by $1\frac{1}{2}$ feet or $\frac{1}{2}$ yard, to 24 feet or 8 yards; and along the top of the columns is placed the number of heaps proposed to be made out of each cart-load, rising from 2 to 20; under which, respectively, is found the number of cart-loads required for an acre, at any of the opposite distances in the left-hand column.

EXAMPLE 1. How many cart-loads are required to manure an acre, laying down the heaps at $2\frac{1}{2}$ yards from each other, and dividing the load into 18 heaps?

Find $7\frac{1}{2}$ feet, or $2\frac{1}{2}$ yards, in the left-hand column, opposite to which, under 18 heaps in a load, is found 43, the number of cart-loads required.

EXAMPLE 2. It is proposed to manure land at the rate of 40 cart-loads per acre, laid down at distances of $3\frac{1}{2}$ yards, or $10\frac{1}{2}$ feet from each other; required into how many heaps each cart-load must be divided?

Find $10\frac{1}{2}$ feet, the proposed distance of the heaps in the left-hand column; then look along the opposite columns until you find the nearest quantity to 40, which is $39\frac{1}{2}$, and on the top of that column is 10, the number of heaps into which each load is to be divided.

To manure land at the rate of a certain number of cubic yards per acre, multiply the proposed number of cubic yards by the number of cart-loads in a cubic yard, to reduce the cubic yards to cart-loads, with which proceed as in the last example.

This Table being calculated on the principle that the heaps are placed at equal distances from each other, it may be necessary to show the method of ascertaining the quantity of manure required, when the distances are greater one way than the other.

RULE. Find the quantity for one of the distances by the Table, then multiply the quantity thus found by the same distance, and divide the product by the other distance. The quotient is the quantity required.

EXAMPLE 3. How many cart-loads of manure will be required for an acre; the distance between the heaps one way is $4\frac{1}{2}$ yards,

the other distance is 6 yards, and the number of heaps to be made from a cart-load is 6 ?

Find 13½ feet, or 4½ yards, in the left-hand column, opposite which, under 6 heaps per cart-load, stands . 40
Which multiply by the same distance, or . 4½

And divide by the other distance, or . 6)180

Which gives the cart-loads required = 30

Table VII. may also be used as a manure Table, by considering the plants as so many heaps of manure laid down at the various distances in the Table.

RULE. To find the number of cart-loads or cubic yards required for any given quantity of land by Table VII., divide the number opposite the given quantity of land, under the given distance, by the number of heaps in a cart-load or cubic yard ; the quotient is the quantity required.

EXAMPLE 4. How many cart-loads of manure will be required for 5 acres, 3 roods, 36 poles of land, laid down in heaps 5½ yards distant from each other, dividing the cart-load into 4 heaps?

In Table VII., under 16½ feet, or 5½ yards, opposite
5 acres stands 800
Opposite 3 roods stands . . . 120
And opposite 36 poles stands . . . 36

Which, divided by the heaps in a cart-load = 4)956

Gives the cart-loads required = 239
To solve the same question by the present Table—
Opposite 16½ feet, and under 4 heaps, stands the
quantity for 1 acre . . . = 40
This multiply by 5 for the 5 acres . 5

200
For 3 roods take ¾ of an acre . . = 30
And for 36 poles take ⁹⁄₁₀ of a rood . = 9

Cart-loads required as above . 239

Note.—A cubic yard of each of the following manures weighs

	cwt.	qr.	lbs.
New dung	9	3	18
(Dung, when fermented, a cwt. or two more)			
Leaves and sea-weed	9	0	3
Compost of dung with weeds and lime which had been once turned over in 9 months	14	0	5
Garden-mould	19	3	25
Water	15	0	3

TABLE XIV.

Explanation of the Table.—The length is found in the left-hand column of the page, rising by ¼ of a foot to 1 foot, then by 1 foot to 20 feet, then 40 and 60 feet; the breadths are found on the top of the pages, rising by 6 inches from 1 foot to 3 feet, thence by 1 foot to 9 feet, and thence by 3 feet or 1 yard to 30 feet; the depths are placed along the tops of the columns, rising by 1 inch, from 6 inches to 1 foot, thence by 3 inches to 2 feet, and thence by 6 inches to 4 feet 6 inches. The content is given in solid or cubic yards and feet; 27 solid feet being equal to 1 solid yard. In calculating the Table, fractions which exceed $\frac{1}{8}$ foot are reckoned ¼ foot, those which are less than $\frac{1}{8}$ are neglected.

Rule. For taking the dimensions of dung-heaps, and heaps of broken metal, &c., which are narrower at top than bottom, first add the breadths of the heap, at the top and bottom together, and divide the sum by 2 for a mean breadth; treat the length in the same manner for a mean length; and if the depth is unequal, take the depth in several places, add them together, and divide by the number of depths taken for a mean depth, and with these mean dimensions find the content by the Table.

Example 1. The breadth of a dung-heap is 14 feet at the top, and 16 feet at the bottom; the length is 59 feet at the top, and 61 feet at the bottom; the depth in three places is 4 feet 3 inches, 4 feet 6 inches, and 4 feet 9 inches; required its content in cubic yards?

First find the mean breadth,

14 feet + 16 feet = 30 ÷ 2 = 15 feet, mean breadth;

Then for the mean length,

59 feet + 61 feet = 120 ÷ 2 = 60 feet, mean length;

And for the mean depth,

$4\frac{1}{4}$ feet + $4\frac{1}{2}$ feet + $4\frac{3}{4}$ feet = $13\frac{1}{2}$ ÷ 3 = $4\frac{1}{2}$ feet, mean depth;

Now find 15 feet, the breadth on the top of the page in the Table, and 4 feet 6 inches the depth on the top of a column, under which, and opposite the length 60 feet in the left-hand column, stands 150 yards, the solid content of the heap.

TABLE XIV.—CONTENT OF MANURE HEAPS, ROAD METAL, &c.   341

To calculate the above by the pen,

Multiply the mean length   60 feet

By the mean breadth   15 feet

                               300

                                60

                               900

And this product by the mean depth $4\frac{1}{2}$ feet

                             3600

                             450

Which divide by the solid feet } 27) 4050 (150 solid yards,
in a yard.   27   as above.

                         135

                         135

                           0

EXAMPLE 2. The mean breadth of a dungpit is 30 feet, the mean length 50 feet, and the mean depth 2 feet 6 inches; required the content in solid yards?

Find 30 feet, the breadth on the top of the page, and for the length 50 feet, take 40 feet and 10 feet, thus

	yds.	feet.
Opposite 40 feet and under the depth 2 feet 6 inches stands . . .	111	3
And opposite 10 feet stands . .	27	21
Solid content	138	24

EXAMPLE 3. Required the content in solid yards of a heap of compost, the mean breadth being 8 feet, the mean length 75 feet, and the mean depth 2 feet 7 inches?

In this example take the length, 75 feet, in two parts, 60 and 15 feet, and the depth also in two parts, say 2 feet and 7 inches, and having found 8 feet the breadth on the top of the page,

	yds.	feet.
Opposite 60 feet and under 2 feet stands	35	15
And opposite 15 feet stands . .	8	24
Then opposite 60 feet, under 7 inches, stands	10	10
And opposite 15 feet stands . .	2	16
Solid content	57	11

In adding up the sums in this example, we find the feet to be 65, which, divided by 27, gives 2 yards to carry to the yards column, and 11 feet over, which is set down.

EXAMPLE 4. The mean breadth of a bing or heap of broken metal for roads is 9 feet, the mean length 21 feet, and the mean depth 3 feet 6 inches; required the solid content in yards?

In this example we might take for the length 20 feet, and 1 foot, but we shall take 10 feet and 11 feet, as they stand next each other in the Table, and may be added together readily at once.

Having found 9 feet, the breadth, on the top of the page,

	yds.	feet.
Opposite 10 feet and under 3 feet 6 inches stands	11	18
And opposite 11 feet stands . .	12	22½
Or 24½ yards, the solid content	24	13½

EXAMPLE 5. The mean breadth of a bing of broken metal is 10 feet 6 inches, the mean length 27 feet, and the mean depth 4 feet; what is its content in cubic yards?

As the breadth 10 feet 6 inches is not found at once on the top of the page, take it in two portions, say 9 feet and 1 foot 6 inches; thus, find 9 feet on the top of the page,

	yds.	feet.
And opposite 13 and 14 = 27 feet, the length, under 4 feet, the depth, stands .	17	9
And	18	18
And in the Table, at 1 foot 6 inches broad, under 4 feet, the depth, opposite 13 feet, stands	2	24
And opposite 14 feet stands . .	3	3
The cubic content	42	0

If found more convenient for calculation, the length may be taken as the breadth, and the breadth as the length. Thus, let us suppose that the breadth in the last example is 27 feet, and the length 10 feet 6 inches; then, having found 27 feet on the top of the page,

	yds.	feet.
Opposite 10 feet, and under 4 feet, stands	40	0
And opposite ½ foot or 6 inches stands	2	0
42 solid yards, the content, as before.	42	0

Note.—Broken metal for roads weighs from 24 to 26 cwt. per cubic yard, the harder weighing heavier than the softer. The breaking of the metal is generally done at a certain rate per cubic yard, which varies from about 1s. 2d. to 1s. 6d. more or less, as the metal is harder or softer. Broken metal is also estimated, in some districts, by the ton of 16 cubic feet. To reduce a measurement found in solid yards by the Table to tons of 16 feet, multiply the solid yards by 27, and divide the product by 16.

TABLE XV.

THE first column on the left hand contains the distances or
widths between the drains; the second contains the length of
drains per acre, in yards; the third the number of rods per acre;
the fourth the number of roods per acre; and the fifth to the
tenth columns contain the number of tiles of each length, required
for an acre, at the opposite widths in the left-hand column.

In the Table, fractions less than $\frac{1}{2}$ of a foot are omitted in the
second column, and when less than $\frac{1}{4}$ of a yard, in the third and
fourth.

Drains in some parts of the country are measured by the rood
of 36 yards in length, and in other parts by the chain of 66 feet;
but statute rods of $5\frac{1}{2}$ yards, and roods of 6 yards in length, being
most generally used, the Table is calculated at these lengths.
The rood of 36 yards is equal to 6 roods of this Table, and the
chain of 66 feet is equal to $3\frac{2}{3}$ roods.

It will be observed that the length of the drains, and the num-
ber of tiles required per acre, is in proportion to the width between
the drains; therefore if a width twice that of any in the Table is
wanted, you have only to divide the numbers in the columns
opposite that width by 2, the quotients will give the length of
drains and number of tiles required.

To find the expense of draining per acre, multiply the number
of yards, rods, or roods, opposite the proposed width between the
drains in the Table, by the estimated cost per yard, rod, or rood,
as the case may be.

EXAMPLE I. It is proposed to drain a field, placing the drains 30 feet apart,
required the length of drains per Imperial acre in yards and roods, and the
number of tiles 14 inches in length that will be needed per acre.
Look in the left-hand column of the Table for 30 feet, the width, opposite
which stands 484 yards, or 80 roods 4 yards, the length of the drains, and
under length 14 inches stands 1245, the number of tiles required to lay
the same.

EXAMPLE II. In draining a field at a width of 80 feet, how many yards,
and how many rods of drains are there per Imperial acre, and what number
of tiles 15 inches in length will be required per acre?
As the Table does not extend to 80 feet, divide the numbers opposite 40
feet by 2, which gives $181\frac{1}{2}$ yards, or 33 rods of drains, and 436 tiles 15 inches
in length per Imperial acre.

EXAMPLE III. Required the expense of draining per acre, at a width be-

tween the drains of 33 feet, the estimated cost being 8½d. per rood of 6 yards.

In the Table opposite 3½ feet, the width, stands 73 roods 2 yards, which at 8½ l. per rood, is £2, 11s. 11¼ l., the expense per acre.

COST OF DRAINING PER ACRE.

The following estimates of the cost of drains is taken from Morton's *Cyclopedia of Agriculture*, and may be useful to those who are not in possession of that work. The cost of cutting, laying, and filling in pipe drains of from 3 feet, to 3 feet 6 inches in depth, the greater depths being in clay or gravel, and the lesser depths in hard indurated soils requiring picking, was 5½d. to 6½d. per rod of 5½ yards, or about 1d. er yard.

Taking the price of tiles at 12s. per 1000, the cost of draining per rod, in soils somewhat difficult to excavate, exclusive of carriage of pipes or tiles, for 3½ feet drains, will be about 7⅞d.

The third column of the following Table shows the cost per acre, according to the different distances between the drains, exclusive of carriage, and of the slight additional expense of the larger pipes required for the mains.

Where the drains are not so deep as 3½ feet, or where, from the ease with which the cutting can be effected, or from other causes, the cost of workmanship does not exceed 4d. per rod, the cost of the drains, omitting fractions, will be as stated in the fourth column of the Table.

Stone drains 3 feet 6 inches in depth, and 5 inches wide in the bottom, in indurated stony clay, is estimated to cost 1s. per rod, for quarrying whinstone, and breaking it to pass through a 3-inch ring; filling stones into carts, and carriage; emptying the stones into drains with the drain-screen, to the depth of 14 inches, and returning the earth into the drains with the spade. The cost per acre is shown in the 5th column of the Table.

