PREFACE TO THE FIRST EDITION

THE work which is now given to the public after years of diligent preparation is not a new edition or revision of the *International Cyclopædia*. It is not based upon that or upon any other publication. The comparatively small portion of text which has been retained unaltered from the *International Cyclopædia* and incorporated in these volumes has been so retained because it has successfully stood the test of searching criticism, and because the Editors regard it as satisfying the most exacting requirements. This, however, is the full extent of the new Encyclopædia's obligation to the old. The present work has been planned and executed as a wholly independent and original undertaking. It represents the practical knowledge gained from an editorial experience of many years. It embodies the results derived from a critical study of all the most famous works of reference which have at any time appeared in Europe or in the United States.

Every encyclopædia which has secured a lasting hold upon the confidence of the reading public has necessarily been distinguished by some especial merit of its own; yet in the case of each existing publication, this peculiar merit has invariably been offset to a greater or less extent by some counterbalancing defect. Hence, there has always been discernible a decided difference of opinion, both among critics, and among readers, as to which one of the standard encyclopædias best fulfils the proper function of such a work. The ideal encyclopædia is one that combines four attributes: first, accuracy of statement; second, comprehensiveness of scope; third, lucidity and attractiveness of presentation; and fourth, convenience of arrangement. Any compilation of this character, which conspicuously fails to embody all of these essential qualities, falls short to that extent of the ideal; and it must be said that no one of the great encyclopædias which are already in existence can fully stand this test. In the course of time there have gradually been developed three distinct and well-known types of encyclopædic publications, each one of which may be regarded as the concrete expression of a single predominating purpose. Thus the *Encyclopædia Britannica* represents, in most of its departments, accuracy combined with fullness of detail, and in its own especial sphere, which is that of science, it long remained without a rival. It is, indeed, as every one is well aware, far less a true encyclopædia than a collection of elaborate monographs, so scholarly and so diffuse that many of these so-called articles have actually been published separately as treatises on their respective subjects. Nevertheless, the *Encyclopædia Britannica*, though its authority has been very great, has never proved to be a wholly adequate and satisfactory work of reference. In the first place, through the massing of its information under a comparatively few titles, it is ill adapted for popular use, even with the aid of the ponderous index which its publishers appended to it in a final volume. In the second place, it omits so many topics of general interest as to oblige its purchasers to supplement it by some more popular if less monumental work. Finally, the treatment of its most important topics is extremely technical and therefore to the great majority of readers almost unintelligible. Hence, the *Encyclopædia Britannica*, while generally accurate and authoritative, is neither truly comprehensive in its scope nor lucid in its method of presentation, while it is decidedly inconvenient for purposes of ready reference.

The great French encyclopædia of Larousse is found in every important library throughout the world, and it is in some respects a model work. In it, the different departments are judiciously divided, and they are treated in detail under the separate titles most appropriate to these divisions. The work, moreover, is unusually complete, and the literary treatment of the different topics included in its text is clear and at times vivacious and entertaining. There exists, however, throughout its pages a lack of accuracy which frequently misleads the reader, while the number of the volumes and their excessive bulk render the encyclopædia both inconvenient in use and almost prohibitory in cost.

The famous *Conversations-Lexikon*, completed and first published by Friedrich Arnold Brockhaus in 1812, and continued by him and his successors through many subsequent editions down to the present time, is an approximation to the ideal encyclopædia. Its accuracy has become proverbial. Its selection of topics and its careful division and subdivision of them for treatment in detail have secured both comprehensiveness of scope and convenience of arrangement. Where it falls short of approaching something like perfection is in the dryness of its narration and its thoroughly German

neglect of literary form. Nevertheless, on the continent of Europe it has long been accepted as the standard encyclopædic work of reference, and it has been translated and imitated in almost every country, notably in the valuable and popular encyclopædia of Chambers, of which the edition that appeared at Edinburgh in 1860 was not only based upon the *Conversations-Lexikon*, but was confessedly in part translated from it.

These three types of encyclopædia represent, as it were, the survival of the fittest, and each of them owes something to the others. Historically, all three have been developed out of the ponderous compilations of the eighteenth century, among which Zedler's *Universal-Lexikon*, in sixty-four volumes (1750), d'Alembert and Diderot's famous *Encyclopédie* in twenty-eight (1772), and Ersch and Gruber's *Allgemeine Encyclopädie* in more than one hundred and sixty volumes remain the most remarkable examples. The gradual evolution of the modern encyclopædia forms, indeed, an interesting study. The older works originally grouped their articles under related departments rather than in alphabetical order; and it was only after many years that the alphabetical arrangement came into general use as being infinitely more convenient for the reader, even though theoretically less scientific. The elaborate system of cross-references, which is now a subject of especial study on the part of all encyclopædic editors, was first developed by Ephraim Chambers in the early part of the nineteenth century. The elucidation of the text by means of diagrams, maps, portraits, colored plates, and other illustrations, was at first quite sparingly employed; but it was an interesting feature of the *Encyclopædia Britannica*, and was finally adopted on a very lavish scale by Brockhaus and by Meyer in Germany.

All modern encyclopædias have incorporated these three features as being absolutely essential. Such fundamental differences as are perceptible between them will be found to exist partly in the scope and purpose of each separate publication, and partly in the method by which the original design has been carried out by those to whom the task has been committed. It therefore seems desirable that, in writing these words of introduction, the Editors of the NEW INTERNATIONAL ENCYCLOPÆDIA should set forth as briefly, yet as clearly as is possible, the manner in which they have endeavored to insure at least a close approximation to what, in their best judgment, an ideal encyclopædia should be.

Since accuracy is very properly regarded as the most essential of all the attributes of such a publication, the Editors have been at especial pains to make this work in its several departments fitly representative of modern scientific scholarship. There has long prevailed in certain quarters a definite yet quite untenable belief that this result can be most satisfactorily attained by assigning sets of articles to separate contributors of eminence, for them to write what pleases them and then to sign what they have written. The signed article, it has been claimed, is the best possible guarantee of accuracy, since it carries with it the weight and the authority of its author's name. This theory, however, will not bear a close examination. For it is evident that no single specialist, however eminent, can be so thoroughly equipped at every point as to leave in what he writes no room for criticism. He has his individual preferences strongly marked, and necessarily also his individual bias. In treating matters of scientific doctrine, therefore, he will quite unconsciously give to his statements the coloring of his own personal beliefs. In discussing controversial topics, he will with the same unconsciousness lay more stress upon the theories which he holds himself than upon those which are accepted and maintained by other men of equal eminence. Moreover, he is apt to assume upon the reader's part too great a familiarity with the subject, and hence to employ language which is excessively technical and difficult to understand. Finally, when the individual contributor is permitted to treat his chosen topics in his own way and without reference to what other contributors have done, there will necessarily result a lack of symmetry and proportion which will be perceptible to the most casual reader of the completed work. These facts have been so often demonstrated in the past as to have led the editors of the Brockhaus *Conversations-Lexikon* to reject the signed article altogether, and to substitute for the individualistic system another system under which each article, though originally written by a single specialist, is subsequently criticised by other specialists through whose hands it passes and by whom it is so modified as, in its final form, to be no longer the work of one particular individual. It represents instead the collective knowledge and the different view-points of a number of highly trained and able men, while it usually receives, as well, a finishing touch from the general editor, who bears constantly in mind the inestimable value of simplicity, proportion, and clearness. No signed article can ever have the completeness, the authority, and the practical value of an article prepared in such a way as this; and the proof of the assertion is found in the undisputed fact that the encyclopædia of Brockhaus has been universally recognized as the most minutely accurate work of reference that exists to-day. Moreover, as a practical matter, the signed article frequently involves a certain inevitable deception. As new editions of an encyclopædia appear, a multitude of changes in the text are necessarily demanded in order to add new facts and modify old theories; and these changes are often made by other hands than those of the original contributors, so that many articles to which a writer's name is signed are no longer in reality his own. Hence the Editors of the present work

have, after much deliberation, dispensed entirely with the signed article. In its stead, they have arranged that every important contribution to the work, while written by a specialist of acknowledged competence, shall nevertheless pass through other hands and receive its final form upon the basis of mutual discussion, criticism, emendation, and suggestion. It is proper here to acknowledge the great value of the assistance rendered by Mr. Louis Heilprin, who has read all the proofs, and whose minute and varied knowledge and wide experience have assured a very high degree of accuracy.

In the second place, the endeavor has been made to render this Encyclopædia more comprehensive in its scope than any other. The rapid march of science during the past few years, the new inventions and discoveries that have been made, the political and social changes that have been effected, and the multitude of absolutely new interests that have arisen in almost every department of human activity, have added an immense mass of topics to the list with which former encyclopædias have had to deal. It is believed that all these topics have here received adequate and accurate attention; while a much greater completeness than is usual will be found in the treatment of nearly every department. It is desirable to call especial attention to the amount of space that has been given to the subject of Geography, both physical and political, and to the carefully selected information relating to municipal organization and the management of public utilities — information such as has never before been systematically given in any encyclopædia published in the English language. Something also should be said of the fullness and the modern character of the articles bearing upon the several departments of Biology, Botany, Education, and Psychology, the Mechanical Arts, Physics, Military and Naval Science, Sociology, and Biography. As to the last-named subject, it may be said, without fear of contradiction, that no encyclopædic reference-book in England or America contains as titles so many names of men and women; while the information given under these titles is brought down to the very eve of the publication of this work. Another department of great interest and value is that which has to do with what may be called miscellaneous information and which covers a range of topics not heretofore included in a general encyclopædia. Under this head will be found, for instance, the titles of famous books, comprising works of fiction, the names of the important characters in imaginative literature, the explanation of political nicknames and popular allusions, and in fact all that class of subjects which has ordinarily been found only in Readers' Handbooks, and similar special compilations. It should be noted, too, that the pronunciation of all unusual, technical, or foreign words has been carefully figured in accordance with a simple phonetic system, and that their etymology has been systematically traced. This etymological work has been done with careful regard to the conclusions of the newest school of philological research, and the facts are set forth as simply and as clearly as is possible. For the convenience of the general reader, all the words and stem-forms belonging to the Græek or to the Oriental languages have been transliterated. Care has been taken to supply every important article with a well-selected bibliography for the guidance of those who may wish to pursue the subject in all its ramifications; and the bibliographical material will be found to comprise not only the standard works, but also special monographs, pamphlets, and papers published by the various learned societies. The Encyclopædia as a whole, then, is in reality a library whose books are so divided and arranged as to make the information which they afford immediately and conveniently accessible to the reader. It is this completeness which justifies the title "International" in its application to this work. The word is one which possesses a new significance to Americans at the present time, when our country has shaken off its former isolation, and has developed so many points of contact, political and commercial, with the other nations of the earth. Yet while the work is international, it is international from an American point of view, and it very naturally gives the fullest treatment to those topics which are of immediate and vital interest to Americans.

(With regard to the third essential — lucidity and attractiveness of presentation — the recognition of its value which has been expressed above, will afford, perhaps, a clue to what the Editors have endeavored to accomplish.) There exists a kind of writing which has become so stereotyped as to be well known to every one, and which might be fittingly described as the encyclopædic style. It is in literature what a monotone is in music — utterly devoid of individuality, of variety, and of interest. It sets forth every possible subject in the same dull way and robs the most living themes of their vitality.† This style has even acquired, by the influence of tradition, a pseudo-sanctity, until many persons have become convinced that an encyclopædic article must inherently and inevitably be a synonym for dullness. This view the editors are very far from entertaining, or from desiring to perpetuate; and so the principal contributors have been selected not only for their special knowledge, but also for their possession of a clear, attractive style; and in those articles of which the subjects lend themselves to a distinctly literary treatment, the authors have been expected to write with the same freedom and with the same personal touch as would characterize their contributions to any literary publication of a high class. As the Encyclopædia is intended first of all for the general reader, it has been written from the general reader's point of view, and in such a way as to be free from all vexatious technicalities. Regard, moreover, has been had to form, and to a logical order of presen-

tation. In every detail, the endeavor has been made to compact really valuable information instead of loosely assorted and often unrelated facts. Even the statistics, which in many works of this character are thrown together in a mass, have been used in such a way as to exhibit comparisons which are significant and which possess an interest of their own for every person of intelligence. In short, the aim has been consistently to present each subject not only so as to inform, but likewise so as to attract and entertain.

The fourth essential of a useful encyclopædia is found in the practical convenience with which it may be consulted. This practical convenience has been studied very carefully both by the Editors and by the contributors with the object of enabling a reader to find, with the least possible expenditure of time and patience, the information of which he is in need. This end has been attained, first, by giving a conspectus of each topic as a whole; second, by treating the same topic more in detail under all the natural divisions into which it falls; and finally, by working out a system of cross-references which may serve as guides from each topic to the others which supplement it and provide the collateral information necessary to its fullest understanding.

It is thought that the illustrations of every kind will be found superior to anything hitherto attempted in any encyclopædia. These illustrations have not been gathered together in a haphazard fashion and merely for the purpose of providing the volumes with a certain number of attractive pictures; but they were suggested and selected by the various contributors, or prepared with their coöperation. In many cases much assistance was derived from the Governmental Departments in Washington, where all the plates relating to Natural History were examined and verified by experts in the Government's employ.

The Editors are thoroughly aware of the formidable character of their undertaking. No one, in fact, who has not been intimately associated with the making of a great encyclopædia can fully understand the difficulties which are inherent in such a task, involving as it does the coöperation of a large body of highly trained and scientifically qualified experts, and demanding so many and such varied forms of effort — organization, selection, knowledge, literary skill, critical judgment, and a true sense of proportion. Nor has it been forgotten that such a work as this should be something more than a convenient book of reference. Encyclopædias have in the past performed, and they are still performing, a remarkable educational function in disseminating exact knowledge upon an immense variety of subjects. It would be difficult to overestimate the influence which has been exercised by such famous works as those which have been mentioned in the preceding pages; for they have been really libraries, and to thousands upon thousands of families they have been the only libraries available. To prepare a book which shall professedly discharge a function so important is no light undertaking; to obtain even a fair measure of success is a memorable achievement. It is the hope of the Editors of this Encyclopædia that the test of time will show them to have profited alike by the merits and by the defects of the works which have preceded it; and that the result may be approved as embodying the experience of the past with an intelligent conception of the requirements of the present.

NEW YORK, June, 1902.

PREFACE TO THE SECOND EDITION

THE First Edition of the NEW INTERNATIONAL ENCYCLOPÆDIA was published in 1902-4. The progress and changes during the ten years that have since elapsed have necessitated a thorough revision of the entire text, the expansion of many departments, and the inclusion of many new articles. So radical were the necessary changes and so extensive the additions that the publishers decided to reset the entire work instead of merely cutting the plates, and to add three new volumes besides increasing somewhat the size of the page.

In carrying out this work the articles have been classified in departments and the head of each department has examined carefully the text of every article and made such changes as were desirable in view of the later information available, including the expansion of the existing text and the addition of new articles, whenever necessary, subject to the rules of proportionate treatment.

The Second Edition retains the essential features of the First, namely: the placing of the subjects under titles to which the reader would naturally turn first, the use of a single alphabet with so copious a supply of cross-references as to dispense with the necessity of an index, a very inclusive title list, a full and practicable bibliography for all important subjects, the latest valuable authentic information available on each subject, the etymology and pronunciation of all unfamiliar titles, the distribution of subjects under their own titles rather than in groups, and a comprehensive and so far as possible non-technical treatment to meet the needs of the greatest number of users.

FRANK MOORE COLBY,
TALCOTT WILLIAMS.

April, 1914.

KEY TO PRONUNCIATION

<p>ā as in ale, fate. Also see ě, below. ā " " senate, chaotic. â " " glare, care, and as e in there. See ě, below. ă " " am, at. ä " " arm, father. â " " ant, and final a in America, armada, etc. In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short u (ÿ). a " " final, regal, where it is of a neutral or obscure quality. a " " all, fall. e: " " eve. e: " " elate, evade. ě " " end, pet. The characters ě, ā, and â are used for ä, ae in German, as in Baedeker, Gräfe, Händel, to the values of which they are the nearest English vowel sounds. The sound of Swedish ä is also sometimes indicated by ě, sometimes by â or ä. ě " " fern, her, and as i in sir. Also for ö, oe, in German, as in Göthe, Goethe, Ortel, Oertel, and for eu and oeu in French, as in Neufchâtel, Crèvecoeur; to which it is the nearest English vowel sound. e " " agency, judgment, where it is of a neutral or obscure quality. ī " " ice, quiet. ī " " quiescent. ī " " ill, fit. ō " " old, sober. ō " " obey, sobriety. ô " " orb, nor. ǒ " " odd, forest, not. o " " atom, carol, where it has a neutral or obscure quality. oi " " oil, boil, and for eu in German, as in Feuerbach. oō " " food, fool, and as u in rude, rule. ou " " house, mouse. ū " " use, mule. ū " " unite. ũ " " cut, but. u " " full, put, or as oo in foot, book. Also for ü in German, as in München, Müller, and u in French, as in Buchez, Budé; to which it is the nearest English vowel sound. û " " urn, burn. y " " yet, yield. B " " the Spanish Habana, Córdoba, where it is like a v made with the lips alone, instead of with the teeth and lips. ch " chair, cheese.</p>	<p>D as in the Spanish Almodovar, pulgada, where it is nearly like th in English then, this. g " " go, get. G " " the German Landtag, and ch in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat. H " j in the Spanish Jijona, g in the Spanish gila; where it is a fricative somewhat resembling the sound of h in English hue or y in yet, but stronger. hw " wh in which. K " ch in the German ich, Albrecht, and g in the German Arensberg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate toward which the tongue is raised. It resembles the sound of h in hue, or y in yet; or the sound made by beginning to pronounce a k, but not completing the stoppage of the breath. The character k is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of kh in the word Khan. n " in sinker, longer. ng " " sing, long. N " " the French bon, Bourbon, and m in the French Étampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce "onion" without touching the tip of the tongue to the roof of the mouth. The corresponding nasal of Portuguese is also indicated by N, as in the case of São Antão. sh " " shine, shut. th " " thrust, thin. TH " " then, this. zh " z in azure, and s in pleasure. An apostrophe ['] is sometimes used to denote a glide or neutral connecting vowel, as in tā'b'l (table), kǎz'm (chasm). Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds. When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English words, and words which are so spelled as to insure their correct pronunciation if they are correctly accented. See the article on PRONUNCIATION.</p>

Assistant Professor of History, College of
the City of New York.
TOPICS IN BIOGRAPHY.
- RALPH S. THOMPSON,
MUSIC AND BIOGRAPHY.
- HUGH P. TIEMANN, B.S., A.M.,
Carnegie Steel Co.
METALLURGY OF IRON AND STEEL.
- CHARLES COMFORT TIFFANY, D.D.,*
Late Archdeacon of New York.
PROTESTANT EPISCOPAL CHURCH.
- ROGER EDMUND TILESTONE,
PAPER.
- WILBUR F. TILLET, S.T.D., LL.D.,
Vice Chancellor of Vanderbilt University,
and Dean of the Theological Faculty.
METHODIST EPISCOPAL CHURCH, SOUTH.
- EDITH M. TILLEY,
Librarian, Newport Historical Society.
NEWPORT, R. I.
- WILLIAM TINDALL,
Secretary, Board of Commissioners, Dis-
trict of Columbia.
DISTRICT OF COLUMBIA.
- EDWARD BRADFORD TITCHENER, D.Sc.,
PH.D., LL.D., LITT.D.,
Sage Professor of Psychology, Graduate
School of Cornell University.
DEPARTMENT OF PSYCHOLOGY.
- ALBERT W. TOLMAN, A.M.,
PORTLAND.
- LUCIUS MOODY TOLMAN, B.S., M.S.,
Chief of Food Inspection Division, United
States Department of Agriculture.
WINES AND DISTILLED LIQUORS.

- OLIVER SAMUEL TONKS, PH.D.,
Professor of Art, Vassar College.
CLASSICAL ARCHÆOLOGY.
- CHARLES HASKINS TOWNSEND, Sc.D.,
Director of the New York Aquarium.
DEEP-SEA EXPLORATION.
- AARON L. TREADWELL, PH.D.,
Professor of Zoölogy, Vassar College.
TOPICS IN BIOLOGY AND BIOGRAPHY.
- N. M. TRENHOLME, PH.D.,
Professor of History, University of Missouri.
TOPICS IN MODERN EUROPEAN HISTORY.
- WILLIAM PETERFIELD TRENT, LL.D., D.C.L.,
Professor of English Literature, Columbia University.
DEPARTMENT OF AMERICAN LITERATURE.
- AMASA TROWBRIDGE,
Late P. A. Engineer, U. S. N.; formerly
Adjunct Professor of Mechanical Engineering,
Columbia University.
TOPICS IN MECHANICAL ENGINEERING.
- ALFRED CHARLES TRUE, PH.D., Sc.D.,
Director of the States Relations Service,
United States Department of Agriculture.
DEPARTMENTS OF AGRICULTURE AND HORTICULTURE.
- CHARLES QUINCY TURNER,
Formerly Managing Editor of *Outing*.
TOPICS RELATING TO SPORTS.
- LEVERING TYSON, A.M.,
Secretary, Alumni Federation, Columbia University.
EDITOR FOREIGN GAZETTEER.
- CLIFFORD BREWSTER UPTON, A.M.,
Assistant Professor of Mathematics in
and Secretary of Teachers College, Columbia University;
Author of *Modern Calculating Machinery*.
CALCULATING MACHINES.
- LEWIS SAYRE VAN DUZER,
Captain in the United States Navy, Retired;
Ex-Secretary of the United States Naval Institute.
DEPARTMENT OF NAVAL SCIENCE.
- GILBERT VAN INGEN,
Assistant Professor of Geology, Princeton University.
DEPARTMENT OF PALEONTOLOGY.
- ARNOLD J. F. VAN LAER, M.E., B.L.S.,
Archivist, State Education Department,
Albany, N. Y.
ALBANY.
- JOHN ROBERT VAN PELT, PH.D.,
Professor of Philosophy and Biblical Literature,
Cornell College (Iowa).
TOPICS IN RELIGIOUS BIOGRAPHY.
- HENRY CLAY VEDDER, D.D.,
Professor of Church History, Crozer Theological Seminary.
BAPTISTS.
- C. W. A. VEDITZ, PH.D., LL.B.,
Formerly Professor of Sociology, George Washington University.
CRIMINOLOGY AND OTHER ARTICLES.
- FELIX VEXLER, A. M.,
Librarian, School of Philosophy, Columbia University.
MODERN PHILOLOGY, AND ORIENTAL SUBJECTS.
- OLAF O. L. VICO, PH.C.,
SCANDINAVIAN LITERATURE, HISTORY, AND BIOGRAPHY.
- HERMAN T. VULTE, PH.D., F.C.S.,
Assistant Professor of Household Chemistry,
Teachers College, Columbia University.
CHEMICAL INDUSTRIES.
- HERBERT TREADWELL WADE,
EDITOR EXACT AND APPLIED SCIENCE AND TECHNOLOGY;
Articles: AERONAUTICS, ELEVATORS, FIRE PROTECTION,
METRIC SYSTEM, WEIGHTS AND MEASURES.
- WILLISTON WALKER, PH.D., D.D., L.H.D.,
Professor of Ecclesiastical History, Yale University.
CONGREGATIONALISM.
- JAMES J. WALSH, M.D., LL.D., LITT.D., Sc.D.,
Lecturer, Champlain Assembly Summer School
and Western Catholic Chautauqua.
TOPICS IN CHURCH HISTORY.
- CHARLES P. WARREN,
FIREPROOF CONSTRUCTION; STEEL SKELETON CONSTRUCTION.
- C. HAROLD WATERBURY, A.B.,
PAPER.
- RICHARD WEBSTER, A.M.,
Formerly Fellow in Classics, Princeton University.
TOPICS IN BIOGRAPHY.
- RAYMOND WEEKS, PH.D.,
Professor of Romance Languages, Columbia University.
PHONETICS.
- FRANK WEITENKAMPF, L.H.D.,
Chief, Art and Prints Division, New York Public Library.
MEZZOTINT; MERYON.
- BENJAMIN WILLIS WELLS, PH.D.,
Formerly Professor of Modern Languages,
University of the South.
DEPARTMENT OF CONTINENTAL LITERATURE.
- EVERETT P. WHEELER, M.A., LL.B.,
Formerly President, Reform Club, and Chairman,
Committee on Law Reform, American Bar Association;
Author of *Daniel Webster, Expounder of the Constitution*, etc.
DANIEL WEBSTER.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

A a. The initial letter of almost every alphabet. The Runic Futhark is an exception to this rule. In this alphabet *a* stands in the fourth place. The Ethiopic likewise departs from the common arrangement, aleph occupying the thirteenth place instead of the first. As our alphabet directly follows the Latin, which itself is based on the Greek, the form of our letter *A*, *a* agrees with the same character in those languages. The letter was called alpha in Greek. In form it agreed with the first letter of the North Semitic alphabet, which was called aleph, and the name evidently came from the same source, though possibly through an Aramaic channel, if the ending *a* is the sign of the emphatic, and not a Greek addition. In the Semitic languages aleph is a consonant, although it has a tendency to lose its consonantal force. There being no corresponding sound in Greek, the letter was employed as a vowel. As to the ultimate origin of this letter nothing is yet known with certainty; but in recent years there has been a strong tendency to abandon the assumption of an immediate derivation of the North Semitic alphabet from Egyptian hieroglyphics or hieratic signs, or from Babylonian cuneiform characters, and to look for a solution of the problem to the later Cretan system of writing transferred to Syria by the Philistines, as Evans does in *Scripta Minoa* (1909), or to linear pottery marks found in many Mediterranean countries, as Flinders Petrie has suggested in *The Formation of the Alphabet* (1912), or to the signs of the lunar zodiac, as is done by Stucken in *Das Alphabet und die Mondstationen* (1913). None of these theories, however, can be supported with sufficient evidence. We do not know the meaning of the Cretan characters, whether the pottery marks have any phonetic value at all, or what signs may have been used in Syria at the time of the invention of the alphabet for the stations of the moon. (See ALPHABET.) The small or uncial *a*, used in ordinary print, is only a modification of the capital *A*. This style of writing prevailed from the second to the seventh centuries of the Christian Era, and is due to the law of least effort. When the scribe began to use papyrus instead of tablets of wax, he traced the letter at one stroke, without lifting his pen from the paper, thus *q*. (Prou, *Manuel de Paléographie*, 3d ed., Paris, 1910, p. 61.)

Phonetic Character. *A* is the vowel sound that is articulated with the least effort. It is the earliest vowel sound uttered by the baby, before it has acquired control over the muscles of the tongue. It is described by phoneticians as a "mid-back-wide" vowel, formed with a wide opening of the jaws, pharynx, and lips. It had what we may term the *ah*-sound, familiarly known as the "Italian," or "Continental" *a*, as in English *father*. (Sweet, *Sounds of English*, Oxford, 1908; Rippmann, *Sounds of Spoken English*, London, 1910.) Such is approximately the original sound of this letter. In English, however, as in other languages, it has undergone many modifications, due mainly to the influence of surrounding consonants. At the present time, instead of calling the letter itself by the name *ah*, as in most Indo-European tongues, we term it *ay*, and write its plural *aes*, *A's*, *As*. (Cf. Tennyson, *The Epic*, ad fin.: "Mouthing out his hollow *oes* and *aes*.") Though somewhat rare in modern English, the *ah*-sound was of quite frequent occurrence in the earliest English or Anglo-Saxon. It was subject, however, to so many modifications and shiftings that it is now difficult to ascertain the number and varieties of the sound. (See PHONETIC LAWS.) In addition to these modifications, other external influences have tended to alter the sound still more. The orthography has failed to keep pace with the changes in pronunciation; hence the anomalous character of *a* as a sound-symbol. Among the numerous sounds that *a* may represent in English, the following are perhaps the most common: *bat*, *bate*, *ball*, *bar*, *bare*, and *what*, or *wash*. To these may be added the sound of *a* in *ask*, *fast*, *ant*, which varies with different speakers, and is probably intermediate between *bat* and *bar*. Furthermore there is the neutral sound of *a*, approaching the *u* in *but* (or the mute *e* of the French *le*), that often occurs in unstressed syllables, like *aboard*, *abundant*, and also the *a* in *any*, *many*, where it approaches a short *e*. Before *l* we find also *au* expressing the same broad sound as *a*, thus *fault* beside *false*. We inappropriately call the *a* in *bate* "long *a*" in contrast with the "short *a*" in *bat*, although the "long *a*" is not strictly one sound, but ends with a glide, like the *e* in *they*.

Indo-European *a*. In the primitive Indo-European, as in most of its descendant dialects,

the *a* (*ah*-sound) had both a short and a long quantity. In the primitive Germanic, however, the long *a* was changed into long *o*; hence it is the short vowel alone that has remained in English. As an example of a primitive short *a*, we may take Indo-European **agro-s*, 'field'; Skr. *ájra-s*; Gk. *ἀγρό-s*; Lat. *ager*; Goth. *akr-s*; Old Eng. *æcer*; Eng. *acre*. As an example of the primitive long *a*, we may take the Indo-European **māter-*, 'mother'; Skr. *mātā*; Gk. *μᾶτηρ*; *μήτηρ*; Lat. *māter*; Old Eng. *mōdor*; Eng. *mother*. See PHONETIC LAWS; and cf. Wright, *Historical German Grammar* (London, 1898).

As a Symbol. Inasmuch as *a* stands at the head of the alphabet, it is therefore commonly used to denote the first in an order or series. Thus, in musical notation (q.v.), it denotes the sixth note of the diatonic scale of C major, or the first note of the relative minor scale of C; the *la* of French, Italian, and Spanish musicians. In the mnemonic words of logic (q.v.), it denotes the universal affirmative proposition, such as, "all men are mortal." The letters *a*, *b*, *c*, are also used in algebra (q.v.) to denote the known quantities as opposed to *x*, *y*, *z*, the unknown quantities. In abstract reasonings, hypotheses, etc., A, B, C, are likewise employed as convenient designations for particular persons and things in relation to the others of a series or group. In writing or printing, the series *a*, *b*, *c*, is commonly used, along with or instead of the Arabic numerals, for marking paragraphs or for reference. In nautical matters, the terms A1, A2, A3 are used (in Lloyd's Register, for example) to indicate the character and condition of vessels, and similarly in business matters to denote the commercial standing of a house. This usage has passed over into popular parlance as an adjective of commendation, so that a person is sometimes spoken of as "A1" to indicate that he is a thoroughly reliable, "first-class" man. A stands also as the first of the Dominical Letters (q.v.).

In Grammatical Forms. This same letter is used in a number of phrases and grammatical forms in English. In the first place, it is employed, beside *an*, as an indefinite article; both forms are weakened from the AS. *ān*, 'one, an.' In provincial expressions *a* ('a) appears as a pronominal form for *he*, etc., as in *quotha*, 'quoth he.' It is also used in dialects in place of *have*, as an auxiliary, or even as a principal verb. As a modern provincial corruption, it is used in lieu of the pronoun *I*. It appears as a preposition for the AS. *an*, *on*, meaning 'on, in,' with a verbal noun in such ancient phrases as *a-hunting*, *a-building*; also as a reduced form of the preposition *of*, now generally written *o'*, in *Jack-a-lantern*, *John a Gaunt*, *man-o'-war*; for *on* in *asleep* (AS. *on slæpe*), *away* (AS. *on weg*), *twice a day*, *now a days*; for *off* in *adown* (AS. *of dūne*); for AS. *of-*, intensive, in *athirst*. Sometimes it stands for the Latin preposition *ā*, meaning 'of, off,' as *a priori*, *Thomas a Becket*. As a verbal prefix, it often stands for AS. *ā-*, equivalent to the modern German *er-*, originally implying 'motion away,' but in earlier English merely intensive, as in *awake* (AS. *āwacen*, Ger. *erwachen*), *arise* (AS. *ārisan*), and in many other phrases. See ALPHABET and ABBREVIATIONS.

A. 1. A symbol used in the classification of

the scale C major or the tonic in the scale of A minor. Before the tenth century A.D. it was actually the first or lowest tone of the fundamental scale, which was A, B, C, D, E, F, G. (See GREEK MUSIC.) 2. As a fixed tone *a'* (435 vibrations) is the standard by which all instruments are tuned. 3. In theoretical works A denotes the triad of A major, and *a* the triad of A minor. 4. In the scores of works requiring more than one performer the letters of the alphabet are used as guides, to enable the performers to find their place readily in case of repetition during rehearsals.

A1. A symbol used in the classification of wooden ships by Lloyds Maritime Insurance Association. The designation follows as a result of examination of a ship by one of the Lloyds surveyors. The symbol A1 denotes that hull and equipment of the ship in question are in good condition; the letter A standing for construction and the numeral 1 for equipment; when the latter is inadequate the figure 2 is used. Should the symbol be preceded by figures, thus, 12A1, it means that the classification is good for 12 years. A1 vessels may receive further extension of classification (1 to 8 years), and the symbol becomes 12A1-Cont. 6A1, which means original 12-year class continued 6 years. If later restored it would still be possible to remain in A1 class with the following symbol: 12A1-Cont.6A1-Rest.6A1. When a vessel has passed the age for the character A, but is still found fit for conveying perishable goods to all parts of the world, it is registered A in red. Ships designated A in black form the third class, and are allowed to carry perishable goods on *shorter voyages*. For further information in regard to the classification of ships for marine insurance, see SHIPS, CLASSIFICATION OF, FOR MARINE INSURANCE.

