by the injection of horse serum or other foreign albumen. If a guinea pig is injected with a small dose of horse serum and after a certain interval receives a second dose, symptoms of severe and often fatal intoxication ensue. The first dose produces no disturbance, but renders the animal abnormally sensitive to a second injection. Anaphylaxis is often confused with serum sickness, to which it has some relation. The use of antitoxin or other serums is sometimes attended by unpleasant phenomena, such as fever, urticaria, itching, œdema, joint pains, glandular enlargements, etc., but these symptoms come on after a single dose. Repeated injections of antitoxin, however, predispose an individual to serum intoxication. See RICHET, CHARLES.

ANARCHIDAS, à-när'kī-das. See WOLF-FISH.

AN'ARCHISM (Gk. ἀν, *an*, priv. + ἀρχή, *archē*, power, sovereignty). A system of social doctrines, and a propaganda based thereon, the essential features of which are the abolition of all constituted authority and the complete emancipation of the individual from every form of control, political, social, or religious. The social state which anarchism seeks to realize is denominated anarchy, a term which connotes, according to the expositors of anarchistic doctrines, not disorder, as in the popular conception, but the most perfect conceivable social order.

On the political and moral side anarchism is antithetical to socialism, as the latter term is commonly understood. Anarchism demands the utter abolition of the state, while socialism would not merely make use of the state for purposes of social reorganization, but would endow it with far greater powers than it possesses at present. Socialism, its orthodox supporters claim, would greatly reduce the importance of the judicial functions of the state, since with the abolition of private property the greater number of disputes and crimes that now occupy the courts would disappear. The administrative functions of the state, on the other hand, would be vastly increased in importance, since it would undertake the management of all productive property, determine the degree in which wants are supplied, and regulate the distribution of the productive resources of society. According to the anarchist view, the socialistic system would destroy liberty and is therefore scarcely preferable to the existing order. In the words of Bakunin "liberty without (economic) socialism is equivalent to privilege, injustice; socialism without liberty amounts to slavery and brutality."

In party organization and tactics socialism and anarchism differ radically. Socialistic parties are closely organized, as a rule; the party platform is held to be binding upon all members, and heretics are visited with prompt expulsion. Anarchism has no binding program, no tests of regularity. Each anarchist is a law unto himself. In practice the anarchists form small groups or circles, which meet for discussion and for the working out of plans of action. The meetings are usually secret, and membership in the group is rarely made public. This is chiefly a result of the hostility of the public authorities which in most countries carry on a more or less consistent policy of suppressing anarchism. The groups in the several cities are federated loosely, sometimes along national, but more frequently along international lines. Propaganda is carried on partly by lectures, partly

by pamphlets secretly printed and distributed through subterranean channels, partly by newspapers. The latter are liable to frequent suppression by the public authorities and change their names and places of publication with bewildering rapidity.

On the economic side anarchism is closely related to socialism. Both anarchism and socialism demand the abolition of private property in the means of production. As there is a socialistic school that would carry the principle of socialization even to goods for consumption, so there is an anarchistic school that would abolish all private property whatsoever. In both schools the main tendency is to limit socialization to the means of production. Both schools look upon the present economic system as a product of historical forces that are almost spent and believe that a revolution is impending. Both schools agree in forecasting a state in which production will be carried on for the common good of those engaged in the actual work of producing. Socialists, however, look upon the coöperative state as an organization dominated by the collective will expressed in political terms. The anarchistic principle of organization is free association based upon mutual interests. According to the anarchistic doctrine, every considerable enterprise will be carried on by a group, the membership of which will be continually changing, as men find that interest or whim draws them elsewhere. But it is assumed that under anarchism interests would soon reach an equilibrium, and economic society would become extremely stable and orderly without the slightest interference with individual liberty.

Organized socialism repudiates the idea that there is any relation between socialism and anarchism, and in the history of the socialistic movement there have been frequent conflicts between the two principles. The issue was first drawn in the Congress of the International Workingmen's Association at Basel in 1869, when the representatives of Marx routed Bakunin and his followers. In 1872, at the Congress of The Hague, Bakunin and his followers were expelled from the association. Since that time there have been periodic expulsions of anarchistic elements from the social democracy in most of the countries of northern Europe. In the United States also anarchism has been generally overthrown by socialism. In Italy, Spain, and Greece, as well as in Latin America, the anarchistic element is dominant in the socialistic party. Anarchistic elements also appear to be making head in France and Belgium, under the form of syndicalism (q.v.), and in the United States in the Industrial Workers of the World (q.v.).

History of the Theory. Greek philosophy, while in its main currents rather socialistic and certainly constructive, was not without its representatives of extreme individualistic theory (Zeno, and among the early Christian philosophers, the Gnostics). A mystical theory of the rights of the individual, which resembles idealistic anarchy, was held by some of the Christian writers of the Middle Ages (Joachim, 1200; Amalric of Bène; the Adamites, 1421; Chelcicky, 1420; and others). The first modern writer of scientific repute is Godwin, who, in his *Political Justice* (1793), proceeds on the doctrine of natural rights and regards all government as a sort of necessary tyranny, to be re-

duced to its lowest terms. This doctrine can be traced through a large number of writings, down to Herbert Spencer's ideas of liberty and the sphere of the state. As a social movement anarchism received its first impetus from Proudhon (q.v.). Proudhon thought he saw in anarchy the only way to free the laborer from the encroachments of the capitalist and to guarantee to every man the right to development. Property, in the sense of income-yielding wealth, he described as robbery and advocated its abolition. The state also should be abolished. Individual or associated enterprise, assisted by gratuitous credit provided by mutual associations, formed the basis of his scheme of economic reorganization. Although Proudhon was regarded by the authorities as a dangerous revolutionist, he deprecated all forms of violence and placed his reliance chiefly in education as a means of social reform. Proudhon's ideas found disciples in Germany in Moses Hess, who published *Philosophie der That* and *Sozialismus* (1843), and Karl Grün, both of whom developed the better side of Proudhon's teaching and proposed needed radical reforms. Anarchistic doctrine assumed its later violent form under the hands of Bakunin (q.v.), who from 1861 to his death in 1876 carried on an extraordinary propaganda and organized a following throughout Europe. Bakunin demanded the abolition of the state and of all forms of property and the reorganization of society on the basis of a federation of communes. Revolutionary anarchism gained a considerable number of adherents in Germany through the propaganda carried on by "Max Stirner" (Johann Kaspar Schmidt), who proposed to abolish the state and private property and to erect a new social order upon a basis of individual interests—"a union of egoists." Two disciples of Bakunin, Prince Kropotkin and Elisée Reclus, have made important contributions to the theory of economic organization under anarchy. In the United States Proudhon's doctrine was taken up by B. R. Tucker, of Boston, who published a translation of Proudhon's *What is Property?* (1876), and *Economic Contradictions* (1888), and also a translation of Bakunin's *God and the State* (1883). Tucker edited a periodical entitled *Liberty*, which began publication in Boston in 1881, but was afterward removed to New York City.

Propaganda of the Deed. The point of chief interest in anarchistic tactics is the employment of violence especially against rulers and high officials of government, euphemistically described by anarchists as "the propaganda of the deed." In 1876 two Italian followers of Bakunin, Carlo Calfiero and Enrico Malatesta, urged, in the Congress of Berne, that revolution is the only efficient means of anarchistic propaganda. In the following year an uprising of Neapolitan peasants, apparently instigated by Calfiero and Malatesta, occurred near Benevento. In 1878 two anarchistic attempts were made upon the life of Emperor Wilhelm I, and in 1878 and 1879 attempts were made to assassinate Alphonso XII of Spain. King Humbert of Italy narrowly escaped assassination in 1878. The propaganda of the deed was adopted by the French anarchists in 1882. Dynamite was employed for the first time by anarchists around Montceau in the conduct of a strike.

In March, 1892, there was a series of explosions in France. For one of these Ravachol was executed (June 11, 1892), and others im-

prisoned. There were serious disturbances and explosions in Spain and Italy. In February, 1893, bombs were exploded at Rome. At Barcelona, on September 23, a bomb was thrown into a group of staff officers at a military review, which wounded several officers, one of whom was Captain-General Martinez Campos, and killed one guard. For this, Codina and five accomplices were shot May 21, 1894. A general conspiracy was unearthed at Vienna, September 23. On November 7 a bomb was thrown into the pit of a Barcelona theatre, which killed 30 and wounded 80. Salvada French was executed for this crime. On December 9, at Paris, during a session of the Chamber of Deputies, a bomb was thrown from the gallery. A woman, perceiving the intentions of the thrower, grasped his arm, causing the bomb to strike a chandelier and explode harmlessly. Vaillant, whose real name was Königstein, a man of German descent, was immediately identified as the thrower, and was executed Jan. 10, 1894, his last words being "Vive l'anarchie!" The French government had previously passed a law making such attempts capital offenses, even though no one was killed. A week after the execution of Vaillant, and in revenge for his execution, a man named Emile Henry exploded a bomb in the café of the Hôtel Terminus, severely wounding many guests. Henry was executed May 21, 1894. In March, 1894, a bomb exploded before the Chamber of Deputies at Rome, but did no great harm. On June 16 an attempt was made on the life of Crispi. For this Paul Fega was sentenced to 20 years' imprisonment. President Carnot of France was assassinated June 24 by an Italian anarchist, Santo Caserio. He died the following day. Caserio was guillotined August 15. A plot against the French Premier Dupuy was frustrated. Active measures were taken against the anarchists, particularly in Italy, where some 2000 suspects were arrested during the summer. The year 1895 was comparatively quiet. In 1896, 11 were killed and 40 wounded by an explosion at Barcelona. For this, which was the result of a conspiracy, 5 men were shot, 13 imprisoned for over 10 years, and 7 for less than 10 years. The premier of Spain, Señor Cánovas del Castillo, was assassinated Aug. 8, 1897, by an Italian, Michele Angiolillo, who was executed 11 days after the crime. On Sept. 10, 1898, the Empress of Austria was assassinated in Switzerland by an Italian, Luccheni, who had come thither intending to kill the Duke of York, but, not finding him, vented his fury upon the Empress. Luccheni was immediately apprehended and sentenced to solitary confinement for life. The death of the Empress caused the summoning of an anti-anarchist conference, attended by representatives of the various governments. The sessions were held at Rome, November 24 to December 21. The results were not made public. King Humbert of Italy was assassinated July 29, 1900, by a countryman, Angelo Bresci. Bresci had been living in America and went to Italy intending to assassinate the King. The murderer was sentenced to life imprisonment. On May 31, 1906, the wedding day of Alfonso XIII of Spain and Princess Ena of Battenberg, a bomb was exploded near the royal carriage on its way from the church at Madrid where the marriage was performed. About 20 persons of the royal escort were killed. In 1909 serious riots occurred in Barcelona that were ascribed, though not on

very satisfactory grounds, to the teachings of the anti-clerical Francisco Ferrer (q.v.). Ferrer had been engaged in anarchistic propaganda at an earlier period of his life, but had abandoned anarchism in order to devote himself to scientific education. None the less he was arrested, tried, and executed Oct. 12, 1909. In November, 1910, an attempt was made by a group of anarchist socialists to assassinate the Mikado. Twenty-five of the conspirators were sentenced to death; only 12 of them, however, were executed. On March 18, 1913, King George of Greece was assassinated at Salonica by an anarchist named Aleko Schinas.

United States. America has witnessed but two such outrages. The first was the famous Haymarket explosion at Chicago on May 4, 1886. This occurred at a large assembly of workingmen. The speakers began uttering revolutionary sentiments, and the gathering was ordered to disperse by the police. An unknown person threw a bomb, killing seven policemen and wounding 60. In the mêlée following, some workmen were killed and others wounded. For this seven were condemned to death, and one (Neebe) to 15 years' imprisonment. Ling committed suicide the day before the time set for the execution. Spies, Parsons, Fisher, and Engel were hanged Nov. 11, 1887, the sentences of Schwab and Fielden having been commuted to life imprisonment. Later Governor Altgeld pardoned Neebe, Schwab, and Fielden. The second was the murder of President William McKinley, at Buffalo, N. Y., Sept. 6, 1901, by Leon F. Czolgosz, who was executed by electricity Oct. 29, 1901. As a result of the ensuing agitation against anarchism, a law was enacted by Congress in 1902 excluding anarchists from the classes permitted to immigrate into the United States.

A., *Modern Science and Anarchism* (Philadelphia, 1913).

ANASAR'CA. A form of dropsy in which there is an accumulation of fluid in the loose tissues of the body. See DROPSY; OEDEMA; BRIGHT'S DISEASE.

AÑASCO, ä-nyäs'kö. A town in the west central part of Porto Rico, on the Añasco River, a few miles from its mouth, and 6 miles north of Maguayez (Map: Porto Rico, A 2). It is the centre of a fertile agricultural region which produces sugar, tobacco, coffee, and vegetables of all kinds. The town has six public schools, a church, and a large sugar-grinding plant. Pop., 1899, 2483; 1910, 3064.

ANASTASIA, än'äs-tā'shī-ä (?-597). A Greek saint. Her beauty attracted the Emperor Justinian, and in order to escape his dishonorable attentions she retired to Alexandria, where she lived 28 years, disguised as a monk. The date of her commemoration is March 10.

ANASTASIA, SAINT. A Christian martyr, slain during the reign of Nero (54-68 A.D.). She is said to have been a pupil of St. Peter and St. Paul. The date of her commemoration is April 15.

ANASTASIA THE YOUNG'ER. A noble

Roman woman who suffered martyrdom during the Diocletian persecution (303 A.D.); the wife of Publius, a pagan, who informed against her as a Christian. Two letters written by her in prison are preserved in Suidas. The Greeks commemorate her as a saint on December 22; the Latins, on December 25.

ANASTASIUS, ăn'ăs-tă'shī-us. A romance by Thomas Hope, an English author and virtuoso (q.v.). It describes the adventures of a Greek youth who, after being acquitted by a Turkish magistrate before whom he was brought for an alleged offense, becomes a soldier of the Sultan and fights under the Turkish flag. In Constantinople he engages in different occupations that are either trifling or discreditable; then, after professing the Mohammedan faith, he travels in Sicily, Italy, and eastern countries and dies in obscurity and neglect. In literary circles the author has ever since been known as "Anastasius" Hope.

ANASTASIUS. The name of four popes and one antipope.—**ANASTASIUS I**, Pope from 398 to about 402. He healed an unseemly strife at Rome by ordering the priests as well as the deacons to stand bowed while the Gospel was read in the Church service. He was vehemently opposed to the doctrines of Origen, one of whose works (*Peri Archon*, i.e., 'Concerning Principles') he condemned as heretical. He is praised by Jerome, who calls him a man of a holy life, of a "rich poverty," and of an apostolic earnestness. He died December, 401, or April, 402. His letters and decretals are in Migne, *Patrol. Lat.*, xx.—**ANASTASIUS II**, Pope from 496 to 498. He was born in Rome. He endeavored to heal the breach with the Eastern church, but the attempt was so ill-judged that Dante puts him in Hell. He died in November, 498.—**ANASTASIUS III**, Pope from 911 to 913. He was born in Rome.—**ANASTASIUS IV**, Pope from 1153 to 1154. He healed two important ecclesiastical quarrels by recognizing Wichmann as Archbishop of Magdeburg, and William as Archbishop of York. He died in Rome Dec. 3, 1154. His letters are in Migne, *Patrol. Lat.*, clxxxviii.—The Antipope **ANASTASIUS** was opposed to Benedict III in 855, but speedily degraded.

ANASTASIUS I (c.430–518). Emperor of the East. He was proclaimed Emperor at Constantinople on the death of Zeno, in 491. He was a native of Dyrrachium, but had spent most of his life in public office at Constantinople. He was over 60 years old at his accession, and was noted for his ability, integrity, and justice. "Reign as you have lived" was the cry with which he was greeted on his first public appearance. He married the widow of Zeno, but had no children. His reign was troubled by local revolts, by a war with Persia in 502–505, and by invasions of Huns, Slavs, and Bulgarians. To check the last, Anastasius built, in 512, the wall which bears his name, 35 miles west of Constantinople. Yet his reign was a very prosperous one. He was unpopular with some, because he was suspected of being addicted to the Monophysite heresy (q.v.); with others, because he was thought to be too puritanical. He suppressed gladiatorial combats with wild beasts and licentious dances. He erected fortresses on the boundaries, restored ruined cities, suppressed some of the most obnoxious taxes; yet he left the treasury, which he had found empty, filled with 320,000 pounds of gold; and a well-disciplined army of 150,000 men. He preserved the

Empire intact, having governed it wisely, leniently, and justly. See Gibbon, *Decline and Fall*, edited by Bury, vol. iv (London, 1898), and Bury, *Later Roman Empire* (London, 1889).

ANASTASIUS II (died 721). Emperor of the East, elected to the throne of Constantinople by the Senate and people in 713. He organized a formidable naval force, which mutinied at Rhodes and proclaimed Theodosius, a person of low birth, Emperor. Theodosius took Constantinople six months later and deposed Anastasius (716), who escaped to Thessalonica and became a monk. In 721 he headed a revolution against the Emperor Leo and was captured and put to death by the latter.

ANASTASIUS THE LIBRARIAN (BIBLIOTHECARIUS) (?–886). A librarian of the Vatican, and abbot of Santa Maria Trans Tiberim, Rome. He was present in 869 at the eighth Council of Constantinople, whose canons he translated into Latin. He wrote a *Historia Ecclesiastica* (edited by Fabretti, 1649, and the *Liber Pontificalis*, biographies of the popes from St. Peter to Nicolas I.

ANAS'TOMO'SIS (Gk. ἀναστόμωσις, an opening of the mouth, from ἀνά, *ana*, again + στόμα, *stoma*, mouth). An anatomical term used to express the union of vessels which carry blood or other fluids, and also, for convenience' sake, the junction of nerves. The veins and lymphatics

ARTERIES ANASTOMOSING.

anastomose to form large single trunks as they approach their ultimate destinations. The arteries break up into small branches, for the supply of the tissues, and each small vessel again communicates with others given off above and below. At each large joint there is a very free anastomosis, so that the safety of the limb beyond may not be entirely dependent on a single arterial trunk, exposed to all the obstructive influences of the different motions of the limb. After a main artery has been permanently obstructed, the anastomosing vessels enlarge, so as to compensate for the loss; but after a time only those whose course follows that of the parent trunk remain enlarged, and the others gradually regain their ordinary dimensions.

AN'ATASE. See OCTAHEDRITE.

ANATH'EMA (Gk. ἀνάθημα, or ἀνάθημα, *anathēma*, that which is set up, offered, or dedicated, from ἀνά, *ana*, up + τίθειναι, *tithenai*, to put, set, place). A word originally signifying some offering or gift to Deity, generally suspended in the Temple. Thus, we read in Luke xxi. 5 that the Temple was adorned "with goodly stones and gifts" (*anathemasi*). It also signifies a sacrifice to God; and, as the animals devoted to be sacrificed could not be redeemed from death, the word was ultimately used in its strongest sense, implying eternal perdition, as in Rom. ix. 3, Gal. i. 8–9, and other places. In the Catholic church a distinction has been made between excommunication and anathema-

tizing; the latter being the extreme form of denunciation against obstinate offenders. The synod of Elvira (306) anathematized those who placed libelous writings in the Church and those who read them; the Nicene Council (325), the Arians; and so later councils and synods those who seriously offended. Thus, that of Paris (846) forbids anathematization to bishops without the consent of their archbishop and fellow bishops, on account of its being a "condemnation to eternal death."

AN'ATHOTH. A town in Palestine, 2½ miles northeast of Jerusalem, and one of the places assigned to the Levites (Josh. xxi.; 1 Chron. vi. 60). It was the birthplace of Jeremiah (Jer. i. 1), as well as the home of Abiathar, the high priest (1 Kings ii. 26), of Abiezer (2 Sam. xxiii. 27), and of Jehu (1 Chron. xii. 3), all prominent in the days of David. The name appears to be the plural of Anath, the Syrian goddess of war, whose name occurs also in Beth-Anath, Samgar ben Anath, and Anammelech (q.v.). It was an important place, being reoccupied after the exile (Ezra ii. 23; Neh. vii. 27). On its site stands at present the little village of Anata, at the top of a hill commanding a view of the Dead Sea. Building stones for Jerusalem are still supplied from a quarry at Anata. It was at Anathoth that Jeremiah bought a field, as a symbol of the assured return from the Babylonian captivity (Jer. xxxii. 7).

ANAT'IDÆ (Lat. *anas*, duck). The family of ducks, geese, and swans (qq.v.). See ANSERES.

ANATOLI, ä'nä-tō'lē, JACOB BEN ABBA (1194-1256). Hebrew translator of Arabic scientific literature and allegorical commentator. He was born in southern France and was invited by Emperor Frederick II of Hohenstaufen to Naples, where he devoted himself chiefly to the translation of Arabic authors or Arabic versions of Greek writers into Hebrew. He was related by marriage to Samuel ibn Tibbon, the translator of Maimonides, and became a great admirer of the Jewish philosopher. Under his influence he wrote his *Mamad ha-talmidim*, 'Goad to the students,' a collection of exhortatory addresses intended to stimulate study. In this work he shows his familiarity with Plato, Aristotle, Averroes, and Christian scholars. He speaks in the highest terms of Michael Scot. Anatoli translated Averroes, Ptolemy's *Almagest*, Al Fargani's *Elements of Astronomy*, and Al Farabi's *Treatise on the Syllogism*. Consult Steinschneider, *Die Hebräischen Uebersetzungen des Mittelalters und die Juden als Dolmetscher* (Berlin, 1893).

AN'ATO'LIA (Gk. Ἀνατολή, *Anatolē*, a rising, east, i.e., from Constantinople; from ἀνά, *ana*, up + τέλλειν, *tellein*, to make to arise, to rise). The modern name for Asia Minor; Turkish, *Anadoli*. It embraces the western peninsula of Asia, bounded by the Armenian highlands on the east, Syria and the Mediterranean on the south, the Ægean Sea on the west, and the Black Sea and the Sea of Marmora on the north. Its area is 193,590 square miles (Map: Turkey in Asia, D 3). It constitutes the western prolongation of the high table-land of Armenia, with its border mountain ranges. The interior consists of a great plateau, or rather series of plateaus, having an average elevation of about 3000 feet, with bare steppes, salt plains, marshes, and lakes; the structure is volcanic, and there are several conical mountains, one of which, the

Argish (or Ergish) Dagh (Argæus), with two craters, rises about 10,000 feet above the plain of Kaisariéh, which has itself an elevation of between 2000 and 3000 feet. The plateau is bordered on the north by a long train of parallel mountains, which skirt the coast of the Black Sea and extend all the way to the Mediterranean and which are cut up into groups by cross valleys. These ranges vary greatly in height, the greatest elevation in the extreme east being about 12,000 feet. They sink abruptly down on the north side to a narrow strip of coast; their slopes toward the interior are gentler and bare of wood. Similar is the character of the border ranges on the south, the ancient Taurus, only that they are more uniform and on the average much higher, although their loftiest summits do not rise above the highest peak of the northern mountains. The Taurus and Anti-Taurus are crossed by several good passes, the most important and famous being the Gölek-Boghaz, or 'Cilician Gates,' 30 miles north of Tarsus, the pathway of all armies, traders, or travelers for ages, the route to and from the Euphrates valley. The western border is intersected by numerous valleys, opening upon the Archipelago, through the highlands of the ancient Caria, Lydia, and Mysia, to the northern part of which mounts Ida and Olympus belong. Between the highlands and the sea lie the fertile coast lands of the Levant. The western coast of Anatolia is remarkably indented and fringed with the islands of the Archipelago. The rivers of Anatolia are not navigable; the largest are the Yeshil-Irmak (Iris), the Kizil-Irmak (Halys), and the Sakariah (Sangarius), flowing into the Black Sea; and the famous Ghediz-Tchai (Hermus), and Menderes (Mæander), into the Ægean. The largest of the salt lakes are Tuz-Tchöllü, Bei-Shehr, and Egerdir.

The climate bears, on the whole, a south European character; but a distinction must be made of four regions. The central plateau, nearly destitute of wood and water, has a hot climate in summer and a cold one in winter; the southern coast has mild winters and scorching summers; while on the coast of the Ægean there is the mildest of climates and a magnificent vegetation. On the northern side the climate is not so mild as on the western; yet the vegetation is most luxuriant, and a more delightful or richer tract than the coast from the Sea of Marmora to Trebizond is hardly to be found. The whole peninsula is subject to earthquakes.

In its flora and fauna Anatolia forms the transition from the continental character of the East to the maritime character of the West. The forest trees and cultivated plants of Europe are seen mingled with the forms peculiar to the East. The central plateau, which is barren, except when assisted by irrigation, has the character of an Asiatic steppe, more adapted for the flocks and herds of nomadic tribes than for agriculture; the southern and western coasts, on the contrary, are characterized by a luxuriant vegetation, which includes the southern fruits of Europe with a slight admixture of the tropical plants of Africa.

Mining is little developed in Anatolia, although its mineral wealth is large and varied, including deposits of coal, lead, manganese, copper, iron, gold, salt, petroleum, meerschau, and many others. The agricultural products include the common grains, fruits in

great variety and abundance, tobacco, cotton, and poppy-seed. Much silk is produced. Among the exports are prunes, figs, olives, poultry, eggs, skins, cattle, carpets, silk, gums, wax, drugs, nuts, sponges, and minerals. Transportation facilities are still inadequate; the railways had in 1910 a total length of 1474 miles.

The population of Anatolia, according to recent estimates, is over 9,089,200, composed of a number of different races. Turks are found all over the country, and occupy the foremost position, both in commercial and in political life. The Turkomans, who are akin to the Turks, are mostly nomadic. Greeks and Armenians constitute a considerable fraction of the population, and commerce is to a great extent in their hands. Other elements are Kurds, Yuruks, Lazes, Jews, and Circassians. About four-fifths of the inhabitants are agriculturists or herdsmen. Among the cities are Smyrna, Scutari, Brusa, Kaisarieh, Adana, Konieh, Sivas, Manissa (Magnesia) Aidin, Trebizond, Amasia, Tokat, Angora, Adalia, Ismid, and Kutaia.

This region was an early seat of civilization. The country has passed under the supremacy of one race after another, and it has been the scene of numerous wars, both in ancient and in modern times. The west coast was early lined with opulent Greek cities, the seats of poetry, learning, and the arts, and great centres of colonization. In the first half of the sixth century B.C. the kingdom of Lydia, under Cræsus, attained the height of its splendor. Cræsus was conquered by the Persians who extended their sway over the whole peninsula. The rule of Macedon succeeded that of Persia. After the disruption of Alexander's Empire the Seleucid kings of Syria were dominant. By the side of the Seleucid realm various states arose, Pergamon, Bithynia, Cappadocia, and Pontus. The Romans first carried their arms into Asia Minor at the beginning of the second century B.C., when they vanquished Antiochus the Great of Syria. In the following century Pontus was a mighty realm under Mithridates the Great, who succumbed to the arms of Pompey. After 395 A.D. Asia Minor formed part of the Greek, or Byzantine, Empire. Under the Byzantines it received the name of Anatolia. In the eleventh century the Seljuks made themselves masters of the region, where they established the sultanate of Rum, with its capital first at Nicæa and then at Iconium. The close of the thirteenth century witnessed the beginnings of the power of the Ottoman Turks, who in the course of the following century established their sway over Asia Minor, which now became a great base whence Mohammedan conquests were carried on in Europe. Since 1453 the Ottoman Turks have ruled Anatolia from Constantinople. The ancient divisions of this region were Pontus, Paphlagonia, Bithynia, Galatia, Lycaonia, Phrygia, Cilicia, Caria, Pisidia, Pamphylia, Cappadocia, Mysia, and Lydia.

Kaunenberg, *Kleinasien's Natur-schätze* (Berlin, 1897); J. Bryce, *Trans-Caucasia and Ararat* (London, 1896); H. C. Barkley, *A Ride through Asia Minor and Armenia* (London, 1891).

ANATOMY. The science that treats of the structure of organic forms, so called from dissection (Gk. *ἀνά*, *ana*, apart + *τέμνειν*, *temnein*, to cut), formerly the sole method of investiga-

tion. It is distinguished as Human, Animal, or Plant Anatomy, according to the organisms under consideration; as Normal or Pathological Anatomy according as these are in health or diseased; as Macroscopic or Gross Anatomy when it deals with structure visible to the naked eye; and as Microscopic or Minute Anatomy when the microscope is used as a means of research. This last division is known as Histology, in view of the delicate webs of structure or tissues (*ιστός*, *histos*, web) it investigates. Comparative Anatomy (see ANATOMY, COMPARATIVE) involves a comparison of the different forms of animals and plants, and Developmental Anatomy or Embryology an account of the different forms assumed by a single individual during its growth.

Other designations applied to anatomy have reference to its application. Dissection and the preparation of anatomical specimens is often called Practical Anatomy; the arrangement of the facts of structure according to their bearing upon the diagnosis and treatment of disorders is Applied Anatomy, which may be divided into Surgical Anatomy, that dealing with structure accessible for surgical operations, and Medical Anatomy, that relating to structure which can be reached only indirectly. The consideration of the deeper relations and causes of structure is called Philosophical Anatomy, or Morphology, and a purely speculative or theoretical disquisition of this kind is termed Transcendental Anatomy.

Anatomy may be treated in two different ways—as Descriptive or Systematic Anatomy, that arranges the facts of the science with reference to the structural affinities of organs forming the systems of the body, or as Topographical or Regional Anatomy, that considers the organs merely with reference to their exact situation and relations to each other. Descriptive Anatomy is usually subdivided into Osteology (see BONE and SKELETON), that treats of the osseous system; Syndesmology, that treats of the ligaments; or Arthrology, that considers the ligaments and joints; Myology, that treats of the muscles; Neurology, of the nerves; Angeiology, of the vessels; Splanchnology, of the viscera.

HISTORY

The knowledge of anatomy possessed by the ancients was slight. The importance of exact information not being generally recognized, and the dead body being held especially sacred, examination of the cadaver was rare and attended with great difficulties. It is among the Greeks that the first traces of the science are found. Hippocrates (460–360 B.C.) and his school appear to have had some knowledge of the skeleton and of the larger viscera; Aristotle (384–323 B.C.) examined a large number of animals and had some remarkably just ideas as to their genetic relationships; Herophilus (c.300 B.C.) and Erasistratus of Alexandria investigated the vessels and the glandular organs. At the Alexandrian school dissection was first publicly practiced, and there a considerable advance was made in the knowledge of the human body. Only fragments of the writings of this time have come down to us. Herophilus described the sinuses of the dura mater, the retina, the lacteals, and the lymphatics, and admitted that the arteries contained blood, his predecessors having held that, like the air-tubes of the lungs, they normally carried air during life. Erasistratus con-

sidered the brain as an organ for the transformation of the "vital spirits" received from the air into "animal spirits" and distinguished between nerves of motion and those of sensation.

The prejudice against dissection appears to have finally overcome the progress achieved by the Alexandrian school, and the belief became current that the healing art depended upon metaphysical conditions impossible to elucidate by an examination of structure. The next considerable advance was made by Claudius Galen (q.v.) of Pergamus (131-201 A.D.), who compiled much from Celsus and others, and was the author of the first systematic treatise that has come down to us. He appears to have examined apes rather than man, but correctly described most of the bones, joints, muscles, cranial and spinal nerves, and many features about the brain and its membranes. He performed a great service for anatomy by clearly and exactly describing what he had actually inspected and by recording his observations in a methodical manner. These very merits, however, caused the almost universal acceptance of his erroneous physiological speculations, which gave rise to false ideas of the structure of the circulatory apparatus that prevailed until the middle of the seventeenth century. He taught that after digestion food is carried to the liver by the portal vein, and there converted into crude blood having nutritive properties due to "natural spirits"; that from the liver it passes to the right side of the heart, where a portion enters the venous system, in which it ebbs and flows, affording nutrition to the body, another portion passing through invisible pores in the septum of the heart to its left side, where it becomes mixed with air drawn in from the lungs by the pulmonary veins, and thus receives the "vital spirits," and is freed from impurities (fuliginous vapors) by the "innate heat" of the heart; thus vitalized and clarified, it passes into the arterial system, in which it also has an oscillatory motion, endowing the body with the higher functions of life, while in the brain it is further elaborated to "animal spirits" that are conveyed throughout the body by the tubular nerves to impart movement.

The irruption of the northern barbarians arrested all attempts at scientific research, and it was not until after the renaissance of letters and science at the hands of the Arabs, who resuscitated the learning of the ancient Greeks, that further advances were made. At Salerno and Montpellier active medical schools were established, and some attempt was made to revive the study of anatomy. Frederick II, Emperor of Germany (1215-50), is said to have forbidden any one to practice surgery without a competent knowledge of anatomy, and to have provided that every five years there should be held at Salerno a public dissection, to which physicians and surgeons from all parts of the Empire were invited. At Montpellier the cadavers of criminals were regularly dissected. The Senate of Venice decreed in 1308 that a human body should be dissected annually. Doubtless autopsies were occasionally held to determine deaths by poisoning, which were not infrequent at this period. At the University of Bologna Mundinus dissected several bodies publicly and published, in 1315, an imperfect little handbook based upon Galen and Arabian authors. At Prague dissection was practiced from the very foundation of the university (1348), at Vienna as early as 1404, at

Tübingen from 1482, and at London from 1540. At Padua (1490) Benedetti erected an anatomical amphitheatre and made public demonstrations. Somewhat later Berengarius of Carpi is said to have dissected more than 100 cadavers. Vidius, from whom the Vidian nerve and Vidian canal are named, professor at Pisa, Guintherius of Andernaeh (1487-1574), professor at Louvain, and Jacobus Sylvius (1478-1555), professor at Paris, as well as many others, dissected from time to time. There was, however, nothing like a careful and systematic examination of the structure of the body. It was considered sufficient to open the great cavities and display the viscera, which were examined in the most superficial manner. Great reliance was placed upon Galen and Hippocrates, supplemented by their Arabian commentators, and their authority was rarely questioned.

Andreas Vesalius (1514-64) (q.v.) of Brussels was the first to proclaim openly the new doctrine, that the structure of man should be learned by a thorough inspection of the human body rather than by reference to ancient authorities. He dissected frequently in public at Padua, Pisa, and Verona, and published, in 1543, his great work, *De Humani Corporis Fabrica*, the first careful and complete description of the body of man based upon actual observation. This work was illustrated by excellent plates made by Stephen von Calcar, a pupil of Titian. Many of Galen's errors were corrected, and the student was urged again and again to verify each statement by reference to the only prime authority, the body of man itself.

A storm of opposition was at once raised. Sylvius, a pronounced Galenist, declared Vesalius to be an impious madman, whose breath poisoned Europe, and he strove in every way to discredit his work. Others, more rational in their opposition, pointed out errors in Vesalius's own book. The ardent young Fleming, impatient and chagrined at this, resigned his chair at Padua and retired to the court of Philip II, at Madrid, where he tried to continue his studies. His enemies did not scruple to attempt to rouse the Inquisition against him. Philip interrogated the faculty of the University of Salamanca, then the leading theological school in Europe, as to whether dissection was permissible. After due deliberation a reply was given, that, since a knowledge of anatomy is useful to man, dissection may be allowed (1556).

The atmosphere of the Spanish court was far from congenial to scientific pursuits. Vesalius contemplated a return to Italy; but coming back from Palestine, whither he had gone, as is supposed, in fulfillment of some vow, he was shipwrecked, and died on the island of Zante. He was the founder of modern anatomy in the sense that he broke with tradition and substituted actual investigation for reliance on authority.

The contemporaries and successors of Vesalius aided much in placing Gross Anatomy upon secure and lasting foundations. The most illustrious among these were Eustachio (c.1520-74) (q.v.), Fallopio (c.1523-62) (q.v.), and Fabricius (1537-1619).

Eustachio made many corrections of the work of Vesalius and was besides an original investigator of great force. From plates prepared by him (but not published until the eighteenth century), it appears that he anticipated many discoveries ordinarily ascribed to anatomists of a later period; but the Eustachian tube, which he

accurately described, is said to have been previously discovered by Alcmaeon about 500 B.C.

Fallopio named the Fallopian tubes (previously discovered by Herophilus) and the seminal ducts and gave a good description of the organ of hearing, discovering in the temporal bone the aqueduct and hiatus that commonly bear his name.

Fabricius of Aquapendente erected at Padua an anatomical amphitheatre. He studied the development of the fœtus and of the embryo chick, described the muscular coat of the alimentary canal and of the bladder, and especially the valves of the veins first discovered by Stephanus of Paris in 1545 and in some situations figured by Vesalius in the second edition of his work. Fabricius supposed that they were for the purpose of retarding the oscillatory flow of the venous blood.

It fell to a pupil of Fabricius, William Harvey, to explain them more satisfactorily and to free anatomy from some of the false notions that survived from the Galenical teaching. From about 1615 to 1628 Harvey demonstrated by public lectures and by published experiments the true circulation of the blood. The lesser or pulmonary circulation had been mentioned by Servetus in 1553 in an obscure pamphlet, and by Realdus Columbus in 1559, but was not generally accepted. Cæsalpinus, in some controversial works published in 1571 and 1593, suggested the probability of a systemic as well as a pulmonary circulation and was the first to use the term *circulatio* in this connection. Yet the Galenical theory of the oscillatory movement of the two kinds of blood and the necessary supposition of orifices in the septum between the cavities of the heart were still taught. Vesalius, it is true, had said that he could not find the orifices and somewhat satirically wondered at the wisdom of the Almighty, who had made them so small that they could not be seen. Harvey, to use his own words, "taught anatomy, not from books, but from dissections; not from the suppositions of philosophers, but from the fabric of Nature," and in a series of most carefully conducted investigations and vivisections succeeded in showing that the blood makes a complete circuit of the body as well as of the lungs. Harvey's work led to a more careful examination of the heart and blood vessels. Stephen Blankaard, in 1675, first effectively demonstrated the finer vessels by injection, a method used by Frederick Ruysch (1638-1731) to show their presence in great numbers in almost every part of the body. The lymphatics, casually seen by several ancient observers, were first carefully studied by Caspare Aselli in 1622. The thoracic duct, discovered first by Eustachius in the horse, was seen in the dog by Pecquet (1627-74) and traced through the diaphragm to the *receptaculum chyli*. It was first observed in man by Jan van Horne (1621-70), professor at Leyden. Still under the hallucination caused by the Galenical theories, anatomists thought that both lacteals and thoracic duct could be traced to the liver. Rudbeck discovered the general lymphatic system in 1651.

A clearer idea of the gross anatomy of the brain, especially of its internal cavities, was due to the descriptions of Francis Boë (Du Bois), usually known as Franciscus Sylvius (1614-72), professor at Leyden, whose name survives in the aqueduct, fissure, fossa, and artery of Sylvius. The science of chemistry was at this

time gradually emerging from the superstitions of alchemy, and Sylvius is also famous for being among the first to attempt to differentiate the structures and fluids of the body by means of their chemical reactions. Vieussens (1641-c.1720) of Montpellier also increased the knowledge of the nervous system, both central and peripheral, describing the anterior pyramids, the olive, and the anterior medullary velum which sometimes bears his name. To Thomas Willis (1621-75) (q.v.) of London, sometime professor at Oxford, is due a systematic description of the brain and its cavities, together with a classification of the cranial nerves in which he finally separated the sympathetic cord from that series. He recognized that the brain becomes gradually more complicated as we ascend the animal scale and that it is more easily understood by a study of the lower and more simple forms. The decussation of the pyramids was first described by Duverney (1648-1730), demonstrator at the Jardin du Roi, afterward the Jardin des Plantes, at Paris. The doctrine of the "animal spirits," supposed to fill the ventricles of the brain and to be distributed by the nerves, was first seriously attacked by Wepffer (1658).

The advance of the physical sciences instituted by Galileo (1564-1642) had a profound effect upon anatomy. The new developments in optics were now called on to contribute to the problems of structure. The optical properties of the crystalline lens were now described by Kepler (1571-1630) (q.v.), the eminent astronomer, who denied that it is the seat of vision as supposed by Hippocrates; the image on the retina was demonstrated by Scheiner (1575-1650); Descartes (1596-1650) showed the eye to be a camera obscura and suggested that accommodation is produced by a change in the convexity of the lens. He also made some very acute observations on the structure and functions of the nervous system, marred, however, by metaphysical speculations that were attacked by Stensen, who declared that in order to determine the functions of organs we must first ascertain their structure.

A new instrument of research which the Italians, impelled by the zeal imparted by Galileo, were the first to apply to scientific uses, was now introduced. This was the microscope, hitherto merely an optical curiosity. The magnifying power of convex lenses was known to the ancients, for even in the ruins of Nineveh a polished rock crystal lens has been found, and there is good reason to believe that similar instruments were used in ancient Egypt and in Greece. Spectacles were used in Europe as early as the thirteenth century, and the compound microscope was invented about 1590 by Hans and Zacharias Janssen of Middleburg, Holland. No means for correcting chromatic and spherical aberration being then known, the first instruments were clumsy and imperfect; consequently, many investigators preferred to use the simple microscope, especially after Leeuwenhoek had shown what excellent results could be obtained with small but accurate lenses.

Among the first and most acute observers was Marcello Malpighi (1628-94), professor at Bologna, Pisa, and Messina, a man of extraordinary acuteness of intellect, combined with an indomitable zeal for natural research. He left his mark in almost all departments of biology. He was an accomplished botanist, and by his researches among plants laid the foundations of

the modern cell-theory; he was an entomologist, devoting himself to an exhaustive study of the anatomy and development of the silkworm; he was an embryologist, being the first to build upon the incomplete studies of Harvey and Fabricius and describe adequately the changes of the chick in the egg; he was a pathologist, studying carefully post-mortem appearances and the causes of disease; he was also a comparative anatomist, drawing many of his conclusions as to the structure of man from an examination of animals.

Before Malpighi's time but little was known regarding the structure of glands. Under this designation were included many non-glandular organs, like the tongue and the brain, the latter being supposed to secrete not only the animal spirits but the nasal mucus, or *pituita*, which was believed to pass down through holes in the cribriform plate of the ethmoid bone. Sylvius had, it is true, distinguished as conglomerate glands aggregations like the pancreas and the salivary glands, and as conglobate glands those of the lymphatic ducts. The ducts of some of the larger glands were unknown, the liver was considered a great blood-making organ that received the bile elaborated by the gall-bladder for the purpose of combining it with the blood, and the mechanism of secretion was wholly misunderstood. Wirsung discovered the pancreatic duct in 1642, but supposed it to be a lymphatic vessel leading to the liver; Wharton described the submaxillary duct in 1652; Steno, the parotid duct (previously thought to be a tendon) in 1661; Bartholin, the sublingual duct; Bellini, the straight tubules of the kidney in 1662; Peyer, the closed follicles of the intestines in 1677, and Brunner, the duodenal glands in 1682. Schneider (1614-80), professor at Wittenberg, finally described the pituitary membrane of the nasal passages and settled the origin of the nasal mucus. It was Malpighi, however, who first united these scattered observations and gave a clear idea of the structure of acinous glands. It was during his researches on this subject that he discovered the acinous structure of the lung and demonstrated that there are no visible orifices by which air can pass from the vesicles into the pulmonary veins. Here, too, he first observed, in the lung of the frog, the capillary blood vessels "distributed in a ring-like fashion," thus justifying Harvey and forever settling the question of the circulation of the blood. He described most of the structure of the kidney as it is known to us to-day, and in the spleen discovered the bodies that bear his name. He saw and described the red blood corpuscles, unaware that they had been previously discovered by Swammerdam, a Dutch anatomist, in 1658. Extending his researches to the skin, he discovered the rete mucosum, or Malpighian layer, and the papillæ, which he surmised were organs of touch. He elucidated the structure of the liver, which Glisson (1597-1677), professor at Cambridge, had already carefully described, showing that it is an acinous gland of peculiar construction, and, by tying the bile duct, demonstrated that the bile is formed in the liver and not in the gall-bladder.

As a consequence of the increase of the power of vision by the use of the microscope, the phenomena of fecundation and the development of the embryo began to receive attention. Spermatozoa were discovered in 1677 by a pupil of Leeuwenhoek, and De Graaf, discovering the

ovisacs (Graafian follicles) about 1672, supposed them at first to be ova. Naboth, too, discovering the closed follicles of the neck of the uterus, supposed them to be ova (*Ovula nabothi*). The ova of the lower vertebrates were, of course, well known, and the phenomena of their development were specially investigated by Malpighi. Van Horne, of Leyden, probably saw the human ovum in 1668, but it was not unmistakably recognized until Von Bär demonstrated it in 1827.

During the course of this investigation two schools arose—the Animalculists and the Ovists, who respectively maintained the superior efficacy of the male or female elements. Attempts were made to explain the transmission of hereditary qualities from parent to child. Aristotle, having studied the development of the egg, had declared that the embryo primitively consisted of simple, undifferentiated material, from which, by successive stages, the adult was formed (theory of post-formation or epigenesis). Opposed to this was another contention, that either the male or the female elements must possess in miniature all the organs of the adult (theory of preformation).

A further result of microscopic research was an enlarged view as to the distribution of living things. The discovery by Leeuwenhoek (1632-1723) that organic infusions soon become replete with living forms when exposed to the air, led to the revival of the ancient notion of the spontaneous generation of living from non-living matter. This led to fanciful theories regarding fecundation that were not overthrown until Spallanzani (1729-99) showed that living forms do not develop in infusions that have been boiled and then excluded from the air, and that filtered seminal fluid lost the power of impregnation. Following up the researches of Hartsoeker (1656-1725), he also demonstrated that ordinary air teems with living particles that enter the human body and pass into infusions. This doctrine was termed panspermatism, and developed afterward into the modern "germ theory," which has had a profound influence upon pathological anatomy.

The following discoveries of this period may be briefly noted: Ole Worm (1588-1654), professor at Copenhagen, discovered the intercalary (Wormian) bones of the skull; Clopton Havers, of England, in 1692, the Haversian canals and the intimate structure of bone; Hooke (1635-1703), the primitive fibrillæ of muscle; Kerkring (1640-93), the valvulæ conniventes of the small intestine; Winslow (1669-1760), of Paris, the foramen connecting the two cavities of the peritoneum; Douglas (1675-1742), of London, the recto-uterine pouch and several other features of the peritoneum and the abdominal wall.

The classification of animals by their anatomical structure, attempted first by Aristotle, was revived by several authors during the eighteenth century, and notably by Karl von Linné (Linnæus) of Råshult, in Sweden (1707-78), who considered that each particular species was immutably established at the creation, man being placed at the head in the order Primates. Buffon (1707-88), however, supposed that variations occur from changes of environment, and even hinted that all species may have originated from a primitive common stock. This was afterward more boldly advocated by Lamarek (1744-1829), who was the first to maintain systematically the mutability of species, and to look

upon man as derived from a common stock with other organisms, conceiving that the ancestral record of all might be represented as a branching tree. To this was opposed the authority of the great comparative anatomist Cuvier (1769-1832), who caused these views to sink into obscurity for a time.

The controversy concerning the early development of the human body was renewed during this period. The weight of authority was overwhelmingly in favor of the theory of preformation, notwithstanding the absurdities to which it committed its advocates. Its most earnest supporter was Haller (1708-77) (q.v.), professor at Göttingen, a man of remarkable learning and indefatigable research, who did much to further exactitude in anatomical knowledge and was the leading physiologist of his time. He made many anatomical discoveries in all parts of the body and finally overthrew the doctrine of "animal spirits," which had ruled all investigations of the nervous system since the days of Hippocrates. He declared, however, that the body of our primitive mother Eve must have contained in miniature all individuals of the human race that had existed since her time and that were hereafter to exist! This was the less excusable, as Kaspar Friedrich Wolff, a young medical student, had published in 1759, as his graduation thesis, a remarkable essay, the *Theoria Generationis*, in which he showed by accurate and conclusive observations that the organs of the body are developed from membranous sheets (the blastodermic membranes) and not from preformed rudiments. He even anticipated the cell theory of the next century by stating that these membranes are themselves composed of globules (cells). Wolff made many other important investigations, and his name has been perpetuated in that of the Wolfian body or primordial kidney. Such was the opposition with which his views were received that he was unable to obtain a professorship in Germany and went to Russia. It was not until Meckel called attention to his work in 1812 that his merits were fully recognized.

Aristotle, Eustachio, and Fallopio had surmised that the organs of the body might be composed of simpler elements; Boerhaave (1668-1738) supposed that everything could be reduced to vessels and fibres; Haller (1708-77) classified structures according to their properties; Bonn (1738-1818) considered that membranes are the anatomical basis of structure. It remained, however, for Bichat (1771-1802) to establish clearly the doctrine that the body with all its organs is made up of a small number of simple tissues. This he did by an examination of their chemical, physical, and vital properties, dispensing wholly with the use of the microscope, then a very imperfect instrument. He applied these views to the elucidation of the anatomy of organs affected by disease, a subject previously studied by Morgagni (1682-1771) and by John Hunter (1728-93). Bichat's death, at the early age of 31, caused by imprudent exposure in the dissecting room, was a great loss to anatomical science.

The science of chemistry had now advanced to a point where it could throw much light upon the composition of the animal body. Four great organic gases had been discovered: carbon dioxide (imperfectly known to Van Helmont in 1640) by Black in 1757, hydrogen by Cavendish in 1766, nitrogen by Rutherford in 1772, oxygen

by Priestley in 1774. Lavoisier (1743-94) showed the importance of all these gases to the animal economy. Fourcroy (1755-1809) was practically the first to investigate the composition of organic products.

The investigation of the human body by so many competent and careful observers gave a new scope to anatomical teaching. It was seen that no proper knowledge of anatomy or surgery could be obtained without the use of the cadaver. At first legal enactments and social ostracism were directed against those who practiced dissection; but on the continent of Europe public dissections were frequently held from the time of Vesalius, and as men of commanding intellect like Malpighi, Stensen, Boerhaave, Morgagni, Haller, Bichat, Hunter, and many others devoted themselves to the pursuit of anatomy, the social stigma was gradually removed. On the Continent laws were early enacted by which the bodies of prisoners and paupers were turned over for anatomical purposes. In Great Britain, however, this was not done, and bodies were quite commonly obtained by robbing graves. When, in 1827, the University of Edinburgh made dissection compulsory, and this example was followed by the other large schools in the United Kingdom, the demand for cadavers became so great that it was practically impossible to supply it without breaking the law. A set of ruffians known as "resurrectionists" became established in every large city, and no cemetery was safe from their depredations. In Edinburgh two scoundrels named Burke and Hare made a business of enticing poor and friendless persons into their haunts, smothering them, and selling their bodies to the medical schools for dissection. Similar cases were those of Bishop and Williams in London. A remedy for this was found in an anatomy act passed in 1832, which legalized dissection and authorized the use of available material under certain restrictions.

Improvements in the microscope made about 1824 gave a new impetus to research. Earlier observers (Hooke, 1665; Grew and Malpighi, 1671; Wolff, 1759) had dimly surmised that organic forms were composed of elementary units, but Schwann, in 1839, was the first to demonstrate this for animals in a satisfactory manner. Observations by Von Mohl, Purkinje, Leydig, Kölliker, Virchow, and Max Schultze soon placed this fact beyond cavil, and thus was established the celebrated cell theory, which declared all organized beings to be composed of essentially similar minute units. This led to great improvements in microscopical technique and the investigation of the chemical properties of cells. Stilling invented section cutting in 1842; Gerlach, carmine staining in 1858; Recklinghausen, silver staining in 1860; Waldeyer, double staining with aniline dyes in 1863, and Golgi, bichromate of silver staining in 1873.

With the establishment of the cell theory came some remarkable generalizations, which have had a profound effect upon anatomy. According to the views advanced by Herbert Spencer, Milne-Edwards, and others, the human body is to be considered as a cell community, in which the laws of division of labor and of differentiation that in human society cause specialization into trades, classes, and employments are applied to the morphological units, the cells. Certain cells become specialized for special functions, and thus are produced the diversified forms of the tissues of the body.

Another remarkable result of the improved methods of investigation was that the body of animals was shown to be developed from a single cell, the ovum. The series of phases by which this astonishing change is effected occupied the attention of many investigators, notably Pander; Von Bär, who established the theory of the germinal layers or blastodermic membranes; Serres, who pointed out the great similarity between the successive phases of the embryo and the series of animal forms now existent on the globe, and a great number of others in all civilized nations. Many details of this wonderful series of changes have yet to be supplied, but the general features of it are now firmly established.

A great impulse was also given to Pathological Anatomy. The phenomena of disease were now traced to the cells, and a knowledge of their anatomical changes was found to be essential. In 1836 Cagniard de la Tour discovered the yeast plant, and many fanciful theories of fermentation and disease were overthrown. Pasteur (1822-95) demonstrated that all fermentations and putrefactions are caused by minute spores that swarm in ordinary air. The parasitic character of many disorders now became evident, and the foundation was laid for modern aseptic surgery. See HISTOLOGY; PATHOLOGY.

It was not until 1859 that the knowledge hitherto obtained was fully applied to the elucidation of the causes of bodily structure. In that year Charles Darwin published the *Origin of Species*, and followed it in 1871 with *The Descent of Man*. These works advanced beyond the position of Lamarck, in that they showed an efficient cause for the cumulative variation of structure among organisms. This is the "struggle for existence" which results in the extinction of those forms not suited to the environment. Unlike the speculations of many previous writers, these views were advanced with extreme caution and supported by a great number of careful observations. They were accepted by a large body of naturalists and caused a renewal of activity in anatomy and the allied sciences. It became evident that fully to understand the structure of man it was necessary to ascertain the laws of development both in the embryo and in the animals from which the human stock may be derived. Comparative Anatomy, Embryology, and Palæontology thus became powerful coadjutors to Human Anatomy.

The importance of the study of the varieties of man now became recognized. Previous workers in this field were Camper (1722-89), the inventor of the facial angle; Blumenbach (1752-1840), who divided mankind into five races; and Retzius (1796-1860), the inventor of the cephalic index for comparing crania. In America Samuel G. Morton became widely known by his great collection of crania, now in the Academy of Natural Sciences in Philadelphia. His *Crania Americana* and *Crania Ægyptiaca* were important contributions. His collections were, in 1856, described and commented on by another anatomist, J. Aitken Meigs, who did much to establish the modern methods of the mensuration of the skull. Jeffries Wyman, of Harvard University, was a man of great erudition and philosophical insight and as a morphologist had no superior among the anatomists of his day. He was the first to describe the arrangement of the bony spiculæ in the neck of the human femur and to contrast it with that in those animals that do not assume the erect posture. He gave the first scientific de-

scription of the anatomy of the gorilla, and wrote on symmetry and homology in the limbs, on the vertebral theory of the skull, on teratological subjects, on spontaneous generation, and on the anatomy of the Hottentot. The question of the unity or diversity of origin of the human race, which was closely connected with the origin of species, excited considerable attention in America about the middle of the nineteenth century. J. C. Nott and George R. Gliddon were the joint authors of two important works on this subject, entitled *Types of Mankind* and *Indigenous Races of the Earth*. This study was greatly stimulated by the discovery of human remains in strata belonging to previous geologic epochs, particularly at Engis and Spy in Belgium, Neanderthal near Düsseldorf, at many places in France, and in South America. Finally, the prediction of Morton, made 40 years before, was verified by Dubois, who found, in the Eocene strata of Java, fossil remains of a remarkable transition form between apes and man (1890-95). This department of anatomy was greatly advanced by the zeal and energy of Paul Broca (1824-80) of Paris, who systematized the methods in vogue and invented many new ones for the examination of the human body.

The localization of all active properties in the cells gave renewed impetus to the study of the structure of these "elementary organisms." At first this structure was believed to be comparatively simple, the protoplasm of which the living substance is composed being apparently a structureless jelly having peculiar physical and chemical properties. Further advances toward perfecting the microscope and microscopic technique have shown this to be a mistake. That protoplasm has definite structure is now agreed by all; the details of the structure are still in dispute. Eminent in this investigation were Carl Heitzmann (1830-96) of New York, Flemming of Kiel, and Bütschli of Heidelberg. The phenomena of indirect cell division (*karyokinesis*) were first connectedly observed by Schneider in 1873 and have been especially investigated by Van Beneden, Boveri, Fol, Oscar Hertwig, and Rabl. The ultimate constitution of the cell received a great deal of attention. Nägeli, in 1884, framed an hypothesis that protoplasm is composed of certain elementary units, termed *micellæ*, whose combination produces its physical and vital properties much as a combination of molecules produces the physical properties of inorganic bodies. Similar, more widely developed theories were framed by De Vries, Hertwig, Weismann, and others. Weismann attempts to explain the phenomena of heredity by supposing that bodily characters are caused by architectural peculiarities inherent in the original generative cells. This is, therefore, a reappearance of the theory of preformation so prevalent during the eighteenth century. Experiments by Hertwig appear to have disproved Weismann's views. Great activity in the investigation of the structure of cells still continues. In America Wilson of New York and Whitman of Chicago have made important contributions to our knowledge of this subject. Heitzmann of New York is well known for his attack upon the cell theory as commonly taught, holding that the cells of the body are connected by minute threads of protoplasm; a theory that has recently been confirmed to a limited degree.

The great strides made in our general knowledge of structure during the nineteenth century

can only be briefly mentioned. The structure and development of bone were elucidated by Goodsir, Purkinje, Sharpey, and Kölliker, the osteoblasts being discovered by Gegenbaur in 1864. The mechanism and development of joints were studied by Braune of Leipzig, Sutton of London, Dwight of Boston, and Bernays of St. Louis. The minute anatomy of muscle is still under consideration, and has been investigated by Krause, Ranvier, Cohnheim, and many others; Humphrey and Huxley (q.v.) in England and Gegenbaur in Germany have written on the general morphology of the muscular system, and Gruber, Theile, Testut, and Ledouble have investigated muscular anomalies. The structure of the capillary blood vessels was first correctly demonstrated by Treviranus in 1836. The blood platelets, or hematoblasts, were discovered by Max Schultze in 1865. In 1884 Metchnikoff, then professor at Odessa, laid the foundation of our modern conceptions of the defensive functions of the blood by demonstrating that the white blood corpuscles and cells of lymph glands have the property of destroying bacteria introduced into the tissues (phagocytosis). The lymphatics were investigated by Kölliker, Ranvier, and Sappey.

In the nervous system the discoveries have been many and brilliant, completely revolutionizing previous notions of its structure. Gratiolet first showed the convolutionary pattern of the brain; Broca was the first to prove that certain motor faculties may be localized upon the cerebral cortex—a subject upon which extensive researches have been made by Fritsch and Hitzig, Ferrier and Horsley. Ehrenberg of Berlin appears to have been the first to describe, in 1833, the large cells of the cerebral cortex and of the spinal cord. The axis cylinder process of nerve cells was discovered by Wagner of Göttingen, Marshall Hall (q.v.) of London was the first to demonstrate reflex movements, Prochaska to discover the differential function of the anterior and the posterior roots of the spinal nerves. By degeneration experiments instituted by Waller, by noting the myelination of nerve fibres as done by Flechsig, and by comparative studies it became possible to trace in the central nervous system the paths by which sensations are received and motor influences discharged.

Improvements in technical methods finally made it possible to trace the processes of nerve cells to their minutest ramifications. This gave rise to the neurone theory, which holds that the nervous tissue is composed of independent cells or neurones that may ramify extensively, some of the ramifications passing into nerve fibres and forming their active conducting elements. This theory has been applied with success to explain the architecture of the nervous system—a subject that is widely engrossing the minds of anatomists, and from which important results are expected in the future.

In the organs of special sense the new ideas of the constitution of the nervous system have elucidated many difficult problems. The anatomy of the ear has been studied by Rüdinger, Helmholtz (q.v.) of Berlin, Retzius of Copenhagen, and Ayers of Cincinnati. The organ of Corti was discovered by the Marchese di Corti in 1851. Schwalbe of Strassburg first saw the taste-buds of the tongue in 1867, Meissner and Wagner the tactile corpuscles in 1852. Galgi described the nerve endings in tendons in 1878, and Ruffini those of the fingers in 1893. The

teeth have been a special object of research with the American anatomists Ryder, Osborn, and Cope, especially with reference to the mechanics of their development.

The researches of American anatomists have borne fruit in other fields. W. E. Horner of Philadelphia discovered the tensor tarsi, or deep layer of the orbicularis palpebrarum, and William Clay Wallace of New York was the first to show the real nature of the ciliary muscle (1835). E. C. Spitzka of New York made important additions to our knowledge of the anatomy of the nervous system. It is to Henry J. Bigelow of Harvard University that we owe the first accurate description of the ilio-femoral ligament of the hip-joint and its application to the reduction of dislocations. His work on the hip, published in 1869, completely revolutionized surgical practice in this matter. It should not be forgotten, however, that Reid, of Rochester, N. Y., had previously, in 1851, shown many of the facts afterward more completely stated by Bigelow. In the realm of comparative anatomy, and especially of palæontology, Joseph Leidy, O. C. Marsh, Harrison Allen, and Edward D. Cope have done much to extend the fame of American science.

Bibliography. Among the recent works on human descriptive anatomy may be mentioned: Quain, Gray, and Morris, in English; Testut and Poirier, in French; Gegenbaur and Rauber, in German. On topographical anatomy, McClellan and Treves, in English; the American *Surgical Anatomy* of Deaver; Tillaux, in French, and Hyrtl, Gerlach, and Merkel, in German, are good works. There is no satisfactory treatise on the history of anatomy. A fairly complete résumé is found in vol. i of *The Reference Handbook of Medical Sciences* (New York, 1913). See ABDOMEN.

ANATOMY, COMPARATIVE. The science that treats of the structure of organisms with the aim of discovering their evolutionary history and of determining what parts are fundamental and primary and what have undergone modifications due to functional changes. This, at least, has been the aim of comparative anatomy since the doctrine of evolution has guided anatomical research. In the early half of the nineteenth century the aim of comparative anatomy was to assist taxonomy, or the natural classification of organisms, by giving a basis for separating the more essential parts (to be used as the basis of the larger groups) from the less essential parts (the basis of the smaller groups). In the latter half of the nineteenth century the aims of comparative anatomy were fostered by the newer science of comparative embryology, which added a new source of evidence for tracing evolutionary history. Together these sciences constitute comparative morphology. In this work the facts which might have been brought together into a general article under this title are distributed under more special headings. Thus, for the history and general scope of comparative anatomy, see ANATOMY; for the comparative anatomy of the several parts of the body, see respectively SKELETON; ALIMENTARY SYSTEM; MUSCULAR SYSTEM; NERVOUS SYSTEM; CIRCULATORY SYSTEM; RESPIRATORY SYSTEM; REPRODUCTIVE SYSTEM; EXCRETORY SYSTEM, and similar titles in connection with human anatomy and physiology, and in zoölogy and embryology. Consult: Cuvier, *Leçons d'anatomie comparée* (1st ed., 5 vols., Paris, 1800-05; 2d ed., 8 vols., 1836-44); Meckel,

System der vergleichenden Anatomie (Halle, 1821-29); Owen, *Comparative Anatomy of Vertebrate Animals* (4th ed., London, 1871); Huxley, *Anatomy of Invertebrates* (London, 1877); Huxley, *Anatomy of Vertebrate Animals* (London, 1871); Gegenbaur, *Elements of Comparative Anatomy* (trans., London, 1878); Wiedersheim, *Comparative Anatomy of Vertebrates* (trans., London, 1898); Wiedersheim, *Lehrbuch der vergleichenden Anatomie* (Jena, 1866); Lang, A., *Textbook of Comparative Anatomy* (of Invertebrates) (trans., London, 1891-96).

ANATOMY OF ABUS'ES, THE. A work by the Puritan Philip Stubbes, published in 1583, condemning many of the customary amusements of the time. A reply to it, by Nashe, was entitled *Anatomic of Absurditie* (1589).

ANATOMY OF MEL'ANCHOLY, THE. A celebrated and curious work by Robert Burton (1577-1640), first published in 1621 and many times thereafter. It treats, as its full title explains, of "all the Kindes, Causes, Symptomes, Prognostickes, and Severall Cures" of melancholy. It appeared under the pseudonym of Democritus Junior, a name which indicates its author's attitude. There is an extended preface, not the less interesting for being autobiographical. The body of the book is in three methodically arranged parts, dealing successively with (1) the causes and symptoms of melancholy; (2) its cure; (3) amorous and religious melancholy. Throughout there are a wealth of historical and literary lore and a quaint and penetrating humor, which have made the book a favorite with many of the finest minds. Dr. Johnson and Charles Lamb especially have recorded their admiration of it. The five editions succeeding the first one included changes of text by Burton himself. Since his time it has been variously abridged.

ANATOMY OF PLANTS. See MORPHOLOGY.

AN'AXAG'ORAS (Gk. Ἀναξαγόρας) (c.500-428 B.C.). The last great philosopher of the Ionian school. (See GREEK PHILOSOPHY.) He was born between 500 and 496 B.C. at Clazomenæ, in Ionia, the son of Hegesibulus. His family was wealthy and distinguished, so that the young Anaxagoras was able to devote himself to intellectual pursuits. Soon after the Persian Wars he moved to Athens, where he lived and taught many years, thus transplanting philosophy from Ionia to Attica, which was destined to be its home for many centuries. Among his pupils were some of the most distinguished Athenians, Pericles, Euripides, possibly Socrates and Archelaus. But after about 30 years' residence he was charged with impiety toward the gods, apparently by the opponents of Pericles, who took advantage of Anaxagoras's novel explanations of natural phenomena to injure the statesman through his friend. The eloquence of Pericles, however, secured a reduction of the sentence from death to banishment for life, and Anaxagoras, after some wanderings, settled at Lampsacus, on the Hellespont, where he died in 428 B.C.

The teachings of Anaxagoras cannot be exactly determined in all points. Of his work *On Nature*, in which he set forth his system, we have only fragments. But it is clear that he made a distinct advance over the earlier Ionian philosophers in that he defined a new principle, *intelligence* or *mind* (*νοῦς*), as operating on *matter*, thus introducing a dualistic explanation of the universe in contrast to the materialistic monism

of his predecessors. This dualism was further developed by Plato and Aristotle. The varied processes of change, growth, and decay were apparently explained to be the combining and separating of matter under the directing influence of intelligence. It was taught that matter is single in its nature and consists of an infinite number of invisible atoms inconceivably small (*σπέρματα*, 'seeds,' named *ὁμοιομερῆ* by Aristotle); these in their original condition make the unformed primitive material, existing in mass and possessing no characteristics. When acted on by intelligence, they form the individual objects we see about us; i.e., bars of gold, or iron, or copper are made up of the same material, but in each case intelligence has caused a result different from the others; and further, the processes of change produced by the spiritual principle are what we call natural phenomena. Intelligence acts from a point, the pole, setting the "seeds of matter" into spherical motion. By this movement the lighter parts are separated from the heavier, the former to be the clear, glowing upper air (ether), the latter to gather in the centre, and, by cooling, to become water, earth, stones, and minerals. The heavenly bodies are masses of stone cast from the revolving earth into the fiery ether, where they are heated and continue their courses, the sun being a mass larger than the Peloponnesus. Anaxagoras's notions with regard to the moon's light, the cause of the rainbow, of winds, and of sound were fairly accurate. Plants, the lower animals, and man, he said, owe their existence and continued life to the Supreme Intelligence which resides in them. In his doctrine of atoms, his "seeds," Anaxagoras approaches the teaching of the Atomic school. (See DEMOCRITUS.) Naturally Anaxagoras did not conceive the nature of his spiritual principle clearly enough to be able to explain details satisfactorily, as Aristotle remarks in his *Metaphysics*; but his great service was that he turned philosophy from thought about things to the consideration of thought itself, and made that one of the most important subjects of speculative inquiry thereafter. Anaxagoras was also classed by Eudemus among the Greek geometricians. Plutarch ascribes to him a work on the quadrature of the circle and asserts, on the authority of Vitruvius, that he wrote a treatise on perspective. Consult Zeller, *Geschichte der griechischen Philosophie* (Leipzig, 1893); Diehls, *Doxographi Græci*; Gomperz, *Greek Thinkers*. The fragments have been edited by Schaubach (Leipzig, 1827); Schorn (Bonn, 1829); Ritter and Preller, *Historia Philosophiæ* (7th ed., Gotha, 1888); and Lange, *History of Materialism* (Eng. trans., Boston, 1886).

AN'AXAR'CHUS (Gk. Ἀνάξαρχος, *Anaxarchos*). A Greek philosopher, follower of Democritus, inclined to skepticism. He was a native of Abdera, and accompanied Alexander the Great in the Asian expedition and was highly prized by him as a counselor and friend. He is said by Cicero to have been cruelly put to death by the Cyprian prince Nicocreon. Consult Zeller, *Geschichte der griechischen Philosophie* (Leipzig, 1893); Gomperz, *Greek Thinkers*.

ANAX'IMAN'DER (Gk. Ἀναξίμανδρος, *Anaximandros*) (610-546 B.C.). A Greek mathematician, astronomer, and philosopher. He was born at Miletus, the son of Praxiades, and was a disciple and friend of Thales, whom he succeeded as the head of the Ionian school. (See GREEK PHILOSOPHY.) He is said to have dis-

covered the obliquity of the ecliptic and certainly taught this doctrine. He appears to have been the first to introduce in Greece the *gnomon* (an instrument for determining the solstices) and the *polos* (sun-dial). The invention of geographical maps is also ascribed to him. According to Simplicius and Diogenes, Anaximander approximated the size and the distances of the planets, constructed astronomical globes, and wrote in prose a work on geometry. He seems to have conceived of the universe as a number of concentric cylinders, of which the outer is the sun, the middle the moon, and the innermost the stars. Within all these is the cylindrical earth. As a philosopher, he speculated on the origin (*ἡ ἀρχή, hē archē*) of the phenomenal world, and found that origin in the infinite or in the limitless, or the indeterminate (*τὸ ἄπειρον, to apeiron*). This principle of Anaximander is generally supposed to have been much the same as the chaos of other philosophers. By it Anaximander meant an endless unlimited mass undetermined by qualities, in no way subject to age or decay; it embraced all things and gave them motion. Through this motion the world came into being. When destroyed, things were absorbed again into the indeterminate. From his basic principle he conceived all opposites, such as hot and cold, dry and moist, to proceed through a perpetual motion and to return to it again. Of the manner in which he imagined these opposites to be formed, and of his hypothesis concerning the formation of the heavenly bodies from them, we have no accurate information. It would seem, however, that he did not believe in the generation of anything in the proper sense of the word, but supposed that the infinite atoms or units of which the *ἀρχή*, or primary matter, is composed, merely change their relative positions in obedience to a moving power residing in it. Consult: Zeller, *Geschichte der griechischen Philosophie* (Leipzig, 1893); Gomperz, *Greek Thinkers*; Diehls, *Doxographi Græci*; Neuhäuser, *Anaximenes Milesius* (Bonn, 1883).

ANAXIMENES, ăn'ăks-ĭm'ê-nēz (Gk. Ἀναξίμενης). A Greek rhetorician and historian, born in Lampsacus, Asia Minor, in the fourth century B.C. He was a pupil of Zōilus and Diogenes the Cynic; is said to have taught Alexander rhetoric and to have accompanied him in the Persian expedition. He wrote histories of Philip of Macedonia, of Alexander, and of Greece, of which a few fragments exist. The history of Greece, in 12 books, began with the origin of gods and men and was carried down to the battle of Mantinea. The rhetoric addressed to Alexander, found among the writings of Aristotle, has also, since the sixteenth century, been attributed to him; it is independent of Aristotle's *Rhetoric* and may have been published before that work. Consult: Spengel, *Rhetores Græci* (Leipzig, 1847); Cope, *Introduction* to his edition of Aristotle's *Rhetoric*; Ipfelkofer, *Die Rhetorik des Anaximenes* (Würzburg, 1889). Only fragments of the work, which deals with the practical art of oratory, exist.

ANAXIMENES. A Greek philosopher, who was born at Miletus, in Asia Minor, and flourished about 546 B.C. He was a pupil of Anaximander (q.v.). He held air, which is so necessary to life, to be the first cause of all things, or the primary form of matter, from which all things are formed by compression or by rarification; all things, therefore, are forms of air,

differing from one another in the degree to which the air has been compressed. He followed Anaximander, then, in seeking a first principle (*ἀρχή*) as the cause of all things; he differed from him in finding that principle in a particular element. Consult: Zeller, *Geschichte der griechischen Philosophie* (Leipzig, 1893); Diehls, *Doxographi Græci*; Gomperz, *Greek Thinkers*.

AN'BURY (probably from AS. *ange*, vexation, trouble + *berry*). A disease of cabbage, turnips, and other cruciferous plants. See CLUB ROOT.

ANCACHS, ăn-kăehs'. A maritime department of Peru, bounded by the department of Libertad on the north, Huánuco and Junin on the east, Lima on the south, and the Pacific on the west (Map: Peru, B 5). The greater portion of the surface is mountainous, but there is some good arable land. The mineral deposits are reputed to be important, but are little worked. Cattle raising and agriculture are prominent industries. There is a railway line running through the State from Chimbote to Huaráz, the capital. Area, 16,500 square miles. In 1896 the population was estimated to be 428,703.

ANCÆ'US (Gk. Ἄγκαιος, *Ankaios*). A name of two of the Argonauts (q.v.) of Greek legend. 1. A son of Poseidon, who became steersman of the Argo after the death of Tiphys. He is noted for the prophecy that he should not live to taste wine from his own vineyard. At the moment when at length he did lift a cup of its vintage he was told that "there's many a slip 'twixt the cup and the lip," and just then the noise of a wild boar which had got into the vineyard called him away. He was killed by the animal and so fulfilled the prediction. 2. A son of Lycurgus the Arcadian. He was killed by the Calydonian boar.

ANCELOT, ăns'lô', JACQUES ARSÈNE POLYCARPE (1794–1854). French dramatist, novelist, and poet, born at Havre, who won fame and a pension in 1819 by his tragedy *Louis IX*. His other serious dramas are not noteworthy; but an epic, *Marie de Brabant*, and a novel *L'homme du monde* (1829), attracted attention. The Revolution of 1830 cost him his pension, and he became a fertile purveyor of light dramas, farces, and vaudevilles of doubtful morality. Very readable are the graceful verses of his epigrammatic satires, *Epîtres familières* (1842); but *Louis IX*, his first considerable work, remains his best. He was admitted to the French Academy (1841). He had already received (1825) the cross of the Legion of Honor. His wife, Marguerite Louise Virginie Chardon (1792–1875), collaborated with him and wrote independently plays and novels.

AN'CESTOR (ME. *ancessour*, from Lat. *ante-cessor*, a predecessor, foregoer). In the English law of inheritance, the person from whom one may inherit real property. It is the correlative of "heir." The term is sometimes loosely used as signifying a progenitor; but properly, in legal usage, an ancestor need not be a progenitor, as one may inherit from his collateral relatives as well as from an ancestor in the direct line. See HEIR; SUCCESSION.

ANCESTOR WORSHIP. Religious regard paid to forefathers, actual or supposed. A brief statement of the distribution of ancestor worship will also serve to indicate the various forms assumed by that cult. We find it in Polynesia and Melanesia, where ancestral cults appear in

most diverse aspects, from a rudimentary offering consisting of some food thrown backward over one's head in the course of a meal, to elaborate rituals with special priests and shrines. Among the South African Bantu ancestor worship appears in the guise of a religious regard paid to animals in whom ancestral souls are believed to be incarnated. In Ashanti and Dahomey the cult of ancestors has taken the form of elaborate burials (especially in the case of kings) associated with monstrous bloody sacrifices. In Egypt the regard for ancestors led to an unprecedented development of the art of embalming and preserving the corpse, as well as to high architectural achievement. In India we find, perhaps, the purest spiritual type of ancestor worship; whereas in China the cult was intimately associated with the institution of the family and exerted a far-reaching influence on the social life of the people.

Ancestor worship as a most important type of religion and ritual was first brought into prominence by Herbert Spencer, who regarded the most primitive form of ancestor worship, namely, the fear of the ghost, as the root of all religion from which nature worship, fetichism, idolatry, and all the higher forms of religion had sprung. Spencer's derivation of animal worship from ancestor worship, the so-called "misinterpretation of nicknames" theory, enjoyed for a time great notoriety if not recognition. In that theory Spencer made use of the well-known tendency of savages to apply animal names as nicknames. This and the alleged inability of primitive language and primitive thought to differentiate between a name and a thing named, led to the belief in animal ancestry. The descendants of a man called "Wolf," after the lapse of two or three generations, deemed themselves the descendants of a wolf, etc. If the ancestor had been famed for his character or achievements, religious regard would be paid to his memory. Thus a cult of the wolf would arise.

Spencer's position was very popular towards the end of the last century, but it cannot be sustained in the light of more recent knowledge. Whereas fear of the dead is, no doubt, a common feature in primitive life, it is far from being universal. Ancestor worship, moreover, is not found among the most primitive tribes, and the more pronounced varieties of the cult occur only among peoples who are fairly advanced. In view of the multiplicity of sources from which religious emotions and rites may develop, it is quite artificial to look for the source of all religion and of all cult to the worship of ancestors. Animal worship and nature cults must have developed innumerable times from other sources than ancestor worship, and often, no doubt, in the absence of the latter. Sir Henry Maine was probably right in maintaining that a strong development of the family was a necessary condition of genuine ancestor worship.

Various beliefs and cults may bear a superficial resemblance to ancestor worship, a resemblance, which, on analysis, proves illusory. Thus the *Di Manes* of the Romans must probably be conceived as undifferentiated hosts of disindividualized spirits. The propitiation of the dead at burial may not be designed to honor the dead, but to purify the living (as in early Rome). On the other hand, ancestor worship may be disguised in the form of another cult,

as happens in the case of the Bantu referred to before. An important part in ancestral cults is often played by different kinds of burial: inhumation, deposition in urns, aerial burial, etc. See BURIAL.

Intimately associated with ancestor worship, although not coextensive with it, are the beliefs in a future life and in immortality. On these topics, as well as on ancestor worship proper, consult J. G. Frazer's Gifford Lectures on *The Belief in Immortality and the Worship of the Dead*, vol. i (1913).

A possible, although not a necessary, development of ancestor worship is idolatry.

For Greek, Hebrew, Persian, etc., ancestor worship, see general articles under these headings.

ANCHIETA, ăn-shyă'tă, JOSÉ DE (1533-97). A Portuguese Jesuit missionary, called "Apostle of Brazil"; related to Loyola. He was born at Luguna, in Teneriffe, Canary Islands, and in 1553 went to Brazil, where he founded the first college for the conversion of natives and was appointed Governor of the converted Indians. Both the Portuguese and savages ascribed to him the working of miracles. He died near Espirito Santo. His work on the *Natural Productions of Brazil* was published by the Academy of Sciences at Madrid and was reprinted in Lisbon in 1812. Consult Rodriguez, *Vida del Padre J. de Anchieta* (1618), and Vaseoncellos, *Vida do Padre Joseph de Anchieta* (1620).

ANCHISAURUS, ăn'kī-să'rūs (Gk. ἄγκυρι, *anchi*, near + σαῦρος, *sauros*, lizard). The best-known of the dinosaurian reptiles that lived on the marshes, flood-plains, and beaches of the Connecticut estuary during the Triassic period. Two species are known, quite perfect skeletons of both of which have been found; the larger, *Anchisaurus colurus*, having had a slender, delicate body about 6 feet long, which length is hardly one-tenth that of many of the enormous dinosaurs found in the Jurassic rocks of the Western States. These carnivorous Anchisauri had small, bird-like heads with large eyes and beaked jaws, each provided with 18 teeth, and had long, slender, bird-like necks. The form and number of the bones of the tail indicate that this member was slender, round, and usually carried free from the ground. Anchisaurus, with its short fore legs, that seldom touched the ground, and its four-toed hind feet, the first digits of which were so weak as to render them incapable of making impressions upon the firm, moist sands of the beach, was in all probability the reptile that made many of the well-known "bird-tracks" of the Connecticut Valley sandstone. See DINOSAURIA.

ANCHISES, ăn-kī'sēs (Gk. Ἀγχίσσης, *Anchisēs*). In Grecian legend, a descendant of the royal house of Ilium (Troy) as grandson of Assaræus, and the father by Aphrodite (Venus) of the Trojan hero Æneas. He had been commanded not to reveal the maternity of the child, but disclosed the secret to his companions, and was made blind and crippled (one legend says killed) by lightning from Zeus. At the fall of Troy his son bore him away on his shoulders, and Vergil describes their voyage to Italy and Sicily, where the old father died and was buried at Drepanum (Trapani). Engraved Roman gems frequently picture Æneas carrying Anchises out of Troy; one fresco at Pompeii showed the same scene.

ANCHITHERIUM, ăn'kī-thē'rī-ŭm (Gk. ἄγκυρι, *anchi*, near + θηρίον, *thērion*, wild beast). One

of the three-toed fossil horses of Middle Miocene Tertiary time, remains of which have been found in North America and Europe. The animal was of the size of the Shetland pony, and had the middle toe of each foot well developed, while the lateral toes, one on each side of the middle toe, though of a length sufficient to reach the ground, were of such delicate construction as to be incapable of supporting any weight. Anchitherium was at one time thought to be one of the ancestors of the modern horse, but is now considered to represent an offshoot from the main line of evolution of the horse, although it lived at the same time and in company with the direct horse ancestors. A complete skeleton of Anchitherium affine, found at Pawnee Buttes, Colo., in 1901, is on exhibition in the American Museum of Natural History in New York City. For descriptions of other forms of fossil horses, the reader is referred to the article on HORSE, FOSSIL.

AN'CHOR (Lat. *ancora*, Gk. *ἄγκυρα*, *ankyra*, akin to Eng. *angle*; literal meaning, 'something crooked, hooked'). A heavy instrument designed to rest on the sea bottom, and, by means of a cable or rope, hold a vessel, buoy, or other floating object in a desired position. Anchors for buoys frequently consist merely of heavy blocks of stone or of concrete, but those for ships are now almost invariably of iron or steel. Many forms of anchors were used by the ancients. The earliest consisted of stones, or baskets of stones, which acted merely as weights without hooking into the ground; these were followed by hooked sticks, weighted to make them sink and having only one arm. Other arms were eventually added, so that the anchors resembled the modern grapnel. The earliest recorded use of anchors was by the Egyptians on their Red Sea galleys, while the Greeks are credited with having used the first iron anchor. Greek vessels had several anchors, one of which, called the "sacred anchor," was never let go until the ship was in dire distress; and a similar custom was, for many years, observed in the British navy. All sea-going vessels ordinarily carry several anchors. Two of these, at least, are carried well forward, one on each bow, and are therefore called *bowers*, and are designated as the *port bower* or *starboard bower*, according to the side of the ship on which they are carried. In addition to these, large vessels carry one or two anchors of about the same size, called *sheet anchors*. They are stowed like the *bowers*, but usually some distance farther, aft, and, not being intended for immediate use, are generally securely lashed in place.

A *stream anchor* is a light anchor, not more than half as heavy as one of the *bowers* and usually about one-fourth. It is often very useful. Very light anchors are called *kedges*. In the United States navy the weight of a battleship's bower or sheet anchor is from 14,000 to 18,000 pounds. Stream anchors (the term "stream" is not now much used) weigh from 1,000 to 3,000 pounds, and *kedges* from 100 to 1,000 pounds. Smaller anchors are carried for the boats. For the purpose of grappling and holding to such objects as a vessel's rigging, trees on shore, chains, and the like, a small instrument called a *grapnel* is used. It has no stock, but has several arms, each sharply pointed. They were much used in "cutting out" expeditions in the days when such enterprises were common. The grapnel, with a short length

of chain attached, as the enemy would have severed a rope with their cutlasses, was thrown into the rigging of the ship attacked. This enabled those of the attacking party, in a tide-way, or when the ship attacked was moving, to keep alongside until they could clamber on board. Grapnels are still issued for use in boats in the United States navy, and a large folding grapnel, with straight hinged arms, is used to some extent in naval boats in place of an anchor of the customary shape. Anchors were formerly made of wrought iron, but are now very largely made of cast or forged steel. There are two types in use, the old, or ordinary type, in which the stock is at right angles to the arms, and patent anchors, which either have no stock at all, or one lying in the same plane with the arms. The shape of the ordinary anchor is familiar, and is shown in Fig. 1.

FIG. 1. ANCHOR.

- | | | | |
|---|-------|---|---------------------|
| A | Ring | F | Fluke |
| B | Stock | G | Arm |
| C | Shank | H | Bill |
| D | Crown | K | Shackle or Jewsharp |
| E | Palm | L | Club-link |

The main body is called the *shank*; at one end it joins the arms, and at the other is pierced by a hole through which passes the iron (or steel) *stock*. The latter has a ball cast on one end; the other end is bent at right angles a few inches from its extremity, and also terminates in a ball, but the ball is removable. The stock is held in position in the shank by a raised lug, or shoulder, on one side, and by a key on the other. The bend at the end permits it to be partly drawn out and folded down along the shank. At the other end of the shank from the stock are the *arms*, which are cast or forged

FIG. 2. PATENT ANCHOR.

| B | Shank | DD | Flukes |
| | | E | Pivot |

in one piece with it. They taper slightly towards their ends, which are called *pees*, or *bills*, and on the side towards the shank have shield-shaped

pieces called the *flukes*. The faces of the flukes are called *palms*. The middle of the curve of the arms, opposite to and in line with the shank, is called the *crown*.

Patent anchors differ in details of design, but in all of them the arms are pivoted to the shank, usually by a very heavy bolt. The flukes are enlarged, and lie in the same plane with the arms and shank when the former are in mid-position. When the anchor is on the bottom, the arms turn, the flukes droop, and, pointed downward, are forced into the ground. To assist in preventing the anchor from being cap-sized by a side pull on the chain, some patent anchors are fitted with short stocks, which lie in the same plane as the arms when the latter are in mid-position. When an anchor of ordinary type is let go, it strikes on the crown and then falls over and rests on one end of the stock. The first pull of the chain *cants* it (i.e., tilts it over), laying the stock flat on the bottom and pointing one of the bills fair for entering the ground. Additional pulls serve to drive the bill and fluke into the ground to a depth which depends upon the strain upon the chain and the softness of the bottom. The principal points of excellence in an anchor are: Holding-power under various conditions, strength, quick-holding, quick-tripping, exemption from fouling, facility of stowing, facility of sweeping, canting, facility of fishing in a heavy sea, and facility of transport in, or by, boats. Slight differences of design make considerable difference in the holding-power of anchors. For an ordinary anchor the most favorable angle for the palm is thought to be a little less than 45 degrees from the middle line of the shank, but in most patent anchors the flukes are permitted to droop not more than 35 degrees. The shank of all anchors projects a short distance beyond the stock, where it is fitted with a heavy ring or shackle called the *ring*; the ring in turn is secured to the chain by a heavy shackle called the *jewsharp*, the jaws of which embrace the club, or body, of a *club-link*; beyond this there is sometimes an open link, and then follows the *chain*. The latter differs from ordinary chain in having a cross-piece in each link called a *stay pin*, the purpose of which is to prevent the chain from *kinking*, to which ordinary chain is liable, and which would be a most serious matter in an anchor chain, because it not only might cause the chain to part under the pull of the ship, but in letting go the anchor a *kink* formed in the *chain-locker* (the box or compartment in which the chain is stowed) might jam in a chainpipe in the deck, or in the hawsepipe, with disastrous consequences.

In the navy and in most vessels of the merchant service the anchor chain was formerly divided into lengths of 15 fathoms (or 12½ fathoms in England), called *shots*, each shot being joined to the succeeding one with a shackle. At 7½ fathoms from the anchor, and again at 37½ fathoms, were placed swivels, to prevent the chain from getting kinks by twisting. In the United States navy the present practice is to place a swivel at 5 fathoms and neither shackle nor swivel between that and 45 fathoms. This is to facilitate getting up the anchor. Neither swivels nor shackles fit the wildcat closely, and, if the pull is heavy, they are apt to slip and cause delay. Merchant ships anchor less frequently and in less exposed places than those which men-of-war are frequently

compelled to accept for anchorage ground, consequently less attention is paid to the details of the *ground-tackle* (i.e., anchors, chains, etc.) of merchantmen. When expecting to remain in port for more than a few days, especially if the harbor or anchorage ground is contracted, or if there is a strong tidal or river current, vessels frequently resort to *mooring*. The length of chain varies with the depth of water and other considerations, but a moor at 45 fathoms is common practice. After dropping one anchor the ship *veers* (i.e., lets run out) chain until about 90 fathoms are laid out; then the other anchor is let go; now, by *heaving in* on the first chain to 45 fathoms and *paying out*, or veering on the second to 45 fathoms, the ship is brought to a middle position between her anchors, and in swinging to the tide or wind will cover very much less ground than if *riding* to a single anchor, and her chain cannot sweep over an anchor and *trip* it (i.e., cause it to let go its hold).

When the ship swings, however, she may not merely move back and forth, but may turn all the way round (e.g., heading north, she may swing until she heads east, then south, and then—instead of going back to east and then north—continue the circle by heading west and then north); this will cause the chains to cross, or if the operation continues, to wind themselves around each other and give what is called a *foul hawse*. This must be cleared by unshackling and unwinding one of the chains, the operation being called *clearing hawse*. To avoid the labor of this, and it is a very laborious task with heavy chain, a *mooring swivel* is frequently used. This is a swivel having two shackles at top and two at the bottom; the chains leading to both anchors are opened at the 45 fathom shackles, and the parts leading from the anchors *bent* (i.e., joined) to the lower shackles of the mooring swivel while the inboard ends (i.e., those extending from the ship) are bent to the upper shackles of the swivel. The ship is now free to swing without fouling her chains, as the swivel turns with her.

Patent anchors are much used, as they are convenient in more ways than one. When on the bottom, there is no arm sticking up in which the chain can catch as the ship swings, or on which she might strike if the water is shallow. When hoisted, the absence of a stock at right angles to the arms facilitates storage; and in most recent ships the anchor is pulled up, without *catting* or *fishing*, into a recess for it in the bow, which is made by enlarging the hawsepipe. Anchors are hoisted by means of a capstan or windlass. The former is shaped somewhat like a huge hour-glass, but is stouter in the middle, and carries about its lower edge a recess with ridges on the upper and lower flanges; this arrangement, in which the chain fits, is called the *wildcat*. Windlasses are like capstans, but are turned on the side, and usually have two or more wildcats. On vessels in which steam gear is not fitted to the capstan, the latter is turned by hand; long wooden bars, called *capstan bars*, are fitted into recesses in the head of the capstan and held in place by a small rope called the *swifter*, which passes through a score, or groove, in their outer ends. Small windlasses are operated by levers like pump brakes, which turn the windlass barrel by means of racks and pawls. In the older ships the first operation of getting up the anchor consists in *bringing-to* the

chain (i.e., in pulling up slack chain from the locker and putting it in the wildcat of the capstan); large ships are now usually fitted with steam windlasses, on which the chain is always in place. The next process is to release the chain from the *bitt* and *stoppers*. The former is a heavy, cylindrical iron casting securely bolted to the deck; in the older ships the chain usually has one turn around it, but when the ship is pulling heavily at her anchor, owing to a strong current or heavy sea, the chain is *double-bitted* (i.e., has two turns). The *stoppers* are short lengths of heavy wire rope hooked to rings in the deck at one end and lashed with rope to the chain at the other; there are usually several stoppers on the chain, and if there is no *controller* (an iron contrivance to hold the chain from running) forward of the bitts, a stopper must now be put on the chain there. The chain is then *unbitted* (i.e., thrown off the bitt); the slack is taken in until the strain is on the windlass, or capstan, and all stoppers taken off. The *heaving in* then begins; when the chain has been hove in until any further pull is liable to cause the anchor to trip, or the ship to drag, it is said to be *hove short* or *at a short stay* (the terms *astay* and *at a long stay* are not much used); and its direction, making an angle of about 45 degrees with the surface of the water, is about parallel to the fore stay of a rigged ship.

If everything is ready for leaving the anchorage, the heaving continues until the chain is vertical, or, in nautical terms, *up and down* (the anchor is then said to be *apeak*), the anchor is *broken out* and hoisted to a convenient position at or into the hawsepipe, when it is said to be *up*.

In old-typé ships a tackle called the *cat* was next used; a hook on the lower block of the *cat-fall* was inserted in the ring of the anchor, and the latter was *catted* by being pulled up to the *cathead*, which projected slightly from the ship's side; the *fish* tackle was then hooked to the crown, and the other end of the anchor pulled up until the shank was about horizontal and the inboard arm rested on an inclined iron plate called the *bill-board*, the latter operation constituting *fishing*. The anchor was now secured by small chains, one in the ring called the *ring-stopper*; and the other, around the shank close to the outboard arm, called the *shank painter*. One end of each of these chains led to a trigger, by striking which the anchor was *let go* with ease and certainty. Under some circumstances it was desirable to *cockbill* the anchor before letting it go. This was done by easing away the shank painter until the anchor hung at the cathead by the ring-stopper; it was then said to be *a-cockbill*. In later ships there was secured on the shank of the anchor, at the balancing point, a link called the *balance-link*. When the anchor was hove up to the hawsepipe (i.e., the cast-iron pipe in the ship's bow through which the chain passes), the cat was hooked to the balance-link, and the anchor lifted in a horizontal position and put in place on the bill-board. Instead of a cathead, this form of cat requires a heavy *cat davit*, or derrick, standing 8 or 10 feet above the deck, and mounted upon a swivel stand. In modern ships cat and fish davits and derricks are unnecessary, as the anchor is pulled directly into the hawsepipe. In *letting go* the anchor it is necessary to control the speed of the chain as

it goes out. For this purpose it was formerly *bitted* (single-bitted, with one turn around the bitt); this prevented the velocity of the chain from becoming too great. When a sufficient quantity of chain had run out, the brake was put on the windlass, and the *compressor* (a curved arm which grips and holds the chain) *hauled to*. The stoppers were then put on and the chain was *secure*. In recent ships the windlass or capstan brake suffices to check or stop the chain.

A *sea anchor* is variously constructed; usually it floats, and is made up of spars and canvas, or something that will not sink and will offer resistance to the water; but it is sometimes made of materials too heavy to float and is then held up more or less by the pull on the anchor rope. Its object is to keep a boat or ship with her bow up to the seas and so enable her to ride them better and roll and wallow about less; and it accomplishes this by being placed in or below the surface of the water, so that it tends to drift more slowly than the boat or ship which is exposed to the force of the wind and of the waves.

Mooring anchors are of various types and are designed for permanent moorings; they are used for holding in place large mooring buoys to which ships may secure themselves in lieu of anchoring, or as anchors for buoys marking a channel or shoal. As has already been stated, some mooring anchors consist merely of a heavy stone, or block of concrete, but others are of the mushroom, or screw, form.

FIG. 3.
MUSHROOM
ANCHOR.

Mushroom anchors of one type have a saucer-shaped head, from the concave side of which extends the shank, which has a shackle in the end for the chain; the other type consists merely of the iron saucer, with the shackle on the convex side; in this second type the anchor holds largely by suction.

Screw anchors, as their name implies, are shaped like screws with very broad flanges and are screwed down into the mud by means of a long bar called the *key*.

AN'CHORAGE, or ANCHORAGE GROUND. That portion of a harbor or roadstead best suited for anchoring vessels; or, in harbors where there is much commerce or traffic, that portion in which vessels are permitted to anchor. A good anchorage is one in which the water is of sufficient but not excessive depth; in which the bottom is of such a character as to enable the anchor to enter in and hold (i.e., the *holding ground* is good), and which is protected from the open sea. The practice of indicating upon charts by means of an anchor the best anchorage in any particular locality still obtains, but is falling somewhat into disuse, owing to the more definite information now given by charts and sailing directions.

AN'CHOR CHAIN. See ANCHOR.

ANCHOR DAVIT. See ANCHOR; DAVIT.

ANCHOR ICE. See ICE.

AN'CHORITE, or AN'CHORET (Gk. ἀναχωρητής, *anachōrētēs*, a recluse, retired man, from ἀνά, *ana*, back + χωρεῖν, *chōrein*, to give way, retire). Literally a person who withdraws from society; a hermit. The name was applied to those hermits who began to appear in the Christian Church in the third century,

living in solitude, and not, like the monks or cenobites, in communities. During the first two centuries Christians generally thought it enough to withdraw from the world by refusing to participate in heathen festivals and amusements; but extreme views became gradually prevalent, and were connected with a belief in the merit of celibacy, of abstinence from particular kinds of food, of self-inflicted tortures, etc. The persecutions to which Christians were subjected drove some into the solitude of deserts; afterward the glory of a life spent in loneliness and austerity became a substitute for that of the martyr's death. The general corruption of society also caused many earnest and well-meaning persons to shun it. The ascetics (see ASCETICISM) set the example of retiring from cities to rural districts and villages; the anchorites went further, and sought to withdraw themselves altogether from mankind; and if the reputation of sanctity which was connected with a life of solitude constituted its chief attraction to some, there can be no doubt that many chose it in the hope of thereby attaining real sanctity. Many of the anchorites voluntarily subjected themselves to the vicissitudes of the weather, without proper habitation or clothing, restricted themselves to coarse and scanty fare, wore chains and iron rings, and some dwelt on the top of pillars for many years (see PILLAR SAINTS) as extraordinary and conspicuous examples of mortification and penance, of whom the most famous is St. Simeon Stylites in the early part of the fifth century. St. Antony of Egypt (q.v.) was one of the first and most celebrated anchorites. The deserts of Egypt were their first home. Thence they spread throughout the Eastern church, but were always rare in the Western church. The anchorites were not always able to preserve their solitude unbroken. The fame of their sanctity drew many to visit them; their advice was often sought; and the number of their visitors was much increased by the belief that diseases, particularly mental diseases, were cured by their blessing. Sometimes, also, they returned for a short time to the midst of their fellow men to deliver warnings, instructions, or encouragements, and were received as if they had been inspired prophets or angels from heaven. The number of anchorites, however, gradually diminished, and the religious life of convents was preferred to that of the hermitage.

AN'CHOR WATCH. A portion of the crew kept on deck during the night when at anchor. During prolonged heavy weather or unfavorable conditions the anchor watch may be kept on deck during the day. In the merchant service one or two men form the ordinary anchor watch; in the navy, four to a dozen or more; though in either case these numbers may be increased under special circumstances. The duties of the anchor watch are to *veer* chain (see ANCHOR), if occasion demands it, spread or take in awnings, cover hatches, secure loose articles if the wind and sea rise; and, in fact, act as a general guard when the greater part of the crew is asleep.

ANCHOVY, ăn-chō'vī (of uncertain origin, perhaps, literally, a dried or pickled fish, from Basque *antzua*, dry). A small fish (*Engraulis encrasiolus*) belonging to the Engraulididæ, a family closely related to the herring. It resembles the latter in general appearance, but is thicker in proportion, and is about 6 inches

in length, having a pointed head with the upper jaw projecting, and a widely forked tail. It abounds in the coast waters of southern Europe, and especially in the Mediterranean, where extensive fisheries are carried on, particularly near Leghorn. They approach the coast from the oceanic depths to spawn in early summer and are caught in seines, to which they are attracted by strong lights in the fishing-boats. Anchovies are salted in small barrels and have been much used for sauces, etc., since ancient times. There are several nearly related species both on the Atlantic and Pacific coast of America and in other countries, where they also form an important food preparation.

ANCHOVY (ăn-chō'vī) **PEAR** (so named from being pickled, see ANCHOVY), *Grias cauliflora*. A plant of the family Myrtaceæ. It grows in boggy places in the mountainous districts of Jamaica and other West Indian islands, attains a height of 50 feet, and has great oblong leaves 2 or 3 feet in length. The flowers are numerous, on short peduncles; they are large, whitish, and sweet-scented; the corolla consists of four petals, and the calyx is four-cleft. The fruit is an ovate drupe of a brownish russet color, crowned with the persistent calyx; the stone is marked with eight ridges. This fruit is pickled and eaten like the East Indian mango and resembles the mango in taste.

ANCHU'SA, ăn-kū'să. See ALKANET.

ANCHYLOSIS, ăŋ'kī-lō'sīs. See ANKYLOSIS.

AN'CIENT DEMESNE, dê-mên' (OF. *de-main*, Lat. *dominium*, Eng. *domain*). In English law, estates of great antiquity, constituting the ancient patrimonial possessions of the crown. Manors (q.v.) of ancient demesne date back to the reign of Edward the Confessor or of William the Conqueror, and appear in Domesday Book under the description of *Terræ Regis*. Though they might be alienated and held by a subject, they were properly kept in the King's hands for the maintenance of the royal dignity. Whether held by a subject or by the King, they enjoyed certain rights and immunities which were not shared by other manors, even when held by the King; especially the right to administer their own justice, free from the interference of the ordinary royal tribunals. Two important and distinctive varieties of tenure developed on these ancient demesne lands: one a privileged form of customary tenure (q.v.), midway between copyhold (q.v.) and socage (q.v.) tenure, which came to be known as *customary freehold*; and the other a peculiar form of socage tenure, which received the name of *tenure in ancient demesne*. Though these *tenures* still survive in England, they have been shorn of most of their peculiar characteristics and assimilated to the more usual tenures. Consult Pollock and Maitland, *History of English Law* (2d ed., London and Boston, 1899).

ANCIENT LIGHTS. Windows that have existed so long that they have acquired an indefeasible right to the light which enters them, free from interference by the owner of the premises over which the light comes. The easement of ancient lights, so called, is the right gained by the owner of a dwelling or other building to restrain his neighbor from interfering with windows which have been in existence from time immemorial. The term does not, therefore, describe a peculiar and distinctive right, but only a method by which the familiar easement of light may, like other easements, be acquired—

the method, namely, of prescription (q.v.). Ancient lights belong to the class of negative easements, which cannot generally be acquired by prescription in the United States. In England they are now regulated by statute (the Prescription Act, 2 and 3 Will. IV, c. 71), which dispenses with the old requirement of use and enjoyment from time immemorial and calls for an existence of only 20 years to create the easement. See EASEMENT; LIGHT, EASEMENT OF; PRESCRIPTION. Consult Gale, *Treatise on the Law of Easements* (8th ed., London, 1908), and Goddard, *Treatise on the Law of Easements* (7th ed., London, 1910).

ANCIENT MAR'INER, THE. A poem by Coleridge, published (1798) in the *Lyrical Ballads* by himself and Wordsworth. It is founded on the sailor's superstition of the sinfulness of killing an albatross and rehearses the sufferings consequently undergone.

ANCIENT OF DAYS. A designation of God in Dan. vii. 9, 13, 22. It represents him as "the aged," "the advanced in days," possibly in contrast with the new divinities Antiochus Epiphanes had sought to introduce among the Jews. In the Ethiopic Enoch the expression "head of days" is not a translation of the term in Daniel, for which the Ethiopic Bible uses another phrase, but probably inspired by it, meaning, not "the old head," but "the Lord of Days." Consult Schmidt, *The Original Language of the Parables of Enoch*, p. 343 (1908).

ANCIENT ORDER OF HIBER'NIANS. See HIBERNIANS, ANCIENT ORDER OF.

ANCIENTS, COUNCIL OF. The upper House of the Legislative Assembly in France, under the Directory, from 1795 to 1799. The chief function of the Ancients was the approval or rejection of measures submitted by the lower House, the Council of Five Hundred.

ANCILE. See SALII.

ANCILLON, ä'n'së'yôn', CHARLES (1659-1715). A French Protestant and educator, born in Metz. Having studied law at Marburg, Geneva, and Paris, he was chosen by his co-religionists to plead their cause before Louis XIV on the revocation of the Edict of Nantes. He is better known as an educator in Prussia, where, in 1687, he was placed in charge of the *Académie des nobles* by the Elector Frederick. With Leibnitz he founded the Academy of Berlin. His writings include *Histoire de l'établissement des Français réfugiés dans les états de Brandebourg* (1690).

ANCILLON, JOHANN PETER FRIEDRICH (1767-1837). A Prussian statesman and historian. He was born in Berlin, a descendant of David Ancillon (1617-92), a French Protestant, who emigrated from Metz after the revocation of the Edict of Nantes, and who became pastor of the French congregation in Berlin. Intermediate members of the same family occupied the same pastorate or were in the service of the Prussian government. Friedrich studied theology, philosophy, and history, and in 1792 was appointed teacher of history in the Berlin Military Academy, as well as preacher to the French congregation. The publication of his *Tableau des révolutions du système politique de l'Europe depuis le XV siècle* (4 vols., 1803-05) secured him the appointment as royal historiographer as well as tutor of the Crown Prince. In 1832 he became Minister of Foreign Affairs, and occupied that place until his death. He was a man of conservative views and a defender of the monarchy.

ANCKARSTRÖM, or ANKARSTRÖM, ä'n'-kär-strëm, JOHAN JAKOB (1762-92). The assassin of King Gustavus III of Sweden. He was a page at court and later an ensign in the Life-Guards, but in 1878 retired from military service with the rank of captain. Of haughty temper, angered at the policy of repression pursued by the crown toward the nobility, he was frequently brought to trial for incendiary speeches. In 1791, with Count Horn, Count Ribbing, Lieutenant-Colonel Liliehorn, and others, he formed a conspiracy for the murder of the King. Chosen by lot to accomplish the deed, at a ball held in the Stockholm opera-house, he approached the King and mortally wounded him with a shot from a pistol (March 16, 1792). He was condemned to death and executed at Stockholm.

ANCON, ä'n-kön', or PORT ANCON. A seaport of Peru, in the department of Lima, 30 miles by rail northwest of Lima. During the construction of a coast-line railway excavation near Ancon brought to light an old burial place in which were found articles illustrating many branches of ancient Peruvian life and customs. Pop., 3000.

ANCONA, ä'n-kō'nà (the name alludes to its situation at the bend of the sea-coast; Gk. ἀγκών, *ankōn*, angle, corner). The capital of the province of Ancona, in central Italy, in the compartimento of the Marches, 132 miles, (185 by rail) northeast of Rome, lat. 43° 37' N. and long. 13° 31' E. It is an episcopal city, and, next to Venice, the most important Italian port on the Adriatic (Map: Italy, H 4). It is beautifully situated in the form of an amphitheatre between two promontories. The harbor has been greatly improved by the government in recent years and is now deep enough for large vessels. It is defended from naval attack by forts and from the violence of the sea by two moles. The ancient mole was built by Trajan and on it stands a triumphal arch of Parian marble designed by Apollodorus. The modern mole with the lighthouse was built by Clement XII and its triumphal arch was designed by Vanvitelli. The cathedral of St. Cyriac, built in the eleventh and twelfth centuries on the site of the temple of Venus mentioned by Catullus and Juvenal, contains 10 of its columns, with a very ancient dodecagonal dome. The town hall was built in the thirteenth century, restored in the fifteenth, and partially modernized in 1647. The museum contains many valuable antiquities and some valuable paintings. The principal industries are sugar refining, shipbuilding, and the manufacture of paper, sail cloth, and silk. The exports are small; the imports are salt fish, coffee, iron and steel, wheat, raw sugar, and coal. Regular steamship communication is maintained with the principal Mediterranean ports. The United States maintains there a consular agency.

Ancona is supposed to have been founded by Syracusans who had fled from the tyranny of Dionysius the Elder. It was destroyed by the Goths, rebuilt by Narses, and again destroyed by the Saracens in the tenth century. It afterward became a republic and was later annexed to the States of the Church. In 1798 it was taken by the French, who in 1799 surrendered it to the Russians and Austrians after a long and gallant defense. In 1832, when the Roman frontiers were in the possession of the Austrians, a French squadron appeared before the

harbor and landed 1500 men, who took possession of the town. It remained in their hands until 1838, when both French and Austrians retired from the Papal States. In 1849 a revolutionary garrison in Ancona capitulated after enduring a siege by the Austrians of 25 days. Pop., 1881, 48,000; 1901, 56,835; 1911, 63,100.

ANCONA, ALESSANDRO D' (1835—). A distinguished Italian critic, journalist, and professor at the University of Pisa. He was born in Pisa. During the days preceding the war of Italian independence he was active in politics, but after the peace of Villafranca he retired from political life, and for awhile edited the leading Florentine journal, *La Nazione*. In 1861 he was called to the chair of literature at the university in his native city. At the age of 18 he published a life and critical edition of the works of the Dominican philosopher, Tommaso Campanella. Among the many volumes which he has since produced, special mention should be made of *I precursori di Dante* (1874), *Origini del teatro in Italia* (1877), *La poesia popolare italiana* (1878); *Manuale della letteratura italiana* (1892-95).

ANCORA, än-kō'rà (It.). A former synonym of the French word *encore*, 'again,' and used in demanding the repetition of a song, for which the French now, however, use the word *bis*, 'twice.'

ANCRE, än'kr', CONCINO CONCINI, MARQUIS D' (?—1617). A Florentine adventurer, who went to the French court in 1600 with Maria de' Medici, Queen of Henry IV. With his wife, Leonora Galigai, he exercised an unhappy influence in promoting the disagreement between the King and Queen. When, after Henry's death, the Queen became regent, Concini, as her favorite, obtained possession of the reins of government and in 1613 was made a Marshal and Prime Minister. He bought the marquisate of Ancre, in Picardy, and took his title from it. Because of his rapacity he became an object of detestation equally to the nobility and the people. A conspiracy was formed against him, to which the young King, Louis XIII, was privy, and he was assassinated in April, 1617, on the bridge of the Louvre just as he was leaving it. Vitry, a captain of the royal bodyguard, accomplished the murder. His wife was soon afterward accused of witchcraft and was executed. Consult Bazin, *Histoire de France sous le règne de Louis XIII* (Paris, 1837-42).

ANCREN RIWLE, än'krën rōōl; *ME. pron.* än'krën rī'le (Rule of Anchoresses). An exposition of duties and rules of life, said to have been drawn up by Simon of Ghent, Bishop of Salisbury (1297), for a religious community of women at Tarrant-Kaines in Dorsetshire.

AN'CRUM MOOR. A moor in Scotland a little northwest of Jedburgh (q.v.). It was, in 1545, the scene of the defeat of 5000 English under Sir Ralph Evers and Sir Brian Latoun by a Scottish force under the Earl of Angus and Scott of Buccleuch. A defaced monument marks the spot where a Scottish maiden, named Lilliard, is said to have done prodigies of valor.

ANCUD, än-kōōd' (formerly San Carlos). Capital of the province of Chiloe, Chile (Map: Chile, C 12). It is situated on the north side of the island of Chiloe, which lies near the mainland, about 575 miles south from Valparaiso, with which it is connected by steamship line. It is about 4000 miles from Panama and has an excellent harbor, some manufactures and fish-

ing interests. It was much frequented as an anchorage in the days of Antarctic whale fishing. It was settled in 1768; was the last stronghold of the Spaniards in Chile during the war of the rebellion, surrendering to the revolutionists in 1826. Pop., 1905, town, 4000; municipality, 25,000.

AN'CUS MAR'CIUS (?-614 B.C.). According to Roman tradition, the son of Pompilia, daughter of King Numa Pompilius, and the fourth King of Rome. Following the example of Numa, he endeavored to restore the almost forgotten worship of the gods and the cultivation of the arts of peace among the Romans. But, despite his inclination for peace, he was engaged in several wars with the neighboring Latin tribes, whom he subdued and reduced to order. These Latins Niebuhr (q.v.) considers to have formed the original plebeians. Against the Etruscans he fortified the Janiculum, connected it with Rome by a wooden bridge, and gained possession of both banks of the Tiber as far as its mouth, where he founded Ostia as the port of Rome. He built the first Roman prison of which we read, a proof that civilization had really commenced, inasmuch as offenses then formally ceased to be regarded as private and personal matters and were treated as crimes against the community. A prison, said to be his, is still in existence near the Forum. He reigned 24 years. It is needless to add that the kings of Rome, as we know them, are not historical characters.

ANCY'RA. See ANGORA.

ANCZYC, än'chits, WLADYSLAW LUDWIK (1823-83). A Polish writer, born at Vilna. He studied pharmacy, but turned to literature, and wrote a number of popular Polish comedies, which are marked by keen characterization and forceful style. His works include *Bureaucracy* (1848), *The Peasant Aristocrats* (1851), *The Inhabitants of Lobsow* (1857), *The Raftsmen* (1875), *The Peasant Emigration* (1876). Of his poems, the narrative *The Tyrtouz* (1883) is perhaps the best known. His labors included also a libretto for the opera *Dutch Voyevoda*. Besides this and other original writing, he translated into Polish many German and French classics, including Victor Hugo's *Ruy Blas*. He edited one popular and one children's magazine, and, under the pseudonym of *Kazimierz Góralczyk*, a number of books for popular reading.

ANDALUSIA, än'dà-lōō'shī-à (Sp. *Andalucía* for Vandalsia, the Land of the Vandals). A region in the southern part of Spain, a part of the old Roman province of Bætica, which comprises the present provinces of Almería, Málaga, Cádiz, Huelva, Seville, Córdoba, and Jaén (Map: Spain, C 4). Its area is 33,697 square miles. The region is divided into Upper and Lower Andalusia. The former comprises the mountainous regions of the Sierra Morena on the north and the Sierra Nevada on the south, with the valley of the upper stream of the Guadalquivir. Lower Andalusia consists chiefly of the valley of both sides of the lower Guadalquivir. The lower regions have a very mild, almost African, climate. On the Atlantic coast the temperature is much lower, and in the highlands snow is not infrequent. The soil is very fertile, both in the mountain valleys of Upper Andalusia and in the deep valleys along the Guadalquivir, and the warm climate allows of the cultivation of many southern fruits. Oranges, lemons, palms, olives, and sugar are cultivated successfully,

while wheat, corn, and other grains ripen as early as April and yield abundant crops. The districts along the coast are generally unfruitful and in some cases utterly unfit for cultivation because of salt lakes and marshes. In ancient times the fertility of Andalusia was proverbial, as evidenced by the names applied to the region such as "granary," "wine cellar," and "gold purse" of Spain. Even at present Andalusia is one of the most fertile parts of Spain; nevertheless, famine conditions prevailed in 1905, and thousands were obliged to emigrate. Cattle-raising is highly developed, and Andalusian breeds of horses, mules, and bulls have long been famous. The people are graceful, and their attire picturesque. Their language is Spanish with a slight admixture of Arabic. Pop., Dec. 31, 1910, 3,828,916.

History. Andalusia, which was overrun by the Vandals in the early part of the fifth century, was probably the Tarshish of the Bible, its name in classical geography being Tartessus (a very ancient town near the mouth of the Guadalquivir having borne the name of Tartessus). From the Carthaginians, who established themselves there in the third century B.C., the country passed to the Romans, who called it Bætica, from the river Bætis (Guadalquivir). Under the Empire it attained great prosperity and assimilated rapidly the civilization of the Romans. The Vandals remained but a short time in the country and were succeeded by the Visigoths, who ruled Spain till the invasion of the Arabs, in 711. The name of Andalusia is inseparably connected with the glory of Saracen and Moorish civilization in mediæval Spain. Within its borders were situated Córdoba, Seville, Granada, and Jaén, the centres of Mohammedan culture, industry, and commerce. By contrast with the gloom and emptiness of the Dark Ages in northern Europe, history has cast almost a fairy light on the plains of "smiling" Andalusia, the home of learning and art, of chivalry and humane toleration. Córdoba was the Athens of the West, the seat of the arts and sciences; and later still, under the Spaniards even, "when the sun of Raphael set in Italy, painting here arose in a new form in the Velasquez, Murillo, and Cano schools of Seville, the finest in the Peninsula." The decadence of Andalusia set in with the downfall of the caliphate of Córdoba in the eleventh century and the disruption of Spanish Islam into a number of independent principalities. One by one the cities of Andalusia passed into the power of Castile. Granada alone and the surrounding *vega* held out for two centuries after Córdoba, Seville, and Cádiz had fallen. The noblest of the Moorish race, fleeing before the Christian advance, crowded into Granada, and the genius of an entire nation made its home within the walls of a city; the lustre which it shed over Granada, however, was but the hectic flush of the dying Moorish civilization. In 1492 Granada was taken by the forces of United Christian Spain. Consult Murray, *The Cities and Wilds of Andalusia* (London, 1853), and Laine, "Sur les routes d'Andalousie" in *La Nouvelle Revue*, No. 115 (Paris, 1898).

ANDALUSITE, *ãn'dà-lũ'sit* (discovered in Andalusia). An anhydrous aluminum silicate that crystallizes in the orthorhombic system, and is usually found in coarse, square, prismatic forms, white or light gray, green, violet, or red in color. A variety known as chiastolite

or macle, is characterized by dark-colored, organic inclusions, arranged symmetrically to the long axis of the crystal, and shows on a fracture a clearly marked cross or square figure. This variety has been found in several localities, as Lancaster and Sterling, Mass.

ANDAMANS, *ãn'dà-manz*. A chain of islands politically attached to British India, situated toward the east side of the Bay of Bengal, between 10° and 14° N. lat. and about 93° E. long., 680 miles south of the mouth of the Ganges (Map: Asia, J 7). The group covers an area of 2508 square miles, and consists of the Great and Little Andamans, divided by the Duncan passage. Three large islands, the North, Middle, and South, and several smaller ones constitute the Great Andamans; the chief of the Little Andamans are Interview, Outram, and Henry Lawrence. With the Nicobar Islands (q.v.), they form a province under a chief commissioner resident at Port Blair. Stewart Sound is the centre for commerce in lumber. Since 1858 the islands have been a penal settlement of India. Except where clearings have been made, the surface is densely covered with forests yielding valuable timber. Of this about 160 square miles is under reserve. Hemp, coconuts, aloes, tea, potatoes, and artichokes are the chief agricultural products, and the cultivation of cacao, indigo, and coffee has been successfully introduced. Port Blair (pop., 1912, 15,600) on the east side of South Island, and Port Cornwallis, on the same side of North Island, have two fine natural harbors. The principal islands have monthly steamboat communication with Calcutta.

Ethnography. The Andamanese, also called Mincopies, are a physically uniform Negrito race, whose stature, however, has a wider range than is generally thought. Their head form tends to be brachycephalic, suggesting relationship with some of the natives of the Nicobar Islands to the south, and with broad-headed Negritos elsewhere. Giuffrida-Ruggeri (1913), the latest anthropological classifier, makes the Andamanese a subdivision of the Asiatic variety of his *Homo sapiens pigmæus* (one of the great divisions of mankind, as one species). Their language, which has several dialects, seems to be unrelated to any other tongue. Their culture is very primitive, but their weapons and industrial and art products show that they have not neglected their environment. They have also, though known only to some of the older members of the more secluded communities, a mythology, with characteristic folk-lore tales. The intelligence of these people has been underestimated. The census of 1901 gives the aborigines as 1882, of whom 842 were females, divided into 12 small tribes. Lying in the route of the Arabs eastward and of the Malays westward, these islands bear traces of the influence of both, and since the establishment of the British penal colony, there is growing up a very mixed race of hybrids. The Andamanese have inhabited their territory since prehistoric times. Flower (1879) and Keane (1896) both hold that they represent a primitive or generalized type, from which, on the one hand, the African negroes, and on the other the Melanesians, may have proceeded. (See NEGRITOS.) The population of the Andamans, with the Nicobars, in 1911, was 26,459. A large part of these are convicts who are employed in reclaiming land and erecting government buildings. The Andamans are mentioned

by Arabic geographers of the ninth century, by Marco Polo in the thirteenth, and Conti in the fifteenth, who gives the signification of the name as 'Gold Islands.' Hopetown, on Viper Island, was the scene of the assassination by a Mohammedan convict of Earl Mayo, Governor-General of India, while on an official tour of inspection in 1872. Consult: Man, *The Aborigines of the Andaman Islands* (London, 1885), and "The Andaman Islands," in *The Indian Antiquary* (vols. xxviii and xxx, Bombay, 1899 and 1900); also Kloss, *In the Andamans and Nicobars* (1903) and the works of Portman, including his *Notes on the Languages of the South Andaman Group* (Calcutta, 1898).

ANDANTE, ăn-dăn'tă (It. going, moving, from *andare*, to walk, go). In music, one of the five principal tempos. It implies a somewhat slow and gentle movement, intermediate between *adagio* (than which it is faster) and *allegro* (than which it is slower). Originally it denoted a moderately animated time, and in works of masters of the eighteenth century it is to be interpreted in this sense. In certain phrases the older meaning still holds to-day. Thus, *poco andante* means 'somewhat animated,' *più andante* 'faster,' *meno andante* 'slower.' *Andantino*, a diminutive of *andante*, bears the same relation to the primitive word as *adagietto* to *adagio*. *Andante* also means the slow movement or section of a musical composition.

ANDANTINO. See **ANDANTE**.

ANDAQUI, ăn-dă'kê. An important Indian confederacy formerly holding the head-streams of the Caquetá and Magdalena rivers and the adjoining mountain region in southern Colombia. Before the period of the Spanish conquest the tribes had attained some degree of civilization, attested by the ruins of temples and other edifices, with gigantic statues carved from the living rock yet to be seen in their ancient territory. A wild and warlike remnant survives in the inaccessible fastnesses at the head of Fragua River, still guarding, according to a local legend, a cavern in which are piled up the golden treasures of their ancestors. The language shows some similarities to the Chibcha, but appears to constitute a distinct stock, the Andaquian. See an account of the Andaqui and their language in *Bull. Amer. Ethnol. Soc.*, vol. i, pp. 53-72 (New York, 1860-61).

ANDAS'TEE. See **CONESTOGA**.

ANDELYS, LES, ăn'zăn'd'lê'. A town in the department of Eure, France, 20 miles northeast of Evreux, on the right bank of the Seine (Map: France, N., G 3). It consists of Grand and Petit Andelys. The former dates from the sixth century and contains the fine collegiate church of Notre Dame, built from the thirteenth to the sixteenth centuries, noted for its superb stained-glass windows and valuable paintings. Petit Andelys clusters around the famous Norman castle of Gaillard, built by Richard Cœur de Lion in 1195, to command the navigation of the Seine and act as a stronghold for Normandy against the French monarchs. Trade is in cloth and grain, and there are manufactures of thread and leather. Pop., 1901, 4539; 1906, 5514; 1911, 5530.

ANDENNE, ăn'dên'. A town of Belgium, in the province of Namur, on the right bank of the Meuse, 10 miles by rail east of Namur (Map: Belgium, D 4). It has manufactures of paper, porcelain, and tobacco pipes, the latter being its most famous product. There are beds of

pipe-clay, quarries of marble, and lead, iron, and coal mines in the neighborhood. Pop., 1900, 7711; 1910, 7803.

ANDER, ăn'dêr, ALOYS (1817-64). A famous Austrian tenor, born at Liebititz, Bohemia. He appeared at Vienna in 1845 and was first to sing there the rôle of John of Leyden in Meyerbeer's *Le Prophète*. His voice was not strong, but was of excellent quality.

ANDERAB, ăn'dêr-ăb', or **INDERAB**, ăn'dêr-ăb'. A town of Afghanistan, on the northern slope of the Hindu-Kush Mountains and on the north bank of the Anderab, or Inderab, River, 85 miles north of Kabul (Map: Afghanistan, L 3). It is surrounded by gardens, orchards, and vineyards and is an important post in the commerce between Persia and India. Pop., estimated at 6000.

ANDERLECHT, ăn'dêr-lêkt. A manufacturing suburb of Brussels, Belgium (Map: Belgium, C 4). It has numerous manufacturing establishments, consisting mostly of spinning and weaving mills, dyeing works, and breweries. Pop., 1890, 32,300; 1910, 63,328.

ANDERLEDY, ăn'dêr-lă'dê, ANTONIUS MARIA (1819-92). A general of the Jesuits, born at Brieg (Valais), Switzerland. He entered the order of Jesuits in 1838, and studied philosophy and theology at Rome and Freiburg. In 1848 he came to the United States, where he was pastor at Green Bay, Wis., and in 1851 returned to Germany, where, until 1853, he directed Jesuit missions. From 1853 to 1856 he was rector of the Jesuit seminary at Cologne. In 1856 he was appointed rector of the seminary at Paderborn, and in 1865 assumed the professorship of moral theology at the Seminary of Maria-Laach, of which he was made rector in 1869. He was appointed, in 1870, assistant to J. P. Beckx, general of the Jesuits, whom he succeeded in 1887.

ANDERMATT, ăn'dêr-măt, or **URSEREN** (the Italian Orsera). The chief town of the Urseren valley, in the canton of Uri, Switzerland, 4 miles south of Göschenen (Map: Switzerland, C 2). It is 4738 feet above sea level and is well fortified, for it is at the intersection of three of the most important Alpine highways, the road through the St. Gotthard Pass, that to the Rhone valley, and the upper Alps road going toward the valley of the Rhine. The St. Gotthard Tunnel passes underneath the valley. The town has an active transit trade and is a summer resort and a centre for winter sports. Pop., 994.

ANDERNACH, ăn'dêr-näg. An ancient town in the Prussian Rhine province, situated on the left bank of the Rhine, about 10 miles northwest of Coblenz and near the mouth of the Nette. The town has manufactures of chemicals, perfumeries, cigars, millstones, exported to distant parts of the world, and *tuffstein*, or trass, an indurated volcanic mud, which, when pulverized and mixed with lime, makes a mortar or cement for constructions under water, and which is used largely in the construction of dikes and sea walls. There is also trade in wine and grain. Pop., in 1890, about 6000; in 1905, 8802. Andernach was the Antunnacum of antiquity, one of the fifty forts of Drusus. Parts of the old walls remain and preserve its mediæval appearance to some extent. The parish church of St. Genoveva, with four towers, one of which dates back to the Carolingian period, and ruins of the old castle of the archbishops of Cologne, are

interesting. After a restoration the Rhein-Tor was gutted by fire in 1907. Late in the fifteenth century Andernach was captured by the Electorate of Saxony. The French burned it in 1688.

ANDERSEN, ä'n'dër-sen, HANS CHRISTIAN (1805-75). A celebrated Danish writer styled the "children's poet," whose best poetry is his prose. He was born at Odense, Denmark, April 2, 1805. The child of poor and shiftless parents, he had little instruction and few associates, but his dramatic instinct was stimulated by La Fontaine and the *Arabian Nights* and a visit of a theatrical company to Odense, in 1818, led him to seek his dramatic fortune in Copenhagen (1819), where for four years he worked diligently, but produced nothing of note. He gained a scholarship, however, and friends, who in 1829 enabled him to publish *A Journey on Foot from Holm Canal to the East Point of Amager*, an arabesque naïvely plagiarized and parodied from the German romanticists. *Fantasies and Sketches*, sentimental and rather mawkish poems, followed in 1831, after which he made a tour of Germany, the first of many wanderings. This inspired *Silhouettes*, a book with admirable pages of description. In 1835 he essayed the *Fairy Tales*, by which he was to achieve world-wide recognition. The classic *Tinderbox* and *Big Claus and Little Claus* are also of this year. He was, however, disposed to underrate his "sleight of hand with fancy's golden apples," devoting himself to novels, *The Improvisatore* (1835), *O. T.* (1836), and *Only a Fiddler* (1837), which gave him a European reputation for picturesque description, humor, and pathos of the romantic type. In the last, there are interesting autobiographical touches; but there is no clear character-drawing in any of them, and this lack made his repeated dramatic essays uniform failures. He was still to write delightful impressions of travel, as in *A Poet's Bazaar* (1842), *In Sweden* (1849), and *In Spain* (1863). He wrote other novels, *The Two Baronesses* (1849) and *To Be or Not To Be* (1857), and an epic failure, *Ahasuerus* (1847); but the *Picture Book Without Pictures* (1840) had revealed his best talent to him as an interpreter of child nature. Between 1852 and 1862 he printed nine small volumes of stories and finished the last of them in 1872. His last years were unharassed by criticism and attended by all the honor and love that should accompany old age. His literary jubilee occurred in 1869, and he died at Copenhagen, Aug. 4, 1875, after a brief and painless illness.

In appearance, Andersen was limp and very ungainly. His nose was large, his neck and limbs long and lank, and his hands and feet very large; yet he fancied himself distinguished looking and had a child's delight in dress and decoration. His character, too, hovered between the child-like and the childish. He never realized the limitations of his genius. Curiously enough, he did not like children, and he was not personally attractive to them. He was a shrewd observer, but self-absorbed and out of touch with his political generation. His literary style is faulty, but it reflects marvelously the vivid imagery of juvenile fancy. He had at his finger-tips all the venerable devices of the nursery to spur attention and kindle sympathy. No writer looks at nature so wholly with the child's eyes as he, none so interpenetrates narration with the smiles, the fears, and the very intonations of childhood. His personifications

may tease the adult fancy, but they are the natural drama of children. Andersen's works are Englished in ten uniform but unnumbered volumes. Mary Howitt's is still the best of many translations of the *Tales*, though it is far from faultless. A sumptuous centenary edition of the *Tales* appeared (1900) under the patronage of the Danish government simultaneously in six languages. Andersen's *Autobiography* was compiled by Jonas (Berlin, 1879). R. Nisbet Bain's *Life of Andersen* (New York, 1895) is the best in English.

ANDERSEN, ä'n'dër-sen, KARL (1828-83). A Danish poet. He was born at Copenhagen, studied law there, and was subsequently appointed curator of the royal museums at the castle of Rosenborg. He first became known through his *En Krands paa en Arbejders Kiste* ('A Wreath for a Laborer's Coffin,' 1857). He also published *Lyriske Smaadigte* ('Shorter Lyrics,' 1863), *Poesier* ('Poems,' 1870), *Genrebilleder* ('Genre-Pictures,' 1876-81), and other works. He made a collection of Icelandic sagas (1864) and translations of Servian folk-songs.

ANDERSON. A city and railroad centre, the county-seat of Madison Co., Ind., 36 miles northeast of Indianapolis, on the Central Indiana, the Cleveland, Cincinnati, Chicago, and St. Louis, and the Pittsburgh, Cincinnati, Chicago, and St. Louis railroads, and on the east fork of the White River (Map: Indiana, D 2). An abundant supply of natural gas promotes the manufacturing industries, which include automobiles, silos, bottles, magnetos, files, tile, cheese-cutters, electric and gasoline motors, pumps, paper boxes, steel and wire nails, mattresses, street cars, etc. The city is the centre of an extensive system of interurban electric railways, the power for the operation of which is supplied by a million-dollar plant. Anderson is the seat of an industrial school and has a Carnegie library and a fine high school building. Near the city are interesting mounds of the so-called "mound-builders." Anderson was settled in 1823, was incorporated in 1865, and is governed under the charter of 1865, which provides for a mayor, elected every four years, and a city council of six members, controlling all appointments. The city owns and operates the water works and electric light plant. Its growth has been very rapid. Pop., 1880, 4126; 1890, 10,741; 1900, 20,178; 1910, 22,476; 1913 (est.), 25,000.

ANDERSON. A city and the county-seat of Anderson Co., S. C., about 100 miles (direct) northwest of the State capital, on the Blue Ridge and the Charleston and Western Carolina railroads (Map: South Carolina, B 2). It has city and school libraries, three splendid school buildings and churches, a fine city hall, hospital, and county court house. The city is in a fertile cotton-growing and agricultural region and has several large wholesale stores. Among its industrial establishments are cotton and cottonseed oil mills, employing 4900 persons, factories for the manufacture of fertilizers, spring beds and mattresses, overalls, collars, and other articles of apparel, lumber and flour mills, and machine shops. A notable feature of the city is a superb electric power station, 10 miles distant on the Seneca River, controlled by a private corporation. The government, under a charter of 1882, is administered by a mayor, elected every two years, and a municipal council. Town meetings are held when neces-

sary. Anderson was settled in 1827 and is the birthplace of John C. Calhoun. A large part of the population lives outside the city limits, which are restricted to one mile. For two decades Anderson has been the most rapidly growing city in South Carolina, and the county ranks second in the United States in the production of cotton. Pop., 1890, 3018; 1900, 5498; 1910, 9654; 1913 (est.), 17,861.

ANDERSON, ALEXANDER (1775-1870). The earliest wood engraver in the United States, also a line engraver. He was born in New York City, the son of a printer, and as a schoolboy his favorite occupation was copying engravings. At 12 he improvised his own copper plate, upon which he drew with a graver made from a pocket knife. In 1789, at his father's wish, he began the study of medicine. He first saw wood engravings by Bewick (q.v.) in 1793 and immediately made trial of boxwood blocks, which were henceforth his favorite medium. The following year he illustrated in this technique the *Looking Glass for Men* for the publisher Durrell. In 1795 he was licensed to practice medicine, and although he was highly successful, he retired from practice in 1798, after the death of his wife, parents, infant son, and brother from yellow fever. During the years following he illustrated many works, chiefly after English originals; such as Bewick's *Quadrupeds* (1810), on the whole an excellent copy; Holbein's *Dance of Death*, published under the title of *Emblems of Mortality* (1810), and *Shakespeare's Plays*, illustrated after Thomson (1812). From 1820 he devoted himself exclusively to wood engraving. The best of all his productions are two fine and spirited cuts, the "Return from the Boar Hunt" after Ridinger, and Teniers's "Water Fowl," both published in 1818. Unfortunately there was no demand for work of such size and excellence by American publishers. He was elected honorary member of the National Academy of Design in 1843, and died, Jan. 17, 1870, at Jersey City.

Anderson was in the truest sense a pioneer; he is the "father of wood engraving" in the United States. Entirely self-taught, he modeled his art upon that of Bewick, whom he approaches only in his very best work. Considering the difficulties surmounted, his achievements are indeed remarkable; but he was constantly handicapped by the poor and cheap character of the illustrations demanded by the American book trade of his day. The volume of his work is enormous. Consult: Lossing, *Memorial Address on Alexander Anderson*, published by the New York Historical Society (1872); *Early American Wood Engravings by Alexander Anderson and Others* (New York, 1877); F. M. Burr, *Life and Works of Alexander Anderson* (New York, 1893); Linton, "The History of American Engraving," in *American Art Annual*, vol. i, part i.

ANDERSON, Sir EDMUND (1530-1605). An English jurist, Chief Justice of the Court of Common Pleas in 1582, distinguished for zeal in the cause of the Established Church, and notorious for harshness toward Catholics and other dissenters. In his attitude at the trials of Robert Brown, the founder of the Brownists, and of John Udall, concerned in the authorship of the Martin Marprelate pamphlets, he showed a spirit of brutal vindictiveness bent on conviction. He was one of the commissioners in 1586 to try Queen Mary of Scotland and after-

ward to try Sir Walter Raleigh. He was a man of extraordinary legal learning.

ANDERSON, EDWIN HATFIELD (1861—). An American librarian, who was born in Zionsville, Ind., and graduated from Wabash College in 1883. After spending a year at the New York State Library School at Albany, he was, in 1885, cataloguer at the Newberry Library in Chicago; from 1892 to 1895 librarian of the Carnegie Free Library at Braddock, Pa.; and for the next decade librarian of the Carnegie Free Library at Pittsburgh, which he had organized. Temporarily he abandoned library work to engage in zinc and lead mining in Missouri, returning to his earlier vocation in 1906 as director of the New York State Library and Library School. After a five years' service in this office he was chosen assistant director, and, on the death in 1913 of John S. Billings (q.v.), director, of the New York Public Library. In 1901-02 Mr. Anderson was president of the Keystone State Library Association and in 1903-04 was a member of the Pennsylvania Public Records Commission. He was president of the New York Library Association in 1908.

ANDERSON, ELIZABETH GARRETT (Mrs.) (1836—). An English physician and pioneer of woman's rights, born in Suffolk. In spite of hostile public opinion and the opposition of the medical schools, she began the study of medicine in 1860. After a course of private instruction, she was repeatedly refused admission to examinations by the Royal College of Physicians and many other bodies, so that it seemed as if she would not be able to gain the necessary diploma permitting her to practice medicine. In 1865, however, she obtained the license of the Society of Apothecaries, and in the following year was made general medical assistant in St. Mary's Dispensary in London, an institution which later developed into the New Hospital for women. She passed the medical examinations of the University of Paris and received the degree of M.D. in 1870. She was senior physician of the New Hospital in 1866-90, dean of the London School of Medicine for Women in 1883-1903, and president of the East Anglian branch of the British Medical Association in 1896-97. Mrs. Anderson was the first woman in England to be honored with the office of mayor, having been elected in 1908 head of the city government of Aldeburgh.

ANDERSON, GALUSHA (1832—). An American theologian. He was born at North Bergen, N. Y., and was educated at the University of Rochester and the Rochester (Baptist) Theological Seminary. He held several pastorates, became president successively of the universities of Chicago (1878-85) and Denison, Ohio (1887-90), professor of practical theology at Chicago in 1892-1903, when he became emeritus professor. His writings include: *The Elements of Chrysostom's Power as a Preacher* (1903); *Ancient Sermons for Modern Times*, a translation from Asterius (1904); *When Neighbors Were Neighbors, a Story of Love and Life in Olden Days* (1911).

ANDERSON, GEORGE B. (1831-62). A Confederate soldier. He was born at Wilmington, N. C., graduated at West Point in 1852, and in 1855 was appointed first lieutenant, serving as regimental adjutant after 1858. He resigned in 1861 to enter the Confederate service and soon became a brigadier-general and was placed in general command of the North Carolina coast

defenses. While leading a brigade at the battle of Antietam (Sept. 17, 1862), he was fatally wounded, and died on October 16.

ANDERSON, JAMES, LL.D. (1739–1808). A Scotch writer on political economy and agriculture. He was born at the village of Hermiston, near Edinburgh, and lost both his parents when very young, so that the management of a large farm, which had been in the possession of the family for a long time, devolved upon him. Recognizing the practical importance of a knowledge of chemistry to a farmer, he attended the chemistry class in the University of Edinburgh and brought the results of his study to bear on his profession. He invented, at an early period of life, the small two-horse plow without wheels, commonly called the Scotch plow, which is generally admitted to have been one of the most useful improvements in agricultural implements ever introduced. In 1780 the University of Aberdeen bestowed on him the degree of doctor of laws. In 1784, on account of his pamphlet, entitled *Encouragement of the National Fisheries*, he was engaged by the government to make a survey of the western coast of Scotland, with special reference to that object. He next began, in 1791, the publication of a periodical called *The Bee*, which was continued for three years. In 1797 he went to London, where he pursued his literary occupations with such intense assiduity that his health gradually gave way. He died on Oct. 15, 1808. In his essay entitled *An Inquiry into the Nature of the Corn Laws, with a View of the Corn Bill Proposed for Scotland* (1777), Anderson anticipates the doctrine of rent later identified with the work of Ricardo. His other writings include: *Observations on the Means of Inciting a Spirit of National Industry* (1777); *An Account of the Present State of the Hebrides* (1785); *Observations on Slavery* (1789); *Recreations in Agriculture, Natural History, Arts, and Miscellaneous Literature* (6 vols., 1799–1802).

ANDERSON, Sir JAMES (1824–93). A Scotch navigator. He was born at Dumfries and in 1851 entered the service of the Cunard Company. He commanded successively four vessels of that line and so distinguished himself by his excellent judgment and high skill that, in 1865, he was selected to command the *Great Eastern* when it was chartered to lay the Atlantic cable (see ATLANTIC TELEGRAPH), and thenceforth his name became intimately associated with that vessel.

ANDERSON, JOHN, F.R.S. (1726–96). A Scotch professor of natural philosophy in the University of Glasgow, and founder of Anderson's College (now merged in the Glasgow and West of Scotland Technical College). He was born in the parish of Roseneath, Dunbartonshire. He studied at the University of Glasgow, in which, in his thirtieth year, he was appointed professor of Oriental languages. Four years later (1760) he was transferred to the chair of natural philosophy. He was greatly interested in the practical application of science, and in a spirit of philanthropy he instituted a lecture course for artisans, in addition to his usual lectures, which were erudite and technical. He continued these twice every week during the session to the end of his life. His valuable work, entitled *Institutes of Physics*, appeared in 1786. Shortly before the French Revolution he invented a form of gun whose recoil was stopped by the condensation of air within the body of

the carriage; but, after having endeavored in vain to attract the attention of the British government to it, he proceeded to Paris in 1791 and, being a sympathizer with the Revolution, presented his model to the National Convention. It was hung up in their hall with the following inscription over it: "The gift of SCIENCE to LIBERTY." Afterward, when the allied forces had drawn a military cordon around the frontiers of France to prevent the introduction of French newspapers into Germany, Anderson ingeniously suggested the expedient, which was adopted and proved quite successful, of making small balloons of paper, to which newspapers and manifestoes were tied, and letting them off, when the wind was favorable, for Germany. By his will he directed that the whole of his effects, of every kind, should be devoted to the establishment of an educational institution in Glasgow to be known as Anderson's University.

ANDERSON, JOHN (1833–1900). A Scotch scientist, born at Edinburgh. He studied at Edinburgh University and from 1864 to 1886 was professor of comparative anatomy at the Calcutta Medical College and curator of the government museum. As scientific officer, he accompanied expeditions to western China in 1868–69 and in 1874–75. In 1881 he was commissioned to make an investigation of the marine animals of the Mergui archipelago. He was a fellow of the Royal Society and a contributor to scientific journals and published *Mandelay to Momen* (1875), *Anatomical and Zoölogical Researches* (1878), *Two Expeditions to Western China* (1876), *Fauna of Mergui and its Archipelago* (1889), and *Herpetology of Arabia, with a Preliminary List of the Reptiles and Batrachians of Egypt* (1896). His observations in the Mergui archipelago appeared in vols. xxi and xxii of the *Journal* of the Linnæan Society.

ANDERSON, JOHN FISHER (1873—). An American physician and bacteriologist, born in Fredericksburg, Va., and educated in the public schools of that and other cities. Having studied medicine at the University of Virginia and taken his degree in 1896, he was appointed passed assistant surgeon in the United States Public Health and Marine Hospital Service, being assigned in the same year (1898) on epidemic duty in connection with yellow fever. He was quarantine officer in the Dry Tortugas (1898–99); sanitary observer at Glasgow, Oporto, and Liverpool (1899–1900); and sanitary attaché at the United States consulates at Barcelona, Marseilles, and other European cities (1900–01). During his service abroad he carried on studies at the Thompson-Yates Laboratory and the School of Tropical Medicine in Liverpool and at the Patologische Institut in Vienna. In 1902 he was appointed assistant director of the Hygienic Laboratory at Washington and in 1909 director. In 1913 he was in immediate charge of the government investigation into the sensational claims of Dr. F. F. Friedmann to the discovery in a "turtle serum" of an absolute cure for tuberculosis. He wrote many articles and bulletins showing the results of original investigations upon the effects of serums, toxins, and anti-toxins; typhoid fever bacteria in mills; tubercle bacilli, etc. In 1912 he collaborated with T. B. McClintic on *A Method of Standardizing Disinfectants*.

ANDERSON, JOHN JACOB (1821–1906). An American author. He was born in New York City and graduated at its Normal School. For

30 years he was attached to, and for 20 years was principal of, a large grammar school in New York. He wrote many text-books of history, including *Pictorial School History of the United States* (1863), *A School History of England* (1870), *Manual of General History* (1867), *Complete Course in History* (1881), *A History of France* (1877), and *A History of the State of New York* (1902).

ANDERSON, LARZ (1866—). An American diplomat, born in Paris, France. He graduated at Harvard in 1888. After traveling for two years he was second secretary of the United States legation in London (1891-93), and first secretary of the United States embassy in Rome (1893-97). During the Spanish-American War he served as adjutant-general of United States Volunteers. He was Minister to Belgium (1911) and Ambassador to Japan (1912 to March, 1913).

ANDERSON, MARTIN BREWER (1815-90). An American preacher and educator, born at Brunswick, Me. Graduating at Waterville College (now Colby University) in 1840, he was for two years tutor of Latin, Greek, and mathematics, and for seven years professor of rhetoric and lecturer on modern history, at his alma mater. In 1850 he became editor of the New York *Recorder* (later the *Examiner*), a weekly Baptist paper. Called in 1853 to be the first president of the University of Rochester, he remained in this office for 35 years, until failing health compelled his resignation. A few years after the Civil War Dr. Anderson was urged to accept the presidency of Brown University. This highest honor which his denomination could confer upon him he was induced to decline because of the great need at Rochester. A vigorous and popular preacher, though never ordained to the ministry, Dr. Anderson was chosen president of the American Baptist Home Missionary Society in 1864 and of the Missionary Union in 1869. For 37 years he was a trustee of Vassar College and for 13 years a member of the New York board of charities. Selections from his numerous *Papers and Addresses* were published in two volumes in 1895, Wm. C. Morey, ed. Consult Asahel C. Kendrick, *Martin B. Anderson* (Philadelphia, 1895).

ANDERSON, MARY ANTOINETTE (1859—). An American actress, born at Sacramento, Cal. Her father, General Anderson, was killed in the Civil War, while serving on the Confederate side. Her mother married Dr. Hamilton Griffin and removed with him to Louisville, Ky. She was educated at the Ursuline Convent and the Academy of the Presentation Nuns in Louisville, and at the age of 13 began to study for the stage under Charlotte Cushman. She made her debut in the character of Juliet at Louisville, Nov. 27, 1875, with success. In 1876 she traveled through the West, and in the season of 1877-78 appeared in Philadelphia, New York, and Boston. In 1884-85 she played at the Lyceum Theatre, London, and in the character of Rosalind, in *As You Like It*, opened the Memorial Theatre at Stratford-on-Avon. From 1885 to 1889 she played in Great Britain, her chief parts being Juliet, Bianca in *Fazio*, Julia in *The Hunchback*; Evadne, Meg Merrilies, Pauline, Galatea, Clarice, in *Comedy and Tragedy*; Parthenia, Rosalind, and Perdita in *A Winter's Tale*, in which she achieved her greatest success. Illness in 1889 compelled her to retire from the stage. In 1890 she married Antonio Navarro de Viana, of New

York, and soon decided not to return to the stage. Consult Mary Anderson's Autobiography, *A Few Memories* (1896), and William Winter, *Stage Life of Mary Anderson* (1886).

ANDERSON, MELVILLE BEST (1851—). An American educator, born in Kalamazoo, Mich. He was educated at Cornell, Göttingen, and Butler universities, and became a professor in the last-named institution in 1877. During the years 1880-91 he held professorships successively at Knox College, Purdue University, and the State University of Iowa. He then accepted the chair of English literature in Leland Stanford, Jr., University and occupied it until 1910, when he was made professor emeritus. For 10 years he was engaged in making a triple-rime translation of Dante's *Divine Comedy*, and also at various times translated and edited a number of French works. In addition, he edited a volume of Bacon's *Essays* (1890) and wrote *Some Representative Poets of the Nineteenth Century* (1896) and *The Happy Teacher* (1910).

ANDERSON, RASMUS BJÖRN, LL.D. (1846—). An American scholar, author, and editor. He was born at Albion, Wis. In 1866 he received an M.A. from Luther College (Decorah, Iowa), and in 1888 an honorary LL.D. from the University of Wisconsin, where from 1875 to 1883 he was professor of Scandinavian languages and literature. From 1885 to 1889 he was United States Minister to Denmark. In 1898 he became editor at Madison, Wis., of *Amerika*, a Norwegian journal. His publications include: *The Scandinavian Languages* (1873); *America Not Discovered by Columbus* (1874); *Viking Tales of the North* (1877); *Norge i billeder* (1899); *Norse Mythology* (1901); *Bygdejevning* (1903), and translations of Brandes's *Eminent Authors in the Nineteenth Century*, and of the works of Björnson (7 vols.).

ANDERSON, RICHARD HENRY (1821-79). A Confederate soldier. He was born in South Carolina, graduated from West Point in 1842, and served as second lieutenant in the Mexican War. He took part in the southern line of operations and became first lieutenant in 1848 and captain in 1855. He resigned from the regular army (May, 1861), became a Confederate brigadier, assisted in the bombardment of Fort Sumter, and served with great gallantry throughout the war, distinguishing himself especially at Fair Oaks, Gaines's Mill, Frazier's Farm, Bull Run, and Gettysburg, where he commanded a division. He rose to the rank of major-general (August, 1862) and of lieutenant-general (May, 1864). In the final campaign he commanded the fourth corps of General Lee's army.

ANDERSON, ROBERT (1750-1830). A Scotch editor and biographer of the English poets. He was born at Carnwath, Lanarkshire; studied theology and afterward medicine in the University of Edinburgh, and became a physician, but soon after his marriage ceased practicing and from that time devoted himself to literature. His most important work was the compilation of *A Complete Edition of the Poets of Great Britain with Prefaces Biographical and Critical* (14 vols., 1792-1807). He edited the *Edinburgh Magazine* and in that capacity became the friend of many young writers, notably Thomas Campbell, who dedicated his first volume of verses to him. Consult Beattie, *Life and Letters of Campbell* (1849); *Poetical Works of Robert Anderson with the Life of the Author by Himself* (1820).

ANDERSON, ROBERT (1805-71). An American soldier. He was born near Louisville, Ky., graduated at West Point in 1825, and served in the Black Hawk War of 1832 as colonel of the Illinois volunteers. At this time Abraham Lincoln was twice mustered out of service and in by him when acting as assistant inspector-general. He was instructor of artillery practice at West Point, 1835-37; served in the second Seminole War, 1837-38, and in 1838 was brevetted captain and became assistant adjutant-general on General Scott's staff. He took part in the Mexican War and was severely wounded at Molino del Rey. In November, 1860, he took command in Charleston harbor, and was for 15 weeks confined to Fort Sumter by the Confederates. On April 14, after a bombardment of 36 hours, he was compelled to evacuate the fort. (See FORT SUMTER.) He was appointed brigadier-general in the United States army in May, 1861, and sent to command the Department of Kentucky, and then the Department of the Cumberland; but, owing to the failure of his health, he was relieved from active duty in October, 1861, and was retired from the service in October, 1863. In 1865 he was brevetted major-general. He translated and adapted from the French *Instructions for Field Artillery* (1840) and *Evolutions of Field Batteries* (1860). His *Reminiscences of the Black Hawk War* are included in the *Collections of the Wisconsin Historical Society* (1883-85), and his letters, under the title, *An Artillery Officer in the Mexican War, 1846-47*, were published in 1911 in New York. Consult Eba Anderson Lawton, *Major Robert Anderson and Fort Sumter, 1861* (New York, 1911).

ANDERSON, RUFUS, D.D., LL.D. (1796-1880). Secretary of the American Board of Commissioners for Foreign Missions. He was graduated at Bowdoin College (1818) and Andover Theological Seminary (1822), and after acting as assistant (1822-32), became full secretary, and so continued until 1866, when he retired. He was lecturer on Foreign Missions in Andover Theological Seminary 1867-69. He was one of the great missionary secretaries and historian of the American Board (3 vols., 1872-74). He inspected the Board's stations and has left the memorial in his *Observations upon the Peloponnesus and Greek Islands* (1830), *A Heathen Nation (the Hawaiians) Civilized* (1870), and in the history mentioned above. He died in Boston, May 30, 1880.

AN'DERSONVILLE. A village in Sumter Co., Ga., 62 miles south of Macon, notable as the site of a Confederate military prison during the Civil War (Map: Georgia, D 3). When established in November, 1863, the prison was an unsheltered inclosure occupying about 22 acres and crossed by a small stream about 5 feet wide and 1 foot deep. Subsequently the area was increased to about 27 acres, though a part of this was rendered unavailable by the establishment of a "dead line," the crossing of which by a prisoner meant immediate death. Into this area sometimes as many as 33,000 Federal soldiers were crowded, forced for the most part to live without shelter, fully exposed to the heat of summer, the frosts of winter, and the frequent storms, while they suffered terribly from the effects of insufficient and improper food. Amid surroundings of indescribable filth, they died by thousands, of diarrhœa, scurvy, dysentery, and fevers. The first

prisoners arrived on Feb. 15, 1864, and the last in April, 1865, the total amounting to 49,485, of whom more than 12,800, or 26 per cent, died in confinement. In the autumn of 1864 many of the prisoners were removed to Millen, Ga., and Florence, S. C., where the conditions were much less severe. A Confederate medical commission, composed of Dr. G. S. Hopkins and Surgeon H. E. Watkins, reported in 1864 that the abnormal death rate was due (1) to "the large number of prisoners crowded together," (2) to "the entire absence of all vegetables as diet, so necessary as a preventive to scurvy," (3) to "the want of barracks to shelter the prisoners from sun and rain," (4) to "the inadequate supply of wood and good water," (5) to "badly cooked food," (6) to "the filthy condition of the prisoners and prison generally," and (7) to "the morbid emanations from the branch, or ravine passing through the prison, the condition of which cannot be better explained than by naming it a morass of human excrement and mud." The post was in command of Gen. W. S. Winder, while Henry Wirz, a Swiss, was the prison superintendent. The latter was convicted by a special military court, in session from August to October, 1865, of "maliciously, willfully, and traitorously conspiring to injure the health and destroy the lives" of Union soldiers at Andersonville, and of "murder in violation of the laws of war," and on November 10 was hanged. Subsequently, the tract of land where the bodies had been hastily buried was turned into a national cemetery. Of the graves, 12,789 have been identified and marked with tablets, while 921 remain unknown. Consult Chipman, *The Horrors of Andersonville Rebel Prison* (San Francisco, 1891); Spencer, *A Narrative of Andersonville* (New York, 1866), and Stevenson, *The Southern Side, or Andersonville Prison* (Baltimore, 1876). Partisan accounts are numerous. For an impartial one see Rhodes, *History of the United States*, vol. v (New York, 1904).

ANDERSSON, ä'n'dër-sen, ADOLF (1818-79). A famous German chess-player, born in Breslau. He studied philosophy and mathematics at Breslau and taught at the Friedrichs-Gymnasium there. In 1851 he defeated Staunton at London. In 1858 he lost to Morphy, at Paris. He won two first prizes in the World's Tournament at London in 1862, and was victorious at Baden-Baden in 1870. He was noted for the brilliancy of his style of play. His *Sixty Chess Problems* is full of deep and ingenious combinations. He also wrote several papers on the theory of chess. Consult Bachmann, *Adolf Anderssen* (Ausbach, 1902).

ANDERSSON, ä'n'dër-sön, KARL JOHAN (1827-67). A Swedish naturalist and South African traveler. In 1850 he joined Francis Galton in a journey in southwest Africa, continued alone through 1853-54, and on his return to England published *Lake Ngami; or, Explorations and Discoveries during Four Years' Wanderings in the Wilds of Southwestern Africa* (1855). He made a journey to Lake Ngami in 1858 with Green, the elephant hunter. On his return he published a book on the Okavango River (1861). In May, 1866, he went on an exploration to the Kunene for the purpose of establishing commercial intercourse with the Portuguese settlements north of that river. He came in sight of the stream, but was too feeble to cross it, and died in trying to return to Cape Town. After his

death his *Notes of Travel in South Africa* (1876) were published.

ANDERSSON, NILS JOHAN (1821-80). A Swedish botanist, born at Gärdserum, Småland. In 1846 he was an instructor in botany at Upsala and in 1847 taught in an elementary school at Stockholm. From 1851 to 1853 he was botanist to the Swedish circumnavigatory expedition, which he described in *En Verldsomsegling* (3 vols., 1853-54). He was appointed an adjunct professor and demonstrator of botany at Lund in 1855, and in 1856 professor and curator of the botanical collections at the Academy of Sciences, Stockholm, and instructor in the Bergiani horticultural school. He also published *Salices Lapponiæ* (1845), *Conspectus Vegetationis Lapponiæ* (1846), *Atlas öfver den Scandinaviska Florans Naturliga Familjer* (1849), *Monographia Salicum Hucusque Cognitarum* (1867), and other works.

ANDES, än'dēz (deriv. uncertain, usually explained as Copper Mountains, from the Peruvian word *anti*, copper; cf. in Germany *Erzgebirge*, Ore-Mountains, and *Bleiberg*, Lead-Mountain). The great mountain chain of South America, extending closely parallel with the Pacific coast and nowhere far from it, from Cape Horn to the northwest coast of the South American continent. Its length is about 4500 miles, extending in latitude from 56° 30' S. to 11° N. In a way it may be regarded as continuous with the Cordilleras of North America, the two forming a well-nigh continuous mountain system 9000 miles in length, stretching from Cape Horn to the Aleutian Islands. The average breadth may be set at 150 miles, although this differs greatly in different parts of the system. Its average height of 12,000 feet is subject to the same qualification. Following the coast, the system trends a little west of south through Colombia and Ecuador, but on entering Peru it turns to the southeast, in which direction it extends through that country and part of Bolivia. Through south Bolivia, Chile, and Argentina its trend is nearly south, but it swings in a broad curve to the eastward near Magellan Strait.