Intervals between the drains in ft.	Rods per acre.	Cost per acre of 3½ feet drains.			Cost per acre, reckoning workmanship at 4d. per rod.			Cost per acre of 3½ feet stone drains.		
		£	s.	d.	£	s.	d.	£	s.	d.
15	176	5	15	6	4	13	6	8	16	0
18	146⅔	4	16	3	3	18	10	7	6	8
21	125½	4	2	6	3	6	10½	6	5	8
24	110	3	12	2¼	2	18	5	5	10	0
27	97⅞	3	4	1¼	2	12	0	4	17	9
30	88	2	17	9	2	6	9	4	8	0
33	80	2	12	6	2	2	6	4	0	0
36	73⅓	2	8	1½	1	19	1½	3	13	4
39	67 9⁄13	2	4	4½	1	16	0	3	7	8
42	62⅞	2	1	3	1	13	6	3	2	10

Drains of broken stones are thus found to be fully 30 per cent. more costly than those of pipe tiles, when cut to the same depths, in the same kind of soil.

TABLE XV. — LENGTH OF DRAINS AND TILES REQUIRED PER ACRE. 363

TABLE XVI.

THE distance between the drains is placed on the top of the
page; the quantity of land to be drained is found in the first and
fourth columns; and opposite any required quantity in which,
under their respective headings, stands the number of rods and
roods of drains in that quantity.

In calculating the Table, the length of the drains in each
quantity is set down to the nearest quarter of a yard

The length of drains in any piece of land may be turned into
local poles or roods of any given length, by multiplying the length
found in the Table; if in rods, by $5\frac{1}{2}$, or if in roods, by 6; and
dividing the product by the length of the given rood in yards.

EXAMPLE. It is proposed to drain a field containing 21 acres,
3 roods, and 14 poles, the drains to be 36 feet apart; what will
be the length of the drains in rods of $5\frac{1}{2}$ yards, and in roods of
6 yards?

Find 36 feet, the distance of the drains apart, on the top of the
page,

	Rods.	Yds.		Roods.	Yds.
then opposite 21 acres stands	1540	0	and	1411	4
opposite 3 roods stands	55	0	and	50	$2\frac{1}{2}$
and opposite 14 poles stands	6	$2\frac{1}{4}$	and	5	$5\frac{1}{4}$
	1601	$2\frac{1}{4}$	and	1467	$5\frac{3}{4}$

Suppose it were required to know the length of drains in the
above in poles or roods of 7 yards in length.

	Roods.	Yds.
Multiply	1467	$5\frac{3}{4}$
by		6
and divide by	7) 8807	$4\frac{1}{2}$
Length required	1258	$1\frac{1}{2}$

TABLE XVII.

SHOWING THE NUMBER OF TILES OR PIPES OF 12, 13, 14, 15, 16, AND 18 INCHES IN LENGTH, THAT ARE REQUIRED TO LAY ANY LENGTH OF DRAINS, FROM 1 TO 5000 STATUTE RODS OF $5\frac{1}{2}$ YARDS, AND 1 TO 5000 ROODS OF 6 YARDS; ALSO THE NUMBER REQUIRED TO LAY FROM 1 TO 30,000 YARDS.

THE first and second pages of the Table are occupied with the number of tiles required for statute rods, and for the same lengths in yards; the third and fourth pages contain the number required for roods of 6 yards, and for the same lengths in yards.

In the first and second pages, the first column on the left hand contains the length of drains in statute rods; the first column of the third and fourth pages contains the length of drains in roods of 6 yards; the second column contains the length of drains in yards; and columns 3 to 8 contain the number of tiles of each length required to lay the number of rods, roods, and yards of drains in the first and second columns.

As there is no allowance made for waste and breakage of tiles, 3 or 4 per 100 may be added to the number given in the Table.

Where fractions occur in the calculation they are reckoned 1.

EXAMPLES.   1. How many tiles, 14 inches long, are required to lay 653 statute rods of drains?

Find 600 in the second page of the Table under rods,
| | |
opposite which, under 14 inches, stands   .   .   8486
And opposite 53 rods stands   750
                                                    ────
                                                    9236
Add for breakage, say 4 per 100   369
                                                    ────
            Number of tiles required,   9605

2. How many 15 inch-pipes are required to lay 549 roods of drains, each 6 yards in length?

In the fourth page of the Table, opposite 500 roods,
   under 15 inches, stands   7200
And opposite 49 roods stands   706
                                                    ────
                                                    7906
Add for breakage three per 100   237
                                                    ────
            Number of pipes required,   8143

3. How many tiles, 13 inches long, are required to lay 5720 yards of drains?

In the second page of the Table, under yards, is found
   5500, opposite which, under 13 inches, stands   .   15231
And opposite 220 stands   610
                                                    ─────
                                                    15841
Add for waste, three per 100   475
                                                    ─────
            Number of tiles required,   16316

TABLE XVIII.

The depths are placed on the top of the pages, the widths on the top of the columns, and the lengths in the first column on the left hand; and opposite each length, under the various widths on the top of the columns, at the depth, on the top of the page, stands the solid content in yards and feet.

As drains and ditches are wider at top than bottom, the mean width must be taken before finding the content by the Table; this is done by adding the widths at top and bottom, and dividing the sum by 2.

If any required dimension is not found in the Table, it may be made up by adding together two dimensions; for example, for a depth of 3 feet 4 inches, the contents for 10 inches and 2 feet 6 inches may be added together; for 3 feet 8 inches, the contents for 1 foot 2 inches and 2 feet 6 inches, &c. Or it may be sometimes more convenient to find the content for the half, or for double the required dimension, such as for a depth of 2 feet 8 inches, take twice the content for 1 foot 4 inches, and for a width of 2 feet 9 inches, take half the content for 5 feet 6 inches, &c. Or, if found more suitable, the content of one dimension may be subtracted from another; thus, if a depth of 4 feet 4 inches is required, the content of 1 foot 2 inches may be subtracted from the content of 5 feet 6 inches, &c. Or, the width may be used for the depth, and the depth, in that case, for the width; as, for example, 200 yards long, and 5 feet 6 inches deep, by 2 feet 6 inches wide = 305 yards 15 feet, and 200 yards long, and 5 feet 6 inches wide by 2 feet 6 inches deep is also 305 yards 15 feet. Any required length may also be made up, by doubling, halving, or adding together the contents of two or more lengths, as is found most convenient.

Note. In adding together two contents, or in subtracting one content from another, it must be remembered that 27 solid feet make one solid yard.

In calculating the Table, fractions in the content, of ½ foot and under are neglected, when they exceed ½ foot they are reckoned 1.

EXAMPLES.   1. Required the solid content of digging in a drain 3 feet 6 inches deep, 7 inches wide at bottom, 13 inches wide at top, and 500 yards in length ?

To find the mean width, 7 + 13 = 20 ÷ 2 = 10 inches mean width ; then find 3 feet 6 inches, the depth, on the top of a page, and opposite 500 yards, under 10 inches, the mean width, stands 162 yards 1 foot, the solid content.

2. Required the solid content of digging in a drain 225 yards in length, 6 feet deep, and top and bottom widths 2 feet 6 inches and 1 foot 6 inches ?

First, 2½ feet + 1½ foot = 4 ÷ 2 = 2 feet, mean width.

Then find 6 feet, the depth, on the top of

	Yards.	Feet.
the page, and opposite 200 yards in length, under 2 feet mean width, stands . .	266	18
And opposite 25 yards stands . . .	33	9
Solid content,	300	0

3. Required the solid content of digging in a drain 3 feet 10 inches deep, width at top and bottom 14 and 8 inches, and 1000 yards long ?

14 + 8 = 22 ÷ 2 = 11 inches mean width; then, as 3 feet 10 inches, the depth, is not found in the Table, take the two depths, of 3 feet, and 10 inches, separately.

	Yards.	Feet.
Thus, at a depth of 3 feet, opposite 1000 yards, under the mean width 11 inches, stands	305	15
And at a depth of 10 inches, opposite 1000 yards, under width 11 inches, stands .	84	24
The solid content,	390	12

4. Required the solid content of digging in a ditch 700 yards in length, 5 feet deep, width at bottom 2 feet, and at top 12 feet ?

2 + 12 = 14 ÷ 2 = 7 feet mean width; but as 7 feet, the mean width, is not in the Table, we may take the width as the depth, and the depth as the width ; and the lengths of 200 and 500 yards = 700.

	Yards.	Feet.
Thus, at a depth of 7 feet, opposite 200 yards, under 5 feet wide, stands . . .	777	21
And opposite 500 yards stands . .	1944	12
The solid content,	2722	·6

TABLES XIX.—XXIV.

TABLE XIX.

Shows the equivalent number of Scotch acres, roods, falls, and ells, in Imperial acres, roods, and poles, from 1 pole to 3000 acres; also, the equivalent value per Scotch acre, from 6*d.* to £100 per Imperial acre.

The first and third columns on the left-hand side of the page contain the poles, roods, and acres Imperial; the second and fourth columns contain the equivalents in Scotch acres, roods, falls, and ells; the fifth column contains the value per Imperial acre, and the sixth column contains the equivalent value per Scotch acre.

The succeeding five Tables are so similar to this one, that no description of them, or examples, will be necessary. It may be proper, however, to state that the basis on which the Tables are constructed is the proportion which the Imperial, Scotch, and Irish acres bear to one another; thus, the Imperial acre contains 4840 square yards, taking the Scotch ell as measuring 37.0598 Imperial inches, the Scotch acre will contain 6104.1279 square yards, and the Irish acre contains 7840 square yards. The equivalents in measure and value are calculated in these proportions.

With the exception of the Tables in which Imperial and Irish measures are compared together, fractions under a foot are neglected; in turning Imperial and Irish measures into Scotch, the fractions of an ell are set down in the decimal form; and the money equivalents are set down to the nearest farthing.

The subjoined Table of Imperial, Scotch, and Irish land measures is given for convenience of reference.

Imperial.	Irish.	Scotch.
9 feet = 1 yard.	9 feet = 1 yard.	9.5377 feet = 1 ell.
30¼ yards = 1 pole.	49 yards = 1 pole.	36 ells = 1 fall.
40 poles = 1 rood.	40 poles = 1 rood.	40 falls = 1 rood.
4 roods = 1 acre.	4 roods = 1 acre.	4 roods = 1 acre.

Example I. A field measures 28 acres, 3 roods, 29 poles Imperial, what is its content in Scotch acres, &c.; and what is its value per Scotch acre at the rate of £60 per Imperial acre?

In the Table, opposite 28 acres Imperial, stands				Ac.	Ro.	Falls.	Ells.
In the Table, opposite 28 acres Imperial, stands	.	.	.	22	0	32	7.39
Opposite 3 roods stands	.	.	.	0	2	15	5.35
And opposite 29 poles stands	.	.	.	0	0	22	35.79
The content in Scotch acres,	.	.		22	3	30	13.03

In the same Table, opposite £60, the value Imperial, stands £75, 13s. 5d., the value per Scotch acre.

EXAMPLE II. A farm measures 350 acres, 2 roods, 15 falls, Scotch measure, and is let at a rent of £1, 15s. per acre; required its content in Imperial measure, and its equivalent rent per Imperial acre?

In Table XX., opposite 300 acres Scotch, stands				Ac.	Ro.	Po.	Yds.	Ft.
In Table XX., opposite 300 acres Scotch, stands	.	.	.	378	1	16	24	3
Opposite 50 acres stands	.	.		63	0	9	14	1
Opposite 2 roods stands	.	.		0	2	20	27	0
And opposite 15 falls stands	.	.		0	0	18	27	6
The content in Imperial measure,				442	0	26	2	3¼

					£	s.	d.
In the same Table, opposite £1, stands	.		.		0	15	10¼
And opposite 15s. stands	.	.	.		0	11	10¾
Rent per Imperial acre	.	.	.	.	£1	7	9

In adding together two or more contents in which there are feet and yards, and the sum of the yards is above 30, it is more convenient first to add together the yards and feet as they stand; thus, in the foregoing example, there are 92 yards 10 feet, and as 30¼ yards make a pole, there will be 3 poles in this, or 90 yards 6¾ feet to subtract from 92 yards 10 feet, leaving 2 yards 3¼ feet, which set down, and carry 3 to the poles column, making 66 poles; 40 poles making 1 rood, set down 26, and carry 1 to the roods, which makes 4 roods, or 1 acre; set down a cypher, and carry 1 to the acres.

TABLE XX.

SHOWS THE EQUIVALENT NUMBER OF IMPERIAL ACRES IN SCOTCH ACRES, AND THE EQUIVALENT VALUE PER IMPERIAL ACRE.

TABLE XXI.

SHOWS THE EQUIVALENT NUMBER OF IRISH ACRES IN IMPERIAL ACRES, AND THE EQUIVALENT VALUE PER IRISH ACRE.

TABLE XXII.

SHOWS THE EQUIVALENT NUMBER OF IMPERIAL ACRES IN IRISH ACRES, AND THE EQUIVALENT VALUE PER IMPERIAL ACRE.

TABLE XXIII.

SHOWS THE EQUIVALENT NUMBER OF IRISH ACRES IN SCOTCH ACRES, AND THE EQUIVALENT VALUE PER IRISH ACRE.

TABLE XXIV.

SHOWS THE EQUIVALENT NUMBER OF SCOTCH ACRES IN IRISH ACRES, AND THE EQUIVALENT VALUE PER SCOTCH ACRE.

TABLE XXV.

IN the first three pages of the Table are found the girths from 15 to 37 feet; in the next three pages, the girths from $37\frac{1}{2}$ to $59\frac{1}{2}$ feet; and, in the last three pages, the girths from 60 to 82 feet; these are placed in the left-hand columns of the pages; the heights from 6 to 21 feet are placed along the top of the other columns; the solid content is found opposite the given girth, in the column under the given height.