AA, ä. The name of numerous small rivers in Europe, of which the best known are the Münster Aa and the Westphalian Aa in Germany, and two rivers in the Baltic Provinces, West Russia, both emptying into the Gulf of Riga. Besides these nearly forty others have been enumerated. The word is said to be of Celtic origin, but it is allied to the O. N. *á*, O. Ger. *aha*, Goth. *ahva*, identical with the Lat. *aqua*, 'water.' Ach, Aach, and Aachen (pl.) are other forms of the same word.

AACHEN, äg'en. See AIX-LA-CHAPELLE.

AAHMES, ä'mës. See AMASIS.

AALBORG, al'börk (Eel-town). An ancient episcopal city of Denmark, capital of the Amt of Aalborg, in Jutland, on the south shore of the Limfjord (Map: Denmark, C 1). The town has a cathedral, a museum, a nautical school, and a library. It is situated on one of the branches of the Danish State Railway, which here crosses the Limfjord on an iron bridge 990 feet long and 16 feet wide. The manufactures of the town are considerable, consisting chiefly of brandy and spirits, cotton goods, dyed articles, cement, and lumber. There is an electric lighting plant. There are some shipbuilding and sea trade, the latter with England, Norway, and Sweden, for the most part in vessels owned by citizens of the town. Fish is the leading article of export. The harbor is safe but too shallow for large vessels. Aalborg has long been an important commercial centre. It was plundered by Wallenstein in 1627 and by the Swedes in 1644 and 1657. Pop., 1890, 19,503; 1906, 31,509; 1911, 33,449.

AALEN, ä'len. A town of Württemberg, Germany, 47 miles by rail east of Stuttgart, on the Kocher River, 1420 feet above sea level (Map: German Empire, D 4). There are cloth manufactures and large iron works. The poet Schubert spent his boyhood in this town, and there is a statue erected in his honor. Pop., 1910, 10,400.

AALESUND, ä'le-sün. See ALESUND.

AALI, ä'lê, MEHEMET, Pasha (1815-71). A Turkish statesman and diplomat. He entered the public service at 15 years of age; was secretary to the Embassy in Vienna in 1835, and from 1840 to 1844 Minister in London. He then became Minister of Foreign Affairs and several times after 1852 was Grand Vizier. He was also promoted to the rank of Field-Marshal and Pasha. In 1856 he represented the Porte at the Congress of Paris and in 1871 took a prominent part in the London conference for the settlement of the Black Sea question. He was favorable to progress and strove earnestly, though ineffectually, to introduce reforms in the Turkish government.

AALST, älst. See ALOST.

AAR, or **AARE**, är (perhaps connected with Skt. *ara*, swift). The largest tributary of the Rhine in Switzerland. It rises in the glaciers west of the Grimsel Pass in the canton of Bern, at an altitude of 7345 feet (Map: Switzerland, C 1), flows northwest and enters Lake Brienz after forming the famous falls of Handeck, 240 feet high. Issuing from Lake Brienz, it enters Lake Thun, passing the town of Interlaken. On emerging from the latter lake, the Aar becomes navigable and, after a winding course northwestward, reaches the Jura Mountains and flows along their southern slope down to its confluence with the Limmat, where it breaks through the ridge and enters the Rhine near Waldshut. Its entire length is about 180 miles, and among its numerous tributaries the most important are the Saane, Zihl, and Emme. Through its tributaries the Aar is connected with some of the principal lakes in Switzerland. The most important cities on its banks are Bern, Solothurn, Aarau, and Interlaken. There are several small rivers of the same name in Germany.

AARAU, ä'rou (*aar* + Ger. *Aue*, meadow, from *aha*, water). Capital of the canton of Aargau, Switzerland, near the Jura Mountains, on the right bank of the Aar, 41 miles northeast of Bern (Map: Switzerland, C 1). It is 1285 feet above sea level and lies in a fertile plain between the Jura and the Swiss plateau. The town is very picturesque and has several museums and a fine cantonal library. There are silk, cotton, leather, and cutlery factories, an iron foundry famed for its cannon and bells, and other workshops. There are fine vineyards on the lower slopes of the Jura Mountains. The town is famous for producing excellent mathematical instruments. North and northeast of the town are the Wasserfluh, 2850 feet high, and the Gisliflüh, 2540 feet high. The river Aar is here crossed by a suspension bridge. Pop., 1900, 7995; 1910, 9536 (commune, 9806).

AARD-VARK, ärd'färk' (Dutch, 'earth-pig'). A burrowing, nocturnal, insect-eating mammal (*Orycteropus capensis*), native and common in South Africa. It is about 5 feet long, including a long, tapering, naked tail. The head is long, thin, and somewhat pig-like, with a tubular snout and high, pointed ears.

The body is stout, fat, and thinly covered with bristly, reddish hairs. The limbs are short, strong, and equipped with claws adapted to digging in hard ground. It inhabits open regions, is timid and mainly nocturnal, lives in burrows, and feeds upon insects, mainly ants and termites, breaking into their "hills" and gathering them into its small mouth by means of its long, protrusile tongue, which is coated with glutinous saliva. The flesh is edible, but likely to taste of the formic acid in its food. A closely allied species (*O. aethiopicus*) inhabits north-eastern Central Africa. These two animals (with several fossil species) represent the Orycteropodidæ, a family of Edentata differing from the remainder of that order in so many respects, for example in the possession of an interparietal, and in character of brain and placenta, that some naturalists have proposed to establish a separate order for it, Tubulidentata. See Plate of ANT-EATERS.

AARD-WOLF (Dutch, 'earth-wolf'). A nocturnal, carnivorous mammal (*Proteles cristata*) of South Africa, resembling a small striped hyena with a dog-like head. It is closely allied to the hyena, from which it differs mainly in its weak jaws and peculiar dentition, which prevent its overcoming and eating vertebrate prey or large carrion. Hence its food consists of small carrion, of grubs, and largely of termites. Its fur is coarse, and capable of erection along the back; in color it is ashy-gray, irregularly striped up and down and around the legs with black; its muzzle is black and nearly naked; legs and feet dark brown in front and gray behind; ears dark brown outside and gray inside. It goes abroad only in the night, and several are said to live in the same burrow. It is the sole representative of the family Protelidæ. See Plate of HYENAS.

AARESTRUP, ä're-strööp, EMIL (1800-56). A Danish poet, born at Copenhagen. He was little regarded during his lifetime, but since the publication of his collected poems, with a critical essay by Georg Brandes, he has been deemed one of the first lyrists of Denmark, noted for his combination of passion and tenderness.

AARGAU, ärgou, or **ARGOVIE**, ärgö've'. A canton of north Switzerland, with an area of 542 square miles (Map: Switzerland, C 1). Its surface is moderately mountainous, and there are a number of fine valleys. The chief rivers are the Aar, a tributary of the Rhine, and its tributaries, the Reuss and the Limmat. There are a number of mineral springs. The soil is very fertile. The vine is cultivated extensively in the river valleys, and the output of dairy products is considerable. The manufacturing industries are well developed and give occupation to about 18,000 people. The production of textiles is the chief industry. For purposes of administration the canton is divided into 11 districts. The legislative power is vested in the assembly (*Grosse Rat*), elected at the rate of one member for every 1100 inhabitants. The executive power is in the hands of a council (*Regierungsrat*) of five members, chosen by the assembly for a period of four years. The referendum is frequently resorted to, and for private initiative in legislation 5000 votes are required. In the National Council Aargau is represented by 10 members. The population was 206,659 in 1900 and 230,629 in 1910. The inhabitants are mostly of German origin, and

the German language is spoken by almost the entire population. Capital, Aarau (pop. commune, 9806 in 1910). Aargau, in its original extent much larger than the present canton, was a part of ancient Helvetia, and was subdued by the Franks in the fifth century. It was held by the Hapsburgs from 1173 till 1415, when it was taken from them by the Swiss Confederates, who gave parts of it to Bern and Lucerne. In 1798 the district was divided into the cantons of Aargau and Baden, which became members of the Helvetic Confederation. Ruled mainly by the aristocratic party, Aargau gained a liberal constitution in 1831, and since then has been the champion of democracy against the reactionists and the clericals. Consult: *Historische Gesellschaft des Kantons Aargau* (Aarau, 1898), J. Heierli, *Die archäologische Karte des Kantons Aargau* (Aarau, 1899), and E. Zschokke, *Geschichte des Aargaus* (Aarau, 1903).

AARHUS, ar'hōōs. A seaport and episcopal city of Denmark, capital of the amt of Aarhus, Jutland, situated on a bay of the Kattegat, in a fertile plain, 68 miles northeast of Fredericia (Map: Denmark, D 2). There are here the oldest Gothic cathedral in the kingdom, the construction of which was begun in 1201, a museum, an exchange, and several banks. The inhabitants are engaged in agriculture, shipbuilding, and manufacturing. The town is connected with the rest of Jutland by the State Railroad, and there are regular lines of steamers to Copenhagen and England. The harbor is well protected by a breakwater and admits vessels of 6 feet draught. The town ranks among the oldest in Denmark, for it had the first Christian church and has been the residence of a bishop since 948. Aarhus was the scene of a Danish defeat by the Prussians in 1849. Pop., 1890, 33,306; 1906, 55,193; 1911, 61,755.

AARON, ar'un (Hebrew 'Aharon). The elder brother of Moses (Ex. iv. 14) and first high priest of Israel, according to Ex. xxix. 3, 29; Lev. viii. 12; and Num. xvi. 17. When Moses was sent on his mission of deliverance to Pharaoh, Aaron was appointed his spokesman and performed some miracles, even bringing on some of the plagues. He was always, however, the subordinate of Moses, from whom he received his ordination. While Moses was absent receiving the Ten Commandments, Aaron yielded to the importunities of the people and fashioned for them the golden calf (Ex. xxii. 1-6). Aaron was concerned in two rebellions. In the first, his authority, as well as that of Moses, was called into question by the Korahites (Num. xvi). The miraculous budding of the rod of Aaron settled that dispute. In the other, Aaron, perhaps inspired by Miriam, rebelled against the authority of Moses, but here Miriam was punished. Because of the incident at Meribah (probably the modern 'Ain Kuderat; see KADESH-BARNEA), where Moses and Aaron struck the rock instead of speaking to it (Num. xx. 8-13), Aaron was not allowed to enter Canaan, but died and was buried on Mount Hor (Num. xx. 22-29) or at Moserah (Deut. x. 6), eight stages away from the former place (Num. xxxiii. 31). Eleazar, his son, succeeded to the high priesthood. Modern scholars have called attention to the fact that Aaron appears as a high priest by the side of Moses only in what are regarded as post-exilic additions in the

Pentateuch. In the earlier parts of this work, on the other hand, Moses wields the magic rod (Ex. iii. 17), gives oracles (Ex. xviii), sprinkles the blood and brings sacrifices (Ex. xxiv), and Aaron is only an attendant, like Hur and Joshua. From Moses as the founder of the priesthood the priestly families of Dan (Jud. xviii. 30) and Shiloh (1 Sam. ii. 30) claim descent. Ezekiel does not trace the origin of the priesthood at Jerusalem further back than to Zadok, who lived in the time of Solomon. Aaron as the high priest is supposed to be the reflection of the actual head of the State and its religious cult in the Persian period. The figure itself is connected by Redslob, Dozy, Land, and Ed. Meyer with the ark (Hebrew 'aron), while N. Schmidt looks upon Aaron as originally an Edomitish numen worshiped on Mount Hor in Petra and Moserah (the modern Jebel Madhera) in the Negeb (q.v.) and later remodeled after Jeroboam (q.v.), who also makes a golden calf and has two sons named Nadab and Abihu. The tomb of Aaron at Petra contains a sarcophagus made up of Greek and Hebrew tombstones with inscriptions, showing their modern origin, but the shrine itself was connected with Aaron already in the time of Josephus (Ant. iv. 4. 7) and therefore no doubt also before the Nabataean period. See Oort, "De Aaronieden" in *Theologisch Tijdschrift* (1884, pp. 289 ff.); Ed. Meyer, *Die Israeliten und ihre Nachbarstämme* (1906, pp. 92 ff.); N. Schmidt, "Jerahmeel and the Negeb" in the *Hibbert Journal* (1908, pp. 339 ff.).

AARON. A villainous Moor in the Shakespearean play of *Titus Andronicus*. The resemblance of Aaron's brazen avowal of his wickedness in the last act of this play to a similar passage in Marlowe's *Jew of Malta* has been cited as an indication that the *Titus Andronicus* may possibly owe its origin to the same author.

AARON BEN ELIJAH. Distinguished Karaite theologian. He was born in Cairo c. 1300, lived for a long time at Nicomedia, in Asia Minor, and died in Constantinople in 1369. He was called Aaron the Younger to distinguish him from Aaron ben Joseph (q.v.). He is perhaps the most profound thinker among the Karaites (q.v.) and has often been compared with Maimonides. He was under the influence of the Mutazilites (q.v.). Like them, he held that all knowledge necessary for salvation emanates from reason and accepted an atomistic theory of the universe which recognized, however, a divine creation of the atoms. He looked upon Abraham as having developed through his own meditation a natural religion, afterwards systematized by Moses. He wrote *'Ez ha-Hayyim*, 'The Tree of Life,' in 1346; *Gan 'Eden*, 'The Garden of Eden,' a Karaite code, in 1354, and *Keter Torah*, 'Crown of the Law,' a commentary on the Pentateuch, in 1362. See Wolf, *Bibliotheca Hebraea* (i, 1715, pp. 114 ff.); Fürst, *Geschichte des Karäertums* (1862-69); Schreiner, *Der Kalam in der jüdischen Literatur* (1895, pp. 57 ff.).

AARON, BEN JOSEPH (c.1260-c.1320). Karaite teacher, physician, and poet. He is often called The Elder to distinguish him from Aaron ben Elijah (q.v.). He was born in Sulchat, Crimea, but lived most of his life at Constantinople. Eager for knowledge, and remarkably free from prejudice, he studied the works of Ibn Ezra and Maimonides and en-

tered into friendly relations with Christians. His best known work is *Mibhar*, 'The Choice,' a commentary on the Pentateuch in which he expressed his philosophical views. He rejects the existence of demons as an absurdity; and he regards the human soul as in its functions dependent upon the brain, the blood, and the spinal cord. His Book of Hymns and Prayers, *Seder Tefillot*, became the standard prayer-book of the Karaites. In this book he introduced also hymns of Ibn Gabirol, Jehudah ha-Levi, and Ibn Ezra. The *Mibhar* was published with a commentary by Joseph Solomon ben Moses Yerushalmi, Koslov, 1835. See Fürst, *Geschichte des Karäertums*, 1862-69; Schreiner, *Der Kalam in der Jüdischen Literatur*, Berlin, 1895, p. 57.

AARSENS, or **AARSSENS**, är'sens, FRANS VAN (1572-1641). A Dutch diplomat. At 26 years of age he was sent to Paris as the agent of the States-General; later he became Ambassador for the United Provinces, and long represented his country at the French court, where he was highly regarded by Richelieu. He was also at different periods Ambassador to Venice, Germany, and England. Motley, who considered Aarsens one of the ablest diplomats of Europe, shows that he contributed largely to the unrighteous death of Barneveldt, 1619.

AASEN, a'sen, IVAR ANDREAS (1813-96). A Norwegian philologist. He was born at Söndmøre. He at first studied botany, but subsequently turned his attention to researches respecting the native dialects. Assisted by the government, he traversed nearly the whole of Norway, investigating popular speech, upon which he sought to base a national language that should be free from Danish influence. "Landsmaal," the artificial language which he formed, was widely adopted by his countrymen. An effort to have it recognized by the government as the official language of Norway (instead of the "Rigsmaal," or Dano-Norwegian) seemed in 1913 assured of success. (See NORWEGIAN LANGUAGE.) In 1848 he published *Det Norske Folkesprogs Grammatik*, and in 1850 added *Ordbog over det Norske Folkesprog*, enlarged under the title of *Norsk Ordbog* in 1873, and in 1856 *Norske Ordsprog*, a treatise on Norwegian proverbs (2d ed., 1881). Through his linguistic work he was the originator of the patriotic movement generally known as the "Maalstræv."

AASVOGEL, äs'fö-gel (South African Dutch for 'carrion-bird'). Any of several South African vultures.

AB, äb. The fifth month of the Jewish religious year, and the eleventh (in intercalary years the twelfth) of the Jewish civil year. The first day of Ab became a fast to commemorate the death of Aaron; but of far greater significance is the ninth, commemorated as a fast to mark the destruction of the first temple by Nebuchadnezzar, 586 B.C., and of the second temple by Titus, 70 A.D., though there is no evidence to show that the latter ever took place on that day of the month. Ab corresponds roughly to July-August of the common year.

ABAB'DE. A Hamitic people west of the Red Sea, below Kosseir. Their habits are those of the desert, the camel being their chief domestic animal.

AB'ACA, ä'ba-kä. A term used in the Philippine Islands to designate the plant which produces manila hemp. See HEMP, MANILA.

ABACO, ä'bä-kö, or LUCAYA, GREAT and

LITTLE. Two of the Bahama Islands, the former 190 miles east of Florida, lat. 26° 30' N., long. 77° W. (Map: West Indies, J 1). Together they cover an area of about 879 square miles. Shipbuilding, wrecking, fishing, and the cultivation of sisal-fibre hemp are the chief employments. Many of the inhabitants are said to be descendants of American Tories. Pop., 1911, 4463.

AB'ACUS (Lat., from Gk. ἄβαξ, *abax*). A calculating machine or table occasionally employed in modern primary schools to make the elementary operations of arithmetic palpable. It consists of a frame with a number of parallel wires, on which beads or counters are strung. In ancient times it was used in practical

CHINESE ABACUS.

reckoning, and is thus used still in China, Persia, and elsewhere. The ancient Greek abacus consisted of a frame on which grooves were marked denoting the several orders, units, tens, etc. In these grooves counters were set to denote the units of each order. Across the grooves ran another, at right angles to them; counters set below this horizontal groove marked the units up to four, those above it denoted five or more units. Fractions were reckoned on a second set of grooves. In the *Abacus Pythagoricus* each counter bore a number, so that only one was needed in each column, and more complicated operations could be performed. The Roman abacus showed, at the bottom, nine perpendicular grooves. On the grooves to the right (grooves 8 and 9) fractions were reckoned, on the duodecimal system; in the other grooves units up to four were counted. Above the first eight grooves were eight shorter grooves, used for reckoning five or more units. (See CALCULATING MACHINES.)

Among the Romans the name *abacus* was given also to a tablet, with a rim about it, covered with sand, on which lines or figures were drawn with the fingers or some pointed instrument. This kind of abacus was used in school, in the study of arithmetic and geometry.

ABACUS. The flat member, usually square or octagonal, which forms the topmost feature of the capital of a pier or column. The edges of the abacus are usually molded, that of the Greek Doric order being the chief exception. In the Corinthian order and some variants of the Roman Ionic the sides are concave in plan and the corners slightly truncated. Gothic abaci are often octagonal; those of the English Gothic are quite as often circular. The term is also (rarely) applied to square tablets or panels in walls or mosaic floors. See CUR, p. 6.

ABAD, ä-bäd' (Pers. and Hind., equivalent to the Engl. 'abode,' for which it is an obsolete form). An affix in the formation of many Oriental geographical names, especially in British India and Persia, as *Hyderabad* (Haidarabad), the 'dwelling' or city of Hyder.

ABADDON (a word peculiar to later Hebrew = 'ruin,' 'destruction'). In the Old Testament one of the names given to Sheol, or rather to the place of the lost in Sheol (Job xxvi. 6; xxviii. 22; xxxi. 12; Prov. xv. 11; Ps. lxxxviii. 11; also Wis. xviii. 22, 25, in some of which passages it is practically personified). Only once used in the New Testament (Rev. ix. 11),

and then as the proper Hebrew name of the King of the Abyss, whose Greek name is Apollyon ('Destroyer'). See APOCALYPTIC NUMBER.

ABAKA KHAN, ä-bä'ká hän' or kän'. See MONGOL DYNASTIES.

hending two very different conceptions: (a) the relinquishment or surrender of a legal right; (b) the willful renunciation of certain classes of legal obligations. Though commonly employed by law writers in the former sense, it is doubt-

ABACUS — TYPICAL FORMS.

ABAKANSK, ä'bä-känsk'. A fortified village in the government of Yeniseisk, Siberia, on the Abakan, near its junction with the Yenisei River (Map: Asia, J 3). It was founded by Peter the Great in 1707, and is situated in a very fertile region in the vicinity of coal mines that give employment to many of its inhabitants. Fur trading is also carried on extensively. Pop., about 2000.

AB'ALO'NE (Sp., of unknown origin). A name in California for the several local species of marine gastropods (family Haliotidæ), otherwise known as ear-shells or sea-ears; representatives are numerous throughout the warmer seas of the world, except the western Atlantic. The shell, although having the shape of a shallow oval saucer, is really a widely flattened spiral, the apex of which is near one end, while the turned-over margin is the columella. (See illustrations on Plate of ABALONE, ETC.) The animal creeps about rocks near the shore, spreading a fringed mantle, and extending tentacles through the row of holes in its shell; it feeds upon seaweeds, and when quiet or alarmed withdraws all soft parts beneath the shield-like shell and sits down with great tenacity, after the manner of its near relatives, the limpets. The lining of the shell is a layer of richly colored mother-of-pearl, much used for inlaying and for the manufacture of small ornaments, buttons, etc. The animals are eaten, especially by Orientals, and great quantities of them are collected and dried on the coast of California, not only for consumption by the local Chinese, but for export to China and Japan. A species in the Channel Islands, England, is regularly collected for food and is called *ormer*.

ABANCAY, ä'bän-kī'. The chief city of the department of Apurimac, Peru, 50 miles west-southwest of Cuzco, on the Abancay (Map: Peru, C 6). It possesses extensive sugar refineries and is the centre of the best sugar-growing district in Peru. There are several gold and silver mines in the neighborhood. Pop., 1896, 1200; 1912 estimate, 3000.

ABAN'DONMENT. A legal term compre-

ful if there is, strictly speaking, any such thing as the loss of a property right by mere abandonment. The cases which seem to support such a view usually, if not always, involve other considerations, such as a gift, an estoppel, or the operation of the Statute of Limitations. In criminal law abandonment is the intentional exposure or desertion of a dependent person by one who is under a legal duty of protecting and maintaining him. A parent or a guardian of the person of a young child is guilty of a misdemeanor at common law if the child is physically injured in consequence of the abandonment; while, if death results therefrom, the abandoning parent or guardian is guilty of murder. Even where no injury follows, abandonment of an infant is now generally punishable as a misdemeanor by statute. At present the offense is generally defined by statute. In some States it has been extended to the abandonment of a disabled or infirm animal in a public place. Consult: Wharton, *Criminal Law* (Philadelphia, 1896); Bishop, *Commentaries on Criminal Law* (Boston, 1895); Wharton, *A Treatise on Criminal Law* (San Francisco, Cal., 1912). See EASEMENT; ESTOPPEL; GIFT; INSURANCE; LIMITATION OF ACTIONS; PATENTS.

ABANO, ä'bä-nō, PIETRO D', also known as PETRUS DE APOÑO or APONENIS (1250-1316). An Italian physician and astrologer, professor of medicine in Padua. He became famous through his work, *Conciliator Differentiarum, quæ inter Philosophos et Medicos Versantur* (Mantua, 1472), the object of which was to reconcile the philosophy and medicine of the time. His fame as a scientist and his enormous popularity as a physician aroused the envy of less successful men. Charges of heresy and atheism were brought against him, and he was arraigned before the Inquisition. He was acquitted in the first trial, but died in prison before the end of the second.

ABANO BAGNI, a-bä-nō bä-nyè. A small watering place in the province of Padua, Italy, 29 miles by rail from Venice. It is famous for its hot sulphur springs, the water of which is

ABALONE, ETC.

1. AGATE SHELL (*Achatina*), with animal extended.
 2. WING SHELL (*Avicula*).
 3. AUGER SHELL (*Terebra*).
 4. ARK SHELL (*Arca*).

5. ABALONE (*Haliotis*), with animal extended.
 6. ABALONE (Interior), showing flattened spine.
 7. ANODON, a River Mussel, with foot extended.
 8. EGGS OF APPLESNAIL.
 9. APPLESNAIL (*Ampullaria*), with animal extended.

cooled in mud basins. They are much resorted to for diseases of the skin. The town was known in Roman times as Fons Aponi or Aquæ Patavinæ. The Monastery of St. Daniel is near by. Pop., 1901, 4550; 1911, 5450.

ABARBANEL, ä-bär'ba-něl'. See ABRABANEL.

AB'ARIM. The name signifying 'those on the other side' and applied to a range of mountains in the land of Moab, east of the Jordan and the Dead Sea (Num. xxvii. 12; xxxiii. 44, 47). Among these uplands was Mount Nebo, the place where Moses is said to have died (Deut. xxxii. 49). There are traces of an earlier use of the term to indicate the territory of Gilead as well as Moab, as in Jer. xxii. 20, where it is ranged with Lebanon and Bashan.

AB'ARIS (Gk. Ἀβάρης). A legendary hyperborean miracle-worker, possessor of a magic arrow of Apollo, on which he could ride through the air. His story probably originated in the mystical movements of the sixth century B.C., though Abaris is first mentioned by Pindar and Herodotus. The New Platonists elaborated the legend and made Abaris a companion of Pythagoras.

ABASCAL, ä'bäs-käl', JOSÉ FERNANDO (1743-1821). A Spanish statesman and general. He entered the army in 1762; became Governor of Cuba in 1796; was Viceroy of Peru from 1804 to 1816; in 1816 he was made Marqués de la Concordia. He was noted for administrative ability, firmness, and moderation.

ABASIA, ä-bä'së-ä. See ABKHASIA.

ABASOLO, ä'bä-söl'ö, MARIANO (1780?-1819). A Mexican revolutionist, born at Dolores, Guanajuato. He participated in the revolution started by Hidalgo in 1810 and rose to be a major-general. He fought at Puente de Calderón, was taken prisoner by the Spaniards, was tried at Chihuahua, and was sentenced to ten years' imprisonment at Cadiz, where he died.

ABATEMENT (OF. lessening, from Lat. *a*, away + *batuere*, to beat). A term used in various senses in the common law of England and the United States, as follows: (1) *Abatement of Freehold*. The unlawful entry upon and taking possession of an estate of inheritance by a stranger after the death of the ancestor and before the heir or devisee has become seized of the estate by entry. (See FREEHOLD; SEISIN.) (2) *Abatement of Nuisances*. A remedy against injury by nuisance by removal of the nuisance. (See NUISANCE.) (3) *Plea in Abatement*. A pleading interposed by the defendant to the plaintiff's complaint or declaration by which the defendant, on some formal and technical ground, seeks to abate or quash the action. If sustained, it does not determine the merits of the controversy, but requires the plaintiff to begin his action anew. (See ACTION; PLEADING.) (4) *Abatement of Legacies*. A reduction of the amount of legacies when the estate of the testator is insufficient to pay debts and legacies in full. (See LEGACY.) (5) *Abatement of Suit*. Suspension of proceedings in a suit in Chancery for want of proper parties to proceed with the suit. Abatement may result from the death, change of interest of a party, or marriage of the plaintiff, if a woman. After abatement the suit may be revived and proceeded with by the legal representative of the deceased party, or by the husband of the plaintiff, if a woman. Action at law when abated could not be revived as in equity. This, however, is now permitted

by statute. (See ACTION.) (6) *Abatement* or discount in commercial law. (See DISCOUNT.) (7) *Abatement* or deduction of duties levied by the custom-house. (See CUSTOMS DUTIES; DRAWBACK.) (8) Abatement or reduction of taxes is regulated wholly by statute. See TAX.

ABATEMENT. IN HERALDRY. Any addition to the coat-armor of a knight or gentleman that was made to indicate an unknighthly deed on the part of the bearer was termed an abatement, and the arms so altered were said to be abated.

ABATI, ä-bä'tê, NICCOLO DELL'. See ABBATE.

AB'ATIS (Fr. *abatis*, mass of crushed objects). A military defense, used for the purpose of retarding an enemy's advance. It is a device as old as the art of war itself, and still used under certain conditions, or in positions where

ABATIS.

wire entanglements are neither possible nor available. It consists of trees felled and placed side by side, the stronger boughs and branches intertwined, and pointed in the direction of the enemy. Leaves and small twigs should be removed and the stiff ends of branches pointed. In the case of intrenchments of a more permanent character, the abatis is built in a slight depression in front of the trench or ditch, so that it is fairly safe from artillery fire.

ABATTOIR, ä'ba'twär' (Fr. *abattre*, to beat down, this referring to the method of slaughtering cattle). As popularly regarded, the establishments in which animals are slaughtered for food are divided into large abattoirs and local slaughter-houses. The former are usually operated in cities in connection with packing houses, while the latter are chiefly found in country towns, and their products are sold in a fresh condition principally for local consumption.

The abattoir system of the United States is of comparatively recent origin, but with the concentration of the meat industry in large establishments it has developed rapidly and assumed enormous proportions. The packing house, of which the abattoir is an important part, has become the great source of meat for domestic consumption and for the export trade.

As a result of investigations of the methods followed in these establishments in the preparation of fresh meats and canned goods, which revealed unwholesome and unhealthy practices, unsanitary conditions, and the inadequacy of government inspection under existing laws, Congress passed, on June 30, 1906, a comprehensive law for the inspection of all meats intended for interstate or foreign trade and of all establishments producing the same, and providing an appropriation of \$3,000,000 per annum to maintain this federal supervision. An additional appropriation of \$200,000 was made in 1913 for

the ensuing year. In 1912 federal inspection was conducted at 940 establishments located in 259 cities and towns. It is estimated that this reached about 60 per cent of the total meat supply of the United States, the remainder being under the jurisdiction of state and local officers.

The largest abattoirs and the principal centres for meat packing are at Chicago, Kansas City, Omaha, St. Louis, Cincinnati, Milwaukee, and Fort Worth. The Union Stock Yards in Chicago is the largest meat-packing centre in the world, covering an area of about 500 acres and representing an invested capital of \$67,000,000. It is an aggregation of abattoirs, packing houses, and other establishments for handling live stock and utilizing the products. During the year 1912 there were received 7,180,967 hogs, 2,652,342 cattle, 505,401 calves, and 6,055,546 sheep, of which 78 per cent of the hogs, 63 per cent of the cattle, 95.5 per cent of the calves, and 81 per cent of the sheep were slaughtered, the remaining animals having been shipped to other points for Eastern slaughter, export, feeding, or breeding purposes.

At the Chicago Stock Yards the animals are received in cars direct from the feeding country. They are unloaded, fed, watered, and sold to the expert buyers employed by the packing companies. They are then subjected to an ante-mortem examination by the government inspectors, and those showing any diseased or unsound condition are slaughtered separately and rejected if found diseased.

In the slaughtering of animals the division of labor is carried out to a very fine degree, which renders possible the greatest skill and speed in the work. The cattle are driven up to the pens on the killing floor, situated several stories above the ground, and stunned by being "knocked" between and above the eyes with a sledge hammer. The animal then rolls out on the killing bed, is shackled, hoisted on the rails of a suspended tramway, and bled by a "sticker." After bleeding, it is moved along to a place where the "header" skins and removes the head. The animal is now lowered from the tramway and skinned, a constant string of butchers following one after another in completing the work and trimming out the dressed carcass. In the larger abattoirs there are from 16 to 32 beds. These beds are the portions of the killing floor opposite to each knocking pen, on which the animal is bled, eviscerated, and dressed. They are arranged in a continuous series, the first workmen starting out on the first bed and going down to the last, by which time the last workman has completed No. 1 carcass, which is then pushed back on the rail out of the way for the next run. In this manner a force of 50 butchers, 45 washers and trimmers, and 60 miscellaneous workers may kill and dress about 7 runs of cattle in an hour, which means an average of from 1100 to 2000 beef carcasses for a day of 10 hours.

During the slaughtering, the carcasses are inspected by the federal meat inspectors. These latter officials follow the "gutter" and inspect the viscera, carefully examining all suspicious indications of disease and loathsome conditions. In case lesions of a serious disease are found, or if the animals are emaciated, advanced in pregnancy, have recently given birth to young, or are immature, the carcass is marked with a tag bearing the letters "U. S. Inspected and Condemned" and is rendered into fertilizer, thus

protecting the public from the danger of ingesting unsound or diseased meat. Those carcasses which fail to reveal conditions which would render the meat unfit for food, are marked "U. S. Inspected and Passed."

With the hogs the process of slaughtering is necessarily somewhat different. In the large packing houses the animals are driven into the catch pens, a chain is passed around the hind leg and attached to one of a series of arms on a constantly moving so-called "Ferris Wheel" which elevates the pig and deposits it on an inclined rail where its weight carries it to the "sticker," who severs the large blood vessel in the neck. As soon as the animal is dead it is placed into the scalding tank, through which it passes by a revolving motion and at the opposite end is lifted out by a cradle and drawn through the automatic scraping machine, which removes most of the bristles. The scraping is completed by hand on the scraping bench, after which the head is almost completely severed from the body. It is at this point that the first government inspector examines the cervical glands of every animal. The carcass is then hung on the track of a suspended tramway and here eviscerated, during which process it is inspected by a second inspector. The carcasses are then passed along the rail through the shower bath into the cooling room, but in cases where lesions are observed, the viscera together with the carcasses are tagged and switched to a special rail. The ultimate disposition of all carcasses is determined upon a final examination made by a third inspector.