The mountain system rises abruptly on both sides throughout its course. Everywhere it presents a steep wall to the Pacific, and on the east it drops abruptly to the Amazon valley; farther south, in Argentina, the land rises somewhat to meet it, and there are outlying ridges, but the main ascent is everywhere steep. The southern part of the system consists of a single range, with here and there outliers of comparatively little height, but from northern Chile and Argentina to Colombia, it consists of a high, broad plateau, capped by two or three ranges, with hundreds of high volcanic peaks, some active, others dormant or extinct.

Geologically the system is of recent origin, although its age has not been closely determined. The material of which it is composed is in the main granites, with schists, slates, and other metamorphic rocks and the oldest of stratified rocks; here and there upturned beds of more recent formation, up to the Jurassic, lie upon the flanks of the ranges, while in Peru the eastern range is composed largely of Silurian beds. Over all, in the neighborhood of the volcanic peaks, which are very numerous in all parts of the range, are spread lava, pumice, scoria, and ashes, in many places burying deeply the metamorphic rocks. Near the northern end, in Colombia and Venezuela, the eastern branches

are composed of recent stratified rocks. For detailed description it will be convenient to refer to the countries traversed by this mountain system, and this order will be followed, commencing at the north.

Colombia and Venezuela. The Andes originate on the north in Colombia and Venezuela in several distinct ranges, which, trending south to southwest, meet and coalesce in the Pasto Knot in southwest Colombia. The westernmost range of magnitude is the Cordillera Occidental, which rises just east of the mouth of the Atrato, and trends southward, parallel to the coast, throughout Colombia. In this are summits 10,000 and 11,000 feet in height, the highest peaks being in the southern part. Near the boundary line with Ecuador it is cut through by the Rio Patia, which flows south and west into the Pacific. East of the Cordillera Occidental, and separated from it by the narrow valley of the Cauca, a branch of the Magdalena, is the Cordillera Central. This range rises from the lowlands between the Cauca and the Magdalena and attains a great height, with Chumbal, 15,715 feet; Guacau, 16,683 feet; Guican, 15,748 feet; Santa Marta, 19,029 feet; Santa Isabel, 16,732 feet; Herveo, 18,045 feet; Ruiz, 17,388 feet; Sugar-loaf, 16,000 feet; Tolima, 18,425 feet, and many others of equal height. The range is composed mainly of crystalline schists, while the higher peaks are volcanoes, which have spread lava and ashes over many parts of the range. East of the Cordillera Occidental and across the valley of the Magdalena is the Cordillera de Bogota, originating in several ranges in the north of Venezuela, which trend in a general southwest direction and come together at various points; the principal ones are the Parija and Merida ranges, which unite near Bogota, beyond which point the range is single. Its highest peak is Cocui, 16,680 feet high. The range is in the main composed of strongly folded Cretaceous and Tertiary beds, and contains no volcanoes.

Ecuador. The Andes of Ecuador form two ranges, the Cordillera Occidental, the continuation of the range of the same name in Colombia, and the Cordillera Oriental, or Real; the two are separated by a high plateau, from 70 to 100 miles wide, with an average elevation of 8000 feet; connecting cross ranges divide this plateau into 10 basins or high mountain valleys. The western range is composed of porphyries, diorites, and greenstone, and the eastern and higher range is composed of gneiss, schist, and granite. Above them tower many high volcanic cones, which have spread lava and ashes over great areas. The great peak of the western range is Chimborazo, 20,517 feet; with Cotocachi, 16,300 feet; and Pichincha, 15,918 feet, the last named near the city of Quito, while in the eastern range are Cotopaxi, 19,580 feet; Antisana, 19,335 feet; Cayambe, 19,186 feet; Altar, 17,736 feet; Illiniza, 17,380 feet; and Carahuairazo, 16,515 feet, with the active volcanoes Tunguragua, 16,579 feet, and Sangai, 17,120 feet. The cross ranges also contain many volcanic peaks, indicating that the whole region must once have been the centre of tremendous volcanic activity.*

Peru. In Peru, Bolivia, and the northern

* It must be remembered that there is always considerable variation in measurements of very high peaks, due to refraction, changing air pressure, etc. Only a *series* of careful measurements, either by triangulation, barometer, or hypsometer, can approach accuracy.

part of Chile the system is much broader and more complex. The Andes of Peru consist of three ranges, the two westernmost being the Maritime or Black, and the Central Cordillera, trending parallel to one another and to the coast, and in the north separated only by a narrow, high plateau, known as the Puna, with an average height of 12,500 feet, and in the south by the narrow valley of the Rio Huay. The Eastern Cordillera, though otherwise continuous, is cut through by no less than six of the head tributaries of the Amazon. The broad, elevated region lying between this and the Cordillera Central, known as the Sierra, is broken by mountain spurs, with broad valleys and plateaus. East of the Eastern Cordillera, or the Andes, as it is locally known, are several lower ranges, trending parallel with the system and separating tributaries of the Amazon. The Maritime and Central Cordillera are composed of crystalline and volcanic rocks, with stratified beds of Jurassic age resting upon their outer flanks. The Eastern Cordillera is composed mainly of stratified beds of Silurian age, with some intrusions of granite. These ranges are connected at the mountain knot of Cerro de Pasco, 14,293 feet high, and again farther to the southeast, at the Knot of Vilcanota, 17,390 feet. South of this latter peak the Central and Eastern Cordillera inclose the lofty plateau on which is Lake Titicaca, situated partly in Peru and partly in Bolivia, and 12,466 feet above the sea. North of the Cerro de Pasco, the Sierra comprises the upper valley of the Marañon, the largest and longest of the head branches of the Amazon, which cuts through the Eastern Cordillera just south of the Ecuador frontier. Between the Cerro de Pasco and the Knot of Vilcanota, the Sierra is drained by the head streams of the Ucayali, a large tributary to the Amazon. These streams also cut gorges through the eastern range. This region was the site of the ancient Inca civilization and is still thickly settled. Among the high peaks of this part of the Andes are Huascaran, 22,051 feet; Huan-dov, 21,089 feet; Misti, 20,013 feet; Chacani, 19,820 feet; and Tutupaca, 18,960 feet.

Bolivia. In Bolivia the system comprises two main ranges, one of which is formed by the coalescing of the two westernmost of the Ecuador ranges. These ranges are widely separated and inclose a broad, greatly elevated plateau, 125 miles in breadth in the northern part, and nearly 300 miles in the south, with an altitude of almost 13,000 feet. The plateau of the Andes has here the greatest lateral extent and altitude in the entire system. The Western range has an average altitude of 15,000 feet, while the Eastern, or Cordillera Real, is still higher, having peaks exceeding 20,000 feet; among them are Illampu, 21,490 feet; Illimani, 21,930 feet; Ancoluma, 21,490 feet; Haina, 20,171 feet; Paniri, 20,735 feet; Licancaur, 19,521 feet; Sajama, 21,047 feet; Isluga, 17,060 feet; and Cacaca, 20,250 feet, all of them near Lake Titicaca. East of this range are several lower subsidiary ranges, which form a complicated system. Lake Titicaca drains southeastward into Lake Poopo, a sink which collects the waters from a large area of the plateau. In the Cordillera Real and the lesser ranges to the east, rise tributaries of the Madeira, one of the main branches of the Amazon, and of the Pilcomayo, tributary to the Plata.

Chile and Argentina. The broad, high pla-

teau, with its bordering ranges and subsidiary eastern ranges of Bolivia, extends southward into these countries, gradually narrowing and decreasing in altitude, until in lat. 32° the Andes become reduced to a single range, except for spurs and outliers, most of which are of comparatively little importance. In the northern part the altitude of the ranges decreases greatly, Juncal, in lat. 26°, having a height of 17,530 feet, and Copaipó volcano, 19,700 feet. Farther south, in the neighborhood of Santiago, the mountains again become loftier. Here are Mercedario, 22,315 feet; Tupungato, 20,286 feet; San José, 20,020 feet; and Aconcagua, 22,860 feet; this latter peak is the highest summit of the entire system and of the whole continent, so far as known. Still farther south, the range again diminishes in height. In lat. 34° is Maipo volcano, 17,670 feet; in lat. 36° is Descabezado, 12,760 feet; in lat. 42° is Tronador volcano, 9790 feet. Here begins the remarkable fiord coast, which extends south to Cape Horn. The heavy precipitation on the west side of the range here produced in past times extensive glaciers, which chiseled the mountains far down below sea level, producing many islands, and an intricate system of mountain-walled channels. These glaciers have been able, by reason of their rapid descent, to cut back their heads across the range in many places, so that now, after their recession, many of the streams which have succeeded them rise far to the east of the Andes, upon the plains of Argentina, and flow through the range to the Pacific. In this region the mountains become still lower, their height ranging from 4000 to 8000 feet, until they finally disappear at Cape Horn.

The lower limit of perpetual snow, although an extremely indefinite line, varying from year to year with exposure and precipitation, has in general, in equatorial regions, an altitude of about 15,500 feet, but ranges 1000 feet on each side of this figure, being higher on the east and lower on the west side of the range. In other words, it is higher where the precipitation is abundant, and lower where it is scanty. It diminishes as the latitude increases, being about 13,000 feet in the latitude of Santiago, and falling to 3000 feet near the southern point of the continent. Glaciers are found on all the high peaks, even those in equatorial regions, which exceed 13,000 feet in height. Here, however, they are small, descending the mountain slope only a few thousand feet. In southern Chile, on the west side of the range, are many of considerable size, originating upon mountains of inferior height, and descending to sea level, even entering the sea, at the heads of fiords.

Volcanoes. One of the striking features of the Andes is its great number of active and extinct volcanoes. Probably not over 60 are now known to be active, but the extinct ones are numbered by hundreds, and have played a very important part, though a secondary one, in creating the present conformation of the mountain system. Three principal centres of volcanic activity are recognized: one in the Andes of the north, in Colombia and Ecuador, extending in latitude from 5° N. to 3° S.; a second in Peru, Bolivia, and northern Chile, extending from 15° to 28° S.; and a third in central Chile, extending from 32° to 40° S. The highest peaks of the Andes are of volcanic formation, and their peculiar conical forms are distinctive features of the Andean landscape. Many of the most

prominent and highest ones have been mentioned; it remains to speak of those which are now active, or which have been active within historic times, and briefly describe their eruptions.

The northern group, mainly comprised in Ecuador, is the most imposing collection of active and extinct volcanoes on earth. Of these, Cotopaxi, Tunguragua, Sangai, and Pichincha have repeatedly been in eruption in historic times, but most, if not all, of the others have for a long time been quiescent. The Altar, a truncated mountain, 17,736 feet in height, is said to have once been the highest in the region, but after a long period of eruption it collapsed within itself. Ruiz, in Colombia, is still smoking, and Tolima is not quite extinct, but as late as 1829 was in eruption. In 1849 Purace, in southern Colombia, suddenly exploded, flooding the neighboring country and covering it with ashes. A similar eruption took place in 1869. Imbabura, in Ecuador, is said to have discharged a deluge of mud and water at the time of the great earthquake in 1868. Antisana is reported as having been in eruption in 1590, and even now sulphurous fumes arise from it. Cotopaxi, always smoking, has been repeatedly in eruption, although its great eruptions have occurred at intervals of centuries. The last one was in 1877. Tunguragua also is active at irregular intervals, the latest eruption being in 1886. Sangai sends off steam constantly with tremendous force and noise. Pichincha has, since its eruption in 1660, given off nothing but steam and a little ashes.

The middle volcanic group is found in both the eastern and western Cordilleras; in Peru it includes Sarasara, Atchatayhua, Corupuna, Ampato, Chachani, and Misti, all now quiescent. Omate and Tutupaca have been in eruption in historic times; indeed, the former was one of the most active in Peru. In Bolivia are Mount Sorata, or Illampu, Sajama, Aucaquilcha, Chachacomani, Huiana, Cacaca, Mesada, and Illimani, while in northern Chile are many volcanic cones, some of great height; among them are Tacora, 19,750 feet, Chipicani, Pomerape, Parinacota, Iquima, 20,275 feet, and Toroni, 21,340 feet, all in the western range. In the eastern range are Tuachela, Olca, Mino, and Ollagua, all smoking or emitting lava. South of Ollagua are at least 30 extinct volcanoes, exceeding 16,500 feet in height; among them are Autopalla, 20,920 feet, Socompa, 19,620 feet, and Lullailaco, 21,670 feet.

In the central Chilean region are Tupungato, San Jose, Maipo, Tinguiririca, all supposed to be extinct. Las Damas and Peteroa are said to have been in eruption in the last century. The volcanoes grouped about Descabezado are quiescent, though appearances indicate recent eruption. Chilean ranges contain several vents, from which lava and ashes have been ejected in recent years. Autuco also has had eruptions within historic times. Farther south, Villarica volcano has frequently been seen in eruption. In all probability, other active volcanoes exist in the fiord region of South Chile, although none has yet been reported.

Hydrography. The Andes system is the source of most of the larger streams of South America. Through nearly its whole extent, wherever the system comprises more than a single main range, the westernmost of these ranges separates the drainage to the Atlantic from that to the Pacific. In Ecuador, however,

no fewer than seven of the 10 high valleys between the ranges are drained westward, and in southern Chile, as has been seen, glaciers have eroded their sources back across the whole range to the Argentina plains. The western streams are short, and owing to the light rainfall on most of the western slope, have small volume. Hence their cutting power is slight. On the other hand, the streams to the east are long, with great drainage basins, and, except in Argentina, are supplied with abundant precipitation by the trade winds. Hence they are powerful streams of large volume and have eroded their courses far up into the mountains.

The Andes of Colombia are drained northward to the Caribbean Sea by the Magdalena, Cauca, and Atrato rivers, and eastward to the same body of water by the Orinoco, and to the Atlantic by the Negro and Yapurá, great branches of the Amazon. The system in Ecuador, Peru, and most of Bolivia is drained eastward by countless tributaries of the Amazon, among which are the Napo, Marañon, Ucayali, Beni, and Mamore. Of these, the Marañon heads between the ranges far to the south, near the Knot of Cerro de Pasco, flowing northwest within the mountain system for 400 miles before breaking through the eastern range into the Amazon basin. The Huallaga, Mantaro, Apurimac, and Urubamba, tributaries of the Marañon, also head between the ranges, cutting gorges through the eastern range. In Bolivia and northwest Argentina is a great region, 800 miles in length, lying between the ranges, with an average altitude of 13,000 feet, which has no drainage to either ocean. In this region is the great Lake Titicaca, which drains by the Rio Desaguadero to Lake Poopo, where the drainage of this semi-desert region is collected. This lake in earlier times drained to the Amazon, but by shrinkage in volume its outlet has been closed, and now it discharges only by evaporation. The eastern slope of the Andes in southern Bolivia and northern Argentina is drained to the Plata, while farther south shorter streams, the Rio Colorado, the Negro, Chubut, and the Deseado, and the Arroyos Bayo and Salado, and other smaller streams, carry the drainage directly to the Atlantic.

Climate. The climate of the Andes differs widely in different parts, with latitude, altitude, and exposure. The eastern slope of the system from the northern end southward to lat. 25°, comprising the portions drained by the Orinoco and Amazon, and lying almost entirely within the tropics, has a heavy, and in many localities a profuse, rainfall. Farther southward in the temperate zone, in the region of prevailing westerly winds, the rainfall on this side of the range diminishes, becoming very light in Argentina, with only eight inches or less in the driest parts. On the west side of the system the rainfall conditions are very nearly reversed, though in the north, in Colombia, the tropical rainfall passes around the end of the range and extends down the western side for some distance, giving to the valleys of the Magdalena, Cauca, and Atrato abundant moisture, and extending southward along the coast as far as Guayaquil, Ecuador. Thence southward, the western coast is an arid and desert region, as far as lat. 30° S. Below this point the precipitation increases, as the westerly winds bring moisture, and the southern coast is well watered.

From Guayaquil a cooler climate is reached

either by going south or by going directly up the mountains. The base of the mountains, within the tropics, has a mean annual temperature of 80° F. or more, while in southern Argentina it is not more than 25°. Within the tropics the temperature ranges from 80° at the base of the mountains to 20° or less at their summits, a range due to altitude alone. Upon the Titicaca plateau Arctic conditions prevail, with frost every month of the year. Where the rainfall is copious, as it is on the eastern side within the tropics, the range of temperature between summer and winter is slight, while upon the west coast, in the same latitudes, where desert conditions prevail, the range is very great. In general, as the mountains are ascended, the contrasts of temperature become greater, owing to the rarefaction of the air. At great altitudes, even, the contrast between day and night is great. South of the latitude of Coquimbo, 30° S., these temperature conditions are reversed, the west slopes having the smallest annual and diurnal range.

Means of Communication. Routes of travel across the Andes are few in number, the passes are very high, and the roads traversing them are, as a rule, very bad. Communication between the peoples on the two sides of the mountains is slight. The high land between the ranges is the best settled part of these sparsely settled countries, and the inhabitants of these elevated regions have some intercourse with the western seaboard, but very little with the low country to the east. But with the development of the mining industry in the mountains and the exploitation of the rubber resources of the upper waters of the Amazon, means of communication across the range are being continually improved. In Colombia the main routes of travel follow the valleys of the Cauca and the Magdalena, while the chief route across the Cordillera Central is via Quindio Pass, connecting Cartago, on the Cauca, with the valley of the Magdalena and ultimately with the capital, Bogota. In Ecuador the main routes pass north and south through the succession of mountain valleys, connecting with the coast at Guayaquil, by railroad from Chimbo, or northward down the Cauca and Magdalena. The most frequented eastward route crosses the Eastern Cordillera between Saraurcu and Antisana and reaches navigable water in the Napo at Puerto Napo. In Peru the plateau within the ranges is connected with the coast by two railways, which are marvels of engineering. The Oroya Railway connects Lima and Callao with Oroya and Concepcion, crossing the Western Cordillera at an altitude of 15,665 feet, in a distance of 106 miles from Lima. The second railway connects Mollendo on the coast with Lake Titicaca. It crosses the Western Cordillera at an altitude of 14,666 feet and terminates at the little town of Puno, on the shore of Lake Titicaca, 12,540 feet high. Several other short lines run from the coast to the foot of the mountains and even some distance into them, following the stream valleys; among them is the line up the Rio Santa to Huaraz.

The somewhat broken character of the ranges in Peru and Bolivia has made the plateau easier of access than it is farther north, and there are many roads and trails from the coast to the summit; but routes of communication to the east, to the country about the upper waters of the Madeira and Plata, are almost entirely lack-

ing. From Autofagasta in northern Chile, on the coast, a railway has been constructed to Oruro, on the plateau, north of Lake Poopo. This road has a total length of 560 miles, making it much the longest of the Andean lines. In central Chile and Argentina a transcontinental railway from Buenos Ayres to Santiago, was completed in November, 1909. It crosses the Andes at Uspallata or Cumbre Pass, not far from Santiago, at an altitude of 12,340 feet. This is the most frequented pass in Chile, as almost all the transcontinental travel goes over it. In 1912 was opened a line from Arica, Chile, to La Paz, Bolivia. It has a length of 266 miles, and much Bolivian trade follows this route.

Flora. In plant life the Andes is the richest of all the mountain systems in the world. Not only do these mountains sustain at their bases the flora of all climates, from the equatorial zone at the north to the cold zone at the south, but they possess these zones in altitude as well; and moreover, certain species of plant life are peculiar to this special region. Plant life is especially prolific in the rainy regions of Venezuela, Colombia, Chile, and Bolivia. In Colombia the palms and their associated tropical flora extend upward on the Andean slopes to an altitude of about 4500 feet, while above this is a mixed sub-tropical belt, extending to an altitude of nearly 12,000 feet, in which grow the cinchona, tree fern, and wax palm, and still higher up, at an altitude of 10,000 to 12,000 feet, the higher Andean bush growth, including the Andean rose; a species of bamboo also grows at these high altitudes.

Farther to the south, in the region of less rainfall, the flora on the east and west sides of the Andes is quite different. On the west side, in lower Ecuador and Peru, the plant life is poor and is that peculiar to a semi-desert region; but it extends up to high altitudes, lichens being found at 18,500 feet altitude; while on the moister Bolivian and Brazilian side the various altitudinal zones occur, beginning with the rich flora of western tropical Brazil and extending up to the true Andean flora. In northern Chile and western Argentina, where there is a rather light rainfall on both sides of the Andes, there is a continuation of the sparser vegetation of the relatively dry region, and the flora of the two sides of the Andes differs less than elsewhere. In the Chile-Argentina region there is a great contrast between the rich vegetation on the moist Chilean side and the thin vegetation on the dry slopes of Argentina. In the southern part of this Andean region great forests of stunted beech and firs occur in the lowlands and extend part way up the mountain slopes. Southward along the Andean chain the altitudinal zones diminish in width in about the same ratio as the decrease in altitude of the snow line, so that in the south, by making an ascent of less than a vertical mile, one can pass through as many vegetation zones as would be encountered in an ascent of three miles under the equator. The upper limit of tree growth, or the timber line, is a far more definite line than the snow line, yet in many places it is not easy to define. It ranges in the Andes from an average of 11,500 feet under the equator, down to about 3000 feet near Cape Horn. It is higher, for apparent reasons, on the moist than on the dry side of the range; thus, in Ecuador it ranges nearly 1000 feet higher upon the east side than upon the west.

Fauna. In the northern Andes of Venezuela and Colombia, where the tropical and sub-tropical forests extend up to an altitude of 10,000 feet, we find the fauna of tropical America existing up to similar high altitudes. The jaguar, puma, bear, ocelot, monkey, tapir, ant-eater, and capibara are found in these forests. Bird life is abundant, many hundreds of varieties of humming birds are found ranging up to seven inches in length, and the bat family is well represented. Snakes, saurians, and turtles are met in great numbers at lower altitudes. Above 6000 feet in altitude there is a great diminution of animal life. In Ecuador there occur certain representative species of the southern Andes, such as the llama and the condor. Insect life also continues very abundant, and fish are found up to an altitude of 14,500 feet. In the Peruvian and Bolivian Andes on the Pacific side, the fauna, like the flora, is limited, but on the eastern or Brazilian slope is exceedingly rich. The vicuña, guanaco, and alpaca are still found in the wild state, and with them are found the chinchilla and viscacha. On the Bolivian slopes the fauna is much more abundant than in Peru. Farther south on the Andean chain the fauna is less rich, and the larger animals of the northern Andes are not found. Herds of guanacos are numerous, and birds are present in great variety and large numbers, but the reptiles show a decided change of form. At the extreme south the land fauna is but poorly represented.

ANDESINE. See **FELDSPAR**.

AN'DESITE. A volcanic effusive rock of porphyritic texture composed essentially of lime-soda feldspar (andesine) with black mica (biotite), hornblende, or augite imbedded in a ground mass of smaller crystals or rock glass. The structure may be, but is not necessarily, porous; in most cases the crystals of andesine are arranged roughly parallel, giving the rock its characteristic fluxion or andesitic structure. This structure is due to the flow of the once molten mass in the form of lava. In composition this family of rocks shows wide variations, limited, however, by the rhyolites (q.v.) and trachytes (q.v.) on the one hand, and the basalts on the other. Fairly rich in silica and alumina, they contain moderate amounts only of the heavier and darker bases, viz., iron, lime, and magnesia. They contain from 60 to 70 per cent of silica, 13 to 18 per cent of alumina, 4 to 9 per cent of iron, 3 to 6 per cent of lime, 5 to 9 per cent of alkalis, and smaller percentages of magnesia. They owe their name to

their extensive development in the Andes of South America, though they occur extensively throughout the entire Cordilleran system of mountains, in South, Central, and North America. See **RHYOLITE**; **TRACHYTE**.

ANDI'RA (Neo-Lat. probably from the native Brazilian name). A genus of about 20 species of tropical American and African trees of the family Leguminosæ, having almost orbicular, one-celled, one-seeded pods. *Andira inermis* grows in low savannahs in the West Indies and is there called cabbage tree or cabbage-bark tree. It is a tree of considerable height, having pinnate leaves, with 13-15 ovate-lanceolate leaflets and panicles of reddish-lilac flowers. Its bark, called cabbage bark, or worm bark, is a powerful anthelmintic, and although it has been discarded from the pharmacopœias of Great Britain, it still finds a place in those of other countries, along with Surinam bark, the bark of *Andira retusa* of Surinam. Similar properties reside in the bark of several species of the allied genus *Geoffroya*.

AND'IRON (OF. *andier*, from Low Lat. *andieria*, a fire-dog; the Fr. *landier* stands for *l'andier*). A metal utensil used in burning wood in an open fireplace. It consists of a horizontal bar supported on three short legs with an upright standard at one end. Andirons are employed in pairs, one andiron being placed on each side of the hearth, with the uprights in front and the horizontal bars extending backward into the fireplace, the logs or sticks of wood resting across the horizontal bars. It is usual to make the uprights of various ornamental designs, and, often, to cover them with copper, brass, or silver. Andirons are manufactured by forging, wrought iron being the material of which they are most commonly made. Handirons, fire-dogs, and dog-irons are colloquial names for andirons.

ANDIZHAN, ä'n'dë-zhän'. Capital of the district of Andizhan, territory of Ferghana, Russian Turkestan (Map: Central Asia, Afghanistan, M 1). It is about 42 miles from Margelan, the capital of the territory, and is the eastern terminal point on the Transcaucasian Railway. Cotton is the principal article of commerce. In December, 1902, 1021 lives were lost in an earthquake (3342 in district). The Russians obtained possession of it in 1875. Pop., 1897, 46,680; 1908, 74,316.

ANDKHUI, ä'nd-kōō'ë. A town of Afghan Turkestan, in the border province of Maimene, about 200 miles south of Bokhara (Map: Central Asia, Afghanistan, K 3). It lies on the trade route between Bokhara and Afghanistan. The surrounding region is notably unhealthy, but is fertile. Andkhui is reputed to have been founded by Alexander the Great. Pop., about 15,000, chiefly Mohammedans.

ANDLAU, ä'n'dlô', GASTON HARDOUIN JOSEPH, COMTE D' (1824-94). A French general, born at Nancy. He attended, for a time, the military school at Saint-Cyr, and later, in active service, distinguished himself as a captain in the Crimean War. At the outbreak of the Franco-Prussian War he was appointed a colonel on the general staff of the Army of the Rhine, and subsequently he fought in the battles before Metz. He was elected a Senator in 1876, and promoted to be a general of brigade in 1879. He was involved in the so-called *affaire des décorations*, in which General Caffarel was found guilty of selling decorations of merit, and fled

to South America. He died at Buenos Ayres. He published *De la cavalerie dans le passé et dans l'avenir* (1869) and *Organisation et tactique de l'infanterie française depuis son origine* (1872).

ANDLAW-BIRSECK, änt'läv-bēr'sëk, FRANZ XAVER, BARON VON (1799-1876). A German diplomat and author. He was born at Freiburg and in early life studied jurisprudence at the university there and at Landshut and Heidelberg and in 1824 entered the public service of Baden. From 1826 to 1830, and again from 1832 to 1835, he was secretary of the embassy at Vienna. He was appointed Minister at Munich in 1838; Minister at Paris in 1843, and in 1846 Ambassador Extraordinary at Vienna. He retired in 1856 and subsequently published: *Erinnerungsblätter aus den Papieren eines Diplomaten* (1857); *Mein Tagebuch 1811-61* (1862); *Die byzantinischen Kaiser; ihre Palast- und Familiengeschichten* (1865); *Sieben heilige Fürsten* (1865).

ANDOCIDES, än-dös'ī-dēz (Gk. Ἀνδοκίδης, *Andokidēs*) (born c.440 B.C.). An Athenian, of high family, the least of the Ten Attic Orators. In 415 he was involved with the younger members of the aristocratic party in the charge of mutilating the Hermæ. (See **ALCIBIADES**.) The charge sprang from the fact that the Hermes before his house was left un mutilated. To protect himself, he betrayed some of his associates, but suffered partial loss of civic rights and went to Rhodes, where he engaged in trade. From 407 he lived in Elis. The amnesty of 403 allowed him to return to Athens. In 399, however, when he had gained prominence in public life, he was charged with impiety because, though barred from the Eleusinian Mysteries by the decree of 415, he had nevertheless attended the festival. By his speech *On the Mysteries* he secured his acquittal. In 391 he was sent to Sparta to negotiate a peace. On his return he was unable, in spite of his speech *On the Peace*, to persuade the Athenians to accept the treaty, was charged with mismanagement, and, it is said by some, was banished. The date of his death is unknown. Three of his speeches are extant: *On his Return* (410 or 409), *On the Mysteries* (399), *On the Peace* (391). The oration *Against Aleibiades* is spurious, and the authenticity of *On the Peace* has been doubted by Sittl, *Griechische Litteratur*. Consult Jebb, *Attic Orators* (London, 1876-80), and Blass, *Attische Beredsamkeit* (Leipzig, 1887-98).

ANDORRA, än-dör'ra. A republic in the valley of the same name in the eastern Pyrenees, between the French department of Ariège, and Catalonia, in Spain (Map: Spain, F 1). The valley is inclosed by mountains, through which its river, the Balira, breaks to join the Segre at Urgel. It leads a semi-independent existence under the protection of France and the Bishop of Urgel. Its area is 175 square miles, and it is divided into six parishes. There is much excellent pasture; vines and fruit trees flourish on the lower grounds, and the mountains contain rich iron mines. The limited area of arable land makes the republic partly depend upon France for its grain. The chief industry is the production of coarse cloth. Small quantities of wool, ores, cloth, and dairy products are exported.

Andorra was declared an independent state by Charlemagne, in reward for services rendered to him by its inhabitants when he was

marching against the Moors. In 1278 Andorra was transferred to the Comte de Foix and the Bishop of Urgel and was administered by two *viguiers* appointed by them. During the French Revolution the relations between Andorra and France were interrupted on account of the latter's refusal to accept the annual tribute, which was considered incompatible with a republican form of government. In 1806, however, the former relations were renewed, and the free importation of cereals from France was allowed in consideration of an annual tribute of 960 francs. The republic is governed by a sovereign council of 24 members, chosen for a period of four years by the heads of the communities. The council is presided over by two syndics, both chosen by the members of the council, one for life and the other for a term of four years. There are two judges called *viguiers*, of whom the first, a French subject, is appointed by France, and the second, a native, by the Bishop of Urgel. There is also a civil judge, appointed by France and the Bishop of Urgel alternately. Under each *viguiers* is an inferior judge called a *bailie*; there is an appeal from his judgment to the civil judge, and finally to the Court of Cassation at Paris, or to the episcopal college at Urgel. In criminal cases there is no appeal from the Court of the Republic itself, in which the first *viguiers* presides. The revenue of the state is derived from lands and from some inconsiderable taxes. The Bishop of Urgel receives from the republic an annual sum of 460 francs. The manner of life of the Andorrans is very simple. There are schools, but education is in a low state. Every able-bodied citizen of the republic is liable to military service between the ages of 16 and 60. In the Carlist wars the neutrality of Andorra was strictly respected, though various complications resulted from its connection with the Bishop of Urgel. The capital, Andorra, is situated in the mountains and has a population of about 1000. The population of the republic is 5231. Consult: Spender, *Through the High Pyrenees* (London, 1898); Deverell, *History of the Republic of Andorra* (Bristol, 1885); Tucker, *The Valley of Andorra* (Cambridge, Mass., 1882).

AN'DOVER. A municipal borough and market town in the county of Hampshire, England, 12 miles northwest of Winchester, on the river Anton (Map: England, E 5). It has manufactures of iron and malt. There are remains of Roman villas in the vicinity. Pop., 1901, 6509; 1911, 7596.

ANDOVER. A town of Essex Co., Mass. It includes several villages and lies south of the Merrimac. The town proper is 23 miles north of Boston, on the Boston and Maine Railroad, and on the eastern bank of the Shawsheen River (Map: Massachusetts, E 2). It produces linen, twine, and shoe-thread, woolen goods, rubber goods, printers' ink, brushes, automobile tubes, and other manufactures. Andover is the seat of the Phillips Academy for boys, founded in 1778, and Abbot Academy for young ladies. It has a public library and owns and operates its water works. The government is administered by town meetings, annual and special, which elect as executive officers three selectmen, make appropriations, and transact other business. First settled in 1643, Andover was incorporated as a town in 1646. It was within the area especially affected by the witchcraft delusion of 1692, and three of its citizens were con-

victed and executed at Salem, many more being tried and acquitted. On March 5, 1698, it was attacked by Indians, who killed five of the inhabitants and burned a number of the buildings. Consult Abbot, *History of Andover* (Andover, 1829), and Bailey, *Historical Sketches of Andover* (Boston, 1880). Pop., 1890, 6142; 1900, 6813; 1910, 7301.

ANDOVER THEOLOGICAL SEMINARY, situated in Cambridge, Mass., whither it was removed in 1908 from Andover, Mass. Not only one of the oldest but one of the most famous theological schools in America, founded in 1807. Although under the control of Congregationalists, it is free to Protestants of all denominations. All applicants must present a college diploma. The Seminary is affiliated with Harvard University, and Andover students are admitted to all courses offered by the Harvard faculties of Arts and Sciences and Divinity. The Harvard theological collections are housed in the Andover building with the Andover collections, and the united library contains about 110,000 volumes, including rare and precious editions and collections. In 1913 there were seven professors, two lecturers, and one instructor. The buildings are valued at \$300,000. The endowments are about \$745,000. President, Albert Parker Fitch, D.D. See Woods, *A History of Andover* (Boston, 1884).

ANDOVER THEOL'OGY. See NEW THEOL'OGY.

ANDRADA E SILVA, ân-drä'dä ê sêl'vá, BONIFACIO JOSÉ D' (1765-1838). A Brazilian statesman and author, born at Santos. He studied in Europe, became professor of geognosy and metallurgy in the University of Coimbra, Portugal, and perpetual secretary of the Academy of Sciences at Lisbon. Having returned to Brazil in 1819, he advocated independence and in 1822 and 1823 was Minister of the Interior under Dom Pedro I. From 1823 to 1829 he was in banishment in France by reason of his liberal views. He published *Poesias d' Americo Elyseo* (Bordeaux, 1825), and writings on mineralogy.

ANDRADE, ân-drä'dä, FRANCESCO D' (1859—). A distinguished Portuguese baritone. He was born in Lisbon, but received his musical education in Italy under Miraglia and Ronconi. He made his début at San Remo as Amonasro in *Aida* and rapidly became famous over all Europe. In Germany he is regarded as the greatest living baritone. He is not connected with any opera house, but appears only as "guest."

ANDRAL, ân'dral', GABRIEL (1797-1876). A celebrated French physician, member of the Institute, born in Paris. In 1823 he published the first volume of his *Clinique médicale*. In 1827 he was appointed professor of hygiene in the University of Paris, and in 1830 professor of internal pathology. His paper *Sur l'anatomie pathologique du tube digestif* ('On the Pathological Anatomy of the Alimentary Canal') was greatly admired, and in 1829 he produced a *Précis élémentaire* on the same science. His *Clinique médicale* treats principally of diseases of the chest, abdomen, and brain. In 1839 Andral succeeded Broussais in the chair of pathology and general therapeutics. His other works include *Projet d'un essai sur la vitalité* (1835), an edition of Lænnec's *Traité de l'auscultation médiate ou traité du diagnostic des poumons et du cœur* (1836), *Cours de patholo-*

gie interne (1836-37), *Sur le traitement de la fièvre typhoïde par les purgatifs* (1837), *Traité élémentaire de pathologie et de thérapeutique générale* (1843). His father, Guillaume Andral, was also a physician of note.

ANDRASSY, än'drä-shī, GYULA or JULIUS, COUNT (1823-90). An Hungarian statesman, born at Zemplén. He was in the Presburg Diet in 1847-48, and in the revolution of 1848 became an earnest adherent of the popular cause and was sentenced to death for his part in the uprising. He fled from the country and remained an exile in France and England until the general amnesty of 1857. Returning home, he was elected a member of the Diet in 1861 and was vice president of this body in 1865.

After the reconstruction of Austria-Hungary on a dual basis, Andrassy became Hungarian Prime Minister, and under his direction the Hungarian Constitution was developed to include such liberal measures as the freedom of the press and the right of public meeting. He also carried a law abolishing the political and civil disabilities of Jews, a measure bitterly opposed by all the Hungarian aristocrats. Andrassy succeeded Count Beust in 1871 as Minister of Foreign Affairs of the Austro-Hungarian Empire. Acting in harmony with Bismarck, he drew up and presented to the Porte in 1876 the famous "Andrassy Note," which set forth the irreducible minimum of reforms demanded by the Christian Powers in respect to Bosnia and Herzegovina. In 1878 he was the chief representative of Austria-Hungary at the Congress of Berlin and negotiated with Bismarck in 1879 the Austro-German alliance. He brought about the occupation of Bosnia-Herzegovina by the dual monarchy, but the step was so unpopular that it was partly the cause of his resignation in 1879. In his place in the Upper House he regained his popular influence as a leader of reform, and his death was considered a national calamity. The making of the Hungarian State and Constitution was largely the result of Andrassy's efforts. Consult: Benjamin Kallay, *Memoirs* (1891); Mano Konyi, *Recollections of Count Andrassy* (1891); E. von Wertheimer, *Graf Julius von Andrassy; sein Leben und seine Werke*, vol. i (Stuttgart, 1910).

ANDRASSY, JULIUS (1860—), son of the preceding, entered the Reichstag in 1884, became under-secretary in the ministry of Wekerle in 1892, secretary of education in 1893, and in the following year Hungarian Minister near the person of the King. He left the Liberal party in 1898, but returned in 1899 after the fall of the Bánffy ministry. In 1905 he was one of the leaders of the Coalition which brought about the fall of the Liberal Siza ministry. In 1906 he became Minister of the Interior in the compromise Wekerle cabinet and held that office until the fall of the ministry in 1909. In 1912 he represented Austria in the diplomatic endeavor to prevent the outbreak of the Balkan War. He wrote *Ungarns Ausgleich mit Oesterreich vom Jahre 1867* (1897); *The Development of Hungarian Constitutional Liberty* (Eng. trans. of Hungarian text, London, 1908).

ANDRÉ, än'drä', CHARLES (1842—). A French astronomer, born at Chauny (Aisne). In 1877 he became professor of astronomy at Lyons, and director of the observatory in that city, in which capacity he visited the Rocky Mountains and Australia to observe the transit of Venus. Among his principal works is *L'as-*

tronomie pratique et les observations en Europe et Amérique depuis le milieu du XVIIe siècle jusqu'à nos jours (5 vols., 1874-82).

ANDRÉ, ăn'dră or ăn'drĭ, JOHN (1751-80). An English soldier in the American Revolution who met his death under circumstances which have given his name a place in history. He was born in London of Genevese and French parentage, entered the English army at the age of 20, and in 1774 joined his regiment in Canada. He was captured by General Montgomery in November, 1775, at St. Johns, and until December, 1776, when he was exchanged, he was held as a prisoner at Lancaster, Pa. He was promoted to be captain in 1777, and soon afterward became an aid to Gen. Charles Grey. In the following year he was raised to the rank of major, and was appointed adjutant-general of the English army in America and aid to Sir Henry Clinton. During the negotiations between Clinton and General Arnold, in 1780, for the betrayal into the hands of the British of West Point, with its stores and magazines, including nearly the whole stock of powder of the American army, Major André acted as the confidential agent of General Clinton and attended to most of the correspondence. In order to perfect plans for carrying out the plot, André, under the assumed name of "John Anderson," left New York on September 20, ascended the Hudson in the British sloop-of-war *Vulture*, and on the 21st and 22d met Arnold in secret and made the necessary arrangements. During their interview the *Vulture* was forced down stream by the fire of an American battery, and André, armed with a pass from Arnold and disguised (against General Clinton's explicit instructions) as a civilian, started on horseback for New York, carrying several incriminating papers, in Arnold's handwriting, concealed in his boots. Near Tarrytown at 9 A.M. on the 23d—when almost within sight of the British lines—he was captured by three American militiamen (John Paulding, David Williams, and Isaac Van Wart), who found the documents and, refusing all bribes, handed their prisoner over to Lieutenant-Colonel Jameson, by whom Arnold was blunderingly notified and thus enabled to escape. A military court, presided over by Gen. Nathanael Greene, and consisting of six major-generals and eight brigadiers, convened on September 29, at Washington's request, and unanimously convicted André of being an English spy. In accordance with military usage, he was therefore condemned to be hanged, and on October 2 the sentence was carried out at Tappan, N. Y., André behaving with the utmost courage and serenity and calling upon the American officers to witness that he died like a brave man. His fate aroused much sympathy everywhere, and his death was passed into history as one of the most pathetic incidents of the Revolutionary War; but it is now generally recognized, both in this country and in England, that Washington could not have acted otherwise than as he did, and that, by the rules of war, André clearly brought upon himself the punishment he received. A monument was erected to André's memory in Westminster Abbey, and in 1821 his body was disinterred at Tappan and conveyed to a grave near the monument.

André had a singularly attractive personality, which has added much to the general interest in his fate. Vivacious, witty, and strikingly handsome, he had, moreover, a charm of manner

which made him a general favorite in the English army and endeared him even to the American officers who came in contact with him during his captivity. He was, besides, remarkably versatile and, in particular, had considerable literary, artistic, and musical talent. A fluent and pleasing writer, he carried on much of Clinton's correspondence and wrote many fugitive verses, some of which, such as *The Cow Chase*, *Yankee Doodle's Expedition to Rhode Island*, and *The Affair between Generals Howe and Gadsden*, were very popular at the time in the English army. During the winter spent by the English in Philadelphia he was the life and soul of all the gayeties and festivities there, and took the leading part in the famous "Mischi-anza"—a pageant given in honor of the departing Lord Howe. Interest in André has been much heightened, also, by the romantic story of his early attachment to a Miss Honora Sneyd, of Lichfield, England, who was subsequently married to the father of Maria Edgeworth.

In vol. vi of the *Memoirs of the Historical Society of Pennsylvania* (1858) is the "Case of Major André, with a Review of the Statement of it in Lord Mahon's History of England," by Charles J. Biddle—an essay containing a full narrative of the case, with a discussion of all the questions of law and duty raised in connection with it. Consult also an excellent work by Sargent, *Life and Career of Major John André* (new ed., New York, 1902); Lossing, *Two Spies* (New York, 1886); and André's *Journal* (Boston, Mass., The Bibliophile Society, 1904). Many of the documents relating to André's capture, trial, and conviction are contained in H. W. Smith's *Andreana* (Philadelphia, 1865), and in Dawson, *Papers Concerning the Capture and Detention of Major John André* (Yonkers, 1866).

ANDRÉ, ăn'dră', LOUIS JOSEPH NICOLAS (1838-1913). A French general, born at Nuits-St. Georges (Côte-d'Or). He served through the siege of Paris, in 1893 became brigadier-general and head of the Ecole Polytechnique, and in 1899 was made general of division. In May, 1900, he entered the Waldeck-Rousseau cabinet as minister of war, retaining his post under the Combes ministry. He was active in combating anti-Republican agitations in the army and resorted to a system of espionage over army officers which led to violent debates in the chamber of deputies in the fall of 1904. Following an assault at the hands of a Nationalist deputy, he resigned, November 14.

ANDREA, ăn-dră'a, GEROLAMO MARQUESE D' (1812-68). An Italian Cardinal. He was born at Naples, educated at the Collège La Flèche, France, and was early appointed Archbishop of Mytilene in *partibus infidelium*. In 1852 he was appointed Cardinal-abbot of Subiaco, and Prefect of the Congregation of the Index, and in 1860 Bishop of Sabina. He took sides with the Patriotic party in 1859 on the question of the national unity of Italy, and at the same time counseled extensive liberal reforms in Church policy. He was suspended from his diocese and abbacy and threatened with permanent deposition from office. He ultimately submitted, and in 1868 was rehabilitated, without, however, being restored to his diocese and the abbacy of Subiaco.

ANDREA DEL SARTO. See SARTO.

ANDREÆ, JAKOB, called SCHMIDTLEIN (1528-90). A German theologian. He was born at Waiblingen; graduated at Tübingen; preached in Stuttgart and Tübingen, and

was very active in promoting the Reformation throughout Württemberg, where he was court preacher. He attended the diets of Ratisbon and Frankfort (1557) and Augsburg (1559), became professor of theology in the University of Tübingen (1562), and provost of the church of St. George. He was active in Protestant discussions and movements, particularly in the adoption of a common declaration of faith by the two parties, the Formula of Concord (1577). In the latter part of his life he traveled in Bohemia and Germany, working for the consolidation of the Reformation, conferring with pastors, magistrates, and princes. He was the author of more than 150 works, nearly all polemical and vigorously written, for the most part directed against Calvinism. For his life, consult Schmoller (Gütersloh, 1890).

ANDREÆ, JOHANN VALENTIN (1586-1654). A German theologian, born at Herrenberg, near Tübingen. He studied at Tübingen, obtained ecclesiastical preferments in the Protestant church of his native country, and became chaplain to the court at Stuttgart, where he died. His writings are remarkable for the wit and humor, as well as for the learning, acuteness, and moral power, which they display. He was erroneously regarded as the founder, or at least the restorer, of the order of the Rosicrucians (q.v.), and this opinion seemed to be supported by reference to three publications: the *Chymische Hochzeit Christiani Rosenkreuz* (1616), the *Fama fraternitatis R. C.*, i.e., *Rosaceæ Crucis* (1614), and the *Confessio fraternitatis R. C.* (1615), of the first of which he acknowledged himself the author, and the other two have so much resemblance to it as to be evidently from the same pen. His intention seems to have been not to promulgate secret societies of mystics and enthusiasts, but to ridicule the follies of the age. He attacked Rosicrucianism itself in some of his later writings. Among the best of his works are his *Menippus s. Satyricorum Dialogorum Centuria* (1617) and *Mythologia Christiana* (1619). He wrote an allegoric poem called *Die Christenburg* (Stuttgart, 1836). For his life, consult Glöckler (Stuttgart, 1866).

ANDREÆ, LAURENTIUS, or LARS ANDERSSON (1480-1552). A Swedish reformer. He was born at Strengnäs, about 40 miles west of Stockholm, 1480; died there April 29, 1552. He studied at Rome, but came home a Protestant, and introduced the reformed faith into Sweden, 1523. He was made Chancellor by Gustavus Vasa, who desired him to translate the Bible, in which work he was assisted by Olaus Petri (New Testament, 1526; Old Testament, 1540). After 1540 he lost the royal favor and lived in retirement.

ANDREANI, än'drà-ä'nè, ANDREA (died, 1623). The most prominent Italian wood engraver in chiaroscuro. The year of his birth is unknown, but his earliest block is dated 1584, his latest 1611. He was born at Mantua and was active chiefly at Florence, Siena, and Mantua. His chief works include the "Pavement of Siena Cathedral," twelve vast prints after Beccafumi; "The Deluge," and "The Destruction of Pharaoh's Host" (1585), both large prints after Titian; and Mantegna's "Triumph of Cæsar" (10 prints, 1598), his best work. Andreani frequently signed blocks which he did little more than retouch. He was one of the world's greatest masters of chiaroscuro engraving. (See WOOD ENGRAVING.) He excelled especially in the arrangement of light and shade,

but his drawing was also correct and sure. From using a similar monogram, his work has sometimes been mistaken for that of Albrecht Altdorfer.

ANDREA PISANO. See PISANI.

ANDREASBERG, än'drà-äs'bèrk, SANKT. A town of Hanover, Germany, in the Harz Mountains, about 27 miles northeast of Göttingen. It was settled as the centre of a rich mining district, yielding iron, copper, silver, lead, cobalt, and arsenic. It lies at the south foot of the Brocken. Its location, 1825 feet above the sea, and its fine climate have made it a tourist and health resort. Pop., about 4000.

ANDREAS CHESNIUS. See DUCHESNE, ANDRÉ.

ANDREE, än'drà, KARL THEODOR (1808-75). A German geographer and journalist. He studied history at Jena, Göttingen, and Berlin, and from 1830 to 1855 was active in journalism. He then gave his attention to geographical and ethnological studies, publishing among other works, *Nordamerika in Geographischen und Geschichtlichen Umrissen* (1851; 2d ed., 1854), *Buenos Aires und die Argentinische Republik* (1856); *Geographie des Welthandels* (1867-77; new ed. by Franz Heiderich and Robert Sieger, 1909). In 1861 he founded the *Globus*, a geographical and ethnological publication.

ANDREE, RICHARD (1835-1909). A German ethnographer and geographer, son of the preceding, born in Brunswick. He studied natural sciences at Leipzig, and from 1859 to 1863 worked as a foundryman in Bohemia, for the purpose of studying the German-Czech race conflict. He was editor of the *Globus* from 1891 to 1903. In 1902 he became professor at the University of Munich. The books embodying the results of his observations in Bohemia are written from the German nationalist point of view. They include *Nationalitätsverhältnisse und Sprachgrenze in Böhmen* (1870) and *Tschechische Gänge* (1872). His later and better-known works comprise *Zur Volkskunde der Juden* (1881), *Die Metalle bei den Naturvölkern* (1884), *Die Masken in der Völkerkunde* (1886), *Die Flutsagen* (1891), and *Braunschweiger Volkskunde* (1896).

ANDRÉE, än'drà, SALOMON AUGUST (1854-97?). A Swedish scientist and aëronaut, born at Grenna. He studied at the technical college in Stockholm and was a member of the Swedish meteorological expedition in 1882-83. Between 1892 and 1895 he made several balloon journeys and finally decided to attempt to reach the North Pole by means of a balloon, partly directed by sails and guide-ropes. On July 11, 1897, accompanied by two friends, Strindberg and Fränkel, he made the start from Dane Island, northwestern Spitzbergen. Four days afterward a carrier pigeon, shot on the sealer *Alken*, was found to convey in a small tube a message written by Andrée two days after the ascent. The message gave the position of the party as lat. 82° 2', long. 15° 5' E., or 145 miles north and 45 miles east of the starting point. Of the thirteen buoys carried in the balloon, five have been discovered on coasts near Spitzbergen. Two contained dispatches, both dated July 11. The "polar buoy," which was to be cast overboard from the highest latitude attained, was found empty, at Spitzbergen, Sept. 11, 1899. Consult Kullenbergh, *Andrée, hans Lif och Person* (Göteborg, 1898), and *Annual Report of the Smithsonian Institution for 1898* (Washington, 1898).

ANDRÉEV, än-drä'yéf, LEONID NIKOLAEVITICH (1871—). A Russian writer of the new school. He was born at Orel and studied law at the universities of Moscow and St. Petersburg. The struggle for existence caused him to attempt suicide at 23. Finding his law practice very unremunerative, he became police-court reporter for a Moscow daily, performing the routine of his humble calling without attracting any particular attention. His first story published was *About a Poor Student*, a narrative based upon his own experiences. It was not, however, until Gorky discovered him by stories appearing in the *Moscow Courier* and elsewhere that Andréev's literary career really began. From that day to this he has been one of the most prolific writers in Russia, producing short stories, sketches, dramas, etc., in frequent succession. His first collection of stories appeared in 1901 and sold a quarter million copies in a short time. Andréev was hailed as a new star in Russia, where his name soon became a by-word. Even outside of Russia his work is better known than that of any of his contemporaries, translations having appeared in all European languages. The following are available in English: *The Red Laugh* (1905), a gruesome narrative of the Russian-Japanese War; *The Burglar* (*Current Literature*, May, 1905), a sentimental sketch; *His Excellency the Governor* (*Harper's Weekly*, Feb. 9 to March 2, 1907), a short story depicting the fear of death; *To the Stars* (*Poet Lore*, Winter, 1907), a four-act poetic drama; *Lazarus* (*Current Literature*, May, 1907), a bold version of the biblical story; *The Life of Man* (*Oxford and Cambridge Review*, Midsummer, 1908), a five-scene mystery play; *The Seven Who Were Hanged* (1909), a story dealing with capital punishment; *Judas Iseariot and the Others* (1910), an attempt to re-create a universal tradition; *A Dilemma* (1910), a story of murder and madness; *Anathema* (1910), a tragedy in seven scenes; *Silence and Other Stories* (1910), tales of horror; *Life is so Beautiful to the Resurrected* (*Current Literature*, September, 1910), a fantasy; *Love of One's Neighbor* (*The Glebe*, January, 1914), a satire.

Andréev occupies a most peculiar position in modern Russian literature. Although he started out in the traditional Russian vein, he soon startled his readers by his eccentricities, which have grown even faster than his fame. As a writer he baffles classification. He is not a realist in the ordinary sense of the term, nor is he a romanticist. He is an unmistakable mystic, whose philosophy, so far as can be inferred from his works, is that of fatalism; most of his heroes land either in the grave or in the madhouse. Moreover, he seems to be notably deficient in synthetic power and normal human sympathy; hence he has not created any real characters nor given us any types, while the writing of novels seems to be entirely beyond him. He has unusually keen analytic power, however, and is undoubtedly an original and very brilliant writer, though he can hardly be ranked among the truly great Russian writers with whom he is erroneously compared by non-Russian readers. Indeed, it is not altogether likely that Andréev's sudden fame will endure beyond his day and generation.

ANDREINI, än'drä-ē'nē. A family of Italian actors and playwrights.—FRANCESCO ANDREINI (c.1548–1624), a Pistoian, whose real name was Francesco dei Cerarchi dal Gallo, began life as

a soldier and was captured by the Turks. Escaping from slavery, he joined, about 1577, the famous comic company of the Gelosi and became celebrated in the part of the braggart Captain Terror of Hell Valley. In 1604 he retired from the stage and devoted himself to literary work, publishing among other things his most famous work, *Le bravure del capitano Spavento* (Venice, 1607), which was translated into French by Jacques de Fonteny (Paris, 1608), and his *Ragionamenti fantastici* (Venice, 1612). His wife Isabella (1562–1604), daughter of Paolo Canali of Venice, one of the most celebrated women of her time, by her wonderful voice, her beauty and wit, became the mainstay of the Gelosi. At her death in Lyons a medal was struck in her honor bearing the words *Æterna Fama*. Her writings include the pastoral drama *Mirtilla*, a number of lyrics, and a collection of letters.—Their son, GIAMBATTISTA ANDREINI (1578–c.1650), on the dissolution of the Gelosi in 1604, founded the company of the Fedeli, where, in the rôle of Lelio, he came to European fame, filling brilliant engagements at Paris under Louis XIII, at Milan and Mantua and in Germany. He is the author of several comedies in the style of his time. To offset the agitation made against the comedy by moralists, he composed a number of religious dramas, the most noted of which is the *Adamo* (Milan, 1613), from which many critics, from the time of Voltaire on, have insisted that Milton derived the conception of his *Paradise Lost*. Andreini's *Teatro celeste* was published at Paris in 1625. His wife, Virginia Andreini (c.1583–c.1628), was equally famous in the Fedeli in the part of Florinda. Her reputation as a singer was made in the *Arianna* of Rinuccini-Monteverdi, at Mantua in 1608. Her portrait was painted by Bronzino, and she was celebrated by many poets of the time, notably by Marino. For the Andreini family consult: E. Bevilacqua, "Giambattista Andreini e la compagnia dei Fedeli" (in the *Giornale storico della letteratura italiana*, vol. xxiii, p. 76, and vol. xxiv, p. 82); E. Allodoli, *Giovanni Milton e l'Italia* (Prato, 1907); W. Smith, *The Commedia dell' arte* (New York, 1912); and Rasi, *Comici italiani* (Florence, 1897).

ANDREOLI, än'drä-ō'lē, GIORGIO (c.1465–c.1555). An Italian designer and maker of majolica ware, one of the most famous of the Renaissance. He was born at Intra on Lago Maggiore (not at Milan, as is usually supposed), and settled in 1485 at Gubbio, where the potter's art was under the enlightened patronage of the Duke of Urbino. In 1498 he became a citizen of Gubbio and in 1518 invented his remarkable lustre, the chief characteristics of which are its beautiful gold and carmine colors. Good examples of his majolica may be found in the local museums of Gubbio, Urbino, Arezzo, and elsewhere in Italy, and also in the principal museums of decorative art in Europe, such as Berlin, Vienna, Paris, and South Kensington. Not all works fired with his lustre were designed by him, for potters of the neighboring cities brought their work to him to be fired. He was assisted in his work by his brothers Salimbene and Giovanni, and after his death it was continued by his son Vincenzo.

ANDRÉOSSI, än'drä-ō'sē, ANTOINE FRANÇOIS, COUNT (1761–1828). A French statesman, born at Castelnaudary, in Languedoc. He was the great-grandson of François Andréossi, who,

with Riquet, constructed the canal of Languedoc in the seventeenth century. He entered the army as a lieutenant of artillery in 1781, joined the revolutionists, rose rapidly in military rank, served under Bonaparte in Italy and Egypt, accompanied him on his return to France, and took part in the *coup d'état* of the eighteenth Brumaire. He was Ambassador at London during the Peace of Amiens, and was made Governor of Vienna after the battle of Wagram. He was for some time Ambassador at Constantinople, from which he was recalled by Louis XVIII. He was raised to the peerage by Napoleon after the return from Elba. After the battle of Waterloo he advocated the recall of the Bourbons, but as deputy from the department of Aude he generally sided with the opposition. He was a man of eminent scientific attainments and distinguished himself as a member of the institute founded at Cairo. He wrote extensively on military history, with particular reference to the artillery arm; and also a *Histoire du Canal du Midi*, in which he asserted the right of his great-grandfather to honors long enjoyed by Riquet. Consult Marion, *Notice nécrologique sur le Comte Andréossi* (Paris, 1846).

ANDRÉS, ân-drās'; JUAN (1740-1817). A Spanish scholar, born at Planes (Valencia). He entered the Jesuit order and after its expulsion from Spain (1767) withdrew to Italy, where for a time he taught philosophy in the College of Ferrara. Afterward he was royal librarian at Naples. In 1815 he became blind. His works are: *Prospectus de Philosophiæ Universæ Publicæ Disputatione Proposita in Templo Ferrariensi* (1773); *Saggio della filosofia di Galileo* (1776); and *Dell' origine, dei progressi e dello stato attuale d' ogni letteratura* (7 vols., 1782-99).

AN'DREW (Gk. Ἀνδρέας, *Andreas*). An Apostle, brother of Simon Peter, born in Bethsaida of Galilee. He was originally a disciple of John the Baptist, but was one of the first called of the disciples of Jesus, and was finally chosen by him from among his larger following to the apostolic office. (See list of apostles in Mark iii. 13-19, with Matthew and Luke parallels.) During the ministry of Jesus he is connected with incidents recorded in John iv. 8; xii. 22; Mark xiii. 3, 4. In Acts he is mentioned only in a list of apostles (i. 13). Subsequent tradition regarding his preaching in Scythia, northern Greece, and Epirus, and suffering martyrdom on a cross shaped like the letter X about 70 A.D., is worthless. See APOSTLE.

ANDREW I. King of Hungary from 1046 to 1061, and cousin of St. Stephen, the apostle of Christianity in Hungary. He owed his choice to the party in opposition to German influence and the spread of Christianity. When firmly established on the throne, he interdicted the pagan cults. Andrew fought with varying fortunes against Henry III of Germany and against his own brother, Béla, whom he had exiled. He was finally defeated, and Béla succeeded him. See Leger, *History of Austro-Hungary* (Eng. trans., New York, 1889).

ANDREW II (1175-1235). A King of Hungary who ascended the throne in 1205. In 1217 he conducted an unsuccessful crusade against the Moslem powers. In 1222 he had to sign the Golden Bull, called the Magna Charta of Hungary, which defined and confirmed the rights and titles of the bishops and nobles whose revolts had disturbed his reign. See GOLDEN BULL.

ANDREW III (?-1301). The last Hungarian King of the Arpád family, grandson of Andrew II. He was born in Venice, while his father was in exile, and succeeded Ladislas IV in 1290. He had to defend his crown against the pretensions of Rudolph of Hapsburg and also against a son of the King of Naples, who claimed to be of the house of Arpád through his mother. The latter was actively supported by Pope Nicholas IV. Andrew made some efforts to develop trade, and his reign was successful on the whole.

ANDREW, A (BRAM) PIATT, JR. (1873-). An American economist and public official, born at La Porte, Ind. He graduated from Princeton in 1895; studied at the universities of Halle, Berlin, and Paris in 1897-99; and, just previous to receiving the degree of Ph.D., at Harvard University in 1900. For the following nine years he was instructor and assistant professor of economics at Harvard. On the creation of the National Monetary Commission in 1908 he became its expert assistant and editor of its publications, a capacity in which he compiled and collected one of the most complete libraries of books bearing on finance and banking ever gathered. In 1909 he was appointed Director of the Mint, and in June, 1910, Assistant Secretary of the United States Treasury. The latter office he resigned, however, in June, 1912, at the same time making public a severe criticism of the conduct of the Treasury Department under Franklin McVeagh. He wrote much on economic and financial subjects in reviews and magazines and became an officer of the French Academy and treasurer of the American Red Cross Society. Among his publications are *Banking Systems and Currency Reform* (1910); *Purpose and Origin of the Proposed Banking Legislation: Three Addresses* (1911).

ANDREW, JAMES OSGOOD, D.D. (1794-1871). A Methodist bishop. He was born in Wilkes Co., Ga., May 3, 1794, became (1816) an itinerant Methodist Episcopal preacher of South Carolina Conference, until consecrated bishop at Philadelphia in May, 1832. On his relations to slavery began the first territorial cleavage of the Methodist Episcopal church. His second wife, whom he married in 1844, was a slaveholder, and in the general conference of 1844 it was declared that "this would greatly embarrass the exercise of his office as an itinerant general superintendent, if not in some places entirely prevent it," and it was resolved "that it is the sense of this general conference that he should desist from the exercise of this office so long as this impediment remains." The Southern delegates protested that the action was extrajudicial and unconstitutional, and the difficulty was finally settled by dividing the churches and property, a church being formed called the Methodist Episcopal Church, South. Bishop Andrew adhered to the South, and continued his episcopal work until 1868, retiring then from age. He died in Mobile, Ala., March 1, 1871.

ANDREW, JOHN ALBION, LL.D. (1818-67). An American statesman, "war Governor" of Massachusetts. He was born in Windham, Me., graduated at Bowdoin in 1837, was admitted to the Boston bar in 1840, practiced there 20 years, and took a prominent part in the cases which arose under the Fugitive Slave Law. In 1858 he was a member of the Legislature and in 1860 was a delegate in the Republican Na-

tional Convention and was elected Governor of Massachusetts by the largest popular majority ever given to a candidate. He foresaw the danger of civil war and took immediate steps to perfect the organization of the militia of his State. Within a week after the first call for troops he sent forward five infantry regiments, a battalion of riflemen, and a battery of artillery. In 1861, and yearly until he insisted on retiring in 1866, he was reelected Governor, and was probably the most efficient of all the "war Governors," continually organizing militia companies and lending aid in every possible way to the Administration. He was at the conference of loyal Governors at Altoona, Pa., in September, 1862, and wrote the address presented by them to the President. He obtained permission from the Secretary of War in January, 1863, to organize colored troops, raised the first colored regiment (the Fifty-fourth Massachusetts Infantry) which participated in the war and sent it to the front early in May. After the war he contended for a policy of conciliation and vigorously opposed all measures likely to humiliate the South. In religion he was Unitarian and presided at the first national conference of that denomination in 1865. He declined the presidency of Antioch (Ohio) College, which was offered to him in 1866. After that time he continued the practice of law in Boston. Consult Chandler, *Memoir, With Personal Reminiscences* (Boston, 1880).

ANDREW, SAINT, OF THE THISTLE. See THISTLE, ORDER OF.

ANDREW, SAINT, THE RUSSIAN ORDER OF. The most distinguished order in the Russian Empire. It was founded on Dec. 10 (N. S.), 1698, by Peter the Great, and membership in it is confined to members of the imperial family, princes, generals-in-chief, and those of similarly high rank. Grand dukes become Knights of St. Andrew at baptism, and other imperial princes upon obtaining their majority. Membership in St. Andrew's carries with it rights to the important orders of St. Anne, Alexander Nevski, and St. Stanislaus. The badge of the order of St. Andrew is a double spread eagle surmounted by the Russian crown. On the obverse of the medal is an enameled cross upon which is borne the figure of St. Andrew, and at the four corners of the cross are the letters S. A. P. R. (*Sanctus Andreas Patronus Russiae*). On the reverse of the badge is the inscription (in Russian) "For Faith and Loyalty." See ORDERS.

ANDREWS, LANCELOT (1555-1626). An eminent English prelate. He was born in London, Sept. 25, 1555, and educated successively at the Coopers' Free Grammar School, Ratcliffe, Merchant Taylors' School, London, and Pembroke Hall, Cambridge, of which college, after having greatly distinguished himself by his industry and acquirements, he was in 1576 elected a fellow. On taking orders, 1580, he accompanied the Earl of Huntingdon to the North of England. His talents attracted the notice of Walsingham, Queen Elizabeth's Secretary of State, who appointed him successively, in 1589, to the vicarage of St. Giles, Cripplegate, a prebendary and canon residentiary of St. Paul's, a prebendary of the Collegiate Church of Southwell, and master of Pembroke Hall. The Queen next testified her esteem for his gifts and piety by appointing him one of her chaplains in ordinary and Dean of Westminster. He rose still higher in favor with King James, who was well

qualified to appreciate his extensive learning and peculiar style of oratory. He attended the Hampton Court Conference, as one of the ecclesiastical commissioners, and took part in the translation of the Bible. The portion on which he was engaged was the first 12 books of the Old Testament. In 1605 he was consecrated Bishop of Chichester. In 1609 he was translated to the see of Ely, and appointed one of his Majesty's privy councilors both for England and Scotland. To the latter country he accompanied the King in 1617, as one of the royal instruments for persuading the Scotch of the superiority of episcopacy over presbytery. In 1619 he was translated to Winchester. He died in Winchester House, Southwark, London, on Sept. 25, 1626. Bishop Andrewes was, with the exception of Ussher, the most learned English theologian of his time. As a preacher he was regarded by his contemporaries as unrivaled; but the excellent qualities of his discourses are apt to suffer much depreciation in modern judgment from the extremely artificial and frigid character of the style. His principal works published during his life were two treatises in reply to Cardinal Bellarmine, in defense of the right of princes over ecclesiastical assemblies. His other works consist of sermons, lectures, and manuals of devotion. Bishop Andrewes was the most eminent of that Anglican school in the seventeenth century of which the nineteenth witnessed a revival under the name of Puseyism. Its distinctive peculiarities were high views of ecclesiastical authority, and of the efficacy of sacraments, ceremonies, and apostolic succession, and extreme opposition to Puritanism. His works are in the Library of Anglo-Catholic Theology, 11 vols., Oxford, 1841-54. Of most fame are his *Devotions* (many editions, London, 1898); *Seventeen Sermons on the Nativity* (1887). For his life, consult Whyte (Edinburgh, 1896), M. Wood (New York, 1898), and Ottley (Boston, 1894).

ANDREWS, CHARLES MCLEAN (1863-). A prominent American historian, born at Wethersfield, Conn. He was educated at Trinity College, and was chosen to a chair of history successively at Byrn Mawr College (1889), Johns Hopkins University (1907), and Yale University (1910). He became a member of the public archives commission, and of the committee on documentary publications of the United States government. His publications include: *Historical Development of Modern Europe* (1898); *A History of England for Schools and Colleges* (1903); *Colonial Self-Government* (1904); *Short History of England* (1912); *The Colonial Period of American History* (1912); *Guide to American Materials in the British Archives* (vol. i, 1898; vol. ii, 1912).

ANDREWS, CHRISTOPHER COLUMBUS (1829-). An American soldier and diplomat. He was born in Hillsboro, N. H., but lived chiefly in Minnesota after 1856. During the Civil War he rose to the regular rank of brigadier-general and at its close was brevetted major-general. He was United States Minister to Sweden from 1869 to 1877, and United States Consul-General to Brazil from 1882 to 1885. His publications include a *History of the Campaign of Mobile* (1867) and *Brazil, Its Condition and Prospects* (1887; 3d ed., 1895).

ANDREWS, EDMUND, M.D., LL.D. (1824-1904). An American surgeon, born at Putney, Vt. He studied medicine at the University of

Michigan, where he was afterward made professor of comparative anatomy. In 1856 he removed to Chicago. He was one of the founders of the Chicago Medical College, which at present forms the medical department of the Northwestern University of Chicago. Dr. Andrews was a surgeon during the Civil War, and, in later life, consulting surgeon to several Chicago hospitals. He introduced a number of valuable improvements into the practice of his profession and published a work on rectal surgery.

ANDREWS, EDWARD GAYER, D.D., LL.D. (1825-1907). An American clergyman; appointed bishop of the Methodist Episcopal Church in 1872. He was born at New Hartford, N. Y., and after graduating at Wesleyan University, Conn. (1847), entered the Methodist Episcopal ministry (1848). In 1854 he became president of Mansfield Female College in Ohio, and for the eight years following was at the head of Cazenovia Seminary. He served as pastor at Stamford, Conn., and Brooklyn, N. Y., from 1864 to 1872, after which he spent many years visiting foreign missions. Bishop Andrews delivered the address at the state funeral of President McKinley in Washington, Sept. 17, 1901.

ANDREWS, ELISHA BENJAMIN, D.D., LL.D. (1844—). An American educator, born at Hinsdale, N. H. He served in Connecticut regiments during the Civil War. Graduating at Brown University in 1870 and at the Newton Theological Institution in 1874, he preached for one year and then was president of Denison University, 1875-79. He was professor of homiletics at Newton Theological Institution, 1879-82; professor of history and political economy in Brown University, 1882-88; professor of political economy and finance in Cornell University, 1888-89, and president of Brown University, 1889-98. He resigned as president of Brown in 1897 because of criticism by trustees of his advocacy of free silver, but at that time withdrew his resignation. He was superintendent of schools, Chicago, 1898-1900, and then became chancellor of the University of Nebraska. In 1892 he was a United States commissioner to the Brussels monetary conference and was a strong supporter of international bimetallism. He became a member of the corporation of Brown University in 1900 and was made president of the Association of State Universities in 1904. He retired from the University of Nebraska as chancellor emeritus Jan. 1, 1909. He has published many college textbooks on history and economics; also, *An Honest Dollar* (1889; 3d ed., 1894); *Wealth and Moral Law* (1894); *History of the United States* (2 vols., 1894); *The History of the Last Quarter Century in the United States, 1870-95* (1896; revised under the title *The United States in Our Own Time*, 1903).

ANDREWS, ETHAN ALLEN (1787-1858). An American educator. He was born in Connecticut, and graduated at Yale in 1810. He practiced law for several years, then (1822-28) was professor in the University of North Carolina, after which he taught in New Haven and Boston. He published a number of Latin text-books and in 1850 a Latin-English lexicon, based on Freund, and with Solomon Stoddard, a Latin grammar, long very popular. The lexicon went through many revisions and came to be known as *Harper's Latin Dictionary* (1907). A monograph, *Slavery and the Domestic Slave Trade in*

the United States, was printed in Boston in 1836. Consult Hubbard Winslow, *Eulogy on the Late Professor E. A. Andrews* (Boston, 1858).

ANDREWS, ETHAN ALLEN (1859—). An American biologist, born in New York City. He received the degree of Ph.B. from Yale University in 1881 and of Ph.D. from Johns Hopkins in 1887, having in the mean time taken post-graduate studies at Yale, at the Polytechnicum of Hanover, Germany, and, as a fellow, at Johns Hopkins. Appointed assistant professor of biology in the last-named university in 1887, he was made associate professor in 1892 and professor of zoölogy in 1908. He became a member of several scientific societies, and in 1904 was president of the Society of American Zoölogists. He contributed on biological subjects to various journals.

ANDREWS, GEORGE LEONARD (1828-99). An American soldier. He was born in Bridgewater, Mass., and in 1851 graduated at West Point at the head of his class. For two years (1854-56) he was assistant professor of engineering at West Point. He then resigned from the service and was engaged in engineering work until the beginning of the Civil War, when he entered the Union Army as lieutenant-colonel. He served in the Shenandoah valley in 1861, took part in Pope's campaign in 1862, was raised to the rank of brigadier-general in November, 1862, and bore a prominent part in General Banks's expedition to New Orleans. He was commander of the Corps d' Afrique from 1863 to 1865, and for "faithful and meritorious services in the campaign against Mobile" was brevetted major-general of volunteers in March, 1865. He was United States marshal in Massachusetts from 1867 to 1871, and was professor of French at West Point from 1871 to 1882, and of modern languages from 1882 until his retirement in 1892.

ANDREWS, LOREN (1819-61). An American educator and sixth president of Kenyon College. He was born in Ashland Co., Ohio, and was educated at Kenyon College. He took an active interest in the common schools, and it is said that much of the present excellence of the Ohio school system is due to him. His administration at Kenyon College was also very successful. At the beginning of the Civil War President Andrews raised a company in Knox County and was made captain. Afterward, as colonel of the Fourth Ohio Volunteers, he saw severe service in Virginia. He died of camp fever while in active service.

ANDREWS, LORRIN (1795-1868). An American educator. He was born in East Windsor, Conn., educated at Jefferson College and Princeton Theological Seminary, and went as missionary to the Sandwich Islands in 1827. In 1831 he founded what became the Hawaiian University, in which he was professor. He was long privy councillor and judge under the native government. He wrote an Hawaiian dictionary and published part of the Bible in that tongue.

ANDREWS, SAINT. See SAINT ANDREWS.

ANDREWS, SAINT. UNIVERSITY OF. See SAINT ANDREWS, UNIVERSITY OF.

ANDREWS, SAMUEL JAMES (1817-1906). An Irvingite divine. He was born at Danbury, Conn., July 31, 1817; graduated at Williams College, 1839; practiced law for some years, but turned his attention to theology, and was a Congregational clergyman from 1848 to 1855. In 1856 he became pastor of the Catholic and Apos-

tolie Church (Irvingite) at Hartford, Conn. His publications embrace: *Life of Our Lord upon the Earth, Considered in its Historical, Chronological, and Geographical Relations* (New York, 1863; new and wholly revised ed., 1891); *God's Revelations of Himself to Men* (1885); *Christianity and Anti-Christianity in their Final Conflict* (1898); *The Church and its Organic Ministry* (1899); *William Watson Andrews: A Religious Biography* (1900).

ANDREWS, STEPHEN PEARL (1812-86). An eccentric writer, and the originator of a system of stenographic reporting. He was born in Templeton, Mass., studied for the bar, and became involved in the abolition agitation, for which he undertook a mission to England. While there he learned phonography, and on his return to America devised a popular system of phonographic reporting. To further this he published a series of instruction books and edited two journals, the *Anglo-Saxon* and the *Propagandist*. He was a remarkable linguist, but an erratic scholar and writer. He devised a "scientific" language, "Alwato," in which he was wont to converse and correspond with pupils. At the time of his death he was compiling a dictionary of it, which was published posthumously.

ANDREWS, THOMAS (1813-85). An Irish chemist and physicist, born at Belfast. He studied medicine and the physical sciences at Glasgow, Paris, Edinburgh, and Dublin. After practicing medicine for several years in his native city, he became, in 1845, professor of chemistry at Queen's College, which position he resigned in 1879. Andrews carried out a number of important researches on the heat developed during various chemical transformations and on the nature of ozone. His most important contribution to science, however, was the discovery (1861) of the continuity of the liquid and gaseous states. He was the first to find that for every gas there is a temperature (called the critical temperature) above which the gas cannot be liquefied, no matter how great the pressure exerted upon it. Below that temperature the gas may be partly liquefied, gas and liquid being separated by the surface of the latter. Precisely at the critical temperature, however, the surface of separation disappears, and the substance enters into a homogeneous state, combining the properties both of the liquid and the gaseous states. This continuity of states has led to an attempt to extend to liquids the laws of gases and thus to establish a relationship between the properties of matter in the two states. This attempt, however, has been only partially successful. See CRITICAL POINT; MENDELÉEFF.

ANDREWS, WILLIAM DRAPER (1818-96). An American inventor. He was born at Grafton, Mass. In 1844 he invented the centrifugal pump, which made it possible to save from abandoned wrecks goods not injured by water. This pump, patented here in 1846, was manufactured in England as the Gwynne pump. Afterward he invented and patented an anti-friction centrifugal pump, made various modifications of the centrifugal pumps, of which the "Cataract" was the most important, and patented a widely used system of gangs of tube wells. His pumps were used on the monitors in the Civil War, and employed in the deepening of the Mississippi River. In 1885 the water supply of Brooklyn was increased by the use of the Andrews gang wells.

ANDREWS, WILLIAM WATSON (1810-97). An American clergyman of the Catholic Apostolic church. He was born at Windham, Windham Co., Conn., graduated in 1831 at Yale, and in 1834 was ordained and installed pastor of the Congregational church at Kent, Conn. He early accepted the tenet of the Catholic Apostolic church, commonly spoken of as the "Irvingites," and in 1849, having given up his charge at Kent, he assumed charge of the Catholic Apostolic congregation in Potsdam, N. Y. He subsequently made his home in Wethersfield, Conn., and traveled much in the Eastern and Middle States as evangelist. Among the congregations established under his direction was one organized at Hartford in 1868. He was an eloquent preacher and a clear and forceful writer. He contributed articles on the Catholic Apostolic church to the *Bibliotheca Sacra* and McClintock and Strong's *Cyclopædia*, prepared for the *Life of President Porter* a chapter on Dr. Porter as "A Student at Yale," and published many reviews, orations, sermons, and addresses, and *The Miscellanies and Correspondence of Hon. John Cotton Smith* (1847). Consult Andrews, *William Watson Andrews: A Memorial* (New York, 1900).

ANDRIA, än'drê-à. An episcopal city in Apulia, south Italy, 5 miles from Barletta and 31 miles west of Bari, with both of which it is connected by a street railway (Map: Italy, L 6). The chief trade is in almonds, for which the country is famous, olives, grain, cattle, and majolica. Andria was founded about 1050 and was a favorite residence of Emperor Frederick II in the thirteenth century. Nine miles south of the city he built the imposing Castel del Monte, having several beautiful Gothic windows, and still well preserved. Pop., 1901 (commune), 49,569; 1911, 53,274.

AN'DRIA. The earliest extant comedy of Terence, adapted in 166 B.C. from the *Andria* of Menander. It deals with the experiences, at Athens, of a girl from Andros.

ANDRIEUX, än'drê-ê', FRANÇOIS GUILLAUME JEAN STANISLAS (1759-1833). A French dramatist and idyllic poet, born at Strassburg. He took an active part in the Revolution, was of the Council of the Five Hundred (1798), professor in the Polytechnic School (1803), in the Collège de France (1814), member of the French Academy (1816), and its perpetual secretary (1829), collaborating actively in its *Dictionary*. He also wrote several comedies, of which the best is *Molière avec ses amis* (1804); a tragedy, *Brutus* (1794), and poems distinguished for purity of prosody and diction. Of these, *Le meunier de Sans-Souci* (1797) is still remembered, and was paraphrased by Luise Mühlbach. As a lecturer he was singularly attractive.

ANDRIS'CUS (Gk. 'Ανδρίσκος, *Andriskos*). A fuller of Adramyttium, who pretended to be the son of Perseus, King of Macedonia, and assumed the name Philip. He was seized, sent to Rome, and imprisoned; but escaped, and in 149 B.C. defeated the prætor Juventius in battle. He reigned as a cruel and oppressive tyrant for about a year, but was finally conquered in 148 B.C. by Quintus Cæcilius Metellus and again taken to Rome, where he was put to death.

AN'DROCLUS (Aulus Gellius, v, 14), or **ANDROCLES** (Ælian, vii, 48). The slave of a Roman Consul of the Early Empire, who compelled him to fight with a ferocious lion in the Circus Maximus. The beast, far from hurting

him, fondled him like a playful dog. When the Emperor and the people demanded an explanation of such strange actions, Androclus explained that he had escaped from a cruel master in Africa and had taken refuge in a desert cave. One day, a lion entered the cave limping painfully and holding up his paw, from which Androclus extracted a large thorn. The grateful beast never forgot this, and when they met again in the Circus at Rome he testified his recognition. Both slave and lion were freed and afterward were exhibited in the streets of Rome.

ANDROGYNOUS, ăn-drōj'ī-nūs. See FLOWER; REPRODUCTION.

ANDROMACHE, ăn-drōm'ă-kē (Gk. Ἀνδρομάχη, *Andromachē*). The wife of Hector and mother of Astyanax, daughter of King Eëtion of Asiatic Thebes. Her father and seven brothers were killed by Achilles, and from that time she clung to Hector with a love whose tenderness and pathos are beautifully depicted in Homer's *Iliad*, especially in her parting with her husband (book vi), and her lament over his body (book xxiv). At the capture of Troy her son was dashed from the walls, and she became the prize of Neoptolemus, son of Achilles, to whom she bore a son, Molossus. Afterward she was the wife of Helenus, Hector's brother, to whom she bore Cestrinus. Her danger from the jealousy of Hermione, wife of Neoptolemus, is the subject of a tragedy by Euripides. See HECTOR; TROJAN WAR.

ANDROM'ACHE. A tragedy by Euripides (q.v.), written probably during the Peloponnesian War, as it contains many unfriendly allusions to Sparta. Its subject is the part of the legend of Andromache in which she is with Neoptolemus, her second husband.

ANDROMAQUE, ăn'drō'măk'. 1. A tragedy by Racine (1667), founded on the classical legend. The story is adapted from Racine in Phillips's play *The Distressed Mother* (1712). 2. An opera by Grétry, presented at Paris in 1780.

ANDROM'EDA (Gk. Ἀνδρομέδη, *Andromedē*). Daughter of the Ethiopian King Cepheus and Cassiopeia. Like her mother, she was remarkably beautiful. When Cassiopeia boasted that her daughter was more beautiful than the Nereids, the latter prayed Poseidon to avenge the insult. Accordingly the territory of Cepheus was devastated by a flood, and a sea-monster appeared, whose wrath, the oracle of Ammon (q.v.) declared, could be appeased only by the sacrifice of Andromeda. Andromeda was fastened to a rock near the sea and left as a prey to the monster; but Perseus, returning from his victorious battle with Medusa, saw the beautiful victim, slew the monster, and received Andromeda as his reward. Our versions of this legend seem largely due to a tragedy by Euripides, which ended with a prophecy by Athena that all concerned would be placed among the stars.

ANDROMEDA. A genus of plants of the family Ericaceæ, represented by a single species, *Andromeda polifolia*, wild rosemary. It is a small evergreen shrub with beautiful rose-colored drooping flowers, is occasionally found in peat bogs in different parts of Great Britain, and common throughout the north of Europe and North America. It has acrid narcotic properties, and sheep are sometimes killed by eating it. The shoots of a closely related genus in like manner poison goats in Nepal, and similar effects are ascribed to the stagger-bush (*Lyonia*

mariana or *Neopieris mariana*) and other related species in the United States.

ANDROMEDA. A large constellation of the northern hemisphere situated just south of Cassiopeia and west of Perseus. It contains no stars of the first magnitude, but is noted for its Great Nebula, the brightest of all the nebulae. In August, 1885, the heart of this nebula was the scene of the outburst of a remarkable *nova*, or temporary new star, which, after increasing in brilliancy from the ninth to the seventh magnitude in less than a month, faded rapidly until, in the following March, it was beyond the range of the most powerful telescopes.

AN'DRONI'CUS. The name of three Byzantine emperors.—ANDRONICUS I (c.1110–85) was the son of Isaac Comnenus. His life was full of vicissitudes. During part of his youth he was a prisoner of the Turks in Asia Minor. He afterward spent some time at the court of his cousin, the Emperor Manuel, and a niece of the Emperor became his mistress. He was appointed to a military command in Cilicia; but, although the favorite of the army, his imprudence and waste of time in dissolute pleasures involved him in defeat. Having engaged in a treasonable correspondence with the King of Hungary and the German Emperor, he was thrown into prison by Manuel, and remained there more than 12 years. At last he succeeded in making his escape and reached Kiev, the residence of Prince Yaroslav. He regained the favor of his cousin by persuading the Russian Prince to join in the invasion of Hungary, but incurred his cousin's displeasure again by refusing to take the oath of allegiance to the Prince of Hungary, the intended husband of Manuel's daughter, as presumptive heir to the Empire. He was sent in honorable banishment to Cilicia, but soon fled to Antioch, where he found a new mistress in a sister of the Empress. The resentment of the Emperor breaking out against him, he sought refuge in a pilgrimage to Jerusalem. His professions of zeal caused his former conduct to be forgotten, and he was invested with the lordship of Berytus (now Beirut); but his profligacy became, if possible, more scandalous than ever. He seduced Theodora, the widow of Baldwin, King of Jerusalem, who lived with him for years as his mistress. The Emperor's anger made the Syrian coast unsafe for him, and he fled with Theodora to Damascus, and finally settled down among the Turks in Asia Minor, with a band of outlaws, making frequent inroads into the Roman province of Trebizond, from which he carried away spoil and slaves. Theodora and her children were at last taken and sent to Constantinople, and thither he followed, imploring the forgiveness of the Emperor, which he obtained; but he was sent to Cenoë, in Pontus. After the death of Manuel popular indignation was excited against the Empress, who acted as regent for her son, Alexius II, and Andronicus was recalled, in 1182, to deliver the Empire from her tyranny. He was appointed guardian of the young Emperor, and soon after his colleague in the Empire. He caused the Empress-mother to be strangled, and afterward Alexius himself, whose widow he married. His reign, though short, was vigorous and restored prosperity to the provinces; but tyranny and murder were its characteristics in the capital. He set no bounds to the gratification of his revenge against all who had ever offended him, and his jealousy of possible rivals was equally sanguine.

nary. At last, a destined victim, Isaac Angelus, one of his relatives, having fled to the church of St. Sophia for sanctuary, a crowd gathered, and a sudden insurrection placed Isaac on the throne, while Andronicus was put to death by the infuriated populace, after horrible mutilations and tortures, on Sept. 12, 1185. He was the last of the Comneni that sat on the throne of Constantinople; but the succeeding dukes and emperors of Trebizond were descendants of his son, Manuel. See Diehl, *Figures Byzantines*, vol. ii (Paris, 1909).—ANDRONICUS II (1260–1332), the son of Michael Palæologus, ascended the throne in 1282; but, after a weak and inglorious reign, was driven from it, in 1328, by his grandson.—ANDRONICUS III (c.1296–1341), after a reign equally inglorious, died in 1341. Consult Gibbon, *Decline and Fall of the Roman Empire*, edited by Bury.

ANDRONICUS (Gk. Ἀνδρόνικος, *Andronikos*), also called CYRRHESTES, from his birth-place, Cyrrhus, in Syria. A Greek architect, who erected the so-called Tower of the Winds at Athens, a building 42 feet high and 26 feet in diameter, dating from the first century B.C. This tower was an octagonal structure, made of Pentelic marble and surmounted by a figure of Triton, which moved with the wind and pointed with a staff to the direction from which the wind came. On the eight sides of the tower, near the top, were sculptured in relief symbolical figures representing the eight principal winds, and beneath these, on the sides which caught the sun, were sun-dials. The interior contained a water-clock. It was repaired in later ages and is still standing in excellent preservation. It stands to the north of the Acropolis, in the district which, under the Romans, became the centre of commercial life at Athens. In the Middle Ages this structure was called "The Lantern of Demosthenes." See E. A. Gardner, *Ancient Athens* (New York, 1902).

ANDRONICUS OF RHODES. A Greek peripatetic philosopher, who lived at Rome in Cicero's time and employed himself in arranging, criticising, and explaining the works of Aristotle, which for some time had been neglected; a great number of these works he was probably the means of preserving to us. He gave to the Peripatetic school a new bent, the philological. None of the writings of Andronicus is extant; a work *On the Passions*, attributed to him, is a compilation of the Roman imperial period; a paraphrase of the Nicomachean Ethics is the work of Constantine Palæocappa of the sixteenth century. Consult, in general, Zeller, *Geschichte der griechischen Philosophie* (Leipzig, 1893); Susemihl, *Geschichte der griechischen Litteratur in der Alexandrinerzeit* (Leipzig, 1891–92).

ANDRONICUS, LIVIUS. See LIVIUS ANDRONICUS.

ANDRONICUS, TITUS. The hero of the Shakespearean play *Titus Andronicus*.

ANDROPH'ILUS (Gr. *andro-philos*, a lover of mankind). The personification of philanthropy in Phineas Fletcher's *Purple Island*, published in 1633.

AN'DROPO'GON (called so from the bearded male flowers, from the Gk. ἀνήρ, *anēr*, man + πώγων, *pōgōn*, beard). A cosmopolitan genus of grasses, including about 150 species, the relative merits of which vary widely. Some are highly prized for hay and pasturage, as *Andropogon halepense*, or Johnson grass, which has

been under cultivation in the United States since about 1830. It yields large quantities of hay, and in Southern States may be cut three or four times a year. On account of its habit of growth—it spreads by its rhizomes—when once established it is difficult of eradication. It is somewhat sensitive to cold and will not persist as a perennial except in warm regions. Recent investigations have shown that Johnson grass, if fed green, is sometimes poisonous to stock. The poisonous action is said to be due to a compound yielding hydrocyanic acid which disappears in ripening or drying. Other species of *Andropogon* are believed to possess this same property. A grass resembling Johnson grass but without its spreading root-stocks has been recently introduced into the United States under the name Sudan grass. It is a native of Sudan, but the grass has met with favor as a drought-resistant hay plant. It is believed to be a variety of *Andropogon sorghum* mentioned below. A number of species of *Andropogon* are well known in the semi-arid region of the United States under the name of blue-stem grasses, and in these regions are of value. The principal of these species are: *Andropogon nutans*, *Andropogon provincialis*, and *Andropogon scoparius*. Other species are known in the eastern and southern parts of the United States as broom sedge; of these *Andropogon virginicus* is one of the most widely distributed. If cut early, the broom sedges make good hay; but if left too long, the plant becomes so woody as to be refused by all stock. In some systems of classification the sorghums are grouped under this genus. The specific name *Andropogon sorghum* and its variety, *sativus*, comprise under these classifications the saccharine and non-saccharine forms. Among the latter are durra, Millo maize, kaoliang, Kafir corn, Jerusalem corn, broom corn, etc., some of which are valuable for forage in dry countries. Eight or ten species are considered of economic importance in Australia. Two tropical species are widely known, the lemon grass (*Andropogon schænanthus*) and *Andropogon nardus*, sources of lemon oil and citronella oil, both of which are largely used in making perfumery.

AN'DROS (Gk. Ἄνδρος). One of the islands of the Greek archipelago, the most northerly of the Cyclades, separated from Eubœa by the Doro channel, 6 miles broad (Map: Greece, F 4). The island is 25 miles long, about 9 miles in its greatest breadth, and covers a total area of about 160 square miles. It is traversed by several mountain chains, separated from one another by deep valleys, which yield grain, olives, and other southern fruits and common vegetables. Domestic animals are raised extensively in the northern part, which is inhabited chiefly by Albanians. The chief towns are Gavriion, the best port, Korthion and Andros, the capital. The last mentioned carries on a large trade, is the seat of Greek and Roman Catholic bishops, and has a population (1907) of 8536. The island was originally settled by pirates and subsequently by Ionians. It was successively in the hands of the Athenians, Macedonians, and Romans, and, in 1207, had a prince of its choosing, the Venetian nobleman Marino Dandolo. In 1566 it fell into the hands of the Turks, whose rule, however, was chiefly restricted to the levying of an annual tribute of 30,000 piasters. At present the island forms a part of Greece. Pop., 1907, 18,035. Consult Kopf, *Geschichte der Insel Andros* (Vienna, 1855).

ANDROS, Sir EDMUND (1637-1714). A Colonial Governor in America, the son of an officer in the English royal household. In 1674 he was sent to America as Governor of the Colony of New York, and to him Sir Anthony Colve, the Governor during the temporary Dutch supremacy, surrendered without forcible opposition. His commission gave him jurisdiction over Long Island, Pemaquid, and the region between the Connecticut River and the Delaware River. He was thus brought into embarrassing relations with the proprietary government of East Jersey and also became engaged in controversies with the authorities of Connecticut. After the charters of the New England provinces had been declared forfeited by the English courts, the policy of the English administration in furtherance of a strongly centralized colonial system was illustrated by the steps taken to consolidate the lands of New England into one province, the Dominion of New England, over which, in 1686, Andros was made Governor-General with large powers. He was to admit religious toleration, but could suppress all printing, name and change his council at will, and, with their consent, levy taxes and control the militia. When Connecticut refused to recognize his authority, he appeared in the council chamber at Hartford, in October, 1687, with an armed guard, and demanded the surrender of the colony's charter. There long survived a tradition of the hiding of the charter in an oak tree. The leaders, both in Connecticut and in Rhode Island, deemed it prudent to render perfunctory obedience to the one in forcible control of the political situation. In 1688 New York and New Jersey were attached to New England, and Andros's rule was extended over all territory between the St. Croix and the Delaware. On hearing of the revolution in England, the people of Boston imprisoned Andros and some of his officers, April 18, 1689, and Leisler set up a rebel government in New York. In July Andros and a committee of accusers were ordered to England, but the charges were never pressed to a formal trial. The accession of William III made possible the undoing of the work of Andros. The charters of Connecticut and Rhode Island were recognized as in force. Massachusetts received from the King a new charter, and New Hampshire was organized as a distinct royal province. In 1692 Andros came back as Governor of Virginia, where he was popular, retiring in 1698, and acting as Governor of Guernsey, 1704-06. In 1691 he published an account of his proceedings in New England. Whitmore (ed.), *Andros Tracts; with notes and memoir* (Prince Society Publications, Boston, 1868-74). The character of Andros is not viewed as it once was by Americans. The changed view can be found set forth, though not impartially, in Ferguson, *Essays in American History* (New York, 1894).

AN'DROSCOG'GIN. A river rising in Umbagog Lake, which lies on the State lines of New Hampshire and Maine. It is 157 miles long and flows through both States, emptying into the estuary of the Kennebec above Bath (Map: Maine, B 7). Its value for navigation is small, but as the elevation of its source at Lake Umbagog is over 2000 feet, and as the descent is abrupt at many places, until at Auburn, Me., the elevation is but 210 feet, it affords extensive power to the many industries established on its banks.

ANDRO'TION (Gk. Ἀνδροτίων). A Greek

orator, praised by Demosthenes and Aristotle, contemporary with Demosthenes, and pupil of Isocrates. When he moved that a crown be presented to the Council of Five Hundred at the expiration of their term of office, he was charged with making an illegal proposal; Demosthenes wrote a speech for one of the accusers, which we still have. He went into exile at Megara, and wrote there, it is said, an annalistic account of Athens from the earliest times, called *Atthis*.

ANDROUET DU CERCEAU, äN'drō'ä' du sâr'sö'. A famous family of French architects of the sixteenth and seventeenth centuries, founded by Jacques Androuet (c.1510-84), called du Cerceau from the circle used as the sign over his workshop. Jacques was one of the leaders in introducing the Italian Renaissance style into France through his works, his writings, and his numerous drawings. He is best known by his *Les Plus Excellens Bastimens de France* (1576-79) and other collections of engravings. He was succeeded by his two sons, Baptiste (c.1544-1602) and Jacques II (died 1614), who took part in many of the great constructions of the time in France, such as the Louvre, the Tuileries, the Pont Neuf, St. Denis (chapel), etc. The third generation was represented by Baptiste's son, Jean (c.1600-16), chiefly noted for the private palaces he built in Paris, such as the Sully and Bellegarde mansions.

ANDRYANE, äN'drë'an', ALEXANDRE PHILIPPE (1797-1863). A French soldier noted for his captivity in the fortress of Spielberg. He was born in Paris, and after serving as an artillery officer until 1815, went to Italy and attempted to incite an insurrection against Austria. He was arrested and condemned to death, but his sentence was commuted by the Emperor of Austria to perpetual imprisonment in the fortress of Spielberg, where for eight years he led a life of torture, vividly described in his *Mémoires d'un prisonnier d'état* (Paris, 1837-38; Eng. trans. by Fortunato Prandi, London, 1848). He was pardoned in 1832 and afterward served with the French army in Italy. After the battle of Magenta he was appointed commissary-general by Napoleon III. In addition to the before-mentioned work he published *Souvenirs de Genève, complément des mémoires d'un prisonnier d'état* (1839).

ANDÚJAR, äN-dōō'här. A town of Andalusia, Spain, in the province of Jaen, 24 miles north-northwest of Jaen, on the right bank of the Guadalquivir, at the base of the Sierra Morena (Map: Spain, C 3). It stands on the highroad at the head of a pass over the Sierra Morena. It is a flourishing town, with fine churches, four nunneries, six monasteries, three hospitals, and a theatre. A promenade extends through the town. There is trade in grain, cattle, pottery, and wine. Alcarrazas, porous stone jars for cooling water, are made here. Andújar is frequented for the mineral springs in its neighborhood. Pop., 1900, 16,302; 1910, 16,499.

ANDVARI, äN-dvä'rë. In Norse mythology, the name of the fish-shaped dwarf who owned the ring, on which he cast the curse of ill-obtained gold, fatal to the possessor. This is the keynote of the remarkable stories of Sigurd Fafnisbane and the German legends presented in musical form by Wagner in an elaborate tetralogy, consisting of *Das Rheingold* (the temptation), *Die Walküre* (Fate), *Siegfried* (the hero), and *Die Götterdämmerung* (the 'Twilight of the Gods,' or end of all things).

AN'ECNOTE (Gk. ἀνέκδοτος, *anekdotos*, unpublished, from ἀν, *an*, negat. + ἐκ, *ek*, out + διδόναι, *didonai*, to give). Procopius called his secret history of Justinian's court *Anecdota*. The name is applied also to portions of ancient writings long unpublished, and a number of such *Anecdota* have been collected in volumes and printed. It ordinarily means some isolated fact, usually of a personal nature, calculated to interest a listener. There are a great many books of anecdotes, the most celebrated in English being the *Percy Anecdotes*. See Hood, *World of Anecdote* (4 vols., Philadelphia, 1901).

ANEGADA, ä'nä-gä'dä (or 'Drowned Island'). The most northerly of the Virgin Islands, belonging to Great Britain (Map: Antilles, F 3). It is in lat. 18° 45' N., long. 64° 20' W., is 12 miles long, and very narrow. The famous Horseshoe Reef surrounds it, and the surf breaks over a great part of the island during a rough sea. The raising of goats and sheep and the production of salt is the occupation of the small number of inhabitants. It is believed that there are mineral deposits, but they have never been exploited.

ANEL, DOMINIQUE (c.1679–c.1730). A French surgeon. He invented a syringe for treatment of *fistula lachrymalis*, but is especially known for his new method of operating for aneurism by ligature of the artery above the swelling, the method later perfected by Hunter. His writings include: *L'art de sucer les playes sans se servir de la bouche d'un homme* (1707); *Nouvelle méthode de guérir les fistules lacrymales* (1713); *Traité de la goutte* (1713).

ANEL'IDA AND AR'CITE. A poem by Chaucer, called also *Queen Anelida and False Arcite*. Anelida is an Armenian queen; Arcite a knight of Thebes. The work is unfinished, but was printed by Caxton. Parts of it have been recognized as taken from Statius's *Thebaid* and Boccaccio's *Teseide*. Chaucer himself acknowledged obligation to Statius and Corinna, a Greek poetess of the fifth century B.C. There is a modern version by Elizabeth Barrett Browning.

ANEM'OGRAPH (Gk. άνεμος, *anemos*, wind + γράφειν, *graphcin*, to write, record). When a wind vane actuates mechanisms connected thereto so as to write a record of its changes of position upon a sheet of paper moved at a uniform rate by clockwork, the apparatus is called an anemograph. In some cases the travel of the wind in miles or feet is also recorded upon the same sheet of paper by an anemometer, but the combined instrument is still called an anemograph. Some instruments record all the shifting positions of the vane and the continuous motion of the anemometer; others show, once each minute, only the instantaneous position of the vane to the nearest one of the eight points of the compass, the travel of the wind being recorded only by whole miles. An instrument of this type is extensively used by the United States Weather Bureau, and since a material amount of rain does not occur simultaneously with sunshine, both these elements also are recorded by one and the same additional pen on the same sheet of paper with the wind. The instrument then becomes a *meteorograph*, but it is popularly called a "triple register" because it comprises three principal recording parts.

AN'EMOM'ETER (Gk. άνεμος, *anemos*, wind + μέτρον, *metron*, measure). An instrument to measure the motion, velocity, or pressure of the

wind by some of the effects it produces. The origin of such instruments is remote and obscure, but Hooke's pendulum anemometer, in which the pressure of the wind is indicated by the deflection of a suspended plate, is mentioned as early as 1667. Anemometers indicating the travel of the wind by the rotation of a wheel or arrangement of vanes began to be used about 1724. The cup anemometer, used at the present time in the United States, England, and elsewhere, was designed by Robinson in 1846 after suggestions by Edgeworth. In very recent times devices for measuring air currents by the electrical energy required to keep a wire heated to a constant temperature when exposed to the wind to be measured, have been suggested by Barus and successfully employed by Thomas in the United States and Morris in England. Many details of the history of anemometers are given by Abbe in his *Metcorological Apparatus and Methods* (Report, Chief Signal Officer, 1887, Washington). Numerous forms and varieties have been worked out, but they may all be grouped in four classes according to the particular effect utilized.

1. Pressure of the wind producing deflection or movement of plates, cylinders, spheres, etc., including bridled anemometers.

2. Pressure and suction of the wind causing difference of level in liquid columns.

3. Pressure of the wind causing rotation of vanes or cups.

4. The cooling of electrically heated wire.

The earliest forms belong in class (1), and the model revived in 1861 by Prof. H. Wild is now used in Switzerland and Russia. In this instrument a plane square tablet is suspended vertically from a horizontal axis which is kept by a wind vane always at right angles to the direction of the wind; the tablet is raised by the wind to an inclined position of temporary rest, and its angular inclination to the vertical is noted on a graduated arc. Cylinders and spheres which do not require to be pointed to the wind have been sometimes used instead of the plate.

Pressure and suction anemometers in their best forms are the same in principle and action as the so-called Pitot tube, employed about 1760 by the engineer of that name, for measuring the flow of water in pipes and channels, and frequently used for the same purpose at the present day. The instrument consists essentially of a column of liquid in a U-tube, one branch of which communicates with a thin-walled, clean-cut tube presented squarely to the wind. The wind thus causes an increase of pressure within this branch, while the other branch is usually connected with an aperture in the side of a smooth tube so disposed that the air flows in undisturbed stream lines directly across the opening. Therefore the pressure of the air within the latter tube is the static pressure of the air in motion. This is the only form of anemometer whose mathematical equation can be written at once from what is known of its theory, viz.,

$$v^2 = \frac{2gh}{d}$$

where h is the dynamic pressure as shown by the height of the liquid column, d is the density of the air, and g is the force of gravity.

The Dines pressure-tube recording anemometer, now extensively used in England, is a practical

adaptation of the Pitot tube to produce continuous records and is especially appropriate to the registration of gusts and the continual fluctuation of the wind's force.

Rotation anemometers are those in which the wind sets in motion plane or curved metallic blades. The earliest form resembled that of Dinglinger, mentioned by Leupold in 1724, in that it used the Polish water-wheel with vertical axis, but differed essentially in that Dinglinger prevented the rotation of the arms and measured the pressure required to keep them quiet, whereas d'Ons-en-Bray, in 1734, allowed them to rotate continuously. Since that time two essentially different varieties of the rotation anemometer have been developed, namely, (a) those of Schrober and Woltmann, Combes, Casella, Whewell, or Biram, in all which sets of plane plates inclined to an axis are forced to revolve about it by the wind blowing in the direction of the axis. The name "air meter" is frequently given to anemometers of this form, which are much used in studies on ventilation of mines and buildings. The most important meteorological application of this style is that manufactured by Richard for use at the French observ-

ROBINSON ANEMOMETER.

ing stations. (b) The Robinson anemometer, brought out by Dr. Robinson in 1846, but suggested to him by Edgeworth many years before. This has come into very general use by English and American meteorological observers as the Robinson hemispherical cup anemometer. In this instrument a vertical spindle carries at its upper end four horizontal arms at right angles to each other; each arm carries at its extremity a hollow hemispherical cup of thin sheet metal whose circular rim is in a vertical plane passing through the common vertical axis of rotation of the spindle. The wind rotates these cups so that the convex side of each cup goes forward. Numerous experiments have been made to determine the relation between the velocity of the wind and that of the cups. The instrument makers have generally followed Dr. Robinson's conclusion, that the linear motion of the centre of the cup is one-third of that of the wind; we now know that this is true only for anemometers of certain dimensions, i.e., 4-inch cups on arms 6.72 inches long, and for velocities ranging from about 5 to 15 miles per hour.

The cup anemometer has been experimentally tested on whirling machines and otherwise, at St. Petersburg, at the Deutsche Seewarte in Hamburg, by Dines in England, and by Marvin in the United States. Chree has recently developed a mathematical theory of the instrument that includes a term for the moment of inertia of the revolving system, Marvin's investigations having shown that such a term is necessary. From all these sources of information it is learned that in perfectly uniform winds the general average ratio between the velocity of the wind and that of the cups varies with

the length of the arm and the size of the cups between 2.5 and 3.5, so that it is necessary to determine the ratio by actual experiment upon each respective type of anemometer.

Anemometers with heavy cups, i.e., with a large moment of inertia, when exposed to winds of rapidly changing velocity, will run faster than the same instrument if the moment of inertia of the cups is small. This is because a sudden increase in the wind acts strongly on the concave faces of the cups and quickly increases the velocity of rotation, whether the cups are light or heavy; however, when a sudden lull occurs, their inertia keeps a set of heavy cups in relatively rapid motion for a considerable time, thus falsifying the wind motion, whereas a set of light cups quickly slow down to the proper rate. The standard aluminum cups used by the United States Weather Bureau have a moment of inertia of about 59,000 gr. cm^2 , and extended comparisons show that in the ordinary gusty winds such as occur day by day, the error of indication due to the moment of inertia effect is probably less than 1 per cent of the wind movement.

A new series of investigations by the Weather Bureau are now (1913) in progress, for the purpose of securing tests at velocities up to and beyond 100 miles per hour. At 80 miles per hour the wind velocity is 2.4 times the velocity of the cup centres.

Observations on strong winds on the summit of Mount Washington indicate that the factors used to compute velocities from the anemometer at sea level apply also to that high elevation, so that there is no evidence that the Robinson anemometer is appreciably influenced by changes in the density of the air, notwithstanding that the wind pressures for a given velocity are smaller in proportion to the density.

Hot-wire Anemometer. The hot-wire anemometer is one of the latest forms of anemometer and has been most fully investigated by Prof. J. T. Morris. The apparatus is briefly described by the author as follows: "In its final form the anemometer consists essentially of a small Wheatstone's bridge having two arms of manganin and the other two of platinum. The former material has a negligible temperature coefficient, whilst that of platinum is considerable. The bridge is constructed so that all cold it is out of balance and the current is increased until the temperature rise of the platinum increases the resistance sufficiently to bring the bridge into balance in still air, an operation which gives the zero of the scale. If now the instrument is placed in a current of air, the wires will be cooled—an operation which does not affect the manganin wires, but lowers the resistance of the platinum pair; and to restore the balance the current through the arms of the bridge must be increased. This current is therefore a measure of the velocity of flow." (*Engineering*, vol. 942, p. 892, London, Dec. 27, 1912).

From tests of the anemometer in a wind tunnel Morris found that between small velocities and 40 miles an hour, the velocity of the wind could be represented by an equation of the following form,

$$V = bw^2 - a,$$

where w is the number of watts required to maintain the wire at a constant temperature, and a and b are constants.

ANEMONE, ETC.

1. THE ARETHUSA (*Arethusa bulbosa*).
2. WIND FLOWER (*Anemone nemerosa*).
3. MOORWORT (*Andromeda Polifolia*).

4. BETEL NUT (*Areca Catechu*).
5. FLAMINGO FLOWER (*Anthurium Andraeanum*).
6. POPPY ANEMONE (*Anemone coronaria*).

ANEMONE, *Lat.* ān'ē-mō'nē; *Engl.* ā-nēm'ō-nē (Gk. ἀνεμώνη, the wind-flower, from ἄνεμος, *anemos*, wind), or WIND-FLOWER. (See PASQUE FLOWER.) A genus of plants of about 85 species belonging to the family Ranunculaceæ, and distributed throughout the temperate and subarctic regions of both hemispheres. They are perennial herbs with lobed to dissected basal leaves, those of the stem forming an involucre, petaloid sepals, no petals, and numerous achenes. (See ACHENE.) The name is said to be derived from the fact that many of the species prefer very exposed situations. Most of them flower early in the spring. One species, *Anemone quinquefolia*, the wood anemone, is a common native of all parts of Great Britain and eastern North America, and its white flowers, externally tinged with purple, are an ornament of many a woodland scene and mountain pasture in April and May. Another species, *Anemone pulsatilla*, or *Pulsatilla vulgaris*, the Pasque flower, adorns chalky pastures in some parts of England at the same season. Its flowers are purple and externally silky. *Pulsatilla patens* is called the American Pasque flower and resembles the European species. The garden anemone is a favorite florist's flower; the varieties are very numerous, and whole works have been published on them and their cultivation, which is most extensively carried on in Holland and has prevailed from a very early period. It is generally supposed that all these varieties have originated from two species, which are natives of the Levant. By cultivation the size of the flower is increased, its form and colors are modified, and many of the stamens are often changed into small petals forming a doubled flower. The cultivation of the anemone requires great attention, the plant preferring light soil. The root, which consists of clustered tubers, is taken up after flowering. The plant is propagated by parting the roots or by seed. In the latter way new varieties are obtained. Seedling plants do not flower till the second or third year. Besides the species which have been named, others occasionally appear as ornaments of our flower gardens. The species of this genus are characterized by the acidity prevalent in the family to which they belong, the rhizomes of *Anemone nemorosa* and others having been recommended in cases of obstinate rheumatism and in tania. See Plate ANEMONE, ETC.

ANEMONE, SEA. See SEA-ANEMONE.

AN'EMOPH'ILOUS PLANTS (Gk. ἄνεμος, *anemos*, wind + φίλος, *philos*, loving, friend). Plants whose flowers receive pollen by means of wind, in contrast with entomophilous plants, whose agents of pollination are insects. See POLLINATION.

ANEM'OSCOPE (Gk. ἄνεμος, *anemos*, wind + σκοπεῖν, *skopein*, to look at, consider). A wind vane or other instrument which shows the direction of the wind. In its simplest and usual form it is an arrow balanced nicely on an upright rod and free to revolve. The arrow may be attached to a spindle connected with an index or compass scale, which may be either at the bottom of the vertical spindle or at any convenient distance. In the wind vane used by the United States Weather Bureau the arrow head consists of a weighted pointer or rod secured to and balancing a tail piece composed of two thin boards about 6 inches wide and 36 inches long, fastened together near the axis but spreading apart about 5 inches at the outermost

extremity for the purpose of steadying the oscillations of the vane. The axis revolves in ball bearings and actuates an arrangement of cams and electric contact springs for automatic registration of wind direction.

The wind vane should be set up in a free and open space at a sufficient height above surrounding buildings or other obstacles to enable it to indicate the true local wind. Other forms of construction and the mechanical explanation of their action are given in Abbe's *Meteorological Apparatus and Methods* (Washington, 1887), and in United States Weather Bureau *Instructions to Observers*. See ANEMOGRAPH.

A'NER. One of the three chiefs making a covenant with Abraham in Hebron (Gen. xiv. 13, 24). Like Mamre and Eschol, this eponym hero probably owes his name to that of a locality. A hill near Hebron still bears the name Ne'r. There was also a city in Manasseh named Aner (1 Chron. vi. 70).

ANERIO, ā-nā'rē-ō, FELICE (1560-1614). An Italian composer, a pupil of Mario Nanini. In 1594 he succeeded Palestrina as composer of the Papal Chapel. Ten books of his composition were published in 1585-1622, but many unpublished manuscripts remain in the archives of the Papal Chapel. He was highly esteemed among the composers of the Italian Renaissance.

AN'EROID (containing no liquid, from Gk. ἀ, *a*, priv. + νηρός, *nēros*, liquid + εἶδος, *eidōs*, form). A barometer first made in serviceable form by M. Vidi of Paris, in 1848, in which the pressure of the air is measured by the change of form an exhausted metallic box undergoes by the influence of the atmospheric pressure.

FIG. 1. ANEROID BAROMETER.

Construction. In the diagram, Fig. 2, AA, is a circular metal box which has been highly exhausted of air and then hermetically sealed. The thin metallic faces are corrugated in concentric rings, so as to increase their flexibility and thus permit considerable motion to and fro under changes of pressure. One face of the box is fixed to the back of the brass case which contains the whole. When the box is exhausted its flexible sides collapse and touch each other, but in use this condition is prevented by the action of a stiff spring, S, which pulls the faces apart a certain distance to a position of equilibrium wherein the pressure of the air upon the

flexible sides of the box is just balanced mostly by the strong pull of the spring, but partly also by the feeble reaction of the sides of the box.

These faces being neither perfectly flexible nor yet perfectly elastic, their reaction is a disturbing influence that explains the errors of "creep" to which all aneroids are subject in a greater or lesser degree.

An increase in the pressure of the air increases the load upon the spring, *S*, and deflects it proportionately. This small motion is slightly magnified by the arm *EG*, securely fixed to the spring *S*, and transmitted through the link, *GH*, to the bent lever, *HKL*, moving in fixed pivots at *K*. From the end, *L*, of the long arm of the bent lever the motion, now further magnified, is transmitted to a little drum, *M*, by means of a very fine chain wound partly around the drum, which is mounted on the axis of the pointer,

PP, of the instrument. A small hairspring, not shown in the cut, on the axis of the pointer serves to take up all looseness in the several joints of the levers and also winds up the little chain, *O*, on the drum when a fall in pressure occurs. The best aneroids now sold are constructed upon this plan, and the box and springs are highly sensitive to changes of air pressure.

Temperature Compensation. Under a given pressure the steel spring, *S*, will deflect more when warm than cold. To compensate for this disturbing effect of temperature a piece of steel is soldered or brazed to the brass arm, *EG* (as at *T*, Fig. 2). By filing this piece of steel thinner or shorter it is possible almost completely to eliminate the disturbing effects of moderate changes in temperature, and the aneroid is then said to be "compensated," and this word is engraved upon the dial.

Graduation. The scale of the aneroid barometer generally represents inches or millimeters of air pressure as shown by the mercurial barometer, but a second scale showing elevations above sea level is often added. The altitude scale is best engraved in a fixed invariable relation to the pressure scale, but it is often placed on a ring that can be adjusted to various relations to the pressure scale. This pattern offers no real advantage and is likely to cause large errors when the instrument is in the hands of one not versed in its use.

The pressure scale is generally one of equal parts; then the parts of the altitude scale become smaller and smaller with increasing altitude. Aneroids of high grade are now often made with altitude scales of equal parts and carry a vernier to permit of very fine readings. The supposed accuracy thus obtained is illusory and imaginary.

Determination of heights. The mathematical relation between atmospheric pressure and altitude (see HYPSONOMETRY) is very complex and cannot be represented with sufficient accuracy for most purposes by a rigid scale of graduations. Suppose one reads the altitude scale of

an aneroid day after day at the same place. He will find a variation of elevation of 200 or 300 feet in a few days and even greater variations over longer intervals of time. A single reading, therefore, is a poor approximation to the elevation.

The proper way to determine an elevation barometrically is to ascertain by simultaneous readings the *difference* in air pressure at the station in question and at least one other station whose elevation is known. The *mean* temperature of the column of air between the stations and its moisture content must also be determined or estimated as accurately as possible. These data, by the use of a suitable hypsometric table, give the difference in elevation between the known and the unknown station. When simultaneous barometer readings at two stations cannot be made, the approximate sea level pressure can often be found or interpolated from daily weather maps, if such are available for the region in question. Although the aneroid is very convenient, very sensitive, and unaffected by variations in gravity, yet its instrumental error changes irregularly in a few weeks or months, sometimes in a few days, especially if exposed to rapid and large changes in pressure, as in mountain climbing, balloon ascensions, etc.

FIG. 2.

DETAIL OF ANEROID.

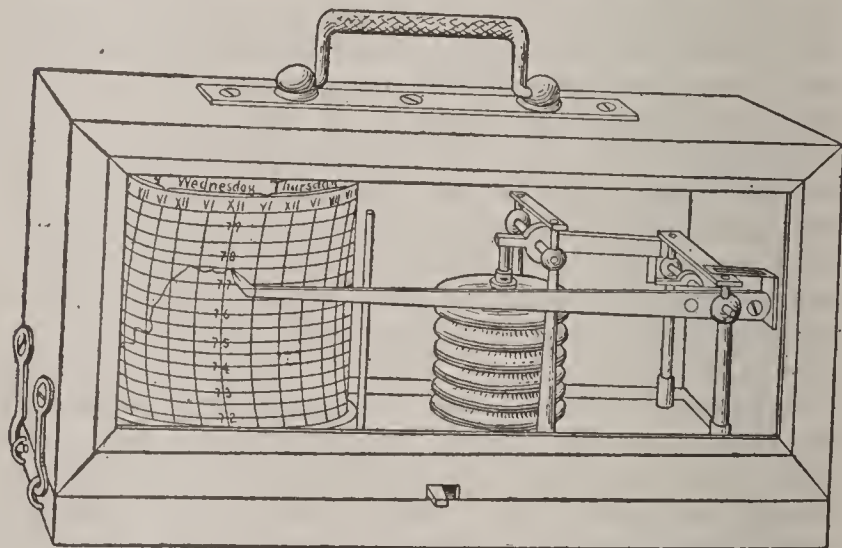

FIG. 3. BAROGRAPH, OR RECORDING ANEROID.

The Bourdon aneroid consists essentially of a portion of a thin hollow ring of elliptical cross-section, such as is used in many forms of steam and other pressure gauges. The ring is exhausted of air and then hermetically sealed, and is therefore a vacuum chamber. Changes of pressure alter the curvature of this ring, whose changes of shape are shown on a magnified scale by a delicate pointer.

The aneroid barometer is also easily arranged to be self-registering, and is then known as a barograph.

Bibliography. For fuller details of the construction and use of the aneroid, consult Abbe's *Treatise on Meteorological Instruments* (Washington, 1887), and the works referred to therein, or any of the larger treatises on experimental physics. See BAROMETER.

AN'EURIN. A Welsh poet, who probably lived c.603. According to the received account, he was the son of Caw ab Geraint, the chief of the Otadini; while others have identified him with Gildas, the historian, and Mr. Stephens, the translator of his poem, makes him Gildas's son. He was present at the battle of Cattrath as bard and taken prisoner. After his release he returned to Llancarvan and later in life lived at Galloway. He is said to have perished at

the hands of Eidyn ab Einygan. His epic poem *Gododin*, which in its present form contains over 900 lines, and is preserved in a manuscript of the thirteenth century, tells of the defeat of the Britons by the Saxons at Catteraeth; but the obscurity of the language has made it impossible to gain from it a clear account of the defeat, and it has even been maintained that the subject of the poem is the massacre of the Britons at Stonehenge (472). Stephens connects the event with the battle of Dagstan (603). The *Gododin* was published with an English version and notes in 1852, by Rev. J. Williams ab Ithel, and the text appears with a translation in F. Skene's *Four Ancient Books of Wales* (1866). The Cymmrodorian Society published in 1855 a new edition, with translation by Thomas Stephens. Aneurin is the reputed author of one other poem. Consult Maclean, *The Literature of the Celts* (Glasgow, 1906). See WELSH LANGUAGE AND LITERATURE.

AN'EURISM. A pulsating tumor, consisting of the dilated wall of an artery, or having direct communication with an artery. Arterial walls are composed of three coats, any or all of which may be involved in aneurismal formation. When the whole wall is evenly dilated, a fusiform aneurism is created. A saccular aneurism is one in which the inner and middle coats have given way at one point, making a sac or pouch, limited by the outer coat only. A dissecting aneurism occurs when the inner and part of the middle coat give way, and the blood is forced between the various layers. Cirroid aneurism occurs when several communicating arterial trunks are dilated. Sometimes a direct communication is found between an artery and a vein, in which case the latter, being exposed to unusual pressure, is apt to become distended and tortuous. Such a condition is called aneurismal varix. A false aneurism is one in which there is rupture of the entire wall of an artery and the blood comes into direct contact with the surrounding tissues. The pathological condition underlying most aneurisms is a weakening of the arterial walls from disease. Arteriosclerosis, favored by age, the excessive use of alcohol, prolonged mental strain, and syphilis are the usual factors. Immediate or exciting causes are sudden strains, injuries, violent exercise, and emotional excitement. Aneurisms prove fatal by pressure on some important part or by rupture. They are cured, sometimes spontaneously, by a deposit, within the sac, of fibrin from the blood—a result the surgeon can promote in various ways. Prolonged pressure on the trunk of the vessel was a favorite method with the older surgeons. The artery may be tied on each side of the sac close to it (method of Antyllus); on the side nearest the heart at some distance from the aneurism (method of Anel); on the distal side near the sac (method of Brasdor); or the first distal branch may be tied off (method of Wardrop). *Aneurismorrhaphy*, introduced by Matas in 1889, consists in laying open the sac and tying off all vessels leading to it without attempting to preserve the parent artery. In saccular aneurisms, however, where only one opening exists between the sac and the artery, this opening may be closed and the empty sac folded down and sutured. This is known as *endo-aneurismorrhaphy*, as is the following procedure. The blood is diverted by means of a rubber tube temporarily inserted into the walls of the vessel, on each side of the

sac. The latter is then obliterated and the wall of the artery repaired. The rubber tube is then removed and the blood allowed to flow through the natural channel. Endo-aneurismorrhaphy is now practiced in many cases where extirpation would formerly have been done, and constitutes a great advance in this branch of surgery, since it preserves the blood supply of the part and prevents many complications which are incident to a sudden cutting off of the circulation. Aneurisms inaccessible to surgical attack are sometimes treated by inserting needles into the tumor; or by inserting and coiling fine silver or gold wire within the sac, to promote clotting. Sometimes an electric current is passed through the coiled wire. Internal aneurism requires prolonged rest and the administration of remedies that quiet the heart's action.

ANFOSSI, àn-fòs'sê, PASQUALE (1729-97). An Italian composer. He was born at Naples, was a pupil of Sacchini and Piccini, and wrote *Il finto medico* (presented in 1764) as his first operatic composition. He was appointed chapelmaster at Venice in 1775 and directed the opera at London from 1781 to 1783. Subsequently he was choirmaster in the church of St. John Lateran, Rome. Of his numerous operas, which are marked rather by skillful arrangement than by much originality, the best known were *L'avarò*, *Il curioso indiscreto*, and *I viaggiatori felici*. His sacred compositions are considered less important.

ANGARA, àn-gä'rá. A river in Siberia, the most important affluent of the Yenisei on its right (Map: Asia, J 3). Properly speaking, there are two rivers by that name: the Upper Angara, rising among the ridges of the Olekma and Vitim Mountains, lat. 57° N. and long. 114° 56' E., and emptying into the northern end of Lake Baikal; and the Lower Angara, an outlet of the lake, whence it issues as a stream of clear, transparent water, flowing by the city of Irkutsk toward the north, then to the west, for a distance of about 1300 miles. The river is about 9000 feet wide at its broadest part and 1600 feet at its narrowest. It is of sufficient depth for navigation as far as Irkutsk, but has numerous rapids in the middle of its course. Steamers do not ascend farther than its junction with the Ilim. Obstructions in the channel have been removed and the most dangerous rapids have been circumvented so that navigation has been greatly improved. Into the Angara fall numerous considerable tributaries—the largest of which are Irkut, Kitai, Bielaya, Oka, and Tasserva on the left, and Kunda, Yanda, Ilim, and Tchadobetz on the right. It was discovered by the Cossack traders early in the seventeenth century; in 1645 Kolenikoff ascended it as far as the lake of Baikal. The Lower Angara is also called Upper Tunguska.

AN'GEL. An antiquated English gold coin, varying in value from \$1.60 to \$2.50. It was so called from the figure upon its obverse of the Archangel Michael piercing the dragon. Angels were coined from Edward IV to Charles I.

ANGEL (Gk. ἄγγελος, *angelos*, messenger). The English word denotes a superhuman being intermediate between God and man. But the original meaning was simply that of a "messenger," either human or superhuman. It is doubtful whether the word was used at all in pre-exilic times as a designation of a being greater than man. In Gen. vi. 2, the term "sons of God" was rendered "angels" by the Greek ver-

sion; in earlier days they were no doubt regarded as divine beings. The "angel of Yahwe" is thought by many scholars to be a manifestation of this deity, and it was probably so understood in antiquity; but the "angel" is likely to have been brought into the text as a substitute for Yahwe himself, appearing in the original form of the narrative. In Jacob's vision the "angels" seem also to have been originally "gods" or "sons of gods." As long as Yahwe manifested himself in human shape, he had no need of a messenger. There were beside him "gods many and lords many" with their habitat in the sky or on the earth, in trees and fountains and stones, by the hearth and in the tomb; but they were not messengers. The gods formed a heavenly council. In the story of the Garden of Eden the divine being who speaks declares: "Man has become like one of us." Possibly the title "Yahwe of hosts" refers to armies of such spirits. But they were simply called *Elohim*, or *Bene Elohim*, "sons of gods," not "angels."

It was the growth of monotheism that forced reflection upon the character of these superhuman beings. The second Isaiah looked upon the gods of the nations as mere lifeless statues. This view could not gain permanent ascendancy. It was too superficial. Only the subordination of all spirits to Yahwe was essential. The gods of the peoples ceased to be independent rulers and became Yahwe's servants, henceforth to do his bidding in connection with the natural forces and elements with which they had been previously associated, or as guardians of the nations they had once governed.

In Daniel the celestial princes of Persia and Greece are mentioned, and already in Deut. xxxii. 8, 9, the original text is supposed to have expressed the idea that when the gods divided between themselves the nations Israel fell on Yahwe's lot. The sons of the gods have become angels in the prologue to Job. An increasing emphasis on the divine transcendence caused a reluctance to ascribe to him certain activities. He no longer reveals himself directly, but through an angel, to his prophets; he does not fight his people's battles, but his chief angel stands up for Israel; he no longer tempts to evil or inflicts it himself, but allows an angel, the Satan, to do this. Angels receive individual names, Michael, Gabriel, Raphael, Uriel. Under the influence of Persian thought, the conception of seven archangels is introduced, corresponding to the seven *amesha spentas*, and these angels are spoken of as "watchers." The idea that the angels were created is found in the Book of Enoch and the Book of Jubilees. The fall of the angels is not taught expressly in the Hebrew Bible, though there are hints of conflicts in heaven, and God is said to find wickedness in his angels; the idea is fully developed in the Book of Enoch.

Jesus in his discourses mentions angels, and, indeed, represents each human being as having a celestial patron (Matt. xviii. 10), pictures the angels as rejoicing over the repentance of sinners (Luke xv. 10), and states that those who are permitted to share in the resurrection will be like angels, having no conjugal relations (Matt. xxii. 30). The evangelists expected his return upon the clouds of heaven as the Messiah accompanied by his holy angels. In the Apocalypse angels figure prominently. They also occur frequently in Paul's writings. Angels are said to be created (Col. i. 16), and should not be

worshiped (Col. ii. 18). Instead of the earlier conception that God himself had written the decalogue and given the law to Israel, the angels were conceived of as the agencies through which the law was given (Gal. iii. 19). The prevalent interpretation of Gen. vi. 1, as referring to intercourse between angels and women, is supposed by many scholars to be the cause of the commandment to women not to wear veils (1 Cor. xi. 10). The angels are powerful beings, "thrones" and "principalities," and men should not turn away from Christ to these "elementary spirits of the world" (Gal. iv. 3).

In the Christian Church the belief in angels has continued until the present time, though gradually losing its intensity through the accession of martyrs and saints to the class of intermediaries between God and man, and in more recent times through the spread of rationalistic tendencies of thought. An excellent summary of our present knowledge of Jewish angelology is found in Dr. K. Kohler's article on this subject in *The Jewish Encyclopædia*; the relations to Babylonian thought are well treated in R. Stübe's *Jüdisch-Babylonische Zaubertexte* (Halle, 1895), and the relations to Mazdaism in Nathan Söderblom's *La vie future dans le Mazdeisme* (Paris, 1901). The names of angels in the Book of Enoch have been discussed by N. Schmidt in *Old Testament and Semitic Studies, in Memory of W. R. Harper* (1908), and Barton in *Journal of Biblical Literature* (1912). A large number found in Jewish and Mandæan lore have been discussed by Montgomery, *Aramaic Incantation Texts from Nippur* (1913).

The creation of the angels was placed, by the Platonizing Church Fathers, before that of the material world; others assigned to it some one of the six days. Equally various were the opinions as to the nature of the angels. The second Council of Nicæa (787) assigned them a subtle, ethereal, or fire-like body; the scholastics, on the other hand, and the Fourth Lateran Council (1215) maintained their immateriality; while others, owing to the appearing of angels, mentioned in Scripture, attributed to them the power of assuming momentarily the corporeal form.

Some of the patristic writers also spoke of good and bad guardian angels, the former of whom were always ready to prompt to good actions and to avert evil, while the latter were equally quick in bringing about mischief, wickedness, and calamity. From the belief in the guardianship of angels, and their participation in the government of the world, arose naturally the practice of invoking and worshiping them. Ambrose said: "We should pray to the angels who are given to us as guardians" (*De Viduis*, ix). Many Christian teachers condemned it, appealing to Col. ii. 18; and the Council of Laodicea, in the fourth century, called it disguised idolatry. But after the Second Council of Nicæa had conceded that, though angels were not to receive divine worship, they might receive reverential obeisance, the practice mentioned became more and more rooted, and continues in the Greek and Roman Catholic churches to this day.

ANGEL, BENJAMIN FRANKLIN (1815-94). An American diplomat, born at Burlington, N. Y. He studied law and was admitted to the bar and served as surrogate in 1834-41 and 1844-47. He was sent as United States Consul to Honolulu in 1853. The same year he was special commissioner to China for the settlement of differences

between the Chinese government and American merchants with regard to the levying of export duties. He was Minister to Sweden and Norway in 1857-62; a delegate to the Chicago Democratic convention in 1864; and in 1873-74 president of the New York State Agricultural Society.

AN'GELA MERICI, mâ-rê'chè, SAINT (1470-1540). Founder of the Roman Catholic order of Ursulines (q.v.). She was born at Desenzano, on Lake Garda, was of the Franciscan tertiaries when she founded in Brescia the order in 1535, and died there, Jan. 27, 1540. Consult her life by Sintzel (Regensburg, 1842) and by J. A. At (Notre Dame d'Alet, 1885).

AN'GEL FISH (alluding to its large, wing-like fins), or ANGEL SHARK, or MONK FISH. An elasmobranch (*Squatina angelus* or *squatina*), very closely related to the shark, with a broad and flattened body and with the much enlarged pectoral fins expanded laterally like wings. It attains a size of three to four feet, and is harmless, being sluggish and feeding on crabs and shells, which it crushes with its small, nail-like teeth. It is found in tropical seas, is common in the Mediterranean, and also occurs upon both the eastern and western shores of the warmer parts of North America, keeping near the bottom and being nowhere numerous. It is also known to American fishermen as "monk fish."

Another angel fish in the United States is one of the porgies (*Chatodipterus faber*). See PORGY.

In Bermuda the name is applied to chatodonts of the genus *Holacanthus*, and especially to the widely distributed emperor fish (*Holacanthus ciliaris*). Goode says that it attains a weight of four pounds and "far surpasses all the other fishes of the region in the delicious flavor and in its lovely hues." A second species is the black angel fish (*Holacanthus tricolor*), which, like the other, is common throughout West Indian waters. See CORAL FISH, and Plate of CORAL FISHES.

ANGELI, än'gë-lî, HEINRICH VON (1840—). A historical, genre, and portrait painter. He was born at Odenburg, Hungary, studied in the Vienna Academy and with Leutze at Düsseldorf, where he painted the famous picture, "Mary Stuart at the Reading of the Death Warrant" (1857). In 1859 he went to Munich and in 1862 he removed to Vienna, where he soon won recognition as a painter of portraits, particularly those of royalty. Some of the best of his portraits are those of the Crown Prince Frederick William (1874); General von Manteuffel (1879) and Andreas Achenbach (National Gallery, Berlin); Field-Marshal von Moltke (Museum of Breslau, 1884); "Queen Victoria Enthroned" (1885); "Emperor William II in the Uniform of a General" (1888), and Empress Maria Fedorovna of Russia. His portraits are characterized by a certain elegance of bearing and by picturesque arrangement.

ANGEL'ICA (Lat., angelic, i.e., plant or herb, in allusion to its medicinal qualities). A genus of plants of about 40 species belonging to the family Umbelliferæ. The species are tall perennial herbs, natives of the northern hemisphere and New Zealand. Wild angelica (*Angelica sylvestris*) is a common plant in moist meadows, by the sides of brooks, and in woods throughout many parts of Europe and Asia. The root is perennial, short, ringed, and branched; it is white within, and contains a yellow, milky juice.

Garden angelica (*Archangelica officinalis*) is a biennial plant, becoming perennial when not allowed to ripen its seeds. It has greenish flowers in almost spherical umbels. The stem is as high as a man. The fruit is long and straw-colored. The root is long and fusiform, an inch or more in thickness, with thick, irregular rugose rootlets. The whole plant, and especially the root, is aromatic and bitter, containing much resin and essential oil. The root has been admitted into the pharmacopœias as an aromatic stimulant and tonic, and occasionally used in nervous ailments, indigestion, flatulence. The root of *Angelica sylvestris* is sometimes substituted for it, but is much weaker. The garden angelica was at one time much cultivated for the blanched stalks, which were used as celery now is; but its cultivation for this purpose has been almost entirely discontinued. The tender stalks and midribs of the leaves, candied, are still, however, a well-known article of confectionery and an agreeable stomachic; the roots and seeds are employed in the preparation of gin and of "bitters." The plant is a very doubtful native of Great Britain, but is common in many parts of Europe and even in Lapland and Iceland. The Laplanders not only use it as food, but regard the stalks roasted in hot ashes as an efficacious remedy in pectoral disorders. The powdered seeds of the wild angelica are used by the country people in some parts of Europe to kill lice. About 20 species of *Angelica* are natives of North America, *Angelica villosa* and *Angelica atropurpurea* being the best known in the eastern United States. They are perhaps without any important economic value.

ANGEL'ICA. 1. In Boiardo's *Orlando Innamorato* and Ariosto's *Orlando Furioso*, a beautiful and faithless Oriental princess, the mischief-maker who beguiles Orlando. She is noted for her magic ring, which had the power of making its wearer invisible. 2. In Congreve's *Love for Love*, an attractive heiress. 3. A character in Farquhar's *The Constant Couple* and *Sir Harry Wildair*.

ANGELICA TREE. See ARALIA.

ANGEL'IC DOCTOR, THE (Lat. *Doctor Angelicus*). Thomas Aquinas, so called by his admirers; known also as "The Angel of the Schools."

ANGELIC HYMN. Another name for the *Gloria in Excelsis* (q.v.).

ANGELICO, FRA (1387-1455). A Florentine religious painter, the last and greatest of the transition from the Middle Age to the Renaissance in Italy. His original name was Guido da Vecchio, and he assumed the name of Giovanni (John) on entering the convent of Fiesole, whence he is often called Fra Giovanni da Fiesole, or, incorrectly, Fiesole. Angelico refers to the character of the good friar, who was afterward beatified. He was born in 1387 at Vecchio, in the fertile Mugello district, a Florentine possession in Tuscany, and entered the reformed Dominican convent at Fiesole in 1407. The head of this house, the pious and able St. Antoninus, probably had a great influence in forming the young brother's character. As the Order adhered to Gregory XII in the papal schism, the brethren were exiled to Foligno and Cortona in 1409 and did not return to Fiesole until 1418. Angelico's master in painting is unknown, but from the character of his work it is evident he began as a miniaturist. His

style shows Sienese affinities, and he may have been influenced by Lorenzo Monaco. Paintings of his earliest period survive at Cortona: "Madonna and Four Saints" with predella of "Life of St. Dominick," in San Domenico, and a beautiful "Annunciation" with predella of "Life of the Virgin," in the Oratorio dell Gesù. Soon after the return to Fiesole he must have painted four small reliquary panels, the most celebrated of which, the "Madonna of the Star" (see illustration), was recently stolen from San Marco, but speedily recovered (1912). Of a not much later date is the remarkable predella, now in the National Gallery, London, "Christ in Glory Surrounded by Saints and Angels"—266 figures in all. To the Fiesolan period belong also the "Coronation of the Virgin" in the Florence Academy, and the larger and finer example of the same subject in the Louvre; also the impressive "Last Judgment" with its delightful representation of Paradise, in the Florentine Academy. Another version of the same subject, perhaps of a later date, is in the Berlin Gallery. In 1431 Angelico signed the contract for the "Madonna of the Linen Weavers," Uffizi, the chief glory of which is the 12 surrounding angels making music—the best known of all his figures. The works of his early period are Gothic in character and decoration, but from about 1430 Renaissance elements appear.

In 1436 the Dominicans of Fiesole moved to the convent of San Marco in Florence, which the munificence of Cosimo de' Medici converted into a house of their order. Michelozzo was the architect, and his architectural forms greatly impressed Angelico and often appear in his work. He was also influenced by the frescoes of Masaccio, in the Brancacci Chapel, as may be seen by his improved rendition of the nude and of movement. For the high altar of the convent church he painted his well-known "Madonna di San Marco," now in the Florentine Academy, and from about the same time dates the "Deposition" said to contain the portrait of Michelozzo. His many beautiful frescoes at San Marco were the cause of its conversion into a national museum. The cloisters contain, among others, "St. Dominick at the Foot of the Cross" and "Christ as a Pilgrim"; the chapter house, a much larger fresco of the "Crucifixion," and in the cells above are 43 frescoes, painted from about 1438 to 1455. Among the most beautiful of these are the "Noli mi Tangere," "Adoration of the Kings," the "Transfiguration," and the "Virgin Enthroned."

In 1455 Fra Angelico was summoned to Rome by Pope Eugenius IV to fresco the Chapel of the Sacrament in the Vatican, which has unfortunately been destroyed. In the summer of 1447, assisted by his pupil Benozzo Gozzoli, he decorated part of the ceiling of the Chapel of San Brizio in the cathedral of Orvieto with the subjects, "Christ in Judgment," surrounded by angels, and "The Prophets." The following winter he probably began the frescoes of the Chapel of Pope Nicholas V, in the Vatican, with eight scenes from the lives of Sts. Stephen and Lawrence. These are his greatest works and show his art at its zenith; for in them he has achieved the perfect freedom of the Renaissance. In 1449 he was prior of his old convent at Fiesole, where we still find him in 1452. He died in the house of his Order at Rome, and his famous grave slab still rests in their church, Santa Maria sopra Minerva.

The traditional view of Fra Angelico as a man of infinite goodness, sincere piety, and sacramental earnestness in his work has proved the correct one. He was par excellence the religious painter of the Renaissance, and his work was really seraphic. His effects are attained by the wonderful expression of the faces and the beauty of color and arrangement. Although his early paintings are deficient in technique, his progress was constant. He gradually mastered the nude, movement, and perspective, and in his last works, the Roman frescoes, he ranks as one of the foremost painters of the Renaissance. In some respects he was even an innovator, being one of the first to paint the Christ Child as a real infant, and the very first to paint a landscape that can be identified, and to communicate a sense of the pleasantness of nature.

Bibliography. The best biographies of Fra Angelico are the delightful and interesting booklet by Supino (Florence, 1898; Eng. trans., Florence, 1902), and the scholarly effort of Langton Douglas (London, 1901). Other treatises are by Cartier (Paris, 1857; new ed., 1902), Förster (Regensburg, 1859), Goodwin (London, 1861), Phillimore (London, 1881), Ley (London, 1886), Beissel (Freiburg, 1895; 2d. ed., 1905), Tumiatì (Florence, 1897), Crawford (London, 1900), Williamson (London, 1901), Niewbarn (Leyden, 1901), Broussole (Paris, 1902), Rothes (Strassburg, 1902), Sortais (Lille, 1905), Cochin (Paris, 1906), Newnes (London, 1906).

ANGELIC SALUTATION. See AVE MARIA.

AN'GELI'NA. 1. In *The Rival Ladies*, by Dryden, a sister of Don Rhodorigo. 2. In Goldsmith's ballad of "Edwin and Angelina" in *The Vicar of Wakefield*, the heroine. 3. A pseudonym used by Harriet Martineau.

ANGELIQUE, àn'zhâ'lêk'. 1. In Molière's *Le malade imaginaire*, the daughter of the "invalid" Argan. 2. In Molière's *Georges Dandin*, the aristocratic wife of the rich peasant who is the principal character.

ANGELL, ân'jêl, GEORGE THORNDIKE (1823–1909). An American philanthropist. He was born at Southbridge, Mass., and was educated at Brown University, Dartmouth College, and Harvard Law School. After his admission to the bar, in 1851, he practiced in Boston for many years. In 1868, with several other influential persons, he founded the Massachusetts Society for the Prevention of Cruelty to Animals, of which association he was later elected president. In the same year he established the publication entitled *Our Dumb Animals*, the first periodical of its kind. During a visit to England in 1869 he urged the Royal Society to publish the *Animal World* and induced the Baroness Burdett-Coutts to organize the Ladies' Humane Educational Committee of England; and he was instrumental in the formation of many similar societies throughout the United States. In 1882 a movement for the establishment of "Bands of Mercy," with the promotion of kindness to animals as their object, was initiated by him. After 26 years 72,000 of these societies were in active existence. In 1889 he was empowered by the Massachusetts Legislature to incorporate the American Humane Education Society. Mr. Angell has also been instrumental in establishing several public health associations and in promoting the movement directed against the sale of poisonous and adulterated foods. Many

FRA ANGELICO

MADONNA OF THE STAR, IN THE CONVENT OF SAN MARCO, FLORENCE

of his publications have been translated into foreign languages. One of them is the entertaining volume entitled *Autobiographical Sketches and Personal Recollections* (Boston, 1891).

ANGELL, JAMES BURRILL, LL.D. (1829–1916). An American educator and diplomat. He was born in Scituate, R. I., graduated at Brown University in 1849, and after travel in the South and in Europe became, in 1853, professor of modern languages and literature in Brown University. He was the editor of the *Providence Daily Journal* from 1860 to 1866, when he was appointed to the presidency of the University of Vermont. In 1871 he became president of the University of Michigan, which under his continued administration came to be one of the foremost universities in the country. He was United States Minister to China from 1880 to 1881, at the same time acting as one of three commissioners to negotiate a new treaty with that government. Dr. Angell was a member of the Anglo-American International Commission on Canadian Fisheries in 1887, and in 1896 he was chairman of the Canadian-American commission on a deep waterway from the great lakes to the sea. He was appointed Minister to Turkey in 1897, but resigned in May, 1898. In 1887 he became a regent of the Smithsonian Institution. In 1909 he was made president emeritus of the University of Michigan. Besides numerous addresses and frequent contributions to magazines, President Angell published *Progress in International Law* (1875), the article on "The Diplomacy of the United States," for the *Narrative and Critical History of America* (1888); *Reminiscences* (1912); *Selected Addresses* (1912).

ANGELL, JAMES ROWLAND (1869—). An American psychologist. He was born in Burlington, Vt., the son of James Burrill Angell (q.v.), and graduated from the University of Michigan in 1890. Post-graduate studies he took at Michigan, Harvard, Berlin, and Halle universities, and in Paris, Vienna, and Leipzig. In 1893 he was instructor in philosophy at the University of Minnesota, a position which he left in the following year to begin a long service in the University of Chicago—becoming assistant professor of psychology and director of the psychological laboratory (1894), associate professor of psychology (1901), and professor and head of the department (1905). In 1908 he was appointed senior dean of the University of Chicago, and in 1911 dean of the University faculties. He became a member of several learned societies, and in 1906 had tendered to him the presidency of the American Psychological Association. His writings include *Psychology* (3d ed., 1907); *Chapters from Modern Psychology* (1911).

ANGELL, JOSEPH KINNICUT (1794–1857). An American lawyer. He was born in Providence, R. I., and graduated at Brown University in 1813. He published a *Treatise on the Law Concerning the Liability and Rights of Common Carriers* (2d ed., 1845); a *Treatise on the Common Law in Relation to Water Courses*, with an appendix (5th ed., 1850); *A Practical Summary of the Law of Assignments* (1835); a *Treatise on the Law of Fire and Life Insurance* (1854); with Chief Justice Samuel Ames, a *Treatise on the Law of Private Corporations* (4th ed., 1858), etc. He also edited the *United States Law Intelligencer and Review* (1829–31).

Consult S. S. Rider, "Bibliographical Memoirs of Three Rhode Island Authors," in *Rhode Island Historical Tracts*, 11 (Providence, 1880).

ANGELL, NORMAN. See LANE, RALPH NORMAN ANGELL.

AN'GELO. 1. In Shakespeare's *Measure for Measure*, the duke's hypocritical deputy. The Duke frustrates his evil designs, compelling him to give up Isabella and marry Mariana, whom he has deserted. 2. A character in Shakespeare's *Comedy of Errors*.

ANGELO, MICHAEL. See MICHELANGELO.

ANGELO, TYRAN DE PADOUE. A drama in prose by Victor Hugo, produced by the Comédie Française, April 28, 1835. It was produced later in London (translated by G. H. Davidson) as *Angelo and the Actress of Padua*. The period of the action is the sixteenth century.

ANGEL OF THE CHURCH. The term applied in Revelation to each of the recipients of the Saviour's messages to the Seven Churches of Asia. It is perhaps best to understand it as meaning the presiding officer of the Church, who would naturally be the one to whom a message would be sent, and who may fairly be considered representative of the churches (cf. Rev. i. 20). See CHURCHES OF ASIA, THE SEVEN.

AN'GELUS, THE. A well-known painting by J. F. Millet (1859). It represents two French peasants stopped in their field work for a moment of prayer at dusk by the Angelus bell, which the artist has suggested by the church spire in the distance. It was sold by the artist for a small sum, but in 1889 was bought by the American Art Association for more than 580,000 francs and exhibited in this country. The next year M. Chauehard bought it for \$150,000; it is understood that it will ultimately find a place in the Louvre.

ANGELUS BELL, THE. A bell rung in all Catholic countries morning, noon, and night to invite the faithful to the recitation of the angelic salutation. Formerly the hours for the ringing of the Angelus were at sunrise, noon, and sunset, but it is now more generally heard at the appointed hours of noon and six o'clock both morning and evening. The bell receives its name from the title given the prayer recited at this time, *Angelus Domini*, also called *Ave Maria*.

ANGELUS DOM'INI (Lat., The Angel of the Lord). The name of a brief prayer repeated by Roman Catholics at the sound of the Angelus bell, at sunrise, noon, and sunset.

ANGELUS SILESIUS, sî-lē'shī-ūs, JOHANN SCHEFFLER (1624–77). A German religious poet. He was born in Breslau, studied medicine at Strassburg, Leyden, and Padua, and in 1653 entered the Catholic Church. In 1661 he joined the Minorites and was ordained priest. His earlier writings include a number of pronouncedly mystical poems, such as the *Cherubinischer Wandersmann* (1657), a profound and pantheistic description of the way to God. Subsequently he became a fanatical controversialist. He wrote some stirring hymns, of which some found their way even into Protestant hymnals. There is an edition of his works, by Rosenthal (2 vols., 1862). Consult also: Schrader, *Angelus Silesius und seine Mystik* (1853); A. Kahlert, *Angelus Silesius: Eine litterarhistorische Untersuchung* (1853); the biography by C. Seltmann (Breslau, 1876); Wilhelm Bölsche, "Ueber den Wert der Mystik unserer Zeit," in the new edition of *Cherubinischer Wandersmann* (Jena, 1905).

ANGELY, ä'n'zh'lé', LOUIS (c.1788–1835).

A German actor and dramatist. He was born in Berlin and began his career as an actor early in life. He was at first a comedian at the German theatre at St. Petersburg and in 1828 went to Berlin, where for two years he was a rather mediocre actor and afterward skillfully adapted French plays to German conditions. Among his best productions are: *Paris in Pommern*, *Die Hasen in der Hasenheide*, *Wohnungen zu vermieten*, *Sieben Mädchen in Uniform* (very successful), *Von Sieben die Hässlichste*, and *Das Fest der Handwerker*, which is still played. His plays were collected and published under the titles of *Vaudevilles und Lustspiele* (4 vols., Berlin, 1828-42), and *Neuestes komisches Theater* (3 vols., Hamburg, 1836-41).

AN'GER (Icel. *angr*, grief, straits; OHG. *angust*; Ger. *Angst*, anxiety; Lat. *angor*, a choking, strangling, anguish, from the root *ang*, seen in Lat. *angustus*, narrow, close; Gk. *ἄγχι*, *anchi*, near; Ger. *eng*, narrow, close; AS. *ange*, *onge*, narrow, strait, troubled). An emotion (q.v.) characterized by a peculiar, aggressive attitude toward its object (usually a person) and by the large number of expressive bodily movements which accompany it. Wundt has attempted a detailed analysis of the emotion. Anger, he finds, belongs to the group of emotions that always refer to some external object. Its various forms differ from one another in three ways. 1. They differ qualitatively, i.e., in the relative amounts of their component feelings. For example, irritation contains a fusion of unpleasantness and excitement, while rage contains unpleasantness and depression. Furthermore, there is a greater amount of unpleasantness in irritation than in rage, so that the former emotion is more subjective—there is a greater consciousness of self. Since, therefore, all forms of anger are objective, and since some forms are further characterized by the dominance of subjective feelings, we may distinguish two classes of anger, the subjective-objective, in which the subjective feelings are most prominent, and the objective-subjective class in which the feelings which refer to the object are so strong that we are scarcely aware of self. 2. They also differ in intensity. Some forms, as rage, are strong; some, as chagrin, are weak; other forms are variable. These two differences, viz., quality and intensity, determine the general character of the emotion. The subjective-objective forms arranged in the order of increasing intensity are: chagrin, irritation, exasperation. The objective-subjective forms arranged in the same order of intensity are: offense, anger, rage. 3. Finally, the various kinds of anger may differ in their modes of occurrence. This difference is determined by the rapidity of the succession of the component feelings. For example, rage may be sudden, it may arise gradually, or it may be intermittent.

The most common bodily accompaniments of anger are vaso-motor disturbances (most easily seen in flushing and pallor), glandular secretion (such as tears and saliva), modifications of respiration, and involuntary movements. Other more or less specific bodily signs are screaming, crying, threatening articulations, trembling, stamping, facial contortions, scratching, striking. The coarser bodily expressions of anger are more moderate in the adult and the cultured than in the child and the primitive man. The efforts of society to secure justice and well-being for the individual destroy many of the sanctions

for anger and also control its manifestations. Doubtless the value of anger in the history of the race has been great. It has prevented the encroachments upon the individual which tend toward extermination. Consult W. Wundt, *Grundzüge der physiologischen Psychologie* (Leipzig, 1911).

ANG'ERBO'DA. In Norse mythology, a giantess, mother of Fenrir.

ANGERMANELF, *ōng'ēr-mān-ēlf'*. A river in Sweden, rising on its western boundary (Map: Sweden, G 5). After passing numerous lakes, it enters the Gulf of Bothnia by a large estuary, north of Hernösand. It is about 150 miles long, navigable for small craft for 75 miles, and celebrated for the beautiful scenery of its banks.

ANGERMANLAND, *-lānt'*. A former division of Sweden, now chiefly comprised in the län of Vesternorrland. It extends along the Gulf of Bothnia and is watered by the Angermann River. The district exhibits great variety of wild and beautiful landscape—wood, mount, stream, and lake. It is under a high state of cultivation, produces barley, rye, and peas, and abounds in excellent pasture-land. The inhabitants are known for their sobriety, industrious habits, and general prosperity. The chief town and port, Hernösand, had a population of 9350 in 1910. It stands on the small island of Hernö, near the mouth of the Angermann River, and has weekly steam communication with Stockholm.

ANGERMÜNDE, *äng'ēr-mūn'de*. A garrison town and railway junction on Lake Münde, capital of a circle of the same name in the province of Brandenburg, Prussia, 45 miles northeast of Berlin by rail (Map: Prussia, E 2). It has iron foundries and manufactures woolen and linen goods. Its principal public building is St. Mary's Church, a lofty Gothic structure of the fourteenth century. Pop., 1895, 7334; 1905, 7589; 1910, 8200.

AN'GERO'NA. An early Roman divinity in some way connected with silence and always represented with her finger on her lips or with the mouth bound with a fillet or gagged. Her festival, the Angeronalia, or Divalia, which was celebrated on the 21st of December, would seem to indicate some relationship with the winter solstice. Later she took on the nature of a goddess of sorrow and disease. See Fowler, *Roman Festivals* (New York, 1899).

ANGERONALIA. See ANGERONA.

ANGERS, *än'zhâ'* (the ancient *Andes*, capital of a Gallic tribe, known under the Lat. form *Andecavi*). Formerly the capital of the duchy of Anjou, and now of the French department of Maine-et-Loire, situated on both sides of the navigable river Mayenne, not far from the junction of the Sarthe with it, about 5 miles from its confluence with the Loire and 190 miles southwest of Paris (Map: France, N., E 5). Old Angers, 'the Black City,' is fast disappearing, and a new, bright town taking its place. The cathedral of St. Maurice is one of the oldest surviving structures and is a fine specimen of thirteenth-century Gothic. The castle of Philip Augustus still stands, with its round towers. Angers is the see of a bishop. It has several colleges, a university with faculties of law, mathematics, science, and philosophy, a school of art, a theological seminary, an institution for the deaf and dumb, a botanical garden, a large picture gallery, several museums and theatres, a public library, and several old churches. The ruins of the ancient castle of

Angers, built by St. Louis about the middle of the thirteenth century, are situated on a projecting rock above the river. Sail-making, cotton-spinning, stocking-weaving, the manufacture of umbrellas and parasols, etc., are carried on to a considerable extent, and there is a trade in corn, wine, brandy, flax, hemp, honey, etc. There are important slate quarries in the neighborhood. Angers is the birthplace of René of Anjou, the learned Ménage, the publicist, J. Bodin, and the sculptor David, whose statue was unveiled in the Place de Lorraine, Oct. 24, 1880. Pop., 1901, 82,398; 1911, 83,786. Consult A. Debidour, *La Fronde angevine; la vie municipale au XVII^e siècle* (Paris, 1877).

ANGERS, AUGUSTE REAL (1838—). A Canadian lawyer and statesman. He was born in Quebec, educated at Nicolle College, and admitted to the bar in 1860. He soon attained considerable success in legal practice and in 1874 was elected as a Conservative to the Legislative Assembly, taking office in the De Boucherville ministry successively as Solicitor-General and Attorney-General. In 1879 he was elected to the Dominion House of Commons, but in 1880 was appointed a judge of the Superior Court of Quebec, an office which he held for seven years. During 1887-92 he was Lieutenant-Governor of Quebec province, and in 1891 caused much political excitement and criticism by his dismissal of Honoré Mercier, Premier of the province. In December, 1892, he was appointed to the Dominion Senate, when he became a member of the Conservative ministry of Sir John Thompson. He was also a member, successively, of the brief ministries of Sir Mackenzie Bowell and Sir Charles Tupper. Upon the defeat of the Tupper ministry in 1896 he retired to private life.

AN'GEVIN LINE, or **DY'NASTY**. The English kings from Henry II to John, since their family, the Plantagenets, came from Anjou in France.

ANGHIERA, än-gyâ'râ, or **ANGHERA**, äng-ä'râ, PIETRO MARTIRE DE. See PETER MARTYR.

AN'GILBERT, *Fr. pron.* än'zhêl'bâr', SAINT (c.740-814). A friend and privy councilor of Charlemagne, the most distinguished poet of his age, who in 790 became Abbot of Centula (the present St. Riquier). In 800 he was present in Rome at the coronation of the Emperor. He was a member of the so-called Academy at the court of Charles, in which he bore the honorary name of Homer. By Bertha, the daughter of Charlemagne, he was father of two sons, Harnid, and Nithard, the historian. His poems, edited by E. Dümmler, are to be found in the *Monumenta Germaniæ Historica*.