The girths being given, rising by a half-foot, from 15 to 82 feet, are, in ordinary cases, sufficiently minute for any measurement; and, if required, any height may be had, rising by a half-foot from 3 feet to $32\frac{1}{2}$ feet, either by taking half the content of one of the heights in the Table, or by adding together the contents of two of the heights. Thus, by taking half the content of the numbers in the Table up to 21, the content of heights rising by a half-foot, from 3 to $11\frac{1}{2}$ feet, will be had, by adding the content of $6\frac{1}{2}$ feet to numbers in the Table, the content of heights, rising by a half-foot from $12\frac{1}{2}$ up to $27\frac{1}{2}$ feet will be got, and by adding the content of $11\frac{1}{2}$ to the content of 17 and upwards, the content of heights will be got, rising by a half-foot, from $28\frac{1}{2}$ up to $32\frac{1}{2}$ feet high.

The contents are set down to the nearest fraction of a foot: fractions of a half-foot and under are neglected, and when above a half-foot, they are reckoned 1.

The dimensions of a circular stack, such as the figure adjoining, is taken as follows:—

Take the girths at the bottom of the stack and at the eaves a, b, and add the two girths together, the half of the sum is the mean girth; then take the height from the ground to the eaves at b, and add to it one-third of the perpendicular height from the eaves to the top of the dotted line on a level with c, the crown of the stack. When the body of the stack does not taper regularly, girths must be taken in
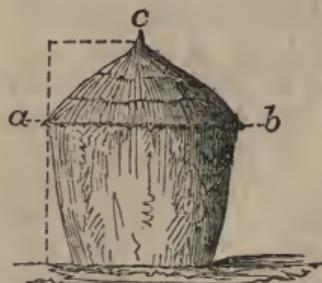

several places, and added together; divide their sum by the number of girths taken, and the quotient is the mean girth. The mean girth and height thus found, are used with the Table, as in the following example :—

Required the solid content of a circular stack, the girth at the bottom being 56 feet, the girth at the eaves 63 feet, the height from the ground to the eaves 12 feet, and the perpendicular height from the eaves to the top of the stack 9 feet.

First, add the two girths, 56 and 63 = 119, half of which is $59\frac{1}{2}$ feet, the mean girth; then, 12 feet added to 3 (one-third of 9) = 15 feet, the mean height.

Now, turn to the Table, and opposite $59\frac{1}{2}$ feet (the girth), under 15 feet (the height), stands 156 yards 14 feet, the solid content of the stack.

To make the calculation by the pen, the dimensions being given in feet :—Square the mean circumference or girth, multiply the product by the mean height, that product multiplied by the decimal .07958 gives the content in cubic feet. If the dimensions be given in inches, multiply the product of the factors in inches by .000046052, and the product will be the content in cubic feet, which divide by 27, to reduce to cubic yards.

Or, the dimensions being given in feet, the square of the girth, multiplied by the height, and the product multiplied by the decimal .0029474 (which is the quotient of .07958 divided by 27), will give the solid content at once in cubic yards.

We shall take the foregoing example as an exercise. By the first method, dimensions in feet,

$59.5^2 = 3540.25 \times 15 = 53103.75 \times .07958 = 4225.996425$ solid feet, and $4225.996425 \div 27 = 156$ yards 13.996425, or nearly 14 feet.

Dimensions given in inches, say girth 714 inches, and height 180 inches,

$714^2 = 509796 \times 180 = 91763280 \times .000046052 = 4225.8257056$ solid feet, very nearly the same as the former.

By the second method,

$59.5^2 \times 15 = 53103.75 \times .0029474 = 156.51799275$ yards. If the fraction .51799275 is multiplied by 27 we get 13.98580425, or nearly 14 feet, as above.

The weight of hay per cubic yard, in stacks, varies very considerably, from quality, size of the stack, age, &c. In England. stacks of new hay may weigh 8 or 10 stones, of 14 lbs., per cubic yard, and when they are 10 or 12 months old, the cubic yard may weigh 14, 16, 18, and sometimes as much as 20 stones. In Scotland, hay is frequently calculated by the Trone stone, varying, in different counties, from 22 to 28 lbs. Imperial. New hay, in small stacks, is supposed to weigh about 5 stones, of 22 lbs., per cubic yard; large stacks, about 6 or 7 stones. Large stacks,

TABLE XXV.—CUBIC CONTENT OF ROUND STACKS.   417

that have stood 10 or 12 months, may weigh 9, 10, or 11 stones per cubic yard, according to size and quality.

According to Baildon, the quantity of corn in a stack may be estimated at the average quantity of a bushel to a solid yard; but if the crop has been mown, a yard will not average more than 3 pecks. Stacks of straw may be estimated at the rate of 18 or 20 yards to a ton.

In order to find the weight of stacks, of all the varieties alluded to above, it was considered most advisable to give, first, Tables showing the cubic content of stacks in solid yards and feet, as has been done in this Table, and in Table XXVI., for measuring stacks of an oblong form, and then to give a separate Table, showing the number of stones in any number of cubic yards, ranging from 4 to 20 stones per cubic yard, as is done in Table XXVII.

If we suppose the foregoing example to be an old hay stack, and may weigh 16 stones Imperial per cubic yard; on turning to Table XXVII. we find that 156 yards will be 2496 stones, at that rate. If the hay is supposed to weigh 9 stones Scotch Trone weight, 156 yards will weigh 1404 Trone stones.

TABLE XXVI.

THIS TABLE SHOWS THE SOLID OR CUBICAL CONTENT OF STACKS OF A SQUARE OR AN OBLONG FORM, IN SOLID YARDS AND FEET, FROM ½ FOOT TO 60 FEET IN LENGTH, ½ FOOT TO 21 FEET IN BREADTH, AND THE SAME IN HEIGHT.

THE breadths are found on the tops of the pages, the lengths in the left-hand columns, and the heights along the tops of the other columns; the content, at a given breadth and height, is found opposite any given length, in the column under the given height.

The content of any dimension, not found in the Table, may be had by adding together the contents of two dimensions, either in length, breadth, or height; or, it may sometimes be more convenient to take the half of the content of double the required dimension. The Table may also be extended to any required length, by adding together the contents of two or more dimensions.

NOTE. As stated in the introduction to Table XXV. (*which see*), the weight of hay stacks, &c., per cubic yard, varies so much, from size, age, and quality, that it was considered most advisable to give, first, Tables showing the cubical content of stacks in solid yards and feet, as is done in this Table, and Table XXV., and then to give a separate Table, showing the number of stones in any number of cubic yards, ranging from 4 to 20 stones per cubic yard, as is done in Table XXVII.

To take the dimensions of a stack of the form adjoining:— Measure the breadth and length of the stack midway between the bottom of the stack and the eaves, *a*, *b*, *d*, for the mean breadth and length; then measure the perpendicular height, from the bottom of the stack to the eaves, at *a* or *b*, to which add one-half of the perpendicular height, from *a* to the top of the dotted line on a level with *c*, the crown of the ridge of the stack, for the mean height.
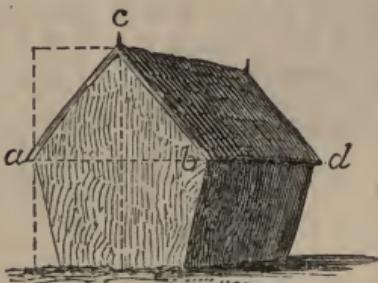

Stacks being usually wider at the eaves than the bottom, the breadth there, of course, exceeds the average width of the stack.

The exact content of the portion above the eaves is found by taking the length and breadth at the eaves by half the perpendicular height from the eaves to the top of the stack, and finding the content by the Tables, which is to be added to the content of the body of the stack, which must be taken by itself. Such minuteness, however, is seldom attended to.

EXAMPLE. Required the content of a hay stack, the mean breadth being 15 feet, the length 50 feet, the perpendicular height from the bottom to the eaves 13 feet, and from the eaves to the top of the ridge 7 feet.

The mean height is 13 feet added to the half of 7 feet = 16½ feet, and as this height is not in the Table, we take first the height 15 feet, and then 1½ foot.

	Yds.	Ft.
Find the breadth 15 feet on the top of the page, and opposite the length 50 feet, under the height 15 feet, stands	416	18
And opposite the same length, under the height 1½ foot, stands	41	18
The solid content, . .	458	9

And, suppose we wish to know the number of Imperial stones in the stack, at the rate of 14 stones per cubic yard, turn to Table XXVII.,

	Stones.
Where, under 14 stones, opposite 450 yards, stands	6300
And, opposite 8 yards, stands	112
The number of stones in the stack, . .	6412

To calculate the above by the pen, multiply the mean length and breadth together, and their product, multiplied by the mean height, gives the solid content, in the same name as the dimensions were taken in; if in inches, divide by 1728 to reduce to feet; and, if in feet, divide by 27 to reduce to solid yards.

Taking the foregoing example,

$$15 \times 50 = 750 \times 16\frac{1}{2} = 12375 \text{ cubic feet,}$$
$$12375 \div 27 = 458 \text{ yards, 9 feet;}$$
$$\text{and } 458 \times 14 = 6412 \text{ stones.}$$

TABLE XXVII.

The content of stacks in cubic yards is placed in the left-hand column of the Table; and, in the first two pages, under their respective headings, opposite each content, is found the number of stones at any required rate, from 4 to 12 stones per cubic yard; the second two pages contain the number of stones in each content, from 13 to 20 stones per cubic yard.

Having ascertained by Tables XXV. or XXVI. the content of a stack in cubic yards, and estimated, from its size, age, &c., the number of stones, whether Imperial or Scotch Trone, that a cubic yard may be supposed to weigh, the number of stones in the stack is at once found in the column under the estimated weight, opposite the given content.

Thus, if the content of a stack is found to be 76 cubic yards, and is supposed to weigh at the rate of 16 stones per cubic yard; on turning to the Table, we find that in the column under 16 stones, opposite 76 yards, stands 1216 stones, the weight of the stack.

Note. The extent and usefulness of the Table may be increased by remembering that a cypher added to the right of any number raises its value tenfold. If, then, we add a cypher to both the yards and the stones, in the above example, a stack containing 760 cubic yards would be shown to weigh 12,160 stones.

To reduce Imperial stones to hundredweights, divide the number by 8; thus, $1216 \div 8 = 152$ cwt.; and $12,160 \div 8 = 1520$ cwt.; which may be divided by 20, to reduce them to tons, if required.

TABLE XXVIII.

The depths are found in the left-hand column of the pages, and the diameters along the tops of the other columns, in their order; and the content, at any given diameter and depth, is found opposite the given depth under the given diameter.

In calculating the Table, fractions of a half-foot and under are neglected, when above a half-foot, they are reckoned 1.

EXAMPLE. What is the cubic content of a cylindrical tank, the diameter of which is 12½ feet, and the depth 8 feet?

Look in the Table for the diameter 12½ feet, and under which, opposite the depth 8 feet, is found 36 yards 10 feet, the cubic content.

To calculate the content of a cylindrical tank, having the diameter and depth given,

RULE 1. Square the diameter, multiply the product by the depth, and by .7854, and, if the dimensions are given in feet, the result is the content in cubic feet; if the dimensions are given in inches, in place of .7854, multiply by .00045452, which will also give the content in cubic feet, which divide by 27, to reduce to cubic yards if required.

2. Or, square the diameter, multiply the product by the depth, and by .02909, the product is the content in cubic yards, if the dimensions are given in feet; if the dimensions are given in inches, in place of .02909, multiply by .000016834, and the product is also the content in cubic yards.

Take, for exercise, the above example, by the rules in their order.

By Rule 1, the dimensions in feet,

$12.5^2 = 156.25 \times 8 = 1250 \times .7854 = 981.75$ cubic feet.

Dimensions in inches, diameter 150 inches, depth 96 inches,

$150^2 = 22500 \times 96 = 2160000 \times .000045452 = 981.7632$ cubic feet, and 981.7632, divided by 27, gives 36 yards 9.7632 feet, or nearly 9¾ feet.

TABLE XXVIII.—CUBIC CONTENT OF CYLINDRICAL TANKS.   451

By Rule 2, the dimensions in feet,

$12.5^2 = 156.25 \times 8 = 1250 \times .02909 = 36.3625$ yards.

Dimensions in inches,

$150^2 = 22500 \times 96 = 2160000 \times .000016834 = 36.36144$ yards, and the fraction, .36144, multiplied by 27, gives 9.7588, or nearly $9\frac{3}{4}$ feet as above.

These results differ a little from the content shown in the Table, as fractions above a half-foot are set down as 1.

NOTE. If the diameter of a circular tank be multiplied by 3.1416, the product is equal to its circumference; and, if the circumference be multiplied by .31831, the product is equal to its diameter.

TABLE XXIX.

The content or capacity of circular tanks, having the *circumference* and *depth* given, is readily found in cubic yards and feet by Table XXV.; and the content of square or oblong tanks, the *length*, *breadth*, and *depth* being given, by Table XXVI.; the *height* in these Tables being reckoned the *depth* of the tank.

Table XXVIII. shows the content of circular tanks, having the *diameter* and *depth* given, in cubic yards and feet.

The cubic content having been found by these Tables, or otherwise, the capacity in Imperial gallons will be shown by the present Table.