The killing and dressing of the animals, however, is but a small percentage of the work done in the abattoir. There are large cutting rooms where the carcasses go from the cooling room to be cut into the various pieces, also curing and smoking rooms for the treatment of these cuts of meats. The making of leaf and steam lard and sausage manufacturing are large industries of themselves. See MEAT; PACKING INDUSTRY; and SLAUGHTER HOUSES.

ABAUZIT, *â'bô'zê'*, FIRMIN (1679-1767). A distinguished French archæologist, historian, and theologian, born at Uzès in Languedoc. Being of Huguenot ancestry and himself a Protestant, when the Edict of Nantes was revoked, he repaired to Geneva, which was then one of the great centres of Protestantism, and where he studied assiduously, so that he became one of those encyclopædic scholars who were typical of the seventeenth century before intense specialization was yet known. Eager to see all the Protestant world, in 1698 he visited both Holland and England. In the latter country he was an associate of Sir Isaac Newton, who acknowledged his own indebtedness to Abauzit for his correction of some errors in Newton's most abstruse mathematical work. Although King William III invited him to make his permanent residence in England, he persisted in returning to Geneva (1715), where he helped the translators in their task of rendering the New Testament into French (1726). His best known historical work was local, and consisted of profound research into the early history of Geneva. This led the authorities of that city to confer upon him all the rights of citizenship. During the remainder of his life he busied himself in the production of theological and archæological monographs. Though he passed for an orthodox Protestant, his actual belief was much disputed

after his death; but this question can never be determined, owing to a curious fact. His heirs, without giving any reason, destroyed all his theological papers which would have thrown light upon the inner workings of his mind. It is known, however, that he did deny to the Apocalypse a place among the accepted canonical writings. Abauzit numbered among his friends some very brilliant writers of his time, the list including not only Newton, but Bayle, Basnage, Voltaire, and J. J. Rousseau. This last-named eccentric genius, who was always chary in bestowing praise upon contemporaries, made Abauzit the subject of a fervid eulogy when writing *La Nouvelle Héloïse*. Abauzit died at Geneva.

AB'BA (Gk. ἀββᾶ). The Aramaic word for 'father.' It occurs three times in the New Testament as a form of address to the Deity (Mark xiv. 36; Rom. viii. 15; Gal. iv. 6). In all these instances its meaning in Greek is added, for the benefit of readers unfamiliar with Aramaic. In Talmudic literature it occurs frequently as a title of honor addressed to a scholar, and also enters into the composition of proper names. The title Abba is frequently met with in ecclesiastical literature and is applied to the bishops of the Syriac, Coptic, and Ethiopic churches.

ABBA ARIKA, ā-rē'kā. A famous Jewish scholar in Babylonia and founder of the academy of Sura. He is usually called Rab. He was the descendant of a distinguished Babylonian family, studied at Sepphoris, and having been ordained there, returned to Babylonia, where he settled first at Nekardea, and then at Sura. His general attitude is best expressed in this utterance: "The commandments of the Law were only given to purify men's morals." He exercised a profound influence on Jewish life and thought. See Muhlfelder, *Rab, ein Lebensbild* (1871); Bacher, *Agada der Babylonischen Amoräer* (1878, p. 1).

ABBADIDES, a-bād'idz or -īdz. An eleventh century Mohammedan dynasty in Spain. The founder was Abd-al-Kasim Mohammed, the very wealthy kadi of Seville, in 1023. Before 1042, when he died, he had made himself recognized as the leader of the Moslems of Arabic or Spanish descent against the Berbers, whose chief was the King of Granada. His son Abbad, surnamed El Motaddid (1042-68), and his grandson, surnamed El Motamid (1068-91), successively held his position and were very remarkable men. Like the later Renaissance tyrants in Italy, they were cruel and licentious, but also noted for their love of literature and culture. Many interesting tales are told of them and their favorites: e.g., of El Motaddid's collection of the skulls of his enemies whom he had killed; or of the caprices of Romaica, the slave girl whom El Motamid married; but especially of the beautiful Zaida, the daughter of El Motamid, whom the latter handed over to Alphonso VI of Castile as a concubine. The misrule and cruelties of the Abbadides led to great dissatisfaction, and the position of El Motamid became so desperate after the capture of Toledo by Alphonso VI, in 1085, that he called in the Almoravides (q.v.). He soon came to open breach with them, but by alternately or simultaneously intriguing with them or with Alphonso he tried to save himself. His efforts failed; Seville was captured in 1091; he was made a prisoner and died in prison in 1095. See Dozy, *Histoire des Musulmans d'Espagne* (Leyden, 1861), and id., *Historia Abbadidarum* (Leyden, 1846).

ABBADIE, dá'bá'dē', ANTOINE THOMSON D' (1810-97); and ARNAUD MICHEL D' (1815-93). Two French explorers, brothers, born in Dublin. They were known for their researches in Abyssinia from 1837 to 1848. According to their own account, their objects were purely ethnological and geographical; but they were regarded by certain English travelers and missionaries as agents employed by the French government for religious and political purposes. Antoine became involved in controversies, and the accuracy of his facts was disputed, but later his reports of geographical discoveries were proved substantially accurate. Among the results of their travels were a catalogue of Ethiopic MSS., an edition of the Ethiopic version of the *Pastor of Hermas*, and the *Géodésie de la Haute-Ethiopie* (1860-73). The English expedition to Abyssinia led Arnaud to publish, in 1868, his *Douze ans dans la Haute-Ethiopie*. Antoine published a *Dictionnaire de la langue Amarinna* in 1881.

ABBADIE, JACQUES (1654?-1727). A French Protestant theologian, who died in London. Of a poor family, he was educated by his friends and advanced so rapidly that at seventeen he was granted the degree of doctor of theology at Sedan. He spent several years in Berlin as minister of the French Protestant church and in 1688 accompanied Marshal Schomberg to England, becoming minister of the French church in London called "La Savoye." He was strongly attached to the cause of William III, who made him dean of Killaloe, Ireland. He wrote a defense of the English revolution of 1688, but was best known by his theological works, the most important of which was *Traité de la vérité de la religion chrétienne* (1684).

ABBAS I, äb'bäs (1557-1628). Shah of Persia; known as "the Great." He was the youngest son of Shah Mohammed Khodabendeh. He rose in rebellion against his father and gained possession of the throne at the age of eighteen. In 1597 he defeated the Uzbeks in a great battle near Herat and drove them from the country. During many campaigns against the Turks he added a great deal of territory to his possessions. He overthrew the Turks and Tatars near Sultanieh and extorted an advantageous peace from them (1618). Upon the renewal of hostilities he captured Bagdad after a year's siege, in 1623. In a fit of Oriental jealousy Abbas killed one of his sons and put out the eyes of two others. He did, however, despite his tyrannical nature, introduce many reforms into his country. See PERSIA.

ABBAS I, PASHA, äb'bäs pá-shä' (1813-54). Viceroy of Egypt and grandson of Mehemet Ali. He was active but not distinguished in Mehemet's wars in Syria. After Ibrahim's short reign he took the throne (1848) as hereditary successor and proved a cruel and capricious ruler. He dismissed all Europeans from state service and in general was a foe to civilization. In the Crimean War he assisted the Sultan of Turkey with his fleet and 15,000 men. It is supposed that he was murdered.

ABBAS II, HILMI (1874-). Khedive of Egypt; eldest son of Tewfik Pasha. He was educated at Vienna, and succeeded his father in 1892. Though holding an unfriendly attitude toward English interests in Egypt, he carried on his government under British supervision following an abortive attempt in 1893 to form an anti-British cabinet. He made an official visit to England in 1899. See EGYPT.

ABBAS IBN ABD AL MUTTALIB, äb'bas 'b'n äbd' èl mōōt-tä'lëb (566-652). Paternal uncle of Mohammed. He was at first a determined opponent of his nephew, but his defeat in battle at Bedr was followed by his conversion, after which he became one of the chief apostles of Islamism. He was the progenitor of the Abbaside caliphs of Bagdad.

ABBASIDES, a-bäs'idz or -idz, THE (Ar. al-'Abbasiyah). Caliphs of Bagdad, and the most celebrated Muslim dynasty, although their rule never extended over the whole of Islam, as had that of the Umayyads. In Spain it was acknowledged only for a few years before the establishment of Abd al Rahman's power and nominally by the Almoravides (1086-1149). After 788 in Fez, and 800 in Kairawan, it was chiefly the spiritual authority of the Abbaside caliph that was recognized in N. W. Africa, until even this was refused by the Almohades (1147-1269) who, like the Umayyads in Cordova (756-1031), assumed the title of caliph. The Abbasides claimed descent from Abbas, the uncle and adviser of Mohammed (566-652). The rivalry between the family of Abbas and the Umayyads led to open rebellion in Khorasan in 747. Ibrahim, the head of the Abbaside faction, defeated the Caliph Marwan II in June, 747. He was indeed taken captive by Marwan in 748; but his brother Abu'l Abbas (q.v.) was proclaimed caliph in 749 and in 750 defeated Marwan in a great battle near the river Zab and established his line firmly on the throne. Abu'l Abbas mercilessly put to death all whom he could find of the family reigning in Damascus and gave himself the surname *al Saffah*, 'the shedder of blood.' In Spain, however, Abd al Rahman, one of the Umayyads who had escaped, succeeded in establishing the great independent amirate, or kingdom (subsequently caliphate), of Cordova. The successor of Abu'l Abbas (750-754), Almansur (754-775), made Bagdad the capital of his empire. Under his followers the empire enjoyed comparative peace and attained to a splendid development. The caliphs became the patrons of literature, art, and learning, and their courts were the home of the most extreme luxury. The caliphs Harun al Rashid (786-809) and al Mamun (813-833) were famous throughout the world for their wealth, their splendor, and their munificence. But the martial vigor of the Arabs was sapped by the influence of Persian luxury, and they gradually ceased to be relied upon for military service. In Africa and in the northeastern part of Persia amirs seized the opportunity to declare themselves independent; in the West the Greek Empire showed a revival of energy; but the real danger came, as with the Roman Empire, from an alien soldiery. Al Mutasim (833-842) had formed a body-guard of Turks, and these in time seized upon the real powers of government. They assassinated al Mutawakkil, the son of al Mutasim, in 861, and in 908 forced al Muk-tadir to delegate the chief powers of government to their commander under the title *amir al umara*. In 945 the caliphs came under the power of the Buwayyid dynasty of amirs in Bagdad; and in 1055 these were succeeded by the Seljuks (q.v.). On the decline of their power the caliphs were able for some time to maintain themselves in Bagdad or the surrounding territory. But in 1258 Hulagu Khan, the Mongol ruler of Persia, burned Bagdad and put the ruling caliph al Mustasim to death. Some of the Abbasides fled

to Egypt, and one of their number was proclaimed by the Mamluk ruler as caliph in Cairo under the name of al Mustansir. His successors continued to enjoy a kind of priestly dignity, investing the Sultans of Egypt with their power. When Selim I conquered Egypt in 1517, he took with him the last of these caliphs, al Mutawakkil II, and allowed this dignitary to invest him with the spiritual as well as the temporal power of the caliphate. He died in 1538 at Cairo. Consult: Muir, *The Caliphate* (3d ed., 1899); Weil, *Geschichte der Chalifen* (Mannheim and Stuttgart, 1846-62); Müller, *Der Islam im Morgen- und Algadland* (1887); Van Vloten, *De opkomst der Abbasiden in Chorasán* (1888).

ABBAS MIRZA, äb'bas mërza (1783-1833). A Persian prince who attained considerable prominence by defending his country against Russia. Aided by English officers, he inaugurated, as a young man, many reforms in the Persian army and waged two unsuccessful wars against Russia. As a result of the first, Persia was forced to cede all of her territory in the Caucasus; as a result of the second, although further territory was lost, Abbas Mirza was recognized as the successor to the Persian throne. The Prince traveled in later years to St. Petersburg and was welcomed heartily by the Czar; he won a reputation for moderation and enlightenment and was a patron of literature. In 1834 his eldest son, Mohammed Mirza, became ruler of Persia. See PERSIA.

ABBATE, äb-bä'tä, NICCOLO DELL' (c.1512-71). The forms Abati, Abbati, and Abbé (French) also occur. An Italian decorative painter and designer. He was born at Modena, studied with his father, a fresco painter, and with the sculptor Begarelli, but was most influenced by the works of Correggio. His early frescoes at Modena are, for the most part, lost, and of those at Bologna but few survive. In 1552 or shortly before, he removed to France, where the remainder of his life was spent. He was Primaticcio's chief assistant in decorating the palace at Fontainebleau, after that master's as well as his own designs. Abbate thus became a follower of Primaticcio (q.v.), whose style he was chiefly instrumental in spreading, particularly through his designs for the decorative arts, which were used as models in other European countries.

ABBAZIA, ä'bä-tsé'ä. An Austrian health resort, charmingly situated at the head of the Gulf of Quarnero (Adriatic Sea), 9 miles west-northwest of Fiume (Map: Austria, D 4). Well sheltered, Abbazia is a favorite summer and winter resort, with a mean temperature of 50° F. in winter and 77° F. in summer. Over 40,000 visitors frequent this retreat annually, among whom are many yachtsmen. It has a new Palast, various bathing institutions, and the Carol Promenade, built in 1896 at the expense of the King of Rumania. The population is about 2500, mostly Croats.

ABBE, ä'bä'. The French name for an abbot (q.v.), but often used in the general sense of an unbeneficed Roman Catholic priest. By the famous Concordat of Bologna between Pope Leo X and Francis I (Aug. 18, 1516), the French King had the right to nominate upward of 200 *abbés commendataires*, who, although without duty, drew an income from the convents. Later it came to be used in France of clerics not in sacred orders, who were tutors or companions in the families of the nobility. In Italy the

same class of unbeneficed clergy are called *abbate*.

ABBE, CLEVELAND (1838–1916). An American astronomer, meteorologist, and educator, born in New York City. He graduated in 1857 at the Free Academy (now the College of the City of New York) and studied astronomy with F. Brünnow at Ann Arbor (1858–60) and with B. A. Gould at Cambridge (1860–64). From 1864 to 1866 he resided at the observatory at Pulkova, Russia, and from 1868 to 1873 was director of the Cincinnati Observatory, where he inaugurated a system of daily weather forecasts based upon simultaneous meteorological observations reported by telegraph. This led to the establishment of a similar system by the government. In December, 1870, Professor Abbe was called to Washington to prepare the official weather predictions and storm warnings, and in 1891 he was appointed meteorologist of the Weather Bureau. To him is due the initiation, in May, 1879, of the movement toward the introduction of the now universal systems of standard time and hourly meridians. In January, 1873, he prepared the first official *Monthly Weather Review*, which continued under his editorship until July, 1909, after which he became editor of the *Bulletin* of Mt. Weather Research Observatory. He is lecturer on meteorology in Johns Hopkins University, Baltimore, and a member of the National Academy of Sciences. He received the degree of LL.D. from the University of Michigan in 1887 and from the University of Glasgow in 1896. The Royal Meteorological Society of Great Britain conferred upon him the Symons Gold Medal in January, 1912. Among his publications are: *Annual Summary and Review of Progress in Meteorology* (1873–88); *Treatise on Meteorological Apparatus and Methods* (1887); *Preliminary Studies for Storm and Weather Predictions* (1889); *The Mechanics of the Earth's Atmosphere* (1891); *Physical Basis of Long Range Forecastings* (1902); *Relations between Climates and Crops* (1905); *Mechanics of the Earth's Atmosphere* (3d coll. 1911).

ABBE, CLEVELAND, JR. (1872—). An American geographer, son of Cleveland Abbe (q.v.). He was born in Washington, D. C., and graduated from Harvard University in 1894. He took post-graduate studies at Johns Hopkins University, receiving the Ph.D. degree in 1898. From 1901 to 1903 he studied geography at the Imperial University, Vienna. He was appointed instructor in physiography at the Corcoran Scientific School of Columbian (now George Washington) University in 1894 and remained in that position until 1897. In 1896–1901 he was an assistant in the Maryland Geological Survey, part of the time also filling the chair of geology and biology in the Western Maryland College. In 1899 he became acting professor of the natural sciences in the Winthrop Normal and Industrial College in South Carolina. He held this position until 1901. Two years later he was appointed aid in the United States Geological Survey, and in 1906 research observer in the United States Weather Bureau. From 1908 to 1910 he was assistant editor of the *Monthly Weather Review*, and in the latter year became assistant in the library of the United States Weather Bureau.

ABBE, äb'be, ERNST (1840–1905). A German physicist. He was born at Eisenach, Thuringia; studied at Jena and Göttingen; became assistant at the astronomical observatory in Göt-

tingen and lecturer before the Physical Society of Frankfort-on-the-Main. In 1870 he was made professor at Jena; in 1878 became director of the astronomical and meteorological observatories, but resigned his ordinary professorial duties in 1891, when he became sole proprietor of the Carl Zeiss optical works in Jena, with which he had been connected since 1866. This he made a co-operative establishment, in the profits from which the officials, the workmen, and the university share. Abbe is well known for the part he played in the design and perfection of optical instruments. The high degree of excellence of the instruments and lenses manufactured by his firm is largely the result of his experimental work. Especially has the improvement been marked in photographic and microscopic lenses. He invented the Abbe refractometer and wrote many papers on optics and optical instruments. See his *Gesammelte Abhandlungen* (Jena, 1904).

ABBE, CONSTANTIN, L'. A story by Ludovic Halévy dealing with the distresses of the good Abbé Constantin when he learns that a neighboring estate has been bought by an American millionaire. He soon discovers, however, to his great joy, that Americans are not necessarily heathen. The book was first published in 1882, and in the next 30 years passed through more than 150 editions.

ABBE, TRUMAN (1873—). An American surgeon, son of Cleveland Abbe (q.v.), and brother of Cleveland Abbe, Jr. (q.v.). He was born in Washington, D. C., and graduated from Harvard University in 1895. He studied medicine at the College of Physicians and Surgeons (Columbia University), New York, receiving his degree in 1899. After post-graduate studies at the University of Berlin in 1899–1900, he served in several hospitals in New York City. In 1902 he was appointed instructor in physics and physiology at Georgetown University, and in 1903 assumed also the duties of instructor in surgery. In 1905 he was appointed instructor in physiology at George Washington University, and four years later instructor in surgery at that institution. He was surgeon in charge of the Garfield Surgical Dispensary from 1906 to 1910. Important researches into the use of radium as applied to medicine brought him a silver medal at the Jamestown Exposition in 1907. He contributed to vol. iii of Wharton and Stiller's *Medical Jurisprudence* in 1905, collaborated with F. H. Bowlby on *Physical Conditions and Treatment*, and wrote many articles on radium and medical subjects for medical journals.

AB'BESS. The superior of a religious community of women, who corresponds in rank and authority to an abbot (q.v.), except that she is not allowed to exercise the spiritual functions of the priesthood—such as preaching, confession, etc. Nor can she release her nuns from their vows or suspend or dismiss them. Her personal confessor and those for her nunnery must be approved by the bishop. The Council of Trent decreed that her electors must be professed nuns and that she must be at least forty years old and an inmate of the nunnery over which she was to preside for at least the eight previous years. The term was in occasional use from early times, but it became the official title of the superiors of Benedictine nunneries, whence it spread in course of time to other orders.

ABBEVILLE, äb'vel' (Fr., 'city of the Abbey,' of St. Riquier). Capital of the arrondissement of Abbeville, in the department of

Somme, France, 28 miles by rail northwest of Amiens (Map: France, N., G 2). Abbeville is built partly on an island and partly on the banks of the river Somme. It is connected with the sea by means of a canal. The streets are narrow, and the picturesque houses are built mostly of brick and wood. The building most worthy of notice is the church of St. Wolfran, commenced in the reign of Louis XII, a splendid example of the flamboyant style. Its city hall, built in 1209, is a curious medieval structure; the library dates from 1690. The important industries of Abbeville centre around its cloth factories, which make velvets, serges, cottons, linens, sacking, hosiery, etc. It is on the Northern Railway, and is connected by canals with Amiens, Paris, Lille, and Belgium. Vessels of between 150 and 200 tons can sail up the Somme as far as Abbeville, which is 12 miles from that river's mouth in the British Channel. Abbeville is well known in the scientific world from the remarkable fossil remains of extinct mammals, as well as the flint implements of prehistoric man, which have been discovered in its neighborhood. Pop., 1896, 17,781; 1901, 20,388; 1906, 20,704; 1911, 20,373.

ABBEVILLE, äb'ë-vil. A town and the county seat of Vermilion parish, La., 150 miles southwest of New Orleans, on the Inter-Coastal Canal, the Vermilion River, and on the Iberia and Vermilion Railroad (Map: Louisiana, C 4). The town is the seat of the Fenwick Sanitarium, and has rice, sugar, and cotton factories. The Inter-Coastal Canal provides water for extensive irrigation work carried on by three companies. The water works and light plant are owned by the town. Pop., 1890, 637; 1900, 1536; 1910, 2907; 1913 (est.), 3500.

ABBEVILLE. A town and the county seat of Abbeville Co., S. C., 105 miles west of Columbia, on the Southern and Seaboard Air Line railroads (Map: South Carolina, B 2). The town contains railroad repair shops, and includes among its industries cotton-ginning, cotton-seed oil pressing, flour and feed milling, and the manufacture of cotton cloth and bricks. Abbeville owns its water works and electric light plant. Pop., 1900, 3766; 1910, 4459; 1913 (est.), 4700.

AB'BEY. See MONASTERY; SANCTUARY.

ABBEY, äb'ï, EDWIN AUSTIN (1852-1911). The foremost of American illustrators; also a distinguished figure and mural painter. He was born in Philadelphia, April 8, 1852. Descended from an artistic family, the lad grew up with brush and pencil. At the age of sixteen he was placed with a wood engraver and afterwards studied for a year in the Pennsylvania Academy of Fine Arts. In 1871 he entered the employ of Harper Brothers in New York, associated with Charles S. Reinhart, Howard Pyle, Joseph Pennell, and William T. Smedley. In 1878 he was sent by the firm to England to make studies for his illustrations of Herrick's *Poems*. They were followed by illustrations to Goldsmith's *She Stoops to Conquer* (1887), *Old Songs* (1889), *Who is Sylvia*, and the *Comedies* of Shakespeare. From 1881 he resided in Great Britain.

As a painter in water colors and pastel, Abbey has shown great ability. Among his best-known water colors are "The Evil Eye" (1887), "An Old Song" (1886), "Le Jongleur"; among his pastels, "Phyllis," "Two Noble Kinsmen." His first oil painting, "A May Morning," exhibited in 1890, met with immediate success. It was fol-

lowed by "Fiametta's Song" (1894), "Richard of Gloucester and the Lady Anne" (1896), "King Lear's Daughters" (1898), presented in 1913 to the Metropolitan Museum of Art, New York; "The Penance of Eleanor, Duchess of Gloucester" (1909), now in the Carnegie Institute Museum at Pittsburgh; "The Crusaders" (1901), "Columbus and the New World" (1906), and a reredos for the American church in Paris (1907). In 1901 he was commissioned to paint the "Coronation of Edward VII," which he completed with great success in 1904, but refused the same commission from George V. He was the third Pennsylvanian commissioned to paint a British coronation. The others were Benjamin West for George III and Charles Robert Leslie for Victoria.

But Abbey's greatest paintings were two great decorative series executed for his native land. The earliest of these, fifteen great canvases representing the "Quest of the Holy Grail" (1891-1902), adorns the book delivery room of the Boston Public Library. The effect of the bright and beautiful colors is, unfortunately, impaired by the position of the paintings. The last ten years of his life were devoted to mural paintings in the Pennsylvania State Capitol at Harrisburg, which show great progress over the previous work. The central dome of the building is adorned by four gigantic lunettes and four ceiling panels. Above the speaker's rostrum in the House of Representatives is the "Apotheosis of Pennsylvania," a canvas 34 feet square, representing famous men of that commonwealth, which ranks as his highest achievement in painting. It is flanked by "Penn's Treaty with the Indians" and by the "Reading of the Declaration of Independence," the latter completed by his pupils in 1913. The rotunda of the ceiling is adorned by a mystic and beautiful representation of the "Hours" of day and night. Of his paintings for the Senate Chamber only one, "Von Steuben Training the American Soldiers at Valley Forge," was completed. His unexpected death in London, Aug. 8, 1911, prevented the painter from finishing the rest.

Abbey ranks as one of the world's greatest illustrators. His marked predilection for the costume and life of the past and his historic and topographic accuracy fitted him peculiarly for the period he has chosen. An excellent draughtsman, he preserved a certain romantic attitude towards his subject, which never fails to charm. As a painter he ranks among the most intellectual and able that America has produced, and although his painting is illustrative, he excels especially in color. He received gold medals at Vienna, Paris, Berlin, Philadelphia, etc.; was a member of the National Academy of Design, New York, the Royal Academy, London; an honorary member of several European academies; Chevalier of the Legion of Honor and corresponding member of the Institute de France; and honorary LL.D. of the University of Pennsylvania. Consult: Abbey, *The Quest of the Holy Grail* (Boston, 1909) for the reproductions; a charming interpretation by Greenslet, same title (ib. 1902).

ABBEY, HENRY (1842-1911). An American poet and merchant, born at Rondout, N. Y. He is the author of *May Dreams*, *Ralph and Other Poems*, *Stories in Verse*, *Ballads of Good Deeds*, *The City of Success*, and *Phaëton*. His works are collected in *Poems of Henry Abbey*, of which there are three editions.

ABBEY, HENRY EUGENE (1848-96). An

American theatrical manager, born at Akron, Ohio. He began as manager of a local theatre, then conducted starring tours for Lotta and others, and in 1876 leased the Academy of Music in Buffalo. Success rapidly followed his removal to New York, where he became manager, first of the Park Theatre, later also of Booth's and the Grand Opera House. Theatres in Boston and Philadelphia, as well, came under his control. Upon his engagement of Sarah Bernhardt and her company in 1880 he became known as the "Napoleon of managers." In 1883-84 Abbey controlled the Metropolitan Opera House, and it was under his management that Adelina Patti, in 1889-90, made a tour of the United States. In 1893 he produced the brilliant spectacular play *America*, built Abbey's Theatre in New York, and resumed control of the Metropolitan.

ABBIATEGRASSO, ab-byä'tä-gräs'sò. A city in north Italy, 394 feet above the sea, on the Grande and Bereguardo canals, 16 miles west of Milan (Map: Italy, C 2). It manufactures fertilizers and markets rice. It was captured in 1167 by Emperor Frederic Barbarossa, and in 1245 by Emperor Frederick II. In 1313 Matteo Visconti vanquished the Guelphs here, and in 1524 Giovanni de' Medici defeated the French. Pop., 1901, 12,270; 1911, 13,168.

ABBITIBBI. See ABITIBI.

AB'BO, or **ABBON OF FLEURY**, flê'rè (ABBO FLORIANENSIS) (945?-1004). A French theologian. He studied at Rheims and Paris, and at the request of Oswald, Archbishop of York, taught in 985-987 in the English abbey of Ramsey. When he returned to France, he was chosen Abbot of Fleury, whose school he developed. He was sent by King Robert upon a diplomatic mission to Pope Gregory V and was killed at the priory of La Réole, Gascony, in an uprising against his reforms in monastic discipline. He wrote an *Epitome de Vitis Romanorum Pontificum, Desinens in Gregorio I* (printed in 1602). His biography was written by his pupil Aimoin in the *Vita Abbonis abbatis Floriacensis*.

AB'BOT (through Lat. *abbas*, Gk. ἀββᾶς, *abbas*, from Syriac *abbā*, father). See ABBE. In the early days of monasteries any monk who won the reverence of the people might be called abba. The term, first used in Syria, spread, and soon was applied to the head of a monastery. Other terms were used—elder, senior, and, in the Greek churches, archimandrite (head of the fold) and hegumenos (leader). The last two terms have survived in the Greek church to the exclusion of abbot. The rule of St. Benedict (c.529) fixed abbot or abbat, as the name of the superior of the monastery. The Benedictine conception is that each house is a home, and abbot is appropriate as the title of the head of the house. The name has been perpetuated by the Benedictines and the orders derived from them, as the Cistercians, Bernhardines, Trappists. Other orders use other terms. In early times the abbot was a layman, as were all monks. Later, convenience led to the ordination of a priest in the monastery, and the abbot was often the priest. In 826 a council decreed that abbots should be ordained, but even in the eleventh century some were only deacons. In the Middle Ages laymen sometimes held the office, often nominally as trustees of the estates of the abbey; but this custom led to great abuses. The mode of election varied in early

times. The earliest and always the most common method was election by the monks. Sometimes the bishop appointed him; occasionally the abbot chose his own successor. The rule of St. Benedict declared that the abbot should be elected by the monks. In the Middle Ages the wealth of the monasteries invited invasion of their rights by the civil authorities, and the prince often usurped the power of appointment. Among the reforms of the Council of Trent (q.v.) was the restoration to the monastery of the right of electing the abbot. The newly elected abbot must be confirmed by the bishop, or, if the house was exempt from his control, by the Pope. Exempt monasteries were rare, there being in England only five or six. The abbots of these had to go to Rome, either in person or by proxy, for confirmation. The cost of travel and fees was enormous, and later the journey to Rome was remitted for a yearly tax of 200 florins to the papal treasury. At present in the United States abbots are confirmed directly by the Pope; in England, by the abbot president, a superior elected by the abbots. The abbot is elected for life. His rule is absolute over the monastery, both as to its temporal estates and its spiritual activities. He himself, however, is under rules which were intended to curb undue ambition and to bind him to his duties in his house. As early as the seventh century certain abbots were granted the right to use pontifical insignia, including the mitre, the crosier, and the ring. There were three classes: mitred abbots; crosiered abbots, allowed by special permission of the Pope to bear a crosier or have it borne before them; œcumenical abbots, ruling the houses of a province or country. Abbots hold a rank immediately after bishops. Their mitres must be less costly than those of bishops, and they are allowed, not a permanent throne, but a temporary one. Abbots have usually sat with bishops in the councils of the Church. They appear in the Council of Constantinople (443), in that of Toledo (653), and in most later councils. In the third Plenary Council at Baltimore (1884) six abbots were present, two of whom had a decisive vote; the rest, a consultative voice. Before the Reformation certain abbots had seats in the English Parliament. In one Parliament in the time of Henry III there were 64 abbots; later Parliaments contained 26. At present there are 17 mitred abbots in the United States, 2 in Canada, 10 in England, 1 in Scotland, 2 in Ireland. See Feasey, *Monasticism* (London, 1898); Gasquet, *English Monastic Life* (London, 1904); Taunton, *The English Black Monks of St. Benedict* (London, 1898).

ABBOT, BENJAMIN, LL.D. (1762-1849). A New England teacher, educated at Phillips Academy and at Harvard College. For nearly 50 years (until 1838) he was at the head of Phillips Academy, Exeter, N. H. Among his pupils were Jared Sparks, Daniel Webster, George Bancroft, Edward Everett, and others who became famous.

ABBOT, CHARLES, first BARON COLCHESTER (1757-1829). A Speaker of the House of Commons. He was born at Abingdon and was educated at Christ Church. After he had occupied numerous positions under the government he became Speaker of the House (1802) and held the office until 1817, when ill health compelled him to retire. He was one of the ablest Speakers that ever occupied the chair, and also

rendered valuable services as a trustee of the British Museum. His valuable *Diary and Correspondence* was published by his son in 1861.

ABBOT, CHARLES GREELEY (1872—). An American astrophysicist, born in Wilton, N. H., and graduated from the Massachusetts Institute of Technology in 1894. In 1895 he was appointed assistant at the Smithsonian Astrophysical Observatory, and in the following year became aid, acting in charge. He was appointed acting director in 1907 and, in March of the same year, director. He devoted himself continuously to researches in solar radiation and with S. P. Langley completed and published the mapping of the infra-red solar spectrum. This is described in vol. i of the *Annals* of the Astrophysical Laboratory. He conducted expeditions to view the total solar eclipses of May 28, 1900, May 18, 1901, and Jan. 3, 1908. His later studies had chiefly to do with the total amount and variability of solar radiation, its absorption in the solar and terrestrial gaseous envelopes, and the effect of its variability on climate. Abbot became a member of many astronomical and other scientific societies. He wrote *The Sun* (1911) and numerous articles on the apparatus, methods, and results of solar research.

ABBOT, EZRA (1819–84). An American biblical scholar. He was born at Jackson, Waldo Co., Maine, and died at Cambridge, Mass. After graduation at Bowdoin College (1840) he taught school in Maine and in Cambridge, Mass., until in 1856 he became assistant librarian of Harvard University. From 1872 till his death he was Bussey Professor of New Testament Criticism and Interpretation in the Divinity School of Harvard University. He received the degrees of LL.D. (Yale, 1869; Bowdoin, 1878); S.T.D. (Harvard, 1872); D.D. (Edinburgh, 1884). His industry, classical scholarship, wide acquaintance with books, and rare capacity for retaining minute information made him a remarkable bibliographer and textual critic. He won fame in the first direction by his valuable *Literature of the Doctrine of the Future Life* (1864), appended to W. R. Alger's book on the subject, and by his bibliographical additions to *Smith's Bible Dictionary* (American ed., Boston, 1867–70, 4 vols.). But much wider was his fame in the second direction, for his acquaintance with the text of the Greek New Testament was recognized throughout the biblical world and placed him beside Lachmann, Tischendorf, Tregelles, Scrivener, Westcott, and Hort. He was therefore an efficient member of the American New Testament Revision Company (1878–81). Into the revision he put the most painstaking and accurate learning. He displayed his attainments in ways which won him the hearty thanks of the authors he aided, but not much public recognition. Thus he was the coadjutor of Caspar René Gregory upon his prolegomena to the eighth major edition of Tischendorf's Greek New Testament (Leipzig, 1884–94, 3 parts); he revised the whole of Schaff's *Companion to the New Testament* (New York, 1883) and greatly enriched E. C. Mitchell's *Critical Handbook of the New Testament* (New York, 1880). His modesty made him indifferent to fame, and he put his strength upon correcting other people's books and upon monographs which the scholarly world appreciated. These latter have been collected by J. H. Thayer, under the title *Critical Essays*

(Boston, 1888). Consult Barrows' sketch of *Ezra Abbot* (Boston, 1884).