ANGI'NA PEC'TORIS (Lat. tightening of the chest or heart), or **STENOCARDIA**. It is characterized by intense pain, a sense of constriction, and a feeling of impending dissolution, which occur in paroxysms beginning over the region of the heart, or deep in the chest, and extending toward the left shoulder. The attacks are apt to appear in succession, and ultimately they kill the patient. Attacks occurring in persons showing evidence of arterio-sclerosis are called *true angina*; those occurring in individuals lacking such evidences are termed *false angina*. As to the true pathological basis of angina pectoris we are still uncertain. It is a symptom, not a disease, and is an incident in the progress of circulatory disorders. Changes in the heart, aorta, and arteries, varying from extensive valv-

ular disease to a mild arterio-sclerosis, have been described. These changes are, however, not constant, and are also found in cases which die with no symptoms of angina. There is usually disease of the coronary or heart arteries, of the nature of an arterio-sclerosis or thickening of the walls. This may be especially marked at the origin of the vessels, and diminishes their lumen. Various theories have been advanced as to the true nature of angina. It has been considered as a neuralgia of the cardiac nerves, as a spasm of the heart muscle, as due to extreme dilatation of the heart, and as a temporary anæmia of the heart muscle due to disease or spasm of the vessels supplying it with blood. Angina pectoris is an affection of adult life, occurring most frequently between the ages of 40 and 50. The paroxysms may be induced by any excess in diet, by exertion, as walking uphill or against a strong wind, or by mental emotions. It is therefore advisable for those who have had an attack of angina to lead a quiet, regular life, avoid excesses of all kinds, and particularly refrain from mental excitement. During an attack the physician usually administers morphine, nitrite of amyl, nitro-glycerin, or chloroform.

ANGIOLIERI, än'jô-lyä'rê, CECCO (c.1250-c.1312). An Italian humorous poet of Dante's time, born at Siena. He sang of his quarrels with his father, his misadventures in love, and the poverty under which he suffered. His verse is original in form. No fewer than three sonnets are devoted to Dante, who, it is inferred, charged him with being a parasite, for in the last of these sonnets Cecco hurls the epithet back at him with a vigor which must have severed their relations once for all. Cecco himself figures in one of the tales of the *Decameron* (ix, 4). Consult Gaspari, *Italian Literature*, Oelsner's translation (London, 1901): D'Ancona, *Studj di Critica e Storia letteraria* (Bologna, 1880).

ANGIOLI'NA. The young wife of the Doge of Venice, Marino Faliero, in Byron's work of that name.

AN'GIO'MA. See TUMOR.

ANGIOSPERMS, än'ji-ô-spêrmz (Gk. ἀγγείον, *angeion*, vessel + σπέρμα, *sperma*, seed). A name applied to the greatest group of seed-plants, Spermatophytes, as distinguished from the other group, Gymnosperms, in which the "seeds are naked." The Angiosperms are estimated to comprise approximately 140,000 species, and they form the most conspicuous part of the vegetation of the earth. Since the Gymnosperms comprise only about 450 living species, it is evident that the Angiosperms are the chief modern representatives of seed-plants. Angiosperms may be said to be the most advanced, the most recent, the most conspicuous, and the most useful of plants. It is among Angiosperms also that the true flowers are developed, with elaborate relations with insects for securing pollination. The group is often called "true flowering plants," because it is characterized by the ordinary conspicuous flower. The two great divisions of Angiosperms are the Dicotyledons and Monocotyledons. The Dicotyledons are characterized by the lateral cotyledons, the organization of the woody bundles of the stem into a hollow cylinder, the open venation (often called "net-veined"), and the five- or four-parted flowers. To this group belong such forms as the common trees (poplars, oaks, elms, etc.), buttercups, roses, peas, umbellifers, heaths, mints, composites, etc. It was once supposed

that the Monocotyledons are the primitive Angiosperms, but more recent investigations, particularly in vascular anatomy, have shown that the Monocotyledons are an offshoot from the Dicotyledons. The latter group, therefore, is the main stock of Angiosperms, including not only the most primitive Angiosperms, but also the most advanced. The Monocotyledons are characterized by the single terminal seed leaf (cotyledon) of the embryo, the scattered woody bundles of the stem, the closed venation (often called "parallel veined"), and the three-parted flowers. To the group belong such forms as the common pondweeds, grasses, palms, aroids, lilies and orchids.

Angiosperms are of every possible variety of habit, from minute floating forms to gigantic trees. The roots, stems, and leaves are more elaborately and variously organized for work than those of any other plant group, and the whole structure of the body is the most complex found in the plant kingdom.

It is among the Angiosperms that "stamens" and "carpels" become definite and distinctly developed. The stamen of the Angiosperm corresponds to a spore-bearing leaf of the fern-plants, but shows no resemblance to an ordinary leaf in form. The region devoted to producing the spores is called the "anther." In observing the development of an anther it is found that four sporangia usually appear, and that as these approach maturity they fuse in pairs, resulting in the appearance of two pollen-sacs, each of which has been derived from two sporangia. Occasionally in Angiosperms the four original sporangia of the stamen remain distinct.

The carpels of Angiosperms give name to the group inclosing the ovules that become seeds, the name "angiosperms" meaning, as has been said, 'seeds in a case.' In this regard they differ decidedly from any carpels which exist among the Gymnosperms, in which group they are flat and

A mature embryo sac (*e*), showing the three antipodal cells (*a*), the two polar nuclei fusing to form the endosperm nucleus (*p*), the two synergids (*s*), the egg (*o*), and the pollen tube entering to discharge its sperm cells. The two integuments (*i*) of the ovule are also shown.

open, exposing the ovules, and giving rise to the name, which means 'seeds naked.'

In order to understand the following statement of the technical characters of angiosperms, it will be necessary to read the articles ALTERNATION OF GENERATIONS, and HETEROSPORY.

In its germination the pollen grain (*microspore*) produces within itself usually three cells, which represent a very much reduced male plant. One of these cells later develops the pollen tube, which penetrates to the egg, while the other two cells are the sperms. The embryo sac within

An embryo sac (*e*), showing the young embryo (*w*), endosperm cells (*z*), and the three disorganizing antipodal cells (*a*).

the ovule, which represents a single unshed spore, produces within itself a group of cells, usually seven in number, which represent a reduced female plant. In the end of the sac toward the micropyle (the opening left by integument) the single egg is situated, and associated with it are two other cells called *synergids* (helpers). This group of three cells is called the egg apparatus. At the opposite end of the sac is a group of sterile cells, usually three in number, called the antipodal cells. More centrally placed in the sac is the seventh cell, that has been formed by the fusing of two cells, and, after the fertilization of the egg, is to develop the endosperm (nutritive tissue of the seed). This cell is called the "definitive nucleus" or "primary endosperm nucleus." Before fertilization, the pollen grain containing the male plant is transferred by the wind or by insects to the stigma (receptive region of the pistil), the process of transfer being called pollination (q.v.). After pollination the pollen tube is developed, which penetrates the pistil and finally reaches the ovule, carrying in its tip the two male cells or sperms. The tip of the tube then enters the micropyle, crowds its way to the egg, and discharges its contents. One sperm passes to the egg and fuses with it, this act being called fertilization. The other sperm fuses with the endosperm nucleus, which therefore becomes a triple fusion nucleus. The occurrence of two fusions with the male cells in the embryo sac has been called "double fertilization," but it is very doubtful whether the fusion of the male cell with the endosperm nucleus is to be regarded as true fertilization. In any event, it does not result in an embryo (a young sporophyte), but in a nutritive tissue (endosperm). Consult Coulter and Chamberlain, *Morphology of Angiosperms* (New York, 1903), and Coulter, Barnes, and Cowles, *Text-book of Botany* (New York, 1910).

ANGLAISE, ä'n'gläz'. An English country dance (*contredanse*), in 2-4, 3-4, or 3-8 time.

ANGLERS AND BATFISH

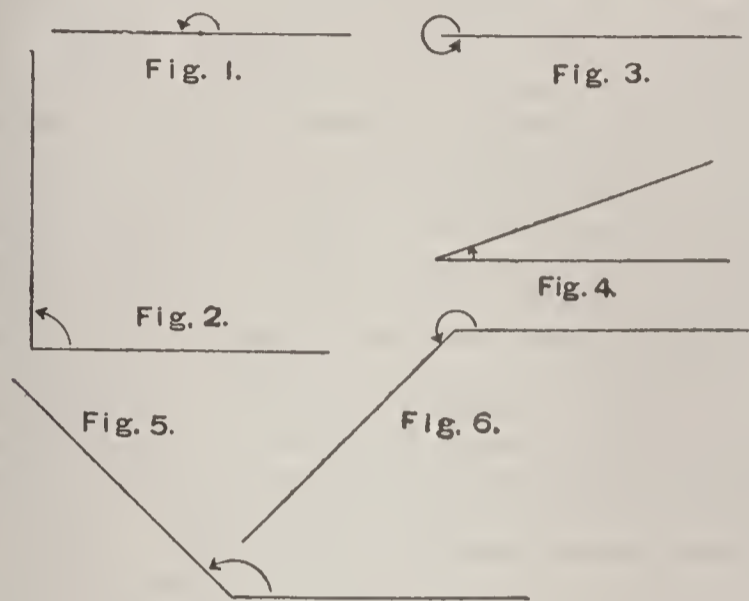

1. ANGLER OR GOOSE FISH (*Lophius piscatorius*).
2. DEEP-SEA ANGLER (*Caulophryne jordani*).

3. DEEP-SEA ANGLER (*Cryptosurus coquesii*).
4. BATFISH (*Ogcocephalus vespertilio*).

It is gay, and probably originated in the older form of the French *rigaudon*. See RIGADOON.

AN'GLE (Lat. *angulus*, a corner, Gk. *ἄγκυλος*, *ankylos*, bent). One of the common geometric concepts. If two lines meet, they are said to form an angle, the lines being called the arms, sides, or legs, and the point of meeting the vertex of the angle. The size of the angle is determined by the amount of turning necessary to carry a moving radius from one arm to the other, and hence is independent of the length of the arms.

If the arms of an angle are in the same straight line on opposite sides of the vertex, a

straight angle (Fig. 1) is formed; half of a straight angle is called a right angle (Fig. 2); two straight angles equal a perigon or angle of 360° (Fig. 3). Angles are also conceived exceeding 360° ; thus an angle of 720° is described when a screw is turned twice around. An angle between 0° and 90° is said to be acute (Fig. 4); one between 90° and 180° , obtuse (Fig. 5); one between 180° and 360° , reflex (Fig. 6). Angles are considered as positive if generated by a radius moving counter-clockwise, and negative if the radius moves clockwise. If the arms are straight, the angle is said to be *rectilinear*; if curved, *curvilinear*; if arcs of great circles on a sphere, *spherical*. Curvilinear angles have the same measure as the rectilinear angles formed by tangents to the curves at the vertex. If two planes meet, they are said to form a *dihedral* (Gk. two-seated) angle; this has the same measure as the rectilinear angle formed by two lines in the planes that are perpendicular to the line of intersection of the planes. If three or more planes meet in one point, they are said to form a *solid* angle, the measure of which is the ratio of the intercepted surface to the entire surface of any sphere having the vertex of the angle as its centre. A solid angle is *trihedral*, *tetrahedral*, etc., according as it is formed by 3, 4, etc., planes. For the various attempts made to define the simple concept angle, consult Schotten, *Inhalt und Methode des planimetrischen Unterrichts* (Leipzig, 1893).

ANGLE, FACIAL. See ANTHROPOMETRY.

ANGLE I'RON. See ROLLING MILLS, for a description of this and other steel shapes.

ANGLE OF EL'EVA'TION, ANGLE OF DEPARTURE, and other terms in Gunnery. See BALISTICS; GUNNERY.

AN'GLER (the name alludes to its seeming to "angle" for its prey; see below). A singularly ugly and voracious marine fish (*Lophius piscatorius*), also known as goose-fish, monk-

fish, all-mouth, and fishing-frog. It is of the order Pediculati, chiefly characterized by the greatly elongated carpal bones, which form a kind of arm supporting the pectoral fins. The angler is a large fish, 3 to 5 feet in length, having the large, flattened head with its wide mouth and projecting lower jaw, and the anterior part of the body, greatly out of proportion to the posterior tapering part. The three anterior spines have become widely separated from the dorsal fin, and shifted forward onto the head, where the most anterior is much elongated, barbel-like, and fleshy at the tip. It is by the brilliant color of this and other worm-like appendages about the mouth that the fish is said to attract smaller fishes and thus make them easy prey. The name "goose-fish" refers to the popular belief that it will seize geese and other swimming birds. As many as seven wild ducks have been taken from the stomach of a single fish. It is a very hardy fish and does not suffer from being out of the water as readily as most fishes. It occurs on the European shores, and on the American coast from Nova Scotia to the Barbados. Some deep-sea fishes of a closely related family (*Antennariidæ*) are sometimes included under the same name and apparently have similar habits. See FROG-FISH, and Plate of ANGLERS AND BATFISH.

ANGLER, THE COMPLEAT. See ANGLING.

AN'GLES. A Low German tribe who occupied the district of Angeln in Schleswig-Holstein and extended to the west as far as the North Sea. With the Jutes and the Saxons, the Angles passed over in great numbers to Britain during the fifth century, and settled in East Anglia, Northumbria, and Mercia. From them England derives its name (Lat. *Anglia*, AS. *Engla-land*). After these migrations from Schleswig, the Danes from the north entered the deserted districts and mingled with the Angles, who remained there. The German language and manners were afterward introduced by immigrant nobles from Holstein and prevailed among the higher classes; but until the nineteenth century the Danish was still generally spoken by the common people. During the nineteenth century the German gained the ascendancy. The modern Angles are said to be of a more passive disposition than the Frieslanders and the people of Ditmarschen, and religious sentiment is very strongly manifested among them. The district called Angeln extends from the Schlei on the south to the Flensburg hills on the north, contains about 330 square miles, and a population of about 38,000. The name has no political or administrative significance. Consult Erdmann, *Ueber die Heimat und den Namen der Angeln*: (Upsala, 1891). Kappeln is the chief town.

ANGLESEY, ăn'gl'sē, or **ANGLESEA** (AS. *Angles' ēg*, the Angles island). A county and island of Wales, separated from the mainland by the Menai Strait (Map: Wales, B 3). Its length is about 20 miles, breadth about 17, coast line about 80, area 276 square miles. The county is divided into three districts, called cantrefs, each subdivided into two cwmwds. The market towns are Amlwch (q.v.), Beaumaris (q.v.), the county town and a municipal borough (pop., 2231), Holyhead (q.v.), an urban district (pop., 10,636), Llangefni, and Llanerchymedd. Pop., 1891, 50,098; 1901, 50,606; 1911, 50,928. The surface is generally flat, and the soil of indifferent fertility and only partially cultivated, by far the largest part be-

ing under pasture. The principal products are wheat, barley, oats, and potatoes. The mineral deposits of the island are varied, but of less importance than formerly; in the latter part of the eighteenth century the Parys copper mines near Amlwch were considered the most productive in the kingdom. Other minerals that occur are copper, lead, silver, marble, limestone, asbestos, and coal. The island is connected with the mainland by one suspension bridge and the Britannia tubular bridge on the route of the Chester and Holyhead Railway. The island is traversed by two railway lines. There are still to be found some ancient relics of Druidism, which once flourished on the island. The Welsh language is largely spoken by the peasantry. Consult H. L. Jones, "The Mediæval Antiquities of Anglesey," *Archæological Journal*, vol. v (London, 1844).

ANGLESEY, HENRY WILLIAM PAGET, FIRST MARQUIS OF (1768-1854). A British general and statesman. He was educated at Oxford and entered Parliament in 1790. He commanded a volunteer corps in Flanders and acquired a high reputation as a cavalry officer in the Peninsular War. At the battle of Waterloo, where he commanded the British cavalry, he lost a leg. On his return to England he received a vote of thanks from Parliament and was made Marquis of Anglesey. In 1828 he was appointed Lord Lieutenant of Ireland at a period when that country was greatly agitated over the question of Catholic emancipation. This he at first opposed, but afterward advocated it, and in consequence was recalled by Wellington in 1829. He was again appointed to the same office under Lord Grey's administration in 1830; but his coercive measures destroyed his popularity, and he resigned his position in 1833. He founded the Irish Board of Education. In 1846 he was made field marshal.

ANGLESITE, ăn'glê-sīt. A lead sulphate that crystallizes in the orthorhombic system and occurs in white, light-yellow, green, and sometimes blue colors. It is formed as a result of the decomposition of galena and was originally found in Anglesea, England, whence its name; it also occurs in Cornwall, Derbyshire, and Cumberland; at various localities in the Hartz; in Hungary; and in the United States, at Phenixville, Pa., at various points in the Missouri lead mines, and elsewhere. Anglesite is useful as an ore of lead.

AN'GLEWORM. An earthworm, when used as fish-bait. See EARTHWORM.

AN'GLIA, EAST. A kingdom founded by the Angles before the middle of the sixth century, in the eastern part of central England, comprising the modern counties of Norfolk and Suffolk and equivalent in extent to the modern see of Norwich. It was somewhat dependent on Kent; but about 654 Anglia fell under the sway of Mercia and so continued till Egbert, King of Wessex, conquered Mercia and East Anglia in 825. Alfred the Great gave Anglia to the Danes under Guthrum in 878; but Edward, his son and successor, forced the Danes to acknowledge him in 921. Anglia soon became a part of the West Saxon kingdom.

AN'GLICAN. Belonging to the Church of England or to the other churches in communion with it, in Scotland, Ireland, the colonies, and the United States. The term is sometimes applied to the High Church party. See ANGLICAN COMMUNION; ENGLAND, CHURCH OF.

ANGLICAN CHURCH. See ENGLAND, CHURCH OF.

ANGLICAN COMMUNION. A term coming to be recognized as the semi-official title of the now world-wide body which is in communion with the Church of England as represented in its centre of unity, the see of Canterbury. It is only in comparatively recent years that this body has come to have anything like a concrete existence, which by the logic of events is crystallizing more and more, in contradiction though it be to the famous Branch Theory on which the claims of the body to be considered a part of the Catholic or Universal Church are based. Its component parts are the Episcopal churches of England, Scotland, Ireland, the British colonies, and the United States, with mission dioceses in various parts of the world. It coheres loosely by means of general agreement in worship and terms of communion, and as an integral body is represented by its bishops from all parts of the world in the Lambeth Conference at irregular intervals. Consult *Official Yearbook of the Church of England*; Tucker, *The English Church in Other Lands* (London, 1886).

AN'GLIN, MARGARET (1876—). An American actress, daughter of the Hon. T. W. Anglin, who at the time of her birth, at Ottawa, Canada, was Speaker of the Canadian House of Commons. After studying at the Empire School of Dramatic Acting (New York City), she made her début at New York in *Shenandoah* in 1894. Among her rôles were Roxane, in Richard Mansfield's presentation of *Cyrano de Bergerac* (1898); Mimi, in *The Only Way* (1899); Mrs. Dane, in *Mrs. Dane's Defense* (1900); Mabel Vaughn in *The Wilderness* (1901); the title rôle in *Zira* (1905); Ruth Jordan in *The Great Divide* (1906). In 1908-09 she went to Australia, where she appeared as Katherine in *The Taming of the Shrew* and Viola in *Twelfth Night*; and in 1910 at the Greek theatre, Berkeley, Cal., she played the title-rôle in a translation of Sophocles's *Antigone*. During the year 1911 she played in *The Rival* and *Green Stockings*. Consult Strang, *Famous Actresses of the Day in America* (Boston, 1899).

AN'GLING (AS. *angel*, fish hook, akin to Eng. *angle*, a corner, bend). The term "angling" has, by common understanding, become restricted to the catching of fish with a rod and line and chiefly as a source of recreation, while fishing may mean any method of taking fish, and frequently implies a commercial enterprise. The term "angle" and its cognate words in most languages are limited to the hook; but it is quite clear that in Anglo-Saxon the word includes as well the line and rod; a definition probably suggested by the position a rod and pendent line take when being used for bait fishing, at which time they form a right angle. Shakespeare refers to the angle in the sense of rod, line, and hook in *Antony and Cleopatra*, and he had good historic basis for selecting angling as a recreation in Egypt, for the mural paintings of the Egyptians make it clear that angling was a favorite pastime of their men of rank. So accurately is the spawning of fish described in the *Bundahish*, a Pahlavi work relating to the creation, as to suggest the existence of angler naturalists among the followers of Zoroaster. Both Greeks and Romans pursued angling for diversion's sake. Many allusions in classical authors justify the inference that the idea expressed by our word "sportsman" had defined

shape in antiquity. From Homer to Oppian there were piscatory poets, who dwelt on the exciting delights of the craft. Oppian's *Halieutica*, a poem of the second century A.D., treats of the natural history of fishes and of the fishing methods of the ancients. The perfect angler is herein defined as "a well-made, active man, patient, vigilant, enterprising, courageous, and full of expedients"; and his outfit is summed up in a couplet—

"The slender woven net, the osier creel,
The tapering reed, the line, and barbèd steel."

The earliest mention of fly-fishing occurs in the *Epigrams* of Martial, wherein is sung the rising of the wrasse "decoyed by fraudulent flies"; but Ælian, the author of a zoölogy, written about 200 A.D., gives a consummate description of this method of taking a certain species of trout as practiced by the Macedonians. From the angling pictures of Ausonius in the fourth century, there is, with the exception of a brief allusion in *Piers Fulham*, written about the year 1420, a break in the literature relating to this subject, until we reach the interesting work, *A Treatyse of Fysshynge wyth an Angle*, printed in England in 1496 as part of *The Book of St. Albans* (2d ed.) and therefore attributed to Dame Juliana Berners, though she could have had no part in its preparation, and it is most probably a compilation from an earlier work. It was published under the title *An Older Form of the Treatyse of Fysshynge wyth an Angle* in 1883. This treatise presents detailed instructions for the manufacture of tackle, gives faultless directions for fly-fishing, and describes minutely "xij flyes wyth wyche ye shall angle to ye thought & grayllying." The flies have been tied by a modern expert, in accordance with the directions given in the treatise, and they do credit to the taste of the first English authoress. Leonard Mascall's *A Booke of Fishing with Hooke & Line* (1590), the next work of importance in English, is largely a reproduction of the essay of the literary prioress. *The Secrets of Angling*, a delightful poem by John Dennys, appeared in 1613, and in 1651 Thomas Barker's *The Art of Angling*, the first work in which the reel is recognized as essential to success in the capture of large fish with rod and line. Two years later, Walton's *The Compleat Angler; or, the Contemplative Man's Recreation*, was given to the world. It was of this book that Charles Lamb wrote: "It would sweeten a man's temper at any time to read it; it would Christianize every discordant, angry passion." Angling is one of the richest departments of English letters. Westwood and Satchel's *Bibliotheca Piscatoria*, published as long ago as 1883, catalogues over 3000 works more or less concerning fish and fishing. To such as wish to understand the natural history of the objects of their pursuit as well as to master the various methods of capture, the following instructive monographs are recommended in addition to the volumes referred to in this article: G. B. Goode, *American Fishes* (New York, 1888); Seth Green, *Home Fishing and Home Waters* (New York, 1888); *The Angler Naturalist*, and the two volumes of the Badminton Library of Sports, entitled *Fishing*; Henshall, *Favorite Fish and Fishing* (New York, 1908); Aflalo, *Sunset Playgrounds* (London, 1909); S. C. Camp, *Fishing Kits and Equipment* (New York, 1910), and *The Fine Art of Fishing* (New York, 1911); Dimock, *The Book*

of the Tarpon (New York, 1911); Rogers, *Sport in Vancouver and Newfoundland* (London, 1912). See FLY CASTING; BAIT-FISHING; TROLLING.

ANGLO-CATHOLIC. A term used for the modern extreme high church party of the Church of England. The basis for the term is the claim that the Church of England is rightfully Catholic, not Protestant. Those who belong to the party use many of the customs and ceremonies of the Catholic church. The use of the term arose in the Oxford movement (q.v.).

ANGLO-IS'RAELITE THEORY. The theory that the English are descended from the Israelites, who were made captives by the Assyrians under Sargon (c.722 B.C.)—the so-called Lost Ten Tribes. The connection is made through Scythians and Saxons. The theory is destitute of scientific proof. For a defense of the view, consult M. L. Streator, *The Anglo-Alliance in Prophecy; or, The Promises to the Fathers* (2 vols., New Haven, Conn., 1900).

ANGLO-JAPANESE ALLIANCE. See JAPAN.

ANGLOMANIA (a hybrid formation from *Anglo*, English + Gk. *μανία*, *mania*, madness, frenzy, enthusiasm). A term which designates, in America and other countries, a weak imitation of English manners, customs, etc., or an indiscriminate admiration of English institutions. In German literature, an *Anglomania* was especially prevalent in the eighteenth century, when translations of English books became numerous and were read with great admiration. The Germans have ascribed the sentimental and affected style of some of their literature to the influence of the English literature of that century. A remarkable *Anglomania* prevailed in France for some time before the commencement of the Revolution. It arose out of political considerations and admiration of English free institutions, but extended to trifles even of fashions and manners, and often became very ridiculous. Since the garish court of the Third Napoleon has been replaced in France by the more sober régime of the Republic, *Anglomania* has replaced *Gallomania* with our fashionable set and has for some time been a fruitful theme of popular satire.

ANGLO-NORMAN LITERATURE, or ANGLO-FRENCH LITERATURE. Anglo-French is a dialect in which are mingled Old French, together with a blending of the Scandinavian language spoken by the followers of Hrolf, or Rollo (q.v.), who invaded the north of France and conquered it about 910. Anglo-Norman literature is that which was composed by the Normans in France or in England, and was equally admired by both. Many writers incorrectly say that it dates from the battle of Hastings (Senlac), but French had become well known to the courtiers of the Saxon court of Edward the Confessor, who preceded King Harold and who greatly favored the Norman-French scholars and poets whom he welcomed. French, indeed, was the language of love and poetry in England, as Latin was the language of scholarship, and it formed the reading of the aristocracy. It was not until the reign of Henry IV that an English language was definitely recognized, except among the peasants and such Saxons as held themselves aloof from Anglo-Norman influences.

Gaston Paris (q.v.) has given an interesting account of the French influence in England in

very early times (*La littérature française au moyen âge*). Certain it is that in the eleventh, and especially the twelfth, century Anglo-French was familiar to both the English and Normans and remained a spoken language until the seventeenth century, and even then it was still employed in legal documents.

How closely alike was the usage in both countries may be seen from the fact that some original manuscripts written in France are now to be found only in England, while many that were written in England are preserved only in France. The language, indeed, was expressive of the early English character—its gaiety, its daring, and its vivid imagination. The typical Englishman as we know him to-day did not come in before the Hanoverians. Prior to that time, as may be seen in Shakespeare and his contemporaries, the English were high-spirited, impulsive, rash, and full of vivid imagination. Only after the French element subsided, does one find the stolid, unemotional type that is choleric rather than full of passion. "Stodginess" was not an early English trait.

The different forms of composition in Anglo-Norman literature were highly varied, though many of the works themselves have not been preserved in the original, since they were transmitted orally. Among them we find historical documents, such as the *Roman de Rou et des ducs de Normandie* by Wace (q.v.), who also wrote a *Geste des Bretons* which is in the nature of history. This was imitated by Benoit de Sainte-More at the command of Henry II. Henry was a remarkable linguist. It was said of him that he knew something of every language spoken from the Bay of Biscay to the river Jordan. His patronage did much to cultivate literature in England and to encourage the development of learning. In his own day a swarm of unhistorical stories relating to the murder of Thomas à Becket sprang into existence and were widely circulated. A very great work of historical and social importance is the history of William the Marshal who was regent of England from 1216 to 1219.

In addition to histories (many of which were written in Latin) were the famous *chansons de geste* (q.v.) and *chansons d'aventure*, which also, like the *romans*, were sung and chanted rather than written down. It is a matter of record that the *Chanson de Roland* was chanted at the battle of Hastings. Among the most famous of love stories is that with which all the world is now familiar under the title of *Tristan and Yseult*, immortalized by Richard Wagner in what is probably the most famous of his operas, as it is one of the most famous romances of passionate love. In the Middle Ages, however, as told by Bérolf and Thomas, it had less vogue than at the present time. A vast number of didactic compositions have been collected and edited, such as lives of saints, works on orthography, bestiaries, psalteries, and *contes moralistes* that were told in the churches and may now be found in the variegated *Gesta Romanorum* (q.v.), which still makes its appeal, and of which Mr. W. D. Howells has written appreciatively in *My Literary Passions*. Translation from the Latin is represented by versions of Eutropius and the pseudo-Dares in the thirteenth century.

Lyric poetry is less frequent than one might expect, and most of it had its origin in France. The same thing may be said of epic poetry, which was popular enough in England but

usually originated in France. Some of the English epics have not even yet been printed and edited, as, for instance, the colossal work on Guy of Warwick. Gower (q.v.) wrote a number of ballads in Norman-French. The so-called *fabliau* is likewise more French than English. There is a volume of *fabliaux* compiled by Nicole Bozon about the year 1320. Much of the Alexander Saga, which at one time was widely read, is drawn from Anglo-Norman *fabliaux*. The French gift for neat and telling satire shows itself in the Anglo-Norman literature, the chief objects of attack being the clergy and women. As for the drama, no plays seem to have been acted in England prior to the fourteenth century; and the earlier English Moralities were drawn from French sources. In the thirteenth century there was written in Norman-French a mystery entitled *Adam*. For religious instruction there have been preserved 60 legends relating to the Virgin Mary, and also the famous *Poème de Marie et de Jésus*.

In the course of time the Anglo-Norman French of England naturally began to vary somewhat from the Norman-French of France. The Hundred Years' War did much to bring English to the front; yet even then a knowledge of French was esteemed the necessary accomplishment of a gentleman, and schools were founded in England for teaching the French language. Among these was Marlborough College, whose original purpose was the preservation and transmission of Anglo-Norman literature. Changes in pronunciation inevitably occurred, until at last Norman-French and Anglo-Saxon had blended into a new language which was thereafter to be known as English. The Reformation made a still deeper breach between France and England, though for a time the Catholic court of Scotland continued the Anglo-Norman tradition.

Bibliography. The present century is witnessing a very keen interest in the revival of Anglo-Norman literature, owing to the fact that the Romance languages are being studied so minutely. The French Société des Anciens Textes has made possible some very brilliant pieces of compilation and exegesis, especially in giving a free hand to Paul Meyer, an indefatigable worker in this fascinating field. He published and edited many texts of Anglo-Norman literature ranging from *lais* to *brutes*. His contributions to the periodical, *Romania*, are also notable. See also Brandin's *Introduction to Fulk Fitz Warine* (London, 1894). The collected papers of Meyer were published by the Société de l'Histoire de France (3 vols., Paris, 1891-1901). Note Schofield, *English History from the Norman Conquest to Chaucer* (London, 1906). Everything by G. Paris is memorable as giving brilliantly what may be called the environment of the Middle Ages in France and England. The work of Skeat, *Principles of English Etymology* (2d series, Oxford, 1891), which is valuable as well as popular; Behrens in Paul's *Grundriss der germanischen Philologie* (2d ed., 1897); L'Héricher, *Les Scandinaves en Normandie* (Paris, 1891); Groeber, *Grundriss der romanischen Philologie*, ii, iii (Strassburg, 1902); and Jusserand, *Histoire Littéraire du peuple anglais*, vol. i (2d ed., Paris, 1895), are indispensable. Compare the articles ENGLISH LITERATURE, FRENCH LANGUAGE, FRENCH LITERATURE, and NORMAN-FRENCH in the present work, with their appended bibliographies.

AN'GLO-SAX'ON ART. A term used to

describe whatever works of art were produced in England during the period of about six centuries between the time of the conquest by the Angles, Saxons, and other Germanic tribes and the time of the Norman conquest in the eleventh century. They found a combination of distinct Roman and Celtic art traditions, and were influenced by them, and subsequently by Christian art from Rome and Byzantium. Their originality was shown principally in their jewelry (especially the *cloisonné*) and arms, in which, however, they had borrowed what they knew from the Goths, whose works of the same kind were far more artistic. In architecture the Anglo-Saxons used principally wood, and relied entirely on foreign workmen for their rare buildings in stone, which were extremely plain, and this, which can hardly be called a "style," was influenced and partly superseded by the Norman style even before the Conquest. The Anglo-Saxons excelled in the illuminating of MSS., and in this they borrowed from the Irish Celts and in their turn assisted the Irish monks in teaching the Carolingian artists; for the great Anglo-Saxon monasteries sent masters to those in Gaul before and after the time of Alcuin.

Architecture. Of the stone churches, hardly a single one survives intact, those of importance having been reconstructed during the Norman or Gothic epochs. The stone masons, who were brought from Gaul and Rome in the seventh century to build the first stone churches, erected for Benedict Biscop the famous monasteries of Wearmouth and Yarrow; small parts of them remain. The little hall church at Bradford, entirely without columns, is almost the only complete structure remaining (705 A.D.). To about the same time belong the crypts at Ripon and Hexham. After these early works, which retain something of a Continental and Roman style, the later monuments of the ninth, tenth, and early eleventh centuries show an increase of Celtic peculiarities. The church towers have sometimes survived where the churches themselves have been renovated, and they form the most interesting group of Anglo-Saxon monuments, from such simple ones as that of Barton-on-Humber, through the more architectural examples at Barnack and Sompting, to the richer towers of Earl's Barton and Deerhurst. They are built of crude, irregular masonry—a few large blocks set in the midst of a mass of small stones. The corners are formed of long-and-short work, the high and narrow stones alternating with the flat, long ones bonded into the wall. In the more elaborate examples the surface is decorated with a series of vertical lines of pilaster strips occasionally joined by arched or gabled connecting strips and the few windows are sometimes arched, sometimes topped with two slanting straight pieces forming gables; while their jambs, or divisions (in two-light windows), are either pilasters or the peculiar baluster colonnettes not found except in this style. There are very few moldings and very little sculpture, none of it being figured. In fact, the style is so rude as hardly to rise to the dignity of art.

Illuminated Manuscripts. The Saxons were entirely without monumental sculpture or painting of native growth, and only their industrial arts are important. Even here they are inferior to the Goths in their jewelry, enameling, and goldsmith work, and to the Irish in their illuminating of manuscripts. Comparison with the

Book of Kells, the Gospels of MacKegol, and other Irish illuminations will prove this. It is true that the Gospels of Lindisfarne (British Museum) are equal to these works, but they were executed by Saxon pupils of the Irish monks. Another remarkably fine work is the Benedictional of St. Athelwold. In one particular the Saxon works are superior—in the treatment of the human figure, which in Irish works is a mere piece of decorative scroll-work without a trace of resemblance to the human form or real drapery. The influence of the pictures and illuminated MSS. brought to England from Rome and of the Byzantine MSS. gave the Saxons the advantage of good models for subjects of religious art, as is shown in such works as the Cuthbert Gospels (British Museum). There are three styles in Anglo-Saxon illuminations: (1) stage of Roman influence, seventh century, when the missionaries from Rome and Benedict Biscop gave Roman models (illustrated by the Golden Stockholm Gospels and the Psalter of St. Augustine, British Museum); (2) stage of Irish influence, with predominance of the geometric ornament of beautiful elaborate designs taken from textile fabrics, metal work, and conventionalized animal forms, seventh and eighth centuries (Durham Gospels, Gospels of St. Cuthbert, British Museum, Athelwold's Book of Prayers at Cambridge); (3) stage of reactive influence of Carolingian (Frankish) and Byzantine art, with re-introduction of figured composition and the placing of ornament in the background. This late development was rapid under the direction of SS. Athelwold and Dunstan, in the ninth and tenth centuries (Psalter of King Athelstan, British Museum; Missal of Leofric, Oxford; Gospels and Psalter of Boulogne; Gospels called "Bib. Greg." in British Museum; Cædmon, Oxford; Cotton Psalter, etc.). Certainly the peculiar interest of all the Saxon illumination lies in its immense initial letters and full-page geometric ornamentation, in which the artists rivaled the Irish in a field where neither Italian nor Byzantine illuminations had preceded them. They blazed a way which was followed by all subsequent illuminators in varying degrees; and for delicacy and precision of touch, judicious treatment of surface, and balance of composition, their geometric work has never been surpassed. In their good though simple color scheme one point is remarkable—that they never used gold leaf. In this they influenced Carolingian illuminators in direct opposition to the Byzantine style of profuse gold grounds and ornaments. In so far as similarities have been noticed in Scandinavian works, it is probable that they are due to influences from Great Britain rather than vice versa. When Charlemagne encouraged art, he found the British monasteries a great resource. The great Bible of St. Denis (British Museum) and the Leipzig Psalter are examples of this British influence on illumination among the Franks. During the last stage, when the geometric style was abandoned, extensive composition in pen-and-ink outline became a favorite method of illustration. Consult: Rickman, *An Attempt to Discriminate the Styles of Architecture in England* (London, 1848); De Baye, *The Industrial Arts of the Anglo-Saxons* (London, 1893); Akerman, *Remains of Saxon Saxondom* (London, 1853); Kemble, *Horæ Ferales* (London, 1863); Parker, *Introduction to the Study of Gothic Architecture* (London, 1847); Westwood, *Fac-*

similes of the Miniatures and Ornaments of Anglo-Saxon and Irish Manuscripts (London, 1868); also volumes of the *Archæologia* (London, 1770 ff.).

ANGLO-SAXON CHRONICLE. There are really Anglo-Saxon chronicles, growing out of a common stock but differing more or less widely from each other, especially in their later entries. Of this four-fold chronicle there are seven manuscripts in existence, four of which (A, C, D, and E) may well be considered independent records.

The common historical material out of which these four have grown is taken from Cæsar's invasion of Britain to the year 892. It seems likely that the idea of a national chronicle to embody existing oral and written records was suggested by King Alfred. The impulse thus given by Alfred was continued under Edward in the official record of the Danish wars which in C and D extends to 915, in A to 924.

From 925 to 975 all the chronicles are very fragmentary, A ending about 1001 with a few local entries. From 983 to 1018 C, D, and E are practically identical, this section, in all probability, having been composed at Canterbury. C extends to 1066, D to 1079, and the last part is mutilated. E is continued until 1154, the later parts showing unmistakable evidence of the harsh Norman rule in the querulous tone and the growing ignorance of the language. Nevertheless, "our debt to it is inestimable."

ANGLO-SAXON LANGUAGE AND LITERATURE. The term "Anglo-Saxon" is employed, in popular speech and to some extent among scholars, to designate the language of the Germanic peoples in England before the coming of the Normans (1066). Such, however, was not the usage of those who wrote in the language. Alfred, Ælfrie, and others repeatedly called it *Englisc*, i.e., English. True, the expressions *Angli Saxones* and *Saxones Angli*, i.e., English Saxons, occur in mediæval Latin literature, but they were used to distinguish the Saxons in England from those on the Continent. It was not until the revival of interest in England's earliest history and literature, which dates from Camden's *Britannia* (1586), that the compound "Anglo-Saxon" made its appearance, to denote, without any reference to their Continental kinsmen, the entire English people and their language. This designation was generally followed by historians and philologists down to 1875. Since then an increasing number of them have adopted the usage of King Alfred. To the earliest period in the history of the English language they have given the name "Old English." The term "Anglo-Saxon," it is argued, is misleading; for it seems to imply that our language before the Norman conquest was not English. It is, of course, admitted that the English language underwent great phonetic and inflectional changes in the twelfth and thirteenth centuries; and yet English has always remained English. On this continuity in the development of our speech, the proper emphasis is laid by the term "Old English." For this and other reasons, it has seemed best to treat the so-called Anglo-Saxon language and literature under ENGLISH LANGUAGE, ENGLISH LITERATURE, ANGLO-NORMAN LITERATURE AND NORMAN FRENCH.

ANGLO-SAXON LAW. The body of law of the Anglo-Saxons. It was not until the close of the nineteenth century that historical investigation made it possible to form even a toler-

ably clear conception of the legal system that prevailed in England prior to the Norman conquest. The earliest written records of that system are the Anglo-Saxon "dooms," or judgments, which go back to the sixth century of our era. From the time of Ethelbert of Kent to that of Edward the Confessor these records, though fragmentary, appear in an almost unbroken series, supplemented by land charters and wills, collected through the industry of modern scholars. These give us a far from complete, but yet a fairly consistent, idea of the principles and procedure of Anglo-Saxon law. This was, even at the time of the Conquest, a primitive law, concerning itself mostly with the personal relations of free and unfree men, liegemen and lordless men, or outlaws, with crimes of violence—homicide, wounding, and cattle-stealing—and with a simple and slowly developing law of real property. Contract law, as we understand the term, did not exist. There was no distinction between willful and accidental homicide or maiming, and all crimes were punished by the infliction of heavy fines, which were graduated, not according to the atrocity of the deed, but according to the personal status or dignity of the person injured. Indeed, the law of persons consisted almost entirely of a graded valuation of the individual's life or limb, and the terms "twelve-hundred-shilling man," "two-hundred-shilling man," were the well-understood equivalents of terms of rank or personal status.

Anglo-Saxon land law was a composite of Teutonic customary law and the rules growing out of the personal and property relations of lord and vassal, the former probably predominating. Folc-land (q.v.) was the name given to land the title to which rested on the common, customary, and unwritten law. Land derived by grant from the King was known as boc-land (q.v.), the title resting on the book, or written instrument, creating it. It is in the latter that the elements of a feudal form of tenure appear; but it is probable that all forms of tenure were more or less dependent; though of feudal tenure, in the strict sense of the term, there are only a few traces before the Conquest. The allodial ownership, referred to in the books, was not the "absolute and unqualified property" in land which Blackstone and other later writers had in mind when they used the term. Sometimes it is employed as the equivalent of boc-land, and more often merely as signifying an inheritable estate. See ALLODIUM; FEUDALISM; TENURE.

The Anglo-Saxon judicial system was of the loosest possible description. The public courts—the hundred court and the county court—were popular and local in character, and had no effective process for carrying their judgments into effect. There was no supreme judicial tribunal, no *curia regis*, such as developed in the Norman period; and when the king's justice was invoked to remedy an act of injustice committed by the regular tribunals, it was an irregular and extra-legal, or at least extra-judicial, power which he was called upon to exercise. Toward the close of the Saxon period a multiplicity of private courts sprang up, the predecessors of the courts-baron of a later date. See MANOR; COURT BARON; CURIA REGIS; KING'S BENCH. Consult: Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899), for a brief but comprehensive description; Lee, *Historical Jurisprudence* (New York, 1900); Holmes, *The Common Law* (Boston, 1881); Chadwick, *Studies in*

Anglo-Saxon Institutions (Cambridge, Eng., 1905).

ANGLO-SAXONS. The collective name generally given by historians to the various Teutonic or German tribes which settled in England, chiefly in the fifth century, and founded the kingdoms which were ultimately combined into the English monarchy and nation. Various groups of them were known as Angles, Saxons, and Jutes. The traditional statement is, that the first of these invaders made their appearance in Britain in 449, having Hengist and Horsa as their leaders. But under the more searching scrutiny of later writers, these famous leaders have come to be looked upon as mythical heroes of romance, common to most of the Germanic nations; and though the fact of a great Germanic invasion in the middle of the fifth century is not doubted, it is believed that this was by no means the earliest period at which Germanic settlements were effected in England. Long previous to this period, a portion of the coast, extending from Portsmouth to Wells in Norfolk, was known as the *Litus Saxonium*; but whether in reference to Saxons by whom it was settled, or to roving adventurers of that race by whom it was ravaged, is still a subject of dispute. Of the three tribes mentioned above, the Jutes are stated to have been the first comers. Their earliest home was in what is now Schleswig, North Germany, and the portions of England of which they possessed themselves were Kent, the Isle of Wight, and the opposite coast of Hampshire. The Saxons settled chiefly in the southern parts of England—in Sussex, Essex, Middlesex, the south of Hertford, Surrey, the part of Hampshire not possessed by the Jutes; also Berkshire, Wiltshire, Dorset, Somerset, Devon, and the portion of Cornwall which did not remain in the possession of its former Celtic inhabitants. The Saxons who invaded England probably belonged chiefly to the portion of that great nation, or confederacy of nations, whose territories lay on the shores of the Baltic and about the lower Elbe, occupying a region corresponding to Holstein, the north of Hanover, and the west of Mecklenburg. Of the settlements of the third tribe we have little knowledge, until we find them established along the eastern coast of Britain. Some recent historians maintain that they were Enger-Saxons, from the lower Weser; but they were probably Angles (q.v.) from Schleswig, a corner of which is at the present time called *Angeln*; it is certain that they made a succession of descents on the coasts of Suffolk and Norfolk, on the country to the north of the Humber, and on the southern part of Scotland between the Tweed and the Forth. From these coasts they made their way inland, and eventually obtained possession of the whole of England, except the portions already mentioned; that is to say, of all the part to the north of the Avon, on the one side, and the Thames on the other, Essex, Middlesex, and part of Hertford excepted. The union of different bands of these conquerors among themselves, with their countrymen who had preceded them, and with the Celtic population which, though conquered, there is no reason to suppose was exterminated, gave rise to the so-called Heptarchy, the kingdoms of Northumbria (originally Bernicia and Deira), Kent, Sussex, Wessex, Essex, East Anglia, and Mercia.

The various independent states into which England had till then been divided were united

by Egbert, King of Wessex, in 827, into one kingdom. The royal family of Wessex, which was thus raised to the kingly dignity over the whole country, never again lost its supremacy till the Norman Conquest, except during the periods from 878 to 958, when the Danes ruled the kingdoms north of the Thames, and from 1016 to 1042, when Danish kings ruled over all of England. Indeed, all the later rulers of England, except the four kings of the Norman house, have been descended from the same line. Alfred the Great was the most famous king during the Saxon period. The whole ruling race eventually came to be known among themselves from the most numerous element in it, the English, and their land as Angle-land, or England. The Celtic races in Wales, Scotland, and Ireland, however, have always known them as Saxons.

Christianity was introduced among the newcomers in the latter part of the sixth century by missionaries from the Christian Scotch and Irish, to the northward, and at about the same time by St. Augustine, a missionary sent by Pope Gregory I, and by his companions and successors. Augustine became the first archbishop of Canterbury; the Roman missionary movement gradually superseded the Celtic, and before the close of the seventh century the whole of England was a Christian country under one metropolitan. Ethelbert, King of Kent, was the first sovereign who embraced the Christian religion. Bringing with them the traditions and feelings of the Empire, the whole influence of the clergy was thrown into the scale of monarchy and greatly tended to its consolidation. Their custom of holding councils of prelates from all over England, and of adopting regulations for the English church at large, also exercised a strong influence on the growth of a feeling of national unity. The English clergy in general were not very submissive to the authority of the popes, and the connection with Rome was a very tenuous one during the whole of the Anglo-Saxon period. St. Dunstan was probably the most famous churchman of this period. The early English church was distinguished for the learning and laboriousness of its clergy. Bede is the most eminent author whom it produced. Between his time and that of Alfred, a very great degeneracy had taken place both in the learning and efficiency of the clergy which that active and enlightened sovereign labored to restore, but with only partial success. St. Boniface and many other English and Scottish missionaries labored with success in the propagation of Christianity in Germany.

The monastic system took strong hold on the Anglo-Saxons, and a number of Benedictine abbeys were founded and endowed with extensive landed possessions. Most of the bishoprics which were to remain the permanent administrative divisions of the English national Church were organized, and the primacy of the two metropolitan sees of Canterbury and York was acknowledged.

The political organization of the Anglo-Saxons before they were united under one government is almost unknown, and must have been exceedingly crude, probably being scarcely developed beyond tribal conditions. After the union under the West Saxon monarchy, however, they attained a considerable degree of constitutional development. The most marked characteristic was the large amount of power possessed by local assemblies, or *mōts*. The township existed

as an economic and administrative, but scarcely as a political, body. The political unit of the country was the *hundred*. It was a certain stretch of country or a certain body of the population whose members met from time to time for various public functions, principally judicial. The significance of the numerical expression applied to it is quite unknown. There was an official known as the *hundred's caldor*, who seems to have presided at the hundred-mōt and exercised certain police functions. Just as a group of townships made up the hundred, so a group of hundreds made up a *shire*, the later *county*. The inhabitants of the shire also held a meeting, the shire-mōt, at which judicial cases were settled as well as at the hundred-mōt, but it seems to have existed more normally for fiscal and military purposes. The able-bodied men of the shire when called out for fighting purposes were known as the *fyrd*. The administrative and military head of the shire was the *caldorman*, called later, in imitation of the Danish term *jarl*, the *earl*. An equally important if not so exalted official of the shire was the *shire-reeve* or *sheriff*, the representative of the king's power and interests in the shire, as the ealdorman was the representative of local independence and self-government.

At the head of the whole system of government was the king, although ordinarily he took no important political action except in conjunction with the *witan*, that is to say, the great men of the country—the prelates, the ealdormen, members of the royal family, and various royal officials. The gatherings of these magnates to determine, along with the king, on important affairs of the nation, was called the *witenagemot*, and was the direct predecessor of the royal council of the Norman period and of the House of Lords of later times. The authority of the kingship was increasing through the whole Anglo-Saxon period, and in the hands of a vigorous king overrode all limitations by the *witan*; although in case of inefficiency or doubtful succession, the latter body exercised a real power of deposition and selection. The form of election and popular acceptance was always carried out.

In early times a fundamental distinction of classes existed. The *ceorl* class were the great body of the people; the *eorl* class were the nobility by blood. The term *eorl* is not to be confused with *earl*, mentioned above, with which it has no historical connection. This distinction of classes was reflected in the amount of the money-fine imposed for murder or other violence, the payment to the injured person or to his relatives being greater in case he were of *eorl* rank than if he were *ceorl*. Members of the royal family were known as *æthelings*. Below all these classes were the *theows*, or slaves. Another distinction which seems to have grown up later and superseded the division into *eorl* and *ceorl*, was one dependent on military service or personal relationship to the king or other great man. A *gesith* or *thegn* was a personal follower of a powerful man, who usually obtained land and privileges as a result of service. Ultimately, *thegn* seems to have become a general expression for any member of the class of gentry who was not known by the higher title of earl, ealdorman, or ætheling. See WITENAGEMOT.

ANGOL, àn-gōl'. Capital of the department of Angol, and of the province of Malleco, Chile, 70 miles southeast of Concepcion (Map: Chile, C 11). It is on a branch railway extending 45 miles southward to Traiguén. In the sixteenth century it was sacked by the Indians and was rebuilt by Mendoza. Pop., 1885, 6331; 1895, 7056; 1903, 7896.

ANGOLA, àn-gō'là (Portug. for the native name *Ngola*). A Portuguese colony in West Africa, extending from 6° to 17° S. lat. and from 12° to about 25° E. long. (Map: Africa, F 6). It is bounded by German Southwest Africa on the south, Northern Africa on the east, and Belgian Congo on the east and north. Its coast line on the Atlantic extends for about 1000 miles, and its entire area, including the small possession of Kabinda, north of the Congo, is 490,463 square miles. The surface is very mountainous in the west, where some of the peaks reach an altitude of about 8000 feet. In the interior there is an extended range of mountains. The coast line forms a great number of harbors, the most important of which are São Paulo de Loanda, Lobito, Benguela, and Mossamedes. The rivers are mostly short and usually dry up during the arid season. The most important and only navigable streams are the Kuanza and Kunene, both flowing into the Atlantic. Temperature varies considerably, owing to the uneven formation of the surface. Rainfall is heavier in the northern part and in the vicinity of the coast than in the south. The agricultural products of Angola consist of manioc, coffee, bananas, sugar-cane, tobacco, and cereals. The land is held mostly in very large plantations by the Portuguese, and the condition of the native farm laborers is very close to actual slavery.

The trade is principally with Portugal. The chief articles exported are coffee, rubber, ivory, wax, and fish. The imports consist mainly of food products and textiles. The value of the imports and exports in 1909 was \$3,097,351 and \$2,999,856 respectively. The principal port is São Paulo de Loanda, commonly called Loanda, the capital of the colony, with a very considerable shipping. There is a railway from Loanda to Ambaca (225 miles), and thence about 75 miles to Malanje. A line from Lobito Bay is under construction toward the Katanga copper mines near the Rhodesia frontier. The total length of railways, as reported in 1913, was 642 miles. The telegraph lines of Angola had a total length of 2688 miles, with 69 offices, in 1911. Post offices, 453. The finances of the colony are in a rather strained condition, in spite of heavy taxation. The budget for the year 1909–10 showed estimated revenue of \$1,272,269 and estimated expenditure of \$1,698,546. For administrative purposes the colony is divided into six districts, which are controlled by the Portuguese government, but the greater part of Angola is under the rule of native chiefs. At the head of the colony is

a governor, appointed by the Portuguese government. The population is estimated at 3,800,000, mostly of Bantu-Negro stock. The number of Europeans is comparatively small, only about 4000; but they have exercised a great modifying influence on the native population inhabiting the western part of the colony as regards their customs and economic condition. The aborigines in the interior have retained their ancient institutions intact. The authority of Portugal in the western part of Africa was first established by the Portuguese explorer, Diogo Cam (Cão), who visited the estuary of the Congo (c.1482). Very little, however, was done by the Portuguese government to extend its rule farther inland, and in the middle of the sixteenth century it was almost entirely superseded by the Dutch. Gradually, by definite treaties, the Portuguese possessions in West Africa were extended to their present proportions.

Consult: J. de Vasconcellos, *As Colonias Portuguezas* (Lisbon, 1897); Châtelaine, *Angola* (Washington, 1893); H. W. Nevinson, *A Modern Slavery* (London, 1906); Mary H. Kingsley, *West African Studies* (London, 1901).

ANGOLA. A city and the county-seat of Steuben County, Ind., 41 miles north by east of Fort Wayne, on a branch of the Lake Shore and Michigan Southern, and the St. Joseph Valley railroads (Map: Indiana, D 1). Angola is the seat of the Tri-State College. The town was settled about 1834, incorporated as a town about 1866, and as a city in 1906. Pop., 1890, 1840; 1900, 2141; 1910, 2640; 1913, 2800.

ANGO'RA (ancient Gk. Ἄγκυρα, *Ankyra*; Lat. *Ancyra*; Turk. *Enguri*). The capital of the Turkish vilayet of the same name, in the mountainous interior of Asia Minor, and distant from Constantinople about 220 miles. The city is fabled to have been built by Midas, the son of the Phrygian Gordius. It was a flourishing city under the Persians; became the capital city of the Gallic Tectosages, who settled in Asia Minor about 277 B.C.; was a principal seat of eastern trade under the Romans, and was made the capital of the Roman province of Galatia Prima. It was the seat of one of the early churches of Galatia, and the scene of two Christian councils, held in 314 and 358. A temple of white marble, of exquisite workmanship, was erected by the citizens and dedicated to Rome and Augustus who had greatly beautified the city. In 1553 a Dutch scholar, Busbecg (q.v.), found in this temple a most important inscription, in two versions, one Latin, the other Greek, recounting the deeds of Augustus. This inscription is to be connected with a statement made by Suetonius (q.v.), in "Vita Augusti," 101, that Augustus left behind three *volumina*, one of which gave "a list of his exploits which he wished to have cut on brazen tablets which should be set up before his Mausoleum." The Latin inscription is a copy, more or less mutilated now, of the record set up at Rome in accordance with the will of Augustus. It was found on the wall of the vestibule, in six parts or pages, three to the right, three to the left of the entrance; the whole inscription is about 26 feet long by 8 feet high. The Greek translation was on one of the outer walls of the temple, and is about 4 feet high by 65 feet long. This Greek version is of very great value, because in many cases it supplements the breaks in the Latin original. The inscription was first printed in Schott's edition of *Aurelius Vic-*

tor (Antwerp, 1579), and has been edited by Mommsen (Berlin, 1883), Willing (Halle, 1897), and Fairlie, as vol. v, no. 1, of *Translations and Reprints from the Original Sources of European History*, published by the Department of History of the University of Pennsylvania (Philadelphia, 1898). Fairlie's book contains both versions and a translation. The text may also be found in Schuckburgh's edition of Suetonius's "Vita Augusti" (Cambridge, 1896). At Apollonia, on the borders of Phrygia and Pisidia, part of the Greek version has been found; this corresponds very closely to the Greek version found at Angora. Casts of the versions at Angora have, since 1882, been in possession of the Royal Academy at Berlin. Angora contains more than 30,000 inhabitants, of whom about one-third are Armenians. The district is famous for its breed of goats, with beautiful long silky hair. Of this goat-hair a kind of yarn is made, known as Turkish yarn or camel yarn, used in the manufacture of camlets which is extensively carried on in Angora itself. Many animals in this region are remarkable for the length and softness of their hair, especially dogs, rabbits, goats, and cats. This characteristic seems to depend upon a peculiarity of the climate, since this distinction disappears when the animals are transported to Europe. Consult Wright, *Cities of Paul* (Boston, 1905).

ANGORA CAT, GOAT, etc. See CAT; GOAT, ETC.

ANGORNU, ä'n'gôr-nōō'. See NGORNU.

ANGOSTURA, ä'n'gôs-tōō'râ. See CIUDAD BOLÍVAR.

ANGOSTURA BARK, or **ANGUSTURA BARK,** or **CUSPARIA BARK.** The aromatic bitter bark of certain trees of the natural order Rutaceæ and species *Cusparidæ*, natives of Venezuela and other countries of South America where it is used to combat periodic fevers. It derives its name from the town of Angostura, whence it is exported. It is said to have been used in Spain as early as 1759, as a remedy for weakness of digestion, diarrhœa, dysentery, and fevers. It is tonic and stimulant. The most important of the trees producing it, *Galipea officinalis*, grows upon the mountains of Colombia. It is a tree 12 to 20 feet high and 3 to 5 feet in diameter, having a gray bark, trifoliate leaves, with oblong leaflets about 10 inches long, and flowers about an inch long, in racemes, white, hairy, and fragrant. The bark contains a chemical substance called *angosturin*, *cusparin*, or *galipein*, to which its medicinal efficacy is ascribed. It is supposed that a variety of Angostura bark is produced by *Galipea cusparia* (called by some *Bonplandia trifolia*), a majestic tree of 60 to 80 feet in height, with fragrant trifoliate leaves more than 2 feet long. Angostura bark was formerly believed to be a valuable febrifuge; but it has been supplanted by quinine, and has, indeed, in some countries of Europe been prohibited, in consequence of its frequent adulteration with the poisonous bark of the *Strychnos nux vomica* (false Angostura bark), or the substitution of that bark for it.

ANGOT, ä'n'göt', CHARLES ALFRED (1848—). A French meteorologist, born in Paris. After the completion of his scientific studies he was for a time professor at the Institute of Agronomy, serving also as secretary-general of the Meteorological Society of France, and for many years as director of the National Bureau of Meteorology. He wrote much on meteorology and kindred

subjects, among his most important works being: *Traité de physique et de piles électrique*; *Traité élémentaire de météorologie* (1899); *Abrégé des instructions météorologiques* (1902).

ANGOULÊME, äŋ'gōō'lām'. The ancient capital of Angoumois, now of the department of Charente in France (Map: France, S., E 3). It is built upon a ridge, down the north slope of which straggle the quaint houses and crooked streets of the old town. The new town occupies the south slope. It is situated on an eminence between the Charente and the Anguienne, and among its industries are a number of paper mills and manufactures of machinery, wire, wine, brandy, woolen stuffs, linen, and earthenware. It possesses a royal college, a museum of natural history, a naval academy, a theological seminary, and a library. It is the seat of a bishop, and the cathedral of St. Peter dates from 1101. The founding of the see took place in 379, and Clovis built the earliest cathedral in 507. In the centre of the town stands the remnant of the ancient castle of Angoulême, in which was born Margaret of Navarre, the author of the *Heptameron* and other works. Pop., 1906, 37,507; 1911, 38,211. Consult: Castaigne, *La Cathédrale d'Angoulême* (Angoulême, 1834); Nanglard, *Fouille historique du diocèse d'Angoulême* (Angoulême, 1894-97); Babinet de Rencogne, *L'Histoire du commerce et de l'industrie en Angoumois* (Angoulême, 1878-79).

ANGOULÊME, CHARLES DE VALOIS, DUC D' (1573-1650). The illegitimate son of Charles IX of France and Marie Touchet. Until 1619 he was known as Comte d'Auvergne. He was imprisoned in the Bastille from 1605 to 1616 for having plotted against Henry IV. He was then released by Louis XIII and restored to his rank in the army, which he commanded at the siege of La Rochelle in 1628. He left some memoirs of the reigns of Henry III and Henry IV.

ANGOULÊME, LOUIS ANTOINE DE BOURBON, DUC D' (1775-1844). The eldest son of Charles X of France and Dauphin during his father's reign. He retired from France with his father (who was then the Comte d'Artois) at the beginning of the Revolution and spent some time in military studies at Turin. In August, 1792, he entered Germany at the head of a body of French *émigrés* and soon after retired to Edinburgh. In 1799 he married his cousin, Marie Thérèse Charlotte, daughter of Louis XVI, with whom until 1814 he lived in exile. On the recall of his uncle, Louis XVIII, he was appointed lieutenant-general of the kingdom; but he failed in his attempt to oppose Napoleon and was forced to capitulate. After the second restoration he was sent by Louis XVIII to the southern provinces to repress the political and religious outbreaks there, and in 1823 he led into Spain the French army, which put an end to the constitution and restored Ferdinand VII to absolute power. He was a man of phlegmatic disposition and mean abilities. When the Revolution took place in July, 1830, he signed, with his father, an abdication in favor of his nephew, the Duc de Bordeaux (Comte de Chambord); and when the Chambers declared the family of Charles X to have forfeited the throne, he accompanied him into exile to Holyrood, to Prague, and to Görz, where he died.

ANGOULÊME, MARIE THÉRÈSE CHARLOTTE,

DUCHESS D' (1778-1851). The daughter of Louis XVI. She exerted great influence over Louis XVIII and Charles X. She was imprisoned in the Temple with her parents, but in 1795 was exchanged for some French prisoners in the hands of the Austrians, and lived at Vienna till her marriage in 1799, with her cousin, the Duc d'Angoulême. Her memoirs were published in London (1852) with the title *Filia Dolorosa*, the editor being Mrs. I. F. Romer. Consult A. F. Nettement, *Vie de Marie de France, fille de Louis XVI* (3d ed., Paris, 1872).

ANGRA DO HEROISMO, äŋ'grà dô ä'rô-ēs'mô (Portug. bay of heroism). The capital of the Azores, a seaport at the head of a deep bay on the south coast of the island of Terceira, lat. 38° 38' N., long. 27° 12' W. (Map: Portugal, B 5). It is a station for ships between Portugal and Brazil and the East Indies, but the harbor, the only available one on the island, is very much exposed. It is the seat of the Portuguese governor-general of the Azores and of the bishop; is well built, but dirty; strongly fortified, and protected by a citadel at the foot of the Monte de Brazil; contains a military college and arsenal, several scientific and literary societies, a cathedral, and numerous churches. There is a considerable export of wine, fruit, honey, grain, and flax. This city furnished an asylum for the Portuguese regency from 1830 till the taking of Oporto by Dom Pedro (1833). Pop., 1911, 10,057.

ANGRA PEQUENA, äŋ'grà pã-kã'nyã (Sp. *pequeña*, little, small; see ANGRA). A settlement and a bay in German Southwest Africa (q.v.). Though poor its harbor is the best sheltered in the German possessions in that part of the continent (Map: Africa, F 7). The commercial importance of the bay has almost entirely disappeared on account of the lack of fresh water and the general barrenness of the surrounding country, although the climate is pleasant. The settlement of Angra Pequena was established by the Bremen merchant Luderitz in 1883, and it was the nucleus of the present German Southwest Africa. It was at Angra Pequena that the German flag was first planted on African soil in 1884. In honor of its founder, Angra Pequena is called by the Germans Luderitz Bay, and the surrounding country is known as Luderitzland.

ANGRI, äŋ'grê. A city in south Italy, 4 miles east of Pompeii (Map: Italy, F 11). It is situated in the mountains, has a castle and a park, and silk and cotton factories. South of the city, on the ancient Mons Lactarius, Teja, the last King of the Ostrogoths, was defeated by Narses in 553. Pop., 1881, 7700; 1901 (commune), 11,219; 1911, 11,574.

ÅNGSTRÖM, öŋg'strēm, ANDERS JÖNAS (1814-74). A Swedish physicist. He entered the University of Upsala in 1833; became privat-docent in physics in 1839, keeper of the astronomical observatory in 1843, and professor of physics in 1858. From 1867 till his death he was secretary to the Royal Society of Sciences at Upsala. He wrote on heat, magnetism, and especially on optics. Among his works were *Recherches sur le spectre solaire* (1869), in which he published his determinations of the wave lengths of most of the dark lines of the solar spectrum known as the Fraunhofer lines; *Sur les spectres des gas simples* (1871), and

Mémoire sur la température de la terre (1871). His best-known work, *Optiska Undersökningar* (1853), treats of the principles of spectrum analysis.

ANGUIER, ä'n'gè'ä', FRANÇOIS (1604-69), and MICHEL (1614-86). Brothers, prominent sculptors of the Baroque period. Both were born at Eu (Normandy); studied with Simon Guilain in Paris, and afterwards at Rome. The chief works of François are the mausoleum of Henri II, Duke of Montmorency, at Moulins (1651-58); figures from the mausoleums of Jacques Augustin de Thou and Jacques de Souvre, in the Louvre, and those of Gaspard de la Châtre and Henri Chabot, Duke de Rohan, in the Museum of Versailles. All of these works are in marble. At Moulins he was assisted by his brother Michel, who also carved many statues for the churches there. From 1654 to 1655 Michel was occupied with the plastic decoration of the apartments of Anne of Austria in the Louvre. His many sculptures include a bronze relief of the "Nativity," now in St. Roche, Paris, and a number of works in the Louvre, including a large terra cotta, "Hermes and Atlas." His masterpiece is the sculptures of Porte St. Denis, Paris, after the designs of Le Brun. The model of the grand staircase of the palace of Versailles is also attributed to him. One of the ablest sculptors of the seventeenth century in France, Michel Anguier united a fine sense of the antique with a strong decorative talent. Compared with his work, that of his brother François, although able technically, seems cold and labored. Consult the monographs on the brothers by Stein (Paris, 1899), the best upon the subject; others are by Sansom (Paris, 1889) and Duplais (Paris, 1890).

ANGUILLA, ä'n-gwî'l'lä, or LITTLE SNAKE (Sp. *Anguila*, ä'n-gè'l'lä; dimin. of Lat. *anguis*, serpent, snake). One of the British West India Islands, about 150 miles east of Porto Rico (Map: West Indies, Q 5). It is about 17 miles long and 4 miles broad, with an area of 35 square miles and a population of (1911) 4075, mostly negroes. The industries are cattle-raising and the production of vegetables, cotton, and salt, the latter obtained from a lake in the centre of the island.

ANGUISCIO-LA, ä'n-gwè'shò-lä, or **ANGUS-SOLA**, ä'n-gòò'sò-lä, SOPHONISBA (1527-c.1623). An Italian portrait painter. She was born at Cremona, of an ancient and noble family. Here she studied with Campi and Gatti, unimportant Eclectic painters, and imparted her own knowledge to five sisters, who also became painters. In later years she became blind, and it was then that Van Dyck visited her and professed himself enlightened by her conversations on art. Sophonisba's popularity was largely due to her personal charm and her wide culture. To modern ages her paintings seem mediocre. Of her portraits, which are to be found at Florence, Madrid, Genoa (Lomellini Palace), and in English private possession, the best known are the numerous portraits of herself, of which there are examples in the Uffizi and at Vienna. One of her best productions is her "Three Sisters Playing Chess" in the National Gallery, Berlin. Consult Fournier-Sarloveze, *Sophonisba Anguisciola et les sœurs* (Paris, 1900).

ANGUS, ä'n'güs, EARLS OF. See DOUGLAS, FAMILY OF.

ANGUS, JOSEPH, D.D. (1816-1902). A Baptist educator, born at Bolam, Northumberland, England. He was educated at the University of Edinburgh, and became president of the Baptist Regents' Park College, in London, in 1849. He was a member of the Bible Revision Committee, and is well known as the author of the *Bible Handbook* (London, 1854), *Handbook of the English Tongue* (1862), *Handbook of English Literature* (1868), *Handbook of Specimens of English Literature* (1866), and the commentary on Hebrews in Schaff's *International Commentary* (1883).

ANGUS, RICHARD BLADWORTH (1831-). A Canadian financier and capitalist. He was born at Bathgate, Scotland, and educated in the public schools. After being employed for several years in the Manchester and Liverpool Bank, he came to Canada in 1857, joined the staff of the Bank of Montreal, and became its general manager in 1869, holding that position for 10 years. He assisted Lord Mountstephen and Lord Strathcona in the reorganization of the St. Paul, Minneapolis, and Manitoba Railway, and, with them, was an influential member of the syndicate which completed the construction of the Canadian Pacific Railway in 1885. He became known as a munificent promoter of charitable institutions and of art.

ANGWANTIBO, ä'n'gwän-tè'bò. The slow lemur. See LEMUR.

ANHALT, ä'n'hält. A duchy of the German Empire, inclosed within Prussian territory (provinces of Saxony and Brandenburg), with an area of 888 square miles (Map: Germany, E 3). The western part, adjacent to Brunswick, partakes of the mountainous character of the Harz region and inclines gradually toward the valley of the Elbe. The latter traverses in a westerly direction the main part of the duchy and receives the Saale, Mulde, and a few minor tributaries. Anhalt has a fertile soil and is well cultivated. Rye, wheat, potatoes, oats, and grasses are grown extensively. The forests occupy a considerable area and belong chiefly to the state. The chief mineral product of Anhalt is salts of different kinds, which are worked exclusively by the government. The output of ore is very limited, while the production of lignite amounted to 1,266,369 tons in 1910. The manufacturing and mineral industries give occupation to over 47 per cent of the population. The chief manufactured products are metal articles, sugar, cement, bricks, soap and other toilet articles, leather, woodenware, and spirits. Exports are chiefly sugar, spirits, grains, salt, carpets, and matches. The railways of Anhalt have a total length of about 180 miles, chiefly state-owned. The constitution of the duchy vests the executive power with the duke, who is assisted by the Diet. The latter is composed of 36 members, elected indirectly for a period of six years. The immediate executive authority is vested in the minister of state. Anhalt is represented by one member in the Bundesrat and two deputies in the Reichstag of the German Empire. For purposes of local administration it is divided into six circles. The budget for the year 1912-13 balanced at 32,275,825 marks. The revenue is derived from taxes, customs, and state domains, mostly salt works. The military organization of the duchy is under the control of Prussia. Education, elementary as well as secondary, is well provided for by the state. The state re-

ligion is Protestant, but the Catholic and Jewish religions are also subsidized to some extent. According to the census of 1910, the population of Anhalt was 331,128, showing an increase of less than 5 per cent for the decade. Over 96 per cent of the population is Protestant. Capital, Dessau (q.v.).

The reigning house of Anhalt traces its origin to Albert the Bear, Margrave of Brandenburg, upon the death of whose grandson, Henry I, in 1252, the Anhalt territories of the family were divided into three parts, which gave rise to the related families of Bernburg, Aschersleben, and Zerbst. The subsequent history of Anhalt is a monotonous succession of reunions and reparcelings. All the parts were united between 1570 and 1586, and were then broken up again into four parts, Dessau, Bernburg, Köthen, and Zerbst. By the successive extinction of the last three lines, Anhalt was definitely reunited in 1863.

ANHALT-BERNBURG, -bĕrn'bŭrk, CHRISTIAN, PRINCE OF (1568-1630). A German general, founder of the Anhalt-Bernburg branch of Anhalt. In 1608 he took a leading part in the formation of the so-called Union of the Protestant German Princes directed against the encroachments of the Catholics. After acting as second commander of the army of that league, he entered the service of King Frederick of Bohemia, and led the army which was defeated by Tilly at Prague (1620).

ANHALT-DESSAU, -dĕs'ou, LEOPOLD I, FOURTH PRINCE OF (1676-1747). A Prussian field-marshal. He entered the Prussian service at the age of 12, and succeeded his father five years later. He distinguished himself at Höchstädt or Blenheim (1704) and in Prince Eugene's brilliant campaigns in Italy. After serving as a volunteer at Malplaquet (1709), he received command of the Prussian forces in the Netherlands, and aided Marlborough in his operations against Villars. In 1712 he was made field-marshal and military counselor to King Frederick I. Under Frederick William I Marshal Dessau aided in the reorganization of the Prussian army. As one of Frederick the Great's generals, he distinguished himself in the War of the Austrian Succession, in which he gained a bloody victory over the Austrians at Kesseldorf in 1745. To his soldiers Leopold of Anhalt-Dessau was known as "Der Alte Dessauer" ('Old Dessau'). Carlyle, in his *Frederick the Great*, speaks of him as "a man of vast dumb faculty, dumb but fertile, deep—no end of imagination—no end of ingenuities—with as much mother wit as in whole talking parliaments." There are numerous lives of him in Germany; the best ones are those of Varnhagen von Ense (Leipzig, 1872) and Crousaz (Berlin, 1875). There is an incomplete autobiography, edited by Hosaus, *Selbstbiographie des Fürsten Leopold*. Consult also Carlyle, *Frederick the Great* (London, 1858).

AN'HARMON'IC RA'TIO (Gk. *ἀν*, *an*, priv. + *ἁρμονία*, *harmonia*, harmony, agreement). An important form of ratio introduced by Möbius under the name *Doppelverhältniss* (double ratio), but called by Chasles *rapport anharmonique*. If a pencil of four lines with vertex *O* are cut by any transversal *SS* in points *A*, *B*, *C*, *D*, the ratio $\frac{AB \cdot CD}{AD \cdot CB}$ is called the anharmonic ratio of the points and also of the pencil,

and is symbolized by $\{O, ABCD\}$ or simply $\{ABCD\}$. Since $\frac{AB \cdot CD}{AD \cdot CB} = \frac{\sin AOB \cdot \sin COD}{\sin AOD \cdot \sin COB}$, the anharmonic ratio is the same for any transversal, such as *S'S'*, of given pencil, so that

$$\{ABCD\} = \{A'B'C'D'\}$$

This *invariance* with respect to projection and section is the fundamental property of the anharmonic ratio. All projective properties of geometric figures are expressible in terms of anharmonic ratios of their lines and points.

The anharmonic ratio $\{ABCD\}$ admits of certain interchanges of letters without altering

the value of the ratio. In fact, the 24 permutations of the letters give only six different anharmonic ratios, and these six are thus related: If $\{ABCD\} = \lambda$, then

$$\{ADCB\} = \frac{1}{\lambda}$$

$$\{ACBD\} = 1 - \lambda \{ABDC\} = \frac{\lambda}{\lambda - 1}$$

$$\{ACDB\} = \frac{\lambda - 1}{\lambda} \{ADBC\} = \frac{1}{1 - \lambda}$$

When the segments are so related that the value of the anharmonic ratio is -1 , the ratio is called *harmonie*. The subject of anharmonic ratio, as indicated above, plays an important part in projective geometry. Consult Cremona, *Elements of Projective Geometry* (London, 1885). See GEOMETRY.

AN'HIDROT'ICS (Gk. *ἀν*, *an*, priv. + *ἰδρῶς*, *hidrōs*, sweat). Drugs which check perspiration. They are chiefly used in the profuse night-sweats of phthisis. The most important are atropine, picrotoxin, agaricin, camphoric acid, sulphuric acid, and gallic acid (qq.v.).

ANHIMA, än'hĕ-mă (Brazilian name). The horned screamer, one of the curious South American birds of the order Palamedeiformes and the family Palamedeidae. See SCREAMER.

ANHIN'GA. A generic and native name in South America of the snake-birds, or darters (family Anhingidae). See DARTER, and illustrations on Plate of FISHING BIRDS (for similar species).

ANHOLT, än'hölt. An island belonging to the district of Randers, Denmark, situated in the centre of the Kattegat, about 22 miles from the peninsula of Jutland and the mainland of Sweden (Map: Denmark, E 2). Anholt Island has an area of 8 square miles, and is nearly twice as long as it is broad. At the eastern end is a lighthouse to mark the dangerous shoals and reefs of the neighborhood. Pop., 1906, 342.

ANHY'DRIDE (Gk. waterless, from *ἀν*, *an*, priv. + *ὑδωρ*, *hydōr*, water). An oxide which

combines with water to form an acid, or an oxide which combines with a basic oxide to form a salt. Sulphuric oxide (SO_3), when added to water (H_2O), forms sulphuric acid (H_2SO_4); sulphuric oxide is, therefore, termed the anhydride of sulphuric acid. Again, chromic oxide (CrO_3) combines with barium oxide (BaO), yielding barium chromate (BaCrO_4); chromic oxide is, therefore, classed as an anhydride.

ANHYDRITE (Gk. *ἀν*, *an*, priv. + *ὕδωρ*, *hydōr*, water). An anhydrous calcium sulphate that crystallizes in the orthorhombic system. It is found crystallized, fibrous, finely granular, or scaly granular. A scaly granular variety from Vulpino, in Lombardy, Italy, takes a fine polish and has been used for sculpture. In America it is found in Lockport, N. Y., near Nashville, Tenn., and extensively in Nova Scotia.

ANI, ä'nê (native Brazilian name). A bird of the genus *Crotophaga*, inhabiting the warmer parts of America and related to the cuckoo. Three species are known, the most common of which (*Crotophaga ani*) is found in Florida, the West Indies, and Yucatan and eastern South America, where it is known as the "black witch," "savannah blackbird," and "rain crow." The anis are birds of medium size, about one foot in length, and have a black, lustrous plumage with blue and violet reflections. The tail contains only eight feathers, the smallest number credited to any living bird. The bill is exceedingly compressed, the upper mandible forming a thin crest. The nests are built in bushes, and the eggs are greenish overlaid with a white chalky substance. One species is said to be communistic, several individuals uniting to form a large nest, which they use in common, and the practice may be common to the tribe. The groove-billed ani (*Crotophaga sulcirostris*) is found from Arizona south to Peru and is named "el garapatero" because it accompanies cattle in the fields, settles on their backs, and picks from their hides the ticks which are called *garapatos*. For illustration, see CUCKOO.

ANICET-BOURGEOIS, ä'nê'sä' bōōr'zhwä', AUGUSTE (1806-71). A French dramatist, born in Paris. The splendid success of a melodrama, *Gustave, ou le Napolitain* (Gaité, 1825), which he wrote at the age of 19, induced him to follow a literary career. He soon became a collaborator with some of the leading authors of France, such as Lockroy, Decourcelle, Labiche, and Brisebarre. Among the vaudevilles and comedies produced in this way were: *Père et parrain* (1834), *Passé minuit* (1839), *Les trois épiciers* (1840), *Le premier coup de canif* (1848), *L'avare en gants jaunes* (1858), *Les mariages d'aujourd'hui* (1861). In conjunction with Barbier, Cornu, Lockroy, Masson, Féval and others he composed several melodramas, such as: *Le couvent de Tonnington* (1830), *Périnet Leclere* (1832), *La nonne sanglante* (1835), *Marceau, ou les enfants de la République* (1848), *La dame de la Halle* (1852), *L'aveugle* (1859), *Le bossu* (1862). His independent works include *La Vénitienne* (1834, one of his best efforts), *La pauvre fille* (1838), and *Stella* (1843). Anicet-Bourgeois was a master of dramatic technique and was unsurpassed in the field of the melodrama. He wrote in all nearly 200 pieces, many of which, however, were composed in collaboration with others, such as Dumas, for example, under whose name many of Anicet-Bourgeois's productions are still performed.

AN'ICE'TUS (?-168). A bishop of Rome from about 157 to 168 A.D. About 160 A.D. he conferred with Polycarp to determine the proper time for celebrating Easter, but they came to no agreement. Although it is not certain that he was a martyr, he is so called in the Roman and other martyrologies. He is commemorated as a saint by the Roman church on April 17.

AN'ILINE (from *anil*, Ar. *an-nil*, for *al*, the + *nil*, from Skr. *nīlī*, indigo), AMIDO-BENZENE, or PHENYL-AMINE, $\text{C}_6\text{H}_5\text{NH}_2$. A liquid organic substance extensively used in the manufacture of dyes. Pure aniline is colorless, has a faint, somewhat disagreeable odor, and boils at 183°C . All aniline ordinarily met with contains a thiophene derivative as an impurity, and it is owing to this that aniline rapidly turns red on exposure to air and light. The impurity is extremely difficult to remove, and really pure aniline, which remains colorless indefinitely, is best prepared by starting with benzene thoroughly freed from thiophene. Aniline combines with acids to form salts, such as aniline hydrochloride, $\text{C}_6\text{H}_5\text{NH}_2\cdot\text{HCl}$. It may be readily prepared by the reducing action of nascent hydrogen on nitrobenzene in acid solution, according to the following chemical equation:

On a large industrial scale aniline is made as follows: A small quantity of ground scrapings of soft iron castings, technically called *swarf*, is introduced, together with some water, into a large cast-iron still furnished with powerful agitators. Crude hydrochloric acid is then added, and nitrobenzene is allowed slowly to flow into the still; at the same time, through another opening, the rest of the swarf to be employed in the operation is allowed to flow into the still in a steady stream. After the first energetic action has subsided, the reacting mixture is heated with a current of steam introduced into the apparatus through several pipes. Six to eight hours suffice to transform all the nitrobenzene employed in one operation. The process may be called continuous, since the acid employed serves merely to start the reaction, and might, theoretically, be used in reducing an indefinite quantity of nitrobenzene, the reduction being effected by the iron and water. In reality, however, a portion of the acid remains combined as ferrous chloride, while most of the iron is transformed into its magnetic oxide, Fe_3O_4 , technically called *black stuff*. All the aniline brought into commerce is made in this manner.

Aniline was first discovered in 1826 by Unverdorben, among the products obtained in the destructive distillation of indigo. In 1834 Runge found it in coal-tar; in 1841 Zinin obtained it by reducing nitrobenzene with sulphuretted hydrogen, and in 1843 Hofmann effected the same reduction with nascent hydrogen, by the reaction of dilute acid and metals. The manufacture of aniline has been an important branch of industry since 1856, when the discovery of mauve was perfected by Perkin.

The qualities of commercial aniline adapted to certain purposes often contain, besides aniline, large quantities of other substances. Thus, crude "aniline for red" contains only about 25 per cent of aniline, the rest being ortho-toluidine and para-toluidine, compounds chemi-

cally allied to aniline. The presence of aniline in a substance submitted for analysis may be readily detected by dissolving some of the substance in water and adding a solution of bleaching-powder: in the presence of aniline an intense purple coloration is produced. Another test for aniline is afforded by the so-called carbylamine reaction: a drop of aniline added to a mixture of chloroform and a solution of caustic potash in ordinary alcohol produces an intensely nauseous smell, due to the formation of phenyl-carbylamine (phenyl iso-cyanide), C_6H_5NC . For bibliography, see COAL-TAR COLORS.

ANILINE COLORS. See COAL-TAR COLORS.

ANILINE POISONING. Aniline is a derivative of coal tar, in which it exists in small quantities, and is chemically the starting point of a host innumerable of compounds used in the arts and medicine. Aniline itself is a colorless liquid, which becomes brown on exposure to the air, constituting the commercial aniline oil. It has an aromatic odor and an acrid, burning taste. When taken in the liquid form or by inhalation, aniline is a very active poison, producing symptoms of headache, dizziness, cardiac and respiratory paralysis, loss of muscular power, cyanosis, convulsions, and coma. The fatal dose is about $1\frac{1}{2}$ drams. Externally aniline is irritating and gives rise to a troublesome form of eczema. Poisoning by this substance occurs, however, most frequently in the chronic form, among workers in aniline dyes (see COAL-TAR COLORS), either in their manufacture or in dyeing processes or in making inks. In medicine a great many aniline derivatives are used, notably the anilids, of which acetanilid, phenacetine, and antipyrine (qq.v.) are types. Several aniline dyes are also employed in medicine, among which may be mentioned methylene blue, an antiperiodic and urinary antiseptic; scarlet red, applied as an ointment to stimulate epithelial growth upon granulating surfaces; fluorescein, sometimes dropped in the eye for diagnostic purposes. Eosin and fuchsin are used in pathological laboratories to stain tissues and microorganisms. Aniline dyes are also largely employed to give an agreeable color to medicines. In whatever form these derivatives are absorbed their general effect is the same. They are cardiac poisons, and have a selective hemolytic action on the blood. The symptoms vary only in degree, according to whether they are slowly or rapidly taken into the body.

ANIMAL (Lat. a living being, from *anima*, current of air, breath of life, soul, *animus*, soul, mind; from the Skr. root *an*, to breathe). A representative of one of the two great groups of organisms, the other including plants. The distinction between animal and plant is hard to draw sharply, although the usual differences between the higher representatives of the two groups are obvious enough. Most higher animals differ from most higher plants in that their food is chiefly solid and organic, in their capacity for locomotion, in their alimentary tube, muscles, nervous system, and sense organs, in their limited growth and greater specialization of parts. This list of differences is really less formidable than it appears; it resolves itself chiefly into a difference of food, which demands that the animal shall seek the food and be provided with organs for locomotion (muscles, nervous system, and sense organs) and digestion. The difference in general

form of body is due to the different methods of getting the (dissimilar) food. This difference in food (solid and organic, as opposed to fluid and inorganic) serves in a general way to divide even the lower animals from the lower plants. But most animal and plant parasites are alike in requiring liquid, organic food; even green plants use organic food (some in large quantities, see SUNDEW), and all animals require inorganic food.

Locomotion is not a distinguishing characteristic of animals, first, because great groups of animals are permanently attached, viz., among protozoans, suctoria, sponges; among cœlenterates, most hydroids and corals; erinoids (sea-lilies); bryozoans, barnacles, and most ascidians. Single cases of attached animals are found in other groups. Secondly, bacteria, diatoms, oscillaria, certain unicellular green algae, and many plant "swarm-spores" are more or less locomotive. In respect to irritability there is little fundamental difference even between the higher animals and plants, for plants respond to the same agents as do animals, but less perfectly. The reproductive process is fundamentally the same in the two kingdoms. In their chemical composition the higher animals differ from most plants; for the former contain no cellulose, whereas the latter are largely built up of it. But cellulose is found also among animals, especially in the test of the tunicates. In their cell structure and cell physiology animals are almost indistinguishable from plants. The fundamental living substance, called protoplasm, is substantially alike in the two kingdoms, and it is probable that future studies will make dimmer rather than clearer the line separating them.

The principal functions of animals are connected with nutrition, locomotion, sensation, and reaction, reproduction, and relation to other organisms. Nutrition involves first the acquisition of food. Food is (1) inorganic—water, oxygen, certain salts; or (2) organic—either vegetable or animal, either dead or living, passive or active. Attached animals depend mostly on dead or on passive living organisms brought to them in currents of water. Those which live on active animals must have the most powerful organs of locomotion and sense. Solid food has to be triturated by teeth or crushing jaws and digested in a food canal. The fluids thus obtained pass through the wall of the food canal either into the general body spaces or into blood vessels, which carry them to the tissues, where they are assimilated or burned for heat and energy. When the food is exclusively fluid, it may soak through the body wall, as in tapeworms, which have no alimentary tract. The oxygen required passes through the wall of the body, is imbibed with water, or enters through special thin wall-tracts of the body surface known as gills or lungs. The body space or blood vessels carry the oxygen to the tissues, where it is used in combustion and in building up the organic compounds. The waste products of catabolism in the tissues are cast into the body spaces (or blood vessels) and eliminated, either directly or by special excretory organs. See ANATOMY; ALIMENTARY SYSTEM; RESPIRATORY SYSTEM; MUSCULAR SYSTEM, and similar articles.

Locomotion involves locomotive apparatus of divers kinds, jets of water, suckers and contractile tubes, lashes, tails, cilia, paddles, fins, wings,

and legs. It involves also muscles and a nervous system to control them.

All the protoplasm of the living body is irritable, but parts of the surface are told off as areas of special sense; for contact, hearing, taste, smell, sight, and temperature. To receive these impressions and to set in action appropriate movements, the central nervous system has become specialized. In the definite reactions which accompany particular situations to the world external to the animal lie the first evidences of a "psychic life." All sessile animals are characterized by lack of many sense-organs, reduction of muscular and nervous systems, and reduction of instincts.

Owing to accidents, the number of individuals tends constantly to diminish, yet it must be maintained. The single way that organisms have of making good losses or increasing their numbers is by dividing; this is the essence of reproduction (q.v.). Of especial significance is the fact that in all groups of animals the bits which have been constricted off (gametes) from time to time unite in pairs to form zygotes before going on with their development. In all reproduction the dividing individuals give rise to two incomplete individuals, except in the case where the division separates a "germ cell" from the body that carried it. The divided pieces or the germ cells are imperfect representatives of the species; they must "regenerate" or "develop" to produce the adult condition. See EMBRYOLOGY; REPRODUCTION.

The relations of animals to other organisms are varied. Many animals, especially in the higher groups, care for their young. Many protect themselves from their enemies by concealment or by flight; others are powerful for offense and defense. On account of the mating instincts, many higher animals have gained peculiar methods of appealing to the eye or ear or smell of other members of the species.

ANIMAL CHEMISTRY. See CHEMISTRY, PHYSIOLOGICAL.

ANIMAL COLORS. The chief animal colors now in use are cochineal, kermes, and lac dye (qq.v.). See also PURPLE.

ANIMALCULE (dimin. of Lat. *animal*, living being). A popular name originally applied to any small animal, but later restricted to microscopic organisms, particularly such as are found in water. The term has no scientific standing and is now little used except in compound names, such as *bell-animalcule*, *wheel-animalcule*, *bear-animalcule*, very different sorts of animals elsewhere described.

ANIMAL FLOWER. A sea-anemone or similar polyp, whose expanded colored tentacles resemble the petals of a blossom. For illustration, see SEA-ANEMONE.

ANIMAL HEAT. Heat generated in the animal body by oxidation of its tissues. In order to understand heat production, distribution, and regulation it is necessary to consider the animal body as a machine for converting potential energy, which is food, into the actual energy of heat and physical work, heat being merely a form of energy. The source of animal energy lies in the oxidation of its waste products, or, more specifically, in the conversion of proteids, fats, and carbohydrates into urea, carbonic acid, and water; and the only two ways by which this energy is liberated are as heat and mechanical labor. In the building up and repairing of tissue (anabolism) heat is ab-

sorbed and converted into its latent form, while during the process of breaking down (katabolism) heat is set free. The muscular system, in which these processes are very active, is obviously, then, the chief source of heat, and next in importance are the large secreting glands, such as the liver. Comparing the temperature of the blood as it enters the liver through the portal vein, with that as it leaves this organ by way of the hepatic vein, we find an increase of about 2° C., showing that the liver has raised the temperature to this extent. The blood itself is not an appreciable source of heat, but acts as an oxygen carrier and a distributor of warmth, bearing heat to the two great regulators of the body temperature, the skin and lungs, where dissipation takes place by evaporation; in the case of the skin, through the medium of perspiration. In animals like the dog, which do not perspire freely, respiration is the chief mechanism of heat regulation, and active exercise is attended by a correspondingly increased respiratory activity (panting). In human beings the skin is the chief regulator of body heat. The process of heat regulation is further controlled by certain areas in the brain and spinal cord, similar to those governing the vaso-motor system, these heat centres in their turn being stimulated or inhibited by afferent impulses from the surface, transmitted through the sensory nerves.

In man the average temperature is about 98.6° F. (36.8° C.), varying with circumstances, being somewhat higher after exercise or a hearty meal and at noon than at midnight. It differs slightly in various parts of the body, the interior being from ½° F. to 1½° F. higher than the surface. It also varies in diseased conditions of the body, rising to 106° F., or even 111° F. or 113° F. in sunstroke or heatstroke, and falling as low as 90° F. in cholera. A temperature of 108° F., if maintained for several hours, is almost inevitably fatal. In starvation a constant phenomenon is the marked fall of temperature, which becomes very rapid as death approaches. In most fish and reptiles, commonly termed "cold-blooded," the temperature differs but little from that of the water or air in which they live; the same is true in hibernating animals during the later part of their torpid condition.

Throughout the animal kingdom the power of generating heat bears a close relation to the activity or sluggishness of the animal. Many birds which are perpetually in action have the highest temperature (100° F. to 113° F.) and the swallow and quick-flighted birds higher than the fowls which keep to the ground. The higher the standard of animal heat, the less able is the animal to bear a reduction of its temperature; if that of a bird or animal be reduced 30° F. the vital changes become slower, and death finally ensues. Fish and frogs, on the other hand, may be enclosed in ice and still survive. Consult Kirkes, *Textbook of Physiology* (Philadelphia, 1907). See METABOLISM.

ANIMAL MAGNETISM. See HYPNOTISM.

ANIMAL PSYCHOLOGY. That department of psychology (q.v.) which has for its subject matter the description of mind as it is found in animals below man. It is frequently called comparative psychology, although that term is more properly reserved for the comparative study of the mind of animals including man. In general, the method of animal psy-

chology consists in the observation of the behavior of animals under various conditions, in the examination of their nervous structure, and in the interpretation, as indicators of mind, of the facts of behavior or structure or both in their relation to human behavior and structure. At first sight the observations of animal psychology appear to differ widely from the detailed verbal reports given in laboratory experiments upon the human subject; the difference is, however, more one of degree of precision than of kind. The special method of normal psychology is the method of introspection (q.v.). Introspection implies, on the part of the subject, observation and a report, and, on the part of the psychologist, an interpretation of the report on the basis of analogy between the psychologist's own mind and the mind which he interprets. The analogy may always be assumed to exist because the psychologist and his fellow being, whose mind he infers, are similar creatures, that is to say, their individual behavior and physiological structure are similar. In much the same way that the human subject introspects, the animal may be said to "observe," in that it clearly experiences certain phenomena, and to "report upon" these phenomena, in that it exhibits gross bodily movements subsequent to the experience. The flight of the deer at the sound of the hunter's gun may be regarded as no less a report upon experience than are the more refined movements of writing or speaking which constitute description by the human being. The difference lies in the accuracy with which the two reports may be interpreted. Gross bodily movements are much less precise and admit of much less specificity of meaning than do the movements involved in language, and the reliability of accurate interpretation on the basis of analogy to the human mind is decreased when there is greater diversity of bodily structure and general behavior between the animal and the human subjects. In the flight of the deer from the hunter, since this diversity is not so great, we may assume something not wholly unlike the human emotion of fear; in the flight of the infusorian from the drop of acid the likeness of conscious experience is much less probable. We may say, then, that the method of animal psychology is, in principle, the same as that of human psychology, but that the interpretation of data is much less precise, and that the degree of precision is least when the diversity of structure and behavior between the animal and man is greatest.

A very frequent resource in animal psychology of an earlier date is the anecdote. In the writings of Darwin and Romanes it forms the principal basis for conclusions concerning the animal mind. The anecdotal method is, however, open to serious objection, in that it does not distinguish carefully between fact and interpretation of fact; moreover, personal bias is not excluded, and superficiality of observation is not condemned. Washburn objects to the method on five grounds: "The observer is not scientifically trained to distinguish what he sees from what he infers. He is not intimately acquainted with the habits of the species to which the animal belongs. He is not acquainted with the past experience of the individual mind concerned. He has a personal affection for the animal concerned, and a desire to show its superior intelligence. He has the desire, common to all humanity, to tell a good story." Wundt

gives a specific instance of the error from Romanes's *Animal Intelligence*. "I have noticed," writes an English clergyman, "in one of my formicaria, a subterranean cemetery where I have seen ants burying their dead by placing earth above them. One ant was evidently much affected and tried to exhume the bodies; but the united exertions of the yellow sextons were more than sufficient to neutralize the effort of the disconsolate mourner." "How much," asks Wundt, "is fact, and how much imagination? It is a fact that ants carry out of their nest, deposit near by, and cover up dead bodies, just as they do anything else that is in their way. They can then pass to and fro over them without hindrance. In the observed ease they were evidently interrupted in their occupation by another ant and resisted its interference. The cemetery, the sextons, the feelings of the disconsolate mourner, which impelled her to exhume the body of the departed—all this is a fiction of the sympathetic imagination of the observer."

The obvious deficiencies of this anecdotal method have led to its almost complete abandonment in favor of the method of experiment. In 1883 Lord Avebury (Sir John Lubbock) published his experimental work on "Ants, Bees, and Wasps," and two years later Romanes reported experiments on cœlenterates and echinoderms. Many German investigators followed in the same path. The publication, in 1898, of Thorndike's *Animal Intelligence*, a book containing the results of experiments made under rigidly controlled conditions upon cats, dogs, and chicks, initiated a period of rapid development in experimental animal psychology and has been followed by a great body of researches into the behavior of various forms from protozoa to vertebrates.

A number of special experimental methods have been developed, particularly in the work upon vertebrates. The observation of structure and behavior have been supplemented by the observation of the alteration in behavior that takes place upon the extirpation of certain parts of the central nervous system or of the peripheral sense-organs. Methods of training have also been worked out. Animals have been required to associate food-getting with special conditioning factors, as color, shape, place. (See LEARNING IN ANIMALS.) The "puzzle-box method," originated by Thorndike, and the "maze method" have been widely utilized. In the former, the animal is required to let itself either out of or into a cage by undoing, often in a given order, a more or less complicated series of fastenings; in the latter, it learns to find its way without mistakes through a labyrinth. In either case the incentive may be hunger, in which event the animal is fed after a successful trial, or it may be desire for freedom or for the nest. In one form of the maze method the creature is punished by an electric shock whenever the wrong path is taken. Sometimes the method of extirpation and of training are combined, and the animal, after learning a problem, is subjected to operation in order to see what the effect may be upon the special association. Thus rats, which had learned a maze, were found to run the course almost as well after their eyes had been removed. An experimental lesion in the frontal lobes of the brains of monkeys was found to result in the loss of recently formed associa-

tions but not of those of long standing. Another method of training (Pawlow) consists in the formation of an association between some irrelevant stimulus and food, and the subsequent measuring of the strength of the association by the amount of salivary secretion that occurs upon the presentation of the originally irrelevant stimulus.

The advantages of the experimental are clear. The conditions are strictly controlled, the observer is impartial and is ordinarily trained in scientific observation. The method, however, presents the danger that the animal will not behave naturally in the surroundings of the laboratory. Fear and loneliness, as well as the extreme hunger used as a motive in some experiments, are not the natural circumstances under which the animal is accustomed to act. With the lower animal forms natural conditions can be fairly well approximated. For the higher forms "the ideal method," Washburn maintains, "involves patient observation upon a specimen known from birth, watched in its ordinary behavior and environment, and occasionally experimented upon with proper control of conditions and without frightening it or otherwise rendering it abnormal."

The tendency, evident in Darwin, Romanes, and their contemporaries, toward the more extremely anthropomorphic interpretation of the facts of animal behavior was the direct result of the Darwinian theory. The Cartesian notion of animals as automata could no longer suffice. From the point of view of the theory of evolution, which regards not only the entire physical structure of the human body, including the nervous system, but also the entire mental structure, which stands in intimate relation to the nervous system, as the result of a long period of development in the animal world, the demonstration of the pre-human mind becomes a necessity. As long as there was opposition to the theory of evolution, its adherents sought for evidence of human intelligence in animals; and this effort, coupled with the inevitable leaning toward anthropomorphic interpretation, led to an undue ascription of human faculties to animals. When, however, the opposition to Darwin's theory had abated, interest centred less in bridging the gulf between the animal and the human mind than in establishing a definite mental scale from the lowest forms up to man,—such a scale as the doctrine of evolution would naturally imply. It now became possible to formulate a principle of parsimony for the interpretation of observed data. Thus Lloyd Morgan laid it down as fundamental that "in no case may we interpret an action as the outcome of the exercise of a higher psychical faculty, if it can be interpreted as the outcome of the exercise of one which stands lower in the psychological scale." It was, of course, the purpose of this principle, which has received quite general acceptance, to offset the obvious tendency to read human consciousness into the performances of animals. The chief argument against the principle seems to be that it is not necessarily implied in the method of animal psychology. "But what," says Lloyd Morgan, "it may be asked, is the logical basis upon which this principle is founded? If it be true that the animal mind can only be interpreted in the light of our knowledge of the human mind, why should we not use this method of interpretation freely,

frankly, and fully? Is there not some contradiction in refusing to do so? For, first, it is contended that we must use the human mind as a key by which to read the brute mind, and then it is contended that this key must be applied with a difference." The justification, it appears, is found in the doctrine of evolution. "Here evolution is postulated. The problem is this: Given a number of ascending grades of organisms, with divergently increasing complexity of organic structure and correlated activities: granted that associated with increasing organic complexity there is increasing mental or psychical complexity: granted that in man the organic complexity, the complexity of correlated activities, and the associated mental or psychical complexity, has reached the maximum as yet attained: to gauge the psychical level to which any organism has been evolved." Thus we assume, on the evolutionary hypothesis, greater simplicity of mind in the lower animal forms, and then adopt the principle of interpretation which is capable of giving results consistent with that premise.

We have seen that the method of animal psychology aims at a description of mind in conscious, living individuals. It presupposes the existence of mind. The question, however, is often asked: What is the criterion of mind? Does all life imply consciousness, or are mental processes first found only at some definite point in the biological scale? Various answers have been given. Some critics have maintained that there is no reliable evidence of mind in any animal, that animal psychology should therefore be abandoned, and that the behavior of organisms below man should be regarded merely as a group of physiological manifestations. Bethe, who, in his study of ants and bees, is an often-quoted expositor of this position, would explain all their complex activities by references to physiological reflexes and even deny them consciousness. More recently there has developed a study of animal behavior for its own sake, without regard to the characteristics of consciousness that the behavior implies; and not infrequently a "behaviorist" suggests that the consideration of mind in connection with the data of behavior is secondary to the real interest of the animal psychologist. Most students of animal activities, however, continue to ascribe consciousness to at least some creatures below man.

These latter investigators form two groups. The first group holds that not all animals are conscious, but only those higher forms which exhibit certain evidences of consciousness. The criterion of mind most usually accepted is the modifiability of behavior by experience. Both Loeb and Morgan hold this view. The former ascribes modification to "associative memory," which is "the fundamental process which occurs in all psychic phenomena"; if the animal can learn, that is to say, it has associative memory and therefore mind. The chief objection to such a position is that all animals and many inanimate objects alter their performance after being repeatedly acted upon by an outside agent. Washburn mentions the wood of a violin, which "reacts differently to the strings after it has 'experienced' them for 10 years." The implication of mind is evidently greatest when the modification occurs upon the first repetition of the experience; hence we may say that, when an animal *rapidly* alters its behavior upon the

repetition of a given situation, the evidence for consciousness is very strong. Loeb fails to find that the lower organisms satisfy his criterion for psychical processes, and explains their activities by reference to a purely physiological reaction, the tropism (q.v.), which is a response "brought about automatically or mechanically" by an agent acting directly upon the organism.

Jennings, on the other hand, discovers evidence of modification of behavior among even the lowest animal forms, and, in contradistinction to the theory of tropisms, attributes certain kinds of organic response to a method of trial and error. He maintains, however,—and it seems correctly,—that there is no real difference between Loeb and himself. The former has assumed a physico-chemical principle, the tropism, and has sought synthetically to build up therewith the simpler forms of behavior. Such forms as could not be synthesized he has missed. Jennings, on the contrary, has worked analytically from behavior down toward an equally mechanistic explanation, although in many cases he has not been able to push his analysis to the limit. Thus Loeb, working from both ends of the biological scale, denies mind to the lower animals, while Jennings, who works continuously down from above, admits its possibility. Now a criterion of the kind put forward by Loeb is, in general, open to the objection that it implies the discontinuity of a series, into which mind is introduced at one particular stage; in particular, the indefiniteness of the criterion actually chosen makes it again unsatisfactory. Since modification of behavior may occur anywhere in the scale, it cannot itself alone serve as the index of mind. If, on the other hand, we accept only such rapid alteration in behavior as will insure the presence of mental process, we find that we cannot even be assured of the existence of consciousness in those animals whose similarity of nervous structure to that of man makes the denial of mind an absurdity. Structure alone, we may add, cannot serve as a criterion, for it is continuous in its forms throughout the scale and affords no opportunity for the elimination of consciousness at any special point. The alternative, at present, then, seems to be to assume consciousness at all points in the biological scale—a notion, which is not inconsistent with the theory that certain of the earliest organic movements were conscious. See ACTION.

The results of experimental work upon the protozoa have shown that the mind of these lowest forms of animals must be of the very simplest. Yerkes observes: "The mind of the one-celled animals consists of a certain limited number of sense qualities, together with the feelings of agreeableness and disagreeableness. There is no sufficient reason for assuming that the animals experience ideas, memories, emotions, sentiments, thoughts, or any of the psychic complexes which have been observed in man. Theirs must be lives of simple awareness of certain features of their surroundings, without even the consciousness of self as distinguished from environment." Amœba, for example, is capable of but three, or at most four, different reactions. A weak mechanical stimulus, such as would be encountered in the ordinary movement of the animal, brings out a positive reaction, that is to say, the amœba pro-

ceeds toward the stimulus; a particle of food elicits a food-taking reaction, in which two pseudopodia are advanced and the food is engulfed; any other stimulus—mechanical, chemical, thermal, photic, galvanic—causes the negative reaction, in which the animal moves away from the source of stimulation. When suspended in water, the amœba throws out pseudopodia until one of them comes in contact with a solid body. There is no reason to suppose that a single reaction is accompanied by more than one sensory process, unless the positive reactions are attended by a vague agreeableness, and the negative, by a dim disagreeableness. At most, however, the consciousness of the amœba can hardly involve more than three or four simple experiences. There can scarcely be any reference to objects, any imagery, any memorial revival, or any ideas. See CHEMICAL SENSE IN ANIMALS; MECHANICAL SENSE IN ANIMALS.

In the lower metozoa—sea anemones, jelly fish, worms, crabs, etc.—we find an increased complexity of both structure and behavior; specific organs, including sense organs, appear; and the forms of reaction are more numerous and more highly differentiated. Consequently we may assume the presence of many more sense qualities than we allowed to the protozoa and the arrangement of these qualities into simple conscious patterns. Some observers would interpret the modification of behavior by experience, in certain of these creatures, as indicating the presence of imagery. Such an interpretation seems, however, to be exceedingly problematical. See IMITATION IN ANIMALS; MEMORY IN ANIMALS.

Among the higher invertebrates—the ants, bees, wasps, and other social insects—we find an exceedingly complex behavior, which, as we have noted, has been interpreted by some to imply a consciousness comparable with that of man. Other investigators have emphasized the instinctive character of the activities of these animals and have been content to consider the higher insects as mere automata. Still others take intermediate ground. The truth is that the insects represent a line of development divergent from the course of evolution that has culminated in man, and it is therefore difficult to describe the insect mind from the analogy of human consciousness. Either we may, because of the fixed character of behavior, assume that the performances of bees and ants are largely reflex and only infrequently conscious, or, on the basis of the relation between emotion and instinct in the human subject, we may attribute a very complex affective consciousness to these creatures. See ANT; BEE; INSECT, *Social Insects*; INSTINCT.

In the vertebrates below the mammals behavior is not so complicated as in the insects, but it indicates a mind more nearly of the human type. The birds and reptiles show some evidence of imagery. Among the mammals vastly more complicated consciousnesses appear; and Yerkes has compared the mind of the cat or dog to that of the human infant in its first year, and the mind of the highest apes to that of the human child in its first three years. In general, we may conclude from the mass of experimental evidence that the vertebrate consciousness is not unlike the human, in that it is characterized by complex patterns of a great variety of sensory and imaginal processes, often

affectively toned. The principal difference between the mind of man and the mind of other vertebrates seems to be that in the latter there is a predominance of sensory experience. Indeed the question has been raised whether any animals possess free ideas, that is to say, ideas referring to absent objects and not grouped about an immediate sensory core; and it is generally admitted that, if such ideas occur, they must be very infrequent. See animal articles on CHEMICAL SENSE; HEARING; IMITATION; LEARNING; MECHANICAL SENSE; MEMORY; VISION.

ANIMALS, CRUELTY TO. See CRUELTY TO ANIMALS.

ANIMAL WORSHIP. See RELIGION.

AN'IMA MUN'DI (Lat. the soul of the world). The view that all the changes in phenomena are due to the operation of conscious beings, conceived on the analogy of human consciousness, was the result of one of the most primitive and most naïve attempts to solve the problems presented to experience by change and chance. (See MYTHOLOGY.) When the early philosophers in any race advanced from a belief in a multiplicity of presiding genii to a belief in a single ordering consciousness, which stands in the same relation to the world as a whole as the human mind stands to the human body, the doctrine of the *anima mundi* was reached. It has been held in various forms and has survived to quite recent times. Anaxagoras, who believed in a universal reason that gave form to the universe, was one of the first Occidental philosophers who held this doctrine. Aristotle escaped animism (i.e., the doctrine of an *anima mundi*) by holding that although Nature is a being in itself alive, God is separated from nature as a transcendent spirit. In the system of the Stoics the *anima mundi* was conceived to be the sole vital force in the universe; it usurped the office of pure spirit, and the doctrine became indistinguishable from pantheism. In modern times Agrippa of Nettesheim (1486-1535) revived the doctrine with a changed terminology, substituting *spiritus mundi* for *anima mundi*. Bruno, Paracelsus, Sebastian Franck, Boehme, Van Helmont, More, and Cudworth (see articles under these titles) have advocated similar views with varying terminology. See PANTHEISM.

ANIMÉ, an'i-mā or mē (of disputed origin). A variety of copal; a white, brittle mineral resin soluble in alcohol and used, to some extent, in the manufacture of sealing wax and of varnishes. See COPAL.

AN'IMISM (from Lat. *anima*, soul), the

belief in spiritual beings. The classical expression of the doctrine of animism, with reference to primitive peoples, was given by E. B. Tylor in his *Primitive Culture*. The idea of a spiritual double, according to Tylor, is first suggested to the mind of the savage by his dream experiences. In his dream he visits his friends and performs various acts, whereas the assurances of his mates convince him that his body has all the while been quietly at rest. These impressions are verified by certain observations during waking hours. The reflection in the water, faithful to its original but possessed of a strange independence; the shadow, ever present but also exhibiting ways of behavior all its own; the echo—all bespeak the presence of a double, modeled after the individual but only in part dependent on it and of a more fleeting and evasive nature. The ideas thus suggested are presently applied by the savage to the interpretation of sickness, coma, death. The possible importance of apparitions and hallucinations, in this connection, has been emphasized by Andrew Lang (*The Making of Religion*). Analogous experiences are responsible for the doubles of animals, plants, inanimate objects. Animism thus becomes a general philosophy of nature utilized by the savage in his attempts to interpret the animate and inanimate world that surrounds him.

The explanation of animism given by Herbert Spencer (*Principles of Sociology*, vol. i) differs somewhat from that presented above. Spencer's primary concern was with the human double, the origin of which he explained by considerations practically identical with those advanced by Tylor; he did not, however, apply the same argument to the rest of animate and inanimate nature, but populated it with human spirits.

The idea of a spiritual entity, as held by the savage, must not be conceived of as utterly devoid of all properties of matter. While free from some of the gross characteristics of objective nature, the soul or spirit is possessed of a certain tenuous substantiality, which makes it possible to prevent its escape from a body by closing all the exits, and which necessitates the presence of a hole, however small, if the spirit is to enter an object or a being.

While no sharp line is drawn in primitive thought between good and evil spirits, spiritual agents are almost universally made use of in the interpretation of disease. The sick man is possessed by a foreign spirit that has entered the body, perhaps during the absence of the patient's own double; and, if health is to be restored, the intruder must be removed. To effect this is commonly the function of the medicine man who, by rubbing, sucking, or striking, induces the disease spirit to leave the body, and presently produces its material embodiment in the form of a small pebble or some other small object.

The doctrine of animism, as an interpretation of savage belief, held absolute sway during the last third of the nineteenth century. Barring the speculative considerations adduced by Spencer and Tylor, an insight into the nature of primitive animism may best be secured by the study of such works as Theodor Koch's "Zum Animismus der südamerikanischen Indianer" (*Internationales Archiv für Ethnographie*, vol. xiii, Supplement) or Waldemar Bogoras' "The Chukechee," part ii, "Religion" (*Publications of the Jesup North Pacific Expedition*, vol. vii).

Since Tylor first proclaimed his minimum defi-

nition of religion as the "belief in spiritual beings," the problem of animism has often been identified with that of religion. In recent years serious objections have been advanced against the legitimacy of such identification. While it is true that all peoples so far investigated were found to profess both animism and religion, a belief in spirits does not *per se* involve a religious attitude. On the other hand, religious emotion may well be aroused by agencies and situations lying outside the domain of animism. See RELIGION.

Others have criticised the conception of a double. Lévy-Bruhl, in particular, has attempted to show that the prevailing belief among primitive tribes is in a multiplicity of spiritual entities or souls, whereas the belief in a double seems to have a rather limited distribution (*Les fonctions mentales des sociétés inférieures*; compare also Wundt's discussion of the soul in his *Völkerpsychologie, Mythos und Religion*, part i).

It has also been claimed in various quarters that the belief in spirits cannot be conceived of as really primitive, that there must have been a "pre-animistic stage," which knew no spirits but endowed nature with vague and undifferentiated magical powers which, while efficient, were also elusive and did not assume the form of individualized entities (Marett, Preuss, Hubert and Mauss, Lévy-Bruhl, Durkheim). Such magical powers are often designated by the Polynesian term *mana*.

The last 25 years have seen much careful and systematic research of savage beliefs. Of these studies was born the conviction that primitive animism ought not to be conceived as a philosophy of nature. Deliberate systematization of his experiences is foreign to the mind of the savage. What animism thus comes to mean is not that the savage conceived of spiritual entities behind all phenomena of objective nature, but that whenever he thought or felt in terms of causes, these causes were for him spiritual entities. His thinking and feeling, moreover, in this as in other connections, were spontaneous, unsystematic, often self-contradictory.

However that may be, animism must be regarded as the most common form taken by primitive beliefs, which have survived in the innumerable animistic superstitions of modern European peasants and, having traveled along the highways and byways of mental progress, still blossom forth in the churches, parlors, and garrets of civilization.

ANIMUCCIA, ä'nè-mōōt'chà, GIOVANNI (c. 1500-71). An Italian musician sometimes called the "Father of the Oratorio." He became maestro di capella of the Vatican in 1555. For the congregation of the Oratory, one of whose objects it was to render religious services attractive to young people, Animuccia composed the *Laudi*, which were to be sung at the conclusion of the regular office, and from which the oratorio is said to have developed. Several of his masses, magnificats, motets, madrigals, etc., have been published, and among these the following are a few of the most noteworthy: *Il primo libro di madrigali, etc.* (Rome, 1595); *Joannis Animucciae Magistri Capellæ Sacrosanctæ Basilicæ Vaticanæ Missarum Libri* (Rome, 1567); *Magnificat ad Omnes Modos* (Rome, 1568); *Il secondo libro delle laudi ove si contengono motetti* (Rome, 1570). See ORATORIO.

ANIMUCCIA, PAOLO (?-1563). An Italian

musician, brother of Giovanni Animuccia. He was one of the ablest contrapuntists of his time and occupied the position of maestro di capella at the church of San Giovanni in Laterano from 1550 to 1552. Many of his motets and madrigals were popular.

ANIO, ä'nè-ō, modern **ANIENE**, ä'nè-ā'nā, or **TEVERONE**. A river in central Italy, 69 miles long, which rises 44 miles east of Rome in the Sabine Mountains, forms famous waterfalls at Tivoli (q.v.), and then flows freely through the Campagna into the Tiber 2 miles above Rome. An aqueduct was built in 265 B.C., with the proceeds of booty taken during the war with Pyrrhus to carry water from Tivoli to Rome. The water power of the Anio is now converted into electric energy, which is transmitted to Tivoli and Rome. See AQUEDUCT.

AN'IONS. See ANODE; ELECTRO-CHEMISTRY.

AN'ISE (Lat. *anisum*, anethum, Gk. ἀν[ν]-ηθον, an[n]ēthon, anise, dill), (*Pimpinella anisum*). An annual plant of the family Umbelliferae. The genus *Pimpinella*, which embraces about 75 species, natives of the Old World, has compound umbels usually without involucre. One European species, adventive in waste places in the eastern United States, *Pimpinella saxifraga*, is known as burnt saxifrage or pimperl, and has no properties of importance. Anise is a native of Egypt and other Mediterranean regions. It is an annual plant; the stem is 1½ to 2 feet high, dividing into several slender branches; the lower leaves roundish, heart-shaped, divided into three lobes, and deeply cut; those of the stem pinnate, with wedge-shaped leaflets. The umbels are large and loose, with yellowish-white flowers. It is much cultivated in southern Europe, Germany, especially in the district around Erfurt, where a large quantity of the seed is annually produced, South America, India, etc. Attempts were made more than 200 years ago to cultivate it in England, but the summers are seldom warm enough to bring it to perfection. It is occasionally sown in gardens for a garnish or for seasoning. Aniseed is used as a condiment and in the preparation of liqueurs; also in medicine, as a stimulant stomachic, to relieve flatulence, etc., particularly in infants; and it has been used in pulmonary affections. It has an aromatic, agreeable smell and a warm, sweetish taste. It contains a volatile oil, called oil of anise, which is nearly colorless, has the odor and taste of the seed, and is employed for similar purposes. One hundred-weight of seed yields about two pounds of oil, which is obtained by distillation; but at Erfurt the oil is made from the stems and leaves.

ANI'SOPHYLL'LY (Gk. ἀν, an, neg. + ἴσος, isos, equal + φύλλον, phyllon, leaf). This is the phenomenon of the production on the same shoot of two sorts of leaves, large and small. It is well illustrated by several species of *Selaginella*, which possesses four vertical rows of leaves, two large and two very much smaller. In this plant the cause of the unequal size of the leaves is not known, but in other cases it has been shown to be due to the unequal action of various factors, the most important of which are light and gravity. The influence of the latter is shown in the development of anisophyllous rosettes upon the oblique stems of *Sempervivum*, while vertical stems of the same plant produce symmetrical rosettes, since all sides of the stem are equally exposed to the action of gravity. Consult Figdor, W., *Die*

Erscheinung der Anisophillie (1909), Boshart, K., *Beiträge zur Kenntnis der Blattasymmetrie und Exotrophie*, and *Flora* 103: 91-124 (1911). See LEAF.

ANJER, än'yër, or **ANJIER**, än'yër. A fortified seaport of Java, on the Straits of Sunda, 60 miles west of Batavia (Map: East India Islands, C 6). It is the landing place for passengers and mails for Batavia and is frequented by steamers for a supply of fresh water and food. In 1883 it was completely destroyed by a wave caused by the volcanic destruction of the neighboring island of Krakatoa, but it has been rebuilt since. Its population is estimated at 3000.

ANJOU, *Eng.* än'joo; *Fr.* än'zhoo' (from *Andecavi*, *Andegavi*, a Gallic tribe). A former province of France, now forming the department of Maine-et-Loire, and small parts of the departments of Indre-et-Loire, Mayenne, and Sarthe. It was inhabited in ancient times by the Andecavi, whose ancient capital bears the modern name of Angers. Under Fulk III Nerra (987-1040) the county of Anjou became very powerful; through his victories and those of his son Geoffrey Martel (1040-60), the counties of Touraine and Maine became subject to Anjou, and the Count of Blois was humbled. From this time amid the alternating fortunes of war Anjou remained one of the great powers in France. The most celebrated of the counts of Anjou was Geoffrey IV (1129-51), called Plantagenet, whose son by Matilda, daughter of Henry I of England, ascended the English throne in 1154 as Henry II. Anjou remained in the possession of the English kings till 1203, when it was seized by Philip Augustus. Some 40 years later it was bestowed as a fief upon Charles, the son of Louis VIII, who became by conquest in 1266 the founder of the Angevin line of kings in Naples and Sicily. At this time for nearly half a century it was united with Provence. From 1328 to the year 1360, in which it was made a duchy, it was held by the French crown as a part of the dowry brought by Margaret of Anjou to Charles of Valois, father of Philip VI. It was reunited with Provence under the rule of the kings of Naples in 1382. In 1480, upon the death of René the Good, it was annexed to the royal dominions by Louis XI. The last who bore the title of Duke of Anjou was the grandson of Louis XIV, who became Philip V of Spain. Consult Marchegay and Salmon, *Chroniques des comtes d'Anjou* (Paris, 1856-71).

AN-JU, än'joo'. A town of northwest Korea, 18 miles from the Gulf of Korea and 160 miles northwest of Seoul (Map: Korea, G 4). It became important during the Russo-Japanese War because of its nearness to the scene of operations.

ANKARSTRÖM, än'kär-strēm, JOHAN JAKOB. See ANCKARSTRÖM.

AN'KERITE. A carbonate of calcium, magnesium, and iron isomorphous with dolomite and siderite (q.v.) and intermediate between them in composition. It crystallizes in brownish to grayish rhombohedra closely resembling those of dolomite. It occurs chiefly in deposits of iron ore and is found in the hematite mines of Antwerp, N. Y., near Londonderry, Nova Scotia, and in the Styrian and German iron mines. It is named after Professor Anker of Styria.

ANKLAM, än'klām. A town of Prussia in the province of Pomerania, 44 miles northwest of Stettin, on the right bank of the Peene, and

4 miles from its mouth in the Kleine Haff (Map: Prussia, E 2). The river is navigable to Anklam, which has long been commercially important. Many of its private houses are excellent samples of German mediæval architecture. It manufactures linens and woollens and sugar, and has breweries, soap works, tanneries, and ship yards. There is considerable trade in the products of its home industries. Anklam was settled by Germans in the twelfth century and joined the Hanseatic League in 1244. During the wars of the seventeenth and eighteenth centuries it was repeatedly sacked. In 1720 it was acquired by Prussia. Pop., 1890, 13,000; 1900, 14,600; 1905, 15,604; 1910, 15,282.

ANKOBAR, än-kō'bēr, or **ANKOBER**. A town in eastern Africa, the former capital of the Abyssinian kingdom of Shoa, situated at an altitude of over 8000 feet, in lat. 90° 34' N. and long. 39° 53' E. (Map: Africa, H 4). The climate is healthful. Its population is estimated at 2000.

ANKO'RI or **ANKO'LE**. A plateau of the Uganda Protectorate, British East Africa, lying between lakes Albert Edward and Victoria.

ANKYLOSIS, än'kī-lō'sīs (Gk. ἀγκύλωσις, *ankylōsis*, a stiffening of the joints, from ἀγκύλη, *ankylē*, the bend of an arm, a joint bent and stiffened by disease). A term used in surgery to denote joint fixation not dependent upon muscular rigidity. It results from injury or disease, causing the formation of fibrous adhesions or the deposit of new bone between the articular surfaces. Osseous union may render the joint perfectly rigid, while fibrous union permits a certain amount of motion. In surgery fibrous is also known as *false*, and bony as *true* ankylosis. The elbow is especially apt to become ankylosed. In the knee or hip-joints osseous ankylosis is the preferable form, as the limb can then afford a rigid support. Joints stiff through a membranous ankylosis may be forcibly bent, and the bond of union ruptured, so as to restore mobility or allow of their being placed in a convenient position. Ankylosis of the joints between the ribs and the vertebræ is common in advanced age; and there are some cases on record of universal ankylosis of all the joints. Ankylosis is caused by injury, tuberculosis, gout, rheumatism, and syphilis. Passive motion, friction, massage, douches, and forcible motion under an anæsthetic are methods of treatment.

ANKYLOSTOMIASIS, än'kī-lō-stō-mī'ā-sīs (Gk. ἀγκύλος, hooked, and στόμα, mouth) or "Miners' Anæmia," is caused by the presence of an intestinal nematoid worm, the *Ankylostoma duodenale*, which acts like a bloodsucker. The disease was discovered by Dubini in 1838 and has been variously named brickmakers' anæmia, tunnel anæmia, Egyptian chlorosis, and Dochmiasis, the latter from the genus *Dochmius*, to which *A. duodenale* belongs. The worm is from 1-60 to 1-25 inch long and nearly cylindrical. Its head is provided with sucking discs and hooklets. The symptoms are those of simple anæmia, with or without bloody diarrhœa. It attacks principally miners. The disease was epidemic among coal-miners in Belgium in 1894, having been brought there by Italian laborers from the St. Gotthard tunnel. Access to the body is gained through the medium of food or soiled hands. Treatment consists of killing the parasites with anthelmintics after emptying the bowels with cathartics, and then relieving the anæmia with

arsenic, iron, or other tonics. As a prophylactic measure, all defecations should be disinfected and strict cleanliness be practiced. See **HOOKWORM DISEASE**.

AN'NA. A city in Union Co., Ill., 36 miles northwest of Cairo, on the Illinois Central Railroad (Map: Illinois, C 6). It is an almost purely agricultural community, producing wheat, corn, hay, fruit, and vegetables. Anna is the seat of the State hospital for the insane, and has a public library. The city owns its water works. Pop., 1890, 2295; 1910, 2809.

ANNA (Hind. *ānā*). An East Indian coin, a sixteenth of a *rupee* (about 33 cents), or about two cents of United States money. The anna is money of account only, though half and quarter annas are coined.

ANNA, SAINT, or ANNE. According to tradition, the wife of St. Joachim. After 21 years of barrenness, she is said to have given birth to the Virgin Mary, the mother of the Saviour. Nothing positive is known about her life; her name does not occur in the Scriptures. The first source for the tradition is the *Proto-evangelium* of James. Her cult can be traced to the fourth century, but toward the eighth she was widely invoked. Her body was believed to have been transferred from Palestine to Constantinople in 710 A.D. Düren, in the Prussian Rhine Province, Ursitz, in the diocese of Würzburg, and other churches claim to possess remains. The Roman Catholic church has a festival in her honor on July 26, established in 1584; the Greek, on December 9. In Austria, Bavaria, and other Catholic countries, this festival is one of great importance. The Fraternity of St. Anna was instituted in the thirteenth century. After the Reformation it was organized anew by the Jesuits and in modern times has manifested some vitality in Bavaria and Catholic Switzerland. She is the patron saint of child-bearers and miners, and it was upon her that Luther called for protection when in the storm, and to her he vowed to become a monk if rescued (1505). The shrine of St. Anne de Beaupré near Quebec is the most famous centre of her cult in America.

ANNABERG, än'nä-bërk. A town of the kingdom of Saxony, in the district of Zwickau, on the right bank of the Selma, 18 miles south of Chemnitz (Map: Germany, E 3), situated 1970 feet above the level of the sea. Originally Annaberg was a mining town and gained her importance in that industry. Barbara Uttmann, in whose honor a statue has since been erected, introduced lace-making in 1550, and since then the town has been chiefly occupied in the manufacture of lace and ribbon, much of which is exported to the United States. Pop., 1890, about 15,000; 1905, 16,813; 1910, 17,025.

AN'NABERGITE. A hydrous nickel arsenate which frequently accompanies nickel and cobalt deposits. It occurs in bright, apple-green fibres and earthy crusts.

ANNA COMNE'NA (1083-1148?). Author of one of the most valuable works in the collection of the Byzantine Historians. She was the daughter of the Emperor Alexius I (Comnenus) and was born on Dec. 1, 1083. She received the best education that Constantinople could give and was betrothed to the son of Michael VII. After the death of her fiancé she married Niephorus Briennius. During the last illness of her father she entered into a scheme to induce him to disinherit his eldest surviving son, John, and to be-

stow the diadem on her husband. After her father's death she plotted against her brother, and as a punishment, Anna, with her mother, was shut up in a convent, where she remained until the death of her brother in 1143. The date of her death is unknown, but she was still at work on her history in 1148. She entitled this work the *Alexiad*. The first two books treat of the history of the Empire from the time of Isaac Comnenus; the remaining 13 books are devoted to the reign of Alexius. Chronologically Anna is frequently at fault, and she omits purposely many events; but as a whole her work is useful. The best editions are those of Schopen and Reifferscheid (2 vols., Bonn, 1839-78), and of Reifferscheid (Leipzig, 1884). Consult: Chalandon, *Règne d'Alexis I* (Paris, 1900); Oster, *Anna Komnena* (Rastatt, 1868-71); and Diehl, *Figures byzantines* (Paris, 1909).

ANNA IVANOVNA, än'nä ê-vi'növ-nä (1693-1740). Empress of Russia. She was the second daughter of Ivan, the elder brother of Peter the Great. She was married in 1710 to the Duke of Courland, the last of his race, who died in the following year. The throne of Russia was offered to her by the Supreme Council on the death of Peter II in 1730, on conditions which greatly limited the power of the monarchy, terms which she soon broke. Her elevation was greatly due to the intrigues of the Chancellor, Ostermann, who had had the charge of her education, but who was disappointed in finding her not so grateful and tractable as he had expected. For some years, however, her rule was tolerable. Abroad, Russia took part in the War of the Polish Succession and waged a successful contest against Turkey in the Crimean War (1736-39). Internally the army was reformed, greater liberty was allowed to the landed gentry, and government debts were paid, though to pay them the peasants were crushed down with taxes. The administration of the Empress was a cruel one, due in a large measure to the influence which her paramour Biron exerted over her. Twenty thousand souls, it is said, were banished to Siberia; numbers were knouted, had their tongues cut out, or were broken alive on the wheel. Eleven thousand perished in this way. Prince Basil Dolgoruki and others of his family suffered the ignominy of the scaffold. At length the health of the Empress gave way. She died on Oct. 28, 1740, and left the throne to her grand-nephew Ivan, with Biron as regent. See **RUSSIA**; **BIRON**.

ANNA KARÉNINA, än'nä ká-rā'nyē-nā. One of Count Tolstoy's novels, which first appeared serially in a Moscow publication, from 1875 to 1878. It is a powerful study of the effects of passion upon human life and is by many considered the author's greatest work.

ANNA KARLOVNA, än'nä kár'löv-nā, or frequently, **ANNA LEOPOLDOVNA** (1718-46). Regent of Russia during the minority of her son Ivan. She was the daughter of Charles Leopold, Duke of Mecklenburg, and of Catharine, sister of the Russian Empress, Anna Ivanovna (q.v.). In 1739 she married Anthony Ulric, Duke of Brunswick-Wolfenbüttel. Her son, Ivan, born Aug. 24, 1740, was appointed by the Empress Anna Ivanovna as her successor. The Empress died in October, 1740, and Biron, whom she had made regent, was overthrown within a month. Anna Karlovna now proclaimed herself Grand Duchess and Regent of Russia; but she showed no capacity for managing the affairs of a great country, spent her time in indolent enjoyments,

and resigned herself very much to the guidance of one of the ladies of her court, Julia Mengden. A conspiracy was formed by a party desirous of raising to the throne Elizabeth, daughter of Peter the Great and Catharine, and this was accomplished on Dec. 6, 1741. The infant Ivan was sent to the castle of Schlüsselburg, where he was afterward murdered; Anna and her husband were condemned to prison for life and conveyed to Kholmogory, on the White Sea, where she died in childbirth. Her husband remained a prisoner for 39 years and died in 1780.

ANNALES, or **ANNALES MAXIMI**. See **ANNALS**.

ANNALISTS. See **ANNALS**.

ANNALS (Lat. *annales*, from *annus*, year). In the original sense, records of public events arranged year by year. In the early days of Rome such records were kept by the priests and were known as the *annales pontificum*, or *annales maximi*, because prepared by the *pontifex maximus*. In later times public men interested in history wrote crude chronicles of events, also known as *annales*, 'Year Books,' because they gave events year by year, with no attempt to trace the sequence of cause and effect; such annalists were Fabius Pictor, Cincius Alimentus, M. Porcius Cato (q.v.), L. Calpurnius Piso, Cælius Antipater, Valerius Antias, Claudius Quadrigarius, and many others. The annalistic method of writing appears even in the great work of Livy (q.v.). For Cicero's judgment of the *Annales* and of the Annalists see *De Oratore*, ii, 51-52, *De Legibus*, i, 6; see also W. W. Capes's edition of Livy, xxi, xxii, pp. xxxvii-xlii (London, 1883). When Ennius (q.v.), the "father of Roman poetry," wrote the deeds of Rome in heroic verse, he called his poem *Annales*; and finally Tacitus (q.v.) thus designated his story of Rome from Tiberius to Nero. See **ACTA**; **ACTA DIURNA**.

ANNALS OF A QUI'ET NEIGH'BORHOOD. The title of a novel by George MacDonald (1866).

ANNALS OF A SPORTS'MAN. A series of 22 short sketches (some of them not more than six pages in length) by Ivan Turgeneff. It was published in book form in 1852, and not only established the author's reputation but helped to bring about the liberation of the serfs under Alexander II. The stories are of the Russian peasant, for the most part, with now and then a sketch of the overseer, the district doctor, or the landed proprietor.

ANNALS OF THE PAR'ISH. The title of a novel by the Scottish writer John Galt (1821).

ANNALS OF THE POOR. A collection of stories containing *The Dairyman's Daughter*, *The Negro Servant*, etc., written by the Rev. Legh Richmond in the Isle of Wight and published in 1814.

ANNAM, ăn-năm' (*Nhan-nam*, Peace of the South), sometimes spelled **ANAM**. The central division of French Indo-China and formerly the designation of an independent empire which included the provinces of Annam, Tongking, and Cochin China (Map: French Indo-China). It embraces the greater part of the east coast of Indo-China (washed by the South China Sea), and stretches from Cochin China on the south to Tongking on the north, its southernmost point being about lat. 10° 30' N. and its northern extremity about lat. 20° 30', at the delta of the Song-koi, or Red River. On the west it is bounded by the country of the Laos, Siam, and

Cambodia. The area is about 52,110 square miles. The coast, about 750 miles long, is deeply indented and fringed with many islets.

Annam is traversed throughout its entire length from north to south by a mountain chain which slopes precipitously toward the sea, but declines gently toward the Mekong valley in the interior. It reaches in the peak of Pu-san an elevation of about 9000 feet. Pu-atuat is about 1000 feet lower. The country has two hydrographic zones. On the west is the basin of the Mekong; on the east are numerous coast rivers, shallow and nearly impracticable for navigation. The Mekong River rises in Tibet, flows through the extreme south of China, traverses the Indo-Chinese peninsula with a rapid current, gathering many tributaries on its way and forms the boundary between Annam and Siam. It is navigated by steamboats along the Annam frontier. The capital of Annam is Hué (population estimated at 61,600). The products of Annam include rice and other cereals, cinnamon, sugar-cane, coffee, tobacco, tea, and cotton. A considerable quantity of silk is produced, and the forests yield valuable woods. The buffalo is domesticated and used in tillage. The Chinese hog is reared in large numbers. The large game characteristic of the wilds of India abounds in Annam. One of the results following on French occupation of the Laos country was the diversion of trade from Bangkok in Siam to the Mekong valley and the sea-coast. The first commercial caravan coming from Laos arrived at Hué in February, 1895. The principal imports are cotton goods, Chinese paper, machinery, metals, Chinese drugs, flour, petroleum, and tea. The exports consist of sugar, cinnamon, horn, ivory, skins, raw silk, tea, wood, etc. In 1897 the imports amounted to 4,719,349 francs and the exports to 2,552,919 francs. The principal ports of Annam are Tourane and Qui-nhon.

The government is in theory a monarchy. The king is assisted by a council of six members, though everything is in reality subject to the French resident superior at Hué, who has a staff of assistants and a military guard. The country is divided into 12 provinces, each of which is subdivided into *fu* ('departments') and *huje* ('districts'). Most of the actual administration of justice and tax collection is under the native officials. Service in the native army, of 10,000 men, who are under French officers, is compulsory. The population of Annam was estimated in 1911 at 5,542,822.

The Annamese comprise at least two different stocks—the rather primitive Mois of the mountainous interior, and the Annamese proper, both of whom exhibit quite uniform physical types, notwithstanding intermixture with other peoples (Khmers, Malays, Chinese, etc.) in prehistoric and in recent times. The foreign-born population, living chiefly in the towns, comprises about 4000 Chinese and 2000 Europeans. In appearance the Annamese proper are the least attractive of the Indo-Chinese races. They are short, rather slenderly built, and brachycephalic. They have a swaggering stride or gait, arising from a peculiar structure of the pelvis and femur and a notable separation of the big toe, or "foot-thumb," from the other toes. In race they are Mongolian. This speech is monosyllabic, belonging to the Mon-Khmer branch of Indo-Chinese languages. Like most of the peoples of this region, they possess strains of Aryan,

and, possibly, negroid blood. Annamese culture and folk-lore are largely reflections of Chinese. From China came also the written characters of their language, their literature, and the form of Buddhism and Confucianism professed by the more enlightened classes. The Annamese are essentially democratic in disposition and live in patriarchal style, the father having almost absolute authority in his family. About 420,000 of the inhabitants are Catholics. Among the principal towns are Hué, the capital, Bindinh (pop., 75,000), Than-hoa, and Tourane (pop., 6800).

Subjected to China, together with Tongking, in the third century B.C. by She Twang Ti, Annam became autonomous under Chinese suzerainty in 1428 A.D. after long and sanguinary wars. In 1789 the ruler of Annam was able, with French aid, to free himself from subjection to China and to join Tongking and Cochin China to his empire. This became a field of French influence. Under Napoleon III France began the establishment of her dominion in Indo-China by engaging in hostilities with Annam in 1858. In 1862 the King was compelled to cede the principal part of Cochin China to the French, and the rest of that territory was added in 1867. The French continued to encroach, entered in 1882 upon the conquest of Tongking (of which they became masters in 1885), and the treaty of June 6, 1884, ratified at Hué, Feb. 23, 1886, established a French protectorate over Annam. French troops occupy the citadel at Hué, and France controls the finances. Prince Bun-Lan, who was proclaimed King in 1889, under the name of Than-Thaï, attained his majority in 1897. On account of his vices and cruelties he was forced by the French to abdicate, Sept. 9, 1907, in favor of his son Duy-Tan (born 1899), who was placed under a council of regency.

Bibliography. Leraye, *L'Empire d'Annam et le peuple annamite* (1889); Jammes, *Au pays annamite* (Paris, 1898); Barral, *La Colonisation française au Tonkin et en Annam* (Paris, 1899); Norman, *Peoples and Politics of the Far East* (London, 1895); Fournereau, *Le Siam ancien* (Paris, 1895); Dumontier, *Les symboles chez les Annamites* (Paris, 1890); and Hannah, *Brief History of Eastern Asia* (New York, 1900).

AN'NA MATIL'DA. A pseudonym under which Hannah Parkhouse Cowley maintained a poetical correspondence with Robert Merry ("Della Crusca"), the leader of the so-called English "Della Cruscans," in the *World*, ending about 1789, when the correspondents first met personally. Their interchange of verses gained an added notoriety from Gifford's satire *Baviad* and *Mæviad*, which held it up to ridicule. "Anna Matilda" has come to be used typically of a writer of tasteless sentimentalism.

AN'NAN. A seaport and parliamentary burgh in the county of Dumfries, Scotland, on the river of the same name, near its entrance into the Solway Firth, and 15 miles by rail from the city of Dumfries (Map: Scotland, E 5). It is neat and well built. Among its industries are shipbuilding, tanning, cotton-spinning, and rope-weaving. Sandstone, of which many of its buildings are constructed, is quarried near by. The river is navigable for large vessels half a mile below the town. There is regular communication by steamers with Liverpool and Whitehaven, and railways connect the town with Edinburgh, Glasgow, and Carlisle.

The burgh unites with Dumfries, etc., in returning one member to Parliament. Pop., royal parliamentary and municipal burgh, 1901, 7073; 1911, 6892.

AN'NANDALE. The valley of the river Annan, in Dumfriesshire, Scotland.

ANNANDALE, CHARLES (1843-1915). An English author. He was born in Kincardineshire, and was educated at Aberdeen University. He edited such important works of reference as the *Imperial Dictionary* (1882); *Blackie's Modern Cyclopædia* (1890; new ed., 1907); *Student's Dictionary* (1895); *New Cabinet Encyclopedia and Treasury of Knowledge* (1895); *New and Universal Self-Pronouncing Encyclopedia*.

ANNANDALE, THOMAS (1838-1907). An English surgeon. He was born at Newcastle and was educated at Edinburgh University, where he subsequently was appointed assistant to Professor Syme. He was for some time demonstrator of anatomy under Professor Goodsir at the same university and in 1877 was made regius professor of clinical surgery there. He published *Diseases and Injuries of Fingers and Toes* (1865), *Abstracts of Surgical Principles* (1868-70), and other important works.

ANNAP'OLIS. The capital of Maryland and the county-seat of Anne Arundel County, on the Severn River, 2 miles from Chesapeake Bay, 26 miles by rail southeast of Baltimore, and 30 miles (direct) northeast of Washington, D. C. It is on the Maryland and the Annapolis, Washington, and Baltimore electric railroads, and has boat service to Baltimore and other cities on the bay (Map: Maryland, M 5). The city's most noteworthy feature is the United States Naval Academy (q.v.), with its beautiful buildings and grounds. Other points of interest are the marine barracks and naval experiment station, St. John's College, founded in 1789, the State government buildings, and the statues of Chief Justice Taney and General De Kalb. The city has a fine harbor and is the seat of an extensive oyster-canning industry, the product being largely exported. Pop., 1890, 7604; 1900, 8525; 1910, 8609.

In 1608 Capt. John Smith visited the site of Annapolis, but no settlement was made until 1649, when a company of Puritans from Virginia established here the town of "Providence," which name was later changed successively to "Proctor's," "The Town," "Anne-Arundel Town," and, finally, to the "Town of Annapolis," in honor of Queen Anne. In 1694 the capital of the province was moved here from St. Mary's, and Annapolis was made a city in 1708 by a charter from Queen Anne. Early in the eighteenth century one of the first free schools on the continent was established here. From this St. John's College (q.v.) developed. On May 25, 1774, the citizens passed resolutions of sympathy for Boston, whose port had just been closed, and on October 18 the brig *Peggy Stewart*, laden with tea, was publicly burned. On Dec. 23, 1783, Washington surrendered his commission as Commander-in-Chief of the Continental Army to Congress, then sitting at Annapolis. Consult Ridgely, *Annals of Annapolis* (Baltimore, 1841), Riley's "Ancient City," and a sketch in Powell's *Historic Towns of the Southern States* (New York, 1900).

ANNAPOLIS CONVENTION, THE. A convention held at Annapolis, Md., Sept. 11, 1786, to consider the question of intercolonial commerce and discuss some proposed alterations in

the Articles of Confederation. Commissioners from only five States, Virginia, Delaware, Pennsylvania, New Jersey, and New York, were present (though New Hampshire, Massachusetts, Rhode Island, and North Carolina had appointed delegates, who did not attend); and the Convention accordingly adjourned after recommending that a convention of all the States be called for the purpose of rendering the "Constitution of the Federal Government adequate to the exigencies of the Union." This led to the Constitutional Convention of 1787. Proceedings may be found in *United States Bureau of Rolls*, vol. i.

ANNAPOLIS ROYAL. Originally the Port Royal of the French occupation. A port of entry and summer resort in Nova Scotia, Canada, 130 miles west of Halifax, on the Dominion Atlantic Railroad, and at the mouth of the Annapolis River, an inlet of the Bay of Fundy (Map: Nova Scotia, D 5). It has an excellent harbor, which is accessible to ocean steamers, and exports lumber and apples, the latter especially, since it is the chief product of the entire district. The United States is represented by a consular agent. Annapolis Royal is the oldest European settlement in British North America. It was the scene of many conflicts between the French and English and was ceded by the former in 1713, when its name was changed in honor of Queen Anne. Old Fort Anne has been restored by the Dominion government and the citizens of the town, and within the fortifications a monument has been erected to the memory of De Monts, who landed here in 1604. Pop., 1901, 1019; 1911, 1019.

ANN ARBOR. A city and the county-seat of Washtenaw Co., Mich., 37 miles (direct) west of Detroit, on the Michigan Central, and the Ann Arbor and Toledo railroads, and the Huron River (Map: Michigan, F 6). It is the seat of the University of Michigan, and has a fine high school, two schools of music, two libraries, a court house, five hospitals, and a large auditorium. Ann Arbor is the centre of a fertile agricultural district and has important manufactures of pianos, flour, automobile accessories, laces and curtains, and steel ball-bearings. Water power producing a supply of electricity sufficient for an area of 60 square miles is obtained from the Barton Dam. Ann Arbor was settled in 1824 and was incorporated as a city in 1851. Pop., 1890, 9431; 1900, 14,509; 1910, 14,817.

ANNARR', or **ONARR'**. In Norse mythology, the husband of Nött (night), and father of Jörd (the earth).

AN'NAS (Heb. merciful). A Jewish high priest, appointed by Quirinius in 6 A.D. and deposed by Valerius Gratus in 15 A.D. He, no doubt, continued to exercise great influence, as the office was held by five of his sons, Eleazar, Jonathan, Theophilus, Ananos, and Matthias, and by his son-in-law, Joseph, surnamed Caiaphas, between 18 A.D. and 36 A.D. The wealth of "the house of Annas" was to some extent derived from the booths, where they provided all kinds of materials for sacrifice. By this monopoly they made the temple "a den of robbers" and drew down upon themselves the curses of the Pharisees as well as the indignation of Jesus. The influential position of Annas may have led to the erroneous statement of Luke, that there were two high priests, Annas and Caiaphas (iii. 2), and the consequent Johannine account of a separate trial of Jesus, before Annas (xviii. 13-

27). A son of Annas, by the same name, was appointed high priest by Agrippa II in 62 A.D. He is said to have put to death James, the brother of Jesus; but the passage of Josephus (*Ant.* xx, 9) which relates this is supposed by many scholars to be a Christian interpolation. Consult Schürer, *Geschichte des jüdischen Volkes*, pp. 270 ff. (4th ed., 1907).

ANNATES, än'näts, or **FIRST FRUITS**. In ecclesiastical law, the value of every spiritual living for a whole year (hence the name, from the Lat. *annus*, a year), which the Pope, claiming the disposition of every spiritual benefice within Christendom, reserved out of every living. This impost was at first levied only from persons appointed to bishoprics; but it was afterward extended to the inferior clergy. The value of these annates was calculated according to a rate made under the direction of Pope Innocent IV (1253 A.D.), but afterward increased by Pope Nicholas III (1292 A.D.). The valuation of Pope Nicholas is still preserved in the exchequer. This papal exaction was abolished in England by the Act 25 Henry VIII, c. 20, and by an act passed in the following year of the same reign (26 Henry VIII, c. 3), the right to annates, or first fruits, was annexed to the crown. The various statutes subsequently passed on this subject have all been consolidated by an act (1 Vict., c. 20) regulating the collection of the moneys so levied. See **FIRST FRUITS**; **QUEEN ANNE'S BOUNTY**.

ANNATTO, än-nät'tô. See **ARNOTTO**.

ANNE (än) OF AUSTRIA (1601-66). The daughter of Philip III of Spain, who in 1615 became the wife of Louis XIII of France. The marriage was so far from being a happy one that the royal pair lived for 23 years in a state of virtual separation—a result due chiefly to the influence of Cardinal Richelieu, whose fixed determination to humble the house of Austria led him to spare no means for alienating the affection of Louis by representing her as ever involved in conspiracies against his authority. Her imprudence, however, lent much force to Richelieu's accusations, for she certainly was concerned to some degree in the conspiracies of Chalais (1628) and Cinq Mars (1642). On the death of the King, in 1643, Anne became Queen Regent for her son Louis XIV, and evinced her discernment by choosing as her minister Cardinal Mazarin, whom she is said to have married secretly, and by whose able management the young King (Louis XIV) came into possession of a throne firmly established on the ruins of contending parties. (See **FRONDE**.) Her character was marked by contradictions. Her stately coldness, which failed to attract her husband, often gave way to fits of reckless gayety which repelled him. Without being actually treasonable, she often engaged in intrigue. Proud of her royal state, she made an Italian *parvenu* her favorite and, as some say, her husband. There was in her a great conflict between the woman and the queen. Consult: Freer, *Married Life of Anne of Austria* (London, 1895, later ed., 1913); *Regency of Anne of Austria* (London, 1866); Matcville, *Memoirs of Anne of Austria and her Court* (New York, 1901).

ANNE OF BRITTANY (1476-1514). Queen of France. She was the daughter and heiress of Francis II, Duke of Brittany. By her marriage to Charles VIII, Dec. 6, 1491, Brittany became incorporated with France. Anne had been affianced to Maximilian of Austria, but the

French King took care not to let slip so rich a prize. During Charles VIII's campaigns in Italy she governed France well. After her husband's death she married his successor, Louis XII, over whom she had great influence. She was a woman of beauty and intelligence.

ANNE OF CLEVES, klēvz (1517-57). The daughter of John, Duke of Cleves, and fourth queen of Henry VIII of England, who reluctantly married her on Jan. 6, 1540, to conciliate the German Protestant princes, but divorced her on July 9 of the same year on the ostensible ground that he had never really given his inward consent to the marriage. Anne was a very homely woman. She died at Chelsea, July 16, 1557. Consult the *Gentleman's Magazine*, vol. ccxc (London, 1901), and Hume, *The Wives of Henry VIII* (London and New York, 1905).

ANNE OF DENMARK (1574-1619). The wife of James I of England (q.v.), born at Skanderborg, Jutland. Negotiations for her marriage to the young Scottish King were begun when she was only 11 years old, but because of the opposition of Queen Elizabeth the ceremony was delayed until after the execution of James's mother, Mary Stuart, Queen of Scots. The Scottish nobility then demanded that the royal match be concluded at once, but two years passed before Anne was married, in August, 1589, by proxy, and on November 23, in person, to James. Six months after the wedding at Opslo, Norway, the couple arrived in Scotland. Anne was crowned with James at Westminster (1603), when he ascended the English throne, and shortly afterward took up her residence in London. Exceedingly fond of display, she found that the active promotion of court entertainments, such as masks, and the furthering of "progresses" through the country, afforded her the best of opportunities for outshining the ladies of her court. She took part in numerous plays, including Ben Jonson's *Mask of Blackness* and *Mask of Queens*, and is reported to have danced in Shakespeare's *Twelfth Night* when she was 43 years old. Anne's "progress" to Bath in 1613 cost £30,000. Accustomed not only to lavish personal display, but to the satisfaction of an expensive taste in things artistic, her demands for funds outstripped a generous Parliament's grants. At the time of her death she had incurred such heavy debts that it was found impossible to get credit for the funeral expenses, and lack of ready money forced a delay. While Anne had inclined toward Catholicism at one time in her life, before its close she professed the Protestant faith. Consult A. Strickland, *Queens of England*, vol. vii (1844).

ANNE OF GEIERSTEIN, gī'ēr-stīn. The title of a novel by Scott (1829), based upon events connected with the victory of the Swiss over Charles the Bold of Burgundy in the fifteenth century.

ANNE, ān, **QUEEN OF GREAT BRITAIN AND IRELAND** (1665-1714). The last British sovereign of the house of Stuart. She was born at St. James's Palace, London, Feb. 6, 1665, and was the second daughter of the Duke of York, afterward James II, by his first wife, Anne Hyde, the daughter of the Earl of Clarendon. When she was about seven years of age, her mother died, and her father soon after professed himself a member of the Church of Rome; but he permitted his daughters to be educated in the principles of the Church of England, for which Anne always retained an ardent if not a very

enlightened attachment. To advance his own popularity, her father gave her in marriage, in 1683, to Prince George of Denmark, brother of Christian V, an indolent and good-natured man, who concerned himself little about public affairs and was endowed with no capacity for taking part in them. Anne's own weakness of character and that of her husband gave opportunity to Lady Churchill, afterward Duchess of Marlborough, her early playfellow, to acquire an influence over her which during many years was almost supreme. During the reign of her father Anne lived in retirement, taking no part in politics. On the landing of the Prince of Orange she seems at first to have hesitated, and even to have been inclined to adhere to the cause of her father, whose favorite daughter she was; but Churchill had made up his mind to an opposite course, and his wife induced the Princess to adopt it. She consented to the act by which the throne was secured to the Prince of Orange in the event of his surviving her sister Mary; but quarreled with the King and Queen over money matters. Although she had borne 17 children, only one, the Duke of Gloucester, survived infancy, to die in 1700, in his eleventh year; and Anne was without a direct heir when she ascended the throne on March 19, 1702. The influence of Marlborough and his wife was powerfully felt in all public affairs during the greater part of her reign. The strife of parties was violent, and political complications were increased by the Queen's anxiety to secure the succession to her brother. In so far as she had any political principles, they were opposed to that constitutional liberty of which her own occupancy of the throne was a sort of symbol, and were favorable to absolute government and the assertion of royal prerogative according to the traditions of her family. These principles, and her family attachment, tended to alienate her from the Marlboroughs, whose policy, from the time of her accession, had become adverse to Jacobitism, and who now, along with Godolphin, were at the head of the Whig party. The Duchess also offended the Queen by presuming too boldly and haughtily upon the power which she had so long possessed.

Anne found a new favorite in Mrs. Masham, a relative of the Duchess, who had introduced her into the royal household. To Mrs. Masham's influence the change of government in 1710 was in a great measure owing, when the Whigs were cast out, and the Tories came into office, Harley (afterward Earl of Oxford) and St. John (Lord Bolingbroke) becoming the leaders of the ministry. But although they concurred more or less in the Queen's design to secure the succession of the throne to her brother, the new ministers had quarrels among themselves which prevented its successful prosecution; their plans and intrigues became sufficiently known to alarm the nation and to alienate many political supporters of the government party. A dispute between Oxford and Mrs. Masham, carried on for hours in the Queen's presence and terminating in her demand for his instant resignation, seems to have brought on the attack of apoplexy of which she died, Aug. 1, 1714. The Elector of Hanover succeeded her as George I. The principal event of her reign was the union of England and Scotland, in 1707, and she was the last sovereign who ruled over these as separate kingdoms, and the first sovereign styled "of Great Britain." Another important event was the War of the

Spanish Succession, in which the Duke of Marlborough won brilliant victories over the armies of Louis XIV of France. Queen Anne was of middle size and comely, though not beautiful. She was virtuous, conscientious, and affectionate, more worthy of esteem as a woman than of admiration as a queen. Her reign is often mentioned as a period rendered illustrious by some of the greatest names, both in literature and science, which her country has ever produced; but literature and science owed little to her active encouragement. Consult: Burton, *Reign of Queen Anne* (London, 1880); McCarthy, *The Reign of Queen Anne* (London, 1902); Paul, *Queen Anne* (London, 1907); Jonathan Swift, *Four Last Years of Queen Anne*.

ANNE, SISTER. In the story of *Bluebeard* (q.v.), the sister of Fatima. While Fatima is awaiting the penalty of her disobedience, Anne, on the top of the tower, watches for the coming of their brothers to save them.

ANNEAL'ING (from ME. *anelen*, OF. *neeler*, Fr. *nieller*, to enamel, from Lat. *nigellus*, blackish). The process by which glass and certain metals are heated and then slowly cooled to make them more tenacious and less brittle. The rationale of annealing has been most studied, perhaps, in connection with steel manufacturing. Important steel castings are nearly always annealed, and it is a common requirement for steel forgings. In the working of metals, such as the drawing of rods, wire, and pipe, the rolling of plates, or hammering, the metal becomes brittle, and frequent annealing is necessary. It is a common practice to anneal steel plates for the best marine boiler work. The hardening and tempering of steel are analogous processes to annealing, there being a close interrelation between the three phenomena. Steel is hardened by sudden cooling from a high temperature, usually at or above red heat, by plunging it into oil, water, etc. To temper steel means, in its specific sense, to mitigate, or to moderate, the effects of previous hardening. It is usually performed by gently reheating the previously hardened steel to a much lower temperature than red heat and then cooling it, generally suddenly, but sometimes slowly. While tempering somewhat moderates the effects of previous hardening, annealing aims nearly completely to eliminate them. Annealing of steel is usually effected by slow cooling from a temperature at or above red heat. Thus steel is in its hardest and most brittle state when hardened, in its softest and toughest when annealed, and in an intermediate condition when tempered.

In hardening, the steel articles, if small, are heated in boxes or pans filled with charcoal dust and placed in reverberatory furnaces. Larger articles are heated in the furnace proper, which is often made of a special shape to fit the form of the article, such, for instance, as a long gun tube. In general, the more rapid the cooling, the harder and more brittle is the steel. The surface of steel or iron, when heated in contact with charcoal, absorbs a certain percentage of carbon, resulting in a higher carbon steel which increases the hardness when the metal is rapidly cooled. By this method a hard surface backed by comparatively soft tenacious iron can be produced, such as armor plate and rock-crushing machines. Mercury is the most rapid cooling agent, and water, rapeseed oil, tallow, and coal-tar follow next in the order named. Steel castings and forgings for guns, marine engine-shafts,

and armor-plate, where strength is more important than hardness, are usually cooled in oil; while steel for cutting tools, where extreme hardness is the important thing, is ordinarily hardened in water.