In calculating the Table, fractions of half a gallon, and under, are neglected; when above half a gallon, they are reckoned 1.

EXAMPLE. How many gallons will a circular tank contain, the diameter of which is 12½ feet, and the depth 8 feet?

	Gallons.
In Table XXVIII., under the diameter 12½ feet, and opposite the depth 8 feet, stands the cubic content 36 yards 10 feet; and, by the present Table, the content in gallons, opposite 36 yards, is	6058
And opposite 10 feet, is	62
Capacity of the tank, . .	6120

Suppose it were wished to construct a tank to contain a certain number of gallons, say about 6000, at a depth of 8 feet, what would the circumference require to be?

	Gallons.
By this Table we find that 36 cubic yards will contain 6058 gallons, and, on turning to Table XXV., the nearest content to 36 yards, under 8 feet, is found to be 35 yards 23 feet, opposite a circumference of 39 feet; and, in this Table, opposite 35 yards, stands	5889
And opposite 23 feet stands	143
Capacity of the tank, . .	6032

TABLE XXIX.—CAPACITY OF TANKS IN IMPERIAL GALLONS.   455

If it be desired to make an oblong tank to contain about the same quantity, the depth to be 8 feet, and the breadth 9 feet, what must be its length?

	Yds	Ft.
In Table XXVI., at a breadth of 9 feet, under a depth (height) of 8 feet, we find opposite a length of 13 feet, stands	34	18
And opposite ½ foot stands	1	9

| Or, a tank 13½ feet long, 9 broad, and 8 deep, will measure . . . . . . | 36 | 0 |

and will contain 6058 gallons.

An Imperial gallon contains 277.274 cubic inches, and if 46,656, the cubic inches in a yard, is divided by that number, the quotient is 168.26677, or a little more than 168¼ gallons per cubic yard; and this number, divided by 27, the cubic feet in a yard, gives a quotient of 6.2321, or a little less than 6¼ gallons per cubic foot.

Thus, if the cubic content of any tank is known, yards multiplied by 168.26677, and feet multiplied by 6.2321, will give its capacity in Imperial gallons. Where great exactness is not required, the yards may be multiplied by 168¼, and the feet by 6¼ in place of the above.

Suppose the solid content of a tank to be 36 yards 10 feet;

						Gallons.
Then, 36 × 168.26677	.	.	.	=		6057.60372
And, 10 × 6.2321	.	.	.	=		62.321

| Capacity of the tank, | . | . | . | . | | 6119.92472 |

or very nearly 6120 gallons, as shown by the Table.

Rules for calculating the capacity of tanks in Imperial gallons.

1. For circular tanks.—Given, the *diameter* and *depth*.
Square the diameter, multiply the product by the depth, and by 4.8947, if the dimensions are given in feet; or, by .0028326, if the dimensions are given in inches.

2. For circular tanks.—Given, the *circumference* and *depth*.
Square the circumference, multiply the product by the depth, and by .49594, if the dimensions are given in feet; or, by .000287, if the dimensions are given in inches.

3. For square or oblong tanks.—Given, the *length*, *width*, and *depth*.
Multiply the length, width, and depth into one another, and the product by 6.2321, if the dimensions are given in feet; or, by .00360654, if the dimensions are given in inches.

We shall perform the foregoing examples, by the Rules, in their order.

1. A circular tank, diameter $12\frac{1}{2}$ feet, and depth 8 feet.

By feet, $12.5^2 = 156.25 \times 8 = 1250 \times 4.8947 = 6118.375$ gallons.

„ inches, $150^2 = 22500 \times 96 = 2160000 \times .0028326 = 6118.416$ do.

2. A circular tank, circumference 39 feet, and depth 8 feet.

By feet, $39^2 = 1521 \times 8 = 12168 \times .49594 = 6034.59792$ gallons.

„ in. $468^2 = 219024 \times 96 = 21026304 \times .000287 = 6034.549248$ do.

3. An oblong tank, length $13\frac{1}{2}$ feet, width 9 feet, and depth 8 feet.

By feet, $13.5 \times 9 = 121.5 \times 8 = 972 \times 6.2321 = 6057.6012$ gallons.

„ inches, $162 \times 108 = 17496 \times 96 = 1679616 \times .00360654 = 6057.60228864$ gallons.

It will be observed that the contents in these examples vary a little from the contents found by the Tables, which is caused by taking the fractions in the calculations of the Table, if above a half-foot, as 1; or, neglecting them, when a half-foot, or under.

Mr. George Melling, at the Annual Show Meeting of the Royal North Lancashire Agricultural Society, held at Burnley in September 1850, stated that he had made a calculation which, he believed, would be found near enough for practical purposes, that during the frosty months of November, December, January, and February, when he considered it useless to apply liquid manure, one cow, during that time, would make 300 gallons. The size of tanks necessary for a farm would, therefore, be regulated by the number of stock kept, at the rate of 300 gallons for each. This would be about 2 cubic yards for one cow, 9 yards for 5 cows, 18 yards for 10 cows, 27 yards for 15 cows, and 36 yards for 20 cows, &c. Tanks of the proper dimensions, either circular, square, or oblong, of the above-mentioned contents, may readily be found by Tables XXV., XXVI., and XXVIII.

TABLE XXX.

To find, by measurement, the weight of live cattle, sheep, and swine, in Imperial stones of 14 lbs., in Smithfield stones of 8 lbs., in cwts., and in scores.

In the first column of the Table, on the left hand, is placed the girths of the animals, in feet and inches; in the second column, the lengths, in feet and inches; in the columns succeeding, opposite each dimension, is found the weight in Imperial stones and lbs., in Smithfield stones and lbs., in cwts., qrs., and lbs., and in scores and lbs.

To get the dimensions, let the animal be made to stand straight, and take the girth close behind the fore legs, at A B (see Frontispiece), in feet and inches, and the length from the top of the shoulder to the bone at the rump, perpendicular to the extremity of the buttock, or from A to C, also in feet and inches. The length of the hog is taken along the curve of the back, as indicated in the figure. Having found the girth and length as directed, look for the girth in the left-hand column, and opposite the length, under their respective headings, stands the weight of the animal in all the various denominations.

Example I. Required the weight of a pig which is 4 feet 4 inches in girth, and 3 feet 3 inches in length.

Having found the girth 4 feet 4 inches in the Table, opposite the length 3 feet 3 inches stands 14 stones 8 lbs. Imperial, 25 stones 4 lbs. Smithfield, 1 cwt. 3 qrs. 8 lbs., and 10 scores 4 lbs.; being the weight of the animal in all the denominations, any of which the dealer may take that best suits his business, or the custom of the place in which he resides.

Example II. What is the weight of an ox, the girth of which is 5 feet 10 inches, and length 5 feet 1 inch?

Having found the girth 5 feet 10 inches, and length 5 feet 1 inch, opposite thereto stands 41 stones 4 lbs. Imperial, 72 stones 2 lbs. Smithfield, 5 cwt. 18 lbs., and 28 scores 18 lbs.; any of which may be selected as is found most convenient.

It is to be observed that the Table shows the weight of the four quarters only of the animal, or, as it is termed, the weight *sinking offals,* which is little more than half the weight of the

TABLE XXX.—WEIGHT OF LIVE CATTLE BY MEASUREMENT.   459

beast, the offals weighing nearly the other half.   The skin weighs about the 18th part, and the tallow about the 12th part of the living animal.   The head and neck of a pig weighs about one-sixth the weight of the four quarters.   The offals of cattle consist of the head, feet, hide, tallow, tripe, blood, &c., and are estimated at from about one-fourth to one-third the price of the four quarters.   The offals of swine may be estimated at about one-eighth of the value of the four quarters.

It is also to be noted that the Table is calculated to show the weight of cattle when in pretty good condition.   If the animal, of which the weight is required, is extra fat, to the weight found in the Table add its 20th part; and, if lean, and in bad condition, deduct the 20th part.   For a cow which has had several calves, and is not in good condition, deduct the 10th part from the weight shown in the Tables, which will then be very nearly the true weight, sinking the offals.

If it be desired to find the weight of an animal in Dutch stones, of $17\frac{1}{2}$ Imperial ounces in its pound, and 16 of these pounds in its stone; or in Scotch Trone stones, varying in different places from 20 to 28 Imperial ounces to the pound, and 16 of these pounds to the stone; there being always the same number of Imperial pounds in a Dutch or Trone stone as there are Imperial ounces in their pound, the Dutch stone will weigh $17\frac{1}{2}$ Imperial pounds, and the Trone stone from 20 to 28 pounds Imperial, in conformity with the usage of different localities.   The Rule, then, to turn the Imperial weight found in the Table into any of these weights is to multiply it by 14, the number of pounds in a stone; and if for Dutch, divide the product by $17\frac{1}{2}$; if for Trone, divide by the number of pounds in the stone of the given weight, and the quotient is stones of the weight required.   If, after the division of the stones, there is a remainder, multiply it by 16, and divide by the former divisor; the quotient is pounds Dutch, or Trone, as the case may be.

It is to be observed, that a weight consisting of stones and pounds Imperial cannot be accurately converted into Dutch or Trone weight, unless the number by which the pounds in the weight is multiplied, bring up the pounds to exact stones.   The reason of which is, that the *ratio* of the Imperial stone is to the Dutch stone as 14 to $17\frac{1}{2}$, and to the Ayrshire stone, in the following example, as 14 to 24, whilst the *ratio* of the Imperial pound is to the Dutch pound as 16 to $17\frac{1}{2}$, and to the Ayrshire pound as 16 to 24.   This remark is also applicable when Dutch or Trone weights are to be converted into Imperial.

EXAMPLE. The girth of an ox is 5 feet 9 inches, and its length 4 feet 10 inches; what is its weight in Dutch stones, and also in Ayrshire stones, of 24 Imperial ounces to the pound?

In the Table the weight is found to be 38 stones 2 lbs. Imperial.   To find the Dutch weight; on account of the fraction in

the Dutch, we must multiply 14 and $17\frac{1}{2}$, the pounds in the respective stones, by 2, and multiply the weight by 28 and divide by 35.

$$
\begin{array}{cc}
\text{Sts.} & \text{Lbs.} \\
38 & 2 \\
& 7 \times 4 = 28 \\
\hline
267 & 0 \\
& 4 \\
\end{array}
$$

$$
35 \left\{
\begin{array}{r}
7 \overline{)\ 1068\quad 0} \\
5 \overline{)\ \ 152\quad 9\frac{1}{7}} \\
\hline
30\quad 8\frac{8}{35}
\end{array}
\right.
$$

or, 30 stones $8\frac{8}{35}$ lbs. Dutch.

To find the Ayrshire stones, we may divide 14 and 24 by 2, and then multiply by 7 and divide by 12,

$$
\begin{array}{cc}
\text{Sts.} & \text{Lbs.} \\
38 & 2 \\
& 7 \\
\hline
12 \overline{)\ 267\quad 0} \\
\hline
22 & 4 \\
\end{array}
$$

Or, 22 stones 4 lbs. Ayrshire Trone.

The following short account of the method of calculating the weight of animals by the pen, and constructing the Table, may be found useful.

It has been ascertained, by a number of experiments, that if the girth and length of cattle are taken as formerly directed, and the solid content found by the rule for calculating the solid content of cylinders, each cubic or solid foot will indicate a weight of 3 Imperial stones, and the third part of a cubic foot, or 576 cubic inches, will consequently be equal to 1 stone. If, therefore, the whole content in cubic inches is divided by 576, the quotient will be the number of Imperial stones in the four quarters of the animal.

RULE 1. Multiply the square of the girth of the animal by the length, both in inches, and the product, multiplied by the decimal .07958, will give the content in cubic inches; which divide by 576, and the quotient is the weight of the animal in Imperial stones of 14 lbs.

2. Multiply the square of the girth by the length, both in inches; and divide the product by 7238, and the quotient is the weight in Imperial stones.

3. Multiply the square of the girth by the length, both in inches, and that product multiply by the decimal .00013816, the product is the weight in Imperial stones.

TABLE XXX.—WEIGHT OF LIVE CATTLE BY MEASUREMENT.   461

Note. The divisor 7238, in Rule second, is the quotient of 576 divided by .07958, and the multiplier .00013816, in Rule third, is the quotient of .07958 divided by 576.

Example. The girth of an ox is 88 inches, and length 63 inches. Required its weight in Imperial stones?

By Rule 1st,

$88^2 = 7744 \times 63 = 487872 \times .07958 = 38824.85376 \div 576 = 67.40426$ stones,

and $.40426 \times 14 = 5.65964$ lbs., and $.65964 \times 16 = 10.55424$ ounces, making the weight 67 stones 5 lbs. $10\frac{1}{2}$ ounces.

By Rule 2d,

$88^2 = 7744 \times 63 = 487872 \div 7238 = 67.404255$ stones; the fractional part of which may be reduced to pounds and ounces as above.

By Rule 3d,

$88^2 = 7744 \times 63 = 487872 \times .00013816 = 67.40439552$ stones.

By the Table the content is found to be 67 stones 6 lbs. The slight difference from the Table, by the first Rule, is caused by taking the remaining fraction .65964, which is above a half-pound as 1. By Rule 2d, the divisor is a very small fraction too large, and by Rule 3d, the multiplier is also a very small fraction too large.

The number 7238, multiplied by 8, and divided by 14 = 4136, is the divisor for Smithfield stones.

		8	4	179	10	314	2	22	1	24	125	16

TABLE XXXI.

