AIX-LA-CHAPELLE, -lá-shá'pél', Ger. **AACHEN** (named from its springs, Lat. *Aquæ*, and the palace chapel). A city of the Prussian Rhine Province, and capital of the government district of the same name, situated in a valley near the river Wurm, about 40 miles west of Cologne, at the Dutch and Belgian frontiers (Map: Prussia, B 3). The city is divided into the inner or old town, the outer or new town, and Burtscheid (incorporated with it in 1897). The streets are generally broad and well paved. Among the principal ones are the Theaterstrasse, Hochstrasse, and Wilhelmstrasse. The most important public squares are the Marktplatz, with the bronze statue of Charlemagne, the Münsterplatz, and the Kaiserplatz, with a large, handsome fountain. Its private houses are for the most part handsome modern buildings and give the city a thoroughly modern appearance. With the exception of its two or three public buildings and churches, little of the ancient town remains. Its former ramparts have been leveled and turned into promenades, and only two of its old gates remain standing. Foremost among the public buildings of interest is the cathedral, a most striking specimen of various styles of ecclesiastical architecture. The oldest portion, which probably dates from the year 796 A.D., is an octagonal chapel, surrounded by a gallery and surmounted by a cupola built in the Byzantine style. A stone slab in the floor marks the traditional burial place of Charlemagne, but the supposed bones of the Emperor are preserved in a shrine in the Hungarian Chapel north of the octagon. Above the slab hangs an immense chandelier of gilded copper, presented by Frederick Barbarossa in 1168. The choir, dating from the fourteenth century and built in the Gothic style, marks the second period of construction. The Hungarian Chapel, built in the early part of the eighteenth century, contains the sacred relics, which are exhibited to the populace every seven years. The other churches of great age are those of St. Foillan and St. Paul, with fine stained glass windows. In the Marktplatz stands the Gothic Rathhaus, built (1353-70) on the

site of Charlemagne's palace, and containing the famous coronation hall (143 feet by 61 feet) of the German emperors, decorated with frescoes depicting scenes from the life of Charlemagne. The Rathhaus is flanked by two towers, one of which, the Granusturm, dates from the thirteenth century. These towers, nearly destroyed by fire in 1883, were restored in 1902.

The city's affairs are directed by a municipal council of 30 members and an executive board of five. Aix-la-Chapelle has an excellent system of sewers, which carry the refuse into the river. The city has owned and operated since 1880 large water works, which net it annually about \$35,000. The gas works are in the hands of private companies which pay the city a tax of about half a cent for each cubic meter sold for lighting purposes and about a quarter of a cent on each cubic meter sold for cooking purposes. The city owns an electric-light plant, which, however, is leased to a private company. Aix-la-Chapelle has several parks and promenades, including a municipal botanical garden. Its educational institutions include free gymnasia, a splendidly equipped technical high school, an industrial high school, an art school, a teachers' preparatory school, and a deaf and dumb school. There are six public libraries, including the municipal library, containing about 100,000 volumes. The commerce of Aix-la-Chapelle is of considerable importance. Its principal industry is wool-spinning and the manufacture of cloth, which is exported to all parts of the world. There are also important manufactures of needles, glass buttons, knives, umbrellas, soap, cement, bells, pottery, and crockery. Aix-la-Chapelle is advantageously situated as a commercial centre, being on the Prussian State Railway and on the line to Antwerp. Local traffic facilities are afforded by electric street railway lines within the city, connecting it also with many of the neighboring towns. The hot sulphur springs of Aix-la-Chapelle are celebrated for their curative properties in rheumatism and gout. They are frequented yearly by about 20,000 visitors. The principal spring is the Kaiserquelle, with a temperature of 136° F. In 1890 the population of Aix-la-Chapelle was over 103,000; in 1900, 135,235; in 1905, 144,095; in 1910, 156,143.

Aix-la-Chapelle was called *Aquisgranum* by the Romans, who frequented the place on account of its warm springs. Under the Frankish emperors it enjoyed great prosperity. Pepin erected here in 765 a palace in which probably Charlemagne was born. The latter made the city his home and lavished favors upon it. From the coronation of Louis the Pious in 813 until that of Ferdinand I in 1531, the German kings were crowned in Aix-la-Chapelle, and 17 imperial diets assembled there. Prior to the Reformation Aix-la-Chapelle was one of the most flourishing of the free imperial cities of Germany. The removal of the coronations to Frankfurt-on-the-Main (beginning with that of Maximilian II in 1562) marked the end of a city's splendor, while the religious troubles of the sixteenth and seventeenth centuries and a disastrous fire in 1656 hastened its decline. In 1793 it was taken by the French, but was ceded to Prussia in 1815. Consult: Stübgen, "Aachens Bebauungsplan und Bauliche Zukunft," in the *Deutsche Bauzeitung* (Berlin, 1880); Drapeyron, "Aix-la-Chapelle et Charlemagne," in the *Revue de Géographie*, vols. xlv, xlvi (Paris, 1899); "Re-

formationsgeschichte Aachens," in the *Historische Politische Blätter*, vol. cxxviii (Munich, 1901).

Treaties of Peace, and Congress of Aix-la-Chapelle. The first peace of Aix-la-Chapelle ended the war carried on between France and Spain for the possession of the Spanish Netherlands, known as the War of Devolution. On the death of Philip IV Louis XIV laid claim to a large portion of those territories in the name of his wife, Maria Theresa, the daughter of Philip, urging the law of succession prevailing in Brabant and Namur respecting private property. The victorious progress of Louis was checked by the triple alliance between England, Holland, and Sweden, and a treaty of peace was concluded at Aix-la-Chapelle, May 2, 1668, by which France retained possession of the fortresses of Charleroi and Lille, which she had already taken, but gave back Franche Comté to Spain.

The second peace of Aix-la-Chapelle concluded the War of the Austrian Succession (Oct. 18, 1748). (See SUCCESSION, WARS OF.) In general the possessions of the several States remained as before the war. Austria ceded Parma, Piacenza, and Guastalla to the Spanish infante, Philip; and the possession of Silesia and Glatz was guaranteed to Prussia. The privilege of the Assiento Treaty (q.v.) was confirmed to Great Britain for four years, and the pretender was expelled from France. Owing chiefly to the exertions of her minister, Kaunitz, Austria came off with but small sacrifice and obtained a ratification of the Pragmatic Sanction (q.v.) from the signatory powers.

The Congress of Aix-la-Chapelle was held in 1818, for regulating the affairs of Europe after the Napoleonic wars. The emperors Alexander I of Russia and Francis I of Austria and King Frederick William III of Prussia were personally present. The plenipotentiaries were Metternich, Castlereagh, and Wellington, Hardenberg and Bernstorff, Nesselrode, and Capo d'Istrias, with Richelieu on the part of France. France was admitted to take part in the deliberations as one of the five great powers of Europe, who proceeded thereupon to sign a protocol announcing a policy known as that of the "Holy Alliance" (q.v.). An important result of the Congress achieved by Richelieu was the immediate evacuation of France by the foreign forces. Consult De Broglie, *La paix d'Aix-la-Chapelle* (Paris, 1892).

AIZANI, ī-zā'nī, or **AZANI**, ā-zā'nī. A city in Phrygia, near Bithynia. In 1824 its remains were found by the Earl of Ashburnham, about 30 miles southwest of Kutaieh. There were a temple of Zeus, a theatre, a stadium, and a gymnasium. The theatre is in good preservation, with a diameter of 185 feet; it had 15 rows of marble seats. The Rhyndacus (now Adranus) rises near the site of Azani and passes through it; it was crossed by two white marble bridges, each of five semicircular arches. Tombs, Roman coins, and inscriptions have been found. The city is mentioned by Strabo.

AJACCIO, ā-yāt'chō. The capital of the French department of Corsica, comprising the whole of the island (Map: Southern France, Corsica, L 7). It is a seaport with a well-sheltered harbor and stands on the west coast, in a fertile belt of land known as Campo d'Oro. Its cathedral dates from 1585. Napoleon was born in Ajaccio, Aug. 15, 1769, and the house is still standing. A marble statue of the First Consul is seen in

the main square. Pozzo di Borgo was also a native of Corsica. The chief industries are the anchovy and pearl fisheries and shipbuilding, and trade in excellent wine and olive-oil, which the region produces in abundance. The harbor is protected by a strong fort. Pop., 1901, 21,779; 1906, 22,264; 1911, 19,227. Consult O. Joanne, *Ajaccio et ses environs* (Paris, 1899).

AJALON, āj'ā-lōn, or **AIJALON**, ā'jā-lōn (R. V.). A town in ancient Palestine, 14 miles northwest of Jerusalem, where Joshua is said to have commanded the moon to stay its course till he had finished his battle (Josh. x. 12). It belonged to the territory allotted to Dan (Josh. xix. 42), but this tribe could not keep it from the Amorites, who held it in the pre-monarchical period (Judges i. 35). Rehoboam fortified it (2 Chron. xi. 10), but in Asa's days it passed into the hands of the Philistines (2 Chron. xxviii. 18). It is mentioned in the Amarna letters (fourteenth century B.C.) under the form Aialuna. The modern village of Yalo represents the ancient site.

AJAWA, ā-jā'wā. A Bantu tribe of Portuguese East Africa, described by Livingstone. They have acquired some culture from contact with the Arabs. Cannibalism still exists among them, and at the funeral of a chief women are sacrificed; though they are accounted intelligent, industrious, and enterprising, a manly and independent tribe of blacks superior to others in this region.

A'JAX (Lat. form of the Gk. *Aías*, *Aias*). The name of two of the Greek heroes of the Trojan War. One of them was called Ajax the Less, or the Locrian, being the son of Oileus, King of the Locrians. At the head of 40 Locrian ships he sailed against Troy and was one of the bravest of the Greek heroes; in swiftness of foot he excelled all except Achilles. When Cassandra fled to the temple of Athena, after the taking of Troy, it is said that Ajax tore her from it by force and dragged her away captive. Others make him even violate the prophetess in the temple. Though he exculpated himself by an oath when accused of this crime by Ulysses, he did not escape the vengeance of the goddess, who caused him to be engulfed in the waves on his voyage toward Greece.

The other Ajax, called by the Greeks the Greater, was the son of Telamon, King of Salamis, and grandson of Æacus. He sailed against Troy with 12 ships, and is represented by Homer as, next to Achilles, the bravest and the handsomest of the Greeks. After the death of Achilles, Ajax and Ulysses contended for the arms of Achilles; and when the prize was adjudged by the Greek chieftains to Ulysses, Ajax in a fit of insanity slew the Grecian flocks, fancying he was slaying his enemies. On recovering his reason he threw himself on his sword. Sophocles, in the tragedy of *Ajax* (well edited by Jebb, Cambridge, 1896), attributes his madness to the intervention of Athena, champion of the Greek host. See TROJAN WAR.

AJMERE, āj-mēr'. An ancient city of Rajputana, India, the capital of the British province of Ajmere-Merwara, 228 miles west of Agra (Map: India, B 3). It is situated in a picturesque and rocky valley at the foot of the mountain of Taragurh, on whose summit there is a fort commanding the city. Another means of defense is an encircling stone wall, which has five lofty and handsome gateways on the west

and north. Most of the streets are narrow and dirty, but some of them are spacious and contain fine residences, besides mosques and temples of massive architecture. The Daulat Bagh, or 'Garden of Splendor,' is now the residence of the British commissioner of the province. The tomb of the Mussulman saint, Kwajah, within the town, is held in great veneration, and pilgrimages are made to it even by Hindus. In October a great annual fair is held in honor of the saint, at which presumed miracles are wrought. The Emperor Akbar journeyed to it from Agra on foot in 1570, in fulfillment of a vow before the birth of his son, Jehangir. Ajmere has manufactures of oil, cotton cloths, celebrated dyeing establishments, and a trade in opium and salt. It is the seat of Ajmere College and of Mayo College, an institution opened in 1875 for the instruction of the Rajputana nobility. The Anasagar, a large artificial lake to the north of the city, supplies it with water. Ajmere dates from about 145 A.D. It came under British rule by purchase in 1818. Pop., 1891, 68,800; 1901, 73,839; 1911, 86,222.

AJMERE-MERWARA, -mâr-wä'ra. A province of British India. It is situated in Rajputana, between 25° 30' and 26° 45' N. lat. and between 73° 53' and 75° 22' E. long. (Map: India, B 3). It occupies an area of 2711 square miles. Its location on the arid eastern slopes of the Aravalli Range (q.v.) and within the zone of uncertain rainfall renders it ill suited to agriculture and makes it subject to famine, the two in the last decade of the nineteenth century being especially severe. By irrigation it has been brought to some degree of productivity, and it yields cotton, wheat, and other food grains, and oil seeds. Iron and a few other metals are found in small quantities. Pop., 1891, 542,358; 1901, 476,912; 1911, 501,395. The inhabitants are mostly Hindus, the number of Mohammedans being about 81,000, and of Jains, 20,300. The Christians number 5400. The capital is Ajmere (q.v.).

AKABAH, ä'kä-bä. A town 2½ miles from the head of the Gulf of Akabah. Its exact location is 29° 30' N., 35° E. (Map: Asia, C 6). The ancient name was Aila, Aelana, or Elath (q.v.). Ahmed ibn Tulun (see TULUNIDS) built a new road across the mountain north of the gulf, which was called Akabat Aila; hence the name Akabah gradually took the place of Aila. The town was conquered by Baldwin I in 1116, taken by Saladin in 1171, and recaptured by Rainaud de Chatillon (q.v.), Lord of Montreal (Shobek) in 1181. It soon returned to the Ayyubid rulers and remained a port of the province of Kerak during the Mamluk period. To-day it belongs to Hejaz (q.v.). Strategically it has always been an important point; and its fortress has been a protection to the pilgrims going to Mecca. In 1841 it was recognized by Turkey as part of Egypt, but in 1892 Turkey resumed possession of it. Early in 1906 the Turks occupied Taba 8 miles south of Akabah (see EZION GEBER), but retired at the request of Great Britain, and a commission determined the boundary line so as to give Akabah to Turkey but include Taba within Egyptian territory. There is telegraphic connection with Maan-Damascus, and a branch line goes from Akabah to the Mecca railroad since 1906. See Musil, *Arabia Petraea*, vol. ii, 1907, p. 256, and article "Aila" in *Enzyklopädie des Islam* (1909).

AKABAH, GULF OF. (Ancient Sinus Ælaniticus.) The eastern of two inlets on the north end of the Red Sea, separating the Sinaitic peninsula from Arabia proper. It is about 100 miles long and 12 to 17 miles wide and forms part of the great rift valley, or structural depression, which extends from the Jordan River-Dead Sea depression in Palestine to Lake Tanganyika and Nyassa in Africa. At its head lies the port of Akabah.

AKAKIA, ä'kä'kê-ä', LE DOCTEUR. The name of a noted French physician of the sixteenth century (Martin Akakia, Grecized from the French name *sans-malice*), borrowed as a pseudonym by Voltaire in his *Diatribes du Docteur Akakia*. This was a brilliant satire, covering with ridicule Maupertuis and the Berlin Academy, of which he was president. King Frederick II, however, had it publicly burned (1752).

AKAMAGASEKI, ä'kä-mä'gä-sä'kê. See SHIMONOSEKI.

AKASHI, ä'kä-shê'. A town of Japan, in the prefecture of Hiogo, situated on the northern coast of the Inland Sea, and giving its name to the passage between Honshiu and the island of Awaji (Map: Japan, D 6). It is a station on the Sanyo Railway, and it lies 12 miles east of Kobé. The district is famous throughout Japan for its scenery, and it is a popular resort. The town contains a Shinto temple in honor of the ancient poet Kaki-no-moto-no-Hitomaro, and the remains of a moat and a large castle. Its meridian is used for the standard time of Japan. Pop., 1898, 21,196.

AKBAR, äk'bër; *Hind. pron.* ük'bër (Ar. very great), properly JALAL-UD-DIN MUHAMMAD (1542-1605). Emperor of Hindustan, the greatest Asiatic monarch of modern times. His father, Humayun, was deprived of the throne of Delhi by usurpers and fled to Persia. On the way thither, in the town of Amerkote, Akbar was born in 1542. Humayun recovered the throne of Delhi in 1555, after an exile of 12 years, but died within a year. The prince of 14 at first committed the administration to Bahram Khan as regent minister, but finding this authority degenerating into tyranny, he shook it off by a bold stroke and took the power into his own hands (1560). At this time only a few of the many provinces once subdued by the Mongol invaders were actually subject to the throne of Delhi; in 10 or 12 years (1568-76) Akbar's empire embraced the whole of Hindustan north of the Deccan, aided by Abu-l-Fazl. The wisdom, vigor, and humanity with which he organized and administered his vast dominions are unexampled in the East. He promoted commerce by constructing roads, establishing a uniform system of weights and measures and a vigorous police. He exercised the utmost vigilance over his viceroys of provinces and other officers, to see that no extortion was practiced and that justice was impartially administered to all classes of his subjects. For the adjustment of taxation, the lands were accurately measured, and statistics were taken, not only of the population, but of the resources of each province. He also forbade child-marriage, permitted the remarriage of widows, and endeavored to stop the practice of suttee. In politics, however, his main endeavor was to fuse the Mussulmans and the Brahmins. In religion Akbar was exceedingly liberal, largely on account of the influence of the vizier Abu-l-Fazl. He was fond of inquiries as to religious beliefs

and invited Portuguese missionaries from Goa to his court to give an account of the Christian faith. Literature received the greatest encouragement. Schools were established for the education of both Hindus and Mohammedans; and numbers of Hindu works were translated from Sanskrit into Persian. Abu-l Fazl (q.v.), the able minister of Akbar, has left a valuable history of his master's reign, entitled *Akbar Nāmah* ('History of Akbar'); the third volume, containing a description of Akbar's empire, derived from the statistical inquiries above mentioned, and entitled *Ayīn-i-Akbarī* ('Institutes of Akbar'), has been translated into English by Gladwin (3 vols., Calcutta, 1786, and London, 1800), and by Blochmann and Jarett (3 vols., Calcutta, 1873-94). Akbar's latter days were embittered by the death of two of his sons from dissipation and by the rebellious conduct of the third, Selim (known as Jehangir), who succeeded his father in 1605 and was suspected of being the cause of his death. Consult Malleson, *Akbar, Rulers of India Series* (Oxford, 1891-1901); Garbe, *Kaiser Akbar von Indien* (1909); id., "Akbar, Emperor of India," in the *Monist*, vol. xix (Chicago, 1909), and Modi, *Parsees at the Court of Akbar* (1903). See INDIA.

AKED, CHARLES FREDERICK (1864—). An Anglo-American clergyman and writer, born and educated at Nottingham. After acting for several years as auctioneer to the sheriff of Derbyshire, he decided to prepare for the ministry and entered the Midland Baptist College. In his earlier pastorates at Syston (1886) and St. Helen's and Earlestown (1888), he became locally known as an able preacher, but his reputation as one of the most eloquent public speakers in the United Kingdom was gained during his service at Pembroke Chapel, Liverpool. Under his ministry, beginning in 1890, this parish became one of the largest in England. As one of the founders of the "Passive Resistance League," designed to oppose the Boer War, Dr. Aked was for a time very unpopular in England. He became widely known as a lecturer, especially in the United States, which he had visited many times before accepting, in 1907, a call to the pastorate of the Fifth Avenue Baptist Church. While his pastorate in New York cannot be said to have been unsuccessful, he found conditions so uncongenial as to induce him to remove to San Francisco in 1911 to become pastor of the First Congregational Church. He became an American citizen in 1913. The degree of D.D. was conferred upon him by Brown University (1907). Besides numerous pamphlets on religious and social subjects, his published writings include *Changing Creeds and Social Struggles; The Courage of the Coward* (1905); *A Ministry of Reconciliation* (1907); *Mercies New Every Morning* (1907); *Wells and Palm Trees* (1908); *Old Events and Modern Meanings* (1908); *The Lord's Prayer: Its Meaning and Message for To-day* (1910).

AKEE, ā-kē' (native name, its scientific name being *Blighia sapida*). A fruit tree of the family Sapindaceæ, a native of tropical Africa, introduced into Jamaica in the latter part of the seventeenth century. It grows to a height of 25 feet or more, with numerous branches and alternate pinnate leaves resembling those of the ash. The flowers are small, white, on axillary racemes; the fruit is about the size of a goose's egg, with three cells and three seeds, and its

succulent aril has a grateful subacid flavor. The fruit is little inferior to a nectarine. Boiled down with sugar and cinnamon, it is used as a remedy for diarrhœa. The distilled water of the flowers is used by negro women as a cosmetic. The akee sometimes produces fruit in hothouses in Great Britain. In order to obtain this the roots should be cramped in pots. The Aki of New Zealand is a totally different plant, *Metrosideros buxifolia*, of the family Myrtaceæ.

AKEL'DAMA. See ACELDAMA.

À KEM'PIS, THOMAS. See KEMPIS, THOMAS.

AKENE'. See ACHENE.

A'KENSIDE, MARK (1721-70). An English author of considerable celebrity in his own day, on account of his didactic poem, the *Pleasures of the Imagination*, and some medical works. He was born at Newcastle-on-Tyne, where his father was a butcher. Being intended for the Presbyterian church, he was sent to study theology at Edinburgh, but soon abandoned it for medicine. He graduated as a physician at Leyden in 1744, and practiced at Northampton, then at Hampstead, and finally in London. His success as a practicing physician was never very great, owing, it is said, to his haughty and pedantic manner. He died in London, soon after being appointed one of the physicians to the Queen. At Leyden he had formed an intimacy with Jeremiah Dyson, and this rich and generous friend allowed him £300 a year. Some of his medical treatises, as that on dysentery, won for him distinction as a specialist. His later poetry, consisting chiefly of odes and hymns, did not attain the same reputation as his *Pleasures of the Imagination*, which was completed in his twenty-third year. In *Peregrine Pickle*, Smollett satirically sketched the character of Akenside under that of the pedant who undertakes to give an entertainment after the manner of the ancients. Akenside, who practiced blank verse and the Spenserian stanza, was one of the pioneers among the romantic poets. He became dissatisfied with his juvenile production and before his death had written a portion of a new poem on the same subject. Both poems were published in the complete edition of his works in 1772. For his biography consult Bucke (London, 1832) and Dyce (London, 1866); and also Beers, *English Romanticism in the Eighteenth Century* (New York, 1899).

AKERBLAD, ä'kēr-blād, JOHANN DAVID (1763-1819). A Swedish Orientalist and learned epigraphist. He was secretary of the Swedish embassy to Constantinople, whence he went to Jerusalem and the Troad in 1792-97. Later (1800) he was chargé d'affaires at Paris, but spent his last years in Rome. He published *Inscriptionis Phœniciaë Oxoniensis Nova Interpretatio* (1802) and *Lettre sur l'inscription égyptienne de Rosette* (1802).

AKERS, ā'kērz, BENJAMIN (PAUL) (1825-61). An American sculptor. He was born in Sacarappa, Me., July 10, 1825, and died at Philadelphia, Pa., May 21, 1861. While in his father's sawmill he made toys and turned his original designs into ornamental woodwork. He tried to be a printer, then essayed to paint, but later turned to sculpture, and studied plaster-casting with Thomas Carew of Boston. In 1850 he opened an atelier in Portland, Me., with the painter Tilton. Among his early works are busts of Longfellow and other celebrities, the proceeds from which enabled him to pass a year in study at Florence. On his return he

modeled busts of President Pierce, Edward Everett, Sam Houston, and other celebrities at Washington. In 1855 he opened an atelier at Rome, where he became the centre of American art circles. Hawthorne refers to his colossal bust of "Milton" and "Pearl-Diver" in the *Marble Faun*; and it is said that the character of Kenyon in that book is drawn from the personality of the young sculptor. At Rome he carved his "Una and the Lion," "Girl Pressing Grapes," "Isaiah," and other works. He remained in Europe until, in 1860, failing health drove him home for a last vain endeavor to recover his strength. His character was singularly attractive and pure. His art, like other classicist sculpture of the period, lacks power and virility.

AKERS, ELIZABETH CHASE ALLEN. See ALLEN, ELIZABETH CHASE.

A'KERSHEM, Miss SOPHRONIA. An unlovely character in Dickens's *Our Mutual Friend*. She becomes the wife of Albert Lamble (q.v.).

AKHALTSIKH, ä'käl-tsëk'. The chief town of a district in the government of Tiflis, Russian Armenia, about 95 miles west of Tiflis, and 1450 miles by rail southeast of Moscow, on the banks of the Poskhov-Tchai, an affluent of the Kur (Map: Russia, F 6). It is situated in a valley of the Keldir Mountains, 3376 feet above sea level. The river running through it divides the town into the old town and citadel, on the left bank, and the new town on the right. It is well protected by a fortress built upon an almost inaccessible height. The climate is salubrious, although the winters are very severe and the summers exceedingly hot. The surrounding scenery presents a view of wild, rugged beauty, enhanced by the numerous gardens encircling the town. The mosque of Sultan Ahmed, built on the model of St. Sophia in Constantinople, has a library attached to it which was considered to be one of the most valuable in the East. The Russians carried off a great part of its most valuable treasures to St. Petersburg. The manufacture of small arms and weapons and silver filigree work is carried on in the town, and an active trade with various places on the Black Sea is maintained. Coal is mined in the vicinity. About 16 miles to the northwest of the town are the well-known Abas-Tumansk mineral springs. Deposits of lignite are found in the neighborhood. Akhaltsikh was anciently called Keldir, or Chaldir. Once a considerable mart for trading in Christian slaves, it has, since its occupation by Russia, become a Christian town. Eighty per cent of its population are Armenians and 10 per cent Jews. It is the seat of an archbishopric of the Greek church. In 1828, when the Russians took possession of it, it had a population of 50,000, but it has decreased since, so that at the time of the taking of the last census, in 1897, there were only 15,300 inhabitants.

AKHISSAR, äk'hīs-sär' (anciently Lat. *Thyattira*, Gk. *Θυάτειρα*, *Thyateira*). A town in the Turkish vilayet of Smyrna, Asiatic Turkey, situated 52 miles northeast of Smyrna, on somewhat elevated ground in the valley of the Hyllus (Map: Turkey in Asia, B 3). The streets are paved with carved stone, and other relics of antiquity abound, but there are no ruins of ancient buildings. Cotton goods are exported, but the town is celebrated for its dyes. The town is situated on the Monissa-

Soma Railway. Its population is estimated at from 12,000 to 22,750.

AKHMIM, äk-mēm', or **EKHMIM, ëk-mēm'.** A city of some 10,000 inhabitants, on the right bank of the Nile, in Upper Egypt (Map: Egypt, E 6). It occupies the site of the ancient Chemmis, or Panopolis, the seat of worship of the harvest god Min, an ithyphallic deity whom the Greeks identified with Pan. In Christian times the city became an important religious centre, and many converts congregated in the vicinity. Nestorius, patriarch of Constantinople, whose heresy was condemned by the Council of Ephesus, 431, died in banishment at Panopolis.

AKHTAL, äk-täl', GHIYATH B. SALT B. TARIKA AL. A Christian Arabic poet, born in Hira about 640 A.D. His mother, Laila, belonged to the Christian tribe Yad. He proudly refused to change his faith, as others did, "from hunger rather than from conviction." His religion possibly shows its influence in his comparative freedom from obscene language; it allowed him to indulge his appetite for wine as a protest against the Moslem prohibition and as a means of gaining inspiration. He was a court poet to the Umayyad rulers in Damascus. If he had not been a Christian, he would no doubt have been regarded as the greatest poet of the Umayyad period; even with this serious drawback he is by general consent accorded a place with Jarir and Farazdak. He died about 710 A.D. See H. Lammens, *Le chantre des Omiades: notes biographiques et littéraires sur le poète arabe chétien Ahtal* (Paris, 1895).

AKHTYRKA, äk-tir'ká. A town of European Russia, in the government of Kharkov, 72 miles northwest of Kharkov and 520 miles south of Moscow (Map: Russia, D 4). It is situated on a small river of the same name, an affluent of the Dnieper, in a rather low valley which is subject to frequent inundation so that at times communication becomes very difficult. It has a lively trade with the great pilgrim crowds attracted there by the famous Akhtyr image of the Holy Virgin which is kept in the cathedral, and by the Trinity cloister, situated on the outskirts of the town. Some manufacturing is carried on in textiles and boots and shoes, and a great annual fair is held. A considerable commerce is also carried on in grain and cattle. The surrounding country is fertile, and excellent fruit is grown. The town was founded by the Poles in 1641 and acquired by the Russians in 1647. Pop., 1912, about 25,000.

AKHUND OF SWAT, ä-kōōnd', swät, THE (1794-1874). A Mohammedan saint, who exercised great influence and had almost unquestioned authority over Mohammedans all over Central Asia. His residence in the mountainous country of Swat, on the borders of India and Afghanistan, was the resort of numerous pilgrimages to consult him on questions of every kind. For half a century the English government assiduously watched this man, who possessed a power which no other person in Asia could pretend to wield; but the Akhund generally kept on friendly terms with the English.

AKIB, ä'këb', LE RABBIN. The pseudonym under which Voltaire published, in 1761, his *Sermon du Rabbin Akib—traduit de l'Hébreu*.

AKIBA BEN JOSEPH, ä-kë'bä bën jō'zëf. A famous rabbi and head of a rabbinical school at Bene-Barak, near Jaffa, and later at Ziphron, modern Zafron, near Hamath. He was born

c.50 A.D. and died as a martyr probably in 132 A.D. Although he began the study of the law at a comparatively advanced age, after having bitterly opposed the rabbis for years, he rose to a prominent position among the rabbis of his day by virtue of his learning and acumen, and many are the stories and legends told about his early struggles and final success. He seems to have been in Rome in 95 or 96 A.D. and made a visit to Nehardea in Mesopotamia sometime before 110 A.D. Akiba laid the basis of the "Mishna" by beginning the systematization of Jewish oral law, and his collection became known as the Mishna of Rabbi Akiba. His influence as a teacher upon the founders of the Mishna was also very great, and it was he likewise who, to a large degree, advanced the peculiar biblical exegesis which is a characteristic feature of Talmudic literature. His scholarship did not weaken Akiba's interest in the political affairs of the day. How far he was personally active in the great Jewish revolt against Rome in Hadrian's time cannot be determined. But it is certain that he saw in Bar Kokba (q.v.), or Bar Kozeba, the promised Messiah and applied to him the title 'son of the star' (Palestinian Talmud, Taanith iv, 68d). Legends gathered around the career of Akiba. He was put to death on account of his transgressing Hadrian's edicts against the practice and teaching of the Jewish religion, after several years of imprisonment, and bore the tortures to which he was subjected with great fortitude. His grave, shown at Tiberias, became a place of devout pilgrimage.

A-KIKUYU. See KIKUYU.

AKITA, ä'kê-tä, or **KUBOTA,** kōō'bō-tä. A town of Japan, the capital of the prefecture of the same name, situated on the western coast of Honshiu, near the Hachiro Lagoon, and on the right bank near the mouth of the Toshimagawa River (Map: Japan, G 4). It carries on a considerable trade in rice with Hakodate and has some manufactures of silk cloth and cotton crape. Pop., 1903, 34,350; 1908, 36,294. The prefecture of Akita is rich in minerals and woodland. Cattle raising, mining, and the manufacture of cloth are the principal industries. Its area is 4500 square miles, and in 1903 it had a population of 834,779.

AKKA, äk'kä. A pygmy tribe or race, now living within the confines of the Belgian Congo, with the Mangbetu (Monbuttu). Their discovery by Schweinfurth for the first time definitely established the stories of African pygmies by classical writers of antiquity, Du Chaillu's accounts having been set aside as too sensational to be believed. In height, the Akka average about 4 feet 6 inches; color, yellow brown; features, negroid. They are extremely retiring and do not mix with neighboring tribes, though usually they live near, and are under the protection of, the tall negroes. Their houses are dome-shaped, arranged in a circle, with the communal cooking fire in the centre. Though dwarfs in stature, they do not hesitate to attack large game with poisoned arrows, the python being their favorite quarry. Their food is principally nuts and berries. The Akka tribe presents a difficult ethnological problem, next to nothing being known of their language and customs. Consult: Schweinfurth, *Heart of Africa* (London, 1873); Deniker, *Races of Man* (London, 1900).

AKKAD, äk'käd or äk'käd. See ACCAD.

AKKERMAN, äk'ker-män'. Formerly a fortress, now the chief town of a district in the government of Bessarabia, Russia, at the mouth of the Dneister, 12 miles from the Black Sea and about 30 miles from Odessa (Map: Russia, D 5). The chief industry of the town is the raising of fruits, especially of grapes, there being no less than 2000 gardens within the city proper, besides numerous other beautiful ones which surround the town. An annual fair is held here during the month of December. The harbor is accessible to large steamers, and the town has regular steamship communication with Odessa, to which it exports fish, wools, wines, and salt, which is procured from lakes and marshes in the vicinity. Akkerman is the site of an ancient Roman town, possibly Alba Julia, which was destroyed and later rebuilt. Pop., 33,000.

AKKESHI, ä'kê-shē, or **AKISHI,** ä'kê-shē. A town of Japan, situated on the southern coast of Yezo, on the Akkeshi Bay (Map: Japan, J 2). It is famous for productive oyster beds and contains an oyster-canning establishment.

AK'KRA, or **AC'CRA.** The chief town of the district of the same name, in the British West African colony of the Gold Coast (Map: Africa, D 4). It has a salubrious climate, being separated from the interior of the colony by mountain chains. The number of Europeans is comparatively small, but the town bears strong marks of European influence. A railroad line connecting Akkra with Mangoase, 40 miles distant, is under construction. There are several churches, a bank, a club house, a number of European shops, and a government school for primary education, to which is attached a school of carpentry and woodwork. Pop., 1901, 14,842; 1911, 19,585.

AKMOLINSK, äk'mō-lyënsk'. A province of the General Government of the Steppe in Russian Central Asia. It extends from the Trans-Siberian Railroad in the north (55° N. lat.) to the Chu River in the south (45° N.). The northern and southern parts of the province are arid steppes mainly with interior basin drainage, i.e., water-courses having no outlet but ending in salt lakes. To these belong the Sary-Su and Chu rivers in the southern part, which is known as the Bekpak-Dala, or 'Hunger Steppe.' The central section is hilly and has deposits of copper, anthracite coal, and some gold; here lives the greater part of the sedentary population. The principal industries of Akmolinsk are the growing of flax and tobacco, cattle raising, fishing, and, in some localities, hunting. The deposits of coal, iron, copper, and the precious metals, have been but little developed. Area, 218,478 square miles. Pop., 1887, 463,400; 1911, 1,064,000, of which about half are nomadic Kirghiz. The capital is Akmolinsk, with about 10,000 inhabitants. It lies near the head of the Ishim River and is a great caravan centre, the most extensive trade being with Tashkiut and Bokhara. The most important town is Omsk.

AKOI'METOI. See ACÆMETÆ.

AK'RAGAS (Gk. 'Ακράγας). The ancient Greek name of the Sicilian city Girgenti. See AGRIGENTUM.

AKRI. See ACTIUM.

AK'RON. A manufacturing city, railroad centre, and the county-seat of Summit Co., Ohio. It is 35 miles south of Cleveland, on the Ohio Canal, and the Erie, the Baltimore and Ohio, the Pennsylvania, the Northern Ohio,

and the Akron, Canton and Youngstown railroads. The city is surrounded by a chain of lakes where hotels and amusement places have been established. Akron is now the largest rubber-manufacturing centre in the world, and the other industries of the city are of great variety. Among these are printing and lithographing, and the manufacture of iron, steel, sewer pipes, pottery, agricultural implements, furnaces, automobiles, and fishing tackle. Founded in 1825, Akron was incorporated as a village in 1835 and as a city in 1865. The rubber industry was started in 1869 by Dr. B. F. Goodrich, and the growth of the automobile business has been responsible for its enormous development. The government is vested in a mayor, president of the council, boards of public service and public safety, treasurer, solicitor, and auditor, all elected for two years. The city council has 11 members, three of whom are elected at large. The board of health consists of five members appointed by the mayor and council. The city's annual income amounts to about \$900,000, of which about \$400,000 is appropriated for education. Other chief items of expense are: fire department, \$101,100; police department, \$68,500. Akron is the seat of Buchtel College, formerly under Universalist control but now non-sectarian. The city maintains a library, a hospital, and owns its water works. One of Akron's notable points of interest is Portage Path, an old Indian trail between the Cuyahoga and Tuscarawas rivers. This trail was at one time part of the western boundary of the United States. Pop., 1870, 10,000; 1890, 27,601; 1900, 42,728; 1910, 69,667. Consult S. A. Lane, *Fifty Years and Over of Akron and Summit County* (Akron, 1892), and *Akron Chamber of Commerce Year Book* (1913-14).

AKRON, UNIVERSITY OF. The **BUCHTEL COLLEGE.**

AKSAKOFF, äk-sä'kōf, IVAN SERGEYEVICH (1823-86). A Russian writer and leader of the Panslavists, born in the government of Ufa. He studied in the school of jurisprudence at St. Petersburg and graduated in 1842, afterward entering the Moscow division of the Senate. In 1848 he entered the service of the Ministry of the Interior. Four years later he became editor of the Moscow *Sbornik*, which was soon suppressed. In 1855-56, during the Crimean War, he was in Bessarabia in command of the Serpukhoff detachment of the Moscow levy. He established the *Den*, a weekly paper published from 1861 to 1865, and the *Moskva*, a daily paper, which was established in 1867. This latter sheet was suppressed three times by the government within 22 months, these suppressions aggregating 13 months of that period. As chairman of the Slavic Philanthropic Society, he worked incessantly in the interest of a united state of all the Slavic nations. During the Russo-Turkish War he became the recognized leader of all those influences that brought about the War of Liberation of the Balkan Slavs, and his speeches in support of this cause had a world-wide circulation. The Moscow Slavic Committee was suppressed as a result of Aksakoff's bitter attacks, whereupon Aksakoff was banished from Moscow, but was permitted to return soon after. From 1880 until his death he published the weekly *Rus* in the interests of the Slavophil party. In December, 1885, he made a bitter attack on Russian diplomacy in

Bulgaria, with the result that an official reprimand was issued against his paper. He was the best-known poet of the Slavophil cause. His complete works were published by his wife after his death. Consult A. N. Shtiglich, *Pamyate Ivana Sergyeevicha Aksakova* (St. Petersburg, 1907).

AKSAKOFF, SERGET TIMOFEYEVITCH (1791-1859). A Russian writer, born in the government of Ufa. Learning his letters at the age of four, he had read widely before he was 10, and was ready to enter the University of Kazan in 1804. On graduating from the university he entered the legislative commission at St. Petersburg, which he served for five years (1807-12). Beginning to write at the early age of 15, he led a busy literary life ever after. His works include the serio-humorous *Observations on Angling* (1847); *Memoirs of a Huntsman in the Government of Orenburg* (1852), with their continuation, *Tales and Memories of a Huntsman* (1855); and *The Family Chronicle* (1856), by some considered his best work, of which a second part appeared as *Bogrov's Childhood* (1858). A selection from his shorter writings was published in 1858.

AKSHEHR, äk-shě'h'r (Turk. White Town, ancient Gk. Φιλομήλιον, *Philomēlion*). A city in the Turkish vilayet of Konieh, Asia Minor, situated on the Scutari-Konieh border, south of the Lake of Akshehr, about 60 miles by rail from Afium-Kara-Hissar (Map: Turkey in Asia, D 3). It lies at the foot of the Sultan-Dagh in a fruitful and well-watered region, has a considerable trade, and manufactures carpets. Pop., about 15,000.

AKSU, äk-sōō'. A town of eastern Turkestan, situated in lat. 41° 7' N. and long. 81° E., 260 miles northeast of Yarkland, west of the river Aksu, at an altitude of over 3000 feet (Map: Asia, H 4). It is surrounded by a strong wall and is of considerable strategic importance. It is a meeting-place for the caravans from Russia, China, West Turkestan, Kashmir, and India. The inhabitants are engaged chiefly in the manufacture of metal ware, tobacco, and cotton and leather goods. Copper and lead deposits are near by. In 1716 Aksu was nearly destroyed by an earthquake. In 1867 it was taken by the Khan of Kashgar, but was recaptured by the Chinese in 1877. Its population is about 20,000.

AKYAB, äk-yäb'. A town of Burma, India, the chief seaport of the district of Akyab or Arakan proper, and the capital of the province of Arakan (Map: Asia, J 7). It is situated on the eastern side of the island of Akyab, at the mouth of the Kuladan River, in lat. 20° 7' N., 190 miles southeast of Calcutta. The houses are well built, the streets broad and regular, and it has a fine and well-protected harbor. The chief article of export is rice. The United States is represented by a consular agent. Its rise from a fishing village dates from its selection as a port and the capital of the province in 1826. Pop., 1901, 35,680; 1911, 37,893.

AL, ä'l. The article in the Arabic language. The pronunciation of the initial vowel is vague, so that the article vacillates between *al* and *el*. Before dentals, sibilants, and liquids, the *l* sound is assimilated to the following consonant, so that, e.g., *al-shams* ('the sun') becomes *ash-shams* in pronunciation, though *al* is still written and it is now customary to print it as well.

The initial vowel is frequently elided when the word preceding the vowel ends in a vowel, e.g., *Abu'l-Feda* for *Abu-al-Feda*. The Arabic article appears in such English words as algebra, alchemy, alcove, and Alhambra, which are directly derived from the Arabic.

ALA. In anatomy and biology any wing-like process or formation, e.g., the *ala nasi*, or lateral wing of the nostril; the *alæ* of the ethmoid bone; the alar ligaments of the knee. In botany, the side petals of a papilionaceous flower.

ALABAMA, ăl'ă-bă'mă or -băm'ă. A river formed by the junction of the Coosa and Tallapoosa rivers, about 10 miles north of Montgomery, Ala. (Map: Alabama, B 4). Its general course is westward to Selma, thence southwestward to about 50 miles north of Mobile, where it meets the Tombigbee, and with that stream forms the Mobile River. It is 320 miles long and navigable from its mouth to Montgomery, nearly its entire length.

ALABAMA, known as the "COTTON STATE." One of the Gulf States of the American Union, situated between lat. 30° 10' and 35° N., long. 84° 53' and 88° 30' W. It is bounded on the north by Tennessee, on the east by Georgia, on the south by Florida and the Gulf of Mexico, on the west by Mississippi; length, about 336 miles from north to south; average width, 175 miles; total area, 51,998 square miles, of which 719 square miles is water (Map: United States, J 4). Alabama, by the revised areas of 1910, ranks as the eighteenth State in the Union in population, the twenty-seventh in size, and ninth in order of admission.

Topography. The southern extremity of the Appalachian mountain system extends into the State from northern Georgia in a series of low parallel ranges. Of these, Raccoon and Lookout mountains are the most prominent, but do not attain any great elevation. They are flat-topped ridges, about 1600 feet in elevation at the Georgia line, gradually lowering to the westward, the Raccoon Mountains extending in a very low range (called Sand Mountains) well across the State, while Lookout Mountain terminates abruptly after reaching a distance of about 60 miles within the State. To the southeast of these ranges lies the comparatively level Piedmont region. To the southwest, at the very terminus of the mountain system, is the low-lying Cumberland plateau—the coal fields of Alabama. On the north of all these are the lower lands of the Tennessee valley. The whole region just described includes the northeast two-fifths of the State. The remainder, the southwest three-fifths of the State, constitutes the coastal plain, which slopes gradually from an elevation of about 600 feet to sea level.

Climate and Soil. Excepting in the lowland along the rivers, the climate is very healthful, particularly in the north. Extremes of temperature are rare, the mean temperature for January being 42.9° and for July 83.9°. The summer heat is tempered by winds from the gulf. Snow falls occasionally in January and February, but rarely in the south; the frost limits at Montgomery are October 10 and April 25. The prevailing winds for the whole year are from the south and southwest.

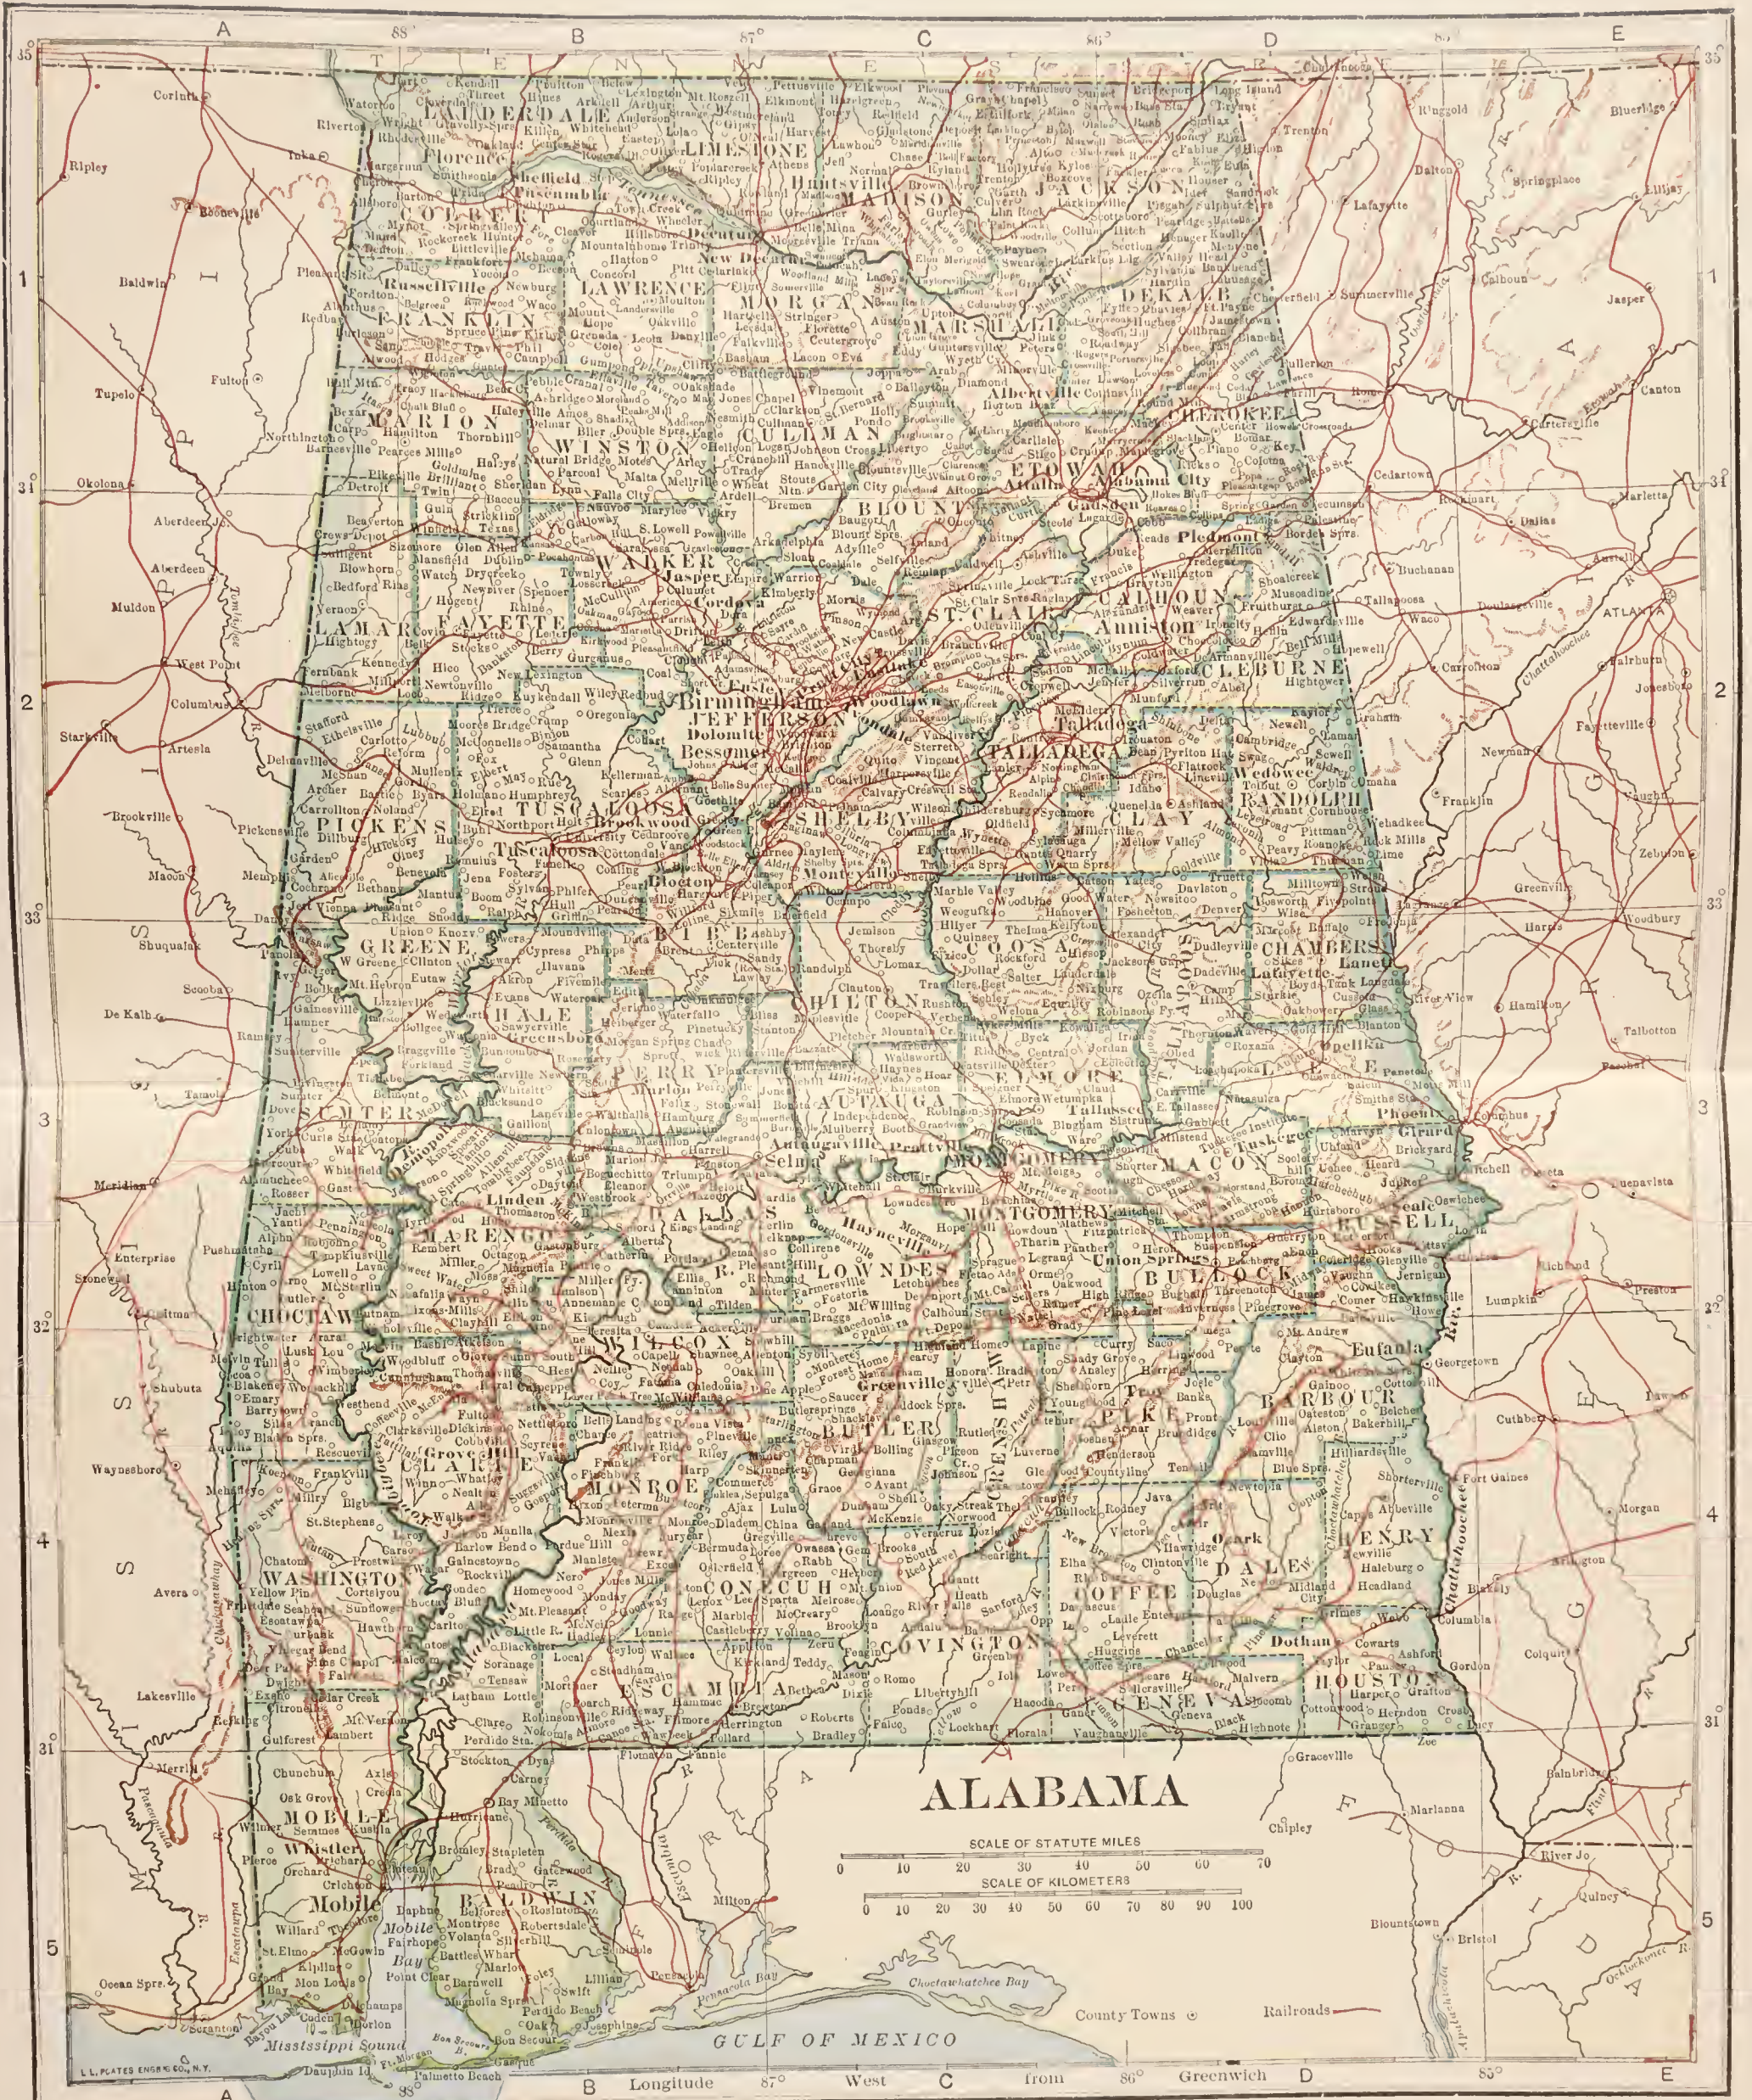

The average temperature and rainfall in the north are 59.70° and 54 inches respectively, gradually increasing to 66.60° and 63 inches in the south.

The valley of the Tennessee has chiefly a deep red calcareous soil, utilized for the cultivation of cereals; that in the metamorphic region is a red or gray loam with clay subsoil; in the coal regions it is sandy, with sand or clay subsoil; the north or middle divisions are bordered by a wide belt of red or yellow loam over stratified rocks and pebbles and are heavily wooded; the cotton belt has a heavy black calcareous soil from 2 to 20 feet deep, forming a portion of the so-called "black belt" of the Southern States. South of this, brown and red clay loams predominate. In the extreme southern countries the soil is light and sandy. Swamp land occupies considerable areas in various parts of the State.

Geology. The stratified rocks represent every formation occurring in the Appalachian region. There are three geological divisions of Alabama, viz.: The northern, containing most of the State north and west of a line from the northeast corner of the State through Birmingham nearly to Tuscaloosa, and including the great Tennessee valley, in which the rock masses belong to the Sub-carboniferous limestones and the Coal measures; their strata are approximately horizontal. Adjoining this on the east is the middle region, bounded by a line drawn from Tuscaloosa through Centreville, Clanton, and Wetumpka to Columbus, Ga. This includes (1) the metamorphic region, with altered and crystalline sediments of Silurian or preceding ages—quartzites, marbles, granites, and gneisses; the strata in many places disintegrated into masses of stratified clay and interlaminated with quartz seams. (2) The Coosa valley, with prevailing calcareous rocks. (3) The Coosa and Cahaba coal fields, their strata consisting of sandstones, conglomerates, shales, and coal beds, tilted and unequally degraded. This division contains some of the highest land in the State. The southern division, south and west of these limits, including the cotton belts, consists largely of drift deposits irregularly stratified over the eroded surface of Cretaceous and Tertiary rocks. Clarke County, between the Alabama and Tombigbee, is rich in fossil remains of the Tertiary age.

Mineral Resources. The southern limit of the mineral region may be indicated by a line passing through Pikeville, Tuscaloosa, and Wetumpka to Columbus, Ga. Within this area are the comparatively insignificant gold deposits of Tallapoosa County, and three fields of bituminous coal over 8660 square miles in extent, named from the rivers that drain them—the Warrior, the Cahaba, and the Coosa. Cannel, free-burning, lump, coking, gas, and other coals of superior quality are found. There are extensive beds of iron ore, including red hematite, limonite, black-band, magnetic, and specular; and the Choccolocco, Anniston, Coosa, Cahaba, Birmingham, and other valleys are noted for the abundance of their iron ore. Among other mineral products are asbestos, asphalt, copper, corundum, emery, fire clay, graphite, granite, lithographic stone, manganese, white and variegated marble, marl, red ochre, phosphates, bauxite, pottery and porcelain clays, salt (in the southwest), slate, soapstone, and small amounts of silver and tin. Natural gas has also been discovered, but the supply is inconsiderable.

Mining.—The utilization of the mineral resources of Alabama is, perhaps, the most remarkable feature of the industrial progress of the South in the last decade. Though it was long known that there were vast quantities of

ALABAMA

L. L. PLATES ENGINE CO., N. Y.

A Longitude 87° West C from 86° Greenwich D 85° E

iron and coal in the State, it was not until a comparatively recent period that the mining of these minerals on a large scale was undertaken. Thus the value of the bituminous coal mined in the State in 1886 was but \$2,500,000. In 1900 it had risen to \$10,000,000, in 1905 to \$14,875,000, and in 1910 to nearly \$20,000,000. The increase in the iron-mining industry is quite as striking. In 1880, 171,000 long tons of iron were mined; in 1905 the production had increased to 4,257,000 tons, and the State ranked third in the production of iron ore.

These conditions are reflected in, and are chiefly responsible for, the great development of the manufacturing industries of the State. See *Manufactures*.

As indicated above, coal and iron constitute the chief mineral resources. The coal is bituminous, and a considerable portion of it is used in the manufacture of coke, in the production of which Alabama is surpassed in quantity only by Pennsylvania.

The statistics of the thirteenth census, which are for the calendar year 1909, show the following facts in regard to the mining of coal in the State. In that year there were 167 coal mines in Alabama; the capital invested was \$19,632,647; the production was 6,515,922 tons, valued at \$8,125,811, and the wage-earners employed numbered 20,914. In the manufacture of coke 2,396,543 tons of coal were used. Since 1909 the production of coal has showed a remarkable increase. In 1910, according to the figures of the United States Geological Survey, there were mined 15,018,965 tons, and in 1912, 16,100,600 tons. In the production of coke, as noted above, the State ranks second. The output in 1912 was 2,975,489 short tons, valued at \$8,098,412, compared with 2,761,521 tons, valued at \$7,593,594 in 1911.

To the remarkable increase in the production of the iron mines of the State is due the wonderful advance of Birmingham and other cities as industrial centres. The greater part of the iron mined is red hematite. The State ranks third in the amount of ore produced; it is surpassed only by Minnesota and Michigan. According to the thirteenth census, the value of the iron ore in 1909 was \$4,939,149, and the statistics of the Geological Survey show a production in that year of 4,321,252 tons. The marketed production in 1912 was 4,563,603 tons, valued at \$5,734,371. In 1909 there were 25 operators of iron mines, and the wage-earners employed in the mines numbered 5666. In the manufacture of pig iron Alabama ranks fourth. There were produced, in 1912, 1,987,753 tons, valued at \$21,371,053, compared with 1,617,150 tons, valued at \$17,379,171 in 1911. The pig iron output has decreased somewhat since 1905, as a result of industrial and other causes. In that year the output was valued at \$22,680,000. Other important mineral products of the State are limestone, bauxite, and graphite, which are mined in Cherokee County. Clay products, sandstone, and mineral waters also have a considerable value. Petroleum has been found in the western section of the Warrior coal fields, at Fayette; wells have been driven, but oil has not been produced in quantities sufficient to justify extensive exploitation of the field.

The total value of the mineral products of the State in 1909 was \$24,350,667. The wage-earners in the mines numbered 30,795, and the capital invested was \$85,081,804.

Fisheries. In 1908 the total value of the product of fisheries in Alabama was \$387,220. By far the most important branch of this industry is the oyster-fishing, and there were 536,300 pounds of oysters taken, valued at \$168,870. Other fisheries of some importance were red snappers, mullets, catfish, and shrimps. The number of independent fishermen was 787, with 61 boats.

Agriculture. Alabama, like most of the other Southern States, is preëminently agricultural. The soils suitable for cultivation are extremely varied. They range from dark, mucky loams along the immediate coast line, to sands, sandy loams, fine sandy loams, and heavy clay soils throughout the more inland regions.

During the decade 1900 to 1910 the increase in the number of farms slightly exceeded the increase in the population. There were, in the latter year, 262,901 farms, compared with 223,220 in 1900, or an increase of 17.8 per cent. The increase in the population in the same period was 16.9 per cent. (See *Population*, below.) Of the total land area of 32,818,500 acres the land in farms in 1910 comprised 20,732,312 acres, a gain of 46,885 acres in the decade. The farm lands improved in 1910 amounted to 9,693,581 acres. The average acres per farm in 1910 were 78.9 and in 1900 92.7.

The total value of farm property in the State in 1910 was \$370,138,429. This includes land, buildings, and live stock. The corresponding value in 1900 was \$179,399,882. This shows an increase of 106.3 per cent in the decade. The average value of all property per farm in 1910 was \$1408, and, in 1900, \$804. The average value of land per acre in 1910 was \$10.46 against \$4.84 in 1900, an increase of 116.1 per cent in the decade.

The tendency to lease farms to tenants or on shares, which is common in some Southern States, is characteristic of Alabama. Of the 262,901 farms in the State in 1910, 158,326 were operated by tenants, and 104,575 by owners or managers. That this tendency is increasing is shown by the fact that, while the total number of farm operators increased 93.5 per cent in the decade 1900-1910, the number of tenants increased 148.7 per cent. The arrangements of lease differ; of the total number in 1910, 67,352 were shareholders, 2428 share-cash tenants, and 83,300 cash tenants.

The relative amount of land cultivated by white and colored farmers in Alabama is of great interest. In 1910, out of a total of 20,732,312 acres in farms, 15,640,877 acres were owned or operated by white farmers, and 5,019,435 by colored farmers. It is significant that while the acreage owned or operated by white farmers decreased from 15,965,260 in 1900 to 15,640,877 in 1910, the acreage owned or operated by colored farmers increased from 4,720,167 in 1900 to 5,019,435 in 1910. The greater number of colored farmers cultivate the property as tenants. Colored owners in 1910 held 1,466,719 acres, while 3,607,234 acres were under tenancy. That negro ownership of farm lands is increasing, while ownership by white farmers is decreasing, is shown by the fact that white ownership in 1900 was 12,348,537 and, in 1910, 11,813,387, while colored ownership increased from 1,216,813 in 1900 to 1,466,719 acres in 1910. Of the 103,929 farms owned in 1910, 74,504 were free from mortgage, 27,457 were mortgaged, and the status of 1908 was unknown. The propor-

tion of farms free from mortgage decreased from 80.8 per cent in 1900 to 73.1 per cent in 1910.

The greater number of farms in the State, for both white and colored, average from 20 to 49 acres. Farms of this size comprise over two-fifths of the entire farm area in the State; one-fifth are from 50 to 99 acres, and about one-eighth from 100 to 174 acres. Thus more than three-fourths of the farms of the State are between 20 and 174 acres.

Of the farmers in Alabama in 1910, 152,458, or 58 per cent, were white, and 110,443 were non-white. Of the non-whites, all but 56 were negroes.

The total value of live stock on the farms of the State in 1910 was \$65,595,000. This includes domestic animals, poultry, and bees. The cattle numbered 932,428; horses, 135,636; mules, 247,146; swine, 1,266,733; sheep, 142,930, and goats, 79,347. The fowls of all kinds numbered 5,028,104. On Jan. 1, 1913, there were in the State 146,000 horses, 270,000 mules, 931,000 cattle, 132,000 sheep, and 1,146,000 swine.

The acreage, production, and value of the principal crops in 1909 and 1912 are given in the following table. The figures for 1909 are from the thirteenth census, and those for 1912 from the United States Department of Agriculture.

	ACREAGE		PROD. BU.	VALUE
Corn,	1912	3,150,000	54,180,000	\$44,120,000
	1909	2,884,824	34,072,032	30,927,210
Wheat,	1912	30,000	318,000	359,000
	1909	13,665	113,953	120,873
Oats,	1912	260,000	5,200,000	3,224,000
	1909	257,276	3,251,146	2,117,703
Potatoes,	1912	15,000	1,215,000	1,094,000
	1909	14,486	1,128,564	884,497
Hay,	1912	209,000	261,000 *	3,811,000
	1909	238,656	251,403	3,357,132

	1909		1,129,527	74,205,236

* tons † pounds ‡ bales of 500 pounds each

The value of the cotton crop in 1909 was over twice the aggregate value of all the other crops combined. The total acreage of the combined cereals was, in 1909, slightly more than three-fourths as great as that of cotton, and their value about two-fifths as great.

In addition to the crops noted above, the State produces others of value. The peanut crop in 1909 was valued at \$1,490,654. Sweet potatoes and yams were valued at \$3,578,710, and cottonseed at \$12,803,196. The growing of orchard fruits and small fruits is of considerable and increasing importance. The former, in 1909, were valued at \$1,818,508, and the latter at \$165,386. Of the orchard fruits, apples are of the greatest importance, and of the smaller fruits, strawberries. Figs, oranges, and grapefruit are grown, but of these only the first is important. The figs produced in 1909 were valued at \$80,960. The production was 1,773,126 pounds.

Forest Products. There were, in 1909, 107,985 farms which reported forest products. These include firewood, material for fences, logs, railroad ties, telegraph and telephone poles, materials for barrels, bark, and naval stores. The total value of these products in 1909 was \$6,308,151, compared with a value of \$2,494,452 for the

product of 1899, an increase of 152.9 per cent. Of the value in 1909 \$3,827,481 was reported as that of products used or to be used on the farms themselves, \$1,899,341 as that of products sold or for sale, and \$581,329 as the amount received for standing timber.

Manufactures. The rapid growth of the manufacturing industries of the State in the last 30 years has been due largely to the development of its rich mineral resources, particularly in the northern part, known as the "Birmingham district." The close proximity of the coal fields of this district to its iron mines has made the iron industry very prosperous, while the great abundance of available coal and extensive forest resources have given a marked impetus to other manufacturing industries.

The importance of the iron industry, as a whole, is due to the exploitation of the rich deposits of iron, coal, and limestone which are found in close proximity in the northern part of the State. These favorable conditions are conducive to the production of pig iron at a relatively low cost.

In 1909 lumbering was the most important single industry, from the standpoint of value of product, value added by manufacture and the number of wage-earners.

During the period from 1899 to 1904 the growth of the industries related to the manufacturing of cotton was remarkable. The number of establishments increased 48.4 per cent, and the value of the product 105.6 per cent. Although the percentages of increase were smaller during the period from 1904 to 1909, the figures indicate a continued development, as the table will show. It is interesting to note that from 1899 to 1904 the percentage of increase in the value of product was higher than that in the value added in manufacture, while in the period from 1904 to 1909 the rate of increase in value added by manufacture was far greater than that shown for value of product. This is due partly to the enormous rise in the price of cotton during the former period and partly to the manufacture of a better grade of goods during the latter period.

The great importance of the coke-making industry is due to the abundant supply of coal suitable for coking purposes and to the demand for coke for fuel in the manufacture of iron and steel.

The table below shows the essential details of the industries in the State whose product in 1909 was valued at more than \$1,000,000. The corresponding data for 1904 are also given.

As will be seen from this table, the total number of wage-earners engaged in the manufacturing industries of the State in 1909 was 72,148, compared with 62,173 in 1904. In 1909 the male wage-earners numbered 65,686, and the female 6462. There were 3653 wage-earners under 16 years of age, and of these 1380 were females. The greater number of children under 16 years of age are employed in the industries related to the manufacture of cotton goods. Of a total number of 12,734 wage-earners employed in these industries in 1909, 18.7 per cent were under 16 years of age.

There are seven cities in the State that are important manufacturing centres. These are Birmingham, Bessemer, Mobile, Montgomery, Anniston, Selma, and Gadsden. Of these Birmingham is by far the most important. The growth of this city in the decade 1900-1910 is

one of the most remarkable instances of rapid increase of population on record. (See *Population*, below.) There were, in 1909, 8999 wage-earners in Birmingham, compared with 3987 in 1904. The value of the products of its industries was \$24,128,214 in 1909, as against \$7,592,958 in 1904. The causes for this phenomenal growth are noted above.

Transportation and Commerce. Alabama has excellent facilities for transportation by both land and water routes. The Alabama and Tombigbee rivers and their tributaries afford

The railway mileage of the State in 1912 was 5295 against 4752 in 1906. Nearly every trunk line in the South passes through Birmingham. In 1907 the Legislature passed many stringent measures designed to regulate and control the railways passing through the State, and attempts to enforce some of these led to a conflict of authority between the State and Federal governments. There is a State Railroad Commission, which, among other things, has the power of general supervision of railroad rates. Mobile is the only seaport. Much of the cotton

COMPARATIVE SUMMARY MANUFACTURES FOR 1909 AND 1904

INDUSTRY	Census	Number of establishments	PERSONS ENGAGED IN INDUSTRY				Primary horse-power	Capital	Salaries	Wages	Cost of materials	Value of products	Value added by manufacture

means for inland navigation, while the Tennessee, which sweeps across the northern part of the State, is navigable to Chattanooga, Tenn., and for small craft as far as Knoxville. Mobile is one of the most important ports on the Gulf of Mexico, and, in addition, the ports of New Orleans and Pensacola in neighboring States are easily accessible. The State has more miles of navigable rivers than any other in the South, but improvement and development have been slow. In 1907 the Mobile Basin and Tennessee River Association was organized to work for the improvement of Alabama waterways. The United States government began in 1910 to make extensive changes in the Alabama and Coosa rivers to Wetumpka, and on the Warrior and Tombigbee rivers.

for export and eastwise shipment goes to Savannah, and most of the lumber to Pensacola.

Banks. There were in the State on Dec. 2, 1912, 324 banks of all classes. The national banks numbered 85, with a capital of \$9,700,000, deposits of \$35,935,708, and total resources of \$66,942,019. There were 11 savings banks, with 24,925 depositors, and deposits aggregating \$2,652,784, and 214 State banks with a capital of \$10,073,390, and savings deposits of \$6,541,489.

Finance. The bonded debt amounts to \$9,057,000, about half of which was created during the reconstruction period, known as the "carpet-bag" régime. Of this debt \$8,103,000 was refunded in 1906, \$7,137,000 matures July 1, 1956, and bears interest at the rate of 4 per cent; the balance, \$966,000, matures Jan.

1, 1956, and bears interest at the rate of 3½ per cent. Interest on both sums is payable semi-annually, on the first days of January and July of each year. The remainder of the bonded debt, \$954,000, matures in 1920 and bears interest at the rate of 4 per cent, payable semi-annually, on the first days of January and July. No provision is made for the final extinction of this debt. New debts can be incurred only for purposes of repelling invasion or suppressing insurrection. Valuation of property has increased from \$130,000,000 in 1880, and \$383,420,000 in 1906, to \$566,807,488 in 1912. The tax rate is limited to 65/100 of 1 per cent (6½ mills on the dollar), on the value of taxable property for State purposes, and ¾ of 1 per cent for county purposes. Of the levy for State purposes, 30 cents on \$100, by constitutional provision, is applied to the support of common schools, and the remaining 25 cents is applied to general purposes, including pensions to indigent surviving Confederate soldiers and the widows of Confederate soldiers, support of State high schools and colleges, salaries, and other expenses. The net receipts for the fiscal year ending Sept. 30, 1912, from all sources, were \$6,061,236.68, and net disbursements for the same period \$5,906,255.56. The principal sources of revenue are: tax on property and polls about 60 per cent; license about 22 per cent; and earnings of convicts about 18 per cent. Of the disbursements, about 50 per cent was expended for schools, colleges, and eleemosynary institutions; about 16 per cent for pensions to indigent surviving Confederate soldiers and widows of deceased Confederate soldiers; about 10 per cent for maintenance of the convict department; about 6 per cent for interest on the bonded debt; about 2 per cent for feeding and removing State prisoners; and the remaining 16 per cent was expended for miscellaneous subjects, including salaries of heads and employees of State departments, and expenses of same, State judiciary, State national guard, etc. The balance, Oct. 1, 1912, was \$262,052.38.

Education. The condition of public education in Alabama has been unsatisfactory since the close of the Civil War. The causes are many: some are local and indicate conditions which will be remedied. There is no compulsory education law in the State, and those who are in charge of the schools have no means of compelling attendance. The large proportion of negroes in the State adds another difficulty to the problem. These causes have resulted in a percentage of illiteracy in Alabama that is exceeded in but two other States, South Carolina and Louisiana. In 1910 the illiterates numbered 352,710, or 22.9 of the entire population. The percentage among the native-born whites was 10.1, while among the negroes it was 40.1. That conditions are improving, however, is shown by the fact that the percentage among the native whites in 1900 was 15.2, and among the negroes 57.4. The percentage for the entire population in 1900 was 34.

According to the thirteenth census, the school population, ages 6 to 20, in 1910 was 750,357, while those attending school numbered 385,449. Of those attending school 244,992 were white and 133,191 were negro. According to statistics supplied by the State Superintendent of Public Instruction the school population of the State in 1912 was 727,297. The white children num-

bered 399,273 and the colored 328,024. The number enrolled in the schools was 446,301, and of these 299,844 were white and 146,547 were colored. In schools for white children were 7972 teachers, and in those for colored children, 2907. The average yearly salary for white teachers was \$376 and for colored \$160. The total amount expended for teachers' salaries, including county superintendents, aggregated \$3,703,711.

There is no legal provision for taxation for educational purposes in the State, but each county is allowed, under the constitution, upon a vote of 60 per cent of the people, to levy a tax of 1 mill or 10 cents on each \$100 of property, to obtain a supplemental school fund for the exclusive use of the county levying it.

In 1912 there were 2941 graded schools for white children in the State, and 814 for negroes. These graded schools form for the whites two-thirds, and for the negroes two-fifths of all the schools in the State. The teachers, especially those in colored schools, have heretofore lacked many qualifications. Recent legislation has, however, greatly improved and strengthened the teaching force. Successful efforts are being made to improve the condition of the elementary rural schools by grading, closer supervision, and the vitalizing of school work.

Forming a part of the educational system of the State are the University of Alabama (q.v.) at Tuscaloosa, the Alabama Polytechnic Institute (q.v.) at Auburn, the Alabama Girls' Technical Institute at Montevallo, normal schools at Florence, Jacksonville, Troy, Livingstone, Daphne for white teachers, and at Moundville, Montgomery, Normal, and Tuskegee for negroes. There are also 9 district agricultural schools, and the Northeast Alabama Agricultural and Industrial Institute at Lineville. Private institutions are St. Bernard College at Cullman; Howard College at East Lake; Southern University at Greensboro; Birmingham College at Birmingham, Spring Hill College at Spring Hill, and 8 colleges for women. The work of the Tuskegee Normal and Industrial Institute (q.v.) is widely and favorably known.

Charitable and Penal. The State institutions comprise the Institution for the Deaf, Dumb and Blind, at Talladega; hospitals for the insane, at Tuscaloosa and Mount Vernon; a penitentiary, at Wetumpka; and nineteen branch prisons, where State convicts are kept. The State owns cotton farms and a cotton mill, where labor is performed by boys and women convicted of offenses by the courts. The convict system has undergone radical improvements, but prisoners are still leased to contractors. The Legislature of 1907 made provision for special courts for juvenile offenders, and at the session of 1911 the office of State prison inspector was created. At this session there was authorized, also, the construction of a reformatory for wayward and delinquent females and of a reform school for juvenile negro law breakers.

Religion. As in other portions of the South, the Baptists and the Methodists have the field almost to themselves. Among other denominations, the strongest are the Presbyterian, Catholic, Christian, and Episcopalian.

Population. The State has shown a steady increase in population, as will be seen from the tabulation by decades: In 1820, 127,901; 1830, 309,527; 1840, 590,756; 1850, 771,623; 1860, 964,201; 1870, 996,992; 1880, 1,262,505; 1890,

1,513,617; 1900, 1,828,697; 1910, 2,138,093. The increase in the decade 1900-10 was 16.9 per cent, which was greater than the increase in any other of the East South Central Division of the States, which includes Kentucky, Tennessee, Alabama, and Mississippi. Alabama ranks eighteenth in population among the States. In 1840 her rank was twelfth, but she has gradually fallen back since that time. The population per square mile in 1910 was 41.7, as against 35.7 in 1900 and 29.5 in 1890.

That the population of the State is preponderantly rural is shown by the fact that in 1910 the rural population was 1,767,663, while the urban was only 370,431. There was, however, an increase of 55.9 per cent in the urban population in the decade 1900-10, while the rural population increased but 11.5 per cent.

The white population in 1910 was 1,228,832, while the negroes numbered 908,282. The white population in 1900 was 1,001,152, and the negro 827,307. The white population, as is true of most of the Southern States, is almost entirely native born. The foreign population in 1910 numbered only 19,286. Of the native white population in 1910, 597,894 were males and 579,565 were females, and there were 103.2 males to 100 females.

The negroes are centred largely in the cotton belt, where they find ready employment as laborers. In certain counties of this belt they outnumber the whites five to one, but in other counties outside the cotton belt these conditions are reversed. The negroes in the rural communities have, in recent years, shown a tendency to gravitate to the cities.

Cities. Birmingham is the largest city in the State, with a population in 1910 of 132,685. Its population in 1900 was 38,415, and the rate of increase in the decade was 245.4 per cent. Only two other cities in the United States increased more rapidly, and these were practically created during the decade. The other large cities are Mobile, 1910, 51,521; 1900, 38,469; Montgomery, the capital, 1910, 38,136; 1900, 30,346; Selma, 1910, 13,640; 1900, 8713; Anniston, 1910, 12,794; 1900, 9695; Bessemer, 1910, 10,864; 1900, 6358, and Gadsden, 1910, 10,557; 1900, 4282. There were 22 cities with a population of over 4000 in 1910, compared with 16 in 1900.

Government. The present constitution was adopted in 1901. The constitutional convention which met in that year devoted a great part of its deliberations to an attempt to evolve a law which would practically eliminate negro suffrage. The following provisions of the constitution accomplished this purpose: In order to register prior to Dec. 20, 1902, the applicant must have engaged in, or have been the descendant of one who has participated in, one of the following events: The War of 1812, the Mexican War, any war with the Indians, the war between the States, the war with Spain, or served with the forces of the Confederate States, or of the State of Alabama in the war between the States; and he must have been an individual of good character, and one who understood the duties and obligations of citizenship under a republican form of government. Since Jan. 1, 1903, the applicant for registration has been required to be able to read and write any article of the Constitution of the United States in the English language and be physically able to work, or to be able to read and write such article, and to have been engaged in some regular trade

or occupation for the greater part of the 12 months next preceding the time he offers to register; or if he is unable to read or write, such inability must be due to physical disability; or the applicant must be the owner in good faith in his own right, or the husband of a woman who is the owner in good faith in her own right, of 40 acres of land situated in the State; or to be the owner or husband of the owner of real or personal property assessed at \$300.

Any person guilty of criminal offense, including the selling, buying, or offering to sell or buy a vote, is debarred from voting. Each county has a board of registrars, consisting of three members who issue the certificates to those entitled to hold them. An amendment to the constitution may be secured by a two-fifths vote of each house, ratified by a vote of the people. A constitutional convention may be called when voted by a majority of each house and ratified by the people, and the power of such conventions in altering, revising, or amending is subject to no restrictions.

Legislative.—The legislative body consists of a Senate and a House of Representatives, the maximum limit of membership being 35 and 107 respectively. The number of Senators must not be more than one-third nor less than one-fourth that of Representatives. Senatorial districts are composed of contiguous undivided counties. Elections are held the first Tuesday after the first Monday in November of every fourth year, and the Legislature meets on the second Tuesday in the following January, the session being limited to 50 days. Members are paid \$4 per day and traveling expenses. Revenue bills originate in the House and cannot be passed in the last five days of the session. The Legislature must provide for the revision of the statutes every twelfth year. One of the numerous legislative prohibitions prevents the State from engaging in or aiding in internal improvements, but in 1908 an amendment to the constitution became operative, limiting the prohibitions referred to as follows: "Provided that the State may under appropriate laws cause the net proceeds from the State convict fund to be applied to the construction, repair, and maintenance of public roads in the State, and the Legislature may make additional appropriations for that purpose."

Executive.—A governor, lieutenant-governor, attorney-general, State auditor, secretary of State, State treasurer, superintendent of education, and commissioner of agriculture and industries are elected every fourth year, at the time and place appointed for the election of members of the Legislature. None of these officers is eligible for reelection, and the governor is not eligible to election or appointment to any office in the State, or to the Senate of the United States, during his term or within one year after the expiration thereof. The lieutenant-governor is ex officio president of the Senate, and succeeds to the office of governor in case that office becomes vacant. The attorney-general, secretary of State, and State auditor constitute a board of pardons, to hear petitions for pardons, commutation, or parole in cases of felony, and advise the governor thereon; but the decision of the governor does not need to conform with that of the board. The governor may veto any bill, or any item of an appropriation bill; but a majority vote of each house may override the veto of the gov-

ernor. A bill becomes law if the governor fails to pass upon it within one week after it has been submitted to him.

The Legislature of 1907 created a State Tax Commission, with power to act as a State Board of Equalization and to recommend improvements in the tax laws. The Legislature of 1911 created a banking department and the office of State prison inspector. The salary of the governor was raised at this session from \$5000 to \$7500, and an executive mansion was purchased. An appropriation of \$100,000 for the improvement of the State Capitol at Montgomery was made. This was available in 1912-13. At this session a State board of arbitration and mediation for the settlement of labor troubles in coal mines was created, and the governor was authorized to appoint an inspector of coal mines for each 2,500,000 tons of coal.

Judiciary.—The judicial power of the State is vested in the Senate, sitting as a court of impeachment, a supreme court, circuit courts, chancery courts, courts of probate, such courts of law and equity inferior to the supreme court consisting of not more than five members, as the Legislature from time to time may establish, and such persons as may be by law invested with powers of a judicial nature. A circuit court, or a court having the jurisdiction of a circuit court, is held in each county of the State at least twice every year. The State is divided into five chancery divisions, with a chancellor for each division. The divisions are subdivided into districts, in each of which the chancellor holds court at least twice each year. Courts of probate exist in each county. Judges of the supreme, circuit, chancery, and probate courts are elected for a term of six years. For each judicial circuit a solicitor (prosecutor) is elected for a term of four years. Each precinct has two justices of the peace and one constable, excepting precincts lying within towns of over 1500 inhabitants, in which precincts the Legislature may establish inferior courts in lieu of the justices of the peace. The Legislature of 1911 created a State court of appeals of three members, elected for a six-year term at an annual salary of \$5000. This court has final jurisdiction in certain cases.

Local and Municipal Government.—The commission form of government is mandatory in cities of the first class, of which Birmingham is the only representative; and for cities with a population from 25,000 to 50,000, of which the only one is Montgomery. In cities of the second class, population 50,000 to 100,000, it is permissive, but not mandatory. For cities of 1000 and over, this form of government is permissive, on petition and favorable vote. Provision is made for the recall of commissioners. Up to June, 1913, the cities of Birmingham, Mobile, Montgomery, Cordova, Hartsell, Huntsville, Talladega, Tuscaloosa, and Sheffield, had adopted this form of government. Both county and municipal corporations are limited in their taxing and debt incurring powers. Each county elects a sheriff who serves for four years and cannot be re-elected. One year's residence is necessary to secure a divorce, the principal causes for which are desertion (two years) and habitual drunkenness. Civil service regulations are provided for cities of over 25,000. The capital is Montgomery (q.v.).

Elections.—The State, like most other Southern States, has a system of primary elections. The party State committees have power to fix

assessments on candidates, and are given other privileges, but in the main the elections are under State control. They must be held four months or more before the November elections, and on the same date in all parts of the State. These elections are for the State and county elective offices, representatives in Congress, and Presidential elections. The election of United States senators is, of course, governed by the Constitutional Amendment of 1912 providing for such elections. There are stringent laws against political contributions by corporations. The State has 12 votes in the Electoral College; prior to 1910 it had 11.

Militia.—The organized militia of Alabama, officially known as the National Guard, consists (1913) of 2581 men. The census of 1910 found 401,145 males of militia age. The National Guard is formed into one brigade, and consists of three regiments of infantry, two of 12 companies each and one of 10 companies, and two battalions of field artillery, composed of four batteries.

History. In 1540 De Soto passed through the territory now included in Alabama, and found it occupied by powerful Indian nations. Among them were the Alibamas, who gave their name to the country; the Chickasaws, the Choctaws, and the Creeks, together constituting the Muskogean family; the Cherokees and Apalaches. Alabama was included under Carolina in the royal grants made by the Stuarts in 1629 and 1663, but no attempts at settlement were made by the English. In 1702 the French, under Bienville, removed from Biloxi Bay, where a fort had been built some years previous, and erected Fort Louis, on Mobile River. Mobile was founded in 1711 and until 1720 was the capital of Louisiana. In 1714 Fort Toulouse was built at the junction of the Coosa and Tallapoosa. The growth of the colony was hindered by disease and poverty; the Chickasaws remained hostile, and the English planted their trading posts in the wilderness north of Mobile. When France ceded her possessions east of the Mississippi to England, in 1763, Alabama north of 32° 40' was added to the Illinois territory, and the part south of the line to West Florida. During the Revolution West Florida, which had by that time gained English and Scotch settlers, remained loyal, and in 1779-80 Spain took advantage of her own war with Great Britain to seize the province. After 1783 the United States, as the successor of England, claimed as far south as the thirty-first degree, but Spain continued to hold the territory south of 32° 40' till 1798. Georgia claimed between 31° and 35° to the Mississippi, but sold her rights in 1802. In 1798 Congress organized the region included between the Mississippi River on the west, the Chattahoochee on the east, the thirty-first parallel on the south, and a line drawn from the mouth of the Yazoo into Mississippi Territory, and in 1804 extended its northern boundary to Tennessee; in April, 1813, the Mobile district was taken from the Spanish by the United States and annexed to Mississippi Territory.

Incited by the British, the Creeks and their allied tribes rose in 1812 against the whites, their atrocities culminating in the great massacre at Fort Mims, on the Alabama River, Aug. 30, 1813. General Jackson headed the forces sent against the Indians, and by his victories at Talladega and the Horse Shoe Bend of the Tallapoosa, 1813-14, forced them to surrender their territory west of the Coosa and south of We-

tumpka. In a number of subsequent treaties the Indians gradually abandoned the larger portion of their land, until, between 1830 and 1836, they were removed in a body west of the Mississippi River. (See CREEKS.) Mississippi was set off March 1, 1817, and on March 3 was formed the Territory of Alabama, with its seat at St. Stephens. The first Legislature met at Huntsville, Jan. 19, 1818, and the State was admitted to the Union Dec. 14, 1819. In 1820 the seat of government was removed to Cahaba, in 1826 to Tuscaloosa, and in 1847 to Montgomery. The people of Alabama were aggressive champions of territorial expansion for slavery purposes, and took a prominent part in the Mexican War. They entered very zealously into the secession movement, and early in December, 1860, urged the Southern States to withdraw from the Union. At Montgomery, on Jan. 11, 1861, an ordinance of secession was passed by a vote of 61 to 39—the minority representing the northern part of the State, where the Whig party had been especially strong. Forts Gaines and Morgan, at the entrance to Mobile Bay, were seized, and on January 21 the Senators and Representatives withdrew from Congress. Delegates from the seceded States met at Montgomery, February 4, and organized the Confederate government. A Confederate arsenal, foundry, and navy yard were soon established at Selma. In February and April of 1862 Federal troops occupied the Tennessee valley. In August, 1864, Farragut destroyed a Confederate fleet in Mobile Bay, and, aided by General Granger with a land force, reduced Forts Gaines and Morgan. In April, 1865, the Union forces took Selma, Tuscaloosa, Montgomery, and Mobile. A provisional government was established June 21, 1865, and a convention repealed the act of secession and altered the constitution. State officers and members of Congress were chosen; but Congress, in conflict with President Johnson, refused admission to the representatives from Alabama. By the reconstruction act of March 2, 1867, Alabama was included with Georgia and Florida in the third military district, under General Pope. In November a new constitution was framed, which received, February, 1868, 70,182 votes out of 71,817 cast, and though the majority of registered voters had remained away from the polls, Congress declared the constitution operative, and it continued in force till 1875, when a new constitution was adopted. On July 14, 1868, military rule ceased, and on Nov. 16, 1870, the State ratified the fifteenth amendment to the Federal Constitution. For a decade after the Civil War, Alabama suffered from maladministration. Party spirit ran very high, and elections were bitterly contested. The dishonesty of officials and the extravagant railway policy they pursued brought the State and the chief towns into serious financial difficulties. With the reorganization of the public debt in 1876 began an era of quiet and prosperity. Cotton and steel manufactures, lumbering, and the mining industries thrived enormously, and many large towns sprang up in the northern part of the State. Agricultural interests, by comparison, showed little growth. Educational progress did not keep up with economic development until the end of the nineteenth century. Since 1874 Alabama has been invariably Democratic.

The wave of prohibition sentiment which passed over nearly all the Southern States in the early years of the twentieth century included

Alabama. The Legislature of 1907 passed local option measures which became effective Jan. 1, 1908. These resulted in the gradual elimination of the legalized liquor traffic in most of the 67 counties of the State and in a majority of the 500 towns. Attempts were made in several counties to have certain provisions of the local option act declared unconstitutional, but they were upheld by the Supreme Court of the State. In 1908 there was such an apparent demand for still more stringent prohibition measures that the Legislature was called in special session to pass additional laws. The result was a so-called State-wide prohibition bill, which made the whole State "dry" by legislative enactment on Jan. 1, 1909. Flaws which led to evasions in its enforcement were found in the administrative features of this law, and in July, 1908, the Legislature again met in special session to provide additional safeguards. The measure passed at this session has been called the most drastic prohibition act ever passed by any State. Officers were given authority to close any place where it was suspected that liquor was sold, and the burden of proof was placed on the defendants. All forms of liquor advertising were forbidden, and provision was made for the impeachment of any officer failing to enforce the law. The transportation of liquor from one person to another was forbidden. This provision, however, which was considered the strongest administrative feature of the law, was pronounced unconstitutional by the courts. The Legislature provided also for an election on an amendment providing for constitutional prohibition. The results of this election, held on March 19, 1909, showed a remarkable reaction against prohibition. The proposed amendment was defeated by over 27,000 votes. In the following year, 1910, State-wide prohibition suffered still other defeats. Emmett O'Neal made his campaign for governorship on a local option platform, while his opponent for the Democratic nomination, Col. H. S. D. Mallory, strongly advocated prohibition. O'Neal was nominated by a majority of over 15,000, and with him a majority of the members of the Legislature pledged to local option. As a result the Legislature of 1911 passed a law known as the Parks local option bill. This practically repealed the stringent measures passed in 1908-09. This law makes the county the unit in voting in the liquor question, and elections can be held only on the petition of 45 per cent of those voting at the previous election. Counties are also allowed to decide whether liquor shall be sold by a dispensary. The Anti-saloon League (q.v.) tested this law in the State courts in 1912, and it was pronounced constitutional. The Legislature of 1911 passed also a bill regulating the sale of liquor under licenses in incorporated places. The sale between the hours of 11 P.M. and 6 A.M. is forbidden, and the number of saloons is limited according to population. Under the Parks law 15 counties voted in 1911 and two in 1912. Nine voted for no license, seven for license, and one for a dispensary. These counties voting for license were, in general, those in which the larger cities of the State are situated.

The passage of unusually severe laws for the regulation of railways and other corporations by the Legislature of 1907 resulted in conflict between the State and Federal authorities on the question of State rights. For a discussion of this subject see STATE RIGHTS.

The deaths of Senators J. T. Morgan and E. W. Pettus in 1907 gave an opportunity for putting into effect the so-called Alabama Alternate Succession Plan. As both these Senators were aged men, at the primaries held in 1906 votes were cast for Senators to succeed them in the event of the death of one or both. John H. Bankhead was nominated to succeed Senator Morgan, and J. E. Johnston to succeed Senator Pettus. Senator Bankhead was reelected in 1911 and Senator Johnston died in 1913.

On Aug. 10, 1909, the Legislature, in special session, ratified the income tax amendment to the Constitution, and was the first State legislature to take such action.

A decision relating to the alleged practice of peonage in the South, which is likely to be historic in that connection, was rendered in the United States Supreme Court in January, 1911. This decision overturned the Alabama law, which hitherto ruled in these cases. Alonzo Bailey, a negro, had a contract to work as a farm-hand at a wage of \$12 per month. He received in advance \$15. After working for a little over a month he stopped work, but did not refund the money. According to the Alabama law such refusal to work and refund the money was *prima facie* evidence of intent to defraud. The defendant is required to prove the contrary, but cannot testify directly as to his intentions. He is, therefore, practically convicted of fraud by stopping work and is heavily fined, and in lieu of payment is put to work without remuneration. This case was before the United States Supreme Court for several years. By the decision rendered in 1911 the Alabama law was declared unconstitutional.

Alabama is consistently Democratic in State and national elections. As noted above, Emmett O'Neal was elected governor in 1910. His term expires in 1915.

In the presidential election of 1908, Bryan received 74,370 votes and Taft 25,305. In the election of 1912 Wilson received 82,439 votes. Roosevelt, 22,689, and Taft, 9731. By the apportionment of 1910 Alabama has 10 Representatives in Congress, whereas previously there were but 9.

The following is a list of the governors of the State, and the parties to which they belonged:

TERRITORIAL GOVERNOR

William W. Bibb 1817-19

STATE GOVERNORS

W. W. Bibb Democrat 1819-20
 Thomas Bibb " 1820-21
 Israel Piekens " 1821-25
 John Murphy " 1825-29
 Gabriel Moore " 1829-31
 Samuel B. Moore " 1831
 John Gayle " 1831-35
 Clement C. Clay " 1835-37
 Hugh MeVay " 1837
 Arthur P. Bagby " 1837-41
 Benjamin Fitzpatrick .. " 1841-45
 Joshua L. Martin " 1845-47
 Reuben Chapman " 1847-49
 Henry W. Collier " 1849-53
 John A. Winston " 1853-57
 Andrew B. Moore " 1857-61
 John G. Shorter " 1861-63
 Thomas H. Watts " 1863-65
 Lewis E. Parsons Provisional 1865

Robert M. Patton Republican 1865-67
 Wager Swayne .. (Military Governor) .. 1867-68
 William H. Smith Republican 1868-70
 Robert B. Lindsay Democrat 1870-72
 David P. Lewis Republican 1872-74
 George S. Houston Democrat 1874-78
 Rufus W. Cobb " 1878-82
 Edward O'Neal " 1882-86
 Thomas Seay " 1886-90
 Thomas G. Jones " 1890-94
 William C. Oates " 1894-96
 Joseph F. Johnston ... " 1896-1900
 William J. Sanford ... " 1900-01
 William D. Jelks " 1901-07
 Braxton B. Comer " 1907-11
 Emmett O'Neal " 1911-15

ALABAMA, UNIVERSITY OF. A co-educational State institution established in 1831 at Tuscaloosa, Ala. It comprises a College of Arts and Sciences, a College of Engineering, schools of Law, Medicine, and Pharmacy, the last two at Mobile, and a summer school which in 1913 had 562 students, the total student registration for that year being 1214 with a faculty of 89. The University has a library of 30,600 volumes, grounds and buildings valued at \$1,225,000, an endowment of \$545,000, and an income of \$162,500. President, G. H. Denny, Ph.D., LL.D.

ALABAMA CITY. A town in Etowah Co., Ala., 56 miles north of Birmingham, on the Louisville and Nashville, the Alabama Great Southern, the Nashville, Chattanooga, and St. Louis, and the Southern railroads (Map: Alabama, C 1). It is situated in an agricultural region producing corn, oats, cotton, wheat, and hay. Coal and red ore are also found in considerable quantities. The city has a large cotton mill and a steel company. Pop., 1900, 2276; 1910, 4313.

ALABAMA CLAIMS. A series of claims for indemnity made upon Great Britain by the United States, based upon the alleged omission of Great Britain to observe the obligations imposed by international law upon neutral nations with reference to their dealings with, and duties to, belligerents. The claims, in most particulars, arose from damages inflicted by vessels in the Confederate service which had been fitted out or built in English waters and allowed to sail thence. The Declaration of Paris (q.v.), adopted in 1856 by most of the nations of Christendom, had abolished privateering, and, though the United States was not a party to the convention, this decree had become a recognized principle of

international law. Moreover, both the United States and England had passed acts early in the century prohibiting the equipment of land or sea forces for the purpose of operating against the territory or commerce of a friendly nation, and making it the duty of the government to prevent such filibustering (Act of Congress of April 20, 1818, 3 Stats. at Large, 448; Foreign Enlistment Act, 59 George III, cap. 69). It was upon these acts and principles affecting international relations that the claims of the United States were founded.

The facts of the case were these: Following President Lincoln's call for volunteers, President Davis of the Confederate States offered letters of marque and reprisal (q.v.) to private vessels to prey upon the commerce of the United States. Prompt advantage was taken of this offer, and numerous privateers issued from southern ports to harry the New York and New England merchant marine. Meanwhile Queen Victoria had issued her proclamation of neutrality, forbidding her subjects to take part with either side, and directing her official servants to accord belligerent rights to both parties to the struggle. Equipment was forbidden the vessels of both belligerents. Notwithstanding this proclamation, and the repeated and urgent protests of the American Minister, Charles Francis Adams, the sympathy of British officials, especially in the colonial ports, with the Southern cause was notorious, and harbors like Nassau in the West Indies became the refuge of Confederate cruisers.

The history of the *Alabama* is typical of the more flagrant cases submitted to the tribunal of arbitration. She was built at Birkenhead, England, under circumstances of great suspicion. The attention of the British government was repeatedly called to the case, and finally some steps were taken by the authorities to detain the vessel; but "No. 290," as she was called, left port without register or clearance papers, July 29, 1862, and, taking on her equipment in the Azores from two English vessels, assumed the name *Alabama*, under which she became famous and set out on her career of destruction. In much the same manner the *Florida*, *Georgia*, *Shenandoah*, and various other cruisers eluded the watchfulness of British officials. Before her destruction by the *Kearsarge*, June 19, 1864, the *Alabama* is said alone to have captured and destroyed 70 vessels of the United States.

The first phase of the controversy appeared in 1862, in the negotiations between the American Minister, Mr. Charles Francis Adams, and Lord John Russell, with reference to the alleged violation of England's Foreign Enlistment Act (1819) by the *Alabama*, and the obligation of the English government to detain her. This the government finally agreed to do; but action was delayed three days because Sir John Harding, an important official before whom the papers had been laid, was suddenly seized with an attack of insanity. The Confederate captain availed himself of this respite and sailed from Liverpool one day before orders arrived for the retention of his vessel. As a result, an enormous loss was inflicted upon American shipping.

Was Great Britain responsible for this, and, if so, to what extent? The solution of this question was the most important problem of diplomacy left as a result of the Civil War. As early as 1865, steps were taken to determine a method of adjustment; but it was not till 1871 that a basis for adjudication was agreed upon,

in the important Treaty of Washington, May 8. By this treaty it was stipulated that all claims known generically as the "Alabama claims" should be submitted to the decision of five arbitrators, one named by England, one by the United States, and one each by the King of Italy, the Emperor of Brazil, and the President of the Swiss Confederation. For the guidance of this court of arbitration, the Treaty of Washington laid down the important "three rules" defining the obligation of a neutral power to use "due diligence" to prevent the hostile use of its ports against a friendly nation. In accordance with this arrangement, the court met at Geneva, Dec. 15, 1871. The chairman of the court was Count Federigo Sclopis, the arbitrator named by the King of Italy; and the other members were Baron d'Itajuba, Brazilian Minister at Paris, Jacob Stämpfli, for three terms President of the Swiss Confederation, Sir Alexander Cockburn, and Mr. Charles Francis Adams. The chief counsel for England was Sir Roundell Palmer, and the American counsel were William M. Evarts, Caleb Cushing, and Morrison R. Waite. The American case, however, was prepared by Mr. J. C. Bancroft Davis. Both the case and the counter-case were prepared and maintained with great ability and acumen, and the arguments were followed with marked interest. More than once, however, a premature termination of the proceedings was threatened by the insistence of the American counsel upon the fact that in estimating the indemnity not only direct damages should be considered, but also such indirect losses as had befallen citizens of the United States through the decrease of trade, the increase of insurance rates, the prolongation of the war, and the additional cost of the prosecution of the war caused by these cruisers. Finally, the claims of the United States for indirect damages were unanimously rejected, on the ground that the principles of international law did not sanction an award of compensation between nations upon claims of that indefinite character. On Sept. 14, 1872, the final award was signed, by which it was decreed that England had incurred no liability arising from the action of the *Sumter*, the *Nashville*, the *Georgia*, the *Tallahassee*, and the *Chickamauga*, or of their tenders, and by a vote of three to two that England had incurred no liability for the work of the *Retribution*. It was, however, determined, by a vote of three to two, that England was responsible for a portion of the acts committed by the *Shenandoah*; by a vote of four to one that England was liable for the results of all the operations of the *Florida*; and by a unanimous vote that England was responsible for all the depredations of the cruiser *Alabama*; and that liability also attached to the acts of the tenders of the *Florida* and the *Alabama*. The consideration of claims arising from the operations of other vessels was excluded for want of evidence. Instead of awarding specific damages apportioned against the several ships and among the several private parties injured, the court awarded a single sum of \$15,500,000, as a full indemnity of all claims against Great Britain. This amount was accordingly paid in the following year. In order to determine the claims of private owners, and to distribute the fund among such claimants, Congress created, by the statute of June 23, 1874, a claims court by which judgments were rendered aggregating \$9,315,753. A second and similar court was established by

the statute of June 5, 1882. The indirect results of this arbitration—which belong rather to the history of international law than to that of the case under consideration—were of even greater importance than its direct results. In strengthening the principle of arbitration as a means of settling grave international differences, in furnishing a high example of justice and disinterestedness in judging between nations, and in defining and elevating the conception of national responsibility, the Geneva tribunal rendered an incalculable service to humanity. The rules laid down for the government of the arbitrators and the court will be found under the title **WASHINGTON, TREATY OF**. For its permanent contributions to international law, see that title. The circumstances under which the case was submitted to arbitration, and its relation to other questions of difference between England and the United States existing at the time, are explained in the articles on **ARBITRATION, INTERNATIONAL LAW**, and **WASHINGTON, TREATY OF**.

Moore, *International Arbitrations*, pages 495–682 (Washington, 1898); and for a discussion of the claims courts, pages 4639–4685 of the same work; also Baleh, *The Alabama Arbitration* (Philadelphia, 1900); Beaman, *The Alabama Claims and their Settlement* (Washington, 1871); Davis, *Mr. Fish and the Alabama Claims* (Boston, 1893); C. F. Adams, *Life of Charles Francis Adams* (Boston, 1900); D. H. Chamberlain, *Charles Sumner and the Treaty of Washington* (1902); for discussions of special phases of the subject, Bullock, *Secret Service of the Confederate States* (London, 1883); R. Semmes, *The Cruise of the Alabama* (London, 1864); and A. Sinclair, *Two Years on the Alabama* (Boston, 1895). For the British side of the controversy, consult Fitzmaurice, *Life of Granville* (1905). A remarkable collection of printed and manuscript official papers pertaining to the arbitration was made by Hon. J. A. J. Creswell and given to the Johns Hopkins University.

ALABAMA POLYTECHNIC INSTITUTE, originally the ALABAMA STATE AGRICULTURAL AND MECHANICAL COLLEGE. A college at Auburn, Ala., organized in 1872, under the Federal land grant act of 1862. The value of its grounds, buildings, and equipment in 1913 was \$476,000, and its total income was about \$71,000. It has a campus and forum of 304 acres. The library in 1913 contained 25,000 volumes; the faculty numbered 70 and the students 810, in preparatory, collegiate, chemical, and agricultural, pharmaceutical, and engineering courses.

AL'ABAN'DITE, or MANGANBLENDE. A black, sub-metallic mineral manganese sulphide. It often accompanies other ores of manganese, as at Tombstone, Ariz., and Snake River, Colo.

AL'ABASTER (Gk. ἀλάβαστρος, *alabastros*), a box or casket of alabaster, the name of the mineral being ἀλαβαστρίτης, *alabastritēs*, which according to Pliny, *Nat. Hist.*, xxxvii, 10, 54, § 143, was derived from the Egyptian town Alabastron, where it was quarried). A name given to two kinds of white stone, chemically distinct, but resembling each other in appearance, and both used for ornamental purposes.

Alabaster proper is a white, granular, semi-transparent variety of gypsum (q.v.) or sulphate of lime. It occurs in various countries, but the finest is found near Volterra, in Tuscany, where

it is worked into a variety of the smaller objects of sculpture, vases, timepiece stands, etc. Gypseous alabaster of good quality is also found in Derbyshire, England, and many ornamental articles are made of it at Matlock and other places. Small quantities of the material are obtained from Nova Scotia and at Loekport, N. Y. Being slightly soluble in water, it cannot be exposed to the weather; and its softness causes the surface easily to become rough and opaque. Nor is it generally found in sufficient masses for large works.

The other stone is a compact, crystalline carbonate of lime, deposited from water in the form of stalagmite, etc. It is distinguishable from the gypseous alabaster by its effervescing with an acid and by its greater hardness; real alabaster may be scratched with the nail. See **GYP SUM**.

ALABASTER, WILLIAM (1567–1640). An English divine, scholar, and poet, born at Hadleigh, Suffolk. He was educated at Trinity College, Cambridge, and in 1596, as chaplain to Robert, Earl of Essex, accompanied the expedition led by the latter against Cádiz. In Spain he was converted to the Roman Catholic faith; but having subsequently again become Protestant, he was appointed a prebendary of St. Paul's Cathedral and was presented to the living of Tharfield, Hertfordshire. "He was," says Fuller (*Worthies of England*), "an excellent Hebrician, and well skilled in cabalistical learning"; statements verified by such treatises as the *Apparatus in Revelationem Jesu Christi* (1607), placed on the *Index Librorum Prohibitorum* by papal authorities, and the *Commentarius de Bestia Apocalyptica* (1621), and by his *Lexicon Pentaglotton* (1637). By Anthony à Wood (*Athenæ Oxonienses*) he is hyperbolically styled "the rarest poet and Grecian that any one age or nation produced." His poetic reputation must depend largely on his Latin tragedy *Roxana* (1632), written in the Senecan manner and frequently presented in the hall of Trinity. This tragedy was referred to by Dr. Johnson (*Life of Milton*) as the only noticeable specimen of Latin verse of English authorship previous to the appearance of Milton's elegies.

ALACOQUE, ä'lä'kök', MARGUERITE MARIE (1647–90). A French nun, whose visions gave rise to the adoration of the Sacred Heart of Jesus. She was born in Burgundy, July 22, 1647. She took the veil in the convent of the Order of the Visitation, at Paray-le-Monial, where she is said to have performed miracles, prophesied, made revelations, and held direct communication with God and the angels. She foretold the day of her death (Oct. 17, 1690) and cut the name Jesus Christ on her bosom with a knife. She was beatified by Pius IX in 1846.

ALACRANES, ä'lä-krä'nēs. A group of small islands, surrounded by dangerous reefs, on the Campeche Bank in the Gulf of Mexico, 90 miles north of Progreso, in the State of Yucatan, Mexico.

ALA-DAGH, ä'lä-däg' (Turk. Mottled Mountain). A mountain chain in Asiatic Turkey, over 11,000 feet high (Map: Turkey in Asia, K 3). The chief portion of the chain is above the basin of Lake Van, forming part of the watershed between the Caspian Sea and the Persian Gulf.

ALAD'DIN. The hero of the *Arabian Nights* tale of *Aladdin and the Wonderful Lamp*. He

is a poor boy in China, who, through a strange adventure, gets possession of an old lamp and ring of magical properties. A chance rubbing of the former calls to his service a mighty genius (*djinn*), the "slave of the lamp," who quickly brings him to wealth, and, having given him the princess for his bride, builds him a magnificent palace in a single night. Later the lamp is lost in the absence of Aladdin, through the trick of the African magician who had formerly owned it, and who now, as a peddler, offers the princess "new lamps for old." He by its agency carries off the whole establishment to Africa, but the "slave of the ring" enables Aladdin to follow, and in the end the magician is slain, the lamp recovered, and Aladdin, with his home and bride, returned to prosperity in China. "Aladdin's lamp" has become a proverbial expression.

ALADJA DAGH, ä-lä'jä däg. A mountain region of Russian Transcaucasia, occupying the eastern part of the province of Kars. It is noted as the place of a decisive engagement between the Russian forces under the Grand Duke Michael and the Turks under Mukhtar Pasha on Oct. 15, 1877. The Russians surrounded the Turkish force, which was entrenched at Aladja Dagh, with the result that a part of them fled toward Kars, while about 7000 surrendered. See **RUSSO-TURKISH WAR**.

ALAGOAS, ä'lä-gō'ash. A coastal state of Brazil in about 9° S. lat., formerly a district of the State of Pernambuco, which surrounds it on the north and west. Its southern and eastern boundaries are formed by the river São Francisco and the Atlantic Ocean, respectively. The area of Alagoas has been usually reported as 22,580 square miles, but a planimetric calculation by Padtberg returns 10,230 square miles. It consists of a coastal strip, about 45 miles wide, of low, marshy land with many lagoons, and a mountainous, forested interior. This region is hot and moist, but, in spite of fertile soil and abundance of water, the province is very sparsely settled, and agriculture is pursued on a limited scale, owing to the deadly climate and prevalence of cholera. The chief products are sugar, dye-woods, ipecac, tobacco, cotton, and coffee. Pop., 1890, 511,440; 1900, 642,249; 1906, 781,600; 1912 (est.), 790,000. Capital and chief port, Maceio (q.v.), which in 1908 had a population of 36,427. Consult *Recenseamento do estado das Alagoas* (Rio de Janeiro, 1898).

ALAGOAS. The former capital of the State of Alagoas, Brazil, situated on Lake Manguaba (Lagoa Manguaba) (Map: Brazil, K 5). Its chief trade is in hides, rum, sugar, cotton, and iron. Pop., 4000.

ALAI (ä-lī') **MOUNTAINS**. A mountain range of Russian Central Asia, in the territory of Ferghana, north of the Pamirs. It consists of a number of parallel ranges and is separated by the valley of the Kysyl-Su from the Trans-Alai chain. Its average altitude is nearly 16,000 feet, while a few peaks rise beyond 20,000 feet.

ALAIN DE LILLE, ä'län' de lël' (1114?-1203?). A Flemish Cistercian monk, called "the universal doctor"; distinguished in philosophy, theology, history, science, and poetry. He was appointed bishop, but soon resigned to enter a monastery. He wrote chiefly in verse on alchemy, natural philosophy, and doctrinal subjects. There is confusion about his identity, and comparatively little is known of his life; but he received his name from Lille, in Flanders,

probably his birthplace. His *Complaint of Nature*, translated from the Latin by Douglas M. Moffat, was published in New York in 1908. Consult M. Baumgartner, *Die Philosophie des Alanus de Insulis* (Münster, 1896).

ALAIS, ä'lë'. A town of the department of Gard, France, situated in a fertile plain on the right bank of the Gardon at the base of the Cévennes Mountains, 23 miles by rail northwest of Nîmes (Map: France, S., J 4). Alais is a very flourishing town, and owes much of its prosperity to the mineral wealth of the surrounding district, which produces coal, iron, lead, zinc, and manganese. The blast furnaces, mines, and factories of various kinds give employment to large numbers of men, and Gard may be justly called the Black Country of France. There is also an extensive trade in silk, glass, bricks and tiles. Pop., 1901, 24,940; 1906, 27,435; 1911, 29,831. There are here monuments to Florian, the novelist, and to Pasteur, who became famous after his studies of the silkworm disease then prevalent in Alais. Alais sided with the Protestants in the religious wars of the seventeenth century, and Louis XIII in person, accompanied by the Cardinal de Richelieu, besieged it, and having taken it in 1629, demolished its walls. Three years later, the Baron of Alais having taken part in the rebellion of Montmorency, the castle was destroyed. Protestantism still prevails to a considerable extent. Consult *Mémoires et Comptes-rendus de la Société Scientifique et Littéraire d'Alais*.

ALAIS, PEACE OF. A treaty which ended the Huguenot wars in France. It was signed June 28, 1629, after the taking of Alais by the royal forces, La Rochelle having fallen by the policy of Richelieu the year before. By its terms the fortifications of the Protestant towns were razed and the Catholic worship reestablished in them, but amnesty and freedom of conscience were granted to the rebels.

ALAJUELA, ä'lä-hwä'lä. The capital of the province of Alajuela, Costa Rica, 13 miles west of San José, and a little on the western side of the watershed between the Atlantic and the Pacific (Map: Central America, E 5). The city is prosperous, because of the neighboring coffee, banana, and sugar plantations and the large cattle ranches. Here many of the insurrections against the republic had their rise, notably the daring attempt in 1824 of the Spaniard José Zamora to bring the State once more under Spanish rule. Pop., 1903, 4860; 1911 (est.), 6000.

ALA-KUL, ä'lä-kool' (Kirghiz, Turk., Mottled Lake). A lake of Russian Central Asia in the government of Semiryechensk, near the Russo-Chinese frontier, in 46° N. lat. and 82° E. long. It lies to the east of Lake Balkash at an elevation of 720 feet above sea level in one of the depressions forming breaches in the mountain barrier which separates the high tablelands of Central Asia from the lowlands to the west. It is about 35 miles long and 25 miles wide and has an area of 790 square miles. Its average depth is 15 feet. The lake is fed mainly by streams rising in the Tarbagatai Mountains to the north, but, as it has no outlet, its waters are salty, and therefore fish are scanty. The name is sometimes also applied to the smaller similar lake to the northwest, more properly called Sassyk-kul, which lies in the same depression and is connected with Ala-kul

by a strip of marshy land. It has an area of 200 square miles.

ALALONGA, ă'lă-lŭn'gă, or **ALILONGHI**, ă'lĭ-lŭn'gĭ. See TUNNY.

ALAM, ă-lăm', ABU'L HAJJAJ YUSUF IBN SULAIMAN AL SHANTAMARI (1019-83). An Arabian philologist. He was born in Santamaria, Spain, taught for many years at Córdoba, and died in Seville. He made a diwan, or collection of the best poems of the six foremost pre-Islamic poets (see ARABIC LANGUAGE AND LITERATURE) and wrote an excellent commentary on it. He also wrote a commentary to a part of Sibawaihi's grammatical work *Kitab*. The diwan was published by Ahlwardt, *The Divans of the Six Ancient Arabic Poets* (London, 1870). His commentary on Zuhair was published by Landberg, *Primeurs Arabes*, vol. ii (Leyden, 1889). Cf. Lyroff, *Zur Geschichte der Ueberlieferung des Zuhair-divans* (Munich, 1892), and Brockelmann, *Geschichte der arabischen Literatur*, i, 309 (Weimar, 1898).

ALAMAN, ă'lă-măn', LUCAS (1792-1853). An eminent Mexican statesman and historian. For a time he was a deputy of the colony in the Spanish Cortes, but in 1823, upon the downfall of Iturbide, returned to Mexico. As minister of domestic and foreign affairs under two successive administrations he developed industry, agriculture, and education. In 1834 he was director of the industrial commission appointed by Santa Anna, in whose dictatorial measures he subsequently (1853) took part. He wrote an extremely valuable *Historia de Méjico*, chiefly devoted to the nineteenth century (5 vols., 1849-52). His further publications include *Disertaciones sobre la Historia Mejicana* (1844-49).

AL'AMANCE, BATTLE OF. See REGULATORS.

AL'AMAN'NI. See ALEMANNI.

ALAMANNI, ă'lă-măn'nĕ, LUIGI (1495-1556). An Italian poet. He was born in Florence and, like Dante, was destined to spend his best years in exile. The Alamanni were zealous partisans of the Medici, whose favor Luigi himself enjoyed until some fancied grievance led him to conspire against the life of the Cardinal Giulio de' Medici, later Pope Clement VII. Being detected, he fled, and eventually took refuge at the French court, where he stood high in favor with Francis I and afterward with Henry II. Except for a brief interval, when Florence threw off the yoke of the Medici and he returned home to urge, unsuccessfully, that the republic should seek the protection of the Emperor Charles V, Alamanni spent the remainder of his life in France, and there most of his poems were written. His collected works include translations, epigrams, plays, *La coltivazione* (Paris, 1546), a didactic poem in imitation of Vergil's *Georgics*; *Opere toscane* (Lyons, 1533), vigorous satires which have been imitated in English by Sir Thomas Wyatt; and two long poems based upon the Arthurian romances: *Girone il Cortese* (Paris, 1548), in 24 cantos, and the *Avarchide*, in 25, the latter being in structure the story of the *Iliad*, freely adapted to fit the siege of Avarco (the modern Bruges) and chiefly interesting as marking the transition from the complicated adventures of Ariosto's *Orlando Furioso* to the classic unity of Tasso. Alamanni's *Versi c prose*, edited with a biography, by P. Raffaelli, was issued in two volumes (Florence, 1859). Consult Hauvette, *Luigi Alamanni, sa vie et son œuvre* (Paris, 1903).

ALAMEDA, ă'lă-mă'dă, or -mĕ'dă. A beautiful residential city in Alameda Co., Cal. It is 6 miles across the bay from San Francisco, with which it is connected by ferries, and is on the Southern Pacific, the Western Pacific, and the Santa Fe railroads (Map: California, C 5). On account of its fine sandy beaches, the city is a popular bathing resort. It has well-paved streets, a good sewage system, a Carnegie library, five public parks, well-equipped playgrounds, municipal baths, and notably good schools. Alameda is in a rich agricultural region, producing a large amount and great variety of fruit and vegetables. It is the home of a large packers' association and a motion-picture company. Among its manufactures are aëroplanes, motors, pumps, and engines. The electric light plant is owned and operated by the city, and a splendid system of street lighting has been adopted. Alameda was incorporated as a city in 1885, since which date its growth has been rapid. In 1913 the city voted to adopt the commission form of government. Pop., 1890, 11,165; 1900, 16,464; 1910, 23,383; 1913 (est.), 26,000.

ALAMINOS, ă'lă-mĕ'nōs, ANTON DE. A Spanish pilot, one of the first to take vessels to the North American coast. He was born at Palos de Moguer, Spain. He accompanied Columbus on his second voyage to the New World. During the second decade of the sixteenth century he conducted Ponce de León, Hernández de Córdoba, Francisco de Garay, and other voyagers who wished to reach the shores of the northern continent. In 1519 he was the first to take advantage of the current of the Gulf of Mexico. He is supposed to have been the author of the earliest detailed map of a part of what is now the United States, designed to show the limits of claims by discovery. This map was first printed by Navarrete, *Colección*, iii, 148 (Madrid, 1829).

ALAMO, ă'lă-mō, THE. A Franciscan mission built within the present San Antonio, Texas (q.v.), about 1722, and occasionally used after 1793 as a fort. It consisted of a church, an inclosed convent yard about 100 feet square, a convent and hospital building, and a plaza covering about 2½ acres, and protected by a wall 8 feet high and 33 inches thick. In 1836, during the war for Texan independence, a remarkable conflict occurred here between a small company of Texans and Americans including Col. David Crockett and Col. James Bowie, who held the fort under Col. W. B. Travis, and some Mexicans who attacked it under Santa Anna (q.v.). After a bombardment lasting almost continuously from February 23 to March 6, a small breach was made in the walls, and early on the morning of the 6th the Mexicans assaulted in force. They were twice driven back with great loss, but scaled the parapet in the third attempt, and a desperate hand-to-hand conflict ensued, in which the Texans, though already greatly weakened by privations and fatigue, fought with the utmost valor until only five of their number remained alive. These were captured and, on Santa Anna's order, were killed in cold blood. Three women, two children, and a negro boy alone survived out of a garrison which, including a reënforcement of 32 men that arrived on March 1, had numbered about 180. The Mexican loss was probably 500, though Santa Anna, in his untrustworthy report, gave it as 70 killed and 300 wounded. "Remember the Alamo!" became a

ALAMO

THE ALAMO, SAN ANTONIO, TEXAS

war-cry of the Texans, who finally defeated and captured Santa Anna at San Jacinto (q.v.). In allusion to the heroism shown by the garrison, Alamo has been called "the Thermopylae of America." In 1913 the city of San Antonio began to restore the Alamo. Consult: Williams, *Sam Houston and the War of Independence in Texas* (Boston, 1893); Potter, *The Fall of the Alamo* (Old South Leaflets); Zavala, *Story of the Siege and Fall of the Alamo* (San Antonio, 1911).

AL'AMOGOR'DO. A town and the county-seat of Otero Co., N. Mex., 86 miles north by east of El Paso, Texas, on the El Paso, Southwestern and the Alamogordo and Sacramento Mountain railroads (Map: New Mexico, F 3). It is the seat of the Southwestern Baptist College and of the New Mexico Institute for the Blind. Fruit-growing is an important industry of the surrounding region, and the town has an ice plant, stone and marble quarries, and copper, lead, zinc, and gold mines. Among the notable features of the town are the Marble and Alamo cañons, Queen of the Mist fountain, and Alameda Park. Pop., in 1913, about 2000.

ALAMOS, ä'lä-môs, or **REAL DE LOS** (rä-äl'dä lôs) **ALAMOS** (Sp., the poplars or sycamores). A town in the State of Sonora, Mexico, 125 miles northwest of Sinaloa (Map: Mexico, E 4). The town is unimportant, but the region has many lead and copper deposits. Pop., 1910, 5736.

ALAMO'SA. A city, and the county-seat of Conejos Co., Colo., 112 miles by rail south of Pueblo, on the Denver and Rio Grande Railroad, and on the Rio Grande (Map: Colorado, D 4). Alamosa has a Carnegie library, an opera house, railroad shops, and a flour mill. It is in an agricultural and stock-raising region, producing alfalfa, hay, sugar beets, small grain, and sheep. The water works and sewage system are owned by the municipality. Pop., 1890, 973; 1900, 1141; 1910, 3013.

ALAN, ä'an, WILLIAM. See ALLEN, WILLIAM.

AL'AN-A-DALE'. One of the companions of Robin Hood (see HOOD, ROBIN) in the old ballads and in Scott's *Ivanhoe*. In the former he is a light-hearted young man, much addicted to the "chanting" of roundelays, whom Robin assists to elope with his love.

ÅLAND ISLANDS, ö'län i'ländz, or ö'län. An archipelago consisting of one large island and many small islands and rocks, about 300 in all, in the government of Abo-Björneborg, Finland, at the entrance of the Gulf of Bothnia (Map: Russia, B 2). The strait separating them on the west from the Swedish coast at Grisslehamn is known as Aland Bay (Aland Haf). The largest of the islands which gives its name (signifying 'land of streams') to the whole group, has an area of 247 square miles; the area of the whole archipelago is 550 square miles. About 90 of the group are inhabited. Pop., 1897, 23,752. Although these rocky isles are covered with but a thin stratum of soil, they bear Scotch fir, spruce, and birch trees and with proper cultivation produce barley and oats, besides affording subsistence to a hardy breed of cattle. The inhabitants, of Swedish origin, are skillful sailors, fishermen, and seal-hunters. These islands belonged formerly to Sweden, but were seized by Russia in 1809. Previous to this they had several times changed hands between these two powers. In 1717 the Swedes were defeated by the Russians

in a naval engagement near Aland, the first important exploit of the Muscovite navy. The importance of these islands as a military position led to the construction, in the reign of the Emperor Nicholas I, of those strong fortifications at Bomarsund which, in August, 1854, were destroyed by the Anglo-French force, commanded by Sir Charles Napier and Baraguay d'Hilliers.

ALA'NI (Gk. 'Αλανοί, *Alanoi*). Nomadic tribes of Eastern origin who spread over Europe during the decline of the Roman Empire. They were first encountered by the Romans, apparently, when Pompey, in the Mithridatic War, led an expedition into the Caucasus. Nero, shortly before his death, planned an expedition against them; in Hadrian's time they threatened Cappadocia. In 276 A.D. they were checked by the Emperor Tacitus in their attempt to go eastward into Persia. The Huns gave them a severe defeat on the Tanaïs (now Don) toward the end of the third century (some writers put this defeat in 370), and then the Alani divided, some going east, but the larger portion joining their conquerors in an onslaught upon the Goths. With the Vandals and the Suevi the western Alani entered Gaul in 406 and later crossed the Pyrenees and founded settlements in Lusitania, where they lived for some time in peace. In 418 they were attacked by the Visigoths, their King was slain, and they became subject to Gunderic, King of the Vandals, losing completely their national independence. Later they served under the Visigothic King, Theodoric, but they sympathized with the Huns, and their desertion at Châlons (451) came near bringing defeat upon the Roman army. They were mentioned occasionally in later times. The eastern Alani seem to have kept their independence after the sixth century. In 1221 Genghis Khan defeated them, and they were so completely subjugated in 1237 by Batu Khan that their name disappeared from history. See *The Cambridge Mediæval History*, vol. i (New York, 1911).

AL-ARAF, ä'l-ä'räf. See ARAF.

ALARCON, ä'lär-kön', HERNANDO DE (1466-1540). A Spanish general, born at Palomares de Huete in 1466; he died in Naples, Jan. 17, 1540. As a youth in his teens he saw service at the sieges of Alhama, Loja, and Coín; and for his gallantry in the uprising at Guéjar he was called before the Commander-in-Chief, Count de La Tendilla, and publicly complimented. The *Gran Capitan*, Gonzalo de Córdoba, took him for service in the Neapolitan War. His conduct in Seminara, Terranova, Cephalonia, and elsewhere caused the King to confer upon him the title of "Señor." For a while he was Governor of Tarentum. After a brief period of rest in Spain (forced upon him by the King as a result of certain gallantries in Naples that were not in the field of military activities), he was returned to Italy in command of a Spanish army and served with great daring and ability at the battles of Ravenna (where he was wounded and captured) and Pavia. After this battle he was placed in charge of Francis I, whom he accompanied to Madrid. There he guarded his royal prisoner despite all efforts at bribery, in the historic Torre de los Lujanes. For his conduct at Pavia and while in charge of Francis I, the Emperor, Charles V, conferred upon him the title of Marqués de Valle Siciliana. The delicacy of his treatment of Francis I marked him as the

proper custodian of Pope Clement VII, after the assault and capture of Rome, in 1527. At the age of 70 he was called to the conquest of Tunis, which he effected in a brilliant campaign. For this service he was rewarded with the Vice-Royalty of Sicily, which he soon asked permission to resign so that he might retire to Castelnuovo. He fell ill and died shortly afterward. See Diona, *Capitanes Ilustres* (1851).

ALARCON, HERNANDO DE. A Spanish-American navigator, and the first European to ascend the Colorado River. On May 9, 1540, he sailed, with two vessels, from Acapulco, with instructions from the Viceroy Mendoza to cooperate with the expedition under Vasquez Coronado, which had gone in search of the Seven Cities of Cibolo, in what is now New Mexico. Alarcón sailed to the head of the Gulf of California and completed the explorations begun by Ulloa in the preceding year, by satisfying himself that there was no open water passage between the Gulf and the South Sea, or Pacific Ocean. Subsequently he entered the Colorado River, which he named the Buena Guia. With two small boats he ascended the river for a considerable distance, making important observations of the natives. On the second voyage he probably proceeded past the present site of Fort Yuma. He learned that Coronado had reached Cibolo, but was unable to communicate with him. A map drawn by Domingo del Castillo, one of Alarcón's pilots, in 1541, is the earliest detailed representation of the gulf and the lower course of the river, of which it gives a very accurate idea. It was first engraved for the Archbishop Lorenzana in 1770 and is given in facsimile by Winsor, *Narrative and Critical History of America* (Boston, 1886). Consult Winship, "Coronado," in *Reports of Bureau of Ethnology* (Washington, 1895).

ALARCON, PEDRO ANTONIO DE (1833-91). A modern Spanish novelist and statesman, born at Guadix, in Granada. He began his professional career as a journalist and published the *Eco de Occidente* of Granada, founded *La Redención*, and after the outbreak of the revolution in 1854 edited for a time a radical satirical paper, *El Látigo*. But he soon withdrew from participation in politics and began the series of short stories and essays which afterward were collected into numerous volumes, such as *Cosas que fueron* (1882); *Amores y amoríos* (1875); *Juicios literarios y artísticos* (1873). His share in the Morocco campaign of 1859 bore fruit in his *Diario de un testigo de la guerra de Africa* (1860), a chronicle noteworthy for its vivid picturesqueness and stirring patriotism. For many years after this he took an active part in national affairs and served successively as Deputy, member of the Council of State, Minister to Norway and Sweden, and Ambassador to the Porte. In 1875 he was elected a member of the Royal Spanish Academy. Of his many later novels, *El escándalo* (1875), written in defense of the Jesuits, made the greatest sensation at the time and led him to write other novels with religious themes; among which *La pródiga* (1882) was popular for a while. But their fame was transitory, and he will be much longer remembered for his less pretentious stories and sketches, his *Historiatus nacionales*, his *El sombrero de tres picos* (1874), and *El niño de la bola* (1880), studies of rustic manners, truly Spanish in their atmosphere, which show

Alarcón at his best. His last volume was a brief account of his works, *Historia de mis libros* (1889), a sort of literary testament. His complete works were published in a set of 19 volumes in 1899.

ALARCON Y MENDOZA, ä'lär-kön' ē mēn-dō'sà, DON JUAN RUÍZ DE (1581?-1639). One of the greatest of the Spanish dramatists of the Golden Age. Born at Tlach, Mexico, he left America in 1600 in order to study law at Salamanca. In 1608 he returned to Mexico in the hope that he might secure a chair at the university. But he failed to do so, and returned to Spain in 1611, where he entered the service of the Marqués de Salinas. His first play, *El semejante de sí mismo*, performed in 1613, was not successful, but it drew attention and hatred upon him, so that Cristóbal Suárez de Figueroa was not at all alone when, with brutally frank reference to Alarcón's physical infirmities, he called the latter "a monkey disguised as a man, an impudent hunchback, a grotesque cripple." Lope de Vega, Mendoza, and others flayed him, whereas Tirso de Molina was friendly to him and collaborated with him. In 1626 he became a member of the Council of the Indies. In 1628 he published a volume containing eight plays, and in 1634 a second volume containing additional plays. Alarcón was the least prolific of all the great dramatists of Spain. He wrote less than did the others, and many of his works circulated under the names of others. But Alarcón took the pains, as did none of his contemporaries, to mull over his plays and polish both their versification and their general composition. Hence his work is more evenly balanced than is theirs. He is unequalled in his creation of characters and in his lofty moral intentions, although he never descends to sermonizing. Fitzmaurice-Kelly says of Alarcón: "There are Spanish dramatists greater than Ruíz de Alarcón: there is none whose work shows such constant perfection. . . . Lope and Calderón have written better plays, and many that are worse: no verse of Alarcón is unworthy of him." His importance is not limited to Spanish literature, for on his *La verdad sospechosa* ('Truth Suspected'), Corneille confessedly modeled his own *Le menteur*, the first great comedy in modern French literature. Among his other plays may be mentioned *Las paredes oyen* ('Walls have ears'), *El examen de maridos* ('The Examination of Husbands'), *El tejedor de Segovia* ('The Weaver of Segovia'), and *Ganar amigos* ('Winning Friends'). The most available edition of his works is that by Hartzembusch in the *Biblioteca de autores españoles*, vol. xx (Madrid, 1852). Consult: Ticknor, *History of Spanish Literature* (Boston, 6th ed., 1888); Fitzmaurice-Kelly, *Littérature espagnole* (Paris, 1904); Fernández-Guerra y Orbe, *Don Juan Ruíz de Alarcón* (Madrid, 1871).

ALARD, á'lär', JEAN DELPHIN (1815-88). A French violinist. He was born at Bayonne, March 8, 1815, the son of an amateur violinist; studied in Paris under Habeneck and Fétis, and won the notice of Paganini when he appeared in concerts. In 1840 Alard succeeded Baillot as first violinist to the King, and in 1843 became professor of the violin at the Paris Conservatoire, a post he held until 1875. Sarasate (q.v.) was among his pupils. He was a representative of the modern French school of violin playing, composed nocturnes, duos, études, etc., for the violin, and was the author of an *Ecole*

du violon, which was adopted by the Conservatoire. He died in Paris, Feb. 22, 1888.

AL'ARIC (Goth., from *al*, all + *reiks*, ruler). The great chieftain of the Visigoths. He makes his first appearance in history in the struggle of the Goths against Theodosius (q.v.). In 394 A.D. he was leader of the Gothic auxiliaries of Theodosius in his war with the usurper Eugenius; but after the death of Theodosius he took advantage of the dissensions and weakness that prevailed in the Eastern Empire to invade (395) Thrace, Macedon, Thessaly, and Illyricum, devastating the country and threatening Constantinople itself. Rufinus, the Minister of Arcadius, appears to have sacrificed Greece in order to rescue the capital, and Athens was obliged to secure its own safety by ransom. Alaric proceeded to plunder and devastate Macedonia and Thessaly, but was interrupted by the landing of Stilicho (q.v.) in Elis with the troops of the West. Stilicho endeavored to hem in the Goths on the Peneus, but Alaric broke through his lines and escaped with his booty and prisoners to Illyricum, of which he was appointed governor by the Emperor, Arcadius (q.v.), who, frightened by his successes, hoped by conferring this dignity on him to make him a peaceful subject instead of a lawless enemy (396). In 401 he invaded Upper Italy; for the first time since the migration of the Teutones (q.v.) and the Cimbric barbarians now invaded Italy. Honorius, the Emperor of the West, fled from Rome to the more strongly fortified Ravenna. In 402 or 403 Alaric encountered Stilicho at Pollentia on the Tanarus; and soon after, the result of the battle of Verona forced him to retire into Illyricum. Through the mediation of Stilicho, Alaric concluded a treaty with Honorius (q.v.), according to which he was to advance into Epirus and thence attack Arcadius in conjunction with the troops of Stilicho. The projected expedition did not take place, yet Alaric demanded indemnification for having undertaken it, and Honorius, by the advice of Stilicho, promised him 4000 pounds of gold. When, after the death of Stilicho, Honorius failed to fulfill his promise, Alaric advanced with an army and invested Rome, which he refused to leave until he had obtained the promise of 5000 pounds of gold and 30,000 pounds of silver. But these negotiations, too, failed to produce any satisfactory result, and Alaric again besieged Rome (409 A.D.). Famine soon rendered it necessary that some arrangement should be made, and in order to do it the Senate proclaimed Priscus Attalus, the prefect of the city, emperor instead of Honorius. But Attalus displayed so little discretion that Alaric obliged him publicly to abdicate and renewed negotiations with Honorius. These also proved fruitless, and Alaric was so irritated at a perfidious attempt to fall upon him by surprise at Ravenna that he advanced on Rome for the third time. His victorious army entered the city Aug. 14, 410, and continued to pillage it for three days, though Alaric strictly forbade his soldiers to dishonor women or to destroy religious buildings. When Alaric quitted Rome, it was only to prosecute the conquest of Sicily and Africa, in order to gain control of their rich grain-lands. The occurrence of a storm, however, which his ill-constructed vessels were not able to resist, obliged him to abandon the project. He died, before the close of the year, at Consentia (Cosenza), in Bruttium. Legend

says that in order that his body might not be discovered by the Romans it was deposited in the bed of the river Busentinus, which was temporarily diverted from its course, and that the captives who had been employed in the work were put to death. Rome and all Italy celebrated the death of Alaric with public festivities. Consult: Hodgkin, *Italy and her Invaders* (Oxford, 1885); F. A. Gregorovius, *History of Rome in the Middle Ages*, Eng. trans., vol. i (New York, 1892); R. Lanciani, *The Destruction of Ancient Rome* (Boston, 1899); *The Cambridge Mediæval History*, vol. i (New York, 1911).

ALARIC II. King of the Visigoths, 485–507. He succeeded his father, Euric. He was of a peaceful disposition and wished to live on friendly terms with the Franks. His dominions were very extensive. Besides Hispania Tarraconensis and Bætica, he possessed numerous rich provinces in Gaul and formed an alliance, which still further increased his power, with Gondoband and Theodoric, the latter of whom was his father-in-law and King of the East Goths. At length, however, he came into collision with the Frankish monarch, Clovis (q.v.), whose cupidity had been excited by the extent and the fertility of the territories over which Alaric II ruled. An excuse for breaking the peace which existed between the two nations was found in the fact that Alaric II was a zealous Arian. This circumstance had given great offense to many of his subjects, who were orthodox Catholics; and ostensibly to vindicate the true doctrine, the newly converted barbarian Clovis declared war against him. The result was fatal to Alaric II. He was slain by the hand of Clovis himself at Vouillé, near Poitiers, and his forces routed. Alaric II is said to have been indolent and luxurious in his youth; but this may simply imply that he was not fond of those sanguinary pleasures which captivated his savage contemporaries. He was tolerant in his religious convictions. Though an Arian, he did not persecute the Catholics. He enacted several useful statutes and kept a watchful eye on all parts of his kingdom. It was during his reign that the *Breviarium Alaricianum*, or Breviary of Alaric (q.v.), was drawn up. It is a selection of imperial statutes and writings of the Roman juriconsults. Alaric II sent copies of it to all his governors, ordering them to use it exclusively. An edition of it was published by Hänel (Leipzig, 1849). Consult *The Cambridge Mediæval History*, vol. i (New York, 1911).

ALARIC COTTIN. Voltaire's nickname for Frederick the Great of Prussia, who was a great warrior, like Alaric, but a very indifferent poet, like the Abbé Catlin, a victim of Boileau's sarcasms.

ALARM' (Fr. *alarme*, It. *all'arme*, to arms, from Lat. pl. *arma*, arms). In military usage, a term which is not so important now as formerly. Originally an alarm was signified by the burning of a beacon, the ringing of a bell, beating of drums, or the firing of a gun. Now, in most instances, an alarm is transmitted by telegraph, telephone, signal lamps, and heliograph, among other devices. In military camps, army posts, or barracks there is generally an alarm or assembly post arranged, where the troops may assemble in response to calls of sudden emergency, such as fire, riot, or other unusual occurrence.

ALARM. A usually but not necessarily self-acting contrivance employed to call attention

to danger or accidents or to arouse persons from inattention or sleep. The common alarm-clock is a familiar example of such a device, and the electric burglar alarm is another. The simplest and most common arrangement of burglar alarm consists of an electric bell with wires leading to all parts of the windows, doors, and other parts of the building to be protected. The terminals of these wires are set in the framing of the windows and doors, so that if they are opened the action presses springs together and rings the bell in precisely the same way as by pressing the ordinary push-button. All special kinds of alarms for house protection consist of modifications in the method of making the contact suitable for special purposes, such as laying sheets of tin under the carpet to make contact with the wires when the carpet is stepped upon. Means are also generally introduced for indicating which window the signal comes from. This is done by leading the wires from each window separately through an annunciator, which shows through which wire, and consequently from which window, the signal came. The alarm will also sound if a window is carelessly left open. The entire alarm wiring of houses is also frequently connected with the police station by wire, so that it is notified of any tampering with the house in the absence of its occupant. Bank vaults and safes are also protected by numerous complicated mechanical and electrical devices which instantly give an alarm to watchmen or police officers of any disturbance due to tampering or attempted burglary. Automatic fire alarms are made in a variety of forms. A frequent arrangement consists of a string or a wire of very fusible metal supporting a weight whose fall sets in operation a train of mechanism which sounds a bell alarm. The weight is caused to fall by the burning or melting of the supporting string or wire. A rise in temperature by some device such as a thermostat or the operation of an automatic sprinkler system may also cause an alarm to be sounded at some central office. In factories and other buildings where there are many occupants fire alarms or gongs are usually required by statute to warn the workers, and this is supplemented by fire drills so as to enable them to leave the building without panic. (See FIRE ALARMS.) In steam boilers an alarm check valve, operating under the pressure of steam, is employed to give the alarm when the water-feeding apparatus ceases to work, or when the water falls below the point of safety. In many types of boilers a fusible plug is set into the crown sheet over the furnace; this plug remains intact as long as water covers such sheet, but melts should it become dry, allowing the steam to escape into the firebox and warn the engineer of the danger. Telegraph and telephone lines usually have some arrangement by which a break in the wires is indicated by a bell alarm. Railway lines have alarm-systems to notify engine-drivers or motormen that another train is on the section which they have just entered, or that a switch is set along. Fog bells, fog whistles, and whistling buoys are forms of alarms, and there are a great variety of other forms, such as alarm compasses, which are contrived to sound an alarm when the vessel deviates from its course; alarm funnels contrived to ring a bell when the liquid has reached a certain height in a cask which is being filled, and typewriter alarm bells which ring as the end of the line being written is approached.

AL'ARO'DIAN. A term derived from the Alarodii of the classical geographers and Herodotus, applied by Sayce and some other ethnographers and philologists to the linguistic stock represented especially by the Georgian among the numerous languages of the region of the Caucasus. The Alarodii dwelt about Mount Ararat and are supposed by some to be identical with the Urartu of the Assyrian inscriptions.

ALAS, à'läs, LEOPOLDO (1852-1901). A Spanish journalist and novelist, and professor of law at the University of Oviedo. As a critic, he was noted for his intolerance of pretense and mediocrity and for the fearlessness with which he spoke his mind regarding men of established reputation. As a novelist, he produced an unimportant work, *Su único hijo* (1891), a volume of short stories called *Pipá*, and one serious novel, *La regenta* (1884-85), an analytical study of criminal passion, revealing a rare subtlety of observation. He was the author of a drama, *Teresa*. His knowledge of European literature was extensive. In journalism he was best known under the pseudonym of "Clarín." He wrote also concerning law and economics: *Relaciones de la Moral con el Derecho* and *Programa de Economía*. He left also an unfinished novel, *Esperaindeo*, which is still inedited.

ALAS'CANS. A designation of foreign Protestants in London in the time of Edward VI from the name of John à Lasco (or Laski), a Polish reformer and refugee, who in 1550 was appointed by the King as superintendent of the foreign congregation there.

ALAS'CO. In Scott's *Kenilworth* (q.v.), an astrologer, also known as Dr. Demetrius Do-boobie, who aids the evil designs of Richard Varney against Amy Robsart.

ALASCO, ä-läs'kô, JOHANNES, or JAN LASKI (1499-1560). A Polish nobleman and traveler, born in Warsaw. He imbibed the doctrines of Zwingli at Zürich. He also knew Erasmus, who esteemed him highly, and in his will provided for the sale of his library to him. He returned to Poland, 1526, but left in 1536, on his declaration of Protestantism, and went to Frisia. There he preached Protestantism, but, anticipating persecution, he went to London, on Cranmer's invitation, and became superintendent of the congregation of the foreign Protestant exiles. On the accession of Mary, in 1553, he and all his congregation were banished. In 1556 he returned to Poland, where he died, at Pirchow, Jan. 13, 1560. He wrote many treatises and was one of the 18 divines who prepared the Polish version of the Bible. For his biography, consult H. Dalton (London, 1886).

ALASHEHR, ä-lä'shë'h'r (Turk. Mottled City). A city in the Turkish vilayet of Aidin, or Smyrna, lying 83 miles east by south of Smyrna, on the northern slope of Mount Tmolus (Map: Turkey in Asia, C 3). It is surrounded by a partly ruined wall and contains eight mosques and five Greek churches. Remains of ancient sculpture are to be found. Alashehr is connected by rail with Manissa and is the seat of a Greek archbishop. There is considerable trade, and mineral springs in the vicinity attract invalid visitors. The population is estimated at about 25,000. Alashehr was founded by Attalus Philadelphus, King of Pergamos, about 200 B.C., and is supposed to be one of the "seven churches of Asia" mentioned in the Apocalypse.

ALAS'KA. A Territory of the United States and its largest outlying possession, forming a

jutting land mass at the northwestern extremity of North America. According to the revised survey of 1906 its total area is 586,400 square miles. The territory ceded by Russia in 1867 (see *History*), and known up to that time as Russian America, was called Alaska by William H. Seward, this being a corruption of the Aleut word *alak'shak* or *al-ay'ek-sa*, meaning 'a great country or continent.' It is bounded on the north by the Arctic Ocean, on the west by the Arctic Ocean, Bering Strait, and Bering Sea, on the south and southwest by the Gulf of Alaska and the Pacific Ocean, and on the east by Canada (Yukon Territory and British Columbia). The eastern boundary from the Arctic Ocean to Mount St. Elias (a distance of 650 miles) is the 141st meridian; thence southeastward to Portland Canal it is a sinuous line (see *Boundary Dispute*) about 660 miles in length. Alaska extends from 129° 58' west to 172° 22' east longitude, and from 51° to 71° 25' north latitude. Approximately it falls between the same parallels as Scandinavia, and Juneau, its capital, is in about the latitude of Edinburgh. The meridian reached by the westernmost of the Aleutian Islands passes near the New Hebrides Islands and through New Zealand. Cape Prince of Wales, the most westerly point of the mainland, is nearly as far west as the Samoan Islands.

Topography. The main mass of Alaska is nearly rectangular, carved out from the continent by Mackenzie Bay on the north and the Gulf of Alaska on the south. An extension to the southeast is furnished by a panhandle—usually called Southeastern Alaska—and another to the southwest by the Alaska Peninsula and the Aleutian Islands. The latter, in conjunction with the Commander Islands of Siberia, form a broken barrier between Bering Sea and the Pacific Ocean. East of this, and parallel to it, lies the Kenai Peninsula, bounded by Cook Inlet on the west and Prince William Sound on the east. The Seward Peninsula extends westward from Central Alaska, and with the Chuckchee Peninsula of Siberia, from which it is separated by Bering Strait, only 54 miles wide, divides Bering Sea from the Arctic Ocean. The coast line of the territory is of two distinct types. Northward from the Alaska Peninsula shallow water conditions prevail, the coast line is regular, and the land slopes gently from the shore. Eastward and southward the shores are usually abrupt, deep water is found near the land, and there are many embayments and islands. The largest of these islands is Kodiak, which with adjacent islands forms a southwestern extension of the Kenai Peninsula. Southeastern Alaska embraces a narrow strip of mainland and the Alexander Archipelago, which fringes the coast for some 300 miles. The largest islands are Chichagof, Baranof, Admiralty, Prince of Wales, and Revillagigedo. The many straits, fiords, and canals of this part of the Territory, together with the rugged mountains of the mainland, have made its scenery world-famous.

Alaska is divisible into four geographic provinces, which named from south to north are: the Pacific Mountain system, the Central Plateau region, the Rocky Mountain system, and the Arctic slope region.

1. The Pacific Mountain system is a rugged highland belt 50 to 200 miles wide, skirting the southern shore line. It comprises four distinct ranges—the Coast, the St. Elias, the Aleutian, and the Alaska—and includes several large

basins, notably those of the Copper and Susitna rivers. The Coast Range stretches through southeastern Alaska. It is 5000 to 8000 feet in height and 50 to 80 miles in width. From its northern part many glaciers discharge into the sea. The St. Elias Range extends northwestward from Cross Sound, bends westward near the mouth of Copper River, and near the head of Prince William Sound (long. 147°) turns sharply southwestward and merges in the highlands of the Kenai Peninsula. Much of the seaward slope is covered by glacial ice. Near long. 142° the chain is parted by the valley of the Chitina River into divergent ranges. Of these the southern, called the Chugach Mountains (8000–10,000 feet high), continues the main range across the head of Prince William Sound, and the northern, called the Nutzotin Mountains (7000–10,000 feet high), stretches westward and forms a connecting link between the St. Elias and Alaskan ranges. Between these two forks is a group of volcanic peaks called the Wrangell Mountains, of which Mount Sanford (16,200 feet) is the highest. The St. Elias Range varies in width from 50 miles near Cross Sound to nearly 100 miles near Mount St. Elias, and then to less than 20 miles in the Kenai Peninsula. Near Cross Sound some peaks rise abruptly from tidewater to over 15,000 feet. Westward the range increases in height and complexity, culminating in Mount St. Elias (18,024 feet) and Mount Logan (19,540 feet). The former marks the international boundary, the latter lies in Canadian territory. The Aleutian Range forms the backbone of the Alaska Peninsula. It rises directly from the sea near the southwestern extremity of the peninsula and skirts the Pacific shore as far as the entrance to Cook Inlet. At this point a broad lowland intervenes and throws the axis to the west; the range (here sometimes called the Chigmit Mountains) continues northward to about lat. 61°, and there falls off abruptly to a lowland. The range is widest near lat. 58°, northward from which it rapidly narrows. The Alaska Range extends northeastward from the vicinity of Lake Clark and sweeps around the great Susitna and Copper river basins, formerly the watershed between the Pacific drainage on the south and east and the Kuskokwim and Yukon waters on the north and west. It averages 50 to 60 miles in width. Its southern end has been little explored, but probably has no peaks higher than 5000 or 6000 feet. Toward the north the relief increases: Mount Spurr measures 10,500 feet, Mount Russell 11,300 feet, and Mount Dall 9000 feet. Mount McKinley (lat. 62° 30'), according to measurements taken by the U. S. Coast and Geodetic Survey, reaches 20,300 feet, the highest on the continent; and Mount Foraker, 14 miles to the south, 17,000 feet. These two, though visible from Cook Inlet and known to whites for more than 100 years, were not indicated on maps until 1898. Mount McKinley was known to Russians as *Bulshaia* and to the natives of Cook Inlet as *Traleika*. Both names signify 'high' or 'big mountain.' The natives of the interior know it as *Denali*. In 1895 it was named Mount McKinley by W. A. Dickey, who ascended the Susitna River and said it was at least 20,000 feet high. In 1898 George H. Eldredge and Robert Muldrow, of the United States Geological Survey, determined its position and altitude, which was later revised as above; and the following year Lieut. Joseph S. Herron, U. S. A., named the second high peak Mount Foraker. In

1902 a more extended exploration of the range was made by Alfred H. Brooks and D. L. Reaburn, of the United States Geological Survey, who were the first white men to reach the base of Mount McKinley. A number of attempts to ascend it were made. In 1912 Professor Herschel Parker of Columbia University and Mr. Belmore Browne of New York got within three or four hundred feet of the summit. In 1913 Rev. Hudson Stuck, Archdeacon of the Yukon, with Mr. H. P. Karstens and two others, reached the top. The eastern end of the Alaskan Range is of lesser altitude, Mount Hayes (13,800 feet) and Mount Kimball (9680 feet) being the highest peaks.

2. East and north of the Pacific Mountains is the Central Plateau region, 200 miles wide, corresponding with the Great Basin region of the western United States. Though formerly a plateau, this region has changed in character. The rivers have trenched broad channels through it, giving it the appearance of a rolling upland with summits of uniform level. The plain of these summits is 4000 feet at the international boundary and falls off gradually to 1000 feet near Bering Sea.

3. The Rocky Mountain system of North America continues northwestward nearly to the Arctic Ocean, then turns almost at right angles, crosses the international boundary in about lat. 68°, and stretches across northern Alaska, finally dying out before it reaches the Arctic Ocean. It enters Alaska as a mountainous belt over 100 miles wide, consisting of several more or less distinct ranges separated by broad, low gaps and containing peaks 7000 to 8000 feet high. The western extension, known as the Endicott Mountains, is little known, but appears to comprise two or more ranges 4000 to 6000 feet in height.

4. The Arctic Slope region begins as a slightly elevated plateau, dissected and more or less rolling, which slopes to the north from the foothills of the Rocky Mountains. This plateau terminates abruptly in a scarp, from which a featureless coastal plain, of varying width, stretches to the Arctic Ocean.

About one-fifth of the drainage of Alaska is toward the Pacific Ocean, nearly one-half toward Bering Sea, and the rest toward the Arctic Ocean. The Pacific drainage embraces two classes of rivers: first, those which rise among the coastal mountains; and second, those which traverse the mountains on their way to the sea. Of the first the Susitna and Copper, and of the second the Alsek, Taku, and Stikine are the most prominent examples. The Yukon (fifth in size of North American rivers) is the master stream, and its basin practically comprises the Central Plateau province. With its longest tributary (the Yukon is formed by the union of the Pelly and Lewes) it is about 2400 miles in length, and its discharge at low water is about 500,000 cubic feet per second. Other chief tributaries of the Yukon are the White, the Porcupine, the Tanana, and the Koyukuk. The headwaters of the Lewes are but 25 miles from the coast at Lynn Canal. Two passes, the Chilkoot (3100 feet) and the White (2800 feet), break the Coast Range at the head of Lynn Canal and afford routes into the interior, which were used by thousands of gold-seekers during the Klondike excitement of 1897 and 1898. A railway over the White Pass now connects tidewater with navigable waters on the Lewes River. The Kuskokwim River, second in size to the Yukon, empties into Bering Sea. Its length is about 1200 miles, and it has many

unexplored tributaries. The Arctic drainage includes the Selawik, Kobuk, and Noatak rivers, flowing westward into Kotzebue Sound; and the Meade, Chipp, and Colville rivers, flowing northward into the Arctic Ocean.

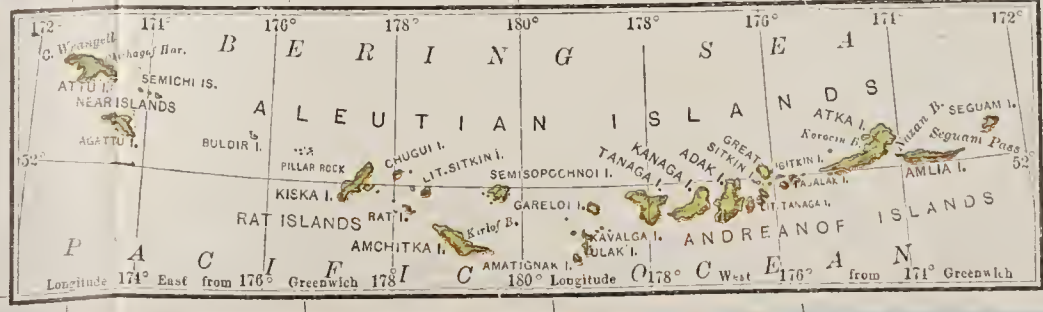

Climate. The range of climate in Alaska is greater than that from Florida to Maine. Only the northern third of the Territory can be said to have a distinctly arctic climate, while the southern seaboard is made comparatively temperate by the warm waters and winds of the Pacific. The records at Sitka in southeastern Alaska show for August, the hottest month, a range of 35° to 87° F.; and for February, the coldest month, a range of 3° to 54° F. The mean annual temperature is 43° F., about the same as that of Christiania, Norway. At Fort Tongass, the extreme southeastern point of the Territory, the records indicate a mean annual temperature of 48°. In southeastern Alaska frosts occur from October to April. The snowfall is light at sea level, but heavy in the mountains. The moist winds of the Pacific precipitate their waters along the coastal zone in a rainfall varying from about 130 inches at Fort Tongass to 84 inches at Juneau. April and July are the driest months. Between Cross Sound and Cook Inlet the rainfall is about the same, as is also the mean annual temperature. Though few climatic observations have been made in the Copper River basin, it is known to be drier and colder than on the coast. Extreme temperatures of 94° F. in August, and -53° F. in December have been recorded. The snowfall is 2 to 4 feet. Frosts occur throughout the year, but are rare in June, July, and the early part of August. Valdes on Prince William Sound has a summer temperature 5° colder and a winter temperature 10° colder than Sitka, and probably 50 per cent less rainfall, with a snowfall of about 12 feet. Cook Inlet and the adjacent region to the north have bright, clear weather in summer and cold winters. The extremes of temperature at Kenai (east side of Cook inlet) are 82° F. in July and -43° F. in December with a precipitation of about 17 inches. The Alaska Peninsula and Aleutian Island region has a climate similar to that of northern Scotland, with a rainfall varying from 24 to 48 inches and a mean annual temperature of about 40°. The Bering Sea coastal province has a rainfall varying from 33 inches at Bristol Bay to 18 inches at St. Michael. At St. Michael the mean annual temperature is 26°, and frosts occur from September to June. The northern half of Bering Sea is frozen from November until April, but St. Michael harbor is closed from the end of September until the middle of June. At Nome and in the Seward Peninsula June and July are often dry and clear, but the rains usually begin in the middle of August, often accompanied by high winds, and stormy weather prevails until snow comes early in October. The Arctic Coast of Alaska has a precipitation of about 8 inches. The extremes of temperature are -55° F. and 80° F.; the mean is less than 8° F. The Arctic Ocean is usually locked in ice from early in September until July. The climate of the interior is continental in character: semi-arid with great extremes of heat and cold. From Bering Sea inland the humidity gradually decreases, until at the international boundary the annual precipitation is less than 12 inches. Here extremes of temperature of 90° F. in summer and -76°

ALASKA

SCALE OF STATUTE MILES

SCALE OF KILOMETERS

Important towns are shown in heavy face type
Railroads shown thus

F. in winter have been recorded. The mean annual temperature at Eagle is about 21° F. Frosts occur throughout the year, but are rare between the middle of June and the middle of July. Snowfall aggregates 2 to 3 feet. The Yukon breaks about the middle of May and closes early in November, but on account of running ice is usually navigable only from June 1 to September 20.

Fauna. Among the large animals of Alaska the most important are bear, moose, caribou, sheep, goats, and deer. Deer are found in abundance in southeastern Alaska and the adjacent islands, but not elsewhere. Goats occur only in the higher ranges of the Pacific seaboard, but the white sheep (bighorn) is found throughout the higher parts of the midland mountain systems and on Kenai Peninsula. At least two varieties of the caribou are met with: the larger, called the woodland caribou, is abundant in the timbered regions of the interior; while the smaller, known as the wild reindeer, or barren ground caribou, meanders in large herds over the timberless northern areas and is also found on the Alaska Peninsula. Moose, though formerly abundant in the timbered valleys, are becoming scarce in some localities visited by white men. Black bear are widely distributed in the coast and inland regions, but are not found in the barren grounds. The true grizzly probably occurs only in the coastal strip of the Panhandle and in the Upper Yukon basin. There are many varieties of brown bear, the largest of which is the so-called Kodiak bear, which is found on the island of the same name. A closely allied variety, the Alaska brown bear, is found on adjacent parts of the mainland. Smaller varieties are found in the barren grounds. The white polar bear is indigenous only in the extreme north, but occasionally one is carried through the straits into Bering Sea. Of the smaller fur-bearing animals there are wolves, wolverines, foxes, beavers, muskrats, otters, mink, weasels, and sable (ermine). Many of the birds of the temperate zone are found in Alaska during the summer months. The ptarmigan occurs throughout the Territory, and the raven and eagle are plentiful in southeastern Alaska. Reptiles and amphibians are scarce, but there is a great variety of insect life, among which the mosquito is most conspicuous throughout the Territory. The marine mammals include whales (several varieties), porpoises, walrus, sea lion, hair and fur seal, and sea otter; but the last-named is nearly extinct. Fish occur in great variety and abundance. The salmon, white fish, and Arctic trout are the most plentiful and widely distributed.

Flora. In the distribution of vegetable life five broad zones can be recognized: (1) the Pacific coastal forests, (2) the southeastern grass lands, (3) the inland woodland, (4) the tundra, or barren grounds, (5) the alpine zone of the high ranges.

The Pacific coastal forests in the southeast include a luxuriant vegetation with much merchantable timber. The soil covering is chiefly moss, but in some flats grass and wild flowers are also found as far to the northwest as Kodiak Island, where the type is more stunted. Hemlock and Sitka spruce are the dominating varieties of trees. Of the deciduous trees, cottonwood, alder, and willow are most abundant. The devil's club, typical of the coastal region, occurs as far west as Cook Inlet, and up the Copper River as far as

Wood's Canyon. The lower Copper River valley is without timber except for some groves of cottonwood. Valuable red cedar is found as far north as Sitka, and the more plentiful yellow cedar as far as Yakutat Bay. The tree line stands at about 3000 to 3500 at Dixon Entrance, and decreases to 500 or 1500 feet on Prince William Sound. Timber is used locally for structural purposes and for making boxes for canned salmon and halibut. There are also large reserves of timber which could be utilized for pulp. Southeastern Alaska has been set aside as the Tongass National Forest, and contains valuable timber reserves. The Chugach National Forest includes an area stretching from Controller Bay to Cook Inlet.

The grass lands of the timberless southwest include the Alaska Peninsula, most of Kodiak Island, and the Aleutian Chain, forming the second province. Grass grows abundantly up to an altitude of 1000 to 2000 feet, above which the vegetation merges into the lichen and moss type of the alpine vegetation zone. This province includes some good grazing lands. Those on Kodiak Island have been used for stock for upwards of a century.

The inland woodland type of vegetation is in most places sharply separated from the coastal forests by a high mountain barrier. At Skagway, on Lynn Canal, and at the head of Cook Inlet, however, there is a mingling of the coast and inland species.

Spruce (black and white) predominates in the interior, but poplar, aspen, white birch, and alder are also common. In the lower Tanana valley tamarack has been found. Near the international boundary the timber line is about 3000 feet above the sea, but along the northern tributaries of the Yukon and the rivers flowing into Kotzebue Sound falls to less than 1000 feet. Heavy forest growth is confined to the valley floors, often to a narrow fringe along the water courses. On the Yukon and some of its larger tributaries spruce trees 2 feet or more at the butt are occasionally found, but as a rule the maximum diameter is 16 to 18 inches. The interior forests, if preserved, will amply supply local use for many years, but the arid conditions and the carelessness of both natives and whites have caused much destruction by forest fires. The fourth province, the tundra, embraces the coastal region northward from the Aleutian Islands to Point Barrow and eastward to the international boundary. The surface is covered with moss and herbaceous plants, with a little fine shrubbery, and fringes of stunted willow along the water courses. The only break in this treeless belt is on the north shore of Norton Sound, where some spruce forests occur. The alpine vegetation zone embraces the upper reaches of the high ranges. Its lower part is characterized by stunted shrubbery, grass, and many flowering plants, merging at higher altitudes into moss and, finally, still higher, into lichens. Throughout Alaska the abundance and variety of wild flowers are striking. Many of these are kindred to species common in the United States. Grasses are very abundant in the Cook Inlet, Copper River, and Yukon River regions, and are also found in sheltered parts of the tundra region.

Geology and Mineral Resources. Some gneisses and schists (Archean?) which occur in the Yukon basin are the oldest rocks of Alaska. The next higher horizon embraces a great com-

plex of altered sediments with many igneous rocks, which are in part Ordovician, Silurian, and Devonian. These form a broad belt stretching between the Yukon and the Tanana, and the same terrain is probably represented in the Seward Peninsula and in the Panhandle. Devonian, Carboniferous, Triassic, Jurassic, and Cretaceous beds have been found widely distributed. The Tertiary is represented by coal-bearing beds which occur in the Pacific, interior, and Arctic provinces. Extensive sheets of recent gravels, sands, and silts mantle much of the Territory. The Coast Range of southeastern Alaska is made up almost entirely of granite and related igneous rocks. Extensive volcanic ejecta occur in the Copper River basin, the Alaska Peninsula, and the Aleutian Islands. There are active volcanoes in all three of these districts. The mountain ranges throughout Alaska are the results of erosion in areas of very recent uplift. During the glacial period the Panhandle, with the exception of some of the higher peaks, was buried in ice, which channeled out the valleys now remaining as fiords. The same ice cap stretched inland over the Coast Range and extended northwestward down the valleys of the tributaries of the Yukon to about lat. 62°. During this period the St. Elias, Alaska, Aleutian, and Endicott mountains were centres of ice accumulation, which did not, however, extend far into the adjacent lowlands. The fast-disappearing remnants of these former ice sheets are the glaciers of the Pacific ranges. During the maximum extension of the ice it covered less than one-fifth of Alaska. The areas now covered by ice and perpetual snow aggregate less than 20,000 square miles. The developed mineral resources include gold (placer and lode), silver, lead, copper, tin, coal, gypsum, marble, and mineral water. Of prospective value are the deposits of zinc, iron, and possibly petroleum and mercury. The highly altered rocks of the Panhandle are the locus of most of the auriferous lode mining and also contain some placer gold, silver, and copper. This belt appears to be continued in the Prince William Sound and Kenai Peninsula region, where it carries gold and copper. The inland placer-bearing districts (including Forty Mile, Fairbanks, etc.) lie in another belt of highly altered rocks, which also appears to crop out in the Seward Peninsula, where rich placers have been found. Copper-bearing rocks occur both on the north and south slopes of the Wrangell Mountains. The coal-bearing rocks of Alaska cover at least 20,000 square miles. Coal has been found in four different horizons: in the Carboniferous and Jurassic near Cape Lisburne, and in the Cretaceous and Tertiary of the Yukon and Pacific coast regions. The last is the most important, and near Controller Bay and in the Matanuska valley has yielded high-grade bituminous and semi-anthracite coals. Lignite coals are very widely distributed. Marble, gypsum, and mineral waters have been found in commercial quantities in the Panhandle, where iron, zinc, and lead deposits are also known to occur. Petroleum seepages occur at several places along the seaboard between Controller Bay and Cook Inlet. Tin (cassiterite) is found near Cape Prince of Wales and on the lower Tanana, and mercury (cinnabar) in the Kuskokwim basin.

Mining. Though the Russians knew that both gold and copper occurred in Alaska, they made no effort to develop it. Their only attempt at mining was to open up a coal deposit on Cook

Inlet in 1854. Gold was found at Sitka in 1876, but it was first mined extensively at Juneau, where it was discovered in 1880. Placer gold in the interior was first found on Forty Mile River in 1886, and this was followed by the discovery of the Birch Creek and Rampart districts in 1893. The annual output of gold from the inland region rose slowly, until by 1895 it amounted to \$800,000; the mining population was then about 1600 men. Meanwhile the coastal region had made steady progress: by 1888 the Treadwell mine on Douglas Island, near Juneau, had become one of the great gold-producers of the world, while a number of smaller mines in the vicinity were developed. The Apollo mine on Unga Island in southeastern Alaska was opened in 1886, and the Cook Inlet placer fields were discovered in 1894. It was the discovery of the Klondike gold placers (1896), close to the international boundary but on the Canadian side, which first attracted large numbers of prospectors to Alaska; but no important discoveries of mineral wealth were made in Alaskan territory until 1899, when the Nome placers were found. The gold production of that year, about \$6,000,000, was nearly double that of 1898. Since 1899 many new gold-bearing areas have been discovered, and marked progress has been made in the placer-mining industry. The Fairbanks district on the Tanana was discovered in 1902, and in 1905 yielded nearly \$6,000,000.

In 1906-07 important new discoveries of placer mines were made in this district, and in 1909 new and valuable quartz veins bearing gold were found in the same region. Placer mining continued to furnish by far the larger portion of the gold produced. During these years a remarkable feature of mining in Alaska was the large quantities of gold found in the sands of the beaches of Cook Inlet and other bodies of water. In 1909-10 a discovery of gold in the waters of Otter Creek, the northern tributary of the Haiditarod or Iditarod River resulted in a rush of prospectors to that region, which is in the Innoko valley. The production from this field increased from \$825,000 in 1910 to about \$3,000,000 in 1912. The gold production of the Territory in recent years has been remarkably constant. In 1910 it was \$16,126,749, in 1911 \$16,853,256, and in 1912 \$17,145,951. Of the production in 1912 \$11,990,000 came from the placer mines, but the tendency is for the relative output from the deep mines to increase. The Fairbanks camp leads all other camps in production, but the output from this camp decreased from \$6,100,000 in 1910 to \$4,100,000 in 1912.

The silver production, chiefly incidental to gold mining, was 515,186 fine ounces in 1912, valued at \$316,839, compared with 460,231 ounces in 1911 and 157,850 ounces in 1910.

The mining of copper promises to be one of the leading mineral industries of the Territory. Copper mining began in 1901 at Prince William Sound, and operations were later extended to Prince of Wales Island. Two smelters were erected here, but have not been operated for several years. The output was not large—in 1905, 30,000 tons, valued at \$700,000. Prospecting had for many years been carried on in the Copper Mine district, and large bodies of ore had been found. It was not until 1911, however, that copper was actually produced in this region. In 1911 the copper production of the Territory

was 22,314,889 pounds compared with 4,311,026 in 1910. The increase was due to the production from the Bonanza mine in the Copper River district. The output in 1912 was 29,230,491 pounds, valued at \$4,823,031.

Placer tin has been mined in the York district of the Seward Peninsula since 1902, and there has been a small amount of lode tin mining in the same district.

The existence of vast fields of coal in Alaska had been known for many years. In 1896 large deposits were found in the valleys of the Matanuska and Bering rivers. The coal in these fields is anthracite and high-grade bituminous, but much is too crushed to yield a high percentage of lump; and its value for steaming is still mooted. The Bering River field covers about 50 sq. miles, or 32,000 acres. It lies approximately 25 miles from the coast of Controller Bay, the nearest tide-water and about 90 miles from Cordova, the nearest good harbor. The Matanuska field is larger, covering about 74 sq. miles, or 47,360 acres. It is north of Prince William Sound and from 150 to 200 miles from Seward or Resurrection Bay. The coal in the other fields of the Territory, so far discovered, is lignite and low-grade bituminous.

The development of the coal fields of Alaska has been retarded by the lack of transportation facilities (see *Transportation*), and by controversies over the proper administration of the coal lands. (See *History*.) In 1911 only one mine, that of the Chignik Coal Mining Company near Chignik Bay, was operated commercially, and the estimated output of the Territory was only 900 tons. In the fiscal year of 1913, 102,169 tons, valued at \$492,301, were imported.

Petroleum has been found in the Katalles field east of the Copper River, but the production as yet has been small. An executive order of Nov. 3, 1910, withdrew unlocated oil lands from entry. Gypsum is found in Chicagof Island. Marble of various colors is quarried on Prince of Wales and other islands of southeastern Alaska. Antimony, graphite, bismuth, cinnabar, and talc have been found, but not in sufficient quantities to justify their commercial exploitation.

The total value of all mineral products in 1912 was \$22,537,821, as compared with \$20,650,000 in 1911.

Some of the defects in the placer-mining laws as applied to Alaska were remedied by the Sixty-second Congress in 1911. The measures passed were designed to mitigate two evils which have hindered the development of placer mining—the unlimited power of attorney, and the association claims. By this enactment no association placer-mining claim in excess of 40 acres may be issued in Alaska. The provision in regard to the power of attorney restricts the number of such powers to two for any one person in any one month.

Fisheries. Fish have always been an important source of food supply for the natives, among whom the salmon, white fish, tomcod, and inconnu fish are most used. The most important of the fisheries are the salmon, cod, halibut, herring, and whale. Whaling, begun about 1840, is the oldest of the fishing industries, but is now on the decline. The catch of the whaling fleet from 1874 to 1900 was valued at about \$11,200,000. The first salmon cannery was established on the Alaskan coast in 1878. There are many species of salmon, of which the king (the largest), silver, red, and hump-

back are the most important. They are very widely distributed, being found along the entire Alaskan coast, but are caught only at the mouths of the streams which they ascend during spawning season. Bristol Bay is the most important salmon-canning centre, but there are several others along the coast southward as far as the boundary.

In 1907 the mild curing of king salmon was begun and proved to be very profitable. The total output of canned salmon in 1912 was the greatest in the history of the industry. There were about 3,900,000 cases of four dozen one-pound cans each, compared with 2,823,817 cases, in 1911. In 1912 there were 87 salmon canneries in operation, compared with 64 in 1911. The total investment in the fisheries of Alaska in 1912 was \$37,549,740, about 90 per cent of which was in salmon fishing. In the several branches of fishing, 24,263 persons were employed, an increase of 6,311 over 1911. The finished product in all branches of fishing for 1912 was valued at \$18,877,468. For several years the United States Bureau of Fisheries has carried on successful experiments in hatching salmon fry for restocking the streams.

The decline of whale fishing is noted above. In 1907 a plant for extracting oil and making guano from whales was established at Tyrell on Admiralty Island. This was operated successfully for several years. But next to the salmon the most important fisheries are those of halibut, cod, and herring. Cod banks are scattered along the entire coast line as far north as the southern part of Bering Sea. Halibut are very abundant along the Pacific shore. The total production of halibut in 1912 was 17,146,743 pounds. Immense shoals of herring visit the bays and estuaries, and a small but thriving industry has grown up in the conversion of herring into oil and fertilizer. This practice is being attacked.

Agriculture. Alaska has probably 15,000 to 30,000 square miles of arable lands: as much as the agricultural land of Finland, a country which not only supports a population of 2,500,000, but exports butter, cheese, grain, and live stock. Because of the high cost of labor, Alaska can support only small farms, but these can be made to yield an ample return because of the abundant local market. In 1903 the homestead law was extended to Alaska and modified to permit the acquiring of 320 acres for agricultural purposes. There being no public land surveys, each homesteader has to make surveys at his own expense, with the result that but little land has been taken up. Since 1910, much of the more accessible arable land has been covered by sub-divisional surveys. Climate and location make southeastern Alaska the most favorable for agriculture, but the heavy forest growth entails an almost prohibitive cost for clearing the land in anything except small patches. Moreover, much of this region is too rugged for the purpose. At Sitka wheat, barley, rye, oats, and a great variety of vegetables, together with strawberries, gooseberries, raspberries, and currants, have been successfully raised. The growing season is from May to October. In general the same conditions prevail to the westward as far as Cook Inlet, though the climate is somewhat colder. The region adjacent to Cook Inlet and the Susitna valley is the most promising for agriculture. Here the abundance of native grasses is evidence of a soil suitable for hay; wheat, barley, oats.

buckwheat, clover, potatoes, and many vegetables have been successfully matured. The growing season extends only from about the first of June until September, but the long days and almost continuous sunshine mature plants very rapidly. On the Alaska Peninsula and adjacent islands the abundance of good grass will undoubtedly mark this for a stock-raising region. The Copper River district also contains good grass country, and barley, oats, and rye, as well as many vegetables have been matured. In favorable localities in the Yukon valley, vegetables have been extensively raised for local use. Oats, rye, wheat, and barley have been raised at Rampart and Fairbanks. The Tanana valley is the most favorable part of the interior for agriculture. Near Fairbanks are a number of prosperous ranches. Hardy vegetables have been matured in the Koyukuk valley north of the Arctic Circle. Grass grows luxuriantly throughout the Yukon basin. The growing season is confined to two or three months in summer, but this is partly compensated for by the length of the Arctic summer day.

The United States Department of Agriculture has established agricultural experiment stations in Alaska, and the results obtained indicate that certain sections of the Territory have great possibilities for the raising of some varieties of grain, vegetables, and fruit. It has been proved that while at present growing of wheat, except in an experimental way, is hardly feasible, a considerable portion of the Territory is adapted to raising barley and oats. At an agricultural fair held at Fairbanks in May, 1911, a great variety of native farm products were shown. These experiment stations have shown, also, that garden vegetables can be successfully grown in Alaska. In 1911, as the result of the increase in farming, the shipment of potatoes from the States was smaller by 25,149 bushels than in 1910; of hay, by 2155 tons; of beans and peas, by 7322 bushels; and of onions, by 964 bushels. Experiments in the growth of a hybrid strawberry, by crossing several cultivated varieties with the wild strawberry of the Alaska coast, have been successful.

A station for the breeding of sheep and cattle is maintained on Kodiak Island. This has met with signal success, but the grazing grounds where the station is situated were badly damaged by a heavy fall of volcanic ashes in 1912. The luxuriant growth of grasses in the territory surrounding Cook Inlet, and in other regions where the climate is comparatively mild, induces the belief among agricultural experts that stock-raising will become in time a profitable industry. The grazing area of the Territory is of large extent.

In 1910 the farms in the Territory numbered 222, with an area of 42,544 acres, of which 2660 acres were improved. The farm property was valued at \$1,468,402. Vegetables were the most important agricultural product, and their value in 1909 was \$186,134; the value of hay and forage was \$94,993.

Furs. The fur trade first attracted the Russians to Alaska and continued to be the leading industry until the development of the gold mines. The most valuable fur-bearing animal is the sea otter, formerly numerous along the entire Pacific coast, but now found only on some of the Aleutian Islands and threatened with extermination. The killing of the sea otter is now prohibited by law. It is estimated

that during the Russian occupation 260,800 sea otter skins were taken, valued at \$26,000,000. Since 1867 about 90,000 sea otter skins have been marketed, but the present annual output is probably less than a score. Good skins are worth from \$800 to \$1200 in the London market. The fur-seal industry, though developed by the Russians, reached its greatest expansion after the transfer of the Territory. It is estimated that from 1745 to 1867, 3,350,000 fur seals were taken. From 1867 to 1902 2,524,082 skins to the value of \$35,000,000 were exported. The fur seal, though during part of the year widely distributed in the northern Pacific and Bering Sea, has only one breeding ground in Alaska, on the Pribilof Islands (lat. 57° N., long. 170° W.), where most of the skins have been taken. In 1870 the capture of seals on these islands, except by government permit, was prohibited by law.

Before April 30, 1910, they were leased by the United States government to companies which had the right to take the fur seals found there. On the expiration of these leases, on the date given above, the United States took sole charge of the islands and the fisheries. The seals had been reduced to such a number that their practical extinction would have been a matter of a few years only, if conditions then prevailing had been maintained. This had come about chiefly because of the practice of "pelagic sealing," which is the killing of seals at sea, outside the three-mile limit. The countries whose fishermen were engaged in this were the United States, Great Britain, Russia, and Japan. The American authorities had for years endeavored to prevent this practice, but with little success. In "pelagic sealing" seals of all ages and both sexes are indiscriminately slaughtered, and the breeding of seals is thereby prevented. To bring an end to this economic waste, which meant the ultimate destruction of all the herds, the United States arranged a conference between the nations concerned. This was known as the International Fur Seal Conference, and it was in session in poaching time from May 11 to July 7, 1911.

As a result of their deliberations it was agreed that "pelagic sealing" should be abandoned for 15 years, and that the terms of the agreement should continue in force after that time unless terminated by a written notice given by one or more of the parties to all the others 12 months in advance. As compensation for this concession the United States agreed to share with the other governments in the profits received from the fisheries on the Pribilof Islands. This convention was ratified and went into effect Dec. 15, 1911. In 1912 the United States Congress passed a measure providing for a close season for five years from 1913 in the Pribilof Islands. Natives in the islands are permitted to kill annually a sufficient number of male seals to provide food and clothing. An actual census of the Pribilof herd in 1912 revealed 215,940 seals of all classes. The provisions of this measure, as well as those of the conference, apply also to the sea otter.

An important measure relating to fur-bearing animals and seals was passed by Congress in 1908. This enactment gives to the Secretary of Commerce and Labor, now the Secretary of Commerce, practical supervision over the fur-sealing industry on the Pribilof Islands. The act also provided that no person shall kill any

otter, mink, martin, sable, fur seal, or other fur-bearing animal in Alaska, except under such regulations as are prescribed by the Secretary. Fur-bearing animals enumerated below may be hunted and killed in the Territory, except during the season specified with respect to each of them.

Sea otter. The hunting or killing of sea otter is prohibited until Nov. 1, 1920.

Beaver. The hunting or killing of beaver is prohibited prior to Nov. 1, 1915.

The hunting or killing of land otter, mink, musk rat, martin, fisher, and ermine is prohibited throughout the season from April 1 to July 31.

The hunting or killing of black bear is prohibited throughout the season from April 1 to July 31.

The hunting and killing of fox, wildcat, or lynx is prohibited throughout the season from April 1 to September 30.

Permits or licenses may be issued by the Secretary for the taking of fur-bearing animals for scientific purposes and for shipment to zoölogical parks.

The animals enumerated above are the most important fur-bearing animals of the Territory. Foxes are found in great abundance. The pelt of the silver-gray fox, next to that of the black fox, is the most valuable, being worth from \$75 to \$100. Fox farms have been successfully established on some small islands on the Pacific coast. These are leased from the government. A successful attempt has been made to introduce domestic reindeer among the natives. The first importation was made from Siberia in 1892, and in 1912 there were 38,476 reindeer in Alaska, of which the natives owned 62.5 per cent. In the latter part of 1911 the first shipment of reindeer meat was shipped from Nome to Seattle. Although the reindeer have not supplanted dogs as draft animals, they will in time become valuable for fur and for food. The total fur shipments from Alaska in 1912 aggregated \$794,156.63, as compared with \$802,750 in 1911.

Transportation and Communication. Transportation is the vital problem of Alaska. Without it, neither the great mineral resources nor the agricultural possibilities can be developed. On the other hand, the uncertainty which has attended the tying-up of the coal lands (see *History*), even more than financial and engineering difficulties, has discouraged railroad construction. No new lines were built for several years prior to 1913, and, in the face of a tax of \$100 per mile, several existing lines were not in operation.

Of the nine lines of railroad in 1913, with a combined mileage of 466 miles, the principal lines were: the Copper River and Northwestern, extending 197 miles from Cordova to Kennicott and a property of the Alaska Syndicate; the White Pass and Yukon, extending in a northerly direction from Skagway 20 miles in American territory and thence 82 miles in Canadian territory to White Horse, along the line of the historic Klondike trail; the Alaska Northern, which extends 71 miles northward from Seward, but which, under the name "Alaska Central," was originally projected into the interior before financial disaster overtook it in 1909; the Seward Peninsula, about 75 miles long, with its terminus at Nome; and the Tanana Valley, which is the only important line in the interior

and runs about 50 miles from Fairbanks to Chena, among the principal placer mining camps of the neighborhood. The Copper River and Northwestern and the Alaska Northern alone are standard gauge.

The urgency of further railroad construction in Alaska is recognized by the Federal government. The Civil Government Act of 1912 (see *Government*) authorized the President to appoint a commission, consisting of an army and a navy engineer, a representative of the Geological Survey, and a civil engineer experienced in railroad construction, to study the transportation problem. The Commission's report, transmitted to Congress on Feb. 6, 1913, recommended, as the best of a number of possible routes, the construction of two trunk-lines: (1) from Cordova to Fairbanks, tapping the Yukon and Tanana valleys and also the Bering River coal fields; and (2) from Seward along Cook Inlet to Iditarod, tapping the Kuskokwim valley and also the Matanuska coal fields, in all, about 733 miles at an estimated average cost of \$48,000 per mile. The Commission reckoned on the basis both of public and of semi-private construction, but did not commit itself to either.

Early in the first session of the 63d Congress, bills were introduced, based substantially on the Commission's report and providing for the construction of Federal railroads between harbors of the southern coast and the interior valleys. The essential features of the bill passed by the Senate, Jan. 24, 1914, were: (1) the exact routes to be determined at the President's discretion; (2) the scheme to be financed by a bond issue of \$40,000,000 at 3 per cent, which should be paid off from part-proceeds of the sale of public lands within the Territory; (3) operation to be directly by the government or on leases not to exceed ten years; (4) facilities to be such as to secure coal for naval purposes. This legislation was urged in the presidential message of Dec. 2, 1913, and the concurrence of the House seemed certain.

The Alaska Road Commission, created in 1905, directs the construction of roads and trails throughout the Territory. In 1913 the total mileage was: Wagon roads, 862 miles; sled roads, 617 miles; trails, 2116 miles. The construction in 1911 of a united trail from Seward on the Pacific slope to Iditarod shortened the winter route to Nome by about 300 miles. In 1913, automobiles were running over a new road between Valdez and Fairbanks, in the interior.

River navigation has been an important factor in the commerce of Alaska. Because of the latitude at which they enter Bering Sea, the Yukon River is useful for two and the Kuskokwim River for three months only, as connecting links with ocean-borne commerce. The entrance of the Yukon is shallow and the channel shifting, and the entrance of the Kuskokwim is tortuous and little known; but once inside, an ordinary river boat can navigate the Yukon to White Horse, in Canada, about 2200 miles, the Tanana, its largest tributary, to Chena, near Fairbanks, and the Kuskokwim to the Forks, about 650 miles from the mouth. With their tributaries, the two systems provide about 5000 miles of navigable water. Despite the short open season, three to three and a half months, and occasional interruption in places by low water, the possibilities of their utilization in the development of their great valleys will suffice for many years. Navigation also exists

on the lower Copper, the Kobuk, and other streams.

The Pacific coast line of Alaska, including the Aleutian Islands, has many excellent harbors. These are open to navigation throughout the year, with the exception of Cook Inlet, which is closed by ice from November until May. The northern half of Bering Sea is closed to navigation from about November to June, but the ice-pack does not come far south of St. Lawrence Island. This part of the coast is almost without harbors. The Arctic Ocean is open only from July to September.

Cables give telegraphic communication with Seattle from certain ports of southeastern Alaska—Cordova, Valdez, and Seward. Telegraphic lines run from Valdez to Fairbanks and down the Yukon to St. Michael, which is connected by wireless station with Nome. These are all military lines. The Navy Department maintains wireless stations at Kodiak and at Unalaska. The War Department has wireless stations at Sitka, Cordova, Fairbanks, Circle, Eagle, Gibbon, and Nulato; and there are private stations at Iditarod and on Bristol Bay. Many of the mining districts are provided with telephone lines.

Commerce. As has been indicated, Alaska's chief industries are mining and fishing, and next to these comes the fur trade, but this is declining, and some districts no longer yield skins enough for local use. Lumbering is only a local industry. There is an abundance of wood suitable for pulp, but no use has been made of it. Although great advances have been made in agriculture, the value of the products is still relatively unimportant.

The volume of commerce is, however, on the increase. The aggregate value of merchandise shipments to and from the Territory in the fiscal year of 1913 was \$67,150,519, as against \$64,122,506 for 1912. The greatest increase noted in the shipments from Alaska was in salmon, where there was an increase of \$2,875,791. The merchandise shipments to Alaska from the United States amounted to \$20,179,547 for the fiscal year of 1913, as against \$18,809,270 for 1912. Manufactured goods ready for consumption comprised the greater part of these shipments, especial increase being noted in machinery. The chief points to which the products of Alaska are sent are Seattle, Tacoma, and San Francisco. Almost all foreign trade is with Canada, though there is a little with Siberia.

Population. The natives of Alaska belong to four groups: the Esquimaux, the Aleut, the Thlinkit, and the Athabaskan. The Esquimaux inhabit all the northern part of the Territory, including the area tributary to the Arctic Ocean and the eastern shore of Bering Sea. Tribes closely related to Esquimaux are found along the eastern shore of the Alaska Peninsula, Kodiak Island, and as far east as the Copper River delta. They are essentially a docile, industrious people, whose food before the coming of the white man was chiefly fish, walrus, and seal, together with caribou in some districts. They are skilled in carving and are excellent boatmen. The Aleut, closely related to Esquimaux, are found only on the Aleutian Islands and adjacent mainland. They also are excellent boatmen and are renowned as hunters of the sea otter, an animal exceedingly difficult to approach. The Thlinkits and the closely related

tribe called Haidas are confined to the Panhandle. At the coming of the Russians they were the most civilized of the native tribes and also the most warlike. They lived in well-built log houses and had an organized tribal system. They are skilled craftsmen and are of far greater intelligence than any of the other aborigines. The Athabaskans (the same stock as the North American Indian) dwell in the interior, reaching the coast only at Cook Inlet. They are a race of hunters, but those dwelling on the larger rivers also use salmon. With the exception of some of the isolated Esquimaux tribes, they are to-day the least civilized of Alaskan natives. Only the coastal natives appear to have any definite tribal organization; the rest are grouped rather by families. Tribal organization has never been recognized by the United States government.

Enforcement of the stringent laws of 1909, prohibiting the sale or furnishing of liquor to natives, has checked demoralization from drunkenness. The introduction of reindeer among the Esquimaux has improved their condition, their income from this source being, in 1911, \$42,216.

The improvement in the native schools has had excellent results, especially among the children. The natives of Alaska, generally, are self-reliant, and many of them engage in profitable industries, especially in the commercial fisheries, and to some extent in the mines in the southeastern part of the country. The natives of the Copper River valley and the Aleutian Islands are poorer than those of most other parts of the Territory, but extreme conditions are not prevalent. The greatest menace is infectious diseases, but the work of physicians of the Bureau of Education has greatly improved health conditions.

The total population of the Territory in 1910 was 64,356; in 1900, 63,592, and in 1890 (partly estimated), 32,052. The increase of nearly 100 per cent in the decade 1890-1900 was due to the rush of the gold-hunters. Although a considerable number of those enumerated in 1900 did not remain in the Territory; and although the natives and Chinese decreased by more than 6000, there was, nevertheless, a slight increase in the population in the decade 1900-10.

The Indian population is almost entirely native. It decreased from 29,536 in 1900 to 25,331 in 1910. The native population, which includes Indians, native whites, and natives of other racial elements, decreased from 50,931 in 1900 to 43,921 in 1910. Of the native population in 1910, 60.6 per cent were born in Alaska, 38.1 per cent in the United States proper, and 1.3 per cent in the Philippine Islands and other outlying territory of the United States.

The white population in 1910 was 36,347, and 22,734 of these were either foreign born or native born of foreign parentage. Of the 17,974 foreign-born whites, 15.1 per cent were born in Sweden, 14.4 per cent in Norway, 12.3 per cent in Canada, 8.6 per cent in Germany, 6.4 per cent in Ireland, 5.7 per cent in England, and 37.4 per cent in other countries. There were, in 1910, 2461 foreign-born colored inhabitants, of whom 1057 were born in China, 897 in Japan, 418 in Canada, and 89 in other countries.

In the total population in 1910 there were 45,857 males and 18,499 females. The number of males to 100 females in the white population

in 1910 was 500.1. This high percentage of males is accounted for by the fact that a large proportion of the native white population is composed of male immigrants from other sections of the United States.

The number of inhabitants per square mile in 1910 was 0.1, the same as in 1900. This is equivalent to an average area of 9.2 square miles, or 5888 acres to each inhabitant. The dwellings in Alaska in 1910 numbered 16,612, and the families 17,809.

There were, in 1910, 14 incorporated towns in the Territory, and of these 7 had a population of 1000 or more. Fairbanks, the largest city, had, in 1910, 3541 inhabitants. The other incorporated places with population in 1910 are: Nome, 2600; Cordova, 1152; Juneau, 1644; Ketchikan, 1613; Treadwell, 1222; Douglas, 1722; Skagway, 872; Valdez, 810; Wrangell, 743; Seward (incorporated in 1912), 534; Haines, 445; Petersburg, 585; Chena, 138; Eagle, 178. The town of Iditarod was incorporated in 1911, and Tanana in 1913. As there were no incorporated places in 1900, it is impossible to give an accurate comparison of population for the two census years. Nearly all these towns show an increase, but several show decreases. Among these is Nome. Sitka, not incorporated in 1910, had a population of 539. The figures for population given above include only those for the white population. In many cases there are, in addition, native villages near these towns which equal or exceed them in population. The government maintains garrisons of 200 or 300 men in four forts: William H. Seward, near Skagway; Davis, near Nome; Liscum, near Valdez; and Gibbin, at the junction of the Yukon and Tanana rivers.

Missions. Christianity came to Alaska through the Greek Catholic missionaries in the early days of the Russian occupation. Wherever the Russians established their trading posts the natives became converts to the Greek Catholic faith. Many of the Aleuts and the natives of the Alaska Peninsula, Kodiak Island, and the vicinity of Sitka still belong to this church, which maintains missions at a dozen localities. Soon after the transfer to the United States, missionaries of other sects went to Alaska and established churches and missions. Now nearly every Christian sect is represented at one or more localities. Besides the Greek church, the Roman Catholics, Episcopalians, Presbyterians, and Congregationalists have the most missions. Probably all of the Alaskan natives are adherents of some Christian sect, though those of the more isolated regions may not visit a mission more than once in two years. Churches for whites of various sects have been established in all of the larger settlements, and many of the clergy have done excellent work in the establishment of hospitals.

Education. The people of Alaska have from the beginning of its occupation shown an interest and pride in their public schools. In the incorporated towns these are supported largely by license money collected in these towns. For places not incorporated provision is made by an Act of Congress passed in 1905. One-fourth of the receipts for license taxes from these communities is set aside to be expended by the government for schools for white children, and for children of mixed blood who lead a civilized life. The native schools are in charge of the United States Bureau of Education. Indus-

trial features are included in the curriculum with a view to attracting the attendance of adults.

Schools are maintained in all the incorporated towns in the Territory. In the schools established by the Act of 1905 the attendance averages about 700. In the native schools are about 4000 pupils. In addition to public institutions, educational facilities are furnished by religious denominations, including those of the Presbyterian, Roman Catholic, Moravian, Methodist, Episcopal, Friends, the Swedish Evangelical, and the Greek Orthodox churches.

Because of the small number of children of school age in the Territory the per capita cost of public instruction is relatively high. The total expenditures for places outside incorporated towns was, in 1912, about \$50,000.

Government. Prior to Aug. 24, 1912, Alaska was a district, or unorganized Territory, with no local legislative body. All its laws were made by the Congress of the United States, and the administrative and judicial officers were appointed by the President.

The Civil Government Act passed by the Sixty-second Congress, and approved by President Taft on the date noted above, created a legislative assembly with limited powers. The passage of this act marked the close of long-continued agitation both within and without the borders of the Territory for some form of self-government. President Taft, in repeated messages to Congress, urged the necessity for the passage of measures providing for this. His preference was for a commission form of government until the Territory should be fitted for actual self-government, but he was satisfied with the modified powers of government given by the act, and therefore signed it.

The act first creates Alaska into an organized Territory and establishes a capital at Juneau. It then provides for a Legislature to consist of a Senate composed of eight members, two from each of the four districts into which the Territory is divided, and a House of Representatives, consisting of 16 members, four from each of the judicial districts. The term of office for senators is four years and for representatives two years. The Legislature meets every two years, beginning in March, 1913, and the Governor has power to call special sessions for a period not exceeding 15 days.

The powers of the Legislature are limited. It cannot grant private charters or special privileges; it cannot grant divorces; it must not interfere with existing laws relating to the regulation of the liquor traffic or gambling, and it cannot incur any indebtedness except for the actual expenses of the government. It is not permitted to levy taxes in excess of 1 per cent of the assessed valuation of property, and it can pass no laws which are inconsistent with the laws already passed by Congress. The Legislature was permitted to modify the qualifications of electors by extending the franchise to women. This it did in its first session. The Governor has the veto power, which may be passed over by a two-thirds vote of both houses. All laws must be submitted to Congress for approval before they become valid, and all measures passed must be transmitted to the President within 90 days of their passage. The act contains a provision for the Railroad Commission referred to in the paragraph dealing with transportation.

The first election for members of the Legislature was held on Nov. 5, 1912, and the first session convened on March 3, 1913.

The executive officers of the Territory are a governor, appointed by the President, a secretary (ex officio) of the Territory, a secretary to the governor, and a surveyor-general. The Territory forms a customs district with a collector at Juneau, and 10 deputy collectors at as many ports of entry. There are four judicial divisions, with centres at Juneau, Nome, Valdez, and Fairbanks. Other departments of the government, administered from Washington, are the land office, the department of education, the immigration service, the mine inspection service, the forest service, the game service, the bureau of fisheries, and the health office.

Towns with a population of 300 or more are allowed to incorporate and elect governing bodies, but otherwise there is no local government. Under a law passed in 1906 Alaska is represented in Congress by a delegate elected by male residents of a year or more in the Territory. A complete criminal and civil code was first enacted for Alaska in 1899-1900 and has been amended from time to time. The seat of government was located at Sitka until 1906, when it was removed to Juneau. There is no land tax in Alaska, except within incorporated towns. The assessed valuation of property in nine incorporated towns levying taxes, 1912-13, was \$6,042,068; the average tax rate was 1.31 per cent.

History. The evidence of old maps shows that something was known of the Alaskan coast as early as 1579, but it was not until 1711 that Popof, a Cossack who visited East Cape (Siberia), brought back definite knowledge of Bering Strait and the continent said by the natives to lie beyond. Vitus Bering, sent out by Peter the Great, sailed through Bering Strait in 1728; and in 1731 Gwosdef, a Cossack, was blown on to the Alaskan coast, on which he was probably the first Russian to land. Another expedition led by Bering sighted the Alaskan coast at Mount St. Elias, July 18, 1741, and landed on Kayak Island. Chirikoff, in command of Bering's second ship, reached the vicinity of Sitka on July 15, but the boats sent to make a landing did not return. Bering, returning along the Aleutian chain, discovered a number of islands and finally was wrecked on Commander Island. The first white settlement was made on Kodiak Island at Three Saints' Bay in 1783. During the succeeding half century the Aleutian Islands were explored and exploited by the Siberian fur-hunters, who reached the Alaska Peninsula about 1761. Within the next century exploration gradually advanced from three directions: the Russians reached it from Siberia through Bering Sea and Bering Strait; the English traders came from the east by way of the Mackenzie valley; and navigators of various nationalities approached it from the south by following the eastern shore of the Pacific. Among the most prominent of these expeditions were the Russian ones led by Synd (1767), Krenitzin (1768), Billings (1785), Kotzebue (1815), Lütke (1826); the Spanish ones led by Bodega y Quadra (1774), Arteaga (1779), Martinez (1788), Malaspina (1791); and one French under command of La Pérouse (1785). But the most important exploration was done by Capt. James Cook, of the English navy, who in 1778

surveyed almost the entire coast line between lat. 58° and 70°. These surveys were extended by various English navigators, notably Vancouver (1793-94), Franklin (1826), Beechey (1826), and the Franklin relief expeditions (1848-53). Meanwhile the English fur traders had approached from the east, and the explorations of Mackenzie (1793), Dease and Simpson (1837), Murray (1847), and Campbell (1848) had added much to the geographic knowledge of the Territory. The Russian fur-trading interests were consolidated in 1788 into a single company, under the management of Alexander Baranof. This so-called Russo-American Company by royal charter obtained a monopoly of the fur trade throughout Alaska and held it until the transfer to the United States. The company gradually extended its field of operations: it founded Kodiak (1792), Sitka (1804), St. Michael (1834), and Nulato (1841); and explored the Lower Kuskokwim, the Yukon as far as the Tanana, and the lower stretches of the Susitna and Copper rivers. In 1865-66 explorations were made by Robert Kennicott, W. H. Dall, and other employees of the Western Union Telegraph Company with the object of connecting Europe with America by telegraph, but the success of the Atlantic cable led to the abandonment of the project. The Russian colonists made no attempt to develop any resources except the furs, and as these generally decreased, the country was considered less valuable. In March, 1867, by treaty negotiated by William H. Seward, Secretary of State, in spite of much opposition, Russian America was ceded to the United States for \$7,200,000 in gold.

On Oct. 18, 1867, the Russian flag was lowered from the flagstaff in front of the Governor's residence at Sitka and the United States flag hoisted amidst the booming of cannon. This was the act of formal transfer by which Russian-America became Alaska and a possession of the United States. At a number of points in southeastern Alaska and Kodiak extensive barracks were erected and occupied by United States troops, while an army officer represented the Federal government. But ten years later all troops were withdrawn, and for a number of years the country was governed by a naval officer stationed at Sitka. Then even this control lapsed, and Alaska was left for a time in the anomalous position of being without either military or civil government. A civil government was enacted by statute in 1884, and has continued with some modifications up to the present day. (See *Government*.) The Alaska Commercial Company succeeded to many of the fur-trading interests of the old Russo-American Company, and as late as 1891 maintained almost a monopoly in this field. For many years after its acquisition Alaska was neglected by the Federal government. The Coast Survey took up the systematic mapping of the shore line, but little attempt was made to explore the interior. The Yukon was mapped in 1869 by Capt. R. W. Raymond, U. S. A., who was sent to determine the approximate position of the international boundary and thus settle the conflicting interests of American and British traders; and in 1883 by Lieut. Frederick Schwatka. Schwatka crossed the Chilkoot Pass (called by him Perrier Pass) with a small party and built a raft at the headwaters of the Lewes and continued down the river in this unmanageable craft, running the various rapids, to Fort Selkirk at the junction of the Pelly and Lewes. From this point on he

was traversing a river which had been explored by the Western Union Telegraph agents and was already occupied by the fur-traders. Schwatka continued his trip to Fort Yukon and thence to the sea.

In 1884 Lieut. W. R. Abercrombie, U. S. A., was detailed to make an exploration of the Copper River, but ascended it only a short distance. This work was taken up again in the following year by Lieut. Henry T. Allen, U. S. A., who, with four men, landed at the mouth of the Copper River in March, 1885, and made his way up that stream by boat and sled for about 300 miles; then crossed to the Tanana by way of the Suslota Pass, and, securing another boat from the natives, continued his journey to the mouth of the Tanana. With indefatigable energy Allen then, with one companion, crossed to the Koyukuk from near the mouth of the Melozi River, and explored it almost from the Arctic Circle to its junction with the Yukon. Crossing by portage from the Lower Yukon to Norton Sound, he made his way to St. Michael, whence he returned by steamer to the United States. Lieut. G. M. Stoney, U. S. N., and Lieut. J. C. Cantwell, U. S. Revenue Marine Service, explored the Noatak and the Kobuk. In 1889 J. E. McGrath and J. E. Turner located the international boundary on the Yukon and the Porcupine. The public interest aroused by the discovery of the Klondike (1897) induced Congress to make appropriation for systematic surveys and explorations by the United States Geological Survey. The Susitna, Kuskokwim, White, and Tanana rivers were explored in 1898, and the Chandlar and Koyukuk rivers in 1899. In 1901 a United States Geological Survey party made a trip the entire length of Alaska, from the southernmost limit to Point Barrow; while another explored the headwaters of the Allen and Kobuk rivers and followed the latter to its mouth at Kotzebue Sound. In 1902 the western front of the Aleutian Range was explored. By 1905 over one-fifth of the Territory had been surveyed and less than one-quarter remained unexplored. In the meantime settlements had rapidly increased both in the interior and along the coast. But many of those founded during the gold craze of 1897-98 were short-lived, for at that time the entire placer-mining industry could not support a population of more than a few thousand. Conditions, however, were completely changed by the discovery of the Nome gold fields (see *Mining*), since which time Alaska has been very prosperous.

Boundary Dispute. When the United States acquired Alaska (1867), its eastern boundary had been fixed by the terms of a treaty made between England and Russia in 1825. At the time this treaty was negotiated England made a determined effort to secure a Pacific outlet for her fur trade, which even then had reached the headwaters of westerly flowing rivers. Russia, however, maintained that the coastal strip as far south as lat. $54^{\circ} 40'$ was hers by right of discovery and occupation, and forced England to accede to her demands. Article III of this treaty, delimiting the first section of the boundary, provides that it shall run from the southernmost point of Prince of Wales Island ($54^{\circ} 40'$), ascend to the north along Portland Canal to that part of the continent where it strikes the 56th parallel, and thence follow the summit of the mountains parallel to the coast as far as the intersection with the 141st meridian,

from which point the 141st meridian shall serve as the line of demarcation between Russian and British possessions. It provided, furthermore, that whenever the summit of the mountains (north of lat. 56°) shall prove to be more than 10 marine leagues from the ocean, the boundary shall consist of a line parallel to the windings of the coast and never exceeding 10 marine leagues therefrom. For upwards of 50 years this delimitation of the boundary appears to have satisfied England and Russia and the United States, for no question was raised regarding it. In 1835 the Hudson's Bay Company attempted to establish itself in what is now southeastern Alaska, but was promptly ejected by the Russian authorities and received no support from England. The conflict between the two rival fur-trading interests was settled by the Hudson's Bay Company leasing a strip of the mainland. That part of the boundary which followed the 141st meridian (north of Mount St. Elias) was absolutely fixed, but to the south the line was less easily defined. As there was no well-defined range of mountains running parallel to the coast, it was generally conceded that the line should lie everywhere 10 marine leagues from tidewater following the sinuosities of the coast, and it was thus indicated on all British and American maps up to about 1885. Meanwhile the discoveries of gold in the inland region made an outlet to the coast all-important to the Canadians. They claimed that the 10 marine leagues should not be measured from the actual shore line, but from a line connecting headland to headland, and even went so far as to state that the boundary should not follow Portland Canal but Clarence Strait. If this claim had been recognized, it would have thrown into Canada the heads of the longer fiords, as well as several of the southern islands (Revillagigedo, Gravina, etc.) of the archipelago. It would have given the Canadians a seaport on Lynn Canal and left the United States with a series of narrow, broken strips of mainland. When this contention was officially put forth in 1888, surveys of the disputed strip of territory were undertaken by mutual agreement. Thus matters went on, until the discovery of the Klondike gold fields (1896) brought the affair to an issue. The people of Alaska were justly indignant that the dispute was not settled. In a number of instances the local officers came to a clash within the disputed territory. On Jan. 24, 1903, a treaty was signed between the United States and Great Britain creating the Alaska Boundary Tribunal, to consist of six impartial jurists, three from each country to settle the dispute. Henry Cabot Lodge, Elihu Root, and George Turner represented the United States, while Richard Everard Alverstone, Lord Chief Justice of England, and Louis Amable Jetté and Allen Bristol Aylesworth, Canadians, represented Great Britain. The tribunal met in London on Sept. 3, 1903, and on October 20 a decision was reached by a majority, the United States representatives and Lord Alverstone voting against the two Canadians, which was an almost complete vindication of the United States contention, though the actual demarcation of the boundary threw about one-third of the disputed area into Canada. By this decision the Canadians were finally shut off from the sea-coast north of $54^{\circ} 40'$. The larger entrance to Portland Canal was given to Canada and the boundary established through Pearse Canal. Surveys to locate these boundaries were

at once begun and continued through the years following.

Coal Land Dispute. The controversy which has marked the attempts to open up the coal deposits of Alaska has been one of the most prominent features of its political history. Suspicion of fraud and monopoly has naturally induced extreme caution; on the other hand, delay in the development of the coal resources has caused equally natural discontent within and without the Territory. The whole question, moreover, has been confused by its intimate connection with a recent and still beclouded partisan controversy.

The situation and extent of the coal deposits of Alaska have been noted in the paragraph on *Geology and Mineral Resources*. The application of as much of the public land laws of 1873 as relate to coal lands was extended to Alaska by act of June 6, 1900. Since these laws, however, contemplated a public survey prior to location, they were not effective in Alaska. This defect was remedied by a supplementary act of April 28, 1904, which permitted individuals to locate claims of 160 acres by permanent monuments, accompanying their applications for entry, to be made within three years, by plats and notes of private surveys. An executive order of Nov. 12, 1906, withdrew all coal lands in Alaska from entry, being modified by a later order so as not to apply to locations made prior to that date.

Under the Act of 1904 and previous to the executive order of 1906, claims were made covering nearly all the deposits of the Bering River field. Since the law permitted claims to be made in person or by power of attorney, agents were active, and most of the claims occurred in groups, which passed commonly under the names of the agents. The "Cunningham group" was the most notable of these, partly because of the value of the deposits it covered, but largely because the claims it comprised progressed farthest toward final patent and brought the coal land dispute to a head. This group was in the Bering River field, and consisted of 33 adjoining claims of approximately 160 acres each, of which one was held directly by the agent, Clarence Cunningham. Preliminary steps were taken in 1903, and the claims were registered in 1904.

In general, the sources of fraud feared in Alaskan coal cases have been: first, "dummy" claimants; second, collusion between bona-fide claimants to operate corporately. Especially keen has been the fear of monopoly by the Alaska Syndicate, otherwise "The Morgan-Guggenheim Syndicate,"—a fear which, whatever its basis in fact, remains one of the controlling factors in the Alaskan situation. The applicants in the Cunningham cases were, in the main, substantial business men of the Northwest, and were hardly suspected of being 'dummies.' The possibility of collusion was the subject of an investigation stretching over seven years. Preliminary inquiries were made in 1905 by a special agent of the Land Office, lapsing until Aug. 7, 1907, when an uncertain report was made upon 25 of the 33 claims. In the meantime, in the spring of 1907, Richard Ballinger, Commissioner of the Land Office from March 5, 1907, to March 5, 1908, ordered Horace T. Jones to conduct a vigorous inquiry. Mr. Jones's final report of November 1 urged further investigation. At the Commissioner's order, Luther R. Glavis,

Chief of the Field Division at Portland, took up the inquiry. On Dec. 23, 1907, Mr. Ballinger ordered the claims clear-listed, but, upon protest from Mr. Glavis in the field, this order was revoked in January when the claims were all but patented. On March 6 the affidavit of Clarence Cunningham was secured, to the effect that his clients had nothing to do with the Guggenheim interests. Later evidence showed, however, that on Dec. 7, 1907, the Guggenheim Syndicate had taken up an option on one-half interest in the Cunningham properties. Furthermore, the affidavit, in ridiculing the impracticability of the existing coal land laws, virtually confessed an intention to work the claims together.

The impracticability of working a 160-acre claim independently under the rough-surface conditions of Alaska was the subject of a remedial act of May 28, 1908, which permitted individual claims, thus far located and entered in good faith, to be consolidated. Stringent provisions against monopoly were added. This act complicated the questions of fact in the Cunningham cases by a problem of construction. Mr. Ballinger, then in private life, appears by his own statement to have represented the Cunningham interests and to have sought to induce them to proceed under the Act of 1908. On becoming Secretary of the Interior in March, 1909, it was his announced policy to leave the adjustment of Alaskan coal land questions to the Assistant Secretary. From the fall of 1908 to the summer of 1909 the investigation dragged, pending a field investigation. On April 20 and thereafter Mr. Glavis was pressed from headquarters to prepare for an early hearing of the claims. This, he protested, would be disastrous to the government's case. His estrangement with his department increased. Finally, in July, he appealed to the Forestry Bureau, which was legally concerned, since 21 of the claims were in the Chugach National Forest. The intervention of the Secretary of Agriculture secured a postponement of the hearing till October 15. On September 18 Mr. Glavis, who now openly charged officials of the Interior Department with trying to rush through fraudulent claims, was dismissed. The Chief Forester, Gifford Pinchot, espoused his cause, and after a violently denunciatory letter of Jan. 6, 1911, was removed by the President. A Joint Committee of Congress, desired by Mr. Ballinger, investigated the affair, and on December 5 reported, on an almost strictly party division, sustaining the Secretary. No action was taken, but in March, 1911, Secretary Ballinger resigned. Walter L. Fisher became Secretary, March 13, and one of his first undertakings was a thorough trip of investigation through Alaska in the summer of 1911.

The Cunningham claims were finally entered for cancellation on June 16, 1911. This action seemed to signal a wholesale disallowance of the outstanding claims. In June, 1913, of the 1129 coal land claims in Alaska, 765 had been cancelled, and field examination had been completed on the rest. As yet, only two patents to coal land had been granted.

The opening of the Alaskan coal fields, then, remains a problem, depending for its solution in part on railroad development (see *Transportation*), in part on a modification of the coal land laws. Probably some system of leasehold, which Secretary of the Interior Lane urged most

emphatically in 1913, will mark the policy of the future.

The same popular outcry against monopoly in Alaska, and especially against monopoly by the "Morgan-Guggenheim Syndicate," which marked the coal land controversy, was further provoked by an executive order of Oct. 28, 1910, which withdrew about 12,800 acres along Controller Bay from the Chugach National Forest and opened them to private entry. Controller Bay is about 25 miles from the Bering River coal field and is the nearest harbor. Monopoly of the coal through a control of terminal facilities was feared. Richard S. Ryan, president of the Controller Bay Railroad and Navigation Company, had petitioned for the withdrawal in 1909, and after the order of 1910, made three scrip entries, aggregating 159 acres. Complying with a Senate resolution of April, 1911, President Taft defended his action in a special message of July 26, 1911, stating that Mr. Ryan had no connection with the Guggenheim interests and that, in all events, the reservation of 80 rod strips between claims having a frontage of 160 rods on navigable waters, in compliance with the law of 1898, was ample guarantee against any future monopoly of terminal facilities. In an address before the American Mining Congress on Oct. 27, 1911, after his return from Alaska, Secretary Fisher indorsed the President's view and also depreciated the value of Controller Bay as a harbor.

In August, 1912, James Wickersham, Progressive Republican, was reelected delegate to Congress by a large plurality. In 1913 Major J. F. A. Strong of Iditarod was appointed Governor.

For an account of the remarkable eruption of the Katmai volcano on June 6, 1912, see VOLCANOES.

ALASKA SA'BLE. A name sometimes applied to the fur of skunks when dyed and prepared for the market.

ALASKA-YUKON EXPOSITION. See SEATTLE.

ALAS'KITE. An igneous rock that consists essentially of quartz and alkali-feldspar. It represents the extreme in silica content of the commoner types and includes many that hitherto have been described as granite, rhyolite, aplite, and similar acidic rocks. The name has been recently introduced in petrology (first employed by Spurr with reference to certain Alaskan rocks), but has gained quite general acceptance among students of that science. See GRANITE.

ALASSIO, à-läs'syô. A seaport of Liguria, Italy, on the Gulf of Genoa, 57 miles by rail southwest of the city of Genoa (Map: Italy, C 3). In winter it is frequented by foreigners, particularly by English-speaking people, and in summer the excellent bathing attracts Italians. The natives are mostly fishermen and boat-builders. Pop., 1901, 5630; 1911, 5558. Consult Scheer's *Alassio und seine Umgebung* (Weisbaden, 1886).

ALAS'TOR (Gk. 'Αλάστωρ). 1. An avenging, haunting spirit. Among the Greeks the name was sometimes applied to Zeus as an avenging deity; also to the Furies. In the Middle Ages it was given to one of Satan's chief ministers, a demon supposed to execute his purposes. 2. A poem by Shelley, published in 1816, entitled in full, *Alastor, or the Spirit of Solitude*.