In tempering hardened steel articles they are slowly heated by contact with hot iron bars, plates, or rings, on the surface of melted lead or other fusible metal, in hot sand, in burning charcoal, or in special furnaces, to a temperature of from 428° F. to 600° F. The temperature required for razors is from 446° F. to 469° F.; for shears and scissors, 491° F.; for woodworking tools, 531° F.; for swords and coiled springs, 550° F.; for handsaws, 600° F. The heated article is cooled by plunging it into a bath of water or oil.

In annealing, the article is heated uniformly in a furnace, without direct contact with the flames, to the temperature generally of bright cherry red. The common method of cooling is to withdraw the fire from the furnace and to close all apertures, allowing the furnace slowly to cool down. Cooling is sometimes accomplished by burying the heated article in ashes, lime, or other slow conductors of heat, and allowing it to become cool by the radiation of its heat. Boiler and ship plates are often cooled by simply withdrawing them from the furnace and throwing them on the mill floor to cool by radiation. When medals are repeatedly struck by the die-stamper, the gold or other metal, by the concussion, becomes brittle, and requires to be heated and annealed at intervals. Annealing is necessary in gold-beating and in rolling, hammering, and stamping sheet metals generally. Articles of tin, lead, and zinc, which are metals with a low melting temperature, are annealed in boiling water, which is allowed to cool with the article immersed. Malleable iron is cast-iron annealed by being covered with powdered hematite ore and heated and then slowly cooled.

In the making of glass vessels by the glass-blower (see GLASS), they are of course quickly reduced in temperature while the fused glass is being molded into the desired shape. The atoms of the glass thus rapidly compelled to assume a permanent position do not seem to be properly and firmly arranged together, and the vessel is very liable to be broken, either by a slight but smart blow, or a sudden increase or decrease in temperature. This brittleness is very observable in the *lacrimæ vitreae*, or glass tears, known as Prince Rupert's drops, obtained by allowing molten glass to fall into water, when the glass forms pear-shaped drops, which are so brittle that if they be scratched with a file or the end be broken off the whole bursts asunder and falls down into a fine powder of glass. The same brittleness is exhibited in Bologna jars, or vials, which are small and very thick, and yet, if a minute angular fragment of any hard substance be dropped into the jar, the latter flies to pieces.

In the annealing of glass vessels they are arranged in iron trays and placed in a long oven, where they are gradually raised in temperature to near their fusing point by the trays being drawn along to the hottest part of the oven; and thereafter the trays, with their contents, are very slowly drawn into a cooler and cooler part, till they become cold. The annealing operation generally takes 12 hours for small articles, such as wine glasses; but days, and even a week or two, are required completely to anneal large vessels. Many articles of glass, such as tubes for

steam gauges, lamp glasses, etc., are annealed by immersion in cold water, which is very gradually raised to its boiling point and then cooled.

The theory of annealing is one of considerable technical intricacy, and scientists are not altogether in agreement as regards many of its features. For the theory and practice of the hardening, tempering, and annealing of steel, consult Howe, *Metallurgy of Steel* (New York, 1892), and Woodworth, *Hardening, Tempering, Annealing and Forging of Steel* (New York, 1903).

ANNECY, ân'sè'. The chief town of the department of Haute-Savoie, France (Map: France, S., L 3), in the midst of a fertile country at the northwestern extremity of the Lake of Annecy and 22 miles south of Geneva. The Lake of Annecy is 1470 feet above the sea and is surrounded by magnificent mountain scenery. It is about 9 miles long and 2 miles wide, its waters flowing by the Fieran to the Rhone. Annecy has manufactures of linens, cotton yarn, felt hats, paper, straw goods, iron, and steel wares. Its linen bleachfields have existed since 1650. Near Annecy is a famous bell foundry. The town is clean and has an air of respectable antiquity, the shops in many of the streets being under arcades. The most remarkable buildings are the château, once the residence of the family of Genevois-Nemours, the old and new bishops' palaces, the cathedral, and the modern church of St. Francis, the latter of which boasts of possessing the relics of St. Francis of Sales and St. Jane Frances Chantal. Annecy has a scientific and archaeological museum. In the public gardens is a statue of Berthollet, a celebrated chemist who was born at Talloire, near by. Pop., 1901, 13,611; 1911, 15,622.

In the twelfth century Annecy was called *Anneciacum Novum*, to distinguish it from Old Annecy, *Anneciacum Vetus*, which occupied the slopes of a neighboring hill, and was a place of some consequence in the times of the Romans. In the earlier part of the Middle Ages Annecy belonged to the counts of Geneva, and on the extinction of that house it passed to the house of Savoy, in whose possession it remained, except for a brief period under the French Empire, until the transference of Savoy to France in 1860.

ANNEL'IDA. See ANNULATA.

ANNENKOFF, ä'nyën-kôf, MIKHAIL NIKOLAYEVITCH (1835-99). A Russian soldier and engineer, born in St. Petersburg. He was educated as a member of the corps of pages, took part in crushing the Polish insurrection of 1863, and was connected with the administration of affairs in Poland until 1866. He was promoted to be colonel, and during the Franco-Prussian War accompanied the German army. In 1867 he attracted considerable attention by his articles in the *Voyeni Sbornik* (a military journal) on utilizing the railroads in military activities. In the Russo-Turkish War of 1877-78 he directed the military transportation. He became a lieutenant-general in 1878 and served in the campaign against the Tekke-Turkomans in 1880-81. He directed the construction of the railway from the Caspian Sea to Samarkand (1881-89) and in 1892 began the construction of the line from Samarkand to Tashkent. He was also known as the chief promoter of the Trans-Siberian Railway. Besides the papers already mentioned, he published *Observations and Views of a Russian Officer* (1871) and *Siberia and its Railroads* (1888).

ANNENKOFF, NIKOLAI IVANOVITCH (1819-

89). A Russian botanist. He studied at Moscow and in 1853 became a director of the School of Agriculture. In 1863 he was appointed director of the School of Horticulture at Uman. His works include a dictionary of botany, in which the names of plants are given in Russian, French, German, English, and other languages.

AN'NEXA'TION (Lat. *annexus*, a tying or binding to, from *ad*, to + *nectere*, to tie). The acquisition by a state of territory previously independent or in the possession of another power. Though strictly applicable, perhaps, only to the extension of a state's sovereignty over adjoining territory (as in the annexation of Alsace-Lorraine to Germany as the result of the Franco-Prussian War, and of California and adjacent territory to the United States as the result of the war with Mexico), the term is applied to any territorial acquisition, near or remote, as in the cession of Porto Rico and the Philippines to the United States, and the forcible annexation of the Boer republics in South Africa to the British Empire. Mere cession of a territory does not nullify the existing laws until otherwise ordained, and, until possession is taken, the prior authorities retain their police functions, although, technically speaking, sovereignty ceases upon completion of cession. Thereupon the inhabitants of the annexed territory are absolved from their allegiance to their former sovereign and their legal relation to him is dissolved, but not their relations to each other. Titles to property are not affected by cession, excepting in the substitution of the new sovereign for the old as lord paramount. See TENURE.

As annexation is a legal fact, resulting in the virtual incorporation of foreign territory in the annexing state, it does not proceed from such extra-legal or informal acts as discovery, occupation, or military conquest, but requires for its completion the official and legal action of the state, by treaty duly made and ratified, by proclamation of the sovereign, or by legislative act. Thus, it was decided by the Supreme Court of the United States, in the so-called Insular cases (1901), that Porto Rico remained foreign territory, notwithstanding the destruction of the Spanish sovereignty and government and the occupation of the island by the military forces of the United States until the ratification of the treaty of peace with Spain in 1898, and that it was this act which extended the sovereignty of the United States over that island. Where the transfer of title is not acquiesced in by the former sovereign, there must be an effective occupation and a virtually complete destruction of the previously existing authority. But the annexation may be complete notwithstanding the active or passive opposition of the inhabitants of the territory affected, as in the case, previously referred to, of the Boers in South Africa and the native population in the Philippine Islands. Consult Randolph, *The Law and Policy of Annexation* (New York, 1901). See ALLEGIANCE; COLONY; CONQUEST, and the authorities there referred to.

AN'NIE LAU'RIE. A Scottish song of the eighteenth century, by William Douglas, of Scotland, to Annie, daughter of Sir Robert Laurie, of the Maxwellton family. It was set to music by Lady Jane Scott.

ANNI'HILA'TIONISM (from Lat. *ad*, to + *nihil*, nothing). The theory of the utter extinction of man's being, both bodily and spiritual.

either at death or at some later period. Christian theology was for ages dominated by the Greek theory of the natural immortality of the soul. Modern philosophy began to question this theory. Spinoza (*Tractatus de Deo et Homine*), Hobbes, and Locke argue for possible annihilation. In theology little was heard of the doctrine until the eighteenth century, when Taylor, of Norwich, England, McKnight, and a few others wrote upon it. Among later supporters perhaps Archbishop Whately may be counted; for in his *View of the Scripture Revelations Concerning a Future State*, he says that in the passages in which "death," "destruction," "eternal death," are spoken of, the words may be taken as signifying literal death, real destruction, the utter end of things; that "unquenchable fire" may mean a fire that quite consumes what it feeds upon, and the "worm that dieth not" may be that which entirely devours its prey. In the United States the question was revived by *Six Sermons on the Question: Are the Wicked Immortal?* by George Storrs (Philadelphia, 1848). James H. McCulloh in his *Analytical Investigations Concerning the Scriptures* (Baltimore, 1852), maintained that after the final decisions at the judgment the wicked will be utterly destroyed by the visitation of God in wrath. C. F. Hudson, in *Debt and Grace, as Related to the Doctrine of a Future State* (Boston, 1857), denies that the natural immortality of the soul is even implied in the Bible; on the contrary, life and immortality are brought to the redeemed alone, all others being not only naturally mortal, soul and body, at death, but after that mortal suspension of positive existence, all are raised at the final resurrection and cast into the lake of fire at the second death. He denies that endless conscious suffering is ever affirmed to be the nature of future penalty, but affirms that the penalty consists in privation, and that in the perpetuity of this privation consists the eternity of future punishment. R. W. Landis replied to Hudson, in his treatise *On the Immortality of the Soul and the Final Condition of the Wicked* (New York, 1859), and many other writers discussed the subject, especially in religious reviews and magazines.

The discussion then broadened out and was participated in by members of all communions. The general purpose was to gain some relief from the thought of the eternal suffering of vast multitudes of human souls. It has accordingly been argued that sin is corrupting in its nature, that it leads necessarily to degeneration and decay, and that a sinning soul, embarked upon a course of rebellion against God, must finally wear its life-forces out and cease to be. It is argued, on the other hand, that this position has no support in the Bible, and that there is no evidence, from the experience of sinners in this world, that sin, however much it may otherwise affect the nature, substantially diminishes the power of life. The tendency among thinkers who have sought relief in this direction has therefore been rather to the doctrine of "conditional immortality," so called, that the soul of man is not by nature immortal, but becomes so by the special gift of Christ upon the exercise of a genuine faith in him, and that apart from this faith man would eventually, and probably at death, cease to be. Against the objection that thus multitudes of souls would seem to have been created to no purpose, the analogies of evolution are brought by some, by which multitudes of forms are

everywhere produced that a few select ones may survive. The soul itself thus enters into the "struggle for existence," and the "fittest" souls survive; that is, those who have risen by Christian faith to the higher plane of life. The chief advocate of the view is Rev. Edward White, *Life in Christ* (London, 1846). A modification of this view is to be found in S. D. McConnell's *Evolution of Immortality* (New York, 1901).

AN'NISTON. A city and the county-seat of Calhoun Co., Ala., 63 miles east by north of Birmingham, on the Southern, and the Louisville and Nashville railroads (Map: Alabama, D 2). It has a fine location in the foothills of the Blue Ridge Mountains and contains a park, fair grounds, the beautiful churches of St. Michael and All Angels, the Alabama Presbyterian College for young men, the Noble Institute for young ladies, and the Barber Memorial Seminary, an industrial college for colored girls. The city is in a productive coal, iron, corn, grain, and cotton region and is the centre of an important cotton trade. Its chief industry, however, is the manufacture of cast-iron pipe. There are also extensive blast-furnace foundries and machine shops, rolling mills, freight-car, locomotive, and boiler works, cotton-goods manufactories, a carriage factory, and a yarn mill. Anniston was founded in 1873 by the Woodstock Iron Company, headed by Samuel Noble, but was not thrown open to the general public until 10 years later. In 1912 the National Guard of eight southern States held their field manœuvres here, under the direction of the United States War Department. Pop., 1890, 9998; 1900, 9695; 1910, 12,794.

ANNOBON, ä-n-ô-bôn'. An island in the Gulf of Guinea, about 1° 30' S. lat., belonging to Spain (Map: Africa, E 5). It has an area of a little over 6 square miles and is highly mountainous. The population in 1910 was 1313, mostly black, and some of them have been converted to Christianity. The island was discovered by the Portuguese in 1471 and ceded to Spain in 1778. The only town is San Antonio de Praga, in the northern part.

ANNONA. See CUSTARD-APPLE.

ANNONAY, ân'nô'nâ' (anciently Lat. *Annoneum*). A picturesque town of France, in the department of Ardèche, situated at an altitude of over 1000 feet, where the valley of the Déome joins the valley of the Cance, 37 miles south of Lyons (Map: France, S., J 3). It has a rugged beauty of its own, the houses and jutting rocks interspersed along steep and narrow streets. The principal buildings are the Gothic church, built in 1614, the college, the museum, and library. It carries on an active trade and industry, the chief articles of manufacture being paper, of which nearly half a million reams are produced annually, glove leather from kid skins, silk and cotton twist, woolen cloth, and flour. A great quantity of silk is produced in the neighboring villages. The paper mills of Annonay were established by the father of the celebrated aeronauts Montgolfier, who were born here, and of whom there is a statue in the Grande Place. Pop., 1901, 17,490; 1906, 17,300; 1911, 16,661.

AN'NUALS. A class of handsomely illustrated collections of prose and verse, imitating the gift-books of the Germans and intended for Christmas, New Year's, and birthday presents. The first, the *Forget-me-not*, was published in London in 1823 and was followed by the *Liter-*

ary *Souvenir*; the *Keepsake*, edited by Lady Wortley and subsequently by the Countess of Blessington; the *Book of Beauty*; the *Musical Bijou*; the *Comic Annual*, begun by Thomas Hood and others, and in the United States by the *Gift* and the *Token*, to mention a few of the many. Large sums were spent on these publications, and large profits were realized; but while many authors of distinction, as Tennyson, Longfellow, and Bryant, were induced to contribute to them, the articles, as a rule, were of an inferior and highly sentimental nature, and after 1840 the demand for annuals declined. The *Forget-me-not* had an unparalleled life of 22 years; but the *Book of Beauty* and the *Keepsake* survived it, the last named ceasing to exist in 1856. The tradition of the old annuals survives in the special Christmas numbers of many magazines. See YEAR BOOK.

ANNUALS, or MON'OCYC'LIC PLANTS.

Plants that live only during a single vegetative period. The aërial parts of many plants are annual, the subterranean parts being persistent, and these must not be confused with annuals.

ANNU'ITY (from Lat. *annus*, year). A sum of money paid annually. If perpetual, the right to receive the payment passes from the annuitant to his heirs. Such perpetual annuities are less frequent than life annuities, which may assume the most varied forms. In the simplest phase of the matter the annuitant receives a fixed annual payment during his life, the annuity being extinguished by his death. If upon the lives of several persons, the aggregate amount of the annuity only is fixed. On the death of one of the recipients, his share is distributed among the survivors, the last person receiving the whole amount which was formerly distributed. The annuity may begin immediately and stop upon the happening of some contingency, as marriage; or again, the annuity may not begin until a later date, in which case it is designated as deferred. Many other combinations can be and actually are devised. Such annuities arise either from testamentary dispositions or from contract. In the former case it is the desire of the testator to insure to the recipient an income fixed in amount either for life or for a lesser period. Thus, a father may provide an annuity for his daughter, to be terminated upon marriage. In case of an annuity resting upon contract, the annuitant, or some one for him, surrenders the use of a sum of money to another person who agrees to make fixed annual payments to the annuitant during the life of the latter. The annuity may be purchased by a single payment or a series of payments extending over a number of years. The latter is particularly applied to old age insurance, the object of which is to secure a fixed annual income after reaching a certain age. Such a contract between two individuals would be little more than a wager. No one can tell how long an individual may live, and one of the parties to the contract must gain at the expense of the other. When, however, the business is concentrated so that the party paying the annuities deals with a large number of persons, the same laws that make life insurance possible make this a calculable and legitimate enterprise. The relations of life insurance and annuities are obvious. They are reciprocals of one another. In life insurance a series of annual payments obtains for heirs of the insured certain capital at death of the insured, while in annuities the surrender of a certain capital in-

sure a series of annual payments during life. Annuities are, in fact, older than life insurance, and the latter is an offshoot of the former.

The elements in the calculation of the rates of annuities are the same as in life insurance, though the calculation is a different one. The first element is the probability of human life, as determined by vital statistics. Upon the length of human life depends the number of payments, and for a given capital, therefore, the amount of such payments. It is obvious that the sum of \$1000 would purchase a larger annuity for a man of 50 than for one of 25. It is equally clear that for a series of contracts once entered upon, a lengthening of the average period of human life would cause pecuniary loss to those paying the annuities, while a shortening of human life would cause a profit. Like results have frequently followed from undertaking annuity contracts upon an erroneous statistical basis. The second element in the case is the interest upon money. If the money surrendered at the outset were locked up in a strong box, the calculation of the payment for a fixed number of years would be simplicity itself. In that case an annuity of \$1 for 10 years could not be purchased for less than \$10. But the purchase money is, in fact, placed at interest, and under the terms of the contract above noted, the seller of the annuity would enjoy the interest on \$10 for one year, on \$9 for the second year, and so on. The purchaser, however, will not surrender his entire claim to interest, but will at least share it with the seller. Thus it follows that an annuity of \$1 for 10 years should be purchased for something less than \$10. How much less, will depend upon the rate of interest. If interest were 6 per cent, the annuity could be purchased more cheaply than if it were only 3 per cent. Changes in the rate of interest complicate the practical problem of executing annuity contracts.

Such contractual annuities as have been described are more frequent in Europe than in the United States. In Europe the earliest public debts were in the form of life annuities. The ill success of these ventures was one of the earliest stimulants to a scientific study of the laws of mortality. In European countries the issue of annuities is still carried on by the government as well as by private companies. The greater familiarity with annuities which prevails in England, for instance, explains the frequent allusions to the interest on the public debt as a multitude of perpetual annuities. The repayment of the principal not being contemplated, the investor in the funds acquires the right to receive a certain annual income, and this right is transferable to his heirs. Annuities are assuming new importance in the United States, owing to the fact that most life insurance companies are beginning to issue new and attractive forms of annuity policies.

The mathematical treatment of the subject is extensive, involving the preparation of mortality and investment tables. The formation of these tables is discussed in the *Assurance Magazine*, a journal of the Institute of Actuaries of Great Britain and Ireland.

The annuity may be chargeable only to the person of the grantor, or it may be a charge on specific personal or real estate. In either case, if given with words of inheritance, it will descend as real property, but for all other purposes it will be treated as personal property. In this

respect it differs from a rent charge (q.v.), with which it is often confused, but which is always charged on specific real estate and, whether inheritable or not, is always treated as real property. Annuities are classed by Blackstone (*Commentaries*, book ii, p. 40) with rents, franchises, etc., as incorporeal hereditaments (q.v.). Like other species of property, they are generally alienable, except in jurisdictions where by statute beneficiaries of trusts for the payment of annuities are not allowed to alienate their interests under the trust.

Consult Blackstone, *Commentaries on the Laws of England*; Kent, *Commentaries on American Law*, and the authorities referred to under the title INSURANCE.

AN'NULAR ECLIPSE. See ECLIPSE.

AN'NULA'RIA (Lat. *annulus*, a small ring). A genus of fossil plants found in rocks of Devonian, Carboniferous, and Permian ages, allied to the modern Equisetaceæ, or Scouring-Rushes, and consisting of fluted annulated stems bearing numerous narrow leaves arranged in whorls at the ring-like joints. *Annularia*, for so long a time considered to be plants of a distinct genus, are now known to be, together with the genera *Asterophyllites* and *Sphenophyllum*, merely heteromorphous leaves of the *Calamites*.

AN'NULA'TA, or **ANNEL'IDA** (Lat. *annulus*, a little ring). A phylum of animals, the annelids, comprising a large group of segmented, worm-like forms, mostly included by Linnæus in his class Vermes. They have a more or less elongated body, which is always composed of numerous segments. The first of these assumes, in many, the character of a head, but in some the head is not clearly set off from the trunk. They have no jointed appendages, but most of them are provided with bristles and hairs, called *setæ*, often in numerous bundles, which are of use to them in locomotion; some, which want these, are furnished with suckers at the extremities and employ them for this purpose; some remain fixed in one place. Their bodies are always soft and without external or internal skeleton; but some of them form for themselves a calcareous covering by exudation; others form coverings partly by exudation and partly by agglutination. Their blood is generally red, but not from red corpuscles, as in vertebrates; sometimes it is greenish or yellowish. The circulatory system is well developed in most annelids, though a few aberrant forms have it greatly reduced or even entirely wanting. It is generally what is called a closed system, i.e., the vessels of which it is composed are entirely shut off from communication with the body cavity. But in the leeches there is no sharp distinction between blood vessels and body cavity. There are always longitudinal vessels, usually two, sometimes four, the dorsal or lateral of which pulsate more or less. These longitudinal vessels are connected by a large number of transverse vessels. Some of these near the anterior end of the body are occasionally larger than the rest and are called "hearts," but there is no true heart. See ALIMENTARY SYSTEM; CIRCULATORY SYSTEM.

The nervous system consists of a pair of ganglia lying above the œsophagus, known as the brain, from which the nerve trunks arise. Usually there are two such trunks, which pass downward and backward around the œsophagus, meeting in the mid-ventral line and running backward to the rear of the body as a double

cord. On this there are ganglia in each segment. The sense of touch is usually acute in annelids and is often localized in tentacles and papillæ. Many species have eyes more or less highly organized; some have sensory pits, supposed to be smelling organs; some have sensory papillæ, which from their occurrence around the mouth are supposed to be organs of taste; and a very few have otocysts, or positional organs. In all annelids, except a few aberrant forms, excretion takes place by means of nephridia, and these are usually arranged a pair in each segment. These nephridia are coiled tubes, one end widened to form a funnel and opening in the body cavity, and the other opening to the exterior. See NERVOUS SYSTEM.

Respiration is either by gills, which are of very various structure and appearance, or through the surface of the body or some part of the alimentary canal. The latter varies greatly with the habits of the worms, but the anal opening is always at the posterior end of the body. The muscular system is usually well developed, for many of these worms are very active animals. The sexes are generally separate, but many annelids are hermaphrodites. Nearly all lay eggs, and these are sometimes provided with a shell. See RESPIRATORY SYSTEM; GILLS; MUSCULAR SYSTEM.

Annelids are widely distributed over the world; while the majority are marine, a large number are found in fresh water or in the earth. Many are carnivorous, but some are almost wholly vegetable feeders. Some are sluggish, but the majority are active, and some move with remarkable rapidity. They vary greatly in size, some being almost microscopic, while others are several feet long. They are usually dull-colored, but some, especially tropical species, are gorgeously arrayed. Aside from the part they play in the economy of nature as soil producers and scavengers, they are of little use to man. Leeches were formerly (and are still sometimes) used in medicine for blood-letting, and a few species are used as food by savages, notably the palolo-worm.

The classification of the annelids has always been a matter of great difficulty, as there are several other groups to which they seem to be related or which they superficially resemble. The matter is not definitely settled, but it seems best now to regard them as a phylum, or type, coördinate with Mollusca, Arthropoda, etc., containing two well-marked classes, and two others whose relationships are very obscure. The largest and most important of these classes is that of the *Chaetopoda*, in which the blood system is closed and the external rings of the body correspond to the internal segments. They have locomotive organs in the form of *setæ*, or appendages provided with them. The class includes a very great number of species of widely different structure and appearance, and the most convenient, though possibly not the most natural, way to divide it is into three groups, Polychæta, Oligochæta, and Myzostomida. The last named are a very small group of curious, degenerate annelids which live parasitically on crinoids. The body is flat and unsegmented and has neither circulatory nor excretory system. The second class is *Gephyrea*, containing marine Annulata "devoid of any trace of segmentation in the adult condition, without parapodia, and either without *setæ*, or with only a limited number." It includes *Sipunculus*, *Echiurus*, and a

few closely related forms. The third class is *Archi-annelida*, minute marine worms, faintly segmented, and represented by only two families—the Histriodrilidæ, parasitic on lobsters, and the Polygordiidæ; the larvæ of both are trochospheres. The fourth class is *Hirudinea*, the leeches, which have the blood system communicating with the body cavity, and the external rings are four or five times as numerous as the inner segments. They have no *setæ* and are provided with suckers. Consult Parker and Haswell, *Zoölogy* (New York, 1897). See EARTH-WORM; LEECH; NEREIS; SERPULA; WORMS; FOSSIL.

AN'NULET (Lat. *annulus*, dimin. of *annus*, a ring). 1. A term in architecture for a small fillet or band in relief encircling a shaft or capital. The annulet is several times repeated under the echinus of the Doric capital. (See ORDERS OF ARCHITECTURE.) The shafts of Moorish columns are often banded with several annulets, and in English Gothic architecture the shafts of a pier-cluster are frequently divided into two or more lengths by molded annulets. 2. *Annulet*, a ring, a charge in heraldry of frequent occurrence.

ANNUNCIADE, ăn-nŭn'shĭ-ăd, or **ANUNCIADA**, ă-nŭn'thĕ-ă'dă (Sp. *Anunciada*, annunciation). The name of several religious orders. 1. The religious Order of the Heavenly Annunciation, or of the Nuns of the Annunciation of Mary, was instituted by Maria Victoria Fornari at Genoa in 1604, after a very strict rule. The convents of the order at one time numbered 50 in France, Germany, and the Netherlands, but they have disappeared since the French Revolution, except the one in Genoa. 2. Another Order of the Annunciation, or of nuns of Mary's Announcement, or the Ten Virtues, was organized by Joanna, the daughter of Louis XI, in 1501, after her separation from Louis XII. It extended to 50 convents for the reception of poor gentlewomen, but was broken up at the Revolution. Some convents still exist in Belgium. 3. The Order of Knights of the Annunciation in Savoy, *Ordine Supremo dell' Annunziata*, now the first Italian order, known originally as the Order of the Neck Chain or Collar, was instituted in 1360 by Amadeus VI, Duke of Savoy. It received statutes from Amadeus VIII, as Anti-Pope Felix V, in 1409, was renewed in 1518 under the name of the Holy Annunciation, and in 1720 was raised by Victor Amadeus to be the first order of the kingdom of Savoy. The King is always grand master. The knights, who since 1720 are not limited in number, must be of high rank, and already admitted to the orders of St. Mauritius and St. Lazarus. They compose only one class. The decoration is a gold medal, on which is represented the Annunciation, surrounded by love-knots. It is usually worn suspended by a simple gold chain, but the proper collar or chain of the order is composed alternately of love-knots and roses. On the roses are engraved the letters F. E. R. T., which some interpret *Fortitudo ejus Rhodum tenuit*, in allusion to the defense of Rhodes by Amadeus V, and which others hold to signify *Frappes, entres, rompes tout*. Since 1680 the knights wear on the left breast a star embroidered in gold. The four officers of the order—the chancellor (always a bishop or archbishop), the secretary (usually the minister of foreign affairs), the almoner (usually the king's first almoner), and the treasurer—wear the decoration round the neck, sus-

pended by a sky-blue ribbon, accompanied by a star on the left breast. For details of costumes, etc., see Burke's *Book of Orders of Knighthood*, pp. 250 et seq. 4. A brotherhood of the Annunciation was established in Rome by Cardinal Turrecremata in 1460. Its primary object was to provide dowries for 12 poor girls, but it now supports 400 girls, to whom it gives 25 scudi (\$25) apiece if they marry, or 50 scudi apiece if they enter a convent. Pope Urban VIII (died 1644) left his entire private fortune (30,000 scudi) to the brotherhood.

ANNUN'CIA'TION, THE (Lat. *ad*, to + *nuntius*, messenger, newsbearer). The announcement by the angel to the Virgin Mary of the incarnation of Christ (Luke i. 26-38). The festival of the Annunciation is kept on March 25, which was for a long period the beginning of the legal year in England. The earliest authentic evidence of the celebration of this feast is in a canon of the Council of Toledo, held in 656.

ANNUNCIATION, THE. A subject frequently treated by religious painters, especially the Italian. The Virgin is commonly represented with needlework or with a book, according to the legends, while the archangel usually appears bearing a lily or cluster of lilies. Among well-known pictures with this title are paintings by Andrea del Sarto, in the Pitti Gallery, Florence; Fra Angelico, a fresco, in the cloisters attached to the church of San Marco, at Florence, a particularly delicate and characteristic treatment of the theme; also by the same, panels in the Gesù, Cortona, and in the Museum of Madrid; Fra Bartolommeo in the Louvre; Luca Signorelli, at Volterra, Italy, in a chapel of the Duomo; Titian and also Tintoretto, in the Scuola di San Rocco and elsewhere at Venice. Among Spanish painters it was often represented by Murillo in a number of pictures in Seville and Madrid, and among moderns by D. G. Rossetti, in the National Gallery, London, a noteworthy example of the pre-Raphaelite school, in which the Virgin is a portrait of Christina Rossetti.

ANNUNZIO, ăn-nŭn'dzĕ-ō, GABRIELE D' (1864—). A leading Italian novelist and poet. He was born at Francavilla al Mare, near Pescara. In his fifteenth year, while a student at Prato, he published his first collection of verse, *Primo Vere* (1879), followed at intervals by *In Memoriam* (1880), *Canto novo* (1882), *Intermezzo de rime* (1884), *Isotta Guttadauro* (1886), and *L'Isotteo e la Chimera* (1890). From the appearance of his first volume, in which he imitated Carducci, he was hailed as a poet of exceptional promise, although the naturalistic tone of many of his earlier poems, especially the *Canto novo*, provoked much censure. His first novel, *Il piacere* (translated under the title *The Child of Pleasure* (Boston, 1910), appeared in 1889 and was evidently written under the dominating influence of Maupassant and Bourget. In the main, it is a psychological study of a thorough-going egotist, whose affections are divided between two women and who in the end ruins the life of one of them as well as his own. His next volume, *L'innocente* ('The Intruder,' 1891), and *Giovanni Episcopo* (1892), are both powerful but gruesome stories, showing strongly the influence of the Russian school, and especially that of Tolstoy's *Kreutzer Sonata*. *Il trionfo della morte* ('The Triumph of Death'), the purpose of which was to establish in Italy "a modern narrative

and descriptive prose," appeared in 1894 and confirmed his reputation as a searching psychological writer, although its audacity has made it impossible to translate the volume in its entirety. About this time some of his volumes were translated into French by M. Herelle, and shortly after their appearance M. de Vogüé wrote a highly eulogistic appreciation of d'Annunzio for the *Revue des Deux Mondes* (1895), under the caption "La Renaissance latine," with the result that the young author suddenly awoke to an international reputation.

During the following years d'Annunzio's literary ideals seemed to undergo an interesting evolution. Grouping together his earlier novels, *Il piacere*, *L'innocente*, and *Il trionfo*, as the *Romances of the Rose*, he conceived the idea of a triple trilogy, the second and third groups to be respectively known as the *Romances of the Lily* and *Romances of the Pomegranate*. The first "Romance of the Lily," *Le vergini delle rocce* ('Virgins of the Rocks'), in which the influence of Nietzsche's doctrine of the Superman is pronounced, appeared in 1896. His long-promised *Fuoco* ('Flame of Life'), the first of the "Pomegranate" series, appeared in the autumn of 1900 and had a great "success of scandal." It is an apotheosis of poetry, physical beauty, and sensual love. It marks the beginning of a decline, more pronounced in his later novels, such as *Forse che sì forse che no* (1910). D'Annunzio also turned his attention to the drama, which it was his ambition to restore to the grandeur and unity of the classic Greek tragedy. In this he has been unsuccessful, for his dramas are usually devoid of action. His plays include *Il sogno d'un mattino di primavera* (1897), *Il sogno d'un tramonto d'autunno* (1898), *La città morta* (1898), *La Gioconda* (1898), *La Gloria* (1899), *Francesca da Rimini* (1901), *La figlia di Jorio* (1904), and *La fiaccola sotto il moggio* (1905), the last two dealing with the life of his native Abruzzi and revealing a marked advance in his dramatic art. The tragedies *La Nave* (1908) and *Fedra* (1909) were both failures. *Novelle della Pescara*, a collection of short tales modeled closely on Maupassant, appeared in 1902. His later lyrical work is contained in the *Laudi*, generally regarded as his finest achievement in poetry, a collection of songs to be completed in seven books dedicated to the pleiades and chanting the praises, as the full name tells, "of the heavens, the sea, the earth, and the souls of heroes." These later poems have been received with great enthusiasm in Italy, where d'Annunzio has been assigned a place in the front rank with Carducci. D'Annunzio is a firm believer in a new Renaissance—a Renaissance which will begin by "re-establishing the worship of Man," and which will "exalt and glorify above all things the beauty and power of man, the conqueror." His most recent works are *Il Martirio di San Sebastiano*, a mystery play originally composed in French and translated into Italian by Janni (1911), and *La Vita di Cola di Rienzo*, the first of a series entitled *vite di uomini illustri e di uomini oscuri* (1913). Though d'Annunzio is a very great artist, Borgese considers him the product of a materialistic age, incapable of a high ideal, which prevailed in Italy after the accomplishment of national unity. Consult: Borgese, *Gabriele d'Annunzio* (Naples, 1909); Collison-Morley, *Modern Italian Literature* (Boston, 1912); Gargiulo, *Gabriele d'Annunzio*

(Naples, 1912); Croce, "G. D'A.," *Critica* (Bari, 1910).

AN'NUS MIRABILIS (Lat. wonderful year; the year of wonders). The title of a poem by Dryden (1667) on England's naval successes in the war with Holland (1666) and on the great fire of London.

ANN'VILLE. An unincorporated town in Lebanon Co., Pa., 5 miles west of Lebanon, the county-seat; on the Philadelphia and Reading Railroad (Map: Pennsylvania, E 3). It is the seat of Lebanon Valley College (United Brethren in Christ), opened in 1866, and has manufactures of shoes, hosiery, etc. The town is governed by five commissioners elected by the people. Annville was laid out in 1762 and originally was called Millerstown, in honor of its founder. Pop., 1890, 1283; 1910, 2482.

ANO'A (native name). A genus of buffaloes, the smallest of all wild cattle, and represented by the sapi-utan of Celebes (*Anoa depressicornis*), having low straight horns, wide at the base. See Plate of BUFFALO.

AN'ODE (Gk. *ánodos*, *anodos*, a way up, from *aná*, *ana*, up + *ódós*, *hodos*, way). A term first used by Faraday to designate the positive terminal or conductor by which the current of a voltaic battery enters a substance, undergoing decomposition by electrolysis. The negative pole, or conductor, by which the current leaves the electrolyte, is called in the same nomenclature the *cathode* (*kata*, downward and *hodos*). *Electrode* is the general term applied to either of these. The products of electrolysis are called *ions* (*iōn*, going). Such as go to the anode receive the name of *anions*, and those passing to the cathode, *cations*. Thus, in the decomposition of water by the passage through it of an electric current between two platinum plates, the water is the electrolyte; the platinum plate connected with the copper or carbon of the battery is the anode; and the one connected with the zinc plate, the cathode. The oxygen and hydrogen which are disengaged are the ions, the oxygen separating at the anode forming the anions, and the hydrogen at the cathode the cations. See ELECTRICITY for a discussion of electrolysis; also ELECTRIC FURNACE and ELECTRO-CHEMISTRY.

AN'ODON'TA. A subdivision of fresh-water mussels of the family Unionidæ, characterized by having light, thin, smooth shells without hinge-teeth. They are abundant in both ponds and streams in America and most other countries. See Plate of ABALONE, ETC.

AN'ODYNE (Gk. *án*, *an*, priv. + *ódýnē*, *odynē*, pain). A remedy given to assuage pain. Properly the term is applied to medicines, such as opium, which act on the nervous system so as to diminish pain. Anodynes may induce sleep. See HYPNOTIC; ANÆSTHETIC.

ANOINTING (Lat. *inunctio*, from *in*, in + *ungere*, to smear, anoint). The custom of pouring oil on the head or of applying unguents to one's body. Anointing was widespread in the ancient Orient for secular as well as for religious purposes. In the Old Testament, where the custom is frequently referred to, the unguent used was olive oil, to which frequently aromatic spices were added. As a part of the regular toilet, anointing was associated with washing (e.g., Ezek. xvi. 9), but in days of mourning, anointing, which was regarded as a symbol of joy and gladness (e.g., Ps. xxiii. 5), was omitted. Head, face, and feet were the parts of the body to which the unguents were applied. The Hebrews

in thus using aromatic unguents no doubt simply followed general customs, and similarly the religious and ceremonial use of unguents was common to the ancient Orient. It was general to anoint kings as a symbol of initiation, and likewise priests and sacred objects were anointed. An interesting development growing out of the custom among the Hebrews was the use of the word *meshiach*, which means 'anointed,' in regard to the kings and the high priests who were anointed with oil, when they assumed their office. In later times the Aramaic form *mes-sicha*, whence the Greek *Μεσσίας*, *Messias*, *Messiah*, was applied to the King of David's line who was expected. The Greek translation *ὁ χριστός*, *ho Christos*, occurs in the Psalter of Solomon, with this significance, and becomes the title of Jesus in the New Testament.

As to the original significance of anointing as a religious rite, scholars hold different views. Some regard the oil as a substitute for blood; others look upon it as itself symbolizing life, fat being, according to ancient ideas, one of the seats of life. In either case the idea expressed by the religious and ceremonial anointing is that of establishing a covenant between the individual and the Deity, perhaps as the source of life of which the oil serves in some way or other as representative. It was the actual rubbing of the unguent over the head, face, or feet whereby direct communion between the individual and the unguent was brought about that constituted the essential part of the ceremony, and not the mere act of pouring it over the head of a person. In the course of time, however, as the custom became more and more merely a mark of honor, the pouring over the head became the customary form of anointing. In the New Testament anointing is merely referred to in the case of the sick; but the rite was adopted by the Roman Catholic and the various Oriental churches, and survives in the anointing of kings in England, Spain, and Russia. See also **CHRISM**; **CORONATION**; **EXTREME UNCTION**; and for anointing of the dead, see **EMBALMING**.

ANOKA, à-nō'ká. A city, the county-seat of Anoka Co., Minn., 18 miles north-northwest of Minneapolis, on the Great Northern, Minneapolis Northern, and the Northern Pacific railroads, and on Rum River (Map: Minnesota, D 5). Anoka has a Carnegie library and is the seat of a State asylum. Its chief industries include a sash and door factory, a motor company, and a starch factory. The commission form of government adopted (1913) provides for election of mayor and four commissioners biannually. Both the water works and electric light plant are owned by the municipality. Pop., 1890, 4252; 1900, 3769; 1910, 3972.

ANO'LIS (in the Antilles, *anoli*, *anoalli*, a lizard). A genus (containing over 100 species) and family (Anolidæ) of small, fine-scaled, iguanid lizards, with considerable ability to change color, numerous in the warmer parts of America and represented in the United States by one species (*Anolis carolinensis*). See **CHAMELEON**. For illustration, see **LIZARD**.

ANOM'ALIS'TIC YEAR. The interval that elapses between two successive passages of the earth through its perihelion, or point of nearest approach to the sun. If the earth's orbit had a fixed position in space, this period would correspond with that of a sidereal revolution, or the time the earth would take after leaving any point of the heavens to return to it again, as

seen from the sun; but the disturbing influence of the other planets causes the perihelion to advance slowly (about 11".6 annually) in the direction of the earth's motion; so that the anomalistic year is longer than the sidereal. Owing to the fact that the advance of perihelion is not quite constant, the length of the anomalistic year varies slowly, increasing at the rate of about 2.6 seconds in 1000 years. According to Newcomb, the length in 1900 was 365 days, 6 hours, 13 minutes, 53 seconds, or 4 minutes, 43.5 seconds longer than the sidereal year. It receives its name from the anomaly (q.v.).

ANOM'ALISTS AND ANAL'OGISTS (for derivation, see below). Under this name were known in antiquity the representatives of the two opposing views of the origin of language. The science of grammar was developed among the Greeks in the Alexandrian Age (q.v.), although some beginning had been made in the earlier period, notably by Aristotle. (See **GRAMMAR**.) The Stoics concerned themselves with the origin of language and maintained that language was a natural growth, while the grammarians maintained that it was the product of convention. Chrysippus (q.v.) went further and taught that language was marked mainly by irregularities (*ἀνωμαλία*, *anōmalia*), and that not analogy, or law, but *consuetudo*, i.e., habit or usage, was the guiding principle of language; the Alexandrians, Aristophanes and Aristarchus, contended that regularity, analogy (*ἀναλογία*, *analogia*), was the rule, and that every departure from regularity is to be explained as an exception to the general law. (See **ANALOGY**.) The Pergamene school of grammarians, under the leadership of Crates (q.v.) of Mallos, adopted the anomalistic doctrine against the analogistic teaching of the Alexandrians. When Crates was sent on an embassy to Rome in the middle of the second century B.C., he transplanted his doctrine to that city; he accepted the phenomena of language as the arbitrary result of custom and usage. The Alexandrians' views, however, gained currency there somewhat later, and the contest between the two doctrines lasted a long time. Ælius Stilo, the teacher of Cicero and Varro, favored analogy; Cæsar wrote two books, *De Analogia*, now lost; and Varro (q.v.) devoted books viii-x, still extant, of his *De Lingua Latina* to a discussion of the two views. The analogistic view finally prevailed. Cicero was an analogist, but he gave great weight to *consuetudo*, going so far as to use forms which he knew to be wrong. As a matter of fact, neither the analogists nor the anomalists were wholly right; language is marked at once by analogy and by anomaly.

Consult: Wheeler, "Analogy and the Scope of its Application in Language," *Cornell Classical Studies* (Ithaca, 1887); Henry, *Etude sur l'analogie* (Paris, 1883); Paul, *Introduction to the Study of the History of Language*, translated and edited by Strong (London, 1888); Strong, Logeman, and Wheeler, *Introduction to the Study of the History of Language* (London, 1891), which is founded upon Paul's work; Sandys, *A History of Classical Scholarship*, especially vol. i, pp. 179-181 (Cambridge, 1906). See **PHILOLOGY**.

ANOM'ALOUS DISPERSION. This phenomenon will be found discussed in the article **LIGHT**, particularly in the section dealing with ether and matter.

ANOM'ALU'RUS. See **FLYING SQUIRREL**.

ANOM'ALY (Gk. *ἀνωμαλία*, *anōmalia*, irregularity, from *ἀν*, *an*, negat. + *ὄμαλός*, *homalos*, even, equal). The angle measured at the sun's centre between a planet in any point of its orbit and the last perihelion. It is so called because it was in it that the first irregularities of planetary motion were discovered. In the ac-

companying diagram, let *P* be a planet, *APA'* its orbit, *C* the centre of the orbit, *S* the sun, and *A* the perihelion, then the angle *ASP* is called the true anomaly. Besides the true anomaly, there are two other anomalies—the eccentric and the mean—which are defined as follows: Let *AQA'* be the semicircle described on *AA'* as diameter, *Q* the point in which the line *PM* drawn at right angles to *AA'* meets the semicircle; then the angle *ACQ* is the eccentric anomaly. The mean anomaly is the angle *ACR*, *R* being the position of a hypothetical planet which moves along the circumference of the semicircle with uniform velocity in such a way that, starting from perihelion *A* at the same time as the true planet *P*, it reaches aphelion *A'* simultaneously with *P*. The difference between the true and the mean anomaly is termed the *equation of the centre* on account of its being the first equation or correction to be applied to the mean motion in the computation of the place of a planet. Kepler's Problem, the solution of which is of a mathematical nature and may be found in treatises on spherical astronomy, consists in the determination of the true anomaly in terms of the mean anomaly.

ANON'YMOUS (Gk. *ἀν*, *an*, negat. + *ὄνυμα*, *onyma*, Æol. and Dor. for *ὄνομα*, *onoma*, name). A term applied to a book the author of which does not give his name; when an assumed name is given, the term "pseudonymous" is used. Works of this class constitute one of the greatest difficulties of bibliography. French literature possesses an excellent *Dictionnaire des ouvrages anonymes et pseudonymes* (4 vols., 3d ed., Paris, 1872-79), by Barbier, embracing the titles of about 24,000 works. The best works in English are: Cushing, *Anonyms* (Cambridge, Mass., 1890), and *Initials and Pseudonyms* (1st series, New York, 1885; 2d series, New York, 1888); Halkett and Laing, *Dictionary of Anonymous and Pseudonymous Literature* (4 vols., New York, 1882-88); Olphar Hamst, *Handbook of Fictitious Names* (London, 1868).

In France and Germany literary criticism, when it extends beyond a brief notice, usually bears the author's name. In Great Britain and the United States there is no uniform practice, though reviews are more commonly unsigned.

ANON'YMUS CUS'PINIA'NI. The Latin designation of an important anonymous manuscript, so called from the name of Joseph Cuspinianus, the scholar who brought it to notice

about the beginning of the sixteenth century. It is an historical account of the quarter-century preceding the fall of the Western Roman Empire. The manuscript is in the Imperial Library at Vienna.

ANOPHELES, ä-nöf'ë-lēz (Gk. *ἀνωφελής*, *anōphelēs*, useless, harmful; from *ἀν*, *an*, priv. + *ὠφέλεια*, *ōpheleia*, help, use). A genus of mosquitoes which form the secondary hosts of malarial parasites and communicate disease. See MOSQUITO.

AN'OPLOTHE'RIMUM (Gk. *ἀνοπλος*, *anoplos*, unarmed + *θηρίον*, *thērion*, wild beast). A genus containing several species of artiodactyl mammals that lived during late Eocene and early Oligocene time in France and the British Islands and that soon became extinct without leaving descendants. The remains of one species, *Anoplotherium commune*, of the size of a deer, occur in such abundance in the early Tertiary beds of the Paris Basin as to justify the conclusion that these animals ranged the forests of Tertiary time in immense herds in much the same manner as do the deer of the present day. The feet were provided with three digits, two of which were of equal size and of some length, while the third was in the form of a reduced dew-claw. *Anoplotherium* is by some authors placed in close relation to the Oreodonts, by others to the Hippopotami. See TERTIARY SYSTEM.

AN'OREX'IA. Loss of natural appetite for food. It is always a symptom of fevers and acute illness. Lack of appetite is a characteristic of many gastric disorders, chronic alcoholism, grief, anxiety, and certain nervous diseases. There may be merely an absence of the hunger sense, or there may be a positive aversion, to the extent of bringing on nausea at the sight of food. Anorexia is not seldom due simply to an excess of nourishment or to eating at too frequent intervals.

ANOR'THITE (Gk. *ἀν*, *an*, priv. + *ὀρθός*, *orthos*, straight; i.e., without right angles). An aluminum calcium silicate of the feldspar group of minerals. It crystallizes in the triclinic system and is found in prismatic crystals in many volcanic rocks; it has also been recognized as a constituent of certain meteorites.

ANOR'THOSITE (Fr. *anorthose*, triclinic feldspar; see ANORTHITE). An igneous rock related to the gabbro family, composed largely of that variety of feldspar, rich in lime, known as labradorite. Anorthosite has a granitoid but generally also a parallel structure, and in addition to labradorite feldspar contains often augite, hypersthene, hornblende, etc. It contains on an average about 55 per cent of silica, 28 of alumina, 10 of lime, 5 of soda, and 1 of potash. An obsolete name is labradorite rock. Anorthosite has been described from the Adirondack Mountains of New York, where it forms the central more mountainous part, including the Mount Marcy group, from Canada and Newfoundland, and from southwestern Norway. It occurs also about Lake Superior. See GABBRO; LABRADORITE.

ANOS'MIA (Gk. *ἀν*, *an*, priv. + *ὀσμή*, *osmē*, smell). A medical term, denoting a loss of the sense of smell. It may be due to causes acting either on the terminals of the olfactory nerve, peripheral, or on that part of the nerve which is within the brain, central.

ANQUETIL, änk'tél', LOUIS PIERRE (1723-1806). A French historian. At the age of 17 he joined the congregation of St. Geneviève;

was director of the Seminary of Rheims, and afterward director of the College of Senlis. In the Reign of Terror he was imprisoned in St. Lazare. He was an early member of the Institute and secured a place as archivist in the department of foreign affairs under Napoleon. His best work was his *Histoire de Reims* (1756-57). He also wrote several volumes of memoirs, such as *Louis XIV, sa cour et le régent* (1789; Eng. trans., Edinburgh, 1791); and an incomplete *Histoire de France depuis les Gaules jusqu'à la fin de la monarchie* (1805). His *Summary of Universal History* was published in English in Philadelphia (1805-09).

ANQUETIL-DUPERRON, du'pâ'rôn', ABRAHAM HYACINTHE (1731-1805). A French Orientalist, born in Paris. He studied theology and Oriental languages and in 1754 enlisted as a private soldier for India. There, after securing the support of the French government, he passed seven years in the collection and collation of manuscripts and studied the language and doctrines of the Parsees. He returned to France in 1762, was elected a member of the Academy of Inscriptions in 1763, and in 1771 published *Zend-Avesta, ouvrage de Zoroastre*, 3 vols., the first translation of Parsee religious works ever made into a European language, about the exactness of which a fierce polemic arose. His further publications include *Legislation orientale* (1778); *Recherches historiques et géographiques sur l'Inde* (1786) as part of Thieffenthaler's *Geography of India; L'Inde en rapport avec l'Europe* (1790); and *Oupnek'hat* (1801-02), a Latin translation of a Persian rendering of the Sanskrit *Upanishads*, noteworthy as the source of Schopenhauer's knowledge of the Indian philosophy by which his own system was not slightly influenced. Consult Sir T. E. Perry, *Bibliographical and Historical Miscellanies of the Philobiblon Society*, vol. iii (1856-57), and A. F. Weber, *Indische Studien* (1853).

ANSÆ (Lat. *ansa*, a handle). The two handle-like projections on the planet Saturn which are observed whenever the rings are tilted with reference to the earth. Galileo, writing to the Grand Duke of Tuscany, announced that the planet, as seen through the then newly invented telescope, appeared to be *tricorps*, and later observers likened the projections to two handles, until Huygens, in 1655, discovered their true nature.

ANSARIES. See NOSAIRIANS.

ANSBACH, äns'bäg, or **ANSPACH** (originally Onolzbach). A town of Bavaria, capital of the circle of Middle Franconia (*Mittelfranken*), on the Rezat, 25 miles southwest of Nuremberg (Map: Germany, D 4). Its only notable buildings are the churches of St. Gumbert and St. John, and the castle, once the residence of the margraves of Ansbach, containing a library and picture gallery. The town has several schools, a synagogue, a theatre, and a public slaughter house. It has iron foundries, breweries, dyeworks, and spinning mills; manufactures vehicles, paper, liquors, tobacco, earthenware, toys, and hardware, and has a considerable trade in wool, flax, and grain. Ansbach sprang up around a Benedictine monastery founded by St. Gumbert in the eighth century. It was the capital of the principality of Ansbach, which from the close of the Middle Ages was for three centuries ruled by margraves of the Franconian branch of the House of Hohenzollern (of Brand-

enburg, later of Prussia). After belonging for a short time to Prussia, Ansbach and its territory, together with the old principality of Bayreuth, which had also been ruled by margraves of the Hohenzollern line and had shared the fortunes of Ansbach, were transferred by Napoleon I to Bavaria in 1806. Pop., 1890, 14,200; 1900, 17,555; in 1905, 18,478; 1910, 19,995.

ANSCHÜTZ, än'shuts, HEINRICH (1785-1865). A German actor. He was born at Luckau and studied at the University of Leipzig, in which city he saw the performances of Iffland, Esslair, and other distinguished actors who occasionally played there. He began his career as an actor at Nuremberg in 1807 and finally became a member of the Hofburgtheater in Vienna. He played both heroic and character parts and was for many years the central figure at the famous playhouse. An autobiography under the title, *Heinrich Anschütz, Erinnerungen aus dessen Leben und Wirken*, was published in Vienna (1866).

ANSCHÜTZ, KARL (1815-70). A German musician. He was born in Coblenz and in 1857 settled in New York, where he became well known chiefly as a conductor of opera and as a pioneer manager of German opera. He was also conductor of the Arion Society (1860-62). Consult F. L. Ritter, *Music in America* (New York, 1895).

ANSCHÜTZ, OTTOMAR (1846—). A German photographer, born at Lissa, in Posen. He devoted himself to instantaneous photography and to reproducing the movements of men and animals with the aid of a "tachyscope" of his own invention. (See STROBOSCOPE.) Anschütz's invention has been applied to useful purposes in physiology.

ANS'DELL, RICHARD (1815-85). An English genre and animal painter, born at Liverpool. He studied art at the local academy, but acquired most of his training by independent sketching and study travels in the north of England and Scotland. In 1847 he removed to London and in 1856-57 visited Spain, which influenced both his subjects and technique. In 1870 he was elected to the Royal Academy. After Landseer, who greatly influenced him, he was the most popular animal painter of England, with a wide range of subjects, made interesting by a dash of human sentiment. He was good in composition, but his animals are not really true to nature. His historical subjects, which attracted much notice earlier in his career, were poor. Ansdell was also a skillful etcher, and examples of his art may be seen in the galleries of Manchester and Liverpool. His best painting is the "Combat of Red Stags."

ANSE D'ARLET, äns' där'lä'. An attractive seaport town on the southwest coast of Martinique, in the canton of Diamaut, directly south of Trois Ilets. Near by is a hot spring, and there are many plantations on which are grown cotton, cacao, and coffee. Pop., about 3000.

ANSE DE PANIER, äns de pâ'nyâ' (Fr. handle of a basket). The equivalent of basket-handle arch. An architectural term for three-centred arches.

ANSELL, MARY. An English actress, who after two years of theatrical experience made a success in 1893 as Nannie O'Brien in *Walker, London*. The next year she retired from the stage to marry the author of the play, J. M.

Barrie, the novelist, at Kerriemuir (July, 1894). In 1913 she published *Happy Houses*.

AN'SELM OF CANTERBURY, SAINT (1033-1109). A scholastic philosopher, born at Aosta, in Piedmont. He led at first a dissipated life and, like Abélard, wandered through France, after the fashion of the scholars of those days, disputing wherever he could find an adversary. Attracted by the reputation of Lanfranc, he went, in 1060, to study at the monastery of Bec, in Normandy. Three years later he became prior, and, in 1078, abbot of this monastery, which under him became famous as a seat of learning. Lanfranc, who in the meantime had gone to England and become Archbishop of Canterbury, died in 1089; and the archdiocese remained four years without a successor, till, in 1093, Anselm was appointed. He was distinguished as both a churchman and philosopher. His numerous embroilments with William Rufus and Henry I, and the unbending spirit which he displayed in these, even when subjected to banishment, indicate the vigor and resoluteness of his character, as much as his writings exhibit the depth and acuteness of his intellect. In 1720 Clement XI expressly placed him in the list of Church authorities. Anselm was a second Augustine, superior to all his contemporaries in sagacity and dialectical skill and equal to the most eminent in virtue and piety. Embracing without question the doctrines of the Church, mostly as stated by Augustine, and holding that belief must precede knowledge and must be implicit and undoubting, he yet felt the necessity of a religious philosophy, urged the duty of proceeding from belief to knowledge, and sought to reduce the truths of religion into the form of a connected series of reasonings. It was for this purpose he wrote his *Monologium sive Exemplum Meditandi de Ratione Fidei*. In his *Proslogium*, otherwise entitled *Fides Quærens Intellectum* ('Faith Seeking Intellect'), he strove to demonstrate the existence of God from the conception of a perfect being. This ontological proof, however, has never been held satisfactory. His writings, *Cur Deus Homo* and *De Concordia Præscientiæ et Prædestinationis*, made an epoch in Christian philosophy. Anselm may justly be reckoned the earliest of the schoolmen, although Alexander of Hales (q.v.) was the first who completely systematized in the scholastic manner the doctrines of the Catholic church. He died in Canterbury, April 21, 1109, and was buried there. The day of his death is observed in the Roman Catholic church. His works are in Migne, *P. L.*, 158, 159, and a few pieces since discovered in Mai, *Nov. Bibl. I.* For his life and teachings, consult: F. R. Hasse (Leipzig, 1843-52); De Rémusat (Paris, 1858); R. W. Church (London, 1870); M. Rule (London, 1883), who also edited two lives of Anselm by Eadmer for the Rolls Series (London, 1884); J. M. Rigg (London, 1896); A. C. Welch (London, 1900). In English are his *Book of Meditations and Prayers* (London, 1872); *Cur Deus Homo*, with selections from his letters and life (London, 1889); *Monologium, Proslogium, and Cur Deus Homo*, edited by S. N. Deane (Chicago, 1903).

ANSELM OF LUC'CA. See ALEXANDER II (POPE).

ANSERES, ān'sēr-ēz (Lat. nom. pl. of *anser*, goose). An order of birds, also called Anseriformes, including the ducks, geese, and swans (q.v.), and characterized mainly by the fact that

the edges of both mandibles are provided with a series of tooth-like projections, those of the upper alternating with those of the lower mandible. The Anseres are found in all parts of the world, and about 200 species are known, mostly of large size. With few exceptions, they are essentially swimming birds and are never found far from water. They breed near the water, lay numerous eggs, and the young are able to care for themselves almost as soon as they are hatched.

ANSGAR, äns'gär (ANSKAR, or ANSCHARIUS) (801-865). A French prelate, styled "the Apostle of the North," on account of his labors to introduce Christianity into Denmark, Sweden, and northern Germany. He was born near the monastery of Corbie, in the vicinity of Amiens, France. In this monastery and that of Korvei, in Westphalia, an offshoot of the former, he was educated, and in the latter he subsequently became preacher. His family belonged to the Frankish nobility, and under the patronage of Louis de Débonnaire he went, with his colleague Autbert, to preach the doctrines of Christianity among the heathen Northmen of Schleswig, where he suffered many persecutions, but had, nevertheless, such success that in 831 the Pope established an archbishopric in Hamburg, and Ansgar was appointed the first archbishop. Here he passed through many difficulties, being compelled to save his life by flight in 845, when the Northmen and Danes under Eric I plundered Hamburg. He afterward made several missionary tours in Denmark and Sweden, and died Feb. 3, 865, at Bremen, where a church was named after him. The Roman Catholic church has canonized him. For his life, consult: G. H. Klippel (Bremen, 1845); Tappehorn (Münster, 1863); A. Butler, *Lives of the Saints*, under February 3 (London, 1847).

AN'SON, GEORGE, LORD (1697-1762). An English admiral and famous circumnavigator. He was born at Shugborough, Staffordshire, April 23, 1697. From an early period he manifested a predilection for a sea life, and entered the navy at the age of 15. In 1716 he served as second lieutenant under Norris; next under Byng in 1718, against the Spaniards; and was made a captain in 1723. In 1739, when war with Spain broke out, he was recalled from the Carolina station, on which he had been placed since 1724, and received the command of the fleet in the South Sea. He sailed from England in September, 1740, with instructions to inflict whatever injury he could on the Spanish commerce and colonies. The preparations for this cruise had been made in the most slovenly manner. Both vessels and stores were bad, and the sailors were old Chelsea pensioners; yet Anson, in spite of these disadvantages, achieved a brilliant reputation by the heroism, prudence, diligence, and humanity he displayed. After his little fleet of seven vessels had been scattered by a storm in doubling Cape Horn, he landed at Juan Fernandez, where he was soon joined by three of his ships, which arrived in a dismantled condition. Under great disadvantages he took several prizes, including a valuable Spanish galleon from Acapulco. Finally, with only one vessel left, he crossed the South Sea, doubled the Cape of Good Hope, and, favored by good fortune, was hidden by a thick fog as he passed through the French fleet and entered the English Channel. He arrived at Spithead, June 15, 1744, and his accumulated treasure, amounting to £500,000, was landed at Portsmouth, sent up to

London, and triumphantly paraded through the city in 32 wagons. He had circumnavigated the globe in three years and nine months, and his perilous cruise greatly extended the knowledge of navigation and geography. It has been described in his *Voyage Round the World* (editors Walter and Robins, 1748; new ed., 1853; in Everyman's Library, New York and London, 1911). As a reward for his services, Anson was made rear-admiral of the blue (1744), and in 1747, having defeated the French admiral Jonquière, at Cape Finisterre, he was created Baron Soberton, and four years later first lord of the admiralty. In 1761 he was made admiral of the fleet. Consult *Life*, by J. Barrow (London, 1839), and M. V. Anson (London, 1912).

ANSON, G. W. (1847—). An English actor, born at Montrose, N. B. He began his career at the Theatre Royal, Edinburgh, in 1865. After touring in the provincial towns and in America, he made in 1873 his London début, in *Sour Grapes*, at the Olympic Theatre, where he was engaged for several years. In 1880 he played Gaston Rieux, in *Heartsease*, with Madame Modjeska at the Court Theatre, and continued in London in various comedy parts till 1885, when he went to Australia for an extended stay. In 1892 he appeared in *The Lucky Dog* at Terry's Theatre, London. Among his subsequent rôles have been those of Schwartz, in *A Bunch of Violets*, at the Haymarket (1894); Hilarius, in *La Poupée*, with Anna Held, at the Lyric Theatre (1887), and Nero, in *Quo Vadis*, at the Adelphi (1900). During the years 1908, 1909, he appeared in the Shakespearean rôles of Old Gobbo in *The Merchant of Venice*, Sir Toby Belch in *Twelfth Night*, and Ligarius in *Julius Caesar*.

ANSO'NIA. A city in New Haven Co., Conn., 12 miles west by north of New Haven, on the Naugatuck River, and on the Berkshire and Naugatuck divisions of the New York, New Haven, and Hartford Railroad (Map: Connecticut, C 4). Among the more prominent features of the city are the public library, built by Caroline Phelps Stokes as a memorial to her grandfather, Anson G. Phelps (q.v.), the founder of Ansonia, the Young Men's Christian Association Building, the Opera House, and the City Hall. A concrete bridge spanning the Naugatuck River has recently been completed at a cost of \$175,000. Ansonia is noted as a manufacturing centre, the products including heavy machinery, rolls for paper making and wheat milling, rubber, sugar, copper, brass, and wire goods, electrical appliances, clocks, etc. The government, under a charter of 1901, is vested in a mayor elected every two years, a municipal council, and administrative officials, the majority of whom are appointed by the mayor with the consent of the council. Settled in 1840, Ansonia was set off from Derby in 1889 and was chartered as a city in 1893. Pop., 1890, 10,342; 1900, 12,681; 1910, 15,152.

ANSPACH, ä'n'späg. See ANSBACH.

ANSPACH, or ANSBACH, ELIZABETH BERKELEY, MARGRAVINE OF (1750–1828). An English dramatic writer. She was a daughter of the Earl of Berkeley and was married in 1767 to Mr., afterward Lord, Craven, but separated from him 13 years later. In 1791 she became the wife of the Margrave of Anspach, with whom she had been some time intimately associated at his court. She and her husband were not received, when they came to England,

either by her family or by royalty, even after she had been created a countess of the Empire by the German Emperor, Francis II. Her wanderings, after the Margrave's death, in 1806, finally ended at Naples, where she spent her last years. Her literary work included poetry, travels, and the plays: *Somnambule* (1778); *The Silver Tankard*, a musical farce (Haymarket, 1781); *The Princess of Georgia* (Covent Garden, 1799); and *Love in a Convent* (1805), in which she herself took part. She also wrote the curious *Memoirs of the Margravine of Anspach* (London, 1825).

AN'STED, DAVID THOMAS (1814–80). An English geologist and mining engineer. He was born in London and received his education at Jesus College, Cambridge. In 1840 he became professor of geology at King's College in London and afterward occupied a similar position at the Putney College of Civil Engineering. His works include: *Geology, Introductory, Descriptive, and Practical* (2 vols., 1844); *Gold-seeker's Manual* (1849); *The Applications of Geology to the Arts and Manufactures* (1865); *The World We Live In* (1870); the fifth edition of his *Physical Geography* appeared in 1871, four years after its first publication.

AN'STER, JOHN (1793–1867). An Irish educator and poet. He was born in Cork Co., Ireland, and was educated at Trinity College, Dublin, where he was regius professor of civil law (1850–67). Besides making contributions to several literary periodicals, he published *Poems and Translations from the German* (1819); a translation of the first part of Goethe's *Faust* (1835); and *Faustus, the Second Part, from the German of Goethe* (1864).

ANSTEY, ä'n'stī, CHRISTOPHER (1724–1805). An English poet and humorist, who was educated at Eton and Cambridge. In his time the two great English universities were representative of a low order of scholarship, such as Gibbon and the poet Gray have vividly pictured in styling them "the home of bats and owls." Anstey, in his Latin oration for the degree of Master of Arts, boldly satirized the conditions which then existed, speaking of *doctores sine doctrina*. Because of his frankness the degree was refused him by the indignant dons. In 1776 he wrote a series of papers, collectedly called *The New Bath Guide, or The Members of The Broadhead Family at Bath*. The lively and piquant satire of this keen critic attracted a large body of readers, who were greatly amused by his observations on society and the manners of a certain class of English; and the book was popular for many years, though his other publications are now forgotten.

AN'STEY, F. See GUTHRIE, THOMAS ANSTEY.

AN'SWER (AS. *and-*; Ger. *ant-* in *Antwort*, answer, Gk. *ἀντί*, *anti*, against + *swerian*, to speak, swear). In law, technically the pleading interposed by the defendant to the plaintiff's bill in an action brought in a Court of Chancery. In his answer the defendant may set up any matter of defense to the plaintiff's claim, but in addition he is required to state fully under oath his knowledge, or, if he has no knowledge, his information and belief, as to all relevant matters alleged or inquired of in the plaintiff's bill. The method of pleading is technically known as giving discovery, and the information thus obtained may be used as evidence in the plaintiff's favor at the trial. It is subject, however, to the rule of chancery

practice, that, if unfavorable to the plaintiff, it is conclusive unless overcome by two witnesses or by one witness and corroborative circumstances. The plaintiff, however, may avoid this consequence by expressly waiving an answer under oath in his bill. At law, as distinguished from equity, the defendant's pleading is technically known as the *plea*; but under the modern statutory system of pleading, the term "answer" is applied indiscriminately to the defendant's plea in either law or equity. See PLEA; PLEADING, and the authorities there referred to.

ANT (AS. *amete*; Ger. *Ameise*; from OHG. *meizan*, to cut, the original meaning thus being 'cut in'; as in Gk. *έντομος*, *entomos*, Lat. *insectum*). A small hymenopterous insect of the family Formicidæ, closely related to the wasps and bees, not only in structure, but in instincts and socialistic economy. "Emmet" is an older form of the word "ant" still in use, and "pismire" is another word occasionally heard. Ants are easily recognized by the well-known form of the body. The demarcation between head, thorax, and abdomen is very noticeable in these insects. From the termites and velvet ants, which most resemble them, true

PARTS OF AN ANT.

a, head; b, antenna; c, jaws; d, thorax and legs; e, pedicel; f, gaster.

ants can readily be distinguished by the peculiar form of the abdomen, the first or first one or two segments of which are constricted off, to form separately jointed small knobs or scales, which greatly increase the flexibility of the body.

Classification. The ants, according to the best authorities, form a single family, Formicidæ, divided into five subfamilies. The subfamilies are founded mainly on the condition of the peduncle or part constricted off from the abdomen (whether composed of one or two portions), and on the presence or absence of a sting.

Polymorphism and Division of Labor. As in other social insects, there is, first of all, a dimorphism of the female sex. But among ants complexity of form goes further than this, on account of the complexity of the social organization. For the ant colony frequently contains enslaved individuals belonging to another species. The different forms of a species of ant are the results of division of labor among the members of the colony. Of the infertile females or workers, some are gatherers of food, some are nurses for the young, while others, of a larger size, act as soldiers to protect the ranks of foraging workers. In certain species certain workers serve as living storehouses. (See HONEY-MAKING ANTS.) Each of these differences in labor is associated with a difference in form. Even among individuals of the same sex and caste, considerable variability occurs. Although the workers are usually wingless, certain ones have been observed with short wings. A part or all of the fertile females may be wingless. Occasionally wingless males may exist together with the winged, while the wingless prevail in a few species.

The Origin and Maintenance of Colonies. Upon the appearance of the winged males and females in the ant colony, both are guarded by the workers until a suitable time for flight. Finally, they are let out on warm days in sum-

mer and autumn to appear in the air in myriads. Mating nearly always takes place while on the wing. Soon after mating, the males die, and those females that escape enemies and inclement weather settle down to the ground, tear off their wings, and make excavations in materials suitable for the construction of their nest. The eggs are then laid, and upon hatching, the larvæ are fed on some substance already stored up within the body of the queen, since she never goes out for food. When the workers of the first set, which are of small size, appear, the care of the larvæ and pupæ devolves upon them, and thereafter the queen devotes herself exclusively to egg-laying. Thus a new colony is established. Frequently one or more young queens are found by workers and conveyed to colonies already established, which they continue to maintain should the former queen be old. Thus more than one queen-ant may, without quarrels, live in a single colony. The workers feed the queen, and follow her on her wanderings throughout the passages and chambers. As she lets fall the eggs, the workers carry them to suitable locations. In the queen's presence they not infrequently perform those same peculiar antics and capers which they employ to express their emotions upon the return of a lost comrade. The legless larvæ and the pupæ are carried to the surface layers by day, for the sake of the sun's warmth, and at night, or during rain, to deeper and drier chambers. The larvæ are fed by the nurses on regurgitated liquid, or on a substance elaborated by them. They are carefully licked and rubbed by the nurses to keep them clean, and when the time arrives for the pupæ to emerge from their silken or naked sheaths, the workers are at hand to help them out and to unfold and dry their wings and legs.

Food. As is the case with all the other labors of the colony, getting the food devolves upon the workers. All sorts of available matter, of either animal or vegetable origin, both dead and freshly killed, serve them for food, and they are fond of sweets. The nectar of flowers and the sweet saps and juices of plants and fruits are sought. Sugar is ever a temptation to them. The honey-dew excreted by plant-lice, the "milch-cows" of ants, is especially prized. To secure it ants will climb even high trees. They follow the aphides about so as to catch the sweet excretion and even stroke them to hasten its expulsion. When the sap supply for the aphides fails, the ants carry their "cows" to new food-plants, and when winter comes on both the adult plant-lice and the eggs are carried out of reach of frost into the ant caverns and carefully attended until spring, when they are again placed on the swelling plant-buds. In warm lands several kinds of ants, such as the agricultural ant (q.v.) of Texas, are said to rear, harvest, and store grain, but there is every reason to believe that this statement is based on faulty observation. This habit has been ascribed to certain American ants of the genus *Pogonomyrmex*, especially to the Texan harvester (*P. barbatus*), but Wheeler has shown that the circle of tall grass, sometimes found around the nest of this species, is not sown by the ants, but springs up from the seeds that have accidentally germinated in the nest during moist weather and have been thrown out as refuse by the insects. Some ants,

studied by Belt in Nicaragua and by Bates in Brazil, accumulate bits of leaves within their caverns or line the walls with them. On the leaf-bits a fungus grows, or is planted, which serves the ants as food. While often very destructive to crops and stored supplies, ants such as the hunting-ants of South America, or the driver-ants of Africa, are useful scavengers; for not a bedbug, booklouse, moth, cockroach, mouse, or rat is overlooked by their myriad numbers. See DRIVER ANT; FORAGING ANT; LEAF-CUTTING ANT; SAUBA ANT.

Nests and Nest Building. In their nest building ants differ from all other social Hymenoptera. The nests or combs of bees are divided into even compartments or cells, whose walls are made of wax, while those of social wasps are built of papery pulp, derived from masticated weather-worn wood. In each cell one egg is laid and one individual is reared. The young of ants, on the other hand, are kept in heaps and moved about from one part of the nest to the other as conditions of temperature and moisture demand. The nests are composed of a variable number of chambers, of irregular shape, connected by galleries. They are usually excavated in the ground, often under the shelter of a stone, or in rotting or living trees, shrubs, or herbs. The chambers and galleries which are excavated in the earth extend a considerable distance down to the region of constant moisture. Some of the sauba ants of South America are said to cross wide rivers by tunneling under the river-beds. Not infrequently the nests are carried above the level of the ground by means of earth heaped up and often cemented together. Some ant-hills are thatched by bits of herbage. In South America ant-hills often exceed the height of man. Some ants tunnel out homes in the trunks of trees, others burrow in the thorns or petioles of leaves. Certain ants make homes by bending leaves in circles. The adult ants cannot produce cement, so the larvæ nearly ready for the pupa stage are utilized. Some of the workers hold the bent edges of the leaves in place, while others bring up the larvæ, whose heads they dab back and forth over the edges of the leaves so as to bind them together with silk.

Symbiosis. Although certain ants are very destructive to vegetation, the relationship between ants and certain plants is sometimes one of mutual advantage, a symbiotic one. Thus, in South America, there is a small acacia known as the bull's-horn thorn, on account of the paired, horn-shaped thorns borne on the tree. While the thorns are still young the ant pierces a hole in the tip of one of them and then makes its way through the thorn to the base, where it tunnels into the other thorn. At the base of each young bipinnate leaflet on this same tree there is a honey-secreting gland, and at the tip a minute, pear-shaped fruit. The fruit does not all ripen at the same time; hence the ants (*Pseudomyrma*) are kept continually running over the tender foliage in search of edible stages. When the tree is disturbed, the ants swarm out of their nests in the thorns, and by their severe sting drive off intruders, such as caterpillars and even vertebrates. But they are most valuable to the tree in warding off the leaf-cutting ants that in a few hours can defoliate a tree. In the leaf petioles of another plant (*Melastoma*) there are two pouches. In

these ants find homes, and, in return, they keep off the leaf-cutting ants and foliage-eating foes. The young, tender leaves of certain orchids and passion-flowers have honey-glands visited by ants to the exclusion of all marauders.

Relations of Different Species to One Another. Almost all kinds of ants carry off the larvæ and pupæ of other kinds of ants for food. At times, doubtless, more are taken than can be consumed; hence some of the captives come to maturity in the foreign nest. Perhaps in some such way as this, out of the instinct of the robber ant arose that of the slave-making ant. Slave-making ants, which are lighter in color than their captives, go forth in armies, attack the nests of the black ants, and carry away the larvæ and pupæ. These are brought up and act as servants or slaves. In some cases the warriors are structurally unable to take food, and hence are wholly dependent on their faithful domestics, who collect the food and actually put it in the mouths of their captors. Other small ants (*Solenopses*) live the lives of thieves, secreted in small chambers excavated in the interspaces between the chambers of large ants. The small entrances to the small chambers will not admit the large ants. Hence the small thieves retreat in safety to their homes with the young of the large ant, which they take for food. With the *Formica rufa* a smaller ant lives, apparently, in perfect harmony, perhaps as a domestic pet. When the *Formicæ* are obliged to move, the small forms go too, tapping antennæ with them, or even riding on the backs of their hosts. Many species of beetles, and other little creatures, are usually present in ants' nests, and seemingly on terms of friendship.

Intelligence of Ants. Ants are sensitive to sound waves, even outside of human range; they are also keenly sensitive to changes in moisture and temperature. When a captive colony was placed by an experimenter near the fire, the heat was so grateful to its members, says he, that "they embraced each other, and skipped and danced like playful lambs or kittens." Many cases of ants indulging in what seems to us to be sportive exercise or play are recorded. Their care for the cleanliness of the growing young and the promptness with which they remove the dead from the nest, show a sanitary instinct. The complete and apparently willing suppression of the individual for the good of the colony almost surpasses man's comprehension of self-abnegation. The law of division of labor rules among ants. Certain groups of individuals perform only certain labors. Labor-saving devices are known to ants, for groups of workers will procure and drop food or building stuffs to waiting companions below and thus save much labor of transportation. They show ingenuity in building bridges, and may even span gaps by means of a rope made up of their own living bodies linked together. Moreover, information seems to be imparted by means of the antennæ, which they cross and rub together. Ants are able to recognize the myriads of members of their own colony, including their slaves, and even those that have been taken away in infancy. These facts and many others convince us that ants in some manner communicate with their companions. Otherwise, how are the discovery and the whereabouts of food too large for removal by one made known to the others; or how are cannibalistic and slave-making wars so managed that

the whole fighting community is ready to go out simultaneously?

Geological Antiquity. Geologically, ants are among the earliest Hymenoptera. In Tertiary times they were, perhaps, the most abundant of all the insects, and thousands of ancient forms have been found in amber.

Consult also the works of Forel, Wheeler, Wasmann, and McCook. See INSECTS; APHIDES; INSTINCT; TERMITES; and the names of various ants.

ANTACIDS, *ant-ās'idz* (*ant* or *anti* + *acid*), or **ALKALIES**. Drugs which diminish or correct abnormal acidity in the digestive tract or the various secretions of other organs. Those which unite directly with free acid in the stomach or intestines are known as direct antacids. Examples of this class are ammonia and its carbonate, magnesia, potassium bicarbonate, lime water, and chalk. Remote antacids, such as the acetates, citrates, and tartrates of the alkalies, act by being changed into carbonates, and thus increasing the alkalinity of the blood, which in turn diminishes the acidity of the urine. Some drugs, as the carbonates or bicarbonates of sodium, potassium, calcium, magnesium, and lithium, act as direct as well as remote antacids. The direct antacids are given after meals to neutralize an excess of the natural hydrochloric acid of the stomach and other acids resulting from fermentation of food. Given before meals, they cause an increase of the acidity of the stomach contents by increasing the secretion of gastric juice. The remote antacids are largely employed in the treatment of rheumatism and gout.

ANTÆ. See PILASTER.

ANTÆOPOLIS. See ANTÆUS.

ANTÆ'US (Gk. *Ἀνταῖος*, *Antaios*). A figure in legends of the Greek colonies in Africa, located at first near Cyrene, finally in Mauretania. His story is unknown to Greek epic poetry and is largely made up of borrowings from earlier legends. In the popular version he was a giant, son of Poseidon and Ge, who compelled all strangers to wrestle; he is thus the native opponent of the Greek colonists. When he was thrown, he received fresh strength from touching his mother, Earth. With the skulls of those he conquered, he built a temple to his father. He was invincible until Hercules discovered the source of his power and killed him by lifting him into the air away from the earth and strangling him; in this conquest the Greeks, as early as Pindar's time, saw the triumph of the intellectual, well-trained Greek athlete over the crude native might of the barbarians. Later Greek writers attempted to localize the myth in a city of Upper Egypt called Antæopolis (Egyptian name, *Du-kau*; Coptic, *Tkan*).

ANTAG'ONISM. The power of one solute

to protect an organism against the toxic action of another solute. See NUTRITION.

ANTAKIYEH, *än'tä-kē'yä*. See ANTIOCH.

ANTAL'CIDAS (Gk. *Ἀνταλκίδας*, *Antalkidas*). A Spartan statesman, son of Leon. Toward the end of the year 393 B.C. he was sent by his government to Tiribazus, the Persian satrap at Sardis, to break up the understanding which then existed between Athens and Persia. He succeeded with Tiribazus by agreeing to the Persian demand that Sparta should recognize the Persian supremacy over the Grecian cities in Asia Minor; Tiribazus gave him money to carry on war with Athens. This arrangement did not meet with the approval of King Artaxerxes, to whom the Athenians had sent a counter embassy, under Conon, and the satrap was recalled. However, in 388 B.C., the King restored Tiribazus and thereby gave evidence of his inclination toward the Spartans. Antalcidas was once more sent to Asia to treat with the Persians. He accompanied the satrap to the Persian court, was well received, and succeeded in coming to an understanding with the King on the basis of the terms previously agreed upon, and thus secured his aid against the Athenians. Antalcidas returned to the fleet, of which he was now made admiral, freed it from the blockade of the Athenians, and shut out the Athenians in their turn from the Ægean Sea. He was now in a position to compel the acceptance of terms. The peace that followed was called "The Peace of Antalcidas." In the winter of 387-386 B.C. representatives of the Greek states assembled at Sardis, where the terms of the peace were read. The final ratification took place at Sparta in 386 B.C. The terms of the peace were as follows: 1. That all the Greek towns on the mainland of Asia Minor, together with the islands Clazomenæ and Cyprus, should remain under the protection of the Persian King. 2. That all other Greek towns, large and small, should be independent; but that the islands of Lemnos, Imbros, and Scyros should, as of old, belong to Athens. 3. That war should be declared against any State that refused to accept these terms. In 372 B.C. Antalcidas went for the third time to treat with the Persians, but, after the battle of Leuctra (371 B.C.), he lost favor in that quarter. In 370-369 B.C. we find Antalcidas Ephor at Sparta. There is no truth in the story that he starved himself to death.

ANT'ANACLA'SIS (Gk. *ἀντί*, *anti*, against + *ἀνακλᾶν*, *anaklan*, to bend back). In rhetoric, a figure in which a word is repeated in a sense different from, if not contrary to, its first use, to give additional force to the expression; as the remark of Benjamin Franklin when he was about to sign the declaration of American independence: "We must all hang together or we shall assuredly all hang separately."

ANTANANARIVO, *än'tä-nä'nä-rē'vö*, or **TANANARIVO**. The capital of the island of Madagascar, favorably situated in the central part at an elevation of over 4000 feet (Map: Africa, J 6). It was originally built chiefly of wood, with irregular streets, but stone and brick buildings have superseded the old structures, and there are many excellent edifices, among which are a great number of churches, two cathedrals, a mosque, several colleges and hospitals, the most prominent building being the royal palace, situated on the summit of a hill. Its commerce, owing to its inland position and the inadequate transporta-

tion facilities, is not very extensive, but it has a considerable number of industrial establishments. The natives show in their manners, as well as in their mode of life, the influence of European civilization. Pop., 1904, 59,551; 1912, 94,813.

ANTAR, än'tär, or **ANTARA**, än'tä-rä, **IBN SHADDAD AL-ABSI**. A celebrated Arabian hero living toward the end of the sixth century and one of the famous pre-Islamic poets of Arabia. His mother was a black slave, Seliba, and as the son of a slave he was obliged to render menial services to the members of his tribe. Through his warlike exploits, however, he secured not only his freedom, but a prominent position in his tribe. He died as a hero in battle. While neither the date of his birth nor of his death is known, he appears to have died shortly before the appearance of Mohammed. He gained equal fame among the Arabs as a poet and as a hero. Only one complete poem of Antar's has come down to us, which recounts his deeds and sings of his love for Abla, whom he married. This poem is generally included in the collection of the choicest seven Arabic poems, known as the *Moallakat*. A recent edition of the Arabic text is by L. Abel, *Wörterverzeichnisse zur altarabischen Poesie I* (Berlin, 1891); an English translation by Johnson in *Seven Arabic Poems* (London, 1897). Such was Antar's renown as a warrior that he becomes the prototype of the hero in the romantic literature of the Arabs. He is the central figure in the most famous of Arab romances, which bears the name *Antar* and is commonly ascribed to Al-Asma'i, who lived in the eighth century. The romance of *Antar*, however, as known to us, is a compilation which has passed through various hands and has gradually grown to huge proportions. It gives an attractive and faithful picture of Bedouin life and is rich in epic interest, although too monotonous to satisfy the taste of the European reader. A translation of a portion of it into English was made by Hamilton in 1820 (*Antar: A Bedouin Romance*, 4 vols., London). A *Divān*, or collection of poems, is also attributed to him. They consist for the most part of fragments and have been published by Ahlwardt, *The Divāns of the Six ancient Arabic poets*, 1870, having formed a part of the collection of Al-Alam. The memory of Antar is also preserved in various places of the East which bear his name. Consult Thorbecke, *Antarah, ein vorislamischer Dichter* (Leipzig, 1867); Ahlwardt, *Bemerkungen über die Aechtheit der alten arabischen Gedichte* (1872); Nöldeke, *Fünf Mo'allakat* (1900); Kennedy, *Pre-Islamic Poets* (London, 1908).

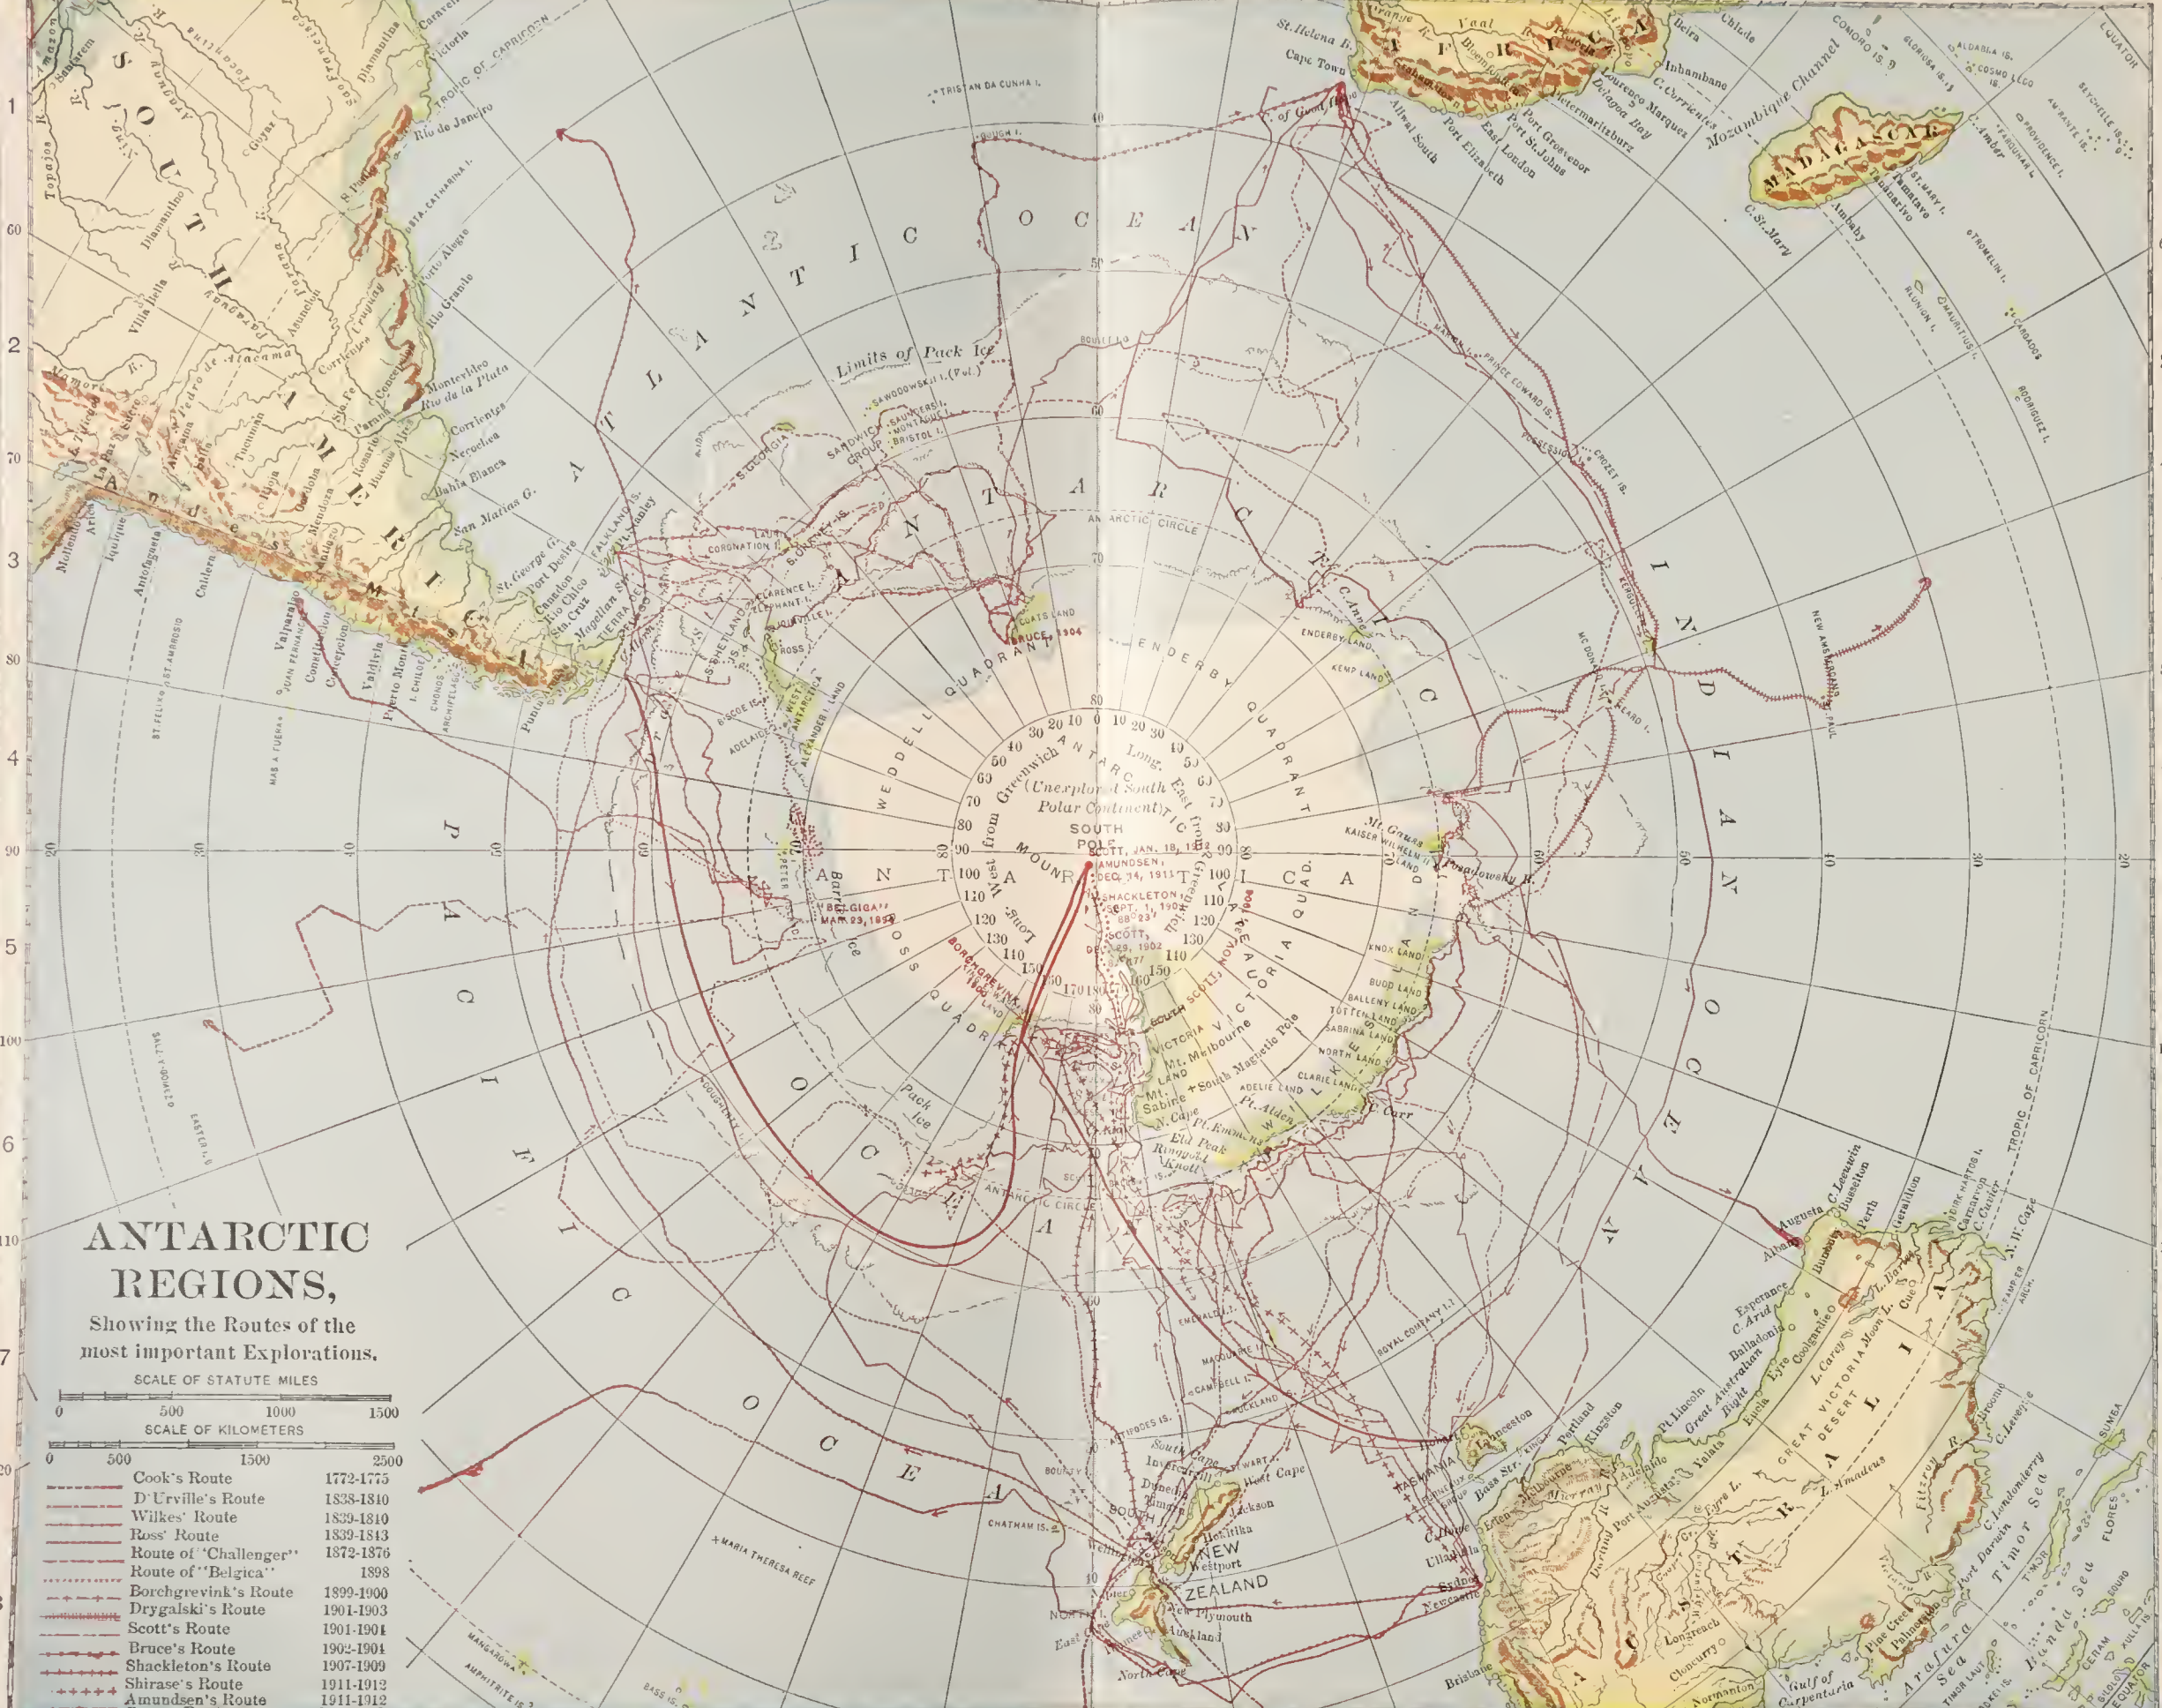

ANTARCTIC CURRENT, LANDS; OCEAN.
See ANTARCTIC REGION.

ANTARCTIC REGION (Gk. ἀντί, *anti*, against, opposite + ἄρκτος, *arktos*, bear, Ursa Major, the north). The name applied to that portion of our earth's surface which encircles the South Pole. Technically and astronomically it is bounded by the Antarctic Circle, and although the Antarctic land masses do not extend much farther equatorward than this, yet the Antarctic influences extend to very much lower latitudes, the solid ice fields drifting on nearly all sides below lat. 60° S., and between the southern extremities of Africa and South America even below lat. 50° S. The limit of this drift ice may be taken as the limit of the Antarctic region, although the drifting icebergs

descend more than 10° of latitude lower. Thus, the Antarctic region is bounded by the Atlantic, Pacific, and Indian oceans. The Antarctic land mass lies, however, mainly within the Antarctic Circle. It is indicated, in the Eastern hemisphere, by a series of minor coast-lines which, roughly speaking, outline the circle between long. c.155° E. and long. c.50° E. Their names are, Adelie Land (c.140° E.), Clarie Land (c.134° E.), Sabrina Land (c.122° E.), Knox Land (c.105° E.), known collectively as Wilkes Land, Kaiser Wilhelm II Land (c.90° E.), Kemp Land (c.60° E.), Enderby Land (c.50° E.). In the Western hemisphere West Antarctica (Graham Land), a long spur, with numerous outlying islands, projects northeastward, from the 70th to 55th degrees of W. longitude, to beyond the 63d parallel of latitude; and near the 156th meridian, W., at the 77th parallel there is another land of unknown extent, called after King Edward VII. Since the recent expeditions of Amundsen and Scott it seems probable that this whole area is a continental land mass, restricted—possibly to separation—by the deep indentations of Ross and Weddell Seas. The former extends to at least 85° S. in 162° W.; the latter to at least 79° S. in 40° W. The remoteness of the Antarctic has prevented its exploration to the same extent as the north polar regions. Cooke (1773-76), Bellingshausen (1821), Weddell (1823), Ross (1842), Wilkes (1840), d'Urville (1840), the *Challenger* expedition (1874), de Gerlache (1897-98), Borchgrevinck (1899-1900), Nordenskjöld (1902-04), Drygalski (1902-03), Scott (1902-04), Charcot (1903-05), Shackleton (1909), Charcot (1910), Amundsen (1911), Scott (1912), Filchner (1912), Mawson (1912), have been the chief explorers of this region. Ross reached a latitude of about 78° 10' S. in 1842, and Scott, in 1902, pushed on to 82° 16' 33" S. The pole itself was finally reached on Dec. 16, 1911, by Amundsen, succeeded within five weeks by Scott, who reached it on Jan. 18, 1912.

Antarctic Lands. The islands and the continent, or continental land-masses, surrounding the South Pole. Little is known of this territory. The continental land-mass where best known, from the northern edge of South Victoria Land in 70° S. to the South Pole, is an elevated ice mantle plateau of an average height of 7000 to 10,000 feet; the pole itself lying at an altitude of 10,200 feet. Superficially all the territories have features in common—more or less lofty coast-lines (with lower islands outlying) covered heavily with snow, often to the water's edge. In many regions barriers or "terraces" of ice, sometimes 200 feet and more above the sea level, border the land for many miles. Behind the sea cliffs, in all the regions that have been visited, there is a more or less level expanse of snow. The outlying islands are mainly of recent volcanic formation; but in those parts of the mainland which have been visited are found granites, fossiliferous sandstones, and other rocks that are characteristic of continental forms. Of the three regions which have been studied, the largest is South Victoria Land, the known coast of which extends between the 160th and 170th meridians E., from about lat. 70° to beyond lat. 83°. Its sea wall of sandstone and granite, containing also carboniferous deposits, is nowhere less than 4000 feet high, and behind it stretches a range of mountains, with peaks ris-

ing to the height of 15,000 feet, and continuing southward in Queen Maud's Range, discovered by Amundsen, to at least 88° S. and 100° W. Several of these peaks are extinct volcanoes, and one, Mount Erebus (12,780 ft.), composing with Mount Terror, Ross Island (c. lat. 77° 30'), is still active. The persistence of the range, with its high altitudes (Mount Markham in South Victoria Land and Mount Fridtjof Nansen in the Queen Maud Range, both 15,000 feet) and its general trend, has suggested the possibility of its forming a part of the same mountain axis to which West Antarctica belongs. In Victoria Land lies the south magnetic pole.

From Ross Island to King Edward VII Land, 400 miles, extends the façade of a mass of ice, rising almost uniformly from 200 to 300 feet above the sea. It was discovered by Ross in 1842 and called the Great Ice Barrier. As shown by Amundsen it extends nearly to 86° S. at 160° W. Its eastern limit may lie in this longitude. It completely fills the head of the Ross Sea embayment as far north as the 79th parallel. It is probably the product of the great Antarctic ice sheet. A similar ice barrier exists at the head of the Weddell Sea. The coast of portions of West Antarctica (Graham Land) are also lofty, and here, too, are found ancient crystalline rocks and, on neighboring islands, sandstones rich in fossils. The interior, as seen from the sea, is apparently an "ice-cap" similar to that of Greenland. The third known territory, Kaiser Wilhelm II Land, consists of a completely snow-covered region, with one denuded peak, the Gaussberg (4000 feet). The structure of the land is of ancient crystalline rock. Behind the Gaussberg extends a relatively level ice-plain. In the vicinity of all these lands there is a sudden rise of the sea bottom to the "continental shelf." Upon this fact the advocates of the continent theory base an argument.

Ice. The pack ice is not so formidable as it is in the Arctic regions. The sea freezes over in winter; but ordinarily, in summer, the ice breaks away from the land, and the major part of it is borne away by the prevailing winds. An outlying pack borders all regions that have been reached by explorers; but not being confined by land, as is the ice of the Arctic basin, it becomes dissipated as the season wears on, and is at no time so heavy as the northern pack.

The icebergs are probably not directly formed from glaciers, as in Greenland; the Antarctic glaciers, although of great extent, are at best very sluggish, and the larger number are receding. The bergs undoubtedly are discharged from the great ice barriers or terraces; they are "tabular" in form and often many square miles in area.

Climate. The temperatures of the Antarctic are colder in summer, and perhaps warmer in winter, than those of the far north. The coldest temperature registered upon the *Discovery* expedition was -67° F. (May, 1903). In all regions, both winter and summer, sudden storms, accompanied by blinding snow, are frequent.

Flora. The vegetation is very sparse, consisting of tussock grass, mosses, and lichens. Of these, however, there are a number of species. Three kinds of hepaticæ have also been found.

Fauna. No land mammals exist. A variety of birds build their nests on the beaches. Among the birds are penguins, skua, petrel, ful-

mar, etc. There are five varieties of seal, and upon the northern coasts sea-elephants and sea-lions are sometimes found. There are six varieties of whales and dolphins. Sea life is exceedingly rich, including, among many other species, sponges, medusæ, echinoderms, crinoids, mollusks, nunatodes, amphipoda, cephalopods, etc. Fishes also are abundant.

Antarctic Ocean. The name Antarctic Ocean has been applied to the waters surrounding the Antarctic land-masses, but, according to modern oceanographical research, it is preferable to consider these waters as forming the southern ends of the Atlantic, Pacific, and Indian oceans, the dividing lines between which would respectively be the meridians of Cape Horn (68° W.), South Cape, Tasmania (146.5° E.), and Cape Agulhas (20° E.). Between the southern ends of the continent and the Antarctic lands the whole circumference of the globe presents an unbroken expanse of waters, save for a few islands here and there, being narrowest (600 miles) between South America and West Antarctica and broadest (at least 2400 miles) between Africa and whatever Antarctic land may lie in 20° E. The floor of Antarctic waters rises abruptly, as stated above, to the edge of the continental land-masses. The floor of the Antarctic gradually shoals from the middle latitude depths toward the South Pole. In general, at lat. 60° S., the waters of the Antarctic Ocean have an average annual temperature at the surface of 29.8° F., which is warmer than the average temperature of the air in the same latitude 28.7° F. At great depths and near the ocean floor the water temperature is between 32° F. and 35° F., but between these depths and the surface there is usually found a wedge-shaped layer of water with a temperature varying from 28° F. to 32° F.

The Antarctic drift is mainly from the west on the outer border and from the southwest and south at the interior of the Antarctic region. There are two great Antarctic currents: one crosses the Antarctic Circle toward the north, between long. 120° and long. 140° W., but swerves toward the east in lat. 50°, and near the South American continent separates, part going northward past Peru, and part preserving its eastward movement past Cape Horn, whence it returns to the Antarctic between long. 60° E. and 80° E.; the other current crosses the Antarctic Circle, going north between long. 80° and long. 100° E., and swerves to the eastward, forming the west Australian current.

The winds at the interior of the Antarctic region are probably directed spirally outward from the polar centre, so that they blow as southeast winds; but on the outer border winds are generally from the west, perhaps mostly from the northwest, rather than from the southwest. The annual precipitation immediately around the South Pole is probably less than 10 inches, but this increases to about 25 inches on the outer boundary of the Antarctic continental lands, from whence there is probably a poleward decrease.

Bibliography. Murray, "Antarctic Research," *Geographical Journal*, vol. iii (London, 1894), modified, however, by several articles in the *Geographical Journal* for 1904 and 1905; Cook, *Through the First Antarctic Night* (New York, 1900); Von Drygalski, *Zum Kontinent des eisigen Südens* (Berlin, 1904); Nordenskjöld

and Andersson, *Antarctica* (New York, 1905); Scott, *Voyage of the Discovery* (New York, 1906); Shackleton, *The Heart of the Antarctic* (2 vols., 1909); Charcot, *Le "Pourquoi Pas?" dans l'Antarctique* (Paris, 1910; Eng. ed., London and New York, 1911); Amundsen, *The South Pole* (1913); *Scott's Last Expedition*, edited by Leonard Huxley (2 vols., New York, 1913). See POLAR RESEARCH, paragraph on *Antarctic Explorations*.

ANTARES, ān-tā'rēz (Gk. 'Αντάρης, *Antarēs*, like Ares, or Mars; from ἀντί, *anti*, against, opposite, compared with + Ἄρης, *Arēs*, Mars). A red star, thought by the ancients to resemble Mars (q.v.). It is a double star, the most conspicuous in the constellation Scorpio, and sometimes called, from its position, *Cor Scorpionis*, or the Scorpion's Heart. It gives its name to the third type in Secchi's classification of stars based on their spectroscopic behavior. The spectra of the stars of this type are characterized by heavy absorption bands or flutings which are quite sharply defined toward the violet and shade off gradually toward the red. It is supposed that the flutings are due in large measure to the presence of titanium. Other conspicuous Antarian stars are Betelgeux in the constellation of Orion, and Mira in the constellation of the Whale. Antares is often of use to navigators in determining longitude.

ANT'-BEAR'. The great ant-eater (q.v.).

ANT-BIRD, **ANT-SHRIKE**, **ANT-THRUSH**, and **ANT-WREN**. Names applied to groups within the large South American family of non-oscine Passeres named Formicariidæ, so called because they are supposed to subsist largely upon ants. More than 250 species are known. They are small or medium-sized, long-billed birds clad in soft grays and browns, inconspicuous in appearance and retiring in habit. Their notes are uttered at rare intervals and are ventriloquial in character although often loud and melodious in spite of their generalized oscine or "singing" organs. They creep silently among the lower branches or search on the ground for their insect food. They are almost always found in flocks attendant upon the swarms of hunting or army ants; yet in spite of the wide-spread belief which has given them their name, they seldom feed upon the ants themselves, but on other larger, more edible insects stirred up by the ferocious ants. The low twittering of ant-birds is always a warning of the approach of an army of ecitons or other ants. Like many other large families of tropical birds, ant-birds have been compelled by competition to specialize, and some have become shrike-like in habits as well as appearance; others resemble the long-legged pittas, while many others parallel wrens, warblers, and thrushes. The so-called ant-shrikes or bush-shrikes constitute in particular the sub-family *Thamnophilinæ*, which are found in the Antilles as well as in northern South America; ant-wrens are prettily marked, small, active, wren-like members of the sub-family *Formicivorinæ*; while the ant-thrushes belong to the typical sub-family *Formicariinæ*, to a Guiana species of which, the woodcock-colored ant-thrush (*Rhopoterpe torquata*), Buffon first gave the name *fourmilier* (ant-eater). The term "ant-thrush" is also improperly applied to the pittas, brilliantly colored, ground-haunting, insect-eating birds of eastern Asia and the Malay Archipelago. See PITTA.

ANT'-EATER. Any of various ant-eating mammals, especially those of the South American Edentate family Myrmecophagidæ. The head in this family is remarkably elongated, with a slender, tubular muzzle, and a small, toothless mouth, with a long, vermiform, protrusile tongue. The eyes and ears are very small. The legs are massive, and the toes united as far as the base of the claws, which are very large and strong and are turned under the fore-feet as the animal walks. The great ant-eater, tamanoir, or ant-bear (*Myrmecophaga jubata*), a native of the tropical forests of South America, is about 2 feet high and 4 feet long without the tail, which is 2½ feet long. The compressed body is covered with long hair, gray, strikingly marked by a black breast-band, which narrows back to the top of the shoulders, while the fore-legs and feet are white. The hair is especially long upon the back and tail, which can be curled over the back and is said to be held there as a shield during rain. The animal dwells in the dense forest, but is wholly terrestrial and does not burrow. It is timid, slow, and inoffensive, but at bay is able to defend itself effectively by means of its long fore-claws, with which it hugs and tears its enemy. These powerful claws are of service in tearing down the hills of the termites and ants, upon which it principally subsists. These are taken by means of the long tongue, which is covered with a sticky secretion from great salivary glands: this tongue is thrust among the disturbed ants or laid in their path and, when a number have adhered to it, is drawn into the mouth.

Only one young one is said to be produced annually, so that the creature is nowhere numerous; nor is this to be regretted, for it has few, if any, qualities to recommend it to man's attention. Another species, the tamandua (*Tamandua tetradactyla*), is much smaller, has a shorter head and short, bristly hair, and a slender, prehensile tail; its body is black, while the head, neck, fore-limbs, and hind-quarters are yellowish-white—a strange dress, varying a good deal among individuals. It also dwells in the equatorial forest of America, but is wholly arboreal, seeking its insect food and making its home in trees. A third species, the little, or two-toed, ant-eater (*Cycloturus didactylus*), is not larger than a rat, is clothed in silky fur, and dwells altogether in trees, for which its long, prehensile tail and curious feet have become especially modified; another species inhabits Costa Rica. For portraits of the three species mentioned above, see Plate of ANT-EATERS.

Other animals called ant-eaters are: 1. The manids, or scaly ant-eaters. (See MANIS.) 2. The aard-vark (q.v.). 3. The porcupine ant-eaters, or Echidnæ. (See ECHIDNA.) 4. The Australian insectivorous marsupials of the genus *Myrmecobius*, as *Myrmecobius fasciatus*, of West Australia, about as large as a squirrel, chestnut red, with white and dark stripes on the back. It has a long slender tongue, like a true ant-eater, but it has more than 50 teeth, a greater number than any other living mammal. It scratches open ant-hills for its food. (See Plate of PHALANGERS.) 5. Any of various ant-eating birds.

ANTECHAPEL. (Arch.) A chapel in front of a church, forming a part of the same structure. In some cases the antechapel serves both as a chapel and as a porch of entrance, as

ANT-EATERS AND ARMADILLOS

1. LESSER ANT-EATER (*Tamandua tetradactyla*).
 2. SCALY ANT-EATER OR PANGOLIN (*Manis javanicus*).
 3. THREE-TOED SLOTH (*Bradypus tridactylus*).

4-5. THREE-BANDED ARMADILLO (*Tolypeutes tricinctus*); rolled up and walking.
 6. PICHICIAGO (*Chlamydophorus truncatus*).
 7. AARD-VARK (*Orycteropus capensis*).

at the abbey of Vézelay in Burgundy and the church of St. Front at Périgueux (twelfth century); in some it takes the place, but not the function, of a porch, as the Galilee Chapel of Durham Cathedral, England; or again it may project from the West front of the church without interfering with the central door or porch, as in the Broadway Tabernacle, New York City.

ANTECHOIR. See CHOIR.

AN'TEDILU'VIAN (Lat. *ante*, before + *diluvium*, flood). A word used to denote whatever existed before the Flood. The antediluvian ages are those which elapsed before the Flood; and in theological language the antediluvian religion means the religion of the patriarchs from Adam to Noah. In geology the antediluvian period had no reference to the Deluge recorded in the Mosaic narrative, but signified only the final transformation of the earth by means of water. The term is not in good use at the present time, except as an adjective of exaggeration to denote extreme antiquity.

AN'TEDON. See CRINOIDEA.

AN'TEFIX (Lat. neut. pl. *antefixa*, from *ante*, before + *fixus*, fastened, fixed). An ornament, usually of terra cotta or marble, repeated along the edge of the roof of a classic building at the foot of each of the ridges covering the joints of the flat tiles of the roof. The antefix

ANTEFIX.

was commonly decorated with an anthemion, painted or carved; sometimes, however, especially in Etruscan examples in terra cotta, a head or even a whole figure in relief formed the chief decoration. The antefix was less used in Roman architecture than in the Greek and Etruscan, and wholly passed out of use with the decline of the Roman Empire.

ANTEIA. See BELLEROPHON.

ANTELAMI, ä'n'tä-lä'më, **BENEDETTO** (active 1177-1233). The most prominent sculptor of the Romanesque epoch in Italy. His sculpture is decorative in character and is conceived in the solemn and grandiose spirit of Lombard architecture. His earliest known work is a "Descent from the Cross" in the cathedral of Parma (1178). In the cathedral of Borgo San Donino (1178-96), the statues as well as the reliefs of the façade were executed under his supervision, and, in the interior, the imposing statue of "Christ Blessing" is by his own hand. His masterpiece was the cathedral of Parma, begun 1196, in which he served both as architect and master sculptor. The numerous sculptures of the façade, depicting the truths of the Christian faith, the fine lunettes of the interior, and the holy-water font were carved by him or under his direction. He also carved the bishop's

chair of the cathedral of Parma and labored upon the portals of Sant' Andrea in Vercelli and also in Milan. Consult Venturi, *Storia dell' arte italiana* (1907).

AN'TELOPE (Gk. *ἀνθόλοψ*, *antholops*, a horned animal). Any of many hollow-horned ruminants forming a group (formerly esteemed the family Antilopidæ) within the family Bovidæ, and usually classified between the cattle and goats. The English word, in its widest popular use, often includes on the one hand a group represented by the chamois and the Rocky Mountain goat, preferably designated goat-antelopes; and on the other the American antelope or pronghorn (q.v.), which belongs to a quite different family. Scientifically, as now restricted by R. Lydekker and recent students, the term excludes these forms. The group cannot be demarked from other bovines by definite characters, yet as a whole it is easily recognized by the graceful build of its members (exhibited in the accompanying illustrations), their short hair, lively colors, manner of carrying the head uplifted, and the absence of a goat-like beard. "The horns, which may or may not be present in the females, are generally long, more or less cylindrical, and often lyrate in shape; while they are frequently marked with prominent rings and have an upright direction. Their bony internal cores, instead of being honey-combed, as in the oxen, sheep, and goats, are nearly solid throughout. These animals generally have a gland beneath the eye, by which they are distinguished from the oxen and goats" (Lydekker). In size they vary from a foot in height to the bigness of a large horse. Almost all are timid, peaceable animals, with small means of defense, and trusting for safety to the agility and fleetness in which they excel. Most of them inhabit plains, and these are highly gregarious; a few are found only in mountainous regions, while others dwell in pairs or small bands in jungles and deep forests. Palæontologists inform us that antelopes are the most generalized members of the Bovidæ now existing, and "since they are also its oldest known representatives, it is probable that from them have been derived the more specialized types,"—oxen, sheep, goats, etc.

Though now wholly restricted to Asia and Africa, the antelopes had formerly a wide distribution in Europe and Asia alone. Their disappearance from Europe and spread into Africa within recent times (geologically speaking), and their enormous multiplication there, form one of the most remarkable incidents in the history of the mammalia. When South Africa was first penetrated by Europeans, many species were found ranging its grassy plains in enormous herds, which formed the principal resource for animal food of the natives and a great number of carnivorous animals. This continued until the middle of the nineteenth century, when the rapid spread of English and Dutch colonization swept them away. Vast numbers were wasted by sportsmen and reckless colonists, or were killed for the sake of their flesh and hides, until now the great herds have disappeared from the remotest veldts, many species a few years ago numbered by tens of thousands are reduced to scattered bands, and others have become wholly extinct. The wide and rapid destruction of these abundant, valuable, and beautiful animals can be paralleled elsewhere only by the swift extermination of the American bison.

Several species are represented only by small bands preserved upon private estates.

Antelopes fall into certain groups having a common resemblance. These will be outlined here, leaving the reader to consult for details the separate articles upon individual species, the most important of which will be found described in their alphabetical places. One collocation is that of the *antelopine* gazelles, including a large number of species elegantly shaped and colored, as a rule not exceeding 30 inches in height, with hairy muzzles and teeth resembling those of goats, and with ringed and usually lyrate or spiral horns; they inhabit deserts from the Cape of Good Hope to India. Here, among less noteworthy kinds, fall the familiar ariel and other gazelles, the black-buck of India, the saiga, chiru, springbok, impalla, and the like. Another group (*cervicaprine*) is represented by the small African reed-bucks, the larger water-bucks, cobus, etc., the smaller rehboks and klipspringer, and the diminutive steinboks. A third (*cephalopine*) group is composed of the duikerboks and other forest-ranging species of Africa, among which are the smallest known ruminants, the least (see BLUE-BUCK) being only 13 inches tall. Only the males of these are provided with horns, and one species (see CHOUSINGHA) has four horns. These pygmies are connected with the cattle by the *alecephaline* antelopes, all large African species characterized by their much greater height at the withers than at the rump, and by having horns in both sexes, the cores of which are cellular as in oxen; prominent examples are the hartbeests, blesbok, bontebok, and gnus. Diverging oppositely from the typical gazelles toward the goats, the *hippotragine* section has been made to include very large African antelopes having long, stout, ringed horns in both sexes, such as the sable and roan antelopes, the extinct blaubok, addax, gemsbok and allied species. Another set of large species is the *tragelaphine*, represented in India by the nilgai, and in Africa by the bushbuck, koodoo, eland, etc. They are the largest, most valuable, and handsomest of all, their ground colors being bright and often ornamented or "harnessed" with conspicuous stripes, while their faces are beautifully marked. Consult: for former abundance in Africa, Harris, *Game Animals of Africa* (London, 1840), with colored folio plates; Lichtenstein, *Säugethiere und Vögel aus dem Kaffernlande* (Berlin, 1842); and the narratives of Livingstone, Gordon-Cumming, Andersson, Drummond, Baker, Schweinfurth, Selous, and similar explorers and sportsmen. For more modern conditions, Millais, *A Breath from the Veldt* (London, 1895); and Bryden, *Nature and Sport in South Africa* (London, 1897). For Asiatic species, Baker, *Wild Beasts and their Ways* (London, 1890); Blanford, *Fauna of British India: Mammals* (London, 1888). For zoölogy, Selater and Thomas, *The Book of the Antelopes* (London, 1894-1900); Brooke, *Proceedings of the Zoölogical Society of London* (1871-73).

For the so-called antelope of western North America, see PRONGHORN.

AN'TENA'TI (Lat. nom. pl. of *antenatus*, from *ante*, before + *natus*, born). In law and history, persons born before a certain time or event, especially with reference to the existence of rights which are claimed. The term is specifically applied: (a) to children born before

the marriage of their parents. By the common law of England such children are held to be bastards and do not become legitimate upon the subsequent marriage of their parents, whereas in the civil and canon law *antenati* are legitimate and capable of inheriting the real property of the father as if born after marriage. The common law rule prevails in the United States excepting where it has been changed by statute. (See BASTARD; HEIR; LEGITIMACY.) (b) In English history, to those natives of Scotland who were born before the accession of the Scotch King James VI to the throne of England as James I, and whose status as English citizens was therefore disputed. (c) In American history, to Americans born in this country before the Declaration of Independence; and, also, to those citizens of the colony of New York who were born during the period of Dutch sovereignty and who survived the transfer of the territory and government to the English crown. The property rights of the antenati, and, to a certain extent, the benefits of the Dutch law, were expressly preserved to them by the articles of capitulation, 1664. Consult the historical introduction to the Grolier Club's *Faesimile of Bradford's Laws of New York, 1694* (New York, 1894). See ALLEGIANCE; ANNEXATION.

ANTEN'NÆ. See INSECT.

AN'TENNA'TA (Lat. *antenna*, sail-yard, Neo-Lat. a feeler; horn of an insect). A class of Arthropoda characterized by the possession of one pair of preoral feelers, three parts of oral limbs and head distinctly marked off from the trunk; respiration by tubular tracheæ, opening externally by segmentally arranged openings called stigmata. The class is divided into two sub-classes: *Myriapoda*, or centipedes, etc., and *Hexapoda*, or insects (qq.v.).

ANTE'NOR (Gk. Ἀντήνωρ, *Antēnōr*). The wise Trojan who advised his fellow-citizens to send Helen back to her husband. In return for his friendliness to the Greeks, his house was spared during the sack of Troy. A later version represents him as betraying the city. Legends differ about him: one is that he built a city on the site of Troy; others make him the founder of various cities in northern Italy (so Vergil, *Aeneid*, i, 242-249, and Livy, i, 1) or of Cyrene.

ANTENOR (Ἀντήνωρ). An Athenian sculptor of the sixth century B.C. He made the original statues of Harmodius and Aristogiton (q.v.), which were carried to Susa by Xerxes (480 B.C.). After the conquest of Persia they were restored by Alexander the Great, or one of his successors, and were set up again in the *Agora*, where they were placed originally; the original statues were seen at Athens by Pausanias (q.v.). In 478 B.C. the original statues were replaced by others executed by Critius and Nesiotes. The statues of Harmodius and Aristogiton, now in the Museo Nazionale at Naples, are regarded by good authorities as copies of those by Critius and Nesiotes.

AN'TEPEN'DIUM (Lat. *ante*, before + *penderē*, to hang). A hanging in front of the altar. As the earliest Christian altars were usually tables of wood or marble, it was customary during service to hang or set in front of them a richly decorated piece of stuff or metal relief. See ALTAR.

ANTEQUERA, än'tā-kā'rā (anciently *Antiquaria*). An important manufacturing town in the province of Malaga, Spain, situated in a fertile plain at the foot of the Sierra de Antequera,

 6. SING-SING (*Cobus defassa*); type of Waterbucks.
 7. SABLE ANTELOPE (*Hippotragus niger*).
 8. ELAND (*Taurotragus oryx*).

on the Guadalhorce, 45 miles west of Granada (Map: Spain, C 4). It has a Moorish castle and is the seat of a number of hidalgos. There are some stately houses, several palaces, and a fine church of the Virgin. It is active in the manufacture of woolen goods, paper, sugar, soap, and silk. There is considerable trade in fruit, oil, and wine. Pop., 1900, 31,665; 1910, 32,366.

AN'TEROS (Gk. Ἀντέρωσ, from ἀντί, *anti*, against + ἔρωσ, *erōs*, love). In the mythology of the Greeks, the brother of Eros, and god of unrequited love.

ANTEROS, or **ANTERUS**. Pope, or rather Bishop of Rome, from Nov. 21, 235, till his death, Jan. 3, 236. He comes in the list of popes between Pontianus and Fabianus.

ANTHE'DON (Gk. Ἀνθηδών). A small town on the north coast of Bœotia, situated at the foot of Mount Messapion, on the strait of Eubœa. It belonged to the Bœotian league; it was destroyed by Sulla, but was later restored. The site, near the modern Lukisi, was described by Leake, *Travels in Northern Greece*, ii. In 1889 excavations were conducted on its site by the American School of Classical Studies at Athens, which brought to light a complex of foundations near the harbor, and what seems to have been a small temple on a hill outside the city. The course of the walls was also traced, and a number of bronze implements and 64 inscriptions were found. The latter are chiefly gravestones, but give some idea of the local alphabet and dialect. Consult *American Journal of Archæology*, vi (1890).

ANTHE'LIA (Gk. ἀντί, *anti*, against + ἥλιος, *hēlios*, the sun). Luminous rings opposite to the sun, seen when the observer looks toward his own shadow cast upon a cloud or bank of fog or on the dewdrops on the grass. The shadow is seen to be encircled by a glory consisting of one or several concentric rings, having their common centre at the anti-solar point. The rings are usually colored, red inside and blue outside, but these are not pure colors, because formed by many overlappings of elementary rings. The outside rings have but little color and fade out into white. The radius of the rings increases with the smallness of the globules that make up the fog or cloud. The largest ring ever observed is the "white rainbow," which has an angular radius of about 40 degrees. It is almost pure white and is generally known by the name of the first observer, as Ulloa's ring. These rings are formed by the interference of rays of sunlight reflected from minute drops very much as in the case of the rings or glories seen close around the sun and moon. All these phenomena were imperfectly explained by Sir Isaac Newton as due to the dispersion of light refracted through drops of fog or rain; the only satisfactory explanation is that first given by Dr. Thomas Young, and more fully developed recently by Dr. Pernter, which attributes them to diffraction or interference. Consult Pernter, *Meteorologische Optik* (Vienna, 1901). See LIGHT.

AN'THELMIN'TIC (Gk. ἀντί, *anti*, against + ἕλμινς, *helmins*, a worm). Any medicine hostile to intestinal parasites. Anthelmintics which destroy are vermicides; those which expel, vermifuges. They act in one of three ways: (1) mechanically; (2) by some intoxicating influence; (3) by an actual poisonous effect. Among the remedies employed for the *Oxyuris vermicularis*, 'seat-worm,' or 'thread-worm,' are

enemata of salt and water, lime water, or of infusion of quassia. For the *Ascaris lumbricoides*, or 'round worm,' santonin (q.v.) and spigelia, or pink-root, are most frequently used. The drugs given to expel tæniæ, or tape-worms, are aspidium, or male fern; pumpkin seeds, and bark of the pomegranate. Kamala (q.v.) is fairly efficient; cusso, or koussou, is of doubtful value. For hookworm (*Necatur americanus*, *Ankylostoma duodenale*) thymol is the most efficient remedy. Vermicides are given after a period of fasting, in order that the worms may not be protected by masses of food, and are followed in three or four hours by a brisk purgative to expel the dead or stupefied parasites. See ASCARIS; WORM.

AN'THEM (ME. *antempne*, earlier *antefne*, ML. *antiphona*, from Gk. ἀντί, *anti*, against + φωνή, *phōnē*, voice, sound). A piece sung in alternate parts. A species of musical composition introduced into the service of the English church after the Reformation, and appointed to be sung daily, at morning and evening service, after the third collect. The words of the anthem are taken from the Psalms, or other suitable parts of the Scriptures, and the music is either for solo or chorus, or a mixture of solo and chorus. It is rendered with or without instrumental accompaniment. In its origin, musical construction, and use the anthem is similar to the motet of the Roman church and the *Kantate* of the Lutheran church. See MOTET; also ANTIPHONY.

AN'THE'MION (Gk. ἀνθέμιον, blossom, flower). A decorative motive of radiating leaves in ancient, Oriental, Greek, and Roman art. Derived originally from the Egyptian

ANTHEMION.

lotus-palmette through Ægean and Assyrian art, it was the most characteristic motive of painted ornament on Greek vases and terra cotta moldings and antefixæ, and was carved on bands and cymas of Ionic and Corinthian buildings and on the heads of funereal stelæ. It was further elaborated by the Romans, revived in the Renaissance, and has been the prolific parent of countless motives in modern art. Consult Owen Jones, *Grammar of Ornament* (London, 1856); Goodyear, *A Grammar of the Lotus* (New York, 1892).

AN'THEMIS. See CHAMOMILE.

ANTHE'MIUS (Gk. Ἀνθέμιος, *Anthemios*) (sixth century A.D.). A Greek architect, mathematician, and engineer; born at Tralles, in Asia Minor. With the assistance of his colleague, Isidore of Miletus, he planned and built for the Emperor Justinian the church of St. Sophia in Constantinople (532-538), one of the greatest buildings in architectural history, and so may

be regarded as the founder of the developed Byzantine style. He wrote, among other mathematical treatises, a work on the subject of burning-glasses. Some fragments of his writings have been found. He continued the Greek tradition of uniting architecture and theoretical mathematics, which the Romans had discouraged, and he was one of the greatest architects of all ages.

ANTHEMIUS. An Emperor of the West (467-472), and son-in-law of the Eastern Emperor Marcian. He was appointed to the Western throne by the Emperor Leo, at the instance of Ricimer, who afterward married Anthemius's daughter. A quarrel arose between them, and Ricimer proclaimed Olybrius Emperor of the West in 472 and marched on Rome, which he took by assault. Anthemius perished in the battle. His character is highly praised in a panegyric of Apollinaris Sidonius (q.v.). Consult *The Cambridge Mediæval History*, vol. i (New York, 1911).

AN'THER (Gk. *ἀνθήρως*, *anthēros*, flowery, blooming). That part of a stamen which produces pollen. An anther usually consists of two small sacs, between which there occurs a certain amount of sterile tissue (the "connective"), which is often nothing more than the top of the axis of the stamen. See FLOWER.

AN'THERID'IUM (a diminutive after the GREEK fashion from *anther*; see AN'THER). The male organ of plants; that is, the organ in which the sperms are developed. Among the algæ and fungi an antheridium is usually a single cell, and in the simplest forms in which antheridia appear this single cell is merely a vegetative cell which under certain conditions produces sperms. In most algæ and fungi, however, the antheridium is a distinctly differentiated cell set apart from the very first for the production of sperms. Among the mosses and ferns the antheridium is a many-celled organ of

bursts open in the presence of moisture and discharges its mass of cells and sperms, the latter of which free themselves by their movements and are ready to swim to the female organs. Among the ordinary ferns the antheridia are on the lower surface of the prothallium, being more or less imbedded in its tissue.

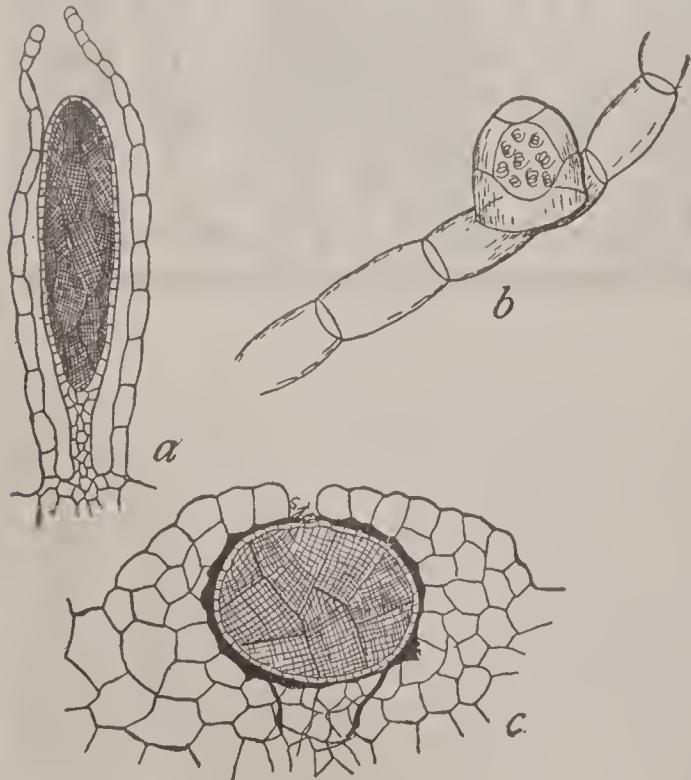

With the introduction of heterospory (q.v.), which involves certain of the fern-plants and all of the seed-plants, the male plant is very much reduced in size, being entirely contained within the spore that produces it, which in the seed-plants is called the pollen grain. This small male plant is in most cases a single antheridium, and in seed-plants the antheridium is represented chiefly by two sperms. In seed-plants, therefore, the antheridium is a concealed organ; while in the lower groups it is a conspicuous organ.

The name is an unfortunate one, since it means "anther-like," having been given under the impression that the anther of seed-plants is a male organ. It would be very desirable to change the name if such a thing were possible, and "spermary" has been proposed as a substitute.

AN'THESTE'RIA. See GREEK FESTIVALS.

ANTHEUNIS, ä'n'tē'nē', GENTIL THEODOOR (1840—). A Flemish poet. He was born at Oudenarde, and removed to Brussels. He is considered one of the best lyric poets of Belgium. His verse is distinguished by depth of sentiment and euphony. Among his most popular songs are *Lentelied*, *Ik ken een Lied*, *Vergeefs*, and *Getrouwe liefde*. Collections of his poems have been published under the titles *Uit het Hart* (1875); *Leven, Lieven, Zingen* (1879).

AN'THOCY'AN, or **ANTHOCYANIN** (Gk. *ἄνθος*, *anthos*, flower + *κύανος*, *kyanos*, a dark-blue substance). The blue, purple, or red pigments found dissolved in the cell sap of flowers, fruits, young leaves and stems, roots, etc. The term "erythrophyll" is still sometimes used in this sense. The chemistry of the anthocyanins is imperfectly known, but the term includes a number of individual compounds closely related to the tannins. There is evidence for the existence of two general groups of the bodies, with rather distinct chemical and physical characters: "beet red," found in all parts of the red beet and in the dark red varieties of *Chenopodiaceæ* and *Amarantaceæ* and other plants; the "vine red," found in wine, autumn leaves of *Ampelopsis*, *Rhus*, *Cornus*, and other plant organs. In an acid medium the anthocyanins take on some shade of red, while in a basic medium they are blue or violet. For this reason the color of the anthocyanin in a plant organ indicates whether the organ is acid or basic. When extracted, some of the anthocyanins form excellent acid and base indicators. The function of anthocyanin in the living plant is not positively known, although numerous attempts have been made to explain its presence and distribution. (See COLOR.) 1. It has been held to be a protection to the green coloring matter of young leaves against too much light, which promotes its decomposition (see CHLOROPHYLL), especially when it is formed slowly on account of low temperature. 2. It has been suggested that it protects the protoplasm against too great intensities of the injurious blue-violet and ultra-violet rays. The absorption spectrum of the anthocyanins does not support either of these views. 3. It is alleged to be of advantage to young leaves and shoots

ANTHERIDIA OF A MOSS.

varying shape. The moss antheridium is a free organ and more or less club-shaped, a section showing that the wall consists of a single layer of sterile cells, and that the rest of the structure is a compact mass of very small cells, within each one of which a single sperm is organized. The antheridium springs open or

by increasing the absorption of the sun's energy, and thus raising their temperature. 4. Many hold that it is a by-product of metabolism that in some cases proves of advantage to the plant, as in the flowers and leaves, while in other cases it is indifferent, as in the roots. While in the main the amount and character of the anthocyan developed is determined by special and varietal qualities, still the amount is often affected by the conditions in which the organ develops. The amount of sugar present is one of the most important conditions. With high sugar content, at least in many plants, there is high tannin and anthocyan content. In turn, high sugar content often goes hand in hand with low temperature. This seems to account for the strong anthocyan development in spring and autumn foliage as well as in alpine and arctic plants.

ANTHOL'OGY (Gk. ἀνθολογία, *anthologia*, a flower-gathering, from ἄνθος, *anthos*, flower + λέγειν, *legein*, to pick out). The title usually given to a book consisting of an unconnected series of choice thoughts, usually of brief compass, whether in prose or in verse, but generally in the latter. In ancient times collections of this kind consisted largely of epigrams. (See EPIGRAM.) Even before Aristotle's day collections had been made of actual inscriptions graven on stone and on votive objects: thus Polemon gathered the Spartan, Philochorus the Attic, Aristodemus the Theban inscriptions. It was an easy step from this to the collection of epigrams that had been published in books: of these there were very many in widely scattered collections, for the most part small. 1. The earliest **Greek Anthology** based on literary pieces was compiled by Meleager, of Gadara, in Syria, about 80 B.C., and was the result of a renewed interest in the older Alexandrian poets. It was named *The Garland* (Στέφανος, *Stephanos*), and contained 130 of Meleager's own epigrams, and selections from 47 other poets, including Alcæus, Alexander Ætolus, Anacreon, Archilochus, Callimachus, Euphorion, Sappho, and Simonides. Something more than 100 years later, Philip of Thessalonica gathered the best epigrams of the preceding century into a collection, which he published in the reign of Caligula, and which at an early date seems to have been combined with Meleager's *Garland*. In both collections the epigrams were arranged according to the initial letters of the first verse. A third collection was made by Straton, of Sardis, in the second century A.D.; and a fourth by Diogenianus Heracleota. The latter seems to have been the first to adopt the name "anthology" (ἀνθολόγιον ἐπιγραμμάτων, *anthologion epigrammatōn*). The writing of epigrams then languished, but it was revived again during the sixth century in Constantinople; and the productions there of Julianus, Christodorus, Leontius, Paulus Silentarius, and others gave occasion for a new anthology, made under Justinian by Agathias of Myrina and called by him *The Cycle* (Κύκλος, *Kyklos*). He was the first, it seems, to arrange his collection according to the themes of the poems. Thus, book vi contained poems of love, book vii poems on the joys of the table and of wine. Within the books the poems of a given author were separated by pieces from an array of other writers. Apparently the combined anthology of Meleager and Philip was current for a long time beside the *Cycle* of Agathias. In the tenth century

small anthologies, the so-called *Sylloge Euphemiana* and the *Sylloge Parisina*, were made; in these two the arrangement was by subjects. Better known and more complete is the large compilation of Constantinus Cephalas in 15 books, which dates from the early part of the same century; here again the arrangement is by subjects, in chapters. Four centuries later, in Constantinople, the monk Maximus Planudes made a careless selection from Cephalas's compilation, in seven books, called ἀνθολογία διαφόρων, ἐπιγραμμάτων, *anthologia diaphorōn epigrammatōn*, *A Collection of Miscellaneous Epigrams*, arranged by subjects, in chapters. This latter was the only anthology known to western Europe until the seventeenth century. It is preserved at Venice in the single manuscript from which it was first published by Lascaris (Florence, 1494). It has been frequently reëdited, and was admirably translated into Latin, in part, by Grotius.

In 1607, however, Salmasius (q.v.) discovered and copied in the Palatine Library at Heidelberg the single manuscript of Cephalas's larger compilation, now known as the *Palatine Anthology*. Salmasius's copy was published first by Brunck in his *Analecta Veterum Poetarum Græcorum* (1776); this edition was superseded by Jacobs's *Anthologia Græca* in 13 volumes (1794-1803; improved edition, 1813-17), and was again reëdited with the addition of epigrams from inscriptions by Dübner, in his *Epigrammatum Anthologia Palatina* (2 vols., 1864, 1872; third volume by Cougny, 1890); Stadtmüller's critical edition of it is not yet completed (vol. i, 1894; ii, 1, 1899). In all, over 300 poets, some of them women, from pre-classical to Byzantine times, are represented in this *Anthology*; the collection is invaluable as a mirror of Greek civilization and thought, and the epigrams express the entire range of human feeling with a brilliancy and cleverness that translation cannot reproduce. Translations have been made into English by Wrangham, John Sterling, Merivale, Garnett, Symonds, and others; into French by Dehesme, into German by Herder and Jacobs. Consult: Wellesley, *Anthologia Polyglotta* (1849); Symonds, *Studies of the Greek Poets* (London, 1893); Butler, *Amaranth and Asphodel* (London, 1881); Mackail, *Select Epigrams* (London, 1906). On the smaller collections, consult Dilthey, *De Epigrammatum Syllogis Quibusdam Minoribus* (1887).

2. **Latin Anthologies.** Among the Romans, the passion for making epitomes, selections, and *florilegia* of all kinds was strongly developed by the first century A.D. (See Nettleship, *Lectures and Essays: First Series*, Oxford, 1885, 248 ff.) Collections of *sententiæ*, or pithy sayings, were early made, for educational purposes. Collections of poems are mentioned in Catullus; book sellers also caused such collections to be made. In 1573 Scaliger published at Leyden, in imitation of the Greek anthology, a Latin anthology, under the title *Catalecta Veterum Poëtarum*, and Pitthöus one at Paris, 1594. A larger collection was issued at Amsterdam (1759 and 1773) by Peter Burmann the younger, under the title *Anthologia Veterum Latinorum Epigrammatum et Poëmatum*; this comprised fugitive Latin verse from the time of Ennius to 100 A.D.; the arrangement was by subjects. In the nineteenth century a more careful anthology was undertaken by Riese (1869-70), a second edition of which has been published (Leipzig,

1906). The arrangement here is according to the sources of the epigrams. The Latin anthologies differ from the Greek in that they are the work of modern scholars who have patiently put together, by careful reading of Latin authors, and of inscriptions as well, the widely scattered remains of the minor poetry of the Romans.

3. **Asiatic Anthologies.** Asiatic literature is extremely rich in anthologies, which consist sometimes of extracts from the best poets, arranged according to the subject, and sometimes of "beauties" of their best poets, with biographical notices, which are placed either in chronological order or according to the countries in which the authors lived.

4. **Arabic Anthologies.** The oldest Arabic anthology is the *Moallakat* (q.v.; see also *ANTAR*), consisting of the seven most celebrated pre-Islamic poems. A much larger collection was made by Abu-Temâm (died 846), who published selections from the old Arabic songs composed previous to the time of Mohammed, arranged them in 10 books and named the entire collection after the first book, which consisted of war songs, *Al Hamâsa*. A German translation by Rückert was published in 1846, under the title *Hamasa*. Another famous anthology is the *Divan* of the Hudhailites (an Arabic tribe), a partial edition of which was published by Kosegarten, and a German translation by Abicht (1879). Wellhausen completed the edition (Arabic and German) in 1887, as part i of *Skizzen und Vorarbeiten*, published by him. Abu'l-Faradj of Ispahan (died 967) gathered together in his *Kitâb al-Aghâni* ('Book of Songs') all the ancient Arabic songs down to the first centuries of the caliphate. It was published by Kosegarten in 1840; but the complete work, in 20 volumes, was not issued till quite recently by the Arabic press of Bulak, to which Brünnow added the twenty-first volume in 1888. An Index to this anthology has been prepared by a group of scholars under the editorship of I. Guidi. Abu'l-Faradj accompanied this work with a minute commentary, which makes it one of the most interesting parts of the old Arabic literature. But the richest and most complete anthology of the later Arabic poetry is *Yatimat al-Dahr* ('The Pearl of the World'), by Taalabi, in which the writers are arranged according to the provinces in which they lived. It has been continued and enlarged since the period of the original compiler. Besides these and similar national anthologies, collections have been made in almost every province where the Arabic culture and speech prevailed. Such, for example, are the numerous Arabico-Spanish anthologies, though these are but little known.

5. **Turkish Anthologies.** The number of anthologies in the West Turkish, or, as it is generally called, the Turkish language, is very large. Most of the poems, however, show a tendency toward imitation of the Persian, which is natural when one recalls the fact that, under the old Ottoman dynasty, Persian was the official language of the court and was generally used by the aristocracy and the cultivated classes. (See below.) The most famous are: *Hesht Behesht* ('The Eight Paradises'), by Sehi of Adrianople (died 1548); *Taskarat ash-Shuara* ('Lives of the Poets'), by Latifi (died 1582), and, under the same title, a similar work of Ashik Chelebi (died 1571); and the great col-

lection, *Subdat al-Ash'âr* ('The Blossoms of Poetry'), by Kassade (died 1621). The substance of these anthologies is to be found in Hammer Purgstall's *Geschichte der osmanischen Dichtkunst* (Pesth, 1836); and in Gibb's *History of Ottoman Poetry* in 5 vols. (1900-08).

6. **Persian Anthologies.** The Persian literature has many anthologies, which are called *safinah* (ship), *majmai* (collection), *bayâd* (album), *intikhâb* or *muntakhab* (selection), and the like. Among these are the *Muntakhab ul-ash'âr* ('Selection of Poems'), compiled in 1748; and the *Daqâ'iq ul-ash'âr* ('Subtleties of Poems'), compiled in the eighteenth century, which deals, as its name implies, especially with the more artificial styles of Persian poetry. The numerous biographical dictionaries of poets, called *Tadhkirat*, or memoirs, contain many verses from the poets whose lives are recorded. One of the most important of these is the *Tadhkirat ash-shu'ârâ*, written by Daulat-Shâh in 1487, and edited by E. G. Browne (London, 1902). The *Farhangi ash-shu'ârâ* ('Dictionary of Poets') contains an anthology of about 22,450 distichs in Persian, and was abridged and freely imitated by Hammer-Purgstall in his *Duftkörner aus persischen Dichtern gesammelt*, reedited by Bodenstedt (Stuttgart, 1860). Persian minor poetry is the most perfect in the world and its forms and tone can be traced not only in the anthologies of the Eastern peoples—the Turks, the Hindus, the Arabs, and the Chinese—but even in modern Occidental writers such as Thomas Moore. Flügel has given an interesting bibliographical catalogue (Vienna, 1865); and some very graceful verse translations by Hermann Ethé can be found in Geiger and Kuhn's *Grundriss der iranischen Philologie*, especially vol. ii (Strassburg, 1906), and in Ethé's scattered contributions to the *Morgenländische Forschungen*. Consult also Meynard, *La Poésie en Perse* (Paris, 1887).

7. **Indian Anthologies.** The literature of the Mohammedan population of Hindustan, which is a mere copy of Persian literature, has also several anthologies. The most important are: *Gulzâri Ibrâhîm* ('Rose Garden of Ibrâhîm'), by 'Alî Ibrâhîm, containing biographical notices of 300 Hindustani poets with specimens of their writings; the collection called *Diwâni Jihân* ('Divân of the World'), by Bēnî-Narāyan; *Gulshâni Hind* ('Garden of India'), by Mirzâ 'Alî Lutf; *Guldasta'i Nishât* ('Garland of Pleasure'), by Manû Lâl (Calcutta, 1836), and *Guldasta'i Nazninân* ('Garland of Delights'), by Karîm-ad-Dîn (Calcutta, 1845). The substance of these works is to be found in Garcin de Tassy's *Histoire de la littérature hindoue et hindoustanie* (2d ed., Paris, 1839-47), which, under the title of *Tabakâli Shurâi Hindi*, was translated into Hindustani by Karîm-ad-Dîn (Delhi, 1848). In the pure Hindu we have a rich collection of songs, the *Râgsâgar* ('Ocean of Musical Verse'), by Krishnânanda (Calcutta, 1845). The modern tendency of Hindu anthologies is wholly away from the Sanskrit, and the vernacular has been used especially, as by Rājā Siva Prasād, who died as recently as 1895. See Grierson, *Modern Vernacular Literature of Hindōstân* (1889).

8. **Sanskrit Anthologies.** The Sanskrit literature is not so rich in anthologies as are other Oriental literatures. But the collections, comprising a hundred strophes each (*Satakas*), and attributed to many poets, may almost be

termed anthologies. True Sanskrit anthologies are the *Saduktikarnāmṛta*, or 'Ear-nectar of Good Sayings,' by Sridharadasa (about 1205 A.D.), the *Sārṅgadharpaddhati*, or Anthology of *Sārṅgadhara*, and Vallabhadeva's *Subhāshitāvalī* ('Series of Good Words'). Böhtlingk, *Indische Sprüche* (3 vols., St. Petersburg, 1870-73), contains an anthology of 7613 Sanskrit strophes, with a literal German translation. Consult Frazer, *A Literary History of India* (1898).

9. **Chinese Anthologies.** The oldest anthology in the world is that which Confucius has handed down under the name of the *Shi-King*, or Book of Songs, forming one of the five great canonical books, or sacred classics of the Chinese. Chinese authors assert that about 3000 other poems were known in the time of Confucius. The *Shi-King* consists of 311 pieces, which picture vividly the manners and customs, the state of knowledge and art, and the aspects of nature in the states which afterward became China. It is, of course, written in the "book language" or classical Chinese of the literati, and time has made it almost unintelligible to those who speak only the vernacular dialects. But it is remarkable for the myriad allusions which it contains to the great body of Chinese literature and is extremely difficult because of the almost unlimited license of its word-order. The best translation with critical apparatus is by James Legge (London, 1876). There is also a version in Latin by Lacharme (Stuttgart, 1830) and one in German by Rückert (Altona, 1833). The poems of the Liang Dynasty (502-557 A.D.), and of the Tang Dynasty (618-905), have also been collected, but are only in part translated. Consult Giles, *A Chinese Biographical Dictionary* (1898); Giles, *Sun Tzu* (1910); and the article CHINESE LITERATURE.

10. **Japanese Anthologies.** The Japanese abound in anthologies, since they consider poetry more as the production of an epoch than of an individual. The oldest and largest anthology, compiled in the eighth century, is called *Manyōshū*, or *Collection of Ten Thousand Leaves*. It contains 4565 songs, mostly in 31-syllable poems. The *Kokinshū*, or *Songs Ancient and Modern*, numbering 1099, was finished about 922. Another anthology of the same century, *Gosen Wakashū*, contains 1356 short poems. Other collections were made by order of the Mikados in the succeeding centuries, ending with the fifteenth, and these, with *Songs Ancient and Modern*, are known under the general name of the *Anthologies of the One and Twenty Reigns*. All of these books have had abundant commentary, and are valuable to the student and historian. As is the case with almost everything in Japanese, the Chinese influence is apparent; but during the last 50 years, since Japan became Occidentalized, the vernacular has largely changed, and recent anthologies show a decided alteration in spirit, thought, and vocabulary, which bring the verse close to the manner of French and German lyrical writers. There are innumerable collections made by imperial or private order, besides many selections of 100 songs each, the most famous of the latter being the *Hiaku-nin-is-shiu* (100 poets, one verse), translated into English with notes by F. V. Dickens (London, 1866), and Clay MacCauley (Tokio, 1899). Consult, also: Leon de Rosny, *Anthologie japonnaise* (Paris, 1870); B. H. Chamberlain, *Classical Poetry of the Japanese* (London, 1880); Aston, *A History of Japanese*

Literature (1899); and for a sympathetic interpretation, Hearn, *Japan* (1904).

AN'THON, CHARLES, LL.D. (1797-1867). An American classical scholar and teacher. He was born in New York City, graduated at Columbia College in 1815, studied law and was admitted to the bar in 1819, but never practiced. The next year he became adjunct professor of Greek and Latin at Columbia; after 15 years, he became full professor. From 1836 to 1867 he was also head master of the grammar school of Columbia College. He was exceedingly efficient as a teacher and won considerable reputation by his annotated editions of a large number of classical authors, prepared as school and college text-books. Besides nearly 50 such works, he published a new edition of Lemprière's *Classical Dictionary* (1825); a new Classical Dictionary (1841, 1855, 1874); manuals of Greek and Roman antiquities (1843, 1852, 1874); *A System of Greek Prosody and Metre* (1840, 1852); *Ancient and Mediæval Geography* (1855); and a number of other handbooks which were long and extensively used by classical students, both in this country and in England. The value of his editorial labors lay largely in the fact that by his books he directed the attention of American classical students to the valuable works produced by German scholarship; he thus gave a great impetus to the higher and more fruitful study of the classics in America. Consult Henry Drisler, *Commemorative Discourse* (New York, 1868).

ANTHONY, ăn'thō-ni. A city, and the county-seat of Harper Co., Kan., 57 miles southwest of Wichita, on the Missouri Pacific, the Atchison, Topeka, and Santa Fe, the Kansas Southwestern, the Kansas City, Mexico, and Orient, and the Chicago, Rock Island, and Pacific railroads (Map: Kansas, D 4). It controls a trade in the products of the surrounding agricultural and stock-raising region and has a salt plant, an ice plant, and a flour mill. Anthony has a large opera house, two hospitals, a Carnegie library, and seven churches. The city owns the water works and electric light plant. It has adopted the commission form of government. Pop., 1890, 1806; 1900, 1179; 1910, 2669.

ANTHONY, ăn'tō-nī, CLEMENS THEODOR (1755-1836). King of Saxony. Upon the death of his brother Frederick Augustus I, on May 5, 1827, he succeeded to the throne. After the disturbances of 1830 he appointed his nephew, Prince Friedrich August, co-regent, and on September 4 of the following year he gave his sanction to a constitutional government for the kingdom.

ANTHONY, HENRY BOWEN (1815-84). An American journalist and legislator. He was born at Coventry, R. I., and graduated at Brown University in 1833. He became editor of the *Providence Journal* in 1838 and continued as such for more than 20 years. In 1849, and again in 1850, he was elected Governor of Rhode Island, on the Whig ticket. He was a Republican member of the United States Senate from 1859 until his death, and served twice (1863 and 1871) as president *pro tem*. A collection of his historical and memorial addresses was printed for private circulation in 1875. He bequeathed to Brown University the Harris collection of American poetry, containing about 6000 volumes. Consult the *Anthony Memorial* (1886), a catalogue of the collection, with a sketch of the donor.

ANTHONY, JOHN GOULD (1804-77). An American conchologist. He was born at Providence, R. I., and for many years was in commerce, but his studies in natural history resulted in his being invited by Prof. Louis Agassiz, in 1863, to the directorship of the conchological department of the Museum of Comparative Zoölogy at Harvard University. In 1865 he accompanied Professor Agassiz on the Thayer expedition to Brazil. He was an acknowledged authority in his field of research, and published: *A New Trilobite: Ceratocephala Ceralepta* (1838); *Descriptions of Three New Species of Shells* (1839); *Descriptions of New Species of American Fluviate Gasteropods* (1861); *Descriptions of New American Fresh-Water Shells* (1866), and other works.

ANTHONY, SAINT. See ANTONY, SAINT.

ANTHONY, SAINT, CROSS OF, or the **TAU CROSS.** A cross, shaped like the letter T. In heraldry the name denotes an ordinary cross consisting of two stripes, one horizontal, the other vertical, crossing each other in the centre of the escutcheon.

ANTHONY, SAINT, FALLS OF. See MINNEAPOLIS.

ANTHONY, SAINT, FIRE OF. See ERYSIPELAS. The Rev. Alban Butler, in his *Lives of the Saints*, gives the following account of the origin of this name: "In 1089 a pestilential erysipelatous distemper, called the *sacred fire*, swept off great numbers in most provinces of France; public prayers and processions were ordered against this scourge. At length, it pleased God to grant many miraculous cures of the dreadful distemper to those who implored his mercy through the intercession of St. Anthony, especially before his relics; the church [of La Motte St. Didier, near Vienne, in Dauphiné] in which they were deposited was resorted to by great numbers of pilgrims, and his patronage was implored over the whole kingdom against this disease." The "Order of Canons Regular of St. Anthony," a religious fraternity, founded about 1090, for the relief of persons afflicted with the fire of St. Anthony, survived in France till 1790.

ANTHONY, SUSAN BROWNELL (1820-1906). An American reformer, born in South Adams, Mass., the daughter of a Quaker. She taught school for 15 years; was active in the total abstinence and anti-slavery movements; advanced a belief in the coeducation of the sexes; and from the Civil War devoted herself entirely to the woman suffrage movement. It was largely the result of her effort that married women in New York State were given the guardianship of their children and the control of their own earnings as early as 1860. She founded (1868) and for three years published *The Revolution*, a woman's rights paper. She was arrested, tried, and fined for voting at the election of 1872. An eloquent speaker, she lectured extensively in England and throughout the United States, and took part in many State campaigns and appeared before many Congressional committees. In 1899 Miss Anthony was a delegate to the International Council of Women, held in London. Two years later she retired from an office she had held for many years, the presidency of the National American Woman Suffrage Association. She contributed to leading magazines and (with Mrs. Elizabeth Cady Stanton and Mrs. Matilda Joslyn Gage) published an extensive *History of Woman Suffrage* (3 vols., New York, 1881-87). For her life, consult Harper, *Life and Work of*

Susan B. Anthony (3 vols., Indianapolis, 1899); Alice Hubbard, *Susan B. Anthony* (East Aurora, 1909).

ANTHONY, WILLIAM ARNOLD (1835-1908). An American physicist. He was born at Coventry, R. I., graduated at the Sheffield Scientific School of Yale University, and was professor of physics and chemistry in Antioch College (Ohio) from 1867 to 1869. From 1869 to 1872 he was professor of physics at the Iowa Agricultural College, and from 1872 to 1887 professor of physics at Cornell University. In 1887 he became a consulting electrician. From 1893 to 1908 he was professor of physics in the Cooper Union School of Science. He contributed a chapter to E. A. Thompson's *Roentgen Rays and Phenomena of the Anode and Cathode* (1896); wrote (with C. F. Brackett) a *Manual of Physics*, and published in 1902 a *Theory of Electrical Measurements* (3d ed., 1908).