ABBOT, FRANCIS ELLINGWOOD (1836–1903). An American writer on philosophy. He was born in Boston, Mass., and graduated at Harvard University (1859) and the Meadville Theological School (1863). After having had charge of Unitarian congregations from 1863 to 1868, he turned to journalism, and from 1870 to 1880 edited a weekly journal, the *Index*, devoted to religious topics. He published *Scientific Theism* (1886) and *The Way out of Agnosticism* (1890).

ABBOT, GEORGE (1562–1633). Archbishop of Canterbury. He was born at Guildford, Surrey, and was educated at Oxford (B.A. 1582; M.A. 1585; D.D. 1597). He took holy orders in 1585 and rose rapidly. His pronounced Puritanism brought him into conflict with William Laud. In 1609 he was appointed Bishop of Coventry and Lichfield and in 1610 he was translated to the see of London. In 1611 he was enthroned Archbishop of Canterbury. He owed these successive appointments to the marked favor of James I and used his exalted position to advance a narrow Protestantism and to persecute Roman Catholics. He also appeared in political life as the determined foe of Spain and France, largely because they were Roman Catholic countries. His courageous opposition to the King on several momentous occasions cost him after 1613 much of the royal favor. While under a cloud he had the misfortune, when hunting, accidentally to kill a gamekeeper. His enemies used the incident against him. Laud brought about a court of inquiry into the alleged infringement of canon law, and three persons designated to bishoprics refused to be consecrated by him. The inquiry came to nothing, but the stigma remained. The death of James I (1625) was an additional misfortune to Abbot, as Charles I was influenced by Laud. After 1627 he was practically deprived of the rights and privileges of his office. He died at Croydon, then the country residence of the Archbishop of Canterbury, Aug. 4, 1633. Of his writings the most popular was his commentary on the Book of Jonah (1600), which was reprinted with a life by Grace Webster (London, 1845).

ABBOT, HENRY LARCOM (1831—). An American soldier and engineer. He was born at Beverly, Mass., and graduated at the United States Military Academy, West Point, in 1854, entering the Corps of Engineers, in which he served with distinction until his retirement in 1895. He was engaged in the survey for the Pacific Railroad and the hydrographic survey of the Mississippi River delta. During the Civil War he was engaged in engineering and artillery operations. He was wounded at the battle of Bull Run in 1861. In the operations around Richmond he commanded the siege artillery. At the close of the war he was brevetted Major-General of Volunteers. For many years he was in command of the garrison of the engineer post at Willetts Point, N. Y., and while there developed the torpedo and submarine defense of the Long Island Sound approach to New York City and founded the school for engineers. In this connection he did much important work in military science, devoting himself to the design and construction of submarine mines and mortar batteries, as well as to the development of military engineering equipment and drill, and serving on the Gun Foundry Board, the Board on Fortifications

and Defenses, and numerous other military commissions. He was a member of the board to devise a plan for the protection and reclamation of the Mississippi basin. In 1872 he was elected a member of the National Academy of Sciences. He served as president of a board of consulting engineers to consider the question of a proposed ship canal from Pittsburgh to Lake Erie, and designed the harbor at Manitowoc, Wis. In May, 1897, he was appointed a member of the Technical Committee of the New Panama Canal Company. He is the author of *Siege Artillery in the Campaign against Richmond* (1867); *Experiments and Investigations to Develop a System of Submarine Mines for Defending Harbors of the United States* (1881), and with Gen. A. A. Humphreys, *Physics and Hydraulics of the Mississippi*, in addition to a large number of reports of military and engineering commissions and boards. Among his later writings may be mentioned *Problems of the Panama Canal* (1905-07).

ABBOT, JOSEPH HALE (1802-73). An American educator, born at Wilton, N. H. He graduated in 1822 at Bowdoin College, and from 1827 to 1833 was professor of mathematics and instructor in modern languages at Phillips Academy, Exeter. He contributed numerous valuable papers to the *Transactions* of the American Academy of Arts and Sciences and was an associate editor of Worcester's *Dictionary of the English Language* (1860).

ABBOT, SAMUEL (1732-1812). An American philanthropist. He was born at Andover, Mass., and was one of the founders of the Andover Theological Seminary, to which he gave \$20,000 in 1807 and \$100,000 more in his will. He was a successful merchant of Boston and a large contributor to charities.

ABBOT, THE. The title of one of Sir Walter Scott's novels, published in 1820. Its incidents form a sequel to *The Monastery*, and are based upon the history of Mary, Queen of Scots, in the years 1567 and 1568, ending with the battle of Langside and her escape to England.

ABBOT, WILLIS JOHN (1863—). An American author and editor, grandson of John S. C. Abbott. He was born at New Haven, Conn., and graduated at the University of Michigan in 1884. He is best known by his *Blue Jackets of '61*, *Blue Jackets of 1812*, and *Blue Jackets of '76*, a series of stories for boys relating to the naval history of the United States, and by his *Battle Fields of 1861*. Mr. Abbot was managing editor of the *Chicago Times* in 1892 and 1893, and from 1896 to 1898 was on the editorial staff of the *New York Journal*. His later writings include: *The American Merchant Ships and Sailors* (1902); *A Story of Our Navy for Young Americans* (1910); *Panama and the Canal in Picture and Prose* (1913).

ABBOT OF JOY (ABBÉ DE LIESSE). The title bestowed upon the chief of a brotherhood founded at Lille. Accompanied by a suite of officers and servants who bore before him a standard of red silk, he presided over the games which were held at Arras and the neighboring towns during the period of the carnival, coming under the general title of "Feast of the Ass" (q.v.). See also MISRULE, LORD OF.

AB'BOT OF MISRULE'. See MISRULE, LORD OF.

ABBOTSFORD, äb-ots-fërd. The estate of Sir Walter Scott, situated on the south bank of the Tweed, about three miles from Melrose Abbey.

Before it became, in 1811, the property of Scott, the site of the house and grounds of Abbotsford formed a small farm known as Clarty Hole. The new name was given it by the poet in remembrance of the days when Melrose abbots passed over the fords of the Tweed. On this spot, a sloping bank overhanging the river, with the Selkirk Hills behind, he built at first a small villa, now the western wing. He added the remaining parts of the building, on no uniform plan, but with the desire of combining some of the features (and even actual remains) of those ancient works of Scottish architecture which he most loved. The result was a picturesque and irregular pile, which has been aptly called "a romance in stone and lime." It remained in Scott's family to the fourth generation, but has lately been leased by rich Americans. See Irving's *Abbotsford* (London, 1850); Lockhart's *Life of Scott* (Edinburgh, 1838); Mary Scott's *Abbotsford* (New York, 1893), and Smith and Crockett's *Abbotsford* (New York, 1905).

AB'BOTT, AUSTIN, LL.D. (1831-96). An American lawyer, born in Boston, Mass., the son of Jacob Abbott. He graduated at the University of the City of New York in 1851 and was admitted to the bar in the following year. He was in partnership with his brothers, Benjamin Vaughan and Lyman (afterward editor of the *Outlook*). He gained a national reputation as counsel for Theodore Tilton in his suit against Henry Ward Beecher. He aided his brother Benjamin in the preparation of his well-known digests of laws and was himself a prolific legal author. His works, mostly of a practical character, included a comprehensive digest of *New York Statutes and Reports*, a treatise on *Trial Practice*, and a useful collection of legal forms, all of which are still of use to the profession. He also wrote, in collaboration with his two brothers, two novels, *Matthew Caraby* and *Conecut Corners*. He was an able lecturer on law and was Dean of the Law School of the University of the City of New York from 1891 until his death.

ABBOTT, BENJAMIN (1732-96). A Methodist Episcopal minister, born on Long Island, N. Y. He was apprenticed to a hatter in Philadelphia and subsequently to a farmer in New Jersey. He was converted from a dissipated life when about 40 years old, and immediately became an itinerant Methodist preacher. After 16 years' service in New Jersey he was assigned to the Dutchess (N. Y.) circuit in 1789. He was transferred to the Long Island circuit in 1791, to Salem, N. J., in 1792, to the Cecil circuit, Maryland, as presiding elder, in 1793, and died at Salem, N. J., in 1796. He was famous in his day and is still remembered as a "rousing" preacher. His vehemence was such that he frequently fainted and generally strongly moved his hearers.

ABBOTT, BENJAMIN VAUGHAN (1830-90). An American lawyer, the son of Jacob Abbott. He graduated at the University of the City of New York in 1850 and was admitted to the bar in 1852. In legal practice his brothers Austin and Lyman were associated with him. In conjunction with his brother Austin he produced nearly 100 volumes of reports and digests of Federal and State laws and a *Dictionary of Legal Terms and Phrases*. In 1865, as secretary of the New York Code Commission, he drafted a penal code which, when adopted by the Legisla-

ture, became the basis of the present code. In 1870 President Grant appointed him one of three commissioners to revise the statutes of the United States.

ABBOTT, CHARLES CONRAD (1843—). An American archæologist and naturalist, born at Trenton, N. J. He studied medicine at the University of Pennsylvania, and served as a surgeon in the Federal Army during the Civil War. From 1876 to 1889 he was assistant curator of the Peabody Museum in Cambridge, Mass., to which he presented a collection of 20,000 archæological specimens; he freely gave also to other archæological collections. His book *Primitive Industry* (1881) detailed the evidences of the presence of pre-glacial man in the Delaware valley, and is a valuable contribution to American archæology. He also published many books on out-door observation, such as *A Naturalist's Rambles about Home* (1884). His other works, besides some fiction, include: *Upland and Meadow* (1886); *Wasteland Wanderings* (1887); *Outings at Odd Times* (1890); *Clear Skies and Cloudy* (1899); *In Nature's Realm* (1900); *Rambles of an Idler* (1906); *Archæologia Nova Cæsarea* (1907-09); *Ten Years' Diggings in Lenâpé Land, 1901-11* (1912). He is well known as a frequent contributor to the *American Naturalist*, *Science*, *Nature*, *Science-News*, and *Popular Science Monthly*.

ABBOTT, EDWARD, D.D. (1841-1908). An American clergyman, journalist, and author, son of Jacob Abbott, born at Farmington, Me. He graduated in 1860 at the University of New York, studied from 1860 to 1862 at the Andover Theological Seminary, and in 1863 served in the United States Sanitary Commission at Washington and with the Army of the Potomac. He was ordained in 1863 to the Congregational ministry, and was pastor of Pilgrim Church, Cambridge, Mass., from 1865 to 1869. From 1869 to 1878 he was associate editor of the *Congregationalist*, and from 1878 to 1888 editor of the *Literary World*, whose direction he again assumed in 1895. In 1879 he was ordained a priest of the Protestant Episcopal Church and appointed rector of St. James's parish, Cambridge. His publications include *The Conversations of Jesus* (1875) and *Phillips Brooks* (1900).

ABBOTT, EDWIN ABBOTT (1838—). An English author, born in London. He graduated at St. John's College, Cambridge, with distinction (B.A. 1861, M.A. 1864); was assistant master in King Edward's School, Birmingham (1862-64), and head-master of the City of London School (1865-89), which he made one of the best day schools in England; retired in 1889, and received a pension the next year. He was twice Select Preacher at Cambridge and once at Oxford. He published *Francis Bacon* (London, 1885); *Cardinal Newman* (1892); *St. Thomas of Canterbury* (1898); *Shakespearean Grammar* (1869; 3d ed. revised and enlarged, 1870), a pioneer work which, though unscientific, has hardly been superseded; *Clue, a Guide through Greek to Hebrew Scripture* (1900); *Corrections of Mark Adopted by Matthew and Luke* (1901); *Comparison of the Words of the Fourth Gospel with those of the Three* (1905); *The Son of Man; or Contributions to the Study of the Thoughts of Jesus* (1910); *Light on the Gospel from an Ancient Poet* (Eng. ed., 1912; Am. ed., 1913); *The*

Fourfold Gospel, section i, Introduction (1913). His brother, **EVELYN ABBOTT** (1843-1901), of Balliol College, Oxford, wrote a *History of Greece* that is a memorial to its author's scholarship.

ABBOTT, EMMA (EMMA ABBOTT WETHERELL) (1849-91). An American soprano, born in Chicago, Ill. She began her musical experience in the choir of Plymouth Church, Brooklyn, N. Y., and afterwards studied in Milan under San Giovanni and in Paris under Delle Sedie. She made her début at Covent Garden, London, as Maria in *La Fille du Régiment*. For three years thereafter she made an operatic and concert tour of England and Ireland under the direction of Colonel Mapleson. Subsequently she returned to the United States, where she sang with the Abbott and Hess Opera Company, and later with the English opera company long known by her name. She sang in *Martha*, *Faust*, *Les Huguenots*, *The Chimes of Normandy*, and the more popular works of Verdi, Bellini, and Donizetti. With the exception of Clara Louise Kellogg, she was perhaps more widely known than any other American singer of her time. Consult H. C. Lahee, *Famous Singers of To-day and Yesterday* (Boston, 1898).

ABBOTT, FRANK FROST (1860—). An American Latinist, born at Redding, Conn. He graduated at Yale in 1882, and in 1891 received there the degree of Ph.D., after study also at Bonn and Rome in 1888-89. From 1885 to 1891 he was tutor at Yale; and in 1891 was appointed professor of Latin in the University of Chicago. He was also annual professor in the American School of Classical Studies at Rome, from 1901 to 1902, and became Associate Chairman of the Managing Committee of the same institution. He went to Princeton as Professor of Classics in 1908. He wrote *A History of Roman Political Institutions* (1901), *The Toledo Manuscript of the Germania of Tacitus* (1903), *A History of Rome* (1906), *Society and Politics in Ancient Rome* (1909), *The Common People of Ancient Rome* (1911), etc. He has contributed to various classical periodicals and became associate editor of *Classical Philology*.

ABBOTT, GEORGE FREDERICK. An English war correspondent and author. He was educated at Emmanuel College, Cambridge, taking the degree of B.A. in 1899. In 1900 he was sent by Cambridge University to Macedonia to make studies in the folk-lore of that country. He acted as special correspondent in southwestern Europe for several London newspapers until 1903. In 1905 he accompanied the Prince of Wales, now George V, on his tour of India. Besides contributing articles to many reviews and magazines, he wrote *Songs of Modern Greece* (1900); *Macedonian Folk-Lore* (1903); *The Tale of a Tour in Macedonia* (1903); *Through India with the Prince* (1906); *Israel in Europe* (editor, 1907); *Greece in Evolution* (1909); *Turkey in Transition* (1909); *The Philosophy of a Don* (1911); *The Holy War in Tripoli* (1912).

ABBOTT, GORHAM DUMMER (1807-74). An American Congregational clergyman and educator, born in Hallowell, Maine. He graduated at Bowdoin in 1826 and at Andover in 1831. With his brothers, Jacob and John S. C. Abbott, he was a pioneer in the higher or collegiate education of young women. In 1847 he founded the Spingler Institute, in New York City. The school maintained a high reputation during its

brief history. He wrote *The Family at Home*; *Nathan W. Dickerman*; *Pleasure and Profit*.

ABBOTT, JACOB (1803-79). A popular juvenile and didactic writer. He was born at Hallowell, Maine. He graduated at Bowdoin College in 1820. Like his brother John, he studied for the ministry at Andover, and was ordained to the Congregational ministry. From 1825 to 1829 he was professor of mathematics and natural philosophy at Amherst. He then established a girls' school in Boston, and in 1834 organized the Eliot Church, Roxbury. Five years later he moved to Farmington, Me. He passed the remainder of his life there, in New York, and in foreign travel, devoting himself wholly to literature. He died at Farmington Oct. 31, 1879. Abbott published more than 200 volumes, the most noteworthy of which are *The Rollo Books* (28 vols.), *The Franconia Stories* (10 vols.), *The Rainbow and Lucky Series* (5 vols.), a number of juvenile histories, written in collaboration with his brother, and a series of histories of America. He also edited many school books. His style had a singular fascination for the young, and many of his writings were popular.

ABBOTT, SIR JOHN JOSEPH CALDWELL (1821-93). A Canadian statesman, born at St. Andrew's, Quebec. He was educated at McGill College, Montreal; studied law, and in 1847 was called to the bar. Beginning in 1859, he represented Argenteuil County in the Canadian Assembly until the union in 1867, when he became a member of the Dominion Parliament for the same place. In 1862 he was solicitor-general in the cabinet of John Sandfield Macdonald, but resigned before his chief lost power. In 1887 Sir John A. Macdonald invited him to join the cabinet as a minister without portfolio. In June, 1891, on the death of Sir John A. Macdonald, Abbott was made Premier of the Dominion government, but resigned in November, 1892, because of his ill health. He took a seat in the cabinet of his successor, Sir John Thomson, but without a portfolio. He was Dean of the Faculty of Law of McGill University for ten years, was considered an authority on commercial law, and was knighted in 1892.

ABBOTT, JOHN STEVENS CABOT (1805-77). An American historian, pastor, and pedagogical writer, a brother of the equally prolific Jacob Abbott (q.v.). He was born at Brunswick, Maine, and graduated at Bowdoin College in 1825. He studied for the ministry at Andover and was ordained a Congregational minister in 1830. He held successive pastorates at Worcester, Roxbury, and Nantucket, Mass. His writings were, from the outset, popular. Beginning with semi-religious pedagogy, *The Mother at Home* (1833), *The Child at Home*, etc., he was presently diverted to history, and after 1844 resigned his pastorate, giving himself entirely to literature. He died at Fairhaven, Conn., June 17, 1877. His most noteworthy books are *The French Revolution*, *The History of Napoleon Bonaparte* (1855), *Napoleon at St. Helena*, *The History of Napoleon the Third* (1868), *The History of the Civil War in America* (1863-65), and *The History of Frederick II, Called Frederick the Great* (New York). All these are readable, and the books on Napoleon were very popular, but none of them has any critical value. In 1910 a series of twenty short biographies of historical characters by J. S. C. and Jacob Abbott, was published.

ABBOTT, LYMAN, D.D. (1835—). An American Congregational clergyman and editor. He was born at Roxbury, Mass., a son of Jacob Abbott. He graduated at the New York University in 1853 and for a time practiced law with his brothers Austin and Benjamin Vaughan Abbott. Afterward he studied theology with his uncle, Rev. John S. C. Abbott, and became pastor of a church at Terre Haute, Ind., in 1860. Five years later he was made secretary of the American Union (Freedman's) Commission and became pastor of the New England Church in New York City. In 1869 he resigned this pastorate and thereafter was successively one of the editors of *Harper's Magazine*, the principal editor of the *Illustrated Christian Weekly*, and, as associate of Henry Ward Beecher, an editor of the *Christian Union* (now the *Outlook*), of which he afterward became editor-in-chief (1882). He succeeded Mr. Beecher as pastor of Plymouth Church, Brooklyn, in 1888, but resigned in May, 1899, and has since devoted himself to editorial and literary work chiefly in connection with the *Outlook*. In collaboration with his brothers Austin and Benjamin he wrote two novels, *Connect Corners* (1885); and *Matthew Caraby* (1888). Among his other numerous works are commentaries, *Jesus of Nazareth* (1869); *Life of Henry Ward Beecher* (1883); *In Aid of Faith* (1885); *Christianity and Social Problems* (1896); *The Theology of an Evolutionist* (1897); *Life and Letters of Paul* (1898); *Life and Literature of the Ancient Hebrews* (1901); *The Rights of Man* (1901); *The Great Companion* (1904); *Personality of God* (1905); *Industrial Problems* (1905); *The Other Room* (1905); *Christ's Secret of Happiness* (1907); *The Home Builder* (1908); *The Temple* (1909); *The Spirit of Democracy* (1910); *America in the Making* (Yale lectures on the responsibilities of citizenship, 1911); *Letters to Unknown Friends* (1913).

ABBOTT, NATHAN (1854—). An American lawyer and law teacher of distinction, born at Norridgewock, Maine, the son of Abiel Abbott. He was educated at Yale College, graduating in 1877, and studied law in Boston University. After some years of practice in the city of Boston he was invited to become Tappan Professor of Law in the University of Michigan, and from that time on has devoted himself exclusively to legal scholarship and teaching. After a year at the University of Michigan, Professor Abbott was appointed Professor of Law in Northwestern University and two years later, in 1895, he became Professor of Law and Dean of the Law School of Leland Stanford University. This position he held until 1907, since which time he has been a member of the Law Faculty of Columbia University, New York City. He is a legal scholar of wide reputation and is a recognized authority on the English and American Law of Real Property.

ABBOTT, THOMAS KINGSMILL (1829-1913). An Irish scholar and educator. He was born at Dublin and was educated at Trinity College, where he afterward occupied the chair of moral philosophy (1867-72), of biblical Greek (1875-88), and of Hebrew (1879-1900). He wrote the following books: *The Elements of Logic* (3d ed., 1895); *Essays*, chiefly on the original texts of the Old and New Testaments (1892); *A Commentary on Ephesians and Colossians* (1897); a translation of *Kant's Ethics*, with a memoir (6th ed., 1909); *Kant's Introduction*

to *Logic* (5th ed., 1878); *Elementary Theory of the Tides* (2d ed., 1901); *Catalogue of Fifteenth Century Books in the Library of Trinity College, Dublin, etc.* (1905).

ABBOTT, WILBUR CORTEZ (1868—). An American historian and educator, born at Kokomo, Ind., and graduated from Wabash College in 1892. He was a graduate student at Cornell University from 1892 to 1895, and in 1897 studied at Oxford, where he received the degree of B.Litt. He studied also in several continental universities. In 1892-93 he was a fellow at Cornell; from 1893 to 1895 was instructor in European history, and in 1895-96 was President White traveling fellow in that university. He became successively instructor in history at the University of Michigan (1897), assistant professor of history in Dartmouth College (1899), professor of European history in the University of Kansas (1902), and professor of history at the Sheffield Scientific School, Yale (1908). He contributed to American and English historical reviews and wrote *Colonel Blood, Crown Stealer* (1911).

ABBREVIATIONS (Lat. *ad*, to + *brevis*, short). Contrivances in writing for saving time and space. They are of two kinds, consisting either in the omission of some letters or words, or in the substitution of some arbitrary sign. In the earliest times, when uncial or lapidary characters were used, abbreviations by omission prevailed, such as we find in the inscriptions on monuments, coins, etc. In these the initial letter is often put for the whole word, as M. for Marcus, F. for Filius. It was after the small Greek and Roman letters had been invented by transcribers for facilitating their work that signs of abbreviation, or characters representing double consonants, syllables, and whole words, came into use. Greek manuscripts abound in such signs, and often only one who has expressly studied Greek paleography can make them out. From the manuscripts they passed into the early printed editions of Greek books, and it is only within the last century that they have quite disappeared. Among the Romans the system was carried to such an extent that L. Annæus Seneca collected and classified 5000 abbreviations. The same practice has prevailed in all languages, but nowhere more than in the rabbinical writings. The abbreviations used by the ancient Romans were continued and increased in the Middle Ages. They occur in inscriptions, manuscripts, and legal documents; and the practice endured in these long after the invention of printing had made it unnecessary in books. An act of Parliament was passed in the reign of George II, forbidding the use of abbreviations in legal documents. Owing to these abbreviations, the deciphering of old writings requires special study and training, and forms a separate science, on which numerous treatises have been written. One of the most exhaustive is Tassin's *Nouveau traité de diplomatique* (6 vols., Paris, 1750-65). See PALEOGRAPHY.

In ordinary writing and printing few abbreviations are now employed. The sign &, originally an abbreviation for the Latin *et*, 'and,' is one of the few still to be met with of this arbitrary kind. It does not stand properly for a word, for it is used in different languages, but for an idea, and is as much a symbol as +. The abbreviations by using the initials of Latin

words that are still in use are chiefly confined to titles, dates, and a few phrases; as M.A. (*magister artium*), Master of Arts; A.D. (*anno Domini*), in the year of our Lord; *e.g.* (*exempli gratia*), for example. Many are now formed from English words in the same way; as F.G.S., Fellow of the Geological Society; B.C., before Christ.

The following table contains many of the more important abbreviations in general use. There are omitted from it many others whose meanings are obvious, and all abbreviations for days, months, countries, States, many proper names, as those of the Scriptures; grammatical, scientific, and other technical terms; familiar titles, as *Mr.*, *Gov.*; and the majority of commercial terms, as B/l, bill of lading. The names of many societies are omitted, especially when their abbreviations, as *Y. M. C. A.*, are well known.

- A.B., Bachelor of Arts.
- Abp., Archbishop.
- A.C. (*ante Christum*), Before Christ.
- Accel. (*accelerando*), In music, more quickly.
- A.D. (*anno Domini*), In the year of our Lord.
- A.D.C., Aide-de-camp.
- Ad lib. (*ad libitum*), At pleasure.
- Aet. (*ætatis*), Of (his or her) age.
- Aevia, Alleluia. In reprints of old music. Consonants are omitted; old *u* written *v*.
- A.H. (*anno Hegiræ*), In the year of the Hegira (reckoning from 622 A.D.).
- A.M. (*ante meridiem*), Before noon; (*anno mundi*), In the year of the world; (*artium magister*), Master of Arts.
- An. (*anno*), In the year.
- Anon., Anonymous.
- Appettando. In music, hurrying.
- A.R.A., Associate of the Royal Academy (London).
- A.S.A., American Statistical Association.
- A tem. In music, after increasing or retarding the time a return to the prescribed time.
- A.T.S., American Tract Society.
- A.U.C. (*ab urbe condita*), From the building of the city—that is, Rome.
- A.V., Authorized Version.
- b., Born.
- B.A. or A.B. (*artium baccalaureus*), Bachelor of Arts.
- Bart. or Bt., Baronet.
- B.C., Before Christ. In music, *basso continuo* (see FIGURED BASS).
- B.C.L., Bachelor of Civil Law.
- B.D., Bachelor of Divinity.
- B.L., Bachelor of Letters.
- B.LL., Bachelor of Laws.
- B.M., Bachelor of Medicine.
- B.Mus., Bachelor of Music.
- Bp., Bishop.
- B.S. or B.Sc., Bachelor of Science.
- B.V.M., Blessed Virgin Mary.
- C. (*centum*), a hundred; chapter; *c.* (*circa*), about; *c.* century. Also C. = Centigrade.
- C.A., In music, *col arco*, with the bow.
- Cantab. (*Cantabrigiensis*), Of Cambridge. In music, *cantabile*, with singing tone.
- C.B., Companion of the Bath.
- C.E., Civil Engineer.
- cf. or cp., Confer; compare.
- Ch., In music, choir-organ (see ORGAN).
- C.I., Order of the Crown of India.
- C.I.E., Companion of the Order of the Indian Empire.

C.M.G., Companion of St. Michael and St. George.
 Co., County.
 c/o., Care of.
 C.O.D., Cash, or collect, on delivery.
 Cr., Creditor.
 Cresc. (*crecendo*), In music, a gradual increase of tone.
 C.S.I., Companion of the Star of India.
 cwt., Hundred-weight.
 d. (*denarius*), Penny; died.
 Dal S., In music, *dal segno*, repeat from the sign indicating repetition.
 D.C. (*da capo*), From the beginning; District Court; District of Columbia.
 D.C.L., Doctor of Civil Law.
 Decresc., In music, *decrescendo* = *diminuendo*.
 D.D., Doctor of Divinity; *donum dedit*.
 D.D.S., Doctor of Dental Surgery.
 D.G. (*Dei gratia*), By the grace of God; (*Deo gratias*), thanks be to God.
 Dim. (*diminuendo*), In music, a gradual decrease of tone.
 Div., In music, *divisi*, strings divided.
 D.Lit., Doctor of Literature.
 Do. (Ital. *detto*, said), Ditto, the same.
 D.O.M. (*Deo optimo maximo*), To God the best and greatest.
 Dr., Doctor, debtor.
 D.Sc., Doctor of Science.
 D.S.O., Companion of the Distinguished Service Order.
 D.V. (*Deo volente*), God willing.
 dwt., Pennyweight.
 e.g. or ex. gr. (*exempli gratia*), For example.
 Esp., In music, *espressivo*, with expression.
 et al. (*et alii*), And others.
 etc. (*et cetera*), And the rest; and so on.
 et seq. (*et sequentia*), And the following.
 F., Fahrenheit.
 f. (*forte*), loudly.
 f. or ff., Following.
 F. and A. M., Free and Accepted Masons.
 F.D. (*fidei defensor*), Defender of the Faith.
 ff. (*fortissimo*), Very loud.
 fl. (*floruit*), Flourished.
 F.M., Field Marshal.
 F.O., In music, full organ.
 fp., In music, *forte piano* = *sforzato* (see SF).
 F.R.C.P., Fellow of the Royal College of Physicians.
 F.R.C.S., Fellow of the Royal College of Surgeons.
 F.R.G.S., Fellow of the Royal Geographical Society.
 F.R.S., Fellow of the Royal Society.
 F.S.A., Fellow of the Society of Antiquaries.
 G.C.B. (Knight), Grand Cross of the Bath.
 G.C.M.G. (Knight), Grand Cross of St. Michael and St. George.
 G.C.S.I. (Knight), Grand Commander of the Star of India.
 G.O., In music, great organ.
 H.B.M., His (or Her) Britannic Majesty.
 H.E., His Eminence; His Excellency.
 H.I.H., His (or Her) Imperial Highness.
 H.M.S., His (or Her) Majesty's Service, or Ship.
 H.S.H., His (or Her) Serene Highness.
 I. (*imperator* or *imperatrix*), Emperor or Empress.
 ib. or ibid. (*ibidem*), In the same place.
 Id. (*idem*), The same; (*Idus*), the Ides.
 i.e. (*id est*), That is.

I.H.S.* (*Iesus Hominum Salvator*), Jesus the Saviour of men.
 Incog. (Ital. *incognito*), Unknown.
 Inf. (*infra*), Below.
 In loc. (*in loco*), In the place referred to.
 I.N.R.I. (*Iesus Nazarenus Rex Iudæorum*), Jesus of Nazareth, the King of the Jews.
 Inst. (*instante—mense* understood), In the current (month).
 I.O.O.F. Independent Order of Odd Fellows.
 J.C.D. (*juris civilis doctor*), Doctor of Civil Law.
 J.P., Justice of the Peace.
 Jr., Junior.
 J.U.D. (*juris utriusque doctor*), Doctor of Laws, i.e., both of civil and canon law.
 Kal. (*Kalendæ*), The Kalends.
 K.C., King's Counsel.
 K.C.B., Knight Commander of the Bath.
 K.C.M.G., Knight Commander of St. Michael and St. George.
 K.C.S.I., Knight Commander of the Star of India.
 K.P., Knight of St. Patrick.
 K.T., Knight of the Thistle.
 L. (*libra*), Pound (in English money).
 lb (*libra*), Pound (weight).
 l.c. (*loco citato*), In the place cited; (lower case) small letters in printing.
 leg. (*legato*), Smoothly; in a connected manner.
 L.H., In music, *linke Hand*, left hand.
 L.H.D. } (*litterarum humaniorum doctor*),
 Litt.D. } Doctor of Literature, or Letters.
 LL.B. (*legum baccalaureus*), Bachelor of Laws.
 LL.D. (*legum doctor*), Doctor of Laws.
 L.S. (*locus sigilli*), The place of the seal.
 M., Monsieur; MM., Messieurs (plural); (*meridies*) noon.
 M.A., Master of Arts.
 Manc., In music, *mancando*, dying away.
 M.B., Bachelor of Medicine.
 M.C., Member of Congress.
 M.D. (*medicinæ doctor*), Doctor of Medicine.
 In music, *main droite*, *mano destra*, right hand.
 M.E., Mining or Mechanical Engineer; Methodist Episcopal.
 mf. (*mezzo forte*), Moderately loud.
 M.F.H., Master of Fox Hounds.
 M.G., In music, *main gauche*, left hand.
 Mlle., Mademoiselle.
 M.M., In music, *Maelzel's Metronome*. (See METRONOME.)
 Mme., Madame.
 M.P., Member of Parliament; Methodist Protestant.
 M.S. or M.Sc., Master of Science.
 MS., Manuscript; MSS., manuscripts.
 Mov., In music, *movendo* = *mancando* (q.v.).
 Mus.B. (*musicæ baccalaureus*), Bachelor of Music.
 Mus.D. (*musicæ doctor*), Doctor of Music.
 N.B. (*nota bene*), Mark well.
 n.d., No date.
 nem. con. (*nemine contradicente*), Unanimously.
 Non. (*nonæ*), The Nones.
 N.S., New style.

* This was originally written IHΣ, the first three Greek letters of the name Jesus; but its origin having been lost sight of, by substituting S for Σ and then mistaking the Greek H (long e) for Latin H, a signification was found for each letter. The symbol was further developed by converting the horizontal stroke, which was the sign of abbreviation, into a cross, in which form it is the recognized device of the Jesuit order.