In the left-hand column of the Table is placed the weight of the live animal in Imperial stones; and when killed, the weight of the four quarters is found opposite each live weight in Imperial stones, Smithfield stones, cwts., and scores.

EXAMPLE. The weight of a live ox has been ascertained to be 133 Imperial stones; how much will the four quarters weigh?

Having found the weight, 133 stones, in the left-hand column, opposite thereto stands 74 stones 11¼ lbs. Imperial, 130 stones 7¼ lbs. Smithfield, 9 cwt. 1 qr. 11¼ lbs., and 52 scores 7¼ lbs., the weight of the four quarters in each of these denominations.

If it were desired to know the weight in Glasgow Trone stones of 22½ Imperial ounces to the pound, or 22½ Imperial pounds to the stone, multiply the weight, found as above, by 14, and divide the product by 22½, or, on account of the fraction, multiply by 28, and divide by 45.

$$
\begin{array}{rr}
\text{Sts.} & \text{Lbs.} \\
74 & 11\frac{1}{4} \\
& 7 \times 4 = 28 \\
\hline
523 & 8\frac{1}{2} \\
& 4 \\
\hline
\end{array}
$$

$$
45\begin{cases} 9\,)\,\dfrac{2094 \quad 7}{} \\ 5\,)\,\dfrac{232 \quad 11\frac{5}{9}}{} \end{cases}
$$
$$
\overline{46 \quad 8\frac{32}{45}}
$$

Or, 46 stones 8$\frac{32}{45}$ lbs. Glasgow Trone weight.

Or, if we turn to Table XXXIV., we there find
that twice 37, or 74 stones Imperial . . = 46 stones 0½ lbs.
And, as the Trone stone is 22½ lbs., 11¼ lbs. is
half a Trone stone, ... = 0 stones 8 lbs.

	Sts.	Lbs.
twice 37, or 74 stones Imperial . . =	46	0½
half a Trone stone, ... =	0	8
	46	8½

Table XXXII., showing the live and dead weight of swine, and Table XXXIII., showing the live and dead weight of sheep, are so similar to this Table that they will require no explanation.

TABLE XXXIV.

Shows the relative or equivalent weight of Imperial stones of 14 lbs., from 1 to 100 stones, in Scotch Troyes or Dutch stones of 17½ Imperial lbs., in Edinburgh Trone stones of 22 Imperial lbs., in Glasgow Trone stones of 22½ Imperial lbs., in Ayrshire Trone stones of 24 Imperial lbs., in Smithfield or London stones of 8 Imperial lbs., in scores or 20 Imperial lbs., and in cwts. or 112 Imperial lbs.

In the left-hand column of the Table are placed the Imperial stones, opposite which, in the other columns, under their respective headings, is found the relative or equivalent weight of the Imperial stones, in stones and pounds of the weights above named.

The Dutch and Trone stones are calculated at 16 of their own ounces to the pound, and 16 of these pounds to the stone, and the relative weight is set down to the nearest quarter of a pound, either over or under the exact result.

Note. See Remarks on these stones in the Table of Weights and Measures; and the relative weight of the Imperial pound, and several of these pounds, in Table XXXVIII.

Example. Required the weight in Glasgow Trone stones of an animal which weighs 78 Imperial stones?

	Sts.	Lbs.
In the Table, opposite 39, half of 78 Imperial stones, under "Glasgow stones," stands . .	24	4¼
Which multiply by		2
Glasgow Trone weight, . .	48	8½

If an equivalent for Imperial stones is wanted in Trone stones differing in weight from those in the Table, multiply the given number of Imperial stones by 14, and divide the product by the number of Imperial pounds in the required Trone stone, the quotient is the equivalent in stones of that weight; if there is a remainder, multiply it by 16, and divide by the former divisor, the quotient is pounds; if there is still a remainder, multiply by 16, and divide by the same divisor for ounces.

To find an equivalent for Imperial pounds, in Trone pounds, multiply the Imperial pounds by 16, and divide the product by the number of Imperial ounces in the given Trone pound, the quotient is pounds of that weight; if there is a remainder, multiply it by 16, and divide by the former divisor for ounces.

To find an equivalent for Trone stones in Imperial stones, multiply the given Trone stones by the number of Imperial pounds in its stone (which is always the same as the number of

Imperial ounces in its pound), and divide the product by 14, the quotient is the equivalent in Imperial stones; the remainder, if any, is Imperial pounds.

To find an equivalent for Trone pounds, in Imperial pounds, multiply the given Trone pounds by the number of the Imperial ounces in its pound, and divide the product by 16, the quotient is the equivalent in Imperial pounds; if there is a remainder, it is Imperial ounces.

EXAMPLES.

1. Required the equivalent of 15 Imperial stones, in Berwickshire Trone stones of 23 Imperial pounds?

```
Imp. Stones.
        15

TABLE XXXV.

SHOWS THE RELATIVE OR EQUIVALENT PRICES FROM 1s. TO 12s. PER IMPERIAL STONE OF 14 LBS., IN SCOTCH TROYES OR DUTCH STONES OF 17½ IMPERIAL LBS., IN EDINBURGH TRONE STONES OF 22 IMPERIAL LBS., IN GLASGOW TRONE STONES OF 22½ IMPERIAL LBS., IN AYRSHIRE TRONE STONES OF 24 IMPERIAL LBS., IN LONDON OR SMITHFIELD STONES OF 8 IMPERIAL LBS., IN SCORES OF 20 IMPERIAL LBS., AND IN CWTS. OF 112 IMPERIAL LBS.

In the left-hand column are placed the prices per Imperial stone; opposite which, in the other columns, under their respective headings, is found the relative or equivalent price of the other weights.

For example, if the Imperial stone is worth 5s. 3d., the Dutch stone, at an equivalent rate, is worth 6s. 6¾d., the Edinburgh stone 8s. 3d., the Glasgow stone 8s. 5¼d., the Ayrshire stone 9s., the Smithfield stone 3s., the score 7s. 6d., and the cwt. 42s.

In calculating the Table the equivalent price is set down to the nearest farthing over or under the exact result.

The price of one weight is converted into an equivalent price in another, in the following manner:—

To convert the price per Imperial stone into an equivalent price per Trone stone, multiply the given price per Imperial stone by the number of Imperial pounds in the given Trone stone, divide the product by 14; the number of pounds in the Imperial stone, and the quotient is the equivalent price sought.

To convert the price per Imperial lb. into an equivalent price per Trone lb., multiply the given price per Imperial lb. by the number of Imperial ounces in the given Trone lb., divide the product by 16, the number of ounces in the Imperial lb., and the quotient is the equivalent price sought.

To convert the price per Trone stone into an equivalent price per Imperial stone; multiply the given price per Trone stone by 14, the number of pounds in the Imperial stone, divide the product by the number of Imperial pounds in the Trone stone, the quotient is the equivalent price sought.

To convert the price per Trone lb. into an equivalent price per Imperial lb., multiply the given price per Trone lb. by 16, the ounces in the Imperial lb., divide the product by the number of Imperial ounces in the given Trone pound, and the quotient is the equivalent price sought.

TABLE XXXV.—EQUIVALENT PRICES OF IMPERIAL STONES, ETC.   523

EXAMPLES.

1. At the rate of 8s. 9d. per Imperial stone, required the equivalent price per Trone stone of 26 Imperial lbs.?
Reduce the rate to pence = 105

```
                    105
                     26
                    ───
                    630
                    210
          14 ) 2730 ( 195 pence = 16s. 3d. per stone.
               14
              ───
               133
               126
              ───
                70
                70
                ──
```

2. At the rate of 11s. 6d. per Ayrshire stone of 24 Imperial lbs., required the equivalent price per Imperial stone?
Reduce the rate to pence = 138

```
                    138
                     14
                    ───
                    552
                    138
          24 ) 1932 ( 80½ pence = 6s. 8½d.
               192
              ────
                12

TABLE XXXVI.

This, and the two following Tables, are so simple that they require little explanation; we may, however, take an example from each, beginning with Table XXXVI.

What is the value or price of 1 stone of each of the denominations in the Table, a score, and a cwt., at the rate of $4\frac{1}{2}d.$ per Imperial pound?

Opposite $4\frac{1}{2}d.$ in the left-hand column, under their respective headings, stands $5s.$ $3d.$ per Imperial stone, $6s.$ $6\frac{3}{4}d.$ per Dutch stone, $8s.$ $3d.$ per Edinburgh Trone stone, $8s.$ $5\frac{1}{4}d.$ per Glasgow Trone stone, $9s.$ per Ayrshire Trone stone, $3s.$ per Smithfield stone, $7s.$ $6d.$ per score, and £2, $2s.$ per cwt.

Example from Table XXXVII.

What is the value of 1 lb. of each denomination in the Table, at the rate of $5\frac{1}{2}d.$ per Imperial lb.?

Opposite $5\frac{1}{2}d.$ in the left-hand column, under their respective headings, stands $6d.$ per lb. Dutch, $7\frac{1}{2}d.$ per lb. Edinburgh Trone, $7\frac{3}{4}d.$ per lb. Glasgow Trone, and $8\frac{1}{4}d.$ per lb. Ayrshire Trone.

Example from Table XXXVIII.

Required the equivalent weight of 9 Imperial lbs. in each of the other denominations in the Table?

Opposite 9 lbs., in the left-hand column, under their respective headings, stands 8 lbs. $3\frac{3}{4}$ oz. Dutch, 6 lbs. $8\frac{3}{4}$ oz. Edinburgh Trone, 6 lbs. $6\frac{1}{2}$ oz. Glasgow Trone, and 6 lbs. Ayrshire Trone.

Tables XXXVI. and XXXVII. are calculated to the nearest farthing; and Table XXXVIII. to the nearest quarter of an ounce, either over or under.

TABLE XXXIX.

Shows the superficial content of slater, tiler, or thatcher work, paving, etc., from 1 inch to 50 feet broad, and from ¼ of a foot to 100 feet in length, in square yards, feet, and inches.

The lengths are found in the left-hand column of each page; the breadths are placed along the tops of the other columns in the Table; under any of which, and opposite any given length in the left-hand column, stands the superficial content in square yards, feet, and inches.

Note. The square yard contains 9 square feet, the foot is 1 foot long and 1 foot broad, and the inch is $\frac{1}{12}$ of a square foot; thus, in adding together two or more contents, 1 for every 12 inches must be carried to the feet column, and 1 for every 9 feet to the yards column. If the length sought exceed 40 feet, and is not to be found in the Table, any length up to 140 feet may be got by the combination of two lengths; for example, a length of 69 feet may be got by taking 40 and 29, or more conveniently by taking 34 and 35; 88, by 70 and 18; 135, by 100 and 35, &c. In like manner, any breadth above 25 feet up to 75 feet may be found by a combination of two breadths; the contents of the two lengths or breadths added together, give the content of the measurement sought.

To measure the roofs of houses, add the breadths of the two sides together, and with the sum of the two, by the length, the content may be found at once; or, if more convenient for calculation, each side may be taken separately, and the contents of the two added together; or, when both sides of the roof are the same in breadth, the breadth of one side may be taken at twice the length. Allowance is made for the double row of slates at the eaves, by bringing the measuring tape over the edg of the slates to the wall.

Examples.

1. What is the superficial content of the roof of a house, the length of which is 39 feet, the breadth of one side of the roof is 14 feet, and the breadth of the other side 16 feet?

First add the breadths of the two sides of the roof 14 + 16 = 30 feet, breadth of both sides; then under 30 feet, and opposite 39 feet, the length, stands 130 square yards, the content.

TABLE XXXIX.—SUPERFICIAL MEASURE.　　529

2. What is the superficial content of a roof 52 feet long, and each side 20 feet broad?

Add the lengths of the two sides together $52 + 52 = 104$ feet, and as this length is not in the Table, we must find the content at 100 feet and 4 feet separately, and add them together; thus, opposite 100 feet, and under 20, stands

						Sq. Yds.	Ft.
under 20, stands	.	.	.	.	.	222	2
And opposite 4 feet stands	.	.	.	.	8	8

The content, . . . 231 1

To measure the thatching of oblong stacks; proceed as directed for the roofs of houses.

To measure the thatching of circular stacks, consider the circumference of the stack at the eaves as the length, and half the slant height from the eaves to the top of the stack as the breadth; or, half the circumference at the eaves as the length, and the whole of the slant height as the breadth; by either method the superficial content is found by the Table.

3. Required the superficial content of the thatching of a circular stack, the circumference at the eaves being 58 feet, and the slant height 12 feet?

If we consider 58 feet as the length, and half the slant height $= 6$ as the breadth, then as 58 is not in the Table, we may take 40 and 18, or twice 29, and add the contents together, thus, opposite 29, and under

						Sq. Yds.	Ft.
6 feet, stands	.	.	.	.	.	19	3
Which multiplied by	.	.	.		2

Gives the content of the thatching, . . . 38 6

If we had considered the half of 58 feet $= 29$ the length, and the whole slant height as the breadth; then, opposite 29, and under 12 feet, the breadth, stands 38 square yards, 6 feet, the content, as by the former method.

Roofing, paving, and mason-work being sometimes calculated by the rood of 36 square yards, the number of roods in any measurement may be found by dividing the content in square yards, as found by this Table, by 36.

Examples.

1. How many roods of slating are in a roof measuring 130 square yards?

$$36\ )\ 130\ (\ 3\ \text{roods}\ 22\ \text{yards.}$$
$$\underline{108}$$
$$22$$

2 L

Or, by Table XL.