ANTHONY DE DOM'INIS. See DOMINIS.

ANTHONY OF BOUR'BON. See ANTOINE DE BOURBON.

ANTHONY'S NOSE. A projecting bluff on the Hudson south of West Point, said to have been named after a trumpeter of Governor Stuyvesant.

ANTHOPH'YLLITE. A name applied to an orthorhombic mineral of the amphibole group, containing the metals magnesium and iron and silic acid. It commonly occurs in lamellar or fibrous masses that have a vitreous lustre and vary in color from brown to green. A "hydrated anthophyllite" has been described in several instances, but in most cases the mineral has been shown to be really a hydrated monoclinic amphibole. Anthophyllite occurs in metamorphic rocks.

AN'THOXAN'THUM. See SWEET VERNAL GRASS.

AN'THOZO'A (Gk. *ἄνθος*, *anthos*, flower + *ζῷον*, *zōon*, animal), or **ACTINOZOA.** A class of cœlenterates, characterized by their polyp-like form. It contains the sea-anemones and all the corals except millepores. See **CŒLENERATA**; **CORALS**; **SEA-ANEMONES.**

AN'THRACENE (Gk. *ἄνθραξ*, *anthrax*, coal) $C_{14}H_{10}$. An organic substance composed of carbon and hydrogen and obtained from coal-tar. The production of anthracene has been of great commercial importance since the discovery of the processes by which it is converted on a large scale into the valuable alizarin dyes. (See **ALIZARIN**.) The portion of coal-tar passing, during its distillation, above 270° C., contains a considerable amount of anthracene; when this portion is cooled, a mass of crystals is deposited, which is separated from the liquid oil by pressure and purified by digesting with the naphtha obtained from another fraction of the coal-tar, viz., the so-called light oil, which passes below 170° C. The product somewhat purified in this manner is brought into commerce under the name of "50 per cent anthracene" and is employed in the manufacture of alizarin. To isolate pure anthracene from this product, it is distilled with potash, and the distillate is treated with carbon disulphide, in which anthracene is nearly insoluble; the remaining traces of impurities may then be eliminated by recrystallization from hot benzene. Pure anthracene is a colorless crystalline substance melting at 213° C. and boiling at 360° C.: it is insoluble in water and but sparingly soluble in alcohol. Graebe and Liebermann obtained it from the coloring

matter of madder, and then, by reversing the process, artificially prepared that coloring matter (alizarin) from anthracene. All commercial anthracene contains more or less carbazol. The chemical constitution of anthracene is represented by the formula:

Consult Auerbach, *Das Anthracen und seine Derivate* (Brunswick, 1880), and Guelm, *Die Anthracenfarbstoffe* (Brunswick, 1897).

ANTHRACITE (Gk. *άνθρακίτης*, *anthrakitēs*, from *άνθραξ*, *anthrax*, coal). A term used to designate the highest grade of coal, or that having the highest percentage of fixed carbon and lowest volatile contents of all the coals. It has been produced from bituminous coal by alteration through the action of pressure and heat. These conditions are produced when rock-masses are folded up into mountains, or when beds of bituminous coal are approached or penetrated by an intrusion of igneous rock. In passing from the horizontal coal measures of western Pennsylvania and Ohio to the greatly folded beds of eastern Pennsylvania, the coal changes from bituminous to anthracite. At Crested Butte, Colo., beds of bituminous coal are found to change to anthracite in those portions of the mass which are in close proximity to basaltic rocks that have been intruded into the beds underlying the coal in that region. The process involves distillation with evolution of gaseous compounds and is probably controlled to some extent by the relative porosity of the overlying rocks, as well as by the varying degree of heat to which the coal is subjected.

Anthracite has great heating power; it burns slowly, giving off but little smoke, and is consequently very clean. The average chemical composition of anthracite coal from different localities is as follows:

	Fixed carbon matter	Volatile	Water	Ash	Sulphur
Mammoth vein, Pa.	86.38	3.08	4.12	5.92	.50
Anthracite, Colo...	82.33	9.96	.81	6.90	1.06
Madrid, N. Mex. ..	93.02	1.04	.16	5.78	.117
Shan-si, China	82.74	5.55	1.55	10.15	.25

Anthracite is found at a number of widely separated localities; but the areas underlain by it are seldom large because its formation is dependent on local conditions. In the United States it is found in eastern Pennsylvania, where it forms several detached areas aggregating about 470 square miles. These fields are known as the Southern, or Schuylkill field (140 square miles); Western Middle field (90 square miles); Eastern Middle field (40 square miles); Northern, or Wyoming (200 square miles); Loyalsock, or Western Northern. The coals all belong to the Middle Carboniferous or Pennsylvania Series, at the base of which is a hard bed known as the Pottsville conglomerate. After beds of the Coal measures had been folded into basins, the presence of the outcropping ledges of conglomerate along the crests of the ridges protected the coal beds to a large extent and have kept them from

being entirely worn away by weathering and erosion. The total number of workable anthracite seams is about 15, but several others are also known. The aggregate thickness of the beds increases from west to east; the best known is the Mammoth Bed, which in places may exceed 100 feet in thickness, while elsewhere it may split up into several beds separated by layers of shale. Wilkes-Barre, Scranton, Hazleton, and Pottsville are important mining towns in the region. At Crested Butte in Colorado, and near Madrid, N. Mex., anthracite is found in beds of Upper Cretaceous age, the formation of the anthracite in each case being due to igneous intrusions. Indeed, at the latter locality, the change from bituminous to anthracite coal takes place within a distance of 2000 feet. In Europe anthracite coal is found in the Carboniferous of South Wales. It is also known in France and Belgium. What are probably the largest deposits in the world are those around Tse-Chau in the province of Shan-si, China. Baron von Richthofen estimated that the unmined anthracite coal in Shan-si amounted to 630,000,000,000 tons, and that the area was greater than that of Pennsylvania.

Anthracite coal, after mining, goes through a crushing and sorting process in coal-breakers, in which the machinery consists of crushing rolls and screens. In this treatment the coal is separated into the different sizes given below, and particles of slate are eliminated. Much of the latter is separated by screens having the bars set at an angle, so that when a mixture of coal and slate passes over them the slate particles, owing to their thinness, slip through, while the coal passes by. Pieces of mixed coal and slate are known as *bone-coal*, and are picked out by boys when the smaller sizes of coal come down the shutes from the screens. Recently, wet methods of separation of slate and coal, by means of jigs (q.v.) have been adopted with great success. The capacity of some breakers is very large, being as much as 2000 to 3000 tons of marketable coal per day of 10 hours.

The following sizes are shipped from the breaker:

Broken, or grate coal, which passes through 4-inch mesh, but not through 2.5-inch mesh.

Egg coal, which passes through 2.5-inch mesh, but not through 1.75-inch mesh.

Stove coal, which passes through 1.75-inch mesh, but not through 1.25-inch mesh.

Chestnut coal, which passes through 1.25-inch mesh, but not through .75-inch mesh.

Pea coal, which passes through .75-inch mesh, but not through .50-inch mesh.

Buckwheat coal, which passes through .50-inch mesh, but not through .25-inch mesh.

Very coarse lumps are known as "steamboat coal," and the finer sizes are now separated into two kinds, which are known as rice and barley. The finest refuse from the breakers and mines is known as "culm" and has been a source of much concern, since, through being considered as waste, it has been allowed to collect in enormous heaps, forming a marked topographic feature of the anthracite regions. Owing to the fineness of this material, it was for some years found difficult to burn it in grates, as it packed and hindered the entrance of air. In recent years methods of utilization for culm have been found, and many of the banks have been worked over and the coarser particles washed out and sized. It can be burned in specially constructed

grates, or can be mixed with tar and pressed into briquettes for use with the ordinary grate. Another important use is for filling in abandoned or partially worked-out mines, which is done by washing the culm down through a pipe into the mine, where it settles into a compact mass.

In the trade anthracite is sometimes classed as follows: Free burning, white ash, hard white ash, Wyoming red ash, Lehigh red ash, Shamokin, Lykens Valley red ash, Schuylkill red ash, Trevorton, Lorberrry red ash, and Bernice white ash. The hard white ash commands the best price.

The production of anthracite coal in Pennsylvania from 1907 to 1911 was as follows:

Year	Total product long tons	Value at mines	Average price per ton	No. employed	Average no. days worked
1907	76,432,421	\$163,584,056	\$2.14	167,234	220
1908	74,347,102	158,178,849	2.13	174,174	200
1909	72,384,249	149,181,587	2.06	166,801	205
1910	75,433,246	160,275,302	2.12	169,497	229
1911	80,771,488	174,952,415	2.17	172,585	246

It is also of interest to note the increase in shipments since the beginning of the industry:

ANTHRACITE COAL SHIPMENTS, 1825 TO 1911

1825	34,893 long tons	1870	16,182,191 long tons
1830	174,734 " "	1880	23,437,242 " "
1835	560,758 " "	1890	36,615,459 " "
1840	864,379 " "	1900	45,107,484 " "
1845	2,013,013 " "	1911	69,854,299 " "
1860	8,513,123 " "		

The exports of anthracite in 1911 were 3,553,999 long tons valued at \$18,093,285, and the imports 2463 long tons valued at \$12,550.

The production of anthracite in Colorado and New Mexico combined amounted to 98,561 short tons in 1911. Various estimates of the amounts of anthracite remaining in the Pennsylvania fields have been made, and all agree in the conclusion that the deposits will last at the present rate of production for more than 100 years. For illustration, see COAL.

Bibliography. For statistics of production, consult volumes on *Mineral Resources*, issued annually by the United States Geological Survey; various reports of the Second Geological Survey of Pennsylvania, and the Annual Reports of the Bureau of Mines, Pennsylvania. For description of occurrence, see *Coal Resources of the World*, an exhaustive work prepared by the XII session of the International Geological Congress, Toronto, 1913. Consult also: J. J. Stevenson, "Origin of Pennsylvania Anthracite," *Bulletin of the Geological Society of America*, vol. v, p. 39 (Rochester, 1894); M. R. Campbell, "Hypothesis to Account for the Transformation of Vegetable Matter into the Different Grades of Coal," *Economic Geology*, vol. i (Lancaster, Pa., 1905); N. F. Drake, "Coal Fields around Tse Chau, China," *Transactions of the American Institute of Mining Engineers*, vol. xxx (New York, 1898). See also COAL; PENNSYLVANIA.

ANTHRAC'NOSE (Gk. *ἀνθραξ*, *anthrax*, carbuncle + *νόσος*, *nosos*, disease). A group of fungus diseases of plants, in which the fruits, stems, and leaves suffer serious injury. Common forms are found upon beans, blackberries,

raspberries, cucumbers, egg-plants, grapes, cotton, peppers, and spinach. Species of *Colletotrichum* and *Glaeosporium* cause most of these diseases. About 500 species have been described under these genera, but it is now believed they may be reduced to a very few. The perfect forms of most of the species are now referred to the genus *Glomerella*. In the fruit attacked definite round discolored spots or pits appear, with a usually 'light-colored' centre, surrounded by darker zones. See GRAPE; BEAN, and the other plants mentioned above.

AN'THRACO'SIS. A disease peculiar to coal-miners, incident to long-continued inhalation of coal dust. The lungs are subjected to constant irritation, become black from deposited coal particles, fibrous tissue increases at the expense of the air spaces, and hard, nodular areas are formed, which tend to undergo ulceration. Such lungs are peculiarly liable to become tuberculous. See PNEUMOKONIOSIS.

AN'THRAPUR/PURIN. See PURPURIN.

AN'THRAX (Gk. *ἀνθραξ*, coal, carbuncle, malignant pustule; Fr. *charbon*). An acute, febrile, infectious disease produced by the *Bacillus anthracis*. The disease is known as charbon, splenic fever, milzbrand, carbonchio, mjeltbrant, and Siberian plague; in man as carbuncle or malignant pustule, wool-sorter's disease, and, incorrectly, malignant œdema.

Anthrax was the first disease traced to bacterial generation. It is most prevalent among herbivorous animals—cattle, horses, sheep, and goats—varying in relative frequency with the region. The camel and various members of the deer family are frequently affected. Anthrax is frequently transmitted to man, especially through abrasions of the hands of those who handle infected wools or hides. It may also be implanted in the lungs through inhalation of infected spores and, though rarely, in the intestines through swallowing food containing anthrax spores. The chief general anatomical changes are hemorrhages, by which all the organs are often permeated, serous, gelatinous, and hemorrhagic infiltrations of the subserous, submucous, and subcutaneous connective tissue, swelling of the spleen and parenchymatous inflammation of the liver and kidneys, and a tar-like condition of the blood. Œdema, fever, diarrhœa, delirium, and hemorrhages are followed speedily by death.

Enzoötic outbreaks of anthrax have been known from time immemorial and in all parts of the globe. In cattle veterinarians distinguish three forms of anthrax: per-acute or apoplectic, in which the animal suddenly drops to the ground and dies in convulsions after a few minutes or at most an hour; the acute form without external swellings, most frequent in cattle, in which the temperature is increased to from 40° to 42° C.; restlessness and excitement, or general prostration, and labored breathing appear, and death supervenes, with signs of asphyxia, in from 10 to 24 hours; the sub-acute form, which is rare, with symptoms the same as in the acute form, but less pronounced, death occurring in from one to seven days.

In both horses and cattle an external form of anthrax occurs, in which tumors or carbuncles develop under the skin. These tumors are distinguished from those of black-leg by the fact that they do not emit a crackling sound on being stroked. Before death the discharges of the body may become mucous or even bloody. In animals

which die of anthrax, blood-clots are found on nearly all the vital organs, and the spleen is enlarged to from two to five times its normal size. If needful, a definite diagnosis may always be made by an examination for the presence of the anthrax bacillus, which may be found in the blood within 16 to 18 hours before death.

In countries subject to the ravages of anthrax, the disease is usually restricted to well-defined areas, which seem to be permanently infected. Anthrax is most common in localities subject to inundation. Ponds of stagnant water and streams polluted with the waste from tanneries and morocco factories may serve as sources of infection. Perhaps the most common means for the spread of anthrax infection is found in the bodies of animals dead of the disease. The anthrax bacillus may gain entrance to the body of an animal in the inspired air, in food or water, or in wounds of the skin. The rapidity with which the different symptoms of anthrax develop depends largely upon the relative resisting power of the animal.

The bacillus in blood drawn from affected animals and dried may remain virulent for a month or longer. Anthrax spores may retain their vitality in the soil for an almost indefinite period, especially if situated at some depth, where they are protected from the action of light and oxygen. Putrefaction destroys the vegetative form of the bacillus, but does not affect the spores. In the filamentous form the bacillus is killed by exposure to a temperature of 55° to 58° C. for 10 to 15 minutes. The spores are very resistant to dry heat, a temperature of 120° to 140° C. for three hours being required to kill them.

Domestic animals may be immunized in practice by attenuated living cultures of the bacilli, by spore-containing cultures, by immune serum, and by immune serum and living cultures.

Active immunization by vaccination has been extensively practiced, as the organism may be attenuated in a variety of ways. The first developed and the one most commonly used is that established by Pasteur in 1881. He found that when grown at a temperature of 42° to 43° C. the pathogenicity of this bacillus gradually decreases until injections no longer cause the death of rabbits, and if continued even the mouse will not succumb, the bacilli in such cultures dying in about a month. Pasteur's method of protective vaccination consists in the injection subcutaneously of a culture attenuated by 24 days' growth at a temperature of 42.5° C., followed in 10 to 12 days by an injection of a stronger vaccine, i.e., one attenuated by a growth of but 12 days at the same temperature.

In 1911 Dawson prepared a single vaccine, which differs from the Pasteur vaccine only in the degree of attenuation and in that it is applied but once. This vaccine is recommended for use when animals are dying from the disease and an immediate protection is necessary. A passive immunity may be established within a few hours by the injection of an immune serum, but such immunity lasts for but one to two weeks.

In primary local affection of the skin, subcutaneous tissue, or the visible mucous membrane, deep incisions should be made, and after thorough scraping the wound should be repeatedly washed and cauterized. In cases of generalized disease which are not far advanced, the treatment with immune serum gives good results. In

the prevention of anthrax the main reliance of the stockman is to be placed in vaccination. Anthrax vaccine may now be purchased of wholesale druggists and has proved very efficient in the prevention of the disease. The most important sanitary measure to be adopted in case of an outbreak of anthrax is the immediate and complete destruction of animal carcasses. This is best accomplished by burning. If anthrax carcasses are not destroyed, the contagion may be spread in the soil and water, and may also be carried by flies, buzzards, dogs, and other carnivorous animals. The thorough sterilization of hair, wool, and animal skins by steam, dry heat, or otherwise, will prevent the infection of man from handling these products.

AN'THROPO-(from Gk. *ἄνθρωπος*, *anthrōpos*, man, human being). A combining form occurring at the beginning of many English words, especially scientific terms, and denoting that the word has something to do with *man* or *mankind*; e.g., *anthropo-geography*, the geographical distribution of mankind; *anthropology*, the science of man; *anthropophagy*, man-eating, or cannibalism; etc.

AN'THROPO-GEOG'RAPHY (Gk. *ἄνθρωπος*, *anthrōpos*, man + *γεωγραφία*, *geōgraphia*, geography). A division of bio-geography which describes the distribution of the varieties of mankind and depends upon anthropology as the science from which it derives its facts regarding the types of men. Both in Germany and France the literature on the subject is assuming considerable dimensions. Prof. Friedrich Ratzel was appointed to the chair of anthropo-geography at Leipzig, in 1866. His *Anthropo-geographie* (Stuttgart, 1899) is a type of this division of geography. Anthropo-geography is treated in more or less detail in most recent works on ETHNOLOGY (q.v.). The most important American work in this field is Semple, E. C., *Influences of Geographic Environment* (New York, 1911). See also GEOGRAPHY, ECONOMIC; ANTHROPOLOGY.

AN'THROPOID APES. See APE.

AN'THROPOL'ATRY (Gk. *ἄνθρωπος*, *anthrōpos*, man + *λατρεία*, *latreia*, worship). A term signifying, according to its derivation, the worship of man, and always employed in reproach. Thus, the early Christians accused the heathen of anthropolatry because in their mythology men were represented as exalted among the gods, although an *apotheosis* (q.v.) was in these cases alleged by their worshipers; and the heathen retorted the charge of the worship of Christ, the reply to which was the assertion of his divinity. But the term is chiefly known in ecclesiastical history in connection with the employment of it by the Apollinarians against the orthodox Christians of the fourth and fifth centuries, who in worshiping Christ worshiped, as

was affirmed, only a man in whom God dwelt. See APOLLINARIS.

AN'THROPOL'OGY (Gk. *ἄνθρωπος*, *anthrōpos*, man + *λόγος*, *logos*, discourse, science). The science of man. Originally the term signified the zoölogy and comparative anatomy of man, but has long since come to have a much wider meaning. Like any other science it now has certain problems of its own according to which its province is determined rather than by the etymology of its name or even its historic development. The fundamental problems of anthropology are the relative antiquity of man's first appearance upon the earth, his subsequent distribution and career. To some extent these problems are shared by other sciences: thus the relative time of man's appearance upon the earth is largely a geological problem in that the ages of the various strata bearing traces of man must be determined entirely by geological methods. Again man's relation to mammals is in the main a zoölogical and palæontological problem for whose solution we must look to special students of those subjects. When, however, we come to man's distribution and career on the earth, we not only deal with the most distinctly human character in the world, but with a problem almost peculiar to anthropology. Anthropologists use the term "culture" to designate the results of man's activities or those characteristics not subject to inheritance. A human being comes into the world with certain instincts or tendencies to act, which may be designated as his biological equipment for life. With the nature of this equipment the zoölogist, physiologist, and psychologist are concerned. The anthropologist, on the other hand, is concerned with the functioning of this equipment, especially those instincts that lead to the production of culture. Though culture is not inherited, it is accumulative in that each group of people tends to preserve and conserve its experience.

It may be necessary to distinguish between the field of anthropology on the one hand and those of history and sociology on the other. While each deals with certain aspects of the cultural problem, they stand quite apart. History has to do with the culture of peoples having more or less definite records, or, at least, with such as have immediate connection with historic cultures. Anthropology takes up the prehistoric period of culture and the savage and primitive groups still living, but not constituting integral parts of the historic nations. The distinction is here fairly definite. Sociology concerns itself with the special social equipments of man and especially with the many practical problems that confront our own social life. To the social activities of non-historic peoples it seldom refers, except for illustrative data and suggestions as to theories for social origins.

It appears, then, that the peculiar and distinctive group of problems in anthropology are those that refer to culture. As we have noted, certain aspects of the antiquity of man are geological problems, but the presence of man in the past is usually determined by the remains or by-products of his cultural activities rather than by his own bones. When such objects are found in a given strata, such as broken flints, cracked animal bones, etc., it is for the anthropologist to say whether the objects in question were made by man and to determine from them what form of culture was practiced by their makers. The geologist is to be called upon to determine

the age and conditions of the particular strata in which the objects were found, but with the cultural problem he has nothing to do, that being the peculiar province of the anthropologist.

There are several subheads under which the data of anthropology are grouped, viz., ethnography, ethnology, archæology, and physical anthropology. The first concerns itself chiefly with the classification and distribution of mankind. Ethnology gives its attention to the cultures of living people, their language, art, religion, social organization, industrial arts, etc. Archæology is the combined ethnography and ethnology of extinct peoples. Physical anthropology concerns itself with comparative studies of the anatomy and physiology of the different peoples, seeking to establish criteria by which the hereditary relationships of the different peoples of the earth may be determined.

The biological sciences have a fundamental conception in the doctrine of evolution which, once comprehended, gives one a general understanding of the whole. Some years ago anthropologists attempted to build their science upon the same conception, as the writings of the period attest, but it is now generally accepted that while the conception applies well enough to man's biological equipment, or to that part of him that is transmitted by heredity, it is not consistent with the facts of cultural development. When one recalls the fact that the biological theory of evolution is based upon descent, it is not strange that the conception should fail in its application to phenomena that are not hereditary but perpetuated by education and imitation. When this point became clear to anthropologists, they formulated what is known as the historical or cultural point of view as opposed to the biological or evolutionary.

The biological or evolutionary point of view was never very clearly formulated, but was an assumption that the law of progressive development held for all forms of culture. It was assumed that the transition of a people from a hunting to an agricultural mode of life, for example, was a normal or even a necessary course of development and a step almost certain to be taken sooner or later by every group of people. In conformity to this theory attempts were made to grade all the cultures found in the world into a progressive series of higher and lower, the most notable being the work of Sir John Lubbock. The difficulty in this case was that a genetic relationship had of necessity to be assumed between all the groups in the scheme ranging from the lowest savagery to the highest civilization, whereas data to support such assumptions were wanting. To prove definitely genetic relationship between types of culture we must know the cultural history of particular peoples. Direct data of this kind from non-historical peoples are scarcely to be had, but as the study of primitive cultures progressed anthropologists found a great deal of indirect data and noted conditions not consistent with the genetic view. During this period of development several important theories were developed: the animistic hypothesis of Tylor accounting for the origin and life history of religious and philosophical concepts; the social evolution of Morgan, Westermarck, et al., accounting for the origins of marriage, exogamy, etc.; the totemic conception in whose development Frazer played the leading rôle; the theory of industrial evolution as developed by Tylor and Balfour, or the

notion that by arranging objects made by man in what seemed to be their most logical order, we can discover their genetic relationship; and, finally, the evolution of art as demonstrated by Haddon and others, the theory being that the origins of conventionalized designs and even simple geometric figures may be discerned by tracing them back to their realistic prototypes. (For similar attempts at the evolution of language, see ARYAN and LANGUAGE.) The chief leaders in this development were Englishmen, Morgan being the only American contributor. This development was certainly due to the influence of Darwin and his contemporaries.

All the preceding conceptions were worked out somewhat deductively and, with one or two exceptions, without resort to direct investigation. The method was to take extracts from the books of travelers or to select objects from museum collections in such a way as to illustrate the workings of each theory.

This period was followed by the one in which we now find anthropology, a period marked by intensive field-research among the peoples now living and highly developed techniques for the excavation and analysis of archæological remains. In this American anthropologists have played a leading part. The result has been the general abandonment of the preceding hypothesis as to the origin of culture and the formulation of several important principles of development.

Among these are the secondary association concept, the principles of convergent evolution, the tribal pattern theory, and independent development, all of which are in opposition to the fundamental concepts in the anthropology of the preceding period. Secondary association is conceived of as the bringing together of unrelated phenomena by historic contact or purely accidental means, such connection having neither functional nor genetic significance. Convergent evolution is the idea that two peoples may arrive at the same form of culture by entirely different steps and methods. The tribal pattern theory is that when once a people have developed definite ideas on religious, moral, or artistic subjects, they tend to recast all new ideas and practices and thus give them the same general pattern. All of these may be considered as definitely established, since authentic examples are available. The last, however, is less conclusive, for, though some examples of independent development are known, there are still able defenders of the theory that similarity of cultures means unity of origin. In the latter Graebner of Germany is the leader, in the former Boas of America. No one denies that both principles operate, but the partisans of one consider the other of minimum importance. All of these views are in one respect opposed to the hypothesis of the earlier period, for in any case the cultural history of a people cannot be reconstructed theoretically. One must know the history of a tribe before he can say which of these principles will account for its culture. This is an empirical point of view, and it is this generalized conception that is now known as the historical or cultural point of view in anthropology.

The practical problems now confronting anthropologists are the collection and recording of facts of human culture among the rapidly vanishing primitive peoples, and the systematic archæological survey of the earth's surface, both supplemented by anthropometric and anatomical

studies of living races and skeleton material. Specimens of many kinds are gathered into museums where some kinds of investigations are made, but the real work is done in the field and not in the museum or laboratory. See MAN; ETHNOLOGY; ANTHROPOMETRY.

Tylor, *Primitive Culture* (1895).

ANTHROPOLOGY, CRIMINAL. See CRIMINOLOGY.

ANTHROPOLOGY, THEOLOGICAL. A theological system which considers man as being the subject of sin and grace. It consequently considers his natural powers, so far as these relate to moral action and states—the moral intuitions, conscience, the affections, the will, habit—the original sin of Adam and its effects upon himself and upon his posterity, the corruption of nature, technically called “original sin,” and the fall, heredity, the bondage of the will, and imputation. To these topics certain others are often added, such as the origin and antiquity of man, the origin of the soul (whether by creationism or traducianism), and the unity of the human race. See SIN, GRACE, ETHICS, ORIGINAL SIN, FALL, IMPUTATION, SOUL, CREATIONISM, TRADUCIANISM.

AN'THROPOM'ETRY (Gk. *ἄνθρωπος*, *anthrōpos*, man + *μέτρον*, *metron*, measure). A method of measurement pursued in anthropology. The primary measurements are those of the normal body at rest, and include stature, weight, circumference of head, reach (or span of extended arms), circumference and expansion of chest, length of arm and leg, sitting height, circumference of waist, limbs, hips, and shoulders, length of forearm and thigh, size of foot, length of fingers, size and position of ear, facial angle (i.e., degree of prognathism), shape of head, size and form of nose, position and attitude of eyes, etc. Of these elements of the human body, only a few are commonly regarded as of ethnic significance, or of use in describing and comparing peoples or races considered collectively; the elements commonly so employed comprise stature, size and shape of head, facial angle, relative length of limb, attitude of eyes, etc. Some or all of the other elements receive special consideration in studies and comparisons of selected classes of population, e.g., school-children of various ages or grades; and certain of the elements are customarily recognized in the study of individuals, such as athletes, criminals, etc. With these definitely quantitative measurements, other individual or typical attributes of the human body are commonly correlated; chief among these are color (of skin, hair, eyes, mucous membrane, nails, etc.), character of pelage (scalp hair, beard, axillary and pubic hair, body hair), local and general texture of integument, form and mobility of features, etc. Other measurements of common use in anthropologic studies are those of the skeleton, particularly the skull, jaws, and long bones. Various anthropologists, like Manouvrier, Deniker, and Pearson, have devised formulas for determining stature from the length of femur, tibia, humerus, and other long bones; and the relative dimensions of the differ-

ent bones of the skeleton are commonly regarded as ethnic indications. The forms of certain bones are also deemed ethnic criteria; the flattening of the tibia (platycnemism) and the perforation of the humerus in the olecranon fossa have received especial consideration in this connection. The measurement of the skull has been developed into a system known as craniometry. A leading feature in this aspect of anthropometry is the cranial index, i.e., the breadth of the skull in proportion to its length as viewed from above (in the *norma verticalis*); and three types are commonly defined as dolichocephalic or long-head, mesocephalic or round-head, and brachycephalic or broad-head varieties of the genus *Homo*, the ratios of breadth to length being about 70: 100, 80: 100, and 85: 100, respectively.

Another important feature of the system is the capacity of the brain-case, measured by means of liquid or fragmental substances (water, glycerin, sand, fine shot, or small seeds), poured into the cavity and afterward weighed or gauged, or by aid of a thin, elastic, and impervious bag inserted through the foramen magnum and afterward filled with liquid; and connected with such determinations is the direct weighing or measurement of the brain itself. Still another feature is the facial angle, i.e., the angle subtended by the bones of the face and forehead with the base of the cranium, viewed from the side (*norma lateralis*), or in vertical antero-posterior section (*norma mediana*). There are several modes of defining this angle, those of Camper, Cloquet, Jacquart, and Cuvier being best known; and the progressively increasing angle from the lower animals to the anthropoids, and thence from the lowest races to the highest type of humanity, is among the striking facts brought out by scientific inquiry. The facial index is another feature of modern anthropometry and affords arbitrary but useful means of comparing crania of different types, while craniometric specialists have devised a series of points, lines, and angles serving to define cranial forms and types in great detail. Among the applications of anthropometry, in what may be called the static aspect, are those involved in the Bertillon system (q.v.) and related methods of bodily description for identification or other purposes, and among these that of identification by finger-prints (i.e., by the patterns of the papillaceous ridges which are peculiar to each individual), which was brought out some years ago in America by Gilbert Thompson and in England by Francis Galton, and has come into general use in the identification of criminals. (The United States Indian service now requires all signatures of Indians to be accompanied by the finger-print).

During recent decades what may be called the dynamic aspect of anthropometry has attained prominence, and the measurement of structures has been supplemented by measurement of functions, both periodic and special. Among the former are rates of respiration and pulsation, which vary with sex, age, and race as well as with individual characteristics and conditions; and various devices (including the plethysmograph, with its variants and improvements) have been devised to measure the interrelations between the periodic and special functions of the human body. The latter functions are too numerous and variable for ready treatment, though athletic records, the military step in various armies, the hours of labor in different countries and classes, and other relevant material are

gradually assuming systematic form. Among the most fruitful lines of measurement of human function are those of experimental psychology, and education where, by use of the special statistical methods of Pearson, the functional relations between different kinds of activity may be discovered. The data obtained through anthropometry may be summarized under somatology (q.v.). See INDEX.

AN'THROPOMOR'PHISM (Gk. *ἄνθρωπος*, *anthrōpos*, man + *μορφή*, *morphē*, form). The application to God of terms which properly belong only to human beings. This may be done literally, teaching that God really has a body as some (see AUDÆUS) have been accused of doing, with doubtful truth. Some philosophers (Hobbes, Forster, Priestley) have ascribed to God a sort of subtle body. Figuratively, anthropomorphism is employed in the Scriptures, as when God is said to have eye or arm. Anthropomorphism ascribes to God human affections and passions and is the more common form of anthropomorphism. The whole tendency arises from the difficulty of conceiving of God as he is in himself, and from the teachings of Christianity, which seeks to reveal God to men and employs terms which are capable of being understood. While it is susceptible of abuse, it has a fundamental justification in the fact that if there is to be any knowledge of God at all, man must be assumed to possess a like nature with God. We are made "in his image." All early religion was strongly anthropomorphic. As it advanced, the gods became less like men in form, but a certain kinship of spirit must always exist, so long as there is any conception which could be called God. The extreme of recoil from anthropomorphism is found in those philosophers (e.g., Fichte and his school) who reject the personality of God as anthropomorphic. Schleiermacher, following Spinoza, thought that there was something in God far higher than personality, which he regarded as a human limitation.

AN'THROPOPH'AGY (Gk. *ἄνθρωπος*, *anthrōpos*, man + *φαγεῖν*, *phagein*, to eat). Cannibalism; the eating of human flesh. See CANNIBALISM.

ANTHU'RIMUM. See ARUM.

ANTHYL'LIS. See KIDNEY VETCH.

AN'TI, or **CAMPA.** An important and warlike tribe of Arawakan stock, occupying the forests at the head waters of the Ucayali River, the pampa of Sacramento, etc., on the eastern slope of the Andes, in southern Peru. The eastern division of the Inca Empire took its name of Antisuyu from them. They are of good physique and pleasant countenance and wear their hair long and flowing, with a poncho belted around the waist as their principal garment. The women are skillful weavers of wild cotton, and the men are good metal workers. They cultivate the ground to some extent and delight in taming animals from the forest. One of their important subtribes is the Machiganga, or Machiyenga, concerning which consult Farabee in *Proc. Amer. Antiq. Soc.*, vol. xx, N. S., pp. 127-131.

AN'TIA'RIA AND ANT'JAR. See UPAS.

ANTIBES, *än'téb'*. A fortified seaport in the department of Alpes-Maritimes, in the southeastern part of Provence, France, and the general port of communication with Corsica. It is 11 miles southwest of Nice, situated on the east side of a small neck of land called La Garoupe, lying west of the mouth of the Var, in a fertile

district (Map: France, S., M 5). The harbor is serviceable only for small craft. It possesses a naval school, and has considerable trade in olives, dried fruits, salt fish, oil, perfumery, etc. The anchovies prepared at Antibes are held in high esteem. The environs of the town are bright with vineyards and orchards, while its gardens of roses and jasmine furnish material for the extensive perfume manufactories of the town. There are a number of tobacco factories. Pop., 1896, 4956; commune, 9329; 1901, 5512; commune, 10,947; 1911, 12,198; commune, 21,414.

Antibes is very old, having been founded under the name of Antipolis by a colony of Greeks from Massila (Marseilles), of which it became a dependency. In the time of Augustus it was elevated to the rank of a *municipium* and must have attained a high degree of prosperity if we are to judge from the ruins of theatres and aqueducts that still exist. After the disintegration of the Roman Empire Antibes shared the fate of all cities in that region, becoming subject to successive tribes of barbarians from the North. In the ninth century it was destroyed by Saracens; in the sixteenth century it was fortified by Francis I and Henry IV; during the War of the Austrian Succession it sustained a siege of three months (1746), and gained some celebrity from having closed its gates against Napoleon on his return from Elba. Consult Vinson, "Le port et le quartier maritime d'Antibes," in *Revue Maritime*, vol. cxlvi (Paris, 1900).

AN'TIBURGH'ER. See BURGHER.

AN'TICANT, DR. PESSIMIST. An appellation of Thomas Carlyle (q.v.).

AN'TICHLOR (*anti* + *chlorine*). Any one of several substances (e.g., sodium sulphite, sodium bi-sulphite, sodium hyposulphite, or calcium sulphide) used by manufacturers of linen and cotton fibre and paper pulp to remove the last traces of free chlorine that had been generated from the hypochlorite used in bleaching the materials mentioned. Free chlorine has a tendency slowly to disintegrate the material unless removed.

AN'TICHRIST (Gk. Ἀντίχριστος, *Antichristos*; from ἀντί, *anti*, against + Χριστός, *Christos*, Christ). A name which occurs only in the Epistles of John, but which, in all likelihood, designates the final New Testament form of a popular belief, whose rise is to be found in later Judaism and which was appropriated with various modifications by biblical writers.

Its source is a question of much debate. Most probably, however, it lay in the popular convictions aroused by the constant announcement of the divine purpose to punish Israel's sin by giving her into the hands of heathen nations, but to recover her by force from their power when her spiritual discipline had been accomplished. The repeated carrying out of this policy, even in earlier Jewish history, evidently impressed the popular mind with the idea of an essential opposition between the heathen nations and the people of God, the final outcome of which was yet in the future, but must be in favor of the chosen people. Such an impression may have been aided by the instinctive natural beliefs in the struggle of darkness with light and chaos with order (Bousset); but, in view of the above unique line of revelation and experience peculiar to the Jewish people, it is quite gratuitous to make such general beliefs the definite source of such a distinctive popular conviction.

As the later revelation emphasized the element of punishment to be administered to the heathen nations by announcing that God would not only recover his people when their discipline was finished, but would chastise the nations for any attempt on their part to overreach the disciplinary mission given them, the popular idea of the hostility of the nations to the people of God was naturally increased. The primary form of this popular conception is evidently used by Ezekiel as a basis for his prophecy concerning the consummation of Israel's restoration, in which he describes the nations of the world as assembled under the leadership of "Gog of the land of Magog," for final battle against Israel (Ezek. xxxviii., xxxix.; see also Zech. xii. to xiv. where the prophet foretells the gathering together of all the nations of the earth to fight against Jerusalem, and the Lord's going forth in turn to fight against them).

In the experience of the Jews under Antiochus Epiphanes, however, the popular conception of this struggle made a distinct advance, in which the opposition was concentrated in a single personage, and all idea of disciplinary mission toward Israel was lost sight of in the conviction of an inherent enmity against the people of God. This secondary form appears in the eschatological prophecies of the Maccabean Book of Daniel (Dan. vii. to ix., xi., xii., in which are given the vision of the beast with the ten horns, triumphed over by the "Ancient of Days," and the vision of the goat with the horn between the eyes who warred against the holy city but was finally himself destroyed).

Naturally, as the idea of a personal Messiah increased in definiteness, this popular belief in a personal adversary would grow stronger, especially when we consider the long-continued influence on Jewish thought of the Daniel prophecies. We can believe, therefore, though the Jewish apocryphal literature antedating the Christian era does not distinctly show it, that the conception of an Antimesiah was more or less current in Judaism before the rise of Christianity. This Antimesianic conception is appropriated by New Testament writers, with modifications due to the newer revelations of truth in the Gospel and apostolic times, particularly those which substituted the spiritual for the national idea of the kingdom of God, and so emphasized the significant distinction between righteousness and sin. So we see Paul's statement concerning the advent and mission of the Man of Sin and his final destruction by Christ (2 Thess. ii. 1-12: "For the day of the Lord will not come, except . . . the Man of Sin be revealed, . . . who opposeth and exalteth himself against all that is called God . . . whom the Lord Jesus shall slay with the breath of his mouth . . . whose coming is according to the working of Satan with all power and signs and lying wonders . . . and deceit of unrighteousness"), where, however, in the deceiving character of his mission, there is brought out a new idea—an idea which is frequently applied by Paul to those who opposed him and his gospel (Acts xx. 30; 2 Cor. xi. 13; 1 Tim. iv. 1, 2). So also we see the various forms of statement in the Book of Revelation regarding the Beast and the Dragon (compare Rev. xi. to xiii., xvi., xix., xx., in which we are told of "the beast that cometh up out of the abyss," who overcomes "the two witnesses," and of the "red dragon having seven heads and ten horns," warring

against the woman and her child and destroyed by Michael and his angels; also of the "beast coming up out of the sea, having ten horns and seven heads," ministered to by the "beast coming out of the earth," with "two horns like unto a lamb," and finding his identification in the mystical number "six hundred and sixty and six"). The idea of the deceiving mission of the adversary, however, is in this book specifically pictured in the separate figure of the False Prophet, "who wrought signs wherewith he deceived them that had received the mark of the beast" (Rev. xvi. 13, xix. 20, xx. 10, though compare also xii. 9 and xiii. 14 for the same characteristics in the Dragon and the Beast). In this figure there is a return to the earlier personal idea of the Antimesiah, and, at the same time, an advance to the final New Testament form found in the Johannine Epistles, where the teaching of false doctrines is personified in the term Antichrist (1 John ii. 18, 22; iv. 1-3: "Many false prophets are gone out into the world . . . Every spirit which confesseth not Jesus . . . this is the spirit of Antichrist"; 2 John 7: "This is the deceiver and the Antichrist").

This Antimesianic conception is clearly appropriated by Jesus as a form for his eschatological statements regarding those who shall appear in opposition to his cause (Mark xiii. 5, 6; "Many shall come in my name, saying, 'I am he': and shall lead many astray"; see also verses 21, 22: "There shall arise false Christs and false prophets, and shall shew signs and wonders, that they may lead astray, if possible, the elect"). In these statements Jesus seems, in the term "false," to have distinctly introduced a new idea, which does not appear to have been present in the popular beliefs. This would, however, have been quickly intelligible to those of his hearers who recalled the false prophets of Jewish history, whose ability to deceive the false Christs were to reproduce. From the tradition of Jesus' words may have come the idea of falseness in Paul's statement regarding the Man of Sin and his own gospel opponents; from its definite form in the written gospel is quite certain to have come John's statement regarding the false prophet, if not his use of the term itself.

The idea of Antichrist persisted into the post-apostolic times, in both Jewish and Christian circles. In the former it returned to its earlier national form; in the latter it carried forward the final New Testament form of the teaching. Consult: H. Gunkel, *Schöpfung und Chaos* (Göttingen, 1895); W. Bousset, *The Antichrist Legend* (Eng. trans., London, 1896); Wadstein, *Die Eschatologische Ideengruppe-Antichrist-Weltsabbat-Weltende und Welgericht* (Leipzig, 1896); M. Friedländer, *Der Antichrist in den vorchristlichen jüdischen Quellen* (Göttingen, 1901). Consult also the Excursuses by Bornemann, Findlay, and Milligan, in their Commentaries on the Thessalonian Epistles; and the article on "Antichrist" in *Standard Bible Dictionary*.

ANTI-CIGARETTE LEAGUE. An organization founded in 1901 for combating by all legitimate means the use of cigarettes and other forms of tobacco by boys. It grew out of the work done along these lines for many years by Miss Lucy Page Gaston. The work of the league includes the introduction of anti-cigarette legislation in State legislatures and the circulation of pledges among boys. The stringent laws against the selling and smoking of cig-

arettes enacted in many States in recent years have been passed largely through the efforts of the league. Its organ, *The Boy Magazine*, is edited by Miss Gaston.

ANTICIPATION. In music. See HARMONY.

AN'TICLI'MAX (Gk. *ἀντί*, *anti*, against + *κλίμαξ*, *klimax*, a ladder, climax). In rhetoric, an abrupt declension by a writer or speaker from the dignity to which his idea has attained. Though the anticlimax is to be avoided in serious discourse, where it leads to bathos, it is employed with fine effect in ridicule and satire. Pope, Addison, and Fielding were masters in this art of unexpected descent. Pope, for example, thus writes of Queen Anne at Hampton Court:

"Here thou, great Anna whom three realms obey,
Dost sometimes counsel take—and sometimes tea."

AN'TICLI'NAL AX'IS. See ANTICLINE.

AN'TICLINE (Gk. *ἀντί*, *anti*, against, opposite + *κλίνειν*, *klinein*, to incline). In geology, a term applied to that form of rock-folding in which the opposite sides or limbs of the fold slope downward and away from the crest of the fold. Anticlinal axis is the axis or crest of such a fold. The anticline may be compared to the ordinary gable roof—the axis corresponding to the ridge of the roof, while the limbs of the anticline correspond to the slopes of the roof. When the anticlinal axis lies in a horizontal plane, which, however, is seldom the case, the layers composing the limbs of the fold are, after erosion, exposed in parallel rows on either side of the axis; those layers of earlier age, and consequently of lower stratigraphic position, occupying positions nearer to the axis, and vice versa. Thus, in an anticlinal ridge the crest of the ridge is occupied by rocks of a geologic age earlier than that of the rocks forming the flanks of the ridge. A special case of anticlinal structure is represented by the dome in which the strata slope away in all directions from a central point or summit.

The supplementary condition to that of the anticline or up-fold, is observed in the *syncline*, or down-fold, and indeed these two types of folds are usually found in close association; the features of anticlines being, however, reversed in synclines. When anticlinal and synclinal axes are tilted and eroded, the component layers outcrop in alternating convergent and divergent series to form zigzag ridges with intervening "canoe-valleys," a type of structure which is well developed in Pennsylvania. The term *anticlinorium* is applied to a compound anticline, and the term *synclinorium* to a compound syncline. Anticlines are sometimes associated with the occurrence of natural gas, it having been demonstrated that the gas occurs at those portions of the gas-bearing stratum that have been thrust upward to form an anticlinal axis or dome. See DIASTROPHISM; GEOLOGY; and for illustration, see Plate accompanying the latter title.

AN'TICOS'TI (N. Amer. Ind. *Naticotck*). A barren island in the province of Quebec, Canada, dividing the Gulf of St. Lawrence into two channels and situated between lat. 49° and 50° N. and long. 61° 40' and 64° 30' W., 40 miles north of Cape Gaspé (Map: Canada, S 7). It is 135 miles long, with a maximum width of 40 miles; has an area of 3147 square miles. It is almost destitute of harbors, the north shore being mountainous, and the south low and beset with shoals, while the neighbor-

ing currents are capricious. Ellis Bay, to the west, and Fox Bay, in the northwest, are the only possible harbors. The climate is severe, while the surface is an alternation of rocks and swamps. The principal inhabitants are the keepers of the lighthouses situated at different parts of the coast. Pop., about 250. There is little good timber, and agriculture cannot be carried on to any great extent because of prevalent summer frosts. Near the island there are considerable salmon, trout, cod, and herring fisheries. It is a favorite resort for seal and bear hunters. The most extensive peat deposits in the Dominion are found here. Marl exists in most of the small lakes and ponds along the coast. In 1873 the island was divided into 20 counties by a land company and was the scene of a disastrous colonization scheme. The colonists were attracted by specious promises, and had to be removed to the mainland after suffering severe privations. In 1895 Anticosti was acquired as a game preserve by M. Menier, a Parisian manufacturer. The rocks of Anticosti are of great interest to the geologist, as they comprise a series of shale and limestone beds that constitute an uninterrupted transition formation between the Ordovician and Silurian systems such as is known in few other localities. Consult: Logan, *Geological Survey of Canada, Report of Progress from its Commencement to 1863*, with atlas (Montreal, 1863-65); Billings, "Catalogue of the Silurian Fossils of Anticosti," *Geological Survey of Canada* (Montreal, 1866). See SILURIAN SYSTEM.

AN'TICY'CLONE. See STORM.

ANTICYRA, ān-tīs'ī-rā (Gk. Ἀντίκυρα). A city of Phocis (q.v.), on the Corinthian Gulf, with an excellent harbor. It was famous for the hellebore which grew in the neighborhood and so was much visited by the sick. The modern town is Aspra Spitia. There were two other towns called Anticyra, one in Locris and one in Malis.

AN'TIDOTE (Gk. ἀντίδοτος, *antidotos*, given against, from ἀντί, *anti*, against + δίδωμι, *didonai*, to give). A term applied in medicine to any substance capable of neutralizing the action of a poison. The action of antidotes may be due either to their chemical properties or to their having physiological effects that are the opposite of those which they are intended to counteract. Acids and alkalies are an example of chemical antidotes. Morphine and atropine are typical examples of physiological "antagonism." In cases of poisoning in which no true antidote is known, the treatment resorted to is necessarily of a mechanical nature. Such cases are in the majority; so that the stomach pump, emetics, and purgatives play an important rôle in the treatment of most cases of poisoning. The following is a list of the ordinary poisons, with their antidotes and other measures employed in counteracting them.

Acetanilid, Antipyrin, Phenacetin (ingredients of Headache Powders).—The patient should be kept warm, and heart stimulants, such as strychnine, digitalis, or whisky be administered.

Acids, Vegetable; Acetic, Oxalic, Tartaric Acids.—Give the patient water containing a suspension of such alkaline substances as chalk, whiting, or, in emergency, plaster scraped from the wall. Then give a dose of castor oil or of Epsom salts.

Acids, Mineral; Nitric, Sulphuric, Hydrochloric Acids.—Give chalk, magnesia, or soap, followed

by demulcent drinks, such as the white of egg.

Alcohol.—The stomach may be emptied by an emetic or a stomach pump, and this followed by such stimulants as aromatic spirits of ammonia or hot coffee in repeated doses until the pulse has become strong. Then cold should be applied to the head and heat to the extremities.

Arsenic, Paris Green, "Rough-on-Rats."—A tablespoonful of "dialyzed iron" (sold in all drug stores) should be given to the patient every half-hour for four doses. This should be followed by a dose of castor oil.

Carbolic Acid.—A good chemical antidote for this is Epsom salts (magnesium sulphate) or any other soluble sulphate; for, on entering the blood, these form with carbolic acid harmless chemical compounds. Give the patient also large amounts of sweet oil, white of egg, and stimulants. Diluted alcohol is a valuable local antidote if given almost immediately after the poison is taken.

Carbonic Acid Gas, Carbonic Oxide, Coal Gas.—Fresh air should be supplied, artificial respiration employed, 30 drops of aromatic spirits of ammonia given every half-hour for three doses, and then one ounce of well-diluted whisky every three hours, for three doses.

Chloral, "Knock-out-drops."—Thirty grains of ipecac in water should be given to the patient as an emetic, followed by a hypodermatic injection of one-twentieth of a grain of strychnine. Friction of the surface, application of warmth, and artificial respiration are effective.

Corrosive Sublimate (Bichloride of Mercury), *Bed Bug Poison, White Precipitate.*—Thirty grains of powdered ipecac in warm water should be given to the patient as an emetic, then the whites of a dozen eggs, and a hypodermatic injection of morphine.

Iodine.—After evacuating the stomach administer starch suspended in water, followed by a dose of morphine hypodermatically, and inhalations of ammonia.

Nicotine, Tobacco.—The patient should be placed flat on the back, and emetics and stimulants should be administered. A hypodermatic injection of one-fortieth of a grain of nitrate of strychnine has a very good effect.

Opium, Morphine.—An emetic or the stomach pump should be employed first of all; then the patient should be made to inhale ammonia, and half a grain of permanganate of potash should be given every hour. Artificial respiration should be employed, two ounces of hot black coffee may be injected into the rectum, and rubbing and gentle shaking or brisk flagellation should be employed to keep the patient awake. A subcutaneous injection of atropine, or 30 drops of tincture belladonna given through the mouth, will have a powerful counteracting effect by stimulating the respiratory centre.

Prussic Acid.—Usually so rapidly fatal that nothing can be done, but when possible the stomach should be washed out, diluted ammonia given by the mouth with a dose of opium to relieve the pain. Then alternating hot and cold douches, atropine and heart stimulants by hypodermatic injection and artificial respiration.

Plomaine Poisoning by putrefied meat or sausage (botulism).—Evacuate and wash out the stomach. Morphine is given to counteract the abdominal pain, and when there is prostration, stimulants.

Strychnine.—The stomach pump should be employed as early as possible, and 20 grains of zinc sulphate should be given, or 30 grains of powdered ipecac, in warm water, as an emetic. Then 20 grains of chloral and 30 grains of bromide of sodium, dissolved together in two ounces of hot water, may be injected into the rectum. In case convulsions occur, they may have to be controlled by the inhalation of chloroform. Chloral, which is in a sense antagonistic to strychnine, is considered a valuable antidote. In any case, 20 grains of sodium bromide should be given by the mouth every hour.

Tansy.—Thirty grains of powdered ipecac in warm water as an emetic, and a dose of castor oil, should be given to the patient.

Turpentine.—An emetic, mucilage of gum arabic, Epsom salts, and a hypodermatic injection of morphine, are indicated.

In the case of unknown poisons it is advisable to give two teaspoonfuls of chalk mixed with water, four eggs beaten up in a glass of milk, and some whisky. The stomach pump, too, may be useful, and in case these measures give no relief, artificial respiration should be employed. Of course, the physician should endeavor to ascertain the nature of the poison and direct the treatment accordingly.

AN'TI-EMET'IC (Gk. *ἀντί*, *anti*, against + *ἔμειν*, *emein*, to vomit). Any remedy which tends to arrest nausea and vomiting. No class of drugs is more unreliable in action, and rest and quiet are at times much more efficient than the administration of an anti-emetic. Drugs may act upon the vomiting centre, as morphine or hydrocyanic acid, or on the nervous system, or locally on the stomach. Of the local remedies, external applications of counter-irritants or of cold may succeed. Emetics act by removing the cause for continued vomiting; lavage, or washing the stomach, in the same way. Cold carbonated waters, alcohol, especially dry champagne, chloroform, opium, bromides, chloral hydrate, and arsenic are at times used successfully. Dilute hydrocyanic acid, small doses of calomel, cerium oxalate, cocaine, carbolic acid, nuxvomica, and the alkalis are among the most reliable anti-emetics. In any case, it is necessary to determine the cause of vomiting before it is possible to select a proper anti-emetic. For example, the gastric disturbance may result from excessive acidity of the stomach contents, when an alkali or simple dilution with water may give relief; or it may be of cerebral origin, in which case such drugs as the bromides or opium may be required. If due to gastric irritation, a local anæsthetic may be efficacious; if to chronic alcoholism, some form of astringent, bitter, or stimulant, may relieve the vomiting. See EMETIC.

ANTIETAM, *ān-tē'tam*, BATTLE OF, sometimes called THE BATTLE OF SHARPSBURG. A sanguinary conflict fought on Sept. 16 and 17, 1862, between a Federal force of about 75,000 under General McClellan and a Confederate force of about 40,000 under General Lee. After having driven McClellan from the Peninsula and Pope from the Rappahannock back upon Washington, Lee took the offensive and crossed the Potomac, with the intention of invading Pennsylvania, and with hopes of inducing Maryland to join the Confederate cause, and possibly of forcing a satisfactory peace upon the Federal government. Dividing his army, he sent Jackson

with 12,500 men on September 15. Meanwhile, on McClellan's advance from Washington, Lee took up a strong position at Sharpsburg, on the west side of Antietam Creek and fortified the passes of South Mountain. These McClellan forced on the 14th (see SOUTH MOUNTAIN, BATTLE OF), and on the 15th the two armies stood facing each other across the Antietam. McClellan delayed his attack, and a part of Jackson's forces rejoined Lee; but on the afternoon of the 16th the Federal commander ordered Hooker across the creek, where the latter skirmished until dark. On the morning of the 17th

the Federal right and centre, under Generals Hooker, Mansfield, and Sumner, though their attacks were badly concerted, forced back the Confederate left under Jackson, who had arrived from Harper's Ferry during the night of the 16th; while the Federal left, under Burnside, which had been unable to cross the creek until 1 p.m. owing to the stubborn opposition of the Confederates at "Burnside's Bridge," attacked at 3 p.m. the Confederate right under Gen. A. P. Hill, and fought stubbornly until dark without obtaining any decisive advantage. McClellan decided not to renew the battle on the following day, though the Confederate right made several assaults upon Burnside's position, and during the night of the 18th General Lee retreated unmolested across the Potomac. The Federals lost in killed, wounded, and missing about 12,500, and the Confederates about 11,000. It was one of the bloodiest battles of the Civil War, more men being killed on September 17 than on any other one day between 1861 and 1865. Tactically, it was a drawn battle, though military critics are almost unanimous in the verdict, that McClellan, who brought only a part of his force into action, made many grave blunders, while the generalship of Lee, who utilized nearly every man, was almost faultless. Strategically, however, it was an important Federal victory, since it forced Lee to abandon his aggressive

campaign and retreat into Virginia. "Without McClellan's victory," says Rhodes, "the emancipation proclamation would have been postponed and might never have been issued." Consult: *Battles and Leaders of the Civil War* (4 vols., New York, 1887); Ropes, *Story of the Civil War* (2 vols., New York, 1894-98); *McClellan's Own Story* (New York, 1887); Michie, *General McClellan* (New York, 1901); Heysinger, *Antietam and the Maryland and Virginia Campaigns of 1862* (New York, 1912).

ANTIFEB'RIN. See ACETANILID.

AN'TI-FED'ERALISTS. A political party in the United States opposed to the so-called Federalists. As a matter of theory and analysis, the Federalists believed in a national system of government, while the Anti-Federalists believed in a decentralized and strictly federal system of government. The Federalists had the advantages of possessing a positive programme, and of gaining the first two points in the conflict when the national constitution was adopted and when they committed the national government to the exercise of such extensive powers as the creation of a national bank. The Anti-Federalists were thus merely a party of political opposition to the party in power. When, however, the Federalists, in the Alien and Sedition Acts (q.v.), seemed to encroach both upon the liberty of the individual and upon the jurisdiction of the States, the opposition of the Anti-Federalists became acute and their fundamental propositions were stated in the Virginia and Kentucky Resolutions (q.v.). This crisis resulted in the triumph of the Anti-Federalists under the leadership of Jefferson in the election of 1800; but soon thereafter the leaders of the party began to abandon its original creed of the strict interpretation of the Constitution and the narrow limitation of the powers of the national government. The first step in this direction was the purchase of Louisiana; and when finally the Federalist party was driven entirely out of existence, its characteristic principles remained effective as the chief principles of the Anti-Federalist party. The party was named the Republican party, then Democratic-Republican, and finally Democratic party. The name Anti-Federalist is commonly applied to the opponents of the party in power up to the end of the Adams administration. Strictly speaking, this is not correct, and the name should be limited to the campaign for the adoption of the Constitution. The Anti-Federalists opposed the adoption. Their objections were largely met by the first 10 amendments which were soon added to the Constitution. This was the party's chief contribution to American history. Consult Ostrogorski, *Democracy*, vol. ii (New York, 1902); and see DEMOCRATIC PARTY; FEDERALISTS; REPUBLICAN PARTY; UNITED STATES.

AN'TIGO. A city and the county-seat of Langlade Co., Wis., on the Spring Brook River, and on the Chicago and Northwestern Railroad, 207 miles by rail northwest of Milwaukee (Map: Wisconsin, D 3). The most noteworthy features are a teachers' training school, a school for the blind, a school of chiropractics, a business college, and a Carnegie library. It is in a productive agricultural and timber region, of which it is the commercial centre, and has extensive dairying interests and manufactures of various kinds of woodenware, besides flour mills, breweries, saw mills, cigar factories, wagon works,

foundries, railroad shops, etc. Settled about 1878, Antigo was incorporated in 1884. The government is administered under a general State law, which provides for a mayor biennially elected, and a municipal council. Altitude, 900 feet. Pop., 1880, 4424; 1900, 5145; 1910, 7196.

ANTIGONE, ān-tīg'ō-nē (Gk. Ἀντιγόνη).

1. In the Theban legend, daughter of Œdipus (q.v.) by his mother, Jocasta, and sister of Eteocles, Polynices, and Ismene. Her story existed in various forms. The Athenian dramatists represented her as accompanying her blind father, Œdipus, in his exile, until his mysterious death or disappearance at Colonus in Attica. When her brother Polynices led the Seven against Thebes, she was in the city, and after the mortal duel between Eteocles (q.v.) and Polynices, she disregarded the decree of Creon, that the latter should be left unburied. Caught in the act of burying her brother by throwing the three handfuls of dust upon his body, she was condemned to be immured in a tomb, where she hanged herself. Her betrothed, Hæmon, son of Creon, committed suicide. Antigone's filial and sisterly devotion are depicted by Sophocles (q.v.) in the *Œdipus at Colonus* and in the *Antigone*. She appears in Æschylus's *Seven Against Thebes* and in Euripides's *Phœnissæ*. She was also the subject of a lost play of Euripides, which seemingly ended with her marriage to Hæmon. 2. ANTIGONE, daughter of Eurytius, and wife of Peleus, who hanged herself upon hearing a false report of her husband's marriage to Sterope, daughter of Acastus. 3. ANTIGONE, daughter of Laomedon, and sister of Priam, who offended Hera by comparing her own beauty to that of the goddess. Hera turned her hair into snakes, which so tormented her that the gods, in compassion, changed her into a stork.

ANTIG'ONUS (Gk. Ἀντίγονος, *Antigonos*), called Cyclops, or the 'One-Eyed' (c.380-301 B.C.). One of the generals of Alexander the Great, and a member of a distinguished Macedonian family. His father's name was Philip, though whether this was Philip of Elymiotis is uncertain. When Alexander died and his Empire was divided (323 B.C.), Antigonus received the provinces of Greater Phrygia, Lycia, and Pamphylia. Being accused of disobedience by Perdiccas, who was aiming at sole control of the lands left by Alexander, he entered into an alliance with Craterus, Antipater, and Ptolemy, and made war on Perdiccas. Perdiccas soon died, but the war was prosecuted against Eumenes and the party of Perdiccas. After the death of Antipater, in 319 B.C., Antigonus began to carry out his plans for obtaining sole sovereignty of Asia. The resultant war was continued with varying success, and many alliances were made and broken. At one time during the long struggle Antigonus was supreme in Asia and assumed the name of king. He himself invaded Egypt, and his son Demetrius Polioretetes carried the war into Greece, but both were compelled to withdraw again to Asia. In 301 B.C. the forces of Antigonus and Demetrius Polioretetes were overwhelmed by Lysimachus and Seleucus at Ipsus, in Phrygia, and Antigonus was killed.

ANTIGONUS (Gk. Ἀντίγονος, *Antigonos*). A Maccabee, King of the Jews, son of Aristobolus II, and the last of the Hasmonean dynasty. In 63 he was taken prisoner by Pompey and sent to Rome; later he escaped. In 56 he was again a prisoner in Rome, but was set free by

the Senate. After the death of the great Antipater, he sought to gain the throne, and about 40 B.C., with the help of the Parthians, who were then, under Pacorus, raiding Syria, he drove Herod from Jerusalem and assumed the royal power and became high priest. Herod fled to Rome, and was proclaimed there by the Senate King of the Jews; with the aid of Octavius and Antony, he returned in 37 B.C. to regain the throne. In the meantime the Parthians had been defeated by Ventidius and driven out of Syria. Antigonus surrendered to Sossius, representative of Antonius. He was taken to Antioch and, at the request of Herod, was there put to death in the same year. See **MACCABEES**.

ANTIGONUS DO'SON (?-220 B.C.). A king of Macedonia, from 229 to 220 B.C., called Dason (Gk. Δώσων, about to give), it is said, because he was "always about to give and never did." He was the grandson of Demetrius Poliorcetes, and on the death of Demetrius II of Macedonia became guardian of the latter's son Philip. He himself, however, married the widow of Demetrius and became king. He sided with the Achæan League against the Spartans, whom, under King Cleomenes, he defeated at Sellasia in 221.

ANTIGONUS GONATAS (319-239 B.C.). A son of King Demetrius Poliorcetes of Macedonia, and grandson of the great Antigonus. On his father's death, 283 B.C., he took the title of king, but, since there were various claimants to the throne, he did not secure the full power until 276 B.C. He was twice expelled from his dominions by a hostile force from Epirus, under Pyrrhus (before 277 and in 273). Consult W. W. Tarn, *Antigonus Gonatas* (Oxford, 1913).

ANTIGONUS OF CARYS'TOS. A Greek sculptor and author. He lived at Athens and Pergamum about the middle of the third century B.C. He worked at Pergamum on the group of bronze statues intended to picture the victory of the Pergamene kings over the Gauls. See **PERGAMON**.) Beside several biographies of celebrated contemporary philosophers, of which large fragments are preserved by Athenæus and Diogenes Laertius, he wrote treatises on painting and the plastic arts. Consult Westermann's *Scriptores Rerum Mirabilium Græci* (Brunswick, 1839), and the first volume of Keller's *Rerum Naturalium Scriptores Græci Minores* (Leipzig, 1877); Ulrich von Wilamowitz-Moellendorf, "Antigonus von Karystos," in his *Philologische Untersuchungen*, iv.

ANTIGONUS OF SO'KO. A Jewish teacher who, according to Pirke Aboth, iii, the only passage in the Mishna referring to him, handed down the tradition from Simon the Just, and expressed the following sentiment: "Be not like slaves who serve their master for their daily food; be like those who serve their master without considering the reward, and let the fear of God be with you." As to the time when he lived, the teachers of Simeon ben Shetach, a contemporary of Alexander Jannæus (102-76 B.C.) are said to have derived the tradition from his disciples, so that he probably appeared early in the second century B.C. Concerning Simeon the Just little is known with certainty (compare Schmidt, *Ecclesiasticus*, 1903, pp. xxiii ff.). Soko, the modern *el Suweke*, lies southwest of Jerusalem near Bet Jibrin, the old Eleutheropolis. A Greek name for a Jew is not strange at this time and in this environment, but the sentence quoted does not necessarily indicate

the influence of Greek thought. It represents a legitimate development of the teaching of the prophets. There is no evidence that he was a member of the Pharisaic party or that this sect existed in his time. Consult Schürer, *Geschichte d. jüdischen Volkes*, 4th ed., vol. ii, p. 420.

ANTIGUA, an-tē'gā or -gwā. One of the British West Indian Islands, situated in lat. 17° 6' N. and long. 61° 45' W., forming with Barbuda and Redonda the most important of the five presidencies of the Leeward group (Map: West Indies, G 3). It covers an area of 108 square miles and had a population of 38,899 in 1911, chiefly negroes. The surface is rugged, and the coasts are highly indented and surrounded with rocks and shoals. The soil is very fertile, especially in the interior, but scarcity of water on the island necessitates the construction of reservoirs and irrigation works. The chief products are sugar, cotton, and pineapples. Commerce declined somewhat owing to the competition of countries paying a bounty on sugar, but latest figures show a new advance. Following is a table of exports and imports in pounds sterling:

Year	Exports	Imports
1898	79,178	105,103
1900	111,849	125,304
1903	110,036	136,147
1907-08	172,410	164,587
1908-09	179,106	175,587
1909-10	114,122	139,496
1910-11	196,184	170,033
1911-12	164,813	187,688

The island suffered severely from the hurricane of August, 1899. Antigua was discovered by Columbus in 1493 and was settled by the British in 1632. Slavery was abolished in 1834. It is the seat of the government of the colony, which consists of an executive council and a legislative council made up of eight official and eight unofficial members, both branches presided over by the Governor. The capital is St. John, with a population of 9262. It has a fine harbor, although English Harbor, on the south coast, is the best port. Consult V. L. Oliver, *History of Antigua* (London, 1894-99).

AN'TI-ÏMPE'RIALIST LEAGUE. An organization founded in 1898, after the conclusion of the Spanish-American War, to oppose the forcible extension of the authority of the United States over foreign peoples. Its work has been chiefly directed towards the immediate independence of the Philippine Islands. The propaganda of the league, carried on by the circulation of pamphlets and circulars, has been forcible and at times bitter. It has combated the American administration of the Philippines since their acquisition by the United States, and has criticised the methods of government with great freedom. The league has its chief membership in New England. Its work has undoubtedly done much to encourage among the Filipinos the idea of immediate independence.

AN'TI-JAC'OBIN, or **WEEK'LY EXAM'INER**, THE. An English paper published from Nov. 20, 1797, to July 9, 1798. It was founded by George Canning and his friends to express their opposition to the principles of the French Revolution. Its editor was William Gifford, who had already made a reputation as a political satirist. Among its contributors, besides Canning, were J. H. Frere and George Ellis.

ANTI-JACOBIN REVIEW', THE. An English periodical founded by John Gifford in 1798 after the discontinuance of the foregoing, i.e., *Anti-Jacobin, or Weekly Examiner*, with which, however, it had nothing to do. Its full title was *The Anti-Jacobin Review and Magazine, or Monthly Political and Literary Censor*. It ceased to appear in 1821.

ANTI-KOKA'NIA. A fossil genus that includes the earliest representatives of life found anywhere up to the present time. The fossils were uncovered by A. C. Lawson in the vicinity of Steeprock Lake, west of Port Arthur, Canada, in strata of supposedly Lower Huronian age, and were described by Walcott in 1912, who placed them in this new genus. They are very primitive forms, built up of a number of tubes which in some instances are of hexagonal cross-section, and having a globose, radiating, or pear-shaped outline. They appear to be ancestral to the sponges, but also show relationship with the corals.

AN'TILEGOM'ENA (Gk. spoken against, from *ἀντί*, *anti*, against + *λέγειν*, *legein*, to speak). A term applied by Eusebius in his *Ecclesiastical History*, iii, 25, to certain New Testament books which were not, in his day, *homologoumena* (*ὁμολογούμενα*), i.e., everywhere acknowledged as authentic and authoritative. There were seven such books, viz., James, 2 Peter, Jude, 2 and 3 John, Hebrews, and the Revelation of John.

AN'TI-LIB'ANUS, or AN'TI-LEB'ANON (Gk. *Ἀντιλίβανος*, *Antilibanos*, Counter Lebanon). A mountain ridge in Palestine and Syria, about 90 miles long, separated from the Lebanon range on the west by the valley of Cœle-Syria (Map: Turkey in Asia, G 5). It is generally inferior to the Lebanon, its highest peak, Mount Hermon, on the southeast, being only a little over 9000 feet in height. This mountain is covered with perpetual snow and gives rise to the river Jordan. The Anti-Libanus is composed of Cretaceous strata and is almost devoid of cedars. Besides Mount Hermon the highest peaks are Tala-at-Musa (8721 feet), Halimat-Kabu (8257 feet), and Abul-Hin (8330 feet).

ANTILLES, *Eng.* *ān-til'lēz*; *Fr.* *ān'tēl'*. A name applied to the West India Islands exclusive of the Bahamas. (See map.) The total area is about 90,000 square miles. The Antilles are generally divided into the Greater and Lesser Antilles. The former comprise the four largest islands, Cuba, Jamaica, Haiti, and Porto Rico, and a few small islands near their coasts. The Lesser Antilles are composed of a chain of small islands which, starting with St. Thomas, extends in the form of a crescent, and includes the Leeward and Windward groups, and all the small islands along the northern coast of Venezuela. Some authorities exclude the Virgin Islands from the Leeward group, thereby making four divisions instead of three. For detailed information, see articles on the groups and separate islands; also article on WEST INDIES.

AN'TILOCA'PRA AMERICANA (*Antelope* + Lat. *capra*, a she-goat). The type genus of the North American ruminant family Antilocapridæ, represented by the pronghorn, characterized by the absence of lateral hoofs, and especially by the fact that the horns, compressed at the base, are branched and deciduous. See PRONGHORN. See Colored Plate of ANTELOPES.

ANTIL'OCHUS (Gk. *Ἀντίλοχος*). Son of Nestor, who died young.

AN'TILOG'ARITHM. See LOGARITHM.

ANTI-MACHIAVEL, *ān'tī-māk'ī-ā-vēl.* A treatise written by Frederick the Great before he came to the throne; published by Voltaire in 1740. It is a reply to Machiavelli's *Prince* and sets forth the obligations of rulers.

ANTIMACHUS, *ān-tīm'ā-kūs* (Gk. *Ἀντίμαχος*, *Antimachos*). A Greek poet and critic of Colophon, who lived about 410 B.C. He was a contemporary of Plato and a forerunner of the poets of the Alexandrine school. His works were more remarkable for learning than for genius. His chief productions were *Lyde*, a cycle of elegies, dealing with his lost love Lyde, which was imitated by Hermesianax, of Colophon, in his *Leontion*; an epic poem, *Thebais*, which the Alexandrine critics thought worthy to be compared with Homer's *Iliad*, but of which now only scanty fragments remain; and a recension of the text of the Homeric poems, from which readings are given in the Homeric Scholia. He was held in high esteem and exercised a great influence on later poets. In the few extant fragments of his works his style, though learned, is rigid and artificial. Consult Kinkel's edition of the *Thebais*, in the *Epicorum Græcorum Fragmenta*, vol. i (Leipzig, 1877), and Bergk's edition of *Lyde*, in *Poetæ Lyrici Græci* (4th ed., Leipzig, 1882).

AN'TI-MA'NSONS. The name of a political party in New York and other states, organized in 1827-28, chiefly as the result of excitement over the fate of William Morgan, of Batavia, N. Y., who was said to be about to publish, or betray, the secrets of the Masonic order, of which he was a member. He disappeared suddenly in 1826, and his fate has never been satisfactorily determined. The opponents of Freemasonry declared that he had been murdered and his body sunk in the river or lake at Niagara. Legal inquiries followed, but proved nothing. At or about that time the Governor of the State was a Mason of the most advanced degrees, and probably a majority of all public officers were members of the order. Widespread excitement pervaded western New York, and the Anti-Masonic party was formed, casting in that State alone 33,000 votes in 1828, about 70,000 in 1829, and 120,000 in 1830, though many in the latter year were anti-Jackson men, without reference to Masonry. The party attempted to organize on national lines in 1830, and especially in connection with its National Convention of 1831; and in 1832 it supported William Wirt for President, but carried only one State, Vermont. The party was also able, through the disorganization of the Democrats, to control temporarily Pennsylvania, and it was strong in Ohio and Massachusetts; but after 1835 it disappeared as rapidly as it had arisen. Many who were conspicuous later in the two chief parties, such as Thurlow Weed, Seward, and Millard Fillmore, first entered politics in the ranks of the Anti-Masons. Upon the coalescence of each of the dominant parties, the life of a third national party became an impossibility, especially upon the subsidence of the excitement out of which it had arisen. That the opposition to Masonry simply served as an issue around which centred several discontented elements is shown by the fact that William Wirt was a Mason and defended the order before the convention which nominated him. Consult: Hammond, *Political History of New York State* (Cooperstown, 1846); Alexander, *Political History of the State of New York* (2 vols., New

York, 1906): McCarthy, "The Antimasonic Party," in the *Report of the American Historical Association for 1902* (Washington, 1903).

ANTIMONAN, ä'n'tê-mô-nän'. A seaport town of Luzon, Philippine Islands, in the province of Tayabas (Map: Luzon, J 11). It is situated on the eastern coast, 19 miles east of Tayabat, opposite Alabat Island, on which there are veins of excellent coral. Pop., 1903, 11,203.

AN'TIMO'NIAL WINE. See TARTAR EMETIC.

AN'TI-MONOP'OLY PAR'TY, THE. A political party organized at Chicago on May 14, 1884, when it nominated Benjamin F. Butler, of Massachusetts, for the presidency, on a platform which demanded an Inter-State Commerce law, a direct vote for United States Senators, a graduated income tax, the establishment of labor unions, the repeal of all tariffs, and the prohibition of grants of land to corporations. In the ensuing election the party united with the Greenback Labor party, the combined vote reaching 130,000 in the election of 1884.

AN'TIMONY (LL. *antimonium*, of disputed origin). One of the well-known metallic elements. It was known to the ancients, but first isolated in 1450. It occurs native in small quantities, occasionally with silver, iron, or arsenic. The chief commercial source is stibnite (gray antimony ore), containing 71.77 per cent of antimony and 28.23 per cent of sulphur, which is found in France, Spain, Germany, Italy, Austria, New South Wales, and Japan. The commercial production of stibnite ceased in the United States in 1907 owing to the low price of metal. The chief source of antimony in the United States, however, is a by-product obtained in smelting antimonial lead-ores, which yields a 'hard' or antimonial lead containing upward of 25 per cent of antimony. The production during 1911 consisted of 1543 tons from domestic and 711 tons from foreign antimonial lead ores. From alloys, scrap metal, and dross the production amounted to 2369 tons. The imports into the United States of type metal during the same period amounted to 4195 tons and contained 17.3 per cent of antimony. The metal is obtained from the ore in two ways: 1. Roasting the sulphide to form volatile oxide which is collected and subsequently reduced in furnaces or crucibles with carbon under a cover of fusible slag in order to prevent the oxidation of the molten reduced metal. 2. Precipitating molten antimony sulphide in a crucible by metallic iron and salt or sodium sulphate forming metallic antimony and a fusible iron-sodium sulphide; the product after refining contains between 98 and 99 per cent of antimony.

Antimony (symbol Sb., at. wgt. 120.43) is a brittle, hard, silver-white metal, easily crystallized, has a specific gravity of from 6.6 to 6.8, melts between 440° and 450° C., boils between 1090° and 1450° C. The chief commercial use of antimony is as a constituent of alloys. With acids antimony forms two classes of salts—antimonious and antimonic—in which the element is trivalent and quinquivalent respectively. The more important compounds of antimony are: the trisulphide, used in medicine and as a brilliant red pigment in oil painting, also in the manufacture of safety matches, percussion caps, fireworks, and yellow pigments; the pentasulphide, a red pigment used for coloring and vulcanizing rubber, or the trichloride, "butter of antimony," used as a bronzing solu-

tion for gun-barrels; the trioxide, used in the preparation of tartar emetic, and as a mordant.

ANTIN, MARY. See GRABAU, MARY ANTIN.

AN'TINO'MIANISM (Gk. *ἀντί*, *anti*, against + *νόμος*, *nomos*, law). The doctrine or opinion that Christians are freed from obligation to keep the law of God. It is generally regarded by the advocates of the doctrine of justification by faith as a monstrous abuse and perversion of that doctrine, upon which it usually professes to be based. From several passages of the New Testament, as Rom. vi. and 2 Peter ii. 18, 19, it would seem that a tendency to antinomianism had manifested itself even in the apostolic age; and many of the Gnostic sects were really antinomian, as were probably also some of the heretical sects of the Middle Ages; but the term was first used at the time of the Reformation, when it was applied by Luther to the opinions advocated by Johann Agricola (q.v.). Agricola had adopted the principles of the Reformation; but in 1527 he found fault with Melancthon for recommending the use of the law, and particularly of the Ten Commandments, in order to produce conviction and repentance, which he deemed inconsistent with the Gospel. Ten years after, he maintained, in a disputation at Wittenberg, that as men are justified simply by the Gospel, the law is in no way necessary for justification nor for sanctification. The "Antinomian Controversy" of this time, in which Luther took a very active part, terminated in 1540 in a retractation by Agricola; but views more extreme than his were afterward advocated by some of the English sectaries of the period of the Commonwealth; and, without being formally professed by a distinct sect, antinomianism has been from time to time reproduced with various modifications. It ought, however, to be borne in mind that the term "antinomianism" has no reference to the conduct, but only to the opinions of men; so that men who practically disregard and violate the known law of God are not therefore antinomians; and it is certain enough that men really holding opinions more or less antinomian have in many cases been men of moral life. It is also to be observed that the term "antinomianism" has been applied to opinions differing very much from each other. In its most extreme sense it denotes the rejection of the moral law as no longer binding upon Christians, and a power or privilege is asserted for the saints to do what they please without prejudice to their sanctity, it being maintained that to them nothing is sinful; and this is represented as the perfection of Christian liberty. But besides this extreme antinomianism, than which nothing can be more repugnant to Christianity, there is also sometimes designated by this term the opinion of those who refuse to see in the Bible any positive laws binding upon Christians, and regard them as left to the guidance of Gospel principles and the constraint of Christian love; an opinion which, whatever may be thought of its tendency, is certainly not to be deemed of the same character with the other. Probably this kind of antinomianism usually originates in mistaken notions of Christian liberty, or in confusion of views as to the relation between the moral law and the Jewish law of ceremonial ordinances.

ANTIN'OMY (Gk. *ἀντινομία*, *antinomia*, opposition of laws; from *ἀντί*, *anti*, against + *νόμος*, *nomos*, law). A word used by Kant to mark the "conflict between two propositions, each of which

seems to be true, but neither of which has any more claim to our assent than the other." Kant uses the term "antithetic" in the same sense. Such a conflict arises when our reason "ventures to go beyond the limits of our experience." There are four of these antinomies; the first two being called mathematical, the last two dynamic. In each case the positive assertion is called the thesis, its negation is called the antithesis. Briefly, his theses are: The world (1) is limited in space and time, (2) consists of parts that are simple, (3) admits of causality through freedom, (4) implies the existence of an absolutely necessary being. Over against these stand the antitheses: The world (1) is without limits in space or time, (2) consists of parts always composite, (3) admits of no causality but that of natural law, (4) implies the existence of no absolutely necessary being. Kant overcomes these antinomies by showing that the contradiction is not real if critically considered with due discrimination between noumena and phenomena. See CATEGORY; KANT.

ANTINORI, ăn'tê-nô'rê, MARQUESE ORAZIO (1811-82). An Italian zoölogist and African explorer, born at Perugia. He went to Egypt in 1859 and with Carlo Poggia explored the Upper Nile country. In the *Bulletin* of the Italian Geographical Society, of which he became one of the founders in 1867, he gives an interesting account of his travels through Nubia. He made a tour through Bogoland, north of Abyssinia, after the opening of the Suez Canal, and in 1875 went to Tunis to investigate the practicability of Roudaire's plan for flooding a portion of the Sahara Desert in order to establish communication with the Mediterranean. He headed an important expedition to Shoa in 1876 and gave the first definite information concerning the zoology of that country.

ANTINOÛS, ăn-tin'ô-ŭs (Gk. Ἀντίνοος, *Antinoos*). A beautiful youth of Claudiopolis, in Bithynia. He was page to the Emperor Hadrian, and the object of his extravagant affection, accompanying him in all his travels. He was either drowned accidentally in the river Nile, or, as some suppose, committed suicide from a loathing of the life he led, in 122 A.D. His memory and the grief of the Emperor were perpetuated by many beautiful statues and bas-reliefs, of which several have been found in the villa of Hadrian near Tivoli (Tibur). There is a colossal bust of him now in the Vatican, a statue in the Capitoline Museum, a bust in the Louvre, etc., and his head appears on many medals. In the attempt of sculptors to produce idealized representations of Antinoüs art received a great stimulus; these attempts resulted in "the triumph of original thought over eclecticism of form." Though the elements in these portrayals are all Greek, "the whole remains one of the most powerful presentments invented by the sculptor's genius." Consult Mrs. Arthur Strong, *Roman Sculpture*, 249 ff. (London, 1907). "In all the figures of Antinoüs," says Winckelmann, "the face has a rather melancholy expression; the eyes are large, with fine outlines; the profile is gently sloped downward; and the mouth and chin are especially beautiful." The city of Besa, in the Thebaïs, near which Antinoüs was drowned, was also rebuilt by Hadrian, and the name of Antinoöpolis conferred upon it, in memory of his favorite. Important festivals in his honor were held at Athens and at Eleusis. Antinoüs was further enrolled among the gods,

and temples were erected to him in Egypt and Greece. Antinoüs is a character in two historical romances, *Antinoüs*, by Taylor, translated from the German by Safford (New York, 1882), and *The Emperor (Der Kaiser)*, by Ebers (Stuttgart, 1880), done into English by Clara Bell.

AN'TIOCH (Gk. Ἀντιόχεια, *Antiocheia*; Lat. *Antiochēa*, or *Antiochia*). The ancient capital of the Hellenistic kings of Syria, on the Orontes, and the most magnificent of the 16 cities of that name built by Seleucus Nicator, and named for his father, Antiochus. Its site was admirably chosen. The river Orontes, issuing from the mountains of Lebanon, flows north as far as the thirty-sixth parallel of latitude and then southwest into the Mediterranean. On the left bank of the river, and at a distance of 20 miles from the sea, lay the famous city, in the midst of a fertile and beautiful plain, 10 miles long by 5 broad. By its harbor, Seleucia, it had communication with all the maritime cities of the West, while it became, on the other hand, an emporium for the merchandise of the East. Behind it lay the vast Syrian desert, across which traveled the caravans from Mesopotamia and Arabia. On the north, the plain of Antioch is bounded by the mountain chain of Ananus, connected with the southeastern extremity of Mount Taurus; and on the south, which is more rocky, by the broken declivities of Mount Casius, from which the ancient town was distant less than two miles. On this fair site, Greek colonies had been planted long before the time of Seleucus Nicator. In early times, a part of the city stood upon an island, which has now disappeared. The rest was built partly on the plain and partly on the rugged ascent toward Mount Casius. The slopes above the city were covered with vineyards, while the banks of the river displayed, as they do even at the present day, a gorgeous profusion of eastern fruit trees. The ancients called the city "Antioch the Great," "Antioch the Beautiful," and the "Crown of the East"; next to Rome and Alexandria it was the greatest city of the Roman Empire. It was a favorite residence of the Seleucid princes and of wealthy Romans and was famed throughout the world for its luxury. It received from Strabo the name of Tetrapolis, because four sites were successively built, each surrounded with a wall. Rebuilt by Seleucus Nicator about 300 B.C. to celebrate his victory at Ipsus, it received its first addition from him; its second from Seleucus Callinicus (246-226 B.C.); and its third from Antiochus Epiphanes (175-164 B.C.). From the first many Jews dwelt in the town, enjoying, by grant of Seleucus Nicator, equal rights with the Greeks. Its public edifices were magnificent. The principal were the palace, the senate house, the temple of Jupiter, burnished with gold, the theatre, amphitheatre, and Cæsarium. It had an aqueduct, a public promenade, and innumerable baths. Under the Romans it was the residence of the Governor of Syria, and the eastern headquarters of Cæsar, Agrippa, Augustus, Herod, Tiberius, and Antoninus Pius. After the founding of Constantinople it ceased to be the first city of the East, but it rose to new dignity as a Christian city, for Antioch was in fact the mother church of Gentile Christianity, the place where the Christians first received that name, the home of the first ministry of Paul, the spot from which he set out on his missionary journeys through Asia Minor and Greece, and

the scene of the first conflict between Jewish and Gentile Christianity, the result of which was the Apostolic Council in Jerusalem about 51 A.D. Ten Church councils were held at Antioch between 252 and 380. Churches sprang up, exhibiting a new style of architecture, which soon became prevalent; and even Constantine himself spent a considerable time here, adorning the town and strengthening its harbor, Seleucia.

The Antiochians themselves, however, brought about the ruin of their beautiful city. They were famous, above all other people in ancient times, for their biting and scurrilous wit and for their ingenuity in devising nicknames. When the Persians, under Chosroës, invaded Syria in 538 A.D., the inhabitants could not refrain from jesting at them. The Persians took ample revenge by the total destruction of the city, which, however, was rebuilt by Justinian. The next important event in its history was its conquest by the Saracens in the seventh century. In the ninth century it was recovered by the Greeks under Nicephorus Phocas, but in 1084 it again fell into the hands of the Mohammedans. The Crusaders besieged and took it in 1098, and it was held by the Christians until 1268. (See ANTIOCH, PRINCIPALITY OF.) Since then Antioch has undergone many vicissitudes. Its population at the height of its grandeur is estimated to have been 400,000. Probably no other great city in the world has suffered so frightfully from earthquakes as Antioch. It was destroyed by one in 526 A.D. A destructive visitation occurred in 1872.

The modern town of Antakiyeh, in the vilayet of Aleppo, is situated on the site of the ancient Antioch (Map: Turkey in Asia, G 4). It is poorly built, and presents a striking contrast to the magnificent walls of the old city, which are still partly preserved. It takes up only a small portion of the ancient city, the remainder being covered with olive trees and date palms. The inhabitants carry on some trade in olives, silk, and grain. The population is estimated at 30,000, of whom about half are Mohammedans, excluding some 8000 Ansariyeh; Orthodox Greeks number about 4000, and there are other Christians and Jews. Antakiyeh is an important American mission station. Consult: K. O. Müller, *Antiquitates Antiochenæ* (Göttingen, 1839); Ritter, *Erdkunde*, vol. xvii, pp. 1147-1210; *Cambridge Medieval History* (New York, 1911). The city figures largely also in Lew Wallace's novel, "Ben Hur" (New York, 1880).

ANTIOCH, PRINCIPALITY OF. A principality founded by the Norman crusader Bohemund (q.v.) in 1098. For about 30 years it was the most important and wealthy portion of the Christian possessions in Syria. Gradually it declined in political importance; but the city remained a stronghold of Christendom in the East until 1268, when it was captured by Bibars, Sultan of Egypt and Syria. Consult Rey, "Résumé chronologique de l'histoire des princes d'Antioche," in the *Revue de l'Orient Latin*, vol. iv (Paris, 1896).

ANTIOCH COLLEGE. An unsectarian co-educational college at Yellow Springs, Ohio. It opened in 1853, with Horace Mann as its first president. It claims to have been the first college in the world to admit both sexes of all races to equal privileges. Endowment, 1913, over \$100,000; value of buildings and grounds, \$150,000; library, 12,000 volumes; faculty, 20; attendance, 230. President, A. D. Fess, LL.D.

ANTIOCHIAN, ăn'tī-ō'kī-an, **SCHOOL.** The rival of the Alexandrian school. It held to the grammatical interpretation of Scripture, instead of to the allegorical or mystical. It dates from the martyr Lucian (died 311) and in its later form from Diodones of Tarsus (died 394). Its chief representatives are Chrysostom and Theodore of Mopsuestia. In theology, while in the main orthodox according to the Nicene type, it leaned toward asserting rather the conjunction than union of the two natures in Christ.

ANTIOCHUS, ăn-tī'ō-kūs (Gk. Ἀντίοχος, *Antiochos*). A common Greek name, borne by 13 kings of Syria, four kings of Commagene (a small country between the Euphrates and Mount Taurus), and many other persons of note. See the following articles.

ANTIOCHUS I SOTER (Gk. Ἀντίοχος Σωτήρ, *Antiochos Sōtēr*, savior, deliverer). King of Syria, 281-261 B.C. The son of Seleucus I Nicator and Apama of Sogdiana. He was born in 324 B.C., fought at Ipsus in 301 against Antigonus and Demetrius Poliorcetes; was associated with his father as ruler from 293, and became his successor after the murder of Seleucus by Ptolemy Ceraunus in 281. Stratonice, his father's wife, became his own consort, Seleucus giving her to him in view of their mutual affection. She was still living in 268. In addition to her he seems to have had for wife also a sister by the same name, daughter of Seleucus and Stratonice. In 275 he gained a decisive victory over the Gauls, who had invaded Asia Minor. But Appian is wrong in maintaining that he was given the surname Soter on this occasion. This seems to have been done only after his death. A cuneiform inscription of the year 269 enumerates all his titles, but does not give this one. On March 21, 268, he laid the foundations of the new Nabu temple at Borsippa. At the instigation of Magas of Cyrene, Antiochus declared war against Ptolemy II Philadelphus. He found an ally in Antigonus Gonatas, King of Macedonia and Greece, but the war led to no decisive issue. He maintained with difficulty the integrity of the great empire his father had left him. Antioch, with its suburb Daphnæ, Seleucia with Ctesiphon, and Sardis were the three capitals of the kingdom. In the last years of his reign he endeavored in vain to prevent Eumenes of Pergamos from maintaining his independence. Antiochus fell upon the battle-field, slain, it is said, by a Gaul, though this statement may be due to a confusion with the end of Antiochus Hierax (q.v.). Consult: Norris, *Annus et epochæ Syromacedonum* (1689); Vaillant, *Seleucidarum imperium* (1732); Frölich, *Annales regum et rerum Syriæ* (1754); Thirlwall, *History of Greece* (1835-44); Droysen, *Geschichte des Hellenismus* (1836, 1877; Eng. trans., 1883-85); Th. Reinach, *Trois royaumes d'Asie Mineure* (1888); Babelon, *Les rois de Syrie* (1890); Wilcken, in Pauly Wissowa, *Realencyklopädie* (1899); Bevan, *The House of Seleucus* (1902); Niese, *Geschichte der makedonischen Staaten* (1893-1903); Bouché-Leclercq, *Histoire des Seleucides* (1913).

ANTIOCHUS II THE'OS (Gk. θεός, god). King of Syria, 261-246 B.C. Son of Antiochus I Soter and Stratonice; succeeded his father. His eight years' war with Ptolemy II Philadelphus cost him many provinces and cities in Phœnicia and Asia Minor. Only the expulsion of the tyrant Timarchus from Miletus in 250 B.C. can

be counted as a real success. He is said to have received the title "Theos" from the grateful Milesians; but this is doubtful. Theodotus seems to have established an independent kingdom in Bactria in 250 B.C., and the Parthian chief Arsaces, or his successor, Arsaces II Tiridates, took possession of Parthia and made himself practically independent in 247 B.C. Probably as early as 250 B.C. a reconciliation was effected between Antiochus and Ptolemy. The agreement was that the former should divorce his wife, Laodice, and marry the latter's daughter, Berenice. Upon the death of Ptolemy II in 247 B.C., Antiochus abandoned Berenice and her child, and went to Ephesus, where he took back Laodice and her sons. She, however, seems to have avenged herself by poisoning him in 246 B.C. Laodice then proclaimed her oldest son, Seleucus, king; and her servants by false promises lured Berenice and her son from Daphnæ, where they were strongly intrenched, and slew them both. Laodice's younger son was Antiochus Hierax. Consult: Niese, *Geschichte der makedonischen Staaten* (1893-1903); Reinach, *Trois royaumes d'Asie Mineure* (1888); Bevan, *The House of Seleucus* (1902); Bouché-Leclercq, *Histoire des Selcucides* (1913).

ANTIOCHUS III THE GREAT. King of Syria, 223-187 B.C. Son of Seleucus II Callinicus (246-226) and Laodice, a sister of Andromachus, ascended the throne at the age of 15, after the murder of his brother, Seleucus III Ceraunus (226-223). His first expedition was against Ptolemy IV Philopator (221-204), who had taken possession of Cœle-Syria and Phœnicia. But the revolts of Molon, Governor of Media, and his brother, Alexander, Governor of Persia, forced him to lead an army against them. He succeeded in defeating them, and also in subduing Artabazanes, King of Atropatene, 220 B.C. While he was occupied in these parts, however, Achæus, Governor of Asia Minor, assumed the royal diadem. Antiochus returned to Syria, suffered a severe defeat at the hands of Ptolemy IV at Raphia, 217 B.C., but still possessed sufficient strength to attack Achæus. After two years' siege Sardis was captured in 214 B.C., and this dangerous revolt was at an end. Soon after Antiochus marched against Xerxes of Armenia, besieged Arsamosata and received a tribute of 300 talents (212 B.C.). He then continued his march into Susiana and Media (210-209), and took 4000 talents of gold and silver from the temple of Anaitis in Ecbatana. Arsaces III Artabanus was defeated, and the Parthian capital Hecatompylus captured. Finally, Arsaces III sued for peace and promised tribute, 209 B.C. In 208 Antiochus made an attack upon Euthydemus of Bactria, and in 206 this King indicated his willingness to recognize the suzerainty of Syria. He furnished elephants and provisions for the expedition against Sophagasenus of Kophen (Kabul). From here Antiochus returned through Arachosia, Drangiana, Carmania, and Babylonia to Syria in 204 B.C. He now united with Philip of Macedonia against Ptolemy V Epiphanes. The battle of Paneas, in 198 B.C., in which Antiochus defeated the Egyptian general, Scopas, determined the fate of Palestine. But the Romans were not willing to allow further encroachments. In 196 B.C. they ordered him to return all places taken from Egypt and deprived him of the Thracian Chersonese that had been given to Seleucus by Lysimachus. Against the

counsels of Hannibal, who urged him to attack Italy itself, Antiochus went with his army to Greece, where he was defeated at Thermopylæ, 191 B.C. Still more crushing was his defeat at Magnesia in 190 B.C. In the treaty of 188 B.C. he was forced to abandon Asia Minor beyond the Taurus, to pay 15,000 talents, and to give hostages, among them his son. To raise the money he pillaged a temple of Bel in Elymais and was probably murdered by the outraged people in 187 B.C.

In addition to the works of Thirlwall, Reinaeh, Niese, Wilken, Bevan, and Bouché-Leclercq, quoted under Antiochus I, consult Flathe, *Geschichte Macedonias* (1834); Heyden, *Beiträge zur Geschichte Antiochos des grossen* (1873); Stark, *Gaza und die philistäische Küste* (1848); Gutschmid, *Geschichte Irans* (1888); Holm, *Griechische Geschichte*, iv (1891); Eng. trans., 1901).

ANTIOCHUS IV EPIPHANES (Gk. Ἐπιφανής, *Epiphanēs*, manifest or, more fully, Θεὸς Ἐπιφανής, *Theos Epiphanēs*, manifest god). King of Syria, 175-164 B.C. Son of Antiochus III, succeeded his brother, Seleucus IV Philopator (187-175). In 189 he had been sent to Rome as hostage, and he had been educated there; in 176 Seleucus had sent his own son Demetrius to take his place. Antiochus was on his way home, when the news reached him that his brother had been murdered by Heliodorus. He took possession of the throne that by right of succession belonged to Demetrius. Suspicious of the young son of Seleucus, he seems to have used Andronicus to remove him, after which Andronicus himself was executed. In 173 Cleopatra died, and hostilities with Egypt began. His first Egyptian campaign, however, did not occur before 169, as Niese and Wellhausen have recognized. He captured Pelusium, entered Egypt, and led Ptolemy VII Philometor as king into Memphis, sought in vain to storm Alexandria, but defeated Ptolemy IX Physcon in a naval battle before he was obliged by troubles in Syria to return. In Judæa Onias III had been removed from the high-priesthood, and his brother, Jason, who was a mere tool of the ambitious family of the Tobiadæ, put into his place in 173. Immediately before the Egyptian expedition the Tobiad Menelaüs secured from Antiochus the high-priestly office. When a rumor spread in Jerusalem that Antiochus had perished, Jason returned, but his brother, Onias III, was preferred by the people. Jason fell, and Onias was made high priest. Menelaüs and other Tobiadæ fled to Antioch. On his way back Antiochus went to Jerusalem to reinstate Menelaüs. Onias III fled to Egypt, where he was granted the privilege of building a temple at Leontopolis by Ptolemy VII Philometor. (See ONIAS'S TEMPLE.) Antiochus entered the temple in Jerusalem and took many of its treasures, among them the golden altar, the candelabra, and the table of incense. He does not seem to have shed any blood. In 168 he undertook his second campaign against Egypt, where Philometor and Physcon were now united against him. His progress was checked by the Roman legate, Popilius Lænas, who demanded immediate obedience to the demands of the Senate. Returning to Syria, he found many of the Jews imbittered by the indignities heaped upon them, rebellious against the illegitimate high priest, and scarcely concealing their joy over his humiliation. He therefore ordered the

walls to be razed, fortified the Acra, put in a strong garrison, destroyed in part the temple, erected on the top of the old altar a new one to Zeus Olympius (*Shikkuz Shamen*, 'abomination of desolation'; for *Baal Shamem*, 'lord of heaven,' Dan. xi. 31), abolished the sacred seasons, forbade circumcision, and burned sacred books, 168 B.C. This course of action may, in part, have been due to a genuine zeal for the god of Hellas, for whom he must have longed during his Roman days, and on whose sanctuaries at Athens, Olympia, and elsewhere he later lavished his gifts. On the other hand, reasons of state may have led him to build a temple to Jupiter Capitolinus in Antioch. That he should have forsaken the gods of his fathers to worship this strange "god of fortresses," seemed to the author of Daniel a particular sign of his wickedness (xi. 38). His stringent measures for the Hellenization of Judæa caused the Maccabæan revolt. Mattathias began the rebellion. After his death in 166, his son, Judas, defeated Apollonius, Seron, Gorgias, and finally Lysias himself; took possession of Jerusalem, except the Acra, and restored and rededicated the temple in December, 165 B.C. Meanwhile Antiochus had gone with an army, first against Armenia and Sophene, 166 B.C., then against Messene on the Persian Gulf, 165 B.C., and finally into Susiana, gaining many victories everywhere. He attempted to plunder the temple of Nanæa in Elymais, but the people defended successfully their sanctuary, and he was forced to retire to Babylon. In Persis he received the sad news from Judæa, and died in Tabæ, 164 B.C., from an illness.

Consult the histories of Greece by Thirlwall and Holm; the histories of the Seleucidæ by Vaillant, Frölich, Babelon, Bevan, Niese, and Bouché-Leclercq; the article on Antiochus IV, by Wilcken in Pauly-Wissowa, *Realencyklopädie*, and Sharpe, *History of Egypt* (1862); Gutschmid, *Geschichte Irans* (1888); Schürer, *Geschichte des jüdischen Volkes*, vol. i, p. 166 (4th ed., 1901); Wellhausen, *Israelitische und jüdische Geschichte* (6th ed., 1907); Droysen, *Kleine Schriften II*, p. 405 (1894) Hofmann, *De bellis ab Antiocho Epiphane adversus Ptolemacos gestis* (1899); Kaerst, *Geschichte des hellenistischen Zeitalters*, vol. ii (1909); Büchler, *Die Tobiaden und die Oniaden* (1899).

ANTIOCHUS V EUPATOR (Gk. Εὐπάτωρ, *Eupator*, born of a noble father). King of Syria, 164–162 B.C., son of Antiochus IV. He was only nine years old when his father died. Lysias became his guardian and regent of the Empire. Accompanied by the young King, Lysias marched against Judæa to quell the Maccabæan revolt. At Beth Zechariah Judas was defeated, Bethzur was taken, and the temple mountain was besieged. The Jews were obliged to negotiate for peace. They had to recognize the Seleucid authority, raze the fortifications of the temple, and accept the garrison in the Acra, but on the other hand were allowed religious freedom. During the absence of Lysias in Judæa a certain Philip, who had been with Antiochus IV Epiphanes when he died and was said to have received from him the diadem and seal that betokened supreme authority; took possession of Antioch. Lysias was quite able to cope with Philip, but the Romans sent an embassy demanding the destruction of the elephants in the army and the ships, and to this Lysias was obliged to agree

in order to maintain his power. He was overthrown, and Antiochus was killed by the soldiers, when Demetrius, son of Seleucus IV, who had escaped from Rome, seated himself upon the throne in 162 B.C. Consult especially Bevan, *The House of Seleucus* (1902); Wellhausen, *Israelitische und jüdische Geschichte* (1907); and Bouché-Leclercq, *Histoire des Seleucides* (1913).

ANTIOCHUS VI THE'OS EPIPHANES DIONYSUS. King of Syria, 145–142 B.C. Son of Alexander Balas and Cleopatra, was proclaimed King while still a minor, living at the court of Imalcue, or Yamliku, King of Chalcis, by Diodotus, called Tryphon, one of Alexander's generals. Tryphon was supported by Jonathan in his struggle against Demetrius, but became apprehensive of the growing power of the Jewish high priest. He took possession of his person and 1000 of his followers. These he massacred, and demanded a ransom for Jonathan, but finally put him to death in Baskama, 143 B.C. In 142 Antiochus, who was a mere child, died, as it was said, from an operation and Tryphon ascended the throne. The Romans inscribed the name of Antiochus as donor upon the golden statue of victory which Tryphon sent as a bribe. Consult Bevan, *The House of Seleucus* (1902); Wellhausen, *Israelitische und jüdische Geschichte* (1907); Bouché-Leclercq, *Histoire des Seleucides* (1913).

ANTIOCHUS VII SIDE'TES (Gk. Σιδῆτης, *Sidētēs*, native of Side). King of Syria, 137–128 B.C. Son of Demetrius I, born at Side in Pamphylia. He resided in Rhodes when he learned that Demetrius II Nicator had been taken prisoner by the Parthians. He went to Antioch and was recognized as King. One of his first acts was to write to Simon, the Jewish high priest, confirming him in his position and granting him the right of coining money. Having overthrown Diodotus, however, he demanded of Simon Joppa, Gazara, and the citadel of Jerusalem. This Simon refused to give, and when Antiochus sent his general, Cendebæus, against him, Simon's sons, Judas and John Hyrcanus, gained a victory, 137 B.C. In 131 B.C. Antiochus marched against Jerusalem, having devastated Judæa, captured the city after a long siege, and imposed very severe conditions upon the country. John Hyrcanus was forced to pay a tribute of 500 talents, to give hostages, and to send troops for the Parthian war. Having restored order in Syria, Antiochus attacked Phraates 130 B.C., defeated him in three battles, and secured the freedom of his brother. But his demands were so exorbitant that the negotiations led to no treaty of peace, and a reversal of fortunes caused Antiochus to lose all that he had gained. Not to fall into the hands of his enemies, he hurled himself from a rock near Ecbatana in Media 128 B.C. Consult: Niese, *Geschichte der Makedonischen Staaten*, vol. iii (1903); Schürer, *Geschichte des jüdischen Volkes*, vol. i (4th ed., 1901); Wellhausen, *Israelitische und jüdische Geschichte* (6th ed., 1907); Bevan, *The House of Seleucus* (1902); Bouché-Leclercq, *Histoire des Seleucides* (1913).

ANTIOCHUS VIII GRY'PUS (Gk. γρυπός, *grypos*, hook-nosed). King of Syria, 125–113 and 111–96 B.C. Son of Demetrius II Nicator and Cleopatra; succeeded his father in 125. He continued the struggle that Demetrius had had with Alexander, called Zabina, 'the purchased one,' and finally vanquished him in 121. Cleo-

patra, who found him too independent, wished to get rid of him, but he forced her to drink the poisoned cup she had prepared for him. For eight years he reigned peacefully, until in 113 Antiochus IX Cyzicenus aroused his suspicions. This son of Sidetes had just married Cleopatra, daughter of Ptolemy IX Physcon. With the aid of the Egyptian King he raised an army and captured Antioch. Antiochus Grypus recaptured the city, and his wife, Tryphæna, put her sister Cleopatra to death in a cruel manner. Soon after Cyzicenus defeated Grypus and avenged his wife on Tryphæna. A reconciliation was effected between the two brothers in 111, and they continued to reign over different parts of northern Syria. Antiochus VIII was slain by Heracleon in 96 B.C. Consult: Kuhn, *Beiträge zur Geschichte der Seleukiden vom Tode Antiochus*, vol. vii (1871); Wilcken, in *Hermes*, vol. xxix, and Pauly-Wissowa, *Realencyklopädie*; Schürer, *Geschichte des jüdischen Volkes*, vol. i, p. 175 (4th ed., 1901); Bevan, *The House of Seleucus* (1902); Bouché-Leclercq, *Histoire des Seleucides* (1913).

ANTIOCHUS IX CYZ'ICE'NUS (Gk. Κυζικηνός, *Kyzikēnos*, native of Cyzicus). King of Syria, 113–95 B.C. Son of Antiochus VII Sidetes and Cleopatra; was sole ruler of Syria between 113 and 111, and from that time to his death held a part of Syria, adjoining Palestine. He aided the Samaritans against John Hyrcanus (110–107 B.C.) without success, and a second attempt to subdue Judæa with the aid of Ptolemy XI Lathyrus likewise failed. Having been defeated in a decisive battle with Seleucus VI, he took his own life in 95 B.C. Consult Kuhn, *Beiträge zur Geschichte der Seleukiden* (1871); Schürer, *Geschichte des jüdischen Volkes*, vol. i, pp. 175 f. (4th ed., 1901); and the histories of Niese (1893–1903), Bevan (1902), and Bouché-Leclercq (1913).

ANTIOCHUS X EU'SEBES (Gk. Εὐσεβής, *Eusebēs*, pious), King of Syria, 95–92 B.C. Son of Antiochus IX Cyzicenus. He continued the war against Seleucus VI and forced him to retire to Mopsuestia, where he was murdered by the populace in 95 B.C. He also defeated Antiochus XI and Philip in 93 B.C., but was himself vanquished by Philip and Demetrius III in 92 B.C. and obliged to flee to the Parthians. He is supposed to have died in 75 B.C., leaving two sons, Antiochus XIII and Seleucus Cybiosactes. His widow, Selene, was given a few towns in Syria by Tigranes of Armenia, who in 92 B.C. took possession of Antioch. Consult histories of Niese (1893–1903), Bevan (1902), and Bouché-Leclercq (1913); Kuhn, *Beiträge zur Geschichte der Seleukiden* (1871), and Schürer's *Geschichte des jüdischen Volkes*, vol. i (4th ed., 1901).

ANTIOCHUS XI EPIPH'ANES PHILADELPHUS. King of Syria, 95–93 B.C., son of Antiochus VIII Grypus; upon the death of Seleucus VI in 95 B.C., he assumed the royal diadem; together with his brother Philip he took vengeance upon the people of Mopsuestia, who had murdered Seleucus VI. But on his return to Syria he was defeated by Antiochus X, and was drowned in the Orontes in 93 B.C. Consult Schürer, *Geschichte des jüdischen Volkes*, vol. i, p. 176 (1901); Bevan, *The House of Seleucus* (1902); Bouché-Leclercq, *Histoire des Seleucides* (1913).

ANTIOCHUS XII DIONYS'SUS (Gk. Διονύσιος, *Dionysos*, Bacchus). King of Syria, 85 B.C., son of Antiochus VIII. He took the crown

when he learned that his brother Demetrius III had been made a prisoner by the Parthians and intrenched himself in Demetrius's capital, Damascus. He was at first victorious in his campaign against the Nabataeans, but was defeated in a second battle, and lost his life in 85 B.C. Consult Bevan, *House of Seleucus* (1902); Schürer, *Geschichte des jüdischen Volkes* (1901); Th. Reinach, *Mithridate Eupator* (1890); Bouché-Leclercq, *Histoire des Seleucides* (1913).

ANTIOCHUS XIII ASIATICUS (Gk. Ἀσιατικός, *Asiatikos*, Asiatic). King of Syria, 69–64 B.C., son of Antiochus X. He was sent by his mother, Selene, to Rome, together with his brother Seleucus Cybiosactes, in 74 B.C., to present his claims to the throne of Egypt, but returned to Syria in 71, having been kept for a ransom by Verres in Sicily, as Cicero informs us. After his victory over Tigranes, in 69 B.C., Lucullus gave to Antiochus a large part of Syria, which he retained until Pompey made it a Roman province, in 64 B.C. Consult: Schürer, *Geschichte des jüdischen Volkes*, p. 178 (1901); Niese, *Geschichte der Makedonischen Staaten* (1903); Bevan, *The House of Seleucus* (1902); Bouché-Leclercq, *Histoire des Seleucides* (1913).

ANTIOCHUS HI'ERAX (Gk. Ἱέραξ, *hierax*, hawk). Son of Antiochus II and Laodice. He was made King of Cilicia by Ptolemy III Euergetes in 243 B.C. Ostensibly for the purpose of assisting Seleucus II Callinicus (246–226) to recover certain provinces that the Egyptian King had taken from him, but really to deprive him of all that he had left, Antiochus sent an army to Syria. Ptolemy came to an agreement with Seleucus, but the war between the two brothers continued. With the aid of the Gauls, Antiochus won a decided victory near Ancyra in 242. Seleucus was supposed to have been slain, and Antiochus mourned him. He then turned his arms against Demetrius of Macedonia and subsequently against Attalus of Pergamus. The war with Seleucus was renewed, and Eumenes used the opportunity to take possession of a large part of Asia Minor. After a signal defeat at the hands of Seleucus, Antiochus fled first to Cappadocia and then to Armenia. Suspecting foul play, he left for Egypt. Ptolemy III made him a prisoner. He escaped, however, and ended his stormy career at the hands of brigands in Thrace, 225 B.C. Consult Wilcken, in Pauly-Wissowa, *Realencyklopädie*; Holm, *Griechische Geschichte*, vol. iv (1891; Eng. trans., 1885); Bevan, *The House of Seleucus* (1902); Bouché-Leclercq, *Histoire des Seleucides* (1913).

ANTIOCHUS OF AS'KALON (?–c.68 B.C.). A Greek philosopher. He was a pupil of Philo and succeeded him as head of the celebrated Academy (see **ACADEMUS**) near Athens. He spent some time in Rome, and was on friendly terms with L. Lucullus. Cicero heard him in Athens in 79–78 B.C. Abandoning the more recent traditions of the Skeptic system in favor of a dogmatic eclecticism, seeking to combine Academic, Peripatetic, and Stoic doctrines into a new system, he introduced into the Academy the philosophy of Stoicism, the fundamental tenets of which he believed to have originated in the Old Academy of Plato. Consult R. Hoyer, *De Antiocho Ascalonita* (Bonn, 1883); Zeller, *Philosophie der Griechen*, 3d ed., vol. iv, pp. 598–610; and various notes, as well as the Introduction, in J. S. Reid's edition of the "Academica" of Cicero (London, 1885).

ANTIOPE, ān-tī'ō-pē. See **AMPHION**.

ANTIOQUIA, ä'n'tê-ô'kê-ä. A department of Colombia, South America, bounded by the departments of Bolivar on the north, Santander on the east, Tolima on the south, and Cauca on the west. Its area is 26,612 square miles. Situated in the region of the Cordilleras, Antioquia has valuable forests, but the soil is not suited to agricultural pursuits. The chief occupation is mining, for the mineral wealth of the department is considerable, especially in the north. Coal, iron, gold, and platinum are found. The region was first explored by Robledo about the middle of the sixteenth century. The population in 1912 was 740,937. Capital, Medellin.

AN'TIPÆ'DOBAP'TISTS. Those who oppose infant baptism. See BAPTISM, INFANT.

AN'TIPAR'ALLELS (*anti* + *parallel*). If a pencil of two lines, $O-XY$, is cut by two

FIG. 1.

parallel lines, AB , MN , and if MN revolves through a straight angle about the bisector of $\angle XOY$ as an axis, falling in the position A_1B_1 , then AB and A_1B_1 are said to be antiparallel to each other. OA and OA_1 are called corresponding segments of the pencil, as are also OB and OB_1 . A and A_1 are called corresponding points, as are also B and B_1 . The triangles OAB and OA_1B_1 are similar to each other. The concept of antiparallels materially simplifies the treatment of a number of propositions of elementary geometry; e.g., in the above figure it is easily seen that $OA:OM=OB:ON$, whence $OA \cdot OB_1=OB \cdot OA_1$. In the following figures, since AB and A_1B_1

FIG. 2.

are antiparallels, we have at once the proof of the important proposition that wherever the point O be taken $OA \cdot OB_1=OB \cdot OA_1$.

ANTIP'AROS (Gk. 'Αντίπαρος, Opposite Paros). Anciently called Olearos or Oliaros. One of the Cyclades Islands, celebrated for a stalactitic cave, near the south coast (Map: Greece, G 4, 5). It is separated from Paros by a narrow strait. It contains about 600 inhabitants, and forms a part of the eparchy of Naxos. Antiparos is 7 miles long by about 3 wide; it is scantily supplied with water, but the flats in the north and the west are tolerably fertile. Grain and wine are cultivated, and there is pasturage for large flocks of goats. The principal occupation of the inhabitants is fishing. From Kastron, the only village on the island, the distance to the stalactitic cave is about an hour and a half's ride. This wonderful cave is not mentioned by any Greek or Roman writer whose works are extant, but must have been visited by the curiosity-hunters of antiquity, for the names of ancient tourists are inscribed about the entrance. It may well have been a place of worship. The entrance is

near the top of a mountain on the southern coast. From a small chamber a long and somewhat dangerous descent leads to the great cavern, 80 feet high, more than 300 feet long, and 100 feet broad, which contains remarkable specimens of stalactitic formation. The cave was first made known to the modern world by M. de Nointel, French ambassador to the Porte, who, in 1673, spent three days in it and caused the Christmas mass to be celebrated on a natural altar. Views of the entrance and the exterior are published in the *Bulletin de géographie historique et descriptive* (Paris, 1887-97). Excavations by Messrs. Bent and Tsountas have brought to light a number of graves belonging to an early period in the "Island" civilization. Since 1872 profitable lead mines have been worked on the island. Consult Bent, *The Cyclades* (London, 1885).

AN'TIPAS. See HEROD.

ANTIP'ATER (Gk. 'Αντίπατρος, *Antipatros*). (c.400-319 B.C.). 1. The son of Iollas, and one of the most distinguished generals of Philip of Macedon and Alexander the Great. It was especially through the loyal services of Antipater and Parmenion (q.v.) that Alexander was enabled to establish his kingdom on a firm basis. When Alexander led his troops into Asia, he left Antipater in sole charge of affairs in Macedonia. The latter discharged the duties of his office with great ability, suppressing insurrections in Thrace and Sparta and supporting Alexander with fresh troops from home. But he was on the point of being superseded, at Alexander's orders, by Craterus, through the influence of Olympias, the mother of Alexander, when Alexander died. In the partition of Alexander's domain among his generals, the government of Macedonia was assigned to Antipater anew, and he was soon after called upon to defend himself against an alliance of the Grecian States, which, on Alexander's death, sought to regain their freedom. He at first met with reverses, but, with the assistance of Craterus, who was also his son-in-law, and Leonnatus, he finally brought the allies into subjection in 322 B.C. This war is usually called the Lamian War, from Lamia, where Antipater was besieged in 323 B.C. Everywhere oligarchies were established, and Athens was obliged to deliver up Demosthenes and Hyperides and to receive a garrison in Munychia. This war was followed by another with Perdiccas (q.v.), Antipater's son-in-law, and Antipater was again successful. After the murder of Perdiccas, in 321 B.C., Antipater was appointed to the supreme regency of Macedonia and the guardianship of Alexander's children. He made a new division of the kingdom, but died shortly after, in 318 B.C., leaving the regency to Polysperchon and a subordinate position only to his own son, Cassander. (See ANTIGONUS.) 2. Son of Cassander and King of Macedonia. His reign followed that of his brother Philip, who had followed Cassander in 297 B.C. He was killed, 287 B.C., by order of Demetrius Poliorcetes. 3. An Idumean, Father of Herod the Great. His first appearance is in the reign of Aristobulus II (69-63 B.C.), as a man of great wealth and important connections. He supported Hyrcanus II against Aristobulus, and after Hyrcanus, in 63 B.C., opened the gates of Jerusalem to Pompey, the influence of Antipater grew apace. In the struggle between Pompey and Cæsar he supported the former, but after the defeat of Pompey made his peace with Cæsar

and continued thereafter his firm adherent. Cæsar showed him many marks of favor. Antipater was poisoned in 43 B.C. 4. Son of Herod the Great by his first wife, Doris; a worthless prince, who was perpetually conspiring against the lives of his brothers. He was finally tried before Quintilius Varus, and executed in prison five days before Herod died.

ANTIP'ATHY (Gk. *ἀντί*, *anti*, against + *πάθος*, *pathos*, suffering, affection, emotion, feeling). By derivation, the opposite of *sympathy* (q.v.). It may be defined as a permanent aversion to, or settled incompatibility with, some object or some quality of an object. We may distinguish between formal or logical antipathy and concrete or actual antipathies. The choleric temperament is, formally, antipathetic to the phlegmatic, and the sanguine to the melancholy. (See TEMPERAMENT.) The term is, however, more usually restricted to such definite cases of individual aversion as the dislike shown by many persons to certain animals—snakes, mice, toads, cats. Some of these antipathies, doubtless, have their root in a cultivated affectation, or in the unconsidered encouragement of a prejudice imbibed in childhood; others date from a particular occasion of fright, or are due to the chance association of the object with an unpleasant incident. If, e.g., a house swarms with mice during a period of great mourning, it is probable that the mourners will henceforth show a marked antipathy to these animals. But there are cases which require a different principle of explanation. The aversion to snakes, e.g., which often prevails among those who have never come into contact with the reptiles and who have nothing to fear from those that they may happen to meet, is, perhaps, a phylogenetic symptom. The snake is the chief enemy of the monkeys, as readers of Kipling's *Jungle Book* will remember; and the liability to fear of snakes may be a heritage from our pre-human ancestry. Some persons, again, cannot enter a room which contains a cat. The explanation may be that the valerianic odor peculiar to the animal is automatically associated in certain constitutions with organic sensations of nausea or shuddering, just as there are persons who are subject to shivering and gooseflesh when a slate pencil squeaks upon a slate. At any rate, the mammals that excite antipathy (mouse, cat, fox, hare, pig) have one and all a marked and peculiar scent; and we know from animal psychology that a smell stimulus may set up a well-marked chemoreflex. The aversion to mice may be derived in part from the uncanny and snake-like character of their locomotion and in part from the ubiquity which their small size makes possible. The aversion to toads (apart from superstitious belief in their poisonous properties) may be due to the clammy cold of their skin; we all know the horrible feeling that arises if, being in the pantry in the dark, the hand by chance is laid upon a piece of cold potato. Many historical cases of antipathy cannot now be explained, simply because there is only the record of the bare fact, with no mention of the conditions under which the antipathy took shape.

Bibliography. A. Mosso, *Fear* (New York, 1896); W. James, *Principles of Psychology* (New York, 1890). On reflex sensations, consult W. Wundt, *Grundzüge der physiologischen Psychologie* (Leipzig, 1910-11). See COMMON SENSATION.

ANTIP'ATRIS. A city of Palestine, built by Herod the Great (37-34 B.C.) in honor of

his father, Antipater. It was situated on the river 'Aujeh, in the southeastern part of the Plain of Sharon, about 11 miles east-northeast of Joppa—probably the modern Ras el-'Ain. In Roman times it was of importance as the junction of several military roads leading from the south and east to Cæsarea, the Roman capital of Palestine. By the Jews it was considered the northwest limit of strictly Jewish territory, its location being within a few miles of the southern border of Samaria. Josephus often mentions it. Paul was escorted as far as Antipatris by Roman soldiers when he was taken from Jerusalem to Cæsarea (Acts xxiii. 31-32).

AN'TIPE'RIOD'ICS. Drugs given to arrest or alleviate the paroxysms of certain periodic fevers. The typical periodic fever is malaria, and the typical antiperiodic is its specific remedy, quinine. Other antiperiodic drugs in general use are cinchona, salicylic acid, eucalyptol, Warburg's tincture, and arsenic.

ANTIPHANES, ān-tīf'ā-nēz (Gk. 'Αντιφάνης). A Greek comic poet of the fourth century B.C. He was one of the chief representatives of the Middle Comedy. Many fragments of his works—which numbered, according to some estimates, 365, and to others 260—are preserved. He is praised by Athenæus for his polished diction. Consult Meineke, *Poetarum Comicorum Græcorum Fragmenta*, vol. iii (Berlin, 1839-57).

ANTIPH'ILUS (Gk. 'Αντίφιλος, *Antiphilos*). A Greek painter of Egyptian birth, who lived at the court of the first Ptolemy, about 330 B.C. Quintilian (xii, 16, 6), who rates him high among the painters of the age of Philip and Alexander, says he excelled in the graceful treatment of subjects of high art as well as of daily life.

AN'TIPHLOGIS'TIC. An agent supposed to combat or prevent inflammation, such as blood-letting, or the internal administration of aconite, veratrum, gelsemium, etc. A favorite local application consists of fuller's-earth and glycerine.

AN'TIPHON (Gk. *ἀντίφωνα*). A notable part of the breviary offices in all Western uses. The recitation of the Psalter forming the staple of the office, antiphons or short texts (generally from Holy Scripture), having special reference to the feast or season celebrated, were sung in connection with the psalms and evangelical canticles to give color and appropriateness to the invariable parts of the service. On the greater festivals (hence called "double feasts"), the antiphons are sung entire before and after the psalms; at other times only the first two or three words were sung before and the entire antiphon after. Pope Gregory I in 590 prepared the first regular *antiphonarium*, a service book containing the proper music for the antiphons.

ANTIPHON (Gk. 'Αντιφών) (480-411 B.C.). The earliest of the Ten Attic Orators in the Alexandrian Canon of Orators, and a teacher of oratory. He was the son of Sophilus the Sophist and was born at Rhamnus in Attica. Although Antiphon was undoubtedly influenced by the teachings of Gorgias, he never developed so rhetorical a style as some of the later orators. He labored to make his arguments clear, solid, and convincing, so that it might be impossible for the judges who listened to the speeches he wrote to refuse their assent to his propositions. His success was unmistakable. He first made oratory a matter of rules and principles and so was "the first contributor to the rules of eloquence." Although he never made a public appearance as a pleader in the courts of justice,

but contented himself with writing speeches for others to deliver, he acquired great influence, which he did not fail to exert for the furtherance of his political principles. He several times held commands in the Peloponnesian War. To him must be attributed the overthrow of the Athenian democracy (411 B.C.) and the establishment of the oligarchical government of the Four Hundred; for although Pisander (q.v.) figured prominently before the people in this revolution, the whole affair, according to Thucydides, was secretly planned by Antiphon. The oligarchical government fell within the year, and Antiphon was brought to trial for treason for having attempted to negotiate peace with Sparta. Thucydides affirms that an abler defense was never made by man in a similar position. Nevertheless he was convicted and put to death, his property confiscated, and his house razed to the ground; it was ordered that his remains should not be interred in Attica, and his children were forever declared incapable of enjoying civic privileges. Of the 60 orations which the ancients possessed, only 15 have come down to us. All deal with murder cases. Three were under Antiphon's name, written for others, and are admired for their clearness, purity, and vigor of expression; the remaining 12 appear to have been intended as specimens of school rhetoric for his pupils. The style is severe and archaic, lacking in ease. They have been edited by Blass (Leipzig, 1881). Consult also Blass, *Attische Beredsamkeit* (Leipzig, 1887-98), and Jebb, *Attic Orators* (London, 1876-80).

ANTIPHON (Gk. Ἀντιφῶν, *Antiphōn*) and **BRY'SON** (Gk. Βρύσων, *Brysōn*). Greek mathematicians of the fifth century B.C., who are credited with having introduced the process of exhaustion for the purposes of the quadrature problem. See QUADRATURE.

ANTIPH'ONY (Gk. ἀντί, *anti*, against + φωνή, *phōnē*, sound, voice). A name given by the ancient Greeks to a species of musical accompaniment in the octave, by instruments or voices, in opposition to that executed in unison, which they called *homophony*. Antiphony is also the name of a species of sacred song sung by two parties, each responding to the other, a practice which was cultivated in the early ages by the Hebrews, Greeks, and Romans. Many of the psalms of David show that antiphonal singing was then in use. Its introduction into the Greek church is ascribed either to Ignatius, Bishop of Antioch, in the second century, or to St. Chrysostom, about 400 A.D.; and Ambrosius, Bishop of Milan, is said to have introduced it into the Western church in the fourth century. The dividing of the antiphonies into verses, with rules regarding the same, is attributed to Pope Celestine in 432. The reformed Christian churches of Germany and England have still retained a certain degree of antiphonal singing, and there are several antiphonal choirs in America, notably that in the church of the Paulist Fathers in New York. The chanting of the psalms in the English cathedral service is an imitation of the ancient antiphony.

ANTIPH'RASIS (Gk. ἀντίφρασις, from ἀντί, *anti*, against, contrary + φράζειν, *phrazein*, to point out, declare, tell). A technical term used by the ancient rhetoricians and grammarians, signifying, etymologically, "contrary-speaking." Properly, it denoted the process of expressing an idea, generally an unpleasant idea, by using a word or expression of meaning opposite to

the natural one. Thus, the Furies were called the *Eumenides* ('the kindly-minded ones'), and the Black Sea, though inhospitable ἄξεινος, *axei-nos*), was named *Pontos Euxinos* ('the Hospitable Sea'). In Greek and Roman comedy, too, the names of the personages often had a meaning diametrically opposed to the characters possessed by them. This use of antiphrasis is common in some modern writers, e.g., Thackeray and Sheridan. An example is Mrs. Candour in the *School for Scandal*. The word "antiphrasis" was used also in a broader sense of the process of expressing one idea by negating the opposite; e.g., *not unmindful*, meaning emphatically *mindful*. This figure is, however, called distinctively Litotes.

ANTIPODES, ăn-tĭp'ō-dēz (Gk. pl. ἀντίποδες, from ἀντί, *anti*, against + πόυς, *pous*, foot). Literally, those who have their feet over against each other. As used in geography, the term means the dwellers at the opposite extremities of any diameter of the earth. From this primary relation there necessarily arise many secondary relations. Antipodes must be on one and the same meridional circle, separated from each other by half the circumference. They must therefore differ in longitude by exactly 180°, with the exception of the poles themselves, which have an indeterminate longitude; and being separated from each other by half the circumference, they must be equidistant from the equator in opposite directions. Take London as an example, in lat. 51° 30' N. and long. 0° 5' W. Its antipodes must be in lat. 51° 30' S. and in long. 179° 55' E., coinciding pretty nearly with a small island to the southeast of New Zealand. This small island, in honor rather of London than of itself, has appropriated the peculiar name of Antipodes Island.

With reference to the earth's daily rotation, noon of the one side must be midnight of the other; while with regard to its annual revolution, summer and autumn of the one side must be winter and spring of the other. With respect, however, to the former contrast, some explanation may be required. If this, for instance, is Wednesday in London, was last midnight in that city the noon of Tuesday or of Wednesday at Antipodes Island? The answer to this question depends upon a conventional usage, according to which (with a few exceptions, dictated by practical considerations) the time of all places east of Greenwich is said to be later than that at Greenwich, and the time of all places west of Greenwich is said to be earlier than that at Greenwich. To avoid confusion it has been agreed, further, to think of Antipodes Island as situated *east* of Greenwich. With this in view, it is clear that the midnight in question at London corresponded to Wednesday noon at Antipodes Island. See INTERNATIONAL DATE-LINE.

ANTIPODES IS'LAND. A small island southeast of New Zealand in 49° 42' S. lat. and 178° 43' E. long., so called because it is nearly the antipode of London (Map: World, Western Hemisphere, O 3). It is uninhabited and has an area of only about 20 square miles. See ANTIPODES.

AN'TIPOPE. A pontiff elected in opposition to one canonically chosen. The regular popes of Rome were occasionally out of favor with a faction which chose its own bishop (e.g., Hippolytus, 218-223; Felix II, 355-356), but the first Antipope is reputed to be Laurentius, elected

in 498, in opposition to Symmachus. Several emperors of Germany set up popes against those whom the Romans had elected without consulting them. Otho the Great displaced successively two popes of Rome; and when the Antipope Sylvester III had expelled Pope Benedict IX, Conrad II, Emperor of Germany, brought back this ecclesiastic, who transferred his dignity to Gregory VI (1044). There were now, consequently, three popes, and their number was increased to four by the election of Clement II in 1046. Shortly after, Alexander II found a rival in Honorius II (1061), and in 1080 the same unseemly spectacle was witnessed when Henry IV, Emperor of Germany, elevated to the papal chair Guibert of Ravenna, under the title of Clement III, in opposition to his implacable adversary, Gregory VII. But after the death of Gregory, Clement was himself opposed successively by Victor III and Urban II, and at last died at a distance from Rome, having just beheld the exaltation of Pascal II as the successor of Urban. During the twelfth century several antipopes flourished, such as Gregory VIII and Honorius III. On the death of the latter, France began to intermeddle in these disgraceful strifes and upheld the cause of Innocent II against Anacletus, while the kings of Sicily, on the other hand, more than once set up a pontiff of their own against the choice of the emperors. Between 1159 and 1378 there were four antipopes; but the most remarkable epoch is "the great schism of the West" produced by these unedifying rivalries in 1378—a schism which divided the Church for 50 years. It broke out after the death of Gregory XI at the election of Urban VI, whom the voice of the Roman people, demanding an Italian Pope and not one who should fix his pontificate, like several of his predecessors, at a distance from Rome, had elevated to the papal throne. The French cardinals objected, withdrew to Provence and elected a new Pope, under the name of Clement VII, who was recognized by France, Spain, Savoy, and Scotland, while Italy, Germany, England, and the whole north of Europe supported Urban VI. The schism continued after their death, when three popes were elected by different parties, all of whom were deposed by the Council of Constance, in 1415, and Cardinal Colonna elected in their place, under the title of Martin V. The last Antipope was Felix V (1439–49). These divisions are often alleged as an argument against the doctrine of papal infallibility; but Catholics consistently affirm that the privilege of infallibility is only claimed in matters of doctrine, and has no relation to questions of fact, such as disputed succession or canonicity of election.

AN'TIPYRETIC (Gk. *ἀντί*, *anti*, against + *πυρετός*, *pyretos*, burning heat, fever). Any drug which lowers febrile temperature by action upon the blood, the circulation, or the secretion of sweat, or by changes in heat production and dissipation through the nervous system. The most important are antipyrine, acetanilid, phenacetine, quinine, salicylic acid (qq.v.) and its derivatives, and others of the benzene series. Less importance than formerly is attached to the action of such drugs in diminishing temperature, as fever is now regarded as a symptom of some disturbance, a symptom which is in many cases best relieved by removing its cause. If the temperature is so high as to appear to be injurious in itself, or if it causes discomfort, these

remedies may be of value. Many of them are efficacious also in relieving pain; e.g., salicylic acid in acute rheumatism; antipyrine, antifebrine, or phenacetine in any painful febrile condition. Quinine is used in malarial fever, not only for its antipyretic effect, but to overcome the malarial organism. (See **MALARIA**.) Cold baths, sponges, packs, etc., are frequently employed to reduce temperature. The antipyretic action of drugs is usually accompanied by more or less depression of the heart. See **CINCHONA**; **SALICYLIC ACID**.

AN'TIPY'RINE (derivation same as of *antipyretics*). A synthetic drug, derived from phenyl hydrazin, having the chemical formula $C_{11}H_{22}N_2O$. It occurs in scaly crystals, colorless and odorless, has a bitter taste, and is freely soluble in water and alcohol. Antipyrine is chiefly used as an antipyretic, but it is also an efficient pain reliever, and nerve sedative, and possesses diaphoretic, mydriatic, and hypnotic properties. Locally it is antiseptic, hemostatic, and astringent. As an antipyretic it acts promptly, lowering the temperature and inducing perspiration. As an analgesic it is used in headache, neuralgia, and dysmenorrhœa; and in acute rheumatism, where it acts somewhat like salicylic acid. As a nerve sedative it is valuable in epilepsy and whooping cough, and to a less extent in chorea.

Like most coal-tar derivatives, antipyrine frequently produces untoward symptoms. Cyanosis, frequent and feeble heart action, dyspnoea, sometimes collapse, occur not uncommonly. Serious symptoms have been produced by 10 or 15 grains, and even death has been caused. This must be remembered especially in cases where the natural tendency of the disease is toward heart weakness. In these cases it should be given sparingly in conjunction with a stimulant. Individual susceptibility varies greatly. The drug sometimes produces rashes which resemble measles, scarlatina, urticaria, erythema, and purpura. These are unpleasant, but not serious. See **ACETANILID**; **PHENACETIN**.

AN'TIQUA'RIAN SOCI'ETIES. Organizations in Europe, England, and America for the promotion of the study of antiquities. The London Society of Antiquaries was antedated by a society established in 1572 and dissolved by James I about 1604. The present London society began to meet about 1707 and received its charter in 1751. The Scottish Society of Antiquaries was founded in 1780, the French society in 1814, and the American Antiquarian Society (see **ANTIQUARIAN SOCIETY, AMERICAN**) in 1812.

ANTIQUARIAN SOCIETY, AMERICAN. A society founded in 1812, which has its headquarters at Worcester, Mass. It owns a library of more than 100,000 volumes, which is especially rich in manuscripts, newspapers, political pamphlets, and early American publications. The *Transactions* have been published since 1820, and the *Proceedings* semi-annually since 1849. A new library for the society was completed and occupied in 1910. The society maintains a fund aggregating over \$100,000 for the support of various departments of its work. See **ANTIQUARIAN SOCIETIES**.

AN'TIQUARY, THE. One of Scott's Waverley Novels (1816), and its chief character, Jonathan Oldbuck, laird of Monkbarons.

ANTIQUÉ, *än-tĕk'* (Lat. *antiquus*, old). As the term "ancients" is commonly applied to the Greeks and Romans, the word "antique" is used

with reference to their works of art, especially their incomparable sculptures. The antique style in works of art is distinguished by critics from the romantic or mediæval, and also from the modern. But anything made to resemble the relics of classic art, however frankly or remotely, may be classed as antique. Moreover, the term has several special meanings. Thus, according to a ruling of the United States Treasury Department, anything made before 1700 A.D. is antique and hence exempt from tariff duty. In printing there is a certain form of type that is known as antique; while in bookbinding the term is applied to embossed, but not gilded, designs or lettering.

ANTIQUITIES. See ARCHÆOLOGY.

ANTIQUITY OF MAN. See MAN.

ANTI-RENTISM. A movement partly political, extending over the years 1839-47, among the leaseholders in Albany, Columbia, Delaware, Montgomery, Rensselaer, and other counties in New York State. These leaseholders held their land under a sort of feudal tenure, in spite of the virtual abolition in 1775 of many of the old manorial and patroonship rights (see PATROONS), the various farms being leased, for the most part, either in perpetuity or for a period of two or three lives, while the ground rents were generally paid in kind and certain feudal services were not infrequently exacted. As the population increased, such an arrangement grew exceedingly irksome to the tenants, who were nominal but not real owners, and who could not, as a rule, transfer their titles without paying to the landlords a portion (usually a quarter) of the amount received. The crisis came in 1839, when Stephen Van Rensselaer (q.v.), one of the largest landholders, died. He had been remiss in collecting his rents, and his heirs served writs of ejectment on tenants in Albany County. The tenants thereupon resisted, and on several occasions the resulting disturbances were so serious that the militia had to be called out. By 1842 the trouble had spread to other manors. Anti-rent associations were formed over most of the leasehold districts, rents were withheld, and evictions resisted, while the grievances of the tenants were aired in newspapers devoted to their interests and in memorials to the Legislature.

The question became political and was fomented by agitators for their own special purposes, the anti-rent party ultimately controlling the legislative delegations of 11 counties. Lawlessness became prevalent, and bands of men, absurdly disguised as "Indians," assaulted, tarred, and feathered, and, in several instances, murdered, deputy sheriffs and their assistants. A law passed by the Legislature against men appearing in public in disguise proved ineffectual, and on Aug. 7, 1845, O. N. Steele, a deputy sheriff of Delaware County, was surrounded and shot down by disguised men while serving a process. Governor Wright forthwith put the county under martial law, and arrested over 100 men, of whom 50 were convicted, 20 being sent to the State prison and 2 sentenced to death. The death penalty was commuted for life imprisonment, and eventually all of the prisoners were pardoned by Governor Young. The repressive measures broke up the unlawful resistance, though they caused the defeat of Governor Wright by John Young, the anti-rent candidate, at the next election. In 1846 an article was inserted in the State constitution abolishing all feudal tenures and forbidding future leases of

agricultural land for more than 12 years. In order to settle the question of title the Attorney-General brought suit against Harmon Livingston. This suit resulted in Livingston's favor, but several out of the multitude of individual suits against the landlords went to the Court of Appeals, which decided in 1852 that without reference to the Constitution of 1846, agreements in restraint of alienation of titles in fee were void. Consult: Cheyney, *The Anti-Rent Agitation* (Philadelphia, 1887), and Murray, *The Anti-Rent Episode in New York*, in the "Report of the American Historical Association for 1896"; also Alexander, *Political History of the State of New York*, vol. ii (New York, 1906); Wright, *Life of Governor Silas Wright* (Auburn, 1847).

AN'TIRRHINUM. See SNAPDRAGON.

AN'TISAB'BATA'RIANS (*anti* + Gk. *σάββαρον*, *Sabbaton*, Sabbath). Those who recognize no obligation to observe either the Jewish Sabbath or the Christian Lord's Day, deeming any one day as sacred as another.

ANTI-SALOON LEAGUE. An organization which was first founded in Ohio as a State body in 1893. The idea spread rapidly, and the league became national two years later. Its object is the radical repression and ultimate suppression of the liquor traffic. Its method includes the federation of existing agencies, especially the churches. There are departments of agitation, legislation, and law enforcement. The league is interdenominational and omnipartisan. It has branches in every State in the Union and publishes papers in nearly all the States. Practically every religious denomination in the United States has a vice president on the governing board of the league. The league has been most effective in the work which it has undertaken. Through its efforts large areas have been freed entirely from the sale of liquor and in other areas it has been greatly restricted. The work of passing restrictive measures through the State legislatures has been aggressively carried on, and where such measures have been passed agents of the league have worked with success for their proper enforcement. The remarkable wave of prohibition which swept over the Southern States in the first years of the twentieth century received its impetus largely from the work of the league. See PROHIBITION. The *Anti-Saloon Year Book* gives an annual summary of the work of the league.

ANTISANA, ä'n'tê-sä'nà. A volcanic peak of the Andes in Ecuador, about 40 miles southeast of Quito, and over 19,000 feet high (Map: Ecuador, B 3). Signs of volcanic activity appeared in 1803 during the eruption of Cotopaxi. Tambo de Antisana, one of the highest settlements on the globe, is on a slope of the Antisana at an elevation of over 13,000 feet.

AN'TISCORBU'TICS. See SCURVY.

ANTI-SEMITISM (*anti* + *Semites*, i.e., Jews). A movement having for its object the exclusion of Jews from posts of political honor or of social prominence. In its extreme form Anti-Semitism seeks ultimately to expel the Jews from the nation, on the ground that they represent a non-assimilable element, exerting a pernicious influence upon the social order. In its inception modern Anti-Semitism was essentially social and economic, and questions of religion had little to do with it. With the progress of the Anti-Semitic agitation, however, the most effective popular attack on the Jew was based

upon his religion. In the Anti-Jewish riots that have occurred in Russia, Austria, Rumania, and Germany the religious element has been prominent, although social aversion and conflicting economic interests have also been in evidence. Anti-Semitism first assumed the proportions of a social movement in Germany about 1879. A political party organized in Berlin sought to place Jews under political disabilities. The leaders of the party were Stöcker, court preacher of Prussia and a Christian Socialist; Professor Treitschke, of the University of Berlin, an historian and deputy in the Reichstag; and Dr. Dühring, author of treatises on history and philosophy. Throughout 1879 and 1880 these men, through the press and in speeches, carried on an active Anti-Semitic propaganda based on social and economic grounds. The matter was brought to a vote in the Reichstag in 1880; but that body declared itself in favor of economic and religious liberty by a decisive vote. The Anti-Semitic Party became a strong one in the Reichstag, however, in the early nineties. Since that time its influence in German politics has been inconsiderable. In France the Anti-Semitic propaganda was begun by Edward Drumont, editor of *La Libre Parole*, about 1882, and reached a climax in the *affaire Dreyfus*. See DREYFUS.

Since its organization in Germany the Anti-Semitic Party has been organized in Russia, Austria, Greece, and Holland. As the Jews in Russia are to a great extent kept out of the ordinary trades, many of them have resorted to the business of money lending, and by means of mortgages placed to secure loans they have obtained control of small landed properties. This fact, coupled with religious prejudice, caused the Anti-Semitic movement in Russia, about 1881, to assume a most violent form. Laws preventing them from entering professions and from living in places other than towns and hamlets were vigorously enforced. In some cities, where a majority of the people were Jews, they were expelled without warning. The Anti-Semitic agitation led in April, 1903, to a terrible massacre of Jews at Kishinev in southern Russia; in 1905 and 1906 sporadic attacks upon the Jews, resulting in loss of life and destruction of property, occurred in various Russian cities. The persecution of the Jews in Russia and Rumania has caused an emigration on a vast scale, especially to the United States and South Africa. Consult Lazare, *Anti-Semitism* (New York, 1903). See JEWS.

AN'TISEP'TIC (*anti* + Gk. *σήπειν*, *sēpein*, to make rotten, to cause decay). In the arts, any substance which arrests fermentation and decay; in medicine, any agent which arrests the development and growth of micro-organisms. A *germicide* is a substance or agency which destroys these micro-organisms. A *disinfectant* destroys the organisms and at the same time removes the noxious products of fermentation and putrefaction. The conditions which favor putrefactive change are a moderate degree of warmth, air, and the presence of moisture and micro-organisms. Measures which tend to limit the action of any of these agencies are antiseptic in character. Cold acts as an antiseptic, by bringing the article to be preserved to a temperature at which the putrefactive bacteria can no longer act. In the preservation of canned goods another principle is employed, that of exclusion of air. The cans, with their contents, are heated, and when all air has been expelled

the tops are soldered on. The principle of excluding moisture is employed in the processes of drying meats, fruits, and vegetables. The action of micro-organisms is often combated directly by the introduction into preserved foodstuffs of such antiseptic substances as boric and salicylic acids and formaldehyde. They are considered injurious, however, and their use is forbidden by law in many States. Besides the antiseptics proper, a number of the more common substances, such as common salt, sugar, alcohol, and saltpetre, are used in food preservation. Antiseptics are used for other purposes besides the preservation of foodstuffs. Thus the preservation of sizes used in paper-making is effected by the addition of sulphurous acid, and the preservation of the commercial gums and pastes by carbolic acid and oil of wintergreen. The preservation of wood from decay by impregnation with tar, creosote, and carbolic acid is also practiced to some extent.

In scientific laboratories antiseptics like alcohol and formaldehyde are largely employed in the preservation of anatomical and biological specimens. In surgery the application of antiseptics, first introduced by Sir Joseph Lister, is a matter of greatest moment. It is an understanding of the use of antiseptic and germicidal agencies that has brought about the remarkable advances made by this branch of the healing art since 1880. The condition that is sought for in every surgical operation to-day is *asepsis*, or surgical cleanliness. When a substance is *aseptic*, it is free from all septic micro-organisms. Instruments are rendered aseptic or sterile by boiling in water, by dry heat, by steam, by washing with the chemical antiseptics, or by exposing them to moist formaldehyde vapors; dressings, by dry heat or by steam at ordinary atmospheres or under pressure; ligatures, by prolonged immersion in alcohol or other antiseptic solutions; and the skin of the patient at the site of the operation, by application, after mechanical cleansing, of a solution of iodine or corrosive sublimate. The chemical substances most commonly employed as antiseptics in medicine are carbolic acid, the bichloride of mercury, peroxide of hydrogen, formaldehyde, free chlorine, iodine, potassium permanganate, iodoform, and boric acid, and to a lesser extent the vegetable substances thymol, menthol, and eucalyptol. See BACTERIA; MICROBE; KOCH, ROBERT; PASTEUR; WOUND.

AN'TISLAVERY SOCIETY, THE AMERICAN. An association organized in Philadelphia, December, 1833, by delegates from the few State or city societies in the United States. The first Antislavery Society was formally organized at Boston in January, 1832, William Lloyd Garrison being the leader of the movement. The American Antislavery Society took the boldest ground in favor of the immediate abolition of slavery, and its work was for many years looked upon as fanatical or at least hopelessly impracticable, its members were denounced, its meetings broken up, and rewards offered in the South for its leaders alive or dead. Divergence of opinion on the question of political action caused a split in the society in 1840. The non-voters under Garrison, although but a small portion of the Abolitionists, gained control of the old society. The others formed the American and Foreign Antislavery Society, but the movement had outgrown a society formation and found a better and more conservative expression in the

Liberty Party (q.v.) and its successors. Among the prominent Abolitionists were William Lloyd Garrison, Wendell Phillips, Samuel J. May, Lucretia Mott, Lydia Maria Child, Arthur Tappan, James G. Birney, John G. Whittier, William Goodell, Gerrit Smith, and William Jay. The parent society continued to exist, until after the adoption of the fifteenth amendment, in 1870, remaining small in numbers but largely influential in its propagandist work. For a partial bibliography of the movement, see the biographical sketches of the leaders here mentioned. See ABOLITIONISTS; SLAVERY.

AN'TISPASMOD'IC (*anti* + Gk. *σπασμός*, *spasmos*, convulsion, spasm). Any drug that has a sedative effect upon the nervous system, either by depressing the brain or spinal cord or by stimulating inhibitory centres, and so regulating the production of nerve force. The former class includes the bromides and chloral. The stimulating antispasmodics are asafetida, belladonna, camphor, Hoffman's anodyne, musk, and valerian. As a class, they are employed in conditions of nervous excitation, particularly of a hysterical nature, in asthma, alcoholism, and in convulsions from epilepsy or other causes.

ANTIS'THENES OF ATH'ENS (born about 450 B.C.). A rhetorician, but later a philosopher and the founder of the Cynic school of Greek philosophy. He was son of Antisthenes, an Athenian, and a Thracian slave-woman. He studied under the Sophist Gorgias, and was a disciple and ardent follower of Socrates; he plays a large rôle in the "Symposium" of Plato. He wrote a large number of philosophical works, in Greek much praised by ancient critics for its purity, and for many years taught elocution and philosophy, in the gymnasium outside Athens known as the Cynosarges; from the name of this gymnasium, perhaps, came the name Cynics (q.v.), which was given to his followers. Antisthenes regarded freedom and happiness as attainable only through virtue; but the meaning of his doctrine is ambiguous until the definition of virtue is given. In this Antisthenes followed Socrates's eudæmonistic principles. For Antisthenes, however, virtue was not in doing good for its own sake; the object of virtue was to render man as independent as possible of the events of life, and this freedom was attainable by reducing the wants of life to what is absolutely inevitable, viz., the wants of hunger and love. Customary morality and the demands of decency, as well as the pleasures of life, both material and intellectual, were ridiculed by Antisthenes and his followers and denounced as depriving man of his freedom, and, hence, as leading to nothing but unhappiness. Nevertheless, the Cynic was not inconsistent when he advocated a philosophic culture; but this culture was to be looked upon as a means, and not as an end; it was desirable not for its own sake, nor for the sake of the intellectual pleasure which it could afford, but as leading our intelligence to avoid consistently the artificial enjoyments of civilized life. Two declamations ascribed to Antisthenes were edited by Friedrich Blass in 1871, but most scholars decline to believe that they were written by Antisthenes. Consult T. Gomperz, *Greek Thinkers* (Eng. trans., vol. ii, 1905).

ANTISTROPHE, *än-tis'trô-fê* (*anti* + Gk. *στροφή*, *strophê*, a turning, strophe, stanza). A stanza or portion of a poem following the strophe, and responding to it. It results also

when the same word or phrase is used at both the beginning and the end of a clause or sentence; as in

"Fare thee well; and if forever,
Still forever fare thee well."

ANTITH'ESIS. See RHETORIC, FIGURES OF.
AN'TITOX'IN (*anti* + *toxin*; Gk. *τοξικόν*, *toxikon*, poison for the arrow, from *τόξον*, *toxon*, bow). During the course of diseases caused by bacterial infection, certain poisons (toxins) are developed in the blood by the bacteria, or exist in the bodies of the bacteria. Nature, in combating the disease, produces certain principles in the serum of the blood of the patient, called antitoxins, which antagonize the action of the toxins. These principles have not been isolated, but they are used to combat disease artificially by injecting blood serum which contains them into the tissues of a person suffering with a bacterial disease, to aid him in neutralizing the toxins resulting from that disease. Antitoxins combating the poisons of tetanus, cerebro-spinal meningitis, snake-bite, pneumonia, tuberculosis, yellow fever, bubonic plague, cholera, and other ailments have been prepared and used. The one most often employed is diphtheria antitoxin, which is frequently called simply antitoxin. See ANAPHYLAXIS; BACTERIA; DIPHTHERIA; SERUM THERAPY.

ANTI-TRADE' WINDS. See WINDS.

AN'TITRIN'ITA'RIAN (*anti* + *trinitarian*, from Lat. *trinitas*, triad, trinity). One who denies the doctrine of the Trinity. An Antitrinitarian differs from a Unitarian only in this respect, that his objection to the doctrine in question is made on philosophical, while that of the latter is made on theological, grounds.

AN'TITYPE (*anti* + *type*; Gk. *τύπος*, *typos*, an impression, model, pattern). The fulfillment of the type. Thus, David is often regarded as a type of Christ, who is, therefore, the antitype; the sacrificial offerings of the Old Testament types of Christ, and he is their antitype. See TYPE.

ANTIUM, *än'shī-üm* (now Anzio, formerly Porto d'Anzio). One of the most ancient cities of Latium. It stood on the coast, about 34 miles from Rome, and, being favorably situated for commerce and piracy, was, under the Volscians, into whose hands it had fallen, one of the most powerful enemies of rising Rome, until finally subdued (338 B.C.). All its ships were at this time taken from the town, and their beaks (*rostra*) were set up on the speaker's platform in the Forum, hence known as the Rostra. It became a favorite resort of the wealthy Romans, and some of the most famous remains of ancient art have been discovered among the ruins of their villas and palaces, such as, perhaps, the "Apollo Belvedere" (see APOLLO BELVEDERE) in the Vatican, and the "Borghese Gladiator" in the Louvre. (See AGASIAS.) In 1878 a statue, long known as the Maiden of Anzio, was discovered there, within the villa of Prince Ludovico Chigi; in December, 1909, the Italian government paid nearly \$90,000 for this statue and set it up in the Museo delle Terme, in Rome. Since that time many have maintained that the statue was rather that of a youth: see *The Classical Weekly*, vol. iii, pp. 146-147 (New York, 1910), and for the opposite view, that it portrays a maiden, a prophetess, see the same periodical, vol. iii, pp. 180-181. It was the birthplace of the emperors Caligula

and Nero, and the latter constructed a splendid port by means of two moles inclosing a basin two miles in circumference. Remains of the moles still exist, although the basin is mostly filled up with sand. In the ninth and tenth centuries the town was made desolate by the raids of the Saracens. Its site is now occupied by Anzio, a favorite bathing resort for the inhabitants of Rome, with some charming villas.

ANT'LEERS (OE. *auntlere*, OF. *antoiller*, from Lat. *ante*, before + *oculus*, eye). The horns of (male) deers. For their structure, etc., see DEER. In the language of British stag-hunting, each part of the horn and each stage of growth receives a name, and many of these names serve to designate a deer of a certain age or fitness. These names are derived from and

TYPES OF ANTLERS.

A, Rusine. B, Normal rucervine. C, Intermediate rucervine. D, Extreme rucervine. E, Sub-elaphine. F, Elaphine. 1, Brow-tyne. 2, Tres-tyne. 3, Royal-tynes.

specifically apply to the European red deer (*Cervus elephas*), now preserved in many parts of Europe for the sport of stag-hunting; and they have descended from ancient terms, mostly French, originating on the Continent in mediæval times. The following is a summary given by Prof. A. H. Garrod in *Cassell's Natural History*, vol. iii:

"In the common red deer, in the spring of the year following its birth, the antlers are nothing more than straight, conical, and unbranched 'beams,' the animal being then known as a 'brocket.' In the following spring the antler has, besides the 'beam,' a small branch from its base, directed forward, known as the 'brow antler'; it is then termed 'spayad.' In the third year an extra front branch is formed, known as the 'tres,' and the whole antler is larger. The tres is sometimes seen in the smaller antler of the spayad. In the fourth year the brow antler is doubled to form the 'brow' and 'bez-tyne,' at the same time that the top of the main beam divides into the 'sur-royals' of the 'staggard,' or four-year-old male. In the fifth year the sur-royals become more numerous, the whole antler of the 'stag' being heavier than previously, only to be exceeded in weight by those of the fully adult 'great hart' with ten or more 'points,' each being larger and longer than the year before."

In Scotland a deer with twelve points is known as a "royal stag"; but this number is sometimes exceeded. The finest heads are no

longer seen in Great Britain, where the habit of shooting the best is leading to deterioration, and fossil antlers from British caves and peat-beds are larger than those of any living individuals, rivaling those of the wapiti in size. Great heads have been obtained within recent years on the vast wild estates of eastern Europe. In many of the old German castles superb heads of sixty or more points are preserved; and Lydekker mentions one shot in Transylvania which had forty-five points and weighed 74 pounds. It should be said, however, that this excessive number of points is the result of injury or disease when the horn was growing, so that a large, symmetric pair with more nearly the normal number of tines is a really better example.

The material of antlers is highly durable, and enters extensively into the arts for making handles of knives, umbrellas, etc., and various ornamental articles.

ANT'LIA PNEUMAT'ICA, or the **AIR-PUMP**. A southern constellation, defined by Lacaille in 1752 and situated between the constellations Argo and Hydra. It contains no large stars.

ANT'-LI'ON. The larva of any insect belonging to the neuropterous family Myrmeleonidæ. The kinds commonly referred to are only those which form pitfalls, and not the members of the family in general, all of which do not possess this habit. The conical pitfalls which

ANT-LION.

Showing the conical Pit with the Larva waiting for its Prey.

are used to aid in the capture of ants and other small ground insects are excavated in sand, dust, and the powdered remains of decayed logs. Their size varies with that of the ant-lion, but they are commonly about one and one-half inches across the top. There are two methods used in the formation of these traps. The simplest trap is excavated by powerful upward tossings of the head after the larva has buried itself below the surface; thus, a funnel-shaped pit is formed. The second method is by crawling backward in a spiral direction just beneath the surface, and by means of the head tossing the sand to the outside. In the bottom of these conical pits the larvæ bury their whole body except their mandibles, which are spread ready for their prey. An ant, for example, strolling about and stepping on the margin of the pit starts a miniature land-slide on account of the looseness of the material in which the pit is excavated. This arouses the ant-lion, which begins actively to throw material from the bottom of the pit, thus accelerating the landslide and bringing the ant within reach of the jaws, which seize it and relax only after extracting the juices from the body. The scissors-like jaws are grooved on their inner side, and thus by opposition a tube is formed through which the juices are sucked. The carcass, extracted of its

juices, is tossed outside of the pit. The posterior part of the intestine of the ant-lion is remarkable for being modified to form a spinning gland or organ. The adult ant-lion spins a cocoon by the aid of sand, etc., in which it transforms to the imago state. The "flies" have four expanded net-veined wings, which are folded over the abdomen when at rest. In most of the species the wings are transparent. About fifty species are found in the United States, most frequently in sandy or semi-arid regions.