- Ob. (*obiit*), Died.
- Op., In music, *opus*, work.
- O.P. (*ordinis prædicatorum*), Of the Dominican Order.
- O.S., Old style.
- O.S.A., Order of St. Augustine.
- O.S.F., Order of St. Francis.
- Oxon. (*Oxoniensis*), Of Oxford.
- p., Page; pp., pages.
- p. (*piano*), Softly.
- P.C., Privy Councilor.
- P.E., Protestant Episcopal.
- Pfte., In music, pianoforte.
- Ph.B. (*philosophiæ baccalaureus*), Bachelor of Philosophy.
- Ph.D. (*philosophiæ doctor*), Doctor of Philosophy.
- Ph.G., Graduate Pharmacist.
- Pizz., In music, *pizzicato* (q.v.).
- P.L., Poet Laureate.
- P.M. (*post meridiem*), After noon; postmaster.
- pp. (*pianissimo*), Very softly.
- P.P., Parish priest.
- P.P.C. (Fr. *pour prendre congé*), To take leave.
- pro tem. (*pro tempore*), For the time.
- prox. (*proximo—mense* understood), In the next (month).
- P.S. (*post scriptum*), Postscript.
- P.T.O., Please turn over.
- Q., Query or question.
- Q.C., Queen's Counsel.
- Q.E.D. (*quod erat demonstrandum*), Which was to be proved.
- Q.E.F. (*quod erat faciendum*), Which was to be done.
- Q.S. (*quantum sufficit*), A sufficient quantity.
- q.v. (*quod vide*), Which see.
- R. (*rex* or *regina*), King or queen. Also, R. = Réaumur.
- R. or R̄ (*recipe*), Take.
- R.A., Royal Academician; Royal Artillery; Royal Arch.
- rall. (*rallentando*), More slowly.
- R.A.M., Royal Academy of Music.
- R.C., Roman Catholic.
- R.E., Royal Engineers.
- Recit., In music, recitative (q.v.).

- For a reproduction of 13,000 abbreviations used in old Latin MSS., consult Campelli, *Dizionario di Abbreviature* (Milan, 1899); Dobbs, *Abbreviations British and Foreign* (1911).
- ABBREVIATIO PLACITORUM**, a-brē'vī-ā'shī-ō plās'ī-tō'rūm (Lat. abridgment or abstract of pleas). A record of judicial decisions in the itinerant Court of the King's Bench (*curia regis*, q.v.) in the Norman period of English law. It is one of the earliest collections of judicial precedents in our law, antedating the *Year Books* (q.v.). It was first published in 1811. See articles on NORMAN LAW; PLEA; PLEADING; MASTER OF THE ROLLS; and REPORT.
- ABBREVIATORS**. In the Papal Court, a college of eleven prelates to whom the revision of the papal bulls and other similar documents is committed, and who sign them in the name of the Cardinal Vice Chancellor. They date from Pius II (1458-64), and derive their name from the fact that by means of traditional abbreviations they prepared a short minute of the decision, which they subsequently expanded into proper form.
- ABBT**, äpt, THOMAS (1738-66). A German popular rationalistic philosopher and prosaist. He was born at Ulm and educated at the University of Halle; under the influence of Lessing, Shaftesbury, Hume, and Voltaire; 1760, assistant professor of philosophy at Frankfort-on-the-Oder; 1761, professor of philosophy and mathematics at Rinteln; 1765, disliking academic duties, he refused calls to Marburg and Halle, but went as high ecclesiastical official to the court of William I of Lippe-Schaumburg at Bückeburg, where he died near the close of his

twenty-eighth year. Although the two essays "Vom Tode fürs Vaterland" (1761) and "Vom Verdienste" (1765) made his reputation, his best work was journalistic. His miscellaneous works were published (1768-81) in 6 volumes.

ABCHERON, äb'she-rön', or **ABSHERON**. See **APSIHERON**.

ABD, äbd. In Arabic and in the Semitic languages in general, 'slave' or 'servant,' as in Abd-Allah, 'servant of Allah'; Abd-al-Kadir, 'servant of the mighty one,' etc.

ABD ALLAH IBN ABD AL MUTTALIB, äb-dal'lä ibn äb'd al mut-täl'lëb. The father of Mohammed. Very little is known concerning his life. Al Kalbi states that he was born in the 24th year of Khosru Nushirwan's reign, consequently in 554, but that may be a mere guess. No value can be attached to the story that Abd al Muttalib vowed to sacrifice a son, if he should have 10 sons, but that he was persuaded to substitute 100 camels for Abd Allah. That 200 maidens of Mecca died of broken hearts from love of the handsome youth on his wedding day is another of these worthless legends. His wife's name was Amina, and we know from the Koran (93, 6) that Mohammed became an orphan at an early age.

ABD ALLAH IBN YASIN AL JUZULI. The founder of the sect of the Almoravides (q.v.). His mother belonged to the tribe of the Juzula; hence his surname. He lived in Nafis, the later Marra'kush (Morocco) in 1037 and studied with Wajjaj, a disciple of Abu Imran of Fez, the Malikite teacher, when he was invited by Yahya b. Ibrahim, a Sanhaja chief, to accompany him as a missionary to his home on the borders of the Sahara. After some time he retired from preaching to an island in the Senegal where he lived with his followers in a *ribat*, at once a hermitage and a fortress, devoting himself to ascetic exercises and preparation for the holy war. He was proclaimed Imam (q.v.) and took an active part in the establishment of the power of the Almoravides in Morocco. He died in 1059. See E. Doutté in *Revue de l'Histoire des religions* (xl and xli, pp. 29 ff.); and A. Müller, *Der Islam im Morgen- und Abendland II* (1887, pp. 611 ff.).

ABD ALLAH IBN ZUBAIR, äb-däl'lä 'b'n sōō'bār' (622-692). Ruler of Mecca, and for some years recognized Caliph of the largest part of the Muslim world. He was the son of Zubair and Asma, the nephew of the prophet and the grandson of Abu Bekr on his mother's side. He believed himself more entitled to the Caliphate than Muawiya, but during his reign concealed his claims. But he refused to recognize Yazid (680) and after Husain's death allowed himself to be proclaimed Caliph by the people of Mecca and took the title *Amir al Muminin* (681). He was recognized everywhere in Hejaz, but soon had to endure a siege of Mecca by Yazid's generals, during which both the city and its famous temple suffered much. Yazid's death, however, in 683, put an end to the siege. Irak, Arabia, and a large part of Syria now recognized him as Caliph; and he sent his governors to the different provinces. But Abd al Malik renewed the war, and his general, Al Hajjaj, besieged Mecca again. After a stubborn resistance it was finally taken, in 692, and Abd Allah, urged into the fight by his proud mother, fell in the battle. See Quatremère, "Notice sur la vie d'Abd Allah b. Zubair," in *Journal Asiatique* (2d series, ix, pp. 299 ff., 385 ff.).

ABD-AL-LATIF, äb-däl-lä-tëf' (1160-1231). A prolific Arabian writer, physician, and traveler. He was born at Bagdad and died while on the pilgrimage to Mecca. His early training consisted in memorizing not only the Koran, but also works on law, philology, and the standard poets. He then went to Damascus, whither Saladin had assembled the learned men of the Mohammedan world. Thanks to the liberality of Saladin and with letters of introduction from his vizier, Fadhl, Abd-al-Latif was able to travel to Egypt, and in Cairo he sought out the great Jewish doctor and philosopher, Maimonides. At Cairo he taught medicine and philosophy, but his love of travel brought him to Damascus again and to Aleppo. Of the many works of Abd-al-Latif only one, *The Account of Egypt*, is generally known. This was translated into Latin by White (1800) and into French by De Sacy (1810), *Relation de l'Egypte* (Paris, 1810). Consult Brockelmann, *Geschichte der arabischen Litteratur* (Weimar, 1898).

ABDALWADIDS, äb'däl-wä'dïdz. A Berber dynasty reigning in Tlemcen (q.v.) from 1239 to 1554. The name of the father of the first independent king was Zayyan; after him this dynasty is also often designated as the Banu Zayyan. Concerning Abd al Wad, or the early history of the family, little is known. But through various ruins, inscriptions, and historical documents the history of the dynasty has been well ascertained. The Abdalwadids maintained a splendid court at Tlemcen and reigned with wisdom and moderation for more than three centuries over the middle Maghrib, or the western part of Algiers. See especially, A. Bel, *Histoire des Beni 'Abd al Wad, Rois de Tlemcen* (Algiers, 1904).

ABD AL WAHHAB, äbd'el-wäh'häb. See **WAHABIS**.

ABD-EL-AZIZ, äb'del-ä-zëz', **MULAI** (1878—). Sultan of Morocco from 1894 to 1908. He was born at Marakesh, and succeeded his father, Sultan Mulai Hassan, in 1894. He was friendly towards Europeans, taking great interest in all kinds of Western inventions. His foreign sympathies offended his subjects, and in 1902 a formidable rebellion broke out under the leadership of a prophet, Bu Hamara. The resulting disorders gave France an opportunity to establish its predominance in the country and led to the Algeiras Conference in 1906, by which France and Spain were commissioned to maintain order on the Moroccan coast. The Sultan, however, was unable to cooperate with them because of his growing unpopularity, and trouble continued. In 1907 Mulai Hafid, elder brother of Abd-el-Aziz, was hailed by southern tribes as Sultan, and the ruler found it necessary to remove his capital from Fez to Rabat. Although the existing government received a loan from France, it was unable to regain its footing. The throne was declared vacant in January, 1908, by the Ulema (religious hierarchy) of Fez, and offered to Mulai Hafid. Abd-el-Aziz, having failed in an attempt to regain his authority by force, came to terms with his brother and retired to private life in Tangier. See **MOROCCO**.

ABD EL KADER IBN MOUHI AD-DIN, äb'dël-kä'dër 'b'n mōō'hë äd-dën' (c.1807-83). A celebrated Arabian chief. He was born near Mascara and was educated under the supervision of his father at the Ghetna, an educational institution of the Marabouts. In his eighth year Abd el Kader made a pilgrimage to Mecca with his father; and in 1827 he visited Egypt, where,

in Cairo and Alexandria, he first came in contact with western civilization. He had a gifted mind, and a character marked by religious enthusiasm and a tendency to melancholy. He was free from cruelty and sensuality. He studied in the chief schools of Fez, maintained the faith of his people, and used their fanaticism as one of his most important sources of influence. His public career began at the time of the conquest of Algiers by the French. No sooner was the power of the Turks broken than the Arab tribes of the province of Oran seized the opportunity to make themselves independent. They obtained possession of Mascara and elected Abd el Kadir their emir. He established his authority over a number of the neighboring tribes. He attacked the French, and after two bloody battles, fought on Dec. 3, 1833, and Jan. 6, 1834, against General Desmichels, then commanding in Oran, obliged the latter to enter into a treaty with him. In the interior of the country his power spread rapidly. The cities and tribes of the provinces of Oran and Titeri acknowledged him as their sultan; the more distant tribes sent him ambassadors with presents. Hostilities were soon resumed between him and the French. (See ALGERIA.) Abd el Kader was defeated (1841) and took refuge in Morocco. There he succeeded in organizing a religious war against the enemies of Islam, and the arms of France were now turned against Morocco for the support given to him. After the decisive battle of Isly (1844) the Sultan of Morocco was obliged to give up Abd el Kader's cause, but soon found that the latter was at least his equal in power. The end of Abd el Kader's power, however, had come. On the night of Dec. 11, 1847, he made a bold attack on the Moorish camp, in which he was defeated. He fled with his followers to Algeria, where the greater part surrendered to the French. Dispirited, Abd el Kader surrendered, Dec. 22, 1847, to General Lamoricière and the Duc d'Aumale. Although now given an annual pension of 100,000 francs, he was kept a prisoner with his family at Toulon, Pau, and the Château d'Amboise. Liberated in 1852 by Napoleon III, he lived at Brussa, in Asia Minor, till 1855. He then, for a time, lived in Constantinople, and finally made his home in Damascus. For his services during the Syrian massacres of 1860 he received the Grand Cross of the Legion of Honor from Napoleon III. In 1865 he visited Paris and England, and was present at the Paris Exposition in 1867. In his retirement he wrote a religious work, a translation of which was published at Paris in 1858, under the title, *Rappel à l'intelligent: avis à l'indifférent*. He died in Damascus, May 26, 1883. See ALGERIA. Consult C. H. Churchill, *The Life of Abd-el-Kader* (London, 1867), described as "written from his own dictation and compiled from other authentic sources," highly eulogistic, and in no sense a scientific biography: Laménaire, *Vie, aventures, combats, amours et prise d'Abd-el-Kader* (Paris, 1848); Bellemare, *Abd-el-Kader, sa vie politique et militaire* (Paris, 1863) and the "Life" by Pichon (1899).

ABD-EL-MELEK, äb'dël-mä'lëk. See ASMAI.

ABD EL MUMIN ABU MOHAMMED, äbd ä'l mōō'mën ä'boo mō-häm'mëd (c.1094-1163). The founder of the dynasty of the Almohades (q.v.). He was born at Tajira, in the Province of Tlemcen, north Africa, and was a member of the Kumiya, one of the Berber tribes of the

Atlas region. After the death of Ibn Tumart, the founder of the sect of the Almohades, who had shown great favor to Abd el Mumin, he was chosen as his successor. He now assumed the title of Caliph, put the Almoravides to flight, and conquered the cities of Oran, Tlemcen, Fez, Salé, Ceuta, and finally, after a siege of eleven months, Morocco (1140-47). He extended his dominion over Al-Maghrib and the other provinces of north Africa, and passed over into Spain, conquered Cordova (1148), Almeria (1151), and Granada (1154); in short, the greater part of Mohammedan Spain.

AB'DEMON. A Tyrian who distinguished himself by solving the riddles which had been propounded to his master, Hiram, by King Solomon. According to the story, Solomon challenged Hiram and the Tyrians to a contest of wits, each side sending riddles for solution by the other. Solomon had already won in the competition, and the amount agreed upon as a wager had been paid him, when Abdemon entered the lists, and not only found answers to the riddles which had baffled his countrymen, but also invented others. Solomon failed to answer them and returned the forfeit.

ABDE'RA (Gk. "Αβδηρα). A town on the coast of Thrace between the mouth of the Nestus and Lake Bistonis. It is fabled to have been founded by Hercules on the spot where his favorite, Abderus, was torn to pieces by the steeds of Diomedes. It was colonized 656 B.C. under the leadership of Timesius of Clazomenæ, but soon after was destroyed by the Thracians; in 543 B.C. it was recolonized by the inhabitants of Teos. It was the birthplace of Protagoras, Democritus, Anaxarchus, Hecataeus (the philosopher and grammarian, of the time of Alexander the Great), and other distinguished men. The natives were, however, proverbial for stupidity, and "Abderite" was hence a term of reproach.

ABD ER RAHMAN or **ABDERRAHMAN**, äb'dërrä'män. The name of several Arab rulers of Spain. See OMMIADS.

AB'DICA'TION (Lat. *abdicatio*, renunciation, from *ab*, away from + *dicare*, to proclaim). The renunciation of an office, generally the office of ruler or sovereign. It is rarely done out of pure preference of a private station, but is generally the result of vexation and disappointment. The general well-being of a State is sometimes served by the abdication of its ruler. Military reverses, popular disaffections, court scandals, and other causes often render it imperative. History records many abdications of this character. It was perhaps voluntarily and from being wearied with dominion that Diocletian, and along with him Maximian, abdicated (305). Christina of Sweden retired from the throne (1654) out of preference for the freedom of private life, but wished still to exercise the rights of a sovereign. Charles V of Germany laid down the crown (1556) and assumed the humble habit of a monk, because his great schemes had failed. Philip V of Spain laid down the crown in 1724, but resumed it on the death of his son. Amadeus VIII of Savoy abdicated (1449) to become a priest. Victor Amadeus II of Sardinia, who abdicated in 1730, wished to recall the step, but this was not allowed. Louis Bonaparte resigned the crown of Holland in 1810 rather than consent to treat that country as a province of France. Charles Emmanuel II of Sardinia retired from the throne

in 1802, not finding himself able to cope with the French. Victor Emmanuel I of Sardinia resigned in 1821 in consequence of a revolutionary movement. William I of the Netherlands resigned (1840) in great measure by reason of his mortification at the disastrous results of his policy regarding Belgium. Foreign force compelled the abdication of Augustus the Strong of Poland (1706), and later, that of Stanislaus Leszczyński (1735) and of Poniatowski (1795), as well as that of Charles IV of Spain (1808), and of Napoleon (1814 and 1815). Insurrections have been the most frequent cause of forced abdications. The early history of the Scandinavian kingdoms abounds in instances. In England the compulsory abdication of Richard II (1399) is an early example. More recent times saw Charles X of France (1830) and Louis Philippe (1848) retire before the storm of revolution. The abdication of Ferdinand of Austria (1848) was a consequence of the events of the year of revolutions; that of Charles Albert of Sardinia (1849) of the battle of Novara. Of several cases among German princes, the chief is that of Ludwig of Bavaria (1848). Amadeus, King of Spain, felt himself obliged to give up his crown on Feb. 11, 1873. Prince Alexander of Bulgaria was compelled in 1886 to relinquish his principality, and three years later King Milan I of Servia, worried by domestic troubles and beset by internal dissensions in his kingdom, left the throne to his son Alexander I. On Feb. 12, 1912, the Emperor Hsuan-Tung was forced by revolution to abdicate the Imperial throne of China. In some countries the king can abdicate whenever he pleases; but in England, the constitutional relation between the crown and the nation being of the nature of a contract, the king or queen, it is considered, cannot abdicate without the consent of Parliament. It is, however, said that the king does abdicate, or, to speak perhaps more correctly, an abdication may be presumed, and acted on by the people, if his conduct politically and overtly is inconsistent with, and subversive of, the system of constitutional government of which the qualified monarchy of his office forms part. At the conference between the two Houses of Parliament previous to the passing of the statute which settled the crown on William III, it would appear that the word "abdicated" with reference to King James II was advisedly used instead of "deserted"—the meaning, it is presumed, being that King James had not only deserted his office, but that by his acts and deeds, of which the said desertion formed part, he had, in view of the Constitution, ceased to have right to the throne. From this it may be inferred that abdication was considered to have a twofold political significance, involving maladministration as well as desertion. The Scottish convention, however, more vigorously and distinctly resolved that King James "had forefaulted [forfeited] the crown, and the throne was become vacant."

ABDI-CHIBA, äb'dê-chê'bâ. A governor of Jerusalem in the time of Amenhotep IV (1403-1385 B.C.). If correctly read, his name probably designates him as a "servant of Hadad," the storm-god; but it possibly was pronounced "Arta-hipa," and may have been of Mitanian origin (compare Pu-hipa, Tadu-hipa, Gilu-hipa). Among the letters found at El Amarna, the site of Amenhotep's capital, Akhetaton, in 1888, Abdi-chiba was the author of at least six (179-

184, ed. Winckler) and possibly of two more (185, 186). He is also mentioned in a letter of Shuwardata (165). These letters are written in cuneiform characters and in a Babylonian dialect that was no doubt spoken by a part of the population in Syria. Abdi-chiba apparently came from a family that had reigned over Jerusalem before the Egyptian conquest, as he repeatedly reminded Amenhotep of the fact that his father and mother had not made him a ruler, but the strong arm of the great King, probably Amenhotep III, had given him the territory of his ancestors, who may have been Mitanians or Hittites. With his neighbors, Shuwardata at Kilti-Keilah and Milkili at Gath, he was often at war. He was accused by them of having plotted with the Khabiri and taken possession of Kilti, while he charged them with the capture of Bit Ninib, a town belonging to the country of Urusalim, and with betraying the land into the hands of the Khabiri. These were, perhaps, the Hebrews in the widest sense, including Israelitish, Edomitish, Moabitish, and Ammonitish clans. The term Abiru probably means simply a 'nomad,' a 'wanderer.' Neither the Egyptian resident nor the King himself seems to have trusted Abdi-chiba, and the correspondence leaves it doubtful whether the relief he asked for was finally granted. These Amarna letters have been published by Winckler, in *Der Thontafelfund von El Amarna* (Berlin, 1889-90), and *Keilinschriftliche Bibliothek*, vol. v (1896), and by Knudtzon, "Die el-Amarna Tafeln" in *Vorderasiatische Bibliothek* (1908-11). They have also been translated or discussed by Halévy in *Journal Asiatique* (Paris, 1891) and in *Revue Sémitique* (Paris, 1893), by Zimmern in *Zeitschrift für Assyriologie* (Leipzig, 1891, vi, 245-263), by Jastrow in *Journal of Biblical Literature* (Boston, 1892, 95-134) and *Hebraica*, ix, 24-46 (Chicago), by Delattre in *Revue des questions historiques* (Paris, 1896), by Eduard Meyer in *Ægyptiaca* (Berlin, 1897), by Breasted, *History of Egypt* (1905), and by Dhorme in *Revue Biblique* (1908), pp. 500 ff., (1909) pp. 50 ff., 368 ff.

ABDIEL, äb'dî-ël (Heb. 'abd, servant + 'ël, god). In *Paradise Lost*, the faithful angel who opposed the revolt in heaven begun by Satan.

ABDO'MEN. The lower cavity of the human body. The trunk of the human body is divided by the diaphragm into two cavities—the upper being the thorax or chest, and the lower the abdomen or belly. Both the cavity and the viscera it contains are included in the term "abdomen." It contains the liver, pancreas, spleen, and kidneys, as well as the stomach, small and large intestine. The lower bowel, the bladder, and internal organs of generation lie in the lowest part of the cavity, which is called the pelvis. The abdomen is lined by a serous membrane, the peritoneum, which is folded over the viscera, allowing them a certain freedom of motion, but keeping them in their proper relations to each other. For convenience in locating its contained organs, the abdominal cavity is divided into nine regions, by planes, located by imaginary lines drawn on the surface of the body. Two horizontal lines divide it into three segments, and these are each subdivided by two vertical lines into three other segments. The three regions in the median line, from above downward, are named the epigastric, umbilical, and hypogastric. The three regions on each side, named in the same order, are the hypochondriac,

lumbar, and iliac. The abdominal viscera are subject to many acute and chronic affections, to which reference is made under their respective headings.

ABDOMEN

Abdomen. In entomology, the last of the three parts into which the body of an insect is divided. It is composed of a number of rings or segments, frequently nine, more or less distinct from each other. It contains a portion of the intestines and the sexual organs. In the perfect insect its segments bear no legs or wings; but the hind legs of larvæ or caterpillars, which afterward disappear, are attached to them. In many insects its last segments bear appendages of various uses and forms, as pincers, stings, borers, or ovipositors, etc. See ANATOMY and authorities there referred to.

ABDUCTION. In its broadest sense, the unlawful taking or detention by force, fraud or persuasion of a person, as a wife, child or ward, from the custody or control of the person legally entitled thereto. The English common law treated the act as a tort or private wrong to the husband, the parent, the guardian and gave to the injured party an action for damages. The term is, however, generally used, in a more restricted sense to denote the criminal offense of forcibly taking away or detaining a woman for the purpose of marriage or of prostitution. As distinguished from kidnapping (q.v.) the crime has been defined by statute in England for more than 500 years. It is also a matter of statutory definition and regulation in this country. Under these statutes it has been generally held that it is immaterial whether the woman abducted was at the time of chaste character or not. The tendency of our legislation is to extend the scope of the term far beyond its common law limits. For example, many statutes declare that a person receiving or harboring a female under the age of 16 years for the purpose of prostitution is guilty of abduction. Nor is his ignorance of the girl's age any defense to the abduction. Under early English statutes, abduction, as therein defined, was a felony with-

out benefit of clergy (q.v.). In this country it is a crime, punishable by imprisonment for a term of years or by a heavy fine or by both. (See KIDNAPPING; CONSENT, AGE OF; WHITE SLAVERY.) Consult the authorities under CRIMINAL LAW; also Wharton, *A Treatise on Criminal Law* (San Francisco, 1912), and Bishop, *New Criminal Law* (Boston, 1900).

ABD-UL-AZIZ, äb'dul-ä-zëz' (1830-76). Thirty-second Sultan of the Ottoman Empire. He was the second son of Mahmud II and succeeded his brother Abd-ul-Medjid, June 25, 1861. He placed the government in the hands of two ministers, Fuad and Ali, both of reforming tendencies, largely reduced his own civil list, and aroused hopes of an improvement in the condition of his Empire. But he soon lapsed into reckless extravagance, and the projected reforms proved meaningless and ineffective. In 1867 he made a tour of Europe, visiting the Paris Exposition and several capitals, in which he spent a vast amount of money to little purpose. In 1868 he reorganized the council of state, and promised more reforms in response to the demand of the Powers; but the revolt in Crete took his attention, war with Greece was probable, and the state of the treasury precluded efficient reform. The Greek difficulty was arranged by a conference at Paris. Ismail Pasha, Khedive of Egypt, took advantage of the Sultan's financial embarrassment to obtain important concessions, among them a new law of succession for his house, and nearly all the prerogatives of an independent sovereign. The Sultan's affairs grew desperate. The friendship of France had been Turkey's main reliance during the Second Empire. When that fell in 1870, the rival Russian influence became powerful at Constantinople. When the revenues were so low as barely to pay interest on the public debt, a revolt began in Herzegovina (1875) and soon extended to Bosnia. A renewed and more imperative demand of the Powers for radical reforms was embodied in the "Andrassy note" (Dec. 30, 1875), and the progressive constitutional party (Young Turkey) demanded the Sultan's abdication. He was deposed by the council of ministers May 30, 1876, and on June 4 was found dead in his apartments, having presumably cut his own arteries with a pair of scissors.

ABD-UL-HAMID, äb'dul-hä-mëd', I (1725-89). Sultan of Turkey and son of Ahmed III. He succeeded his brother, Mustapha III, in 1774. He was twice involved in wars with Russia. By the treaty of Kutchuk-Kainardji in 1774 he was compelled to relinquish his suzerainty over the Crimea and other Tatar regions. In 1788 the town of Otchakov was stormed by the Russians, a humiliation which is said to have hastened his death. Consult Assim Taxischi, *History of Abd-ul-Hamid and Selim III* (Constantinople, 1867).

ABD-UL-HAMID II (1842-). Thirty-fourth Sultan of the Ottoman Empire; second son of Abd-ul-Medjid. He was born Sept. 22, 1842, and succeeded to the throne Aug. 31, 1876, on the deposition of his elder brother, Murad V. Abd-ul-Hamid came to power at a trying time. The insurrection in Bosnia and Herzegovina was gaining strength, Servia had declared open war upon Turkey, and Russia was fomenting the spirit of dissatisfaction in the Slav states tributary to Turkey. The party of Young Turkey, led by Midhat Pasha, attempted

to establish a parliamentary government and to escape European control just when the aid of Europe was needed against Russia. The savage measures taken to suppress the revolt in Bulgaria and the failure of all Turkish promises of reform quickly alienated the Powers, who gave Russia a free hand. The Czar declared war in April, 1877, a Russian army at once invaded Turkey and advanced almost to Constantinople. Turkey was saved only by European jealousy of Russia. The treaty of San Stefano between the belligerents was materially modified by the Congress of Berlin (q.v.), but even then Turkey lost its remaining claims to suzerainty over Montenegro, Servia, and Rumania, yielded all real sovereignty in Bulgaria, Bosnia, and Herzegovina, and lost some of its territory in Asia Minor. The Sultan was bound by the treaty to introduce reforms in the Christian provinces, but he failed to do this and adopted a distinctly reactionary policy. He took into his own hands the direction of the council of ministers and made his government a personal one. The Armenian outrages from 1895 to 1896 at first aroused the signatory powers of the Berlin treaty to action, but the international relations at the time were complicated, and Abd-ul-Hamid pursued the policy he has always so well understood of eluding all demands for redress or reform by means of promises and excuses, playing off the rival Powers against one another in the meantime. In 1897 a rising in Crete, brought on by Turkish misgovernment, was assisted by Greece and led to war between that country and Turkey. (See GREECE.) European Turkey continued in the meantime in a state of chronic unrest with serious revolts in Macedonia and Albania. Reform plans proposed by Austria and Russia were reluctantly yielded to by the Sultan; they were not executed. A second reform promise was similarly kept. In 1905 Great Britain put forward further proposals. The Sultan reluctantly yielded and in the same year narrowly escaped assassination. Three years later the smoldering forces of discontent broke out in Constantinople itself. The Sultan was forced by the "Young Turk" or reform party to restore the constitution of 1876, and shortly afterwards Abd-ul-Hamid opened the Turkish Parliament. In 1909 a counter-revolution, apparently engineered by the Sultan, proved a failure. A "Young Turk" army marched on Constantinople and deposed him, sending the ex-ruler and his harem to Salonika. Thence on Nov. 2, 1912, he was conveyed back to Constantinople on a German warship and shut up in a palace on the Asiatic side of the Bosphorus. Consult Bérard, *La Turquie et l'Hellénisme contemporain* (Paris, 1893) and *La politique du sultan* (Paris, 1897); McCullagh, *The Fall of Abd-ul-Hamid* (London, 1910).

ABDULLAHI IBN SEYID MOHAMMED, äb'dul-lä'hê 'b'n sä-yêd' mô-häm'mêd. See KHALIFA.

ABD-UL-MEDJID, äb'dul-me-jêd' (1823-61). Sultan of the Ottoman Empire from 1839 to 1861. He succeeded his father, Mahmud II, at a time when the Turkish Empire was threatened by the ambition of the great Viceroy of Egypt, Mehemet Ali. The army had been defeated and dispersed by the Egyptians in the battle of Nisib, June 24, 1839, and there was nothing to hinder the victorious Ibrahim Pasha from advancing on Constantinople, where a large

party was favorable to the elevation of Mehemet Ali to the sultanate. The intervention of the Christian Powers saved the house of Osman. The treaty of July, 1840, from which France kept aloof, rescued the young Sultan from sure destruction. Mehemet Ali had to submit, Nov. 27, 1840, to the restriction of his power to Egypt; and the treaty of July, 1841, to which France subsequently adhered, settled the future dependent relation of Egypt to Turkey. The Sultan, though not very energetic in body or mind, proceeded in the path of reform begun by Selim III and Mahmud II. In this he had for his chief adviser Reshid Pasha, an intelligent and humane Mussulman educated in France. The aim of all his measures was to place the Ottoman population on a footing with the civilized inhabitants of the west. A proclamation of the rights of all subjects, irrespective of creed, was issued in the *hatti-sherif* of November, 1839. This was followed by numerous reforms in all departments, and in 1850 the adherents of all religions were decreed equal in the eye of the law. The good purpose of these decrees was obstructed by the illiberal Moslems, and they remained practically a dead letter. In 1850 the Sultan, in spite of the menaces of Russia and Austria, refused to give up Kossuth and the other Hungarian refugees. The Sultan had a specially difficult part to play during the war with Russia (1853-56) and the diplomatic negotiations consequent to it. Abd-ul-Medjid was the thirty-first sovereign of the race of Osman. He died June 25, 1861, and was succeeded by his brother, Abd-ul-Aziz (q.v.). See OTTOMAN EMPIRE.

ABD UR RAHMAN, äb'dur-rä'män (1778-1859). Sultan of Fez and Morocco from 1823 to 1859. He was the rightful heir to the throne when his father died, in 1794, but was superseded by an uncle, after whose death he ascended the throne. The first four years of his reign were occupied in quelling insurrections. Austria refused to pay the tribute for safety against pirates; but the Sultan wisely adjusted the dispute by relinquishing this sort of blackmail, formerly levied on European ships in the Mediterranean. The war waged by Abd el Kader (q.v.) against the French in Algeria involved the Sultan in its events. He was overwhelmed by Bugeaud in the battle of Isly (1844), and forced to turn against Abd el Kader. The Sultan was a zealous Mussulman without the fanaticism common among his countrymen; as a ruler he was strict and often cruel. He was succeeded by his eldest son, Sidi-Mohammed (1803-73).

ABD UR RAHMAN (ABD AL-RAHMAN) KHAN, kân (1830-1901). Ameer of Afghanistan (q.v., paragraph on *History*) from 1880 to 1901. In the confusion succeeding the death of his grandfather, Dost Mohammed (q.v.) (1863), he supported the pretensions of his father, Afzul, against his uncle, Shere Ali, who had been named as his successor by the late ameer. The rebellion was at first successful, and Abd ur Rahman was installed as Governor of Balkh, where he showed himself a wise ruler. In 1868 Shere Ali overthrew his rivals, and Abd ur Rahman took refuge in Russian territory, living at Samarcand upon a liberal Russian pension. In 1879 he returned to his old province of Balkh, which had always been well disposed toward him. Yakub, the son of Shere Ali, who had been set up as ameer by the English and then

left to shift for himself, was unable to maintain order, and a new war with the English was followed by his deposition. Abd ur Rahman, in July, 1880, was recognized as ameer by the leading chiefs and was confirmed by the Anglo-Indian government, from whom he received a subsidy of £160,000 a year and much in the way of military equipment. It had been feared from his previous relations with Russia that he would be favorable to Russian designs; but he at once resumed the pro-English policy of his grandfather, and, by a firm and skillful control of the tribes of his realm, preserved the integrity of Afghanistan and maintained peaceful relations with his powerful neighbors. In 1893 the mountainous district of Kafirstan, in the Hindu Kush, was ceded to him by the Anglo-Indian government, and in 1896 he completed the subjugation of the tribes inhabiting it. He was an intelligent, well-meaning ruler, of a masterly habit, which stood him in good stead in dealing with his half-barbarous people. He was made by the British government a Grand Commander of the Star of India, and also G. C. B. He died October 3, 1901, after a brief illness, and was succeeded by his eldest son, Habib Ullah (q.v.), who for some time had borne an active part in the government and shown much administrative ability. See **AFGHANISTAN**. Consult: J. A. Gray, *At the Court of the Ameer* (London, 1895); Wheeler, *The Ameer Abdurrahman* (London, 1895); Mohammed Khan (Mir Munshi Sultan), *The Life of Abdur Rahman, Ameer of Afghanistan* (London, 1900).