The next lower number of yards to 130
   is .   .   .   .   .   108 = 3 roods.

And the remainder is . .   22 yards. as above.

2. How many roods of mason-work are there in a stone wall 6 feet 6 inches high, and 826 feet long?

The readiest way to calculate this is to consider the wall twice the height, or 13 feet, and half the length, or 413 feet.

Then, opposite 100 feet in length, Sq. Yds. Ft.
   under 13 feet, stands .   .   . 144 4
Which multiplied by .   .   .   4

   Gives the content of 400 feet = 577 7
And opposite 13 feet stands . .   18 7 Ro. Yds. Ft.
To reduce this to roods, divide by 36) 596 5 (16 20 5
                             36

                            236
                            216

                             20

Or, by Table XL.   Yds. Ft.
The next lower number of yards to 596 5
   is 576   = 16 roods.

Leaving a remainder of . . 20 5
Making the answer 16 roods, 20 yards, 5 feet, as above.

TABLE XL.

Though the measurement of slater, thatcher, or mason work is made in square feet or square yards, the price of the work is frequently calculated at a certain price per rood of 36 square yards. The superficial content of any piece of work having been calculated in square feet or square yards by Table XXXIX., or otherwise, this Table will show the number of roods therein contained.

Examples.

1. How many roods are there in 3564 square feet?
Look in the feet column for 3564, and in a line with it under roods, stands 11 roods, the answer.

2. How many roods are there in 864 square yards?
Look in the yard column for 864, and opposite thereto, under roods, stands 24 roods, the answer.

3. How many square feet are there in 15 roods, 16 square yards?

Find 15 roods in the Table, and in a line
with it, to the left, under feet, stands   4860
And opposite 16 yards in the Table,
under feet, stands   .   .   .   144
                             ―――
                  5004 feet, the answer.

4. The superficial content of a wall round a gentleman's garden, 7 feet high, and 1214 feet long, is found to be 8498 square feet, required its content in roods and yards?

Find in the Table the next lower number
of feet to   8498
Which is .   .   .   .   .   8424 = 26 roods,

Leaving a remainder of   .   .   74
The next lower number of feet to 74 is   72 = 8 yards,

And leaving a remainder of   .   .   2 feet,
or showing the content of the wall to be 26 roods, 8 square yards, and 2 square feet.

TABLE XLI.

THE Table is divided into 7 columns; in the first column, on the left, is the content in square yards; on the tops of the other six columns the various thicknesses are placed in their order; under any of which, opposite any given content, is found the number of bricks that will be required for a building of the given thickness and content.

By adding together the number of bricks of two or more contents in the Table, the number required for a building of any extent will be found.

Standard bricks are supposed to measure 9 inches in length, $4\frac{1}{2}$ inches in breadth, and $2\frac{1}{2}$ inches in thickness. But during the time that an excise duty of 6s. $1\frac{1}{2}d$. per 1000 bricks (now abolished), was charged on all bricks that did not exceed 150 cubic inches before being burned, some manufacturers, while studying that their bricks should not exceed the legal size when green, endeavoured to turn them out as large as possible after being burned. The consequence was, that in different brick-works, from the manner of the manufacture, the quality of the material, and the different forms of the moulds, bricks, after being burned, varied from the above mentioned size up to $9\frac{5}{8}$ inches long, $4\frac{3}{4}$ inches broad, and $3\frac{3}{8}$ inches thick.

Of the standard bricks about 4500 are required for an English rod, and 5400 for a Scotch rood, standard thickness; of the medium size, about 4050 are required for an English rod, and 4860 for a Scotch rood; and of the largest size, about 3600 are required for an English rod, and 4320 for a Scotch rood. The first page of the Table, or No. 1, shows the number required of standard bricks; the second page, or No. 2, the number required of medium sized bricks; and the third page, or No. 3, the number required of the largest sized bricks, for each content in the left hand column.

In Scotland, brick-work is generally calculated by the square yard, or by the rood of 36 square yards; in England it is usually calculated by the square rod of $30\frac{1}{4}$ square yards, equal to $272\frac{1}{4}$ square feet; but, as the fraction is troublesome in practice, 272 square feet is reckoned a rod. Brick and half thick, or making

TABLE XLI.—NUMBER OF BRICKS IN A BUILDING.   543

allowance for mortar, 14 inches thick is the standard thickness for brick-work; and buildings which are over or under this thickness, must be reduced to the standard before computing the price.

To reduce brick-work to standard thickness, multiply the superficial content of the building, by the number of half bricks in the thickness, and divide by 3, the quotient is the content, standard thickness. Thus, to reduce works of 2 bricks thick to standard, multiply by 4 and divide by 3; and to reduce work of $2\frac{1}{2}$ bricks thick to standard, multiply by 5 and divide by 3. A rod of brick-work, standard thickness, contains 306 cubic feet; and to reduce a measurement given in cubic feet, to standard thickness, multiply the number of cubic feet by 8 and divide by 9—the quotient is superficial feet standard thickness, which divide by 9, to reduce to square yards, if desired, or refer to Table XL.

Examples.

1. What number of bricks, of each of the three sizes, will be required to build a wall one brick thick, and measuring 2 Scotch roods, 23 yards?

	Bricks.
On referring to Table No. 1, under 1 brick thick, opposite 2 roods or 72 yards, stands	7200
And opposite 23 yards stands	2300
Number of bricks, standard size,	9500
In Table No. 2, under 1 brick thick, opposite 72 yards, stands	6480
And opposite 23 yards stands	2070
Number of bricks, medium size,	8550
In Table No. 3, under 1 brick thick, opposite 72 yards, stands	5760
And opposite 23 yards stands	1840
Number of bricks, largest size,	7600

2. What number of bricks, of the medium size, will be required for a wall measuring 121 square yards, standard thickness?

	Bricks.
In Table No. 2, opposite 100 yards, under $1\frac{1}{2}$ brick thick, stands	13500
And opposite 21 yards stands	2835
Number of bricks required,	16335

3. How many square yards, standard thickness, are in a building $2\frac{1}{2}$ brick thick, and measuring 3024 square feet; also, the number of bricks, of the largest size, required for its formation?

Bricks.

To reduce the feet to square yards, divide them by	9)3024
Square yards 2½ bricks thick, . .	336
Which multiply by	5
And divide by	3)1680
Square yards standard thickness .	560
Then to find the number of bricks—in No. 3, under	
1½ brick thick, opposite 100 yards, stands . .	12000
Which to make 500, multiply by	5
	60000
And opposite 60 yards stands	7200
Number of bricks required, . .	67200

Or more shortly, by adding two cyphers to the number for
5 yards = 600, we get the number for 500 yards = 60000
And for 60 yards 7200

Number of bricks as above . . . 67200

4. In a building containing 1296 cubic feet of brick-work, how
many square feet and square yards are there, standard thickness?

Multiply the cubic feet	1296
By	8
And divide by	9)10368
Gives standard square feet; which, divided by .	9) 1152
Gives standard square yards, . .	128

TABLE XLII.

Shows the number of flooring tiles and bricks required to lay any number of square yards, from $\frac{1}{4}$ yard to 200 yards, with tiles of 6 inches, 8 inches, 9 inches, and 1 foot square; and with bricks 9 inches long, $4\frac{1}{2}$ inches broad, and 3 inches thick, on bed, and on edge.

The Table is divided into 7 columns; in the first column, on the left hand, is the content of the floor or measurement in square yards; in the other columns, opposite the yards, under the different sizes, is the number of tiles or bricks required for any given number of square yards, of all the various sizes.

When the number of yards sought is not in the Table, add together the contents of two numbers whose sum is equal to the number sought; thus, for 38 take 19 twice; for 59 take 29 and 30, &c.

In the column of tiles at 8 inches square, $20\frac{1}{4}$ is the correct number for 1 yard; but where any fraction occurs in the calculation, it is reckoned 1 in the table.

Examples.

1. The measurement of a floor is 72 square yards, how many tiles of 6 inches square will be required to lay it?

	Tiles.
As 72 yards is not in the Table, we may take the half of 72, or 36 twice; thus opposite 36 yards stands	1296
Which multiplied by	2
Gives the number of tiles required =	2592

2. A court yard measures 528 square yards, how many bricks on edge will be required to lay it?

If we add a cypher to the content for 50 yards = 2400, we get the content of 500 yards . . . . =	24000
And opposite 28 yards stands	1344
Number of bricks required . .	25344

TABLE XLII.—NO. OF TILES AND BRICKS REQUIRED FOR FLOORING. 549

TABLE XLIII.

Shows the solid content in cubic feet and inches of round timber, or growing trees, from 1 to 40 feet in length, and at quarter-girts, from 4 to 38¼ inches.

The various quarter-girts are placed in the first column on the left hand; the lengths are placed on the tops of the other columns in their order; and the solid content at any given quarter-girt, and any given length is found under that length, opposite the given quarter-girt, in cubic feet and inches.

Note. Each inch denotes a slice an inch thick, and 1 foot the side of the square, so that 12 of these slices or inches make a cubic or solid foot, and in adding two or more contents together, 1 for every 12 inches is to be carried to the feet column. In calculating the Table, fractions which do not exceed a half inch are neglected, above a half inch they are reckoned 1.

The usual way of measuring round or unsquared timber, if the tree tapers regularly, is to take the girt in the middle with a cord, and after deducting from 2 to 4 inches, as allowance for the bark of elm, beech, ash, &c., and 5 or 6 inches for the bark of old oaks, the cord is folded into four equal parts for the quarter-girt. If the tree is irregular in shape, several girts will require to be taken, and their lengths added together; their sum is to be divided by the number of girts, and the quotient is a mean girt, the fourth part of which, after making allowance for the bark, is to be taken for the quarter-girt. Timber under 6 inches diameter is not included in measurements, unless by special agreement.

The rule to find the content is—square the quarter-girt, multiply the product by the length of the tree; this last product is the solid content.

Example. Required the solid content of a round tree 19 feet long, and the mean girt, after making allowance for the bark, 85 inches.

	Ft.	In.	Pts.		
The quarter girt of 85 inches is 21¼ inches,	1	9	3		
or, ...	1	9	3		
to be multiplied into itself or squared .					
	1	9	3		
	1	3	11	3	
			5	3	9
	3	1	7	6	9
Which multiply by 10 and 9 = 19 feet, .	10				
	31	4	3	7	6
Product by multiplying by 9, . .	28	2	8	0	9
Content of the tree nearly 59 feet 7 inches,	59	6	11	8	3

TABLE XLIII.—SOLID CONTENT OF ROUND TIMBER.   551

To find the content of this example by the Table,

	Ft.	In.
opposite 21¼ inches, the quarter girt, under 10 feet, stands	31	4
And under 9 feet stands,	28	3
The content,	59	7

This way of calculating the content of round timber gives the content less than the truth, in the proportion of 11 to 14, or nearly one-fourth. A considerable portion of what is under-reckoned is no doubt lost in the squaring, and both the buyer and seller being usually aware of the fact, the price is so arranged that there is no great practical loss to either party in following this long-established custom.

The nett content of round timber may be found by the following rule:—After making allowance for the bark, multiply the square of ⅕th of the mean girt by twice the length; the product, after deducting 1 for every 190 feet, will be the nett content.

	Ft.	In.
The foregoing example, wrought by this rule, gives the solid content	75	10
Content by the common method,	59	7
Difference of the two,	16	3

Table XLIV. (which see), furnishes an easy method of ascertaining the content of round trees with great exactness. The above example is performed by it as follows:—

In that Table, opposite the girt 85 inches, or 7 feet 1 inch, stands	3.993
which multiply by the length in feet,	19
	35.937
	39.93
Pointing off 3 places of decimals, leaves 75 feet,	75.867
Multiply the fraction by	12
And we get 10 inches, and nearly a half inch, .	10.404

TABLE XLIV.

Shows the solid content of 1 foot in length, of cylindrical trees, etc., at girths, or circumferences, from 1 foot 4 inches, to 12 feet 9 inches.

The Table is divided into 3 double columns, each having the girths in feet and inches on the left hand; and immediately opposite each girth is found the content of 1 foot in length, at that girth, in cubic feet, and decimals of a foot.

To find the content of a tree by the Table. Take the girth of the tree in feet and inches, from which deduct from 2 to 4 inches for the thickness of the bark; find the remainder of the girth in the left-hand column of the Table, and multiply the number opposite by the length of the tree in feet; point off three places of figures on the right hand of the product, the figures on the left are cubic feet; multiply the figures pointed off by 12, and from the product again point off three places of figures on the right, the figures on the left are solid inches, or slices 1 foot square and 1 inch thick; the remainder may be again multiplied by 4 and treated in the same manner for quarters of an inch.

Example.

What is the solid content of a tree 15 feet in length, and girth at the one end 128 inches, at the other 96 inches, after deducting 2 inches for the bark; giving a mean girth of 112 inches.

On referring to the Table, opposite the girth
112 inches = 9 feet 4 inches, stands . .	6.932
Which multiply by the length . . .	15
	34660
	6932
Point off three places for feet . . .	103.980
Multiply the remainder by . . .	12
Point off three places for inches .	11.760
Multiply the remainder by . . .	4
Which gives 3 quarters of an inch . .	3.040

Making the content 103 feet, 11¾ inches.

TABLE XLIV.—SOLID CONTENT OF CYLINDRICAL TREES, ETC.   559

If there are odd inches in the length, add a proportional part of one foot, after multiplying by the feet.