ALATAU, ä'lä-tou' (Turk. mottled mountain range). A name given to a range of lofty mountains forming the boundary between Turkistan and Mongolia and the northern limit of the great tableland of Central Asia (Map: Asia, G 4). It is made up of three sierra-like subranges, the Dzungarian, the Trans-Ili, and the Kuznets Alatau. These are all grouped around Lake Issik-Kul as a central point. The peaks of the Alatau, which are principally of granitic formation, attain an elevation of over 15,000 feet.

AL'ATER'NUS (Lat.). The old name of a genus which has now been merged with the genus *Rhamnus*. (See BUCKTHORN.) The common European plant which has long been referred to *alaternus* is a large shrub, densely branched, with shining leaves and clusters of small flowers much frequented by bees. The

berries partake of the purgative qualities attributed to *Rhamnus cathartica*.

ALATRI, ä-lä'trè. An episcopal city in South Italy, 9 miles north of Frosinone (Map: Italy, H 6), occupying the site of the ancient Aletrium. Is a summer resort and contains important cloth factories. Ruins in the near-by valley of Cosa exemplify to a marked degree the characteristics of ancient fortifications. There are fine examples of twelfth-century painted wood carving in the church of Santa Maria Maggiore. Pop., 1901, 15,322; 1911, 16,323.

ALATYR, ä'lä-tēr'. The chief town of a district in the government of Simbirsk, Russia, on the Sura, 107 miles northwest of Simbirsk (Map: Russia, G 4). It has two cathedrals, four monasteries, a hospital, schools, etc. Milling, brewing, and brick-making are the principal industries. Pop., 1897, 11,100. It was founded in 1552 by Ivan the Terrible.

ALAUZI, ä'lou-sé'. A town on the Alausí River, in the province of Chimborazo, Ecuador, 75 miles east of Guayaquil (Map: Ecuador, B 4). It is situated 7980 feet above sea level on a fertile plateau of the Andes. Textiles are manufactured. The town is a health resort, as there are hot springs in the neighborhood. Pop., 1910 (est.), 5000.

ALAUZ, ä'lö', JEAN, called LE ROMAIN (1786-1864). A French historical painter, born at Bordeaux. He was a pupil of Vincent and Guérin, director of the French Academy at Rome from 1846 to 1853, and in 1851 was elected a member of the Institute. The principal cause of his reputation was the favor shown him by Louis Philippe, who gave him commissions for several hundred pictures in the Museum of Versailles. He restored several rooms in the Palace of Fontainebleau and decorated the cupola of the Palace of the Senate. His cold and academic art is devoid of true pictorial qualities.

ALAVA. See BASQUE PROVINCES.

ALAVA, ä'lä-vä, DON MIGUEL RICARDO DE (1771-1843). A Spanish general. He was born at Vittoria, Spain, and died at Barèges, France. Sprung from a noble family, he entered the navy in early life, but changed later to the land service. His political conscience was as flexible as his political career was checkered. He abandoned Ferdinand VII for the French in 1808; left the French for the English in 1811, and entered once more into the service of Ferdinand, in 1815, as Minister to The Hague. In 1820 he was leader of the Liberals in the Cortes; in 1822 he fought against Ferdinand's guards at Madrid, and the next year he negotiated with the Duc d'Angoulême for the restoration of Ferdinand to his throne. Fearing Ferdinand's vengeance, however, Alava fled the country. From his exile in England he was recalled by Maria Christina, who made him Ambassador, first to London, in 1834, and, in 1835, to Paris. The following year he refused to swear to the constitution of 1812, reestablished by the insurrection of La Granja, and retired to France.

ALAY, ä-lī'. A Turkish ceremony on the assembling of the forces at the breaking out of a war, the chief feature of which is a public display of the sacred standard of Mohammed, which may be looked upon only by Moslems and touched only by emirs. It is a capital offense for a Christian to look upon the banner.

ALB. See COSTUME, ECCLESIASTICAL.

ALBA, ä'l'bä (ancient Lat. *Alba Pompeia*, White Pompeia). An episcopal city of the prov-

ince of Cuneo, North Italy, situated on the right bank of the Tanaro, 31 miles southeast of Turin (Map: Italy, C 3). The vast Gothic cathedral of San Lorenzo dates from 1486, and there are rich collections of ancient manuscripts, coins, vases, and household utensils. The country produces wine, grain, cattle, silk, truffles, and cheese. Pop., 1901, 12,800; 1911, 14,176.

ALBA, ä'l'bä, DUKE OF. See ALVA.

ALBACETE, ä'l'bä-thä'tä. A town of Spain, capital of the province of the same name, in Murcia. It is situated at an altitude of more than 3800 feet, 138 miles southeast of Madrid, and on the railway which runs from Madrid to Alicante (Map: Spain, E 3). It stands in a fertile but treeless plain; consists of an upper and a lower town, the latter of which, being modern, is built with some degree of regularity, and contains a number of squares, hospitals, a bull ring, and many good houses. It is a place of considerable trade and is noted in Spain for the manufacture of knives, daggers, and cutlery. There are sulphur mines near by, matches are manufactured, and there is considerable trade in agricultural products. Annual cattle fairs are held here. Pop., 1887, 20,700; 1900, 21,373; 1910, 24,805.

AL'BACORE, or **AL'BICORE** (Portug. and Sp. *albacora*, from Ar. *al*, the + *bakr*, a young camel, a heifer). A tunny, especially the long-finned, or alalonga. See TUNNY.

AL'BA LON'GA. An ancient town of Latium, founded, according to the popular account (Livy, i, 3; Vergil, *Aeneid*), by Ascanius, son of Æneas, on a ridge overlooking the Alban Lake (Albanus Lacus). Here lived several generations of kings, and here were born the twins Romulus and Remus, sons of King Numitor's daughter, Rhea Silvia, by the god Mars. Alba Longa was destroyed under Tullus Hostilius, third king of Rome, and never rebuilt, its inhabitants being removed to Rome (Livy, i, 32). The legend, in its general outline, is doubtless based on facts. In 1817 a remarkable prehistoric necropolis was found here, buried under volcanic ashes and containing burial urns in the form of round huts. (See ARCHÆOLOGY.) The site of the town seems to have been near the modern Castel Gandolfo. The Emperor Domitian had a villa there.

ALBAN, ô'l'ban, SAINT. According to legend, the first martyr of Britain. He was born at Verulam in the third century, and after having long lived as a heathen, was converted to Christianity, but put to death in 304. His day is June 22. The town of St. Albans, which bears his name, is believed to stand on the site of his birthplace or the scene of his martyrdom. See ST. ALBANS.

ALBAN LAKE. See ALBA LONGA.

ALBA'NI. In ancient times, a people in Asia inhabiting the country between the Caucasus and the Cyrus River, and between Armenia and the Caspian Sea, corresponding with the modern Shirvan and southern Daghestan. The ancient Albanians were described as tall, strong, and of graceful appearance. They were nomads. A Roman army under Pompey first encountered them in 65 B.C. and found a force of 60,000 infantry and 22,000 cavalry opposing it. Pompey secured a nominal submission, but they continued practically independent.

ALBANI, ô'l'bä-nī. A rich and celebrated family of Rome, who came originally from Albania in the fifteenth century and settled first

at Urbino. The great influence of the family dates from the accession (1700) of Giovanni Francesco Albani to the papal throne as Clement XI. It has since furnished a succession of cardinals. Cardinal Alessandro Albani (q.v.) made the celebrated art collection of the Villa Albani at Rome.

ALBANI, ALESSANDRO (1692-1779). A nephew of Pope Clement XI, who insisted on his entering the priesthood and to whom Albani's worldly life later gave much trouble. He was created Cardinal by Innocent XIII in 1721. He was born at Urbino and was a brother of Annibale Albani. Under Maria Theresa, he served as Minister at the Papal Court and Crown-Protector of Austria. After his death his collection (at Rome) of statues and other works of art was bought by George III.

ALBANI, EMMA (1852—). The stage name of Marie Louise Cecilia Emma Lajeunesse. A Canadian dramatic soprano. She was born at Chambly, near Montreal, Nov. 1, 1852. She made her first public appearance at Albany, N. Y., when but 12 years old. She studied under Duprez, of Paris, and Lamperti, of Milan, made her début at Messina as Amina in *La Sonnambula* (1870), and has sung in opera in London, Paris, Berlin, St. Petersburg, and many cities of the United States. Among her impersonations are Senta in the *Flying Dutchman*, Elisabeth in *Tannhäuser*, Elsa in *Lohengrin*, Marguerite, Lucia, Mignon, Ophelia, and Isolde. Madame Albani has also sung in oratorio. She married Ernest Gye, the impresario, in 1878. Consult H. S. Edwards, *The Prima Donna* (London, 1888). She published her memoirs under the title *Forty Years of Song* (London, 1911).

ALBANI, FRANCESCO (1578-1660). An Italian painter, one of the principal representatives of the Eclectic school of Bologna (q.v.). He was born at Bologna, where he studied first with Calvaert, a Netherlander, and then in the school of the Carracci (q.v.), chiefly under Agostino. To his earliest period belongs the cycle of frescoes in Palazzo Fava (1598) representing the "Life of Æneas," and the "Life of the Virgin" in the Palazzo dei Conservatori, Rome. About 1600 he removed to Rome and became an assistant to Annibale Carracci, whose influence gradually supplanted that of Agostino in his works. He took a prominent part in the former's frescoes in Palazzo Aldobrandini, Rome, and practically executed those representing the "Life of San Diego" in San Carlo degli Spagni, Rome, now in the museum of Barcelona. His other frescoes include the important ceiling of the Palazzo Torlonia, Rome, decorated with subjects from Ovid, those of the choir chapel of Santa Maria della Pace, Rome. His easel pictures of this period are hard to distinguish from Annibale's. By him are probably the "Ascension of the Virgin" and "John the Baptist," in Dorchester House, London; "Pan Teaching Apollo the Flute" and "Silenus" in the National Gallery, and perhaps the celebrated portrait called "Beatrice Cenci," attributed to Guido. After his return to Bologna in 1616, he married his second wife, Doralice, by whom he had 10 beautiful children, who are said to have served as models for the cupids of his pictures. Wealthy and popular, he led a happy life. His altar-pieces of the period are not important, the best being an "Annunciation" in San Bartolommeo, Bologna; but the smaller religious pictures are better in quality,

particularly his "Holy Families" in Dresden, Louvre, etc. Best of all are his mythological subjects, to which he was by temperament adapted. Prominent among these are four circular panels of antique love subjects in Palazzo Borghese, Rome, often repeated in more or less independent versions. Best known of all his paintings are the "Dancing Cupids" in the Dresden Gallery, which also possesses 10 others; "Cupid Disarmed," "The Toilet of Venus," and 13 others are in the Louvre. The Museum of Turin is particularly rich in his mythological subjects. His last years were embittered by his fierce rivalry with his former friend and lifelong competitor, Guido Reni, and by the loss of his fortune through the mismanagement of his brother. At best his paintings are bright and delicate in color and elegant and graceful in form. The landscapes are particularly charming. His work, however, is unequal in quality, that of the last period being generally inferior. Consult the references under CARRACCI.

ALBANI, MATTHIAS. The name of two famous Tyrolese violin makers, father and son. The father was born in 1621 at Bozen. He was a pupil of Stainer. He died in 1673. The son studied with the masters of violin making at Cremona and afterward settled at Rome. The instruments he made between the years 1702 and 1709 are exceedingly valuable and are by some considered equal to those of Amati.

ALBANI, VILLA. The palace of the Albani family at Rome, containing a famous collection of antique works of art.

ALBANIA, ăl-bă'nî-ă; *Mod. Gk.* ăl'vâ-nyē'ă (Turk. *Arnaut*). An independent principality in the western part of the Balkan Peninsula, extending along the Adriatic from Montenegro to Greece and separated from Serbia mainly by the river Drin and Lake Ochrida. In a wider sense the name is applied to the whole region formerly embraced in the Turkish vilayets of Janina, Monastir, Scutari, and a part of Kossovo, but now annexed to Montenegro, Serbia, or Greece (Map: Balkan Peninsula, C 4). It takes in ancient Illyria, most of Epirus, and parts of Macedonia, and covers an area estimated at from 12,000 to 22,000 square miles, according as the name is taken in a narrower or broader sense. It borders on Montenegro and the sanjak of Novibazar on the north, Macedonia on the east, Greece on the south, and the Adriatic Sea on the west. The entire country is traversed by numerous high mountain chains, alternating with long and narrow valleys, running from northwest to southeast. The elevated plateaus found among the mountain chains are mostly fruitful and well populated, and some of them inclose lakes. The rivers of Albania, of which the most important are the Boyana, Drin, Devol, and Voyussa, have an exceedingly tortuous course, on account of the mountainous character of the surface. The climate is healthful and moderate and the soil for the most part fertile. Grain and tobacco grow well, and the olive is cultivated extensively and widely exported. There are also shipments of fish and sea salt.

There is no actual coördinated government among the tribes occupying this large area, who are mostly Mohammedans, but all have been, in a loose way, subject to the rule of Turkey till the Balkan War of 1912. It was then the desire of Serbia to annex the whole of this

State, or at least to secure the valuable port of Scutari (Albanian: Schodra), but the move in this direction was blocked by the European powers at the instance of Austria.

There is hardly such a thing as education in Albania, although in some parts there are a few schools and at Scutari is a Jesuit college. The sons of some of the leading families are sent abroad for education, and there appears now to be an awakening of the younger element to the importance of acquiring knowledge.

The population of Albania, within the broader limits given above, is probably not far from 2,000,000, of which some 250,000 are Serbs and Bulgars. Albania proper, or the region which is inhabited mainly by Albanians, has a much smaller population (less than 1,000,000). The Albanians, or Arnauts, who call themselves Shkipetars (Skipetars), are the descendants of the ancient Illyrians, and occupy a unique position among the Caucasian races. Only slightly civilized and very warlike, they keep the country in a constant state of turmoil. The differences in religion of the various tribes, their strong feeling of clanship, together with the warlike spirit of the people, afford ample opportunity for civil strife. In their form of government the Albanians still retain some of the patriarchal institutions. The Mohammedan religion is professed by most of them, while the Christians number 190,000, divided almost equally between Roman and Greek Catholics. There are nearly 200,000 Albanians in Greece, found chiefly in Attica, Megaris, and the islands of the Ægean; about 100,000 in southern Italy, and smaller groups in the Slavonic districts of southern Austria-Hungary. The turbulent tribes which inhabited the region in antiquity resisted all attempts at subjugation, and except during the reign of Pyrrhus of Epirus (296-272 B.C.) never acknowledged any supreme authority. In the Middle Ages the inhabitants displayed the same obstinacy in their resistance first to the Greek Empire, then to Serb and Bulgarian invaders, and finally to the Turks. Their great leader, George Castriota, or Scanderbeg (1404-68), overwhelmed twenty-three Ottoman armies, some of them commanded by the Sultan in person, and though after the fall of Scutari, in 1478, the nominal authority of the Porte was acknowledged, the country at all times enjoyed a very large measure of freedom. The conversion of the majority to Mohammedanism in the sixteenth and seventeenth centuries at once distinguished them from the neighboring Serbs, Bulgars, and Greeks who remained Christian, and enabled them to play an important rôle in the history of the Ottoman Empire. From 1807 to 1822 Albania was practically independent under the rule of Ali Pasha (q.v.), the Lion of Janina. The feeling of inveterate hostility for the Greeks kept the Albanians from embracing their cause in the war of liberation. The Turkish Revolution of 1908 (see TURKEY) added impetus to the chronic disorders and insurrections which reached their climax in the revolt of the powerful Christian tribe of Malissori in 1911-12. This revolt, together with concurrent outrages in Macedonia, was one of the causes of the Balkan War of 1912-13 (q.v.), the outcome of which was such as to preclude the further exercise of Turkish dominion in that part of Europe. It had been hoped by the Balkan allies—Greece, Servia, Montenegro and Bulgaria—that they might partition Albania among themselves, but the persis-

tent opposition to such a plan on the part of Austria-Hungary and Italy, both of which had important political and economic interests at stake, caused the European Powers to intervene and to erect a portion of Albania into an autonomous principality under their own protection. By a series of arrangements during 1912-13, the territory formerly embraced under the generic name of Albania was distributed as follows: Ipek and Jakova were awarded to Montenegro; Servia secured Prisrend, Dibra, and Monastir; Greece obtained Janina; while to the principality of Albania were guaranteed Scutari, Alessio, Durazzo, Avlona, and Koritza. In the course of the Balkan War two provisional governments were set up in Albania—a republican form at Valona under the presidency of Ismail Kemal Bey, and a monarchical form under Essad Pasha, an experienced soldier, who enlisted the support of the northern tribesmen. In October, 1913, an International Commission of Control, consisting of six members, chosen one each by Austria-Hungary, Italy, Russia, Great Britain, France, and Germany, was established at Valona. The Powers invited Prince William Frederick of Wied to assume the crown of the principality. Consult: H. Callan, "Albania and the Albanians," in *Scottish Geographical Magazine*, vol. xv (Edinburgh, 1899); P. Traeger, "Mittheilungen und Funde aus Albanien," in *Zeitschrift für Ethnologie*, vol. xxxii (Berlin, 1900); Durham, *High Albania* (London, 1909); Grothe, *Durch Albanien und Montenegro* (Munich, 1913).

ALBANIAN LANGUAGE. The Albanian forms one of the eight chief divisions of the Indo-Germanic languages (q.v.) and is a descendant of the ancient Illyrian, of which only a few words are preserved. On account of the large number of Greek loan-words in its vocabulary, the Albanian was formerly thought to belong to the Hellenic branch of dialects; but it is now known to be quite independent and to form a branch by itself, akin rather to the Slavic family than to the Greek group. Geographically, the language is not confined to Albania alone, but may be traced also in southern Italy and Sicily. Two main dialect-groups of the language may be distinguished. The northern class, called Gegish, is the more primitive, while the southern, or Toskish, is permeated with loan-words. Of all the languages of the Indo-Germanic group, Albanian has been the most changed in vocabulary by borrowed words, although it has preserved in the main its structure. The vocabulary of loan-words is chiefly Latin, augmented by Slavic and Greek accretions, and in Gegish especially, by numerous Turkish words. From the grammatical point of view, its main characteristic is the abundant use of auxiliaries. The verbs have eight conjugations, distinguished by their infinitives. If poor in intellectual terms, it abounds in physical terms. In point of literary culture Albanian is the most backward of all the Indo-Germanic languages, and it can scarcely be said to possess a literature. While it is rich in folk-songs, tales, and proverbs, only within a comparatively short time has any systematic endeavor been made to cultivate the literary potentialities of the people. In the Gegish dialects the alphabet usually employed is the Roman. Consult: G. Meyer, *Kurzgefasste albanesische Grammatik* (Leipzig, 1888); *Etymologisches Wörterbuch der albanesischen Sprache* (Strassburg, 1891); Pedersen, *Albanesische Texte* (Leipzig, 1895); Pek-

mezi, *Grammatik der albanesischen Sprache* (Wien, 1908); Johl, *Studien zur albanesischen Etymologie und Wortbildung* (Wien, 1911); Wiegand, *Albanesische Grammatik im Südgermanischen Dialekt* (Leipzig, 1913); Lambertz and Pekmezi, *Lehr und Lesebuch des Albanischen* (Vienna, 1913).

ALBAN (äl'ban) **MOUN'TAINS**. A group of volcanic mountains in Central Italy, 13 miles southeast of Rome, with several extinct craters, two of which are occupied by sombre Lake Albano and beautiful Lake Nemi (Map: Italy, G 6). The central crater terminates in Punta Faete and in Monte Cavo, 3145 feet above the sea, on which stood the temple of Jupiter Latiaris, where the sacrificial festival of the *Feriae Latinae* was celebrated annually. The scanty ruins of the temple disappeared about 1777, when Cardinal York, the last of the Stuarts, built on the spot a Passionist monastery. From here there is a splendid view of the sea, the Campagna, and the surrounding mountains. The beauty of the scenery and the agreeableness of the climate have made the Alban Mountains a favorite summer resort of the Romans from the most ancient times. Places that are worthy of a visit by the tourist are Frascati (q.v.), Albano, Grotta Ferrata, Marino, Castel Gandolfo (q.v.), and Rocca di Papa. The site of Alba Longa (q.v.), Rome's mother city, was on the east side of Lake Albano.

ALBANO LAZIALE, or **ALBANO**, äl-bä'nö lä-t-syä'lä. A town of Italy, about 12 miles southeast of Rome, on the declivity of the lava walls which encompass Lake Albano (Map: Italy, G 6). It is the seat of a bishop and is surrounded by handsome mansions of the wealthier Romans. Pop. (of the commune), 1911, 8826. The town is celebrated for the beauty of its scenery and the purity of its air. It is on the opposite side of the lake from the site of Alba Longa and owed its origin to the villas of ancient Roman magnates, such as Pompey, Domitian, and Clodius, which are replaced in our own times by the villas of the princely families of the Barberini, Altieri, and others. There are a large convent, and a museum of antiquities from Alba Longa. An excellent wine is produced in the environs. Near the town, on the old Appian Way, are found the remains of an amphitheatre and ancient tombs. A notable modern structure is the viaduct passing over the deep valley between Albano and the town of Ariccia. It is 182 feet high, 988 feet long, and was erected by Bertolini during 1846-53. The Alban Lake (Lago di Albano or Lago di Castello), is formed in the basin of an extinct volcano, has a circumference of 6 miles, and a depth of about 560 feet. It abounds in fish and has an elevation of about 960 feet above sea level. Ancient writers say that, while the Romans were at war with the Veientes (398 B.C.), this lake rose to an extraordinary height in the heat of summer. Etruscan diviners declared that the conquest of Veii depended upon letting off the waters of the lake. Stimulated by this, the Romans, under the direction of the Etruscans, opened an emissary or tunnel through the lava wall on the northwest. In the execution of this work they acquired the art of mining, which they now applied to undermine the walls of Veii. The tunnel, which still remains, and still fulfills its ancient office, is more than a mile in length, with a height of 7 feet and a width of 4 feet. It is the only outlet for the

waters of the lake. On the eastern bank of the lake rises Monte Albano, or Monte Cavo, the ancient Albanus Mons, about 3100 feet high, which commands an extensive and magnificent view. Upon its summit once stood the magnificent temple of Jupiter Latiaris, which was approached by a paved way, for the ascent of the solemn processions of the Latin confederation (*Feriae Latinae*) and for the ovations of Roman generals. The road remains, in great part, perfect to this day. The Albano stone, called peperino, was much used in Roman buildings. It is a kind of volcanic tufa, of an ash-color, and is still quarried extensively at Albano.

ALBANS, öl'banz, SAINT. See SAINT ALBANS.

ALBANUS LACUS. See ALBA LONGA.

ALBANY, äl'bä-nī. A seaport and municipality of Plantagenet Co., western Australia, on Princess Royal Harbor, an inlet of King George's Sound, 352 miles from Perth by rail (Map: Australia, D 6). The harbor is one of the finest in Australia and is well fortified. Albany is a port of call for all steamers to Australia taking the Cape route. Its equable climate has made it the health resort of the State. The United States has a resident consular agent. Pop., 1911, 3586.

ALBANY. A city and the county-seat of Dougherty Co., Ga., 107 miles south by west of Macon, on the Central of Georgia, the Atlantic Coast Line, the Seaboard Air Line, the Georgia Southwestern and Gulf, the Georgia Northern, and the Albany and Northern railroads, and on the Flint River, at the head of high-water navigation (Map: Georgia, B 4). It is in an agricultural region and controls large commercial interests, particularly in cotton, cottonseed oil, bricks, fertilizers, lumber, melons, pecans, etc. The city has paved streets, an electric car line, is the home of the Georgia Chautauqua and is noted for numerous artesian wells, which are the exclusive source of the water supply. Settled in 1836, Albany was incorporated two years later. The government, under a charter of 1899, is administered by a mayor, elected biennially, and a council, whose consent is required for all appointments of administrative officials made by the mayor. The water works, gas plant, and electric light plant are the property of the municipality. It also has a public library, a Federal building, court-house costing \$125,000, a hospital, and a Confederate monument. Pop., 1900, 4606; 1910, 8190; 1913 (est.), 12,000.

ALBANY. A city and the county-seat of Gentry Co., Mo., 50 miles northeast of St. Joseph, on a branch of the Chicago, Burlington, and Quincy Railroad, with motor-bus connection with the St. Louis and Omaha (Map: Missouri, B 1). The city has fine residences, is surrounded by rich farming country, and has some commercial and industrial interests. It is best known, however, as the seat of Palmer College, which was recently removed from Le Grand, Iowa, and replaces the Northwest Missouri College. It also has a Carnegie library. Albany is governed, under a charter of 1897, by a mayor, who is elected for two years, and a city council. The water works and electric light plant are owned and operated by the municipality. Pop., 1890, 1334; 1900, 2025; 1910, 1922.

ALBANY. Capital of New York State, the county-seat of Albany County, and an important railroad and commercial city. It is on the west bank of the Hudson River, nearly 6 miles below the head of navigation, 145 miles north of New

York City, and about 200 miles west of Boston (Map: New York, G 3).

A narrow alluvial plain extends along the river, and from this the ground rises sharply to a sandy plateau about 200 feet above tide level, with valleys separating the four ridges into which the slope is divided. The principal streets are Broadway, North and South Pearl streets, which run parallel to the river, and State Street, which runs westward, ascending the face of the hill at a very steep grade. The most striking feature as well as the most important edifice in Albany is the Capitol, which is built of Maine granite, in the Renaissance style. Since its corner-stone was laid, in 1871, it has cost over \$24,000,000. The edifice has been built with the advantage of large ideas and limitless resources, and the disadvantages of a succession of architects with changing views; these circumstances have left their imprint on the structure. But when all has been said in criticism of details, the general plan, and unused possibilities, it must be ranked among the great buildings of the country. Within are rooms for the Assembly, Senate, Court of Appeals, the Governor, and other State officials. Many relics of the Revolution and Civil War are kept in a military museum on the second floor. Facing the Capitol are the State Hall, and the city hall, of reddish granite, with Romanesque doorways and majestic campaniles, while opposite the Capitol, on Washington Avenue, stands the new State Education Building, a notable structure of four stories and basement with imposing marble colonnade, which, besides offices for the Board of Regents and the Department of Education, contains the State Library and the State Museum. The Federal Building, containing the custom house and post-office, is at the foot of State Street, and on the same street, about a block below the Capitol, is the building known as Geological and Agricultural Hall, which formerly housed the State Museum of Natural History, but which since the transfer of that museum to the State Education Building is used exclusively by the State Department of Agriculture. In the residence districts the most important architectural features are the churches, four of which have more than a local interest: the North Dutch Church, St. Peter's Church, "one of the richest specimens of French Gothic in this country," the cathedral of All Saints, and the cathedral of the Immaculate Conception, with lofty double spires and a spacious interior treated with taste and dignity.

Other important buildings are the Union Station, the Hotel Ten Eyck, the Albany Academy, the new High School, the Albany Institute and Historical and Art Society, the Homœopathic Hospital, Harmanus Bleecker Hall, and the State Armory. The third Van Rensselaer manor house, built in 1765, was removed in 1893 to the campus of Williams College at Williamstown, Mass. The old Schuyler mansion, for many years used as an orphan asylum by the Sisters of Charity, was recently purchased by the State and will be used as a museum. Albany is the seat of a State normal college, and contains the law and medical departments of Union University at Schenectady, and also Dudley Observatory, in the southwest corner of the city. Near the latter are the pavilions of the hospital, built in 1899, and of the orphan asylum, built in 1906; and in the same section is the county penitentiary, opened in 1848,

which confines annually between 300 and 400 prisoners, the majority sentenced for short terms.

The city has 402 acres devoted to parks, the largest of which, Washington Park, in the western part of the city, contains a lake 1700 feet long, and two fine bronzes: Calverley's statue of "Robert Burns," and Rhind's statue of "Moses at the Rock of Horeb." In the beautiful Rural Cemetery about 4 miles north of the city is the tomb of President Arthur.

Trade and Transportation. Albany is a terminus of the Boston and Albany Railroad, and the division terminus on the main lines of the West Shore, the New York Central and Hudson River and the Delaware and Hudson railroads. It is thus at the intersection of the great thoroughfares of traffic and travel from Boston and New York to the west and the north. It also has direct steamboat communication by day and night lines with New York and Hudson River points, while by the Erie and the Champlain canals it has water routes to the interior of the State and the west and north. It still remains an important centre of passenger travel, but the great bulk of freight movement now passes the city in through shipments. Manufacturing interests in Albany have increased considerably. The most important industries now include iron, wood, and brass manufactures; printing and engraving; shirt, collar, and cuff manufactures; manufactures of clothing, caps, and knit goods; brewing; tobacco and cigar manufactures; and carriage and wagon building.

The city has about 41 miles of street railways, and electric lines connect also with towns some distance away. There are three bridges across the river to Rensselaer, two of which are used by the railroads and foot passengers, and the third is open for foot and wagon traffic. The water supply is furnished in part by a gravity supply, from a lake 5 miles distant; but a large proportion is pumped from the Hudson River, an improved filtration system having been adopted for the latter supply. There are about 100 miles of paved thoroughfares, some of which are laid with asphalt and brick and creosoted wooden blocks, though most of the important streets are paved with granite blocks and many still have cobblestone pavements.

Administration. As provided by legislative enactment for cities of the second class, the government is vested in a mayor, elected biennially; a city council, the president being elected at large and the aldermen by wards; and administrative departments constituted as follows: *Finance*—comptroller, treasurer, and a board of estimate composed of the mayor, comptroller, corporation counsel, president of the common council, city engineer, and treasurer; *Public Works*—commissioner, who appoints superintendents of water works and parks, city engineer; and a board of contract and supply, composed of the mayor, comptroller, commissioner of public works, corporation counsel, and city engineer; *Public Safety*—commissioner, who appoints chiefs of police and fire departments, with their subordinates, and a health officer and district health physicians; *Public Instruction*—three commissioners of education (term, six years), who appoint the superintendent of schools and teachers; *Assessment and Taxation*—four assessors, two elected every two years for a term of four years; *Charities and Correction*—commissioner, who appoints an overseer of the poor

THE CAPITOL AT ALBANY

and assistants; *Judiciary*—one police court justice who holds office six years, and three city court justices; *Law*—corporation counsel, who appoints an assistant and subordinates. Of these officials, the comptroller, treasurer, assessors, and police and city court justices are elected; all others are appointed by the executive. A sealer of weights and measures is also appointed by the mayor, and supervisors are chosen by popular election.

The annual expenditures of the city amount to over \$3,000,000, the principal items (for maintenance and operation) being about \$187,000 for the police department, \$198,000 for the fire department, \$411,000 for schools, \$400,000 for bureau of water, and \$90,000 for street lighting.

Pop., 1870, 69,422; 1880, 90,758; 1890, 94,923; 1900, 94,151; 1910, 100,253, a gain of but 6.5 per cent in the decade 1900-10.

History. Albany claims to be the second oldest permanent settlement within the limits of the 13 colonies, and has great historical significance on account of its strategic importance during the century of conflict between the English and French in America and in the American Revolution. As early as 1524 the French navigator Verrazano sailed up the Hudson River, and about 1540 a French trading post was set up near the present site of Albany. But this proved only temporary, and the continuous history of the place dates from the effective discovery of the region by Henry Hudson in 1609. Hudson's voyage was followed by Dutch traders, who, in 1614, established a trading station on Castle Island under the name of Fort Nassau. Three years later, the trading post was removed to the mainland. The first actual settlers, however, were 18 Walloon families, who were sent out by the Dutch West India Company in 1623. During the same year Fort Orange, or Aurania, was built, near the site of the present Steamboat Square. Three years later an Indian war broke up the settlement for a time, the families being removed to Manhattan and only a small garrison left in charge of the fort. In 1630 Kiliaen Van Rensselaer bought an extensive tract of land surrounding Fort Orange and sent over settlers from Holland, who rented their land from him as their patroon, or lord of the manor. (See PATROON.) The principal settlement of this patroonship or colony of Rensselaerswyck was located in the immediate vicinity of the company's fort and became the nucleus of the present city. The settlement remained a part of the patroon's colony until 1652, when, after much friction between the patroon's agents and the officials of the company, it was, by a high-handed measure of Director-General Stuyvesant, declared to be independent of Rensselaerswyck and annexed to Fort Orange. The settlement was originally known as the *Fuyck*, or hoop-net, from the converging lines of its streets; afterward it was called Beverwyck, and on the transfer of New Netherland to the English, in 1664, the name of the village was changed to Albany, in honor of the Duke of York and Albany, afterward James II. In 1686 Albany received a city charter from Governor Dongan, providing for an elected council and a mayor to be appointed by the Governor. The first Mayor, Peter Schuyler, continued to serve until 1694. The settlement continued to be inhabited mainly by the Dutch, but the increase in the English population is indicated by the erection of an English church in 1714.

As a frontier town open to Indian attacks, Albany was protected not only by the fort, but by a stockade surrounding the compactly built area. During the French and Indian wars the city was the storehouse for munitions of war, the rendezvous for the troops, and a place of safety for refugees and wounded soldiers. In 1754 there was held at Albany the first general Congress (see ALBANY CONVENTION) of all the colonies, at which plans of union were discussed.

Burgoyne's campaign in 1777 was directed against Albany, as the key to the situation in the north; but the battle of Saratoga preserved this strategic point to the patriots. During the next 20 years Albany was at times the headquarters of the State government; in 1797 it was made the permanent capital of the State, and the first State House was built a few years later.

In 1820 Albany had a population of only 12,630; but the Erie Canal opened a new field for commercial activity and brought a rapid development. By 1840 the population was 33,721, or nearly treble that of 20 years before; by 1860 it had reached 62,367, but since then the increase has been at a slower rate. In 1839 there began the "Anti-Rent War" (see ANTI-RENTISM), the result of an attempt by the Van Rensselaer heirs to collect the quit-rents on the old leases made in the pre-Revolutionary days. Albany has been visited by several disastrous fires, those in 1797 and 1848 being the most destructive. On March 29, 1911, fire destroyed the entire State Library of 500,000 volumes, which was located on the third, fourth, and fifth floors of the west side of the State Capitol. The lower part of the city has often been inundated by spring floods in the river. In 1886 the bicentennial of the incorporation of the city was celebrated with elaborate ceremonies; and on Jan. 6, 1897, the centennial of the selection of the city as the State capital was also commemorated. In 1894 the Delavan House, for 50 years the resort of politicians and eminent men, was burned. See A. J. Weise, *The History of the City of Albany* (Albany, 1884); J. Munsell, *The Annals of Albany* (10 vols., Albany, 1850-59), and *Collections on the City of Albany* (4 vols., Albany, 1865-71); G. R. Howell and J. Tenney, *Bi-centennial History of Albany. History of the County of Albany, N. Y., from 1609 to 1886* (bound with *History of the County of Schenectady*, New York, 1886); C. Reynolds, *Albany Chronicles* (Albany, 1906); and a sketch in L. P. Powell's *Historic Towns of the Middle States* (New York, 1899).

ALBANY. A city and the county-seat of Linn Co., Oreg., 80 miles southwest of Portland, on the Southern Pacific, the Oregon Electric, and the Corvallis and Eastern railroads, and on the Willamette River (Map: Oregon, B 3). It is the seat of Albany College (Presbyterian), opened in 1867, and has a Carnegie library, a hospital, an academy, and many churches. The river, crossed here by a fine steel bridge, furnishes good water power. There are chair, sash, and door factories, sawmills, flouring mills, railroad machine shops, a prune-packing establishment, etc. Flour, grain, lumber, fruit, and sandstone are exported. The surrounding country is rich in timber. Albany was settled about 1850 and was incorporated in 1864. Pop., 1900, 3149; 1910, 4275; 1913 (est. including suburbs), 7500.

ALBANY. A river rising in Lake St. Joseph, in the province of Ontario, Canada. It

flows northeast for a distance of about 400 miles, forming part of the boundary between Ontario and the territory of Keewatin. It is navigable as far as Martin's Falls and empties into James Bay at Fort Albany.

ALBANY, or **AL'BAINN**. An ancient name for Scotland, retained in poetical usage down to our own day. Connected with it is the term "Albiones" applied to the inhabitants of the entire British Islands in Festus Avicenus's account of the voyage of Hamilcar, the Carthaginian, in the fifth century B.C.; also the term "Albion" (q.v.), which appears as the name of the islands in Aristotle's *Treatise of the World*. It may be that Albion, or Albany, was the original name of Britain among its Celtic population, and that it only became restricted to the provinces of Scotland north of the firths of Clyde and Forth when the Celts had for the most part become confined to the same region. The modern use of the name "Albany" may be said to have taken its rise in an act of a Scottish council, held at Scone, in June, 1398, when the title of Duke of Albany was conferred on the brother of King Robert III, then acting as regent of the kingdom. The title, being forfeited in the grandson of the first holder, was afterward conferred on Alexander, second son of King James II, in the person of whose son, John, it became extinct in 1536. Subsequently it was conferred on Lord Darnley, and after him on a number of princes of the royal family. Prince Charles Stuart assumed the appellation of Count of Albany as an incognito title and gave the title of Duchess of Albany to his legitimated daughter. The title was restored in 1881 and conferred upon Prince Leopold, and after his death upon his son, who later became Duke of Saxe-Coburg.

ALBANY CONVENTION OF 1754. In 1754, when hostilities were about to begin between the French and English in America, the lords of trade recommended that an inter-colonial convention be called to "confirm and establish the ancient friendship of the Five Nations" and consider plans for a permanent union among the colonies. On June 19 commissioners from Massachusetts, Connecticut, New Hampshire, Rhode Island, Pennsylvania, Maryland, and New York assembled at Albany, and, after arranging for the participation of the Indians in the war, adopted, with some modifications (July 11), a plan of intercolonial union proposed by Franklin. This plan provided for the appointment by the crown of a president-general, who was to nominate military officers, commission all officers, and have veto power over the acts of the Grand Council; and for a Grand Council, to be made up of representatives chosen by the legislature of each colony every three years, no colony to have more than seven members nor less than two. This council was not to be prorogued, dissolved, or kept in session longer than six weeks against its consent, and, with the approval of the president-general, was to manage Indian affairs, authorize new settlements, nominate all civil officers, impose taxes, enlist and pay troops, and construct forts, all of its acts to be valid unless vetoed by the crown within three years. The plan was everywhere rejected—by the court and the royal governors, because it gave too much power to the colonies; by the colonies, because it gave too much power to the king. It is notable as being the first comprehensive scheme of union formally proposed to the various colonial governments in

America. Consult *New York Colonial Documents*, vol. vi, and R. Frothingham, *Rise of the Republic* (Boston, 1872).

ALBANY, DUKE OF. See LEOPOLD, GEORGE DUNCAN ALBERT.

ALBANY, DUKE OF. In Shakespeare's *King Lear* (q.v.), the husband of Lear's daughter Goneril (q.v.).

ALBANY, LOUISA MARIA CAROLINE, also **ALOYSIA, COUNTESS OF** (1753–1824). She was the daughter of a minor German prince, and the wife of Charles Edward Stuart, the Young Pretender, to whom she was married for reasons of dynastic policy. Her husband, unable to win recognition of his royal title, called himself the Count of Albany, and he and his Countess led an unhappy and childless existence, wandering aimlessly from one Italian city to another. The Count drank heavily. His wife met Alfieri, the tragic poet of Italy. She fled from her husband, sought refuge with her brother-in-law, Cardinal Yorke, and incidentally saw much of Alfieri. On the death of her husband she and the poet lived openly together in Florence, their great love immortalized in literature by his world-famous pen. He died in 1803, and the grief-stricken widow commissioned the great sculptor Canova to carve his tombstone. The Countess, however, found solace in society. She became the friend of Madame de Staël and opened a brilliant salon in Florence, which, except for a brief period when she was forced to Paris by the jealousy of Napoleon, she maintained till her death. Among those who frequently visited her were Byron, Lord John Russell, Lamartine, Chateaubriand, and Cardinal Consalvi. She and Alfieri are buried together in the church of Santa Croce at Florence, between the tombs of Machiavelli and Michelangelo. Consult: Lee, *The Countess of Albany* (London, 1884); Cerro, *Vittorio Alfieri e la contessa d' Albany* (Torino, 1905); Vaughan, *The Last Stuart Queen* (New York, 1911).

ALBANY RE'GENCY, THE. A name popularly given to a group of New York Democrats living at Albany, who, from 1820 to about 1850, controlled the nominating conventions and patronage of their party within the State and by dictating its general policy exerted a powerful influence in national as well as State politics. They derived their power largely from their great personal influence and remarkable political sagacity and were, for the most part, earnest opponents of political corruption, though they uniformly acted upon the principle, first formulated in 1833 by one of their number (Marcy), that "to the victors belong the spoils." Among those who at various times were members of this unofficial body were Martin Van Buren, William L. Marcy, Silas Wright, John A. Dix, Edwin Croswell, Benjamin F. Butler, A. C. Flagg, Dean Richmond, and Samuel A. Talcott, several of whom "graduated" from it into high offices under the national government. The Regency's loss of prestige dated from about 1848, when their opponents adopted methods similar to their own, and the Democratic party in the State split into irreconcilable factions. (See BARNBURNERS.) Consult Alexander, *A Political History of the State of New York* (2 vols., New York, 1906), and Morgan Dix, *Memoirs of John A. Dix* (New York, 1883).

ALBA POMPEI'A. A town of ancient Italy, in Liguria. See ALBA.

AL'BATEG'NIUS. See AL-BATTANI.

AL'BATROSS (corrupted from Portug. *alcatraz*, the pelican, from Ar. *al*, the + *câdous*, bucket, referring to its supposedly water-carrying pouch). A popular name for the large marine birds of the family Diomedidæ, closely related to the petrels (q.v.). Albatrosses are among the most exclusively pelagic birds known. They occur on nearly all parts of the ocean, except the north Atlantic, and even there, owing to their extraordinary power of flight, they are

BEAK OF AN ALBATROSS

occasionally seen. Like the petrels, albatrosses have the hind toe, or hallux, reduced to a mere claw, or entirely wanting, while the other three toes are fully webbed. The nostrils also open at the ends of nearly cylindrical, horizontal tubes, a character upon which the order Tubinares is based. Albatrosses differ from petrels, however, not only in their great size, but also in having the nostril tubes placed one on each side of the bill, at its base, instead of close together on top. The bill of an albatross is a heavy and powerful structure, four inches long or more, and strongly hooked at the tip. The covering consists of several distinct plates of horn. The plumage of the body is very thick and compact and well adapted to withstand not only water but cold. Experiment has shown that an albatross can withstand a temperature far below freezing for weeks at a time, even when confined, so that active movement is impossible. The tail is comparatively short and more or less rounded, but the wings are exceedingly long and pointed. The great length of wing is largely due to the unusual length of the humerus and the radius and ulna. Owing to this great length of upper arm and forearm, the number of flight-feathers carried on the wing exceeds that of any other known bird, the number of secondaries being about 40. As might be supposed from their size, albatrosses are very voracious. Their food is all gathered from the surface of the sea, as they do not dive. Fishes, pelagic mollusks, and other floating animal matter, including the offal of vessels, compose the food of these birds, and they may be caught from a vessel with hook and line baited with salt pork. Their power of flight is very remarkable, and they occasionally follow vessels for days at a time. Because of this habit, and because they are almost the only visible inhabitants of the wastes of the southern oceans, sailors regard them with superstitious affection, and it is considered a forerunner of most serious misfortune to kill an albatross. This fact has passed into literature in Coleridge's *Rime of the Ancient Mariner*. The best modern description of the bird is in Froude's *Oceana*. Albatrosses seldom visit land, and then only remote antarctic and oceanic islands, to breed. Often no nest is made, but the single egg is dropped on the bare earth. The egg is large and white, and somewhat ellipsoidal in shape.

The number of forms of albatross is still doubtful, but it is probably about 17. Of these all but seven are placed in the genus *Diomedea*. The largest, and perhaps the best known, species is the wandering albatross (*Diomedea exulans*), which is found throughout the southern oceans and occasionally strays to Europe and possibly to Florida. The plumage of the adult is chiefly white, but the larger wing-coverts and part of the back are more or less barred with black. The young are dusky, lighter on the lower parts. This species is about 4 feet in length, and 10 to 14 feet in extent of wings. On the Pacific coast of North America occur four species, of which the short-tailed (*Diomedea albatrus*) and the black-footed (*Diomedea nigripes*) are fairly common. They are rather small for albatrosses, only 3 feet long and about 7 feet across the wings. Another species of about the same size, widely distributed over the Pacific Ocean, is the sooty albatross (*Phœbetria fuliginosa* or *palpebrata*), the only member of its genus. These three species are easily distinguished by their color: The short-tailed albatross is white, with dark wings and tail and flesh-colored feet; the black-footed is dark chocolate-brown, whitening on the head, and the feet are black; while the sooty albatross is uniform sooty-brown, with light-colored feet. The last species also has a wedge-shaped tail and a slender bill. The yellow-nosed albatross (*Diomedea chlororhyncha* or *Thalassogeron chlororhynchus*), so called from the color of the bill, is a well-known southern species. All these small forms are known to sailors as "mollymawks." See Plate of AUKS, ALBATROSSES, ETC.

AL-BATTA'NI, MOHAMMED IBN JABIR IBN SINAN, known as ALBATEGNIUS (so called from Batan in Mesopotamia) (c.850-929). An Arab chief, one of the most famous astronomers and mathematicians of his race. His first astronomical observations were made at Rakka (877-878) and extended over a period of more than 40 years. He also made several important contributions to pure mathematics. He used the sine of an angle in place of the chord of double the angle (an idea that had occurred to Aryabhata), computed a table of cotangents, and formulated certain propositions in spherical trigonometry. His astronomical works were first made generally known to European scholars through a translation by Plato of Tivoli, under the title *Mahometis Albatanii de Motu* (or *Scientia*) *Stellarum*. This work has been edited in Arabic and Latin by C. A. Nallino (Milan, 1899). Al-Battani corrected numerous errors of Ptolemy, whom, in general, he followed; e.g., he gave the obliquity of the ecliptic as $23^{\circ} 35'$ instead of $23^{\circ} 51' 20''$. He also gave the length of the tropical year as 365 days, 5 hours, 46 minutes, 24 seconds; too short by 2 minutes, 26 seconds, but an improvement upon that of Hipparchus, who gave $365\frac{1}{4}$ days $- \frac{1}{300}$ day, which was too short by 4 minutes, 48 seconds.

ALBAUGH, ăl'bô, JOHN W. (1837-1909). An American actor and manager. He was born Sept. 30, 1837, at Baltimore, where he made his first appearance as Brutus in a play called *Brutus, or the Fall of Tarquin* (1855), on a stage managed by Joseph Jefferson. Of his many subsequent impersonations, perhaps the best known was that of Louis XI, at what later became Daly's Theatre, in New York. After 1868 he was manager of theatres in St. Louis, New Orleans, and Albany, and for a number of years

in Washington and Baltimore, where he owned the new Lyceum. He retired from the stage in 1899. Much of his subsequent leisure years was devoted to his noted stock farm near Washington. Consult Clapp and Edgett, *Players of the Present*, Dunlap Society, publishers (New York, 1899).

ALBAY, ăl-bî'. A province and a town of Luzon, one of the Philippine Islands. The province takes in the southeast end of the island and contains an area of 997 square miles and a population (1903) of 240,326 (Map: Philippine Islands, H 6). The surface is rugged, bears traces of volcanic origin, and the province has several extinct volcanoes and the active volcano of Mount Mayon, 8504 feet high. It is well watered and has good roads. A considerable part is covered by thick forests, full of good timber and game. The province contributes about one-fourth of the total hemp export of the Philippines. The production of oil from the cocoanut, the manufacture of boats, and the mining of coal are among the other industries. Gold and silver are found in small quantities. The chief city is situated near the eastern coast, on the Bay of Albay. It has a good harbor and is the seat of a considerable trade. Pop., 1903, 14,049.

ALBE'DO (Lat. whiteness). In astronomy, the reflecting power of a planet's surface. The quantity of reflected solar light received by us from any given planet depends, of course, on the character of that planet's surface. If it were like polished silver, for instance, the albedo would be very high; much higher, indeed, than the power actually possessed by the surface of any known planet. Astronomers designate the albedo of any planet by means of a fraction indicating the ratio of light reflected to the total quantity of light received. Thus the moon's average albedo is 0.17, which means that about one-sixth of the light received by the moon from the sun is again reflected. According to Müller, who made extended observations on the light of the planets at Potsdam from 1885 to 1893, the albedo of Mercury is 0.17; of Venus, 0.91; of Mars, 0.27; of Jupiter, 0.74; of Saturn, 0.87; of Uranus, 0.72; and of Neptune, 0.63.

ALBEE, ERNEST (1865—). An American scholar and educator, born in Langdon, N. H. He graduated from the University of Vermont in 1887 and after post-graduate courses at Clark and Cornell universities, received the degree of Ph.D. from the latter in 1894. In 1892 he was appointed instructor; in 1902 assistant professor; and in 1907 professor of philosophy in Cornell University. From 1903 to 1908 he was editor of *The Philosophical Review*. He wrote *A History of English Utilitarianism* (1902) and many articles on philosophical subjects.

ALBEMARLE, first DUKE OF. See MONK or MONCK, GEORGE.

AL'BEMARLE, THE. A Confederate ram, which, after doing great damage to the Federal shipping, was blown up and completely destroyed on the night of Oct. 27, 1864, by W. B. Cushing. See CUSHING, W. B.

ALBEMARLE, or ISABELA, ISLAND. The largest of the Galapagos Islands (q.v.), lying between lat. 0° 15' N. and 1° 5' S., and long. 90° 50' W. and 91° 45' W. It is of volcanic origin and irregular in form, its greatest length about 90 miles and its greatest breadth about 50. The surface, which covers an area of 1650 square miles, is elevated, reaching an alti-

tude of 4700 feet. Albemarle Point is the northernmost extremity of the island.

ALBEMARLE SOUND. An inlet in the coast of North Carolina, nearly 60 miles long and 4 to 15 miles wide, separated from the ocean by an island and not appreciably affected by the tides (Map: North Carolina, F 1). It receives the Roanoke, Chowan, Perquimans, Little, and Pasquotank rivers, and is connected with Currituck and Croatan sounds, the latter of which flows into Pamlico Sound. It is about 12 miles in length, and its greatest depth is 18 feet. It is so shallow in some places that it is of little value for navigation.

ALBENGA, ăl-ben'gä. A seaport and episcopal see of Liguria, Italy, 52 miles by rail southwest of Genoa and on the Gulf of Genoa. The sea-coast line has receded, and its harbor has disappeared. This town is the site of the Roman Albingaunum, which was the chief town of the Ingauni. Many ruins are visible in the vicinity, the most important of which are the old town walls and a bridge. The modern town is reputed to be the quaintest on the Riviera and contains a Gothic cathedral, the châteaux of Italian nobles, the chapel of Santa Maria, and an interesting leaning tower. Pop., 1901, 6250; 1911, 6882.

ALBENIZ, ăl'bä-nëth', ISAAC (1860-1909). A Spanish pianist and composer. He was born at Camprodon. His musical precocity almost equaled that of Mozart, so that at the age of six he was accepted as a pupil by Marmontel. After two years of study his father took him on concert tours through Europe and America, but soon realized the necessity of further serious study. The boy then took the regular course at the conservatory at Brussels, where he continued the piano under Brassin and studied composition under Dupont and Gevaert. This course he supplemented further by instruction from Jadasohn, Reinecke, and Liszt. As a concert pianist he soon made a great reputation and was appointed court pianist to the King of Spain. He wrote an oratorio *Cristo*, many zarzuelas (q.v.), and the operas *The Magic Opal* (1893), *Enrico Clifford* (1895), *Pepita Jimenez* (1896). The number of his compositions for piano is over 200. In his latest works he shows to a marked degree the influence of Debussy.

ALBER, ăl'bër, MATTHÄUS (1495-1570). A German theologian, one of the promoters of the Reformation. He was born at Reutlingen, near Stuttgart, was educated at Tübingen, and in 1521 returned to preach in Reutlingen, where he introduced the Reformation. He rejected Latin and used the native tongue in church services, put out the images, and took a wife. He was summoned before the imperial chambers and charged with nearly 70 distinct heresies, to all of which, save that of speaking disrespectfully of the mother of Christ, he confessed guilty. He was tried, but set free without punishment. Alber was a friend and ally of Luther. He has been called, indeed, the "Luther of Swabia," because of the great part he played in that country. Some of his sermons, a catechism, and a work on *Providence* have been published. For his life consult J. Hartmann (Tübingen, 1863).

ALBERDINGK THIJM, ăl'bër-dink tīm, JOSEPHUS ALBERTUS (1820-89). A Dutch author, born at Amsterdam. In 1876 he was appointed professor of æsthetics in the Art Academy at Amsterdam. From 1852 he edited the *Volks-almanak voor Nederlandsche Katholicken*, and

from 1855 *De Dietsche Warande*, devoted to the art and literature of the Middle Ages. He published newspaper criticisms, *Drie Gedichten* (1844), *De Klok van Delft* (1846), *Palet en Harp* (1849), *Verspreide Verhalen in Proza* (3 vols., 1879-83), and other volumes. His prose fiction is considered his best work. A five-volume edition of his writings was printed in Amsterdam (1909). Consult the biography by Van der Duys (Amsterdam, 1889); also, a biography based on Alberdingk's letters, by his daughter (Amsterdam, 1896).

ALBERIC I, ăl'bēr-ik (died 925). An adventurer, of Lombard extraction, who appeared in Rome in 889. He soon joined his fortunes with those of Berengar (q.v.), became Margrave of Camerino, and later Duke of Spoleto. He married Marozia (q.v.) before 915, and in 916 joined John X in expelling the Saracens, who had terrorized Italy for more than 30 years. For his services he was probably made "Consul of the Romans." Nothing definite is known of his later years; but he is said to have ruled Rome despotically for a time, to have been driven from the city; to have summoned the Hungarians to his aid, and to have been slain by the Romans about 925.

ALBERIC II (?-954). The son of Alberic I and Marozia. In 932 he led the Romans in a successful attempt to achieve their independence of Hugo, King of Italy, and was elected "prince and senator of all the Romans." Until his death, in 954, he ruled the city absolutely, but wisely and moderately. He was succeeded by his son Octavian, who became Pope, as John XII, in 955.

ALBERONI, ăl'bâ-rō'nê, GIULIO, CARDINAL (1664-1752). An Italian prelate, minister of Philip V of Spain. He was the son of a poor vine-dresser and was born at Firenzuola, in Parma. From a chorister in a church at Piacenza, he quickly rose, through his abilities, to the dignity of chaplain and favorite of Count Roncovieri, Bishop of San Donino. After some diplomatic service in Italy and a visit to Paris, he was sent by the Duke of Parma as chargé d'affaires to Madrid, where he speedily gained the favor of Philip V. He brought about the King's marriage to Elizabeth Farnese, overthrew the powerful Countess Orsini, and rapidly became Grandee, Cardinal, and Prime Minister (1717). Into the languid body of moribund Spain he infused new energy, invigorated her government, revived her commerce and her manufactures, reconstructed her army, rebuilt her fleet. But Alberoni was ambitious, and in order to gratify the covetous desires of Elizabeth Farnese, he suddenly invaded Sardinia, in violation of the Peace of Utrecht, cherishing the hope of reëstablishing the monarchy of Charles V and Philip II, and startling Europe by his insolent audacity. The regent of France broke off his alliance with Spain and united himself with England and Austria. Alberoni was not dismayed. Even when the Spanish fleet in the Mediterranean was destroyed by an English one, he contemplated an extensive war by land, in which all the European powers were to have been entangled. He patronized the Pretender, to annoy England, and the French Protestants, to annoy France. He sought to unite Peter the Great and Charles XII with him, to plunge Austria into a war with the Turks, and to stir up an insurrection in Hungary; and, through his influence with one of the parties at the French

court, he actually accomplished the arrest of the regent himself (the Duke of Orleans). But so universal became the complaints against Alberoni that Philip lost courage, and made peace, agreeing to the dismissal of the Cardinal. In 1719 Alberoni received a command to quit Madrid within eight days and the kingdom within three weeks. Exposed to the vengeance of every power whose hatred he had drawn upon himself, he knew no land where he could remain. Not even to Rome could he venture, for Clement XI was more bitterly inimical to him than was any secular potentate. He wandered about in disguise and under fictitious names. At length he was imprisoned in the Genoese territory, through the solicitation of the Pope and the Spanish monarch; but he speedily recovered his liberty, and two years after the death of Clement, was reinstated by Innocent XIII in all the rights and dignities of a Cardinal. In 1740 he retired to Piacenza, where he died 12 years after, at the age of 88. He bequeathed his possessions in Lombardy to Philip V, while his cousin and heir, Cesare Alberoni, became possessor of 1,000,000 ducats. Consult: Rousset, *Histoire du Cardinal Alberoni* (The Hague, 1719; Eng. trans., London, 1719); Bourgeois, *La Jeunesse d'Alberoni* (Paris, 1900); and "Cardinal Alberoni: An Italian Precursor of Pacifism," in *American Journal of International Law*, vol. vii (New York, 1913).

ALBERS, ăl'bērs, JOHANN FRIEDRICH HERMANN (1805-67). A German physician, professor of pathology at Bonn. He established there an asylum for the treatment of insanity and nervous diseases, and in 1856 he was director of the pharmacological cabinet. His atlas of pathological anatomy (1832-62) and books on various branches of medical science were regarded as standard works and are still useful and interesting.

ALBERT, ăl'bērt; *Ger. pron.* ăl'bērt. In Goethe's *Sorrows of Werther* (q.v.), the husband of Lotte, with whom Werther is in love. The character is said to have been taken from that of Goethe's friend Kestner.

ALBERT, *Ger.* **ALBRECHT**, ăl'brēkt. The name borne by five archdukes of Austria, of whom two (I and V) were also emperors of Germany.—**ALBERT I**, Archduke of Austria and Emperor of Germany, was the eldest son of Rudolph of Hapsburg and was born c.1250. Rudolph, before his death, endeavored to have Albert appointed as his successor in the Empire; but the Electors, already aware of the tyranny of Albert, refused to comply. After the old King's death Austria and Styria revolted; but Albert, having vigorously crushed the rebellion, turned his attention toward the Empire. The Archbishop of Mainz, an instrument of the Pope, secured the privilege of appointing the imperial candidate and named his cousin, Adolphus of Nassau, in 1292. Albert took the oath of allegiance and quietly awaited developments. In 1298 Adolphus, who had disgusted his subjects, was deposed, and Albert was elected. He was obliged to fight for the new honor and met his rival in a battle near Worms, in which Adolphus was defeated and slain. Albert was crowned at Aix-la-Chapelle in August, 1298; but Pope Boniface VIII denied the right of the princes to elect Albert and refused to recognize him. Albert, however, made an alliance with Philip the Fair of France and, securing the neutrality of Saxony and Brandenburg, invaded the Electorate of Mainz and forced the Archbishop to make an

alliance with him, thus securing a former ally of the Pope. Boniface was alarmed by his success and entered into negotiations with him. As a result, Albert broke his alliance with Philip, recognized the supremacy of the Pope, and promised to defend the rights of the Roman court whenever called upon. Boniface then excommunicated Philip, and offered the throne to Albert in 1303; but Philip soon retaliated by getting the Papacy under the power of the French crown. After this Albert fought unsuccessfully against Holland, Zealand, Friesland, Hungary, and Thuringia. In January, 1308, news arrived of a rebellion among the Swiss in Unterwalden, Schwyz, and Uri, and the Emperor seized this pretext to subjugate the country. An act of injustice, however, occasioned a crime which put an end to his life. His nephew, Duke John, claimed Swabia as his rightful inheritance, but had urged his claims in vain. When Albert was departing for Switzerland, John renewed his demands, but was refused, and so he resolved to be revenged. He conspired against his uncle's life and assassinated him on the road to Rheinfelden, while separated from his followers by the river Reuss. The Emperor expired, May 1, 1308, in the arms of a beggar woman. Albert left six sons and five daughters, the children of his marriage with Elizabeth, daughter of the Count of Tyrol. The story of William Tell is connected with Albert I. See Mücke, *Albrecht I von Habsburg* (Gotha, 1866). ALBERT V (as German king, Albert II) was born in 1397 and inherited the duchy of Austria while still a child. After receiving what was for the times an excellent education, he assumed direct control of the government in 1411. In 1422 he married the daughter of the Emperor Sigismund, and on the death of the latter, in 1437, succeeded, by election, to the crowns of Hungary and Bohemia. In March, 1438, he was elected King of Germany. Wars with the Turks and disorders in Bohemia and Hungary disturbed his short reign. He died Oct. 27, 1439. See Altmann, *Die Wahl Albrecht II zum römischen Könige* (Berlin, 1886).

ALBERT (?-1412). Duke of Mecklenburg and King of Sweden, a son of Duke Albert I of Mecklenburg. Within a year after he was proclaimed King of Sweden (1364) he was compelled to fight against his uncle, Magnus II, whom he defeated and captured at the battle of Enköping. Hakon of Norway, a son of the latter, who had also disputed the right of succession, fled after the battle, but was compelled to sign a treaty of peace in which he renounced all claims to the throne. The victory, however, was bought at the price of great concessions to the Royal Council, and Albert could find no support among the people, who were heavily burdened with taxes. Consequently an attempt to restore his power failed, and Margaret, widow of King Hakon of Norway, was invited to the throne. Albert was defeated and captured at the battle of Falköping (Feb. 24, 1389), and was not liberated until 1395, when he formally resigned all rights to the crown, and retired to Mecklenburg, which, as Duke Albert II, he ruled until his death. See MARGARET (1353-1412).

ALBERT (1490-1568). The last Grand Master of the Teutonic Order and first Duke of Prussia. He was the son of the Margrave Frederic of Ansbach, who wished him to enter the Church. He was educated under the care of Archbishop Hermann, of Cologne, where he became a canon.

He did not, however, neglect knightly exercises. He accompanied the Emperor Maximilian I in his expedition against Venice and was present at the siege of Pavia. In 1511, when scarcely 21 years old, he was chosen Grand Master of the Teutonic Order, the knights expecting their feudal allegiance to Poland to be abolished on account of his near relationship to Sigismund, the monarch of that country, while they also hoped for protection against the Poles from his friends in Germany. He was consecrated at Mergentheim with his father's consent. In 1512 he removed to Königsberg, having been acknowledged by Poland likewise; but, refusing to take the oath of allegiance, he was plunged into a war with Sigismund in 1520. The year after, a four years' truce was agreed to at Thorn. Albert next made his appearance at the Imperial Diet at Nuremberg as a German prince of the Empire, to induce the other princes to assist him against the Poles. But Germany could at that time grant no assistance to any one. Disappointed in his hopes, Albert threw himself into the cause of the Reformation, which had rapidly spread into Prussia and broken the last strength of the declining order, whose possessions now appeared a certain prey to Poland. He still hoped to preserve these by acting upon Luther's advice to declare himself secular Duke of Prussia and place his land under the sovereignty of Sigismund. This was done with great pomp at Cracow in April, 1525, the duchy being secured to him and his descendants. During the remainder of his life Albert zealously sought to further the welfare of his duchy. He regulated the administration of all affairs, both secular and ecclesiastical, established the ducal library, founded in 1544 the University of Königsberg, gathered many literary men around him, and caused their works to be printed. In 1527 he married Dorothea, daughter of Frederick, King of Denmark. Albert earnestly desired peace, but found himself entangled in conflicts with the nobles and in theological disputes, which, along with other troubles of a more personal character, saddened the close of his life. Consult Lohmeyer, *Herzog Albrecht von Preussen* (Dantzic, 1890); and for the part played by Albert in the Reformation, Tschakert, *Herzog Albrecht von Preussen* (Halle, 1894).

ALBERT (1559-1621). Archduke of Austria. He was the sixth son of the Emperor Maximilian II. He was brought up at the Spanish court and dedicated himself to the Church. In 1577 he was made Cardinal, in 1584 Archbishop of Toledo, and during the years 1594-96 held the office of Viceroy of Portugal. He was next appointed Stadtholder of the Netherlands. In 1598 he resigned his ecclesiastical offices and left the Church, and married the Infanta Isabella, receiving with her the Netherlands and Franche Comté. Had it been possible to regain by any means Spain's rebellious provinces, Albert's mild character and conciliatory policy might have done so. As it was, he became engaged in constant warfare prosecuted with little success and marked by bitter feeling on both sides. Later in life he became fanatic, priest-ridden, and in a measure incapable of efficient rule. (Consult Dubois, *Histoire d'Albert et d'Isabelle* (Brussels, 1847), and Schmolke, *Albert und Isabella* (Berlin, 1878).)

ALBERT (1490-1545). Archbishop of Magdeburg and Elector of Mainz, generally called Albert of Brandenburg. He was the younger son

of the Elector John Cicero of Brandenburg, and was born in Brandenburg, June 20, 1490. In 1513 he became Archbishop of Magdeburg, and also administrator of the bishopric of Halberstadt, and in the next year Archbishop and Elector of Mainz. He was put in charge of the preaching, within a certain district, of the jubilee indulgence granted by Leo X, on the condition that one-half the proceeds was to be sent to Rome. He appointed the Dominican Tetzl sub-commissioner in the work, whose preaching gave occasion to Luther to post up his well-known 95 theses. He was made a Cardinal in 1518. Even in the Archbishop's own diocese the reformer's doctrines found not a few adherents, so that Albert was compelled at the Imperial Diet at Augsburg (1530) to act the part of peacemaker. When he joined the holy alliance against the League of Schmalkalden, Luther made a fierce attack on him in writing. He was the first of all the German princes who received the Jesuits into his dominions. In 1541 he granted religious liberty to his subjects, under the condition that they should pay his debts, amounting to 500,000 florins. He died at Mainz, Sept. 24, 1545. For his life consult J. May (Munich, 1865-75), and Redlich, *Albert und das Neue Stift zu Halle* (Mainz, 1900).

ALBERT, called ACHILLES (1414-86). Elector of Brandenburg, third son of Friedrich I and Elizabeth of Bavaria. He was born at Tangermünde and after the death of his father, in 1440, succeeded to the margraviate of Ansbach, where, together with several other feudal lords, he soon came into conflict with the inhabitants of the cities of South Germany, which were united against him. In 1449 he attacked Nuremberg, but was defeated at Pilsen and compelled to effect a permanent compromise (1453). By the death of his brother John he succeeded to the margraviate of Bayreuth, and in 1470 his brother Friedrich II transferred to him the margraviate of Brandenburg and the electoral dignity. He was fond of display and amusements and was distinguished by an enlightenment far in advance of his age.

ALBERT, called ALCIBIADES (1522-57). A margrave of Brandenburg, who was born at Ansbach. Although reared in the Protestant faith, his military enthusiasm and love of power induced him to serve in the army of Charles V, and he fought in the campaign against France in 1543. Afterward he conspired against the Emperor with Maurice of Saxony and several other princes, and was personally instrumental in arranging the Treaty of Chambord with Henry II of France (Jan. 15, 1552). In consequence of differences with his confederates, he subsequently again embraced the cause of Charles, who ratified his territorial claims. In an endeavor to carry these into effect, however, Albert was twice defeated (July 9 and Sept. 12, 1553). He was soon afterward outlawed by the Emperor and fled to France (1554). He died in 1557, shortly after his return to Germany.

ALBERT, à'l'bâr', ALEXANDRE MARTIN (1815-95). One of the leading members of the provisional government of France after the revolution of February, 1848. Though a poor mechanic, he took great interest in the political questions of his time and participated in the revolutions of 1830 and 1848. While keeping at his trade, he edited a workingman's paper, started in 1840, called *L'Atelier*. He was sum-

moned by Louis Blanc from his shop, where he was making buttons, to the presidency of the committees on the national workshops and national rewards, but presently resigned and entered the Assembly. For his participation in the attempt of May 15, 1848, to overthrow the government, he was condemned to imprisonment for life, but was pardoned in 1859 by Louis Napoleon. During the commune (1871) Albert played a part of some prominence, but from that time to his death he gradually lost both influence and prestige. He was known in French politics as *L'ouvrier Albert*.

ALBERT, à'l'bêrt, ARISTIDES ELPHONSO PETER (1853—). A bishop of the Methodist Episcopal Church, South, and also a practicing physician and surgeon. His father was a Frenchman, his mother a slave, and he was born in St. Charles parish, Louisiana. Freed by the war, he removed with his mother to New Orleans. He graduated in arts and theology at Straight University, New Orleans, and in medicine at New Orleans University (1892). After holding various appointments in the Methodist Episcopal Church, South, including that of editor-in-chief of the *Southwestern Christian Advocate* (five years) and the presidency of Gilbert College, Baldwin, La. (1896-1900), he became pastor of Wesley Chapel, New Orleans (1900-02). He represented his conference in the Ecumenical Conference in London in 1901.

ALBERT, called THE BOLD (1443-1500). Duke of Saxony, founder of the Albertine line. He was a younger son of the Elector Frederick, called "the Gentle." From 1464 he reigned conjointly with his brother Ernest, who had been invested with the electoral dignity and gradually obtained such valuable accessions of territory in Thuringia and elsewhere that a separation into the Ernestine and Albertine branches became necessary. At the Reichstag held at Freiburg, in 1498, he was appointed "hereditary governor and potentate" of Friesland. A magnificent bronze monument was dedicated to him at Meissen in 1876.

ALBERT, COUNT OF BOLLSTÄDT (c.1193-1280). A German philosopher, usually called Albertus Magnus, and styled *Doctor Universalis*, who was distinguished for the extent of his acquirements and for his efforts to spread knowledge, especially of the works and doctrines of Aristotle. He was born at Lauingen, in Swabia, probably in 1193, but the date is disputed. After studying principally at Padua, he entered the order of the Dominican friars in 1223 and taught at Regensburg, Bologna, Strassburg, Freiburg, Hildesheim, and Cologne, where Thomas Aquinas became his pupil. He afterward repaired to Paris, where he expounded the doctrines of Aristotle. In 1254 he was appointed Provincial for his order in Germany and undertook the reform of the monasteries. Through his interest in their libraries he added to his already great sum of knowledge. He defended the mendicant orders against the attacks of the University of Paris, and, at the same council, discussed the errors of Averroës. In 1259 he was relieved by Pope Alexander IV of the task of Provincial, but only that he might take the bishopric of Ratisbon. But in 1262 he retired to a convent at Cologne to devote himself to literary pursuits. Here he composed a great number of works, especially commentaries on Aristotle. In 1270 he left Cologne to travel through Bavaria and France, preaching a crusade. In 1274 he attended a council at Lyons, and on the way back

defended publicly at Paris some of the works of his favorite pupil, Thomas Aquinas. He died Nov. 25, 1280, leaving his greatest work, the *Summa Theologiæ*, incomplete. The fullest edition of his works was prepared by Jammy (21 vols., Lyons, 1651), but it is uncritical and far from complete. Many of the writings attributed to him seem to be spurious. He was the greatest student of Aristotle which scholasticism had up to his time produced. He held an inclusive theory regarding the dispute of nominalism and realism; that universal ideas are prior to particulars, being original types in the Divine mind; are in things, since they are the common basis of the class of things; and after things, for our minds deduce them from particular things. He recognized the difference between natural and revealed religion and abandoned the idea of deducing special doctrines, like the Trinity, from reason. He held that all things in philosophy are true in theology, but that beyond the knowledge gained from philosophy is a realm where the mind must depend upon revelation. Revelation is above reason, but not contrary to reason. The extensive chemical and mechanical knowledge which Albert possessed, considering the age in which he lived, brought upon him the imputation of sorcery, and in German tradition he has a very ambiguous reputation. It is related, for instance, that in the winter of 1240 he gave a banquet at Cologne to William of Holland, King of the Romans, and that during the entertainment the wintry scene was suddenly transformed into one of summer bloom and beauty. This myth may rest on the fact that Albert had a greenhouse. The scholastics who followed Albert's opinions took the name of Albertists. His best-known works are *Summa Theologiæ* and *Summa de Creaturis*. For his life, consult Sighart (Regensburg, 1857; English translation by Dixon, London, 1876). For his philosophy, consult Erdman, *History of Philosophy*, vol. i (London, 1890).

ALBERT, COUNT OF GEIERSTEIN, gī'ēr-stīn. In Scott's novel, *Anne of Geierstein* (q.v.), the head of the "Secret Tribunal." At various times he appears in monkish disguise; later he slays Charles of Burgundy in battle.

ALBERT, ä'l'bërt; Ger. pron. ä'l'bërt, EDUARD (1841-1900). An Austrian surgeon. He was born at Senftenberg, in Bohemia, and studied medicine at Vienna. In 1873 he was made professor of surgery at Innsbruck. From 1881 until his death he was clinical professor of surgery at Vienna. His published works include *Beiträge zur Operativen Chirurgie* (1878-80), *Diagnostik der Chirurgischen Krankheiten* (7th ed., 1896), and a text-book of surgery in four volumes, which has passed through several editions. Albert's original researches resulted in valuable contributions to surgical diagnosis, to operative surgery, and to other branches of medical knowledge.

AL'BERT, Fr. pron. ä'l'bâr', EUGEN FRANCIS CHARLES D' (1864—). A pianist and composer; born at Glasgow, April 10, 1864; the son of Charles d'Albert, a French musician and dancing-master, who was his first teacher. He studied in the National Training School, London, under Sir Arthur Sullivan, Prout, and Pauer, and in 1881 gained the Mendelssohn scholarship; under Hans Richter in Vienna and under Liszt in Weimar. In the same year he made his first appearance at a philharmonic concert in Vienna with brilliant success. He was soon made court pianist in Weimar, trav-

eled in Europe, and came to America in 1892-93 and 1904-05. His interpretations of Bach and Beethoven have been generally deemed the most forceful heard in recent years. His mastery of technic, intellectual grasp, force, and fire place him among the most eminent pianists of the world. His compositions include two concertos for piano and orchestra, pianoforte music, a suite, symphony, two quartets for strings, several songs, and the operas *Der Rubin* (1893); *Ghismonda* (1895); *Gernot* (1897); *Die Abreise* (1898); *Kain* (1900); *Der Improvisator* (1900); *Im Tiefland* (1903); *Das Flötensolo* (1906); *Tragaldabas* (1907); *Izeyl* (1909); *Liebesketten* (1913). Of these operas *Im Tiefland* was given at the Metropolitan Opera House in New York (1908). His later compositions show distinct individuality. He has also made excellent transcriptions for piano of some of Bach's organ works. About the year 1907 complaints began to be heard that his technic had deteriorated. In spite of increasing adverse criticism he continued to appear as a performer until 1909. After three years' retirement he reappeared in 1912 on the concert platform, showing that he had fully regained his former faultless technic.

ALBERT, ä'l'bërt; Ger. pron. ä'l'bërt, FRANCIS CHARLES AUGUSTUS EMANUEL (1819-61). Prince of Saxe-Coburg-Gotha, and the husband of Queen Victoria of Great Britain. He is popularly known as Prince Albert and the Prince Consort. He was born at Rosenau Castle, near Coburg, Aug. 26, 1819, the second son of Ernest, Duke of Saxe-Coburg-Gotha, and his wife Louise, daughter of Augustus, Duke of Saxe-Gotha-Altenburg. In the Prince's sixth year his parents separated, and he never afterward saw his mother, who died in 1831. The Prince and his elder brother, under a private tutor, received a careful education, and after a year of study at Brussels he attended the University of Bonn, where, in addition to the sciences connected with statecraft, he devoted himself with ardor to the study of natural history and chemistry and displayed great taste for the fine arts, especially painting and music. Several compositions of his obtained publicity, and an opera, afterward performed in London, is said to have been composed by him. He was gifted with a handsome figure and obtained expertness in all manly exercises. He married the young Queen of Great Britain on Feb. 10, 1840. On his marriage Prince Albert received the title of Royal Highness, was naturalized as a subject of Great Britain, and obtained the rank of field-marshal, the knighthood of the Order of the Bath, and the command of a regiment of hussars. As the union proved in the highest degree a happy one, the Prince was loaded with honors and distinctions both by the Queen and the nation. The title of Consort of Her Most Gracious Majesty was formally conferred in 1842, and that of Prince Consort, in 1857, made him a prince of the United Kingdom. He was also made a member of the Privy Council, governor and constable of Windsor Castle, colonel of the Grenadier Guards, acting Grand Master of the Order of the Bath, Chancellor of the University of Cambridge, the standard of which he succeeded in raising considerably, and Master of the Trinity House. Notwithstanding his high and favored position as the Queen's trusted counselor, the Prince, with rare prudence and tact, abstained from meddling with State affairs, and thus escaped the jealousy and detraction of parties, gradually attaining, indeed, the widest popularity. When the Whig

ministry in 1840 proposed for him the income of £50,000, as consort of Queen Victoria, the Tories in conjunction with the Radicals, succeeded in limiting the sum to £30,000. This incident, which occurred before the marriage, appears to have been the only instance of any manifestation of party feeling with reference to the Prince. On the other hand, he opened for himself an influential sphere of action, in the encouragement and promotion of science and art, appearing as the patron of many useful associations and public undertakings. The Exhibition of 1851 owed its origin and the greater part of its success to the Prince. An incessant worker in the interests of his adopted country, his toil undermined his constitution, and he succumbed to an attack of typhoid fever, Dec. 14, 1861. His memory is perpetuated under the surname "Albert the Good." The last of his political acts, one of particular interest to the United States, was instrumental in preventing a war which threatened to arise out of the seizure of the Confederate envoys on the English steamer *Trent*. The draft of the ministerial ultimatum submitted to the Queen seemed to the Prince needlessly irritating. Weak then from the beginning of his last illness, he arose at seven the next morning (Dec. 1, 1861), and wrote and presented a memorandum of his objections to the Queen. His suggestions, adopted by Lord Russell, proved acceptable to President Lincoln. Consult: Martin, *Life* (London, 1875-80); Vitzhum, *Reminiscences* (Eng. trans., 1887); Grey, *The Early Years of His Royal Highness the Prince Consort* (New York, 1867); Bräuer, *Prinz Albert von England und Die Deutsche Einheitsfrage* (Leipzig, 1910); *Principal Speeches and Addresses of Prince Albert* (London, 1862); Wintle, *The Story of Albert the Good* (London, 1897); Stockmar, *Denkwürdigkeiten aus den Papieren des Freiherrn Christian Friedrich von Stockmar* (Brunswick, 1872), translated by G. A. M. under the title *Memoirs of Baron Stockmar* (London, 1873), and Jerrold, *The Married Life of Queen Victoria* (New York, 1913).

ALBERT, FREDERICK AUGUSTUS (1828-1902). King of Saxony, 1873-1902. He served in the first Schleswig-Holstein War, and after his father's accession in 1854 presided over the Council of State. In 1866 he commanded the Saxon army, coöperating with Austria against Prussia. On the entrance of Saxony into the North German Confederation, this force became the twelfth corps of the North German army, and with them the Prince won high honors at Gravelotte and Sedan, receiving the Prussian Iron Cross and the command of the newly formed fourth army, at the head of which he entered Paris with the Emperor and the German princess. He succeeded his father on the throne in 1873. He died June 19, 1902, and was succeeded by his brother Georg. Consult Dittrich, *König Albert und Prinz Georg von Sachsen* (Minden, 1896), and Harden, *Monarchs and Men* (New York, 1913).

ALBERT, FREDERICK RUDOLPH (1817-95), generally spoken of by English writers as the Archduke ALBERT. Archduke of Austria, son of Archduke Charles, grandson of Leopold II, and first cousin of the father of the reigning Emperor. He was distinguished in youth as a cavalry commander, doing good service in the battle of Novara in 1849. He was Governor of Hungary, 1851-60; in 1866 he commanded the Austrians in Venetia, and won the victory of

Custoza, June 24; but Benedek's defeat at Sadowa, July 3, made his success nugatory. He became field-marshal in 1863 and inspector-general of the Austrian army in 1866. Albert married, May 1, 1844, Archduchess Hildegarde, daughter of Ludwig I of Bavaria. She died April 2, 1864.

ALBERT, HEINRICH (1604-51). A celebrated German composer, sometimes erroneously called Alberti, who was instrumental in developing the present form of the German *Lied*. He was born at Lobenstein, Saxony, and in 1622 went to Dresden to study music under his cousin, the Kapellmeister Heinrich Schütz (q.v.). He established himself at Königsberg in 1626, but soon afterward was taken prisoner by the Swedes. After two years of captivity he returned to Königsberg, when he again turned to music. In 1630 he received an appointment as organist at the cathedral, and at the same time began a thorough course in music under Stobäus. In conformity with the wishes of his parents, however, he discontinued his musical studies and entered the University of Leipzig to study law. Albert was not only a fine musician, but a poet of distinction as well, and the verses which he set to music were usually of his own composition. Several of these, however, were written by the poet Simon Dach, an intimate friend of Albert, and one whose influence is still evident in the well-defined poetic rhythm of the song-forms created by the latter. Albert published eight books of arias (1638-50) and the *Kürbishütte* (1645), a collection of chorals, arias, and *Lieder* for one or several voices. Many of his hymn-tunes, such as the well-known *Gott des Himmels und der Erden*; *Ich bin ja, Herr, in Deiner Macht*; and *Unser Heil is Kommen*, are still extensively used in the Protestant service. A selection of his songs, with the music, has been published in the work entitled *Neudrucke Deutscher Litteraturwerke* (Halle, 1883).

ALBERT, JOSEPH (1825-86). A German photographer, who was born and died at Munich. He established a photographer's studio at Augsburg in 1850, and removed to Munich in 1858. About 1867 he introduced an improvement of the greatest importance in photo-mechanical printing (*Lichtdruck*). It had been known since about 1854 that a film of gelatin containing potassium-bichromate does not receive greasy inks unless it has been previously subjected to the action of light and damping. This fact had been utilized for printing purposes by coating a metal plate with gelatin containing some bichromate of potash and chloride of mercury, treating with silver oleate, and exposing to the action of light through a negative. On washing and inking with a lithographic roller, the plate could be used for printing. The soft gelatin coating, however, was extremely perishable, and therefore the process was capable of only limited application until Albert introduced his improvement. Albert found that the gelatin could be sufficiently hardened and rendered durable simply by the action of light. In place of the old metallic plates, he therefore substituted transparent plates, the uncoated side of which he exposed to the action of light. In this manner it became possible to obtain more than a thousand "Albertype" copies from one plate, and the process was adopted in general use. See GELATIN PROCESS.

ALBERT I, called THE BEAR (c.1100-70). Margrave of Brandenburg. He was the son and

successor of Otto the Rich, Count of Ballenstädt, and of Eilika, daughter of Magnus Billung, Duke of Saxony. Having aided the Duke of Saxony, who became the Emperor Lothair, he received from the latter Lusatia, to be held as a fief of the Empire, and later the northern "mark." In the year 1137 Henry, Duke of Saxony, having been put under the imperial ban, the duchy was given to Albert, when he took the title of Duke of Saxony. Henry, however, was victorious in the contest which followed, and Albert was compelled to flee, and retained only the margraviate of northern Saxony. Returning to his own country, he had himself invested with the lands which he had conquered from the Wends, as a hereditary fief of the Empire, and thus became the founder and first margrave of the new State of Brandenburg. Consult Heinemann, *Albrecht der Bär* (Darmstadt, 1864).

ALBERT I (1317-79). Duke of Mecklenburg, founder of the present reigning dynasty. He was a son of Prince Henry II, the Lion, and reigned as prince from 1329 until 1348, when he was appointed Duke by the Emperor Charles IV. Relying upon the cities of his realm, he sought to suppress the frequent feuds of the nobles and to find advantages by active participation in the affairs of the Empire. Upon the extinction of the dynasty of Schwerin, he united the domains of that principality with his own (1358). He was also instrumental in securing the crown of Sweden for his son, afterward known as Albert II. See **ALBERT, DUKE OF MECKLENBURG**, and **KING OF SWEDEN**.

ALBERT I (1875—). King of the Belgians. He was born April 8, 1875, the only son of Philip, Count of Flanders, younger brother of Leopold II of Belgium (q.v.). He was carefully educated and in 1900 married Duchess Elizabeth, daughter of Karl Theodor, Duke of Bavaria, and Marie Joseph, daughter of Prince Miguel of Braganza. Before his accession to the throne he bore the title Count of Flanders. His democratic and friendly manner had made him the most popular member of the reigning house. He traveled widely and was a student of politics and economics. In 1898 he visited the United States and made a study of American railroads under the guidance of James J. Hill. Several years later, he made an extended tour of the Belgian Congo and upon his return to Belgium strongly urged upon his uncle the need of railroad development and of reform in the treatment of the natives. When he became King, many improvements in the administration of this colony were carried out. (See **BELGIUM** and **CONGO, BELGIAN**.) On the death of Leopold II Albert became King, on Dec. 23, 1909. Three children were born of his marriage—Prince Leopold, heir-apparent, born Nov. 1, 1901; Prince Charles, born Oct. 10, 1903, and Princess Marie-José, born Aug. 4, 1906.

ALBERT II, DUKE OF MECKLENBURG. See **ALBERT, KING OF SWEDEN**.

ALBERT IV, called **THE WISE** (1447-1508). Duke of Bavaria, third son of Albert III, surnamed "the Pious." After the death of his father, in 1460, he was placed under the guardianship of his elder brothers, John III and Sigismund, who had conjointly succeeded to the regency; and upon the death of John (1463), he became co-regent with Sigismund. The acquisition of the territories of the house of Bavaria-Landshut greatly increased the extent of his possessions. In consequence of this in-

crease of power, however, he became involved in a feud with several members of the nobility, and his interference in the affairs of Regensburg (Ratisbon) finally aroused the displeasure of the Emperor and he was placed under the ban. His principal achievement was the establishment of the law of succession in the dukedom of Bavaria (July 8, 1506).

ALBERT V (1528-79). Duke of Bavaria, a son of Duke William IV and Maria Jakobäa of Baden. He succeeded to power in 1550 and soon became involved in religious and other disputes, in consequence of which the power of the feudal barons in his dominions was completely broken. He banished the Protestants from his dominions and prohibited the publication of books favorable to them. He greatly encouraged engraving, painting, brass-founding, and the industrial arts, and laid the foundation of a museum of art as well as of a museum of antiquities, a gallery of paintings, and a royal library. Upon his death he left debts to the amount of 2,500,000 florins.

ALBERTA, ä'l-bûr'tä, a province of Canada established on Sept. 1, 1905, with Saskatchewan (q.v.), by the Dominion Parliament. It was formed out of the former district of Alberta, and parts of the former districts of Athabasca, Saskatchewan, and Assiniboia, and its boundaries are described as the line of the 60th degree of north latitude on the north, the 120th meridian west of Greenwich and the main divide of the Rocky Mountains on the west, the 49th parallel on the south, and the 110th meridian west of Greenwich on the east. The area is given officially as 253,540 square miles. Of this 187,500 square miles are rated as good arable land; 35,400 square miles have been homesteaded or given away in special grants to those who agree to settle on the land or perform settlement duties; 20,500 square miles have been granted to railway companies as subsidies for the construction of their lines; and 4120 square miles have been granted to the Hudson's Bay Company. Most of this is classified as agricultural land. Of the total area of the province, about 91,000 square miles have been surveyed. In 1901 the population of the province was 72,841. By 1906 this figure had increased to 185,412, the advance being due to immigration, which has been very rapid. Following is a table showing the arrival of immigrants since 1906:

1906.....	17,559
1907.....	31,477
1908.....	27,651
1909.....	42,509
1910.....	44,782
1911.....	45,957
1912.....	48,073
Total	258,008

The population figure for the census of 1911 was 374,663. The northern half of the province and the eastern part of the southern half are, generally speaking, level; but the western part below lat. 56° N., and the southwestern, as it nears the foothills of the Rocky Mountains, become broken and hilly. Most of the eastern half and part of the western are prairie land. Central Alberta is well timbered and well watered. The western part of Lake Athabasca is within the limits of the province, and there are numerous smaller lakes. The river systems are of great

ALBERTA

SCALE OF MILES
0 10 20 30 40 50

Railways thus

importance in determining the fertility of the soil by the intersecting valleys which they create. The Athabasca and Peace rivers, joined by numerous tributaries, flow northerly and northeasterly respectively into Lake Athabasca, and thence into the Mackenzie River system and the Arctic Ocean; the Saskatchewan, north and south branches, and tributaries traverse the western part of the province and join the system that drains into Hudson Bay; in southern Alberta some of the tributaries of the Missouri River take their rise and thence drain into the Mississippi and the Gulf of Mexico.

The soil of Alberta is exceptionally rich in the great central region, consisting chiefly of from one to three feet of black vegetable mould, with but small mixture of sand and gravel. The eastern part, except in the south, is not so fertile; and in the south the comparative lack of moisture is being supplied by irrigation. This portion, which was formerly given up to ranching, has recently been devoted in many places to mixed farming and promises a considerable increase in that respect. Irrigation works receive government supervision and aid, and have also been undertaken by many farmers on their own lands, and by corporations, including the railway companies. In 1906 one of the latter was engaged in an irrigation scheme which embraced 3,000,000 acres between Bow and Red Deer rivers. The climate of the province is healthful and invigorating, extremes of heat and cold being mitigated by the dryness of the air; but, as the province extends through 11 degrees of latitude, the temperature varies considerably. Calgary, in lat. 51°, has a moderate and changeable climate, with a mean winter temperature of 15.4°; Edmonton, 53½°, enjoys a steadier climate, but the mean winter temperature drops to 10.3°; Fort Chippewyan, 59°, has a severe climate, with mean winter temperature of 7.2°. The average annual temperature at Edmonton is about the same as that of St. Paul, Minn. The Chinook winds that blow from the west across the Rocky Mountains melt the snow, so that in the southern part of the province cattle and horses can live in the open air throughout the winter. The possibilities in cereal crop raising in Alberta were recognized at the beginning of the twentieth century, and during the first decade the cultivation of cereals developed enormously. Wheat, oats, and barley are most successfully cultivated, especially in central Alberta. Wheat often produces 40, barley 60, and oats 70 to 85 bushels per acre, the latter sometimes producing 100 weighed bushels per acre. Following is a statement showing increase in grain production in Alberta for the decade 1901-11:

Grain	1901		1911	
	Acres	Bushels	Acres	Bushels
Spring wheat . . .	42,668	780,613	757,493	15,730,238
Fall wheat	518	14,682	182,671	4,336,749
Barley	10,987	285,381	103,302	3,037,584
Oats	117,224	3,770,701	669,825	27,604,993
Rye	1,018	17,249	2,190	38,722

Root crops are also successful, and in southern Alberta the sugar beet, which is of exceptional quality, promises large additions to this industry. Apples are grown; so is tobacco in certain parts, and among the native small fruits are raspberries, strawberries, gooseberries, cran-

berries, cherries, and black currants. In the lakes fish are plentiful, and an abundance of small game, such as mallard, teal, wild goose, partridge, and prairie chicken, is found. Twelve government creameries and a large number of others attest the growth of dairying, and the industry is organized with special reference to cold storage and rapid shipment. In 1911 the value of the field crops was \$47,675,000, of which amount the fall wheat was valued at \$5,993,000; spring wheat, \$16,260,000; oats, \$15,893,000; and barley, \$1,694,000. In 1912 there were 351,500 horses, 1,091,600 cattle, 181,000 sheep, and 175,200 swine.

Manufacturing interests are important and growing rapidly. In 1910 there were 290 manufacturing establishments, an invested capital of \$29,518,346, employing 6980 persons, and a product valued at \$18,788,826. In 1905 there were 120 establishments, an invested capital of \$5,545,821, employing 2045 persons, and a product valued at \$5,116,782.

The mineral deposits of Alberta are especially rich. There are large areas underlaid with bituminous coal, semi-bituminous, and lignite, the aggregate coal area being placed at 16,588 square miles. There is an extensive and valuable anthracite deposit in the neighborhood of Banff, on the Canadian Pacific Railway. Gold has been found in the vicinity of Edmonton, and along the banks of the Athabasca, Saskatchewan, Pembina, Macleod, and other rivers. Galena, with a large percentage of silver, has also been found, and natural gas occurs in several places. In 1910 there were mined 878,011 tons of lignite, 1,896,961 tons of bituminous coal, and 261,785 tons of anthracite. In 1912 the lignite output had increased to 964,700 tons; but owing to labor troubles the output of bituminous and anthracite had decreased to 649,745 and 80,119 tons respectively. The total value of the mineral production in 1912 was \$12,110,960.

The bank clearings for Edmonton, Calgary, Medicine Hat, and Lethbridge in 1912 amounted to \$643,836,229 as compared with \$408,811,748 in 1911.

The railway development of the province since 1900 has been remarkable. The main line of the Canadian Pacific was completed to Vancouver in 1885, and in 1905 this was the only railway in the province. At that time it had a mileage of 1060, and the principal branch lines stretched from Calgary to Edmonton and from Calgary to Macleod. In 1912 the province had four lines—the Canadian Pacific, the Canadian Northern, the Grand Trunk, and the Edmonton Duvegan and British Columbia railways, with mileages of 1480, 1912, 638, and 25, respectively, and a grand total of 3055 miles. The cities of the province, with population according to the 1911 census, are: Calgary, 43,704; Edmonton, 24,900; Lethbridge, 8050; Medicine Hat, 5608; Strathcona, 5579; Wetaskewin, 2411. These cities and many towns are growing rapidly. There are still millions of acres of free land. The government forest reserve on the Rocky Mountain slope includes over 18,000 square miles. In 1905 the immigration into Manitoba, Saskatchewan, and Alberta amounted to 146,266, of which the last-named province received about one-third. Of these immigrants 65,359 were British, 43,652 from the United States, and 37,255 from Continental Europe. In the fiscal year ended March 31, 1912, the immigration into Manitoba, Saskatchewan, and Alberta

amounted to 135,592, of which the last-named province received 45,957.

In 1912 the government telephone system had 4000 miles of long distance line, connected with 270 points; 4800 miles of rural line with 5000 subscribers; and a total investment of \$3,800,000. Early in the same year, according to the statement of Premier Sifton, the programme of new construction included over 3000 miles of rural lines and over 700 miles addition to existing long distance lines. In 1912 in 82 towns there were 118 newspapers, of which 10 were daily and 99 weekly.

The government of Alberta is organized on the same principle as the other provinces of the Dominion. The capital is Edmonton. The province is represented in the Dominion Senate by four members, a number which may be increased. To the House of Commons it sends seven representatives, but this number will be increased to 12 on the basis of the 1911 census. The legislative power is vested in an assembly of 41 members with the lieutenant-governor, who is aided in the performance of his executive duties by an appointive council. The province derives its revenue from three sources: (1) from a Dominion subsidy, which in 1912 was \$1,216,895; (2) from public school lands, which in 1912 amounted to \$166,056; and (3) from a tax on corporations, such as insurance, railway, land, loan, and trust companies, banks, etc. From these three sources there is an annual revenue of about \$3,000,000. The grants made by the Dominion government towards the provincial treasury are the following: for the support of the government and legislature, \$50,000; an allowance of 80 cents per head on an estimated population of 250,000 and up to 800,000, yielding at present \$200,000; compensation for the share of the public debt falling on the province, which has no debt of its own, 5 per cent on the sum of \$8,107,500 or \$405,375; compensation for the retention by the Dominion government of public lands within the province, 1 per cent on an estimated valuation of \$37,500,000 until the population shall exceed 400,000, 1½ per cent until a population of 800,000 is reached, 2 per cent when 1,200,000 has been reached, and 3 per cent thereafter; for the construction of the necessary public buildings one-fourth of 1 per cent on the valuation of the public lands is granted for a period of five years. The lands granted to railways within Alberta aggregate 13,120,000 acres, and an equal area, approximately, is distributed in the form of Indian reservations, parks, school lands, and the possessions of the Hudson's Bay Company. In 1912 there were 2029 school districts in the province, about 70,000 pupils, and grants paid amounted to \$430,932.72. There is nominal provision for separate public schools for Protestants and Roman Catholics, but in most districts it is not put into effect. The higher educational institutions include the University of Alberta at Edmonton, with the affiliated Alberta College (Methodist) and Robertson College (Presbyterian); the University of Calgary; a provincial normal school; Lutheran College at Camrose; Mount Royal College (Methodist), and Western Canada College (Baptist) at Calgary; and the Presbyterian Ladies' College at Red Deer.

The formal inauguration of provincial government took place at Edmonton on Sept. 1, 1905, in the presence of Earl Grey, the Governor-General of Canada, and Sir Wilfrid Laurier, the Do-

minion premier. George Hedley Vicars Bulyea was installed as first lieutenant-governor, and Alexander Cameron Rutherford, a leading Liberal politician, was entrusted with the task of organizing the first government of the new province. The first Legislature assembled at Edmonton early in 1906. During its sessions, which lasted until 1910, a number of important measures were passed. A public school system was organized, a judicial system established, government-owned and operated telephones introduced, restrictions imposed on the liquor traffic, and for the protection and compensation of miners and other workmen. Liberal government aid was extended to agriculture and the development of the dairying industry. In July, 1909, the Grand Trunk Pacific Railway connected Edmonton with Winnipeg, and in the same year the government bought the Bell Telephone Company's rights and made public ownership of the telephone system complete. In October Earl Grey laid the cornerstone of the new parliament building at Edmonton. The second Legislature, which assembled in February, 1910, was formally opened by Lieutenant-Governor Bulyea, who in the same year was appointed for a second term. A political crisis, involving the resignation of Premier Rutherford and the accession to his office of Hon. Arthur Lewis Sifton, Chief Justice of the Province, was precipitated by the proposed building of the Alberta and Great Waterways Railway, to connect Edmonton with the vast northern grain-growing fields of the province. The terms of the contract, and certain proceedings which had taken place in pursuance thereof, were criticized as insufficiently protecting the popular rights. Premier Sifton undertook to procure the application of over \$7,000,000, which had been deposited in various banks under proceedings growing out of the contract, for purposes of revenue. The promoters of the railway opposed this, and the resulting litigation culminated in an appeal to the Judicial Committee of the Privy Council, which in 1912 had not given a decision. During 1911-13 two proposed changes of public policy commanded wide attention. The government opposed the Canadian Pacific Railway's exemption from taxation. The amount involved was over \$60,000,000, but the Judicial Committee of the Privy Council upheld the legality of the exemption. It was also proposed that the province should acquire control of all lands not available for free settlement, and which at present are part of the public domain and vested in the crown. The objects were increased efficiency in developing the provincial resources and the expansion of the provincial revenues. The question was regarded as likely to persist until settled in favor of the Province. The rapid progress of Alberta compelled the enlargement of the Cabinet, so that in 1912 it had increased from four to eight administrative departments. Consult Leo Thwaite, *Alberta: An Account of its Wealth and Progress* (London, 1912).

ALBERT CHAPEL. A memorial chapel in Windsor Castle. See WINDSOR CASTLE.

ALBERT EDWARD. See EDWARD VII.

ALBERT EDWARD NYANZA. See LAKE EDWARD.

ALBERT EMBANKMENT. The name given to a part of the Thames Embankment (q.v.), London.

ALBERT HALL, THE ROYAL. An amphitheatre in Kensington, London, built in 1867-71

for concerts and other large assemblies. In shape the building is oval, 270 by 240 feet in dimensions; it seats 8000 people. Its style is Italian Renaissance, the material being brick and the chief external ornament a frieze in terra cotta, representing the different races of men. Its organ, which has nearly 9000 pipes, is famous as one of the largest in the world.

ALBERTI, ăl-bâr'tê, DOMENICO (c.1707-40). An Italian composer. He was born in Venice and died in Formio. A style of broken chord bass-accompaniment, which he developed, still is called "Alberti" or "Albertinian" bass.

ALBERTI, LEON BATTISTA DEGLI (1404-72). An Italian architect and writer, the leader in the second phase of early Italian Renaissance architecture, and its greatest theorist on the fine arts. He was born in Venice, Feb. 18, 1404, the illegitimate son of Lorenzo degli Alberti, of a noble and powerful Florentine family, at that time in exile. He received the best education which the age could afford, at first in the school of Barsizia at Padua, then at the University of Bologna, from which he was graduated, at the age of 24, with the degree of Doctor of Laws. At 20 he wrote a Latin comedy which deceived the elect, and he thoroughly mastered Greek, besides being proficient in mathematics and the natural sciences. He was, moreover, a poet and a philosopher, and as a musician ranked as one of the first organists of his day. He excelled also in physical and social accomplishments, and, like Leonardo da Vinci, exercised a powerful and fascinating influence upon all contemporaries. In 1428 he returned from exile to Florence, and afterward traveled through France, the Low Countries, and Germany in the following of the Cardinal Albergati. In 1432 he was appointed a papal secretary by Eugenius IV. His architectural training began with the study of antique monuments during his first stay in Rome, 1432-34. Returning with the Pope to Florence, he entered with ardor into the artistic life of the city. Brunelleschi and Donatello (q.v.) were his friends and associates, and it was probably at this time that he discovered the mathematical laws of linear perspective, which were of incalculable value to the painters of his own and the succeeding generation. He took an active part in the literary life of Florence, and figured as a champion of the use of the native tongue instead of Latin. After spending nine years with the papal court in Florence and elsewhere, he returned with it to Rome, where most of the remainder of his life was spent. He was secretary to six popes, and stood in high favor with Eugenius IV, Nicholas V, and especially with the humanist Pius II. His advice in matters of architecture was, no doubt, sought by the supreme pontiffs, and at least under Nicholas V he was in charge of the projects for rebuilding St. Peter's and the Vatican.

Although Alberti's buildings rank among the best of the Renaissance, he was a theorist rather than a practical architect. He furnished only the plans of his buildings, never supervising their construction. His art is the most strictly classical of the Early Renaissance and prepared the way for that of Bramante (q.v.) and the High Renaissance. Its purity is shown in the façade of the church of San Francesco at Rimini, adapted from the arch of Augustus at Rimini. His intended use here of the dome, his barrel vaults at Sant' Andrea in Mantua, show how in construction he also returned to the forms

of ancient Roman architecture. He had a number of pupils and associates, who carried out his plans: Matteo dei Pasti, at Rimini; Fancelli, at Mantua; Bertini in the façade of Santa Maria Novella at Florence (where he so successfully copied the mediæval style of incrustated marbles); and Rossellino in the famous Rucellai Palace (1446-51) at Florence, which combined the older rustic with the smooth pilastered style. His book *De Re Ædificatoria* (1485) was the first great printed work on architecture of the Renaissance, and had been preceded by a manual on the five orders, as well as by other manuals on statuary and painting. The best of these is *De Pictura libri iii*, written in Italian, and the most important treatise on painting before Leonardo. It was first published at Basel in 1540, and the best modern edition is that of Janitscheck (1877). Consult his biography by Mancini (Florence, 1882), for detailed and reliable information; also the scholarly treatise of Von Geymüller, in *Die Architektur der Renaissance in Toscana* (Munich, 1888). The latest biography is by Londi (Florence, 1906), and there is an excellent and detailed article by Suida, in Thieme and Becker's *Allgemeines Künstler Lexicon*, vol. i (Leipzig, 1907).

ALBERTINELLI, ăl-bâr'tê-něl'lê, MARIOTTO (1474-1515). A Florentine painter of the High Renaissance. He was born of an ancient and noble Florentine family and studied with Cosimo Roselli, and, according to Berenson, with Piero di Cosimo. In Roselli's workshop he formed his life-long friendship with Fra Bartolommeo (q.v.). Jovial and worldly, he was the direct opposite of his clerical friend, with whom he established a common studio. When Bartolommeo entered the cloister in 1500, Mariotto worked independently until his friend's return to Florence in 1509, when he joined him in the atelier of the cloister of San Marco. Their joint signature was a cross with two locked rings until their final separation in 1512. According to Vasari, Albertinelli, in despair, became an innkeeper; what really happened was that he inherited his father-in-law's wine shop. A public house bearing his name still exists in Florence. He soon resumed painting and was afterwards active at Santa Maria della Quercia and in Rome, where he fell ill. He died Nov. 5, 1515, soon after his return to Florence. Although his pictures show his intimate relation with Fra Bartolommeo, who was the stronger artist of the two, Albertinelli's best work belongs to the finest produced by the Renaissance. Among their joint productions are an "Annunciation" (1497) in the Volterra, the "Last Judgment" (1498), a fresco of Santa Maria Novella, now in the Uffizi; and the fine "Madonna in Glory" in the cathedral of Besançon. Of his independent pictures the finest is the "Visitation" (1503) in the Uffizi, a work of great beauty; others are a "Holy Family" in the Pitti Gallery, a smaller "Madonna," a "Trinity" and an "Annunciation" (1510), in the Florence Academy; a small triptych in the Poldo-Pezzoli Museum, Milan; and the painting of a female saint, in the possession of Mrs. Samuel Untermyer, New York. Consult Gruyer, *Fra Bartolommeo della Porta et Mariotto Albertinelli* (Paris, 1886), and the works cited under Fra Bartolommeo (q.v.), which treat also his friend.

ALBERTIS, ăl-bâr'tês, LUIGI MARIA D' (1841-1901). An Italian traveler, born at Voltri. He attended the College of Savona and served in the

army of Garibaldi in 1860. From 1871 to 1878 he made a careful exploration and study of the island of New Guinea. The results of this expedition he published in his *Esplorazione della Nuova Guinea* (1880; Eng. trans., 1880).

ALBERTITE. An asphaltic hydrocarbon compound obtained at Hillsborough, Albert Co., New Brunswick, Canada, where it occurred in a fissure vein in rocks of the Upper Devonian age. It is a soft, jet black mineral that has been derived from petroleum by oxidization of the oily contents, and it was at one time highly prized as a gas-enricher. See ASPHALTIC COAL.

ALBERT LAKE. See LAKE ALBERT.

ALBERT LEA. A city and the county-seat of Freeborn Co., Minn., 100 miles (direct) south of Minneapolis on the Chicago, Milwaukee, and St. Paul, the Minneapolis and St. Louis, the Chicago, Rock Island, and Pacific, the Iowa Central, and the Illinois Central railroads (Map: Minnesota, D 7). Two fine lakes, county fair grounds, well-kept parks and boulevards, and large hotels make Albert Lea a popular summer resort. The city also contains a splendid county court house, an opera house, public baths, etc., and is the seat of the Albert Lea College for women (Presbyterian), opened in 1885, and the Luther Academy. It is the market for the agricultural and dairy products (chiefly butter) of the surrounding region. It has the only creamery owned and operated by the State in the world. It has also gas engine, corset, paper box, mill tool, road grader, and culvert and tank factories, two creameries, a pork-packing house, etc. There are some 50 artesian wells of chalybeate water, which are owned and operated by the city. Pop., 1890, 3305; 1900, 4500; 1910, 6192; 1913 (est.), 11,283.

ALBERT MED'AL. A decoration instituted in England (1866)—in memory of Prince Consort Albert, whose name it bears—to reward heroic acts in saving life at sea. In 1877 it was extended to acts of gallantry in preventing loss of life in perils on land. There are two classes, the first of gold and the second of bronze, with the words "For Gallantry in Saving Life at Sea" or "on Land," as the case may be.

ALBERT MEMORIAL. A monument of Prince Albert, the Consort of Queen Victoria of England, who died in 1861. The monument, by Sir Gilbert Scott, is in the Victorian Gothic style, in an adaptation of Italian Gothic suggestions, with inlays, mosaic, and a frieze of allegorical sculpture, the whole forming a vaulted canopy over the statue of the Prince. It is situated in Kensington Gardens. See LONDON.

ALBERT NYANZA. See LAKE ALBERT.

ALBERT OF AIX, or AACHEA (fl. c.1125). A French historian, of whose life very little is known beyond the fact that he was a canon and "custos" at Aix-la-Chapelle. He was the author of a work which included the history of the first crusade and of the Latin Kingdom of Jerusalem to 1121. Formerly this was widely used by all historians of the crusades from William of Tyre (q.v.) down to 1840. Then its value was attacked by H. von Sybel (q.v.), and for about 40 years it was regarded as almost worthless. Now its value is again recognized, and the theory is current that Albert's work is based upon a chronicle written by a follower of Godfrey of Bouillon (q.v.). Along with much fabulous material it contains much that is valuable. There is no good edition; the least unsatisfactory is in the *Recueil des Historiens des croisades: histori-*

ens occidentaux. See Sybel, *Geschichte des ersten Kreuzzuges* (2d ed., Leipzig, 1881); Kugler, *Albert von Aachen* (Stuttgart, 1885); Ver-crugsse, *Essai critique sur la chronique d'Albert d'Aix* (Liège, 1889).

ALBERTSON, CHARLES CARROLL (1865—). An American clergyman and writer, born at Plainfield, Ind. Educated at first to be a lawyer, he later turned to the ministry, for which he received his training at the Garrett Biblical Institute of Northwestern University. He filled pastorates at Goshen, Ind. (1888-92); Jamestown, N. Y. (1892-95); Buffalo, N. Y. (1895-99); and Philadelphia (1899-1904). In 1904 he became pastor of the Central Presbyterian Church of Rochester, N. Y., where he remained until called to the pulpit of the Lafayette Avenue Presbyterian Church, Brooklyn, in 1913. The degree of D.D. was conferred upon him by Allegheny College in 1899. Becoming known as a lecturer and as preacher to various colleges, Dr. Albertson was made a member of the American Philosophical Society and of the Victoria Institute of London. Besides editing several religious compilations and contributing articles to periodicals, he published the following: *Safe Counsel and Sweet Comfort* (1891); *The Gospel according to Christ* (1898); *Many Voices* (1904); *Death and Afterwards* (1907); *College Sermons* (1910); *Distinctive Ideas of Jesus* (1911).

ALBERTUS MAG'NUS. See ALBERT, COUNT OF BOLLSTÄDT.

ALBERTYPE. See PHOTOGRAPHY; ALBERT, JOSEPH.

ALBES'ENCE. This term is applied to the whitening of portions of foliage leaves different from the blanching due to the absence of light (*etiolation*, q.v.) or the absence of green caused by the lack of iron (*chlorosis*, q.v.). The variegated leaves of many greenhouse plants, such as fancy caladiums, silver geraniums, and striped ribbon grass, afford good examples of albescence. Such leaves must be regarded as less efficient foliage organs than those entirely green. In the case of abutilon (q.v.), the whitening is thought to be due to the presence of a virus, at least the albescence may be transmitted through inoculation by grafting, but in other instances the cause of the albescence is unknown.

ALBI, à'lbè, or ALBY. The capital of the department of Tarn in France, built on an eminence (570 feet high) overlooking the river Tarn, which is here crossed by a beautiful stone bridge (Map: France, S., G 5). Albi suffered greatly during the religious wars which devastated the land in the time of the Albigenses, who took their name from this town. The chief building is the cathedral of St. Cecilia, built of brick in a unique style and decorated on wall and ceiling with frescoes executed by the first Italian painters of the day. The south portal is a remarkable example of decorated Gothic. It is adorned with an exquisite recumbent statue of the patron saint in marble. The town maintains a library (including many incunabula) and a museum. There are large brickyards at Albi, and it has a considerable trade in grain, wine, fruit, etc., and linen, cotton, wool, and leather manufactures. Pop., 1896, 14,983; 1901, 18,262; 1906, 23,303; 1911, 25,100.

AL'BIA. A city and the county-seat of Monroe Co., Iowa, 68 miles southeast of Des Moines, on the Chicago, Burlington, and Quincy, the Minneapolis and St. Louis, the Wabash, the Southern Iowa Traction Company, and other railroads

(Map: Iowa, E 3). With its excellent transportation facilities, the city controls a large trade in coal, which is extensively mined in the county, and in agricultural products, live stock, and grain. There are also metal works, a telephone factory, and a packing house. Pop., 1890, 2359; 1900, 2889; 1910, 4969; 1913 (est.), 5342.

AL'BIGEN'SES. A name applied to the heretical Cathari in the south of France about the beginning of the thirteenth century. The name arose from the circumstances that the Cathari were especially numerous in the district of Albigeois, about Albi, in Languedoc. It seems to have been first used in 1181. The so-called Albigenian Crusade was undertaken by Pope Innocent III in 1209. The immediate occasion of it was the murder of the papal legate and inquisitor, Peter of Castelnau, who had been commissioned to extirpate heresy in the dominions of Count Raymond VI of Toulouse; but its real purpose was to deprive the Count of his lands, as he had become an object of dislike from his toleration of the heretics. It was in vain that he had submitted to the most humiliating penance and flagellation from the hands of the legate Milo and had solicited papal absolution by great sacrifices. The legates Arnold, Abbot of Citeaux, and Milo, who directed the expedition, took by storm Béziers, the capital of Raymond's nephew, Roger, and massacred 20,000 of the inhabitants, Catholics as well as heretics. Simon de Montfort, who conducted the war under the legates, proceeded in the same relentless way with other places in the territories of Raymond and his allies. Of these, Roger of Béziers died in prison, and Peter I of Aragon fell in battle. A part of the conquered lands were given as a reward to Simon de Montfort, who was killed at the siege of Toulouse, 1218. Counts Raymond VI and VII disputed the possession of their territories with his son. But the papal indulgences drew fresh crusaders from every province of France to continue the war. Raymond VII continued to struggle bravely against the legates and Louis VIII of France, to whom Montfort had ceded his pretensions. After many thousands had perished on both sides, a peace was concluded, in 1229, when Raymond purchased relief from the ban of the Church by immense sums of money, gave up Narbonne and several lordships to Louis IX, and had to make his son-in-law, the brother of Louis, heir to his other possessions. The Albigenes were left without a protector. The heretics were handed over to the proselytizing zeal of the order of Dominicans and the tribunals of the Inquisition, and both used their utmost power to bring the recusant Albigenes to repentance, and also, by inflicting severe punishment on the penitent converts, to inspire dread of incurring the Church's displeasure. From the middle of the thirteenth century the name of the Albigenes gradually disappears. The remnants of them took refuge in the East, some settling in Bosnia. Consult: Schmidt, *Histoire de la secte des Cathares ou Albigeois* (Paris, 1849); Lea, *History of the Inquisition* (New York, 1888); Döllinger, *Beiträge zur Sektengeschichte des Mittelalters* (Munich, 1890); Luchaire, *Innocent III et la croisade des Albigeois* (Paris, 1905). The last is easily the best discussion of the subject, but contains no references to sources.

ALBI'NO (Portug. and Sp., from Lat. *albus*, white). A term first applied by the Portuguese

to the white negroes of West Africa; now applied to any individual in whom there is congenital deficiency of pigment in skin, hair, iris, and choroid of the eye. The skin is abnormally pale, the hair is white or pale flaxen, and the iris is pink. An albino is termed *leucoëthiop* by the Latins, *kakerlak* by the Germans, *bedo* in Ceylon, and *dondo* in Africa. The absence of pigment in the iris renders an albino's eyes sensitive, and partially blind in the sunlight. Nystagmus (oscillation of the eyeball), photophobia, and astigmatism are often present. Albinism is found in many races as a rare condition. Cushing found it among the Zuñi. It is sometimes a family trait. It occurs frequently among rabbits, mice, birds, and other lower animals. See also SOMATOLOGY; VITILIGO; MELANISM AND ALBINISM.

AL'BINOVA'NUS, PEDO. A Roman epic writer; a friend and contemporary of Ovid, who addressed to him one of his *Epistolæ ex Ponto*. He is to be identified, perhaps, with the Pedo mentioned by Tacitus as *præfectus equitum* under Germanicus (q.v.) in Germany. In addition to his epic on the exploits of Germanicus in Germany, fragments of which are preserved in the *Suasoriæ* of Seneca, he is said to have written a poem entitled *Thesëis*, an epic on contemporary history, and numerous epigrams; but he was probably not the author of the elegy on the death of Drusus, which has been attributed to him. Albinovanus is quoted by the younger Seneca, who calls him *Fabulator Elegantissimus*, and is mentioned as a wit by Martial and Quintilian. Consult: Wernsdorf, *Poetæ Latini Minores*, vol. iv; Bährens, *Poetæ Latini Minores* vol. i (Leipzig, 1879; 2d ed., by Vollmer, Leipzig, 1910); Haupt, *Opuscula*, vol. i (1875); Haube, *Beitrag zur Kenntnis des Albinovanus Pedo* (1880).

ALBINUS, BERNHARDT SIEGFRIED (1697–1770). A German anatomist, born at Frankfort-on-Oder. He studied medicine under his father, Boerhave, and Rau. In 1718 he became professor of anatomy at the University of Leyden, and, in 1745, professor of medicine. He was known as one of the greatest instructors in anatomy of his day, and his works *De Ossibus Corporis Humani* (1726) and *Historia Musculorum Humini* (1734) are still of considerable value.

ALBI'NUS, CLODIUS, the popular name for DECIMUS CLODIUS CEIONIUS SEPTIMIUS ALBINUS (?–197 A.D.). A Roman commander. He was a governor of Gaul and Britain at the time of the death of the Emperor Commodus (192), and was made Cæsar by Septimius Severus in 194, as a means of keeping him neutral. After defeating his rivals, however, Severus turned his arms against Albinus, and in a battle near Lugdunum (Lyons) in Gaul (197), Albinus was defeated and killed (Dio Cass. lxx, 4, *Vita Albini*).

AL'BION (Lat. Gk. Ἄλβιον, *Alouïōn*, from Lat. *albus*, white, referring to the chalk cliffs of the southern coast). The most ancient name of the island of Great Britain. See under ALBANY, or ALBAINN.

ALBION. A city in Calhoun Co., Mich., 96 miles west of Detroit, on the Michigan Central, the Lake Shore and Michigan Southern railroads, and an electric line running from Kalamazoo to Detroit, and on the Kalamazoo River (Map: Michigan, E 6). The city owns its water supply, has a city library, two hospitals and park, and is the seat of Albion College, under Methodist

Episcopal control. Its principal manufactures are malleable iron, flour, carriage and automobile seat springs, locks, hinges, screens, and agricultural implements. Albion was first settled in 1830 and is governed under a charter adopted in 1896, revised in 1897 and in 1899, which provides for a mayor, elected annually, and a city council, composed of the mayor, city clerk, and eight aldermen. Pop., 1890, 3763; 1900, 4519; 1910, 5833; 1913 (est.), 7893.

ALBION. A village, the county-seat of Orleans Co., N. Y., 30 miles northwest of Rochester, on the New York Central Railroad, Buffalo, Lockport, and Rochester Railway, and on the Erie Canal (Map: New York, B 4). The Western House of Refuge for Women, the Swan Library, the high school, the court house, Pullman Memorial Church, and Mount Albion Cemetery are prominent features of interest. It has a very large canning factory and manufactures cement building blocks, etc. Much fruit is grown in the surrounding country. There are three large cold-storage plants in the village. Albion is governed, under a revised charter of 1890, by a mayor, elected triennially, and a board of trustees. Pop., 1890, 4586; 1900, 4477; 1910, 5016; 1913 (est.), 5800.

ALBION, NEW. The name given by Sir Francis Drake to the western coast of North America, which he visited in 1579. It was originally applied to the whole region including the peninsula of Lower California, but was restricted by Humboldt and other geographers to the section actually explored by Drake between San Francisco Bay and the Columbia River. Consult the map in the Hakluyt Society's edition of Fletcher's *World Encompassed by Sir Francis Drake*.

AL'BION AND ALBA'NIUS. An opera or masque by John Dryden, written to celebrate the successes of the Stuarts after the restoration. It was produced, with music by Louis Grabu, in 1685, and first published the same year. It is an allegory, with classical nomenclature. Albion represents Charles II; and Albanus, James, the Duke of York.

ALBION COLLEGE. An American college, situated at Albion, Mich., established as a seminary in 1835 and organized as a college in 1861. In 1912 it had 27 professors and instructors, and 331 students in the college department, 134 in the schools of music and painting, 91 in the business department, and 68 in the preparatory department. The endowment fund is \$355,000, the value of buildings and grounds \$250,000, and the annual income from \$45,000 to \$50,000. The library contains 22,100 volumes and 4300 pamphlets. President, Samuel Dickie, LL.D.

ALBION'S ENGL'LAND. A long narrative poem on English history, by William Warner (c.1558-1609). It was first published in 1586, in four books on legendary incidents from Noah's time to that of William the Conqueror; but other books were successively added, till there were 16, bringing the story down to the reign of James I. Many of its materials have been used by later poets.

ALBISTAN, ä'l'bê-stän', or **EL-BOSTAN,** ël'bê-stän' (Turk. the garden). A town in the Turkish vilayet of Aleppo, about 40 miles north-northeast of Marash, on the small river Jihun (Map: Turkey in Asia, G 3). It is situated in a fertile portion of Anatolia and has a considerable trade in grain. In 1277 there was a bloody battle fought here between the inhabitants and invading Mongols. The town was be-

sieged by the Egyptians late in the fourteenth century. Its population is about 6500.

AL'BITE (Lat. *albus*, white). A sodium feldspar or sodium aluminum silicate, usually white in color, that crystallizes in the triclinic system. It is a constituent of many alkaline rocks and is found extensively in the United States. Certain varieties called moonstones, having a blue chatoyant effect, are cut and polished as gems. See FELDSPAR.

ALBO, ä'l'bô, JOSEPH (c.1380-1444). A Jewish preacher and theologian of Spain. He was born probably at Montreal, Aragon, studied under the speculative philosopher Hasdai Crescas, and in 1413-14 seems to have taken part in the extended theological discussion at Tortosa. He is known chiefly for his apologetic entitled *Ik-karim* ('Principles'), which has exerted wide influence. The work was first published in 1485, was translated into German by Schlesinger (1844), and into English in the *Hebrew Review*, vols. i-iii. Albo reduced to three the basic principles of Judaism: the existence of God, revelation, and divine retribution. Consult Back, *Joseph Albo* (1869), and Tünzer, *Die Religionsphilosophie des Joseph Albo* (1896).

ALBOIN, ä'l'boin (?-c.572 or 573). The founder of the Lombard dominion in Italy. He succeeded his father in 565 A.D. as King of the Lombards, who were at that time settled in Noricum and Pannonia. He first aided Narses against the Ostrogoths and afterward, allying himself with the Avars, attacked the Gepidæ and defeated them in a great battle (566 or 567), slaying their King, Cunimund, with his own hand. On the death of his first wife, Chlotsuinda, he married Rosamund, daughter of Cunimund. He invaded Italy in 568 with his own nation of Lombards, some of the Gepidæ, 20,000 Saxons, and adventurers from other nations; overran Venetia in 568, Liguria in 569, and Etruria in 570, and captured Beneventum in 571. Pavia was conquered in 572, after over three years of siege. During a feast at Verona he made his queen drink out of the skull of her father, which he had converted into a wine-cup. In revenge she incited her paramour, Helmechis, to murder her husband (572 or 573). To escape the fury of the Lombards, Rosamund fled with her associate and the treasure to Longinus, the exarch, at Ravenna. Longinus becoming a suitor for her hand, she administered poison to Helmechis, who, discovering the treachery, caused her to swallow the remainder of the cup, and she died with him. For several centuries the name of Alboin continued to be famous among the German nations, who celebrated his praises in martial songs. See Foulke, *History of the Langobards* (Philadelphia, 1907).

AL'BOLENE. A neutral, bland hydrocarbon oil, of mineral origin, used in medicine to carry remedies intended to be sprayed into the nose and deeper air passages; as a bland dressing for wounds to prevent dressings from adhering to the granulating surface; and sometimes as a mild laxative in place of castor oil or olive oil. See PETROLEUM.

ALBONI, ä'l'bô'nê, MARIETTA (1823-94). An Italian contralto, born at Cesena, in the Romagna, March 10, 1823. A pupil of Madame Bertolotti, and later of Rossini, she made her début at the age of 15 at Bologna as Orsini in *Lucrezia Borgia*, and her success led to an engagement at La Scala, Milan. In 1846-47 she sang in all the principal cities of Europe; in London,

at Covent Garden, in rivalry with Jenny Lind, who was at Her Majesty's Theatre. In 1852 she visited the United States, singing in the chief towns in opera and concert. With the exception of Malibran (q.v.), she was the greatest contralto of the nineteenth century. Her voice, a fine contralto with a compass of two and one-half octaves, ranging as high as mezzo-soprano, possessed at once power, sweetness, fullness, and extraordinary flexibility. In passages requiring elevation and semi-religious calmness she had no peers, owing to the moving quality of her voice. She possessed vivacity, grace, and charm as an actress of the *comédienne* type, but her attempt at a strongly dramatic part, like Norma, turned out a failure. She married Count Pepoli, of the Papal States, but kept her maiden name on the stage, appearing in opera at Munich as late as 1872. Her husband died in 1866, and in 1877 she married M. Zieger, a French officer. She died at Ville d'Avray, near Paris. Consult G. T. Ferris, *Great Singers* (New York, 1893), and A. Pougin, *Marietta Alboni* (Paris, 1912).

AL-BO'RAK. According to the Moslem creed, the animal brought by Gabriel to carry Mohammed to the seventh heaven. It had the face of a man, the body of a horse, the wings of an eagle, and spoke with a human voice.

ALBORNOZ, ä'l'bör-nōth', GIL ALVAREZ CARRILLO DE (c.1310-67). A warlike Spanish prelate. He was born at Cuenca, studied at Toulouse, and subsequently became almoner to Alfonso XI, King of Castile, who appointed him Archdeacon of Calatrava, and in 1337 he was chosen Archbishop of Toledo. He took part in the wars against the Moors, saved the life of the King in the battle of Tarifa, and was present at the siege of Algeciras, where the King dubbed him knight. After the death of the King he went to Pope Clement VI at Avignon, who made him a Cardinal. Innocent VII also recognized his abilities as an astute diplomat and twice sent him as Cardinal-Legate to Rome, where, by his tact and vigor, he secured, in spite of the intricate complications of affairs, the restoration of the papal authority in the States of the Church (1353-62). Pope Urban V felt that he owed the recovery of his dominions mainly to him, and out of gratitude appointed him legate at Bologna, in 1367. In the same year he died, at Viterbo; but as he had expressed a wish to be buried at Toledo, Henry of Castile removed his body with almost royal honors, and Urban even granted an indulgence to all who had assisted in transferring the body from Viterbo to Toledo. He left a valuable work upon the constitution of the Roman church, printed for the first time at Jesi in 1473 and now very rare. By his will he provided for the foundation of the College of Spain at Bologna.

ALBRECHT, ä'l'brëkt. See ALBERT.

ALBRECHTSBERGER, ä'l'brëkts - bërK'ër, JOHANN GEORG (1736-1809). An Austrian musician, one of the most learned contrapuntists of his age. In 1772 he was appointed court organist, and in 1792 kapellmeister of St. Stephen's Cathedral, Vienna. Among his pupils were Beethoven (whose genius he failed to recognize), Hummel, Moscheles, Seyfried, and Weigl. Of his numerous compositions, few ever appeared in print. His most important contributions to music were his theoretical works, the *Gründliche Anweisung zur Komposition* (1818), and *Kurzgefasste Methode, den Generalbass zu erlernen* (1792).

ALBRET, ä'l'brë', JEANNE D' (1528-72). Queen of Navarre, only daughter of Henry II of Navarre, and Margaret, sister of Francis I. Jeanne married Antoine de Bourbon. She was celebrated for her intellectual strength and personal beauty. She embraced Calvinism and, in spite of Spanish menaces and Roman intrigue, kept her possessions. In 1567 she declared the reformed religion established in the kingdom, and in 1569, with her children, Henry, afterward Henry IV of France, and Catherine, she brought a small band of Huguenots to Coligny at La Rochelle, and after the murder of the Prince of Condé she was looked upon as the only support of the Protestants. She wrote prose and verse, and some of her sonnets have been published. Consult *Mémoires et poésies de Jeanne d'Albret* (Paris, 1893) and *Lettres d'Antoine de Bourbon et de Jehanne d'Albret publiées pour la Société de l'histoire de France* (Paris, 1877).

ALBRET, THE LORDSHIP OF, in the Landes, in France. The lords of Albret were prominent in the Hundred Years' War (q.v.), and Charles, Lord of Albret, was commander of the French forces at Agincourt, where he was killed. John of Albret became King of Navarre by his marriage with Catherine de Foix (q.v.). Their son Henry was created Duke of Albret in 1550. His grandson was Henry of Navarre, by whose accession to the French throne the dukedom became united to the crown; but it was granted to the family of La Tour d'Auvergne in 1651.

ALBRIGHT, ô'l'brīt, JACOB (1759-1808). The founder of the Evangelical Association (q.v.). He was born near Pottstown, Pa., May 1, 1759, and died at Mühlbach, Pa., May 8, 1808. In 1792 he joined the Methodist church, in 1796 began his very successful career as preacher among the Germans, and in 1807 was elected first bishop of the church which he founded. For his life, consult Yeakel, *Jacob Albright and his Co-laborers* (Cleveland, 1883).

ALBRIGHT BRETH'REN. See EVANGELICAL ASSOCIATION.

ALBRIGHT COLLEGE. A coeducational institution, under the control of the United Evangelical Church, at Myerstown, Pa., founded in 1895 and consolidated in 1902 with Central Pennsylvania College. It has a classical course, requiring Greek for the A.B. degree, Latin, scientific and chemical-biological courses. It has also a preparatory school and music and art departments. In 1913 the faculty numbered 17, and the students 222. The school has a library of 8000 volumes, property valued at \$140,000, an endowment of \$86,000, and an income of \$34,000. President, J. F. Dunlap, D.D.

ALBRIZZI, ä'l-brët'së, ISABELLA TEOTOCHI, COUNTESS D' (1763-1836). An Italian author. She was born at Corfu, of Greek parentage. As the wife of the Inquisitor of State, Count Giuseppe Albrizzi, her home in Venice became the rendezvous for many celebrities of the day, such as Alfieri, Foscolo, and Byron. With Cicognara, she was one of the first to call attention to the genius of Canova, to whom she paid a glowing tribute in her celebrated work, *Opere di scultura e di plastica di Ant. Canova descritte da J. A.* (1809); also published under the title *Descrizione delle opere di Canova* (5 vols., 1821-25). Her other writings include *Ritratti* (1807, 1826); 17 essays on distinguished contemporaries, and a life of Vittoria Colonna (1836).

ALBRUNA. A German seer of the time of the Roman Emperor Augustus. She is men-

tioned by Tacitus (*Germania*, viii), and is supposed to have acquired renown during the campaigns of Drusus and Tiberius. Albruna is the same as the Old Norse *alfruna* and the Anglo-Saxon *helrun* and is the collective term for the wise women of the ancient Germans.

AL'BUCA'SIS. See ABU'L KASIM.

ALBUERA, ăl-bwā'rá. A hamlet in the Spanish province of Badajoz, famous for the battle of May 16, 1811, between the combined English, Spanish, and Portuguese forces under General Beresford, and the French under Marshal Soult, who were not so numerous as the allies, but had abundant artillery. The object of the French was to compel the English to raise the siege of Badajoz. The result was that Soult was obliged to retreat to Seville with the loss of 8000 men; the loss of the allied forces was about 7000. In proportion to the numbers engaged, the battle was the most sanguinary in the whole contest. Of 6000 British who charged the French entrenchments, only 1500 remained unwounded.

ALBUFERA, ăl'bōō-fā'rá (Ar. *al*, the + *bu-haira*, coast-lake). A lake near Valencia, in Spain, about 10 miles in length and 4 miles in breadth. It is separated from the sea by a narrow tongue of land, and a canal connects it with the city of Valencia (Map: Spain, E 3). Its fish and game birds attract sportsmen, and it is said to have been excavated by the Moors. From it Marshal Suchet (q.v.) took the title of duke.

ALBU'GO. See LEUCOMA.

ALBULA, ăl'bu-lá. A river in the canton of Grison, or Graubünden, Switzerland (Map: Switzerland, D 2). The Albula is the largest tributary of the Hinter Rhine and rises in Albula Pass, flowing through the Albula valley to empty into the Hinter Rhine after a course of 29 miles. Its outlet is 4500 feet lower than its source.

AL'BULÆ A'QUÆ. Sulphur springs near ancient Tibur (see TIVOLI), much used by invalids for bathing and drinking. Three still remain, forming the lakes known as Bagni di Tivoli.

ALBULA PASS. A high, rocky pass in which rises the Albula River, Switzerland (Map: Switzerland, D 2). It is situated 7600 feet above sea level and lies between the peak of Crasta Mora (9600 feet high) and the Pitz Urtsch or Albulahorn (10,700 feet high). Over it runs the road from Tiefenkasten to Ponte, the shortest route into the Engadine. The opening of a railway line through the pass in 1903 established its importance as a route for trade.

AL'BUM (Lat., neut. of *albus*, white). Among the Romans, a wooden tablet whitened with gypsum, on which were written in black letters the *Annales Maximi* of the pontifex (see ANNALS), the *acta* (q.v.) of the magistrates, etc., edicts of the prætor, and public announcements generally. The word was also applied to the contents of such a board, and, since lists of corporations had to be published, album came to denote any such catalogue; e.g., *Album Senatorium*, the official list of the Senate. In the Middle Ages the word was used to denote any list, catalogue, or register, whether of saints, soldiers, or civil functionaries. In the gymnasia and the universities on the Continent, the list of the names of the members is called the album. The name is also applied to the "black board" on which public notifications of lectures, etc.,

are written up. But its popular signification in modern times is that of a book for containing photographs, or a blank book for a drawing-room table, intended to receive fugitive pieces of verse, or the signatures of distinguished persons, or sometimes merely drawings.

ALBUMAZAR, ăl'bōō-mä'zēr (805-885). An Arabian astrologer, born at Balkh, whose true name was ABOU-MASCHAR DJAFAR IBN-MOHAMMED. He believed that the world was created when the seven planets were in conjunction in the first degree of Aries and that it would be destroyed when they are again in conjunction in the last degree of Pisces. He is the author of more than 50 works, several of which have been translated into Latin. Of the latter are: *Flores Astrologici* (1488); *De Magnis Conjunctionibus, Annorum Revolutionibus ac eorum Projectionibus* (1489); *Introductorium in Astronomiam* (1506).

ALBU'MEN (Lat. the white of an egg, from *albus*, white). In plants, a name formerly applied to the nutritive tissue of seeds, now commonly known as "endosperm." See SEED.

ALBUMEN, or **ALBUMIN**. The most important ingredient in the white of egg. It abounds in the blood and more or less in all the serous fluids of the animal body. It also exists in the sap of vegetables and in their seeds and edible parts. Albumen is often used as a mordant, to fasten various colors on cotton. It is prepared industrially in considerable quantities by drying the white of egg without allowing it to coagulate. For this purpose the white of egg is placed in shallow vessels and kept at a temperature of about 50° C. (122° F.) in well-ventilated chambers. Unless coagulation has taken place, the dried albumen remains completely soluble in water. Albumen is used in photographic printing, and its property of coagulating with heat into an insoluble variety renders it useful in clarifying solutions, as in sugar refining. An aqueous solution of albumen shows the characteristic biuret reaction; if, namely, one adds to a solution containing albumen some caustic alkali and then, drop by drop, some dilute copper sulphate solution, the mixture assumes a reddish color, which gradually turns reddish-violet and violet-blue. However, the biuret test alone does not positively prove the presence of albumen, as many other substances, for instance, those containing the groups CH₂NH₂, CONH₂, CSNH₂, etc., give the same reaction. For this reason it is important to supplement the biuret reaction with one or more other tests: for instance, treatment with concentrated sulphuric acid and a little sugar, which shows a pretty red color if albumen is present. With corrosive sublimate (bichloride of mercury) and other poisonous salts, albumen forms insoluble compounds; it is, therefore, often used in medicine as an antidote. Consult Schryver, *Chemistry of the Albumens* (London, 1906). See ALBUMINURIA.

ALBU'MINOIDS. See PROTEIDS.

AL'BUMINU'RIA (Lat. *albumen* + Gk. *ούρον*, *ouron*, Lat. *urina*, urine). Generally, a symptom of disease of the kidneys; notably Bright's disease (nephritis). It consists of the presence of albumen in the urine. Tests for albuminuria: (1) Pour into a small test tube a little fresh urine, then gently add about one-half the same amount of cold nitric acid. The presence of a white ring at the junction of the liquids indicates albumen. (2) Partly fill a test tube with

fresh urine; add a few drops of acetic acid; boil the top of the liquid. Coagulation indicates the presence of albumen. Physiological albuminuria occurs in young adults, after muscular exercise, and also in some people after cold baths and during indigestion. It may not always be present, even in severe Bright's disease, and it is not necessarily an indication of disease. See BRIGHT'S DISEASE.

ALBUÑOL, ä'l'bōōn-yōl'. A town of Spain, in the province of Granada, 41 miles southeast of Granada, and about 3 miles from the coast of the Mediterranean (Map: Spain, D 4). It is a well-built town, with clean, paved streets. There are lead mines in the surrounding district, which abounds also in vineyards and is very productive of figs and almonds. The making of wine and brandy and the drying of raisins are the chief occupations of the inhabitants of the town itself. Pop., 1900, 9356; 1910, 7749. The port of Albuñol is a small place called Rábita.

ALBUQUERQUE, Eng. pron. ä'l'bū-kūr'kê. The largest city of New Mexico and the county-seat of Bernalillo Co., on the Rio Grande, 60 miles (direct) southwest of Sante Fe, and on the Atchison, Topeka, and Santa Fe, and the Santa Fe and New Mexico Central railroads (Map: New Mexico, C 3). It has an elevation of 5000 feet, and, on account of the climate, which is especially adapted for the treatment of tuberculosis, is an excellent health resort and attracts from 3000 to 4000 persons annually between October and May. It is the seat of the University of New Mexico, organized 1889, a government school for Indians, founded 1881, six large sanitoriums, and eight denominational and mission schools. The lumber interests are very extensive, and there are railroad shops, a large Indian trading company, a woolen mill, a tie-preserving plant, flour mills, foundries, machine shops, cigar factories, mineral water establishments, etc. Other industries of the city are truck farming, fruit growing, and the mining of lead, zinc, gold, and copper. Albuquerque was founded in 1706, was named in honor of Affonso de Albuquerque, then Viceroy of New Mexico, and was a prominent settlement during the Spanish régime. The church of San Felipe de Neri, established in 1658, still stands. Other notable features are the Harvey Indian Muscum, said to contain the finest basket and blanket collection in existence; the federal building; and the Isleta Indian Pueblo. The new town really dates from 1880, and was incorporated as a city in 1892. The mayor is elected annually, and the city council is composed of eight members. The gradual enlargement of the Santa Fe railroad shops is responsible for a continual growth. Pop., 1890, 3785; 1900, 6238; 1910, 11,020; 1913 (est.), 18,000.

ALBUQUERQUE, AFFONSO DE, THE GREAT (1453-1515). Viceroy of the Portuguese Indies. He was born at Alhandra, a town near Lisbon, and is known in the national epics as "the Portuguese Mars" and as "the Portuguese Cæsar." Albuquerque spent his youth in attendance at the palace of King Alfonso V. He took part in the expedition against the Turks, which terminated in the victory of the Christians at Otranto in 1481. In 1489 he became Chief Equerry to King John II. He was assigned to duty on the Indian fleet of 1503 and acquitted himself with such discretion that King Emanuel appointed him Viceroy of the Portuguese possessions in the East in 1506. His predecessor, Francisco de

Almeida (q.v.), refused to give up his office, however, and sent Albuquerque as a prisoner to Cananore. In October, 1509, he was released and took over the authority of the Viceroy. Albuquerque captured the fortress of Goa, Feb. 16, 1510, but was forced to evacuate it and retire to Panjim, where he awaited reënforcements from Europe, with whose help, on Nov. 26, 1510, he recaptured the city, which has ever since been the chief seat of Portuguese power and commerce in the East. He gradually completed the conquest of Malabar, Ceylon, the Sunda Isles, the peninsula of Malacca, and (in 1515) the island of Ormuz, at the entrance of the Persian Gulf. He made the Portuguese name respected in the East, and many of the princes, especially the kings of Siam and Pegu, sought his alliance and protection. He maintained strict military discipline, was active, humane, respected, feared by his neighbors, and beloved by his subjects. Notwithstanding his valuable services, Albuquerque did not escape the envy of the courtiers and the suspicions of King Emanuel, who appointed Lopez Soarez, a personal enemy of Albuquerque, to supersede him as Viceroy. This ingratitude affected him deeply. Ishmaël, the Shah of Persia, offered his assistance to resist the arbitrary decree of the Portuguese court, but Albuquerque would not violate his allegiance. A few days afterward, commending his son to the King in a short letter, he died at sea near Goa, Dec. 16, 1515. Emanuel honored his memory and raised his son to the highest dignities in the State. This son, whose name, Braz, or Blasius, was altered to Affonso after his father's death, compiled from the official dispatches and private letters of the Viceroy the *Commentarios do Grande Affonso d'Albuquerque* (printed in Lisbon in 1557; reprinted in 1576 and 1774). A translation, edited by W. de G. Birch, published by the Hakluyt Society of London, in four volumes, 1875-84, is the standard authority for this period of Indian history. See also Stephens, *Albuquerque and the Early Portuguese Settlements in India* (London, 1892), id., *Albuquerque* (Oxford, 1905), and Keller, *Colonization* (Boston, 1908).

ALBUR'NUM (Lat. sap-wood, from *albus*, white). An old name for the sap-wood of ordinary trees (Dicotyledons and Conifers). As the tree adds new layers of wood, the ascending sap abandons the deeper-seated layers, which also become modified through age. This leads usually to a sharp contrast in the appearance of the two regions, the outer region traversed by the sap (*alburnum*) being lighter in color and consisting of thinner-walled cells than does the older heart wood or "duramen." See **WOOD**.

ALBURQUERQUE, ä'l'bōō-kēr'ká (Sp. from Lat. *albus*, white + *quercus*, oak-tree). A town of Estremadura, Spain, in the province of Badajoz, 24 miles north of Badajoz, and about 10 miles from the Portuguese frontier (Map: Spain, B 3). It was once fortified. There are factories of tanned leather, soap, chocolate, pottery, and oil, and flour mills. The soil produces rye, grapes, and olives, and there are forests of oak and cork trees. Cattle fairs are held here in May and September. Pop., 1900, 6338; 1910, 11,141.

ALBURY, ä'l'bēr-ī. A town of New South Wales, on the Murray River, connected with Victoria by two bridges (Map: New South Wales, G 6). The Murray is navigable by steamers to Albury, which is 1800 miles from

the river's mouth and 190 miles by rail from Melbourne, and 386 miles by rail from Sydney. The town is well known for the wines made in the surrounding districts, from which it also derives considerable trade in agricultural and mineral products. Pop., 1911, 6309.

ALCÆ'US (Gk. Ἀλκαῖος, *Alkaios*). One of the first lyric poets of Greece and contemporary with Sappho. He was a native of Mitylene, on the island of Lesbos, and flourished at the end of the seventh and the beginning of the sixth century B.C. Alcæus was of aristocratic birth and became a leader against the tyrants of his native city, Myrsilus and Melanchrus. Banished from home, he traveled, it is said, as far as Thrace and Egypt. While he was absent, a former comrade in arms, Pittacus, was called to the head of the State by the people, whereupon Alcæus took up arms against him as a tyrant; but in attempting to force his way back he was captured by Pittacus, who, however, generously granted him life and freedom; his last years he spent in Mitylene. Alcæus's odes in the Æolic dialect (see ÆOLIANS)—arranged in 10 books by the Alexandrians—contained political songs bearing on the struggles against the tyrants (some of these he wrote while in exile), hymns, and drinking and love songs. Only fragments remain. Alcæus invented the form of stanza which is named after him, the Alcaic; this Horace, the most successful of his imitators, transplanted into the Latin language (see ALCAICS). The fragments were collected in Bergk's *Poetæ Lyrici Græci*, vol. iii, 4th ed., pp. 147ff. (Leipzig, 1882). Consult Smyth, *Greek Metric Poets* (New York, 1900).

ALCA'HEST. See ALCHEMY.

ALCA'ICS. Certain kinds of Greek and Latin Logædic verse, named from the poet Alcæus (q.v.), their reputed inventor. In Greek the greater Alcaic consists of a preliminary syllable (*anacrusis*), a trochaic dipody, cyclic dactyl, and trochaic dipody catalectic:

∫ : — ∪ | — ∪ | — ∪ ∪ | — ∪ | — ∪

The lesser Alcaic is composed of two cyclic dactyls and a trochaic dipody acatalectic,

— ∪ ∪ | — ∪ ∪ | — ∪ | — ∪

The Alcaic stanza consists of two greater Alcaics, a trochaic quarternarius, with anacrusis,

∫ : — ∪ | — ∪ | — ∪ | — ∪

and a lesser Alcaic.

In Horace the second foot in the first three verses of the stanza is an irrational spondee (— >), so that the Alcaic stanza in Horace runs as follows (compare, e.g., Odes 3, 3, 1-4):

Ius : tum et te|nacem | proposi|ti vi|rum
non : civium | ardor | prava iu | benti | um,
non : voltus | instan|tis ty | ranni
mente qua|tit soli|da, neque | Auster

ALCAIDE, ăl-kād'; *Sp. pron.* ăl-kī'dā (*Sp.* from *Ar. al*, the + *qāid*, governor), or **ALCAYDE**. A Moorish title, applied by Spanish and Portuguese writers to a military officer having charge of a fortress, prison, or town. It has also been used to designate a jailer. It is to be distinguished from *alcalde*, which indicates a civil officer.

ALCALA DE GUADAIRA, ăl'kă-lä' dă gwă-dī'ră (*Ar. al*, the + *Kal'at*, *Kal'ah*, castle + *Sp. de*, of). The ancient Carthaginian Hienippa (place of many springs). A town of Andalusia,

Spain, in the province of Seville, 7 miles east of Seville, partly on a hill, and overlooked by the ruins of an ancient Moorish castle, once one of the most important, as its ruins are still among the finest, in Spain (Map: Spain, C 4). The town is beautifully situated, and on account of the salubrity of the climate is much resorted to as a summer residence by the inhabitants of Seville. It is celebrated for producing a fine grade of bread. There are over 200 flour mills and numerous bakeries in the town which supply Seville. Water comes from a hill above Alcalá, which is perforated by tunnels, forming underground canals. Some of the tunnels are believed to be Roman works, but most of them are known to have been made by the Moors. Pop., 1900, 8287; 1910, 8940.

ALCALÁ DE HENARES, ă-nă'rēs. An old town in Spain, in the province of Madrid, situated on the Henares, 22 miles from the city of Madrid (Map: Spain, D 2). It formerly had a university, founded by Cardinal Ximenes in 1510, and once enjoyed a world-wide fame, second to that of Salamanca alone, which at one period it actually surpassed. In 1836 the university, together with its library, was removed to Madrid. In this library was deposited the original of the celebrated polyglot Bible, which was printed in this town, and called the Complutensian, from the ancient name of the place (Complutum). Alcalá de Henares has, besides, a cavalry school, several interesting churches, and a prison for 800 female convicts, the only institution of its kind in Spain. Its industries include a linen thread factory, soap works, weaving mills of various kinds, and a large leather factory. It is the birthplace of Cervantes, of the Emperor Ferdinand I, and of Catharine of Aragon, first wife of Henry VIII of England. Pop., 1900, 12,056; 1910, 11,728. Consult Calleja, "Bosquejo Histórico de los Colegios Seculares de la Universidad de Alcalá de Henares," in vol. cxvi *Revista Contemporanea* (Madrid, 1899), and Quesada, *Alcalá de Henares* (Buenos Ayres, 1905).

ALCALA LA REAL, lä rä-äl' (*Ar. al*, the + *Kal'at*, *Kal'ah*, castle, fortress, and *Sp. la*, the + *real*, royal). A city of Andalusia, Spain, in the province of Jaen, 26 miles northwest of Granada (Map: Spain, D 4). It is situated on a conical hill, in a narrow valley, on the north side of the mountains which separate the province of Jaen from that of Granada, at an elevation of over 3000 feet above sea level. It is very picturesque, irregularly built, with steep and narrow streets and bold towers, and it has a hospital, formerly an abbey, a very fine building. The neighborhood produces grain, olives, wine, and fruit of the finest quality, and the inhabitants are mostly engaged in agriculture. Brandies, flour, and soap are manufactured. There are many electrical plants. Pop., 1900, 15,948; 1910, 17,046. The town first appears in history under the name of *Al Kalá de Bcū Zaida*, which was the name of its Moorish lord. In 1341 the place was captured by Alfonso XI, who conferred upon it the title of *La Real*.

ALCALDE, ăl-käl'dă (*Sp.*, from *Ar. al*, the + *qādī*, judge). The general title of judicial and magisterial office. It is still used in Spain and in countries in America settled by the Spaniards. The mayor of the *pueblo* or town is called the *alcalde* and is invested with judicial as well as executive powers.

ALCAM'ENES (Gk. Ἀλκαμένης, *Alkamenēs*).

A famous Athenian sculptor, said to have been a pupil of Phidias. His latest work is dated in 403 B.C., but his most famous works seem to have been executed from 440 to 430 B.C. His greatest achievement was the "Aphrodite in the Garden" at Athens, of which the "Venus Genetrix" statues are probably copies. If Pausanias (q.v.) is right (5, 10, 8) in attributing to an Alcamenes the sculptures in the west pediment of the temple of Zeus, at Olympia, and a statue of Hera in a temple on the road to Phaleron which was destroyed by the Persians, we must assume that there was also an older sculptor of the same name. See GREEK ART.

ALCAMO, ä'l'ká-mō. A city in Sicily, 840 feet above the sea, and 52 miles by rail, plus 5 miles by highway, southwest of Palermo (Map: Italy, G 10). It has an Oriental appearance in spite of the fact that in 1233, after an insurrection, Frederick II substituted Christian for Saracenic population. The campanile of the cathedral contains a "Crucifixion" by Gagini; the church of San Francisco, statues of the Renaissance period; and the church Dei Minori, a "Madonna" by Rozzalone. Above the town to the south towers Mount Bonifato to the height of 2700 feet, from which is a magnificent prospect of the Bay of Castellamare. The country is agriculturally rich. Pop., 1881, 37,697; 1901, 51,798; 1911, 32,211. Consult "Documenti sulle chiese di Alcamo" in *Archivio Storico Siciliano*, vol. xxv (Palermo, 1900).

ALCANDRE, ä'l'kän'dr'. In Mademoiselle de Scudéry's *Clélie, Histoire Romaine*, a character representing the young Louis XIV.

ALCÁNTARA, ä'l-kän'tä-rä (Ar. *al*, the + *kantarāh*, bridge). Sometimes identified, but erroneously, as the Norba Casarea of the Romans. An old fortified Spanish town, built by the Moors in the province of Estremadura (Map: Spain, B 3). It is noted for the bridge, which was built by Trajan early in the second century. This is 616 feet long and 190 feet high, with six arches, and was constructed of stone without cement. In 1809 the English partially destroyed the bridge, and it suffered again in the civil war of 1836. From that time until 1860, when it was repaired, the inhabitants used a ferry. Pop., 1900, 3097; 1910, 3654.

ALCANTARA. A seaport town of Brazil, in the State of Maranhão, 17 miles northwest of Maranhão, commanding the north side of the entrance to the bay of S. Marcos (Map: Brazil, J 4). It was formerly the capital of the province, but the shallowness of the harbor has prevented its trade from increasing. There are two salt-pits not far from the town. Coffee, hides, sugar, and salt are exported. Pop., about 10,000.

ALCÁNTARA. A western suburb of Lisbon, where, in 1580, the invading Duke of Alva won a victory over the Portuguese. It is now a part of the city.

ALCANTARA, DOCTOR OF. An opera by Julius Eichberg (q.v.), first presented in Boston in 1862.

ALCANTARA, ORDER OF. A religious and military order of knighthood, established about 1176 on the model of the Templars. In 1197 Pope Celestine III confirmed the privileges of the order, imposing the oaths of obedience, poverty, chastity, and eternal war against the Moors. The order was at first known as the Knights of St. Julian, but in 1217 Alfonso IX gave them the town of Alcántara, which he had taken from the Moors. They settled in this town and were

known as the Order of Alcántara. In time the grand mastership of the Order was united to the Spanish crown by Pope Alexander VI, in 1495, when the former Grand Master was made Archbishop of Toledo and a Cardinal. In 1546 the Knights were allowed to marry, but were obliged to take an oath to defend the Immaculate Conception. For a time in their early history the Knights of Alcántara acknowledged the superiority of the Knights of Calatrava, but later were independent. In 1835 the Order was suppressed and its property confiscated by the State.

ALCARAZ, ä'l'ká-räth'. A town of La Mancha, Spain, in the province of Albacete, 36 miles west-southwest of Albacete (Map: Spain, D 3). It stands on the slope of an isolated hill, on the left bank of the Guadarmena, a feeder of the Guadalquivir. The town owes its importance to copper, tin, and zinc mines in the vicinity, which give employment to some of its inhabitants. There are factories of tanned leather, and brandies, and woolen and linen mills. The town is in a great cattle-producing district. Pop., 1900, 4503; 1910, 5405.

AL'CATRAZ', or **PEL'ICAN ISL'AND**. An island in the Bay of San Francisco, nearly 4 miles northwest of the city. It is 1650 feet in length, and it rises 130 feet above the level of the bay. The United States government maintains upon it important fortifications, which command the entrance to the Golden Gate. On its most elevated point has been erected the highest lighthouse on the Pacific coast.

ALCAVALA, ä'l'ká-vä'lä, or **ALCABALA** (Sp. from Ar. *al*, the + *gabālah*, duty, tax). A duty formerly charged in Spain and her colonies on transfers of property, whether public or private. It was probably instituted in 1341 by Alfonso XI, beginning with 5 to 10 per cent, and by the seventeenth century had increased to 14 per cent of the selling price of all commodities, raw or manufactured, charged as often as they were sold or exchanged. This impost was enforced, despite its ill effect on the commerce of the kingdom, down to the invasion of Napoleon, and indeed, in a modified form, has been continued to the present day. Catalonia and Aragon purchased from Philip V exemption from the tax, and, though still burdened heavily, were in a flourishing state in comparison with districts covered by the alcavala.

ALCAZAR, ä'l-kä'zär; *Sp. pron.* ä'l-kä'thär (Sp. from Ar. *al*, the + *kaṣr*, palace, castle). The name given in Spain to the large palaces built by the Moors, especially royal palaces or those of great emirs. They are often even more in the nature of strongholds than the Florentine palaces, being built around one or more large arcaded courts, with towers at the angles, heavy high walls, and a single gateway with inner and outer gates. Several still exist in the large Spanish cities, dating from Moorish times, as at Malaga, Seville, Toledo, and Segovia. The alcazar differs from the real fortress palace or acropolis fort, called "kal'at" (such as the Alhambra), in being within, instead of outside, the city streets. The term would apply, however, to any palace throughout Mohammedan countries. The best-preserved imitation of this type in Christian art is the princely palace at Ravello, near Naples, built under the influence of Mohammedan art.

ALCAZAR, or **KASR-EL-KEBIR**. A town of Morocco, on the Luccos, 23 miles from its

mouth, at El Araish, on the Atlantic, and 58 miles south of Tangiers. The town is the centre of a fruit-growing district, and wine is manufactured. It was built in the twelfth century and is uninviting because of winter floods which make fever prevalent. The chief edifice is an ancient mosque. King Sebastian of Portugal was defeated and killed here in a battle on Aug. 4, 1578. Early in June, 1911, the Spaniards sent a vessel to El Araish and thence dispatched a column to Alcazar, an act which was resented by powers interested in the Moroccan situation, who claimed violation of existing treaties. Spain denied the charge and defended her action in landing troops on the ground that the movement was aimed solely to defend the city against hostile pretenders and to offer protection to Spanish subjects in a danger-infested city. Pop., about 25,000. See MOROCCO, *History*.

ALCAZAR DE SAN JUAN, ăl-kă'thär dă sän hwän'. A town of Spain, in the province of Ciudad Real, 92 miles by rail from Madrid (Map: Spain, D 3). It lies in a mountainous region in the vicinity of extensive iron mines and soda and alkali deposits. It has a number of soap, dagger, powder, and saltpetre factories and carries on a large trade in wine. The environs of Alcázar are believed to have been described by Cervantes in *Don Quixote*. This town is one of many which claims the author as a native. Pop., 1900, 11,292; 1910, 13,647.

ALCE'DO (Lat.), **ALCY'ONE**, ăl-sī'ō-nē (Gk. Ἀλκυόνη, *Alkyonē*). The names of genera of kingfishers, in allusion to a classic myth. See **ALCYONE** and **KINGFISHER**.

ALCEDO Y HERRERA, ăl-thă'dō é âr-ră'rá, ANTONIO. A Peruvian soldier and historian, whose *Diccionario geográfico-histórico de las Indias Occidentales*, published at Madrid in four volumes (1786-89), supplies much exclusive information concerning the middle period of Spanish-American history. The original work was suppressed by the Spanish government. An English translation by G. A. Thompson (London, 1812-15) contains considerable additions. Alcedo was also the compiler of an important bibliographical work, the *Biblioteca Americana*, the numerous manuscript copies of which are frequently cited by writers on early American bibliography.

ALCESTE, ăl-sĕst'. 1. A character in Molière's play entitled *Le Misanthrope* (q.v.). 2. A name used as a pseudonym by a number of modern French writers, among them Amédée Achard, Alfred Assolant, Louis Belmontet, Hippolyte de Castille, and Edouard Laboulaye. 3. A tragic opera by Gluck, first performed with an Italian text, Dec. 16, 1767, at Vienna. Ten years later it was produced in French at Paris. The printed score appeared in 1768 and contains an elaborate preface in which Gluck lays down the principles that guided him in his reform of the opera. See **GLUCK**; **OPERA**.

ALCESTER, ăl'stĕr, FREDERICK BEAUCHAMP PAGET SEYMOUR, BARON (1821-95). An English admiral. He was born in London, educated at Eton, and entered the navy in 1834. He became a captain in 1854, a rear-admiral in 1870, and an admiral in 1882. In 1880 he was in command of the allied fleet which made a demonstration off the Albanian coast in order to compel the Turks to cede Dulcigno to Montenegro. For this service he was created G. C. B. In the Egyptian War of 1882 he commanded the British

fleet at the bombardment of Alexandria. He was raised to the peerage later in the same year.

ALCES'TIS. See **ADMETUS**.

AL'CHEMIL/LA. See **LADY'S MANTLE**.

AL'CHEMIST, THE. A noted comedy by Ben Jonson, acted in 1610, printed in 1612. It makes a jest of the then popular belief in the philosopher's stone and the elixir of life; its leading character, Subtle, is a quack who deludes Sir Epicure Mammon and other credulous persons till he is finally exposed.

ALCHEMY (Ar. *al*, the + *kīmīyā*, from late Gk. χημ[ε]ία, *chēm[e]ia*; see below and under **CHEMISTRY**). A term applied to the chemistry of the Middle Ages, but more commonly to the search after the transmutation of base metals into gold. "Alchemy," Paracelsus defines, "is the science which teaches how to change one kind of metals into another." The origins of alchemy are buried in remote antiquity. It is impossible to tell when man, surrounded as he is in nature by a great variety of substances and materials, first acquired some knowledge of the properties and transformations of some of these materials, or when he began theorizing about the relationships that almost obviously exist between many of them. A body of knowledge, kept jealously secret, was gradually accumulated by the Egyptian priests and is referred to as the Sacred Art of Egypt. The Egyptians possessed considerable practical knowledge of metallurgy, of the arts of glass-making, bleaching, and embalming; and Mary the Jewess, who was said to have been the sister of Moses, was credited by the alchemists with the invention of a form of the water-bath. There are grounds for believing that the very word "chemistry" is derived from *Chemi*, the most ancient name of Egypt, while the name "Hermetic art," frequently applied to alchemy, is derived from the name of its alleged founder, Hermes Trismegistos, who is believed to have been the Egyptian priest Hermon, of the first century of our era.

The Greek philosophers certainly devoted much speculation to the relationship of the various forms of matter, and the conception that appealed to them most was that of a universe made up of a single primordial matter, of which all substances are but outwardly differing forms. Thales considered water as that primordial substance. Later the idea became current of earth, water, air, and fire, either as distinct elements or as attributes variously associated with a primordial matter, producing the various solids and liquids and rendering these either cold or hot. That the idea of the essential unity of all matter, together with such phenomena as the well-known "transmutation" of ores into metals, should have suggested the transmutation of the commoner metals into gold, is natural; and, as a matter of fact, efforts in this direction began to be made even during the classical period of antiquity. The Arabs, and through them mediæval Europe, inherited both the alluring problem and its underlying conception of the world of matter, and some of the best men of the age devoted themselves to the attack of the transmutation problem with unparalleled perseverance and assiduity. "They are not given to idleness," says Paracelsus, ". . . but diligently follow their labors, sweating whole days and nights by their furnaces."

Practical contact with natural phenomena in the laboratory, and continual failure of the main

search, led to a variety of speculative working-assumptions, and these, often supported by nothing but the fame of their authors, turned into dogmas taught with unhesitating assurance as established truth. The mere desire to discover a substance which would help transform common metals into gold begot a universal belief in the actual existence of such a substance, and the "philosopher's stone," "magisterium," or "great elixir" became as much a reality in the alchemist's world as the actual substances which he was handling. Geber, the famous master of Arabian alchemy, taught that matter was composed of three elements: mercury, sulphur, and arsenic, of which the first two are contained in all metals. He, too, imagined the existence of a further substance; only, Geber's "magisterium" had the power of curing all disease.

Subsequently the properties of the different magisteria were assumed to be possessed by one and the same substance, and the belief spread that the philosopher's stone could transmute all metals into gold, as well as cure all diseases, restore youth, and indefinitely prolong life. At times one or more of these interesting properties were attributed to some actually known substance. Thus, a solution of gold was believed by Geber, Roger Bacon, and many others to be the very elixir of life, and Raymond Lully was inclined to attribute the same power to alcohol. Paracelsus believed in the existence of an "alcahest," a substance possessing, not only the several properties of the philosopher's stone, but also the power of dissolving everything placed in contact with it. According to Paracelsus, whichever of the four kinds—salts, sulphurs, mercuries, or mixts—a given substance may belong to, it also contains the alcahest, or "quintessence."

A pure metal, as we conceive it to-day, contains nothing but itself; it is, as we sometimes say, 100 per cent pure. The alchemist had no such definite conception, and such expressions as "a gold *infinitely* superior to any heretofore seen" are but too frequently met with in alchemical literature. Of course, the adept might expect anything he desired in a substance purified to infinity: many expected to find the *soul* of the substance altogether free from material dross. But the intellectual chaos in which the alchemists were groping in their researches was still further deepened by the obscurity of language employed in the publications of the period. Not only, as Kunckel complained, was the sulphur of one writer not the sulphur of another, but the sages seemed to feel a certain delicacy about uncovering the nakedness of truth to the gaze of the vulgar and quite intentionally obscured the meaning of their utterances. Needless to say, the initiated suffered more than the vulgar from this cabalistic obscuration of style.

Astrological superstition added a further share to the confusion of thought, and the adverse position of the planets was often held responsible for the failure of a "projection." Above all, however, the growth of correct knowledge was impeded by widespread fraud and imposture among the adepts. For while many, especially among the earlier alchemists, were prompted by genuine scientific curiosity and carried on the search of the "stone" in all sincerity, making important inventions and discoveries in course of their search, not a few made use of the Hermetic art for extortionary purposes. A notorious example of the latter class is Giuseppe

Balsamo, better known as Count Cagliostro, who, with the aid of his beautiful wife and other confederates, amassed a great fortune by demonstrations of the art of changing common metals into gold and by similar practices. False stories, too, abounded in alchemical literature. Raymond Lully must have been genuinely affected when he observed the "transmutation" of iron into copper on plunging a bar of iron into a solution of copper salt. But Helvetius is plainly prevaricating when he describes in minute detail how, in January, 1667, he obtained from the Hermetic artist Elias—a man of middle height, honest, grave countenance, straight black hair, etc.—a small piece of the philosopher's stone, sufficient to change just six drams of lead into gold; how he, Helvetius, and his wife melted that quantity of lead in a crucible and added the stone; whereupon, in a quarter of an hour, he "found that the whole mass of lead had been turned into the finest gold"!

In the light of the recent conception of the atoms of matter as constituted by large numbers of the still smaller atoms of electricity, the ancient belief in the essential unity of all substances cannot be scoffed at. To be sure, our modern treasure of definition and practical analytical method renders alchemical practices in the narrower sense of the term quite absurd and robs of all reason the existence of such an organization as the present-day "Alchemical Society of France." The substances which we class as elements have passed essentially unchanged through a myriad of chemical and physical processes; they are not affected by violently explosive chemical reactions, nor by powerful galvanic currents, nor by the heat of the electric arc or even of the sun. Only radioactivity, a process before which we still remain as passive spectators, unable either to arrest it or bring it about at will, has demonstrated the possibility of transmutation in nature. For the formation of the element helium from the element radium, discovered by Sir William Ramsay, is a genuine and thoroughly established transmutation of one chemical element into another.

Consult: Justus von Liebig, *Familiar Letters on Chemistry*, original in German, exists in translations (London, 1851); F. Hofer, *Histoire de la chimie* (Paris, 1869); G. F. ALCHYMIST, DER, dër ä'l'ké-mést. A German opera by Spohr, the text being by Pfeiffer, produced at Cassel, July 28, 1830. It is founded on Washington Irving's tale of *The Alchemist*.

ALCIATI, ä'l-chä'tè, ANDREA (1492-1550).

An Italian juriconsult of the Renaissance, successively professor of law in the universities of Avignon, Bourges, Bologna, Pavia, and Ferrara. He improved the method of studying Roman law by substituting historical research for the servile forms of the glossarists. He wrote many legal works, including commentaries on the Code of Justinian and the Decretals, a history of Milan, notes on Tacitus and Plautus, and a *Book of Emblems* (1522), or moral sayings, in Latin verse, which has been greatly admired. Consult Ernst von Mueller, *Andreas Alciati* (1907).

ALCIBIADES, ăl'si-bi'ä-dēz. A tragedy in five acts by Thomas Otway, produced in 1675 at Dorset Garden Theatre, London, with Betterton in the title rôle.

ALCIBIADES (Gk. Ἀλκιβιάδης, *Alkibiadēs*) (c.450–404 B.C.). An Athenian politician and general. He was the son of Clinias and Dinomache, and belonged to the class of the Eupatridæ. He was born at Athens, lost his father in the battle of Coronea in 446 B.C., and was in consequence educated in the house of Pericles, his uncle. In his youth he gave evidence of his future greatness, excelling both in mental and bodily exercises. His handsome person, his distinguished parentage, and the high position of Pericles procured him a multitude of friends and admirers. Socrates was one of the former and gained considerable influence over him, but was unable to restrain his love of luxury and dissipation, which found ample means of gratification in the wealth that accrued to him by his union with Hipparete, the daughter of Hipponicus. His public displays, especially at the Olympic Games, in 420 B.C., were incredibly expensive. He bore arms for the first time in the expedition against Potidæa (432 B.C.), where he was wounded, and where his life was saved by Socrates, a debt which he liquidated eight years after at the battle of Delium by saving, in his turn, the life of the philosopher; but he seems to have taken no considerable part in political matters till after the death of the demagogue Cleon, when Nicias (q.v.) brought about a treaty of peace for 50 years between the Athenians and the Lacedæmonians, 421 B.C. Alcibiades, jealous of the esteem in which Nicias was held, set himself at the head of the war party and persuaded the Athenians to ally themselves with the people of Argos, Elis, and Mantinea, and did all in his power to stir up afresh their old antipathy to Sparta; the allies, however, were defeated at Mantinea in 418. It was at his suggestion that the Athenians, against the vigorous opposition of Nicias, engaged in the celebrated enterprise against Syracuse (q.v.), to the command of which he was elected, with Nicias and Lamachus. But while preparations were being made, it happened that during one night all the statues of Hermes (q.v.) in Athens were mutilated. The enemies of Alcibiades threw the blame of this mischief upon him, but, fearing that, if tried at once, he would be acquitted through the support of the soldiers, with whom he was very popular, postponed impeachment of him till he had set sail for Sicily. They then stirred up the people against him to such a degree that he was recalled in the autumn of 415 B.C. to stand his trial. See **ANDOCIDES**.

On his way home, Alcibiades landed at Thurii in Italy, fled from the fleet, and betook himself to Sparta, where, by conforming to the strict manners of the people, he soon became a favorite. He induced the Lacedæmonians to send assistance

to the Syracusans, under Gylippus (q.v.), persuaded them to occupy permanently a post at Decelea in Attica, to form an alliance with the King of Persia, and, after the unfortunate issue of the Athenian expedition in Sicily, to support the people of Chios in their endeavors to throw off the yoke of Athens. He went thither himself and raised all Ionia in revolt against Athens. But Agis (q.v.) and the other leading men in Sparta, jealous of the success of Alcibiades, ordered their generals in Asia to have him assassinated. Alcibiades discovered this plot and fled to Tissaphernes (q.v.), a Persian satrap, who had orders to act in concert with the Lacedæmonians. He now resumed his old manners, adopted the luxurious habits of Asia, and made himself indispensable to Tissaphernes. He represented to the latter that it was contrary to the interests of Persia entirely to disable the Athenians. He then sent word to the commanders of the Athenian forces at Samos that he would procure for them the friendship of the satrap if they would control the extravagance of the people and commit the government to an oligarchy. This offer was accepted, and in 411 B.C. Pisander (q.v.) was sent to Athens, where he had the supreme power vested in a council of 400 persons. When it appeared, however, that this council had no intention of recalling Alcibiades, the army at Samos chose him as their commander, desiring him to lead them instantly to Athens and overthrow the tyrants. But Alcibiades did not wish to return to his native country till he had rendered it some service, and he accordingly attacked and defeated the Lacedæmonians by sea and land. Tissaphernes now ordered him to be arrested at Sardis on his return, the satrap not wishing the King to imagine that he had been accessory to his doings. But Alcibiades found means to escape, placed himself again at the head of the army, beat the Lacedæmonians and the Persians at Cyzicus, 410 B.C., took Cyzicus, Chalcedon, and Byzantium, restored to the Athenians the dominion of the sea, and then returned to his country (407 B.C.), to which he had been formally invited. He was received with general enthusiasm, as the Athenians attributed to his banishment all the misfortunes that had befallen them.

The triumph of Alcibiades, however, was not destined to last. He was again sent to Asia with 100 ships; but, not being supplied with money for the soldiers' pay, he was obliged to seek assistance at Caria, where he transferred the command in the meantime to Antiochus, who, being lured into an ambushade by Lysander (q.v.), lost his life and part of the ships. The enemies of Alcibiades took advantage of this to accuse him and appoint another commander. Alcibiades went into voluntary exile at Pactye in Thrace, one of the strongholds which he had built out of his earlier spoils. But being threatened here with the power of Lacedæmonia, he removed to Bithynia, with the intention of repairing to Artaxerxes, to gain him over to the interests of his country. At the request of the Thirty Tyrants of Athens, and with the concurrence of the Spartans, Pharnabazus, a satrap of Artaxerxes, received orders to put Alcibiades to death. He was living at this time in a castle in Phrygia; Pharnabazus caused it to be set on fire during the night. As his victim was endeavoring to escape from the flames, he was pierced with a volley of arrows. Thus perished Alcibiades (404 B.C.), about the forty-fifth year

of his age. He was singularly endowed by nature, being possessed of the most fascinating eloquence and having in a rare degree the ability to win and to govern men. Yet in all his transactions he allowed himself to be directed by external circumstances, without having any fixed principles of conduct. On the other hand, he possessed that boldness which arises from conscious superiority, and he shrank from no difficulty, because he was never doubtful concerning the means by which an end might be attained. Consult: The *Lives*, by Plutarch and Nepos; Grote, *History of Greece* (New York, 1853-56); Hertzberg, *Alkibiades, der Staatsmann und Feldherr* (Halle, 1853); Houssaye, *Histoire d'Alcibiade* (2 vols., Paris, 1873). The *Life* by Plutarch has been newly translated, with valuable notes, by B. Perrin (New York, 1912).

ALCÍ'DA: GREENE'S METAMORPHOSES. A pamphlet by Robert Greene, of which the first known edition dates from 1617, though it was licensed in 1588 and probably published soon after. It contains stories illustrating the ills that result from feminine vanities.

ALCID'AMAS (Gk. Ἀλκιδάμας, *Alkidamas*). A Greek rhetorician, pupil of Gorgias and the last of the Sophistical school, of the fourth century B.C. He was a native of Elæa, in Aiolis in Asia Minor, but gave instruction in eloquence at Athens. The only complete extant declamations attributed to him are: Ὀδυσσεύς, in which Odysseus accuses Palamedes of treachery to the Grecian cause during the siege of Troy (compare Vergil, *Æneid*, iii, 81 ff.); and Περὶ Σοφιστῶν, concerning the Sophists. The latter oration, which is said to have been directed chiefly against Isocrates, the contemporary of Alcidas, in support of the teachings of Gorgias, has been published by Blass in his second edition of *Antiphon* (p. 193). The Ὀδυσσεύς, however, was not written by Alcidas. Consult Vahlen, *Der Rhetor Alcidas* (Vienna, 1864), and Blass, *Die Attische Beredsamkeit* (Leipzig, 1892).

ALCI'DES. A patronymic of Hercules, from the name of his grandfather, Alcæus.

AL'CIMUS. A high priest of the Zadokite family, born about 200 B.C., and appointed to his office probably first by Antiochus V, Eupator, and then, after he had been driven away by the Maccabees, by Demetrius Soter (162 B.C.). He was a leader in the Hellenistic party which opposed the Maccabees, and is said on the occasion of the defeat of the latter (April, 160 B.C.) to have torn down the wall of the court of the inner temple at Jerusalem, probably for the purpose of rebuilding it on a more magnificent scale. See the discussions of his career in Wellhausen, *Israelitische und jüdische Geschichte* (4th ed., 1907), and Büchler, *Tobiaden und die Oniaden im II Makkabäerbuche* (Vienna, 1899).

ALCINOUS, āl-sīn'ō-ūs (Gk. Ἀλκίνοος, *Alkinoos*). A mythical King of the mythical Phæacians, grandson of Poseidon. His daughter, Nausicaa, rescued the shipwrecked Odysseus, who was entertained and sent home by Alcinoüs and his Queen, Arete. His people were skilled seamen, but luxurious, and his domain Scheria, a Grecian fairyland. Later tradition identified Scheria with the island of Corcyra (Corfu). Consult Homer, *Odyssey*, vi-viii.

AL'CIPHON (Gk. Ἀλκίφρων, *Alkiphron*). A Greek rhetorician who flourished probably about the close of the second century A.D. He was the author of 118 letters in three books, which pro-

fess to be epistles written by common people—peasants, fishermen, courtesans, and parasites. Various historical personages are named as if living: these all belong to Athens of the fourth century B.C. The scene, too, is always Athens or its neighborhood. The dialect also is Attic, handled in the main with correctness and elegance. Their style is pure and their form excellent; they are valuable as character sketches, which picture clearly Athenian life of the fourth century B.C.; and the letters of the courtesans, being based on the new comedy, especially on lost plays of Menander, assist us to recreate that literature. Edited by Meineke, in *Fragmenta Comicorum Græcorum*, vol. iv (Leipzig, 1853); Wagner (Paris, 1878); and Hercher, in his *Epistolographi Græci* (Paris, 1873). There is an English translation by Beloe (London, 1890).

ALCIPHON. The hero of Thomas Moore's novel, *The Epicurean*, published in 1827, to which was appended, in 1839, the poem entitled *Alciphron*, in which the author had first taken up the theme.

ALCIPHON, or **THE MINUTE' PHILOSOPHER.** A work by Bishop Berkeley, written at his home in Rhode Island, and published in 1732, after his return to England. It is a dialogue, in which Alciphron, a skeptic, is made the chief speaker for the sake of showing the weakness of the infidel's position.

ALCIRA, āl-thē'rá. A town of Spain, in the province of Valencia, 20 miles south by west of Valencia, on an island in the river Júcar (Map: Spain, E 3). It is surrounded by old walls with strong towers. The principal streets are wide, but the town is ill built. The main buildings are three churches, six monasteries, and a theatre. The surrounding country is fertile, and there are groves of orange and palm trees, but, owing to the rice swamps, there is much malaria. Fruit and rice are the principal articles of trade. The many canals admirably illustrate the system of irrigation introduced by the Moors, and the town was one of their important trade centres. It has two fine bridges, and there is a remarkable stalactitic cavern in the vicinity. Pop., 1900, 19,906; 1910, 22,057. Alcira was known in Roman times as Sætaticula and was the chief seat of the tribe of the Contestani. The district about Alcira is sometimes called the garden of the kingdom of Valencia.

ALCMÆ'ON (Gk. Ἀλκμαίων, *Alkmaïōn*). In Greek legend, the son of Amphiaräus (q.v.) and Eriphyle (q.v.), and brother or father of Amphilocheus. He was the leader of the Epigoni (q.v.), who captured Thebes to avenge the death of their fathers in the War of the Seven (see SEVEN AGAINST THEBES). As Eriphyle had betrayed her husband to his death, Amphiaräus ordered his son to kill her. For this act madness came upon Alcmæon, and he was pursued by the Furies. In his flight he came to Psophis, in Arcadia, whose King, Phegeus, sought to purify him and gave him his daughter Arsinoë. Alcmæon gave her the necklace and the peplus of Harmonia, the bribe by which Eriphyle had been induced to persuade Amphiaräus to take part in the War of the Seven. Presently the crops failed, and Alcmæon, uncured and driven by the Furies, went to the river-god Acheloiüs (q.v.), who also purified him and gave him his daughter, Callirhoë. For her he took his gifts from his former wife under pretense of dedicating them at Delphi, that he might be com-

pletely cured. When his father-in-law heard of this deceit, he sent his sons to exact vengeance; they killed Alcmæon, but Alcmæon's sons by Callirhoë took bloody vengeance at her instigation. There are indications of a cult of Alcmæon at Psophis, where his tomb was shown, and at Thebes. Later stories told of Alcmæon's conquest of Acarnania (q.v.), apparently as a mythical prototype of the Corinthian civilization of that region.

ALCMÆON (Gk. Ἀλκμαίων, *Alkmaïōn*). A Greek physician and naturalist, who lived in the latter half of the sixth century B.C. He was a native of Crotona, in Italy, and is said to have been a pupil of Pythagoras. He made important discoveries in anatomy and was the first to practice dissection. He wrote a book *On Nature*, of which we have fragments.

ALC'MÆON'IDÆ (Gk. Ἀλκμαιωνίδαι, *Alkmaïōnidai*, descendants of Alcmæon). A distinguished family in ancient Athens, whose founder, Alcmæon, according to tradition, came from Pylos, Messenia. One of them was the Archon Megacles, who, about 612 B.C., slew the conspirator Cylon and his followers at the altars where they had fled, in spite of his promise to spare them. For this sacrilege the whole family was banished, about 596 B.C. They maintained a conflict for many years with Pisistratus and his sons, however, and in 510 were finally brought back to Athens by the help of the Spartans, who were led to aid them by the partiality of the Delphic oracle. Clisthenes (q.v.), then the head of the family, was the noted legislator. Even more famous members of it were Pericles and Alcibiades.

ALC'MAN (Gk. Ἀλκμάν, *Alkman*). A poet of the second half of the seventh century B.C., who is considered the founder of Dorian lyric (choral) poetry. He was born at Sardis, the capital of Lydia, in Asia Minor, but was probably of Greek extraction. A doubtful tradition said that he was a slave; in any case, he attained a high position at Sparta, where he made his home, and became teacher of the State choruses. In the Hellenistic period six books of his poems were current, comprising pieces called partheneia, hymns, hyporchemes, pæans, erotica, and hymenaia. (See PÆAN.) He was counted the founder of erotic poetry, and reached great perfection in his partheneia. His dialect was the Dorian, but his verses show many Æolian characteristics. Alcman occupied the first place in the Alexandrian Canon. The bucolic poets regarded him as their predecessor, and we know that he was read with pleasure in the second century A.D., although his dialect was then considered harsh and unmusical. Only fragments of his poetry remain, edited in Bergk's *Poetæ Lyrici Græci*, vol. iii, pp. 14 ff. (4th ed., Leipzig, 1882); a fragment discovered in 1896 is published in *Oxyrhynchus Papyri*, vol. i. No. VIII. See also H. W. Smyth, *Greek Melic Poets* (New York, 1900).

ALCME'NE, ãlk-mē'nē (Gk. Ἀλκμήνη, *Alk-mēnē*). In Greek mythology, the daughter of Electryon, King of Mycenæ, and wife of Amphitryon (q.v.), mother of Heracles, by Zeus, who came to her in the form of her husband. This story is well told in the *Amphitruo* of Plautus (q.v.). She was the mother of Iphicles by Amphitryon.

AL'CO (native name). A small, long-haired dog of tropical America, known both wild and in a domesticated condition. In the latter state

it is gentle and home-keeping; and as its ears are pendulous it is considered by most authorities as a species introduced in the early days of the Spanish conquest and since become partly feral. Consult Gosse, *A Naturalist's Sojourn in Jamaica* (London, 1851).

ALCOBAÇA, ãl'kõ-bã'sã. A town in the province of Estremadura, Portugal, situated between the Alcoa and Baca rivers, 4 miles east of Vallado, the nearest railway station. On the west Alcobaca is dominated by a range of hills crowned with Moorish ruins. The most notable feature of the town is the Cistercian abbey of Santa Maria, one of the finest and richest monasteries in the world. It contains the tombs of Inez de Castro and of some Portuguese monarchs. The buildings comprise an imposing church, in early Gothic, five cloisters, seven dormitories, a library containing over 25,000 volumes, and a hospedaria. It is supplied with water by a tributary of the Alcoa, which flows through the enormous kitchen. The abbey was built from 1148 to 1222, was sacked by the French in 1810, and was secularized in 1834. The north part of the structure is now used as a barracks for cavalry. Pop., 1900, 1562.

ALCOCK, ãl'kõk, Sir RUTHERFORD (1809-97). An English diplomatist and author, born in London. He studied medicine and became distinguished as an army surgeon and hospital inspector and afterward as a lecturer on surgery. In 1844 he was sent as British Consul to China, and he served in Amoy, Fuchow, and Shanghai. He won such distinction in these services that, in 1858, he was made Consul-General in Japan. Here great difficulties were experienced: Japan was in a state of feudal anarchy, assassination was rife, Englishmen treacherously assaulted, the British legation itself twice attacked and once burned, yet Alcock stood by his post. Under his influence, Shimonoseki was bombarded in 1864, after which, the Yeddo government refusing to open more ports to trade, an indemnity of \$3,000,000 was extorted, part of which was paid by the Mikado's government in 1874. Recalled in 1865 from Japan, he was appointed Minister Plenipotentiary to Peking and served from 1865 to 1871. It was Alcock who first brought Japanese art to the world's notice, in the London World's Exposition (1862). He was, from 1876, for a long time the president of the Royal Geographical Society. His publications include *Life's Problems; The Capital of the Tycoon* (1863), *Art and Industries in Japan* (1878), and many geographical and other articles in periodicals. For further account of his career, consult R. J. Mitchie, *An Englishman in China during the Victorian Era* (Edinburgh, 1900).

ALCOFRIBAS NASIER, ãl'kõ'frë'bã' nã'syã'. The pseudonym, formed anagrammatically from his own name, under which François Rabelais published his *Pantagruel*, etc.

AL'COHOL (Ar. *al*, the + *kohl*, exceedingly fine powder of antimony for painting eyebrows; hence the quintessence of something; finally rectified spirits, alcohol), or **ETH'YL ALCOHOL**, C₂H₅OH, often called spirits of wine. A chemical compound of carbon, hydrogen, and oxygen that has been known and extensively used from the earliest times. It is consumed in very large quantities in the form of intoxicating liquors and is used for various purposes in the arts and manufactures. The alcohol of commerce, in its various forms, is all made by fermentation.

Natural products containing a large amount of starch, such as grain, rice, potatoes, etc., are reduced with water to a paste, and a small quantity of malt is added to produce fermentation, by which the starch is in a short time transformed into dextrin and a kind of sugar called maltose, according to the following chemical equation:

Then yeast, which consists of living plant cells, is added to set up a new process of fermentation, by which the maltose is converted into alcohol, according to the following chemical equation:

The manufacture of alcohol thus involves two distinct processes of fermentation; for neither can alcohol be obtained from maltose by the action of the *diastase* of malt, nor can maltose be obtained from starch by the action of yeast. Small quantities of organic substances are usually produced along with ethyl alcohol during fermentation; one of these is the well-known *fusel oil*, a mixture of alcohols chemically allied to ordinary alcohol and containing mainly amyl alcohols. (See AMYL ALCOHOL.) A small quantity of fusel oil is contained even in the "raw spirit," a strong alcohol obtained by distilling the weak solution obtained through fermentation. To free the raw spirit from fusel oil, which is highly injurious, it is mixed with water, filtered through charcoal, and subjected to a process of fractional distillation, the intermediate fractions, called rectified spirit, being practically free from fusel oil. The presence of the latter in spirituous liquors may be readily detected by adding a few drops of colorless aniline and two or three drops of sulphuric acid, a deep-red coloration being produced in the presence of fusel oil. The flavor of alcoholic beverages is due to the presence of various organic substances often produced by modifying the process of manufacture. Thus both the flavor and color of beer depend largely on the temperature and duration of heating of the malt before using it; the flavor of Scotch whisky is derived mainly from the peat used in drying the malt, etc. The quantity of alcohol contained in various beverages is very different: gin, rum, and the strong liquors contain from 40 to 50 per cent of alcohol; port contains from 15 to 25 per cent; sherry or madeira, from 15 to 20 per cent; champagne and burgundy, from 10 to 13 per cent; hock, from 10 to 12 per cent; claret, from 8 to 12 per cent; cider and strong ale, 5 to 9 per cent; beer or porter, from 2 to 5 per cent; koumyss, from 1 to 3 per cent. The *United States Pharmacopœia* fixes the specific gravity of rectified spirit at 0.820, which corresponds to 91 per cent of absolute alcohol. The amount of alcohol in spirituous liquids is estimated by observing their specific gravity; but as they usually contain other substances besides water, they must be distilled before a determination can be made. Alcohol in its various forms, especially if taken habitually, is highly injurious to health. While it promotes very powerfully the secretion of the gastric juice, it sets up inflammation of the gastric walls and gradually produces chronic dyspepsia. (See ALCOHOL, PHARMACOLOGY, etc.). The effects of chronic

alcohol poisoning are described in the article ALCOHOLISM (q.v.).

Alcohol cannot be entirely freed from water by distillation. Anhydrous or absolute alcohol may be prepared by boiling strong commercial alcohol with unslaked lime until a small sample is turned yellow by barium oxide; to remove the last traces of water the alcohol thus obtained may be further treated with anhydrous copper sulphate and finally distilled over a small quantity of metallic calcium. It must, however, be remembered that drying with metallic calcium introduces into the alcohol a small amount of ammonia, derived from the nitrogen usually present in calcium in the form of calcium nitride. The presence of traces of water may be readily detected by the use of dehydrated copper sulphate, which remains white only in perfectly anhydrous alcohol. Absolute alcohol acts as a deadly poison. It is a colorless liquid of specific gravity 0.8062 at 0°; it boils at 78° and solidifies at about 130° below zero C. It is extremely hygroscopic and mixes in all proportions with water, ether, chloroform, carbon disulphide, and many other liquids. It is also an excellent solvent for many substances, such as oils, gums, resins, and a number of inorganic compounds, and is thus largely employed in the preparation of tinctures, varnishes, dyes, perfumes, etc. The presence of alcohol in aqueous solutions is best detected by the so-called iodoform reaction: small quantities of iodine and of caustic potash almost immediately produce in the presence of alcohol a precipitate of iodoform, which may be readily recognized by its odor. In this manner it has been demonstrated that minute quantities of alcohol are present in the soil, in water and in the atmosphere. Small quantities of alcohol have likewise been found in the urine in diabetes. When acted on by an excess of dry chlorine gas, alcohol is transformed into chloral, from which, by the action of alkali, very pure chloroform may be obtained; chloroform may also be prepared from alcohol directly by the action of bleaching powder (chloride of lime). When warmed with concentrated sulphuric acid, alcohol yields ordinary ether. Alcohol is thus extensively employed in the manufacture of chloral, chloroform, and ether.

During the Middle Ages aqueous alcohol was prepared by the distillation of fermented material. Anhydrous alcohol was prepared first by Lowitz in 1796, and its composition was determined first by Saussure in 1808. See FUEL; METHYLATED SPIRIT.

Consult: Stevenson, *A Treatise on Alcohol, with Tables of Specific Gravities* (London, 1888); Maercker, *Handbuch der Spiritusfabrikation* (Berlin, 1889; French trans., 2 vols., Lille, 1889); Roux's series of seven books on the manufacture of alcoholic beverages, published under the general title *La fabrication de l'alcool* (Paris, 1885-92); Brachvogel, *Industrial Alcohol: Its Manufacture and Uses* (New York, 1907); Herrick, *Denatured or Industrial Alcohol* (New York, 1907); Wright, *Handbook on the Distillation of Alcohol from Farm Products* (New York, 1907); and *Brenneri-Lexicon*, edited by Delbrück (Berlin, 1912 ff.).

ALCOHOL, PHARMACOLOGY (PHARMACODYNAMICS), TOXICOLOGY, AND THERAPEUTIC USE. Ethyl, or grain alcohol (C₂H₅OH) is the only one of the lower alcohols found in the tissues and body fluids under normal conditions. Ac-

According to recent investigations (Schweissheimer) normal human blood contains, especially after digestion, from 0.003 to 0.004 per cent of alcohol.

Alcohol is used, in one form or other, as a beverage, a drug, and as an external application. Its value depends upon three factors, viz., (a) its local irritant action, (b) its effect on the central nervous system, and (c) its use as a food. When alcohol is applied to the skin in concentrations varying from 60 to 90 per cent, it produces a reddening (flushing) of the skin, and a feeling of heat which is due to a dilatation of the blood vessels and consequent increased flow of blood to the part. When the alcohol begins to evaporate, a sensation of cold is experienced. If applied in concentrated form to a mucous membrane or open wound, it produces pain and a whitening of the tissue at the point of application; this on closer examination will be found to be a coagulum of the tissue protein.

The actual value of alcohol as a beverage cannot be discussed apart from its value as a food, although it is usually imbibed solely for its refreshing and stimulating effect. The rôle played by alcohol on the digestive function has been the subject of many discussions. The belief prevails, especially amongst the laity, that taken in small amounts it will create an appetite and stimulate digestion. It has been found, however, that very small amounts of alcohol do not affect, or stimulate only slightly, the digestive power of ferments outside of the body. It has been further noted that alcohol in a dilution of 5 to 10 per cent diminishes the rate of digestion itself. The pancreatic function is affected by even smaller amounts. Alcohol, when placed in the mouth in a sufficiently dilute form, will stimulate the flow of saliva, but this is considered a reflex act. Acting as an irritant directly on the stomach wall, it accelerates the secretion of gastric juice. According to Chittenden and Mendel, this increased secretion of gastric juice will also occur if the alcohol is introduced in the intestine.

The effect of alcohol on the amount of digestion still remains a matter for dispute. Some (Chittenden, Mendel, and Jackson) assert that the retarding effect of alcohol on digestion is compensated by the increased flow of gastric juice. Others (Kretschy and Buchner) argue that protein digestion is distinctly retarded by alcohol or even beer, which contains only a little alcohol. Eichenberg and Wolffhardt think that alcohol or wine stimulates the digestion, and Gluzinsky states that alcohol, when present in the stomach, inhibits digestion, but that after it is resorbed digestion proceeds at a better rate than when no alcohol had been present. Zuntz and Magnus-Levy conclude that, when beer is taken with the dietary, absorption and utilization of the food by the tissues are not favored. On the other hand, Atwater and Benedict found that alcohol, when given in moderate amounts, appears to increase very slightly the availability of the nutrients in the diet, but more especially the protein. They point out, however, that in view of the fact that there are often marked differences in the availability of the same kind of diet with different persons and with the same persons at different times, this conclusion must be held with a degree of reserve.

At one time it was supposed that alcohol on

absorption by the digestive tract was not utilized by the body, but was eliminated by the skin, lungs, and kidneys in an unchanged state. The experiments of Atwater and Benedict showed, however, that 98 per cent of the alcohol ingested was utilized in the human organism when the subjects received 2½ ounces of alcohol per day, or about as much as would be taken in a bottle of claret, 6 ounces of whisky, or 5 ounces of brandy. It was further noted that a pound of alcohol would furnish as much energy as 1.73 pounds of carbohydrates (starches, sugars, etc.), or 0.78 pounds of fats. It can, therefore, be inferred that alcohol, when utilized by the body, must either produce tissue itself or undergo oxidation and spare some tissue which would otherwise be oxidized for heat and energy production. That alcohol does cause fats and carbohydrates to be spared is to-day an established fact, and the evidence thus far gathered, although not conclusive, makes us almost believe that it will spare the main tissue substance, protein, also, although according to Neumann the body must first become accustomed to alcohol before it can spare protein. The sparing power of alcohol explains in part why some users of alcohol become fat, although in the case of beer-drinkers the solid materials may have some nutritive value. In any case, however, alcohol can never substitute as a regular thing for any great part of the nutrients in the dietary.

The continuous temperate use of alcohol produces a certain degree of tolerance—an immunity as it were—in many subjects; others are hypersusceptible and cannot stand it at all. As some seem to tolerate large doses without any untoward effects, it is obvious that tolerance is entirely dependent upon the quality of the cellular make-up of the individual taking alcohol. Alcohol has a direct toxic effect upon the cells it comes in contact with, and local damage is directly relative to the amount of alcohol present.

The absorption of alcohol is most rapid when the digestive tract is comparatively empty. This explains why the ill effects of alcohol are less apparent when food is eaten at the same time or shortly after taking the alcohol; it is a notable fact that some foods by virtue of their nature delay the absorption of alcohol. Alcohol when taken by way of the mouth goes over into the blood, and the largest amount of alcohol is present in the blood of intoxicated persons.

The principal action of alcohol is on the central nervous system, but it also acts on the spinal cord. Binz and his followers believe that it first stimulates and then depresses, while Schmiedeberg and adherents think that alcohol depresses the central nervous system from the outset. In the first, or excitement, stage alcohol influences the heart beat, the blood pressure rises, an ephemeral but deceptive feeling of warmth is experienced, and there seems to be an increased faculty of motion and speech. Whether this first stage is actually due to the stimulating action of the drug is still a matter of dispute. It has been suggested, however, that it is due to some action on the peripheral nerves, or possibly to the utilization of the alcohol as a food by the muscle tissue. Alcohol does not increase the capacity for mental or physical work; its use practically always causes a dulling of judgment. Kraepelin, of Munich,

who probably has done the most work on the psychological effects of alcohol, is of the opinion that the receptive and intellectual powers are weakened by very small quantities of alcohol, while motor function is increased by very small quantities and retarded by large quantities. Typesetters have been found to make fewer errors and do more work when not using it.

In the narcotic stage there is a generally lowered psychic activity, sensation and motion are lessened, the speech is muttering and thick, the senses are blunted, the gait staggering, and finally there is a tendency to sleep. When unconsciousness is established, there is anæsthesia. In the paralytic stage, i.e., beginning of medullary paralysis, the breathing is slow, intermittent, and stertorous, the pupils are dilated, the pulse is hardly perceptible, the reflexes are abolished, and the skin is cold.

While immediate death is rare from acute alcohol poisoning, many fatalities occur as a result of losing consciousness. In such cases vomitus may be sucked into the air tubes (trachea, etc.), or the subject may fall face downward into water or mud and become suffocated. In winter intoxicated persons often freeze to death. The minimum fatal dose of alcohol is not exactly known; some give it as between 60 and 180 grams (about 2-6 ounces by weight). In Maschka's cases a girl of five and a boy of nine died after the forced administration of about 1.6 oz. of absolute alcohol.

The recovery from alcohol poisoning is slow, and coma is replaced by natural sleep. On awakening the symptoms of an acute gastrointestinal catarrh (since the stomach, etc. are in an irritable condition) and possibly a neuritis are noted. There are present a coated tongue, foul breath, loss of appetite, vomiting—especially when food is taken—and headache.

By long and injudicious use, alcohol affects all tissues with which it comes in contact. It acts as a stimulator of cell growth, often in undesirable places, as in the liver, kidneys, etc.; it is entirely or in part responsible for many human ills as cirrhosis of the liver (hobnail liver, etc.), nephritis (kidney disease), diabetes, gout, hardening of the arteries (arteriosclerosis), gastritis, insanity, etc. Alcoholics are very susceptible to infectious diseases in general, especially pneumonia and tuberculosis.

Alcohol, when habitually used by parents, has undoubtedly untoward effects on the progeny, as is shown by a vast amount of statistical data. Experimentally, Stockard has shown with guinea pigs that alcohol had a distinct effect on the development of the embryo. The statistics gathered in Paris in the service of Bourneville showed that of 3271 children of impaired mental condition 1156 had alcoholic fathers, 100 alcoholic mothers, and 53 had both alcoholic fathers and mothers; in 538 cases no data were obtainable, and in the remainder the parents were temperate.

Even from what has been said against alcohol, it is not altogether sure that its use as a medicine can be dispensed with. In pharmacy and medicine it finds extensive use as a solvent for drugs, and for preparing fluid and solid extracts and tinctures of drug plants, for essential oils, alkaloids, etc. As a remedy it is valuable in shock, collapse, and syncope, in fever, in conjunction with other drugs for snake bite, locally as an antiseptic, anodyne, stimulant,

and dressing for wounds, for hardening the cuticle when bed sores are threatened, as a cooling lotion, etc. It must not be assumed, however, that alcohol is good in all diseases, for we know to-day that for most epileptics it is decidedly detrimental.

Schweisheimer, "Der Alkoholgehalt des Blutes unter verschiedenen Bedingungen," in *Deut. Arch. Klin. Med.*, cix, Nos. 3-4.

ALCOHOLISM. The term employed to denote the symptoms of disease produced by alcoholic poisoning. In acute alcoholism, which is generally caused by the rapid absorption of a large quantity of alcoholic drinks, the first symptoms are animation of manner, exaltation of spirits, and relaxation of judgment. The emotions are altered and often perverted; muscular movements become irregular or ataxic; the mechanism of speech suffers. The further development of the symptoms presents a variety of effects. In the ordinary course of the action of the drug, dizziness, disturbance of sight and hearing, and other troubles due to disorder of the central nervous system, ensue, leading to heavy sleep or profound coma, from which it is sometimes impossible to rouse the individual, who lies completely paralyzed, breathing stertorously. Sometimes the alcohol affects so strongly the centres of respiration and circulation that death is caused by paralysis of one or other, or both. This condition of coma requires to be carefully distinguished from opium poisoning. In the former, the face is usually flushed and the pupils dilated, while in the latter the face is pale and the pupils contracted. The odor of the breath is no criterion, inasmuch as sympathizing bystanders are apt to administer spirits in every case of depression, often with hurtful effects. Fracture of the skull, delirium of meningitis, and coma after epilepsy or after cerebral hemorrhage are often undiscovered by the inefficient ambulance surgeon, who is led to diagnose a condition from an alcoholic breath. A second class of alcoholics act in an entirely different manner. Instead of sinking into stupor or coma, the individual becomes more and more excited, bursts into wild mirth or passionate anger, struggles violently with those who attempt to soothe him, and may grievously harm himself or others. This is the condition known as alcoholic mania—the physical explanation of many fearful crimes. It is more apt to follow a somewhat protracted debauch. After a longer or shorter period of fierce excitement, it is in most cases succeeded by great depression, and sometimes during this condition there may be sudden death from failure of the respiration or circulation. In some patients, the stage of excitement culminates in a convulsive seizure. The convulsions are repeated at intervals, are very complicated in character, and produce remarkable contortions of the body. These usually

grow less violent and, passing off, end in deep sleep; but here also death may occur from the action of the poison. Such cases of "alcoholic epilepsy" are comparatively rare and occur principally in acute exacerbations of chronic alcoholism. Acute alcoholism is more apt to occur in those who are of unsound mind and weak nervous system, and this applies especially to the two last-described forms of the affection. In the treatment of acute alcoholism it is always wise to wash out the stomach, in case alcohol is present, or to accomplish much the same object by free vomiting and purgation. In the profound coma the administration of stimulants, such as ammonia and strychnine, may be called for, and sometimes artificial respiration may be the only means of saving life. In the maniacal and convulsive forms of the affection, sedatives must be used. After the immediate symptoms have passed away in all forms, the individual must be carefully fed with nutrient enemata, on account of the disturbance of the digestive system, along with remedies which will subdue the digestive irritation and overcome the depression of the nervous system.

Chronic alcoholism is caused by the prolonged use of overdoses of various alcoholic drinks. Changes (see ALCOHOL, PHARMACOLOGY, etc.) are caused in every tissue of the body, but the nervous, respiratory, and circulatory systems are more especially affected, together with the liver and kidneys. There is always more or less catarrh of the digestive organs, shown by dyspepsia, heart-burn, vomiting—especially in the morning—and usually diarrhœa. The liver becomes enlarged from congestion, and may afterward shrink, pressing on the veins and bringing back blood to the heart from the abdominal viscera, leading to congestion of the bowels, hemorrhoids, and hemorrhages. From changes in the organs of circulation there is a tendency to palpitation, fainting, and breathlessness on exertion. These alterations are degenerations of the heart, which may be soft or even fatty; fibrous changes in the walls of the arteries; and dilatation of the capillaries from paralysis of the vaso-motor nerves. This last condition gives the florid complexion and mottled appearance to chronic drinkers. There is, besides, usually some congestion of the kidneys; but it is erroneous to attribute Bright's disease mainly to alcohol. The lungs are subject to chronic congestion and catarrh of the bronchial tubes and lung tissues. The muscular system suffers, the muscles becoming flabby and fatty. There is a great tendency to deposition of fat, and skin diseases are frequently induced by the vaso-motor changes.

Two characteristic results of the action of the drug on the central nervous structures are delirium tremens and alcoholic insanity. (See INSANITY.) In treating chronic alcoholism the great point is to prevent the employment of alcohol in any form and to invigorate the bodily and mental functions. See DELIRIUM.

Social scientists agree that alcoholism presents one of the most serious of modern social problems. The chief sociological effects of alcoholism are connected with increased morbidity and mortality, industrial accidents, pauperism, crime, insanity, and degeneracy in offspring. The statistical treatment of such effects is at present extremely unsatisfactory. The difficulties inherent in the collection and interpretation of such statistics are complicated by the par-

tisanship of opponents or supporters of the traffic in alcoholic liquors.

With respect to mortality, the evidence of life insurance companies is fairly trustworthy. Statistics were published in 1910 giving the experience of the Leipzig Ortskrankenkasse with respect to about 1,125,000 insured in the period 1887-1905. Of these 4847 were classed as "alcoholics," having been treated at some time during the period for delirium, etc. The mortality of the alcoholics was about three times the average for the same age groups. With this may be compared an investigation undertaken by a British actuary, Mr. F. G. P. Neison, in 1850, dealing with the mortality of a group of a little over 6000 heavy drinkers. Placing the general mortality of England and Wales at 100, the mortality of this group was 325.

Such figures do not, of course, show the net death rate due to alcohol, since it is impossible to determine in how large a proportion of the cases alcoholism is a result rather than a cause of a constitutional weakness that would naturally increase mortality. More satisfactory evidence is afforded by the statistics of mortality in the occupations in which the temptation to drink is especially strong, such as brewing, retail dealing in alcoholic beverages, innkeeping. There is no reason for assuming a higher proportion of constitutional defectives in these industries than in the general population. According to the experience of the Gotha Life Insurance Company, the excess of mortality of brewery workers over that of the general population is 62 per cent, tapsters, 55 per cent, innkeepers, 47 per cent.

Since persons known to be heavy drinkers are generally rejected by insurance companies, information relating to mortality among them is meagre. Some life insurance companies distinguish carefully between total abstainers and moderate drinkers. The latter invariably show a heavier death rate than the former. The most striking figures that have been published by any company are those of the United Kingdom Temperance and Provident Institution. The records cover the period 1866-1905 and show that mortality among total abstainers amounts to 71.54 per cent of the calculated probabilities, as compared with 94 per cent for the moderate drinkers.

There are no trustworthy statistics of the total number of deaths in any country due to alcoholism. In 1883 a report was published by the Harveian Society of London, analyzing the data for 10,000 deaths. The reporters came to the conclusion that alcohol had played some part in causation in 14 per cent of the cases. Assuming that the figures, which were for London, would apply to the country as a whole, it was estimated that the mortality from alcohol in England and Wales would amount to nearly 40,000 annually. An American actuary, Mr. E. B. Phelps, working on the basis of the published statistics of the registration area, calculated the alcoholic mortality in the United States at 7.7 per cent of the whole mortality, or practically 66,000.

A considerable body of statistics on the relation between alcoholism and sickness is being collected in European countries which practice invalidity insurance. The available statistics indicate that, measured in number of days ill, the morbidity of those described as alcoholic is about twice that of the general population.

The tuberculosis morbidity rate is especially heavy among workers in the alcoholic trades, being inferior only to the rate among stone cutters, metal polishers, and printers.

The connection between alcoholism and accidents is generally recognized, but trustworthy statistics bearing upon it are rare. In Prussia, 1869-73, of 33,321 fatal accidents, 4.66 per cent were assignable to drunkenness. In Saxony, of 17,939 fatal accidents in the period 1847-76, 6.2 per cent were due to drunkenness. In England, 1877-81, of 87,458 persons fatally injured, 9.2 per cent were either intoxicated or suffering from delirium tremens. These are, of course, minimum figures, as in many cases all evidence as to the state of the person injured is destroyed by the accident.

Indirect evidence of the relation of alcoholism to industrial accident is given by the distribution of accidents through the week. It is a well-known fact that drinking is most common, among industrial laborers, on Saturday evening and Sunday. An investigation of accidents in the building trades showed that of 3972 accidents 19.9 per cent occurred on Monday, while the next highest percentage was 16.5 per cent. Of 25,295 accidents in the Berlin building trades, 1885-98, 18.7 per cent occurred on Monday, the next highest percentage being 16.6. The same fact is brought out by analysis of the accident statistics of other cities.

There is no agreement as to the relative amount of pauperism due to alcoholism. The Committee of Fifty, which made a careful study of the social aspects of the liquor problem in the United States, assigns 33 per cent of pauperism to the personal use of alcohol, 8.7 per cent to its use by others. British estimates place the percentage of pauperism due to alcoholism at from 20 to 50 per cent. German estimates are far lower—10 to 20 per cent. No estimates of the kind have much scientific value. It is impossible to determine in many cases how far alcoholism is a cause of pauperism, how far merely a concurrent effect of an original moral and physical weakness.

The relation between insanity and alcoholism is close, but here again statistics furnish no clue to the determination of cause and effect. In the asylum population of England and Wales, 17,000 out of 116,000 have alcoholic histories. One-third of the lunatics of New York have been alcoholics. Statistics of the insane in Vienna (1895-96) disclose an alcoholic history in the case of 40 per cent. Prussian statistics for 1888 indicate a connection between alcoholism and insanity in 40 per cent of the cases treated in asylums. The records of the Asylum of St. Anne in Paris indicate an alcoholic history for 51 per cent of the men and 22 per cent of the women.

The relation between alcoholism and crime is still closer. The Committee of Fifty scrutinized the records of 13,402 convicts in 17 American prisons and found that 49.95 per cent had alcoholic histories. In an investigation of Sing Sing and Auburn prisons it was found that, of those who had committed crimes against the person, 40.47 per cent were habitual drunkards. In England prisoners convicted of grave homicidal offenses show an alcoholic percentage of 60. An investigation of the records of 32,837 prisoners in the jails and prisons of the German Empire showed alcoholic histories in the case of 46.1 per cent of the murders, 63.2 per

cent of the homicides, 74.4 per cent of homicidal assaults, and 62 per cent of milder assaults. An investigation of convicts in Vienna showed that 58.8 per cent were victims of alcoholism; a similar investigation in Paris showed that 68.6 per cent of the prisoners at the St. Pélagie were alcoholic.

There appears to be strong evidence in support of the view that alcoholism is a factor in producing degeneracy in offspring. Direct experiments carried on with dogs and guinea pigs have established beyond question that excessive amounts of alcohol reduce markedly the number of live offspring as well as the viability of those born living. An excessive proportion of the offspring are physically defective. The taint may be conveyed by either parent. The human race, it would appear, is more nearly immunized to alcohol, and the transmission of physical taint through alcoholism is not so certainly established. None the less there is no lack of statistics indicating some relation between alcoholism and congenital defects. Figures for epileptics at the Craig Colony in New York indicate that over 20 per cent of the inmates are the offspring of alcoholic parents. Bourneville found that of 2552 mentally defective children in the institution at Bicêtre, France, 41 per cent had alcoholic parents. Detailed studies of family histories have brought out the fact that congenital defects may be related to alcoholism in grandparents, where the parents themselves were not alcoholic. On this ground many social scientists believe that the figures given above greatly understate the part played by alcoholism in producing such defects.

Bibliography. The Committee of Fifty has made the best study of the subject in its volume on *Economic Aspects of the Liquor Problem* (Boston, 1899). Consult also: "The Relations of the Liquor Traffic to Pauperism, Crime, and Insanity," *Twenty-sixth Annual Report of the Massachusetts Bureau of Labor Statistics* (Boston, 1895); "Economic Aspects of the Liquor Problem," *Twelfth Annual Report of the United States Department of Labor* (Washington, 1898); Hoppe, H., *Die Tatsachen über den Alkohol* (Berlin, 1901); Kelynack, T. N., *The Drink Problem* (New York, 1907); Williams, H. S., *Alcohol* (New York, 1909); Phelps, E. B., *The Mortality of Alcohol* (New York, 1911). See TEMPERANCE; PAUPERISM; CRIME.

AL'COHOLOM'ETRY (*alcohol* + Gk. μέτρον, *metron*, *measure*). A name applied to any process of estimating the percentage of absolute alcohol in a sample of spirits. Certain chemical methods have been tried for the purpose, but the one usually employed consists in determining the specific gravity of the spirit. As liquors, however, generally contain other substances besides water, they must be carefully distilled before a determination can be made. Every mixture of alcohol and water has a specific gravity of its own, which depends (1) on the relative composition of the mixture, and (2) on the temperature; once the specific gravities of various mixtures have been determined, the composition of a sample can be ascertained by determining its specific gravity and observing the temperature. The following table shows the specific gravities of mixtures of alcohol and water, containing 5, 10, 15, 20, etc., per cent by weight of alcohol, at the temperatures 0°, 10°, 20° and 30° C.:

Percentage by weight of alcohol.	0°	10°	20°	30°
5	0.99135	0.99113	0.98945	0.98680
10	0.98493	0.98409	0.98195	0.97892
15	0.97995	0.97816	0.97527	0.97142
20	0.97566	0.97263	0.96877	0.96413
25	0.97115	0.96672	0.96185	0.95628
30	0.96540	0.95998	0.95403	0.94751
35	0.95784	0.95174	0.94514	0.93813
40	0.94939	0.94255	0.93511	0.92787

See also article HYDROMETER.

ALCOHOLS. A name applied in organic chemistry to one of the largest and most important classes of carbon compounds. The alcohols possess in common certain chemical properties, though they are otherwise very different from one another. They all contain one or more hydroxyl groups (OH) linked directly to some fatty hydrocarbon group (such as methyl, CH₃, ethyl, C₂H₅, etc.), and are subdivided both with reference to the number of their hydroxyl groups and with reference to the nature of their hydrocarbon groups. When the alcohols are acted on by the chlorides or bromides of phosphorus, chlorine or bromine takes the place of their hydroxyl groups, and as a result, halogen derivatives of the corresponding hydrocarbons are produced. Thus, by the action of phosphorus pentachloride, ethyl alcohol may be transformed into ethyl chloride (mono-chloro-ethane), according to the following chemical equation:

With reference to the number of their hydroxyl groups, the alcohols are divided into *mono-hydric*, *di-hydric*, *tri-hydric*, etc. According to the nature of the radicle to which these groups are attached, alcohols may be *saturated* or *unsaturated*, *fatty* or *aromatic*. With reference to their chemical constitution and behavior toward oxidizing agents, alcohols are further divided into *primary*, *secondary*, and *tertiary*. The primary alcohols are characterized by the uni-valent group CH₂OH; the secondary, by the di-valent group CHOH; the tertiary by the tri-valent group COH. The differences in their reactions are described below.

The hydrogen of the hydroxyl group of an alcohol can be replaced by metals or by hydrocarbon radicles or by acid radicles. In the first of these cases a metallic *alcoholate* is obtained; in the second case, an *ether*; in the third case, an *ester*. Thus, by the action of metallic sodium on ordinary (ethyl) alcohol, sodium alcoholate is obtained, according to the following chemical equation:

On the other hand, by dehydrating ethyl alcohol, ordinary ether is obtained, as follows:

In this transformation (usually effected by the dehydrating action of sulphuric acid), the ethyl group of one molecule of alcohol evidently takes the place of the hydroxyl hydrogen of another molecule. Finally, the action of an organic acid replaces the hydroxyl hydrogen of an alcohol by an acid radicle. For instance:

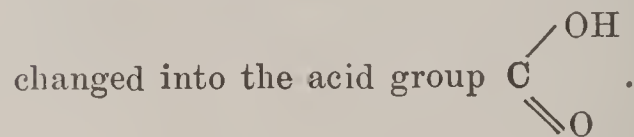

The chemical transformations characterizing the three sub-classes of the alcohols, viz., the primary, secondary, and tertiary alcohols, are as follows:

1. It was mentioned above that primary alcohols contain the group CH₂OH. When they are oxidized, this group is changed into the group

another important class of organic compounds. By further combination with oxygen aldehydes readily yield acids, the group CHO being ex-

2. When secondary alcohols are oxidized, their characteristic group CHOH is converted into the group CO, and as a result *ketones* are produced.

3. Tertiary alcohols cannot be transformed by simple oxidation into a compound whose molecule contains the same number of carbon atoms.

The three sub-classes of alcohols can thus be readily distinguished from one another by their behavior toward oxidizing agents.

Primary alcohols may be transformed into corresponding secondary or tertiary alcohols with the aid of sulphuric acid. Thus, by dehydration with sulphuric acid normal propyl alcohol, C₂H₅CH₂OH (primary), is converted into propylene, CH₃CH:CH₂; but when this is re-hydrated by dissolving in fuming sulphuric acid and boiling with water, *iso-propyl* alcohol, (CH₃)₂CHOH (secondary), is obtained. In this manner a hydroxyl group can be made to change its position in the molecule by simple laboratory methods.