ABECEDARIANS, ā'bê-sê-dā'rī-anz (Lat. *abecedarius*, pertaining to the alphabet, with reference to the first four letters). Followers in 1522 of Nikolaus Storch, a clothmaker of Wittenberg, a disciple of Luther, who imbibed enthusiastic views commonly called Anabaptist. They also believed it was best not to know how to read, since the Holy Spirit would convey knowledge of the Scriptures directly to the understanding, and, as education might be a hindrance to salvation, they encouraged pupils to leave the schools and universities and learn trades.

A'BECE'DARY CIR'CLES. Rings of letters described around magnetized needles, by looking at which friends at a distance were supposed to be able to communicate with each other.

A BECK'ET, THOMAS. See **BECKET, THOMAS**.

A'BECKETT, ARTHUR WILLIAM (1844-1909), son of Gilbert Abbott A'Beckett. An English journalist, novelist, and dramatist, born in London. In early life he edited the *Glowworm* (1865-68) and the *Britannia Magazine* (1868-70). During the Franco-Prussian War he was special correspondent for the *London Standard* and *Globe*. In 1874 he became a member of the staff of *Punch*, on which he remained until 1902. For the next two years he edited *John Bull*. Among his publications are *Modern Arabian Nights* (1885); *The Modern Adam* (1899); *London at the End of a Century* (1900); *The A'Becketts of Punch* (1903); *Recollections of a Humorist* (1907).

A'BECKETT, GILBERT ABBOTT (1811-56). An English humorous writer, born in London. He became a lawyer and during the last seven years of his life was a metropolitan police magistrate, in which office he displayed marked ability. He also devoted much of his time to

literature, was the founder of *Pigaro in London*, the precursor of *Punch*, and became one of the original staff of the latter. He wrote more than 60 plays, and with Mark Lemon dramatized *The Chimes* and other works of Charles Dickens at the author's request. He was the author of the *Comic History of England* (new ed., 1907); *Comic History of Rome* (1852); *Comic Blackstone* (1869). Consult *The A'Becketts of Punch* (1903) by his son, Arthur William.

A'BECKETT, GILBERT ARTHUR (1837-91). An English journalist and dramatist, son of Gilbert Abbott A'Beckett (1811-56). He was born in London and studied at Westminster School and Christ Church, Oxford. He wrote many successful songs, and the librettos of *Canterbury Pilgrims* and *Savonarola*, operas by Dr. Villiers Stanford, and was joint author, with Herman Merivale, of the poetic drama entitled *The White Pilgrim*. During the last 12 years of his life A'Beckett was one of the best-known contributors to *Punch*.

ABEDNEGO, a-bēd'nē-gō. The name given in Babylon to Azariah, one of the companions of Daniel (Dan. i. 7 ff.). It is probably an intentional change from Abd Nebo, 'servant of Nebo,' or Abd Nergal, 'servant of Nergal.'

ABEEL, á-bēl', DAVID, D.D. (1804-46). An early missionary to China. He was born in New Brunswick, N. J., June 12, 1804; graduated from the theological seminary of the Reformed Dutch Church in his native town, and became pastor in Athens, Greene Co., N. Y., 1826. Failing health compelled his resignation after two years and a half; in 1829 he went to China as chaplain in the employ of the Seamen's Friend Society; in 1830 was transferred to the American Board of Commissioners for Foreign Missions. He traveled extensively through the Far East, and on his way home invalided he went over Europe and excited great interest in missions there, as he did later in America (1833-36). Again thinking himself well enough for service, he returned to China in 1838, but was compelled by his increasing debility to return home (1845) and died in Albany, N. Y., Sept. 4, 1846. As one of the earliest and most devoted of missionaries he is still remembered. His addresses in London led to the formation of the Undenominational Society for Promoting Female Education in the East (1834); in 1844 he founded the Amoy Mission, now under the Reformed Dutch Church Foreign Mission Board. He published *Journal of a Residence in China* (New York, 1834; 2d ed., 1836); *The Missionary Convention at Jerusalem, or An Exhibition of the Claims of the Word of the Gospel* (1838). For his biography, consult G. R. Williamson (New York, 1848).

A'BEL (Heb. *hēbēl*, probably akin to Aramaic *habbala*, 'herdman'). According to Gen. v. 2, the name of the second son of Adam and Eve. The first-born, Cain (q.v.), settled down to agricultural life; the younger brother became a shepherd. At the close of the year, Cain offered up of the fruits of the field as a sacrifice to God, but Abel brought the firstlings of his flock. While the latter's gift was accepted by the Deity, not a glance was bestowed on the offering of the former. In consequence of this Cain's jealousy was aroused, and he slew his brother Abel. The story is generally understood by modern scholars as referring to two tribes in the Negeb (q.v.), north of Kadesh-

Barnea (q.v.), and as emphasizing the contrasts, shown in their history, between the nomadic, the pastoral or semi-nomadic, and the agricultural life. The Judæan story-teller looked back on Abel as a lost tribe destroyed by Cain, or the Kenites (q.v.). At his own time the latter were wandering nomads, having no share in the cultivated land and living without the privileges and protection of its sanctuaries. (See ASYLUM.) This condition was felt to be abnormal and therefore a punishment for past crimes. It was inferred that they must once have been tillers of the soil but had been driven out into the wilderness because of their manner of worship and their treatment of Abel. Fruits of the field, cereals and wine, had been their offerings, but these things had not been acceptable, had brought no prosperity. On the other hand, the tribe of Abel had prospered, their animal sacrifices being graciously received. Jealous of this prosperity, the Kenites had finally violated their covenant with Abel and caused this tribe to perish. The *huwe*, or brother-relation, between a pastoral and a farming tribe, still existing between certain tribes of *badwin* (see BEDOUIN) and *fellahin* (see FELLAH), implies the duty of the latter to furnish bread-stuff to the former in lieu of protection against enemies. The extermination of Abel, however, has been sufficiently punished by the hard life the Kenites had to lead in the land of Nod (q.v.), and there should be no feud between them and the Judæans, seeing that they had received a sign (probably circumcision, q.v.) as a protection against further vengeance for Abel. It has been suggested by Winckler that the tribe of Abel once occupied the district around Maon and Carmel (q.v.), that this was appropriated by the Kenites, who laid it under cultivation, and that they were themselves later driven out of it. So far as Abel is concerned this is not improbable. Underlying the story is the conception of the semi-nomadic or pastoral life as intrinsically nobler and more pleasing to God than either the farmer's life or that of the wild nomad. This is reflected in the implied disapproval of vine culture in the tale of Noah's drunkenness (Gen. ix. 20-21), in many utterances of pre-exilic prophets, and in the story of the Rechabites (q.v.) who had followed the commandment of their ancestor not to build or live in houses, not to plant or own vineyards or drink wine, and not to sow seed or possess a field. Even in later thought Abel remained the type of the true worshiper, and his animal sacrifice was regarded as better than Cain's (Heb. xi. 4); he was himself looked upon as the righteous man, the possessor of true faith, in contrast to Cain the wicked (Matt. xxiii. 35; Luke xi. 51; 1 John iii. 12). In the *Testament of Abraham* Abel plays the part of judge of the nether world. Whether this later development of the figure was due to identification with some chthonic deity cannot be determined. The proposed connection with Tammuz as the 'son,' Bab. *aplū*, can scarcely be maintained. There is a manifest relation between Abel and Jabal (q.v.); while the explanation of the name as meaning 'breath,' 'vanity,' has no value. See the important article by B. Stade, "Das Kainszeichen" in *Zeitschrift für Alt-testamentliche Wissenschaft* (1894, pp. 250 ff.); H. Winckler, *Geschichte Israels* II (1900, pp. 189 ff.); Ed. Meyer, *Die Israeliten und ihre Nach-*

barstämme (1905, pp. 393 ff.); N. Schmidt, *The Messages of the Poets* (1911, pp. 291 f.).

ABEL, CARL, Ph.D. (1837-1906). A German philologist. He was born in Berlin, and after studying at the universities of Berlin, Munich, and Tübingen, acquired familiarity with all European and several Oriental tongues. He was at one time a lecturer at Oxford, taught philosophical and comparative linguistics at the Humboldt Academy of Science at Berlin, and was linguistic assistant in the German Foreign Office. His publications in German, French, and English are numerous. The works include *Linguistic Essays* (1880), *Slavic and Latin*, the Ilchester lectures on comparative lexicography delivered at Oxford (1883), *Russland und die Lage* (1888), and *Letters on International Relations before and during the War of 1870* (London, 1871), which created some attention at the time.

ABEL, Sir FREDERIC AUGUSTUS (1827-1902). An English chemist. He was born in London and devoted himself chiefly to the science of explosives. He was consulting chemist to the British War Department from 1854 to 1888. Abel introduced important improvements in the manufacture of gun-cotton and of blasting gelatine, and with James Dewar invented cordite, the standard explosive of the British War Department. He published *Gun-cotton* (1866); *The Modern History of Gunpowder* (1866); *On Explosive Agents* (1872); *Researches in Explosives* (1875), and *Electricity Applied to Explosive Purposes* (1884). He wrote also, in conjunction with Colonel Blexam, a *Handbook of Chemistry* (1854).

ABEL, JOHN JACOB (1857-). An American physiological chemist. He was born in Cleveland, Ohio, received his education at the University of Michigan, and studied medicine in Germany. On his return to this country he became connected with the Johns Hopkins University, where he was made professor of pharmacology in the medical school and head professor of physiological chemistry. Dr. Abel's researches have formed valuable contributions to our knowledge of the fluids and tissues of the animal body.

ABEL, ä'bël, KARL FRIEDRICH (1725-87). A German musician and composer, celebrated as the last virtuoso on the viola da gamba. He was born at Cöthen, became a pupil of Sebastian Bach, and was a member of the Royal Polish Orchestra at Dresden. He went to England in 1759 and six years later became chamber musician to Queen Charlotte. Together with John Christian Bach (the London Bach), a son of Sebastian, he directed the subscription concerts, known as the Bach-Abel Concerts, from 1765 to 1782. His works comprise 37 symphonies, string quartets, trios and sonatas for piano.

ABEL, ä'bël, NIELS HENRIK (1802-29). One of the most brilliant mathematicians of the first part of the nineteenth century. He was born at Findöe, Norway. After a course of study at the University of Christiania, he spent two years in Paris and Berlin and in 1828 was made instructor at the university and at the military school in Christiania. He was the first to demonstrate with rigor the impossibility of solving by the elementary processes of algebra general equations of any degree higher than the fourth. His chief contributions were made to the theory of functions, of which he was one of the

founders. An important class of transcendental functions (see FUNCTIONS) are known as Abelian, from their discoverer. There are also Abelian equations, groups and bodies. The binomial theorem (q.v.), proved by Newton and Euler, received at the hands of Abel a wider generalization, including the cases of irrational and imaginary exponents. Abel's works, in two vols., were published by the Norwegian government (Christiania, 1st ed., 1839; 2d ed., 1881).

ABÉLARD (Engl. äb'ë-lärd; Fr. ä'bä'lär'), **PIERRE** (1079–1142). A scholastic philosopher and theologian, the boldest thinker of the twelfth century. His name is commonly given in the French form, Abélard or Abailard; in Latin, Abailardus or Bajolardus. But these are epithets of uncertain meaning, the latter form perhaps from *bajulus*, 'teacher,' the former from *abeille*, 'a bee.' He had properly the single name Peter, *Petrus*, to which was added *de Palais*, from the place of his birth, Le Pallet, or in Latin form Palatinus, a village 8 miles southeast of Nantes, Brittany, western France. He was born in 1079. His father was the knight Berengar, lord of the village; his mother was Lucia, and they both later on entered monastic orders. An irrepressible thirst for knowledge and a special pleasure in scholastic logic moved Abélard to resign his rights of primogeniture in favor of his younger brothers. His first teacher was Roscellin, the Nominalist, during the latter's stay at Vannes. He wandered about in search of knowledge until he arrived in Paris, where he became a pupil of William of Champeaux, the Realist, the head of the cathedral school of Notre Dame there, but soon incurred the hatred of his master, whom he puzzled by his wonderful subtlety. He fled to Melun, where he started a school of his own, and afterward to Corbeil, admired, yet persecuted, wherever he went. He then returned home for the restoration of his health. With renewed strength, he returned to Paris, reconciled himself with his opponents, and molded, by his influence as a lecturer, some of the most distinguished men of his age, among whom were the future Pope Celestine II, Peter Lombard, Berengar, his future apologist, and Arnold of Brescia.

At this time, however, there also lived in Paris with her uncle, the canon Fulbert, Héloïse, the 18-year-old natural daughter of a certain canon John, of Paris, already remarkable for her beauty, talents, and attainments. At Fulbert's invitation Abélard made his home with him and instructed Héloïse. She soon kindled in the breast of Abélard, then 38 years old, a violent and overwhelming passion, which was returned by Héloïse with no less fervor. The lovers were happy together until Abélard's ardent poetical effusions reached the ears of the canon. He sought to separate the lovers, but it was too late. They fled together to Abélard's home, where, in his sister Dionysia's house Héloïse gave birth to a son and was privately married to Abélard with the consent of her uncle. Not long after, Héloïse returned to Fulbert's house and denied the marriage, that her love might be no hindrance to Abélard's advancement in the church. Enraged at this, and at a second flight which she took with Abélard to the Benedictine nunnery at Argenteuil, where she had been educated, a flight which Fulbert interpreted as showing Abélard's desire to rid himself of his wife,

Fulbert, in order to make him canonically incapable of ecclesiastical preferment, caused Abélard to be emasculated. In deep humiliation Abélard entered as a monk the abbey of St. Denis, in Paris, and induced Héloïse to take the veil at Argenteuil.

But the lectures which he began to give soon after exposed him to new persecutions. The synod of Soissons (1121) declared his opinions on the Trinity to be heretical. In punishment he had to throw the offending treatise into the fire, to read publicly the Athanasian Creed, and to endure a brief imprisonment. The charge seems to have been that he declared God the Father alone omnipotent. But what cost him more was his declaration that St. Dionysius, the patron saint of France, had been bishop of Corinth, and not of Athens, for this stirred up court opposition. He fled from St. Denis to the monastery of St. Aigulph, near Provins, but was brought back and compelled to retract his opinions concerning St. Dionysius. He was then allowed to go, and went to Nogent-sur-Seine, and there built of reeds and rushes a little chapel to the Trinity, and later, on account of the press of hearers, who planted their huts about him, a structure of wood and stone, which he called the Paraclete, the ruins of which exist to this day. But as everything he did caused adverse criticism, so the name that he gave the building—because it brought into unusual prominence the Holy Spirit—involved him in fresh trouble, and he left the Paraclete and accepted the abbotship of St. Gildas de Rhuys, on the coast of Lower Brittany. It was a sore trial for him to contend with the unruly monks. Meanwhile, the convent at Argenteuil, where Héloïse was prioress, had been broken up. Abélard transferred Héloïse and her nuns to the Paraclete and made her abbess of the nunnery he established. It was a long distance from St. Gildas, but, as spiritual director, he frequently went thither. Naturally, he fell under suspicion of renewing his intimacy with Héloïse, and so the lovers finally restricted themselves to writing. The correspondence has been preserved. On his part it was sternly repressive, to the point of coldness; on her part the heart expressed its love, which was an inextinguishable passion, both of body and soul, and tyrannical in its demands upon the monk who had ceased to share it.

After ten more years, Abélard, fearing an attack upon his life, left his monks and became a wandering teacher again. Two men, Norbert and the much more famous Bernard of Clairvaux, were always on his track. The Council of Sens, held in 1141, under the influence of Bernard, condemned his teachings. Abélard appealed to the Pope, Innocent II, and the latter confirmed the finding of the council and ordered his imprisonment and the burning of his writings. Abélard submitted; reconciled himself with Bernard, and was on his way to Rome to undergo his punishment, when he came, worn out, to the great monastery of Chuny. Through the friendly offices of Peter the Venerable, its noble abbot, he received permission to retire thither and a release from the order of imprisonment. He had not long to live, but the time was well spent in religious exercises and in occasional teaching. He had the scurvy, and when his ills increased he was removed to the priory of St. Marcel at Chalon-sur-Saône, where the air was better, it was thought. There he

died, on April 21, 1142. His body was brought to the Paraclete. Héloïse died there May 16, 1164, and was laid beside him. In the cemetery of Père-la-Chaise in Paris their bones are now united in one tomb, erected in 1817.

The loves of Abélard and Héloïse have made them immortal, but Abélard also has importance as a philosopher. He followed John Scotus Erigena, the ninth century philosopher, in his rationalism. He planted himself on Aristotelian ground (although all he knew of Aristotle was derived from Latin quotations) and did much to overthrow the prevalent realism. He stated the theory later known as conceptualism, rejecting both nominalism and realism. He held that we come to the conception of the general by thought upon the particular. General ideas are the creation of the intellect and in so far have reality. His great service in the development of ethics was in his treatment of conscience by dwelling upon the subjective aspect. He also has great importance as the virtual founder of the University of Paris, in a sense the mother of mediæval, and so of all modern, universities. This claim may be made for him because he first established schools independent of the monastic and episcopal schools. In Melun, in Corbeil, and then in Paris, at Nogent-sur-Seine, he had thousands of pupils and gave an extraordinary impetus to learning and speculation. His example as an independent teacher was followed. Out of such gatherings of students at a later date the universities were evolved. By his appeal to reason instead of authority, he showed the path to intellectual freedom and thus became the prophet of the freedom of speech and research for which the universities properly stand. In both these respects his pedagogical importance is great, and so his particular opinions and errors are of comparatively small moment.

His works, all written in Latin, first printed at Paris, 1616, are in Migne, *Patrol. Lat.*, clxxviii (Paris, 1855); also as edited by Victor Cousin: *Ouvrages inédits d'Abélard* (Paris, 1836); *Opera* (1849-59, 2 vols.); to which should be added his *Sic et Non*, editors, E. L. T. Henke and G. L. Lindenkohl (Marburg, 1851); *Planctus Virginum Israel super filia Jeptæ Galaditæ*, editors, W. Meyer and W. Brambach (Munich, 1886); *Tractatus de Unitate et Trinitate* [discovered, edited, and published by R. Stölzle under title: *Abélards 1121 zu Soissons verurtheilter Tractatus, etc.*] (Freiburg-im-Breisgau, 1891); his *Hymnarius Paraclitensius*, editor G. M. Dreves (Paris, 1891). The letters of Abélard and Héloïse have very often been published and translated, e.g., the Latin text and the French translation by Gréard (Paris, 1885); complete English translation by J. Berington, with the Latin text, *The History of the Lives of Abeillard and Héloïse* (Birmingham, 1788), edited by H. Mills (London, 1850); O. W. Wight, *Lives and Letters of Abélard and Héloïse* (New York, 1861). Consult: A. S. Richardson, *Abélard and Héloïse* (New York, 1884), with selections from their letters; H. Morton, *Love Letters of Abélard and Héloïse* (New York, 1901), and the standard biography of Abélard by C. de Rémusat (Paris, 1855). For recent literature concerning him, consult: H. Hayd, *Abälard und seine Lehre im Verhältniss zur Kirche und ihrem Dogma* (Ratisbon, 1863); H. V. Sauerland, *Abälard und Héloïse* (Frankfort, 1879); P. Tiby, *Deux couvens au moyen*

âge, ou l'abbaye de Saint Gildas et le Paraclet au temps d'Abélard et d'Héloïse (Paris, 1851); C. A. Wilkens, *Peter Abälard* (Bremen, 1851); C. de Rémusat, *Abélard*, a drama (Paris, 1877); S. M. ABELE, à-bēl'. See POPLAR.

ABELIN, ä'be-lën, JOHANN PHILIPP (?-c.1635). A German historian. He wrote under the names Philipp Arlanibäus, Abeleus, and Johann Ludwig Gottfried, or Gothofredus. He produced a number of works still consulted, including the *Arma Suecica* (1631-34), and the *Inventarium Sueciæ* (1632), descriptions of military events of the time. He also founded the *Theatrum Europæum* (1635-1738), an illustrated serial work on contemporary history, for which he compiled the first two volumes. Others of his publications are a *Historische Chronika* (1633) and an *Historia Antipodum* (1655). See Droysen, *Arlanibäus, Godofredus, Abelinus* (1864).

ABELITES, ä'bēl-its, or **ABELONIANS**, äb'ë-lō'nī-anz. A very small Christian sect of the fourth and fifth centuries, found in the neighborhood of Hippo, in north Africa. Their chief distinction consisted in marrying but abstaining from matrimonial intercourse, in order not to propagate original sin. They kept up their numbers by adopting children. They held that Abel so lived, because the Bible mentions no children of his. They are noticed by Augustine, *De Hæresibus Liber*, and in an anonymous work, *Prædestinatus*.

ABEN, ä'bën. A form used in the transliteration of Oriental names instead of the more correct *Ibn* ('son').

ABENCERRAGES, ä-bën'se-rä'jes; *Sp. pron.* ä-bän'sä-rä'häs. According to legend, a noble Moorish race whose struggles with the family of the Zegrîs and tragical destruction furnish the material for the historical romance *Las guerras civiles de Granada*, by Gines Perez de Hita (Saragossa, 1595). From this Chateaubriand composed the novel *Le dernier des Abencérages*. There was actually a family of Abencerrages, powerful in the first quarter of the fifteenth century, but their history has been so embellished by legend that it is difficult to say what is true and what is imaginary.

ABEN-ESRA, ä'bën ëz'rà, or **IBN EZRA**, properly ABRAHAM-BEN-MEIR-IBN-ESRA (1092-1167). One of the most learned Jews of his time. He was born in Toledo, Spain. He died Jan. 23, 1167. He was master of the Hebrew, Arabic, and Aramaic languages; had considerable knowledge of mathematics, astronomy, and medicine; was a scientific observer and a poet and generally distinguished himself as a sagacious thinker. He visited Lombardy, Provence, France, Egypt, and England, and passed the later years of his life in Rome, everywhere

teaching grammar, theology, astronomy, etc., besides writing works on Hebrew grammar and composing numerous poems. His *Commentaries on the Old Testament* are the most important of his works, though his scientific method occasioned opposition upon the part of the Talmudists. He also produced some treatises on astrology, since published in Latin. The scholastic writers mention Aben-Esra as ABENARE or AVENARD. An English translation of his *Isaiah* has been made by M. Friedländer (London, 1873), of his *Canticles* by H. J. Mathews, with original text in Friedländer, *Miscellany of Hebrew Literature*, vol. ii (London, 1877).

ABENSBERG, ä'bëns-bërk. A town in Lower Bavaria, Germany, situated 18 miles southwest of Ratisbon and 1200 feet above sea level. It has warm springs and ruins of a castle. On April 20, 1809, Napoleon here defeated the Austrians and opened the way for the victory of Eckmühl. Pop., 2300.

ABEOKUTA, ä'bâ-ô-kôô'tâ. A city in Egba-land, a division of Yoruba, on the Slave Coast, north of Lagos, with which it is connected by rail. It is situated on an elevated plain, on the banks of the Ogun River, and is surrounded by a high mud wall. It occupies an extensive area, but its general appearance is that of a very large village. Abeokuta was founded about 1825 as a result of the slave-hunting expeditions of the natives of Dahomey and Ibadan. It was founded primarily on the lines of a confederation for mutual protection, each tribe, however, preserving its individual rights and customs. The population has been variously estimated, but British figures, returned in 1911, show 51,000 inhabitants, most of whom are artisans and traders and show much skill in their buildings and textiles. There is considerable commerce in manufactured goods from Europe which are exchanged for products of the surrounding region, cotton being the most important.

ABERAVON, äb'ër-ä'von. A seaport on Glamorgan county, Wales, 11 miles by rail southeast of Swansea, on the river Avon (Map: England and Wales, C 5). In the Vale of Avon are found coal, iron, and copper, and the principal industry of the town and immediate district is metal working. There is here a Cistercian monastery of the thirteenth century. Pop., 1901, 7553; 1911, 10,505.

ABERBROTHWICK, äb'ër-bröth'ik. See **ARBROATH**.

AB'ERCARN (Celtic *aber*, confluence of rivers + Gael. *carn*, a conical heap of stones). A town in Monmouthshire, England, 5½ miles southwest of Pontypool. It is a progressive municipality, owning waterworks and cemeteries. Pop., mostly engaged in coal mining and metal working, 1891, 10,400; 1901, 12,607; 1911, 16,445.

ABERBROTHWICK, äb'ër-bröth'ik. See **ABERCROMBY, JAMES**.

ABERCROMBIE, JOHN (1780-1844). An eminent Scotch physician. He was born at Aberdeen and graduated in medicine at Edinburgh in 1803. He practiced his profession in the Scottish capital and soon became recognized as the first consulting physician in Scotland. Among the honors bestowed upon him were the degree of M.D. from Oxford, the rectorship of Marischal College, the vice-presidency of the Royal Society of Edinburgh, and the office of physician in ordinary to His Majesty for Scotland. Besides his professional writings he pub-

lished *Inquiries concerning the Intellectual Powers* (Edinburgh, 1830), and *Philosophy of the Moral Feelings* (London, 1833), both of which attained a remarkable popularity. They championed the views of the Scotch school as represented by Dugald Stewart, but had no originality and therefore have now little philosophical value.

ABERCROMBIE, JOHN WILLIAM (1866—). An American educator, born at Kelly's Creek, Ala., and graduated from Oxford College (1886) and the law school of the University of Alabama (1888). Immediately following his college course he served as President of Ashland College and at the close of his legal studies as principal of Cleburne Institute, both in his native State. A period of two years (1890-91) as president of Bowdon College, Ga., was succeeded by six years as superintendent of schools in Anniston, Ala. In 1897 he was appointed president of the Southern Female Seminary (now the Anniston College for Young Ladies); in 1898, Alabama State superintendent of education; and in 1902, president of the University of Alabama. His interest in politics resulted in his election (1896 and 1898) to the State Senate, where he was made chairman of the committee on education. Of the National Education Association Abercrombie was a director (1900-04) and vice president (1903-04); and of the Southern Educational Association president (1905-06). He became, also, a member and officer in several other national and State educational associations and commissions. The *Biennial Report* of the Department of Education of Alabama, for 1899-1900, and several articles and pamphlets on educational subjects, were prepared by him. He received the degree of LL.D. from the University of Alabama in 1904 and the University of South Carolina in 1905. He was elected to the Sixty-third Congress in 1912.

ABERCROMBY, äb'ër-krüm'bī, or **ABERCROMBIE, JAMES** (1706-81). A British soldier, born at Glassbaugh, Scotland. He entered the army as colonel in 1746, and was raised to the rank of major-general and sent to America in 1756, where in 1757 he replaced Loudon as commander-in-chief of the British and colonial forces. On July 8, 1758, at the head of 15,000 men, he attacked Ticonderoga (q.v.), but was repulsed with a loss of fully 2000 men. This attack was the culmination of a career of incapacity, and in September he was superseded by Sir Jeffrey Amherst. Returning (1759) to England, he became a member of Parliament, and was conspicuous as an upholder of George III's colonial policy. For his record as an officer in America, consult Parkman, *Montcalm and Wolfe* (Boston, 1884).

ABERCROMBY, Sir RALPH (1734-1801). A distinguished British general. He was born at Menstry, near Tullibody, Scotland, October, 1734. He was educated at Rugby and studied for the legal profession at Edinburgh and Leipzig, but preferred the army, and a cornet's commission was obtained for him in 1756. In 1758 he accompanied his regiment to Germany, where he saw active warfare and gained experience in army management. At the conclusion of peace he was stationed in Ireland for several years. He married in 1767 and by 1773 had risen to the rank of lieutenant-colonel. He entered Parliament and strongly opposed the American war, a course particularly honorable, as he desired active service. The war with France gave him

his opportunity. Family influence and his reputation procured his promotion to be major-general of a brigade ordered to Flanders, where he distinguished himself so highly as to be publicly thanked by the Duke of York. Under him the Duke of Wellington, then Lieutenant-Colonel Wellesley, commanding the Thirty-third Regiment, received his baptism of fire. Abercromby was knighted on his return to England in 1795, and was surprised to find himself famous as his country's greatest general. The disastrous campaign, however, had shown him the deterioration in army discipline, and his energies were devoted to the reorganization of the whole army system. In 1796 he conducted a successful expedition to the West Indies. In 1797 he went to Ireland as commander of the forces. He strongly condemned the governmental policy toward that country, however, and this caused his resignation; but he was at once given a similar appointment in Scotland. In 1799 he was placed in command of the expedition to Holland and began it brilliantly; but he was superseded by the Duke of York, and the campaign ended ignominiously. Abercromby alone acquitted himself with credit, and the ministry wished to make him a peer, but he refused to have his name associated with a failure. In 1800 he commanded the expedition to the Mediterranean and after some brilliant operations defeated the French in the battle of Alexandria, March 21, 1801. During the action he was struck by a musket-ball in the thigh; but not until the battle was won and he saw the enemy retreating did he show any sign of pain. The ball could not be extracted; mortification ensued, and seven days later, on March 28, 1801, he died. Abercromby was at once gentle and brave, clear-sighted and cool in deliberation; in action, prompt and daring. Apart from his qualities as a soldier, he was a man of liberal accomplishments, free from prejudices, and of sound practical judgment. The national gratitude to this eminent man took the form of a peerage conferred on his widow, afterward enjoyed by his eldest son, with the title of Baron Abercromby. Consult: J. Abercromby, *Memoir of the Life of Sir R. Abereromby* (Dublin, 1801); J. Abercromby, Baron Dunfermline, *Memoir of Lieutenant-General Sir Ralph Abereromby* (London, 1861).

ABERDARE, äb'ër-dâr'. A town in Glamorganshire, Wales, on the right bank of the Cynon, 4 miles southwest of Merthyr-Tydfil (Map: Wales, C 5). It is situated in a rich mineral district, having extensive coal, iron, and tin works. Aberdare has canal and railway connection with the coast; much coal is exported, and its growth has been remarkable. From an unimportant village of 6500 inhabitants in 1841 it has developed into a thriving town of 38,431 in 1891, 43,365 in 1901, and 50,844 in 1911.

AB'ERDEEN' (Celtic *aber*, confluence of waters, i.e., of the Don and Dee). The fourth largest city of Scotland, and the county town of Aberdeenshire. It is situated in the southeastern part of the county, on the North Sea, about 130 miles by rail north of Edinburgh (Map: Scotland, F 2). It forms the chief part of a parliamentary burgh of the same name and comprises the territory between the rivers Dee and Don, thus including what was formerly known as Old Aberdeen; the district of Torry in Kincardineshire, south of the Dee, was incorporated with the city in 1891. Aberdeen has a

mean temperature of about 46° F. and is about 66 feet above sea level. It is a handsome city, largely built of granite quarried in the neighborhood, and is therefore known as the "Granite City." The streets are mostly regular and well paved. Union Street, its principal thoroughfare, has been described as one of the handsomest streets in Europe and contains many notable buildings, including the Town and County Bank and the Palace Hotel. Of first importance are the Municipal and County Buildings (in Castle Street, a short easterly extension of Union), an imposing structure in the Scotch baronial style, built in 1867-78. Near by is "The Cross," a curious monument adorned with medallions of Scottish monarchs. At the western end of Union Street are the Music Hall buildings, particularly notable in point of architecture, and the Trades' Hall, in which are kept the shields of the different incorporated trades. Several of the bank buildings are tasteful edifices. Notable in architectural merit are the new buildings of Marischal College in Broad Street, opened in 1906. The East and West churches, although comparatively modern, are interesting from the fact that they are built on the site of the ancient church of St. Nicholas and are connected by an old wooden tower. Among the many other churches of Aberdeen the Roman Catholic church is notable for its beautiful spire, 200 feet high, and the cathedral of St. Machar, begun in 1357, for its severe simplicity of style. The river Dee is crossed by four bridges, one of which, a stone bridge, dates from 1527.

The city has an excellent harbor with immense floating docks and a breakwater, enabling it to carry on a large maritime trade in textile goods, agricultural products, and granite. It is a large manufacturing centre, the chief industries including cotton spinning, manufacture of cotton, woolen, and linen goods, iron founding, and paper making. Granite cutting and shipbuilding are also quite important, although the latter industry has diminished since the days of wooden vessels, when the Aberdeen clippers were famous. The deep-sea fisheries are important. Aberdeen's means of communication are excellent. It is at the junction of three railway lines, and is connected by steamer with Leith, Newcastle, Hull, and London. Its own shipping comprises about 180 steam and 40 sailing vessels, tonnage about 100,000. In 1911 the net tonnage entered at the port was 201,508, and cleared 32,194; while the net tonnage of vessels arriving was 1,041,424, and departing, 1,020,498. The chief exports are fish, spirits, cloth manufactures, coal products, stone, etc., and the chief imports barley, wheat meal, maize, oats, flaxseed, sugar, timber, paper-making materials, etc. In 1911 imports were valued at £1,163,618, and exports at £1,496,670. Aberdeen is the fifth port of importance in Scotland. The United States is represented there by a consular agent.