ANTOFAGASTA, ä'n'tô-fâ-gäs'tâ. A northern province of Chile, bounded on the north by the province of Tarapacá, on the east by the republic of Argentina, on the south by the province of Atacama, and on the west by the Pacific Ocean. It has an area of 46,609 square miles. Taking in a large part of the Atacama desert, the surface is mostly mountainous and barren and interspersed with salt lagoons and marshes. It contains a number of volcanoes and has large deposits of silver, lead, iron, manganese, borax, guano, and saltpetre, much of which is mined and exported. Notwithstanding the phenomenal increase in the population of the province between 1885 and 1910 (from 21,213 to 118,718) on account of new mineral discoveries, Antofagasta is still one of the most sparsely populated provinces of Chile, its density being 2.6 to the square mile. This territory was ceded to Chile by Bolivia as a result of the war ending in 1883. The capital and chief seaport is Antofagasta.

ANTOFAGASTA. A port and the capital of the Chilean province of the same name (Map: Chile, C 8). Founded in 1870, it increased rapidly in importance, owing to the saltpetre deposits in the neighborhood and to the rich silver mines of Caracoles and Huan-chaca, with which it is connected by railway. Among the imports are hardware, machinery, drugs and medicines, and cotton fabrics. Antofagasta is about 3000 miles from Panama. Pop., 1885, 7600; 1907, 32,496; 1910, 36,000.

ANTOINE, ä'n'twän', ANDRÉ (LÉONARD) (1851—). A French theatrical manager, born at Limoges. He was for several years a clerk with the Paris Gas Co., but his chief interest came to be in the stage. In 1887 he founded in Paris the Theatre Libre, known also as the Theatre Antoine, an enterprise in which he showed a remarkable skill in the production of plays. He became co-director of the Odéon Theatre in Paris in 1896, and director ten years later. Here he produced many successful plays by modern authors and revived many of the plays of French and foreign writers, including Shakespeare. He was made a Chevalier of the Legion of Honor and an officer of public instruction.

ANTOINE, JULES DOMINIQUE (1845—). One of the principal representatives of the opposition party in Lorraine. He was born at Metz and served in the Franco-German War as officer of the *Garde Mobile*. After the war he became prominent in Metz as an exponent of the Anti-German sentiment in the Municipal Council and the local diet. In 1882 he was elected representative to the Reichstag, but after a fruitless attempt to deliver an address in French before that body, abstained almost altogether from attending the sessions. He was reelected by his constituents in 1884 and in 1887. He was tried for treason and sentenced to permanent exile (1889), whereupon he became a naturalized citizen of France, being made Paymaster-General in 1893.

ANTOINE DE BOURBON, ä'n'twän'de böör' bôn' (1518-62), King of Navarre. He was born in Picardy, the son of Charles of Bourbon. In 1548 Antoine, then Duke of Vendôme, married Jeanne d'Albret, the heiress of Navarre, and through her became King of Navarre and Lord of Béarn (1555). He was feeble and irresolute and fluctuated between the two religious parties in France. At the beginning he sided with his brother Louis, Prince of Condé, and was involved in the conspiracy of Amboise, but in 1561 he was made Lieutenant-General of France and, embracing Catholicism, soon formed a coalition with the Duke of Guise and the Constable of Montmorency. He received command of the royal army besieging Rouen and there met his death in an assault on the city (Nov. 17, 1562). Antoine de Bourbon is best known as the father of Henry of Navarre, who became Henry IV of France. See BOURBON, HOUSE OF.

ANTOKOLSKI, ä'n'tô-kôl'skê, MARK MATVEYEVITCH (1843-1902). A Russian sculptor of Jewish parentage. He was born at Vilna and studied in St. Petersburg Academy of Fine Arts. His earliest successes were a wooden statue "The Jewish Tailor" (1864), "The Miser" (1865) in ivory, which obtained him an imperial pension, and the marble "Kiss of Judas" (1867). In 1868 he received a stipend for traveling, and while in Italy he completed his famous statue, "Ivan the Terrible," which made him an academician. The Emperor Alexander II bought the statue and ordered a bronze cast, now in Alexander III Museum; a marble copy is in the Hermitage at St. Petersburg. Among other sculptures of the artist are: "Peter the Great" (1872, a colossal marble figure); "Christ before the People" (bronze, 1874); "The Death of Socrates" (1876); "The Last Sigh" (1878); "Spinoza" (1882); "Yermak" (the Cossack conqueror of Siberia); "The Sleeping Beauty" (1900), and a portrait statue of the novelist, Turgenieff. Most of the above sculptures are in the new Alexander III Museum, St. Petersburg. Among his portraits of the imperial family are the bronze statue of Alexander II at Moscow and that of Alexander III in the Kremlin. At the Paris International Exposition of 1878 Antokolski was awarded the first prize for sculpture, and two years afterward he settled permanently in Paris. He was a Chevalier of the Legion of Honor, corresponding member of the Académie des Beaux-Arts, etc. His art is characterized by powerful realism and energy of expression.

ANTOMARCHI, ä'n'tô-mär'kê, FRANCESCO (1780-1838). The physician of Napoleon at St. Helena. He was born in Corsica, studied medicine at Pisa, and afterward practiced in the Santa Maria Hospital at Florence. At the request of Napoleon's mother he was induced by Cardinal Fesch to succeed Dr. O'Meara as the attendant physician of the Emperor at St. Helena. At first there was little cordiality between the two; but subsequently Napoleon conceived a high regard for his countryman and at his death left him 100,000 francs. The physician afterward declared that the death of Napoleon had not been caused by cancer of the stomach, but by a malignant fever peculiar to the island, and he refused to sign the *post-mortem* certificate. In 1830 Antomarchi displayed what he represented to be a death mask of Napoleon. The likeness was considered ac-

curate by many, but the phrenologists found fault with the contour of the cranium, and doubt was cast upon the genuineness of the mask. Nevertheless, it forms the model from which many busts of Napoleon have been made. At the outbreak of the Polish revolution, in 1830, Antomarchi went to Warsaw and soon afterward returned to France, whence, in 1836, he proceeded to America. He died at Santiago, Cuba. He published *Les derniers moments de Napoléon* (Paris, 1823; London, 2d ed. of Eng. trans., 1826).

ANTONELLI, ä'n'tò-nè'l'lé, GIACOMO (1806-76). An Italian Cardinal and statesman, born at Sonnino. At the Seminary in Rome he became conspicuous for intellectual capacity, and Pope Gregory, recognizing his ability, attached him to his suite. He became Under-Secretary in the Ministry of Interior in 1841, and in 1845 Minister of Finance. At the accession of Pius IX he joined the Pope's reformatory schemes and gained great influence, becoming Cardinal in 1847 and a member of the Ministerial Council through which Pius undertook to establish his reforms. In 1848, when the ministry of priests and laymen was established, Antonelli became Prime Minister. After the Pope's pronouncement against the war with Austria (1848), Antonelli resigned, but afterward, when he had perceived the Pope's motive, he abandoned his national policy and associated himself entirely with the conservative element. Upon the reestablishment of the papal power through the intervention of France, Antonelli returned to Rome with the Pope (1850) and reorganized the administration along strictly absolutistic lines. He rejected all advances of the Powers recommending opportunistic reforms and would not yield to the nationalistic aspirations of the Italians. He raised vain protests against the aggrandizement of the royal territories at the expense of the Papal States. During the closing years of his life he lost his influence with the Pope, who yielded more and more to the Jesuit element. At his death he was Prime Minister to the Pope. A deficit of 45,000,000 lire was discovered in the Vatican finances at this time. He left his property, amounting to about \$8,000,000, to his three brothers, and his alleged daughter, the Countess Lambertini, vainly sued for a share. Consult Pillon de Thury, *Biographies des cardinaux* (1862).

ANTONELLO DA MESSINA (c.1430-79). A Sicilian painter of the Renaissance, famed as the introducer of oil painting into Italy. On the basis of Vasari's assertions he was said to have studied in Flanders and to have brought the oil technique to Venice, with whose school he is generally classed. But documents recently discovered by Dei Marzo and La Corte-Cailler show that he was born 1430 (not 1447) in Messina. Here he lived and practiced certainly till 1465 and probably until 1474. In 1475-76 he was in Venice, where he painted the lost altar-piece of San Casciano, which exercised a profound influence upon Venetian art. During the latter year he was also in the service of the Duke of Milan, and in 1478 he again appears in Messina, where he died the middle of February, 1479. There is no reason to assume that he visited Flanders, for in Naples, where he probably studied, Flemish influence was predominate and the oil technique was practiced. To his earliest period belongs a "Salvator Mundi" (1465) in the National

Gallery, London; to the second a triptych in the gallery of Messina (1473), representing the Madonna dell' Rosario with saints, a portrait of a young man in the Berlin Gallery, and an "Annunciation" in the Palazzo Acreide (Syracuse). To the Venetian period belong the remarkable portrait of a condottiere in the Louvre (1475), a "Crucifixion" in the Antwerp Gallery, the portraits of the young men in the Trivulzio Gallery, Milan, the Borghese Gallery, Rome, and National Gallery, London (1476). Among his undated pictures are a beautiful St. Sebastian in the Dresden Gallery and a St. Jerome in London, both probably belonging to his last period.

Antonello was the only great painter of the Renaissance in south Italy. His reputation was as great among his contemporaries as in modern times. The chief characteristics of his art are a trenchant realism, strong characterization, and wonderful color. Consult: Morelli, *Italian Painters* (London, 1892); Beltrami, *Archivio storico dell' arte*, vii; the monographs on Antonello by Di Marzo (Palermo, 1903), La Corte-Cailler (Messina, 1903), and D'Amico (Messina, 1904); L. Venturi, *Le origine della pittura veneziana* (Venice, 1907).

ANTONIA MAIOR (39 B.C.-?). The elder of the two daughters of Mark Antony and Octavia, and grandmother of the Emperor Nero. Her son, C. Domitius, was Nero's father. Her husband was L. Domitius Ahenobarbus.

ANTONIA MINOR (c.36 B.C.-38 A.D.). Sister of Antonia Maior, mother of the Emperor Claudius and of Germanicus the great general, and grandmother of Caligula. Her husband was Drusus, brother of the Emperor Tiberius. Caligula at first treated her with respect, but afterward subjected her to indignities.

ANTONIDES, ä'n-tò'nè-däs, JOANNES (1647-84). A Dutch poet. He was born in Goes and was educated at the expense of one of the chiefs of the admiralty at Amsterdam. He was the foremost pupil of Vondel, whom he resembled in poetical ability, although his works are marred by turgidness and monotony. He is best known by his poems, and a tragedy written at the age of 19, called *Trazil of overrompelt Sina* ("The Conquest of China," 1866). His fame was fully established by the publication, in 1671, of *Ystroom*, an epic on the river Y.

ANTONI'NA (449-c.565). The wife of the Byzantine general Belisarius. Though the daughter of a circus-rider, she was a favorite of Theodora, the wife of Justinian, and through the influence of the Empress reduced Belisarius to a state of servile submissiveness and impelled him to many acts of injustice. In connection with his public career, however, she frequently showed great foresight and diplomacy. See BELISARIUS.

ANTONINE COLUMN. The column of Marcus Aurelius in Rome. It was erected in 176 A.D. to commemorate that Emperor's victories in his German and Sarmatian wars. The column stood in a square surrounded by a portico and was part of a superb group of monuments to commemorate the Antonine dynasty, similar to the column of Trajan, which it imitated, having the same height (100 feet), and reliefs similarly arranged in ascending spirals, giving the history of the campaigns. It now adorns the Piazza Colonna.

ANTONINES, AGE OF THE. The period in Roman history marked by the reigns of Anto-

ninus Pius and Marcus Aurelius Antoninus (A.D. 138-180). It was noted for its peace and prosperity.

AN'TONI'NUS. The name of several Roman Emperors, who are to-day generally distinguished by their titles or nicknames. See ANTONINUS PIUS; AURELIUS; CARACALLA.

ANTONINUS, ITINERARY OF (Lat. *Antonini Itinerarium*). A valuable geographical work, containing the names of all the places and stations on the principal and cross-roads of the Roman Empire, with their distances from one another in Roman miles. It has been usually attributed to the Emperor M. Aurelius Antoninus (Caracalla), whence its name. The testimony, however, of the Greek geographer Æthieus, author of the *Cosmographia*, assures us that a general survey of the Roman Empire was commenced 44 B.C., in the consulship of Julius Cæsar and M. Antonius, and completed in the reign of Augustus, when the results of the survey received the sanction of the State. These results, it is with some probability inferred, are embodied in this *Itinerary*, which, it is further supposed, received additions and amendments in the time of the Antonines. Subsequent improvements went down to the reign of Diocletian. The best editions are those of Wesseling (Amsterdam, 1735) and Parthey (Berlin, 1848). Consult D'Urban, *Recueil des itinéraires anciens*, with 10 maps (Paris, 1845).

ANTONINUS, MARCUS AURELIUS. See AURELIUS, MARCUS ANTONINUS.

ANTONINUS, SAINT (1389-1459). An Archbishop of Florence. His real name was Antonio Pierozzi, and he is also known by the name of De' Foreiglioni. At first prior to several monasteries, he was, in 1446, appointed to the archbishopric of Florence, where his noble efforts tended greatly to alleviate the sufferings attendant upon the pestilence, famine, and earthquake of the period 1448-53. He was canonized by Pope Adrian VI in 1523. The 2d of May is consecrated to his memory in the Roman Catholic church. The most important of his writings are: *Summa Theologica Moralis, Partibus IV Distincta* (1477), a compilation of ethical precepts after Thomas Aquinas, which went through 15 editions in the first 50 years; *Summa Confessionalis*; *Summa Historialis*, a chronicle; and *Lettere* (1859). A monument to him was erected in Florence, and his cell in the monastery of St. Mark's is still pointed out.

ANTONINUS, WALL OF (Lat. *Antonini vallum*). See ROMAN WALL.

ANTONINUS AND FAUSTI'NA, TEMPLE OF. A prostyle temple in Rome, facing the Sacred Way, on the north side of the Forum (q.v.), voted by the Senate in 141 A.D., in commemoration of the elder Faustina, wife of Antoninus Pius, who died in that year and was deified. (See APOTHEOSIS.) Antoninus's own name was added to that of his wife on his death in 161 A.D.; together they were the patron deities of the temple. The temple has six unfluted columns in front and three on the sides. The frieze is richly sculptured. Before the twelfth century the temple was dedicated to St. Laurence under the title of San Lorenzo in Miranda. Urban V used much of its material in the reconstruction of the Lateran. Consult Huelsen, *The Roman Forum* (Rome, 1906); Platner, *The Monuments and Topography of Ancient Rome* (New York, 1911).

ANTONINUS LIB'ERA'LIS. A Greek

writer on mythology, who lived about 150 A.D. and is supposed to have been a freedman of Antoninus Pius. He wrote in prose *Μεταμορφώσεων συναγωγή* (*Metamorphōseōn Synagōgē*), a collection of 41 myths dealing with transformations. Most of these are derived from ancient sources, now lost, so that the work is valuable.

ANTONINUS PI'US; TITUS AURELIUS FULVUS BOIONIVS ARRIUS (86-161 A.D.). A Roman Emperor (138-161 A.D.) who was born at Lanuvium in the reign of Domitian. His family was originally from Nemausus, now Nîmes, in Gaul. He was brought up by his maternal grandfather, Arrius Antoninus, a righteous and cultured man. He inherited great wealth and early gave proof of excellent qualities. In 120 he was made consul; afterward he was sent by Hadrian as proconsul into Asia, where the wisdom and gentleness of his rule won him a higher reputation than had been enjoyed by any of his predecessors. By his wife, Faustina, he had four children, of whom three died, leaving a daughter, Faustina, afterward wife of Marcus Aurelius. In 138 he was adopted by the Emperor Hadrian, in consequence of merit alone, and came to the throne in the same year. The reign of Antoninus Pius was peaceful and happy. In his private character he was simple, temperate, and benevolent, while in public affairs he acted as the father of his people. The persecution of the Christians, which was continued during his reign, was partly stayed by his mild measures. He was little engaged in war, except in Britain, where he extended the power of Rome and built a wall between the Forth and the Clyde, as a defense against invasions by the predatory inhabitants of the north. (See ROMAN WALL.) The reign of Antoninus Pius illustrates the saying, "Happy the nation which has no history," for by the justice, wisdom, kindness, and courtesy of the Emperor his vast Empire was preserved from the crimes, conspiracies, insurrections, and bloodshed, the recording of which formed the largest part of the historian's work in the dark centuries of the Roman Empire. It is said that only one Senator was impeached during the lifetime of Antoninus Pius. Literature received great encouragement; the laws were improved, commerce extended; the means of communication were facilitated by the repair of roads, bridges, etc.; new sanitary regulations were introduced, and a taste for architecture fostered in the citizens. The epithet Pius, 'dutiful,' was conferred on him on account of his conduct in defending the memory of his predecessor, Hadrian, against certain dishonoring charges brought forward by the Senate. The column raised to his memory by his adopted son and successor, Marcus Aurelius Antoninus (q.v.), was discovered in 1709, but exists only in fragments. For the column now in the Piazza Colonna at Rome see ANTONINE COLUMN. See also FAUSTINA.

ANTO'NIO. 1. The Changeling in Middleton's play of the same name. 2. The steward in Webster's *Duchess of Malfi*. 3. The Duke of Milan in Shakespeare's *Tempest*. 4. The Merchant of Venice in Shakespeare's play of the same name, who, unable to repay money borrowed of the Jew Shylock, becomes liable for the stipulated forfeit, a pound of flesh.

ANTONIO, an-tō'nē-ō, NICOLAS (1617-84). A Spanish bibliographer and critic. In 1654 Philip IV made him his general agent at the court of Rome for the kingdoms of Spain and

Two Sicilies and the Duchy of Milan. There he remained nearly 20 years and employed most of his time on his great work, which was a list, as nearly complete as possible, of Spanish authors and their writings, from the time of Augustus down to his own day. He published part of it at Rome in 1672, under the title, *Bibliotheca Hispana Nova*, in two volumes, treating authors from the year 1500 to 1670; and in 1696 there appeared, also at Rome and in two volumes, his *Bibliotheca Hispana Vetus*, which begins with the reign of Augustus and closes with the year 1500. About 1677 he was fiscal for the Royal Council in Madrid. His *Bibliotheca Hispana* is considered by some critics the most comprehensive work on Spanish literature. There was an edition of Madrid, 1783, annotated by Gregorio Mayáns y Siscar; but the most available edition is that of Madrid, 1788, in four volumes. He also wrote a critique on fabulous histories (Valencia, 1742). Consult Menéndez y Pelayo, *La Ciencia española* (Madrid, 1887); Haebler, *Biblioteca ibérica del siglo XV* (Paris, 1906).

ANTONIO DE SEDILLA, dā sā-dē'lyá (c.1730–1829). A Spanish missionary priest, better known as 'Père Antoine.' In 1779 he was sent to New Orleans to reinaugurate the Inquisition there, but was immediately sent back by Governor Miro, who felt that the enforcement of Spain's rigid laws against heretics would precipitate a revolution. Père Antoine returned to New Orleans in 1783 as priest of the St. Louis Cathedral and by his kindness and his numerous charities earned the love of the residents, especially of the French element. Until 1886 a palm tree planted by him was a landmark in New Orleans, and about it clustered many picturesque traditions, some of which are given in Gayarré, *History of Louisiana* (3 vols., New York, 1846–53). Consult T. B. Aldrich's story, *Père Antoine's Date Palm*, and Arthur Phelps, "Louisiana," in the *American Commonwealths series* (Boston, 1905).

ANTO'NIUS, GAIUS, surnamed HYBRIDA. A Roman consul, son of Marcus Antonius the orator, and uncle of Mark Antony. He was Cicero's colleague in both the prætorship (65 B.C.) and the consulship (63). He was regarded at first as one of Catiline's conspirators, whether rightly or wrongly we cannot say. Cicero, to whom his attitude seems to have given some concern, secured for him the province of Macedonia and so won him completely to his own side. On his return to Rome (59), he was accused of having taken part in Catiline's conspiracy and of extortion in his province, and, though defended by Cicero, was condemned on both charges. He then retired to the island of Cephallenia, but was recalled, probably by Cæsar, and was in Rome at the beginning of 44 B.C.

ANTONIUS, MARCUS (143–87 B.C.). One of the most eloquent of Roman lawyers and speakers, commonly called "the Orator." He was the grandfather of Mark Antony, the triumvir. He was prætor in 104 B.C., and the following year governor (*legatus pro prætore*) of Cilicia; in 99 he held the consulship. He favored the aristocratic party, and was an adherent of Sulla in the Civil War against Marius, by whose order he was assassinated. In the judgment of Cicero, Antonius and L. Crassus were the first Roman orators who equaled the great speakers of Greece. Both are interlocutors in Cicero's *De Oratore*. Consult the Intro-

ductions to editions of Cicero's *Orator* and *De Oratore*, by J. E. Sandys and A. S. Wilkins respectively (Cambridge, 1885; Oxford, 1888).

ANTONIUS, MARCUS (83–30 B.C.). A famous Roman, commonly known as Mark Antony, a descendant of one of the oldest patrician families. He was grandson of the orator Antonius (q.v.), and the son of the prætor, M. Antonius Creticus; on the side of his mother, Julia, he was related to Julius Cæsar. He wasted his youth in dissipation and, finding himself pressed by numerous impatient creditors, escaped to Greece in 58 B.C., where for a short time he listened to the teaching of Athenian philosophers and orators. His studies here were soon interrupted by the pro-consul Gabinius (q.v.), who appointed him leader of his cavalry. In the campaign against Aristobulus II (q.v.) in Palestine and in Egypt, Antonius distinguished himself by his courage and activity and ingratiated himself with the soldiers. After assisting Cæsar in Gaul, he went to Rome, in 50 B.C., to advance the interests of the former, who stood in great danger from the hostility of the oligarchical party, and was appointed an augur and chosen one of the tribunes of the people. In the following year, on account of his adherence to the party of Cæsar, he was expelled from the curia and fled to Cæsar, who made use of this event as a pretext for his war against Pompey. At the outbreak of this war Antonius received the appointment of commander-in-chief in Italy. In the battle of Pharsalus he commanded the left wing of Cæsar's army. In 47 he was made master of the horse by Cæsar, who left him to govern Italy during his absence in Africa. Antony, as usual, disgraced himself; was perpetually drunk; divorced his wife and married an actress, with whom he paraded himself offensively through the chief towns of the peninsula. In 44 B.C. he married Fulvia, the widow of Clodius, was made consul, and vainly endeavored to prevail on the Romans to recognize Cæsar as Emperor. After the assassination of Cæsar he played the part so well described by Shakespeare, and by his funeral oration and the well-timed display of Cæsar's bloody robe so wrought upon the passions of the people that the conspirators were compelled to escape from Rome, leaving the successful orator for a while in possession of almost absolute power. A formidable rival to Antonius now appeared in the person of the young Octavianus (the future Augustus), whom Cæsar had designated as his heir, and a contest for the ascendancy ensued. The eloquence of Cicero, who, in his *Orationes Philippicæ*, denounced Antonius as an enemy of the State, secured the triumph of Octavianus in the Senate. Antonius, who had been besieging Decimus Brutus in Mutina (Modena), in order to obtain possession of Cisalpine Gaul, which had been voted to him by the people as one of his provinces (Brutus claimed it because after Cæsar's death the Senate had assigned it to him, as part of its agreement with the Liberators, as the murderers of Cæsar called themselves) was finally overthrown by the forces of the Senate in 43 B.C. He escaped beyond the Alps, visited the camp of Lepidus, who commanded in Spain and Gaul against the Pompeians, and gained the favor of his army, of which he took command. Plancus and Pollio joined him with their troops, and Antonius, who so recently had escaped as a helpless fugitive from Italy, returned toward Rome at the head

of 17 legions and 10,000 cavalry. Octavianus, who had pretended to maintain republican principles, was ordered to oppose Antonius; refusing to do this, he now threw off the mask and held a consultation with Antonius and Lepidus near Bologna, at which it was determined that as triumvirs they should share the whole Roman world among themselves. To secure their spoil, they returned to Rome and began their course of murder and robbery throughout Italy. Among their first victims fell Cicero, the orator, whose eloquence they dreaded. According to Appian (see APPIANUS), 300 senators and 2000 knights were put to death in the proscriptions of the triumvirs.

After making Italy safe for themselves and raising an enormous sum of money to carry on their war abroad, Antonius and Octavianus led their troops into Macedonia against Brutus and Cassius, and defeated the republican forces at Philippi (42 B.C.). Antonius next paid a visit to Athens, and then went into Asia, to subdue the East and to punish Cleopatra, Queen of Egypt, whose conduct had offended the triumvirs. The Queen herself appeared to answer his challenge and captivated Antonius by her beauty and address. The general who had overcome Brutus and Cassius was now made a prisoner, though not of war. He followed Cleopatra into Egypt and lived with her in idleness and luxury, until he was aroused by tidings of the quarrel which had taken place in Italy between his own relatives and Octavianus. This dispute gave rise to a short war, which came to an end before Antonius arrived in Italy. A new division of the Roman world between the triumvirs was soon quietly arranged at Brundisium, 40 B.C.; Antonius took the East, from the Adriatic to the Euphrates, Octavianus took the West; the ambition of the feeble Lepidus was appeased by his having the whole of Africa for his portion. Even this shadow of dominion was taken from him in 36 B.C. Meanwhile Antonius had confirmed his renewal of friendly relations with Octavianus by a marriage with Octavia, his sister. He now returned to Cleopatra, resumed his former voluptuous mode of life, squandered the wealth of Rome in gifts to his royal mistress, and became guilty of gross acts of injustice. Octavianus made use of these facts to excite the indignation of the Roman people against Antonius, and a war between the rivals became unavoidable. Antonius, in his idleness, tried to postpone the trial of strength which he saw inevitably approaching. In 36 B.C. he met disaster in an expedition against the Parthians; this increased popular disquiet at his conduct with Cleopatra. Presently, at Rome, he was formally deprived of his power, and war became inevitable. This Octavianus skillfully caused to be proclaimed against Cleopatra, thus putting himself into the position of one defending his country against a foreign foe, and Antonius into that of one supporting a foreigner against his fatherland. In the naval engagement which took place (31 B.C.) near Actium (q.v.), Antonius and Cleopatra were utterly defeated. His subsequent hope of finding troops still faithful to him in Libya was disappointed. He returned to Egypt, where, with Cleopatra, he once more forgot political cares and vexations, until his amusements were suddenly interrupted by the arrival of Octavianus at Alexandria. Antonius now roused himself, made a charge with his cavalry, and repelled the enemy; but the ad-

vantage was only momentary. Deserted by the Egyptian fleet, as by his own army, and suspecting that even Cleopatra had conspired against him, he went to her palace, from which the Queen had escaped. Deceived by a false message informing him of the death of Cleopatra, Antonius committed suicide by falling upon his sword, in the year 30 B.C. He died in the arms of Cleopatra, who immediately after put an end to her life.

ANTONIUS, SAINT. See ANTONY OF PADUA.

ANTONOMASIA, ăn'tō-nō-mă'zhī-ă (Gk. ἀντονομασία, from ἀντί, *anti*, against + ὀνομάζειν, *onomazein*, to name). In rhetoric, the substitution of any epithet or phrase for a proper name; as "The Stagyrte" for Aristotle, "The Little Corporal" for Napoleon, "The Man on Horseback" for Grant, "The Man from Nowhere" for Kipling, etc. Sometimes the process is reversed; as, calling a good orator a "Cicero." In either case the figure is akin to metonymy.

ANTON ULRIC, ăn'tōn ũl'rik (1714-80). The second son of Duke Ferdinand Albert of Brunswick-Wolfenbüttel (till 1735 Brunswick-Bevern, the title by which the Prince was first known in Russia). He married Anna Karlovna (q.v.), niece of Anna Ivanovna, Empress of Russia, in 1739. In 1740 the Empress fell dangerously ill and appointed Ivan, the infant son of Anton, her successor, with Biron as regent. After her death Anton Ulric made some feeble attempts to reverse these appointments, which only led to the punishment of those supposed to have instigated them and to his own military degradation. Biron's conduct toward the parents of the infant Prince became unbearably insolent, and Anna appealed in despair to General Münnich, who put a sudden end to Biron's sway and declared the Grand Duchess and her husband regents. After a few months Anna ungratefully overthrew Münnich. After his fall, as little unity prevailed among the ministers as between herself and her husband, and the government was looked upon as both a foreign and a contemptible one. Then came the revolution of Dec. 5, 1741, which raised Elizabeth Petrovna (q.v.) to the throne. Anton Ulric and his consort were exiled, and lived long at Kholmogory, in the government of Archangel. Anna died in 1746. Catharine II offered Ulric his freedom, but he declined it. Ultimately he grew blind. Catharine gave his children comfortable homes in Jutland. Consult Brückner, *Die Familie Braunschweig in Russland* (St. Petersburg, 1876).

AN'TONY, SAINT, OF THEBES (c.251-356). The father of monastic asceticism, known as the Great. He was born at Koma, near Heraklea, in Upper Egypt. His parents were both wealthy and pious, and bestowed on him a religious education. Having, in obedience to what he believed to be a divine injunction, sold his possessions and distributed the proceeds among the poor, he withdrew into the wilderness, where he disciplined himself in all those austerities which have hallowed his memory in the Catholic church and formed the model of the monastic life. When 30 years of age, however, desirous of obtaining a deeper repose than his situation afforded, he penetrated farther into the desert and took up his abode in an old ruin on the top of a hill, where he spent 20 years in the most rigorous seclusion; but in 305 he was persuaded to leave this retreat by the prayers of numerous anchorites who wished to live under

his direction. He now founded the monastery of Fayum, which was at first only a group of separate and scattered cells, but which, nevertheless, may be considered the origin of cenobite life. He declined, however, to preside over a monastery. The persecution of the Christians by Maximian, in 311 A.D., induced St. Antony to leave his cell and proceed to Alexandria to comfort the martyrs; but in the course of a year he returned to his solitude, which he soon left and plunged yet deeper into the desert. At length he found a lodgment on a hill, about a day's journey from the Red Sea; but his disciples, discovering his retreat, so pressed him with their affectionate importunities that he ventured to accompany them back. After many pious exhortations he once more left them and soon became the mighty oracle of the whole valley of the Nile. In 335 the venerable hermit made a journey to Alexandria, at the request of Athanasius, to dispute with the Arians. He had interviews with Athanasius and other distinguished persons, but soon retired to his desert home, where he died, 356 A.D.

His whole conduct indicates the predominance of a glowing and yet gloomy fancy, and a disposition to lead a life of absolute solitude. Although the father of monachism, St. Antony is not the author of any monastic "rules"; those which the monks of the Eastern schismatic sects attribute to him are the production of St. Basil. He is, perhaps, the most popular saint in the Catholic church. The chief source of information is the *Life of St. Antony*, attributed to Athanasius. Accounts of his life and miracles are given in the *Acta Sanctorum* of the Bollandists, under the date of the 17th of January, on which day his festival was kept.

ANTONY, SAINT, OF PADUA (1195–1231). A famous saint. He was born at Lisbon, Portugal, Aug. 15, 1195, baptized as Ferdinand, but took the name Antony when he entered the order of St. Francis, in 1220, after being a canon of St. Vincent's in Lisbon, and already noted for biblical and patristic learning. In 1221 he attended a meeting of the order at Assisi and made a poor impression, but soon after produced great astonishment and delight at a meeting with the Dominicans, and was sent by St. Francis as revival preacher to northern Italy, where he met with tremendous success. In 1223, after studying at St. Francis's direction mystical theology for five months, he was appointed the first theological tutor in the order, and taught in northern Italy and France. In 1227 he became provincial of northern Italy; in November of that year he entered Padua for the first time. In 1230 he went to Rome as delegate to get the papal decision upon the binding nature of certain points in the Franciscan rule—not, as frequently asserted, to secure the deposition of the general of the order. He died at Padua, June 13, 1231. He was canonized by Pope Gregory IX in 1232. His great repute as a preacher gave rise to legends of miraculous powers. He is the patron saint of animals. Once he preached a sermon to the fishes, it is said, and they listened to him with rapt attention. Joseph Addison gave an abstract of it in his *Remarks on Italy*. For the classic biography of Antony, consult Emmanuel de Azevedo of Coimbra, *Vita del Taumaturgo . . . Sant' Antonio di Padova* (latest ed., Padua, 1829). Consult also: De Chérance, *Antony of Padua* (London, 1895); I. Beale (1897), Mrs. Arthur Bell (1901), in

French by A. Lepître (Paris, 1901). His works were published by Horoy in his *Medii Ævi Bibliotheca Patristica* (Paris, 1885).

ANTONY AND CLE'OPA'TRA. A tragedy by Shakespeare (1607). It was based upon the life of Antony in North's *Plutarch* and is admired for the vigor with which the author deals with a difficult theme. The play is to some extent imitated in both Dryden's *All For Love* and Fletcher and Massinger's *The False One*.

ANT PLANTS. See MYRMECOPHYTES.

ANTRAIQUES, än'trâg', EMANUEL LOUIS HENRI DE LAUNAY, COMTE D' (1755–1812). A French publicist and diplomat. He was born at Villeneuve, department of Ardèche. His talents were first displayed in his *Mémoires sur les Etats-généraux, leurs droits et la manière de les convoquer* (1788), in which he predicted the downfall of absolute monarchy realized in the French Revolution. In 1789, when he was chosen a deputy, he defended, however, the privileges of the hereditary aristocracy. In 1790 he was employed in a diplomatic mission at St. Petersburg and Vienna, where he upheld the cause of the Bourbons. He incurred the displeasure of Bonaparte, but fled from France in 1798. In 1803 Alexander of Russia sent him on an embassy to Dresden, where he wrote a brochure against Napoleon, entitled *Fragment du XVIII livre de Polybe trouvé sur le mont Athos*. He was murdered, with his wife, near London by an Italian servant. Consult L. Pingaud, *Un agent secret sous la révolution et l'empire le comte d'Antraiges* (Paris, 1893).

AN'TRIM. A maritime county in the north-east of Ireland, in the province of Ulster. It is bounded, north, by the Atlantic; west, by the north part of the river Bann, dividing it from Londonderry, and by Lough Neagh; south, by Lagan River, separating it from the county of Down; southeast, by Belfast Lough; and north-east, by the North Channel (Map: Ireland, E 2). Its greatest length is 56 miles, its greatest breadth, 20 miles; its extent of seacoast, 90 miles. Area, 1176 square miles. About two-thirds of this is arable, and there are few forests. Mines of fine salt occur at Carrickfergus, and small coal fields near Ballycastle and in the interior. Rich beds of a fine quality of iron ore are worked at Glenravel, and this is exported from Cushendall and Carnlough. The soil of Antrim is light, and the chief crop is oats. The land is much subdivided, and the raising of flax, and various branches of linen, cotton, and coarse woolen manufacture employ a great portion of the people, although grazing is becoming more and more important. There are salmon and other fisheries, which furnish employment for the inhabitants along the coast. The principal towns are Lisburn, Ballymena, Ballymoney, Carrickfergus, Larne, and Antrim. In 1898 Belfast, the former capital, was constituted into a county borough. Pop., 1911, 478,603. In 1891 the population embraced in the present county limits was 208,010, 196,090 in 1901, and 193,864 in 1911. This county is not seriously affected by emigration.

AN-TUNG, än'töong'. A town in south-eastern Manchuria, on the Yalu, about 7 miles from its entrance into the Bay of Korea (Map: Korea, F 4). In 1911 its population was estimated to be over 160,000. It is the seat of a United States consul. It was the headquarters of General Kuroki during the battle of the Yalu in the Russo-Japanese War.

ANTWERP (Fr. *Anvers*). A province of Belgium south of the Netherlands, with an area of 1093 square miles (Map: Belgium, C 3). The soil, in some places reclaimed heaths, is fertile and yields grain and vegetables. Cattle and other domestic animals are raised. The chief manufactures of the province are laces, sugar, wool, cotton fabrics, and liquors. Capital, Antwerp. Pop., 1900, 819,159; 1910, 968,677; 1911 (est.), 987,201.

ANTWERP (Fr. *Anvers*, anciently *Andoverpum*, from *Anc de Werp*, at the wharf, harbor). A city of Belgium, capital of the province of the same name, situated on the right bank of the Scheldt, in lat. 50° 13' N., long. 4° 23' E. (Map: Belgium, C 3). It ranks first in commercial importance and second in population among the cities of Belgium, and its harbor is considered one of the best in Europe. Antwerp is situated in a fruitful and well-cultivated region. The larger part of the city lies within the walls, which have been continually extended and improved and at present have a total length of 8 miles. In point of architectural beauty and artistic achievements, Antwerp has but few rivals among European cities.

The most noteworthy edifice is the cathedral of Notre Dame, the noblest and largest specimen of Gothic architecture in the Low Countries. It is 383 feet long, 213 feet wide, 131 feet high, and covers an area of 70,060 square feet. It was begun in 1352 and continued at various periods during the fifteenth and sixteenth centuries. The roof is supported by 125 pillars, and the tower (403 feet high), whose exquisite beauty Charles V was wont to compare to Mechlin lace, is a marvel of gracefulness. The highly ornamented portal and the fine tracery of the window above it are particularly worth seeing. The impressive interior, the unusual seven-aisled division of which is to be noted, contains three celebrated works by Rubens, "The Descent from the Cross," "The Elevation of the Cross," and, adorning the high altar in the choir, "The Assumption"; the first named being the most magnificent, and generally considered his masterpiece. The church of St. James, begun in the late Gothic style, in 1491, and completed in 1656, outranks the cathedral in the splendor of its decorations and monuments. It has many altars, private chapels, and burial vaults, belonging to the most distinguished families of Antwerp, and contains the tomb of Rubens, who devoted himself to its embellishment. Of the secular buildings, the Hôtel de Ville, in the Grande Place, a fine structure in the Renaissance style, dating from 1561 to 1565, and rising to a height of 180 feet, and the Bourse, a stately edifice in the late Gothic style, deserve especial attention. The museum, erected in 1879-90, from plans by Winders and Van Dyck, is an imposing rectangular structure, inclosing six inner courts. Its picture gallery boasts of an unusually fine collection of paintings by the old masters, including about 800 canvases, especially of the Flemish school, among which are rare specimens by Jan van Eyck, Memling, Massys, Rubens, Van Dyck, etc.; "The Entombment of Christ," the masterpiece of Quinten Massys, and the "Christ Crucified," by Rubens, a work of great dramatic effect, being the most remarkable. Worthy of mention are also the Musée Plantin-Moretus, famous for its collection of everything pertaining to the early history of printing, the Guild Hall of the Archers, the

Vielle Boucherie, or old meat market, and the Steen, part of the old castle dating from the tenth century, once the seat of the Inquisition and now containing an archaeological museum.

Antwerp is administered by a burgomaster, assisted by five assessors and a municipal council. The burgomaster is nominated by the king for a period of eight years. The assessors are chosen by the municipal council for the same period. The municipal council numbers 39 members, including 8 members from the labor council, who are elected by all voting citizens for 8 years. The city is divided into 9 districts, administered by commissioners. Water is supplied by private companies. With the exception of the railway stations and the harbor, which have electric lights, the city is lighted by gas. The municipal expenditure in 1910 was 49,440,011 francs.

The most noteworthy educational institutions are the commercial school, established in 1852, the Athénée Royal, the Royal Museum of Fine Arts, dating from 1665, and attended by over 160 students, and the Royal Conservatory of Music, with an attendance of about 1350. Some of the higher schools are managed by Jesuits, and the German School is supported by the German government. Besides numerous scientific associations, Antwerp has many societies for the advancement of art, and its triennial exhibition of paintings is regarded as an important event in the world of art. The city has 2 theatres and 2 municipal libraries. Of the 16 daily newspapers published in Antwerp 6 are in French and 10 in Flemish. Besides 2 hospitals with 900 beds, an insane asylum, and asylums for orphans and aged people, there is a considerable number of minor charitable institutions maintained by private societies. The industrial establishments of Antwerp include distilleries and breweries, textile mills, diamond-cutting works, sugar refineries, cigar factories, etc. Antwerp is inferior to few European cities in the volume of its commerce; it is one of the greatest centres of the grain import trade. Its commerce is chiefly with the Balkan countries, Russia, the United States, and South America. The total annual value of the commerce, of which a large portion is transit, exceeds \$1,200,000,000. Antwerp has magnificent harbor advantages. The quays, built of granite, have a total length of 3½ miles and are provided with gigantic cranes for the loading and unloading of vessels. There are 8 large basins and a number of smaller ones connected by sluices with the Scheldt. Plans for enlarging the port were decided upon in 1905. Its area was to be tripled, giving it 37.3 miles of running quays, a canal was to be constructed 5 miles long and 815 feet wide, and also an artificial channel for the Scheldt, the sand banks of which are rather dangerous to navigation. The cost of the work was estimated at 250,000,000 francs (\$48,250,000), and the time necessary for its completion no less than 10 years. In 1911, 6908 vessels of 13,330,699 tons entered at the port, and 6928 of 13,325,781 tons cleared. Antwerp is the chief arsenal of Belgium and is fortified by strong ramparts and numerous citadels and forts, which the government contemplates to extend so as to include a circumference of nearly 80 miles. It has also devices for the flooding of the surrounding country and contains a garrison of about 10,000 men. In 1800 the population was about 40,000; in 1830, 73,500; in 1880, 169,112; in 1900,

272,831; in 1910 (census of December 31), 301,766. With the communes of Berchem, Borgerhout, and Hoboken, which are practically part of the city, the 1910 population was 398,255. The average annual temperature of the city is about 50°, or nearly the same as that of New York.

Antwerp appears in history as early as the seventh century, is spoken of as a market town some hundred years later, and by the middle of the twelfth century seems to have attained considerable prosperity as a trading town. Steadily extending its commercial operations under the rule of the Dukes of Burgundy, it became in the second half of the fifteenth century the world-mart of Europe, supplanting the other great Flemish cities, Bruges and Ghent. It was the *entrepôt* for the trade between England and the Continent, and in its harbor vessels from the north and the south of Europe met to exchange their cargoes. In the first half of the sixteenth century, under the rule of Charles V, the city was at the height of its splendor and prosperity. It was the principal station of the Hanseatic League and the centre of the money exchanges of Europe, while its manufacturing industry was on a level with its vast shipping. Material prosperity was accompanied by intellectual progress, and the great schools of Flemish painters made Antwerp their principal home. The events of the Reformation brought about a sudden decline. The reign of terror instituted by the Duke of Alva; the massacre of 6000 citizens, and the burning of 800 houses during three days in 1576 ("the Spanish Fury"); and the siege of 14 months by the Duke of Parma (1584-85), to whom the city offered a heroic but ineffectual resistance, sapped the prosperity of Antwerp. Its population at the end of the sixteenth century had dwindled to 55,000, or less than half of what it had been at the beginning of the century. Its ruin was completed by the Peace of Westphalia (1648), which closed the navigation of the Scheldt. This impediment continued until 1863, except during the French occupation (1794-1814) and during the period when the city belonged to the kingdom of the Netherlands (1815-30). By 1800 the population had declined to less than 40,000. Napoleon then attempted to set it up as a rival port to London. During the Belgian Revolution of 1830 the Dutch general Chassé held the citadel for two years against the citizens, until he was forced to surrender by a French army under Gérard. After the revolution the growth of the city was rapid. Consult: J. P. Van Mol, *Guide to Antwerp* (Antwerp, 1886); E. Rowland, "Le Port d'Anvers," in *L'Economiste Français*, vol. ii (Paris, 1899); "The Great Fire at Antwerp, and its Effects," in *The Builder*, vol. lxxx (London, 1901).

ANTYL'LUS (Gk. Ἄντυλλος, *Antyllos*). A Greek physician and surgeon who is supposed to have lived in the third or fourth century A.D. He is said to have been a voluminous writer, but only the fragments of his works quoted by Oribasius are extant. Of these extracts, the most interesting describe his method of operating on aneurisms. This method is still used and known by his name. (See ANEURISM.) Antyllus is the earliest writer whose directions for performing tracheotomy are extant.

ANU, ä'nōō. The chief god of the Babylonian pantheon, the king and father of the gods. He seems to have been originally a Sumerian deity

representing heaven (ana), and the Akkadians also conceived of him as seated at the north pole of the ecliptic. He was "the great god" of Der (Dur-ilu, southeast of Bagdad) and had a temple at Uruk (see ERECH) which he shared with his daughter Nanai (Ishtar), as well as one at Assur (q.v.) which he shared with Adad (q.v.). A recently discovered Sumerian inscription, giving an account of the deluge, shows that Anu originally was the local god of a city bearing his name. The city has not been identified. With Ellil (of Nippur) and Enki or Ea (of Eridu) he forms a triad frequently invoked. But, like other heaven gods, he is not prominent in the cult and has more relations with the gods who flee to him for refuge than with men. As the functions of the old god Anshar (Ashur) had been transferred to Anu, so the citizens of Babylon regarded Anu as having transferred the rule of the world to their local god Marduk. Consult Jensen, *Die Kosmologie der Babylonier*, pp. 18, 272 (1890); Zimmern, *Die Keilinschriften und das Alte Testament: Religion und Sprache* (1902); Jastrow, *Die Religion Babyloniens und Assyriens* (1902-12); Jeremias, *Das alte Testament im Lichte des Alten Orients*, p. 94 (1906).

ANU'BIS (Gk. Ἄνουβις, *Anoubis*, hieroglyphic *Anúpu*). An Egyptian deity. His original seat of worship is not known with certainty, but there is some reason to believe that it was near Memphis. As his sacred animal, the jackal, haunts the desert valleys used as burial places, Anubis became the god of the necropolis and was supposed to conduct the souls of the dead down to the lower world, Amenthes, like the Greek Hermes Psychopompos. Hence the late Greek combination Hermanubis. Anubis was also the assistant of Osiris at the final judgment, and weighed in the scales the heart of the deceased against the feather, symbolic of truth and right. As the balance was found level or the reverse, the fate of the deceased was determined. When a more elaborate mythological system was formed, Anubis was made the son of Osiris by his sister Nephthys. The god is usually represented in human form, with the head of a jackal, which the Greeks changed into that of a dog and called the cities sacred to Anubis, Kynopolis ('Dog City'). Of these cities, the best known is that in Middle Egypt. In Roman times, when the Egyptian worship had spread to Italy, Hermes, who was identified with Anubis, sometimes had the dog's head among his insignia. For illustration, see EGYPT. See BABOON.

ANU'KIS (Egyptian *A nūqet*). An Egyptian goddess worshiped in the district around the first cataract of the Nile. She usually accompanies the god Chnum and is represented in human form, with a red crown of feathers on her head. For some reason now unknown she was identified by the Greeks with Hestia (Lat. Vesta). For illustration, see EGYPT.

ANU'RA (Gk. ἄν, *an*, priv. + οὐρά, *oura*, tail), of SALIENTIA (Lat. from *salire*, to hop, jump). An order of Amphibia embracing about 900 forms, including those that have no tail when adult. It is subdivided by Cope into three sub-orders: Aglossa, African and tropical American (Pipa) toads, and fossil forms; Firmisternia, frogs; Arcifera, toads. The two latter are now included in the sub-order Phaneroglossa.

ANURADHAPURA, ä-nōō'räd-ha-pōō'rä. A

ruined city in the northern part of Ceylon, 50 miles from Dambul. In ancient times it was the capital of the island and achieved considerable importance. In the last decade of the nineteenth century the surrounding jungle was thoroughly explored, and many new ruins were disclosed. Most of these have been set apart for conservation by the crown. The population in 1911 numbered about 3700.

A'NUS (Lat.). The external termination of the rectum. The anus is kept firmly closed by the *external* and *internal sphincter* muscles, the former of which contracts the integument around the opening and, by its attachment to the coccyx behind and to a tendinous centre in front, helps the *levator ani* muscle in supporting the aperture during the expulsive efforts that are made in the passage of the fæces or intestinal evacuations; while the latter, or *internal sphincter*, is an aggregation of the circular muscular fibres of the lowest part of the rectum and acts in contracting the extremity of the tube. The main function of the *levator ani* muscle is expressed in its name. It supports the rectum and pelvic structures and during the act of defecation lifts the lower end of the gut up from the mass of extruded fæces. The integument around the anus lies in radiating folds, which allow of its stretching without pain during the passage of the fæces; and the margin is provided with a number of sebaceous glands, which, in some of the lower animals, secrete strongly odorous matters. (See SCENT GLANDS.) Infants are occasionally born with an imperforate anus, or congenital closure of the rectum. In the simplest form of this affection the anus is merely closed by thin skin, which soon becomes distended with the meconium (q.v.). More complicated cases are those (1) in which the gut terminates some distance above the seat of the anus in a blind sac or pouch, (2) where the rectum terminates in the bladder, urethra, or vagina. Fortunately the closure by a layer of skin is far the most common form of imperforate anus, and the condition is readily relieved by a simple surgical operation. The complicated cases require opening of the abdominal cavity and creating an artificial anus in the lower part of the abdominal wall. If the condition of imperforate anus is neglected, the child dies in a few days as a result of intestinal obstruction.

Spasm of the sphincter ani is characterized by violent pain, with difficulty in passing fæces. On examination, the muscle feels hard, and resists the introduction of the finger. Spasm of the sphincter is a symptom of fissure, ulcer, or some other form of anal or rectal irritation. Suppositories containing opium or belladonna, introduced during the period of relaxation, are sometimes of use, and if there are ulcers or fissures they must be speedily treated. *Ulceration* around the anus, not extending within the orifice, is common in persons who are not cleanly, especially in women with vaginal discharges. The treatment consists in strict attention to cleanliness, and application of silver nitrate or carbolic acid. If the ulcer is seated partly *without* the anus and partly *within* the rectum, the distress is much more severe. *Fissure of the anus* is an affection consisting in one or more cracks, excoriations, or superficial ulcerations, situated between the folds of the skin and mucous membrane at the verge of the anus and only slightly involving the rectum. They give

rise to intense pain during the passage of the evacuations, and for some hours afterward to great discomfort, smarting, and itching. The treatment to be adopted is to endeavor to procure regular and somewhat soft evacuations, and to sponge with warm water immediately afterward, the parts being dried with a soft cloth. One or two applications of solid nitrate of silver will sometimes cure the disease, and an ointment of oxide of zinc, or one containing cocaine, will serve to allay irritation and promote healing. If these measures do not afford relief, the sphincter muscle must be dilated, the base of the fissure incised and curetted. *Pruritus ani*, which simply means itching and irritation of this part, is a symptom of certain morbid changes rather than a special disorder; but it is a very common affection, and is productive of much suffering. It is often associated with an unhealthy state of the intestinal secretions or with simple constipation; with uterine and ovarian diseases; kidney disease; diabetes; neurasthenia; tea, alcohol, tobacco, and opium habits; the presence of threadworms in the rectum; eczema, or other skin diseases; and it is peculiarly common in persons whose occupations are sedentary. The affection is often aggravated by the patient's being unable to refrain from scratching, which tends to create excoriations, ulcerations, and thickening of the skin. The treatment must aim to remove the cause, whether general or local. If the affection arise from worms, or a loaded state of the large intestine, enemata and purgatives will give immediate relief. If unhealthy excretions exist, attention must be paid to the diet, the bowels must be kept freely open, and strict local cleanliness observed. If there are any cracks or ulcers, these must be treated. In all cases of pruritus which have persisted for any length of time, the skin is found thickened and the redundant layers of epidermis must be removed and kept from re-accumulating by the application of suitable ointments. The other principal affections of the anus are *fistula*, *piles*, and *prolapsus*, which are discussed in special articles.

AN'VARI. A Persian poet famed for his panegyrics and for his verse in satiric vein. His full name was Auad-uddin Ali Anvari. He was born in the first part of the twelfth century, in the province of Khorassan. He first wrote under the title of Khavaran, from his native district; but he afterward adopted Anvari as his poetic epithet, and by this he is known to fame. He was educated at the collegiate institute at Tus (see FIRDAUSI), and he devoted his attention especially to astronomy; but finding more opportunity for preferment at court in literature, he composed a panegyric in honor of Sanjar, the ruler of Khorassan. This by its artistic grace immediately won him the royal favor, and he continued to enjoy the patronage of Sanjar's two successors as well. But Anvari's latter days were attended by ill luck. Employing his astronomical knowledge, he prophesied that a certain conjunction of the stars in October, 1185, would be accompanied by a frightful storm and dire disasters. The utter failure of the evil portents which were predicted drove him practically into banishment, and he withdrew to Nishapur and later retired to Balkh, where he died about 1190. Anvari's verses, as shown by his *Divan*, or poetical collection, are masterpieces of artistic form. With the consummate skill of a romantic panegyrist he combined, in high degree, the

subtle force of a keen satirist of the foibles and follies of his time. His elegy on the captivity of Sanjan has been pronounced one of the most beautiful in Persian literature. There is a lithographed edition of the *Divan* (Lucknow, 1880). Consult Ethé, in the *Grundriss der iranischen Philologie*, vol. ii (Strassburg, 1896-1904). See PERSIAN LITERATURE.

AN'VIL (ME. *anvelt*, AS. *anfilte*, of uncertain origin). An iron or steel block, with a smooth, flat face or top, on which malleable metals are hammered and shaped. Anvils vary in size from the tiny articles used by jewelers to the enormous anvil blocks of power hammers, which weigh several tons. (See HAMMERS.) Blacksmiths' anvils have a cone or horn at one end of the flat face and a socket for a chisel in the other end. They are commonly made of cast iron faced with steel, the steel face being placed at the bottom of the mold and the iron poured upon it.

ANVILLE, ä'n'vêl', JEAN BAPTISTE BOURGUIGNON D' (1697-1782). A French geographer. He was born at Paris and devoted himself to geographical and mathematical studies with such success that at the age of 22 he became royal geographer. He read the Greek and Latin historians and philosophers, as well as poets, noting the names and positions of cities and nations. He advanced the science of geography, not only by the number of maps (211) which he published, but also by publication of 78 memoirs full of erudition and of historic and critical details. Most of these are included in the *Recueil des mémoires de l'Académie des Inscriptions et Belles-lettres*. His great map of Africa was the most complete yet published. Among the most important of his works are *Atlas général* (1737-80) and *Atlas Antiquus Major*, with the *Géographie ancienne abrégé* (3 vols., 1769). His *Compendium of Ancient Geography* was published in English in London (1791) and in New York (1814). Consult O. Hartig, *Aeltere Entdeckungsgeschichte und Kartographie Afrikas mit Bourguignon d'Anville als Schlusspunkt* (Vienna, 1905).

ANZAN, än-zän', or **ANSHAN**, än'shän'. The name of an important city and also a country in the Zagros Mountains. Gudea of Lagash declares that he captured the city of Anshan. In the Nabunaid-Cyrus Chronicle Cyrus calls himself "king of the city of Anshan," and in the Cylinder Inscription he gives the same title to his father Cambyses, his grandfather Cyrus, and his great-grandfather Teispes. On the other hand, Anshan is mentioned with Elam, Simash, and Barachsu as a country in the inscription of Anumutabil of Der; and the booty of Ecbatana is said to have been carried by Cyrus to the land of Anshan. The priestly rulers in Susa under Babylonian suzerainty call themselves patesis of Susa and governors of Elam and Simash, but do not mention Anshan, or Anzan. Later, however, the independent kings in Elam in the twelfth century give themselves uniformly the title "king of Anzan and Susa." Eduard Meyer identifies Anzan with Susa, and much may be said in favor of this view. The objection based on the juxtaposition of Anzan and Susa may perhaps be met by the not improbable assumption that there were two cities, possibly on either side of the Choaspes—one where the native element continued to dominate, called Anzan, and the other where the Semitic influence since the

Akkadian conquest was more strongly felt, which was called Shushun-Susa. This would explain why Susa alone is mentioned by the patesis, and also by Asurbanipal; while the native kings put Anzan first, and the dynasty of Teispes used Anshan alone. It was in Anzan-Susa that the ancestors of Cyrus reigned for three generations, and the great conqueror himself from 559 to 550 B.C., when the capture of Ecbatana made him King of Media and Persia. Consult: Billerbeck, *Susa* (1893); Scheil, *Textes élamites-anzanites*, i, ii, iii (1901-07); Ed. Meyer, *Geschichte des Altertums*, i, 2, pp. 409 f. (1909). See SUSA; CYRUS.

ANZENGRUBER, än'tsen-grōō'bēr, LUDWIG (1839-89). An Austrian dramatist and novelist, born at Vienna. He left school early, and after spending some time as bookseller's assistant, became a strolling actor at the age of 20. While leading this life (1860-67), he wrote a number of plays, none of which met with success, then returned to Vienna to try his hand at literature, and finally accepted a clerical position in the police department of his native city. While thus employed he produced, in 1870, his *Pfarrer von Kirchfeld*, an anti-clerical drama, which caused a sensation and made him famous. He now decided to devote himself exclusively to literature. In the following year was performed the *Meineidbauer*, a powerful tragedy of peasant-life, by many considered his masterpiece. Even more popular proved his comedy *Kreuzelschreiber* (1872). All these plays were performed in the popular Theater an der Wien. In his dramas of modern Viennese life Anzengruber was less successful, but when he returned to the scenes and characters of the peasant life he knew so well, he achieved uniform success, as with his *G'wissenswurm* (1874) and many other plays. He showed the same power of character-drawing in his novels *Der Sehandfleck* (1876) and *Der Sternsteinhof* (1883-84). His pathos and humor are equally genuine. Although many of the characters in his plays and novels speak the dialect of Upper Austria and Styria, his works have won a conspicuous place in German literature, and several of his plays hold the German stage, at the present day. His *Gesammelten Werke* were published in 10 vols. (1890; 3d ed., 1897). Consult: A. Bettelheim, *Ludwig Anzengruber* (Dresden, 1891); R. Rosner, *Erinnerungen an Anzengruber* (Leipzig, 1891); S. Friedmann, *Ludwig Anzengruber* (Leipzig, 1902).

ANZIN, än'zän'. A town in the department of Nord, France, on the Scheldt, near Valenciennes, in the centre of a most productive coal-mining district (Map: France, N., J 2). Anzin has metal foundries, machine shops, glass-works, breweries, sugar refineries, and distilleries. Pop., 1901, 14,444; 1906, 14,387; 1911, 14,439.

ANZIO, än'zê-ō, formerly PORTO D' ANZIO. A Mediterranean seaport in the province of Rome, Italy, 33 miles southeast of Rome by rail (Map: Italy, G 6). It has fishing industries and, with Nettuno (pop., 1900), 1½ miles eastward, is a favorite bathing resort of the Romans. It occupies the site of Antium (q.v.). Excavations have brought to light remains of an ancient wall, but the modern town dates from the restoration of the harbor in 1698 by Pope Innocent XII. There are several palatial villas in the suburbs. Pop., 1901, 3561; 1911, 4506. Consult Sofredini, *Storia di Anzio* (Rome, 1879).

AOKI, ä'ō-kê, SHUZO (1844-1914). A Japanese statesman, born in Choshu. He was appointed

secretary of the Japanese legation at Berlin, in 1873, and afterward Minister there. He married the German Baroness von Rahden. In 1886-89 he was Vice-Minister of Foreign Affairs, in 1889-91, and in 1898-1900 Minister of Foreign Affairs. He became the first Japanese Ambassador to the United States in 1906, serving until December, 1907. Following his residence in Washington, he became a member of the Japanese Privy Council.

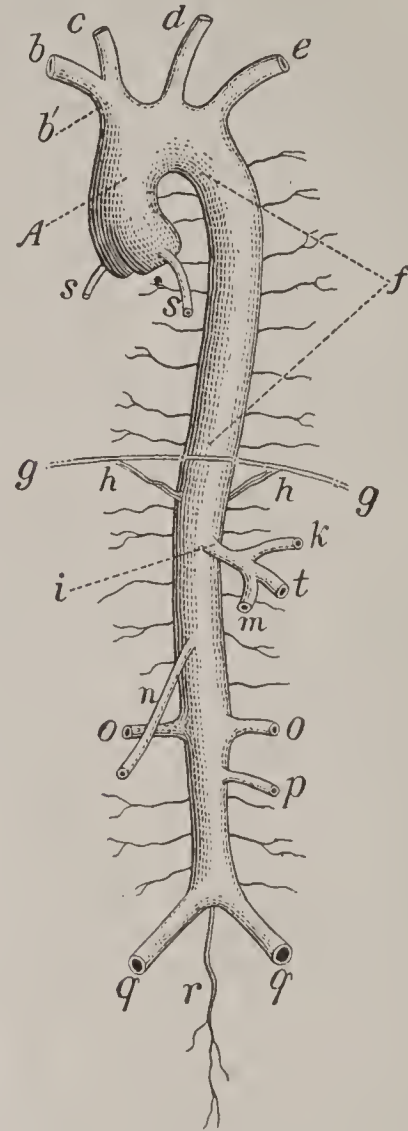

AOMORI, ä'ô-mô'rê, or **AWOMORI**, ä'wô-mô'rê. A seaport town of Japan, capital of the prefecture of the same name, situated at the northern end of Honshiu, on the Aomori Bay (Map: Japan, G 3). It is in the midst of the chief sphere of volcanic activity in the Empire. Pop., 1903, 34,857; 1908, 47,206.

AONIA, ä-ô'nî-â (Gk. 'Aovla). A district of Bœotia in ancient Greece. The Muses, as dwelling on Mount Helicon, in Aonia, were called *Aonides*.

A'ORIST (Gk. ἀόριστος, *aoristos*, without boundaries, undefined, unqualified, from *á*, *a*, priv. + *ὀρίζειν*, *horizein*, to divide, to bound). A form of the Greek verb which expresses the simple occurrence of an action in indefinite past time; it gets its name from the fact that it merely denotes "the occurrence of an action without any of the limitations as to *completion*, *continuance*, *repetition*, etc., which belong to other tenses." In distinction from the imperfect, the aorist expresses only the occurrence of an action or the entrance into a state or condition, while the imperfect represents an action or state as going on or as repeated in past time. Sometimes, too, in contrasts, the imperfect denotes attempted action, the aorist completed or successful action.

AOR'TA (Gk. ἀορτή, *aortē*, from *ἀείρειν*, *aeirein*, to lift, raise). The great arterial trunk which, rising from the left ventricle of the heart, sends its branches ramifying through the whole body. The aorta in man is subdivided by anatomists into the arch, the thoracic aorta, and the abdominal aorta. The *arch* is a loop with the convexity directed upward, forward, and to the right side, reaching at its highest part to a level with the second piece of the breastbone, and then descending to the left side of the fourth dorsal vertebra. Five arteries arise from the arch—viz., two coronaries, for the supply of the muscular tissue of the heart itself; the innominate, and the left carotid and left subclavian arteries. At the commencement of the arch are three small swellings or pouches, the aortic sinuses, below which are the three semilunar valves or folds of the lining membrane, which prevent regurgitation of the blood into the heart. The *thoracic aorta* extends from the fourth dorsal vertebra to the diaphragm, gradually occupying the mid line of the spine. The thoracic aorta gives off the bronchial arteries (two or three) to supply the tissue of the lungs; and some small branches (three or four) to the œsophagus, and intercostal arteries, to supply the walls of the chest (10 on left, and 9 on right side). The *abdominal aorta* extends from the diaphragm to the fourth lumbar vertebra, opposite the lower margin of which it divides into the two common iliac trunks. The abdominal aorta gives off the two phrenic arteries to the diaphragm; the cœliac axis, which divides into three large branches for the stomach, liver, and spleen; the superior mesenteric for the small, and part of the large intestine; the *renals* (two), one for each kidney; the *supra-renals* (two); the spermatic; the inferior mesenteric,

for the lower part of the large intestine; and four or five lumbar arteries, which supply the lower part of the abdominal walls (the loins). Where the aorta bifurcates, a small artery, the sacra media, or caudal artery, arises, and passes along in the mid line; in fish and in animals with large tails, this branch is a continuation of the aorta.

AORTA.

A, ascending arch of aorta; ss, coronary arteries; b', innominate artery; b, right subclavian; c, right carotid; d, left carotid; e, left subclavian; f, thoracic aorta; gg, diaphragm; hh, phrenic arteries; i, cœliac axis; k, coronary or gastric; t, splenic; m, hepatic; n, superior mesenteric; oo, renal arteries; p, spermatic; q, common iliac; r, middle sacral.

The above is the usual arrangement; but occasionally it varies, especially in the number of arteries springing from the arch. During fetal life there is a communication between the arch of the aorta and the pulmonary artery called the *ductus arteriosus*, the canal of which becomes obliterated after birth. The velocity of the blood current in the carotid artery has been estimated at 300 to 500 millimeters per second. For diseases to which the aorta is subject, see ARTERY; ARTERIOSCLEROSIS.

AOSTA, ä-ôs'tâ (anciently Lat. *Augusta*). A town in north Italy, on the left bank of the Dora Baltea, 49 miles northwest of Turin (Map: Italy, B 2), the site of the Roman Aosta, founded by Terentius Varro after he conquered the Salassi. There are many evidences of the Roman occupation still extant, their walls being especially well preserved. The Arch of Augustus, a cathedral said to have been founded by St. Eusebius, the Leper's Tower, celebrated in Xavier de Maistre's works, and the ruins of Bramafame Castle, belonging to the Counts of Challant, are all very noteworthy. The chief trade is in leather, cheese, and wine. The province is rich in iron, copper, and lead, in its pine forests, and in mineral springs, of which the most famous

are those of Courmayeur, Pré-Saint-Didier, and St. Vincent. Pop., 1881, 7437; 1901, 7875; 1911, 7008.

AOSTA, DUKE OF. A title of the House of Savoy, borne by Amadeus, a former King of Spain, and now by his son, Emmanuel Filibert.

AOUDAD, ä'oo-dād (Moorish name). The wild sheep of the mountains of northern Africa (*Ovis tragelaphus*), usually known as Barbary sheep. It is somewhat goatlike in form, 3 feet in height, and light brown in color, with very long whitish hair growing from the throat, chest, and about the forelegs. Its horns resemble those of the bharal, and do not exceed 24 inches in length. This animal is common in the high Atlas ranges, where it wanders over the more precipitous regions of their arid southern slopes from the Atlantic to Tunis, keeping within sight of the Desert, and hiding among the fantastically decomposed and bushy rocks of those limestone mountains with singular skill. The animal has many names. In menageries, where it breeds and lives well, it is often labeled "ruffed mouflon" or "bearded argali"; the Moors of Algeria call it "aoudad," but the natives there know it as "arūi"; it is the "kebsli" of the Egyptians, and the "tidal" or "teybel" or "beyden" of Nubia. (See Plate of WILD GOATS, ETC.) For habits and methods of chase, consult E. N. Buxton, *Proceedings Zoölogical Society of London* (1890) and id., *Short Talks* (London, 1898); Lydekker, *Wild Oxen, Sheep and Goats* (London, 1898).

APACHE, ä-pä'chā. A general name applied to several divisions of Athapasean-speaking tribes in New Mexico and Arizona. These are now designated as Jicarillas (northern New Mexico), Mescaleros (southern New Mexico), Chiricahua (Fort Sill, Okla.), White Mountain, and San Carlos (both in eastern Arizona). They formerly roved in small bands over an extensive territory in southeastern Arizona and southwestern New Mexico and extended their forays far down into Mexico. Although essentially predatory in habit and carrying on constant raids against the Mexican settlements, they remained on friendly terms with the Americans until provoked by outrages about the time of the annexation of their country by the United States, after which their condition was one of chronic hostility toward the citizens of both governments until they were finally subdued and confined to their present reservations. Upon the surrender of the last hostile band, the Chiricahuas, in 1886, such energetic protest against their continued presence in the Territory was made by the people of Arizona that the whole Chiricahua band was deported to the East and, after some years of military confinement in Florida and Alabama, was settled at Fort Sill, Okla., on the Kiowa Reservation, where the few survivors and their descendants are still held as military prisoners. In 1900 the Apache tribe, including 300 Chiricahuas at Fort Sill, numbered 5200 souls. The Lipans, although spoken of as Apaches on account of their linguistic affinity, are a distinct tribe, and hostile to the Apaches.

APACHE CAÑON. See GLORIETTA.

APACHE TIM'OTHY. See CANARY GRASS.

APAFI, ö'pö-fi, or **ABAFI**, ö'bö-fi, **MICHAEL I** (1632-90), Prince of Transylvania. He accompanied Prince George II in an expedition against the Poles in 1656, was taken prisoner by the Tatars, and after his release returned to his estate. In 1661 he was chosen Prince of Transylvania, through the support of Ali Pasha,

generalissimo of the Turkish forces under Sultan Mohammed IV. During the peace concluded with Austria after the battle of St. Gotthard (1664), he reigned peaceably under the protection of the Porte. He remained faithful to the Ottoman power till after the siege of Vienna in 1683. Fortune then changed. The Imperial troops invaded the country; and in August, 1687, Apafi made a treaty with the Emperor by which Transylvania was declared to be freed from Turkish suzerainty and placed under Austrian protection. At Fogaras the Transylvanian deputies, assembled at the National Diet, took the oath of fealty to the Hapsburgs as legitimate monarchs of Hungary. Ever since the death of his wife, Anna Bornemitz, in 1688, Apafi had been sorely afflicted both in body and mind, and died (April 15, 1690) on the eve of a fierce retributive war, commenced by his old allies, the Turks, who considered themselves ill-used by his desertion of them. His son, **MICHAEL II** (died 1713), succeeded to the throne and its perils. The Turks, under the vizier Kiuprili, overthrew the Imperial army, but the internal troubles of the Ottoman Empire hindered them, or rather Count Tökölyi (q.v.), whom they were supporting, from reaping the fruits of their successes. The Imperial troops subsequently regained everything. By the Treaty of Carlowitz, 1699, Transylvania was incorporated with Hungary, and the young Transylvanian prince was inveigled to Vienna and cajoled into giving up his dominions to Leopold I of Austria in lieu of a pension of some 15,000 florins.

APALACHEE, ä'pä-lä'chê, or **APALACHI**, ä'pä-lä'chī. A tribe of Muskogean stock formerly occupying the country about Apalachee Bay, northwestern Florida. About the close of the sixteenth century Spanish Franciscan priests established missions among them, which continued in a prosperous condition for more than 100 years, until invaded in 1702-08 by the English from Carolina, accompanied by a large force of Indian auxiliaries. In three several expeditions the mission churches were burned, the missionaries slain, and the Apalachee tribe practically wiped out of existence, more than 1000 prisoners being brought back to be sold as slaves in Carolina or distributed by the English among their savage allies. A large number were thus incorporated among the Creeks, where for a time they preserved their name and language, but are now extinct. Consult Gatchet, *A Migration Legend of the Creek Indians*, pp. 74-76 (Philadelphia, 1884).

AP'ALACH'EE BAY. An arm of the Gulf of Mexico near the northwestern part of Florida, extending about 50 miles inland (Map: Florida, D 1). It receives the waters of St. Mark's River, at the mouth of which stands the town of the same name. Its average depth is 18 feet, and it affords a good harbor for small craft.

APALACHICOLA, ä'pä-läch-ī-kō'lā. A city, port of entry, and the county-seat of Franklin Co., Fla., 85 miles southwest of Tallahassee, on St. George Sound (Gulf of Mexico) at the mouth of the Apalachicola River and the Apalachicola Northern Railroad (Map: Florida, C 2). The value of its foreign commerce amounted in 1912 to about \$700,000, consisting almost entirely in the export of lumber, other commodities, with imports, forming a very insignificant share. Pop., 1900, 3077; 1910, 3065.

APALACHICOLA. A river formed by the junction of the Chattahoochee with the Flint, at

the southwest corner of the State of Georgia. Thence flowing southward through Florida, it empties into Apalachicola Bay, an arm of the Gulf of Mexico. It is navigable for steamboats through its entire course of 90 miles.

APALIT, ä'pá-lét'. A town of Luzon, Philippines, in the province of Pampanga (Map: Luzon, E 7). It is situated 8 miles southeast of Bacolor, on the right bank of Rio Grande de la Pampanga, and had a population in 1903 of 12,206.

APAME'A ('Απάμεια). The name of several cities in western Asia. 1. A treasure city of the Seleucidæ (q.v.), in the valley of the Orontes, in Cœle-Syria. It was destroyed by Chosroes (q.v.), in the seventh century A.D., but was rebuilt. The Arabs called it Famia. It was still of consequence in the time of the crusades. 2. A city in Phrygia, founded by Antiochus Soter, near Celænæ, not far from the junction of the Marsyas and the Mæander. Here, in 188 B.C., was signed the treaty between the Romans and Antiochus the Great (q.v.). From Sulla's time it was an important centre of trade, thanks to its favorable position; many Italians and Jews resided there. From the third century A.D. it began to decline. Since the thirteenth century it has belonged to the Turks. Many important Greek and Roman inscriptions have been found on the site.

AP'ANAGE. See APPANAGE.

APAR, ä'pär. See ARMADILLO.

APAREJO, ä'pá-rä'hô (Sp. pack saddle). A leather bag about 2 feet wide, nearly encircling the mule or horse on which it is placed. The aparejo is used in the United States army as a substitute for the pack saddle (q.v.). Two round hand holes are placed in the middle of each side, the two side pouches of the bag being braced by small ash or other elastic wooden sticks and stuffed with hay or moss. The advantages claimed are that it distributes the load to greater advantage than any other system of pack transport and secures better results from the animal. In the United States mountain artillery and pack trains the aparejo is used to the exclusion of all other systems of pack transportation.

APARRI, ä-pär'rê. A town of Luzon, Philippines, in the province of Cagayan, 54 miles north of Tuguegarao. It is situated on the northeastern coast, at the estuary of the river Cagayan, is the chief port for coasting and ocean trade on the north, and is the base for river navigation. Under Spanish domination it was the residence of a port captain. It is the northern terminus of a highway and telegraph line across the island to Manila. Pop., 1903, 18,252.

APARTMENT HOUSE. A building containing a number of distinct dwellings, or "apartments," of several rooms each. A tenement house conforms to this definition; and in New York and the United States generally, there is no legal distinction between tenements and apartment houses. In English and American usage, however, an apartment house differs from a tenement by superior design, finish, equipment, and cost; not by size, nor by number of rooms. The term "flats," sometimes applied in England to high-class apartments, is usually in the United States restricted to apartments in houses having no elevator or hall service. There are in American cities various classes of apartment houses, most of which have their analogues in at least the larger European cities. The chief are: (1) apartment hotels for either transient

or permanent occupants, having suites of from two or three to six or even seven furnished rooms cared for by the hotel servants, a hotel office, and a public restaurant, with other conveniences for families or individuals desiring to escape the cares of housekeeping; (2) ordinary apartments, usually of from five or six to nine or more rooms, besides from one to three bath-toilet rooms to each suite, such apartments being let by the year unfurnished; (3) bachelor apartments of two or three rooms and bath, furnished or unfurnished; (4) small unfurnished flats of three, four, or five rooms, for families of moderate means; (5) "duplex" apartments, each suite having rooms on two different floors; (6) studio apartments, having studios occupying the height of two stories, with dwelling rooms, etc., on two floors adjacent thereto; (7) coöperative apartment houses owned jointly by the tenants or by some of them, in which case the rents paid by the others go to the joint account of the owners. Some houses combine the features of two or more of the above classes. All American apartment houses of more than four stories (except some of the earliest built, and the "flats") have elevators, hall attendance, heat, hot-water supply, and electric lighting, and in many flats all these are found except the first two. In Europe generally most of these features are lacking, except in the newest and most expensive buildings. The most recent German examples, however, at least in Berlin, are said to rival or surpass the best American practice in these respects.

Features common to American apartment houses generally may be enumerated as follows: 1. A public entrance leading to a hall which gives access to elevators and stairs, usually with an adjoining reception room (unless itself fitted up as a reception hall); in many cases a telephone exchange, served either by a special clerk or by the hall attendant, provides communication with every apartment. 2. A special entrance for servants and tradesmen, leading to a dumb-waiter or service elevator and service stairs in the rear. 3. Each apartment has its outer door from the public lobby or stair-landing, opening into its own corridor either directly or through a so-called "foyer" or private reception hall. 4. Each apartment comprises a parlor, dining room, pantry, kitchen, bath-and-toilet room, and from two to five or six bedrooms. Larger apartments may have library, music room, dressing rooms, several servants' rooms, refrigerated storeroom, and several bath-and-toilet rooms. 5. Hot and cold water supply in kitchen, pantry, bathrooms, and dressing rooms. 6. Steam or hot-water heating. 7. Electric lighting. In many modern apartments and flats the kitchen is equipped for cooking by gas only, and in the more elaborate and costly houses a vacuum-cleaning plant and artificial refrigeration for the pantry or storeroom, are provided. In the smaller apartments the laundry tubs are in the kitchen; in the larger ones usually on a top floor in a general laundry (or rarely in the basement), and steam drying-closets are provided in connection with them. Servants' rooms are either connected with each suite or grouped all on an upper floor. Storage rooms are provided in the basement. Many houses have a restaurant or common dining room for those averse to the cares of cooking and of the table. Some apartments have roof gardens. There is the greatest variety in the

number and size of rooms. In European apartment houses generally the rooms are larger than in most American examples and the bedrooms, at least, better lighted. The European street lay-out, resulting in a fundamentally different ground plan of the house, permits of greater street frontage than is practicable in New York or in many American cities, and of lighting more rooms from the street. Moreover, the European houses (of which the Parisian are typical) are usually built around spacious courts, giving abundant light and air to even the minor service rooms, which in American houses (especially the older New York houses) are too often lighted and ventilated from narrow courts or shafts. Since the enactment of the Tenement House Law (q.v.) in New York the practice there has greatly improved, owing to the legal regulation of the sizes of courts—many houses having large interior garden courts; others, courts open to the front on the street. The defective street layout and the tendency to congestion in American cities have combined to limit the size of the rooms in apartment houses. The economy of space has been carried so far that in some Western examples the beds are by day folded into the wall out of sight, so that the same room may serve both as a reception room or living room and as a chamber—a highly objectionable and unsanitary device for making two or three rooms serve the purposes of four or five. The rental of apartments in New York, where they average higher than in most cities, ranges from \$30 to \$1000 a month, or at the rate of from \$6 to \$60 a month per room. In Paris, while the upper limit of rentals is as high as in New York, one can obtain much more spacious and desirable accommodation at the lower rates, say from \$40 to \$120 a month: the same is true of Berlin and Vienna, except that the upper limit is not so high.

Historical Development. In some European cities, like Paris and Rome, individual or one-family houses have for at least two centuries been attainable only by the rich, people of moderate means occupying hired lodgings in large buildings, each family having one floor ("flat," in English parlance) or half or quarter of a floor; in many cases in a "palazzo" or mansion fallen from its former glory, whose large apartments have been cut up into smaller rooms for humbler tenants. In Paris great blocks of apartments were erected under the Second Empire (1852–70), designed with considerable architectural skill, though lacking many of what Americans call "modern conveniences." In the better class of these *maisons de rapport* the façade is of monumental design, with continuous balconies above the basement and at the top story; the entrance driveway (*porte cochère*) into the court, the entrance lobby, stairs and stair halls, and the *salon* of each apartment, being treated with elaborate architectural finish. The rooms are large, but the kitchen equipment and plumbing are primitive, there is no elevator, rarely a bathroom (in the English or American sense), and no hot-water supply. Sunlight and air, however, abound. In the more recent French apartments, built since 1900, modern conveniences are more generally to be found, though the elevator is usually a small "automatic" affair whose use for descending is forbidden! The absence of good elevator service is due to the fact that the height of buildings is limited

by law, so that there are seldom more than five or six stories (*rez-de-chaussée, entresol, premier étage, deuxième étage, etc.*, and *mansarde*). In Germany and Austria the apartment houses have generally followed French models. In London the apartment house has never been very popular, and there is no well-marked type of design. The too prevalent refusal to lease apartments for less than two or three years, and the conservatism with regard to elevators and other conveniences, partly explain this. In the United States the earliest apartments, built in New York between 1870 and 1875 to meet the changed conditions following recuperation from the Civil War were primitive affairs, both in design and construction. A rapid extension and improvement came with the improvement of the elevator, the development of fireproof building, and the introduction of electric lighting, about 1880. A further stimulus was given by the adoption of steel-frame construction in Chicago and New York, and later by the consolidation of Greater New York in 1898. The growth in number, size, and splendor of New York apartment houses since 1900 has been phenomenal. During the past 20 years other cities have built apartment houses in great number, even small cities and suburban towns yielding to the movement, as providing a relief from many cares incident to life in a private house. For the apartment house, with its janitor service, hall attendance, central heating and hot-water supply, elevators, and apartments each with rooms on one floor, makes possible housekeeping with one or two servants (or even none at all), where from three to six would be required in a private house. Indeed, the difficulty of securing good domestic service in America has been the strongest influence favoring the development and multiplying of apartment houses. The prevalence of the system in Paris, Berlin, Vienna, and Rome is due to other causes, largely local. The influence of apartment-house life upon the family and society is a serious problem not yet studied as it deserves to be.

For the legislation concerning apartment houses, see TENEMENT HOUSE LAWS. For the general literature of the subject, consult the files of English, American, and European architectural periodicals; also Daly, *L'Architecture privée au XIX^e siècle* (Paris, 1877); Guadet, *Théorie de l'architecture*, vol. iii (Paris, 1902); Perks, *Residential Flats of All Classes* (New York, 1905).

APASTAMBA, ū'pā-stūm'bā. An ancient Sanskrit author, noted in connection with Vedic literature because of the *Srauta-, Grhya-, Dharma-, and Kalpa-Sūtras*, which bear his name. See VEDA.

APATIN, ō'pō-tin. A town of the kingdom of Hungary, in the county of Bács-Bodrog, situated on the left bank of the Danube, about 45 miles southwest of Maria-Theresiopel (Map: Hungary, F 4). Its chief industry is the manufacture of rope made from the hemp raised in the vicinity. A Roman intrenchment, the Römerschanze, 13 feet high and 20 feet broad, is the greatest point of interest. Pop., 1900, 13,940; 1910, 16,798 (mostly Germans).

AP'ATITE (from Gk. ἀπάτη, *apatē*, deceit, as the mineral has often been mistaken for other minerals). A mineral consisting of phosphate with some chloride and fluoride of calcium, its composition being represented by the formula $3Ca_3(PO_4)_2 + Ca(ClF)_2$. It occurs both

in crystalline and amorphous form and is largely used in the manufacture of fertilizers, for which it is valuable on account of the contained phosphoric acid. It occurs in both stratified and crystalline (metamorphic and igneous) rocks, especially in the latter. It is thus found in the older crystalline rocks in Canada, New York, Maine, and New Jersey; in Europe it is known in England, France, Saxony, Tyrol, Bohemia, Spain, Norway, etc.; but the only deposits of economic importance are those of Canada, Norway, and Spain. Most of the Canadian material that has been shipped contains 85 per cent of the phosphate of lime. In recent years the enormous deposits of rock phosphate or amorphous phosphate of lime have seriously injured the Canadian trade.

Phosphate Rock. Amorphous phosphate, or phosphate rock, is a name given to non-crystalline deposits of phosphate of lime occurring in more or less abundance at certain localities and of importance as a source of fertilizer. In the United States the most important deposits under active exploitation are in South Carolina, Florida, and Tennessee, but small quantities are obtained in Arkansas and some of the Rocky Mountain States. The Florida deposits, which have been worked since 1888, are found near the western coast. They occur as lumps imbedded in clay, known as rock phosphate; in pebble agglomerations, known as land pebble; or as a mixture of small pebbles and sand in the river bottoms called river pebble. The latter mixture is obtained by dredging, the sand being eventually separated by screening. The South Carolina deposits are found in an area about 60 miles long, between Charleston and Beaufort. The phosphate occurs in nodules buried in sand and clay, the productive bed being one to two feet thick. An acre yields 400 to 1200 tons. The South Carolina district was opened up in 1867. Both the Florida and South Carolina deposits occur associated with rocks of Tertiary age, and many teeth of sharks, elephants, etc., together with bones, are found with the phosphate. The phosphoric acid of the mineral is supposed to owe its origin to the accumulation of excrement and decaying animal matter deposited along the shores or in pools during Tertiary times, and to subsequent local replacement of limestone, or to concretionary segregation of phosphate of lime. In south central Tennessee, the phosphate is associated with Ordovician, Devonian and Post-Tertiary rocks. Enormous beds of phosphate have been recently uncovered in the States of Idaho, Utah, and Wyoming, constituting altogether the largest resources of that material in the world. They consist of rock phosphate, phosphatic shales, and cherty layers, with a thickness up to 200 feet, inclosed in Carboniferous limestone. They appear to offer an almost inexhaustible source of supply that will be drawn upon extensively, no doubt, when the southern deposits become depleted. The phosphate industry of the United States has assumed great importance in recent years, and much of the material is shipped to foreign countries. The annual output greatly exceeds that of any other country; though Tunis and Algeria have recently come into prominence as producers of the material. Crude rock containing less than 50 per cent of calcic phosphate is unsalable. Siliceous impurities are inert, but alumina and ferric oxide are bad, because they tend to change

the refined phosphate back to an insoluble condition. Lime, if present, neutralizes some of the sulphuric acid used in the manufacture of the fertilizer. The price of phosphate varies from year to year, and with its grade. The Florida hard rock averages the highest in phosphoric acid and commands extensive markets by reason of its accessibility to shipping points. The present output of phosphate rock in the United States exceeds 3,000,000 tons a year with a value, approximately, of \$12,000,000.

For general information, the reader is referred to the paper by Adolphe Carnot: "Sur les variations observées dans la composition des apatites, . . . Remarques sur le gisement et le mode de formation de ces phosphates" in the *Annales des Mines*, vol. x (Paris, 1896). Papers descriptive of the phosphate deposits of particular regions are: Branner, "The Phosphates of Arkansas," in the *Transactions of the American Institute of Mining Engineers*, vol. xxvi (New York, 1896); Hayes, "The Tennessee Phosphates," in the *Sixteenth Annual Report of the United States Geological Survey*, part iv (Washington, 1895). For information on the western phosphate deposits, consult papers by Gale and Richards, and a separate paper by Blackwelder, *Bulletin No. 430, United States Geological Survey*.

APATU'VIA. See FESTIVALS; GREEK FESTIVALS.

APAYAO, ä-pí'you. A head-hunting people living in Apayao sub-province and Ilocos Norte, Luzon. They are a dialect group of the Tinguian. See PHILIPPINES.

APE (AS. *apa*, Ger. *Affe*). A monkey; any quadrumanous animal, especially one of large size, and belonging to the Old World. (See below.) Thus, the "apes of Gibraltar," or "Barbary apes," are macaques (q.v.), and some "sacred apes" are baboons. (See BABOON; MACAQUE; MONKEY.) More particularly the word nowadays applies to simians (family Simiidae), called "anthropoid apes," because they most resemble mankind.

The *Anthropoid Apes* consist of the chimpanzees, gorilla, and orang, the gibbons, together with several extinct and fossil species; but the three forms first mentioned are those usually in the mind of those who use the term in its popular sense. All approach, and some may exceed, man in size, frequently assume an erect attitude (though none are so much at ease in this position as are some gibbons), and resemble him in

(Right) GAMBIAN CHIMPANZEE (*Pan chimpanse*).

3. GORILLA (*Gorilla gorilla*).
4. SIAMANG GIBBON (*Symphalangus syndactylus*).

structure more closely than they do the apes and monkeys of other families. This is much more marked in young examples, however, than in the adults, which in advanced age become more and more brutish. This is particularly true of the characteristics of the skull, where huge, bony "crests" and super-orbital ridges develop, the canine teeth become greatly enlarged, and a revolting expression of face reveals the essentially savage and intractable nature of the animal, which, enforced by gigantic strength, renders these apes among the most formidable and ugly of wild beasts. The skeleton is substantially similar to the human skeleton, differing from it in greater size and weight and in certain proportions; the arms also are relatively much longer, and the legs shorter, and the great toe is longer and opposable only to a very limited degree. The spine lacks those curvatures in its lower part which enable man to stand erect with ease. In the flatness of the sternum and the absence of a certain small bone in the wrist these apes agree with man and differ from the monkeys. The skull is thicker, has in age great bony ridges, and projects at the muzzle; the teeth are of the same number and character as man's, but they are not set in a horseshoe form, but more nearly on three sides of a square, the front teeth making a decided angle with the cheek teeth, where the canines are developed into great tusks. The brain-case is smaller, and the bulk of the brain far less than that of man. Thus, according to Mivart, a normal human brain never measures less than 55 cubic inches, while that of the chimpanzee (the nearest) measures only 27½ cubic inches; the cerebrum is also relatively shorter. In its general form and structure, however, the brain of these apes is like that of man and is richly convoluted. There are no important differences in the soft parts of the body or their functions.

Externally, all the anthropoid apes are covered with black, brown, or reddish coarse hair, on all parts of the body except the face and palms, where the skin is dark, leathery, and wrinkled; the naked patches and callosities so frequently found upon the buttocks of the lower apes are absent or very small; nor are there any cheek pouches. There is no trace of a tail. The chimpanzee and gorilla are closely related to one another, but the orang is as distinct in structure from them as it is widely removed in habitat. All are inhabitants of the equatorial regions of the Old World, and restricted to forests, where they live in the trees, building rude sleeping platforms and shelters, and feeding wholly upon vegetable food—chiefly fruits. See CHIMPANZEE; GIBBON; GORILLA; ORANG-UTAN; MONKEY; and Plate of ANTHROPOID APES.

APEAK'. See ANCHOR.

APEL, ä'pel, JOHANN AUGUST (1771–1816). A German scholar and author. He was born at Leipzig, studied there and at Wittenberg from 1789 to 1793, and in 1801 was an alderman at Leipzig. He wrote several dramas, drawn largely from antiquity and slightly esteemed, a *Gespenssterbuch*, collections of short stories (4 vols., 1810–14), and a *Wunderbuch* (3 vols., 1815–17) both popular. The first of them contained the story of *Der Freischütz*, which formed the basis

for the text of Weber's opera of that name. He is perhaps best known for his *Metrik* (2 vols., 1814–16), which was a step forward in the understanding of ancient prosody.

APELDORN, ä'pel-dörn, or **APELDOORN**. A beautiful town in the Netherlands, province of Gelderland (Map: Netherlands, D 2). It is situated about 17 miles north of Arnhem, on a canal which joins the river Grift, a branch of the Yssel. Near Apeldorn is the royal château Het Loo, originally a hunting lodge of the Duke of Gelderland and a favorite palace of William III of England when Stadtholder. It is now the summer residence of Queen Wilhelmina. The principal industry is paper making, the produce of the numerous mills being in large part exported to the East Indies. Pop., 1890, 19,190; 1900, 25,761; 1910, 35,838; 1911 (est.), 37,517.

APELLES, ä-pěl'ēz (Gk. Ἀπελλῆς). The most celebrated painter in ancient times, the son of Pytheas, and probably a native of Colophon, on the Ionian coast of Asia Minor. The statements that he was a native of Cos or of Ephesus seem due to his long residence in those places. He was probably made a citizen of Ephesus, and may have died at Cos, which afterward possessed an unfinished painting by him. He lived during the latter part of the fourth century B.C. He first studied at Ephesus, under Ephoros, and afterward at Sicyon under the celebrated teacher Pamphilus of Amphipolis, where he may have learned the fine drawing in which he excelled. From Sicyon he seems to have gone to Pella in Macedonia, where he painted portraits of Philip and became the friend of Alexander, who sat to no other painter, though frequently to him, and permitted him much freedom of speech. His most celebrated portrait represented Alexander wielding the thunderbolt, of which it was said "of the two Alexanders, Philip's is invincible, Apelles's inimitable." He also painted portraits of some of the generals of Alexander. His most celebrated works were mythological or allegorical. Very famous were his "Anadyomene" (q.v.) and his "Artemis Surrounded by Maidens." Of his painting of "Slander," in which also appeared Ignorance, Suspicion, Envy, Deceit, Remorse, and other personifications, Lucian gives a detailed description which has inspired Botticelli, Dürer, and other artists. He seems to have returned to Asia after Alexander's conquests, and most of his celebrated works were found in Asiatic cities. At Rhodes he visited the painter Protogenes, and is said to have contributed to his reputation by offering a high price for one of his pictures. He was generous in his appreciation of his rivals, though fully aware of his own merits. He admitted that Melanthius surpassed him in grouping, and Asclepiodorus in symmetry, and that Protogenes was inferior only in never knowing when to stop, which deprived his pictures of the grace that Apelles claimed as his own. He seems to have been remarkable for his accuracy of drawing and fine coloring, probably due to a thorough theoretical and practical training. The industry with which he practiced drawing was so great as to give rise to the proverb which, in the Latin version, is *Nulla dies sine linea*. Many anecdotes are related of Apelles. When his works were exposed to public view, he used to place himself behind a picture, to listen to the criticisms of the common people. A cobbler having detected a fault in the shoe of one of his figures, it is stated that Apelles instantly

rectified it; but when the cobbler, on the following day, extended his criticism to the legs, the painter rushed from his hiding-place and told the cobbler to stick to the shoes, or, in the Latin version, which has become proverbial, *Ne supra crepidam sutor judicaret*. Consult: Pliny the Elder, *Historia Naturalis*, xxxv, 91 ff.; Woltmann and Woermann, *History of Painting*, vol. i (Eng. trans., New York, 1886); Houssaye, *Histoire d'Apelles* (Paris, 1867); Wustmann, *Apelles' Leben und Werke* (Leipzig, 1870).

APEL'LICON OF TEOS (died 84 B.C.). A wealthy bibliophile, born at Teos, but later a citizen of Athens. He gathered a great library, in part by purchase, in part by theft of original documents from the archives of Athens and other Greek cities. He is known now chiefly for the part he played in preserving the writings of Aristotle.

APELT, ä'pelt, ERNST FRIEDRICH (1812-59). A German philosophical writer, born at Reichenau. He studied at Jena and Leipzig and was made professor of philosophy at Jena in 1840. His works include: *Die Reformation der Sternkunde* (1852); *Die Theorie der Induktion* (1854); *Metaphysik* (1857); *Parmenidis et Empedoclis Doctrina de Mundi Structura* (1857); *Religionsphilosophie* (1860).

AP'EMANT'US. A churlish cynic in Shakespeare's *Timon of Athens*, supposed to have been modeled after the sketch of a similar character given in Lucian's *Public Sale of Philosophers*, a work with which Shakespeare might easily have been acquainted.

APENNINES, äp'e-ninz (It. *Appennino*; Lat. *Mons Apenninus*, Apennine Mount, from Cym. Celt. *pen*, hill, summit, promontory). A mountain chain belonging to the system of the Alps and extending uninterruptedly throughout the whole length of the Italian peninsula. Its separation from the Maritime Alps is purely conventional, there being no change of structure, and the beginning is usually taken to be about at longitude 8° E., the actual division being one of the passes there, generally that called Bocchetta dell' Altare, a few miles from Savona. From this point the chain, under the name of the Ligurian Apennines, girdles the Gulf of Genoa in the immediate vicinity of the sea, and then runs slightly south of east inland almost across the peninsula at lat. 44°, and then southeastward, forming the watershed between the Adriatic and the Mediterranean, but gradually approaching the eastern coast, till, in the highlands of the Abruzzi, it borders close upon it; after which it takes a more southerly direction, traversing Calabria. The formation of the uplift on the north coast of Sicily being the same as that in Calabria, the Apennines may be considered to continue and terminate in that island. The total length is about 800 miles, and the breadth varies from 25 to 85 miles.

Geographers divide the Apennines as follows: 1. The North Apennines, from the Col di Tenda, or the Bocchetta dell' Altare, in the Maritime Alps, to the pass of Borgo San Sepolcro, in the neighborhood of Arezzo, on the eastern border of Tuscany. 2. The Central Apennines, from Arezzo to the valley of the Sangro. 3. The South Apennines, from the valley of the Sangro to Cape Spartivento, terminating in the height called Aspromonte (6420 feet). To these may be added, as a fourth division, the Insular Apennines, or Sicilian Range. The first division is generally subdivided into (a) Ligurian, (b) Tuscan, (c)

Umbrian. The leading feature of the Apennines, wherever they approach the coast, is their extraordinarily steep declivities; while in Middle Italy and the adjoining portions of Upper and Lower Italy, long, terraced plateaus, lower ranges, and finally, relatively extensive coast plains mark their gradual descent on the west. The general name for these lower ranges is Sub-Apennine; but they have a variety of specific designations, such as the mountains of Carrara and Seravezza, Protomagno and Monte Amiata, in Tuscany; the Sabine, Alban, and Volscian mountains in the former Papal States; Monte Gargano on the southeastern coast, north of Manfredonia, etc. The main chain of the Apennines does not send off spurs into the Apulian Peninsula or heel of Italy, which in the main is rather level, or only interspersed with detached groups of hills. The principal chain exhibits for the most part a dreary and barren appearance, somewhat like a vast wall, with very few projecting peaks to break the dull monotony of the scene, and therefore seldom furnishes any salient points on which the eye of the spectator can rest with pleasure. Naked, riven, covered with thick débris, the declivities seem as if scorched by the southern sun. Only in the Abruzzi, in the Sub-Apennines, and especially in the marble-bearing mountains of Carrara and Seravezza do the bold and magnificent forms of the Alps reappear.

The average height of the entire chain of the Apennines is about 4000 feet, which, however, in the north sinks down to little more than 3500 feet, and in the mountains of the Abruzzi rises to 7000 feet. Here, in Monte Corno, the highest peak of the range, forming part of the Gran Sasso d'Italia, they reach an elevation of 9560 feet. The North Apennines attain in Monte Cimone, situated in the province of Modena, a height of 7103 feet. The highest peak of the South Apennines is Monte Polino, with an elevation of 7325 feet. On the highest peaks snow may be found at all seasons.

The Apennines are pierced by 13 principal passes. These are, proceeding from north to south: (1) the pass of Tenda; (2) of Bocchetta; (3) of Cisa; (4) of Monte Cimone; (5) of Poretta; (6) of Pietramala; (7) of Borgo San Sepolcro; (8) of Furlo; (9) of Serravalle; (10) of Aquila; (11) of Isernia; (12) of Arcano and Troa; (13) of Potenza.

Geology. The prevalent rock is a species of compact limestone, of a whitish-gray color, belonging to the Jura formation. Resting on the limestone is found a more recent formation of sandstone and marl, which is especially abundant in the middle region of the Sub-Apennines and contains an extraordinary number of fossils of the Tertiary Age. In the Apuan Alps and at several coast points remnants of older formations occur, but except these, and the rocks of the Calabrian portion where the prevailing limestone changes to crystalline and schistose rocks, the basic structure is Mesozoic and Tertiary. On the watershed of the north and central Apennines there are found Paleozoic clay-slate, graywacke-slate, etc. The Apennines, especially the Roman and Neapolitan, are distinguished from all other mountain chains by the rich variety of marbles which they contain. In some places the quarries seem inexhaustible. Igneous rocks are numerous in the middle and southern regions, where volcanic disturbances have produced many wonderful formations—as,

for instance, the crater lakes of Albano, Nemi, Vesuvius, Solfatara.

The direction of the great chain is favorable to the formation on the western side of important river basins, such as those of the Arno, the Tiber, the Garigliano, and the Volturno; while on the eastern side we find nothing but small streams, in most cases destitute of affluents, hurrying down to the sea through wild, precipitous valleys. In northern Italy the Ligurian Apennines, almost overhanging the Gulf of Genoa, develop on the southern slopes only puny streams, while their northern slopes send down, through the plains of Piedmont, large tributaries to the Po.

Flora. Where the Apennines, in general so poorly supplied with permanent streams, exhibit a trace of Alpine abundance of water, there is no lack of rich pastures and dense forests; but usually only thin grass and wild, scrubby bushes cover the stony slopes. The greater number of the roaring forest brooks in the deep, rocky ravines display during the summer only dry beds. Where the mountains dip down to the sea, as at the Riviera of Genoa and the Gulf of Naples, a rich, distinctively southern vegetation clothes the declivities. Gigantic agaves, Indian figs, myrtle bushes, orange groves, suggest in these northern lands the splendors of the tropics. The altitudinal vegetation zones are characterized as follows: Vine and olive up to 1300 feet; chestnut and oaks from 1300 to 3300 feet; pines from 3300 to 5200 feet; shrubs and grasses above 5200 feet, succeeded above by naked rocks.

APENRADE, ä'pën-räde. A town in the Prussian province of Schleswig-Holstein, situated at the head of a bay of the same name, opening into the Baltic Sea (Map: Prussia, C 1). It has an excellent harbor and considerable shipping trade. Pop., 1895, 5564; 1905, 7023; 1910, 7800. The town dates from the thirteenth century. It was destroyed by fire three times and in 1864 was captured by the Prussians. In the neighborhood is the Castle of Brundlund, built by Queen Margaret in 1411.

APEPI, or **APO'PHIS**. The name of two Egyptian kings of the Hyksos Dynasty. (See HYKSOS.) Little is known of either, and only a few scanty memorials of them have been found. Under APEPI I, whose date is very uncertain, science and letters seem to have flourished. The celebrated *Rhind Mathematical Papyrus*, a sort of practical handbook for the solution of arithmetical and geometrical problems, bears a colophon stating that the manuscript was copied, in the thirty-third year of this King, from an original written in the reign of Ameneinhat III. APEPI II flourished about 1650 B.C., and several monuments exist bearing his name. A papyrus in the British Museum (Sallier I) contains a legendary account of the breaking out of a war about religious matters between Apepi and Sequenen-rec, Prince of Thebes. It would seem, therefore, that Egyptian tradition regarded Apepi II as the Hyksos ruler in whose reign began the long war for the independence of Egypt.

APEREA, ä-pä'rê-ä. See CAVY; GUINEA-PIG.

APE'RIENTS. See LAXATIVE; PURGATIVE.

APET'ALOUS. See FLOWER.

A'PEX (Lat. the extreme end of a thing; point, summit). A term used in mining to designate the outcropping edge of a mineral vein or lode. As interpreted legally, it is not necessary that the edge of the vein should project above

the surface of the ground, but simply above the surface of the inclosing bedrock, and both vein and bedrock may therefore be covered by soil or drift. The term "outcrop" in the legal sense, as used above, does not agree with the geological application of the term in all cases; for if a vein dips nearly parallel with a sloping surface, and may be exposed at a point below the apex, due to an irregularity in its dip, this second exposure, while constituting an outcrop in the geological sense, would not be one legally. According to the Revised Statutes of 1872, a miner having the apex of a vein within the boundaries of his claim is allowed to follow it along the strike until it intersects the end lines of his claim extended vertically downward. On the dip, however, he is at liberty to follow it indefinitely, even if it extends outside the vertical side lines of his surface location. This prohibits another person from sinking to the first party's vein from a point outside the latter's surface claim. This apex rule has led to many lawsuits, some of which were costly, involving property worth several million dollars. Thus, where two veins join below the surface and each is worked by a different party, both may endeavor to claim possession of the true apex, but under the apex law slighter pretenses are sometimes used by one person to gain ownership of another's vein. See **LODE**; **MINING CLAIMS**; **OUTCROP**; **DIP**; **STRIKE**; **ORE DEPOSITS**; and consult Barringer and Adams, *The Law of Mines and Mining in the United States* (Boston, 1897; 1911).

APEX OF THE SUN'S WAY. A term used to denote that point of the heavens toward which the sun's motion in space is at present directed. Tobias Mayer of Göttingen was the first to speculate on the effect that the motion of the solar system as a whole would have on the relative positions of the fixed stars, in causing those ahead to open out and those behind to close in upon the line of motion. Sir William Herschel, by considering the motions of a comparatively small number of the brighter stars of the northern hemisphere, fixed on a point in the constellation Hercules as the solar apex. More recent investigations, involving a larger number of stars and carried on with all the modern refinements of astronomical measurement, have led to various estimates of the position of the apex, but it appears to be the general consensus of opinion that it lies in the neighboring constellation of the Lyre, a few degrees from the place indicated by Herschel. See **STARS**.

APHANIP'TERA. An order of insects, which includes the fleas, distinguished from the Diptera by having the three segments of the thorax "distinct and nearly equal, the two last rings (mesothorax and metathorax) bearing short, leaf-like appendages; and mouth-parts adapted for piercing."

APHASIA, ä-fä'zhī-ä, or -zī-ä (Gk. ἄφασια, speechlessness, from ἄ, a, priv. + φάσαι, phanai, to speak). Complete or partial loss of the power to express or understand the conventional symbols of language, resulting from disease of the brain centres involved. Aphasia may be classified as either motor or sensory, but the two forms may coexist. Motor aphasia results from inability to convey the necessary nerve impulses to the organs of speech. The motor speech area is in the third frontal convolution (Broca's convolution), and injury to this part of the brain or of the nerve tracts leading from it to

control the motions of the tongue and lips produce motor aphasia. With this affection the person may know what he wishes to say, but is unable to say it; he may be able to talk, but not say the words he wishes. All gradations of this affection, from slight to severe forms, exist, and it is one of the commonest forms of aphasia. There are several types of motor aphasia. When the patient is unable to write, he is said to have agraphia. Some victims of aphasia are able to write, but cannot enunciate words or sentences. The various degrees of this form of aphasia are severally termed aphemia, alalia, or anarthria, depending on the amount of impairment. Sensory aphasia, or amnesia, is a loss of memory for words. Three distinct types are recognized. 1. A simple loss of memory for words. 2. Word deafness or inability to comprehend spoken language. The auditory centre, or centre for auditory memories, that portion of the brain which hears and understands spoken speech, is in the first temporal convolution. Any defect of this centre, or of the fibres which go from it to the motor speech centre, produces what is known as word deafness. In this form the person may hear perfectly well, may read and speak, but does not understand spoken language. 3. Word blindness, or lack of power to understand written or printed words. The optical centre is located in the occipital lobes, and disease or injury of its cells, or of the fibres which lead from it to the motor speech centre, produces word blindness. In this form of aphasia the person, although capable of seeing, does not comprehend what he sees. He can talk and repeat aloud what is said to him, or write what may be said or what he reads. Several other sub-varieties of aphasia may be merely mentioned. Paraphasia denotes inability to connect ideas with the words proper to their expression; agrammatism, ataxaphasia, loss of the grammatical sense. Bradyphasia is abnormal slowness of speech. Aphasia is a symptom of many brain troubles. The most important cause is hemorrhage into the brain substance, involving the areas above described. Tumors, brain abscess, injuries of the brain, exhaustion, and some of the insanities may be accompanied by aphasia. The treatment is that of the underlying disease. Consult Gould and Pyle, *Cyclopedia of Medicine and Surgery* (Philadelphia, 1912).

A'PHEK. 1. A place north of Beirut (Josh. xiii. 4), having a temple to Ashtoreth, which was destroyed by Constantine on account of the impurity of the rites celebrated in it; probably the modern Khirbet Aphka at the source of Nahr Ibrahim. 2. One of the "twenty and two cities with their villages" belonging by inheritance to the tribe of Asher (Josh. xix. 30; Judg. i. 31). 3. A stronghold near Megiddo, where the Philistines assembled their army for the battles of Gilboa (1 Sam. xxix. 1) and Ebenezer (1 Sam. iv. 1), and from which Benhadad and Hazael (1 Kings xx. 26; 2 Kings xiii. 17) made their attacks upon Samaria. Over 100,000 of the Syrians are said to have been slain in one day's battle; the rest fled into Aphek, where 27,000 more were killed by a falling wall (1 Kings xx. 29, 30). It is probably identical with Apukn in the annals of Thothmes III (1501-1447), but this place has not yet been identified.

APHE'LION (Gk. ἀπό, απο, away + ἥλιος, helios, the sun). That point in the elliptical orbit of a planet which is most remote from the

sun. The opposite point, or that nearest to the sun, is styled the perihelion. At the former point the swiftness of the planet's motion is least and begins to increase; at the latter it is greatest and begins to decrease. This irregularity of motion is most remarkable in comets, since their orbits deviate most from the circle. See APSIDES.

APH'ELIOT'ROPISM, or NEGATIVE HELIOTROPISM. That form of sensitiveness by virtue of which plant organs direct their axes away from the source of incident light. Certain roots show this reaction to light; e.g., those of mustard seedlings. It is seen also in the tendrils of *Bignonia capreolata*. See HELIOTROPISM.

APHE'MIA. A form of aphasia in which the ability to write is retained. See APHASIA.

A'PHID (probably from Gk. ἀφειδής, *apheidēs*, unsparing, from ἀ, *a*, priv. + φείδεσθαι, *phaidesthai*, to spare). An insect of the family Aphididæ, commonly known as plant-lice, which live either free on the foliage, bark, or roots of plants, or inclosed in galls. They nourish themselves on the sap of their plant hosts, which they suck up through a long slender haustellum. They are minute, the largest being only one-fourth of an inch long. They are usually green or brown and somewhat pyriform in shape. Most of the forms that live on roots underground have neither compound nor simple eyes. Many species secrete a cottony, protective coat. At the posterior end of the abdomen most aphids have a pair of tubes from which they discharge a liquid for defense against their enemies, and also excrete from the anus a sweet liquid which is eagerly collected by ants and some other insects. This latter liquid is called "honey-dew" and often falls upon and varnishes the leaves of plants. When the wind is blowing it may fall to the ground as a fine spray. Although ants are indirectly injurious to plants by protecting or even cherishing the aphides, they may be said to be beneficial in collecting the honey-dew, since its presence on the leaves or stems is apt to form a favorable substratum for the growth of parasitic fungi which are injurious to the plants.

Dimorphism, or even polymorphism is very common among aphides. Thus the cospecific forms which live on the roots of plants and those that live on the foliage may exhibit certain structural differences. The sexes may be winged or wingless, and the females may lay eggs or bring forth their young alive. In the spring the fertilized eggs give rise to females, and these may produce females parthenogenetically for several generations, till later in the season, either at times of drought or on the approach of winter, both males and females make their appearance and become the parents of fertilized eggs. These eggs hatch the following spring as the "stem mothers," and the cycle is repeated.

Aphides stunt or kill growing tips, weaken entire trees by impoverishing their sap, and some species produce galls or other abnormal growths. They may destroy entire crops of cereals. Nearly all garden vegetables suffer from their ravages, and hot-house plants are particularly infested by them. The price of hops from year to year varies largely according to the abundance of the hop aphid. See HOP-LOUSE.

To the same group belongs the grape-vine phylloxera of Europe and America. Inundation of the ground during cold weather is fatal to

this pest. Carbon bisulphid and fumigation with tobacco, and spraying with neutral soaps are effective checks. Young fruit and shade trees may also be treated with soap washes, as well as with hydrocyanic-acid gas applied under closed tents. Birds, spiders, syrphus-fly larvæ, and ladybird beetles destroy great numbers of aphides and they are persecuted by deadly parasites. Indeed were it not for the many insect foes of aphides there would be little or no vegetation. The winter eggs of these insects may endure any amount of cold, but a cold, wet spell in the spring is often fatal to the newly hatched aphides. Among the most important species of this group are the "grain-lice," melon or cotton aphid, various peach and apple aphides, pea "louse," etc.

Bibliography. Thomas, *Eighth Report State Entomologist of Illinois* (Springfield, 1879); for Europe, Buckton, "Monograph of British Aphides," Ray Society (London, 1879-83). For bibliography of principal works on these insects see W. D. Hunter, *Bulletin 60, Iowa Agricultural Experiment Station* (Ames, Iowa, 1901).

A'PHIS-LI'ON. The larva of a lace-winged fly, especially of the family Hemerobiidæ, which feeds on plant lice. It is closely related to the ant-lions and golden-eyed flies. See LACEWING.

APHO'NIA (Gk. ἀφωλία, from ἀ, a, priv. + φωνή, phōnē, voice, sound). The term used in medicine to signify a more or less complete loss of voice. It is distinct from mutism, in which it is impossible to form articulate sounds, and in most cases the voice is not entirely lost. The voice is essentially produced by three distinct agents, viz., (1) the expiration of air, (2) the opening of the glottis, and (3) the tension of the vocal cords; and hence anything interfering with expiration, or with the functions of the glottis and vocal cords, may cause aphonia. Thus, it may result from paralysis of the respiratory muscles, from pulmonary emphysema, or pneumonia; or it may be caused by diseases of the larynx, as chronic laryngitis, œdema of the glottis, polypus, etc.; or by pressure on the larynx caused by abscesses, vegetations, and any kind of morbid growth; or it may be traced to some functional or organic disturbance of the vocal cords. The muscular fibres which act on these cords may become affected in acute laryngitis by extension of the inflammation, or their action may be impeded by the pressure of false membrane in croup. Aphonia may often be traced to compression of the recurrent or inferior laryngeal nerve, which is the nerve supplying motor power to all the muscles of the larynx except one. Such pressure is not infrequently caused by aneurism, abscess, or tumor. A wound or contusion of the pneumogastric nerve, or one of the recurrent branches, will cause aphonia or, more commonly, extreme hoarseness from paralysis of the laryngeal muscles on one side. Aphonia is, moreover, very commonly associated with hysteria.

APH'ORISM (Gk. ἀφορισμός, *aphorismos*, a limitation, definition, from ἀπό, *apo*, away + ὀρίζειν, *horizein*, to bound, divide). A maxim or any short and significant saying; such as "Habit is a second nature." Sometimes a complete work is written in the form of a series of aphorisms, arranged in due order, and leaving their connection to be traced by the reader's reflection.

APHRAATES, ā-frä'tēz. A Persian Christian of the fourth century, who, after his con-

version from heathenism, took the name of Jacob and was known as the "Persian Sage." He is said to have been an opponent of Arianism, and after his conversion lived at Edessa and later at Antioch. According to Prof. William Wright, he was bishop of the convent of Mar Matthew near Mosul and composed his works in 344, 345, and 377. His writings consist of 22 alphabetical homilies (ed. W. Wright, London, 1869; Graffin, Paris, 1894), and the separate homily *On the Cluster*, the text of which has been recovered lately. In the *De Viris Illustribus* (written before 496) of Gennadius of Marseilles, and in the ancient Armenian version, published by N. Antonelli (Rome, 1756), the homilies were ascribed to Jacob of Nisibis, who died in 338. The real author, however, is cited by name by Abhdisho, and by Elias of Nisibis (eleventh century), in his *Chroniele*. Consult: W. Wright, *Syriac Literature* (London, 1894); Duval, *Littérature Syriacque* (Paris, 1899); J. Forget, *De Vita et Scriptis Aphraatis* (Louvain, 1882); and Thalhofer, *Bibliothek der Kirchenväter* (Kempen, 1869-86), where eight of the homilies are translated. Ger. trans. by Bert in Von Gebhardt and Harnack, *Texte und Untersuchungen* (Leipzig, 1888); French by Parisot in *Edition Graffin*; English by John Gwynn in Schaff and Wace, *Select Library of Nicene and Post-Nicene Fathers*, vol. xiii (2d series, 1898).

APHRODISIA, ā'rō-dīz'ī-ā. The name given to the festival celebrated in honor of Venus. See GREEK FESTIVALS; VENUS.

APHRODISIAC, ā'rō-dīz'ī-āk (Gk. ἀφροδισιακός, *aphrodisiakos*, pertaining to Aphrodite, or Venus, goddess of love). A name applied to drugs that excite erotic desire, though the term may also include any physical or mechanical means employed for the same purpose. All drugs that are tonic in their effects and which promote the health of the body are indirectly aphrodisiac in their tendency. Such are strychnine, iron, quinine, etc. True aphrodisiacs are very rare, and it is doubtful if there be any whose use is not injurious if given in effective doses. Such are hashish (*Cannabis indica*), cantharides, a violent and dangerous irritant, *Blatta orientalis*, and *Damiana*, a preparation made from a species of *Turnera* found in Mexico. Drugs having the contrary effect are called anaphrodisiacs (q.v.).

APHRODITE, ā'rō-dī'tē. See ANADYOMENE; VENUS.

APH'THÆ (Gk. ἄφθα, *aphtha*, eruption, ulceration). Small round or oval whitish patches, plaques or ulcers surrounded by a red border and very painful, which appear on the mucous membrane of the mouth, in the affection known as aphthous stomatitis. The favorite sites of these patches are the sides of the tongue, or its under surface, or in the fold between gums and lips. It is a disease of the dentition period of children, although adults are sometimes attacked. The irritation of dentition and general lowered vitality are predisposing causes, while faulty oral hygiene, unclean nursing bottles, decomposing particles of food and the like are the exciting factors. No specific germ has been definitely associated with aphthæ, nor has the affection been proved to be contagious. The treatment consists in cleansing the mouth with mild antiseptic washes, touching the ulcers with nitrate of silver or other caustics, and paying strict attention to oral cleanliness. This affection is not to be confused with Thrush (q.v.).

APH'THOUS FE'VER. See FOOT AND MOUTH DISEASE.

APH'YDROT'ROPISM, or NEGATIVE HYDROTROPISM. That form of sensitiveness by virtue of which a plant organ turns its axis away from the source of diffusing moisture. The phenomenon is seen in the fruiting bodies of many fungi. The vegetative filaments remain in the moist substratum (being positively hydro-tropic), but the reproductive filaments, which bear the spores, grow out into the much drier air. See HYDROTROPISM.

APIA, ä'pě-ä. The principal town in the Samoan Islands, South Pacific Ocean. It is situated on the northern coast of the German island of Upola, in lat. 13° 49' S., long. 171° 48' W. It has an open harbor and is the chief commercial centre of the Samoan group. Most of the trade is British, and cocoa and copra are the principal exports. The town consists chiefly of one long street running along the harbor. There is a Roman Catholic church, several schools, and a district court. On March 15, 1889, Apia was visited by a disastrous hurricane, in which several vessels, including one American and two German warships, were destroyed, and 146 lives lost. Apia was constituted a municipality in 1899 and was for a time under the joint supervision of the British, American, and German consuls. Its population in 1910 was about 1450, of whom about 400 were Europeans. Apia is the seat of a United States consulate. See SAMOAN ISLANDS.

A'PIA'CEÆ. See UMBELLIFERÆ.

A'PIA'NUS, PETRUS (1501-52). A German astronomer and geographer, born at Leisnig, Saxony. His name was Peter Bennewitz, or Bienewitz (*Biene* is German for bee, which in Latin is *apis*—whence his adopted name). He was, from 1527, professor of mathematics at Ingolstadt and was celebrated as a mathematician, astronomer, and general savant, and especially as a cosmographer. He was the inventor of a number of philosophical instruments, and some of the earliest maps of America were printed by him. The best known among his writings is the *Cosmographia* (Landshut, 1524; Antwerp, 1529).

APICES, äp'î-sēz. See NUMERAL.

APICIUS, ä-pîsh'î-ūs, MARCUS GABIUS. A Roman epicure, who lived in the time of Augustus and Tiberius and was celebrated for his luxurious table and his acquirements in the art of cookery. When, by the gratification of his favorite indulgence, he had consumed the greater part of his fortune, and had only some \$400,000 left, he poisoned himself, in order to avoid the misery of plain diet. Two other gourmards—one in the time of Pompey, the other in the reign of Trajan—are mentioned under the name Apicius. The Roman cookery-book, *Cælii Apicii de Re Coquinaria*, ascribed to Apicius, belongs to a much later time, as it abounds in inaccuracies and solecisms. It is edited by Schuch (Heidelberg, 1867).

AP'ICUL'TURE. See BEE-KEEPING.

APINUS, ä-pě'nus, FRANZ MARIA ULRICH THEODOR (1724-1802). A German physicist, born at Rostock. He devoted himself to the study of medicine and the exact sciences, and in 1757 he was appointed professor of physics at St. Petersburg. He is chiefly remembered for his extension of Franklin's electrical theory, but also published valuable works on various other branches of the physical sciences, including a

work *On the Distribution of Heat at the Surface of the Earth* (1762).

A'PION (Gk. Ἀπίων). An Alexandrian grammarian of the first century A.D. He was born in the Oasis in the Libyan Desert, but came early to Alexandria, where Didymus (q.v.) received him into his house. He became a pupil of the grammarian Apollonius and Euphranor and eventually succeeded Theon as head of the Alexandrian school. (See ALEXANDRIAN AGE.) He traveled much in the cities of Greece, lecturing on Homer, whereby he gained great renown, but more from the brilliancy of his manner than from the value of the matter presented. His journeys extended to Rome, where his boastful nature won him from the Emperor Tiberius the nickname *cymbalum mundi* ('the cymbal of the universe'). The Alexandrians gave him citizenship; later, as leader of the anti-Jewish party, he was sent during the reign of Caligula at the head of an embassy to Rome to oppose the Jewish delegation led by the philosopher Philo. Josephus's tract, *Against Apion*, answering charges made on this occasion, is one of our chief sources of knowledge in regard to him. In the reign of Claudius Apion lived and taught at Rome. His chief writings were a comprehensive work, in five books, on the history and civilization of Egypt, which contained the famous story of Androcles (q.v.) and the Lion, preserved by Aulus Gellius (v, 14), and the tale of the love of a dolphin for a beautiful boy, also preserved by Gellius (vi, 8); and a Homeric glossary, which has been thought to be identical with that in the appendix to the *Etymologicum Gudianum*, p. 601, ed. Sturz (Leipzig, 1818), though probably without good reason. The scanty fragments of his historical works are collected by K. and Th. Müller, *Fragmenta Historicorum Græcorum*, vol. iii, pp. 506-516 (Paris, 1868-74).

A'PIOS TU'BERO'SA. See GROUND-NUT.

A'PIS (Gk. Ἄπῖς). A sacred bull worshiped at Memphis by the ancient Egyptians. His Egyptian name, *Hap*, is of uncertain etymology. Originally he may have been an independent local divinity, but in historical times he appears as the sacred animal of the god Ptah of Memphis. Later he was considered as an incarnation of Osiris, of Sokaris, or even of the sun; but usually he was, through a false etymology, associated with the Nile (*Ha'pi*). According to Greek accounts, he was not allowed to live longer than 25 years, and if he survived his allotted time was secretly drowned in a well. The bodies of the Apis bulls were carefully embalmed and were buried in subterranean rock-hewn tombs, in the Serapeum at Memphis (not to be confounded with the famous Serapeum of Alexandria), where Apis, under the name Serapis (a combination of Osiris and Apis), was worshiped as the patron of the dead. Three tombs, with numerous Apis mummies, were discovered by Mariette in 1851. After the death of an Apis bull, the country was searched, sometimes for years, until another was found bearing the sacred marks. As to the precise nature of these marks, traditions vary widely. The animal, however, must be black, with certain white spots, and a peculiar knot under the tongue. When found, he was solemnly conducted to Memphis and installed in the temple with great festivities. The day of his installation and that of his birth were celebrated annually, and oracles were derived from his movements and from the

nature of his appetite. Even the cow which had become the mother of an Apis bull received divine honors. The sumptuous worship of this animal seems to have impressed the Greeks as more remarkable than that of any other sacred animal. For illustration, see EGYPT.

AP'LACOPH'ORA. See AMPHINEURA.

AP'LANATIC LENS (not wandering, from Gk. *ἀ*, *a*, priv. + *πλανᾶσθαι*, *planasthai*, to wander). An achromatic lens corrected for spherical aberration (q.v.), so that all rays of light which emanate from one point and pass through the lens are focused at a point. The construction and correction of photographic lenses are fully described, from the technical standpoint, in Otto Lummer's *Photographic Optics*, translated by Silvanus P. Thompson (New York, 1900). See LIGHT; LENS.

APLITE. See GRANITE; ALASKITE.

APNŒA (Gk. *ἀπνοια*, from *ἀ*, *a*, priv. + *πνεῖν*, *pnein*, to breathe). Partial or complete suspension of respiration. It takes place when the blood is too highly oxygenized and fails properly to stimulate the respiratory centres. See also ASPHYXIA; DYSPNŒA.

APOC'ALYPSE. See REVELATION.

APOC'ALYP'TIC LIT'ERATURE' (Gk. *ἀποκαλύπτειν*, *apokalyptein*, to uncover, reveal). The designation of certain prophecies and revelations of Jewish and Christian authorship dating from about 200 B.C. to about 150 A.D. Their general subject is the problem of the final triumph of the Kingdom of God. The Jewish apocalypses profess to reveal the future glory of Israel, i.e., the divine vengeance on her enemies and oppressors and her enjoyment of an era of wonderful happiness. In the earlier apocalypses the new age is to be realized on earth and by the righteous only. The judgment on the wicked will be a physical one, by war, pestilence, and death, and the holy land and city will be the special objects of divine favor. In the later works more interest is taken in the transcendental world of spirits, angels, heaven, and hell. In some apocalypses a personal Messiah as the central figure of the new age is very prominent; in others he holds a secondary place or is not considered at all. Alterations and interpolations by Christian hands, making the alleged predictions point more definitely to Jesus, gave certain of these Jewish works a very wide circulation in the early Church.

The purpose of these works, all written in times of trial and disaster, was to vindicate God's ways to the faithful, who were sorely tried by the apparent triumph of the wicked, i.e., the heathen nations without and the irreligious within Israel. The fundamental ideas represented are those of the Pharisaic Judaism of the more popular, non-scholastic type—legalistic indeed, but full of passionate earnestness. This literature is mostly pseudepigraphic. The revelations and predictions are set forth as though actually received and written or spoken by ancient worthies, as Enoch, Moses, etc. But it is not difficult, in many cases, to see that the pretended prediction is but the résumé of past history. Where the pseudo-prophecy ends and the attempt at prediction really begins, the author is seen to be dealing with his own times, and the date of the work is thus betrayed.

The tone of these works is one of such assurance that they were once widely accepted as genuine prophecies, and found a warm reception in Jew-

ish and early Christian circles. In time most of these works came to be looked upon with disfavor, except in the less enlightened circles of the Christian Church. Though all were originally written in Hebrew, Aramaic, or Greek and all once circulated in a Greek form in the early Church, several of the most important are known to-day only in such translations as the Ethiopic or Syriac, and many others have utterly perished. This literature is of the highest value to-day because of the light it throws on the growth of eschatological and Messianic doctrines among the Jewish people just previous to the rise of Christianity, especially since these doctrines have, in a purified form, found a permanent place in the Christian system.

The extant Jewish apocalypses are the following: 1. *The Book of Daniel*, composed about 165 B.C. (See DANIEL, BOOK OF.) 2. *The Book of Enoch*. A compilation from at least five different Enoch books. The earliest of these goes back to the Hasmonæan period. Of greatest importance for the history of the Messianic hope is the book called "The Parables of Enoch" (chaps. xxxii-lxxii of the whole collection). Concerning the date of this book there is as yet no consensus of opinion among scholars. It also contains extensive interpolations from an apocalypse of Noah. (See ENOCH, BOOK OF.) It contains much about angels and supramundane matters. The book is quoted in Jude 14. 3. Another Enoch book, *The Secrets of Enoch*, composed c.50 A.D., is now extant only in a Slavonic translation. 4. *The Sibylline Oracles*. Jewish imitations of the utterances of the heathen Sibyls. The present collection in 14 books represents the growth from beginnings made by Hellenistic Jews in the second century B.C. The later portions are by Christian hands. The oldest and most important parts are in book iii, lines 97-828. These oracles were highly esteemed and frequently quoted by the early Church Fathers. 5. *The Psalms of Solomon*. A collection of 18 patriotic and religious psalms, written originally in Hebrew some time after Pompey had made Judæa subject to Rome (63 B.C.). Until recently these were known only in a Greek translation, but in 1909 Rendel Harris published a Syriac translation of Psalms i-xvii. The apocalyptic element in these is very small. Psalm xvii contains strong Messianic hopes. These psalms are interesting for comparison with the early Christian hymns in Luke i and ii. 6. *The Book of Jubilees*. A revelation made to Moses of the course of events from Adam to Moses's own day. The history is divided into 50 periods of 49 years each; hence the name of the book. The outline is that of Genesis, but great liberties are taken with the text. The patriarchs are made the exponents of the writer's strict Pharisaic views and hopes. The book was written probably between 135 and 105 B.C. 7. *The Testaments of the Twelve Patriarchs*. The dying exhortations of the twelve sons of Jacob to their children. Each testament deals with some virtue or fault which the patriarch exemplified in his life and also contains predictions relating to the future of his descendants. These predictive portions have been largely worked over by Christian hands. The original Jewish work was composed about 109 B.C. by an ardent partisan of the rule of the Maccabæan priest-princes. It was later revised by an opponent of these princes about 70-40 B.C. 8. *The Assumption of Moses*, or *Testament of Moses*,

was written shortly after the death of Herod (4 B.C.). It gives the parting communications of Moses to his successor, Joshua, in which he unfolds the course of Israel's history down to the time of the successors of Herod, after which the writer claims that the Messianic age will come. 9. *The Apocalypse of Baruch*. One of several *Baruch* books once current in Jewish circles. It contains material of different dates from 50 to 90 A.D., and illustrates the Messianic hopes of Pharisaic Judaism just before and after the fall of Jerusalem, 70 A.D. On this account it is one of the most important of apocalyptic works. 10. *Fourth Esdras* (*Second Esdras* in the English Apocrypha of the Old Testament) contains seven alleged visions of Ezra, the famous scribe. His grief over the hard fate of Zion is relieved by the revelation of the coming Messianic era and punishment of the wicked. The book was written by a Jew, probably about 81-96 A.D., but has been slightly revised and added to by Christian hands. The work is also important because of its profoundly theological character in its serious and almost despairing grapple with the problems of sin and its consequences. For a complete list of Jewish Apocalypses, of which the titles alone remain, see Schürer, *History of the Jewish People in the Times of Jesus Christ*, §§ 32-33.

Of the Christian Apocalypses the most important is the canonical *Book of Revelation* (q.v.). Other less important ones are: *The Apocalypse of Peter*, of which a small fragment has recently been discovered treating of the place of eternal punishment. *The Apocalypse of Isaiah*, which treats of the history of the Church to the Neronian persecution, after which the final age is to appear. *The Shepherd of Hermas*, composed by Hermas, brother of Pius, Bishop of Rome c.150.

In the foregoing article no mention has been made of the very large number of apocalyptic writings of distinctly Christian origin which were produced from the second century onward, to satisfy an unhealthy craving for the occult and marvelous or to embellish the stories of the saints.

Bibliography. Deane, *Pseudepigrapha* (New York, 1891); Schürer, *History of the Jewish People in the Times of Jesus Christ*, §§ 32-33 (trans., New York, 1885-91); article "Apocalyptic Literature" in the *Encyclopædia Biblica* (New York, 1899). For English readers the most valuable editions of the Jewish Apocalypses are those by R. H. Charles (of all but Nos. 4, 5, and 10), and *The Apocrypha and Pseudepigrapha of the Old Testament* (ed. by Charles, Oxford, 1913).

APOCALYPTIC NUMBER, THE. The mystical number which is given in Rev. xiii. 18 as the designation of the beast of the ten horns and seven heads (v. 1), and which, in the accepted text, reads "six hundred and sixty and six."

Many interpretations of this number have been given by *Gematria* (q.v.). In view of the fact, however, that the author of the book, as is evident from the context, intended to represent some powerful and hostile personality in his own time whose identity was to be recognized by the circle of readers to whom he was writing, but hidden to all others, the interpretations can be largely reduced. The one most generally accepted and perhaps most probable is that—on the basis of the Hebrew numerical alphabet, which con-

tains no characters for *e* or *a*—the author intended to represent Nero—

N (e)	R	O	N	K (e)	S (a)	R	}	666
50	200	6	50	100	60	200		

It is claimed, however, that there is variant reading for the text that gives the number "six hundred and sixteen," which, on the basis of the Greek numerical alphabet, would represent Gaius (Caligula)—

G	A	I	O	S	K	A	I	S	A	R	}	616
3	1	10	70	200	20	1	10	200	1	100		

In confirmation of this second reading, it is urged that an author writing for Greek readers would be more likely to use the Greek alphabet, with which they were familiar, than the Hebrew, with which they were unacquainted. But it is to be noticed that in ix. 11, a Hebrew as well as a Greek word is used for the mystical idea the author has in mind ("... the angel of the abyss, in Hebrew called Abaddon, and Greek Apollyon"), and xvi. 16, a Hebrew word alone, ("... the place which is called in Hebrew, Har-Magedon"). It is not impossible, therefore, that Hebrew letters were intended to be represented by the number here given. In fact, the variant reading may have quite naturally come from the voluntary omission by copyists of the second *n* of *Neron* in the first reading, Nero being the more familiar form. See ANTI-CHRIST; REVELATION OF SAINT JOHN.

APOCALYPTIC WRITINGS. See APOCALYPTIC LITERATURE; APOCRYPHA.

AP'OCATAS'TASIS (Gk. ἀποκατάστασις, *apokatastasis*, restoration). A word found in Acts iii. 21 (compare Rom. viii. 21, Eph. i. 9, 10, Col. i. 19). It has been interpreted by some as pointing to the final salvation of all men and has been employed as a technical term with this signification. See UNIVERSALISM.

AP'OCHROMATIC LENS. See MICROSCOPE.

APOC'RYPHA (Gk. ἀπόκρυφος, *apokryphos*, hidden, concealed, from ἀπό, *apo*, away + κρύπτειν, *kryptein*, to hide). A term used to designate books that are not regarded as canonical, though they have been read, cherished, and often quoted as Scripture in synagogue and church. As to the origin of this term, it is not certain whether it is a translation of the Hebrew word *genuzim* or came into vogue because it had already in Greek been used for "secret" books. The verb *ganaz* means 'to store away,' 'to withdraw from use,' and the root idea suggests that it is something precious that is hidden. Worn-out scrolls of the law were removed to the Genizah. But books that were not considered to possess such a sanctity that they required a ceremonial washing after contact with them were also stowed away, removed from public use. Thus the term is used in connection with the process by which the canon was reduced to its final form; the sages intended to "withdraw" Ecclesiastes, they actually decided to "withdraw" Ecclesiasticus. Many books that were in this manner withdrawn were particularly cherished in some circles, because they were regarded as containing the secrets of the universe and of the future. Fourth Esdras makes a distinction among the books given by divine inspiration; 24 are intended for the wise and the foolish, the rest are secretly handed over to the wise (xiv. 26, 46). But these treasures, so dangerous to the peaceful

development of the people, were withdrawn by the sages; even Daniel was relegated from "the prophets" to the third group, "the writing." It seems probable that 'to remove,' 'to withdraw,' is a secondary meaning, and that the original meaning was 'to treat as a treasure,' 'to cherish,' 'to hold as a precious secret.' This then approaches the significance of the word in the title of a Leyden magical papyrus "The Sacred Apocryphal Book of Moses Called the Eighth or Holy Book," "The Apocryphal Books of the Phœnicians" from which Pherecydes of Syros is said by Suidas to have learned his wisdom, and "The Apocryphal Books of Zoroaster," of which, according to Clement of Alexandria, the Gnostic Prodicus had a copy. Unfortunately, we do not know whether any of these titles is earlier than the appearance of the term *ganaz* in Hebrew writings, or what expressions were used by the Essenes and the Therapeutæ to designate their hidden books. After the final establishment of the Hebrew canon, many works that had been secluded, or otherwise were not approved, were simply referred to as "the outside books." To some such writings, found in the Greek Bible, but not in the Hebrew, Jerome applied the term "apocrypha," and the same designation actually came to be used of books that in the formation of the New Testament canon were left outside.

From the standpoint of ecclesiastical usage there is a number of books that forms a distinct group and has held a peculiar position. It is composed of (1) *Ecclesiasticus*, or the Wisdom of Jesus, son of Sirach, (2) *Wisdom of Solomon*, (3) *Baruch* with the *Epistle of Jeremiah*, (4) *Tobit*, (5) *Judith*, (6) *1 Maccabees*, (7) *2 Maccabees*, and (8) some sections of *Esther* and *Daniel* found in the Greek text, but not in the Hebrew or Aramaic. These had a place in the Greek Bible and all its daughter versions as well as in the Latin Vulgate, were read as Scripture in the early Christian Church and throughout the Middle Ages, were declared by the Council of Trent, at its fourth session, in 1546, to be "inspired and canonical," and are so held by the Roman Catholic church and some of the Greek and Oriental churches. A certain distinction is recognized between them and the books in the Hebrew Bible, but only in time, not in degree of inspiration or canonical authority; and they are now, as in the past, often referred to by Roman Catholic scholars as "deuterocanonical." On the other hand, the Protestant churches since the Reformation, the Greek Orthodox church of Russia, at least since the latter part of the eighteenth century, and some other churches under Protestant influence have declared them to be "apocrypha" and denied their inspired and authoritative character. The reformers kept them in their Bibles and recommended them for purposes of edification, though not for "the establishment of doctrine," and until the eighteenth century it was customary to give them a place between the Old and New Testaments. But the struggle concerning the canonicity of these books led to their rejection, so that the great Protestant Bible Societies no longer publish Bibles containing them. The Church of England is alone in not rejecting their use in worship. At the present time, however, there is a revived interest in them, and they are being made more accessible to Christians in Protestant countries. Each of these books is discussed in a separate article, and for the question as a whole see

DEUTEROCANONICAL BOOKS. Aside from the books whose canonicity was decided by the Council of Trent there are some found in the Greek or Latin Bibles which are often included by Protestants with what they call Apocrypha. Such are *1 Esdras*, also called *3 Esdras*, which appears to be only another and possibly an earlier Greek translation of our Hebrew Ezra, (2) *2 Esdras*, also called *4 Esdras*, an apocalypse found in Latin and various other versions, originally written in Aramaic, and (3) *The Prayer of Manasses*, originally an addition to 2 Chronicles. Except in some of the Oriental churches, these are not now regarded as canonical, and fall under the head of apocrypha. If the term "deuterocanonical" is used, as seems proper, for the books so designated by Roman Catholic scholars, there is no need of employing the term "pseudepigrapha" for what they call "apocrypha." Pseudepigraphy, a wrong claim or tradition in regard to authorship, is not a distinguishing characteristic of this literature. The apocrypha are divided into two classes according to their Jewish or Christian origin.

I. **Old Testament Apocrypha.** We possess several lists of apocrypha drawn up in the ancient Church, such as the Stichometry of Nicephorus, the Athanasian Synopsis, a catalogue published by Montfaucon, an enumeration in the Apostolical Constitutions, and the Gelasian Decree; and many works are referred to by patristic writers. Of these some have come down to us, in whole or in part, while others have not yet been recovered. They may be divided into historical legends, testaments, apocalypses, philosophy, and poetry. Among the legends mention should be made of *The Life of Adam and Eve* (see ADAM, BOOKS OF); *The Book of Jubilees* (q.v.); *The Martyrdom of Isaiah*, which has been preserved in the first part of the Ethiopic book *The Ascension of Isaiah*; the Story of the Three Pages in *1 Esdras*; *The Prayer of Manasses*; *The Letter of Aristeas to Philocrates* (see ARISTEAS); the stories told in the fragments of *Artapanus* (q.v.) and *Eupolemus* (q.v.); *3 Maccabees*, a story of the wonderful deliverance of the Jews in Alexandria in the time of Ptolemy IV Philopator (221-205 B.C.); *The Story of Aseneth*, the wife of Joseph; and such later works as *The Book of Jasher* (q.v.), *Josippon* (q.v.), *The Contradictio Salomonis*, a contest in wisdom between Solomon and Hiram; the *Liber Antiquitatum Bibliarum*, ascribed to Philo; *The Chronicles of Jerahmeel* (q.v.). Among the testaments the most important are: *The Testament of Abraham*, preserved in Greek and Slavonic; *The Testaments of Isaac and Jacob*, preserved in Arabic and Ethiopic; *The Testaments of the Twelve Patriarchs*, preserved in Greek, Armenian, and Slavonic, probably dating from the second century B.C.; *The Testament of Naphtali*, preserved in a later Hebrew translation; *The Testament of Job*, preserved in Greek (see JOB, TESTAMENT OF); *The Testament of Moses*, probably preserved, as Moore has suggested, in the part of *The Assumption of Moses* now extant in a Latin translation; *The Testament of Solomon*, translated by Conybeare in *Jewish Quarterly Review* (1899); and *The Rest of the Words of Baruch* or the *Paralipomena Jeremiae*, preserved in Greek and Ethiopic. Among the apocalypses there are: *The Book of Enoch* (q.v.), preserved in Ethiopic and partly in Greek; *The Sibylline Oracles*, in Greek; *The Assumption of Moses*, preserved in

part in Latin; the *Syriac Apocalypse of Baruch* (see BARUCH); *The Greek Apocalypse of Baruch* (see BARUCH); *The Secrets of Enoch*, preserved in Slavonic; *1 Esdras*, or *The Apocalypse of Ezra*, preserved in Latin, Syriac, Ethiopic, Arabic, and Armenian (see EZRA, APOCALYPSE OF); *The Apocalypse of Elijah*, preserved in the Coptic and published by Steindorff in 1899; *The Apocalypse of Zephaniah*, preserved in Coptic and published by Steindorff in 1899; *The Prophecy of Eldad and Modad*, quoted by Hermas (ii, 34); and *The Book of Og the Great* and *The Penitence of Jannes and Jambres*, referred to in the Gelasian Decree. As late as in the twelfth century an *Apocalypse of Daniel* appeared, in which there is a distinction between the Messiah, son of David, and the Messiah, son of Joseph, which is discussed by Darmesteter in *Mélanges Rénier* (1887). *Fourth Maccabees* is a philosophical treatise on "The Supremacy of Reason." It is in Greek and has been wrongly ascribed to Josephus. The most important collection of apocryphal hymns of Jewish origin are those found in *The Psalter of Solomon*. These hymns, 18 in number, were originally written in Hebrew. They were composed about the middle of the first century B.C. and have been preserved in Greek and, except the last, in Syriac. Five other psalms preserved in Syriac have been published by Wright in *Proceedings of the Society of Biblical Archaeology* (1887). One of them is identical with the additional Psalm cxi in our Greek Bibles. Since most of this literature has passed through Christian hands, there are, especially in the apocalypses, occasional Christian interpolations. See also APOCALYPTIC LITERATURE.

II. **New Testament.** The New Testament apocrypha include numerous works purporting to have been written by apostles or their associates, but not able to secure a general or permanent recognition. These may be classified thus: (a) Gospels; (b) Acts of Apostles; (c) Epistles; (d) Apocalypses; (e) Didactic Works; (f) Hymns.

(a) Apocryphal gospels may be divided into several groups. 1. Those dealing with the nativity and childhood of the Virgin Mary, and the birth, infancy, and childhood of Jesus. Probably the earliest of these is the *Protevangelium of James*. It is but an enlargement of the nativity narratives in the canonical Matthew and Luke, and may have been written in the second century. Closely connected with the *Protevangelium* is the *Gospel of Thomas*, which treats of the childhood of Jesus. He is represented as even then working miracles and as fully conscious of his divine mission. This work was much used by Gnostics. It is to be dated not later than 150 A.D. The matter contained in these two works was combined with additions and variations in the later *Nativity of the Virgin Mary*, ascribed to Matthew. A still later form of the same material is found in the so-called *Arabie Gospel of the Infaney*, which devotes much space to the experiences of the Holy Family in Egypt. In *The History of Joseph the Carpenter* Jesus is represented as telling his apostles of his mother's betrothal, of his own birth, and, more particularly, of the last sickness and death of Joseph. 2. There is a second group of writings treating of the passion and post-mortem experiences of Jesus. *The Gospel of Nicodemus* is a late compilation of two earlier and altogether separate works, *The Acts*

of Pilate and *The Descent of Christ into Hades*. *The Acts of Pilate* is probably the older, but in its present form an enlargement of the reputed official acts or reports of Pilate, to which reference is made by Justin Martyr (c.150 A.D.). The second work is mainly an imaginary narrative represented as having been told by two men raised from the dead at the time of the crucifixion (compare Matt. xxvii. 52-53). 3. More important than these are the gospels of the same type as those in the New Testament canon. *The Gospel according to the Hebrews*, probably the same as the *Gospel of the Nazarenes*, was one of the earliest gospel-books. It was probably a secondary form of the Aramaic original of our canonical Greek Matthew, written perhaps as early as 100 A.D. for the use of the Aramaic-speaking Christians of Palestine and Syria. The later Jewish-Christian sect of the Ebionites had a gospel called *The Gospel of the Twelve*, written in Greek, probably not earlier than 200 A.D. *A Gospel of the Egyptians* was in existence in the latter half of the second century. It was probably used in the country districts of Egypt. 4. Other gospels claimed apostolic authorship. The most important of these is the *Gospel of Peter*. Serapion, Bishop of Antioch, 190-211 A.D., discovered that this work was in use among the Christians of his diocese. Its use was neither approved nor severely condemned by the orthodox Bishop. A large fragment of this gospel was discovered in Egypt in 1885 and published in 1892. Though written early, certainly in the second century, it seems never to have been used as an authoritative gospel in the regular Church service. *A Gospel or Traditions of Matthias* (another name for Zacchæus, the publican), was known to Origen. This, with a *Gospel of Philip*, was used by Egyptian Gnostics. Other gospels of similar character were circulated under the names of Andrew, Barnabas, and Bartholomew. 5. Other forms of gospel material were in circulation in early times. Sayings of Jesus not contained in any known treatise are met with occasionally, such as the very interesting collections of Logia discovered at Oxyrrhynchus in Egypt. (See AGRAPHIA.) 6. In addition to the above there were gospels of an avowedly heretical type. Of these, the *Gospel of Basilides*, written by the famous Gnostic for the use of his disciples, and *Marcion's Gospel*, which appears to have been a form of our Gospel of Luke, were the most important.

(b) Apocryphal acts of apostles. The beginning of this literature is traditionally connected with the name of Leucius Charinus. Whether he is an historic personage is gravely doubted by many scholars. He is accredited with having composed the *Acts or Travels* (Περίοδοι) of the Apostles Peter, John, Thomas, Andrew, and Paul (each apostle treated separately). In these *Acts* certain Gnostic tendencies were manifest, such as a mystic doctrine of the Cross and those ascetic teachings that exalt celibacy as a form of higher life. Later works of like character were the *Acts of Matthew*, of *Bartholomew*, and of *Philip*. On this originally Gnostic basis, by expurgation or abbreviation of objectionable material, or by rewriting, yet using the same outlines, a series of Catholic Acts was produced, written from a more orthodox standpoint. A secondary form of the same literature is the so-called Abdias collection of *Martyrdoms* (*Passiones* and *Virtutes*) of the several apostles

and their companions (sixth century). The most important and extensive of these Acts are *The Acts of John* and *The Acts of Judas Thomas*, the Apostle to the Indians.

(c) Of apocryphal epistles, the most famous is the *Correspondence between Abgar, King of Edessa, and Jesus*. Apocryphal Pauline epistles were: 1. An *Epistle to the Laodiceans*, on the basis of the hint in Col. iv. 16. 2. An *Epistle to the Alexandrians* mentioned as early as c.170 A.D. 3. A *Third Epistle to the Corinthians*. These are imitations of the Pauline letters in the New Testament. 4. *Correspondence between Seneca and Paul* in 14 letters (at least as early as the fourth century).

(d) Apocryphal apocalypses. Of these *The Apocalypse of Peter* is the most important, a small fragment of which was discovered with the fragment of the *Gospel of Peter*. The work was in existence as early as 175 A.D. and highly esteemed in some quarters. To this class belong also the *Vision of Hermas* and the *Christian Sibylline Oracles* (q.v.). *The Apocalypse of Paul*, *The Vision of Paul*, *The Apocalypse of the Virgin Mary* and other like works are late and less important.

(e) Didactic works. *The Preaching* (κήρυγμα) of Peter was written very early, possibly before 100 A.D. It was perhaps also known as the *Didascalia* or *Doctrine of Peter*.

(f) Hymns. The discovery in 1909 by J. Rendel Harris of the *Odes of Solomon* has given us the only large collection of early Christian hymns. In the Syriac text Odes iii-xlii have been preserved. They were probably written in Greek, somewhere in northern Syria, in the second century A.D. (See SOLOMON, ODES OF.) For other works sometimes classed as New Testament apocrypha, see APOSTOLIC FATHERS; CLEMENTINA; BARNABAS, ACTS AND EPISTLE OF; HERMAS, SHEPHERD OF; TEACHING OF THE TWELVE APOSTLES.

Bibliography. For the apocrypha of the English Bible see the literature quoted in connection with each book and under Deuterocanonical Books. There are approximately complete translations of the Old Testament apocrypha in Kautzsch, *Die Apokryphen und Pseudepigraphen des alten Testaments* (Tübingen, 1900), and Charles, *The Apocrypha and Pseudepigrapha of the Old Testament* (Oxford, 1913). See also G. F. Moore, article "Apocrypha" in *Jewish Encyclopædia*; Churtow, *Uncanonical and Apocryphal Scriptures* (1884), *The Uncanonical Writings of the Old Testament Found in the Armenian MSS. of the Library of St. Lazarus*, translated into English by Jacques Issaverdens (Venice, 1901). The texts of the New Testament apocrypha have been published by Tischendorf, *Evangelia Apocrypha* (Leipzig, 1854), *Acta Apostolorum Apocrypha* (Leipzig, 1851), and *Apocalypses Apocryphæ* (Leipzig, 1866); R. A. Lipsius and Bonnet, *Acta Apostolorum Apocrypha* (Leipzig, 1883); Zahn, *Acta Johannis* (Erlangen, 1880); A. Hilgenfeld, *Novum Testamentum extra Canonem Receptum* (Leipzig, 1884); and *Evangeliorum (et ceterorum) quæ supersunt* (a collection of fragments), *Editio altera*. They have been translated into English by Walker in *The Ante-Nicene Christian Library*; and Pick, *Paralipomena* (1908); *Apocryphal Acts* (1909). Discussions: The most extended are R. A. Lipsius, *Die apokryphen Apostelgeschichten* (Brunswick, 1883-90), and Zahn, *Geschichte des neutesta-*

mentlichen Kanons (2d ed., Leipzig and Erlangen, 1889). For further literature, consult Krüger, *History of Early Christian Literature* (New York, 1897); Bardenhewer, *Geschichte der altchristlichen Literatur* (1902); Reid, article "Apocrypha" in *Catholic Encyclopædia*.

AP'OCYNA'CEÆ (Gk. ἀπό, apo, away from + κύων, kyōn, dog). The DOGBANE FAMILY. A family of dicotyledonous plants, the species of which are herbs, shrubs, vines, and trees, mostly with a copious, milky juice. The leaves are mostly opposite, entire, and without stipules. The flowers are five-parted; ovary single. Fruit, a follicle or drupe; seed often covered with a thistle-like down. There are about 130 genera and more than 1000 species in this family, the principal subdivisions of which are: ARDUINEÆ, represented by *Arduina* and *Landolphia*; PLUMBERIEÆ, containing the tropical genus *Tubernæmontana*, and *Aspidiosperma*, *Vinea*, and *Alstonia*; and ECHITIDEÆ, which embraces *Kickxia*, *Apocynum*, *Nerium*, and *Strophanthus*. The properties of plants of this family vary greatly, but many are exceedingly poisonous. Some, like *Kickxia* and *Landolphia*, are rich in caoutchouc; *Apocynum* yields valuable bast fibre, and its rhizomes are used in medicine; *Strophanthus* contains in its seed a powerful poisonous alkaloid; while others have varied economic uses. See PERIWINKLE; OLEANDER; INDIAN HEMP; RUBBER; STROPHANTHUS; DOGBANE; WRIGHTIA; POISONOUS PLANTS; ETC.

APOCYNUM, ā-pōs'ī-nūm. A genus of plants. See DOGBANE.

APOCYNUM, ā-pōs'ī-nūm. A drug composed of the powdered root of *Apocynum cannabinum*, Canadian hemp. Its taste is acrid and bitter. It contains a bitter principle, apocynine, gallic and tannic acids, etc. Its active ingredients are soluble in water and alcohol. Moderate doses increase the secretions of the skin, bronchi, and kidneys. Large doses cause vomiting and purging. The chief use of apocynum is as a diuretic, especially in dropsy. See APOCYNACEÆ; DOGBANE.

APODES, āp'ō-dēz (Gk. ἀ, a, priv. + πούς, pous, foot). An order of teleost fishes, variously limited, including the eels (not the electric eel), murenas, and allied serpentiform species. Consult T. Gill, *Standard Natural History*, vol. iii, p. 100 (Boston, 1885) and Jordan, *Fishes*, p. 364 (New York, 1907). See EEL.

AP'ODIC'TIC (Gk. ἀποδεικτικός, apodiktikos, demonstrating, -ive). A logical term signifying necessary, and applied to judgments, which admit of no contradiction. It is used largely by Kant. See A PRIORI.

APOG'AMY (Gk. ἀπό, apo, away from + γάμος, gamos, a wedding). A name which refers to the fact that a plant which ordinarily comes from a fertilized egg may, under certain conditions, develop in some other way. In all plants, except the very lowest, there are two plants in each life-cycle: a sexual plant and a sexless one, each producing the other. (See ALTERNATION OF GENERATIONS.) Apogamy is a general term, used to cover all cases in which the sexless plant does not come from a fertilized egg, without reference to the method of its origin. "Parthenogenesis" is that form of apogamy in which a plant is developed from an egg that has not been fertilized. In other cases of apogamy the new plant is developed in a vegetative way from various other tissues, such an origin being distinguished as "vegetative

apogamy." The phenomenon of apogamy has been observed chiefly among the ferns, which seem to respond most readily to the conditions which favor it. Numerous cases have now been observed (both among native and cultivated forms), in which the leafy plant (sexless) arises in various ways directly from the prothallium (sexual), without the fertilization or even the production of an egg. Among the mosses apogamy has never been observed; that is, there is no reason to believe that the spore-bearing structure (sexless plant) ever has any other origin than a fertilized egg. Among the seed-plants the phenomenon has been recorded in a number of cases, and has often been wrongly referred to parthenogenesis. So far as the records go, parthenogenesis has been established in comparatively few seed-plants. In various other cases, however, in which embryos are known to arise in seeds which have received nothing from the pollen, it is discovered that the embryo is not developed by the unfertilized egg, but arises vegetatively from various tissues of the ovule, just as a bud may develop almost anywhere upon a plant. The fact that a seed contains an embryo is no sure indication that this embryo has developed from the egg.

AP'OGEE (Gk. *ἀπό*, *apo*, from + *γῆ*, *gē*, earth). When the earth and some other planet reach such positions in their respective orbits that the distance between them is a maximum, then that planet is said to be in its apogee. The use of the word "apogee" is usually restricted to the sun and moon, the sun's apogee corresponding to the earth's aphelion, and the moon's apogee being the point of its orbit most remote from the earth. Apogee is opposed to perigee.

AP'OGEO'T'ROPISM, or **NEGATIVE GEOTROPISM**. That form of sensitiveness to gravity in plants by virtue of which organs tend to grow vertically upward—that is, in a direction opposite to that of the earth's attraction. The best example of this phenomenon is found in the main shoots of most plants. When "centrifugal force" is brought to bear upon the plant in place of gravity, the stems of seedlings grow toward the centre of revolution, while the roots being positively geotropic, grow in the opposite direction. See **GEOTROPISM IN PLANTS**.

APOLDA, *à-pōl'dà*. A town of the grand duchy of Saxe-Weimar, Germany, near the Ilm, a feeder of the Saale, 8 miles northeast of Weimar (Map: Germany, D 3). It is a station on the Thuringian Railway, between Weimar and Weissenfels, and a place of much industrial activity, having extensive manufactures of hosiery and woven goods, boilers and engines, and bell foundries. Pop., 1895, 20,798; 1900, 20,352; 1905, 21,262; 1910, 22,592.

AP'OLIS'TA. A small tribe of Indians, whose language constitutes them a distinct linguistic stock, originally inhabiting the valley of the Apolo (whence the name), an affluent of the Rio Beni, in northern Bolivia, northeast of Lake Titicaca. They now live just north of the Lecos. Consult the writings of Armentia, Ballivian, Cardús, etc. De Créqui Montfort and Rinet, in a monograph on the Apolista or Lapaçu language in *Zeitschrift für Ethnologie*, vol. xlv, pp. 512-531 (1913) seek to prove it "a moribund Arawak dialect."