The di-hydric alcohols, as the name indicates, contain two hydroxyl groups. *Glycols* is the name usually applied by chemists to the di-hydric alcohols. The simplest glycol, derived from methane (CH₄)—the simplest hydrocarbon—should be represented by the formula CH₂(OH)₂. But though certain compounds of this glycol have been obtained, the glycol itself could not be prepared in the free state. Experience shows, in general, that the formation of a compound in which two hydroxyl groups might be attached to one carbon atom is almost invariably accompanied by a loss of the elements of water. The imaginary compound CH₂(OH)₂ is thus split up, according to the following equation:

The compound CH₂O (formaldehyde) is therefore obtained in reactions which might be expected to result in the formation of the glycol CH₂(OH)₂. The simplest glycol actually pre-

pared is a derivative of ethane (C_2H_6), one hydroxyl group being attached to each of the two carbon atoms of ethane, and its formula

therefore being $\begin{array}{c} CH_2OH \\ | \\ CH_2OH \end{array}$. This glycol evidently

contains two primary alcohol groups (CH_2OH), by the oxidation of one or both of which a series of interesting compounds is obtained, including:

Glycols containing two tertiary-alcohol groups (COH) are usually called *pinacones*, the simplest pinacone known being represented by the following graphic formula:

The simplest and best-known tri-hydric alcohol is the well-known glycerin (q.v.). Among other poly-hydric alcohols may be mentioned the hexa-hydric alcohol *mannitol*, which is found in *manna* (q.v.). The poly-hydric alcohols generally possess a sweet taste and are insoluble in ether. A number of them occur ready-formed in nature.

The mono-hydric alcohols are rarely found in nature in the free state; in the form of esters, however, i.e., in combination with acids, they occur largely in the vegetable kingdom. The formation of alcohols from the sugars through fermentation is described elsewhere. (See ALCOHOL and FERMENTATION.) It remains to mention here a few of the general chemical methods by which alcohols are made artificially.

1. Many alcohols are prepared from the corresponding hydrocarbons by substituting halogens for part of their hydrogen, and treating the halogen derivatives thus obtained with dilute aqueous alkalis or with moist silver oxide. The following equations represent examples of the formation of alcohols from halogen-substitution products of hydrocarbons:

2. Since aldehydes are produced by the oxidation of primary alcohols, the latter may be obtained, conversely, by reducing aldehydes.

3. Since ketones are produced by the oxidation of secondary alcohols, the latter may, conversely, be prepared from ketones by reduction. Thus, secondary propyl alcohol may be obtained by the action of nascent hydrogen on acetone (dimethyl-ketone).

4. Tertiary alcohols may be prepared from chlorides of acid radicles with the aid of compounds of zinc with hydrocarbon radicles. Thus,

tertiary butyl alcohol is obtained according to the following equation:

The aromatic alcohols, i.e., alcohols whose molecules contain a benzene nucleus may be prepared by methods analogous to those just described. Aromatic alcohols must be distinguished from the phenols—a class of hydroxyl derivatives of the aromatic hydrocarbons—which are in many respects quite different from the alcohols. See PHENOLS.

A variety of alcohols may now be best prepared by the Grignard reaction, a general method by which innumerable syntheses have been carried out in recent years. See GRIGNARD REACTION.

ALCOLEA, ä'l'kô-lä'ä, BRIDGE OF. A bridge across the river Guadalquivir, 8 miles northeast of Cordova, Spain, the scene of a battle Sept. 28, 1868, between the revolutionary troops of Serrano and those of Queen Isabella. The latter were beaten, and the Queen, dethroned, fled to France.

ALCORAN, ä'l'kô-rän or ä'l'kô-rän'. See KORAN.

ALCORN, ä'l'körn, JAMES LUSK (1816-94). An American statesman, born in Golconda, Ill. He was educated at Cumberland College, Ky., and became a lawyer in that State and sat in its Legislature. He went to Mississippi in 1844 and served in the State Legislature from 1846 to 1865, when he was elected United States Senator, but was not then permitted to take his seat. In 1861 he had been a member of the secession convention. He was elected Governor on the Republican ticket in 1869, but resigned two years later to enter the United States Senate, where he continued until 1877. In 1873 he was defeated for Governor on an independent ticket. He was the founder of the levee system of Mississippi, and became president of the Levee Board of the Mississippi-Yazoo Delta. Four years before his death he was a member of the State Constitutional Convention. A Mississippi agricultural and mechanical college for colored students which he was instrumental in establishing was named in his memory. Further proof of his interest in the negro race is found in his *Civil Rights* speech, published by the Government Printing Office in 1874.

ALCOTT, ä'l'küt, AMOS BRONSON (1799-1888). An American educational reformer, conversationalist, and Transcendental philosopher. He was born at Wolcott, Conn., Nov. 29, 1799, and died in Boston, March 4, 1888. He was the son of a farmer, and his first experience of life was gained as a peddler in the South. In 1828 he became an educational reformer and established in Boston a school in which he attracted much attention by the novelty of his methods. Of this there is an account by Elizabeth Peabody (*A Record of Mr. Alcott's School*, 1834; 3d ed., 1874). His method was largely conversational, and a transcript of his talks appeared in 1836 as *Conversations with Children on the Gospels*. Ways that would now seem more commendable than noteworthy then met with bitter denunciation, so that Alcott abandoned his school, moved to Concord, and

sought to disseminate his views on theology, education, society, civics, and vegetarianism through lectures, winning attention by his originality and sometimes graceful though often rambling speech. In 1842 he visited England and returned with two friends, one of whom bought an estate near Harvard, Mass., where they endeavored to found a community, "Fruitlands," which speedily failed. Alcott then went to Boston and later to Concord, leading the life of a peripatetic philosopher and giving "conversations," which found increasing favor, especially in the West. In later years his manner became more formal and his always nebulous teaching apparently more orthodox. Besides frequent contributions of "Orphic Sayings" to the Transcendental organ, *The Dial*, he published fragments from his voluminous diary, *Tablets* (1868); *Concord Days* (1872); *Table Talk* (1877); *Sonnets and Canzonets* (1877), and also *New Connecticut* (1881), and an *Essay on Ralph Waldo Emerson: His Character and Genius* (1882). For his biography, consult Sanborn and Harris, *Life* (2 vols., Boston, 1893); also Lowell's contemporary criticism, in *A Fable for Critics* (New York, 1848), and "A Study from Two Heads," in the *Poems*.

ALCOTT, LOUISA MAY (1832-88). An American novelist and juvenile writer. She was born at Germantown, Pa., Nov. 29, 1832, and died at Boston, March 6, 1888. She began her active life as a teacher, writing stories of harmless sensation for weekly journals and publishing the insignificant *Flower Fables* (1855). During the Civil War she volunteered as an army nurse and wrote for a newspaper the letters afterward collected as *Hospital Sketches* (1863). She first attracted notice by *Little Women* (1868; second part, 1869), the best and most popular of her writings, in which she drew herself in the character of Jo. Among the more noteworthy of numerous other contributions to the literature of adolescence are: *An Old-Fashioned Girl* (1869), *Little Men* (1871), and *Jo's Boys* (1886). Her novels, *Moods* (1863) and *Work* (1873), attracted little attention. In later years she suffered much from ill-health; but her writing was to the last singularly buoyant and hopeful, full of faith in human nature, democracy, and freedom. She was typical in her social ethics of the literary generation in which her father, Amos Bronson Alcott (q.v.), had been a prominent figure. There is a *Life*, by Cheney (Boston, 1889), which is more frankly written than most biographies, and one by Belle Moses (New York and London, 1909), under the title *Louisa May Alcott, Dreamer and Worker*.

ALCOTT, MAY (1840-79). An American artist, daughter of Amos Bronson Alcott and wife of Ernest Nieriker. She was born at Concord, Mass., and studied at the Boston School of Design and in Paris. She showed considerable skill in still-life subjects, particularly in flowers and sketches of nature, but attained her greatest success by her oil and water-color copies of the paintings of Turner, which were highly praised by Mr. Ruskin and were given to the pupils of the South Kensington schools, London, to work from. Mrs. Nieriker was the author of *Concord Sketches* (Boston, 1869) and of *Studying Art Abroad* (1879).

AL'COVE. In architecture a recess opening from a larger room or inclosure, usually in order to serve some special function. Among

special forms of the alcove may be mentioned the bay-windows of modern houses; the apses (see APSE) of Roman basilicas and Christian churches, and the *trielinia* and *alæ* of the typical ancient Roman house, the former surviving to our time in the dining alcoves of many Syrian houses. In France, at least in Brittany, the bedstead is built into an alcove, and in some French châteaux and palaces the royal bedstead was set in an elaborately decorated alcove hung with tapestries and divided from the main bed-chamber by a carved balustrade (Chamber of Henry IV in the Louvre; of Louis XIV at Versailles). Business offices are sometimes arranged with alcoves for special functionaries or clerks, and certain libraries are planned on the alcove system, a part or the whole of one or both sides of a main reading- or book-room being set off into alcoves for special study or for particular classes of books. A similar arrangement is often employed in museums of art or science. See HOUSE; LIBRARY BUILDINGS.

ALCOY, ăl-kō'è. A town of Spain, in the province of Alicante. It is situated on the river Alcoy, 24 miles north-northwest of the city of Alicante (Map: Spain, E 3), and is one of the most busy and prosperous of Spanish towns. It is picturesquely placed on the slope of the Sierra Mariola, whose streams afford an abundance of water power. The public buildings include a consistory, town hall, poorhouse, and public granary. The city is the great centre of paper manufacture, and the mills are of considerable antiquity. The cigarette paper of Alcoy is especially well known in Spain. Sugar-plums (*peladillas de Alcoy*), woolen cloth, linen and cotton goods, as well as hardware, form other important branches of manufacture. Pop., 1910, 33,896. The prosperity of the place was interrupted for a time in 1873 by an insurrection of the Spanish Internationals, and the district is a centre for frequent communistic agitation.

ALCUDIA, ăl-kōō'dé-à, MANUEL DE GODOY. See GODOY, MANUEL, DUKE OF ALCUDIA.

ALCUIN, ăl'kwīn, or FLACCUS ALBINUS (c.735-804). The most distinguished scholar of the eighth century, the confidant and adviser of Charlemagne. He was born at York, was educated under the care of Archbishop Ecbert, and his relative Ælbert, and succeeded the latter as master of the school of York. Charlemagne became acquainted with him at Parma, as he was returning from Rome, whither he had gone to bring home the *pallium* for a friend. He invited Alcuin to his court and had his assistance in his endeavors to civilize his subjects. As a result of this association, Alcuin became the preceptor of the Emperor, whom he instructed in various subjects, especially rhetoric and dialectics. To render his instruction more available, Charlemagne established at his court a school called Schola Palatina, the superintendence of which, as well as of several monasteries, was committed to Alcuin. In the learned society of the court Alcuin went by the name of Flaccus Albinus. In 790 Alcuin returned to England, but was recalled by Charles in 794, who needed his aid at the Council of Frankfort. He again returned to York, but was forced by political changes to go back to France. He retired to the abbey of St. Martin, in Tours, in 796, and taking as his model the school of York, taught at Tours. While there he wrote frequently to the Emperor. He died May 19, 804.

He left, besides numerous theological writings, a number of works on philosophy, mathematics, rhetoric, and philology, as well as poems and a great number of letters. His letters, of which 311 are extant, while they betray the uncultivated character of the age generally, show Alcuin to have been the most accomplished man of his time. He understood Latin, Greek, and Hebrew. Editions of his works appeared in 1617 (Paris), 1777 (Ratisbon), and in Migne's *Patrologia*. Consult Mullinger, *Schools of Charles the Great* (London, 1877), West, *Alcuin and the Rise of Christian Schools* (New York, 1892), and Gaskoin, *Alcuin* (New York, 1904), and Page, *The Letters of Alcuin* (New York, 1911).

AL'CYONA'RIA (from Gk. ἀλκυόν[ε]ιον, *alkyon[e]ion*, bastard-sponge). A subclass of the Anthozoa, comprising a group of coral-polyps, characterized by the presence of eight

ALCYONARIA.

tentacles around the mouth and the division of the gastrovascular cavity into eight chambers. Typical forms, like the precious red corals, fall into the subordinate group Alcyonacea; the sea-fans constitute the group Gorgonacea; and the sea-pens the group Pennatulacea. See CORAL.

ALCY'ONE, āl-sī'ō-nē, or **HALCY'ONE** (Gk. Ἁλκυόνη, Ἁλκυόνη, *Alkyonē*, *Halcyonē*). In later Greek legend, the daughter of Æolus and wife of Ceyx, King of Trachis in Thessaly. According to one story, inconsolable on the death of her husband, she threw herself into the sea, whereupon she and her husband were changed into kingfishers as a reward of their mutual devotion. Alcyone was originally a sea divinity and appears in the legends of Bœotia, Argos, Megara, and elsewhere. The myth has been perpetuated in zoölogy by the name of a genus (*Alcyone*) of kingfishers; these birds are frequently called halcyons in poetic literature.

ALCYONE (Gk. Ἁλκυόνη, *Alkyonē*). The most brilliant of the "seven stars," or Pleiades. It is a star of the third magnitude and was supposed by Mädler to be the central sun, in reference to which our sun with its planets and all other known systems are moving, perhaps revolving within some almost incomprehensible period of time. It has been shown, however, that any central sun hypothesis is, as yet, far too daring, considering the insufficient state of our knowledge of sidereal systems and their motions. See PLEIADES.

ALDA, FRANCES (1884—). The stage name of a distinguished soprano. Her real name is Davis. She was born in New Zealand of Eng-

lish parents, but educated at Paris, where she was a pupil of Marchesi. She made her début at the Opéra Comique in Paris in 1904. In 1908 she became a member of the Metropolitan Opera House in New York. She won fame not only on the operatic stage, but also on the concert platform. In 1910 she was married to Giulio Gatti-Casazza, the director of the Metropolitan Opera House.

AL'DABEL'LA. 1. In Ariosto's *Orlando Furioso* (q.v.), the wife of Orlando, daughter of Monodantes and sister of Oliviero. In French and Spanish versions of the Orlando legends she appears as Alda and Auda. 2. In Dean Milman's tragedy of *Fazio* (q.v.), a fascinating but wicked woman, of whom Bianca, Fazio's wife, has cause for jealousy, and who is finally condemned to a nunnery.

ALDAN, āl-dän'. An affluent of the Lena, rising in the Siberian territory of Yakutsk, near the mountain ridge of Yablonov, in lat. 56° 31' N. and long. 123° 51' E. (Map: Asia, M 3). After flowing in a generally northerly direction for 1320 miles it empties into the Lena, 111 miles below Yakutsk. It is navigable for a distance of over 600 miles and abounds in sturgeon and sterlet.

ALDAN, āl-dän'. A mountain range on the left shore of the river that gives it its name, between 55° and 61° N. lat. (Map: Asia, M 3). It is a branch of the Stanovoi, about 400 miles long. The best-known summit, Kapitan, has an altitude of over 4000 feet.

ALDBOROUGH, āld'būr'ō, or, colloquially, ā'bro (AS. *ald*, old). An ancient village in the West Riding of Yorkshire, 16 miles west-northwest of York (Map: England, E 2). It is chiefly remarkable for its ancient ruins, as it was the Isurium of the Romans, and after York (*Eboracum*) the most considerable Roman camp north of the Humber. Remains of aqueducts, buildings, tessellated pavements, implements, urns, and coins have been found in great number. Pop., 1901, 439; 1911, 422.

ALDEB'ARAN (Ar. *al-dabarān*, the follower, i.e., of the Pleiades). The name of a brilliant red star of the first magnitude, in the constellation Taurus. It is the largest and most brilliant of a cluster of five which the Greeks called the Hyades and is situated a little to the southeast of the Pleiades. From its position in Taurus it is sometimes termed "the bull's eye." Its parallax, as determined by Elkin at New Haven, is 0".109, corresponding to a distance of 30 light-years.

ALDEGONDE, āl'de-gōnd', PHILIP VAN MARNIX, SAINT. See MARNIX, PHILIP VAN.

ALDEGREVER, āl'de-grā'vēr, HEINRICH (1502—c.1560). A German engraver and painter of the Renaissance, one of the foremost of the "Little Masters." He was born at Paderborn (Westphalia), the son of a burgher, but his real name, Trippenmeker, he discarded in adult life. The character of his art leads to the conclusion that he probably studied at Nuremberg, where he was influenced by the Beham brothers (q.v.) and by Penez (q.v.), not by Dürer, as is commonly supposed. He settled at and became a burgher of Soest, where he practiced his art. He was most distinguished as a line engraver. His earliest plates, like the "Standard Bearer" (1530), designed more directly under the Nuremberg influence, are the best. Of great merit also are the portrait busts of Luther and Melancthon after Crauch, and of the Anabap-

and alcohol. Thus, by the action of strong potassium hydroxide, benzaldehyde (q.v.) gives a mixture of benzoic acid and benzyl alcohol ($C_6H_5CH_2OH$).

ALDEN, ăl'den, BRADFORD R. (1800-70). An American soldier. He was born at Meadville, Pa., and in 1831 graduated at West Point, where he was an instructor from 1833 to 1840. He subsequently served for two years as aid to General Scott, and from 1845 to 1852 was commandant of cadets at West Point. In 1853 he organized and led an expedition against the Rogue River Indians, and in a fierce battle, fought near Jacksonville, Oreg., was so severely wounded that he was soon afterward forced to retire permanently from the army.

ALDEN, CYNTHIA MAY (WESTOVER) (1862—). An American journalist and author, born at Afton, Ind., and educated at the University of Colorado and the Denver Business College. For several years she taught music and held positions as soloist in New York City church choirs. Remaining in New York, she was appointed (1887) an inspector of customs, an office which she distinguished by many important seizures of smuggled goods. She acted as secretary to the Commissioner of Street Cleaning for two years, and for a time was employed in the State Museum of Natural History. This position she resigned to enter journalism, as editor of the woman's department, first, of the *New York Recorder*, and afterward of the *New York Tribune*. During her three years with the *Tribune* she planned and founded the International Sunshine Society, of which she became president-general. Although Mrs. Alden accepted a place on the editorial staff of the *Ladies' Home Journal*, she continued to reside in New York. Her published writings include: *Manhattan, Historic: Artistic; Bushy: Child Life in the Far West; Women's Ways of Earning Money* (1904).

ALDEN, HENRY MILLS (1836—). An American editor and author, born at Mount Tabor (near Danby), Vt. He graduated in 1857 at Williams College, where James A. Garfield and Horace E. Scudder were among his fellow-students and in 1860 at the Andover Theological Seminary. Subsequently he was licensed to preach, but was never settled. From 1863 to 1869 he was managing editor of *Harper's Weekly*, and in the latter year became editor of *Harper's Monthly*. In 1863-64 he lectured before the Lowell Institute, Boston, on "The Structure of Paganism." He is known as a classical student of large acquirements, particularly in connection with Greek literature and thought; and his first literary ventures were two articles contributed to the *Atlantic* on the Eleusinian Mysteries. His long editorial service has been unobtrusive but distinctive. His personality has pervaded *Harper's Magazine*, in which he has aimed, among other things, to recognize the novice and to encourage the best type of Americanism. He collaborated with A. H. Guernsey in the preparation of *Harper's Pictorial History of the Great Rebellion* (1862-65); and has published *The Ancient Lay of Sorrow*, a poem (1872), and two profound metaphysical essays, *God in His World* (1890, published anonymously), *A Study of Death* (1895), both extensively read and enthusiastically received by critics, and *Magazine Writing and the New Literature* (1908). With William Dean Howells he has edited numerous collections of stories by American writers.

ALDEN, Mrs. ISABELLA MACDONALD (1841—).

An American author, writing under the pseudonym of "Pansy." She was born at Rochester, N. Y. In addition to much fiction for older readers, her works include the *Pansy Books*, a series of about 75 juvenile works, a life of Christ, called *The Prince of Peace* (rev. ed., 1908); a novel, *Unto the End* (1902). Among later books are *Her Own Way* (1912); *A Long Way Home* (1912); *A King's Daughter* (1913). She edited the young folks' journal *Pansy* from 1873 until 1896, and was at various times on the editorial staff of the *Christian Endeavor World* and other religious magazines, Japanese as well as American. Her works have been translated into many foreign languages.

ALDEN, JAMES (1810-77). An American naval officer, born in Portland, Me. He entered the navy as midshipman in 1828, was in the Wilkes exploring expedition to the Antarctic (1838-42), in several naval operations of the Mexican War (1848), and from 1848 to 1860 in the coast survey. In the Civil War he commanded first the steamer *South Carolina* and then the sloop-of-war *Richmond*, being present at the capture of New Orleans and the attack on Port Hudson. He was promoted to be captain in 1863 and commanded the sloop *Brooklyn* in Mobile Bay and at Fort Fisher. He became a commodore in 1866, was placed in command of the Mare Island (Cal.) navy yard in 1868, and in 1869 was appointed Chief of the Bureau of Navigation. He was promoted to the rank of rear admiral in 1871 and took command of the European squadron; he was retired in 1873.

ALDEN, JOHN (1599-1687). One of the Pilgrim Fathers. He was born in England. As a cooper, he was engaged in making repairs on the *Mayflower* at Southampton, and sailed in her, signing the compact. He settled at Duxbury, Mass., and married Priscilla Mullens. Their courtship forms the theme of Longfellow's poem, *The Courtship of Miles Standish*. He was a magistrate for more than 50 years and greatly assisted in the government of the infant colony. He outlived all the other signers of the compact.

ALDEN, RAYMOND MACDONALD (1873—). An American scholar and educator, born in New Hartford, N. Y. After studying at Rollins College, Fla., and at the University of Pennsylvania, from which he graduated in 1894, he took post-graduate courses at his alma mater and at Harvard. In 1894-95 he was instructor in English at Columbian (now George Washington) University; in 1896-97 assistant in English at Harvard; and in 1898-99 senior fellow in English at the University of Pennsylvania. Chosen to fill the assistant professorship of English literature and rhetoric at Leland Stanford, Jr., University (1899), he became associate professor in 1909. In 1911 he accepted the chair of English at the University of Illinois. His writings include: *The Rise of Formal Satire in England* (1899); *The Art of Debate* (1900); *On Seeing an Elizabethan Play* (1903); *Consolation: An Ode* (1903); *Knights of the Silver Shield* (1906); *An Introduction to Poetry* (1909); *A Palace Made by Music* (1910). He also edited several plays of Shakespeare and other Elizabethan dramatists and in 1910 an edition of Thoreau's *Walden*. Alden became known as a contributor of articles to educational journals and short stories to magazines. In 1913 he edited an edition of Shakespeare's *Sonnets* and *A Lover's Complaint*.

ALDEN, TIMOTHY (1823-58). An American inventor of a machine for setting and distributing type. He was born at Barnstable, Mass., and was sixth in descent from John Alden, the *Mayflower* Pilgrim. In early life he was a compositor in his brother's printing office, and while thus engaged is said to have declared: "If I live long enough I will invent a machine to do this tiresome work." After the inventor's death the machine was improved by Henry W. Alden.

ALDEN, WILLIAM LIVINGSTON (1837-1908). An American author. He was born in Williamstown, Mass., and was educated at Lafayette and Jefferson colleges. In 1865 he joined the editorial staff of the *New York Times* and at once attracted attention by his humorous writings. During President Cleveland's first administration (1885-89) he was Consul-General of the United States at Rome, and at the expiration of his term was made Chevalier of the Order of the Crown of Italy by King Humbert. In 1893 he settled in London and became literary correspondent of the *New York Times*. Among his publications are: *Domestic Explosives* (1878); *Shooting Stars* (1879); *Moral Pirates* (1881; new ed., 1908); *Life of Christopher Columbus* (1881); *Cruise of the "Ghost"* (1882; new ed., 1909); *Cruise of the Canoe Club* (1883); *A Lost Soul* (1892); *The Mystery of Elias G. Roebuck* (1896); *His Daughter* (1897); *Dewitt's Dream* (1902); *New Robinson Crusoe* (1903); *Cat's Tales* (1905); *Jimmy Brown Trying to Find Europe* (1905).

ALDER, al'dēr (Lat. *alnus*). A genus of plants of the natural family Betulaceæ. (See BIRCH.) The genus consists of trees and shrubs, natives of cold and temperate climates; the flowers in terminal, imbricated catkins, which appear before the leaves in some species, though in other species leaves and flowers appear simultaneously. In *Alnus maritima* the flowers appear in the autumn, and the fruits ripen in the following season. The common or black alder (*Alnus glutinosa* or *vulgaris*) is a native of Great Britain, northern Africa, and of the northern parts of Asia, and escaped from cultivation in America. It has roundish, wedge-shaped, obtuse leaves, lobed at the margin and serrated. The bark, except in very young trees, is nearly black. It succeeds best in moist soils and helps to secure swampy river-banks against the effects of floods. It attains a height of 30 to 60 feet. The wood is of an orange-yellow color. It is not very good for fuel, but affords one of the best kinds of charcoal for the manufacture of gunpowder, upon which account it is often grown as coppice-wood. Great numbers of small alder trees are used in Scotland for making staves for herring barrels. The wood is also particularly valuable on account of its property of remaining for a long time under water without decay, and is therefore used for the piles of bridges, for pumps, sluices, pipes, cogs of mill-wheels, and similar purposes. The bark is used for tanning and for dyeing. It produces a yellow or red color, or, with copperas, a black color. The leaves and female catkins are employed in the same way by the tanners and dyers of some countries. The bark is bitter and astringent. The individual tree, viewed by itself, may be regarded as somewhat stiff and formal in appearance, but in groups or clusters it is ornamental. The northern limit of the common alder is the Swedish shore of the Gulf of Bothnia, in the

south of Angermannland, where it is called the sea alder, because it is only in the lowest grounds, near the sea, that it occurs. The gray or white alder (*Alnus incana*), a native of many parts of continental Europe, especially of the Alps, and also of North America and of Kamtchatka, but not of Great Britain, differs from the common alder in having acute

ALDER LEAF AND CATKINS.

leaves, downy beneath, and not glutinous. It attains a rather greater height, but in very cold climates and unfavorable situations appears as a shrub. It occurs on the Alps at an elevation above that to which the common alder extends, and becomes abundant also where that species disappears in the northern part of the Scandinavian peninsula. The bark is used in dyeing. *Alnus cordifolia* is a large and handsome tree, with cordate acuminate leaves, a native of the South of Italy, but found to be quite hardy in England. Some of the American species are mere shrubs. The bark of the smooth alder (*Alnus rugosa*), found from south New England to Wisconsin, Kentucky, and Florida, is used in dyeing. The green or mountain alder (*Alnus crispa*) ranges from north New England to the shores of Lake Superior, and northward and southward to North Carolina. *Alnus oregona* is a handsome species of the northern Pacific coast region. In the mountain regions of Alaska and elsewhere alders are the first arborescent growth to succeed conifers swept away by avalanches, etc.

Fossil Forms. Leaves of a plant doubtfully allied to the alder have been described from the Cretaceous rocks of Greenland and North America under the name *Alnophyllum*, while true alders attained a considerable degree of develop-

ment in Tertiary times throughout the northern parts of Europe, Asia, and Africa.

ALDER FLY. An insect of the family Sialidæ. See CORYDALIS.

ALDERMAN, ʔdër-mən. The designation used in the United States for the representative of the citizens of a district or ward in a city or large town, whose duty it is to attend the local legislature and enact municipal regulations. The title originally derived from the Anglo-Saxon *ealdorman*, compounded of *ealdor*, 'older,' and *man*, and applied to persons of high and hereditary distinction, such as princes, earls, and governors. Whether any definite and invariable functions were connected with the ancient rank of *ealdorman* does not seem to be very clearly ascertained. There were also aldermen of counties, hundreds, cities, boroughs, and castles. At present in England, Wales, and Ireland, aldermen are officers invested with certain powers in the municipal corporations, either as civil magistrates, or as deputies of the chief civil magistrates in cities and towns corporate. The corresponding title in Scotland is bailie. In the majority of American cities aldermen form a legislative body, having limited judicial powers in matters of internal police regulation, etc., though in many cities they hold separate courts and have magisterial powers to a considerable extent. (See sections on *Local Government* in the articles on the important countries and articles on American cities.)

ALDERMAN, EDWIN ANDERSON (1861—). An American educator, born at Wilmington, N. C., and educated at the university of that State. He was professor of English in the North Carolina State Normal College in 1892; professor of pedagogy at his alma mater in 1892-96, and president of that institution in 1896-99. In June, 1904, after four years as president of Tulane University, he became president of the University of Virginia. He also served as district director of the Southern Education Board and as editor-in-chief of *The Library of Southern Literature*. His writings include several biographical and historical works.

ALDERMAN LIZ'ARD. The name, in California, of the obese Chuckwalla (q.v.).

ALDERNEY, ʔdër-nī (Fr. *Aurigny*, the *Riduna* of Antoninus). One of the Channel Islands (q.v.), separated from Cape La Hague, France, by a perilous channel, 7 miles wide, called the Race of Alderney. It is 4½ miles long, with an extreme breadth of 1½ miles and an area of 3 square miles (1962 acres) (Map: France, N., D 2). The southeast coast is lofty and bold; it slopes to the northeast and north, forming small bays. It is strongly fortified, and at Braye there is an extensive granite breakwater, built at an enormous expense by the British government in order to form a naval station and harbor of refuge, but the project was a failure. The dangerous Casket rocks, surmounted by three splendid lighthouses, lie 6 miles southwest. St. Anne, in the centre of the island, is the chief town. Alderney is included in the bailiwick and governorship of Guernsey, but has minor legislative and judicial administrations locally elected. Agriculture and grazing are the only industries. The island is known for a distinctive breed of cows. Pop., 1891, 1857; 1901, 2062; 1911, 2561.

ALDERNEY CATTLE. See CATTLE.

ALDERSGATE, ʔdërz-gät. In the old city wall of London, the gate which stood at the

present junction of Aldersgate Street and St. Martin's-le-Grand. It was between Cripplegate and Newgate. It was rebuilt in 1616, with figures of King James I and of the prophets Jeremiah and Samuel.

ALDERSHOT, ʔdër-shöt (for *Aldersholt*; *holt*, a wood, Ger. *Holz*, wood). A town in Hampshire, England, 14½ miles east of Basingstoke (Map: England, F 5). Its importance arises from the vicinity of the permanent military camp, established here in 1854-55, which accommodates upward of 20,000 troops. An equestrian statue of the Duke of Wellington stands on an eminence called "Cæsar's Camp," which commands a fine view of the manœuvring ground. Aldershot is a busy junction of the London and Southwestern Railway, with two depots, and has all the elements of a thriving town. Pop., 1891, 25,595; 1901, 30,974; 1911, 35,175.

ALDERSHOT CAMP. A permanent camp of the British army, situated about 35 miles southwest of London, England, and used during the spring and summer for army manœuvres on a larger scale than is possible elsewhere in the kingdom. Up to the Boer War of 1899, the Aldershot garrison consisted of troops available for service with the first army corps. It is also used by volunteers and militia during their annual training and is the headquarters for various military instruction.

ALDGATE, ʔld'gät'. The eastern gate in the old city wall of London, near the present junction of Houndsditch, Aldgate High Street, and the Minories. Its date and the origin of the name have been much disputed. The gate probably dated from the late Saxon or early Norman period, and the name, spelled *Alegate* in a document earlier than 1115, seems to mean the 'gate free to all.'

ALDHELM, äld'hëlm (c.640-709). An ecclesiastic, possibly a son of the King of the West Saxons. He was educated at Canterbury, became abbot of Malmesbury about 676, and Bishop of Sherborne in 705, but continued to act as abbot of his monasteries. He was a famous scholar. His works are found in *Migne, Patrologia Latina*, vol. lxxix.

ALDIE, ʔld'i. A village of Loudoun Co., Va., about 35 miles west of Washington, D. C. Here, on June 17, 1863, a force of Federal cavalry under Pleasonton defeated a force of Confederate cavalry under Stuart.

ALDIN, CECIL CHARLES WINDSOR (1870—). An English artist and illustrator, born at Slough and educated at Eastbourne College and Solihull Grammar School. He studied anatomy at South Kensington and animal painting under F. W. Calderon. Within three years after his first drawing was published in the *Graphic* (1891) he was commissioned to illustrate Kipling's *Jungle Stories* for the *Pall Mall Budget*. In 1899-1900 he painted a series of sporting prints in vivid colors, known as "The Fallowfield Hunt," which became so popular as to be reproduced by thousands in England and the United States. Aldin made many drawings for the English illustrated weeklies and for important books, becoming one of the best-known men of the day in his profession. He published, in 1913, *Painting Book: The Farm Yard; Jock and Some Others* (with R. Waylett).

ALDINE (äld'in or ʔld'in) **EDITIONS.** A name given to the books printed by Aldus Manutius and his family, at Venice (1490-1597),

prized for their scholarly correctness, beautiful typography, and tasteful manufacture, and, subsequently, for their rarity. They include editions of Greek, Latin, and Italian writers, in many cases the earliest printed. The first Aldus was an innovator. He first used italic type (1501) and introduced fine paper or parchment editions (1499). He was an artist in the designing of type, having 9 varieties of Greek and 14 of Roman letters. The establishment remained for more than a century in the family, and produced 908 works, which bear its imprint of an anchor with twisted dolphin, often with the Latin motto, *Sudavit et Alsit*. As the editions gained in reputation, they were often counterfeited by printers in Lyons and Florence. The most precious are those of the first 12 years, especially *The Hours of the Blessed Virgin* (1497) and the *Vergil* (1501). See MANUTIUS.

ALDINI, ăl-dē'nē, ANTONIO (1756-1826). An Italian statesman, born in Bologna. He studied law in Rome and became professor of that subject and a practicing barrister there. After the separation of Bologna from the Papal States, he went to Paris and upon his return became president of the Council of Ancients of the Cisalpine Republic. He was dismissed from this position in 1798 because of his opposition to the measures of Napoleon, who, however, in 1801, made him president of the Council of State of the Italian Republic. Of this position he was deprived by Melzi. When the Kingdom of Italy was formed in 1805, Aldini was made a Count, and Secretary of the Interior, in which capacity he drew up the decree dissolving the Papal States. After 1815 he lived in retirement at Milan.

ALDINI, GIOVANNI (1762-1834). A nephew of the famous Galvani and brother of Count Antonio Aldini; a student of natural science. He held the chair of physics at Bologna in 1798, was a founder of the National Institute of Italy, received the British Royal Society's gold medal, and was made Knight of the Iron Crown and Councilor of State at Milan by the Emperor of Austria. He spent much of his fortune in organizing a school of science for workingmen at Bologna. He carried on investigations in applied science and worked out methods of applying galvanism to various useful purposes in medicine and in the industrial arts.

ALDOBRANDINI, ăl'dō-brān-dē'nē. A noble family of Florence, raised to the princely dignity by Pope Clement VIII.—**SALVESTRO ALDOBRANDINI** (1499-1588). A famous teacher of law at Pisa. He led a successful revolt against the Medici in Florence, defended the city against the imperial army of Charles V, and upon its capture was condemned to death, but the intervention of a powerful friend of the Medici caused the change of his sentence to that of banishment in 1530. He went to Rome, Naples, and Bologna, where, in 1538, he became Papal Vice-Legate and Vice-Regent. Realizing the futility of a return to Florence, he went to Ferrara, whence he was called to Rome as fiscal advocate of Pope Paul III.—**IPPOLITO ALDOBRANDINI** (1536-1605). A son of the preceding. He became Pope, with the title of Clement VIII (q.v.)—**PIETRO ALDOBRANDINI** (1571-1621). Cardinal; a nephew of Pope Clement VIII. He continued the policy of Clement and zealously promoted the development of the sciences. The great sums of money which he had accumulated he sought to secure by the purchase of Sulmona,

Bari, and Bisignano. He became Archbishop of Ravenna under Pope Paul V. When the Roman branch of the family became extinct (1681), a dispute as to inheritance and succession arose between the Borghese and the Pamfili branches, and the princely title, as well as the greater part of the fortune, passed to the Borghese branch.

ALDOBRANDINI MARRIAGE, THE. A famous mural painting, since 1818 in the Vatican Library. It was found in 1606 at Rome and was named after its original modern owner, Cardinal Aldobrandini. It is probably of the time of Augustus. The picture contains 10 figures, arrayed in two groups. In the centre of the bridal chamber sits the bride. On the same couch is the *pronuba*, the bride's attendant (a married woman, a Roman practice); close by is a slave woman ready to assist the bride. In the other group, on the left, in a separate chamber, are three women, preparing a bath; on the right, directly before the bridal couch, is the waiting husband. Three women, finally, are busy with a sacrifice and with the bridal song. The picture illustrates Roman bridal ceremonies and is itself illuminated by such a poem as Catullus, lxi; indeed, it has been thought that the picture was intended to illustrate the marriage there described. Others think it a portrayal of the marriage of Peleus and Thetis, others of that of Paris and Helen, and still others simply an ideal picture. It presents the appearance of a frieze, 8 feet long by 4 feet high.

ALDO MANUZIO, ăl'dō mā-nōō'tsē-ō. See MANUTIUS.

ALDRED, ăl'drēd, or **EALDRED** (?-1069). A noted English ecclesiastic. He became Abbot of Tavistock about 1027 and Bishop of Worcester, 1044. He made a pilgrimage to Jerusalem in 1058; was elected Archbishop of York in 1060, and died Sept. 11, 1069. He was very influential under Edward the Confessor, by whom he was employed on embassies. He submitted to and crowned William the Conqueror. He was capable and honest, instituting many reforms, and spending his wealth freely in the service of the Church.

ALDRICH, ăl'drīch or ăl'drīj, ANNE REEVE (1866-92). An American poet and novelist, whose few works gave promise of a brilliant future. She was born at New York, April 25, 1866, and died there June 22, 1892. Her first work, *The Rose of Flame* (1889), was followed by *The Feet of Love*, a novel, in 1890. *Songs about Life, Love, and Death* appeared posthumously in 1892. The general characteristic of her works is intense, passionate, and erotic.

ALDRICH, CHESTER HARDY (1862—). An American public official, Governor of Nebraska, 1911-13. He was born in Pierpont, Ohio, and graduated from Ohio State University in 1888. Admitted to the bar in 1891, he practiced in David City, Neb., for a number of years. His interest in politics led to his election in 1907 to the State Senate and in 1910 to a successful campaign as Republican candidate for governor. For reelection in 1912 he was defeated by J. T. Morehead, Democrat. Governor Aldrich took an active part in the attempt to nominate Theodore Roosevelt for the presidency in 1912, and was one of the seven governors who signed a letter urging the latter to become a candidate.

ALDRICH, HENRY (1647-1710). An English theologian, musician, and architect, dean of Christchurch College, Oxford, from 1689. He

wrote a treatise on logic, *Artis Logicæ Compendium* (1691), which, with notes by Dean Mansel, was used as a text-book at Oxford for more than a century. He designed several of the buildings at Oxford, but is best known for his musical attainments. He wrote on the history of music, and composed services, anthems, and catches. His extensive musical library, second only to that of the British Museum, he left to Christ Church.

ALDRICH, JOHN MERTON (1866—). An American entomologist, born in Olmsted Co., Minn., and graduated from the South Dakota Agricultural College in 1888. Post-graduate studies in entomology he took at the University of Minnesota, the Michigan Agricultural College, the University of Kansas, and, previous to receiving a Ph.D. degree in 1906, at Leland Stanford, Jr., University. He was professor of zoölogy at the University of Idaho and entomologist at the experiment station there maintained from 1893 to 1905, when he was tendered the chair of biology. In 1911 he began special studies of the insects of the western salt and alkaline lakes. His published writings include *Catalogue of North American Diptera* and numerous entomological papers. He was made a member of the executive committee of the Entomological Society of America.

ALDRICH, NELSON WILMARTH (1841–1915). An American politician, born at Foster, R. I. In 1875–76 he was a member of the Rhode Island House of Representatives, and in the latter year its Speaker. He was elected to Congress in 1878 and 1880. In 1881 he resigned to take a seat in the Senate, in which he served continuously for 30 years. In his last 10 years in the Senate he held a position of undisputed leadership, chiefly in consequence of his thorough mastery of the details of parliamentary organization and through his skill in effecting combinations of the representatives of various interests. His policies were ultra-conservative, and his voluntary retirement in 1911 was due largely to the impracticability of checking longer the development of progressive tendencies in his party. Aside from his work in perfecting the senatorial methods of transacting legislative business, Aldrich figures in legislative history chiefly in connection with tariff and currency legislation. The Payne-Aldrich Tariff Act of 1909 was largely shaped by Aldrich and forced through Congress under pressure exerted by him. He was largely responsible for the Aldrich-Vreeland Currency Law, enacted in 1908, and as Chairman of the National Monetary Commission, created by the same act, directed a broad investigation of the banking and currency systems of the United States and of foreign countries, with a view to securing information upon which to base a comprehensive scheme for the reform of the American banking system. In 1911 Aldrich made public a tentative scheme, designed to increase the effectiveness of reserves through their control by reserve associations. (See BANK; BANKING.) The Aldrich plan, though approved in its essential features by most monetary specialists, was received with suspicion by the public, which had come to associate the name of Aldrich with the highly protected interests, the "trusts," and Wall Street. Mr. Aldrich's very considerable financial interests, founded originally upon wholesale trade and later extended to manufactures and speculative finance, and his connections with John D. Rockefeller, Jr., his son-in-

law, explain sufficiently the popular belief that his legislative services were at the command of the large interests. A just view would appear to be that, both in his defense of high protection and in his currency projects, Mr. Aldrich was actuated by a desire to further the material interests of the country as a whole; but that his interpretation of the interests and needs of the country is of a character that prevailed among practical politicians in the last quarter of the nineteenth century rather than that which is generally acceptable in the first quarter of the twentieth century.

ALDRICH, RICHARD (1863—). An American writer on music. He was born in Providence, R. I. While pursuing the regular academic course at Harvard University, he also took the course in music under Prof. J. K. Paine. From 1885 to 1889 he was the musical and dramatic critic of the *Providence Journal*. He has been the musical critic of the *New York Times* since 1902. He translated Lilli Lehmann's *Meine Gesangskunst* (1902) and wrote *A Guide to Parsifal* (1904) and *A Guide to the Nibelungen Ring* (1906).

ALDRICH, THOMAS BAILEY (1836–1907). An American poet, novelist, traveler, and editor. He was born at Portsmouth, N. H., Nov. 11, 1836. After a boyhood spent in New England and Louisiana, he entered a counting-house in New York in 1854. He was employed as "reader" in a publishing house in 1857, and he served successively on the staffs of the *New York Evening Mirror*, the *Home Journal*, and the *Saturday Press*. In 1866 he removed to Boston, where he was editor of *Every Saturday* until 1874. He then became a regular staff contributor to the *Atlantic Monthly*, and on the retirement of W. D. Howells, in 1881, succeeded to the editorship, which he held until 1890. Afterward he devoted himself to literary work and travel. Aldrich is best known as a poet. He has, not very aptly, been called "the American Herrick," owing to the fact that his verse is graceful, light, and melodious, carefully wrought, restrained, and reminiscent of places that he has visited. His chief publications of verse, besides the collective editions, are: *The Bells* (1855); *The Ballad of Babie Bell* (1856); *Pampinea, and Other Poems* (1861); *Cloth of Gold, and Other Poems* (1874); *Flower and Thorn* (1876); *Friar Jerome's Beautiful Book* (1881); *Mercedes, and Later Lyrics* (1883); *Wyndham Towers* (1889); *Unguarded Gates, and Other Poems* (1895). Like his poetry, Aldrich's prose is delicate and finished in style. His best-known piece of fiction is probably *Marjorie Daw* (1873); and his *Story of a Bad Boy* (1870) is also very popular. Other novels are: *Out of his Head, a Romance* (1862); *Prudence Palfrey* (1874); *The Queen of Sheba* (1877); *The Stillwater Tragedy* (1880); and *Two Bites at a Cherry* (1893), a volume of short stories. His volumes of travel and reminiscence are *From Ponkapog to Pesth* (1883) and *An Old Town by the Sea* (1893). In 1905 he published, in blank verse, a tragedy, *Judith of Bethulia*, which was played by Miss Nance O'Neill. His biography, written by Ferris Greenslet (1908), is a fine appreciation of both Aldrich and his writings.

ALDRICH, WILLIAM SLEEPER (1863—). An American scientist and educator, born in Philadelphia, Pa. He graduated from the United States Naval Academy in 1883 and a year later received the degree of M.E. from the Stevens

Institute of Technology. After several years of teaching in high schools he was successively instructor in drawing (1889-91) and associate in mechanical engineering (1891-92) at Johns Hopkins University; professor of mechanical engineering and director of mechanical arts at West Virginia University (1893-99); and professor and head of the department of electrical engineering at the University of Illinois (1899-1901). For the 10 following years he held the position of director of the Thomas S. Clarkson School of Technology. During the Spanish-American War Aldrich saw service with Admiral Sampson's fleet in Cuban waters. He became a member of numerous scientific societies. His published writings include *Notes on Building Construction and Architecture*, with W. H. Browne, Jr., and *Manual for Electrical Engineering Laboratory*, with same (1900).

ALDRIDGE, ă'đrĭj, IRA FREDERICK (c.1810-67), "The African Roscius." There are conflicting accounts of his early life. One is that he was a mulatto, born at Bel Air, Md., about 1810, was apprenticed to a German ship carpenter, accompanied Edmund Kean to England as a servant, returned in 1830 or 1831, and appeared on the stage in Baltimore without success; after which he went back to England and gained a high reputation. Another story is that he was the son of a native of Senegal, who was brought here as a slave, became a Christian, and pastor of Greene Street Chapel (African) in New York; that Ira was born in that city in 1807, and was sent to Glasgow University to be educated for the ministry. Preferring the drama, however, he made his *début* at the Royalty Theatre, London, as Othello, and became remarkably popular. He played also Aaron, in *Titus Andronicus* (1852), and Zanga, Orozembo, Rolla, and other characters for which his color was suited, throughout England. At Belfast he played Othello to the Iago of Edmund Kean, who greatly admired him. In 1852 he appeared in Brussels and thereafter on the Continent took high rank in tragedy. He received crosses and medals from the emperors of Austria and Russia and the King of Prussia and was honored with membership in several of the great academies. He married an Englishwoman.

ALDRINGER, ălt'rĭng-ĕr, also ALTRINGER, or ALDRINGEN, JOHANN, COUNT (1588-1634). A general in the imperial German army during the Thirty Years' War. He was born at Diedenhofen and studied at the University of Paris. As a reward for his defense of the Elbe Bridge at Dessau, April, 1626, against Mansfield, he was created a Count in 1628. He was in high favor with Wallenstein and after the conclusion of peace with Denmark was appointed major-general. In this capacity he served with distinction under Collalto at the siege of Mantua. On his return to Germany, in 1631, he coöperated with Tilly and, upon the death of that commander (1632), became his successor. As field-marshal, he afterward conducted a successful campaign in Franconia, Bavaria, and Swabia against the Swedes. Eventually influenced by the Court party against Wallenstein, he defended the imperial cause, although he adroitly evaded the order to take Pilsen. After Wallenstein's death, he fought against the Swedes on the Danube, where soon afterward he met his death in the defense of Landshut. Consult Ernst Brohm, *Johann von Aldringen* (1882), Hermann Hallwich, *Johann von Aldringen*

(Leipzig, 1885), and J. Krebo, *Zur Beurteilung Holks und Aldringens. Historische Vierteljahrsschrift*, vol. iii (Leipzig, 1900).

ALDROVANDI, ăl'drô-văn'dê, ULISSE (1522-1605). An Italian naturalist. He was of noble birth. He became, in 1554, a professor of philosophy and logic, and in 1560 lectured on botany in the University of Bologna. He also practiced medicine and succeeded, after violent popular opposition, in establishing an inspectorship of drugs and pharmacies. The Pope confirmed him in the office. Afterward he became professor of natural history, established the Botanical Garden of Bologna in 1567, and was employed for many years in forming a collection of specimens as a basis for an encyclopædic work on animal life. To this end he traveled extensively and enlisted the aid of Gesner and others. In this work, and in the preparation of drawings, he expended the greater part of his fortune. He ceased teaching in 1600 and devoted himself to the publication of his great work, issuing four volumes in Latin on ornithology (1559-1603) and one on mollusks. He bequeathed his collections and manuscripts to the Senate of Bologna; the collections became the nucleus of the great museum of that city, and the manuscripts remained in the university library. Ten other volumes, more or less prepared by him, were rapidly brought out by his colleagues and pupils; but many manuscripts and drawings remain unpublished. He did a great service in stimulating scientific study and collected an enormous number of facts and specimens; but his writings were prolix and not discriminative. Nevertheless, some volumes, as those on birds, rapidly ran through several editions, and the entire series was epitomized by Johnstone. Consult his biography by G. Fantuzzi (Bologna, 1774).

ALDUS, ăl'dŭs. See MANUTIUS, ALDUS.

ALE. See BEER; BREWING.

ALEANDER, ăl'ĕ-ăn-dĕr, HIERONYMUS (1480-1542). An Italian humanist and Papal Legate. He was born at Motta, near Treviso, and after a short course in medicine devoted himself to the study of theology and languages. He entered the service of the Bishop of Liège, Eberhard of the Mark, in 1514, and in 1519 he went as Papal Legate to Germany, to combat the Lutheran movement. He inspired the famous edict of Charles V against the reformer (May 26, 1521), a document antedated May 8, 1521, and probably emanating from the pen of Aleander. In 1525 he was captured in the battle of Pavia, but was ransomed from the Spaniards for 500 ducats. As Legate to Germany in 1532, he unsuccessfully endeavored to frustrate the Peace of Nuremberg. In 1536 Pope Paul III appointed him a member of the reform commission under Contarini (q.v.), and two years afterward he was created Cardinal and was again sent to Germany; but his mission proved unproductive of results. His letters and reports are valuable historical documents, and his celebrated writing, *De Concilio Habendo*, is said to have been consulted at the Council of Trent. For his biography down to 1529, consult J. Paquier (Paris, 1900); also in general, Brieger, *Aleander und Luther 1521* (Gotha, 1884); Kelkoff, *Die Depeschen Aleanders vom Reichstag zu Worms* (Halle, 1886).

ALEARDI, ăl'ă-ăr'dĕ, ALEARDO (1812-78). An Italian patriot and poet, formerly hailed as a rival of Prati. He was born at Verona, studied law at Padua, and was active in the outbreak of

1848. He was sent by the short-lived Venetian Republic to represent its interests at Paris. After the Republic's downfall, his connection with later conspiracies caused his imprisonment at Mantua, 1852, and at Verona and Josefstadt in 1859. Here he remained until liberated by the Peace of Villafranca. He subsequently became professor of æsthetics at Florence, Deputy in the Italian Parliament, and finally Senator. He died at Verona, which has perpetuated his memory by a monument and by a bridge named in his honor. Aleardi's poems will live on account of their artistic finish and their delicate appreciation of nature, but they are marred by a prevailing lack of force and are overburdened with imagery. The best include *Il monte Circello*, *Un' ora della mia giovinezza*, and *I sette soldati*, which was dedicated to Garibaldi, and *Le Città Italiane Marinare e Commerciantie*, considered by many his finest poem, and recounting the rise, flourishing, and fall of the maritime and commercial cities of Italy: Venice, Florence, Pisa, and Genoa. An edition of his collected poems appeared at Florence (1862), and a fifth edition with additional material appeared in the same city in August, 1878, shortly after his death. His *Epistolario* was published, with an introduction by G. Trezza, in Verona, 1879. Consult Augusto Bazzoni, *Aleardo Aleardi*, Turin, 1863, for a brief sketch of the man and his work.

ALECSANDRI, ä'lëk-sän'drë, or **ALEXANDRI**, VASILIO, or BASIL (1821-90). A Rumanian patriot and poet. He was born in northern Moldavia, studied at Paris from 1834 to 1839, took part in the revolutionary movement of 1848 in Rumania, and was obliged to seek refuge in Paris. In 1859 and 1860 he was Minister for Foreign Affairs, was elected to the upper chamber in 1879, and in 1885 was appointed Minister at Paris. He was always active in seeking the freedom and unity of Rumania. He collected *Poesii populare ale Românilor* (1853), and wrote *Les doines* (1853) and *Doine si lacrimioare* (1863), two volumes of verse, and the dramas *Despot Voda* ('Prince Despot,' 1880); *Fîntîna Blandusiei* (1884), and *Ovidiu* ('Ovid,' 1885). His *Opere* appeared in seven volumes in 1873-76.

ALEC'TO (Gk. Ἀληκτώ, *Alëktō*, from *à*, *a*, priv. + *λήγειν*, *lëgein*, to stop, to cease, The Tireless). The name of one of the three Eumenides (q.v.).

ALEC'TROMAN'CY. See SUPERSTITION.

ALEDO, ä-lë'dō. A city and the county-seat of Mercer Co., Ill., 35 miles southwest of Rock Island, on the Rock Island Southern and the Chicago, Burlington, and Quincy railroads (Map: Illinois, B 2). It contains the William and Vashti College, owned and operated by the county, Drury Academy, and a State agricultural experiment station. The city is in a rich farming region and manufactures brick and tile. Pop., 1890, 1601; 1900, 2081; 1910, 2051; 1913 (est.), 2650.

ALEE'. See HELM.

ALEGRIA, ä-lä'grë-ä. A town on the west coast of Cebú, Philippines, on the strait of Tanon, 55 miles southwest of the town of Cebú. Pop., 1903, 9579.

ALEMAN, ä'lä-män', MATEO (1547-1615?). A famous Spanish novelist, born at Seville in September, 1547. Little is known of his life except that he took his bachelor's degree at Seville in 1565, was appointed to the royal treas-

ury in 1571 or 1572—a position which he resigned after 20 years, as poor as when he assumed it—and emigrated to America in 1608 and probably died in Mexico (where he seems to have been established as a printer by 1609) some time after 1615. His writings include a poetical biography of St. Anthony of Padua (1604) and an *Ortografia castellana* (Mexico, 1609). In 1613 he published the *Sucesos de D. Frai Garcia Gera, arzobispo de Mejico*, and the *Oracion funebre* for the said archbishop. His great work, however, is *Guzman de Alfarache* (1599, second part probably in 1604), a novel with a rogue for the hero, which revives the picaresque tradition of Mendoza's *Lazarillo de Tormes*. *Guzman* at once became exceedingly popular, and within six years had run through 26 editions, aggregating upward of 50,000 copies, besides being translated into French and Italian. In 1623 James Mabbe published the first English version, of which Ben Jonson wrote: "This Spanish Proteus, though writ but in one tongue, was formed with the world's wit." Both in the delineation of manners and in the purity of style, *Guzman* ranks next to *Lazarillo*, which is recognized as the enduring type of the comic prose epic. While lacking the originality, conciseness, and caustic humor of the unknown author of *Lazarillo*, Aleman shows keen powers of observation and a wide knowledge of human nature; and in *Guzman* he has given the world a most diverting study of blackguardism, his hero showing all the resources of a consummate rascal in the various characters of stable boy, beggar, thief, coxcomb, mercenary, valet, and merchant. The book, however, is marred by the moral reflections of the author, which obtrude themselves with somewhat wearisome persistence. The most available editions of *Guzman* are: Aribau's in the *Biblioteca de autores españoles*, vol. iii (Madrid, 1846); Cejador's in the *Biblioteca Renacimiento* (Madrid, 1913). For a critically annotated edition of the *Sucesos*, see A. H. Bushee, "Les Sucesos de Mateo Alemán" (*Revue Hispanique*, xxv, New York, 1911); *Bibliotheca Romanica*, vols. 183-187; *Biblioteca Espanola*; Mateo Aleman, *Guzman de Alfarache*, Primera Parte (Strassburg). Consult: Chandler, *Romances of roguery* (New York, 1899); De Haan, *The Novela Picaresca* (Baltimore, 1900); *Discursos leidos ante la Real Academia Espanola por los excmos senores D. Francisco Rodriguez Marin y D. Marcellino Menendez y Pelayo, en la recepcion publica del primero* (Sevilla, 1907; the first of these discourses is devoted to Aleman).

AL'EMAN'NI, more correctly spelled **ALAMANNI**. The name of a military confederacy of several German tribes which began to appear on the lower and the middle Main about the beginning of the third century. Caracalla fought with them first on the Main in 211 A.D., but without conquering them; Alexander Severus (q.v.), after his war in the East, marched against them, but was slain by his soldiers in a mutiny. Maximinus (q.v.), successor of Severus, finally drove them beyond the Rhine. After his death they again invaded Gaul, and even threatened Italy, but were defeated by Postumus who pursued them into Germany and fortified the boundary of the Roman territory called the Agri Decumates. The mounds near Pforung, on the Danube, the rampart extending through the principality of Hohenlohe to Jaxthausen, and the ditch with palisades on the north side of the Main, are remains of these

fortifications. The Alemanni, however, did not desist from their incursions, although repeatedly driven back. After 282, being pressed upon from the northeast by the Burgundians, they made permanent settlements within the Roman boundary from Mainz to Lake Constance. Constantius twice defeated them as they were raiding Gaul. Julian, too, came (357) to the relief of Gaul, which had been again suffering from the incursions of the Alemanni, and soon compelled eight chiefs to sue for peace. Their united force, in their principal battle with Julian, amounted to 35,000 men. After the fifth century the confederated nation is spoken of as Alemanni and Suavi or Suevi. During the fourth century they had crossed the Rhine, and extended as far west as the Vosges and south to the Helvetian Alps. At length Clovis broke their power in 496 and made them subject to the Frankish dominion. The southern part of their territory was formed into a duchy, called Alemannia (q.v.). The name of Swabia was later applied to the part of the duchy lying east of the Rhine. From the Alemanni the French have given the name of Allemands and Allemagne to Germans and Germany in general, though the inhabitants of the north of Switzerland, with those of Alsace and part of Swabia, are the proper descendants of the Alemanni. See ALMAIN. Consult *The Cambridge Mediæval History*, vol. i (New York, 1911).

AL'EMAN'NIA, or **AL'AMAN'NIA**. The country of the Alemanni (q.v.). The region included part of the later Switzerland and Tyrol. In the tenth and eleventh centuries Alemannia, or Swabia (q.v.), was one of the four great duchies of the German kingdom.

ALEMBERT, ä'län'bâr', JEAN LE ROND D'. See D'ALEMBERT.

ALEM'BIC (formed by the Arabs from their article *al* and Gk. ἀμβίξ, *ambix*, a goblet). A form of still introduced by the alchemists, who

ALEMBIC.

used it in manipulative chemistry for distillation and sublimation.

ALEMTEJO, ä'län-tä'zhü (literally, in Portuguese, 'beyond the Tagus'). A province in the south of Portugal, bounded by the province of Beira on the north, Spain on the east, Algarve on the south, Estremadura and the Atlantic Ocean on the west (Map: Portugal, B 3). Area, 9431 square miles. Alemtejo, although the largest, is the most sparsely populated province of Portugal. The eastern and southern parts are covered with low, detached mountains, rising to nearly 2000 feet on the southern frontier. These are generally well wooded, oaks and chestnuts predominating. The chief rivers are the

Guadiana, Tagus, and Sado. The climate is hot, and swamps, especially those along the coast, render it unhealthy. Fertile plains are found in the northeast, where wheat, barley, corn, rice, and fruit are grown in considerable quantities. The rearing of domestic animals, horses especially, is an important occupation. Manufacturing industries and commerce have been neglected, but some fine olive oil is produced. There are iron mines and quarries, but the mineral wealth of the province has been little developed. Administratively, Alemtejo is divided into the three districts of Portalegre, Evora, and Beja. Pop., 1890, 388,813; 1900, 416,105; 1910, 478,584.

ALENCAR, ä'län-kär', JOSÉ MARTINIANO D' (1829-77). A Brazilian jurist and novelist, born at Fortabza. He studied law at São Paulo and became a brilliant advocate. In 1868 he was elected deputy for Ceará as a Conservative and in 1868-69 was Minister of Justice. His works, chiefly fiction, most of the material for which is drawn from Indian legend, include *O Guarany*, *Iracema*, *O Gaucho*, and *Urabijara*.

ALENÇON, *Fr. pron.* ä'län'sôn'; *Eng. pron.* ä-lën'sön. The capital of the department of Orne, in Normandy, France, situated on the Sarthe (Map: France, N., F 4). The surrounding region is fertile, and the town is one of the brightest and freshest looking in France. It is the seat of a bishop, and the cathedral is its principal building. Three battlemented towers, the only portion of the old castle which remains, are used as the Hôtel de Ville. The town church—a structure of the sixteenth century, containing the remains of the tombs of the Alençon family, few members of which survived the Revolution—is built in the Gothic style. The inhabitants produce excellent woolen and linen stuffs, embroidered fabrics, and straw hats, and manufacture leather and vehicles. The manufacture of point d'Alençon lace and of Alençon diamonds is no longer important. Pop., 1901, 17,270; 1906, 17,843; 1911, 17,378. Consult Odolant-Desnas, *Mémoires historiques sur la ville d'Alençon* (Alençon, 1787).

ALENÇON, FERDINAND PHILIPPE MARIE, DUC D' (1844-1910). A French nobleman, born at Neuilly, the second son of Louis, Duc de Nemours, and the grandson of Louis Philippe, King of France. He was fourth in order of succession to the French throne, being second cousin to the Duc d'Orléans, the French Pretender. In 1868 he married Sophie, Herzogin zu Bagern, who died in 1897, leaving him two daughters and a son. The greater portion of his later years was spent at his villa at Wimbledon, England.

ALEP'PO (Ar. *Haleb*). One of the most important cities of Syria, and capital of the Turkish vilayet of Aleppo (33,436 square miles; pop., 995,800) (Map: Turkey in Asia, G 4). It is about 80 miles east of the Mediterranean Sea, on both banks of the Kuwek, in about 36° 12' N. lat., and 37° 12' E. long. It is surrounded by hills and has regular and clean streets. In the northwestern part stands the citadel, situated on a hill and surrounded by a deep moat. The town was formerly surrounded by a strong wall, of which only a small portion is left, the remainder, together with many of the public buildings, having been destroyed by the earthquake of 1822. The bazaar is extensive and well built. The European colony of Aleppo is considerable, and there are several European

schools and Christian churches. Among the mosques the most noteworthy is the Great Mosque, or *Jami Sakarya*, containing the alleged remains of Zacharias, the father of John the Baptist. Before the earthquake of 1822, and repeated visitations of the plague and cholera, Aleppo was a great commercial centre in spite of its inland position. It supplied a large part of the Orient with various fabrics of wool, cotton, silk, and silver and gold ware. The trade is still considerable, and its chief exports are wool, cotton, grain, gums, saffron, sesame, and hides. Some silk embroidery, carpets, and leather goods are manufactured. The chief port of Aleppo is Alexandretta (q.v.). The importation of European goods by native merchants has increased rapidly. Aleppo is the seat of a United States consul and several European consuls. The population is estimated at about 200,000, of whom probably more than three-fourths are Moslem. Aleppo is believed to be of great antiquity. In ancient times its name was Berœa, given to it by Seleucus Nicator. It was attacked and taken repeatedly by the Saracens and Mongols, and suffered considerably from earthquakes during the twelfth century. In 1516 Aleppo was wrested from the Mamelukes by the Turkish Sultan Selim, and it became the capital of a pashalic. The city is supposed to have contained in those times about 300,000 inhabitants and carried on a large trade by caravans, which subsequently fell off on account of the discovery of the sea route to the East Indies. In 1850 there was an uprising of Christians, suppressed only after considerable bloodshed. Massacres of Christians occurred in 1862. Consult E. Blochet, "L'histoire d'Alep," in the *Revue de l'Orient Latin* (Paris, 1897).

ALEPPO BUT'TON. See BOIL.

ALER, ä'lër, PAUL (1656-1727). A Jesuit and scholastic, born at St. Veit, Luxemburg. After teaching at Cologne, he became professor of theology at Trèves, and in 1703 regent of the gymnasium of Cologne. In 1713 he became regent of the gymnasia at Aix-la-Chapelle, Münster, Trèves, and Jülich. His best-known work is the *Gradus ad Parnassum* (1702; 8th ed., 1879). He wrote 11 tragedies, some in Latin and some in German, and other works on philosophy, philology, and poetry.

ALES, ä-lës', or **ALESSE,** ALEXANDER. See ALESIIUS, ALEXANDER.

ALESHKI, ä-lyësh'kê, formerly DNEIPIROVSK. The chief town of a district, in the government of Taurida, Russia, on the Dnieper River, 3 miles southeast of Kherson, and 153 miles northwest of Simferopol, the capital of the government (Map: Russia, D 5). There is considerable trade, and the inhabitants are engaged principally in agriculture and fishing. Pop., 1897, 9100. It was founded by the Genoese in the tenth century and called by them Elice.

ALESIA, ä-lë'shî-â. A town of Gaul, the capture of which, in 52 B.C., forms one of Cæsar's greatest exploits. The Gauls were making a last effort to shake off the Roman yoke, and Vercingetorix, their bravest leader, after several defeats, had shut himself up with 80,000 men in Alesia, there to await the reënforcements expected from a general insurrection of the Gauls. The town was on a lofty hill and well calculated for defense. Cæsar, with 60,000 men, surrounded the place, with the view of starving it into surrender. He fortified his position by two lines of ramparts of prodigious extent and strength

—one toward the town, for defense against the sallies of the besieged, the other toward the plain, against the armies of relief. Before the relieving forces could assemble, 250,000 strong, he was ready for them; and all their assaults, combined with the desperate efforts of the besieged, were of no avail. Alesia was obliged to surrender, and Vercingetorix was made prisoner. See Cæsar, *De Bello Gallico*, vii. Alesia was afterward a place of some note under the Empire, but was destroyed by the Normans in 864. Near the site of Alesia, west of Dijon, stands the modern village of Alise Sainte-Reine, near which, on the summit of Mont-Auxois, Napoleon III erected a colossal statue of Vercingetorix.

ALESIIUS, ä-lë'shî-üs, ALEXANDER (1500-65). A Protestant theologian. His original name was Ales, but he was also called Alesse, ab Ales, and Alane. He was born in Edinburgh, studied at St. Andrews, became a canon of the Collegiate Church, and contended vigorously for scholastic theology. He was appointed (1528) to refute the reformed views of the Scotch protomartyr Patrick Hamilton, but the result was that his own faith in the old church was shaken, though he long kept the fact secret. For a sermon against dissoluteness among the clergy he was put in prison (1531), whence he escaped to the Continent (1532), traveled in Europe, and settled in Wittenberg, where he met Melancthon. Meantime he was condemned in Scotland (1534), for heresy, without a hearing. After Henry VIII broke with the Church of Rome, Alesius went to England (1535) and was cordially received by the King, Cranmer, and Cromwell, and was appointed lecturer on theology at Cambridge. But he gave offense, and soon went to London and practiced medicine. In 1540 he returned to the Continent and was chosen to a theological chair at Frankfort-on-the-Oder, the first professor who taught the reformed doctrines. In 1543 he quitted Frankfort for Leipzig, where he filled a similar professorship until his death. He visited England in 1549. He died at Leipzig.

ALESSANDRIA, ä'lës-sän'drê-â. Capital of the Italian province Alessandria (c.1980 square miles; estimated pop., 1911, 850,000), a strong fortress in a marshy region on the Tanaro, 47 miles from Genoa by rail (Map: Italy, C 3). Its chief ecclesiastical buildings are the cathedral, rebuilt in the beginning of the nineteenth century, and the old church of Santa Maria di Castello. There are a royal palace, an old castle, and extensive barracks. Noteworthy is the Academy of Sciences and Arts, founded in 1562. Alessandria has cotton, woolen, and linen mills, hat factories, etc. The city derives considerable commercial importance from its position on the chief railway lines of eastern Italy. Population of commune, 1901, 71,298.

Alessandria was founded in 1168 by the inhabitants of Cremona, Milan, and Placentia, as a bulwark against Frederick Barbarossa, and was named Alessandria in honor of Pope Alexander III. Frederick tried to capture it, but failed. As it was a fortress to guard the passage of the Bormida and Tanaro, and also the central point of communication between Genoa, Milan, and Turin, the town was often a scene of battle. It was taken and plundered in 1522 by Duke Sforza; besieged, but without success, by the French, under the Prince of Conti, in 1657; and taken, in spite of obstinate resistance, by Prince Eugene, in 1707. After the prostration of Austria at the battle of Marengo, in

1800, Bonaparte concluded an armistice at Alessandria, in accordance with which Upper Italy, as far as the Mincio, was ceded to the French, with 12 fortresses. It was the principal stronghold of the Piedmontese during the insurrection of Lombardy and Venetia in 1848-49, when many new fortifications were added; those built by the French during their occupation, 1800-14, had been destroyed by the Austrians in 1815.

ALESSI, à-lès'sè, **GALEAZZO** (1512-72). An Italian architect of the late Renaissance, born in Perugia. He was associated with Michelangelo at Rome in 1536, but followed more the manner of Vignola, adopting a formal, classic style. Aside from a few works at Perugia, his masterpieces are at Genoa, whose famous palace architecture he helped develop, especially the Via Nuova (now Garibaldi), with the Cambiaso, Spinola, Serra, and other palaces. He built the Palazzo Marini, now the Municipal Palace of Genoa. Of his Genoese villas, the most beautiful is the Pallavicini; the domical church of the Carignani is his one important ecclesiastical work. His influence was felt throughout Italy, and in France, Portugal, and Flanders.

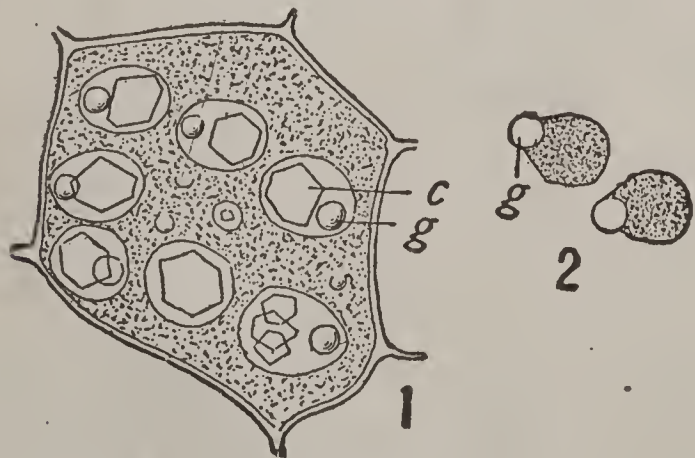

ALESUND, ò'le-sun or a'le-sun, or **AALESUND**. A town in the Norwegian province of Romsdal, on two islands of the Skjærgaard Archipelago (Map: Norway, C 5). The harbor is excellent, and the inhabitants of the town carry on a large cod-fishing trade. Houses are almost entirely of stone, the town having been rebuilt largely since 1904, when it was nearly gutted by a disastrous fire. A statue of the Emperor William II commemorates the assistance rendered by the Germans at that time. Pop., 1900, 11,700; 1910, 13,858.

ALETIA. See COTTON INSECTS.

ALE'TRIUM. A town of ancient Italy, in Latium. See ALATRI.

ALEU'ROMAN'CY. See SUPERSTITION.

ALEURONE, à-lū'rôn (Gk. *ἄλευρον*, *aleuron*, wheaten flour). The stored proteid which occurs as minute granules in the food-bearing tissue (*endosperm*) and embryos of many seeds. The granules are much smaller than starch grains, with which they often occur. They are usually rounded in form (though the so-called proteid crystals of some plant tissues are angu-

ALEURONE.

1. A cell from the Castor bean, as seen in water, showing roundish aleurone grains imbedded in the protoplasm. In each, one or more crystals, *c*, and usually a globoid, *g*.

2. Isolated aleurone grains of the same, as seen in olive oil.

lar), and may be simple or complex in structure. The more complex form of granule consists, in great part, of amorphous proteid substance, in which lie imbedded a large crystalloid and a much smaller globoid. The crystalloid is an angular mass of proteid material, differing

from most true crystals by swelling in water; the globoid is a nearly spherical mineral concretion, consisting mainly of a double phosphate of magnesium and calcium. Seeds rich in aleurone are the castor bean (*Ricinus*), the Brazil nut (*Bertholletia*), peas, beans, etc. See PROTEINS.

ALEUTIAN ISLANDS (à-lū'shan). An archipelago stretching about 800 miles westward from the extremity of the Alaska Peninsula, and forming with the Commander Islands of Siberia a broken barrier between Bering Sea and the Pacific Ocean. There are about 150 different islands, varying in size from rock pinnacles to land masses like Unimak Island, 65 miles long and 25 miles wide, which lies at the eastern end of the chain. The islands lie in a belt 20 to 50 miles wide, between long. 163° 30' W. and 172° 22' E., and lat. 51° and 54° 50' N. They are mountainous, the highest peaks being Mount Shishaldin (8000 feet) on Unimak Island and Mount Makushin (4000 feet) on Unalaska Island, both active volcanoes. There is no timber on the islands, but they support a luxuriant growth of grass and abundant wild flowers. The soil is fertile, and the growing season long enough to mature any vegetables. Cattle have been successfully raised at Dutch Harbor, and the islands undoubtedly have prospective value for grazing purposes. Caribou were formerly found on Unimak Island, but are now extinct; and the rest of the group contains no land animals larger than the fox. The adjacent waters teem with marine organisms, the largest of which are the sea otter (now nearly extinct) and the hair seal. The cod and halibut fisheries are valuable. The precipitation is from 24 to 48 inches, and the mean annual temperature about 40°. The harbors are open throughout the year. The population in 1910 was 1083, of which less than 200 were whites. The largest settlements are Dutch Harbor and Unalaska, both on Unalaska Island. The natives, termed Aleuts by the Russians, are closely related to the Esquimaux. The ravages of the Russian fur-traders from 1754 to 1800 at one time threatened almost to exterminate the native population. The Russians practically enslaved the natives, compelling them to capture sea otters. The Aleuts (see ALASKA, *Population*) were long supported by the trade in sea otter skins, but now they make a precarious living by fishing and fox-trapping. There is a small fur trade in the islands, and Dutch Harbor is used as a coaling station by some of the vessels sailing to Nome. They are mostly converts to the Greek church, which maintains missions and schools on Unimak and Attu islands. On Unimak there is also a Methodist mission. There is a lighthouse on the western end of Unimak Island, and the Navy Department is constructing a coaling station on Kiska Island, about midway of the chain. Vitus Bering, a Russian fleet captain, discovered the Aleutian Islands in 1741.

ALE'WIFE (either *aloofe*, the Indian name of the fish, or from its resemblance to a corpulent woman who keeps an alehouse). A small clupeoid fish (*Pomolobus pseudoharengus*), 8 to 10 inches long, closely related to the herring and the shad and resembling the latter in form and color. It is very abundant on the eastern coast of the United States, where it enters Chesapeake Bay and its rivers, the Hudson, and other streams to spawn. Their time of arrival de-

pends upon the temperature, but usually is during the first week of April in the Hudson, somewhat in advance of other fishes. "Their eggs are adhesive, like those of the herring, and stick to the bottom in shoal water, or to anything they may touch, from 60,000 to 100,000 being laid by each female fish at once, almost all of which are devoured by countless enemies before they can hatch." They have also become landlocked in several lakes of western New York. Though inferior to the shad in quality, they are taken in vast quantities (62,000,000 pounds reported in 1896), and are, next to the shad and the salmon, the most important American anadromous food-fish. It is called *gaspereau* by the French-Canadian fishermen, and branch-herring and saw-belly are other local names. In Bermuda the term "alewife" is applied to the round pompano. See Plate of HERRING AND SHAD.

AL'EXAN'DER. The name of eight popes.—ALEXANDER I, Pope about 109–117.—ALEXANDER II (Anselm, Bishop of Lucca), Pope 1061–73. He was one of those raised to the papal see by Hildebrand and showed the latter's zeal in abrogating simony and clerical marriages. He favored William the Conqueror's invasion of England. Through the first part of his reign there was an anti-pope, Honorius II.—ALEXANDER III (Roland of Siena), Pope 1159–81. He had the active opposition of the Emperor Frederick I, who set up three anti-popes in succession. But he finally overcame all his rivals and the Emperor himself. The tragic history of Thomas à Becket comes in his pontificate, and he forced the unwitting cause of the murder, Henry II of England, to do penance for the deed and to restore the church property which he had confiscated. His works are in Migne, *Pat. Lat.*, vol. cc. His *Summa* was separately edited by F. Thaner (Innsbruck, 1874). For his life, consult H. F. Reuter (Leipzig, 1860–64).—ALEXANDER IV (Rinaldo de Conti), Pope 1254–61. He had a controversy with the Emperor Frederick II, and in the last year of his pontificate the Flagellants appeared in Rome.—ALEXANDER V (Pietro Philargi), Pope 1409–10. He was the choice of the Council of Pisa and designed to supersede the two rival claimants to the papal succession. But his rivals would not retire, and he dismissed the council, thus really making more trouble. He conferred upon the mendicant monks the right to hear confession.—ALEXANDER VI (Rodrigo Lenzuoli Borgia), Pope 1492–1503 (1431–1503). The most celebrated of the eight popes of this name, and the most notorious prince of his age. He was a native of Valencia in Spain. He was handsome and gallant, and his early life was flagrantly dissolute; but he was made a Cardinal at the age of 25 by his uncle, Calixtus III, and on the death of Innocent VIII ascended the papal chair, which he virtually bought. The long absences of the popes from Italy had weakened their authority and curtailed their revenues, and, as a compensation, Alexander endeavored to break up the power of the Italian princes and appropriate their possessions for the benefit of his own children, Giovanni, Duke of Gandia, Cesare, Duke of Valentinois, and Lucrezia, the Duchess of Ferrara, borne him by a mistress with whom he lived publicly even during his occupation of the papal seat. To gain his end he employed the favorite weapons of the princes of the Renaissance, perjury, poison, and

the dagger. Modern research discredits the tradition of his death by poison and ascribes it to a fever. The most memorable events of his pontificate were the burning of Savonarola (q.v.), the partition of the New World between Portugal and Spain, and the introduction of the *Index Expurgatorius* of prohibited books. Alexander VI came down to recent times as one of the most nefarious men in history, laden with such vices and crimes as murder, treason, incest, and apostasy. In the nineteenth century, however, serious attempts were made, if not to rehabilitate his character, at least to mitigate the charges brought against him. For the older view in its extremest form, see the *Diarium* of Burchard, master of ceremonies to Alexander VI (Paris, 1883), and Gordon, *Alexander VI and his Son* (London, 1729). For a more charitable estimate, see Roscoe's *Life and Pontificate of Leo X* (London, 1805), and for a well-sustained apology, Leonetti, *Papa Alessandro VI* (Bologna, 1880); Gregorovius, *History of Rome in the Middle Ages*, vols. vi and vii (Eng. trans., London, 1900), while inclining to the generally accepted opinions, deprives Alexander of the qualities of sagacity and fearlessness which no one else denies him, and depicts him as the weak instrument of his ambitious son, Cesare Borgia. Other biographies are by F. Kaiser (Regensburg, 1878) and Clément (Paris, 1882).—ALEXANDER VII (Fabio Chigi), Pope 1655–67. He confirmed the condemnation of Jansenism and had the satisfaction of receiving the Swedish Queen, Christina, the daughter of Gustavus Adolphus, into the Catholic church. Consult his life, by S. Pallavicini (Prato, 1839).—ALEXANDER VIII (Pietro Ottoboni), Pope 1689–91. He published the bull "Inter Multiplices" against Gallicanism.

ALEXANDER I (?–330 B.C.). King of Epirus; son of Neoptolemus and brother of Olympias, the mother of Alexander the Great. He was made King of Epirus by Philip of Macedon, about 342 B.C., and it was at his marriage with Philip's daughter Cleopatra (336 B.C.) that Philip was assassinated. At the request of the Tarentines, Alexander went to Italy (332), to aid them against the Lucanians and the Bruttii, but, after considerable success, was slain by the Lucanians at the battle of Pandosia, in southern Italy.

ALEXANDER I (1857–93). Prince of Bulgaria from 1879 to 1886. He was the second son of Prince Alexander of Hesse by amorganatic marriage with Countess Julia of Hauck. He served in the Russo-Turkish War of 1877–78 on the staff of General Gurko and in the personal suite of the Czar. After the erection of Bulgaria into an autonomous principality, he was elected hereditary prince, April 29, 1879, by the Bulgarian Sobranje, at the instance of Russia, and the choice was confirmed by those powers which had participated in 1878 in the Congress of Berlin. The principality was organized under Russian influence, but at once developed political parties. Alexander began his administration with a Conservative ministry, seeking to maintain a good understanding with Russia and to establish an orderly government. He then tried a Nationalist ministry, but in 1881 dismissed it, convoked the Sobranje, and secured special powers, under which he appointed a Conservative ministry, headed by two Russian generals, Kaulbars and Soboleff. The Conservative party was but a small faction, and Alexander now allied himself with

the Nationalists, who were enabled to assert themselves more and more against the Russian influence. In 1885 eastern Rumelia revolted against its Governor-General, sought aid from Alexander, who assumed the title of Prince of the Two Bulgarias, and accomplished the union in spite of Russian opposition, securing recognition as Governor from the Porte. This brought on a war with Servia, in which Bulgaria triumphed, Prince Alexander conducting his army with courage and skill. In the night of Aug. 20-21, 1886, a conspiracy headed by Zankoff, and inspired by Russian machinations, forced him to sign his abdication, and he was kidnapped and taken into Russian territory. Popular indignation in Bulgaria procured his release, but on September 7 he formally abdicated, fearful of continued opposition from Russia. He had shown a courage, ability, and loyalty to Bulgaria such as had hardly been expected. He died on his estate at Gratz, in Styria. Consult: Soboleff, *Der erste Fürst von Bulgarien* (Leipzig, 1886), trans. from Russian; Draudar, *Prince Alexander of Battenberg* (1884); A. Koch, Alexander's chaplain, *Prinz Alexander v. Battenberg* (Darmstadt, 1887), and Macdonald, *Czar Ferdinand and His People* (New York, 1913).

ALEXANDER I (c.1078-1124). King of Scotland, the fourth son of Malcolm Canmore. He succeeded his brother Edgar in 1107, but he ruled over only the old kingdom of Scotland, north of the Forth and Clyde, Cumbria having been made practically an independent principality by Edgar on his deathbed. Alexander was called "the Fierce," as a result of his campaign against some northern clans who had rebelled because of their aversion to the introduction of English customs. Alexander was naturally inclined to follow English ways, for his mother was Margaret, grandniece of Edward the Confessor, his wife, Sibylla, was a natural daughter of Henry I of England, and he himself had been educated in England. During his reign there was peace between England and Scotland. Yet he worked earnestly for the independence of Scotland, and especially to free the Scottish church from its subjection to either York or Canterbury. He bestowed great gifts on the church and founded several monasteries, including the abbeys of Scone and Inchcolm. He died April 27, 1124, and was succeeded by his brother David.

ALEXANDER I (1876-1903). King of Servia. The son of King Milan and Queen Natalie. On the abdication of Milan, in 1889, he was proclaimed King, under a regency. In 1893 he assumed personal control of affairs, and in 1894 he abolished the Servian Constitution in favor of an earlier and more reactionary one. In July, 1900, he married Madame Draga Mashin, a widow much older than himself. He and his consort were assassinated, June 11, 1903. See **SERVIA**.

ALEXANDER I, PAVLOVITCH (1777-1825). Emperor of Russia from 1801 to 1825. He was born Dec. 23 (12, Old Style), 1777, at St. Petersburg and was the son of Paul I and Maria Feodorovna (born Dorothea of Württemberg). The violent and arbitrary reign of Alexander's predecessor produced a conspiracy to force his abdication in favor of his son. The Polish prince, Adam Czartoryski, a friend of Alexander, who gives a circumstantial account of the conspiracy, says that Alexander was privy to the

plan of forced abdication, but not to the assassination. The news of the accession of Alexander was received, according to the Russian historian Karamsin, as "a message of redemption." Alexander had been educated under the direction of his grandmother, Catharine II, by eminent instructors, chief among whom was the Swiss Colonel LaHarpe, whose ability and liberal views made a strong impression upon the imaginative character of his pupil. His education, however, was still incomplete when broken off by the dismissal of LaHarpe, on account of his sympathy with the French Revolution. Alexander received a military training which was equally incomplete. His defective education, his experiences in the courts of his great but despotic and immoral grandmother and of his half-insane father produced a curious mingling of characteristics and tendencies. Czartoryski speaks of the frank avowal made to him in 1796 by Alexander of his sympathy with republicanism and his belief that hereditary power was unjust and absurd. The tragedy with which his reign began also made its impression.

He began his reign with sweeping reforms. He abolished the barbaric and excessive punishments in use under his predecessors, restrained the brutality of the police, did away with the secret tribunal, pardoned many of his father's victims, and in other ways reformed the laws and procedure. Restrictions upon literature, art, and trade were removed. "I would not place myself above the law, even if I could," Alexander wrote to the Princess Galitzin, "for I do not recognize any legitimate power on earth that does not emanate from the law. . . . The law should be the same for all." He was aided in his work by four intimate friends, young men of liberal views—Count Paul Strogonoff, Prince Victor Kotchubei, Nicholas Novossiltsoff, and Prince Adam Czartoryski. These Alexander called his "committee of public safety." They deliberated the duties and the limitations of the imperial power—a new question in Russia, and not much considered since that time. In 1801 the Senate was made the supreme high court, its ukases to be subject only to the imperial veto. The first move of the Senate in opposition to the Emperor, however, met with a sharp rebuke, and Czartoryski well explains the attitude of Alexander: "The Emperor liked the forms of liberty as we like spectacles. . . . He would have willingly consented that the whole world should be free on condition that the whole world should submit voluntarily to his single will." The Russian Senate, in which the idle nobility were shelved, was not the body with which to experiment in parliamentary government. Alexander and his associates discussed the emancipation of the serfs; but the time seemed hardly ripe for that measure. An imperial ukase of March 3, 1804, attempted to ameliorate their condition.

The real administrative achievement of Alexander was the creation by the ukase of Sept. 8, 1802, of the ministries, eight in number: Interior and Police, Finance, Justice, Public Instruction, Commerce, Foreign Affairs, Marine, and War. This was a marked step toward an orderly government from the semi-Asiatic methods by which the growing Empire had been managed. Each department was in charge of a minister and an adjunct. Progress was made toward a codification of the laws. The privilege hitherto held by the nobles only, that their

patrimonial estate should not be confiscated as a punishment, was made the common right of all subjects. An imperial bank was instituted, Odessa was made a free port, the laws regarding debt and mortgages were amended, and by the ukase of 1818 peasants were permitted to carry on manufactures. Alexander sent expeditions around the world and made treaties with the United States, Spain, Brazil, and Turkey. Settlements were established on the northwestern coast of America, but the enunciation of the Monroe Doctrine in 1823 checked the Russian advance in the last direction. The new Ministry of Public Instruction meant much for the Empire. There had been but three universities in Russia—Moscow, Vilna, and Dorpat. These were strengthened and three others were founded at St. Petersburg, Kharkov, and Kazan. Literary and scientific bodies were established or encouraged, and the reign became noted for the aid lent to the sciences and arts by the Emperor and the wealthy nobility.

The foreign policy of Alexander was marked, like his internal policy, by plans outrunning performance. He at first stood as an advocate of peace. He endeavored to obtain from Napoleon just compensation for the German States; but, becoming convinced of Napoleon's bad faith, he joined the coalition of 1805. He was the ally of Prussia against Napoleon in the campaign of 1806, carrying on wars at the same time with Persia and Turkey. His forces fought an indecisive battle at Eylau in February, 1807, and were totally defeated at Friedland in the following June. In July, 1807, Alexander signed the Treaty of Tilsit, in which he left Prussia to her fate. Dazzled by the genius of Napoleon and by his scheme for the division of the world into an Eastern and a Western Empire, Alexander joined the Continental System (q.v.), declared war on England (1808), and wrested Finland from Sweden. At Erfurt in the autumn of 1808 the two emperors met with great pomp, but the ill-assorted alliance soon lost force. The pressure of the Continental System on the material resources of Russia, the growth of the Napoleonic despotism, the existence and aggrandizement of the Duchy of Warsaw, were utterly opposed to Alexander's theories and to his sense of sound Russian policy. At length in 1812 a rupture ensued, and Napoleon's Grand Army entered Russia, only to be destroyed in the retreat from Moscow. Alexander threw himself into the struggle of Europe against the French Emperor and raised an army of nearly 900,000 men. He took part personally in the campaigns and was prominent in the negotiations at Vienna.

Here Alexander was at the height of his power. He alone of the allied sovereigns was a liberal, and it was largely owing to his influence that Switzerland received her autonomy and France her *Charta*. The Czar, however, had a weaker side; he was a religious fanatic who prayed with the Quakers on the one hand and joined in religious dances with the Raskolnicks on the other. This mysticism was skilfully played upon by Madame Krüdener, a divorcée, and under her influence Alexander instituted the Holy Alliance (q.v.). This was really a harmless thing, despite the furor which it caused; but not so the personality of the Czar, of whose mental vagaries it was a good expression. By 1820 Alexander had forgotten his liberalism. Kotzebue, his agent, was murdered in Germany, a regiment of the guard refused to parade, and

Metternich fanned the flames of suspicion. As a result the ardent young reformer was drawn into a reactionary course. He concurred in the Austrian policy of Metternich, and by repressing insurrection in Europe assisted in crushing the political progress of the nations. The spread of education and liberal ideas, and the disorder of the finances, due to Russia's active part in the Napoleonic wars, aroused popular discontent, which was put down by the censorship and police espionage. Alexander became morbid and embittered, and sought relief alternately in dissipation and in religious mysticism. Personal exposure during the inundation of St. Petersburg in 1824 undermined his health; the death of a favorite daughter and the discovery of a Russo-Polish conspiracy against the House of Romanoff aggravated his illness. With the Empress he sought rest in the Crimea, but was seized by an illness on the journey and died at Taganrog, Dec. 1, 1825.

Bibliography. Schnitzler, *Histoire intime de la Russie sous les empereurs Alexandre I et Nicolas I* (Paris, 1847); Bogdanovitch, *History of the Reign of Alexander I*, in Russian (St. Petersburg, 1869-71), the first four volumes of which are translated into French; Rabbe, *Histoire d'Alexandre I* (Paris, 1826); Schilder, *Emperor Alexander Ist* (St. Petersburg, 1905).

ALEXANDER II (?-c.242 B.C.). King of Epirus, son of Pyrrhus (q.v.) and of Lanassa, daughter of the Sicilian tyrant Agathocles (q.v.). He succeeded his father in 272 B.C. To avenge the death of Pyrrhus, slain while fighting against Antigonus Gonatas (q.v.), he seized Macedonia, the latter's kingdom. Soon afterward, however, he was deprived of both Macedonia and his own dominions by Demetrius, son of Antigonus (so Justinus: others call him brother of Antigonus), but recovered Epirus by the aid of the Acarnanians and Ætolians (Just., xxvi, 3; xxxviii, 1; and Plut., *Pyrrh.*, 9).

ALEXANDER II, NIKOLAYEVITCH (1818-81). Emperor of Russia from 1855 to 1881, son of Nicholas I. He was born April 29, 1818, and received a thorough education and military training. He traveled in Germany and in 1841 married Princess Maria of Hesse-Darmstadt. He also journeyed through Russia, Siberia, and the Caucasus and took a creditable part in the campaigns against the Tcherkesses. On succeeding to the throne during the Crimean War (March 2, 1855), he assured the foreign ambassadors that he would adhere to the policy of his uncle (Alexander I) and his father, but his desire was for an honorable peace. In March, 1856, he was compelled to sign the humiliating Treaty of Paris. Alexander had not been in sympathy with the reactionary course of his father. While not a liberal, or an idealist like the first Alexander, he represented the intelligent thought of Russia and believed that a transformation was needed to place it in the first rank among nations. He soon announced his intention to promote reforms, and he was encouraged in this by the shock which the Crimean War had given to the old corrupt officialism of the Empire. Two reform parties arose—one a liberal constitutional party, having its centre at St. Petersburg; the other an old Russian nationalist party, centring at Moscow. They were united only in enmity to the bureaucracy. In response to their wishes and his own convictions, Alexander relaxed the censorship of the press, permitted travel, exercised

a close control over officials, recalled many who had been exiled to Siberia during the previous reign, extended education, and without instituting radical changes in the machinery of the government greatly widened the liberty of his subjects.

His best-known administrative act was the emancipation of the serfs. With this, of necessity, went a reform in the system of land tenure. Nearly all of Russia was held in large estates, worked by serfs who were nominally attached to the land, but were in fact almost as much at the disposal of their masters as if they had been slaves. Nine-tenths of the arable land of Russia was thus held by the imperial family and about 100,000 noble families. Beginning in 1858 by freeing the serfs on the estates of the imperial family, the Czar completed the emancipation by the ukase of March 3, 1861. Serfs who had been domestic servants, not attached to the land, became free without right to property. Those who had been attached to the land were enabled by a State loan, payable 6 per cent annually for 49 years, to purchase the interest of the former landlords in a certain share of the land. The freedmen thus became peasant proprietors, the land being held by the *mirs*, or village communities, which could assign it to the members. Police authority was put in the hands of the communal assemblies, and larger powers of taxation, administration, and police were vested in district and provincial councils. This reform, excellent in theory, increased the burdens of the peasantry. The village community became responsible for a heavy redemption tax from three to six times as high as all possible income that could be derived from the land. It could be paid in one way only—by the labor of those persons in the village community who worked outside as farm hands, factory laborers, etc. The peasant must not leave his commune without a pass; he must return when summoned—for his commune was responsible for this huge additional tax levied to pay interest on loans that went into the pockets of the nobility as ready cash. The peasant became poorer than ever before, and the foundations were thus laid for the agrarian crises of the early twentieth century.

The Emperor also established a regular system of courts. Public schools were founded after the model of western Europe, and scientific schools were erected in addition to those devoted to the regular classical training. The army, which in the Crimean War had so disappointed Nicholas I, was reorganized on the Prussian plan. While Alexander went thus far with the liberals, the Pan-Slavism of the Nationalists found equal sympathy with him. He said to the Polish deputies: "Embrace the union with Russia and abandon all thoughts of independence, now and for evermore impossible. All that my father did was rightly done. My reign shall be a continuation of his." The Polish national movement, culminating in the insurrection of 1863, was severely repressed, and a relentless process of Russification was instituted under Michael Muravieff. Since that time Poland has been under what is practically martial law. After 1863 there was a gradual return to absolutism in Russia, and many of the liberties that had been granted were withdrawn or modified, the Czar falling more under the influence of the conservative Nationalist party, led by Katkoff, the Moscow editor. For a few years

the liberals contented themselves with criticism of the conservative position and legal attempts to restore their influence. Then began the revolutionary movement, which finally developed in the hands of a few violent spirits into terrorism after 1875. (See NIHILISM.) The socialism of Marx and Proudhon had by this time been brought in from western Europe.

Between 1868 and 1881 the armies of Alexander were advancing the Russian frontiers in Central Asia. In 1868 Samarkand was occupied; in 1873 the Khan of Khiva was reduced to vassalage; in 1876 Khokand was annexed; and in 1881, just before the assassination of the Emperor, Geok-Tepe, the stronghold of the Teke Turkomans, was taken. The vigorous policy adopted after 1870 brought on a war with Turkey in 1877-78, in which the Russian standards were carried almost to Constantinople. This war appealed to the chivalric spirit of Alexander, who wished to be known as the Liberator Czar, because it was in a sense a crusade in behalf of the oppressed Christian peoples of the Balkans. The hopes of a Russian hegemony in the Balkan Peninsula, entertained by the Pan-Slavists, were overthrown, however, at the Congress of Berlin (q.v.).

The existence of the liberal and reactionary parties side by side in Russia explains some of the inconsistencies in Alexander's character. It is because of these opposing influences, both patriotic, that progressive and oppressive measures were often simultaneously enacted. Personally, Alexander seems to have tended always to the liberal side, although somewhat embittered by the spread of the revolutionary agitation. His life, during the years 1879-81, was never safe from the conspiracies of the extreme revolutionists, who pursued him with a remarkable persistence of hatred. After the terrible explosion of 1880, in the Winter Palace, Alexander gave General Loris-Melikoff, a distinguished officer of liberal tendencies, an extraordinary dictatorial commission for six months, and it is said, that, under Loris-Melikoff's advice, he was considering the question of the promulgation of a constitution by ukase when he was assassinated in St. Petersburg by the explosion of a bomb while driving from the parade to the Winter Palace on Sunday, March 13, 1881. He was succeeded by his son, Alexander III.

ALEXANDER II (1198-1249). King of Scotland. He succeeded his father, William the Lion, in 1214. He early displayed that wisdom and strength of character by which he won the appellation of "the Peaceful," and in virtue of which he holds so high a place in history among Scottish kings. In 1214 he joined the English barons who had combined to resist the tyranny of King John and secured the Magna Charta. This drew down upon him and his kingdom the papal excommunication; but the ban was removed, and the liberties of the Scottish church were confirmed. On the accession of Henry III to the English throne, Alexander brought the feuds of the two nations to a temporary close

by a treaty of peace (1217), and in 1221 he married Henry's eldest sister, the Princess Joan. The alliance thus established was broken after the death, without issue, of Queen Joan (1238), and the second marriage of Alexander with the daughter of a nobleman of France. In 1244 Henry marched against Scotland to compel Alexander's homage, but peace was concluded without an appeal to arms. While engaged in one of those warlike expeditions which the turbulence of his subjects so frequently rendered necessary, Alexander died of fever at Kerrera, a small island in the Bay of Oban.

ALEXANDER III, ALEXANDROVITCH (1845-94). Emperor of Russia from 1881 to 1894. He was born March 10, 1845, and he succeeded his father, March 13, 1881, but was not crowned until May 27, 1883, after the panic caused by the assassination of Alexander II had somewhat subsided. Alexander at first expressed his intention of following out the constitutional reforms of Loris-Melikoff, but he fell under the influence of the leaders of the old Russian Nationalist party, Katkoff, Pobiedonostseff, and Ignatieff, and restored the autocratic system of Nicholas so far as internal affairs were concerned. He pursued a stern policy of repression with regard to the political agitation which had caused the violent death of his father. The Terrorists were practically suppressed, a rigid censorship was reestablished, education was restricted, and dissenting religions were persecuted. As a result of the persecution, Jews in great numbers emigrated from the country, chiefly to the United States and South Africa. The policy of the Russification of the non-Russian provinces, begun by Nicholas I and discontinued for a time by Alexander II, was resumed with new vigor. The finances of the Empire were well managed. The revenue was largely increased, and a protective tariff was used as a part of the system to strengthen Russian nationality.

In his foreign policy Alexander did not follow the example of Nicholas. His influence was directed toward the preservation of peace. Russia and France were drawn into closer and closer connection in opposition to the Triple Alliance of Germany, Austria, and Italy. Alexander continued the policy of interference in the affairs of the Balkan States, especially Bulgaria, bitterly resenting that spirit of nationalism which his father had regarded as ingratitude toward Russia. He endeavored, not very successfully, to counteract Austrian influence among the Balkan peoples. In Asia he continued to round out the frontier and strengthen Russia's hold on its provinces. Several attempts were made to assassinate him, but they lacked the completeness of preparation and the venomous persistence which had pursued his father. Alexander married Dagmar (re-baptized into the Greek church as Maria Feodorovna), daughter of Christian IX of Denmark, Nov. 9, 1863. He died Nov. 1, 1894; and was succeeded by his son, Nicholas II.

Consult: Andrews, *Historical Development of Modern Europe*, vol. ii (New York, 1898); Scignobos, *Political History of Modern Europe* (New York, 1900); Samson-Himmelstierna, *Russland unter Alexander III mit Rückblicken auf die jüngste Vergangenheit* (Leipzig, 1891), translated by Morrison, *Russia under Alexander III and in the Preceding Period* (New York, 1893); Lowe, C., *Alexander III of Russia* (Lon-

don, 1895). This reign has claimed very little special attention from historians.

ALEXANDER III (1241-85). King of Scotland. He succeeded his father, Alexander II, in 1249, and two years afterward he married the Princess Margaret, eldest daughter of Henry III of England. Alexander's minority enabled Henry to prosecute successfully for some time his schemes for obtaining entire control over the Scottish kingdom; but long before he reached manhood, Alexander displayed so much energy and wisdom as to give assurance that when the administration of affairs should come under his personal direction it would be vain to think of reducing him to submission. Very shortly after he had come of age his energies were summoned to the defense of his kingdom against the formidable invasion of Hakon, King of Norway (1263), who claimed the sovereignty of the Western Isles. In attempting a landing at Largs, on the coast of Ayr, the Norwegian prince was unsuccessful, and, as his fleet had suffered from storms he was obliged to return home. Alexander, as the result of this failure of Hakon, secured the allegiance both of the Hebrides and of the Isle of Man. An alliance was formed between Scotland and Norway, and strengthened in 1281 by the marriage of Alexander's only daughter, Margaret, to Eric, King of Norway. This princess died in 1283, leaving an infant daughter, Margaret, commonly called "the Maid of Norway," whose untimely death, on her way to take possession of her throne, was the occasion of so many calamities to Scotland. During the concluding years of Alexander's reign the kingdom enjoyed a peace and prosperity which it did not taste again for many generations. The justice, liberality, and wisdom of the King endeared his memory to his subjects, while the misfortunes that followed his death heightened the national sense of his loss. His eldest son, Alexander, who had married the daughter of the Count of Flanders, died without issue in 1283. After the death of "the Maid," Alexander contracted a second marriage with Joleta, daughter of the Count of Dreux. He was killed by falling from his horse in 1285.

ALEXANDER, ABRAHAM (1718-86). An American legislator. He was born in North Carolina and in early life was a magistrate of Mecklenburg county, which he represented in the Colonial Legislature until 1775. In this year he served as chairman of the county convention, which, on May 31, passed a series of resolutions, later distorted into the famous "Mecklenburg Declaration of Independence" (q.v.).

ALEXANDER, ARCHIBALD (1772-1851). An American Presbyterian clergyman. He was born in Augusta (now Rockbridge) Co., Va. He was self-educated and was led to religious study in the revival of 1789. He was licensed to preach in 1791 and spent several years as an itinerant missionary, and was president of Hampden-Sidney College, 1796-1801. In 1802 he married the daughter of Rev. Dr. Waddell, the blind preacher whose eloquence was eulogized by William Wirt. He was pastor of Pine Street Presbyterian Church, Philadelphia, from 1807 to 1812, and was at the organization of the theological seminary of the Presbyterian church at Princeton, N. J. He was unanimously chosen professor of theology, the position which he maintained with eminent success until his death there, Oct. 22,

1851. His best-known work is *A Brief Outline of the Evidences of the Christian Religion* (Princeton, 1823), which has been translated into many languages and is a text-book in colleges. He wrote also *The Canon of the Old and New Testaments Ascertained* (1826); *The Log College* (1845); and *Moral Science*, which was published after his death (1852). Consult, for his life, J. W. Alexander (New York, 1854).

ALEXANDER, BARTON STONE (1819-78). An American soldier, born in Kentucky. He graduated at West Point and entered the engineer corps in 1842. He was engaged in engineering work from 1842 to 1859, superintending the construction of the military asylum at Washington, the marine hospital at Chelsea, Mass., and the Minot Ledge lighthouse, and in 1860 was employed in the construction of defenses around Washington. Subsequently he served with gallantry in the Manassas campaign and in the battle of Bull Run, was Consulting Engineer on the staff of General Sheridan (1864), and in March, 1865, was brevetted Brigadier-General. In 1865-67 he was in charge of public works in Maine. He became senior engineer, with the rank of Lieutenant-Colonel, in 1867, and he was a member of the Pacific board of engineers for fortifications from that time until his death.

ALEXANDER, BOYD (1873-1910). An English naturalist and explorer. Educated at Radley College, he early enlisted in the militia battalion of the Rifle Brigade, and later served with the Gold Coast Constabulary and the regular Rifle Brigade. He led many journeys of exploration and scientific research in various parts of the world, including the Cape Verde islands, the Zambesi River, Fernando Po, and the Niger-to-Nile region. In 1909 he explored several islands in the Gulf of Guinea, and continuing on to the Kamerun country, made a special study of the craters of volcanic mountains. Among other contributions of his to science was the discovery of many new birds, when his party made the first ascent on record of Mount St. Isabel. He received a gold medal from the Royal Geographical Society of Antwerp in 1907, and a year later was made a gold medalist of the Royal Geographical Society of London. In May, 1910, while on a journey of exploration in the French Congo, Alexander was murdered by natives. His writings include the account of his African journeys, *From the Niger to the Nile* (2 vols., 1907); "Birds of Kent" in the *Victorian History of England*; and many papers in geographical journals. In 1912 *Boyd Alexander's Last Journey, with a Memoir by Herbert Alexander*, was published.

ALEXANDER, DE ALVA STANWOOD (1846-). An American public official and historian, born in Richmond, Me., and graduated from Bowdoin College in 1870. From 1862 to 1865 he served as a private in the Union army. Having studied law and been admitted to the bar, he practiced law in Indianapolis until 1881. In that year he was appointed an auditor in the United States Treasury, resuming the practice of law at Buffalo, N. Y., in 1885. From 1889 to 1893 he was United States Attorney for the northern district of New York, and from 1897 continuously to 1912 was a member of Congress. His defeat finally came in a general Republican overthrow in New York. He made an exhaustive study of New York politics, and his *Political History of the State of New York* (3 vols., 1906-09) is con-

sidered the final authority on this important subject. He became an overseer of Bowdoin College and received the degree of LL.D. from that institution.

ALEXANDER, EBEN (1851-1910). An American diplomat and educator, born in Knoxville, Tenn., and graduated from Yale College in 1873. Almost continuously throughout his life, after this date, he was identified with the University of North Carolina, as professor of ancient languages and later of Greek, and as dean of the faculty. One year (1885) he spent as chairman of the faculty of the University of Tennessee, and four (1893-97) as United States Minister to Greece, Servia, and Rumania. The Tennessee State Teachers' Association made him their president in 1886.

ALEXANDER, EDWARD PORTER (1835-1910). An American soldier and engineer. He was born at Washington, Ga., and graduated at the West Point Military Academy in 1857. After serving as an engineer in the United States army, he joined the Confederacy in 1861, and advanced to the rank of Chief of Ordnance and Chief Signal Officer in the Army of Northern Virginia (1861-62). In February, 1864, he was commissioned Brigadier-General. He was also Chief of Artillery in General Longstreet's corps, and served in that capacity in the battles of the Wilderness and Spottsylvania and at the siege of Petersburg. At the close of the war he was appointed professor of mathematics and engineering at the University of South Carolina, and four years afterward began his career as general manager and president of various Southern railroads. He was a government director of the Union Pacific Railroad from 1885 to 1887, and in 1901, as engineer arbitrator, took charge of the boundary survey between Costa Rica and Nicaragua. He wrote *Railway Practice* (1887), and *Military Memoirs of a Confederate* (1907; new ed., 1913).

ALEXANDER, FRANCIS. An early American portrait painter (1800-81). He was born in Windham Co., Conn., and was practically self-taught in his art. After practicing in Connecticut and at Providence, R. I., he was invited by Gilbert Stuart to settle at Boston, where he enjoyed great vogue as a portrait painter. He studied in Florence and Rome from 1831 to 1833, after which he returned to Boston. His last years were spent at Florence, where he died in 1881. He was of a very enterprising character, and it is related that when Dickens visited America in 1842, he appeared with the pilot who had come to guide the ship into the harbor and induced the novelist to sit to him for a portrait. His best-known portrait is that of Mrs. Fletcher Webster in the Boston Museum of Fine Arts. His art resembles that of the painters of the middle period of American painting, being classic in line and glossy in color. Consult Isham, *History of American Painting* (New York, 1905).

ALEXANDER, Sir GEORGE (1858-). An English actor and manager, whose full name is George Alexander Gibb Samson. He was born at Reading, June 19, 1858, and was educated at Clifton, Stirling, and Edinburgh. In 1881 he joined Irving's company at the Lyceum, where later he won particular successes as Faust (1886) and Macduff (1888). In the season of 1884-85 he accompanied Mr. Irving to America. Mr. Alexander began management in 1890 at the Avenue Theatre, but took the St. James Theatre

in the next year. He has produced more original plays by English authors than any other manager. Some of his notable productions have been *The Idler* (1891), *Lady Windermere's Fan* (1892), *The Second Mrs. Tanqueray* (1893), *The Prisoner of Zenda* (1896), *In Days of Old* (1899), and Stephen Phillips's *Paolo and Francesca* (1901), besides several successful Shakespearian productions, including *As You Like It* (1896), and *Much Ado About Nothing* (1898). He played in *The Builder of Bridges* before H. M. King Edward, December, 1908, and in *Money* at the Royal Command performance, May, 1911, given on the occasion of the State visit of the German Emperor. He became president of the Royal General Theatrical Fund.

ALEXANDER, GROSS (1852-1915). An American clergyman and writer, born in Scottsville, Ky. Graduating from the University of Louisville in 1871, he was from then until 1873 a tutor in that institution. Following two years as professor of Latin and Greek at Warren College, Ky., he entered the Drew Theological Seminary, from which he graduated in 1877. Successively he filled pastorates at Lake Mohonk, N. Y. (1875-76); at New Brighton, Staten Island (1877); and in Kentucky (1877-84). Having occupied during the next 17 years the chair of New Testament Greek and exegesis at Vanderbilt University, he was appointed presiding elder of the Louisville conference (1902). In 1906 he became editor of the *Methodist Review* and book editor of the Methodist Church, South. In addition to many essays and articles on theological subjects, Dr. Alexander's writings include: *History of the Methodist Episcopal Church, South*, in the *American Church History Series* (1894); *The Beginnings of Methodism in the South* (1897); *The Son of Man: Studies in his Life and Teaching* (1899); *Commentary on Colossians and Ephesians* (1909); *New Study of the Resurrection of Jesus* (1913).

ALEXANDER, HARTLEY BURR (1875-). An American scholar and educator, born in Lincoln, Neb. He graduated from the University of Nebraska in 1897; was a fellow at the University of Pennsylvania (1898-1900); a fellow at Columbia University (1900-01); and from the last-named institution received the Ph.D. degree in 1901. He was an editor and contributor on the staff of the *NEW INTERNATIONAL ENCYCLOPEDIA* in 1903; for the five succeeding years was a member of the staff of Webster's Dictionary; and in 1908 became professor of philosophy at the University of Nebraska. He was made a member of several learned societies. His published writings include: *The Problem of Metaphysics* (1902); *Poetry and the Individual* (1906); *The Mid-Earth Life* (1907); *Odes on the Generations of Man* (1910); *The Religious Spirit of the American Indian* (1910).

ALEXANDER, JAMES (c.1690-1756). A colonial lawyer. He was born in Scotland, emigrated to New Jersey in 1715, practiced law, and was temporarily disbarred for defending John Peter Zenger (q.v.), when he was accused of sedition in 1733. He held many responsible public offices, including those of Surveyor-General of New York and New Jersey; member of the Legislature and Council of the province of New York; Attorney-General of the province from 1721 to 1723, and later its Secretary. He was one of the founders of the American Philosophical Society. His son was William Alexander (q.v.).

ALEXANDER, Sir JAMES EDWARD (1803-

85). A Scotch officer, traveler, and author. He served in the war against Burma (1825) and in various other campaigns. He traveled in Persia and South America, and in 1836-37 conducted an exploring expedition into Africa. He retired in 1877, and the honorary rank of General was given to him in 1881. His works include: *Travels through Russia and the Crimea* (1830); *Transatlantic Sketches* (1833); *Expedition of Discovery into the Interior of Africa* (1838); *L'Acadie* (1849); *Incidents of the Last Maori War* (1863); *Bushfighting* (1873).

ALEXANDER, JAMES WADDELL (1804-59). An American clergyman, a son of Dr. Archibald Alexander. He graduated at Princeton College in 1820 and afterward was a tutor there. He was installed pastor of the Presbyterian church at Charlotte Court House, Va., in 1827, and of the First Church of Trenton, N. J., in 1829. He was professor of Belles Lettres and Latin in Princeton College, 1833-44, pastor of the Duane Street Church, New York, 1844-49, and professor of ecclesiastical history, church government, and sacred rhetoric in Princeton Seminary, 1849-51. When the Duane Street Church in New York was reorganized as the Fifth Avenue Church, he again became its pastor and continued to be until his death. Among his many works are volumes of sermons; *Plain Words to a Young Communicant* (1854), *The American Mechanic and Workingman* (2 vols., 1847), and a biography of his father (1854).

ALEXANDER, JOHN HENRY (1812-67). An American scientist, born at Annapolis, Md., and educated at St. John's College there. He was connected with the Maryland geological survey and did much toward opening the coal fields of that State. He published in 1840, a *History of the Metallurgy of Iron*. He was active in establishing a uniform standard of weights and measures throughout the United States and published a *Universal Dictionary of Weights and Measures* (1850). He was professor of physics for two years in St. John's College, Md., and held a similar position at the University of Pennsylvania. In 1857 he was chosen delegate from the United States government to the British commission on decimal coinage. He was recommended as director of the mint, but died before appointment. Consult: Hilgard, *Biographical Memoir of John H. Alexander* (Washington, 1877); National Academy of Sciences, *Biographical Memoirs*, vol. i (Washington, 1866).

ALEXANDER, JOHN WHITE (1856-1915). An American portrait, figure, and decorative painter, a leading figure in contemporary art. He was born in 1856 in Allegheny City, now a part of Pittsburgh, Pa. Orphaned in infancy, he was reared by his grandparents and at the age of 12 became a telegraph boy in Pittsburgh. His talents in drawing attracted the attention of one of his employers, who assisted him to develop them. At 18 he became an apprentice in the art department of *Harper's Weekly*, at the same time that Abbey, Pennell, Pyle, and other celebrated illustrators labored there. After three years' apprenticeship he went to Munich (1877). He studied for a short time at the Royal Academy, but owing to lack of funds he removed to the village of Polling, Bavaria, and worked with Frank Duveneck. He went with Duveneck to Venice, where he profited by the advice of Whistler, and then continued his studies in Florence, Holland, and Paris. In 1881 he returned to New York and speedily achieved great

success in portraiture, numbering among his sitters Oliver Wendell Holmes, John Burroughs, Walt Whitman, whose powerful characteristic portrait is in the Metropolitan Museum of Art, New York City, Henry G. Marquand, R. A. L. Stevenson, and President McCosh of Princeton University. His first exhibition in the Paris Salon of 1893 was a brilliant success and was followed by his immediate election to the Société Nationale des Beaux Arts. For many years he divided his time between Paris and New York, where he later resided. In 1901 he was named Chevalier of the Legion of Honor, and in 1902 member of the National Academy of Design, New York, becoming president in 1909. He was also LL.D. of Princeton and a member of the American Academy of Arts and Letters. Among the gold medals received by him were those of the Paris Exposition (1900) and the World's Fair at St. Louis (1904). He was an honorary member of several European societies, including the Secessionists of Munich and Vienna.

Among his principal paintings are a portrait of Fritz Thaulow (1894), Wilstach collection, Philadelphia; "The Pot of Basil" (1897), Boston Museum; "Pandora" (1898); "In the Café," Philadelphia Academy; "La Femme Rose," Carnegie Institute, Pittsburgh; "The Green Bow," Luxembourg, Paris; "Two Sisters"; the portraits of Rodin (1900), Mrs. Alexander, Worthington Whitredge (Century Club, New York), and Mrs. Wheaton. His portrait of President Loubet hangs in the Elysée Palace, Paris. The Metropolitan Museum possesses his "Study in Black and Green" and "The Engagement Ring" (1912), and the Art School of Yale University his portrait of John F. Weir (1913). His mural paintings include six large canvases representing the "Evolution of the Book" in the Congressional Library, Washington (1896-97); and a splendid series of many panels covering the walls of the three stories of the entrance hall to the Art Museum of the Carnegie Institute, Pittsburgh. The general subject is the "Apotheosis of Pittsburgh," which is represented in the central panel as a mailed knight, saluted by panel after panel of workmen and by the nations of the earth. Alexander's original and highly individual art is based upon a very personal interpretation of humanity. He is especially known as a subtle portrayer of modern woman in her graceful poses and movements, but his strong and characteristic men are no less effective, and he has painted landscapes of great charm and individuality. His very modern technical methods have caused him to be called the most Parisian of American painters. By the use of a very coarse canvas and thin pigments he achieves rapid execution, direct presentation, and great carrying power. His color is fluid and pleasing, with striking light and shade effects. But though always able, his work is not uniformly excellent. Consult *The Studio*, vol. xx (1900); *International Studio*, vols. xxxiv (1908), xlii (1911); Isham, *History of American Painting* (New York, 1905).

ALEXANDER, JOSEPH ADDISON (1809-60). Eminent American biblical scholar, born in Philadelphia, a son of Dr. Archibald Alexander. He was a pupil of his father, graduated at Princeton College in 1826, was adjunct professor there of ancient languages and literature from 1830 to 1833, instructor, associate professor, and professor of Oriental and biblical literature in Princeton Seminary from 1833 to 1850; of

Church history and government from 1851 to 1860, of New Testament literature and biblical Greek in 1859 and 1860. He wrote commentaries on *The Psalms* (3 vols., 1850); *Isaiah* (2 vols., 1846-47); *Matthew* (1860); *Mark* (1858); *Acts* (1856), all drawn largely from German sources. He also published *Sermons* (2 vols., 1860). Consult his *Life* by H. C. Alexander (2 vols., New York, 1869).

ALEXANDER, LEGEND OF. A famous but largely fictitious account of the adventures of Alexander the Great, which was the basis of many romantic works in the Middle Ages. It originated probably at Alexandria, in Egypt. The historical narrative of Callisthenes (q.v.) having been lost, there appeared about 200 A.D. under his name (sometimes referred to as the pseudo-Callisthenes) a Greek story, which represented Alexander as really the son of Nectanebus, the last King of Egypt, and credited him with a fabulous series of exploits in connection with his actual conquests. This compendium of legendary lore on the Macedonian conqueror was translated into Latin early in the fourth century by Julius Valerius. His version was subsequently abridged, particularly in the account called *Historia de Præliis*, by Archbishop Leo, about the end of the tenth century. Besides these there were the so-called "Letter of Alexander to Aristotle" on the wonders of India, the "Correspondence" of Alexander and Dindimus, King of the Brahmans, a brief rhythmic abecedary poem on Alexander, and the *Iter ad Paradisum*. About the twelfth century, the period of the *Chansons de geste* of the cycle of Charlemagne, several French poems were built upon the Alexander Legend; one of the earliest was that of Alberic of Besançon, written in ten syllable lines in the Provençal language, of which only the beginning is extant; the best known is the great *Chanson d'Alexandre*, by Lambert li Tors and Alexandre de Bernai. The twelve-syllable lines in which this was written gave its name to the Alexandrine verse. The Alexander of the Middle Ages was essentially a mediæval knight. He became one of the "nine worthies," and one of the four "kings" in the game of cards. More or less original versions of the legend appear in poems of nearly every European country, and even in the Orient, where the story of the pseudo-Callisthenes was rendered into Syrian and Armenian as early as the fifth century. Some of the Slavic forms of the tale go back through Byzantium to this eastern version. Of those in western Europe, most notable after the French poems are perhaps those in German by Lamprecht, who translated that of Alberic, and by Rudolph of Montfort, of the thirteenth century. In Spain the *libro de Alixandre*, one of the oldest monuments of Spanish poetry, has been attributed to Juan Lorenzo Segura of Astorga, but he was probably the copyist only. Though the author reveals his acquaintance with the French poems, his version is original in many ways. Among the numerous English versions of this legend the earliest is probably the *Lyfe of Alisaunder* in verse, composed about 1330. It was published in H. Weber's *Metrical Romances* (vol. i, 1810). Thomas (or Eustache) of Kent's abridged version of Valerius and of the French romances, was originally written in the Anglo-Norman, under the title *Le roman de toute chevaleric*. It was translated into English under the title *King Alisaunder*. Consult: Paul Meyer, *Alexandre le Grand, histoire de la légende*

d'Alexandre dans les pays romains (Paris, 1886); Spiegel, *Die Alexandersage bei den Orientalen* (Leipzig, 1851); Ausfeld, *Der griechische Alexanderroman* (Leipzig, 1907); Pfister, *Kleine Texte zum Alexanderroman* (Heidelberg, 1910); Morel-Fatio, *El Libro de Alixandre* (Dresden, 1906); Roskopf, *Editio princeps des mittel-englischen Cassamus* (Erlangen, 1911).

ALEXANDER, MRS. See HECTOR, ANNIE.

ALEXANDER, SAMUEL (1859—). An English philosopher and educator, born at Sydney, N. S. W. He was educated at the University of Melbourne and at Oxford and was Fellow of Lincoln College from 1882 to 1893. In 1893 he was appointed to the chair of philosophy in Owens College (Victoria University). He was president of the Aristotelian Society from 1908 to 1911. In addition to frequent important contributions to the *International Journal of Ethics*, to *Mind*, and other periodicals, he wrote *Moral Order and Progress* (1889); *Locke* (1908).

ALEXANDER, STEPHEN (1806-83). An American astronomer. He was born at Schenectady, N. Y., and was educated at Union College and Princeton Theological Seminary. He remained at Princeton, becoming adjunct professor of mathematics (1834-45), professor of mathematics (1845-54), and professor of astronomy from 1840 until his retirement in 1878 as professor emeritus. During a part of this time he was professor of natural philosophy. In 1860 he was at the head of the expedition to Labrador to observe the solar eclipse of July 18, and was sent on a similar mission in 1869. He was the author of many scientific papers, chiefly astronomical, such as *Physical Phenomena Attendant upon Solar Eclipses* (1843), *Origin of the Forms and Present Condition of Some of the Clusters of Stars* (1850), and *Harmonies in the Arrangement of the Solar System*. He also wrote on the *Fundamental Principles of Mathematics*. Consult "Memoir of Stephen Alexander" (*National Academy of Sciences, Biographical Memoirs*, 1886, vol. ii).

ALEXANDER THE GREAT (365-323 B.C.). King of Macedonia and conqueror of the eastern world, son of Philip II of Macedon (q.v.) and of Olympias, an Epirot princess. At Alexander's birth his father had already established his position as King of Macedonia, had made great progress in developing his army, and had begun the extension of his kingdom to the eastward, so that he possessed the rich gold mines in Mount Pangæus. The yearly revenue of 1000 talents from these mines made feasible his policy of expansion. Though a thoroughgoing Macedonian, Philip was still possessed of genuine Greek culture; doubtless, while a hostage at Thebes, he had learned much beside military and political wisdom. He chose Aristotle as his son's tutor. How far the teacher influenced the pupil we cannot determine; he undoubtedly gave him a thorough training in rhetoric and literature—he may have inspired that love for the Hellenic past which characterized Alexander later; but it is improbable that Alexander's far-reaching ambition for conquest gained the sympathy of Aristotle. In the summer of 336 B.C. Philip was assassinated; that the murder was instigated by Olympias, whom Philip had put away in favor of the niece of his general Attalus, there is little doubt. Philip had gained a remarkable position for a Greek ruler. He had extended his empire eastward, had made Thrace tributary, and had tried to capture Byzantium.

Thessaly was dependent on him; he had gained a place in the Amphictyonic Council; and, by his victory at Chæronea (August, 338), he had made himself the head of all Greece, a position formally recognized by the Congress of States at Corinth in the following year. The greatest legacy, however, which he left his son was the large conception of a Panhellenic empire.

At his accession Alexander found himself surrounded by enemies at home and threatened by dangers abroad. The subject States were planning to revolt, and Greece hated the Macedonian hegemony. But the hands of assassins cleared away his domestic enemies. With the greatest speed he descended to the south; before the summer closed he had reestablished Macedonia's position in Lower Greece and had been elected by the Congress at Corinth to his father's place as General of the Greeks against the Persians (336). The next year he speedily carried out a successful campaign against the defecting Thracians, and penetrated to the Danube. On his return he crushed in a single week the threatening Illyrians and then hurried into Greece, for certain States had been negotiating with Persia. When a report spread that Alexander was dead, the Thebans sought to throw off the Macedonian yoke. Alexander hastened from Illyria to Thebes, defeated the Thebans, and captured the city. In September, in accordance with a vote of the Congress of Corinth, he razed Thebes to the ground, sparing only the house of the poet Pindar. This prompt action ended all positive resistance in Greece and left Alexander free to enter on his eastern campaigns.

At the beginning of 334 he crossed to Asia Minor, where his generals had already gained a foothold. To secure Macedonia and Greece he had been forced to leave behind a considerable portion of his army; only 30,000 foot and 5000 horse, it is said, followed him, yet these were undoubtedly skilled veterans. His ships numbered but 160, which were so inadequate to combat the 400 galleys of the Persians that he soon disbanded them. After visiting the site of ancient Troy and making offerings there, he advanced in early summer to meet a Persian force at the river Granicus. He was victorious and then proceeded to the conquest of Asia Minor. The prompt surrender of Sardis, without resistance, gave him the satrapy of Lydia, and Miletus soon fell. Halicarnassus resisted stubbornly for a time; but finally the defenders withdrew after firing the city. At the close of the summer's campaign Alexander marched into Lycia, which yielded at once, and then advanced through Pamphylia and Pisidia to Celænæ and Gordium, where with a stroke of his sword he loosed the famous knot and entitled himself to become the lord of Asia. See GORDIAN KNOT.

Gordium was the mustering point for the year 333. Alexander led his reassembled army first into Cappadocia, where he received the submission of Paphlagonia, and then advanced to the "Cilician Gates." By a ruse he caused the hostile force here to retire and entered Tarsus unopposed. All Cilicia was soon secured. Thus in less than two summers the greater part of Asia Minor had been won and Alexander had taken the first step in his plan of conquest. The next was to advance by way of Syria to the subjugation of Egypt; this accomplished, Alexander could proceed against Babylon and Susa. But the Great King had assembled a vast

host to check the invader. Battle was joined in the little plain of Issus, where the enormous numbers of the Orientals could not be employed to advantage. The day was decided by Alexander's attack on that part of the line where Darius was in his war-chariot (this scene is portrayed in a famous Mosaic, now in the Museo Nazionale at Naples). The Great King turned and fled, while the Greeks drove all before them. The mother, wife, and children of Darius fell into Alexander's hands, but were treated by him with the respect due royalty. While this victory at Issus opened the way to Syria and Egypt, it was far more valuable to Alexander in the prestige it gave him. Darius himself wrote to Alexander, complaining that Alexander had been an unprovoked aggressor, begging for the return of the royal captives, and proposing to make a treaty of alliance. To Alexander the letter seemed to have, after all, a tone of condescension, and his reply was a stern command to Darius, his defeated foe and subject, to come to him and offer submission.

Alexander was not lured aside to pursue and crush Darius, but moved against Syria, and against the Phœnician towns, especially Tyre and Sidon. Sidon had been reduced by Persia a few years before, so that she welcomed Persia's new foe, who accepted her submission and restored her former territory and rights. The Macedonian army reached Tyre at the end of 333; when this city declined to receive Alexander, it was at once invested. The siege lasted from January to the end of July, 332; again and again the attackers were beaten back, but at last the city fell before a concerted onslaught. Alexander now could advance on Egypt, since Syria was secure. Gaza alone offered stubborn resistance, but succumbed after a siege of some weeks.

About November, 332, Egypt, now wholly cut off from Persia, was reached, and the Persian satrap promptly yielded. At Memphis Alexander was crowned king; he then sailed down the Nile to Canopus and founded a new city bearing his name. (See ALEXANDRIA.) This he intended to become the new capital of Egypt and to supplant Tyre as the emporium of trade. History has shown how wisely the site was chosen and the city planned, but the most significant immediate result was the transfer of commerce from the Phœnicians to the Greeks. Presently Cyrene sent Alexander her submission, so that his influence extended to Carthaginian territory. Early in 331 he visited the shrine of Ammon-Rê in the Libyan desert (see AMMON), where tradition says the god acknowledged him as his son, thereby giving him divine title to succeed the Pharaohs.

The following spring Alexander returned to Tyre, where he was occupied with questions of organization. Then he started for Babylon with 40,000 foot and 7000 horse. Early in August he reached the Euphrates, then advanced across northern Mesopotamia, and marched down the banks of the Tigris. At last he heard that Darius was encamped in a plain near Gaugamela with an enormous host, which tradition reports numbered 1,000,000 infantry and 40,000 horse. October 1, 331, the armies engaged. At certain points the Greeks were hard pressed, but at a critical moment Alexander broke the Persian centre, whereupon Darius fled as he had done at Issus; finally the Macedonians won at every point. Darius was pursued to

Arbela (q.v.), where his chariot and weapons were found, but the King escaped on horse to the Median highlands. Babylon opened its gates to the victor, and there the army rested. Susa, with its enormous treasures, soon fell into Alexander's hands.

It was of great importance that Persis and its capital be secured at once, so that although the season was mid-winter Alexander pressed on over the Uxian Pass. He stormed the almost impregnable "Persian Gates" by a surprise march over snow-covered mountains, and soon was at Persepolis and the royal palaces, whose ruins still give some idea of their magnificence. No less than 120,000 talents were found in the treasuries, together with other spoil. At Pasargadæ also much treasure was taken. About four months, apparently from January to April, 330, were spent at the ancient palace of the Achæmenian kings. (See ACHÆMENES.) During this time the district of Caramania yielded. Then Alexander started in pursuit of Darius, who, he had heard, was at Ecbatana with an army; but on reaching the city he found that Darius had fled eastward. Alexander soon pressed on, but after great efforts secured only the dead body of his enemy, who had been treacherously slain by his followers. One of the murderers had fled to Hyrcania on the south shore of the Caspian, and Alexander felt it necessary to secure this district before following the other chief assassin into remoter Bactria. The Persians who had retreated into Hyrcania yielded when Alexander appeared, and left him free to advance into northern Areia, where the Persian satrap promptly surrendered. It is not possible here to give in detail the successive steps of Alexander's new advance; by midsummer, 328, he was master of Drangiana, Seistan, Gedrosia, and Arachosia, satrapies corresponding roughly to modern Afghanistan and Baluchistan; he had annexed Bactria and Sogdiana at the north, and had fixed the limits of his conquests in this direction by founding Alexandria Eschate (Khodjend) near the pass over the Tian-shan Mountains. The following year was spent in putting down uprisings and in firmly establishing his power.

Alexander then turned to the conquest of India; one purpose of this, no doubt, was to secure control of the valuable trade-routes to India. He came back to Afghanistan and at Nicæa (Kabul?) prepared for the new campaign. The advance must have been made by the Khyber Pass. The winter of 327-326 was spent in subduing the hill-men and the inhabitants of the river valleys along the western base of the Himalayas. In the spring he marched to the Hydaspes, receiving the submission of the native princes on the way. At the river he was opposed by King Porus, but by stratagem and skill the Indian monarch was defeated. Alexander gave him back his kingdom much increased, thereby securing a buffer State on his own borders, for apparently he intended the Indus to be the eastern boundary of his Empire. He then continued to the south-east until he reached the river Hyphasis. Here the Macedonians refused to go farther, and unwillingly Alexander was obliged to turn back when, as he thought, he was near the end of the world. He returned to the Hydaspes; then advanced southward, subduing the tribes of the Lower Punjab, and finally reached the Indian Ocean in the early summer of 325. Part of his

ALEXANDER THE GREAT
MARBLE BUST IN THE BERLIN MUSEUM

force had already been dispatched to reduce a revolt in Arachosia. Alexander himself started in early autumn to return to Babylon across the desert of Mekran, while his fleet was to find a seaway between the East and the West. For two months he and his army struggled across the desert, suffering from heat, hunger and thirst. The losses were very great, so that only a portion of those who started reached the capital of Gedrosia. After a rest, Alexander pressed on to Kirman, where he met his Admiral, Nearchus, who in spite of great hardships had made the voyage from India. He was ordered to sail along the Persian Gulf and up the river Pasitigris to Susa, whither Alexander proceeded overland. Upon his arrival his first task was the correction and punishment of misrule on the part of his satraps, many of whom, believing he would never return, had oppressed their provinces and had planned to set up independent kingdoms. When the abuses had been corrected and the guilty punished, Alexander set about the further amalgamation of the Greeks and the Orientals. He had already founded Greek cities wherever he had been; he now encouraged intermarriage and set the example himself by taking to wife Statira, the daughter of Darius. He had already married Roxana (q.v.), a Bactrian princess; he thus followed the polygamous custom of Persia. Many of his officers chose Persian consorts. Furthermore he planned to admit Orientals and Greeks to equality in military service, and established military schools in the various provinces, much against his veterans' wishes.

The greater part of the year 324 was spent in a survey of the Persian Gulf and in general organization at Ecbatana. In the winter Alexander returned to Babylon, where embassies from the remotest west came to seek his friendship. But his mind was now busy with plans for building up a great sea trade with India by way of the Red Sea, the Persian Gulf, and the Indian Ocean. Babylon was to become a great seaport. With these things in view he planned a naval expedition to circumnavigate and conquer Arabia. Before this could start, Alexander fell ill of a fever following a carouse, and in 12 days he lay dead (June, 323).

The rapidity and brilliancy of Alexander's military operations have generally obscured his preëminent qualities as a statesman. He inherited from his father the concept of a great empire, and he had the genius to lay the foundations of a unified realm surpassing the dreams of Philip. Throughout the course of his conquest he organized the rule of his satrapies so that the power was divided and revolt made difficult. Seeing that the ruler of the vast realm which he was conquering should adopt much of the native custom, he assumed not a little Oriental state, which undoubtedly strengthened his position in spite of the disapproval it aroused among his Greek followers; and he took many wise measures to amalgamate the East and the West. His plans for trade development would have had great effect on social and economic conditions if he could have carried them out. The unified Empire which he had created was soon divided among many Macedonian rulers. Yet all the results of his work were not lost. The small Hellenic State had disappeared forever with its narrow exclusiveness, and a more tolerant attitude was maintained by the Greek world after him. The Romans

entered into the fruit of his conquests, and the spread of Christianity in the East was made the easier by them.

Wheeler's *Life* (New York, 1900); J. P. Mahaffy, *The Story of Alexander's Empire* (1886); *Progress of Hellenism in Alexander's Empire* (1905). See ALEXANDER, LEGEND OF.

ALEXANDER, THE PAPHLAGONIAN. A celebrated impostor of the early part of the second century A.D., of whom Lucian gives a description. He was born at Abonouteichos, in Asia Minor, and after being for some time associated with another charlatan named Coccynas, of Byzantium, returned to his native place and established a pretended oracle of Æsculapius, whom he showed in the form of a serpent. Here he gained great reputation, which extended even to Italy. He was especially resorted to during the plague of 166 A.D..

ALEXANDER, SIR WILLIAM, EARL OF STIRLING (c.1567-1640). A Scottish poet and statesman; born probably at Menstrie. He was educated at Glasgow University, traveled on the Continent, was tutor to the young Earl of Argyle, and so found access to the court of James I of England. He wrote sonnets, the *Four Monarchick Tragedies*, *Elegy on the Death of Prince Henry*, *Doomsday*, and many minor poems. In 1621 he received the largest gift ever bestowed on a subject, viz., a "gift and grant" of Canada, including Nova Scotia and Newfoundland; a striking expression of royal ignorance of geographical limits in America. Charles I confirmed the grant. Alexander was made Secretary of State for Scotland in 1626, in 1630 was created a peer as Lord Alexander of Tullibody and Viscount Stirling, and was made judge of the Sessions in 1631. The next year he built the Argyle House, still one of the sights of Stirling. In 1633 he was made Earl of Stirling and Viscount of Canada and in 1639 Earl of Dovan. Consult *Poetical Works*, with memoir (Glasgow, 1870-73), and for his biography, Rogers, *Memorials of the Earl of Stirling* (1877).

ALEXANDER, WILLIAM (1726-83). An American soldier, generally called "Lord Stirling." He was born in New York City and was the son of James Alexander (q.v.). He served in the French and Indian War, first as commissary and then as aid-de-camp to General Shirley: but went to England in 1756 to defend Shirley against the charge of neglect of duty (see SHIRLEY, WILLIAM), and to urge his claim before the House of Lords to the earldom of Stirling, through descent from Sir William Alexander, Earl of Stirling (c.1567-1640). This claim was not allowed, and in 1761 he returned to America. He soon became Surveyor-General and a member of the Provincial Council, and in November, 1775, enlisted as Colonel in a New Jersey regiment. In January, 1776, he was promoted to the rank of Brigadier-General, and on August 27 took a conspicuous part in the battle of Long Island (q.v.), where his brigade was almost annihilated and he himself was captured. He was exchanged within a month, became a Major-General in February, 1777, served with great gallantry and efficiency in the battles of Brandywine, Germantown, and Monmouth, and subsequently was in command at

Albany, N. Y., until his death. He was well educated, was an enthusiastic student of mathematics and astronomy, and was one of the founders and first governor of King's College (now Columbia University). He published a pamphlet entitled *The Conduct of Major-General Shirley, Briefly Stated* (1756), and *An Account of the Comet of June and July, 1770*. Consult W. A. Duer, *Life of William Alexander, Earl of Stirling*, in the collection of the New Jersey Historical Society for 1847, and Charles Rogers, *Memorials of the Earl of Stirling and of the House of Alexander*, 2 vols. (Edinburgh, 1877).

ALEXANDER, WILLIAM (1824–1911). Protestant Archbishop of Armagh and Primate of all Ireland. He was born at Londonderry and was educated at Tunbridge School and at Exeter and Brasenose colleges, Oxford. After entering holy orders he first served a curacy in the north of Ireland, and later became chaplain to the Marquis of Abercorn, Lord Lieutenant of Ireland. He then successively occupied the positions of Dean of Emly (1863) and Bishop of Derry and Raphoe (1867). In 1896 he was enthroned as Archbishop of Armagh. Bishop Alexander, who was select preacher before the universities of Oxford (1870–72 and 1882), Cambridge (1872 and 1892), Dublin (1879), and lecturer at Columbia College (1892), was the author of the following important works: *Witness of the Psalms to Christ* (Bampton Lectures, 3d ed., 1890); *Verbum Crucis* (1892), *Discourses on Epistles of St. John* (1889), *Commentaries on Epistles to Colossians, Thessalonians, Philemon* (Speaker's Commentaries, vols. iv, v); *St. Augustine's Holiday and Other Poems* (1887); *Primary Convictions* (2d ed., 1898); *Leading Ideas of the Gospels* (3d ed., 1898); *The Finding of the Book, and Other Poems* (1900); *Our National Church* (1906).

ALEXANDER, WILLIAM LINDSAY (1808–84). A Scotch divine, born in Edinburgh. He was educated at Edinburgh and St. Andrews, became pastor in Edinburgh, 1835, and professor of theology in the Congregational Theological Hall in that city, 1854. He was a member of the Old Testament Company of the Bible Revision Committee. His publications embrace *The Connection and Harmony of the Old and New Testaments* (London, 1841; 2d ed., 1853); *The Ancient British Church* (1852; ed. by S. G. Green, 1891); *Christ and Christianity* (1854); *Life of Ralph Wardlaw, D.D.* (Edinburgh, 1856); *Labor and Adventure in Northern Europe and Russia* (ed. by J. Paterson, D.D., London, 1858); *A Commentary on Deuteronomy* (1881), and one on *Zechariah* (1885), edited with a life; Charles Ferme's *Analysis on Romans* and A. Melville's *Commentary on Romans*, both translated from Latin (Edinburgh, 1860); and the third edition of Kitto's *Biblical Encyclopædia* (3 vols., 1862–66), translation of Haevernick's *Introduction* (1852), and part of *Dorner's Person of Christ* (1861). For his biography, consult J. Ross (Edinburgh, 1886).

ALEXANDER ÆGUS. See ROXANA.

ALEXANDER ÆTO'LUS (Gk. Ἀλέξανδρος ὁ Αἰτωλός, *Alexandros ho Aitōlos*). A Greek poet (c.315–265 B.C.), the one Ætolian poet of whom we have knowledge. Though born in Ætolia (q.v.), he lived mainly at Alexandria, where he was considered one of the seven poets of the Alexandrian tragic pleiad; he was busy there also in the library. (See ALEXANDRIAN AGE.) He also wrote short epics, elegies, and

epigrams, of which fragments have been preserved. These fragments, published in Bergk's *Poetæ Lyrici Græci*, attest the cultivated taste of the writer and prove him one of the immediate predecessors of Callimachus. Consult Couat's *La poésie alexandrine* (1882); Susemihl, *Geschichte der griechischen Litteratur in der Alexandrinerzeit*, vol. i (Leipzig, 1891–92).

ALEXANDER ARCHIPELAGO. A group of over 1100 islands and islets off the west coast of Alaska, U. S., in lat. 54° 40' to 58° 25' N. Chichagof, Baranof, Kupreanof, Kuiu, Admiralty, and Prince of Wales are the largest. The town of Sitka is on Baranof Island, the most important of the group.

ALEXANDER BALAS. King of Syria (150–145 B.C.). He was probably born in 173 B.C. Whether he was the second son of Antiochus IV Epiphanes who had escaped when his brother Eupator was murdered, as he himself claimed, and Eumenes and Attalus, of Pergamum, and Ptolemy VII Philometor, of Egypt, maintained, or an impostor possessing a marked resemblance to Eupator, used as a tool by Eumenes, as Diodorus, possibly on the authority of Polybius, the friend of Demetrius, states, cannot be positively decided. In 153 he appeared in Rome with Laodice, the daughter of Antiochus Epiphanes, to plead his cause. Supported by Rome, Pergamum, Cappadocia, and Egypt, he struggled with Demetrius I. In 152 he appointed Jonathan, the Hasmonæan, as high priest, an office which the latter publicly assumed at the Feast of Tabernacles of that year. In 150 B.C. Alexander married Cleopatra, daughter of Ptolemy VII Philometor, and on that occasion conferred on Jonathan the titles of military and civil governor. In 147 B.C. Apollonius, Governor of Cœle-Syria, took up arms for Demetrius II, but was defeated by Jonathan at Ashdod. The Hasmonæans had every reason to be pleased with Alexander. But he was an incapable and corrupt ruler and hated by his soldiers, who deserted him in 145 B.C. He fled to Abbae, in Arabia, and was there assassinated. His official surnames were Theopator Euergetes, but in Syria he was also called Balas, which may represent Baal. See Niese, *Geschichte der griechischen und makädonischen Staaten*, vol. iii (1903); Bevan, *The House of Seleucus II* (1902); Bouché Leclercq, *Histoire des Seleucides* (1913).

ALEXANDER COL'UMN (Russ. *Aleksandrovskaia Kolonna*). A monument to Alexander I of Russia. See SAINT PETERSBURG, *Topography*.

ALEXANDER JANNÆ'US (Lat. form of Heb. *Yannai*, Jonathan) (129–78 B.C.). King and high priest of the Jews from 104 to 78 B.C. He was warlike and energetic and extended the frontiers of his kingdom toward the west and the south. Severely defeated by Ptolemy Lathyrus in Galilee, he formed an alliance with Cleopatra of Egypt and drove the invader from the country. Wars with the Moabites, the Ammonites, and the Arabians engaged his attention till his death. Internally his reign was marked by bitter conflicts between the Sadducees, of which party he was the head, and the Pharisees, who comprised the vast mass of the people. It is estimated that 50,000 people perished in the civil strife. In putting down a revolt at Jerusalem he slaughtered 6000 of the insurgents, and in the year 86, returning triumphantly from exile, where he had been driven by the Pharisees,

he caused 800 rebels to be crucified in his presence and their wives and children to be butchered before their eyes. Consult Josephus, *Antiquities of the Jews*, book xiii, chaps. xii–xv, and *Jewish War*, book i, chap. iv.

ALEXANDER JOHN I (1820–73). Prince of Rumania from 1859 to 1866. He was a Moldavian boyar, by name John Cuza, who, when Moldavia and Wallachia determined to form a Rumanian State, was elected Prince of Rumania under the above title by the Assemblies. He received the recognition of the Sultan in 1861. His reign was arbitrary and unconstitutional and convinced the Rumanians of the impracticability of having as sovereign one of their own number. He followed the example of Napoleon III in his methods, endeavoring to mask arbitrary government under plebiscites and universal suffrage. He became exceedingly unpopular and was forced to abdicate in 1866.

ALEXANDER KARAGEORGEVITCH, kä'râ-gâ-ôr'gâ-vich (1806–85). Prince of Servia, born at Topola. He was for a time an officer in the Russian army and was chosen prince in 1842. Wholly under Austrian influence, he angered the National party by his neutrality during the Crimean War and in 1858 was deposed. He was accused of conspiracy in the murder of the Prince Michael (1868) and was sentenced to an imprisonment of 20 years *in contumaciam*. The few reforms accomplished during his reign are not to be attributed to him.

ALEXANDER LAND. A land area in the Antarctic (lat. 68° 43' S., long. 70° to 75° W.), discovered by Bellingshausen in 1821.

ALEXANDER NEVSKI, nyëf'skê (1220–63). A Russian hero and saint. He was born at Vladimir, the son of Prince Yaroslav of Novgorod. In order to defend the country, which was attacked on all sides, but especially by the Mongols, his father left Novgorod, intrusting the government to his sons, Feodor and Alexander. Feodor died soon after. Alexander vigorously resisted the enemy, but Russia was forced to submit to the Mongol dominion in 1240 A.D. Alexander now fought to defend the western frontier against the Danes, the Swedes, and the Teutonic Knights. He received the surname of Nevski from the splendid victory over the Swedes, which he won in 1240 on the Neva, in the region where St. Petersburg now stands. In 1242 on the ice of Lake Peipus he defeated the Livonian Knights of the Sword, who had been instigated by the Pope to attack the Russian heretics. After the death of his father, in 1246, he became Grand Duke of Kiev and Novgorod, and in 1252 through the influence of the Tatars Grand Duke of Vladimir. Pope Innocent IV made a diplomatic attempt in 1251 to reunite the Greek and Roman churches, since his military scheme had failed, and with this end in view sent an embassy to Alexander, which, however, proved ineffectual. To the end of his life Alexander remained a vassal of the Tatars or Mongols. Thrice he had to renew his oath of fealty to the Asiatic barbarians, making in each instance a journey to their camp. He died Nov. 14, 1263, on his return from the last of these journeys. The gratitude of the nation perpetuated his memory in popular songs and even canonized him. Peter the Great honored his memory in 1723 by building a magnificent convent on the spot where he had fought his great battle, and in 1725 founded the knightly order of St. Alexander Nevski.

ALEXANDER OF APH'RODIS'IAS. A Peripatetic philosopher, who was born at Aphrodisias in Caria and lived about 200 A.D. He was the most learned and intelligent Greek commentator on Aristotle (especially on the *Metaphysics*) and was known as "The Exegetes," or "The Expounder." His works, which formed a rich mine for later interpreters, especially Simplicius (q.v.), were early translated into Latin, and are thus in large part preserved; they are still of good service in the interpretation of Aristotle. He also wrote original treatises, the most important of which are those *On Fate* and *On the Soul*. At the time of the Renaissance a philosophic school which adopted Aristotle's views on immortality was named after him "the Alexandrist" (q.v.).

ALEXANDER OF HALES, hâlz (Lat. *Alexander Halensis*) (?–1245). A famous English theologian, known as "the Irrefragable Doctor." He was born in Hales, Gloucestershire, but had attended the schools of Paris, had taken the degree of doctor, and had become a noted professor of philosophy and theology there, when (1222) he suddenly entered the Order of the Franciscans and became a lecturer among them. He resigned in 1238 and died as a simple monk in Paris, 1245. His chief and only authentic work is the *Summa Universæ Theologiæ* (best ed., 4 vols., Venice, 1576), written at the command of Pope Innocent IV, and enjoined by his successor, Alexander IV, to be used by all professors and students of theology in Christendom. Alexander gave the doctrines of the Church a more rigorously syllogistic form than they had previously had and may thus be considered as the author of the scholastic theology. Instead of appealing to tradition and authority, he deduces with great subtlety, from assumed premises, the most startling doctrines of Catholicism, especially in favor of the prerogatives of the papacy. He refuses any toleration to heretics and would have them deprived of all property; he absolves subjects from all obligation to obey a prince who is not obedient to the Church. The spiritual power, which blesses and consecrates kings is, by that very fact, above all temporal powers, to say nothing of the essential dignity of its nature. It has the right to appoint and to judge these powers, while the Pope has no judge but God. In ecclesiastical affairs, also, he maintains the Pope's authority to be full, absolute, and superior to all laws and customs. His work marks the completion of the first great period of scholasticism.

ALEXANDER OF PHERÆ. See PHERÆ.

ALEXANDER OF THE NORTH, THE. Charles XII of Sweden. Sometimes so called from his warlike exploits.

ALEXANDER POL'YHIS'TOR (Gk. Πολύιστωρ, *polyhistōr*, very learned). A famous historian of the first century B.C., who was a native of Cottyacum, in Phrygia, but was educated at Miletus. In Sulla's war against Mithridates he was taken captive and brought to Rome, where Cornelius Lentulus gave him his freedom. Sulla afterward granted him Roman citizenship. Alexander gained the surname Polyhistor because of the great number of his historical works; but he also wrote on geography, grammar, science, rhetoric, and philosophy. All of his books have perished; but they were extensively quoted by Pliny the Elder, Diogenes Laertius, and particularly Clement of Alexandria and Eusebius. These excerpts show him to

have been a rather poor compiler without marked literary ability or historical judgment. But he was evidently a great reader, and he perused Jewish and Samaritan works as well as Greek authors. Thus the world is indebted to Alexander for all extant information concerning such Jewish writers as Philo, the epic poet; Ezekiel, the tragedian; Eupolemus, the historian; Demetrius, the historian; Artapanus, the chronicler; Aristeeas, the historian, and such Samaritan writers as Theodotus and Molon. The genuineness of these fragments has been doubted by Rauch and Cruice; but the defense by Müller, Freudenthal, and Schürer is quite convincing. Alexander refers twice to the Bible and gives from Berosus the story of the Deluge and possibly also the legend of the confusion of tongues. The text of the fragments will be found in Eusebius, *Præparatio Evangelica* (London, 1842) and Clement, *Stromata*, i, 21, 130 (Oxford, 1869); Müller, *Fragmenta*, iii, 211 ff., and translated in I. R. Cory's *Ancient Fragments* (London, 1876), J. Freudenthal, *Hellenistische Studien* (Breslau, 1875), Unger, in *Philologus*, 1888, Montzka, in Lehmann's *Beiträge zur alten Geschichte*, ii, pp. 351 ff. (1902), and E. Schürer's *Geschichte des jüdischen Volkes*, iii, 469 ff. (4th ed., 1909), discuss excellently the question of their genuineness.

ALEXANDER SEVERUS (c.205–235). Emperor of Rome from 222 to 235 and cousin, adopted son, and successor of Elagabalus. The excellent education which he received from his mother, Julia Mammæa, rendered him one of the best princes in an age when virtue was reckoned more dangerous than vice in a monarch. He sought the society of the learned; Paulus and Ulpian, the jurist (q.v.), were his counselors; Plato and Cicero were, next to Horace and Vergil, his favorite authors. Although a pagan, he revered the doctrines of Christianity, and often quoted the saying, "Whatsoever ye would that men should do to you, do ye even so to them." Beloved as he was by the citizens on account of his equity and wisdom, and for the simplicity and purity of his life, he was too weak to maintain discipline in the army, and so soon became an object of hatred to the unruly Prætorian Guards. His first expedition, against Artaxerxes, King of Persia, was happily terminated by a speedy overthrow of the enemy. But during one which he undertook against the Germans on the Rhine, to defend the frontiers of the Empire from their incursions, an insurrection broke out among his troops, headed by Maximinus, in which Alexander was murdered, along with his mother, not far from Mainz. The grateful people, however, enrolled him among the gods. After his death military despotism obtained the ascendancy.

ALEXANDER'S FEAST, OR THE POWER OF MUSIC. An ode written by John Dryden for St. Cecilia's Day, 1697. It contains a number of lines now familiar from quotation.

AL'EXAN'DRA, CAROLINE MARIE CHARLOTTE LOUISE JULIE (1844—). Dowager Queen of England, was born at Copenhagen, Dec. 1, 1844, the daughter of Christian IX, King of Denmark. She was married to Albert Edward Prince of Wales, March 10, 1863, and had three sons (two of whom have since died) and three daughters. She visited Russia at the time of the death of Alexander III and also made several visits to Denmark. She took interest in many benevolent enterprises and became an ac-

complished musician, holding the degree of honorary musical doctor. Upon the accession of Albert Edward to the throne (1901) she became Queen of England, and reigned with him until his death, May 6, 1910. She celebrated in 1913 the fiftieth anniversary of her wedding and of her arrival in England. Consult S. A. Tooley, *Queen Alexandra* (London, 1902). See EDWARD VII.

ALEXANDRA, FEODOROVNA. Empress of Russia. See ALEXANDER III.

ALEXANDRA FALLS. See HAY RIVER.

ALEXANDRE, ä'läks-än'drä, RABBI AARON (c.1766–1850). A German chess-player, born at Hohenfeld, Bavaria. He went to Strassburg in 1893, as an instructor in German, and subsequently to Paris and London. He published an *Encyclopédie des échecs* (1837) and a *Collection des plus beaux problèmes d'échecs* (1846), both still valuable.

ALEXANDRE LE GRAND, ä'lëks'än'dr' le grän'. The name of a tragedy by Racine, produced in 1665. The actress who played Axiane in this piece was the cause of a bitter rivalry between Racine and Molière.

AL'EXANDRET'TA, or **ISKANDERUN**, is-kän'de-röön'. A seaport of Asiatic Turkey, in the vilayet of Adana, on the Gulf of Iskanderun, which forms the extreme northeast nook of the Mediterranean Sea, 70 miles from Aleppo and 45 miles from Antioch by rail (Map: Turkey in Asia, G 4). It is surrounded by hills in a very picturesque locality. The harbor is naturally one of the best on this coast, and the town is important strategically because it commands Beilan Pass, the gateway to northern Syria. It is the port of Aleppo and the seat of an extensive trade in silk goods, wool, hides, leather, licorice, butter, cloth, and some raw products, amounting in 1910 to about \$10,000,000 for imports and about \$6,500,000 for exports. The population is about 9000. Alexandretta is the seat of a United States vice consul.

ALEXANDRI, ä'lëks-än'drë. See ALECSANDRI.

AL'EXAN'DRIA (Ar. *Iskanderieh*). A city founded by Alexander the Great, in the winter of 332 B.C., on the site of an Egyptian town, Rhacotis (Map: Africa, G 1). It was situated at the Canopic mouth of the Nile, on the low ridge separating Lake Mareotis from the Mediterranean, and was laid out by the architect Dinocrates (q.v.), of Rhodes, in the form of a parallelogram; two main streets, lined with colonnades and said to have been 200 feet wide, crossed at right angles, though somewhat to the north and east of the centre lines. The other streets were also at right angles with one another, and the arrangement seems to have remained undisturbed for a long period, although the level of the city was raised and new streets laid out above the old ones. The city had a fine double harbor, formed by building a mole (the Heptastadion), 7 furlongs in length, to the island of Pharos, off the northeast end of which was a lighthouse, regarded as one of the wonders of the world. (See PHAROS.) The small harbor, on the west, was open, but the large harbor was entered only by a narrow passage between the Pharos lighthouse and a mole built out from the promontory Lochias on the east of the city. The city grew rapidly and became one of the chief centres of the trade between the east and the west, while the generous policy of the Ptolemies, who made it their capital, attracted a large foreign population. In Roman

days the city was the capital of Egypt. (See EGYPT, near the end of the article.) At Alexandria, under the Romans, there was a very important mint.

Egyptians, Greeks, and Jews were the chief elements, each gathering in a special quarter of the city. On Lochias were the royal palaces, and the neighboring part of the city was filled with magnificent buildings, including the museum and the famous library (see ALEXANDRIAN LIBRARY), the monument of Alexander, the graves of the Ptolemies, the temple of Poseidon, and the Cæsareum—afterward a church, and once marked by the two obelisks known as Cleopatra's Needles, of which one was transported to the Thames Embankment in London in 1878, and the other to Central Park, New York, in 1881. These obelisks were originally erected by Thothmes III and were brought to Alexandria by the Romans. Near the Cæsareum was the great emporium and somewhat to the south lay the Bruchion (Βρύχιον), a residence quarter. The great temple of Serapis lay in the southwest, or Egyptian quarter, where now stands a solitary column, the so-called Pompey's Pillar, a monolith of red granite 73 feet high, erected in 302 A.D. by the Roman eparch, Pompeius, in honor of Diocletian. Earthquakes and floods have changed the surface of the ground, and but few remains are now visible, though excavations conducted for Napoleon III in 1866 by Mahmoud Bey revealed a number of paved streets, and those of 1898-99 by Dr. Noack have thrown much light upon the successive periods of building in the city. The original foundations of the time of Alexander rest on the natural rock and are about 14 $\frac{2}{3}$ feet below the paved streets, which seem to belong to an extensive rebuilding of the city by Antoninus Pius, and are now covered with the earth on which the modern city stands. The policy of Ptolemy Philadelphus and his immediate successors drew not only traders but learned men to the city, and Alexandria became the centre of Greek intellectual life during the third and second centuries B.C. (See ALEXANDRIAN AGE.) The city also developed a very characteristic type of art, which vied with that of Pergamus and seemed to have had great influence on the West. (See ARCHÆOLOGY; ALEXANDRIAN AGE.) Alexandrian influence is marked at Pompeii (q.v.) and in Provence. Consult Mahmoud Bey, *Mémoire sur l'antique Alexandrie* (Copenhagen, 1872); Lombroso, *L'Egitto al Tempo dei Greci e dei Romani* (Rome, 1882, 1886); Aeroutsos Bey, *L'ancienne Alexandrie, étude archéologique et topographique* (Paris, 1888).

In 30 B.C. Egypt passed into the hands of the Romans under Octavius (Augustus), becoming directly subject to the Emperor, and governed by a prefect appointed by him. Under Roman rule Alexandria lost much of its former pre-eminence as the capital of the Hellenistic world; and though for many centuries it continued to be one of the greatest cities of the Empire, especially as one of the chief sources of the grain-supply of Rome, its decline from the magnificent prosperity it had enjoyed under the Ptolemies was rapid after the first century of the Christian era. The Jewish inhabitants of Alexandria joined in the great national revolt of 116 A.D., and in the desperate struggle which ensued the Jewish population was annihilated, and a large part of the city was destroyed. The excesses of the Alexandrian mob, famous

throughout the Empire for its fickleness and its violence, plunged the city into misfortunes twice during the third century. In 215 the seditious conduct of the populace led to a general massacre of the inhabitants at the order of the Emperor Caracalla. Forty-five years later civil war broke out among the different quarters of the city, lasting for 12 years and resulting in the destruction of the Bruchion, the richest district of Alexandria, with its ancient palaces, temples, and public buildings. With the rise of Alexandria as one of the great Christian capitals of the Empire, religious tumult took the place, in large measure, of political dissension, and paganism and Christianity fought out their battle in many bloody riots. The triumph of the new faith was signalized in 389 by the destruction of the Serapion, the last refuge of the pagan belief, but religious peace was by no means secured. (On the destruction of books at this time in the Serapion, see F. J. Teggart, in the *New York Evening Post*, July 7, 1898.) Between 413 and 415 the patriarch Cyril led mobs of monks against the heretics and Jews, and one of these militant bands tore to pieces the beautiful pagan priestess, Hypatia (q.v.). In 616 Alexandria was taken by Chosroes, King of Persia. In December, 641, it fell into the hands of Amru, the Mohammedan conqueror of Egypt, General of the Caliph Omar. The story of the destruction at this time of the famous library at the command of the Caliph Omar is discredited. With the Arabian conquest a period of swift decay set in. The commerce of the city was almost entirely diverted to other cities, the last remnants of its prosperity being destroyed by the discovery of the all-water route to India. Toward the end of the eighteenth century its population was probably less than 7000. On July 2, 1798, Alexandria was taken by the French, who held it until Aug. 31, 1801. In the nineteenth century the city entered upon a new era of prosperity under the wise rule of Mehemet Ali. During the disturbances in connection with the rebellion of Arabi Pasha (q.v.), Alexandria was bombarded by the English fleet under Admiral Seymour, July 11-12, 1882.

Modern Alexandria is divided into two parts. The peninsula between the eastern and western harbors is inhabited chiefly by Mohammedans. It has crooked and narrow streets, a large number of mosques, and, with the exception of the palaces of wealthy Turks, few buildings worthy of notice. The European quarter is situated on the mainland south of the eastern harbor. It is well built and has many of the improvements essential to a modern city. The centre of the European city is the Mehemet Ali Square, containing the statue of Mehemet Ali and surrounded by the official buildings and the finest residences of the Europeans. There are three theatres, a number of churches of different denominations, and the museum of Græco-Roman antiquities. Alexandria has two harbors. The eastern is accessible only for vessels of very light draught and is used mostly by fishing vessels. The western harbor is the chief shipping centre; commercial steamers entered, in 1911, 2014 of 3,443,705 registered tons net. There is, besides, the outer harbor, protected by a mole nearly two miles long. Alexandria is at present one of the chief commercial ports on the Mediterranean and the principal port of Egypt. Its imports and exports in 1911 were valued at £E23,680,344 and £E28,014,926 respectively. The chief arti-

cles of export are grain, cotton, beans, sugar, and rice. With Cairo, Alexandria is connected by rail (since 1855) and by the Mahmudieh Canal. Along the latter are situated the summer residences of the Europeans. It is also connected by cable lines with Malta, Cyprus, Crete, and Port Said. The city obtained a new and adequate water supply in 1906. The population was 332,246 in 1907. It consists chiefly of Mohammedans, with about 50,000 Europeans, mostly Greeks and Italians. Consult Sharpe, *Alexandrian Chronology* (London, 1857), and Kingsley, *Historical Lectures and Essays* (New York, 1889). See EGYPT.

ALEXANDRIA, ä'lëks-än'drë-ä. The principal town of the district of the same name in the government of Kherson, Russia, situated at the confluence of the Berezovka and Ingulets rivers, 216 miles from the city of Kherson and about 950 miles from St. Petersburg. The principal occupations of its inhabitants are farming and cattle-raising, and much activity is displayed in its tanning, soap, and candle-making industries. Pop., 1885, 17,400; 1897, 14,000; 1910 (est.), 15,000.

AL'EXAN'DRIA. A villa and country-seat in Peterhof, one of the summer residences of the imperial family of Russia. Planned at the initiative of Alexander I, the noble structure was finished and the grounds laid out only in 1830, during the reign of Nicholas I.

ALEXANDRIA. A city in Madison Co., Ind., 50 miles northeast of Indianapolis, on the Cleveland, Cincinnati, Chicago and St. Louis, and Lake Erie and Western railroads (Map: Indiana, D 2). It has extensive manufactures of glass, paper, mineral wool, and wire fence. Situated in an agricultural region, Alexandria produces much fruit and grain, and many vegetables. The city operates its own water works and has a Carnegie library. Alexandria was first settled in 1834, and is governed under a legislative act of 1905, which provides for a city council of six members and places the mayor's term at four years. The city, once the centre of a natural gas belt, suffered a great loss of population and industrial prosperity with the failure of the gas supply. Pop., 1890, 715; 1900, 7221; 1910, 5096.

ALEXANDRIA. A city and the county-seat of Rapides parish, La., 193 miles northwest of New Orleans, on the Chicago, Rock Island, and Pacific, the Louisiana and Arkansas, the St. Louis, Iron Mountain, and Southern, Morgan's Louisiana and Texas, and the Texas and Pacific railroads; on the line of the Louisiana Railway and Navigation Company; and on the Red River (Map: Louisiana, C 2). It has fine government buildings, a public library, an Elks' Home, a country club, and an opera house. Alexandria is the seat of important commercial and manufacturing interests, principally in cotton, cottonseed oil and cake, sugar, molasses, and lumber. It also produces corn, rice, alfalfa, fruit, and vegetables. The city owns the Artesian water supply, the sewage system, and the electric light and power plant. Pop., 1890, 2861; 1900, 5648; 1910, 11,213; 1913 (est.), 15,000. Alexandria occupies in part the site of an old Indian village. It was once a trading post of the French and Spanish and grew rapidly, being incorporated as a city in 1819. In 1864 the city was almost totally destroyed by fire. Its later development came with the building of the Texas and Pacific Railroad to this point in 1882.

ALEXANDRIA. A city and the county-seat of Douglas Co., Minn., 130 miles northwest of Minneapolis, on the Great Northern and the Minneapolis, St. Paul, and Sault Ste. Marie railroads (Map: Minnesota, C 5). It is admirably situated in a lake region popular as a summer resort and is the centre of a productive wheat-growing and stock-raising district. The manufactures include flour, furniture, wagons, sleighs, boats and launches, stove fixtures, cutlery, and beer, and the city also has a large cold storage plant, and owns the electric light and water works. Pop., 1890, 2118; 1900, 2681; 1910, 3001; 1913 (est.), 3200.

ALEXANDRIA. A city and port of entry in Virginia. It is on the Potomac River, about 6 miles below Washington, and on the Southern, the Pennsylvania, the Atlantic Coast Line, the Baltimore and Ohio, the Seaboard Air Line, and the Chesapeake and Ohio railroads (Map: Virginia, G 3). Alexandria is 100 miles from the mouth of the Potomac, but the stream which forms its harbor is a mile wide and is accessible to large vessels. The city is able, therefore, to control an extensive and increasing trade. It has several glass factories, machine shops, fertilizer factories, a brewery, a pump factory, a silk mill, tread mills, etc. Alexandria owns and operates its gas plant, and has a public library, a hospital, an Episcopalian Theological Seminary, and notably good schools. It was first incorporated in 1749 and is now governed by a charter of 1879, as revised in 1895. The mayor is elected for four years, and the city council is a bicameral body. The people elect all important officers, such as treasurer, auditor, tax collector, etc., the city council electing the others; the mayor has no power of appointment. At Alexandria, originally called Bellehaven, Braddock made his headquarters before marching against the French in 1755, and here, on April 13, the governors of New York, Massachusetts, Pennsylvania, Maryland, and Virginia met to form plans for the expedition. Alexandria lay within the territory ceded by Virginia to the United States in 1789, but was retroceded in 1846 and again became a part of Virginia in 1847. In 1814 the inhabitants, terrified by the approach of a British fleet, secured immunity from attack by paying the equivalent of about \$100,000. During the Civil War Alexandria was occupied by Federal troops and was the capital of that part of Virginia which adhered to the Union and recognized Pierrepont as Governor. A Confederate monument, entitled "Appomattox," has been erected in the city, and the Marshall House, where Ellsworth was killed, still stands. Washington was one of the first vestrymen of Old Christ Church here. His pew and also that of General Lee are objects of great interest to visitors. Pop., 1890, 14,339; 1900, 14,528; 1910, 15,329; 1913 (est.), 16,000. Consult *Celebration of the First Centennial of the Municipal Government of Alexandria* (Alexandria, 1880).

ALEXANDRIA BAY. A village in Jefferson Co., N. Y., on the St. Lawrence River, 30 miles north of Watertown, reached by trolley from Redwood, on the Rome, Watertown, and Ogdensburg Railroad. It is the principal resort among the Thousand Islands, which lie opposite and below the village in the St. Lawrence. The entire series of islands forms a grand natural, though, to an extent, also artificially improved, park. The water works are owned by the vil-

lage. Alexandria Bay was settled about 1830 and was incorporated first in 1879. It has a library, founded by Dr. J. G. Holland, and a motor boat factory. Pop., 1890, 1123; 1900, 1511; 1910, 1899; 1913 (est.), 2000.

AL'EXAN'DRIAN AGE. The best literature of ancient Greece, especially poetry, had been fostered by two forces, religion and political freedom. With the loss of political liberty in Greece under Macedonian domination, creative power declined also, and Athens ceased to occupy the preëminent position in literature which she had so long held. During the third century B.C. Alexandria became the centre of science and literature under the direction of the Ptolemies, who used their wealth to attract poets, scholars, and artists to their capital. The religion of Alexandria by this time was not Hellenic, but predominantly Oriental. Ptolemy Soter invited to his court the learned Peripatetic philosopher, Demetrius of Phalerum, under whose advice he laid the foundations of the later collections and libraries. His son, Ptolemy Philadelphus (285-247), however, by his large expenditures became the actual founder of the museum and the libraries; his successor, Ptolemy Euergetes (247-222), fostered especially mathematical and geographical investigations; and the succeeding rulers continued the support of learning in varying degrees. The centre of intellectual life was the library in connection with the museum. This was enriched in every possible way; the total number of books about 250 B.C. is put by Tzetzes (q.v.) at upward of 530,000. The museum had porticoes, lecture halls, and rooms in which scholars lived free of cost; some of the most eminent among these received large annuities from the royal purse. The school thus established resembled in many ways a university. The highest honor attainable was the position of librarian; this was held between 285 and 150 B.C. successively by Zenodotus, Callimachus, Eratosthenes, Apollonius, Aristophanes, and Aristarchus. The chief activity of these grammarians was directed to collecting and preserving what had come down from earlier ages, to establishing standard editions of authors and to the publication of explanatory comments on them. Lists of the best authors (Canons) were also drawn up, as of the five tragedians, the nine lyric poets, and the 10 orators. Intellectual curiosity and the cosmopolitan character of the population led to translation into Greek of works in the Semitic tongues; the so-called Septuagint version of the Old Testament was made under Ptolemy Philadelphus.

Creative poetic impulse was now nearly dead, although bucolic poetry, epigram, and elegy still show originality. Most of the poets, however, were imitators who depended on learning and art and not on genius; they studied closely the works of their predecessors, reproducing more or less closely their form, but for the most part lacking their inspiration. In poetry, then, as in other fields, the Alexandrian Age is marked primarily by reflection, research, and erudition. The most important names are those of Theocritus, Apollonius Rhodius, Callimachus, Aratus, Nicander, Euphorion, and Lycophron. At this time mathematics and astronomy also flourished; the most important names in this field in the pre-Christian period are the names of Euclid, Apollonius, Eratosthenes, Aristarchus, Hipparchus, and Hero, with whom must be reckoned also Archimedes, although his life

was spent at Syracuse. Of the later scholars, Ptolemy (Claudius Ptolemæus) (second century A.D.) is famous for his geographical and astronomical works. In the field of pure and applied sciences the Alexandrian Age achieved much. Thus, Aristarchus measured the sun and the moon; Euclid wrote the first systematic treatise on geometry; Archimedes applied mathematics to hydrostatics; Apollonius of Perga wrote the first systematic treatise on conic sections; Eratosthenes worked out a calendar which was the basis of the Julian calendar; Hipparchus determined within six minutes the length of the solar year. Even after the fall of the Ptolemaic dynasty, the museum, libraries, and schools continued to make Alexandria a great intellectual centre for many centuries; the schools of philosophy in particular enjoyed great prosperity, but literary activity had by this time centred in Rome. Under Cæsar a large part of the collection of books was burned; but the loss was repaired in some measure by the removal of the Pergamene library to Alexandria and by acquisitions elsewhere. During the fourth century A.D. the city suffered severely from the struggles between Greeks and Christians, and finally Occidental learning ceased with the conquest by the Arabs in 641. See ALEXANDRIA.

Alexandrian Philosophy. The Alexandrian philosophy is characterized by a blending of the philosophies of the East and of the West, and by a general tendency to eclecticism, as it is called, or an endeavor to patch together, without really reconciling, conflicting systems of speculation, by bringing together what seemed preferable in each. Here belongs the work of Aristobulus (q.v.). The Alexandrian philosophers were, however, not without their sects; the most famous of these were the Neo-Platonists (q.v.). Uniting the religious notions of the East with Greek dialectics, they represent the struggle of ancient civilization with Christianity; and thus their system was not without influence on the form that Christian dogmas took in Egypt. The amalgamation of Eastern with Christian ideas gave rise to the system of the Gnostics (q.v.), which was elaborated chiefly in Alexandria.

On the museum and libraries, see ALEXANDRIAN LIBRARY; MUSEUM; PTOLEMY I; and consult: Ritschl, *Die alexandrinischen Bibliotheken* (Breslau, 1838) and Couat, "Le Musée d'Alexandrie," in *Annales de Bordeaux* (Paris, 1879); also, in general matters, Simon, *Histoire de l'école d'Alexandrie* (2d ed., Paris, 1845); Saint-Hilaire, *De l'école d'Alexandrie* (Paris, 1844-45), and Vacherot, *Histoire critique de l'école d'Alexandrie* (Paris, 1846-51); J. E. Sandys, *A History of Classical Scholarship* (New York, 1906-08); Susemihl, *Geschichte der griechischen Litteratur in der Alexandrinerzeit* (Leipzig, 1891-92); Baumgarten, *Die Hellenistisch-Römische Kultur* (Leipzig, 1893).

Alexandrian Art. The style of art inaugurated in the time of Alexander, centring in the city of Alexandria. It prevailed throughout the Græco-Oriental States up to the time of the Roman conquest, and even then continued to exercise great influence on the formation of Roman art. Its characteristics were: (1) Regularity of plan in laying out cities; (2) love of the colossal, exaggerated, and picturesque in architecture and sculpture; (3) invasion of the element of color and pictorial effect in all arts;

(4) love of the comic and the obscene; (5) rise of portraiture and *genre*. The old Hellenic poise had departed, and the art was one of extremes; it sought its models in every-day life and did not care for types of gods or men. The art of Pompeii shows how this art permeated Roman civilization at the beginning of the Empire. Consult: G. Schreiber, *Die hellenistischen Reliefbilder* (Leipzig, 1894); Collignon, *Histoire de la sculpture grecque* (Paris, 1892-97); Gardner, *Handbook of Greek Sculpture* (London, 1896-97); Mitchell, *A History of Ancient Sculpture* (New York, 1883); Woltmann and Woermann, *Geschichte der Malerei* (Eng. trans., New York, 1880); Mau-Kelsey, *Pompeii: Its Life and Art* (New York, 1902).

ALEXANDRIAN CO'DEX. See BIBLE.

ALEXANDRIAN LI'BRARY. The plan for this, the most famous collection of the ancient world, seems to have been formed by Ptolemy I, Soter (died 283 B.C.), perhaps at the suggestion of an Athenian, Demetrius of Phalerum. The development of this plan and the connection of the library with the museum was the work of Ptolemy II, Philadelphus, about 275 B.C., who collected books on a scale hitherto unknown and placed them at the disposal of the learned men gathered in the museum. (See ALEXANDRIAN AGE.) The management was intrusted to a series of scholars, whose labors led them to a careful study of Greek literary history and the classification of writers, with results of great importance for the transmission of classical texts to our own time. The first librarian was Zenodotus of Ephesus, under whom the poets were arranged. The first catalogue seems to have been the work of Callimachus, and included a classification of the authors, according to their principal themes, as historians, orators, etc. Under each author's name were given a brief biographical sketch, a list of his genuine and spurious works, the opening words of each work, a brief table of contents, and the number of lines occupied in the standard MSS. Variations in names or titles were carefully noted. In the time of Ptolemy Philadelphus, the number of rolls in the main library was 490,000 (often a roll contained more than one work), and in the annex, in the temple of Serapis, the Serapeum (q.v.), 42,800. At the time of Cæsar's visit, in 47 B.C., the number had risen to 700,000, of which a part was consumed in a great fire, which spread from the burning royal fleet, which Cæsar had fired to prevent its falling into the hands of the Egyptians. This loss was in part replaced by the library of Pergamus, which Antony gave to Cleopatra. In Roman times, however, the chief literary centre seems to have been the library in the Serapeum, which was destroyed when the Christians sacked the temple (390 A.D.). The fate of the rest of the library after the loss of its most valuable part is unknown, but it seems likely that much of it had been lost before the surrender of the city to the Arabs, perhaps in the time of Aurelian (272), when the larger part of the district in Alexandria in which the main library was situate was laid waste. The story of the destruction of the books by order of the Caliph Omar is now universally discredited, as resting on very unreliable sources. Consult: Ritschl, "Die Alexandrinischen Bibliotheken," in his *Opuscula Philologica*, vol. i (Leipzig, 1867); Susemihl, *Geschichte der griechischen Litteratur in der Alexandrinerzeit* (Leipzig, 1891-92); and J. E.

Sandys, *A History of Classical Scholarship*, vol. i, pp. 107 ff. (New York, 1908). See ALEXANDRIA.

AL'EXAN'DRIANS, EPISTLE TO THE. See APOCRYPHA, *New Testament*.

ALEXANDRIAN SCHOOL. 1. A school of theology founded in Alexandria by Pantænus (180-203), taught by Clement of Alexandria and by Origen, and carried on until the end of the fourth century. It presented Christian truth as modified by philosophic speculation. It was well attended and very influential. Many of the great leaders of orthodoxy came from it, as Athanasius, Cyril, the two Gregories, and Basil. In biblical interpretation it stood for the allegorical method. Consult Kingsley, *Alexandria and her Schools* (London, 1854). 2. The term is also used for the general tendencies in literature, art, and philosophy which arose in Alexandria. This city was the meeting-place of East and West, and its influence was for a tolerant cosmopolitanism.

ALEXANDRINES, ăl'ĕg-zăn'drĭnz. Rhyming verses, consisting each of 12 syllables of six measures. The name is most probably derived from an old French poem on Alexander the Great, belonging to the twelfth or thirteenth century, in which this measure was used; according to others, it was so called from the name of the author of that poem. The Alexandrine became the regular epic, or heroic, verse of the French, among whom each line was divided in the middle into two hemistichs, the cesura, or pause, falling at the end of the sixth syllable. Though Corneille was usually very careful to observe this rule, French poets, from Racine on, have not hesitated to take the greatest liberties with it in order to avoid the monotonous regularity. In Victor Hugo's *La légende des siècles* the cesura may be found in almost any part of the line; and there are verses which have as many as two or three cesuras. Nor in English is this rule always observed, as in the following verse from Spenser:

That all the woods shall answer, and their echo ring.

The only considerable English poem wholly written in Alexandrines is Drayton's *Polyolbion*; but the Spenserian stanza regularly ends in an Alexandrine, and the measure occurs occasionally in blank verse and in our common heroic verse, as the last verse of a couplet:

When both are full, they feed our blest abode,
Like those that watered once the paradise of God. — *Dryden*.

AL'EXAN'DRISTS. Those Renaissance followers of Aristotle who attached themselves with much zeal to the interpretation of Aristotle given by Alexander of Aphrodisias. They stood in bitter rivalry with the Averroists and the Thomists. The dispute concerned itself chiefly with the relation between the individual soul and the universal reason, and with the consequences of this relation for personal immortality. The Thomists, following Thomas Aquinas, held that Aristotle regarded reason as belonging to the individual soul; the Alexandrists maintained that Aristotle considered the individual soul as a merely animal and mortal function, which during the earthly life alone is rationalized by the informing power of universal reason; the Averroists held the intermediate view, viz., that the universal reason works upon the soul and makes it actual intelligence, and then incorporates this actual intelligence with its own eternal nature. Accordingly, the Thom-

ists believed in individual immortality, the Alexandrists in no individual immortality, and the Averroists in the immortality of what has been the individual, but has lost its individuality, to be taken up as a permanent element in the life of God. The leading Averroists were Nicoletto Vernias (died 1499), Alessandro Achilini (died 1518), and Agostino Nifo (1473-1546); the leading Alexandrists were Ermolao Barbaro (1454-93) and Pietro Pomponazzi (1462-1524), the leading Aristotelian of his time; among the Thomists of the Renaissance may be mentioned Francis Suarez (1548-1617). Consult Ueberweg-Heinze, *Grundriss der Geschichte der Philosophie* (Berlin, 1894-98; Eng. trans. by Morris, New York, 1871), and E. Renan, *Averroès et l'Averroïsme* (Paris, 1852).

AL'EXAN'DRITE. See CHRYSOBERYL.

ALEXANDROPOL, ä'lëks-än-drō'pōl (*Alexander* + Gk. πόλις, *polis*, city), formerly GUMRI. A fortified town in Russian Armenia, 85 miles southwest of Tiflis, and 30 miles from Kars on the Arpa-Tschai (Map: Russia, F 6). It is the largest town in the Aras basin, and its importance as a strategic point commanding the entrance to Armenia was recognized by the Russians, who, in 1837, founded it as a stronghold. The fort is 300 feet above the town, which is nearly a mile above sea level, and is large and strong, capable of accommodating 10,000 soldiers. It has been the scene of several encounters between the Russians and the Turks. The chief industry of the town is the manufacture of silk. Pop., 1885, 22,600; 1897, 32,000.

ALEXANDROV, ä'lëks-än'drof. A town in Russia in the government of Vladimir, on an affluent of the Kliasma, a branch of the Volga, 72 miles east of Moscow (Map: Russia, E 3). It was a favorite summer residence of the Czar Ivan the Terrible, who introduced here in the sixteenth century the first printing-press used in Russia. There is here a magnificent imperial stud, established by the Empress Elizabeth in 1761 and completed about 20 years after. The town is noteworthy for its convent, in the burial grounds of which are kept the remains of two sisters of Peter the Great. Steel and cotton manufactures are prominent industries. Pop., 1885, 6700; 1897, 6848.

ALEXANDROVSK, ä'lëks-än'drofsk. A fortified town in the south of Russia, in the government of Ekaterinoslav, on the left bank of the Dnieper, below the cataracts, about 80 miles by rail south of Ekaterinoslav (Map: Russia, E 5). Inland productions are shipped here for the Black Sea, and it is known for its storing facilities, but it has no considerable industries of its own. In the vicinity there are many hillocks, or mounds, which are in all probability the graves of the great chiefs of the ancient Scythians. Opposite the town is the Khortista Island, the chief seat of the famous Zaporogian Cossacks in the seventeenth century. Pop., 1885, 6700; 1897, 16,393.

ALEXANDROVSK - GRUSHEVSKI, grōō-shëf'skê. A town in the territory of the Don Cossacks, Russia, situated on the river Grushevka, about 20 miles from Novo-Tcherkask. It is well known for the rich coal mines in its vicinity, notably along the banks of the Grushevka. The anthracite coal of these deposits is of remarkable purity, containing as much as 94 per cent of carbon, the highest percentage found anywhere. The discovery of coal in this region dates as far back as the latter part of the

eighteenth century, but exploitation of the mines was not commenced until 1839. The yearly output of the mines averages over half a million tons. Pop., 1910, 45,536.

ALEXEI, ä'lëk-sä', ALEXANDROVITCH (1850-1908). A Russian Grand Duke, fourth son of Alexander II, and uncle of Nicholas II, born Jan. 14, 1850. In 1872 he traveled through the United States. He was Commander-in-Chief of the fleet during the Russo-Japanese War, but the disasters which befell the naval forces of Russia in the course of the war followed by the repeated mutinies of the sailors in the Black Sea and the Baltic revealed the deplorable condition to which mismanagement and corruption had reduced the naval strength of the Empire and led to his resignation in the latter part of 1905.

ALEXEI MIKHAILOVITCH, më-kī'lō-vëch (1629-76). Russian Czar, second of the Romanoffs. He succeeded his father, Michael Feodorovitch, in 1645. Owing to his inexperience and youth, the early part of his reign was a stormy one, but in 10 years he had quelled all insurrectionary feeling and was prepared for foreign conquests. In his two campaigns against the Poles (1654-56 and 1660-67), he took Smolensk, overran and devastated almost the whole of Lithuania, and even secured for himself the possession of several provinces. He also gained a part of the Ukraine; and though his war with Sweden (1656-58) was unfortunate, he lost nothing by the following peace. His reign was also marked by great extension of Russian influence eastward, many freebooting raids of the Cossacks over the central Asiatic steppes, and an actual attack on China via the direction of the Amur River. Alexei conferred great benefits on his countrymen by the introduction of various important reforms into the Russian laws; he ordered translations of numerous scientific works, chiefly of a military nature, and even ventured on some ecclesiastical changes. In his private character he was amiable, temperate, and pious. By his second wife, the beautiful Natalia Naryshkin, he was the father of Peter the Great.

ALEXEI PETROVITCH, pë-trō'vëch (1690-1718). The eldest son of Peter the Great of Russia. He was born at Moscow. Because he had shown himself opposed to the reforms and innovations made by the Emperor, Peter threatened to exclude him from the succession to the throne. With this prospect he appeared to be satisfied and declared his intention of spending the remainder of his days in a monastery. But when Peter the Great undertook his second tour in western Europe, Alexei, under the pretense of following the Czar, escaped in 1717 to Vienna and thence went to Naples. He was induced to return to Russia, where, by the ukase of Feb. 14, 1718, he was disinherited, and an investigation was ordered, for the purpose of detecting persons concerned in his flight. A widespread conspiracy to undo all of Peter's reforms was discovered. Eudoxia, the mother of Alexei, Maria Alexeyevna, step-sister of the Czar, and several other personages were made prisoners and either executed or otherwise punished. Alexei was condemned to death, but soon afterward received a pardon. The terror and agitation of the trial, however, and the actual torture to which he was subjected, led to his death in 1718. The Czar, to avoid scandal, ordered the proceedings at the trial to be published. Other

accounts assert that Alexei was beheaded in prison. By his wife, Charlotte Christine Sophie, of Brunswick-Wolfenbüttel, Alexei left a son, who, as Peter II, was elevated to the throne in 1727. Consult Bain, *The First Romanovs* (London, 1905).

ALEX'IANs. See ALEXIUS.

ALEX'IS. In *The Faithful Shepherdess* (q.v.), by John Fletcher, the name of a shepherd. The name is taken from Vergil's second Eclogue.

ALEXIS, or ALEX'IUS I, COMNE'NUS (1048-1118) (Gk. Ἀλέξιος Κόμνηνος, *Alexios Komnenos*). One of the ablest rulers of the Byzantine Empire. He was born at Constantinople, the son of John Comnenus, brother of the Emperor Isaac Comnenus. In his youth Alexis gave brilliant promise of the vigorous military genius which he afterward manifested, and at length, after some anarchic reigns of brief duration, his soldiers succeeded in elevating him to the throne, while the old and feeble Nicephorus Botaniates, his predecessor, was obliged to retire to a monastery (1081). Gibbon graphically summarizes the position and achievements of Alexis in the forty-eighth chapter of his *Decline and Fall of the Roman Empire*. Everywhere he was encompassed with foes. The Scythians and Turks were pouring down from the north and northeast, the fierce Normans, who had violently effected a lodgment in Italy and Sicily, were menacing his western provinces; and, finally, the myriad warriors of the first crusade burst into his Empire on their way to Palestine, and encamped around the gates of his capital. Yet he contrived to avoid all perils and disgraces by the wisdom of his policy, the mingled patience and promptitude of his character, and his discipline in the camp. He reigned for 37 years, and if it had been possible to preserve the Byzantine Empire in its integrity, a ruler like Alexis might have done it.

Undoubtedly the great interest which attaches to Alexis arises from his relations to the crusaders. Historians differ as to the purity and sincerity of his conduct toward them. His daughter Anna (q.v.), who wrote his life, defends his "policy" with filial piety; but it is clear that he entertained a profound dread and suspicion of the half-civilized Franks and, knowing the weakness of his own Empire, was compelled to dissimulate. He promised them help and persuaded them to go off into Asia; but when they did not keep their agreements, he did not fulfill his promises, and simply used them as his instruments to reconquer from the Turks the islands and coasts of Asia Minor. Perhaps, however, little apology is needed for a monarch who "subdued the envy of his equals, restored the laws of public and private order, caused the arts of wealth and science to be cultivated, and transmitted the sceptre to his children of the third and fourth generations." In addition to Gibbon, consult Chalandon, *Essai sur le règne d'Alexis Ier Comnène* (Paris, 1900).

ALEXIS, or ALEXIUS II, COMNENUS (c.1168-83). Emperor of Constantinople. He succeeded his father, Manuel I, about 1180, and was deposed and strangled by his uncle, Andronicus (1183).

ALEXIS III, ANGELUS (?-1210). Brother of Isaac Angelus, Emperor of Constantinople, whose throne he usurped in 1195. In 1203 his capital was besieged and taken by the Venetians and an army of French crusaders, who reinstated Isaac II. On the capture of the city Alexis III fled, and died a few years afterward in exile.

ALEXIS IV, ANGELUS (?-1204). Byzantine Emperor in 1203-04, son of Isaac II (Angelus). After the flight of his uncle, Alexis III, he was associated with his father in the government. After reigning only a few months, however, he was deposed and put to death by Alexis V.

ALEXIS V, surnamed DUKAS MURTZUPHLOS (?-1204). Byzantine Emperor in 1204. After the murder of Alexis IV (1204), he usurped the throne, but at the end of a few weeks was deposed by the crusaders, who had resolved on a partition of the Empire of the East. He fled to the Morea, where he was seized by the Latins, tried for the murder of Alexis IV, and cast from the top of Theodosius's Pillar. Consult Pears, *Fall of Constantinople* (New York, 1886), and Oman, *Byzantine Empire* (New York, 1912).

ALEXIS, or ALEXIUS, COMNENUS (c. 1180-1222). A grandson of Andronicus I. When Constantinople was captured by the crusaders in 1204, Alexis, taking advantage of the situation, captured Trebizond and some other cities on the Black Sea. He took the title of Grand Komnenos, and became Governor or Duke of Trebizond. His family reigned there for over two centuries and a half. His grandson assumed the title of Emperor. See Gibbon, *Decline and Fall*, edited by Bury, vol. vi (London, 1898).

ALEX'IS (Gk. Ἀλέξϊς) OF THURIL. A Greek comic poet of the third century B.C. He was born at Thurii, in Magna Græcia, and was, according to Suidas (q.v.), uncle and instructor of Menander. He wrote at Athens, where, according to Plutarch, at the age of 106, he died on the stage while being crowned as victor. Suidas assigns to him 245 comedies, of which we know 130 by name; the extant fragments exhibit elegance and wit. His delineations of the parasite were skillful. He was much admired by the Romans. See the edition by Hirschig (1840) and that of Meineke, in his *Fragmenta Comico-rum Græcorum*, vols. i and iii. Consult M. Rösler, *Die Fassungen der Alexius-legende, mit besonderer Berücksichtigung der mittellenglischen versionen* (Vienna and Leipzig, 1905).

ALEXIS, WILLIBALD (1798-1871). The assumed name of Wilhelm Häring, the founder of the German historical novel. Born at Breslau, June 29, 1798, he removed to Berlin, where he began a gymnasium course, but left to take part in the French campaign of 1815, returned to study law and history at the universities of Breslau and Berlin, and then after a few years as a law court official he turned to editorial duties (later on the staff of the *Vossische Zeitung*) and other literary work and to business enterprises. In 1851 he removed to Arnstadt, where after a long illness he died, Dec. 16, 1871. His wife was an Englishwoman.

His works are varied and voluminous: poems, stories, sketches, reviews, editorials, dramas, novels, tales of crime, and translations, among others Walter Scott's "Lady of the Lake," but his fame rests upon his historical novels under the influence of this English author. His first two, *Wallador* (3 vols., 1823-24) and *Schloss Avalon* (3 vols., 1827) passed for a long time as Scott's work. They were translated into English and several other languages. His best novels, based mostly upon the history of Brandenburg and Prussia, are *Cabanis* (6 vols., 1832), *Roland von Berlin* (3 vols., 1840), *Die Hosen des Herrn von Bredow* (5 vols., 1846-48), and *Ruhe ist die erste Bürgerpflicht* (5 vols., 1852). Collected works publ. 1874 in 20 vols.

He was influenced first by Ludwig Tieck and then by Scott. Although occasionally encumbered with too much mere historical detail, his best works are marked by accurate descriptions especially of North German scenery, lifelike pictures of people and times, bright touches of genuine humor, and a strongly patriotic tone. They are now, however, considered too long. His poems and dramas are inferior.

ALEXISBAD, à-lèk'sès-bät'. A watering place in the duchy of Anhalt, Germany, with an altitude of about 1000 feet. It has two kinds of springs. The Selke spring is used for bathing and contains chloride and sulphate of iron, while the Alexis spring contains carbonic acid and is used for drinking purposes. Alexisbad was established as a watering place by the Duke of Anhalt-Bernburg in 1810.

ALEXIUS. A Roman saint of the fifth century, patron of the society of Alexians or Cel-lites. He is said to have been a Roman Senator, but gave up the world for a life of poverty and celibacy. His relics are said to have accomplished marvelous cures. Alexius is honored in the calendars of the Latins, Greeks, Syrians, Maronites, and Armenians. His festival occurs on July 17. He was a favorite subject among the poets of the Middle-High-German period. Consult: Massmann, *Sankt Alexius Leben* (Quedlinburg, 1843); Paris and Pannier, *La vie de Saint Alexis* (1872); Blau, *Zur Alexislegende*, in the *Germania*, vol. xxxiii (1888), and A. Amiaud, *La légende syriaque de Saint Alexis* (1889).

ALEXIUS. The name of several Byzantine kings. See ALEXIS.

ALEY, ā'lī, ROBERT JUDSON (1863—). An American scientist and educator, born at Coal City, Ind. He attended Valparaiso College from 1879 to 1882, graduated from Indiana University in 1888, and took post-graduate studies at Leland Stanford, Jr., University and the University of Pennsylvania, receiving the Ph.D. degree from Pennsylvania in 1897. Having had experience in teaching mathematics in normal schools and colleges prior to and during his university studies, he was appointed professor of this subject at Indiana University in 1891. This position he resigned, after 18 years of service, to become State Superintendent of Public Instruction (1909), and this in turn he gave up the next year when chosen president of the University of Maine. For many years he was mathematical editor of the *Inland Educator* and *Educator-Journal* and in 1903 became editor-in-chief of the latter publication. He was made a member of many American and foreign scientific societies. His published writings include *The Geometry of the Triangle* (1897); *Graphs* (1900); *The Essentials of Algebra* (1904) and *Supplementary Problems in Algebra*—both written in collaboration with D. A. Rothrock; *Story of Indiana and its People* (1912).

AL'FA. One of the varieties of esparto (q.v.), a plant which grows in North Africa. Its fibre is valuable for paper-making.

ALFAL'FA (Sp. from Ar. *al-faḥḥaḥ*, the best feed), also called LUCERNE. A leguminous plant, widely used, especially in Europe and in parts of North and South America, as a forage and hay crop for stock. The plant (*Medicago sativa*) is a native of the valleys of central western Asia. It has been cultivated in Europe for more than 2000 years, and was introduced into Mexico and South America at

the time of the Spanish conquests. In 1854 it was brought from Chile to California, whence it spread rapidly over the semi-arid regions of the Pacific and Rocky Mountain States, where it is now extensively grown. Since then it has become an important crop in the irrigated regions of the West and is also cultivated in that section with only the natural rainfall. In the Eastern and Southern States the acreage in alfalfa has largely increased since 1900. In 1909 Kansas led in acreage and hay production, with 955,470 acres yielding 1,995,571 tons of hay. Nebraska, Colorado, and California ranked next in acreage that year, and Utah stood first in the production of alfalfa seed with 51,812 bushels.

Alfalfa is a long-lived herbaceous forage plant belonging to the clover family. It bears its small kidney-shaped seeds in spirally coiled pods with from two to three turns. The plant has an extensive root system, the taproot often being 15 or more feet long. It is adapted to a wide range of conditions, being grown from sea level to altitudes of over 7500 feet, in dry regions as well as those with copious rainfall, and in tropical climates as well as in sections having severe winters. Hardy strains, however, are required to succeed under climatic extremes.

The plant demands a deep, porous, and fertile soil, well drained, having an adequate lime content and quite free from weeds. It responds readily to soil treatment with barnyard manure, green manure, and commercial fertilizers. As alfalfa, like other leguminous crops, adds nitrogen to the soil through the nodule-forming bacteria of its roots, the commercial fertilizers used need not contain much nitrogen, but they should supply phosphoric acid and potash in liberal quantities. Where liming is required the application is best made the year before the crop is sown, a ton of unslaked lime per acre being usually sufficient. A clean soil is necessary to keep the tender young alfalfa plants from being crowded out by the weeds. The preceding crop should preferably be a fertilized hoed crop such as corn, cotton, potatoes, etc., or a green-manuring crop either turned under or harvested sufficiently early to admit of timely preparing the land for alfalfa. In preparing the seed bed the land should be plowed about 8 inches deep, put into the best of tilth, the upper 2 to 3 inches pulverized finely, and the soil allowed to settle. The plowing is done about six weeks before seeding, and the land is brought into condition by disking and harrowing. The seed is drilled or broadcasted in late summer or in the spring and covered deep enough to insure moisture for germination. From 15 to 30 pounds of seed are usually sown per acre, the quantity being governed by the type of soil and the moisture conditions. Alfalfa is sometimes sown with a nurse crop, but this is not generally recommended. The inoculation of the soil to insure the presence of the nodule-forming bacteria is effected by transferring soil from an alfalfa field producing the nodules abundantly on the roots of the plants or by treating the seed with pure cultures of the particular bacteria. Soil in which sweet clover or bur clover is growing can also be used. Where the culture of the crop is of long standing, the land is usually sufficiently inoculated. For hay alfalfa is cut when the plants are coming into bloom, and again from two to six times, according to the character of

the season. The annual yield of hay varies from three to six or more tons per acre.

Alfalfa is used as a soiling crop, as pasturage, and in the form of silage and hay, and is fed to dairy cows, beef cattle, sheep, hogs, horses, and poultry. It is also an excellent honey crop for bees. The green product has the following percentage composition: water, 71.8; protein, 4.8; ether extract, 1; nitrogen free extract, 12.3; crude fibre, 7.4; and ash, 2.7. When cured as hay, the average percentage composition is: water, 8.4; protein, 14.3; fat, 2.2; nitrogen free extract, 42.7; crude fibre, 25, and ash, 7.4. The different crops and cuttings do not vary greatly in composition. When alfalfa flowers begin to appear, the stalk constitutes about 50 or 60 per cent, and the leaves 40 or 50 per cent of the whole plant. At the usual time of cutting, alfalfa leaves contain one-third more of the total dry matter of the crop. The leaves contain from one-quarter to one-third as much crude fibre as the stalks, and from two to three times as much albuminoids. As shown by experiments with cattle, the following percentage amounts of the ingredients are usually digested: 60.7 per cent of the total organic matter, 72 per cent of the protein, and 69.2 per cent of the nitrogen free extract. Of the crude fibre of alfalfa hay, about 46 per cent is on an average digestible. Chemical analysis and digestion experiments show that alfalfa compares very favorably with red clover, both as green fodder and as hay. When fed as a soiling crop, it should be partially wilted or mixed with hay or straw. In dry regions of the West it is much used for pasturage, especially in the fall, but there is always more or less danger of its causing the cattle to bloat or of the plants being killed by too close pasturage.

Alfalfa Diseases and Enemies. The diseases generally attacking alfalfa affect either the roots or the stems and leaves. Of the root diseases, root-rot (*Ozonium omnivorum*) is most prevalent and destructive, destroying the stand completely as it spreads in almost perfect circles. Land infested with root-rot should be used for other crops than alfalfa for several years in order to get rid of the disease. Of the diseases attacking the leaves and stems the leaf spot (*Pseudopezia medicaginis*) is the most common. It usually occurs on the leaves of the older plants and may be recognized by the minute brown spots of irregular shape on the green or discolored leaflets. Leaf-rust (*Uromyces trifolii*), powdery mildew (*Erysiphe trifolii*), downy mildew (*Peronospora trifolii*), and another leaf-spot disease (*Macrosporium sarcinæforme*) are also destructive, and the most effective remedy is to mow the crop as soon as these diseases appear to become troublesome. Anthracnose (*Colletotrichum trifolii*) is locally destructive. Alfalfa is also attacked by a parasitic flowering plant known as dodder (q.v.). Animal pests such as gophers, prairie dogs, and mice often cause considerable damage, and in parts of the Western United States an insect known as the alfalfa weevil is very injurious to the crop. In the semi-arid sections grasshoppers often are troublesome.

ica (Chicago, 1910). See also ALKALI SOIL, *Bibliography*.

AL-FARABI. See FARABI.

ALFELD, älf'fält. A town of Prussia, pleasantly situated in a mountainous district at the base of the Sieben Berge, a group of hills, on the Leine, 27 miles south of Hanover. Its industries include the manufacture of paper and farm machinery, and there are iron works. Pop., about 6000.

ALFIERI, àl-fyā'rè, CESARE, MARQUIS DI SOSTEGNO (1796-1869). An Italian diplomat and statesman, a kinsman of Vittorio Alfieri, the poet. He was born at Turin, Aug. 13, 1796, and, having early devoted himself to affairs of State, was successively Secretary of the Sardinian legations at Paris, The Hague, St. Petersburg, Berlin, and Florence. Returning to Turin in 1831, he was associated with Cavour. When the Reform Commission was appointed, Alfieri became its president, and accomplished much for the elevation of universities and for advanced study in general. He was for a very short time in 1848 Prime Minister, then Vice President of the Senate, and, from 1856 to 1860, its President. He died at Florence, April 16, 1869.

ALFIERI, VITTORIO, COUNT (1749-1803). The most important of the Italian dramatic poets, a younger contemporary of Metastasio and Goldoni, a man as unique in his personality as in his writings, and held in honor to-day by his countrymen less for the tragedies which first made him famous than as the reviver of a national spirit in modern Italy. The salient facts of his life are known mainly through his *Autobiography*, a work exceptional in its class for its frank sincerity and keen personal interest. He was born Jan. 17, 1749, at Asti, in Piedmont, which in those days was looked upon by the mass of Italians almost as alien territory. Of the misspent youth which he afterward so keenly regretted, eight years were passed in the Academy of Turin—years of "uneducation," he calls them. Eight years more were equally wasted in roving through France, England, and Holland, and in an idle and dissolute life in Turin. It was not until his twenty-sixth year and his fourth serious infatuation—this time for a certain Marchesa Turinetti di Prie—that he felt himself inspired with lofty aims, and especially with a desire to make a name for himself in the field of dramatic poetry. Under this inspiration he made his first dramatic essay, some scenes of a *Cleopatra*, resumed his serious studies, and removed to Florence in order to perfect himself in the correct Tuscan idiom, for his Italian at this time was scarcely better than his French. In Florence he first met the Countess of Albany, the unhappy wife of Charles Edward Stuart, and formed for her that life-long attachment which he defined as a "degno amore" and which has become historic. After her separation from her husband in 1780, Alfieri joined her for a time in Rome, and after the Pretender's death was seldom separated from her during the remainder of his own life. There is, however, no ground for believing that they were secretly married. For several years they lived in Paris, but narrowly escaped in the Reign of Terror and, being forced to flee, took refuge once more in Florence. Here Alfieri died, Oct. 8, 1803, and here, in the church of Santa Croce, the Countess caused a monument to be erected by Canova to his memory.

Besides his tragedies and autobiography, Alfieri's literary activity produced numerous son-

nets and odes, his *Misogallo*, a fierce denunciation of France, in mingled prose and verse, some unimportant prose writings, and six comedies, four of which, *L'Uno*, *I Pochi*, *I Troppi*, *L'Antidoto*, form a political tetralogy intended to show that the best government is that founded upon the will of the people. The series of tragedies began with *Cleopatra*, first produced at Turin in 1775 and continued until 1789. The most important are *Virginia*, *Agamennone*, *Oreste*, *Timoleone*, *Maria Stuarda*, and *Saul*, which is still regarded as his masterpiece. They are all obviously cast in one and the same mold, and that a narrow one; all classically correct, yet full of dignity and lofty sentiments. The principles which he laid down he rigidly followed. He did not permit himself to imitate or even to read Shakespeare; but adhered to the model of Greek and French tragedy, and followed to a large extent the classic unities. A tragic subject, in his opinion, was one which permitted a powerful excitation of good or evil passions; his own themes were regularly drawn from some stirring event of history or mythology. His highest aim was to unite "artistic truth with moral truth, beauty with morality." He wished the theatre to be "a school in which men might learn to be free, brave, and generous, inspired by true virtue, intolerant of violence, full of love for their country, with a true knowledge of their personal rights, and in all their passions enthusiastic, upright, and magnanimous." It was Matthew Arnold who summed up Alfieri as "a noble-minded, deeply interesting man, but a monotonous poet"; but his poetry was not found monotonous by his own or the following generation. What he did for tragedy was carried on by Monti, by Foscolo, by Pellico, and others. What he did for Italian unity is harder to measure. An entire generation of patriots was inspired by his *Virginia* and *Brutus* and *Timoleone*, and drew freely upon them for passages with which to inflame their hearers. His persistence in regarding himself primarily a native of Italy, and in speaking and writing in classic Tuscan, bore special fruit in his native Piedmont. In the words of his fellow-countryman, Gioberti, "the revival of civil order throughout the peninsula, the creation of a laic Italy, is due to Vittorio Alfieri, who, like a new Dante, was the true secularizer of the spirit of the Italian people and gave to it that strong impulse which still lives and bears fruit."

The complete edition of Alfieri's works is that published at Pisa (1805-15), in 22 volumes. The first edition of the tragedies is that of Siena (1783), containing only 10 tragedies. Good editions of selected tragedies are those edited by G. Falorsi (Florence, Barbera), Pisaneschi (Turin, Paravia), and Trevisan (Verona). For biographical and critical details, consult: *Autobiography*, translated by Lester (New York, 1845); Centofanti, *Tragedie e vita d'Alfieri* (Florence, 1842); Copping, *Alfieri and Goldoni: Their Lives and Adventures* (London, 1857); Howells, *Life of and Essays on Alfieri* (Boston, 1877); Antonini and Cognetti, *Vittorio Alfieri* (Turin, 1898); G. Carducci, *Primi Saggi* (Bologna, 1889); and E. Panzacchi, *Vita italiana nel settecento* (Milan, 1896); Dole, *Teacher of Dante and Other Studies in Italian Literature* (New York, 1908), and Holland, *Builders of Modern Italy* (New York, 1908). Available editions of the important *Vita* alone are those of London, 1807 (2 vols.), and Florence, 1822. See also the edition of the *Vita* annotated by Arturo Linaker,

a second edition of which appeared at Florence, 1905.

ALFILARIA, ăl-fil'ă-rĕ'ă. See GERANIUM.

ALFINGER, ăl'fĭng-ĕr, AMBROSIODE (?-1532). A German soldier of fortune, who in 1528 became the agent of the Welser family of Augsburg, to finish for them the conquest of Venezuela; this being the condition under which they held title to the country from Castile. He led out a company of Germans, but his expedition to the neighborhood of Lake Maracaibo and to New Granada was notorious for its cruelties, and he was killed by an Indian.

ALFIO'NA (Mex. Sp.). The largest of the California surf fishes. See SURF FISH.

ALFONSINE, ăl-fŏn'sĭn, or **ALPHONSINE TABLES**. A revision of the planetary tables of Ptolemy made by the ablest Christian, Jewish, and Moorish astronomers in Spain for Alfonso X (the Learned) of Castile. The many imperfections of the Ptolemaic Tables, due to the erroneous values of the length of the year and of the precession of the equinoxes employed by Ptolemy, had become more and more manifest with the increasing accuracy of astronomical knowledge, and had rendered such a revision necessary. The work was begun in 1248 and was completed at the enormous cost of 400,000 ducats, it is said, in 1252, the year of Alfonso's accession to the throne. The tables were printed for the first time in 1483 in Venice. They were held in only moderate esteem by later astronomers, and Tycho Brahe is said to have deplored the waste of money involved in their compilation.

ALFON'SO I OF CASTILE and VI OF LEON, "the Valiant" (1030-1109). He was the son of Ferdinand the Great, King of Castile and Leon. Leon was given to him by his father; Sancho, the eldest son, received Castile; Garcia, youngest of the three, a part of Galicia and Portugal. Alfonso came to the throne in 1065. War soon broke out between the brothers, and in 1068 Sancho defeated Alfonso in a bloody battle on the Pisuerga. Three years later Alfonso defeated Sancho on the Carrión; but Sancho, reënforced, it is said, by the renowned Cid, Roderigo Diaz de Bivar, nearly annihilated the Leonese army, took Alfonso prisoner, compelled him to abdicate, and shut him up in a monastery. Alfonso escaped and sought shelter with the Moorish King of Toledo. Sancho took possession of Leon and immediately attacked Garcia, defeating and capturing him at Santarem. In 1072 Sancho was assassinated by a Castilian knight, and Alfonso, upon solemnly declaring himself innocent of the murder, was reinstated in his kingdom of Leon, to which was added Castile. His brother Garcia, King of Galicia, was preparing to attack him, but was treacherously invited to his court, made a prisoner, and died in confinement 10 years later. Alfonso now ruled over nearly all of his father's kingdom, and went to the assistance of the Moorish King, who had befriended him and whose kingdom was being invaded by Cordovans. Alfonso's gratitude ended with the death of the old King; he did not scruple to attack his son, and soon captured the city of Toledo, thus adding New Castile to his dominions. Alfonso was monarch of most of Christian Spain, when a powerful Almoravide army from Africa, with the assistance of the King of Seville, inflicted upon him a terrible defeat, in 1086, near Zalaca. He gradually regained strength, but in 1108 the Moors defeated

him and killed his only son. The next year Alfonso died and was succeeded by his daughter, Urraca, who became the wife of Alfonso I of Aragon. His illegitimate daughter, Theresa, married Henry of Burgundy, and gave birth to the first King of Portugal.

ALFONSO I OF NAPLES AND SICILY. See ALFONSO V OF ARAGON.

ALFONSO I (?-1134). King of Navarre and Aragon, who succeeded Pedro I in 1104. His marriage with Urraca, heiress of Alfonso VI, of Leon and Castile, brought that kingdom under his sway. Misunderstandings soon arose with Urraca, and a divorce was granted. Alfonso, however, continued to fight against Castile, thus prolonging the final strife with the Moors. He was called "emperor" and "fighter"; the latter name he won by his victories over the Moors. In 1114 he began the siege of Saragossa, which he captured four years later. In 1120 he slew 20,000 Moors on the field of Daroca. In 1123 he invaded Valencia and two years later he went to the aid of the Christian Moors in Andalusia. In 1130 he crossed the Pyrenees and captured Bordeaux and Bayonne. In 1133 he besieged Fraga on the Cinca. The contest was long and severe, bringing from Africa 10,000 Almoravides. Finally, however, the Christians were defeated. Alfonso died in 1134.

ALFONSO (Port. *Affonso*) I (1094-1185). King of Portugal, son of Henry of Burgundy, conqueror and Count of Portugal. His father died when he was about two years old, and the management of affairs fell into the hands of his ambitious and dissolute mother, Theresa of Castile, from whom he was compelled to take it by force on attaining his majority. He was forced into war with Castile, whose supremacy he did not recognize. He then attacked the Moors and won a brilliant victory on the plains of Ourique (1139), where, according to the legend, 200,000 Moors perished. From that day he took the title of king. He was crowned by the Archbishop of Braganza, and the coronation was sanctioned by the Pope in 1169. On Oct. 23, 1147, he took Lisbon, with the aid of some English crusaders under William Longsword, on their way to the Holy Land. The booty was so rich that most of the crusaders returned home. In 1158, after a two months' siege, he became master of Alcazar de Sal. He took by assault the fortress of Santarem from the Saracens, in 1171, and annihilated the garrison; at the same place he defeated the Almohade ruler, Jusef-ben-Jakub, in 1184. He invited to his land the Knights Templars and the Knights of St. John and established the Orders of Avis and of St. Michael. He died at Coimbra, Dec. 6, 1185. He is generally regarded as a saint by the Portuguese.

ALFONSO III, surnamed "the Great" (848-912). King of Leon, Asturias, and Galicia. He succeeded his father, Ordoño I, in 866, but had to maintain his rights by force of arms. From 870 to 901 he was at war with the Moors and gained many victories. In 888 Garcia, the son of Alfonso, raised the standard of revolt. Alfonso collected his forces, conquered his son, and threw him into prison. But Garcia's mother, with the help of several of the grandees, excited a new conspiracy, which resulted in the abdication of the monarch in favor of his imprisoned son, in 910. He died at Zamora in 912. Many fabulous stories are told of him, but little is known which would justify his legendary fame.

ALFONSO V (1385-1458). King of Aragon,

Naples, and Sicily. He reigned from 1416 to 1458, receiving the surname "Magnanimous," because on his accession to the throne he destroyed a document containing the names of all the grandees who were hostile to him. He is renowned chiefly for having brought Southern Italy under the dominion of Aragon. In 1420 he attacked Corsica, but speedily hastened to Naples at the request of Queen Joanna II, who in return for his assistance against Louis of Anjou named him as her heir. For some time he enjoyed her highest favor; but in 1423, having thrown into prison her minion, Caracciolo, who was his enemy, the Queen declared for his rival, Louis. At her death, in 1435, Alfonso resolved to claim the kingdom; but René of Anjou, whom Joanna had appointed her successor after the death of Louis, opposed him. Rome and Genoa sided with René. The Genoese fleet inflicted a most serious defeat upon the Aragonese fleet, and Alfonso was captured. He was sent to the Duke of Milan, who set him at liberty and formed an alliance with him. After several battles Alfonso overthrew his adversary and entered Naples in triumph. Having once firmly established his power, he proceeded to suppress the disorders which had sprung up during the reign of Joanna. He died at Naples, June 27, 1458.

ALFONSO V (1432-81). King of Portugal, surnamed "the African," in honor of his victories over the Moors in Algiers. At his father's death, in 1438, there was a fierce struggle for the regency between the Queen Mother and the uncles of the King. Finally the Queen was defeated and his uncle Pedro became regent. In 1448 Alfonso assumed the government; in the following year he declared his uncle a rebel, and defeated him in battle. After a campaign in Africa, Alfonso undertook to seize upon Castile and Leon, but was defeated at Toro. Alfonso endeavored to get assistance from the King of France, but, finding that he was being deceived, he abdicated in favor of his son, Juan, in 1476. He was forced, however, to ascend the throne again. In 1479 he signed the treaty of Alcantara with Castile. In 1481 he died of the plague. He founded the Order of the Tower and Sword under the invocation of San Diego. In his reign the explorations of the Portuguese along the western coast of Africa were pushed beyond the equator.

ALFONSO VI OF LEON. See ALFONSO I OF CASTILE.

ALFONSO VI (1643-83). King of Portugal. Paralyzed at the age of three, and neglected by his mother, the Queen Regent, the Prince developed into a dissolute king. He drove his mother from the court, but was himself the victim of a plot between his wife and his handsome brother Dom Pedro. Alfonso was dethroned and imprisoned (1668), and Dom Pedro took his place as King of Portugal, and, after the death of Alfonso, as husband of his Queen.

ALFONSO X (1221-84). King of Leon and Castile, surnamed "the Astronomer," "the Philosopher," or "the Wise" (*El Sabio*). He succeeded his father, Ferdinand III, in 1252. As early as the storming of Seville, in 1248, he had given indications of his courageous spirit. But instead of wisely confining his efforts to the conquest of the Moors and the repression of the nobility, he lavished the resources of his kingdom in efforts to secure the imperial throne of Germany, to which he was elected in 1257.