Aberdeen sends two members to Parliament and is one of the most progressive of municipalities. It has the usual authorities, consisting of a lord provost, bailies, councilors, etc. (See GREAT BRITAIN, paragraph on *Government*.) The city owns and operates its water and gas works and an electric light plant, as well as its electric tramways, and maintains public baths, markets, and two cemeteries. It has taken up the question of the proper housing of the working people, and as a result has established a lodging house and erected several

workingmen's dwellings. Aberdeen's educational institutions are numerous, and include the University of Aberdeen (q.v.); among the other colleges and schools are Robert Gordon's College, which receives a yearly grant from the city; an art school; a navigation school; an ancient grammar school dating from 1263, the United Free Church College, a divinity school with a library of 30,000 volumes; the Mechanics' Institute; and the Aberdeen and North of Scotland College of Agriculture, which was founded in 1904 and had in 1913 an enrollment of about 600. Among the benevolent and charitable institutions are the Royal Infirmary, an epidemic hospital and one for incurables, a large lunatic asylum, and a poorhouse. The city has two fine public parks. Aberdeen appears in the twelfth century as a populous town. William the Lion granted it a charter in 1179, and Robert Bruce extended its privileges. The English burned the town in 1336, but it was rebuilt as New Aberdeen. It suffered severely during the civil wars of the seventeenth century. A period of great prosperity began in 1818, with the rediscovery of the art of granite polishing. Aberdeen is a royal, parliamentary, and municipal burgh; pop. of the municipal burgh in 1891, 121,905; 1901, 153,503; 1911, 163,891.

ABERDEEN. A city and the county-seat of Monroe Co., Miss., about 141 miles by rail southeast of Memphis, Tenn., on the Frisco Lines, the Illinois Central, and the Mobile and Ohio railroads, and on the Tombigbee River (Map: Mississippi, J 3). It has an oil mill, grist mill, cotton gins, and manufactures clothing, cotton-seed oil, wagon spokes, and barrel staves, and buttons. It is an important cotton market. The city owns the waterworks and electric light plant. Pop., 1900, 3434; 1910, 3708; 1913 (est.), 4500.

ABERDEEN. A city and the county-seat of Brown Co., S. D., 280 miles west of Minneapolis, Minn., on the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, the Minneapolis and St. Louis, and the Great Northern railroads (Map: South Dakota, F 2). It has a public library, a fine municipal building, two daily newspapers, a court house, an opera house, a Federal building, five inside rest parks, and is the seat of a state normal and industrial school. The city has important commercial interests, and manufactures flour, soft and pressed brick, chemicals, candies, grain bins, clothing, and artesian well supplies; there are also several grain elevators and creameries. Settled in 1880, Aberdeen was incorporated in 1882, and has since adopted the commission form of government. The waterworks are the property of the municipality. Pop., 1890, 3182; 1900, 4087; 1910, 10,753; 1913 (est.), 14,500.

ABERDEEN. A city in Chehalis Co., Wash., 50 miles (direct) west of Olympia, at the head of Grays Harbor; on the Chehalis River; on the Northern Pacific and Chicago, Milwaukee, and St. Paul railroads; and on the line of the Oregon and Washington Railway and Navigation Company; two steamship lines connect it with Californian ports (Map: Washington, B 4). The city is rapidly growing on account of its extensive lumber industry and abundant natural resources. The surrounding region is rich in dairying products. Among the city's industries are logging, lumber, and shingle mills, cooperages, shipyards, and fish and clam packing-houses. Aberdeen owns and operates its water-

works. Pop., 1890, 1638; 1900, 3747; 1910, 13,660; 1913 (est.), 17,500.

ABERDEEN, fourth EARL OF, GEORGE HAMILTON GORDON (1784-1860). A British statesman, born at Edinburgh. He was educated at Harrow, and in 1804 took the M.A. degree at St. John's College, Cambridge. In 1801 he had succeeded to the earldom and made a journey through Greece, which is perpetuated by Byron's satirical distich,

"First in the oat-fed phalanx shall be seen
The traveled thane, Athenian Aberdeen."

He was elected a Scotch representative peer and took his seat as a Tory in December, 1806. In 1813 he was appointed Ambassador Extraordinary to Austria, where he gained the friendship of Metternich, whom he considered a pattern of diplomacy. He signed the Treaty of Paris as one of England's representatives. He was raised to the peerage as Viscount Gordon. He was Foreign Secretary under Wellington, 1828 and 1830, and under Peel, 1841 to 1846, in 1834 and 1835 acting as Peel's War Secretary. The general principle which guided his policy as Secretary of State and Foreign Affairs was that of non-interference in the internal affairs of foreign states, which, joined to his well-known sympathy with such statesmen as Metternich, exposed him—not always justly—to the suspicion of being inimical to the cause of popular liberty. His gradual abandonment of high Tory principles was evinced by his support of the bill for the repeal of the test and corporation acts and of the Roman Catholic Emancipation Act. The conclusion of the Chinese War, the Ashburton Treaty, and the Oregon Treaty were the principal services rendered to the country during his administration. In 1852, on the resignation of Lord Derby, the extraordinary state of parties necessitated a coalition, and Lord Aberdeen was selected as Prime Minister. The ministry which he headed was composed of many of the most brilliant men in England, among them Russell, Palmerston, and Gladstone; but the feeble and vacillating policy displayed in the conduct of the war with Russia gradually undermined its stability, and the disastrous mismanagement brought to light in the winter of 1854, in all departments of the public business connected with the war, filled up the measure of popular discontent and led to his resignation in 1855. He died in London. Consult Gordon, *Earl of Aberdeen* (London, 1893).

ABERDEEN, GEORGE GORDON, EARL OF (1637-1720). A Lord Chancellor of Scotland. He was educated at King's College in Aberdeen and was professor there in 1658. He became an advocate in 1668 and entered the Scottish Parliament in the following year. From 1682 to 1684 he was Lord Chancellor, and later was an active leader in Parliament (1685-86). The revolution that placed William on the throne aroused his opposition, but he finally submitted after the accession of Anne.

ABERDEEN, ISABEL MARIA, COUNTESS OF (1857—). A British social worker and author. She is the youngest daughter of Dudley Coutts Majoribanks, first Baron Tweedmouth, an eminent banker, and was born at "Guisachan," Inverness-shire, Scotland. In 1877 she was married to the seventh Earl of Aberdeen (q.v.). She early became interested in social and philanthropic work, especially in behalf of her own sex, and before 1893 was elected president of

several women's associations in Great Britain, including the Scottish Mother's Union, the Women's Local Government Society, the Women's Liberal Federations of England and Scotland. She founded the Onward and Upward Association, an organization for promoting a more sisterly interest among women of every station in life, and especially between mistresses and their female servants. In 1886, during her husband's first term as Lord Lieutenant of Ireland, she founded the Irish Industries Association. During 1893-98, when her husband was Governor-General of Canada, she founded the National Council of Women and the Victorian Order of Nurses. During 1893-99 she was president of the International Council of Women and was reelected in 1904. In 1913 she visited the United States, and while here studied American methods of social work. She is the author of *Through Canada with a Kodak; Our Lady of the Sunshine* (1910), and edited the proceedings of *The International Congress of Women* (1900) and *Ireland's Crusade against Tuberculosis* (3 vols., 1908).

ABERDEEN, JOHN CAMPBELL GORDON, first MARQUIS OF (1847—). A British statesman. Educated at St. Andrews and Oxford; in 1880 was appointed Lord Lieutenant of Aberdeenshire, and from 1881 to 1885 was Lord High Commissioner to the General Assembly of the Church of Scotland. From January to July, 1886, he was Lord Lieutenant of Ireland, from 1893 to 1898 Governor-General of Canada, and in 1905 became Lord Lieutenant of Ireland on the accession of the Liberals to power, resigning in December, 1914. Consult Justin McCarthy, *British Political Portraits* (1903).

ABERDEEN, UNIVERSITY OF. A university at Aberdeen, Scotland, consisting of two colleges, King's and Marischal. The first of these, known at one time as the College of St. Mary and later as King's College, was founded by the Bishop of Aberdeen, William Elphinstone, as early as 1494; the second, always known as Marischal College, was founded by Earl Marischal of Scotland, George Keith, in 1593. The two colleges led a separate existence up to 1858, when, by an act of Parliament, they were united into the University of Aberdeen. It is a coeducational institution, having between 1200 and 1300 students, and still retains some of the traditions of the mediæval university. There are the customary five faculties of arts, science, law, theology, and medicine, taught by some 30 professors and many assistants. At present the Faculty of Arts, which includes courses for teachers, has the largest number of students (over 450), with the Faculty of Science ranking second in popularity. The work of the university is carried on in two different centres, its buildings being located in separate sections of the city. Besides enjoying State and private endowments, the University of Aberdeen is a beneficiary of the Carnegie Trust Fund. Thanks to these heavy endowments, it has several important museums and a library of over 140,000 volumes.

AB'ERDEEN'SHIRE. That county of Scotland which projects farthest northeast into the North Sea (lat. 57° 40' N.). It comprises the drainage basins of the rivers Don and Ythan, and the greater part of the Dee basin (Map: Scotland, F 2). It is popularly divided into five districts, Mar, Strathbogie, Garioch, Formartine, and Buchan, and has an area of 1971

square miles. Among the principal towns are Aberdeen, the capital, Peterhead, and Fraserburgh. The chief industries are connected with agriculture and sea fisheries. Most of the manufactures, among which may be mentioned paper milling, centre about Aberdeen. Fine granite is quarried. Pop., 1801, 121,100; 1901, 304,439; 1911, 312,177. Consult A. Smith, *History of Aberdeenshire* (Aberdeen, 1875).

ABERDOUR. A village in Fifeshire, Scotland, 18 miles by rail northwest of Edinburgh. Its pleasant situation on the shore of the Firth of Forth has made it a favorite sea-bathing resort. It has ruins of a Norman church and of an old castle. About a mile off shore is the island of Inchcolm (q.v.). Pop., 1901, 1997; 1911, 2147.

ABERGAVERNNEY, äb'ër-gän'nî, or äb'ër-gäv'n'nî (the Roman *Gobannium*). A market town of Monmouthshire, England, 13 miles by rail west of Monmouth, beautifully situated in the valley of the Usk, where it joins with the Gavenny (Map: England, D 5). The town is regularly and compactly built, and many improvements have of late years been made. It was incorporated in 1899. St. Mary's Church, which was once a fine cruciform structure containing many interesting monuments, has been spoiled by restorations. The castle, built by Hammeline de Baladun, soon after the Conquest, is now a ruin. There are quarries, collieries, and iron works in the neighborhood, and it is also a fishing centre. Pop., 1891, 7700; 1901, 7795; 1911, 8511.

AB'ERNE'THY. A village in Perthshire, Scotland, on the Tay, about 6 miles southeast of Perth (Map: Scotland, E 3). It is believed to have been the metropolis of the Picts, and for many years in the ninth century was the seat of the only bishopric in Scotland. The principal object of interest is an ancient round tower in the churchyard, like which there is only one other in Scotland. Pop., 1901, 1276; 1911, 1267.

ABERNETHY, JAMES (1815-96). A Scotch civil engineer. He was born at Aberdeen. In 1841 he was resident engineer of the Aberdeen harbor works, and from 1842 to 1852 was surveying officer for the Admiralty. He was the first to apply hydraulic power to the working of lock-gates and constructed such important works as the Birkenhead docks, the Hull Alexandra docks, and the Turin and Savona Railway (Italy). He was also the director of the works for the draining of Lake Abukir, Egypt, by which 20,000 acres were reclaimed. In 1881 he was elected President of the Institute of Civil Engineers.

ABERNETHY, JOHN (1680-1740). An Irish dissenting minister. He was born at Colerain, Ireland, the son of a dissenting Presbyterian minister; was educated at Glasgow and Edinburgh, and was licensed to preach before he was 21 years old. He was ordained at Antrim in 1703; in 1717 he was invited to a congregation in Dublin and another in Belfast, while Antrim desired him to remain. The synod was appealed to and decided that he should go to Dublin, but he declined and remained at Antrim. This refusal to obey the synod was unheard of and was considered ecclesiastical rebellion, and a fierce controversy ensued, the parties dividing into "subscribers" and "non-subscribers." Though himself strictly evangelical, Abernethy and his associates were

remotely the occasion of the contest which ended in eliminating Arian and Socinian elements from the Irish Presbyterian Church. In 1726 Abernethy and all the "non-subscribers" were turned out with due ban and solemnity, but only four years afterward he was called to a "regular" congregation in Dublin. In 1731, in the controversy regarding the test act, Abernethy took broad ground "against all laws that, upon account of mere differences of religious opinions and forms of worship, excluded men of integrity and ability from serving their country." He was a century ahead of the time and had to argue against those who denied that a Roman Catholic or a dissenter could be a "man of integrity and ability." Abernethy was foremost where unpopular truth and right were to be maintained, and his *Tracts*, collected after his death, did good service for generations. He died in Dublin, December, 1740. Consult Drechal, *Sermons of John Abernethy, with his Life* (London, 1748-51).

ABERNETHY, JOHN (1764-1831). An eminent English surgeon. He was born in London. He was a pupil of John Hunter; in 1787 was appointed assistant surgeon of St. Bartholomew's Hospital, and in 1815 chief surgeon. Soon after his appointment he began to lecture in the hospital on anatomy and surgery and may be said to have laid the foundation of its character as a school of surgery. His clear, simple, and positive style, illustrated by an inexhaustible variety of apt anecdotes, made him the most popular medical teacher of his day. In 1813 he was appointed surgeon to Christ's Hospital, and in 1814 professor of anatomy and surgery to the Royal College of Surgeons. His practice increased with his celebrity, which the singular eccentricity and occasional rudeness of his manners contributed to heighten. He made a great improvement on John Hunter's operation for the cure of aneurism by tying the external iliac artery. Of his works, the most important are his *Observations on the Constitutional Origin and Treatment of Local Diseases* (1806) and his *Lectures on the Theory and Practice of Surgery* (1830).

ABERRATION, CHROMATIC (from Lat. *ab*, away + *errare*, to wander, and Gk. *Χρῶμα*, *chrōma*, color; literally, colored deviation). A phenomenon observed when images of an object emitting white light are formed by a lens or a prism, it being observed that there is then not one white image, but many colored ones, which do not occupy the same position and which are of different sizes, thus producing a blurred image with a colored border. It is explained in the article LIGHT that the sensations of different colors are due to waves in the ether of different wave-number or wave-length, and that these waves, in passing through portions of transparent matter, such as glass, travel with different velocities, depending upon their wave-number. As a consequence of this, in passing through lenses or prisms, waves of different wave-number have different paths. White light is shown to be due to the reception by the eye of waves of different wave-number; or, in other words, from a "white object," or an object "emitting white light," waves of different wave-numbers proceed outward. These waves are such that each train of waves of a definite wave-number would produce in the eye a definite color-sensation, e.g., blue, green, etc. In this sense we may speak of "blue-waves," "green-

waves," etc.; and in general white light is due to the reception by the eye of waves which correspond to the "colors of the spectrum"—violet, blue, green, yellow, orange, red, and all the intermediate shades. Therefore, owing to this difference in path in a lens or prism of waves of different color, if an image of a white object is formed there will be a series of images corresponding to the different colors, these images differing in position and size as well as in color. This result is said to be due to the "chromatic aberration" of the lens or prism. (There are, of course, ether-waves which do not affect the sense of sight; and any prism or lens

FIG. 1.

which is transparent to them will in general deviate waves of different wave-number differently, and so have this same kind of aberration, as ordinary glass lenses have for visible waves.) Mirrors do not have chromatic aberration, as there is no refraction of the rays. Moreover, it is possible, by combining two or more prisms or lenses, to diminish greatly the aberration. (See ACHROMATISM.) The colors which are not thus brought to the same focus form the "secondary spectrum."

Reference to the diagrams will possibly serve to explain the matter more fully. Fig. 1 shows the dispersion (q.v.) of a beam of white light on passing through a prism, or, in other words, its separation into its constituent colors.

In fig. 2 let *MN* represent a convex lens, which may be considered as consisting of a num-

FIG. 2.

ber of prisms and having the same dispersive effect. Let *A* represent a source of white light. Considering a pencil which falls on the lens at *c*, where it is refracted, it is found that dispersion takes place, and the red rays after being deviated proceed to *D*, where an image of the object *A* is formed, while the violet rays which undergo greater refraction proceed to *C* and there form an image of the object *A*. Consequently, if the image at *C* is examined with an eye-piece, or allowed to fall on a screen, it will be found to have a red border, while that at *D* will be seen surrounded by violet. When correction is made for chromatic aberration, the purpose for which the lens is designed must be considered. (See TELESCOPE.) For photographic work the violet rays are required, and any correction (see ACHROMATISM) should aim to bring them to the desired focus. For a visual telescope

or microscope the yellow rays must be considered, and such a combination of lenses made that they are brought to the same focal plane. The chapters on optics in Müller-Pouillet's *Lehrbuch der Physik* (Brunswick, 1897) treat the subject most fully, as does Glazebrook's *Physical Optics* (London, 1898). The correction of this evil in photographic lenses is extensively treated from the theoretical standpoint in S. P. Thompson's translation of Lummer's *Photographic Optics* (London, 1900). See also Wood's *Physical Optics* (New York, 1905); Blein, *Optique geometrique* (Paris, 1913); Percival, *Geometrical Optics* (New York, 1913); Nutting, *Outlines of Applied Optics* (Philadelphia, 1912).

ABERRATION, SPHERICAL. A term used in geometrical optics (see LIGHT) to express the difference in path and effect of rays of light incident perpendicularly and obliquely upon a mirror or upon a surface separating two portions of transparent matter, e.g., upon a surface of water. If a source of light is very small, it can be called a "point-source" and can be considered as sending out "rays of light" in all directions, like the radii of a sphere. If one of these rays is perpendicular to the surface of the mirror or to the surface of separation of the two media, the rays near this will form a small cone or "pencil of rays"; and in optics it is shown that such a perpendicular pencil of rays always gives rise by reflection or refraction to another pencil of rays which meet in a point called the "image" or "focus" of the point-source. If, however, a small cone or pencil of rays be chosen around a ray which falls obliquely on the mirror or separating surface, it will give rise by reflection or refraction to rays which do not form a cone and therefore do not have a point as a focus, except in the case of a plain mirror, such as an ordinary looking-glass. If the incident pencil is narrow, the reflected or refracted rays will have two foci, in the form of two short, straight lines, some distance apart and perpendicular to each other. These are called "focal lines"; and in between them the rays come the closest to forming a point focus, producing what is called the "circle of least confusion." If, instead of considering a narrow pencil of rays, we study the whole bundle of rays falling on the entire reflecting or refracting surface, it is evident that the rays have a real or virtual focus on a surface which can be thought of as due to the combined effect of the short focal lines produced by the individual pencils of which the bundle of rays is composed, and which has a cusp or projecting point ending at the point-focus due to the perpendicular pencil. A section of this "caustic surface" is often seen on looking down on a cup of coffee or a glass of milk, if there is a lighted lamp near; because the projecting sides of the cup or glass act as a curved mirror. An immediate consequence of spherical aberration is that the image formed of any object by a curved mirror or by a lens or prism is not "sharp," but blurred, unless care be taken to exclude the oblique rays. This is done ordinarily by the use of diaphragms, such as are seen in opera-glasses, photographic lenses, etc. The smaller the opening in the diaphragm, so much the sharper is the image. See CAUSTIC.

The accompanying diagrams will show the effect of spherical aberration in the case of spherical and parabolic mirrors and convex lenses. In Fig. 1 parallel rays are incident on a spherical mirror. Those falling perpendicu-

larly, i.e., near the centre of the mirror, O , are reflected to the point Q , which is termed the principal focus of the mirror. The rays which strike the surface more obliquely do not meet at Q after reflection, but at points which lie on the caustic surface whose section is represented by the heavy line with a cusp at Q . In Fig. 2 the elimination of spherical aberration by the use of a parabolic mirror is shown, as here, by the peculiar property of a parabola (q.v.), all rays parallel to the axis are brought to a point at F , called the

FIG. 1.

focus. For this reason the parabolic mirror is theoretically the most available for telescopes (q.v.), but in practice the construction of such mirrors presents great difficulties, which are but rarely effectually surmounted. The effect of spherical aberration in the case of a lens is indicated in fig. 3, where the rays passing

FIG. 2.

through the lens near its circumference are brought to a focus at C , while those lying nearer the axis AB meet at or near F . The foci for intermediate rays lie between that point and C . From these diagrams the advantages obtained by the use of diaphragms will be seen. The oblique rays, or those which strike the mirror or

FIG. 3.

lens at a distance from its centre and which do not come to a focus at the same point as those passing through the central portion, are accordingly cut off and the image rendered more

distinct. The spherical aberration of lenses can be reduced by using two or more lenses in combination, as is done in the case of most photographic objectives. Two lenses with equal focal lengths can be combined, and their effect is the same as a lens with one-half the focal length, while the spherical aberration is greatly diminished. The books of reference mentioned under ABERRATION, CHROMATIC, will also supply ample information on this subject.

ABERRATION OF LIGHT. The displacement of the apparent direction of a heavenly body, due to the effect of the earth's motion on the direction of the relative velocity with which the light of the heavenly body approaches the earth. The phenomenon of aberration arises from the fact that light requires appreciable time for its transmission through space. The motion of light traveling from a star or a planet toward the earth, combined with the earth's own motion, causes an apparent displacement of the stars on the sky; they all appear to occupy positions a little different from their true ones. In explaining this phenomenon, we often use the analogy of a man running in a rain-storm. Though the raindrops may be falling straight down, they will seem to the running man to descend on his face in a slanting direction. Light, too, may be coming down, as it were, vertically, but as the earth, with the observer on it, is hurrying through space, there will be produced a similar apparent slanting of the light. The accompanying diagram will serve to make this clear: Suppose the light to be traveling from a distant star S in the direction SO ; let the velocity of light be V , and let it be represented in magnitude and direction by the length AO . Suppose also that the earth is moving in the direction EO with velocity v represented by the length EO . Then, if we consider O as a fixed point, the light is approaching O with velocity represented by AO . Also, since the earth is approaching O with velocity represented by EO , the point O may be regarded as approaching the earth with

an equal and opposite velocity which will therefore be represented by OE . Hence the relative velocity with which the light is approaching the earth is the resultant of the two velocities represented by AO and OE . By the principle of mechanics known as the triangle of velocities, this resultant is represented in magnitude and direction by AE . Now the apparent direction of an object is determined by the direction in which the light from the object is moving at the instant it enters the eye of the observer. When therefore the earth has reached O , the star is seen in the direction OS' drawn parallel to EA , although its true direction is OS . Hence the star will be seen on the sky displaced in the direction of the terrestrial motion. But since the motion of our planet takes place in a closed, oval curve, the apparent

displacement of the star is now in one direction, and now in another, corresponding to the directions in which the earth is moving at different points of its oval path. The result is that the star itself seems to move each year through a small curve; and this is a sort of miniature reproduction of the earth's orbit around the sun.

In the explanation just given, we have considered the heavenly body to be one of the fixed stars, and therefore so far distant from the earth that its annual motion relative to that body is inappreciable. When, however, the body under observation is itself in motion with respect to our earth, as is the case with the sun and the other planets of the solar system, a further somewhat analogous displacement is produced. Astronomers therefore need to correct all their observations by a process of calculation, so as to reduce them to what they would be if no such thing as aberration existed.

The Constant of Aberration. The displacement angle SOS' is called the aberration error of the star. The maximum aberration will be observed, in general, twice a year, namely, when the line joining the earth and the star is at right angles to the earth's line of motion, and the angle SOS' in this case is called the *constant of aberration*. It may be shown by trigonometry that the constant of aberration measured in seconds is 206,265 times the ratio of the velocities v and V . The value of this constant, as adopted by the Astronomical Congress at Paris in 1896, is $20''.47$, which is probably correct to within two-hundredths of a second. At any other time the aberration error is found by multiplying the constant of aberration by the sine of the earth's way, the earth's way being the angle OEA , or the angle between the direction of the star and that of the earth's motion. It follows therefore that a star situated at the pole of the ecliptic will appear to describe a small circle of diameter $41''$ on the celestial sphere, since the line joining it to the earth is always at right angles to the direction of the earth's motion, while stars in the ecliptic will oscillate to and fro in straight lines $41''$ long. A star lying between the ecliptic and its pole will appear to describe an ellipse, the longer of whose axes is equal to twice the aberration constant, and the shorter to twice the constant multiplied by the sine of the star's latitude (q.v.).

The particular importance of the constant of aberration is due to the computations rendered possible by a knowledge of its exact value. Its measurement with the utmost possible precision has long been the object of very earnest efforts; and few other astronomical problems have received so much attention in recent years. Combined with the known velocity of light, it gives us the earth's orbital velocity in miles per second. From this we get the length of the annual terrestrial orbit in miles, and then by a simple calculation we find its semi-diameter, or the distance from the earth to the sun. This last is the fundamental unit for astronomical measures of distance, and its exact evaluation is considered the most important of all astronomical problems.

Aberration was discovered by James Bradley (q.v.) in 1725. Hooke had reported the discovery of large parallax in the case of the star γ Draconis, and accordingly, in 1725, Bradley undertook a series of measurements on the star

with a zenith sector for the purpose of verifying Hooke's observation. He found that the latitude of the star underwent small periodic variations during the course of the year, and, moreover, that the displacement was greatest when the parallactic displacement should have been zero. He therefore abandoned all attempts to explain the phenomenon as due to parallax, although its annual recurrence led him to infer that it was in some way connected with the motion of the earth about the sun. It is said that the true explanation was suggested to him in 1728 while sailing on the Thames. He observed that the wind seemed to shift whenever the boat was put about, and was told, on questioning the boatman, that the direction of the wind vane at the head of the mast was due to the motion of the boat as well as to the direction of the wind. This gave him the desired clue, and shortly after, in 1729, he announced his discovery to the Royal Society.

The aberration discussed above may be termed the annual aberration. Besides this, a star suffers diurnal aberration, due to the effect of the earth's diurnal rotation about its axis on the relative velocity of light. The displacement due to this cause diminishes from a maximum of about 0".32 for stations situated on the equator to zero at the north and south poles. There is, moreover, a secular aberration, caused by the translation of the solar system as a whole through space, but since, so far as our present knowledge extends, this motion is in a straight line and its rate is constant, it affects all stars equally, so that their relative positions remain unaltered. All that can be said is that the right ascension and declination of each star are different by constant amounts from what they would be if this aberration were absent. See PARALLAX, section *Solar Parallax*; SUN.

ABERSYCHAN, äb'ēr-sük'an. A town in Monmouthshire, England, about 11 miles by rail north of Newport, in a wild mountainous region, and on the edge of the coal district. Numerous collieries and iron foundries are located here. Pop., 1891, 15,300; 1901, 17,768; 1911, 24,661.

AB'ERT, HERMAN (1871—). A German writer on music. He was born in Stuttgart and received his first musical education from his father, who was first conductor at the court opera. Later he became a pupil of the Stuttgart conservatory. After graduation from the gymnasium he devoted himself from 1890 to 1895 to the study of classical philology at the University of Tübingen, where he received the degree of Ph.D. From 1897 to 1901 he spent at the University of Berlin in research work relating to the history of music. From 1902 to 1909 he was lecturer on music at the University of Halle; since 1909 he has been professor. Besides numerous special studies relating to the history of music contributed to the volumes of the *Internationale Musikgesellschaft* he published: *Die Lehre vom Ethos in der griechischen Musik* (1899); an excellent biography of Schumann in Reimann's series *Berühmte Musiker* (1903); *Die Musikanschauung des Mittelalters und ihre Grundlagen* (1905); *Jommelli als Opernkomponist* (1908).

AB'ERT, JOHN JAMES (1788-1863). An American military engineer. He was born in Shepherdstown, Va., and graduated at West Point in 1811, but resigned from the army and practiced law in Washington. He served as a

private in the battle of Bladensburg, Aug. 24, 1814. Later in the same year he joined the corps of engineers and in 1838 had become colonel in command of the topographical bureau. He was retired in 1861. Colonel Abert exercised an important influence in the development of the earlier engineering works of the government.

AB'ERTIL'LERY. A town in Monmouthshire, England, 4½ miles northwest of Pontypool. It is in the heart of the coal fields, and mining is the occupation of most of the inhabitants. Pop., 1891, 10,850; 1901, 21,945; 1911, 35,425.

ABERYSTWITH, äb'ēr-ist'with. A favorite watering-place, summer resort, and educational centre in Cardiganshire, Wales, on Cardigan Bay, about 50 miles north-northeast of Swansea (Map: Wales, B 4). On a hill above the town stand the ruins of an old castle erected by Gilbert de Strongbow. Adjoining it is the University College of Wales, established in 1872. Pop., 1891, 6700; 1901, 8014; 1911, 8412.

ABERYSTWITH, UNIVERSITY COLLEGE OF. See WALES, UNIVERSITY OF.

ABESHR, ä-běsh'r. The capital of the state of Wadai, in Nigeria, West Africa, about lat. 14° N., long. 21° E. (Map: Africa, G 3). It was once the centre for richly laden caravans from Tripoli, Kano, and the east. Its importance has greatly decreased because of pillage by the inhabitants. Pop., about 10,000.

ABET, **ABET'TOR** (Lat. *a + beter*, to bait or urge on). In criminal law to abet is to encourage, incite, or instigate the commission of a crime. An abettor is an accessory (q.v.) and, by the better opinion, an accessory before the fact.

ABEY'ANCE (OF. *abeiance*, from *a*, Lat. *ad*, at + OF. *beer*, Fr. *bayer*, Middle Lat. *badare*, to gape, to expect). A legal term importing that the title to real or personal property, a dignity, or office is not vested in any one, but is suspended until the true owner appears or the right thereto is determined. Strictly speaking, there could be no abeyance of a freehold at common law. In legal contemplation, there must always be some one in whom a present estate or interest in the land is vested. This, however, did not apply to future estates which might be in abeyance. Thus, when one holds land for life, with remainder to the heir of a living person other than himself, the remainder is in abeyance, since the heirs of that other remain undetermined while he is alive. Titles of honor are said to be in abeyance when it is uncertain who shall enjoy them. Thus, under the English law, when a nobleman leaving a title descendible to his heirs general dies, leaving daughters and no male issue, the King, by his prerogative, may grant the title to any one of the daughters. Until the King exercises his prerogative, the title, which is thus suspended, is said to be in abeyance. See the authorities referred to under the article on PROPERTY.

AB'GAR. A common name or title of several kings of Edessa in northwestern Mesopotamia. One of them is known from an alleged correspondence with Christ. The account given by Eusebius (*Ecclesiastical History*, xiii, i.) states that he sent a letter to Christ requesting him to come to Mesopotamia and heal him. To this Christ made a reply that, although unable himself to come, he would, after his ascension, send

a disciple. Both of these letters Eusebius claims to have found in the archives of Edessa and believes to be genuine. Other versions add that Christ sent to the King a portrait, now displayed at both Rome and Genoa. Consult R. A. Lipsius, *Die Edessenische Abgar Sage* (Brunswick, 1880).

ABHEDĀNANDA, äb'-hä-dä'nān-dā, SWAMI (1866—). A Hindu lecturer and author, born in Calcutta, India, and educated at Calcutta University. He was a disciple of Sri Rāmākṛishna Paramahansa, and became a member of the Order of Sanyāsins, said to be one of the oldest orders of priesthood in the world. In 1897 he removed to the United States, where he delivered lectures on the Vedānta philosophy, organizing and becoming head of the Vedānta Society of New York. He delivered many lectures on Hindu philosophy before educational institutions, societies, etc., and came to be considered one of the leading exponents of Monistic Vedānta in America. Among his published writings are *Reincarnation* (1899); *Spiritual Unfoldment* (1901); *Philosophy of Work* (1902); *How to be a Yogi* (1902); *Divine Heritage of Man* (1903); *Self-Knowledge* (1905); *India and her People* (1906); *Human Affection and Divine Love* (1911); *Great Saviors of the World*, vol. i (1911); and many pamphlets on philosophical subjects.

ABHOR'RERS. In English history, the name given to the Tory element that expressed abhorrence of the petitions presented to Charles II for the reassembling of Parliament (1679) and that upheld the King in his efforts to control public opinion. Their opponents were called Petitioners.

ABI'ATHAR (Heb. 'the excellent one is father'). The high priest whose father, Ahimelech (1 Sam. xxii. 20), or Ahijah, was slain at the command of Saul for having received and helped the fugitive David (1 Sam. xxii. 9-10). In 2 Sam. viii. 17 we should read with the Syriac version "Abiathar, son of Ahimelech," and not, as the Masoretic text, "Ahimelech, son of Abiathar." Abiathar also was a strong adherent of David, and showed his friendship especially during Absalom's rebellion (2 Sam. xv. 29). At a later time Abiathar favored Adonijah (1 Chron. i. 7), and for this Solomon deprived him of his priesthood and banished him to Anathoth (1 Kings ii. 26-33). With his deposition the direct line of Eleazar comes to an end, and the place is taken by Zadok and his descendants (1 Kings ii. 35. See Ezek. xl. 46; xliii. 19; xlv. 15). In our Greek text of Mark ii. 26 Abiathar is given as the name of the priest at Nob who gave David the showbread. But the words "under Abiathar the high-priest" are not found in the Sinaitic Syriac and are probably a later gloss of a reader whose memory failed him. See AHIMELECH.

A'BIB. The older biblical name for the first month of the Jewish ecclesiastical, and the seventh of the civil, year. In this month the feast of Passover is celebrated (Ex. xiii. 4; xxxiv. 18). In the later books of the Bible representing the period when the Babylonian names, together with the Babylonian calendar, were adopted by the Hebrews (Neh. ii. 1; Esther iii. 7), the month is called Nisan, and this name is used at the present time in the official calendar of the Jewish church.