Thus, if the length had been 15 feet 3 inches,

content of 15 feet in length, as above, .	103.980
3 inches equal ¼ of 6.932 = ...	1.733
	105.713
	12
	8.556
	4
	2.224

<div align="center">Content, 105 feet 8½ inches.</div>

If a given girth exceeds the Table, multiply the number opposite its half by 4, the product is the content of 1 foot in length by the given girth, which multiply by the given length.

<div align="center">EXAMPLE.</div>

What is the solid content of a tree 12 feet in length, and girth 16 feet 6 inches.

Opposite 8 feet 3 inches, the half of 16 feet 6 inches, stands	5.416
Which multiply by	4
	21.664
To be multiplied by the length, . . .	12
	259.968

and .968 = 11½ inches, gives the content 259 feet 11½ inches.

The Table is calculated as follows :—The area of a circle, whose circumference is 1 foot = .0795775, is divided by 144, the number of square inches in a square foot, = .000552622, = the area of a circle whose circumference is 1 inch, in the decimal of a foot. Then, as the areas of circles are to one another as the squares of their circumferences, the square of any given circumference or girth, multiplied by this fraction and by the length, gives the solid content.

The content of the first example is thus found :—The girth is 112 inches, then $112^2 = 12544 \times .000552622 = 6.932090368$ the tabular content of 1 foot, which is to be multiplied by 15, the length in feet, and the product is 103.98135552, the content in cubic feet.

To save trouble in the multiplication, only three places of decimals are retained in the Table, and the third figure is increased by 1, when the figure in the fourth place is above 5.

The following Rules will meet any case that can occur, either when the girth and length, or when the diameter and length, are given to find the solid content.

1. Given the girth and the length, both in feet.
   Multiply the square of the girth by the length, and the product by .07958; the result is the content in cubic feet.

   Or, multiply the square of the girth by the length, and divide the product by 12.5664; the quotient is the content in cubic feet.

2. Given the girth in inches, and the length in feet.
   Multiply the square of the girth in inches by the length in feet, and the product by .000552622; the result is the content in cubic feet.

   Or, multiply the square of the girth in inches, by the length in feet, and divide the product by 1809.56; the quotient is the content in cubic feet.

3. Given the girth and the length, both in inches.
   Multiply the square of the girth by the length, and the product by .000046052; the result is the content in cubic feet.

   Or, multiply the square of the girth by the length, and divide the product by 21714.69; the quotient is the content in cubic feet.

   NOTE. As the fractional part of the divisors in the last two Rules bear but a small proportion to the integral part, when great exactness is not required they may be omitted. It may be mentioned, that when two or more numbers are to be multiplied into one another, any one of them may be made the multiplier or the multiplicand that is most convenient.

4. Given the diameter and the length, both in feet.
   Multiply the square of the diameter by the length, and the product by .7854; the result is the content in cubic feet.

   Or, multiply the square of the diameter by the length, and divide the product by 1.2732; the quotient is the content in cubic feet.

5. Given the diameter in inches, and the length in feet.
   Multiply the square of the diameter in inches by the length in feet, and the product by .0054542; the result is the content in cubic feet.

   Or, multiply the square of the diameter in inches by the length in feet, and divide the product by 183.35; the quotient is the content in cubic feet.

TABLE XLIV.—SOLID CONTENT OF CYLINDRICAL TREES, ETC. 561

6. Given the diameter and length, both in inches.

Multiply the square of the diameter by the length, and the product by .00045452; the result is the content in cubic feet.

Or, multiply the square of the diameter by the length, and divide the product by 2200.1579; the quotient is the content in cubic feet.

NOTE. The fractional part of the last divisor (.1579) bearing the proportion to the integral part of only 1 to 13930 may be entirely omitted.

This most convenient and easily remembered divisor was first made known by the late Mr. Wilson of Thornly, near Glasgow, in a work entitled "The Survey of Renfrewshire," published by him in 1812. It is the product of the reciprocal of .7853981634, the area of a circle whose diameter is 1 = 1.2732395, &c., multiplied by 1728, the cubic inches in a solid foot. The following Table shows its value and usefulness—

	Cub. Ft.
1728 cubical inches	= 1
2200 cylindrical inches	= 1
3300 spherical inches, or spheres, 1 inch in diameter,	= 1
6600 conical ins. or cones, base 1 in. diam. and height 1 in.	= 1

Rule 6 shows the method of using 2200 to find the content of cylinders.

To find the content of a sphere:—Cube the diameter in inches, and divide the product by 3300; the quotient is cubic feet.

To find the content of a cone:—Multiply the square of the diameter by the height, both in inches, and divide the product by 6600; the quotient is cubic feet.

The solid content of the frustum of a cone may be found, when the dimensions are given in similar terms to any of the six cases preceding, for finding the contents of a cylindrical tree, &c., by the following Rule—

Square the girths or diameters of the two ends, to which add their product; multiply the sum by one-third of the length; and multiply or divide the product by the number directed in that one of the preceding Rules for finding the content of a cylinder, the dimensions of which are in the same terms as the given dimensions of the frustum; the result is the content in cubic feet.

We shall calculate by this Rule the solid content of the tree, the dimensions of which are given in the first example, viz., girth at the one end 128 inches, at the other 96 inches, and length 15 feet.

The girth being given in inches, and the length in feet, will fall under Case 2, and, after having conducted the calculation according to the present Rule, the last product must be multiplied by .000552622, or divided by 1809.56, as directed under that Case.

$$128^2 = 16384$$
$$96^2 = 9216$$
$$128 \times 96 = 12288$$

$$\underline{37888}$$

It may be observed that two cyphers are annexed to the dividend, to compensate for the two places of decimals in the divisor; and also that it is unnecessary to carry the quotient further than three places of decimals.

It was stated in the introduction to the preceding Table, that by the usual rule for measuring round timber, the content shown was less than the truth in the proportion of 11 to 14, or, less in that proportion than the content found by the present Table. There is, however, a source of additional loss, in the fact that the tree is measured as a cylinder, in place of being measured as the frustum of a cone. The amount of error from this cause varies in the proportion of the difference of the girths, or diameters of

TABLE XLIV.—SOLID CONTENT OF CYLINDRICAL TREES, ETC.   563

the two ends of the tree, which error becomes rapidly less, as the girths or diameters of the ends approach to equality. Thus, when the girths, or diameters of the two ends, are to one another as 8 is to 4, the loss, by using the mean girth, or the mean diameter, is 1 in 27; when they are to one another as 8 is to 5, the loss is 1 in $56\frac{1}{3}$; when as 8 is to 6, the loss is 1 in 147; and when they are as 8 is to 7, the loss is only 1 in 675.

The ever-varying proportions of the one end of a tree to the other render it impossible to get a constant multiplier or divisor, by which a Table of the true content of conic frustums could be formed; but in the measuring of round tapering timber this, in general, is not of much importance, as, on the one hand, if a tree be not perfectly circular, the content will thereby be something lessened; and, on the other, if the dimensions of the two ends differ considerably, the value of the tree per cubic foot is also proportionally lessened. It may, therefore, be concluded, that if the solidity of a tree be calculated as a cylinder of its mean girth or diameter, the content is shown for practical purposes with al desirable exactness.

LAND SURVEYING.

Land Measuring is the art by which we ascertain the superficial content of any tract of ground.

There are various methods of obtaining the measurement, some of them requiring familiar acquaintance with mathematics, whilst others need nothing beyond a knowledge of the simplest principles of mensuration. As the present work addresses itself entirely to practical men, we shall confine our remarks to the popular method ordinarily employed.

Land is commonly measured with what is called *Gunter's chain*. This chain is divided into 100 links, and at the end of every ten links a piece of brass is fixed, with notches denoting the number of tens, so that the number of links may be readily ascertained. The *English chain* is 22 yards or 66 feet in length, and each link 7.92 inches; the *Scotch chain* is 74.1196 feet long, each link being 8.894352 inches. Both chains are divided into 100 links. The English, or Imperial measure, is now the only legal standard in the United Kingdom.

In taking measurements in the field, the various distances are set down in links, which are afterwards reduced to acres, roods, poles, &c. The field requisites for a land-measurer are the *chain* just mentioned, a bundle of *arrows*, a *cross-staff*, and a number of *signals*. The arrows are usually ten in number, and two feet in length, each has a piece of red cloth affixed to the head, by which it is easily distinguishable at a considerable distance when stuck in the ground. The use of the arrows is to indicate the number of chains in any line of the survey. The cross-staff is a pole 10 links long, shod at one end with iron, and pointed, that it may be thrust into the earth as occasion requires. A small block of wood about 6 inches square, having grooves cut round its margin at right angles to each other, is fitted on the pole, and slides up and down according to the height of the eye; its use is for obtaining a perpendicular from the base line of any triangle to the angular point. The signals are more or less numerous, according to the extent of the field or tract to be surveyed; their use is to mark definitely the various points and bearings; they are usually slight poles, from six to eight feet in length, with a small red flag attached to each.

Land surveying is divided into three distinct operations. I. The actual measurements in the field. II. The plotting, or laying down on paper all the lines and angles of the field, accord-

ing to a scale fixed on. III. The reducing the measurements of the various triangles, and thence obtaining the total superficial content of the whole survey. We shall take each division in order.

I. The land surveyor requires an assistant in the field, who is called the *leader*, as it is his business to lead or carry out the chain under the direction of the surveyor, who, for the sake of distinction, is named the *follower*. The leader is first directed to fix the signals at the angular points of the field; he then takes the end of the chain in one hand, and the ring of arrows and the cross-staff in the other, and proceeds in the measurement of the *longest* or *base* line, under the guidance of the follower, who holds the other end of the chain, and has his field-book ready to note down the various measurements taken. The leader fixes an arrow when he has extended the chain to its full length, and proceeds onward till the follower reaches this arrow, when the chain is again drawn tight, the leader leaving another arrow, and the follower taking up the one first left. The entire line is thus passed over, the leader leaving his arrows as the chain runs out, and the follower gathering them up as the data of the measurement. The follower must be careful to observe that the leader keeps in the line between him and the signal towards which they are measuring; and he must also direct him to give information when he arrives at any point on the line whence a perpendicular may be raised to the angles on either side. When the leader intimates his arrival at any such point, both he and the follower stop, draw the chain tight, and leave it extended on the ground. The follower does not remove the last arrow for the present, but leaves it standing, and lays those he has gathered up beside it; he then proceeds to the place where the leader has stopped, and taking the cross-staff, ascertains the precise point whence the perpendicular can be raised to the angle. This is done in a very simple manner; the cross-staff is planted close to the chain, and one of the grooves made to coincide with it; or, in other words, on looking through the groove in opposite directions, the measurer must see the point whence he set out, and the point to which he is tending; then looking along one of the grooves at right angles, (without disturbing the position of the cross-staff) he must see whether it bears directly on the angular point; if it do not, the cross-staff must be moved backward or forward along the chain till the precise point is determined; its position on the line of measurement is then noted in the field-book, an arrow is planted at the spot, and the leader and follower taking their respective places, proceed with the measurement of the remainder of the line; which having completed, the various perpendiculars are measured from the points indicated by the arrows.

If the subject of the survey be a triangular or quadrilateral field with *straight* sides, the field work is completed when the longest line, (that is, the base in the triangle, and the diagonal in

the quadrilateral) and the perpendiculars are measured. If the field is contained under a greater number of sides than four, it will be necessary to intersect it with two or more lines from each of which perpendiculars must be erected to the angular points along the boundary. Very frequently also, there will be what is termed *off sets*, or the irregularities of a crooked boundary. In this case it is necessary to take a straight line between two angles of the field where these occur, and measure offsets or perpendiculars from that line towards every bend or angle in the boundary, by which means a number of small triangles or trapezoids are obtained, to be included in or deducted from the total area, according as they are situated *within* or *without* the boundary line.

By the aid of a single diagram we shall endeavour to give a few illustrative examples of field-work, which will remove all misapprehension and difficulty.

Let it be required to find the content of the triangular field A B C. The field measurements will be the line A B = 900 links, or rather A F = 300, and F B = 600, and the perpendicular F C = 480; from these the subsequent operations of plotting and estimating the content can readily be performed, as will presently be shown.

We may here remark that the plan observed in keeping the field-book is by no means uniform, nearly every surveyor having his own peculiar method; and so long as there *is method*, and the memoranda be arranged in a way that the measurer can himself fully comprehend them when he leaves the field, it is of small consequence what plan may be adopted. Usually, however, the page of the field-book is divided into three columns; the centre one is occupied by the measurements of the principal lines, and in the right and left hand columns are entered the perpendiculars and offsets from those lines. Let us suppose that it is required to find the measurement of a quadrilateral field A B C D. The data to be obtained in the field are these; the diagonal A B, 900 links, the perpendicular F C, 480, and the perpendicular D E, 510. Again, we will suppose one side of the field has the crooked and irregular boundary D *d e f* B; in this case, in addition to those already mentioned, the field measurements will be
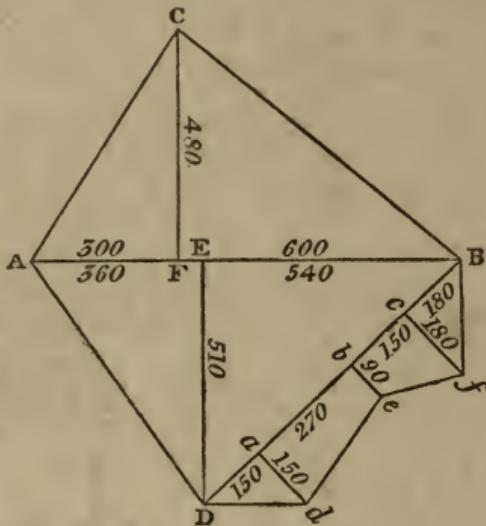

the line D B, 750 links, distinguished into D a 150, $a b$ 270, $b c$ 150, and c B 180; and the perpendicular offsets $a d$ 150, $b e$ 90, and $c f$ 180.