Richard of Cornwall was chosen in opposition to him. Neither could succeed in securing recognition, and ultimately the imperial crown was placed upon the head of Rudolph of Hapsburg (1273). While Alfonso was striving for the crown of the Holy Roman Empire, his throne was threatened by the turbulence of the nobility, and at the same time he had to contend with the Moors. The latter, however, he defeated, in 1262, in a bloody battle. In 1270 an insurrection broke out in his dominions, at the head of which was his brother Philip. Later his son Sancho also rebelled and in 1282 deprived him of his throne. He now sought the help of the Moors, but after fruitless efforts to recover his power, he died at Seville, April 4, 1284. He was the most learned prince of his time and has acquired lasting fame through the completion of the code of laws called the *Siete Partidas*, which 200 years later became the law of the land. There are still extant several long poems of his, a work on chemistry, *El libro del tesoro*, translated later by Brunetto Latini (q.v.), and various translations of Arabic works. He labored much to revive knowledge, increasing both the privileges and professorships of the University of Salamanca. He sought to improve the Ptolemaic planetary tables, whose anomalies had struck observers even at that early time. For this purpose, in 1240, he assembled at Toledo upward of 50 of the most celebrated astronomers of that age. His improved tables, still known under the name of the Alfonsine Tables, were completed in 1252. See ALFONSINE TABLES.

ALFONSO XII (1857-85). King of Spain. The son of the deposed Queen Isabella II. He was born at Madrid and was proclaimed King Dec. 30, 1874. On Jan. 23, 1878, he married Princess Maria de las Mercedes (youngest daughter of the Duc de Montpensier), who died soon after. In 1879 he married Archduchess Maria Christina of Austria, by whom he had three children. Returning from an informal visit to Germany, 1883, he was publicly insulted in Paris, and war with France was for a few days thought probable. Alfonso's reign was, on the whole, commendable. His posthumous child, Alfonso XIII, succeeded him.

ALFONSO XIII (1886—). King of Spain. He was born May 17, 1886, the posthumous son of Alfonso XII and of Maria Christina, Archduchess of Austria, who was appointed regent during his minority. The early reign of the young king was marked by mutinies abroad, while at home dissatisfaction found expression in cabinet crises and military insurrections, labor riots, and anarchistic disturbances. The unfortunate war against the United States led to the practical annihilation of Spain's colonial empire. The King assumed personal charge of the government on attaining his sixteenth year (1902). His frank and courageous though somewhat impulsive nature gained him the affection of the nation. On May 31, 1906, he married Princess Ena, daughter of the late Prince Henry Maurice of Battenberg and Princess Beatrice, daughter of Queen Victoria. On their wedding day the royal pair narrowly escaped death in a bomb explosion, the work of anarchists, which killed a score of persons about the King. As a result of this attack several nihilists were brought to trial, among them a prominent educator, Francisco Ferrer. Ferrer was summarily executed, and the King and his government became the subject of much bitter criticism. He

has, however, in general, proven himself a liberal monarch, supporting steadily an anti-clerical program, and insisting at times on exercising his royal power of pardon even at the cost of losing his ministry. Several other attempts to assassinate him were made, one on April 13, 1913.

ALFONSO MARIA DI LIGUORI, mà-rě'à dâ lě-gwō'rě. See LIGUORI.

ALFORD, ălfěrd, HENRY, D.D. (1810-71). An English biblical critic and poet. He was born in London, Oct. 7, 1810, and educated at Trinity College, Cambridge. He became Fellow of Trinity in 1834, Vicar of Wymeswold, a college living, in the diocese of Peterborough, 1835; minister of Quebec Chapel, Marylebone, London, 1853; Dean of Canterbury, 1857. He was very versatile, could play and sing, carve and paint. He wrote poetry and sermons. He was a literary critic and editor. But his reputation rests upon his edition of the Greek New Testament, in which for the first time the treasures of German linguistic and exegetical studies were introduced in comprehensive fashion to those unfamiliar with German. It was begun in 1845, and the fourth and last volume published in 1861. For the day it was a great service. He enabled the mere English reader to reap a great part of his harvest by his *New Testament for English Readers* (4 vols., London, 1868). Other of his writings have had much vogue, especially his poetry, *The School of the Heart, and Other Poems*, etc., which is characterized not so much by depth or originality as by freedom from affectation, obscurity, or bombast. Among his latest writings was *A Plea for the Queen's English* (6th ed., 1880), which excited considerable discussion. He also published several volumes of sermons. He died at Canterbury, Jan. 12, 1871. Consult *The Life of Dean Alford*, by his widow (London, 1873).

ALFRED. A village in Allegany Co., N. Y., 12 miles southwest of Hornell, on the Erie Railroad (Map: New York, C 3). Alfred was settled in 1807 and was incorporated in 1887; it is known principally as the site of Alfred University (q.v.). The New York State School of Clay Working and Ceramics and a State School of Agriculture are also here. The village has a Carnegie library, a museum, and owns its water works. Pop., 1890, 786; 1900, 786; 1910, 759.

ALFRED, or **ÆLFRED**, THE GREAT (848-900). King of Wessex from 871 to 900. He was born at Wantage, in Berkshire, in 848. His father was Æthelwulf, King of the West Saxons. Alfred, the youngest of five sons, succeeded to the throne in 871, on the death of his brother Æthelred. His reign, which lasted nearly 30 years, is noteworthy, first, because of the wars with the Danish invaders; second, because of the interest which the King took in education. Before discussing his real achievements, however, it may be well to speak briefly of some things erroneously attributed to him. In the popular legends he has been regarded as the author of many reforms and institutions which were in no way due to him. His real and great merits have been overlooked because of the actions incorrectly credited to him. Except for the false statements in many secondary works, it would be unnecessary to say that he did not institute trial by jury and that he was not the founder of the University of Oxford. The picturesque tales of his hiding from the Danes, of

the burned cakes, and of his visit to the Danish camp disguised as a harper, are inventions of a later age.

Alfred became King in the midst of a Danish invasion. After several battles he was able to make peace with the enemy, probably by paying them money. In the following years there was peace, but in 876 the marauding expeditions began again, and by the beginning of 878 the Danes were successful almost everywhere and met with no general resistance. About Easter, 878, Alfred established himself at Athelney and gathered there all the forces that he could. Several weeks afterward he marched to Brixton, gathering troops as he went, and in the battle of Ethandun, probably Edington in Wiltshire, he defeated the Danes and captured their stronghold. The Danish King Guthrum was baptized, and the peace of Wedmore followed. There were some less important engagements in the following years, but on the whole, for the next 14 years Alfred was able to give his time to the internal affairs of his kingdom. In 892 (or 893) the Danes, who had been driven away by Arnulf (q.v.), King of Germany, made a descent upon England. For four years the warfare went on almost continuously, but at last the Danes were driven off—some to Northumbria, some to East Anglia, and others to the Continent. These Danish invasions had an important influence on the history of England. By crushing the individual kingdoms, they worked, unwittingly, for the unity of England. Alfred, by withstanding them successfully, made his kingdom the rallying point for all the Saxons and prepared the way for the eventual supremacy of his descendants.

Alfred was an enthusiastic scholar and a zealous patron of learning. When he came to the throne, as he himself wrote, he found little or no interest in education and few learned men. He invited to his court native and foreign scholars, of whom the best known are Asser and John Scotus Erigena. He labored himself, and encouraged others to labor, for the education of his people. The composition of the *Anglo-Saxon Chronicle* may have been due to his initiative. He himself translated works which he thought would be useful to his people, and instead of merely translating literally, he expanded or omitted portions in order to make the work more serviceable. His principal works were translations of the following: Boëthius, *Consolation of Philosophy*; Orosius, *History of the World*; and Gregory the Great, *Pastoral Care*. Of the last there is an excellent edition in the publications of the Early English Text Society. He is said to have translated, or to have had translated, the *Soliloquies of St. Augustine*. Alfred may have translated Bede's *Ecclesiastical History*, but there is much controversy concerning this, as the translation seems to be made into the Anglian dialect and not the West Saxon. If it was not the work of Alfred, it may have been made under his direction. See Miller, *The Old English Version of Bede's Ecclesiastical History*, Early English Text Society (London, 1890); Schipper, *König Alfreds Uebersetzung von Bedas Kirchengeschichte* (Leipzig, 1897).

His laws show no striking changes from the laws of earlier kings; in fact, he disclaimed originality and spoke of his work as mainly a compilation of existing laws. But they are marked by two characteristics which deserve notice: first, they are intensely religious; sec-

ond, they make no distinction between English and Welsh, as the earlier laws had done.

Alfred died, Oct. 28, 900. (The date 901 given by the Anglo-Saxon sources seems to be wrong.) But the millenary of King Alfred was celebrated on Sept. 18, 1901, at Winchester, the former capital of the Anglo-Saxon kingdom. The commemorative exercises were participated in by many distinguished men from all English-speaking countries. On September 20, the day of the most important functions, all the delegates joined in a great procession and marched to the site where the colossal statue of Alfred, the work of Thornycroft, was unveiled, and the oration was delivered by Lord Rosebery.

In the United States the Society of American Authors encouraged the celebration of "the one thousandth anniversary of the founder of the Anglo-Saxon race." Exercises were held on October 28 in libraries and schools in various cities. The chief celebration was in New York City, where Alfred Bowker, the Mayor of Winchester, was the guest of honor.

Bibliography. The great contemporary sources of information for Alfred's life are Asser's *Life of Alfred* and the *Anglo-Saxon Chronicle*. Of each of these there are several editions in the original Latin; translations can be found in the Bohn Library; in Stevenson's *Church Historians of England*, and elsewhere. The genuineness of Asser's work has been the subject of much controversy, but most scholars now believe it to be a contemporary work, with some later interpolations.

Of secondary works Pauli's *König Alfred*, edited by Thomas Wright, is still deserving of mention. The constitutional events of the reign are described in Stubbs, *Constitutional History*, vol. i (Oxford, 1891). The millenary celebration caused the production of many books and articles. Of these the following may be mentioned: Plummer, *Life and Times of Alfred the Great* (Clarendon Press, 1902); Earle, *The Alfred Jewel* (Clarendon, 1901); Bowker, *Alfred the Great* (London, 1899), which contains seven special studies by Sir Walter Besant, Sir Frederick Pollock, Frederic Harrison, and others; Conybeare, *Alfred in the Chronicles* (London, 1900); Draper, *Alfred the Great* (London, 1901); Harrison, *Writings of King Alfred* (New York, 1901); Hughes, *Alfred the Great*, new edition (London, 1901); Jeffery, *A Perfect Prince, The Story of the England of Alfred the Great* (London, 1901); Macfayden, *Alfred the West Saxon* (London, 1901); Wall, *Alfred the Great: His Abbeys of Hyde, Athelney, and Shaftesbury* (London, 1900); Snell, *Age of Alfred* (New York, 1912); Greswell, *Story of the Battle of Edington* (Taunton, England, 1910).—Mr. Slade, of the Library of Congress, has prepared a bibliography of Alfred, which aims at completeness; consult also the bibliography in Wülker, *Grundris zur Geschichte der Angelsächsischen Litteratur*, pp. 386–451 (Leipzig, 1885).

ALFRED OF BEVERLEY (born c.1100). An old English chronicler, about whom little is known. He describes himself as treasurer and sacristan of the church of Beverley, in Yorkshire, where he wrote in Latin a chronicle history of Britain, from the fabulous period down to 1129, called the *Annales* (in nine books). It is mostly a compilation. An inferior MS. was printed by T. Hearne (1716).

ALFRED UNIVERSITY. A non-sectarian American university, at Alfred, N. Y., organized

as a school in 1836 and as a university in 1857. Its total endowment, including equipment, etc., is about \$500,000. The library has 25,000 volumes. The campus covers 16 acres, containing 14 university buildings, including a new library building valued at \$30,000, the gift of Andrew Carnegie. The university has collegiate, industrial mechanics, fine arts, music, theological and preparatory departments, a State school of clay working and ceramics, and a State school of agriculture. Instructors (1912) 42, students 447. President, Rev. B. C. Davis, Ph.D.

ALFRETON, ăl'fēr-ton. An old market town of Derbyshire, England, about 12 miles by rail north of Derby (Map: England, E 3). Its foundation is ascribed to Alfred the Great. It is a flourishing manufacturing town, and its industries include pottery works, collieries, and iron foundries. Pop., 1891, 15,400; 1901, 17,505; 1911, 19,049.

ALFURESE, ăl'fōō-rēz' or ăl'fōō-rēs', **ALFURU**, ăl'fōō'rōō, or **ALFORA**, ăl'fō'rā (Ar. *al*, the + Portug. *fora*, outside, thus probably meaning 'the outsiders'). In Celebes, the Moluccas, etc., a term applied to the tribes, of the interior especially, who seem to differ from the more or less prevalent Malay type, being perhaps pre-Malay aboriginals. The name can hardly have, however, any strict anthropological connotation. In Celebes the Alfurese are found chiefly in the north, in Gilolo in the central regions, while in Ceram they are the predominant race. The Alfurese of Celebes are probably not so different from the Malaysians as has hitherto been believed, being a mixed race. The Alfurese of Gilolo were considered by Wallace the true aborigines of the island; and some of those of Ceram, etc., are of Papuan stock at bottom. There are, evidently, several kinds of Alfurese (the word has somewhat the sense of our "gentile," "pagan"), some Malays doubtless, others pre-Malay, still others of Papuan affinities. See **CELEBES**; **MOLUCCAS**.

ALGÆ, ăl'jē (Lat. nom. pl. of *alga*, 'sea-weed'). A group of chlorophyll-bearing or colored Thallophytes. The Algæ are contrasted with the Fungi, which latter are devoid of chlorophyll. The presence of chlorophyll enables the Algæ to manufacture their own food; therefore they are independent plants. The Fungi, lacking chlorophyll, are dependent plants, obtaining their food as parasites or saprophytes. The Thallophytes (the lowest great division of the plant kingdom) include many organisms which cannot be referred to either Algæ or Fungi. There is an obvious relationship between the Algæ and the Fungi (q.v.), the latter probably having been derived from the former.

Classification. The Algæ are divided into three great groups, viz., Green Algæ (*Chlorophyceæ*), Brown Algæ (*Phæophyceæ*), and Red Algæ (*Rhodophyceæ*). Under the scientific names there will be found accounts of their general habits and most striking characteristics. From the names of these groups one might imagine that they are distinguished by color marks; but in reality fundamental morphological characters form the basis of the classification. Although it is convenient to think of the Algæ as distinguished by their color, there are many exceptions to the rule, and color should never be regarded as the foundation of the classification.

Chlorophyceæ. The Green Algæ usually contain no pigment in addition to chlorophyll. They

include the simplest Algæ and are supposed to represent the group from which the higher plants have been derived. Usually six orders are referred to this group, but some of them are very artificial, and further knowledge will doubtless dispose of them differently. Nevertheless, this grouping is convenient and assists one in keeping the facts in mind. The most primitive order is called Volvocales and is characterized by its motile vegetative cells, which swim freely by means of cilia. So animal-like is their appearance that they are often regarded as animals and referred to the Flagellates (q.v.).

The most primitive of the Volvocales are single, isolated cells; but the higher Volvocales are characterized by colony formation, i.e., the association of cells (individuals) in a colony of definite form and structure. Colony formation reaches its extreme expression in *Volvox*, a globular colony comprising thousands of cells and visible to the naked eye. The cells of Volvocales under certain conditions produce swimming spores (*zoöspores*), which are really only small vegetative cells. Under other conditions sexual cells (*gametes*) are produced, which are really only very small zoöspores. These gametes pair and fuse, producing a single, thick-walled cell (fertilized egg), which is a protected cell and starts new generations at the beginning of the next growing season. Among the lower Volvocales the gametes are alike, so that there is no visible distinction of sex; but in the higher Volvocales the pairing gametes have become very much unlike in appearance and behavior, one of them being a large and passive cell (*egg*), the other a small and active cell (*sperm*). In this group, therefore, one can see the origin of sex (gametes from zoöspores) and the differentiation of sex (eggs and sperms). Under certain conditions the motile vegetative cells of the Volvocales lose their cilia and pass into a motionless condition. This temporary condition among Volvocales becomes the permanent condition in the second order of Green Algæ, the Protococcales.

The Protococcales also include one-celled forms, *Pleurococcus* (one of the green slimes) being the most common example, but differing from the simple Volvocales in being a motionless cell. It is very common on damp stones, on the north (moister) side of tree trunks, on flower pots in greenhouses, etc. Like the Volvocales, however, the Protococcales also tend to colony formation, the extreme expression of this tendency being *Hydrodictyon* (water-net), a remarkable colony, forming hollow nets sometimes a foot long. The simple *Pleurococcus* forms reproduce only by vegetative multiplication; i.e., the solitary cell divides to form two new cells or individuals. Among the higher Protococcales, however, swimming spores are formed and also gametes, but differentiation of sex is not attained.

The third order, Confervales, was probably derived from the simpler Protococcales and is regarded as the representative order of Green Algæ. It is also thought to be the genetic order, i.e., the order that has given rise to the higher plants. Its features in general are a filamentous body of many cells and an abundant formation of zoöspores. In the lower stretches of the order the body is a simple filament, but later it becomes a profusely branching filament, and in some cases a sheet of cells, as in *Ulva*, the sea-lettuce. The notable feature of the order, however, is the evolution of its sexual char-

acters. In *Ulothrix* there may be seen every gradation between zoöspores and gametes, so that it is obvious that gametes are simply very small zoöspores. This plant is much used, therefore, to illustrate the origin of sex. In *Ædogonium*, however, the gametes are differentiated into large eggs and small sperms. In both cases the gamete-producing cells are ordinary vegetative cells, which are transformed into sex organs by certain conditions. The most remarkable and suggestive form among the Confervales is *Coleochæte*, whose body is a sheet or mass of cells, and which represents a form from which the liverworts (Bryophytes) might have been derived. Not only does it produce eggs and sperms, but the fertilized egg, instead of producing a new *Coleochæte* plant, forms a small body containing spores (spore-case), and these spores produce the new *Coleochæte* plants. This is a suggestive appearance of the alternation of generations (q.v.) which characterizes the higher groups of plants.

The fourth order, Siphonales, was certainly derived from the Confervales, and is characterized by its cœnocytic body, i.e., a body in which there are no cross-walls, and which is therefore one continuous cavity. The connection with Confervales is indicated by the fact that some Confervales (as *Cladophora*) are incompletely cœnocytic, cross-walls occurring, but the cells containing many nuclei. When completely cœnocytic bodies are attained, they belong to Siphonales. This order is largely marine, and many marine forms display a very highly differentiated body. A very common fresh-water form is *Vaucheria*, and it is interesting in that the gamete-producing cells are differentiated from the vegetative body, so that the oogonium and the antheridium are not transformed vegetative cells.

The Conjugales form a fifth order of Green Algæ, and their relationship to the other orders is very doubtful. *Spirogyra* is the most common representative of the Conjugales, forming green, scummy growth on the stagnant water, and hence often called pond scum. The order is unique among Green Algæ in having no swimming cells, a remarkable fact in connection with an aquatic group. No spores are produced, and the pairing gametes are brought together usually through conjugating tubes. The order is remarkable also for the form of its chloroplasts, which in *Spirogyra* are green, spiral bands, and in *Zygnema* star-shaped bodies. The Desmids are also included among the Conjugales, although they are one-celled forms with a peculiar cell structure. The Diatoms show certain resemblances to the Desmids, but their position is very uncertain.

The Charales are usually included among Green Algæ as a sixth order, but it seems clear that such a grouping is artificial, based on the pigment character of the group and not on its structure. Charales, or "stoneworts," form dense growths on the bottom of ponds, and resemble profusely branching green stems. The stems and branches have definite nodes which produce whorls of branches. The sex organs, borne at the nodes of branches, are remarkably complex, especially the antheridium, which produces thousands of biciliate sperms of high organization. The structure of the working body and of the sex organs suggests a group intermediate between Thallophytes and Bryophytes.

A group of Thallophytes has long been known as the Blue-green Algæ (Cyanophyceæ), which are not at all related to the true Algæ. They are closely related to the Bacteria, and these two groups constitute the group Schizophytes ("fission plants"), very distinct from Algæ and Fungi. The Blue-green Algæ have been confused with the true Algæ simply because they contain a green pigment (possibly chlorophyll), in this case associated with a blue pigment, which together give a bluish-green tint. The structure of the one-celled body, however, is very different from that of the true Algæ. Instead of having such distinct cell organs as the nucleus and chloroplast, the cell structure appears almost homogeneous. The nuclear material is not organized into a definitely bounded nucleus, and the pigment is diffused through the general body rather than restricted to a definite chloroplast. The only method of reproduction is vegetative multiplication, a cell dividing to form two new cells, and the succession of divisions is so rapid that a single cell (individual) may give rise to thousands in a very short time. It is this very rapid succession of divisions that is referred to in the name "fission plants." The cells tend to form colonies, chiefly filamentous in form, common illustrations being *Nostoc* and *Oscillatoria*, the latter form receiving its name from the characteristic oscillating movement of the filaments. The cells are held together in colonies by the production of mucilage by the cell walls, which is so abundant in the case of *Nostoc*, that the plant occurs in nature as jelly-like lumps in which filamentous colonies are imbedded. *Nostoc* also shows a differentiation of the members of the colony, certain cells losing their contents, often enlarging, and serving as anchoring cells. By means of these cells (*heterocysts*) the colony is broken into living fragments, each fragment wriggling loose and developing another colony. This colony multiplication is distinct from cell (individual) multiplication. Blue-green Algæ endure conditions that would destroy other plants. For example, they live in great numbers in the boiling water of hot springs and geysers. This power of endurance is seen also in their near relatives, the Bacteria.

Phæophyceæ. The Brown Algæ constitute a very large and chiefly marine group, with forms ranging from simple filaments to the gigantic kelp or Devil's Apron (q.v.) and highly specialized rock weeds. This class also presents an excellent illustration of the principal stages in the evolution of sex. There are two divisions: one, whose reproductive cells, whether sexual or asexual, are swimming spores, and the other, whose reproductive cells are large eggs fertilized by swimming sperms. The motile reproductive cells of the group, whether sexless spores or gametes (sexual cells), are peculiar in being bean- or kidney-shaped, with the pair of cilia inserted laterally. There are a dozen or more orders in this group, the largest being the Ectocarpales, comprising some of the simplest filamentous forms; the Laminariales or kelps; and the Fucales, which include the rock weeds and *Sargassum*. In vegetative complexity some of the Fucales are probably the most advanced of all the Algæ. For illustration see PHÆOPHYCÆ.

Rhodophyceæ. The Red Algæ are acknowledged to be the most beautiful of all the marine Algæ, because of the delicacy of their structure and brilliancy of color. The vegetative structure is not so highly differentiated as in some of the

Brown Algæ, but the method of sexual reproduction is especially complex. The oogonium has a hair-like process ("trichogyne," q.v.) against which the sperms lodge. The contents of sperm are discharged into the trichogyne and pass into the body of the oogonium. The result is not a fertilized egg, but the oogonium (often fusing with adjacent cells to form a large chamber) buds out numerous branches that produce spores, and this whole spore-bearing structure usually becomes ensheathed by a jacket of cells. This spore-bearing structure, with or without a jacket, is the *cystocarp*, whose spores (*carpospores*) produce the new plants. The Red Algæ also develop asexual spores, which are non-motile (as are the sperms), and since they are produced in a group of four in each sporangium, they are called *tetraspores*.

The presence of Algæ in reservoirs is often a source of much annoyance, if not a source of disease. Recent experiments have shown the possibility of speedily destroying these objectionable growths by treating the storage basin two or three times during the summer with copper sulphate in such amount as to give an extremely dilute solution. Fully 100 water supply reservoirs have been successfully treated without a single instance of injury being reported. Cress beds have been freed of *Spirogyra* by using 1 part of copper sulphate to 50,000,000 parts of water. For illustrations, see articles CHLOROPHYCEÆ; CYANOPHYCEÆ; PHÆOPHYCEÆ; RHODOPHYCEÆ.

For general description of Algæ, consult: Murray, *Introduction to the Study of Seaweeds* (London, 1895); Farlow, *Marine Algæ of New England* (Salem, 1881); Cooke, *British Fresh-Water Algæ* (London, 1881-83); id., *Introduction to Fresh-Water Algæ* (London, 1902); Wolle, *Fresh-Water Algæ of the United States*.

ALGARDI, ăl-gär'dè, ALESSANDRO (1602-54). The most prominent Italian sculptor of the Baroque period after Bernini (q.v.); also an architect. He was born at Bologna, where he first studied painting under Lodovico Carracci, but afterward took up sculpture with Conventui. His early works were ivory carvings and models for small silver and bronze work executed at Mantua under the patronage of Duke Ferdinand, and afterward (from 1625) at Rome. For 15 years he was then principally employed in restoring antique statues. In 1640 he was made head of the Academy of St. Luke, and in the same year he received his first important public commission, the colossal marble group of "St. Philip Neri and the Angel" in Santa Maria in Vallicella (Rome). The following year he carved his well-known "Beheading of St. Paul" for the church of San Paolo, Bologna. Under Pope Innocent X he replaced Bernini as court sculptor. In this capacity he designed the statues and reliefs on the façade of the Villa Doria-Pamfili, in Rome, the stucco ceilings of the interior, and the magnificent garden, with its fountain and casino. In 1645 he designed the colossal bronze statue of Innocent X. Among his other portraits of this Pope is an excellent bust in the Metropolitan Museum of Art, New York. About 1749 he completed the colossal tomb of Pope Leo XI in St. Peter's, and the same year he designed the great fountains of the court of Pope Damasus in the Vatican. Most celebrated of all his works is the marble relief of the "Retreat of Attila from Rome" in St. Peter's (1450), the largest alto-rilievo in the world.

Like other Baroque sculptors, Algardi conceived sculpture in the pictorial sense. His style was modeled upon Bernini's, but is more detailed in finish and dryer in textures. He excelled especially in portraiture. Though his works are of high technical ability, their effect is marred by a hollow pathos and exaggerated dramatic action. An architect of note, he designed the Villa Doria-Pamfili and the façade of Saint Ignazio in Rome.

AL'GARO'BA. See MESQUITE TREE.

ALGAROTTI, ăl'gà-rõt'tè, FRANCESCO, COUNT (1712-64). An Italian philosopher and art critic. He was born in Venice, studied at Rome and Bologna, and when 21 years old published in Paris his *Neutonianismo per le donne* ("The Newtonian Philosophy for Ladies"), a work on optics, on which his reputation was founded. Until 1739 he lived in France and for many years enjoyed the friendship of Voltaire. On his return from a journey to Russia he first met Frederick the Great, who bestowed upon him the title of Count and in 1747 made him Court Chamberlain. He also enjoyed the favor of Augustus III of Poland and lived alternately in Berlin and Dresden until his return to Italy in 1754. He died at Pisa, where Frederick the Great raised a monument to his memory in the Campo Santo. He was a versatile man and a voluminous writer. In his day he was considered a good judge of painting and architecture, and his reputation is confirmed by his *Saggi sopra le belle arti* ('Essays on the Fine Arts') and by the paintings he selected for the Dresden Gallery. His chief defect of style was the strong Gallic flavoring, due to a too faithful study of French literature. English readers are most likely to think of him as Carlyle's "young Venetian gentleman of elegance in dusky skin and very white linen." Algarotti's collected works appeared, with biography by D. Michelessi, Venice, 1791-94.

ALGAROVILLA, ăl'gà-rò-vèl'yà (Sp. *algarroba*, from Ar. *al-kharrubah*, the carob tree). An astringent product of *Pithecolobium parvifolium*, one of the Leguminosæ growing in tropical America, the pods of which are said to be four times as rich in tannin as the best oak bark. Black ink is made from it, also a yellow dye, and it is useful in medicine.

ALGARVE, ăl-gär'vã. The smallest and most southerly of the provinces of Portugal, situated between Alemtejo and the Atlantic Ocean (Map: Portugal, A 4). Its area is 1873 square miles. The northern part of the province is occupied by the Sierra de Monchique, a range of mountains with an average height of 4000 feet, which are a continuation of the Sierra Morena of Spain and terminate in Cape St. Vincent, the southwest extremity of Europe. The highest ridges are destitute of vegetation, and these mountainous regions are poorly adapted for agricultural purposes. From the main ridge the country slopes southward in jagged terraces and low hills, leaving a level tract of a few miles along the coast. The African heat of the climate is mitigated by the cool sea breeze. The only river of importance is the Guadiana, which is navigable and which separates Algarve from Spain in the east. The soil of the plain is indifferently suited for the production of grain, or even for pasturage; but it produces many kinds of southern fruit, including figs, almonds, olives, and grapes. The mineral wealth is considerable, but its exploita-

tion is insignificant. The principal occupations of the inhabitants are agriculture, cattle-raising, sea-faring, fishing, and the production of sea salt. Pop., 1900, 255,191; 1911, 274,122. The inhabitants have preserved many of the characteristics of the Moors. The chief town is Faro, with a population of about 12,000. In ancient times this province was much more extensive. It received its name from the Arabs, in whose language Algarve signifies 'a land lying to the west.' It belonged to the Moors until 1253, when Alfonso III united it to the crown of Portugal as a separate kingdom.

AL'GAZEL (*Al* is the Ar. article *the*). A gazelle; ordinarily the dorcas. See GAZELLE.

AL'GEBRA. A branch of pure mathematics that materially simplifies the solution of arithmetical problems especially through the use of equations. It also forms the introduction to all of the higher branches of mathematical science, except pure geometry.

The name is derived from the title of the Arabic work by Al-Khuwarizmi (q.v.), *Ilm al-jabr wa'l muqabalah*, meaning 'the science of reintegration and equation'; that is, the science that relates to the reduction of equations to integral form and to the transposition of terms. The title appeared thereafter in various forms, as *ludus algebræ almugrabalæque*, and *algiebar* and *almachabel*, but the abbreviation algebra was finally adopted. The science also went under various other names in the fifteenth and sixteenth centuries, as the *ars magna* (Cardan, 1545), the *arte maggiore*, the *regola de la cosa* (because the unknown quantity was denominated *cosa*, the 'thing'), and hence in early English the *cossike art*, and in German the *Coss*.

The exact limitations of algebra are not generally agreed upon by mathematicians, and hence various definitions have been proposed for the science. It has been proposed to limit it to the theory of equations, as the etymology of the word would suggest; but this has become a separate branch of mathematics. Perhaps the most satisfactory definition, especially as it brings out the distinction between algebra and arithmetic, is that of Comte: "Algebra is the calculus of functions, and arithmetic is the calculus of values." This distinction would include some arithmetic in ordinary school algebra (e.g., the study of surds), and some algebra in common arithmetic (e.g., the formula for square root).

The oldest known manuscript in which algebra is treated is that of Ahmes, the Egyptian scribe, who, about 1700 B.C., copied a treatise dating perhaps from 2500 B.C. In this appears the simple equation in the form, "Hau (literally heap), its seventh, its whole, it makes 19," which, put in modern symbols, means $\frac{x}{7} + x = 19$. In Euclid's *Elements* (about 300

B.C.) a knowledge of certain quadratic equations is shown. It was Diophantus of Alexandria (q.v.), however, who made the first attempt (fourth century A.D.) to work out the science. In the following century Aryabhata (q.v.) made some contributions to the subject. Little was then done until about 800 A.D., when Al-Khuwarizmi wrote. His efforts were followed by another period of comparative repose, until the Italian algebraists of the sixteenth century undertook the solution of the cubic equation. (See EQUATION.) In this, building upon the efforts of Ferro and Tartaglia, Cardan

was successful (1545), although there is reason to believe that the real honor belongs to Tartaglia. Soon after, Ferrari and Bombelli (1579) gave the solution of the biquadratic equation.

The principal improvements in the succeeding century related to symbolism. It took a long time, however, to pass from the radical sign of Chuquet (1484), $\sqrt[4]{10}$ through various forms, as $\sqrt[3]{10}$, to our common symbol $\sqrt[4]{10}$ and to the more refined $10^{\frac{1}{4}}$. Similarly it was only by slow steps that progress was made from Cardan's cubus p 6 rebus æqualis 20, for $x^3 + 6x = 20$, through Vieta's

$1C - 8Q + 16N$ æqu. 40, for $x^3 - 8x^2 + 16x = 40$ and Descartes'

$$x^2 \infty ax - bb, \text{ for } x^2 = ax - b^2,$$

and Hudde's

$$x \infty qx. r, \text{ for } x^3 = qx + r$$

to the modern notation. To the Frenchman Vieta, whose first book on algebra, *In Artem Analyticam Isagoge*, appeared in 1591, credit is due for the introduction of the use of letters to represent known as well as unknown quantities.

The next step led to the recognition of the nature of the various number systems of algebra. The meaning of the negative number began to be really appreciated through the application of algebra to geometry by Descartes (1637), and the meaning of the so-called "imaginary," when Wessel (1797) published his memoir on complex numbers, or, more strictly, when Gauss (q.v.) brought the matter to the attention of mathematicians (1832).

The effort to solve the quintic equation, seriously begun in the sixteenth century, had met with failure. It was only after the opening of the nineteenth century that Abel, by the use of the theory of groups discovered by Galois, gave the first satisfactory proof of the fact, anticipated by Gauss and announced by Ruffini, that it is impossible to express the roots of a general equation as algebraic functions of the coefficients when the degree exceeds the fourth.

Among the later additions to the science of algebra may be mentioned the subjects of Determinants (q.v.), Complex Numbers (q.v.), Substitutions and Groups (q.v.), Forms and the modern treatment of Equations (q.v.), and Quaternions (q.v.). Under these heads may be found historical sketches dealing with the recent developments of algebra.

ALGECIRAS, ăl'jê-sî'ras, *Sp. pron.* ăl'nă-thê'râs (from Ar. *al-jazîrah*, the island, peninsula). A seaport of Spain, in the province of Cadiz, 6 miles west of Gibraltar (Map: Spain,

C 4). Its harbor is good and protected by a fort. It is a well-built city, with fine churches and monasteries. It maintains a brisk and profitable coasting trade, which consists chiefly of exports of leather, charcoal, cork, grain, stone, and spirits. Many of the inhabitants are engaged in fishing. Pop., 1900, 13,131; 1910, 15,818. This was the Pontus Novus of Roman times and later was the first place seized by the Moors from Africa (711). They called it Algeciras, the green island, from the islet at the harbor's mouth, still known as Isla Verde. Alfonso XI besieged it for 20 months and took it after his victory at Rio Salado, 1344. The Moors are said to have used gunpowder for the first time at this siege, at which all Christendom was represented by knights and crusaders. An international conference for the regulation of Moroccan affairs assembled at Algeciras in January, 1906. See MOROCCO.

AL'GER, HORATIO, 2D (1832-99). An American writer of juvenile literature. He was born at Revere, Mass., graduated at Harvard College in 1852, and afterward at the Harvard Divinity School. He became pastor of the Unitarian church at Brewster, Mass., in 1864; but two years later he went to New York, where he labored for the improvement of the condition of street boys. He wrote much for newspapers and periodicals and published about 70 books, of which nearly 800,000 copies have been sold. These writings include the popular Ragged Dick, Tattered Tom, and Luck and Pluck series. In 1879 he published *Grand'ther Baldwin's Thanksgiving, With Other Ballads and Poems*. A new edition of his *Works* was published in 1913.

ALGER, PHILIP ROUNSEVILLE (1859-1912). An American naval officer, born in Boston. He graduated from the United States Naval Academy in 1880 and subsequently served at sea and in the Navy Department at Washington until 1891. He was appointed professor of mathematics (on duty at Washington), and later, with the rank of captain, head of the department of mechanics at Annapolis. At the end of his period of service there, from 1899 to 1907, the department was discontinued. He was made a member of the special Naval Board of Ordnance, and Secretary-Treasurer of the United States Naval Institute. The Institute's *Proceedings* he edited after 1903. Besides articles on ordnance contributed to service journals, his published writings include *Exterior Ballistics* (1904), *Elastic Strength of Guns* (1906), and *War on the Sea* (1908).

ALGER, RUSSELL ALEXANDER (1836-1907). An American soldier and politician, born in Lafayette, Ohio. He studied law at Akron, Ohio, was admitted to the bar in 1859, and began practice at Cleveland. He removed to Michigan in January, 1860, and in September, 1861, enlisted in the Union army as a volunteer, serving successively as captain, major, and lieutenant-colonel, and being brevetted first as brigadier-general and then as major-general "for gallant and meritorious services." He returned to Michigan in 1864, where he amassed a large fortune in the lumber business. He took an active interest in both local and national politics, and was Governor of Michigan from 1885 to 1886. He became Commander-in-Chief of the G. A. R. in 1889, and in 1897 became Secretary of War in President McKinley's cabinet. His administration of the department during the Spanish-American War met with the

most vigorous criticism. He was charged with being directly or indirectly responsible for the unsanitary condition of camps, the overcrowding and unfitness of transports, the insufficiency of physicians and medicines, the bad quality of food, and the incompetence of subordinate officers. An investigating committee, appointed by the President, in the main exonerated Alger. He resigned Aug. 1, 1899. In 1902 he was appointed to the United States Senate, and in 1903 was elected to that body. He wrote *The Spanish-American War* (New York, 1901). Consult *Memorial Addresses, 59th Congress* (Washington, 1907).

ALGER, WILLIAM ROUNSEVILLE (1822-1905). An American Unitarian clergyman and ethical writer, born at Freetown, Mass., Dec. 30, 1822. He graduated at the Harvard Divinity School in 1847, held pastorates successively at Roxbury, Boston, New York, Denver, Chicago, and Portland, Me., and afterward lived in Boston. He wrote *Poetry of the Orient* (1856), *History of the Doctrine of a Future Life*, which contains a comprehensive bibliography on the subject by Ezra Abbot (1863), *The Genius of Solitude* (1865), *Life of Edwin Forrest* (2 vols., 1878), *Symbolic History of the Cross* (1881), and *The School of Life* (1881).

ALGE'RIA (Ar. *Al-jazīrah*, the island; Fr. *Algérie*). A French colony in northern Africa, situated between lat. 30° and 37° N. and long. 2° 10' W. and 8° 50' E. (Map: Africa, E 1). It is about 550 miles long from east to west and extends inland from 320 to 380 miles. Algeria is divided into Algeria Proper, or the Northern Territories, and the Southern Territories. Their combined area is 222,119 square miles. Its boundaries are formed by the Mediterranean on the north, Morocco on the west, Sahara on the south, and Tunis on the east.

Physiography. The entire northern part is traversed by a section of the Atlas Mountains, which cover the northern part of Africa from the Atlantic to the Gulf of Gabes. The mountain system of Algeria consists of two principal chains, running parallel to each other and connected by small ridges. The northern chain, called Little or Maritime Atlas, runs along the coast, in places very near the sea. Of its several ranges, the Jurjura, to the east of Algiers, rises to a height of about 7500 feet. The Great Atlas is situated south of the Little Atlas, and contains some of the highest peaks of Algeria, as Mount Shelia (about 7600 feet) in the Jebel Aures. These mountains present a steep wall toward the Sahara, but slope more gradually on their northern side, where they are covered with extensive forests. They are furrowed by deep and tortuous defiles. The Algerian Sahara is a rocky plateau, with an average elevation of about 1500 feet. Some geographers distinguish a third chain, the Sahara Border Range, situated between the Great Atlas and the Sahara Desert. The coast of Algeria is much broken, and forms numerous bays, the principal among them being the Bay of Algiers and the gulfs of Bougie and Bona.

The surface of Algeria represents three natural divisions or zones. The first, known as the Tell, is the most northern part of the country extending inland for about 50 miles and taking in the northern slope of the Little Atlas. It is the most productive and best watered part of the country, and contains most of the European settlements. The second, central zone, in-

cludes the elevated steppes south of the Tell and the Great Atlas Mountains. It is interspersed with numerous saline lakes or *shotts*, which generally evaporate during the dry season, leaving a thick stratum of salt on the bottom. In this section there are only a few little streams, which dry up for a part of the year. The third zone is the Algerian Sahara, with an uncertain area estimated at upward of 100,000 square miles. It is subdivided into three parts, called Fiafi, Kifar, and Falat, respectively. The first term is generally applied to the oases of the desert. They are mostly well watered and covered with vegetation and contain numerous thriving villages and settlements. The second refers to those parts of the desert which are covered with grass part of the year. They have no settled population, but are visited by the nomadic tribes on account of the grass. The third part includes the rest of the desert, which is utterly devoid of vegetation and unfit for human habitation. A remarkable feature of the Algerian Sahara is the dried-up river courses. At present, only two such courses are known, called the Wady Igharghar and Wady Miya, respectively. The first begins south of Algerian Sahara near N. lat. 26° and runs due north, terminating at the Shott Melrir. Its length is over 700 miles, and its breadth, even at present, is about 4 miles in some parts. The Wady Miya is a branch of Igharghar, which it joins about 60 miles south of Shott Melrir. There is still some water running beneath its bottom.

Algeria is rich in minerals. Among the metals which are obtained are iron, lead, copper, and quicksilver. Sulphur and petroleum are found, and there are valuable deposits of phosphates. Salt is a most important product. Onyx and beautiful white and red marbles are quarried.

The most important river is the Sheliff, which has in the main a westerly course and empties into the Mediterranean near Mostaganem. Its length is about 400 miles. Among other streams are the Seybouse, which empties into the Gulf of Bona, the Wady el Kebir, which flows past Constantine, and the Tafna in the extreme west. None of these rivers is navigable, but they all contribute considerably to the fertility of the regions through which they flow.

The climate is generally healthful, except in the marshy lowlands. The rainy season on the coast lands lasts from October to March. The summer is hot and rainless, with the noted *sirocco*, or desert hot wind blowing at intervals.

The mountain forests are filled with cedars and different kinds of oak, as well as pines, ashes, junipers, aloes, dwarf palms, and cactuses, but they are rapidly disappearing, giving place to pastures. The flora of the central zone is confined mainly to grasses and some aromatic herbs. Myrtles, olives, pistachias, and dwarf palms are among the characteristic plants of the northern zone. The fauna of Algeria is generally African in its character. Lions were once common, but have now vanished. The smaller carnivorous animals, like jackals and hyenas, are numerous, and antelope, deer, and wild boars are found.

Products. Algeria is chiefly an agricultural country, and its importance is increasing. For 1910 the total agricultural population was returned as 3,738,413, of whom 212,625 were European, mostly French. The soil is generally extremely fertile, and the greater part of the

area under cultivation is devoted to grain crops. The area under cultivation in 1910 was 3,512,635 hectares, of which 3,001,066 hectares were under cereals and 152,129 hectares under the vine. The total cereal production was 22,127,835 metric quintals, of which 9,763,372 were wheat, 10,361,277 barley, and 1,672,138 oats. The wine yield was 8,413,654 hectoliters. The cultivation of silk, olives, dates, and other fruits is also important, and is participated in to a considerable extent by Europeans. Potatoes, carrots, onions, and asparagus are the chief vegetables exported. Alfa grass is exported in large quantities to England. The forest area is estimated at about 2,800,000 hectares, of which over 70 per cent belongs to the State. The exploitation of the forests is considerably hindered by their inaccessibility. Much attention is given to mining, which is carried on chiefly by English firms. Among other industries are pottery, leather-dressing, weaving, and the production of esparto goods.

The commerce of Algeria is increasing. Imports, valued at 448,200,000 francs in 1907, amounted to 511,967,000 francs in 1910; while exports advanced from 338,500,000 to 513,267,000. In the latter year the imports from France amounted to 437,896,000 francs, and the exports thereto 410,367,000. After France the countries of greatest trade importance are Great Britain, Morocco, Germany, Belgium, and Spain. Imports consist chiefly of textiles, clothing, furniture, machinery, coffee, tobacco, timber, and coal. The leading exports are wine (207,698 francs in 1911), cereals (80,492,000), live stock (34,193,000), fruits (15,902,000), iron ore (12,000,000), phosphates (10,977,000), tobacco (10,047,000), zinc, cork, vegetables, wool, hides, and alfa. The total length of the railway was 2049 miles at the beginning of 1912. Algeria has, besides, a good system of national roads and about 100 miles of tramway lines. Entered at Algerian ports in 1910, 5003 vessels of 5,691,063 tons; cleared, 5198 of 5,953,639 tons; about half of the shipping is French.

The administration of Algeria is vested in a governor-general, who is assisted by a council. Under the law of Dec. 2, 1902, the governor-generalship of Algeria was divided into two parts, Algeria proper, and the Southern Territories, with separate administrations and budgets but under one governor-general. The Southern Territories were constituted out of portions of Algeria and the Sahara. Algeria proper, or the Northern Territory, comprises 80,208 square miles, with a population (1911 census) of 5,069,522; the Southern Territories aggregate 141,911 square miles, with 494,306 inhabitants; total, area 222,119 square miles; pop., 5,563,828. The population in 1906 was 5,231,850, of whom 4,477,792 were indigenous. All the laws for Algeria are framed by the French National Assembly. The three departments of Algiers, Oran, and Constantine, into which the Northern Territory is divided, have their own councils, which send delegates to the Superior Council, meeting once a year to discuss the budget. Each department sends one senator and two deputies to the National Assembly. Justice is administered by courts of first instance, of which there are 16, justices of the peace, commercial courts, and a Court of Appeals, situated at Algiers. Criminal justice is organized on the same basis as in France. For the transaction of affairs between the natives

and the Europeans or the government, there are organized so-called *Bureaux Arabes*, which also supervise the religious affairs of the natives. The military forces of Algeria number about 56,000 men, and consist of the Nineteenth Army Corps and the Territorial Army. The financial system of Algeria closely resembles that of France. The revenue is obtained from customs, monopolies, and direct taxes, the latter being the only tax paid by the natives. The budget of Algeria proper for 1912 showed estimated receipts of 145,167,014 francs and estimated expenditures of 145,155,971 francs; that of the Southern Territories 6,523,301 and 6,513,284. The military expenditure is borne by the French budget. By the law promulgated Dec. 19, 1900, Algeria was constituted a legal person, with power to own property, contract loans, grant railway franchises, award public contracts, etc.; and in the following year a decree transferred the customs department from the authorities at Paris to the governor-general. Education and religion are supported by the State. In 1910 there were 116 infant schools (with 24,889 pupils), 1443 primary schools (147,099), and 328 Mussulman primary schools. The Mussulmans have their own schools for secondary education. Lycées are found in the larger cities, and there are nine commercial schools in Algiers, as well as an institution for higher instruction, with several faculties. All religions represented were subsidized until the enactment of the Separation Law in 1905. The native population consists chiefly of Berbers (of whom the Kabyles are a part) and Arabs. The former constitute perhaps 75 per cent of the population and are the original inhabitants of the land. They have a higher standard of morality than the Arabs; they are Mussulmans, but do not practice polygamy. The Arabs are to a considerable extent intermixed with the Berbers. They inhabit chiefly the Tell region and the towns. Part of them are organized in tribes, under chiefs who are not recognized, however, by the French government. They are Mohammedan and practice polygamy. The nomadic part of the Arab population, among whom the tribal system is chiefly developed, hold land in common, each tribe being entitled to a certain territory by virtue of tradition. The non-indigenous population in 1906 numbered 680,263; of these 278,976 were French (exclusive of 170,444 naturalized French), 117,475 Spaniards, 64,645 Jews, 33,153 Italians. These figures do not include certain persons, as the military, counted apart and numbering 73,789. Negroes and Turks are found in only very small numbers. The capital, Algiers, had a population of 172,397 in 1911.

History. In ancient times the Numidians occupied eastern and the Moors (or Mauri) western Algeria. Under the Romans the former possessed the province of Numidia, the latter that of Mauretania Cæsariensis. Like all of northern Africa, these provinces enjoyed a high degree of prosperity and civilization under Roman sway, which was checked by the Vandal conquest about 440 A.D. The settlement of Arabic immigrants in the country after the Mohammedan conquest in the seventh and eighth centuries reared an Oriental civilization in place of that of Rome, and Arab princes ruled the land until the rise of the Almohades (q.v.), who governed until 1269, after which the country was split up into small states. Af-

ter the expulsion of the Moors from Spain in 1492, they settled in Algeria, and began that career of piracy against the Christian nations which gave the country its evil reputation through many centuries. Hard pressed by Spain, one of the Algerine chiefs, the Emir of Metidja, called in the Turkish corsair Horuk, known as Barbarossa (q.v.), a renegade Greek, who turned against the Emir, and made himself Sultan of Algiers. He was overthrown by the Spaniards and beheaded in 1518; but his brother, Khair-ed-Din, also known to the Christians as Barbarossa, succeeded him, repulsed the Spaniards with the assistance of a Turkish army, and established a military despotism sustained by piracy, which lasted until the French conquest. Khair-ed-Din placed the country under the suzerainty of the Turkish Sultan. The Emperor Charles V, in 1541, led a great expedition against this daring corsair, but met with disaster. In 1600 the soldiery of Algiers obtained from the Turkish Sultan the privilege of setting up an officer, called the Dey, who was to share the authority with the Turkish Pasha. The history of Algiers in the sixteenth and seventeenth centuries is a part of the history of the Barbary pirates and of the fruitless efforts of the Christian powers to suppress them. Spanish, French, English, and Dutch were equally unsuccessful. Early in the eighteenth century the Dey Ali Baba effected the virtual emancipation of the country from the dominion of Constantinople. He banished the Turkish Pasha, who had heretofore represented the Sultan, persuaded the latter to leave the power solely in his hands, and paid no more tribute.

Algeria was now ruled by a military oligarchy, at the head of which stood the Dey, and after him the powerful Turkish militia, recruited from Constantinople and Smyrna. Besides these there was a divan or Council of State, chosen from the 60 principal civil functionaries. The internal history of the country henceforth presents nothing but a bloody series of seraglio revolutions caused by the Janissaries, who permitted few of the deys to die a natural death. Algeria continued to defy the greater Christian powers, and to enforce tribute from the lesser. A final Spanish attack, made on a formidable scale in 1775, was as unfortunate as those that had preceded. During the French Revolution and the time of the Empire, its aggressions were much diminished, in consequence of the presence of powerful fleets in the Mediterranean Sea; but at the close of the Napoleonic wars they were recommenced vigorously. The first substantial rebuke was administered by a small United States squadron, commanded by the younger Decatur, which defeated an Algerine squadron off Cartagena, June 20, 1815, and compelled the Dey to acknowledge the inviolability of the American flag. About the same time Admiral Lord Exmouth, with a strong English and Dutch fleet, bombarded the capital and compelled the Dey to conclude a treaty (1816), by which all Christian slaves were released without ransom, and a promise was given that both piracy and Christian slavery should cease forever. The pledges were not kept. As early as 1817 Algerine pirates ventured as far as the North Sea, and seized all ships in their course not belonging to any of the Powers that sent them tribute, as was done by Sweden, Denmark, Portugal, Naples, Tuscany, and Sar-

inia. Treaties were of no avail. The Spanish, the Italian, and in particular the German shipping suffered severely. In 1817 the Dey Ali greatly curtailed the power of the Janissaries. His successor, Hussein, by his rash conduct brought on the conflict with France which broke the Moslem power in Algeria and made it a French province. In addition to the standing grievances against Algeria, there was a dispute regarding the payment of a debt incurred by the French government to two Jewish merchants of Algiers at the time of the expedition to Egypt. This matter had long been pending in the French courts, and as the Dey was a creditor of these Jews, he took a personal interest in the matter, and wrote to the King of France, who did not reply. At a reception of the consuls, he taxed the French consul with this, and when the latter replied that "a King of France could not condescend to correspond with a Dey of Algiers," Hussein angrily struck him.

This high crime against the dignity of nations brought the retribution which had not followed years of barbarous piracy. In 1830 the Dey and the Turks were expelled by a French fleet and a strong army under Bourmont, and the French conquest of Algeria began. The excesses of the French soldiers awoke the resentment of the native population, who regarded all restraints as removed when their Turkish masters were driven out. For 17 years the Arabs maintained a vigorous resistance to the French and after them the Kabyles, the native population of the original Berber stock, still continued the struggle in a desultory manner. The drastic measures of the French military government did not tend to pacify the people, whose antagonism was inflamed by race hatred and religious fanaticism. Bourmont was succeeded by Clausel, Berthezène, and the Duke of Rovigo, all of whom failed to master the situation. Abd-el-Kader, a young Arab emir of marked abilities and dauntless spirit, had meanwhile brought together and organized the scattered forces of rebellion and was secretly assisted by the Emperor of Morocco. A treaty was concluded with him during the provisional administration of General Voirol, and an attempt was made to promote the material interests of the country. Toward the end of 1834 there was an effort to organize the administration on a permanent civil basis, and Gen. Drouet d'Erlon was made Governor-General, but a renewed outbreak by Abd-el-Kader led to his recall and that of the military commandment. Clausel, now a Marshal, was sent back to the Regency in 1835, but had to be reënforced by Bugeaud, who made a peace with the Arab chieftain, May 20, 1837, by which Abd-el-Kader recognized the sovereignty of France, but received in return several valuable provinces. In February, 1837, Damrémont succeeded Clausel as Governor-General, and after the former's death, at the storming of Constantine, General Valée was appointed to the difficult post. In October, 1839, Abd-el-Kader violated his last treaty on an insignificant pretext, and a general attack was made upon the French positions. Bugeaud supplanted Valée in 1841, and began an inexorable and unscrupulous campaign against the Arabs with an army augmented to nearly 100,000 men. Abd-el-Kader kept up a determined fight against odds until December, 1847, when he surrendered to General Lamoricière. (See ABD-EL-KADER.) An irregular warfare

against French authority was then taken up by the Kabyles, thwarting for many years all attempts to establish civil government.

From 1858 to 1860 the military government of Algeria was superseded by the institution of a special ministerial department for Algeria and the colonies, which was first of all intrusted to Prince Napoleon. In December, 1860, however, a military government was reinstated, and Marshal Péligri made Governor-General, with a Vice-Governor under him, a Director-General for civil affairs, and a council of thirty members. In 1863 the Emperor Napoleon announced that he was willing to give the colony a new constitution, with a chamber of representatives for provincial affairs; he also addressed a letter to the Governor-General, in which he explained that Algeria was no colony in the strict sense of the word, but an Arab kingdom, and that the natives had the same right to protection as the colonists. In 1864, however, strife again arose between the colonists and the Arabs; and it was only after several engagements, during the months of April and May, that peace was restored by the submission of the conquered tribes. Péligri having died in May, 1864, Marshal MacMahon was appointed to succeed him. In the following year the Emperor himself made a journey to Algeria, and on March 5th issued a proclamation, in which, although explaining to the Arabs that the Regency must continue to be united to France, he promised to maintain their nationality and at the same time gave them assurance that they should always remain in undisturbed possession of their territories. Yet these and other measures for conciliating the Arabs were all in vain; for, shortly after the Emperor's return to France, insurrections broke out in the province of Oran and elsewhere. In 1867 and 1868 a severe and general famine checked the military enterprises of the Arabs: and there was peace till 1870, when, owing to the Franco-Prussian War, the Emperor found it necessary to withdraw to Europe the greater part of the forces in Africa. MacMahon's place was then taken by General Durieu, as interim Governor-General, and the natives began to entertain hopes of freeing themselves from the yoke of France. The last serious rebellion was suppressed in 1871. Since then, under the third republic, the industrial and political development of the country has been extremely rapid. A civil government was immediately established, which, changed and modified in 1891 and 1900, provides for the division of the colony into three departments, each sending to the French National Legislature one senator and two deputies. The local administration is conducted by a governor, assisted by a superior council, which is partly elective and partly nominated, and a democratic lower house, wholly elective. Difficult problems of land tenure and education have been manfully faced. The trade of Algeria has doubled; agriculture has been greatly diversified; the appropriation for schools more than quadrupled. Railroads have been built, and Algiers has developed into a beautiful city. The two latest problems which confront the colony both arose in 1912—the one relative to the opening of important coal mines, the other in regard to compulsory military service. Their settlement is still pending.

ALGERINE WAR, ăl'jê-rên'. See BARBARY POWERS, WARS WITH THE.

AL GHAZZALI. See GHAZZALI.

ALGHERO, ăl-gă'rô, or **ALGHERI**, ăl-gă'rê. An episcopal city on the north coast of Sardinia, 21 miles southwest of Sassari (Map: Italy, C 7), founded by Genoese in 1102, and settled by Catalonians in the fourteenth century, who contributed the dialect now spoken by the inhabitants. It is situated on a high, rocky shore, and the harbor is fortified. There are Spanish fortifications and towers in a fine state of preservation and a cathedral dating from 1510. The Casa Albis, where Charles V stayed when he was en route to Africa in 1541, is still pointed out to visitors. Interesting caverns are near the city, the most famous of which is the Grotto of Neptune. The surrounding country produces much fruit, oil, and wine, while coral and shell fish are taken from the sea. Calcium mines have been opened and preserve factories established. Pop., 1911, 11,860.

ALGIERS, ăl-jêrz' (Ar. *Al-jazâ'ir*, the islands, referring to an island in its bay; Fr. *Alger*, ăl'zhâ', formerly ăl'zhâr'). The capital and chief seaport of Algeria, situated on the west shore of the Bay of Algiers, in lat. 36° 47' N., and long. 3° 4' E. (Map: Africa, E 1). It is located on the slope of the Sahel chain, the rich verdure of the mountains giving a beautiful background to the dazzling white of the city, which has the shape of a triangle, while over all towers the Moorish citadel or kasbah, over 400 feet above the sea. Algiers is divided into two parts. The lower part is the modern city, which has been built by the French and which differs in no respect from any well-appointed European city. It has wide and well-shaded streets, spacious squares with statues and parks, and five municipal buildings, mostly located in the Boulevard de la République. The city is lighted by gas, and the water is supplied by four aqueducts, built in the beginning of the seventeenth century. In strong contrast to the European Algiers is the old Moorish city, which rises above the former, and which, in all essentials, continues to be what it was during the reign of the Turkish deys. The streets are narrow and crooked and often impassable for vehicles. The whitewashed

stone houses present bare walls to the street, but their interiors bear the marks of splendor and beauty characteristic of Moorish architecture. The roofs are flat, and in the evening become centres of gayety and are even used occasionally for social functions. An additional picturesqueness is given to the Moorish part of the town by the motley crowds in its streets, including the elegantly dressed Frenchman, the splendidly arrayed Moor, as well as the scantily clad native from the interior. The mosques are less numerous than they were before the French occupation, when their number was estimated at about 100. At present there are only four mosques used as regular places of worship, but there are numbers of tombs of saints or "kubas," which are also used occasionally for that purpose. The construction of the citadel or kasbah was begun in 1516; this building, the palace of the deys until the French conquest, was the scene of many attacks. At present it is used as barracks for the French soldiers, and many of its historical features have been entirely obliterated. The modern city has several splendid churches, including the Roman Catholic cathedral of St. Philippe. Of educational institutions the city has schools of law, medicine, science, and letters, several lycées for the natives as well as for Frenchmen, and a number of commercial colleges and higher Mussulman schools. There are also a library and museum, two theatres, and several scientific societies. The harbor is spacious and well fortified. The commerce is very extensive, and its shipping amounts to nearly 7,000,000 tons annually. The commerce is chiefly with France; but there is also considerable export trade with Great Britain and Spain. Algiers is also one of the most important coaling stations on the Mediterranean. Owing to its mild climate and the fertile as well as picturesque country in which it is situated, the city has become a favorite health resort, and its transient population is steadily increasing. It is connected by rail with Oran and Constantine and communicates with France by steamer and cable. Since the French occupation its growth has been quite rapid. In 1838 it had a population of 30,000; 1881, 65,000; 1891, 83,000; 1896, 96,784; 1906, 138,240 (the municipal population was 145,280 and the total population of the commune, including certain persons, as the military, who are counted apart, was 154,049). Europeans numbered 105,908, of whom 50,996 were French, 23,305 naturalized French, and 12,354 Spaniards. The Jews numbered 12,490. The population, according to the 1911 census, was 153,468; municipal population, 162,326; total for the commune, 172,397. The percentage of natives is steadily declining, while the foreign population, especially the French, shows a steady increase. Algiers is the seat of the governor-general and of the superior civil and military officials of Algeria and the department and arrondissement of Algiers. The city is supposed to have been founded A.D. 944, and fell into the hands of the French, July 5, 1830.

ALGOA BAY, ăl-gô'ă. A large inlet at the southeastern extremity of Cape Colony (Map: Africa, G 8), into which the Sunday and Baasher rivers flow. Although exposed to south winds, the bay furnishes good anchorage and is of considerable commercial importance. It is known in history as the landing place of the first British immigrants to South Africa. Port Elizabeth

is situated on the west side at the mouth of the Baasher.

ALGOL, ăl'göl (Ar. *al-ghül*, the demon). A remarkable variable star in the constellation Perseus. Its variability was first noticed by Montanari in 1669, though the name of the star indicates that the phenomenon was not unknown to the Arabs. Goodricke discovered its periodicity in 1783 and suggested that it was due to the interposition of a dark satellite. Its period is 2 days, 20 hours, 48 minutes, and 55.4 seconds, and is maintained with great regularity. Ordinarily the star is of the second magnitude; but it suffers periods of diminution, lasting $4\frac{1}{2}$ hours, followed by constant minima of 20 minutes, and a return in $3\frac{1}{2}$ hours to the original brilliancy. At minimum it is of the fourth magnitude and gives only one-sixth as much light as it does in the maximum phase. Algol is the type of a class of variable stars numbering about 30, whose minimum phase is very short. Goodricke's suggestion as to the cause of the variability of Algol was the subject of a searching inquiry by Pickering, who, in 1880, announced that the observed phenomena could be completely accounted for by supposing Algol to be accompanied by a comparatively non-luminous companion-star with a diameter about three-quarters of that of the bright star, the two being engaged in mutual revolution in a period identical with the known period of variability. Pickering's explanation was confirmed in striking manner by Vogel, who found, by his spectroscopic observations in 1889, that the visible star is receding from the earth at the rate of about 26 miles per second before the minima, and approaching us at about the same rate after the minima. His approximate estimate of the dimensions of the system assigns to the distance between Algol and the dark companion a value of 3,230,000 miles and makes the diameters of the two bodies 1,061,000 and 834,300 miles respectively; their respective masses are four-ninths and two-ninths of that of the sun. The orbit is supposed to be seen nearly edgewise from the earth. Chandler's suggestion that there exists still another invisible component rests upon less reliable evidence, derived from a study of the variations in Algol's position on the sky, as observed with meridian instruments by several successive generations of astronomers.

ALGOM'ETER. See **PSYCHOLOGICAL APPARATUS**.

ALGO'NA. A city and the county-seat of Kossuth Co., Iowa, 105 miles (direct) north by west of Des Moines, on the east fork of the Des Moines River, and on the Minneapolis and St. Louis, the Chicago and Northwestern, and the Chicago, Milwaukee and St. Paul railroads (Map: Iowa, C 1). It is the centre of an agricultural, dairying, and live-stock region, and manufactures creamery supplies, foundry and machine-shop products, planing-mill products, bricks, tile, wagons, etc. The city contains a public library, opera house, and a handsome court house. The electric light and water works are owned by the city. Pop., 1890, 2068; 1900, 2911; 1905, 3047; 1910, 2908; 1913 (est.), 3300.

ALGON'KIAN SYS'TEM. In geology, that system, consisting chiefly of highly metamorphosed clastic rocks, that lies unconformably between the Archæan beneath and the Cambrian above and at the very bottom of the entire series of sedimentary rocks of the earth's crust. The name "Algonkian" was proposed by Walcott in

1889, and has been quite generally accepted by the more progressive American geologists. The rocks of this system consist of crystalline marbles, slates, schists, quartzites, conglomerates, and gneisses, all of which have, through more or less profound regional metamorphism, been derived from original sedimentary rocks, together with contemporaneous igneous intrusives and lava flows. The Algonkian system includes the Huronian and Keweenawan formations of the Lake Superior region, the Grenville series of the Adirondacks and eastern Canada, and the Hastings series of Canada. The known fossils of Algonkian age are very obscure and few in number. Because of the extensive metamorphism suffered by the rocks of both the Archæan and Algonkian systems, rendering, in many regions, their separation under the two divisions almost impossible, it is thought advisable to consider all rocks formed before the Cambrian period under the more comprehensive title **PRE-CAMBRIAN FORMATIONS**.

ALGON'QUIAN STOCK. The most widely extended and most important Indian linguistic stock of North America, formerly occupying nearly the whole area (with the exception of that occupied by the Iroquoian tribes) stretching from Labrador to the Rocky Mountains in the north, and extending southward to Pamlico Sound on the coast and to the Cumberland River in the interior. It included several hundred tribes and sub-tribes speaking probably 40 distinct languages, besides a large number of dialects. Both linguistic and traditional evidence point to the north Atlantic coast, from the St. John to the Delaware River, as the region from which the various cognate tribes migrated westward and southward. From the fact that the earliest settlements in Canada, New England, New York, New Jersey, and Virginia were all made within the Algonquin area, the history of these tribes is better known, and their languages have been more studied, than those of any others north of Mexico. According to Michelson, these languages fall into four groups, the Blackfoot, Cheyenne, and Arapaho standing apart and distinct from the remaining group. For full two centuries they opposed the advance of the white man step by step, under such leaders as Opechancano, Philip, Pontiac, and Tecumseh, with the final and inevitable result of defeat, suppression, and swift decay. The number of the Algonquian stock (1910) is about 82,000 souls, of whom about 43,000 are in the United States, the remainder being in Canada, with the exception of a few hundred refugees in Mexico.

The principal Algonquian tribes were the Algonquin, Malecite, Miami, Micmac, Naskapi, Cree, Montagnais, Abnaki, Pennacook, Massachusetts, Wampanoag, Narraganset, Mohegan, Mahican, Montauk, Lenape or Delaware, Nanticoke, Powhatan, Pamlico, Shawano, Ojibwa, Ottawa, Menominee, Potawatami, Sack, Fox, Kickapoo, Blackfoot, Cheyenne, and Arapaho. (See **INDIANS**.) Consult Truman Michelson, "Classification of Algonquian Tribes," *Twenty-eighth Annual Report Bureau of American Ethnology*.

ALGON'QUIN, frequently spelled **ALGONKIN**. An Indian tribe formerly centring about Nipissing Lake and the middle Ottawa River, Ontario. The name (more properly Algomekin) signifies people 'on the other side' of the river. French missionaries began work among the Algonquins early in the seventeenth century and soon dis-

covered their language to be the key to all the numerous dialects now included by philologists under the Algonquian stock. In consequence of destructive wars waged against them by the Iroquois, the tribe rapidly declined, some fleeing to the Upper Lakes, where, with other refugees, they became known later as Ottawas (q.v.); while others, retaining the old name, were gathered into mission villages under French protection. In 1900 there were about 960 Algonquins settled in several villages in Quebec and Ontario, exclusive of those confederated with Iroquois at the Lake of Two Mountains, in Quebec and at Gibson, Ontario, to the number of perhaps 150 more.

ALGORISM. A word variously used in arithmetic. Primarily it referred to the system of Hindu numerals, concerning which European scholars received much of their early information through the work of Al-Khuwarizmi (q.v.), or Algoritmi, as the name appeared in the mediæval Latin. Those scholars who adopted the Hindu numerals were called, from his name, Algorists, as distinct from the Abacists, who used the abacus in their computations. The word appears in various forms, as *algorithmus*, *algrim*, *augrim* (Chaucer). At present the word is generally used to designate any particular arrangement of numerical work, as the algorism for square root or the algorism for division. See ARITHMETIC.

ALGUAZIL, älgwá-thēl', or **ALGUACIL** (Sp. *alguacil*, for Ar. *al-wazir*, the vizier). The general name in Spain of the officers intrusted with the execution of justice. There are *alguaciles mayores*, who either inherit the office of executing justice in a town as a hereditary right belonging to their families, or are chosen to the office by the municipality; formerly the name was given also to the officers that executed the sentences or orders of tribunals, such as the tribunal of the Inquisition and of the various orders of knights. But usually, under the name of Alguazil, is understood the *alguaciles menores*, or 'ordinarios,' that is to say, the attendants or officers of the courts of justice, *gens-d'armes*, bailiffs—in short, all the inferior officers of justice and police who are appointed to their office by the judges, *alguaciles mayores*, or town council.

ALHAGI, älhājī. See MANNA.

ALHAMA, älä'mâ (Ar., the bath; the Roman *Astigia Juliensis*). A town of Andalusia, Spain, in the province of Granada, 25 miles southwest of Granada (Map: Spain, C 4). Its situation is wild and romantic, for it is built, terrace above terrace, upon a hill on either side of which rise naked limestone crags, while the Sierra Alhama towers to the height of 8000 feet in the background. Alhama is noted for its baths, which are much frequented in the spring and fall. They are situated in the valley of the Marchan, are of a sulphurous character, and reach a temperature of from 107° to 113° F. The Baña de la Reina is a Roman building of great antiquity; the Baño Fuerte is a Moorish structure. An earthquake in 1884 wrought much havoc, and, in consequence, the town has been largely rebuilt, modern structures replacing Moorish edifices. The principal manufactures are flour, spirits, soap, and gypsum, while the important products are grain, wine, oil, almonds, and esparto. Alhama was a watering place and fortress in the time of the Romans, and the Moors valued highly its medicinal springs. It

was, however, chiefly as a fortress and outpost to Granada that it was important to them, and when it was captured by the Christians, Feb. 28, 1492, it caused the widespread mourning expressed in the famous ballad, *Ay de mi Alhama*, well known in the English translation. Pop., 1900, 7683; 1910, 7812.

ALHAMA. A town of Murcia, Spain, situated at the foot of the Sierra de España, on the southern slope, 13 miles southwest of Murcia (Map: Spain, E 4). It is celebrated for its sulphur springs and warm mineral waters, 102° to 108° F., and is a favorite resort of invalids and holiday-seekers in spring and early summer. Fruit, especially fine grapes, is grown, and fabrics, alcohol, and saltpetre are manufactured. Copper and iron are found in the neighborhood. Alhama was known in the Roman era and figured in the Moorish wars. Pop., 1900, 8410; 1910, 9184.

ALHAM'BRA (Ar. *al*, the + *hamrā*, red). The fortified palace-citadel of the Moorish kings of Granada. As early as the ninth century a citadel was located here with the name *al-Hamra*, which was rebuilt when Granada became the capital of what was left of the Moorish dominions in Spain, by King Mohammed Ibn-el-Ahmar and his successors (1248, 1279, 1306, 1354). The citadel stands on a hill north of Granada, on a terrace about 2500 by 675 feet, and is surrounded by a wall with 13 square towers, over a mile in circuit, built of the red brick which gave it the name of *Kal'at el-Hamrā*, 'The Red Castle.' Inside the citadel were beautiful gardens, a donjon citadel, a gate of justice, a watch tower, and, finally, the palace itself, as sombre and plain on the outside as it was smiling and decorative within. Charles V destroyed a large part of it (especially the Winter Palace) to make room for a tasteless Renaissance building (which, however, was never completed); and Philip V still further mutilated it. Mutilated as it is, it remains the best exemplar of Moorish art in Spain, even though in details the work may not be so exquisite as earlier work in Egypt and the East. What remains is grouped around two principal oblong courts, the Alberca Court, or Court of the Blessing (140 × 74 feet), and the Court of the Lions (116 × 66 feet); and several smaller courts, among them that of the Mosque. There are porticoes, pillared halls, small gardens, baths, and a mosque. The Court of the Lions is surrounded by arcades supported by 124 white marble columns, while similar arcades frame the ends of the other court. The main reception-hall, called the Hall of the Ambassadors, is a square (37 feet), surmounted by a beautiful dome 75 feet high, with stalactite pendentives. Connected with the Court of the Lions are two smaller but equally exquisite halls, the Hall of the Abencerrages, with a dome and exquisite columns, used as a banquet-hall, and the Hall of the Two Sisters, a pleasure-room communicating with the baths. There is a network of smaller apartments. All the surfaces are decorated with a bewildering mass of color and design in tiles, stucco, and painting. The ornamentation comprises intricate geometrical patterns, floral designs and arabesques, and a profusion of Cufic mottoes and of heraldic devices, all stamped or cast in stucco and richly painted in red, blue, black and gold, or executed in a mosaic of small enameled tiles. The most characteristic parts were reproduced in the Alhambra Court of the Crystal Palace, at Syden-

ham, London, and the palace has served as a model for innumerable modern imitations of Moorish art. The Alhambra was partly restored by Queen Isabella II, but was damaged by fire in 1890. Consult: Washington Irving, *The Alhambra* (New York, 1832); Goury and Jones, *Plans, Elevations, Sections and Details of The Alhambra* (London, 1842); M. Junghändel, *Die Baukunst Spaniens* (Dresden, 1889); Girault de Prangey, *Monuments arabes et moresques d'Espagne* (Paris, 1839); Bisson, *Choix d'ornements moresques de l'Alhambra* (Paris, 1855); Contreras, *La Alhambra, el Alcázar y la gran mezquita* (Madrid, 1885); Borrmann, *Die Alhambra* (Berlin, 1900); Calvert, *The Alhambra* (New York, 1907); id., *Granada and the Alhambra* (New York, 1907). See MOHAMMEDAN ART.

ALHAMBRA. A city in Los Angeles Co., Cal., 8 miles east of Los Angeles, on the Southern Pacific and Santa Fe and the Pacific Electric Interurban railroads (Map: California, G 8). It is the seat of the Agnes Hill-Runkle School of Music and the San Gabriel Mission Church (Catholic), founded in 1771 by Franciscan Fathers. There is also a parochial school in connection with the mission. A Mission play similar to the Passion Play at Oberammergau is produced there. The city is primarily residential, but there are some factories. Pop., 1900, 808; 1910, 5021; 1913 (est.), 8000.

ALHAMBRA, THE. A famous collection of tales and legends of the Alhambra, or palace of the ancient Moorish kingdom, at Granada, by Washington Irving (1812).

ALHAZEN, ăl-hă'zen, EL-HASAN IBN EL-HASAN IBN EL-HAITAM, ABU 'ALI (c.965-c.1039). An Arabian mathematician and physicist. From his native city, Basra, he went to Egypt and died in Cairo. A man of remarkable intelligence and productiveness, he wrote commentaries on Aristotle, Galen, Ptolemy, Euclid, and Archimedes, and also made numerous original contributions to science. His *Optics*, the most important Arabic work on the subject, was translated into Latin, probably by Gerard of Cremona, and not by Vitellius, who wrote an original work on optics, and was published at Basel in 1572 under the title, *Opticæ Thesaurus Alhazeni Arabis Libri Septem, nunc primum editi, eiusdem Liber de Crepusculis et Nubium Ascensionibus, etc., a Fcd. Risnero*. Various other of his works have been translated in whole or in part by Woepecke, Sédillot, Suter, and Baermann. He is now known chiefly from the problem bearing his name: From two given points within a circle to draw to a point on the circumference two lines which shall make equal angles with the tangent at that point. For bibliography of this problem, consult the *American Journal of Mathematics*, vol. iv, p. 327.

AL-HEN'NA. See HENNA.

ALHONDIGA DE GRANADITAS, ăl-ôn'dê-gă dă gră'nă-dê'tăs. A fortified public storehouse near Guanajuato, Mexico, where, in 1810, in the beginning of the revolution against Spain, the local government officials took refuge and defended themselves vigorously, being captured only after severe fighting by the insurgents under Hidalgo. Local tradition of the fight declares that when the Spaniards in the granary had exhausted their stock of cannon balls, they used bags of silver coins, fresh from the mint, and also quicksilver flasks, which were stored there for use in connection with the great silver mines of the place. Hidalgo was subsequently

defeated and executed at Chihuahua, and his head was suspended from a spike on the wall of the Alhondiga, now the local prison.

ALI, IBN ABU TALIB, ă'lê ib-nă'bôō tâ'lêb (c. 600-661). Fourth Caliph, cousin of Mohammed, and one of his first converts. Ali became a staunch adherent of Mohammed, and fought bravely and vigorously for him. On the death of Mohammed it was expected that Ali, who had married Fatima, the daughter of the Prophet, would succeed him as leader, but he only reached the caliphate on the murder of Uthman, the third Caliph, in 656. His caliphate was very stormy and full of wars, due to the opposition of Ayeshah, the young widow of Mohammed, and her party, chief among whom stood Muawiya, the Governor of Syria. In the "Battle of the Camel," fought at Basra in 656, Ayeshah was captured, and later Muawiya was met at the battle at Siffin. On the 22d of January, 661, Ali was attacked by three members of the Kharijite sect and murdered at Kufa. Near this city he was buried, and when later a monument was raised to his memory, so many pilgrims came that it became the centre of a city, Masjid Ali. After his death his followers formed themselves into a sect called the Shiite, which numbers about 15,000,000, scattered in Irak, Syria, Afghanistan, India, and in the neighborhood of Medina. Persia is a decidedly Shiite country, while Turkey is Sunnite. The Fatimides, who reigned in Egypt, were believed to be the descendants of Ali and Fatima. Ali was noted for his great knowledge and wisdom. Fleischer published Ali's *Hundert Sprüche* ('Hundred Maxims') in the Arabic and Persian texts, with a translation (Leipzig, 1837). The *Divan* was published by Kuypers (Leyden, 1745), and later at Bulak in 1840. Some of the maxims and poems attributed to Ali, of course, may be genuine, but the majority of them bear traces of later composition. Consult Brockelmann, *Geschichte der arabischen Litteratur*, vol. i, pp. 43-44 (Weimar, 1898).

A'LIAS. A name other than his true and proper name by which a person passes or is known. The phrase (Lat. *alias dictus*, otherwise called) from which the term is derived was formerly employed in indictments and pleadings to render absolutely certain the description of the individual intended by adding his fictitious or assumed name. In order to constitute an alias, the name so described need not be assumed for purposes of deception or from any improper motive. Stage names, pseudonyms, and even nicknames, are properly comprehended under the term. But a name which has, by legal process, been assumed in lieu of one's original name is not an alias. See NAME.

ALI BABA, ă'lê bă'bă. The hero of the story of "Ali Baba and the Forty Thieves," in the *Arabian Nights' Entertainments*. He is a poor forester, who accidentally learns the magic formula which opens the door to a robbers' cave. In their absence he repeats the "open sesame" (which has thus become proverbial), enters the cavern, and loads his ass with their treasures. His brother, Kasim, tries to imitate his success in carrying off their wealth, but after entering the cave, forgets the word "sesame," and so is entrapped and slain by the robbers. These then come to Ali Baba's house concealed in oil jars. They are discovered, however, by the ingenious slave girl, Morgiana, who kills them with boiling oil.

ALHAMBRA
THE COURT OF LIONS

ALIBERT, à'lê'bâr', JEAN LOUIS (1766-1837). Physician to Louis XVIII, of France. As chief physician of the hospital of St. Louis he devoted himself especially to the study of diseases of the skin. His chief work was *Traité complet des maladies de la peau* (1833), but his *Physiologie des passions; ou nouvelle doctrine des sentimens moraux* was given a second edition in Brussels (1825).

ALI-BEY, ä'lê-bâ' (1728-73). Mameluke ruler of Egypt. He was born in Abkhasia in the Caucasus, and when a boy was sold as a slave into Egypt. He gained the favor of his master, and rose to be one of the Mameluke beys. In 1766 he seized the government, freed himself from the power of the Sultan, coined money, and assumed the rank of Sultan of Egypt. Soon afterward he captured and plundered Mecca and undertook to conquer all Syria, in alliance with Daher, Pasha of Acre. At Damascus, June 6, 1771, he routed the Turks with great slaughter and took possession of the city through his general, Mohammed; but the latter turned against him and, proceeding to Egypt, put an end to Ali-Bey's power at Cairo. Returning with an army from Syria, Ali-Bey was defeated at the battle of Salahieh and perished a few days later.

AL'IBI (Lat. elsewhere). A defense resorted to in criminal prosecutions, when the party accused, in order to prove that he could not have committed the crime with which he is charged, tenders evidence to the effect that he was in a different place at the time the offense was committed. When true, there can be no better proof of innocence; but, as offering the readiest and most obvious opportunity for false evidence, it is always regarded with suspicion. Consult Wharton, *Criminal Law* (Philadelphia, 1896).

ALICANTE, ä'lê-kän'tâ. The chief town of a province of the same name in Spain (Map: Spain, E 3). It is picturesquely situated on a steep hill, at the bottom of which it extends along a level strip of land. This latter portion of the city is comparatively modern, well built, and convenient, with fine squares and promenades. The upper city is a jumble of narrow crowded streets. It possesses several fine churches, two nunneries, a library, a bishop's palace, and a picture gallery, and is overlooked by the castle of Santa Barbara from an eminence 850 feet above the sea. The town, which is, with the exception of Cadiz and Barcelona, the most important seaport of Spain, is strongly fortified, and its harbor is naturally protected. Alicante derives considerable revenue as a seaside resort; but its main source of wealth is the export trade, for much of the oil, wine, silk, fruit, saffron, raisins, liquorice, esparto, and grain of the fertile province of Valencia pass through this port. There is a very large tobacco factory. Alicante is the seat of a United States consulate. This town is the Roman Lucentium, and in ancient times was of considerable importance. It was captured by the Moors in 713 and recaptured by Ferdinand III. Pop., 1910, 51,665.

ALICATA, ä'lê-kä'tâ. See LICATA.

AL'ICE. 1. In Shakespeare's *Henry V*, one of the Princess Katherine's ladies in waiting. 2. The heroine of an Elizabethan tragedy, *Arden of Feversham* (q.v.). 3. In Meyerbeer's opera *Robert le Diable*, the foster sister of Robert, who saves his soul from ruin.

ALICE MAUD MA'RY, PRINCESS, GRAND

DUCHESS OF HESSE-DARMSTADT (1843-78). The second daughter of Queen Victoria, born April 25, 1843. She was much beloved by the English people for her amiability, gracious disposition, and domestic virtues. On July 1, 1862, she married Prince Frederic William Louis of Hesse-Darmstadt. She died at Darmstadt, Dec. 14, 1878, of diphtheria, a few days after the death of her youngest daughter from the same disease. Consult Sell, *Letters with Memoirs of Alice, Grand Duchess of Hesse* (London, 1884), and Helena (Princess Christian), *Letters with Memoirs of Alice, Grand Duchess of Hesse* (London, 1897).

ALICE, OR THE MYST'RIES. A novel by Bulwer, published in 1838.

ALICE'S ADVEN'TURES IN WON'DER-LAND. A story for children, by Lewis Carroll (C. L. Dodgson), published in 1869. It is the narrative of a little girl's dream. A sequel to it is *Through the Looking-Glass* (1871).

ALICIA, à-lîsh'î-â. 1. In Rowe's tragedy *Jane Shore* (q.v.), a mischief-making lady who ruins the heroine, through jealousy, and goes mad herself. 2. In Lillo's *Arden of Feversham*, the same character as Alice Arden, in the original Elizabethan tragedy of the same name.

AL'IDADE (Ar. *al-'idâdah*, the revolving arm). A radius bearing a vernier (q.v.), which travels around a graduated circumference. When an angle is to be measured, the alidade takes first the position of one arm of the angle and then of the other, and the arcs are "read" by the vernier; the difference of the two readings is the measure of the angle. See COMPASS.

ALIEN, âl'yen (Lat. *alienus*, strange, foreign). One recognized by the state in which he sojourns as owing primary allegiance to a foreign sovereign. It is used ordinarily in contradistinction to citizen (q.v.). An alien may become a citizen by *naturalization* (q.v.). Alien friend and alien enemy denote, respectively, an alien whose country is at peace, or is at war, with the country where he is sojourning. In Great Britain the status of aliens is regulated by the Naturalization Act of 1870 (33 and 34 Vict. c. 14). In this country their status is determined generally by State laws, although these are subject to some modification by treaties between the Federal government and that of a foreign country. An alien does not possess political rights, nor is he subject to the political duties of a citizen, and yet he may be required to serve in the militia or police of the country where he is residing and to contribute to the support of such establishments. At common law an alien could not become an owner of real property, although a distinction was made between a case of title by *purchase* (q.v.) and by *descent* (q.v.). If an alien acquired title by purchase, as by a grant (q.v.), or devise (q.v.), he was allowed to hold it until office found (q.v.), that is, until his alienage was duly established, upon inquiry instituted by the proper official, while apparent title by descent was absolutely invalid. This common law disability has been removed in England, as well as in many of our States; and aliens may now acquire, convey, and transmit title to real and personal property in the same manner as citizens. An alien friend may contract, sue, and be sued as though he were a citizen while he is allowed to remain in the country; but he may be expelled or deported at any time, subject to treaty stipulations; his immigration may be prevented, or may be per-

mitted, subject to imposed conditions. An alien enemy is not allowed to maintain an action in the courts of this country, unless he can show some special authority or license therefor; but he may be sued here. Nor can he enter into valid contracts with citizens which are inconsistent with a state of war. The tendency of modern law is to accord to alien enemies, who are permitted to remain in a country, all the rights and privileges of alien friends.

The status of aliens in the United States is involved in some ambiguity owing to the diversity and occasional conflict of State and Federal laws with respect to them. Thus a State may violate or may tolerate the violation by its citizens of rights conferred on aliens within its boundaries by treaties made by the Federal government with the foreign government to which such aliens owe allegiance and to which they look for protection. By the Constitution all treaties with foreign powers are a part of the supreme law of the land. In theory, therefore, the treaty rights of aliens are safeguarded by the Federal authority. As a matter of fact, however, the Federal government exercises no effective authority in such cases, and some eminent lawyers deny that it has, under the Constitution, any such authority. The better opinion, however, is that the government has all requisite power to enforce its treaty obligations, and that all that is necessary is for Congress by suitable legislation to put this power into effective judicial form. Consult *Ann. Report, Am. Institute of Criminal Law and Criminology* (September, 1913); C. H. Burr, *The Treaty-Making Power of the United States* (Philadelphia, 1912). Consult Nelson, *Select Cases, Statutes, and Orders Illustrative of the Principles of Private International Law* (London, 1889), and Cockburn, *Nationality* (London, 1869).

ALIEN AND SEDI'TION ACTS. A series of statutes enacted during the administration of John Adams (q.v.), occasioned largely by the desire of the party in power to stifle the more virulent forms of political opposition then prevalent and to check the activities of those who sympathized with France. There were four statutes passed in execution of the policy of the Federalists (q.v.), of which two became especially notorious. The Alien Act, passed June 25, 1798, to remain in force two years, gave the President power to order the removal from the country of aliens judged to be dangerous, and provided that if those so notified did not leave the country or secure from the President a license to remain, they would be subject to imprisonment for not over three years, and be disqualified from ever becoming citizens of the United States. The President also might order the removal from the country of any alien thus imprisoned, and if such alien should thereafter be found in the country he might be imprisoned for as long a period as the President should deem the public safety required. The Sedition Act, passed July 14, 1798, to be in force until March 3, 1801, imposed penalties not exceeding a fine of \$5000 and five years' imprisonment for conspiring against the government and its measures and for interfering with the operations of the government. It imposed a penalty of imprisonment for not over two years and a fine of not over \$2000 for printing scandalous material concerning the Federal government, the President or Congress. There were also passed the

Alien Enemies Act, July 6, 1798, providing for the treatment of aliens with whose government the United States might be at war, and the Naturalization Act, June 18, 1798, fixing 14 years' residence as a qualification for the acquisition by foreigners of citizenship. The extreme character of these statutes and the partisan spirit which produced them caused an immediate and violent reaction, which was expressed in such forms as in the Virginia and Kentucky Resolutions (q.v.) and which hastened the overthrow of the Federalist party. See historical section under UNITED STATES. For the method and consequences of the enforcement of the above acts, consult Wharton, *State Trials of the United States during the Administrations of Washington and Adams* (Philadelphia, 1849).

ALIENATION, ā'lyen-a'shūn (Lat. *alienatio*, the transferring of the possession of a thing to another, from *alienus*, another's, foreign). A legal term to describe the transfer of title to land, or of any interest therein. The modes in which alienation is effected are numerous, ranging in our legal system from the feoffment (q.v.), or livery of seisin (q.v.), of old English law, to the modern transfer by deed (q.v.) or will (q.v.). (See CONVEYANCE.) The right of alienation is one of the two great incidents of the ownership of property, as now understood (the other being the right of inheritance); but this is a distinctly modern notion, and ownership may well exist, and has often existed, without the right to alienate the property owned. In English law the right of a freehold tenant to alienate his lands was long restricted by rules derived from the feudal system. Most of these restrictions were swept away by the third statute of Westminster (18 Edw. I, 1290), known as the Statute Quia Emptores (q.v.), which declared that from thenceforth "it should be lawful to every freeman to sell at his own pleasure his lands and tenements, or part of them," and the few that remained, by the statute of Military Tenures, passed in 1660 (12 Car. II, c. 24), which deprived the crown of the right to exact of its tenants *in capite* the obnoxious fines on alienation. But it was not until the thirty-second year of Henry VIII (1527), that the right to alienate lands by will was finally conceded by Parliament. Now, however, the principle of the alienability of real property has become so firmly established that we cannot conceive of absolute ownership without that quality, and it has long been a rule of our law that a condition attached to the grant of a fee, forbidding or restraining its alienation, is void, as being repugnant to the estate granted. It should be said, however, that such conditions annexed to life estates and leaseholds are perfectly good and of frequent occurrence.

Alienation may be either voluntary or involuntary. The former comprehends the usual modes of conveyance, including transfers by will. The latter refers to the acquisition of title by judgment, execution, bankruptcy, and the other modes in which creditors have at different times and in different jurisdictions been permitted to satisfy their claims by legal process out of the real property of the debtor. See the authorities referred to under the title REAL PROPERTY.

ALIENATION OF AFFECTION. See HUSBAND AND WIFE.

ALIENIST, ā'lyen-īst. See PSYCHIATRY.

ALI FERROUGH BEY, ā'lê fēr'rô bâ (1865—). A Turkish statesman who was born

at Constantinople, and became successively secretary of the embassies at Paris, London, and Bucharest; councilor of the embassy at St. Petersburg and Minister Plenipotentiary and Envoy Extraordinary of Turkey to the United States. He published *Public and Private International Law*, and histories of Arabia and Turkey. He was recalled from his post at Washington in 1901.

ALIGARH, ä'lê-gär'. The capital of the district of the same name (area, 1958 square miles), in the Northwest Provinces of India, the native name of which, Koil, has been replaced by that of the adjoining fort, famous for its commanding situation and historic associations. The fort, at an altitude of 740 feet, stands in lat. 27° 56' N., long. 78° 8' E., 47 miles north of Agra and 74 miles south of Delhi (Map: India, C 3). Its capture from the Maharrattas in 1803 by General Lake assured British supremacy in the Upper Doab, and it was the scene of exciting incidents during the mutiny of 1857. Cotton and grain are the principal products of the district, and the only important industries are the manufacture of flour and cotton pressing. The town on the railway route from Calcutta to Peshawar is a thriving municipality. It is the seat of the Mohammedan Anglo-Oriental College, which is connected with the University of Allahabad. Pop. of town, 1891, 61,485; 1901, 70,434; 1911, 64,825.

ALIGNMENT. A term used in surveying, drawing, and military tactics, equivalent to "in line." Thus, the alignment of a battalion is effected when the men are drawn up in line; the alignment of a camp is a rectilinear arrangement of the tents, according to some prearranged plan.

ALIKHANOFF, ä'lî-kä'nôf, GENERAL (Ali Khan Avarski) (1846-1907). A Russian soldier. He was born at Baku, of Lesghian parentage, and was educated at Webb's School at Tiflis. In 1862 he entered the Russian army as cornet and saw service in the Caucasus. His efficiency soon won for him promotion to the rank of major, and the position of aid-de-camp to the Grand Duke Michael, then Viceroy of the Caucasus. In 1877, as the result of a quarrel with a superior officer, he was reduced to the ranks: as a private soldier taking part in the disastrous campaign against the Turcomans in 1879, and serving also under Skoboleff. He attracted attention by writing for the *Moscow Gazette* a series of brilliant articles describing the Russian advance on India. Of such value did his services become that he was made lieutenant in 1882. Soon afterward, when he had been secretly to Merv, and had negotiated successfully with the Turcoman chiefs to secure their submission, he was made lieutenant-colonel and first Governor of the territory thus gained. He took a conspicuous part in the "Penj-deh affair" of March 30, 1885, when the Russian troops, under General Komaroff, attacked and defeated the Afghan forces while the Russian and British governments were negotiating the boundary of Afghanistan. In 1901 he was promoted to be major-general. The severity with which he treated the Armenians and Georgians over whom he was placed gained for him the bitter hatred of these peoples. He was sent to investigate the Tatar-Armenian outbreak of 1905, but his sympathy with the Mussulman was so obvious that he was soon recalled. In the same and following years he suppressed with great severity the

disturbances in Georgia. He was killed by the explosion of a bomb at Alexandropol, in the Caucasus, on July 16, 1907. The assassination was attributed to an Armenian effort for revenge.

ALIKULUF, ä'lê-kôo-lôof'. A tribe occupying the central and western region of the archipelago of Tierra del Fuego, South America, and representing a distinct linguistic stock, the Alikulufan. Although they go almost naked in the coldest weather, and huddle in shelters hardly deserving the name, they show great skill in the making of weapons, fishing utensils, and canoes, while the women weave water-tight baskets of reeds. They have also trained a native dog to hunting. They now number but a few hundred at most. Consult Chamberlain in *American Anthropologist*, N. S., vol. xiii, pp. 89-92 (1911).

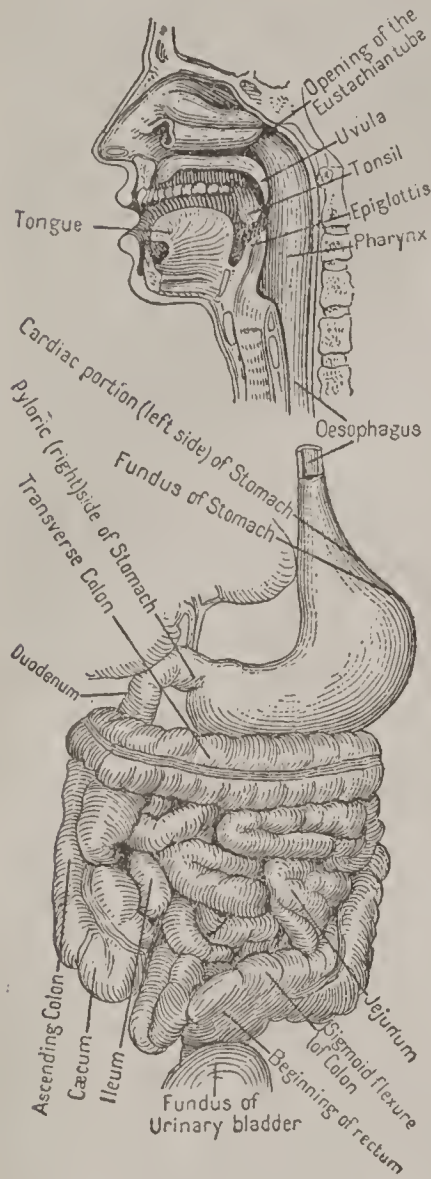

ALIMA, à-lê'mâ. A tributary of the Lower Congo, rising in French Congo, and after a short course westward emptying at Ibaka (Map: Congo Free State, C 3). In its lower course it is navigable for light vessels. It was discovered by De Brazza in 1878 and thoroughly explored by Balley in 1883.

ALIMENTARY CANAL (from Lat. *alimentum*, food). In mammalia, that portion of the digestive apparatus through which the food passes from the time of its entrance until its exit from the body. It is lined by a mucous membrane, which extends from the lips to the anus, being modified in each region. (See MUCOUS MEMBRANE.) The alimentary canal begins at the mouth and is continued into the space called the pharynx, which also communicates with the nostrils above, and the gullet or œsophagus below. The pharynx is surrounded by three muscles, the constrictors, which grasp the food and force it into the next portion of the alimentary canal, the œsophagus. This is a tube composed of an outer layer of longitudinal muscular fibres, and an inner of circular, which extend down to and spread out upon the stomach. These fibres, by a series of peristaltic contractions, carry the morsel of food along into the stomach. In vomiting, there is a reversal of these actions, which ruminating animals can accomplish at will. The œsophagus passes through an opening in the diaphragm and joins the stomach, which is a pouch curved with the concavity upward, expanded into a *cul de sac* on the left side (the cardiac extremity), and gradually narrowed to the right or pyloric end. It consists of muscular fibres continuous with those of the œsophagus, which become thicker toward the pylorus. Its external surfaces are covered by peritoneum, and its thick, soft mucous lining, when the stomach is empty, lies in folds. Between the muscular and mucous layers is a fibrous layer, in which the blood vessels lie before they pass into the mucous layer. (See STOMACH.) At its pyloric or right extremity the stomach communicates with the small intestine, which is about 22 feet in length and is arranged in convolutions, which occupy the middle portion of the abdominal cavity, being kept in position by the mesentery, which attaches them to the posterior wall of the abdomen.

The small intestine is subdivided into three parts. The first 10 inches from the stomach constitute the *duodenum*. Into it open the duct of the pancreas and the common bile duct. Of the remaining portion, the *jejunum* includes about two-fifths and *ileum* three-fifths. The tube con-

sists of three layers, and the whole is surrounded by peritoneum. See **INTESTINE**.

The ileum ends, in the right iliac region, in the large intestine, which is from 5 to 6 feet

ALIMENTARY TRACT IN MAN.

in length. It begins at the pouch called the *cæcum* (q.v.), from which springs the *appendix vermiformis*; a double valve guards the opening of the small into the large intestine. The colon passes upward on the right side nearly to the liver (ascending colon), crosses the left hypochondrium (transverse colon), descends to the left iliac fossa (descending colon), where it bends like an S (sigmoid flexure) and joins the rectum at the left margin of the true pelvis. The colon is distinguished by its pouched or sacculated appearance and the presence of three flat bands of longitudinal muscular fibres on its exterior wall.

The peritoneum covers it only in parts. (See **COLON**.) The rectum is not sacculated, but its muscular coat becomes much thicker; at its lower end the longitudinal muscular fibres stop, but the circular fibres become greatly increased, forming the internal sphincter muscle. See **ANUS**.

The alimentary canal thus consists of a continuous passage lined by mucous membrane, which rests on a fibrous and muscular layer. Its length is generally about five or six times the length of the body, or 30 feet. It begins below the base of the skull, passes through the thorax, abdomen, and pelvis, and consists, in brief, of the mouth, pharynx, oesophagus, stomach, small and large intestine. The above description refers to the alimentary canal in human anatomy; its parts are variously modified in different animals, as will be found in the articles on its several subdivisions. The process of carrying the digested food to the tissues of the body is discussed under **CIRCULATION**.

ALIMENTARY SYSTEM, EVOLUTION OF THE. An alimentary system as defined above is almost wanting among plants, which, practically without exception, use only fluid or gaseous food, or else render solid substances fluid before ingestion. This difference between animals and plants is one of the best distinguishing characters.

Types of Alimentary Tracts. The simplest may be designated the temporary type—that exhibited by *Amœba*. This jelly-like, amorphous organism, when it comes upon a solid particle in the water, simply engulfs it at any point by flowing around it. The engulfed particle is sur-

rounded by a sphere of water. From the plasma of the *Amœba* an acid is secreted into the sphere of water, and this dilute acid gradually dissolves the solid particle; the solution is then absorbed by the protoplasm. In the case of the *Amœba* there is no definite, permanent alimentary tract. The same is true of all the rhizopodous Protozoa and of the parasitic ones which do not feed on solids. Many of the ciliate and flagellate Infusoria, on the other hand, ingest solid particles through a permanent mouth and gullet into the general protoplasmic spaces. The surface around the mouth opening may be provided with cilia to carry food into the mouth.

The second type of alimentary tract is permanent but diffuse. This is the type exhibited by sponges. There is not one digestive region, but hundreds of them, as many, indeed, as there are pores and canals passing through the body wall. The solid food passes into these canals; the canals are lined by curiously modified "collared" cells. These pick up the particles and engulf them, as a flagellate infusorian does. The whole sponge, indeed, behaves like a colony of Protozoa, specialized in different directions in different regions of the sponge body.

The third type of alimentary tract is permanent, and concentrated in one cavity, and that cavity is a sac, having only one external opening. This type is characteristic of all the Cnidaria, and is found in certain flatworms. It is typically illustrated by *Hydra*. *Hydra* consists of a body wall surrounding a central cavity that has one opening at the upper pole, surrounded by a circlet of tentacles. The opening serves both as mouth and anus. The body wall is two-layered; the outer layer is the sensory one; the inner layer is digestive. The origin of this type is uncertain; it seems quite likely that it has not developed from the sponge type, but that it represents an altogether new line of evolution, in which the body is not to be considered as a colony of infusoria-like cells, but as a greatly enlarged protozoan, with many nuclei and hence with many cells. On this last hypothesis the digestion cavity of *Hydra* would be homologous with that of an infusorian. In the sea anemones the digestive sac is more complicated than in Hydrozoa, in that it is divided into a number of alcoves opening into one central chamber. The alcoves arise in consequence of a series of radial partitions (called mesenteries) arranged in a plan of four and its multiples or six and its multiples, that pass from the outer body wall toward the centre. In the sea anemones the entrance to the digestive sac is an elongated slit that serves both as mouth and anus. According to one theory, the separate mouth and anus of higher forms arise from opposite extremities of this slit, while in the middle part of the slit the lips are fused together. In the lower flatworms, the planarians and trematodes, the body is elongated, and the digestive sac is elongated likewise; but it is still a sac with a single opening. The cestodes, being abject parasites living in the digestive juices of the host, need no digestive tract and have none. In the higher flatworms, nemathelminths, Nemertinea, Bryozoa, and Brachiopoda, as well as in mollusks, mouth and anus have become distinct, and the digestive sac has become a digestive tube or canal, as in higher groups. With the formation of a digestive tube three portions may be distinguished; viz., fore gut, mid gut, and hind gut. The first and last

are usually of ectodermal origin. The mid gut is usually lined by entoderm. These three parts of the alimentary tract undergo special modifications. The beginning of the fore gut, or mouth, becomes fitted with grasping and sensory organs; and lower down in the œsophagus there is frequently found a crushing organ, the gizzard. The mid gut is very glandular. In many species the glands have enlarged to perform their work better, and appear as appendages of the mid gut; e.g., the pancreas or hepatopancreas. The hind gut is the rectum. These conditions are shown in their simplest form in the annelids. The sandworm of the sea coast has great jaws in the œsophagus, which is protrusible. Behind, a pair of digestive glands open into the food canal. In the earthworm the œsophagus leads into a crop, and this in turn into a muscular gizzard. In the intestine two dorsal grooves add to the glandular surface. Passing to arthropods, we find the mid gut occasionally coiled, and frequently bearing digestive glands, that gain a great size in the Decapoda. A gastric mill is present in the Malacostraca. In both annelids and arthropods the mouth is on the same side of the body as the great nerve cord, and the anus is placed in the last metamere of the body.

In the Chordata the alimentary tract has very different relations from those found in the Annelida and Arthropoda. In the latter groups the alimentary tract lies dorsal to the main nerve and ventral to the heart; in the chordates the tract is dorsal to the heart and ventral to the spinal cord. The question how the vertebrate condition is derived from the invertebrate condition is a difficult one to answer. It has even led some to deny that vertebrates are related to Annelida or Arthropoda, as it is impossible to think of an animal adapted to traveling on one surface turning over and traveling on its back and transmitting this tendency to its descendants. It is more likely that the intermediate form was one that, like many of the lowest Chordata—the tunicates—was sessile in a ventral position at some time of life and consequently had neither dorsal nor ventral surface.

Embryological History. The history of the alimentary tract in vertebrates is as follows: Part of the outer layer of the germ becomes infolded as a pocket to form the lining of the archenteron or primitive gut. (See EMBRYOLOGY.) By the continued growth of the mesoderm and body cavity the archenteron comes to lie as a canal, closed at the anterior end and communicating posteriorly through the "neurenteric canal" with the neural tube. Later, an infolding of ectoderm occurs on the ventral surface of the embryo to form the proctodeum and anus. The neurenteric canal closes and the post-anal gut degenerates. Finally the ectoderm is in-pocketed at the anterior end of the archenteron, forming the stomodeum, and the two cavities become confluent by the breaking away of the opposed walls. Thus, the completed alimentary tract is composed of an ectodermal anterior and posterior end and of an entodermal middle portion. It is enveloped by a mesodermal layer.

Phylogenetically, two quite distinct parts in the alimentary tract of vertebrates can be distinguished, and these do not coincide with the embryological divisions. In *Amphioxus* more than the first half of the length of the alimentary tract is devoted to the purpose of respiration, since its walls are provided with gill slits.

This may be called the respiratory part of the alimentary tract in contradistinction to the remaining hinder portion—the digestive part. The first is also known as the proenteron. The hinder part is often divided into two—its entodermal part (mesenteron) and its proctodeal portion (metenteron). It will be convenient to treat of the alimentary tract under the three heads of proenteron, mesenteron, and metenteron. Before going on to this analytical treatment of the tract and its appendages, a few words may be said concerning the general histology of the entire tract. As already stated, two germ-layers are involved: entoderm (or ectoderm) and mesoderm, and to these must be added mesenchyme. The entoderm is always a single layer and forms the so-called *mucosa*; it gives rise to the digestive and glandular epithelium. Next outside lies the mesenchymatous mass, with its blood vessels and nerves—the *sub-mucosa*. Outside of this is the muscular layer derived from mesoderm and containing within circular muscle fibres and without longitudinal ones. Lastly, outside of all and continuous with the lining of the body cavity in all its parts, is the layer of flat epithelial cells, constituting part of the peritoneal membrane.

The Proenteron.—This region is characterized, in the lower forms, by gills. In *Balanoglossus* and in *Tunicata* such a gill-bearing region is well developed, and in the *Tunicata* becomes extremely complex, in adaptation to their sessile habit, which requires large respiratory surface, since a change of water cannot be got by traveling. In *Amphioxus* the gill slits are simple but very numerous—100 or more. The variability in number arises from the fact that the slits continue to increase in number as the animal grows older, new ones being formed at the posterior end of the series. Thus the proenteron grows at the expense of the mesenteron. In embryologic history a single row of 14 slits first arises as ventro-dextral organs; next, a second row of 9 slits is formed at the right of the first, which, as it grows larger, pushes the first row to the left side, where it lies permanently. The cause of the development of the left series on the right side is that the large mouth at first occupies the left side, and its movement ventrally is accompanied by profound changes in the surrounding parts. It has been suggested that the mouth of the ancestors of vertebrates was placed in the mid-dorsal line in front of the notochord; but that, the support of the notochord being needed for the snout in the animal's journeys through the sand, it pushed forward and thrust the mouth to one side. The mouth is dorsal, or, better, *neural*, in young tunicates and in adult annelids; and the embryonic changes in the position of the mouth in *Amphioxus* apparently recapitulate the phylogenetic changes. The gill slits of the young *Amphioxus* open from the gut cavity directly to the exterior, but later they open into a common atrium on the ventral side, which functions somewhat as an operculum. The details of the gill system of higher vertebrates will be discussed under RESPIRATORY SYSTEM. It is here merely necessary to say that the number of gill slits becomes much reduced, usually to five or six pairs of slits.

The Mouth.—The beginning of the alimentary tract is enlarged to form an oral or buccal cavity, provided with teeth and glands. The glands are modified skin glands, as would be

expected from their ectodermal origin. The glands develop by a depression of the epidermis and come to lie imbedded deeply in the cutis of mesenchymatous origin. The function of the glands is to keep the mouth moist, consequently they are found only in land vertebrates. The poison glands of serpents are modified oral glands. Salivary glands find their highest development in mammals. They are probably immensely developed skin glands or groups of such. They secrete a thick, glairy fluid, whose chief function is to moisten the food and thus to assist in its mastication and deglutition. On this account these glands are most highly developed in the Herbivora and are absent in Cetacea. Saliva also acts upon starchy food, converting it into sugar.

The tongue is a mass of intertwined muscles, having various functions, as of tasting, grasping, touching, and speaking. In fishes it is little developed, being represented by a thickening of the mucosa covering the ventral part of the hyoid bone. In Amphibia and reptiles it shows a great advance in size and complexity, being capable of extrusion to a great extent (especially in lizards), both through the elongating action of its intrinsic muscles and the forward movement of the base of the hyoid bone.

The thymus gland arises in fishes by the budding off of epithelial masses from the anterior four or five gill pockets; it is thus of multiplex origin. Usually these independently arising masses fuse into a pair of spindle-shaped bodies, but in the Gymnophiona the components persist as distinct bodies. In the land vertebrates, with fewer gill-slits, the points of origin are reduced in number. Into the paired masses connective tissue and blood vessels grow, eventually constituting the greater part of the organs. The function of the thymus is still unknown. It attains its largest size in reptiles and birds. In man it reaches its maximum development in the second year and then gradually degenerates.

The thyroid gland arises directly from the alimentary tract. It has a double origin. First, it arises as an unpaired pocket of the ventral wall of the pharynx behind the last gill-slit: the paired masses are called "accessory thyroid glands." The median part is morphologically the most important. It is the only part found in Amphioxus and Cyclostomi. In these groups it exists as a groove in the ventral wall of the pharynx, called the "hypobranchial groove." A similar groove is found in all tunicates (the "endostyle"), and is glandular in function. In the lower true vertebrates, where the paired components first arise, they remain distinct; in mammals all components fuse.

Œsophagus and Stomach. These parts of the alimentary tract constitute the fore gut in the more restricted sense. They are limited anteriorly by the oral cavity; the limitation is a sharp one, however, only in mammals, which possess a soft palate that curtains off the mouth from the respiratory passage. This soft palate makes its first appearance in the crocodiles, but without the uvula. The posterior limit of the fore gut is not always easy to fix, since not all vertebrates have a specialized stomach with a pyloric valve. The opening of the bile duct may be taken as the lower limit. The post-pharyngeal proesenteron is extremely short in Amphioxus and the lowest vertebrates, and is of relatively slight importance; it gains size and importance as we ascend the vertebrate series. The

digestive function is, in the higher groups, transferred to a more anterior region of the enteron, and, coincidentally, the entire alimentary tract, which is primitively straight, undergoes a great increase in length and becomes strongly folded. A differentiation of the proesenteron into œsophagus and stomach is first indicated in selachians, and becomes pronounced in Amphibia. The two organs differ not only in their diameter, but also in the character of the mucous membrane, which is smooth and forms a ciliated epithelium on the œsophagus and folded and non-ciliated in the stomach. In birds the œsophagus is specialized, in that it is greatly enlarged at one point, forming the crop. The crop is best developed in granivorous birds; in it grain is acted upon chemically. Certain fish-eating birds have a reservoir (false crop) for excess of food. Insectivorous and frugivorous birds have no sign of a crop. The stomach, likewise, is very complex in birds. There is first a highly glandular, chemically active *proventriculus*, and, below, a mechanically acting muscular stomach or gizzard. In mammals the stomach is the most distended and one of the most functional parts of the alimentary system. An anterior or cardiac portion can be distinguished from a posterior pyloric part. The stomach is larger and more complex in herbivores than in carnivores. In the herbivores the cardiac and pyloric parts are each divided into two parts. The first is a large sac called the pouch, or *rumen*. It communicates broadly with the second chamber, the *reticulum*, so called from its network of folds. Next comes the *psalterium*, whose walls are raised into high, thick-set folds, so that under most circumstances nothing but semi-fluid materials can pass between the folds. The last part is the *abomasum*, with highly vascular and glandular walls. This complex stomach seems to have arisen by natural selection as an adaptation to the peculiar habits possessed by the ruminants. They are all weak, defenseless mammals, and their herbivorous habits require that they shall feed in open fields where the danger of detection by the larger carnivores is very great. The shorter the time they are exposed in the open field the less will be the chance of their destruction. It has therefore been of advantage that they have become able to crop a large amount of grass rapidly without masticating it, the mastication being first done after the ruminant has retired from the field to the secluded forest. The food thus taken into the stomach fills the rumen and reticulum and is mingled with and partly macerated by the saliva. By the action of the abdominal muscles and diaphragm, as in hiccoughing, the food is returned to the mouth and is there masticated. Finally, divided and mixed with saliva, it passes down the œsophagus and is led by means of a special fold directly to the psalterium, through the leaves of which the finely triturated mass can pass. In the fourth part, or abomasum, true gastric digestion now occurs.

Intestinal Region. The mesenteron is, in the higher vertebrates, separated from the proesenteron by a circular fold of the intestinal wall, the pyloric valve. The function of the tract is, on the one hand, to secure fluids that will finish the work of digesting the food which was begun in the stomach, and on the other to absorb the products of digestion. The variations in form of the mesenteron are all to enable it to perform the processes to better advantage. Some of the variations are readily visible to the naked eye,

such as the foldings of the gut or out-pocketings from it; others are microscopic, and due to foldings in the lining of the alimentary tract.

Liver and Pancreas. The largest of these out-pocketings is the *liver*. It is phylogenetically an old organ, as it occurs in all the vertebrates, even in *Amphioxus*. The form of the liver is always closely adapted to that of the cavity in which it lies. In myxinoids it consists of two lobes, and this is probably the "ground-form" of the organ in all vertebrates. In many cases it is further subdivided into (dog, weasel) six or seven lobes even. The right lobe is the larger, and in it the gall-bladder, when present, lies imbedded. The liver arises as an evagination of the epithelial lining of the ventral wall of the anterior portion of the intestine. In *Amphioxus* it is located just behind the gill region. The hepatic fundaments are soon transformed into glands made up of branching tubules. The network of tubules early differentiates into excretory and secretory parts. In amphibians and reptiles the tubular nature of the gland is easily recognizable, but in higher vertebrates (birds, mammals, man) the tubular structure is inconspicuous. Simultaneously with the development of the tubules a meshwork of blood vessels appears in the liver. In birds and mammals at the point at which the primary bile ducts open into the duodenum a small evagination is formed. This evagination elongates to form the bile duct. The gall-bladder is a reservoir for storing the gall. It develops as an evagination of the bile duct or from the hepatic ducts. The liver serves as a storehouse in which the sugar not needed by the system for immediate consumption is stored up in the form of glycogen; it destroys the old red blood corpuscles and oxidizes nitrogenous materials into urea. Its function in digestion is less clearly understood. Fats, however, more easily pass through a membrane moistened with bile, and a greater proportion of fat passes unabsorbed through the intestine of a dog when the bile duct is stopped; hence bile probably aids in some way in the absorption of fats. The alkalinity of the bile also aids the pancreatic juice in overcoming the acidity of the gastric juice. Bile also aids in stimulating the action of the muscles of the intestine. Its absence leads to biliousness and even jaundice, and finally the bile acts as a preservative when deficient putrefaction of the contents of the alimentary canal results. The pancreas also arises as an evagination of the alimentary tract, but from the dorsal side of the duodenum, and usually opposite the origin of the liver. Except in cyclostomes and some teleosts, the pancreas is always present in vertebrates. Its size and form varies, and it is not infrequently lobate. In structure it is a racemose gland. Its secretion is either poured directly into the intestine (as in birds, crocodiles, *Emydidae*, and some mammals), or, as development proceeds, its outlets move nearer and nearer the bile duct, and finally the secretions of the liver and pancreas are poured into the intestine through a common duct. The pancreatic secretion is alkaline. Its rôle in digestion is very great. Its action on starch is like that of the saliva, only much more energetic. Through the agency of the ferment trypsin it affects proteids, and by another ferment, steapsin, fats are split up into fatty acids and glycerin. The soap and glycerin are both soluble in water and hence are easily absorbed. Much of the fat, however, is emulsified by the albumen;

that is to say, it is broken up into fine drops, which are prevented from fusing by the presence of a coating of albumen. The fat in the emulsion is probably capable of absorption as it is.

The Pyloric Tract. The straight tube of *Amphioxus* is chiefly an absorbing organ, the digestive secretions being poured into the cavity from the liver. In the earth-inhabiting *Gymnophiona* and *Amphisbænæ* and the elongated snakes the alimentary tract is little convoluted, since here either the process of absorption is not very rapid, or the area of the mid gut is, even when straight, considerable, relative to the total volume of the body (snakes). The mesenteron is also straight in *Petromyzon* and some of the sharks which lead an active carnivorous life, but the shortness is fully compensated for by an extensive folding of the inner absorbing surface through the formation of the so-called spiral fold, or spiral valve. The method of origin of the fold is seen in *Petromyzon*, where it is first represented by a strong, spirally twisted artery lying on the internal wall. This gradually sinks deeper and deeper toward the lumen of the gut, carrying the wall of the gut before it. As a result of this process we find a long, spirally twisted fold projecting far inward from the wall of the gut. The fold itself is richly vascular, from the ramifications of the small blood vessels from the artery. Such a spiral valve is found best developed in *Selachians*, but it exists also in *Ganoids*. *Teleosts* lack such a spiral valve, but the absorbing surface is increased by another means—namely, by out-pocketings, so-called *pyloric appendages*. That these are primarily not glands, but have an absorbing function, is indicated by two facts: (1) They are sometimes found stuffed with food, and (2) their presence seems to be correlated with the absence of the spiral valve and vice versa, even in closely allied species having similar habits; and therefore it is probable that they fulfill the same office in the economy of the organism. Thus, *Polypterus* possesses a well-developed spiral fold, but only a few pyloric appendages, while *Lepidosteus*, which is provided with only a slight fold, is superabundantly provided with pyloric appendages. All of this evidence is not quite satisfactory, and it seems probable that in some cases the pyloric appendages are indeed glandular—as, for instance, when several open into the mesenteron by a common duct. Physiological studies are needed to settle this question.

The Mesenteron.—From the *Amphibia* on, with exceptions, the mesenteron becomes more and more convoluted externally, and at the same time the absorbing surface is increased by folds. Thus, in the frog, the anterior part of the mesenteron is covered by a fine network of folds. Further posteriorly these arrange themselves into structures like the semi-lunar valves of the heart, opening backward. Similar contrivances for increasing the internal absorbing surface are found also in reptiles and birds. In birds and mammals, when the longitudinal folds of the mesenteron are poorly developed, we find finger-like processes—*villi*—produced into the lumen of the gut. Into these folds of the mucous epithelium are continued the connective tissue of the submucosa, together with blood vessels, lymph vessels, and nerves. Food in solution is taken up by the epithelial cells just as an *amœba* takes it up by throwing out pseudopodia. A large share of the absorptive process is probably to be assigned to the lymph cells, which wander

about in the submucosa and even make their way through the mucosa into the lumen of the gut.

Metenteron.—Like the other parts of the alimentary tract, this becomes differentiated from the common enteron only in the higher vertebrates. In the higher fishes it is indicated by an enlargement of the intestine. This enlargement is directly continuous posteriorly with the cloaca, into which also the urogenital ducts open. In Amphibia and reptiles the ventral wall of the hinder part of the metenteron is enlarged to form a (functional) urinary bladder. In Amniota the metenteron is separated from the mesenteron by an ileo-cæcal valve (q.v.). In nearly all vertebrates the metenteron—in contradistinction to mesenteron—has a straight course; hence it is often called *rectum*. In many mammals, as in man, it is greatly elongated, forming a colon ascendens, transversus, and descendens. A blind pocket or *cæcum* is often formed in connection with the metenteron and is a mere swelling in the wall in reptiles, but attains an enormous development in many birds, in which group it is usually paired. In mammals it is never so long as in birds, but is variable in extent. Thus, in herbivores it may even be as long as the body of the animal possessing it, and in some rodents it contains a spiral valve. In carnivores, on the contrary, it is poorly developed. It would seem to be somewhat compensatory with relation to the rest of the metenteron, for it is much better developed in the horse and allies which have a simple stomach than in the ruminants with a complicated one. Among certain mammals (e.g., man) the distal part of the cæcum is greatly reduced, forming the vermiform process. In man the cæcum is at first of nearly uniform character—the vermiform process arises by a degeneration of its distal end—a process which occurs relatively late. This indicates that in man the cæcum was quite recently of relatively greater importance, and indicates further that man's ancestors were herbivorous—a fact which the presence of the now degenerating third (hindermost) molar likewise confirms.

There are certain other appendages of the metenteron to which we can only refer. Such are the unpaired finger-shaped gland of the dorsal roof of the rectum in sharks, the paired dorsal pockets of Chelonia, and the unpaired bursa Fabricii of birds. The function of the last two organs is doubtful. The bursa Fabricii is a spherical or club-shaped organ lying ventrad to the vertebral column and dorso-caudad to the rectum, to which it is attached postero-ventrad to the urogenital opening. It arises as a solid mass, in which secondarily cavities appear, lined by epithelium from the mucosa of the metenteron. They are, therefore, not to be regarded as lymph spaces, nor the organ as a lymph organ. Its development is, therefore, much like that of the thymus gland. The organ degenerates toward the end of the first year, but persists throughout life in some species as an organ covered with a connective tissue coat, and possessing many elongated follicles lined by epithelium within. The function and phylogenetic significance of this organ are both obscure. Possibly it is homologous with the paired pockets of Chelonia; the ontogeny of these latter organs is, however, yet quite unknown.

ALI MIRZA, ä'lê mēr'zâ, MOHAMMED (1872—). Shah of Persia, who succeeded his father, Muzaffar-ed-Din, on the death of the lat-

ter on Jan. 8, 1907. He was educated in Europe and prior to his succession to the throne was Governor-General of Azerbaijan, a position in which heirs to the Persian throne usually receive their preliminary training. His European education, it was thought, had given him pronounced sympathies for western civilization, and hopes were entertained for the prosperity of Persia under his rule. Soon, however, he showed himself arbitrary and untrustworthy, and he became so unpopular that an attempt was made on his life on Feb. 28, 1908. The agitation made by the so-called Nationalist Party for reforms in the government in 1898 (see PERSIA) resulted in the practical defeat of Mohammed and the establishment of a Russian-English protectorate over Persia. Internal dissension continued in 1909, and on July 13 of that year the Nationalists succeeded in obtaining possession of Teheran, the capital. The Shah took refuge in the Russian legation, finding himself, on the formation of a Nationalist Assembly, deposed, and his son, Ahmed Mirza (q.v.), chosen Shah in his place. Forbidden to remain on Persian soil, Mohammed left for Russia, but at once began intrigues to regain his throne. Having succeeded in 1911 in raising and equipping a body of troops, he arrived in Persia in July of that year. At once the Mejliss, or Assembly, placed on his head a price of 100,000 tomans (about \$178,000). His adherents were defeated by the Nationalist forces, and in March, 1912, he was obliged to return to Russia, where he rejoined his family.

AL'IMONY (Lat. *alimonia*, *alimonium*, nourishment, sustenance, from *alere*, to feed, nourish). In English and American law, the allowance which a married woman is entitled to receive out of her husband's estate by decree or order of the court on judicial separation or divorce *a mensa et thoro*. By Scotch legal writers the term is sometimes used as synonymous with aliment. In the United States jurisdiction with regard to alimony is conferred, in general, by statute on courts of equity. Alimony is of two sorts: *pendente lite* and permanent. The object of the first is to enable a wife to carry on litigation with her husband by securing her support during the pendency of suit. Should she have sufficient means of her own, no allowance will usually be made; the amount is fixed at the discretion of the court and may be changed by the same authority. Permanent alimony is a periodical allowance from a husband decreed to a wife as the result of litigation in her favor. If the result be against her, no allowance is made. The amount varies with the means of the husband and the needs and position of the wife, but is usually from a third to one-half of his income, and is subject to change from time to time, as the court finds circumstances to warrant. The court may enforce its decree by contempt proceedings and the commitment of the defaulting husband to jail, and can prevent a husband from leaving the State if it is made to appear that he means thereby to avoid payment. In some States alimony becomes a lien on the husband's real estate, or the court may compel him to give security for its prompt payment; or, in proper cases, the husband may be restrained by injunction from so disposing of his property as to place it beyond the reach of the court. See DIVORCE.

ALIN, ä'lîn, OSCAR JOSEF (1846–1900). A Swedish historian and politician, born at Falun. He became professor of political economy at the

University of Upsala in 1882, and later its rector. Becoming a member of the Riksdag in 1888, he came to have great influence in the councils of the Conservative party. He published many historical works, including *Bidrag till svenska rådets historia under medeltiden* (1872); *Sveriges Historia, 1511-1611* (1878); *Bidrag till svenska statsricketets historia* (1884-87); *Den svensk-norsk Unionen* (2 vols., 1889-91); *Fjerde Artiklen af Fredstraktaten i Kiel, 1814* (1899).

ALI PASHA, ä'lë på-shä' (1741-1822). An Albanian ruler, notorious for cruelty, and known as "the Lion of Janina." He was born at Tepeleni, in the Albanian province of Janina. His father, one of the Albanian beys, died in Ali's boyhood, and the rearing of the child was thus left to his mother, a vindictive and merciless woman, who apparently instilled into him her own spirit. His youth was passed in peril and hardship, seeking to recover the possessions of which the neighboring pashas had robbed his father. Young Ali at last had to betake himself to the mountains and even to pledge his sword to save himself from dying of hunger. At length a change came in his fortunes, and he returned to Tepeleni in triumph. On the very day of his return he murdered his brother and then imprisoned his mother on the charge of poisoning him. He helped the Porte to subdue the Pasha of Scutari and thereby obtained the lands taken from his father and several Greek cities. He also attacked and slew (with the permission of the Sultan) Selim, Pasha of Delvino, and, as a reward, was appointed Lieutenant to the new Pasha of Derwent. He used this office to enrich himself by sharing the profits of brigandage. For this he was deposed, but he bought his way back into favor. For his services in the Turkish military forces in the war of 1787 he was named Pasha of Trikala in Thessaly; at the same time he seized Janina and had himself appointed Pasha of that province. Having thus won a position of power by the most unscrupulous means, he displayed marked administrative ability. He swept his old friends, the robbers, from the mountain roads, incorporated them into military troops, quelled the wretched factions that prevailed, and everywhere introduced order in the place of anarchy by the vigor and vigilance of his administration.

In order to gain a seaport on the Albanian coast Ali formed an alliance with Napoleon. But Napoleon was defeated in Egypt, and Ali, not to be caught on the losing side, changed friends quickly and as an ally of the English soon found himself in full possession of three towns on the Adriatic. He revenged upon the inhabitants of Gardiki an injury done to his mother 40 years before, by the murder of 739 male descendants of the original offenders, who themselves were all dead. But at the same time he maintained order and justice. Security and peace reigned, highroads were constructed, and industry flourished, so that the European travelers, with whom he willingly held intercourse, considered him an active and intelligent governor. From the year 1807, when he once more entered into an alliance with Napoleon, the dependence of Ali on the Porte was merely nominal. Having failed, however, to obtain, through the influence of Napoleon, Parga, on the coast of Albania, and the Ionian Islands, he now entered into an alliance with the English, to whom he made many concessions. In

return for these they granted Parga, nominally to the Sultan, but really to Ali. As he now considered his power to be securely established, he caused the commanders of the Greek armatole (or Greek militia), who had hitherto given him assistance, to be privately assassinated one by one, while at the same time he put to death the assassins, to save himself from the suspicion of having been their instigator. The Porte at length determined to put an end to the power of this daring rebel; and in 1820 Sultan Mahmud sentenced him to be deposed. Ali put up a stiff fight, but at last surrendered, on the security of an oath that his life and property would be granted him; the Turks, however, stabbed and then decapitated him. Ali, like many other half-civilized monarchs and chiefs who have lived within the sphere of European influence, was keenly alive to whatever occurred among the powers of Christendom. Though utterly illiterate himself, he had all the foreign journals translated and read to him. He watched every political change, as if conscious that the interests of his little region depended for their future prosperity on the West, and not on the East, and made friendly advances to both the French and English. Consult: Ibrahim Manzour Effendi, *Mémoires sur le Grèce et l'Albanie pendant le gouvernement d'Ali Pacha* (Paris, 1827); Pencker, *Die Sulioten und ihre Kriege mit Ali Pascha von Janina* (Breslau, 1834); Davenport, *The Life of Ali Pasha* (London, 1837).

AL'QUOT PART (Lat. *aliquot*, some, several). One quantity or number is said to be an aliquot part of another when the quotient of the latter divided by the former is an integer; e.g., 2, 4, 5, 10, 12½, are aliquot parts of 100.

ALISCANS, ä'lë'skän', **ALESCHANS**, or **LES ALYSCAMPS**, lä zä'lë'skän' (from Lat. *Elysi Campi*, Elysian Fields). A mediæval cemetery near Arles, in the south of France, supposed to have been consecrated by an apparition of Christ himself. Hence the name of a *chanson de geste*, of the twelfth century, describing two battles fought in this place by William, Count of Orange, against the Saracens. Defeated in the first fight, he raised a new army and renewed the combat with success. The same Christian hero appears in various other *chansons* of the period.

AL'ISMA'CEÆ. A family of monocotyledonous plants, containing about 15 genera and 60 species, widely distributed in fresh-water swamps and streams. Conspicuous representatives of the group are arrow leaf or arrow head (*Sagittaria*), and water plantain (*Alisma*).

AL'ISON. The young wife of John, a rich but miserly old carpenter in Chaucer's *Miller's Tale*. She was "long as a mast and upright as a bolt," more "pleasant to look upon than a flowering pear tree," and her skin "was softer than the wool of a wether." Absolon, a parish clerk, was in love with her, but she herself loved Nicholas, a threadbare scholar lodging in her husband's house.

ALISON, Rev. ARCHIBALD (1757-1839). An English philosophical writer. He was born in Edinburgh and studied at the University of Glasgow and afterward at Oxford. He took orders in the Church of England and subsequently held several preferments, among others a prebendal stall in Salisbury, and the perpetual curacy of Kenley, in Shropshire. From 1800 he officiated in a chapel in his native city,

where he remained till his death. Alison is principally known by his *Essays on the Nature and Principles of Taste*, first published at Edinburgh in 1790. The *Essays* advocate what is called the "association" theory of the sublime and beautiful. Two volumes of his sermons, first published at Edinburgh in 1814, were very popular in their day, and reached the sixth edition in 1816. See *ÆSTHETICS*.

ALISON, Sir ARCHIBALD (1792-1867). A British lawyer, historian, and writer. He was born at Kenley, Shropshire, Dec. 29, 1792. In 1805 he entered Edinburgh University, where he obtained highest honors in Greek and mathematics. He was called to the bar in 1814 and, owing to friendly influence, presently made a handsome income, which enabled him to travel on the Continent, then sought by many young men who desired to visit the scenes of the wars against Napoleon. From 1822 to 1830 he was advocate-deputy, and made his appearance as a writer on law, politics, and literature. In 1835 he settled near Glasgow, as Sheriff of Lanarkshire, an office conferred on him the preceding year, and began systematic and unremitting public and literary work. His *History of Europe*, a popular rather than a profound book (10 vols.), begun in 1829, finished in 1842, achieved a great success. For the sixth edition, published in 1844, the author received 2000 guineas. By 1848, 100,000 copies had been sold in the United States. It was translated into several languages, including French, German, and even Arabic. A continuation of the *History* for the period 1815-1852 (9 vols.) was completed in 1859. His other works, *Life of the Duke of Marlborough* (1845), *The Principles of Population* (1840), etc., though less successful, attracted wide notice. In 1845 he was elected Lord Rector of Marischal College and in 1851 of Glasgow University. He was made D.C.L. of Oxford University, and in 1852 received a baronetcy. In politics he was an arch-Tory. He continued his labors, in health and strength, almost to the day of his death, May 23, 1867. Over 100,000 persons attended his funeral. Consult his *Autobiography*, edited by his daughter-in-law (Edinburgh, 1883).

ALISON, Sir ARCHIBALD, Jr., K.C.B. (1826-1907). A British general. He was born in Edinburgh, the son of the historian, and educated at Edinburgh and Glasgow universities. He entered the army in 1846; served in the Crimean War at the siege of Sebastopol, and in India, where he lost an arm at the relief of Lucknow; and in the Ashanti expedition of 1873-74 he commanded the European brigade. He held an active command in the Egyptian expedition of 1882-83 and was promoted to be lieutenant-general for gallantry. On his return from Egypt he commanded at Aldershot in 1883-89, in 1888 was made an adjutant-general, and in 1889 was chosen military member of the Council of India. Four years later he was retired. He published a valuable treatise on *Army Organization* (1869).

ALISON, WILLIAM PULTENEY, M.D. (1790-1859). A Scotch political economist, physician, and professor of the practice of medicine in the University of Edinburgh from 1822 to 1856. He was an elder brother of the historian and was extremely popular with all classes of the community, because of his efforts to alleviate the sufferings of the poor. A pamphlet published by him in 1840 had the effect of bring-

ing about an improved poor-law for Scotland. He published a work entitled *A Dissertation on the Reclamation of Waste Lands* (1850), recommending the colonization of such lands by paupers and criminals, and several books upon medical subjects, among which may be mentioned his complete treatises on general pathology entitled *Outlines of Physiology* (3d ed., 1831), and *Outlines of Pathology and Practice of Medicine* (1844).

A'LITHE'A. The name of a character in Wycherley's play, *The Country Wife*, and in Garrick's *Country Girl*. She is a self-possessed and witty woman of the world.

ALIZ'ARIN (probably from Ar. *al*, the + 'asūrah, juice extracted from a plant), sometimes called madder extract. An exceedingly valuable coloring matter. With the oxides of aluminium, iron, and most other metals, it gives a series of beautifully colored insoluble salts or lakes. It was first obtained from madder (the root of *rubia tinctoria*), which has been used for ages in dyeing Turkey-red on cotton. In 1868 Graebe and Liebermann discovered a process by which it could be manufactured from anthracene, thus for the first time artificially producing a natural coloring substance. Their method, since modified with a view to economy, consists in the following operations: (1) *Anthracene*, a hydro-carbon contained in the refuse coal-tar of gas works, is oxidized with potassium bichromate to yield the compound *anthraquinone*; (2) when anthraquinone is heated with fuming sulphuric acid, *anthraquinone-sulphonic acids* are produced; (3) if the sodium salts of these acids are kept for 48 hours, in closed cylinders, with caustic soda and potassium chlorate, at a temperature of 180° C., the sodium salts of *alizarin* and similar compounds, called *purpurins*, are obtained; (4) the sodium salts of alizarin and purpurin are then dissolved in water, and, by addition of hydrochloric acid, alizarin itself and the purpurins are set free and precipitated in crystalline form. The precipitate is collected in filter-presses, thoroughly washed with water, and brought into the market in the form of a rather thin paste usually containing either 10 or 20 per cent of alizarin. Pure alizarin can be readily obtained from this paste by sublimation. Alizarin was first made on an industrial scale by Perkin in 1869.

Alizarin is to some extent soluble in hot water. In the dyeing processes fabrics are first soaked in a solution of the required mordant, and after the latter has been decomposed by steam or with alkali, leaving an insoluble metallic hydroxide in the fibre, alizarin solution is applied to produce the desired "lake."

Chemically, alizarin is a dioxy-anthraquinone, having the structural formula

Nitro-alizarin (commercial *alizarin orange*), which is itself a coloring matter, yields, when heated with glycerin and sulphuric acid, another color, *alizarin blue*, used in calico printing. *Alizarin carmin* is another important alizarin color; it is much used as a substitute for cochineal.

The artificial production of alizarin on a large industrial scale has naturally brought about important changes in the agriculture of

the countries where madder used to be extensively cultivated. Consult: Auerbach, *Das Anthracen und seine Derivate* (2d ed., Brunswick, 1880); Gnehm, *Die Anthracenfarbstoffe* (Brunswick, 1897); Benedikt, *The Chemistry of the Coal-Tar Colors* (trans. by Knecht, 3d ed., London, 1900); Green, *A Systematic Survey of the Organic Coloring Matters* (London, 1904).

AL'KAHEST, or **ALCAHEST** (a word arbitrarily formed by Paracelsus after Arabic fashion). See **ALCHEMY**.

ALKAHEST, or **THE HOUSE OF CLAES** (*The Search for the Absolute*) published in 1834, is one of the most striking novels in Balzac's series *La Comédie Humaine*. Its central character, a Flemish chemist of wealth and position, devotes everything—fortune, name, health, and even sanity—to solve the mystery of matter and finally dies heart-broken and defeated.

AL'KALIES. See **ANTIDOTES**.

ALKALIES (Fr. *alkali*, ultimately from *Ar. al*, the + *kaly*, ashes of saltwort). A term applied to the compounds of hydrogen and oxygen with the metals lithium, sodium, potassium, rubidium, cesium, and the radicle ammonium. The alkalies are all soluble in water and have the property of neutralizing acids as well as of turning solutions of red litmus blue. The word "alkal," which is derived from the Arabic, and means *ash*, was originally given to the ashes of sea plants, and was applied first to potash, called the *vegetable alkali*, and then to soda, which was derived from rock salt and called *mineral alkali*. These two became known as the fixed *alkalies*, in distinction from ammonia, which was called the *volatile alkali*. The alkalies are exceedingly caustic and act as powerful corrosive poisons. They show great avidity for acids and combine with them, forming salts, in which the special properties of both acid and alkali are generally destroyed; hence they are said to neutralize one another. (See **ACIDS**.) The alkalies find extensive use in the arts, as in the manufacture of soap and of baking powders, and in dyeing. The alkaline earths, lime, magnesia, baryta, and strontia, form a group of substances closely allied to the alkalies, but differing from the latter in being less soluble and by the fact that their carbonates are insoluble in water. Consult G. Lunge, *A Theoretical and Practical Treatise on the Manufacture of Sulphuric Acid and Alkali* (London, 1891), and *The Alkali-Maker's Handbook* (London, 1891). See **BASE**.

AL'KALI FLAT. See **PLAYA**.

ALKALIMETER. See **ACIDIMETRY AND ALKALIMETRY**.

AL'KALI SOILS. A term applied to soils occurring in regions of deficient or irregular rainfall, which contain unusually large amounts of soluble salts concentrated in or near the surface. Under certain conditions of moisture these salts appear on the surface of the soil in the form of a crust or powder known as *reh* in India, *sabach* in Egypt, and *alkali* in America. The main constituents of this saline efflorescence are sodium sulphate, sodium carbonate, and sodium chloride, mixed in varying proportions. There are also present salts of calcium and magnesium and smaller amounts of potassium sulphate, sodium phosphate, and sodium nitrate, these salts furnishing the most important elements of plant food. Two main classes of alkali are commonly distinguished:

"black" alkali, in which sodium carbonate predominates, and which is on this account highly corrosive and injurious to vegetation; and "white" alkali, the predominant constituent of which is sodium sulphate, and which is much less harmful to plant growth than is the black form. A saline form in which sodium chloride predominates is also frequently met with. Black alkali derives its name from the dark-colored spots which may usually be observed where it abounds, and which owe their color to the organic matter dissolved from the soil by the sodium carbonate.

Practically the same soluble (alkali) salts occur in all soils, but in humid regions the abundant rainfall prevents their accumulation on or near the surface, carrying away in the drainage those salts for which the soil has not a strong absorptive power. In regions of deficient rainfall, on the other hand, the scanty moisture which reaches the soil merely serves to dissolve the salts and carry them down a short distance into the ground, whence they are rapidly drawn up by the capillary rise of the water. The moisture, evaporating at the surface, leaves the salts accumulated there. Such accumulations of alkali are also found in regions which have a rainy and a dry season (as in parts of India), and where the rains occur commonly in sudden and violent downpours, which quickly pass without wetting the soil to any considerable depth.

In irrigated regions alkali frequently appears at the surface of the soil as a result of excessive application of water combined with defective drainage. Irrigation water, carried by canals running through porous, sandy soils, or applied in excessive amounts on the higher lands, seeps through to the lower-lying lands, carrying with it the soluble salts. Conditions are sometimes aggravated by the use of irrigation water rich in soluble salts.

Alkali soils generally occur in circumscribed areas ("spots"), but sometimes as broad stretches of "alkali deserts." Such soils are common in arid regions, i.e., where the average annual rainfall is less than 20 inches (500 millimeters). According to Hilgard, "the arid region, thus defined, includes, in North America, most of the country lying west of the one hundredth meridian, up to the Cascade Mountains, and northward beyond the line of the United States; southward, it reaches far into Mexico, including especially the Mexican plateau. In South America it includes nearly all the Pacific slope (Peru and Chile) south to Araucania; and eastward of the Andes the greater portion of the plains of western Brazil and Argentina. In Europe only a small portion of the Mediterranean border is included; but the entire African coast belt opposite, with the Saharan and Libyan deserts, Egypt, and Arabia are included therein, as well as a considerable portion of South Africa. In Asia, Asia Minor, Syria (with Palestine), Mesopotamia, Persia, and northwestern India up to the Ganges, and northward, the great plains or steppes of central Asia eastward to Mongolia and western China, fall into the same category, as does also a large portion of the Australian continent." There are extensive regions, especially in European Russia, which are not strictly arid according to this definition, but in which alkali soils are of frequent occurrence.

Alkali injures plants by its corrosive action

(in the case of black alkali) on the root crown, and by interference with osmotic action, by which seeds and plants take up the moisture and soil solutions, and thus prevents or seriously retards germination and growth. The latter effect results only when the soluble salts are present in considerable amount; on the other hand, a small amount of alkali appears to have a beneficial effect. Alkali, especially the black variety, also renders soils pasty and difficult to till and drain, and tends to form a tough hardpan impervious to water. Alkali soils are, as a rule, more moist than those free from a localized excess of soluble salts. This is due to the strong absorptive power of the salts for water and their retarding effect on evaporation.

Alkali soils are generally so fertile when freed from excess of noxious salts, and their area is so rapidly increasing under careless methods of irrigation, that the reclamation of alkali lands is a matter of the greatest agricultural importance. Alkali soils may be improved by (1) reducing surface evaporation, which may be effected by maintaining a loose tilth in the surface soil, by mulching, and by the growth of plants which root deeply and shade the soil, or which take up large amounts of soluble salts in their growth; (2) deep and thorough tillage; (3) the use (on black alkali) of chemical correctives, such as gypsum, which converts most of the corrosive carbonate into the comparatively harmless sulphate; and (4) leaching out the excess of salts by irrigation in connection with underdraining. The first two methods of treatment are merely temporary expedients, and are of value only when the amount of alkali is small. The third also affords only temporary relief, and is of value mainly when the amount of alkali is small and of the black variety. It is, however, very effective when employed in connection with the fourth method, for it improves the drainage, and tends to fix in the soil certain of the valuable fertilizing constituents, especially alkaline phosphates and humus, which would otherwise be lost in the subsequent leaching; for it must be borne in mind that, although the leaching process is effective in removing the noxious salts, it is likely to carry away with them a large part of those ingredients upon which the productiveness of the soil depends.

Alkali lands are commonly either entirely devoid of vegetation, or else produce plants of little or no value to man. Plants differ widely as regards tolerance of alkali in the soil, the tolerance depending much upon the kind and proportion of the salts present as well as upon the nature of the plant itself. Hilgard proposes to utilize the natural vegetation as an index of the kind of salts predominating in a soil. Thus, under California conditions, the samphires (*Salicornia subterminalis* and *Allenrolfea occidentalis*), alkali-heath (*Frankenia grandifolia campestris*), and *Cressa cretica truxillensis* are especially indicative of excessive amounts of salts of any kind; tussock grass (*Sporobolus airoides*) and greasewood (*Sarcobatus vermiculatus*) of the presence of large amounts of black alkali; and samphires and saltworts (*Suaeda torreyana* and *Suaeda suffrutescens*) of white alkali. The natural vegetation also furnishes, according to Hilgard, a means of determining the reclaimability of alkali soils. Thus, when tussock grass, greasewood, the samphires, saltworts, alkali-heath,

and cressa occupy the ground as an abundant and luxuriant growth, such land is considered irreclaimable for ordinary crops unless underdrained for the purpose of washing out surplus salts, as explained above. The more important and valuable of the plants which can withstand large amounts of alkali are the Australian salt-bushes (*Atriplex* spp.), *Modiola decumbens*, tussock grass (*Sporobolus airoides*), wild millet (*Beckmannia cruceiformis*), and barnyard grass (*Panicum crus-galli*). Of ordinary farm crops which show a marked tolerance of alkali may be mentioned rice, the millets, beets, English rape, sunflowers, asparagus, celery, spinach, onion, alfalfa, Bokhara clover, and grapes. The Australian salt-bushes, especially *Atriplex semibaccata*, have recently come into considerable prominence as a useful crop for alkali soils. They are highly tolerant of alkali, taking up large amounts of the soluble salts in their growth (nearly 20 per cent of the dry matter of salt-bushes is ash), and they produce a forage of considerable value.

Kearney, "The Choice of Crops for Alkali Lands," *U. S. Dept. Agr., Farmers' Bulletin 446*; G. P. Merrill, *A Treatise on Rocks, Rock Weathering, and Soils* (New York, 1897).

AL'KALOIDS (literally, resembling alkali). A term applied to all nitrogenous basic compounds found in plants, mostly in the monocotyledon species. They arise in plants, probably, through the decomposition of more complex nitrogenous substances; the decomposition products first found react with other substances present and turn into methyl derivatives, esters, or glucosides; finally, these derivative alkaloids combine with the acids present in the plant to form salts. The alkaloids are, as a rule, the most important medicinal principles of the plants from which they are derived, and in moderate doses constitute therapeutic agents of the highest value. In larger quantities, however, they are extremely poisonous. Most alkaloids are chemically composed of carbon, hydrogen, nitrogen, and oxygen. A very few, including the well-known nicotine of tobacco, and coniine, contain carbon, hydrogen, and nitrogen, but no oxygen. The alkaloids that contain oxygen are non-volatile solids, and can mostly be obtained in the form of colorless crystals. Those that contain no oxygen are volatile liquids. The separation of the two groups of alkaloids can therefore be readily effected by simply subjecting the given mixture to a process of distillation. Like most other substances occurring in plants, the alkaloids are optically active, generally turning the plane of polarized light to the left. See STEREO-CHEMISTRY.

Many alkaloids are chemically related to the organic bases, *pyridine*, *pyrrolidine*, *quinoline*, *iso-quinoline*, and *purine*. Thus, coniine, piperine, and trigonelline are pyridine derivatives; atropine, cocaine, ecgonine, and nicotine are

pyrrolidine derivatives; brucine, cinchonidine, cinchonine, quinine, and strychnine are quinoline derivatives; hydrastine, narceine, narcotine, and papaverine are iso-quinoline derivatives; while caffeine, theobromine, and theophylline are purine derivatives and therefore relatives of uric acid. The parent substances (pyridine, quinoline, etc.) of the alkaloids, appear in the free state when the latter are subjected to such violent reactions as fusion with caustic soda or potash, strong heating with phosphoric acid, distillation with zinc dust, or the like. Most alkaloids contain one or more methoxyl (OCH₃) groups. The presence of these, and the number of them present, may be determined by Zeisel's method, which consists in boiling the given alkaloid with hydro-iodic acid; the result is that the methoxyl groups present are replaced by hydrogen atoms, while as many methyl iodide molecules appear as a by-product as there were methoxyl groups in the alkaloid molecule.

In recent years important advances have been made in our knowledge of the constitution of the alkaloids, and many of these substances have been obtained synthetically. Some of the more valuable results of recent study are incorporated in the list given below and in special articles under the names of the more important alkaloids.

In contradistinction to the true, or *natural alkaloids*, a certain number of substances not found ready-formed in nature, but prepared artificially in the chemical laboratory, have been termed *artificial alkaloids*. Antipyrine, kairine, thalline, and the ordinary acet-anilide, or anti-febrine, are examples of artificial alkaloids, which resemble the natural alkaloids in their physiological action.

The separation and detection of the several alkaloids is often a matter of great importance in medico-legal examinations. The analytical method usually employed (the so-called Stas-Otto method) consists in partially separating the given mixture by the use of water, alcohol, ether, chloroform, benzine, and amyl alcohol, then applying tests depending upon the characteristic reactions of the various constituents. Tannic, picric, and phospho-molybdic acids, potassium-mercuric iodide, and a few other reagents form insoluble precipitates with the alkaloids.

The following are the more important natural alkaloids, their characteristic properties, and the sources from which they are obtained.

Aconitine, C₃₁H₄₇NO₁₁; melting point, 184° C.; insoluble in water; soluble in alcohol, ether, and chloroform; a violet coloration is produced when its solution in phosphoric acid is cautiously evaporated. It is found in aconite, the tuber of *Aconitum napellus* Linné.

Atropine, or *Daturine*, C₁₇H₂₃NO₃; melting point, 115° C.; soluble in alcohol and chloroform; sparingly soluble in hot water and in ether. It does not exist ready-formed in nature, but is produced by the transformation of the alkaloid hyoscyamine. Atropine has been reproduced synthetically. Its constitution is represented by the formula:

Berberine, C₂₀H₁₇NO₄+4.5H₂O; melting point, 120° C.; soluble in hot water or alcohol; its aqueous solution is colored red by chlorine. It is found in yellow puccoon, the rhizome and roots of *Hydrastis canadensis* Linné; also, in Canadian moonseed, the rhizome and roots of *Menispermum canadense* Linné, and in other plants.

Brucine, C₂₃H₂₆N₂O₄+4H₂O; melting point, 100° C.; soluble in alcohol and in chloroform. It imparts to strong nitric acid a red coloration that gradually changes to yellow; the coloration becomes violet on addition of stannous chloride. It is found along with strychnine, in nux vomica.

Caffeine or *Theine*, C₈H₁₀N₄O₂; melting point, 230.5° C.; soluble in hot water and in chloroform; sparingly soluble in hot alcohol. If its solution in chlorine water is evaporated and ammonia added to the residue, the latter turns purple. It is found in many plants and is contained in considerable quantities in tea and coffee. Caffeine has been reproduced synthetically. Its constitution is represented by the formula:

Cinchonidine, C₁₉H₂₂N₂O; melting point, 200.5° C.; soluble in chloroform and in alcohol. It is lævo-rotatory (i.e., its solutions turn the plane of polarized light to the left). It is found along with quinine in cinchona bark. Cinchonidine is probably a stereo-isomer (see STEREO-CHEMISTRY) of cinchonine.

Cinchonine, C₁₉H₂₂N₂O; melting point about 240° C.; sparingly soluble in chloroform and in hot alcohol. It is dextro-rotatory and is found in cinchona bark. Cinchonine has not yet been synthesized, and its constitution is not quite completely established.

Cocaine, C₁₇H₂₁NO₄; melting point, 98° C.; soluble in alcohol and in ether; sparingly soluble in water. It produces local anæsthesia when injected subcutaneously or applied to mucous membranes. It is found in coca, or cuca, the leaves of *Erythroxylon coca* Lamarek. Cocaine has been reproduced synthetically. Its constitution is represented by the formula:

Codeine, C₁₃H₂₁NO₃; melting point, 155° C.; soluble in alcohol, chloroform, and ether. With strong sulphuric acid and chloride of iron it gives a blue coloration. It is one of the alkaloids contained in opium.

Colchicine, C₂₂H₂₅NO₆; melting point, 145° C.; soluble in water, alcohol, and chloroform. It imparts to strong nitric acid a violet color which gradually turns brown. It is the active principle of colchicum root, the corm of *Colchicum autumnale* Linné.

Coniine, C₈H₁₇N; boiling point, 168.5° C.; soluble in alcohol, ether, and chloroform; sparingly soluble in water. Its aqueous solution gives a brown precipitate with a solution of iodine. Coniine has dextro-rotatory power. It

is the active principle of hemlock, the fruit of *Conium maculatum* Linné. Coniine has been reproduced synthetically. Its constitution is represented by the formula:

Curarine. $\text{C}_{18}\text{H}_{35}\text{N}$ (or $\text{C}_{10}\text{H}_{15}\text{N}?$); a yellow powder, soluble in water and in alcohol; turns purple if treated with strong hydrochloric acid. It is the active principle of the South American arrow poison curare, which is made from certain plants, including species of *Strychnos*.

Daturine, see *Atropine*, above.

Ecgonine, $\text{C}_9\text{H}_{15}\text{NO}_3$; melting point, 205°C .; soluble in water and in ethyl acetate; sparingly soluble in alcohol and ether; insoluble in acetone, chloroform, toluene, carbon disulphide, and carbon tetrachloride. It occurs together with cocaine in coca, the leaves of *Erythroxylon coca* Lamarck. It has been reproduced synthetically, and its constitution, which is very similar to that of cocaine, is represented by the formula:

Emetine, $\text{C}_{30}\text{H}_{40}\text{N}_2\text{O}_5$ (or $\text{C}_{28}\text{H}_{40}\text{N}_2\text{O}_5?$); melting point, $62^\circ - 65^\circ \text{C}$.; soluble in alcohol, ether, and chloroform; gives with a solution of sodium molybdate in strong sulphuric acid a brown coloration which turns blue on addition of hydrochloric acid. It is the active principle of ipecac, the root of *Cephaelis ipecacuanha*.

Eserine, or *Physostigmine*, $\text{C}_{15}\text{H}_{21}\text{N}_3\text{O}_2$; melting point, $40^\circ - 45^\circ \text{C}$.; soluble in alcohol, ether, and chloroform; bleaching powder colors its solution red, but the color disappears again on addition of an excess of bleaching powder. It is the active principle of Calabar bean, the seed of *Physostigma venenosum* Balfour.

Hydrastine, $\text{C}_{21}\text{H}_{21}\text{NO}_6$; melting point, 132°C .; soluble in chloroform and in benzine, sparingly soluble in ether and alcohol, almost insoluble in water. Two drops of dilute potassium permanganate solution, added to a solution of hydrastine sulphate, produce an intense blue fluorescence. Hydrastine occurs, together with berberine (see above) in yellow puccoon, the rhizome and roots of *Hydrastis canadensis* Linné. Its constitution is represented by the formula:

Hydrastinine, $\text{C}_{11}\text{H}_{13}\text{NO}_3$; melting point, $116^\circ - 117^\circ \text{C}$.; extremely soluble in alcohol, ether, and chloroform; sparingly soluble in hot water; in the form of its hydrochloride it is used as a reliable remedy for menorrhagia and metrorrhagia. It does not exist ready-formed in nature, but is produced by oxidizing hydrastine (see above) with nitric acid. Its constitution is represented by the formula:

Hyoscyamine, $\text{C}_{17}\text{H}_{23}\text{NO}_3$; melting point, 108.5°C .; soluble in water, alcohol, ether, and chloroform; gives a purple color with strong nitric acid. By the action of caustic alkalies it is readily transformed into the alkaloid atropine (see above). Hyoscyamine is found in many plants of the natural order *Solanaceæ*; e.g., in henbane, the leaves and flowering tops of *Hyoscyamus niger* Linné, and in the leaves of *Atropa belladonna* Linné.

Morphine, $\text{C}_{17}\text{H}_{19}\text{NO}_3$; melting point, 230°C . It may be extracted from alkaline solutions by means of chloroform. With strong nitric acid it gives a blood-red coloration that gradually turns yellow. It is one of the constituents of opium.

Muscarine, $\text{C}_5\text{H}_{15}\text{NO}_3$; a liquid soluble in water and in alcohol; insoluble in ether and chloroform. It is found in the fly fungus, *Amanita muscaria*.

Narceine, $\text{C}_{23}\text{H}_{29}\text{NO}_9$; melting point, 145.2°C .; sparingly soluble in the ordinary solvents. A solution of sodium molybdate in strong sulphuric acid gives a green coloration that turns dark-red. It is one of the constituents of opium and resembles morphine in its physiological action. Its constitution is represented by the formula:

Narcotine, $\text{C}_{22}\text{H}_{23}\text{NO}_7$; melting point, 176° ; soluble in chloroform, less soluble in hot alcohol and ether. Its solutions are laevo-rotatory, but when acidified turn the plane of polarized light to the right. It is one of the constituents of opium. Its chemical constitution is represented by the formula:

Nicotine, $C_{10}H_{14}N_2$; boiling point, $241^\circ C.$; soluble in water, alcohol, and ether; its smell and taste are like those of tobacco. With hydrochloric acid it gives a violet coloration that turns orange on addition of nitric acid; with iodine solutions it gives a yellow precipitate. It is the active principle of tobacco, the dried leaves of *Nicotiana tabacum*; tobacco smoke, however, contains no nicotine. Nicotine was reproduced synthetically by Pictet in 1903. Its constitution is represented by the formula:

Papaverine, $C_{20}H_{21}NO_4$; melting point, $147^\circ C.$; soluble in hot alcohol and in chloroform; gives a violet coloration with strong sulphuric acid. It is found in opium. Its chemical constitution is represented by the formula:

Physostigmine, see *Eserine*, above.

Pilocarpine, $C_{11}H_{16}N_2O_2$; a semi-fluid alkaloid soluble in alcohol, ether, and chloroform; gives a green coloration with strong sulphuric acid and potassium bi-chromate. It is one of the active principles of pilocarpus, or jaborandi, the leaflets of *Pilocarpus selloanus* Engler, or of *Pilocarpus jaborandi* Holmes.

Piperidine, $C_5H_{11}N$; a liquid alkaloid produced by the decomposition of piperine, a substance found in pepper.

Piperine, $C_{17}H_{19}NO_3$; melting point, $128^\circ C.$; soluble in hot water and in chloroform; with strong sulphuric acid it gives a yellow color that changes to brown, then to a greenish brown.

It is found in plants of the natural order *Piperaceæ*, and is one of the chief constituents of ordinary black pepper. Piperine has been reproduced synthetically. Its chemical constitution is represented by the formula:

Quinidine, $C_{20}H_{24}N_2O_2$; melting point, $168^\circ C.$; soluble in chloroform, less so in alcohol and ether; sparingly soluble in water; its solution turns the plane of polarized light to the right. It is found in cinchona bark.

Quinine, $C_{20}H_{24}N_2O_2 + 3H_2O$; melts in its water of crystallization at $57^\circ C.$, loses its water at 100° , then melts again at $177^\circ C.$; soluble in alcohol, ether, and chloroform; sparingly soluble in water; its solutions turn the plane of polarized light to the left. It is found in cinchona bark. Quinine probably has the constitution represented by the following formula:

Solanine, $C_{42}H_{73}NO_{15}$; melting point, $235^\circ C.$; it may be extracted from its alkaline solutions by means of chloroform; with strong sulphuric acid it gives an orange coloration that turns a brownish red. It is found in bitter-sweet (woody nightshade), the young branches of *Solanum dulcamara* Linné.

Strychnine, $C_{21}H_{22}N_2O_2$; melting point, about $264^\circ C.$; soluble in chloroform and in hot alcohol; sparingly soluble in water and in ether. It gives a pretty display of colors with strong sulphuric acid and a grain of potassium bi-chromate. It is found in plants of the natural order *Loganiaceæ* and is usually obtained from nux vomica.

Thebaine, or *Paramorphine*, $C_{19}H_{21}NO_3$; melting point, $193^\circ C.$; soluble in alcohol and chloroform; gives, with strong sulphuric acid, a dark-red coloration which turns yellow. It is found in opium.

Theine, see *Caffeine*, above.

Theobromine, $C_7H_5N_4O_2$; sublimes without melting at $290^\circ C.$; sparingly soluble in the ordinary solvents; may be extracted from an

alkaline solution by means of chloroform. On evaporation with chlorine-water a brown residue is obtained that turns purple if a little ammonia is added. It is found in cacao beans. Theobromine has been reproduced synthetically. Its chemical constitution is represented by the formula:

Theophylline, $\text{C}_7\text{H}_8\text{N}_4\text{O}_2$; melting point, 264°C .; soluble in warm water, sparingly soluble in cold alcohol. When a chlorinated solution of theophylline is evaporated to dryness, a scarlet residue is obtained, which turns violet on addition of ammonia. Theophylline is found, together with caffeine, in tea. Its chemical constitution is represented by the formula:

Trigonelline, $\text{C}_7\text{H}_7\text{NO}_2$; melting point, 218°C .; extremely soluble in water, less soluble in alcohol; insoluble in ether, chloroform, and benzene; not affected by hot concentrated sulphuric acid. It is found in the seeds of *Trigonella fœnum græcum* and of *Strophantus hispidus* and in the roots of *Strophantus kombé*. It has been reproduced synthetically. Its constitution is represented by the formula:

Veratrine, $\text{C}_{32}\text{H}_{49}\text{N}_6\text{O}_9$; a mixture of two isomeric alkaloids; melting point, 155°C .; soluble in alcohol, ether, and chloroform; gives a red coloration if heated with strong sulphuric or with fuming hydrochloric acid. It is found in the seed of *Asagraea officinalis* Lindley.

The extraction of an alkaloid from the plant in which it occurs is often a matter of considerable difficulty. The volatile alkaloids may be obtained by distilling the plant or vegetable product with water and lime (or caustic soda); the liquid distilling over is neutralized with sulphuric acid and evaporated to dryness; the sulphate of the alkaloid may then be dissolved out of the residue by means of a mixture of alcohol and ether. To extract a non-volatile alkaloid, the plant is macerated and treated with a dilute solution of some acid in ordinary alcohol; the solution thus obtained is rendered alkaline by the addition of soda, and the alkaloid set free is either directly obtained in the form of a precipitate, or else may be extracted from the alkaline solution by means of ether, chloroform, or some other solvent that does not mix with water. Such processes, however, usually yield not one single, but mixtures of two or more alkaloids, and those contaminated with

large quantities of other organic substances, which often render the isolation of a single alkaloid in the pure state very difficult.

Most alkaloids have a powerful physiological action even if employed in very small quantities. The action of certain alkaloids is, however, at least partly antagonistic to the action of certain others. For this reason one alkaloid may sometimes be employed to relieve the poisonous effect of another alkaloid, though it may itself be a violent poison. The antagonism of morphine and atropine is of considerable value in cases in which a subcutaneous injection of morphine is indicated: the cardiac depression, indigestion, and constipation, usually caused by morphine, may be prevented by injecting simultaneously a trace of atropine.

The alkaloids are sometimes spoken of as vegetable bases, natural organic bases, or vegetable alkaloids. The latter name is applied to them in contradistinction to the animal alkaloids, or *ptomaines*, that are formed during the putrefaction of animal products. Like the vegetable alkaloids, the ptomaines are highly poisonous nitrogenous bases, and they resemble the vegetable alkaloids both in their chemical properties and in their physiological action. See PTOMAINES.

The most important alkaloids are described in some detail under their special names. See also STOVAINE.

'ALKAMA IBN ABADA AL TAMIMI AL FAHL. A famous Arabian poet, living in the sixth and the beginning of the seventh centuries. He sang in his kasidas the wars between the Lahmids in Hira and the Ghassanids in Bosra, and entered into poetic contests with Amr al Kais. It is said that Jundab, the wife of 'Amr al Kais, in deciding such a contest, gave the victory to 'Alkama, with the consequence that she was divorced and married the latter poet. Through the recital of some of his poems he freed his brother Sha's and some other Tamimites from captivity in 583 A.D. His diwan has been published by Socin, *Die Gedichte des Alkama al Fahl* (Leipzig, 1867), with a German translation, and by Ahlwardt, *The Diwans of the Six Ancient Arabic Poets* (London, 1870), without a translation.

AL'KANET (dim. of Sp. *alcana*, *alheña*, from Ar. *al*, the + *hinnā*), *Anchusa*. A genus of plants belonging to the family Boraginaceæ and not natives in America. Some of the species are cultivated on account of their hardiness and their blue or purple flowers, which are in coiled clusters suggesting those of the forget-me-not. The common alkanet (*Anchusa officinalis*) grows in dry and sandy places, and by waysides, in the middle and north of Europe. The roots, leaves, and flowers were formerly

used in medicine as an emollient, cooling, and soothing application. The evergreen alkanet (*Anchusa sempervirens*) is also a native of Europe, and a doubtful native of Great Britain, although not uncommon in situations to which it may have escaped from gardens, being often cultivated for the sake of its beautiful blue flowers, which appear early in the season, and for its leaves, which retain a pleasing verdure all winter. It is a plant of humble growth, rising only a few inches above the ground. A number of other species are occasionally seen in our flower borders. *Anchusa tinctoria*, to which the name alkanet or alkanna (Ar. *al-chenneh*) more strictly belongs, is a native of the Levant and of the south of Europe, extending as far north as Hungary. The root is sold under the name of alkanet or alkanna root; it is sometimes cultivated in England; but the greater part is imported from the Levant or the south of France. It appears in commerce in pieces of the thickness of a quill or of the finger, the rind blackish externally, but internally of a beautiful dark-red color, and adhering rather loosely to the whitish heart. It contains chiefly a resinous red coloring matter, to which the name "alkanet" is often applied. See ALKANET, below.

ALKANET. A beautiful red coloring matter obtained from the roots of the alkanet or orchanet herb (*Anchusa tinctoria*, Tausch.) and largely used for imparting a red color to varnishes, cosmetics, etc. It is extracted from the roots by means of benzine, and, on evaporating the latter, is obtained in the form of a thick paste that is insoluble in water, but readily soluble in alcohol, ether, benzine, various oils, and other organic liquids. Alkanet should not be confounded with the red coloring matter contained in the roots of the henna, or alcanna, plant (*Lawsonia inermis* L.). The chemical composition of purified alkanet seems to correspond to the formula $C_{15}H_{14}O_4$.

AL'KEKEN'GI. See PHYSALIS.

AL-KHUWARIZMI, ʾal-kū'wā-rīz'mê, ABU 'ABD ALLAH MOHAMMED IBN MUSA, of Khwarezm, a mediæval State included in the present Khanate of Khiva (?-c.831). A Moslem philosopher and celebrated algebraist. He was one of the savants who went to Bagdad in Al-Mamun's reign. He worked in the observatory there, computed a set of astronomical tables, and wrote several works on mathematics. Among these works were treatises on the Hindu arithmetic (trans. Gerard of Cremona, or Adelard of Bath; published by Boncompagni, Rome, 1857), the sundial, the astrolabe (an instrument used to take the altitude of the sun), on chronology, geometry, and algebra. His *Al-jabr wa'l muqabalah*, i.e., the redintegration and the comparison, gave the name to algebra (q.v.). His discussion of the quadratic equation, in which he called to his assistance geometric diagrams, is quite complete. His name appeared in Latin in the form *Algoritmi*, from which we have our word "algorism" (q.v.). His algebra was translated into Latin by Gerard of Cremona, and into English by F. Rosen (London, 1831). Consult Brockelmann, *Geschichte der arabischen Litteratur* part i, p. 215 (Weimar, 1898).

AL KINDI. See KINDI.

ALKMAAR, ʾalk-mār'. An old town in the province of north Holland, in the Netherlands, situated on the North Holland Canal, 20 miles northwest of Amsterdam (Map: Netherlands,

C 2). It is well built, has very clean streets, and is intersected by broad canals. It possesses a town-house, ornamented with curious Gothic carving, with a tower, a museum of antiquities, and a library, and the church of St. Laurence, which dates from the fifteenth century. It is a centre of trade in grain, butter, and cheese. Alkmaar exports great quantities of the last-mentioned commodity, more than one-half the output of the province passing through this town. There are minor maritime industries. It is the birthplace of Henry of Alkmaar. (See ALKMAAR, HEINRICH VON.) Alkmaar, first of all the Netherland cities, successfully resisted the Spanish in 1573, and the anniversary of that siege was commemorated in 1873 by the erection of a statue of Victory, by Stracké. Here, on Oct. 18, 1799, the Duke of York signed a capitulation, by the terms of which the Russo-British army, twice defeated by the French under Brune, left Holland. Pop., 1890, 15,803; 1900, 18,275; 1910, 21,374.

ALKMAAR, HEINRICH VON. A low German translator or adapter of the famous animal epic, *Reynard the Fox* (*Reineke Fuchs*) (q.v.), printed in 1498. Alkmaar is said to have been a tutor of the Duke of Lorraine in the latter part of the fifteenth century. See ANGLO-NORMAN LITERATURE.

AL'KOREM'MI. In William Beckford's romance of *Vathek* (q.v.), the name of Vathek's palace, to which he had added five parts, corresponding to his five senses.

AL'LA, or EL'LA. In Chaucer's *Man of Law's Tale*, the name of the king who marries Constance.

ALLA BREVE, ʾal'lâ brâ'vâ (It. according to the *breve*). In music, a species of common time with a quick movement. In early ecclesiastical music we find no terms indicating the tempo or rate of movement, until, in the fifteenth century, the expressions *augmentation* and *diminution* were introduced to indicate that note values were to be changed by lengthening or shortening. The sign of diminution was a vertical line drawn through the time signature; \emptyset for triple and \emptyset for duple time. With this diminution, breves (q.v.) were to be taken in the time of semi-breves, thus quickening the movement. At that time the unit of count was a semi-breve. When the breve was "diminished," it meant that one must count "by the breve," hence the name Alla Breve.

In modern music Alla Breve measure (sometimes called Alla Cappella) is marked \emptyset or $\frac{2}{2}$

and calls for two counts to the bar, with half notes as the unit. See MENSURABLE MUSIC.

ALLAH. The name of the deity used by Mohammedans. It is generally supposed to be a contraction of *al ilahu*, 'the god,' but may be derived from the Aramaic *alaha*, which has the same meaning. Among the Nabataean inscriptions from Hejra names like Abd allaha, Abd allahi, Zaid allaha, Saad allahi, Wahab allahi, and Taim allahi are of frequent occurrence (*Corpus Inscr-Sem.*, ii, 238, 302, 315, 369, 358, et al.). These are several centuries earlier than Mohammed. In the Safaitic inscriptions the name "Allah" occurs alone. Pre-Islamic poets mention Allah as a great god; and many passages in the Koran show that the Arabs in "the time of ignorance" used the name. Wellhausen supposes that it was employed as an appellative

for the local god of Mecca, Hubal (q.v.). Hubal himself is found among the Aramaic-speaking Arabs of N. W. Arabia and was probably an importation from the North. The conception of Allah in the Koran and in the succeeding Moslem schools of theology has been best described by McDonald. Consult: Wellhausen, *Reste Arabischen Heidentums*, pp. 217 (2d ed., 1907); Nöldeke, 'Arabs' in *Encyclopædia of Religion and Ethics* (1908); McDonald, 'Allah' in *Enzyklopædie des Islams* (1910).

ALLAHABAD, ä'l'lä-hä-bäd'. A district and a division of the United Provinces of Agra and Oudh, British India.

ALLAHABAD (Ar. *Allah*, God + Hind. *abad*, city, dwelling). The seat of the government of the United Provinces of Agra and Oudh (formerly the Northwest Provinces), British India (Map: India, D 3). It occupies the fork of the Ganges and Jumna which forms the lowest extremity of the extensive region distinguished as the Doab, or the Country of Two Rivers, lying between those natural boundaries. Its position at the confluence of the holy rivers, which has long made it a centre of superstitious reverence and worship, and a much frequented place of pilgrimage for the purposes of ablution, also rendered it a natural centre of commerce and civilization, an advantage which has been fully appreciated by the British government. It commands the navigation both of the Ganges and of the Jumna. It is on the direct water-route between Calcutta and the Upper Provinces, and is a main station on the Grand Trunk Road and also on the East Indian Railway. Allahabad is 72 miles west of Benares; is distant from Calcutta, by land, 496 miles; by water, 808 miles in the rainy season, 985 miles in the dry season. From Delhi it is distant 386 miles, and from Bombay, by the Jabalpur branch of the East Indian Railway, 840 miles. The cotton, sugar, and indigo produce of the fertile district of Allahabad is brought in large quantities into the city, to be transported thence to Calcutta and elsewhere. Steamers sail to Calcutta and barges to Delhi.

In point of appearance, Allahabad is scarcely worthy of its character and renown. With the exception of a few ancient monuments of costly, elaborate, and tasteful workmanship, the native part of the city consists of mean houses and a network of narrow streets. The most noteworthy buildings are the Jumma Musjid, or the great mosque, and the Sultan Khossor's caravansary—a fine cloistered quadrangle. The fort is of red stone and is approached by a very handsome gate; it contains the palace or residency, and the famous Asoka or Gada Pillar, the club of Bhin Sen, 240 B.C. Below the fort, built over "the undying banyan tree," is the subterranean Chali Satum temple, which is said to communicate with Benares by an underground passage, through which flows a third holy river, the Sereswati, visible only to the eye of faith, the dropping moisture on the rocky walls pointed out as the river scarcely justifying the presumption. Allahabad possesses a hospital, theatres, bazaars, etc., and the Muir Central College (founded 1872), the chief educational institution in the United Provinces. (See INDIA.) As generally in the towns of India, the European quarter is vastly superior. Its nucleus appears to have been the native fort, which on the east and south rises directly from the banks of both rivers, while toward the land its artificial de-

fenses, of great strength in themselves, are not commanded from the neighborhood by any higher ground. This citadel, described by Heber as having been at one time "a very noble castle," has lost much of its romance by having had its lofty towers pruned down to bastions and cavaliers. The Europeans of the garrison occupy well-constructed barracks. Beyond the fort are the cantonments for the native troops. In connection with these are numerous villas and bungalows, few other spots in India boasting such handsome buildings of this kind, which are rendered still more attractive and agreeable by avenues of trees winding between them and connecting them with the fort, the city, and several of the adjacent localities. Two boat bridges cross the Ganges, and the East Indian railway-bridge spans the Jumna at Allahabad. So many poor pilgrims throng the city, especially at the time of the great annual religious fair in January, that instead of Allahabad, the natives call it "Fakirabad," or the city of beggars. The pilgrims assemble to bathe at the confluence of the rivers, and in 1904 it was estimated that 250,000 were present on the great bathing day. Every twelfth year the gathering is much larger; a million people are said to have been present in 1894. From the octroi, professional and carriage taxes, rents and proceeds of the Hindu fair, a considerable municipal revenue accrues, which is expended on police, lighting, street sprinkling, water works, maintenance of parks, medical assistance, and charities. Allahabad was founded by Akbar in 1575, on the site of an ancient fort. From 1765 to 1801 it underwent three changes of rulers, coming in the latter year under British domination. The mutiny of 1857 brought disaster to Allahabad. On the 6th of June of that year, the insurrection, which had begun at Meerut on the 10th of May, extended itself to Allahabad. Though the Europeans held the fort, the mutineers were for some days undisputed masters of all beyond; and between the ravages of the marauders and the fire of the garrison, the city became little better than a heap of blackened ruins. New buildings began to spring up as soon as order had been restored, and most of the city has been rebuilt since that date, with the exception of the few monuments of ancient native architecture described above. Pop. (including cantonments), 1891, 175,246; 1901, 172,032; 1911, 171,697.

ALLAIN-TARGE, ä'län' tär'zhâ', FRANÇOIS HENRI RENÉ (1832–1902). A French politician, born at Angers. He studied law at Poitiers, was admitted to the bar in 1853, and from 1861 to 1864 was substitute Imperial Procurator at Angers. From 1864 to 1866 he was an editor of the *Courrier du Dimanche*. He joined the staff of the *Avenir National* in 1868, and in the same year founded the *Revue Politique*. Upon the fall of the Empire, he was appointed by the government for national defense Prefect of the department of Maine-et-Loire. He was subsequently an army commissary, and resigned with Gambetta upon the conclusion of peace. He was a municipal Councilor of Paris in 1871 and 1874, Deputy in 1876, 1877, and 1881, and Minister of Finance in Gambetta's cabinet. In 1885–86 he was Minister of the Interior in the cabinet of Brisson.

AL'LAMAN'DA (named after the Swiss scientist Allamand, who died in 1787). A genus of about 12 species belonging to the family Apocynaceæ, and natives of Central and South

America. A number of species are cultivated as greenhouse shrubs, mostly climbers, with whorled leaves and large terminal funnel-shaped flowers. *Allamanda cathartica*, a native of the West Indies, is a climber with whorled or opposite oblong leaves, and golden-yellow flowers, white marked in the throat. It has violently emetic and purgative properties; but in small doses an infusion of the leaves is esteemed a valuable cathartic medicine, especially in the cure of painters' colic.

ALLAN, DAVID (1744–96). A Scottish genre and portrait painter. He was born at Alloa, studied in Glasgow and afterward at Rome under Gavin Hamilton. During a sojourn of 17 years in Rome he won the gold medal of the Academy of St. Luke and became a member of that body. In 1777 he settled at London as a portrait painter, and in 1780 he removed to Edinburgh, where he became the head of the Trustees' Academy in 1886. He now began to paint scenes from Scottish folk life, becoming a forerunner of Wilkie. Although interesting as illustrations, these paintings are totally deficient in technique. Allan was also an illustrator, his best-known work being illustrations of Allan Ramsay's *Gentle Shepherd* and of the *Poems* of his friend Robert Burns.

ALLAN, MAUD (1879—). An American classical dancer. She was born in Toronto, Canada, but when she was four years of age her family removed to San Francisco. She early manifested unusual musical talent, and after pursuing her studies abroad for several years she received from the Berlin Royal High School of Music the highest diploma for piano-playing. Afterward she decided to become a dancer and in 1902 made her first appearance before an invited audience at the Vienna Conservatory of Music. Her success led to public appearances in Brussels, Berlin, Budapest, Hamburg, and Paris. A far greater triumph than these was her appearance at the Palace Theatre in London in 1908 in "The Vision of Salome." In 1910 she appeared in New York.

ALLAN, Sir HUGH (1810–82). A Canadian ship-owner. He went from Scotland to Canada as a clerk in 1826 and in 1835 became a ship-builder and commission merchant. During the Canadian rebellion of 1837–38, he served in the army as a volunteer and reached the rank of captain. He helped establish (1853), after many disasters, the Allan Line of screw steamships and was one of the projectors of the Canadian Pacific Railway and figured in the scandal connected with that road. Many transportation, manufacturing, and mining companies owed their success largely to his enterprise. He received the honor of knighthood in 1871, for his service to commerce. He was one of the wealthiest men in Canada.

ALLAN, Sir WILLIAM (1782–1850). A Scotch painter. He was born in Edinburgh and studied art in the Trustees' Academy there and in the schools of the Royal Academy, London. In 1805 he went to St. Petersburg, and spent several years in various parts of Russia and Turkey, where he acquired material for his first successful pictures. Returning to Scotland in 1814, he devoted himself to Scottish historical painting. This part of his work includes "John Knox Admonishing Queen Mary" (1823), and the "Death of the Regent Murray" (1825). In 1834 he returned to his earlier subjects, and his "Polish Exiles on their Way to Siberia" and

"The Moorish Love-Letter" won him a seat in the Royal Academy. Later pictures were "A Slave-Market in Constantinople" (1837), "The Battle of Prestonpans" (1842), "Waterloo," from both the French and English sides (1443–44), "Peter the Great teaching Shipbuilding to his Subjects" (ordered by the Czar, 1845). Allan became president of the Royal Scottish Academy in 1838, in 1841 succeeded Wilkie as limner to the Queen in Scotland, and was knighted in 1842. He was the intimate friend of Sir Walter Scott, whom he portrayed in his study (National Portrait Gallery, London). His work, very famous in his own day, is now considered lacking in originality and deficient in color. Consult the *Art Journal* (1849, 1850, 1903).

ALLANITE. A mineral silicate of the epidote group containing iron, calcium, aluminium, and the rare metals caesium, neodymium, praseodymium, lanthanum, and yttrium. It occurs in black or dark brown crystals with submetallic or resinous lustre and exhibiting strong pleochroism. It is found as an accessory mineral in many basic crystalline rocks and is frequently associated with masses of magnetic iron ore.

ALLANTOÏN (ultimately derived from *allantois*), $C_4H_6N_4O_3$. An organic substance found in the allantoic and amniotic fluids, in fetal urine, and in the urine of many animals during a short time after birth. It is a crystalline, solid substance, sparingly soluble in cold water, but dissolving readily in hot water or alcohol, and in solutions of alkaline carbonates. It may be obtained from the urine of calves by evaporating and letting stand, at ordinary temperatures, until the substance crystallizes out. Chemically, allantoin is the di-ureide of glyoxylic acid. It is one of the most important products of the oxidation of uric acid (allantoin is found in urine after uric acid has been taken internally), and, on the other hand, it may be readily made from urea by prolonged heating with glyoxylic acid. Allantoin may be best prepared by oxidizing uric acid with peroxide of lead, according to the following chemical equation:

The graphic formula of allantoin is

Allantoin was first discovered in 1790 by Vauquelin. See URIC ACID.

ALLANTOÏS (Gk. *állās*, *allas*, a sausage, and *ēidos*, *eidōs*, shape). A delicate membranous bag, which makes its appearance in the eggs of birds during incubation. Its function is chiefly the aëration of the blood of the embryo or chick. It sprouts from the lower part of the intestine of the chick, and rapidly enlarges, so as almost completely to inclose it, lining nearly the whole extent of the membrana putaminis—the double membrane which is immediately within the egg-shell. It is covered with a network of arteries and veins, corresponding to the umbilical artery and vein of mammalia; and the aëration of the blood is accomplished by the air which enters through the pores of the shell; but as the lungs become capable of their function, the circulation in the allantois diminishes, and its footstalk contracts and at last divides, leaving only a ligamentous

remnant. The allantois is never developed in the eggs of fishes and amphibians, hence these are called anallantoid vertebrates; while reptiles, birds, and mammalia, in which it is present, are called allantoid. In the mammalia it is superseded at an early period of foetal life by other contrivances, but continues to exist in the lower animals for receiving the urinary secretion through the urachus, a purpose which it serves in birds and reptiles likewise. In the human species it disappears very early, only a minute vesicle remaining. See EMBRYOLOGY.

ALLARD, á'lär', JEAN FRANÇOIS (1783-1839). Generalissimo of the army of Lahore, and previously Adjutant to Marshal Brune under Napoleon. After the murder of Marshal Brune (q.v.), Allard left France (1815), intending to emigrate to America, but changed his plan, went to Egypt, thence to Persia, to Kabul, and finally to Lahore (1820), where he engaged in the service of Ranjit Singh (q.v.), by whom he was made generalissimo. He married a native of Lahore, and identified himself with the interests of his adopted country, but he could not forget France, and the troops which he commanded were drilled under the French tricolor. The changed political situation after the revolution of 1830 brought him back to Paris (1836), where he was received with distinction and was made French chargé d'affaires in Lahore. He presented to the royal library of Paris a valuable collection of coins and returned to Lahore, leaving his wife and children in Paris. He distinguished himself in the Sikh campaigns against the Afghans and died at Peshawar, Jan. 23, 1839. His remains were, according to his own wish, buried with military honors at Lahore.

AL'LARGAN'DO. A term in music calling for a retardation of the tempo together with an increase in tonal volume. It is usually found in passages leading up to a climax, where the music assumes a character of broadness and majesty. Mere retardation of tempo, which usually goes parallel with decrease of tonal volume, is *rallentando* or *ritardando*.

ALLA'TIUS, LEO (1586-1669). A Greek ecclesiastic of the Roman Catholic church. He was born on the island of Chios, removed in 1600 to Rome, and studied at the Greek College there. He was appointed grand-vicar to the Bishop of Anglona, and was sent in 1622 by Gregory XV to bring to Rome the Palatinate, or Heidelberg, library. In 1661 he was appointed by Alexander VII librarian of the Vatican. He tried to reconcile the Western and Eastern churches, writing such treatises as *De Ecclesiæ Occidentalis atque Orientalis Perpetua Consensione* (1648) and *De Utriusque Ecclesiæ in Dogmate de Purgatorio Consensione* (1655). His further works include *De Libris Ecclesiasticis Græcorum* (1645) and *Græciæ Orthodoxæ Scriptores* (1652).

ALLEE VERTE, á'lá'vârt' (Fr. green walk). Once a fashionable promenade in Brussels (q.v.), now given over to business interests. It is lined with lime trees, crosses a canal in the city by means of a lofty bridge, and continues as the *Avenue de la Reine* to the church of St. Mary.

ALLEGAN, ä'lê-gan. A city and the county-seat of Allegan Co., Mich., 33 miles south of Grand Rapids, on the Lake Shore and Michigan Southern, the Pere Marquette, and the Michigan Central railroads, and on the Kalamazoo River (Map: Michigan, D 6). It contains a Carnegie library, a fine court house, a city hall, and a

hospital. The city is in a fertile agricultural and fruit-growing region and has valuable natural advantages in good water-power, derived by means of two dams, one in the city and the other on the river, 3 miles above. Power from the latter is transmitted for a considerable distance. The industrial establishments include paper, planing, and flour mills, furniture, casket, mirror, and picture-frame factories, carriage works, and a foundry and machine shop. Allegan was settled in 1835, was first incorporated in 1838, reincorporated in 1858 and again in 1907. The water works are owned and operated by the municipality. The business section of the city was destroyed by fire in 1884. Pop., 1900, 2667; 1910, 3419; 1913 (est.), 3500.

AL'LEGA'NY. A village in Cattaraugus Co., N. Y., 70 miles by rail southeast of Buffalo, on the Erie and the Pennsylvania railroads, and on the Allegheny River (Map: New York, B 6). The village is engaged in the oil industry and has a canning factory, five cheese factories, and saw mills. It is the seat of St. Bonaventure's College and Seminary, a Roman Catholic institution organized in 1859, and St. Elizabeth's Academy for Girls. Allegany was incorporated in 1905. Pop., 1910, 1286; 1913 (est.), 1300.

ALLEGATION. In common law pleading the assertion, declaration, or statement of fact made by a party to a suit upon which he relies to sustain his cause of action. As the term is limited to statements of fact, it does not include the declarations of legal right nor the remedy demanded in the pleading. In English ecclesiastical law, the entire plea of a party, comprehending all the statements of fact upon which he relies, is called his allegation. The term is also employed in a special sense in the phrase "allegation of faculties," to denote the statement of the property of the husband in a claim for alimony made by a wife in a suit for divorce in the ecclesiastical court. See PLEADING; DECLARATION; PLEA.

AL'LEGHA'NIES. A mountain range of Pennsylvania, Maryland, West Virginia, Virginia, and North Carolina, lying west of the Blue and Blue Ridge ranges, and having the same direction, northeast to southwest (Map: United States, Eastern Part, K 3). Rich mines of coal and iron have been so highly developed as to make the adjoining regions the greatest in the world in coal mining and in the manufacture of iron and steel products. The term "Alleghanies" is sometimes incorrectly extended to include the whole Appalachian system, of which it is a part. See APPALACHIANS.

AL'LEGHE'NY. An important manufacturing city in Allegheny Co., Pa., on the north banks of the Allegheny and Ohio rivers, now consolidated with the city of Pittsburgh under one municipal government and making up the "North Side" of that city. Connected with the central part of Pittsburgh by eight large bridges, affording ample facilities for communication, even before political consolidation, the two cities have always formed one industrial and social community. Allegheny is the terminus of the Western Pennsylvania, the Pittsburgh and Western, and the Buffalo, Rochester and Pittsburgh railroads; and is on the Pittsburgh, Fort Wayne and Chicago, the Cleveland and Pittsburgh, the Pittsburgh and Erie, and the Pittsburgh and Newcastle railroads, all of which belong to the Western division of the Pennsylvania system. Electric railways connect with

towns in the northern portion of Allegheny County and in Butler and Lawrence counties. It has also a large river traffic. This portion of the city of Pittsburgh covers about 12 square miles, and its topography is decidedly hilly: the hills in the northern part of the city rising to a height of 700 feet above the river or about 1300 feet above sea level. In the central part of the city is a park of over 100 acres, while in the northern part is located Riverview Park of over 150 acres. In the parks the Soldiers', the Washington, the Humboldt, the Anderson, and other monuments are interesting features. The more important benevolent institutions are the Allegheny General, the Presbyterian, and the St. John's hospitals, the colored Orphan Home, the Pittsburgh and Allegheny Orphan Home, the Home of the Friendless, the Gusky Orphanage, the United Presbyterian Children's Home, and the St. Joseph's Orphan Asylum. The Western (State) Penitentiary is also located here. Allegheny is the seat of the Western Theological Seminary of the Presbyterian church, of the Allegheny Seminary of the United Presbyterian church, and of the Reformed Presbyterian Seminary. The Allegheny Observatory (the Astronomical Department of the University of Pittsburgh) is situated on a high hill in the northern part of the city, and in the central part the Carnegie Free Library of over 100,000 volumes occupies a block. The library building is the first erected by Mr. Carnegie on his well-known principles of municipal support.

The most important industrial establishments are the extensive iron and steel rolling mills, and car and locomotive works; there are also large pickling and preserving plants, and many factories of white lead, sanitary plumbing supplies, salt, leather, stoves, and ranges.

Allegheny was laid out in 1788, and the lots were sold in Philadelphia by the State government in order to provide funds to redeem Revolutionary scrip. It was incorporated as a borough in 1828 and in 1840 as a city. On July 4, 1874, occurred a disastrous fire in which 199 buildings were consumed or badly damaged, and three weeks later a flood destroyed much property and caused 124 deaths. The city's growth since 1870 has been remarkable. Pop., 1870, 53,180; 1910, 132,283. The consolidation with the city of Pittsburgh was effected in 1907. Consult: Cushing, *History of Allegheny County* (Chicago, 1889); Lambing and White, *Allegheny County: Its Early History and Subsequent Development* (Pittsburgh, 1888).

ALLEGHENY COL'LEGE. A college at Meadville, Pa., founded in 1815 as a Presbyterian institution. The first president, Rev. Timothy Alden, D.D., secured for the college the support of many prominent men, among them John Adams and Thomas Jefferson. The gifts of the libraries of James Winthrop and William Bentley also attracted attention to the institution. In 1833 the college was transferred to the patronage of the Methodist church under an agreement that guaranteed a liberal and non-sectarian management. Courses are offered in the arts and sciences, but the main emphasis has always been put upon non-technical cultural subjects. The buildings and the grounds are valued at \$580,000. The more important of the buildings are Bentley Hall, the library (38,000 volumes), Cochran Hall, and Ford Memorial Chapel. The endowment amounts to \$750,000. In 1912-13 the faculty numbered 23 and there were 407

students, of whom 162 were women. President, William H. Crawford, D.D., LL.D.

ALLEGHENY RIVER. A river of Pennsylvania and New York, rising in Potter Co., Pa., nearly 2000 feet above the sea, and uniting with the Monongahela at Pittsburgh to form the Ohio (Map: Pennsylvania, B 2). Although flowing through a hilly region, it is navigable for small boats for nearly 200 miles above Pittsburgh, whence, via the Ohio and Mississippi, navigation extends to the Gulf of Mexico. It is about 325 miles long and drains an area of 11,000 square miles.

ALLE'GIANCE (Lat. *ad*, to + OF. and Eng. *liege*, but the formation was influenced by Lat. *alligare*, to bind to, and also by *lex*, law). "Allegiance," says Blackstone, "is the tie, or *ligamen*, which binds the subject to the sovereign, in return for that protection which the sovereign affords the subject." Allegiance is the highest legal duty of the subject, and consequently its violation, treason (q.v.), is the highest legal offense. Allegiance is of three kinds: (1) Natural or implied allegiance is that which every native or naturalized citizen owes to the State to which he belongs and whose protection he enjoys. Independently of any express promise, every man, by availing himself of the benefits which an organized political society affords, comes under an implied obligation to defend it, and this equally whether the attack be from without or from within. This conception of allegiance as a political obligation, involved in the notion of citizenship, is comparatively modern, and has gradually supplanted the feudal conception of allegiance as a duty voluntarily assumed as an incident of the feudal tenure of land. (2) Express allegiance is that obligation which arises from an express promise or oath of allegiance. The old English oath of allegiance corresponded in the case of the sovereign, as lord paramount of all the lands in England, to the oath of fealty, which, by the feudal law, all freehold tenants were required to take to their landlords. As administered for upward of 600 years, it contained a promise "to be true and faithful to the king and his heirs, and truth and faith to bear of life and limb and terrene honor, and not to know or hear of any ill or damage intended him, without defending him therefrom."

With the substitution of the political for the feudal motive for allegiance and its consequent general obligation, the importance of the oath of allegiance has greatly diminished. It is commonly exacted of aliens acquiring naturalization, of persons lately in rebellion on resuming the status of citizens, and of public officers of all grades, and members of the bar. The form commonly employed in this country is a simple oath to support the Constitution of the United States and of the State of which the person taking the oath is a citizen. (See OATH.) (3) Local or temporary allegiance is that obedience and temporary aid due from an alien (q.v.) to the State or community in which he resides, by virtue of which he becomes subject to its laws, and liable for duty in the maintenance of social order.

It is but recently that the principal governments of Europe have come to recognize the right of persons voluntarily to change their allegiance as well as their residence, and such recognition is still grudging and imperfect. The United States has always held it to be a natural right, and our legislation so recognizes it. This

difference of view has sometimes brought our government into sharp diplomatic conflict with the States of Europe, especially in the effort to protect from military conscription former subjects of those States who had renounced their allegiance and become naturalized citizens of the United States. These efforts have generally proved successful, but the principle contended for by our government, though accepted (so far, at least, as the naturalization of their subjects in the United States is concerned) by England, France, Germany, and Austria-Hungary, is repudiated by Russia, Turkey, and some other States. This principle is plainly declared in the act of Congress relating to naturalization (q.v.), passed in July, 1868. The preamble states that the right of expatriation is natural and inherent in all people, and indispensable to the enjoyment of the rights to life, liberty, and the pursuit of happiness; that, recognizing this right, our government has received emigrants from all nations and given them citizenship and protection; that it is necessary for the maintenance of public peace that the claim of foreign allegiance as to such adopted citizens should be promptly and finally disavowed; and therefore it was enacted that any declaration, opinion, order, or decision of any officer of this government which denies, impairs, restricts, or questions the right of expatriation, is inconsistent with the fundamental principles of the government; that all naturalized citizens of the United States, while in foreign States, are entitled to, and shall receive from this government, the same protection of person and property that is accorded to native-born citizens in like circumstances. This broad declaration of rights and duties was followed in May, 1870, by the British Parliament in an act revising all British laws on alienage, expatriation, and naturalization—the government for the first time recognizing the right of subjects to renounce allegiance to the crown.

Allegiance of the population of a State or district is often transferred *en masse*, as an incident of territorial conquest or as the result of the cession of territory, as in the successive purchases of Louisiana from France, of Florida and the Philippine Islands from Spain, and of Alaska from Russia, as well as in the enforced cession to the United States of Texas and Porto Rico, and to Germany of Alsace-Lorraine as the result of successful war. The right of a State to claim the allegiance of the inhabitants of territory so acquired is undoubted, and it is only as a humane concession to the sentiment of loyalty of such a population that the right to choose between the old and the new allegiance is sometimes reserved by the treaty of cession. This permission has, in modern times, usually been granted, the inhabitants of the ceded territory being permitted to retain their nationality by withdrawing within a specified period from the ceded district.

In military usage allegiance is the oath demanded of officers and men to the sovereign or president, as supreme commander-in-chief of the army. In the German Empire the troops of Bavaria do not recognize the absolute control of the King of Prussia, except in time of war, when the full oath of allegiance and implicit obedience to the orders of the German Emperor is taken. Consult: Blackstone, *Commentaries on the Laws of England*, book i, chap. x; Pollock and Maitland, *History of English Law* (2d ed.,

Boston, 1899), vol. i, pp. 296–307, 458–467, vol. ii, pp. 502–511; Salmond, "Citizenship and Allegiance," in *Law Quarterly Review*, vol. xviii, Nos. 67, 69 (London, July, 1901, and January, 1902); Kent, *Commentaries on American Law*, vol. ii, section xxv. See also CITIZEN; SUBJECT.

ALLEGORY (Gk. ἀλληγορία, *allēgoria*, speaking otherwise, allegory, from ἄλλος, *allos*, other + ἀγορεύειν, *agoreuein*, to speak). The allegory as a literary manner is a narrative in which the incidents and the characters really refer to a complete and logical scheme of underlying thought. To be successful, the narrative must be not only interesting for itself, but also in perfect harmony with the veiled course of abstract reasoning. Such is Bunyan's *Pilgrim's Progress*, where, under the guise of a journey from the City of Destruction to the Celestial City, are portrayed the spiritual conflicts and the ultimate victory of the faithful Christian. Allegory, like other kindred figurative ways of speech, such as metaphor and personification, appears in all literatures. The Eastern people from the earliest times have been fond of it. Witness the beast fables which pass under the name of Pilpay, or Bidpai, where moral observations are enforced by tales about animals; also the comparison of Israel to a vine in the eightieth Psalm. The parables of Christ in the New Testament are essentially allegorical. (See PARABLE.) Though the Greeks had the allegorical habit earlier, the first definite mention of an allegory among them occurs in Plato's *Phædrus*. In this dialogue Socrates remarks on the tendency toward the rationalistic explanation of myths. This and other dialogues of Plato contain very beautiful allegories, among which may be cited the comparison of the soul to a charioteer drawn by two horses, one white and the other black. For Latin literature may be mentioned the story of Cupid and Psyche (which, though Greek in origin, survives only in the *Golden Ass* of Apuleius), Vergil's well-known description of Fame in the fourth book of the *Æneid*, and Ovid's splendid picture of the abode of that goddess in the twelfth book of the *Metamorphoses*. To a later time belongs Boëthius's *De Consolatione Philosophiæ* (sixth century A.D.), which was one of the widest-read books in the Middle Ages. The most flourishing period for the allegory in western Europe was from 1300 to 1600. In the long list of works are Dante's *Divine Comedy*, *The Romance of the Rose*, Langland's *Piers Plowman*, Chaucer's *House of Fame*, the writings of a whole school of Scotch poets, Hawes's *Pastime of Pleasure*, Barclay's *Ship of Fools*, Spenser's *Faerie Queene*, Swift's *Tale of a Tub*; and Addison's *Vision of Mirza*. Obvious allegory has now gone out of fashion, but we have in its place a vaguer symbolism, as in Tennyson's *Idylls of the King*.

The form of allegory thus defined and illustrated is often called moral or spiritual, to distinguish it from the historical allegory; i.e., the representation of historical characters under fictitious names. Thus, Lucifera in the *Faerie Queene* stands not only for pride, but also for Mary, Queen of Scots. The historical allegory became in the seventeenth century a favorite device of romancers, who described contemporary events in the terms of recent history. Of this style, an admirable example is Madame de Lafayette's *Princesse de Clèves*. Moreover, allegory is not confined to literature; it appears equally in painting and sometimes in sculpture.

Allegorical Interpretation. That kind of interpretation whereby the literal meaning of a passage or work is set aside for a more spiritual and profound import. St. Paul allegorizes when he interprets the history of the free-born Isaac and the slave-born Ishmael (Gal. iv. 24). At Alexandria, where met the Greek and the Jew, allegorical interpretation of the Old Testament was practiced as a critical method. Philo Judæus (20 B.C.), for example, applied the principles of Plato's philosophy to Hebrew theology. He was followed by many Christian theologians, the most famous of whom were Clement of Alexandria and Origen. The latter went so far as to say that "the Scriptures are of little use to those who understand them as they are written." As a specimen of his procedure may be taken his interpretation of the Mosaic account of the Garden of Eden. According to him, Paradise symbolized a high primeval spirituality; the Fall consisted in the loss of this state through spiritual and not material temptation; and the expulsion from the Garden lay in the soul's being driven out of its region of original purity. This allegorical method also gained foothold among the critics of Greek literature. Porphyry (died c.305), for example, explained the grotto of the nymphs in Homer's *Odyssey* (book xiii) as an allegory of the world. In a sense, the so-called "metaphysical interpretations" of Christian Science are allegorical. For a succinct account of the progress of allegory with special reference to English literature, consult W. J. Courthope, *A History of English Poetry* (London, 1895).

AL'LEGRET'TO. A musical term denoting a time faster than *andante* (q.v.) and slower than *allegro* (q.v.). However, much confusion has resulted from the fact that eminent composers of the last century were not agreed as to the exact character of the tempo. Even Beethoven uses the designation sometimes for fast, sometimes for slow movements. In both the Seventh and Eighth symphonies the *allegretto* movements are slow, equivalent to *andante* and *andante con moto* respectively, whereas in the famous sonata op. 27, No. 2 (Moonlight) the same term is used to denote the *scherzo* and is equivalent to a fast *allegro*. Modern composers generally employ the term in its correct signification.

ALLEGRI, ăl-lă'grê, ANTONIO. See CORREGGIO.

ALLEGRI, GREGORIO (1584-1652). An Italian composer. He was born in Rome, probably of the Correggio family. He studied under Nanini and was a friend of Palestrina. Appointed to the choir of the Sistine Chapel, Rome, by Urban VIII, he retained the position until his death. He was one of the earliest composers for stringed instruments. His most celebrated work, however, is the *Miserere*, for two choirs (of four and five parts), still annually rendered in the Sistine Chapel on Good Friday. Mozart, at the age of 14, performed the wonderful feat of writing the entire work from memory after having heard it but twice. Allegri is regarded as a link between the Roman and Neapolitan periods of Italian music.

ALLEGRO, ăl-lă'grô (It. from Lat. *alacer*, alacritous, lively). One of the five principal tempos (q.v.) in music, implying that the piece is to be performed in a quick or lively style. *Allegro*, like all the other degrees of movement, is often modified by other terms, such as *allegro non tanto*, *allegro ma non troppo*, *allegro mode-*

rato, *maestoso*, *giusto*, *commodo*, *vivace*, *assai*, *di molto*, *con brio*, etc. As a substantive, *allegro* is used as the name of a whole piece of music, or a movement, generally the first, of a symphony, sonata, or quartet.

ALLEINE, ăl'en, JOSEPH (1634-68). An English nonconformist divine, author of *An Alarm to the Unconverted*. He was born at Devizes, 86 miles west of London, was educated in Corpus Christi College, Oxford, and became a tutor there (1653). He was offered a political place, which he declined, but gladly took the office of assistant to George Newton, rector of the church of St. Mary Magdalene, Taunton (1654). About this time he married Theodosia, daughter of Richard Alleine. He was not only constant in religious work, but deeply learned in various sciences, and on intimate terms with the patriarchs of the Royal Society. When the persecution of nonconformists came, he and his senior pastor were ejected, and Alleine became an itinerant preacher of the Gospel wherever he could find opportunity. For this he was imprisoned, but released in May, 1664; yet in spite of the Conventicle Act or Five-mile Act, he pursued his work and was again imprisoned. His later years were full of persecution and suffering. No Puritan nonconformist name is more affectionately cherished than his. He died at Taunton, Nov. 17, 1668. For his life, consult Stanford (London, 1861).

AL'LEINE, or **ALLEIN**, RICHARD (1611-81). An English writer and theologian, author of *Vindiciæ Pietatis*, or *A Vindication of Godliness* (London, 1663). He was born at Ditchat, Somersetshire; educated at Oxford; became assistant in the ministry to his father, Richard Alleine, and was noted for his eloquence. He declared for the Puritans, but continued for 20 years (1641-62) rector of Batcombe in Somerset. On the passage of the Act of Uniformity he went with the ejected, and, after the Five-mile Act, preached where he could find occasion. His *Vindication of Godliness* was refused license, and Roger Norton, the King's printer, caused a large part of the first edition to be seized and sent to the royal kitchen for kindling; but, on reading it, he brought back the sheets and sold the work from his own shop, for which he had to beg pardon on his knees at the council table. Alleine died at Frome Selwood, Dec. 22, 1681.

ALLEMAINE, ăl-măn'. An old name for Germany (cf. Fr. *Allemagne*). See ALEMANNI.

ALLEMANDE, ăl'lê-mând' (Fr. feminine of *allemand*, German). A French dance, said to have been invented in the time of Louis XIV, which again became popular at the Parisian theatres during the reign of Napoleon I. It has the tempo of a slow waltz and consists of three steps (*pas marchés*) made in a sliding manner, backward and forward, but seldom waltzing or turning round. The whole charm of the dance lies in the graceful manner of entwining and detaching the arms in the different steps. In England it was called *Almain*, and is mentioned in Ben Jonson's play, *The Devil is an Ass*, acted in 1610, which proves it of earlier origin. The name has also reference to a German dance of Swabia, of which Beethoven's 12 *Deutsche Tänze* for orchestra are specimens. The *Allemande* is also the name of a movement in the *Suite* (q.v.), having no relation to the dance of the same name. It usually consists of a figurative melody which has a simple accompaniment.

AL'LEMAN'NI. See ALEMANNI.

ALLEN, ALEXANDER VIETS GRISWOLD, D.D. (1841-1908). A Protestant Episcopal theologian, born at Otis, Mass. He graduated at Kenyon College in 1862 and at Andover Theological Seminary in 1865. In 1867 he became professor of church history in the Episcopal Theological School at Cambridge, Mass. His publications include *Continuity of Christian Thought* (Boston, 1884; 11th ed., 1895), *Life of Jonathan Edwards* (1889), *Religious Progress* (1894), *Christian Institutions* (New York, 1897), *Life and Letters of Phillips Brooks* (2 vols., 1901). For his life consult C. Slattery (New York, 1911).

ALLEN, ANDREW HUSSEY (1855—). An American archivist and author, born in New York City. He graduated from Harvard in 1878, studied law, and was admitted to the bar, but never engaged in practice. From 1882 to 1885 he was disbursing agent of the court of commissioners of the Alabama claims. While serving in the United States Department of State as Chief of the Bureau of Rolls and Library from 1892 to 1905 he inaugurated (1893) the *Bulletin of Rolls and Library* as a medium for the publication of catalogues, indexes, and important papers of the national archives. This he edited to its conclusion in 1905. His published writings include: *Official Relations of the United States with the Hawaiian Islands from the First Appointment of a Consular Office there by the United States Government* (1893); *Method of Recognition of Foreign Governments and Foreign States by the Government of the United States*, (1897). He edited vols. i-iv of the *Documentary History of the Constitution of the United States* (1894-1905).

ALLEN, ARABELLA. A character in Dickens's *Pickwick Papers*. She becomes Mrs. Nathaniel Winkle.

ALLEN, CHARLES, LL.D. (1827-1913). An American jurist, born in Greenfield, Mass. He graduated from Harvard in 1847, studied law, and was admitted to the bar in 1850. For the next 12 years he practiced his profession in his native town. In 1861 he became Reporter of Decisions for the Supreme Judicial Court of Massachusetts, and soon after removed to Boston; from 1867 to 1872 he was Attorney-General of the State; and in 1881 was chairman of the commission to revise the statutes of Massachusetts. During his 16 years of service (1882-98) on the bench of the Supreme Judicial Court of the State, he became known as one of the most eminent jurists of his day. Among his legal writings are *Allen's Massachusetts Reports* (14 vols., 1861-69), and *Telegraph Cases* (1873). He also published *Notes on the Bacon-Shakespeare Question* (1900).

ALLEN, CHARLES GRANT BLAIRFINDIE (1848-99). An English author, better known as Grant Allen. He was born in Kingston, Canada, of Irish descent, and was educated at Merton College, Oxford, where he graduated in 1871. He then spent a few years as principal of a colonial college in Jamaica. He is best known by his popular scientific works, his expositions of the theory of evolution being particularly clear and readable. He spent most of his life in London, where he died. Among his scientific books are: *Physiological Æsthetics* (1877), probably his best work; *The Color Sense* (1879); *The Evolutionist at Large* (1881); *Vignettes from Nature* (1881); *Colin Clout's Calendar* (1883); *Flowers and their Pedigrees* (1884); *The Story of the Plants* (1895), and *Evolution of the Idea of God*

(1897). He also wrote a life of Charles Darwin (1885) and about 30 novels, among them: *Philistia* (1884); *The Devil's Die* (1888); *A Bride from the Desert* (1896); *The Woman Who Did* (1895), which excited much notice and comment when it appeared because of the author's bold treatment of the sex problem. Historical studies also attracted him, and he published *Anglo-Saxon Britain* (1881) and a series of historical guide books to Paris, Florence, and Belgium.

ALLEN, CHARLES HERBERT (1848—). An American politician and banker. He was born at Lowell, Mass., graduated in 1869 at Amherst College, and for a time was in the lumber industry at Lowell. In 1881-82 he served in the Lower House of the Massachusetts State Legislature and in 1883 in the State Senate. He was subsequently elected to the Forty-ninth and Fiftieth (1885-89) congresses. In 1898 he succeeded Theodore Roosevelt as Assistant Secretary of the Navy, and in 1900-01 was the first civil Governor of Porto Rico. In 1902 he retired from public life and became associated with banking and insurance interests in New York City. He was elected president of the American Sugar Refining Co. in 1913.

ALLEN, DAVID OLIVER (1800-63). An American missionary, born at Barre, Mass. He graduated in 1823 at Amherst College, studied at Andover Theological Seminary, and in 1827 went to Bombay as a missionary. He traveled widely in western India, established schools, directed a new translation of the Bible into Mahratta, and in 1853 returned, much broken in health, to America. His *History of India* was published at Boston in 1856.

ALLEN, EBENEZER (1743-1806). An American soldier. He was born in Northampton, Mass., and removed to Vermont in 1771. He became a Lieutenant in a company of Green Mountain Boys, was with Ethan Allen at Ticonderoga and with Colonel Warner in Canada, and during the Revolution served first as Captain in and then as Major of a battalion of New Hampshire rangers. He was conspicuous for gallantry at the battle of Bennington, and in September, 1777, forced the evacuation of Ticonderoga by his capture of Mount Defiance. For the next two years he commanded Fort Vergennes, part of this time serving also on the Board of War, and in 1780 he helped Governor Clinton of New York to intercept Sir John Johnson's raid from Canada. He was prominent in the planning of a new government for Vermont, helping to frame its constitution.

ALLEN, EDWARD PATRICK (1853—). A Roman Catholic bishop of Mobile, Ala., appointed in 1897. He was born at Lowell, Mass., and after completing a theological course at Mount St. Mary's College, Emmitsburg, Md., was ordained a priest in 1881. Afterward he held a professorship at Mount St. Mary's and was its president from 1884 until he was consecrated bishop by Cardinal Gibbons. During his administration he relieved the college of its heavy indebtedness, increased its equipment, and enlarged its faculty.

ALLEN, ELISHA HUNT (1804-83). An American diplomat and Hawaiian justice, born at New Salem, Mass. He graduated at Williams College, was called to the Massachusetts bar, and was a member of the State Legislature of Maine from 1836 to 1841 and in 1846. Between these periods he was a member of Congress. In 1849

he was elected to the Massachusetts Legislature and from 1852 to 1856 was United States Consul at Honolulu, Hawaii. In 1857-76 he was Chancellor and Chief Justice of the Hawaiian Islands and after that time was Minister of the Hawaiian Islands to the United States. He was dean of the diplomatic corps in Washington at the time of his death.

ALLEN, ELIZABETH CHASE AKERS (1832-1911). An American author, born at Strong, Me. Her verses, entitled "Rock Me to Sleep, Mother" (1859), became widely known and were frequently set to music. Mrs. Allen began to write under the pen-name Florence Percy. Among her works, which include both prose and poetry, are: *Poems* (1866-69); *Queen Catharine's Rose* (1885); *The Silver Bridge* (1885); *Two Saints* (1888); *The Proud Lady of Stavoren* (1897); *The Ballad of the Bronx* (1901), and *The Sunset Song* (1902). She was married first to Paul Akers (q.v.), the sculptor, who died in 1861, and second to E. M. Allen of New York.

ALLEN, ETHAN (1737-89). An American soldier. He was born at Litchfield, Conn., and about 1769 removed to Vermont, settling first at Bennington, where he became conspicuous in the contest between New Hampshire and New York for jurisdiction over the "New Hampshire Grants," now Vermont. He represented his fellow settlers in a suit at Albany in 1771, but, their claims being disregarded, he organized a force of Green Mountain Boys for the eviction of New York settlers. Governor Tryon, of New York, thereupon declared him an outlaw and offered £150 for his arrest. At the outbreak of the Revolution Allen and his associates offered their services to the patriot party and organized an expedition against Ticonderoga (q.v.). On the morning of May 10, 1775, he surprised the garrison and forced its commander to surrender "in the name of the great Jehovah and the Continental Congress." Allen soon afterward joined General Schuyler's army, was employed in secret missions to Canada, and rendered valuable aid in Montgomery's expedition. He was taken prisoner, Sept. 25, 1775, near Montreal, and was sent to England. Some months later he was sent back to this country and was kept as a prisoner in Halifax and New York until May 3, 1778, when he was exchanged. After his release he returned to Vermont, was brevetted Lieutenant-Colonel by the Continental Congress and became Brigadier-General of Vermont militia, though he devoted his attention chiefly to the old territorial dispute, and incidentally carried on a correspondence with Governor Haldimand of Canada, upon which a charge of treason was subsequently based. No satisfactory explanation has ever been given of his conduct, but the charge of treason is at least not fully substantiated. He moved to Burlington in 1787 and died there two years later. Though a blusterer, he was as full of action as he was of talk and had very great ability as a leader both in politics and in war. He wrote a *Narrative of Colonel Ethan Allen's Captivity* (1779), which went into numerous editions; a *Vindication of the Opposition of Vermont to the Government of New York* (1779), and *Reason the Only Oracle of Man, or A Compendious System of Natural Religion* (1784). Consult Henry Hall, *Ethan Allen* (New York, 1892), and Sparks, *Ethan Allen* (Boston, 1834).

ALLEN, FRED HOVEY (1845-). An American Congregational clergyman and author. Born

at Lyme, N. H., he graduated at the Hartford Theological Seminary, studied at Boston University and the universities of Berlin, Vienna, and Paris, and held pastorates in Boston, Wollaston, Abington, and Rockland. He founded and for some time edited the Lawrence (Mass.) *Eagle*, but is best known as the inventor of the first photogravure plates for art reproduction made in America. His writings include: *Masterpieces of Modern German Art* (1884); *Recent German Art* (1885); *Grand Modern Paintings* (1888).

ALLEN, FREDERIC DE FOREST (1844-97). An American classical scholar. He was born at Oberlin, Ohio, and graduated at Oberlin College in 1863. He was at Leipzig in 1868-70, and took his Ph.D. there with his thesis *De Dialecto Loerensium*, which is still an important monograph. Following his foreign study he was professor of foreign languages successively in the University of East Tennessee, the University of Cincinnati, and Yale College; for the last 17 years of his life he held the chair of classical philology at Harvard. In 1881-82 he was president of the American Philological Association, and in 1885-86 director of the American School of Classical Studies at Athens. In addition to numerous articles in classical journals he published an edition of the *Medea of Euripides* (4th ed., 1901); *Remnants of Early Latin* (1880); a revision of Hadley's *Greek Grammar* (2d ed., 1886); *Greek Versification in Inscriptions* (1888); *Æschylus: The Prometheus Bound and the Fragments of the Prometheus Unbound* (1897). His *Posthumous Papers* were published in the *Harvard Studies in Classical Philology*, vol. ix (Boston, 1898). In the same volume will be found a memoir of Mr. Allen, with a list of his books, by James Bradstreet Greenough.

ALLEN, GRANT. See ALLEN, CHARLES GRANT BLAIRFINDIE.