APOL'LINA'RIS (?-392). The younger, Bishop of Laodicea in Syria, and one of the warmest opponents of Arianism. Both as a man

and a scholar he was held in the greatest reverence, and his writings were extensively read in his own day. His father, Apollinaris the elder, who was Bishop of Laodicea, was born at Alexandria, and taught grammar, first at Berytus, and afterward at Laodicea. When Julian prohibited the Christians from teaching the classics, the father and son endeavored to supply the loss by converting the Scriptures into a body of poetry, rhetoric, and philosophy. The Old Testament was selected as the subject for poetical compositions after the manner of Homer, Pindar, and the tragedians; while the New Testament formed the groundwork of dialogues in imitation of Plato. But it was chiefly as a controversial theologian, and as the founder of a sect, that Apollinaris is celebrated. He maintained that the *logos*, or divine nature in Christ, took the place of the rational human soul or mind, and that the body of Christ was a spiritualized and glorified form of humanity. This doctrine was condemned by several synods, especially by the Council of Constantinople (381), on the ground that it denied the true human nature of Christ. The heresy styled Apollinarianism spread rapidly through Syria and neighboring countries, and, after the death of Apollinaris, its adherents formed two sects—the Vitalians, named after Vitalis, Bishop of Antioch, and the Polemeans, after Polemo, who added to the doctrine of Apollinaris the assertion that the divine and human natures were so blended as one substance in Christ that his body was a proper object of adoration. On this account they were accused of *sarcolatria* (worship of the flesh) and *anthropolatria* (worship of man) and also were styled *synousiastoi* (*σύν, syn*, together, *οὐσία, ousia*, substance), because they confused the two distinct substances. Other leaders were Valentinus and Timothy. Consult Harnack, *History of Dogma*, vols. iii, iv.

APOLLINARIS, SAINT. A citizen of Antioch, founder and bishop of the church of Ravenna. He was said to have followed St. Peter to Rome, where he was ordained. Tradition says he was martyred in Ravenna, after being bishop of that place for 26 years.

APOLLINARIS, SULPICIUS. See **SULPICIUS APOLLINARIS**.

APOLLINARIS SIDO'NIUS, CAIUS SOLILIUS (c.430-487 or 488). A Roman author, political leader, and Bishop of Arverna (Clermont-Ferrand), born at Lyons. He married in about 452 the daughter of Avitus, who was Emperor from 455 to 456. He was Prefect of Rome in 467, bishop in 472, and headed the national party against the Goths. In 474 he was imprisoned, but was later released and ruled his bishopric until his death. After his death he was canonized. He wrote nine books of letters of great historical value, and 24 poems, mainly panegyric. The best edition of his work is in the *Auctorum Antiquissimorum*, vol. viii, in the *Monumenta Germaniæ Historica* (Berlin, 1887). Consult Hodgkin, *Italy and her Invaders*, vol. ii (Oxford, 1892), and Dill, *Roman Society in the Last Century of the Empire* (London, 1898).

APOLLINARIS WA'TER. An alkaline mineral water obtained from a spring in the valley of the Ahr, in Rhenish Prussia, which was discovered in 1851. Its pleasant taste and richness in carbon dioxide gas make it a valuable table water, recommended for dyspepsia and loss of appetite.

Its composition is:

Sodium carbonate	6.964	grains in a pint
Magnesium "	2.751	" "
Calcium "	1.900	" "
Sodium chloride	2.743	" "
Sodium sulphate	1.548	" "
Sodium phosphate }	Traces.	
Potassium salts }		
Iron oxide with alumina	0.049	" "
Silicic acid	0.099	" "
Carbonic acid (free and semi-combined)	42.81	cub. in. in a pint
Carbonic acid (combined)	12.44	" "

APOLLO. A borough in Armstrong Co., Pa., 25 miles (direct) northeast of Pittsburgh, on the Pennsylvania Railroad and on the Kiskiminetas River (Map: Pennsylvania, B 6). It is the centre of a coal-mining region and manufactures steel, lime, and woolen goods. Apollo was settled in 1790, laid out in 1816, and incorporated as a borough in 1848. Pop., 1890, 2156; 1900, 2924; 1910, 3006.

APOLLO (Gk. Ἀπόλλων, *Apollōn*, Doric for Ἀπέλλων, *Apellōn*). Next to Zeus, the most important and most widely worshiped divinity of Greece. Later antiquity identified Apollo with the sun, but in Homer the two are entirely distinct. As to the origin and the meaning of the name Apollo, there is no general agreement among scholars, though the weight of argument is slightly in favor of those who interpret it as 'he who wards off,' 'he who drives away' evil, from which conception it is easy to explain many of the varied forms of the Apollo cult. Thus Apollo is a god who heals diseases and purifies from moral defilement. So he was said to have purified Orestes (q.v.) for the murder of his mother, and so he was invoked to purify and cleanse entire communities afflicted by pestilence. In the same way his protection was extended to flocks and herds, as is shown by his epithet *Nomios*, and by the story of his serving as the shepherd of Admetus (q.v.), to the great increase of the flocks of that king. He also appears as protecting the grain from mildew, and as driving away field-mice, whence his surname *Smintheus*; as Apollo *Parnopios* he kept off the locusts (*πάρνοπες*). There are also traces of Apollo as a war god, who can drive away the enemy and who mingles actively in the fray; at the shrine in Amyclæ (q.v.), near Sparta, he appeared with a helmet and a lance. Nor is this view of the original conception of Apollo in any way inconsistent with his very obvious connection with the light. For that he was early connected with the sun is clear, from the celebration of his departure in the autumn to a distant land, and his return in the spring. Light is regarded as a healer and protector, the bane of evil spirits who love darkness. The light and heat, however, are not always beneficent, and Apollo thus appears as the sender of pestilence and as bringing sudden death with his unerring arrows. As a light-god, also, he is called *Lycean* and *Lycian*; these terms may be connected with the Latin *lux*, 'light.' The ancients connected them with the Greek word for 'wolf' (*λύκος*, *lykos*), and some good modern authorities consider Apollo as originally a herdsman's divinity in the form of a wolf. In a kindred view "Apollo was one outgrowth of the shepherd-god existing in each community, himself once a shepherd, protecting the sheep from wolves, patron of the music and the games that shepherds love." He is also styled *Phœbus* (*Φοῖβος*), the 'bright one,' the 'brilliant one.' Whatever may have been his early nature, the

prominent conception of Apollo in historic times was as a god of prophecy and so of music and song. His most famous oracle was at Delphi (q.v.), but there were others at Delos; at the Ismenian sanctuary near Thebes; at Abæ, on the border of Phocis; at Patara, in Lycia; and at Claros, in Ionia, near Colophon. Apollo was also a god of colonization, and many Greek cities believed that their founders had been guided by Apollo in the form of an animal or bird.

As is natural in the case of a god so widely worshiped, the legends of Apollo are highly diversified, though the main features show considerable unity, due to the overpowering influence of the cults at Delphi and Delos, which made their versions canonical. He was the son of Zeus and Leto (Latona), born with his twin sister Artemis (see *DIANA*) on the island of Delos, which had hitherto floated on the sea, but now became fixed, and afforded a refuge for Leto, who had been driven from all other places by the wrath of Hera (see *JUNO*). After his birth the god hastened to Delphi and slew the dragon Python, who had pursued his mother during her sorrow. For other legends see *ADMETUS*; *HYPERBOREANS*; *LAOMEDON*; *NIOBE*. In Greece Apollo was not the god of any single race. The Ionians worshiped him as the ancestral god, *Patroös*; the great Dorian festival, *Carneia* (see *GREEK FESTIVALS*), was held in his honor. At Athens, at the *Thargelia*, in May, first fruits were offered to him, there were musical contests in his honor, and the city was purified by special rites that the ripened grain might escape his wrath. In Rome his worship was introduced from Greece at a comparatively late date. The earliest mention of a place of worship for Apollo is in 443 B.C., and it was not till 212 B.C. that the *Ludi Apollinares* were celebrated. Augustus greatly increased the honor of the god in gratitude for the victory of Actium (q.v.) (for Apollo's help of Augustus at Actium see Vergil, *Æneid*, viii, 704 ff.), and built him a splendid temple on the Palatine, with which a library was connected. The temple contained the celebrated statue of the god by Scopas.

The representations of Apollo in ancient art are almost innumerable. As Apollo *Agyieus*, or Apollo of the Streets, he was worshiped in the form of a conical stone. In general, two chief types can be distinguished. In the one Apollo appears as a nude youth, the ideal of youthful strength and beauty. This can be traced from the rude statues of archaic art, of Melos, Thera, and Orchomenus, through the Payne-Knight bronze, and the Choiseul-Gouffier marble in the British Museum, to the almost effeminate type of the Apollo *Sauroctonos* (the lizard-slayer) of Praxiteles, or the glorious divinity of the Apollo of the altar frieze from Pergamon (q.v.). The other type represents the god as clad in the long robe of the musician playing on the lyre, as he appears in the statue in the Vatican (see *APOLLO BELVEDERE*), which is probably a copy of the work of Scopas. The special attributes of Apollo are the bow and the quiver, the laurel and the lyre. Consult: Overbeck, *Griechische Kunstmythologie* (Leipzig, 1871-89); Wernicke in the Pauly-Wissowa *Realencyklopädie der klassischen Altertumswissenschaft* (Stuttgart, 1900); Farnell, *The Cults of the Greek States* (Oxford, 1896-1907).

APOLLO BELVEDERE, bĕl'vâ-dâ'râ. A celebrated statue of antiquity, probably found

at Grotto Ferrata (less probably at Porto d'Anzio: see ANTIUM), and in 1503 placed in the Belvedere of the Vatican by Pope Julius II. The left hand and right forearm were restored by Montorsoli, a pupil of Michelangelo. The ægis (q.v.), which has been restored in the left hand, on the evidence of a bronze statuette, supposed to have been found in 1792, and now in St. Petersburg, is not known as an attribute of Apollo, nor is its presence in the statuette proved; further, the statuette has been pronounced by Furtwaengler (q.v.) a modern forgery. The significance of the statue cannot be surely determined. In one view the beautiful face expresses divine wrath and contempt. The god, clad only in the chlamys (q.v.), is moving forward against the powers of evil to rescue the distressed. Furtwaengler rejected this view and maintained that the right hand originally held a laurel branch wound with fillets, and that the presence of the quiver shows that the left raised the bow. The bow, he continued, marked Apollo as the "Far-Darter"; the laurel and the fillets referred to the propitiatory and cleansing power of Apollo. Thus the statue emphasizes two views of Apollo. This statue was once regarded as the highest type of Greek art, but it has long been known to be only a careful Roman copy, made about the beginning of the Empire, of a Greek original, which cannot well be earlier than the latter part of the fourth century B.C. (possibly by Leochares), while many good authorities regard it as belonging to the third, or even second century. Consult W. Helbig, *Guide to the Public Collections of Classical Antiquities in Rome* (a translation of a German work, by J. F. and Finlay Muirhead, Leipzig, 1895); A. Furtwaengler, *Masterpieces of Greek Sculpture*, a translation by Eugenie Sellers (London, 1895).

APOLLO CITH'ARÆ'DUS (Gk. *κιθαρωδός*, *kitharōdos*, harper, from *κιθάρα*, *kithara*, lyre + *αοιδός*, *aoidos*, singer). Apollo, in his function of God of Music. Two famous statues of him in this capacity are in existence: one at the Vatican, the other at the Glyptothek in Munich, both of uncertain date and origin.

APOLLO CLUB. A seventeenth-century literary *coterie*, resembling the Elizabethans' "Areopagus," or that still more famous gathering which, in the eighteenth century, surrounded Dr. Johnson. Among its members were Ben Jonson, Robert Herrick, Randolph, and other poets and pamphleteers. Its meeting place was the Devil Tavern at Temple Bar.

AP'OLLODO'RUS (Gk. *'Απολλόδορος*, *Apollōdōros*). 1. An Athenian painter of the fifth century B.C., an elder contemporary of Zcuxis. He is said to have introduced the rendering of light and shade in place of the flat coloring of his predecessors. 2. A celebrated architect of the early part of the second century A.D., employed by the Emperor Trajan in the construction of his splendid stone bridge over the Danube, in the building of the Forum called the Forum of Trajan, and other works in Rome. His severe censure of Emperor Hadrian's architectural plans is said to have caused Apollodorus's banishment and death. 3. A Greek grammarian of the second century B.C. He studied philosophy in his native Athens and then joined the Alexandrian scholars about Aristarchus; he wrote a chronicle in iambic verse and several grammatical works. His greatest work was *On the Gods*, apparently a history of the Greek religion, though its exact

nature can only be conjectured from scattered notices. The extant mythographical handbook which begins with the origin of the gods, and ends with the story of Troy, and which is of great value, is certainly, though it bears the name of Apollodorus, a compilation of a later date.

AP'OLLO'NIA (Gk. *'Απολλωνία*). The name of more than 30 ancient cities. 1. In Illyria, on the Aoüs, founded by emigrants from Corinth and Coreyra, commercially prosperous, and toward the end of the Roman Empire a seat of literature and philosophy. 2. In Thracia (afterward Sozopolis, and now Sizeboli), colonized by Milesians, and famous for a colossal statue of Apollo, by Calamis, which was removed to Rome by Lucullus (q.v.). 3. The port of Cyrene (afterward Sozusa, and now Marsa Suza), which outgrew Cyrene itself and left evidences of its magnificence in the ruins of its public buildings. Eratosthenes (q.v.) was born there. 4. A city of Macedonia, referred to in Acts xvii. 1, as one of the stations on the road from Amphipolis to Thessalonica. Its exact position is not known. It was, doubtless, on the celebrated Via Egnatia, probably near the present Gol (Lake) Beshik, to the south. Little is known of its history.

AP'OLLO'NIUS (Gk. *'Απολλώνιος*, *Apollōnios*). An Alexandrian scholar, son of Archibius. He lived toward the end of the first century A.D. and compiled a lexicon of Homeric words, the main sources of which were Apion's *Glossary* (see APION), and the commentaries of Aristarchus and Heliodorus. Though it has come down to us in abridged and otherwise imperfect form, this work is valuable for the exegetical study of Homer.

APOLLONIUS, OF PERGA. A mathematician, younger contemporary of Archimedes and Eratosthenes. Born at Perga, in Pamphylia, he lived, during the years of his activity as a scholar, which were approximately from 247 to 205 B.C., at Alexandria and Pergamum. His principal work was a treatise on Conic Sections, in eight books, the first four of which, accompanied by a sixth-century commentary on them by Eutocius, have come down to us in the original Greek. The extant books give the elements of the subject as an introduction to the more advanced theory. Apollonius clearly indicates his indebtedness to earlier scholars: at the same time it is plain that much of his work was original. Books i-vii were twice translated into Arabic in the ninth and tenth centuries; copies of these translations have been known in Europe since the seventeenth century; from one of these Arabic translations a Latin translation of books v-vii was made by Abraham von Echelles and Alfonso Borelli, and published at Florence in 1661. Of book viii there exist only certain *lemmata* of Pappus (q.v.) dating from the third and fourth centuries A.D. Apollonius's work, containing 400 problems, was so complete that it left little for his successors to improve. He wrote on the methods of arithmetical calculation, on statics, the stations and regressions of the planets (a work upon which Ptolemy drew in writing the *Almagest*), and on transversals of conics, which laid the foundation for the geometry of position. Among his other works deserving mention are: *De Sectione Spatrii*, *De Sectione Determinata*, and *De Tractionibus*. Apollonius's problem, "To draw a circle tangent to three given circles in a plane," found in his

APOLLO BELVEDERE
IN THE BELVEDERE OF THE VATICAN

treatise on *Contact*, has been solved by Newton, Vieta, and others. Consult: Halley, *Opera et Studia* (Oxford, 1710), which is the best edition of the extant works of Apollonius; Heiberg, *Apollonii Pergaei quae Graece Exstant Opera* (Leipzig, 1891-93); H. G. Zeuthen, *Die Lehre von den Kegelsehnitten im Altertum* (Copenhagen, 1886). T. L. Heath's Cambridge edition also deserves mention.

APOLLONIUS, OF TRALLES. See AMPHION.

APOLLONIUS, OF TYANA. A native of Tyana, in Cappadocia, who lived in the time of Christ. He was a zealous follower of the doctrines of Pythagoras. He traveled through Asia to Nineveh and Babylon, thence to India, where, at the court of King Phraortes, he met Jarchas, the principal Brahmin. When Apollonius returned from this pilgrimage, his fame as a wise man was greatly increased; the people regarded him as a worker of miracles and a divine being, and princes were glad to entertain him at their courts. He himself seems to have claimed insight into futurity rather than the power of working miracles. Yet in Rome it was claimed that he raised a young woman from the dead. He was acquitted of treason by Nero, because the indictment had vanished from the paper. After extensive travels in Spain, Italy, Greece, and Ethiopia, he was accused of having taken part in an insurrection against Domitian. He appeared before the tribunal, but soon miraculously vanished. Ultimately he appears to have settled in Ephesus, where he opened a Pythagorean school and continued his teaching until he died, nearly 100 years old. His history was written by Philostratus (q.v.), but is plainly a religious novel intended for the entertainment of Julia, wife of the Emperor Severus. The travels of the apostle Paul are a more likely inspiration to this work than the Gospel narrative of Christ. It contains a mass of absurdities and fables through which an outline of historical facts and the real character of the man are sufficiently discernible. Hierocles, a heathen statesman and opponent of Christianity, wrote, in the third century, a work on the life and doctrines of Apollonius, with a view to prove their superiority to the doctrine of Christ. In modern times Blount in England and Voltaire in France have renewed the attempt. Consult: B. L. Gildersleeve, *Essays and Studies* (New York, 1890), and L. Dyer, *Studies of the Gods in Greece* (New York, 1894); and for his life, Philostratus in the Teubner series, vol. i (Leipzig, 1870-71); Eng. trans., Guthrie (New York, 1905); Fr. trans., A. Chassang (Paris, 1862); Ger. trans., E. Baltzer (Rudolstadt, 1883); also the essay of F. C. Baur, "Apollonius von Tyana und Christus," in *Drei Abhandlungen* (ed. Zeller, Leipzig, 1876); O. de B. Prieulx, *The Indian Travels of Apollonius of Tyana* (London, 1873); D. M. Tredwell, *A Sketch of the Life of Apollonius of Tyana* (New York, 1886); G. R. S. Mead, *Apollonius of Tyana* (London, 1901); Campbell, *Apollonius of Tyana* (New York, 1909).

APOLLONIUS, OF TYRE. The hero of a Greek romance now lost, which in a Latin version enjoyed great popularity in the Middle Ages and was translated into almost all the languages of western Europe (the earliest translation seems to have been one into Anglo-Saxon, in the ninth or the tenth century). In it are related the romantic adventures which be-

fell Apollonius, a Syrian prince, previous to his marriage with the daughter of King Alcistrates, of Cyrene. To these are added the adventures of his wife, who was parted from him by apparent death, as well as those of his daughter, Tarsia, who was carried off by pirates and sold in Mytilene. The work closes with the reunion of the whole family. The original Greek work, which was soon lost, belonged to the third century A.D. and showed close relations with the *Ephesiaea* of Xenophon of Ephesus. The Latin version was made by a Christian, not earlier than the fifth century. The account given in the *Gesta Romanorum* and the part contained in the *Pantheon* of Godfrey of Viterbo (c.1185) are drawn from this early translation. The earliest translation from the Latin was into Anglo-Saxon in the ninth or the tenth century; an early English rhymed version of the end of the fourteenth century is to be found in Gower's *Confessio Amantis*; and the materials are employed in Shakespeare's *Pericles, Prince of Tyre*. About 1300 Heinrich von der Neuenstadt produced a poetical version in over 20,000 verses, based probably on the account in the *Gesta Romanorum*. The *Histori des Küniges Apollonii*, published 1476, is translated from Godfrey of Viterbo, as is the Spanish version of the thirteenth century, printed in Sanchez's *Colección de Poesias Castellanas* (Paris, 1842). Several French and Italian versions have been made from the same source. There are also middle and modern Greek versions extant. The Latin translation, which survives in about 100 manuscripts, from the Greek original, has been edited by Riese, *Historia Apollonii Regis Tyri* (2d ed., Leipzig, 1893). Consult in general: the preface to Riese's edition; Rohde, *Der griechische Roman und seine Vorläufer* (Leipzig, 1900); Hagen, *Der Roman vom König Apollonius in seinen verschiedenen Bearbeitungen* (Berlin, 1878); Krumbacher, *Byzantinischer Litteraturgeschichte*, p. 434; M. Haupt, *Opuscula*, vol. iii; Simrock, *Quellen des Shakespeare* (Bonn, 1872).

APOLLONIUS DYS'COLUS (Gk. Ἀπολλώνιος Δύσκολος, *Apollōnios Dyskolos*). An Alexandrian scholar who lived in the first half of the second century A.D. He and his son, Herodian, were the greatest Greek grammarians. Apollonius reduced grammar to a system and made a science of syntax. He wrote a large number of works, but the greater portion of them perished early. Four are extant: those on *Pronouns*, on *Conjunctions*, on *Adverbs*, and on the *Syntax of the Parts of Speech*. It is not clear whether the surname *Dyscolus* ('crabbed') had reference to his literary style or to his disposition of mind. Priscian (q.v.) founded his great work on Latin grammar on the work of Apollonius. Consult J. E. Sandys, *A History of Classical Scholarship*, vol. i, pp. 319 ff. (Cambridge, 1906).

APOLLONIUS MO'LON. A Greek rhetorician, born at Alabanda, in Caria. He taught rhetoric at Rhodes and was a distinguished pleader in the courts. In 81 B.C., having been sent to Rome as an ambassador by the Rhodians, he addressed the Roman Senate in Greek. He stayed some time at Rome and was there heard by Cicero, who afterward (78 B.C.) studied under him at Rhodes. Other distinguished Romans, among them Cæsar, also attended his lectures.

APOLLONIUS RHO'DIUS (c.295-c.215 B.C.).

An epic poet, son of Silleus (or Illeus), born at Alexandria. As a youth he was the pupil of Callimachus (q.v.), but afterward entered into a bitter strife with his former teacher, on literary grounds. Callimachus was the champion of the short poem in the artificial and learned style, while Apollonius preferred the lengthy poem in the simple style of Homer. The *Argonautica*, the most important and only extant poem of Apollonius, was in part written while the author was at Alexandria and was received with scorn by the audience there. Apollonius then withdrew to Rhodes, revised his poem, and produced it with great acclaim. He received citizenship at Rhodes, set up a school of rhetoric there, and styled himself the *Rhodian*. Later in life he is said to have returned to Alexandria and to have succeeded Eratosthenes as librarian—an office which he held till his death. The *Argonautica* is an epic poem in four books, containing an account of the expedition of the Argonauts in quest of the Golden Fleece. The first two books describe the departure of the expedition and the adventures on the way; the third book tells of the passion of Medea for Jason; the fourth book gives an account of the return home. The poem imitates the language and style of Homer, but it is labored and lacks spirit and movement, except in the third book, on which Vergil drew largely in writing the fourth book of the *Æneid*; in this book Apollonius shows himself master of the psychological analysis of human passion. The *Argonautica* was much admired by the Romans, being translated at least once, by Varro, of Atax, in Gaul, a contemporary of Horace, and often imitated by them. (See VALERIUS FLACCUS.) Apollonius wrote other works in verse and in prose. There are critical editions by Merkel (1854) and R. C. Seaton (Oxford); translations by A. S. Way (London) and Seaton (New York, 1912). There is an annotated edition in English, unfortunately not critical or accurate, by G. W. Mooney (London, 1912).

APOL'LOS (Gk. Ἀπολλῶς, an abbreviation of Ἀπολλώνιος, *Apollōnios*). An early Christian missionary and companion of St. Paul. He was an Alexandrian, converted probably in Alexandria by followers of John the Baptist, and at once threw himself with enthusiasm into the work of propagating the new faith. He came to Ephesus and there gladly accepted the fuller instruction which he received from Priscilla and Aquila. Thus equipped, he passed on to Corinth, where he labored with great success (Acts xviii. 24–28). But unhappily there were those there who made a party called by his name and so contributed to the factional troubles in the Corinthian church. From Corinth he went to Ephesus. But his Corinthian admirers, who preferred his more rhetorical manner of preaching to the simpler manner of Paul, desired his return, and he promised to come a little later (1 Cor. i. 10–12; iii. 4–6; xvi. 12). The last mention of him in the New Testament (Titus iii. 13) shows him about to undertake a journey to Crete. According to tradition he became the first Bishop of Crete.

APOLLO SAUROK'TONOS (Gk. Σαυρόκτονος, *Sauroktonos*, *Lizard-Killer*, from σαύρα, *lizard* + κτείνω, *to kill*). A statue of the youthful Apollo in the Vatican—a copy of a bronze of Praxiteles, which Pliny calls “the most beautiful bronze statue left in the world.” It represents the

god leaning against a tree, dart in hand, ready to slay a lizard as it runs up the trunk. In the Roman Campagna men and boys still amuse themselves throwing knives at lizards. The statue was found in 1777 in the Villa Magnani, on the Palatine. Consult Helbig, *Guide to the Public Collections of Classical Antiquities in Rome*, translated by James F. and Findlay Muirhead (Leipzig, 1895–96).

APOLLYON, à-pōl'li-on, or à-pōl'yūn (Gk. Ἀπολλύων, from ἀπολλύναι, *apollynai*, to destroy). A designation used (Rev. ix. 3–11) to translate the Hebrew *Abaddon*, which means ‘destruction,’ and which was one of the names given to the great gathering place of the dead, more commonly known as Sheol. Apollyon is personified as the angel having dominion over the locusts coming up out of the “bottomless pit” at the sound of the fifth trumpet on the day of judgment. In Talmudic literature (*Shabbath* 55a) Abaddon is the name given to the angel who with Maweth, i.e., ‘death,’ stands over the six angels of destruction, who aid God in the punishment of the wicked.

AP'OLO'GIA PRO VI'TA SU'A (Lat. defense of his life). John Henry (afterward Cardinal) Newman's defense of his position in the “Oxford Movement.” Its immediate cause was an accusation made by Charles Kingsley, that “Truth for its own sake has never been a virtue with the Roman clergy. Father Newman informs us that it need not and, on the whole, ought not to be.” Newman first demanded a substantiation or a retraction of this charge; and unable to obtain either, published the *Apologia*.

APOL'OGIE FOR PO'ETRY. A famous work written by Sir Philip Sidney in 1580, and published in 1595, in answer to an attack on the playhouses entitled *The School of Abuse*, dedicated to him without his consent, by Stephen Gosson. It is a defense and eulogy of the art of poetry, closely modeled after Aristotle's *Poetics* and couched in the exaggerated Elizabethan style.

AP'OLOGUE (Gk. ἀπόλογος, *apologos*). A fable or short story, with animals or inanimate objects as actors or speakers, intended to convey some moral. The true apologue differs, however, from both the fable and the parable—from the former in that it always carries a moral, and from the latter in not being realistic. The apologue, though dramatic, cannot reach such artistic heights as the parable, since the points of resemblance between the animal and the man are too few and the analogies too crude. Unlike the parable, which aims to bring out man's relations to God, the apologue falls far short of portraying human character; it parodies rather than depicts human nature. Its origin is very ancient and its historical development very uncertain. It was first conceived in the East, where this form of tale served the purpose of voicing the slaves' protest against oppression. Both Æsop and Phædrus, the accredited fathers of the apologue, were slaves. Others after them have so much translated, amended, and edited their fables that it baffles the specialist to trace their history. Some of those who have imitated these earlier fables most successfully were La Fontaine in France, Lessing in Germany, and Kryl'ov in Russia. That collection, however, which is known as *Æsop's Fables* still enjoys the greatest reputation throughout the world. For an account of

the fable, consult Jacobs, Introduction to *The Fables of Æsop* (New York, 1896).

APOL'OGY (Gk. ἀπολογία, *apologia*, a speech in defense, defense). A term now commonly understood as synonymous with an excuse for breach of an engagement, etc., but originally used as the title of any work written in defense of certain doctrines, as in the *Apology of Soerates*, ascribed to Plato and Xenophon; the *Apology for the Christians*, by Tertullian, and in many other defenses of the Christians, written by Justin Martyr, Aristides, Athenagoras, Tatian, Theophilus, Origen, Eusebius, Minucius Felix, Arnobius, Lactantius, Augustine, Orosius, and others. After the fourth century, when the Church was made dominant under the Roman emperors, apologetical writings were less called for; but Bartholus Edessenus and Raymundus Martinus wrote against the Jews and the Mohammedans. In the fifteenth century, when the revival of learning placed Christianity in apparent opposition to the Platonic philosophy, Marsilius Ficinus wrote in defense of revelation; and, some time after the Reformation, the spread of free-thinking and skepticism in England was opposed by a variety of apologetical works, chiefly maintaining the points that Christianity is a divine revelation, Christ a divine Messenger, and His Church a divine institution. The defense of Christianity on grounds of reason came now to be treated as a distinct branch of theology, under the name of *Apologetics*. Among the numerous apologetic works by Protestants may be mentioned those by Grotius (*De Veritate*, etc.), Butler (*Analogy of Religion, Natural and Revealed*), Lardner (*Credibility of the Gospel History*), Leland, Addison, Soame Jenyns (*Internal Evidences of the Christian Religion*), Hugh Farmer, Bishop Watson (*Apology for Christianity*), Paley (*Evidences of Christianity and Horæ Pauline*). Among Roman Catholic apologetic writers the most eminent are Pascal, Hauteville, Guenée, Bergier, Mayr, and Chateaubriand.

In the nineteenth century a great number of apologetic works by Neander, Tholuck, and others were called forth in reply to Strauss's *Das Leben Jesu* and the *Vie de Jésus* by Renan. Later came the attacks from agnostic, materialistic, and other philosopho-scientific sources, and these have been replied to by Christian scholars, as A. Ebraid, *Apologetics* (2d ed., Gütersloh, 1878-80; Eng. trans., 3 vols., Edinburgh, 1886-87); P. Schanz (Catholic) (Freiburg, 1895-98; Eng. trans., 3 vols., Dublin, 1897); A. B. Bruce, *Apologetics* (New York, 1892). Manifestly these works are written to meet a passing need, and few of them retain much value after a few years.

AP'OMOR'PHINE (Gk. ἀπό, *apo*, away from + *morphine*). An artificial alkaloid made by heating morphine with hydrochloric acid under pressure. The salt of apomorphine employed in medicine is the hydrochloride, which occurs in minute, colorless crystals that acquire a greenish tint on exposure to light and air. It is the best known of the so-called systemic emetics (see **EMETIC**) and causes vomiting within 5 to 20 minutes, whether given by mouth or hypodermatically. This emesis is due to direct action on the vomiting centre in the medulla. It is repeated frequently, with little nausea, after the stomach has been emptied, and is accompanied by marked muscular relaxation. The respiration and circulation are also depressed, and

large doses may cause convulsions, followed by paralysis. As an emetic it is used when prompt action is desired or when swallowing is difficult or impossible. It is used also in small doses as a sedative expectorant. Furthermore, apomorphine has been recommended as a hypnotic and is said to act usually within 10 or 15 minutes. For this purpose a small dose is given hypodermatically after lying down.

AP'ONEURO'SIS (Gk. ἀπονεύρωσις, end of a muscle where it becomes tendon, from ἀπό, *apo*, away + νεῦρον, *neuron*, sinew, tendon). An anatomical term for a sheet-like expansion of strong fibrous tissue, of which there are many examples in the human body. For the sake of convenience, it is generally confined to expansions from the tendons of muscles, as the lumbar aponeurosis. If a tendon is very broad and expanded, as that of the external oblique muscle of the abdomen, it is said to be aponeurotic. Some muscles, as those on the shoulder-blade, are partially covered with a tendinous expansion, to which some of their fibres are attached; this is termed the aponeurotic origin of the muscle; it gives the muscle a more extensive attachment, without adding materially to its weight.

APOPHYGE, à-pŏf'ī-jē (Gk. ἀπό, *apo*, from + φεύγειν, to flee). In architecture, (1) a molding of concave, approximately quarter-round section, like an inverted cavetto, by which the shaft of a column or pilaster flares out to form the cincture at the top of the base. (See **COLUMN**; **ORDERS OF ARCHITECTURE**.) This flare is very pronounced in some early Greek Ionic orders, as in that of the temple of Apollo Epikourios at Bassæ. (2) The hollow molding or profile, almost a scotia, under the echinus of some early Greek Doric capitals in Magna Græcia (at Præstum, the Basilica and temple of Demeter, and a temple at Metapontium). It is loosely used also of the transition from shaft to echinus of any Greek Doric capital and of the slight flare under the astragal at the top of the shaft in all the Roman orders. The French word *congé* (= leave-taking, dismissal) is used by many in the same sense.

APOPH'YLLITE (Gk. ἀπό, *apo*, away + φύλλον, *phyllon*, leaf). A common mineral of the zeolite group. It is a hydrated potassium-calcium silicate crystallizing in tetragonal forms. The lustre is vitreous except on cleavages parallel to the basal pinacoid, which show a pearly lustre. It is colorless, white, pink, or greenish. Apophyllite occurs as a secondary mineral in basalt and other volcanic rocks. Excellent specimens are found in the United States at Bergen Hill, N. J., and throughout the Lake Superior region, as well as in Greenland, Mexico, the Harz region, and Nova Scotia. It is named from its tendency to exfoliate under the blowpipe.

AP'OPLEXY (Gk. ἀποπληξία, *apoplēxia*, from ἀπό, *apo*, away + πλήσσειν, *plēssein*, to strike). A term applied to an engorgement of blood, with or without extravasation, in the brain, producing coma. In medicine three distinct affections of the brain circulation are understood: cerebral *embolism*, cerebral *thrombosis*, and cerebral *hemorrhage*. These differ in their cause and somewhat in their symptoms. In cerebral *embolism* there is a sudden blocking up of one of the blood vessels of the brain by some foreign body in the circulating blood. Such foreign bodies usually come from the valves of the heart,

which in a number of septic diseases, as rheumatism, typhoid fever, gonorrhoea, etc., have minute growths upon them. These become detached and are swept into the circulation and may block up a brain artery. The symptoms come on acutely, may occur in the young or old, and may be slight, if a small vessel is blocked, or severe if the vessel is large. There may be sudden dizziness and weakness, going on to slight convulsive movements of one side of the body and loss of consciousness. This is accompanied by deep, noisy breathing, a slowing of the pulse, and perhaps a slight rise in temperature. The person may soon recover, usually with some weakness in some part of the body, or with a slight paralysis of some of the muscles of the leg, arm, or face. At times the whole of one side of the body may remain paralyzed.

Cerebral thrombosis is due to a disease of the blood vessels themselves, during which blood clots may form in them and thus cut off a portion of the brain substance from its normal supply of blood. Syphilis is the chief cause, especially in individuals under 40 years of age. The symptoms are apt to come on gradually. Following a period of headache, dizziness, and nausea, may occur sensations of prickling in the fingers; convulsive movements in some of the muscles, twitchings, or loss of muscular strength. At the time of attack the symptoms resemble those of embolism.

Cerebral hemorrhage is the most important cause of apoplexy. It occurs from the rupture of a blood vessel into the brain substance, and the severity of the symptoms depends partly on the amount of the hemorrhage, largely on the part of the brain involved. Hemorrhage is more apt to occur in the aged, and it is a frequent cause of death in those over 60 years of age. The symptoms may be sudden and terminate in death, or there may be several attacks of giddiness or collapse, with tingling or numbness of the extremities, or loss of speech. Patients may have several attacks and yet recover, with some persisting paralysis of one side of the body or of one arm or one leg. Little can be done before a physician comes. Mustard baths to the feet and the application of ice to the head may help in some cases. Persons with the "apoplectic habit" should take special care not to become mentally disturbed.

APOPLEXY, PARTURIENT. See MILK FEVER.

APORT'. See HELM.

APOS'PORY (Gk. *ἀπό, apo*, away from + *σπόρος, sporos*, seed). A name which literally means "without spore reproduction" and which refers to the fact that in some cases the sexual plant develops directly from the sexless one without the intervention of a spore. This phenomenon, like its correlative, *apogamy* (q.v.), has been especially observed among ferns, and the list of known forms which show it is increasing rapidly. Under certain conditions, which are not clear, a prothallium (the sexual plant) buds directly from various regions of the fern leaf, common among which are abortive sporangia and leaf teeth. Among mosses cases of apospory have been observed, and have also been induced artificially. In these cases a sexual plant is developed directly from the spore-bearing structure (the sexless plant). Among seed-plants apospory has not been observed and in the very nature of things is not likely to be found, one reason for this being that the sexual

plant is so very much reduced that it would hardly be observable, even if it were to appear vegetatively.

APOS'TATE (Gk. *ἀποστάτης, apostatēs*, deserter, renegade, from *ἀπό, apo*, away + *ιστάναι, histanai*, to place, to stand). Literally, any one who changes his religion, whatever may be his motive; but, by custom, a word always used in an opprobrious sense, as equivalent to renegade, or one who, in changing his creed, is actuated by unworthy motives. In early Christian times the word was applied to those who abandoned their faith in order to escape from persecution (see LAPSED); but it was also applied to such as rejected Christianity on speculative grounds, as, for instance (though in his case there had been no intelligent reception of Christianity), the Emperor Julian was supposed to have done. After the fifth century, when heathenism was declining, many who had no sincere belief in Christianity, yet made profession of it and were baptized; these also were styled apostates. The Roman Catholic church at one period imposed severe penalties on apostasy. The apostate was, of course, excommunicated, but sometimes, also, his property was confiscated, and he himself banished or even put to death. Those who embrace a religious faith are called "converts" by those they join and "perverts" by those they leave. The term "apostasy" is now employed commonly, and often abusively, as a reproach for great or sudden changes in political opinions.

A POSTE'RIO'RI. See A PRIORI.

APOSTLE (Gk. *ἀπόστολος, apostolos*, one sent forth as delegate, from *ἀπό, apo* + *στέλλειν, stellein*, to send). The name used in the New Testament to designate primarily that group of Christ's disciples who were called by Him to be His more intimate companions during His ministry, and to proclaim, as His representatives, the gospel to men. They were 12 in number: Simon Peter (surnamed Cephas, the Greek transliteration of the Aramaic *Kēphā*, 'rock,' of which the Greek *petros* is the translation, John i. 35-42), James (the son of Zebedee, Mark iii. 17), John (brother of James, Mark iii. 17; the two latter being surnamed Boanerges, Mark iii. 17), Andrew, Philip, Bartholomew, Matthew (the son of Alphæus, Hebrew name, Levi, Matt. ix. 9), Thomas (also called Didymus, John xx. 24), James (the son of Alphæus, Mark iii. 18), Thaddæus (called in Luke vi. 16 and Acts i. 13 Judas, the son of James, doubtless to distinguish him from Judas Iscariot, cf. John xiv. 22), Simon (the Canaanite, Mark iii. 18, of which the Greek equivalent is *Zēlotēs*, 'Zealot,' the surname given him in Luke vi. 15 and Acts i. 13), and Judas Iscariot.

Their qualifications, as understood by the early Church, were evidently that they should have been with Jesus during His ministry and have seen Him after His resurrection (Acts i. 21, 22). As a result, however, of exercising its rights in the election of a substitute for Judas Iscariot, in order to maintain the original number, and as a result, further, of admitting into this number an extra apostle in the person of the divinely appointed Paul, the Church evidently considered itself justified in modifying these qualifications so as to adapt the office to the needs of its developing mission. As a result, others prominent in this work received the name of apostle besides the Twelve and Paul. So James, the Lord's brother, though apparently not commissioned to any specific work, is hon-

ored with this title, in view, doubtless, of his special relationship to the Lord (Gal. i. 19) and his special witness to the Resurrection (1 Cor. xv. 7). So Barnabas, though lacking any relationship to the Lord and not having been a witness of the Resurrection, was given this title, because of his special appointment by the Church to the mission work with Paul (Acts xiii. 1-3; xiv. 4, 14). So, doubtless, the title came to be extended to those who, though not outwardly appointed to any specific work, gave evidence of their divine choice to it by the signal way in which they accomplished it, e.g., Andronicus and Junia (Rom. xvi. 7), Apollos (1 Cor. iv. 6, with 9), Silvanus and Timothy (1 Thess. i. 1, with ii. 6), and the body of apostles, which Paul seems to have in mind as extending beyond the twelve (1 Cor. ix. 5; xv. 5-7). This enlarged application of the term is recognized by patristic writers, such as the author of the *Didaché* and of the *Shepherd of Hermas*.

Among the credentials of the apostolic office were apparently the ability to work miracles (e.g., 2 Cor. xii. 12), and the conversion to God of those to whom they brought the gospel (e.g., 1 Cor. ix. 2). If the office possessed peculiar rights, among them doubtless were the appointment of the original officers of the local churches (e.g., Acts xiv. 23), as well as the regulation of the teaching and morals within the churches' organized limits (e.g., 2 Thess. iii. 6). The characteristic duty of the office consisted, most likely, in the preaching and missioning of the gospel (e.g., Acts vi. 2-4). At the same time, however, as to how far the apostolate was considered by the early Church as an office at all is a question of large debate.

There is no evidence of any division of territory among the twelve. The nearest approach to this is in the mutual understanding referred to in Gal. ii. 9, by which Peter was recognized as the leader of the mission to the circumcision, which would naturally mean, in general terms, the Palestinian Jews; and Paul and Barnabas were recognized as the leaders to the uncircumcision, which would as naturally indicate, generally, the Gentiles outside of Palestine; but even this was not strictly carried out, since Paul began his work in most places to which he went by preaching in the synagogue, while the epistolary address in 1 Peter would imply that Peter had a considerable parish of Gentile Christians in Asia Minor.

In 2 Cor. viii. 23 and Phil. ii. 25, in which passages Paul speaks of the messengers of the churches, the word *ἀπόστολος* is used in its common classical meaning of 'commissioned messenger,' and in Heb. iii. 1, where Christ is referred to as "the Apostle and High Priest of our confession," the word is applied in the same sense, from the point of view of Christ's divinely appointed mission into the world (cf. John xvii. 18). For details of apostolic life and work, see under individual apostles.

Bibliography. In general, see Lightfoot, "Excursus on Name and Office of an Apostle," in *Commentary on Galatians* (London, 1877); Weizsäcker, *The Apostolic Age* (Eng. trans., Edinburgh, 1894); Harnack, *Die Apostelchre* (2d ed., Leipzig, 1896); E. Haupt, *Zum Verständnis des Apostolats im Neuen Testament* (Halle, 1896); Allen, *Christian Institutions* (New York, 1897); Hort, *Ecclēsia* (New York, 1898); Falconer, *From Apostle to Priest* (New

York, 1900); T. M. Lindsay, *The Church and the Ministry* (New York, 1903).

APOSTLE OF FREE TRADE. A title frequently applied to Richard Cobden (q.v.), author of *The Exponent of the Principles of Free Trade*, for his persistent advocacy of the repeal of the high-tariff policy which England practiced from 1830 to 1846. He gave utterance to the strikingly accurate prophecy that America must at no distant date enter into serious competition with English products; that, in this competition, England would be heavily handicapped by protection, and that the soundest policy for her lay in the direction of free trade. A fluent speaker, he carried these theories into Parliament and was directly responsible for the repeal of the obnoxious duties on corn.

APOSTLE OF INFIDELITY. A term applied to Voltaire on account of his persistent attacks upon the Church, and his unfailing protection of those whom he believed to be persecuted by her. See VOLTAIRE.

APOSTLE OF IRELAND. A title given to Patrick, Bishop and saint, who, early in the fifth century, felt himself divinely inspired to attempt the conversion of Ireland, which was at that time a heathen country. See PATRICK, SAINT.

APOSTLE OF TEMPERANCE. Theobald Mathew, so designated through his great labors during the first half of the nineteenth century to further the cause of temperance in the United Kingdom and especially in Ireland, the country of his birth.

APOSTLE OF THE ARDENNES, är'dën'. An appellation given to St. Hubert, the son of the Duke of Aquitaine, in the reign of Theodoric, King of the Franks. He was converted from a gay life by the vision of a stag bearing a shining cross between its antlers. He was made Bishop of Liège in 708 and died in 728. A century after his body was transferred to the Benedictine convent of Andoin, in the Ardennes, which thence received the name of St. Hubertus. He was held to be the patron of hunting and the chase.

APOSTLE OF THE HIGHLANDERS. A Celtic missionary to the Caledonians, otherwise known as St. Columba; the founder of the monastery of Iona in or about the year 565.

APOSTLES, ACTS OF THE, APOCRYPHAL. See APOCRYPHA, *New Testament*.

APOSTLES, TEACHING OF THE TWELVE. See TEACHING OF THE TWELVE APOSTLES.

APOSTLES' CREED. See CREEDS.

APOSTLESHIP OF PRAYER. A Catholic association of prayer, founded at Vals, France, in 1844. In 1861 a priest, Rev. Henry Ramière, adapted its organization to general use and published a description of it in "The Apostleship of Prayer." It has had a rapid growth, its membership now numbering over 25,000,000, of which about 4,000,000 are in the United States. It is under the care of the Jesuit order and is directed by means of a journal, the "Messenger of the Sacred Heart." Consult *Handbook of the Apostleship of Prayer* (New York).

APOSTLES' ISLANDS, or THE TWELVE APOSTLES. A group of islands in Lake Superior, near the western end, belonging to Wisconsin (Map: Wisconsin, C 1). They number in all 27, with an area of 125,000 acres. The largest is Madeline Island, on which are La Pointe, a thriving town, and the La Pointe Indian Reservation. Others are Oak, Presque, and Outer

islands. This group was settled by French missionaries as early as 1680.

APOSTLE SPOONS. The name given to spoons, usually in sets of 13, the handles of which are formed by images of the twelve apostles and of the Virgin Mary. Up to the seventeenth century such sets were favorite christening gifts. Complete sets are quite rare. In 1904 such a set was sold in London for £4900.

APOSTLE TO GERMANY. A title given to St. Boniface, an English missionary (died 755), for his lifelong labors among the Frisian and German tribes.

APOSTLE TO THE ENGLISH. An appellation given to St. Augustine, who led the body of monks sent to England by Gregory I to "convert the Angles into angels."

APOSTLE TO THE FRENCH. An appellation of St. Denis (q.v.), the patron saint of France, who is said to have been beheaded about 272 A.D. at Paris.

APOSTLE TO THE GENTILES. A name applied to St. Paul because of his life-work—"to preach the gospel to all mankind."

APOSTLE TO THE INDIANS, THE. John Eliot, thus styled because of his efforts to convert the Indian tribes of New England in the middle of the seventeenth century. See ELIOT, JOHN.

APOSTLE TO THE SCOTS, THE. A term applied to the Scottish reformer and historian, John Knox (q.v.), because of his untiring exertions to spread the Calvinistic doctrines in Scotland at the expense of those of the English and Roman Catholic churches. Also called the Apostle of the Scottish Reformation.

APOSTOLIC, or AP'OSTOLICAL. An adjective used in various connections to denote something that is supposed to date from the age of the first apostles of the Christian Church, or to have received their sanction, or to rest upon their authority. As applied to a church, it means that the twelve apostles, or at least one of them, taught the truths it stands for. As applied to a doctrine or practice, it means that either it is taught in the New Testament or that traditionally it has been handed down from apostolic days. The claim to such origin, in particular cases, is much disputed by Protestants among themselves in regard to such points as infant baptism, immersion, and church government; and by Protestants over against Roman Catholics as to the priority of the Church of Rome and papal claims generally.

APOSTOLIC BRETHERN, or APOSTOLICI. The name given in Italy, toward the end of the thirteenth century, to one of those sects which, animated by the spirit of an Arnold of Brescia, felt constrained to oppose the worldly tendencies of the Church. Its founder was Gherardo Segarelli, a weaver in Parma. Rejected, from some cause or other, by the Franciscan Order; his long-continued and enthusiastic meditations led him to the profound conviction that it was above all things necessary to return to the simple forms of apostolic life. Accordingly, he went about (1260) in the garb of the apostles, as a preacher of repentance, and by his practical discourses gathered many adherents into a kind of free society, bound by no oaths. At first he managed to avoid any direct collision with the dogmas of the Church; but after 20 years of undisturbed activity and growing influence, Segarelli was arrested by the Bishop of Parma, who, how-

ever, soon after released him and kept him in his palace as his fool and in 1286 banished him from his diocese. Upon the occasion of his release, Pope Honorius IV renewed a decree of the Council of Lyons (1274) against all religious communities not directly sanctioned by the papal chair. In 1290, Nicholas IV setting himself to expose and persecute the Apostolic Brethren, they, on their side, began to denounce the papacy as the Babylon of the Apocalypse. Many, both men and women, perished at the stake, among them Segarelli (July 18, 1300). But his cause survived him. Dolcino, a more energetic and cultivated man, brought up as a priest, who had previously taken an active part in Tyrol against the alleged corruptions of the Church, now headed the sect in Italy. He taught the duty of a complete renunciation of all worldly ties, of property, settled abode, etc. Having retreated into Dalmatia, he announced from thence the dawning of the new era and in 1304 reappeared in upper Italy, with thousands of adherents, as the enemy of the papacy, at that time humbled and impoverished by France. In 1305 a crusade was preached against him. He fortified the mountain Zebello, in the diocese of Vercelli, but was, after a gallant defense, compelled by famine to submit. After horrible tortures, which he bore with the utmost fortitude, he was burned at Vercelli, June 1, 1307. In Lombardy and the south of France brethren lingered till 1368.

APOSTOLIC CONSTITUTIONS AND CANONS. The Constitutions are a collection of ecclesiastical ordinances, in eight books, erroneously supposed to have been the work of the apostles, and to have been written down by St. Clement. In the last chapter of the eighth book the so-called Apostolic Canons, 85 in number, are given. It is now recognized that both works are compositions of the fourth or the beginning of the fifth century. The theory most generally held is that the first six books of the Constitutions are based upon the *Didascalia*, a work of the last third of the third century; that the seventh book is a reworking of the *Didache*, a second-century work; and that the eighth book rests probably upon a collection based upon the Canons of Hippolytus (q.v.). The Canons were probably composed in Syria. The authority of the Constitutions was never accepted in the Western church, and was rejected by the Eastern at the Council of Constantinople in 692. The Canons were accepted by the Eastern church at that council. In the West the first 50 were translated by Dionysius Exiguus (q.v.), were incorporated in the *Decretum* of Gratian (q.v.), and, although held to be apocryphal, are considered an important source for the rules of the primitive Church. A translation of both may be found in the *Ante-Nicene Fathers*, vol. vii (Buffalo, 1886), and a bibliography in vol. ix (Buffalo, 1887). The original text was edited by P. Lagarde (Leipzig, 1862). For the Canons, consult especially Lauchert, *Kanones* (Freiburg and Leipzig, 1896); for the Constitutions, Funk, *Die apostolischen Konstitutionen* (Rothenburg, 1891).

APOSTOLIC DELEGATE. A permanent representative of the Pope in a foreign country. In countries having diplomatic relations with the papal court, he is a government official; elsewhere he is purely an ecclesiastical official. The Delegation to the United States was established in 1893. It has been held by Monsignors Satolli (1893-96), Martinelli (1896-1902), Fal-

conio (1902-11), and Bonzano (1911—). The ecclesiastical power of the Delegate in the United States is very great, his decision being final in all cases laid before him from the church courts.

APOSTOLIC FA'THERS. The name given to the disciples and immediate followers of the apostles, especially to those among them who have left real or so-considered writings behind them. These writings, in Lightfoot's edition, comprise the Epistle of Clement of Rome, and the so-called Second Epistle, which is not his; the seven Epistles of Ignatius of Antioch; the Epistle of Polycarp of Smyrna; the Martyrdom of Polycarp; the Teachings of the Apostles (the Didache); the Epistle of Barnabas; the Shepherd of Hermas; the Epistle of Diognetus; the fragments of Papias; and the Reliques of the Elders, preserved in Irenæus. The writings of the Apostolic Fathers, as to their form and subject, may be looked upon as a continuation of the apostolic epistles, though far inferior to them. They are very valuable as showing the beliefs and practices of the early Church. Editions of the Apostolic Fathers were published by J. B. Cotelerius (Paris, 1672); W. Jacobson (Oxford, 1838); C. J. Hefele (Tübingen, 1839); A. R. M. Dressel (Leipzig, 1857); Gebhardt, Zahn, and Harnack (Leipzig, 1876-78; text ed., 1877; 3d ed., 1900); J. B. Lightfoot (texts and Eng. trans., London, 1891; 2d ed., 1893). There is a separate English translation in *Ante-Nicene Library* (Edinburgh), vol. i (1867); *Christian Literature* editions (New York), vols. vii, ix. See the separate articles on the Apostolic Fathers mentioned above.

AP'OSTOL'ICI, or **AP'OTAC'TICI** (i.e., renunciants). A sect of heretics in Phrygia, Cilicia, and Pamphylia, in the third and fourth centuries, who renounced all their possessions, forbade marriage, and adopted an ascetic mode of life.

APOSTOLIC MAJ'ESTY. A title held by the kings of Hungary, conferred in 1000 by Pope Sylvester II along with the regal crown upon St. Stephen, ruler of Hungary, who had not only greatly encouraged the progress of Christianity but actually preached himself. In 1758 the title was renewed by Pope Clement XIII, in favor of Maria Theresa as Queen of Hungary, and it continues to be used by the Emperor of Austria as King of Hungary.

APOSTOLIC MENNONITE CHURCH. See MENNONITES.

APOSTOLIC PAR'TY. The name given in Spain early in the nineteenth century to a faction of fanatical Catholics who demanded the restoration of the Inquisition and the reëstablishment of the unlimited power of the King. They formed themselves (soon after the revolution of 1820) into an Apostolic Party, whose leaders were fugitive priests and whose troops were smugglers and robbers. They were popularly supposed to be ruled by a committee known as the Apostolic Junta. After taking an active part in all the subsequent agitations, they finally merged (1830) in the Carlist Party.

APOSTOLIC SUCCESSION. The doctrine that the powers of the Christian ministry are transmitted from Christ to those called to that ministry through those themselves consecrated to episcopal authority and office who trace their authority back by successive ascent to the Apostles; the system by which the Church, as an organic body, is made self-perpetuating, and by

which the fullness of corporate life, the integrity of essential truth divinely revealed and committed to the Church, and the validity of Sacraments are maintained unimpaired. The ground for establishing this doctrine is held to be the continuous teaching and practice of the Church from and including the Apostles' times, witnessed to by the New Testament, especially the teaching of Christ and that of the epistles of St. Paul to Timothy and Titus, and further evidenced by writers of the Apostolic age and documents preserved in the works of later writers. The most important of this class of authorities outside the New Testament are the Epistles of Ignatius, the Teaching of the Twelve Apostles, the Epistle of St. Clement to the Corinthians, and the earliest ecclesiastical canons, which order that the consecrators to the episcopate shall be not fewer than three, the purpose being primarily to secure the transmission through a network of lines rather than a chain of single links, and secondarily to insure the public consent of the Church. It is strictly insisted upon by Eastern, Roman Catholic, and Anglican churches, none of which recognizes as valid the acts of those who have not received ordination from a bishop in the succession. In recent times controversy has arisen as to the maintenance of the succession in the Anglican church during the sixteenth century. The Bull of Leo XIII, set forth on the Roman Catholic side, lays stress on the question of sufficient intention in consecrations during the sixteenth century. A few minor bodies, like the Vaudois, the Moravians, and the Swedish church, assert that they can trace some kind of succession in a direct line to the Apostles. See BISHOP; ROMAN CATHOLIC CHURCH; PARKER, MATTHEW. Consult Haddan, *Apostolic Succession in the Church of England* (London, 1869); Gore, *Church and Ministry*, and *Roman Catholic Claims* (1894); Moberly, *Ministerial Priesthood* (1898); Denny, *Anglican Orders and Jurisdiction* (1893); Brightman, *What Objections have been made to English Orders* (1896); the *Catholic Cyclopædia* (1909).

APOS'TROPHE. See CHLOROPLAST.

APOTH'ECARY. See CHEMISTS AND DRUGGISTS.

APOTHEGM, ἀπό-θημ (Gk. ἀπόφθεγμα, *apophthegma*, an utterance). A term used to designate any truth or maxim sententiously expressed. The oracles of the heathen gods often took this form, as also the proverbs, memorable sayings, etc., of the sages of antiquity. In modern times Lord Bacon has made a charming collection of apothegms.

AP'OTHE'OSIS (Gk. ἀποθέωσις, deification, from ἀπό, *apo*, away + θεός, *theos*, god, deity). The raising of a mortal to the rank of a god. From the polytheistic point of view, there is nothing monstrous in this idea; on the contrary, it is quite natural, and a necessary part of the system. Among pagans generally, and especially among the Romans, every departed spirit became a deity (see LARES; MANES); "and as it was common for children to worship (privately) the *manes* of their fathers, so was it natural for divine honors to be paid publicly to a deceased emperor, who was regarded as the parent of his country." The deification was accomplished by a formal decree of the Senate; henceforth the emperor so deified was called *Divus*. At the *Consecratio*, as it was called, of a Roman emperor, the body was burned on a funeral pile, and, as

the fire ascended, an eagle was let loose to mount into the sky, carrying, it was believed, the soul of the emperor from earth to heaven. Many coins of deified Roman emperors are found with the word *consecratio* surrounding an altar, with fire on it. Other members of the imperial family, including women, were deified. Divine honors were also paid to living persons, as to Julius Cæsar and Augustus. This latter practice originated in the Orient, and was adopted, at a late date, by the Greeks; Lysander, Philip of Macedon, and Alexander the Great were so worshiped.

APOTOME. In Greek music. See LIMMA.

APOX'YOM'ENOS (Gk. ἀποξυόμενος, scraping one's self, from ἀπό, *apo*, away + ξύειν, *xyein*, to scrape). A well-preserved marble copy in the Vatican of a statue by Lysippus, representing an athlete scraping himself with the strigil. It was found in Trastevere, at Rome, in 1849. The original was in bronze, and stood in front of the baths of Agrippa.

AP'PALACH'IAN MOUNTAIN CLUB. A society of persons interested in the mountains of New England and adjacent regions. It was organized in 1876, incorporated in 1878, and authorized by legislative act of 1894 to hold mountain and forest lands and historic sites. In addition to fostering the love of nature, it aims to preserve the beauty of mountain forests and resorts, to render them attractive to visitors, to publish accurate maps, and to collect scientific data concerning the mountains. In 1893 it took the initiative in the creation of the Metropolitan Park system of Greater Boston. *Appalachia*, the club journal and its principal literary expression, has (1913) reached 48 numbers, constituting 12 complete volumes; an annual *Register* has been published since 1879, and a *Bulletin* which presents the current affairs of the society, monthly since 1907. Several books relating to mountaineering, etc., have also been published under its auspices. Its library consists of over 2500 volumes, 1000 pamphlets, 2000 maps or sets of maps. The notable Sella Collection, containing some 600 photographic views from the principal mountain ranges of the world, is one of its most valuable assets. Frequent meetings are held in Boston from October to May, at which lectures of geographic interest are presented, to many of which the public are invited. The membership in March, 1913, numbered 1744.

APPALACHIANS. The general name for the extensive mountain system in eastern North America, extending in a northeast-southwest direction from Newfoundland to central Alabama, consisting largely of parallel chains separated by deep valleys. It is narrowest in New York and is sharply broken by the Hudson River, and again by the valley of New River, into three divisions. At its southern end the system curves slightly to the westward, and beyond the Mississippi valley is resumed as the Onachita uplift of southern Arkansas and Indian Territory.

General Character. The uplift may be described as a long, narrow tableland, from 100 to 300 miles in width, with an altitude of 1500 to more than 6000 feet. In the United States it is bordered on the east by the well-defined Blue Ridge, and on the west by the Alleghany Plateau escarpment, which two ridges lie approximately parallel, and 75 to 100 miles apart, throughout their lengths. Between these outer ranges lie a great number of smaller disconnected mountain ridges, chiefly parallel to the

main axis of the system in the central and northern part, but much broken in the southern and southeastern Appalachians. These mountain ridges maintain a remarkably uniform altitude, gradually increasing from both directions toward the central mass in western North Carolina. Lying between the comparatively narrow and regular wall of the Blue Ridge and Alleghany ranges, west of it, is the great Appalachian valley, which is a characteristic feature of the topography, for it extends the entire length of the mountain system. Here and there it is broken by minor ridges into two or three parallel valleys, but the general nature of a trough between mountain ranges is maintained throughout. In New York it is known as the Wallkill valley; in Pennsylvania, the Lebanon, Lancaster, and Cumberland valleys; in Virginia it is the historic Shenandoah valley, or "Great Valley of Virginia"; and still farther south it is the Tennessee valley, extending into Alabama and Georgia.

Divisions. The Appalachian system has not a uniform conformation throughout its extent, but is divided into three sections, the Northern, the Central, and the Southern Appalachians, with the lines of separation as stated above. This division is not merely of an arbitrary nature, but is founded on well-marked differences in the structural and physiographic features of the three regions. The Northern division includes the Green Mountains, the White Mountains, the highlands of Maine, the Shickshock Mountains, the Notre Dame Range of Quebec, and terminates in the hills of Newfoundland. In the central division the Blue Ridge Range has gentle slopes, rising usually to rounded crests, which show a gently undulating sky line, with here and there a peak rising a little higher than the usual level. (See BLUE RIDGE.) To the west of this ridge is a more or less elevated northerly extension of the great Appalachian valley, which in general presents a succession of depressions and heights, the former worn by streams to a depth, in some cases, of 200 feet, while the latter rises to a height of usually less than 1000 feet above the depressions. The Alleghany Mountains rise west of the valley in bolder sculpturing than that of the Blue Ridge, the side toward the great interior valley, the "Alleghany front," or escarpment of the Alleghany Plateau, being steep and rugged; but on the side of the Mississippi valley the slope is gradual, descending westward in lessening ridges from the crest which marks the summit region; this configuration is due to the fact that the stratified rocks (see below) incline westward, exhibiting their upturned edges in precipices toward the east. Beginning with the Catskills, the line is broken by the broad valley of the Delaware, but reappears in several prominent ranges in Pennsylvania. The westernmost, or "front," range, is confusingly called First, or Blue, Mountain, with Peter's, or Second, Mountain, behind it, east of the Susquehanna. East of the Susquehanna, the Tuscarora, Blacklog, Jack's, Standing Stone, and Tussey's are well-defined ranges westward, filling the whole region with crowded heights to the long range distinctively termed Alleghany, which stretches from the border of New York down into West Virginia. In the Virginias both the Blue Ridge and the western ranges become loftier and better defined. The front range is here called the Great North Mountain, and west of it lie successively the Shenandoah and several broken ranges, ris-

ing to the continuation of the Alleghanies proper. These draw together at the southwest extremity of Virginia, where a new uplift, the Cumberland Mountains (q.v.), rises west of them and terminates in the Clinch Mountains. The Southern Division extends from the valley of New River, in Virginia and West Virginia, southward. The valley of the Tennessee makes a break, south of which the range reappears in the prolongations of the Cumberland Mountains in northern Alabama. In New Jersey the "Highlands" of the Blue Ridge rise to heights of 1000 to 1500 feet; in Pennsylvania to 2000 feet; in Virginia from 2000 to 4000 feet (Hawk's Bill, 4066 feet), and with a breadth of 16 miles. In North Carolina, near the Virginia line, the Blue Ridge forks, the Unaka Mountains, of somewhat greater altitude but of lesser continuity, branching off toward the southwest, while the Blue Ridge proper takes a more southerly course. The Alleghanies, which really begin with the Catskills, in New York State (highest 4200 feet), have in the northern part a general elevation of about 2000 feet, which increases to 4400 feet in Virginia and Kentucky, and still farther south decreases from 200 to 2500 feet. The absence of any isolated peaks is highly characteristic of the whole Alleghanian region; the mountains everywhere present the appearance of long, evenly topped ridges, and the name applies to the whole ridge.

The prominence of the Blue Ridge is the characteristic feature of the central division of the Appalachians. This rises suddenly from the Piedmont Plateau, east and south of it, to heights far greater than the Alleghanies attain. Beginning prominently in South Mountain, in southern Pennsylvania, it stretches southwestward in greater and greater heights, through Virginia and western North Carolina, where it divides, the northern branch continuing westward to Georgia as the Unaka, or Great Smoky Mountains. These form a broad mass of mountains on the border between North Carolina and Tennessee, containing peaks exceeding those of the White Mountains of New Hampshire, and consequently the highest east of the Rocky Mountains. The culminating group, reaching in Mount Mitchell 6710 feet, is known as the Black Mountains (q.v.), and contains many peaks above 6000 feet in height. The Unaka Mountains are characterized by the great sharp-ridged spurs which leave the main chain and preserve its height for a distance of several miles; between these spurs are deep valleys only wide enough at the bottom for the creek-beds which are invariably found there. The altitudes of the extended valleys in this great highland region are from 2000 to 3000 feet. To the west of the steep-sided Unaka ridge lies a valley, about 50 or 60 miles wide, in Tennessee, which contains the Tennessee River and its tributaries, the Clinch, Holston, and French Broad.

Geology. The Appalachian Mountains are folded mountains; i.e., they have been formed by plications or folds of the rock layers that make up the crust of the earth in this region, and the particular type of plication is so well developed in this region that it has received the name of the "Appalachian type" of folding. The Blue Ridge, along the eastern side, consists of layers of crystalline rocks, the oldest known in the Appalachians, that have suffered so great an amount of metamorphism as to render the determination of their exact age a matter of

considerable difficulty. They are grouped under the term "fundamental complex," and it is certain that they are in large part pre-Cambrian; and some are even Archæan on the eastern edge of the Blue Ridge. On the western edge isolated masses of Cambrian rocks are found. All these rocks of the Blue Ridge have been much folded and compressed, so that the layers now stand almost on end and are even overturned. Great faults and overthrusts are common, and add to the difficulty of unraveling the structure of the district. In the Appalachian valley the geological structure is also quite complex, though the strata are not so intensely metamorphosed. The rocks are limestones, shales, and sandstones, and they lie in closed folds that become more open toward the western side of the valley. These folds are peculiar in that their eastward slopes are always steeper than the westward. When the folds are overturned, the inversion is toward the east; and overthrusts are also toward the east and often of considerable extent. This valley is largely the result of the erosion of a great limestone formation, of Cambro-Silurian age, that extends its entire length. The Alleghany Mountains consist of rocks of Paleozoic age, Cambrian to Carboniferous, inclusive, that have been elevated into folded ridges and then eroded to their present topography. The softer beds have been worn into valleys, and the harder beds, having resisted erosion, have been left to form the ridges and benches. In this limestone also have been eroded the wonderful series of caves of the Shenandoah valley and elsewhere, of which that at Luray, Va., is a striking example. (See CAVES.) Anticlinal and synclinal folds alternate in diminishing intensity toward the west, where they disappear in the nearly horizontal beds of the Cumberland Plateau, which is made up of Carboniferous rocks.

Drainage Development. The region now occupied by the Appalachian Mountains has been the scene of many physiographical changes too complex to explain here. At a comparatively recent time, however, the whole of the Appalachian system consisted of a great rounded plateau with an elevation of perhaps 4000 feet, the surface of which is called by geologists the Kittatinny Plain. Above this plain arose to a moderate height the now high mountains of western North Carolina. Along a central zone the land increased in altitude to a region in Virginia which thus became the watershed. The rain now did its work, and the great rivers—the New, the Roanoke, James, Potomac, and Susquehanna—cut out their paths through the then nearly level region, and a well-developed system of highlands and drainage was established. However, the subsequent elevation of land in this region by amounts ranging from 200 feet in the north to 1700 feet in Virginia, once more disturbed the adjustment of the water systems and gave a new impetus to the work of the flowing waters.

While the Appalachian Mountains form the watershed between the Atlantic slope and the Mississippi valley, yet throughout there is no definite watershed line on one side of which the rivers flow to the west and on the other toward the east. In the northern part the streams chiefly break through the mountains from the western side to the east. In the middle part some escape toward the east and some toward the west; while at the south the eastern mountain range of the Blue Ridge forms the watershed. The water-courses appear to be independ-

ent of the direction of the mountain ranges, and instead of pursuing what appear to be the natural directions along the present great valleys, they flow across the ridges through deep gaps in them. This peculiar circumstance is due to the fact that these gaps were cut by the streams before the intervening ridges were upheaved.

The chief streams draining the eastern slopes of the central and southern divisions of the Appalachians into the Atlantic are the Hudson and its branches on the west; the Delaware, Schuylkill, Susquehanna, Potomac, and the James, which cut their way eastward through the mountain ranges; and the Rappahannock, Dan, Yadkin (Pedee), Catawba, Broad, Saluda (branches of the Santee), and the Savannah, which rise from the eastern slope of the Blue Ridge, whose western slopes drain into the Susquehanna, Shenandoah (Potomac), James, or Tennessee. On the south are the Chattahoochee (head stream of the Apalachieola) and the Coosa (head stream of the Alabama), flowing into the Gulf of Mexico. The streams draining the Appalachian region on the west are tributary to the Ohio River. They are the Hiwassee, the Little Tennessee, and the French Broad, which flow from the Blue Ridge through a network of high mountains and break through the great Unaka range to the Tennessee; the Holston and Clinch rivers, also tributaries of the Tennessee; the Cumberland, the New (head of the Kanawha), the Little Kanawha, Allegheny, and Monongahela. The last two join to form the Ohio. The rivers draining the northern section are the St. John, Penobscot, Kennebec, and Connecticut.

Climate. The climate of the Appalachian Mountains must be characterized as temperate, as they extend from a region in which the average annual temperature is 46° F. southward to a region of 61° F. The region, therefore, partakes of the general climatic conditions of its latitude, modified by its altitude. As the prevailing winds come from the southwest, they do not bring much moisture, and the rainfall and snowfall are not excessive, though greater upon the heights of the central ranges than in the lower areas outside. The rainfall for the year averages about 40 inches throughout most of the Appalachian region, but in the southern section increases to 60 or 70 inches. Droughts frequently occur at the north, but seldom at the south. On the whole, the summer climate of the Appalachian region is delightful, and its charms are becoming more and more appreciated by summer visitors. This attractiveness is increased by the abundance of vegetation, the beautiful scenery, in which grandeur may often be found, and particularly by the presence in many parts of the mountains of springs of saline, chalybeate, and other mineral-bearing waters, both hot and cold. These medicinal waters, together with the purity and energizing character of the air, have long given the mountains, especially in North Carolina and Virginia, a high repute as a health resort.

Vegetation and Fauna. The Appalachian region is principally covered with the climax deciduous forest of eastern North America, viz., that known as the beech-maple-hemlock forest. It differs from the same forest in more northern areas by the presence of such trees as the chestnut, many species of oak, tulip, and magnolia, but such northern forms as the black and yellow

bireh, the white ash, and the hickories still persist. This forest is marked by great luxuriance and by the large size of many of the trees composing it. In the undergrowth laurel (*Kalmia*) and rhododendron are abundant, especially towards the south. Upon the higher slopes of the mountains the more xerophytic oaks and conifers are abundant. Among the latter are such northern species as the white pine, the balsam fir, and the black spruce, and the more southern *Pinus rigida*, *P. pungens*, and *P. mitis*. Such northern shrubs as *Acer spicatum*, *A. pennsylvanicum*, and *Sorbus americana*, together with several species of *Vaccinium*, are prominent in the undergrowth. The she-balsam, *Abies fraseri*, the Carolina hemlock, *Tsuga caroliniana*, and the mountain-rose bay, *Rhododendron catawbiense*, are found only above 2000 feet from Virginia to Georgia, and a vast array of northern shrubs and herbs reach their southern limit along the same elevations. Of the larger mammalia bears, deer, wildeats, are still common, but by no means plentiful. Wolves and panthers have practically disappeared. Small game birds and foxes are plentiful. At the South wild turkeys are still found. Unfortunately rattlesnakes and copperheads are to be found all over the mountains, yet rarely in dangerous numbers. The woods and streams abound, beyond almost any other part of the Temperate Zone, in fresh-water mollusks.

Mineral Resources. Economic products of considerable importance are found in the Appalachian system. Coal (q.v.) is far the most important; the entire anthracite field and part of the bituminous field of Pennsylvania and other states lie in the Alleghany Mountains and the Cumberland Plateau or its northern extension. The petroleum and oil fields of New York, western Pennsylvania, and southward, barely touch the edge of the Appalaehian region. Of the metals, iron occurs as hematite, limonite, and magnetite at many localities; zinc is found in association with magnetite at the well-known localities of Franklin Furnace and Ogdensburg, N. J., and as blende, calamine, etc., associated with lead, at the Bertha Mines in Wythe County, Va. Lead has been found in small amounts at many points, but does not occur in sufficient quantity to constitute an independent industry. Copper is found native in the crystalline rocks of Virginia, and as chalcopyrite often in large masses, as at Ducktown, eastern Tennessee. Gold and silver occur in small amounts chiefly in Georgia and North Carolina; nickel and cobalt are also found sparingly. Bauxite, one of the ores of aluminum, has assumed great importance in Alabama, and manganese has been mined in large quantities in Tennessee and Virginia. Natural cement, of such high grade as to make it a rival of Portland cement, is found at many outcrops of the Upper Silurian formations in New York, New Jersey, Pennsylvania, and Maryland, and lime is burned throughout the region. Building stone of good quality is abundant, and slate of excellent grade is quarried in New Jersey and Pennsylvania. Asbestos, mica, garnet, and emery are mined in Virginia, the Carolinas, and Georgia, and gems of many kinds are found in the Blue Ridge. The entire Appalachian system had a distinct influence on the early history of North America and the United States. It formed a great barrier to western settlement that was only permanently overcome when the pioneers of Daniel Boone's time, 1775, broke through the passes and secured a footing

in the Kentucky and Ohio valleys. Previously the Hudson and the Mohawk valleys offered the only practicable highway into the interior of the continent, and the indomitable warriors of the Iroquois effectually blocked that path, their settlements being distributed from Albany to Buffalo and their several political divisions lying transversely across the State of New York.

AP'PANAGE, or **APANAGE**. A French word which originally meant a provision for younger children when the main inheritance descended by primogeniture. Then it came to be the name applied in feudal law to contributions from the exchequer granted for the maintenance of princes of the royal house, or to lands and the revenues of lands set apart for the same purpose. Territorial appanages were bestowed either for life or upon a man and his direct heirs forever. It is of importance historically only in French history. Under the kings of the Capetian line it became the custom to set apart a valuable territory as the provision for the maintenance of each one of the younger sons and sometimes of the daughters. This custom was a constant source of danger to the policy of consolidation which had made the Capetian line strong, but it was persisted in until the end of the monarchy, in spite of attempts by statute to limit appanages to money or property other than land. In 1810 appanages were established by law for the descendants of Napoleon. By the Restoration their appanage was restored to the Orléans family, and this, which was united to the crown in 1832, was the last appanage in France. In England the Duchy of Cornwall is in form an appanage of the Prince of Wales; but other members of the royal family in Great Britain, as well as in most of the continental monarchies, are now provided for by annual grants from the Civil List. A survival of the appanage in Germany and Austria is the permanent endowment sometimes granted by the state to the princes of mediatised houses.

AP'PARA'TUS (Lat. from *ad*, to + *parare*, to make ready, prepare). In the sciences, a collection of tools or instruments for experimenting or working. In physiology, a group or collection of organs associated in a single function; as, the heart, veins, and arteries are the circulatory apparatus; the legs are the apparatus of locomotion, etc. The term is applied also to any materials used in the comparative critical study of a document.

APPARATUS, PSYCHOLOGICAL. See PSYCHOLOGICAL APPARATUS.

APPARENT (Lat. *ad*, to + *parere*, to come forth, be visible). A term used to express a number of important distinctions, especially in astronomy. The *apparent diameter* of a heavenly body is the angle formed by two lines drawn from the opposite ends of a diameter to the spectator's eye; this obviously depends upon the distance of the body as well as upon its real magnitude; it is also called the *angular diameter*. A planet seen from the surface of the earth seems nearer the horizon than if seen from the centre of the earth: what is seen from the surface of the earth is the *apparent altitude* of the planet; its real altitude would be seen if an observation could be made from the centre of the earth. The apparent altitude differs from the true on account of parallax and refraction (qq.v.). *Apparent noon* (called also *true noon*) is the time when the visible sun is on the meridian; mean noon is the time when the sun would be on the meridian if his motion in the heavens were uniform and parallel to the equator. (See EQUATION OF TIME.) The daily and annual motions of the sun in the heavens are both *apparent motions*, caused by two real motions of the earth. In general, apparent phenomena are the phenomena of the actual visible heavenly bodies, while the corresponding true phenomena are what the former would be if certain disturbing causes were eliminated.

APPARITION (Lat. *apparitio*, an appearance, from *ad*, to + *parere*, to come forth, be visible). An illusion or hallucination in which objects, commonly human beings, are seen with such vividness as to be regarded as real. The hallucinations of delirium or insanity are not included under this term. Before the diffusion of modern science, there existed a well-nigh universal belief in the reality of apparitions. Greek and Roman poetry abounds with instances; folklore owes much of its attractiveness to its wealth of spectres and phantoms, fairies and brownies, and its witches and ghost-haunted houses. Dr. Johnson voices the universality of this belief, and, incidentally, gives us a glimpse of a vein of superstition and credulity in his nature when, in his *Rasselas*, he causes Imlac to say: "That the dead are seen no more I will not undertake to maintain against the concurrent testimony of all ages and all nations. There is no people, rude and unlearned, among whom apparitions of the dead are not related and believed." It is not difficult to understand how the untutored savage, encouraged by the events of his dream consciousness which led him to believe in a spirit-self existing apart from its body-self, should come to have an equally strong belief in the externality of the apparitions which he saw in his waking consciousness. Indeed, authorities are not wanting who see in the attitude of early man to apparitions the most important, if not the unique, origin of religion. Whether this be true or not,

we know that many social phenomena which present religious phases (e.g., witchcraft) have owed the possibility of their existence largely to a widespread belief in apparitions.

The reign of universal superstition has, it is true, given way before the onward progress of the scientific spirit; but the more subtle variations of the belief in apparitions have not as yet entirely disappeared. There still prevails a belief in the supernormal nature of apparitions as manifested in clairvoyance (q.v.), telepathy (q.v.), and spiritualism. We need refer, for example, only to the birth in 1847 of modern spiritualism, as a direct descendant of the belief in "haunted houses." In 1882 the Society for Psychical Research was instituted in England. One of its express purposes was to collect data upon the subject of apparitions. Much material has been published in the "Proceedings" of the Society, and in book form by Gurney, Myers, and Podmore. These authors express the relation of apparitions to telepathy in the following passage: "This book, then, claims to show (1) that experimental telepathy exists, and (2) that apparitions at death, etc., are a result of something beyond chance, whence it follows (3) that these experimental and these spontaneous cases of the action of mind on mind are in some way allied." The opposing position is that of Buckley, who asserts that "before endeavoring to explain how phenomena exist, it is necessary to determine precisely what exists; and so long as it is possible to find a rational explanation of what unquestionably is, there is no reason to suspect, and it is superstition to assume, the operation of supernatural causes." If we apply this criterion to the lately collected evidence for apparitions, we must discount for errors of observation, for errors of memory, and for the strong influence of autosuggestion (q.v.). We shall then find that we have left certain unexplained phenomena. Those who do not believe in apparitions account for these as illusions or hallucinations (q.v.).

APPEAL' (from Lat. *appellare*, to address, appeal to, call, summon). In English legal procedure, a term that has two distinct meanings.

1. It denotes an accusation by a private person against another for some heinous crime, demanding punishment on account of the injury to the appellant, or a member of his family, or, in case of treason, against the king. The person appealed, known as the appellant, was entitled to trial by battle (q.v.) if he demanded it. This method of prosecution remained in force until abolished by Act of Parliament in 1819 (59 Geo. III, c. 46), although it had been used but rarely for a century prior thereto. The last appeal of murder brought in England (which led to the enactment of the statute above referred to) was that of Ashford *vs.* Thornton, instituted in 1818, and reported in 1 Barnwell and Alderson, 405. Consult Blackstone, *Commentaries*.

2. The other signification of the term is that of a complaint to a superior court of an unjust judgment rendered by an inferior tribunal. The

object of the appeal is to secure the reversal or modification of the judgment or decree of the inferior court through the intervention of the superior tribunal. Originally the word was confined to a proceeding for the review of a decision in an equity, an admiralty, or an ecclesiastical cause. Common-law judgments were reviewed by a writ of error. The chief distinction, between a writ of error and an appeal was that the former brought before the higher court only errors of law committed in the court below, while the latter brought up for review findings of fact as well as of law. The tendency of modern legislation is toward the abolition of forms of action, and as a consequence the method of appeal has generally come to supersede the writ of error, both in England and the United States. (See ERROR, WRIT OF.) The grounds of appeal, the courts to which an appeal may be taken, and the methods of prosecuting appeals are regulated in the various jurisdictions by statutes and court rules. These are so diverse that no attempt will be made here to state their provisions. See COURT; PLEADING.

In parliamentary law, appeal denotes the proceeding by which a member tests the correctness of a ruling of the presiding officer by calling for a vote of the meeting thereon. See PARLIAMENTARY LAW.

APPEAR'ANCE (for derivation, see AP-PARENT). A term used in its most general meaning to signify what is presented in consciousness. It is that of which consciousness is cognizant as an object distinct from itself. For instance, in a perception I may have of a piece of money, its yellowness, its weight, its hardness, are all appearances to me. Now, the fact that appearance is always related to consciousness raises a metaphysical problem; viz., Is there anything more ultimate, more real, than appearance? And, if so, are the yellowness, the weight, the hardness, and other appearances of the coin really a revelation of what the coin is in its deepest nature, or are they merely the form in which that ultimate nature, whatever it may be, is disguised when it comes into my consciousness? Different schools of philosophy have given different answers to these questions, but a careful examination of the answers shows that they are all determined by the view taken of the nature of reality.

1. Assume that there is a reality different from appearance, that what a thing really is is what it is in absolute independence of all its relations; assume that "we must everywhere distinguish between the intrinsic being of a thing and its relations," adding that knowledge is always a relation, and it becomes clear that the reality of the thing, its intrinsic being, need not be revealed in the appearance it presents to consciousness. In fact, the question arises whether appearances must not be always deceptive. An affirmative answer to this question is the fundamental tenet of dogmatic skepticism (q.v.) and of critical philosophy. (See KANT.) A suspense of judgment on the problem is the attitude of the ancient Skeptics. A negative answer given without giving a reason for it is the attitude of dogmatism. A negative answer can be justified only by showing the nature of consciousness to be such that the presence of a reality in it does not necessarily transform it from what it is in its ultimate character. This is what some conceive to be the problem set by the science of epistemology, or theory of knowl-

edge. See KNOWLEDGE, THEORY OF. Recent realists have developed a theory of consciousness which, they believe, solves the problem. See REALISM and NEW REALISM.

2. Assume we do not and cannot know whether there is a reality distinct from appearance, but that at least we have the conception of its possibility, and the result of this confession is a critical skepticism.

3. Assume that there is no reality *apart* from appearance, and we have on the one hand Positivism (q.v.), and on the other the idealistic systems of philosophy.

Thus the attitude taken toward appearance may form the basis for one of the most convenient classifications of the different systems of philosophy.

Consult: Bradley, *Appearance and Reality* (London, 1897); Royce, *Conception of God* (New York, 1898) and *The World and the Individual* (New York, 1900); Lotz, *System der Philosophie* (Leipzig, 1884; trans. by Bosanquet, 2 vols., Oxford, 1888); Hegel, *Encyclopädie der philosophischen Wissenschaften im Grundrisse* (Heidelberg, 1830), in part translated into English by Wallace, under the titles *Hegel's Logic* (Oxford, 1892-94) and *Hegel's Philosophy of Mind* (Oxford, 1894); Fullerton, *The World We Live In* (New York, 1912); James, *Essays in Radical Empiricism* (New York, 1912).

APPEARANCE. The legal proceeding by which a defendant brings himself, or is brought, into court and made subject to its jurisdiction. In modern judicial procedure the actual presence of the defendant is, in civil cases, dispensed with, a written "appearance" being entered in lieu thereof, though in criminal proceedings, especially in cases of felony, actual presence is still generally necessary in order to give the proceedings regularity. In neither case, however, is appearance necessary to give the court jurisdiction of the person of the defendant, that being effected by the service of the process whereby the action is instituted. The usual method of making appearance is for the party to plead, i.e., put in his answer or defense, though it may be done formally, by serving upon the opposing party a regular notice of appearance, or, informally, by any act whereby the jurisdiction of the court is recognized, as by demanding or submitting to a preliminary examination. In civil cases appearance is usually by attorney. See ACTION; ANSWER; PLEADING; PROCEDURE.

APPEND'ANT RIGHTS (Lat. *ad*, to + *pendere*, to hang). In English law, certain common rights in the land of another (such as common of pasture) which have existed from time immemorial, and which are historically appurtenant to the land of the person claiming the right. They differ from *appurtenant rights* in that the latter, though also connected with the land of the claimant, may be of modern origin and may be acquired by ordinary prescription (q.v.) or by grant; whereas appendant rights are invariably ancient and cannot be created at the pleasure of the parties. For this reason the number of such rights is limited and cannot be enlarged. They are probably survivals of community rights in common lands, which have persisted notwithstanding the inclosure of such lands and their appropriation by private owners. See APPURTENANCE; EASEMENT; PROFIT À PRENDRE; REAL PROPERTY.

APPEN'DICI'TIS. See VERMIFORM APPENDIX.

APPEN'DIX VER'MIFOR'MIS. See VERMIFORM APPENDIX.

APPENZELL, ä'pen-tsöl' (anciently, Lat. *Abbatis Cella*, abbot's cell). A canton in the northeastern part of Switzerland (Map: Switzerland, D 1), encircled by the canton of St. Gall. It is situated in the heart of the Alps and is noted for its scenic beauty. Altitudes range from 1300 feet, the lowest elevation, to 8215 feet in Sentis. Other prominent points are Jeiden, Wildkirchli, St. Anthony's Chapel, Ebenalp, and the Hone Kasten. The Sitter, a tributary of the Thur, is the chief river. The lofty mountains preclude agriculture on a large scale, but the pasture land is the richest in Switzerland. After the religious wars of 1597 a change was effected in the government of the canton along religious lines, whereby were formed two half-cantons, Ausserrhoden and Innerrhoden, each having an independent local government with representation in the Federal Parliament. Innerrhoden, almost entirely Roman Catholic, is 63 square miles in area and had in 1910 a population of 14,631, engaged principally in cattle raising. The women make beautiful hand embroidery. Trogen, the capital, which had in 1910 a population of 2347, is pleasantly located and is a summer resort. Ausserrhoden, the seat of the Reformed church, 96 square miles in area, had in the same year a population of 57,723, mostly employed in cotton and silk manufacture, chiefly for firms in St. Gall. The capital, Appenzell, had, in 1910, a population of 5126. It was at one time the country-seat of the abbots of St. Gall and is very interesting to-day.

AP'PERCEPTION (Lat. *ad*, in addition to + *percipere*, to seize entirely, observe, perceive). A term first employed by Leibnitz (1646-1716), for whom it signified a spontaneous activity of the ego which exercised such a modifying influence upon the crude "perceptions" of sense that they became transformed into clear and ordered elements of knowledge. This metaphysical concept was used by Kant (1724-1804) in his epistemology, with sharp emphasis upon the spontaneity of the activity. On the other hand, the term was taken over into psychology by Herbart (1776-1841) and his followers, has been reformed and exhaustively treated by Wundt, and more recently has received extended discussion at the hands of the English psychologist Stout.

Herbart and his school, especially Lazarus (1824-1903) and Steinthal (1823-99), lay stress upon the practical significance of apperception. This principle forms, indeed, the corner-stone both of their psychology and of all modern theories of education based upon it. Apperception is "that psychical activity by which individual perceptions, ideas, or ideational complexes are brought into relation with our previous intellectual and emotional life, associated to it, and thus raised to greater clearness, activity, and significance." The mental resultant of previous experience wherewith we meet and receive a new experience is termed an "apperception mass." There will, of course, be individual variations in the nature of this mass; different minds are unequally prepared for a particular experience. One child will call butterflies "flying pansies"; another knows them to be insects. Thus, from the Herbartian standpoint,

it is of extreme importance for the teacher to acquaint himself with the existing store of ideas in the minds of the children under his charge, in order that the new matter which he presents may be received by appropriate thought-attitudes.

Wundt's treatment combines the psychological acumen of Herbart with the Kantian emphasis upon spontaneity as the characteristic feature of apperception. It includes a careful analysis of the experience of spontaneity into its ultimate psychical and physiological conditions. The salient points of Wundt's doctrine are as follows: Apperception designates (1) either certain phenomena actually given in consciousness, or (2) a certain activity which we infer from these conscious data—i.e., a concept or category under which the phenomena are grouped. As regards the phenomena themselves, we have to note first that the different components of a given consciousness vary in prominence. Some ideas are clear, standing in the focus of attention (q.v.); others are obscure. Ideas may, then, be in consciousness and yet not be "apperceived." Furthermore, the relation is not fixed. An idea may disappear from the focus of attention and another, previously obscure, take its place. Clearness is not, like quality or extent of sensation, dependent merely upon the character of the stimulus. It is not, like intensity, which it most resembles, a function of a single idea, but attaches to a number of ideas. Now the entrance of an idea into the focus of attention is by no means a simple matter. Analysis discloses, besides the increase of the given idea in clearness, (1) a feeling of activity, (2) inhibition of other ideas, (3) strain sensations and concomitant feelings which intensify the feeling of activity, and (4) the reflex effect of (3), which intensifies the given idea. A careful examination of Wundt's writings shows that the "feeling of activity" is not ultimate and unanalyzable, distinct from either sensation or affection (q.v.), but rather a conventional term representing a complex of sensation and affection from the presence of which in consciousness we infer an activity or spontaneity. Wundt distinguishes between "active" apperception, marked by the feeling of activity, and "passive" apperception, marked by a feeling of passivity, a lessening of the intensity of the concomitant phenomena, and less clearness of the focal idea. In typical passive apperception the clarifying of the idea is determined unequivocally and immediately. In active apperception there are several rival ideas; the result is equivocal and frequently delayed. The conditions of apperception are either (1) objective, viz., (a) the intensity, and (b) the frequency of the presented occurrence; or (2) subjective, viz., (a) the nature of the immediately preceding consciousness, and (b) the individual disposition of the mind, as determined by its entire previous history.

Apperception is closely related to association. Association, according to Wundt, furnishes all the possible connections of ideas; apperception decides which of the possibilities shall be realized. Thus the idea *x* may be associatively connected with *a*, *b*, *c*, and *d*, but apperception may bring it about that, in a given case of the arousal of *x*, only *b* appears in attention. This process of choice, of the enhancement of one out of several ideas, together with the feeling of activity, differentiates apperception from asso-

ciation. Apperceptive connections themselves may be either simultaneous or successive. The former are subdivided into (a) agglutinations, (b) apperceptive fusions, and (c) concepts. (See ABSTRACTION.) The judgment is typical of the successive form of apperceptive connections.

Stout defines apperception as the "process by which a mental system appropriates a new element, or otherwise receives fresh determination." Great stress is laid upon the "preformed mental system," which is regarded as an organic whole, not (as by Herbart) a mere apperception-mass of presentations. By its reaction upon the further processes of attention, it gives us the clew to the problems of mental growth and mental organization. Stout further introduces the ideas of "negative" and "destructive" apperception. Negative apperception is a form in which the effort to appropriate a new element is unsuccessful; destructive apperception is a form in which "one system by appropriating a new element wrests it from its preformed connection with another system." In each case there results some positive effect; former systems become modified or new systems are developed.

The early experimental investigations of apperception deal for the most part with the time relations of the various factors involved; the later investigations have analyzed the conditions under which apperception occurs. Valuable results have been gained by a study of the apperception of ideas as conveyed by language (q.v.), both spoken and written.

APPERT, à'pâr', BENJAMIN NICOLAS MARIE (1797-c.1847). A French philanthropist and educator, born in Paris. He introduced into several military schools a system of mutual instruction, and in 1820 founded and conducted gratuitously a school for prisoners at Montaigu. He was suspected of having aided the escape of two prisoners and was himself confined in the military prison. Here he made a study of the moral and physical circumstances of the prisoners, and after his liberation he devoted much time to the study of schools, prisons, and hospitals and published his researches in his *Journal des Prisons* (1825-30) and in a four-volume work called *Bagnes, prisons, et criminels* (1836). After the Revolution of 1830 he was employed by Louis Philippe to superintend the measures taken for the relief of the indigent classes. He also wrote a work entitled *Dix ans à la cour du roi Louis-Philippe* (1846). In his *Conférences contre le système cellulaire* he strongly opposed the system of solitary confinement. It is said that he taught at least 100,000 soldiers to read and write. He has been criticised for one-sidedness, but seems to have been a sincere and warm-hearted philanthropist.

APPERT, FRANÇOIS (?-1840). A French technologist, the brother of Benjamin Appert.

He invented (1804) a method of preserving food without the use of chemicals. His method is fully described in his work on the *Art of Preserving Animal and Vegetable Substances* (5th ed., 1834; Eng. trans., London, 1811). It is the well-known method of placing the article of food to be preserved in a can, after heating it, and then sealing the can hermetically. The publication of his method brought Appert a prize of 12,000 francs from the French government.

AP'PETITE. See DIGESTION, ORGANS AND PROCESS OF, IN MAN.

AP'PIAN. See APPIANUS.

APPIANI, ä'pê-ä'nê, ANDREA (1754-1817). An Italian painter, born at Milan. His artistic training consisted in extensive studies of antique sculpture and of the Renaissance masters, and he is the chief master of the classicists in Italy. He first acquired fame by the frescoes of the palace of Monza and of the cupola of Santa Maria presso San Celso (Milan) and was appointed first painter of the court of Italy by Napoleon. He portrayed the Emperor, the Viceroy of Italy and his family, and frescoed several rooms of the royal palace at Milan. After his patron's fall he was afflicted by poverty and illness and died of apoplexy. By reason of the charm of his style he was called the "Painter of the Graces." He excelled all painters of his day in fresco; his oil paintings, to which an entire room of the Brera Gallery is devoted, are mediocre.

AP'PIA'NUS (Gk. Ἀππιανός, *Appianos*). A native of Alexandria, who lived during the reigns of Trajan, Hadrian, and Antoninus Pius. He was the author of a Roman history in Greek, entitled Ῥωμαϊκά (*Rōmaïka*), in 24 books, of which only 11 are extant in complete or fairly complete form. It was not remarkable for anything except the plan on which it was written. Instead of proceeding to exhibit chronologically the growth of the Empire, from its rude beginning on the Palatine Hill to the period when its power held the whole world in awe, which is at once the popular and the philosophical method, he divided his work into ethnographic sections, recording separately the history of each nation up to the time of its conquest by the Romans. First in order were the books devoted to the old Italian tribes; then came the history of Sicily, Spain, Hannibal's wars, Libya, Carthage, and Numidia, Macedonia, Greece proper and its colonies, Syria, Parthia, the Mithridatic wars, the Roman civil wars, wars in Egypt, and the imperial wars in Illyria and Arabia. The more complete extant portions deal with Spain, Hannibal, Carthage, Syria, Mithridates, the Roman civil wars, and Illyria. As an historian, Appianus is a mere compiler and not very accurate in his compilation. His geographical knowledge in particular is singularly deficient, considering the age in which he lived. The best edition is that of L. Mendelssohn (Leipzig, 1879-81), resting in large part on the great edition of Schweighäuser (q.v.) in three volumes (1785); translated by H. White (New York, 1899): the translator's preface contains much valuable matter, especially on the manuscripts of Appian.

AP'PIAN WAY (Lat. *Via Appia*). A Roman road, well named by the poet Statius *regina viarum* ('the queen of roads'), the oldest and most celebrated of the Roman roads. It was begun by Appius Claudius Cæcus while

ensor (312 B.C.). It led from the Porta Capena in the Servian wall at Rome in a southerly direction to Capua, passing through Tres Tabernæ, Appii Forum, Terracina, etc. Subsequently it was carried on to Beneventum, Tarentum, and thence to Brundisium. It was carefully built, though the pavement of large hexagonal blocks, principally lava, on a firm foundation and strengthened by cement, is probably not the original bed. From Rome Terracina the course is nearly straight, in spite of the steep grades in crossing the Alban Mountains and the difficulties of the Pontine marshes. Near Rome the road was lined with tombs, of which many remains can still be seen. The most remarkable of these tombs are those of the Scipios and of Cæcilia Metella. The ancient pavement, in good repair, is still in use in places.

AP'PIA VIA. See APPIAN WAY.

AP'PIUS, MARKET OF. See FORUM APPII.

AP'PIUS AND VIRGIN'IA. A Roman legend of an attempted corruption of maidenly virtue, which has since proved a fertile subject for romancers. The story was originally told by Livy. It is repeated in the *Pecorone di Giovanni Fiorentino*, published in 1378, and again in *Painter's Palace of Pleasure*, in 1566. Modifications of it occur in the *Roman de la Rose* and in Gower's *Confessio Amantis*. "The Doctor" of the *Canterbury Tales* also repeats it in substance. The title has headed no less than three English plays: an early tragical comedy, by an unknown author signing himself R. R., a tragedy by Webster, printed in 1654, and a tragedy by Dennis, in 1709. It is also the subject of a poem, "Virginia," by Macaulay. For other plays on the same subject, see VIRGINIUS.

APPIUS CLAU'DIUS CRAS'SUS. A Roman decemvir (451-449 B.C.). While the other decemviri (q.v.) were engaged in repelling an incursion made by the Sabines, Appius Claudius and his colleague Oppius remained in Rome, with two legions to maintain their authority. Meanwhile Appius Claudius had been smitten by the beauty of Virginia, daughter of a respected plebeian named Lucius Virginius, who was abroad with the army. By force and stratagem, representing that she was the born slave of Marcus Claudius, one of his clients, Appius Claudius gained possession of the girl. Lucius Icilius, who was betrothed to Virginia, and Numitorius, her uncle, threatened to raise an insurrection against the decemviri. Virginius, hurriedly recalled from the army by his friends, appeared and claimed his daughter; but, after another mock trial, she was again adjudged to be the property of Marcus Claudius. To save his daughter from dishonor, the unhappy father seized a knife and slew her. The popular indignation excited by the case was headed by the senators Valerius and Horatius, who hated the decemvirate. The army returned to Rome with Virginius, who had carried the news to them, and the decemviri were deposed. Appius Claudius died in prison by his own hand (so Livy states), or was strangled by order of the tribunes. His colleague, Oppius, committed suicide, and Marcus Claudius was banished.

AP'PLE. The name applied to a tree belonging to the rose family of plants, as well as to its fruit. The common apple is known botanically as *Pyrus malus*; the crab apples belonging to *Pyrus baccata*. All the cultivated

apples of the world have come from these two forms. The fruit of the apple is a *pome*, consisting of a thickened fleshy portion, resulting from the development of the calyx, inclosing the horny cells forming the core and covering the true seeds.

The common apple, *Pyrus malus*, has been in cultivation since prehistoric times. Charred remains of the fruit have been found in the mud of the lakes inhabited by the Lake Dwellers, and according to De Candolle, the tree was probably indigenous to Anatolia, the south of the Caucasus, and northern Russia, and its cultivation began at a very early date. The Siberian Crab, *Pyrus baccata*, is a native of the north, and is of great importance to fruit-growers not only on account of its own hardy and resistant character, but also because it transmits much of its hardiness to its crosses with *Pyrus malus*, thus producing a fruit of good quality that can endure northern climates. Besides these European apples, North America has several wild species. Among these, the prairie apple, *Pyrus ioensis*, is perhaps the most promising from a horticultural standpoint, because crosses between it and *Pyrus malus* (to which class the so-called *Pyrus soulardii* undoubtedly belongs) are already valuable. The eastern wild apple, *Pyrus coronaria*, is of little value for its fruit, but its bloom is beautiful. China and Japan have native apples which are of little economic importance, but are interesting in that they carry the genus through the north temperate zone around the world.

Economically the apple is the most important fruit of temperate regions. It is grown over a wide area, prospering as far north as Scandinavia and as far south as the southern mountain districts of the United States. It has, moreover, been carried into the southern hemisphere, and now, with rapid ocean transit, New Zealand and Tasmanian apples are annually offered during April and May in the markets of London and San Francisco.

North America is the leading apple-growing region of the world. Apples are raised on a commercial scale east of the Rocky Mountains from Nova Scotia south to northern Georgia and west to Wisconsin, Iowa, Nebraska, Kansas, and Oklahoma. In recent years the industry has developed rapidly in Colorado, Utah, Idaho, Montana, British Columbia, Washington, Oregon, and California. These several regions produce an annual aggregate product of 50,000,000 barrels. The greater portion of this yield finds a ready market within the domain of North America; but an increasing share of the crop is being annually exported, mainly to Liverpool, London, and Glasgow. Germany and the Mediterranean countries may be counted upon as a future market for American apples.

The apple is propagated both by budding and by grafting the desired sort on young seedling trees, which are usually grown from seeds obtained from apple pomace at the cider mills. (See BUDDING; GRAFTING.) Such seeds give a progeny variable both in hardiness and in habit of growth, and are therefore less desirable for stocks than seedlings grown from seeds of the wild *Pyrus malus* of Europe. Budded trees are preferred by most growers and nurserymen in the eastern parts of the United States; largely because of their quick growth, which shortens the time during which money invested is non-productive. The root-grafted tree is preferred

by planters in the northwest; such trees form roots from the scion, if a short piece-root is used. This, sooner or later, produces a tree on its own root, which in turn eliminates the uncertainty of the seedling root and, when "iron-clad" scions are used, gives a perfectly hardy tree. Grafting is again important for the purpose of converting bearing trees, of several years' standing, from one variety to another.

Dwarf apples are grown as espaliers in parts of England. The dwarf trees are obtained by grafting the desired variety on Paradise or Doucin stocks. These are dwarf forms of *Pyrus malus*. New varieties of apples are obtained by sowing the seeds of cultivated sorts. Seeds from such fruits are more likely to give variable offspring than those from wild trees. Frequently thousands of seedlings are grown without producing one valuable tree. Apple trees grow large and endure many years. In planting an orchard, therefore, the trees should be given ample room; 40 feet each way is close enough in New York and the New England States, where the trees grow largest. Farther south, where the trees do not attain great size and are shorter-lived, 33 to 35 feet apart each way is not too close. In the Northwest trees should be planted even closer than this, for there they are liable to injury from sun-scald and wind. Closely planted and low-headed trees serve as a mutual protection. Soils for the apple which have given the best crops and have produced longest-lived trees are chiefly composed of clay or clay-loam impregnated with gravel. Such land, situated so as to afford good air as well as land drainage, produces more regular crops of highly colored and highly flavored fruits than lower and heavier lands. Atmospheric drainage is one of the best material safeguards against late spring frosts, and good land drainage assures a congenial soil for the plant.

The greatest demand in the ripening of the fruit and seed is made upon potash and phosphoric acid. These are the two ingredients most frequently needed by the orchard. If nitrogen be lacking, it can be made up by growing a leguminous crop, such as Canada peas, cow-peas, or beans, upon the soil and turning it under.

Cultivation. Good cultivation is an important part of orchard management. In favorable localities, cultivated and fertilized, shallow-rooted crops may be grown between the rows of trees for a few years without detriment to the orchard, but the orchard should not be used as a pasture lot or as regular farm land. Cultivation should be done early in the season to stimulate early growth, but discontinued by July 15 in the United States in order that growth may be checked and the wood mature properly to insure hardiness during the winter and a crop the following season. Sowing a leguminous cover crop at this time, to be turned under in the spring will facilitate the maturing process, add to the supply of nitrogen, and keep the soil in good physical condition. Another essential is proper pruning. This must be modified to suit the variety, locality, and purpose for which the tree is grown. In general, a low head, wide-spreading branches evenly disposed about the trunk and at different heights, are desirable ends. Thinning the fruit shortly after the June drop materially increases the number of fancy apples, reduces the culls, and increases the resistance of the remaining crop to windfall.

Harvesting and Storage. The work of Powell, Fulton, and others has shown that apples should be fully grown and highly colored to give them the best commercial and keeping quality. When harvested in that condition, they are less likely to scald in storage and are worth more money than when picked in a greener condition. Overgrown apples, such as those produced on young trees, are an exception and require earlier picking. After the fruit is picked, the ripening processes continue much more rapidly at the same temperature than when the fruit is left on the tree. Therefore after picking, the fruit should be taken at once to the storage room. Any bruising or rough handling hastens decay. The fruit keeps best and longest if stored at a temperature of 31° to 32° F. Early apples keep best in small packages which cool down rapidly in storage. Wrapping each fruit with unprinted newspaper prolongs the keeping quality and reduces the amount of decay. Wrapping is commercially profitable only with the highest dessert quality of fruit or for home use. Winter apples keep satisfactorily in barrels.

Varieties. Each section of the world possesses a certain number of varieties which are peculiarly suited to its soil and climate. When apple culture is to be extended to a new region, the problem to be solved is to ascertain which varieties are best adapted to the conditions prevailing in that region. In the United States the varieties held in highest favor by the inhabitants of any given locality have usually proved safest to plant for commercial purposes.

Uses. The apple is used most extensively for cooking and for eating out of hand. It is also employed for cider making and vinegar making. For these purposes smaller or inferior fruits are usually taken. Brandy and other beverages are made from the juice also. Large quantities of the fruit are now dried in evaporators, the product being quite extensively exported to European countries.

Apple Diseases. The apple is subject to a number of fungous diseases, the more important of which are rust, scab, bitter or ripe rot, canker, and crown gall. The rust is due to the heteroecious fungus *Gymnosporangium macropus*, the cause of the well-known galls on cedar or juniper trees. These gall-like growths ripen in the spring of the year and present horn-shaped orange-colored masses filled with spores. The spores are blown to apple trees and cause the rust of the leaves. This generation of the fungus has been given the name *Ræstelia pyrata*. In addition to the leaves the fruits are attacked, often severe losses occurring. There is some evidence that the mycelium of the fungus may find its way into the leaf buds of the apple and infect the next crop without having to depend on the alternate generation. Destroying all cedar trees and thoroughly spraying the apple trees with Bordeaux mixture (see FUNGICIDE) will hold the disease in check. Some other species of *Gymnosporangium* are associated with apple rust, and a similar disease of pears is common. The apple scab is caused by the fungus *Venturia pomi*, formerly known as *Fusicladium dendriticum*, its conidial stage. Leaves and fruit of both the apple and pear are subject to attack of this fungus. Upon the fruit dark circular spots are formed, and often a number of spots run together and the fruit cracks, exposing the hard brown tissue beneath.

Upon the leaves the spots are somewhat similar to those on the fruit, but they are lighter in color. The affected leaves are crumpled, ragged, and finally fall off. This is one of the most serious fungous diseases to which the apple and pear are subject. Varietal differences in susceptibility to scab have been noted in some localities. Spitzenberg, Fameuse, Fall Pippin, and Harvest apples are especially subject to disease, while Ben Davis, King, Fallwater, and many others are less seriously affected. This disease and the losses occasioned by it may to a large degree be prevented by thorough spraying with Bordeaux mixture, lime-sulphur, or other fungicide, three to five applications being given the trees at intervals of about 10 days, beginning at the time of the swelling of the buds. The bitter or ripe rot is due to the fungus *Glomerella rufomaculans*, formerly known as *Glæosporium fructigenum*. This fungus is widely distributed and often causes great loss to fruit-growers. Upon the fruit it produces a soft rot, in later stages often becoming corky, dry, and dark. In advanced stages the fruit is shriveled and dried up. The name "bitter rot" is derived from the bitter flavor of the fruit often associated with this disease. The fungus also produces cankers on the limbs of the trees, from which spores spread to the succeeding crop of apples. All cankered limbs should be cut out, mummied fruit gathered and destroyed, and the trees sprayed as above. There are a number of diseases of apple trees called canker. One common in Europe, due to *Nectria ditissima*, has recently been found in the United States. The pear blight organism, *Bacillus amylovorus*, has lately been found to cause cankers on limbs and trunks of pear and apple. *Nummularia discreta* causes what is known as Illinois canker. The so-called New York apple tree canker is due to *Sphæroopsis malorum*, a fungus that also causes a black rot of the fruit. The Oregon canker is due to *Neofabræa malicorticis*. These fungi gain entrance through wounds, destroying the bark and later the underlying wood. Where the attack is slight, cutting out the affected areas, the wound to be disinfected, may be followed, but where severe the trees should be cut and burned, as they are a menace to other trees. Spraying may be beneficially employed in connection with the pruning. The crown-gall of apples, due to *Bacterium tumefaciens*, is found upon the trunk or larger roots just below the surface of the ground. Galls are found elsewhere, but they usually are much smaller. Hard and soft galls are met with, and a disease known as hairy root is believed by some to be a form of crown-gall.

Insect Pests. A large number of insects injuriously affect apple trees and fruit, among which certain scales, beetles, and moths are preëminent. **Beetles.**—Wood-boring beetles are very destructive, especially the round-headed borer (*Saperda candida*) (see Plate of BEETLES), and the flat-headed borer (*Chrysobothris femorata*). The former is one of the worst enemies of apple culture in the United States; and like the others does its damage as a grub, born from an egg laid in the bark, where it bores into and feeds upon the sapwood. A special description of these beetles and other apple-boring beetles, with advice as to control of similar pests, is given in *Entomological Circular No. 32*, and *Bulletin 22*, of the Bureau of Entomology, United States Department of Agricul-

ture. Various root borers and fruit borers are also to be feared here and in foreign lands, especially in Australia, where also a harlequin fruit bug is dangerous. The plum curculio over a great deal of its range is easily second in importance to the codling moth. *Moths*.—Important enemies are to be found among the Lepidoptera, which place eggs on the newly set fruit, whence caterpillars develop within the developing fruit, or which destroy the leaves. The codling moth, tent caterpillar, cankerworms (q.v.), and lesser apple worm are prominent among these. In Europe the principal damage is done by a small white, black-spotted ermine moth (*Hyponomeuta padellus*), and in Japan by a moth (*Laverna herellera*), whose larvæ live in the core of the fruit. The worst American insect of this class is the codling moth, which may be treated by spraying with an insecticide (q.v.). Paris green and arsenate of lead are most frequently used for this purpose. *Scales*.—The San José and oyster-shell scales, which attach to the bark and suck the sap, are two of the most serious enemies of the tree. *Aphids*.—Several species, especially the woolly aphis, are troublesome pests. A calendar showing the kind and approximate time of spraying to check insect pests and diseases is given below:

Directions for making and applying these sprays may be found in the article FUNGICIDE.

Fossil Forms. The genus *Pyrus* is known in a fossil state from the Cretaceous of North America and the Tertiary of North America and Europe.

Woolverton, *The Canadian Apple Grower's Guide* (Toronto, 1910); S. W. Moore, *Practical Orcharding on Rough Lands* (Akron, Ohio, 1911).

APPLE, HENRY HARBAUGH (1869—). An American clergyman and educator, born at Mercersburg, Pa. He graduated from Franklin and Marshall College in 1889 and from the Theological Seminary of the Reformed Church in the United States in 1892. Ordained to the ministry of his denomination, he became pastor of St. John's Church in Philadelphia (1892)

SPRAYING CALENDAR FOR DISEASES AND INSECT PESTS OF THE APPLE

NAME OF TROUBLE	I TREATMENT	II TREATMENT	III TREATMENT	IV TREATMENT	V TREATMENT
Scab.....	Copper sulphate solution or lime-sulphur solution before buds break.	Bordeaux mixture or lime-sulphur solution when leaf buds are open but before flower buds expand.	Bordeaux mixture or lime sulphur solution as soon as blossoms have fallen.	Bordeaux mixture or lime sulphur solution 10-12 days after (III).	Repeat (III) once or twice at intervals of two weeks.
Rust	" "	" "	" "	" "	" "
Brown spot.....	Bordeaux mixture at same time as II treatment for apple scab.	Same as III for apple scab.	Same as IV for apple scab.		NOTE—This disease is liable to cause loss of foliage near harvest time. Ammoniacal copper carbonate should be used for late treatments. Lime sulphur has usually less caustic effect on leaves than Bordeaux mixture.
Bitter rot	Bordeaux mixture or lime-sulphur mixture about 8 weeks after blooming.	Bordeaux mixture or lime sulphur solution 10 days to 2 weeks later.	Ammoniacal carbonate of copper or lime-sulphur mixture as substitute for Bordeaux 2 to 3 weeks after (II).	Repeat (I) if second brood is troublesome.	
Tent caterpillar ...	Arsenate of lead or Paris green in II treatment for scab.	Repeat (I) in 8 to 10 days.			
Spring cankerworm	Arsenate of lead or Paris green before blossoms open or as soon as they fall.				
Codling moth	Same as III treatment for scab, with lead arsenate added.	Repeat (I) before blossom buds open.	Repeat (I) 8 to 9 weeks after petals fall.		
Plum curculio	" "				
Bud moth	Arsenate of lead or Paris green as soon as tips of leaves show in bud.				
San José scale.....	Winter treatment with strong lime-sulphur mixture or late winter application of a miscible oil.				
Oyster-shell scale..					

and of Trinity Church in York, Pa. (1898). In 1909 he was chosen president of Franklin and Marshall College. Besides holding official position in several other denominational organizations, he was, in 1905, president of the Potomac Synod of the Reformed church.

APPLE BRANDY. Brandy produced by distilling the fermented juice of apples. It was at one time extensively produced in New Jersey, where it was known as "Apple-jack," and on account of its ardent and intoxicating qualities as "Jersey Lightning." The process of manufacture is similar to that employed in distilling the juices of other fruits, which will be found described in DISTILLED LIQUORS.

APPLEBY, WILLIAM REMSEN (1865—). An American metallurgist and educator, born in Hoboken, N. J. He graduated from Williams College in 1886 and studied at the Columbia School of Mines in 1886-87. During the two following years he was assistant analytical and pharmaceutical chemist in the New York College of Pharmacy. He became professor of mining and metallurgy at the University of Minnesota in 1890, and in 1891 professor of metallurgy and dean of the School of Mines. He was made a member of several scientific societies.

APPLE OF DISCORD. A golden fruit bearing the inscription, "For the fairest," which was thrown by Eris, or Discord, into the midst of the company at the marriage of Peleus and Thetis. The prize was claimed by Juno, Minerva, and Venus, and was adjudged to Venus by Paris, who was called in to make the award. The decision brought about the Trojan War.

APPLE OF SOD'OM. See SODOM, APPLE OF.

APPLE SHELL, or APPLE SNAIL. A large, globose, amphibious mollusk of the warmer parts of Africa and America, of the family Ampullariidæ. They inhabit marshes, attaching their large eggs to the leaves of water plants, where they are searched for and devoured by birds. They possess both lungs and gills, and in some regions use both these organs in rapid alteration, as was observed by Semper (*Animal Life*, p. 191, New York, 1881) in the Philippines. "The ampullaria," he remarks, "lying not far from the surface of the water, protrudes above it a breathing siphon, and inhales air through it; then it closes its lungs, reopens the siphon, and admits a stream of water through it into the branchial cavity." The shells are large, thin, brilliantly striped (see Colored Plate of SNAILS), and are known in South America as idol shells. See Plate of ABALONE, ETC.

APPLETON. A city and the county-seat of Outagamie Co., Wis., 100 miles by rail northwest of Milwaukee, on the Chicago and Northwestern, and the Chicago, Milwaukee, and St. Paul railroads (Map: Wisconsin, E 4). It is situated on the falls of the Fox River, which by a series of dams is navigable for steamboats and, with a fifty-foot fall, supplies extensive water power for various manufactures, chief of which are paper and pulp. The dairying interests also are important. Appleton is the seat of Lawrence University, a Methodist Episcopal institution, organized 1847, and has two libraries and three hospitals. The city was settled in 1848 and incorporated as a village in 1853 and as a city in 1857. It has adopted the commission form of government. Pop., 1890, 11,869; 1900, 15,085; 1910, 16,773.

APPLETON, CHARLES EDWARD (1841-79).

An English editor. He was born at Reading, and was educated at St. John's College, Oxford, and in Germany. He is remembered chiefly as the organizer of the movement for the "endowment of research," and as founder (1869) and editor (1869-79) of the *Academy*, the distinguishing characteristic of which was its signed articles. Consult John H. Appleton and A. H. Sayce, *Life and Literary Relics* (London, 1881).

APPLETON, DANIEL (1785-1849). An American publisher. He was born in Haverhill, Mass.; first engaged in the dry-goods business there and in Boston, and in 1825 removed to New York to follow the same business. He gradually combined the importing of books with the dry-goods trade and finally devoted himself entirely to the book business, publishing his first book in 1831. The firm which he established, known ever since as D. Appleton and Company, is continued by his descendants.

APPLETON, GEORGE SWETT (1821-78). An American publisher, the third son of Daniel Appleton. He was born in Andover, Mass., studied at Leipzig, and for a number of years was a publisher and bookseller in Philadelphia. In 1849, with three brothers, John, William, and Sidney, he succeeded to his father's publishing business in New York. He was a scholar and art connoisseur, becoming literary adviser to the firm. *Appleton's Art Journal* and the *Popular Science Monthly* were planned by him.

APPLETON, JAMES (1786-1862). An American temperance reformer, born at Ipswich, Mass. When a young man he served in the Massachusetts Legislature. He fought as colonel of militia in the War of 1812 and was promoted to be a brigadier-general. Having removed to Maine, he was elected to the Legislature of that State in 1836. In 1837 he presented to the Legislature a report in which were advanced the principles that afterward became the basis of the Maine liquor law.

APPLETON, JESSE (1772-1819). An American author and educator. He was born at New Ipswich, N. H.; graduated at Dartmouth College in 1792, and was ordained pastor of the Congregational Church, Hampton, N. H., in 1797. He taught in several New England academies and from 1807 to 1819 was president of Bowdoin College. President Franklin Pierce was his son-in-law. *The Works of Jesse Appleton* were published in two volumes in 1836, by Prof. A. S. Packard. Consult: biographical sketch by Rev. Dr. Nicholls in a collection of Appleton's addresses (1820); memoir by Rev. B. Tappan prefixed to *Sermons and Lectures of Jesse Appleton* (1822).

APPLETON, JOHN (1815-64). An American diplomatist. He was born at Beverly, Mass., and graduated at Bowdoin College in 1834. In 1838 he was editor of the *Eastern Argus*, published in Portland, Me. Seven years later he became chief clerk of the Navy Department at Washington; then he held a corresponding position in the State Department. He was *chargé d'affaires* to Bolivia (1848-49), a member of Congress from 1851 to 1853, secretary of legation in London (1855-56), Assistant Secretary of State (1857), and Minister to Russia (1860-61).

APPLETON, JOHN HOWARD (1844—). An American chemist. He was born at Portland, Me., and received his education at Brown University, where he became instructor in 1863 and professor of chemistry in 1868. He wrote a

series of popular text-books that are well known for their attractive form and clearness of exposition. The series includes: *The Young Chemist* (1878); *Qualitative Chemical Analysis* (1878); *Quantitative Chemical Analysis* (1881); *Chemistry of the Non-Metals* (1884); *The Metals of the Chemist* (1891); *Chapters on the Carbon Compounds* (1892); *Lessons in Chemical Philosophy* (2d ed., 1890); *The Assay-Book for Students* (1906).

APPLETON, NATHAN (1779-1861). An American merchant, born at New Ipswich, N. H. He was in partnership with his brother Samuel in Boston. With others, he started the first power-loom for weaving cotton in the United States. He was one of the Merrimac Company whose enterprise founded the city of Lowell (q.v.). He served several terms in the Massachusetts Legislature; in 1830 and in 1842 he was a member of Congress, where he was one of the prominent advocates of a tariff for protection. He published (1858) *Remarks on Currency and Banking*. Consult R. C. Winthrop, *Memoir of Nathan Appleton* (Boston, 1861).

APPLETON, SAMUEL (1766-1853). An American merchant and philanthropist, brother of Nathan Appleton, born at New Ipswich, N. H. He passed his boyhood on a farm. In 1794 he and his brother Nathan went into the English trade in Boston, and afterwards added cotton manufacturing, in which they made a fortune. He retired from active business in 1823 and devoted his entire income to benevolent and scientific purposes, for which he bequeathed \$200,000. Consult the Memoir in *Massachusetts Historical Society Proceedings* (1855-58).

APPLETON, THOMAS GOLD (1812-84). An American poet, artist, and scholar, patron of art and science, born in Boston. He was a brother-in-law of the poet Longfellow and was a noted wit and raconteur. He founded the Boston Literary Club. His verses are collected in *Faded Leaves*; his prose in *A Nile Journal* (1876); *Syrian Sunshine* (1877); *Windfalls* (1878); *Chequer Work* (1879). *A Life and Letters of Thomas Gold Appleton* was edited by Susan Hale (1885).

APPLETON, WILLIAM HENRY (1814-99). An American publisher. He was born at Haverhill, Mass., and studied in secondary schools. In 1848 he became the senior member of the firm of D. Appleton and Company, and for 60 years was prominent in the book trade. He was active in the struggle for an international copyright. Among the publications brought out by him were *The New American Cyclopædia* (1858-63); *Webster's Spelling-Book* (1858); cyclopædias of *Drawing* (1857), *American Biography* (1887-1900), *Applied Mechanics* (1897), and an *Annual Cyclopædia* (1885-1903). In 1872 he wrote *Letters on International Copyright*.

APPLIQUÉ, à'plē'kâ' (Fr. *appliqué*, from *appliquer*, to apply). In architecture and decoration, any design or feature having the appearance of being independently made and applied or attached to the surface of the object it is intended to adorn. The so-called "strap work" of the English Elizabethan and Jacobean styles (1558-1625) is sometimes so designated because it imitates certain woodwork and metalwork of Germany and the Netherlands, in which jigsaw or cut-out patterns on metal, ivory, or wood, were applied to furniture, jewel-boxes, book-covers, etc., and secured by nails or rivets with decorative heads. Such façades as have this ap-

pearance of having been brought from elsewhere and fastened to the buildings they decorate (a fashion of design usually open to severe criticism) are sometimes called *appliqué* façades, sometimes frontispieces. In textile art *appliqués* of lace or of some contrasting material cut into decorative patterns are very common decorative devices.

When an applied ornament, however, is *sunk into* the body of the decorated object, it ceases to be *appliqué* and becomes an inlay. See ELIZABETHAN ORNAMENT.

APPOGGIATURA, à-pöd'jä-tōō'râ (It. from *appoggiare*, to lean, rest). One of those melodic ornaments which are regarded as accessory notes having no time value and which are printed in small characters. There are two distinct varieties of the *appoggiatura*, the long and the short. The *Long Appoggiatura* was a device of the early classic composers, who disliked to use unprepared suspensions and invented the idea of covering or disguising them by writing them in small notes, as mere embellishments of the melody. This unhappy inspiration has been a source of needless trouble to the music student, who is obliged to learn various rules for the proper execution of this device, in which a note is given one value in writing and another in performance. The time of an *appoggiatura* is taken from that of the following or "principal" note, and the *appoggiatura* note is marked with its actual value, while the principal note is marked with the value which both together have. The general rule for its execution is that the *appoggiatura* is played exactly as if it were written as a large note, and the following note is given what remains of its face value, as shown in the following examples:

WRITTEN THUS.

PLAYED THUS.

The *Long Appoggiatura* always occurs *on* the beat, and has therefore the accent which the principal note *appears* to have. When written before a chord, the *appoggiatura* only delays the note to which it belongs.

This device has been entirely discarded by modern composers, and Dr. Hugo Riemann wisely suggests that in new editions of the old works it should be removed, and the notes rewritten in the form in which they are to be played.

The *Short Appoggiatura*, now commonly called a grace-note, also originated in the early classic period. It is written as an eighth note, with a stroke through the stem,  and is played so quickly that it really has no perceptible time-value. Opinions differ as to whether it should be played on the beat or before it, the difference being merely a question of accent. The classic tradition and conservative opinion demand its execution on the beat, but many musicians of the present day consider it more graceful and more truly ornamental if played without accent,

before the beat. The final decision must be left to the taste of the performer.

APPOINTMENT (Fr. *appointment*). In English and American law, the act of vesting an estate in one's self or in another, under a power or authority so to do, conferred by the owner of the land. Such powers are created by deed or will, and must be exercised in the manner prescribed by the instrument conferring the power, but only by an instrument competent to create or transfer an interest in real estate. See **POWER OF APPOINTMENT**.

Appointment to Office is the formal designation, by one in whom the authority has been lawfully vested, of a person to hold a public office or perform a public duty. The term is not properly applicable to the choice of an officer by public election. Usually a certificate, or commission, signed by the appointing officer, is required by law, and this becomes a public record and constitutes the appointee's evidence of title to the office, and his justification for exercising its powers, without which such exercise constitutes usurpation. As to the nature of the rights conferred by an appointment, see **OFFICE**, and articles and authorities there referred to; also **DE FACTO**.

APPOLD, ăp'old, JOHN GEORGE (1800-65). An English inventor. His chief inventions were an improvement of the centrifugal pump, a process for dressing furs, and an apparatus for paying out submarine telegraph wire, which was very useful in laying the Atlantic cable.

APPOMATTOX COURT-HOUSE. A village in Appomattox Co., Va., 23 miles east of Lynchburg, on the Norfolk and Western Railroad. The village is the seat of an agricultural school and a government experiment station. Here General Lee surrendered the army of Northern Virginia to General Grant, April 9, 1865, and virtually ended the Civil War. Pop., about 500.

APPONYI, ăp'pō-nyī, ALBERT, COUNT (1846—). Son of György, and a prominent member of the Hungarian Diet. He was originally the leader of the Conservative "National Party," but in 1899 joined the Liberal Party and in 1901 was elected president of the Chamber of Deputies. He resigned in 1903, announced his secession from the Liberal Party, and in 1904 reorganized the National Party. With his followers he joined the coalition which brought about the fall of the Tisza cabinet in 1905. In April, 1906, he became Minister of Education in the compromise Wekerle cabinet. He visited America in 1904 as a delegate to the World Peace Conference at St. Louis, and again in 1911, when he lectured in the interests of International Peace. He published *Esthetics and Politics, the Artist and the Statesman* (1895) and *A Brief Sketch of the Hungarian Constitution and of the Relation between Austria and Hungary* (1908).

APPONYI, GYÖRGY (George), COUNT (1808-99). A Hungarian statesman. He was a member of the Presburg Diet of 1843-44, and Hungarian Court Chancellor in 1847. He was the leader of the Conservative Party, and opposed the revolutionary movement of 1848-49. He lived in retirement until 1859, when he became a member of the Austrian Reichsrath, where he displayed great ability as a leading advocate of various plans for restoring the Constitution to Hungary. In 1861 he opened the Diet at Budapest as Royal Commissioner and presided over the sittings of the Upper House.

He was most influential in bringing about the transformation of Austria-Hungary on the present dual basis.

APPOR'TIONMENT (Lat. *ad*, to + *portio*, part, share, portion). A partition and readjustment of legal rights or obligations to conform to a change in the relations of the parties thereto, and to adjust their respective interests in the subject-matter affected by the change. Apportionment is of frequent occurrence in the law, and may conveniently be considered, first, with reference to the division of claims, or rights, and, second, with reference to the division of obligations, or burdens.

Apportionment of rights occurs where a person having an interest in land or a contract right, entitling him to the use or profits of the land or to payments of money, parts with a share or portion of such right or interest to another. Thus, if the owner of land which is subject to a lease at a fixed rent, sells a portion thereof, the purchaser is entitled to have the entire rent apportioned so that he shall receive the share due from the parcel of which he has become the owner. So, also, apportionment of rent takes place where an entire tenement or estate is partitioned among tenants in common, or passes by will or otherwise to several persons in parcels. Again, if the owner of land under cultivation, for the benefit of such land and of every part of it, enjoys an easement or profit *à prendre* in the land of another, as to take water for irrigation, or manure or seaweed for fertilizing it, a conveyance of a part of his land carries with it a right to a proportionate enjoyment of such easement or profit. This will, of course, be true only in cases where the right so claimed and enjoyed is apportionable or divisible in its nature. A right of way or a right to pasture one's cattle on a neighbor's land would not ordinarily be apportionable, though it is said that a right to pasture a certain number of cattle may be apportioned. The foregoing are all cases of apportionment "in respect of the estate or interest enjoyed" and present no great difficulty. But where the apportionment claimed is "in respect of time," as where the new right accrues between fixed periods of payment, the law is not so simple or consistent. At common law, rents, annuities, dividends, and similar payments falling due at fixed periods were not deemed apportionable in respect of time. That is to say, if an annual rent or a dividend were due on the first day of January, a conveyance of the land or of the corporate shares on the 31st of December would carry with it the entire rent or dividends. No part of it being due until the whole was payable, it was not considered capable of being apportioned. Interest on money loaned was an exception, as in theory of law interest was earned—i.e., accrued—from day to day (*per diem in diem*), notwithstanding the fact that by agreement of the parties the payment was postponed to a fixed date. The inequitable operation of this rule regarding fixed payments and the inconveniences resulting from it have brought about a general change in the law, by statute, both in England and in the United States, and it is now provided that all rents, annuities, dividends, and other periodical payments in the nature of income, are to be considered as accruing from day to day and to be apportionable in respect of time accordingly. At the present time the question of the appor-

tionment of fixed payments presents itself most frequently in connection with the respective claims to income of life tenants and remaindermen, or of the executor of a deceased testator and the person entitled under his will to corporate stocks left by him. The calculation of the respective shares of the parties is sometimes intricate and difficult, depending upon tables of longevity, but the principles governing their interests are as simple as they are just and convenient.

Apportionment of obligations depends on very different principles from those which result in apportionment of rights or claims. Indeed, it may be asserted, as a general proposition, that burdens are not apportionable. A tenant cannot, by alienating a portion of his tenement, relieve himself of any part of his obligation to pay rent; nor can a person, by rendering only a part of the service which he has contracted to perform, entitle himself to compensation for the service rendered. Rights are assignable; obligations are not assignable. No man can at his own will, or by his own act, rid himself of a legal duty by transferring it to another. This is true even of burdens which, in theory of law, rest upon land, as mortgages, servitudes, and other incumbrances. The partition of the land among several owners will not, in general, relieve any portion thereof of the burden which rests upon the whole and upon every part and parcel thereof, although, as between themselves, the several owners may be entitled to an equalization of the obligation which each is equally liable to perform. (See CONTRIBUTION; EXONERATION; SUBROGATION.) The severity of this rule has been relaxed in a few exceptional cases. Thus, it is held that where a person fails to complete a contract for personal services, in consequence of subsequent disability or death, compensation may be recovered for the services actually rendered. (See RESCISSION; CONTRACT.) Again, in cases where a tenant under a rent is evicted from a part of the premises by paramount title—i.e., by some one having a title superior to that of his landlord—the rent is apportioned, the tenant being liable only for the use and occupation of the part actually retained by him. If, however, the eviction be by the landlord himself or by a stranger, or even if it be by the destruction of the premises, in whole or in part, there will be no apportionment of the rent, the tenant in the former case being freed from all his obligations under the lease, and in the second case continuing liable for the whole rent, notwithstanding the eviction. See EVICTION; LANDLORD AND TENANT; RENT; and the authorities noted under the various titles above referred to.

APPORTIONMENT BILLS. In the United States, laws passed by Congress after each decennial census, to define the number of members of the House of Representatives to which the several States are entitled. Every State has at least one member. Twelve apportionment bills have been passed. The first Constitution adopted by the original thirteen States fixed the number of members at 65, and the ratio of representation at 30,000. Representative population then meant all free white citizens and three-fifths the number of slaves; two-fifths of the slaves, all aliens, and Indians not taxed, were excluded from any share in choosing members of Congress. The Fifteenth Amendment to the United States Constitution conferred the fran-

chise on the emancipated slaves in the South. The following figures show the variations of apportionment made for each census:

Period	States	Members	Pop. to a member
1789	13	65	30,000
1790	15	105	33,000
1800	16	141	33,000
1810	17	181	35,000
1820	24	213	40,000
1830	24	240	47,700
1840	26	223	70,068
1850	32	234	93,423
1860	34	243	127,381
1870	37	293	131,425
1880	38	325	151,913
1890	44	356	173,901
1900	45	386	193,175
1910	46	433	211,887

The House had grown rapidly in number of members until 1830, when it was found that it would soon become unwieldy unless the number of representative population required to a member should be largely increased; so the ratio was increased by one-half (raised from 47,700 to 70,680). Since then the purpose has been to keep the House below 300 members, and the ratio is raised regularly, while the number of members is seldom increased unless by the addition of new States. In the various State legislatures a similar practice prevails. At stated intervals, generally of ten years intermediate with the Federal period, a reapportionment is made. This period is often taken advantage of by the party in the majority, who, by combinations of various kinds, "gerrymander" the State, and so redistrict that their opponents are in a hopeless minority at the polls on many succeeding election days.

APPOSITION (Lat. *appositio*, a setting before, from *ad*, to + *ponere*, to place). A term in grammar signifying the annexing of one substantive to another, in the same case or relation, in order to explain or limit the first; as, *my brother, the physician; Thomas the Rhymer*. Whole sentences or clauses admit of apposition. Thus: "Napoleon sought the way to India through Russia, a stroke of genius." Sometimes a connecting word is used where logical propriety would require apposition; as, *the city of London, for the city London*.

APPOSITION, IN GROWTH. See GROWTH.

APPRAISEMENT (from Eccles. Lat. *apprætiare*, to value at a price, to rate, from Lat. *ad*, to + *pretium*, price). The official or formal valuation of property, in accordance with legal requirements, or by agreement between the parties interested. Official appraisements in legal proceedings are regulated generally by statute, and are most frequently resorted to in the case of merchandise subject to customs duty; of the personal estate of a decedent; of property taken for public use under the right of eminent domain, or damaged by authorized public works, such as canals; of wrecked property; of property of bankrupts or insolvents; and of property levied upon under judicial process, or distrained for rent. Unofficial appraisements are often provided for by the agreement of parties interested, as in the case of insured property which is injured or destroyed. When an appraisement is duly made, in a legal proceeding or by mutual agreement, the value set upon the property is, as a rule, conclusive upon the parties interested therein. The person appointed or agreed upon to make an appraisement is known as an appraiser. He need not be a technical expert,

but must be "reasonably competent." Official appraisers are usually required to make their return or report in writing and under oath.

The United States revenue laws provide for the appointment by the President of appraisers and general appraisers of customs in the several collection districts, and, where these are lacking, for the appointment of merchant appraisers by the collector of the district. See CUSTOMS; TARIFF LAWS.

AP'PREHEND' (Lat. *apprehendere*, to seize). To take a person into custody by warrant of law for the purpose of subjecting him to criminal process. The apprehension of the person accused of crime is not, strictly speaking, a part of the criminal process, but may precede it, or may occur at any stage in its progress prior to execution of the sentence imposed. Indeed, in some jurisdictions, it may be dispensed with altogether, where the sentence does not call for the physical punishment of the offender. In England and the United States, however, the trial of a person accused of crime cannot proceed without apprehension or personal submission of the accused to the process of the court. The term "arrest" (q.v.), which is, in strictness, applicable only to detention in civil cases, is now commonly employed in all cases of taking a person into custody under legal process.

AP'PREHEN'SION (Lat. *apprehensio*, a setting upon, grasping, understanding, from *ad*, to + *prehendere*, to seize). A term denoting the subjective aspect of perception and imagination, as presentation and representation denote their objective side. Two special uses of the word may be noticed. 1. The phrase "direct apprehension" is employed for the habitual recognition of objects and persons whose presence in our surroundings is a matter of course. We do not, in strictness, "recognize" the clothes that we put on every morning, the pen with which we write, the familiar faces of our household; there is no trace of associative supplementing, or of any well-marked mood of familiarity. Rather, we apprehend them directly. Their look and touch set up a certain bodily attitude, the attitude of easy "at-homeness"; and it is the vague, ill-defined mood of "at-homeness" which mediates the recognition (q.v.). 2. Stout has carried this reduction a step further, in his doctrine of "implicit apprehension." "It is possible," he says, "to distinguish and identify a whole without apprehending any of its constituent details." It is possible, e.g., to understand the meaning of a word—something that stands for a highly complex combination—without any mental imagery whatsoever; the meaning is implicitly apprehended by an imageless thought. There is something fascinating about this assumption of "a mode of presentational consciousness which is not composed of visual, auditory, tactual, and other experiences derived from and in some degree resembling in quality the sensations of the special senses," yet which possesses "a representative value or significance for thought"; but its assumption is unnecessary. We know that the "meaning" which accrues to a perception is largely the result of a pre-determination. (See DETERMINING TENDENCY.) Originally the conscious context which gave meaning was elaborate, but eventually this context may disappear and the meaning be carried in physiological terms. So the sound, or articulatory "feel," or sight of the word—or even an unconscious nervous "set"—might come, in time,

to carry the meaning which had originally been carried by associated images. Moreover, there can be no understanding, even of the most familiar word, without the arousal of the mood of "at home," with its constituent organic sensations; and there can be little doubt that these are the real vehicle of the word's meaning. Consult G. F. Stout, *Analytic Psychology* (London, 1909), and E. B. Titchener, *A Text-book of Psychology* (New York, 1910).

APPREN'TICE (LL. *apprenticius*, learner, from *apprehendere*, to grasp). A person, generally a minor, lawfully bound to the service of another, in consideration of maintenance and instruction by that other in some art or trade. It was formerly the law in England that a minor seeking to pursue any trade or art involving skill and experience must serve an apprenticeship of seven years, but this was repealed by Act of Parliament in 1814. Except as hereinafter stated compulsory apprenticeship has never existed in the United States. At present the apprentice system in England and in many of our States applies chiefly to orphans or to the children of paupers, and to some extent in this country to minors who, because of delinquency or improper guardianship, are taken in charge by the State acting *in loco parentis*. In such cases the apprenticeship is usually compulsory, i.e., with or without the consent of the minor affected, but in voluntary apprenticeships, even under the old English system, the consent of the minor was always requisite. The system is now regulated by statutes in most of our States, and their provisions must be strictly complied with, or the apprenticeship will be invalid. Ordinarily the consent of the minor, and of his father, mother, or guardian, is required; the apprenticeship is limited to the age of 21 in the case of boys, and 18 in the case of girls, and ceases upon the death of either the master or the apprentice. By section 4509 of the United States Revised Statutes, a boy who has attained the age of 12 years may be apprenticed to the sea service, with his consent and that of his parents, such apprenticeship to cease when he becomes 18 years of age. The Thirteenth Amendment to the United States Constitution, prohibiting "slavery or involuntary servitude, except as a punishment for crime," it has been judicially declared, does not relieve an apprentice from doing service against his will. Consult Kent, *Commentaries on American Law* (14th ed., Boston, 1896); Austin, *The Law Relating to Apprentices* (London, 1890), for the English laws; and the works referred to under the titles CONTRACT; MASTER AND SERVANT.

Apprentice, Naval. Apprentices are enlisted for the United States naval service between the ages of 15 and 17 to serve until they reach 21 years of age. Minors between the ages of 15 and 17 are not enlisted without the consent of their parents or guardians. The applicant must be of robust frame, intelligent, of perfectly sound and healthy constitution, free from all physical defects or malformation, and not subject to fits. He must also be able to read and write. Upon enlistment boys are rated as third-class apprentices and receive \$9 per month and one ration. After completing their tour of service in a cruising training-ship, if qualified, they are advanced to apprentices of the second class at \$15 per month. After serving one year in cruising ships of war, if qualified, they are advanced to apprentices, first class, at \$21 per

month. Apprentices, first class, during the last year of their enlistment, may be given acting appointments as petty officers, third class, and if they serve the probationary period in the United States navy, they must be recommended to a permanent appointment previous to discharge. Upon the expiration of the enlistment of an apprentice, he will, if recommended, receive an honorable discharge. As soon as practicable after the apprentices are enlisted, they are forwarded to the naval training-station at Newport, where they receive instruction in English studies and in the rudiments of the profession of a seaman, for a period of six months. At the termination of this period the apprentices are transferred to the cruising training ships. There are three departments of instruction and training—seamanship, gunnery, and English, the last embracing the ordinary curriculum of an elementary school. There is also special instruction as buglers, carpenters, sail-makers, and blacksmiths. The course of instruction on board the cruising training ships is of six months' duration. The instruction begun at the shore station is continued aboard the cruising vessels with an increase of practical work. When transferred to the regular service cruisers, the instruction is still continued, and the apprentices are regularly examined before being advanced in rating. Should the term of enlistment of an apprentice expire while he is abroad, he is to be sent to the United States as soon as practicable unless he desires to reënlist.

APPROACH'ES (Fr. *approcher*, It. *appropiarsi*, ML. *appropriare*, come near to, from Lat. *ad*, to + *prope*, near). A term used in the science of fortification, to describe the sunken trenches or passages constructed by an attacking force to cover and protect their advance on a fortified position. Care is taken in the construction of approaches, which are usually in a zigzag course, to avoid enfilade or direct fire, particularly the former. The style of approaches built will depend altogether on the character and strength of the besieged, and the time available for the work. Generally, continuous lines of breastworks are built, parallel to the opponents' lines. If excavation is difficult or impossible, breastworks of sandbags and gabions are built. Approaches are often called *saps*, the operation *sapping*, the diggers *sappers*. The end of the sap nearest the enemy is called the *saphead*. (See *SAP*.) Important examples of this branch of military operations are the works constructed by the French and English troops in the Crimean War of 1854, at the siege of Sebastopol, and more recently the extensive works built by the Japanese in their attack and capture of the strongly fortified and stubbornly defended position of Port Arthur. See *FORTIFICATION*; *SIEGE AND SIEGE WORKS*.

APPRO'PRIA'TION (late Lat. *appropriatio*, a making one's own, from *ad*, to + *proprius*, one's own). 1. The act of applying specific property to a particular use. 2. The act of reserving property for a designated use. In its first signification, the term is applied to unlawful acts, such as those of conversion (q.v.) or embezzlement (q.v.); and to lawful acts, such as the adoption of a design or symbol as a trade-mark, or the final setting aside of specific goods under an executory contract of sale (q.v.) for the purpose of transferring the title or

ownership to the buyer. In this signification, also, it is used in the phrase appropriation of payments. When X owes Y several debts, X has the right to appropriate a payment which he makes to any of the debts. If he pays, without exercising the right, Y may appropriate the payment to any debt. In case a payment is made without appropriation at the time, by either X or Y, and subsequently they disagree as to its appropriation, the courts will apply it in accordance with their conception of the justice of the case. These conceptions, as announced in various reported decisions, are tending toward the establishment of fixed rules. Such rules are applied, however, only to voluntary payments, of which the debtor had the power of appropriation. If, for example, a payment is made under judicial process, as upon the sale of the debtor's property under the foreclosure of a mortgage, it will be appropriated ratably toward the claims for which the mortgage was security.

In the second of the above significations, the term "appropriation" is found most frequently in constitutional and statutory provisions. By Article I, Section 9, of the United States Constitution, it is declared: "No money shall be drawn from the treasury, but in consequence of appropriations made by law." In England, "Not a penny of revenue can be legally expended, except under the authority of some Act of Parliament." The most important statute of this sort is the annual Appropriation Act, by which definite sums are reserved for specified objects. Consult the works mentioned under the titles referred to in this article, and for appropriation by a debtor those referred to under the title *CONTRACT*; for appropriation of funds by the government consult Story, *Commentaries on the Constitution of the United States* (5th ed., Boston, 1891), and Von Holst, *Constitutional Law of the United States of America* (Chicago, 1887).

APPROVE'MENT. The inclosing, by the lord of a manor, of a part of the common (q.v.), or waste lands of the manor, for the purpose of cultivation and improvement. When the acts of approvement and inclosure are completed, the land so inclosed loses its character as common land and is converted to the use of the lord. In general, the lord cannot exercise this right to the exclusion of rights of common, and therefore he can only approve a part of the common land, leaving enough of the waste to satisfy the needs of commoners. The matter is wholly regulated by statute. Consult Pollock and Maitland, *History of English Law* (2d ed., Boston, 1899), and authorities referred to under *COMMON*.

APPROX'IMA'TION (Lat. *approximare*, to approach, from *ad*, to + *proximus*, nearest). In mathematics, a process or a calculated result not rigorously exact, but approaching the truth with continually increasing exactness, or near enough for a given purpose; e.g., the process of solving a higher numerical equation by Horner's method gives a root that, as the process is extended, approaches the true root with continually increasing exactness; multiplying the diameter of a circle by 3.1416 gives the circumference near enough for most purposes. It should be remembered that a result cannot be more accurate than the data, and that in mensuration the data are not usually carried beyond thousandths of a unit; hence the great importance of approximation, even in ordinary arithmetical calculations.

APPUI, à'pwé'. See POINT D'APPUI.

APPUN, äp'pun, KARL FERDINAND (1820-72). A German naturalist, born at Binzlan. In 1849 he undertook a journey of exploration to South America, where he remained for 19 years. The three years from 1868 to 1871 he spent in his native country, after which he returned to his wanderings in South America, where his death was caused by an accident with sulphuric acid. Appun's studies were extended over a large area in Venezuela, Brazil, and British Guiana. His published works include *Unter den Tropen, Wanderungen durch Venezuela, am Orinoco, durch Britisch-Guayana, und am Amazonenstrom in den Jahren 1849-68* (1871).

APPUR'TENANCE (OF. *apurtenance, apartenance*, from Lat. *ad*, to + *pertinere*, to belong). In law, a subordinate right to another's land which is an incident to the estate of the persons entitled to enjoy the right. Upon conveyance of the principal estate, the appurtenances pass to the grantee without being expressly mentioned in the grant. An appurtenant right is the antithesis of a right in gross, which is a property right attached to the person of the owner. It is not an incident of real estate and may be conveyed apart from it. Appurtenances are classified as profits, sometimes called rights of common, and easements. A profit appurtenant is the right of the owner of real estate, as such, to take a portion of the soil or product from the land or water of another, as to pasture cattle, cut timber, catch fish, take ore or gravel or the like. An easement appurtenant is any right of the owner of real estate, as such, in or over the land of another, which does not involve taking any part or product of the land, as a right of way, or the right to have light and air pass over the land of another. See EASEMENT; PROFIT; SERVITUDE; and the authorities referred to under REAL PROPERTY.

APRAXIN, ä-präks'in, FEDOR MATVEYEVITCH (1671-1728). A distinguished Russian admiral. When hardly 10 years of age he entered the service of Czar Fedor Alexeyevitch, and at 12 that of Peter the Great, who conceived a great attachment for him, which lasted during the life of the monarch. In 1692, when but 21, he was appointed governor of Archangel, a post of considerable importance in those days. Rising gradually in rank and favor, he was after the year 1700 the most powerful and influential person at the court of the Czar, who made him chief admiral of the Russian navy, of which, in fact, Apraxin may be considered the creator. While Peter was fighting the Swedes in the north, Apraxin was building war vessels, fortresses, and wharves in the south. In 1709 he was appointed president of the admiralty; in 1708 he defeated the Swedish general Lybeker in Ingermanland and saved the newly built city of St. Petersburg from destruction (in appreciation of which services he received a medal from Czar Peter); in 1709, on Peter's return from abroad, Apraxin was made one of his secret advisers and given the title of Count; in 1710 he captured the important town of Viborg, in Finland, and in 1711 commanded in the Black Sea during the Turkish War. The following year he returned to the north, and in 1713, with a fleet of 200 vessels, sailed along the coast of Finland, took Helsingfors and Borgå, and defeated the Swedish fleet. The result of his great successes was that at the peace of Nystad,

in 1721, Russia obtained possession of the coveted Baltic Provinces and became the leading power in the Baltic Sea. In 1715 and again in 1718 Apraxin was found guilty of embezzlement and extortion, but, owing to the high favor in which the Czar held him, he escaped serious punishment and lost nothing in reputation. Even for the fine which Apraxin had to pay he was more than recompensed by his royal friend, who presented to him many private estates. Remaining Peter's closest adviser and best aid, Apraxin accompanied him in his Persian War in 1722 and was present at the siege of Derbend. His last naval expedition was in 1726, when he repaired with the Russian fleet to Reval, to defend that place against an expected attack by the English. He died at Moscow.

APRAXIN, STEPAN FEDOROVITCH, COUNT (1702-60). A Russian general. In 1737 he served against the Turks, gaining rapid promotion, being appointed ambassador to Persia in 1742, general-in-chief in 1746, and field-marshal in 1756. In Elizabeth's court he was a strong opponent of Prussian influence and in the Seven Years' War, as field-marshal, led an army of invasion into Prussia, defeating the Prussian Field Marshal Lewald at Grossjägerndorf, 1757. In the midst of success, he retreated, at the call of Bestuzheff, who wanted to raise Paul to the Russian throne over his father (Peter III), who was the legitimate heir, as the Empress Elizabeth fell dangerously ill. On recovering, the latter removed Bestuzheff and put Apraxin into prison. Of the manner of his death there exists the following legend in Russia: The court-martial reported to the Empress that the prisoner denied any guilt, whereupon she recommended it to apply the last remedy—to set him free. At the next session, when Apraxin persisted in claiming innocence, the president of the court-martial urged his colleagues to apply "the last remedy." No sooner were these words uttered than Apraxin, thinking they referred to torture, fell in a fit of apoplexy.

A'PRICOT (Fr. *abricot*, Sp. *albaricoque*, Portug. *albricoque*, from Ar. *al-birqūq*, *al-burqūq*). A fruit (Lat. *Prunus armeniaca*, i.e., Armenian plum) resembling in several respects both the peach and plum and really intermediate between them. It is supposed to be a native of China and was brought into Europe at the time of Alexander the Great. The flesh of the apricot is firm, sweet, and aromatic; the stone is smooth and slightly furrowed, like that of some plums. The skin is downy, like that of the peach. The tree resembles the plum more than the peach, in that it has ovate, acuminate, and cordate, smooth, double-toothed leaves, on long stalks, and solitary, sessile, white flowers which appear before the leaves.

The apricot is grown abundantly in France, Italy, Turkey, Syria, and Palestine, and to some extent in Australia and South Africa. The tree is as hardy as the peach, but the danger of loss from frost, owing to its early blooming habit, as well as from plum curculio, has restricted its cultivation in the eastern United States. In California and Oregon it is extensively raised. In England it is a favorite with gardeners and is grown both in the open and as espalier or cordon on protected walls. In the eastern United States, when trained in similar manner to a northern or northeastern wall, the buds are usually sufficiently retarded to escape frost.

In the eastern United States the apricot is usually budded or grafted upon the plum. This fits it for heavy soils; on light soils it does well when worked upon the peach, and in California, where apricot stocks can be obtained, it is worked upon the apricot itself. In New York State there are commercial orchards of apricots, top-worked on the plum. The Russian apricot is a hardy form of *Prunus armeniaca*, and although not in itself of merit for its fruit, may prove to be a valuable stock for the more desirable forms. The Japanese apricot, which is chiefly grown for its blossoms, is *Prunus mume*. Orchard culture is, in general, the same as for the peach. (See PEACH.) The apricot has numerous varieties, of which some of the best are Holland (Breda), Moorpark, Early Golden, and Peach. The fresh fruit is now commonly found in the markets. Large quantities are also dried in California and Oregon in evaporators. The product is extensively shipped to different parts of the United States and abroad, for cooking purposes. Apricot pits are now exported to Europe where an oil similar to almond oil is extracted from the kernels. In the Orient the kernels are largely eaten like almonds. Dried sheets of apricot paste form an important part of the rations of the Mohammedan soldier. For composition and food value of the fruit, see general article on FRUIT. For illustration see Plate of ABUTILON and DRUPES.

Diseases. The apricot is subject to the same diseases as are the peach and plum. The most common disease is the *leaf rust*. It may be prevented by the thorough use of the standard fungicides (q.v.).

APRIES, ā'pri-ēz (Gk. Ἀπρίης, *Apriēs*; Uaphres, Egyptian, *Uah-eb-ré'*). An Egyptian King of the twenty-sixth dynasty. In the Old Testament he is called Pharaoh-hophra. He reigned from 589 to 570 B.C., at the time when the Babylonians subjected Palestine and threatened Egypt. He aided the Jews in their resistance against Nebuchadnezzar, but was unable to prevent the fall of Jerusalem. Apries seems, however, to have warded off the Babylonian attack upon Egypt. The revolt of his native troops sent against the Cyrenæans in aid of the Libyan King Adikran led to the usurpation of Amasis (q.v.). Herodotus, who in general gives a strangely distorted account of Apries, relates that the usurper kept him alive for some time, until at last he was forced to yield up the dethroned King to an infuriated mob. This story is, however, not confirmed by the Egyptian inscriptions.

A'PRIL. See MONTH.

APRIL FOOL. The first of April, known as "All Fools' Day," has long been in America, and for a still longer period in many European countries, a day for mocking unwary persons by sending them on bootless errands or making them the victims of some other practical joke. The custom seems to have been unknown to German antiquity. Grimm regards it as having been introduced into Germany from France, in comparatively modern times. Various theories have been held as to the origin of the custom. One writer traces the custom to the miracle-play formerly represented at Easter, which sometimes showed the sending of Christ from Annas to Caiaphas and from Pilate to Herod; another finds the origin in some ancient pagan festival, such as the Huli festival held by the Hindus on March 31, or the Feast of Fools, celebrated

by the Romans on February 17, at which similar tricks were played. In France the victim is called *un poisson d'Avril*, 'An April fish' (possibly from the reopening of the fisheries at that season); in Scotland, a gowk or a cuckoo.

APRIL HOPES. One of the most striking and characteristic of Howells's books, published in 1887. The heroine, Alice Pasmer, is a well-born, well-bred New England girl, but with a Puritan conscience which "makes no allowance for human nature."

A PRIO'RI (Lat. from something prior, foregoing, *a*, from, and *prior*, prior). In Aristotelian terminology, a designation applied to arguments from cause to effect, as opposed to *a posteriori* (Lat. from something posterior, following), which describes arguments from effect to cause. But since Kant's day *a priori* has become an epithet, often polemic, applied to judgments alleged to have a validity independent of experience. Its antonym in this meaning is still *a posteriori*, which means 'resting upon experiential proof.' The attitude one takes toward the question of the possibility of *a priori* judgments is one of the most crucial tests of one's affiliation among the philosophic schools. Rationalists, Intuitionists, and Criticists (i.e., followers of Kant) maintain that many of our judgments are *a priori*; Empiricists deny it. The debate, however, seems to be conducted upon a false assumption, shared by most of the protagonists on either side, viz., that experience comes piecemeal, or, that technically, it is atomistic in character. If such were the case, then any valid universal judgment would have to be *a priori*, for no number of *isolated* experiences could point to a general law. But experience does not grow by the accretion of unrelated elements; rather is its growth a process of organic expansion under stimulation, which for practical purposes must be regarded as proceeding from the external world. In the knowledge thus acquired, there is the coöperation of what may be distinguished as two factors, the nature of the organism and the nature of the stimulus that gives rise to a content in consciousness. Now, these two factors may conveniently be designated the *a priori* and the *a posteriori* constituents of knowledge. But it is of the utmost moment to guard against the error of supposing that antecedently to experience there is a thing called mind which comes to the act of experience ready equipped with either a determinate nature or with full-blown knowledge of some sort. The literature of the subject is enormous. Omitting all reference to ancient philosophers, some of the noteworthy books bearing on the topic are: J. Locke, *Essay Concerning Human Understanding* (best ed., by Fraser, 2 vols., Oxford, 1894); Leibnitz, *Nouveaux essais sur l'entendement humain*, English by Langley (New York, 1896); also selections translated by Duncan (New Haven, 1890) and by Latta (Oxford, 1898); D. Hume, *Treatise of Human Nature*, book i, part iii (Selby-Bigge ed., Oxford, 1888); D. Hume, *An Enquiry Concerning Human Understanding* (Selby-Bigge ed., Oxford, 1894); Kant, *Kritik der reinen Vernunft*, English by Max Müller (London, 1896); Hegel, *Encyclopädie der philosophischen Wissenschaften im Grundrisse* (Heidelberg, 1830), in part translated into English by Wallace under the titles, *Hegel's Logic* (Oxford, 1892-94) and *Hegel's Philosophy of Mind* (Oxford, 1894); R. H. Lotze,

Logik (Leipzig, 1880), edited in English by B. Bosanquet (2 vols., Oxford, 1888); J. S. Mill, *Logic and Examination of Sir W. Hamilton's Philosophy* (London, 1867; last in author's lifetime, 1872); E. Caird, *A Critical Account of the Philosophy of Kant* (2 vols., New York and London, 1889); F. H. Bradley, *Principles of Logic* (London, 1883); B. Bosanquet, *Logic* (Oxford, 1888); L. T. Hobhouse, *Theory of Knowledge* (London, 1896). See also KANT; DEDUCTION; INDUCTION; LOGIC; EMPIRICISM; TRANSCENDENTALISM.