Offsets are usually measured, unless they be of great length, with the cross-staff, which is made 10 links long for this purpose. If, however, these perpendiculars exceed two or three lengths of the staff, it is better to use the chain. These offsets, it is also to be noticed, are to be measured in the course of ascertaining the line D B.

In simple surveys, such as the preceding examples refer to, it is usual to sketch the form of the field on a page of the book, and enter all the measurements and remarks on the corresponding parts of the sketch; this is an excellent plan, and should always be adopted where the case will admit of it.

II. We come now to the plotting, or laying down the true figure of the field on paper, according to some determinate scale; and this operation is no less simple than that of taking the field measurements. The surveyor requires to be provided with a case of drawing instruments, containing compasses, steel pen, parallel ruler, &c.; and also a plotting scale, graduated into chains, and parts of a chain. The paper on which the plotting is to be made, should be damped on the back, and fastened down by pasting the edges on a drawing-board of suitable dimensions. When dry, the paper thus prepared presents a smooth and uniform surface; whilst the board on which it is laid prevents the points of the compasses from piercing deeply into it and making unsightly holes.

We will begin by plotting the field A B C, the measurement of which forms the first example in the preceding section.

Draw an indefinite line and set off from the plotting scale the base A B = 900 links, marking with the point of a pencil the terminations A and B; set off on A B the distance A F = 300 links; from the point F, raise an indefinite perpendicular, and set off on it F C = 480 links; draw lines connecting the points B C, A C, and the field is correctly plotted. The field A B C D, it will be obvious merely requires the erection of the perpendicular D E = 510 links, and drawing lines connecting the points A D, D B, in addition to the foregoing operation.

In the third example, where the boundary D $d e f$ B, is irregular; on the line D B set off D a = 150 links, $a b$ = 270 links, $b c$ = 150 links, and c B = 180 links; and from the points a, b, c, raise the perpendiculars $a d$ = 150 links, $b e$ = 90 links, and $c f$ = 180 links. Draw lines connecting the points D d, $d e$, $e f$, f B, which finishes the plotting of the whole field A C B $f e d$ D.

It is usual to place the north side of the plan uppermost, with a flower-de-luce to indicate the north point, and in a vacant place to insert a scale of equal parts or chains, and the title of the plan.

III. The next thing to be done is the computing the contents

of the various triangles, and trapezoids, and bringing out the total area of the whole survey, which is performed in the following manner.

1. The base and perpendicular of any triangle multiplied into each other, gives *twice* the area of such triangle; or, the base multiplied by half the perpendicular, is equal to the area of the triangle.

2. The sum of the parallel sides of any trapezoid (*i.e.*, a four-sided figure having two of its sides parallel), multiplied by the perpendicular distance between them, gives twice the area of such trapezoid; or, half the sum of the parallel sides, multiplied by the perpendicular, is equal to the area of the trapezoid.

3. The number of square links in an acre is 100,000. Hence this rule:—square links are reduced to acres by cutting off five figures to the right, as a remainder, which is to be multiplied successively by 4 for roods, 40 for poles, 30¼ for yards, and 9 for feet, at each multiplication cutting off 5 figures to the right; the numbers on the left of the point being acres, roods, poles, yards, and feet.

Surveys are computed in the following manner.

Required the area of the field A C B f e d D?

Links.

Triangle A B C = A B 900 × C E 480	=	432000
Triangle A B D = A B 900 × D E 510	=	459000

Offsets.

Triangle D a d = D a 150 × a d 150	=	22500
Trapezoid a d e b = a d 150 + b e 90 × a b 270 =		64800
Trapezoid b e f c = b e 90 + c f 180 × b c 150 =		40500
Triangle c f B = c f 180 × c B 180	=	32400

according to the Rule, divide by 2)1051200

The Imperial Gazetteer ;

A GENERAL DICTIONARY OF GEOGRAPHY, PHYSICAL, POLITICAL, STATISTICAL, and DESCRIPTIVE ; including Comprehensive Accounts of the Countries, Cities, Principal Towns, Villages, Seas, Lakes, Rivers, Islands, Mountains, Valleys, &c., in the World. Now Publishing in parts, imperial 8vo, 2s. 6d. each; and divisions, 10s. each.

It is the purpose of the IMPERIAL GAZETTEER to supply such a Work as the circumstances of the present age require. In its compilation, *the most recent and authentic sources* will be consulted, and particular attention will be paid to the Trade and Resources of the various places described, and to the Social Condition, Manners, Customs, &c., of the Inhabitants. Great care will also be bestowed on the Physical Geography of Countries, in the various departments of Geology, Hydrography, Climatology, Botany, Zoology, &c., and on the laying down of geographical positions and relative distances.

As no written description of a locality can give so accurate a conception of its features or position as a plan or pictorial representation, this Work will be Illustrated by above SEVEN HUNDRED ENGRAVINGS on Wood, printed in the text. These Illustrations will comprise Views of Cities and Towns; of Remarkable Buildings, Antiquities, Natural Scenery, Costumes, Plans of Ports and Harbours, and Small Maps of River Mouths, Islands, and Island Groups, &c., on an enlarged scale. See full Prospectus, Recommendations, and Conditions in part first.

" This excellent book of reference. . . . . . All the articles we have examined, whether long or short, exhibit a greater degree of correctness in minute detail than we should have thought practicable in so comprehensive a Work."—*Athenæum.*

"This is just such a book as we have long desired to see. . . . It is distinguished at once for completeness and correctness."—*Economist.*

"The information is brought down to the very eve of publication. . . . All who are desirous of purchasing a Geographical Dictionary, at once copious and exact in its information, cannot do better than provide themselves with this."—*London Atlas.*

" We feel qualified to speak unhesitatingly of the great superiority of the present Work to all others of its class."—*Eclectic Review.*

"Nothing of Gazetteer kind hitherto published, approaches it in greatness of design, and in excellence of matter."—*Manchester Examiner and Times.*

The Popular Encyclopedia,

OR CONVERSATIONS LEXICON; being a General Dictionary of Arts, Sciences, Literature, Biography, History, Ethics, and Political Economy; with Dissertations on the Progress of Science, Literature, and the Fine Arts, by THOMAS THOMSON, M.D., F.R.S., &c., Sir DANIEL K. SANDFORD, D.C.L.; and ALLAN CUNNINGHAM. *Illustrated by many Hundred Plates and Diagrams.* Complete in 14 half vols., 11s. each, or 28 divisions, 5s. each.

Barnes' Notes on the New Testament.

ILLUSTRATED AND ANNOTATED EDITION. With 28 Steel Plates; 22 Maps and Plans; and 28 Engravings on Wood—in all *Seventy* separate Plates, from the most authentic materials. Illustrating the principal Scripture scenes and sites of celebrated Cities, Towns, &c. The whole complete in 33 parts, 1s.; or in double vols., 6s. each; and 1 at 4s. 6d. Considering the Illustrations, at once the best and the cheapest edition of Barnes' Notes. Of this Edition, Mr. Barnes writes thus :—

"I feel greatly obliged to you for the manner in which you have got up my NOTES ON THE NEW TESTAMENT; and hope you will receive ample compensation for the expense you have incurred in doing it. *I feel* PARTICULARLY *gratified with the plates; they are exceedingly beautiful, and, in my view, greatly increase the value of the work.*"

Barnes' Notes on the Old Testament.

BOOKS OF JOB, ISAIAH, AND DANIEL, with additional Notes, Engravings on Steel, and above 150 Illustrations on Wood; most of them to be found in no other Edition. 19 parts, 1s. each; or Job, 2 Vols., cloth, 6s.; Isaiah, 2 Vols., 7s.; Daniel, 2 Vols., 7s., and in 1 Vol. 6s. 6d.

These volumes have Prefaces, Notes, Appendices, and Illustrations to be found in no other Edition.

DR. HAMILTON, in the " Lamp and the Lantern " says,—

" For the elucidation of the text [of the Bible] there is nothing better than the little volumes of Albert Barnes, as far as they have gone. *As it contains Supplemental Notes of great value, our personal preference is for Blackie's Edition.*"

Barnes' Questions on the New Testament.

For Bible Classes and Sunday-Schools. One Vol., cloth, 3s. 6d.; or in 6 Parts, 6d. each. Part I. Matthew—Mark; Part II. Luke—John; Part III. Acts; Part IV. Romans; Part V. 1 Corinthians; Part VI. Hebrews.

This will be found an admirable Manual for Sunday-school Teachers and Heads of Families.

Adam's Roman Antiquities;

Or, An Account of the Manners and Customs of the Romans. Edited by JAMES BOYD, LL.D., one of the Masters of the High School, Edinburgh. 100 Illustrations. Royal 18mo, cloth, 5s. 6d., or with QUESTIONS, 7s.

QUESTIONS for the use of Schools separate, 1s. 6d.

Agriculture. A Cyclopedia of Agriculture,

Practical and Scientific. By JOHN C. MORTON. *See* page 16.

Agriculture. The Agriculturist's Calculator;

A Series of Forty-five Tables for Land Measuring, Draining, Manuring, Planting, Weight of Hay and Cattle by Measurement, Building, &c. 17 numbers., royal 18mo, 6d. each, bound, 9s.

Agriculture. The Farmer's Guide.

A Treatise on the Diseases of Horses and Black Cattle, with Instructions for the Management of Breeding Mares and Cows. By JAMES WEBB, Veterinary Surgeon. Seventh edition. F'cap 8vo, cloth, 3s. 6d.

Agriculture. How to Choose a Good Milk Cow;

Or, A Description of all the Marks by which the Milking Qualities of Cows may be Ascertained. By J. H. MAGNE. With a Supplement on the Dairy Cattle of Britain. By JOHN HAXTON. Illustrated with Engravings, cloth, 3s.

Aikman. The History of Scotland,

From the Earliest Period to the Present Time. A new Edition, with NINETY ILLUSTRATIONS ; comprising Portraits, Views of remarkable localities, and Designs of prominent historical incidents. In 53 parts, 1s. each ; or 11 divisions, 5s. each, and 1 division, 6s.

This is the only Work embracing the entire range of Scottish History from the Earliest Times to the Year 1851. It is at once the most complete and best illustrated History of Scotland hitherto offered to the public.

Anderson. The Ladies of the Covenant;

Or, Memoirs of Distinguished Scottish Female Characters, embracing the period of the Covenant and Persecution. By the Rev. JAMES ANDERSON, author of "The Martyrs of the Bass." Numerous Engravings. Antique cloth, 7s. 6d. ; calf extra, antique, bevelled boards, 14s. ; or in 14 numbers, 6d. each.

A History of the Earth and Animated Nature;

By OLIVER GOLDSMITH. With numerous Notes from the Works of CUVIER, WILSON, L. BONAPARTE, CAMPIER, VAILLANT, LAMARCK, LESSON, LACEPEDE, AUDUBON, &c.; as well as from the Works of the more distinguished British Naturalists. Re-issue, with Coloured Plates; containing nearly 2400 illustrative figures, of which 230 are carefully coloured. 2 vols. royal 8vo, cloth extra, 40s.; or 36 parts, 1s. each.

Rhind's History of the Vegetable Kingdom;

Embracing the Physiology, Classification, and the Culture of Plants; with their various uses to Man and the Lower Animals, and their application in the Arts, Manufactures, and Domestic Economy. Illustrated by 700 figures on wood and steel, of which 100 are beautifully Coloured. 22 parts, royal 8vo, 1s. each.

A Cyclopedia of Agriculture,

PRACTICAL AND SCIENTIFIC; in which the Theory, the Art, and the Business of Farming, in all their departments, are thoroughly and practically treated. By upwards of Fifty of the most eminent Farmers, Land-Agents, and Scientific Men of the day. Edited by JOHN C. MORTON. With above One Thousand Illustrations on wood and steel. 2 large vols. super-royal 8vo, cloth, £3, 15s.; in parts, 2s. 6d. each; or in divisions, 10s. each.

The object of this Work is to present to the Agricultural reader the whole of the truth immediately connected with his profession, so far as it is known to the men most familiar with the sciences it involves, the methods it employs, and the risk it incurs.

Illustrations on wood and steel, of Farm Buildings, Insects, Plants, cultivated and uncultivated, Agricultural Machines, Implements and Operations, &c., will be given wherever they can be useful.

"The new 'Cyclopedia of Agriculture,' now in course of publication by Blackie and Son, is, in my judgment, by far the most important and useful contribution hitherto made to the agricultural library. In truth, to the farmer, it supersedes the necessity of (I may say) encumbering himself with other works, as it embraces the entire field of practice and science connected with Agriculture, according to the latest and best authorities; and excludes much matter, to be found in earlier treatises, which carefully-conducted practical experiments, and the application of science in later times, have taught us to reject as founded in error. Such is the impression I have formed after reading the whole of the 24 Parts which have been delivered to subscribers, so far as they relate strictly to the Science and Practice of Agriculture."—*From an article in the Agricultural Gazette of January 21, 1854, by* CHARLES LAURENCE, Esq., *the Querns, Cirencester.*