ALLEN, HARRISON (1841-97). An American physician and anatomist. He was born in Philadelphia and graduated in medicine at the University of Pennsylvania in 1861. In 1862 he became a surgeon in the United States army and served until the conclusion of the Civil War. In 1865 he was made professor of comparative anatomy and medical zoölogy at the University of Pennsylvania and was transferred in 1878 to the chair of physiology, which he occupied until 1895. Dr. Allen was professor of anatomy and surgery at the Philadelphia Dental College and surgeon to the Philadelphia Hospital. He was president of the American Laryngological Society in 1886 and of the American Anatomical Society from 1891 to 1893. In addition to many papers contributed to medical journals, he was the author of *Outlines of Comparative Anatomy and Medical Zoölogy* (1867), *Studies in the Facial Region* (1874), *An Analysis of the Life Form in Art* (1875), and *System of Human Anatomy* (1880).

ALLEN, HENRY (1748-84). An American religious enthusiast. He was born at Newport, R. I., but afterward settled in Nova Scotia, where he taught that the souls of all men are emanations from the same Spirit, that they were present with our first parents in Eden, that Adam and Eve in innocency were pure spirits without material bodies, that there will be no resurrection of the body, that men are not bound to obey the ordinances of the Gospel, and that the Scriptures are not to be interpreted literally, but in a spiritual sense. He published a volume of hymns and several treatises and sermons.

Though he made many converts to his religious ideas, the Allenites dwindled after his death.

ALLEN, HENRY WATKINS (1820-66). An American soldier and politician. He was born in Prince Edward Co., Va.; educated at Marion College, Mo.; taught school and practiced law in Mississippi. In 1842 he raised a company and served in the Texan war against Mexico. He was subsequently a member of the State Legislature of Mississippi and later of Louisiana. After studying law at Harvard and traveling in Europe, he entered the Confederate service in 1861 as Lieutenant-Colonel. He was wounded at Baton Rouge and at Shiloh, became a Brigadier-General in 1864, and in the same year was elected Governor of Louisiana, in which capacity he rendered valuable services to the Confederate government. After the war he removed to the City of Mexico, edited the *Mexican Times*, wrote *Travels of a Sugar Planter*, and assisted in the opening of trade between Texas and Mexico.

ALLEN, HORACE NEWTON (1858—). An American diplomatist and missionary. He was born in Delaware, Ohio, graduated in the Ohio Wesleyan University, studied medicine, and went as medical missionary (Presbyterian) to China. In 1884, at the time of the coup d'état of Kim Ok Kiun, he was at Seoul, Korea, and saved the life of a relative of Queen Ming. He was made court physician, and established a hospital under government control. When the first Korean legation went to Washington in 1888, he acted as interpreter and secretary. Returning to Korea in 1890, he soon became noted for his knowledge of Korean affairs and in 1901 was made United States Minister Plenipotentiary to the Korean Empire. Publications: *Korean Tales* (1889); *A Chronological Index of the Foreign Relations of Korea from the Beginning of the Christian Era to the Twentieth Century* (1900); *Supplement* (1903); *Korea: Fact and Fancy* (Seoul, 1904); *Things Korean* (Seoul, 1908).

ALLEN, HORATIO, LL.D. (1802-89). An American civil engineer. He was born at Schenectady, N. Y., graduated in 1823 at Columbia, and in 1826 was appointed resident engineer of the summit level of the Delaware and Hudson Canal, after serving for two years in a similar position on the Chesapeake and Ohio Canal. He was sent to England in 1828 to buy locomotives for the canal company's projected railway, made the acquaintance of George Stephenson, and in 1829, at Honesdale, Pa., the initial point of the railway, operated the "Stourbridge Lion" in the first trip made by a locomotive on this continent. From 1829 to 1834 he was the chief engineer of the South Carolina Railway, at that time the longest railway in the world (about 150 miles), and from 1838 to 1842 was principal assistant engineer of the Croton aqueduct for supplying water to New York City. He was at various times chief engineer and president of the Erie Railway, and consulting engineer for the Panama Railway and the Brooklyn Bridge. In 1842 he became connected with the New York Novelty Works, which furnished engines for nearly all the American and many foreign war vessels and steamships of the time. In 1872 and 1873 he was president of the American Society of Civil Engineers. He was the inventor of the so-called "swiveling truck" for railway cars. *The Railroad Era: First Five Years of its Development* (1884) was written by him. Consult M. N. Forney, *Memoir of Horatio Allen* (reprinted from the *Railroad and Engineering Journal*).

ALLEN, IRA (1751-1814). One of the founders of Vermont. He was born in Cornwall, Conn., and in 1772 removed to Vermont, where he served as a Lieutenant under his brother Ethan, and took an active part in the boundary dispute between New York and New Hampshire. As Lieutenant in Colonel Warner's regiment, and close associate of General Montgomery, he served in the Revolution. He was a member of the Vermont Legislature (1776-77) and of the State Constitutional Convention (1778) and in 1780-81 was a Commissioner to Congress. At various times he was a member of the Vermont Council; secretary and treasurer, and a member of the Board of War during the Revolution. The number of offices which he held finally provoked hostility. In 1789 he presented to the Legislature a memorial for the establishment of the University of Vermont, together with a subscription list of £5643, £4000 of which, plus a fifty-acre site at Burlington, he contributed. He was called the "Metternich of Vermont" and the "Father of the University of Vermont." He went to France in 1795 and bought 20,000 muskets and 24 cannon, intending to sell them to Vermont; but he was captured at sea and taken to England on a charge of furnishing arms to Irish rebels. He was acquitted after a lawsuit that lasted eight years. He published *The Natural and Political History of Vermont* (London, 1798; *Vermont Historical Society Collections*, 1870) and *Statements Appended to the Olive Branch* (1807); "Miscellaneous Remarks on the Proceedings of the State of New York vs. the State of Vermont," in *Vermont Historical Society Collections* (Montpelier, 1870).

ALLEN, JAMES LANE (1849—). An American novelist and writer of short stories, born at Lexington, Ky. He was educated privately and at Transylvania University, and subsequently taught for a time in the University of his native State. During early years of bitter poverty he had snatched leisure for some writing, but it was not until 1886 that he found himself sufficiently established as a contributor to magazines to be able to devote himself solely to literary work. He then took up his residence in New York. The background of his fiction is almost always Kentucky—for that State he has done what Thomas Nelson Page has done for Virginia and George W. Cable for Louisiana. Both in rendering incomparably the prodigal beauty of his homeland, and in portraying the vanished or vanishing social types of pioneer or ante-bellum days—Mr. Allen is a rare artist. But he is a psychologist and moralist as well; like Hawthorne, it is the problem of the human soul that most concerns him. His best work is included in the following list: *Flute and Violin* (1891); *The Blue Grass Region, and Other Sketches* (1892); *John Gray: a Novel* (1893); *The Kentucky Cardinal* (1895); *Aftermath* (1896); *A Summer in Arcady* (1896); *The Choir Invisible* (a rewriting of *John Gray*, 1897); *The Reign of Law* (1900); *The Mettle of the Pasture* (1903); *The Bride of the Mistletoe* (1909); *The Doctor's Christmas Eve* (1910); and *The Heroine in Bronze* (1912). Consult for biographical facts *Book News Monthly*, vol. xxiv, p. 753; for a consideration of Mr. Allen as an interpreter of Kentucky life, H. A. Toulmin, in *Social Historians* (Boston, 1911).

ALLEN, JEROME (1830-94). An American educator and author. He was born at Westminster, Vt., and graduated at Amherst College

in 1851. He presided over several educational institutions in the West from 1851 to 1885 and was professor of pedagogy at the University of New York from 1887 to 1893. To his efforts more than to any other agency was due the founding of the New York School of Pedagogy, of which he became dean in 1889. Professor Allen's publications include a *Handbook of Experimental Chemistry* (1876); *Short Studies in English* (1886-87); *Mind Studies for Young Teachers* (7th ed., 1887); and *Temperament in Education* (1890). For many years he edited Barnes's *Educational Monthly* and *School Journal*.

ALLEN, JOEL ASAPH (1838—). An American naturalist. He was born at Springfield, Mass., July 19, 1838. Between 1865 and 1869, and again in 1873, he took part in various scientific expeditions to Brazil and Florida and to the Rocky Mountains, gathering material and contributing studies of it to scientific periodicals, especially the *Proceedings of the Boston Society of Natural History*. In 1870 he became an assistant in the Museum of Comparative Zoölogy at Harvard University and later its curator of birds and mammals. In 1886 he was appointed to a similar office in the American Museum of Natural History in New York. He was one of the founders and early presidents of the American Ornithologists' Union and the editor of its quarterly publication, *The Auk*, from 1884 to 1912. He was one of the early members of the National Academy. Dr. Allen won rank as one of the foremost systemists of American mammals and birds, in which work he made minute subdivisions. He also made fruitful researches into the principles of geographical distribution, and those governing climatic and seasonal variation in color, size, and other details. In addition to a great number of scientific papers, he is author of *Mammals and Winter Birds of Eastern Florida* (1871); *The American Bisons* (1876); *Monographs of North American Rodentia* (with E. Coues, 1877); *History of North American Pinnipedia* (1880); *Mammals of Patagonia* (1905); *The Influence of Physical Conditions in the Genesis of Species* (1905), and *Ontogenetic and Other Variations in Musk-Oxen* (1913).

ALLEN, JOSEPH HENRY (1820-98). A Unitarian scholar. He was born at Northborough, Mass., Aug. 21, 1820; graduated at Harvard College, 1840, and at the Divinity School in 1843. He was pastor at different places; editor of *The Christian Examiner*, 1857-69; lecturer upon ecclesiastical history in Harvard University, 1878-82; joint editor (with J. B. Greenough) of a series of classical text-books; author of *Hebrew Men and Times* [to the Christian era] (Boston, 1861); *Christian History in its Three Great Periods: (1) Early Christianity, (2) The Middle Age, (3) Modern Phases* (3 vols., 1882-83); *Our Liberal Movement in Theology, chiefly as Shown in Recollections of the History of Unitarianism in New England* (1882); *Historical Sketch of the Unitarian Movement since the Reformation* (New York, 1894). His works show independent study and acquaintance with sources, and his denominational histories rest upon personal acquaintance with leaders. He died in Cambridge, Mass., March 29, 1898.

ALLEN, KARL FERDINAND (1811-71). A Danish historian, born at Copenhagen. He studied at the university there, and in 1845 to

1848 made examinations of various European archives. He was appointed an instructor and titular professor at Copenhagen in 1851 and professor of history and northern archæology in 1862. His principal work is his *De Tre Nordiske Rigers Historie, 1497-1536* ('The History of the Three Northern Kingdoms,' 5 vols., 1864-72), one of the most important contributions to the history of northern Europe.

ALLEN, RICHARD (1760-1831). A colored Methodist preacher. He was born in slavery, but bought his freedom and afterward acquired considerable wealth. He became a local Methodist preacher in 1782 and organized the first church for colored people in the United States, in Philadelphia, in 1793. He was the first colored minister ordained by Bishop Asbury (1799), and was elected a bishop of the African Methodist Episcopal Church on its formation in 1816. He died in Philadelphia.

ALLEN, ROBERT (1815-86). An American soldier. He was born in Ohio, graduated at West Point in 1836, served with distinction in the second Seminole War and in the Mexican War, and was subsequently Chief Quartermaster of the Pacific Division until 1861, when he became Quartermaster of the Department of Missouri. In this capacity, and afterward (1863-66), as Chief Quartermaster of the Missouri Valley, he rendered valuable services to the Federal armies in the West, and by successive promotions became Brevet Major-General in 1865. After the war he was again Chief Quartermaster of the Pacific Division until retired in 1878.

ALLEN, THOMAS (1849—). An American landscape and animal painter. He was born at St. Louis, Mo., studied long at the Düsseldorf Academy and with Ecoen in Paris. After a sojourn of 10 years abroad, he opened a studio in Boston. He became a member of the Society of American Artists (1880) and an associate member of the National Academy of Design (1884) and was one of the international board of judges at the Chicago Exposition in 1893 and president of the International Jury at St. Louis in 1909. In 1910 he became chairman of the Art Commission of the City of Boston. His most successful works are landscape and animal subjects, and include "O'er All the Hilltops is Rest," "Maplehurst at Noon," and "Toilers of the Plain." Although he keeps pace with modern technical achievements, Allen, in his reserved and harmonious art, represents conservative tendencies in American painting.

ALLEN, VIOLA (1869—). An American actress, born in Alabama, Oct. 27, 1869, daughter of C. Leslie Allen, an actor of great repute. She appeared on the stage when 15 years old, in *Esmeralda*, at the Madison Square Theatre, New York (1882), and later played in the company of John McCullough and with Tommaso Salvini, Lawrence Barrett, Joseph Jefferson, and W. J. Florence. In 1893 she joined the Empire Stock Company and appeared in *The Masqueraders* and *Under the Red Robe*. In 1898 she made a wide reputation in Hall Caine's dramatized novel *The Christian* and subsequently starred in *In the Palace of the King* (1900), by F. Marion Crawford and Lorimer Stoddard, *Twelfth Night*, *A Winter's Tale*, *As You Like It*, *The Lady of Coventry* (1911), etc. Consult L. C. Strang, *Famous Actresses of the Day in America* (Boston, 1899), and J. B. Clapp and E. F. Edgett, *Players of the Present* (New York, 1899).

ALLEN, WILLIAM (1532-94). An English Cardinal. Born at Rossall, he studied in Oriel College, Oxford, and became principal of St. Mary's Hall in 1556. He opposed the Reformation and after Elizabeth's accession he went to Louvain (1561). He returned to England (1562), but his proselytizing zeal made another flight necessary, and he went to Holland (1565) and never revisited England. He was ordained priest at Mechlin, was more prominent in organizing in the University of Douai (1568), a college for English Roman Catholics, whence he sent Jesuit priests to his native land, the aim of his life being to restore papal supremacy in England. In 1570 he became regius professor of divinity, in 1587 a Cardinal; in 1589 he was offered the archbishopric of Malines, but declined the honor. He died at Rome, Oct. 16, 1594. He made vigorous efforts to check the progress of the Protestant Reformation in England and engaged in polemical writing. Several violent libels of the time are attributed to his pen, but his authorship of these has been disputed. Among the Jesuit priests he sent to England was the celebrated Father Campion, put to death by Elizabeth. He published 10 volumes, among them *Certain Brief Reasons Concerning Catholic Faith* (1564), and aided in revising the English translation of the Bible known as the Douai Bible. Consult his *Letters and Memorials*, with introduction by T. F. Knox (London, 1882).

ALLEN, WILLIAM (1770-1843). An English philanthropist. He was lecturer on chemistry in Guy's Hospital, fellow of the Royal Society, and one of the founders of the Pharmaceutical Society. Jointly with Samuel Pepys he established the chemical composition of carbonic acid. He belonged to Sir Humphry Davy's circle of friends, and at his request he lectured on physics at the Royal Institution. He was a prominent member of the Society of Friends and bore an active part in the philanthropic movements of his time. Wilberforce and Clarkson were his intimate friends, and he shared in the anti-slavery agitation. He was an active supporter of Lancaster and Bell in their educational movement, championing their side of the controversy in his journal, *The Philanthropist* (1811-17); and he was associated with Robert Owen in his schemes for social improvement. He also founded industrial schools and advocated the abolition of capital punishment. He contributed papers to the *Philosophical Transactions*. Consult *Life of William Allen, with Selections from His Correspondence* (2 vols., Phila., 1847).

ALLEN, WILLIAM (1784-1868). An American educator and author. He was born at Pittsfield, Mass.; graduated at Harvard in 1802, and after a few years spent in pastoral work became assistant librarian at Harvard. There he prepared his *American Biographical and Historical Dictionary* (1809), the first work of general biography published in the United States. The third edition (1857) has notices of nearly 7000 Americans, while the first has only 700. He contributed to a new edition of Webster's Dictionary 10,000 words not before given. In 1810 he became his father's successor in the pulpit in Pittsfield. In 1817 he was elected president of Dartmouth College, and from 1820 to 1839 (with a short interim) he was president of Bowdoin College. Allen's memoir was published in 1847.

ALLEN, WILLIAM (1806-79). An American

statesman. He was born in North Carolina, but at an early age went to Ohio, where he practiced law. He was elected to Congress in 1832 by the Democrats, but was defeated on a second trial. He was twice elected to the United States Senate and served from 1837 to 1849. In 1848 he was offered the nomination for President, but declined it on the ground that he was pledged to Gen. Lewis Cass. In 1873 he was elected Governor of Ohio. Two years afterward he was a candidate for reelection, but as he made his canvass on the greenback issue, of which cause he had become the foremost advocate, he was defeated by R. B. Hayes. He is said to be the author of the famous alliterative slogan of the campaign of 1844, "Fifty-four forty, or fight," and while in the Senate, because of speeches he made, was variously known as "Earthquake Allen," "Petticoat Allen," and "The Ohio Gong." Consult Howard Carroll, *Twelve Americans* (1883).

ALLEN, WILLIAM FRANCIS (1830-89). An American educator and historian, joint editor of Allen and Greenough's series of school books. He was born at Northborough, Mass., and graduated at Harvard in 1851. He studied history and antiquities in Germany and Italy for two years and afterward became professor of Latin and Roman history at the University of Wisconsin, where he held a chair from 1867 until his death. In addition to his text-books, he published many works of standard merit, including *Outline Studies in the History of Ireland* (1887). A memorial volume of his *Essays and Monographs* was published in 1890, containing a sketch of his life.

ALLEN, WILLIAM HENRY (1784-1813). An American naval officer. He was born in Providence, R. I., and entered the navy in 1800. In 1807 he was Third Lieutenant of the *Chesapeake* when she was captured by the *Leopard*, and was a Lieutenant on the frigate *United States* in the action with the *Macedonian*, Oct. 25, 1812, in which the latter was captured. Afterward he commanded the brig *Argus*, cruising off England in 1813. After having captured \$2,000,000 worth of property, he encountered the British brig *Pelican*, August 14, and lost his own vessel, dying the next day of wounds received in the fight.

ALLEN, WILLIAM HENRY, LL.D. (1808-82). An American educator. He was born at Manchester, Me., and graduated at Bowdoin College in 1833. He was instructor in Latin and Greek at Cazenovia (N. Y.) Seminary from 1833 to 1836; professor of natural philosophy and chemistry in Dickinson College, 1836-46; of philosophy and English literature there from 1846 to 1849, acting as president for two years; president of Girard College, Philadelphia, 1850-62 and 1867-82. Between his two terms at Girard he served as president of the Pennsylvania State Agricultural College. In 1872 he was chosen president of the American Bible Society. He was the author of a number of interesting pamphlets and reports on educational subjects.

ALLEN, ZACHARIAH (1795-1882). An American scientist and inventor. He was born in Providence, R. I., graduated at Brown University in 1813, studied law in the office of James Burrill, and was admitted to the bar in 1815. Subsequently he became a manufacturer, and in 1825 visited Europe for the study of mechanical methods in England, Holland, and France.

He constructed (1821) the first hot-air furnace for the heating of dwelling houses, was the first to calculate the motive power of Niagara Falls (*Silliman's Journal*, April, 1844), devised the system of mutual insurance of mill property, and framed new laws for regulating the sale of explosive oils. In 1833 he patented his best-known invention, the automatic cut-off valve for steam engines, still in use with improvements. He was from 1822 a member, and from 1880 president, of the Rhode Island Historical Society. His publications include: *The Science of Mechanics* (1829); *Philosophy of the Mechanics of Nature* (1851); *The Rhode Island System of Treatment of the Indians, and of Establishing Civil and Religious Liberty* (1876); address at the bi-centennial anniversary of the burning of Providence; and *Solar Light and Heat, the Source and Supply* (1879). Consult Perry, *Memorial of Zachariah Allen, 1795-1882* (Cambridge, 1883).

ALLEN-A-DALE. See ALAN-A-DALE.

ALLENDE. A city in Mexico. See SAN MIGUEL DE ALLENDE.

AL'LENITES. See ALLEN, HENRY.

ALLENSTEIN, ä'l'ën-stîn. A town of East Prussia, capital of the circle of Allenstein, situated about 32 miles from the Russian frontier, on the river Alle (Map: Prussia, J 2). It is a well-built and neat-looking town, with an old castle, a monument to Kaiser Wilhelm I, several churches, a gymnasium, and an agricultural school, a hospital, gas works, and a number of markets. Its industrial establishments include iron foundries, machine shops, and it manufactures barrels, stoves, and matches. Pop., 1900, 24,307; 1905, 27,422; 1910, 33,070.

ALLEN'TIAC. A now extinct South American linguistic stock. At the time of the Spanish conquest the Allentiacs, or Huarpes (Guarpes), inhabited the plains about the great lagunes of Huanacache, in Argentina. They are said to have been a rather savage people and unrelated to the tribes of the Andean valleys. See Chamberlain, in the *American Anthropologist*, vol. xiv, n. s., pp. 499-500 (1912), and Cojazzi, *Gli Indii dell' Arcipelago Fueghino* (Turin, 1911).

ALLENTOWN. A city and the county-seat of Lehigh Co., Pa., 50 miles (direct) northwest of Philadelphia, on the Lehigh River, the Lehigh Canal, and on the Lehigh Valley, the Central of New Jersey, the Perkiomen, and Philadelphia and Reading railroads (Map: Pennsylvania, K 6). The city is one of the largest producers of furniture in the United States, is second in the production of American silks, and has extensive manufactures of iron and steel, cement, shoes, hosiery, underwear, wire, auto fire engines, cigars, thread, etc. The original Portland cement fields are only 10 miles distant. The city is the seat of Muhlenberg College (Lutheran), established 1867, and of the Allentown College for Women, and has an Elks' Home, a library, a hospital, and many churches, in one of which the Liberty Bell was hidden when removed from Philadelphia to prevent its capture by the British. Allentown was laid out about 1752 by William Allen, then Chief Justice of Pennsylvania, and was known by its present name until, in 1811, it became the seat of justice of Lehigh County, and was incorporated as the borough of Northampton. In 1838 its original name was restored, and in 1867 Allentown was incorporated by a special

charter. It adopted the commission form of government in 1913. The water works are owned and operated by the municipality. Pop., 1890, 25,228; 1900, 35,416; 1910, 51,913. Consult Matthews and Hungerford, *History of the Counties of Lehigh and Carbon* (Philadelphia, 1884).

ALLEP'PI, à-lëp'è, or **ALLAPPALI,** à-läp'-à-lë. A seaport on the west coast of the native State of Travancore, in the southern part of Madras, British India (Map: India, C 7). It has a sheltered roadstead and carries on a considerable export trade in coffee, pepper, and cardamoms. Canals and lagoons along the coast facilitate trade with Cochin on the north and Trivandrum on the south. Pop., 1901, 24,918.

ALLER, ä'l'ër. A river of Germany, rising about 20 miles west of Magdeburg. It flows northwestward, joining the Weser near Verden. Of its course of 155 miles, the greater part across Hanover, the portion which lies below Calle is navigable.

AL'LERTON, ISAAC (c.1583-1659). One of the Pilgrim Fathers who came to America in the first voyage of the *Mayflower*. He was one of the energetic and wealthy members of Plymouth Colony and was sent to Europe several times as its agent. A disagreement with the colony in 1631 resulted in his removal to New Amsterdam, where he became a member of the Council in 1643. He spent the latter years of his life in New Haven. His daughter, Mary, was the last survivor of the *Mayflower* company.

ALLESTREE, or **ALLESTRY,** RICHARD (1619-81). An English divine and educator, born at Uppington in Shropshire. After graduating from Oxford he took arms for the King in 1642. He remained an active Royalist throughout the Commonwealth and at the Restoration became canon of Christ's Church and lecturer at Oxford and, in 1663, the King's chaplain and regius professor of divinity at Oxford. His works include several volumes of sermons.

ALLEVARD-LES-BAINS, ä'l'vâr'lâ-bän'. A town of the department of Isère, France, on the left bank of the Breda, 15 miles southeast of Chambéry. It has iron and steel manufactures and is a popular resort because of valuable medicinal springs and the picturesque scenery of its valley. Pop., 1901, 2546; 1911, 2715.

ALLEYN, ä'l'en, EDWARD (1566-1626). An English actor, theatre manager, and the founder of Dulwich College. Born in the parish of St. Botolph, just out of London, he went upon the stage shortly before Shakespeare came from Stratford. Alleyn won rapid success, especially in tragedy, playing among other rôles the Jew in Marlowe's *Jew of Malta*, and also Tamburlaine and Faustus. He owned several playhouses and in 1592 married the step-daughter of Philip Henslowe (q.v.), with whom he was associated in building the Fortune Theatre and in various other enterprises, including the profitable business of bear-baiting. As his wealth increased, he ceased acting and became a manager. His chief claim to remembrance is as the munificent founder of the College of God's Gift, at Dulwich. His motive in this benefaction has been ascribed by tradition to an apparition of the devil, who appeared to him as he was playing that character in a theatre, but his well-known liberality and the fact that he was childless are more to the point. The college was begun in 1613, and in 1619, after some obstruc-

tion on the part of Lord Chancellor Bacon, who wished the King to prefer the foundation of two lectureships at Oxford and Cambridge, it obtained the royal charter. Here for several years Alleyn resided and managed the affairs of the institution. Alleyn was a friend of Shakespeare and Ben Jonson and a patron of Dekker (q.v.) and other writers. He was buried in the chapel of the college he had founded, and among its possessions are his portrait and a collection of his business papers. Consult: J. P. Collier, *Memoirs of Edward Alleyn* (London, 1841); J. P. Collier, *Annals of the Stage* (London, 1819); Warner, *Catalogue of the Manuscripts and Muniments at Dulwich College* (London, 1881); Thomas Fuller, *Worthies of England* (London, 1662).

ALLEYNE, ăl'in, ELLEN. A pseudonym under which Christina G. Rossetti wrote for *The Germ*.

ALL FOR LOVE, OR THE WORLD WELL LOST. One of Dryden's best-known tragedies, produced in 1678. It is unrhymed, and in some respects is an imitation of Shakespeare's *Antony and Cleopatra*.

ALLGAU, äl'goi. A subdivision of the European Alps (q.v.) in its widest sense, surrounding the basin of the Iller River in southwestern Bavaria. The name is also applied to the Bavarian districts of Sonthofen and Immenstadt.

ALLGEMEINE ZEITUNG, äl'ge-mī'ne tsī'tung (Ger. 'general newspaper'). The first German newspaper of a high class. It succeeded in 1798 the *Neueste Weltkunde* and was published by Cotta (q.v.), who had sought Schiller as editor. The journal became the organ of statesmen and publicists and has always commanded the services of distinguished literary men as critics and correspondents. First published at Stuttgart, it was successively transferred to Ulm and Augsburg and is now published at Munich.

ALL HAL'LOWS, COLLEGE OF. A college in Dublin, Ireland, for the training of Roman Catholic missionaries. It derives its name from its situation on grounds which once belonged to the monastery of All Hallows, suppressed by Henry VIII. It was founded in 1842 by Father Hand. One year after its foundation the college had 38 students. Over 500 of its graduate priests are to be found in English-speaking countries, and many of these are active among the Irish Catholics in the United States. Among its professors were Dr. Woodlock, Dr. Moriarty, the Rev. Thomas Potter, and Henry Bedford.

AL'LIÄ. In ancient geography, a small stream which flowed into the Tiber about 11 miles north of Rome. It is celebrated as the scene of the defeat of the Roman army by the Gauls, under Brennus, about 390 B.C. Immediately afterward, Rome was taken, plundered, and burned. It is difficult to identify the Allia with any of the modern streams; but the evidence seems in favor of the Fosso della Bettina.

AL'LIÄ'CEOUS PLANTS. Plants of the genus *Allium* (q.v.), belonging to the Liliaceæ. The term is generally employed to denote not only the possession of certain botanical characters, but also of a certain smell and taste, well known by the term "alliaceous," of which examples are readily found in the onion, leek, garlic, and other familiar species of *Allium*, much employed for culinary purposes. These plants contain free phosphoric acid and a sulphuretted oil, which is partly dissipated in

boiling or roasting. The alliaceous flavor is, however, found also, although in comparatively rare instances, in plants of entirely different botanical affinities.

ALLI'ANCE. A city and the county-seat of Box Butte Co., Neb., 360 miles west by north of Lincoln, on the Chicago, Burlington, and Quincy Railroad (Map: Nebraska, B 1). It has important stock-raising interests and manufactures butter. It has municipal water works and lighting system. Pop., in 1890, 829; in 1900, 2535; 1910, 3105; 1913 (est.), 4000.

ALLIANCE. A city in Stark Co., Ohio, 50 miles (direct) south-southeast of Cleveland, on the Mahoning River, and at the junction of the Cleveland and Pittsburgh, the Pittsburgh, Youngstown, and Ashtabula, the Lake Shore and Michigan Southern, and the Pittsburgh, Fort Wayne, and Chicago railroads (Map: Ohio, H 4). It is a large railroad centre and has interurban lines running in all directions. Mount Union Scio College (Methodist Episcopal) is located here. Alliance has a large steel plant, and among its extensive manufactures are gun carriages, traveling cranes, boilers, drop forgings, account registers, and automobile parts. It has large railroad shops. Alliance was settled in 1838 as Freedom, but in 1854 was incorporated under its present name. The government is administered under the provisions of the Ohio Municipal Code of 1902. The mayor is chosen biennially, and there is a city council of seven members. The water works are owned by the city. Pop., 1900, 8974; 1910, 15,083; 1913 (est.), 18,000.

ALLIANCE ISRAELITE UNIVERSELLE, äl'yäns' ès'rá'ä'lét' ü'ně'vâr'sěl'. An association founded at Paris in 1860 by six Frenchmen (Astruc, Isidore Cohen, Jules Carvalho, Narcisse Leven, Eugene Manuel, and Charles Netter) for the amelioration of the condition of the Jews throughout the world. The original members of the society were Jews, and by far the largest number of its members at present belong to that faith. The organization is unique in that it is a universal educator of Jews and Gentiles alike; hence it has enjoyed at all times the sympathy and coöperation of many prominent Christians. As outlined in its prospectus, the programme of the society included the emancipation of the Jews from oppressive and discriminating laws, political disabilities, and the defense of them in those countries where they were subjected to persecution. For the attainment of this object the founders of the society purposed to carry on a campaign of education through the press and by the publication of works on the history and life of the Jews. In the beginning, however, the course of action adopted by the society for bringing relief to their oppressed brethren in other countries was to secure the intercession of friendly governments in their behalf. Thus, as early as 1867 the governments of France, Italy, Belgium, and Holland made the renewal of existing treaties with Switzerland conditional upon that country's granting full civil and political rights to the Jews. In 1878 representatives of the Alliance laid the condition of the Jews in the Balkan Peninsula before the Congress of Berlin, as a result of which the Treaty of Berlin stipulated that in Rumania, Servia, and Bulgaria no discrimination should be made against any religion in the distribution of civil rights. Of late years the activity of the Alli-

ance has tended to become more educational than political, and the chief problem with which it was occupied at the beginning of the twentieth century was the improvement of the condition of the Jews in the Orient. Schools have been established in Bulgaria, European and Asiatic Turkey, Persia, Tunis, Morocco, and elsewhere. In 1913 the number of such schools was about 150, with a teaching staff of over 700 and an attendance of 45,000. Instruction is carried on in the language of the country or in the dialect employed by the majority of pupils, and instruction, as well as school supplies and lunches, is free to the poorest pupils. In addition to the cultural schools, many manual training workshops have been established for boys and schools of domestic science for girls, the encouragement of handicrafts among the Jews being one of the chief educational aims of the Alliance. Linguistic and vocational training are encouraged in every Alliance school, while the preparation for good citizenship is never neglected. Two farm-schools have been established—one near Jaffa in Palestine, the other at Djedeida, near Tunis; the former of these has supplied the Jewish colonies in Palestine with skilled agriculturists and supervisors. At Paris there is a normal school for the education of teachers who are exclusively drawn from the schools of the Alliance and are sent back after a thorough training to carry on in their turn the work of instruction in their native countries. The central committee of the Alliance, with its seat at Paris, consists of both resident and non-resident members, the latter being scattered all over the world, five of them residing in the United States. The central committee stands in constant communication with the regional and local committees, of which there are a number in the United States, the principal ones being at New York and Philadelphia. The Alliance publishes monthly bulletins and a semi-annual report in French and German, and at intervals issues reports in English, Hebrew, Hungarian, and Judeo-Spanish. In 1910 the Alliance, with the coöperation of the French consular authorities, secured important concessions in Fez. Indeed, in Persia, Morocco, Russia, Turkey, and elsewhere, the good offices of the Alliance, discreetly and persistently rendered, have done much to better the laws under which Jews live. In 1910 the fiftieth anniversary of the Alliance was universally celebrated. Both European and Eastern political history have been influenced by its activities. For a full account of it, consult N. Leven, "L'Alliance Israélite Universelle" in *Cinquante Israélite Universelle*, vol. i (Paris, 1911). Current news of its activities will be found in *Ost und West*, the German organ of the Alliance Israélite Universelle.

ALLIANCE OF THE REFORMED CHURCHES HOLDING THE PRESBYTERIAN SYSTEM. An alliance formed in London in 1875. It holds councils, which have no legislative authority but great moral weight. In them the various Augustinian non-prelatical and Presbyterian or Reformed national and denominational churches find representation. There are over 90 of these churches, with over 5,000,000 members and 25,000,000 adherents, throughout the world. In the intervals between councils the business of the Alliance is conducted by an executive commission. The councils have been held at London, 1875; Edinburgh, 1877; Philadelphia, 1880; Belfast, 1884; London, 1888; Toronto,

1892; Glasgow, 1896; Washington, 1899; Liverpool, 1904.

AL'LIA'RIA. The old name of a genus of plants belonging to the family Cruciferae, but now included in the genus *Sisymbrium*. It is known by the popular names of sauce-alone and jack-by-the-hedge. The best known species, *Sisymbrium alliaria* (*Alliaria officinalis*), called garlic-mustard, is a native of Great Britain, not unfrequently found on hedge-banks and in waste places in dry, rich soils, and is common in most parts of Europe. It has also become introduced in a number of places in the United States. It is a biennial, with a stem 2 to 3 feet high; large, stalked, heart-shaped leaves, white flowers, and pods much longer than their stalks, which are somewhat spreading. It seems more deserving of cultivation than many other plants which have long received the constant care of the gardener, being wholesome, nutritious, and to most persons pleasant. The powdered seeds were formerly employed as a sternutatory.

AL'LIBONE, SAMUEL AUSTIN (1816-89). An American author. He was born at Philadelphia, and although engaged in commercial pursuits, devoted considerable time to literature. It was therefore as an amateur that he began the literary work to which the best part of his life was devoted. This work, the *Critical Dictionary of English Literature and British and American Authors*, contains notices of 46,599 writers. The first volume appeared in 1854. In 1891 a three-volume supplement to this work, with 37,000 authors' names and 93,000 titles, appeared. Allibone was book editor and corresponding secretary of the American Sunday-school Union from 1867 to 1873 and from 1877 to 1879. In 1879 he was appointed librarian of the Lenox Library in New York and held this position until 1888. He died at Lucerne, Switzerland, Sept. 2, 1889. Besides the *Critical Dictionary*, he compiled the following works: *Poetical Quotations from Chaucer to Tennyson*, containing 13,600 passages, taken from 550 authors (1878; 1901); *Prose Quotations, from Socrates to Macaulay*, with indexes to the 8810 quotations, containing the names of 544 authors and 571 subjects (1876); *Explanatory Questions on the Gospels and the Acts* (1869); *An Alphabetical Index to the New Testament* (1868); *Indexes to Edward Everett's Orations and Speeches* (1850-59); *Great Authors*, an anthology (1885). New editions of his *Poetical Quotations* and *Prose Quotations* were published, respectively, in 1891 and 1893.

AL'LICE, or AL'LIS (Fr. *alose*, from Lat. *alausea*). A European shad (*Alosa vulgaris*), about 20 inches long, caught for food when ascending the rivers to spawn. It is the larger, and considered the better of the two species of European shad, of which the other is called the twaite. These are the maifisch of the Rhine valley.

ALLIER, à'lyâ'. A department in central France bordering on the Loire, formed mainly out of the old province of Bourbonnais. There are marble and granite quarries, and coal and iron mines in the mountains in the southeast. There is considerable farm land and many mineral springs, the ones at Vichy being best known. Area, 2850 square miles. Pop., 1901, 422,024; 1906, 417,961; 1911, 406,291. Capital, Moulins.

ALLIER. A tributary of the Loire, which

has its source in the water-shed in the eastern part of Lozère, a department of France (Map: France, K 6). It flows in a northerly direction, through Haute-Loire, Puy-de-Dôme, and Allier, and after a course of more than 250 miles falls into the Loire below the town of Nevers. It is navigable for 140 miles.

AL'LIGA'TION (Lat. *alligare*, to bind to, tie up). A form of proportion of eastern origin, which appears in the early works of Arabian and Hindu writers, notably in the *Lilavati* of Bhaskara Acharya (c.1150). The process was for several centuries confined to problems concerning the combination of metals. Two forms of alligation were recognized, viz., alligation *medial* and alligation *alternate*. Alligation medial teaches the method of finding the price or quality of a mixture of several simple ingredients whose prices or qualities are known; e.g., What is the fineness of gold produced by mixing 6 ounces of gold 22 carats fine with 4 ounces of gold 17 carats fine? Alligation alternate teaches what amount of each of several simple ingredients, whose prices or qualities are known, must be taken to form a mixture of any required price or quality; e.g., How much gold 700 fine and 900 fine must be melted together to produce gold 800 fine? Problems of this kind are indeterminate; that is, they have more than one solution and are best treated by algebraic equations. Alligation in its arithmetic form has practically disappeared from recent text-books and may be regarded as obsolete.

AL'LIGATOR (Sp. *el lagarto*, the lizard, Lat. *lacertus*, lizard). A genus of reptiles of the family Crocodylidae. True alligators differ from crocodiles in the following respects: The feet are less webbed; the head is shorter and flatter; the long first and fourth teeth of the under jaw fit into pits in the upper jaw, and not into notches between the teeth, and this causes the whole head to be broader and the snout more obtuse than in crocodiles. There are only two species of alligators—the jacare and cayman (q.v.) of Central and South America being classified in a distinct genus. These species are—*Alligator sinensis*, of China, and *Alligator mississippiensis*, of the southern United States. Among the Neocene fossils of the south of England are remains of an alligator, or of a form that approaches very near to it; but this single species comprises all extinct species known, showing that the genus may be of modern origin. Their characteristics are largely those of the other crocodylians (see Crocodile): activity at night, offensive and defensive swinging of the tail, bellowing, egg-laying, etc.; but they are less aquatic than the typical crocodiles and spend much of their time basking in the sun on land. The alligator of the United States originally ranged from North Carolina to the Rio Grande along the coast and up the larger rivers, ascending the Mississippi as far as Jefferson Co., Miss., about lat. 32°; and in favorable places it used to be enormously abundant. It is now rarely seen north of Florida or the coast swamps of Louisiana; and the constant persecution of it for sport, its hide, ivory, or eggs is fast leading toward its extermination. It is estimated by the United States Fish Commission that 3,000,000 alligators were killed in Florida alone between 1880 and 1900. This alligator reaches about 16 feet in length when fully grown, and then is greenish-black above, having lost the yellowish color-bands that belong to its earlier years. It spends

most of the day asleep in the sun on a mud bank or log, slipping into the refuge of the water when disturbed. It is timid and quick to retreat, rarely showing any disposition to attack a man, though boats are sometimes followed. When cornered, or caught upon the hook and hauled ashore, or, as is sometimes done, captured and bound with a rope when asleep, the animal proves an ugly customer, rushing with formidable open jaws at its enemies and striking from side to side with its powerful tail. They are strong and active swimmers, and always on the lookout for swimming animals like muskrats or dogs, and sportsmen have often lost in this manner dogs that have ventured or been sent into the water after game. Alligators lie in wait in shallows, or close to the shore, for such prey also, yet their main fare is fish, salamanders, and the like. Like other crocodylians, it carries its prey to the bottom to be devoured, and then its windpipe and ears are closed against admission of water. The body of the alligator emits a fetid odor, and its flesh, which is white and tender, has a musky taste, yet is eaten by the Indians and some others. During the colder months it burrows into the swamp mud and hibernates, the depth and length of this torpidity being greater, of course, in the more northerly parts of its habitat. Consult Belt, *Naturalist in Nicaragua* (London, 1888).

The breeding of the alligator is thus described by Dr. Hugh M. Smith (*United States Fish Commission, Bulletin XI*, 1891): "The maternal alligator in April or May seeks a sheltered spot on a bank and there builds a small mound. The foundation of the mound is of mud and grass, and on this she lays some eggs. She covers the eggs with another stratum of grass and mud, upon which she deposits some more eggs. Thus she proceeds until she has laid from 100 to 200 eggs. The eggs in the course of time are hatched by the sun, assisted by the heat which the decomposition of the vegetable material generates. As soon as they have 'chipped the shell' the baby alligators are led to the water by the mother, who provides them with food which she disgorges, showing much anxiety for their safety. At this early period of their existence they are exposed to many dangers, being a favorite prey of fishes and turtles." It has been thought that alligators grow very slowly and that about 15 years was necessary for them to reach a length of two feet, while a 12-foot specimen indicated a patriarch of over threescore and ten years. Under extremely adverse conditions of existence, such as cold and lack of sufficient food, the growth may be considerably retarded, but in a favorable environment alligators grow very rapidly. From the time of hatching, an alligator in four years may attain a size large enough to have a commercially valuable hide. The following table showing the *average* increase of growth has been compiled from notes made in the reptile house of the New York Zoölogical Park:

Oct. 1900, hatched.....	Length 8 inches; weight 1 $\frac{3}{4}$ oz.
Oct. 1901.....	Length 18 inches; weight 9 $\frac{1}{4}$ oz.
Aug. 1902.....	Length 23 inches; weight 3 lbs.
Mar. 1903.....	Length 45 inches; weight 14 lbs.
Oct. 1905.....	Length 64 inches; weight 50 lbs.
Oct. 1906.....	Length 72 inches; weight 72 lbs.

Alligators are extensively utilized. Their hides can be tanned into an excellent leather, which has become expensive. The teeth, obtained by rotting the skulls in the ground, are of fine

ivory, and valued for carving into ornaments. They are worth about \$2 a pound (of 50 to 75 teeth). Both flesh and eggs are eaten by some persons, and the eggs are valued because they can be hatched in boxes of warm sand, yielding young alligators to be sold as pets, or killed and made into curious ornaments. Consult Gill, *Smithsonian Miscellaneous Collections*, vol. xlviii (Washington, 1907). See CAYMAN.

ALLIGATOR AP'PLE. See CUSTARD APPLE.

ALLIGATOR FISH. A fish of the family Agonidæ, whose members have an elongated angular body covered with large bony plates that form a coat of mail. The best-known one is *Podotheus aeipenserinus*, a species 12 inches long, found on the northern Pacific coast.

ALLIGATOR GAR. The great gar (*Litholepis* or *Lepisosteus tristæchus*) of the rivers of the southern United States, Cuba, Mexico, and Central America, which is greenish in color and sometimes reaches a length of 20 feet. Its flesh is worthless as food, and its scaly armor often turns a spear or even shot. While it is able to breathe air to a certain extent, yet it soon dies in foul water. See GAR.

ALLIGATOR PEAR. See AVOCADO.

ALLIGATOR TER'RAPIN, TORTOISE, or TURTLE. A snapping turtle, especially the long-necked, long-tailed, very large species (*Macrochelys lacertina*) of the southern Mississippi valley, which may weigh over 100 pounds, and have a head measuring 25 inches in circumference. Its flesh is valued as food. The jaws are so powerful that they can cut through a broom handle. The shell is dull yellow in color, matching the coffee-hued waters of its native river. It feeds on fish, which it captures with a sudden dart of the head as it lies hidden on the muddy bottom. See TURTLE.

AL'LINGHAM, WILLIAM (1824-89). An Anglo-Irish poet, born at Ballyshannon, Donegal. He won attention by *Poems* (1850), some of which had previously appeared in English periodicals. In the same year he came to London and was appointed to a subordinate post in the customs. He received a civil pension of £60 in consideration of his services to literature in 1864; married Helen Patterson, a well-known water-color painter, in 1874, and in the same year became editor of *Fraser's Magazine*. He died at Hampstead. His first collection of poems was followed by *Day and Night Songs* (1854), a new edition of which (1855) was illustrated with woodcuts from designs by Arthur Hughes, Rossetti, and Millais. Among subsequent volumes were *Laurence Bloomfield in Ireland*, an ambitious but unsuccessful narrative poem (1864); *In Fairy Land*, illustrated by Richard Doyle (1870); *Songs, Ballads and Stories* (1877); *The Fairies* (1883); *Flower Pieces, and Other Poems*, with designs by Rossetti (1888). *Mary Donnelly* is perhaps the best known of Allingham's many natural and graceful lyrics. His *Diary*, edited by Mrs. Allingham and Radford, is full of fascinating anecdotes of his friends and contemporaries, among whom were Tennyson, Thackeray, and Carlyle. (London, 1907.)

ALLINSON, ANNIE CROSBY (EMERY) (1871—). An American educator and writer, born in Ellsworth, Me. In 1892 she graduated from Bryn Mawr College. She took post-graduate studies at this college and received the degree of Ph.D. in 1896. In 1893 and 1894 she studied at the University of Leipzig. She was appointed Dean

of Women and assistant professor of classical philology at the University of Wisconsin in 1897. There she remained until 1900, when she received the appointment of Dean of the Women's College of Brown University. In 1905 she was married to Francis Greenleaf Allinson (q.v.). On her marriage she resigned the position at Brown University. She was joint author with her husband of *Greek Lands and Letters* (1909), and contributed on classical and other subjects to reviews and magazines.

ALLINSON, FRANCIS GREENLEAF (1856—). An American philologist and educator. He was born in Burlington, N. J., and in 1876 graduated from Haverford College. He then spent one year in Harvard University. From 1877 to 1880 he was a fellow of Johns Hopkins University, receiving the degree of Ph.D. in the latter year. From 1880 to 1882 he was an assistant professor of Greek and Latin at Haverford College, and from 1882 to 1891 was head master of classics at the University School in Baltimore. He was appointed assistant professor of Greek and Latin at Williams College in 1892. After serving until 1895 in this chair, he was called to be associate professor of Greek and classical philology at Brown University, and became professor of classical philology in 1898. In 1910 and 1911 he was annual professor at the American School of Classical Studies at Athens. His published writings include *Greek Prose Composition* (1895); *Greek Lands and Letters* (with A. C. E. Allinson, 1909). He edited texts of several Greek authors and was a contributor to *Studies in Honor of Basil L. Gildersleeve* (1892). He contributed also to *The American Journal of Philology and Proceedings of the American Philological Association*.

ALLIOLI, ä'lê-ô'lê, JOSEPH FRANZ (1793-1873). A Roman Catholic biblical scholar. In 1830-36 he issued at Nuremberg, in six volumes, Braun's annotated German translation of the Bible from the Vulgate, but so revised as to be practically a new work. It was the first of its kind to receive papal approbation.

ALLIOT, ä'lyô' (JEHAN DANIEL) HECTOR (1862—). A Franco-American archæologist, born at Château des Forestiers, Gironde, France. He graduated from the Lycée Bordeaux in 1879, and later specialized in medicine and chemistry, coming to be known, however, as a writer on art. In 1891 he was associated with Farah Pasha in explorations at Tyre, Asia Minor. As director of the Cliff Dwellers Exploration for the Chicago Exposition in 1893, he made a valuable collection, now the property of the University of Pennsylvania. In 1908 he was appointed professor of art history in the University of Southern California; in 1909 commenced service as curator of the Southwest Museum; and in 1911 occupied the chair of technology in the School of American Archæology. His later archæological work was among the Ute, Hopi, and Pueblo Indians, to whom he devoted over 10 years of research. He became a member of many foreign and American archæological and geographical societies and an officer of the French Academy.

AL'LISON, WILLIAM BOYD (1829-1908). An American legislator. He was born at Perry, Ohio, attended Allegheny and Western Reserve colleges; studied law and practiced in Ohio until 1857, when he removed to Iowa. During the Civil War he was a member of the Governor's staff. Elected as a Republican, he served in the

House of Representatives from 1863 to 1871; was elected to the United States Senate in 1873 and reelected five times. He was an active member of the Senate, serving on many commissions. From 1881 to 1893, and again two years later, he was chairman of the Committee on Appropriations. The essential feature of the coinage act of 1878, known as the Bland-Allison Act, or more properly the Allison Act, was due to him. He was one of the representatives of the United States at the Brussels Monetary Conference in 1892. Twice he was a prominent candidate in Republican national conventions for the presidential nomination. Both President Garfield and President Harrison offered him the Treasury portfolio.

ALLIT'ERA'TION (Lat. *ad*, to + *littera*, letter). The frequent occurrence of the same or similar letters or sounds. In old German, Anglo-Saxon, and Scandinavian poetry alliteration took the place of rhyme. This kind of verse, in its strict form, required that two stressed syllables in the first hemistich and one in the second hemistich should have the same sound, if consonantal, as in the following Anglo-Saxon line:

Flota fāmīg heals fūgle gēlicost.
(The boat with bow of foam likest a bird.)

Alliterative poems continued to be written in English after it had assumed its modern form. The most remarkable is *Piers Plowman*, a poem of the fourteenth century, of which the following is a specimen:

In a somer seson whan soft was the sonne.

Even after the introduction of rhyme, alliteration continued to be largely used as an embellishment of poetry, and is so, though to a less extent, to this day:

Full fathom five thy father lies.—*Shakespeare.*

The fair breeze blew, the white foam flew,
The furrow followed free. — *Coleridge.*

A rag and a bone and a hank of hair. — *Kipling.*

Alliteration is not confined to verse; the charm that lies in it exercises great influence on human speech generally, as may be seen in many current phrases and proverbs in all languages: example, "life and limb," "house and home," "wide wears," "tight tears," etc. It often constitutes part of the point and piquancy of witty writing. Among modern writers this use of alliteration is well illustrated by Sydney Smith: for example, when contrasting the conditions of a dignitary of the English church and of a poor curate, he speaks of them as "the right reverend Dives in the palace, and Lazarus-in-orders at the gate, doctored by dogs and comforted with crumbs."

In the early part of the seventeenth century the fashion of hunting after alliterations was carried to an extreme; even from the pulpit, the chosen people of God were addressed as "the chickens of the Church, the sparrows of the spirit, and the sweet swallows of salvation." *Ane New-Year Gift*, or address, presented to Mary, Queen of Scots, by the poet Alexander Scott, concludes with a stanza running thus:

Fresh, fulgent, flourist, fragrant flower formose,
Lantern to love, of ladies lamp and lot,
Cherry maist chaste, chief carbuncle and chose, etc.

In the following piece of elaborate trifling, given (but without naming the author) in H. South-

gate's *Many Thoughts on Many Things*, alliteration is combined with acrosticism:

A n Austrian army, awfully arrayed,
B oldly by battery besieged Belgrade;
C ossack commanders cannonading come,
D ealing destruction's devastating doom;
E very endeavor engineers essay
F or fame, for fortune, forming furious fray,
G aunt gunners grapple, giving gashes good;
H eaves high his head heroic hardihood;
I braham, Islam, Ismael, imps in ill,
J ostle John Jarovlitz, Jem, Joe, Jack, Jill;
K ick kindling Kutusoff, kings' kinsmen kill;
L abor low levels loftiest, longest lines;
M en march 'mid moles, 'mid mounds, 'mid murd'rous mines.
N ow nightfall's near, now needful nature nods,
O pposed, opposing, overcoming odds.
P oor peasants, partly purchased, partly pressed,
Q uite quaking, "Quarter! quarter!" quickly quest.
R eason returns, recalls redundant rage,
S aves sinking soldiers, softens signiors sage.
T ruce, Turkey, truce! truce, treach'rous Tartar train!
U nwise, unjust, unmerciful Ukraine,
V anish, vile vengeance! vanish, victory vain!
W isdom wails war—walls warring words. What were
X erxes, Xantippe, Ximenes, Xavier?
Y et Yassy's youth, ye yield your youthful yest.
Z ealously, zanies, zealously, zeal's zest.

While recent poets, as Tennyson, Swinburne, and Kipling, employ alliteration combined with vowel distribution, for beautiful sound effects, yet prose writers seem to avoid it, or at least to keep it from becoming obvious. Observe from the *Passing of Arthur*: "And on a sudden, lo! the level lake, and the long glories of the winter moon." Tennyson's alliterations are less obvious than Kipling's; whereas Swinburne revels in the recurrence of like sounds and makes this a part of his metrical theory. Consult Guest, *English Rhythms* (London, 1882), and J. Schipper, *Grundriss der Englischen Metrik* (Leipzig, 1895), and for this use of alliteration in Greek and Latin, Plessis, *Métrique Grecque et Latine* (Paris, 1889); Klotz, *Altrömische Metrik* (Berlin, 1890); and Puhlig, *De Alliterationis Vi et Vsu* (Breslau, 1912). See ASSONANCE; ENGLISH LITERATURE; GREEK LITERATURE; LATIN LITERATURE.

AL'LIUM (Lat. garlic). A genus of plants of the family Liliaceæ containing about 300 species. The commonly cultivated species are onion, garlic, leek, chives, and shallot, and these forms represent the habit of the genus, with its alliaceous (q.v.) odor, bulbs, long and narrow leaves, and umbels of small flowers. Eight or nine species are natives of Great Britain, of which the most common is ramsons (*Allium ursinum*), a species with much broader leaves than most of its congeners. It is most frequently found in moist woods and hedge-banks, but occasionally in pastures, in which it proves a troublesome weed, communicating its powerful odor of garlic to the whole dairy produce. Crow garlic, or wild onion (*Allium vineale*), another British species, is sometimes very troublesome in the same way in drier pastures. Both are perennial, and to get rid of them their bulbs must be perseveringly rooted out when the leaves begin to appear in spring. This species has been introduced into the eastern part of the United States, where it is troublesome in lawns, parks, and pastures. A small quantity of carbolic acid injected into the cluster is said to destroy them. Over 60 species are indigenous to the United States, about 50 of them belonging to the Western States. A number of species are grown indoors or as ornamental plants in gardens. Among these *Allium neapolitanum* is one of the best. If grown out-doors, it needs protection in most localities in the United States.

ALLMAN, ăl'man, GEORGE JAMES (1812-98). A Scotch zoölogist. He was born in Ireland, graduated in 1843 at Trinity College, Dublin, and was in the following year appointed regius professor of botany in Dublin University. In 1855 he was appointed regius professor of natural history in Edinburgh University and, having resigned in 1870, was chosen president of the Linnæan Society in 1874 and president of the British Association in 1879. He received numerous medals from the scientific societies and published *Monograph of the Fresh Water Polyzoa* (1856) and *Monograph of the Gymnoblasic Hydroids* (1871-72).

ALLMERS, ä'l'mërs, HERMANN LUDWIG (1821-1902). A German poet, born at Rechtenfleth, near Bremen. He studied at Berlin, Munich, and Nuremberg and made his first appearance in literature in his *Marschenbuch* (1858; 4th ed., 1902). This was followed by *Dichtungen* (1860; 4th ed., 1900), and *Römische Schlendertage* (1869; 11th ed., 1904), containing observations on Italian life. His drama, *Elektra* (1872; 2d ed., 1895), with music by A. Dietrichs, was very successful. His further works include *Fromm und Frei* (1891), a volume of verse. His complete works appeared in 1891-95 in six volumes. Consult L. Bräutigam, *Der Marschendichter Hermann Allmers* (Oldenburg, 1891).

ALL'MOUTH. The angler or goosfish. See ANGLER.

ALLOA, ă'l'ô-ă. A seaport and the county-town of Clackmannanshire, Scotland, at the mouth of the Forth, and 32 miles by rail from Edinburgh (Map: Scotland, E 3). It is a town of considerable antiquity and is supposed to have been built on the site of the Alauna of Ptolemy. The principal articles manufactured are whisky, ale, cotton, woolen goods, glass, and iron. Considerable coal is obtained from the neighboring collieries, and much of this is exported. Alloa has an excellent harbor, with floating and dry docks. There is regular steamer communication by river with Edinburgh and Stirling. In the neighborhood is Alloa House, supposed to have been built in the thirteenth century, the home of the Earls of Mar and the Erskines, and many Scottish princes. Pop. (police burgh), 1901, 11,555; 1911, 11,893; (parish), 1901, 16,858; 1911, 17,130.

ALLOB'ROGES (Lat. pl.). A people of Gaul whose territory is now Savoy and Dauphiné. Vienna (the modern Vienne) was their chief town. They were subjected to Rome 121 B.C., by Fabius Maximus, and remained loyal.

AL'LOCU'TION (Lat. *allocutio*, a speaking to, from *ad*, to + *loqui*, to speak). A term applied, in the language of the Vatican, to denote specially the address delivered by the Pope at the College of Cardinals on important ecclesiastical or political circumstances. An allocution presents the papal conclusions on subjects which have usually been discussed by ecclesiastical bodies, and which involve political or religious problems of prime importance to the Church, or to some section of it. Though delivered in secret, it is afterward published and is an important ecclesiastical document.

ALLO'DIUM, or ALLODIAL OWNERSHIP (Med. Lat. probably from OHG. *al*, all + *ôt*, *ôd*, property, estate). The free and absolute right of property in land, properly opposed to feudal tenure (q.v.), or the holding of land in subordination to a superior owner. Blackstone is responsible for the view, which has been gen-

erally taken by legal writers of the last century, that a condition of allodial landholding prevailed in England prior to the Norman Conquest, and that this was rapidly superseded by the introduction of the feudal system of land tenure by the Conqueror and his immediate successors, whence Lord Coke's statement that there "is no land in England in the hands of any subject but it is held of some lord by some kind of service." There can be no question as to the universality of feudal tenure, as described by Coke; but it may be doubted whether, in our legal system, the free and unqualified ownership of land—corresponding to the title by which goods and chattels are held—has ever been generally recognized. It is more than probable that from the first the idea of ownership underwent a change when it was transferred from cattle and other personal property to land, and that the owner of land was generally conceived of as having a more or less temporary interest, as holding in subordination to the superior rights of the community, which was somehow regarded as the ultimate and permanent owner. However this may be, we do not find in the books any general recognition of allodial ownership, in the strict sense of the term, anywhere in Europe; and the rapidity with which the feudal system spread over England after the Conquest would seem to indicate that among the Anglo-Saxons such absolute ownership of land was the exception rather than the rule. The terms "alod" and "allodium" do, indeed, occur with some frequency, but usually in a derivative sense, to describe lands which, though held in some form of dependent tenure, are inheritable and thus similar to the modern estate in fee simple. Since the decay of the feudal system in England and its general abolition in the United States, the term "allodial" has come to be applied to the common form of land tenure in subordination to the paramount title of the State, which now commonly prevails, and which, though not entirely free and absolute, has been divested of all the burdensome incidents which were characteristic of feudal tenure. Some of our State constitutions and many of our statutes have expressly declared all tenures to be allodial, in this sense of the term, and in most of the States they are, in the absence of legislation on the subject, deemed to be so. In several of the States, however, tenures partaking more or less of the feudal character still survive. Consult the authorities referred to under REAL PROPERTY.

ALLOG'AMY (Gk. ἄλλος, *allos*, other + γάμος, *gamos*, a wedding) or CROSS-POLLINATION. A transfer of the pollen of one flower to the pistil of another. Allogamy is subdivided into geitonogamy, in which the pollinated flower is on the same plant, and xenogamy, in which it is on a different plant. The opposite of allogamy is autogamy, or self-pollination. See POLLINATION.

ALLON, ă'l'on, HENRY, D.D. (1818-92). An English Congregational leader, born at Welton, near Hull. He graduated at Chestnut College, 1843, and was pastor of Union Chapel, Islington, London, from 1844 until his death. He edited the *British Quarterly Review* from 1865 to 1887. He published, besides sermons, the life of Rev. James Sherman (London, 1863), and that of Thomas Binney, prefixed to his edition of Binney's sermons (1875), and *Land and the Puritans* (1882). He compiled *The Congregationalist Psalmist*. Consult his memorial (1892).

ALLONGE, à'lôn'zhâ', AUGUSTE (1833-98). A French landscape artist. He was born in Paris and studied with Cogniet and Ducornet. He is noted for his charming use of charcoal in landscape work, but his oil paintings, as well, have won approval. His method of using charcoal has almost created a "school" for workers in that material, and his drawings are much sought and highly prized by connoisseurs. His subjects are landscapes of a placid and sylvan kind. Among his works in oil are views on the Somme; among those in charcoal are "Moulin de Givry." He and Camille Bernier were the first to recognize the beauty of Brittany and to find their subjects there. His writings include *Le fusain* (1873) and a later *Grand cours de fusain* (54 plates).

ALLOP'ATHY. See HOMŒOPATHY.

AL'LOPHANE. A fragile hydrated aluminium silicate belonging in the clay group of minerals. It is usually found in amorphous incrustations of a pale sky-blue color, but sometimes of various shades of green, brown, or yellow. Allophane is produced by the alteration of some aluminous silicate, such as one of the feldspars. Acids attack it with the liberation of silica. It occurs in various European localities and at Richmond, Mass., Bristol, Conn., and Morgantown and Friedenville, Pa.

AL'LOPHAN'IC ACID. See UREAS, THE COMPOUND.

ALLORI, àl-lô'rè. The name of two Italian painters, of the later Florentine school.—ALESSANDRO (1535-1607) was a pupil of his father's friend, not his uncle, Bronzino, who brought him up. He afterwards adopted a mannered imitation of Michelangelo. He was chiefly employed in the churches of Florence and Tuscany, in the Ducal Villa Poggio a Cajano, and in portraiture. He wrote for artists a treatise on anatomy.—His son and pupil CRISTOFORO (1577-1621) forsook Alessandro's manner for that of Pagani. A more important artist than his father, although his style is mannered, he was influenced by Andrea del Sarto, attaining beauty of color and delicacy of execution. His most celebrated work is "Judith with the Head of Holofernes" in the Pitti Palace, Florence, with replicas in Vienna and the Uffizi. The Pitti collection also has a fine "St. Julian," the Louvre "Isabella of Aragon Pleading with Charles VIII."

ALLOT'ROPY (Eccl. Gk. ἀλλοτροπία, *allotropia*, variety, from ἄλλος, *allos*, other + τροπος, *tropos*, turn, way, guise), or ALLOTROPISM. A term used in chemistry to denote the existence of an element in several forms differing from each other in their physical properties. By the silent discharge of electricity in an atmosphere containing ordinary oxygen, the latter is transformed into ozone. Ozone can be readily shown to be made up of nothing but the element oxygen; yet oxygen gas and ozone exhibit important differences in their properties; thus ozone (Gk. ὀζων, smelling) has a peculiar and characteristic odor, while oxygen gas is odorless; ozone reacts much more readily with various substances; it has bleaching and disinfectant properties not possessed by oxygen gas, and it is much denser than oxygen. Phosphorus affords another example of allotropism. In ordinary circumstances, and when freshly prepared, phosphorus is a pale yellow solid of the consistence and aspect of wax and to some extent flexible and translucent. It requires to be placed in a vessel with water to keep it from taking fire

spontaneously, and it is very poisonous. The same element, when dried and kept for some time at a moderately high temperature, passes, weight for weight—without addition or subtraction of matter—into a substance known to chemists as *amorphous* phosphorus. The color of this new variety is brownish red; and it exists as a powder which has no odor, does not take fire, and is not known to be poisonous at all. Three allotropic modifications of the element carbon are known: diamond, graphite, and amorphous carbon (pure lamp-black). Of nitrogen, only one—the ordinary inert form—was known until 1911, when Strutt discovered an allotropic modification. This new form is produced from ordinary nitrogen by the electric spark. It exhibits a peculiar luminescence for some time after the sparking has been discontinued and is chemically active, readily uniting with phosphorus, iodine, mercury, and other elements.

The different varieties of sulphur, boron, silicon, etc., furnish other examples of allotropism. Though comparatively few elements have been obtained in more than one form, there seems to be no reason why, in general, any other chemical element should be incapable of existing in two or more allotropic modifications. The existence of allotropic varieties brings to the mind the polymorphism of crystalline substances and the isomerism of organic compounds. From the point of view of the atomic theory, the different allotropic modifications of an element are, probably, made up of molecules containing different numbers of atoms, or else of atoms differently combined: thus a molecule of ordinary oxygen contains two oxygen atoms, and its chemical symbol is O₂; a molecule of ozone contains three oxygen atoms, and its chemical symbol is O₃. A similar explanation of the nature of allotropy in solid elements is, however, purely hypothetical; for nothing is known of the ultimate structure of solids. Consult D. Berthelot. *De l'allotropie des corps simples* (Paris, 1894), and Ouyard, *Etats allotropiques des corps simples* (Paris, 1894).

ALLOUEZ, à'lōō'â', CLAUDE JEAN (1620-89). One of the early French Jesuits who visited the Great Lakes. He founded the Mission of the Holy Ghost on Lake Superior in 1665, explored Green Bay, and established missions among the Illinois Indians, settling at Kaskaskia (q.v.) and continuing there the mission begun by Marquette. He retired in 1679 on the approach of La Salle, an enemy of the Jesuits, and died among the Miamis on St. Joseph's River. Consult an autobiography in *Jesuit Relations* (Cleveland, Ohio, 1900), and Shea, *Catholic Church in Colonial Days*.

ALLOW'ANCE. In military usage, money allowed in lieu of forage, food, horses, clothing, or quarters, or for any extra work or duties that may have been performed. Such allowance constitutes extra pay. In the United States army "allowance" or "allowances" usually refer to the things gratuitously allowed and not to their money equivalent. For example, fuel, light, heat, quarters, and forage are "allowances"; when the equivalent in money is furnished in lieu thereof, this money is called "commutation." See PAY AND ALLOWANCES, MILITARY.

ALLOWANCE OF QUARTERS. See PAY AND ALLOWANCES, MILITARY.

AL'LOWAY KIRK. A ruined church in the parish of Ayr, Scotland, near the mouth of the

Doon, celebrated in Burns's *Tam o' Shanter*. At very short distances from it are the cottage in which the poet was born, the monument erected to his memory in 1823, and the Auld Brig o' Doon, over which Tam o' Shanter made his escape from the witches.

ALLOY' (Fr. *aloi*, from Lat. *alligare*, to bind to, from *ad*, to + *ligare*, to tie). A mixture of two or more metals, usually produced artificially by fusion, although sometimes found native. Alloys are characterized by certain definite properties, which, according to Sir William C. Roberts-Austen, include: liquidation, which is shown by the separation of that constituent which has the lowest melting point when the alloy is heated; density, which seldom corresponds to the mean of those of the constituents of the alloy, being usually either more or less than that shown by the percentage composition; tenacity, which is usually greater than that of the constituents of the alloy, although it is sometimes diminished; hardness, which is almost always increased; extensibility, which is almost always diminished; and fusibility, the melting point being generally lower than the mean of the melting points of the constituent metals.

The great value of metallic alloys in commerce is due to the fact that certain properties which are desirable for practicable purposes may be imparted to many metals by a suitable addition of other metals. For instance, gold and silver are too soft for use as coins when pure, but may be rendered sufficiently hard by the admixture of small proportions of copper. Similarly the hardness of copper is greatly increased by the addition of zinc, yielding brass. In making alloys, the least fusible metal is melted first, after which the others are added. When three metals are used to form the alloy, they are melted in pairs and afterward together. The more important metallic alloys, which are included among the materials of constructive engineering, are the bronzes, the brasses, the coin alloys, and a few alloys of tin, lead, zinc, antimony, and bismuth. The following are the principal alloys, their composition and uses:

Bronze is an alloy of copper and tin. The knowledge of bronze is very old, it being used by the ancients for making coins, weapons, tools, and ornaments. Many of these ancient peoples were very skillful bronze-founders. The principal bronzes are those used in coinage, in ordnance, in statuary, in bells and musical instruments, and in mirrors and the specula of telescopes. *Coin bronze* as made by the Greeks and Romans consisted of from 96 per cent copper and 4 per cent tin to 98 per cent copper and 2 per cent tin. Modern investigations have shown the range of good alloys for this purpose to be quite large, varying from 96 per cent copper and 4 of tin to 80 per cent copper and 14 of tin, the best falling near the middle of this range. *Gun bronze* has different compositions in different countries, but the most common proportion would seem to be 90 per cent copper and 10 of tin, or 89 per cent copper and 11 of tin. When well made, it is solid, yellowish in color, denser than the mean of its constituents, and much harder, stronger, and more fusible than commercial copper: it is somewhat malleable when hot and much less so when cold. *Statuary bronze* is nearly the same composition as gun bronze. It should be rapidly melted, poured at a high temperature, and quickly cooled to get

the best results. *Bell metal* is richer in tin than the preceding, and varies in composition somewhat with the size of the bell, the proportion of tin being the larger in the case of small bells. The range of good practice in bell metal is from 18 to 30 per cent tin and from 82 to 70 per cent copper. Chinese gongs are made from 78 to 80 per cent copper and 22 to 20 per cent tin, and are beaten into shape with the hammer, being tempered at intervals during the process. (See ANNEALING.) Bell metal is dense and homogeneous, fine ground, malleable if quickly cooled in the mold, rather more fusible than gun bronze, but otherwise similar, excelling, however, in hardness, elasticity, and sonority. *Speeulum metal* contains often as much as 33 per cent tin; it is almost silvery white, extremely hard and brittle, and capable of taking a very perfect polish. Bronze for bearings and other friction surfaces in machinery is made of many proportions, varying from 88 to 96 per cent copper, as more or less hardness is required. *Phosphor bronze* (q.v.) is an alloy of copper, zinc, and tin, which has been given exceptional purity by fluxing with phosphorus. It is very tough and hard, and is used for piston rings and valve covers, pinions, cog wheels, screw propellers, etc. *Tobin bronze* and *Bridgeport bronze* are alloys of copper and zinc in the proportion of about 60 to 62 of copper and 36 to 38 of zinc, with small percentages of tin, iron, and lead. It has great tensile strength, and corrodes with great difficulty. *Aluminum bronze* consists of 90 per cent copper and 10 of aluminum, and is malleable and exceedingly tenacious. It has a golden color and is used in jewelry. When the aluminum exceeds 10 per cent, the alloy becomes brittle, and when 20 per cent is reached, it can be crushed in a mortar. *Manganese bronze* is an alloy consisting of about 88 per cent copper, 1½ of tin, 8.7 of zinc, and smaller percentage of iron, lead, and phosphorus; it is much used for making screw propellers. Both Tobin bronze and manganese bronze are in reality more nearly brasses, since the zinc percentage is greater than the tin percentage.

Brass is an alloy of copper and zinc varying in proportions from 10 parts of copper to 1 of zinc to 1 part of copper to 5 parts of zinc. (See BRASS.) Brass is extensively employed in the arts in the manufacture of scientific apparatus and mathematical instruments, the small parts of machinery, and many sorts of hardware. It can be cast, drawn into wire, rods, or pipe, and rolled into sheets. Brass containing 55 to 60 per cent of copper and 45 to 40 per cent of zinc, when heated, can be extended under hydraulic pressure through dies into various forms for structural purposes; this is known as extruded metal. Brass is harder than copper, very malleable and ductile, and can be "stuck" in dies, formed in molds, or "spun" in lathes into vessels of a wide variety of forms. It is a much poorer conductor of electricity and heat than copper and is more fusible. *Aluminum brass* is made of equal weight of aluminum bronze, copper, and zinc. It has a very high tensile strength and has been used for screw propellers.

Other alloys than bronzes and brasses exist in an immense variety, and have numerous applications in the arts and sciences, although they are much less used than the bronzes and brasses. Only a few of these alloys can be mentioned here. *German silver* (q.v.) is an alloy of

copper, zinc, and nickel in the respective proportions of about 60, 20, and 20 per cent. It is used for table utensils, ornaments, and in the form of sheets, and is one of the most difficult alloys to handle in the foundry and rolling mill. *Pewter* is an alloy of tin and copper often mixed with lead. *Britannia metal* (q.v.) is an alloy of tin, antimony, copper, and brass. It and pewter are much used in making table utensils. *Stereotype metal* is an alloy of 16 per cent antimony, 17 of tin, and 67 of lead. (See PRINTING.) *Babbitt metal* (q.v.) is an alloy of 4 parts copper, 12 parts tin, 8 parts regulus of antimony melted together, and 12 parts tin added after fusion. It is used for lining bearings for journals. *Solders* are alloys used for joining metallic surfaces and parts and have a wide range of composition. The soft solders are made of tin and lead; the hard solders are usually made of brass, and special solders are composed of various alloys of copper, zinc, lead, tin, bismuth, gold, and silver. In making solders, great care has to be taken to secure uniformity of composition. For this reason they are often granulated by pouring from a height into water, or by reducing the cast ingots into powder and then remelting the granulated or powdered material. The soft solders are usually sold in sticks, and silver and gold solder in sheets. Platinum is soldered with gold, and German silver with a solder of equal parts of silver, brass, and zinc. The essentials of a good solder are that it shall have an affinity for the metals to be united, shall melt at a considerably lower temperature, shall be strong, tough, uniform in composition, and not readily oxidized. *Type metal* is an alloy of lead and antimony in the proportions of 4 to 1. It is a hard alloy capable of being cast in molds, and taking form very perfectly. *Gold coin* consists of an alloy of 900 parts gold, 75 parts copper, and 25 parts silver. Iron forms compounds with many elements that are used in metallurgical processes, as ferromanganese, ferro-titanium, and ferro-tungsten, which will be considered under IRON AND STEEL. Mercury combines with many metals to form amalgams (q.v.). During the years 1875-78 a board for testing iron, steel, and other metals met at the Watertown Arsenal, Mass., and very thoroughly considered the properties of various alloys. Their report, published in 1881, contains much information on the subject, together with a bibliography. Consult: Guettier, *A Practical Guide for the Manufacture of Metallic Alloys*, translated by Fesquet (Philadelphia, 1872); Larkin, *The Brass and Iron Founders' Guide* (Philadelphia, 1878); Graham, *The Brassfounders' Manual* (London, 1879); Brannt, *Metallic Alloys* (London, 1889); Hiorns, *Mixed Metals, or Metallic Alloys* (New York, 1890); Thurston, *A Treatise on Brasses, Bronzes, and Other Alloys, and their Constituent Metals* (New York, 1897); Roberts-Austen, "Reports to the Alloys Research Committee," *Proceedings, Institution of Mechanical Engineers* (London, 1891, 1893, 1895, 1897, 1899, and 1904); and Howe, *Iron, Steel, and Other Alloys* (Boston, 1903); "Aluminum Alloys," *United States Geological Survey* (1911), and *Metal Industry* (1910).

ALLOYS, MAGNETIC, COMPOSED OF NON-MAGNETIC METALS. Hadfield has discovered that the addition of a certain amount of manganese to iron renders the latter perfectly non-magnetic. In 1904 Heusler made the very remarkable dis-

covery that, conversely, certain non-magnetic metals may be rendered magnetic by alloying them with manganese—itsself perfectly non-magnetic. Thus, copper, aluminium, and antimony are on the list of distinctly non-magnetic metals. Yet an alloy containing 60 per cent of copper, 14 of aluminium, and 26 of manganese is magnetic. Furthermore, and curiously enough, the magnetic property of the alloy may be readily caused to vary. When freshly prepared, the alloy is but faintly magnetic. If heated to 170° C. (c.340°F.) and then suddenly chilled with water, it loses its magnetic property altogether. But if subsequently kept for some time at the temperature of boiling water, or thereabout, it becomes more permanently, and this time quite strongly, magnetic. Alloys of manganese with antimony, too, are distinctly magnetic. An adequate theoretical interpretation of these facts is, in the present state of science, impossible. The conclusion, however, to which they point is, that magnetizability is rather an acquired and variable than an inherent and constant property of matter, and that its ultimate cause may lie, not deeply within the chemical atoms, but rather in the physical conditions produced, as it were, accidentally in certain molecular complexes. This conclusion suggested to Clemens Winkler a possible analogy in radioactivity, and he raised the question whether radioactivity, too, might not be a more or less accidental physical rather than a deep-seated chemical property of substances, and whether radium itself might not be simply common barium with the property of radioactivity acquired.

ALLPORT, SAMUEL (1816-97). An English petrologist, distinguished by his pioneer work in the field of microscopic petrology. He was librarian of Mason College from 1880 to 1887.

ALL-SAINTS' BAY. A bay in the province of Bahia, Brazil, in 13° S. lat. and 39° W. long. (Map: Brazil, K 6). It forms a superb natural harbor, 37 miles long and 27 miles broad, with an easy entrance. It contains several islands, the largest of which, Itapasica, is 18 miles long and 3 miles broad. The town of Bahia (q.v.) is situated on it.

ALL-SAINTS' DAY. In old English, All-Hallows, All-Hallowmas, or simply Hallowmas, a festival of the ancient Christian Church, introduced because of the impossibility of keeping a separate day for every saint. As early as the fourth century, on the cessation of the persecution of the Christians, the Sunday after Easter was appointed by the Greek church for commemorating the martyrs generally; and in the Church of Rome a similar festival was introduced about 610 A.D., when the old heathen Pantheon (the present Rotunda, or Santa Maria de' Martiri) was consecrated, on March 13, to Mary and all the martyrs. But the real festival of All Saints was first made of obligation by Gregory IV in 835. It was admitted into England about 870 and is now a well-recognized day there and wherever the Church calendar is closely followed. The choice of the day was doubtless determined by the fact that a chapel in St. Peter's Church in honor of all the saints was consecrated by Gregory III, in 731, on November 1, which established the date of the Roman observance. In conformity with this local custom Gregory IV ordered the first of November to be universally observed for the commemoration.

ALL SORTS AND CONDITIONS OF MEN.

A story, by Sir Walter Besant, of a wealthy college girl who endeavors to show to the poor of East London a way of escape from the sordid misery of their lives. The People's Palace in East London owes its origin to this novel.

ALL SOULS COLLEGE. A college of the University of Oxford, founded in 1437-38 by Archbishop Chichele, partly as a chantry where prayers should be made for the souls of all Christians (especially such as fell in the war for the crown of France, of which Chichele had been the adviser), and partly as a society of fellows free from the charge of undergraduate students. The college has been noted for the devotion of its members to history and law, subjects in which the founder was distinguished. In late years the number of fellowships has been increased from 40 to 50, and two Chichele professorships have been instituted—one in international law and diplomacy, and one in modern history. The fellows are selected for their distinction in the study of law and history. Among the ecclesiastics who have been enrolled at All Souls College are Sheldon, Jeremy Taylor, and Reginald Heber; among lawyers and statesmen, Blackstone, Gladstone, Salisbury, and Curzon. The Codrington Library contains over 70,000 volumes and is noted as one of the finest law libraries in England.

ALL-SOULS' DAY. A holy day of the Roman Catholic church, which falls on November 2. The object of it is by prayers and almsgiving to alleviate the sufferings of souls in purgatory. For long no especial day was appointed for the commemoration of all the departed who have not attained perfect life. Among the early Christians the names of the departed were entered on the diptychs, or lists, used at the altar, from which the priest read the names of those for whom he was required to pray that God might give them "a place of refreshment, light, and peace." In the sixth century it was customary in Benedictine monasteries for a commemoration of all the departed brethren to be held at Whitsuntide. In Spain the memorial of All Souls was celebrated in the time of St. Isidore on the octave of Pentecost; this seems a Western echo of the Oriental custom of commemorating All Saints on that day, and All Souls on the Saturday before Whitsunday. St. Odilo of Clugny, in 998, ordered that in all monasteries affiliated to Clugny the commemoration of All Souls should follow on the morrow of the Feast of All Saints. Thence the observance of November 2 as All Souls' day spread throughout the West as a universal custom. The day furnishes a place for the survival, among the European peasantry, of many folk-customs from the pre-Christian times.

ALLSPICE (*all + spice*). A name given to the dry unripe berry of the pimento (*Pimenta officinalis*), a small evergreen tree. The berry is supposed to combine the flavor of several spices, especially cinnamon, nutmeg, and cloves; hence the name. The tree is cultivated in the West Indies, especially in Jamaica, for its aromatic leaves and berries. The berries grow in clusters. They are about the size of peas and are used as a spice for seasoning food. The word "allspice" is also applied to the aromatic bark of various other plants, particularly *Calycanthus floridus* (q.v.). For illustration, see Plate of ABUTILON.

ALLSTON, MARGARET. See BERGENGREN, ANNA (FABQUHAR).

ALLSTON, THEODOSIA BURR. See BURR, THEODOSIA.

ALLSTON, WASHINGTON (1779-1843). A distinguished American painter and author. He was born at Waccamaw, S. C., on his father's plantation, Nov. 5, 1779, but passed his childhood and received his education and early instruction in art at Newport, Boston, and Cambridge. Malbone, the miniature painter, was an early friend and adviser, and the portraits of Pine a valuable influence. After graduating from Harvard in 1800, Allston went to Charleston, S. C., where he began his art career. In 1801 he went with Malbone to London and became a student of the Royal Academy, which was at that time under the presidency of his fellow countryman, Benjamin West. In 1804 he visited Paris in company with the afterward celebrated painter Vanderlyn. Here, before going to Italy, he studied in the Louvre the masterpieces of the various schools and showed a decided preference for the rich, glowing color of the Venetians, an influence which held more or less through life. He passed four years in Rome, the companion of Thorwaldsen, Coleridge, Vanderlyn, and Washington Irving, studying the great masters and acquiring their dignified and lofty style, for which he was peculiarly fitted by temperament. He returned to America in 1809, married a sister of Dr. William Ellery Channing, and went again to London, where he painted and exhibited with marked success for seven years. Failing in health, he came home in 1818, and settled first in Boston, afterward in Cambridge, where he passed the remainder of his life in comparative seclusion on account of enfeebled health. He attracted to himself a refined and cultivated circle of friends and admirers; for Allston was a man of scholarly tastes, a rare talker, and a writer of much charm. His temperament was nervous and high-strung. His cast of mind was eminently artistic, imaginative, and of a noble tenor.

Although Allston was esteemed by contemporaries the greatest artist of his day, modern criticism fails to confirm this verdict. His smaller paintings and portraits often show delicacy of drawing and refinement of color; but his more ambitious efforts prove his inability to realize artistically his mighty conceptions. One of the earliest of his important canvases, "The Dead Man Revived" (1810), was purchased by the Pennsylvania Academy of the Fine Arts. Then followed a number of historical and imaginative works: "St. Peter Liberated by the Angel" and "Uriel in the Sun." In America, after his final return, he painted "The Prophet Jeremiah," now at Yale College, his large unfinished "Belshazzar's Feast," now in the Boston Athenæum, and several smaller works, including "Dante's Beatrice," and "Spalatro's Vision of the Bloody Hand," a powerfully dramatic work. The Metropolitan Museum in New York possesses "The Flood" and "A Spanish Girl." His best-known portraits are those of Benjamin West (Boston Athenæum) and Coleridge (National Portrait Gallery, London). His poem, *The Sylphs of the Season*, was delivered before the Phi Beta Kappa Society at Cambridge and subsequently published in London (1813). He wrote also a novel, *Monaldi* (Boston, 1841). His *Lectures on Art* appeared after his death. He died at Cambridge, July 9, 1843, and his

burial took place by torchlight. For his biography, consult the volume on him in Sweester's *Artist Biographies* (Boston, 1879), and the *Life and Letters* published by his relative, J. B. Flagg (New York, 1892).

ALL'S WELL THAT ENDS WELL. A comedy by Shakespeare, produced in 1601, but probably largely written as early as 1595. It was included in the folio of 1623. The plot is based upon a story in Boccaccio's *Decameron*, which had been already borrowed in Painter's *Palace of Pleasure*. Shakespeare, however, added the comic characters of Lafeu, Parolles, and the clown, though without transforming the pathos of the original tale.

ALL-THE-TALENTS MINISTRY. A complimentary designation bestowed by its friends on the English ministry formed by Lord Grenville in 1806. Used in derision by its opponents, it has passed into history as an ironical appellation.

ALLU'VION (Lat. *alluvio*, a washing upon, from *ad*, to + *luere*, to wash). The legal term for land gained from the sea or other waters, public or private, by the imperceptible reliction of the water boundary or the gradual washing up of silt and earth, the scientific and popular term for which is *alluvium*. Alluvion is an accretion (q.v.) to the upland and becomes part and parcel of the land to which it is annexed and the property of the owner of the latter. When the change effected by the water is sudden, or so rapid as to be perceptible from day to day, as where the line of the seashore is altered by a storm, or a river suddenly changes its course, or where the deposit, however gradual, is the intentional result of artificial causes, it is not an alluvion or accretion, and the title to the land so covered or uncovered is not affected. Thus, if the sea suddenly engulfs a tract of upland, the land continues to be the property of its former owner, even though it remain permanently submerged. The division of alluvion between adjoining riparian proprietors, whose division line, if projected, would cut it, is a matter of some difficulty. Among several rules which have been adopted, the simplest is that which on private streams prolongs the division line at right angles with the middle line or thread of the stream. As such middle line is the boundary between opposite riparian proprietors, an island formed in the stream belongs to the proprietor on whose side of the line it lies. If this line cuts the island, the latter is divided by the line. Consult Angell, *Treatise on the Law of Watercourses* (Boston, 1877), and Gould, *Treatise on the Law of Waters* (Chicago, 1900). See AVULSION; RIPARIAN RIGHTS; SEASHORE; WATER RIGHTS.

ALLU'VIUM (from Lat. *ad*, to + *luere*, to wash). A term applied to the sediment transported by rivers and spread over submerged lowlands during periods of flood. This alluvium sometimes forms "flood plains" bordering rivers, or builds up conical heaps, "alluvial cones," at points where rivers debouch from narrow valleys on to lower areas, or constitutes deltas at river mouths. Alluvial soils are among the most productive known, because of the additional fresh material applied to their surfaces during periods of high water. The flood plains of the Nile, Ganges, and Mississippi are illustrations. See DELTA; FLOOD PLAIN; RIVER; SOIL.

ALLWARD, WALTER SEYMOUR (1875—). A Canadian sculptor. He was born at Toronto

and educated in the public schools. In 1889 he was apprenticed to an architect and after five years' study, during which he showed a decided talent for architectural figure-work, began his career as sculptor with the figure of "Peace," surmounting the Northwest Rebellion Monument in Queen's Park, Toronto. He was next commissioned to execute busts of several eminent Canadians for the Art Gallery of the Provincial Museum in that city. Full-length heroic statues of Sir Oliver Mowat, Gen. John Graves Simcoe, J. Sandfield Macdonald, and other prominent Canadians, erected in different cities, attest the popularity and artistic appreciation of his work. His greatest success stands in Queen's Park, Toronto, and is the well-known monument, whose main shaft is 70 feet high, commemorating the Canadian soldiers who fell in the Boer War in South Africa.

ALL'WORTH, LADY. In Massinger's play, *A New Way to Pay Old Debts*, a wealthy widow.

ALLWORTH, TOM. In Massinger's *A New Way to Pay Old Debts*, the stepson of Lady Allworth, and lover of Margaret Overreach.

ALL'WORTHY, THOMAS. The generous squire in Fielding's *Tom Jones*; foster-father of the hero. He is a philanthropic gentleman, an admirable character, understood to be patterned after Fielding's own benefactor and friend, Ralph Allen.

ALMA, ä'l'mä. A river in the Crimea, rising on the northern woody slope of the Yile, south of the Tchatir-Dagh. It flows at first in a northerly direction, then turns to the west, and empties into a small bay on the Black Sea, 17 miles north of Sebastopol. It is about 46 miles long. The vale of the Alma is renowned for the beauty of its scenery and its many magnificent fruit gardens. On the steep banks of this stream, through the channel of which the British troops waded amidst a shower of bullets, a brilliant victory was won on Sept. 20, 1854, by the armies of Britain, France, and Turkey, under Lord Raglan and Marshal Saint-Arnaud, over the Russian army, commanded by Prince Mentchikoff. After five hours of stubborn fighting the Russians were forced to retreat in disorder upon Sebastopol, 17 per cent of the Russians (numbering 33,000, against 62,000 of the allies) having been killed and wounded. The Turks took no active part in the battle.

AL'MA. A city and county-seat of Wabaunsee Co., Kan., 35 miles west of Topeka, on Mill Creek, and on the Atchison, Topeka and Santa Fé and the Chicago, Rock Island and Pacific railroads (Map: Kansas, F 2). It is the centre of an agricultural and stock-raising district and has good water power and a large flour mill. Pop., 1890, 1125; 1900, 966; 1913 (est.), 1100.

ALMA. A city in Gratiot Co., Mich., 90 miles northeast of Grand Rapids, and 40 miles west of Saginaw, on the Pere Marquette and the Ann Arbor railroads, and on Pine River (Map: Michigan, E 5). It is the seat of Alma College (q.v.), the Michigan Masonic Home, and has an excellent high school. The most important manufactures are auto trucks, hay and paper presses, gas engines, beet sugar, furnaces, cement blocks, flour, asphalt mastic, and lumber products. It is one of the best agricultural territories in the State. Alma was settled in 1853 and was incorporated as a city in 1905. The mayor is elected annually, and the council is composed of eight members. The water works

are the property of the municipality. Pop., 1880, 456; 1890, 1655; 1900, 2047; 1904, 3015; 1910, 2757; 1913 (est.), 3000.

ALMA. A city and county-seat of Buffalo Co., Wis., 52 miles northwest of La Crosse, on the Mississippi River and on the Chicago, Burlington and Quincy Railroad (Map: Wisconsin, B 4). It is in an agricultural region, is connected by steamboat with ports on the river, and has some minor manufactures. Pop., 1890, 1428; 1900, 1201; 1905, 1172; 1913 (est.), 1250.

ALMA. In Spenser's *Faerie Queene*, the personification of the human soul, the queen of "Body Castle."

ALMA. A pseudonym of Charlotte Yonge, the novelist.

ALMACK'S, ʔl'mäks. A suite of assembly rooms in King Street, London, built in 1765. They took their name from that of their builder, or, rather, that assumed by him. It is said he was originally a poor Scottish Highlander named McCall, and that as a preparatory step to rising into importance in London, he inverted the syllables of his patronymic. The name of Almack's is chiefly associated with the balls which were held there for many years under the management of a committee of ladies of high rank. The glory of Almack's belongs to a period earlier than the middle of the nineteenth century, but the name has become synonymous with aristocratic exclusiveness. The London club now known as Brooks's, formerly Almack's, was established by Almack in Pall Mall some time before 1763. Consult Timbs, *Clubs and Club Life in London* (London, 1873), and Walford, *Greater London* (London, 1883-84).

ALMA COLLEGE. A coeducational institution at Alma, Mich., under control of the Presbyterian church, founded in 1887. In addition to the college department, conferring the degrees of A.B., Ph.B., and B.Sc., it maintains an Academy, Schools of Music and Art, and Extension Courses, with a total attendance in 1913 of 310 and a faculty of 27. It has a campus of 36 acres valued, with the buildings, at \$175,000, and an endowment of \$400,000. President, Thomas C. Blaisdell, Ph.D.

ALMADA, ʔl-mä'dá. A town of Portugal, in the province of Estremadura, on the south bank of the Tagus, opposite Lisbon. It is built at the foot of a height, on the summit of which is the fortress of San Sebastian, is a great wine depot, and has long been celebrated for its fruit. Near it is the gold mine of Adissa. Pop., 1900, 7913.

ALMA DAGH, ʔl'mä däç'. The ancient *Amanus*. A branch of the Taurus mountain range in Asia Minor.

ALMADÉN, or **ALMADÉN DEL AZOGUE**, ʔl'má-dän' děl á-thō'gá (Ar. mine of quicksilver). A town in Spain, 50 miles west-southwest of Ciudad Real, situated between two mountains in the Sierra Morena chain (Map: Spain, C 3). Its ancient name was Sisapon. It is a pretty town, with a ruined Moorish castle and a school of mines. It owes all its importance to famous quicksilver deposits which were known to the Romans and Moors. In the sixteenth century they were leased to the Fuggers of Augsburg. In 1645 they reverted to the crown. During part of the nineteenth century they were worked by the Rothschilds of London. There are five stages or galleries, the lowest being 1150 feet beneath the surface. The mercury is found in many combinations, but about 10,000 tons of

ore are annually raised, 10 per cent of which is pure metal. Employment is given to 4000 miners. Sulphur and lead are also found in the vicinity. Pop., 1900, 7459; 1910, 8398.

ALMAGEST, ʔl'má-jěst. The greatest work of Claudius Ptolemæus (see **PTOLEMY**) bore the title *Μεγάλη Σύνταξις*, *Megalē Syntaxis* ('great system'). The admirers of Ptolemy changed *μεγάλη*, *megalē*, great, to *μεγίστη*, *megistē*, greatest, and the Arabian translators added the Arabic article *al*, producing *al-majisti*, whence was derived the common mediæval title "almagest." The work contains Ptolemy's important contributions to trigonometry and mathematical astronomy.

ALMAGRO, ʔl-mä'grō. A town of New Castile, Spain, in the province of Ciudad Real, 12 miles east-southeast of Ciudad Real (Map: Spain, D 3). It is situated in a high, arid plain, is well built, and has wide paved streets and a fine square. Brandy, soap, and earthenware are manufactured, and lace-making gives employment to a large number of women in Almagro and the neighboring villages. The surrounding country is celebrated for its beautiful vineyards and olives, and there are many mineral springs. The vine of this region yields the well-known red wine Valdepeñas. Pop., 1900, 8015; 1910, 8310.

ALMAGRO, DIEGO DE (1475-1538). A Spanish adventurer, said to have been a foundling in the Spanish town whose name he bore. He came to America with Pedro Arias de Avilla in 1514 and settled at Darien, whence he removed to Panama in 1519, when that town was founded. In 1524 he formed a partnership with Pizarro for the conquest of a region on the Pacific coast to the south, which was reported to contain gold. The first voyage was a failure. The second voyage, undertaken in 1526, began with a succession of reverses, and Pizarro wished to abandon the enterprise, but Almagro persuaded him to continue, and eventually they were rewarded with the wealth of the Incas' Empire. Pizarro secured to himself and his brothers most of the fruits of victory and deprived Almagro of his fair share of plunder and power. In 1535 Almagro obtained from Charles V the title of Adelantado, or Governor, of "New Toledo," a territory extending 200 leagues along the coast, beginning at the southern limit of Pizarro's grant. A dispute immediately arose as to the boundary between the two grants, Almagro claiming that Cuzco lay within his territory. He returned from an expedition which he had undertaken, without much success, into the snowy plateau region of the southern Andes, to enforce this claim, and entered Cuzco, asserting that he was its legitimate governor. The Marquis Pizarro at once dispatched Espinosa to effect, if possible, an amicable settlement; but Almagro was elated by his recent successes and refused to entertain any compromises. Further negotiations led to a personal conference between Pizarro and Almagro, Nov. 13, 1537, which ended in an altercation, and the two old friends parted, for the last time, in very angry mood. Pizarro's forces gradually forced Almagro back toward Cuzco, near which place he made a stand. A furious battle was fought, April 26, 1538. Almagro was captured, and garroted in the following July.

Almagro's son, **DIEGO (1520-42)**, called *el Mozo* to distinguish him from his father), whose mother was an Indian girl of Panama, was at

first treated kindly by Pizarro; but he soon came under the influence of some of his father's friends, who had formed a conspiracy to overthrow Pizarro. The marquis was murdered on June 26, 1541; the conspirators proclaimed the lad Almagro, who was about 21 years old, Governor of Peru and then promptly quarreled among themselves. When all but one of the leaders had been murdered or had died from fever and exposure, Almagro took matters into his own hands and ordered the execution of the only remaining man of consequence among them. Meanwhile Vaca de Castro, who had been sent from Spain by the government to end the civil war in Peru, arrived and assumed the government. Almagro refused to submit and was attacked by the royal forces, who defeated him in a desperate battle on Sept. 16, 1542. Almagro fled to Cuzco, but was arrested, immediately condemned to death, and executed in the great square of the city.

AL'MAIN. An old name for Germany, derived from that of the *Alemanni* (q.v.).

ALMALEE, ä'l-mä'lë. See ELMALU.

AL'MA MA'TER (Lat. nourishing mother). A name applied to a university or college, and expressing the relation between the institution and the students who have been educated in it. The term is one of affection, and suggests a mutual dependence of university and alumnus one upon the other. The term "matriculation" (q.v.) is derived from the same root and is applied to entrance into a university; it carries the same meaning.

AL-MAMUN, ä'l'mä-möön', ABU ABBAS ABD-ALLAH (783-833). A caliph of the line of the Abbasides (q.v.), distinguished for his intellectual qualities. He was the son of Harun-al-Rashid. When Harun died, his brother Amin succeeded to the caliphate; but his treatment of Al-Mamun led to war, and after five years of fighting Amin was slain and Al-Mamun took his place (813). The early part of his reign was disturbed by revolts and heresies; but when affairs settled down he fostered the cultivation of literature and science throughout his Empire, and Bagdad became the seat of academic instruction and the centre of intelligence. He had books translated from Greek, Pahlavi, and Aramaic, founded astronomical observatories, determined the inclination of the ecliptic, had a degree of the meridian measured on the plain of Shinar, and constructed astronomical tables of remarkable accuracy. He paid more respect to science than to orthodoxy and drew his servants from all countries and all creeds. In 827 he favored the heretical doctrines of the Mutazilites (q.v.), who asserted the free will of man and denied the finality of the Koran. In the latter years of his reign he was involved in war with the Greek Emperor Theophilus, and revolts broke out in various parts of his Empire. In 833, after quelling a disturbance in Egypt, he marched into Cilicia against the Greeks, but died suddenly near Tarsus, leaving the caliphate to his younger brother, who took the name Al Mutasim. Al-Mamun was the author of *Inquiries into the Koran*, a tract on *Signs of Prophecy*, and one on *The Rhetoric of the Priests and Panegyrist of the Caliphs*. Consult Muir, *The Caliphate* (London, 1891). See ARABIA.

AL'MANAC (of disputed origin). A book or table containing a calendar of the civil divisions of the year, the times of the various astronomical phenomena, and other useful or enter-

taining information. Till a comparatively modern date, this additional matter consisted of astrological predictions and other analogous absurdities; it now embraces, in the best almanacs, a wide variety of useful notes and information, chronological, statistical, political, agricultural, etc.

The history of almanacs, like all early history of astronomy, goes back to very ancient times. The Alexandrian Greeks certainly had almanacs, though the time when they first appeared in Europe is not precisely known. The oldest of the copies (manuscript) existing are of the thirteenth and fourteenth centuries; there are specimens in the libraries of the British Museum and of Corpus Christi College, Cambridge. The earliest-known printed European almanac was compiled by the celebrated astronomer Purbach and appeared between the years 1450 and 1461; but the first almanac of importance was that compiled by his pupil, Regiomontanus, for the 57 years from 1475 to 1531, for which he received a munificent donation from Matthias Corvinus, King of Hungary. Bernardo de Granolachs of Barcelona commenced the publication of an almanac in 1487; the printer Engel of Vienna, in 1491; and Stöffler of Tübingen, in 1524. Copies of these are now very rare. In 1533 Rabelais published at Lyons his almanac for that year and renewed the publication in 1535, 1548, and 1550. The fame and popularity of the astrologer Nostradamus, who prophesied the death of Henry II of France, gave such an impulse to the publication of predictions that in 1579 Henry III of France prohibited the insertion of any political prophecies in almanacs—a prohibition renewed by Louis XIII in 1628. Before this, in the reign of Charles IX, a royal *ordonnance* required every almanac to be stamped with the approval of the diocesan bishop.

Prophetic almanacs have circulated very largely in France in the rural districts and among the uneducated. The most interesting of these is perhaps the old *Almanach Liégeois*, a venerable remnant of superstition. It was first published at Liège—according to the invariable title-page which takes no note of time—in 1636, by one Matthieu Laensbergh, whose existence, however, at any time seems very problematical. The *Almanach Liégeois* is a most convenient one for those who are unable to read, for by certain symbols attached to certain dates the most unlettered persons can follow its instructions; thus, the rude representation of a vial announces the proper phase of the moon under which a draught of medicine should be taken; a pair of scissors points out the proper period for cutting hair, a lancet for letting blood. Of course, among innumerable predictions, some may naturally be expected to come to pass. So in 1774 this almanac predicted that in April of that year a royal favorite would play her last part. Madame du Barry took the prediction to herself, and repeatedly exclaimed: "I wish this villainous month of April were over." In May Louis XV died, and Madame du Barry's last part was really played. The credit of old Matthieu was established more firmly than ever. In 1852, a commission having examined between 7000 and 8000 of the national chapbooks, which included a great number of almanacs, pronounced them so deleterious that it became necessary forcibly to check their circulation. Although still in vogue amongst the ignorant, their popularity is greatly on the wane.

In England, so far was any restraint from being put upon the publication of prophetic almanacs, or "prognostications," as they were usually called, that royal letters patent gave a monopoly of the trade to the two universities and the Stationers' Company, under whose patronage, and with the *imprimatur* of the Archbishop of Canterbury, such productions as *Moore's Almanac* and *Poor Robin's Almanac* flourished vigorously; although "it would be difficult to find, in so small a compass, an equal quantity of ignorance, profligacy, and imposture as was condensed in these publications." The memory of Partridge, long employed as the prophet of the Stationers' Company, is preserved in the lively diatribe of Swift, writing under the name of Bickerstaff. There is a legal decision on record in the year 1775, in favor of a bookseller named Carnan, abolishing the monopoly of the Stationers' Company. In 1779 Lord North brought in a bill renewing their privileges. After a powerful speech against the measure by Erskine, who exposed the pernicious influence of the productions published under the monopoly, it was rejected. The Stationers' Company, however, still maintained their ground by buying up all rival almanacs; and it was not until the publication, in 1828, of the *British Almanac*, by the Society for the Diffusion of Useful Knowledge, that the eyes of the English public became opened to the irrational and deleterious nature of the commodity which their own indifference or folly, as much as the selfishness of their purveyors, had hitherto maintained in existence.

In Scotland the earliest almanacs seem to have been produced about the beginning of the sixteenth century. Shortly after the beginning of the seventeenth century the almanacs, or "prognostications," published at Aberdeen had begun to acquire a great reputation. About the year 1677 they were sold for a *plack* each; and the annual circulation amounted, on an average, to 50,000 copies. In 1683 appeared a rival publication, under the title of *Edinburgh's True Almanack, or a True Prognostication*. For a long time Scottish almanacs continued, like all others of that age, to contain little besides a calendar, with a list of fairs, and—what constituted the great attraction—predictions of the weather. But something more instructive and comprehensive became requisite, and the *Edinburgh Almanac* seems to have been among the first to respond to this requirement of advancing civilization; for, by various additions, such as a list of Scottish members of Parliament, it had, in 1745, been extended from the original 16 pages to 36. In 12 years from that date it had swelled to 72 pages; in 1779 it had reached 252 pages. After 1837 it was published under the title of *Oliver and Boyd's New Edinburgh Almanac*, and extended to above 1000 pages.

Almanacs containing astrological and other predictions are still published in Great Britain; but their influence is extremely limited, even among the most ignorant portion of the community, and their contents are fitted to excite amusement rather than any stronger emotion.

In America the publication of almanacs for popular use is confined very largely to the vendors of proprietary or patent nostrums and medicines. These persons distribute the almanacs gratuitously, judging rightly that they constitute a most excellent advertisement of their wares. This is due principally to the fact that people keep their almanacs at hand throughout

the year, and thus the advertisements printed in them are ever present to the public eye. Among the almanacs in the United States that are sold for a small price, the most important are probably the *Old Farmers'*, issued in New England, and those coming from several great newspaper offices. It is believed that the first common almanac in North America was for 1687, from Bradford's press in Philadelphia. Franklin's *Poor Richard's Almanac*, begun in 1732, was kept up by him about 25 years, and was widely known both at home and abroad for its wise and witty sayings. *The American Almanac and Repository of Useful Knowledge* was issued in Boston from 1828 to 1861; a continuation, *The National Almanac*, came out for two years only, 1863 and 1864. Nearly every religious denomination has its special annual, either almanac or year-book; and many trades, professions, and enterprises have similar publications.

The *Almanach de Gotha* occupies a place among almanacs peculiarly its own. First published in 1763, it gives genealogical particulars concerning all the sovereign houses of Europe, the mediatised families of Germany, and most of the European princely and ducal houses of non-sovereign rank. It also contains much valuable information regarding the officers of administration and the statistics of the different political divisions of the globe. Until 1871 it appeared in French; since that time it has been published in both French and German.

Astronomical Almanacs. There are also important astronomical almanacs. The *Nautical Almanac*, published in England, was projected by Nevil Maskelyne, Astronomer Royal from 1765 to 1811, who urged its value in connection with the use of lunar distances for the determination of longitude. The first edition of this work was published with the authority of government in 1767. After Dr. Maskelyne's death it gradually lost its character, and in 1830, in consequence of the numerous complaints made against it, the government requested the Astronomical Society to pronounce upon the subject. The suggestions of the society were adopted, and in 1834 the first number of the new series appeared, with such additions and improvements as the advanced state of astronomical science rendered necessary. Still older than this almanac is the French *Connaissance des Temps*, commenced in 1679 by Picard and now published under the authority of the *Bureau des Longitudes*. Its plan is similar to that of the *Nautical Almanac*, but it has contained a larger amount of original memoirs, many of them of great value. Equally celebrated is the Berlin *Astronomisches Jahrbuch*, issued from the Berlin Observatory.

In the United States, Congress in 1849 provided for the publication of such a work, in which "the meridian of the observatory at Washington shall be adopted and used as the American meridian for astronomical purposes, and the meridian of Greenwich shall be adopted for all nautical purposes." Accordingly the *American Ephemeris and Nautical Almanac* was begun in that year by Charles Henry Davis, of the United States navy, and the first volume (for 1855) was published in 1853. The publication is issued from the office of the *Nautical Almanac*, United States Naval Observatory, in Washington, and contains tables of the predicted positions of the sun, moon, and planets, and of all the fixed stars used in navigation. It is pub-

lished three years in advance, for the convenience of navigators bound on long voyages. These astronomical almanacs are also of the greatest importance to astronomers, as they contain collections of numerical data required in the computation of their celestial observations. Their preparation and publication, however, are so costly that they are possible only to the great financial resources of governments, and it is largely for this purpose that governmental astronomical observatories are maintained.

* **ALMANACH DE GOTHA**, ăl'mă'na' de gö'tă'. See under ALMANAC.

AL'MANDINE (Fr. *almandine*, from Lat. *alabandina*). The red, transparent, precious variety of garnet, so called from Alabanda, a town in Caria, where it was found. This name is given to a violet-colored variety of Spinel ruby.

ALMANSA, ăl-măn'să. A town of Murcia, Spain, in the province of Albacete, 43 miles east by south of Albacete, on the Madrid and Alicante Railway (Map: Spain, E 3). It is situated on a fertile plateau. Almansa carries on manufactures of linen, hempen, and cotton fabrics, the materials of which are supplied from the neighborhood; also of brandy, leather, and soap. Many sheep graze on the fine pastures in the vicinity of this town. Pop. of the commune, 1900, 11,117; 1910, 11,887. Near Almansa the French, under the Duke of Berwick, natural son of James II of England, gained a victory on April 25, 1707, over an army of Spanish and English troops commanded by Henry de Ruvigny, Earl of Galway. See SUCCESSION WARS.

AL-MANSUR, ăl'mân-sōōr' (Ar. The Victorious), ABU JA'FAR ABDALLAH IBN MOHAMMED (712-775). The second Caliph of the house of the Abbasides (754-775). He regulated the finances and the post in the kingdom and patronized learning. One of his great achievements was to found Bagdad. He died during a pilgrimage to Mecca, at the age of 63. See ABBASIDES.

ALMA-TADEMA, ăl'mă tād'ê-mă, SIR LAURENCE (1836-1912). A well-known painter, of Dutch origin and Belgian training, who practiced most of his life in London. His real name was Laurens Alma Tadema, but he adopted the more aristocratic form in England. He was born in West Friesland, Jan. 8, 1836, and studied under Wappers and for a longer period under Leys at Antwerp. Pictures of Frankish life occupied him till 1863, after which he took up Ancient Egyptian subjects for two years, finally devoting himself mainly to depicting the life of the Greeks and Romans. Early essays in this style were the "Warrior of Marathon" (1865), "Roman Amateur," and the "Pyrrhic Dance," which he sent over to the Royal Academy in 1869, in which year he went to live in London. His success was recognized by membership in the Academy in 1879 and knighthood in 1899. His house in Grove End Road, furnished in classic style with exquisite taste and containing his valuable collection of antiquities, was a centre of famous artistic gatherings. Among important pictures are "The Roses of Heliogabalus" (1888), "Spring" (1894), "The Conversion of Paula" (1898), and "Thermæ Antoninianæ" (1899). At the World's Fair of St. Louis (1904) he exhibited the "Coliseum," the "Shrine of Venus," and "Caracalla." Later works are the "Finding of Moses" (1905), "A Family Custom" (1909), and the "Voice of Spring" (1910). His work is remarkable for its careful archæological research. He is pe-

culiarly successful in painting marble and bronze. In composition he is scholarly; his drawing is good, his coloring faithful, but he is at times charged, and not without reason, with a lack of sentiment. His pictures indeed have the value of trustworthy records of the past, but they rarely move more than the intellect. His wife and pupil, LAURA T. ALMA-TADEMA (1852-1909), was a genre painter of delicacy and charm, whose art found inspiration in Dutch genre of the seventeenth century. Consult: Zimmern, *L. Alma-Tadema: His Life and Work* (London, 1886); Georg Ebers, *L. Alma-Tadema* (Eng. trans., New York, 1886); Monkhouse, *British Contemporary Artists* (London, 1899); Standing, *Sir Laurence Alma-Tadema* (New York, 1905).

ALMA-TADEMA, Miss LAURENCE. An English author and poet, daughter of Sir Laurence Alma-Tadema. Her published writings include: *Love's Martyr* and *The Wings of Icarus*, novels; *The Crucifix*, tales; *The Fate Spinner*, a novel (1900); *The Herb o' Grace*, essays (1901-02); *Songs of Womanhood* (1903); *Four Plays* (1905); *Tales from My Garden* (1906). In 1907-08 she gave a course of readings in the United States on the *Meaning of Happiness*, etc. She translated several works of foreign writers.

ALMAVIVA, ăl'mă-vē'vâ, COUNT. A character in Beaumarchais's comedies *Le barbier de Séville*, *Le mariage de Figaro*, and *La mère coupable*, appearing successively as a fascinating young nobleman, a disillusioned husband, and an old gallant.

ALMEH, ăl'mê, or **ALMAI** (Ar. 'ālimah, learned woman, from 'alama, to know). A class of singing girls in Egypt. To enter the almeah one must have a good voice, know the rules of verse, and be able to improvise couplets adapted to circumstances. These girls are in demand at all entertainments and festivals, and at funerals as hired mourners. They are distinct from the *ghawāzī*, or dancing girls, who are of a lower order and perform in the streets.

ALMEIDA, ăl-mă'ê-dă. Formerly one of the chief strongholds of Portugal, situated on the river Coa, on the Spanish frontier, in the province of Beira (Map: Portugal, B 2). In 1762 it was captured by the Spaniards, who soon afterward surrendered it. In their retreat from Portugal, 1811, the French, under General Brenier, destroyed a great portion of the fortifications of Almeida, which, however, were speedily repaired by the English. It is celebrated also for its sulphur waters. Pop., 1900, 2312.

ALMEIDA. A town situated on the east coast of Brazil, in the State of Espirito Santo, near the mouth of the Reis Magos River, 20 miles north of Victoria. It was founded by Jesuits in 1580. Pop., 1912, 5000.

ALMEIDA, FRANCISCO DE (1450?-1510). A Portuguese warrior and empire builder. For his services against the Moors he was made, in 1505, Viceroy of the Portuguese possessions in the East Indies. At Cannanore, Cochin, and Quilon, and in Ceylon and Sumatra he either built fortresses to protect the Portuguese factories or founded new trading posts. His attempt to establish the supremacy of Portugal in the Indian seas brought him into conflict with the Venetians and the Egyptians. In a great battle fought between Lorenzo de Almeida, son of Francisco, and a combined Venetian and Egyptian fleet, in the harbor of Chaul, in 1507, young Lorenzo fell. To avenge his death, Fran-

LAURENCE ALMA-TADEMA
AT THE SHRINE OF VENUS

cisco sacked the ports of Goa and Dabul, and refusing to acknowledge Albuquerque, who had been sent out to supersede him, destroyed the Egyptian fleet at Diu in 1508. Then he resigned his command and sailed for home, but perished in a skirmish with African savages near the Cape of Good Hope.

ALMEIDA - GARRETT, ăl-mă'ê-dă-găr-rêt'/JOÃO BAPTISTA DA SILVA LEITÃO. VISCOUNT OF (1799-1854). A distinguished Portuguese statesman and author, leader of the romantic movement in his country, and its most important poet of the nineteenth century. He was born at Oporto and died at Lisbon. After a boyhood spent in the Azores, under the tutelage of a highly gifted uncle, Bishop of Angra, he attended the University of Coimbra and there imbibed the revolutionary ideas which led him to participate in the revolt of 1820 and three years later resulted in his expatriation. Hitherto his writings, such as the dramas *Merope* and *Catão*, and the didactic poem on painting, *O Retrato de Venus*, reflected the spirit of French classicism and the native "Arcadian" school. In England and France, however, he came under the influence of Scott and the French romanticists, and this influence is reflected in his epic, *Camões* (1825), the burden of which is the poet's longing for his home: and in his equally well-known *Dona Branca* (1826), a long poem, half epic, half lyric, and aimed especially against monastic life. He returned to Portugal in 1826 and suffered a brief imprisonment owing to some political articles. Two years later he was again forced to seek safety in exile: but when, in 1832, Dom Pedro returned from Brazil for the purpose of contesting the throne with his brother, Dom Miguel, Almeida-Garrett joined his forces, and after the victory of 1833 was rewarded with a place in the cabinet as Minister of the Interior. His life henceforth was one of remarkable activity. As a member of the national Cortes, he showed himself an uncompromising supporter of democratic principles and instituted many reforms. He interested himself especially in the founding of a national theatre and a conservatory of dramatic art, and wrote a long series of prose dramas, the central figure in each case being some typical national character, such as *Auto de Gil Vicente* (1838), *De Filippa de Vilhena* (1840), and *Frei Luiz de Sousa* (1844). One of his most important contributions to literature is his *Romanceiro* (1851-53), a collection of 32 early Portuguese ballads and romances, the text of which he freely restored and emended. His last work is a poem, *Folhas caídas* ('Fallen Leaves'), a dramatic record of a love that came in the autumn of life, which for pathos and emotional power is hardly equaled in Portuguese literature. An edition of his collected works appeared after his death (Lisbon, 1854-77). The best biography is that of Gomes de Amorim, *Garrett, Memórias biographicas* (3 vols., Lisbon, 1881-84).

ALMELO, ăl'mă-lŏ'. A town in the Netherlands, 21 miles by rail northeast of Deventer (Map: Netherlands, E 2). Linen and cotton goods are manufactured. There are many churches, in one of which is the family vault of the Von Rechteren, who were lords of the district previous to the fourteenth century. Their castle is here also. Pop., 1889, 8354; 1900, 10,018.

ALMERIA, ăl'mă-rĕ'ă (Ar. The Conspicuous). The capital of the province of Almeria

in Spain, 60 miles southeast of Granada, and the seat of a bishop (Map: Spain, D 4). It stands at the head of the Gulf of Almeria, at the mouth of the river of the same name, and its harbor, which is one of the best in Spain, is well fortified and is 178 acres in extent. Behind it rises a lofty mountain ridge on which is a Moorish fortress. The flat-roofed houses are Oriental in character, and some ruined castles, together with the general appearance of the place, evidence its antiquity. The Gothic cathedral, begun in 1524, is essentially Spanish in its fortress-like outline and battlemented walls. The church of San Pedro occupies the site of a mosque. Other institutions include a normal school and several monasteries. There are manufactures of sugar, white lead, macaroni, etc., but the most important commercial interest in Almeria is its exportation of fruit. It is estimated that 1,000,000 boxes of grapes, each weighing 50 pounds, are shipped from this port annually. Other articles of commerce include oranges, almonds, pomegranates, figs, dates, oil, etc., and iron ore. It is a winter resort for invalids, as its climate rivals that of Nice. Pop., 1910, 45,198. Almeria is one of the most ancient cities of Spain and was founded by the Phœnicians. The Romans called it *Unci*, and *Magnus Portus*, the great harbor. It flourished under the Moors, when, as the proverb says, "Granada was no more than its farm." When it passed into Christian hands (1489), its prosperity languished, and only within recent years have railway facilities brought back something of its former activity.

ALMERIA. In Congreve's *Mourning Bride* (q.v.), the heroine, bride of Prince Alphonso, whom she mourns until his unexpected return. Her rôle is famous for the lines, "Music hath charms," etc.

AL'MERI'CIANS. The followers of Amalric of Bène (q.v.).

ALMIQUI, ăl-mĕ'kĕ (native name). A Cuban insectivore. See SOLENODON: and plate of CAVIES accompanying article CAVY.

ALMISSA, ăl-mĕ'să. A port of the Austrian crownland of Dalmatia, 14 miles southeast of Spalato, at the mouth of the Cetina. The hills in the neighborhood yield an excellent muscatel wine for which the region has become famous. Almissa was at one time the rendezvous of the pirates who infested the Adriatic. It was formerly tributary to Venice as a part of the small republic of Poglizza. Pop. (commune), 1890, 13,200; 1900, 15,100; 1910, 16,645.

ALMODÓVAR DEL CAMPO, ăl'mô-dô'văr dĕl kām'pô. A town of New Castile, Spain, in the province of Ciudad Real, 22 miles southwest of Ciudad Real (Map: Spain, C 3). It stands on the summit of a ridge, near the Vega, a branch of the Guadiana. The streets are tolerably clean but ill paved. There are ruins of a Moorish fortress. The inhabitants are chiefly employed in agriculture, and the only manufactures are domestic. Large flocks of sheep graze on extensive crown lands which are near by, and there are rich seams of coal. Pop., 1900, 11,615; 1910, 13,833.

ALMOHADES, ăl'mô-hădz (Ar. *Al-Muwahhidun*, who proclaim the unity of God). The name of a dynasty that ruled in northwestern Africa and Spain during the twelfth and thirteenth centuries. In the reign of Ali b. Yusuf (1107-43), the second Amir al Muslimin of the Almoravides (q.v.), a religious teacher, Mo-

hammed b. Tumart, calling himself Al Mahdi (the guided), founded the sect of the Almohades in Africa. They were opposed to the realistic anthropomorphism of orthodox Islam. Their leader exercised great influence over the Arabs and Berbers throughout northern Africa. Ibn Tumart (q.v.) imposed on his disciples new ceremonies and wrote for their benefit a special treatise entitled *On the Unity of God*. He found a successor in Abd-al-Mumin. Abd-al-Mumin (q.v.) assumed the title of a Caliph or *Amir al Muminin*. Under him the Almohades rose to great power. They extended their conquests into Spain in 1146, subjugating Andalusia, Valencia, and a part of Aragon, and Portugal as far as the Tagus. Under Abu Yakub Yusuf (1163-84) and Yakub-al-Mansur (see ABU YUSUF YAKUB), the dynasty of the Almohades continued to flourish in great splendor. But in 1212 they were completely defeated by Christians in the battle of Navas de Tolosa, the result of which was a rapid collapse of their power in Spain. The power of the Almohades in Spain terminated in 1257 and in Africa in 1269. Consult: Freeman, *History and Conquests of the Saracens* (Oxford, 1856); Coppée, *Conquest of Spain by the Arab-Moors* (Boston, 1881); Dozy, *History of the Almohades* (2d ed., 1881); Fagnan, "Histoire des Almohades," in *La Revue Africaine* (Algiers, 1892); Luciani, *Le livre d'Ibn Tumart* (1903), with Goldziher's Introduction; Goldziher in *Zeitschrift der deutschen Morg. Ges.* xli, 30-140; Codera, *Decadencia y desaparicion de los Almoravides en España* (1899); Bel, *Les Benou Ghanya* (1903).

ALMON, ä'l'mon, JOHN (1737-1805). An English journalist and bookseller, born in Liverpool. He attended school for a short time at Warrington, was apprenticed to a printer and bookseller, and in 1759 settled in London as a journeyman printer. He soon took to pamphleteering, became a member of the staff of *The London Gazetteer*, and by a pamphlet entitled *A Review of Mr. Pitt's Administration* won the favor of Burke and others of the opposition party at the time of Pitt's resignation (1761). He then became a publisher and bookseller on his own account and was patronized largely by the members of the opposition. He was a close friend and ardent supporter of John Wilkes (q.v.), and in 1780 was fined for selling a paper containing one of the letters of Junius. In 1784 he became proprietor and editor of the *General Advertiser*, but two years later was driven by a libel suit to relinquish this undertaking. He rendered an important service to students of American history by publishing *The Remembrancer* (1775-83), a monthly collection of contemporary documents bearing on the Revolutionary War, especially of such documents "as serve to display the injustice of the design and the folly of the councils of Great Britain." He also published a valuable *Collection of all the Treaties of Peace, Alliance, and Commerce between Great Britain and Other Powers from 1688 to 1771* (1772); *Biographical, Literary, and Political Anecdotes* (1797); and *Correspondence of John Wilkes, with a Memoir of his Life* (1805). By his contest with the authorities he did much to establish a greater freedom of the press. Consult *Memoirs of John Almon, Bookseller, of Piccadilly* (London, 1790).

ALMONACID DE TOLEDO, ä'mô-nâthêd' dâ tôlâ'dô. A little town of Spain in the province of Toledo, connected with Toledo by rail. It

contains an old Moorish castle and is famous chiefly as the place of a battle between Spanish and French forces on Aug. 11, 1809, in which the latter, numbering about 30,000, were defeated. Pop., 1900, 1574; 1910, 1801.

ALMOND, ä'münd (Lat. *amygdala*, Gk. ἀμυγδάλη, *amygdalē*), *Amygdalus*. A genus of the family Rosaceæ, consisting of trees and shrubs. The almond tree (*Prunus amygdalus* or *Amygdalus communis*) grows from 20 to 30 feet high, closely resembles the peach in general appearance and bloom and furnishes the almond nuts of commerce. It is native to the Mediterranean basin and southwestern Asia and has been in cultivation from remote times. The fruit is a drupe with a thin, hard covering, which splits open when ripe.

Almonds are of two kinds—bitter and sweet. The bitter almond is cultivated to a limited extent in Mediterranean countries, and the nuts are used in the manufacture of flavoring extracts and of prussic acid. The sweet, or edible, almond is grown on a commercial scale in the south of Europe, in California, and in some other countries of similar climate. The nuts contain a large quantity of a bland, fixed oil; they have an agreeable flavor, and are used for desserts, in confectionery, and medicinally in an emulsion which forms a pleasant, cooling, diluent drink. There are three classes of sweet almonds—the hard shell, soft shell, and the paper shell almond. The latter two only are important commercially. Of foreign varieties, the long almond of Malaga, known as the Jordan almond, and the broad almond of Valencia, are most valued in the trade. In California success in almond-growing came only with the improvement of selected seedlings of local origin. Ne Plus Ultra, Nonpareil, IXL, and Languedoc are the best known of these. California produces annually about 6,000,000 pounds of nuts. In addition to the home production, the United States imports, annually, about \$3,000,000 worth of nuts. In Syria and northern Africa almonds are grown on dry and stony soils. They are believed to withstand drought better than any other fruit, but are the most susceptible of the deciduous fruits to injury from frost. In California good-paying crops are secured only on fertile, well-drained soils, preferably warm loams; and in the arid regions water for irrigation must be abundant.

The almond is propagated mainly by budding on seedling bitter almond stocks. Trees come into bearing in from two to four years from budding, and reach mature fruitage in from seven to 10 years. On strong land the trees are set at least 24 feet apart each way. The tree is shaped during the first three years' growth, after which little pruning is required. Varieties should be mixed in orchard planting, to insure cross-pollination.

The almond is also widely grown for ornamental purposes in localities where it seldom if ever produces fruit. It is a favorite flowering shrub in England, northern Europe, and parts of the eastern and southern United States. It is one of the earliest fruits to bloom. The peach-like blossoms appear before the leaves.

The flowering almond (*Prunus nana* or *Amygdalus nana*) is a low shrub, seldom more than two or three feet in height. It is common in southern Russia and is frequently planted as an ornament. Another species (*Prunus andersonii*) is found among the hills of southern California,

about the Colorado desert. It is a bushy shrub, and the fruit is a small, velvety drupe, little more than half an inch long. Other species not well known but similar to these are found in the East. Fossil forms of the almond occur in the Miocene Tertiary beds of Oeningen, Germany. See Plate of ACANTHUS.

ALMOND DISEASE. The principal almond disease is that known as leaf-blight. It is caused by the fungus *Cercospora circumcissa*, which attacks the leaves and twigs, and often defoliates the trees by midsummer. Upon the leaves small distinct yellow spots are formed, from which the leaf tissue falls, leaving the leaf appearing as though pierced by numerous shot. The disease may be prevented by spraying the trees before blooming, and about twice after blooming, with the ammoniacal copper carbonate solution. (See FUNGICIDES.) The second spraying should be applied when the trees are in full leaf, and the third two to four weeks later. Almond trees are also subject to crown-gall due to *Bacterium tumefaciens*, and to a common leaf-rust, *Puccinia pruni-spinosæ*. Spraying will control the rust, but there is no known remedy against crown-gall.

ALMONDE, ăl-môn'dă, PHILIPPUS VAN (1644-1711). A Dutch Vice-Admiral, who served under De Ruyter in the fights of 1676, and after the Admiral's death commanded the Dutch Mediterranean fleet. He was with Tromp in subduing the naval power of Sweden in 1677. He commanded in 1688 the fleet which conducted William III to England, and four years afterward gained fame by his defeat of the French at La Hague. In 1702, with the English Admiral, Sir George Rooke, he commanded the allies which destroyed the Spanish fleet in the Bay of Vigo.

ALMONDS, ä'mündz, EXPRESSED OIL OF. A fixed oil expressed from bitter or sweet almonds, and sometimes used in medicine. It has a pale yellow color and a mild, rather agreeable taste. It consists largely of olein.

ALMONDS, VOLATILE OIL OF. See BENZALDEHYDE.

ALMONER, ăl'mün-ēr (OF. *almosne*, alms, from Lat. *eleemosyna*, Gk. *ἐλεημοσύνη*, *eleēmosynē*, mercy, alms). The name given originally to a member of a religious order who distributed the money and other things set apart for alms, which by canonical law was to amount to at least a tenth of the revenues of the establishment. Afterwards ecclesiastics also received this name who were appointed by princes to the same office in their households. The Grand Almoner of France was one of the principal officers of the court and of the kingdom, usually a cardinal, and, in right of his office, commander of all the orders. Queens, princes, and princesses had also their almoners, and bishops were usually appointed to this office. In England the office of Hereditary Grand Almoner is now a sinecure, his only duty being to distribute the coronation medals among the assembled spectators. The Lord High Almoner, usually a bishop, distributes twice a year the sovereign's bounty, which consists in giving a silver penny each to as many poor persons as the sovereign is years of age.

ALMONTE, ăl'mönt. A town in Lanark Co., Ontario, Canada, 35 miles southwest of Ottawa, on the Canadian Pacific Railway (Map: Ontario, G 2). It is a centre for the marketing of agricultural products and manufactures woolen and knit goods and machinery. Almonte was settled

in 1830 and was incorporated as a town in 1881. The government is vested in a mayor, elected annually, and a council. Pop., 1901, 3023; 1911, 2452.

ALMONTE, ăl-môn'tă, DON JUAN NEPOMUCENO (1803-69). A Mexican General and diplomat. He was the reputed son of Morelos (q.v.), the patriot priest. As a mere child he took part in the war of liberation, and in 1815 was sent to the United States to be educated. His diplomatic career began at an early age, and he had filled responsible positions in London and South America before he joined the staff of Santa Anna in 1836, in which year he was made prisoner at San Jacinto. Under Bustamante he was Minister of War, and from 1841 to 1846 was Minister to the United States, retiring when the annexation of Texas had become a certainty. In 1853 he was again Minister to the United States; in 1857 he was Minister to France; he had been twice an unsuccessful candidate for the presidency, and party spirit led him to participate in the French invasion of Mexico and the election of Maximilian. Almonte was proclaimed Dictator of Mexico in 1862, but was distrusted by all parties and was removed the same year. The next year he was President of a junta styled the "Regency of the Mexican Empire." In 1864 Maximilian made him regent of the realm and Grand Marshal, and in 1866 he was sent as Minister to Paris, where he died.

ALMORA, ăl-mō'ră. The capital of the Kumaon division, Northwestern Provinces, British India. It is situated on the crest of a mountain ridge, 5337 feet above the sea, and on the head waters of the Kosila, a branch of the Ramgunga, 87 miles north of Bareilly. It gives its name to a district, has a cantonment for two battalions of Ghurkas, and is a health resort for invalids and consumptives. There are several educational institutions, one of which is Ramsay College. The surrounding region produces tea. Pop., 1901, 8596; 1911, 10,560.

ALMORAVIDES, ăl-mō'ră-vīdz (Ar. al-Murabitun, the hermits). A Moslem dynasty in northwest Africa and Spain. The name is derived from *ribat*, which means 'a fortified place on the frontier' and also 'a hermit's hut.' It was the designation of the place on an island in the Senegal where Abdallah b. Yasin (q.v.) gathered his followers and trained them in religious practices and arms. Hence *al murabitun* came to mean 'the Ribat people,' the followers of Abdallah. As a religious sect the movement started about 1037. During the lifetime of the Mahdi the holy war was conducted by himself and the chiefs of the Sanhaja tribe in southern Morocco, Yahya b. Ibrahim, Yahya b. Umar and Abu Bekr b. Umar. The kingdoms of Sijilmasa (1055) and Aghmat (1056) were conquered. With the aid of Zainab (q.v.) Yusuf ibn Tashfin (q.v.), the nephew of Abu Bekr, became, after the death of the Mahdi (1059), *Amir al Muslimin* and the real founder of the Empire. He built Marrakush (Morocco) and extended his power into Algeria. At the urgent request of the Mohammedan rulers of Andalusia, and especially al Mutamid b. Abbad of Seville, he went across to Spain and defeated the Christians at Zallaka (Sacralias) Oct. 23, 1086. Yusuf b. Tashfin soon made the Moslem princes of Andalusia subject to his authority. He reigned from 1061 to 1107. His son, Ali b. Yusuf, maintained his rule until 1143. In 1147 Morocco fell before

the attack of Abd al Mumin (q.v.), and two years later the power of the Almoravides in Spain ended. Unlike their successors, the Almohades (q.v.), the rulers of this family always recognized the spiritual authority of the Abbaside Caliph in Bagdad. Consult Dozy, *Histoire des Musulmans d'Espagne* (1861); A. Müller, *Islam in Morgen- und Abendland* (1887); Mercier, *Histoire de l'Afrique Septentrionale* (1888); Codera, *Decadencia y desaparicion de los Almoravides en España* (1889); A. Bel, *Les Benou Ghanya* (1903).

ALMQVIST, älm'kvist, KARL JONAS LUDWIG (1793-1866). A Swedish writer of unusual versatility but very unstable genius. He was born at Stockholm. At 20 he left a good post in the civil service and founded a sort of Brook Farm in the forests of Vermland, where the "come-outers" lived under turf, wore homespun, and ate porridge. The experiment failed, and Almqvist resorted to school-teaching and the composition of text-books, at Stockholm, until the publication of a group of romances under the title, *The Book of the Thorn Rose* (begun in 1832), brought him sudden fame. This work shows great power of language and richness of color; and the dramas which followed, though erratic in plan, are masterly in dialogue and of great tragic force. Almqvist now gave himself wholly to literature and published a great number of books and pamphlets on history, religion, ethics, æsthetics, and pedagogy, as well as lyrics, dramas, and novels, chiefly socialistic in tone and often contradictory in teaching, but marked by a brilliant style. His moral instability apparently led him to crime, for in 1851 he was charged with forgery and murder, and fled from Sweden to America, where he earned a precarious living under an assumed name until 1866, when he returned to Bremen, and lived there under the name of C. Westermann until his death, Sept. 26, 1866. Far too little is known of his American experiences, which must have been highly adventurous. The novels and tales on which his literary fame will rest are of the romantic type. The best of the tales are *The Mill at Skällnora*, *Araminta May*, and *Grimstahama's Settlement*. Of the novels, *The Palace* is typically romantic in its poetic humor. A later work, *It's All Right*, is in another key, more like the problem novel of our day, and is a grim picture of the evils of conventional marriage, indicating the degeneracy of his misused genius.

ALMS'HOUSE. The place where the publicly supported poor are cared for, sometimes called the poorhouse, the infirmary, etc., and, in England, the workhouse. Wherever indoor relief is provided, the almshouse is the central local institution throughout the United States for the care of the aged and infirm poor, and also for able-bodied poor who are not committed as vagrants to a correctional institution. It is frequently located on a farm, known as the poor-farm, where light work is given the inmates, the results being utilized to contribute toward their support. The latest available figures give for the United States 2476 almshouses, with 81,764 inmates. Consult: A. G. Warner, *American Charities*, chap. vi (Boston, 1894); C. R. Henderson, *Modern Methods of Charity* (New York, 1904); Special Report of the Census Bureau, *Paupers in Almshouses, 1904* (Washington, 1906); A. Johnson, *The Almshouse* (New York, 1911). See PAUPERISM; POOR LAWS.

ALMUCANTAR, älm'kän'tër (Ar. *al-muḳanṭarāt*, pl. of *al-muḳanṭar*, sun-dial). In astronomy, a small circle of the celestial sphere parallel to the horizon. The word had fallen rather into disuse among astronomers, but has been used of late years as a name for an instrument invented by Chandler. The instrument consists of a telescope supported on a metal float placed in a basin of mercury. This arrangement assures the perfect horizontality of the float, and the telescope can be used to observe heavenly bodies situated at exactly equal altitudes in the celestial hemisphere. Astronomical investigations of considerable importance have been carried out by the use of the almucantar.

AL-MUKANNA, älm'kän'ná. See MOHAMMEDAN SECTS.

AL'MY, JOHN JAY (1814-95). An American naval officer. He was born in Rhode Island and entered the navy as a midshipman in 1829. He engaged in the suppression of the African slave trade in 1843-45 and took part in the capture of Vera Cruz and Tuxpan in the Mexican War. He was in the blockade service during the Civil War, and afterward had a varied life on the coast survey as commander of vessels making expeditions to Central and South America and South Africa, and as an officer on ordnance duty in the Brooklyn Navy Yard. He ended his career as commander of the Pacific squadron, becoming a Rear Admiral in 1873. Four years later he was retired.

ALNASCH'AR. In the *Arabian Nights*, the barber's fifth brother, proverbial as a dreamer. Having put his money into a stock of glassware with which to engage in trade, he falls to imagining what he will do with the wealth he is to gain from it and, inadvertently kicking over the basket, smashes all his wares. The name was humorously applied to S. T. Coleridge from his having dreamed the fragment of *Kubla Khan*, which he wrote after waking.

ALNUS, äln'ūs. See ALDER.

ALNWICK, änn'ik. The capital of the county of Northumberland, England, on the Alne, about 32 miles north of Newcastle (Map: England, E 1). The streets are broad, well paved, and well lighted; the houses modern, built of stone, and in some instances handsome. There are numerous churches and a large park in which are ruins of several abbeys and monuments of historical interest. A large market place occupies the centre of the town. At one time there were many tanning establishments, but milling and brewing are among the industries carried on to-day. Alnwick was at an early period a border stronghold, and some fragments of the ancient walls even yet remain. Alnwick Castle, the residence of the dukes of Northumberland, stands at the north entrance of the town, and is considered one of the most magnificent baronial structures in England. During the Middle Ages it was a bulwark against the invasions of the Scots, who thrice besieged it. Pop., including Canongate, 1901, 6716; 1911, 7041. Consult F. G. Halleck, *Alnwick Castle and Other Poems* (New York, 1836), and C. H. Hartshorne, *Alnwick, etc.* (London, 1860).

ALO'ADÆ, or **ALOY'DÆ** (Gk. Ἄλωάδαι, *Alōadai*, or Ἄλωειδαι, *Alōeidai*), OTUS and EPHEIALTES. The sons of Aloeus, or of Poseidon, and Iphimedeia, wife of Aloeus. They were celebrated for their great size and extraordinary strength. Every year they grew an ell in breadth and a fathom in height, and at the end of nine years

were thirty-six feet broad and fifty-four feet high. They are fabled to have chained the god Ares, and to have kept him in a bronze cask for thirteen months. They also threatened the Olympian gods with war, and would have piled Pelion and Ossa on Olympus had they not been destroyed by Apollo before their beards were grown. It is further said that they fell in love, the one with Hera and the other with Artemis; but, when Artemis appeared to them in the form of a hind and ran between them, they shot at the supposed animal and killed each other. They were worshiped as heroes in some places.

AL'OE, *Lat. pron.* ăl'ô-ē; *Engl. pron.* ăl'ô (Gk. ἀλόη, *aloē*). A genus of plants belonging to the family Liliaceæ, including about 100 species which are natives chiefly in the Mediterranean region, Western Asia, and South Africa. About

probably an introduced plant. The extract prepared from its leaves is known as Hepatic aloes, or as Barbadoes aloes. The Socotrine or Zanzibar aloes is the product of *Aloe Perryi*. The bitter principle of aloes has been called aloin. With oxygen aloin forms several compounds that possess acid properties. In the East Indies it is employed as a varnish to prevent the attacks of insects; and has even been applied to the bottoms of ships to protect them from marine worms. A beautiful violet color which does not require a mordant to fix it, is obtained from the leaves of the Socotrine aloe. It also affords a fine transparent color for miniature painting. Mohammedan pilgrims suspend an aloe over their doors on their return from Mecca, to signify that they have performed the pilgrimage. The American aloe is a different plant. Numerous species are used as decorative

COMMON ALOES.

50 miles from Cape Town is a mountainous tract completely covered with aloes, and the hills on the west side of Socotra exhibit them in similar profusion. The species vary in height from a few inches to 30 feet. They have permanent succulent leaves. The negroes of the west coast of Africa make cords and nets of the fibres of their leaves, and stockings are woven from the fibres of a species found in Jamaica. Aloes are chiefly valuable for their medicinal properties, which are laxative, drastic, emmenagogue, and vermifuge. The well-known drug called Aloes (q.v.) is the inspissated juice of the leaves of several almost tree-like species, and particularly of *Aloe socotrina*, a native of the island of Socotra; *Aloe purpurascens*, *Aloe spicata*, and *Aloe arborescens*, which principally yield the Cape aloes; *Aloe arabica*, *Aloe linguiformis*, *Aloe mitriformis*, and *Aloe vera*; which last, found in the East and West Indies, in Italy, and in some of the islands of the Mediterranean, is the only species which can be reckoned European, although it also is

plants. For this purpose they are grown indoors and set out during summer. They may be propagated by seed, suckers, or cuttings. See AGAVE, and Plate of ACACIA.

ALOES, ăl'ôz. The inspissated juice of the leaves of various species of Aloe (q.v.). A drug of great antiquity, for we find Dioscorides, a writer on materia medica of the first or second century, making mention of aloe as a substance obtained from a plant and possessing cathartic properties. It is obtained from numerous sources, including Bombay, Arabia, Socotra, Madagascar, the Cape of Good Hope, and the West Indies. All these varieties bear large, thick, fleshy leaves, stiff and brittle, pointed, and generally terminating in a strong spine, filled with a mucilaginous pulp, and containing an intensely bitter juice, which yields the medicinal substance of aloe. It is obtained, sometimes in the form of tears, by incision, spontaneous exudation, and inspissation upon the plant; sometimes by spontaneous evaporation of the juice, which exudes by pressure from the

leaves when cut away near the base; sometimes by evaporating the same juice with the aid of heat; and lastly, by evaporating the juice and the decoction of the leaves. The following names are made use of in commerce to denote the various kinds of aloes found in the market: Socotrine, Clear, Cape, East Indian, Barbadoes, and Caballine aloes. The only varieties officially recognized by the Pharmacopœia of the United States are: (1) Socotrine aloes (*Aloe socotrina*), so called from its supposed source, the island of Socotra, near the mouth of the Arabian Gulf. It is a product of *Aloe Perryi*, a plant from the east coast of Africa, the island of Socotra, and Arabia. (2) Barbadoes aloes (*Aloe Barbadensis*) is prepared in the West Indies from *Aloes vera* and other varieties of aloes. Browne's *Natural History of Jamaica* states that the largest and most succulent leaves are placed upright in tubs, that the juice may dribble out. This, evaporated, is sold as Socotrine aloes; but the common aloes is obtained by expressing the juice of the leaves, boiling it with water, evaporating, and pouring it into gourds; whence this kind is often called gourd aloes. Aloes contains an active principle, aloin, and a resin. When employed in small doses, aloes exerts a tonic, and in larger doses a cathartic action. It acts chiefly upon the large intestine, whose contractions it stimulates. It also causes congestion of the pelvic organs. Upon the bowels its effect is slow, requiring 10 to 12 hours. Aloes is an ingredient of a number of laxative pills mentioned in the United States Pharmacopœia. For illustration see ACACIA.

AL'OE'S WOOD, also AGILA WOOD, EAGLE WOOD, or AGALLOCHUM. The inner part of the trunk of *Aquilaria ovata* and *Aquilaria agallocha*, trees native of the tropical parts of Eastern Asia and the Malay Archipelago, and supposed to be the *aloes* or *lign aloes* of the Bible. They are large spreading trees, with simple alternate leaves. Aloes wood contains a dark-colored, fragrant, resinous substance, and is much prized in the East as a medicine, and for the pleasant odor which it diffuses in burning. The resinous substance is found only in the inner part of the trunk and branches, the younger wood being white, and almost scentless. The trees abound in the eastern part of Asia, especially in Cochin China, the Moluccas, and neighboring islands. Aloes wood is not only much prized in the East as a perfume, but many medicinal virtues are ascribed to it. The ancients ascribed to it similar virtues, and so valued it for these and its fragrance, that Herodotus says it once sold for more than its weight in gold. It was regarded almost as a universal medicine. Its very fragrance was supposed to have a beneficial influence, and it was therefore worn about the person. As it admits of a high polish and exhibits a beautiful graining, precious gems were set in it; and it was cut into fantastic forms and worn in head-dresses, etc. There seems to be allusion to a similar use of it in Ps. xlv. 8, "All thy garments smell of myrrh and aloes and cassia." Or perhaps this merely refers to its being employed to perfume clothing. It was also, from a very early period, much used to perfume the apartments of the great. The fragrance continues undiminished for years. Lign aloes is a corruption of *lignum aloes* (aloes wood).

ALO'GIANS, or **AL'OGI** (Med. Lat. *alogiani*, *alogi*, from Gk. *ἀ*, *a*, priv. + *λόγος*, *logos*, word,

reason). A small and obscure sect of heretics in the second century who opposed the Montanists (q.v.), and rejected John's authorship of the Fourth Gospel, and the Apocalypse, holding that the Gnostic Cerinthus was the author.

ALON'ZO THE BRAVE AND THE FAIR IM'OGENE, A ballad by M. G. Lewis (q.v.), known as "Monk" Lewis.

ALOPECIA, ă'lō-pē'shī-ă (Lat. from Gk. *ἀλωπηκία*, *alopēkia*, fox mange; from Gk. *ἀλώπηξ*, *alōpēx*, a fox). A disease characterized by loss of hair from any part of the body. See BALDNESS.

ALORA, ä'lō-ră. A town of Andalusia, Spain, in Málaga province, 18 miles northwest of Málaga. It stands on an elevated site near the right bank of the Guadalhorce, at the foot of the Sierra del Hacho, and in the midst of a fertile country (Map: Spain, C 4). Some of the streets are well built and well paved; some are very steep and irregular. The inhabitants are mostly employed in agriculture, and grain, dates, and fruit are grown. Some spirits and wine are manufactured. The medicinal and mineral springs of Alora are highly valued by citizens of Málaga, who resort in large numbers to this place. Pop., 1900, 10,206; 1910, 10,975.

ALOST, ä'lōst (literally, to the east, from Ger. *Ost*, east, it being near the eastern frontier), or **AELST**, älst. A town in Belgium, the old capital of the province of East Flanders, situated on a tributary of the Scheldt, called the Dender, which is here converted into a canal (Map: Belgium, B 4). It is a walled city with five gates, and has the famous church of St. Martin, an unfinished edifice, in late Gothic, one of the grandest in Belgium, and containing a famous painting by Rubens, depicting Christ appointing St. Rochus tutelary saint of the plague-stricken. In the Grand Place is a statue of Thierry Martens, who was born here, and who introduced the art of printing into Belgium in 1475. There is a town hall (about 1200), a college, a hospital, the royal school for sons of military men, an academy of design, etc. Its industries are weaving in silk, wool, and cotton, flax-spinning, lace-making, and it has a thriving trade in hops and grain. Pop., 1900, 30,100; 1905, 32,163; 1911, 34,336.

ALOY'SIA. See LIPPIA.

ALOYSIUS, SAINT. See GONZAGA, HOUSE OF.

ALP, älp; **ALB**, älb (Swabian) (Lat. *alpes*, perhaps of Celtic origin; Gael. *alp*, rock, cliff), also called the Rauhe Alb or Swabian Jura. A chain of mountains in southern Germany, about 70 miles in length, and from 12 to 15 miles in breadth, extending northeast and southwest, and forming, in part, the watershed between the Neckar and the Danube. It lies almost entirely within the kingdom of Württemberg, but crosses Hohenzollern and is situated from 50 to 100 miles east of the Black Forest, but, unlike the latter region, is clothed with forests of hard wood instead of pine. It forms a table-land intersected by a few narrow, deep valleys. The average height of the system is rather more than 2000 feet. On the north it descends to the Neckar in ridges of rocky cliffs and abrupt pointed headlands, but on the south it gradually slopes away to the level of the valley of the Danube. The scenery is often very picturesque, for the sharp, precipitous crags are frequently crowned with the ruins of the strongholds of some of the famous old German families, such as the Hohenzollerns, Hohenstaufens, etc. The

geological formations of the Swabian Alps are limestones of Mesozoic age, which, though regularly stratified, have been folded to a considerable extent. Caverns of a very remarkable character abound. The valleys at the base of the hills are fertile and produce abundance of wine and fruit, but the high table land has an extremely poor and barren soil. The word "Alp" is sometimes applied to the green pasture lands on the slopes of the mountains in Switzerland.

ALPAC'A, or **PA'CO** (Ar. *al*, the + Peruv. *paca*). One of the two domestic races of the Guanaco (*Lama huanacos*), a cameloid mammal of the Andean region. It is smaller than the llama and more nearly resembles the vicuña, although now considered to have been, like the llama, derived from the guanaco. (See LLAMA.) Its form is very sheep-like, except for the long, erectly carried head; and, although some have run wild, it is mainly known in great, semi-domesticated flocks kept by the Peruvian mountain Indians for the sake of the wool. These flocks graze on the pastures of the loftiest valleys, almost at the snow-line, which seem to be the natural home of the animal and where they have formed interesting instincts and habits of vigilance and protection against sudden storms and snowfalls. These flocks are said to be so careful to keep together that it is impossible to separate a full-grown individual, so that none can be truly tamed which is not taken when very young. Once a year the Indians drive their flocks to stone inclosures or huts and shear the wool, after which the flocks are again turned loose. This custom is prehistoric, and Squier says that many of the shearing huts about Lake Titicaca have stood there since long before the Spanish conquest. The alpaca is known from the equator to Tierra del Fuego, but is most common in Peru and Chile; its flesh is well liked as food, and the animal is occasionally used as a beast of burden. The alpaca's coat consists of a thick growth of woolly hair, varying from black to gray or yellowish, and reaching, when unshorn, a length of some two feet. The annually shorn fleece is about eight inches in length. The fibre is small but strong, elastic, very lustrous and silky, and highly valued for weaving warm and fine cloth. The natives of the Andes have made use of it from time immemorial for their ponchos or blankets, remains of which have been found in the oldest graves of the period of the Incas; but it was not until 1836 that the wool began to be exported to Europe and the manufacture of alpaca shawls, cloth, etc., regularly began. This was due to the sagacity and energy of Sir Titus Salt, whose mills at Saltaire, England, are regarded as the foremost in Great Britain. Now the imports of alpaca wool into Europe and America number many millions of pounds annually; but not all of the so-called alpaca cloth is really manufactured from that wool alone, or even in part. See GUANACO; LLAMA; VICUÑA, and Plate of CAMELS AND LLAMAS.

Attempts have been made to introduce the alpaca into Europe, but not with satisfactory results. The considerable flock formerly existing in the Pyrenees seems to have disappeared. Similarly, the costly trial of acclimatizing them in Australia has failed. An attempt was made in 1821 to introduce the alpaca into the United States; a fund was raised, and in 1857 a cargo of them was shipped to Baltimore; but the result showed that they could not be acclimatized.

ALP-ARSLAN, älp'är-slän' (Strong Lion) (c.1028-72). A Seljuk Sultan. He was born in Turkestan about 1028 and succeeded his uncle, Togrul Bey, as ruler of the Seljuk realm of Persia, in 1063. His first act was to unite the whole of his dominions in one kingdom. He embraced Mohammedanism and took the surname of Alp-Arslan ('Strong Lion'), his real name being Muhammad Ghiyath-ud-Din abu Khvajah. The Caliph of Bagdad gave him the title of Adhad-ud-Din ('Defender of the Faith') and decreed that prayer might be made in his name. He had an excellent vizier, Nizām-ul-Mulk, who was the founder of all the colleges and academies in the kingdom. From 1064 to 1071 Alp-Arslan pursued the course of his conquests and ruled from the Tigris to the Oxus. In 1064 and 1068 he invaded Armenia and Georgia, at that time Christian kingdoms. He next proceeded against the Greeks, who, under their brave Emperor, Romanus IV (Romanus Diogenes), thrice drove the Turks beyond the Euphrates. In August, 1071, a bloody battle was fought near the fortress of Malaskerd, between the towns of Van and Erzerum. Alp-Arslan gained the victory. The Greek Emperor was taken prisoner, and obtained his liberty only by the payment of an enormous ransom. In the following year Alp-Arslan invaded Turkestan, but he perished at Berzem, in Turkestan, by the poniard of Yussuf Kothual, defender of the fortress, whom he had conquered and condemned to death. He was buried at Merv. Consult Bury's ed. of Gibbon's *Decline and Fall of the Roman Empire* (London, 1898).

ALPE'NA. A city and the county-seat of Alpena Co., Mich., 125 miles north of Bay City, on the Detroit and Mackinac Railroad and on Thunder Bay (Map: Michigan, F 3). It is situated in a region containing numerous lakes and is a popular health resort. It has a United States fish hatchery, public library, parks, and municipal electric light and water plants. Large quantities of lumber in various products are exported, and there are fisheries, tanneries, and manufactures of cement, paper, machinery, excelsior, etc. The city has important mineral products, including limestone, clay, and shale. Excellent water power is secured from three dams across the Thunder Bay River, south of the city. Alpena was settled in 1835, incorporated in 1871; its charter, revised in 1897, limits the mayor's term to two years and provides for a city council of 12 members. Pop., 1900, 11,802; 1910, 12,706; 1913 (est.), 15,000.

AL'PENHORN, or **ALP'HORN**. A simple conical, somewhat curved wind-instrument, about 3 feet long, and made of wooden strips. It has a hard-wood cupped mouthpiece and a bell. The notes are the open harmonics of the tube, the quality of tone being modified by the material and by the smallness of the bore in relation to the length of the tube. It is used by the Swiss to convey signals. The melody usually played on this instrument is called the *Ranz des Vaches* (q.v.). The alpenhorn is usually represented in the orchestra by the oboe, English horn, or bassoon. See MUSICAL INSTRUMENTS.

ALPES, BASSES. See BASSES-ALPES.

ALPES MARITIMES, älp mã'rê'têm'. A department of France (q.v.), in the extreme southeast, on the shores of the Mediterranean and confines of Italy. It is formed mainly of the territory of Nice, ceded by Italy to France in 1860. There are many famous health resorts

in this department, as it is one of the most picturesque and one of the most delightful in the country. The area is 1443 square miles. Capital, Nice. Pop., 1906, 344,007; 1911, 356,338.

AL/PETRA/GIUS. See NUR-ED-DIN EL-BETRUJI.

ALPHA AND OMEGA (α [α λφα] and ω [ὦ μέγα, great ω], the first and last letters of the Greek alphabet). A term employed to convey the idea of completeness. The phrase occurs in the New Testament (Rev. i. 8; xxi. 6; xxi. 13) to denote the immeasurable fullness of God and of Jesus Christ; in Rev. i. 8 it is applied to God; in the other passages, to Christ. The Hebrews similarly employed the phrase Aleph and Tau, the first and the last letter of their alphabet, to denote a thing in its entirety. See, e.g., Jalkut Rubeni xvii. 4, xlvi. 4, cxviii. 3. A somewhat similar phrase is found in Isa. xlv. 6, "I am the first, and I am the last," which, applied to God, is intended to express both eternity and universal sway.

ALPHABET (late Gk. ἀλφάβητος, *alphabētos*, from ἄλφα, *alpha* + βῆτα, *bēta*, the names of the first two letters of the Greek alphabet; compare the Late Lat. *abecedarium*, the English A B C, and Russ. *azbuka*, from *azu* + *buki*, the names of the first two letters). An alphabet may be defined as a series of characters, usually having a fixed order, employed to represent the single sounds of a language. Strictly speaking, this definition applies only to an alphabet like those of Greece and India in which the vowels as well as the consonants are represented. But the term is also used of the Semitic alphabets that made no attempt to represent vowel sounds. The series of signs for consonantal sounds invented by the Egyptians has also been called an alphabet, though it was never relied upon exclusively, but always more or less supplemented by symbols for words, ideograms, and determinatives. Sometimes the word is likewise employed, loosely and improperly, to designate a system of characters denoting syllables or combinations of elementary sounds. For the various modes employed to represent language, see WRITING; HIEROGLYPHICS; CUNEIFORM INSCRIPTIONS. For the variations in the style of writing at different periods, see PALEOGRAPHY.

The Greeks appear to have been the first to invent an alphabet in which the single sounds of their language, vowels as well as consonants, were expressed by a series of letters. Before the invention of this alphabet Greek colonists on Cyprus had used a syllabary in which the five vowels *a*, *e*, *i*, *o*, and *u* were represented by single letters, but the syllables, beginning with a consonant, were evidently pronounced either with or without the vowel. But the earliest form of the Greek alphabet, without the letters ϕ , χ , and ψ , meets us on Crete, Melos, and Thera, and it is natural to look in that direction for the origin of this most advanced type of alphabetic writing. There was a connection, however, between this alphabet and the one used by the Semites in Syria, suggesting that it was brought to the Greeks by the Phœnicians. This was the view held by many of the Greeks, as appears from the statements of Herodotus and other ancient writers and from the word *φοινικῆια*, *phoinikēia*, which denotes the letters of the alphabet and occurs in an inscription of Teos in Asia Minor belonging to the first half of the fifth century B.C. It is true that others attributed the invention of the alphabet to such

mythical characters as Prometheus, Musæus, Palamedes, and Cadmus, who originally had no connection with Phœnicia, while the addition of certain letters was assigned to Epicharmus and Simonides. Special interest attaches to a statement by Diodorus that "the Cretans have an answer to those who attribute the invention of letters to the Syrians, and who say that the Phœnicians learned them from these and passed them on to the Greeks, this being done through Cadmus and those with him sailing to Europe, so that the Greeks call the letters Phœnician; to this they reply that the Phœnicians were not the original discoverers of letters, but that they simply changed their forms" (v, c. 74). A real tradition probably did not exist anywhere. The foreign names of many of the letters and the similarity in form and order observed by travelers would naturally give rise to the idea of a Phœnician origin. Unfortunately, we do not know whether the 11 or 12 Semitic names were originally used, whether the ending *a* in nine cases is the Aramaic emphatic or a Greek addition, and why the Semitic names of seven or eight other letters were not employed. But, as may be seen from the accompanying table, the forms of the earliest Greek letters bear a close resemblance to those of the North Semitic alphabet. Moreover, the order of the letters in the North Semitic alphabet, as shown by their numerical values and their use in acrostic compositions, is the same as that proved for the Greek by similar evidence and by the so-called *abecedaria*, or alphabets found on early vases. The proximity in both alphabets, of Beth, 'house,' and Daleth, 'door,' Jodh, 'hand,' and Kaph, 'palm of the hand,' Mem, 'water,' and Nun, 'fish,' Resh, 'head,' Peh, 'mouth,' and Shin, 'tooth,' can scarcely be explained except by a common origin. It seems probable, therefore, that the Greek alphabet is an adaptation of a consonantal alphabet invented in Syria. It is possible that more than one type of alphabet appeared in Syria about the same time. Besides the North Semitic alphabet, the South Semitic may also have originated there. This alphabet, in which more than 2000 Minæan, Sabæan, Katabanian, and Hadramautian inscriptions are written, is likely to be as old as the other. There is as yet no consensus of opinion as to the age of the Minæan inscriptions; but Glaser, Winckler, Schmidt, Weber, and Grimme have adduced many reasons for believing that some of them go back to the end of the second millennium B.C. (See MINÆANS.) Attempts have been made, notably by Lidzbarski, to show how the letters could have been derived from the North Semitic, but they have not been convincing. In the present state of our knowledge it is doubtful whether the southern Semites derived their alphabet from their northern kinsmen, as there is much that seems to indicate that both branches are indebted to a common source. Whatever be the relation of the Semitic alphabets to one another, the present evidence points to the conclusion that the consistent employment of a small number of signs to denote, not words nor syllables, but the elementary sounds of a language, originated among the Semites, and that through the trading branch of this family, the Phœnicians, this system of writing was carried to the Greeks and the West. Though the attempts to assign meanings to all the Semitic names of the letters has not proved successful, there can be no doubt

that at least 11 are significant; Aleph means 'ox'; Beth, 'house'; Daleth, 'door'; Jodh or Jadh, 'hand'; Kaph, 'hollow of the hand'; Mem, 'water'; Nun, 'fish'; Ain, 'eye'; Peh, 'mouth'; Resh, or Rosh, 'head'; and Shin, 'tooth.' This leads naturally to the conclusion that the characters were originally representations of these objects, or at least showed some resemblance to them. Inquiry in this direction leads, however, to no satisfactory result as to the origin of the letters, though it may throw light on that part of the Semitic world where the names arose. As the peoples of Syria had intimate connections with Egypt, and as the hieroglyphic and hieratic systems had been in use there for centuries before the earliest known Semitic inscriptions, it was natural to look to the valley of the Nile for the symbols from which the letters had been derived. In a course of lectures given at Paris in 1838, Lenormant attempted to identify the Phœnician letters with Egyptian hieroglyphics; and in 1859 Emmanuel de Rougé read before the Académie des Inscriptions et Belles Lettres a paper in which he sought to prove that the source of the alphabet was to be found in the hieratic characters, as shown in the Papyrus Prisse, an Egyptian document which cannot be later than the eleventh dynasty and may well be much earlier. De Rougé's arguments were first published in detail after his death by his son, in *Mémoire sur l'origine égyptienne de l'alphabet phénicien* (Paris, 1874), in which also a summary of Lenormant's views appeared for the first time in print. De Rougé's opinion was adopted by Canon Isaac Taylor in his book *The Alphabet* (London, 1883), and has been retained in the second edition (1899). Breasted, *History of Egypt*, p. 484 (1905), maintains that with the papyrus the hand that was customarily written upon it also passed into Phœnician before the tenth century. But Ed. Meyer, *Geschichte des Altertums*, i, 1, p. 217 (3d ed., 1910), who thinks that a Phœnician invented the Semitic alphabet c.1000 B.C., deems it historically irrelevant where he obtained his signs and important only that he employed the principle, already discovered thousands of years before in Egypt, of separating the individual sound and using a sign for it. A new turn to the discussion was given by the discovery in 1887 of the Telel-Amarna tablets containing a series of letters written in Syria in the beginning of the fourteenth century B.C., which showed that at that time the cuneiform characters were used by the Phœnicians and other Semites even for correspondence with the Egyptian court and that the Babylonian was evidently the language of international relations. Even before this time Deecke, in *Zeitschrift der deutschen Morgenländischen Gesellschaft*, pp. 103 ff. (1877), and Hommel, *Geschichte Babyloniens und Assyriens*, p. 54 (1885), had attempted to show a connection between the Phœnician alphabet and the cuneiform of Assyria or Babylonia. Delitzsch, *Die Entstehung des ältesten Schriftsystems* (Leipzig, 1897), and Peiser, *Studien zur orientalischen Altertumskunde* (1900), have developed the Babylonian theory, though with differences in detail. This theory, however, labors under one serious difficulty. The early Babylonian characters which are supposed to throw light upon the Phœnician prototypes are probably more than 2000 years older than the earliest Phœnician inscriptions and differ decidedly from the cuneiform characters in use in Syria within 250 or 300 years

of the time when the alphabet must have been developed. Peiser has shown that there was a certain principle of arrangement of the Babylonian signs; but Zimmern's attempt to prove a Babylonian influence on the order of the alphabet is not convincing, *Zeitschrift der deutschen morgenländischen Gesellschaft*, p. 670 (1906). It is now known that the Babylonian signs had names (see Viktor Christian, *Die Namen der Assyrisch-Babylonischen Keilschriftzeichen*, 1913), but the names of numerous objects found in both are not arranged in the same order. Similar objections may be brought against De Rougé's derivation from the earlier hieratic. Neither the Egyptian nor the Babylonian origin can, therefore, be regarded as proved.

But Babylon and Egypt were not the only great powers of the early civilization of the East. The Hittites (q.v.) had a hieroglyphic system of their own, which might easily have influenced the Phœnicians, but the alphabet is far more likely to have developed from a linear than from a hieroglyphic system of writing. The Cypriote Greeks down to the fourth century B.C. made use of a syllabic system which in some of its signs shows a resemblance to the Hittite. The value of these signs has been established. In some respects this script furnishes a closer approach to the alphabet than any other that is known to us. Of the greatest importance, however, is the discovery of at least two early systems of writing on the island of Crete. One of these is distinctly pictorial or hieroglyphic, the other (and later) is linear, and contains a number of forms closely analogous to the Phœnician and early Greek characters. Over 2000 inscriptions have been found, most of them in the archive of the palace at Cnosus. (See the account of Ægean Culture under ARCHÆOLOGY.) We know from Egyptian inscriptions that the Philistines took part in the invasion by seafaring Mediterranean peoples of Egypt and Syria, in the reign of Rameses III (c.1200 B.C.), and from the Bible that the Philistines came from Caphtor (Crete) and that Cretans were in the bodyguard of David. It is natural that the discoverer of ancient Crete and its wealth of epigraphic material should have thought of this connection between the island and Syria. Already in 1895 he hinted at a Cretan Philistine influence on the development of the Semitic alphabet (*Cretan Pictographs*, p. 102). In a paper read before the First International Congress for the History of Religion at Paris, in 1900, Schmidt suggested that the North and South Semitic alphabets developed independently in Syria during the twelfth century from a common source, that this source was the script brought over by the Philistines from Crete, and that some of the characters retained their original designations, while others were translated into the language of Canaan. The Cretan origin was also maintained by Fries, *Zeitschrift des deutschen Palästina-Vereins*, pp. 118 ff. (1900), though he looked to the cuneiform system for the names and order of the letters; and by Dyer in lectures delivered in America, 1900-01. Evans has developed his theory most fully in *Scripta Minoa* (1909). The importance of this Ægean element in the discussion cannot be fairly estimated until the Cretan linear and hieroglyphic systems are at least partially understood, for as yet none of the values of the signs is known. It is obvious that mere external likeness is insufficient to prove a common origin;

there must be sufficient resemblance in sound or meaning to account in some degree for the choice of that particular sign by the borrower to serve as a letter in the new alphabet. This is emphasized by Peters, in *Journal of the American Oriental Society*, pp. 177 ff. (1901), who, without committing himself to any theory, characterizes Evans's proposition as "certainly not lacking in plausibility." W. M. Flinders Petrie, in his recent work on the *Formation of the Alphabet* (London, 1912), develops his theory, originally propounded in the eighteenth *Memoir of the Egyptian Exploration Fund*, pp. 31-32 (London, 1900), that the origin of the Græco-Phœnician alphabet is to be sought in ancient signaries or series of signs "that had been gradually brought into use for various purposes." These signs, originally placed on articles of pottery for the purpose of indicating ownership, were given a commercial value and spread by trade from land to land "until the less known and less useful signs were ousted by those in more general acceptance." He asserts that they were already in use in Egypt in prehistoric times. Some two dozen of these signs finally triumphed and became common property to a group of trading communities along the Mediterranean in the form of a kind of short-hand. But Weill, in *Revue Archéologique*, i, 213 ff. (1903), Daressy, in *Annales du Service*, vi, 103, and Eduard Meyer, *Geschichte des Altertums*, i, 2, p. 61 (1909), have urged serious objections against this interpretation of the signs and regard them simply as factory marks without any phonetic value. Such signs of owner or maker meant for recognition, but not as sound-symbols or letters, are used in all ages. Stucken's theory, based on a relation of the alphabet to the signs of the zodiac, assumes a significance of some of the letters and an acquaintance with the zodiac in Syria at the time of their invention that cannot be proved.

The most important inscriptions written in the North Semitic alphabet coming from the earliest period (c.1000-539 B.C.) are the following: (1) on a bronze bowl found at Limassol, Cyprus, in 1877, dedicated by a servant (governor or vassal) of Hiram, King of the Sidonians, to Baal Lebanon, c.970 B.C.; (2) on a number of ostraca found in the palace of Omri and Ahab at Samaria in 1910, dated in the years of a king who is probably Ahab (872-853 B.C.); (3) on a stele found at Diban in 1868, erected by Mesha, King of Moab, after the death of Ahab, c.850 B.C.; (4) on a stele found at Zenjirli in 1902 and published in 1911, erected by Kilamu, King of Ya'udi, c.840 B.C.; (5) on a stele discovered by Pognon in 1903 and published in 1907, erected by Zakir, King of Hamath and La'ash, c.800 B.C.; (6) on a statue to Hadad found at Gerjin in 1890, erected by Panamu, King of Ya'udi, c.780 B.C.; (7) on a stone found at Zenjirli in 1891 inscribed by Bar Rekab, King of Samal, in the time of Tiglath Pileser IV (745-728 B.C.); (8) on a tombstone found at Tachtali Bunar in 1888, dedicated by Bar Rekab, King of Ya'udi, to Panamu, in the time of Tiglath Pileser IV; (9) on weights found by Layard at Nineveh in 1853 from the eighth and seventh centuries B.C.; (10) on a stone found at Gezer in 1908, giving a calendar, probably from the eighth century B.C.; (11) on a rock in the Siloam tunnel discovered in 1880, from the time of Hezekiah (715-686 B.C.); (12) on some seals published by Levy in 1869 and

Clermont Ganneau from the eighth and seventh centuries; (13) on a stone found at Hasanbey-li, near Zenjirli, by Luschan in 1895 from the eighth or seventh century B.C.; (14) on a bronze bowl found at Olympia, Greece, from the seventh century B.C.; (15) on a silver bowl found at Wladikaukaz in Caucasus, from the seventh century B.C.; (16) on the colossi at Ipsambul, Nubia, found in 1845, from the time of Psammetichus II (594-588); (17) on a stone found at Nora, Sardinia, probably from the seventh or early part of the sixth century B.C.; (18) on a golden medallion found at Carthage in 1894, probably from the seventh or sixth century; (19) on a stone found at Malta in 1820, probably from the seventh or sixth century B.C.; (20) on a stone from a temple at Taima, northwestern Arabia, found by Huber in 1880, probably from the sixth century B.C.; and (21) on two stones found at Nerab, near Aleppo, from the seventh or sixth century B.C.

All of these exhibit the alphabet in substantially the same form, whether they are written in Phœnician, Aramaic, Moabitish, or Hebrew. The same general type is preserved in all Phœnician and Punic inscriptions, though the hand becomes more and more cursive in the later Carthaginian. It was also used by the Samaritans for the Pentateuch, their Aramaic Targum, and other works, while the Jews adopted, even for the Hebrew Scriptures, the square Aramaic characters. These appeared already in an early form in Egypt, as the Elephantine papyri (q.v.) show, and developed into a great variety of distinct types among the Aramaic-speaking peoples. (See ARAMAIC LANGUAGE AND LITERATURE.) The Aramaic script employed in various parts of the Achæmenian Empire spread beyond the realm of Aramaic speech. It became modified into the Pahlavi (q.v.) of the Arsacid and Sasanian periods, and subsequently into the alphabet in which our manuscripts of the Avesta (q.v.) are written. From the legends on coins it is evident that the Kharosthi alphabet of India, in which some of the Asoka (q.v.) inscriptions are written, goes back to the Aramaic script of the Achæmenian period which may have been introduced in India already by the governors of Darius I (521-485 B.C.). The Brahmi alphabet, in which the majority of the Asoka inscriptions are written, was already at that time used in India. Whether this script was likewise derived from the Aramaic is a moot question. At present, however, there is a strong tendency to regard it as having for its basis the South Semitic. The age of this alphabet and the relations between South Arabia and India render such a derivation possible. Like the Greek alphabet, those of India introduced supplementary signs for the vowels, fewer in the Kharosthi, and more in the Brahmi. The former is read from right to left, the latter from left to right. From the Brahmi the devanagari (q.v.) is a later development. It spread into Thibet and was introduced into China by Kublai Khan (q.v.). The alphabets used in Ceylon, Burma, Siam, and Cambodia, as well as in Korea and Japan before the introduction of the Chinese, came from another branch of the Brahmi. The South Semitic alphabet was introduced also in Abyssinia several centuries before our era (see ETHIOPIC) and is still used in writing the Amharic, the Tigre, and the Tigrina. The script of the Safaitic, Lihyanian, and Thamudene in-

scriptions is generally regarded as an offshoot of the Sabæan, but its age and relation to the South Semitic cannot yet be determined. On the origin of the Arabic script see ARABIC LANGUAGE AND LITERATURE. The Arabian letters, with some modifications, were adopted for later Persian and Turkish.

When the Greeks invented their alphabet is uncertain. It can scarcely have been earlier than 1000 B.C., nor later than the eighth century, as it evidently succeeded the Dorian invasion, but preceded the great colonizing movement, since the colonies regularly use the same alphabet as the mother city. Our earliest extant inscriptions come from the seventh century, and no inscription mentioned by the ancient Greeks was earlier than the middle of the eighth. The most important change they had to make in the alphabet invented in Syria was to introduce signs for the vowels. As such they used Aleph, He, Waw, Yodh, and Ayin. Among the wealth of sibilants offered, Zain was universally appropriated for the double consonant Zeta (probably *dz*); as between Samech, Tzade, and Shin there is great diversity of usage among epigraphists as to the exact course of the development. In the Ionian alphabet, which ultimately came into general use, the place of Samech was filled by Xi (χ), Tzade was dropped, and Shin used for the simple *s* sound. A history of the numerous local variations in the Greek alphabet lies outside the scope of this article. It is enough to mention the chief varieties, which were influential in the development of borrowed alphabets. The primitive alphabet, omitting Xi and ending with Upsilon, is found in early inscriptions of Thera, Melos, and Crete. To this alphabet were added three supplementary signs, and in the method of this change the Greek alphabets after the seventh century fall into two great groups, the Eastern and Western. The former includes Asia Minor, the islands of the Ægean, and some points on the Greek mainland; the latter includes Eubœa, most of the States of Greece proper, Sicily, and Italy. It is to be noted that the lines of demarcation are not those of the dialects nor of the races, though the Eastern group is largely Ionian, and the Western Dorian. Attica occupies a middle position. The Eastern alphabet adopted $\Xi = \xi = x$, and added $\Phi = \phi = ph$, $\chi = \chi = ch$, and $\Psi = \psi = ps$. The Western alphabet shows $\chi = \xi = x$, $\Phi = ph$, $\chi = ch$, $\Psi = ps$ was expressed by $\pi\sigma$ or $\phi\sigma$, or in some cases by a new sign \star . As to the origin of these signs, Prætorius, in *Zeitschrift der deutschen morgenländischen Gesellschaft*, p. 676 (1902); p. 715 (1904), suggests that the very similar Saffaitic signs became known to some Greeks, in Damascus, c. 800 B.C. and adopted by them; while Evans, *Scripta Minoa*, p. 92 (1909), perhaps more plausibly suggests that they were taken directly over from some South Semitic source. Possibly we should then think of the Minæan alphabet, which we know to have existed at the time, and the forms of the letters likely to have been familiar to some extent in the Philistine Negeb and Gaza. The curious diversity in their use still lacks a satisfactory explanation. Among the East Greeks also arose the differentiation of the *e* and *o* sounds; after some variations, the short *e* came to be denoted by E, while for the long *e* was chosen the original aspirate (H); O was appropriated for short *o*, and for long *o* a new symbol (Ω) was invented. Waw or

Digamma (F) was disused, as the sound had been early lost among the Ionians. In adopting the alphabet, the Greeks seem at first to have adopted also the direction of writing, from right to left, but very early to have become more independent and to have adopted the form where the lines run alternately from right to left and left to right, like the course of the oxen in plowing, whence the name *βουστροφηδόν*, *boustrophedon*. But the direction was unimportant, and the early inscriptions show many strange variations. It was not until the fifth century that the habit of writing from left to right supplanted the earlier forms.

Through the Greeks the alphabet was brought to Italy, and naturally in the Western form, since the oldest settlement, Cumæ in Campania, was made by colonists from Chaleis and Cumæ in Eubœa. From the Chaleidian alphabet the Etruscan and Latin alphabets were derived. Many other local variations developed; but most of the Italian alphabets preserved throughout their history the original direction of the writing. The Latins, however, probably because of growing intimacy with the Greeks, adopted the later Greek method. Our earliest Latin inscriptions come from the sixth century B.C. The Greek alphabet was not adopted in its entirety. The aspirates (*th*, *ph*, *ch*) were not needed, and Z, though perhaps existing in early times, was soon dropped. Its place was later taken by G, a differentiation of C, which seems for a time to have done duty for both the *k* and *g* sounds, as K early fell into disuse, if it did not actually disappear. About the time of Cicero, for the transcription of Greek names, the characters Y (U) and Z were introduced at the end of the alphabet. This Latin alphabet, as spread by the Roman conquests, became the alphabet of most of the modern European languages. The Slavs, however, derived theirs from the Greek of the ninth century A.D. In its early ecclesiastical form it is said to have been the invention of the missionary Cyril, who found it necessary to add 12 signs to express the Slavonic sounds. In Russia it has undergone various modifications, but is still used by Russians, Servians, Bulgarians, and Croatians. Poles and Czechs received the Latin alphabet with the Roman Catholic faith. The number of letters was afterward increased to 48, and in the reign of Peter the Great again reduced so as to form the present Russian alphabet of 35 letters. See RUNES and OGAM for primitive Germanic and Irish writing, and GLAGOLITSA and KIRILLITSA for the Slavic alphabets.

Bibliography. Isaac Taylor, *The Alphabet* (2d ed., 1899). This is the most complete treatment in English, but must be used with caution. A convenient but rather popular summary, with numerous illustrations, may be found in E. Clodd, *The Story of the Alphabet* (London, 1900). Consult also: Berger, *Histoire de l'écriture dans l'antiquité* (2d ed., Paris, 1892); Peters, "Recent Theories of the Alphabet," *Journal of the American Oriental Society*, xxii, pp. 176 ff. (1901); Evans, *Cretan Pictographs and Pre-Phœnician Script* (London, 1895); *Further Discoveries of Cretan and Ægean Script* (London, 1898); *Scripta Minoa*, Oxford, 1909; Flinders Petrie, *The Formation of the Alphabet* (London, 1912); Stueken, *Der Ursprung des Alphabets und die Mondstationem* (Leipzig, 1913). ALPHABETICAL NOTATION. In music. See **MUSICAL NOTATION**; **NUMERICAL NOTATION**; **TABLATURE**.

ALPHAND, ăl'fän', JEAN CHARLES ADOLPHE (1817-91). A French civil engineer. He was born at Grenoble, studied at the Ecole Polytechnique, and was appointed an engineer at Bordeaux. He was appointed chief engineer of the improvements of Paris in 1854, director of works in 1871, and in 1878 director of water supply and drainage. In 1857 he was chief engineer of roads and bridges, and in the Franco-Prussian War was Colonel of an engineer corps charged with the task of strengthening the fortifications of the capital. He divides with Baron Haussmann the honor of having reconstructed Paris and is to be credited with an important share in the plans for the expositions of 1867, 1878, and 1889. He was the author of a work on the parks, boulevards, and promenades of Paris (1867-73), one describing the trees and flowers of the same city (1874), and of *Art in Gardens* (1886).

ALPHE'US (Gk. Ἀλφειός, *Alpheios*). The chief river of the Peloponnesus (Morea), rising in the southeast of Arcadia and flowing west through Elis and past the famous Olympia into the Ionian Sea. This river is one of the most celebrated in ancient song and is connected with a beautiful and characteristic Greek legend. The upper course of the Alpheus was of a sort likely to affect strongly the imagination of the Greeks. In its passage through Arcadia, a country consisting of cavernous limestone and abounding in shut-in basins and valleys, it twice disappears under ground and rises again. After these feats it was deemed capable of anything—even of flowing under the sea—and the Greek colonists of Sicily thought they recognized it in

their new country. Close on the margin of the sea in the island of Ortygia (the site of Syracuse), was the beautiful and copious fountain of Arethusa, and its fresh water was believed to be that of the Alpheus. As evidence it was asserted that, when the river overflowed its banks, the refuse of Olympia polluted the fountain, and that a golden cup, thrown into the Alpheus at Olympia, reappeared in Arethusa. This popular belief was reflected in a favorite story of the later classical times. The river-god Alpheus became enamored of the nymph Arethusa while she was bathing in his stream. To escape him, she prayed to Diana, who changed her into a fountain and opened up an underground passage for her to Ortygia. The river still pursued, and, passing from Greece to Sicily below the sea without mingling his waters with it, united with his love in the fountain.

ALPHONSE, ăl'fôn's' (1220-71). Count of Poitiers and Toulouse, son of Louis VIII of France. He took part in the sixth crusade (1248-54), led by his brother, Louis IX (St. Louis), with whom he was taken prisoner at Mansurah. He also accompanied King Louis on the seventh crusade (1270), against Tunis, where he fell fatally ill. His administration of the affairs of his domains was prudent and just and made in general toward increased autonomy and centralization.

ALPHONSINE, ăl-fôn's'in, **TA'BLES**. See **ALFONSINE TABLES**.

AL'PINE CLUBS. Societies established primarily to promote a spirit of fellowship among lovers of the sport of mountaineering, later fostering mountain exploration and scientific research. The earliest and most noted is the Alpine Club, of England, organized in London in 1857. The Italian and the Swiss Alpine clubs followed in 1863, after which the movement gained rapidly in extent and popularity, until at its jubilee in 1907 the original society could count no less than 166 descendants, representing nearly every civilized country. Some of these national societies are very large, having sections at various centres of population. The German and Austrian society had, in 1912, 403 sections and a total membership of 93,500. Nearly all these clubs are open to women. The original English club being an exception, a woman's society, the Lyceum Club, was organized at London in 1907. In America the first society of the kind—of a purely social nature—was founded in the college coterie at Williams-town, Mass., as early as 1863; the largest is the Appalachian Mountain Club (q.v.), founded in Boston in 1876. On the Pacific coast are the Sierra Club (1892) at San Francisco, the Mazamas (1894) at Portland, and The Mountaineers (1906) at Seattle. The American Alpine Club (1902) is organized more nearly on the lines of the original society and has a limited membership (80 in 1913), but admits women. The Alpine Club of Canada (1906), with headquarters at Banff, devoted chiefly to the study of the Canadian Rocky Mountains, has had a phenomenal growth—over 800 members in 1913.

The more important societies have encouraged geographical exploration in remote mountain ranges—the Himalayas, Tian Shan, Andes, Alps of New Zealand, Alaska, Equatorial Africa, etc.

There now exists a large body of Alpinistic literature, which began in 1859 with the Alpine Club's *Peaks, Passes, and Glaciers*, which was continued in the *Alpine Journal*, 1863. Certain of the continental societies have published extensively. *Appalachia* (12 vols.), *Alpina Americana* (2 nos.), the *Sierra Club Bulletin* (9 vols.), and the *Canadian Alpine Journal* (5 vols.) represent the literary activity of the American societies.

ALPINE PLANT. A plant whose natural habitat is in high altitudes. These plants form one of the three great climatic groups of xero-

where in mosses, is found in many seed plants, which sometimes resemble a brain coral in general effect. 5. The rosette habit is frequent. 6. The flowers and roots of Alpine plants, in striking contrast to the stems and leaves, are not reduced; they may even be increased. This combination makes the roots and flowers appear gigantic, and travelers, as a consequence, are always struck with the relatively large floral development. 7. Alpine leaves show decidedly xerophytic structures, many plants having thick-

Spring beauties (*Claytonia*) from the eastern lowlands (a) and Alpine districts of the Rocky Mountains (b). Note that the Alpine form shows great stem reduction, moderate leaf reduction, flowers relatively unchanged, and increased root system.

phytes (q.v.) and have in general the ordinary xerophytic structures. Among the leading peculiarities of Alpine vegetation may be noted: 1. The gnarled and twisted aspect of the shrubs and trees; so characteristic is this habit in the mountain pine of Europe that the tree has been called by the Germans *Krummholz*, i.e., 'crooked wood.' 2. The vegetation is notably dwarfed. 3. The plant axes are commonly horizontal rather than vertical, and as a result there are a great number of creeping plants. 4. The "cushion (Ger. *Polster*) habit," so common else-

Cross-section of leaf of Germander (*Teucrium*) from the Alpine regions (a) and the lowlands (b). Note the greatly increased leaf thickness and palisade development in the Alpine leaf. After Bonnier.

skinned, leathery evergreen leaves, as the pines and rhododendrons, while others have hairy leaves, as the edelweiss. Kerner, *Die Abhängigkeit der Pflanzengestalt von Klima und Boden* (1869), and Bonnier, *Cultures expérimentales dans les hautes altitudes* (1888 to date), have carried on some remarkably interesting experiments to determine the influence that Alpine climates exert upon plants. Lowland plants were taken into Alpine regions and were found to assume structural features similar to those usually found in Alpine plants but not usually found under lowland conditions. In particular, subterranean organs were found to increase in size, while aerial stems became reduced and tended toward horizontality. The leaves became smaller and thicker and often more hairy; sometimes the leaves showed more red coloration. The flowers became relatively, and in some cases absolutely, larger and more highly colored, and blossoming often took place earlier than in the lowlands. Structurally the leaves showed a thicker cuticle and increased development of palisade cells. Bonnier found that these plants increased in Alpine characters year by year, and that, when taken again to the lowlands, the Alpine features were not lost for a long time. In general, the structures of Alpine plants are similar to those of Arctic plants, but it has been noticed that the leaves are thinner and show more differentiation, intercellular spaces are fewer, and palisade cells better developed. Hairy plants are perhaps more characteristic of Alpine than of Arctic regions. The Alpine conditions are peculiar and are chiefly due in the last analysis to the rarefied air. The consequent decrease in pressure has probably a direct

effect on vegetation, but experiments have not yet made this clear. In any event, the thin air causes a greatly increased intensity of heat and light by day and a greatly increased radiation of heat by night. Thus great extremes of temperature are the rule. The rarity of the air also prevents great rainfall. These conditions, together with exposure to wind, work in harmony toward the development of a highly xerophytic flora, as has been previously mentioned, and it is easy to see how none but xerophytes can survive in such a location. The differences between Arctic and Alpine conditions may be summed up thus: Arctic light is more constant, but less intense, and this perhaps accounts for the differences in leaf structure and color intensity in Arctic and Alpine regions, as stated above. The changes of temperature are more rapid in Alpine districts. The xerophytic structures of Alpine plants are perhaps due to causes set in operation by thin air, while in Arctic plants the causes may be set in operation rather by the cold or even frozen soil. See also MOUNTAIN PLANT, and the plate showing ALPINE VEGETATION, accompanying this article.

ALPIN'IA. See GALANGALE.

ALPINO, ál-pē'nō, PROSPERO (1553-1617). A Venetian botanist and physician. He anticipated Linnæus in determining the sexual differences of plants, and one of his papers gave Europe the first notice of the coffee shrub. He filled the chair of botany in the University of Padua for many years. His best-known work is *De Plantis Ægyptiis Liber* (Venice, 1592; Padua, 1640). The genus *Alpinia* is named after him.

ALPS. The word "Alp" is of uncertain origin. By some it is said to be Celtic from *alb*, meaning 'high'; by others to be from Lat. *albus*, 'white'; but by the residents of these mountains, Alp is never used except as meaning the grassy "benches" or plateaus which are to be found abundantly at various high altitudes and which in summer afford pasturage for great numbers of cattle. The "Alps," then, in native phraseology means these plateaus and not the peaks, though in general usage it includes all—peaks, alps, valleys—the range as a whole. The name is applied collectively to a mountain system of southern Europe, which includes most of Switzerland, and extends into France on the west, Austria on the east, Italy on the south, and Germany on the north, and covers altogether an area of some 80,000 to 90,000 square miles (Map: Europe, D 4).

The system rises from the shore of the Mediterranean west of the Gulf of Genoa, and at first trends northward to the west of the plain of Lombardy; then swinging to the east, it stretches with an east and west trend through Switzerland and across the north of Italy into Austria. The total length of the system is upward of 600 miles, and its breadth ranges from about 75 to about 150 miles. It contains hundreds of peaks exceeding 10,000 feet, and its crowning summit, Mont Blanc, has an altitude of 15,781 feet. In the extreme northeast, where the Alpine system reaches the Danube, it is met by a range belonging to the great system of the Carpathian and Sudetic mountains. On the west the Alps are connected with the Jura Mountains. In the south the Apennines form a great continuation, extending through Calabria and into Sicily. The Cévennes in southeastern France constitute in a measure a connecting link with

the Pyrenees. The range of mountains known as the Dinaric Alps, on the borders of Dalmatia and Bosnia, are a connecting link between the Alpine system and the Balkan Mountains. The slopes upon the south, to the plains of Lombardy, are much more abrupt than those on the north, to the lower lands of Switzerland and Austria. This broad, complex mountain region is the source of many of the great rivers of Europe. The western slope of that part of the range which trends north from the Mediterranean shore is drained into that sea by the Rhone, while the east slope of this part, together with the southern slope throughout Italy, is drained into the Adriatic mainly by the river Po. The north slope is drained into the North Sea by the Rhine, and into the Black Sea by the Danube, which flows around the eastern end of the mountain system. The head branches of these rivers, aided by the glaciers at their sources, have eroded this mountain mass into a complex of short ranges and ridges, many of which have received distinctive names.

Subdivisions. The Alps are commonly, but quite arbitrarily, divided into three portions. The Western Alps comprise that portion having a north and south trend, and extending northward to the Great St. Bernard Pass; the Central Alps extend thence eastward to the Brenner Pass, while the Eastern Alps include the remainder. In the Western Alps the ranges and ridges are broken and irregular, while in the other parts of the system the secondary ranges trend more commonly parallel to the axis of the system. The system is still further subdivided into groups or ranges separated from one another more or less completely by stream gorges. The following groups are comprised in the Western Alps: The Maritime Alps, near the Mediterranean coast; the Cottian Alps, stretching from Mont Chambeyron, 11,155 feet, to the Col de Fréjus. It contains two peaks exceeding 12,000 feet in height—Monte Viso 12,609 feet, and Viso di Vallante, 12,048 feet. West of it is the small group known as Oisans, or Dauphiné Alps, with Mont Pelvoux, 12,970 feet, and Pointe des Ecrins, 13,462 feet, the highest peak. The Graian Alps are the northernmost group of the Western Alps; here are Grand Paradis, 13,324 feet; Mont Pourri, 12,428 feet; La Grivola, 13,028 feet; the Grands Coulvirs, 12,567 feet; the Grande Sassièrè, 12,323 feet; and, at the turning point of the range, Mont Blanc, 15,781 feet.

The Central Alps are subdivided into many groups, of which only the principal ones can be mentioned. The Bernese Alps separate the upper valley of the Rhone from the Aar and comprise many well-known peaks, among them the Jungfrau, 13,672 feet; Finsteraarhorn, 14,026 feet; Aletschhorn, 13,720 feet; Mönch, 13,465 feet; Eiger, 13,040 feet; Schreckorn, 13,385 feet, and Wetterhorn, 12,150 feet. This is one of the most rugged groups of the system, containing many peaks exceeding 12,000 feet in height and having many glaciers, one of which, the Aletsch, is the longest in the Alps. On the opposite side of the Rhone valley is another splendid range, the Pennine Alps, in which, grouped about Zermatt, are the Matterhorn or Mont Cervin, 14,780 feet; Weisshorn, 14,803 feet; Grand Combin, 14,164 feet; Lyskamm, 14,889 feet; Mischabel, 14,941 feet; and Monte Rosa, 15,217 feet. The St. Gothard Range stands at the sources of the Reuss, Rhine, and Ticino, separated on all sides by comparatively

MT. HOOD, OREGON, SHOWING OSCILLATIONS OF THE TIMBER LINE. The trees, mostly mountain pines and hemlocks, advance farther up on the ridges than in the valleys.

low passes. To the south and east of it, and to the northeast of the Pennine Alps, are the Lepontine Alps, through which from northwest to southeast extends the valley of the Ticino. Between the Aar and Reuss are the Emmenthal Alps, separated from the Alps of Uri on the east by the Brünig Pass. The Tödi chain continues the line of Bernese Alps northeastward, with Tödi, 11,887 feet. The Rhetian Alps stand about the headwaters of the Inn River and contain many fine peaks, exceeding 11,000 feet in height, while south of them is the splendid Bernina group, with Mont Bernina, 13,304 feet. Still farther south, on the south flank of the system and east of Lake Como, are the Alps of Bergamo. East of the Rhetian Alps are the Otzthal and Ortler Alps, with peaks rising above 12,000 feet, the Ortlerspitze being 12,800 feet.

The Eastern Alps are of less height than the other two groups and are broken into a great number of semi-detached groups and ranges; the North and South Tyrolean, Sarnthal, Dolomite, Venetian, Carnic, and Julian Alps, Hohe Tauern, Niedere Tauern, and the Salzburg, Styrian, and Austrian Limestone Alps. The Eastern Alps culminate in the Gross-Glockner, in the Hohe Tauern, on the borders of Tyrol, Carinthia, and Salzburg, which rises to a height of 12,457 feet, and from which descend glaciers almost rivaling those of the Swiss Alps.

The highest part of the Alpine system, as expressed by the altitude of its summits, is in the western part of the Central Alps, in the Bernese and Pennine groups, and about Mont Blanc. From this region the altitudes diminish eastward and southward. Owing to the broken character of the system, passes are numerous; many of them are comparatively low, and are utilized as routes for roads and railroads. Some of them have been used as routes of travel for many centuries.

—Passes and Routes. Owing to the broken nature of the ranges, the passes are frequent and good. A number of them were known to, and used by, the Romans. The chief of these were the Mont Genève (6083 feet), from Briançon to Césanne, and the Brenner (4495 feet), Innsbruck to Verona. The passage of the Western Alps is made by five principal roads: 1. The military road, La Corniche, a coast road at the foot of the Alps from Nice to Genoa, parallel to which a railway now runs. 2. The road over the Col-di-Tenda, between Nice and Cuneo, made in 1778; highest point, 6150 feet. A railway tunnels it. 3. The highroad over Mont Genève, connecting Provence and Dauphiné with Turin; highest point, 6100 feet. 4. The carriage road made by Napoleon in 1805, over Mont Cenis, connecting Savoy with Piedmont; highest point, 6850 feet. Near this the chain is pierced by the railway tunnel of Mont Cenis. 5. The pass of the Little St. Bernard, connecting Savoy and Piedmont; highest point, 7180 feet. The passage of the Central Alps is made by eight principal roads: 1. That of the Great St. Bernard, connecting the valley of the Rhone with Piedmont; highest point, 8120 feet. It was crossed by Napoleon in 1800. 2. The magnificent road over the Simplon, which mountain is pierced by the Simplon railway tunnel at a level below that of the St. Gothard tunnel, was constructed by Napoleon, 1801–06, and connects Valais with the confines of Piedmont and Lombardy; highest point, 6590 feet. 3. The pass of St. Gothard, connecting Lucerne with Lago Maggiore; highest point, 6936 feet.

One of the great Alpine railway tunnels is the St. Gothard. (See ST. GOTHARD.) 4. The San Bernardino Pass; highest point, 6770 feet. 5. The Splügen Pass, connecting the sources of the Rhine with the Adda; highest point, 6945 feet. This pass was the one used by the Romans in their intercourse with the countries bordering on the Danube and the Rhine and also by the German armies on their marches into Italy in the Middle Ages. 6. The Furka Pass, separating the heads of the Rhine and Rhone, and crossed by a wagon road at an altitude of 7992 feet. 7. The Stelvio Pass (Stilfser Joch), on the frontiers of Tyrol and Lombardy, traversed by the most elevated carriage road in Europe; its highest point, 9855 feet. 8. The Brenner Pass on the road from Innsbruck to Trent and Verona; highest point, 4495 feet. It is now crossed by a railway. Besides these great roads, leading south into Italy, there are two which lead north from the valley of the Rhone and cross the Bernese Alps, over the Grimsel Pass, 7103 feet high, and the Gemini Pass, 7640 feet high. Just east of the Gemini is the Lötschen Pass, tunneled by a railway. The roads over the Eastern Alps are much lower and also much more numerous than those in the Middle or Western Alps. The principal are: 1. The road from Venice to Salzburg, crossing the Noric Alps at an elevation of rather more than 5000 feet. 2. The road over the Carnic Alps, which divides into three branches—the first leading to Laibach, the second to the valley of the Isonzo, and the third to the valley of the Tagliamento. 3. The roads from the Danube at Linz to Laibach.

There are four railways crossing the Western and Central Alps: The Mont Cenis, connecting France with Italy; the St. Gothard, connecting Lake Lucerne with Lago Maggiore; the Simplon, from the upper Rhone Valley to Lago Maggiore, and the Brenner, from Munich and Innsbruck to Verona and Venice. The Arlberg railway, which pierces the Alps in the Arlberg tunnel, is the great highway between Switzerland and Austria. Besides these through lines there are many extending into the heart of the mountains. From the upper valley of the Aar many lines extend southward into the Bernese, Urner, and Glarner Alps to Interlaken, Lauterbrunnen, and Grindewald, and to Brienz, Meiringen, Lucerne, and Linthal. A railway passes up the Rhone valley, with a branch to Zermatt, in the Pennine Alps. On the Italian side several railways penetrate the mountains to considerable distances. The Eastern Alps are crossed by several railway lines, which subdivide and join, sending off many branches within the mountain area. Many of the points affording the grandest views in the Alps are now reached by mountain railways; the Gornegrat Railway, the highest railway in Europe, in the vicinity of the Matterhorn, climbing up to an elevation of 9908 feet. The most extensive panorama to be had from any easily accessible point is that obtained from the summit of the Rigi, a peak near Lucerne, less than 6000 feet high. As a pleasure ground for the lovers of grand scenery and adventurous mountain climbers, the Alps are the most attractive region on the earth. It is a truism that the most valuable of Switzerland's assets is the scenery of the Alps. Not that these are the finest mountains on the face of the globe, but there are no others comparable with them which are so accessible, and in which living and

travel are so pleasant and easy. Railways and carriage roads traverse these mountains in all directions. At the best scenic points are excellent hotels, and guides are provided for conducting visitors to all points. Hence every year tens of thousands of travelers visit the Alps from all parts of the civilized world.

Glaciers. As the Alps rise to heights of 12,000 to nearly 16,000 feet above the sea, in a region of ample rainfall, the precipitation on these mountains is great, and gives rise to extensive glaciers, which originate near the summits and descend to different levels, the longest reaching within four or five thousand feet of sea level, and one of them, the Lower Grindelwald, having its termination at an elevation of only 3550 feet. The principal glaciers are found in the Bernese and Pennine Alps and the group about Mont Blanc, although numerous smaller ones exist in many other parts of the system. The total number is estimated at 1200, of which 471 are in Switzerland and 462 in Austria, those in the former country being by far the largest, covering an area of 710 square miles; the total area of snow and ice in the Alps is about 1600 square miles. The area of one glacier in Alaska, the Muir, is 350 square miles, and it has 20 feeders greater than the Mer de Glace; while the largest and longest of the Swiss glaciers, the Aletsch, in the Bernese Alps, has a length of 16 miles (area, 50 square miles), and a breadth of ice of more than a mile. In length the Unteraar is next, with a length of 10.4 miles, followed by the Gorner in the Pennine Alps and the Viesch in the Bernese Alps, each of which is 9.4 miles in length. Other well-known glaciers are the Mer de Glace, above the Valley of Chamonix, Miage Glacier, which has its source on Mont Blanc, the Oberaar and the Unteraar, in the Bernese Alps, and the Rhone Glacier in the same group, near the Furka Pass.

Our present knowledge of glaciers, their origin, structure, flow, advance, recession, and the phenomena of erosion, has been largely derived from a study of these Alpine glaciers. The present glacial system is but the last remnant of a great ice sheet which once covered both flanks of the mountain system, descending to the plains and valleys on either side. As it shrank it left great rivers of ice, which carved mountain gorges and lake basins. (All glaciers of the northern hemisphere are now receding, and probably those of the southern hemisphere also.) The lake scenery of the Alps is unrivaled for beauty, grandeur, and diversity. The largest lakes include Geneva, draining into the river Rhone, Neuchâtel, Bienne, Thun, Brienz, Lucerne, Zug, Zürich, Constance, Como, Lugano, Garda, and Maggiore. In the high mountains are cirques at the heads of all gorges not now occupied by ice, with little lakelets surrounded by frowning semi-circular sweeps of cliffs, hanging valleys, and smooth-sided, U-shaped gorges, planed and polished, all bearing mute evidence of their glacial origin. Since the recession of the glaciers, the rivers in their turn have done a vast deal of erosion, but have not yet by any means effaced from the land the handwriting of the ice. The main Alpine region is drained on the north by the upper system of the Rhine, including the Reuss, Aar, and Thur, and by south branches of the Danube, including the Iller, Lech, Isar, Inn, and Enns; on the east by west branches of the middle Danube, including the Drave and Save; on the south by the upper Adriatic coast

streams, including the Tagliamento, Piave, Brenta, and Adige, and by the northern branches of the Po, including the Mincio, Oglio, Adda, Ticino, Sesia, and Dora Baltia; and on the west by the eastern tributaries of the lower Rhone, the Durance, Isère, and the upper Rhone itself.

Geology. The Alps are the result of intense folding and faulting of the strata, carried on for a long time, the folds and faults mainly trending northeast and southwest, accompanied and followed by long-continued and intense erosion by ice and water. The net result of the earth movements was greatly to elevate the surface in a broad anticline, composed of many sharp anticlines, synclines, and monoclines. Erosion has planed these off to a comparatively smooth curve, has removed the stratified beds in great part from the higher portions of the system, leaving only fragments of the older beds in limited localities, and has laid bare vast areas of the underlying gneissic rocks. Hence the higher parts of the system are composed almost entirely of gneissic and allied rocks, while upon the flanks are found stratified beds, lying in various positions with regard to the system, here lying up against it, there dipping away from it. The folding and faulting occurred in various geologic epochs, from Paleozoic times down, but was apparently most intense in relatively recent times, in the Mesozoic. They occurred at different times in different parts of the system, and not always or everywhere in the same direction, so that the result, in detail, is exceedingly complicated, and in some places in Switzerland mountain masses of different constitution are suddenly interpolated. These are called *Klippen*. The principal field of these movements, where the folding and faulting is most complicated and greatest, is north of the higher parts of the range, in other words, on the northern slope; here are found stratified beds succeeding each other in bewildering fashion. The southern or Italian slope is much simpler in structure.

Climate. The Alpine region is at the meeting place of the high middle-latitude marine climate of Western Europe, the continental climate of Central Europe, and the low-latitude marine climate of the Mediterranean regions. While it does not lie directly in the main path of the cyclonic disturbances which sweep across Northern Europe from west to east, yet it does lie within the sphere of influence of these storm centres. Moreover, during the spring, numerous extended cyclones pass over the Alpine region; but they are less frequent in the winter and fall, and are almost totally lacking in the summer. This is the chief reason for the steady cold of the Alpine winter, with but few intensely cold waves, the serenity of its summer climate, and the harshness of its spring weather. The average annual temperature on the northern Alpine boundary at altitudes of 1500 feet is about 48° F., while the seasonal averages range from about 30° F. in winter to 65° F. in summer. In winter temperatures usually descend as low as zero F., and in summer rise as high as 90° F. On the southern Alpine boundary, at altitudes of about 800 feet, the average temperature for the year is about 54° F., the variations ranging from 35° F. in winter to 72° F. in summer; but in winter the temperature usually does not descend below 15° F., and in summer may reach even 95° F. With increase of altitude above these regions there is on the average for the year a decrease in temperature of about 1° F.

ALPINE SCENERY
CHILLON AND THE DENT DU MIDI

for each 330 feet of altitude; but the rate of decrease is much more rapid in summer than in winter. The average daily temperature is remarkably uniform in the Alps; but the temperature changes from day to night are excessive, on account of the intense action of the sun by day and the rapid cooling by radiation by night, as in all elevated regions. The absolute humidity decreases with the altitude, and is greater in summer than in winter. The relative humidity, and, consequently, the degree of cloudiness, are least in winter in the Alps, while in the surrounding region the relative humidity and cloudiness are usually greatest in winter.

On the north side the annual rainfall is from 25 to 40 inches; but this increases irregularly to about 90 inches on the southern side, where the steep slopes deflect upward the moisture-laden warm winds from the Mediterranean Sea. The average annual rainfall for the whole region cannot be far from 60 inches, while that of the surrounding lowlands is less than 35 inches. Where the high mountains have a copious rainfall on the windward side, the valleys on the leeward side experience a deficiency; so that on one side of a mountain range the rainfall may be many times that on the other side. Of the total annual rainfall throughout the Alps about 18 per cent occurs in the spring and about 25 per cent in winter. In summer the proportion decreases from 37 per cent in the northern part to 25 per cent in the south; but in the fall, on the contrary, the proportion increases from 20 per cent in the north to 33 per cent in the south. In the higher Alps much of the precipitation is of course in the form of snow, which is carried down to lower levels by glaciers and is there melted. The snow line in the Alpine mountains undergoes an annual variation, reaching its lowest altitude, about 2000 feet, toward the end of January, and its highest altitude, in the neighborhood of 9500 feet, about the middle of August. The limit differs for the northern and southern exposures, the snow line on the southern slopes lying over 150 feet higher in mid-winter, and about 1300 feet higher in the early fall. At low altitudes of 2000 to 3000 feet, the snowy days much exceed the number of days on which the ground remains snow-covered, but at altitudes of 8000 feet, the first snow commonly remains throughout the season of snow. The lower limit of perpetual snow is at an altitude ranging from 8500 feet to 9500 feet.

The general winds of the Alps follow the cyclonic and anti-cyclonic laws, which give a veering through the south when the cyclones pass to the north, as they usually do, and through the north when the cyclones pass to the south. Local winds are very prevalent; among these the mountain and valley winds, blowing upward from the valleys by day and downward from the mountains by night, are the most characteristic. In the Central and Northern Alps occur these hot, dry winds called the föhn. These are the result of descending air on the leeward side of the mountains after much of the moisture has been condensed by the cold high up on the windward side. These föhn winds, while a source of discomfort to the inhabitants, are welcomed in the spring, for they clear the ground of snow much more rapidly than the sun can accomplish it. Such is the evaporating power of the föhn winds that it may cause two feet of snow to disappear in half a day.

Fauna. The large native animals of the Alps

are becoming scarcer and scarcer, by reason of the increasing number of sportsmen and the fact that the exploration habit, which is here practiced by tourists as in no other part of the world, has left scarcely a valley in untrodden seclusion. The wild cat, the brown bear, and the wolf have been driven into the more remote recesses, and are gradually becoming rare. The chamois and the ibex are found among the higher mountains, the haunts of the latter being among the inaccessible rocky solitudes bordering on the snow line. The pursuit of these animals is the most exciting and dangerous of European hunting sports. Foxes, weasels, and Alpine hares are plentiful, while otters and ermines are less numerous. The badger is common in the lower Alps, but the marmot is more distinctively an Alpine habitant, and it seems to maintain its numbers, and flourishes along with some smaller rodents in the higher altitudes even up to the snow line, the Alpine snow mouse having been found up to an altitude of 12,000 feet. The birds of the lower Alps are very numerous, consisting of the adjoining European species, and among the higher mountains are to be found eagles, hawks, and owls, and the smaller birds, choughs, snow finches, and larks. The great lammergeyer, once quite common in the higher Alps, has now become almost extinct. Game birds, such as woodcock, grouse, and partridges, are fairly abundant. Reptiles are not numerous. The lakes of the Alpine region contain a large variety of fishes; trout, salmon, and in some localities species of whitefish being the most important. Insects of all kinds flourish in the Alps. Butterflies and beetles are numerous, and extend up to snow altitudes. With increase of elevation, however, their colors become more and more subdued, and they become more and more deficient in wing power, thus necessitating a closer contact with the ground than prevails in like species below.

Flora. The forms of plant life of the Alps differ with the altitude, ranging from those common in Europe, at lat. 46°, to those typical of the arctic regions. The main subdivision of the Alpine plant growth is therefore into altitudinal zones; with increase of altitude there is a corresponding poleward change in the flora. The Alpine slopes are noted for their verdure up to the limits of vegetation; at low altitudes are the forests and meadows, while above these are the shrub and flower-decked pastures, which are such an important feature both in the landscape and in local life. At the base of the Alps on the south side, the lemon and olive flourish; but on the whole the prosperous growth of the vine may be taken as the most significant indication of plant life. With the grape occur the hardy plants of central Europe, grains, and the principal deciduous trees, oak, beech, ash, sycamore, maple, chestnut, and walnut. These latter are to be found up to an altitude of 4000 or 5000 feet, when they give way to the coniferous trees, which, while plentiful only up to an altitude of 6000 to 7000 feet, are in places found at still greater elevations, where the fir, the larch, and the creeping pine are the chief species seen, together with shrubs of central and northern Europe. The Alpine roses and violets are celebrated for their beauty. The typical Alpine plants, those which grow above the tree line, in some instances up to the region of eternal snow, are characterized by a low, clumpy growth which sends forth at the proper season flower stalks

which bear beautifully colored flowers. The blossoms of many species have peculiar hairy or woolly coatings. Gentians, violets, Alpine bells, edelrue, and the world-famed edelweiss are among the beautiful flowering plants of the region. Shrubs, such as the juniper, dwarf willow, and dwarf rhododendron, also occur in some places in profusion. Above the highest altitude of flowering plants and stunted shrub growth, from 10,000 to 12,000 feet, algæ, mosses, and lichens are the only vegetable life. There is not, however, a uniform flora at the same altitude in all parts of the Alpine region. Some species are indeed common in the appropriate climatic zone throughout the whole region; but, on the other hand, some species are limited to the west Alps, while others are peculiar to the north, south, or east Alps. Some of the arctic plants are so narrowly limited in distribution as to be found only on certain mountain groups.

Bibliography. The list of writings relating to the Alps is a very long one, and embraces important works in all of the principal languages of western Europe, French, German, Italian, and English. In fact, no other single region has been so much written about from a geographical point of view. For a detailed knowledge of the Alps, the publications of the various Alpine Clubs offer the richest sources of information. The chief of these clubs are: The English Alpine Club (organized in 1857), publishes *The Alpine Journal* (London); Deutscher (1869) and österreichischer (1862) Alpen-Verein (fused, 1874), 1800 members, *Zeitschrift des Deutschen und Oesterreichischen Alpen-Vereins* and *Mittheilungen* (Vienna); Club Alpin Suisse (1863), *Annuaire* and *L'écho des Alpes* (Geneva); Club Alpino Italiano (1863), *Revista mensile* and *Bollettino*; Der österreichische Touristen-Club (1869), *Oesterreichische Touristen-Zeitung* (Vienna); Le Club Alpin Français (1874), *Bulletin mensuel* and *Annuaire* (Paris); Der Verein der Naturfreunde (1877); Der Oesterreichische Alpen-Club (1878), *Oesterreichische Alpen-Zeitung* (Vienna); Le Club Alpin International à Nice (1879); Der Alpen-Club Salzburg (1880); Sannthaler Alpen-Club (1880); Der Touristen-Verein Hermagor (1882); La Società degli Alpinisti Triestini (Roveredo). For the best general description, consult: F. Umlauf, *The Alps*, translated by Louisa Brough (London, 1889); T. G. Bonney, *The Alpine Regions of Switzerland and Neighboring Countries* (London, 1868), and *The Building of the Alps* (New York, 1912); J. Tyndall, *The Glaciers of the Alps* (London, 1896); J. Tyndall, *Hours of Exercise in the Alps* (London, 1873); Rambert, *Les Alpes suisses*, 5 vols. (Geneva, 1866-74); Desor, *De l'orographie des Alpes* (Neuchâtel, 1862); C. Bowney, *The Building of the Alps* (London, 1912); R. H. France, *Die Alpen* (Leipzig, 1913).

ALPUJARRAS, ăl'pōō-Hä'rās (Ar. *al*, the + *basharat*, herbage). A mountainous region in Andalusia, Spain, running parallel to the Sierra Nevada on its south side (Map: Spain, D 4). It is remarkable for its narrow, deep-cut, and romantic valleys, which are the most fertile in Spain. The inhabitants are in part of Moorish descent, large numbers of Moors having taken refuge here after the fall of the kingdom of Granada.

AL RAKIM, är'rä-kēm'. A name in the Koran (Sura xviii. 8), connected with the tale of the "Seven Sleepers." It is commonly understood to apply to the dog that guarded the "Sleepers" in their cave. But it has also been variously understood to mean the cave itself, or the valley wherein the cave was situated, or, again, the tablet set up over the entrance of the cave, enumerating the names of the slumbering occupants. See SEVEN SLEEPERS.

AL'REDUS, or **AL'FRED**. See ALFRED OF BEVERLEY.

ALSACE-LORRAINE, ăl'zās'lōr'rān' (Ger. *Elsass-Lothringen*; *Elsass*, ancient *Alsatia*, from the river *Ill* + Ger. *Sasse*, settler, tenant; *Lothringen*, the realm of Lothaire, grandson of Charlemagne). An imperial territory (*Reichsland*) occupying the southwestern end of the German Empire, and bounded by the Grand Duchy of Luxemburg, the Rhine province of Prussia, and the Rhine Palatinate on the north, Baden on the east, Switzerland on the south, and France on the west. Its area is 5603 square miles. Administratively it is divided into the districts of Upper Alsace, Lower Alsace, and Lorraine, the last being a fragment of the old Lorraine. Alsace is touched by the Rhine on the east and the Vosges Mountains are on the west border. The eastern part is an extensive plain, slightly inclined toward the Rhine, where it occasionally passes into swamps and marshes. The western part is traversed by the Vosges, which attain their greatest elevation in Alsace, the Sulzer Belchen (Ballon de Guebwiller) rising to a height of nearly 4700 feet above the sea. German Lorraine is a plateau region. The offshoots of the Jura where they enter Alsace are about 2500 feet high. Alsace-Lorraine belongs entirely to the basin of the Rhine. The Ill, a tributary of the latter, rises at the south end of Alsace and flows to the north throughout the greater part of its length. In the north, Alsace is watered by the Zorn, Moder, and a few other tributaries of the Rhine; while the western part of Lorraine is crossed by the Moselle.

The lakes are generally small, and furnish water for irrigation and water-power projects. The climate is mild, with a slight difference between the plains and the mountainous regions. The respective average summer temperatures of the two regions are 61° F. and 58°, and those for the winter 39° and 37°. Strassburg has an average yearly temperature of 50°, and Metz about 48.5°. Rainfall is abundant.

Agriculture. The soil of the country is well adapted for agriculture and is in some parts extremely fertile. The mountainous region is devoted almost exclusively to the cultivation of fruit and the vine, which grows as high as 1300 feet above the sea. The southern end of Upper Alsace is considered the most fertile part of the country, in contrast to the northern part of Lorraine, where the stony nature of the ground renders it unfit for agricultural purposes. About 48 per cent of the land is under tillage, over 30 per cent under forests, nearly 13 per cent in meadows, and about 2.3 per cent in vineyards. The land is divided into very small holdings, only about 2 per cent of the total area being in estates of over 50 acres each. Wheat, rye, barley, and oats are the chief grains. Potatoes and sugar beets, as well as hay and hops, are produced in large quantities. The cultivation of tobacco is still very important, although it has been declining of late. The cultivation of the vine is carried on more extensively than in any other section of the German Empire. Alsace produces chiefly white wines, while Lorraine yields exclusively red wines. The value of the output in 1911 was 34,900,000 marks, of which nearly one-half, or nearly one-tenth of the value produced in the Empire, was credited to Lower Alsace. The forests of Alsace-Lorraine consist largely of foliaceous trees, and are owned to a considerable extent by the communities.

Mining. Alsace-Lorraine occupies at present the first rank among the iron-producing countries of the German Empire. The growth of iron mining has been very rapid for the last decade, and, while in 1892 the production of iron ore in Prussia exceeded the output of Alsace-Lorraine by about 500,000 metric tons, in 1911 the latter produced 17,754,571 tons against Prussia's 4,948,711. The centre of iron mining is at the western end of Lorraine, near the frontier of Luxemburg, where the highlands on the left bank of the Moselle contain vast deposits of iron and some phosphate. Coal is mined principally in the Vosges; the output in 1911 was 3,033,436 tons. The output of salt is considerable (60,790 tons in 1911).

Manufactures. Among the manufacturing industries of Alsace-Lorraine the production of textiles occupies the chief place, employing about one-third of the total population engaged in industrial pursuits. Cotton weaving has been carried on extensively in Alsace-Lorraine since the middle of the eighteenth century and is at present considered the most important among the manufacturing industries. The production of textiles is carried on chiefly at Mülhausen, Kolmar, and along the numerous streams, which are utilized largely for industrial purposes. The production of woolens and yarns is very extensively developed in Lower Alsace. Linen and silk weaving establishments are also numerous. The production of textiles is still to some extent a house industry, especially in Lower Alsace. The iron and steel industry is next to the textile in importance. There are extensive

foundries, machine shops, tool factories, and numerous other plants for the production of various iron products. The value of the annual output of the mills and foundries is about \$40,000,000. Breweries and distilleries are numerous, but supply chiefly local demand.