A'PRON (by wrong division into *an apron* for a *napron*, OE. *napron*, OF. *naperon*, Fr. *naperon*, dimin. of *nappe*, cloth, tablecloth, from Lat. *mappa*, cloth, cf. *napkin*). An outer garment, originally of linen but often of cloth or leather, covering the front of the person and intended to protect other clothes from injury. It is used in Coverdale's translation of the Bible (1535) and also in the Authorized Version, to render the Hebrew word *chagorah*, applied to the covering of fig-leaves made by Adam and Eve after the Fall. It has been applied also to various mechanical devices used as a means of protection as (1) in military affairs, a rectangular piece of lead, with a projection on the under side, used to cover the vents in old-fashioned cannon; (2) in shipbuilding, the piece of curved timber set just above the forward end of the keel, to join the several pieces of the stem and connect them more firmly with the keel (see SHIPBUILDING); (3) in engineering structures, a platform placed at the base to protect it from heavy shocks; (4) in carpentry, the horizontal piece of timber which takes a carriage-piece or rough string on a staircase, and also the ends of joists which form the half-space or landings; (5) in plumbing, the lead sheeting or flushing dressed on the slates in front of a dormer window or skylight; (6) in mechanics, the piece which holds the cutting tool in a planing machine; (7) in architecture, a more or less flat member placed against or above anything for protection, as the decorative member under a veranda cornice. Besides the obvious uses of aprons in the original sense, they are worn also in elaborately decorated forms as part of the costume of Freemasons (see MASONS, FREE) in the lodge; while bishops and deans in the Church of England wear an apron of black or purple silk which is an abbreviation of the older cassock.

AP'ROSEX'IA. Lack of power to concentrate the attention. The term is most frequently used to describe a condition of mental vacuity, inattention, and restlessness present in many children who suffer from adenoids (q.v.).

APSE (for derivation, see APSIDES). An architectural term used by Greeks and Romans to designate a vaulted structure, such as a domical chamber, or even a triumphal arch. The Romans applied it particularly to the large, semicircular niche that projected from some of their temple cellas or basilicas; in the temples it was the place for the cult image of the god; in the basilica it was the prætor's tribunal, where he sat surrounded by his assessors. In both cases it was the culminating point of the structure. The partial derivation of the Christian church or basilica from the Roman basilica or law court makes it natural that this semicircular projection or apse should appear as an integral part of the earliest churches. Early Church writers called it *exedra*, *concha*, or *conchula bematis*. The higher clergy were seated on a

bench around the apse; the bishop took the prætor's place in the centre of the semicircle. Being the most sacred part of the church, the apse received the richest and most artistic decoration, and the most sacred subjects were depicted upon its semidome and walls. The width of the apse usually corresponded to that of the nave or central aisle of the church, whose end it seemed to form. It was not until the seventh or eighth century that smaller apses were often placed in the same way at the ends of the side aisles. They may have developed from the small sacristies which had for centuries usually been placed there.

Byzantine architects gave a polygonal form to the exterior, while preserving the interior semicircular outline (e.g., Ravenna). Square apses,

APSE FLANKED BY TWO APSIDIOLES.

S. Pedro Avila (Spain)

very rare at first, became common in the eleventh, twelfth, and thirteenth centuries, especially in Cistercian abbeys. The development of transepts led sometimes to the use of apses at their terminations, as in the Romanesque churches at Cologne and in the French Gothic churches of Senlis, Noyon, and Soissons. Many German Romanesque (and a few Gothic) churches have an apse at the west as well as the east end. The addition of an ambulatory (q.v.) with radiating chapels greatly enriched the east end of the church, both internally and externally; while the lengthening of the eastern portion between the apse and the transepts to accommodate the choir, transferred thither from its former position in the crossing and eastern part of the nave, further increased the importance and splendor of the apse, the whole eastern part of the church, including the apse, ambulatory, and chapels, being thereafter generally known as the "choir." This change seems to have begun in the twelfth century. The development of Gothic construction, with its multiplied buttresses, pinnacles, and flying arches, gave still greater magnificence to the exterior of the apse, in contrast to its primitive plainness (Amiens, Le Mans, Cologne cathedrals). See CHOIR, CHURCH.

APHERON, äp'she-rôn'. A peninsula of Russia on the west shore of the Caspian Sea (Map: Russia, G 6). It is famous for its immense deposits of naphtha, probably the richest

in the world. The soil is sterile, and strong winds prevail. See BAKU.

AP'SIDES, äp'si-dēz (Gk. pl. of *ἀψίς*, *apsis*, loop, juncture). The two extreme points in the orbit of a planet—one at the greatest, the other at the least distance from the sun. The term "apsides" is applied in the same manner to the two points in the orbit of a satellite—one nearest to, the other farthest from, its primary; corresponding, in the case of the moon, to the perigee and apogee. A straight line connecting these extreme points is called the line of apsides, or the major axis of the orbit. In the planetary orbits this line has no fixed position in space, but undergoes a motion in the plane of the orbit. This fact in the orbit of the earth gives rise to the difference between the anomalistic (q.v.) and sidereal years. This motion of the line of apsides is especially remarkable in the orbit of the moon, an entire revolution taking place in 3232.57 days, or a little less than nine years.

APSID'IOLE. A small apse or apse-like projection; used especially of the small semicircular chapels radiating from the apse or ambulatory, or projecting from the east side of a transept, in early mediæval churches. See APSE; CHURCH.

AP'SLEY HOUSE. The mansion built by Lord Bathurst in 1785, and purchased in 1820 by the government for the Duke of Wellington in reward for the latter's services to the nation in the Napoleonic wars. In 1830 its windows were broken by the mob on the anniversary of Waterloo, and the Duke was forced to have them protected by iron shutters.

APSLEY STRAIT. See BATHURST ISLAND.

APT, äpt (anciently, Lat. *Apta*). The capital of the arrondissement of the same name, in the department of Vaucluse, France, on the Coulon River and the Mediterranean Railway (Map: France, S., K 5). It contains a communal college, library, meteorological station, and manufactures silk. There is some trade in grain and fruit. Its cathedral is supposed to have been built about the eighth century, and it contains numerous specimens of Romanesque architecture. Roman remains have been found in the vicinity, for in ancient times Apt was the chief city of the Vulgientes and received much attention from Julius Cæsar, who gave it the name of Apta Julia. It came into the possession of France in 1481. Pop., 1901, 5948; 1906, 6418; 1911, 6336.

AP'TERAL (having no wings, Gk. *ἀ*, *a*, priv. + *πτερόν*, *pteron*, wing). A term applied to Greek and Roman temples without lateral colonnades, or *pteromata*, outside the *eella*; and also to Christian churches which either had no aisles or whose façades had the form of a single unbroken gable, not divided into three sections.

AP'TERYG'OTA. A prime division of Insecta, embracing primitive insects without wings and including the Thysanura and Collembola. See BRISTLETAIL; SPRINGTAIL.

AP'TERYX (Gk. *ἀ*, *a*, priv. + *πτέρυξ*, *pteryx*, wing). The scientific name for a genus of small ratite birds of New Zealand, comprising the order Apterygiformes. It has come into general use and, except locally, has taken the place of the native name "kiwi." The term "wingless" is incorrect, for while the fore limbs are greatly reduced and functionless, yet there are present the humerus and a single complete digit.

This remarkable group of birds was for a long time a puzzle to ornithologists. Sham first

described an apteryx in 1813, and not until the accumulation of material in 1833 was it possible to assign it even its approximate place in systematic classification. Owen investigated its anatomy so carefully that, supplemented by Parker's later studies, the structure of few birds is even to-day more thoroughly understood. Its body shows a confusing mingling of primitive and specialized characters. For example, while the plumage covers almost the entire body uniformly, yet the wings, nostrils, and oil-gland are extremely specialized. Until the middle of the last century almost no living birds had been seen by travelers or naturalists, and not until 1847 did a second species become known. Three years later a third was discovered. In 1851 the first living apteryx reached England, and since then many have thrived in various zoölogical gardens and have laid eggs, none of which, however, have been fertile. They are ill adapted for exhibition, as their nocturnal habits keep them hidden from view, usually concealed beneath straw or any material at hand. In 1872 a complete account of the apteryx was published by Sir W. Buller. This extent of knowledge is very fortunate, for these birds, so highly interesting as relics of past times and an extinct fauna (see MOA), are to-day approaching extinction. Portions of their haunts have recently been set aside as game preserves, so there is a bare chance that they may exist for some time and possibly hold their own for years. Six forms are recognized: the apteryx, or kiwi, of North Island, *Apteryx bulleri* or *mantelli*; *Apteryx oweni*, a very different species, known as the Gray Apteryx, is confined to South Island, while a spotted sub-species of this form, *Apteryx oweni occidentalis*, is found on both islands. *Apteryx australis*, *lawryi*, and *haasti* complete the list. Consult Pott's articles in the *Transactions of the New Zealand Institute*.

The apteryx, or kiwis, are about the size of common fowls and are robust in form, with massive legs and feet, having a short hind toe (not present in other existing Ratitæ, no visible wings or tail, a very long, down-curved flexible bill, with the nostrils at the extreme end, and a covering of loosely vaned, almost hairlike feathers, which have no after shaft. The southern and northern kiwis are dark reddish-brown, striped lengthwise with yellowish-brown, but Owen's kiwi, which is much smaller than the others, is light grayish-brown transversely barred with black. Fossilized species are also known from remains found in company with the bones of moas. The females are about one-sixth larger than the males—a fact connected with their extraordinary reproduction, for the female lays only one yellowish-white egg (or uncommonly two) annually, which is gigantic in proportion to the size of the bird, that of the North Island species measuring 5 by 3 inches, or nearly a quarter of the bulk of the mother's body. This is deposited in a depression in the ground, and is incubated wholly by the male; and the young one when hatched is well grown, well feathered, and able to take care of itself.

These birds are natives of the mountainous forested parts of New Zealand; they are entirely nocturnal in their habits, and doze inertly in the daytime, in a rolled-up attitude. In former days, when they were numerous, they went about in small companies, and toward morning the woods rang with their shrill cries. The loss of flight-power is compensated by great strength

of the feet (the sharp claws of the toes are good weapons), and they run swiftly. Their food consists mainly of earthworms, which are obtained by plunging the bill deeply into the ground, the location of the worm having been detected, probably, by the sense of smell aided by that of touch. The nostrils differ from those of all other birds in being at the extremity of the upper mandible, and the bird makes a continual sniffing sound as it moves about. Other insects and some fruits are also eaten. The common statement that when quiet the kiwi sustains its weight by resting upon the point of the bill is an exaggeration; this attitude is rarely taken. Their numbers are greatly decreased, and these birds will soon become extinct, no doubt, as a wild species. Kiwis are still numerous, however, in some of the more secluded forests; but the Norway rat is fatal to all ground birds. Kiwi feathers were prized by the Maoris for hair-like ceremonial mats.

Consult Newton, *Dictionary of Birds* (London and New York, 1893-96), for a general history of investigations. For anatomy, consult: Owen, *Transactions of the Zoölogical Society*, vol. ii (London, 1846); Parker, *Transactions of the Philosophical Society* (London, 1891, 1892). For habits, consult Buller, *Birds of New Zealand* (2d ed., London, 1888), various articles in the *Transactions of the New Zealand Institute*, and Hutton and Drummond, *Animals of New Zealand* (1905). See Plate of CASSOWARIES, ETC.

AP'THÆ. See APITHÆ.

AP'THORP, WILLIAM FOSTER (1848-1913). An American writer and musical critic, born in Boston, Mass. He graduated at Harvard in 1869 and studied music under J. K. Paine and B. J. Lang. He is well known as the author of *Hector Berlioz: Selections from his Letters and Writings*, with a biographical sketch, a pioneer work in English on this composer; and books of musical criticism, including *Musicians and Music Lovers* and *The Opera, Past and Present*. He lectured at the Lowell Institute, Boston, and the Peabody Institute, Baltimore, and taught at the New England Conservatory, Boston, and the College of Music of Boston University. From 1892 to 1901 he wrote the analyses of musical compositions which appeared in the programme of the Boston Symphony Orchestra. For twenty years after 1881 he was musical critic of the *Boston Transcript*.

APULEIUS, LUCIUS. A Latin satirical writer of the second century. He was born about 125 A.D., at Madaura, in Africa, where his father was a magistrate, and a man of large fortune. Apuleius first studied at Madaura, then at Carthage, which at one time enjoyed a high reputation for its school of literature. Afterward he went to Athens, where he entered keenly upon the study of philosophy, displaying a special predilection for the Platonic school. The fortune bequeathed to him at his father's death enabled Apuleius to travel extensively. He visited Asia and Italy and was initiated into numerous religious mysteries. The knowledge which he thus acquired of the priestly fraternities he made abundant use of afterward in his *Metamorphoses*, or *Golden Ass*. He went also to Rome, perhaps about 150, and practiced law there; at this time, too, he published, it would seem, his *Metamorphoses*. His first appearance in literature arose from a lawsuit. He had, about 155, returned to Africa, and had gone to Dea, a town on the coast near

the modern Tripoli. Having married there a middle-aged lady, named Pudentilla, very wealthy, but not particularly handsome, he drew down upon his head the malice of her relatives, who desired to inherit her riches, and who accused Apuleius of having employed magic to gain her affections. His defense (*Apologia*, still extant) spoken before Claudius Maximus, proconsul of Africa, was an eloquent and successful vindication of his conduct. After this event his life appears to have been devoted zealously to literature and public oratory, in both of which he attained great eminence. He was extremely popular, so that Carthage and other cities erected statues in his honor.

The *Metamorphoses*, or *Golden Ass*, the work by which his reputation has survived, is a romance or novel, whose principal personage is one Lucian, supposed by some, chiefly on the evidence of the eleventh and last book, to be the author himself. Lucian, in search of adventure and keen for knowledge of various mysteries, is by an accident transformed by magic into an ass; in this guise he has all sorts of adventures till at last he recovers his human form by eating roses in the hands of a priest of Isis. It has been often regarded as a satire on the vices of the age, especially those of the priesthood, and of quacks or jugglers affecting supernatural powers, though Bishop Warburton and other critics fancied they could detect in it an indirect apology for paganism. More probably it is only a series of amusing stories without serious purpose. Its merits are both great and conspicuous, as are also its faults. Wit, humor, satire, fancy, learning, and even poetic eloquence abound. Apuleius had a wonderful power of accurate and vivid observation of details, and his stories are highly realistic. The style is vigorous and exuberant, but is also disfigured by excessive archaisms, and there is a frequent affectation in the metaphors, etc. The name *Golden Ass* is not due to Apuleius himself, but is a complimentary designation of later times. The most exquisite thing in the whole work is the episode of Cupid and Psyche (imitated by La Fontaine). It has been by some supposed to be an allegory of the progress of the soul to perfection. Besides the *Apologia* and *Golden Ass*, we have from the pen of Apuleius an anthology in four books, called *Florida*, a work on the daemon of Socrates, one on the doctrines of Plato, one on *The Universe*, etc. Many of his works are lost. A recent edition is by J. van der Vliet, the *Metamorphoses* (Leipzig, 1897); *Apologia* and *Florida* (Leipzig, 1900). Much better is that by R. Helm, the *Apologia* (Leipzig, 1895); the *Metamorphoses* (Leipzig, 1907); *Florida* (Leipzig, 1910); and the *De Philosophia Libri*, by P. Thomas (Leipzig, 1908). The *Golden Ass* was translated into English by T. Taylor (London, 1822), by Sir G. Head (London, 1851), by Walter Pater (q.v.), in his *Marius the Epicurean*, and by H. E. Butler (Oxford, 1910). Butler also translated the *Apologia* and the *Florida* (Oxford, 1909). A still earlier translation by Adlington in 1566 has been republished, with an introduction by Whibler (London, 1893), and again with an introduction by T. Seecombe (New York, 1913). An English version of the works of Apuleius was published in London, 1853. Consult also for Apuleius's life and works E. Rohde, *Rheinisches Museum*, pp. 66-113 (1885); and the edition of the Cupid and Psyche story by L. C. Purser (London, 1910).

APU'LIA. A part of ancient Italy lying along the Adriatic Sea, and bounded on the west and south by the Frentani, Samnium, Lucania, and Calabria (Map: Italy, L 6). Modern Apulia (It. *Le Puglie*) comprises the provinces of Bari, Foggia, and Lecce. It is a vast plain drained by numerous small streams flowing toward the Adriatic; on the whole, however, the land is *pauper aquæ*, as Horace called it. The country has extensive areas of pasture land, and the raising of domestic animals is the chief occupation of the inhabitants, as it was in ancient times. Chief towns: Bari, Brindisi, Foggia, and Lecce. Pop., 1881, 1,519,064; 1901, 1,949,423; 1911, 2,128,632. According to old poetic traditions, Daunus, King of the Apulians, when banished from Illyria, had settled in Apulia. The chief towns of Apulia were Arpi, Barium, Canusium, Luceria, and Venusia (birthplace of Horace). The Romans first came in contact with the Apulians in 326 B.C., when a friendly alliance was formed; but the Apulians joined the Samnites, the Tarentines, and finally Hannibal in attempts against Roman supremacy. Much of the Second Punic War was fought in Apulia, and here the Romans lost the disastrous battle of Cannæ (q.v.). After the fall of Hannibal Apulia was wholly subjugated by Rome. When Augustus divided Italy into districts, the *Regio II* was made to include Apulia and Calabria.

APURE, á-pōō'râ. An important tributary of the Orinoco, rising in the eastern slopes of the Andes near Bucaramanga, in Colombia, South America. Flowing eastward it enters Venezuela, receiving from the south the Cauca-gua River and from the north the Portuguesa, the Guarico, and others; finally joining the Orinoco 200 miles above Ciudad Bolivar. It is more than 700 miles long, navigable through the greater part of its course.

APURIMAC, ä'pōō-rē'mäk (Peruvian *upu*, principal, chief + *rimac*, oracle). A Peruvian river, one of the head streams of the Ucayali (q.v.) (Map: Peru, C 6). It flows from Lake Vilafro in the high Andes in lat. 15° S., about 100 miles northwest of Lake Titicaca, and flows northwest throughout about 500 miles of its course, but after uniting with the Perene it is known as the Tambo. It flows eastward and then northward for a distance of 100 miles to its place of union with the Quillabambi, to form the Ucayali, which in turn, uniting with the Marañon, forms the Amazon. The Apurimac possesses the peculiarity that its tributaries, the chief of which are the Pampas, Mantaro, and Perene, are received from the west side. Among the tributaries of the Amazon it probably rises nearest to the Pacific Ocean. The Apurimac and its tributaries are of the nature of great mountain torrents, and their rocky and rugged banks are generally difficult of access and oft-times wholly inaccessible. The valleys through which they flow vary in climate and productiveness with change of altitude. The lower valleys yield the products of the tropics, and the upper ones those of temperate and cold climates. The basin of the Apurimac, as a whole, is said to be the finest part of Peru, and to contain the largest proportion of native population—the best specimens of the aboriginal civilization.

APURIMAC. A department of Peru (Map: Peru, C 6). Area, 8189 square miles. The surface is largely elevated and well watered. Coffee, rubber, sugar, and cacao are grown, and gold and silver are mined. Cattle raising is a minor in-

dustry. The population was officially estimated in 1896 at 177,387. Capital, Abancay.

A'PUS (Gk. ἄπους, without feet). A genus of entomostracous crustaceans, within the family Apodidæ and the sub-order Phyllo-poda. The more common species are 2 or 3 inches in length, and in the general shape of the large, shield-like carapace recall horseshoe crabs. In spite of the generic name, from 11 to 60 pairs of feet or appendages are present. Their eggs when dried in the mud may remain dormant for months or even years and in this state be transported long distances attached to the feet of water birds. They usually swim back downward and thus protect their soft body from the attacks of water beetles and other aquatic enemies. For many generations parthenogenetic reproduction by unfertilized eggs may take place, and in the case of some species the males have never been discovered.

AQUÆ GRATINÆ. See AIX-LES-BAINS.

A'QUÆ SEX'TIÆ (Lat. Sextian waters). A town of ancient Gaul, famous for the victory of Marius over the Teutones, Ambrones, and other German tribes, in 102 B.C. It is now known as the French town of Aix, in Provence.

AQUÆ SO'LIS (Lat. waters of the sun). Now the English town of Bath (q.v.); an ancient Roman city, remarkable for its magnificent edifices and for the medicinal property of its springs. Recent excavations have brought to light the remains of many Roman bath-houses.

AQUÆ STATIELLÆ. See ACQUI.

AQUAMARINE, -mā-rēn' (Lat. *aqua*, water + *marinus*, belonging to the sea). A bluish-green variety of beryl that is used as a gem. It is found in a number of localities in the United States, the richest-colored gems coming from Royalston, Mass. A celandine green variety of apatite is also called aquamarine.

AQUA RE'GIA (Lat. royal water). A name given to a mixture of nitric and hydrochloric acids, which may be used as a solvent for gold, whence its name, as gold was called by the alchemists the king of metals. It is usually prepared by mixing one part of nitric acid with from three to four parts of hydrochloric.

AQUARELLE. See WATER-COLOR PAINTING.

AQUA'RIANS. A name applied to several different sects in the early Church. It was used (1) of some of the Ebionites, who were charged with idolatrous veneration of water as the source of life; (2) of Manichæan ascetics who rejected the use of wine as a luxury. (3) The name was chiefly used of the followers of Tatian (q.v.), who advocated the use of water instead of wine in the eucharist. They lasted to the time of Augustine, in the fourth century.

AQUA'RIMUM (Lat. a watering-place for cattle, from *aqua*, water). A tank or vessel containing either salt or fresh water, in which either marine or fresh-water plants and animals are kept in a living state. From 1854 to 1860 there was a mania for these scientific toys, and they became not only an aid to study, but a source of rational amusement, depending in principle upon the relations discovered by science between animal and vegetable life, and particularly upon the consumption by plants under the action of light of the carbonic-acid gas given forth by animals, and the consequent restoration to the air or water in which they live of the oxygen necessary for the maintenance of animal life. The aquarium must, therefore, contain both plants and animals, and in something like a

proper proportion. Zoöphytes, annelids, mollusks, crustaceans, and fishes may thus be kept in health and their habits observed. If perfectly balanced, the aquarium requires little care beyond the replacing of water lost in evaporation, but where there is a preponderance of animal life the water must be frequently aërated, which can be accomplished by taking up portions of it and pouring them in again from a small height. The fresh-water aquarium is frequently provided with a fountain, which produces a continual change of water; but even where this is the case, the presence both of plants and animals is advantageous to the health of both. When sea water cannot be easily procured for the marine aquarium, a substitute may be made by mixing with rather less than 4 quarts of spring water $3\frac{1}{2}$ ounces of common table salt, $\frac{1}{4}$ ounce of epsom salts, 200 grains troy of chloride of magnesium, and 40 grains troy of chloride of potassium. With care the water may be kept pure for a long time. No dead animal or decaying plant must be permitted to remain in it. Salt water, artificially prepared, is not fit for the reception of animals at once; but a few plants must first be placed in it, for which purpose some of the green algæ, especially species of *Ulva*, are most suitable. The presence of a number of mollusks, such as shore snails, is necessary for the consumption of the continually growing vegetable matter, and of the multitudinous spores, particularly of algæ, which would otherwise soon fill the water, rendering it greenish or brownish, and non-transparent, and which may be seen beginning to vegetate everywhere on the pebbles or on the glass of the tank. In a fresh-water aquarium, pond-snails, such as species of *Lymnæa* or *Planorbis*, are equally indispensable. For large aquaria, tanks of plate glass are commonly used; smaller ones are made of bottle-glass or crystal.

Aquaria should be placed where they have sufficient access to good light. This is, of course, essential to the green plants and will also prevent the excessive growth of dangerous fungi. The gills of fishes, their eyes, and any wound on the body are frequently attacked by these fungi. These can often be removed in the case of fresh-water forms by a temporary bath in a common salt solution, sufficiently strong and for a sufficient length of time to kill the fungi. The fish, although severely affected by the salt, will revive upon being flushed with an abundance of fresh water. The plants or animals with which the aquarium is to be stocked must vary with the tastes and purposes of the individual. Among fishes, the goldfish (q.v.) stands first in beauty, variety of fantastic forms, and in tenacity of life. The sticklebacks (q.v.) are desirable because of their small size and their interesting nest-building and breeding habits. Crabs and anemones are common objects in marine aquaria. Notable large public aquaria are maintained in various cities of Europe. From a scientific standpoint, the aquaria at the Naples Marine Station have been of great importance. In Great Britain the Brighton Aquarium has long been prominent, and of much service to science. In America the aquarium of the United States Bureau of Fisheries at Washington, D. C., and the New York City Aquarium are worthy of mention. The latter was installed in old Fort Clinton, on the Battery, long known as Castle Garden, where in 1897 it was perfected by Dr. Tarleton Bean. It has seven great floor-tanks, or

pools, and nearly 100 wall-tanks, lighted from above and in the rear, and disposed in two tiers, the upper viewed from a gallery. Both marine and fresh-water fishes and other aquatic animals are displayed, and the mechanical arrangements are of the highest excellence. It is sustained by the city, under the control of the New York Zoölogical Society, and is entirely free to the public. For detailed directions as to the establishment and management of aquaria, see Eggeling and Ehrenberg, *The Fresh-water Aquarium* (New York, 1908).

AQUA'RIOUS (Lat. the water-bearer). The eleventh sign of the zodiac, through which the sun moves in parts of the months of January and February; its conventional symbol is , which is probably intended to represent a stream of water. It is also the name of a zodiacal constellation whose position in the heavens may be found by producing a line in a southerly direction through the stars in the head of Andromeda and the wing of Pegasus.

AQUATIC ANIMALS. See DISTRIBUTION OF ANIMALS.

AQUATIC PLANTS. A term applied to many widely distributed plants that live either wholly or partly in water. Some aquatic plants have their inflorescence, and even part of their foliage, above the surface of the water; others are in water entirely; still others are attached by roots to the bottom. The algæ, which are exclusively aquatic, seem adapted to perform under water all the functions of their life. Aquatic plants are generally of less compact structure than plants belonging to other classes and are therefore better adapted for rising in their growth toward the surface of the water. But many of them, including some of the algæ, are also provided with air-bladders of considerable magnitude, as may be seen in some of the common seaweeds. Some of the more common aquatic plants are shown in the accompanying plate and deserve brief descriptions.

Cat-Tail (*Typha latifolia*), sometimes called bulrush or tule, grows to the height of 5 or 6 feet. Its rootstocks are astringent and diuretic and abound in starch. Its young shoots are much eaten by the Cossacks of the Don and are sometimes used in England under the name of "Cossack asparagus." Its pollen is inflammable and has been used as a substitute for lycopodium.

Long-leaved Pondweed (*Potamogeton lucens*) is one of some 65 species and a number of varieties, included in the genus *Potamogeton*, which belongs to the family Naiadaceæ. The long-leaved pondweed has thin elliptical leaves that float on the surface of ponds or slow streams. It is indigenous to the United States and is found from New Brunswick to Washington and south to Florida and California.

American Lotus (*Nelumbium luteum*), also known as yellow nelumbo, yields edible tubers and seeds. The seeds are sought after by children, and the farinaceous roots are agreeable when boiled. The plant is found as far north as Ontario.

Water Hyacinth (*Eichhornia speciosa*), which belongs to the family Pontederiaceæ, occurs in tropical and subtropical streams of the American continents, being a native of tropical South America, and is widely cultivated in Europe. It is capable of growing on marshy banks, but attains a much larger size when floating on the water, as it usually does, without being attached to the bottom. The rosettes formed by its leaves above

the surface of the water are sometimes no less than two feet high. The rapidity with which they multiply may be seen from the fact that, within a few years after having been introduced for the purpose of beautifying St. John's River, in Florida, they threatened to render navigation on the river an impossibility. Great masses of these plants accumulate along the shores and are often driven by wind and current until they form obstructions extending over the entire breadth of the river, and through which not only small boats, but even paddle-wheel steamers, cannot penetrate. Such obstructions have developed in northern South America and, as already stated, on St. John's River and its tributaries in Florida. An agent of the United States Department of Agriculture, who undertook, in 1897, to investigate the danger thus caused to navigation in Florida, came to the conclusion that perhaps the best way of exterminating the nuisance is to spread among the water hyacinths their natural enemies, the water weeds, or water pests (*Elodea canadensis*); further, to disseminate among them some virulent disease capable of destroying them; and finally, to reconstruct the bridges, so that the mass of obstructing plants may be freely carried out into the ocean.

Common Arrowhead (*Sagittaria latifolia*) is a widely distributed plant with beautiful, white, scentless flowers. It is indigenous to North America, where it extends as far south as Mexico, being found in shallow waters throughout the United States and Canada. The name arrowhead, or *Sagittaria*, is given not only to the common American plant, but to an entire genus of aquatic plants belonging to the family Alismaceæ. The generic name of these plants refers to the shape of their leaves. The plants include natives of both cold and warm climate, and are distinguished by flowers having three herbaceous sepals and three colored petals, with numerous stamens and carpels. This species is also a native of Europe and Asia. The Chinese arrowhead, *Sagittaria sinensis*, has long been cultivated in China and Japan for its edible corms, which abound in starch. It is grown in ditches and in ponds and has arrow-shaped, acute leaves and a branched polygonal scape (leafless stem). A large number of species and varieties of arrowhead are native in American waters.

Water-Lily (*Castalia odorata*), often called the "sweet-scented water-lily," has a large white flower of great beauty and of very sweet smell. Its home is North America. Besides this plant, the name "water-lily" is commonly applied to other species of *Castalia*, as well as to plants of the genera *Nymphaea* and *Nelumbo*, all of which belong to the family Nymphaeaceæ. Great Britain produces three species, viz., *Castalia alba* (the white water-lily), *Nymphaea lutea*, and *Nymphaea minima* (yellow water-lilies); all these have heart-shaped leaves floating on the water, those of the yellow lilies being raised by the stalks a little above the surface. The seeds of these species, as well as those of the water-lily of the Nile (*Nymphaea lotus*), are farinaceous and are sometimes used as food. The stems of *Nymphaea lutea* are used by the Turks in making a refreshing beverage.

Consult: Britton and Brown, *Illustrated Flora of the Northern United States, Canada, and the British Possessions* (New York, 1913). The structural characters of aquatic plants are discussed at some length under HYDROPHYTES. See

AQUATINT. A variety of etching, the peculiarity of which consists in the resin ground with which the plate is prepared. The outline was first etched in the usual manner (see ETCHING), and the plate cleaned. Then, according to the French, or *dry*, method, the plate was inserted in a box partly filled with powdered resin set in motion by a fan. An even surface having been thus obtained, the plate was heated and the acid applied. The result was a soft background, not unlike that of a mezzotint. Gradations of tone were gained by successive bitings, and white surfaces by the use of varnish. According to the English, or *wet*, method, the plate was treated with a solution of resin dissolved in spirits of wine, the evaporation of which left the resin evenly spread over the plate. Aquatints were printed in black and white, sepia, or in color. The latter effect was obtained by separate printings for each color in France, or partly by printing and partly by hand, as in England. In delicacy of color the aquatint surpasses all prints and could give an almost perfect imitation of water color. The aquatint was invented (or at least perfected) by Jean Baptiste Leprince, a pupil of Boucher. His first plate dates from 1750, the first English print by Paul Sandby from 1775. The greatest of French artists in this medium were François Janinet (1752-1813), Philibert Debucourt (1755-1832), and somewhat later Descourtis, Alix, Morret, Sergent. In England the aquatint flourished somewhat later than in France and was chiefly used in book illustration. The principal English aquatintists were Malton, Stadlet, Bluch, Sutherland, Jukes, Reeve, and Dubourg. A fine example of an English book thus illustrated is David Cox's *Treatise on Landscape Painting and Effect in Water Color* (1814). The collecting of aquatints has in recent years become very popular, and phenomenal prices are paid for good examples. A single print by Debucourt was lately sold for £300. Consult *The Connoisseur*, vol. xxvi (London, 1910).

AQUA TOFANA, tô-fä'nâ (Lat. *aqua*, water, of Tofana; see below). A poisonous liquid described as a clear, colorless, tasteless, and odorless fluid, a few drops of which were sufficient to produce death, which resulted slowly and without pain or fever, under a constant thirst, and weariness of life, and an aversion to food, the strength of the victim diminishing gradually. It is said to have been invented by a Sicilian woman named Tofana, who lived about 1650-1730. She sold the preparation in vials marked "Manna of St. Nicholas of Bari," and it was much sought after by young wives who wished to get rid of their husbands. It is now believed to have been a preparation of arsenic.

AQUAVIVA, ä'kwâ-vê'vâ, CLAUDIO (1543-1615). The fifth general of the Jesuit Order, appointed in 1581, its greatest general and best administrator. He was noted for his attempt to increase the importance and effectiveness of the order through the enforcement of a rigid and uniform system. To this end he wrote *Ratio Studiorum Societatis Jesu* (1586; rev. ed., 1599), and *Directorium Exercitiorum Spiritualium* (1599).

AQUUEDUCT (Lat. *aquæ ductus*, a conduit of water). Broadly speaking, this word means any conduit for conveying water, but usage, both

ancient and modern, has practically limited the word to masonry conduits with little or no more slope than is necessary to cause the water to flow through them by gravity. Such limitations generally exclude mere channels or ditches (canals) in the natural earth, on the one hand, and closed conduits (pipes) under pressure, on the other, except as these form links in an aqueduct of composite type. The masonry portions of some modern aqueducts are under pressure for a part or all of their lengths, and frequently sections of iron or steel pipes under pressure are used to convey the water of an aqueduct beneath a deep valley. Inverted siphons, as these depressed sections are called, are the modern substitute for the aqueduct bridges of earlier days, or for the circuitous routes necessary to avoid the construction of such bridges. Siphons were not unknown to the Romans, who lacked, however, knowledge of cast-iron pipe, or any other pipe of large size, capable of conveying water under heavy pressure. The general abandonment of the masonry aqueduct for conduits or pipe lines of cast or wrought iron, steel and wood, with a consequent diminution in the cost of rights of way, labor, and material, has resulted from a variety of causes, such as shorter routes and smaller conduits. Marked characteristics of the modern aqueducts have been great boldness and freedom in the use of the tunnel, including tunnels under heavy pressure, as in parts of the New Croton, the Catskill, and the Los Angeles aqueducts, and also in the employment of long-span arches for aqueduct bridges, or the substitution of iron or steel (at present the latter) for masonry bridges. In the latest aqueducts bridges have given way almost entirely to tunnels.

Ancient Oriental peoples, such as the Persians and Phœnicians, used a system of subterranean channels of masonry with vertical shafts at intervals, such as Polybius described (x, 23, 3) for Hecatompylos, the capital of the Arsacidæ. The Pelasgic and Mycænæan cities, such as Mycenæ and Argos, were thus supplied. Herodotus describes, as one of the most remarkable works of Greek lands, the aqueduct of Samoas, built by the engineer Eupalinos with a gallery 8 feet square. He also saw at Tyre three aqueducts with arches and viaducts which were imitated at Carthage before the Roman conquest. The early Latin tribes in Italy continued the Pelasgic tradition, as is shown in the famous outlet of the Alban Lake. The water supply of Athens and its plain can still be studied in a variety of conduits and aqueducts earlier than Hadrian's more striking constructions. The custom of subterranean aqueducts was at first also followed by the Romans, whose Appian aqueduct had less than 300 feet supported on arcades above ground. Gradually, with the increase of luxury and the desire to carry the water to the higher hills of Rome, more of the aqueduct was areaded, and the water brought from a greater distance.

The principle of the inverted siphon was used in the aqueducts of Patara, Pergamum, and Aspendos, in Asia Minor, at Constantinople, at Tebessa in Africa, and at Lyons, where it can be studied in great detail; but Vitruvius (vii, 6), in describing this method, warns against it in the case of large volumes of water, whose pressure would not be withstood by the lead or terra-cotta pipes then in use. In a few cases expensive bronze pipe was used to resist pressure.

The careful grading of the aqueduct to prevent a too rapid flow was assisted by curves in the line of construction. This explains apparent peculiarities in direction. Tunnels were often cut, sometimes over three miles long. The fall recommended by Vitruvius is six inches in every 100 feet, but it was usually greater. At the head of the aqueduct a large reservoir, or *piscina*, was established; minor basins were constructed at intervals along the line for filtering and clarifying the water by passing it through gravel. The channel for the water, or *specus*, between 2 and 4 feet wide, and $4\frac{1}{2}$ and $6\frac{1}{2}$ feet high, was originally of stone, lined with hydraulic cement; afterwards of concrete faced with brick. At frequent intervals were blow-holes through the top or sides, to afford ventilation and access to the interior, and their place was taken in the subterranean sections by inspection wells, or *putei*. The channels were large enough to admit the workmen along their entire length for inspection and repair. Leakages were frequent, and the heavy lime incrustations, if not periodically removed, gradually reduced the size of the channels and their carrying capacity. In many cases several water supplies were carried on the same arches, being joined at a certain distance from their source, and each water being usually carried in its separate channel. This is the case with the Marcia, which carries also the Tepula and the Julia.

At the city end of the aqueduct a capacious reservoir was constructed called a *castellum aquarum*, where the water was cleared by passing through several chambers and from which it was then distributed over the city. These *castella* were sometimes, as in the case of the Claudia and the Alexandrina, at Rome, important artistic structures. Here there were separate purifying and storing compartments for each class of structures supplied; in the Republican period there were only three—public fountains, baths, and private houses. But under the Empire the subdivision became much more elaborate. Certain very large single buildings, such as baths, had separate reservoirs. The water was carried into buildings by lead pipes through an official bronze joint stamped with its exact capacity and serving as a meter. The conservation and regulation of the water supply, the exact allowance to individuals, corporations, and public buildings, was secured by a very careful administration. This care was not only applied in Rome itself, but was coextensive with the entire line of aqueduct as it was tapped at intervals and used by towns, settlements, and private owners for drinking and irrigation. To assist the administration, a strip of land 30 feet wide was reserved along the entire course, as government property, and marked by boundary stones at intervals of 240 feet. The administration was under the care of the censors, and then of the quæstors and ædiles; but under Augustus the bureau was better organized, and put in charge of a *Curator Aquarum*, with his two assistants, his clerks, his consulting engineer, and his various classes of officials and of artisans comprising a *familia* of slaves: ushers, lictors, and criers, as well as pipe-layers, pavers, masons, levelers, measurers, inspectors, reservoir keepers, etc. As usual with Roman buildings, the aqueducts were built by contract, and the use of unskilled labor made their cost relatively small. The Appia is said to have cost

\$675,000. The repairing of the Appia and Anio Vetus, and building of the Marcia in 144–140 B.C., cost only about \$850,000. Under the more lavish Empire the Claudia and the Anio Novus cost about \$4,000,000, but none of the others were as expensive as these.

ROMAN AQUEDUCTS

Among the Roman aqueducts those of Rome itself possess the greatest interest, because of their number, length, and boldness of design and execution. Two of them, in fact, are still in use, and water from the very source that supplied one of them (Marcia), restored in 1869, is now delivered to the city through a modern water-works system. Not only are they in remarkable preservation, but, most happily for engineers and archæologists alike, they are described in some detail by a Roman engineer who was water commissioner of Rome in 97 A.D., named Sextus Julius Frontinus, in his *Two Books on the Water Supply of Rome*. This work was first made available to English readers in 1899, through a translation by Clemens Herschel, an American hydraulic engineer, who gives not only the Latin text, but also a photographic reproduction of the oldest Latin MS. in existence, in the library of the Benedictine monastery at Monte Cassino. Besides all this, the book in question contains several chapters of comment by the translator, both on the aqueducts and the water supply of Rome in general. Mr. Herschel concludes that the capacity of the ancient Roman aqueducts has been greatly over-rated, and that, instead of the 400,000,000 gallons a day given by some writers, based on Frontinus's calculations, "thirty-eight million gallons one day with another" is "a fair estimate at which to set the water supply within the walls of ancient Rome in 97 A.D., though the total ranged, no doubt, some 20,000,000 gallons per day either side of that mark from time to time. This would make about 38 gallons per day per inhabitant, which is still a very large figure when use alone, not waste, is taken into account; and when, further, we consider that by far the greater part of the people undoubtedly used only such water as was carried to their homes in jars on the heads of slaves and other women." Still, Frontinus describes nine aqueducts in use in his day, the main facts regarding which may be summarized as follows:

1. *Aqua Appia*, built by and named after the censor, Appius Claudius, in 312 B.C. Its springs were between the sixth and seventh milestones from Rome, and its course was about 11 miles long. All but 300 feet was underground. The exact size of its channel is uncertain, but is given by several authors as about 2.5 feet wide and 5 feet high in the clear.

2. *Anio Vetus*, constructed 272–270 B.C. by M. Curius Dentatus and Fulvius Flaccus. All but 1100 feet was underground. Remains may be traced both near Tivoli and near the Porta Maggiore. Its water is taken from the river Anio, about the twentieth milestone, 3 miles beyond Tivoli, and its course, which is very circuitous, is about 43 miles long. It was about 3.7 feet wide and 8 feet high inside, of heavy masonry of peperino stone, plastered on the inside.

3. *Aqua Marcia*, named after the prætor, Quintus Marcius Rex, 144–140 B.C., had its source in springs between Tivoli and Subiaco, near the

thirty-sixth milestone from Rome, was over 62 miles long, and carried into the city 195 feet above sea level, so as to reach the top of the Capitol. Near its head it is 5.7 feet wide and 8.3 feet high, and farther on it is 3×5.7 feet. This and the two preceding aqueducts were built of rough-hewn dimension stone, $18 \times 18 \times 42$ inches, or more, while the later ones, except Claudia, were of concrete and brick. The greater part of Marcia was underground, but there were some long stretches on arches—over 7 miles—some of which are still standing and bear parts of two and three other aqueducts (Anio Vetus, Claudia, and Anio Novus) above them. This is especially the case near Tivoli, where there are superb viaducts and bridges alternating with tunnels. There are about 6 miles of arcades near Rome.

4. *Aqua Tepula*, 125 B.C., leading from springs on the slopes of the Monti Albani, had at first an independent channel, on the arcades of the Marcia, 6 feet above it, or 201 feet above sea level. It was 2.7 feet wide by 3.3 feet high, and commenced not far from the eleventh milestone.

5. *Aqua Julia*, the first imperial aqueduct, constructed by M. Agrippa, under Augustus, in 33 B.C., took water from springs near the source of Tepula (twelfth milestone), and was mixed with the latter to cool it, and entered Rome on the arcades of the Marcia, about 212 feet above sea level. Its channel was 2.3 feet wide and 4.6 feet high. Portions of Marcia, Tepula, and Julia, one above the other, are still in existence at Porta Tiburtina.

6. *Aqua Virgo*, 19 B.C., also constructed by Agrippa. Aqua Vergine, as it is now called, is still entire, having been restored by Popes Nicholas V and Pius IV. The source of the Aqua Virgo is near the eighth milestone, only 80 feet above sea level; its channel was 14 miles long, and it entered the city 13 feet lower. The channel was about 1.6 feet wide and 6.6 feet high. It still supplies the famous Trevi fountain and others.

7. *Aqua Alsietina*, about 10 A.D., constructed by Augustus, now called the Aqua Paola, starts at a pond near the fourteenth milestone, and supplies the fountains in front of St. Peter's and the Fontana Paola, on the Montorio. Its original object was irrigation, and the supply of the Naumachia of Augustus, which was a sheet of water for the representation of sea fights. Its water, which was undrinkable, reached Rome in a channel 24 miles long, about 55 feet above the sea, the lowest level of any.

8. *Aqua Claudia*, 38–52 A.D., commenced by Caligula and completed by Claudius, starts near the thirty-eighth milestone and is about 45 miles long. Its line of nearly 10 miles of magnificent arches still stretches across the Campagna and forms one of the grandest of Roman ruins. At its upper end its channel was 3.3 feet wide and 6.6 feet high. When it reaches the Campagna, it carries the Anio Novus (see below), the lower aqueduct being of dimension stone and the upper of brick, lined with concrete. The water of these two aqueducts reached the Palatine 185 feet above the sea; but at Porta Maggiore the water in Anio Novus was at an elevation of 230 feet and Claudia 9 feet lower.

9. *Anio Novus*, also 38–52 A.D., was nearly 62 miles long, thus being the longest of the aqueducts, and starting at the Anio, near the thirty-eighth milestone. Its channel had a width of 3.3 feet and a height of 9 feet. Some of its arches

are over 100 feet high, and its ruins are as superb as those of the Claudia, the two combining before entering Rome.

10. *Aqua Trajana*, built in 109 A.D., started at Lake Bracciano, was about 40 miles long, followed nearly the same route as *Aqua Alsietina*, and its waters join to form the supply of the present *Aqua Paola*. It was used for supplying the Janiculum and the Trastevere.

11. In 226 A.D. an eleventh and last aqueduct was built, called *Aqua Alexandrina*, to supply the Campus Martius. The other aqueducts sometimes credited to old Rome were probably branches of some of the eleven.

Although stone continued in use for aqueducts under the Empire, concrete with *opus reticulatum* and concrete with brick were used both in various parts of Italy and even in Rome itself, especially in the *Aqua Alexandrina* and Nero's additions to the Claudia. There remain many imposing Roman aqueducts in different parts of the Empire. The high viaducts and bridges in France, such as those near Nîmes, Cahors, and Lyons; in Spain at Segovia, Mérida, and Tarragona; at Constantinople, at Beirut, at Cherchel, and Carthage are especially imposing—higher and bolder than anything at Rome; some have two, some three superposed stories of arcades, with a total height of between 100 and 300 feet. The Pont du Gard and the aqueduct of Segovia are the finest in existence. The stonework in the provinces is even superior to the average in Rome. The following examples may be mentioned: *Italy*: Minturnæ (fine *opus reticulatum*, very decorative), Genoa (very early, c.210 B.C.), Puteoli, Pompeii, Termini in Sicily. *Gaul*: Nîmes (Pont du Gard), Lyons (4 aqueducts in *opus reticulatum*, with siphons and bridges), Metz (with a great bridge of 114 arches), Paris (3 aqueducts of late Roman date), Frejus (a superb example, built under Claudius, 30 miles long, with many arcades), Antibes (2 aqueducts, one still in use), Arles, Marseilles, Aix, Vienne, Autun, Besançon, Poitiers (4), Cahors (a superb three-storied viaduct), Toulouse, and many others. *Germany*: Mainz, Treves, Cologne, Solicinum, Windisch. *Spain*: Segovia (built under Trajan, 12 miles long, with a superb viaduct of 119 arcades, 818 yards long, in two stories), Tarragona (built in the Republican Period, c.210 B.C., 6 miles long, with magnificent two-storied viaduct of 11 and 25 arches), Chelva, Seville, Mérida (2 aqueducts, one still in use; the other by Augustus, with a viaduct of three stories), Consuegra, Calahorra. *Portugal*: Elvas, Evora, Beja. *Africa*: Tebessa, Constantine (3), Tipasa, Cherchel (Cæsarea), Orléansville, Carthage (Punic and Roman), Makter (with a viaduct). *Asia*: Anzarba, Beirut (with a bridge), Palmyra, Baalbek, Petra, Sinope, Nicomedia, Antioch, etc.

The Oriental provinces of the Empire, preserving Greek engineering traditions, were more scientific, as shown by frequent use of siphons. The Byzantine emperors continued the Roman traditions, as shown by the aqueducts of Valens and Justinian at Constantinople, in connection with which are the wonderful cistern-reservoirs in the city with their forests of columns. Adana, Mopsuestia, and many other Eastern cities were provided by Justinian with aqueducts. The Gothic kings attempted the same, as in the extremely bold viaduct at Spoleto, loftier than any Roman work; their work in Spain was continued by the Moors, as at Elvas. The Mohammedans

throughout the East continued the construction of aqueducts; but the Middle Ages in Europe were comparatively inactive in this branch of engineering. The Gothic aqueduct at Solmona and that at Coutances are perhaps the finest in Europe of this age. The Renaissance renewed the art, beginning with the Roman popes of the sixteenth century. France soon followed suit, as in the aqueduct of Arcueil at Paris built for Marie de' Medici, in 1613, and that of Maintenon under Louis XIV. In 1753 Charles III built the great aqueduct of Caserta, about 30 miles long. The aqueduct of Marseilles, begun in 1847 and over 40 miles long, with 75 tunnels and several viaducts, is the only work of modern engineering construction comparable artistically to the Roman; it could have been built for a fraction of the cost (\$1,200,000) by using siphons.

MODERN EUROPEAN AQUEDUCTS

Among the European aqueducts constructed during the latter part of the nineteenth century may be mentioned, first, that conveying water from Loch Katrine to Glasgow, built in 1855-60. This has been supplemented by a short connection with Loch Arklet, and connections with other lochs were projected in 1913. The new water-supply conduits of Manchester and Liverpool, built in 1881-92 and 1885-94, respectively, are partly masonry structures and partly pipe lines. The Liverpool supply is brought from Lake Vyrnwy, a distance of 68 miles, partly in tunnel. The Manchester supply comes from Lake Thirlmere, a distance of nearly 96 miles, through 36 miles of concrete conduit and 14½ miles of tunnel, making 50½ miles of masonry aqueduct, and through 45 miles of iron pipe. The largest tunnel is 8½ miles in length, and the longest inverted siphon, of iron pipe, is about the same length. Another inverted siphon is under a head of 480 feet. The masonry aqueduct is 7 feet in diameter. Since their original construction the three aqueducts just named have been brought up to their full or more than their full capacities, as originally designed, by duplicate and in some cases triplicate conduits, for the whole or portions of their length.

Vienna, Austria, completed a 55-mile aqueduct in 1873 and later extended it to 65 miles to gain more water. It has a carrying capacity of 36,500,000 gallons and a total fall of 985 feet, a large part of which is in a series of drops in the first 10 miles of the original construction. These drops, with gates, were designed to keep the aqueduct from being under pressure. After the drops, most of the aqueduct is in tunnel. The first Kaiser-Franz-Joseph Aqueduct, as it was called, becoming inadequate, plans for a second one of the same name were made about 1899 and had been nearly executed in 1910. It is 114 miles long and takes in six mountain streams, the highest being 1658 feet above the city. Its capacity is 55,000,000 gallons a day. Of its total length 44 miles are in rock or earth tunnel, apparently lined with concrete. The longest tunnel is 17,630 feet. Valleys are crossed by inverted siphons of cast-iron pipe, one of which is about 6 miles long, besides which there is at least one masonry arched bridge crossing. The typical tunnel sections are of horseshoe shape, about 7 feet high and 6½ feet wide, with a water depth of about 5½ feet. In some places the arch of the rock tunnel was left unlined.

AMERICAN AQUEDUCTS

In the United States notable aqueducts were completed by New York in 1842 and a second in 1890 (Old and New Croton); Boston in 1848 and a second in 1878; Brooklyn in 1859; Baltimore in 1862 and a second in 1880; Washington in 1863, with a second one begun in 1883, abandoned before fully completed and finally put in use in January, 1902; St. Louis, Mo., about 1893; the Metropolitan Water Board (Boston and surrounding towns) in 1897; and Jersey City, put in use in 1904 (on this work masonry aqueducts and tunnels are used only where steel pipe lines are not available). In 1913 New York City had nearly completed a third aqueduct, larger and longer than the two earlier ones, and Los Angeles, Cal., completed the longest aqueduct as distinguished from a pipe line, ever yet undertaken.

Cast-iron, steel, or wood pipe is used in place of masonry for nearly all American aqueducts, especially since the introduction of riveted steel pipes; and where masonry is used the trend of

was designed to carry 72,000,000 gallons a day. In 1865 the portion of aqueduct below 92d Street was replaced by two 72-inch cast-iron pipes, for which three 48-inch pipes were substituted later on. In 1870 another length of aqueduct within the city was replaced by six parallel lines of 48-inch cast-iron pipe, $\frac{3}{4}$ mile long. This aqueduct was carried as near the surface as the grades would permit.

The *New Croton Aqueduct*, like the old one, begins at Croton Lake, formed by a dam on the Croton River, and extends to 135th Street, New York City. Its total length is 30.75 miles, or 33.10 miles if the pipe line extension to the Central Park reservoir is included. Of the masonry aqueduct, 29.63 miles is in tunnel, requiring shafts from 18 to 402 feet deep for its construction. About 7 miles of the tunnel is under pressure, including the crossing beneath the Harlem River, where there is a pressure of 55 pounds when full. Most of the pressure tunnel is $12\frac{1}{3}$ feet in diameter, but under the Harlem, where the masonry is lined with cast iron, the diameter is only $10\frac{1}{2}$ feet. In general the aqueduct is shaped like a horse-

PROFILE OF THE CATSKILL AQUEDUCT.

the latest practice is to employ concrete, either alone or reinforced by steel rods, wire, or expanded metal. The steel is imbedded in the concrete, and since it can resist high tensile strains, aqueducts of reinforced concrete may be subjected to pressure. Reinforced concrete was employed on the Jersey City aqueduct.

The *Old Croton Aqueduct*, supplying New York City, has a total length of 38.1 miles and a total fall of 43.7 feet, the ordinary grade being 1.1088 feet per mile. It is of brick-lined masonry, the bottom being an inverted arch of 6.75 feet chord, 0.75 feet versed sine; sides, 4 feet high, battered to 7.42 feet apart at top; covered with semicircular arch, giving total interior height of 8.64 feet and cross-sectional area of 53.34 square feet. The Harlem River is crossed on a granite masonry arched bridge, 100 feet high in the clear, and about 1400 feet long, the water being conveyed in two 36-inch cast-iron pipes and one $90\frac{1}{2}$ -inch wrought-iron pipe, the latter added in 1860. The Manhattan valley is crossed by inverted cast-iron pipe siphons, two miles long, the original two 36-inch pipes being supplemented by a 48-inch in 1853 and a 60-inch in 1861, the latter being reported as the largest iron pipe cast up to that time. The aqueduct

shoe, 13.53 feet high and 13.6 feet wide, has a fall of 0.7 foot per mile and an original rated carrying capacity (see below) of about 318,000,000 gallons a day. At the Jerome Park storage reservoir, in the north part of the city, and some 23 miles from the upper end, it is reduced to a rated capacity of 250,000,000 gallons a day and changed to a circular section, $12\frac{1}{4}$ feet in diameter, for over 6 miles. The cost of the aqueduct varied from \$89.98 to \$123.25 per lineal foot in different sections and under varying conditions. When the New Croton Aqueduct was designed, it was estimated that it would carry 318,000,000 gallons a day, while flowing to a depth of 12.842 feet in the horseshoe sections. Gaugings after its completion fixed the carrying capacity at about 302,500,000 gallons. Careful studies made by John R. Freeman in 1899 (*Report upon New York's Water Supply*, New York, 1900) led him to conclude that the aqueduct was then carrying 16 per cent less for stated depths than shown by the earlier gaugings, part of the difference being due to deterioration of the inner surface.

The *Catskill Aqueduct*, designed ultimately to furnish New York City with an additional water supply of 500,000,000 gallons a day from streams

in the Catskill Mountains, west of the Hudson River, was put under construction late in 1906 and was practically finished in 1913, but some of the accessory reservoir work was not to be completed until about 1920. The aqueduct proper is 92 miles long, beyond which first a

The fourth type of Catskill Aqueduct includes 7 so-called inverted siphons, 6 miles in aggregate length. These are steel pipe, 9 and 11 feet in diameter, $\frac{7}{16}$ to $\frac{3}{4}$ -inch thick, lined with 2 inches of cement mortar and covered outside with concrete, the whole in an earth

CUT AND COVER SECTION CATSKILL AQUEDUCT.

tunnel and then pipe lines extend to a total length of 34 miles, including branches, to connect with various parts of the city pipe distribution system. The aqueduct extends from the Ashokan impounding and storage reservoir to the Kensico storage reservoir, 30 miles north of the City Hall in New York, and on to the Hill View storage and equalizing reservoir near the Yonkers-New York City line, some 15 miles from the City Hall. At the outset the aqueduct will carry some 250,000,000 gallons, but later on other streams and impounding reservoirs will be made tributary to it, thus utilizing its full capacity. Over 25 per cent of the length of the aqueduct is under pressure, including a number of deep tunnels, driven from vertical shafts through rock.

The most remarkable of these tunnels is the one beneath the Hudson River, a few miles from West Point. This tunnel is 1100 feet below the surface, 3022 feet from shaft to shaft. The shafts and tunnel are lined with concrete and have a finished diameter of 14 feet. Of its length of 92 miles, 55 miles of the Catskill Aqueduct are of the cut-and-cover type, horse-shoe-shaped, 17 feet high and 17½ feet wide, the maximum size, built of concrete. These por-

embankment. There will be three pipes side by side, but for the present only one is being built; elsewhere the aqueduct is of full capacity from the start. Three of the largest Venturi meters (q.v.) in the world are built into the Catskill Aqueduct at different points. Each is 410 feet long, and entirely of reinforced concrete, except for the bronze throats and piezometer rings.

From the Hill View reservoir the City Aqueduct system will convey water to the five boroughs of New York City. For the first 17½ miles this is a pressure tunnel 15 to 11 feet in diameter, in solid rock at depths of 200 to 750 feet below the surface. The 24 vertical shafts for driving the tunnel and affording connection with the trunk water distributing mains in the city streets are lined with concrete, as is the length of the tunnel. The city aqueduct tunnel goes beneath the Harlem River, Manhattan Island, and the East River into Brooklyn. Cast-iron and steel pipe extend from the Brooklyn end of the tunnel to supply Brooklyn, Queens, and Richmond boroughs. To reach the latter (Staten Island) a cast-iron pipe will be laid on the bed of the Narrows. There will be

TYPICAL SECTION OF ASHOKAN DIKE.

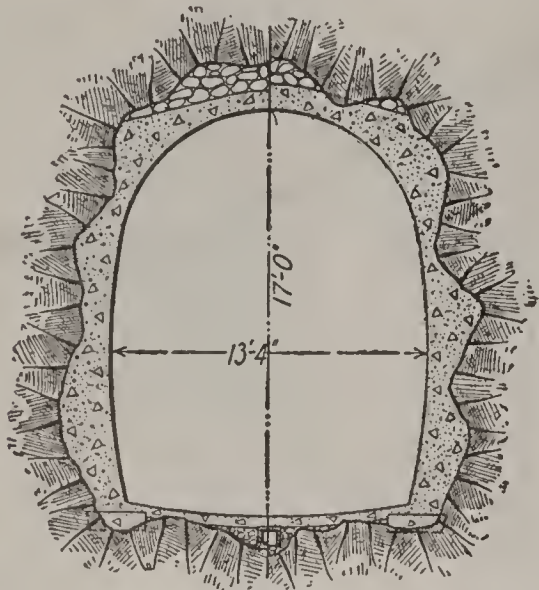

tions are not under pressure, nor are the 24 grade tunnels, aggregating 14 miles in length, horseshoe in shape, 17 feet high and 13½ feet wide, also lined with concrete. Besides the grade tunnels there are 7 deep concrete-lined pressure tunnels, totalling 17 miles in length, about 14 feet in diameter.

a terminal storage reservoir on Staten Island. The city aqueduct and pipe system and terminal reservoir will cost \$25,000,000. The cost of the aqueduct proper, including reservoirs, was estimated at \$162,000,000 in 1905.

The Catskill Aqueduct crosses beneath the New Croton Reservoir and thus can be used to

supply water through either the Old or New Croton aqueducts.

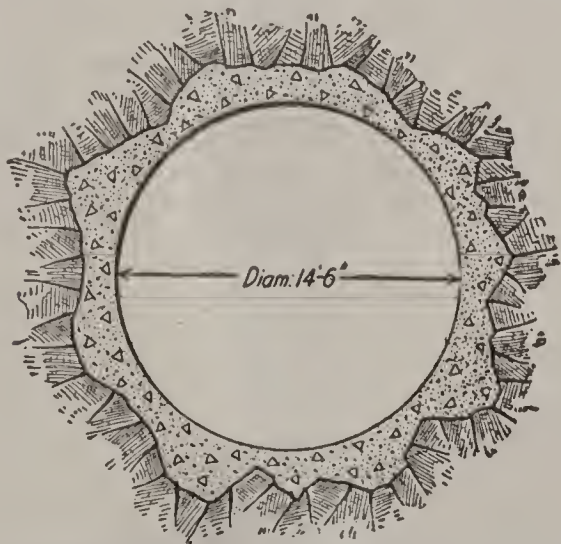

The *Wachusett Aqueduct* for Boston and vicinity has a rated daily capacity of 300,000,000 gallons. It is 12 miles long, if the 3 miles of canal at its lower end are included, and leads from the site of a handsome masonry dam on

GRADE TUNNEL, CATSKILL AQUEDUCT.

the Nashua River, at Clinton, Mass., to the Sudbury reservoir, a part of the old Boston water works, now controlled by the Metropolitan Water Board. The first two miles of the *Wachusett Aqueduct* is in tunnel, through rock so compact that about one-half of it required no lining. After the tunnel come 7 miles of aqueduct proper, built in embankment or in excavation. Both tunnel and covered aqueduct are built in the general shape of a horseshoe, from 11½ to 13½ feet wide and from 10½ to 11 feet 10 inches high, and are of concrete, with the lower portion lined with one course of brick. Below the section just described there are 3 miles of open channel or canal. The aqueduct is carried over the Assabet River on a handsome granite masonry bridge of seven 29½-foot spans.

The *Cabin John Arch*, which carries the first Washington aqueduct across a creek of the same name, was for many years the largest single-

SECTION OF PRESSURE TUNNEL, CATSKILL AQUEDUCT.

span masonry bridge in the world, having a length of 220 feet and rising to a height of 101 feet in the clear. The rise of the arch, from the spring line, is 57½ feet. The bridge is 20 feet wide, and its total length is 420 feet. It was built of large granite blocks, with sandstone parapets and coping. It cost \$237,000.

The *Los Angeles Aqueduct* was begun in 1907, completed in 1913, and was to go into operation in 1914, on the completion of a connecting pipe

line between its lower end and the city of Los Angeles, Cal. It is approximately 235 miles long, including 8.5 miles of reservoir flow and some 10 miles of power canal. It has a rated capacity of 259,000,000 gallons a day, only a small part of which will be needed to supplement the existing supply. It was proposed to use the surplus to irrigate some 135,000 acres of land near the city until it was needed for domestic consumption. The aqueduct will divert the entire flow of the Owens River, through an intake 11 miles north of Independence, Cal., near the foot of Mount Whitney (Sierra Nevada Mountains), the highest peak in the United States proper. The intake is at elevation 3812 feet above sea level, and as the business section of Los Angeles is some 275 feet above sea level, the highest parts of the city can be supplied by gravity after allowing for friction losses in the aqueduct and pipe line below it, and still leave many hundred feet fall available for power.

By keeping the aqueduct at the hydraulic grade for as great a distance from the intake as was feasible the head of water is conserved and brought relatively near the city, where the

OLIVE BRIDGE DAM — MAXIMUM MASONRY SECTION.

inevitable drop is to be utilized to develop, ultimately, 120,000 horse power of electrical energy, which will be transmitted to Los Angeles for sale for light and power purposes or for use by the city itself. Hydro-electric generators of nearly 40,000 horse power were under construction in 1913. There are several storage reservoirs along the line of the aqueduct, and in 1913 one was under construction and another projected at its lower end. The lower of these terminal reservoirs has its water surface at 1135 feet above sea level. The aqueduct is notable (1) for its great length, (2) on account of the construction difficulties involved, and (3) because it was built, including a large cement plant and an extensive telephone system, almost wholly by the city (i.e., without contractors).

The aqueduct crosses a long stretch of the Mojave Desert and extends for miles along mountain sides, through mountains, across valleys. For much of its distance it is remote from railways and sources of water supply, requiring long hauls of heavy material by wagon and the construction of several hundred miles of pipe lines for temporary water supply. The first 21 miles of the aqueduct is an unlined canal, 59 feet wide at the water depth of 7 feet. Then

come about 40 miles of concrete, lined open ditch, 30 feet wide at the water surface, with slopes 1 to 1 for a water depth of 10 feet, below which there is a curved bottom $1\frac{1}{2}$ feet deep in the centre. For the remaining distance the aqueduct is closed, sometimes on the hydraulic grade and sometimes under pressure, with various types of construction. Altogether there are about 98 miles of covered conduit, with concrete or reinforced-concrete bottom and sides and reinforced-concrete covers, flatwise. There are also about 43 miles of concrete-lined tunnels, some of which are under pressure, and 12 miles of inverted siphons of either riveted steel plates or reinforced concrete. The concrete-lined-and-covered portions generally have curved bottoms and slightly battered sides. One of the maximum cross-sections of this type has a curved bottom 10 feet wide and 1 foot deep; sides battering 1 on 12 and a water depth of about 9 feet. One of the principal tunnels is of horse-shoe shape, 10 feet 10 inches high and $9\frac{1}{2}$ feet wide. The standard reinforced-concrete siphons are $10\frac{3}{4}$ feet in diameter. The jawbone steel siphon is from 10 to $7\frac{1}{2}$ feet in diameter, 8000 feet long, under a maximum head of 850 feet, and is composed of plates $\frac{1}{4}$ to $1\frac{1}{8}$ inches thick.

In round numbers the Los Angeles Aqueduct was estimated to cost \$25,000,000, including the reservoirs undertaken up to 1914 and land and water rights, but not including power development, nor the 13 miles of 72-inch to 62-inch steel pipe line from the lower reservoir to the city, nor the trunk lines for proposed irrigation service. Approximately \$12,000,000 was expended for labor, with an average wage of \$2.75 per day of eight hours and a minimum of \$2.25. Rights of way and lands cost \$7,000,000, and freight, live stock, electrical energy, etc, \$1,500,000. Detailed descriptions of the work appeared in the engineering press during its construction and especially in *Engineering News* for June 19, 1913, and *Engineering Record* for Nov. 1, 1913, where are published semipopular accounts of the aqueduct.

AQUEOUS HUMOR. A limpid fluid which occupies the anterior chamber of the eyeball, the space between the cornea and the lens. In foetal life the chambers are divided by the membrana pupillaris (q.v.) and in adult life by the iris. It consists of water, with, according to Berzelius, about a fiftieth of its weight made up of chloride of sodium and extractive matters held in solution. This watery secretion is produced by epithelial cells covering the posterior surface of the iris and the ciliary muscle. (See EYE.) It is rapidly resecreted if allowed to escape through a wound in the cornea.

AQUEOUS ROCKS. In geology, rocks which have been laid down as mechanical, chemical, or organic deposits from water. They belong to the stratified rocks, which also include rocks deposited from air (æolian deposits).

I. The mechanical deposits from water are derived from the destruction of preëxisting rocks. Rain and rivers move considerable quantities of disintegrated material, depositing it wherever the load is too great for the volume

and velocity of the current. Waves, rolling against a shore, break from it small and large fragments, carry these fragments back with them, and deposit them in layers on the bottom of the basin. The coarse particles are left nearest the shore, forming conglomerate or gravel; finer particles are carried somewhat farther out, forming sand, which by cementation becomes sandstone, quartzite, novaculite, or, when mixed with feldspar, arkose or graywacke; still finer particles are carried yet farther out and are deposited, to form mud or clay, which by cementation or consolidation becomes mudstone, shale, or slate.

II. Chemical deposition from water may be due to the mingling of solutions, to changes in the temperature or pressure of water containing substances in solution, or to the simple evaporation of water. For convenience in discussion, chemical precipitates may be divided into three general classes: (a) precipitates of the alkalis and alkaline earths, giving calcareous tufa, sinter, travertine, stalactite, onyx marbles, oolite, gypsum, rock salt; (b) siliceous precipitates, giving chert (flint or hornstone), geyselite, siliceous sinter; (c) ferruginous precipitates, giving iron ores. Their deposition is frequently promoted by minute forms of vegetable and animal life that live in the water. So that some examples are closely related to class iii of the group.

III. Organic deposits originate in the growth and decay of organisms, either *in situ* or after transportation. Deposits of this character are commonly made in water which is deeper and quieter than that in which chemical deposits are made. They may be divided into (a) calcareous accumulations, resulting in shell marl, chalk, limestone, dolomite; (b) siliceous accumulations, such as infusorial earth, siliceous ooze, some forms of flint or chert; (c) ferruginous accumulations resulting in certain bog ores; (d) carbonaceous accumulations, known as peat, lignite, brown coal, or coal.

Rocks of mechanical and organic deposition form the great mass of the aqueous rocks. The common order of occurrence from the shore outward—conglomerate, sandstone, mud, and limestone—corresponds in a general way with increase in depth of water. It follows, therefore, that if at any point the body of water is transgressing on the land, resulting in deepening of the water, the vertical order of superposition of mechanical deposits will be conglomerate, sandstone, shale, and limestone; and, vice versa, if the water is receding, the order will be reversed. There is thus a change of character of the sediments in any series both laterally and vertically. See GEOLOGY; LITHOGENESIS.

AQUILA (Lat. *aquila*, an eagle). A constellation lying on the celestial equator. Its brightest star, Altair, is of the first magnitude, and has a parallax (q.v.) of 0".23. A *nova* or temporary new star was discovered in this constellation by Mrs. Fleming on negatives taken at Harvard in 1899.

AQUILA. A companion of Paul mentioned in Acts xviii. 2 f., 18, 26; Rom. xvi. 3 f., 1 Cor. xvi. 19, and 2 Tim. iv. 19. He is said to have been "of Pontus by race," but a Jew, probably a proselyte. Expelled from Rome, when the Jews were driven out of the city after the insurrection of Chrestus (see Suetonius, *Vita Claudii*, 15) c.49 A.D., he went to Corinth, where he probably was converted to Christianity by

Paul. Like him, he was a tent-maker by trade. His wife, Prisca (q.v.), or Priscilla, is often mentioned before him, always together with him, and seems to have been a strong personality. The couple moved over to Ephesus, where they saved the life of Paul at the risk of their own necks. When Apollos (q.v.) came to Ephesus, they undertook to "expound unto him the way of God more perfectly" (Acts xviii. 26). From Rom. xvi. 3 f., it has been inferred that they afterwards returned to Rome, but many scholars regard these salutations as later additions, possibly from another epistle. The author of 2 Timothy still places them in Ephesus. Later tradition connects Aquila with Luke as his life-long companion and makes him one of the 70 disciples sent out by Jesus (Luke x. 1). See the commentaries on Acts, the Lives of Paul, and Lipsius, *Apokryphe Apostelgeschichten*, vol. i, pp. 203, 399; vol. ii, pp. 2, 367 (1883-90).

AQUILA, ä'kwê-lâ, DEGLI ABRUZZI (It. Aquila of the Abruzzi). An episcopal city in south Italy, on the Terni-Solmona Railway, 62 miles southeast of Terni (Map: Italy, H 5). It is pleasantly situated on a hill beside the Aterno, and because of its altitude (2200 ft.) it is a favorite summer resort. The streets are broad, the houses picturesque, and the churches numerous and interesting. In 1703 it was almost destroyed by an earthquake, in which 2000 persons perished. The historical vicissitudes of the city are interesting. Frederick II built it in the thirteenth century to check papal depredations. Soon afterward Manfred razed the city, following which it was rebuilt by Charles I, and the free peasantry of the district maintained it as an almost independent republic until the Spaniards compelled its subjection in 1529. It has linen, leather, paper, and wool factories, and is an important saffron and lace market. Pop., 1881, 14,720; 1901, 21,261; 1911, 21,724.

AQUILA, GREEK VERSION OF. See **AQUILA**, PONTICUS.

AQUILA, ä'kwê-lâ, JOHANN KASPER (1488-1560). A German Protestant reformer. He was born in Augsburg, studied at Ulm and in Italy, and in 1515 was appointed chaplain to Franz von Sickingen. He accepted Lutheranism and was imprisoned, but was released, and while court chaplain to the Elector of Saxony at Wittenberg (1524-27), through his knowledge of Hebrew assisted Luther in translating the Bible. Against the Interim (q.v.) he wrote *Christliche Bedenken auf das Interim* (1548) and *Das Interim illuminiert* (1548), for which a price was set on his head by Charles V. In 1552 he was restored to his pastorate at Saalfeld, which Luther had procured for him in 1527, and filled that office until his death.

AQUILA, PONTICUS, i.e., **AQUILA OF PONTUS**. A celebrated translator of the Old Testament into Greek. He was born at Sinope in Pontus, Asia Minor, and is said by Epiphanius to have been a relative of Emperor Hadrian, who in the twelfth year of his reign, i.e., 128 A.D., sent him to rebuild Jerusalem as Ælia Capitolina. He became a Jewish proselyte and a disciple of Rabbi Akiba, under whose guidance he made his translation before 135 A.D. His version was marked by an extreme literalness and was preferred by the Jews to the so-called Septuagint. Justin seems to have known it in 160 A.D., and Irenæus refers to it in 177 A.D. Origen copied it in the third column of his Hexapla and used

it, with Theodotion's, in his recension of the Septuagint. The scattered quotations in the Church fathers and the margins of manuscripts have been best published by Field, *Origenis Hexaplorum quæ supersunt* (Oxford, 1875). Specimens have been recently discovered in Cairo and published by F. S. Burkitt, *Fragments of the Book of Kings, according to the Translation of Aquila* (Cambridge, 1897), and C. Taylor, *Origen's Hexapla* (part of Ps. xxii) (Cambridge, 1901).

AQ'UILE'GIA. See **RANUNCULACEÆ**.

AQUILEIA. See **AQUILEJA**.

AQUILEJA, ä'kwê-lâ'yâ (or **AGLAR**, ä-glâr', as it was called in the Middle Ages). A small town of the Austrian crown-land of Görz and Gradisca, situated on the Lagunadi Grado, which is at the head of the Adriatic, about 25 miles west-northwest of Trieste (Map: Austria, C 4). This once flourishing seaport has dwindled to an insignificant fishing place of a few thousand inhabitants, with little to remind one of its former prosperity and importance but its ancient cathedral and the remains of the Patriarch's Palace. It offers, however, a rich field to antiquarians. Strongly colonized by the Romans in 183 B.C. as a bulwark against the Celts, it became in time the second city of Italy, and in 168 A.D. was so strongly fortified by Marcus Aurelius as to be considered the most important post of the Empire on the north. In the reign of Hadrian, its population was between 300,000 and 500,000. It was the meeting place of the Æmilian Way (q.v.) and the roads and Alpine passes leading to central and southeastern Europe, and one of the principal naval ports; it was thus an important centre of trade. The surrounding country supplied wine, oil, cattle, and hides. Here the Emperor Maximinus perished (238), and in the vicinity Constantine II lost his life in a battle against his brother Constans (340). When the town was destroyed by Attila (452), it had 100,000 inhabitants. It never recovered, although between 556 and 1750 it was the seat of a patriarch. In 1809 it was acquired by Austria. Consult: G. Bartoli, *Le Antichite d'Aquileja* (Venice, 1739); Zahn, *Austria Friulana* (Vienna, 1877); Meyer, *Die Spaltung des Patriarchats Aquileja* (Berlin, 1898).

AQUIN, ä'kän'. A seaport on the south shore of the island of Haiti, 50 miles west of Jacmel, and a few miles east of Aux Cayes. It exports dyewood. The population numbers about 22,000.

AQUINAS, THOMAS, or THOMAS OF AQUINO (c.1226-74). One of the most influential of the scholastic theologians, who bears the honorable titles and epithets of *Doctor Communis* ('Universal Doctor,' fourteenth century); *Doctor Angelicus* ('Angelical Doctor,' sixteenth century); *Princeps Scholasticorum* ('Prince of Scholastics'); *Doctor Ecclesiæ* ('Doctor of the Church,' 1567); "Patron of all Catholic Schools" (1880). He was of the family of the counts of Aquino, in the kingdom of Naples, and was born in the castle of Roccasecca, directly north of Aquino, about 50 miles northwest of Naples, about 1226. He received the rudiments of his education from the Benedictine monks at Monte Cassino, which was only a few miles away, and completed his studies at the University of Naples. A strong inclination to philosophical speculation and theological study determined the young nobleman, against the will of his family, to enter (1243) the Order of Dominicans. In order to frustrate

the attempts of his friends, especially his mother, to force him to give up his monastic life and enter the world, his order sent him to Rome and thence to Paris. On his way thither his brothers overtook him at Acquapendente, and by force brought him to the castle of St. John, near Aquino, and there he was closely guarded for a year, and every effort was made to break his resolution to remain a monk. But at length his mother came to his release, and he went, in the company of the General of the Dominicans, to Paris and thence to Cologne, about 1245, where he studied under Albert the Great (Albertus Magnus) (q.v.). At Cologne he pursued his studies in such silence that his companions gave him the name of the "Dumb Ox." But Albert is reported to have predicted "that this ox would one day fill the world with his bellowing." He accompanied Albert to Paris in 1245 and back to Cologne in 1248, when he was commissioned by his order, the Dominican, to establish a theological school there. In it Aquinas taught until in 1251 (or 1252) he was sent to Paris to teach in the Dominican monastery of St. Jacques. He defended his order in his *Contra Impugnantes Dei Cultum et Religionem*. He was already a distinguished scholar and teacher. He continued to lecture with great applause in Paris, till Urban IV, in 1261, called him to Italy to teach philosophy in Rome, Bologna, Pisa, and other places. Finally he came to reside in the convent at Naples (1272-74), where he declined the offer of the dignity of archbishop, in order to devote himself entirely to study and lecturing. It was while there that the following incident is said to have occurred. One day Christ appeared to him and said: "You have written ably about me. What reward would you like to have?" He said: "Lord, nothing, except thyself." Being summoned by Gregory X to attend the general council at Lyons, he was taken ill on the way in the castle of his niece at Ceccano. Realizing that it was his last illness, he was at his own request transferred to the neighboring Cistercian monastery of Fossanuova, so that he might die in a religious house. He lingered there a month and died on March 7, 1274. Dante held (*Purgatorio*, xx, 68) that he was poisoned at the instigation of Charles I of Sicily, who dreaded the evidence that Aquinas would give of him at Lyons; but it is probably not true. His relics were fought for, and his right arm is now in St. Jacques, Paris, other parts in Salerno and Naples, and the rest of his body in Rome. He was canonized July 18, 1323.

Even during his life Aquinas enjoyed the highest consideration in the Church. His voice carried decisive weight with it. A general chapter of Dominicans in Paris made it obligatory on the members of the order, under pain of punishment, to defend his doctrines. Like most of the other scholastic theologians, he had no knowledge of Greek or Hebrew and was almost equally ignorant of history; but his writings display a great expenditure of diligence and dialectic art, set off with the irresistible eloquence of zeal. His chief works are: *A Commentary on the Four Books of Sentences of Peter Lombard*, the *Summa Theologiae*, *Questiones Disputatae et Quodlibetales*, and *Opuscula Theologica*. He gave a new and systematic foundation to the doctrine of the Church's treasury of works of supererogation, to that of withholding the cup from the laity in the communion, and to that of transubstantiation. He also treated Christian morals

according to an arrangement of his own, and with a comprehensiveness that procured him the title of the "Father of Moral Philosophy." The definiteness, clearness, and completeness of his method of handling the theology of the Church gave his works a superiority over the text-books of the earlier writers on systematic theology. His *Summa Theologiae* is the first attempt at a complete theological system, but he died ere he could complete it. In his philosophical writings, the ablest of which is his *Summa de Veritate Catholicae Fidei contra Gentiles*, he throws new light upon the most abstract truths. The circumstance of Aquinas being a Dominican, and boasted of by his order as their great ornament, excited the jealousy of the Franciscans against him. In the beginning of the fourteenth century Duns Scotus (q.v.), a Franciscan, came forward as the declared opponent of the doctrines of Aquinas, and founded the philosophico-theological school of the Scotists, to whom the *Thomists*, mostly Dominicans, stood opposed. The Thomists leaned in philosophy to nominalism (q.v.), although they held the abstract form to be the essence of things; they followed the doctrines of Augustine as to grace, and disputed the doctrine of the immaculate conception of the Virgin. The Scotists, again, inclined to realism and to views of the Semipelagians and upheld the immaculate conception.

Aquinas's life was spent in such great toil, not only as an author but as a teacher and as the trusted servant of his order and the adviser of popes, that it was comparatively brief. Yet its literary product was enormous. His mind was remarkably clear, so that although he was the very embodiment of the scholastic method of endless analysis and questionings, he wrote in a way intelligible and interesting to the modern reader. One of his great services is the prominence he gives to Aristotle, upon whose works he wrote elaborate commentaries. Plato also was his master, and to the fathers he yielded loyal submission. He also was a profound Bible student, as he showed in his *Catena Aurea*, which is an exhaustive theological interpretation of the Gospels. In fact, take him all in all, there is no theologian of the past who deserves and rewards study more than he, and the Roman Church does well in accepting him as her great master in theology. Pope Leo XIII in his Encyclical, "Æterni patris" (Aug. 4, 1879), declared that the philosophy and theology of Aquinas was the proper basis for all such teaching in Catholic Christendom.

His works, all written in Latin, were first printed by Pope Pius V (Rome, 1570-71, 17 vols., folio; mod. ed., Paris, 1871-80, 34 vols., 8vo; probably final form, sanctioned by Pope Leo XIII, Rome, 1882). The greatest of the works, the *Summa Theologiae*, was reprinted in 8 volumes (Paris, 1869); German translation, 12 volumes (Ratisbon, 1886-92). The *Summa de Veritate Catholicae Fidei* has been published in French, with Latin text (Paris, 1854). Modern English translations of parts of all the works have been published as follows: *Catena Aurea* (8 vols., London, 1841-45); *On the Rulers and Members of Christian States*, from *De Regimine Principum* (London, 1860); *Homilies upon the Epistles and Gospels for the Sundays of the Christian Year*, and the *Festival Homilies* (London, 1873); *On the Two Commandments of Charity and the Ten Commandments of the Law* (London, 1880); *Notes on the Angels* (London,

1888); *Maxims and Prayers and the Little Office* (London, 1890); *On the Sacrament* (London, 1890); *Aquinas Ethicus, or the Moral Teachings of St. Thomas* (London, 1892); *The Lord's Prayer*, made up of parts of the *Summa*, in condensed translation (London, 1892). For interpretation of his work in general, consult L. Schütz, *Lexicon. Sammlung, Uebersetzung und Erklärung der in sämmtlichen Werken des heiligen Thomas von Aquinas vorkommenden Kunstausdrücke und wissenschaftlichen Aussprüche* (Paderborn, 1895). For his biography, consult: in English, R. B. Vaughan (London, 1893), Pius Cavanagh (1890); in German, C. Werner (Regensburg, 1858-59), J. Tansen (Kevelaer, 1898); in Dutch, H. J. Schaepman (Utrecht, 1898).

AQUINO, ä-kwē'nō. A town in the province of Caserta, Italy, 5 miles northeast of Pontecorvo. It is the seat of a bishop, and, in addition to the Via Latina, which is near by, there are ruins of the Roman town, Aquinum. The most interesting of these are fragments of the temples of Diana and Ceres, a gateway now known as the Porta San Lorenzo, and a theatre. In 1224 the philosopher Thomas Aquinas was born in the neighboring castle of Roccasecca. Aquino is also celebrated as the birthplace of Juvenal. Pop., 1911, 3222.

AQUITA'NIA. The Latin name of a part of Gaul, originally including the country between the Pyrenees and the Garonne, peopled by Iberian tribes. Augustus, when he divided Gaul into four provinces, added to Aquitania the country lying between the rivers Garonne and Loire. Shortly before the extinction of the Roman Empire, Aquitania passed into the hands of the West Goths. In 507 it was conquered by Clovis, King of the Franks, and during the Merovingian dynasty became an independent duchy. Though subjugated by Charlemagne, the duchy again claimed independence under the weak monarchs of the Carolingian dynasty. In 1137 Aquitania (or Aquitaine, a name later supplanted by the name *Guienne*) was united to the crown of France by the marriage of Louis VII with Eleanor, heiress of Aquitania. In 1154 it was united with England, as the result of the marriage (1152) of Henry Plantagenet with Eleanor, whom Louis had divorced, and a long series of disputes took place between England and France respecting Aquitania, which was ultimately united to the crown of France by Charles VII in 1451.

ARA, ä'rä, or **ARARA**. See **COCKATOO**.

ARABAH, ä'rä-bä. The name used in ancient times to designate the entire length of the deep depression extending through the Jordan valley and the Dead Sea as far as the Gulf of Akabah. It was consequently applied to the district around the Lake of Galilee (Deut. iii. 17); the Dead Sea was called the "Sea of the Arabah" (Deut. iv. 49), and the "Brook of the Arabah" (Amos vi. 14) was probably the Wadi el Ahsa falling into the Dead Sea from the south. At present the term is confined to the southern part between the Dead Sea and the Gulf of Akabah, while the northern part including the Jordan valley and the Dead Sea is called El ghor, 'the depression.' Consult Hull in *Memoirs of the Palestine Exploration Fund* (1886); Lartet, *Voyage d'Exploration de la Mer Morte* (1880); Blankenhorn, in *Zeitschrift des deutschen Palästina-Vereins* (1896); Musil, *Petræa: Edom* (1907-08).

AR'ABA'TA (native South American name). The straw-colored howling monkey. See **HOWLER**.

ARABESQUE, är'ä-bësk' (Fr.). The term signified originally 'resembling Arabic work' and was properly applied to ornament which, by its intricate and fantastic character and avoidance of naturalistic representation, might be held to suggest Arabic decoration. (See **ARABIAN ART** and **MOHAMMEDAN ART**.) Its use came, however, to be extended so as to apply to any intricate decoration of a conventional or fanciful character, such as the foliated scroll patterns of late Greek, Roman, or Pompeiian friezes, panels, and pilasters, and even to the complex interlaced designs of Byzantine, Irish, Scandinavian, and Romanesque art of the early Middle Ages, in which grotesque symbolic monsters were intertwined with vines and scrolls. When the Renaissance sought to revive the arts of classical antiquity, the Roman ornamentation was imitated more or less freely, and the term "ara-

a

b

ARABESQUE.

a, Arabian Arabesque. b, Italian Arabesque.

besque" applied to much of the resulting decoration, although this in no wise resembles Arabic design. The most celebrated designer of such arabesques was Raphael, who made a special study of the painted stuccoes of the Baths of Titus, the Golden House of Nero, and the ruins on the Palatine, and produced in the famous arabesques of the Loggia of the Vatican, designs of marvelous fertility of invention, which powerfully influenced the decorative art of the sixteenth century. In common usage to-day any conventional pattern of an intricate character, composed of graceful interlaced curves and more or less fantastic forms, is called an arabesque.

ARABESQUE. In music, the ornamentation of a theme by means of grace notes, trills, arpeggios, etc. Since Schumann used the term as a title for one of his piano pieces (op. 18), an extremely graceful composition in free rondo form, several other composers have given the same title to works similar in character and form. Among the finest examples are the two exquisite arabesques in E and G by Debussy.

ARABGIR, ä'räb-gër'. See **ARABKIR**.

ARABIA. The great southwestern peninsula of Asia, called by the inhabitants *Jazirat al 'Arab*, 'the peninsula of Arabia'; by the Turks and Persians, Arabistan. Its northern boundary depends upon whether Arabia Petræa and the Syrian Desert are included or not, and is consequently drawn either from Akaba to Koweit, from Port Said due east to Akaba and Koweit, from Port Said to the southern end of the Dead Sea and then across to the head of the Persian Gulf, or from the Egyptian border to Akaba or al Ahsa and then in a semicircle around the Hammad to the Persian Gulf. On the east it is bounded by the Persian Gulf and the Gulf of Oman; on the south by the Indian Ocean and the Gulf of Aden, and on the west by the Red Sea and, if the Sinaitic peninsula is included, the Isthmus of Suez. When the name is taken in its widest sense, Arabia may be said to be situated in lat. $12^{\circ} 40'$ to about 35° N., and long. $32^{\circ} 30'$ to 60° E., its greatest length from north to south being about 1500 miles, its greatest breadth about 1200 miles, and its area about 1,200,000 square miles; without Arabia Petræa and the Syrian Desert, it would reach to lat. $29^{\circ} 30'$ N., begin with long. 35° E., and have an area of about 1,000,000 square miles.

The name "Arabia" is probably derived from 'Arab, 'desert,' of which the feminine form is still used to designate the arid depression between the Dead Sea and the Ælanitic Gulf. (See ABABAH.) 'Arab was the name given by the Hebrews to the desert, to a particular people in the desert, and to the steppe-dwellers of north Arabia in general (Isa. xxi. 13; Ezek. xxvii. 21; Jer. xxv. 24). Already Shalmaneser III characterized Gindibu, who came with 1000 camels to the battle of Qarqar (854 B.C.) as an Arabian (*Ar-ba-a-a*), and after his time *Arabu*, *Arabia*, or *Aribi* occurs frequently in the Assyrian inscriptions. It is not impossible that the Eremitæ ('Ερεμιταί) in Homer are Arabians (*Odyssey*, iv, 84), as Zeno and Strabo maintained, but it cannot be regarded as certain. Darius I (521-485 B.C.) mentions *Arabaya* among the subject lands, always placing it after Babylonia and Assyria, but before Egypt (*Behistun Inscription*, i, 15). In Sabæan inscriptions 'Arab is used apparently as a designation of the nomads in north Arabia (*Corpus Inscriptionum Semiticarum*, iv, p. 123). In his article on 'Arabia' in *Encyclopædia Biblica*, Nöldeke has pointed out that one of the oldest poets employs the term 'arraba for 'speaking plainly,' i.e., 'speaking in Arabic.' Gradually the name extended from the nomad to the settled people in north Arabia, from north Arabia to the whole peninsula.

Ptolemy divided the country into *Arabia Petræa*, *Arabia Felix*, and *Arabia Deserta*. By *Arabia Petræa* he understood the Roman province of Arabia, including the territory east of the Araba taken by the Nabatæans, the later Idumæa or the Negeb (q.v.), and the Sinaitic peninsula; by *Arabia Felix* he meant the independent country west and south of the desert, from Akaba to Bab-el-Mandeb and Oman, and by *Arabia Deserta*, probably the Hammad and Nufud standing more or less under Parthian influence. The name "Arabia Petræa" was derived from Petra, the capital of the ancient Nabatæan kingdom and of the Roman province. As Petra means 'rock,' Arabia Petræa was in later times wrongly interpreted as Stony Arabia. *Arabia Felix*, like the Greek 'Αραβία εὐδαιμών (*Arabia Eudaimon*), was an essentially correct trans-

lation of 'Arab al yaman, which meant the Arabia that is on the right hand, i.e., on the south, and also on the lucky side. In Ptolemy's time the region south of Akaba (q.v.) was evidently called by the Arabs *al Yaman*, 'The South,' in distinction from the region north of this point called *al Sham*, 'The North.' The Dahna desert, south of Nejd, is not likely to have been known to Ptolemy. The Arab geographers of the Middle Ages give us the names of various provinces, and these have for the most part continued in use to the present time. The present provinces are (1) *al Tih*, the Sinaitic peninsula; (2) *Hejaz*, or the 'barrier,' a name originally referring to its position between Tihama, the coastland, and Nejd, the highland, but later assumed to refer to its location between al Sham (Syria) and al Yaman (Yemen); (3) *Asir*, the alpland south of Hejaz, known under this name only during the last century, formerly belonging in part to Hejaz and in part to Yemen; (4) *Yemen*, the southwestern corner of the peninsula, having, like Hejaz and Asir, its Tihama, or littoral, on the Red Sea and including Nejran; (5) *Hadramaut*, east of Yemen, along the southern coast; (6) *Mahra* and *Shihr*, the ancient *Habashat*, the incense country farther east to the border of Oman (7) *Oman*, the southeast projection into the Indian Ocean; (8) *Hasa*, formerly called *Hajar* and *Bahrain* (the two seas, referring to the Persian Gulf on both sides of al Katar); (9) *Bahrain*, now used as a designation of Uwal and seven other islands in the Persian Gulf opposite Hasa; (10) *Dahna*, the great territory between Hadramaut, Oman, and Nejd; (11) *Nejd*, in the interior; and (12) *Nufud*, the desert north of Jebel Shammar. The Hammad is divided into three parts, *Badiyah al Sham*, *Badiyah al Jazira*, and *Badiyah al Irak*, deserts of Syria, Mesopotamia, and Babylonia, respectively; while southern Belka and al Makra are now counted as belonging to Syria.

Our information concerning the physical geography of Arabia comes partly through such classical writers as Eratosthenes, Strabo, Pliny, and Ptolemy, and Arab geographers like Hamdani, Ibn Haukal, Istakhri, Mukaddasi, Idrisi, Ibn al Mujawir, and Ibn Batuta, and partly through modern explorers. Much of our knowledge is due to the accounts of north Hejaz, or the Land of Madyan, by Beke, Burton, Doughty, Huber, Euting, and, most recently, Jaussen and Savignac; of the holy cities by Varthema, Leiblich, Burckhardt, Burton, Hurgronje, and Maltzan; of Asir by Tamisier; of Yemen by Niebuhr, Forskål, Arnaud, Halévy, and Glaser; of Hadramaut by Wrede and Hirsch; of Oman by Wellsted, Palgrave, and Zwemer; of Hasa by Pelly; of Bahrain by Bent; of Nejd by Sadlier, Wallin, Doughty, Lady Anne Blunt, and Palgrave; and of various parts of Arabia Petræa by Seetzen, Burckhardt (the discoverer of Petra), Laborde, Brünnow and Domaszewski, Palmer, Trumbull, Lagrange, Schmidt, Musil, Stanley, Hull, Petrie, and others. Yet their visits were for the most part merely tours of reconnoissance. No part of the country has been properly surveyed, and more than one-third of it is absolutely a *terra incognita*. How far its character may have changed in historic times is impossible to determine. But De Goeje has expressed the conviction that the great wadies, Humth, Dawasir, Hanifa, Rumma, and others, were once perennial streams; and Caetani, *Studi di Storia Orientale*

(Milano, 1911), has given strong reasons for the belief that the desiccation has taken place in the last few thousand years, and that in earlier times the huge peninsula had physical features and climatic conditions far different from those now prevailing and more conducive to the development of human life. The largest portion of the country lies in that great desert zone which stretches from the shores of the Atlantic to those of the northern Pacific. The interior, so far as it has yet been explored, seems to be a great plateau, in some places reaching a height of 8000 feet. The western border crest of this plateau may be regarded as part of a mountain chain, beginning in the north with Lebanon and stretching south to the Strait of Bab-el-Mandeb. From Bab-el-Mandeb another chain runs northeast, parallel to the coast, to Oman. The elevation of the mountains in the extreme south of the peninsula is estimated at 13,000 feet. From the mountain range on the west the plateau slopes to the northeast and forms in general a vast tract of shifting sands, interspersed here and there about the centre with various ranges of hills, which, like the shores of the peninsula, are generally barren and uninteresting.

One of the chief characteristics in the physical aspect of the country is the scarcity of permanent rivers. Like most desert regions, Arabia has a large number of river courses, or *wadies*, among which the Wadi al-Rumma is the longest, traversing under different names the entire country from west to east. But they are, almost without an exception, either completely dried up or only filled with water now and then in the rainy season. Springs are very few, and in the cultivated parts of the country large numbers of wells, cisterns, and reservoirs are prepared for the reception of rain water.

Arabia has, on the whole, an African climate. Though surrounded on three sides by the sea, its chains of hills exclude in a great measure the modifying influence of air currents from the ocean. In several parts of Arabia hardly a refreshing shower falls in the course of the year, and vegetation is almost unknown; in other torrid districts the date palm is almost the only sign of vegetable life. Over vast sterile tracts hangs a sky of almost perpetual serenity. The time and duration of the rainy season varies in the different parts of the country. In Yemen it lasts from June to September and is often followed by a shorter rainy season in the spring. In the coast regions of Hadramaut and Oman it lasts from February to April, while in the highlands of the former it takes place between April and September. Light frosts mark the winters in the centre and northeast. During the hot season the simoom (q.v.) blows, but only in the northern part of the land.

The districts which are not too arid for culture produce wheat, barley, millet, dates, tobacco, indigo, cotton, sugar, tamarinds, coffee, balsam, aloe, myrrh, frankincense, etc. Arabia has but a small area of forests, but has vast stretches of desert grass, fragrant with aromatic herbs, and furnishing admirable pasturage for the splendid breed of horses. Coffee, one of the most important exports, is an indigenous product of both Arabia and Africa, as are also the date palm and banana. The trade in coffee, dates, figs, spices, and drugs was once very important, but is now much smaller than formerly. Arabia has few manufactures, but carries on a transit

trade in foreign fabrics, besides importing these to some extent for its own needs.

In the animal kingdom an African character prevails generally. Sheep, goats, and oxen satisfy the immediate domestic and personal necessities of the inhabitants, to whom the camel and horse are trusty companions in their far wanderings. Gazelles and ostriches frequent the oases of the deserts, where the lion, panther, hyena, and jackal hunt their prey. Monkeys, pheasants, and doves are found in the fertile districts, where flights of locusts often make sad devastation. Lizards and venomous snakes are numerous. Fish and turtle abound on the coast. The noble breed of Arabian horses has been cultivated for several thousand years, but the horse is of less general importance in Arabia than is popularly supposed. The most characteristic of all animals in the peninsula is the camel; the breed of Oman is celebrated for its beauty and swiftness. Among the minerals of Arabia may be mentioned iron, copper, lead, coal, basalt, and asphaltum, and the precious stones emerald, carnelian, agate, and onyx. Pearls are found in the Persian Gulf.

According to Palgrave's estimate, Hejaz has about 1,000,000 inhabitants; Yemen, 1,000,000; Hadramaut and Mahra, 1,000,000; Oman and Hasa, 2,500,000; and Nejd, 2,000,000, which would give to Arabia a population of about 7,500,000. These figures are probably too high; but with our total ignorance concerning the larger part of the interior, and in the absence of a regular census for any district, it is not possible to verify any statement on this point. The Arab is of medium stature, compactly built, and of brown complexion. Earnestness and pride are distinctive characteristics; by nature he is quick, sharp-witted, lively, and passionately fond of poetry. Courage, temperance, hospitality, and good faith are his leading virtues; but these are often marred by a spirit of sanguinary revenge and rapacity. His wife keeps the house and brings up the children. Even in the desert the children are generally taught to read, write, and calculate. The Arab cannot conceive a higher felicity than the birth of a camel or a foal, or that his verses should be honored with the applause of his tribe. The Arabs are, as a rule, monogamists, although frequently the wealthy chiefs have several wives. Matrimonial ties are severed at will, and the ill-treated wife can always find refuge in her father's tent.

Arabian life is either *nomadic* or *settled*. The wandering tribes, or Bedouins, are well known to entertain very loose notions of the rights of property. The settled tribes, styled Fellahs, are despised by the Bedouin, who scorns to be tied down to the soil, even where such bondage might make him wealthy.

Ethnography. Concerning the earliest inhabitants of the peninsula we have no definite knowledge. Doughty found in the northern deserts stone implements of a well-known type furnishing evidence of man's existence there in the Paleolithic Age. Whether the race that produced them was swept away or merged with tribes coming from the west, we have no means of determining. On the whole, the latter theory seems preferable to the assumption that the Semites were the descendants of the Stone Age people first occupying the country. The Semitic type may have developed in Africa before the invasion of Arabia, or it may be the result of a fusion of the invaders with the aborigines, as

in Babylonia, Syria, and Abyssinia. The stock that already was, or was destined gradually to become, Semites may have shown, at its first appearance in Arabia, the power to absorb and to assimilate which has been a characteristic trait ever since. The tribes that emigrated from Arabia and became known in history as Akkadians, Assyrians, Lulubians, Gutians, Amorites, Aramæans, Hebrews, and Chaldæans brought with them Semitic speech, though they spoke different Semitic languages. When these migrations took place, the population had not yet attained the degree of homogeneity found in later times. Before the leveling influence of Islam came in, there were always marked differences between the settled tribes of the south and the nomads of the north, those on the Erythraean and those on the Persian Gulf and the Indian Ocean. Islam united Arabia, but also sent out its sons to all parts of the Moslem world and drew to it slaves and foreigners who had accepted this faith. This must be borne in mind when the present Arab type is considered. It presents examples of the tall and the short, the long-headed and the broad-headed, the brunette and the blond, the straight-haired and the wavy-haired, evidencing considerable intermixture with Negroid and Aryan elements. Differences continued to exist between the Kalb, or southerners, and the Kais, or northerners, between the city-dwellers and the nomads; but the unity of language and religion made it possible for the Arab to make a strong impression upon the world outside of his peninsula. He took a leading part, together with the Persian, in developing Moslem civilization. The Arabic alphabet spread with the Arabic religion; the Arabic numerals were indeed derived from India, but in the hands of the Arabs became an instrument for a higher development of mathematics. The Arabs fostered commerce and geographical exploration, created a new order of architecture, made the productions of the Greeks accessible to European nations, and in the cultivation of the sciences, philosophy, literature, and art were far in advance of the rest of the world. Even away from Arabia they have maintained their peculiar genius, and when they intermarried with conquered or converted peoples, have to a remarkable extent impressed upon them their own characteristics. Hamites, Negroes, Aryans, Mongolians, and Malays have received a large infusion of Arab blood; and Keane rightly emphasized the absorptive power of the Arabs, to whom not only the mass of kindred Semites in Asiatic Turkey, but also other ethnic elements embracing Islam have the tendency of becoming more and more assimilated. See Plate, RACES OF ASIA, accompanying ASIA, and the articles on SEMITES. For various topics connected with the ethnography of Arabia consult *The Encyclopedia of Islam, A-D* (Leyden, 1908-13).

Politically, Arabia is divided as follows: The Sinaitic peninsula forms a dependency of Egypt. The western coast, forming the two vilayets of Hejaz and Yemen, as well as the region of Hasa, on the eastern coast, belong to Turkey. Oman is administered by an independent imam, while Aden (q.v.) forms a dependency of Great Britain, which exercises a protectorate over a considerable territory. The remainder of the country is divided into a number of independent or semi-independent states, under hereditary or chosen chiefs, bearing the title of emir, sheikh, or imam. Their function appears to be limited

to leading the troops in time of war, levying tribute, and administering justice. A spirit of liberty in the people moderates the authority of their chieftains; but instances of extreme despotism have not been infrequent, in both early and modern times. The most important cities of Arabia are Mecca, Medina, and Jidda in Hejaz; Hodcida, Sana, Mocha, and Aden in Yemen; Makalla in Hadramaut; Maskat in Oman; Katif in Hasa; Riad and Hail in Nejd.

History. While historic data do not carry us beyond the last centuries of the second millennium B.C., the expeditions of Naram Sin, of Agade to Magan (East Arabia) and Gudea, of Lagash to Magan and Meluhha (West Arabia), as well as those of the Egyptian kings of the third and fourth dynasties, to the Sinaitic peninsula, may have taken place in the fourth millennium, and show that the country was then inhabited. The invasion of Babylonia by the Semitic Akkadians (see ACCAD), probably in the fifth millennium B.C., and those of Assyrians, Gutians, Lulubians, Amorites, Aramæans, Hebrews, and Chaldæans (q.v.) at various times after them, testify to the movements of peoples upon the peninsula and, to some extent, to their character, before the appearance of our first South Arabian inscriptions. The history of the last 3000 years may be divided into two great periods—one extending from the establishment of the Minæan kingdom to Mohammed, and the other from Mohammed to the present day. Each of these naturally falls into a number of sub-periods. In the first there are those of (1) the kings of Ma'in c.1200-750; (2) the *mukarribs*, or priest-kings, of Saba (c.750-525); (3) the kings of Saba (c.525-115); (4) the kings of Saba and Raidan (c.115 B.C.-300 A.D.); (5) the Aksumite invasions and the kings of Himyar (300-570). Although some eminent scholars still hesitate to bring the Minæan inscriptions back further than to the ninth century (see MINÆANS and SABÆANS), there is a growing tendency to concede that they are earlier than the Sabæan. The failure of any mention of the powerful Minæan kingdom, which had its outposts in northern Hejaz and al Tih, in the inscriptions of Assyrian kings who invaded that very region, while mention is made of the Sabæans, is significant, as is also the fact that the Minæans (Mainim) are referred to as invaders of Palestine in the days before Saul in Judges x. 12. The list of about 30 kings in Ma'in certainly covers a number of centuries. Nothing that is known to us concerning the origin of the alphabet prevents the assumption that the peculiar characters used in the Minæan inscriptions were already invented in the twelfth century B.C. (See ALPHABET.) It is not impossible that, in a period of comparative weakness on the part of the rulers in Ma'in, Saba was independent, and a Queen reigned in Marib, nor that this Queen of Sheba visited Solomon in Jerusalem, perhaps for political purposes, to enter into an alliance with the King, who had such vital interests at Ezion-geber on the Gulf of Akabah against their common enemy, the Minæan King, holding control of the land of Midian immediately south of this place. Similarly, the Sabæan mukarribs may have sought aid from Assyria. Tiglath Pileser IV (745-728), Sargon II (722-705), Sennacherib (705-681), Esarhaddon (681-668), and Asurbanipal (668-625) made expeditions into north Arabia and had dealings not only with the Sabæans

but also with the Kedarenes, the Dedanites, and the Nabataeans. In 715 a number of Hejaz tribes, among them the famous Tamudi, or Thamud, referred to by Mohammed, were deported to Samaria (q.v.). The conquest of Egypt by Cambyses in 525 paved the way for the subjugation of North Arabia, which was organized as a satrapy called Arabaya by Darius Hystaspis. It was no doubt the danger of the Persian approach that consolidated the Sabæan power in the south, and the rulers appear as kings after 525. Alexander was not able to carry out his plan to go into Arabia; and the Ptolemies who established trading stations on the Erythræan held peaceful relations with the tribes of Hejaz and Yemen. During the period of the kings of Saba and Raidan the most important event was the invasion of the country by the Romans. In the year 24 B.C. Augustus sent the prefect of Egypt, Ælius Gallus, with his ally, the Nabataean King Obodas II (28-9 B.C.), against the Sabæan power. The army of 10,000 men reached the territory of Saba, took the cities of Nejran, Nashk, and Kamina, but were unsuccessful in their siege of Marib and returned to Egypt. The Nabataean kingdom, which had extended into Hejaz, to Damascus, and toward the borders of Egypt, became a Roman province in 106, the year being fixed by an inscription of Rabel II dated in 405 of the Seleucid era and the twenty-fourth year of the King. The Palmyrene kingdom, flourishing especially under Odenath I, Odenath II, and Zenobia (q.v.), was overthrown by Aurelian in 272. Other buffer states, however, were established by the Lahmids of Hira, the Ghassanids of Bosra, and the Banu Kinda in Nejd. In the south the growing power of the Himyarites, leaning on the Sasanids, was only checked temporarily by the Aksumite occupation of Saba and Raidan (300-378 and 525-570), but practically ended by the Persian conquest in 570.

In the second period of Arabian history the centre of power shifts from Yemen to Hejaz. It may be divided into the following sub-periods: (1) Mohammed and the three first caliphs (570-656); (2) Ali and the Umayyads (656-750); (3) the Abbasids (750-900); (4) the Karmatians and the Fatimids (900-1171); (5) the Ayyubids (1171-1260); the Mamluks (1260-1517); and the Ottoman Turks, the Portuguese, the Wahabis, and other independent powers (1517-). Through the pressure of Christianity, represented by Abyssinia and the Byzantine Empire, and Mazdaism, represented by the zealous Sasanid dynasty, south Arabia lost its power and independence. But about the time when the end came, the man was born who was destined to weld together all Arabia by a new religious faith and a new political organization, to destroy the Persian Empire and all but annihilate the religion of Zoroaster, reduce Oriental Christianity to insignificant fragments, conquer northern Africa, Spain, and Sicily, and finally absorb the Byzantine Empire itself. He belonged to the tribe of the Kuraish. This tribe, living in and about Mecca, had risen to great prominence on account of its noble descent, its enterprise, and its wealth. Its members became the perpetual guardians of the sacred Kaaba at Mecca. This structure from the earliest times had been a place of pilgrimage for the peoples of the entire peninsula. In the great fairs which were annually held not far from Mecca, the first steps toward Arab unity were

made. These annual meetings were marked by the celebration of athletic games and poetic contests and possessed also a certain religious character which made them in some respects similar to the Olympian Games of ancient Greece, with which they may also be compared for their effect upon the building up of an Arabian nationality. The way, then, was prepared for Mohammed, who, through the teaching of Islam, was destined to unite the entire peninsula under his rule within the short period of 10 years; for after he had won over the powerful Kuraish to his doctrine and had provided himself in this manner with an efficient army, the chaotic condition of political life in Arabia made the spread of his faith all the more easy. Arabia enjoyed the most prosperous period of its history during the reigns of the first three caliphs (632-656), under whom Syria, Egypt, and Persia were conquered. Then the tide of Moslem conquest swept westward over the whole of northern Africa and the Spanish Peninsula and seemed about to engulf ancient Gaul, when it was arrested between Poitiers and Tours by Charles Martel, ruler of the Franks (732). The removal of the capital first to Kufa under Ali and then to Damascus under the Umayyads had tended to reduce the importance of Mecca and Medina, and with the spread of Islam the direct influence of Arabia itself gradually declined. This was especially true after the year 750, when the Umayyads were overthrown by the descendants of Abbas. So long as Damascus had been the centre of the Moslem world, the Arab element had been preëminent, and the great generals and administrators of the caliphs had been drawn chiefly from the inhabitants of the peninsula; but with the establishment of the Abbásid dynasty of caliphs, who removed the seat of the Mohammedan power in the east to Bagdad, and the rise of a great Mohammedan realm in the extreme west, the magnificent rôle which Arabia had played came to an end. The Abbasid caliphs continued indeed to be recognized, after the insurrection quelled by Hajjaj, in Hejaz; but independent amirates grew up in Yemen and Oman. The tenth century was characterized in Arabia by the spreading power of the Karmatians, a religious and political sect whose founder was Abdallah ibn Maimun, though it was named after Hamdan al Karmat. (See MOHAMMEDAN SECTS.) In 900 Hasa was conquered; in 929 Mecca was taken and the sacred stone carried away; in 951 Oman was subdued. The whole peninsula was ruled by the mahdi and caliph of this powerful sect. The Fatimids were able to some extent to restore order in Hejaz; but the growing power of the grand-sharif of Mecca soon made their authority merely nominal. By the services of Saladin in freeing Mecca and Medina from that awful scourge, the lord of Montreal (Shobek), Renaud de Chatillon, the Ayyubids gained much prestige and influence in Hejaz; and Mamluks like Nazir (1310-1345) retained some power in Hejaz and were prayed for as caliphs in Mecca, though every attempt to gain control of Yemen was a failure. The imamates, sultanates, and amirates of Hasa, Oman, Yemen, and Nejd were quite independent. In 1508 the Portuguese captured Maskat and held it until 1659, when it fell into the possession of a line of native rulers who succeeded in extending and consolidating their power. The present dynasty established itself in 1741. Selim I conquered Hejaz in 1517

and Yemen some years later. The caliphate of the Ottoman sultans was recognized in Hejaz until 1803, though the real power was in the hands of the grand-sharif. After the Wahabite occupation the Turkish government was restored, and the province is now ruled by a wali, or governor, sent from Constantinople. Yemen was lost to the Turks in 1630 and ruled by the imam of Sana until 1871, when the suzerainty of Turkey was recognized again. Meanwhile Aden (q.v.) had been taken by England in 1811. Towards the middle of the eighteenth century there appeared in Nejd a prophet, less original but also less self-indulgent than the founder of Islam, less radical but more sincere than Hamdan al Karmat, Mohammed ibn Abd al Wahhab. He was a stern reformer, preaching temperance and justice, himself an ascetic and a just man, unwilling to make any concessions or compromises, opposed to current superstitions, and counting as such the veneration of the Prophet, the saints, and the sacred places. Under his successors the Wahabite sphere of influence expanded. Kerbela was destroyed in 1802; Mecca was sacked in 1803 and remained in the hands of the Wahabites until 1813. Mohammed Ali sent his son Tusun to cope with this power, and later a greater general, his son Ibrahim, who by 1818 had greatly reduced its territory and prestige. The Saud dynasty at Riad continued, however, to be independent and only yielded to the growing strength of the Rashids at Hail. Mohammed Ali sent 11 expeditions into Asir, which was especially devoted to the Wahabite cause, but in 1841 had to conclude an inglorious peace. Asir is to-day practically independent, and even the Turkish control of Yemen is more nominal than real. Rebellion against Turkish authority has sometimes assumed the character of a regular war, as in 1891, when over 50,000 tribesmen are said to have engaged in a pitched battle, and again in 1905, when more than 100,000 men were drafted in Asia Minor and Syria for the war in Yemen, which was waged with varying success on both sides and does not seem to have issued in a materially changed relation of this province to the Turkish government.

ARABIA DESERTA (Lat. Deserted Arabia). The name applied by ancient geographers to the northern and central third of the country. It is a region of hard, gravelly soil, diversified here and there by patches of stunted bush and meagre grass.

ARABIA FELIX (Lat. Happy Arabia). The name given to the southeastern part of Arabia; a tolerably fertile region.

ARABIAN ART. This term, though often erroneously applied to many divisions of Mohammedan art (q.v.), belongs properly only to those phases of the arts of design which grew

ARABIC CARVED PANEL FROM CAIRO.

up under Arab dominion, chiefly in Arabia, Syria, northern Africa, and Sicily. The Arabs were not originally an artistic nation, but employed the artists of the peoples they conquered in the seventh to ninth centuries. Gradually, like the Romans, they developed an architecture and decorative arts distinctly their own, wholly different from those of the conquered nations though derived largely from them. Architecture was highly developed in mosques and palaces; carving, inlaying of marble, wood, and mother-

of-pearl in intricate geometric patterns, manuscript illumination, calligraphy, and certain forms of work in brass and in glass, were brought to high perfection. As in most of the phases of Moslem art, the representation of living beings, human or animal, was rigidly excluded. The Moorish art of north Africa was an offshoot from the Arabic art of Egypt. Consult Gayet, *L'Art Arabe*; Bourgoin, *Les arts arabes* (Paris, 1873); Prisse d'Avennes, *L'art arabe* (Paris, 1877); Saladin et Migeon, *Manuel d'art musulman* (Paris, 1907); Fago, *Arte arabe* (Rome, 1909).

ARABIAN GULF. See RED SEA.

ARABIAN MUSIC. The influence of the Arabs upon modern music is distinctly felt in many of our orchestral instruments. Their musical system, however, has left no traces, because it was rather a philosophical and mathematical speculation than a practical system. Although in early times the Arabs had primitive instruments and characteristic melodies, we cannot speak of a distinctly Arabic system of music until after the conquest of Persia by the Arabs in the seventh century A.D. With wonderful rapidity the conquerors assimilated the musical art of the conquered, so that in a short time the pupils rose to the position of masters. Since then the music of Persia and Arabia is like two great streams flowing side by side and frequently intermingling. Already in the eighth century we find theoretical writings on music by Arabic authors. When Al Farabi, in the tenth century, attempted to supplant the Arabic system by that of the Greeks, he failed, because the Arabic-Persian system had already reached a high development. The theoretical founder of the Arabic-Persian school is Sifa al-Din, an Arab by birth, who lived in the fourteenth century. The Arabic system constructed a scale by joining together a tetrachord (D, E, F#, G), and a pentachord (G, A, B, c, d), so that the semi-steps are between the third and fourth and sixth and seventh degrees. Each whole tone was divided into three third tones, so that the octave contained 17 third tones. These third tones were not regarded as chromatic alterations of a fundamental tone, but were denoted by the theorists by separate numbers, so that the first tone of the second octave was 18, of the third octave 35. Octaves and fourths are regarded as consonances, thirds and sixths as dissonances. The fifth was a disputed interval. Out of a possible number of 84 scales, the theorists selected 12 as practicable. These were called *Makamat*. Besides these complete scales there were recognized six *Awasat*, combinations of from five to nine third tones, which stood in the same relation to the scales as the tropes of the Plain Chant stood to their respective modes. While the theorists continually introduced new systems of wonderful ingenuity, the practical musicians were guided chiefly by their ear, and this led them to conceive their melodies in a scale corresponding exactly to our D major. The principal instrument of the Arabs was the lute (q.v.), which they adopted from the Persians. The tanbur had a circular or oval body, a very long neck and three strings. The kanun was a kind of cembalo with 75 gut strings (three to each tone) over a square resonator. Among the instruments played with a bow the principal one was the rebab or rebic, which has developed into our violin. The kemangeh was made of a cocoanut over which

was stretched a membrane. The strings were fastened on an excessively long and thin neck. The chief wind instrument was the zamr or zurna, a kind of oboe. The nefyr is a trumpet similar to ours. The nakarich is our kettle-drum. The number of instruments used by the Arabs is enormous. There are 32 kinds of lutes, 12 kinds of kanuns, 14 instruments played with a bow, 3 kinds of lyre, 28 kinds of flute, 22 kinds of oboes, 8 kinds of trumpets, and drums. Consult Land, *Over de Toonladders der Arab. Musick* (Amsterdam, 1880); A. Lappage, *La musique arabe* (Paris, 1905); J. Rouanet, *La musique arabe* (Algiers, 1905); J. Rouanet and E. N. Yafil, *Répertoire de musique arabe et maure* (Algiers, 1905); R. Mitjana, *L'orientalisme musical et la musique arabe* (Upsala, 1907); G. Tesenti, *Canti e ritmi arabici* (Rome, 1910); P. Tripodo, *Lo stato degli studi sulla musica degli Arabi* (Rome, 1904).

ARABIAN NIGHTS. The common English title of a collection of stories called in Arabic *alif laila wa laila*, 'Thousand and One Nights.' In regard to the number of the stories as well as their form and arrangement the different copies of the text vary greatly. There are, as Zotenberg has shown, three distinct groups of manuscripts: (1) those from Asia containing, as a rule, only the tales told on 281 nights, but presenting a comparatively old and excellent text; (2) those from Egypt, more complete but scarcely more than a century old; and (3) some of Egyptian or Tunisian origin showing the influence of both types. None of these manuscripts contains all of the stories; and the Arabic text of some of the most famous among them has only been found and published in recent years by Zotenberg and Nöldeke. This variation in the manuscripts, while also an index of the popularity which the collection enjoyed, is due to their gradual growth and to the different centres in which the traditions regarding them developed. They were first made known to Europe by Antoine Galland (1646-1715), a French Orientalist, who succeeded, after much effort, in obtaining a manuscript. Between 1704 and 1717 Galland's translation appeared in 12 volumes under the title of *Mille et une Nuits, contes Arabes traduits en Francais*. The stories of the eleventh and twelfth volumes Galland did not find in any manuscript, but heard them from the lips of the Maronite Hanna, who had accompanied the physician Declos to Paris. Hanna seems to have used a manuscript not known to Galland. Among his stories were those of Ali Baba and the Forty Thieves, Ali Khuja, the Bewitched House, Ahmed and the Fairy, and the Two Jealous Sisters. While received with great enthusiasm by the general public, doubts were freely expressed in learned circles as to the genuineness of the tales published by Galland. Oriental scholars did not hesitate at first to declare against their authenticity and denounce them as forgeries. Having taken only an obscure place in the literature of the East, and their style unfitting them from being classed among models of eloquence or taste—having no object of a religious, moral, or philosophical nature in view, while the manners and customs delineated in them were different from all received ideas of those of the Moslem nations—their success took the critics by surprise. It was not long, however, before such skepticism gave way, and they were recognized

not only as genuine productions but as a characteristic expression of eastern thought and manners. The success of Galland's translation spread the tales throughout Europe. Few books have been translated into so many different languages and given delight to so large a number of readers. In addition to the translations into European languages we must bear in mind that the Arabic original has also been the source of renderings into many eastern tongues, notably Persian, Turkish, and Hindustani, so that more than any other compilation, with the single exception of the Bible, the Arabian Nights has encircled the entire world. It may be said that in these Oriental tales there has sprung up a new branch of literature, for their influence on the literature of the present day is easily discernible. Here are found depicted, with much simplicity and great effect, the scenes of the town life of the Moslem. The prowess of the Arab knight, his passion for adventure, his dexterity, his love, and his revenge, the craft of his wives, the hypocrisy of his religious teachers, and the corruptibility of his judges, are all dramatically delineated—far more vividly represented, in fact, than is possible in a book of travels; while gilded palaces, charming women, lovely gardens, and exquisite repasts captivate the sense of the reader and transport him to the land of wonder and enjoyment. Besides entertaining the mind with the kaleidoscopic wonders of a teeming and luxurious fancy, which is their most obvious merit, they present a treasure of instruction upon life in general and Oriental life in particular. This is undeniable, notwithstanding the fact that the aspects of society they depict are far from standing high in the social scale either as to civilization or morality.

The inquiry into the origin and date of the Arabian Nights may be said to have begun with Galland himself. In his dedicatory epistle he suggested that the stories came from India by way of Persia and took their present form in the middle of the thirteenth century. Scott, in 1811, indicated his belief that the original Arabian Nights consisted of a far smaller number than the 1001 in 36 parts, and that upon the original stock various novelists of the Moslem world engrafted their performances. Hammer-Purgstall was the first to call attention, in *Journal Asiatique*, pp. 253 ff. (1827) to a passage in Masudi's *Muruj al dhahab*, written in 947 A.D., referring to a book called "Thousand and One Nights" translated from a Persian work entitled *Hazar Afsanah*, or 'Thousand Tales,' telling the story of the King and his wazir, Sharazad and Dinazad. De Sacy replied in the *Mémoires de l'Académie des Inscriptions*, pp. 30 ff. (1833); showing evidence of an Arabic-Egyptian origin and a date as late as 1450. Hammer-Purgstall reiterated his opinion in *Journal Asiatique*, pp. 175 ff. (1839); and quoted another passage from Nadim's *Kitab al Fihrist*, written 987, confirming Masudi's account. The story known to Masudi and Nadim has many points of resemblance to our *Arabian Nights*. In both the framework is essentially the same—a king who was in the habit when wedding a damsel to kill her after having spent one night with her, and a damsel who entertained a king with stories so fascinating that he respited her each night in order that he might hear the continuation. This continued for 1000 nights, at the end of which period the

king decided to preserve his consort's life. Nadim also gives the name of the heroine as Shahrazad, and says that the book was written for Humai, daughter of Bahman. Firdausi makes Humai the daughter and wife of Bahman Ardashir, i.e., Artaxerxes Longimanus. Lane, in 1839, sided with De Sacy and emphasized the points that seemed to indicate an Egyptian origin at the end of the Mamluk, or beginning of the Turkish, period. That was substantially also the attitude of Weil (1838). De Goeje distinguished between the final edition in Egypt, c.1450 and the earlier forms of the work, made the translation of the Persian *Hazar-Afsanah* the nucleus, and regarded this Persian story as a variation of an old Persian legend of which another form is found in the Book of Esther (*De Gidd*, 1886). Burton in his *Terminal Essay*, which also appeared in 1886, took the same view, except that he did not attempt to trace a connection between the Persian heroine and Esther. The necessity of eliminating later glosses was suggested by A. Müller in *Bezenberger's Beiträge* (1888); and Zotenberg, on the basis of a careful examination of the various groups of manuscripts, hinted at an earlier eastern and a later Egyptian form of the collection, *Notices et Extraits des Manuscrits de la Bibliothèque Nationale*, pp. 167 ff. (1887). Mardrus thinks that 13 stories go back to the tenth century, that the collection as a whole assumed a definite shape in the thirteenth century, and the same tales may be as late as the sixteenth. The title, however, of the book known to have existed in the tenth century seems to suggest a much larger number. There are 264 stories, divided on 1001 nights, in the manuscript that has the most. The Achikar story found among the recently discovered Elephantine papyri (q.v.) shows that this kind of literature flourished and was widely spread in the Achæmenian period. While there is little resemblance between Esther and Shahrazad, and Ahasuerus (q.v.) is not Artaxerxes, but Xerxes, it is, therefore, not impossible that the romance was written in the Seleucid period or even before Alexander. That Shahriar appears as a Sasanid king, reigning in the Ganges valley, and having his brother as vassal in Samarkand shows how even the framework suffered change; and new stories were undoubtedly substituted for, and added to, the old ones. The additions made in Egypt must have been considerable, and the interpolations and changes in the text numerous.

Regarding the character of the stories and the material contained in them, we may distinguish three categories: (1) beast fables, (2) fairy tales, and (3) anecdotes. Of these, the beast fables represent probably the oldest structure, reverting, as they eventually do, to the primitive beliefs which attributed to animals human powers and evident superhuman faculties. Some of them are clearly of Indian origin, coming from the Panchatantra which was translated into Persian in the reign of Khosru Anushirvan (531-579), and from Persian, into Arabic by Mnkaffa in the time of Almanzur (754-775). The fairy tales show the eastern imagination at its best, though it should be remembered that some of the tales are transformed myths that again belong to a more primitive age than one which was able to exercise the imaginative fancy for its own sake, independent of doctrines or of symbolical purposes. Burton assumes that

the fairy tale proper in the *Arabian Nights* is "wholly and purely Persian" (*Terminal Essay* to his translation, p. 127), and so far as the stimulus toward this branch of literature is involved, he is unquestionably right. Characteristically Arabic, on the other hand, are the stories introduced to prove a point or to point a moral, while the incidents and anecdotes, historical and otherwise, are likewise the genuine production of the Arabic mind. The poems introduced into the stories, to which justice is done only in the excellent translation of Burton, are drawn either from the *Moallakat* (q.v.), the courts of Harun al Rashid, al Asma'i and Abu Nuwas, al Hariri's *Makamat*, or the later Egyptian poets.

In judging of the obscene allusions with which many of the tales are well stocked, and the frankly indelicate manner in which incidents are related that shock Occidental sensibilities, it must be borne in mind that many themes may be discussed in the Orient with perfect simplicity that would be regarded as improper among us, so that not everything which seems obscene was really intended to be such. But making due allowance for this difference between the Oriental and Occidental point of view, there remains a large residuum of erotic material that is undoubtedly introduced to add piquancy to the tales. Such material, however, has its value for the student of customs and manners, who is given an insight into conditions existing at one time in the Orient which is not to be had in any other way. Indeed, apart from the entertaining character of the tales, they abound in references to religious and social customs and manners of thinking that make them a perfect storehouse of valuable material for the one who wishes to study the Orient, and modern scholars have done much toward utilizing this material in their researches regarding Mohammedanism and Arabic antiquities as well as Arabic history. No systematic study has as yet been undertaken of the relations of the Arabian Nights to Mediæval European literature. In Boccardo's *Nuova Enciclopedia* (1882) the article on *Mille e una notte* discusses the possible influence on Boccaccio and Giovanni of Florence, and the manifest imitation of Shahryar in Ariosto's *Astolfo*. Toldo, in *Miscellanea di Studi Critici in honore di Arturo Graf*, pp. 491 (1903), suggests that some other stories found their way from the *Arabian Nights* of the tenth century to France, Italy, and Germany. Further investigation along these lines would be of great value.

The best editions of the Arabic text are those of Macnaghten (Calcutta, 1839-42; lithographed, Bombay, 1879) and the Bulak editions of 1835 (2 vols.) and 1885 (4 vols.). A shorter and at times expurgated text is given by M. Habicht and Fleischer (12 vols., Breslau, 1825-43). That of Salhani (5 vols., Beirut, 1888-90), is even more changed, not to offend Christian taste. Galland's French (1704) was soon followed by an English rendering, which as early as 1713 had already reached a fourth edition. The first English translation which in part, at least, was made from the Arabic was by Jonathan Scott (6 vols., 1811). It was not complete. Torrens, in 1838, began an independent translation, of which, however, only one volume was published. E. W. Lane published a translation which gave only an abridged text. Of the 100 tales in the Bulak edition he

rendered only half into English; a popular edition was published in 1847, *The Thousand and One Nights*. The notes constitute a valuable feature. Lane's edition has been repeatedly re-issued, the last one being in six volumes, edited by Joseph Jacobs (London, 1898). John Payne's translation, based upon the Macnaghten MSS. and prepared for the Villon Society, was issued in nine volumes (London, 1882-84). It was a work of great merit as a literary production, but was privately printed and is very scarce. The most excellent English translation, however, is that of Sir Richard Burton, in ten volumes (1885-86), with a "Terminal Essay" embodying the results of Burton's researches as to the origin, age, and character of the tales. To this he subsequently added six supplemental volumes (1887-88), containing tales not included in Macon's edition and drawn from other printed texts and manuscripts. An abridged and expurgated edition of Burton's work was prepared by Lady Burton and issued in six volumes (London, 1887-88). There are four noteworthy translations in German. The earliest was that of Habicht published at Breslau in 15 volumes (1824-25). This was followed by a translation by Zinserling, which was based upon the French translation of Hammer-Purgstall (3 vols., Stuttgart, 1823). Gustav Weil's translation appeared in three volumes at Stuttgart in 1838-43, and that of Max Henning in the *Reclam Universal Bibliothek* (Leipzig, 1896 et seq.). Of these the most reliable is that of Weil. In France Galland's translation has been superseded by that of Mardrus in eleven volumes (Paris, 1899-1904), and editions have been issued by Caussin de Perceval (9 vols., Paris, 1806), Edouard Gautier (7 vols., 1822-24), M. Destain (6 vols., 1823-25), and Silvestre de Sacy (3 vols., 1838).

The success of Galland's venture gave rise to many imitations that appeared in France, England, and Germany, all more or less expurgated and altered to adapt them for popular use. A complete bibliography of the *Arabian Nights* is given in Chauvin, *Bibliographie des ouvrages arabes*, vol. v (Paris, 1901).

ARABIAN SEA (anciently, Lat. *Mare Erythræum*, or the Red Sea) (Map: Asia, F 7). The northwestern part of the Indian Ocean, lying between Arabia, India, and Baluchistan. Its southern limit is generally supposed to be on a line from Cape Comorin, in Hindustan, to Cape Guardafui, in Africa. By the Gulf of Aden it communicates with the Red Sea and also with the Mediterranean through the Suez Canal (q.v.). On the northwest it forms the Gulf of Oman, with its continuation called the Persian Gulf. Among its eastern inlets may be mentioned the gulfs of Cutch and Cambay. The only important river it receives is the Indus, from the east. Its most important islands are the Laccadives and Socotra. The commercial significance of the Arabian Sea was very great in ancient times, when the products of the Orient were conveyed hither by sea to be transported by caravans to Europe. But with the discovery of the all-sea route to India, in 1497, its importance was lost until the opening of the Suez Canal in 1869 gave a fresh stimulus to commerce in that quarter. At present it is again a busy water thoroughfare. Consult C. F. Oldham, "Topography of the Arabian Sea," in *Asiatic Journal*, vol. lxiv (Calcutta, 1896).

ARABIA PETRÆA (Lat. Rocky Arabia).

The northwestern and more hilly region of Arabia, into which *Arabia Deserta* merges.

ARAB'ICI, or **ARA'BIANS**. A sect in Arabia, in the third century, which held that the soul dies with the body and will be raised again with it. Eusebius says that Origen, at their invitation, held a debate with them at a considerable synod, convinced them of their error, and they renounced it.

AR'ABIC LAN'GUAGE AND LIT'ERATURE. The Arabic is one of the Semitic languages (q.v.). Arabia is generally supposed to have been the home of the whole Semitic family at a remote period of history. Even if, as many scholars think, the stock originally came from Africa, it is admitted that the peninsula was the distributing centre of the vast majority of Semites. From there the Akkadians (see **ACCAD**) pushed their way into Babylonia, the Amorites and Hebrews into Syria, and the Aramæans into the countries around the Syrian desert. What the language of Arabia was in the fifth millennium B.C. can only be inferred from a comparison of the four great branches of Semitic speech; and such a comparison suggests that even then there were marked dialectical differences, becoming accentuated among the emigrants in their new environment and developing within Arabia itself. Our earliest inscriptions, coming from Yemen and possibly going back to the second millennium B.C., reveal certain archaic features already lost in the Akkadian, showing the persistence of the original type. While these inscriptions indicate the general character of the language in the extreme south, we have as yet only slight hints as to how man spoke in other parts of Arabia 3000 years ago.

More than 2000 inscriptions secured through Halévy, Euting, and especially Eduard Glaser (q.v.), have made us to some extent acquainted with the various dialects spoken in Yemen, Kataban, and Hadramaut during a period of, at least, 1500 years. Aside from *su* instead of *hu* and initial *s* in the causative, peculiar to the Minæan and connecting it with the East Semitic languages, and certain minor differences, a remarkable stability characterizes the written language of south Arabia throughout these centuries. (See **MINÆANS**; **SABÆANS**.) The spread of Islam, and with it the language of the Koran, caused the gradual disappearance of the earliest known type of Arabic. Only survivals of it are found in the modern dialects of Mahra, Shihra, and Socotra. As to the origin of the peculiar script used for it in ancient times some scholars hold that it is an adaptation of the North Semitic alphabet, while others maintain that it developed independently as the result of contact between Minæan colonies in north Arabia and the Philistines in Gaza and the Negeb who had come over from Crete, where a system of writing had long been in vogue. (See **ALPHABET**; **CRETE**.) Elements of the South Semitic alphabet are found in north Arabia in the Lihyanian, Thamudenic, and Safaitic inscriptions. In a greatly modified form language and script have both survived in the Tigrina, the Tigre, and the Amharic. See **ETHIOPIC**.

It was the North Arabic, however, that was destined to become one of the great languages of the world, in the hands of the pre-Islamic poets, Mohammed and the Moslem writers. It adopted a later form of the Aramaic alphabet.

By a system of diacritical points new letters were formed making it possible to indicate a number of consonantal sounds for which the Aramaic alphabet had no special characters; while, on the other hand, some of the Aramaic letters were not used. At a later time some letters were used, in an abbreviated form, to indicate the main vowel sounds, and others were employed to signify certain peculiarities of pronunciation. It is now known that the rounded cursive script, the *Neskhi*, is not a modified form of the more pointed Kufic, as was for a long time supposed. The former has been found in papyri dated in the seventh century, and it is probable that the Koran was first written in this script. The Kufic, first employed in the city of Kufa, was one of several variations, intended to give the writing a more ornate form. It was used, along with the *Neskhi*, for some centuries.

Before Mohammed the speech of the North Arabian tribes found its most perfect and beautiful expression in the songs of the great poets. In comparison with this classical language the Koran exhibits certain peculiarities of the prophet's own dialect, that of the Kuraish in Mecca. These were to some extent obscured, but not obliterated, by the later vocalization which was done on classical models. While the language of the Koran profoundly influenced theologians and jurists, poets naturally sought their patterns among the acknowledged masters of the past; and it may be said that the language of the songs became the literary language of the Moslem nations. Since the Koran must be used and explained, and the daily prayers offered, in Arabic, the language spread far and fast among the converted or conquered peoples. But it could not long remain unaffected by the vernacular in the lands subjected to Islam, and, as all parts of Arabia participated in the conquest, dialectical differences also tended to spread and to perpetuate themselves. The earlier history of the modern dialects is little known. There are some songs and stories, however, from Irak, Africa, and Spain, already quoted in the Middle Ages, that show the peculiarities characteristic of the dialects of Babylonia and northwest Africa. At the present time the main dialects are those of Arabia, Syria, Irak, Egypt, northwest Africa, and Malta.

The literature in this language may be divided into the following periods: (a) 328-610 A.D., (b) 610-750, (c) 750-1000, (d) 1000-1258, (e) 1258-1517, (f) 1517 to the present time. To the pre-Islamic period belong a few Syrian inscriptions, like those of al Namara (328), Zabad (512 and 513), and Umam al Jimal. The most important productions, however, are the songs of famous poets of which collections were made by Moslem authors. Among these are the *Moallakat*, a *diwan* made by Hammam, consisting of a characteristic song of each of the following poets: Amr al Kais, Antara, Labid, Tarafa, Zuhair, Amr ibn Kulthum, and Harith ibn Hilliza. Other names were substituted for the last two, or two more were added, in later collections. The name "Moallakat" means 'the excellent ones' and not 'the suspended ones,' as it was understood by some Moslem writers who, ignorant of earlier conditions, imagined that they had been hung upon the Kaaba in Mecca. Another *diwan* was made up by al Alam consisting of six poems by Amr al Kais, Antara, Labid, Tarafa, Nabigha, and Alkama. Songs

have been preserved in later *diwans* of a very large number of pre-Islamic poets. Among them were such men as Umayya ibn abi al Salt, Kab ibn Zuhair, al Absi, Shanfara, a Jewish poet, Samu'al ibn Adiya, and a Christian, Adi ibn Zaid of Hira. There were also poetesses in Arabia in pagan times. The treasury of ancient song was gathered together in the *Mufaddaliyat*, the *Hamasa* of Abu Tammam (q.v.); the *Hamasa* of al Buhturi, the *Kitab al Aghani* of Abu'l Faraj al Isfahani, the *Jamharat ash'ar al 'Arab* of Abu Zaid, the *Ikd al farir* of Ibn al Rabbihi, the *Mukhtarat al Shaarai* and elsewhere. The songs of the Banu Hudhail and those of the poetesses also formed such *diwans*, or collections. Besides the *shair*, or singer, the *rawi*, or narrator, also cultivated his art, and some stories have come down to us. The text of all these pre-Islamic productions is often fragmentary and poorly preserved. A new period began with Mohammed (571-632). The Koran, which gave birth to a religion and which founded the greatest politico-religious system of the Middle Ages, soon dominated all branches of intellectual activity. The earliest products of this domination were grammar and lexicography, the necessary instruments for the exegesis of the Koran. Schools were founded in Basra, Kufa, and Bagdad, where the sciences were studied, especially by Persian Mohammedans. Such a one was the first grammarian of Basra, Abd al-Rahman ibn Hormuzd (c.730). Among the noteworthy grammarians and lexicographers may be mentioned: Abu'l-Aswad al-Duali (eighth century), the inventor of the diacritical points; Khalil ibn Ahmad (718-791), of Oman, the founder of Arabic metrics and the author of the first Arabic lexicon, *Kitāb al-'Ain*; his disciple, Sibawaihi (796), author of an extensive grammar (translated into German by Jahn, Berlin, 1894); Ibn Duraid (d.934), author of the lexicon *al-Jamharah*; Ismail ibn Abbad al-Sahib (d.995), author of the lexicon *al-Muhit*; Jamal al din abu'l Fadl Mohammed b. Mukarram b. Manzur al Ansari (1232-1311), author of an extensive lexicon, *Lisān al-'Arab*; al-Zamakhshari (d. 1143), author of a grammar, *al-Mufassal*, and a lexicon, *Assās*; and Ibn Malik (d.1273), who wrote a grammar in 1000 verses under the title *Kitāb al-Alfiyah*.

As all Mohammedan philosophy, theology, law, and statecraft is derived primarily from the Koran, its interpretation became the object of discussion at a very early period. Hence an immense literature of commentaries and super-commentaries grew up, only the most important of which can be mentioned: those by al-Tabari (d.923), Hasan al-Nisaburi (d.1015), Abu'l Kasim ibn Satama (d.1019), al-Zamakhshari (d.1143), Mohammed al-Kurtubi (d.1272), Fakhr al-din Razi (d.1209), al-Baidawi (d.1286), and Jalal al-din al-Suyuti (d.1505). But Mohammedanism, as a system, rests as much upon the oral as upon the written law. The sayings and doings of Mohammed and his immediate followers form the science of the Hadith or traditions, which vary both as to value and authenticity. Around these there has also grown up a large literature; the great collections of such traditions were made by al-Bukhari (d.870), Muslim (874), Ibn Maja (d.887), al-Tirmidhi (892), and Abu Dawud al-Sijistani (d.941).

As early as the end of the seventh century,

a school of Mohammedan jurisprudence was founded in Medina by Abd Allah ibn Masud (d.652), Abd Allah ibn Abbas (d.687), and Sulaiman ibn Yasan (d.722). Its decisions were collected toward the end of the eighth century by the distinguished jurist Malik ibn Anas (d.812) whose *'al-Muwatta'* became the code for Hejaz, Tunis, Algeria, and Morocco, and was further developed by Yahya ibn Yahya Utbi (d.868), and Ibn abu Zaid al Kairawani (d.999). There are three other recognized codes, of Abu Hanifah (d.767), recognized in Bagdad, Transoxiana, India, China, and by the Turks, of Muhammed al-Shafii (d.820), recognized in Egypt, Iran, and Java, and of Ahmad ibn Hanbal (d.855). Other codes, to the number of 72, are proscribed as heretical. These have produced an extensive literature of commentaries and pandects, which has not exhausted itself in our own day.

The activity of the Mohammedans was not confined to philological and theological studies. With the accession of the Abbasides a new field was opened by the introduction of foreign civilizations. Learned men were invited from other countries and remunerated in a princely manner. The works of Greek, Syriac, Old-Persian, and Indian writers were translated into Arabic. Schools of philosophy were founded at Bagdad, Cordova, Cairo, etc., where the writings of Aristotle, Plato, and the Alexandrian philosophers were expounded and commented upon. Dogmas, hitherto regarded as sacred, were freely discussed and rejected. (See MUTAZILITES.) From these schools issued the philosophers al-Kindi (eighth century), al-Farabi (960), Ibn Sina (Avicenna 980-1037), al-Ghazzali (1111), Ibn Bajah (1138), Ibn Tufail (d.1185), and Ibn Roshd (Averroes, 1153-98), whose works, subsequently translated into Latin, were studied for many centuries in European universities.

In mathematics the Mohammedans made great advances by introducing the numerals and other modes of notation, the sine instead of the chord, and by extending the application of algebra. Astronomy was zealously cultivated in the schools of Bagdad, Cairo, and Cordova. According to Ibn al-Nadbi (1040), the library at Cairo possessed two celestial globes and 6000 astronomical works. In the ninth century the three sons of the librarian, Musa ibn Shahr, calculated accurately the diameter of the earth and the precession of the equinoxes. At the same time lived al-Farghani, author of an astronomical encyclopædia, which was translated in the twelfth century by Johannes Hispalensis. In the tenth century al-Battani (Albatagnius) flourished, to whose name is attached the introduction of trigonometrical functions, and the observation of the obliquity of the ecliptic. Among the astronomers whose works were translated into Latin may be mentioned Thabit ibn Korrah (901), Jabir ibn Aflah, who in 1196 constructed the first observatory at Seville, and Nasir al-din al-Tusi, the paraphraser of Euclid. Medicine and natural history were cultivated by the Mohammedans with a like success. In the seventh century the writings of Galen, Hippocrates, Paul of Ægina, etc., were translated from the Greek into Arabic. Ibn abi Usaibiah (1203-69) devotes a whole volume to the medical literature in Arabic. Among the medical writers may be mentioned Mohammed al-Razi (tenth century), whose works were translated into Latin; Ali ibn Ridwan (1061); Ibn Sina

(Avicenna); Abu'l-Kasim (1107), who wrote on surgery and surgical instruments; Abd al-Malik ibn Zuhr (1162), and Abd Allah ibn al-Baitar (1248), whose *Materia Medica* had great vogue.

History in all its forms was cultivated at an early time by the Mohammedans; several chronicles were written in the days of the Umayyad dynasty. Persian historiography influenced the Arabs to record the events of their past life as a people; and the growing interest in the prophet and his times furnished a healthy stimulus. From the middle of the eighth century we have an uninterrupted series of historians. The earliest of these were Mohammed ibn Ishak (d.768), whose biography of Mohammed was enlarged by Ibn Hisham (d.821), and Mohammed al-Wakidi (d.822), who wrote the history of the prophet at Medina. No less than 140 titles of works written by al-Kalbi (c.819) are mentioned, dealing largely with history and genealogy. It was a Persian, Abu Jafar al-Tabari (838-923), who produced the first universal history in Arabic, beginning with creation. A similar work was produced by Ibn al-Athir (1160-1234). Of the early historians mention must also be made of Ibn Kutaibah (892) and al-Baladhuri (892), who deals especially with the early conquests of the Arabs. In the tenth century wrote al-Hamdani (945), Hamzah al-Isfahani (961), and al-Masudi (956), who has left us a history of civilization. Among the historians of later centuries mention may be made of Ibn Maskawai (1030), al-Makin (1273), Ibn al-Amid (b.1254), al-Biruni (1308), historian of chronology and the Herodotus of India, Abu'l-Fida (d.1331), and Ibn Khaldun (d.1406), the greatest of all Arabic historians and the first to compose a philosophy of history. The chief historians of Spain were Ahmad al-Dhabbi (1195), Ibn Bashkuwal (d.1182), Mohammed ibn al-Abbar (d.1259), and Ahmad al-Makkari (d.1631). Among the noted historians of Egypt were Abd al-Latif (d.1231) and al-Makrizi (d.1441), of Maghrib al Kairawani (d.1070) and Ibn Khaldun; and of Spain al Kustubi (d.1182). More characteristic of Arabic historiography are the numerous local histories and biographical monographs produced. Among the most remarkable of these are the works of Jalal al-Din al-Suyuti (1505), author of 510 works, among which were histories of Cairo and Damascus; of Abu Ubaidah (d.824), author of 105 monographs, among which are histories of Mecca and Medina; of Ali ibn Asakir (1175), author of a history of Damascus in 80 volumes, of Baha al-din ibn Shaddad (1234), author of a history of Aleppo, Mohammed al-Shahrastani (1153) wrote a history of religious and philosophical sects which is still our chief authority on the subject. The most noteworthy biographical writers were Abu Zakariyah al-Nawawi (1274) and Ibn Khallikan (1282), who treats of 865 persons. Bibliography was treated of by Mohammed ibn Ishak al-Nadim (995), who wrote the *Kitab al Fihrist*, Ali ibn Yusuf al-Kifti (1248), and Hajji Khalifa (1658). With the exception of Ibn Khaldun the Arabic historians lack critical sense; they are mostly mere chronographers. In geography they displayed much greater ability and have left us works of lasting value. The chief geographical writers are Ibn Hisham, Khurdadhbeh (d.912), al-Masudi, Ahmad ibn Fadlan (d.921), Abu Ishak al-Istakhri (tenth century), Ibn Haukal (d.977), al-Mukaddasi (d.985), the traveller Ibn Batutah (d.1377),

Yakut (d.1178), who, like al-Bakri (d.1094), wrote an extensive geographical dictionary, al-Kazwini (d.1276) and Abu'l Fida.

Besides these advances in the solid branches of knowledge the genius of the Arabs continually flowered into poetry. From Bagdad to Cordova the Mohammedan world was full of sweet singers. Collections of the works of older poets (*diwans*) were made, of single writers, and of the poems of individual tribes, or arranged according to the subject matter of the poems. In the Umayyad period Akhtal, Farazdak, and Jarir are considered the greatest poets. A woman, Laila al Akhyaliyya (d.706), also won fame. Abu Nuwas, Muti ibn Ayas, Muslim ibn al-Walid (d.757); Abu'l Asahiya, Abu Tammam, Abu Firas (d.968, Mutanabbi, Ibn Farid, the mystic and Abu'l Ala al Ma'arri, were the most eminent poets in the flourishing period of the Abbasides. The royal poets Abd al-Rahman (d.788) and Al-Mutamid (d.1095) of Spain; al-Tughrai (d.1120), the panegyrist of Mohammed, al-Busiri (d.1279) and Umar ibn Rabia (d.1328) also deserve mention. Though much of this poetry was scholastic in form al-Mutanabbi (965) is considered one of the greatest Mohammedan poets and his *diwan*, with its 289 poems, was always widely read. A new species of poetry was invented, the *Makamat*, a sort of rhymed prose in a finished and most ornamental style and exhibiting merely the literary prowess of the writer. Of such a kind were the writings of Ahmad al-Hamadhani (d.1007) and Abu Mohammed al-Hariri of Basra (d.1121). Side by side with this scholastic poetry there grew up a large mass of popular verse, which refused to be bound by the canonical metres and which developed the strophe, otherwise unknown to Arabic literature. A particular form of this was the *Muwashshah*, or girdle poem. The epistolary style developed by Abu Bekr al Khwarizmi (q.v.) and further by Al Hamadhani (q.v.), reached its perfection in the works of Abu'l Ala al-Ma'arri (q.v.), one of the foremost poets in the Moslem world and a very radical thinker. A popular and at times fantastic prose literature also made its appearance, in which the eastern craving for the wonderful and gorgeous was richly gratified. This was largely influenced by non-Arabic literatures, as in the *Fables of Bidpai*, translated in 750 by Abd Allah ibn al-Mukaffa from the Persian, in *The Seven Wise Masters*, and in the *Arabian Nights* (q.v.). Pure Bedouin romances are the stories of *Saif ibn dhi Yazan*, of the *Banu Hilal*, of *al Zir*, and especially the *Antar Romance*, which gives the most faithful picture of desert life, and which was not without influence upon the romance and chivalry of mediæval Europe.

All this culture of the early centuries of Mohammedanism presents a strong contrast to the decline which is evident from the ascendancy of the Turks in the sixteenth century to our own day. Scholastic discussions on dogmatics and jurisprudence, and purely grammatical disquisitions became the order of the day. The expedition of Napoleon to Egypt presaged the introduction of western culture to the East, and a slow intellectual resurrection has commenced. The printing presses of Bulak, Fez, Constantinople, Beirut and of several Indian cities are extremely productive, and edition after edition is quickly exhausted. Newspapers in Arabic are now published all over the East, and even in western cities, e.g., Paris and New York. Writ-

ers have also begun to attempt, with more or less success, to imitate European forms of thought and sentiment. Of these may be mentioned Michael Sabbagh of Syria (*La Colombe Messagère*, Arabic and French, Paris, 1805); the Sheik Riffa of Cairo (*The Broken Lyre*, Paris, 1827); *Manners and Customs of the Europeans* (Cairo, 1834); *Travels in France* (Cairo, 1825). But despite all this, the results obtained in Egypt during the period from 1798 down to the English tutelage, in 1882, were meagre. Mohammed Ali introduced the printing press in 1821 and founded a school for mathematics. Some of the works of the best European writers were translated into Arabic; the vice-regal library was founded in Cairo in 1870. Few great scholars and writers have as yet appeared; and it is as yet uncertain whether the attempt to develop the common speech into a literary language will be more successful. The endeavor to substitute the Roman script for the Arabic (furthered notably by Prof. W. Fiske) has not been effective. Only in Malta has the Latin alphabet been used for the last 60 years. The following modern poets deserve mention: Hasan al-Attar (1766-1838); Abd Allah Pasha al-Fikri (1834-90); Aisha Ismat Hanun, daughter of Ismail Pasha; and Mohammed Uthman Jalal (b.1829), the translator of Racine and Molière. To these may be added the historians Abd-Allah al-Sharkawi (1737-1812, and Abd al-Rahman al-Jabarti (d.1826), both historians of the French occupation; Ali Pasha Mubarak (1823-93), the topographer of Cairo and Alexandria; and the great jurist Ibrahim al-Bajuri (1783-1861), rector of the al-Azhar University. In Syria the beginnings of a new life are due to European and American efforts. The American Presbyterian missionaries and the French Jesuits (since 1869) have started a new life in Beirut by means of the printing press and modern schools. A real interest in the old literature has been awakened, many of the masterpieces being reëdited in a critical spirit. In this connection may be mentioned the philologist and poet Nasif al-Yaziji (1800-71), who wrote the critical observations in De Sacy's edition of Hariri (*Epistola Critica*, Leipzig, 1848); Butrus al-Bistani (1819-83), author of a dictionary and a general encyclopædia; Ahmad Faris al-Shidyak (d.1884), the grammarian; Khalil Sarkis (1877), the historian of Jerusalem; and Louis Cheikho, the learned editor of the old Arabic poets. In the old home of the faith, Mecca, literary activity still continues to our own day, but upon the old theological and dogmatic lines. Worthy of mention are Ahmad Dahlan (d.1886), theologian and historian, the author of more than 20 works, and Mohammed ibn Umar al-Nawawi, by origin a Malay, the author of 18 works upon different subjects, the first of which appeared in 1879. In India European influence in literature is confined to the publications of the *Biblia Indica*; and to a few writers such as Siddik Hasan, husband of the Sultane of Bhopal (d.1889). The same condition prevails in the Maghrib (North-west Africa). But French culture has already begun to exercise an influence upon Arabic literature in Algiers; and the same may in course of time be expected from the French occupation of Morocco (1911). As yet, however, productions of the lithographic press at Fez are all confined to the older Islamic theological, legal, and historical literature.

Bibliography. 1. General works: Brockelmann, *Geschichte der arabischen Litteratur* (Weimar, 1898-1902), and his more popular work (with translations) published under the same title (Leipzig, 1901); Huart, *History of Arabic Literature* (New York, 1903); Chauvin, *Bibliographie arabe* (Liège, 1892, et seq.); Hammer-Purgstall, *Litteraturgeschichte der Araber* (7 vols., Vienna, 1850-56, antiquated); Arbuthnot, *Arabic Authors* (London, 1890); Nicholson, *A Literary History of the Arabs* (Cambridge, 1909); Von Kremer, *Culturge-schichte des Orients* (Vienna, 1877); Goldziher, *Mohammedanische Studien* (Halle, 1889-90); Zenker, *Bibliotheca Orientalis* (Leipzig, 1846, for printed books); Hartmann, *Arabic Press of Egypt* (London, 1898); Ahlwardt, *Verzeichniss der arabischen Handschriften der königlichen Bibliothek zu Berlin* (Berlin, 1887, et seq.); 2. Language: De Sacy, *Grammaire arabe* (3d ed., revised by Machuel, Paris, 1904); Caspari, *Arabische Grammatik* (5th ed., revised by A. Müller, Halle, 1887); Wright, *A Grammar of the Arabic Language* (3d ed., revised by Robertson Smith and De Goeje, Cambridge, 1896-98); Nöldeke, in *Denkschriften der Wiener Akademie der Wissenschaften* (1896), and *Beiträge zur Semitische Sprachwissenschaft* (Strassburg, 1904); Socin, *Arabische Grammatik* (7th ed. by Brockelmann, Berlin, 1913); Flügel, *Die grammatischen Schulen der Araber* (Leipzig, 1862); Reckendorf, *Die syntaktischen Verhältnisse des Arabischen* (Leyden, 1898); Brockelmann, *Grundriss der Vergleichenden Grammatik der semitischen Sprachen* (1908-13). *Hommel, Süd-Arabische Chrestomathie* (1893). 3. Poetry: Nöldeke *Beiträge zur Kenntniss der Poesie der alten Araber* (Hanover, 1864); Ahlwardt, *Ueber Poesie und Poetik der Araber* (Gotha, 1856), and *Bemerkungen über die Aechtheit der alten arabischen Gedichte* (Greifswold, 1872); Schack, *Poesie und Kunst der Araber in Spanien und Sizilien* (Berlin, 1865); Basset, *La poésie arabe antéislamique* (Paris, 1880); Jacob, *Studien in arabischen Dichtern* i-iii (Berlin, 1893-95); Hartmann, *Das arabische Strophengedicht* (Weimar, 1896-97); Carlyle, *Specimens of Arabic Poetry* (London, 1840); Clouston, *Arabic Poetry* (London, 1880); Lyall, *Ancient Arabic Poetry* (London, 1885). Cheikho, *Poetesses of the Jahiliyya* (in Arabic, Beirut, 1897). 4. History: Wüstenfeld, *Die Geschichtschreiber der Araber* (Göttingen, 1882). 5. Geography: Wüstenfeld, *Die Litteratur der Erdbeschreibung bei den Arabern* (Magdeburg, 1842). 6. Philosophy: De Boer, *Geschichte der Philosophie in Islam* (Stuttgart, 1901); Munk, *Mélanges de philosophie juive et arabe* (Paris, 1859); Dugat, *Histoire des philosophes et des théologiens musulmans* (Paris, 1879); Dieterici, *Die Philosophie der Araber im X Jahrhundert* (Leipzig, 1876-78). 7. Science: Wüstenfeld, *Geschichte der arabischen Aerzte* (Göttingen, 1840); Leclerc, *Histoire de la médecine arabe* (Paris, 1876); Sédillot, *Materiaux pour servir à l'histoire comparée des sciences mathématiques chez les Grecs et les Orientaux* (Paris, 1845-49); Steinschneider, *Die arabischen Uebersetzungen aus dem Griechischen* (Leipzig, 1889-93); Wiedemann, *Ueber die Naturwissenschaften bei den Arabern* (Hamburg, 1890); Suter, *Die Mathematiker und Astronomen der Araber* (Leipzig, 1900).