Transportation and Trade. The transportation facilities of the Reichsland are not behind its industries. There are over 5000 miles of highways, nearly one mile of road to one square mile of territory. Of railway it had in 1912 1305 miles, or nearly 22.3 miles for every 100 square miles of territory, about the same as in the State of Illinois. The canal system of Alsace-Lorraine is one of the best in the Empire, and the government expends large sums on its maintenance and constant extension.

Government. Alsace-Lorraine was established as a part of the German Empire by the law of June 9, 1871; from that year the chief executive head has been the German Emperor, acting through the Statthalter, his appointee, at Strassburg. The constitution of the Empire was extended to the Reichsland Jan. 1, 1874, and on October 29 following a provincial committee (elected indirectly), the *Landesausschuss*, was established. This body was abolished by the constitution of May 31, 1911. Under the constitution the legislative power rests with the Emperor and a diet of two chambers. The First Chamber consists of representatives of the religious bodies, of the four larger cities, of their chambers of commerce, of the agricultural councils, of the trades union, etc., and of members named by the Emperor in number (18 in 1913) not exceeding the rest of the members. All hold office for five years. The Second Chamber consists of 60 deputies elected for five years by general suffrage, direct and secret. The Statthalter is assisted by a ministry. The districts of Upper and Lower Alsace and Lorraine are administered by presidents and councils. The Reichsland sends three members to the Bundesrat and 15 to the Reichstag. The revenue is obtained chiefly from direct and indirect taxes, customs, and state forests. The budget for 1912 balanced at 74,049,304 marks. The public schools are under the supervision of the school board, presided over by the Secretary of State. Since the German occupation the proportion of illiterates has diminished considerably. Education is still controlled to a considerable extent by the Church, over 27 per cent of the teaching staff consisting of clergymen and persons belonging to religious orders. Alsace-Lorraine contains one university, that of Strassburg. The population of Alsace-Lorraine in 1900 was 1,719,470, showing an increase of over 7 per cent since 1890; in 1905 it was 1,814,564, showing an increase of nearly 5.24 per cent since 1900; in 1910, 1,874,014 (Lower Alsace, 700,938; Upper Alsace, 517,865; Lorraine, 655,911). In 1910 Roman Catholics numbered 1,428,343; Protestants, 408,274; other Christians, 3868; Jews, 30,483; others, 3046. Of the total 965,625 were male and 908,389 female. Strassburg, the capital, had 178,891 inhabitants.

History. Originally a part of Roman Gaul and inhabited by Celtic tribes, the region now known as Alsace was overrun by the Germanic nations during the fourth and fifth centuries and was ultimately brought under the dominion of the Franks. The Teutonic invaders supplanted, to a great extent, the old Celtic inhabitants, and by the tenth century the country

had become thoroughly Germanized. After the partition of the Frankish Empire, Alsace was held by the dukes of Swabia and later by the Hapsburgs, under whose rule it enjoyed prosperity. Rich and powerful towns, chief among them Strassburg and Kolmar, sprang up and attained, in the course of time, a very large degree of self-government, entering frequently into treaty relations with other cities of the Empire and partaking fully in the intellectual and spiritual life of the German people. Modern Lorraine, in the meantime, originally the nucleus of the independent nation of Lorraine, had become steadily more and more French. A part of the possessions of the Duke of Burgundy, its autonomous position tended to disappear; until finally Henry II invaded the country, seizing Metz, Verdun, and Loué. Alsace next became the object of French ambition. In the Peace of Westphalia, in 1648, the Hapsburgs (as rulers of Austria) ceded their territories in Alsace to France. Louis XIV subsequently seized the numerous free cities of Alsace. Kolmar was incorporated with France in 1680 and Strassburg in 1681. The Treaty of Ryswick (1697) confirmed France in possession of Alsace.

Systematic attempts to assimilate the inhabitants, who were mainly of Germanic stock, with the French were made by the government, but met with no success until the Revolution, when, in the general overthrow of feudalism, Germans and French were drawn together by the common ideal of democracy. The French spirit penetrated deeply into the upper and middle classes, and even the mass of the population was reconciled to French rule. When war, therefore, between France and Prussia broke out in 1870, those natives of Alsace who did not side zealously with France remained neutral. In Lorraine occurred some of the most decisive battles of the war, Gravelotte and Vionville and the siege of Metz. The surrender of Alsace and a part of Lorraine was made the principal condition of peace by Prince Bismarck, who acted in this as the exponent of a widespread spirit in Germany, which demanded the recovery of the ancient Germanic borderland. Alsace (with the exception of the district of Belfort), and the part of Lorraine where the French language had not supplanted the German, became a part of the newly founded Empire, and were put under the direct control of the Emperor. The attempt to win back the people to German influences was greatly hampered by the vehement opposition of the Gallicized upper classes and the clergy, and the civil administration was brought almost to a standstill for a number of years by the refusal of the men elected to the district and provincial councils to take the oath of loyalty and perform their functions; the representatives to the Reichsrath were, for the most part, French irreconcilables. In 1872 the German government called upon the inhabitants to declare themselves either German citizens or French. More than 150,000 expressed their adherence to France, and of these nearly 50,000 removed across the border. On the part of the German authorities a policy of severity approaching military rule was tried in alternation with one of mildness and concession, and for a long time both proved equally ineffective. The Germanization of the provinces has steadily been aimed at, however, in acts making the study of the German language compulsory in the public schools, and the use of it obligatory in the

courts and legislative bodies; in the suppression of French radical newspapers, and in the establishment of higher schools of learning under German control. After 1890 the prospect of an ultimate reconciliation became brighter; a loyalist party appeared which wielded some influence in the elections. The status of Alsace-Lorraine, however, is still far from settled. A great number of the inhabitants yet hope to become reunited to France, while others urge that Alsace-Lorraine should become a republic like Switzerland, with its neutrality recognized by international agreement. In December, 1913, the situation was more critical than ever, owing to the stern suppression of an anti-Prussian demonstration, giving rise to a parliamentary crisis of serious proportions.

Consult: H. Witte, *Zur Geschichte des Deutschthums im Elsass und im Vogesenengebiet* (Strassburg, 1897); Gerber, *La condition de L'Alsace-Lorraine dans l'Empire Allemand* (Lille, 1906); H. Derichsweiler, *Geschichte Lothringens* (Wiesbaden, 1901).

ALSA'TIA. The popular name of Whitefriars, London, which served early in the seventeenth century as a refuge for criminals—a reservation which was abolished by Parliament in 1697. See the account in Scott's *Fortunes of Nigel*.

ALSBERG, ălz'bĕrg, CARL LUCAS (1877—). An American chemist, born in New York City. His father, Meinhard Alsberg, was one of the founders of the New York Chemical Society, which subsequently grew into the present American Chemical Society. Carl Alsberg graduated from Columbia College in 1896, then studied medicine in Columbia University, receiving the degrees of M.D. and M.A. in 1900. The three following years he spent in Germany, devoting himself to physiology, pharmacology, and chemistry under Hofmeister, Emil Fischer, and others. From 1902 to 1908 he was connected with the Harvard Medical School, acting as head of the department of biochemistry from 1905 to 1908. In the latter year he was appointed chemical biologist in charge of the Poisonous Plant laboratory in the Bureau of Plant Industry at Washington, and in 1912 President Taft chose him to succeed Harvey W. Wiley (q.v.) as Chief of the Bureau of Chemistry in the United States Department of Agriculture. He has published a number of original studies on the chemistry of the nucleic acids and the proteins, on the value of sea foods, phosphoric acid metabolism, poisonous plants, and enzymes.

ALSEA. A tribe of Indians near the mouth of the Alsea River, Oreg., now reduced to a few individuals. See YAKONAN.

ALSEN, ăl'zen (Dan. *Als*). An island in the Baltic belonging to the Prussian province of Schleswig-Holstein and separated from the mainland by the Sound of Alsen, which in some parts is less than 400 yards wide (Map: Prussia, C 1). Its greatest length is nearly 20 miles, its greatest breadth about 12 miles, and its area is 124 square miles. The island is very picturesque in appearance, with a fertile soil. Its lakes have fish, and apples constitute an important article of commerce. The soil is fertile and yields grain. The chief towns are Sonderburg and Nordburg. The former is the capital, has a fine harbor, and is well fortified. Close to the harbor are the ruins of an old and famous castle, in which Christian II of Denmark and Norway was confined from 1532 to 1549. In the

war of 1864 Alsen was taken by the Prussians from the Danes. Pop., 1900, 2500.

AL SIRAT, ʔs sê-rät'. The bridge from this world to the Mohammedan paradise, as narrow as a razor's edge, on which the virtuous pass to paradise, while the wicked fall into hell; derived from the Zoroastrian idea of the Chinvat Bridge.

ALSOP, ʔl'söp, RICHARD (1761-1815). An American author, born in Middletown, Conn. Before he finished his course at Yale College, he went into business. His literary tastes caused him to join the "Hartford Wits," among whom were Theodore Dwight, Benjamin Trumbull, and Lemuel Hopkins, and later he became the principal contributor to the *Echo*, a satirical publication (1791-95; published in a volume, 1807). His works include a *Monody on the Death of Washington*, in heroic verse (1800); *The Enchanted Lake of the Fairy Morgana* (a translation of a portion of *Orlando Innamorato*, 1808); *The Natural and Civil History of Chile* (from the Italian of Molini, 1808); and the *Captivity and Adventures of J. R. Jewett among the Savages of Nootka Sound* (1815). Alsop was an accomplished linguist.

ALSTED, ʔl'stët, JOHANN HEINRICH (1588-1638). A German Protestant divine and voluminous writer, professor of philosophy and divinity at Herborn and Weissenburg. He was born near Herborn, and died at Weissenburg, Transylvania. Of his compilations may be mentioned his *Cursus Philosophici Encyclopædia*, which includes a treatise on the use and abuse of tobacco, particularly noteworthy from its date; *Thesaurus Chronologiæ*; and *De Mille Annis*. The latter was a prophecy that the millennium would commence in 1694.

AL'STRÆMÆRIA, or **ALSTRÖMER'S**, ʔl'strë-mërz, **LILY** (named after the Swedish botanist, Klas von Alströmer). A genus of South American plants of the family Amaryllidaceæ, which is distinguished by tuberous roots and by often having the outer segments of the perianth different in form from the inner. The leaves are twisted, so that what should be the upper surface becomes the lower. The species number about 60 and are natives of the warmer parts of America. Some are sufficiently hardy to endure the open air in England and as far north as Virginia in the United States and are admired ornaments of flower gardens. Some have climbing or twining stems. Among these is the *salsilla* (*Alstræmeria salsilla*), a plant of great beauty, with lanceolate leaves, a native of Peru, cultivated in the West Indies, the tubers of which are eaten like those of the potato. In Great Britain it requires the hothouse. *Alstræmeria ovata*, also a beautiful plant, with a slender, twining stem and ovate leaves, is cultivated in Chile for its tubers, which are used as food. It has been introduced into Great Britain, but its cultivation has made little progress. The tubers weigh from three to six ounces. A kind of arrowroot is also prepared in Chile from the succulent roots of *Alstræmeria pallida* and other species. One of the finest species for greenhouse growing is *Alstræmeria alba*.

ALSTRÖMER, ʔl'strë-mër, KLAS VON (1736-94). A Swedish naturalist. He had for his master and friend Linnæus, who named in his honor the genus *Alstræmeria*. He visited Spain and spent 15 months there in the mountains. Unfortunately the journal of his observations was burned. He also wrote a work on the breeding of fine-wooled sheep.

ALTABAN, ʔl'tä-bän, or **ALTASAN**, ʔl'tä-sän. A division of the Ifugao tribe which formerly inhabited the northwestern part of Nueva Vizcaya province, Luzon, Philippine Islands. They no longer exist as a separate group.

ALTAI (ʔl-ti') **MOUNTAINS** (Tatar, golden mountains, from *altun*, *altan*, golden; Chin. *keen-shan*, same meaning). A mountain range of Central Asia forming part of the elevated region on the borders of Siberia and the Chinese Empire. The name formerly had a much wider significance, and included the entire line of high lands from the Irtysh River to the Okhotsk Sea, which is composed of several structurally independent units; but it is now limited to the much smaller group lying on the borders of Mongolia, Sungaria, and Siberia, and between about 45° and 54° N. lat. The range has a general trend to the northwest and southeast, nearly at right angles to that of the larger system. The Altai Mountains begin on the southeast with the Ektag range (Greater Altai), in the region of the Gobi Desert, and for some distance they form the boundary between Mongolia and Sungaria. Toward the northwest the range increases in breadth by the converging of outlying mountains, and also in height, but after passing the Siberian frontier it gradually loses its massive character and fades out into the steppes. On the slopes of the Ektag are the sources of the Black Irtysh, Kobdo, and Urungu rivers. North of this range and across the valley of the Bukhara River are several mountainous groups which constitute the Northern Altai. The latter are arranged along an axis parallel to that of the Ektag range, and attain an extreme elevation of over 10,000 feet in Mount Byelukha ('White Mountain'). The Tarbagatai group, farther west, may also be included with the Altai range. This group begins in Sungaria and reaches across the Siberian frontier, where it is continued by the Tschungistan Mountains into the region of the Khirgis steppes. Geologically, the Altai consist of a central core of schists and granite broken through by intrusions of igneous rocks, with Paleozoic strata ranging from the Silurian into Carboniferous on the outer edges. As the mountains were formed by upheaval at an early geological period, they have been subjected to long-continued denudation and erosion. Their crests, of which only the highest rise above the snow line, are generally well rounded, and their slopes are covered with a rich growth of grass or with heavy forests of pine, cedar, and birch. Deer, hares, and wolves abound in the lower, and bears in the higher, portions of the range. The mountains are but thinly populated, except within the limits of the Russian Altai, where there is a well-developed mining industry.

ALTA'IC and **U'RAL ALTA'IC**. Terms used of a family of languages in parts of northern, eastern, and central Europe and the greater part of northern and eastern Asia, besides still other sections. See **URAL-ALTAIC** and **TURANIAN**.

ALTAMAHA, ʔl'tä-mä-hä'. A river formed by the confluence of the Oconee and Ocmulgee rivers, at the boundary line of Montgomery and Appling counties, Georgia. It flows to the southeast and empties into the sound of the same name, below Darien (Map: Georgia, E 4). It is 155 miles long, drains an area of 14,400 square miles, and is navigable for its entire length for boats drawing five feet of water.

ALTAMIRA, ʔl'tä-më'rá. A famous cavern

in northern Spain noted for its prehistoric paintings. See PALEOLITHIC PERIOD.

ALTAMIRA Y CREVEA, ä'l'tä-mē'rä ē krä'vâ-ä, RAFAEL. Contemporary Spanish critic and historian. Born at Alicante, 1866. After completing his law studies, he went to Madrid, where he collaborated on various political and professional newspapers and magazines and wrote several novels. Later he became professor in the *Institución Libre de Enseñanza* (one of the most influential educational institutions in Spain). For a while he was director of the Republican newspaper *La Justicia* and then was called to a professorship of law at the University of Oviedo. While at Oviedo he became interested in university extension, and it is largely owing to his indefatigable zeal that there is university extension in Spain to-day. Altamira became later Director-General of Primary Education in Spain and a member of the important *Junta para ampliación de estudios superiores*, also of the Hispanic Society of America, the Real Academia de Ciencias Morales y Políticas of his own country; and an officer in the Order of the Corona d'Italia.

Altamira has attained prominence as an orator, lecturer, and critic of art and history, and has made lecture tours to South America, the West Indies, and the United States. He is at present a correspondent of the *Revue Historique* at Paris and *The Athenæum* at London.

His published work includes the following important titles: *Historia de la propiedad comunal*; *De historia y arte*; *Psicología del pueblo español*; *Historia del derecho español*; and in French, *L'Enseignement des sciences sociales en Espagne*. The most notable work of Altamira is his *Historia de España, y de la civilización española* (Madrid, 1901-11), four volumes of which have already appeared. A fifth volume, in preparation, will probably complete the work.

AL'TAMONT. 1. A character in Rowe's play, *The Fair Penitent*; the husband of Calista, the heroine, and slayer of Lothario, who has seduced her. 2. In Thackeray's *Pendennis*, a name assumed by the convict Amory on his return; the father of Blanche Amory.

ALTAMONT, FREDERICK. In Scott's novel *The Pirate*, the assumed name of the pirate John Bunce.

ALTAMURA, ä'l'tä-mōō'rä. An episcopal city in the province of Bari, Italy, 60 miles northwest of Tarentum (Map: Italy, L 7). It is surrounded by walls and is situated at the foot of the Apennines. The magnificent cathedral was consecrated in 1231, under Frederick II, and, after a remodeling early in the fourteenth century, was poorly restored in 1860. The country produces oil, wine, grain, and cattle, and the fairs at Altamura are attended from far and near. Pop., 1881, 20,000; 1901, 22,729; 1911, 25,616.

AL'TAR (Lat. *altare* or *altar*, probably originally a high place, from *altus*, high). The place on which sacrifices were made or offerings laid or libations poured or some other act of worship performed. Altars were in use from the earliest times among all historic peoples. Some of those mentioned in the Old Testament are among the earliest of which descriptions are recorded.

The Ancient East. The oldest altars of the Babylonians which have been excavated are square heaps of sun-dried bricks, and Herodotus relates that their great altars were made of

(i.e., incased with) gold. The Assyrians built altars of limestone and alabaster. The British Museum has several highly decorated examples: one triangular, another oblong, with scrolls that call to mind the expression "horns of the altar," which is literally carried out in many Græco-Roman altars with ox-horns or ram-horns at the corners. The Egyptians seem to have used two varieties—a concave conical altar for incense or smaller offerings; and great cubical blocks of stone, decorated with carvings, for larger sacrifices. The Metropolitan Museum, New York, possesses an excellent example of the first variety in the basalt altar of King Chephren and of the second in the great granite altar from the pyramid temple of Amenemhat I. The Hebrews in earliest times erected altars of unhewn stone in places where Yahwe was supposed to have manifested himself. But when worship became centralized at Jerusalem, only two altars were permitted in the temple: 1. The Altar of Burnt Offerings, built of stone and covered with plates of brass, whence it is also called the "Brazen Altar." It was 20 cubits in length and breadth and 10 cubits high and stood in the court to the east of the temple proper. 2. The Altar of Incense, or the Golden Altar, constructed of cedar wood and covered with plates of beaten gold. It stood within the Temple and was only 1 cubit in length and width and 2 high. (See TEMPLE OF JERUSALEM.)

Greek and Roman Altars. The altar was primitively of two classes: Either (1) placed on some height and often nothing but a mound of earth or a heap of stones or of ashes; or else (2) the family altar connected with each dwelling, in front of the entrance. This was smaller, permanent, and more artistic. Then came the altars connected with temples, either in the outer air, in front of the temple steps, or within. The great public altars of Græco-Roman worship in historic times, at which whole hecatombs were sacrificed and great festivals held, developed into immense artistic monuments, as, for example, that of Hiero at Syracuse, that of Hera at Samos, of Apollo at Delphi, and of Zeus at Olympia; the last-named was 125 feet in circumference. The famous altar at Pergamum (see PERGAMUM, GREAT ALTAR OF), with sculptures representing the combat of the gods and the giants, was 40 feet high. Probably such altars and their platforms are derived from the early Pelasgic altars that stood on an immense three-stepped platform and were the one centre of worship, for the Pelasgians had few temples. The Romans also used such colossal and artistic altars, especially to consecrate imperial worship: there was one for Spain and one for Gaul (at Lyons), with an abundance of statuary and decoration, where the Spanish and Gallic councils met annually and proclaimed their political allegiance. The Altar of Peace, with its sculptured friezes, erected in honor of Augustus, at Rome, to celebrate the pacification of the world, was one of the artistic masterpieces of the Augustan reign. (See ARA PACIS.) Of the smaller altars and tables of offerings, hundreds were erected in every city, not only in connection with the temples, but also in shrines and chapels and throughout the streets: they are among the finest pieces of Græco-Roman decoration and are of all shapes—circular, polygonal, square, or oblong. Usually each was consecrated to a single god or hero. Of course, the use to which the altar was put influenced its form, according as

it was for incense or sacred fire, for libations, for fruits, flowers, or the like, or for bloody sacrifices.

Christian Altars. In the Christian Church the altar was quite different in its suggestions. All reminiscence of heathen altars was abhorrent. The marble sarcophagi in which were buried the bodies of martyrs in the catacombs were among the earliest altars, except, indeed, plain wooden tables which developed into marble slabs with one or more legs. For several centuries only a single altar was allowed in each church—none outside—and it was always erected over the relics of a martyr; later, under the monastic régime, when chapels dedicated to saints were added to the church plan, each had its own altar. As early as the fifth century, precious metals came into use for altars. In the Western Church the great variety of shape in pagan times was reduced to one—moderately oblong. The altar was placed in the axis of the church, in front of the chord of the apse, or in the middle of the transept, if there was one. Beneath it was the confession for the relics of the saint, which afterward developed into the crypt. Above it rose a tabernacle, canopy, or ciborium. The structure of the altar itself was rarely ornamented, though in Italy the faces were often inlaid with marbles and mosaics. Nevertheless the altar usually had a number of artistic accessories that must be mentioned to give an idea of its appearance. The *altar-front* or *frontal* was a decoration for the front and sometimes for the other sides of the altar, not merely when the structure was a slab supported on legs, but even when it was solid. It was sometimes in the shape of a rich hanging; sometimes it was a relief of gold, silver gilt, enamel or silver. Famous mediæval altar-fronts are that of the cathedral of Basel, now in Cluny Museum, Paris; the Pala d'oro (q.v.), in St. Mark's, Venice; in Sant' Ambrogio, Milan; in San Giacomo, Pistoia. The *altar-piece* is used as a decoration placed on top of the altar at the back, a custom that did not come into use until the Middle Ages, when the altar was made to face the people and not the apse and when altars against the wall were multiplied. Some altar-pieces, complements to the altar-fronts, were of precious metals, as in St. Mark's, Venice, and San Giacomo, Pistoia, but usually they were devotional pictures, preferably in the form of triptychs, or even groups of sculpture, or a sculptured tabernacle. (See PREDELLA.) The altar-piece was sometimes treated with great splendor of architecture, sculpture, painting, and carving, and made into an imposing architectural composition rising to a considerable height, as (especially) by the Germans and Flemings in the Late Gothic period, and by the Spaniards throughout the entire duration of the Spanish Renaissance. The *altar-screen* is often connected with the confession and its staircase. In early churches it was surmounted by sculpture and hardly distinguishable from an altar-rail.

In the Greek church the altar has retained its primeval simplicity. It is square in form, so that the clergy may pass around in administering the sacrament, and without wealth of decoration which is confined to the iconostasis (q.v.) in front of the altar. Since the Reformation the use of the altar in the Roman Catholic church has remained essentially the same. Although it has been retained by churches of

the Anglican and Lutheran communion, its use has been greatly modified and its importance diminished. It has given place to the simple communion table in the Reformed church, and with the non-liturgical Protestant denominations, such as Presbyterians, Congregationalists, Baptists, Methodists, etc., the use of the altar is of course conditioned by the mode of administering Holy Communion. (See COMMUNION IN BOTH KINDS; LORD'S SUPPER.) Consult Schmid, *Der christliche Altar und sein Schmuck* (Regensburg, 1871); Rohault de Fleury, *La Messe* (Paris, 1883); Thier, *Les principaux autels* (Paris, 1888); Lowrie, *Monuments of the Early Church* (New York, 1901); Gilbert Scott, *English Church Architecture* (London, 1881).

ALTAROCHE, ăl'tà'rôsh', MARIE MICHEL (1811-84). A French playwright and journalist, born at Issoire. From 1834 to 1848 he was editor-in-chief of *Charivari*, the influence of which was increased by his political satires and his general wit and acumen. He was elected to the Assembly in 1848, but retired the following year and from that time was successively manager of the Odéon, Folies Nouvelles, and other theatrical enterprises. He wrote *Chansons et vers politiques* (1835), *Contes démocratiques* (1837), *Aventures de Victor Augerol* (1838), and the following plays: *Lcstocq ou le retour de Sibérie* (1836) and *Le Corrégidor de Pampe-lune* (1843).

ALTAZ'IMUTH (*altitude* + *azimuth*; see AZIMUTH). An astronomical instrument, used for determining the position on the sky of stars or other heavenly bodies by measuring their altitude and azimuth (qq.v.). The altazimuth instrument has two brass circles—one with its plane horizontal, the other with its plane vertical—and a telescope is attached to the circles. When this is directed so that a star appears at the intersection of a pair of crossed threads fixed in the field of view, it is possible to read the star's altitude and azimuth from the graduations engraved on the two circles. Being of considerable complexity, the instrument does not give results of a precision quite equal to those obtained with the meridian circle; and for this reason it is employed chiefly in its portable form when observations must be made at temporary observatories, such as eclipse expedition stations. It is in use, however, at Greenwich, for observing the moon on nights when it is not possible to observe that body in the meridian.

ALTDORF, ält'dôrf, or **ALTORF**. The capital of the Swiss canton of Uri, situated in a sheltered spot at the base of the Grunberg, about 2 miles east of the Lake of Lucerne (Map: Switzerland, C 2). It lies 1518 feet above sea level, and is a well-built town, having a church, a nunnery, and a Capuchin monastery, which was built in 1581 and which is the oldest in Switzerland. The town is connected with the Tell legend—for Tell is said to have lived at Bürglen, which is near by—and Tell dramas are played here by the citizens. The spot where his son stood to be shot at is marked by a bronze statue of father and child, by Kissling, erected in 1895. Southeast about 1½ miles is the entrance to the Schächenthal. Pop., 1900, 3147; 1910, 3837.

ALTDORFER, ält'dôr-fër, ALBRECHT (?1480-1538). A German painter, architect, and engraver on copper and wood. The exact date and place of his birth are unknown, though the latter was probably near Landshut; but

most of his life was passed at Regensburg, where he filled important civic positions as life member of the outer and later of the inner council, attained wealth, and where he died Feb. 13, 1538. He was influenced to some extent by Dürer, but is of independent importance, being chief master of the so-called "Danube" style and founder of a school. His pictures are marked especially by romantic imagination, his landscapes, which constitute the most important part of his work as a painter, being rather the creation of his own fancy than faithful transcripts of nature. But while his drawing is frequently disappointing, his coloring is rich and strong. One of his best-known works, the "Victory of Alexander at Arbela" (1529), so captivated Napoleon that it was carried off to Paris and only restored in 1815 to the Pinakothek at Munich, where are also his "Susanna's Bath" (1526) and others. Among important examples of his art in the Berlin Museum are "Repose on the Flight to Egypt," "Beggary Sitting on the Train of Pride," and a "Nativity." Others are at Augsburg, Nuremberg, Regensburg, and Vienna. His work on copper, of which over 100 examples remain, entitles him to a place among the "little masters"; and he was also a practicing architect, who held the office of city architect to Regensburg. Consult Friedlander, *Albrecht Altdorfer* (Leipzig, 1891); Voss, *Meister der Graphik*, iii (Leipzig, 1910).

ALTEA, äl-tā'á. A seaport town of Valencia, Spain, in the province of Alicante, 25 miles northeast of Alicante (Map: Spain, E 3). It stands on a rising ground at the head of the bay of Altea, is known for its exports of raisins, and has a lighthouse. Pop., 1900, 6179.

ALTEN, äl'ten. A portion of the province of Finmarken, in northern Norway, surrounding the Altenfjord. It consists of fertile tracts, where, in spite of the high latitude, much grain is grown.

ALTEN, äl'ten, KARL AUGUST, Count of (1764-1840). A celebrated Hanoverian general in the Napoleonic wars. He entered the army in 1781 and gained distinction at Valenciennes and Hondschooten. He was First Lieutenant in 1800, but after the capitulation at Lauenburg went to England, where he was made commander of a battalion in the German Legion (1803). In 1808 he assisted as General of Brigade in covering the retreat of General Moore to Corunna. In 1811 he took part under General Beresford in the siege of Badajoz and the battle of Albuera, and in the following year was promoted by the Duke of Wellington. In almost all the engagements of the Spanish war of liberation—at Salamanca, Vitoria, in the Pyrenees, Nivelle, Nive, Orthez, Toulouse—Alten took a prominent part. At Waterloo he held La Haye-Sainte for hours against the French. He commanded the Hanoverian contingent of the army of occupation in France (1818) and after his return to Hanover was made Minister of War.

ALTENA, äl'tā-ná. A town of Westphalia, Prussia, in the district of Arnsberg, on the Lenne, 40 miles northeast of Cologne (Map: Prussia, B 3). The town possesses a war monument, several churches, and the ancestral castle of the old Counts von der Mark. Its principal manufactures consist of iron, copper, brass, and nickel goods, one of its specialties being metal ecclesiastical vessels. Pop., 1900, 12,800; 1905, 13,594; 1910, 14,579.

ALTENBURG, äl'ten-burk. The capital of

the German duchy of Saxe-Altenburg, situated in a fertile country in lat. 50° 59' N., and long. 12° 25' E., about 24 miles south of Leipzig, near the river Pleisse (Map: Germany, E 3). It is the home of the Duke of Saxe-Altenburg. Pre-eminent among the noteworthy buildings is the ducal castle, built upon an almost perpendicular porphyry rock and celebrated as the scene of the abduction, in 1455, of the two Saxon princes, Albert and Ernest. A curious building is the so-called Rothen-Spitzen, composed of two connected towers, containing the State archives. Altenburg possesses several excellent educational institutions, a museum, a picture gallery, and a theatre. The card-game "Skat" originated among the well-to-do peasants of this region. The benevolent institutions include an infirmary and a hospital for poor citizens. Brushes, gloves, hats, playing cards, and cigars are among the chief manufactures, and it has a considerable trade in woolen yarn and produces much grain. Pop., 1890, about 31,000; 1905, 38,818; 1910, 39,977.

ALTENDORF, äl'ten-dōrf. Formerly a commune in Rhenish Prussia; since 1901, a suburban district of Essen, comprising the towns and villages of Kronenberg, Schederhof, Alfredshof, Bochelt, and Vogelheim. At the time of the incorporation it had a population of 63,271. Altendorf is liberally supplied with schools, one of the largest being that of the famous Krupp iron works, which are located here. In addition to the iron industry, Altendorf has extensive coke, brick, and cement works.

ALTENESSEN, äl'ten-ēs'sen. A city in the Prussian Rhine province, about 2 miles north of Essen, of which it is a suburb. It has important coal mines and machine works. Pop., 1890, about 18,000; 1905, 33,421; 1910, 40,672.

ALTENSTEIN, äl'ten-stīn. A castle in the duchy of Saxe-Meiningen, near the watering place of Liebenstein, and about 13 miles southeast of Eisenach, on the south slope of the Thüringerwald. It is the summer residence of the reigning dukes. There is here a beautiful park containing a limestone cavern 600 feet long in which there is a subterranean lake. St. Boniface, "the apostle of Germany," lived and preached here from 724 to 727; and near by is the place, marked by a monument, where, in 1521, Luther, while returning from Worms, was seized and carried off to the Wartburg.

ALTENSTEIN, KARL, BARON VON STEIN ZUM (1770-1840). A Prussian statesman. He was born at Ansbach and studied at Erlangen and Göttingen. After the Treaty of Tilsit he became the head of the finance department. In 1815 he went to Paris with Wilhelm von Humboldt to claim the restoration of works of art taken from Prussia by the French armies. He was Minister of Public Worship and Education during 1817-38 and did great service for the universities and schools. Under his direction the University of Bonn was founded and a great number of gymnasiums were opened. He drew up the education law of 1819, which is still the basis of public instruction in Germany.

AL'TERA'TION (from Lat. *alter*, other, different). In its most general sense, with reference to a written instrument or a property interest, alteration is such a change as, if effective, would result in substituting a different instrument or interest for the original. An alteration of an easement, as a right of way, consists in changing its course or boundaries.

An alteration of a written instrument consists in making any material change in its language or character, such as erasing, interlining, or adding terms, or removing a seal from a deed. An immaterial change does not come under the description of an alteration. At common law, the alteration of a written instrument avoided it as against a party not assenting thereto. In England it does not matter whether the alteration is made by a party or by a stranger. In this country a distinction is made between the two cases, and alteration by a stranger, or spoliation (q.v.), as well as alteration by a party through pure accident or innocent mistake does not invalidate the instrument, if its original language or tenor remains discoverable. The common-law rule rests upon considerations of public policy, its object being to deter the holder of a written instrument from tampering with it and to force him to carefully guard its integrity. By the Bills of Exchange Act in England and the Negotiable Instruments Law in several of our States, a holder in due course of an altered negotiable instrument may enforce it according to its original tenor. See the authorities referred to under CONTRACT; DEED; NEGOTIABLE INSTRUMENT.

ALTERATION, IN MUSIC. See MENSURABLE MUSIC, *Alteratio*.

AL'TERATIVE (Lat. *alter*, other, another, different). In medicine, a term applied to a remedy that acts slowly and in an unknown way, probably by promoting metabolism and improving the nutrition of the body. Alteratives may act on certain glands, or upon absorption in general; they are given in comparatively small doses, and for a considerable length of time. Mercury and iodine are examples of powerful alteratives, and their most effective action is seen in cases of syphilis.

Some preparations of arsenic are powerful alteratives in certain skin diseases. Cod liver oil (q.v.) is an alterative which is used with great benefit in tuberculous conditions, rickets, and other diseases associated with poor nutrition. Preparations of phosphorus have a powerful alterative action. Colchicine (q.v.) is said to act in this way in gout and subacute rheumatism. Sarsaparilla (q.v.) was formerly believed to possess strong alterative qualities, but it has been shown to be practically inert.

ALTER (äl'tēr) **FRITZ** (Ger. Old Fritz). A popular designation of Frederick the Great.

ALTERNATING (äl'tēr-nä'ting) **CURRENTS**. See ELECTRICITY; DYNAMO-ELECTRIC MACHINERY.

AL'TERNA'TION OF GEN'ERA'TIONS (Lat. *alternatio*, an interchange, from *alter*, other, and *generation* from *genus*, birth, descent, offspring). The successive occurrence in one life-cycle of two or more dissimilar forms; the process by which in its life history a plant or animal may pass through alternating phases that do not resemble one another, especially differing in being successively sexual and asexual. This phenomenon is very widespread among organisms, and assumes different characters in different groups of plants or animals.

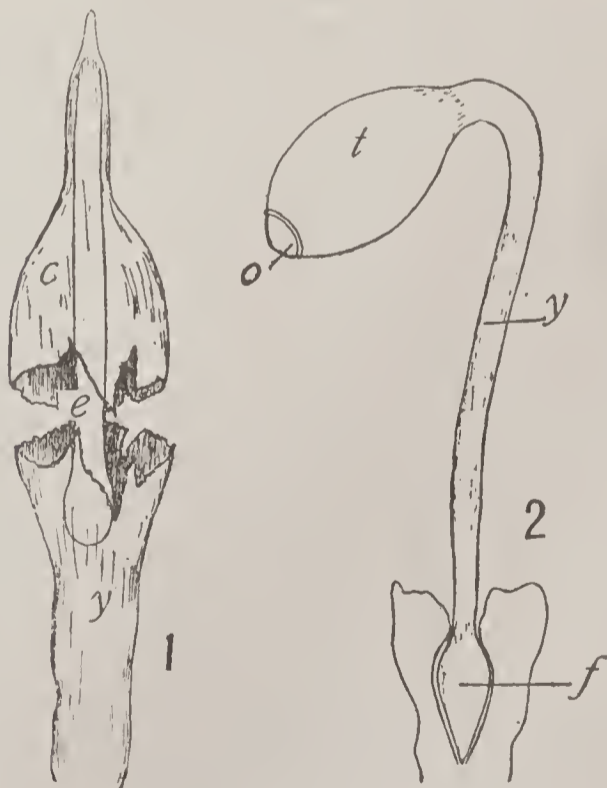

Among Plants. Alternation of generations is found in all forms of plants excepting the lowest. One may get some conception of alternation of generations in plants by comparing it with the very different alternation of forms which occurs in the life history of a moth or butterfly. In the plant, however, instead of having a series

of forms which pass into one another, our plant larva forms an egg which produces the mature form. If in the life history of a butterfly the larva should lay eggs and thus produce the mature forms, we should have something resem-

Life history of a moss: 1, the gametophyte, with the protonema (*p*) developed from an asexual spore (*y*), and giving rise to buds (*b*) that develop the leafy shoot (*s*); 2, the young sporophyte (*c*) rising above the leafy shoot (*s*).

bling the alternation of generations in plants. One of these generations has sex organs and hence is called the gametophyte; while the other generation has no sex organs and is known as the sporophyte. Both generations produce spores, but in a very different way. By means of its sex organs the gametophyte produces spores in a sexual way, i.e., by the fusion of two sex cells, and such spores are called in general oöspores, or fertilized eggs; while the sporophyte by ordinary cell division produces spores which are called asexual spores, meaning spores which have not been formed by sex organs. In the life history of the plant the fertilized egg

Sporophyte (sporogonium) of a moss: 1, the young sporophyte (*e*) rupturing the calyptra, carrying up the cap-like upper portion (*c*); 2, a mature sporophyte, showing imbedded foot (*f*), seta (*y*), capsule (*t*), and operculum (*o*).

of the gametophyte gives rise to the sporophyte, while the asexual spore of the sporophyte gives rise, in turn, to the gametophyte, and so the alternation continues.

Alternation of generations is first manifested

among the lowest plants (Thallophytes), but it is not established for all plants until the liverworts and mosses (Bryophytes) are reached. The phenomenon is still more apparent among the ferns and their allies (Pteridophytes); but among the seed plants (Spermatophytes), while evident to the laboratory student, it is well-nigh invisible to the ordinary observer. It is to mosses and ferns, therefore, that one must go for the clearest examples of alternation of generations.

In an ordinary moss the gametophyte consists of the well-known leafy moss plant, which bears sex organs at the tips of its main stem or branches. By means of these sex organs a fertilized egg (oöspore) is formed. When the fertilized egg germinates, it produces the sporophyte, which in this case consists of a more or less elongated stalk (seta) bearing at its summit a capsule or spore case. The leafless sporophyte is anchored in the leafy gametophyte by means of an organ called the foot. This peculiar sporophyte of the moss is commonly spoken of as the fruit, and when it appears upon the leafy plants these are said to be "in fruit." The spores formed in the spore cases are asexual and upon germination produce new leafy plants (gametophytes).

In the case of the ordinary ferns, which belong to the great group Pteridophytes, the same phenomenon may be observed, but with a striking difference. In the mosses the prominent leafy plant is the gametophyte, while in the fern the conspicuous leafy plant is the sporophyte. The gametophyte of the fern is a simple flat body (prothallium) resembling a minute liverwort. Upon this prothallium the sex organs are developed and the fertilized eggs are formed. From these fertilized eggs the comparatively large leafy fern body arises. This leafy body (the sporophyte) produces, usually upon the under side of the leaves, numerous asexual spores, which upon germination give rise again to simple gametophytes.

Among certain club mosses and other Pteridophytes the sporophyte produces two kinds of asexual spores. The most apparent difference between these spores is that of size, and hence they are called "microspores" (small spores) and "megaspores" (large spores). The microspore upon germination produces a male gametophyte, i.e., a gametophyte which bears only male organs. The megaspore upon germination produces a female gametophyte, i.e., a gametophyte which bears only female organs. The differentiation of spores is spoken of as "heterospory," and all the higher plants are heterosporous. With the appearance of heterospory the alternation of generations passes out of the reach of ordinary observation, since the gametophytes are so much reduced as seldom to leave the spores which produce them. In a seed plant, for example, the whole visible body of the tree, shrub, or herb is a sporophyte; the pollen grains are the small asexual spores or microspores, while the so-called embryo sac in the ovule is the large asexual spore or megaspore. The male gametophyte consists of only two or three cells, which form within the pollen grain. The female gametophyte consists of more numerous cells, but they are entirely confined within the megaspore walls and hence never leave the ovule.

Taking the plant kingdom as a whole, it may be said that in the lowest plants only a gametophyte exists. In higher forms a sporophyte be-

gins to appear, at first dependent upon the gametophyte, as in the mosses, but presently attaining independence and prominence, as in the ferns and seed plants. With the independence of the sporophyte, the gametophyte became gradually reduced in size, until in the highest plants it is visible only under the special technique of the laboratory. The significance of alternation of generations in the plant kingdom is by no means clear. One of its results, however, is to multiply the product of a single fertilized egg. If there were no alternation of generations, one fertilized egg would result in a single new plant. By the interposition of a sporophyte bearing numerous spores, each one of which may form a new gametophyte, a single fertilized egg may result in many new plants. Another result has been to assign different kinds of work to different individuals. Conditions that favor the dispersal of aerial spores are not consistent with those that favor fertilization (which results in the fertilized egg), and therefore it is of advantage to have spores and sex organs produced by different individuals. Since this conflict is most obvious in connection with land plants, it is believed that alternation of generations became universal in connection with the land habit.

There is a cytological test for alternation that may be mentioned. The nucleus of each kind of plant has a definite number of chromosomes (q.v.). When fertilization occurs, which involves the fusion of two cells, the fertilized egg contains double the number of chromosomes contained by the egg or sperm, usually spoken of as the $2x$, or diploid number. Since the sporophyte arises from the fertilized egg, it is the $2x$, or diploid generation. When the sporophyte produces spores, a reduction in the number of chromosomes occurs, so that each spore contains the x number (haploid). Since the gametophyte is produced by the spore, it is the x or haploid generation. The sporophyte is begun, therefore, by doubling the chromosomes (fertilization), and the gametophyte is begun by reducing the number. It is obvious that a real alternation occurs whenever fertilization occurs. A fertilized egg always contains the $2x$ number, and although in many low plants it does not produce any structure that can be called a sporophyte and does produce directly another gametophyte, still the fertilized egg represents a sporophyte, because it is a $2x$ cell. Consult Coulter, Barnes, and Cowles, *Text-Book of Botany* (New York, 1910). See APOGAMY.

Among Animals. In the simplest case of alternation of generations among animals, the successive generations differ only slightly. Thus, in many butterflies having two broods during the year, the spring brood is unlike the fall brood; for example, in our "spring azure" the spring brood is of a violet color, and the fall brood is dark; both are sexual, but the spring and fall forms alternate in the series of generations. This form of alternation of generations is called *seasonal*.

The next example shows a greater difference between alternating generations. In a certain nematode (*Leptodera nigrovenosum*), both males and females are found living in pools of water or in damp earth. These pair, and the fertilized eggs develop into larvæ that enter into the bodies of aquatic animals and develop there as parasites, not as male and female individuals, but as hermaphrodites. These lay self-fertilized eggs,

which develop free as either males or females. Here a diœcious generation (A) alternates with an hermaphroditic generation (B). This kind of alternation of generations is called *heterogony*.

In a third form of alternation of generations eggs are produced, but the fertilization of the egg is omitted from alternate or even several successive generations; these are then followed by diœcious, sexual individuals. To this class belong many cases of parthenogenetically reproducing species; among flat-worms, trematodes; among crustacea, the Cladocera; and among insects, aphids, such as Phylloxera, Chermes, etc. In most of these cases there is a marked difference in form between the individuals of the diœcious and the parthenogenetically reproduc-

ALTERNATE GENERATION IN HYDROIDS.

A Campanularian Hydroid: *a*, root-stock (hydrorhiza); *b*, *b*, hydranths; *c*, *c*, gonangia, containing medusa buds; *d*, a free-swimming, gamete-producing medusa; *e*, ciliated larva before settling down.

ing generation. This class of cases is called *heterogenesis*. See HOP-LOUSE.

In the fourth form of alternation the fertilized egg develops into a generation (A) having a characteristic form, and capable of setting free neither eggs nor spermatozoa, but capable of forming buds. These buds develop into a new and different form of individual (generation B), which is diœcious and sets free zygotes, from which generation A is produced. There are numerous examples of this class among animals, e.g., among cœlenterates, the Hydrozoa and some Scyphozoa and Strobila; among flat-worms, certain cestodes (Echinococcus); among annelids, certain Syllidæ and aquatic Oligochæta; among tunicates, the Salpæ and Doliolidæ. This class of alternation of generations has been called *metagenesis*. As an example of it, one of the Hydrozoa may be taken. The free-swimming jellyfishes are diœcious and produce the male and female gametes, which unite in the water. The larvæ which result from the development of

the eggs settle down, become attached, and develop into a hydroid, which produces a colony by budding. Certain buds are set free as jellyfishes, and these in turn set free the gametes. Thus the hydroid form (A) and the jelly form (B) alternate with each other.

In certain respects the gamete-producing generation of spermatophytes among plants (see above) resembles the maturation period preceding the formation of gametes in the higher animals; and it has been suggested that even in vertebrates, including man, we have an alternation of generations: (1) the non-sexual generation beginning with fertilization and ending with the primary oöcyte or primary spermatoocyte; (2) the sexual generation beginning with the primary germ-cell and ending with the ripe germ-cell (two-cell division).

Leuckart, *Ueber den Polymorphismus der Individuen, etc.; ein Beitrag zur Lehre vom Generationswechsel* (Giessen, 1851).

AL'TERNA'TOR. See DYNAMO-ELECTRIC MACHINERY.

ALTGELD, ält'gëld, JOHN PETER (1847-1902). An American politician. He was born in Germany and was brought to the United States when an infant. His parents settled near Mansfield, Ohio. He entered the Union army at the age of 16 and served until the close of the war. He at first taught school, then studied law, and was admitted to the bar in 1869, his election as State Attorney of Andrew County, Mo., following in 1874. He was judge of the superior court of Chicago from 1886 to 1891, and Governor of Illinois from 1893 to 1897, in which capacity his pardon of the anarchists Fielden, Neebe, and Schwab excited wide comment. As a prominent advocate of free silver, he was an active supporter of William J. Bryan during the presidential campaigns of 1896 and 1900. He did much to advance the cause of prison reform and was a vigorous and effective public speaker. In 1890 his writings, *Our Penal Machinery and its Victims* and *Live Questions*, were published together.

ALTHÆ'A (Gk. ἀλθαία, *althaia*, wild or marsh mallow). A genus of plants of the family Malvaceæ, differing from the true mallow (*Malva*) chiefly in its six to nine bractlets (involucl) beneath the flower. The species (about 15), natives of Europe and Asia, and naturalized in North America, are annual and perennial shrubby plants that are much grown for their showy flowers. The more common species are the marsh-mallow (*Althæa officinalis*) and the hollyhock (*Althæa rosea*). The name *Althæa* is applied also by gardeners to the Rose of Sharon (*Hibiscus syriacus*). See HOLLYHOCK; MARSH-MALLOW; HIBISCUS.

ALTHÆA, or **ALTHEA** (Gk. ἄλθαία, *Althæa*). In Greek story, the mother of Meleager (q.v.). The Fates had told her that her son's life would last as long as a log of wood burning upon the hearth at his birth should be unconsumed. She quenched the fire and long preserved the log, but finally in anger at him set it on fire and so ended his life. She was the daughter of Thestius, wife of Cœneus, King of Calydon, and mother also of Tydeus and Deïanira.

ALTHE'A. In Richard Lovelace's *To Althea*

from *Prison, and Other Lyrics*, a poetical name applied to his love Lucasta, who is understood to have been Lucy Sacheverell.

ALT'HORN. See SAXHORN.

AL'THORP, LORD. See SPENCER, JOHN CHARLES.

ALTHU'SIUS, JOHANNES (1557-1638). Professor of law and ethics at Herborn. He published the first treatise on politics written in Germany. He made the basis of social life an express or implied contract between associated men, thus anticipating Rousseau's famous social contract theory. He defended resistance to usurpation of the rights of the people, from whom all rights proceed. He put combinations of workmen in the category of monopolies to be regulated. His chief works are: *Politica Methodice Digesta* (Herborn, 1603); *Jurisprudentiæ Romanæ Libri* (Herborn, 1588); *Dicæologica Libri Tres Totum et Universum Jus, quo Utimur, Methodice Complectantes* (Herborn, 1617). Consult Otto Gierke, *Johannes Althusius* (Breslau, 1880).

ALTIM'ETRY (Lat. *altus*, high + Gk. μέτρον, *metron*, measure). The art of ascertaining altitudes geometrically or measuring vertical angles by means of a quadrant, sextant, or theodolite. When used for this purpose, the instrument is known as an altimeter.

ALTIN, ălt-tin', **ALTYN-NOR** (Tatar *altun*, golden + *nor*, lake), or **TELETS LAKE.** A freshwater lake in the government of Tomsk, Siberia (Map: Asia, H 3). It is in the Altai Mountains, 1600 feet above sea level, is about 75 miles long, has an average breadth of about 20 miles, and is about 184 square miles in area. This lake is remarkable because in winter the northern part is frozen so as to bear sledges, while the southern part has never been known to freeze.

AL'TITUDE (Lat. *altitudo*, height, from *altus*, high, lofty). In astronomy, the elevation of a heavenly body above the horizon. It is measured not as a linear distance, but by the angle which a line drawn from the eye to the heavenly body makes with the horizontal line, or by the arc of a vertical circle intercepted between the body and the horizon. Altitudes are measured by means of a telescope attached to a graduated circle. (See **CIRCLE**.) The telescope being directed toward the body to be observed, the angle which it makes with the horizon is measured on the graduated circle. The altitude thus observed is the apparent altitude. To obtain the true altitude, corrections for refraction and the dip of the visible horizon below the true horizon must be applied to the apparent altitude. (See **HORIZON**.) In the case of the sun, moon, planets, a further correction for parallax must be made to obtain the true altitude, which is, in this case, sometimes called the geocentric altitude. The correct determination of altitudes is of vital importance in navigation. The sextant is the only astronomical instrument of precision that can be used without a fixed support on the deck of a rolling ship, and it is essentially an instrument for measuring altitudes. See **SEXTANT**; **ALTAZIMUTH**; **LATITUDE**.

ALTMAN, BENJAMIN (1840-1913). An American merchant, art-collector, and philanthropist, born and educated in New York City. Starting out first in his father's dry-goods store, and later in a small way for himself, he gradually built up a business, one of the most im-

portant of its kind in the world. As a philanthropist Mr. Altman did not become widely known, not because he did not give generously and wisely, but because he always gave without ostentation. But as a collector of great art treasures, chosen with the most fastidious taste, he came to have an international reputation, second only to that of J. Pierpont Morgan. This magnificent collection was found, after Mr. Altman's death, to have been willed, for the public benefit, to the Metropolitan Museum of Art (q.v.), the greatest single gift such an institution has ever received. The estimated value, more than \$15,000,000, is a mere guess; literally, the collection is priceless.

ALTMÜHL, ält'mұл (Ger. old mill). A river of Bavaria which rises at its western border, flows northeast through the Swabian Jura, and empties into the Danube between the towns of Ingolstadt and Ratisbon, and near Kelheim (Map: Bavaria, D 4). It is 100 miles long, and connected with the Regnitz, an affluent of the Main, by the Ludwigs-Kanal, thus establishing communication with the Rhine.

AL'TO. The deepest of the two principal species of voice found in women and boys. Its average range is from *g* to *c*². Originally the *cantus firmus* was given to the tenor (q.v.), against which a higher part, the *discantus*, was set contrapuntally. With the development of harmony a third part, the *contratenor*, was added, which sometimes was above, sometimes below, the tenor. Naturally the extended range demanded by the parts written for *contratenor* exceeded the natural compass of natural voices, and it was divided into two separate parts, the *contratenor altus* and *contratenor bassus*, whence the abbreviations *alto* and *basso*. In the sixteenth century the *contratenor altus* was sung by men with falsetto voices, as women were not permitted to sing in the church. In England this was also the general practice in the rendering of glees, and is not quite extinct to-day. Such male altos are called *alti naturali*. In Germany a distinction is made between *alto* and *contralto*, the latter denoting an exceptional range as low as *e* or even *d*. In English the two terms are used interchangeably. But in recent years a well-marked distinction has sprung up, employing the term "alto" for the vocal parts of a composition, whereas the term "contralto" designates the artist. In combination with another word, such as alto-trombone, alto-oboe, etc., it denotes an instrument of such a family with a lower range. For Alto Clef see **MUSICAL NOTATION**; **CLEFS**.

ALTON, ăl'ton. A city and railroad centre of Madison Co., Ill. It is picturesquely situated on limestone bluffs, 200 feet above the Mississippi River, which is spanned here by the great bridge of the Chicago, Burlington, and Quincy Railroad, 25 miles above St. Louis (Map: Illinois, B 5). Alton is on the Chicago and Alton, the New York Central, the Chicago, Peoria, and St. Louis, the Chicago, Burlington, and Quincy, the Wabash, the Missouri, Kansas, and Texas, and the Illinois Terminal railroads. Alton has a public library and a park, called Rock Spring Park. It is the seat of the State hospital for the insane, Shurtleff College (Baptist), organized 1827, the Monticello Female Seminary, the Western Military Academy, and the Ursuline Convent and Novitiate. The city is a commercial centre, manufacturing bottles, straw board, corrugated paper, cartridges,

powder, flour, tools, etc. Alton was settled in 1783, incorporated in 1835, and is governed by a charter granted under a general law of 1876. The mayor is elected for two years; the city council is made up of 14 members; and town meetings are held annually. Upper Alton (Pop., 1910, 2918) was annexed in 1911. The mayor appoints the school board and the heads of the police and fire departments, with the approval of the council. On Nov. 7, 1837, occurred here the famous anti-abolitionist riot, in which Elijah P. Lovejoy was killed and his printing office demolished. A monument has been erected to his memory. Other notable features are the Hayner Memorial Library and the city hall, scene of a Lincoln-Douglas debate. Pop., 1890, 10,294; 1900, 14,210; 1910, 17,528.

ALTON (al'ton) **LOCKE, TAILOR AND POET.** A novel by Charles Kingsley, published 1850.

ALTON, ä'l'tön, **JOHANN SAMUEL EDUARD D'** (1803-54). A German anatomist, son of the anatomist and archaeologist Joseph Wilhelm Eduard d'Alton. He studied medicine at Bonn and became professor of anatomy at the Academy of Arts in Berlin in 1827. In 1834 he was made professor of anatomy and physiology at Halle. His writings include *Handbuch der menschlichen Anatomie* (1848-50), *De Monstris Quibus Extremitates Superfluæ Suspensæ Sunt* (1853), and *De Monstrorum Duplicium Origine* (1849).

ALTONA, ä'l'tō-nā. The largest and richest city in the Prussian province of Schleswig-Holstein, situated on the right bank of the Elbe, its eastern boundary adjoining the Hamburg suburb of St. Pauli (Map: Prussia, C 2). From a commercial point of view, Altona forms one city with Hamburg. In 1888 it entered the German Customs Union. On account of its advantageous situation on the Elbe and railway connection with other German cities, its trade is of considerable importance and extends to England, France, the Mediterranean Sea, and the West Indies. There are many important industrial works in Altona; among others, cotton and woolen mills, iron foundries, glass works, breweries and distilleries, and establishments for the manufacture of chocolate, cigars, cotton, soap, leather ware, etc. Local transportation is afforded by numerous street-car lines, which also connect Altona with Hamburg. These are all in the hands of private corporations. The rise of Altona to its present importance has been recent and rapid for a Continental town. In 1880 its population was 91,049; in 1890 the suburbs of Bahrenfeld, Othmarschen, Ottensen, and Övelgönne were incorporated with Altona, and the total population was 143,249; in 1900, 161,507; in 1910, 172,533.

The streets of Altona are broad and for the most part regular, and well lighted by electricity. The city has only about 50 acres laid out in parks. This, however, does not include the suburbs. Among the notable buildings may be mentioned the Rathaus, the palace of justice, the custom house, and the city theatre. Among the objects of greatest interest in the city is the old cemetery of the Portuguese Jews.

The city's affairs are administered by a municipal council composed of 35 members, and an executive board composed of 9 members. (See **PRUSSIA, Government.**) The street-cleaning of Altona is a model of thoroughness.

The city owns its water works, containing a

filtering plant by means of which the water of the Elbe is purified for drinking purposes. The plant yields an annual profit of about \$90,000. Its system of sewers is practically similar to that of Hamburg. It has not as yet adopted the system of sewage farms, which has proved so successful in some of the German cities. The annual expense of drainage and sewerage is about \$12,000.

Altona has an organized fire department, which forms one of the chief items of expense in the city's budget, amounting annually to about \$44,000. Altona owns and operates its own gas works at a net profit of about \$75,000 annually. Its electric light plant is owned and operated by a private company, which pays the city 10 per cent of its receipts.

Among the charitable and benevolent institutions are a public poorhouse, an infirmary, insane asylum, a house of refuge for boys, one general hospital, two hospitals for children, and a lying-in hospital. Its educational institutions include a gymnasium, three high schools, several technical schools, 27 grammar schools, a school of navigation, and a museum.

Altona was settled in 1536, and rapidly developed into a prosperous commercial town. In 1640 it came under the rule of Denmark. Its trade suffered during the Napoleonic wars, but revived with peace. In 1866 it was annexed to Prussia. Consult Worrl, *Illustrierter durch Hamburg-Altona* (Leipzig, 1902).

ALTO-OBOE. See **ENGLISH HORN.**

ALTOONA, ä'l-tōō'nā. A city in Blair Co., Pa., 117 miles east of Pittsburgh, on the Pennsylvania Railroad (Map: Pennsylvania, C 3). It is at the eastern base of the Alleghenies (q.v.), between Allegheny Mountain and Brush Mountain, situated amid picturesque scenery at an elevation of 1180 feet. Altoona is a typical American railroad town, its industries centring principally in the immense shops of the Pennsylvania Railroad, which employ 16,000 operatives and have an extensive production of locomotives, passenger coaches, and freight cars. These are the largest railroad shops in the world. The city has a public library, two hospitals, 52 churches, and Lakemont Park. Of particular interest is the famous Horseshoe Bend on the main line of the Pennsylvania Railroad near the city. There are municipal water works, built in 1860 and acquired by the city in 1872. Altoona spends annually in maintenance and operation about \$565,000, the principal items of expense being \$280,000 for schools, \$35,000 for the fire department, \$97,000 for the water works, \$50,000 for the police department, and \$20,000 for municipal lighting. The city was founded in 1850 by the Pennsylvania Railroad Company, was incorporated as a borough in 1854, and was chartered as a city in 1868. The citizens of Altoona voted to adopt the commission form of government in 1914. The great railroad strike of 1877 caused considerable excitement, and troops were ordered out to protect the company's property. Pop., 1880, 19,710; 1890, 30,337; 1900, 38,973; 1910, 52,127.

ALTOONA, or **AL'LATOO'NA, PASS.** A pass near Allatoona, Ga., the scene, on Oct. 5, 1864, of one of the most hotly contested of the minor battles of the Civil War. In his operations about Atlanta General Sherman made Allatoona his secondary base, and stored there 1,000,000 rations of bread, which General Hood determined to capture, detailing Gen. S. G.

French for the enterprise. As soon as Sherman was aware of Hood's designs he ordered General Corse (q.v.), stationed at Rome, to move with the utmost speed to the assistance of the small garrison, to hold the place against all odds, until the arrival of reinforcements. Accordingly, with a force of less than 2000, he maintained the defense against some 4000 Confederates from nine in the morning until three in the afternoon, when General French, alarmed by the approach of Federal reinforcements, withdrew. The loss in killed, wounded, and missing was about 700 on each side. An interesting account is given by Ludlow, *The Battle of Allatoona Pass* (Detroit, 1891).

ALTORF, ält'ôrf. See **ALTDORF**.

ALTO-RILIEVO, ält'ô-rè-lyä'vô. A form of relief sculpture in which the figures project strongly, usually more than one-half their thickness, from the background. See **RELIEF SCULPTURE**.

ALTÖTTING, ält-ët'ing. A place of pilgrimage not far from the Inn, situated 41 miles southwest of Passau, in one of the most beautiful and fertile plains of Upper Bavaria. Multitudes of Catholics from Germany and Austria visit the ancient chapel containing a black wooden image of the Virgin (the Black Virgin), dating back to the eighth century, and great treasures of jewels, the hearts of Maximilian I and of many princes of the Bavarian family, are said to be interred there. In the Peter and Paul's Chapel lies the body of Count Tilly. Altötting was originally a *villa regia*, where several German emperors held their court. From 1838 to 1873 it was the headquarters of the Redemptorist Fathers, and at present is the site of a Capuchin monastery. Pop., 1910, 5408.

ALTRANSTÄDT, ält'rân-stët. A village in Saxony, 15 miles west of Leipzig (Map: Prussia, E 3). It is famous as the place where Augustus II, Elector of Saxony and King of Poland, concluded a treaty with King Charles XII of Sweden in 1706. Pop., 1900, 823.

ALTRICES (Lat. nom. pl. of *altrix*, a female nourisher). A term used in ornithology (opposed to *Precoces*) to designate birds whose young are hatched in a helpless condition and require the care of the parent birds. Such birds usually build some sort of nest, where the young remain for some time after hatching. The young are usually naked when hatched. Nearly all land birds (except most game birds), and some water birds, as herons, pelicans, etc., are altricial. See **BIRD**; **NIDIFICATION**.

ALTRINCHAM, ält'rîng-am. A market town of Cheshire, England, on Bowden Downs, 8 miles by rail southwest of Manchester (Map: England, D 3). It is situated on two railway lines and near the Bridgewater Canal, which has contributed greatly to its prosperity. It is a very neat and clean town, and on account of the salubrity of the air and near-by woods is a favorite residence of many of the merchants of Manchester. It has manufactures of artificial manures, cotton goods, linotype machines, and has an iron foundry; but the chief employment of its inhabitants is the raising of fruit and vegetables for the markets of Manchester. Altrincham was a prosperous town in the time of Edward I, from whom it received many privileges. Pop., 1901, 16,831; 1911, 17,816.

ALTRUISM, ält'rô-iz'm (It. *altrui*, of, to, or for others, from Lat. *alter*, another). A word first coined in French by Comte (*altru-*

isme), and introduced by his Positivist followers into English as the antonym of egoism or selfishness. It signifies consideration for others and a due regard for their feelings and interests. Altruism is regarded by Positivists as the crowning virtue, in the exercise of which the perfected individual will find not only his duty but his chief pleasure. The word is now used far beyond the circle of Positivists, sometimes quite loosely in the sense of action resulting in the welfare of others, whatever might be the motive; sometimes more strictly in the sense of conduct motivated by the desire for this welfare. It is only in this stricter application that the word has any significance for ethics. One of the most important problems of ethics is that concerning the relations between one's own interests and those of others, in so far as these interests enter as motives into conduct. There are two rival issues to the question. One school maintains that self-sacrifice is the supreme moral principle, the other champions self-assertion. This difference gives occasion to another use of the terms "altruism" and "egoism." The view that altruism is the highest moral motive is itself called altruism, just as the view that acknowledges the primacy of egoism among moral motives is itself called egoism. For the criticism of these two views and for bibliography, see **ETHICS**; **HEDONISM**; **UTILITARIANISM**.

ALTRUISTS, SOCIETY OF. See **COMMUNISTIC SOCIETIES**.

ALTSCHUL, ält'shool, ELIAS (1812-65). An Austrian physician of Jewish extraction. He was born at Prague and studied medicine, graduating at the University of Vienna in 1832. He became professor of medicine at the University of Prague in 1848, and in 1853 founded the first homœopathic magazine in Austria, under the title of *Monatsschrift für Theoretische und Praktische Homöopathie*. He introduced homœopathy at the University. His principal works are: *Dictionnaire de médecine oculaire* (2 vols., 1856); *Lehrbuch der Physiologischen Pharmacodynamik* (1850-52); *Das therapeutische Polaritätsgesetz* (1852).

ALTUS. A city and the county-seat of Jackson Co., Okla., 147 miles southwest of Oklahoma City, on the St. Louis and San Francisco, the Kansas City, Mexico, and Orient, and the Wichita Falls and Northwestern railroads (Map: Oklahoma, B 4). The industries of the city include flour, oil, and alfalfa mills. The county is adapted to truck farming and stock raising. The water works and electric light plant are owned by the municipality. Pop., 1900, 1927; 1910, 4821; 1913 (est.), 5200.

ALTWASSER, ält'väs-er. A town of Silesia, Prussia, 43 miles by rail southwest of Breslau. It has coal-mining industries and manufactures of machinery, porcelain, glass, and mirrors. Pop., 1900, 12,144; 1905, 15,267; 1910, 17,321.

ALT-ZABRZE, ält-zäb'zhe. See **ZABRZE**.

AL'UM (Lat. *alumen*, of unknown origin). A double salt consisting of a sulphate or selenate of the monovalent element or radicle, and a sulphate or selenate of a sesquioxide, that crystallizes in the isometric system with 24 molecules of water. The principal alums of commerce contain potassium, ammonium, or sodium, and the sesquioxide of aluminum.

Potassium alum is a white, astringent, saline compound, found native as *kalinite*. It is made by calcining carbonaceous shales, the residue

from which is digested with sulphuric acid, yielding aluminum sulphate; to this potassium sulphate is then added, the resulting crystals constituting the alum. Another method consists in dissolving the alumina derived from the minerals cryolite or bauxite in sulphuric acid and treating the solution with potash or ammonia.

Ammonium alum is found native as *tschermigite*, and is artificially made by combining ammonium sulphate with aluminum sulphate as previously described. The low cost of ammonium sulphate, obtained as a by-product in the manufacture of illuminating gas, has led to the substitution of this alum in commerce for potassium alum. The properties of the ammonium and potassium alums are similar, though the ammonium compound is less soluble in water.

Sodium alum is found native as *mendoxite* and is made by the combination of sodium sulphate with aluminum sulphate.

Alum is used as mordant in dyeing, to clarify liquors of various kinds and especially water, to precipitate sewage, to harden tallow, fats, and gypsum in the tanning of leather; the ammonium alum is used in the manufacture of baking powders. A potassium chromium sulphate, called *chrome alum*, and an iron aluminum sulphate called *iron alum*, are also used in the arts, especially as a mordant in dyeing and in tanning skins. Consult J. Gardner, *Acetic Acid, Vinegar, Alum, Ammonia, etc.* (Philadelphia, 1885).

ALU'MINA (from *alum*). Aluminum oxide, the most abundant of the earths. It is found native, nearly pure as bauxite and as corundum; with minute quantities of metallic oxides, as ruby, sapphire, Oriental amethyst, Oriental emerald, and Oriental topaz; and with considerable quantities of iron oxide, as emery. It is also found in combination with silica, as in many of the minerals of the feldspar group as well as in certain igneous rocks.

Alumina is known in two forms—a white, soft, pulverulent variety, and a colorless crystalline variety. It may be prepared in a pure state by heating potash alum with a solution of ammonium carbonate; the resulting aluminum hydrate is well washed, dried, and ignited, the residue being pure alumina. A comparatively pure alumina may also be obtained by heating ammonium alum until its volatile constituents are driven off. When alumina is precipitated from a solution containing some coloring matter, such as logwood, it carries down the color with the flocculent precipitate, forming colored insoluble salts called *lakes*. It is this property that has led to its extensive use as a mordant in dyeing. By fusion in the electric arc furnace, the soft, clay-like bauxite is transformed into an exceedingly hard material now much used as an abrasive under the name of *alundum*. Corundum, sapphire, and ruby have been made in Paris from alumina.

ALU'MINITE. A hydrous aluminum sulphate found in compact white masses, in beds of clay.

AL'UMIN'IUM, or **ALU'MINUM** (from Lat. *alumen*, alum). A metallic element, next to oxygen and silicon the most widely distributed. It is not found native, but in combination, chiefly as an oxide in the mineral corundum (ruby, sapphire, and emery); hydrated oxide in bauxite, hydrargillite and diaspore; hydrated phosphate in wavillite; hydrous sulphate in

combination with potash in alunite and in combination with oxygen and metals as aluminates, as in spinel, chrysoberyl, and gahnite. It also occurs as a silicate in various clays. Its chief ore is bauxite of which the United States produced, in 1911, 155,618 tons, valued at \$750,649, or \$4.82 per ton at the mines. France also produced approximately the same amount. The production from other countries is very small. Two new ores were reported in 1911, which will probably become important factors in the production. Extensive deposits of alunite (hydrous sulphate of alumina and potash) containing 37 per cent Al_2O_3 and 11.4 per cent K_2O are reported to exist in Utah and Colorado, and wavillite (phosphate and hydrate of alumina with water of crystallization), containing 38 per cent Al_2O_3 and 35.2 per cent P_2O_5 has been discovered in Georgia. The elementary nature of aluminium was recognized by Davy and others, but the metal was not isolated until 1828, when Wöhler succeeded in decomposing aluminium chloride by the action of potassium. Deville, in 1854, obtained the metal by electrolysis. Deville's experiments attracted the attention of Napoleon III, under whose patronage a metallurgical plant was established at Javelle, France. Ingots of the metal were exhibited at the World's Fair held in Paris, 1855. In 1886 Hamilton Y. Castner, of New York City, invented an important process for the reduction of aluminium, comprising an improved method of obtaining sodium, by which the price of that reducing agent was lowered from one dollar a pound to one-fourth that amount. He established a plant in Oldbury, England, and began the commercial production of aluminium. Meanwhile, Hall, of Pittsburgh, Pa., and Héroult and Minet abroad, perfected electrolytic methods for the reduction of aluminium. In Hall's process the alumina is held in solution by a molten fluoride bath, which is itself not decomposed by the electric current. The latter is conveyed to the melted solution by means of carbon cylinders placed in the bath for positive electrodes, a carbon-lined pot forming the negative electrode. The oxygen of the alumina goes off at the positive electrode as carbon dioxide, wearing away the carbon at the rate of nearly a pound of carbon to the pound of aluminium produced. The reduced metal settles at the bottom of the pot, which is easily tapped, yielding a metal of 99 per cent purity. The Pittsburgh Reduction Co. erected works for the reduction of aluminium by the Hall process in 1889 near Pittsburgh, and in 1895, taking advantage of the power obtained from the Falls, a large electrolytic plant at Niagara. Extensive litigation between the Electric Smelting and Aluminium Co. (Cowles) and the Pittsburgh Reduction Co. was compromised in 1903. In 1911 the only producer in the United States was the Aluminum Company of America. The Southern Aluminum Company began the erection of a plant in 1912 with a capacity of 5000 tons per year. The production of aluminum in the United States has increased with great rapidity. In 1886, the year of Castner's invention, the production was only 1.5 tons; in 1891, 75 tons; in 1896, 650 tons; in 1901, 3575 tons; in 1906, 7455 tons, and in 1911, 23,062 tons. The price has decreased almost in proportion to the increased production; in 1855 aluminum sold at \$90 per pound; in 1870, at \$12 per pound; in 1889, at \$2 per pound; in 1904, at 33 cents per pound,

and for 1911 the average price was 22 cents. The price during 1910 and 1911 varied from 19 to 24 cents, depending upon the supply and demand. Cheap power is essential to produce aluminum commercially.

Aluminium (sym. Al., at. wt. 27.11) is a white metal with a bluish tinge, is extremely malleable, and has a specific gravity of 2.56, which may be increased to 2.68 by rolling. In its tensile strength it ranks with cast iron, breaking at 15,000 pounds to 20,000 pounds per square inch, but in malleability and ductility it ranks with gold. Like gold and silver, it hardens in working, and rods and wire vary in strength from 26,000 pounds to 62,000 pounds per square inch. The electrical conductivity of aluminium is about 50, with copper at 90, and silver at 100; and its thermal conductivity is 38, with copper at 73.6, and silver at 100. It is also sonorous. Aluminium is a little softer than silver, but its ductility allows it to be drawn, punched, or spun into almost any form. It is practically non-tarnishable, but, strictly speaking, after long exposure to the atmosphere its polish becomes dulled by a very thin film of white oxide. Aluminium is not acted upon by hydrogen disulphide, carbon monoxide, carbon dioxide, or sulphurous acid. It is practically unaffected by common salt, either wet or dry, and hence by sea water. On the other hand, solutions of the caustic alkalis readily attack it, and hydrochloric acid is its natural solvent. Aluminium forms alloys with most of the metals. Those with copper, silver, and tin are much used on account of their color, hardness, and stability, and the ease with which they are worked. (See ALLOYS.) Those with copper are called aluminium bronzes, and those with silver are known as *tiers argent*. The lightness of metallic aluminium, subsequent to the improved processes for its manufacture, suggested its application as a substitute for iron, tin, or copper; but as yet it has failed to supersede any of these metals, on account of its high price and low tensile strength. It is largely used in the form of canteens, cups, and cooking utensils in the United States army; in the textile industry for imparting a brilliancy particularly adapted to ceremonial and theatrical costumes; for paper decorations; and in thin sheets to replace tin foil for wrapping tobacco and candy. For electrical conductors the objection has been its tensile strength, but this has been overcome by placing on the market a conductor composed of seven wires, the centre one of which is of steel with high tensile strength. This wire has been adopted by the Pacific Light and Power Company, and in 1911 a line 275 miles in length was erected from Los Angeles to the power plant; this line is the longest of its size in the world. In the form of alloys it is largely used in the construction of automobiles, balloons, and aëroplanes. In 1911 the British government constructed the framework of its new naval airship of duralium, which contains 91 per cent of aluminum and has a tensile strength of 25½ tons per square inch, about the same as mild steel.

ALUMINO-THERMICS. A term applied to that branch of metallurgy in which the heat, developed by burning metallic aluminum, is utilized (1) to reduce other metals from their oxides, chlorides, or sulphides; (2) to raise the temperature of juxtaposed metals so that welding by pressure may be accomplished; or (3) to obtain molten iron for use in repairing broken iron and steel frames and shafts.

The principle of the reduction of metallic compounds by aluminum has long been known. Friedrich Wöhler, the discoverer of aluminum, tried in 1857 to produce metallic chromium from chromium chloride by means of metallic aluminum, and succeeded in making a chromium-aluminum alloy. The great difficulty in utilizing the reducing power of aluminum for practical purposes has been the fact that the reaction takes place only at very high temperatures and with explosive violence. Dr. Hans Goldschmidt of Essen, Germany, has succeeded in overcoming the practical difficulties and has evolved the "Goldschmidt process," which has found wide practical application in several departments of mechanical engineering.

The chemical reaction involved in this process is strongly exothermic, so that it is only necessary to start it at one point of the mixture, the heat thus liberated being sufficient to raise the adjacent parts to the temperature of reaction, and so on until the entire mixture has been acted upon. In order to start the reaction, a special ignition powder is used. The chemistry of the reaction is very simple and is shown by the following formula:

where M represents the metal to be reduced. In practice the metallic oxide, mixed with the proper proportion of powdered aluminum, is

GOLDSCHMIDT PROCESS FOR RAIL-WELDING SHOWING CRUCIBLE AND MOLD.

placed in a base-lined vessel, and a small quantity of barium peroxide and powdered aluminum is laid on the top of the mixture. The reaction is started either by igniting this ignition powder

with a match or by touching a red-hot iron rod to it. In a few seconds the entire mass becomes white-hot and molten; the reduced metal collects at the bottom, and the molten aluminum oxide (artificial corundum) floats on top. The temperature of the molten mass has been estimated to be 3000° C. (over 5400° F.).

The Goldschmidt process is used to manufacture pure metallic chromium *absolutely free from carbon*. Made in the electric furnace or by reduction with carbon, chromium contains im-

in first, coats the interior of the mold and the outside of the pipes or rods with a protective coating which prevents the steel, flowing in afterward, from melting or sticking to either. The heat of the molten mass rapidly raises the temperature of the iron objects to the welding point, and set-screws force them together to form a butt-weld. As applied to repairing broken castings, the pieces are welded together by white-hot molten iron. The thermit is placed in a special crucible and the molten product

REPAIRING A SHAFT BY USE OF THERMIT.

purities and up to 12 per cent of carbon, which renders it useless for the manufacture of chrome steel. Manganese, also produced extremely pure by this process (up to 99 per cent of manganese), is used in the manufacture of special steels containing as much as 12 per cent of manganese, and as these steels are finding increased application the matter is one of some importance. The chief use of this carbon-free metal, however, is in making special brasses, bronzes, and other important alloys.

Probably the widest application of the Gold-

JOINING RAIL ENDS BY THE USE OF "THERMIT."

schmidt process is that of a mixture of iron oxide and aluminum, called "thermit," for repairing iron and steel objects by welding. As applied to welding iron pipes, rods, or similar objects, the ends, clamped against each other, are inclosed in a cast-iron mold. The thermit is then ignited in a flat-bottom crucible and the contents poured into the mold. The slag, going

poured directly on the iron pieces. The intense heat melts the surfaces of the solid pieces and causes them to become firmly cemented together by the solidifying molten metal. This result, called a fusion weld, is largely used for welding electric-traction girder-rails, where a continuous joint is desired for conductivity in order to diminish resistance. It is also used to repair broken gear-wheels, propeller and crank shafts, steamship stern-posts, connecting rods, locomotive frames, wheels, etc. The enormous advantage in repairing the objects in place is obvious, particularly in the case of steamships, where important repairs can be made without removing the parts. This is strikingly illustrated in repairing the stern-post, propeller blades, shafts, and other parts of a vessel directly accessible when the latter is in dry dock.

ALUMINUM BRONZE. See ALLOY, *Bronze*.

ALUM ROOT. A name given in the United States to two plants, very different from each other, but agreeing in the remarkable astringency of their roots. One of these, *Geranium maculatum* (see GERANIUM), very much resembles some of the species of *Geranium* which are common weeds in Great Britain. The root contains 12.27 per cent tannin, gallic acid, pectin, and red coloring matter. The tincture of the root is of use in sore throat and ulcerations of the mouth and is also administered in various diseases. The property of astringency belongs, in an inferior degree, to some other species of *Geranium* and of the kindred genera *Erodium* and *Pelargonium*. The other American plant to which the name alum root is given is *Heuchera americana*, of the family Saxifragaceæ (see SAXIFRAGE), an order in which also astringency is a prevalent property. The root of *Heuchera* is a powerful styptic and is used to make a wash for wounds and obstinate ulcers.

ALUM SHALE. A variety of shale or shaly sandstone containing iron pyrites, which on

weathering yields alum. In the process of weathering the pyrite decomposes, and the products of decomposition, reacting on the alumina of the shale, yield limonite and alum. The same process can be hastened by roasting the rock. Alum shales are found in many formations. For commercial purposes the shale is crushed and spread out for exposure to the weather or is roasted; but the industry is rapidly dying out, and is not carried on in the United States. An alum shale from England has the composition: silica, 51.16; iron sulphide, 8.50; iron protoxide, 6.11; alumina, 18.30; lime, 2.15; magnesia, .90; sulphuric acid, 2.5; carbon, 8.29; water, 2.00; total, 99.91.

ALUN'DUM. See ALUMINA.

AL'UNITE. A hydrated aluminum and potassium sulphate that crystallizes in the hexagonal system. In color it is usually white, although gray and reddish varieties are sometimes found. It occurs in seams in trachitic and allied rocks, where it has been formed as the result of the action of sulphurous vapors on the rock. This mineral, which is used as a source of alum, is found at Tolfa and Montioni in Italy, in Hungary, and elsewhere in Europe; also at various localities in the United States, especially in Custer Co., Colo.

ALUNNO, NICCOLÒ. See NICCOLÒ DA FOLIGNO.

AL'URED. See ALFRED OF BEVERLEY.

ALUTA, ǎ'ly-tǒ, or ALT, or OLT. An affluent of the Danube rising in the Carpathians, in Transylvania. After entering Rumania through the so-called Red Tower Pass of the Transylvanian Alps, it joins the Danube near Nicopolis (Map: Turkey in Europe, E 2). It is about 340 miles long and is unfit for navigation on account of the rapidity of its current.

ALVA. A city and the county-seat of Woods Co., Okla., 150 miles northwest of Oklahoma City, the State capital, situated at the north fork of the Canadian River, on the Atchison, Topeka, and Santa Fe, and the Chicago, Rock Island, and Pacific railroads (Map: Oklahoma, C 2). Alva is in an agricultural region, producing corn, alfalfa, wheat, oats, etc. The leading industries are flour milling, dairying, and the manufacture of brooms. Alva is the seat of the Northwestern State Normal School and has two fine school buildings, a hospital, a library, a city hall, a court house, and an opera house. It owns its water works. Pop., 1890, 1499; 1900, 2800; 1910, 3688.

ALVA, ǎl'vá, or **ALBA,** FERNANDO ALVAREZ DE TOLEDO, DUKE OF (1508-82 or 83). A Spanish general and statesman. His family was one of the most distinguished in Spain. He was trained by his grandfather for war and politics, entered upon a life of brilliant and intense activity, and became Prime Minister, and General of the armies of Spain under Charles V and Philip II. As a young man he fought in the campaigns of Charles V against Francis I, but his military talent was not thought highly of, and this hurt his pride. His appointment to high command was attributed to favor and influence rather than ability. He was in the campaign against the Elector John Frederick of Saxony, over whom he gained a brilliant victory at Mühlberg in 1547, and fought against Henry II of France and in the Italian campaign of 1555 against the combined French and papal forces, when he overran the States of the Church, but was instructed by Philip II, after the abdication of Charles V, to give up

his conquests. He acted as proxy for Philip at the French court when the Spanish King espoused Elizabeth, daughter of Henry II of France, after the peace of Cateau-Cambrésis in 1559. Alva is best known for his work in the Netherlands, where he was sent in 1567, with unlimited authority to repress the Dutch revolt against Spanish tyranny and the Inquisition. He promptly established the tribunal which has been known as the "Bloody Council." This body, without legal status or procedure, entered upon a general proscription of the living and the dead and the confiscation of property. Excessive taxation brought commerce almost to a standstill, and more than 120,000 Protestants emigrated. Counts Egmont and Hoorne were executed. Prince Louis of Orange was defeated, and Prince William was driven into Germany, after which Alva made a triumphal entry into Brussels, Dec. 22, 1568. He was especially honored by the Pope, and set up in Antwerp a statue of himself trampling on two figures, representing the nobles and people of the Netherlands. His bloodthirsty tyranny intensified the resistance of the Dutch, and after the destruction of his fleet the King recalled him at his own request (1573). He claimed to have caused the execution of 18,000 men. He was received in Madrid with the highest honors, but for an act of disobedience was banished from the court until called upon to conduct a campaign (1580) against Dom Antonio, of Portugal. The country was conquered and treated with that cruelty and license which always followed Alva's course. Alva was tall, spare, bronzed, with a long beard, a typical Spanish grandee. He was not, however, the bloodthirsty tyrant that Motley describes, and in one instance at least in the execution of Hoorne and Egmont, Alva long delayed action, writing to the King of Spain as he finally signed their death warrant that "it hurt him in his soul." Consult: J. L. Motley, *Rise of the Dutch Republic* (New York, 1836); P. J. Block, *History of the People of the Netherlands* (New York, 1900); Rustant, *Historia de Don Fernando Alvarez de Toledo, duque de Alva* (Madrid, 1751).

ALVARADO, ǎl'vá-rá'dó. A seaport in the State of Vera Cruz, Mexico, at the mouth of the Papaloapan River, 40 miles southeast of Vera Cruz (Map: Mexico, L 8). The harbor is well sheltered, but is too shallow for vessels of more than 13 feet draught. Nevertheless the town is a native trading post and a headquarters for steamers engaged in the coasting trade. The climate is very unhealthful because of the surrounding swamps. Its exports are rice and cacao. The inhabitants are engaged in fishing, principally, and the surrounding waters yield turtles, oysters, and crabs. Pop., 1910, 4347.

ALVARADO, ALONZO or ALFONSO DE (?-1554). A Spanish soldier of the sixteenth century. He was born at Burgos, served under Cortes in the conquest of Mexico, and under Pizarro in that of Peru. Sent to Chile in 1537 against the rebel Almagro, he was defeated at the Abancay River by Orgoñez. In 1548, under Gasca, he assisted in suppressing the revolt of Gonzalo Pizarro. He was appointed Captain-General of La Plata and Protosí, but was vanquished by the malcontent Giron in 1554 and died not long after.

ALVARADO, PEDRO DE (c.1486-1541). A Spanish adventurer, a companion of Cortes, and afterward conqueror of Guatemala. He was born

at Badajoz, in Spanish Estremadura. In 1510 he sailed for the New World, passing some time in the islands of Santo Domingo and Cuba. In 1518 he was dispatched from Cuba, by Velasquez, the Governor of that island, to explore, under the command of Grijalva, the shores of the American continent, when for the first time the Spaniards heard of the riches of Montezuma and of his vast empire. In February, 1519, Alvarado sailed with Cortes from Havana for the conquest of Mexico, in which Alvarado played a part second only to Cortes. His blue eyes and blond beard strengthened the impression among the dusky Aztecs that the invaders were "children of the sun," descendants of Quetzlcoatl, who were looked for to resume the dominion of the ancient royal house in Mexico. While he held the city of Mexico, during the absence of his chief, he massacred in the midst of a fête a great number of Aztec nobles. In the night retreat of July 1, 1520, the *noche triste*, Alvarado commanded the rear-guard and saved his life by a famous leap, the "salto de Alvarado," which he accomplished with the aid of his long spear across a wide breach in the causeway along which the retreating Spaniards were being driven. After the conquest of Mexico he was sent, in 1523, to subdue the tribes on the coast of the Pacific in the direction of Guatemala. He was completely successful and returned in 1527 to Spain, where the Emperor Charles V appointed him Governor of Guatemala. Pizarro and Almagro were then prosecuting a brilliant career of conquest in South America. Alvarado did not intend to intrude on their territories, but, as he considered the province of Quito to be without the limits of these, he landed with a force of five hundred soldiers at Bahía de los Caraques, whence he penetrated into the heart of the country, crossing the Andes by a bold and hazardous march. In the plain of Rio Bamba he was met by some of the troops of Pizarro, headed by Almagro, and agreed to retire on receiving an indemnity. Subsequently he received the government of Honduras in addition to Guatemala. He perished in an affray with the Indians near Guadalajara in western Mexico in 1541, crushed under his fallen horse. His greed for wealth led him to commit incredible acts of cruelty, that in the eyes of historians have overshadowed his military valor and talent.

ALVAREZ, ál'vá'râ', ALBERT RAYMOND (1861—). A French vocalist. He was born at Bordeaux. He was first in the army as a musical conductor; afterward he studied at the Conservatoire, Paris, and appeared as an operatic tenor. He first sang at the Paris Opéra in 1892 and soon became the leading tenor of the Opéra. In 1893 he appeared in Covent Garden, London. He visited the United States in 1898-99 and 1900. The unanimous approval which he met in Europe was not wholly confirmed in this country. His répertoire includes no less than 45 operas, in 11 of which he created the principal parts.

ALVAREZ, ál-vä'râth, DON JOSÉ (1768-1827). A Spanish sculptor, known also as Alvarez y Cubero. Born at Priego, he studied at the Academy of San Fernando, Madrid, at Paris, and under Canova at Rome. Refusing to recognize Joseph Bonaparte as King of Spain, he was imprisoned in Castle Sant' Angelo, Rome, but was released and employed by Napoleon in the decoration of the Quirinal Palace. Under Ferdinand VI he returned to Spain, was made sculptor to

the King in 1816, and director of the Academy of San Fernando in 1826. He was the chief Spanish representative of the so-called Classicist school of sculpture, the principal masters of which were Thorwaldsen and Canova. His works include statues of members of the royal family of Spain, a number of tombs of Spanish grandees, and several mythological figures and groups. The most celebrated of his works is a group in the Royal Museum of Madrid representing a scene from the siege of Saragossa.

ALVAREZ, JUAN (1790-1867). A Mexican general of Indian descent. He was born in Atoyac in the Mexican territory of Guerrero. He joined the revolutionary army in the war for Mexican independence. As a cavalry captain he distinguished himself in the battle of Tres Palos and in an assault on the fort of Acapulco, where he was wounded. He joined Santa Anna in the overthrow of the imperial government of Iturbide. He fought in the Mexican War with the United States in 1847, and he became the first Governor of the new State of Guerrero in 1849. Later he was one of the principal leaders in the successful revolt against the rule of Santa Anna. In September, 1855, he succeeded Carrera as President, but he became disgusted with the petty intrigues of his associates and resigned before the end of the year. Alvarez took up the fight for reform in the Three Years' War against the conservative reaction. He was one of the most determined opponents of Maximilian during the Second Empire in Mexico. Although many times a revolutionist, he had no selfish ambitions. His real interests were indicated by the various literary and scientific societies of which he was a member.

ALVARY, älvä'rè, MAX (1858-98). The stage name of a famous German dramatic tenor. He was born at Düsseldorf; his father was an eminent landscape painter, Andreas Achenbach. He studied singing with Lamperti and Julius Stockhausen of Frankfort, but owing to his father's opposition to his going on the stage, did not make his début until 1882, at Weimar, in *Stradella*. He came to this country in 1884, and made his first appearance as José in *Carmen* at the Metropolitan Opera House, New York. During his five years' engagement here he developed, partly under Seidl's guidance, into one of the greatest interpreters of Wagnerian rôles. His impersonation of *Siegfried* is still regarded as peerless. Alvary returned to America for the season of 1894-95 and again in 1896. March 21, 1895, at the Metropolitan Opera House, he sang *Siegfried* for the one hundredth time. In November, 1896, he was afflicted with cancer of the stomach, resulting, it is supposed, from bruises received by a fall through an open trap on the Mannheim stage. He went to his beautiful country-seat, Datenberg, the building of which, and his enforced absence from the stage, had impoverished him. Here he died, Nov. 8, 1898.

ALVENSLEBEN, älvëns-lä'ben, KONSTANTIN VON (1809-92). A Prussian General, born in Prussian Saxony. He was trained in the cadet corps, served through the Danish War and the war with Austria, and commanded the third army corps in the Franco-German War. He retired in 1873. A Prussian infantry regiment was named for him, as was also one of the forts at Metz.

AL'VERSTONE, LORD. See WEBSTER, SIR RICHARD.

ALVINCZY, ăl'vîn-tsê, JOSEPH, BARON VON (1735-1810). An Austrian field-marshal. He fought in the Seven Years' War at Torgau and Teplitz, and in 1789 he led the force which unsuccessfully attempted to capture Belgrade by storm. Between 1790 and 1793 he fought bravely in the Netherlands, and in 1796 was placed at the head of the Austrian forces in Italy. Here he was badly defeated by Napoleon, at Arcola and Rivoli. He became field-marshal in 1808.

AL'VIS (All-wise). In Norse mythology, the dwarf, a suitor for the hand of Thor's daughter, who answers Thor's questions in the lay (song) of Alvis.

AL'VORD, BENJAMIN (1813-84). An American soldier and writer. He was born at Rutland, Vt., and graduated at West Point in 1833. After serving in the second Seminole War (1835-37), and as mathematical instructor at West Point, he participated in the war with Mexico, and attained the brevet rank of major. During the march from Vera Cruz to Mexico he was chief of staff to Major Lally's column. He was paymaster of the department of Oregon from 1854 to 1862, and brigadier-general of volunteers from 1862 until his resignation of this grade in 1865. He was then brevetted brigadier-general in the regular army. He was paymaster at New York City till 1867, then in the district of Omaha, Neb., till 1872, and paymaster-general from 1872 until his retirement in 1881. Among his publications are *Tangencies of Circles and of Spheres* (1855) and *The Interpretation of Imaginary Roots in Questions of Maxima and Minima* (1860).

ALVORD, CLARENCE WALWORTH (1868—). An American scholar and educator, born in Greenfield, Mass. He graduated from Williams College in 1891, took post-graduate studies at the universities of Berlin, Chicago, and Illinois, and received the degree of Ph.D. from the last-named in 1908. After 10 years as a teacher in preparatory schools, he became (1901) instructor in history at the University of Illinois, assistant professor (1907), and associate professor (1909). In 1906 he was made special editor for the publications of the Illinois State Historical Society. An officer and member of many State and national historical societies, he contributed numerous articles to periodicals, and edited the *Cahokia Records* (1906); *Invitation sérieuse aux habitants des Illinois* (with Dr. C. E. Carter, 1908); *Governors' Letter Books* (with Dr. E. B. Greene, 1909); *Kaskaskia Records* (1909). In 1912, with Lee Bidgood, he wrote *First Explorations of the Trans-Alleghany Region by the Virginians*.

ALVORD, CORYDON A. (1812-74). An American printer. He was born at Winchester, Conn., and in 1845 removed to New York, where he became widely known as a printer of illustrated books. His establishment on Vandewater Street was one of the largest in the country. It contained fonts of old-style type and of ancient and Oriental letters which enabled him to make remarkable fac-similes of old texts. He was at one time president of the New York Typothetæ. After retiring from business in 1871 he removed to Hartford, where he prepared a history of Hartford and Winchester.

ALVORD, HENRY ELIJAH (1844-1904). An American soldier and authority on dairy matters, widely known as a writer and public speaker, and for many years prominently identi-

fied with agricultural education and experimentation. Enlisting in the Union army in 1862, he became a Major three years later. In the regular army he was a cavalry Captain (1866-72) and Chief Engineer on General Sheridan's staff (1868-69). Major Alvord was the first army officer to be detailed to an agricultural college as military instructor. Subsequently he became manager of the Houghton Farm Experiment Station, professor of agriculture in the Massachusetts and New Hampshire colleges, president of the Maryland College, and the first director of the Maryland Experiment Station. In connection with the "School of Farming" of the Chautauqua reading courses, he conducted what was probably the first correspondence course in agriculture in America. He was one of the founders of the Association of American Agricultural Colleges and Experiment Stations, serving as president in 1894-95, and was prominently identified with Federal legislation pertaining to agriculture. He was instrumental in organizing the first creamery east of the Hudson River, as well as many others in Massachusetts, Vermont, and Maine. He organized the Dairy Division of the United States Department of Agriculture in 1895 and remained its chief to his death. The American chapters of *Dairy Farming* (1881), as well as many agricultural monographs, were written by him.

ALWAR, ăl'wūr'. A feudatory state of Rajputana, British India (Map: India, C 3). Its area is 3221 square miles. Pop., 1911, 791,688.

ALWAR. Capital of the native Rajputana state of the same name, India, on the Northwestern Railway, 98 miles by rail from Delhi (Map: India, C 3). It is the residence of the Maharaja and of a British political agent. The town, dominated by an imposing fort 1200 feet above it, is picturesquely situated on undulating ground. Its chief building is the royal palace. Other noteworthy features are temples and tombs, and churches of the Roman Catholic and Presbyterian missions. At the time of the Diamond Jubilee of Queen Victoria, and to commemorate the event, there was founded here a school for young noblemen. The town has a fine water supply from the artificial Sili-ser Lake, 9 miles southwest of the city. Pop., 1901, 56,771; 1911, 41,305.

AL'WATO. See ANDREWS, STEPHEN PEARL.

AL'WOOD, WILLIAM BRADFORD (1859—). An American horticulturist, born in Delta, Ohio. He studied at Ohio State University (1884); Columbian (now George Washington) University (1886-88); the Royal Pomological School in Germany, and the Institut Pasteur in Paris. From 1882 to 1886 he was superintendent of the Ohio Agricultural Experiment Station, and for the two following years served as special agent of the United States Department of Agriculture. Except for the first three of the 16 years (1888-1904), during which he was vice-director of the Virginia Agricultural Experiment Station, he was also professor of horticulture and allied subjects at the Virginia Polytechnic Institute. During this period he carried on important investigations in horticulture and mycology. After being in charge of investigations into the fermentation of fruit products for the Government Bureau of Chemistry from 1900 to 1906, he was given the post of enological chemist. A model farm, on which he gave an example of what country life should be, became Alwood's

chief interest after his retirement from teaching. In 1900 he was vice-president of the International Congress on Agricultural Education, and in 1907 of the International Congress on Viticulture, both held in Paris. Several medals and decorations were conferred upon him by the French government and French agricultural societies. He wrote many pamphlets on horticultural subjects, on the chemical composition of apples and grapes, and on the composition of wines and ciders fermented with pure yeasts. Among the later of these is his *Enological Studies* (1912).

ALYATTES, ă'l'i-ăt'těz (Gk. Ἀλυάττης). A King of Lydia (c.618-560 B.C.). He took Smyrna, drove the Cimmerians from Asia, and extended the Lydian power to the river Halys. He also attacked Clazomenæ, but was repulsed. A six years' war was waged between him and Cyaxares, King of Media. He was succeeded by his son, Cræsus. His tomb, not far from Lake Gygæa, was one of the wonders of antiquity. Consult A. von Ölfers, *Ueber die lydischen Königsgräber bei Sardes* (1858).

AL'YPIN. A drug used for producing local anæsthesia, as a substitute for cocaine (q.v.). Its chemical makeup is denoted by the name monohydrochloride of benzoyletetrabutylammonium ethylisopropyl alcohol, and the formula $C_{16}H_{26}O_2 N_2HCl$. The substance occurs as a white crystalline powder, having a bitter taste, and freely soluble in water and alcohol. Its chief use is as a substitute for cocaine in spinal anæsthesia, being less toxic than the latter.

ALYP'IOS (c.360 A.D.). A Greek writer on music. He was born at Alexandria. His *Introduction to Music* (εἰσαγωγή μουσική) constitutes our chief source of information regarding the musical system of the ancient Greeks. (See GREEK MUSIC.) He discusses the art under seven headings: 1. Sounds; 2. Intervals; 3. Systems; 4. Modes; 5. Tones; 6. Alterations; 7. Composition, of which, however, only the chapter on Tones has been preserved. Of the other chapters not even fragments have come down to us. The treatise contains the 15 transposition scales in both vocal and instrumental notation in the diatonic, chromatic, and enharmonic systems. The work was first printed by Meursius in 1616. A critical edition was published in 1895 by Karl von Jan in the series *Musici scriptores græci*. A separate appendix, *Melodiarum reliquia*, containing all preserved Greek compositions, appeared in 1899.

ALYS'SUM (Gk. ἄλυσσον, *alysson*, a plant used to check hiccough, from ἄ, *a*, priv. + λύζειν, *lyzein*, to hiccough). A genus of low-growing, mostly perennial plants, of the family Cruciferae. There are many species and cultivated varieties, mostly of European origin. The flowers are small, white or yellow, and borne in racemes. The sweet alyssum (*Lobularia maritima*), grown in low borders, window gardens, baskets, and fenced-in greenhouses, is an annual.

ALZEY, ăl'tsī. An old city in Rhenish Hesse, on the Selz, 18 miles by rail southwest of Mainz (Map: Prussia, C 4). Its industries are weaving and the manufacture of shoes, leather ware, and furniture. Pop., 1890, about 6000; 1900, 6900; 1910, 7500. It was known in the fourth century and was built on the site of the Roman settlement of Altiaia. In 1912 excavation brought to light the remains of a stone fort. Volker the Fiddler, a hero of the *Nibelungenlied*, is supposed to have come from Alzey.

ALZOG, ăl'tsôg, JOHANN BAPTIST (1808-78). A Roman Catholic theologian. He was born at Ohlau, Silesia, June 29, 1808, and was professor of church history in the University of Freiburg from 1853 till his death there, March 1, 1878. He wrote a *Manual of Universal Church History*, which is known in many languages (original, Mainz, 1840; 10th ed. by F. X. Kraus, 1882, 2 vols.; Eng. trans., Cincinnati, Ohio, 1874-76, 3 vols.); also *Grundriss der Patrologie oder der ältern christlichen Litterargeschichte* (Freiburg, 1866; 4th ed., 1888). He was, in 1869, a member of the commission on dogma which prepared the work for the Vatican Council, and was the only member of the commission who opposed the promulgation of the dogma of papal infallibility. He concurred in it, however, after its adoption.

AM'ADAS, or **AM'IDAS**, PHILIP (1550-1618). An English navigator. He was born in Hull, England. Sir Walter Raleigh selected him as captain of one of the two ships sent out in 1584 to find a suitable place on the coast of North America for planting a colony. He and Barlow, captain of the other vessel, coasted northeasterly from the vicinity of Cape Fear and reached Ocracoke Inlet (July 13). They landed on the narrow island separating Pamlico Sound from the Atlantic and afterward visited the Indians on Roanoke Island. They returned to England and gave a glowing account of the country, Barlow writing the report. Several years afterward Amadas conducted an expedition to Newfoundland. Consult Hakluyt, *Principall Voyages*, vol. iii (new ed., London, 1809-12).

AMADEO, ă'mă-dă'ô, GIOVANNI ANTONIO (c.1447-1522). A rarer form of the name, OMODEO, also occurs. The most prominent Lombard sculptor of the Renaissance, also a distinguished architect. He was born in 1447 in Pavia and probably studied with local sculptors. His earliest-known work is the door from the church to the lesser cloister of the Certosa of Pavia and several of the fine figured capitals of both cloisters. To this period also, though somewhat later, belong the doors from the church to the sacristy of the Certosa and the Lavado door. The masterpiece of the period, however, is the celebrated Colleoni Chapel in Bergamo (1470-75), one of the finest productions of decorative art of Italy, containing the tombs of the great condottiere and his daughter Medea, as well as many fine reliefs and sculptural decorations. These early works show great talent in composition and a wealth of fantastic decoration; the figures are well rounded and carefully modeled. But he soon adopted a more naturalistic style, resembling that of the Mantegazza (q.v.) brothers, with heavy broken draperies and flat decorative surfaces. This second manner is seen in the reliefs now incased in the pulpit of the cathedral of Cremona and in the masterpiece of all his works, the façade of the Certosa of Pavia, the gem of Lombard architecture and sculpture. He designed the façade and with the aid of assistants, notably Brioso, executed one-half of its sculptures, the remainder being assigned to the Mantegazza brothers. To him we owe the beautiful bas-relief extending across the lower part of the façade, most of the relief medallions, the window frames and other decorations of the upper façade, as well as the floor of the great cloister. Among several tombs which he designed, the most impres-

sive are two now in the chapel of Palazzo Borromeo in the Isola Bella, Lago Maggiore; the larger of these is one of the most typical, and the richest in decoration of the Lombard Renaissance. Amadeo's last important sculpture was the sarcophagus of St. Lanfrancus in the church of that martyr near Pavia, showing a change from his second manner to a third more correct in form and even more original than his previous work.

Amadeo's activity as an architect was second only to his work as a sculptor. Besides designing the façade of the Certosa, he was also, in conjunction with Dolcebuone, architect of Milan Cathedral. To him we owe the light and graceful Gothic spire which is its crowning feature. Its many sculptures were carved by his pupils after his designs. Somewhat earlier he designed the Renaissance Palazzo Bottigella in Pavia and the arcaded extensions of the cathedral. His last years were embittered by the interference of the engineers of Milan Cathedral with his plans, and he died Aug. 27, 1522. Although he belonged both in sculpture and architecture essentially to the Renaissance, his versatility is attested by his treatment of the Gothic in the spire. Consult the monographs on Amadeo by Frizzoni (Rome, 1873), Majocchi (Paris, 1903), Malaguzzi-Valori (Milan, 1905).

AM'ADE'US. A name borne by several members of the House of Savoy (q.v.), including one King of Spain. See AMADEUS I.

AMADEUS I, FERDINAND MARIA (1845-90). Duke of Aosta and King of Spain. He was the second son of Victor Emmanuel of Italy and was Rear-Admiral in the Italian navy and Lieutenant-General in the army. He married Princess Maria del Pozzo della Cisterna, daughter of the Countess de Merode, May 30, 1867. On Nov. 16, 1870, the Cortes of Spain elected him King, and on December 4 Amadeus accepted the crown, with the sanction of his father and the approval of the Great Powers. He reached Madrid Jan. 2, 1871, four days after the assassination of General Prim. He himself was attacked by assassins in July, 1872. In the same year a Carlist rising took place. On Feb. 11, 1873, he abdicated for himself and his heirs, and returned to Italy, the Spanish Cortes proclaiming the Republic, and making Figueras provisional President. Consult Whitehouse, *The Sacrifice of a Throne* (New York, 1897). See SPAIN.

AMADEUS VIII. See under FELIX.

AM'ADIS OF GAUL. A legendary hero of the most famous of mediæval romances, which even the barber of Don Quixote had not the heart to consign to the flames. It was the centre and parent of a cycle of similar tales of chivalry which have their representatives in every literary language of mediæval Europe and even in Hebrew. In what language it was first written is uncertain. Portugal, Spain, France, and England claimed its nativity, and, with the exception of Portugal, all with some show of justice. It owes its inspiration to the Arthurian cycle, appears to have been developed in northern France, the home of the mediæval epic, to have migrated thence to Provence, and to have been carried by the troubadours, either as a complete story or as a tradition, to Spain, where we find the epic mentioned by poets in the middle of the fourteenth century in a way to indicate that it was already widely popular there, though no contemporaneous trace of it has been found in Italy. (Consult Braunfels, *Kritischer Ver-*

such über den Roman Amadis von Gaula, Leipzig, 1876.) The earliest surviving Amadis legend is by the Spaniard Garcia Ordoñez de Montalvo and appears to have been finished about 1470. He allowed himself considerable liberties with the tradition, especially toward the close, and his anonymous successors extended the romance to 12 books and more than three times the length he had given it. It was first printed in 1519, and so fully embodies the taste of the generation that had given it birth that it almost immediately became part and parcel of the literary consciousness of Europe, each nation recognizing and reclaiming its share in it, although they claimed no part of the continuation by Montalvo, in which he described, out of his own invention, the deeds of the son of Amadis, Esplandian. Amadis was rendered into Italian in 1546, and into German before the end of the century. It attracted the attention of Francis I during his captivity at Madrid, and at his command was translated by Nicolas de Herberay, who rendered two-thirds of the Spanish epic into polished French, finishing his work in 1548. Ten translations followed this, with supplementary adventures and imitations, till the whole swelled at last to 25 books, detailing the adventures of an entire family. In its simpler form it tells how its hero, Amadis, the illegitimate son of Perion, King of Gaul, and Elisena, a princess of Brittany, was placed by his mother in a river in a box, was rescued at sea by a Scottish knight, and educated at the Scottish court, was enamored of Oriana, daughter of King Lisuarte of England, married her, returned to Gaul, and spent the rest of his life, there and elsewhere, in manifold adventures. Both the French and the Spanish Amadis were criticised in their own day for defective structure, hyperbolic phantasy, immorality, and irreligion. Their popularity lasted until they themselves had raised up worthier imitators of their example. The first of these was d'Urfé's *Astrée*.

An English version of Amadis, much shortened to its advantage, was made by Southey (London, 1803). For the origin of the story consult Grässe, *Litteraturgeschichte* (Dresden, 1844-50); Körting, *Geschichte des französischen Romans im XVII Jahrhundert* (Leipzig, 1885); and for further bibliography, Braga *Grundriss der romanischen Philologie* (Strassburg, 1893), and Menendez y Pelayo, *Origines de la Novela* (Madrid, 1905).

AMADIS OF GREECE. A supplement to *Amadis of Gaul*, a Spanish work by Feliciano da Silva. It is noteworthy as being perhaps the source of Florizel in Shakespeare's *Winter's Tale*, and of the "Masque of Cupid," in Spenser's *Faerie Queene*.

AMADOR, ä'mä-dör', MANUEL (1833-1909). First president of the Republic of Panama. He was formerly connected with the French diplomatic service in Panama and had some military training. After a short business career in early life, he took up the practice of medicine, becoming distinguished in that profession. In 1903 he took a prominent part in the revolution against Colombia which resulted in Panama's independence. He was elected president of Panama Feb. 17, 1904, and three days afterward was inaugurated to hold office for four years. At the end of that time he declined a renomination. Since his death the main fortification at the Pacific end of the Panama Canal has been named Fort Amador.

AMADOR DE LOS RIOS, ä'má-dōr' dā lōs rē'ōs, José (1818-78). A Spanish critic and historian, born at Baena. He first became known as editor (with Madrazo) of the collection entitled *Monumentos arquitectónicos de España*. His most noted work is the *Historia crítica de la literatura española* (1861-65), of which he completed but seven volumes. Despite many defects resulting from its scope and complexity, and from the date of its composition, this work must still be consulted for the period of which it treats. His other publications include works on the art monuments of Toledo and Seville, a history of Latin-Byzantine art in Spain, and the exhaustive *Historia social, política y religiosa, de los judíos de España y Portugal* (1875-76).

AMADOU, äm'ä-dōō' (Fr. tinder, from *amadouer*, to bait, allure, coax, alluding to its use as tinder during the Middle Ages). A name given to some fungi of the genus *Polyporus*. They grow upon old trees, especially oak and ash in Great Britain and on the continent of Europe. The fungus appears as a leathery or fleshy mass, sometimes becoming hard, often bracket-shaped or hoof-shaped, and its lower surface is pierced by the innumerable "pores" that give name to the genus. *Polyporus igniarius* is called hard amadou, or touchwood. *Polyporus fomentarius* is called soft amadou, or German tinder. They are used as styptics for stanching slight wounds; and when steel and flint were in general use for striking fire, were much employed as tinder. The soft amadou is used for making small surgical pads, for which its elasticity peculiarly fits it. The remarkably light wood of *Hernandia guianensis*, a shrub of the family Thymelæaceæ, is readily kindled by flint and steel and is used as amadou in Guiana.

AMAGER, ä-má'gēr. An island in the district of Copenhagen, Denmark; it is in the Sound, and separated from Zealand by the Kalvebod Strand (Map: Denmark, F 3). Amager has an area of 25 square miles. Christianshavn, at the northern end of the island, forms part of the city of Copenhagen. The chief trade is market gardening for that city. The shipping of the island is of some importance. The inhabitants are chiefly descendants of Dutch emigrants of the sixteenth century, who still preserve their old dress and customs. Pop., 1900, 25,000.

AMAI'MON, or **AMOY'MON** (probably Gk. *ai*, a priv. + Heb. *maimin*, believer). A demon named in the theory of the Middle Ages as king of the eastern part of hell. Asmodeus (q.v.), the demon of desire, was his lieutenant. See allusions in Shakespeare's *Merry Wives of Windsor*, ii, 2, and *Henry IV*, first part, ii, 4.

AMAL'ARIC (502-531). The last Visigothic King of Spain (526-531). He married Clotilda, daughter of Clovis, King of the Franks, in 527, and treated her so badly because she would not embrace Arianism that her brother Childebert marched against him and defeated him. According to Gregory of Tours, Amalaric was killed in the battle; according to others, he fled to Barcelona, where he was killed by rebel subjects.

AM'ALASUN'THA (?-535). Queen of the Ostrogoths, daughter of Theodoric the Great. On the death of Theodoric, her son Athalaric succeeded under the regency of Amalasantha. She was well educated and preferred the Roman civilization. The Goths, who were opposed to

this, incited her son to rebellion in 533. Amalasantha subdued the rebellion, and Athalaric died the following year, at the age of 18. She then associated her cousin Theodahad with her in the kingdom, but did not marry him, as he already had a wife. In 535 Theodahad murdered Amalasantha, under the pretext that she was planning to betray the Goths to Justinian. Her actions had made it probable that she was thinking of retiring to Constantinople. Belisarius avenged her death by killing Theodahad in 536. Consult Hodgkin, *Italy and her Invaders*, vols. iii and iv (2d ed., Oxford, 1896). See **GOTHS**.

AMAL'ECITE. See **MALECITE**.

AM'ALEKITES. An Edomitish tribe in the Negeb (q.v.), south of Judah and north of Kadesh Barnea (q.v.), according to Num. xiii. 29; xiv. 39. Amalek is represented as a son of Eliphaz, the son of Esau by a Horite woman, Timna, his concubine; consequently as a bastard tribe of Edomitish origin (Gen. xxxvi. 12). Their country is first mentioned in Genesis xiv. as the scene of the wars of Chedorlaomer of Elam in the neighborhood of En Mishpath or Kadesh. (See **CHEDORLAOMER**.) The memory of early struggles between Amalek and the invading tribes has probably been preserved in the accounts of an Amalekite victory at Horma (Num. xiv. 45) and a defeat at Rephidim (Ex. xvii. 8-16). In the days of Saul they were almost annihilated (1 Sam. xv. 2), and later David overcame a band of marauding Amalekites with great slaughter, pursuing them until "there escaped not a man of them save 400 young men who had camels and fled" (1 Sam. xxx. 1-20). In the prophecies of Balaam, which are ascribed by many critics to the age of David, Amalek is described as "the first of nations," but "his end is sure destruction" (Num. xxiv. 20). The inveterate hostility between Amalek and Israel is reflected in so late a production as the Book of Esther, where the designation of Haman, the arch-enemy of the Jews, as "the Agagite" (Esther iii. 1), is introduced in order to emphasize his descent from Agag, the King of Amalek (Num. xxiv. 7). Grimme has suggested that Amalek is a broken plural of Amlak and that it is identical with Meluhha, a country frequently mentioned in Babylonian inscriptions and apparently designating northwestern Arabia, at least, in earlier times. But this identification is very uncertain. Consult: Eduard Meyer, *Die Israeliten und ihre Nachbarstämme*, pp. 345 ff. (1906); Grimme, *Mohammed*, p. 11 (1904); Schmidt, *Messages of the Poets*, pp. 333 ff. (1911).

AMALFI, ä-mäl'fē. A seaport town in Campania, south Italy, situated on the Gulf of Salerno, about 22 miles southeast of Naples. It is built on the slope of a mountain rising from the coast and covered with splendid trees and gardens. The houses tower one above another and are connected by stairways and bridges. The most interesting building of the place is the old cathedral, with its bronze doors cast in Constantinople in the eleventh century, a mosaic façade, and columns from Pæstum. An old Capuchin monastery, dating from the beginning of the thirteenth century, is now used as a hotel. It is finely situated west of Amalfi in the hollow of a rock rising about 230 feet from the sea. The town produces paper, soap, and macaroni, but these industries are declining. Pop., 1901, 7300; 1911, 7472. According to local tradition, Amalfi was founded by Constantine

the Great. From the ninth to the eleventh century it was an independent state and was ruled by doges. Early in the Middle Ages the city had a population of 50,000 and rivaled in importance Genoa and Pisa, with the latter of which Amalfi was continually at variance. One of the oldest maritime codes, the *Tavole Amalfitane*, was compiled in Amalfi, and the town is otherwise famous as being the birthplace of Flavio Gioja and of Masaniello.

AMAL'GAM (Lat. Gk. μάλαγμα, *malagma*, an emollient, plaster, from μαλακός, *malakos*, soft). An alloy of mercury with one or more other metals. An amalgam of silver crystallizing in the isometric system has been found native; a gold amalgam, too, has been reported from several localities, including California. Artificially, amalgams are made (1) by bringing metallic mercury into contact with another metal, as antimony, arsenic, bismuth, etc.; (2) by bringing mercury into contact with a saturated solution of a salt of the other metal, when part of the mercury goes into solution and the remainder combines with the liberated metal, which is the case with calcium, iron, and certain other metals; (3) by placing the metal to be amalgamated in a solution of a salt of mercury, which is the usual method for amalgamating copper and aluminum; finally (4) by placing the metal to be amalgamated in contact with mercury and dilute acids.

Amalgams may be either solid or liquid. Those which are liquid are regarded as solutions in which there is an excess of mercury. The more important amalgams are as follows: *Copper amalgam*, which is made by triturating finely divided metallic copper with mercurous sulphate under hot water. This amalgam has the property of softening when kneaded, and becoming quite hard after standing some hours, which has led to its use for filling teeth. *Gold amalgam* is formed by heating mercury with powdered gold or gold foil. The readiness with which mercury combines with gold has been made the basis of an important process for the extraction of the latter from ores. After the ore containing the free gold is crushed to a fine powder it is washed over copper plates, the surface of which contains a thin film of mercury. The free gold is caught by the mercury, forming an alloy or amalgam which can be scraped from the plate in a plastic condition. The percentage of gold in this amalgam, or its fineness, varies with the size of the gold particles; coarse gold produces high-grade amalgam, whereas fine gold produces low-grade amalgam. The gold is recovered by washing foreign matter from the amalgam in hot water with an excess of mercury, squeezing the excess of mercury from the resultant amalgam through chamois or canvas, and then placing the residue in a retort from which the balance of the mercury is distilled and condensed for further use. Oils or grease coming in contact with the crushed ore will prevent the gold from forming an amalgam with the mercury. *Silver amalgam* is formed by the union of mercury with finely divided silver, and this fact is taken advantage of for the extraction of silver from its ores by a process analogous to that described in connection with gold amalgam. An amalgam consisting of eight parts of mercury to one part of silver is used for silvering metals.

Mercury readily combines with sodium when the two elements are brought in contact with

each other, yielding an amalgam which is used for amalgamating copper plates, and in the chemical industry as a reducing agent. *Tin amalgam* is formed when mercury is brought in contact with tin in the proportions of three parts of the former to one part of the latter. This amalgam is the one commonly used for silvering mirrors. *Zinc amalgam* results when zinc filings are mixed with mercury at a heat somewhat below the boiling point of the latter. It is used for coating the rubbers of electric machines. Amalgams of bismuth, cadmium, magnesium, potassium, and other metals are known, but have no important commercial uses. Consult: Dudley, "An Index to the Literature of Amalgams," in *Proceedings of the American Association for the Advancement of Science* (Salem, 1889); Rose, *The Metallurgy of Gold* (London, 1902); Eissler, *The Metallurgy of Gold* (London, 1896).

AMAL'GAMA'TION. See GALVANIC BATTERY.

AMALIA, à-mä'lê-à, ANNA (1739–1807). The wife of Duke Ernst August of Saxe-Weimar-Eisenach. She was born at Wölfenbüttel. On the death of her husband, in 1758, she was appointed Regent for her infant son, Karl August, whom, aided by his tutor, Wieland, she trained in the love of literature and art, also doing much to foster education and material prosperity throughout his domains. Soon after assuming the government, the Duke, with his mother's active coöperation, gathered at Weimar a galaxy of literary talent probably never equaled. Goethe, Herder, and Schiller were its brightest stars, but they shone in goodly company. Weimar continued during and beyond her life what she, more than any other, had made it, the literary centre of Germany. Consult Gerard, *A Grand Duchess, The Life of Anna Amalia, and the Classical Circle of Weimar* (New York, 1902), and see GOETHE.

AMALIE, à-mä'lê-ê, MARIE, or MARIE AMÉLIE (1782–1866). The wife of Louis Philippe, King of the French. She was the daughter of King Ferdinand I (IV) of the Two Sicilies. When she married Louis Philippe (then Duke of Orleans), he was a political exile, without hope of ever rising to the throne of France. Amalie never interfered in politics and, possessing all the domestic virtues, was happy with her husband.

AMALIE, à-mä'lê-e, MARIE FRIEDERIKE (1818–75). Queen of Greece, daughter of Grand Duke Augustus of Oldenburg. She married King Otho of Greece, Nov. 22, 1836, shared in her husband's unpopularity, and after his deposition in 1862 accompanied him to Bavaria, residing after his death at Bamberg.

AMALRIC. See AMAURY.

AMAL'RIC OF BENE, bán (d. between 1204–07). Also called AMAURY OF CHARTRES. The founder of a school of Pantheists known by his name. He was born at Bène, near Chartres. He lectured in Paris upon philosophy and theology about 1200. He held that God is all, and that he who believes this can commit no sin. His doctrines were condemned by the university. Pope Innocent III confirmed the condemnation (1204) and ordered Amalric to return to Paris and recant, which he did, and so when he died, which was in the same year, he was buried in the consecrated ground of the monastery of St. Martin des Champs, Paris. But when it was discovered that the sect which he had founded had spread throughout France, a synod was

called in Paris in 1209, his teaching formally condemned, several of his followers burned at the stake as heretics, and his own body was also dug up, burned, and the ashes thrown to the winds. His doctrines were formally condemned by the fourth Lateran Council in 1215. Consult Haureau, *Histoire de Scholastique*, and Hefele, *Conciliengeschichte*.

AM'ALS, or **AM'ALI**. The royal family of the Ostrogoths, which furnished the sovereigns for about two centuries. The most noted were Theodoric the Great (q.v.), Amalasu(n)tha, and Witigis. The race came to an end in 605, when Germanus Postumus and his daughter were put to death by Phocas. Hodgkin, in *Italy and her Invaders*, vol. iii (Oxford, 1896), gives a genealogical table of the Amals.

AM'ALTHE'A (Gk. Ἀμάλθεια, *Amaltheia*). A nymph, the nurse of the infant Zeus. The name was transferred to the goat which, according to the Cretan legend, suckled the god and was rewarded with a place among the stars. This goat was called first merely *Aiæ*, the Greek word for goat, and was thought of as the property of Themis and the nymph Amalthea. Amalthea was in origin a fructifying earth-goddess, and so was naturally associated with Ge ('Earth') and Themis. The "cornucopia," or horn of plenty, really an attribute of all the deities who were believed to control the fruits of the earth, was said to be the horn of the goat Amalthea, which had been broken upon a tree. See **ÆGIS**.

AMA'MA, SIXTINUS (1593-1629). A Dutch Orientalist. He was born at Franeker, Friesland, studied Oriental languages at the University there, and subsequently at Exeter College, Oxford. He succeeded Drusius as professor of Hebrew at Franeker. In 1625 he was called to Leyden, but the Estates of Friesland refused to permit him to go. He was among the first to advocate a thorough knowledge of the original languages of the Bible as indispensable to theologians. His works include: *Dissertatio qua Ostenditur Præcipuos Papismi Errores ex Ignorantia Hebraismi Ortum Sumpsisse* (1618), *Censura Vulgatæ Versionis V Librorum Mosis* (1620), and a *Hebreeuwisch Woordenboek* (1628).

AMANA, äm'ä-nä. A German religious community established at Amana, Iowa, comprising several villages of settlers situated a few miles apart under the government of a president and 13 directors, elected annually by the community. Family life is preserved, but meals are provided for a number of families together. Woolen mills, flour mills, sawmills, dye-shops, and agriculture are the chief industries operated in common for the benefit of all. Life is simple, and all necessaries are furnished freely to members of the community. New members are elected after a probationary period. Daily prayer meetings are held. The sect was founded by Eberhard Gruber in Württemberg, Germany, 1714, and came to America, 1843, settling first in western New York and moving to Amana, 1855-64. The community in 1913 numbered about 1800 persons and owned 26,000 acres of land, their total property being valued at \$1,800,000. Consult B. M. Shambaugh, *Amana, the Community of True Inspiration* (1908). See **COMMUNISM**; **COMMUNISTIC SOCIETIES**.

AMAN'DA. In Cibber's comedy, *Love's Last Shift*, and Vanbrugh's *The Relapse* (from which Sheridan made *A Trip to Scarborough*), the faithful and charming wife of Loveless, who has

basely deserted her, but is finally won back by the sense of her fidelity.

AMANDE DE TERRE, ä'mänd' de târ'. The French name for *Cyperus esculentus*. See **CHUFA**.

AMAN-JEAN, ä'män'jän', EDMOND (1860—). A French portrait and decorative painter. He was born in Chevry-Cossigny (Seine et Marne) and studied principally with Lehman in the Ecole des Beaux Arts, Paris. His art is correct in design, excels especially in delicate and original color, and altogether renders him a most subtle portraitist of women. His chief works include two scenes from the life of Joan of Arc (1887-88) in the Museum of Orleans; portrait of a young lady (1891) in the Luxembourg Gallery, Paris; three decorative pieces in the Musée des Arts Decoratifs; La Vasque, a decorative panel in the Carnegie Institute, Pittsburgh, and Madame N. (1906) in the Museum of Buenos Aires. He excels especially in pastels, depicting enchanting heads of young women. An exhibition of 10 of his best paintings, along with many others of the advanced French group, was held in Buffalo in 1910, and afterwards in other American cities.

AM'ANI'TA (Gk. nom. pl. ἀμανίται, *amanitai*, a sort of fungus). A genus of poisonous fungi related to *Agaricus*. *Amanita muscaria*, which is common in woods, especially of fir and beech, in Great Britain, and also in the United States, is one of the most poisonous fungi. It is sometimes called fly agaric, being used in Sweden and other countries to kill flies and bugs, for which purpose it is steeped in milk. The pileus or cap is orange-red, with white warts, the gills white, and the stem bulbous. It grows to a considerable size. Notwithstanding its very poisonous nature, it is used by the natives of Kamtchatka to produce intoxication. *Amanita phalloides*, commonly called death cup, is quite similar to the fly agaric. It is perfectly white, with white spores, and a ring on the stem. For illustration, see **FUNGI**, **POISONOUS**.

AMANTS MAGNIFIQUES, ä'män' mä'nyë-fêk' (Fr. magnificent lovers). A prose comedy in five acts by Molière, written by order of Louis XIV in 1670. The two lovers are princely rivals, who give various entertainments and ballets for which the slender plot is made the occasion.

AMAPALA, ä-mä'pä-lä. A free port of Honduras, situated on the north shore of the island of Tigre, in the Gulf of Fonseca, about 950 miles from Panama (Map: Central America, D 4). The harbor is very good, capable of containing vessels of the deepest draught, and the town has a healthful climate. It has secured a good part of the trade of San Salvador and Nicaragua, as it is the only large port of Honduras on the Pacific coast. The chief articles of export are hides and coffee. Gold, silver, and mineral ores were formerly exported in great quantities. The town was founded in 1838, and the opening of the port took place in 1868. Pop., about 3000.

AMARA-KOSA, äm'ä-rä kō'shā. See **AMARASINHA**.

AM'ARANT. A giant slain by the legendary Guy of Warwick (q.v.) in the Holy Land.

AM'ARANTH (Gk. ἀμάραντος, *amarantos*, from ἀ, *a*, priv. + μαραινειν, *marainein*, to die away, wither), *Amaranthus*. A genus of plants of the family Amaranthaceæ. This genus contains about 50 species of wide distribution, but chiefly abounding within the tropics. They are herbs or shrubs, with simple leaves, and flowers

in heads or spikes. The genus *Amaranthus* has mostly monœcious flowers. Some of the species are naturally of singular form, and others assume singular but monstrous forms through cultivation. Love-lies-bleeding (*Amaranthus caudatus*), prince's feather (*Amaranthus hypochondriacus*), and other species are common annuals in our flower gardens. The spikes of *Amaranthus caudatus* are sometimes several feet in length. The dry red bracts which surround the flower retain their freshness for a long time after being gathered, for which reason the plant has been employed by poets as an emblem of immortality. The globe amaranth (*Gomphrena globosa*) and the cockscomb, well-known tender annuals, belong to the same family. The globe amaranth is much cultivated in Portugal and other Roman Catholic countries for adorning churches in winter. Its flowers, which are of a shining purple, retain their beauty and freshness for several years. About a dozen species are native and introduced in the United States, where they are mostly coarse annual weeds. *Amaranthus blitum*, *Amaranthus oleraceus* (Chusan han-tsi), and other species are used as pot-herbs. Wholesome mucilaginous qualities are generally found in the leaves throughout the order. The seeds of *Amaranthus frumentaceus* (called kiery) and of *Amaranthus anardana*, or *Amaranthus paniculatus*, are gathered for food in India. Medicinal properties are ascribed to some species of the family, particularly to *Gomphrena officinalis* and *Gomphrena macrocephala*, which have a high and probably exaggerated reputation in Brazil as cures for many diseases.

AM'ARANTHA'CEÆ, AMARANTH FAMILY (for derivation, see AMARANTH). A family of dicotyledonous plants, embracing about 500 species. They are widely distributed, but are most abundant in the tropics. In floral characters they greatly resemble the Chenopodiaceæ, differing in some minor particulars and in habit of growth. The general inflorescence is racemose, the auxiliary cymes going to make up a compound inflorescence. In general habit most of the species are rather coarse weeds, although some are grown as ornamentals, such as cockscomb, prince's feather, love-lies-bleeding, etc. The chief genera are *Amarantus*, *Celosia*, *Gomphrena*, and *Iresine*.

AMARAPURA, ūm'ā-rā-pōō'rā, or UMMERAPURA, City of the gods. The former capital of Burma, situated on the east bank of the Irrawaddy, and on the Rangoon and Mandalay Railway, 9 miles northeast of Ava, in lat. 21° 57' N., long. 96° 7' E. It was founded in 1783; in 1810 it was almost totally destroyed by fire; and in 1839 an earthquake laid it in ruins. In 1852-53 it was finally deserted and the capital of the country removed to Mandalay. Nothing remains of the old city save some rows of beautiful trees and interesting ruins of a palace and of several pagodas. A celebrated temple in the suburbs contains a famous colossal bronze image of Gautama (Buddha). The population in 1810 was estimated at 170,000; it has declined to less than 9000.

AM'ARASIN'HA, or **AM'ARA-SIM'HA**. A celebrated Sanskrit lexicographer of antiquity, whose vocabulary, *Amara-kośa*, or Amara's Treasury, formed a storehouse of words in early times and a mine of information for later workers in the field. This glossator is commonly called simply Amara in the native commentaries;

but his title *Simha* shows that he belonged to the princely class. Little is known of his life, except that he was a Buddhist in religion, and it is assumed that all his writings, except the dictionary, perished through the persecutions which the Buddhists at one time suffered at the hands of the orthodox Brahmans. There is, however, great uncertainty as to the time when Amara lived. His date has been generally put at about 500 A.D., though by some authorities it is given as a century or more earlier. His name is associated with the poet Kalidasa (q.v.) and the others of the "nine gems" at the court of Vikramaditya in an Augustan Age of Sanskrit literature. The sixth century A.D. is the date most commonly assigned for the reign of this monarch; but the Hindus place him some centuries earlier, a view which there is rather a tendency to follow than to reject. (See KALIDASA.) The real title of Amara's Sanskrit vocabulary is not *Amara-kośa*, but *Nāmalingānūsāsana*, 'a book of words and genders.' It is also called *Tri-kāṇḍa* or *Trikāṇḍi*, i.e., tripartite, from its three books of words and homonyms relating to the world and man and miscellaneous matters. The second of these is the longest, and each book is subdivided into chapters, called *vargas*. The whole work comprises about 1500 verses, generally consisting of lines of 16 syllables, and the words, about 10,000 in number, are arranged, not alphabetically, but, in general, as synonyms according to subject and gender. There are numerous editions of the *Amara-kośa*, accompanied also by the old native commentaries. Mention may be made of the edition with introduction, English notes, and index by Colebrooke (Serampore, 1808). This was reprinted in 1829. A French edition, with translation, was published by Loiseleur-Deslongchamps (2 vols., Paris, 1839-45). Valuable are the editions by Chintāmani Sāstrī Thatte, under the superintendence of F. Kielhorn (2d ed., Bombay, 1882), and in the collection of Sanskrit ancient lexicons, or Abhidhānasangraha (Bombay, 1889). Consult Zachariæ, "Die indischen Wörterbücher (Koś'a)," in Bühler's *Grundriss der indo-arischen Philologie und Altertumskunde* (Strassburg, 1897).

AMARI, ā-mā'rē, MICHELE (1806-89). An Italian historian and Orientalist. He was born at Palermo. At the age of 16 he entered a government office, and soon afterward—his father being condemned to 30 years' imprisonment for a political crime—the duty of supporting his mother and the other members of the family devolved upon him. He succeeded, nevertheless, in acquiring an education, learned French and English, and published a translation of *Marmion* in 1832. In 1837 he removed to Naples. In 1841 appeared his masterpiece, *La Guerra del Vespro Siciliano* ('The War of the Sicilian Vespers'), in which the author overthrows the prevalent notion, established by Villani, of the cause of the famous massacre of 1282. The book was quickly prohibited and, as a consequence, widely read. It was translated into German by Dr. Schröder, of Hildesheim, and into English by Lord Ellesmere. Dreading punishment at Naples, Amari fled to France, where he gave himself up to the study of Arabic and modern Greek, and to the preparation of his *Storia dei Musulmani di Sicilia* (1854-68). Upon the outbreak of the revolution of 1848, he returned to Italy, and shortly after his arrival was elected vice president of the committee of war in Sicily.

He was next sent on a diplomatic mission by the provisional government to France and England. In 1849 he published at Paris *La Sicile et les Bourbons*, to show up the pretensions of the Neapolitan sovereign. After the Sicilian insurrection had been quelled, Amari took up his residence in Paris, where he devoted himself to literary pursuits till 1859, when he returned to Italy, fighting the following year under Garibaldi. He was made Senator in 1861, and in 1862-64 was Minister of Instruction. He resigned his professorship at Florence in 1878 and removed to Rome, where he continued his historical studies. He died July 16, 1889. Other writings of Amari are upon the language and history of the Arabs, in the *Revue Archéologique*, the *Journal Asiatique*, etc. His letters were published at Turin (1896).

AMARILLO. A city in Potter Co., Texas, 32 miles southwest of Panhandle, on the Fort Worth and Denver City, the Atchison, Topeka, and Santa Fe, the Chicago, Rock Island, and Gulf, the Pecos and Northern Texas, and the Southern Kansas of Texas railroads (Map: Texas, B 2). The city is in a productive agricultural and stock-raising region and has some manufactures. Its growth has been rapid. Pop., 1890, 482; 1900, 1442; 1910, 9957.

AMAR'NA LET'TERS. A collection of more than 300 letters and dispatches, inscribed upon clay tablets, which were found, in the winter of 1887-88, in the village of Telel-Amarna (q.v.) in Middle Egypt. They represent the Asiatic correspondence of the Egyptian court about 1400 B.C., and it is a remarkable fact that they are in the cuneiform character, and, with three exceptions, in the Babylonian language, which would thus appear to have been the medium of diplomatic communication throughout western Asia. One of the letters is in the language of Mitani, in northern Mesopotamia, and two are in that of Arçapi or Arzaya (probably Cyprus). Among the writers are the Egyptian kings Amenophis III (q.v.) and Amenophis IV (q.v.), and the kings of Mitani, of Babylonia, of the Hittites, and of Alashia (Cyprus). It appears from these letters that the Egyptian kings of the eighteenth dynasty intermarried with the royal houses of both Mitani and Babylonia. Amenophis III married a sister of Kadashman-Bel, King of Babylonia, and also a sister of Dushratta, King of Mitani; while Amenophis IV married a niece of his father's Mitanian wife. Frequent reference is made to commercial affairs, implying a considerable intercourse between Egypt and the Asiatic States. By far the greater number of the Amarna letters proceed from Egyptian officials and subject allies in Syria, at that time a dependency of Egypt, and afford a valuable insight into the state of Palestine before the Hebrew invasion. The growing weakness of Egypt and the extension of the Hittite dominion in the north can be clearly seen, and the withdrawal of the Egyptian troops gave opportunity for conflicts between the princes of the small city-states into which the land was broken up. To add to the general confusion, the country was threatened on the east by the Khabiri—marauding nomads from the Arabian Desert, whose sphere of activity extended from southern Palestine as far north as Sidon, Beirut, and Gebal. Some scholars are inclined to identify the Khabiri with the Hebrews, but this theory has not met with general approval. The letters of

the Palestinian princes, which are full of mutual recriminations, reveal the fact that there were two chief parties—one loyal to Egypt, the other professing loyalty, but in reality allied with the enemies of Egypt and everywhere successful. Among the most zealous supporters of Egypt was the Prince of Jerusalem, at this time a city of some importance. Two letters are written in a curious dialect which has been taken as the oldest known specimen of Indo-Germanic. Consult: Winkler, in *Schraders Keilinschriftliche Bibliothek* (Berlin, 1896); Eng. trans. by Metcalfe, *The Tell El Amarna Letters* (New York, 1896); Knudtzen, *Die Zwei Arzawa-Briefe* (Leipzig, 1902).

AM'ARYL'LIDA'CEÆ (THE AMARYLLIS FAMILY). A family of monocotyledonous plants with about 70 genera and nearly 1000 species. The plants resemble those of the Liliaceæ in many respects, except that they all have inferior ovaries. The species are mostly tropical and subtropical, and are generally found in dry regions. Many are bulbous, leafing and flowering only in the wet season, while others have thick fleshy leaves covered with wax or otherwise protected for their xerophytic habitat. Some of the Amaryllidaceæ are of great economic value (see AGAVE, HEMP, SISAL), while many others are extensively cultivated as ornamentals. See NARCISSUS; AMARYLLIS; BLOOD FLOWER; ALSTREMERIA; GALANTHUS; POLIANTHES, ETC.

AM'ARYL'LIS (from the famous nymph *Amaryllis*). A genus of bulbous-rooted plants of the family Amaryllidaceæ. Originally the genus included a large number of species, natives of the warmer regions of the globe, but most of them have been put into other genera, until in some writings only one South African species is left in *Amaryllis*. Many of them have flowers of very great beauty. A species known as *Amaryllis formosissima* was brought to Europe from South America in the end of the seventeenth century and has since been in common cultivation as a garden flower. Its scentless flowers are of a beautiful red color, exhibiting a play of golden gleams in the sunshine. *Amaryllis belladonna*, known also as the belladonna lily, has a scape one to three feet high, bearing an umbel of rose-colored fragrant flowers. *Amaryllis amabilis*, *Amaryllis josephinae*, and *Amaryllis vittata* are among the most admired bulbous-rooted plants. *Amaryllis sarniensis* is one of the most hardy species, flowering freely in Guernsey, with a little protection during winter, and although commonly called Guernsey lily, it is supposed to be a native of Japan. By artificial pollination, a great number of hybrid forms have been produced.

AMARYLLIS. A shepherdess in the *Idyls* of Theocritus and in Vergil's *Eclogues*. The name is sometimes used as the type of a bucolic sweetheart, as in the pastoral of *The Faithful Shepherdess*, by Fletcher, and Milton's *Lycidas*.

AM'ASA. See JOAB.

AMASIA, à-mä'sê-à (ancient Gk. Ἀμάσεια, *Amaseia*). A town of Asiatic Turkey, the capital of the sanjak of the same name, in the vilayet of Sivas, on the right bank of the Yeshil-Irmak, 200 miles southwest of Trebizond (Map: Turkey in Asia, F 2). It stands in a deep and narrow valley, and the river, flowing through a narrow channel, between precipitous rocky banks, affords fine water power and is used for irrigation purposes. Amasia is the centre of the silk industry in Asia Minor, and

exports silk and grain to Aleppo, Damascus, and even Constantinople. It contains a fine bazaar and a large number of Mohammedan schools for higher education. There are to be found the ruins of an old castle, built on the site of the ancient acropolis, and a number of archaic remains. The population is estimated at 30,000. Amasia was the birthplace of the geographer Strabo, and was once the capital of the kings of Pontus, whose tombs have been discovered near by.

AMA'SIS (Gk. *'Αμάσις*, Egyptian *'Ah-mose*, probably 'child of the moon'), or **AAHMES**. The name of two Egyptian kings.—**AMASIS I.** The first Pharaoh of the eighteenth dynasty. He reigned for at least 22 years, from about 1600 B.C., or perhaps a little later. He finished the long war against the Hyksos or Shepherd Kings, rulers of a foreign race, who had subjugated part of Lower Egypt. He captured their stronghold, Avaris, in the Delta, expelled them from Egypt, and began the Egyptian conquests in Asia by making Palestine and Phœnicia tributary.—**AMASIS II.** The fifth Pharaoh of the twenty-sixth dynasty, well known through the anecdotes of Herodotus. Egyptian sources tend to confirm the statements of the Greeks that he was of humble origin and not particularly refined as to habits. He came to the throne through an insurrection of the native troops against King Apries (q.v.), whom he dethroned and slew. The usurper reigned from about 570 to 526 B.C. and was a wise and prudent ruler. He fought against Nebuchadnezzar and later cleverly avoided the conflict with the rising Persian power. (See History of Egypt, under title EGYPT.) The conquest of Cyprus is ascribed to him, though perhaps erroneously. He employed Greek mercenary troops and assigned to the Greeks the city of Naucratis, in the Delta, which soon rose to great commercial importance. Greek writers speak of Anasis in a very kindly spirit and endeavor to prove that he was the friend of various Greek sages and statesmen. (See POLYCRATES.) He is said to have married a Greek woman of Cyrene, but it is quite impossible that she could have been his legitimate wife.

AMATEUR' (Fr. from Lat. *amator*, lover, from *amare*, to love). It would seem at first easy to define the word "amateur" in sports; yet it is a subject that has for half a century taxed the most active and subtle brains of two continents. One would say offhand that the amateur in sport is one who engages in a personal physical contest of pluck, nerve, muscle, and skill for the love of it, as distinguished from the professional, who enters for profit; but that by no means disposes of this intricate subject. There were early found to be men in plenty who entered a particular contest because they loved the sport and who derived no pecuniary interest from that contest, yet whom it was unfair to allow to enter it. As a matter of fact, not long after the renaissance of athletic contests in 1850, it became obvious that the lines would have to be drawn more strictly, or those would have an unfair advantage whose daily occupations gave them a continuous training in the skill needful for perfection. Take, for example, a boat-builder of the old school, one who had been apprenticed to it in his youth and had spent all his early manhood in the handling of boats and oars and in rowing and gradually acquiring the knowledge, power, and

endurance of a waterman. To such a man, trained and hardened by years, rowing became a second nature, and his skill in it automatic. It was plainly unfair to allow such a man, however much he rowed for love of the sport and without taking money for his prize, to enter contests where the rest of the participants had acquired their knowledge and skill only for the pleasure of the game and as part of the ordinary routine of school and college or for health and pleasure's sake. So it came to pass that the boat-builder and waterman were early excluded from the amateur ranks. The same principle has been working itself out ever since. Step by step the fences against professionalism have had to be raised, until now the rules bar them out of all contests under the control of the Amateur Rowing Association of England. No person can enter as an amateur "who has rowed or steered in any race for a stake, money, or entrance fee; who has ever knowingly rowed or steered with or against a professional for any prize; who has ever taught, pursued, or assisted in the practice of athletic exercises for any kind of profit; who has ever been employed in or about boats, or in any manual labor for money or wages; who is or has been by trade or employment for wages a mechanic, artisan, laborer, or engaged in any menial duty; or who is disqualified as an amateur in any other branch of sport." The most jealous stickler for the purity of amateur oarsmanship could hardly desire the line to be more firmly or decisively drawn; yet the rules governing amateur athletics in America do go farther, for, *inter alia*, they make a man a professional who engages in an athletic contest where professionals participate, even though no prize is at stake. The following are the rules of the Amateur Athletic Union, which claims jurisdiction over the following games: (1) Basket ball, (2) billiards, (3) boxing, (4) fencing, (5) gymnastics, (6) hand ball, (7) hurdle racing, (8) jumping, (9) lacrosse, (10) pole vaulting, (11) putting the shot and throwing the discus, hammer, and weights, (12) running, (13) swimming, (14) tugs of war, (15) walking, (16) wrestling.

Conditions of Competition.—"1. No person shall be eligible to compete in any athletic meeting, game, or entertainment given or sanctioned by this Union who has (a) received or competed for compensation or reward, in any form, for the display, exercise, or example of his skill in or knowledge of any athletic exercise, or for rendering personal service of any kind to any athletic organization, or for becoming or continuing a member of any athletic organization; or (b) has entered any competition under a name other than his own, or from a club of which he was not at that time a member in good standing; or (c) has knowingly entered any competition open to any professional or professionals, or has knowingly competed with any professional for any prize or token; or (d) has issued or allowed to be issued in his behalf any challenge to compete against any professional, or for money, or (e) has pawned, bartered, or sold any prize won in athletic competition, or (f) is not a registered athlete. Nor shall any person residing within the territory of any active member of this Union be eligible to compete for or to enter any competition as a member of any club in the territory of any other active member of this Union, unless he shall have been elected to membership in such

club prior to April 1, 1891; provided, however, that this restriction as to residence shall not apply to undergraduates connected with any allied college athletic organization.

"2. No one shall be eligible to compete in any athletic meeting, games, or entertainment given or sanctioned by this Union, unless he shall be a duly registered athlete, a member of the organization from which he enters, and shall not have competed from any club in this Union during a period of three months next preceding such entry; nor shall any member of any club in this Union, or any club in any district in this Union, be allowed to compete in case he has within one year competed as a member of any other club then in this Union, except with the consent of such other club, which consent shall be filed with the Registration Committee of his district prior to such competition, unless such other club shall have disbanded or practically ceased to exist; provided, that the requirements of this section shall not apply to any athletic meeting, games, or entertainment, the entries for which are confined to the club or organization giving such meeting or entertainment.

"No athlete who has been released from a club which is a member of this Union, and who competes for another club directly thereafter, shall be allowed to compete again for the club he was released from for one year from the date of his release, except that the club has disbanded or ceased to exist.

"No person shall be eligible to compete for or enter any competition as a member of any club in the territory of any active member of this Union, unless he shall have resided within the territory of said active member at least four months previous to entering for competition; nor shall any person be eligible to enter or compete in any district championship meeting unless he shall have been a *bona fide* resident of such district for at least six months prior to the holding of such championship meeting; and no person shall be eligible to compete in a championship meeting of more than one district in one year. The restrictions contained in this section shall not affect the eligibility of an undergraduate connected with any allied college athletic organization who shall have been elected to membership in any club of this Union prior to Nov. 20, 1899, to represent such club as long as he remains an undergraduate; nor shall these restrictions apply to an undergraduate competing for any college belonging to an allied body.

"3. No prizes shall be given by any individual, club, committee, or association, or competed for or accepted by any athlete, except suitably inscribed wreaths, diplomas, banners, badges, medals, time-pieces and mantel ornaments, or articles of jewelry, silverware, table or toilet service, unless authorized by the Registration Committee."

It will be noticed that this organization does not control golf, in which game amateurs may play in contests against professionals even for a prize; with this limitation, however, that if, in the open contest, an amateur win he must take the prize in plate, and not in money. The golf rules are formulated and enforced by the United States Golf Association.

In cricket there is no bar whatever to playing against or with professionals openly paid for their services or even hired season after season by their clubs; but cricket has been in

existence so long, and its ethics are so well understood that no harm results; the professional needs no laws to define his social position or the part he takes in a game which has escaped the eagerness so characteristic of the more modern games. In fact, in nearly every sport there are shades and differences in definition and practice. Notably is this so in bicycling, wherein the classification has been altered several times, and in football, where the rules of college games extend so far as to limit the contestants to those who have been resident pupils for such and such a time and are in such and such an educational grade. Other minute distinctions entitle a man to or debar him from the right to play, and readers desiring to be perfectly sure of their position on any given sport, in any given year, will do well to consult the actual rules in force formulated by the governing body of the sport.

Professionalism sometimes tends to elevate the standard of sports so far as records are concerned, and it is not in itself necessarily bad. But, although some of the truest sportsmen have been professionals, the nature of sport is such that its best uses, recreation and emulation, are in danger of being lost sight of by the professional whose aim is to make money. Baseball in this country has lost none of its popularity through professionalism, its control now being adequate. Bicycle racing, however, has degenerated into a mere gate-money exhibition. In England football is in danger from the same cause, while in America football is played almost exclusively by the colleges, and professionalism is practically unknown. Into some other sports the spirit of professionalism has never entered; notably is this so in lawn tennis, curling, quoits, canoeing, archery, polo, croquet, and its successor roque. These and a few other games have always been played solely by enthusiastic lovers of them. The amateur spirit is essentially a moral quality, and the games will retrograde, or otherwise, just in proportion as the moral code of the contestants is interpreted. Laws are next to useless where men are determined to evade them. Happily, the tendency of the times is distinctly toward a higher plane of interpretation and a stricter separation of the amateur from the professional.

The most conspicuous case in recent years of the enforcement in this country of the standards of amateurism was that of James Thorpe, the remarkable American Indian athlete, who won the all-round championship in the Olympic Games at Stockholm in 1912. Early in the following year it became known that Thorpe, using his own name, had been a salaried member of obscure North Carolina baseball teams in 1909 and 1910. Thorpe (who was a student at the Carlisle Indian School when he was entered in the Olympic Games) admitted the charge, but declared that he did not realize that playing ball for money had made him a professional. The American Olympic Committee and the Amateur Athletic Union promptly disclaimed any previous knowledge or hint of Thorpe's professionalism, apologized to the International Olympic Committee and to the nations concerned for having entered him in the games, and repudiated him as an American contestant. Thorpe returned the trophies he had won at Stockholm and soon after (in 1913) became a member of the New York baseball team in the National League. See OLYMPIC GAMES.

AMATI, ä-mä'tê. A family of celebrated Italian violin makers, who lived in Cremona. Andrea, the eldest, born about 1510, was descended from an ancient family dating back to the eleventh century. The date of his death is also unknown, but it is established that he was still living in April, 1611. He was the founder of the Cremona school of violin makers. His early instruments are so Breseian in character that he is supposed to have been a pupil of Gasparo da Salò. Few of his violins are extant. His model was small, with high back and belly, amber varnish, and clear though weak tone. Nicolo, his younger brother, made basses in preference to violins, and was his inferior. Andrea's sons, Antonio (1555-1638) and Geronimo (1556-1630), worked together much after their father's style. Geronimo also made instruments alone, of larger pattern, and changed the shape of the pointed sound-hole. Geronimo's son, Nicolo (1596-1684), was the most eminent of the family. His model is of extreme elegance. The corners are sharply pointed, the backs and bellies of beautiful grained wood, the sound-holes graceful and bold, the scroll of exquisite cut, and the varnish transparent and of a deep, rich hue. As a rule, he worked after a small pattern, but he produced some large violins, which are now called "grand Amatis" and are highly valued. He also made a number of beautiful tenors and violoncellos. His label reads: *Nicolaus Amati Cremonens. Hieronimi filius Antonii nepos fecit anno 16*—. Antonio Stradivari and Guarneri were his pupils, and the Jacobs of Amsterdam and Grancino of Milan were among his most successful imitators. With Geronimo (1649-1740), his son, the family of Amati ends. He followed their trade, but made indifferent instruments. For a further discussion of the family and their musical inventions, see under VIOLIN.

AMATITLÁN, ä-mä'tê-tlän'. A department, town, and lake of Guatemala, Central America. The town, the capital of the department, situated on the shores of the lake 12 miles southwest of Guatemala City, is also known as St. Juan de Amatitlán. It was founded by Jesuits, who formerly engaged here in extensive sugar-cane cultivation. The gathering of cochineal constitutes the chief industry, and there is trade in salt, raw silk, and fruit. Salt and alum wells and hot springs exist in the neighborhood. The lake has a length of 9 miles and an extreme breadth of 3. The population of the town in 1903 was 12,000; of the department, 35,387. A 1910 estimate returns the same figure for the town and 38,000 for the department.

AMATO, ä-mä'tō, PASQUALE (1878—). A distinguished baritone. He was born at Naples, and his parents expected him to follow the profession of a civil engineer. His remarkable voice showed itself very early, and he was frequently heard at amateur gatherings. Upon the advice of friends he entered the conservatory at Naples and took up singing seriously. After three years he made his début in 1900 at the Bellini Theatre as Germont in Verdi's *Traviata*. His reputation grew rapidly, and within two years he was one of the principal baritones of the Italian Opera at Buenos Aires. There Toscanini was so impressed with the young artist that he recommended him to Gatti-Casazza, who was then the director of La Scala in Milan. An engagement for Milan followed, but after a few appearances Amato suddenly lost his voice.

Gradually the voice came back. After some minor engagements at German theatres he returned to Italy, and in 1909 became a member of the Metropolitan Company of New York. Since then he has been heard in all the principal cities of the United States, where he is one of the most highly esteemed artists of the present day.

AM'ATON'GALAND. See TONGALAND.

AM'AURO'SIS (Gk. ἀμαύρωσις, a darkening, from ἀμαυρός, *amauros*, hardly seen, dim, obscure). A term applied to absolute blindness, often with no discoverable changes in the eye as, for example, in hysteria. It is also used to include all other cases of total blindness. The word is becoming obsolete. See AMBLYOPIA.

AMAURY, ä'mō'rê', or **AMALRIC**. The name of two kings of Jerusalem. 1. Amaury I was born in 1135 and reigned from 1162 to 1174. He was the brother of Baldwin III. In 1164, 1167, and 1168 he invaded Egypt, but was driven out by Saladin, who carried the war into Amaury's country in 1170. 2. Amaury II, born 1144, was King of Cyprus (1194-1205), and titular King of Jerusalem in 1197, but never made good his claim to the latter kingdom. He died at Acre in 1205. See Stevenson, *Crusaders in the East* (Cambridge, 1907).

AMAURY OF CHARTRES. See AMALRIC OF BÈNE.

AMAXICHI, ä'mäks-ê'kê, or LEVKAS. The capital of the Ionian island of Santa Maura, or Leucadia (Map: Greece, B 3). It is the residence of a Greek metropolitan and is built on the edge of the shallow lagoons which separate the northeast part of the island from the mainland, which narrows down from less than a mile in the north to 3500 feet. It has two harbors. Amaxichi derives its name from Gk. ἀμαξαι, *amaxai*, cars, which the Venetian garrison employed in bringing down oil and wine from the inland districts to the point nearest the fort of Santa Maura, where, subsequently, a settlement was made. Modern buildings are constructed of wood because of the frequency of earthquakes. There are numerous interesting ruins near by on the site of the ancient town of Leucas. Pop., 1896, 5868.

AMAXOSA. See ZULU.

AM'AZI'AH (Heb. whom Yahwe strengthens). Eighth King of Judah. He succeeded Joash (or Jehoash), and his reign may be fixed approximately at 796-777 B.C. Amaziah undertook two wars—against Edom and against Israel, respectively. In the first he is said to have been successful, despite the fact that he had dismissed his mercenaries and thus weakened his army (2 Chron. xxv. 10). The account, however, is not found in the earliest records. Edom was defeated in the Valley of Salt, and Selah, possibly the Petra of later times, was captured (2 Kings xiv. 7). Elated by his success, he challenged Joash, King of Israel, who accepted the challenge only when compelled to. Amaziah was defeated (2 Kings xiv. 12) and taken prisoner to his own capital. Amaziah survived his defeat by 15 years (2 Kings xiv. 7), when he was killed by conspirators at Lachish (2 Kings xiv. 19). The biblical narrator has a word of praise for Amaziah, because in punishing the murderers of his father, Joash, he did not harm the children of the conspirators (2 Kings xiv. 6). See the histories of Israel by Stade, Wellhausen, and Kittel (2d ed., 1909-12).

AM'AZON. A river of South America and

the greatest in the world, called by various names and, finally, by the explorer Orellana, who made the first descent from the Andes to the sea, named Amazon. This was derived from the well-known Amazon legend, which is claimed by some to have had also a native origin among the northern Caribs, but this is doubtful. Orellana found that in certain tribes the warriors were assisted in battle by the women, and undoubtedly from that fact he applied the Old World legend to them and consequently to the river. With the natives each section had its separate name; that is, each band or tribe named its own portion. One of its earliest names by the Spaniards was Marañon, now only applied to a part of its upper course (Map: South America, D 3).

The head waters of the Amazon, the Marañon, and the Ucayali rivers, rise in the central and northern Peruvian Andes, and after a northerly course parallel with these mountains unite in about long. 74° W., and the united waters pursue an almost easterly course between lat. 5° S. and the equator to the Atlantic, which is reached in long. 50° W., where this meridian intersects the equator. The Marañon, which rises in long. 76° 30' W. and lat. 10° 30' S., is properly the head stream of the Amazon, as it is farthest west; but the Ucayali is slightly the larger, and has its source farther south in the Andes in long. 72° W. and lat. 16° S. From long. 70° W., where the Amazon leaves Peru, its course is confined to Brazil.

The total length of the Amazon from the head waters of the Ucayali is about 3300 miles. It is between one and two miles wide where it enters Brazil, and gradually increases in breadth, enlarging to a width of 50 miles at its main mouth; and where it enters the sea the distance across it, from headland to headland, is fully 150 miles.

The total area drained by the Amazon is more than 2,500,000 square miles, a territory equal in extent to about 85 per cent of that of the United States (exclusive of Alaska), and embraces most of the South American continent west of long. 50° W. and between lat. 3° N. and lat. 17° S., except a comparatively narrow strip along the Pacific coast and a somewhat broader one on the Atlantic. The latitudinal zone drained by the rivers from the north averages only 6° or 7° in width, while that on the south has a breadth of 13° or 14°.

The chief rivers flowing into the Amazon from the north are the Napo, Putumayo, Yapura, and Rio Negro. These rivers flow in a direction more or less parallel with that of the Amazon, and thus they drain but a narrow longitudinal belt.

The chief affluents from the south (in addition to the Huallaga, an affluent of the Marañon, and the Ucayali) are the Javari, Juruá, Purus, Madeira, Tapajos, and Xingu. The Tocantins River practically belongs to this system of southern branches, being connected with the Amazon by an arm of that river, which cuts off the large island of Marajó.

The basin of the Amazon lies almost wholly within the belt of remarkably uniform equatorial heat, so that there is an uninterrupted plant growth throughout the year. There is a moderately heavy rainfall over the whole of the basin, except in the western part, where, east of the Andes, the rainfall is excessive; and higher up among the Andes, where it is deficient. The

very heavy rains in the upper waters of the basin are responsible for the enormous amount of water supplied to the river, which makes it (and its western tributaries) navigable to such a great distance from its mouth. In most sections there is a rainy season from January to May, and a six months' dry season from June to December. In the Upper Amazon valley the rainy season begins in November and continues until July, during which time the prevailing wind is northwest; but in the dry season the wind is chiefly from the southeast. The rainfall amounts to over 100 inches a year in this section.

The alternation of the rainy and dry seasons produces corresponding periods of high and low water in the rivers. Even in the Marañon a rise of 30 feet occurs in the wet season, and throughout the whole length of the Amazon during about half the year its waters are swollen and the adjoining low country inundated. These floods are not by any means of uniform magnitude, and at intervals of every few years abnormally high water occurs. The current of the Amazon averages about 2¼ miles per hour, but its velocity is much increased during the floods.

The drainage basin of the Amazon is remarkably level, and the slope from the outlying bounding highlands is very gradual. The height of land almost to the very sources of the branch rivers does not exceed 1000 feet, and as falls or rapids east of the Andes are almost unknown, these rivers are navigable for the greater part of their lengths. The Amazon and its tributaries form the most remarkable and extensive system of inland water highways in the world. The possibilities of future development in the chain of South American inland navigation are shown by the fact that on the north the Amazon has water communication with the Orinoco through the Rio Negro and the Casiquiare, while on the south the navigable waters of the Tapajos lack little of connecting it with the head waters of a tributary of the Plata River.

Within the basin of the Amazon there occur horizontal layers of argillaceous rocks and sandstone, which vary in height from 100 to 1000 feet. These and other deposits seem to indicate that at one time a local mediterranean sea covered the present Amazonian lowlands, and the Marañon had for its outlet into the western end of this sea a delta, which has gradually moved eastward as the shallow sea became filled up.

Not only the source streams, but nearly all the tributaries of the Amazon, experience a succession of falls where their waters enter upon the floor of the main stream, and some branches have falls higher up. Above these falls, which vary from a succession of rapids to falls of 50 feet or more, navigation is again resumed. On the Lower Amazon these rapids occur at a distance of from only 200 to 300 miles from the main stream; but the distance increases toward the west, so that on the Madeira and Rio Negro rivers the falls are far removed from the mouths, while most of the southern branch rivers west of the Madeira lie almost entirely within the unobstructed low belt.

Where the Amazon enters Brazil its elevation is less than 300 feet above sea level. Even at its low stage its usual depth in its lower course is about 150 feet, and in places it is said to be much deeper still. It has been estimated that

the Amazon discharges between 4,000,000 and 5,000,000 cubic feet of water per second; and with this enormous outflowing water there is carried every 24 hours a quantity of sediment sufficient to form a solid cube measuring 500 feet on each edge. In the flood season it rises in places 30 or 40 feet, and the villages, though built on posts, are frequently in such a state that a canoe can be paddled into the house. The entire country is inundated. The great rise begins in November and is highest in June, in which month there is nothing but water and trees everywhere along its banks and for many miles in each direction. Only the forest shows where the banks ought to be.

The Amazon is navigable by ocean steamers for a distance of 2300 miles, to Iquitos, and for smaller boats 486 miles beyond; but at the entrance to the gorges of the eastern Andes, navigation is practically suspended, on account of the rapids occurring there. Steamboat navigation began in 1853, but it was not until 1867 that the navigation of the river was thrown open to the world. Now lines of steamers ply from the mouth of the Amazon to various points above, Manãos, Remate de Males, Iquitos, etc. Vessels enter the Amazon through the estuary of the Para River, since the main mouth of the Amazon north of Marajo Island is shoal water filled with rocky islands. At the mouth there is a continual battling of the river current, the tides, and the winds. The tidal influence is felt up the river to a distance of about 400 miles. The tidal bore is at times so pronounced as to form successive walls of water 10 to 15 feet in height, which noisily sweep everything before them in their mad rush against the river current. The latter is perceptible at a distance of fully 200 miles seaward from the mouth of the river.

India rubber is the chief export from the Amazon basin, the finest quality coming from the Acre district. The trees from which the rubber is obtained grow wild in the dense forest, and rubber-hunting is a regular occupation. The importance of the Amazon as a highway of foreign commerce will become greater and greater as the economic development of Brazil proceeds, when in exchange for the ever-increasing quantities of tropical products exported, there will be returned the manufactures and products of the temperate zones.

Fauna. The Amazon valley is covered with thick forests of lofty growth, which are thinly inhabited by numerous independent savage tribes, some of whom are little known. They are armed with bows and arrows, with clubs, and with the long blow-gun with which they shoot needle-like arrows, tipped with the deadly Wourahli poison, which almost instantly paralyzes the victim. The animal life is exceedingly rich in numbers, but the flood conditions which so generally compel arboreal habits in unaquatic animals greatly limit at least the species of mammals. The principal animals are the tapir, jaguar, panther, cavy, armadillo, sloth, peccary, ant-eater, and monkey. Birds are exceedingly numerous; many of them are songless, but bedecked with gorgeously colored feathers; such are the humming birds and parrots. Among the snakes, the giant anaconda, or *sucuruju*, is the best known, and of the lizards the iguana attains formidable size. Numerous alligators and turtles, and the great water mammal, the manatee, frequent the river and its branches. Of

fishes there is a greater variety than in any other stream, and in fact a large proportion of the present known species are found in the Amazon. Insects exist in the forests in countless numbers. Neither the fauna nor the flora of the Amazon has been more than partly studied, and that mostly by visiting naturalists.

Flora. The flora of the immediate vicinity of the river is that which flourishes in a watery soil and which will survive the long-continued annual inundation which occurs in midsummer. There is no suspension of plant activity; leaves remain green throughout the year, and no month is without its bloom or fruit. Aquatic plants grow in great profusion and attain enormous size, a prominent example being the giant lily, *Victoria regia*. In the undergrowth occur rubias, myrtles, leguminosæ, epiphytic orchids, bromelia, and ferns.

The Amazonian forest presents to the river a wall-like frontage of trees, interwoven with vines and roots clothed and fringed with moss in the most fantastic manner. A continuous mass of verdure overhead has a secondary flora of its own. Some of the trees grow to a height of even 200 feet. The largest unexplored areas of South America are in the Amazon basin, and especially between the Tocantins and the Madeira rivers. The quest for rubber is rapidly revealing the untraversed tracts between the large tributaries. See BRAZIL.

Among the ports on the Amazon (from its mouth upward) are Macapá, Santarem, Obidos, Manãos, Teffe, and Tabatinga. The commercial outlet of the Amazon basin is Pará.

Bibliography. Bates, *The Naturalist on the River Amazon* (London, 1892 and 1910); Wallace, *Travels on the Amazon and Rio Negro* (London, 1870; 2d ed., 1889); Sichertel, *Der Amazonenstrom* (Strassburg, 1893); Marajó, *As Regiões Amazonicas* (Lisbon, 1895); Herndon and Gibbon, *Exploration of the Valley of the Amazon* (Washington, 1853); Keller-Leuzinger, *The Amazon and Madeira Rivers* (New York, 1874); Smith, *Brazil, the Amazon and the Coast* (New York, 1879); Carvajal, *Descubrimiento del rio de las Amazonas*, with an introduction by Medina (Seville, 1894); Schütz-Holzhausen, *Der Amazonas* (Freiburg, 1895); Mozans, *Along the Andes and Down the Amazon* (New York, 1911); Pearson, *Rubber Country of the Amazon* (New York, 1911); Lange, *In the Amazon Jungle* (New York, 1912).

AMAZONAS, ä'mä-zō'näs. A northern department of Peru. Area, 13,943 square miles. It is slightly mountainous and has a fertile soil, which produces tobacco and sugar-cane, while some gold is mined. In 1896 the population was estimated to be 70,676, but later figures are smaller because of a steady decrease in the birth rate. Capital, Chachapoyas.

AMAZONAS, or **ALTO AMAZONAS**. The northernmost and largest of the Brazilian states, bounded by British Guiana, Venezuela, and Colombia on the north, State of Pará on the east, Bolivia and the State of Matto Grosso on the south, and Colombia and Peru on the west (Map: Brazil, E 4). Its total area is 732,439 square miles. The surface, with the exception of a few mountain chains on the Venezuelan border, is one alluvial plain, covered with impenetrable forests, and intersected by the Amazon, with its numerous tributaries, including the Rio Negro and Madeira. The climate, although hot, is not unhealthful, and the soil is very fertile.

Industrially, the State is little developed, and its leading articles of trade are food products, principally coffee. With an area three and a half times as large as that of France, an abundance of fertile land, and excellent waterways, Amazonas had (1900) a population of 249,756, or about one inhabitant for three square miles. In 1908 one enumeration gave 280,000. Its capital and chief port is Mañaos. Amazonas originally formed a part of the State of Pará, and was constituted a separate State in 1850. Consult J. Verissimo, *Pará e Amazonas* (Rio de Janeiro, 1899), and C. L. Temple, *The State of Amazonas* (London, 1900).

AM'AZONITE, or AMAZON STONE. See MICROCLINE.

AM'AZONS, AMAZ'ONES (from Gk. Ἀμαζών, *Amazōn*). In early Greek legends, a race of warlike women, who either suffered no man to live among them or held men in servitude for the continuance of the race. The earliest accounts place them in Asia Minor, especially on the river Thermodon; later writers put them farther to the north and the west, in Scythia and the Caucasus; and finally we hear of Amazons in Libya, at the south of the known world. Their expeditions, undertaken for war and plunder, led them into Scythia and Syria, but especially to the coast of Asia Minor, where we find them in conflict with Priam, Bellerophon, and other heroes. In this region they were said to have founded many cities, notably Ephesus, where they established the temple of Artemis, which furnished them a refuge when they were defeated by Hercules. They were daughters of Ares and worshiped him and Artemis as their chief gods. They appear chiefly in three stories: (1) the killing by Achilles of their Queen Penthesilea, who led her army to the relief of Troy; (2) the conflict with Hercules, which arose from his endeavor to secure the girdle of their Queen Hippolyta, and led, according to some writers, to their annihilation; (3) the war with Athens, which began with the expedition of Theseus to carry off the Amazon Queen, and ended with their invasion of Attica, their attack on the Acropolis from the Areopagus (q.v.), and their total destruction by Theseus and the Athenians. The origin of these legends is not clear; but if we consider the localities in which the Amazons lived, and remember that in historic times the Greeks found tribes about the Black Sea in which the women held sway and took part in war, while in Caria, Lycia, and Lydia there is much evidence for descent traced through the mother, it seems not improbable that the Amazons embody a reminiscence of the people and the civilization which preceded the Greeks on the east of the Ægean, a civilization in which the women held the important place in state matters and in religion; the Amazons, then, reflect the goddess of this civilization. Representations of the Amazons are very common in all periods of Greek art. At first they appear in the costume of Greek hoplites, but later assume the Scythian garb. They are armed with lance, battle axe, or bow, and usually carry a crescent shield; one breast, the right, is commonly bare. Among the chief ancient representations are the reliefs from Gyölbashi, in Vienna, which seem to reflect the painting of Micon at Athens; and the friezes from Phigalia and the mausoleum at Halicarnassus, in the British Museum. Of the statues, three types go back to the best period of Greek art; the

"Wounded Amazon," in Berlin, probably by Polycleitus; the "Wounded Amazon" of the Capitoline Museum in Rome, and the "Unwounded Amazon" in the Vatican. It was said that, in order to be unimpeded in war, they burned off their right breasts; but no work of art surely shows them thus mutilated, and undoubtedly the story is merely an invention to explain a false etymology, as though the composition of the word "Amazon" were ἀ, priv., and μαζός, *mazos*, breast. Miss Bennett, in *American Journal of Archaeology* (1912), has suggested that a statue at Princeton represents an Amazon with mutilated breast. Consult Klügmann, *Die Amazonen in der attischen Litteratur und Kunst* (Stuttgart, 1875), and Corey, *De Amazonum Antiquissimis Figuris* (Berlin, 1891). For a very recent discussion of the Amazons and a good bibliography, see Florence M. Bennett, *Religious Cults Associated with the Amazons* (New York, 1912).

AM'BAKIS'TA. A Bantu tribe of Amboia, Portuguese West Africa. They were enterprising traders originally, but were ruined by the Portuguese and dispersed to other regions.

AMBALA, ūm-bā'lā, or **UMBALLA**. A city in India, capital of the district of Ambala in the Punjab (Map: India, C 2), and an important station on the Sindh, Punjab, and Delhi Railway, 150 miles northwest of Delhi. It is a large, walled town, in a level, well-watered, and cultivated country, and has an extensive trade. It contains a fine Gothic church, a Presbyterian church, dispensary, hospital, and leper asylum. The town was founded in the fourteenth century. Here, at a grand durbar, in 1869, Shere Ali, ameer of Afghanistan, concluded a treaty with Lord Mayo, Governor-General of India. Ambala is an important military station. Pop., 1901, 79,638; 1911, 80,131.

AMBALEMA, äm'bā-lā'mā. A city in the department of Tolima, Colombia, on the left bank of the Magdalena (Map: Colombia, B 2). The city lies 28 miles above Honda in the midst of an excellent tobacco-growing district and is one of the most modern as well as one of the most thriving towns of Colombia. It is noted for its manufacture of cigars. Pop., 1912, 6285.

AMBARI HEMP, äm-bä'rë. See HIBISCUS.

AMBARVA'LIA (Lat. *ambi*, round, about, and *arvum*, a field, arable land). Originally a religious procession round the land of the early Roman community, whose purpose was to purge the crops from evil influences. It was held annually, late in May. The main feature of the ceremony was known as the *Suovetaurilia*, because a pig (Lat. *sus*), a sheep (Lat. *ovis*), and a bull (Lat. *taurus*) were led all around the fields, driven by a crowd, whose members were garlanded and carried olive branches, and chanted as they moved. These three animals represented the farmers' most valuable possessions, and they were offered as the crops were ripening and in greatest danger from bad weather and diseases. After the animals had been led three times around the fields, they were sacrificed, and a prayer, which has been preserved in very ancient language, was offered to Mars, conceived of in his original function as a god of vegetation. The view of Mommsen, Heusen, and Jordan that this festival was identical with the Ambarvalia celebrated by the Arval Brothers (q.v.), has been questioned in recent years. Consult Fowler, *Roman Festivals* (London, 1899). See ROMAN FESTIVALS.

AMBARVA'LIS. See ARVAL BROTHERS.

AMBAS'SADOR (Med. Lat. *ambasciator*, agent, from *ambasciare*, to go on a mission, earlier *ambactiare*, from Lat. *ambactus*, vassal; according to Festus, of Celtic origin; compare Welsh *amaeth*, husbandman, and Goth, *andbahts*, servant; Ger. *Amt*, office). The highest rank of public minister accredited to a foreign court. Though used popularly and sometimes by writers on public law in a loose sense as the equivalent of minister (q.v.), the term is strictly appropriately used only of the highest of the four orders of diplomatic agents established by the Congress of Vienna in 1815 and that of Aix-la-Chapelle in 1818. The classification then adopted, which has been generally accepted, is as follows: (1) ambassadors, and legates and nuncios of the Pope; (2) envoys and ministers plenipotentiary; (3) ministers resident, accredited to the sovereign; (4) *chargés d'affaires*.

The ambassador is supposed to represent directly the head of his state, who signs his credentials, or letters of credence, and the ambassador therefore enjoys of right the privilege of personal communication with the sovereign to whom he is accredited. Ministers and *chargés d'affaires* do not, in theory, possess this right, though in the case of the minister, at least, the privilege is not usually denied. The *chargé d'affaires* is, in fact, not accredited to the sovereign, but to the minister of foreign affairs, and is regarded merely as an agent of his government to transact the business intrusted to him. Modern methods of carrying on the diplomatic intercourse of states have greatly diminished the relative importance of ambassadors, as compared with other diplomatic agents, and little remains of their primacy excepting a superior dignity and impressiveness and certain rights of precedence on ceremonial occasions. Prior to 1893 the government of the United States had been represented abroad by no agents of higher rank than ministers resident, who were, in the case of the great Powers, accredited as envoys extraordinary and ministers plenipotentiary. But in that year Congress passed an act authorizing the President to accredit ambassadors to certain European courts. Later the work of ambassador was conferred on the ministers to Mexico, Brazil, and Japan. The countries in which the United States was represented by ambassadors in 1913 were Austria-Hungary, Brazil, France, Germany, Great Britain, Italy, Japan, Mexico, Russia, and Turkey. The privileges and immunities of ambassadors are dealt with under DIPLOMATIC AGENTS. See also ASYLUM, RIGHT OF; EXTERRITORIALITY; LEGATION.

AMBATO, âm-bä'tô, or ASIEN TO DE AMBATO, â-syân'tô dâ âm-bä'tô. A town in the province of Leon, Ecuador, on the northeastern slope of Chimborazo, 78 miles south of Quito, and 8859 feet above sea level (Map: Ecuador, B 4). It was destroyed in 1698 by an eruption of Cotopaxi, but was rebuilt and flourished rapidly. It manufactures shoes and carries on an active trade in grain, sugar, and cochineal, which are produced in the surrounding region. In 1913 work was begun on the Ambato to Curaray Railway. This opens up a territory in the eastern part of the country which is rich in minerals, timber, and stock raising and agricultural advantages. Pop., about 10,000.

AM'BER (from Ar. *'anbar*, ambergris; called so from its resemblance to ambergris). A fossil resin of vegetable origin. It is usually of a

pale-yellow color, sometimes reddish or brownish; it is sometimes transparent, sometimes almost opaque. It occurs in round irregular lumps, grains, or drops; has a perfectly conchoidal fracture, is slightly brittle, emits an agreeable odor when rubbed, melts at 550° F., and burns with a bright flame and pleasant smell. Thales of Miletus was the first to notice that when amber is rubbed it becomes capable of attracting light bodies; this was the first electric phenomenon produced by man. An acid called succinic acid (named from the Lat. *succinum*, amber) is obtained from it by distillation. Amber had formerly a high reputation as a medicine, but the virtues ascribed to it were almost entirely imaginary. It is employed in the arts for the manufacture of many ornamental articles and for the preparation of a kind of varnish. Great quantities are consumed in Mohammedan worship at Mecca, and it is in great demand throughout the East. It was obtained by the ancients from the coasts of the Baltic Sea, where it is still found, especially between Königsberg and Memel, in greater abundance than anywhere else in the world. It is there partly cast up by the sea, partly obtained by means of nets, and partly dug out of a bed of carbonized wood. Limited quantities of it are found in the United States. It sometimes occurs in diluvial deposits, as in the gravel near London; but it is very rare in Great Britain. It is obtained in small quantities from the coasts of Sicily and the Adriatic, and is found in different parts of Europe, in Siberia, Greenland, etc. It sometimes incloses insects of species which no longer exist. Leaves have also been found inclosed in it. Specimens which contain insects or leaves being much valued, artificial substitutes are often manufactured and imposed upon collectors. According to an ancient fable, amber is the tears of the sisters of Phaëthon, who, after his death, were changed into poplars. The ancients set an immense value upon it. Pieces of amber have occasionally been found of twelve or thirteen pounds weight, but such pieces are extremely rare.

AMBER-FISH. Any of several carangoid fishes of the genus *Seriola*, numerous on both coasts of North America, which are of moderate size, graceful form, often brightly colored and excellent to eat. The commonest species of the Atlantic coast is *Seriola lalandi*. On the Pacific coast an allied species (*Seriola dorsalis*), the yellowtail, is highly valued as a food-fish and by anglers. For further discussion and illustration, see HORSE MACKEREL.

AMBERG, âm'bërk. The old capital of the Upper Palatinate in Bavaria, 35 miles east of Nuremberg and 32 north of Ratisbon (Map: Bavaria, D 4). It is situated on both sides of the Vils and is well built. The ancient walls are now transformed into shady avenues. Amberg is the seat of the court of appeal for the district, possesses a library of 34,000 volumes, a lyceum, an agricultural and industrial school, a municipal hospital, a house of correction, and numerous churches, among which St. Martin's, with a 300-foot tower, is especially noteworthy. There is located here a royal factory for the manufacture of small arms. The principal products are earthenware, woolen cloths, ironmongery, and beer. Some coal and iron is mined in the vicinity. Near Amberg Archduke Charles defeated the French under Jourdan on Aug. 24, 1796. Pop., 1890, 19,000; in 1900, 22,096; in 1905, 24,303; 1910, 25,222.

AMBERGER, äm'bĕrk-ĕr, CHRISTOPH (c.1500–c.1561?). A German painter of the Renaissance. The date and place of his birth are unknown, but he practiced chiefly at Augsburg, where he was active from c.1530. He developed under the influence of Hans Burgkmair and was affected by Venetian color. His portraits are characterized by a distinguished bearing and by a soft pictorial treatment. The most important are those of the Emperor Charles V (1532) in the Berlin Gallery, a young member of the Fugger family (1541) in private possession at Augsburg, and the geographer Sebastian Münster (1532), also in Berlin. His altarpieces are mannered and show greater Italian influence. By far the best is a triptych in the cathedral at Augsburg, dating from 1554 and representing the "Madonna with Angels Making Music," and wings representing Sts. Ulric and Afra. Consult his biography by Haasler (Königsberg, 1894).

AMBERGRIS, äm'bĕr-grĕs (Fr. *ambre gris*, gray amber; Ar. 'anbar). Also spelled *ambergrise* and *ambergrease*. A fatty secretion formed in the bowels of some sperm whales (q.v.) and valued as a material for perfume. It is taken from whales directly, but more often is found floating in waters (especially of the tropics) frequented by these cetaceans, or cast upon the beaches in lumps of all sizes up to a mass exceeding 200 pounds in weight. It is lighter than water, gray marbled with blackish in color, opaque and waxy in consistency, softens readily under heat, melting into resinous liquid at 145° F., and develops on exposure to the air a sweet, "earthy" odor in place of its disagreeable smell when first taken from a whale. Chemically, it is soluble in oils, but resists acids; and it dissolves readily in hot alcohol, yielding a substance termed "ambrein." As this is closely related chemically to known biliary secretions, it is further evidence that ambergris is of this nature, perhaps induced by, and partaking of, the squids upon which the sperm whale largely feeds, remains of whose beaks are frequently found mixed with it. Like other bezoars and substances of mysterious origin, ambergris was formerly regarded as an efficacious medicine, but its virtues were imaginary, and it is no longer used in pharmacy, nor as a flavor in cookery, except among a few barbarians of the East. It has a high commercial value, however, as a material for the manufacture of various perfumes, and the price is increasing, owing to the increasing rarity of the sperm whale and a growing demand. Hence it is adulterated and imitated; a test of its genuineness is described as "its solubility in hot alcohol, its fragrant odor, and its uniform fatty consistence on being penetrated by a hot wire."

AM'BER ISLANDS, or **ELECTRIDES**. In later Greek geography, the islands, famed for their amber, situated in the North Sea, from Denmark to the mouth of the Rhine. Also certain islands at the mouth of the legendary river Eridanus (the Po).

AMBERT, äm'bâr'. An ancient town in the department of Puy-de-Dome, France, 34 miles southeast of Clermont (Map: Southern France, H 3). It is situated 1730 feet above sea level and is on the Dore River. It contains a church of the fifteenth and sixteenth centuries, and the manufactures include lace, rosaries, paper, and ribbons. There is some trade in cheese. Pop., 1911, 7863.

AMBERT, JOACHIM MARIE JEAN JACQUES

(1804–90). A French General and writer. He was born at Chillas, near Cahors (Lot), and was educated at Saint-Cyr. He served in the Spanish and Belgian campaigns, distinguished himself in Algeria, and became Brigadier-General in Europe. He traveled extensively in Europe and America and for some time was a contributor to *L'Abeille*, a French journal published at New Orleans. Among his numerous writings are: *Etudes tactiques* (1865); *Histoire de la guerre de 1870–71* (1873); *Les soldats français* (1878–82); *Gaulois et germains, récits militaires* (1884–86).

AM'BER WITCH, THE. An English opera by W. V. Wallace, the text being by H. F. Chorley, first presented at Her Majesty's Theatre, London, Feb. 28, 1861. Its incidents are based on those of a German story by Meinhold (1843).

AM'BIGU'ITY (Lat. *ambiguus*, going about hither and thither, uncertain, doubtful). In law, the duplicity or uncertainty of meaning of a word, clause, or other part of a written instrument. The rule of evidence forbidding the admission of parol evidence to contradict, vary, or explain a written document is subject to the important exception that parol evidence may be introduced for the purpose of explaining an ambiguity in a written instrument. Lord Bacon's classification of ambiguities as "latent" and "patent" has been generally accepted by the courts, but has little importance. A patent ambiguity is one which appears on the face of an instrument without referring to any intrinsic fact or circumstance. Thus, if a testator after referring in his will to two persons named John, made a bequest to John, the term of the bequest would constitute a patent ambiguity. A latent ambiguity is one which is disclosed only by the proof of extrinsic facts. Thus, if a testator made a bequest to a person, naming or otherwise describing him, and it appeared extrinsically that there were two persons answering the description, the terms of the bequest would constitute a latent ambiguity. It is sometimes said that parol evidence cannot be introduced to explain a patent ambiguity. The statement is much too broad. In any case the underlying facts necessary to put the court in the position of the writer may be proven by extrinsic evidence, whereas direct evidence of intention, as declarations of intention by the writer, will be received, only in that kind of latent ambiguity known as an equivocation, where the name or description employed is equally applicable to two or more persons or things. See the authorities named under the titles **CONTRACT**, **WILL**, and **EVIDENCE**.

AMBI'ORIX. A chief of the Eburones in Belgic Gaul, who fought against Julius Cæsar in 54 B.C. By cunning and strategy he defeated one important Roman garrison under Sabinus and Cotta and massacred every man; but while on the march to another camp, he encountered Cæsar himself, who easily defeated him, though Ambiorix with a few men escaped into the forests.

AMBI'TIOUS STEP'MOTHER, THE. A tragedy by Nicholas Rowe, produced and printed in 1700. The scene is laid in Persepolis.

AM'BLER, JAMES MARKHAM MARSHALL (1848–81). An American surgeon, born in Fauquier Co., Va., and educated at the medical college of the University of Maryland. From 1874 to 1879 he was assistant and past-assistant surgeon, U. S. navy. He volunteered as

surgeon to the *Jeannette* Arctic expedition in 1879 (see DE LONG, GEORGE W.), and was in the first cutter with De Long when the officers and crew left the sinking vessel (June 13, 1881). His body was found March 23, 1882, and buried on Monument Hill, on the Lena Delta, where a pyramidal structure of stone and timber was erected to the memory of the explorers.

AMBLER. A borough in Montgomery Co., Pa., 16 miles northwest of Philadelphia, on the Philadelphia and Reading Railroad (Map: Pennsylvania, L 7). The region is chiefly agricultural, producing wheat, hay, rye, and dairy products. The borough has a Methodist Episcopal church which is celebrated for its beautiful stained-glass windows. There are many places of historic interest, notably, Fort Washington, General Washington's old camping ground, and the home of Gen. George Meade. At Ambler is located a very large chemical factory, and there is also a large asbestos, shingle, slate, and sheathing company. The town is a popular summer resort for Philadelphians. Pop., 1900, 1884; 1910, 2649; 1913 (est.), 4000.

AM'BLESIDE. A town in the heart of the English lake district, Westmoreland; a favorite resort for tourists on account of its scenery and its nearness to points of historic interest, the homes of Wordsworth, Dr. Arnold, and others. Fragments of Roman buildings have been found in the neighborhood. Stock Gill Force is a waterfall in the hills near the town. Pop., 1901, 2536.

AMBLETEUSE, ä'n'bl'tēz'. A seacoast village of France, in the department of Pas-de-Calais, on the English Channel, about 15 miles southwest of Calais and 6 miles north of Boulogne. It is famous as the landing place of James II, after his flight from England in 1689. There is a monument erected by Napoleon to the Grand Army in 1805. Pop., 1901, 685; 1911, 814.

AM'BLYO'PIA (Gk. ἀμβλυόπια, dim-sightedness, from ἀμβλύς, *amblys*, blunt, dull + ὤψ, *ōps*, eye). A name given to diminished acuteness of vision not relieved by the use of glasses and in many cases not accompanied by any visible ocular changes. The term is, however, sometimes more loosely used to include other forms of imperfect sight. Congenital amblyopia of one or both eyes is often due to hyperopia, myopia, or astigmatism. These prevent perfect vision, and although the use of proper glasses may eventually cause an improvement in young persons, this is impossible if the lack of proper vision has lasted long. Congenital amblyopia for colors (see COLOR BLINDNESS) may occur with a contraction of the visual field. Hysterical amblyopia, usually unilateral, may amount to total blindness. There is contraction concentrically of the field of vision for white and colors, and the fields for colors do not maintain the relative sizes which they normally possess. There are generally other hysterical symptoms. Simulated amblyopia is pretended blindness in one or both eyes. Toxic amblyopia is produced at times by large doses of quinine, or excessive and continual use of tobacco, alcohol, particularly wood alcohol, opium, and other drugs. If the drug is entirely given up recovery may occur after a long time. Malarial amblyopia of one or both eyes is usually relieved by quinine. Uræmic amblyopia sometimes appears suddenly in both eyes during an attack of uræmia, without retinal changes, though at times accompanying an albuminuric retinitis. It is generally

very transitory. *Amblyopia ex anopsia* is a term applied to partial or complete blindness in an eye from disuse, such as occurs in strabismus or squint. See SIGHT, DEFECTS OF.

AM'BLYOP'SIDÆ (Gk. ἀμβλύς, *amblys*, dull + ὄψις, *opsis*, the look, eyesight). A family of small fishes allied to the eyprinodonts mostly living underground and having their eyes in varying degrees of degeneration. See CAVE ANIMALS.

AMBLYP'ODA (Gk. ἀμβλύς, blunt + πούς, foot). An order of Eocene mammals, including all the short-footed, archaic ungulates. Four families are recognized—the periptychids, pantolambdids, coryphodonts, and uinatheres. The group was of Holarctic origin, and the most general character was the stumpy feet, furnished with five toes, supporting stout, pillar-like limbs. The earliest known forms were of medium size, and partly arboreal; later forms (Coryphodon) equaled small rhinoceroses in size, and were furnished with defensive canine tusks. They were feebly muscled, with short tail, clumsy feet, and of amphibious habits. Finally, the huge uinatheres became the dominant quadrupeds of the Middle Eocene. These great creatures had long narrow skulls with three pairs of horn-cores on the facial portion.

The group seems to have become suddenly extinct in the Upper Eocene. It is astonishing that these exceedingly clumsy and defenseless animals, handicapped by a most diminutive brain, should have survived and steadily increased in size throughout so long a period. We may attribute their extinction to either of two causes—either the low brain power which may have inhibited proper defense and care of the offspring, or the arrested development of the grinding teeth, which are neither larger nor more effective for the comminution of food in the gigantic uinatheres than in the much smaller coryphodon. For details, consult Cope, *Vertebrata of the Tertiary Formations of the West* (1884); Osborn, "Evolution of the Amblypoda," *Bull. Amer. Mus. Nat. Hist.* (1898); Matthews, "A Revision of the Puero Fauna," *id.* (1897); *Monographs of the United States Geological Survey* (Washington, 1884); Osborn, *The Age of Mammals* (1910).

AMBLYS'TOMA (Gk. ἀμβλύς, *amblys*, blunt, dull + στόμα, *stoma*, mouth). A genus of salamanders ranging over Mexico and the United States. They generally prefer damp climates, for the 15 or more species are grouped in the watered regions on either side of the arid plains. Only one species (*Amblystoma tigrinum*) ranges over all of the United States and into Mexico. The eastern examples transform early and while yet small. The larval or "axolotl" stage of the western forms grows large, transforms late, and may even become sexually mature while still bearing external gills. One Mexican form has never been observed to metamorphose. See AXOLOTL; SALAMANDER.

AM'BO (Lat. *ambo*, Gk. ἀμβων, from ἀναβαίνειν, to ascend). The pulpit or reading-desk used in the early Christian churches. There were usually two of them, placed on either side of the raised choir for the lower clergy, which occupied the upper part of the middle nave, below the altar. These ambones were entered from within the choir and stood on its outside edge, toward the aisles, connected with the encircling parapet or screen. They had usually a double staircase on either side and three levels

—the upper for the reading of the Gospels and for preaching, confessions of faith, and important ecclesiastical announcements; the middle one for the reading of the Epistles; the lower for other parts of the Bible. Usually one ambo was devoted to the reading of the Gospels, and near it stood the paschal candlestick, while the second ambo was for the Epistles. The earliest ambones are at Ravenna (cathedral and Sant' Apollinare). Those at Rome are mediæval (San Clemente, San Lorenzo), but are better preserved. They were of marble, merely carved in the earliest examples, inlaid with mosaics in later times. To the form with a single stairway the term "pulpit" is more appropriate. See PULPIT.

AMBOINA (Malay *Ambun*), APON, or THAU. The most important of the Moluccas, belonging to the Dutch, and lying southwest of Ceram and northwest of Banda. The island has an area of 264 square miles and is divided by the Bay of Amboina into two unequal peninsulas (Map: East India Islands, G 5)—Hitu the larger, and Leitimor, the smaller. The surface is irregular, highly mountainous, but fertile. There are many small streams which are not navigable. The soil is fertile and produces coffee, pepper, indigo, and rice. But the main product of the island is the clove, which grows there in abundance and constitutes the chief article of commerce. A great part of the island is covered with forests full of valuable woods. The inhabitants number about 39,000. They are physically and linguistically Malayan, although some Papuan admixture from Ceram has occurred. They have also Portuguese blood. Their language contains a considerable Portuguese element, and their religion is Protestantism (introduced by the Dutch), with the addition of rites and ceremonies borrowed from the Portuguese Catholics and inherited from their aboriginal past. The residency of Amboina comprises, besides the Amboina Island, the southern Moluccas, the Banda group, Ceram, Buru, Kei Islands, Aru Islands, and a few other islands, with a total area of 19,871 square miles and a population, 1905, of 299,004, of whom 2232 are Europeans and 1353 Chinese. The capital of the island and of the residency is Amboina. The history of Amboina is similar to that of the Moluccas, except for the massacre of the British settlers by the Dutch in 1623, for which the Dutch government was compelled by Cromwell in 1654 to pay the sum of £300,000, in addition to a small island, as a compensation to the families of the massacred. Consult: *The Barbarous Proceedings against the English at Amboyna* (London, 1651); Beaumont, *Dutch Alliances* (London, 1712); Verbeek, "Over de geologie van Ambon," in vols. vi and vii, *Koninklijke akademie van wetenschappen* (Amsterdam, 1899).

AMBOINA. The capital of the Dutch residency of that name (q.v.), situated near the middle of the northwest shore of Leitimor, one of the peninsulas of the island of Amboina, in the Moluccas in 3° 41' S. lat., and 128° E. long. It is well built, has wide streets, and contains a church, several schools, a hospital, and an orphan asylum. The government buildings are situated in Fort Victoria. The roadstead is spacious and affords safe anchorage. Fishing is the occupation of many inhabitants. The town suffered considerably during an earthquake in January, 1898. Pop., 1900, 7978.

AMBOINA WOOD. See KIABOUCCA.

AMBOISE, äN'bwäz'. A town on the left bank of the Loire, in the department of Indre-et-Loire, France. It is 15 miles by rail east of Tours and lies in a region so rich in vineyards that it has been called "the garden of France." The town has considerable steel and woolen manufactures, and trade in leather and cloth. It possesses a castle, in which several of the French kings have resided, and in which Charles VIII was born. The town owes much of its importance to the renown of the great churchmen and statesmen, Cardinal Georges and François Charles d'Amboise. It is memorable as the scene of the commencement of religious wars which devastated the kingdom during the sixteenth century, and where the word "Huguenot" was first applied to the Protestant party. The castle of Amboise was much improved by Louis Philippe, and was the residence of the Arab chief Abd-el-Kader during his captivity in France. Pop., 1901, 4538; 1911, 4660. Consult Chevalier, *Inventaire analytique des archives communales d'Amboise, 1421-1789* (Tours, 1874).

AMBOISE, äm'bwäz, AIMERIC D' (?-1512). A French Admiral. He was Grand Master of the Knights of St. John in Rhodes in 1503, and in 1510 he defeated the Sultan of Egypt in a sea fight.

AMBOISE, GEORGES D' (1460-1510). Cardinal and Prime Minister under Louis XII of France. He was born at Chaumont-sur-Loire. At a very early age he became almoner to Louis XI. It is generally stated that he became Bishop of Montauban at 14; later he was made Archbishop of Narbonne, in 1493 Archbishop of Rouen, and in 1498 Cardinal. Initiated in early years into the intrigues of the court, he soon, by his zealous services, secured the confidence of Louis of Orleans (Louis XII), by whom he was made Premier in 1498. From this time Amboise became the prime mover in all the political affairs of France. By his advice the King undertook the conquest of Milan, which had such great influence on the fortunes of France. After the death of Pope Alexander VI Amboise endeavored to get himself elected as Pope. At first he attempted to terrorize the conclave of cardinals by military force, but he was induced to dismiss his forces and then first Pius III—who occupied the papal chair only 27 days—and later Julius II were elected. Amboise was made Legate of France for life. Cardinal Amboise was a dexterous, experienced, and ambitious statesman. He governed France wisely, introduced reforms in the judicial system, reduced taxation and by his benevolence earned the respect of the whole nation. He died in Lyons, May 25, 1510, but his body was carried to Rouen, where his tomb is one of the striking features in the cathedral. Consult Legendre, *Vie du Cardinal d'Amboise* (Rouen, 1726), and Lavissee, *Histoire de France*, vol. v (Paris, 1903).

AM'BOY CLAYS. A great series of upper Cretaceous clay deposits found extensively developed in northeastern New Jersey, especially in the region around Perth Amboy, whence the name. The beds, which are of non-marine origin, are also known as the Raritan clays, because the Raritan River flows through the area in which they outcrop, and their total thickness, including the interbedded sands, is about 350 feet. A few of the beds contain an abundance of plant remains as well as some of mollusks. The Amboy clays are of great eco-

conomic value, being used in the manufacture of chinaware, firebricks, stoneware, brick, and tile. Large pits have been opened in the deposits at Perth Amboy, South Amboy, Woodbridge, and other points. The clays are used chiefly within the State, but large quantities are also sent to neighboring States. See CRETACEOUS SYSTEM; FIRECLAY; CLAY.

AMBOYNA. See AMBOINA.

AMBRACIA, ām-brā'shī-ā (Gk. Ἀμβρακία, *Ambrakia*). A Greek city in the southern part of Thesprotia, in Epirus, on the Arachthus River, about 10 miles from its mouth. It was colonized by the Corinthians, under the leadership of Gorgus, son of Cypselus, in the latter half of the seventh century B.C., and soon rose to a position of great wealth and power. Later, it came under Macedonian control. Pyrrhus of Epirus received it from Cassander as a reward for help against his brother Antipater; he made it his capital and enriched it with many public buildings and works of art. The latter were removed and carried to Rome when the town was taken by the Romans in 189 B.C. After Augustus, in 31 B.C., transferred the inhabitants of Ambracia to the newly founded city of Nicopolis, Ambracia sank into insignificance. The modern town is Arta. See Oberhammer, *Akarnanien, Ambrakia, Amphilochien, Leukas im Altertum* (Munich, 1887); Leake, *Travels in Northern Greece*, vol. i, pp. 205 ff. (London, 1835).

AMBRA'CIAN GULF. See ARTA, GULF OF.

AM'BREE, MARY. The subject of a ballad included in Percy's *Reliques of Ancient English Poetry*; a woman who, to avenge the death of her lover, is said to have disguised herself as a soldier and fought against the Spaniards at the siege of Ghent in 1584. Though unknown in history, she is frequently alluded to by the poets, especially by Ben Jonson, who refers to her in his *Epicæne* (iv, 2), *Tale of a Tub* (i, 2), and *Fortunate Isles*; by Fletcher, in his *Scornful Lady* (Act v); and by others of the period, to whom she became a sort of typical virago.

AMBRIDGE. A borough in Beaver Co., Pa., 16 miles northwest of Pittsburgh, on the Pennsylvania Railroad and the Ohio River (Map: Pennsylvania, A 6). The industries of the borough include bridge building, metal molding, and the manufacture of tubes. The water works are owned by the municipality. Pop., 1910, 5205; 1913 (est.), 8000.

AMBRIZ, ām-brēz'. A seaport town, the capital of a district of the same name, in Portuguese Angola, West Africa. It is 70 miles north of Loanda, at the mouth of the Loje River, and has a large export trade in coffee, ivory, and gums. Extensive copper deposits exist in the district. Its occupation dates from 1855. Pop., 2500.

AMBROGIO IL CAMALDOLESE, ām-brō'-jō ēl kā-māl'dō-lā'zā (properly AMBROGIO TRAVERSARI) (1378-1439). An Italian humanist and Greek scholar, born in the Romagna. He early entered the Convent degli Angeli at Florence, studied the Greek ecclesiastical writers in the original when a knowledge of Greek was rare even among scholars, and in 1431 was appointed Director-General of the Camaldolese Order by Eugenius IV. A member of the circle which Cosimo de' Medici had assembled at Florence for the restoration of the studies of antiquity, he prepared at his request a translation of

Diogenes Laërtius. Symonds refers to him as a "little, meagre, lively, and laborious man."

AMBROS, ām'brōs, AUGUST WILHELM (1816-76). One of the greatest authorities on the history of music. He was born at Mauth, near Prague, and received his education at the gymnasium and University of Prague. In 1840 he entered the office of the Attorney-General, where his exceptional ability was soon recognized, so that in 1850 he was appointed Attorney-General. Decided musical ability manifested itself very early, but his parents obstinately refused to have this talent cultivated. Nevertheless he secretly studied piano and composition with such success that he repeatedly appeared in public as a pianist. His compositions include several overtures, a *Stabat Mater*, two Masses (in B flat and A minor), a national opera, *Bretislav a Jitka*, and numerous pieces for piano. These are well written, and betray the influence of Schumann. In 1872 he received an appointment at the Ministry of Justice in Vienna and a professorship at the Conservatory. He first attracted attention by his *Grenzen der Poesie und Musik* (1856), a reply to Hanslick's *Vom Musikalisch Schönen*, which had appeared two years previously. In 1860 he published his important *Kulturhistorische Bilder aus dem Musikleben der Gegenwart*. Under the pseudonym "Flamin" he contributed many excellent criticisms to Schumann's *Neue Zeitschrift für Musik*. His great fame, however, rests on his *Geschichte der Musik*, which he began in 1860. It is entirely the result of original researches. In the accomplishment of this difficult task he had the hearty coöperation of the government and the Viennese Akademie, the former granting him extended leaves of absence and the latter substantial funds. In his quest for materials he ransacked the rich libraries of Vienna, Venice, Rome, Bologna, Florence, Naples, and Munich. Unfortunately he died before the completion of the fourth volume, which treats of Palestrina and the beginning of dramatic music. The work was completed by F. W. Langhans (q.v.) under the title *Geschichte der Musik des 17, 18 und 19 Jahrhunderts* (1882-87). The original four volumes have been revised by Sokolowsky, Reimann, and Leichtentritt, who have made use of the most recent investigations up to 1911.

AMBROSE (fl. 1190). A Norman poet and chronicler. He is known through his work called *L'Estoire de la guerre sainte*. This manuscript, discovered by Gaston Paris, describes in verse the adventures of Richard Cœur de Lion as a crusader in the Holy Land in 1190-92. Consult Gaston Paris's edition of the poem in his *Collection des documents inédits sur l'histoire de France* (1897).

AMBROSE. A swindler in Lesage's *Gil Blas*, who, in league with a young man and women, all disguised, entices Gil Blas into a house which the girl says is hers. Here they relieve him of his ring and his money. They then decamp, and he finds out that the house is only a hired lodging.

AM'BROSE, SAINT (c.340-397). One of the most celebrated of the ancient Fathers of the Church and one of the four doctors of the Western church. He was born at Trèves, where his father, as Prefect of Gaul, was wont to reside. According to his earliest biographer, Ambrose received a fortunate omen even in his cradle: a swarm of bees covered the slumbering boy, and the astonished nurse saw that the bees

clustered round his mouth without doing him any harm. His father, perhaps remembering a similar wonder related of Plato, foretold from this a high destiny for Ambrose. He received an excellent education in Rome with his brother Satyrus, who died early, and his sister Marcellina, who became a nun. Ambrose studied law and entered the civil service, and soon distinguished himself so much that he became, about 370, a consular magistrate in Upper Italy, with his court at Milan. In this office his gentleness and wisdom won for him the esteem and love of the people, whose prosperity had been much injured by the troubles caused by Arianism. Accordingly he was unanimously called, by both Arians and Catholics, to be Bishop of Milan in 374. He long refused to accept this dignity and even left the city; yet he soon returned, was baptized, as hitherto he had been only a catechumen, and was consecrated eight days afterward. The anniversary of this event is still celebrated as a *fête* by the Catholic church. As a bishop, Ambrose won universal reverence by his mild and gentle, though, toward wickedness of every kind, severe and unbending character. Thus he defended the churches of Milan against the proposed introduction of Arian worship by the Empress Justina (385–386), and brought to repentance and public penance the Emperor Theodosius himself, who had caused the rebellious Thessalonians to be cruelly massacred by Rufinus (390). He is best remembered, however, not as the faithful bishop and wise counselor, nor as the fluent preacher and learned theologian, but as the sympathizing friend of Monica, the mother of Augustine, when she deplored his rejection of orthodox Christian teaching, and as the one whom Augustine heard with pleasure and who received him into the Church. Ambrose died in Milan, April 4, 397. The Ambrosian ritual has also received his name only because Ambrose had made some changes in it, which are retained at the present day in the Milanese church. A commentary on the Epistles of Paul, which was formerly ascribed to Ambrose, is now frequently ascribed to the Roman deacon Hilarius, and is usually quoted as the "Commentary of the Ambrosiaster." Ambrose is the patron saint of Milan, and the large Ambrosian Library (q.v.) received its name in honor of him. The best edition of his works, in which he followed in many things the Greek theological writers, is that published by the Benedictines (2 vols., Paris, 1686–90), reprinted in Migne, *Patr. Lat.*, xiv–xvii, later edited by Ballerini (6 vols., Milan, 1875–86); by C. Schenkle in *Corpus Scriptorum Ecclesiasticorum Latinorum* (Vienna, 1896 sqq.); English translation of some of his principal works by H. de Romestin (New York, 1896). For his biography, consult Barry (London, 1896). His fifteenth centenary was observed in Milan in 1897. Consult *Il Quindici Centenario della morte di S. Ambrogio* (Milan, 1897).

AM' BROSE'S TAV' ERN. An old tavern in Edinburgh, noted as the scene of the *Noctes Ambrosianæ* (q.v.) by Christopher North (John Wilson). It is no longer standing; its site is occupied by the new register house.

AMBRO'SIA, ām-brō'zhī-ā (Gk. ἀμβροσία, from ἀμβροτος, *ambrotos*, immortal, from ἀ, *a*, priv. + βροτός, *brotos*, for *μροτός, **mrotos*, mortal). In the classical mythology, with *nectar* (q.v.), the food and drink of the gods. The word is etymologically identical with the Sanskrit *a-mṛta*,

immortal, drink of immortality, and the same root appears in the Latin, *im-mortalis*. Properly, then, *ambrosia* denotes merely immortality, the natural element, the natural sustenance of gods. Naturally, therefore, the gods not only ate ambrosia, but also bathed and anointed themselves with it; and the adjective *ambrosial* may be applied to any of their possessions. Without ambrosia the gods lose their strength; if given to mortals, it confers ageless immortality. It also preserves bodies from decay. The conception of the nature of ambrosia varied, according to its use. As a food, it was like bread; as nectar, like wine. In some of the later writers, nectar becomes the food and ambrosia the drink of the gods. This variation is natural enough, since originally ambrosia and nectar were identical.

AMBRO'SIA BEE'TLES. Beetles of the family Scolytidæ, which differ from the bark-borers by pushing their galleries deeply into timberwood and feeding upon a substance called "ambrosia." They include the genera *Xyleborus*, *Platypus*, *Corthylus*, and their allies, and are common and often injurious throughout North America. All are very small, elongate, compact beetles, of the form shown in the illustrations of their work on the Plate illustrating ARMY-WORM and AMBROSIA BEETLES, and their cylindrical galleries rarely exceed a tenth of an inch in diameter. These galleries penetrate the solid wood deeply, ramify widely, are uniform and free from dust, and have many short branches, serving as brood-cells; their walls are stained, and the perforations and stain injure the wood for many uses, although not sufficient to harm the life of the tree perceptibly. The most interesting feature of their history is the care given to their young, and the cultivation of fungi—acts unique among beetles, and comparable to those of the social hymenoptera. Habits and methods vary among the different genera, but in general are as follows: Within their galleries is found a substance, taking various forms, most usually that of a cluster of chains of beads, which has been named "ambrosia," and which is shown by the microscope to be a fungus. This fungus is succulent, and forms the food of the insects and their young, and it is planted and cultivated by these beetles, which regard its safety with the apparently anxious solicitude that bees feel toward their stores of honey food. It is started by the mother insect upon a carefully prepared bed of wood dust, some species devoting special chambers to this purpose, others starting a bed anywhere near the larvæ, using the excrement of the larvæ as an aid to its propagation. Sap must be present, however, in order to secure its growth, and in most species the sap must be in a condition of fermentation. Then the fungus must be eaten as it grows—kept grazed down—or it will ripen, emit spores, and choke up the tunnels. All these difficulties are so well met by these minute gardeners that many generations in succession sometimes inhabit and continue to enlarge their system of galleries. These are sometimes bored in vigorous timber, but more often in weak trees, and dead wood is sometimes occupied, certain species exhibiting a special predilection for the staves of wine casks. A full treatment of this group and their customs and effects has been given by H. G. Hubbard, *United States Department of Agriculture*, new series, *Division of Entomology. Bulletin No. 7* (Washington, 1897).

AMBRO'SIAN CHANT. The choral music

of the early Christian Church, introduced from the Eastern church into the Western by St. Ambrose, Bishop of Milan, in the fourth century. About the real character of this music little is known. It resembled the Gregorian chant, which did not replace it, but was only a general revision of it. It has been stated that St. Ambrose adopted the four authentic modes (see *MODES*) from the Eastern church. Although it is probable that he did so, the point has not yet been established by positive evidence. That even after the Gregorian revision the Milan liturgy retained some special characteristics, we learn from the statements of some mediæval writers; but what these peculiarities were we do not know. Proof is wanting that the famous "Ambrosian Hymn," *Te Deum laudamus*, was composed by St. Ambrose; it seems probable that this melody was also taken over from the Eastern church. Consult: Camilla Perego, *Regola del canto Ambrosiano* (Milan, 1862); A. W. Ambros, *Geschichte der Musik*, vol. ii (Breslau, 1862-82); G. M. Dreves, *Aurelius Ambrosius, der Vater des Kirchengesanges* (Freiburg, 1893); F. A. Gevaert, *La Mélodie antique dans le chant de l'église latine* (Ghent, 1895); G. Houdard, *La Cantilène Romaine* (Paris, 1905); P. Wagner, *Ursprung und Entwicklung der liturgischen Gesangsformen bis zum Ausgange des Mittelalter* (Leipzig, 1910); E. Garbagnati, *Rivista sulantica salmodia ambrosiana* (Rome, 1912); A. Steier, *Untersuchungen über die Echtheit der Hymnen des Ambrosius* (Leipzig, 1903).

AMBROSIAN LIBRARY. A famous library in Milan, so named in honor of St. Ambrose, the patron saint of the city. It was founded in 1609 by Cardinal Federigo Borromeo, who, in 1609, formally opened it to the public. The library contains upward of 230,000 printed volumes and 8400 manuscripts, some of them of great value. Among the latter the chief treasures are a Greek Pentateuch of the fifth century; several palimpsest texts, including an early Plautus; fragments of Ulfilas's Gothic translation of the Bible; the celebrated Codex Atlanticus, containing original drawings and MSS. by Leonardo da Vinci, and a copy of Vergil with marginal notes by Petrarch. The library possesses a small but excellent collection of paintings, including Raphael's cartoon for the "School of Athens," and the celebrated portrait of Bianca Sforza by Ambruogio da Predis.

AMBROSIAS'TER. The name by which the unknown author of the *Commentaria in xiii Epistolas beati Pauli* is known. The use of this name is due to the fact that from the middle of the ninth century to the time of Erasmus this work was generally ascribed to Ambrose of Milan. This authorship Erasmus held to be doubtful—a position which is confirmed not only by the lack of all external evidence in its favor, but by definite internal evidence against it.

Owing to the citation by Augustine of a passage from these Commentaries as by St. Hilary, it has been thought by some critics that they are to be identified with the lost commentary of Hilary of Poitiers on the Epistles. Others in turn have ascribed them to well-nigh every Hilary of antiquity.

In 1899 Dom Morin, in the *Revue d'histoire et de littérature religieuses*, suggested that they were the work of Isaac, a professed convert from Judaism, who was exiled to Spain in 378-380 and is said thereupon to have re-

lapsed to his former faith. This view Morin later withdrew in favor of an authorship by Decimus Hilarianus Hilarius, proconsul of Africa in 377. As between these two views modern scholars are somewhat divided, though they are one in attributing to the author of the Commentaries the pseudo-Augustinian work known as *Quæstiones ex utroque testamento*.

However the authorship of these two works may be decided, it is acknowledged that the Commentaries give perhaps the most sane, lucid, and thoughtful exposition of the Pauline Epistles previous to the Reformation, while the Questions constitute the earliest presentation which we have of biblical difficulties. See Souter, *A Study of Ambrosiaster* (1905); Turner, in *Journal of Theological Studies* (April, 1906).

AMBRO'SIO, or THE MONK. A romance by M. G. Lewis (hence known as "Monk" Lewis), first published in 1795. The hero is a Capuchin abbot of Madrid, who loses his character and is condemned by the Inquisition, but saves himself for a time by a compact with Lucifer.

AM'BROTYPE (Gk. ἀμβροτος, *ambrotos*, immortal + τύπος, *typos*, impression). An early form of positive photograph on glass, similar to the daguerreotype. It consisted of a thin collodion negative backed with a black surface and viewed by reflected light.

AM'BRY, AUMERY, or ALMERY (OF. *almarie*, Fr. *armoie*, from Lat. *armarium*, a closet, chest; for the *b*, see ALHAMBRA). A niche in the wall of a church shut in by a door, or a small cabinet of wood by the altar, holding the vestments and utensils for the mass. In monastic buildings ambries were presses, or even store-rooms or pantries, used for keeping plate, hanging towels, and the like.

AM'BULANCE (Fr. *hôpital ambulant*, walking hospital, from Lat. *ambulare*, to walk). A two- or four-wheeled wagon constructed for conveying sick or wounded persons. Ambulances are constructed to run very easily and are designed to carry one or two tiers of stretchers. Some forms are fitted with water-tank, medicine chest, operating-table, and other conveniences. City hospital ambulances are light, four-wheeled wagons furnished with one or two beds, surgical appliances, and restoratives. Since 1899 electric automobile ambulances have been used by the larger hospitals in the larger cities of the United States. A surgeon rides in the ambulance, and in crowded streets a gong is kept sounding in order that the ambulance may have the road cleared. Ambulances used in the army are large spring wagons provided with all the necessary appliances for the care and transportation of the sick and wounded. In each division of the army these wagons are organized into a corps and placed under the command of an ambulance officer. Railway cars and steamers are also fitted up with conveniences for transporting patients to more remote and permanent hospitals. The system perfected in this country during the Civil War has now been adopted by most of the civilized nations. We find something like an ambulance service, however, introduced into the French army as far back as 1792, by Baron Larrey, whose *Ambulances volantes*, or 'flying field hospitals,' were used to attend the wounded and remove them promptly from the scene of action. Shortly afterward Baron Percy organized a corps of *brancardiers*, soldiers equipped with first-aid appliances and stretchers,

who were trained to collect the injured while fighting was going on and carry them outside the zone of hostilities. The Geneva Convention of 1864 favored the extension of ambulance service in war, and the modern Red Cross service may be said to date from that time. Several of the continental countries keep permanently in reserve railway trains completely equipped for hospital service. In France an ambulance is a portable hospital attached to every division of an army in the field and provided with all the requisites for the medical succor of sick and wounded troops. Such an ambulance is stationed at some spot removed from immediate danger, and soldiers after a battle seek those who have been wounded and convey them to the ambulance. The French also introduced the *cacolets*, which consist of two easy-chairs slung in panniers across the back of a mule, which are available along paths where no wheel-carriage could pass. The *cacolets* have since been adopted by other armies, as well as improved hand-litters, and wheeled litters or barrows.

AMBULANCE CORPS. See HOSPITAL CORPS.

AM'BULATORY (from Lat. *ambulare*, to walk). In mediæval architecture, any covered walk or passage, such as the arcades of a cloister (see MONASTERY). More specifically, the aisle around the apse at the east end of a church, connecting the north and south aisles of the choir; called also *deambulatory*. The earliest example was probably that of the original place of St. John Lateran at Rome (fourth century). The cathedrals of Paris and Chartres have double ambulatories. See APSE.

AM'BUSCADE' (from Low Lat. *imboscare*, to ambush, from *in*, in + *boscus*, bush, wood). A device of military strategy often employed in ancient and mediæval warfare; now, owing to the changed conditions of fighting, rarely possible. Originally it had special reference to bodies of men "concealed in a wood," as its name implies. The only modern instance of the use of this particular device occurred at the battle of Santiago, during the Spanish-American War of 1898, when effective damage was inflicted on the American attacking forces by Spanish sharpshooters hidden in the dense foliage of the trees. Ambuscade must not be confounded with AMBUSH, which see.

AM'BUSH (for derivation, see AMBUSCADE). A strategical device, enabling one force successfully concealed to surprise, defeat, or capture another. It is probably the one element of strategy that time has never changed; for notwithstanding the transformation that has taken place in the general science of warfare, the ambush with all its variations of form and method still remains. An ambush may be on any scale, from the surprise and capture of a small reconnoitring patrol to the defeat of an army. In the latter case it occasionally is described by a more ambitious title by some European authorities, but such is the exception rather than the rule. Every campaign that history has recorded gives incident after incident of the more or less successful practice of this particular form of strategy; but it has been left to the Anglo-Boer War of 1900-01 for its highest and most successful development. In this campaign the Boers practically owed nearly every success to the use of the ambush in one form or another; a typical example was encountered in General Roberts's

campaign. During his march to Bloemfontein a strong detachment of Boer troops, under Gen. Christian De Wet, cleverly concealed themselves among the rocks and kopjes at a place called Sannahspost. A convoy of 128 wagons, carrying valuable supplies and munitions of war, together with their escort, walked unsuspectingly into the trap, and were captured without the firing of a shot or the showing of a single man other than De Wet himself. A body of 200 volunteer horse, sent from the main column to ascertain the whereabouts of the convoy, were similarly captured, and on attempting to escape were practically annihilated by their unseen enemy. Consult Conan Doyle, *The Great Boer War* (London, 1901).

AMEER'. See EMIR.

AM'ELAN'CHIER. A genus of plants of the family Rosaceæ, related to the apple, and distinguished by an ovary having twice as many cavities as styles. It consists of about 25 species of shrubs or trees with simple leaves, abundant racemes of white flowers, and soft, juicy, and agreeable fruit somewhat larger than a pea. About 18 species occur in North America, and they have received such names as Service or Sarvos berry, June berry, shad bush, May cherry, sand cherry, etc. See Plate of SPIRÆA.

AMELIA, à-mā'lê-à (ancient *Ameria*). A city of central Italy, in the province of Perugia, 21 miles southwest of Spoleto. It has been the seat of a bishop since 340 A.D., and has a cathedral. Remains of great polygonal walls show that it was once of some importance, but in the days of Republican Rome it is known chiefly as the birthplace of Sextus Roscius Amerinus, in whose defense Cicero delivered a speech. It claims to be 400 years older than Rome. Pop., 1901, 6246 ; 1911, 10,124.

AME'LIA. A novel by Fielding, published by Millar, who is said to have paid £1000 for the copyright, Dec. 19, 1751. Two editions were called for on the day of publication. Much of the story is autobiographical, some of the adventures of the hero, Booth, recalling incidents in the author's earlier life in the country, while the title-character was largely suggested by the personality of Fielding's first wife. The book was a great favorite with Dr. Johnson. Consult Piozzi, *Anecdotes of the Late Samuel Johnson*, LL.D. (London, 1786).

AMELIA ISLAND. A small island off the east coast of Florida, opposite the mouth of St. Mary's River (Map: Florida, G 1). It was settled by General Oglethorpe in 1736, and in 1739 it was the scene of the first bloodshed in the war between Spain and England, a party of Spaniards killing two unarmed Highlanders. After 1808 the island, then a part of Spanish East Florida, was a notorious resort for pirates, smugglers, and slave-traders. In March, 1812, it was captured by rebels against Spain and immediately handed over to the United States; early in 1813 the United States troops stationed here were withdrawn, and in 1817 the island was captured by a filibustering expedition, while later in the year a Mexican force took temporary possession of it in the name of Mexico. The United States again occupied it in 1818 and held it in trust for Spain until she acquired the Floridas by the treaty of 1819. Consult McMaster's *History of the People of the United States*, vol. iv (New York, 1893-1900).

AMELIE-LES-BAINS, à'mâ'lê'lâ'bân' (Fr. 'watering place of Amelia,' wife of Louis Phi-

lippe), formerly called Arles-les-Bains. A famous watering place and summer resort in France, situated in the department of Pyrénées-Orientales, at the confluence of the Tech and the Mondony, at an altitude of nearly 800 feet above sea level (Map: France, S., G 6). It has 30 copious sulphur springs, with a temperature from 63° to 145° F., the waters of which are used both externally and internally. It contains a very large military hospital and numerous remains of Roman thermæ. Pop., 1901, 1340; 1906, 1328; 1911, 1383.

AMELOT DE LA HOUSSAYE, äm'lö' de lä öö'sä', ABRAHAM NICOLAS (1634-1706). A French historian, who was made a prisoner in the Bastille by order of Louis XIV. He published a *History of the Government of Venice*, translations of Machiavelli's *Prince*, of Tacitus's *Annals*, and of Sarpi's *History of the Council of Trent*, the notes to the last of which, written by himself, gave great offense to the advocates of the unlimited authority of the Pope. Voltaire speaks of his histories as very good and of his memoirs as very faulty.

AMEN (Heb. 'it is firm,' hence 'surely,' 'verily,' transliterated into Gk. ἀμήν, *amēn*, Lat. *amen* and so in later versions). A word expressive of assent or affirmation. It is sometimes used at the beginning of a sentence referring back to words of a preceding speaker, e.g., 1 Kings, i. 36; Jer. xxviii. 6. The meaning then is 'let it be so.' This is also the usual rendering of the word in the Greek Old Testament, γένοιτο, *genoito*, 'let it be.' Sometimes it is detached, nothing following, with the same significance, e.g., Deut. xxvii. 15-26; 1 Chron. xv. 36, identical with Ps. cvi. 48, shows its liturgical use c.200 B.C. In Isa. lxxv. 16 we should probably read *omen*, and not *amen*; consequently 'the God of Truth,' as in Isa. xxv. 1. Jesus seems to have used the term adverbially—'verily,' 'of a truth.' It occurs more frequently in the Gospel of Matthew, which stands nearest to the lost Aramaic gospel, than in the other Synoptics. There is no parallel to this usage in Talmudic literature. It may be a manner of using the term peculiar to himself or to the Galileans of his day. The author of the Fourth Gospel observed it and doubled it, probably to give it a mystic significance. In Rev. iii. 14 Jesus is himself called ὁ ἀμήν, *ho amēn*, 'The Amen,' and the name is explained as 'the faithful and true witness,' which shows that words employed in the liturgy were often but vaguely understood, even when the root idea of the word was known. See H. W. Hogg, in *Jewish Quarterly Review*, p. 1 (1896); Dalman, *Die Worte Jesu*, pp. 185 ff. (1898).

AMEN, HARLAN PAGE (1853-1913). An American educator. He was born at Sinking Spring, Ohio, and graduated at Harvard University in 1879. In 1895 he became principal of Phillips Exeter Academy, which under his management continued to hold its place as one of the foremost educational institutions in the United States.

AMENDE HONORABLE, ä'mänd' ö'nö'rä'bl' (Fr. honorable amends, satisfactory reparation). Formerly an infamous punishment to which criminals were condemned who had offended against public decency or morality. It was first introduced in France in the ninth century and remained in force there until formally abrogated in 1791. It was restored as a punishment for sacrilege in 1826, but disappeared

finally in 1830. It consisted of a confession made by a bareheaded and kneeling criminal in open court, conducted thither with a rope around his neck by the common hangman. In popular language, the phrase now denotes a public re-antation and reparation to an injured party for improper language or treatment, or is still further extended to mean an apology of any kind, an "honorable compensation" for insult or injury.

AMENDMENT. A term used with reference both to legislative action and parliamentary and judicial procedure. Amendment in legislation is the alteration of an existing statute by means of a new legislative enactment which may expressly refer to and modify the earlier law, or which by reason of its inconsistency with the earlier law may impliedly modify its scope or meaning. In general there is no limitation upon the power of legislative bodies to amend or repeal existing laws, except the provisions of the constitution to which the legislative body is subject. The British Parliament, being itself the constitution-making body, has unrestricted power to amend and repeal existing laws. In the United States Congress has power to repeal laws of the United States, but it has no power to amend the provisions of the Constitution. The method of amending the Constitution of the United States is provided by Article V of that instrument, but the exercise of this power is limited by the provision "that no State without its consent shall be deprived of its equal suffrage in the Senate." The United States Constitution contains no provision directly limiting the power of the State legislatures to repeal the statute law of the several States; but Article I, Section 10, providing that "No State shall pass any law impairing the obligation of contract," amounts to a restriction on the power of the State Legislature to repeal statutes which are in effect contracts with the citizen of the State. This construction was first established in the celebrated Dartmouth College case (q.v.). The several State constitutions may also, and frequently do, limit the power of the Legislature to amend or repeal existing laws. See CONSTITUTIONAL LAW; ABRIGATION.

Amendment in parliamentary procedure is used in order to vary or to qualify a motion, bill, or resolution before the House. Amendment is usually offered by means of a motion, and when adopted in accordance with the rules of parliamentary procedure becomes a part of the original motion or bill, which may then be voted upon. In the case of bills before legislative bodies amendment is not infrequently a method of changing the entire scope and meaning of a bill or of dismissing it from any further consideration. See PARLIAMENTARY LAW, and the authorities there referred to.

Amendment in the law of pleading and practice is the correction of an error or defect in a pleading or judicial proceeding in the progress of an action or other proceeding. The amendment may be "as of course," i.e., without application to the counsel or judge, or "on leave," as the statute or rules of pleading and practice may require. Amendment at common law independently of statute might be made to remedy formal defects by leave of the court at any time before the signing of the judgment in the action. Leave to amend was a discretionary matter, and when granted, it might be on such terms as the court should direct, usually on payment of the

costs of the action up to the time of amendment. By modern statutes amendments are sometimes allowed after judgment in furtherance of justice, and they are at any stage of the case before judgment more liberally allowed than formerly, when the defect is one of substance or affects the merits of the case. See PLEADING; PRACTICE; STATUTE OF JEOFAILS, and the authorities there referred to.

A'MENEM'HAT. The name of four Egyptian kings of the twelfth dynasty.—**AMENEMHAT I.** He reigned for 30 years, beginning about 2130 B.C. How he came to the throne is not known, but on his accession he found Egypt in a state of great disorder. He thoroughly reorganized the government, restored order, and conducted a wise and vigorous administration. He checked the power of the great nobles, and personally superintended a new survey of the whole land. Amenemhat warred in Nubia and on the Asiatic frontier of Egypt, but his chief attention was devoted to internal affairs. He was a great builder, and his monuments are found from Nubia to the Delta. In later times he was esteemed a sage, and, in a work composed apparently under the nineteenth dynasty, he is represented as giving instructions in the art of government, based on his own experience, to his son Usertesen (afterward Usertesen I).—**AMENEMHAT II.** He reigned for 35 years, beginning about 2066 B.C. During the first two years of his reign he was regent with his father, Usertesen I, and, for three years before his death, his son Usertesen II was associated with him in the government. In the twenty-eighth year of his reign he sent an expedition to Punt on the Somali coast.—**AMENEMHAT III.** Son of Usertesen III. He reigned for 44 years, from about 1986 B.C. Monuments of this King are found throughout Egypt, but his greatest work was connected with the Fayum (Coptic, *Phiom*, the lake). Amenemhat I (q.v.) had built a dam, reclaiming a considerable extent of land from the highest part of the bed of Lake Mœris. Amenemhat III greatly extended this system of damming. By means of a large embankment, about 20 miles long, he reclaimed some 40 square miles of fertile land and at the same time converted the lake into a gigantic reservoir, whose waters, replenished annually by the inundation of the Nile, were used for irrigating the adjacent country. The lake continued to serve this purpose down to the fifth century B.C. Later it was gradually dried up, and, under the Ptolemaic dynasty, a Macedonian colony was established on a portion of its former bed. The pyramid of Amenemhat III, at Hawara, near Illahun, is built of Nile brick and formerly had a casing of limestone. When entered by Petrie, in 1889, the King's stone sarcophagus was found in the sepulchral chamber, but the mummy had been removed. Adjoining the pyramid are the ruins of the famous labyrinth, formerly a gigantic peristyle temple, covering an area 1000 feet long by 800 feet broad.—**AMENEMHAT IV.** Son of Amenemhat III, reigned for some nine years, from about 1941 B.C. His reign seems to have been marked by no event of special importance.

A'MEN-HO'TEP. See AMENOPHIS.

AMENITIES OF LITERATURE. A work relating to English literary history, by Isaac Disraeli, completed in 1841.

AM'ENO'PHIS (Egypt. *Amen-hôtep*, Ammon is pleased). The name of four Pharaohs of the

eighteenth dynasty.—**AMENOPHIS I,** the second King of this dynasty, son of Amasis I. He reigned for 10 years, from about 1570 B.C. He carried on some insignificant wars in Nubia, and against the Libyans on the northwest frontier of Egypt. After his early death he was revered as the patron of the Theban necropolis, and, together with his mother, Nofretari, received divine honors. His mummy, found at Dair el-Bahri, is now in the museum of Gizeh.—**AMENOPHIS II.** He reigned for some 25 years, from about 1450 B.C., waged energetic wars in Syria, and maintained the territory inherited from his father, Thothmes III, in Asia and Ethiopia.—**AMENOPHIS III.** Son of Thothmes IV. He reigned for 36 years, from about 1410 B.C. In the early part of his reign he seems to have warred in Asia, but later he did little to maintain his Syrian provinces. The Amarna Letters (q.v.) show that in his reign, and in that of his successor, the Egyptian supremacy in Asia was seriously threatened. Amenophis is noted for his activity as a builder. He erected in Thebes a gigantic temple; but of this nothing remains except the two colossi at the entrance, one of which, in classical times, became famous as "the vocal Memnon." The Amarna Letters record the fact that Amenophis married Gilukhepa, sister of King Dushratta of Mitani in northern Mesopotamia. His principal wife (whom he commemorates on his monuments), Teye, was a foreigner. The magnificent tomb of her parents, Thua and Yua, was discovered in 1905 by Mr. Davis.—**AMENOPHIS IV.** The Napkhururiya (Egyptian Nefer-Khoper-re) of the Amarna Tablets. This monarch is one of the most interesting characters in Egyptian history, because of the great religious reform which he attempted. He endeavored to supersede the old polytheistic religion of Egypt by the exclusive worship of the Sun. But his fanatical efforts in this direction, his persecution of the cult of the Theban god Ammon, and the shifting of his residence to Telet-Amarna led to no permanent results. After his reign of 18 years (beginning about 1375 B.C.) his innovations were abolished, and the old religion was again triumphant. By his wife Nefer-titi he had six daughters.

AMEN'ORRHŒ'A (Gk. *ἀ, a*, priv. + *μήν mēn*, month + *ῥοία, rhoia*, flow, flux). The suspension from any cause other than pregnancy, or the menopause, of the catamenial flow. It is generally an indication of functional disturbance and is to be regarded as a symptom rather than a malady. It is frequently dependent on anæmia, chlorosis, tuberculosis, or obesity, or may be due to defective development of the sexual organs. The treatment adopted should tend to strengthen the general health; the diet should be nourishing and generous, iron and arsenic administered, the bowels carefully regulated, and the patient should take mild exercise in the open air. See EMMENAGOGUE; MENSTRUATION.

A'MENT (Lat. *amentum*, strap or thong), or **CAT'KIN.** A flower cluster in which simple flowers are developed upon an elongated axis and are subtended and more or less concealed by conspicuous bracts. Such clusters are found in the birches, alders, willows, etc., which, in consequence, are often called Amentiferæ. See INFLORESCENCE.

A'MENT, WILLIAM SCOTT (1851–1909). An American missionary in China. He was born at

Owosso, Mich., of Dutch descent, and educated at Oberlin, and at Union (N. Y.) and Andover Theological seminaries. He went to China as a missionary of the American Board and was stationed in Peking, where, in the summer of 1900, he was one of the 800 foreigners and 3000 native Christians who were besieged in the Boxer revolt. When the siege was raised, Dr. Ament, with the missionaries of his station and 500 native Christians, took possession of the deserted premises of a lesser Mongol prince who had become a fugitive. He was a leader in reestablishing the native Christians, and in making necessary readjustments, but subsequently was severely criticised by many of the American newspapers as morally guilty of looting. This charge was disproved. See his life by H. D. Porter (New York, 1911).

AMENTHES, ā-mĕn'thĕz. The Greek form of the Egyptian *Amente*[t], 'the Lower World,' or realm of departed spirits. The word signifies, literally, 'the Western (World),' as the mysterious abode of the dead was supposed to lie beneath the western horizon. The graves of the ancient Egyptians were situated in the desert on the western side of the Nile, and the souls of the dead were believed to pass, with the setting sun, through the gates of Amenthes, where, after many perils, they appeared before Osiris (q.v.) and his 42 assessors to undergo final judgment. The views of the Egyptians in regard to the life of the soul in the nether world were manifold. Plutarch defined Amenthes as meaning 'giving and taking,' and it is sometimes derived from *amen*, 'hidden,' but such etymologies are valueless. See also ANUBIS; SET; AUTHOR.

A'MENTIF'ERÆ. A name of convenience, not of classification; used to include the dicotyledonous plants that bear aments (q.v.) or catkins. The familiar representatives of this assemblage are willows, poplars, walnuts, hickories, birches, alders, beeches, and oaks.

AMERBACH, ä'mĕr-bäg, JOHANNES, also known as EMMERPACH (1444-1513). A German printer, educated in Paris. He established a press at Basel, publishing the works of St. Ambrose and St. Augustine, and began to publish those of St. Jerome, which were finished by his son Boniface. He was one of the first to use Roman instead of Gothic letters.

AMERCE'MENT (Angl. Fr. *amerciment*, from *amercier*, to be at the mercy of). In old English law, a pecuniary penalty imposed for crime or for the violation of the fealty which the freeholder owed his lord. It was imposed as the result of a judicial conviction of the offense charged, but differed from a fine in that it was a commutation of a sentence of forfeiture of goods, while the fine was a commutation of a sentence of imprisonment of the person. The decree of the court was that the offender was at the mercy (*in misericordia, à merci*) of the king, the sheriff, or the lord in whose court the judgment was rendered. The amount of the amercement, originally unlimited, as the term implies, was regulated by a provision of Magna Charta (1215), which decreed that all amercements should be set, or fixed, by good men of the neighborhood, the peers of the offender, and that the amount should vary with the gravity of the offense. Consult Pollock and Maitland, *History of English Law* (2d ed., London and Boston, 1899). See CRIMINAL LAW; FINE: PUNISHMENT.

AME'RIA. The ancient name of Amelia (q.v.), a city in Italy.

AMER'ICA (named after Amerigo Vespucci, an Italian navigator). America, or the New World, is one of the great land divisions of the earth. It has a meridional extent of about 9000 miles, stretching from 72° N. lat. (Boothia Felix) to 56° S. lat. (Cape Horn), without including the Arctic islands. Its extreme northern part extends far within the Arctic Circle, while on the south it stretches to the border of the Antarctic Ocean. Excluding its islands, it lies between the meridians of 34° and 168° west of Greenwich, and has a maximum breadth of about 3300 miles. The entire area is estimated to be 16,000,000 square miles.

General Features. The New World differs from the Old in size, having about half its area. It differs also greatly in outline, in location on the earth's surface, and in the character of its coasts and its relief. The Old World has, very roughly, a triangular form; while the New World consists of two triangles connected with each other. While both grand divisions lie mainly north of the equator, a greater proportion of the Old World is in the northern hemisphere. The coasts of the Old World, taken as a whole, are much more broken than the American coasts. The principal relief feature of the Old World is a great stretch of elevated land crossing most of Europe and Asia in an east and west direction, while the backbone of America traverses its length in a direction nearly north and south, near its western coast.

America is bounded on the north by the Arctic Ocean, on the south by the Antarctic, on the east by the Atlantic, and on the west by the Pacific. While stretching from one polar ocean to the other, it separates the Atlantic and Pacific throughout their whole length. In the extreme northwest it almost touches Asia, from which it is separated by Bering Strait. Very narrow passages separate it from the extensive islands that constitute the Arctic Archipelago of the Western Hemisphere.

Physical Divisions. America is divided into two continents,—North and South America, separated in part by the Caribbean Sea and the Gulf of Mexico, and connected by the narrow Isthmus of Panama, 40 miles in width.

North America has an area of about 8,300,000 square miles; and South America of 7,700,000. The mean altitude above sea level of both continents is not far from 2000 feet.

These two great continents are much alike in some respects, while differing in others. They are both triangular in shape, with the base of the triangle at the north and the opposite apex at the south. Each has its greatest length along meridians, and greatest breadth along parallels of latitude; each has a great mountain system running the whole length of the western side and parallel to it, and a shorter secondary and more disconnected mountain system in the eastern part, also parallel to the coast, the two mountain systems in each case converging toward the lower apex of the continent. In both cases the eastern ranges are the oldest geologically.

While the two American continents thus present certain similarities of configuration, they are very differently placed on the sphere, and thus their climatic differences are marked, and the conditions dependent on climatic influences likewise differ. The broad part of North

America lies mainly within the north temperate zone, and only its apex extends into the tropical zone; thus causing a great portion of the continent to be dominated by comparatively low temperature conditions. In South America, on the contrary, the broad part lies within the tropics, and a comparatively small portion of it extends into the temperate zone.

Coasts. With regard to the nature of their coast-lines, North and South America present an extraordinary contrast. North America, in its extreme irregular coast-line and its great peninsulas, is the counterpart of the Eurasiatic continent in the Old World, while South America, with its almost unbroken coast, is the counterpart of Africa. In North America we have the peninsulas of Alaska, Labrador, Nova Scotia, Florida, Yucatan, and Lower California. South America presents but one great peninsula, that of Patagonia. The Atlantic coast of America is far more irregular and broken than that of the Pacific. On the north of North America, Hudson Bay projects far into the interior of Canada, forming a vast inland sea. Farther south, the Gulf of St. Lawrence and the Bay of Fundy form deep indentations. On the Atlantic coast of the United States are several large bays and harbors, Massachusetts Bay, Long Island Sound, Delaware and Chesapeake bays, and Albemarle and Pamlico sounds being among them. The Gulf of Mexico and the Caribbean Sea have many arms, extending into the land, among them the gulfs of Campeachy, Honduras, and Colon.

The Atlantic coast of South America is simpler, the chief indentations being, on the north the gulfs of Darien and Venezuela, on the northeast the estuary of the Amazon, and on the east the harbors of Bahia and Rio de Janeiro, the estuary of the Rio de la Plata, and the gulfs of Blanca, San Matias, and San Jorge, on the Argentine coast.

The west coasts of both continents are in the main extremely simple. Between lat. 42° S. and 49° N. there are few harbors. In South America, the Gulf of Guayaquil is almost the only indentation of magnitude. South of lat. 42° S., however, the character of the coast changes to a fiord coast, with many deep, narrow passages and hundreds of islands. Where the two continents meet, the bend of the Pacific coast forms the deep bay of Panama. The west coast of North America south of the parallel of 48° N. is broken deeply only by the Gulf of California and San Francisco Bay, but near the northwest corner of the United States a fiord coast commences with Puget Sound and extends thence along British Columbia and Alaska to the Aleutian Islands. The Bering Sea coast of Alaska is low and broken by many indentations, and similar conditions prevail on the Arctic coast.

Topography. The prominent relief feature of both continents consists in a great system of elevation, stretching along or near the western coast, from Cape Horn in South America to the extreme end of the Alaska peninsula in North America. This is known in South America as the Andean Cordillera, and in North America as the Cordillera. It differs greatly in its different parts, in breadth, height, complexity, and character. In North America the Cordillera are succeeded on the east by a broad valley; east of this valley, and separating it from the Atlantic, is the shorter, smaller, and

lower Appalachian system. In South America the succession is somewhat similar. East of the Andes is a broad slope or depression, which in Argentina continues to the Atlantic; but in eastern Brazil and the Guianas the continuity of the eastward slope is broken by numerous short and comparatively low ranges, corresponding roughly with the Appalachians of the northern continent.

North America. In North America the Cordillera develops its greatest breadth and complexity in the main body of the United States. Here it includes a broad plateau 1000 miles in width, with an elevation of from 5000 to 10,000 feet, on which stand a succession of mountain ranges trending nearly north and south, the highest of which rise to altitudes of from 14,000 to 15,000 feet. The highest of these ranges are in Colorado and California. In the former State are the Front Range, with Long's Peak, 14,271 feet; Gray's Peak, 14,341 feet; Pike's Peak, 14,108 feet; the Sangre de Cristo Range, with Blanca Peak, 14,390 feet; the Park Range, with Mount Lincoln, 14,297 feet; the Sawatch Range, with the Mountain of the Holy Cross, 14,170 feet; Elbert Peak, 14,421 feet, and Mount Harvard, 14,375 feet; and the San Juan Mountains, with Uncompahgre Peak, 14,289 feet, and Mount Wilson, 14,250 feet.

The principal range of California is the Sierra Nevada, with Mount Corcoran, 14,093 feet; Fisherman Peak, 14,448 feet; Mount Whitney, 14,502 feet; and Mount Shasta, an extinct volcano, 14,380 feet. The Cascade Range of Oregon, Washington, and British Columbia is a continuation of the Sierra Nevada in direction, though not in structure, as it is in the main the product of volcanic action and contains many extinct volcanoes, the highest of these being Mount Rainier, 14,363 feet. Northward in British Columbia the system is not so high nor so broad, but following the coast around through Alaska, it rises in semi-detached groups and ranges, some of which are of great height, culminating in Mount McKinley, north of the head of Cook Inlet, 20,500 feet in height, the highest summit in North America. Another high peak, on the boundary between Alaska and Canada, is Mount St. Elias, 18,024 feet above the sea. This was long supposed to be the highest point in North America.

The area of Mexico, with the exception of the State of Yucatan, lies almost entirely within the Cordilleran mountain system. The plateau extends southward into it from the United States, with an elevation ranging from 4000 to 7000 feet. Upon this undulating table-land, which is known as the plateau of Anahuac, are many mountain ranges and many active or dormant volcanoes, the latter being the highest peaks of the country. Among them are Popocatepetl, 17,520 feet; Orizaba, 18,250 feet; Iztaccihuatl, 16,960 feet; Nevada de Toluca, 14,950 feet; and Malinche, 13,460 feet. In the countries of Central America the Cordillera is represented by detached ranges of hills, with numerous volcanic peaks, some of which are active, others extinct.

The depression lying east of the Cordillera stretches in the north to the Atlantic or to Hudson Bay, and in southern Canada and the United States to the Appalachian or Eastern Mountains, with a breadth of 25° of longitude. Over this great area the surface presents no serious variations of level. The only elevations of importance are the Ozark Hills in Arkansas, south-

ern Missouri, and Oklahoma, with a maximum altitude little over 3000 feet.

The Appalachian Mountains extend from Newfoundland and the Gaspé Peninsula in south-eastern Canada, southwestward through the eastern United States to central Alabama and Georgia, in a fairly continuous system. They form a narrow plateau, 100 to 300 miles in width and 1500 to 3000 feet in height, which is bordered on the east by the Blue Ridge and on the west by the Alleghany Mountains. In the northern section the line of elevations includes the Green and White Mountains of Vermont and New Hampshire, which differ more or less in their geological structure from the central and southern portions of the system. The highest summits are Mount Washington in New Hampshire, 6279 feet, and Mount Mitchell in North Carolina, 6711 feet. East of this mountain system the land slopes gently to the Atlantic coast, and is known as the Piedmont Plateau and the Atlantic Plain. See ROCKY MOUNTAINS; APPALACHIANS; ETC.

South America. The Cordillera of the Andes follows the western coast of South America in a continuous mountain system from Cape Horn to the Isthmus of Panama, leaving a narrow strip of lowland between its base and the coast nowhere much more than a hundred miles in breadth. In the south the system is narrow and simple, consisting in great part of a single range, which has no great height. Northward it increases in altitude and becomes more complex, reaching a culminating point in the great peak of Aconcagua, in lat. 32° S., which reaches the height of 23,080 feet, the loftiest summit in South America. Still farther north the peaks are not so high, but the system broadens and becomes more complicated by the appearance of ranges in Argentina, east of the Andes proper. In lat. 18° S. the system curves to the northwest, following the coast; here it has a breadth of fully 300 miles, with two, and, in places, three main ranges, and incloses an elevated plateau, on which is situated Lake Titicaca, 12,645 feet high. Near this lake, in the Cordillera Real, are many high peaks, among them Ancocuma, 21,490 feet; Cacaca, 20,250 feet; and Illimani, 21,192 feet.

Still following the coast, the system turns north again at the Gulf of Guayaquil, maintaining the form of a broad, elevated plateau, bordered by lofty ranges, with many volcanic peaks. In the neighborhood of the equator, in Ecuador, are many notable peaks, among them Tunguragua, 16,690 feet; Cotopaxi, 19,613 feet; Chimborazo, 20,498 feet; Antisana, 19,335 feet; Cayambe, 19,186 feet; and Pichincha, 15,918 feet. From this knot of lofty volcanoes the system falls off in altitude northward toward the Isthmus of Panama and the shores of the Caribbean Sea, splitting into three ranges, which trend away from one another to the north and northeast.

East of the Andes the level of the land descends rapidly to the llanos of the Orinoco, the valley of the Amazon, and the pampas of Argentina. This great area, comprising by far the greater part of South America, is but slightly diversified by hills, forming mainly an immense plain. In eastern Brazil is a mountain system standing on a broad plateau, and composed of many ranges, trending in general parallel to the coast and having collectively a great breadth. The highest point in this system is

Itatiaia, with an altitude of 10,340 feet. A similar but smaller plateau occupies much of the area of the Guianas. See ANDES, etc.

The islands pertaining to this grand division belong mainly to North America. In the Arctic Ocean these land bodies are numerous and large, Greenland, almost continental in area, being the largest of them. West of Greenland, across Smith Sound, is the great extent of Ellsmere Island, with Axel Heiberg, and other islands west of it, and south of this are North Devon and Baffin islands, with many other large islands to the west, including Bathurst, Melville, Prince of Wales, North Somerset, Banks and Victoria islands, the whole forming an extensive archipelago in the Arctic Sea. In Bering Sea, on the northwest of the continent, are several smaller islands, while the chain of the Aleutian Islands, stretching in a great curve, convex southward, from the point of the Alaskan Peninsula, partly separates Bering Sea from the Pacific. On the east side of the continent, the great island of Newfoundland partially closes the mouth of the Gulf of St. Lawrence.

Mainly within the tropics, and lying between the northern coast of South America and the southeast coast of the United States, are the West Indies, with Cuba, Haiti, Jamaica, and Porto Rico, known collectively as the Greater Antilles, and many smaller islands grouped about and stretching away from them. They are the unsubmerged portions of a mountain system. On the north side are the Bahamas, consisting of a large number of small coral islands, and on the southeast, stretching in a broad curve, convex to the east, to the south American coast, are the Lesser Antilles,—all small, and many of them of volcanic origin. The best known among them are Guadeloupe, Martinique, and Trinidad. South America has few islands, the Falkland Isles, east of the Strait of Magellan, being the largest, if we except Tierra del Fuego, at the south end of the continent. Off the west coast, and under the equator, are the Galapagos Islands, once prominent as a source of guano.

Hydrography. *North America.*—While most of North America is drained into the Atlantic, great areas are drained into the Pacific and Arctic oceans. The Rocky Mountains, i.e., the easternmost ranges of the Cordillera, carry the continental divide, and most of the ranges and valleys of this system are drained westward to the Pacific by the Colorado River of the West, through its marvelous canyons to the head of the Gulf of California, by the Sacramento and San Joaquin, to San Francisco Bay, and by the Columbia, the Fraser, Copper, and other rivers. The northern and northeastern slopes of the system, as well as most of Alaska and much of the Yukon province of Canada, are drained by the great river Yukon to Bering Sea. The northern part of the great central depression of the continent sends its waters to the Arctic Ocean by way of the Mackenzie and Coppermine rivers. Farther south the land is drained to Hudson Bay by the Nelson and other rivers, and to the Atlantic directly by the chain of the great lakes, Superior, Michigan, Huron, Erie, and Ontario, and the river St. Lawrence. The waters of the southern part of this depression are collected by one of the greatest rivers of the earth, the Mississippi, with its branches, the Ohio, Missouri, Arkansas and Red rivers, and are carried to the Gulf of Mexico. The coast-land

of the Gulf of Mexico itself is drained by a number of rivers on either side of the Mississippi. The Atlantic slope of the Appalachian mountain system is drained to the Atlantic by many comparatively small rivers.

Besides the great lakes of the St. Lawrence system, North America contains many large bodies of water. In Canada are Great Bear and Great Slave and Athabasca lakes in the Mackenzie River system; lakes Reindeer, Winnipeg, Manitoba, and Lake of the Woods, which are drained to Hudson Bay, and Lake Nepigon, tributary to the St. Lawrence system. In the northern United States are thousands of small lakes, which, in common with those of Canada, were formed by the Laurentian glacier. In the Cordilleran region are many lakes, some of glacial origin, like Pend Oreille and Flathead, others of volcanic origin, like Yellowstone Lake, while many occupy desert valleys and have no outlet, like Great Salt, Carson, and Walker lakes. See YUKON RIVER; MISSISSIPPI, ETC.

South America.—South America is for the most part drained into the Atlantic Ocean, the Andes forming a great and continuous watershed; and while three great river systems carry most of the waters to the sea, yet a number of secondary but by no means small rivers aid them in this work. In the extreme northwest of South America, the Magdalena drains the region in which the Andes separate into diverging ranges before their subsidence. The area of its basin is not great, but the enormous rainfall sends great volumes of water through this river channel into the Caribbean Sea. The entire length of the Magdalena, independent of its windings, is not over 700 miles. The great valley at the extreme north of South America, lying between the Andes on the west and the plateau of Guiana on the east, is drained by the Orinoco, which, although not more than 1200 or 1400 miles long, not counting the windings, carries an immense volume of water into the Atlantic, because it, too, lies almost wholly within the belt of excessive rains. Between the Orinoco and the Amazon there are a number of short rivers draining the plateau of Guiana, and heading chiefly in the watershed between this section and the valley of the Amazon on the south. Next in order, proceeding southward on the Atlantic coast, is the mighty Amazon itself, whose system drains the great valley included between the plateau of Brazil on the southeast, the plateau of Guiana on the north, the Andes on the west, and the highlands of the Cordillera Geral and Matto Grosso on the south, thus embracing about one-third of South America. The Amazon pours a vastly greater quantity of water into the ocean than any other river on the globe. The plateau of Brazil is drained chiefly by the Tocantins, which flows to the north and empties into the Pará estuary; a number of smaller streams which flow northeast and enter the Atlantic between the mouth of the Pará and Cape St. Roque; the São Francisco, which has a generally northeastern direction, and a few smaller streams which drain the short eastern slopes along the whole extent of coast between the mouth of the São Francisco, lat. 10° S., and the estuary of the Plata, lat. 35° S. The Plata, which receives the waters of the Paraná, Paraguay, and Uruguay, drains the whole of the south central part of South America, from the Amazon watershed in lat. 15° S. to lat. 35° S., and embraced between

the coast sierra on the east and the Andes on the west. This great river system has been compared with the Mississippi River system, with which it has certain features in common. South of the Plata are a number of rivers, including the Colorado, Negro, and Chubut. On the Pacific coast the drainage is effected by short, torrential streams scarcely worthy the name of river. See AMAZON; ORINOCO, ETC.

Geology. The geological history of North America, considered in a broad way, is not complex. The oldest part of the continent, the first to be elevated above the sea, is the northwestern section, including the Adirondacks of New York and the Laurentian Highlands of Canada, and a region about the Great Lakes, together with a southward projection just east of the Blue Ridge in the Southern States. This is the Archæan area. From this, as a nucleus, the continent grew westward, as is indicated by the surface formations, which become successively more recent. The eastern portions of the Appalachians are in great part composed of Silurian beds. The plateau forming the western part of the system is Carboniferous, which formation also underlies much of the Mississippi valley. The great plains which form the eastward slope of the Cordilleran plateau are floored, in westward succession, by Triassic, Cretaceous, and Tertiary beds.

The mountains of the Cordilleran system are mainly of recent formation and show strata of all ages, as they have been much disturbed by uplift, and the beds exposed by subsequent erosion. Upon the mountains granitic rocks largely predominate, as the stratified beds which formerly covered them have been eroded away, while in very many cases these stratified beds still remain on the flanks of the ranges, as hog-back ridges. The valleys are often partially filled with detritus from the mountains. In this region many great areas have been covered by outflows of lava, some of them in very recent times. The regions bordering the coasts of the Atlantic and the Gulf of Mexico are floored with Cretaceous and Tertiary deposits, indicating their comparatively recent uplift. At present there are no active volcanoes in the United States proper or in Canada. The third greatest volcanic belt in the world is in Alaska, extending from Mount Wrangell for 1600 miles westerly along the Alaska peninsula and the Aleutian chain. Some of the volcanoes of this region are majestic in their proportions, like Iliamna, Redoubt, Shishaldin, and Wrangell, which range in height from 8952 for Shishaldin to 17,500 for Wrangell. Shishaldin is constantly active. There have been numerous violent eruptions in this field, the latest, highly destructive, the eruption of Katmai on June 6, 1912, a peak 7500 feet high, on the peninsula opposite Kodiak Island. Day was made night, and the town of Kodiak, 100 miles distant, was covered with ashes like a deep snow. Bogoslof peak, which rises out of Bering Sea northwest of Unalaska, forms and reforms its surface frequently, aided by the disintegrating action of the sea. In Mexico, Central America, and the West Indies there are many active volcanoes. See *Geology* under UNITED STATES; CANADA, ETC.

South America.—The eastern highlands are of Archæan and Palæozoic formations, with a superimposed layer of sandstone. No subsequent submergence has occurred, and no folding has taken place since Palæozoic times, so that

no recent marine deposits have been made, and the deep valleys are due to erosion rather than to irregular faulting, the rock layers lying horizontally. These eastern highlands are but the remains of a great mountain system which has been worn away to the existing condition in the filling up of the plains below, to which they have contributed their material. The western highlands (see ANDES), while of more recent origin than the eastern, are made up of ranges differing in geologic age. Most of the great peaks of the Andes are of volcanic origin, and many of them are still active, or have been eruptive in recent and historic times. The lowlands east of the Andes are, so far as known, floored with Tertiary deposits, with broad bands of alluvium bordering the larger streams. See *Geology* under BRAZIL; ARGENTINA, ETC.

Glaciation. In recent geologic times nearly all of Canada and much of the United States were covered by a great sheet of ice, the Laurentian glacier. In the United States it covered New England and New York, extended southward to the Ohio River and westward to the Missouri. Throughout this area the surface has been modified by erosion and deposition by ice. Stream courses have been changed, countless lake basins have been formed, and the surface covered with drumlins, kames, and other morainal deposits. In the northern part of the Cordillera evidences of former glaciation are everywhere abundant, and in the higher ranges many glaciers still exist. Indeed, in the mountains on the Alaska coast, where the precipitation is profuse, there are glaciers of great magnitude, many of which reach the sea. The Muir Glacier covers over 350 square miles, and there are others of equal size. In the fiords of Prince William Sound huge glaciers reaching tide water are common. Even these great glaciers, however, are but the much reduced relics of far larger ones, which covered the coast and eroded the fiords intersecting it.

In South America the glacial history, so far as known, is confined to the Andes. Most of the higher peaks, even those under the equator, have glaciers upon their upper slopes, while in the southern portion of the system glaciers are extremely abundant, and the configuration of the land shows that in past time they covered it, lying in every gorge and fiord, which are evidently products of ice erosion.

Climate. Stretching from the south temperate zone through the tropics to the north polar zone, America has many climates, dependent upon latitude, prevailing winds, and the distribution of the relief features. The main body of North America is principally within the region of the anti-trades or prevailing westerlies. These winds give to the western coast of the United States and Canada and to southeastern Alaska an insular climate with great uniformity of temperature and a heavy rainfall. Their influence extends inland but a short distance, owing to the mountain ranges which border this coast, and the rest of the United States and Canada have a continental climate with much greater extremes of temperature; the Cordilleran region, which is dependent upon the Pacific as its source of precipitation, has an arid climate; but in the east, where the Gulf of Mexico and the Atlantic serve as sources of supply, the rainfall is ample.

Central America is within the region of the trade winds and has measurably an insular cli-

mate, owing to the narrowness of the land. That portion of South America which lies in the tropics, over which the trade winds blow continuously from the east, has a warm, moist climate and a heavy rainfall. This region is limited on the west by the Andes, over whose wall none of the moisture from the Atlantic can pass. Hence most of the Pacific coast of South America within the tropics is a desert. In Chile and Argentina the conditions prevailing in North America are duplicated. Here in the south temperate zone the prevailing westerly winds bring to the western coast the mild, saturated atmosphere of the Pacific. The temperature is uniform throughout the year and the rainfall heavy; while east of the Andes the westerly winds, deprived of their moisture in crossing the mountains, blow dry over the land, and the semi-desert pampas are the result.

North America.—The mean annual temperature ranges from 80° F. in Central America down to 5° on the Arctic coast, and except on the Pacific coast the temperature decreases quite regularly with the latitude. On the Pacific coast the reduction in temperature with increase in latitude is much less rapid. At San Diego, on the southern boundary of the United States, the mean annual temperature is about 70°, while the Alaska coast, even as far north as Prince William Sound, has a temperature only 30° lower and 20° higher than in the same latitude on the Labrador coast. This measures the effect of the ocean in ameliorating the mean annual temperature.

In midwinter (January) the temperature ranges from 80° in the south to -25° on the Arctic coast. Here again the reduction with increasing latitude is much less on the Pacific coast than in the interior or on the Atlantic coast. The coast of southern Alaska is 30° warmer than that of Labrador in approximately the same latitude. The midsummer (July) temperature is highest on the arid plateau of northern Mexico and in southern Arizona, where it reaches 95°. Thence it diminishes in all directions, sharply to the west as the Pacific coast is neared, and much more gradually northward and eastward. The range of summer temperature between San Diego and the Aleutian Islands is but 20°, from 70° to 50°, while in the eastern part of the continent its range is from 80° to 40°, and in the Cordilleran region from 95° to 40°. In this latter region extreme heat as well as extreme cold is frequently encountered; in southern Arizona temperatures of 120° have been recorded, and 100° as far north as lat. 60°. On the Pacific coast the range of temperature between midsummer and midwinter (July and January) seldom exceeds 20°, while upon the Atlantic coast the corresponding range is nearly twice as great, and in the Cordilleran region it is in many places three times as great.

The distribution of rainfall over North America depends upon the configuration and relief of the land and on the direction of the winds. In the region of the trade winds the rainfall is very heavy, 200 inches at Panama, and diminishing northward. In the region of the anti-trades, the Pacific coast receives nearly all the moisture brought by these winds from the Pacific, and here the amount and distribution of the rainfall are radically affected by the relative temperatures of land and sea. Where and when the land is colder than the sea, moisture is condensed from the air currents and falls in

rain; the rainfall is therefore heavy on the northern part of this coast and light on the southern part, and is heavy in winter and light or entirely absent in summer.⁷

At San Diego the rainfall, even in winter, is very light, while at Puget Sound it has increased to from 75 to 100 inches, and has an average along the Alaska Pacific coast of about 90 inches annually, most of which falls in winter. Air currents from the Pacific, deprived of most of their moisture in passing over the mountain ranges near the Pacific coast, flow over the Cordilleran region during most of the year as dry winds. In the summer, however, they retain a little moisture, which they give up to the high ranges of the interior. Hence this region, which is upon the whole desert, or semi-desert, receives most of its scanty supply of rain, 20 inches or less, in the summer time.

Moving eastward, this general air movement from west to east, which commonly takes the form of great cyclones or anti-cyclones, draws air currents from all directions. These, coming off the Gulf of Mexico, are saturated with moisture and, cooling as they go northward, give rain to the land. Thus the great depression of the continent is watered in the main from the Gulf of Mexico, the rainfall ranging from 60 inches on the coast to 30 inches in the region of the Great Lakes and Hudson Bay. These cyclonic disturbances, as they approach the Atlantic, draw saturated air currents in from that ocean, and from that source of moisture the Atlantic coast is watered, the amount of rainfall ranging from 50 to 40 inches.

South America.—The southern continent has no such range of temperature as North America, since it lies on both sides of the equator. The annual temperature ranges from 80° to 40°, the highest temperature being in the northern part. The midwinter (July) temperature ranges from about 80° in the north to 35° in the south, and the midsummer temperature from 85° to 50°, the highest being in the interior, in northern Argentina. On the southern part of the west coast of South America, where the prevailing winds are from the west, the temperature is moderated by them as on the western coast of North America, making the winter temperature higher and the summer temperature lower. The greatest range between summer and winter is found in northern Argentina, a region corresponding in situation to the Cordilleran region in North America. Here the range between the hottest and coldest months is from 25° to 30°.

The great Amazon basin, lying within the tropics, is abundantly watered by the trade winds which come to it saturated from the Atlantic. The rainfall over this great area is estimated at from 50 to 75 inches and in some parts is 150 to 200 inches. This heavy rainfall extends to the foot of the Andes and even up its abrupt eastern slopes. The air currents, thus deprived of their moisture, descend the western slope as dry winds, and the narrow western base of the range receives little moisture. Farther south in southern Chile and Argentina, the conditions are reversed. The westerly winds bring rain to the narrow strip of land on the west coast, which receives as much as 80 inches in certain localities, and the pampas on the east receive very little, on account of the intercepting mountains.

Flora. North America.—The flora of North

America is varied, ranging from those plants peculiar to Arctic regions to those of the tropics. In the extreme northern part of Canada and Alaska, where the ground is constantly frozen, thawing only on the surface in the summer and forming the well-known tundra, the prevailing plant life consists of grasses, moss, with a few dwarf Arctic willows. But in the short, hot summers of this region even the tundra is gay with bright-colored blossoms. Near the Arctic Circle forests of spruce, with some birch and alders, appear, at first in scattering clumps, and then more continuously, especially along the river bottoms. Thence southward as far as the North Saskatchewan River, in Canada, the land is forested with coniferous trees, spruce, pine, fir and hemlock. This timbered area extends southward along the Pacific coast nearly to San Francisco Bay. In Washington, Oregon, and California exist probably the heaviest forests in the world, consisting entirely of coniferæ, great firs, sugar pines, redwoods, and the giant sequoia, the largest and the oldest living thing.

Eastern Canada and the United States are forested, the western limit including most of Minnesota, Wisconsin, and Indiana, southern Missouri, the eastern part of Indian Territory, and northeastern Texas. In the central United States the prevalent species change to hard woods, while in the southern States yellow pine becomes the dominant species. West of this forested region in the United States and Canada is the prairie region, once grassed and with groves of timber, now highly cultivated, which passes by insensible degrees into the treeless plains which form the eastern slope of the Cordilleran plateau.

In the Cordilleran region forests are, as a rule, found only on the mountains and consist mainly of coniferæ. The valley vegetation depends upon the degree of aridity; here may be found grass, artemisia, cacti, yucca, and other thorny desert shrubs, which in some localities grow so densely as to form what is called chaparral. Throughout a certain belt from northern Texas across New Mexico, Arizona, southern Colorado, and southern Utah, on mesas and the lower hills and mountains occur the piñon (*pinus edulis*) and the juniper. The northern plateau region of Mexico is without forests, except upon the higher ranges, while the southern and lower part of the country, with Central America, has a tropical profusion of fruit and vegetation. See *Flora*, under ROCKY MOUNTAINS; CANADA; UNITED STATES; MEXICO; NICARAGUA, ETC.

South America.—The flora of South America ranges from that of the tropical to that of the temperate zone and is controlled not only by latitude, but by altitude and rainfall. At the extreme north in Colombia, on the waters of the Magdalena, the hot climate and excessive rainfall produce a luxuriant vegetation which changes from its tropical character only with great change of altitude above the sea, palms, bamboos, and tree ferns forming much of the lower forests, and coniferæ higher on the mountains. To the east of this region are the llanos of the Orinoco, with their tall grasses and isolated trees. To the south of these, east of the Andes, are the great selvas of the Amazon, with their rich forests and mixed flora. Directly south of these occur the great forests of the Matto Grosso, to the east of which lie the Ca-

tinga woodlands and the Brazilian campos, with their thickets interspersed with open glades. To the west of the Matto Grosso lie the low mountains of southwestern Brazil and Bolivia. To the south of the Matto Grosso lies the Gran Chaco, with its wax palms and other rich forest growth. Still farther south begin the plains or pampas of the Plata, which, at first consisting of rich grasses, soon degenerate into the dry plains of southern Argentina, with their stunted and poor plant growth. The flora of the western strip of South America, which includes the Andean regions, is in general tropical or sub-tropical at low levels, and changes in altitudinal zones with increase of height above the sea level, but is much modified by the distribution of rainfall throughout the length of the continent, which permits of an abundant vegetable growth in the northern and southern portions, but greatly limits it in the intervening region of little rainfall. The potato is indigenous to South America. See *Flora* under ANDES; COLOMBIA; ECUADOR; PERU; BOLIVIA; CHILE; AMAZON; BRAZIL; ARGENTINA.

Fauna. In considering this subject, it must be recognized, first, that we here have to deal with two continental faunæ, for the animal life of North America is almost completely different from that of South and Central America. This unlikeness seems related in large degree to history and derivation. The fauna of North America is very similar to that of the northern zones of the Old World, in large part identical with it. Among mammals substantially similar to those of Europe or northern Asia are all the bears, wolves, the lynx, most fur-bearers (*Mustelidæ*), the bison, reindeer, moose ("elk" of Europe), bighorn, white goat, beaver, and the majority of the rodents, and small insectivores, bats, etc., where the differences are rarely more than generic. The peculiar North American mammals of note are the puma, the skunk, the pronghorn, the musk-ox, and certain rodents, as the pouched-rats and sewellel. The absentees are equally interesting. Although they arose in Tertiary North America, no horses, camels, or rhinoceroses are in its recent fauna; nor any true antelopes or swine (except in the extreme southwest); of marsupials a single form, the opossum, is present. The birds present a similar parallelism with northern Europe and Asia, many species, and nearly all the families, being common to both continents. The same is true of reptiles and amphibians, which are marked in North America by the preponderance of certain subordinate forms, such as the rattlesnakes, rather than by anything very different from those of the Old World. Fishes present somewhat greater distinctions, yet the bulk of fresh-water fish are similar to, and some are identical with, those of the colder parts of Europe. Insects and fresh-water mollusks seem generally related to those of Europe and Asia; but the United States is richer than any other part of the world in fluviatile mollusks, especially river mussels (*Unionidæ*). On the whole, the Nearctic fauna is closely allied to the Palæartic, and by some students they are united in a single grand division, termed "Holarctic," or "Triarctic."

South America, considered with reference to its fauna, includes Central America, the lowlands of Mexico, and the West Indies, and forms one of the grand zoögeographical divisions, named "Neotropical" by Selater. It is characterized by

richness and isolation, leading to the belief that its union with North America has been accomplished at a comparatively recent date and that the origin of its animal population is exceedingly remote and was followed by long isolation. It has eight families of mammals absolutely confined to it, including two families of monkeys, markedly different from those of the Old World (but no lemurs), the blood-sucking bats, and the greater part of the order of Edentates, and many peculiar rodents. The continent has no *Mustelidæ* or *Viverridæ*; only one kind of bear; almost no insectivora; no horses or related animals, except one species of tapir; no ruminants, except the cameloid llamas (not known elsewhere), and only a few small ungulates of any sort. Birds display still greater isolation and singularity when compared with the avifauna of the Old World or of North America. Wallace gives 23 families and 600 genera as exclusively Neotropical, while that continent or its northerly extensions possess the greater part of many other important families, such as the humming-birds (some 500 species), tanagers, and macaws, to which must be added a long list of peculiar sea-fowl. Among reptiles there are less peculiar forms, the boas and scytales being most conspicuous among snakes; but there are several local families of lizards and many genera, the iguanids being widely developed, while the *Varanidæ*, *Lacertidæ*, and *Agamidæ*, so characteristic of the Old World, are entirely absent from America. The Amphibia present a similar case. Fishes of fresh waters are enormously abundant, and their resemblance, as a whole, is to the African piscifauna, while many are survivors of very ancient types, such as lepidosiren. Similar facts might be adduced to show the regional exclusiveness of the insects and other invertebrates. On the whole, South America is characterized by the possession of a very uniformly distributed fauna, far more local and distinct than that of any other continent, unless it be Australia, probably more than four-fifths of its species being restricted to its zoögeographical boundaries. See DISTRIBUTION OF ANIMALS.

HISTORY

Discovery. Christopher Columbus, in 1492, added a new world to European commerce and civilization; but there can be little doubt that the Western Hemisphere to which Columbus opened the way had previously been visited by voyagers from the older world. There is nothing inherently impossible in the stories that Japanese or Chinese vessels, blown by storms or carried by the Pacific currents, reached the western coast of North America. The most circumstantial of these tales relates that some Chinese Buddhist priests in the fifth century A.D. reached a land of Fu-sang, and successfully returned with the account of their adventures in what some critics have thought was the country now known as Mexico, but which is now generally believed to have been Japan. From Europe the earliest visitors to America came by way of Iceland, and the story of their experiences, though it does not satisfy all the demands of modern historical criticism, may safely be deemed true in its principal details. In 876 Gunnbjörn, a sea rover, while on his way from Norway to the new Norse settlement in Iceland, was blown westward until he sighted an unknown land. A

century later, about 985, a restless young Norwegian named Eric the Red succeeded in verifying the stories which had been handed down from Gunnbjörn's time and in establishing a settlement on the shores of the land to which, with the idea of attracting colonists, he gave the name of Greenland. Two years or so after this, Bjarni Herjulfson, while in command of a ship in which he had set out to visit the Red Eric's settlement, encountered storms that drove him, as he reported, southward until he came in sight of land.

In the year 1000 Leif, Eric's son, started to explore Bjarni's land. He came first to a barren shore backed by ice-covered mountains, a description which suggests Labrador. Sailing south, he met with more pleasant regions, to which he gave the names of Markland and Vinland. Many attempts have been made to identify these localities, and Newfoundland and Nova Scotia perhaps best answer the essential conditions. At Vinland a flourishing settlement was established and maintained for several years, and there Gudrid, the wife of Thorfinn Karlsefni, gave birth, in 1007, to a son, Snorri, from whom the sculptor Thorwaldsen claimed descent. Many localities—Newport and Dighton, on Narragansett Bay; Cambridge and Waltham, on the Charles; Salem, indeed, well-nigh every town situated beside a pleasant river northward from Long Island—have laid claim to this Norse settlement, regarding the actual situation of which, however, nothing certain is known. During the succeeding 500 years many voyagers may have crossed the Atlantic, but none of them left any proof of their work. Madoc, son of Owen Gwynedd, a Prince of Wales, is said by Humfrey Lloyd, in a book printed in 1559, to have sailed westward and to have established a transatlantic Welsh colony in 1170. The Venetian brothers Zeno, between 1380 and 1390, probably made a voyage from the Shetland Islands to Iceland and Greenland, and in their letters home to their Italian brethren they seem to have given a picturesque account of what they had learned about the country lying still farther to the southwest. French, Breton, and Basque fishing vessels very likely visited the cod banks in the western Atlantic during the fifteenth century; but if they did, they were careful not to let the information of their valuable discovery reach their rivals.

Consecutive discovery and exploration began with the voyage of Christopher Columbus in 1492. (For a full account of his expeditions, see COLUMBUS, CHRISTOPHER.) In 1493 and 1494 Columbus established the main features of the islands in the West Indies. In his third voyage, 1498, he touched at Trinidad and followed the mainland for some distance; and in 1502-04 he coasted from Yucatan to Venezuela. Meanwhile, in 1497, John Cabot sailed from England and reached the neighborhood of the Gulf of St. Lawrence; but many years passed before the identity of the land, which served as headquarters for the hosts of fishing boats frequenting the banks, with that of the New World of the Spaniards was definitely determined. It appears probable that almost simultaneously with Cabot's landing on the American continent Pinzon (accompanied by Vespucci) discovered Central America. A succession of voyages now rapidly extended geographical knowledge of the coast line of the Mexican Gulf and northeastern South America. In 1499

Ojeda and Vespucci coasted the northern shores of the southern continent, naming Venezuela, 'the little Venice,' and uniting this coast with the territory visited by Columbus. Pinzon, early in 1500, reached Brazil, entered the mouth of the Amazon, and crossed the equator, reaching 8° 20' S. on the Brazil coast. Cabral, in 1500, too, was blown to the same coast while trying to follow the route of Vasco da Gama to the East Indies and thus established the Portuguese claim to a part of America. Vespucci, transferring his services to Portugal, in 1501 followed the coast from Cabral's Land nearly to the mouth of the Plata. These were the official recorded voyages; but the extent and importance of the information secured by the surreptitious voyagers who were striving to gain a part of whatever the new-found lands had to offer is best shown by the fact that though Cuba was not officially circumnavigated until 1508, by Ocampo, nevertheless, it is represented as an island on La Cosa's map of 1500 and on the Cantino Portuguese map of 1502. As soon as it was realized that a vast land mass still barred the way to India and Japan, the problem of foremost importance became that of finding a water route through or around the western continent. The way was found in 1520 by Fernão Magalhães, commonly known as Magellan. Magalhães sailed so directly for the strait which now bears his name that it has been surmised that he already knew of its probable existence from the captains of merchant vessels who had explored the coast to the extreme south in their search for trading chances, and, indeed, it is depicted on a globe made before the voyage of Magalhães. (This globe was made by Johann Schöner, 1515. A copy of it is in the city museum of Frankfort, Germany. Magalhães passed through the strait in Oct.-Nov., 1520.) From the western end of the strait Magalhães laid his course to the East Indies. There, on one of the Philippine Islands, he was killed in April, 1521; but Juan Sebastian del Cano, in command of the *Victoria*, prosecuted the voyage successfully, and reached Seville in September, 1522, by way of the Cape of Good Hope, having circumnavigated the globe for the first time.

The exploration of the interior demanded attention as soon as the main features of the coast had been determined. In 1513 Vasco Nuñez de Balboa ascended one of the peaks in the range which forms the isthmus of Panama, and looked down upon a south sea, to which Magalhães, a few years later, gave the name of Pacific, because of his calm and pleasant passage. Cortes, in 1519, set out from Cuba to investigate the persistent gold rumors from the West, and landed at a port to which he piously gave the name of Vera Cruz. Two years later he had mastered the geography, as well as the people, of central Mexico, and within the ensuing ten years his captains traversed a large part of the Central American region, reaching the Pacific by several routes. In 1527 Cortes built a fleet on the western coast, which he dispatched to the Moluccas under Alvaro de Saavedra, for the purpose of coöperating with an expedition commanded by Sebastian Cabot, who had, however, turned aside from his original purpose of sailing to the East Indies by way of the Strait of Magellan, and was spending three years in ascending nearly to the head waters of the Plata. In 1536 Cortes found Lower California, which

was supposed to be an island. In 1539 Francisco de Ulloa determined it to be a peninsula. This, however, was forgotten, and in 1540 Alarcón proved its continuity with the mainland by his trip up the Colorado River of the West. Similarly, in 1512, Ponce de Leon discovered the "island" of Florida, which Pineda, in 1519, definitely connected with the continent by a voyage along the coast from Florida to Vera Cruz. Ponce de Leon was followed by Narvaez, Cabeza de Vaca (the latter making the first journey of a European across the continent to the west coast of northern Mexico, in 1536), and Fernando de Soto, whose explorations, combined with that of Vasquez Coronado from Mexico to the Kansas-Nebraska prairies, had, by 1545, made known the principal features of central North America south of the Missouri and Ohio rivers.

Francisco Pizarro was the successful discoverer of the truth in the reports of a rich land southward from Panama, of which the settlers had heard from the time of their first visit to the isthmus. Between 1531 and 1534 Pizarro brought the Inca Empire of Peru within the limits of the known world, while his associate, Diego de Almagro, pushed on farther south into the plateau of northern Chile. Gonzalez Pizarro, in 1540-41, crossed the Andes and reached the head waters of the Amazon, which one of his companions, Francisco de Orellana, followed down to its mouth, reaching the sea in August, 1541. The reports of a large river in the northeastern part of the southern continent caused much confusion in the handiwork of European map-makers, and it was a long while before they succeeded in evolving two distinct river systems. It is often quite impossible to determine from the narratives of early explorers in the interior whether they are describing the Orinoco or the Amazon. The latter was known at first by several names, among them *Marañon* and *Orellana*; but the name given for the tribe whose female warriors, with their men, fought *Orellana* and thereby suggested the original Amazon myth of the Old World, eventually became the accepted designation. The other great river system, that of the *Plata*, was first visited in 1515 by De Solis, whose name clung to it for several years, until after the explorations of Sebastian Cabot and Diego Garcia in 1527-30. The only remaining section of South America, from the Strait of Magellan northward to Chile, which had been explored to 40° south by Valdivia in 1540, is not known to have been visited until the latter part of the century, when Drake and his fellow freebooters undertook to tap the sources of Spanish wealth. Drake started off on a mission of vengeance for the injuries he had brought upon himself in the West Indies in the winter of 1577-78. Sailing through the Strait of Magellan, he followed up the west coast, plundering as he went, until he had filled his vessels with Spanish treasure. Learning that his enemies were watching to attack him when he should return through the strait, Drake decided to seek some other way home to England. He tried first for a northwest passage; but the season was not propitious, and after visiting the California coast and annexing it to the British crown under the name of New Albion, he turned westward and completed the first English circumnavigation in 1580.

John Cabot showed the way to the Newfoundland Banks, and it is probable that English,

Breton, and Basque fishermen visited the neighboring coasts regularly from the very beginning of the sixteenth century. They added little, however, to the general geographical knowledge of the country. Gaspar de Cortereal visited the St. Lawrence region or the Labrador coast in 1500-01, and Jean Denys of Honfleur was on the Newfoundland coast in 1506. By chance a record of these voyages has been preserved. Many similar voyages must have been undertaken, but all traces of them are lost. In 1524 Giovanni de Verrazano, sailing with a commission from the French King, followed the North American coast for a long distance, perhaps from Cape Fear as far as Cape Race. He entered the mouth of the river later called the Hudson and is the first European on record to do so. His narrative provides the earliest description of many of the characteristic features of the coast. At one point he saw open water beyond low-lying land, such as the narrow islands which protect the Albemarle and Pamlico sounds, and he guessed that this might be the much-sought Southern Sea. In consequence, many of the maps of the ensuing years represent a vast gulf of the Pacific, entering from the west and occupying the larger part of the northern continent, being separated by a narrow isthmus from the Atlantic. In 1534 and 1535 Jacques Cartier entered the Gulf of St. Lawrence and sailed up the river as far as the present site of Montreal, where he heard of the Great Lakes—another hopeful clue to the longed-for water passage to the east. During the second half of the century, attempts at settlement led to a more careful determination of the details of the north Atlantic coast. St. Augustine was founded in 1565. Raleigh's famous "lost colony" on the Carolina or "Virginia" coast was established in 1587, and the attempts to determine the fate of the settlers led to several voyages during the next two decades, by means of which the coast was more or less carefully examined from New Jersey southward. Farther north, the work of Gosnold in 1602, Pring in 1603, Champlain and Weymouth in 1605, and in 1609 Hudson, who entered the river bearing his name, marked out the courses which were followed year by year by a constantly increasing number of vessels.

Champlain settled Quebec in 1608, and began the systematic exploration of the interior by visiting the lake which preserves his name in 1609. In 1615 he penetrated to Lake Huron. Traders and missionaries year by year pushed their way farther up the river and along the lakes. Père Allouez, in 1665, founded a mission on the southern shores of Lake Superior, and in 1672, accompanied by P. Dablon, he made a tour through Wisconsin and Illinois. A year later Marquette and Joliet reached the Upper Mississippi. In 1679 La Salle began his career by a voyage from Niagara to the southern end of Lake Michigan. Hennepin, one of La Salle's companions, crossed to the Mississippi, which he followed up as far as Minneapolis in 1680. Two years later La Salle made a trip down the Ohio to the Mississippi and on to the Gulf of Mexico, establishing the claim of France to the whole of the interior of the continent.

Henry Hudson, in 1610, entered the bay to which his name has been attached, and there, with several others, he was left in an open boat by his mutinous sailors. Some years earlier, in 1592, Juan de la Fuca, in a Spanish vessel, prob-

ably entered the sound on the western coast which was more carefully explored and named by Captain Vancouver exactly 200 years later, and carried home a report that he had seen a vast stretch of open water extending eastward. The attempts to find a way between these two bays, the search for the Northwest Passage, belongs to the article on Arctic discovery. The discovery of the interior of Canada was largely accomplished by the trappers and agents of the Hudson's Bay Company, which was organized in 1670; but it was not until 1738-1743 that Pierre Gaultier Varenne de la Verendrye and his sons made known the vast extent of the country lying east of the northern Rocky Mountains. The sons went as far as, probably, the Wind River Mountains, in 1742-43. In 1769-72 the fur-trader Hearne traced the Coppermine River to the sea, and in 1793 Mr. (afterward Sir A.) Mackenzie, while crossing the continent for the first time north of Mexico, from the Atlantic to the Pacific, discovered the course of the river to which his name has been given. In 1776 Escalante and Dominguez, two Spanish priests, traveled north from Santa Fé to Utah Lake, thence south to the upper Virgin River, and east and south to Zuñi and Santa Fé.

The real exploration of what is now the western part of the United States did not begin until after the republic had acquired some of that region. As soon as the Louisiana purchase had been concluded, Jefferson dispatched Lewis and Clark to investigate the course of the Missouri and determine its relation to the Pacific, which they did by descending the Columbia to the sea, their journey occupying the years 1804-06. Pike, meanwhile, was traversing the country between the head waters of the Mississippi and Red rivers, and afterward, 1806, he went to the Rocky Mountains south of the peak which now bears his name, but which he did not climb, examining it from another height. Pike's Peak was named by Long, James Peak, after his botanist, who was the first white man on record to reach its summit. Pike trespassed on Mexican territory and was captured, being later released in Mexico. He did not find the Red River of that region of which he was in search.

Among the other explorers of the United States in the first half of the nineteenth century were Ogden, General Ashley, Jedediah Smith, Joseph Walker, James Bridger, Long, Bonneville, Schoolcraft, Catlin, Nicollet, and Frémont. Among their successors in the second half of the century were Ives, Wheeler, Whitney, Hayden, and Powell. The list of explorers of British America and Alaska in the nineteenth century embraces Sir John Franklin, Back, Richardson, Beechy, Dease, Simpson, and Rae, whose activity lay in the realm of Arctic exploration, and Bell, Selwyn, Dawson, Dall, Muir, Allen, Schwatka, Ogilvie, Russell, and Low. Of the many explorers of South America in modern times mention may be made of Humboldt, Maximilian of Wied, Spix, Martius, Auguste de Sainte-Hilaire, Orbigny, Pöppig, the brothers Schomburgk, Darwin, Avé-Lallemant, Tschudi, Castelnau, Burmeister, Herndon and Gibbon, Chandless, Crevaux, Bates, Karl von den Steinen, and Ehrenreich. Among the explorers of the Andes in recent times have been Reiss, Stübel, Whymper, Fitzgerald, and Conway.

Colonization. Before Columbus left the newly discovered West India Islands in January,

1493, he built a fort on Española, now Haiti. Here some 40 of his sailors remained to form a settlement which should serve as headquarters for the further discoveries that Columbus expected to make as soon as he could return to the new world. These first Spanish colonists were killed by the Indians, but their places were taken by others, numbering between 200 and 300, who accompanied Columbus on his second voyage. During the early months of 1494 the town which they built, named in honor of the Queen, Isabella, rapidly assumed the appearance of a flourishing city. During the next 10 years a constant stream of settlers, many of them accompanied by their families, flowed from Spain into the new city. Many of these remained there to practice the trades necessary to town life, while others took farms near by or went on to assist in building up the newer towns which were being established at every good harbor and in the mining districts. These places became in a surprisingly short time practically self-supporting, and they were soon able to supply men and equipment for further exploration. Cortes drew from Cuba whatever he needed for his enterprise of 1519, a debt which Mexico repaid by furnishing the supplies for the large expedition which Vasquez Coronado led through the present Arizona and New Mexico to the great buffalo plains of the Mississippi valley in 1540-41. Moreover, Almagro and Pizarro drew from Panama the means for their adventurous expeditions into Peru and Ecuador, and these countries furnished the supplies to send Valdivia southward into Chile (1540), and Orellana and Ursua (see AGUIRRE) to explore the trans-Andean regions. By 1550 the Spanish-American settlements were firmly established, with every prospect of developing into powerful and wealthy colonies. Unluckily, the home government in Spain persisted in retaining all the administrative authority in the hands of officials appointed in Europe. As a result, the colonists were subjected to a succession of incompetent, corrupt governors, ignorant of American conditions, and desirous only of securing the greatest annual revenue for themselves and for the royal treasury. Deprived of all the incentives of public service, the Spanish-Americans suffered a steady decline in social and intellectual tone, very similar to that which was so noticeable in the northern English colonies between 1690 and 1750. Missionary zeal supplied almost the only active force for extending the colonial limits. The Jesuits built up a very remarkable domination over the natives along the upper Paraná and Paraguay, and north of Mexico the Franciscans, although driven out of New Mexico by the native "rebellion" of 1680, eventually succeeded in laying the foundations for permanent settlements in that region. During the eighteenth century there was a flourishing provincial life along the upper Rio Grande del Norte, the strength of which may be inferred from the fact that the first printing press west of the Mississippi, in what is now United States territory, was set up about 1737 in the town of San Fernando de Taos, New Mexico, which is still many miles from any railway. The Franciscans, Dominicans, and Jesuits sent their friars into Alta, or Upper California, and the mission buildings whose ruins are now so carefully cherished were begun at San Diego in 1769. Before the end of the century 17, in all, had been established, and by 1820 three more were

added, making a total of 20. Soldiers and ranchers followed the priests, and by 1800 the Spanish settlements were scattered thickly along the Pacific coast as far north as the Bay of San Francisco, and they were numerous in New Mexico in the valley of the Rio Grande.

Portugal began to colonize the eastern coast of South America in 1531, in order to maintain its claim to what is now Brazil against the Spanish, who were locating everywhere else on the new continent. A few settlements along the coast, however, were all that resulted until early in the eighteenth century, when the Portuguese tried to develop the country as a substitute for the East Indian possessions which the English and Dutch had taken from them. There was little European impress upon the country, however, before 1808, when the Portuguese court emigrated to Rio de Janeiro, which became for a while a pseudo-European capital. In 1821 King John VI went back to Portugal, but he left his eldest son, Dom Pedro, as Emperor. Extensive Brazilian estates were granted to his European retainers, and foreign capital began to be introduced. The country was developed for investment rather than colonization. There was no extensive taking up of the land by Europeans until the second half of the nineteenth century, when Italians, Germans, and Poles turned their attention to this region.

The French colonization of North America began with De Monts' settlement on the Bay of Fundy in 1604. The English (see ARGALL) effectually stopped all efforts to extend these settlements along the Maine coast, and so Champlain undertook to open up the interior by way of the St. Lawrence River. Quebec was settled in 1608 and Montreal in 1642; but these towns grew rapidly as trading and shipping places rather than as centres for colonization. A few other towns were started along the lines of communication with the trapping and hunting regions around the great lakes, as headquarters for trade with the Indians. As the competition with England for the possession of the country south of the lakes became keen, military posts, of which Fort Duquesne is the best known, were established on the Ohio and the Mississippi, to emphasize and protect the French claims. Nowhere was there much actual possession of the soil. When, in 1763, England secured the whole of French North America east of the Mississippi, the greatest part of it was open for settlement by her own people.

The English, like the other European nations, began by establishing outposts, first for the fishermen on Newfoundland before 1570, and in 1585 on the Carolina coast for the purpose of extending the search for gold and treasures inland. Religious and political conditions, however, changed the character of the English emigration to America soon after 1600. In 1620 and 1630 the Pilgrims and Puritans established themselves along Massachusetts Bay, with the deliberate purpose of becoming permanent inhabitants of the country. A few years earlier, in 1607, a Church of England colony had been attempted at Sagadahoc, now Popham Beach, on the Maine coast; but it made no permanent impression on New England. The same year a settlement was started at Jamestown, in Virginia, a successor to Raleigh's "lost colony" of 1587; and after many vicissitudes this gradually acquired a permanent character. The English Roman Catholics had held themselves ready to emigrate if

necessary throughout the reign of Elizabeth, but it was not until 1634 that they prepared a place for themselves in Lord Baltimore's grant of Maryland. The development of New England, beginning with the "great immigration" of 1630, was very rapid. In 1635 the "Bay Colony" was able to spare a large body of people, who, disagreeing with the majority in some minor matters of doctrine, preferred to live by themselves along the Connecticut River. A year later, others who differed from the Boston elders in opinions regarding more vital points of dogma formed the Providence Plantations as a refuge for those who desired religious liberty. The Southern colonies were settled more slowly, the formal organization of colonial governments (the Carolinas in 1663 and Georgia in 1733) being brought about partly by the necessity of counteracting the extension of the Spanish settlements north and west from St. Augustine (founded in 1565). St. Augustine and Chamita, New Mexico (founded 1598), are the oldest European towns in the United States. Santa Fé was founded in 1605.

The Dutch promptly organized trading posts along the river explored by Hudson in 1609, and sent over a large body of colonists during the next 10 years to hold the country. Rivalry with the English on the east, and with the Swedes, who settled on the Delaware in 1638, prepared the way for the absorption of the latter by the Dutch in 1655, and in turn for the occupation of the Dutch territory by the English in 1664.

French trappers and frontiersmen wandered up and down the Mississippi and along its western tributaries in steadily increasing numbers from the time of La Salle's voyage down the river in 1682. By 1803, the year of the Louisiana purchase, these men and their descendants were scattered widely over the western plains, drawing their supplies from the large village at St. Louis or the small town of New Orleans. tics was largely responsible for the annexation, in 1845, of Texas, and the same force, acting in advance of economic or agricultural reasons, led to the organization of the emigrant aid societies in 1854 to hasten the settlement of Kansas and Nebraska. Gold was discovered in California at least as early as 1841, but it was the dramatic discovery in 1848, at Sutter's Mill, that excited the world. Its discovery in Nevada a decade later, and in the Klondike in 1897, resulted in opening up those regions. For further information, see special articles under the political divisions of the continent.

Bibliography. GENERAL FEATURES, PHYSICAL

DIVISIONS. A comprehensive work is, Reclus, *Nouvelle géographie universelle*, vols. xv-xix (Paris, 1890-94), translated and edited by Keane and Ravenstein (London, 1890-95). The following monographs comprised in Stanford's *Compendium of Modern Geography and Travel* are comprehensive: Dawson, *North America, Canada, and Newfoundland* (London, 1897; revised edition preparing, 1913); Gannett, *North America; The United States* (London, 1898); Keane, *Central and South America* (London, 1909). Consult, also, in general: *The National Geographic Magazine* (Washington, 1888 et seq.); *The American Geographical Society Journal and Bulletins* (New York, 1852 et seq.); Humboldt, *Examen critique de l'histoire de la géographie du Nouveau Continent* (new ed., Paris, 1836-39); Perez, *Geografía general del Nuevo Mundo* (Bogotá, 1888); Sievers (editor), *Amerika. Eine allgemeine Landeskunde* (Leipzig, 1894; 2d ed., 1913); Dupont, *Notions de géographie générale et géographie physique, ethnographique, politique et économique du continent américain* (Paris, 1900); Hellwald, *Amerika in Wort und Bild* (Leipzig, 1883-85); Shaler, *Nature and Man in America* (New York, 1891); Russell, *Volcanoes of North America* (New York, 1897); Russell, *Glaciers of North America* (Boston, 1898); Wright, *Ice Age in North America* (Oberlin, Ohio, 1911); Powell, "Physiographic Regions of the United States," *National Geographic Monographs*, vol. i (New York, 1895); Shaler (editor), *United States of America* (New York, 1894); Comte d'Ursel, *L'Amérique du Sud* (2d ed., Paris, 1879); Child, *The Spanish-American Republics* (New York, 1891); Thomas, *Explorations dans l'Amérique du Sud* (Paris, 1891); Vincent, *Around and About South America* (New York, 1890); Charles Johnson Post, *Across the Andes* (1912); Hiram Bingham, *Across South America* (1911); Chase S. Osborne, *The Andean Land* (1909); James Bryce, *South America, Observations and Impressions* (New York, 1912); Burmeister, "Die Südamerikanischen Republiken, Argentina, Chile, Paraguay, und Uruguay," in *Petermanns Mitteilungen, Ergänzungsheft 39* (Gotha, 1875); *Reports of the Princeton University Expeditions to Patagonia, 1896-99*, edited by Scott (Princeton, 1901 et seq.); H. H. Bancroft, *Native Races of the Pacific States of North America* (1874-76); papers of the Archæological Institute of North America (1881 et seq.); publications of the American Bureau of Ethnology; publications of the Smithsonian Institution and Peabody Museum.

GEOLOGY. *United States Geological Survey Annual Reports* (Washington, 1885 et seq.); *United States Geological Survey Bulletins* (Washington, 1884 et seq.); *United States Geological Survey Monographs* (Washington, 1890 et seq.); Suess, *Das Antlitz der Erde* (Prague, 1883-88); *Boletín del Instituto Geológico de Mexico*, Nos. 1-14 (Mexico, 1895-1900); Darwin, *Natural History and Geology of the Voyage of the "Beagle"* (London, 1809); Darwin, *Geological Observations on Volcanic Islands of South America* (London, 1892); Steinmann, "Sketch of Geology of South America," in *American Naturalist*, vol. xxv (Salem, Boston, Philadelphia, 1891); Salisbury, *Outlines of Geologic History, with special reference to North America* (Chicago, 1910).

HYDROGRAPHY. *Reports of the United States Coast and Geodetic Survey, Geological Survey,*

and Department of the Interior (Washington); *United States Hydrographic Office Publications* (Washington, 1867 et seq.); Newell, "Report of Progress for 1893 et seq., United States Division of Hydrography," *Geographical Survey Bulletins* 131, 140 (Washington, 1893-95); Russell, *Lakes of North America* (Boston, 1895); Russell, *Rivers of North America* (Boston, 1898); Ray, "Navigation of the Gulf of Mexico and Caribbean Sea," *United States Hydrographic Office, No. 86* (Washington, 1898); Humphrey and Abbott, "Report on the Physics and Hydraulics of the Mississippi River," *United States Army Corps of Topographical Engineers, Professional Paper No. 13* (Washington, 1876).

CLIMATE. Publications of the United States Weather Bureau (Washington); of the various State Weather Series of the United States; of the Canadian Meteorological Office (Toronto); and of the Mexican Weather Service, *Observatorio Meteorológico Central* (Mexico); Waldo, *Elementary Meteorology* (New York, 1896); Greely, *American Weather* (New York, 1888); Gould, *Annales de la Oficina Meteorológica Argentina* (Buenos Ayres, 1878); Arctouski, *Studies on Climate and Crops* (New York, 1910); *A New Theory on Pacific Coast Climate* (Honolulu, 1909); Denison, *Climates of the United States* (Chicago, 1907).

FLORA. Britton and Brown, *Illustrated Flora of the Northern United States, Canada and the British Possessions* (New York, 1896-98; 2d ed., 1913). Heller, "New and Interesting Plants from Western North America," in *Torrey Botanical Club Bulletin*, vol. xxvi (New York, 1899); Small, "Notes and Descriptions of North American Plants," in *Torrey Botanical Club Bulletin*, vol. xxv (New York, 1898); Berg, *Physiognomy of Tropical Vegetation in South America* (London, 1854); Rusby, "Enumeration of Plants Collected in South America," in *Torrey Botanical Club Bulletin*, vols. xv, xx, xxii, xxv, xxvii (New York, 1888-96-98, 1900); Goodale, *The Wild Flowers of America* (Boston, 1887); Hervey, *Beautiful Wild Flowers of America* (London, 1878); Newhall, *The Trees of Northeastern America* (New York, 1891); Newhall, *The Shrubs of Northeastern America* (New York, 1893); Newhall, *The Vines of Northeastern America* (New York, 1897); Sargent, *The Silva of North America* (Boston, 1890-91); Heller, *Catalogue of North American Plants North of Mexico* (Lancaster, 1900); Gray, *Synoptical Flora of North America* (New York, 1886-95-97); Scribner, *American Grasses*, parts i-iii (United States Department of Agriculture, Washington, 1897-1900); Lesquereux and James, *Manual of Mosses of North America* (Boston, 1884-95); Harshberger, *Phytogeographic Survey of North America* (New York, 1910); Bowman, *Forest Physiography* (New York, 1911).

FAUNA. For bibliography of American fauna, consult the authorities referred to under the individual countries, and under such heads as BIRD; INSECT; MAMMALIA; DISTRIBUTION OF ANIMALS, ETC. The one work best outlining American zoölogy is the *Standard Natural History*, edited by Kingsley (Boston, 1885). Consult also: Wallace, *The Geographical Distribution of Animals* (London and New York, 1876); Merriam, "The Geographic Distribution of Life in North America," *Proceedings of the Biological Society*, vol. viii (Washington, 1892); Elliot, *North American Shore Birds* (New York, 1895); Elliot, *Game Birds of North America* (New

York, 1897); Elliot, *Wild Fowl of North America* (New York, 1898); Apgar, *Birds of the United States* (New York, 1898); Cope, "The Crocodiles, Lizards, and Snakes of North America," *United States National Museum Report*, 1898 (Washington, 1900); Goode, *American Fishes* (New York, 1888); Edwards, *The Butterflies of North America* (New York, 1868-88); Scudder, *Butterflies of the Eastern United States and Canada* (Cambridge, 1888); Scudder, *Brief Guide to the Common Butterflies of the United States and Canada* (New York, 1893).

HISTORY AND DISCOVERY. For the discovery and colonization of the American continent, consult: Winsor, *Narrative and Critical History of America* (Boston, 1884-89); Bourne, *Spain in America* (New York and London, 1904), is an excellent work. This work is valuable for its careful study of the sources of information and for its copious bibliography. For a popular and concise but on the whole scholarly treatment of the subject, consult Fiske, *The Discovery of America* (Boston, 1893). Henry Harrisse, *The Discovery of North America* (Paris, 1897), is a scholarly and ample work. The best books on special topics will be found under the individual explorers, countries, and colonies. See also Larned, *Literature of American History, a Bibliographical Guide* (Boston, 1902); Channing, Hart, and Turner, *Guide to the Study and Reading of American History* (Boston and London, 1912).

AMERICA. An American national hymn, by the Rev. Samuel F. Smith (1832). The melody, ascribed to Henry Carey (1742), is identical with that of the English national anthem, "God Save the King," and, popular in France from 1775, became national in Denmark, Germany, and Prussia. Consult E. Bohn, *Die Nationalhymnen der europäischen Völker* (Breslau, 1908).

AMERICA. The name of the schooner-yacht which in the international yacht race of 1851 won the cup since known as the "America's Cup." See YACHT.

AMERICAN, THE. A novel published in 1877 in Henry James's "earlier manner." The central character, Christopher Newman, while traveling in Europe for pleasure, falls in love with a Frenchwoman of noble birth. The way in which James brings out the inevitableness of Newman's failure in his suit for her hand is the striking feature of the book.

AMERICAN ALL'SPICE. See CALYCAN-THUS.

AMERICAN AL'OE. See AGAVE.

AMERICAN AS'SOCIA'TIONS AND SOCI'ETIES. For descriptions of associations and societies whose official titles begin with the word "American," see names of subjects in which such organizations are interested. Example: For the American Academy of Political and Social Science, see POLITICAL AND SOCIAL SCIENCE, AMERICAN ACADEMY OF.

AMERICAN BAP'TIST MIS'SIONA'RY UNION. See MISSIONS.

AMERICAN BLIGHT. A term used abroad for the injurious effects upon trees or plants of plant-lice of the cosmopolitan genus *Schizoneura*, especially *Schizoneura lanigera*. For a general description of the ravages of plant-lice and the best methods for their destruction, see APHID. Consult *Circular No. 20*, Div. Entom., U. S. Dept. Agriculture (Washington, 1898).

AMERICAN BOARD OF COMMIS'SION-

ERS FOR FOREIGN MIS'SIONS. See MIS-SIONS.

AMERICAN COM'MONWEALTH', THE. A historical and critical work on the social and political institutions of the United States, by the Right Hon. James Bryce (q.v.). It was first published in 1888. A much enlarged edition appeared in 1893-95, and a new edition, completely revised by the author and with additional chapters, was published in 1910. Whether considered as a text-book for colleges and universities, or as a guide for the average reader who wishes to understand the structure and true spirit of the institutions of the United States, *The American Commonwealth* is probably the most authoritative and widely read work on the subject of which it treats.

AMERICAN COUS'IN, OUR. One of the best known plays of the English dramatist, Tom Taylor (1858), very popular a generation ago. The unimportant character, Lord Dundreary, became in the clever creation of E. A. Sothorn a great part. For Americans, however, the drama must always possess melancholy associations, for it was while enjoying its presentation that Lincoln was assassinated.

AMERICAN FLAG, THE. See FLAG.

AMERICAN FORK. A city in Utah Co., Utah, 32 miles south of Salt Lake City, on the Denver and Rio Grande and the San Pedro, Los Angeles, and Salt Lake railroads (Map: Utah, C 2). Pop., 1900, 2732; 1910, 2797.

AMERICAN IN'STITUTE OF THE CITY OF NEW YORK. An organization to promote, by means of exhibitions and fairs, the interests of agriculture, commerce, manufactures, and arts in the State and country. The institute was founded in 1828, and its fairs attracted wide attention from investors and capitalists. Among the inventions which received early recognition from the institute were the McCormick reaper, the sewing machine, Colt's fire-arms, the type revolving and double power printing press machines, the first anthracite coal burning stove, the Morse telegraph, the stocking loom, the telephone, and the Francis metallic lifeboat and life-saving appliances. The American Institute now embraces in its organization five sections: The Farmers' Club, the Electrical Section, the Horticultural Section, the Photographic Section, and the Polytechnic Section. It has a valuable scientific library of over 15,000 volumes.

AMERICAN IP'ECAC. See GILLENIA.

AMER'ICANISMS. Words and phrases peculiar to the United States. They are classified by one writer on this subject (Bartlett) as follows: 1. Archaisms, obsolete, or nearly so, in Great Britain. 2. English words used in a different sense. 3. Words used in the original sense in the United States, although not in Great Britain. 4. English provincialisms adopted into general use in America. 5. Newly coined words owing their origin to productions or circumstances of the country. 6. Words derived from European languages, especially the French, Spanish, and Dutch. 7. Indian words. 8. Negroisms. 9. Peculiarities of pronunciation. Accepting for the present this arrangement, we may cite as examples of archaisms, *fall*, for autumn, *freshet*, to *lam*, in the sense of to beat, to *squelch*, and to *tarry*. These are only a few; for an American philologist has stated that of the words, phrases, and constructions found in the Bible and Book of Common Prayer, "about one-sixth, which are no longer used in England

in ordinary prose-writing, would apparently be used without thought or hesitation by an American author." Among the many English words used in a different or perverted sense are *barn* for stable; *boards*, for deals; *buggy*, a four-wheeled vehicle—in England, two-wheeled (but the word itself is Anglo-Indian); *calico*, printed cotton, in England means unprinted; *clever*, for good-natured—in England, generally, intelligent or skillful; *corn*, for maize, whereas in England it means wheat, in Scotland, oats, and in Ireland, barley; *cracker*, for biscuit; *depot*, for station; *dress*, for gown; *forehanded*, well-to-do—in England, means timely, early; *hack*, a hackney coach—in England, a hired horse; *homely*, plain-featured—in England, homelike or unadorned; to *jew*, to haggle—in England, to cheat; *likcly*, for promising; *lumber*, for timber; to *mail*, for to post; *notify*, to give notice—in England, to make known; *pond*, a natural pool of water—in England, artificial; *reliable*, for trustworthy; *saloon*, for tap-room; *smart*, for talented; *smudge*, a smoldering fire used to drive away insects—in England, simply an overpowering smoke; *store*, for shop; *tavern*, for inn (a tavern in Great Britain provides no lodgings); *temper*, with us meaning passion, is in England control of passion; *ugly*, for ill-natured; *venison*, deer's flesh—in England, meat of any wild animal; *track*, for line; *vest*, for waistcoat. We use also, in large number, different words for the same thing, as *conductor*, for guard; *editorial*, for leader; *elevator*, for lift; *horse-car*, for tram, and *sleeper*, for tie. One must here note that *argot* and genuine slang are scarcely to be regarded as necessarily either American or British, for in the underworld of both nations they are intelligible. So *graft*, *the push*, *in the swim*, *the stir* (prison) and hundreds more.

Examples of words retaining here their old meaning are: *Fleshy*, in the sense of stout; *offal*, the parts of a butchered animal not worth salting; *sick*, in the sense of ill; and *wilt*, in the sense of wither. On the other hand, to *heft*, meaning with us, to weigh by lifting, keeps, in England, its original meaning, to lift. Many words called archaic or provincial by English writers are widely current among Americans in both speech and literature—among them adze, affectation, angry (wound), andiron, bay-window, bearer (at a funeral), to blaze (a tree), burly, cesspool, clodhopper, counterfeit money, cross-purposes, deft, din, hasp, loophole, ornate, ragamuffin, shingle, stand (speaker's), stock (cattle), thill, toady, tramp, truck, and underpinning. Among newly coined words and expressions are these, showing plainly their origin on the frontier or in the forest: backwoods, cache, clearing, to draw a bead, to fight fire, a gone coon, salt-lick, hogwallow, logging camp, prairie schooner, raft (of dead trees), squatter, squawman, the timber, and trapper. Ranch life has given us such words as corral, cowboy, roundup, and stampede; the mining regions, bed-rock, diggings, to pan out, to prospect, and to stake a claim. From the farm and plantation we have obtained among others, bagassee, broom-corn, Hessian fly, Indian meal, and truck-patch; while trade has supplied us with bogus, drummer, posted up, and to settle (a bill). Many others might be added from the language of Wall Street. Our political terms and phrases include the following, most of which are the subject of special articles in this *ENCYCLOPÆDIA*; Agri-

cultural wheel, barnburner, bloody shirt, boodle, buncombe, carpet-bagger, caucus, copperhead, to eat crow, dark horse, doughface, favorite sons, fence-riding, F. F. V.'s, filibuster, fire-eater, gerrymander, half-breed, hoodoo, stalwart, hunter, jayhawker, Ku-Klux-Klan, loco-foco, log-rolling, Lynch law, Teddyite, graft (London argot), Mugwump, omnibus bill, pipe-laying, plank, primary, reconstruction, salt river, shin-plaster, spellbinder, squatter sovereignty, Greenbacker, wire-puller, Yazoo fraud.

Words derived from foreign languages are numerous and one philologist (W. W. Crane) asserts that, though few are intelligible to English people, they are more extensively used by Englishmen than is generally supposed, and "form the really distinctive features of what may be termed the American language." Thus, from the Spanish we have in corrupted or contracted form, beno (*vino*), creole (*criollo*), garrote (*garrota*), jerked beef (*charqui*), key, a small island (*cayo*), lasso (*lazo*), mustang (*mesteño*), pickaninny, contracted to *pickney* in S. C. (*pequeño niño*), Sambo (*Zambo*, a person of negro and Indian blood); stampede (*estampedo*); and such literally appropriated words as adobe, bonanza cañon, beano (*vino*) and mesa. From the French have been obtained among many, bayou (*boyau*, a trench), cache or cash (*acher*), chowder (*chaudière*), shivaree (*charivari*; Low Lat. *charivarium*), metif, an Indian half-breed (*métif* or *métis*), mascot, and the identical butte, levee, portage, prairie, and voyageur. From the Dutch have come boss, an overseer or superior (*baas*); used also in England but there derived from South African Dutch; cold slaw, cabbage salad (*kool slaa*); cruller (*kruller*, to twist); hook, a point of land (*hoek*, a corner); noodles, an imitation of macaroni (*noodlejes*); overslough, to supersede or defeat (*overslaan*, to skip or pretermitt); stoop or stoup, the step or steps of a house (*stocp*). Kill, a small stream, retains both its old sound and spelling, and Santa Claus (*Klaas*) receives as much respect as before the slight change in his name. The Germans have contributed bumper (*bummler*, a braggart, a loafer), pretzel, and dude.

From the Indian we have chinquapin, a kind of oak (Va., Algonquian, *che-chicnamin*); hominy (Va., Algonquian, *custathominy*); moccasin (Mass., Algonquian, *mockisin*); opossum (*appasum*); pow-wow (*powan*, a prophet or conjurer); raccoon (Algonquian, *aroughcūn*); sachem (*sakemo*); skunk (Abnakis, *secanu*); succotash (Nanaheganset, *mcsimotash*); toboggan (*odabogan*); tomahawk (Algonquian, *tamahagan*, a war-club); wigwam (Natic, *weecwahm*), tepee and wick-i-up, and mush (Alaskan, meaning "start," "get-up" as addressed to an animal). Among words introduced or invented by the Southern negroes are: brottus, a small gift (Ga.); buccra, a white man; corn (harvest) songs (Md.); cracklings or goody-bread, bread containing roasted pork-rinds; enty? is that so? (Sea Islands); goober, a peanut (W. African *guja*, or Guinea *gobbe-gobbc*, Va. and N. C.); lagniappe, a tradesman's gratuity (Sp. *ñapa*, La.); moonack, a mythical animal; pickaninny, and pinder, a peanut (Fla.); while the Chinese word kowtow or kotow, salutation by prostration, has (or had) a limited use in the sense of obsequious politeness.

In the matter of pronunciation, slight differences exist. The word *trait*, for instance, is pronounced *tray* by the English, the *i* in *sliver* is

lengthened by them, and *schedule* is commonly pronounced *shedule*. We may mention here that *cheerful* retains in some parts of the South its old pronunciation, *cherful*. In the pronunciation of proper names, English and American usages frequently disagree. In England Ralph is pronounced Rafe; Brownell, Parnell, etc., are accented on the first syllable; Powell is Pool, and Howells is Hools (both of these Welsh); the last syllable of Gladstone is sounded short. With English surnames and geographical names cultivated Americans should seek to follow English usage. In Christian names Englishmen generally use only the first, while Americans always give the full form. In England we read of Ralph Emerson, Edgar Poe, etc. What have been termed by Grant Allen "Americanisms in spelling," examples of which are *labor*, *offenses*, and *theater*, are undoubtedly the result of the extensive use of Webster's spelling-books and dictionary and the recent agitation for a simpler spelling, as *tho*, *thru*, etc.

Americanisms are classified by Reeves as follows: (1) Eastern dialects; (2) Southern; (3) Western; (4) Pacific or mining; and he adds as a possible (5) English-Dutch (German) of Pennsylvania. This convenient arrangement enables us to separate such words and phrases as are limited to particular sections or localities (provincialisms) from those that may be called national. Beginning with New England, we have: to *admire*, for to like, e.g., "I should admire to go"; to *allot*, or *'lot*, for intend; *barm*, for yeast; *be*, for am or are; *bettermost*; *blob*, a blossom; *blowth*, blossoming time; *bungtown copper*, a counterfeit; to *calculate*, for to infer or suppose; *empti'n's*, any dregs; to *fail up*; to *fay*, for to fit; *fore-chamber*, a front bedroom (Me.); *gawnicus*, a dolt; *grayslick*, a glassy stretch of water (Me.); *Hessian*, as a term of reproach; *like*, without a specified object, as "How did you like?" (a place, person); *long-favored*, tall; *mush-muddle*, a potpie (Cape Cod); *pew-cart*, a box-like carriage (Nantucket); *pleasant*, for pleasing; *pokeloken*, a marsh (Me.); *priest*, for a clergyman of any denomination; *pung*, a kind of sleigh; *rifle*, a whetstone for scythes; *sconce*, for discretion, like the French *bonne caboche*; to *seep*, to pour through a sieve or hole; *slip*, for pew; *spero*, a common-place entertainment, "small doings" (Vt.); *staddle*, a sapling; *suant* or *sucnt*, level, uniform; to *sugar off*, to boil maple syrup down until it grains; *tackling*, for harness; *timbers*, for skeleton of a whale; *torsh*, the youngest child (Cape Cod); to *train*, to move briskly (like the militia on "training day"), to frolic; *vestry*, the chapel or lecture-room of a non-liturgical church; *v'y'ge*, for voyage; *wopper* (or *whopper*-) *jawed*; *wicket*, a hut or shelter of boughs (Me.); *winegar*, for vinegar (Essex Co., Mass.); *York shilling*, ninepence. In New York State, among localisms derived from the Dutch, are *bockey*, a gourd-dipper; *fyke*, a bow-net; *hoople*, a child's hoop; *pile*, an arrow, and *scup*, a swing, a name still used by children of foreign parentage on the "east side" of New York City. *Slip*, an opening between wharves, is apparently an indigenous English word; the provincial English *duff*, dough or paste, signifies, in the Adirondacks, fallen and matted hemlock needles; and *dimpy* (probably from the English *dimpsy*, a kind of preserve) is the name given in some places to a tea-party, or a small social gathering at which refreshments are

served. New Jersey, settled, like New York, both by English and Dutch, preserves in remote localities some Old World words, or perversions of the same; for example, *blickie*, a tin pail; to *heir to*, to inherit; *jag*, a small load; *mux*, disorder, and *piece*, a cold meal hastily prepared, or one for farm hands. Examples of the provincialisms of Pennsylvania, which were introduced by the English, Scotch-Irish, and Germans, and in many instances have been carried beyond her borders by emigration, are: *after-night*, for after candle-light; *Aprile*, for April (Cumberland valley); *barrick*, a hill; *bealing*, suppurating; *brickle*, brittle; *dipsey*, the sinker of a fishline; *dozy*, timber brittle from decay; *fouty*, trifling; to *get shut*, to get rid; *gums*, for overshoes (eastern Pa.); *horsebeast*; to *lift*, a collection in church, to take up; *onec*, immediately; *outcry*, public auction; *riffles*, ripples; *scrapple*, an article of food (Philadelphia); *slave*, a fierce dog, i.e., needing to be chained (western Pa.); to *smouch*, to kiss; *sots*, common yeast; to *top* (a candle), to snuff; to *thrcap*, to argue; *yammer*, a whine or whimper; *pig-people* (New Jersey), the same as "poor white" in the South.

The South has retained fully as many old English words and pronunciations as New England and has originated some of the most expressive terms used in ordinary conversation, a number of which, by migration, have been domesticated in the West and on the Pacific coast. Among them are *afcaired*, afraid; *amber*, expectoration produced by chewing tobacco (Va., Carolina); *beast*, horse; *branch*, a stream of any size; *bucket*, pail; *brogan*, a kind of boat (Chesapeake Bay); *castaway*, overturned; *central*, central (Va.); to *chunk*, to throw a missile; *coppen*, cow-pens; *complected*, having a certain kind of complexion; *condeript*, thrown into fits (Ky.); *corn-dodger*; *cracker*, a poor white (Ga., Fla.); *dinghy*, a kind of row-boat (Fla.); *dismal*, a swampy tract of land (N. C.); *docious*, for docile; *donock*, or *donnock*, a stone (Southwest); *escalan*, a kind of coin (La.); *evening*, afternoon (also in Illinois); *feaze* or *feeze*, *faze*, an excited state; *fice* or *phyce*, a small dog, cur; *French*, anything distasteful (Va., Md.); *grundpy*, groundpea (Tenn.); *gum* or *bee-gum*, a hive made from a hollow tree; *gumbo*, okra, or a dish made of it; *gumbo*, a patois; *hammock* or *hummock*, a peculiar kind of land, often hilly (Fla., Texas); *hoe cake*, a corn cake once baked on a hoe; *holpen*, helped (biblical); *honey-fogling*, for cheating or coaxing; *hot*, hit; *howdy*, how do you do?; *human*, for person; *Jeames*, James (Ind., Va.); *kiver*, cover; *lane*, any inclosed road; *lightwood*, pine chips or knots; *marooning*, picnicking or traveling by carriage; *mammoxed*, seriously injured; *marvel*, for marble; *maverick*, an unbranded yearling (Texas and Southwest); *million*, melon; *necessity*, necessity; *or'nary*, contemptible; *paint*, a spotted horse; *peart*, lively, brisk; *pine-tag*, pine needle; a *pol*, a blow; *pone*, bread of Indian meal; *powerful*, very; *quarters*, farm buildings or out-houses inhabited by negroes; *rance snuffle*, a malignant act (Ga.); *rantankerous*, quarrelsome (Ga., but also N. Y.); to *reckon*, to suppose or conclude; *rock*, stone; *roustabout*, *savigerous* or *survigrouis*, fierce, alert (so cited by Mrs. Trollope); *slash*, low ground or an opening in the woods; *right smart*, great or considerable; to *scringe*, to flinch (Texas); *skygodlin*, obliquely (Texas); *swash*, a narrow channel of

water; *tackey*, neglected or dowdy; to *tarrify*, to coerce; to *tote*, to carry; *trash*, worthless or low-born persons, especially *poor white trash*; to *up*, used as a verb; *used*, used to; *you all*, of any number of persons; *you-uns*, for you.

The West, using the term in its old sense, which included the interior States as well as the Northwest and Southwest, in addition to words derived from the French and Spanish, some of which have already been cited, has brought into its vocabulary many peculiar words and expressions. Such are *after-clap*, a demand made after a bargain is closed; *Arkansas tooth-pick*, a kind of bowie-knife; *bad man*, a murderer; *bell mare*, the horse leading a drove of mules (Southwest); to *bear off*, to separate a stray "brand" by riding between it and the herd (Southwest); *bodewash* (*bois de vache*), dried cow-dung used as fuel (Southwest); to *build*, to make shoes (Ohio); to *buss*, to strike; *catawampous* or *catawamptious*, terribly or completely; *country*, for State or section; *cowbrute* (Mo.); *doggerly*, a grogshop; *drink*, river; *galoot*; to *take a gird*, for to make an effort; to *hustle*; *keener*, a sharp man; *lave!* (*lève*), get up! or rise up! (Mississippi valley); *locoed*, for frenzied, Sp. *loco* (Kansas and Southwest); *long sweetening*, molasses (Iowa, from New England); *main traveled road*, highway; *naked possessor*, one without title to his farm (Southwest); *oldermost*, oldest; *plumb sure*; to *pull foot*, to hasten; to *raise*, to obtain; *robbilæ*, pemmican boiled with flour and water (Northwest); to *slosh 'round*, to brag, also to frequent saloons (South and West); *sugar* or *sugar-tree*, maple; *sun-up*, sunrise; *swinger*, the middle horses in a team of six; *tenderfoot*, a newcomer; to *trash* (to cover) *a trail*; *every whipstick*, for continually, often; to *want down* or *up* (Ill.); *worm* (or snake) fence; to *zit*, to sound like a bullet striking the water. The Pacific slope is responsible for *adobe*, soil from which *adobe* bricks are made; to *bach*, to camp out without ladies; *Bostons*, white men in general (Or. Indian); *coulee*, *cooley*, a rocky valley (Or. and Wis.); *claim*, land to which one has a legal right; *claim-jumper*, one who forcibly takes another's claim; to *coyote*, to sink a small shaft (Cal.); *diggings*, a particular locality; *hardpan*; *heeled*, for armed; *pay-streak*, a profitable lode or vein; *rusher*, a person going to the mines; *tangle-foot*, bad liquor. Local usage differs greatly in connection with articles in common use. The Eastern *paper bag* is in the central West a sack, and in portions of the South a *poke*; a *scuttle* or *pail* is a bucket. The British *perambulator* is in the East a baby-carriage, and in the Central West a baby buggy or cab. A *comfortable* is a comfort. A distinction, furthermore, should be made between words that are used in large cities and those that are in the main confined to small communities. In the country, people *hire help* and *keep girls*; in the cities they have *servants* or *maids*; the city *nurse* is lengthened in the country to *nurse-girl*. The original English *folks* is now a provincialism in this country. Most of the New England words and forms used by Lowell in the *Biglow Papers* are provincialisms. Some Eastern provincialisms are in general use in the Central West.

Early writers on Americanisms were wont to stamp every odd or vulgar word and expression as American, with the lamentable result, as Richard Grant White complained, of creating a belief that there is a distinctive American lan-

guage, "a barbarous, hybrid dialect, grafted upon English stock;" the truth being that most of the so-called Americanisms were brought to this country by its early settlers, English, Scotch-Irish, Dutch, Germans, etc., and that many of them are now used only by the unlettered. The language of the "stage Yankee," and that of the characters in dialect-stories, Northern and Southern, are with few exceptions English, provincial or obsolete in the mother country, and not "American" in the true sense of the word. In the county of Suffolk, according to Lounsbury, the following "Americanisms" were current as recently as 1823: *Applc-fritters, by gum, ehaw, eutc, darnation, gal, gawky, hoss, ninny-hammer, ride like blazcs, sass (sauce), sappy and tantrum.* White prepared a long list of words and phrases supposed to be indigenous, and proved their British origin by citing early dates at which they appear in literature, or the names of authors in whose works they occur. Selecting from this list, and indicating by the letter "a." words known to be ancient, by "m." such as are here used in provincial speech, and by "Bible," King James' version, we submit the following: To *admire*, in the sense of to wish eagerly (Chapman's *Homer*, 1655); to *advocate* (Milton); *apart*, aside (Bulwer); *baggage*, luggage (Fielding, T. Hughes); *blizzard* (m.); *blow*, boastful talk (a., m.); to *bolt*, to rush or escape (Dryden); *bosom*, applied to a man (Shakespeare); *bulldoze* (W. Scott); *bureau*, for chest of drawers (Fielding, Hare); *by the skin of onc's teeth* (Bible); *catamount* (a.); *chaw* (1530, m.); *chore*, light work (Ben Jonson); *clean gone* (Bible); *clever*, good-natured (Elizabethan writers); *conclude*, resolve (Tyn-dale, Froude); *crevasse* (Chaucer); *deck of cards* (Shakespeare); *divine*, clergyman (W. Scott, G. Eliot); *elect*, for conclude or determine (Lord Thurlow, Ruskin); to *enjoy poor health* (m.); *fall*, for autumn (Cairne, 1552; Froude); *feel to*, as in the expression, "I feel to rejoice" (m.); to *fellowship* (Chaucer); *fix*, to put in place or order (Farquhar, Sterne); *fleshy*, stout (Chaucer, Professor Owen); *folks*, people (Byron, Bulwer Lytton); *gent* (Pope); *a good time* (Swift); *grain*, any cereal (Wiclif); *guess*, think or suppose (Wiclif, Milton, A. Trollope); *gumption* (a., m.); *heft* (Sackville, T. Hughes); *hclp*, servant (T. Hughes); *human*, person (Chapman's *Homer*); *lung*, hanged (Shakespeare, C. Reade); to *hustle* (a.); *illy* (a., m.); *influential* (W. Thompson, c.1760); *improvcment*, of an occasion, etc. (Defoe, Gibbon); *institution*, in the sense of an establishment of foundation (Beatty, 1784; Trollope); *interview*, to meet for conversation (Dekker); to *let on*, to divulge (m.); to *let slide* (Gower); *limb*, leg (Fielding); *love*, like (Cowper); *lucrative* (Bacon); *mad*, angry (Bacon, Middleton); *magnetic*, as an adjective (Donne); to *make a visit* (m.); *metropolis*, the chief city of the State (Milton, De Quincey, Macaulay); *million*, melon (Pepys); *musicianer* (Byron); *nicc*, pleasing or agreeable (a., m.); *notify*, to give notice (m.); *notions*, for small wares (Young); *overly*, excessively (m.); *parlor*, for drawing-room (G. Eliot, Helps); *pcruse*, scan or read (W. Scott); *professor* of religion (Milton); *pumpion* (pumpkin) pie (1615); *quit*, leave off (Ben Jonson); *railroad*, railway (J. H. Newman, Mrs. Trollope); *rare*, underdone (Dryden); *reliable* (Richard Montague, 1624;

Gladstone); *reckon*, suppose or conclude (Bible, W. Scott); *rock*, stone (a.); *run*, a small stream (a.); *siek*, ill (Bible, Evelyn); *skedaddle* (m.); *slick* (a.); *span new* (Chaucer); *spell*, a period of time (a.); *spruce*, neat (Evelyn); *spunky* (Burns); *swop, swap* (B. Jonson, Dryden); to *take on*, to wail or grieve (a.); *tend*, attend (Shakespeare); *town*, as a geographical division (Wiclif); *well*, prefacing a sentence (Disraeli); *Whittling* (Walpole); and the writer would add the following which are sometimes ridiculed as outlandish products of the New World: *A howling wilderness* (Bible); *Mr. — and lady* (Thackeray); and to *set store by*, in the sense of to prize or appreciate (Mrs. Oliphant). Gilbert M. Tucker says that the 460 words in Elwyn's *Glossary of Supposed Americanisms* are all of British origin; that in Pickering's work (1816) not more than 70 words out of the 500 are really American; and that out of the 5000 or more entries in Bartlett's *Dictionary*, only about 500 are genuine and distinct Americanisms now in decent use. Most New Englanders, said James Russell Lowell, speaking of colloquialisms still heard in Massachusetts, stand less in need of a glossary to Shakespeare than many a native of the old country. It may be added that many words formerly termed Americanisms are as commonly used in England as here, though not in polite speech or literature; e.g., *bamboozle, chockful, duds*, and *sight* for number, while, on the other hand, such old forms as *axe* for ask, and *housen* for houses, are frequently heard in England and rarely here.

Richard Grant White and T. R. Lounsbury limit the term "Americanisms" narrowly. According to the former, they must not have been transplanted, but must be perversions or modifications of English words or phrases, and must be used in the current speech or literature of the United States at the present day. "Words which are the names of things peculiar to this country are not Americanisms, except under certain conditions (*maize, squaw, wigwam*). They are merely names which are necessarily used by writers and speakers of all languages. If, however, any such word is adopted here as the name of a thing which already had an English name (*wigwam*, for hut or public hall; *squaw*, for wife), it then becomes properly an Americanism. *Indian*, and names compounded of *Indian*, were given by Europeans. Indian pudding is an American thing, but its name is not an Americanism." As he rejects *Indian summer, paleface, succotash, tomahawk*, and the rest, White asks, "What have we to do with the Indian?" and proceeding, crosses from the list of cherished "Americanisms," *bronco, lacrosse, stampede*, and their kin; *abolitionist, border-ruffian, gerry-mander, reservation*, etc., as well as *groundhog, long-moss, pine barrens*, and *saltlick*, to go further, besides refusing to discuss such words as *intervale* and *water-gap*, because they are "legitimate English." Lounsbury, like White, objects to the expression, "the American language," and remarks of the so-called "Yankee dialect" that it is never "the characteristic tongue of any one man, or of any one class, or of any one district." He doubts whether the term "Americanisms" can be regularly applied to *eent, eongress, mileage, nullification*, and so on, and prefers to call them "American contributions to the common language."

American newspapers are largely to blame

for the mongrel and high-sounding words heard in the United States, especially those derived from the Latin or the Greek. The oratory of political campaigns gives rise to not a few astonishing Americanisms and our humorists have coined many more that are beloved by the public. Persons of fair education, who, as we learn from their talk, *engage in avocations, reside in a mansion, wear pants, donate to charities, ride to the metropolis in a smoker, retire to bed, and have proclivities*, must be expected to use also *enthuse, funeralize, saleslady, and shootist*, when they find them in their favorite journals; but criticism under this head comes with little grace from the English, whose *leaderette* is as absurd as our *editorial paragraph*, and *agricultural laborer*, a clumsy name for him whom we term a *farmhand*. Our colleges, Yale in particular, are prolific in slang, some of which, as to *rattle*, in the sense of to confuse, soon become public property. Most of our colloquial expressions are short-lived, but the following may be instanced as having been in use for a long period: to *absquatulate*; *baggage-smasher*; to *bark up the wrong tree*; *bottom dollar*; *caboodle*; to *boost*; to *cavort*; *conription fit*; not to *carc a continental*; a *continental darn*; to *chip in*; *coon*, a colored man; a *coon's age*, an indefinitely long time; to *dust*, to leave quickly; to *euchre out*; to *flash in the pan*; *flatfooted*; *gum game*; *highfalutin*; *last o' pea time*; *level best*; to *liquor*; to *moosey*, to leave quickly; *hike*, to tramp; *obligated*; to *paddle one's own canoe*; to *pan out*; *picayune*, small, mean; to *raise Cain*; *right away*; to *run*, in the sense of to manage or conduct; to *salt a mine*; *sample room*, drinking-bar; *shoddy*, applied to a person; to *smile*, to drink spirits; *sockdologer*, a finishing blow or argument; to *sour on*; a *square meal*; to *strike oil*, to get rich suddenly; to *stump*, to puzzle, or challenge; to *talk turkey*, to brag; *tuckered out*; to *vamose* (Sp. *vamos*), to leave quickly; to *weaken*, to yield or give out; to *squeal*, to betray.

T. W. Higginson (see *Bibliography, infra*), in examining a glossary of the slang used about 1798 by British prisoners in the Castle in Boston Harbor, now Fort Independence, discovered a number of words that had been classed as of recent origin, the most familiar of which are *grub*, victuals; *douse the glim*, put out the light; and *spotted*, for found out. Also some that are not given in any English glossaries, as *briar*, a saw; *nipping-jig*, the gallows; and *wibble*, a dollar. Most of these expressions belong to the *argot* of thieves.

When we remember that the dialects of the countries in England have marked differences—so marked indeed that it may be doubted whether a Lancashire miner and a Lincolnshire farmer could understand each other—we may well be proud that our vast country has, strictly speaking, only one language. It is remarkable that the influx of European immigrants has not resulted in some States in reducing English to a *patois*, if not in extinguishing it, or in giving it scant room in a mongrel vocabulary. Again, it might reasonably be expected that, in the course of three centuries, the political and social changes which we have undergone, and the peculiar circumstances attending the settlement of new regions, would have separated us so widely from the mother country that, in spite of kinship and commer-

cial intercourse, some radical differences in language would have been evolved. The reason for a general standard in America is found in the wide use of text-books, such as the old Webster's speller; and because of the increasing foreign element in this country, our public schools are forced to devote much time to the teaching of English, a thing regarded in England as more or less unnecessary, because the stock is homogeneous. What has been styled "the American worship of the dictionary" has at least given us a definite standard and prevented anything like a *patois*. Increased intercourse with the English and a wider reading of English popular writers have tended to graft upon our speech a large number of words that would once have been unintelligible or at least purely British. Kipling, Conan Doyle, and Henry James may be cited as the three writers most responsible for this growing likeness of usage.

Lowell introduction to the *Biglow Papers* (Cambridge, 1848); A. L. Elwyn, *Glossary of Supposed Americanisms* (New York, 1858); J. R. Bartlett, *Dictionary of Americanisms* (Philadelphia, 1859; 4th ed., 1877); Schele de Vere, *Americanisms* (New York, 1872); Norton, *Political Americanisms* (New York, 1891); Leland, *A Dictionary of Slang, Jargon and Cant* (London, 1887); G. Giggs, *Dictionary of the Chinook Jargon* (Washington, 1863); Leland, *Hans Breitmann's Ballads* (Philadelphia, 1870); Harris, *Uncle Remus, His Songs and His Sayings* (New York, 1880), and *Nights with Uncle Remus* (New York, 1883); R. G. White, "Americanisms," *Atlantic Monthly*, vols. xli-xlv; T. R. Lounsbury, "The English Language in America," *International Review*, vol. viii; G. M. Tucker, "American English," *North American Review*, vol. cxxxvi; W. W. Crane, "The American Language," *Putnam's Magazine*, vol. xvi; Rev. H. Reeves, "Our Provincialisms," *Lippincott's Magazine*, vol. iii; T. W. Higginson, "American Flash Language in 1798," *Science*, May, 1885; "Southwestern Slang," *Overland Monthly*, August, 1869; Brander Matthews, "Briticisms and Americanisms," *Harper's Magazine*, July, 1891; Peck, *What is Good English* (New York, 1899). See also *Dialect Notes*, published by the American Dialect Society since 1889, which also has issued lists of American slang words and localisms. Studies of several Southern dialects, by Calvin S. Brown and Sylvester Primer, have appeared in the *Publications of the Modern Language Association*, and C. F. Smith, "On Southernisms" in the *Transactions of the American Philological Association* (1883). The many lists that have been put forth as representing the linguistic peculiarity of one locality are usually inaccurate because the compiler is ignorant of slang and provincialisms in a larger sphere, and so foists upon a particular community expressions that are colloquially common elsewhere. See Farmer, *Americanisms Old and New* (London, 1889); and Clapin, *New Dictionary of Americanisms* (New York, 1902).

AMERICANISTS, INTERNATIONAL CONGRESS OF, is an organization to promote the investigation of the origin and history of the native races of North and South America. The first congress was held in 1875, at the call of the

French Society of Americanists, an organization still in existence. As used by this society the term "Americanist" applies to any student of American anthropological problems. Previous to 1900 the organization was distinctly European, but at that date it was reorganized to hold biennial alternate meetings in Europe and America, the session of 1914 being in Philadelphia, Pa. The various American and European governments appoint two officials to attend the sessions in addition to the regular members of the association. For further details see the published proceedings.

AMERICAN KNIGHTS, ORDER OF. See KNIGHTS OF THE GOLDEN CIRCLE.

AMERICAN LITERATURE. A term applied rather loosely to the body of writings in the English language produced in the territory now occupied by the United States. It includes a period extending from 1608, when Captain John Smith's *True Relation* was published in London, to the present day. Strictly speaking, the works of Smith and of those of his contemporaries who did not make a permanent sojourn in the New World, belong rather to British than to American literature. Again, it is plain that the term "literature" must be used with considerable latitude, if it can be made to include the news-letters, the bare annals, the topographical treatises, the controversial pamphlets, the sermons and other theological lucubrations that form the bulk of the writings produced by the colonists of the seventeenth and eighteenth centuries. The paucity of the materials at their command has, however, induced American literary historians to give a hospitable reception to almost everything that can be called a book written in the American colonies or about them, whether published in England or at home after Stephen Daye had set up his press at Cambridge, Mass., in 1639.

Surprise has sometimes been expressed at the fact that Englishmen, contemporaries of Shakespeare and Milton, should, in their new environment, have written practically nothing of æsthetic value. The excuse is usually made for them that they had many more necessary things to do, such as felling the forests and keeping off the Indians. This excuse is certainly applicable, but it may be doubted whether the Puritan or the Cavalier stock that settled America would have been noted for great contributions to English literature had they remained in the mother country. The companions of Bradford and Winthrop would have done what writing they did on theological subjects; the companions of Captain Smith and the younger sons of royalist country gentlemen would have written little more than they did in Virginia. The colonial literature of the seventeenth century is chiefly valuable to the historian and the antiquarian. The early colonists wrote for utilitarian purposes. The Virginians wrote to convey information to their friends at home and to encourage emigration; the Puritans wrote for these reasons and also to defend and expound their theology and to train up the new generations in the ways of the old. For literary art in itself, or indeed for any art, they had little care, but when, as not infrequently happened, the men who wrote were interesting or great in their private or public capacities, they managed to impart some of their finer qualities to their writings, which may not exactly live, but are, at least, worthy of remembrance if not

of perusal by the reader interested in the history of his country.

The portion of this early literature produced by the southern and middle colonies is comparatively meagre. Captain Smith's works, which culminate in the composite *General History of Virginia, New England and the Summer Isles* (1624), are quaint and crude, but full of their adventurous and magniloquent author's energy. William Strachey's account of the famous wreck of Sir Thomas Gates (1610) may possibly, some think probably, have given Shakespeare hints for his description of the storm in *The Tempest*. Nothing so interesting was in all probability produced in Virginia until 1649, when a certain Colonel Norwood narrated to his relative, Sir William Berkeley, the adventures that had befallen him during and after his shipwreck. The same picturesque Governor Berkeley is one of the protagonists in the next Virginian tract of importance—the so-called *Burwell Papers*, descriptive of Bacon's Rebellion (1676). Only two interesting books are credited to Maryland during this century, John Hammond's *Leah and Rachel* (1656) and George Alsop's quaint *Character of the Province of Maryland* (1666). The Carolinas were settled too late to produce anything of consequence. The same thing is true of the Middle colonies, although Daniel Denton's *Brief Description of New York* (1670) is not uninteresting and Gabriel Thomas's *Account of Pennsylvania and New Jersey* (1698) does not lack sprightliness. Consult the books by W. P. Trent cited in the bibliography below.

An abundance rather than a lack of writings confronts the student of the seventeenth-century New England. The histories composed by Gov. William Bradford of Plymouth and Gov. John Winthrop of Massachusetts have many merits, but are on the whole fatiguing reading. The sermons and theological treatises of such representative divines as Thomas Hooker, Thomas Shepard, John Cotton, Peter Bulkeley, and their compeers furnish interesting passages for our anthologies, but are rarely read *in extenso*. The works of Roger Williams are probably treated in a similar fashion; but the loss falls upon the reader as well as upon the fame of that truly great man. Another writer who deserves more attention than he receives is Daniel Gookin, who wrote two books about the Christian Indians, for whom he labored in conjunction with that famous apostle, John Eliot. But unquestionably the most interesting book in prose produced in New England during the seventeenth century was Nathaniel Ward's *Simple Cobbler of Agawam* (1647), a whimsical compound of satire and invective that is almost without parallel. John Josselyn's *New England's Rarities Discovered* (1672) and his *Account of Two Voyages* (1674) deserve mention also as almost turning credulity into artistic virtue.

But the early New Englanders wrote verse as well as prose, especially verse of an elegaic nature. In 1640 appeared the astonishingly crude *Bay Psalm Book*. Ten years later Mrs. Anne Bradstreet's *Tenth Muse Lately Sprung up in America* was published in London, accompanied by poetical panegyrics that made the modest woman blush. Mrs. Bradstreet was not without genuine powers, as her later works showed; but she followed bad models, had no eye for the beauties of nature, and is in consequence al-

most unreadable to-day. This fate has not befallen Michael Wigglesworth's *Day of Doom* (1662), a New England Inferno which long continued to be popular. Its quaint stanzas are perused to-day with sensations quite different from those produced by them 200 years ago; but they are still read, and even quoted for amusement—a fortune not accorded to the amiable Wigglesworth's other performances. Wigglesworth is, however, almost a great poet when he is compared with contemporaries like Peter Folger, Franklin's grandfather, whose *Looking-Glass for the Times* (1677) is almost the *ne plus ultra* of doggerel. Perhaps the only poems of any decided merit composed in America during the seventeenth century are an anonymous epitaph on Bacon, given in the *Burwell Papers*, and an *Elegy on the Rev. Thomas Shepard* (1677), by the Rev. Uriah Oakes, President of Harvard.

The close of the seventeenth century in New England is marked for us by the famous persecutions for witchcraft which have given so sinister a reputation to many good men, especially to the two Mathers, Increase and Cotton. These are in some ways the most important divines of early New England, although they mark the decline of the theocracy rather than its culmination. Both were voluminous writers, and both treated in particular the two topics uppermost in the New England mind: to wit, the struggles of the saints against witches and fiends and against the savage Indians. All the dominant ideas of the times are found embodied in the younger Mather's encyclopædic *Magnalia Christi Americana* (1702), a chronicle which is not altogether authoritative as to facts, but is typical of its fantastic author and of the Brahmin caste he represented. Typical of the old order that was passing, and of the new that was coming in, is Judge Samuel Sewall's *Diary*, which ran from 1673 to 1729. Sewall is the Pepys of his time, and many a quaint page can be extracted from his jottings; but he should also be remembered as perhaps our first abolitionist, his short tract, *The Selling of Joseph*, dating from 1700. Another early diarist is Mrs. Sarah Kemble Knight, who wrote a sprightly account of a journey she took on horseback in 1704 from Boston to New York. Even in New England secular writing became more popular as the eighteenth century advanced, which is what one might expect, since the colonies were growing prosperous and were being affected by the utilitarian tendencies of the epoch. There is a considerable amount of verse, none of it of much consequence, and there is quite a mass of history, particularly of narratives dealing with Indian atrocities. Probably the most important poets are the Rev. Mather Byles and his contemporary, Joseph Green, but they succeeded best in trifles. The most scientific historian of the period is the Rev. Thomas Prince; the most interesting is the quaint Scotchman, William Douglas, whose *Summary* dates from 1747-51.

But theology did not vanish from New England with the weakening of the theocracy. The Rev. John Wise, with his *Churches' Quarrel Espoused* (1710) and his *Vindication of the Government of New England Churches* (1717) showed himself to be the peer of any of his forerunners and gave lessons in statesmanship to the revolutionary leaders who were to follow him. Greater than Wise was Jonathan Edwards, the most

original theologian and metaphysician that the New World has produced. In his juvenile papers Edwards anticipated Berkeley; in his personal memoranda and occasionally in his formal treatises he showed that he was a poet-mystic and a lover of nature rare for his times; in his *Narrative of Surprising Conversions* (1736) he displayed a remarkable psychological acumen. He is, of course, best known to-day by his *Freedom of the Will* (1754), which is still a powerful piece of exposition, although its conclusions seem monstrous and untenable, and by his minatory sermons, which, like the famous one preached at Enfield, Conn., held his awe-struck hearers suspended over the very mouth of hell. Edwards's theology is now antiquated, but his works contain the germs of nearly all subsequent theological speculations, and they are a well of inspiration to thoughtful readers. Consult Wendell and Greenough, *A History of Literature in America*.

The only American colonial who ranks with Edwards as a writer and thinker, Benjamin Franklin, while also a New Englander, is always regarded as a representative of the Middle colonies. Other interesting writers were grouped about him in Philadelphia, but New York and New Jersey produced few of any consequence. As a student of nature Franklin was only the foremost of an interesting group of men such as James Logan, John Bertram, and John Winthrop, of Harvard. As a writer and thinker on political subjects he exemplified the spirit of the age that was to produce publicists like John Dickinson, whose *Letters from a Farmer* (1767) focused the spirit of resistance; Samuel and John Adams, Jefferson, Hamilton, and Madison—men whose political writings, culminating in *The Federalist* (1788), astonished Europe and reached what perhaps is the high-water mark in this species of composition. For, as is well known, the eighteenth century was not less predominantly political than the seventeenth had been theological. It was also utilitarian, and so Franklin, who thoroughly summed up his age, was the creator of Poor Richard, whose *Almanac* may almost be said to be the foundation stone of popular education in America. It is probably his delightful *Autobiography*, however, that gives Franklin his position as the writer of the only literary classic produced in America before the nineteenth century. Taken along with his letters, this book, in both style and substance, furnishes us with one of the most remarkable self-revelations in literature. We read from a sense of duty a few authors of our Revolutionary period, like the satirists Francis Hopkinson and John Trumbull, author of *McFingal* (1775-82); we know *The Indian Burying Ground*, and a few other verses of the patriotic poet, Philip Freneau; we remember from our histories that the ill-fated Thomas Godfrey was the author of our first true poetical tragedy, *The Prince of Parthia* (1765); we smile at the mention of Joel Barlow's *Vision of Columbus* (1787), which developed into his formidable epic, *The Columbiad* (1807); but for many of us the true American literature of the eighteenth century is represented by the miscellaneous writings of Franklin.

This, however, is not altogether fair. Several of Franklin's contemporaries deserve to be remembered as writers of interest and of some importance. Among these are the Quaker John

Woolman; the loyalist historian of Massachusetts, Thomas Hutchinson; the patriotic historian and portentous dramatist and poet, Mrs. Mercy Otis Warren; the negro poetess, Phillis Wheatley, whose imitative verses astonished the learned of her day; the laborious poet, Rev. Timothy Dwight, whose *Conquest of Canaan* (1785), together with the productions of the so-called "Hartford Wits," was intended to lay the foundation of a real American literature and has at least been buried sufficiently deep for that purpose; the novelist, Mrs. Susanna Haswell Rowson, whose *Charlotte Temple* (1790) is still read—all these and a few other writers should be remembered before we accuse the eighteenth century in America of literary barrenness. These are not a tithe of the authors whom a serious literary historian would feel obliged to treat, and even we must add to them such a conscientious, if dull, historian as the Rev. William Stith, of Virginia, the distinctly more picturesque defender of the Old Dominion, Robert Beverley, and of the genial cavalier, Col. William Byrd, of Westover, whose *History of the Dividing Line* (1729) between Virginia and North Carolina is a remarkably entertaining production. To these Southern historians the name of Dr. David Ramsay, of South Carolina, should be added; but it is of more importance not to forget the greater works of two citizens by adoption—the Englishman, Thomas Paine, and the Frenchman, Hector St. Jean de Crèvecoeur. Paine's *Crisis* and his *Common Sense* (1776) did perhaps more to make independence the goal of the American Revolutionists than any other contemporary writings, and it was the spirit of the Revolution that animated his later but less acceptable books. Crèvecoeur's *Letters from an American Farmer* (1782) are full of an idealism more charming than can be found in Paine and of a love of nature almost worthy of Thoreau himself.

The confused period between the close of the Revolution and the beginning of the nineteenth century was naturally not propitious to literature. But many of the writers mentioned in the last paragraph did their best work in it, and to them we may add the names of Royall Tyler, whose play, entitled *The Contrast* (1786), was the first American comedy of importance; Noah Webster and Lindley Murray, famous later for their works in lexicography and grammar; Jeremy Belknap, author of one of the best of our early State histories, that of New Hampshire (1784); William Dunlap, whose *History of the American Stage* (1832) is still important, and Joseph Dennie, a writer of a mildly Addisonian type, whose *Portfolio*, founded in 1801, marked, with the contemporaneous establishment of the New York *Evening Post*, the great aid that journalism would give to literature throughout the new century.

But a more conspicuous writer than any of these, our first novelist, Charles Brockden Brown, had written his three most important novels, *Wieland*, *Ormond*, and *Arthur Mervyn* in the three closing years of the eighteenth century. He published three other novels in 1801, and his literary activity, which was mainly associated with Philadelphia, promised much for the new Republic. But his work was cut short by ill-health and an early death, and to modern readers his stories, while marked by distinct imaginative power, are too plainly connected with the extravagant school of God-

win and Mrs. Radcliffe to be attractive. Brown deserves, however, to be remembered as the first American who made the profession of letters a success, and he was a genuine predecessor of Hawthorne and Poe.

The opening decade of the nineteenth century was one of great political importance; but it is marked by few literary names of note, John Marshall's *Life of Washington* (1804) being less important than his judicial decisions, and the writings of the Rev. M. L. Weems and William Wirt not meaning much to the sophisticated readers of a century since. But in 1809 a work that will probably never lose its interest made it certain that American literature, in the true sense of the term, had been born. In this year Washington Irving gave the world "Diedrich Knickerbocker's" *History of New York*. Irving may be a little out of fashion to-day with some readers, and he may seem almost as much a British as an American classic; but a classic he is, whose style has perhaps not been surpassed, and whose essays, short stories and works of travel, biography, and history must be read by all cultivated Americans. During his long life he was the worthy head of the Knickerbocker school of writers who made New York the literary centre of the country before the rise of New England Transcendentalism.

It was more than a decade, however, after Irving's success before a really great writer arose to keep him company. Such poets as Washington Allston, John Pierpont, and Mrs. Sigourney, and such a dramatist as John Howard Payne, cannot send us back, with any great enthusiasm, to the second decade of the century just passed. It is true, nevertheless, that the founding of the *North American Review* at Boston in May, 1815, was an important event, and that, by publishing two years later the youthful Bryant's *Thanatopsis*, it introduced to the world a poet of dignity and power, who, if not precisely great, was at least able to interpret pleasingly and satisfactorily to Americans the natural beauties of their native land. Two other poets, inferior to Bryant, yet still remembered, Joseph Rodman Drake, author of *The Culprit Fay*, and Fitz-Greene Halleck, author of an elegy on Drake and some stirring lyrics, also made their appearance in this decade.

When James Fenimore Cooper published *Precaution*, in 1820, he gave the public no evidence that one of the greatest of modern writers of fiction had arisen. A competent reader of *The Spy*, which was issued the very next year, might, however, have perceived the fact. Two years later, *The Pilot* and *The Pioneer* showed that although Cooper might be essentially a follower of Scott, and although his style might be often slipshod and his power of characterization, especially in the case of women, almost nil, he was, nevertheless, master in his own splendid domain—the sea, the forest, and the prairie. The *Leatherstocking Tales* have been frequently called the real American epic, and a recognition of the truth of this statement would prevent many persons from underrating the genius of one of the few Americans who have won a world-wide fame by their writings. America has produced several authors of finer genius than Cooper possessed, but perhaps none of larger.

Besides Cooper the third decade of the last

century brought into notice the poet James Gates Percival, who unfortunately did not deserve the reputation he speedily acquired. A less highly praised poet, Edward Coate Pinkney, is now more interesting on account of his small but genuine lyric vein. The same decade counts among its worthies the indefatigable historiographer, Jared Sparks, and the admirable student of Spanish literature, George Ticknor. Lydia Maria Child, Edward Everett, the elder William Ellery Channing, and Bronson Alcott also made their appearance as writers; and Poe and Hawthorne published juvenile works that are now very rare. But perhaps the best-known production of the period is Webster's reply to Hayne, which struck the keynote that was to dominate our literature for the next generation and of which President Lincoln, in 1861, ordered a million copies to be printed and distributed.

The year 1831 saw the establishment of William Lloyd Garrison's *Liberator* and the publication of Whittier's first book, *Legends of New England*. Both men were to do a great work for the anti-slavery cause, and Whittier in especial was to endear himself to his native section as its true poet laureate. The writer who best represented New York at this period was Nathaniel Parker Willis, poet, traveler, and journalist. But he, though still interesting, has greatly declined in reputation. The same thing is true of those representative ante-bellum Southern writers, William Gilmore Simms, of South Carolina, and John Pendleton Kennedy, of Maryland, who, with Robert Montgomery Bird, of Pennsylvania, formed a group of romancers inferior indeed to Cooper, yet worthy of being read, at least in their best novels, such as *The Yemassee*, *Horse Shoe Robinson*, and *Nick of the Woods*. Besides these writers, who began their careers in the thirties, we should recall the historian George Bancroft, whose *History of the United States* remains eminently valuable, though dull and incomplete.

The Transcendental movement in New England, culminating in *The Dial* of the early forties, is, of course, the prime fact of American literary history before the Civil War. Yet many of the writers more or less connected with it, such as the critics George Ripley and Margaret Fuller, and the poets C. P. Cranch and Jones Very, have long since become mere names to most readers. The poet-naturalist, Thoreau, however, has not only held his own, but has gained ground year by year, and Emerson has taken his place with Hawthorne and Poe in the very front rank of American writers. Throughout his long life, Emerson was to his countrymen and to many Europeans not merely a great writer but an inspiring seer, and there are not wanting readers to-day who consider him, in his double capacity of philosopher and poet, the greatest of American men of letters. Since the publication of *The Scarlet Letter* (1850), this position has been assigned to Hawthorne by the majority of his countrymen, while foreign readers, especially in France, have unhesitatingly assigned it to Edgar Allan Poe, whose haunting poems and tales have seemingly exerted a greater literary influence than the works of any other American.

More influential, so far as the culture of the American people is concerned, has been the poetry of Henry Wadsworth Longfellow. It has been recognized by the critics that Longfel-

low's genius was at first overestimated; but critical depreciation has probably been carried too far, and it seems quite likely that the best loved of American poets will continue to rank not far below the greatest of his contemporaries. Much the same thing may be said of Oliver Wendell Holmes, whose *Autocrat of the Breakfast Table* (1858) has lost little or nothing of its popularity. As a poet also, Holmes, though he may most fairly be called the laureate of Boston, still has a hold upon the heart of the nation, and he should perhaps be better known as a novelist than he is; for his *Elsie Venner* (1861) is a striking book, though described by one of Holmes's friends as "a medicated novel."

James Russell Lowell by his *Fable for Critics* and the first series of *The Biglow Papers* (1848), had proved himself to be our greatest poetical humorist and satirist before the Civil War began. That cataclysm inspired him to write his great odes, and later he became easily the first of American critics and letter-writers, and one of the first of American publicists. He is too near us for a proper estimate to be made of his rank in our literature, but it would appear that his fame as humorist, essayist, and epistolary master is secure. Secure, too, seems the fame of those admirable historians William H. Prescott and John Lothrop Motley, although some of the former's works have suffered as technical history through the discoveries of modern investigators. Their junior, Francis Parkman, is, however, generally regarded as their superior, his great series of histories dealing with the struggle between French and English for the mastery of the New World being as fascinating and at the same time as scientifically thorough as any other historical compositions.

All the writers treated in the immediately foregoing paragraphs won at least a partial recognition before the Civil War. Their fame has not, however, entirely cast in the shade such writers as Richard Henry Dana, Jr., author of *Two Years Before the Mast* (1840), and Herman Melville, whose *Typee* (1846), *Omoo* (1847), and *Moby Dick* (1851), are among the best books of adventure in our literature. Nor is the work of Bayard Taylor, Donald G. Mitchell, Richard Grant White, James T. Fields, Thomas Wentworth Higginson, and Charles Eliot Norton, to be omitted even in so brief a sketch as the present. Mention should be made also of George William Curtis, E. P. Whipple, and the two Southern poets, Paul H. Hayne and Henry Timrod, as well as of the worthy Philadelphia dramatist and poet, George Henry Boker. Two other writers who emerged before the Civil War claim attention. One, Mrs. Harriet Beecher Stowe, stirred the sympathies of the civilized world by her pathetic story of American slavery, *Uncle Tom's Cabin* (1852); the other, Walt Whitman, by his *Leaves of Grass* (1855-83), poetically expressed the democratic ideal in a way that appealed profoundly to European readers; won him quite a large circle of devotees at home; and bids fair to secure for him a high place in American poetry.

The most noteworthy name in the decade to which the Civil War belongs is that of Samuel L. Clemens, who, over the pseudonym of "Mark Twain," won a world-wide reputation as a humorist and writer of fiction. Two other humorists who filled a large place in their day, whatever their future place may be, are Henry

W. Shaw (1818-85), better known as "Josh Billings"; and Charles Farrar Browne (1834-67) ("Artemus Ward"). With them appeared a number of authors whose later and more mature work has made them known throughout the country. One of the most important stories of the decade—important rather in its practical effect than by its literary value—was *The Man Without a Country* (1863), by Edward Everett Hale. Appearing at a time when the feelings of the nation were so divided, it did much to strengthen a spirit of loyalty to the Union. Two other writers, who first came to notice in the sixties, were cut off in what promised to be most fruitful careers—Theodore Winthrop, the novelist, whose *John Brent* (1862) was full of racy vigor, and Sidney Lanier, regarded by some critics as the most important American poet of the last 40 years.

Since 1870 the number of publications has been constantly and rapidly increasing, and two dominant types have appeared—the local short story and an exaggerated form of the romantic novel. As the Middle and Western States became more settled, a new type of literature arose, which was especially adapted to the new conditions. As early as 1868 a magazine, *The Overland Monthly*, had been established in San Francisco; and in it appeared the vivid, racy, unconventional story, *The Luck of Roaring Camp*, by Bret Harte. From the appearance of this tale may be dated the vogue of the short story dealing with the local conditions in various sections of the United States. Following Bret Harte, many writers appeared all over the country, each depicting the life and manners of his own particular section. For the most part, they emphasized local conditions by employing the dialect peculiar to their division of the country. Among the more successful of these dialect writers were Joel Chandler Harris, with his *Uncle Remus* stories; Edward Eggleston, the author of *The Hoosier Schoolmaster* (1871), and other tales of the Middle West; G. W. Cable, who so skillfully depicted the French Creole life of New Orleans; and Mary Noailles Murfree, better known under her pseudonym "Charles Egbert Craddock," whose novels of the mountain whites of Tennessee, Kentucky, North Carolina, and Georgia first attracted the attention of the country to these peculiar people. But although the majority of short-story writers used dialect forms, there were a number who generally adhered to more conventional styles of expression, depending upon their power of characterization and the enumeration of salient details to give the necessary semblance of reality. Among these were Harold Frederic, who dealt with the crude life of west-central New York, producing at least one notable book (1896) in *The Damnation of Theron Ware* (republished in England under the title *Illumination*); Hamlin Garland, who wrote of the Northwest; Thomas Nelson Page, who made his own the landed gentry of Old Virginia; James Lane Allen, who depicted the people of Kentucky; and Mary E. Wilkins, who with deserved success wrote her vignettes of the narrower life of New England. F. R. Stockton drew with much quaint humor some familiar and very characteristic American types in *Rudder Grange*; and Ernest Thompson Seton described the lives of wild animals by the original and interesting method of looking at their environment from their own assumed standpoint.

Besides these writers there were a few successful authors whose works cannot be classified under any one division. First of these is Gen. Lew Wallace, whose *Ben Hur* (1880), a tale of the early days of Christianity, was immensely popular. It was a forerunner of the reaction against the short dialect story; for just as the psychological novel had given place to the story, so it in turn was to be superseded by the unalloyed romance. A prolific and interesting writer was Francis Marion Crawford, who was an exponent of the theory that a novel should be essentially a drama, in which descriptions should take the place of scenery, a notion admirably carried out in his most powerful work, *Greifenstein*. At the same time William Dean Howells and Henry James were working along lines parallel yet clearly separated. The former practically created the novel of American social life with men and women rather than incidents for material; and in his stories commonplace occurrences charm through his skillful realization of the characters. Mr. Howells in his many novels of American life has done for our country what Balzac did for France in his *Comédie Humaine*. Moreover, in such books as *The Rise of Silas Lapham*, he has caught and fixed with remarkable success the characteristics of an era that will soon be known only by these works of genius. Henry James has been characterized as the "creator of the international novel." His psychology is admirable though almost too subtle and his style is refined to a degree. Mrs. Wharton, first noticed as a follower of Henry James, shows in her later works but little of his influence. *The Valley of Decision* (1903), a story of Italy in the eighteenth century, attracted notice. *The House of Mirth* (1905), a story of "society" life in New York, was considered at the time the finest American novel recently written. Gertrude Atherton in her best writing reveals the days of Spanish California, and in *Senator North* there is a very striking study of an individual who has an admixture of black blood.

In 1894 *The Prisoner of Zenda*, by an English author, Anthony Hope Hawkins, being well received by a public tired of psychology and dialect, and eager for tales of adventure, in welcome contrast with the commonplace civilization of the day, made the romantic novel popular. Winston Churchill, Mary Johnston, Bertha Runkle, Charles Major, Maurice Thompson, S. Weir Mitchell, Paul Leicester Ford, and many others wrote historical romances, of which hundreds of thousands of copies were sold within very short periods. The beginning of the twentieth century was marked by the introduction of the novel dealing with the individual who is in revolt against existing social conditions. Although this perhaps is not yet a clearly defined department of fiction, *Unleavened Bread* (1900), by Robert Grant, *A Singular Life* (1895), by Elizabeth Stuart Phelps, and *A Gentleman from Indiana* (1900), by Booth Tarkington are all novels which show the same general tendency to emphasize individualism.

At present skillful craftsmen in fiction multiply, and a group of recent cultivators of the field may be mentioned. Margaret Deland (1857—), through her "Old Chester" stories, has a niche of her own among our twentieth-century story-tellers. For the light clever fiction of Richard Harding Davis (1864—) and Robert W. Chambers (1865—) the public has shown a

prodigious liking. Kate Douglas Wiggin (Mrs. George C. Riggs) (1857—) has won and held a large audience with stories of California, New England, and old England. Gertrude Atherton (1857—), a stronger novelist, but of uneven quality, writes indifferently of East and West, or of life abroad, and in *The Conqueror* produced an impressive historical novel. A novelist—primarily of American history—whose work improves in successive books, is Winston Churchill (1871—); his *The Crisis* is of the best of Civil War stories. A Southern novelist of manners of the days during and since the War is Ellen Glasgow. Another Southern novelist is Mary Johnston (1870—), who brings together war time incidents of fact and fiction with striking panoramic effect. David Graham Phillips (1867–1911) stands out from the company of mere clever writers by his rude force, his definiteness of social and moral aim, and his vocal Americanism. As purely American as Phillips, is Robert Herrick (1868—), with his novels depicting, particularly, the Middle West. The ranch and the mines of the far West are the themes of the unmistakably indigenous work of Owen Wister (1860—). In 1910 America lost by the death of Sydney Porter, "O. Henry," a short-story writer of extraordinary variety and ingenuity, and perhaps the most popular practitioner of the *genre* in this country. Frank Norris's novels, written between 1897 and 1902, notably *The Pit*, are sensational but strong; and *The Call of the Wild*, *The Sea Wolf*, and other tales of life in Alaska, the Yukon, etc., by Jack London (1876—) are stirring and adventurous.

Humor of a distinctively national stamp has been a pretty constant property of American literature from Benjamin Franklin to Mark Twain and beyond. Most of our greater writers—Irving, Lowell, Holmes, and Bret Harte among them—were humorists incidentally, not primarily; but there is a group of men who were humorists first and last. To this group belong, in addition to Mark Twain, Josh Billings, and Artemus Ward, mentioned all of them above, Edgar Wilson Nye (1850–96), "Bill Nye"; George Ade (1866—); and Finley Peter Dunne (1867—), "Mr. Dooley." Bill Nye and George Ade descend too often in their extravagant horseplay to the level of the newspaper comic supplement. Mr. Dooley is easily the first of our present-day humorists, and in his inimitable Irish-American idiom has satirized the foibles and idols of the hour in a running fire of racy and brilliant papers that mayhap will survive both.

In turning to poetry one is struck with the dearth of really important names. Among any number of versifiers, musical but commonplace, E. C. Stedman, R. H. Stoddard, T. B. Aldrich, Richard Watson Gilder, H. C. Bunner, and Richard Hovey are amongst those whose poetry has risen above the ordinary level. An exception is to be made in the case of W. D. Howells's *Stops of Various Quills*, a book now little read, but for technique and deep feeling worth the whole body of other contemporary American verse. Others of the older singers are still heard, among them James Whitcomb Riley (1853—), while Cincinnati Heine Miller (1841–1913), "Joaquin Miller," has recently sung his last song. William Vaughn Moody (1869–1910), perhaps more the poet than any other American of his generation, leaves behind him his friend, Edward Arlington Robinson (1869—),

who may be characterized in like terms. The work of Madison Cawein (1865—) should have honorable mention, as also that of Ridgely Torrence (1875—), Louis Vernon Ledoux (1880—), Emily Dickinson, Josephine Preston Peabody, and Percy Mackaye (1875—).

In historical composition there has been a marked inclination to follow the example set by the English historian, J. R. Green, and not only to weigh carefully the dramatic events of political history, but also to study with equal thoroughness the character of the people themselves. This tendency has been especially evident in the works of John Fiske, John Bach McMaster, Woodrow Wilson, and Edward Eggleston, all of whom have added much to our knowledge of conditions and men at the beginnings of our national life, and in the elaborate researches of Justin Winsor. Another historical writer of great importance is James Ford Rhodes, the historian of the Civil War and the period of Reconstruction, whose work, beginning with the Compromise of 1850, is the most richly documented American history that has yet been produced. Mention should also be made of William M. Sloane, the author of a monumental biography of Napoleon, now superseded by the English biography of J. H. Rose; William A. Dunning with his minute researches in the history of the Civil War; Woodrow Wilson, whose *History of the United States* is one of the few that cover the whole period of our national existence; H. W. Elson, whose book is equally comprehensive and still more popular; while Harry Thurston Peck in his *Twenty Years of the Republic* (1885–1905) attempted, not unsuccessfully, the difficult task of writing a contemporaneous history with impartiality and lucidity.

Literary criticism has had many representatives; but since James Russell Lowell's death American literature has found no one fitted to succeed him. The best-known critics who enjoyed a certain amount of authority in late years were William Dean Howells, Henry James, Brander Matthews, George E. Woodberry, Harry Thurston Peck, William C. Brownell, Norman Hapgood, James Huneker, F. M. Colby, and Paul Elmer More. In recent criticism, however, there is a note of individual preference at times almost emotional, and an absence of definite æsthetic standards, such as those which characterized the work of Sainte-Beuve and Brunetière in France and of Matthew Arnold and Courthope, in England. Consult H. H. Boyesen, "American Literary Criticism," in his *Silhouettes* (1894); and the article CRITICISM.

In conclusion, the most important developments since 1870 are New England's loss of literary supremacy; the wide distribution of literary activity; the decline of the essay as a recognized medium of purely literary expression; the predominance of light fiction, and an unparalleled increase in the number of books, newspapers, magazines, and other periodicals. In the early twentieth century the serious book has largely yielded to the magazine, and the magazine to the "literary supplement" of the newspaper; just as the legitimate drama had been supplanted successively by the light comedy, the vaudeville, and the moving-picture show. Many take a pessimistic view of American literary tendencies, but it is likely that the great increase in the number of those who read something will end in a greater demand for serious

literature, as discrimination is developed by comparison and criticism.

Bibliography. For the best account of Colonial and Revolutionary literature, consult: Tyler, *History of American Literature* (4 vols., New York, 1878-97); for a good general survey, Richardson, *American Literature* (New York, 1887-88); Nichol, *American Literature* (Edinburgh, 1882); Wendell, *A Literary History of America* (New York, 1900); C. Noble, *Studies in American Literature* (New York, 1898); Katherine Lee Bates, *American Literature* (New York, 1898); Brownell, *American Prose Masters* (1909); Trent, *Southern Writers* (1910); for poetry, Stedman, *Poets of America* (Boston, 1885); Stedman, *An American Anthology* (New York, 1901); Rittenhouse, *The Younger American Poets* (1904); for prose, Carpenter, *American Prose* (New York, 1898); for anthologies of prose and verse, Stedman and Hutchinson, *Library of American Literature* (11 vols., New York, 1888-90); Duyckinck, *Cyclopædia of American Literature* (New York, 1865). The best series of monographs on American authors is the American Men of Letters Series (Boston) and the American section of the English Men of Letters Series (New York). See also Whitcomb, *Chronological Outlines of American Literature* (New York, 1894); Trent, *History of American Literature* (New York, 1904); Vincent, *American Literary Masters* (1906); and the biographical notices at the end of articles relating to important writers in the present work. Allibone's *Critical Dictionary of English and American Literature*, with supplementary volumes, appeared in 1891 and contains 93,000 titles.

AMERICAN MERCHANT MARINE. See UNITED STATES. *Shipping*; SHIPPING SUBSIDIES.

AMERICAN MUSE'UM OF NAT'URAL HIS'TORY. See MUSEUM.

AMERICAN NOTES. By Charles Dickens, published in 1842, after his first visit to the United States. They excited resentment in America.

AMERICAN PAR'TY. This party is generally considered as being the same as the Know-Nothings. The terms were not synonymous at first, but later came to be. (See KNOW-NOTHINGS.) The American Party was an expansion of the Know-Nothings into a national political organization. It came into existence soon after the election of 1852, which witnessed the end of the Whigs. The increasing agitation against slavery and the opposition to the Fugitive Slave Law were bound to produce a new party to oppose the Democrats. This party was the result. Its cardinal principles were opposition to foreigners and to the Roman Catholic church. The only national election in which it played an important part was that of 1856. Its candidates were Fillmore and Donelson, and they polled nearly a million votes. See Woodburn, *American Politics* (New York, 1903); Stanwood, *History of the Presidency* (Boston, 1898).

AMERICAN PEACE SOCIETY. See PEACE MOVEMENT, INTERNATIONAL.

AMERICAN RIV'ER. A river in north central California (Map: California, C 2). It rises in Eldorado County and flows southwesterly toward the Sacramento River, into which it empties a little above the city of Sacramento. Gold has been frequently found along its banks.

AMERICAN SYC'AMORE. See PLANE.

AMERICAN SYS'TEM. See TARIFF.

AMERICAN U'NIVER'SITY. An institution of higher learning under the auspices of the Methodist Episcopal Church, situated at Washington, D. C., chartered in 1893. Its plans include the College for Graduate Study, providing (1) an institute for research, (2) courses of lectures, and (3) a system of fellowships. A Board of Award, consisting of seven, supervises its academic work and nominates to the fellowships. The plan of organization provided that for entrance to all courses the bachelor's degree, or its equivalent in scholarship, should be required. The assets in 1913 amounted to \$3,000,000. Chancellor, 1913, Franklin Hamilton, Ph.D.

AMERICAN WINE. See WINE.

AMERICA'S CUP. See YACHT.

AMERICUS. A city and the county-seat of Sunter Co., Ga., 71 miles by rail southwest of Macon, at the junction of the Central of Georgia and the Seaboard Air Line railroads (Map: Georgia, B 3). It is in an agricultural region, producing cotton, corn, watermelons, pecans, and peaches. The chief industries of the city include cotton oil, fertilizer, metal and monument works. Americus is the seat of a State agricultural college, and has a fine Y. M. C. A. building, a Carnegie library, and a palatial hotel. Eleven miles north of the city lies historic Andersonville (q.v.). Settled in 1832, Americus was incorporated in 1855. It is governed by a charter of 1889, which places the mayor's term at two years, and provides for a city council of six members elected on a general ticket, with full power of appointment. The city owns and operates its water works. Pop., 1900, 7674; 1910, 8063; 1913 (est.), 11,000.

AMERIGHI, ä'mâ-rê'gê, MICHELANGELO. See CARAVAGGIO.

AMERIGO VESPUCCI, ä'mâ-rê'gö vës-pööt'-chê. See VESPUCIUS, AMERICUS.

AM'ERIND. A name suggested as a designation for the American Indians (including the Eskimo and the Fuegians), as distinguished from the natives of India and the adjacent regions. It is compounded from the two words, *American* and *Indian*, and originated with Major J. W. Powell, Director of the Bureau of American Ethnology, and an American lexicographer. See article AMERIND in *Handbook of Amer. Inds. N. of Mexico*, Pt. I (Washington, 1907), p. 49.

AMERLING, ä'mêr-ling, FRIEDRICH VON (1803-87). An Austrian portrait and figure painter. He was born at Vienna and studied at the academy there. He then worked with Sir Thomas Lawrence in London and with Horace Vernet and also studied in Italy (1831), where he was influenced by Venetian color. On his return to Vienna his portrait of the Archduke Rudolph of Austria (1832) won the favor of Emperor Francis I, who ordered a portrait of himself enthroned in the royal regalia (1833). He painted several other portraits of the Emperor and became in consequence the principal portrait painter of the Viennese aristocracy. The years 1841-44 were spent chiefly in Florence and Rome, where he began to paint single figure subjects with great success. Of his portraits, which number about 1000, are those of Prince Schwarzenberg, Princess Khevenhüller, the sculptor Thorwaldsen, the poet Grillparzer, Prince Liechtenstein, and several of the artist himself. His figure subjects include a "Lute Player," the painter's brother as a "Fisher Boy," and the "Apostle Paul" (the last two in the Imperial Gallery, Vienna), and "The Greek Girl." His

portraits are rich in color and the well-characterized sitters are elegant in bearing; but the pose, especially of the woman, is often affected and theatrical. Consult the painter's *Life* by his friend Frankl (Vienna, 1889); Pollak, *Oesterreichische Künstler* (Vienna, 1905).

AMERSFOORT, ä'mērz-fōrt. An ancient town in the province of Utrecht, Netherlands, 15 miles by rail northeast of Utrecht on the Eem, which flows into the Zuider Zee (Map: Netherlands, D 2). The town is situated in a fertile plain at the foot of sandy hills. Tobacco is much grown in the district, and cotton and woolen goods, leather, soap, glass, beer, etc., are manufactured. The Catholic church of St. Mary, built in the fourteenth century, was partly destroyed by an explosion in 1787, but its Gothic tower was not injured. This tower is 312 feet high, has excellent chimes, and is considered the finest in Holland. There is also a fine museum, and a college of Jansenists. Pop., 1890, 15,500; 1900, 19,089; 1911, 23,997.

AMERY, ā'mēr-i, LEOPOLD CHARLES MAURICE STENNETT (1873—). An English historian and publicist, born at Gorakpur, India, and educated at Harrow and at Balliol College, Oxford. He traveled in the Near East in 1897-98, after being elected a fellow of All Souls College, Oxford, and in 1899 joined the staff of the *London Times*. For this paper, at the outbreak of the Boer War, he organized the staff correspondence in South Africa. He contested seats in Parliament in 1906, 1908, and 1910, and in 1911 was elected from South Birmingham as a Unionist. In addition to the monumental *Times History of the War in South Africa*, which fills seven volumes and is considered an exhaustive and definitive treatment of the war, he wrote *The Problem of the Army* (1903); *Fundamental Fallacies of Free Trade* (1906); *The Great Question* (1909); *The Case against Home Rule* (1912); *Union and Strength* (1912).

AMES, ānz. A city in Story Co., Iowa, 37 miles north of Des Moines, on the Chicago and Northwestern Railroad (Map: Iowa, D 3). It is the seat of the State College of Agriculture and Mechanic Arts (founded in 1869), which has an enrollment of over 2500 students and occupies a plant covering more than 1000 acres. Ames possesses a Carnegie library and owns and operates its water works and electric light plant. Its chief industry is the manufacture of banners and pennants. The Lincoln Highway passes through the city. Pop., 1890, 1276; 1900, 2422; 1905, 3292; 1910, 4223; 1913 (est.), 5000.

AMES, ADELBERT (1835—). An American soldier. He was born at Rockland, Me., and graduated at West Point in 1861. He was wounded at the first battle of Bull Run and afterward served with distinction at Malvern Hill, Antietam, Fredericksburg, Chancellorsville, Gettysburg, and Petersburg. He was brevetted (March 13, 1865) major-general of volunteers for conduct at Fort Fisher, and on July 28, 1866, became a lieutenant-colonel in the regular army. He was afterward Provisional Governor of Mississippi from 1868 to 1869, and was Commandant of the Fourth Military District (including Mississippi) from 1869 to 1870, and was a United States Senator from 1870 to 1873, when he became Governor of Mississippi by popular election. His administration of affairs soon antagonized the whites, who accused him of favoritism to the negro population, and a bitter race war ensued, culminating in the

Vicksburg riot of Dec. 7, 1874, and in numerous minor conflicts between Democrats and Republicans. Finally, in 1876, the Democrats having secured a majority in the Legislature, Ames was impeached, and resigned on condition that the charges against him be withdrawn. (See MISSISSIPPI.) He then removed to New York, and, later, to Lowell, Mass., and during the Spanish-American War served as brigadier-general of volunteers.

AMES, FISHER (1758-1808). An American orator and Congressman. He was born at Dedham, Mass., April 9, 1758. He graduated at Harvard in 1774, began the practice of law in 1781, and soon became favorably known through his trenchant newspaper articles in condemnation of Shays's Rebellion (q.v.) and in favor of a strong government. This local reputation was increased by his efforts in favor of the Federal constitution in the Massachusetts Convention of 1788, the immediate result of which was his election to Congress, where he served for eight years, becoming known especially as an accomplished public speaker. In his later years he served in the Massachusetts Council, delivered a eulogy on Washington before the Legislature, and produced a number of essays; but he took no part in active politics. In 1804 he declined the presidency of Harvard. He died July 4, 1808. A single volume of his *Works* was published in Boston (1809), and later his son, Seth Ames, edited his writings and speeches in more extended form, with a memoir by J. T. Kirkland (Boston, 1854).

AMES, HERMAN VANDENBURG (1865—). An American scholar and educator, born in Lancaster, Mass. Having graduated from Amherst College in 1888, he took advanced courses at Columbia and Harvard universities, receiving the degree of Ph.D. from Harvard in 1891. After teaching for three years in the University of Michigan, he went abroad for further post-graduate work at Leipzig and Heidelberg. He became assistant professor of history in Ohio State University (1896), and, in the University of Pennsylvania, successively instructor in American constitutional history (1897), assistant professor of American history (1903), and professor of American constitutional history (1908). Professor Ames was also made dean of the Graduate School at Pennsylvania in 1907. Besides his other activities, he lectured at summer sessions of Columbia and the University of Wisconsin and became member and officer of many historical societies. In addition to contributing frequently to periodicals and editing *State Documents on Federal Relations*, *The States and the United States* (1906), he wrote: *The Proposed Amendments to the Constitution of the United States*, which received a prize of the American Historical Association (1897); *Outline of Lectures on American Political and Institutional History during the Colonial and Revolutionary Periods* (3d ed., 1908); *Syllabus of American Colonial History* (with W. T. Root, 1912).

AMES, JAMES BARR (1846-1910). An eminent American educator and legal scholar. He was born in Boston, graduated in 1868 at Harvard and in 1872 at the Law School of the University, in 1868-69 was an instructor in a private school at Boston, and from 1871 to 1872 was tutor in German and French at Harvard. In the same institution he was appointed successively instructor in history (1872), asso-

ciate professor of law (1873), and professor of law (1877). In 1895 he became dean of the Harvard Law School. He published various articles in the *Harvard Law Review* and similar periodicals and compiled and edited numerous valuable collections of cases on torts, trusts, and suretyship, and other legal questions. A man of profound but unaffected scholarship and a teacher of rare power and distinction, he exerted a wide and lasting influence on the development of the law of this country. His scattered essays on legal topics were collected and published after his death as a memorial to his genius, under the title *Essays in Legal History* (Boston, 1912). It is not too much to say that they constitute the most important contribution to legal scholarship that has yet been made in America. He received the degree of LL.D. from New York University (1898), the University of Wisconsin (1898), and the University of Pennsylvania (1899).

AMES, JOSEPH (1689–1759). An English antiquary and bibliographer, born at Yarmouth. He was in some sort of mercantile pursuit, and in addition to various other compilations published the *Typographical Antiquities* (1749), regarded as forming the foundation of English bibliography.

AMES, JOSEPH ALEXANDER (1816–72). An American portrait painter. He was born in Roxbury, N. H., and was a pupil of Washington Allston in Boston. Of varied talents, he painted figure, genre and landscape, but his portraits are his best work. In 1848 he went to Rome, where he painted a picture of Pope Pius IX. On his return to America he lived successively at Boston, Baltimore, and New York, where he was elected a member of the National Academy of Design in 1870. His best portraits are those of Emerson, Rachel, Ristori, Clarence A. Seward, Webster, Choate, and President Felton of Harvard; his figure subjects, "Miranda" and the "Death of Webster."

AMES, JOSEPH SWEETMAN (1864—). An American physicist and educator, born at Manchester, Vt. He graduated in 1886 at the Johns Hopkins University; became professor of physics there (1899), and director of the physical laboratory (1901). Professor Ames was elected an honorary member of the Royal Institution of Great Britain. He became assistant editor of the *Astro-Physical Journal* and associate editor of the *American Journal of Science*; editor-in-chief of the *Scientific Memoir Series*; editor of J. von Fraunhofer's memoirs on *Prismatic and Diffractive Spectra* (1898); author of *The Theory of Physics* (1897), *Elements of Physics* (1900), *The Induction of Electric Currents* (2 vols., 1900), *Text-Book of General Physics* (1904).

AMES, MARY CLEMMER (Mrs. EDMUND HUDSON) (1839–84). An American author, best known by her "Woman's Letter from Washington," contributed for many years to the *New York Independent*. She was born at Utica, N. Y., and at an early age married the Rev. Daniel Ames, from whom she was divorced in 1874. Her early newspaper experience was gained on the *Springfield Republican*, the *New York Press* (1865), and the *Brooklyn Daily Union* (1869–71). In 1871 she received \$5000 for her work, the largest salary ever paid a newspaper woman up to that time. In later life she removed to Washington, where her home was a literary and social centre, and in 1883 she married Edmund Hudson, editor of the

Army and Navy Register. Her works include *Victoria* (1864) and *Eirene* (1870), novels; *Ten Years in Washington* (1871); *Memorials of Alice and Phœbe Cary* (26th ed., 1885), of whom she had been an intimate friend; a volume of poems (1872); *Outlines of Men, Women, and Things* (1873); *His Two Wives* (1874); and *Poems of Life and Nature* (3d ed., 1886). Her complete works were published at Boston (4 vols., 1885). Consult Hudson, *Memorial Biography of Mary C. Ames* (Boston, 1886).

AMES, NATHAN P. (1803–47). An American manufacturer of firearms, ordnance, and cutlery. In early life he owned extensive cutlery works at Chicopee Falls, Mass., but afterward removed to Cabotville (now Chicopee). The works were supplemented in 1836 by a bronze foundry, where most of the brass guns for the United States army were cast. There also the statues of DeWitt Clinton, in Greenwood Cemetery, Brooklyn; of Washington, in Union Square, New York; and of Franklin, in School Street, Boston, were cast.

AMES, OAKES (1804–73). An American manufacturer and legislator. He was born at Easton, Mass., and at an early age entered his father's workshop, where he soon familiarized himself with every detail of the shovel business, which, upon the discovery of gold in California and the impetus thereby given to railroad building, soon became a most important industry. He served in the cabinet of the Governor of Massachusetts in 1860. Four years later, after others had failed, he was called upon by President Lincoln and others to build the Union Pacific Railroad, which great undertaking he successfully completed on May 10, 1869. He had invested \$1,000,000 in the enterprise and had pledged the remainder of his fortune for the same purpose. He was censured by the Forty-second Congress for participation in the Credit Mobilier (q.v.), but afterward was vindicated in a resolution passed by the Massachusetts Legislature (May 10, 1883). From 1862 to 1873 he represented the second Massachusetts district in Congress. He bequeathed \$50,000 to children of North Easton, Mass. A fine monument in his memory was erected by the Union Pacific Railroad at Sherman, Wyoming, the highest point reached by the railroad. Consult *Oakes Ames: A Memoir* (Cambridge, 1884).

AMES, OLIVER, LL.D. (1831–95). The thirty-first Governor of Massachusetts, a son of Oakes Ames. He was trained in his father's manufactory and upon his death undertook the discharge of the numerous financial obligations incurred by the building of the Union Pacific Railroad and other enterprises, paying within a few years debts aggregating millions of dollars. In 1882, after being a member of the State Senate for two years, he was chosen Lieutenant-Governor of Massachusetts, serving for four successive terms, and in 1886 was elected Governor, to which office he was reelected in 1887 and 1888.

AMES, WILLIAM (1576–1633). An English Puritan clergyman and writer on moral philosophy, born in the county of Norfolk and educated at Christ College, Cambridge. He was compelled to leave England because of persecution for nonconformity, and then became professor of theology in the University of Franeker, Friesland, from 1622 to 1632. He was famous in his time as a master of theological controversy and is considered to have had a great influence

on the religious thought of Europe. His best-known work is *De Conscientia, eius Iure et Casibus* (1632).

AMES, WINTHROP (1871—). An American theatrical manager, born at North Easton, Mass. After he graduated from Harvard in 1895 and had spent an additional year of special study at the university, he was engaged in editorial and publishing work in the general field of art and architecture for some eight years. His chief interest, however, lying in the theatre and its management, he undertook, in 1904, the direction of the Castle Square Theatre in Boston, a house devoted especially to producing good plays at popular prices. Mr. Ames's Boston success induced the founders of the New Theatre in New York City to select him (1908) as director of their ambitious enterprise. While artistically successful, his management of this theatre was, from a variety of reasons, so unprofitable financially that the project had to be abandoned in 1911. (See **DRAMA**.) Mr. Ames built, in 1912, a small but elegant playhouse which he called The Little Theatre, there presenting some of the most notable dramatic productions seen in New York City in a number of years. He also built the Booth Theatre (1913).

AMESBURY, āmz'bēr-ī. A town in Essex Co., Mass., on the Boston and Maine Railroad, 42 miles northeast of Boston (Map: Massachusetts, F 2). It has a public library, operates its own water works, and manufactures carriages, electric automobiles, automobile fittings, hats, reed and rattan goods, mirrors and reflectors, motor boats and dories, brass castings, shoes, and hinges. The government is administered by town meetings, held annually. Originally a part of Salisbury, Amesbury was virtually separated as New Salisbury in 1654 and was incorporated in 1666 and named (from Amesbury, England) in 1667. There is here a monument erected to Josiah Bartlett, who was born in Amesbury. John Greenleaf Whittier lived here from 1836 until his death in 1892. Pop., 1890, 9798; 1900, 9473; 1910, 9894. Consult J. Merrill, *History of Amesbury* (Haverhill, 1880).

AM'ETHYST (Gk. ἀμέθυστος, *amethystos*, a remedy against drunkenness, from ἀ, *a*, priv. + μέθυ, *methy*, wine). A violet blue or bluish-violet variety of quartz, the color of which is believed to be due to manganese oxide. It is one of the most widely used of the semi-precious stones, rings, pendants, necklaces, and other articles of jewelry. The ancients imagined it to possess the property of preventing drunkenness, and some of those addicted to that habit wore it on their persons. Amethyst frequently occurs lining the interior of balls or geodes of agate and in veins and cavities in various rocks. The finest specimens are from Scotland, Siberia, India and Ceylon. In the United States the amethyst is found in many localities, but seldom of sufficient clearness or color to be used as a gem. The Lake Superior crystals, from the slaty formations around Thunder Bay, are perhaps the best known, and annually thousands of dollars' worth is sent from this locality to be sold at Niagara Falls and other tourist resorts. The Oriental amethyst is a purple variety of corundum.

AM'ETRO'PIA (Gk. ἀ, *a*, priv. + μέτρον, *metron*, measure, or ἀμέτρος, *ametros*, disproportionate + ὤψ, *ōps*, eye). Any departure from the normal refractive condition of the eye or emme-

tropia. In emmetropia, in the absence of accommodative effort, i.e., when the eye is at rest, parallel rays of light are focused on the retina. In ametropia the retina may lie behind the principal focus of parallel rays, in which case the eye is said to be myopic; or in front of this focus, when it is called hyperopic. In the one case the eyeball is too long, in the other too short. See **HYPEROPIA**; **MYOPIA**; **ASTIGMATISM**; **VISION**.

AMGA, ām-gä'. A river in the territory of Yakutsk, Siberia, rising in the Aldan Mountains, flowing toward the northeast, and joining the Aldan, a tributary of the Lena (Map: Asia, N 2).

AMHARA, ām-hä'rá (the high lands). The central division of Abyssinia, occupying the territory around Lake Tsana (Map: Africa, H 3). The capital is Gondar. See **AMHARIC LANGUAGE**.

AMHARIC (ām-hä'rik) **LAN'GUAGE**. A modern Semitic dialect which derives its name from the people of Amhara (q.v.), one of the divisions of Abyssinia. Next to the Arabic, Amharic is the most widely spread of the Semitic languages. It has displaced in popular usage the original language of Abyssinia, the Ethiopic or Geez, and is now the spoken tongue, whereas the Geez is only used in the liturgy. For many years Amharic had no writing, so that it changed very much in its forms, conjugations, and even in the meanings of its roots. Moreover, its vocabulary received non-Semitic additions from the surrounding African tribes. Hence it is that Amharic is the least Semitic of the Semitic languages, and this appears very strongly in the syntax. When the Amharic language began to be written, the Ethiopic or Geez letters were used. A literature has grown up in comparatively modern times. Its oldest documents are some war songs from the fifteenth and sixteenth centuries, published by Guidi, *Le canzoni geez-amarina in onore di Rè-Abissini* (1889); *Documenti amarina* (1891). With the seventeenth century begins the creation of a purely Amharic literature, partly under the influence of European missionaries. The translation of the Bible was made by missionaries. Of grammars there are those of Ludolph (Frankfort, 1698); Isenberg (London, 1842); Massaja (Paris, 1867); Prätorius (Halle, 1879); Guidi (Rome, 2d ed., 1892); Mondon-Vidailhet (1898); Apevork (1905); Mahler (1905); of dictionaries, Isenberg's (London, 1841); A. d'Abbadie's (1881). See **AFRICAN LANGUAGES**.

AM'HERST. A district of Lower Burma (q.v.), British India.

AMHERST. A town in Hampshire Co., Mass., 16 miles north of Springfield, on the Boston and Maine and Central Vermont railroads (Map: Massachusetts, C 3). The scenery is picturesque, with beautiful views of the Connecticut valley, Mount Holyoke, and other mountains. It is the seat of Amherst College and of the Massachusetts Agricultural College (qq.v.). Straw hat manufacture is the principal industry. Probably settled as early as 1703, Amherst was part of Hadley and was known successively as New Swamp, Hadley Farms, East Farms, and East Hadley until, in 1759, it was incorporated as a district under its present name, given by Governor Pownall in honor of Gen. Jeffrey Amherst (q.v.). In 1776 it became a town. The government is administered by town meetings. Amherst is rich in Revolutionary tradition. Pop., 1890, 4512; 1900, 5028; 1910, 5112; 1913

(est.), 5308. Consult Carpenter and Morehouse, *The History of the Town of Amherst* (Amherst, 1896); Walker, *Historic Homes of Amherst* (Amherst, 1905).

AMHERST, formerly FORT LAWRENCE. A port of entry and the chief town of Cumberland Co., Nova Scotia, Canada, near the head of Cumberland Basin, and on the Inter-Colonial Railway (Map: Nova Scotia, E 3). It is 138 miles by rail north by west of Halifax, and has car shops, woolen mills, boot and shoe factories, iron foundries, engine and boiler works, tanneries, trunk factories, etc. An important trade in lumber and coal is carried on. Pop., 1901, 4964; 1911, 8973; 1913 (local est.), 10,320.

AMHERST, JEFFREY, BARON (1717-97). An English soldier. He was born at Riverhead, Kent, and for some time was a page in the household of the Duke of Dorset. He entered the army as ensign in 1731, soon became an aid-de-camp of General Ligonier, and in the War of the Austrian Succession served at Dettingen, Fontenoy, and Roncoux, and in the Seven Years' War at Hastenbeck. In 1758 Pitt raised him from the rank of Lieutenant-Colonel to that of Major-General, and put him in command of the expedition against Louisburg, which, after a short siege, surrendered on July 27. In September he replaced Abercromby as Commander-in-Chief of the English forces in America and in 1759 led the expedition against Ticonderoga and Crown Point, gaining possession of the former July 23 and of the latter August 1. In the following year he commanded in person the forces before Montreal and on September 8 compelled the French to capitulate and surrender Canada with all its dependencies to the British crown. For his services he was appointed Governor-General of British North America, was formally thanked by Parliament, and was made a Knight of the Bath. Having no knowledge of Indian warfare and scorning to avail himself of the undisciplined colonial militia, he proved unfit for the task of suppressing the conspiracy of Pontiac (q.v.) and returned to England in 1763, where, as the conqueror of Canada, he was received with the greatest enthusiasm. He was absentee Governor of Virginia from 1763 to 1768, was appointed Governor of Guernsey in 1770, and became a Privy Councilor in 1772. From 1772 to 1782 and from 1783 to 1793 he was acting Commander-in-Chief of the British Army. He became a General in 1778, was Commander-in-Chief 1793 to 1795, and was made a Field-Marshal in 1796. For his record as an officer in America, consult Parkman, *Montcalm and Wolfe* (Boston, 1884), and *The Conspiracy of Pontiac* (Boston, 1851).

AMHERST, WILLIAM PITT, EARL OF (1773-1857). A British diplomatist and statesman. He succeeded his uncle Jeffrey as Baron Amherst in 1797. In 1816 he was sent as ambassador to China, where he refused to perform what he thought a degrading act of kneeling, which was required of all who would see the Emperor. For this he was not allowed to enter Peking, and the object of his mission was frustrated. On the way home he was wrecked. Another ship, in which he returned, touched at St. Helena, where he had several interviews with Napoleon. He was Governor-General of India from 1823 to 1828, and for his services in conducting the first Burmese War he was created an earl in 1826. Consult Mrs. A. I. Ritchie, *Lord Amherst and the British Advance Eastward* (1842).

AMHERSTBURG. A town and port of entry in Ontario, Canada, on the Detroit River, 4 miles above Lake Erie, and on the Michigan Central Railroad (Map: Ontario, A 5). The town has steamer connection with Detroit, Mich. It has a public library and is the seat of a United States consul. Amherstburg is the centre of a farming district in which corn and tobacco are raised. There are grazing lands and limestone quarries in the vicinity, and the industries include saw and flour milling and manufactures of iron and cement. This town is one of the oldest settlements in upper Canada. It was dismantled by the British in 1813 and a week later was destroyed by General Harrison, of the United States army. Pop., 1901, 2222; 1906 (local est.), 2480; 1911, 2560.

AMHERST COLLEGE. A leading American college, situated at Amherst, Mass., and founded in 1821 by Congregationalists in the interest of Christian education. Up to the year 1906 the graduates numbered 4700, of whom 1411 entered the ministry, while an equally large number became teachers. The unusual educational influence wielded by Amherst for half a century was due to a considerable extent to two of its presidents, Edward Hitchcock and Julius H. Seelye. The former was probably the most distinguished American geologist of his time, and the latter united with a broad scholarship in the humanities great ability as a practical educator. Amherst has never endeavored to become a university, but has steadily increased in efficiency as a non-specialized and non-technical liberal college. In 1912 the faculty numbered 48, and the students 421. The total value of the buildings and grounds is about \$1,000,000; the interest of over \$300,000 is used to aid needy students; the annual income of the college is about \$150,000, and the entire property under the control of the college aggregates \$3,500,000. The library contains 100,000 volumes and is the largest belonging to any purely collegiate institution in the country. Of accessories to the college may be mentioned the Hitchcock ichnological cabinet, the Adams collection in conchology, the Shepard meteoric collection, and an extensive and valuable geological and mineralogical collection gathered largely by the personal efforts of Prof. Benjamin K. Emerson. The Pratt Gymnasium, athletic field, and college hospital are the gifts of the sons of the late Charles Pratt of Brooklyn, N. Y. The presidents have been: Zephaniah Swift Moore, D.D., 1821-23; Heman Humphrey, D.D., 1823-45; Edward Hitchcock, D.D., LL.D., 1845-54; William A. Stearns, D.D., LL.D., 1854-76; Julius H. Seelye, D.D., LL.D., 1876-90; Merrill Edwards Gates, LL.D., Ph.D., 1890-99; George Harris, D.D., LL.D., 1899-1912; Alexander Meiklejohn, Ph.D., LL.D., 1912. Consult Tyler, *A History of Amherst College* (New York, 1896, 1910).

AMICABLE NUMBERS (Lat. *amicabilis*, friendly). Two numbers, each of which is the sum of the factors of the other, are called amicable numbers, as 220 and 284, e.g.:

$$220 = 1 + 2 + 4 + 71 + 142$$

$$284 = 1 + 2 + 4 + 5 + 10 + 11 + 20 + 22 + 44 + 55 + 110$$

The classification and fanciful name are due to the Pythagoreans, who made much of number mysticism.

AMICE, äm'is. See COSTUME, ECCLESIASTICAL.

AMICI, ä-më'chë, GIOVANNI BATTISTA (1786-

sponding nitrils. Thus acetamide, CH_3CONH_2 , changes into CH_3CN .

The amides are all soluble in alcohol and in ether, and many are more or less soluble in water. Most of them are solid crystalline substances that can be distilled without decomposition.

The *acid amides* should be distinguished from the *amido-acids* (now more frequently referred to as *amino-acids*); compounds of the latter class may be obtained by treating the halogen-substitution products of acids, or of esters, with ammonia, while, as stated above, the acid amides are produced by the action of ammonia on the chlorides of acid radicles. The following two equations may serve to show the formation of, and the difference in chemical constitution between, an acid amide and an amido-acid:

AM'IDO-AC'IDS. See AMIDES.

AMID'SHIP, or MIDSHIP. See SHIPBUILDING.

AMIÉL, à'myél', HENRI FRÉDÉRIC (1821-81). A Swiss essayist, poet, and professor of æsthetics. He was born at Geneva, Sept. 27, 1821, and died there, May 11, 1881. He is remembered almost solely for his *Journal intime*, a diary of 1700 pages of manuscript, posthumously published in part in 1883-84 and translated into English in 1889, with a critical study by Mrs. Humphry Ward. This journal, through its singular clearness, keenness of insight, and sensitiveness to impression, is the complete revelation of a cast of mind that felt itself peculiarly modern and peculiarly entitled to be self-distressed. It expresses with masterful passion and original power the spiritual yearning and despair of a pure soul gasping in a rationalistic atmosphere. Thus Amiel is a curious projection into reality of the Shakespearean Hamlet, in whom morbid introspection numbs action. He is more fascinating than stimulating, more sombre than pessimistic, more subtle than strong. His thoughts will be cherished for the beauty and perfection of their form rather than for any tonic quality in their teaching. Less read (poetical) works of his are the poems *Grain de Mil*, *Il Penseroso*, and *Charles le Téméraire*. There is a *Life of Amiel*, by Vadier (Paris, 1885). Consult also, Bourget, *Nouveaux Essais* (Paris, 1885), Matthew Arnold's essay on Amiel, in *Essays in Criticism*, and the Introduction by E. Scherer.

AMIENS, à'myān' (from the Lat. *Ambiani*, the name of a Belgic tribe; literally 'dwellers on the water'; compare Gadhel, *abhain*, *abhuinne*, water, a river). The capital of ancient Picardy and of the present French department of Somme, situated on the river Somme, 81 miles by rail from Paris (Map: France, N., H 3). The residential section is well built with wide, well-paved streets and fine squares. The business part of the town is crossed by several canals and is rather unattractive. The old town is surrounded with boulevards, which occupy the site of the ancient fortifications, and there is in the western part an extensive pleasure ground, the Promenade de la Hotoie, used for public concerts and festivals. The world-famous cathedral is situated in the eastern part, facing the

Place Nôtre Dame. Besides being the largest ecclesiastical edifice of France, the cathedral of Amiens is also one of the finest specimens of Gothic architecture (q.v.) in Europe. Its construction was begun in 1220 by the architect Robert de Luzarches, and was continued by Thomas de Cormont and his son Renault. It was finished in 1288, but many additions have been made since; the two side towers of the façade are without spires. The length of the cathedral is 470 feet, that of the transept 213 feet, and the width of the nave 144 feet. The façade has three lofty porches profusely decorated with statuary and other sculptural ornaments. The central spire over the transept is very slender and 360 feet in height. The interior is also very imposing. The nave is 147 feet high, and the vaulting is supported by 126 columns. There are numerous chapels, and the transepts are covered with fine reliefs. At the sides of the nave are placed bronze statues of the two founders of the cathedral, and there are also large marble statues at the entrance to the choir. Besides the cathedral the most noteworthy buildings are the town hall (begun in 1550) and the Château d'Eau, where the water works of the city are situated. Of educational establishments Amiens has lycées for boys and girls, a preparatory medical school, a theological seminary, a school of music, a municipal library, with about 100,000 volumes and nearly 600 manuscripts, and the museum of Picardy, containing collections of antiquities, sculptures, and paintings. Amiens was of considerable industrial importance as early as the twelfth century, and in the sixteenth century it became one of the largest centres of the textile industry in France. At present the chief manufactures are linen, woollens, silk, velvet, and shoes. It is the seat of a bishop and of a court of appeals. Agglomerated pop., 1911, 79,070; total municipal, 87,100; counted apart, 6107; total, 93,207, as compared with 90,753 in 1901.

Amiens was anciently known as Samarobriva and was the capital of the Gallic Ambiani. Cæsar included it in Gallia Belgica, and it became a Roman stronghold; Marcus Aurelius adorned it. In the fifth century it fell into the hands of the Franks. In 1185 Philip Augustus, in consolidating the kingdom, induced Philip of Alsace to cede it to the crown. From 1435 to 1477 the city was in the possession of the dukes of Burgundy. Taken by the Spaniards in 1597, it was besieged and recaptured by Henry IV. It was the capital of Picardy until 1790. In November, 1870, it was captured by the Prussians. The famous Treaty of Amiens between Great Britain on one side and France, Spain, and Holland on the other, in which Great Britain recognized the changes made by France in the map of Europe and gave up most of her recent conquests, was signed in the hôtel de ville on March 27, 1802. Among notable men born in this city was Peter the Hermit. Consult A. de Calonne, *Histoire de la ville d'Amiens* (1900).

AMIN'ADAB SLEEK. See SLEEK, AMIN-ADAB.

AMINE, à-mèn'. The name of two characters in the *Arabian Nights*. 1. In the *History of Sidi Nouman*, his wife, whose habit of eating only so much rice as she could pick up on a bodkin excited his suspicions, and who, he discovered, partook of ghoulish feasts in the cemetery. She used also to lead her three sisters about like hounds. 2. In the story of *Three*

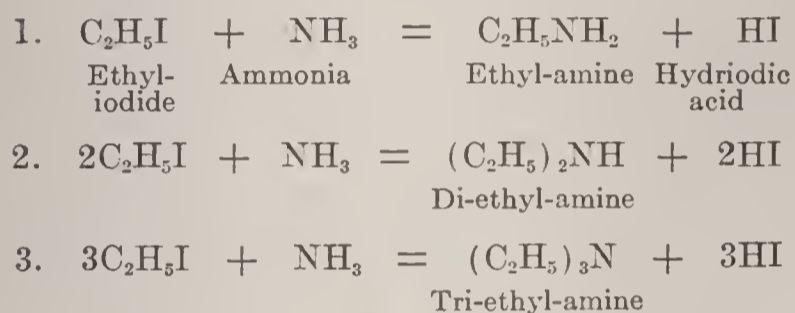

AMIENS CATHEDRAL

Ladies of Bagdad, the half-sister of Zobeide and wife of Amin, the Caliph's son, who becomes estranged from her, but is reconciled.

AMINES (derived from *ammonia*). A general term applied in organic chemistry to an important class of basic compounds derived by substituting hydrocarbon radicles like methyl (CH_3), ethyl (C_2H_5), etc., for one or more of the hydrogen atoms of ammonia (NH_3). The compound CH_3NH_2 is called methyl-amine; the compound $(\text{CH}_3)_2\text{NH}$, di-methyl-amine; the compound $(\text{CH}_3)_3\text{N}$, tri-methyl-amine. An amine derived by replacing one hydrogen atom of ammonia is called a *primary amine*; one derived by replacing two hydrogens is called a *secondary amine*; one derived by replacing all of the hydrogen of ammonia is called a *tertiary amine*.

The amines may be readily prepared by the action of halogen substitution products of the hydrocarbons upon ammonia (Hofmann's method). Thus, by the action of mono-iodoethane (ethyl iodide) upon ammonia, one or more ethyl groups (C_2H_5) are introduced into the molecule of ammonia (NH_3), according to the following chemical equations, which usually take place simultaneously:

As the amines are powerful bases, they combine, of course, with the hydriodic acid formed in these reactions, producing salts like $\text{C}_2\text{H}_5\text{NH}_2\text{HI}$, from which the amines are readily isolated by distilling with caustic alkalies.

Simultaneously with the above three reactions, a fourth reaction takes place: viz., between the halogen substitution product of the hydrocarbon and the tertiary amine produced in the third reaction. This fourth reaction, in the case of tri-ethyl-amine, is represented by the following equation:

The compound formed in this reaction is evidently ammonium iodide (H_4NI), all the hydrogen of which has been replaced by ethyl-groups (C_2H_5); it is therefore named tetra-ethyl-ammonium-iodide. When treated in aqueous solution with silver hydroxide, it is transformed into tetra-ethyl-ammonium hydroxide $(\text{C}_2\text{H}_5)_4\text{NOH}$. Bases like $(\text{C}_2\text{H}_5)_4\text{NOH}$, derived from ammonium hydroxide by substituting hydrocarbon radicles like methyl (CH_3), ethyl (C_2H_5), etc., for all of its hydrogen, are termed *quaternary ammonium bases*.

The above method of preparation of the amines and the substituted ammonium salts may also serve in determining the nature of an amine. An example will render this clear: an amine found in herring-brine has the molecular formula $\text{C}_3\text{H}_9\text{N}$; is it the primary amine $\text{C}_3\text{H}_7\text{NH}_2$ (propyl-amine), or the tertiary amine $(\text{CH}_3)_3\text{N}$ (tri-methyl-amine)? To answer this question the amine may be treated with methyl iodide, and, when the reaction is completed, the resulting substance analyzed. The formation, as a

final product of the reaction of the compound $\text{C}_4\text{H}_{12}\text{NI}$, proves that the substance $\text{C}_3\text{H}_9\text{N}$, found in herring-brine, is a tertiary amine $(\text{CH}_3)_3\text{N}$, for only one methyl group (CH_3) is required to transform it into the substituted ammonium iodide $\text{C}_4\text{H}_{12}\text{NI}$ [$(\text{CH}_3)_4\text{NI}$]; while if it were the primary amine, $\text{C}_3\text{H}_7\text{NH}_2$, the number of methyl-groups taken up would be three, and the compound $\text{C}_6\text{H}_{16}\text{NI}$ [$\text{C}_3\text{H}_7(\text{CH}_3)_3\text{NI}$] would be formed. The number of groups, like methyl, ethyl, etc., taken up by an amine thus generally determines its nature.

The nature of amines is also shown by their behavior toward nitrous acid, the three subclasses of amines being characterized as follows:

1. Primary amines are converted by nitrous acid into the corresponding alcohols; thus, ethyl-amine is transformed into ethyl alcohol, according to the following chemical equation:

just as ammonia is transformed into water:

2. Secondary amines are converted by nitrous acid into compounds containing the group NO , and called *nitroso-amines*; thus, di-ethyl-amine, $(\text{C}_2\text{H}_5)_2\text{NH}$, is transformed into ethyl-nitroso-amine, according to the following equation:

3. Tertiary amines are not affected by nitrous acid.

It has been stated above that when ethyl-iodide or similar substances are treated with ammonia, four reactions take place simultaneously, and a mixture of four compounds is obtained: viz., the salts of a primary, a secondary, and a tertiary amine, and a substituted ammonium iodide. The separation of the four compounds may be effected by the following method: 1. The mixture is distilled with caustic potash, which leaves the substituted ammonium iodide undecomposed as a residue, while the salts of the three amines are decomposed, and a mixture of the amines in the free state passes over in the distillate. 2. When the distillate is treated with ethyl-oxalate, the primary amine (say, ethyl-amine) is converted into a derivative of *oxamide* (the di-amide of oxalic acid, $\left. \begin{array}{c} \text{CONH}_2 \\ | \\ \text{CONH}_2 \end{array} \right\}$), according to the following equation:

while the secondary amine (say, di-ethyl-amine) is converted into a derivative of *oxamic acid* (the mono-amide of oxalic acid, $\left. \begin{array}{c} \text{CONH}_2 \\ | \\ \text{COOH} \end{array} \right\}$), according to the following equation:

the tertiary amine is not affected by treatment with ethyl-oxalate, and as it is much more volatile than both ethyl-oxamide and ethyl-di-ethyl-oxamate, it may be readily separated from these compounds by distillation. Finally, the two compounds derived respectively from the primary and secondary amines may be readily separated, since ethyl-oxamide is solid, while ethyl-di-ethyl-oxamate remains liquid on cooling the mixture. The primary and the secondary amines may be obtained separately in the free state by distilling the substances thus separated with caustic potash, the reactions taking place, respectively, according to the following two equations:

The amines are much more powerful bases than ammonia. Their odor resembles that of ammonia, from which, however, the gaseous amines may be readily distinguished by their inflammability. Many liquid and solid amines, too, have been obtained. All of the amines known have been made by artificial chemical processes, and certain amines are found among the products of decomposition of nitrogenous substances. The quaternary ammonium bases (such as tetra-ethyl-ammonium-hydroxide) are similar, and even more powerful in their action than caustic potash.

Amines containing a benzene-nucleus are classed with the so-called aromatic compounds of organic chemistry and are subdivided into *amido-compounds* and *aromatic amines* proper, according as their nitrogen is linked to the nucleus immediately, or through the medium of CH_2 -groups. Ordinary aniline is an example of amido-compound, its formula being $\text{C}_6\text{H}_5\text{NH}_2$. Benzylamine, $\text{C}_6\text{H}_5\text{CH}_2\text{NH}_2$, is a true aromatic amine. The aromatic amido-compounds undergo an interesting transformation when treated with nitrous acid in the cold, the resulting substances being known as *dialzo-compounds* (q.v.).

AMINO-ACIDS. See POLYPEPTIDES.

AMIN'TA. A celebrated pastoral play by Torquato Tasso, produced at Ferrara in 1573. It is an allegory, presenting the characters of the court where Tasso lived.

AMINTE, ä'mänt'. 1. In Molière's *Les précieuses ridicules* (q.v.), the sentimental name taken by the girl Cathos. 2. A character in Molière's *L'Amour médecin*.

AMIN'TOR. The hero of Beaumont and Fletcher's *Maid's Tragedy* (q.v.), a young nobleman who, though betrothed to Aspatia, yet by the King's command marries Evadne, the heroine.

AMIOT, ä'myö'. See AMYOT.

AMIRANTE, äm'i-ränt', or **AD'MIRAL**, **IS'LANDS.** A group of islets in the Indian Ocean in lat. 5° S. and long. 53° E. (Map: Africa, K 5). They are of coral formation, belong to Great Britain, and are dependencies of the Seychelles. All the islands are fertile, and

the small population is engaged in agriculture and fishing.

AMIS ET AMILES, ä'më' zä ä'mël', also called AMIS ET AMILOUN. A *chanson de geste*, dating from the twelfth or thirteenth century. It consists of about 3500 verses, chiefly decasyllabic. Amis and Amiles are two noble knights whose close resemblance and whose friendship and mutual sacrifices are the theme of the poem. They first escape the machinations of the treacherous Hardré while in the service of Charlemagne, whose niece is given in marriage to Amis. Bellicent, the Emperor's daughter, loves Amiles, who is thereby brought into great peril, but he is rescued by Amis and obtains the princess. Amis, however, in fighting in place of his friend, has had to perjure himself. For this he is punished with leprosy, of which at last he is cured by the blood of Amiles's two sons, voluntarily sacrificed by their father. These then are miraculously restored to life.

AM'ISH CHURCH, THE. See MENNONITES.

AMISH CHURCH, THE OLD. See MENNONITES.

AMISTAD (ä'më'städ') **CASE, THE.** A case before the United States Supreme Court involving the legal status of kidnapped negroes. In 1839 some slaves recently kidnapped from Africa, who were being carried from Havana to Puerto Príncipe, Cuba, in the Spanish schooner *Amistad*, killed two of the crew, the others escaping, and ordered two whites, their owners, whose lives they spared, to steer the vessel to Africa. The latter steered north instead, and in August the vessel was captured off Long Island by a United States warship. President Van Buren wished to surrender the negroes to the Spanish government, in accordance with the treaty of 1795, as "property rescued from pirates"; but the Supreme Court finally decided (in March, 1841) that the blacks, having been originally kidnapped, were by international law, which then prohibited the slave trade, free men. The case was argued before the Supreme Court with great ability by John Quincy Adams and aroused much excitement throughout the country, especially among the radical abolitionists, who advocated violent measures to secure the release of the negroes. Consult: Peters, *Reports of United States Supreme Court XV* (Washington, 1828-43); Barber, *History of the Amistad Captives*; an interesting article in vol. xxii (N.S.) of *The New England Magazine* (Boston, 1900); *Executive Document 185*, 26th Congress, 1st session.

AMITE, ä-mët'. A town and the parish-seat of Tangipahoa parish, La., 68 miles northwest of New Orleans, on the Illinois Central Railroad, and on the Tangipahoa River (Map: Louisiana, E 3). It is the centre of a prosperous agricultural community, producing fruit, vegetables, corn, and cotton. Numerous artesian wells are used for irrigation. Amite was almost destroyed by a cyclone in 1908 and was rebuilt in less than a year. Pop., 1900, 1547; 1913 (est.), 2200.

AM'ITO'SIS (Gk. ä, a, priv. + *mitos*, *mitos*, a thread of the warp). A division (rare) of the animal or plant cell by simple constriction without the formation of nuclear figures. See CELL; MITOSIS.

AM'ITYVILLE. A village in Suffolk Co., N. Y., 33 miles by rail east of New York City, on the Long Island Railroad (Map: New York, B 3). It is on the south shore of Long Island, on Great South Bay, and the excellent bathing, boating, and fishing facilities make it a popu-

lar summer resort and place of residence. There are sanitariums, an infirmary, an academy, and several club buildings. Pop., 1890, 2293; 1900, 2038; 1910, 2517; 1913, 2850.

AM'LET, DICK, or RICHARD. In Vanbrugh's play, *The Confederacy* (q.v.), the dissipated son of a vulgar old woman, who is proud of him and gives him money with which to play the fine gentleman. His breeding betrays itself, however, and he marries the daughter of Grife the Scrivener.

AM'LETH, or HAMLETH. Prince of Jutland, supposed to have lived in the second century B.C. According to Saxo Grammaticus, he was the son of Horvendill and Gerutha; and after the murder of his father by his uncle Fengo, who married Gerutha, he feigned himself a fool to save his own life. Saxo relates a number of little things regarding Amleth, which are a curious medley of sharp and lively observation and apparent madness. We are told that, on one occasion, when he visited his mother, suspecting that he was watched, he began to crow like a cock and dance idiotically about the apartment, until he discovered, hidden in a heap of straw, a spy in the person of one of Fengo's courtiers, whom he immediately stabbed; he then so terrified his mother by his reproaches, that she promised to aid him in his intended revenge on his father's murderer, and, according to the old chronicler, really did so. Scandinavian traditions confirm the existence of a prince of this name. In the vicinity of Elsinore is shown a suspiciously modern-looking pile of stones, which bears the name of Hamlet's grave. Saxo himself does not mention the manner or circumstances of Amleth's death; but the French translator, Belleforest, says, in his *Histoires tragiques* (1564), that he was murdered at a banquet. Most of the recent historians of Denmark consider the history of Amleth fabulous. As the ultimate source of Shakespeare's tragedy of *Hamlet*, it possesses a perennial interest for all the civilized world. There are two Hamlet sagas in Icelandic, one of which, the romantic *Ambales Saga*, has been edited and translated, with an introductory essay, by I. Gollancz (1898).

AM'LVCH, äm'luk. A seaport town of Anglesey, North Wales, on the northern coast of the island, 14 miles northwest of Beaumaris (Map: Wales, B 3). It is a busy but rather dirty town, and derived its importance and wealth almost entirely from the rich Parys and Mona copper mines in the vicinity. Copper-smelting was carried on extensively in Amlwch, but this industry has died down considerably. A harbor, capable of receiving vessels of 600 tons burden, was formed by excavation out of the solid slate rock, at the expense of the mining companies. Some slate is quarried, and there are iron foundries and tobacco and fertilizer works. Pop., 1891, 5400; 1901, 5300; 1911, 4837.

AM'MAN. See RABBAH.

AMMAN, JOBST (Jost, Jos, Justus) (1539-91). A German engraver and designer of the Renaissance. He was born at Zürich, the son of a professor, and grew up in the cultured circle about Zwingli. His teachers in art are unknown, but his earliest independent work is certain designs for stained glasses, executed in Basel (1557) and now in the Museum there. In 1561 he was at Nuremberg, probably in the atelier of the engraver Virgil Solis, whom he succeeded as illustrator for the publisher Feycrabend. For the latter he designed the wood cuts for the

Frankfort *Bible* of 1565 and the etchings for Frunsberger's *Kriegsbuch* (1573). In 1577 he became a citizen of Nuremberg, where he was held in the highest honor by distinguished contemporaries. They hailed him "absolutissimus pictor" and as the Apelles of his day, but modern criticism takes a less exalted view. His drawing is indeed fair, his execution spirited, his manner neat and decided; but his elongated figures are often mannered, and the enormous volume of his work, necessitated by financial straits, injuriously affected its quality. But considered as illustrations, his thousands of drawings are charming and interesting in the extreme. They show a rich, full knowledge of life, a sparkling humor, and form an incomparable source of the history of civilization. His aquarelles and wash drawings are of particular charm. Some are family trees and family books of Nuremberg patricians, still in private possession there; others are taken directly from life, like "The Entrance of Emperor Maximilian II into Nuremberg," containing 450 figures, in the cabinet of prints in Munich, which possesses other fine examples. But of greatest importance are his drawings for wood cuts, through which he exercised the widest popular influence of any artist of his day. He drew directly on the wood, and sometimes even cut the engravings himself, as in the *Kartenspielbuch* (1588). Of special importance are the 115 wood cuts of the arts and trades, with text by Hans Sachs (Frankfort, 1568), and his *Book of Hunting* (1584). His best etchings are in Jamnitzer's *Book of Perspective* (1568). Consult Ammann, *Geschichte der Familie Amman von Zürich* (Zürich, 1904), and Andresen, *Der deutsche Peintre-Graveur* (Leipzig, 1864-66).

AMMAN, JOHANN KONRAD (1669-1724). A Swiss physician and one of the earliest writers on the instruction of the deaf and dumb. In his work, *Surdus Loquens* (1692), he describes the process employed by him in teaching, which consisted principally in fixing the attention of the pupils on the motions of his lips and larynx while he spoke and inducing them to imitate him until they could utter distinct words. He practiced in Holland.

AMMANATI, äm'mä-nä'tè, BARTOLOMMEO (1511-92). An Italian architect and sculptor, born at Settignano; one of the foremost artists of the late Renaissance, at first a pupil of Baccio Bandinelli, and afterward, at Venice, of Sansovino, whom he assisted in connection with the Library of St. Mark. On his return to Florence he came under the influence of Michelangelo's Medici Sacristy sculptures. Like other sculptors of his time, he was much influenced by the discovery of the Farnese Hercules in 1540. He went to Rome and collaborated with Vignola at the Villa of Pope Julius III. He returned to Florence in 1557, became architect of Cosmo de' Medici, and devoted himself thenceforth to the beautifying of his native city. His Santa Trinità Bridge, several fountains, and small private palaces (Pucci, Giugni) are successful; but his great courts of the Pitti Palace and Santo Spirito are less commendable; in the first-named he sought to combine the massive rustications of Brunelleschi's front of the same palace with the classic orders, inspired perhaps by Sammichele's fortified city gates at Verona. He afterward redeemed himself in the simpler court of the Collegio Romano at Rome (1582), and in the Ruspoli Palace (1586).

AM'MEN, DANIEL (1820-98). An American naval officer. He was born in Brown Co., Ohio, entered the naval service as midshipman in 1836, and by successive promotions rose to the rank of rear-admiral in 1877. He took part in the Wilkes exploring expedition (1838-42) and in 1853 on an expedition to the Paraguay River. In 1861-62, and again in 1863-64, he served in Admiral Dupont's blockading squadron, and as commander of the gunboat *Seneca* participated in the reduction of Port Royal (Nov. 7, 1861), and took command of the forts after their surrender. He commanded the monitor *Patapsco* before Fort Macallister (March 3, 1863), and before Fort Sumter (April 7, 1863); and in the two attacks on Fort Fisher (December, 1864, and January, 1865), was in command of the *Mohican*. He served as chief of the Bureau of Yards and Docks from 1869 to 1871 and of the Bureau of Navigation from 1871 to 1878, when he retired to private life. He designed the "Ammen life raft" and the ram *Katahdin* and wrote *The American Inter-Oceanic Ship Canal Question* (1880); *The Atlantic Coast* (1883), a discriminating account, from the standpoint of a naval specialist, of the operations of the Federal navy along the Atlantic coast during the Civil War; *Country Homes and their Improvement*; and *The Old Navy and the New* (1891).

AMMERGAU (äm'mër-gou) **MYSTERY.** See PASSION PLAY.

AM'METER, or AMPERE'METER (*ampère* + Gk. μέτρον, *metron*, measure). An instrument which is used to measure the intensity of an electric current and which indicates this quantity directly in amperes (q.v.). Ammeters are constructed in numerous forms, which are based for the most part on the galvanometer (q.v.), on the intensity of attraction for soft iron exerted by a hollow coil of wire carrying a current, or on the electro-dynamometer. As the galvanometer is used to detect and measure minute currents, so the ammeter is employed in testing and engineering to indicate large currents, and to enable an observer to read directly in amperes the current flowing at any instant in a circuit. A good form of ammeter is the Weston instrument, made in the United States and used all over the world. It consists of a voltmeter (q.v.), or portable galvanometer, whose movable coil is connected in parallel with a low resistance formed by one or more copper wires. As the current in a circuit depends upon the fall in potential across a constant resistance (in this case the copper wire), the operation of the instrument will readily be seen. Numerous other forms of ammeters are constructed, the simplest of which consist of a coil of wire through which the current passes, enclosing a soft iron core suspended by a spring. The amount that this core is attracted is indicated by a pointer on a scale, which can be made regular by constructing the core of suitable shape. In other ammeters a magnetic needle is placed between the poles of a strong permanent magnet and is surrounded by coils through which the current passes. This current in passing deflects the needle by an amount depending upon its intensity. The dynamometer or some modification of it, is often used to measure alternating currents and consists of two coils, one of which is free to revolve against the action of a spring. When the current passes through the two coils, which are normally at

right angles, there is a tendency for the movable coil to take a position parallel to the other, and the amount of motion depends upon the intensity of the current.

AM'MIA'NUS MAR'CELLI'NUS. The last Latin historian of the Roman Empire. He flourished in the latter half of the fourth century and wrote a history of Rome from the accession of Nerva (96) to the death of Valens (378), designed as a continuation of the histories of Tacitus; the work was called, apparently, *Rerum Gestarum a Fine Corneli Taciti Libri*. When complete, it was in 31 books, of which only 18 (14-31) are extant, covering the last 25 years of contemporaneous history (353-378). Ammianus Marcellinus was himself a Greek, born of good family, at Antioch; but he had served for years in the army, and had risen to rank in the Eastern and Gothic campaigns before he settled down in Rome to a quiet and studious life. His book is of great importance as the conscientious work of an experienced man; but the Latin is rude, and the style is heavy and dull. The account of the events of Julian's reign is especially valuable. The edition by Gardthausen (Leipzig, 1875), long standard, has now been supplanted by that of an American scholar, C. U. Clark (Berlin, 1910). Consult also A. M. Harmon, "The Clausula in Ammianus Marcellinus," *Transactions of the Connecticut Academy of Arts and Sciences*, vol. xvi, pp. 119-245 (1910), a study of the rhythm that characterized Ammianus's prose. There is an English translation by C. D. Yonge, in Bohn's *Classical Library* (London, 1862).

AMMIRATO, äm'mê-rä'tò, SCIPIONE (1531-1601). An Italian historian of some merit. He was born in Lecce, in the kingdom of Naples, and after living in Venice, Rome, and Naples, settled at Florence. In Venice he aided in editing an edition of Ariosto. His reputation, however, rests mainly upon his *Istorie fiorentine*, which in 1570 he was commissioned to write by the Grand Duke Cosimo I, and which covers the history of Tuscany from the earliest times down to 1574. It shows distinct ability and historical acumen and is based upon original documents and other authentic sources. First complete edition, Florence, 1641-47; best modern reprint, Turin, 1859. He wrote also some discourses on Tacitus, and genealogies of the Florentine and Neapolitan families. In 1595 he was made a canon of the cathedral of Florence.

AM'MON. An Egyptian deity. His name (Egyptian *Amon*, later *Amûn*) was explained by the priests as meaning 'the hidden,' 'mysterious'; but this etymology is not reliable. Originally Ammon was merely the local god of Thebes; but after the Theban dynasties became rulers of all Egypt (beginning with the eighteenth dynasty, about 1600 B.C.), he became the official head of the pantheon and national deity of Egypt. His worship spread throughout Ethiopia and Libya, and he had a famous oracle in the Libyan Desert. The Greeks identified him with their supreme god Zeus, and named Thebes, his original seat of worship, Diospolis. In the Old Testament the city is called No-Amon, 'The City of Ammon.'

Although not originally a solar divinity, later theological schools ascribed a solar character to this god, and he was called Ammon-Rê, i.e., 'Ammon the Sun.' In his statues Ammon is generally represented in human form, with skin of a

bluish tint, and wearing a peculiar headdress, from which rise two immense feathers, while a long and narrow band hangs down behind. He often appears in the form of his sacred animal, the ram, or as a ram with a man's head. Among the Greeks and Romans, the Libyan type, with a human head bearing a ram's horns, became popular. For illustration, see EGYPT. See ANDROMEDA.

AMMON, OTTO (1842—). A German anthropologist and editor. He was born at Karlsruhe and was educated as a civil engineer, which profession he followed from 1863 to 1868. He then became a publisher and editor, but in 1883 began to devote himself to literary work and afterward made several important contributions to sociological and anthropological literature. He was the discoverer of the so-called "Ammon's law," that the Teutonic race betrays almost everywhere a marked tendency toward city life, which he has demonstrated in a series of interesting measurements of the physical characteristics, especially of the head, of thousands of conscripts in the Baden army, showing radical differences between the form of the head in city and country and between the upper and lower classes in the larger towns. His chief works are: *Die natürliche Auslese beim Menschen* (Jena, 1893); *Die Gesellschaftsordnung und ihre natürlichen Grundlagen* (Jena, 1895; 3d ed., Jena, 1900). *Zur Anthropologie des Badens* (Jena, 1899); and important articles as follows: "Die Geschichte einer Idee," *Rundschau* (Berlin, 1896), on the physical types of city populations; "Der Abänderungsspielraum," *Naturwissenschaftliche Wochenschrift* (Berlin, 1896); "Die Menschenrassen in Europa," *Rundschau* (Berlin, 1896); *Die Körpergrösse der Wehrpflichtigen in Baden, 1840-64* (Karlsruhe, 1849); *Anthropologische Untersuchungen der Wehrpflichtigen in Baden* (1890).

AMMONIA. See ANTIDOTE.

AMMONIA (Gk. ἀμμωνιακόν, *ammōniakon*, rock-salt), NH_3 . A colorless, pungent, combustible, gaseous compound of nitrogen and hydrogen. It was known to the ancients as volatile alkali and is said to have been called *vehement odor* by Pliny. Its name is believed to be derived from Zeus Ammon, near whose temple in Libya, Upper Africa, it was first produced by burning camels' dung. Others derive it from Ammonia, a Cyrenaic territory. In 1774 Priestley obtained it by boiling its aqueous solution and collecting the gas, which he termed *alkaline air*, over the mercurial pneumatic trough. Scheele showed that it contained nitrogen, and Berthollet, in 1785, demonstrated its composition. Free ammonia does not occur in nature, but its salts are found in the atmosphere and in rain-water, in mineral and sea waters, in most plants, and as a product of the decay of nitrogenous organic bodies.

It may be made by heating ammonium chloride with lime. The principal commercial source of ammonia has until recently been from the destructive distillation of coal in gas making. In the distillation of coal in a retort, there is obtained, first, illuminating gas, and, secondly, a liquor which contains ammonia. Allowing this liquid to settle, the aqueous portion separates, from which free ammonia is first expelled by means of steam, after which the liquor is treated with lime and further steam to expel the fixed ammonia. The steam, ammonia, and other gases are passed through strong sulphuric acid in lead

tanks, and the crystals of ammonium sulphate which then form are removed from time to time by means of ladles, while the free ammonia is collected in water yielding aqueous ammonia or hartshorn, a transparent, colorless, alkaline liquid with an acrid, caustic taste and pungent odor. When exposed to the air, it loses ammonia, and when reduced to minus 40°C . it freezes.

On account of its nitrogen content, ammonia, in the form of its salts, is an extremely important ingredient of artificial fertilizers. The world's demand for nitrogenous fertilizers is rapidly growing, and the consumption in 1911 amounted to \$190,000,000. The value, therefore, of an industrial method for making ammonia artificially (synthetically) from hydrogen, which is a by-product in many industries and can be obtained cheaply, and from nitrogen, of which the atmosphere contains an unlimited supply, promises to be very great. Such a synthetic process has been invented by Professor Haber (q.v.) of Berlin and Dr. Carl Bosch of the *Badische Anilin und Soda Fabrik*, and is now used on an industrial scale. It has long been known that minute quantities of ammonia are produced by the silent discharge or by a series of electric sparks in a mixture of hydrogen and nitrogen. In 1881 minute traces of ammonia were obtained by Johnson, by passing a mixture of the component gases over spongy platinum. But the history of the new synthetic ammonia industry commences really in 1904, when Haber and Van Oozdt undertook a purely scientific study of the subject. Many reactions are known which do not proceed to completion. For example, if we should mix 60 grams of acetic acid with 46 grams of alcohol and allow the mixture to stand for an indefinite period of time, 40 grams of the acid would combine with $30\frac{2}{3}$ grams of the alcohol, and there the reaction would stop. In scientific language one would say, "The reaction has reached equilibrium" (for the theory of chemical equilibria, see REACTION). Haber undertook an investigation of the chemical equilibrium of the combination of hydrogen and nitrogen. But while the combination of acid and alcohol just referred to stops after no less than 67 per cent of the substances have combined, Haber found that the combination of hydrogen and nitrogen stops after only 0.02 per cent have combined. In other words, for every 100 parts of ammonia that should have been obtained if the reaction proceeded to completion, only 0.02 parts were actually obtained on account of the reaction reaching an inconvenient equilibrium. In 1908 Haber and Le Rossignol found that even that small yield had been overestimated, and so on the face of it the manufacture of synthetic ammonia appeared to be a dream. And yet four years later, in 1912, the building of a large industrial plant for the manufacture of synthetic ammonia was begun at Oppau, near Ludwigshafen-on-the-Rhine in Germany.

The general theory of chemical equilibria permits of foreseeing that the equilibrium of hydrogen and nitrogen combination would be greatly influenced by the temperature at which the reaction takes place, and that the lower the temperature the greater would be the percentage yield of ammonia. The case of ammonia is, therefore, quite similar to that of sulphuric acid, for here too the yield of sulphur trioxide from a given quantity of sulphur dioxide and

oxygen is the greater the lower the temperature. Another prediction of the theory of chemical equilibria is that the yield of ammonia will be the better the greater the pressure under which the components are caused to combine. Experiment soon confirmed the correctness of both of these theoretical deductions. Thus, at 800° C. (1472° F.) and under a pressure of one atmosphere the yield of ammonia was only 0.01 per cent, while at 500° C. (932° F.) the yield rose to 0.13 per cent. Again, when at 800° C. the pressure was raised from 1 to 100 atmospheres, the yield of ammonia rose from 0.01 to 1.1 per cent; and when the pressure was similarly increased at 500° C., the yield rose from 0.13 to 10.8 per cent. The dream of the synthetic production of ammonia was thus turning into a reality. But there were still immense difficulties to overcome. In the first place, at temperatures low enough to give a good yield, the velocity of the reaction is impracticably small for commercial purposes. The only way to hasten a reaction without raising the temperature is to employ catalyzers. Theoretically the phenomena of catalysis are still, unfortunately, quite obscure (see CATALYSIS); hence, at this point the practical investigation, no longer guided by the light of scientific theory, must needs assume the form of a blind search. Thousands of trials were made, and a number of substances were found that greatly hastened the reaction. While platinum was found to be almost worthless, the similar metal osmium appeared as the best catalyzer of ammonia formation. However, this metal is too rare and costly to be of practical promise. But uranium, manganese, pure iron, and certain other cheap and readily procurable substances were found to be sufficiently powerful catalyzers, and it was further discovered that the admixture to them of traces of certain other substances (certain metals, caustic soda, lime, common salt, etc.), called "promoters," increased their catalytic power still further. On the other hand, the catalyzers, as well as the reacting gases themselves, must be all but absolutely free from certain impurities (sulphur, phosphorus, arsenic, and other metalloids) which act as powerful "poisons." Thus, the presence of only 0.01 per cent of sulphur in iron renders it useless as a catalyzer. The difficulty of preparing on an industrial scale substances of such extraordinary degree of purity, and of guarding against the veriest traces of impurity finding their way to the catalyzer and reacting gases during operation, discouraging as it seemed at first, was finally overcome. To-day the new industry, with its great promise for the future, stands as a monument of the ultimate practical utility to mankind of the abstract thought of "pure science."

Another promising method of making ammonia consists in the action of water or alkalies upon many nitrides (compounds of nitrogen with other elements), particularly the nitrides of calcium, aluminium, silicon, and titanium. Calcium nitride is readily produced by the action of nitrogen upon calcium carbide; the nitride of silicon is produced by the action of nitrogen and carbon upon silica (sand); etc. This method, too, is now used more or less on an industrial scale.

Dry ammonia can be liquefied by pressure, provided the temperature does not exceed 130° C. (266° F.), which is its "critical temperature." The liquid has a specific gravity of only 0.63 at 0° C. Its vapor pressure equals one atmos-

phere at -32° C., which is therefore its boiling point. In many ways liquid ammonia greatly resembles water. Thus its molecules, like those of water, are associated into complexes, its latent heat of vaporization is very high (see under REFRIGERATION, the use of ammonia in the Carré and Linde processes for the production of artificial cold), and it exhibits many abnormalities of physico-chemical behavior similar to those of water. This suggested an investigation of liquid ammonia as a solvent. The study was taken up by E. C. Franklin with collaborators and yielded a variety of interesting results. For example, pure ammonia, like pure water, is a very poor conductor of the electric current. But when a salt is dissolved in it, the conductivity becomes very good, showing that salts are dissociated in ammonia as well as in water.

Ammonia gas is extremely soluble in water (one volume of water dissolves under certain conditions 700 to 800 volumes of the gas). The solution gives a "strongly alkaline" reaction with litmus, and yet ammonia, or rather its hydrate, ammonium hydroxide NH_4OH , existing in solution must be recognized as a very weak base. This is shown by the electrical conductivity of the solution being very small by comparison with a solution of sodium or potassium hydroxide, and also by the fact that these latter alkalies, when added to the solution of an ammonia salt, deprive this salt of its acid almost completely.

Ammonium sulphate, which is a white crystalline compound, is largely used both alone and in mixtures as an artificial fertilizer; it is also used in the manufacture of alum and in the preparation of other ammonium salts. Ammonium chloride, called also *sal ammoniac*, is used in pharmacy, in dyeing, and as a convenient source of ammonia. Ammonium carbonate, called also *sal volatile*, is used for scouring wool, for dyeing, and as a baking powder. Consult: Arnold, *Ammonia and Ammonia Compounds* (London, 1889); Lunge, *Coal Tar* (London, 1882); Berntsen, "Synthetic Ammonia" in *Transactions of the Eighth International Congress of Applied Chemistry*, vol. xxviii, p. 182 (New York, 1913); Haber and Van Oozdt, *Zeitschrift für anorganische chemie*, vol. xliii, p. 111 (1904); Haber and Le Rossignol, *Berichte der deutschen chemischen Gesellschaft*, vol. xl, p. 2144 (1907); Haber and Le Rossignol, *Zeitschrift für Elektrochemie*, vol. xiv, p. 181 (1908); Haber, *Zeitschrift für Elektrochemie*, vol. xvi, p. 244 (1910).

AMMO'NIAC (Lat. *ammoniacum*, Gk. *ἀμμωνιακόν*, *ammōniakon*, gum-ammoniac), or GUM AMMONIAC. A gum-resin, used medicinally in certain plasters. It is obtained from the *Dorema ammoniacum*, an umbelliferous plant found in Persia and Turkestan. The gum is made by drying the milky juice of the plant. It occurs in commerce either in tears, or in masses formed of them, but mixed with impurities. It is whitish, becoming yellow by exposure to the atmosphere, is softened by the heat of the hand, and has a peculiar heavy smell and a bitter taste.

AM'MONI'ACAL COP'PER CAR'BONATE. See FUNGICIDES.

AMMON'IFICA'TION. The term applied to the transformation of organic nitrogenous compounds into ammonia through the action of micro-organisms. See NITRIFICATION.

AMMONITE (derived from *ammonia*). A trade name of a fertilizer rich in nitrogen (13 to 14 per cent), obtained largely from rendering establishments and beef-extract factories. It is practically identical with the "dried meat meal" or "azotin" found on the market as a fertilizer. See MANURES AND MANURING.

AMMONITES, äm'mön-its. A people allied to the Moabites, and also (though less closely) to the Israelites. According to Gen. xix. 38, they were descendants of Ben-Ammi, the son of Lot, and while this account is fanciful, there is no reason to doubt the relationship implied between Ammonites and Moabites. The Ammonites inhabited the country east of the Jordan, between the rivers Arnon and Jabbok, i.e., the desert country east of Gad. Their chief city was Rabbath Ammon (Deut. iii. 11; Ezek. xxi. 20), known as Philadelphia in the time of the Greek occupation and at present as Amman. The relation between the Ammonites and Israel was almost continuously hostile. Jephthah defeated them with great slaughter (Judg. xi. 4-33; xii. 28 may be a later interpolation); they were also overcome by Saul (1 Sam. xi. 1-11) and were subdued with great severity by Joab and David (2 Sam. xii. 26-31). A precious stone from the crown of the statue of Milkom, their god, which weighed a talent of gold, was placed on David's head, and the Ammonites were put to forced labor. After the disruption of Solomon's kingdom the Ammonites attacked Gilead, perhaps together with the Assyrians (2 Kings xv. 29; 1 Chron. v. 26), for which they are denounced by the prophets Amos (i. 13), Zephaniah (xxviii., xxix.), Jeremiah (xlix. 1-7), and Ezekiel (xxi. 28-32). In the days of Jehoshaphat the Ammonites made an abortive attempt to attack Judah (2 Chron. xx. 1-30), and later they were defeated by King Jotham (2 Chron. xxvii. 5). After the captivity an Ammonite, Tobiah, was among the enemies of Nehemiah, though he maintained friendly relations with the nobility and priesthood in Jerusalem (Neh. iv. 1-15; vi. 17; xiii. 4). In the days of Judas Maccabæus the Ammonites, together with their Syrian allies, were thoroughly routed by the Jews (1 Maccabees v. 6). Justin Martyr affirms that in his time (about 150 A.D.) the Ammonites were still numerous. The chief deity worshiped by the Ammonites was Milkom, which signifies 'king' (1 Kings xi. 5, 7-33), who bore the same relation to his people as Chemosh did to Moab and Yahwe to Israel. He was the natural protector to whom they looked for succor in distress. Of the rites of the Ammonites we know very little, but the worship was probably similar to that of the Moabites as well as to that of the Israelites in the early stages of their history. The Ammonitish language, likewise, was practically identical with Moabitish and ancient Hebrew, the differences between them being merely of a dialectical order. See the commentaries on Gen. xix. 38, by Dillmann, Delitzsch, Gunkel, Holzinger, Skinner, and Driver.

AMMONITES, äm'ö-ni'téz. A generic name given by Lamarck and L. von Buch to a group of tetrabranchiate cephalopod shells found in the Mesozoic rocks of Europe. A still earlier name applied to them by the alchemists and others of the Middle Ages was Cornu Ammonis, from a fancied resemblance to the horns of Zeus Ammon. The term "Ammonites" has, as a generic name, fallen into disuse, for more recent re-

searches have shown that Von Buch's name included a large array of species that present characters not only of a generic but also of family rank. The name is, however, still used in a loose way to distinguish those Mesozoic cephalopods, with complicated suture lines, from the Palæozoic Goniatites with more simple sutures. Von Buch's three genera, Ammonites, Ceratites, and Goniatites, with their numerous species, have been broken up into a host of new generic terms, about 50 in number, and these latter have been grouped into about 90 families, all of which are included in the order Ammonoidea. For the structure of the shell, the distribution of the species, and the geological history of the group, see CEPHALOPODA.

AMMONIUM (from *ammonia*), NH₄. A chemical radicle composed of one atom of nitrogen and four atoms of hydrogen. This radicle or atomic group acts like the univalent elements sodium and potassium and is contained in ammoniacal salts. An amalgam, too, has been obtained in which it exists in direct combination with mercury. Ammonium amalgam is a pasty, lustrous, metal-like substance formed by passing an electric current through ammonium chloride in contact with mercury. It can also be obtained by the action of sodium amalgam (liquid) upon a strong aqueous solution of ammonium chloride: the sodium amalgam turns into ammonium amalgam and becomes rigid. It is an unstable body, which readily decomposes, giving off ammonia and hydrogen.

AMMONIUM. See SIWAH.

AMMONIUM SULPHATE. A high-grade nitrogenous fertilizer (about 20 per cent nitrogen), obtained largely as a by-product of gas works, coke ovens, etc. See MANURES AND MANURING.

AMMONIUS (Gk. Ἀμμώνιος, *Ammōnios*). An Alexandrian philosopher of the third century A.D., surnamed Saccas ('sack-carrier'), because, it is said, he had been a porter in his youth. He was of Christian parentage, but, according to his most eminent pupil, Plotinus, his studies led him to abandon Christianity for the old Greek religion; this is denied, however, by Eusebius and St. Jerome. Longinus says that as a philosopher he surpassed all his contemporaries; his teaching was directed chiefly toward harmonizing the doctrines of Plato and Aristotle, and through his disciples he became the founder of the Neo-Platonic school of philosophy. Among his pupils were Origen the Neo-Platonist, Origen the Christian, Longinus, Herennius, Theodosius, Antoninus, and Plotinus. Ammonius left no writings, but his esoteric teachings were spread by Origen and Herennius, and especially by Plotinus.

Ammonius was the name of several other learned men in the later periods of Greek history: Ammonius, a Peripatetic philosopher of the first century, the teacher of Plutarch, the first, so far as we know, to give to the teachings of Plato that religious-mystic coloring which became predominant later; Ammonius, a Christian philosopher of Alexandria in the third century, who wrote a work on the agreement of the teachings of Moses and Jesus, and composed a harmony of the Gospels; Ammonius, son of Hermeas, a Peripatetic philosopher of the fifth century A.D., disciple of Proclus and author of commentaries on Aristotle; Ammonius, the famous surgeon of Alexandria, who lived in the latter half of the first century B.C.—he first prac-

liced lithotomy; Ammonius, the grammarian, pupil of Aristarchus, and his successor as head of the Alexandrian school.

AM'MONOID'EA. An order of tetrabranchiate cephalopods, equivalent in rank to the Nautiloidea. It contains more than 5000 species, all of which are extinct and found in a fossil state in marine rocks of Devonian and Carboniferous, and abundantly in those of Mesozoic age of all parts of the world. The form of the animal in this order is unknown; but from the structure of the shell it is supposed to have a form like that of its only living ally, the nautilus, though of a more delicate construction, and to have been a crawler instead of a swimmer. The shell is coiled in a single plane, with its apex in the centre of the coil, and it is usually compressed into a discoid. This discoid form is in some phylogerontic or senile types of Mesozoic Age changed to a turreted or irregular or straight shell. The 5000 species of the order are grouped under about 500 genera and some 98 families, according, chiefly, to the form and mode of development of the so-called suture lines, which are the lines of union of the internal septal walls with the inner wall of the shell. The order is of peculiar interest, in that, of all groups of animals, it furnishes the finest illustrations of evolution, and the laws of growth and decline, of ontogeny and phylogeny; in other words, of bioplastology. For more particular information and illustrations, see CEPHALOPODA.

AMMONOO'SUC, UPPER, LOWER, and WILD. The name of three rivers in New Hampshire. The UPPER AMMONOOSUC rises in the Randolph range of the White Mountains, flows to the north, then turns westward, draining an area of 252 square miles in Coos County, and empties into the Connecticut below Groveton (Map: New Hampshire, G 3). The LOWER AMMONOOSUC rises in the west slope of the Presidential Range in Coos County, flows westward, enters Grafton County, and then flows south-westward for a total length of nearly 100 miles, emptying into the Connecticut at Wells River (Map: New Hampshire, F 4). The WILD AMMONOOSUC flows into the Lower Ammonoosuc near Bath.

AMMOPH'ILA (Gk. ἄμμος, *ammos*, sand + φίλος, *philos*, friend, loving). A genus of grasses distinguished by a spike-like panicle and by the character of the glumes, which are nearly equal, keeled, longer than the paleæ of the single floret, and surrounded at the base by a tuft of hairs. *Ammophila arenaria* or *Ammophila arundinacea*, formerly called *Arundo arenaria*—a grass about two to three feet high, with rigid bluish leaves, the edges of which are rolled in, and creeping rootstocks—is frequent on sandy shores of Great Britain and the Continent of Europe. It is sometimes called beach grass, sea reed, or sand reed, and sometimes mat grass, because the culms are wrought into foot-mats, coverings for stairs, etc. It is also called *marram*, by which name it is designated in laws both English and Scottish, by which the destruction of it was prohibited under severe penalties, because of its great utility in fixing the shifting sand. In Holland and in Norfolk, as well as in the United States, it is extensively employed—along with the sea lyme grass (q.v.)—in preserving the banks of sand which prevent the inroads of the sea. It is of little value as food for cattle, although they eat the very young leaves. The

fibre has been used instead of flax, but is too short. Beach grass has been used in the manufacture of paper of coarse quality.

AM'MUNI'TION (Fr. *amunition*, probably by wrong division of *la munition* into *l'amunition*; from Lat. *munire*, to fortify, defend). A term which embraces all the ordnance stores used in the actual firing of guns of every sort and calibre, and which includes gunpowder, projectiles, primers, and their accessories. When the powder, projectile, and primer are so combined in a single piece as to be ready for firing as soon as placed in the gun, the packages so formed are called *fixed ammunition*; the term is also extended to ammunition for large guns in which the powder is inclosed in a primed metallic case, but loaded separately from the projectile. This type is now very little used. In small arms the ammunition is invariably of the fixed type. For heavy guns the ammunition is almost universally fixed for calibres of less than four inches. Above this, the practice is not uniform in all countries or in all classes of

FIXED AMMUNITION—UNITED STATES NAVY.

1. One-pounder. 2. Six-pounder, three-inch and four-inch.

- A. Brass cartridge case, bottle-necked at E.
- B. Rotating band (copper).
- C. Projectile.
- D. Base of cartridge case.
- E. Bottle-neck of cartridge case.
- F. Primer.

guns. In the United States naval guns of 1899 and later models, fixed ammunition is used for calibres not exceeding four inches; guns of five-inch calibre on the recent battleships have charges in primed brass cartridge cases, but the projectile is not attached to it but is separately loaded into the gun. Some guns of five-inch calibre and all larger pieces have the charges put up in cartridge bags. A form of lock, which automatically ejects the primer, assists to make the loading with powder in bags about as rapid as if it were incased in metal. The metallic cartridge cases used for fixed ammunition are now generally made of hard drawn brass of the best quality, stamped from sheets or plates of varying thickness, depending upon the calibre of the gun for which they are designed. The circular disk cut from the sheet or plate is first given the form of a shallow cup and then drawn out and pressed into finished shape. The cases usually have a rim around the base, but some have a groove, called a *cannelure*, sunk into and surrounding the base; the chief use of both rim and cannelure is to enable the extractor to take hold of and extract the empty case after firing; but the rim also assists to hold the case in its proper position in the gun. The high velocity given the projectile in a modern gun entails the use of a relatively large charge of powder; to hold this, and to avoid undue length of case, which involves unnecessary weight and introduces difficulties in connection with vibrations and pressures,

the case is increased in diameter over the powder and drawn down to form a bottle-neck where it grips the projectile. No paper cases are used for military or naval arms, but the cases for the ammunition of breech-loading shot-guns have the cylindrical portion of cardboard or *papier-maché*, the base being of brass formed in the manner already described.

Gunpowder (see EXPLOSIVES; GUNPOWDER), the propelling force in all military weapons in general service, is put up, for guns of large calibre, in bags made of some sort of cloth, usually serge or silk. For convenience of handling, the charges are divided into sections when the weight of the full charge exceeds 100 pounds. Powder charges, when in bags, are stowed in water-tight copper tanks in compartments or buildings called magazines; on shipboard, magazines are placed below the water line, near the bottom of the ship, and as far away as practicable from the heat of boilers and engines, and are artificially cooled by refrigerating apparatus. Temperatures exceeding 90° F. injuriously affect the stability and ballistic qualities of the powder. Such temperatures do not render a well-made powder dangerous until long after its ballistic properties are ruined. Great care is also taken to keep hygrometric condition of magazines constant, as this is quite as important as the temperature in securing even combustion and pressures in the gun. In fortifications the magazines for war service are below ground or behind ample protections. Fixed ammunition is stored in rooms similar to magazines, as are also projectiles.

Powder charges, whether in metallic cases or in bags, are ignited by primers; these are of four types: percussion, friction, electric, and combination (percussion and electric). Percussion primers resemble miniature fixed ammunition; in the United States navy percussion primers are used only in one-inch, three-inch, and six-inch powder ship guns and in three-inch ship and field guns. They are about an inch long, one-fifth of an inch in diameter in the body, and enlarged considerably at the base; they contain 42 to 270 grains of fine powder in the body, and a primer cap in the head, which will ignite when struck by the firing pin of the gun lock. Friction primers are of the same shape and size, but are ignited by the friction caused by drawing a serrated strip of metal through the fulminate in the primer head. Their use in the United States navy has been discontinued, but they are still in some favor in other services. Electric primers differ from those already mentioned in being ignited by an electric spark instead of by friction or percussion. Single and double wire systems are employed; in guns which do not use fixed ammunition the current, furnished by a dry battery, or the dynamo, passes through a single insulated copper wire into the primer; there it encounters resistance in the shape of a bridge of platinum wire, and thence escapes through the metal of the primer to the gun and so to earth; in passing through the platinum bridge it heats the latter white hot and thus causes ignition. In guns using fixed ammunition, the electric primer is screwed or pressed into the base of the powder case; the current enters the primer through the electric primer connection, which is similar to the percussion firing pin, but is insulated in order to carry the current. The combination primer is the kind principally used in large guns of recent type

in the United States navy. It is arranged to be fired either by percussion or electricity. Electric primers are also used, but to a less extent.

Ammunition Supply. Ammunition for the supply of the artillery of the United States land service may be divided into two classes: (1) ammunition supply for all sea-coast guns permanently mounted in fortifications; (2) the ammunition supply for the mobile army, including small arms, field artillery, heavy field artillery, and siege artillery, all of which accompany an army in the field. The supply for sea-coast guns is stored in magazines under the emplacements of the guns. For calibres up to and including 4.7-inch, fixed ammunition is used, while separate loading of charge and projectile takes place for calibres above 4.7-inch.

The ammunition supply for the mobile army includes ammunition for small arms (rifles, machine guns, and pistols) and ammunition for the field artillery, which in the United States includes the following calibres: 2.95-inch mountain gun, 3-inch field gun, 3.8-inch field howitzers. These all employ fixed ammunition, and the weights of projectiles are as follows: 12 lbs., 15 lbs., 30 lbs., respectively. Such artillery forms the divisional artillery, accompanying a division in the field. In addition, in the rear of a field army with the auxiliary troops, there are the 4.7-inch gun using fixed ammunition, and the 6-inch howitzer, with weights of projectiles, 60 lbs. and 120 lbs., respectively. These two arms are classed as heavy field or siege artillery, but are sufficiently mobile to accompany or follow an army in the field.

The question of maintaining a sufficient supply of ammunition has become one of increasing importance and difficulty, on account of the increasing demands for artillery support in battle, which demands have been met by recent improvements in ordnance affording greater rapidity of fire in both small arms and artillery. The supply of ammunition is maintained as follows: 1st. By *combat trains* composed of ammunition wagons (q.v.) which accompany battalions of infantry (two to each battalion) and squadrons of cavalry (one to each squadron), and caissons (12 to each battery) which accompany artillery to the vicinity of the fight. 2d. By *ammunition trains* which are held in rear to resupply the combat trains.

The ammunition of a normal division of about 18,000 men requires, for small arms, three wagon companies (81 wagons in all); for artillery, 2 wagon companies (54 caissons in all): a total of 135 wagons. In addition to this, the depots established in rear of the army must be kept supplied from arsenals in order to meet the rapid consumption of ammunition at the front. The ammunition and combat trains, with the ammunition carried on the person and on the guns, provide for 330 rounds per rifle and 464 rounds per gun.

The difficulty of devising practical methods and means of supplying a moving army composed of several divisions is apparent. In modern armies the study of this subject has been given the greatest attention.

The question of ammunition was one of the subjects of the Peace Congress held at The Hague in the summer of 1899, and strong recommendations were made to discountenance the use of explosive or expanding bullets. The English in the Sudan, and in smaller Indian punitive

expeditions, found that the smallness, shape, and velocity of a modern rifle bullet had not a sufficiently deterring effect on the charging masses of tribesmen, and frequently used the so-called dum-dum bullet, which is made of softer metal and expands on contact. During the Boer War dum-dum and explosive cartridges were frequently found after the various battles, each side charging the other with having used them. In modern wars the small, clean-cut wounds caused by the bullets of high-power rifles have been found fatal only in a small percentage of cases. Instances are frequent where men continued to fight for some time after being hit.

In England, and Europe generally, all government-made ammunition is manufactured at the government arsenals. See ARSENAL.

The word "ammunition" is still retained in the English services in its early English form, as pertaining to certain forms of military supplies; ammunition shoes, ammunition socks, ammunition bread, ammunition shirts, etc., as distinct from the same articles supplied from purely civil sources. See PROJECTILES; FUZE; PRIMER; CARTRIDGE; ORDNANCE; ARTILLERY; COAST ARTILLERY.

AMMUNITION CHESTS. Boxes containing ammunition, packed so as to be fitted for transport by either elephant, camel, bullock, pack-horse, or mule; or in the case of horse and field artillery so arranged that the gunners may utilize them for seats or pack them in caissons. In the United States Field Artillery the words "ammunition chests" designate specifically the rectangular steel boxes permanently fastened to the limbers and caissons. The limber chest carries 36 rounds, the caisson chest 70 rounds, each round being provided with its own compartment. Seats for cannoneers are provided on the lids of these chests.

AMMUNITION WAGON. A specially built wagon for the safe and speedy transport of ammunition. The general use of rapid-fire rifles and guns has made the question of suitable wagons, capable of carrying the large quantities of ammunition demanded by modern arms and warfare, one of the most important features of a campaign. Such wagons need great strength, easy draught, flexibility, and adjusted balance. They must also be so arranged that the shells and fuses are held firmly in place. In the United States army vehicles carrying artillery ammunition assigned to batteries are called caissons. Twelve caissons accompany each battery of four guns. Two ammunition wagons carrying small-arm cartridges accompany each battalion of infantry. Only one such wagon is assigned to a squadron of cavalry. See AMMUNITION.

AMNESIA, *ăm-nē'zhī-ă*, loss of memory of words; sensory aphasia. Three clinical forms of amnesia are recognized, viz., simple loss of memory for words; word-blindness, or inability to comprehend written or printed words; and word deafness, loss of power to understand spoken words. Senile changes, injuries or tumors of the brain, some insanities, and even fatigue or the exhaustion of disease may cause amnesia. See APHASIA.

AM'NESTY (Gk. *ἀμνηστία*, *amnēstia*, forgetfulness, from Gk. *ἀ*, *a*, priv. + *μνᾶσθαι*, *mnasthai*, to remember). An act of State granting oblivion for past offenses, and generally employed where pardon (q.v.) is extended to whole classes or communities instead of to individuals before

trial and conviction. The President may grant amnesty by a general proclamation for offenses against the United States, except in cases of impeachment; and the Supreme Court has held that Congress also may pass acts of general amnesty. (Brown vs. Walker, 161 U. S. 591, 1895.)

AMNESTY PROCLAMATION. An executive order issued by President Johnson, May 29, 1865, defining in exact legal form, and to some extent narrowing, the terms of general pardon granted by President Lincoln in 1863 to Confederates who took the oath of allegiance to the Constitution of the United States. Although several classes of men were especially excepted from this amnesty, the free use of the pardoning power by the President prevented proscriptions. In 1872 Congress passed an amnesty act of the broadest scope, pardoning practically every one who had taken part in the Civil War against the United States.

AM'NION (Gk. *ἀμνιον*). The membrane which immediately invests the embryo, appearing very early in the development of the latter and adhering closely to it. As gestation proceeds, this membrane secretes from its inner surface a fluid which separates it from the fœtus. This fluid, the *liquor amnii*, supports and at the same time gives free movement to the fœtus, preserves it from injury, and maintains around it an equable temperature; and later, during labor, becomes, with its inclosing membranes, an important dilator of the genital canal. See EMBRYOLOGY; CAUL.

AM'NIO'TA. See EMBRYOLOGY.

AMŒ'BA (Neo-Lat.; Gk. *ἀμοιβή*, *amoibē*, change, alternation). A microscopic animalcule or single-celled organism, classified among the lowest Protozoa, which inhabits fresh water or occasionally moist earth. It appears in water under great magnification as a clear, translu-

AMŒBA.

Beginning at the upper left-hand figure, the successive drawings show the progress of a division of an amœba through its nucleus into two.

cent, highly refracting body. It is made up of a substance that does not mix with water, is viscid like glue, and has a specific gravity a little greater than water, namely, about 1.015. Under the highest power of the microscope, particularly after death, the body is seen not

to be perfectly homogeneous, but to be made up of films inclosing water-filled spaces. This structure may be imitated by making a fine mixture of oil and potassium carbonate and letting it stand in water. The potassium carbonate is hygroscopic, and eventually an emulsion is produced in which the oil stands to the water in the same relation that the protoplasmic films do to the water spaces. The cytoplasm is not all of the same kind. Near the centre is a specialized portion known as the nucleus, the protoplasm outside of which is called cytoplasm. Between nucleus and cytoplasm a constant interchange of material is taking place in the living cell, and the two parts are interdependent.

A living amœba under appropriate conditions exhibits a continual movement of the protoplasm. The very structure favors a constant movement, as witness the artificial emulsion, whose outline is constantly changing. In amœba processes (pseudopodia) are thrust out at certain points of the body, and others behind them are retracted, and thus a change occurs in the centre of the mass and locomotion is effected. Amœba is irritable, i.e., it is affected in a definite manner by external conditions; it "responds" to them by moving with reference to them. Without a stimulus there would probably be no movement at all. If the stimulus comes upon the organism from one side, it may move toward or from that side. Thus the amœba moves from the point of contact of a needle or from the source of light, or it moves so as to keep in water of a medium temperature. Thus we see that protoplasm early had the capacity of appreciating external conditions and moving with reference to them.

The amœba is, by its movements, constantly expending energy. Also, its plasma is undergoing constant destruction and must be reformed. Food here serves two purposes: (1) it serves as fuel; (2) it forms new protoplasm. There is no proper oral aperture, and the food is merely taken into the interior of the body by a process of intussusception—any portion of the surface being chosen for this purpose, and acting as an extemporaneous mouth. Sometimes the ingestion of food takes place chiefly at the posterior end of the body. When the particle of food has been received into the body, the aperture by which it was admitted again closes up, and the discharge of solid excreta is effected in an exactly similar but reverse manner. Food stuffs that are ingested become dissolved (digested) and penetrate the plasma films. Here they are burned (oxidized) and carbon dioxide, water, urea, and other substances are produced. These get back into the water spaces and are finally thrown out with the "contractile vacuole." This process is excretion. But in the plasma film, where the food stuff was burned, there is an increase of temperature. This heat is used in part in chemical work—in the building up of new living molecules from food stuffs. Here, then, is a great chemical laboratory in the protoplasm.

"The 'contractile vesicles' are cavities within the endosarc, of which ordinarily only one is present in the same individual, though there may be two or more. In position, the contractile vesicle, or 'pulsating vacuole,' as it is often called, is usually placed toward the hinder end of the body, as is also the nucleus."

Reproduction takes place by simple division,

each amœba, as it reaches maximum size, splitting in two, as shown in the illustration. See CELL; PROTOZOA.

AMŒBE'AN VERSES (Gk. ἀμοιβαῖος, *amoi-baios*, responsive, alternate). A species of pastoral poetry in which two persons answer each other alternately, as in some of the *Idyls* of Theocritus, the third, fifth, and seventh *Eelques* of Vergil, the ninth ode of the third book of Horace's *Odes*, and in Catullus, 62. The first singer might select any theme and any form of verse; he might vary the theme at will. The other was bound to answer on the same or a kindred theme, to employ the same form of verse and the same number of verses, and yet in force and spirit to outdo the first. Poems of this sort presuppose skill in improvisation.

AMOL, à-mōl'. A Persian town, in the province of Mazanderan, situated on both banks of the Heraz, a short distance from its fall into the Caspian Sea (Map: Persia, D 3). It contains fine bazaars and a number of ruins and old tombs, including that of Mir Bursuk, who died in Amol in 1378, and whose memory is held in great reverence by the natives. Pop., about 10,000.

AMOLE, à-mō'lâ. The Mexican name for soapwort (q.v.).

AMO'MUM (Lat. Gk. ἄμωμον, *amōmon*, an Indian spice-plant). A genus of about 55 species belonging to the family Zingiberaceæ, and natives of Asia, Africa, and Australia. Among them is the plant yielding cardamom and grains of paradise (q.v.).

AM'ON. A King of Judah (c.639–637 B.C.), son of Manasseh. After a short reign he fell a victim to a court intrigue. His death was avenged, and his son Josiah succeeded him on the throne. He was buried in the garden of Uzzah.

AMONTONS, à'môn'tôn', GUILLAUME (1663–1705). A French physicist and inventor. He devoted himself to physical research, investigating the phenomena of friction and perfecting many instruments used in experimental philosophy. With the aid of the barometer he studied the variations of atmospheric pressure and, by the use of a thermometer of his own invention, discovered independently, though simultaneously with Halley, that the boiling point of water varies with the external pressure of the atmosphere and hence with the elevation. He also invented an ingenious method of telegraphic communication, a new hygrometer, etc. He wrote *Remarques et expériences physiques sur la construction d'une nouvelle clepsydre, sur les baromètres, les thermomètres, et les hygromètres* (1695), besides contributions to the *Mémoires* of the Académie des Sciences.

AMORES. See OVID.

AM'ORET. In Fletcher's *Faithful Shepherdess* (q.v.), a shepherdess betrothed to Perigot at the "Virtuous Well" and after many troubles, patiently borne, united to him.

A'MORET, or **AMORET'TA**. In Spenser's *Faerie Queene*, the twin sister of Belphœbe (q.v.), brought up by Venus and Psyche. She loves Sir Scudamore, but is imprisoned by the enchanter Busirane; in the end, however, she is happily married, appearing as the type of feminine affection.

AMORETTI, à'mō-rēt'tê, CARLO (1741–1816). An Italian naturalist and author. He was born near Genoa and died at Milan. He was a member of the order of St. Augustine, professor

of law at the University of Parma, and afterward curator of the Ambrosian Library at Milan. He is remembered chiefly for a good biography of Leonardo da Vinci (1784), and various treatises on natural science, including a study of the natural history and geography of lakes Como, Maggiore, and Lugano, entitled *A Journey from Milan to the Three Lakes* (1794).

AMORGOS, à-môr'gôs (Gk. Ἀμοργός). The most easterly island of the Cyclades, Greece, having an area of 52 square miles, with its greatest length from northeast to southwest (Map: Greece, G 5). The island is crossed by a mountain range and yields olive oil, wine, fruit, and grain. Its chief town is Korax, or Chora, on the eastern coast. Amorgos was famous in antiquity for the fine quality of its flax. Pop., 1907, 2627. Consult H. Hautteœur. "L'île d'Amorgos," in *Bulletin de la Société royale belge de géographie*, vol. xxiii (Brussels, 1899), and J. Delamarre, "Amorgos," in *La Revue de Philologie*, vol. xxv (Paris, 1901).

AMORITES (Heb. *amorim*, Bab. *amurru*, Eg. 'mr, probably *amur*). The name of a Semitic people in Syria and Babylonia. From the earliest times the inhabitants of Babylonia seem to have designated Syria as "the land of the Amorites." Lugalzaggisi of Erech, Sargon of Akkad, Gudea of Lagash, Gimil Sin of Ur, and the Elamitish King Kudur Mabuk speak of their expeditions against this country. It was chiefly northern Syria, including the Phœnician coast, that was reached by these raids. In the Amarna letters this district is also described as the land of the Amorites. Abd Ashirat and his son Aziru, who caused so much trouble to the Egyptian governors, were Amorites. From the tablets found by Winckler at Boghazkui in Asia Minor, the ancient capital of the Hittite Empire, we know that Aziru, "king of the land of Amurru," was able to leave his throne to a line of descendants, Temen Teshub, Abi Teshub, and Bentashina, who ruled under Hittite suzerainty, in the city of Amur, probably Kadesh on the Orontes. Bentashina even made raids into Babylonia so far as the city of Akkad (see ACCAD), for which complaint is lodged with his over-lord, Hattushil. (See HITTITES.) The Egyptian inscriptions of Seti I, Rameses II, and Rameses III inform us of the causes that led to the overthrow of the dynasty founded by Aziru. It went down before the attacks of the Peoples of the Sea. The Egyptian sovereignty which Aziru had exchanged for the Hittite was probably imposed on the Amorites as a result of the numerous campaigns waged against the powerful prince of Kadesh by Thothmes III (1501-1447 B.C.) in the land of Amur. The Assyrian kings Tiglath-Pileser I, Adadnirari III, Sargon II, and Sennacherib use as terms to denote Syria "the land of the Amorites" and "the land of the Hittites." According to Genesis xiv. there were Amorites in Hebron and Hazazon-Tamar (i.e., Engeddi) in the days of Amraphel and Abraham (c.2100 B.C.). At the time of the Hebrew invasion there were two Amoritish kingdoms east of the Jordan, those of Og in Bashan and Sihon in Heshbon, which were conquered (Num. xxi. 21 ff.). To the latter an old song refers which may go back to the time of the conquest (Num. xxi. 27-30). Amoritish city-kingdoms also existed in the West Jordan country against which the invaders fought, many of them succumbing only in the reign of David. They were gradually absorbed in Israel and Judah and are referred to in later times only as a

people of the past that once possessed the land, along with Canaanites and others (c.g., Amos ii. 9, 10). The proper name of the chief god of the Amorites was Amur, and his consort was Ashirat.

Amorites also formed an element of the population of Babylonia. In fact, the first Babylonian dynasty, whose most famous king was Hammurapi (q.v.), was Amoritish. Many of the officials were Amorites. There was a secretary of the Amorites, as there was one of the Aramæans. Names compounded with that of their great god Amur are frequent, and men and women of "the children of the Amorite" appear in a contract. Whether these Amorites invaded Babylonia from the desert or came from Syria cannot yet be determined. Clay maintains that they brought from Syria to Babylon a high civilization. This is not capable of proof. But it is significant that the most powerful and brilliant of early Babylonian dynasties was Amoritish. Until recently the Amorites were known only through casual references to them in the Old Testament. The Hebrews themselves knew little of their early history. In the light of recent discoveries they are seen to have played a very important part in history. The old etymologies of their name 'the highlanders,' 'the tall ones,' have no value. Consult: Ed Meyer, *Geschichte des Altertums* (2d ed., 1909); Clay, *Amurru, the Home of the Northern Semites* (1909); Schmidt, *Messages of the Poets*, pp. 320 ff. (1911); Böhl, *Kanaaner und Hebräer*, pp. 31 ff. (1911). See ARABIC LANGUAGE AND LITERATURE.

AM'OROUS BIG'OT, THE. A play by Thomas Shadwell, presented in 1690.

AMOR'PHA. See INDIGO.

AMOR'TIZA'TION. The charging off or redeeming of capital investment in a plant or mine during the life of the property. Dividends on investments of limited life, such as mines, should be considered as interest on the investment plus the return of capital. When the dividends from a mine investment amount to 10 per cent, the life of the property must be 17.7 years to return the capital and 6 per cent interest on the investment providing the remaining 4 per cent of dividend is invested as received at 4 per cent interest. A dividend of 15 per cent when subdivided into 7 per cent income from investment and 8 per cent as return of capital requires, when the 8 per cent is reinvested at 4 per cent interest, 10.3 years for the entire return of the original investment.

A'MORY, BLANCHE. A character in Thackeray's *Pendennis* (q.v.), really named Betsy; an insincere and selfish girl, whose emotions are all shams.

AMORY, ROBERT (1842-1910). An American physician. He was born in Boston and studied medicine at Harvard and later in Paris and in Dublin. In 1869 he was made lecturer at Harvard College on the physiological action of drugs. He was also for some time professor of physiology at the Bowdoin Medical School. Besides a translation from the German of Russ's *Lectures on Physiology* (1875), Dr. Amory published a number of interesting papers on the physiological action of various chemical substances. He also wrote a volume on poisons, forming part of Wharton and Stillé's *Medical Jurisprudence*.

AMORY, THOMAS (1691?-1788). An Irish author, called the "English Rabelais," and supposed by certain authorities to have been slightly

insane. He was the son of Counselor Amory, who was appointed by William III secretary for the foreign estates in Ireland. His birthplace is not known, but in 1757 he was living in seclusion in Westminster. It is supposed that he sketched portions of his own career in his *Life of John Bunce* (2 vols., 1756-66), which is a literary curiosity. A sketch of his life appeared in the *Saturday Review*, May 12, 1877.

AMORY, THOMAS COFFIN (1812-89). An American lawyer and author. He was born in Boston, Mass., and after graduating at Harvard (1830) held various posts in connection with the municipal government of Boston, and served in the State Legislature. In addition to official reports and addresses, his publications include the *Life of James Sullivan* (Boston, 1859); *Military Services and Public Life of Major-General John Sullivan* (Boston, 1868); *The Transfer of Erin, or The Acquisition of Ireland by England* (1877); pamphlets on subjects connected with the Revolutionary War, among which was a *Life of Sir Isaac Coffin* (1886), and numerous poems, of which the best known is *William Blackstone, Sole Inhabitant of Boston* (2d ed., 1877).

AMOS. A Hebrew prophet of the eighth century B.C., author of the biblical book which bears his name. According to his own statement he was not a prophet by profession, but a herdsman and tender of sycamore trees (i. 1; vii. 14). His home was at Tekoa, but it is not certain whether this place is in Judah, near Bethlehem, or in Israel. He prophesied during the reigns of Uzziah in Judah and Jeroboam II in Israel (about 750 B.C.). In a discourse at Bethel he denounced the moral delinquencies and foretold the punishment, first of several surrounding nations including Judah, then of Israel itself, on account of the various sins which had brought the anger of Yahwe upon the kingdom. For this he was taken severely to task by Amaziah, who charged him with delivering his oracles for money and asked him to go elsewhere and prophesy, which only brought upon the head of the chief priest at Bethel a still fiercer denunciation. The style of Amos is remarkable for its clearness and picturesque vigor and abounds with images taken from rural and pastoral life. While Amos is the first of the prophets who wrote as well as spoke, the editing of his prophecies belongs to a period long subsequent to his death. Hence modern critics have detected in them numerous additions, insertions, and changes, made by various hands. Amos ix. 8-15 seems very clearly to point to the exile, when the tent of David, i.e., the Davidic dynasty, had fallen, and the people were in special need of encouragement. For recent discussions of the problems involved, consult G. A. Smith, "The Twelve Prophets" in *The Expositor's Bible*, vol. i (New York, 1896-97); H. G. Mitchell, *Amos* (Boston, 1899); Driver, *Joel and Amos* (1897); the commentaries of Nowack (1903); Marti (1904); and W. R. Harper, *Amos and Hosea* (1905).

AMOS JUDD. A skillful story by J. A. Mitchell (q.v.) of Hindu mysticism in New England surroundings.

AMOSKEAG, ăm'ôs-kĕg'. See MANCHESTER, NEW HAMPSHIRE.

AMOUR, L'. A novel by the famous French historian Jules Michelet (q.v.), published in 1859, when he was 61 years of age. It is devoted to the ideal of the family.

AMOY, à-moi' (the local pronunciation of *Hai-mun*, or Gallery Gate). A Chinese city at the southern end of the island of the same name, in lat. 24° 28' N., long. 118° 4' E., in the province of Fukien (Map: China, E 7). The island of Haimun is 40 miles in circumference. It is opposite the centre of the island of Formosa, with which it carries on considerable trade. Its harbor is a fine one, and much of the trade to Chang-chu-fu on the Pei-chi (Dragon) River, at the mouth of which Amoy is situated, passes through this port. Amoy is the ancient centre of the tea trade. The Portuguese came here in 1644, but were expelled for their cruelty. The English traded here until 1730, when they were ordered to remove to Canton. Nearly all the tea brought to Boston harbor by the British ships in 1773 was from Amoy, in the neighborhood of which it was grown. All the tea now exported to the United States from Amoy is grown in Formosa and sent here for reshipment. Even this trade is being gradually lost since the harbor at Kelung, Formosa, has been deepened, and it is expected that it will be entirely ruined when the harbor improvements at Kelung and at Tamsui shall have been completed. The British treaty of 1842 made Amoy one of the five ports opened to foreign commerce, and the treaty of Tien-tsin in 1858 confirmed and extended the privilege. Amoy has long been the centre of flourishing Christian missions in Fukien. In 1882 a British engineer discovered coal and iron within 40 miles of Amoy, in an area of 50 square miles and within 20 miles of water traffic. The harbor is large, safe, and picturesque. There are three granite docks built by foreigners, an English church and club, and a daily newspaper. One hundred thousand emigrants pass through Amoy every year to Singapore, and about 25 per cent of those who leave the port do not return. It is estimated that over 2,500,000 of Amoy people were abroad in 1905. Four-fifths of the families have some members abroad, but for whose remittances the distress would be terrible. Pop., 1911, 114,000.

AM'PELIDA'CEÆ. See VITACEÆ.

AMPELIUS, LUCIUS. A Roman writer, who lived between the second and fourth centuries A.D. He was the author of a note-book, *Liber Memorialis*, which contained, in 50 chapters, a condensed and meagre summary of various astronomical, geographical, mythological, and historical writings. The *Liber* is, for the most part, too inaccurate for use as a work of reference, but it is valuable as the only ancient work which mentions the celebrated sculptures of Pergamus, discovered in 1878 and now at Berlin (see PERGAMON). It is usually appended to editions of Florus, and has been edited with notes by Beck (Leipzig, 1826). The best text is that of Wölfflin (Leipzig, 1853).

AM'PELOP'SIS (Gk. ἄμπελος, *ampelos*, vine + ὄψις, *opsis*, appearance). A genus of vine-like, woody plants much used for ornamental decoration of buildings. It includes the Virginia creeper, or American woodbine, and the Japanese ivy or Boston ivy, which is probably the favorite of all the hardy vines grown in cities in the eastern United States. It is especially effective for a considerable area from Massachusetts to Florida and on the Pacific coast, but north of the Ohio and west of the Mississippi River it is tender. In autumn the dying leaves of ampelopsis turn a most brilliant red and yellow. A single fossil species of this genus,

Ampelopsis tertiaria, has been recognized in the White River beds of the Tertiary in Wyoming.

AMPERE, ăm-pâr' (derived from the name of Ampère). The practical unit employed in measuring the intensity of an electric current, and technically defined as one-tenth of the C.G.S. electromagnetic unit (see ELECTRICAL UNITS) of current. By intensity of current is meant the quantity of electricity which passes any cross section of the wire or conductor in the course of one second of time. The current depends upon the resistance of, and the difference of potential at the ends of, the conductor, varying inversely as the former and directly as the latter. From Ohm's law that $C = \frac{E}{R}$, when C is

the current, E the difference of potential, and R the resistance, we have amperes = $\frac{\text{volts}}{\text{ohms}}$. A

current of electricity can do work in decomposing certain chemical substances into their respective elements; consequently, by measuring the amount of a substance so decomposed in unit time, we can ascertain the strength of the current. The ampere, accordingly, was defined by the London Conference of 1908 as the amount of a constant current which, when passed through a solution of nitrate of silver, in accordance with standard specifications, deposits silver at the rate of 0.001118 of a gram per second. The instrument used in such a determination is called a "silver voltameter" (q.v.). Within the past few years it has been proved that the quantity of silver deposited in a voltameter depends upon many conditions previously unsuspected, such as the age of the solution, the construction of the voltameter, etc. For full details as to our present knowledge of the subject, the reader should consult the *Bulletins* of the Bureau of Standards, Washington, D. C.

AMPÈRE', ăm-pâr', ANDRÉ MARIE (1775-1836). A distinguished French physicist, mathematician, and naturalist, born at Lyons. The death of his father under the guillotine in 1793 made a deep and melancholy impression on the mind of the young man, and he sought solace in the study of nature and the Latin poets. In 1801, after he had been engaged for some time as private mathematical tutor at Lyons, he became professor of physics in the Central School of the department of Ain at Bourg. He was afterward professor of mathematics at Lyons. He was called to Paris, where he distinguished himself as an able teacher in the Polytechnic School. He began his career as an author by the essay on the mathematical theory of chances, *Sur la théorie mathématique du jeu* (Lyons, 1802). In 1814 he was elected a member of the Academy of Sciences and in 1824 was appointed professor of experimental physics in the Collège de France. Science is largely indebted to Ampère, especially for his electro-dynamic theory and his original views of the identity of electricity and magnetism, as given in his *Recueil d'observations électro-dynamiques* (Paris, 1822) and his *Théorie des phénomènes électro-dynamiques* (Paris, 1826). Ampère was the inventor of the astatic needle (q.v.), which made possible the modern astatic galvanometer (q.v.). He was the first to show that two parallel conductors carrying currents traveling in the same direction attract each other, while if traveling in opposite directions they repel each other. Am-

père also formulated the theory that there were currents of electricity circulating in the earth in the direction of its diurnal revolution which attracted the magnetic needle. The ampere (q.v.), or unit of the strength of an electrical current, is named after him. Ampère's scientific papers are largely contained in the *Annales de Physique et de Chimie*. A eulogy by Arago, delivered shortly after his death, which contains an account of his life, will be found translated into English in the annual report of the Smithsonian Institution for 1872 (Washington, 1872).

AMPÈRE, än'pâr', JEAN JACQUES ANTOINE (1800-64). A French academician, essayist, literary historian, and professor in the Collège de France. He was born at Lyons, the son of André Marie Ampère. His essays, collected as *Littérature et voyages* (2 vols., 1834), attest his knowledge of foreign countries and their literatures. Better known are the essays on the formation of the French language, *Histoire de la formation de la langue française* (1841) and *La Grèce, Rome et Dante* (1850). Ampère was a judicious critic, a profound scholar, and master of a precise style. Consult Pottou, *Etudes sur la vie et les travaux de Jean Jacques Ampère* (Paris, 1867); while notices of him are found in Sainte-Beuve's *Portraits Littéraires*, vol. iv, and in *Nouveaux Lundis*, vol. xiii.

AMPERE, ăm-pâr', **TURNS**. In problems involving the magnetic field produced by a current flowing in a coil of wire, two of the factors necessary are the strength of current in amperes, and the number of turns or revolutions that the conductor through which the current passes makes in forming the coil or solenoid. Their product is known as the ampere turns.

AM'PHIARA'US (Gk. Ἄμφιαραός, *Amphiaraios*). A Greek chthonic divinity. At Oropus he had a celebrated oracle, healed the sick, and was honored with games. He was worshiped elsewhere also as a hero and prophet. In legend Amphiaraius is prominent in the war of the Seven against Thebes, into which he was forced by the treachery of his wife, Eriphyle, who was bribed by Polynices. As he fled from the victorious Thebans, Zeus caused the earth to open and engulf him with his horses and chariot. He was a descendant of the seer Melampus, and son of Oicles and Hypermetra. According to later writers, he took part in the Calydonian hunt and the Argonautic expedition. See ADRASTUS; ÆSCHYLUS; ETEOCLES AND POLYNICES; SEVEN AGAINST THEBES.

AMPHIB'IA (Gk. ἀμφί, *amphi*, on both sides + βίος, *bios*, life). A class of vertebrates intermediate between fishes and reptiles. It was made by Linnaeus to comprise reptiles, amphibia, and cartilaginous fishes, but has been restricted, until now it is equivalent to Batrachia, and includes frogs, toads, newts, salamanders, the snake-like Gymnophiona and gigantic extinct forms, the Stegocephali. As adults, many, but not all of them, are able, either by the possession of lungs or by means of skin respiration, to come from water to land; hence their name.

Distinctive Characteristics. All the free-developing amphibia possess gills in the larval stage that, in some forms, persist throughout life. The skin is soft and glandular and serves in part or wholly to aerate the blood. The outer layers of the skin become cornified and are periodically shed, and in a few cases there is a bony dermal skeleton. The paired fins of fishes are replaced by pentadactyl legs. In some forms, as in sirens, one pair of limbs may be wanting,

and in such forms as *Gymnophiona* both pairs may be lacking. The mouth is terminal, and the teeth are firmly ankylosed to the supporting bones. The tongue, when present, is bifid and is so fixed at the front of the mouth that the free end turns backward. The mouth and pharynx are ciliated and into them open the internal nares. The alimentary tract is nearly straight in the elongated forms, or it may be much convoluted, as in the case of vegetable-feeding tadpoles. There are a two-lobed liver and a pancreas. The lungs are thin-walled sacks that may have internal folds, but some salamanders are lungless. The heart is usually composed of two distinct auricles, one ventricle, and a conus arteriosus. The red blood corpuscles are oval, nucleated, and large in comparison with those of warm-blooded vertebrates.

Breeding Habits. The eggs may be fertilized internally or externally, just as they are being deposited in the water. In most cases they are left to chance, but in some species are carried in strands, or otherwise cared for by the male or female. A few have brood pouches, and one toad rears its young in pits in the skin of the back. A few forms bring forth their young in an active condition. The gill-bearing or larval stage (axolotl) of *Amblystoma tigrinum* is capable of breeding, and under certain conditions may undergo its metamorphoses. (See AXOLOTL.) The eggs are pigmented and usually undergo total and unequal segmentation. They possess a large amount of yolk, so much in a few cases, such as pipa, that the embryo lies coiled over the egg as though it were a fish. The blastula and gastrula stages are present, but are modified in form and manner of development by the presence of the yolk; the medullary groove develops by a pair of upfoldings along the middle of the back, and by fusion of head and body the tail becomes marked off; on the neck are two or three pairs of external gills. At about this time the tadpoles hatch and begin to swim about or adhere to weeds by means of the sucker on the ventral surface of the head. At first the tadpole has no mouth, but soon one develops; the external gills dwindle and are replaced by the internal, which are covered by a fold of skin. The hind limbs are the first to appear externally, lungs develop, and the larva can breathe both on land and in water. The gills of the Anura continue to dwindle, and likewise the tail is gradually and completely absorbed. Tadpoles as well as some adult amphibia have the power of reproducing lost parts. See TOAD.

The early stages of amphibians are not always passed in water. Some of the European salamanders are viviparous, the young being born all developed, but still requiring water. The young of the viviparous *Cæcilidæ*, however, take to a terrestrial life as soon as they are born. So, too, certain frogs (e.g., *Rana opisthodon*, of the Solomon Islands) hatch from eggs laid out of the water as perfect, air-breathing frogs. In many species, as in the persistent gilled Urodela, the adult lives chiefly in the water; in other cases, as in the other Urodela, the *Cæciliidæ*, and the Anura, the adult lives on land.

Habits. The adult Amphibia feed on worms, slugs, and insects. Hence they are all useful to agriculture. None has a poisonous bite, but all trust largely for safety to acrid or poisonous secretions from the skin glands. The tadpoles subsist almost entirely on water vegetation, such as algæ. In cold or dry seasons Amphibia pre-

serve themselves by burrowing down into mud and earth, and there fall into a lethargic sleep. Most Amphibia keep near water, and their young develop in it. A few forms that live in mountains, in trees, or on dry, porous volcanic islands, bring forth their young well enough developed to breathe air, thus approaching a reptilian condition of development. Many, but not all, amphibians are nocturnal, being most active in their search for food or mates in the early morning or evening hours.

Geographical Distribution. The amphibia thrive best in warm and moist countries. A few live in the temperate zone, some frogs penetrating far north, but not so far as the polar regions. The order of relative abundance of amphibia in the different countries is as follows: Tropical America, India, Africa, Australia, North America, Europe. Many families and genera have a very limited range, since, although fresh water is a necessity to them, the sea is a complete barrier to their spread. Salamanders are confined mainly to Europe and North America, and only toads and frogs are of world-wide distribution.

Classification. There are four orders of Amphibia: the Urodela, possessing a tail throughout life (newts and salamanders); the Anura, without tail in the adult stage (frogs and toads); the *Gymnophiona*, snake-like, without limbs, and blind, and the *Stegocephalia*, and other extinct often gigantic tailed forms fossil in the Carboniferous, Permian, and Trias rocks. The existing species number about 1000.

Ancestry. The Amphibia have doubtless sprung from fish-like ancestors, and the link with that ancestry is found in the fossil group of *Stegocephalia*, whose head carries great plates. The piscine group from which the Amphibia arose must have been either the Dipnoi, which are to-day largely air-breathers, or the *Crossopterygii*. Gadow, in 1901, gave the following features of Amphibia as those that proclaim their piscine descent: (1) the possession by the heart of a long conus arteriosus (anterior to the ventricle) provided with, in many cases, numerous valves, on at least (in Anura) one series at the base, another at the beginning of the truncus where the arches branch off; (2) the strictly symmetrical arrangement of these arches; (3) the three-chambered heart is still like that of Dipnoi; (4) the occurrence of as many as four or even five branchial skeletal arches in the larval stage; (5) the glottis (or entrance to windpipe) is supported by cartilages which themselves are derivatives of posterior visceral arches; (6) the development (in Urodela as in *Stegocephalia*) of the vertebræ from four pairs of elements called arcualia, and the formation of the intervertebral joints by a split across the intervertebral ring of cartilage; (7) the hypoglossal nerve still lies outside and behind the skull as a cranial nerve; (8) the presence of lateral sense organs; (9) the possession of external gills, as in Dipnoi and *Crossopterygii*. It is frequently assumed that the first Urodela were aquatic creatures, provided with a finned tail and small lungs. Gadow believes these to be larval acquisitions, not ancestral reminiscences. The fact that the ancestors of Amphibia evolved the pentadactyl condition proves that they were land animals. The evolutionary change through which the early Amphibia passes are thus enumerated by Gadow.

1. "Terrestrial, with two pairs of pentadac-

tyloid limbs; breathing by lungs only; with a fully developed apparatus of five pairs of gill arches, which during the embryonic life perhaps still carried internal gills, with or without several pairs of gill elefts. Reduction of the dermal armor and of the eutaneous scutes had taken place.

2. "Additional respiratory organs were developed by the embryo, in the shape of external gills; these were at first restricted to embryonic life (as in the existing Apoda), but were gradually used also during the aquatic life of the larva. These external gills, together with the lungs, have superseded the internal gills, of which there are now no traces either in Urodela or in Anura.

3. "Some Urodela, retaking to aquatic life, retained and further enlarged the external gills into more or less permanent organs. The majority of Urodela hurry through the larval, aquatic stage, and some—e.g., *Salamandra atra*—became absolutely terrestrial. The possession of unusually long external gills by this species and by the Apoda indicates that these organs are essentially embryonic, not larval, features."

Bibliography. The foremost systematic writers upon this group are G. A. Boulenger, of the British Museum, and E. D. Cope. The latter has completely monographed North American forms in "Batrachia of North America," *Bulletin 34, United States National Museum* (Washington, 1889). This discusses the larger relations of the group and gives an extensive bibliography. For a still more recent general treatise consult H. Gadow, "Amphibia," *Cambridge Natural History*, vol. viii (Cambridge, 1901), and "Amphibia," by Lydekker, Cunningham, Boulenger, and Thompson (London, 1912). For a more popular treatment, consult Dickerson, *The Frog Book* (New York, 1906). See ALIMENTARY SYSTEM (*Evolution of*) and similar articles relating to comparative anatomy.

AMPHIBIA, FOSSIL. See STEGOCEPHALIA.

AMPHIBIOUS PLANTS. Plants that are able to thrive either with their leaves submerged or completely exposed to the air (see also AQUATIC PLANTS). In some plants both air and water leaves are of the same size and form, but in other instances they exhibit striking differences of structure. Often, as in the mermaid weed (*Proserpinaca palustris*), or in one of the watercresses (*Radicula aquatica*), the water leaves are finely dissected; but the forms produced in the air are quite entire. The water buttercups, *Ranunculus multifidus* and *R. aquatilis*, show similar variations. Some of the arrowheads, like *Sagittaria heterophylla*, produce early in the season narrow grass-like leaves quite below the surface of the water, but somewhat later the leaves emerge from the water and have broad arrow-shaped blades. In other cases, like that of the water smartweed (*Polygonum amphibium*), the principal difference between the water and the air forms is in the entire absence of hairs from the aquatic form and the decided pubescence of the aerial foliage. The causes of these variations in the leaves of amphibious plants are not fully known, but it has been demonstrated that transpiration is one of the most important factors.

AMPHIBOLE (Gk. ἀμφίβολος, *amphibolos*, doubtful, ambiguous; alluding to its being easily confounded with augite). An important group of rock-making minerals closely allied to the pyroxene (q.v.) group. The amphiboles are

metasilicates, principally of calcium, magnesium, or iron, and sometimes also of manganese, sodium, and potassium. The group is subdivided according to the forms of crystallization. Those that crystallize in the orthorhombic system include anthophyllite and its variety Gedrite; the monoclinic section includes the typical mineral amphibole with its varieties, as well as glaucophane, erocidolite, and certain other minerals; while the triclinic section includes anigmatite. All of these minerals have a common prismatic cleavage of from 54° to 56° and also agree in their optical characters and chemical composition.

The most important member of the group is the mineral amphibole, which gives its name to the series. The several varieties of amphibole are divided into two groups, according as they do or do not contain aluminum. The non-aluminous varieties include tremolite, a calcium magnesium silicate that is usually white to dark gray in color, and is found both in crystals and massive; actinolite, a calcium magnesium and iron silicate of varying shades of green; grünerite, an iron silicate which is of a brown color that occurs in fibrous masses. The aluminous varieties include the several varieties of hornblende, which comprises the dark green and black varieties, known as common hornblende (black), pargasite (green and blue), and edenite (white, gray, and pale green). These minerals are found in crystalline metamorphic limestones, granitic, and schistose rocks, and in volcanic or igneous rocks. Nearly every member of the group has several varieties, each of which, besides having a separate name, differs from the type by some slight variation in color, optical properties, or chemical composition. Many varieties of amphibole have been cut as gem-stones.

AMPHIBOLITE. A group of metamorphic rocks characterized by the presence of amphibole (q.v.) in large amount and by a more or less marked foliation or parallel arrangement of the constituents. According to the nature of the amphibole, and to some extent dependent upon the associated minerals, several varieties of amphibolite may be distinguished, such as actinolite-schist, tremolite-schist, glaucophane-schist, and hornblende-schist, which are the more common ones. The name "hornblende-schist" properly belongs to the variety having the common iron-alumina amphibole, but is sometimes used by petrographers in a larger sense as practically synonymous with amphibolite. The different members are all hard and rather tough rocks, resistant to rupture except in the case of the very schistose types which may be cleaved quite readily in a single direction. The amphibole is usually developed in blades or prisms, without crystal terminations, arranged in parallel order that simulates the bedded structure of sedimentary rocks. Their grain varies from coarse to fine, the finer sorts being, perhaps, the more common. Their color is white or grayish in the iron-free tremolite-schist, pale to bright green in actinolite-schist, blue when the amphibole belongs to the glaucophane variety, and dark green to black when common hornblende is the chief ingredient. The associated minerals include feldspar, quartz, and mica of chief importance, besides chlorite, garnet, iron oxides, pyrite, and others in moderate to small amounts.

The amphibolites are of secondary origin and may be formed from either igneous or sedimen-

tary rocks, as has been demonstrated in numerous instances. The change involves in either case a thorough rearrangement of the chemical constituents, sometimes with the introduction of new material, and a recrystallization which destroys the fabric or texture of the parent rock. The agencies productive of such transformation are mainly heat and pressure, under conditions that obtain in the deeper parts of the earth's crust. (See METAMORPHISM.) Among igneous rocks the change is more frequent in the case of varieties like gabbro, dolerite, and pyroxenite that contain relatively large amounts of the iron-magnesia minerals, whereas in the feldspathic varieties, like granite, syenite, and diorite, the end result is usually a gneiss. In large bodies of igneous rock it is not uncommon to find that the process of metamorphism has not been complete throughout, but has been more effective on the borders than in the interior; thus may be observed a gradual transition from amphibolite, on the one hand, to a rock which still preserves its original characters. Of sedimentary strata impure limestones and calcareous clays are most liable to conversion into amphibolite under regional metamorphic influences. The development of tremolite and actinolite is often noticeable in limestones, also around the borders of an igneous intrusive.

Amphibolites are quite widely represented in the older geological formations. They occur in the Adirondacks and along the metamorphic belt of the Appalachians, in the Lake Superior region, and various other parts of the world where the rocks have been subjected to shearing and compression incident to the upraising of mountains. Economically they are not of much importance in themselves, although they may inclose important ore-bodies; the productive iron formations of the Lake Superior region include a rock known as grünerite-schist which is allied to actinolite-schist. By alteration under surface influences amphibolites yield hydrated compounds like talc, chlorite, and serpentine. In the western Adirondacks are large bodies of fibrous talc that have been derived mainly from alteration of tremolite-schist.

AMPHICTYON. See AMPHICTYONIC COUNCIL.

AMPHICTYONIC COUNCIL, AMPHICTYONY (from *Amphictyon*; see below). A name given to various confederations of Greek States, but applied usually to a celebrated religious congress of the confederated tribes of ancient Greece, which met twice every year, at Delphi and Thermopylæ. The meetings at Delphi took place in the temple of Apollo, those at Thermopylæ in the temple of Demeter, which was in the village of Anthela. The congress was composed of the deputies of 12 tribes, whose names are given differently in different authors. The list of Æschines (containing but 11 names) is as follows: Thessalians, Bœotians, Dorians, Ionians, Perrhæbians, Magnetes, Locrians, Cætæans, Phthiots, Malians, and Phocians. The twelfth tribe was probably either the Dolopians or the Ænianians. Each tribe sent as delegates two members, who possessed equal authority. Tradition connects the origin of the Amphictyonic Council with Amphictyon, son of Deucalion. We may at least be sure that the institution was one of great antiquity. Its importance declined in the course of time, and by the third century B.C. it had lost much of its old authority. The duties of the Council were primarily religious and were connected with the care of the

temple of Apollo at Delphi and the protection of the holy lands, treasures, and other perquisites of the god. It was also intrusted with the preparation and direction of the Pythian Games. The duty of protecting the property of Apollo carried with it the power to prosecute and punish all who in any way injured the majesty of the god. Thus the Council possessed important judicial rights, and, since it also had power to regulate matters relating to peace and war among the different members of the federation, it in time acquired political importance also. The members bound themselves by an oath not to destroy any city of the Amphictyons or cut off their streams in war or peace; also, if any State should break this oath, to unite in proceeding against and destroying such a State. Such a war was called a Holy War. There were in early times various other amphictyonies, or associations of tribes, among the Greeks, as at Argos, Onchestus, Delos, and elsewhere, but little is known of these. The correct form of the name, which, however, is not found till 380 B.C., is *Amphictiones* and signifies 'Neighbors.' Consult Tittmann, *Ueber den Bund der Amphictyonen* (Leipzig, 1880), and Freeman, *History of Federal Government* (2d ed., London, 1893).

AMPHICTYONY. See AMPHICTYONIC COUNCIL.

AMPHICYON. A slow and clumsy carnivore chiefly of the Miocene horizons; a giant dog in many respects, with teeth which combined the characters found in dogs and bears.

AMPHILOCHUS (Gk. Ἀμφίλοχος, *Amphilochos*). In legend, a son of Amphiaraüs, and, like him, worshiped as a prophet at Oropus and elsewhere; one of the Epigoni, and founder of Amphilocheian Argos in Ambracia. Another group of legends connected Amphilocheus with Cilicia and Pamphylia, whither he was said to have gone after the Trojan War, in which he took part as a suitor of Helen. With Mopsus, he founded Mallus, but later they quarreled and killed each other. Their graves were shown at Mallus, where was also an oracle of Amphilocheus.

AMPHINEURA (Gk. ἀμφί, *amphi*, around + νεῦρον, *neuron*, sinew, nerve). An order of mollusks, characterized by the peculiar arrangement of the nervous system. There are two lateral and two ventral nerve trunks bound together by numerous commissures and provided with ganglion cells throughout their whole length. Anteriorly these cords pass into the cerebral ganglion, which, however, is often hardly more than the upper half of a ring which encircles the œsophagus. The amphineura are bilaterally symmetrical and have the foot somewhat like that of the gastropods. They either have a shell of eight pieces or there is no shell at all. They are all marine forms, chiefly of the warmer seas, and rarely reach a large size. There are two distinct sub-orders, the Polyplacophora, or Chitons (q.v.), and the Aplousophora, or Solenogastres. The latter are degenerate, or are Amphineura whose development has been arrested at an early stage; they are worm-like animals of small size, without a shell, the foot, mantle, and mantle-cavity greatly reduced, and in some forms almost wanting: Only a few recent species are known.

AMPHION (Gk. Ἀμφίων). In mythology, son of Zeus and Antiope, twin brother of Zethus. The story of Antiope and her sons existed in many local forms, but the accepted ver-

sion of later times was found in the *Antiope* of Euripides, of which only fragments have been preserved. Antiope, fleeing from her father, the river-god Asopus, who had threatened to punish her for yielding to Zeus, who had visited her under the form of a satyr, went to King Epopeus, at Sicyon. Dragged thence by her uncle, Lycus of Thebes, she bore the twins on Mount Cithæron, where they were exposed, but found, and reared by a shepherd. Story made Amphion the son of Zeus, Zethus the son of Epopeus. Antiope, cruelly mistreated by Lycus and his wife Dirce, fled to the mountain, and found there her sons. To avenge her wrongs, the twins tied Dirce to the horns of a wild bull, and captured Lycus, who surrendered Thebes, which they fortified. Amphion charmed the stones into place by his lyre. The characters of the brothers are sharply contrasted: Zethus is the rough huntsman, and Amphion is the gentle musician. Amphion and Zethus were honored at Thebes as Dioscuri, as Castor and Pollux were at Sparta. Amphion married Niobe and was killed by Apollo, or committed suicide when his children were killed. The punishment of Dirce is the subject of a celebrated group of statuary—"The Farnese Bull"—by Apollonius and Tauriscus of Tralles, found in the Baths of Caracalla in Rome in 1546 and now in the Naples Museum. It is a work of the early part of the first century B.C., but has been much restored.

AM'PHIOX'US (Gk. *ἀμφί*, *amphi*, at both ends + *ὄξυς*, *oxus*, sharp). A small, bilateral, translucent, marine animal, about two or three inches long, thought by some to be an offshoot of the primitive vertebrate stock, and by others to be a degenerate, primitive vertebrate. The amphioxus, or 'lancelet,' has no well-defined brain, but a persistent and unsegmented notochord. The muscles are arranged in 62 V-shaped myomeres dovetailed into one another. The single mouth and anus are in the median line. There are no limbs, ears, sympathetic nerves, or genital ducts. The gill slits, which are numerous and supported by bars, open from the mouth into the atrial chamber, which has one opening to the exterior, the atrial pore. The best-known species is *Amphioxus lanceolatus*, which dwells

AMPHIOXUS.

1. Ventral view of the entire animal lying on its side. 2. Side view. *a*, anterior end, showing cirri about the hooded mouth; *b*, caudal fin; *c*, anus; *d*, atrial pore or excurrent orifice for the water constantly taken in at the mouth; *e*, generative organs; *n*, notochord.

buried in sand near the seashore line. Its food, which consists mainly of diatoms, is sucked into its mouth. The adults swim about in the evening only, but the young are very active. The segmentation of the egg is complete, and results in the formation of a blastosphere, which invaginates to form a gastrula. The medullary groove is formed by a sinking of the ectoderm along the mid-dorsal line. The cavity of the gastrula becomes the gut of the adult. In the active early life of the embryo the ectoderm is

ciliated. The simplicity of its development has made the amphioxus a favorite object of study for the descriptive and experimental embryologist. If the two cells which are the result of the first segmentation are separated, each cell will develop into a complete individual one-half the size of the normal embryo. Incomplete separation results in the formation of double or Siamese-like twins. Compare *BALANOGLOSSUS*; and consult A. Willey, *Amphioxus and the Ancestry of the Vertebrates* (New York, 1894). See the articles on the evolution of the alimentary, circulatory, muscular, nervous, and respiratory systems, under *ALIMENTARY SYSTEM*, etc.

AMPHIP'ODA (Gk. nom. neut. pl., from *ἀμφί*, *amphi*, around + *πούς*, *pous*, foot). An order of crustaceans, distinguished by the sessile, lateral eyes and the greatly compressed body. They are mostly of small size, and some are very minute. Their name alludes to the peculiar arrangement of the so-called walking-feet, four pairs of which point forward and three backward. The abdomen, or "tail," is also a powerful locomotive organ, and assists the animal in jumping, which is its usual mode of progression. Even in swimming its movements are chiefly a succession of jumps. The amphipods are usually plainly colored, but some forms are very handsome. A large number of species is known, but zoölogists are by no means agreed as to their classification, some making only two and some as many as nine families. They occur in both fresh and salt water and are especially abundant along sandy beaches, where they skip about in such a lively manner that they are called beach-fleas or sand-hoppers. Amphipods are also found living in sponges and jellyfish and as true parasites on the skin of whales. They are widely distributed over the world, occurring even in the Arctic regions, and are of great practical importance as food for fishes. See *BEACH-FLEA*; *CRUSTACEA*.

AMPHIP'OLIS (Gk. *Ἀμφίπολις*). A city of ancient Macedonia, situated in a deep bend of the river Strymon, about 3 miles from the sea (Map: Balkan Peninsula, D 4). Its position on terrace-like hills in a bend of the river made it important as the port of entry for the fertile Strymon valley and Thrace; the neighborhood yielded timber for ships, as well as gold and silver. It belonged originally to the Edonians, a Thracian people, and was called, on account of the roads which met here, *Ἐννέα Ὀδοί* ('Nine Ways'). Aristagoras of Miletus, who first attempted to colonize it, was cut off with his followers by the Edonians. The Athenians next tried to gain possession of it. Their first army, amounting to 10,000 men, was utterly cut to pieces at Drabescus, 465 B.C., but their second, under Hagnon, son of Nicias, was successful, 437 B.C. The Thracians were expelled and a new city was built, to which Hagnon gave the name Amphipolis, because it had the river on both sides. Owing to its mixed population, Amphipolis was not friendly to Athens, and in 424 B.C. readily joined the Spartan Brasidas (q.v.). The Athenian general, Cleon, having been sent to recover the city, was defeated and slain in a battle fought near its walls in 422 B.C.; Brasidas also fell in the engagement. Though nominally restored to Athens by the peace of Nicias (q.v.), Amphipolis seems to have remained independent until its surrender to Philip of Macedon. At Amphipolis was situ-

ated the chief mint of the Macedonian kings; under the Romans it was the capital of eastern Macedonia. In the Middle Ages it was called Popolia. Its site is now occupied by a Turkish town, but a few of its ruins are still visible. Consult Leake, *Travels in Northern Greece* (London, 1835), and Heuzey and Daumet, *Mission archéologique en Macédonie* (Paris, 1876).

AM'PHISBÆ'NA (Gk. ἀμφίς, *amphis*, on both ends + βαίνειν, *bainein*, to go). The type genus of a family of degraded, limbless lizards, of the general appearance of snakes or worms, found only in the West Indies and South America. The best known of the 30-odd forms is the sooty or dusky species, *Amphisbæna fuliginosa*. The body is 18 to 24 inches long and nearly the same thickness throughout; head small, eyes small, ears covered with skin, and tail very short. It tunnels under ground, feeding on insect larvæ and worms. As it moves either way with equal ease, rumor gave it two heads, and asserted that when cut in twain the parts would find each other and reunite. Its dried and pulverized flesh was supposed to possess miraculous curative properties.

AMPHIS'SA (Gk. Ἀμφισσα). The official name of Salona, the capital of the Greek nome of Phocis (Map: Greece, D 3). It is situated 31 miles northeast of Lepanto, at the western foot of the Parnassus, a few miles from the site of Delphi. The town lies in a fertile plain and has trade in tobacco and grain. A road runs to the harbor of Itea, 5 miles to the south, on the Bay of Salona. It is on the site of the ancient Amphissa, which was an important post in the ancient wars against Philip of Macedon. Pop., 1896, 5416.

AM'PHITHE'ATRE (Gk. ἀμφιθέατρον, *amphitheatron*, a double theatre, from ἀμφί, *amphi*, around + θέατρον, *theatron*, a place for seeing; hence, a place, of whatever shape, entirely surrounded by seats for spectators). 1. An architectural structure invented by the Romans for exhibiting gladiatorial combats, fights of wild beasts, and other spectacles. (See GLADIATOR.) These contests were at first given in the Circus (q.v.), later, in the Republican period, in the Roman Forum (q.v.), within hastily contrived wooden scaffoldings; in other Italian towns, too, the gladiatorial combats were long given in the Forum. But in 59 B.C., according to Pliny, *Historia Naturalis*, xxxvi, 117-120, Curio, wishing to surpass all his predecessors in the sumptuousness of his shows, erected two wooden theatres, back to back, where dramatic performances were given simultaneously; and when these were over the two theatres were made to revolve and close up. Their tiers of seats inclosed an arena suited for the contests which then followed. This story, however, is regarded by good authorities as the outcome of a false interpretation of the term *amphitheatrum*, common in modern as in ancient times, by which amphitheatre is interpreted as a double theatre. The elliptical shape of the amphitheatre would have been the natural result of holding the gladiatorial combats in the rectangular Forum; the elliptical shape met the two needs of an amphitheatre—that of confining the combatants to a small space, and that of giving every spectator a good view. Perhaps the model was found in the cities of Campania; for Pompeii had an amphitheatre as early as 70 B.C. Cæsar first erected, in 46 B.C., a permanent structure of this kind in wood. Still, combats of gladiators

and wild beasts continued to be given in the Circus and the Forum. In 30 B.C., under Augustus, Statilius Taurus built the first amphitheatre that was partly of stone, in the Campus Martius: it remained the only one in Rome not entirely of wood until the erection of the Coliseum by Vespasian, whose son and successor, Titus, dedicated the edifice in 80 A.D. Even the upper part of the Coliseum itself was originally of wood until the restoration, after a great fire, in 223. The example of Rome was followed by all the cities of any importance throughout the Empire, where the love of bloody sports, so repugnant to the Greeks, spread rapidly. Amphitheatres were erected throughout Italy and Sicily (Verona, Putcoli, Capua, Pola, Syracuse, Pompeii, Tusculum, etc.), Spain (Tarragona, Italica), France (Arles, Nîmes, Bordeaux, Saintes, etc.), England (Silchester, Cirencester), Germany, North Africa (El-Jemm), Asia Minor (Pergamum, Cyzicus), Greece (Corinth, Sparta). The ruins of almost 100 have been found. Those that are well preserved are among the finest remains of Roman architecture. Whenever possible, the natural incline of a hillside was utilized to save expense, by cutting part of the seats in the natural rock (so, for example, at Pompeii). But in most cases the amphitheatres were entirely free-standing structures of elliptical shape, built of brick, stone, and marble (so at Rome and Verona). The Coliseum (or Colosseum) at Rome seated 87,000 persons, according to a document of the fourth century; but Hülsen believes that there were that number of running feet of benches and that only about 50,000 persons could be seated. Its greatest length is 616 feet, its greatest breadth 510 feet. Several others are of about the same size, as, for example, those at Pozzuoli, Capua, Italica, Verona, Tarragona, El-Jemm. The exterior wall of the Coliseum, nearly 160 feet high, was divided into four stories; the three lower ones consisted of series of arches framed by engaged columns and entablatures, the lowest, Tuscan-Doric; the second, Ionic; the third, Corinthian, according to a common Roman usage. The upper story (added, as already stated, in 223, to replace the original wooden superstructure), was broken merely by windows and pilasters, as well as by the high masts to support the awnings. The lowest arcades served as entrances; four, unnumbered, were main entrances; 76 were numbered entrances leading to the staircases. The arcades of the second and third stories opened on the covered promenade galleries, passageways, and staircases; between each pair of columns stood a statue. On the outside of the topmost story or attic is a row of consoles, in which are sockets for the masts that supported the great awnings (*velaria*), which protected the spectators from the sun when necessary. How these were stretched we do not positively know; it may well be that they covered only the seats, being supported at the inner end by masts on the podium or just behind it. Other amphitheatres vary, from two stories at Nîmes to three at Verona, three and a basement at Pola, and four at El-Jemm. The arrangements were as follows at the Coliseum: There were four tiers, or stories, of seats, forming the *cavea* and corresponding to the four external stories. Under them were five concentric corridors communicating with the staircases; and the raking vaults that support the seats and staircases are one of the most superb and impressive parts of

the structure. The interior of the *cavea*, or place for the spectators, had three sections: the lower one, or *podium*, with the seats and thrones of honor; the *mæniana*, or stepped tiers of seats, occupying the height of two stories; and the *porticus*, or portico. The podium was a platform, about 12 feet high, immediately above and around the arena, reserved for the Emperor and other persons of greatest distinction, including the Senators, and crowned with special boxes and balconies. The *mæniana* were in two horizontal sections, where the spectators could be seated according to their rank; the first 14 rows behind and above the podium were given to the equites, or knights (see EQUESTRIAN ORDER), the rest to inferior citizens. Behind and above the second *mænianum* there was a wall 16 feet high, pierced by windows and doors leading to a corridor. On this wall rested a Corinthian colonnade, which, together with the exterior wall of the whole structure, carried a flat roof. In the portico thus formed were the seats of the women; on the flat roof of the portico was standing-room for the lowest portion of the community. Each row of seats was numbered and the places marked. A large *personnel* kept order. The central space, measuring 280 by 176 feet, in which the contests took place, was called the *arena* (q.v.). Under it was an elaborate system of substructures, not only for under-draining, but also for housing men and animals, with wells, windlasses, and inclined planes for hoisting the animals, and other means of communicating with the arena—such as the *vomitoria*—and with the outside—such as passages to the imperial palaces. Especially interesting is a row of beasts' dens following the oval outline of the arena above. The seats of the Coliseum are not preserved; in the amphitheatres at Verona and Nîmes they have been, and both of these, as well as that at Arles, have been more or less restored and are often employed to-day for public spectacles. Neither is the entire circuit of outer wall as well preserved in the Coliseum as at these cities or at Pola. At Capua and Pozzuoli the substructures of the arena are in perfect condition.

2. A hall for public lectures or demonstrations in an institution of learning, having the seats in successive curved tiers, the room being usually of semicircular plan or approximating this: a famous example is the lecture-hall of the Ecole des Beaux-Arts at Paris, with superb mural decorations by Delacroix. In hospitals and schools of medicine and surgery the principal operating-room or room for surgical and anatomical demonstrations is often called the amphitheatre.

Consult: Friedländer, *Sittengeschichte Roms* (Leipzig, 1881-90); there is a much later edition, the eighth about 1912, translated in four volumes by Magnus, Freese, and Gough under the title, *Roman Life and Manners under the Early Empire* (London, 1910-13); De Ruggiero, *Dizionario epigrafico* (Rome, 1887-93); Middleton, *Remains of Ancient Rome* (London, 1892); Daremberg and Saglio, *Dictionnaire des antiquités grecques et romaines* (Paris, 1881-92); Durm, *Die Baukunst der Römer* (Darmstadt, 1887); Guadet, *Théorie de l'Architecture* (Paris, 1904); Baumeister, *Denkmäler des klassischen Alterthums* (Munich, 1885-88); Lanciani, *The Ruins and Excavations of Ancient Rome* (New York, 1897); Platner, *The Monuments and Topography of Ancient Rome* (New

York, 1911); Babucke, *Geschichte des Kolosseums* (Königsberg, 1899).

AM'PHITRI'TE (Gk. Ἀμφιτρίτη). The daughter of the sea-god Nereus and of Doris, the wife of Poseidon, and mother of Triton. Amphitrite was worshiped only in company with Poseidon and appears with him on many painted votive tablets from Corinth. Her marriage with Poseidon forms the subject of a fine Roman marble relief, in Munich, representing her as drawn in a car by Tritons, surrounded by Nereids and sea monsters. She appears with Poseidon also in representations of assemblies of the gods.

AMPHIT'RUO, or **AMPHIT'RYON**. A comedy or burlesque by Plautus, based on the legend of Jupiter and Alceme, Amphitryon's wife. Its Greek prototype is unknown. It has been well edited by Palmer (London, 1890).

AMPHIT'RYON, or **AMPHIT'RUO** (Gk. Ἀμφιτρύων, Lat. *Amphitryo* or *Amphitruo*). Legendary son of Alcæus of Tiryns. He accidentally killed Electryon, father of Alceme, King of Mycenæ, for which deed he was expelled from Mycenæ. He took refuge in Thebes with his wife Alceme. Here she became the mother of Heracles by Zeus and of Iphicles by Amphitryon. Amphitryon's tomb and the ruins of his house were shown in Thebes in the days of Pausanias. See **AMPHITRUO**.

AMPHITRYON. 1. A comedy of Molière, produced in 1668, and taken from that of Plautus. 2. An opera by Grétry, the words being by Sedaine, produced in Paris, 1781. 3. A comedy by Andrieux, presented in 1782. There are also operas with this title in Italian, Portuguese, and Swedish.

AMPHITRYON, OR THE TWO SO'CIAS. A comedy by Dryden, with musical portions, produced in 1690. It was adapted from Molière's play.

AM'PHIU'MA (corruption from Gk. ἀμφί, *amphi*, on both sides + πνεῦμα, *pneuma*, breath, referring to the gill). A genus of tailed amphibia that loses its tadpole gills, but retains in the adult stage one gill slit on each side of the neck; hence it is half-way between the mud-puppy (*Necturus*), which retains its external gills throughout life, and the newts, which retain neither gills nor slits. See **CONGO-SNAKE**.

AM'PHORA (Gk. ἀμφορεύς, *amphoreus*, Homeric ἀμφιφορεύς, *amphiphoreus*, from ἀμφί, *amphi*,

AMPHORÆ.

on both sides, and φέρειν, *pherein*, to carry). Among the Greeks and Romans, a large vessel,

usually made of clay, with a narrow neck and two handles. Many amphoræ ended in a sharp point below for insertion in a hole in a stand or in the ground. The pointed form of the amphora was used for preserving wine and oil, as in the Panathenaic amphoræ. A peculiar tall and slender form was the Loutrophoros, which was used for water for the bridal bath and to mark the graves of the unmarried. The amphora appears in a great variety of forms among the Greek painted vases. Amphora was also a liquid measure in Rome, equivalent to 26.26 litres, or about seven gallons. Among the Romans wine, oil, fruits, nuts, and other small objects were transported regularly in amphoræ, even across seas, so that the carrying capacity of a vessel was reckoned at so many hundred or thousand amphoræ. The name was also given sometimes to the Attic metretes—equal to about 11 gallons. In modern times *anfora* is the name of a wine measure in Venice. See VASE.

AM'PLIFICA'TION (Lat. *amplius*, large + *facere*, to make). A term in rhetoric, meaning that an idea, an opinion, or an inference is presented to the mind accompanied by accessory circumstances. Its aim is to make a powerful and vivid impression on the reader or the hearer. It is generally produced by breaking up general statements into particulars, by employing some form of repetition, by adding illustrative details, and by quotation. This is called also the dynamic method of rhetoric, and is especially effective in addressing juries or popular assemblies. The most remarkable instance of amplification in English oratory is to be found in Daniel Webster's thrilling address to the jury in the famous case of the shocking Knapp-Crowninshield murder (1830). Consult Genung, *The Working Principles of Rhetoric* (Boston, 1901).

AM'PLITUDE (Lat. *amplitudo*, from *amplus*, large). In astronomy, the angular distance of a heavenly body at the time of its rising or setting from the eastern or the western point of the horizon. When the sun is in the equator (i.e., at the time of either equinox), it rises exactly east and sets exactly west, except for the small effects of refraction (q.v.). Therefore, at these times the amplitude is zero. Its amplitude is at the maximum at midsummer and again at midwinter; and that maximum depends upon the latitude of the place, being $23\frac{1}{2}^\circ$ at the equator and increasing to lat. $66\frac{1}{2}^\circ$, where it becomes 90° . The amplitude of a fixed star remains constant all the year round.

AMPTHILL, ämt'hill, FIRST BARON. See RUSSELL, ODO WILLIAM LEOPOLD.

AMPUL'LA (dimin. of *amphora*, or rather of the older form *ampora*; in Greek, *λήκυθος*, *lēkythos*). Apparently a generic term among the ancient Romans for any little bottle of earthenware, glass, or other material, used for holding liquids, especially oil for use after the bath, or ointments; a common form was that of a tall, slender, narrow-necked vessel with a handle. The *ampulla Remensis* (the holy vessel, Fr. *la sainte ampoule*) was the name of that famous vessel in which was contained the unguent (believed to have been brought by a dove from heaven) that anointed Clovis (q.v.), King of the Franks, at Rheims in 496 A.D., and with which every succeeding monarch of France, down to Louis XVI, was anointed at his coronation. This ampulla was shattered, along with a great many more valuable things, at the Revolution of 1789; but a fragment of it was preserved by some de-

vout royalist, and handed over at the restoration to the Archbishop of Rheims. Curious to say, a little of the miraculous substance still remained, and, being mixed with oil, was used to anoint Charles X in 1825.

AM'PUTA'TION (Lat. *amputare*, to lop off, cut around). The cutting off of a part which, by its condition, endangers the safety, health, or comfort of the patient. Injury, gangrene, and malignant growths are the most frequent causes for amputation. The amputation of a limb was in ancient times attended with great danger of the patient dying during its performance, as surgeons had no efficient means of restraining the bleeding. They rarely ventured to remove a large portion of a limb, and when they did so, cut in the gangrened parts, where the vessels would not bleed; the smaller limbs they chopped off with a mallet and chisel; and in both cases had hot irons at hand with which to sear the raw surfaces, boiling oil in which to dip the stump, and various resins, mosses, and fungi, supposed to possess the power of arresting hemorrhage. Some tightly bandaged the limbs they wished to remove, so that they mortified and dropped off; and others amputated with red-hot knives, or knives made of wood or horn dipped in vitriol. The power of controlling hemorrhage was obtained by the invention of the ligature by Paré in the sixteenth century, and by the invention of the tourniquet (q.v.) in 1674 by a French surgeon, Morell. The ancient surgeons endeavored to save a covering of skin for the stump, having the skin drawn upward by an assistant before making the incision. In 1679 Lowdham, of Exeter, suggested cutting semicircular flaps on one or both sides of a limb, so as to preserve a fleshy cushion to cover the end of the bone. Both these methods are now in use, and are known as the "circular" and the "flap" operations; the latter is most frequently used.

A "flap" amputation is performed thus: The patient being placed in the most convenient position, an assistant compresses the main artery of the limb with an elastic band or a tourniquet. Another assistant supports the limb. The surgeon with one hand lifts the tissue from the bone, and transfixing with a long narrow knife, cuts rapidly downward and toward the surface of the skin, forming a flap; he then repeats this on the other side of the limb. An assistant now draws back these flaps, and the knife is carried round the bone, dividing any flesh still adhering to it. The surgeon now saws the bone. He then seizes the larger blood vessels with artery forceps and ties them with ligatures. All the vessels being secured, after removal of the tourniquet, the flaps are stitched together and a suitable dressing applied. With the advent of antiseptic methods and anæsthetics, and a better understanding of the processes of tissue repair, the necessity for amputation has greatly diminished, particularly in military surgery. Modern high velocity missiles are aseptic, and often bore a clean hole through a bone without shattering it; and the immediate application of an emergency dressing or "first aid packet" insures prompt healing.

AM'PYX (Gk. *ἄμρυξ*, a woman's head-band, a snood). A characteristic Ordovician genus, comprising about 50 species, restricted to North America and Europe, of blind trilobites, in which the central portion (*glabella*) of the head shield is often armed with a cylindrical or angu-

lar sharp spine, the length of which in many species exceeds that of the entire body. Long curved spines are also developed upon the genal angles or posterior corners of the sides of the head shield. The thoracic portion of the body is short, consisting of five or six segments, and the tail shield is triangular and unarmed. For illustration, see TRILOBITA.

AMRAPHEL, äm'ra-fél. A King of Shinar, i.e., Babylonia, who, according to Genesis xiv, invaded Palestine, together with Chedorlaomer, King of Elam, Arioch, King of Ellasar, and Tidal, King of Goiim. There is no account of this expedition in Babylonian literature, and none of the names has been identified with certainty. But it does not seem improbable that the account of such an expedition has been drawn from Babylonian sources. The names of the four kings inspire confidence. Ed. Meyer in 1884 called attention to the genuinely Elamitish character of the name Chedorlaomer (Kudur Lagamar); and Schrader three years later identified Amraphel with Hammurabi. Dhorme has suggested that the Hebrew form of the name is due to the last sign *bi* having been written *bi*, as sometimes happens, and this sign has also the value of *pi*. Another manner of writing it was Hammurapi. If the expedition is historical, it must have taken place before the thirtieth year of the King's reign. The discovery by King that the second Babylonian dynasty was at least in part contemporaneous with the first has reduced his date, which may now be placed with some degree of confidence in 2124–2081 B.C. It still remains doubtful whether any light is thrown by this identification on the historic character or date of Abraham. See HAMMURAPI; ARIOCH; CHEDORLAOMER; and consult Dhorme in *Revue Biblique*, p. 205 (1908).

AMR IBN AL-AS, äm'r 'b'n äs (died 663 A.D.). An Arabian general. He was one of Mohammed's disciples, though before his conversion in 629 A.D., a furious opponent. Chiefly to him were the Prophet's successors indebted for the conquest of Syria. In 640 he led 40,000 men into Egypt and within three years effected the subjugation of the country. In 642, after a siege of 14 months, he took Alexandria, losing 23,000 men. In the struggle between Ali and Muawiya for the caliphate, Amr sided with the latter and to him was due the triumph of the Umayyads over the Alids. From 661 to his death he was Emir of Egypt and by his wise administration facilitated the conversion of the country to Islam. He is credited with projecting a canal to unite the Mediterranean and Red seas and is charged with causing the destruction of the famous library at Alexandria; but the charge may well be dismissed, as it was not advanced until six centuries after his death. Consult Sir William Muir, *The Caliphate* (London, 1891).

AMR IBN KULTHUM. A famous Arabic poet whose chief work was given a place in the Muallakat (q.v.). He lived in the sixth century A.D. and was head of the Taghlib tribe. His mother was Laila, the daughter of a poet, al Muhallil. Because of an insult to her he slew Amr ibn Hind, one of the Lahmid rulers at Hira in 570. Consult Rothstein, *Die Dynastie der Lahmididen in al Hira*, p. 100 (Berlin, 1899).

AMRITSAR, üm-rit'sär (*Umritsar*). A city of the Punjab, India, in lat. 31° 40' N. and long. 74° 45' E., on the Sindh, Punjab, and Delhi Railway (Map: India, B 2), 330 miles by rail

northwest of Delhi. It is the capital of a district of about 1600 square miles area, with a population of over 1,000,000, and of a division with an area of 5354 square miles and a population of about 2,750,000, both of the same name. Amritsar is, next to Delhi, the richest and most prosperous city in northern India, being connected with Lahore, the capital of the Punjab, distant 36 miles to the west, by a canal, and possessing considerable manufactures of cotton, silks, shawls, carpets, etc., and carrying on a large trade. It is the religious centre of the Sikhs—a distinction which, along with its name, it owes to its "pool of immortality," on an islet of which stands the marble Darbar Sahib, the chief temple of the Sikh faith, maintaining an establishment of over 500 priests and founded in 1574 by the minor apostle Guru Ram Das. Amritsar is a favorite pilgrim resort; and it was the place where, perhaps to bind the Sikhs more firmly, was signed the treaty of 1846, providing for the cession to the British of the territory between the Beas and the Sutlej. The huge Govindgarh, or fortress, built in 1809, is the most prominent feature of Amritsar. The town has a good water supply in connection with the Bari Doab Canal. It is a municipality of the first class and is the seat of a native college. Pop., 1901, 162,429; 1911, 152,756.

AMRU-'L-KAIS, äm'rōo-'l-kīs' (written also **IMRU'LKAIS** and **AMRULCAIS**). By many esteemed the greatest of Arabian poets. He was the son of Hujr and belonged to the South Arabian family of the Kinda. His life falls in the sixth century. One of his ancestors established a principality in Nejd; but their power dwindled more and more, and Amru-'l-Kais struggled in vain to recover it. About 530 he was invited by Justinian to Constantinople, where he spent many years. Before leaving he left his daughter and treasure with the Jewish ruler Samu'al ben Adia, who preferred to have his son die rather than to hand over what had been intrusted to him to Harith, the Ghassanid. He was made Phylarch of Syria by Justin II and is said to have died in Ancyra from poison sent him because he had seduced a princess in Constantinople. He was the author of the first poem in the collection called the Muallakat (q.v.). See Sir William Jones, *The Moallakat* (London, 1782); W. Ahlwardt, *The Diwan of the Six Ancient Arabic Poets* (London, 1870); G. de Slane, *Le divan d'Amro'l Kais* (Paris, 1837); F. Rückert, *Amrilkais, der Dichter und König* (Stuttgart, 1843).

AMRUM, äm'rōom, or **AMROM**, äm'röm. One of the north Frisian Islands, on the west coast of Schleswig, Germany, south of the Sylt, an island of the same group (Map: Denmark, B 4). The island is about 6 miles long and has an area of about 8 square miles. On the west side are high sand-dunes. It is unproductive. The fishing and oyster gathering were formerly considerable, but have dwindled away. Except for a little grazing land, the island is important only as a watering place. Pop., 1900, 900.

AMSDORF, äms'dôrf, NIKOLAUS VON (1483–1565). A German Protestant reformer, an early and determined supporter of Luther. He was born at Torgau, Dec. 3, 1483, educated at Leipzig, and was among the very first students of the university at Wittenberg (1502), where he afterward taught philosophy and theology. He was with Luther at the Leipzig disputation (1519) and the Diet of Worms (1521) and was

in the secret of his Wartburg seclusion. He assisted the first efforts at reformation in Magdeburg, Goslar, and Einbeck. He was active in the Smalkald debates and spoke strongly against the bigamy of the Landgrave of Hesse. He was made Bishop of Naumburg in 1542, but was driven away in 1547 by the Imperial party during the Smalkaldic War, and took part in founding the University of Jena. In 1552 he became superintendent at Eisenach, where he died unmarried, May 14, 1565. He superintended the publication of Luther's works and opposed Melancthon on the separation of the High-Lutheran party. He is the author of the familiar dictum, "good works are prejudicial to salvation," by which he meant those works which man thinks in themselves certain to save his soul. For his biography, consult: T. Pressel, *Leben und ausgewählte Schriften der Väter und Begründer der lutherischen Kirche* (Elberfeld, 1862); also Meurer, vol. iii (Leipzig, 1863).

AMS'LER, SAMUEL (1791-1849). A prominent line engraver of the German school, born at Schinznach, Switzerland. After preliminary training with Lips at Zürich, he studied at the Munich Academy under Hess. Proceeding to Rome in 1816, he came under the influence of Thorwaldsen and Cornelius. His technique, modeled upon that of Dürer and Marcantonio, is powerful and sure, and he is very faithful to the originals followed. His chief works include engravings of "Alexander's Triumphal Procession" by Thorwaldsen, Dannecker's "Christ," and Overbeck's "Triumph of Religion and the Arts." He is especially known as an engraver of the works of Raphael.

AM'STERDAM (earlier *Amstelledamme*, the dam or dyke of the Amstel). The chief city of the Netherlands, situated at the confluence of the Amstel with the Y or Ij (pronounced eye), an arm of the Zuider Zee (Map: Netherlands, C 2). Amsterdam has an area of 18½ square miles and has the shape of a semicircle, its diameter being the Y or Ij. The town is further cut up into six other concentric zones by canals. Other canals (or *grachten*) split up the city into 90 islands, crossed by about 300 bridges. Along these, rows of trees are planted, making the finest avenues of the city, of which the Singelgracht, 7 miles long, the Prinsengracht, the Keizersgracht, and the Heerengracht, which is 147 feet wide, are the most handsome. The bridge over the Amstel, the Hoogesluis, has 32 arches, is 620 feet long, and affords a fine view of the city and harbor. In the southern part of the city some of the canals have been drained and filled in to form broad streets, as also a portion of the Y, which now is the site of the central railroad station. The great square of Amsterdam is the so-called Dam, getting its name from its position on the west side of the old wall that is popularly believed to be the site of the city's first foundations. Around it are the royal palace, the exchange, and the Nieuwe Kerk (New Church), and from it as a centre radiate the principal streets and street-car lines of the city. Here is the monument to the loyalty of Holland during the Belgian revolution of 1830-31. It is called *Het Metalen Kruis* ('the metal cross'), a reminiscence of the commemorative war medals then issued. Here, too, for one week in summer the boys of the city have the privilege of playing, because, it is said, in 1622 some boys here discovered a conspiracy of the Spaniards against the town.

Many of the buildings of the city are in the Dutch brick style of the seventeenth century. They are all built on piles, because of the loose, shifting nature of the sandy soil. It is necessary to go down from 14 to 60 feet before a firm foundation can be secured. An interesting part of the city is the Jewish quarter, the Jews having formed an important element of the inhabitants from the middle of the seventeenth century. In this part of the city Rembrandt lived and Spinoza was born.

Among the ecclesiastical structures of the city, the Nieuwe Kerk (New Church), or St. Catharine's Church, a cruciform basilica in the late Gothic style, erected in 1408-78, is the finest. The interior contains interesting remnants of old stained glass, a beautifully carved pulpit, executed by Vinckenbrinck in 1649, and monuments to Admiral de Ruyter and the famous Dutch poet Vondel. Here the Dutch sovereigns are enthroned. The Oude Kerk (Old Church), or St. Nicholas's Church, a Gothic structure dating from about 1300, is noticeable for handsome stained-glass windows of the sixteenth and seventeenth centuries, and contains several monuments to naval heroes. In the Jewish quarter the synagogue of the Portuguese Jews is interesting, as being built in imitation of Solomon's Temple; it also boasts a considerable number of costly vessels. The handsomest secular edifice is the royal palace, built by Jacob van Kempen in 1648-55 as a *stadthuis*, or town hall, a massive structure resting on a foundation of 13,659 piles, and surmounted by a round tower rising 187 feet from the base and commanding an extensive view. The gilded vane of the tower represents a merchant vessel. The building is adorned with numerous statues, bas-reliefs, and mural paintings, the interior profusely decorated by eminent Dutch sculptors (especially Artus Quellinus) and painters of the seventeenth century. All the principal apartments are lined with white Italian marble and richly adorned with sculptures, especially the magnificent reception room, an apartment of great splendor, and one of the largest halls in Europe, measuring 120 feet in length, 57 feet in width, and 100 feet in height. The building was converted into a royal residence in 1808, being presented by the city to King Louis Bonaparte. The Rijks-Museum, a stately edifice, erected in 1877-85, in the early Dutch Renaissance style, with various Gothic and Romanesque characteristics, is richly adorned with the work of Dutch architects, painters, and sculptors, including allegorical bas-reliefs, encaustic paintings, and figures in colored tiles, symbolic of the Dutch towns and provinces. The museum contains one of the most important collections of paintings and engravings in the world. The works of Rembrandt are especially well represented, and besides his most celebrated work, the so-called "Night Watch," include "De Staalmeesters" ('Syndics of the Cloth Hall'), "The Jewish Bride," and one of his most finished portraits, that of "Elizabeth Bas." Van der Helst's "Banquet of the Civic Guard," is another highly prized gem of this collection, which abounds in select paintings by the most famous Dutch and Flemish masters. The museum further includes an interesting department showing the development of ecclesiastical art in the Netherlands from the Carolingian period to the seventeenth century, and a valuable collection of objects of industrial art. In the

Fodor Museum may be seen 161 admirable paintings by modern Belgian, Dutch, and French artists; about 300 drawings by old masters, and about 100 engravings. The Six Gallery is a small but extremely valuable collection of paintings by the old Dutch masters, while the modern Dutch artists may be studied to great advantage in the Municipal Museum, containing about 200 select specimens.

Amsterdam has long been renowned as a centre of learning. The school known as the *Athenæum Illustre* of Amsterdam, which was founded in 1632, in 1877 was reorganized as the University of Amsterdam. Its library now has 148,000 volumes, including the Rosenthal collection of 8000 works on Jewish literature. It is rich in manuscripts and original letters. Amsterdam possesses excellent facilities for medical study; her hospitals are famous. Other educational institutions are state, normal, industrial, and commercial schools, the National Academy of Arts, the Royal Academy of Sciences, the Royal Dutch Geographical Society, a school of navigation, and a municipal school for primary teachers, and a school of acting. The Botanical Gardens rank among the foremost in Europe, and are equipped with a library and ethnographical museum. They were established by the society *Natura Artis Magistra*, founder also of the Zoölogical Gardens. There are numerous other institutions of learning and scientific societies, the most remarkable of the latter being the *Maatschappij tot nut van't Algemeen*, or Society for the Public Welfare, which has spread over all Holland. It was founded at Edam in 1784 and moved to Amsterdam in 1787. It aims at bettering the education and culture of the people and strives toward this end in every possible way.

Amsterdam has six theatres, one of them owned by the city. Prominent among the benevolent institutions are the various orphan asylums, one of which, the Diaconic Asylum, erected in 1889, has about 1200 inmates.

For centuries Amsterdam has been the centre of Dutch industry, and its diamond-polishing factories are the most extensive in the world. These are exclusively in the hands of the Portuguese Jews and employ upward of 12,000 workmen. Machinery manufacture, ship building, and iron molding are important industries, and there are large refineries for borax and camphor, producing over 22,000 tons annually. The preparation of rice for the market amounts to 23,000 tons yearly, and besides, there are large glass-blowing establishments and many breweries and lumber mills. Other manufactures are articles of gold and silver, silk, porcelain, and carpets, cordials, chocolate, tobacco, leather, dye-stuffs, astronomical instruments, chemicals, cobalt blue, stearine and sperm candles, and sailcloth.

Amsterdam's commercial importance has advanced rapidly since 1865. Since 1876 the short North Sea Canal has been in operation, running to an artificial harbor of 250 acres on the North Sea. The celebrated North Holland Canal (1825) has been supplanted by it for most of the sea traffic. The Merwede Canal to Gorinchem was built in 1892. Within the city much attention is paid to dredging and improvement of the canals centring to the north in the three islands, near which are the docks of the various steamship lines that connect the city with all the great ports of the world. Here, too, are

the naval docks and stores, a vast system of docks for merchant shipping, granaries, and railway terminals for the reception of coal and iron ore, raw materials, etc. Another canal connects Amsterdam with Utrecht. There is a floating dry dock on the north bank of the Y for ships of 4000 tons and of 16 feet draught, while another dock of twice the size has been constructed. Amsterdam had need of such improvements, for her percentage of shipping entering Holland was 18.8 in 1889 and 6.66 in 1899; by 1911 it had risen to 13.5. In 1911 the total tonnage, entered and cleared, was 3,411,000.

The chief trade is with the Dutch East Indies, and the imports are mainly tropical products, such as raw sugar, Java and Sumatra tobacco, coffee from Brazil and Java, tea, chemicals, cinchona, and other drugs, lumber, and rice. Other articles of import are machinery and manufactured articles, wheat, glassware, and petroleum. In addition to the colonial products—coffee, tobacco, drugs, and rice—Amsterdam exports such Dutch products as cheese, beer, and manufactured articles mentioned above.

Amsterdam is the chief financial centre of the Netherlands. Its stock exchange, once the centre of the world's banking transactions, is still of considerable importance. There are many other financial and commercial institutions, and the city is the seat of the Bank of the Netherlands established in 1814 on the model of the Bank of England. It has full control of the country's paper money. It is the successor of the famous Bank of Amsterdam, founded in 1609 and dissolved in 1796, which played so important a rôle in the history of banking.

Amsterdam has a complete network of communications with the interior through railway and steamship lines, while various electric lines traverse her streets. There is also a suburban steam railroad.

Amsterdam's new method of fortification merits some attention. In 1870 the old walls had all been razed, and since then a system of dikes and sluices has been devised whereby the surrounding country may be flooded; so that now there is only one fort, that at the entrance to the harbor.

Upward of one-fifth of the population of Amsterdam are Catholics, and the Jews form nearly one-ninth. There are, besides, many Germans. Pop., 1879, 316,000; 1900, 510,900; the census of Dec. 31, 1909, showed 566,131 inhabitants, and the estimate of Dec. 31, 1911, 580,960.

History. We first hear of Amsterdam in the thirteenth century. Giesebrecht II of Amstel built a castle there in 1204 to protect the town, and in 1240 his son, Giesebrecht III, for the purpose of keeping out the sea, constructed a dam, which gives the town its name. The count of Holland, Floris V, gave the city free trade with his territories, and Amsterdam became part of the County of Holland in 1347. From now on the town increased rapidly, and, though devastated by fire in 1421, it was influential enough to obtain from Maximilian I the right of bearing the imperial crown as its crest. After the war of independence, when Antwerp succumbed to the Spaniards, Amsterdam became the chief commercial centre of the North; and after the foundation of the Dutch East and West India companies, in the first quarter of the seventeenth century, with their headquarters in the city, it attained still greater

prosperity. Even the wars with England in 1652-64 and 1665-67 did not long hinder its progress. The decline of the city came in the latter part of the eighteenth century, as a result chiefly of the war with England of 1780-84 and the alliance with France. Its commerce disappeared entirely after it became a part of the French Empire in 1810, only to be revived in the second half of the nineteenth century by the building of the great canals to the sea and to the Rhine system.

AMSTERDAM. A barren islet of volcanic origin, in the Indian Ocean, situated in lat. 37° 52' S. and long. 77° 37' E. It covers an area of about 25 square miles and, together with the adjacent island of St. Paul, forms a dependency of Mauritius. Both islands lie about midway between the Cape of Good Hope and Tasmania. It was discovered by Van Diemen in 1663, and came under French control late in the nineteenth century.

AMSTERDAM. A city in Montgomery Co., N. Y., 33 miles by rail northwest of Albany; on the Mohawk River, the Erie Canal, and the New York Central and Hudson River and the West Shore railroads (Map: New York, F 3). Prominent features include St. Mary's Catholic Institute, the Fort Johnson Museum, homes for aged women and children, and two hospitals. Amsterdam has factories producing knit goods, carpets, rugs, wagon springs, linseed oil, brooms, silk gloves, paper boxes, etc. First settled about 1778 and known as Veedersburg until 1804, Amsterdam was incorporated as a village in 1830, and as a city in 1885. Pop., 1890, 17,336; 1900, 20,929; 1910, 31,267.

AMSTERDAM, UNIVERSITY OF. A Dutch university founded by the city of Amsterdam in 1632 as the Athenæum Illustre, in 1867, after a checkered existence, it was reorganized, and in 1877 was raised to the dignity of a royal university, ranking with those of Leyden, Groningen, and Utrecht. In 1911-12 it had 1130 students and an income of over 600,000 florins. Its faculties include law, medicine, mathematics and science, arts, and theology. Its administration is in the hands of a "Curatorium" of five members and a secretary, chosen by the crown. The professors form the Senate, with a Rector Magnificus as their head, and a Secretary of the Senate. The library is large and includes a number of special collections, particularly in Hebrew and on medicine.

AMU, à-mōō', or **AMU DARYA**, à-mōō' dār'yä (ancient OXUS). A large river of Central Asia, which has its source in the Pamir plateau between India and Bokhara, flowing thence northwest in the Aral Sea. In its course through the mountains it is joined by the Surkhab from the region of the Alai and Trans-Alai Mountains, by the Kafirnahan and Surkhan from the Hazrat Sultan chain, and by numerous smaller streams, but after emerging from the outer slopes it receives no important tributaries. The Zerafshan on the north and the Murghab on the south, which formerly drained into the Amu, now lose their waters in the desert regions at some distance from its bed. It is navigable by light-draught boats for nearly one-half of a total length of about 1600 miles, but its chief importance is as a reservoir for irrigation rather than as a commercial highway. Some geographers assert that the course of the Amu has been changed within historic times, holding that, as late as the first half of the six-

teenth century, it flowed into the Caspian Sea, and that the course has been changed twice to the Aral Sea. Consult: Sir H. C. Rawlinson, "The Road to Merv," in the *Proceedings of the Royal Geographical Society*, new series, vol. i, p. 161 (London, 1879); Krapotkin, "The Old Beds of the Amu-Daria," *Geographical Journal*, vol. xii (London, 1898).

AMUCK', or **AMOK'**, RUNNING (Javanese *amook*, to kill). A practice in Java among those in whom a ferocious madness is produced by long use of opium. The sufferer rushes abroad, armed with some weapon, usually a *kris* or large dirk, striking indiscriminately at all whom he encounters. When one is seen to start on his madness, the people cry "amok" and immediately hunt the maniac to death. Probably in many cases this is deliberate on the victim's part, as a means of suicide.

AMULET (Lat. *amuletum*, from Ar. *hamalet*, that which is suspended). Any object worn as a charm, or sometimes placed in a building to ward off evil. Amulets originated at an early date in the Orient, and regard for them is among the earliest superstitions of the Babylonians and Egyptians. The magical formulas connected with them are frequent in early Babylonian texts. Their religion included belief in a multitude of spirits present everywhere and influencing every act. Hence the necessity of preserving the house, property, and person by images and formulas, and these were from the beginning connected with medicine. Not only among the ancient Egyptians but also among many savage peoples of to-day, a large proportion of the forms of ornamental art were originally amulets, i.e., possessed of magical efficiency. (See ANIMISM, FETISH.) Even the monotheistic Hebrews were not free from the taint, and the so-called *phylacteries*, with passages from sacred writ, were an adaptation of these magical beliefs. The Greeks and Romans inherited the same beliefs in a modified degree. Perhaps the most general evil to be guarded against by amulets at all times was the Evil Eye, which is still so firmly believed in throughout Latin countries. There were various classes of amulets. First came certain precious or other stones supposed to possess mysterious helpful properties: agates for spiders' and scorpions' stings, and for protection against thunderstorms; diamonds for melancholy; jasper for the tongue-tied and to bring on rain; amethyst against drunkenness, and, with certain inscriptions and figures, as antidotes to poisons, hail, and locusts, etc. One of the most permanent of all such beliefs is that in the beneficial effects of coral. Metals, also, and plants, were used as amulets. So were various parts of certain animals, such as hyena teeth or marrow, wolves' fat, rats' ears, foxes' tongues, and bats' heads. Most efficacious of all are the teeth of different animals. After these natural objects come artificial ones. A large proportion of ancient jewelers' work was undoubtedly made in connection with the wearing of amulets, especially necklaces, rings, bracelets, earrings, and other pendants. Other ways of carrying amulet material was in gold balls or *bullæ*, or in sachets. The formulas carried were usually inscribed, not on paper, but on some durable substance—metal, terra cotta, ivory, precious stones. Trinkets of every variety and shape—crescents, disks, pendants—were hung about the necks of children and adults as charms; and

few went without them. Figures of gods and genii had magic virtue as well; so did verbal formulas. (See ABRACADABRA, and ABRAXAS.) Many of such tiny images are found on necklaces. Anchors and horseshoes, heads and figures of animals, votive hands and feet, thunderbolts, vases, and many other objects, all had their specific values. The amulets not only were suspended around the neck, worn in jewelry, and sewed in the clothing, but also were affixed to furniture and walls, painted or carved on doors and walls, and buried in the ground. They even followed the deceased to his grave. Christianity was as unable as Judaism to eradicate the practice; so it sought to mitigate it by legislation and by offering devotional substitutes in the form of sacred relics or formulas from the Bible. These substitutes were carefully distinguished from the heathen amulets which the clergy were forbidden in the fourth century to make, under pain of deprivation of holy orders, and the wearing of which was solemnly condemned by a council in 721. But in the East the practice still flourishes, as well as in parts of southern Europe. Consult King, *History of Precious Stones and Gems* (London, 1873), and Kunz, G. F., *The Curious Lore of Precious Stones* (Philadelphia, 1913).

AMUNDSEN, ä'mün-sen, ROALD (1872—). A Norwegian explorer, born at Borge, Norway. He was educated for the naval service of Sweden-Norway, and became a second lieutenant. In 1901 he made observations on the East Greenland current which were considered valuable. He was permitted to join the *Belgica* expedition to the Antarctic in 1897-99, and was first officer of the ship throughout that expedition, which explored the region west of Graham Land. He sailed from Norway, June 17, 1903, in the ship *Gjøa*, for the purpose of relocating the position of the north magnetic pole to the north of the American mainland and making a magnetic survey of that region. Sir James C. Ross, in 1831, had fixed the position of the magnetic pole on the west coast of Boothia. Amundsen made his headquarters on the southeast side of King William Land, and, by many excursions, he was able to prove that the north magnetic pole has no immovable and stationary position but in all probability is in continual movement. His numerous observations during 19 months were taken to Norway, where their study is not yet completed. Captain Creak, the British authority on terrestrial magnetism, wrote in 1906 that years would elapse before the observations would be in form to yield the definite information expected.

During this work Lieutenant Hansen charted the east coast of Victoria Land, which had never been surveyed, as far north as the seventy-second parallel. The land formerly seen by Dr. Rae at the south end of Victoria Strait proved to be a group of over 100 small islands. The feature of Amundsen's work, however, which excited most general attention was his achievement of the Northwest Passage. In the summer of 1905 his party made their way from King William Land westward through the channels between the American mainland and the islands, reaching near Herschel Island on August 13, waters that are visited every year by San Francisco whalers.

After his return to Europe Amundsen began preparations for his proposed five years' drift on Nansen's ship, the *Fram*, across the north

polar area to make a scientific study of all the natural phenomena that could be observed. His plan was endorsed by leading geographers, but the necessary funds had not been provided up to 1910. The explorer, however, sailed from Norway on August 9, that year, though lacking \$40,000 worth of equipment that he deemed necessary for the northern undertaking. He believed he had ample supplies for an attempt on the south pole, but he did not announce his purpose until he reached Madeira, when he wrote to Nansen that he thought his chances for reaching the south pole were good, and success in that field would doubtless bring him the funds needed for the northern project. His comrades agreed to stand by him in the new venture, and the *Fram* sailed for the Antarctic.

The Bay of Whales, 115 miles west of King Edward VII Land, became Amundsen's base of operations. He had conceived the daring idea of planting his winter camp on the surface of the great ice barrier. He arrived in the Bay of Whales on Jan. 14, 1911. Fourteen days later all the material for his house, all the supplies for nine men for two years, had been taken to the top of the ice, the house erected, and Amundsen and his landing party and 97 Eskimo dogs were established in their winter camp.

Amundsen remained in the Antarctic a few days over a year. While the climax of his work was the discovery of the south pole, the whole period was marked by first-rate achievement and the best of good fortune, much of which could not have been his if he had not prepared for every undertaking with exhaustive attention to detail. His equipment met every requirement. He had placed his whole trust in Eskimo dogs and skis with the result that he was able to plant his supply stations far to the south, each depot so well marked by flags and signs that he could find it later even in dense fog. His dogs were so well and carefully kept that they were able to render the best service. Before the sun disappeared his party had secured 66 tons of fresh seal meat for men and dogs.

On Dec. 14, 1911, Amundsen and his four comrades reached the south pole after a journey of 863 miles from their camp. When they reached the end of the ice barrier and began to ascend the slope of the Antarctic continent, they were still 335 statute miles from the pole. Mounting to the plateau, the highest altitude attained was 11,124 feet above sea level; and from this place they traveled to the pole over an even plain at practically the same level. Many mountain ranges and isolated peaks rose to heights of 16,000 feet and more. The large area of new land discovered and scientific contributions to several departments of knowledge placed this expedition among the most successful of polar enterprises. After his return from the south pole Amundsen lectured in most countries of Europe and North America and in Australia. His book, entitled in the English edition "The South Pole" (1913), was published in several languages.

When Amundsen returned home, the Norwegian government appropriated a sum of money practically adequate for the needs of his proposed drift across the Arctic Ocean; one of the geographical societies also contributed \$25,000 towards the work. The explorer expected in 1914 to push the *Fram* into the ice of the Arctic Ocean north of Bering Strait.

AMUR, ä-moor'. A province of eastern Si-

beria (q.v.), situated north of the Amur River; area, 174,427 square miles. It was ceded by China to Russia in 1858. The capital is Blagovyeschensk. Pop., 1891, 87,705; 1897, 120,306; 1912, 230,200.

AMUR. A river of eastern Asia, formed by the junction of the Shilka and Argun rivers, near the Russian village of Ust-Strielka, at the north end of the Khingan Mountains, lat 53° 20' N. and long. 121° 28' E. (Map: Asia, N 4). From the point of junction of the two rivers the Amur flows at first east and then southeast along the northern boundary of Manchuria, to about parallel 48° N. and long. 131° E. at Ekaterino-Nikolsk, where it turns east-north-east, and at about 137° northeast, and near Fort Nicolayevsk, in lat. 53° 20' N., it empties into the strait which separates the island of Saghalin from the mainland, near the point where that channel opens into the Sea of Okhotsk. Including its headstream of Argun, the Amur has a total length of nearly 2800 miles, and its basin is estimated at more than 770,000 square miles. The principal tributary of the Amur is the Sungari, which joins it on the right near the point at which the Amur begins its great bend toward the north and soon after passes through a gorge 140 miles long. Another important affluent from the right is the Ussuri. The chief affluents on the left are the Zeya and the Bureya. The river is very wide in the lower part of its course, and there are many islands in it. The great station of the steamers that navigate the Amur and the Ussuri is Khabarovsk (formerly called Khabarovka), which is connected by rail with Vladivostok. On the left bank of the Amur, near the parallel of 50°, is Blagovieshtchensk, the capital of the Amur territory. A short distance below this town, on the opposite bank, is Aigun. The Amur is navigable for smaller vessels through its entire course, and steamers can ascend the Shilka beyond the town of Strietensk. As far as the mouth of the Zeya, vessels drawing as much as eight feet can go. The Amur is open for navigation for only about six months in the year. The region through which it flows is partly covered with thick forests, and but few settlements are found on its banks. Gold is mined in some quantity on its upper waters.

As early as 1636, several Russian adventurers, attracted by rumors of the wealth of the regions to the southeast of Lake Baikal, made excursions into the Chinese territories on the Lower Amur by way of the Shilka River. In 1649 Khabarov descended the Amur, subdued the native tribes, and erected a number of forts at the junction of its tributaries. In 1658 Nertchinsk on the Shilka was founded, and about 1665 Fort Albasin was erected. The Chinese, who had watched the Russian advance with great uneasiness, now took up arms, attacked Fort Albasin repeatedly, and in the peace of Nertchinsk (1689) succeeded in closing the Amur to the Russians, who for more than 150 years made no conquests in Manchuria, and contented themselves with extending their influence through commerce, missionary work, and diplomacy. With the appointment of Count Nicholas Muravieff to the governorship of East Siberia, active operations recommenced. A line of forts was constructed on the Amur, the coast of the Gulf of Tartary, and the island of Saghalin. In four expeditions undertaken in 1854 and subsequent years Muravieff established the

authority of Russia over the Amur region, and some slight attempts were made at colonizing the country with Russian settlers. With the English and French marching upon Peking, China could not resist the Russian encroachments. The treaties of Aigun and Tien-tsin concluded in 1858, and the supplementary treaty of Peking in 1860, in ceding eastern Manchuria to the Russians, merely gave formal recognition to an accomplished fact. By these treaties Russia obtained possession of all the country between the Pacific and the Amur, the Ussuri and the Tiumen rivers down to the Korean frontier. In this manner the long-desired goal of Russian foreign policy, an outlet and an ice-free port on the Pacific, was attained. The new territory was divided into two regions, the Amur Territory and the Maritime Province. In 1861 Vladivostok was founded; it became the chief military centre and arsenal of the Russians in the East, until supplanted after 1898 by Port Arthur. During the Boxer uprising of 1900 the Chinese bombarded the town of Blagovieshtchensk on the eastern bank of the Amur. This was followed by the Russian occupation of Manchuria and the chain of events leading to the Russo-Japanese War. Consult: Collins, *Voyage down the Amur* (New York, 1866), and *Exploration of the Amoor* (1864); Andree, *Das Amurgebiet* (Leipzig, 1876).

AMURATH, ä'mōō-rät', or **MURAD' I** (1319-89). Sultan of the Ottoman Empire from 1359 to 1389, succeeding his father Orkhan. He was the first to lead a powerful Turkish army into Europe and in 1361 took Adrianople and fixed there his residence. He completed the subjugation of Asia Minor, and in 1389 his army dealt a crushing blow to the kingdom of Servia in a battle fought at Kossovo. The great Sultan himself was slain on the field of battle, stabbed, according to the common account, by a wounded Servian nobleman as he was surveying the scene of his victory. Amurath was remarkably able, but is said to have been absolutely illiterate, signing treaties by dipping his hand in ink and making a mark with three fingers together, with the fourth finger and thumb stretched wide apart. Consult Hammer-Purgstall, *Geschichte des osmanischen Reiches* (Pesth, 1840).

AMURATH, or **MURAD II** (1403-51). The tenth Sultan of the Turks. He succeeded his father, Mohammed I, in 1421. In 1422 he contended against a pretender, Mustapha (the legitimate Mustapha having previously died), but overcame him without bloodshed. He took Salonica from the Venetians in 1430 and opened the way for subjugating Greece. He went on successfully, on the whole, till 1442, when he was defeated by Hunyady; in 1444 he was obliged to make peace with the Christians. At that time he lost a son, and abdicated in favor of another son, Mohammed, only 14 years old. The Hungarians renewed the war almost immediately, and, hastening from retirement, he overwhelmed them in the battle of Varna, Nov. 10, 1444, where Ladislas, King of Hungary and Poland, fell. He again retired and again came forth to quell an insurrection of the Janissaries. He invaded Albania and was defeated by George Castriota (Scanderbeg); but he retired only to gain a great victory over his formidable adversary Hunyady at Kossovo, in 1448. He was the first Ottoman monarch who caused bridges of great length to be built, and in his reign

poetry, jurisprudence, and theology began to flourish. Consult Lane-Poole, *Turkey* (New York, 1889), and Halil Ganem, *Les Sultans Ottomans*, 2 vols. (Paris, 1901-02).

AMURATH, or **MURAD III** (1545-95). A Sultan of the Turks. He succeeded his father, Selim II, in 1574. He was a feeble, uxorious, superstitious man. His reign was marked by great reverses in Hungary, counterbalanced by territorial gains in Persia and Asia Minor. He made commercial treaties with the Western Powers and was also the first to feel the tyranny of the Janissaries.

AMURATH, or **MURAD IV** (1611-40). A Sultan of the Turks. He succeeded his uncle, Mustapha, in 1623. He is known as "the Turkish Nero," and, like his Roman namesake, he began his reign with great promise; but the mutinous behavior of his soldiers, and the frequent rebellions that marked the first years of his rule, made him a tyrant of extraordinary cruelty. His greatest exploit was the retaking of Bagdad from the Persians (1638), after an assault lasting 30 days, an occasion on which he slaughtered 30,000 of the inhabitants.

AMURATH V (1840-1904), Sultan of Turkey. He was the son of Sultan Abd ul Medjid and was born Sept. 21, 1840. After the accession of his uncle, Abd ul Aziz, in 1861, he was kept in forced retirement, but was placed upon the throne by a revolution May 30, 1876. He showed strong symptoms of insanity, however, and was deposed August 31 of the same year.

AMUSSAT, á'mu'sá', JEAN ZULÉMA (1796-1856). A French surgeon. He entered the army, was assistant surgeon under Esquirol in the Salpêtrière Hospital, and prosecutor at the Paris faculty of medicine. He improved and invented many surgical instruments and was the first to show the importance of torsion of arteries in hemorrhage. He wrote on the nervous system, lithotomy, etc. An operation for opening the large intestine at a point where it is not covered with peritoneum was perfected and first practiced by Amussat. It is still performed, and it bears his name. Among his publications are researches regarding the nervous system (1825), and a memoir on the torsion of arteries (1829), the latter winning a prize from the Institute.

AMY'CLÆ (Gk. Ἀμύκλαι, *Amyklai*). 1. An ancient town of Laconia, on the eastern bank of the Eurotas, 2½ miles southeast of Sparta, in a richly wooded and fertile region. It was early a famous city and after the Dorian conquest seems to have maintained its independence as an Achæan town until the development of the Spartan power. In the neighborhood of Amyclæ have been found important remains of Mycænæan civilization, including the gold cups of Vaphio. At Amyclæ was an ancient temple of Apollo, containing a primitive bronze image of the god (*xoanon*) standing on an elaborate bronze throne. It was the work of Bathycles. Pausanias has given a description of it, important in the history of early Ionic art. At Amyclæ were celebrated annually the Hyacinthia, in memory of Hyacinthus (q.v.). 2. **AMYCLÆ**, or **Amuclæ**, an ancient city on the coast of Latium, Italy, said to have been built by a colony from the Greek Amyclæ. It had ceased to exist before the time of Varro. Tradition said that after many false alarms of the approach of the enemy it was decreed that no one at Amyclæ should announce the approach of an

enemy. Hence, when the enemy did appear, they found it easy to take the town. This story is, however, an invention, to explain the phrase *tacitæ Amyclæ*, which somehow had become proverbial to express profound silence.

AMYG'DALIN (Lat. *amygdala*, Gk. ἀμυγδάλη, *amygdalē*, almond), C₂₀H₂₇NO₁₁, 3H₂O. A crystalline substance existing in the kernel of bitter almonds and in various other plants. It is obtained, by extraction with boiling alcohol, from the paste of bitter almonds, which remains after the fixed oil has been separated by pressure. The alcoholic solution usually contains more or less oil, which must be removed by decantation or filtration; it is then evaporated till a syrup is left, from which the amygdalin may be obtained by the addition of ether; amygdalin is insoluble in ether and is, therefore, precipitated by it from its solutions. Amygdalin has a somewhat bitter taste, but is not poisonous. It may be dissolved in water for any length of time without undergoing any change; but if some emulsin (or some dilute mineral acid) be added to the solution, a sort of fermentation is set up, and the amygdalin gradually undergoes decomposition into benzaldehyde (q.v.), glucose, and hydrocyanic or prussic acid. Now, as emulsin, too, is one of the constituents of bitter almonds, when the paste of bitter almonds is brought into contact with water, a poisonous liquid is obtained. Emmerling has succeeded in producing amygdalin synthetically, from mandelic nitril glucoside and ordinary glucose, by means of maltase, an enzyme contained in yeast.

AMYG'DALOID (Gk. ἀμυγδάλη, *amygdalē*, almond + εἶδος, *eidōs*, shape). A name given in geology to igneous rocks, generally of a basaltic nature, which contain numerous almond-shaped or spheroidal cavities filled with foreign minerals, such as quartz, calcite, or some one of the zeolites. These cavities are regarded as the result of the escape of gases when the rocks cooled, at which time the crystallization of the minerals also took place, these being for the most part similar in composition to the rock.

AM'YL (Lat. *amylum*, from Gk. ἄμυλον, *amylon*, starch + ὕλη, *hylē*, material), C₅H₁₁. A radicle, or group of atoms, found in the molecules of many carbon compounds.

AMYL AL'COHOL. A name applied to eight alcohols having the same molecular composition (C₅H₁₁OH), but more or less different chemical and physical properties. Seven of these alcohols have actually been prepared; the possibility of the existence of the eighth is indicated by the structural theory of compounds. The most important amyl alcohols are the two found in fusel oil, which is produced as an impurity during alcoholic fermentation. Of these, one is called iso-butyl-carbinol, (CH₃)₂CH.CH₂.CH₂OH; the other, secondary butyl-carbinol CH₃.CH²CH(CH₃).CH₂OH. Iso-butyl-carbinol boils at 131° C., has a specific gravity of 0.810, and is optically inactive; it forms the predominating constituent of fusel oil. Secondary butyl-carbinol boils at 128° C., and imparts to fusel oil, of which it forms 10 to 20 per cent, the property of turning the plane of polarized light to the left. The esters (compound ethers), formed by the union of amyl alcohols with some of the acids of the acetic acid series, have highly aromatic odors, resembling those of the apple, the pineapple, the strawberry, the banana, and other fruits. Fusel oil is therefore used in

making artificial fruit essences, which are now generally employed for flavoring syrups, confectionery, etc.

AM'YLENE HY'DRATE. See AMYL ALCOHOL.

AM'YL NI'TRITE. An extremely volatile, pale yellow, oily liquid, with an aromatic taste and fruity odor. It is formed by the action of nitric acid upon amylic alcohol (fusel oil). As it rapidly deteriorates, it is necessarily kept in "small, dark, amber-colored and glass-stoppered vials, in a cool and dark place." The drug is also put into closed glass capsules, or "pearls," which may be crushed in a handkerchief when desired for use. Though occasionally administered internally, it is usually given by inhalation. A moderate amount inhaled causes immediate flushing of the face, a feeling of fullness and pain in the head, tumultuous heart action, labored breathing, and a soft and full pulse. If continued, the head seems distended as though it would burst, and the other symptoms increase. Within a few minutes all these symptoms disappear except the headache, which may last several hours. Poisonous doses cause pallor, irregular breathing, muscular relaxation, and death. Xanthopsia, or yellow vision, sometimes follows inhalation of amyl nitrite, but this is transitory. The chief use of amyl nitrite is to relieve attacks of angina pectoris. It is also valuable for aborting epileptic seizures, especially when there is an aura, or peculiar sensation denoting the approach of one of these. In seasickness, and such spasmodic conditions as asthma, tetanus, or strychnine poisoning, it is occasionally effective. See NITROGLYCERIN.

AMYLOP'SIN. A ferment or enzyme contained in the pancreatic juice which has the property of converting starch into sugar. See DIGESTION; PANCREATIN.

AMYNTAS, à-mîn'tās, I (Gk. Ἀμύντας). King of Macedonia from about 540 to 498 B.C. In token of submission to the Persians about 513 B.C., he presented earth and water to the ambassador, Megabazus, whom Darius, on his return from the Scythian expedition, had left at the head of 80,000 men in Europe. He remained subject to the Persian King.

AMYNTAS II (or **III**). King of Macedonia from about 394 to 369 B.C., son of Philip, the brother of Perdiccas II. He succeeded his father in Upper Macedonia and obtained the crown of the entire country by the murder of the usurper, Pausanias (393 B.C.). Soon after his accession he was driven from Macedonia by the Illyrians, but by the aid of the Thessalians was restored to his kingdom. Afterward he entered into an alliance with the Spartans. He left three sons, Alexander, Perdiccas, and Philip the Great. Some authorities call him Amyntas III; according to them Amyntas II ruled from about 394 to 389.

AMYNTAS III (or **IV**) (-336 B.C.). Grandson of Amyntas II, son of Perdiccas. On the death of his father, in 360 B.C., he was the lawful heir to the throne, which was, however, usurped by his uncle, Philip, father of Alexander the Great. He was put to death in the first year of the reign of Alexander the Great (336 B.C.), who charged him with having conspired against his life.

AMYNTOR, GERHARD VON. A German writer. See GERHARDT, DAGOBERT VON.

AMYOT, à'myô', JACQUES (1513-93). Tutor of King Charles IX, of France, Bishop of

Auxerre, and Commander of the Order of the Holy Ghost, born at Melun, and professor of Greek and Latin at Bourges. He is remembered chiefly for his translations of the Greek romances, *Theagenes and Chariclea* (1547), and *Daphnis and Chloë* (1559), together with *Diodorus Siculus* (1554), *Plutarch's Lives* (1559), and *Plutarch's Morals* (1572). This Plutarch was the basis of North's English version (1575) used by Shakespeare. It was much admired for its personal touch and was used by Corneille. It outranks Amyot's other translations among French classics.

AMYOT, à'myô', or **AMIOT**, JOSEPH MARIA (1718-93). A celebrated French Jesuit and Oriental scholar. He lived as a missionary in China from 1750 to the time of his death. His knowledge of Chinese dialects enabled him to collect many valuable notices of antiquities, history, language, and arts in China. His writings include large contributions to the *Mémoires concernant l'histoire, les sciences, les arts, les mœurs, et les usages des Chinois par les missionnaires de Peking* (1776-1814). His *Dictionnaire Tatar-Mantchou-François* (1789-90) was edited by Langlés.

AM'YRAL'DISM. See AMYRAUT.

AMYRAUT, à'mê'rô', MOSES (MOÏSE) (1596-1664). A French Protestant theologian and metaphysician. He was born at Bourgueil, near Tours. His father set him to study law, and he made rapid progress in the University of Poitiers. He became a licentiate in law (1616), but the reading of Calvin's *Institutes* induced him to leave law for theology, and he studied at Saumur and "sat at the feet of the great Cameron," a pupil as great as his master. There he became a pastor in 1626; in 1633 professor of theology. He was co-professor with Louis Capel and Josua de la Place. Their life-long friendship was beautiful and remarkable, as is their memory as joint authors of the *Theses Salmurienses*. In 1631 Amyraut published *Traité des religions* (Saumur), still a living work; and thenceforward he was foremost in provincial and national synods. The esteem in which he was held was shown when the Charenton synod of 1631 chose him to present to the King the *Copy of the Complaints and Grievances for the Infractions and Violations of the Edict of Nantes*. Before this time all save Roman Catholic deputies had addressed the King on their knees; but Amyraut refused to speak unless he could stand as did the Romanists, and carried the day, his rehearsal charming even his adversaries. His oration is an historic landmark of French Protestantism. He held fast to Calvinism, but with an unusual liberality. He was repeatedly accused, but never convicted, of heresy, because in his *Traité de la prédestination* (1634) he advocates a modification of the strong predestination theory of the Synod of Dort by the "Universalismus hypotheticus," i.e., the theory that God offers salvation to all under the conditions of faith. This is known as Amyraldism and found many adherents—among them Baxter, Andrew Fuller, and the New England divines. He died at Saumur, Jan. 8, 1664. He left many religious works.

AN, or **ON**. The Egyptian name of Heliopolis.

A'NA. A termination added to the names of remarkable men, to designate collections of their sayings, anecdotes, etc.; as in the works entitled *Baconiana*, *Johnsoniana*. Such titles were first used in France, where they became common

after the publication of *Scaligerana* by the brothers Dupuy (The Hague, 1666). In English literature there are many works of this kind. America, also, has its *Washingtoniana*, while Jefferson's *Anas* are well known to students of the history of American politics.

AN'ABAP'TISTS (Gk. ἀναβαπτίζειν, *anabaptizein*, to rebaptize). A term applied generally in Reformation times to those Christians who rejected infant baptism and administered the rite only to adults; so that when a new member joined them, he or she was baptized, the rite as administered in infancy being considered no baptism. Still, because all other branches of the Church considered this a *second* baptism, the term *Anabaptist*, i.e., one who baptizes *again*, was naturally applied to them. The name is, however, not now used by the present Baptists.

The Anabaptist movement was not the product of the Reformation. It was a combination of two factors, the religious and the social, both of which came from times previous to the Reformation. On the religious side it was the successor of the various groups of *brethren* and *Friends of God*—unorganized movements, mostly of humble men, who insisted upon religion as a personal relation between man and God, repudiated the exclusive claims of the Church, and fostered a pure and pious life by Bible reading and, where possible, a single common worship. The social side was the outgrowth of the unrest of the artisans and peasants under the growing oppression of the rich. The Reformation, by casting society into a seething pot, brought all kinds of discontent to the surface. The social unrest soon found expression in the "Peasants' War" (q.v.) (1525), in which demands for both religious and economic reforms were voiced. The religious side was represented in a great number of individuals and loosely organized "praying circles," not separated from the Church, but looking askance upon its ritual and denying miraculous efficiency to the sacraments. This led in time to the denial of infant baptism and the demand for adult baptism only. The logical result of this was the rebaptism of those who had been baptized in infancy, whence the name Anabaptists. The name, however, as so often happens, indicates only an incidental part of the movement. The essential element of the movement was not a question of baptism, but of individual religion as against ecclesiasticism and the connection of church and state. In the theology there was much variety, from a sincere acceptance of the Apostles' Creed in most of north Europe to a frank anti-trinitarianism, especially among the humanists of Italy. Luther, who was conservative in theology and as ardent an advocate of church and state as any Catholic, soon lost sympathy with the Anabaptist movement. Lutheranism represented the upper social classes and the princes; Anabaptism, the peasant and artisan classes, though with a sprinkling of humanists. Organization began in 1524, when delegates from a wide circle met at the house of Hübmaier in Waldshut, and tried to lay down rules of living from the Bible, but did not form a church organization. A second conference was held at Augsburg in 1526, and a general synod at Augsburg in 1527. Here a simple statement of doctrine was framed, much like that now held by the Moravians (q.v.), and an organization formed, which in general was of the Presby-

terian order. From this time Anabaptists, already widespread, grew rapidly till they extended from England to Italy, from the Netherlands and Switzerland to Poland and Hungary. Their opposition to the state churches made them everywhere subject to persecution, often to death with torture. The darkest pages of the Reformation history are those which tell the story of the sufferings of the Anabaptists, under both Catholic and Protestant governments. It is not surprising that so loosely organized a movement of religious enthusiasts should have furnished some cases of fanaticism. It was formerly common to judge the whole movement by these extreme instances, but a better knowledge of the facts has led historians to a more lenient estimate. It is true that some, especially in the early days, dreamed dreams and saw visions and hoped for the speedy coming of the earthly kingdom of Christ. Such were the "prophets of Zwickau" (1520), in Saxony, at whose head was Thomas Münzer (q.v.). They gained a notoriety by coming to Wittenberg, where for a time they won some sympathy from Melancthon. The extreme of fanaticism occurred in Münster, where the Anabaptists laid aside their usual doctrine of non-resistance and defended themselves by force of arms. The leaders were the Protestant minister Rothmann, and the burghers Knipperdolling and Krechting, the tailor, John Bockelson of Leyden, Gerritt Kippenbrock of Amsterdam, a bookbinder, and Matthys of Haarlem. With their adherents they soon made themselves masters of the city. Matthys regarded himself as a prophet, and when he lost his life in a sally against the Bishop of Münster, who was besieging the town, Bockelson and Knipperdolling took his place. The churches were now destroyed, and 12 judges were appointed over the tribes, as among the Israelites; and Bockelson (1534) had himself crowned King of the "New Sion," under the name of John of Leyden. As the siege went on, the strain of the situation grew more severe. Then came one of those strange turns which sometimes occur in a crowd under excitement. John of Leyden proposed that, under the circumstances in the town, polygamy should be allowed. The matter was debated for eight days, and at last his opponents accepted his position. This event is not to be excused, but the whole Anabaptist movement should not be pilloried in history on account of the one moral aberration of the half-crazed population of a besieged town. Anabaptists generally were especially pure in morals. Soon after, the town fell (1535), the leaders were executed with torture, and the kingdom was wiped out in blood.

Most of the Anabaptists were not fanatics, but simple Christians, trying to live according to the New Testament and making much of the "inner light" of the Spirit. Their creed can be learned from Zwingli's attack upon them. See the English translation in Jackson's *Selections from Zwingli*, pp. 123-258 (New York, 1901). This humble folk were treated like criminals, because the authorities recognized that their principles, though in no way sinful, were subversive of the tyrannical government they exercised. Anabaptists must die because they would not submit to the established order. To this day the advocates of the state church look askance at them. At first among them the mode of baptism was not considered important

and so not much discussed. It was by pouring or sprinkling.

A new era for the Anabaptists begins with Menno Simons. (See MENNO.) Surrounded by dangers, Menno succeeded, by prudential zeal, in collecting the scattered adherents of the sect and in founding congregations in the Netherlands and in various parts of Germany. He called the members of the community "God's congregation, poor, unarmed Christians, brothers"; later, they took the name of Mennonites, and at present they call themselves, in Germany, Taufgesinnte; in Holland, Doopsgezinden—corresponding very nearly to the English designation Baptists. This, besides being a more appropriate designation, avoids offensive association with the early Anabaptists. Menno expounded his principles in his *Elements of the True Christian Faith*. This book is still an authority among the body, who lay particular stress on receiving the doctrines of the Scripture with simple faith and acting strictly up to them, setting no value on learning and the scientific elaboration of doctrines. They reject the taking of oaths, war, every kind of revenge, divorce (except for adultery), infant baptism, and the undertaking of the office of magistrate; magistracy they hold to be an institution necessary for the present, but foreign to the kingdom of Christ; the Church is the community of the saints, which must be kept pure by strict discipline. With regard to grace, they hold it to be designed for all, and their views of the Lord's Supper fall in with those of Zwingli; in its celebration the rite of feet-washing is retained. In Germany, Switzerland, and Alsace their form of worship differs little from the Lutheran. Their bishops, elders, and teachers serve without pay. Children receive their name at birth, baptism is performed in the place of worship, and adults that join the sect are re-baptized. (See MENNONITES.)

Almost the only split among the early Continental Baptists on doctrinal grounds was that which took place in Amsterdam in 1664. Arminianism had not been without its influence, especially among the Waterländers, originally more liberal in their views. A leading congregation accordingly divided into two parties, one (Galenists, from Galenus, their leader) advocating freer views in doctrine and discipline; the other (Apostoolists, from Samuel Apostool) adhering to absolute predestination and the discipline of Menno. The liberal party rejected creeds as of human invention, adopted much of the philosophy and theology of England, and exercised no little influence on the intellectual progress of Holland. These two parties gradually absorbed the other sections of the Baptists in the Netherlands; and about the beginning of the nineteenth century a union took place by which all the congregations now belong to one body.

For the modern denomination called Baptists, see BAPTISTS. For the Anabaptists of the Reformation consult Lindsay, *History of the Reformation*, vol. ii (New York, 1907).

ANABARA, ä-nä'bä-rä'. A river in Siberia, emptying into the Arctic Ocean (Map: Asia, L 1), and forming the boundary between the government of Yeniseisk and the territory of Yakutsk.

A'NABAS, AN'ABAT'IDÆ. See CLIMBING FISH.

ANAB'ASIS (Gk. ἀνάβασις, from ἀνά, *ana*, up

+ βαίνειν, *bainein*, to go). The name of two historical works. 1. The *Anabasis of Cyrus*, written by Xenophon early in the fourth century B.C., which gives a narrative of the unfortunate expedition of the younger Cyrus against his brother, the Persian King Artaxerxes, and of the retreat of his 10,000 Greek allies under the command of Xenophon. See CYRUS THE YOUNGER. 2. The *Anabasis of Alexander*, written by Arrian, 166-168 A.D., and giving an account of the campaigns of Alexander the Great. See ARRIANUS.

AN'ABLEPS (Gk. ἀναβλέπειν, *anablepein*, to look up). A genus of cyprinodont fishes, the four-eyes, remarkable for the incomplete division of the eye into an upper smaller and a lower larger part, the best-known species being *Anableps anableps*. The division of the eye is effected by the growth of two processes of the iris toward each other across the pupil, and a corresponding band of the conjunctiva across the cornea. As they are surface fish, and swim

ANABLEPS TETRAOPHTHALMUS.

A. Attitude in swimming. B. Vertical section of the eye through the lens, showing the lenticular form of the upper half receiving light through the air, and the suborbicular shape of the lower half receiving light through water. C. Diagram of the eye across the front, showing external dark band. (After Tegetmeier.)

with their eyes partly projecting above the water, the upper part serves the purpose of seeing in the air and the lower for seeing in the water. They occur in shallow water along the coast and in the rivers of tropical America. It is impossible for them to dive to any depth and they progress by a succession of short skips or jumps along the surface. They can also make their way very rapidly over mud-flats.

ANAB'OLISM (Gk. ἀναβολή, *anabolē*, something heaped up), and **CONSTRUCTIVE METABOLISM**. Terms applied to the chemical processes of the living body, which result in the formation of more complex compounds from simpler ones. See METABOLISM.

ANAB'RUS. See LOCUST.

ANACAONA, ä'nä-kä'ō-nä, or GOLDEN FLOWER. An Indian princess, sister and wife respectively of Behechio and of Caonabo, caciques of Haiti when Columbus discovered the island (1492). She succeeded her brother as ruler of his tribe, and after the death of Caonabo was on friendly terms with the Spanish until 1503, although many of her subjects revolted under the foreigners' ill-treatment. In the latter year she gave a feast in honor of Ovando, the Spanish Governor, but in the midst of the festivities was arrested and put to death by his order. She composed ballads and narrative poems.

AN'ACAR'DIA'CEÆ (Gk. *ἀνά, ana* [like] unto + *καρδία, kardia*, heart), SUMACH FAMILY. A family of dicotyledonous plants, consisting mostly of trees and shrubs, with acrid, resinous, or milky sap, in some instances very irritating and poisonous. The leaves are usually alternate, rarely opposite; flowers small, polygamous, dioecious, or perfect. This family embraces about 50 genera and 500 species, most of which occur in the tropics of both hemispheres, the only prominent genus indigenous to the United States being *Rhus*; the *Sumach* and *Poison Oak* (q.v.). The genera of the family are grouped into a number of sections, the more important of which are: *Mangifera*, of which *Mangifera* and *Anacardium* are the principal genera; *Spondia*, represented by *Spondias*; *Rhoidea*, the chief genera of which are *Pistacia*, *Rhus*, *Cotinus*, and *Schinus*; and *Semecarpæ*, represented by *Semecarpus*. The entire family abounds in resins and tannins, furnishing the source whence some of the most valuable lacquers, varnishes, and tanning materials are obtained, while some species produce wholesome and pleasant fruits, some of which are extensively grown in the tropics. For detailed economic descriptions, see CASHEW NUT; PISTACIA; MASTIC; HOG PLUM; POISONOUS PLANTS; MANGO; SUMACH, and other names mentioned above.

AN'ACAR'DIUM. See CASHEW NUT.

ANACHARIS, ä-näk'ä-ris (Neo-Lat. from Gk. *ἀνά, ana*, up + *χάρις, charis*, grace). An old name for a genus of plants now called *Elodea* (or *Philotria*), and belonging to the family Hydrocharitaceæ. The best-known species is *Elodea (Anacharis) canadensis*, a native of North America, where it grows entirely submerged in the water of ponds and slow-flowing streams. The plant is a much-branched perennial, with long, slender stems that bear numerous small sessile, linear-oblong leaves arranged either in whorls or oppositely upon the axis. The small flowers appear upon the surface of the water for a short period of time sufficient for pollination, after the accomplishment of which act the female flowers are withdrawn beneath the surface; a case similar to that in the eel-grass (*Vallisneria*, q.v.). This plant was introduced into Great Britain about 1842, and because of its rapid growth has become a serious obstacle to navigation in many of the tide-water streams. *Elodea* is a good example of a plant, innocuous in its native country, which has been introduced elsewhere and found there such a congenial habitat as to enable it to become a most obnoxious weed.

ANACHARSIS, ä'n'ä-kär'sis (Gk. *Ἀναχάρσις*). A Scythian, the brother of King Saurius, said by Plutarch and Diogenes Laertius to have visited Solon at Athens, to have lived with him on terms of intimacy, and also to have been initiated into the Mysteries. From the early fourth century B.C., the tendency to idealize the barbarian peoples of the North assigned to him the highest qualities; his love of learning is said to have caused him to travel through many lands; he was numbered among the Seven Wise Men; and from Aristotle's time many wise sayings and proverbs were attributed to him. They are edited by Mullaeh, *Philosophorum Græcorum Fragmenta* (Paris, 1860-81). Under the title *Voyage du jeune Anacharsis en Grèce*, Jean Jacques Barthélemy, a well-known French author (q.v.), wrote in 1789 a description of Greek life and manners, displaying learning and

good taste, but disfigured by many anachronisms. Anacharsis is made to visit Athens only a few years before the birth of Alexander the Great, and the features of several distinct periods in Grecian history are confusedly regarded as having been contemporaneous. The book, therefore, will not bear a critical examination; but it has contributed its share toward an improved knowledge of ancient life, and has given rise to several similar works, such as the *Gallus* and the *Chari-cles* of Becker.

ANACHARSIS CLOOTS. See CLOOTS.

ANACH'RONISM (Gk. *ἀναχρονίζεσθαι, anachronizesthai*, to refer to wrong time, from *ἀνά, ana*, back, against + *χρόνος, chronos*, time). An error in chronology. Sometimes an anachronism is purposely made for the sake of effect, or to bring certain events within convenient compass for dramatic purposes. Shakespeare, in his *Julius Cæsar*, makes the "clock" strike three; and Schiller, in his *Piccolomini*, speaks of a "lightning-conductor" as known 150 years before its invention. These discrepancies, however, do not seriously injure the general truth of a poetical work. The anachronism is more offensive when, in a work which pedantically adheres to the costumes and other external features of old times, we find a modern style of thought and language, as in the old French dramas of Corneille and Racine. In popular epic poetry anachronism is a common feature. Thus, Achilles is always young; Helena, always beautiful, etc. In their versions of old classic traditions the writers of the Middle Ages converted Alexander, Æneas, and other ancient heroes into good Christian knights of the twelfth century. In the *Nibelungenlied* Attila and Theodoric are good friends and allies, though the latter began to reign some 40 years after the former. At the end of the poem, the heroine, who must have been nearly 60 years old and had passed through great affliction and sorrow, is still the "beautiful Queen Kriemhild." Many ludicrous examples of anachronisms may be found in old Dutch paintings; e.g., Abraham, Isaac, and Jacob in modern costumes, and Adam in Paradise, armed with a musket.

ANACHUANA, ä'nä-chwä'nä. A village and bay, on the northern coast of the Isthmus of Panama, just west of Cape Tiburon.

AN'ACLE'TUS I, SAINT, otherwise CLETUS. Second or third Bishop of Rome. A martyr under Domitian. Others say that he succeeded Clement I as fifth Bishop of Rome, and was martyred under Trajan. His day is July 13.

ANACLETUS II (?-1138). Anti-pope, by name Peter Pierleoni. He sprang from a rich and powerful Roman Jewish family, studied in Paris, became Cardinal in 1116, was chosen Pope in 1130 by a faction of cardinals opposed to Innocent II, and was sustained by the Roman and some other states. He maintained himself at Rome against the arms of Lothaire, the opposition of other kings, and the clergy in general. He died Jan. 25, 1138.

AN'ACOLU'THON (Gk. *ἀν, an*, priv. + *ἀκόλουθος, akolouthos*, following, attending). A term employed both in grammar and in rhetoric to denote the absence of strict logical sequence in the grammatical construction. Such inconsequences, to which some languages lend themselves more readily than others, abound in the classic Greek writers as well as in the Elizabethans who caught their spirit. Languages characterized by grammatical rigidity (Latin,

German, and Russian, for instance) are ill adapted to this kind of license. Of course, in colloquial speech nothing is more common than anacoluthon, but careful writers in all languages shun it. The following from Disraeli illustrates the fault: "Lost in profound reverie, the hours flew on."

AN'ACON'DA (origin unknown; possibly native name). Any large crushing snake, a boa. More especially the great South American water-boia (*Eunectes murinus*), called in Brazil *Sucuriu*, which is closely allied to the boa constrictor, and is sometimes 20 feet long. Its nostrils are capable of being closed while in the water. It haunts the banks of streams in Guiana and Brazil, where it preys on the animals that live in the water or come to the banks to drink. When on land it is rather helpless. It is rich brown, beautifully decorated by a double series of dorsal blotches and with irregular ring-spots along the sides. Consult Mole and Ulrich, *Proceedings Zoölogical Society of London* (1894). See **BOA**, and **PLATE OF BOAS**.

ANACONDA. A city and the county-seat of Deer Lodge Co., Mont., 26 miles west by north of Butte, on the Butte, Anaconda, and Pacific, the Chicago, Milwaukee, and St. Paul, and the Northern Pacific railroads (Map: Montana, C 3). It has parks, a race track, and fair grounds, the Hearst Free Library, two opera houses, and a daily newspaper. Deposits of gold, lead, silver, and sapphires are found in the vicinity, and the city is noted for its copper-smelting works, which have a daily capacity of some 12,000 tons of ore and are the largest in the world. The copper produced by the Washoe Reduction Works, of the Anaconda Mining Co., comprises 10 per cent of the world's output of copper. Railroad shops, brass and iron foundries, machine shops, refractory brick works, and a brewery, further represent the industrial interests. Founded in 1884, when the reduction works were established, Anaconda has developed with the copper industry. The mining company owns all the public utilities. Altitude, 5280 feet. Pop., 1890, 3975; 1900, 9453; 1910, 10,134; 1913 (est.), 12,500.

ANACOR'TES. A city in Skagit Co., Wash., 90 miles north of Seattle, on the Great Northern Railroad, and a port on the Inland Navigation Company, the Pacific Coast Steamship Company, the Alaska Pacific Steamship Company, and the Island Navigation Company lines (Map: Washington, C 2). The leading industries of the city include lumber mills, salmon canneries, cod-fish plants, box factories, oil and glue factories, glass works, a ship yard, etc. Ample water power is available in the Skagit valley, within a radius of 25 miles. Among the notable features of the city are the Carnegie library, Deception Pass, the city park, and Cap Santa Park. The government of the municipality is vested in a mayor and seven councilmen. Pop., 1890, 1131; 1900, 1476; 1910, 4168; 1913 (est.), 6000.

ANAC'REON (Gk. Ἀνακρέων, *Anakreōn*) (c.570-490 B.C.). One of the most esteemed lyric poets of Greece. He was born at Teos, a seaport of Ionia, and spent part of his youth in Abdera (q.v.), to which place most of his fellow townsmen emigrated when their city was taken by the Persians in 545 B.C. He was patronized by Polycrates, the ruler of Samos (533-522), who invited him to his court; and there he sang in light and flowing strains the

praise of wine and love. After the death of Polycrates, he went to Athens (521 B.C.) and was received with distinguished honor by Hipparchus. After the fall of Hipparchus he accepted an invitation from Echeerates, a Thessalian prince, to make his home with him. Great honors were paid to him after his death. Teos put his likeness upon its coins, and Pausanias (q.v.) saw a statue to him on the Acropolis of Athens, which represented him in a half-drunken condition. The Alexandrians knew five books of his poems; but we have only two poems complete, and a few scanty fragments. The collection of poems known as *Anacreontics* gives weak imitations of his work, dating from the Alexandrine period to late Byzantine times; as has been well said, "The extraordinary fame of the Teian bard in modern times is largely due to the admiration of poems which Anakreon did not write, an admiration that is at once vicious on the stylistic side and ignorant of the debased form in which the *Anakreontica* are composed." The genuine fragments are published in Bergk's *Poetæ Lyrici Græci*, vol. iii, 5th ed., Leipzig, 1900). They have been paraphrased in English by Thomas Moore. Anacreon's poems are marked by sweetness, urbanity, exquisite simplicity, and by a delicate and airy touch; he deals chiefly with love and wine, but shows also a marked capacity for satire. See H. W. Smyth, *Greek Melic Poets* (New York, 1900).

ANACREON MOORE. The Irish poet, Thomas Moore, not only translated Anacreon, but wrote English poems in imitation of his beloved master. The following epigram, contained in an after-dinner speech, is said to have given rise to the nickname:

"Oh, weep not for Anacreon dead!
Oh, mourn not for Anacreon fled!
The joys long dead will Time restore
For we have one Anacreon Moore."

ANACREONTICA, ANACREONTICS. See **ANACREON**.

ANACRU'SIS (Gk. ἀνάκρουσις, a pushing up or back). A metrical term adopted in 1798 by Gottfried Hermann (q.v.) as a result of his philosophical study of metrical problems. Stated simply, it means that the first syllable of a line of verse is not to be regarded as anything more than a sort of preliminary to the actual metrical entity, like the upward movement of the bâton of a musician in directing an orchestra. This notion, which has been generally though not universally accepted, revolutionizes the technical structure of both ancient and modern poetry and tends to change what was formerly known as iambic verse into verse that is trochaic. (See **IAMBIC MEASURE**.) Its application may be illustrated by taking the following familiar line from Gray's *Elegy* and "scanning" it according to the older system, and again, by the use of an anacrusis as by Hermann:

× × × × ×
The cur | few tolls | the knell | of part | ing day.

This is an iambic line pure and simple. As Hermann would have it, the first syllable is an anacrusis, and the rest of the line becomes trochaic, thus:

> / / / / / >
The | curfew | tolls the | knell of | parting | day.

It is worthy of remembrance that none of the ancient authorities on metrical questions had

any conception of an anacrusis, and that, when read, the listener is not conscious of any difference between the two lines. The whole matter is purely technical. For practical illustrations see VERSIFICATION.

AN'ACYC'LUS. See PELLITORY OF SPAIN.

AN'ADAR'KO. A city and the county-seat of Caddo Co., Okla., 50 miles from Oklahoma City, on the Chicago, Rock Island, and Pacific Railroad, and on the Washita River (Map: Oklahoma, C 3). Anadarko has two government Indian schools, a fine county court house, a park, and a Chautauqua auditorium. It is in the centre of the richest agricultural county in the State, producing corn, wheat, cotton, alfalfa, and a great variety of vegetables and fruit. Both the water works and lighting plant are owned by the city, power being obtained by means of a dam across the Washita River. The industries of the city include cotton gins, oil and flour mills, and grain elevators. Pop., 1900, 2190; 1910, 3439; 1913 (est.), 4000.

ANADIR, ä'nä-dīr', or ANADIR BAY. A sea or large gulf of northeastern Asia, constituting the northwestern part of Bering Sea (Map: Asia, Siberia, R 2). It is about 480 miles in circumference and about 250 miles wide, and is frequented by whalers.

ANADIR. A river in the extreme northeast of Siberia, rising in the mountain lake Ivashkino. It flows first in a southwesterly and then in an easterly direction, mostly through rocky, snowy regions, for a distance of about 400 miles, and empties into the gulf of the same name, in lat. 64° 40' N. It drains an area of about 115,000 square miles, and the Mayin, the Bielaya, and the Krasnaya are the principal tributaries. Consult Kraemer, "Der Anadyr-Bezirk nach A. W. Olssuffjew," in vol. xlv, *Petermann's Mitteilungen* (Gotha, 1879).

ANADYOMENE, än'ä-dī-ōm'ē-nē (Gk. ἀναδυομένη, from ἀναδύεσθαι, *anadyesthai*, to rise). A name applied to Aphrodite emerging from the sea. The ancients used the word especially to denote a celebrated painting by Apelles (q.v.), representing the goddess as she was rising from the sea, and wringing out her long hair with both hands. It was painted for the temple of Asclepius on the island of Cos. Augustus bought it for 100 talents of remitted taxes and placed it in the temple of Julius Cæsar in the Forum at Rome; by Nero's time it was practically ruined and was replaced by a copy made by Dorotheus. It is frequently mentioned in the Greek Anthology, but the allusions do not furnish the data for accurate reconstruction of the painting. The name is frequently applied to similar representations of Aphrodite rising from the waves or standing in a shell and wringing the water from her hair; the relation of these to the painting by Apelles cannot be determined.

ANADYR, ä'nä-dīr'. See ANADIR.

ANÆ'MIA (Gk. ἀν, *an*, priv. + αἷμα, *haima*, blood) is a depraved condition of the blood, the term covering several distinct disorders, characterized either by a deficiency in volume or in some of the normal constituents. A reduction in the number of red blood corpuscles is called *oligocythemia*; in the white corpuscles, *leucopenia*; *oligochromenia* is applied to a lowered percentage of hemoglobin; while a diminution of the volume of blood is termed *oligemia*. In medicine anæmias are divided somewhat arbitrarily into two general types—*primary*, or *idiopathic*, and *secondary* anæmias. The primary

anæmias, *pernicious anæmia*, splenic anæmia, leukæmia, and Hodgkin's disease—are due to disease of the blood-making tissues, notably the spleen, lymph glands, or bone marrow, and are generally fatal. Pernicious anæmia is a disease of middle life, brought on by chronic indigestion, intestinal poisoning (auto-intoxication), chronic malaria, prolonged mental strain or worry, and other similar causes. The chief blood changes consist in a marked reduction of the number of the red cells, and changes in the heart, liver, and blood-making organs. There are usually great pallor, shortness of breath, weakness, and palpitation of the heart. *Secondary anæmia* is a symptom found in many diseases and conditions, as malaria, hemorrhage, jaundice, poisoning by lead, mercury, copper, or arsenic; further, it may be due to improper food, insufficient sunlight, or to blood-sucking intestinal parasites; or, finally, it may occur during Bright's disease, diabetes, or cancer. The symptoms are similar to those of pernicious anæmia, but less severe. The curative treatment of the secondary anæmias consists in allowing the patient fresh air, good nourishment, and materials which promote the formation of the deficient elements of the blood, such as iron and arsenic. See CHLOROSIS. For "Miners' Anæmia," see ANKYLOSTOMIASIS.

ANA'ËROBES. See RESPIRATION.

AN'ÆSTHE'SIA (Gk. ἀν, *an*, priv. + αἴσθησις, *aisthēsis*, feeling, sensibility, or ANALGESIA). A loss of sensibility to external impressions. Anæsthesia means, properly, the loss of the sense of touch; analgesia, the loss of the sense of pain. The terms are often used interchangeably, and anæsthesia has come to mean the loss of sensibility to all kinds of sensory impressions. Tactile, pain, heat, cold, and muscular senses are those usually affected. All these sensations are received by special sense organs situated on the outside of the body or in mucous membranes. From the sensory end organs the paths for these sensations pass into the spinal cord and thence up to the brain. Disease or injury in any part of the path may produce a loss of these sensations. Thus, if a nerve which contains sensory fibres is injured, the parts whose sensory nerves are detached from the brain lose all sensibility. In a certain rare disease (syringomyelia) there is loss of pain sense and of the sense of heat and cold, but not of tactile sense. Should accident or disease occur still higher up in the sensory area of the brain, or in areas where sensory fibres come together, as in the medulla and internal capsule, one side of the entire body may become anæsthetic. Such extreme grades of anæsthesia are infrequent, but there is almost no area in the body which may not lose its sensibility by accident or disease. Even in "functional" diseases, as hysteria, in which no known changes have taken place in the nervous tissues, loss of sensibility may occur. For *Artificial anæsthesia*, see ANÆSTHETIC. See also SENSATION.

AN'ÆSTHET'IC (for derivation see ANÆSTHESIA). A general term embracing two great groups of anæsthetics: (1) local anæsthetics, affecting a restricted area; (2) general anæsthetics, temporarily affecting the sensibility of the entire body. Cold is one of the safest local anæsthetics, in the form of cold water or cracked ice. Various freezing mixtures, such as ether spray or ethyl chloride spray, are even more valuable, but require skill and experience in use, or the part may be frozen and thus injured. Carbolic acid, creosote, thymol, and vola-

tile oils, containing phenol-like bodies, are local anæsthetics. These, when applied, have the power of paralyzing the sense organs of the skin and mucous membranes. Their use is attended with danger, however, and they should be administered by a physician only. The most important of the local anæsthetics is cocaine (q.v.), which has the peculiar and useful property of being able to paralyze sensory nerves alone. In a weak solution it is injected under the skin, which it renders anæsthetic, relieving pain, as in neuralgia, and permitting operations on the part. Applied to the mucous membrane, it destroys all feeling, and can be used in the eye, ear, nose, mouth, rectum, vagina, urethra, and bladder, to overcome pain or permit operations. Dr. J. Leonard Corning, of New York, in 1885, discovered that when injected in weak solution into the spinal canal, it produced a loss of all sensation below the place of injection. Extensive operations have been performed under spinal anæsthesia, and children have been born without pain to the mother; but there are some serious disadvantages in this medullary narcosis. Eucaine and stovaine have replaced cocaine for this purpose, having been found safer.

It is probable that for thousands of years the natives of India have used Indian hemp for the relief of pain, while the inhabitants of China have used opium from the poppy plant. In all ages and among all peoples, alcoholic drinks have been used to diminish sensibility to pain.

In 1800 Sir Humphry Davy, experimenting with nitrous oxide (q.v.) or laughing gas, suggested its usefulness as an anæsthetic. In 1844 Dr. Horace Wells (q.v.), an American dentist, demonstrated that the gas may be actually employed for painless extraction of teeth. In 1828 Dr. Hickman suggested carbonic acid gas. As early as 1795 Dr. Pearson had used the vapor of sulphuric ether for the relief of spasmodic affections of the respiration. The fact that sulphuric ether could produce insensibility was known to Faraday in 1818 and was shown by the American physicians, Godwin (1822), Mitchell (1832), Jackson (1833), Wood and Bache (1834); but it was first used to prevent the pain of an operation by Dr. Crawford W. Long (q.v.), of Georgia, who removed a tumor from a patient under ether in 1842. Unfortunately Long did not publish his discovery to the medical world and failed to utilize his opportunity. Upon the suggestion of Dr. Jackson, Dr. W. T. G. Morton (q.v.), a dentist of Boston, after experimenting privately, introduced ether anæsthesia into general use in 1846. At the request of Dr. John C. Warren, Morton administered ether in an operation at the Massachusetts General Hospital on Oct. 16, 1846. In December, 1846, Robinson and Liston, in England, operated on patients rendered insensible by the inhalation of ether vapor. This substance was extensively used for a year, when Sir J. Y. Simpson, of Edinburgh, discovered the anæsthetic powers of chloroform (see CHLOROFORM), and introduced the use of it into his own department, midwifery. Since that time chloroform has been the anæsthetic in general use in Europe; but ether is preferred in America, except for children and parturient women. Chloroform should not be given where there is weak action of the heart from disease. No anæsthetic should be given in case of chronic or severe kidney disease. Consult Sir Frederick Hewitt, *Surgical Anæsthesia* (4th ed., London, 1912), and R. W. Cal-

lum, *The Practice of Anæsthetics* (New York, 1909).

AN'AGAL'LIS. See PIMPERNEL.

ANAGNI, à-nä'nyë. An episcopal city in south Italy, situated on a hill 1510 feet above sea level, 36 miles southeast of Rome (Map: Italy, H 6). It is the site of Anagnia which Vergil mentions as "wealthy Anagnia." The city is intimately connected with papal history, as it is the birthplace of four popes, and others here sought asylum in times of persecution. The Cattedrale di Santa Maria is the most noteworthy edifice. It was erected in the eleventh century and was restored in 1350. Its style is pure, and it contains many interesting antiquities. Anagni is the residence of many noble Italian families. Pop., 1881, 8023; 1901, 10,059; 1911, 10,429.

ANAGNIA. See ANAGNI.

AN'AGRAM (Gk. *ἀνά*, *ana*, backward + *γράμμα*, *gramma*, writing). The transposition of the letters of a word, phrase, or short sentence, so as to form a new word or sentence. It originally signified a simple reversal of the order of letters, but has long borne the sense in which it is now used. The Cabalists attached great importance to anagrams, believing in some relation of them to the character or destiny of the persons from whose names they were formed. Plato entertained a similar notion, and the later Platonists rivaled the Cabalists in ascribing to them mysterious virtues. Although now classed among follies, or at best among ingenious trifles, anagrams formerly employed the most serious minds, and some of the Puritan writers even commended the use of them. Cotton Mather, in his elegy on the death of John Wilson, the first pastor of Boston, in New England, mentions:

His care to guide his flock and feed his lambs
By words, works, prayers, psalms, alms, and *anagrams*.

The best anagrams are such as have, in the new order of letters, some signification appropriate to that from which they are formed. It was a great triumph of the mediæval anagrammatist to find in Pilate's question, "*Quid est veritas?*" ('What is truth?') its own answer: "*Est vir qui adest*" ('It is the man who is here'). Anagrams, in the days of their popularity, were much employed, both for complimentary and for satirical purposes; and a little straining was often employed in the omission, addition, or alteration of letters, although, of course, the merit of an anagram depends much upon its accuracy.

Isaac D'Israeli (*Curiosities of Literature*, vol. iii) has a chapter on anagrams, which, as an exercise of ingenuity, he ranks far above acrostics. Among a great many considered by him worthy of record, are the following: the mistress of Charles IX of France was named Marie Touchet; this became *Je charme tout* ('I charm every one').

On a visit to King's Newton Hall, in Derbyshire, Charles II is said to have written on one of the windows, *Cras ero lux* ('To-morrow I shall be light'), which is the anagram of *Carolus Rex*.

Anagrams have now gone out of fashion, or rather have been relegated to the puzzle column of the magazine for the household. And yet even in this century writers have formed their pen-names by recombining the letters of their real names. For example, Bryan Waller Proctor is still called Barry Cornwall; add *poet*, and the anagram becomes complete. Besides D'Israeli,

cited above, consult Wheatley, *On Anagrams* (Hartford, 1862).

AN'ACHEIM. A city in Orange Co., Cal., 27 miles by rail southeast of Los Angeles; on the Southern Pacific and the Atchison, Topeka, and Santa Fe railroads (Map: California, H 9). It is in a fertile valley and has fruit canning and drying interests, and a large trade in oil, oranges, lemons, walnuts, and farm and dairy products. Sugar, beer, wines, and brandies are manufactured. The city owns and operates its water works and electric light plant. Anaheim was settled by 50 German families in 1857 on a coöperative basis, and in 1878 was incorporated as a town. An interesting account of its early history is given in *Nordhoff, Communitistic Societies of the United States* (New York, 1875). Pop., 1900, 1456; 1910, 2628.

ANAHUAC, ä'nä-wäk'. A Mexican term applied to the great central plateau of Mexico, which comprises nearly half of the total area of the Republic. Roughly speaking, it lies between 15° and 31° N. lat. and long. 95° and 110° W., while its altitude ranges between 6000 and 9000 feet. The plateau is the granary and stock-raising centre for the country, whose chief cities are mainly situated upon it. The name "Anahuac" was the Aztec term for all Mexico.

ANAÏTIS, än'ä-ī'tīs. The ancient Persian goddess of waters, whose worship was widely spread in the East in early times. The Avesta (q.v.) celebrates her praise as the celestial stream *Arđvi Sura Anahita* 'the lofty, mighty, and undefiled,' and describes her descent from the heavens. She appears as *Anahata* in the cuneiform inscriptions of the Persian King Artaxerxes II (fourth century B.C.). Her name as *'Anaitis*, *Anaitis*, is in Strabo, Plutarch, and elsewhere, and she became familiar in Greece as Venus Anaitis (*'Aφροδίτη 'Αναΐτις*, *Aphroditē Anaitis*). She was the patron of fecundity and secured for pregnant women an easy delivery. Consult Windischmann, *Die Persische Anahita oder Anaitis* (Munich, 1856), and Jackson, *Iranische Religion*, in Geiger and Kühn's *Grundriss der iranischen Philologie*, vol. ii (Strassburg, 1896-1904).

AN'AKIM (Heb. children of Anak, i.e., the long-necked, a giant). Represented in the Old Testament as a race of giants (Num. xiii. 33; Deut. ii. 10-12, etc.), one of whose strongholds was Kirjath-Arba, or Hebron, in southern Palestine (Josh. xiv. 12-15), but who were spread over the mountains of Judah and Israel. Anakim is an indefinite designation like Rephaïm for miscellaneous groups of the pre-Israelitish inhabitants of Palestine. They are said to have been conquered by Joshua together with the rest of the Canaanitish peoples (Josh. xi. 21), though according to verse 22 a remnant survived in the Philistine cities of Gaza, Gath, and Ashdod.

ANAL'CITE, ANALCIME, or CUBICITE (Gk. *αν, an*, priv. + *ἀλκή, alkē*, strength; refers to its weak electricity when heated or rubbed). A common zeolite mineral, chemically a hydrated silicate of sodium and aluminum. It crystallizes in isometric forms, commonly the trapezohedron. Its lustre is vitreous, its color white, greenish, or faintly red. It occurs with other zeolites.

AN'ALEM'MA (Gk. *ἀνάλημμα*, a support, prop; a sun-dial). A name given to an orthographic projection of a sphere upon the plane of a meridian, the point of sight being assumed at an infinite distance on a line normal to the given plane and passing through the centre of

the sphere. The term was also applied to the sun-dial, but more often to an instrument of brass or wood, on which the above projection could be drawn and which was used for astronomical purposes. The term is further employed to designate a scale, often seen on terrestrial globes, showing the declination of the sun and the equation of time for various days of the year.

AN'ALGE'SIA. See ANÆSTHESIA.

ANAL'OGISTS. See PHILOLOGY.

ANALOGISTS. See ANOMALISTS AND ANALOGISTS.

AN'ALOGUE (Gk. *ἀνά, ana*, according to + *λόγος, logos*, due ratio). A term in comparative anatomy. Organs are *analogous* to one another, or are *analogues*, when they perform the same function, though they may be altogether different in structure; as the wings of a bird and the wings of an insect. Organs, again, are *homologous*, or *homologues*, when they are constructed on the same plan, undergo a similar development, and bear the same relative position, and this independent of either form or function. Thus, the arms of a man and the wings of a bird are homologues of one another. See HOMOLOGY.

ANAL'OGY (Gk. *ἀναλογία, analogia*, equality of ratios). In general, an agreement or correspondence in certain respects between things in other respects different. Euclid employed it to signify proportion, or the equality of ratios, and it has retained this sense in mathematics; but it is a term little used in the exact sciences, and of very frequent use in every other department of knowledge and in human affairs. In grammar we speak of the analogy of language; i.e., the correspondence of a word or phrase with the genius of the language, as learned from the manner in which its words and phrases are ordinarily formed. (See PHONETIC LAWS.) In philosophy analogy presupposes a rule inferred from observation of instances and is the application of this rule to other instances not precisely but somewhat similar. We venture upon this application with more or less confidence according to the degree of ascertained similarity and according to the extent of observation from which our knowledge of the rule has been derived. John Stuart Mill, in his *Logic*, states the formula of analogy in this way: "Two things resemble each other in one or more respects; a certain proposition is true of the one, therefore it is true of the other." What makes analogical reasoning successful at all is the fact that superficial resemblances often point to fundamental identity in type. Analogical reasoning is the assumption of a deeper significance in similarities than our knowledge of the facts warrants. When this assumption is justified by the event, the analogy has been fruitfully suggestive; when it is not, the analogy has been misleading. Even when analogy leads to discovery, it does this merely by suggestiveness; the final establishment of the truth analogically suggested is never accomplished by analogy, but by some stricter logical method. Thus, reasoning from analogy indeed warrants only probable conclusions; but the probability may become of a very high degree, and in the affairs of life we must often act upon conclusions thus attained. Reasoning from analogy, however, requires much caution in the reasoner. Yet even when its conclusions are very uncertain, they often serve to guide inquiry and lead to discovery. Many of the most brilliant discoveries

recently made in natural science were the result of investigations thus directed. (For the "Analogies of Experience" in Kant, see F. Paulsen, *I. Kant*, Eng. trans., 1902. See also Bacon's *Novum Organum*, Aph. ii, 27, Fowler's ed.) In law, reasoning from analogy must often, to a certain extent, be admitted in the application of statutes to particular cases. Upon similar reasoning the practice of medicine very much depends. In literary criticism it is also often necessary for purposes of interpretation, the sense of the author in a passage somewhat obscure being in some measure determined according to passages in which he has expressed himself more clearly. The application of this rule to the interpretation of Scripture is a point of difference between Protestants and Catholics, the latter insisting upon the interpretation of difficult passages by ecclesiastical tradition and authority. Protestant theologians have very generally employed, with reference to this rule of interpretation, the phrase "analogy of faith," deriving it from Rom. xii. 16; but the meaning of the expression in that verse is disputed. The opposite of analogy is *anomaly* (Gk. irregularity); and this term is used not only in grammar, but with reference to objects of natural history which in any respect are exceptions to the ordinary rule of their class or kind. In physiology analogy is similarity of function between organs which are structurally or morphologically different; e.g., the tail of a fish and that of a whale are analogous organs; in this usage analogy is opposed to homology, which refers to the structural similarity of organs that may even perform different functions; e.g., the wing of a bird and the arms of a man.

ANALOGY OF RELIGION, THE. The popular name of a famous theological treatise by Joseph Butler, Bishop of Durham. The full title is, *The Analogy of Religion, Natural and Revealed, to the Constitution and Course of Nature*. (For a statement of the leading aim of the *Analogy*, see JOSEPH BUTLER.) The book is in two parts. The first treats of the analogy between natural religion, implying belief in God as the Creator and Governor of the universe, and what is known as natural law; the second discusses the analogy between revealed religion and natural law. Butler's argument is not directed against atheistic or pantheistic opponents of Christianity, but against the deists of his time, notably, Matthew Tindal and John Toland (qq.v.), whose works were written to disprove the necessity of revelation in religion.

ANALYSIS (Gk. *ἀνάλυσις*, a resolution into parts, from *ἀνά*, *ana*, up + *λύειν*, *lyein*, to loosen). A term frequently employed in general philosophy and in the sciences, as the opposite of the term "synthesis." In philosophy the term "analysis" is generally applied to the mental act of distinguishing within a given object its various characteristics; thus, the process by which we recognize that an apple is a thing whose attributes are sweetness, roundness, rosiness, etc., is said to be a process of analysis. On the contrary, the process by which we recognize that various properties together form the characteristics of a single object is termed "synthesis"; thus the consolidation, in our mind, of the several characteristics of an apple into a single concept, is a synthesis. The two processes are complementary aspects of the same mental act. It should be borne in mind that analysis does not really destroy the unity of a given

object; it merely recognizes various distinctions within that unity. Nor does synthesis fuse into indistinguishableness the characteristics it starts with; it correlates them into a unity, but in that unity the identity of each part is fully preserved.

In mathematics the term "analysis" is employed, on the one hand, to denote a potent method of discovery and demonstration; on the other hand, and more or less inaptly, to designate collectively several important branches of modern mathematics.

The method said to be analytic consists in resolving a given relation into its mathematical elements. Analysis in this sense of the term is sometimes applied to the solution of geometric questions. It consists in assuming a certain relation to be the true answer to the question and resolving that relation into simple truths. Euclid (*Elements*, book xiii) formulates this idea as follows: "Analysis is the obtaining of the thing sought by assuming it and so reasoning up to an admitted truth." For example, let the question be, In what ratio does the altitude of an isosceles triangle divide its base?

The simple answer that suggests itself through the inspection of a figure is that the base is bisected. Assume this to be so. In that case the two triangles into which the altitude divides the given triangle are identically equal, because their sides are respectively equal; and therefore the two angles made by the altitude and the base are also equal. But the latter conclusion is an evident truth if we remember that the altitude of a triangle is a line perpendicular to its base. We therefore infer that our assumption was correct and that the base is really bisected. Furthermore, by reversing the above process we can now demonstrate our assumed truth synthetically; i.e., reconstruct it from the simple, admitted truths, to which the analysis has led.

Now, although the demonstrations of geometric theorems, and perhaps most of the theorems themselves, were originally discovered in the manner just indicated, by analysis, most of the ordinary text-book demonstrations are undoubtedly syntheses, for they gradually lead from the mathematical elements—the axioms—to more or less complex truths. Geometry is therefore spoken of as a synthetic science. However, the *reductio ad absurdum*, which is not infrequently employed, is a purely analytical method, differing only in form from the type of analysis considered above. The suggested relation is, namely, assumed to be not true, but false, and this is shown to lead to absurd conclusions—the inference being that the suggested relation is necessarily true.

In designating a part of mathematical science, the term "analysis" is applied, on the one hand, to the theory of functions (including series,

logarithms, curves, etc.), on the other hand, to the mathematics of infinitesimal quantities, comprising the differential calculus, the integral calculus, and the calculus of variations. Algebra, although usually limited to equations, includes in the wider sense of its name the branches just enumerated. Indeed, it is because of their relation to algebra that these branches have been united under the general term "mathematical analysis." Algebra itself, however, is far from being uniformly analytical, and many an instance of pure synthesis may be found in any of the branches of applied algebra, say in analytical geometry. In general, there is no branch of human thought in which the method of analysis, or that of synthesis, is used exclusively. The complete abolition of either of these methods would involve not a small diminution in our power of establishing interesting truths.

In discussions concerning the methods of science, the processes of analysis and synthesis are often erroneously identified with those of induction and deduction. The reason of this lies mainly in the fact that there has been considerable disagreement as to the proper definition of the terms in question. The distinction between the two pairs of antithetic terms becomes perfectly clear, however, if we define analysis as leading from the compound to the elementary, and synthesis as leading from the elementary to the compound; induction as leading from the particular to the general, and deduction as leading from the general to the particular. As thus defined, analysis, as well as synthesis, may be coincident, though not identical, with either induction or deduction. Thus, to turn for an illustration again to mathematics, the ordinary demonstration of a geometric theorem is a deduction; for what can be more general in character than the axiomatic truths from which the theorem is deduced? But the demonstration is also a synthesis; for what can be more elementary than those axioms which are used in reasoning up to the theorem? On the other hand, Newton's binomial theorem, as often demonstrated in text-books of algebra, presents an instance of synthesis coincident with induction. The general relation expressed by that theorem is induced by the examination of a number of particular instances. But the demonstration is also a true synthesis, for it combines a number of relations into one.

More or less extensive discussions of the analytical processes of philosophy may be found in the following works: R. H. Lotze, *Logic* (Eng. trans., Oxford, 1888); F. H. Bradley, *Principles of Logic* (London, 1883); L. T. Hobhouse, *Theory of Knowledge* (London, 1896), and Bosanquet, *Logic* (Oxford, 1888). See also ANALYTIC JUDGMENT; JUDGMENT; KNOWLEDGE, THEORY OF; LOGIC.

ANALYSIS, CHEMICAL. The art of determining the chemical composition of substances. The derivation of the word "analysis" (see preceding article) suggests that chemical analysis necessarily requires the breaking up of substances into their constituent parts. In practice the term is used in a wider sense and is often applied to methods of testing that involve no processes of separation. In most cases, however, one or the other constituent is actually isolated, or some constituents of the original substance, which would interfere with the examination, are actually removed.

An analyst may restrict himself merely to de-

termining what are the constituents of the substance submitted to him; in that case the analysis is *qualitative*. Or he may also determine the relative amounts of some or all of the constituents; then the analysis becomes *quantitative*. In some cases he can only state what elements are present, and in what quantities they enter into the composition of the given substance. The analysis is then said to be *ultimate*. In most cases, however, he further tries to determine in what combinations and in what conditions in respect to their capacity of forming combinations the elements exist in the given substance; and then the analysis is termed *proximate*. The ultimate analysis of organic substances is of great importance and has been brought to high perfection. (See CARBON COMPOUNDS.) On the other hand, the proximate analysis of organic substances is often a task beyond the power of analytical chemistry. Attempts, however, have been made to treat this subject, too, in a systematic manner.

Preliminary Examination of Inorganic Substances. When a substance is submitted for qualitative analysis, the chemist first notes its color and form—the latter with the aid of a simple magnifying glass. The substance is then usually subjected to an examination by means of the blowpipe (q.v.) or the non-luminous gas-flame. (See FLAME.) Blowpipe analysis has been elaborated into a systematic scheme for the detection of all the important metallic and of some acidic radicals, and has proved of great value, especially to the mineralogist. (See MINERALOGY.) The chemist, as a rule, makes only a brief examination to determine the general nature of the substance and to answer such questions as whether water, organic matter, silicates, complex cyanides, large quantities of an easily reducible metal, sulphur and arsenic, are or are not present, such constituents often rendering necessary a modification of the usual scheme of systematic analysis. Heating a small portion of the substance in a closed glass tube reveals the presence of most kinds of organic matter by the smell and separation of carbon, and the presence of water by the drops which condense in the cooler part of the tube. Heating on charcoal with a reducing flame, sometimes with the aid of fluxes, shows the presence of metals that give volatile oxides, the latter forming characteristic coats on the charcoal; and the same test makes it possible to detect any important quantity of an easily reducible metal, metals in the free state being readily identified by their lustre and physical properties. The behavior of the substance when fused with a bead of sodium metaphosphate or of sodium carbonate shows whether a silicate or much silica is present, etc. Often additional special tests are made. For example, gently warming a small portion of the substance with concentrated sulphuric acid may serve to detect volatile acidic substances, such as sulphurous acid and nitrous acid, which might be lost in the regular processes or appear in another form.

If the substance submitted for analysis is a liquid, its color and odor are noted, its reaction toward litmus is ascertained, a portion is evaporated to dryness, and the solid residue, if there is any, is subjected to the preliminary examination as in the case of any other solid.

Qualitative Inorganic Analysis. Before a systematic qualitative analysis of a solid substance can be undertaken, the substance must be

obtained in solution. Sometimes substances submitted for analysis are found to be directly soluble in water. In most cases, however, substances cannot be dissolved unless transformed chemically. Since most chlorides and most inorganic acids are soluble in water, the desired transformation can usually be effected by treating the finely powdered substances with aqueous hydrochloric acid, which converts the metals or metallic oxides present into chlorides, while the acids originally combined in the substance are set free. In case metals (such as silver) are present, which form insoluble chlorides, or in case non-metals (such as sulphur or arsenic) are present, or in case hydrochloric acid does not attack the substance, nitric acid is used. By this the metallic compounds present in the substance are transformed into nitrates, and all normal nitrates are soluble in water; on the other hand, the non-metals present are mostly changed into the corresponding oxygen acids, which are likewise soluble in water—sulphur, for instance, being transformed into sulphuric acid. Many important and familiar substances, however, resist the action of both of these acids. A few, as gold and platinum, will dissolve, forming soluble compounds in a mixture of hydrochloric and nitric acids, the so-called aqua regia, which, on warming, gives off free chlorine. But other substances, such as glass, porcelain, and many natural silicates, resist the action of acids almost entirely. Such substances are usually broken up by melting them with carbonates of the alkali metals and potassium nitrate, or by treatment with hydrofluoric acid. Subsequent treatment with water and hydrochloric acid then usually yields the required solutions.

Let us suppose that we have obtained a clear solution in nitric acid, which may contain all the more familiar metals and is free from organic matter. To this solution we add hydrochloric acid; if we obtain a white solid substance, which does not dissolve in a moderate excess of acid, we know we must have present some or all of the three metals, lead, silver, or mercury in the univalent form, since, of all the more familiar metals, only these three form insoluble, or nearly insoluble, chlorides. The solid precipitate is separated from the liquid by filtration, and we have then on the filter a solid which may consist of any or all of the chlorides of lead, silver, and univalent mercury. A study of the properties of these chlorides shows that lead chloride is freely soluble in hot water, while the other two are not. Therefore, if the mass is treated with hot water, the lead chloride, if present, will dissolve, and can be filtered off while the other two remain behind. The liquid is then examined for lead, which is easily done, since all metals which could interfere with the test have been separated. Further, since silver chloride is known to be easily soluble in aqueous ammonia, while mercurous chloride is converted into a black, insoluble mass containing free mercury, one might assume that treatment of the two chlorides with ammonia solution would effect an easy separation of silver chloride from mercurous chloride. This case, however, well illustrates one of the difficulties of analytical work. If the amount of mercurous chloride is large in proportion to the amount of silver chloride, the metallic mercury set free by the action of ammonia causes the formation of metallic silver, which is practically insoluble in ammonia. If, therefore, ammonia has failed to

extract anything from the precipitate in question, we cannot conclude that silver is absent. We must, then, treat the black mass with a mixture of nitric and hydrochloric acids, which dissolves the black substance containing mercury; while the silver, if at all present in the original substance, remains behind, again in the form of silver chloride, but this time unmixed with anything else. Such cases frequently occur. So often is the behavior of a substance toward a reagent modified by the presence of other substances, that no scheme of analysis worked out at the writing table possesses any value until thoroughly tested in the laboratory.

The filtrate obtained on precipitating out the three metals just spoken of is treated with sulphuretted hydrogen. This precipitates a second group of metals, which are separated from one another by methods analogous to those employed for the first group. The filtrate obtained on precipitating out the metals of the second group is usually treated with ammonium sulphide, and the filtrate from the ammonium sulphide group with ammonium carbonate. Thus the metals that may be present in the original substance are separated into several groups and then special methods are employed to separate and test for the several metals composing each group.

The acid radicals are tested for in a somewhat similar manner, but usually less systematically; because by the time all the metals present have been identified, the analyst usually is able to exclude the possibility of the presence of a large number of acids.

The spectroscope (q.v.) is usually applied to identify the metals potassium and lithium, and is quite indispensable when substances are to be examined to ascertain whether they are in the purest condition possible, since the instrument is capable of revealing the presence of the merest traces of substances. See SPECTRUM ANALYSIS.

The system of analysis usually followed may be carried out mechanically and almost without intelligence, if the substance examined contains only the more familiar metals and acids, and those in considerable quantities. In fact, qualitative analysis is criticised by teachers on this account, when used as a discipline, or as a means of acquiring a scientific knowledge of chemistry. The ordinary scheme, however, overlooks even some elements of common occurrence, as titanium; and when the chemist has to take into consideration small amounts and the less familiar elements, all his chemical knowledge and acuteness find full field for exercise.

It may be seen from the above that the chemist relies on two sets of properties for the identification of a substance: First, those that belong to the substance itself under ordinary conditions; for example, the yellow color and the lightness of sulphur. Such properties may be called properties of condition. On the other hand, if sulphur is heated sufficiently without access of air, it assumes the form of a red vapor; if heated with access of air, it forms with the oxygen of the air a colorless gas possessing a characteristic odor. The first of these changes is physical; the second, chemical. Physical or chemical changes may thus serve to bring out certain properties that are just as characteristic of the substance as the properties of condition. Such properties may be called properties of reaction. They are far more numerous than properties of condition and far more useful to the analyst. In the case of

sulphur, for instance, the properties of condition are only apparent when the sulphur is in a nearly pure form; but the two properties of reaction just mentioned as an example enable us to identify sulphur even when mixed with so much foreign matter that the characteristic color and lightness are quite masked.

Quantitative Analysis. Before beginning a quantitative analysis the chemist must know, in part at least, the qualitative composition of the substance to be analyzed. This knowledge may be obtained by a special qualitative analysis, or, more frequently, from the results of numerous analyses of similar substances.

Methods of quantitative analysis which involve weighing (see BALANCE) are termed *gravimetric*. Methods that involve measuring the volumes of solutions are termed *volumetric*. Finally, methods involving the decomposition of substances by means of an electric current are termed *electrolytic*.

As an illustration of the methods of gravimetric analysis, we may take the analysis of an alloy of silver and copper, such as is used for silver coins in the United States. If high-class weights and a balance are at the disposal of the analyst, not more than half a gram (less than one-fourth of a dime) is the most suitable weight to be taken of the alloy. If the weights or the balance is inferior, a larger amount must be taken, so that the errors of weighing may remain proportionately small. The alloy is dissolved in nitric acid, the insoluble residue (carbon and tin oxide) filtered off and weighed, and the filtrate is treated with hydrochloric acid to precipitate silver chloride, just as in qualitative work. In quantitative work, however, certain precautions must be taken in carrying out this simple operation. Thus, only a slight excess of hydrochloric acid must be added, since silver chloride is somewhat soluble in a large excess of that acid; the liquid must be vigorously stirred and warmed to cause the precipitate to assume a form in which it can be easily filtered and washed, etc. The silver chloride is then filtered off, dried, ignited, and weighed, proper corrections being made for the weight of the ash of the filter. The amount of silver in the alloy is then readily calculated from the weight of silver chloride yielded. The filtrate from the silver chloride contains copper and usually a small amount of lead. The exact amount of copper contained in this filtrate may be best determined by electrolysis. For this purpose the filtrate is first evaporated to dryness, in order to get rid of the hydrochloric acid; the residue is taken up with dilute nitric acid, and the solution thus obtained is subjected to the action of an electric current passing between two carefully weighed platinum terminals immersed in the liquid. The copper is thus deposited in the metallic state on the electro-negative terminal, while the lead is deposited in the form of lead dioxide on the terminal connected with the positive pole. The gain in weight of the terminals gives directly the weight of copper and permits the calculation of the weight of the lead.

Another method, involving the fusion of substances by heat and usually termed the "fire method," is applied chiefly to the determination of metals in ores, and is especially useful in the case of gold and silver ores. Thus, the amount of silver in an ore free from gold may be easily and quickly found by heating a weighed portion of the ore with metallic lead and a little fused

borax in an oxidizing atmosphere. The lead melts, the ore floats on the surface, sulphur and arsenic are volatilized as oxides, the lead is partly oxidized, and the oxide of lead forms a liquid slag with most of the constituents of the ore. At the end of the operation a lead button is obtained, containing the silver. This button is placed on a porous support made of bone-ash (calcium phosphate) and again heated in an oxidizing atmosphere. The lead melts and oxidizes, part of the oxide passes off as gas and part sinks into the porous support, while the silver remains behind as a metallic button, which can be weighed. If gold is present, it is found and weighed with the silver, and then separated by a wet process.

Although gravimetric methods are the more generally applicable, volumetric methods are much more commonly used in the every-day work of the technical analytical chemist. Hundreds of volumetric determinations are made daily in all great manufacturing centres for every one gravimetric determination. As an illustration of volumetric analysis, we may take a method used for the determination of iron in iron ores and applicable to all iron ores found in the United States, except those containing titanium. The process depends on the fact that when a solution of potassium permanganate is added to an acid solution of iron in the ferrous state, the iron is changed into the ferric state, while the strongly colored permanganate is transformed into an almost colorless manganous salt, the volume of potassium permanganate solution thus decolorized being proportional to the amount of ferrous iron present in the acid solution. This fact is made use of by the analyst in the following manner: He first determines the maximum volume of the given permanganate solution which can be completely decolorized by a known amount of iron. For this purpose, say, 300 milligrams of pure iron are dissolved in hydrochloric acid and some metallic zinc is added in order to make certain that all the iron is present as ferrous chloride, FeCl_2 (and not as ferric chloride, FeCl_3). The given permanganate solution is then slowly added from a burette to the solution of iron until the disappearance of the color has ceased to take place. The burette then shows what volume of the permanganate solution can be decolorized by 300 milligrams of iron dissolved as a ferrous salt. Suppose the volume of permanganate solution thus measured is 40 cubic centimeters. Then it is evident that one cubic centimeter of the solution could be decolorized by 7.5 milligrams of iron. A weighed portion of the ore to be examined, say, 500 milligrams of it, is now treated in exactly the same manner as were the 300 milligrams of iron; i.e., the ore is dissolved in hydrochloric acid, its iron is carefully reduced to the ferrous state, and the permanganate solution is slowly added from the burette until no more can be decolorized. Suppose the volume of the permanganate solution decolorized this time is 41 cubic centimeters. Then, since 7.5 milligrams of iron are required to decolorize every cubic centimeter of the permanganate solution, it is evident that the 500 milligrams of the ore must contain 307.5 (i.e., 7.5×41) milligrams of iron and hence the ore is reported to contain 61.5 per cent of iron.

Special Methods of Analysis. Any physical property which depends on the amount of substance present, and is capable of measurement,

may be used for quantitative determinations. Thus, the specific gravity of liquids, which can be readily determined with great accuracy, is extensively used to determine the amount of the dissolved substance in pure or nearly pure solutions. In this manner the amount of alcohol, potassium, or sodium hydroxide, common salt, and, indeed, of all the more familiar salts contained in aqueous solutions, may be determined more readily than in any other way. For determinations of this kind, when no high degree of accuracy is required, the hydrometer is extensively used in chemical laboratories. (See HYDROMETER; ALCOHOLOMETRY.) Among other properties used may be mentioned the coefficient of refraction, the optical rotatory power—much used in determining the strength of sugar solutions (see SUGAR), the intensity of the color or the degree of opacity of solutions and of liquids containing solids in suspension, the electrical conductivity, the boiling point of solutions, the melting point of solids, etc.

Analysis of Gases. The analysis of gases differs from that of solids and liquids in that it is more easy to measure than to weigh gases, and hence the results are usually given in percentages by volume. For many gases reagents are known which absorb the gas readily and completely. Thus, a mixture of carbon dioxide, ethylene, oxygen, carbon monoxide, and nitrogen may be analyzed by bringing a measured volume into contact with caustic potash (which absorbs the carbon dioxide), then with fuming sulphuric acid (which absorbs the ethylene), then with an alkaline solution of pyrogallol (which absorbs the oxygen), then with a solution of cuprous chloride (which absorbs the carbon monoxide), and noting the contraction caused by each treatment. The nitrogen remains behind unabsorbed. Hydrogen and marsh-gas are usually determined by combustion with oxygen. Gases very soluble in water, such as sulphur dioxide, are absorbed in that liquid, and then the amount dissolved is determined by a volumetric process. Carbon dioxide in air offers a special case. As in normal air only 3 parts in 10,000 are present, the ordinary process of measuring the volume before and after treatment with caustic potash requires special apparatus and great care to get good results. Usually a large volume is treated with a measured quantity of a solution of barium hydroxide of known strength, a portion of the barium hydroxide being thus converted into insoluble barium carbonate, and the rest estimated volumetrically.

When the highest degree of accuracy in gas analysis is required, the gases must be confined over mercury; further, only solid absorbents must be used, and careful corrections must be made for changes of pressure and temperature. When water is used to confine the gas, some inaccuracy is introduced, since all gases are more or less soluble in water. In technical work, however, a very high degree of accuracy is but rarely required. The technical analysis of gases has assumed great practical importance, owing to the extension of the use of gaseous fuels.

Accuracy. The accuracy of analytical work varies within wide limits, according to the purpose which an analysis is intended to serve. The most accurate analyses are those made to determine the proportions by weight, in which the various elements unite with each other. Thus, the proportion in which silver and chlorine unite forms one of the best determined constants of

nature. In determining the proportion in which magnesium unites with chlorine, a series of determinations has been obtained agreeing so perfectly with each other that a loss or gain of only one-twentieth of a milligram of the magnesium chloride analyzed corresponds to the difference between the highest or lowest results and the average. No such accuracy is attainable in commercial or technical work. Nor, if attainable, would it be of any value, since it is but seldom possible to obtain samples representing precisely the average composition of large quantities of material.

The aim of the commercial and technical analyst is usually, not to attain extreme accuracy, but to obtain results which he knows to be correct within certain limits. Thus, if an analyst is required to find the percentage of copper in a sample representing a large cargo of ore, in order to fix its commercial value, he can determine the copper by the electrolytic method to within about one part in 400 without undue expenditure of time or labor. If the object of the analysis is to enable the superintendent of the smelting furnace to make up charges of a suitable content of copper, a much quicker volumetric process is used; the results are then less accurate than those of the electrolytic process, but still much more accurate than is necessary for the purposes of the smelter. When it becomes necessary to determine the amount of substances which occur in relatively very small quantities, it is impossible to avoid relatively large errors. For instance, in determining the amount of phosphorous in a specimen of steel, where the total amount is only about one part in 1000, the analyst is not surprised to find that, in spite of all care, differences of 2 per cent occur between the results of determinations made carefully and under exactly the same conditions.

History. Systematic chemical analysis dates only from the latter half of the eighteenth century, although chemists of an earlier period had accumulated observations which made it possible to test for the presence of many substances. Bergman (1735–84) first attempted to give a plan for systematic qualitative analysis of inorganic substances in the wet way. Until the work of Lavoisier (1743–94) had shown the importance of relations by weight, quantitative determinations attracted little attention, although such determinations were by no means entirely wanting. After the triumph of Lavoisier's views, the importance of quantitative analysis was fully seen; and the labors of Klaproth (1743–1817), Proust (1755–1826), and Vauquelin (1763–1829) rapidly enriched chemistry with new methods. But it is to Berzelius (1779–1848) that quantitative analysis owes the heaviest debt. Berzelius published tables of the atomic weights of all the elements well known at that time, and some of his values for these important constants have scarcely been improved on since. In the course of these researches an immense number of new methods were developed. Two of his pupils, Heinrich Rose (1795–1864) and Friedrich Wöhler (1800–82), not only added to the methods in use, but published comprehensive works on inorganic analysis. The final edition of Rose's work, published after his death by his pupil, R. Finkener, remains an invaluable work to the analyst of to-day. Although K. R. Fresenius (1818–97) added many new methods, his great service, which secures

him a conspicuous place in the history of analytical chemistry, was the collection and comparison of the various methods in use, the publication of text-books, which have formed the models of most others since published, and the founding of a periodical devoted to analytical chemistry. The last editions of his standard works are in the hands of every analyst.

Volumetric analysis was introduced by Gay-Lussac (1778-1850); but although he gave the first of his important processes to the world as early as 1824, it was not until the publication of Fr. Mohr's text-book on the subject that volumetric analysis began to rank in importance with gravimetric methods. The ultimate analysis of organic bodies was attempted with some success by Lavoisier and Berzelius. Gay-Lussac, in 1815, introduced the use of cupric oxide, and Liebig (1803-73) gave the process essentially its present form. Dumas (1800-84) introduced, in 1830, the method for the determination of nitrogen by direct measurement of the liberated gas, which is still preferred in strictly scientific work to the easier method devised by Kjeldahl.

Many attempts were made to analyze gases in the eighteenth century and in the beginning of the nineteenth, but it is to Bunsen (1811-99) that we owe the perfection of the methods at present in use for gas analysis. The first edition of his text-book, *Gasometrische Methoden*, was published in 1857. The improvements since that time have been principally in the direction of adapting the methods to rapid work for technical purposes.

Bibliography. Rose, *Handbuch der analytischen Chemie*, completed by Finkener (Leipzig, 1867-71); Mohr, *Lehrbuch der chemisch-analytischen Titrimethoden*, edited by Classen (Brunswick, 1886), and *Chemisch-technische Untersuchungs-Methoden*, edited by Lunge (Berlin, 1900); Fresenius, *Manual of Qualitative Chemical Analysis*, translated by Wells (New York, 1897); Fresenius, *Anleitung zur quantitativen chemischen Analyse* (Brunswick, 1875-87); Hempel, *Methods of Gas Analysis*, translated by Dennis (New York, 1892); Ahrens, *Anleitung zur chemisch-technischen Analyse* (Stuttgart, 1900); Treadwell, *Kurzes Lehrbuch der analytischen Chemie* (2 vols., 3d ed., Leipzig and Vienna, 1904-05); Treadwell, *Tabellen zur qualitativen Analyse* (7th ed., Berlin, 1912); Herz, *Physikalisch-chemische Grundlage der analytischen Chemie* (Stuttgart, 1907); Fiseher, *Elektroanalytische Schnellmethoden* (Stuttgart, 1908); Beekurts, *Analytische Chemie für Apotheker* (2d ed., Stuttgart, 1908); Ostwald, *Die wissenschaftlichen Grundlagen der analytischen Chemie* (Dresden and Leipzig, 1894; authorized English translation by McGowan, London and New York, 1895); Stieglitz, *Elements of Qualitative Chemical Analysis* (2 vols., New York, 1911); Böttger, *Stand und Wege der analytischen Chemie* (Stuttgart, 1911); Classen, *Handbuch der analytischen Chemie* (2 vols., 6th ed., Stuttgart, 1906 and 1912); Classen, *Theorie und Praxis der Massanalyse* (Leipzig, 1912); Biltz, *Qualitative Analyse anorganischer Substanzen* (4th ed., Leipzig, 1913); Mulliken, *Identification of Pure Organic Compounds* (3 vols., New York and London, 1896).

AN'ALYT'IC GEOM'ETRY. Geometry treated by means of algebra. Geometric conditions are expressed by equations which, after certain transformations, are interpreted again in geometric concepts. The powerful algebraic method

is thus made use of for discovering and demonstrating in a simple and easy manner the most complicated relations existing between quantities in space.

The interpretation of geometric relations in algebraic terms is effected by the use of some system of coördinates (q.v.). The primitive system of coördinates, called rectangular coördinates, is due to Descartes (Lat. *Cartesius*), from which fact they are often called Cartesian. In this system the position of a point (as P_1 ,

in the figure) is determined by its distance from the fixed axes XX_1 and YY_1 in the plane, called *axes of coördinates*, which intersect at right angles in a point O , called the *origin*. The distance x_1 of P_1 from YY_1 is called the *abscissa* of P_1 , and the distance y_1 from XX_1 is called the *ordinate*. The two lines x_1, y_1 , are called the *coördinates* of P_1 . Similarly, the coördinates of P_2 are x_2, y_2 . P_1, P_2 , or the points $(x_1, y_1), (x_2, y_2)$ are sufficient to determine the straight line AB . The algebraic equation (q.v.), $y = ax + b$, a, b , being constants, will be satisfied by various values of x and y . The various values of x , as x_1, x_2, x_3 —taken with the corresponding values of y , as y_1, y_2, y_3 —will represent a series of points $(x_1, y_1), (x_2, y_2), (x_3, y_3)$, lying in a straight line. That is, an algebraic equation of the first degree is represented by a straight line. In a similar manner an equation of the second

degree is represented by a curve. In the figure, c is a circle whose equation is $x^2 + y^2 = r^2$, r being the radius of the circle. This is evident by reference to the figure, since the coördinates of any point (x, y) form the sides of a right-angle triangle of hypotenuse r , so that $x^2 + y^2 = r^2$. The curve c is an ellipse whose equation is $b^2x^2 + a^2y^2 = a^2b^2$, a being the semi-major axis and b the semi-minor axis. The curve h is a hyperbola whose equation is $b_1^2x^2 - a_1^2y^2 = a_1^2b_1^2$. If the equations $x^2 + y^2 = r^2$ and $b_1^2x^2 - a_1^2y^2 =$

$a_1^2 b_1^2$ are solved for x, y , their roots are the coördinates of the points of intersection of the curves c, h . These values may be real or imaginary; if real, the curves cut in real points, as in the case of c, h ; if imaginary, the curves are said to cut in imaginary points, as in the case of e, h .

The practical work of plotting a curve may be explained by referring to a particular example; thus, to represent graphically the equation $2x^2 - 3y^2 = 10$. Rearranging and solving the equation for $y, y = \pm \frac{1}{3} \sqrt{6(x^2 - 5)}$. Therefore, by giving x various values (noticing that $x^2 > 5$ for real values of y) we have corresponding values of y as follows:

$$\begin{aligned} x &= \pm \sqrt{5}, \pm \sqrt{6}, \pm \sqrt{7}, \pm \sqrt{8}, \pm \sqrt{9}. \\ y &= 0, \pm \frac{1}{3} \sqrt{6}, \pm \frac{2}{3} \sqrt{3}, \pm \sqrt{2}, \pm \frac{2}{3} \sqrt{6}. \end{aligned}$$

Taking the approximate square roots, and laying off the abscissas and ordinates as indicated, and then connecting the successive points, the graph is an hyperbola, like h shown in the figure.

The power of the analytic forms to express geometric relations may be seen from the following: Let $z_1 = 0$ and $z_2 = 0$ represent the equations $a_1 x^2 + b_1 y^2 - c_1 = 0$ and $a_2 x^2 + b_2 y^2 - c_2 = 0$. Any values of x, y satisfying these two equations will evidently satisfy the equation $(a_1 x^2 + b_1 y^2 - c_1) - k(a_2 x^2 + b_2 y^2 - c_2) = 0, k$ being any constant. But this equation is $z_1 - k z_2 = 0$. Hence, if $z_1 = 0, z_2 = 0$ are the equations of any two curves, any point common to the two satisfies the equation $z_1 - k z_2 = 0$, and, therefore, this is the equation of a curve passing through all intersections of the given curves. In the same way, equations of any degree may be represented and discussed.

The position of a point in space of three dimensions may be expressed in terms of its distances from three fixed planes. In this way the properties of spheres, ellipsoids, and other solids are expressed by equations. In space of four dimensions the coördinates of a point are (x, y, z, w) , and in space of n dimensions $(x, y, z, \dots; n$ quantities), although we cannot draw the figures.

The ellipse, hyperbola, and parabola, being sections of a right circular cone, are known as *conic sections* (q.v.). They were chiefly investigated by purely geometric methods until the appearance of Descartes's *Discours* (1637). In the extensive development of analytic geometry since Descartes, a large number of coördinate systems have been introduced, the most important being the polar, generalized, homogeneous, Lagrangian, Eulerian, barycentric, and trilinear coördinates.

The most comprehensive English works are those by Salmon, *Treatise on the Conic Sections* (Dublin, 1879); *Higher Plane Curves* (1873); *Treatise on the Analytic Geometry of Three Dimensions* (Dublin, 1874). Other noteworthy works are: R. F. A. Clebsch, *Vorlesungen über Geometrie* (Leipzig, 1876); M. Chasles, *Traité de géométrie supérieure* (Paris, 1880); and among recent elementary works are those of C. Smith, Briot, Bouquet, Townsend, Stande, Niewenglowski, and Seott. For a further discussion, see GEOMETRY; COÖRDINATES.

ANALYTIC JUDGMENT. In Kantian philosophy, a judgment in which the predicate is the definition (q.v.) or part of the definition of the subject. All other judgments are synthetic. The distinction between analytic and synthetic judgments is open to serious objec-

tions if the distinction is to be made absolute. Concepts (q.v.) vary from mind to mind, and even in the same mind from time to time. To the laboratory chemist, perhaps the most essential mark in the concept water is expressed in the formula H_2O ; i.e., water is conceived to be a chemical union of oxygen and hydrogen in definite proportions. But the non-scientific man may have a clear idea of what he means by water and can perhaps define his concept. In such a case the definition would not include any reference to oxygen and hydrogen. Thus, the judgment that water is a certain chemical combination of oxygen and hydrogen, while an analytic judgment for the chemist, may be a synthetic judgment for the person who has not yet studied chemistry. Analysis and synthesis in logic are concomitant aspects of the same operation; every analytic judgment may be viewed as at the same time synthetic, and every synthetic judgment is also analytic. Consult E. Caird, *The Critical Philosophy of Immanuel Kant* (2 vols., New York and London, 1889). See the authorities referred to under ANALYSIS.

AN'ALYT'IC LAN'GUAGES. See PHILOLOGY.

AN'ALY'ZER. That part of a polariscope (q.v.) which is used for examining light after it has been polarized. (See LIGHT.) It may be a movable mirror, a plate of tourmaline, a doubly refracting crystal, or a Nicol prism. The latter is most frequently employed for this purpose.

ANAM'. See ANNAM.

ANAMALAI, a-ná-má-lí', HILLS. A mountain chain in south India, in Coimbatore district, Madras. It is a continuation of the western Ghats below the Palghat Pass and contains several lofty peaks. Valuable teak forests are on their sides, and there are many wild beasts.

ANAMIRTA, an'á-mir'tá. See COCCULUS INDICUS.

ANAMMELECH, a-nám'ê-lêk. A divinity worshiped by the inhabitants of Sepharvaim, who were deported to Samaria (2 Kings xvii. 31). It was probably the goddess Anath, the spouse of Melek. She may have been identical with the Anathyaho, or Anath, spouse of Yaho, worshiped by the Jews of Elephantine in the fifth century B.C. See ELEPHANTINE PAPYRI.

ANAMORPHISM. See METAMORPHISM.

AN'AMO'SA. A city and the county-seat of Jones Co., Iowa, about 40 miles (direct) southwest of Dubuque, on the Wapsipinicon and Buffalo rivers, and on the Chicago and Northwestern, and the Chicago, Milwaukee, and St. Paul railroads (Map: Iowa, F 2). It is the seat of a State reformatory. Anamosa has a considerable trade in building stone and manufactures school supplies, butter tubs, hoods, and spades. The city owns its water works. Pop., 1900, 2891; 1905, 2878; 1910, 2983.

ANA'NAS. See PINEAPPLE.

AN'ANI'AS (Gk. 'Avavias, transliteration of Heb. word, 'Yahwe hath been gracious'). 1. One of the members of the early Church at Jerusalem who conspired with his wife, Sapphira, to make a false statement respecting their gift of property to the community of the brethren and was, with her, struck dead (Acts v. 1-11). 2. A disciple at Damascus mentioned in connection with Saul's experience in that place (Acts ix. 10-17; xxii. 12-16). 3. A high priest at Jerusalem, mentioned in connection with Paul's appearance before the Sanhedrin and

later, before Felix, at Cæsarea (Acts xxiii. 2-5; xxiv. 1; cf. Josephus, *Ant.* xx, 6. 2).

ANANIEV, or **ANANYEV**, à-nän'yěf. A town in the government of Kherson, Russia, about 220 miles northwest of Kherson, on the banks of the Tiligula, 95 miles north of Odessa (Map: Russia, C 5). There is little manufacturing, and the only trade is in agricultural products. It has a mixed population of Russians, Jews, and Rumans, numbering in all about 17,000 in 1897, as against 14,200 in 1885. Ananiev was annexed to Russia in 1792.

ANAPA, à-nä'pá. A small seaport on the north coast of the Black Sea, in the Kuban territory, Russia (Map: Russia, E 6). An old rampart, now serving as a promenade, is a feature of the town. A trade in grain and fish is carried on. Founded by the Turks as a fortress in 1781, Anapa was repeatedly attacked by the Russians in their wars with Turkey. It was finally taken and annexed in 1829. In 1854, at the approach of the allied fleet, Russia evacuated it, after destroying its fortifications. Pop., about 7000.

AN'APÆST (Gk. ἀνάπαιστος, *anapaistos*, struck back, i.e., a dactyl [q.v.] reversed, from ἀνά, *ana*, back + παίειν, *paiein*, to strike). The name of a measure, or foot, in Greek verse, consisting of two short syllables and one long syllable; thus — — —. It has been called the marching rhythm, as the language of the chorus in Greek tragedy fell into anapæsts on entering or leaving the orchestra. It was also the prevailing measure in the parabasis of Aristophanic comedy, corresponding to the modern topical song. By analogy, the name is also employed to designate in modern verse a trisyllabic measure of two unstressed syllables followed by a stressed syllable; for example: "I am món | arch of áll | I survéy." See VERSIFICATION.

ANAPHRODISIACS, àn-àf'rò-diz'í-àks (Gk. ἀν, *an*, priv. + ἀφροδισιακός, *aphrodisiakos*, pertaining to Aphrodite, goddess of love). Substances used to lessen the sexual desire. In the first place, all causes of genital irritation should be removed. Careful cleansing should be insisted on, and in many cases circumcision is needed. Saccharine or highly acid urine should be corrected. Distention of the bladder should be avoided if possible. Vesical calculus, worms, hemorrhoids, and anal fissure may all act as causes of sexual excitement and should be treated if present. Constipation should be relieved. The clothing, especially at night, should not be too warm, and the bed should be hard. The diet should be restricted in amount and chiefly vegetable, while spices and stimulants of all kinds should be avoided. Hard mental work and abundant exercise, especially with the arms, are strongly indicated. Ice, applied locally, and cold baths, local or general, are very potent. Besides these measures, some drugs are of value. The best are probably the bromides. They should be given in full doses, and if necessary pushed to the physiological limit. Tobacco, conium, gelsemium, and belladonna are valuable in certain individuals. The nauseants are valuable temporary expedients, but cannot be used in a prolonged treatment. It must be remembered that nymphomania and satyriasis are due to cerebral conditions and occur during attacks of insanity or during delirium produced by alcohol and other drugs.

ANAPHYLAXIS. A hypersensitive condition induced in certain animals or individuals