ABICH, ä'bīk, WILHELM HERMANN (1806-86). A German geologist and traveler. He was

born in Berlin. He studied at the university there, in 1842 became professor of mineralogy in Dorpat, and in 1853 member of the St. Petersburg Academy of Sciences. He explored the Caucasus, Russian Armenia, northern Persia and Daghestan, and published several important works on the geology and mineralogy of those regions, among which may be mentioned: *Ueber die Natronseen auf der Araxesebene* (1846 and 1849); *Sur la structure et la géologie du Daghestan* (1862); and *Geologische Forschungen in den kaukasischten Ländern* (3 vols., 1878-87).

ABIES, ä'bī-ēz. See FIR.

AB'IGAIL or **ABIGAL** (Heb. 'father is joy,' or 'father has rejoiced'). The wife of King David, famed for her beauty and discretion. Abigail was originally the wife of Nabal, and gave food to David during his flight from Saul, after her husband had refused to do so. "About ten days later" Nabal died, and David took Abigail to wife (1 Sam. xxv. 2-42). The Amalekites captured Abigail during a raid on Ziklag (1 Sam. xxx. 5), but David recovered her (1 Sam. xxx. 18), and she bore him a son, Chileab (2 Sam. iii. 3), or Daniel (1 Chron. iii. 1). Another Abigail was daughter of Nahash, sister of Zemiah, Joab's mother, wife of Ithro, the Ishmaelite, mother of Amasa (2 Sam. xvii. 25, the less probable statement in 1 Chron. ii. 16 makes her a sister of David). In modern usage, derived from 1 Sam. xxv. 25, Abigail is employed as a general name for a waiting-maid or a lady's-maid.

ABI'JAH (Heb. 'Yahweh is father'), or **ABI'JAM**. The name of several persons mentioned in the Bible. The most important are: 1. Abijah, King of Judah, a son of Rehoboam and Maacah, the daughter of Abishalom (1 Kings xv. 2). He succeeded his father and reigned about three years (c.937-934 B.C.), during which time there was war between him and Jeroboam I (1 Kings xv. 7). Abijah probably gained a victory over Jeroboam near Zemaraim (2 Chron. xiii), but the number of combatants, 1,200,000, is greatly exaggerated. 2. A son of Jeroboam I, King of Israel (c.935-932 B.C.), who died in his childhood (1 Kings xiv. 1-18). The Vatican MS. and Lucianic recension of the Greek version bring in the story of his illness and his mother's visit to the prophet Abijah immediately after the death of Solomon, consequently before Jeroboam ascended the throne.

ABILA, äb'ila. An ancient city in Syria, capital of the tetrarchy of Abilene (q.v.), generally called Abila of Lysanias (q.v.). The modern site is Sūk Wādy Baradā, 20 miles N.W. of Damascus. Mediæval Arab geographers called this place Abil al Suk. There are still ruins of a temple, aqueducts, and tombs on the banks of the Baradā where the city once stood; and there is a Roman mile-stone with the inscription *mil. pass. II* exactly two miles from Suk.

ABILDGAARD, ä-bil'gār, NIKOLAI ABRAHAM (1743-1809). A Danish historical painter. He was born at Copenhagen, studied at the Academy there and in Rome and Naples. In 1778 he was appointed professor of the Academy at Copenhagen and, in 1789, its director. His most important work, a series of ten pictures in the castle of Christiansborg, was burned with the castle in 1794. The best paintings of his latest period were four scenes from Terence's *Andria* and others after Apuleius' *Golden Ass*, all in the Gallery of Copenhagen. Abildgaard

was the chief representative of the classic painting in Denmark and exercised a wide influence through his pupils, like Thorwaldsen.

ABILE'NE. A district referred to in Luke iii. 1, as well as in Josephus (*Ant.* xix, 5, 1; xx, 7, 1) as the tetrarchy of Lysanias. It was a fragment of the earlier kingdom of Iturea, the capital of which was Chalcis in the plain of Massyas, between the Lebanon and Anti-Lebanon Mountains. When the Romans took possession of this region, the Iturean kingdom became broken up into four tetrarchies, of which Abilene was one. This took place, probably, between 36 and 23 B.C. The Lysanias referred to by Luke was the second of that name, the first Lysanias having been ruler of the still undivided territory. The district of Abilene was so named from its chief town, Abila, on the Abanah, or Barada, the stream on which Damascus is situated. Abila, which has been identified with the ruins at Sūk Wādy Baradā, was on the eastern slope of the Anti-Lebanon range, just where the Abanah breaks through the mountains. In 37 A.D., Caligula gave Abilene to Agrippa I, who died in 44. In 53 it was given by Claudius to Agrippa II, who ruled it until his death in 100, when it became a part of the Roman province of Syria. Consult Schürer, *History of the Jewish People*, i, ii. 325-344.

ABILENE, ab'ē-lēn. A city and the county-seat of Dickinson Co., Kan., 163 miles west of Kansas City, on the Union Pacific, the Chicago, Rock Island, and Pacific, and the Atchison, Topeka, and Santa Fe railroads, and on the Smoky Hill River (Map: Kansas, E 5). The surrounding region is agricultural—alfalfa, corn, and wheat being the principal crops. Abilene is primarily residential, having many fine homes, but the city is the commercial centre for the district, and grain milling and the manufacture of merry-go-rounds and dairy products are among the industries. The city owns its water works, and an excellent supply is obtained from the celebrated Sand Springs, four miles from Abilene. Settled about 1860, Abilene was incorporated in 1869, the charter of that date continuing in operation until the commission form of government was adopted in 1911. During the early days of the beef industry Abilene and Dodge City (q.v.) were the greatest shipping points for cattle in the United States, being at the end of the long trail up which came practically all the beef cattle raised in the southwest. Pop., 1900, 3507; 1910, 4118; 1913 (est.), 4547.

ABILENE. A city and the county-seat of Taylor Co., Texas, 160 miles west by south of Fort Worth, on the Texas and Pacific, Wichita Valley, and Abilene Southern railroads (Map: Texas, E 3). It has a State Epileptic Colony. The industrial establishments include flour, grist, and planing mills, cotton gins, a cotton oil mill, a cotton compress, etc., a sanitarium, a Federal Court House, and a Carnegie Library. The commission form of government has been adopted. Pop., 1900, 3411; 1910, 9204; 1913 (est.), 12,000.

ABIMELECH, ā-bīm'ē-lēk (Heb. 'my father is king,' or 'Melek is father'). The name of two kings mentioned in the Old Testament.

1. A son of Gideon (Judges viii. 31), reckoned as one of the judges (Judges x. 1). Upon the death of his father, who refused to take the title of king, Abimelech set out to claim the sovereignty. He is said to have slain 70 of his brothers and to have been declared king

(Judges ix. 1-6). One of his brothers, Jotham, who escaped Shem, taunts the Shechemites with a fable whose point is that the nobler trees do not wish to rule over others, only the bramble is self-confident. In this fable it is possible to see a feeling antagonistic to monarchy. Three years afterward the Shechemites under the leadership of Gaal made an unsuccessful attempt to throw off his rule (Judges ix. 22-41). After capturing Shechem and burning the temple of Baal-berith, Abimelech went against Thebez, and here, while besieging the place, he was struck on the head by a piece of millstone thrown from the wall by a woman. To avoid an ignominious death, he ordered his armor-bearer to run him through (Judges ix. 43-57). His reign is the first attempt to establish a monarchy in Israel.

2. A King of Gerar mentioned both in the biblical narrative about Abraham (Gen. xx. and xxi. 22-32), and about Isaac (Gen. xxvi. 7-11, 26-33). The story in both cases is substantially the same. Abimelech takes Sarah into his harem, after Abraham, for fear that he should be killed, had declared her to be his sister. In a dream the true relation between Abraham and Sarah is revealed to Abimelech, who forthwith returns Sarah to her husband and loads the latter with presents of cattle and servants. Similarly Isaac declares to the men of Gerar, among whom he has settled, that Rebekah is his sister. Abimelech, however, discovers the true relationship and reproaches Isaac for having almost been the cause of bringing a "great sin" upon Abimelech and the men of Gerar. In view of this similarity, it is generally supposed by modern critics that the two stories are but different versions of one and the same tale. By an error the name Abimelech has been introduced instead of Achish (1 Sam. xxi. 2) in the title of Ps. xxxiv. In 1 Chron. xviii. 16 the text erroneously reads Abimelech instead of Ahimelech (q.v.).

ABINGDON. A city in Knox Co., Ill., 50 miles west of Peoria, and 85 miles northeast of Quincy, on the Chicago, Burlington, and Quincy and the Minneapolis and St. Louis railroads (Map: Illinois, B 3). It is the seat of Hedding College, a Methodist Episcopal institution, opened in 1853. Abingdon has wagon works, an animal-trap factory, said to be the largest in the world, and manufactures shirts and overalls, cement, paving brick, and tile. It is an agricultural region and has a few coal mines. The city was first settled in 1828 and was incorporated in 1857. It is governed by the charter of 1859. The mayor's term is one year, and the city council is composed of five members. The city owns its water works. Pop., 1890, 1321; 1900, 2022; 1910, 2464; 1913 (est.), 3000.

ABINGDON. A town and the county-seat of Washington Co., Va., 189 miles west by south of Lynchburg, on the Norfolk and Western and Virginia-Carolina railroads and the Holston River (Map: Virginia, C 5). It is the seat of Martha Washington College (Methodist Episcopal, South), established in 1858, Stonewall Jackson Institute (Presbyterian), opened in 1869 (both for young ladies), and Abingdon Academy. It also has a U. S. court house and county court house. There are canning, brick, cigar, column, and wagon factories, and flour, lumber, and planing mills. Abingdon was settled about 1770 and was incorporated in 1778.

The town has furnished the State with three governors, Floyd, Robertson, and Campbell. Pop., 1910, 1757; 1913 (est.), 1760; with suburbs, 3000.

AB'INGTON. A manufacturing town in Plymouth Co., Mass., 20 miles southeast of Boston, on the New York, New Haven, and Hartford Railroad and Old Colony Electric (Map: Massachusetts, F 3). It was settled about 1680 and incorporated as a colonial town in 1712. The town's affairs are administered by town meetings. The leading industry of Abington is the manufacture of boots and shoes. The town owns and operates its water works. It has a fine park in which a memorial arch to Civil War veterans was dedicated in 1912. Pop., 1890, 4260; 1900, 4489; 1910, 5455; 1913 (est.), 5500. Consult B. Hobart, *History of the Town of Abington* (Boston, 1866).

ABINGTON, FRANCES (1737-1815). A famous English actress. She was the daughter of Barton, a common soldier. As an errand-girl, she acquired French from a milliner. She became a flower-girl at the theatres, and made her first appearance at the Haymarket in London (1775) as Miranda, in *The Busybody*. She was married to Abington, her music teacher, from whom she soon separated. The headdress she wore was adopted by the women of fashion, and the "Abington cap" became famous. Returning to England in 1765, at the invitation of Garrick, she played at Drury Lane for 18 years, and later at Covent Garden. She was the original representative of Lady Teazle in 1777, and played many Shakespearean parts. After the retirement of Mrs. Pritchard and Kitty Clive, she had no rivals on the London stage and became the first comic actress of the period. Her last appearance was on April 12, 1799.

AB'IOGEN'ESIS. See BIOGENESIS.

ABIPONE, ä'bê-põ'nâ. A South American Indian tribe of Guaycuruan stock, which formerly wandered over the Gran Chaco region, west of the Paraguay River, from the headwaters of the Rio Grande in Bolivia southward to the Vermejo in Argentina. Their traditions pointed to a more northern origin. They obtained horses about the year 1640 and soon developed into bold riders and implacable foes of the Spaniards. They were of splendid physique and lived entirely by hunting. The women tattooed, and the men practiced the couvade. Their weapons were the bow, the lance, and the shield. The Jesuits established missions among them, but, owing to constant wars with the Spaniards and with other tribes, and also to the custom among the women of killing all but two children born to a family, the tribe, which about 1780 was estimated at 5000, dwindled rapidly and is now extinct. See Dobrizhoffer, *An Account of the Abipones* (3 vols., London, 1822), Church, *Aborigines of South America*, pp. 262-268 (London, 1912), and Kersten in *Intern. Arch. f. Ethnogr.*, vol. xvii, pp. 1-75 (1904).

ABITIBI, äb'î-tîb'î. A Canadian river and lake. The river flows northward to James Bay in Hudson Bay, and is the outlet of the lake which is situated in lat. 48° 24' N. at an elevation of 830 feet, with a Hudson Bay Co. trading station of the same name upon its shores.

ABJURATION (Lat. *ab-jurare*, to deny upon oath, to forswear). The act of dissolving by an oath the allegiance due to a temporal or spir-

itual ruler. It is in this sense that the term is employed in the Oath of Abjuration by which in England all subjects bound themselves not to acknowledge any right in the Pretender to the crown. To abjure the realm is to renounce one's citizenship and go into voluntary exile. Formerly in England any felon who had taken sanctuary (q.v.), except those guilty of treason or sacrilege, might claim immunity by abjuring the realm. This privilege was abolished by Act of Parliament in the first year of James I (1603). In the United States an alien applying for citizenship is required under oath "to renounce and abjure all allegiance and fidelity which he owes to any foreign prince." See OATH.

ABKHASIA, äb-kä'sê-ä, or **ABASIA.** A district of European Russia in the government of Kutais, Trans-Caucasia. It comprises the southern slope of the Caucasus Mountains extending to the Black Sea, in lat. 44° 15' N. It derives its name from the Abkhasians. Its mountainous surface is covered with rich woods of oak, walnut, etc. Area coincident with that of the military district of Sukhum, 2545 square miles; pop. (1911), 136,500. Its population, mainly Mingrelians and Abkhasians, is engaged in agriculture, cattle-raising, and trade in lumber. The soil is fertile, and grain and fruit are grown. After the Emperor Justinian introduced the Christian religion, Persia, Georgia, and Turkey ruled in succession, the latter suppressing Christianity and establishing Moslemism. The Russians began to establish themselves after the Treaty of Adrianople in 1829, but the conquest was not completed till 1864. The chief town in this region is Sukhum Kale. The people speak a Circassian dialect, and are physically akin to that stock, although typically ruder and less graceful. Their folk-life is also more primitive. As a result of the Russian occupation, 20,000 natives emigrated into Turkish territory. See CIRCASSIANS.

AB'LATIVE CASE. A form of grammatical inflection, found in many Indo-European languages, expressing ablative relations which are usually denoted in English by means of the prepositions *in, with, by, from,* etc.

ABLAUT, äb'lout; *Ger. pron. äp'lout.* or VOWEL GRADATION. The name given by German scholars, and in common use in English, to a change in the root vowel in different forms of the same word. It appears throughout the Indo-Germanic languages, and is frequent in nouns, although it is most obvious in the so-called "strong verbs" of the Germanic group (e.g., *sing, sang, sung*). It is divided into quantitative (varying between vowels of different length) and qualitative (as between *e* and *o*). Both forms depend originally on accent, as Sanskrit *sétu*, 'binding,' but *sitá*, 'bound,' or Greek *πατήρ*, 'father,' but *εὐπάτωρ*, 'of noble descent.' The full application of ablaut has conclusively shown the existence of dissyllabic and even trisyllabic roots in Indo-Germanic. Consult: Hirt, *Der indo-germanische Ablaut* (Strassburg, 1900); Wood, *Indo-European a; ai; au* (ib., 1905). See PHONETIC LAWS.

AB'LEGATE (Lat. *ab, away, from, off + legare, to send with a commission*). A papal envoy or emissary, a special commissioner, deputed by the papal court at Rome to carry the hat and red biretta to a newly appointed cardinal. His official duties are completed when the latter has received the insignia of his office. The

so-called *apostolic* ablegates are of higher rank than those termed *pontifical*.

ABLU'TION. See PURIFICATION.

ABNAKI, ăb-nă'kê ('Easterners'). A confederacy of Algonquian tribes, including the Passamaquoddies, Penobscots, Norridgewocks, and others, formerly occupying what is now Maine and southern New Brunswick. On the northeast their territory adjoined that of the Micmacs, while on the southwest it merged into that of the Pennacooks. In consequence of King Philip's War (see WAMPANOAG), they attached themselves to the French side and maintained unceasing hostility against the encroachment of the English, until the destruction of their principal town at Norridgewock and the killing of their missionary Rasle in 1724, after which the greater portion removed to Saint Francis, Canada, whither other refugees from the New England tribes had already preceded them. Those who remained afterward entered into an arrangement with the English by which they were confirmed in possession of a small part of their ancient inheritance. They are now represented by the Malecites on Saint John River, New Brunswick, and Quebec, the Passamaquoddies on the bay of that name in Maine, the Penobscots at Oldtown, Maine, and the Abnakis at Saint Francis and Bécancour, Quebec. Their language is preserved in the monumental dictionary of Rasle.

ABNER (Heb. 'Father of light'). The son of Ner, and cousin of Saul, and commander of his army (1 Sam. xiv. 50). After Saul's death the tribe of Judah recognized David, while Abner prevailed upon the other tribes to recognize Saul's son, Ishbaal (2 Sam. ii. 8-11). (See ISHBOSHETH.) David sent his army, under Joab, into the field, and at the pool of Gibeon they met. Abner resorted to a ruse to terrify Joab's men. He proposed an athletic contest for amusement between twelve of his men and twelve of Joab's. The former were Benjaminites and probably, like Ehud, left-handed so that they could conceal a short sword on their right side. The result was that by a trick the Judæans were all slain. The indignant army of Joab then fell upon Abner's host and inflicted upon it a crushing defeat (*ib.*, verses 12-16). In his flight Abner, being hotly pursued by Asahel, turned and reluctantly slew him (*ib.*, verses 19-23). Afterward Abner had a quarrel with Ishbaal and went over to David (2 Sam. iii. 7-11, 17-21); but the death of Asahel produced a blood feud between Joab (Asahel's brother) and Abner, which ultimately led to Abner's death. In consequence of a quarrel between Abner and his master, Ishbaal, who accused him of having designs upon the throne, Abner espoused David's cause. While being hospitably entertained by David at Hebron, Abner was treacherously killed by Joab with the connivance of his brother Abishai (2 Sam. iii. 22-27). The murder called forth general indignation, and the King himself acted as chief mourner. He ordered a public mourning, and an elegy is preserved (2 Sam. iii. 33-34), composed by David in memory of Abner, which reads:

"Has Abner died as Nabal died?
Thy hands are not in fetters bound,
Thy feet are not in brazen chains;
Through sons of violence thou hast fallen!"

The plural, vouched for by the Greek version, was purposely used. David probably knew that

Joab had murdered his guest, but it was not politic to point to his great general as the assassin. See Batten in *Zeitschrift für die alttestamentliche Wissenschaft* (1906, pp. 90 ff.) and N. Schmidt, *The Messages of the Poets* (1911, pp. 367 ff.).

AB'NEY, Sir WILLIAM DE WIVELESLE (1844—). An English astronomer and physicist. He was born at Derby, educated at the Royal Military Academy, Woolwich, became a lieutenant in the Royal Engineers in 1861 and a captain in 1871. He was president of the Royal Astronomical Society, 1893-95, and president of the Physical Society of London, 1895-97. He became adviser to the Science and Art Department of the Board of Education in 1903, having been principal assistant secretary since 1899. In the same year he became a member of the Advisory Council for Education to the War Office. He is well known for his researches in photography and spectroscopy, and has published a number of important books on these subjects, including *Instruction in Photography* (1870); *Treatise on Photography* (1875); *Colour Vision, Colour Measurement and Mixture* (1893); *The Pioneers of the Alps*, with C. D. Cunningham (1888). He was knighted in 1900.

ABNORMAL PSYCHOLOGY. See MENTAL PATHOLOGY; PSYCHOLOGY.

ÅBO, ă'boo or ă'boo. The most ancient city and former capital of Finland, now the chief town of the Russian government of Åbo-Björneborg, situated on the river Aurayoki, near its embouchure in the Gulf of Bothnia, 128 miles west by north from Helsingfors, and nearly 400 miles by rail from St. Petersburg (Map: Russia, B 2). Its streets are broad and lined with rather low stone buildings. Owing to its antiquity, Åbo has a number of buildings of historical interest, among them the cathedral, which is dedicated to St. Henry, the patron saint of Finland. It contains a magnificent sarcophagus erected in 1865 for the unfortunate Queen, Catharine Monsdotter, who died in 1512. In one of the suburbs is the spring of St. Henry, in which, according to tradition, the first Finns embracing Christianity were baptized. It is in regular steamship communication with St. Petersburg, Copenhagen, Stockholm, and other ports on the Baltic. As its harbor does not admit vessels of more than 10 feet draught, large ships dock at Bornholm, which is visited annually by some 700 vessels, whose aggregate tonnage reaches about 200,000 tons. Shipbuilding is an important industry, many Russian warships having been constructed in this city. The great Crayton works supply the Russian fleet with torpedo boats. It has a number of cotton mills, tobacco factories, sugar refineries, and machine shops, and exports lumber and dairy products. Of its educational institutions, the School of Navigation and the School for Deaf Mutes deserve special attention. In addition to these it has a number of gymnasiums, a technical institute, a commercial school, and a normal training school. The United States is represented by a consular agent. Pop., 1897, 34,964; 1910, 49,691. The inhabitants are largely Finns and Swedes, the former predominating. The town grew up around a castle (which is still in existence and is used as a prison at present) founded in 1156 by Eric IX, and became an important place in the following century. It was repeatedly attacked and destroyed by the Rus-

sians in their many wars with the Swedes and finally fell into their hands in 1808; since then it has remained a Russian possession. It was the capital of Finland until 1819. In the year 1827 a great part of the town, including the university buildings, was destroyed by fire, and the university was removed to Helsingfors, now the capital. The Peace of Åbo (1743), between Sweden and Russia, gave Russia control of the southern part of Finland as far as the Kymen River and put an end to the war commenced by Sweden, under French instigation, in 1741.

ÅBO-BJÖRNEBORG, ö'boo- or a'boo-byēr'-ne-börg. A government in southwest Finland. Area, 9333 square miles. Its topography is like that of the rest of Finland. Interspersed among the granitic ridges are many lakes and marshes. The southern section is more hilly than the northern, and along the seashore has many safe havens for sea-going vessels. Except the Kumo, Åbo-Björneborg has no navigable rivers. It has a temperate and healthful climate, and the principal industries are agriculture, cattle-raising, and fishing. There is a flourishing mining industry, the chief products being granite, black marble, iron, and clay. Åbo-Björneborg is, moreover, the foremost manufacturing province of Finland, the chief branches of industry being wood and metal working, distilling, brewing, and the manufacture of sugar, leather, paper, and tobacco. Pop., 1897, 425,026; 1904, 470,077; 1910, 499,332. About one-fifth are Swedes.

AB'OLI'TIONISTS (Lat. *abolitio*, an annulling, from *abolere*, to check the growth). The term used in the United States, after 1835 and until the Civil War, for those opponents of slavery who were the most intense in their desire to secure the immediate emancipation of the blacks. Others avowed their "anti-slavery" opinions, but these advocated, by all the means they could command, immediate "abolition." Their position was weakened, and their reputation for sobriety was damaged, by their steadfast refusal to recognize the binding force of any human laws which recognized human slavery, and even of the constitution; and their extreme demands and radical methods repelled the sympathy of many conservative men who desired that the abolition of slavery should be secured by expedient and legal means. Although discredited in many quarters, the abolitionists were in the end successful, from one point of view, in making slavery a national issue and in hastening the time of final decision as to its continuance. Among the most conspicuous leaders of the abolitionists were William Lloyd Garrison, a vigorous and fearless writer, Wendell Phillips, Gerrit Smith, a generous philanthropist, Theodore Parker, Arthur Tappan, William Goodell, and Lucretia Mott. The lives of most of these leaders have been written. Consult Garrison, *William Lloyd Garrison* (New York, 1885-89) and Hume, *The Abolitionists* (New York, 1905); Herbert, *Abolition Crusade and Its Consequences* (New York, 1912). See ANTI-SLAVERY SOCIETY; GARRISON, WILLIAM LLOYD; GIDDINGS, JOSHUA R.; and PARKER, THEODORE.

ABOLITION OF SLAVERY. See SLAVERY.

ABO'MA (Portug.). A boa. The term is widespread in tropical America, but lately has been more especially applied to the Central American thick-headed rainbow or singed boa

(*Epicrates oenchrus*), which is of great size and is dark yellowish-gray, having a row of dark brown rings along the back, and the sides marked with dark blotches, each inclosing a lighter crescent. In the sunlight the pattern disappears under a blaze of peacock green, merging into red and violet, the scales fairly glowing with iridescence. See BOA and Plate of BOAS.

ABOMEY, ä'bō-mā'. A former capital of the kingdom of Dahomey, West Africa, situated about 60 miles inland, in 7° N. lat. and 2° 4' E. long. It is situated in a plateau and is surrounded by a wall built of mud and thorns, and a deep trench. The houses, also built of mud, are unpretentious in appearance. There are several royal palaces, once the scenes of religious rites and barbaric orgies. Before the French occupation Abomey was an important slave market, but at present the traffic is confined to ivory, palm oil, and gold. The town was captured by the French in 1892. Pop., 10,732.

ABORIGINES, äb'ō-rīj'ī-nēz. Properly, the earliest inhabitants of a country. The Roman and Greek historians, however, apply the name to a mythical people, brought by story in connection with Latinus, Evander and Æneas (q.v.). According to tradition, they had their original seats in the mountains about Reate, now Rieti; later they descended into Latium, and subdued or expelled the Siculi (according to another story, they combined with the Siculi) and occupied the country. The Aborigines then disappeared as a distinct people, they and their subjects (or allies) having taken the name of the Latini. The Romans derived the name from *ab*, from + *origo*, origin, and so used the name *aborigines* as exactly equivalent to the Greek *Autochthones* (q.v.). This etymology, however, modern scholars will not accept; it has been recently suggested that *Aborigines* is a mutilated form of the true name of this early people.

ABOR'TION (Lat. *abortio*, from *ab*, away + *oriri*, to rise). The expulsion of the offspring from the womb of its mother before it is capable of living independently. Abortion occurring in a woman before the sixth month of pregnancy is generally called a miscarriage. If the fœtus leaves the womb after it is viable and before the proper end of pregnancy, the occurrence is termed a premature delivery. Hegar considers that there is, in women, one abortion to every 10 normal pregnancies; Devilliers states the ratio as one in three or four. Whitehead states that 80 per cent of all abortions take place between the second and fourth months of pregnancy. It is therefore important that a mother should have special care during the early months of gestation. Microscopical examination is required to determine the fact of an abortion occurring within four weeks of conception. After the first month the fœtus commences to assume a recognizable shape.

Causes of Abortion. Abortion may be due to disease of the father, to morbid changes in the ovum, to morbid changes in the placenta, or to maternal causes. 1. Of the diseases of the father that may cause abortion, syphilis is the most important. Habitual abortion leads to the suspicion of syphilitic taint, although other causes may bring about this condition. Old age, tuberculosis, or kidney disease of the father may so affect the vitality of the germ at

conception that, although pregnancy may occur, there is not enough strength to complete the development. 2. Causes due to disease or death of the ovum itself, apart from other causes, are rare. They are usually associated with some defect in the formation of the young embryo. 3. Placental causes are frequent. If the placenta does not have a sufficient area from which to draw a blood supply for the fœtus, the latter may die; or if the placenta is fastened low in the uterus, hemorrhage and abortion are very liable to occur. 4. The causes which are due to disease or injury of the mother are the most frequent. Diseases of the decidua of the uterus and of the other generative organs, such as tumor of the ovary, distention of the Fallopian tubes, inflammatory adhesions about the uterus, and badly formed pelvic organs, are among the local causes. Certain constitutional diseases may also cause abortion, as syphilis. Alcoholic excesses are almost as pernicious. Poisoning with metals, as lead or mercury, with phosphorus and other poisons, as coal gas and many volatile oils, and some of the acute diseases, pneumonia, yellow fever, smallpox, and peritonitis, have brought about abortion. Shock and injury are very important causes. Excessive muscular fatigue, bicycle riding, horseback riding, lawn tennis, use of the sewing-machine, and swimming are especially to be avoided. Lack of hygiene is also responsible for numerous cases. Insufficient food, contaminated air, change in climate, and tightly laced corsets, all interfere with the proper nourishment of the fœtus and thus induce abortion. After abortion has once taken place, others are very likely to occur, even in comparatively healthy women. A normal healthy mental attitude is a saving grace from this accident.

Symptoms. The cardinal symptoms are pain and hemorrhage from the uterus, these varying greatly, according to the completeness of the process. Early symptoms may be a sensation of weight, with distress or slight pain in the back, increased by standing or walking, followed by oozing or a menstrual flow, or a sudden large hemorrhage. This may occur intermittently, sometimes lasting several days, with small discharges of blood, with pain, and then a cessation of all the symptoms for a few hours or more. In later abortions, the *liquor amnii*, in which the fœtus is suspended, may either ooze away or come away in a gush.

The pain is rarely continuous; at times it resembles the intermittent pains of a colicky diarrhœa. It is caused by the contraction of the uterine muscle trying to eject a foreign body. With each muscular contraction there is oozing, or more copious bleeding, or the expulsion of the product of conception. If the pains are comparatively weak and occur at long intervals, it may be possible to prevent the abortion. If they are strong and come closely one after the other, the chances of stopping the process are less.

Treatment. Healthy physical and mental exercise is one of the best preventives of this accident. In families where the mother or grandmother aborted frequently, special care of diet, exercise, and clothing should be taken. Constipation should be avoided by the use of water and the green vegetables. Should the symptoms mentioned occur, the woman should lie down, absolutely quiet, on her back and call her regular medical attendant.

There are occasional cases (as where the outlet of the pelvis is very contracted) in which it is necessary for physicians to induce abortion. It cannot be too generally known that all attempts at procuring criminal abortion, either by the administration of powerful drugs or the application of instruments, are accompanied with extreme danger to the pregnant woman. It cannot be too earnestly impressed upon the mind of those who are tempted to procure a criminal abortion by means of drugs that the danger of causing death is very serious. Many so-called emmenagogues (q.v.), which induce the menstrual flow in a woman who is not pregnant, but is merely suffering from amenorrhœa, or suppression of the menses, are abortifacients only when given in such doses as to endanger life, or to set up violent internal inflammations. Among these are the various preparations of ergot of rye (q.v.), savin (the most powerful of all emmenagogues), borax, rue, tansy, cantharides, etc. In the South, among the ignorant negroes, concoctions of pennyroyal and cotton-root bark are used for the same purpose. The milder emmenagogues, such as iron, aloes, etc., have no abortive tendency, except in the case of those women who are predisposed to abort. Violent purgatives, in cases where they have caused abortion, have not done so because they directly exercise an ecboic effect on the uterus, but only as a secondary consequence of the excessive intestinal irritation which they cause.

Abortion, in Law. The criminal act of causing the premature bringing forth of the human fœtus. Under modern statutes the crime may be committed at any stage of the development of the fœtus, but it would seem that by the common law of England the act of relieving the pregnant woman of the fœtus before it had given any signs of life was not a criminal offense if done with her consent; if committed without her consent, it was punishable only as an assault. In this country divergent views have been held by the courts. In a number of States there are decisions or dicta to the effect that "to produce an abortion on a woman, before she is quick with child, and with her consent," is not to commit the common-law crime of abortion. On the other hand, it has been judicially declared in Pennsylvania that "it is not the murder of a living child which constitutes the offense of abortion, but the destruction of gestation by wicked means and against nature," and, consequently, that one who intentionally causes the miscarriage of a woman, even with her consent and before the fœtus has quickened, is indictable at common law. At present the crime is generally defined, with much particularity, by statute, and may be committed by one of three classes of persons. First, by the pregnant woman who takes any drugs or submits to any treatment with intent to produce her miscarriage, unless that is necessary to save her life or the life of the child. Second, by a person prescribing, supplying or administering any substance to a woman, or treating her, with intent to cause her miscarriage, unless that is necessary to save her life or the life of the child. Under some statutes, such a person may be guilty of the offense, whether the woman is pregnant or not, or whether the fœtus is alive or not, or even whether the attempt to procure miscarriage succeeds or not; the gist of the crime consisting in the intention with which the act was done. Third, by a person manufacturing, giving, or selling an instrument or substance with intent that

it may be unlawfully used in procuring the miscarriage of a woman. Acts done in procuring an abortion may subject the wrongdoer to punishment for another crime also, as assault (q.v.), or homicide (q.v.). Consult: Wharton, *Criminal Law* (San Francisco, 1912); Clark and Marshall, *Treatise on the Law of Crimes* (St. Paul, 1905).

Abortion in Animals. See CONTAGIOUS ABORTION.

Abortion in Plants. That kind of arrest in development by which an organ appears in its early stages, but fails to develop to its normal form or size. For example, in many flowers certain stamens are aborted, their primordia having appeared, but having failed to develop into functioning stamens. The abortion may be of any degree between the first appearance of the organ and its complete maturity. A very closely related term is "suppression," in which not even the beginning of an expected organ appears. The phenomenon is chiefly observable in connection with the flower (q.v.).

ABORTION, CONTAGIOUS. See CONTAGIOUS ABORTION.

ABOU BEN ADHEM (ä'bōō bēn äd'hēm) **AND THE ANGEL.** A short narrative poem by Leigh Hunt, the significance of which appears in the line,

"Write me as one that loves his fellow men."

ABOUKIR, ä'bōō-kēr'. See ABUKIR.

ABOULIA, ä-bōō'li-ä. See under INSANITY.

ABOUT'. See TACKING.

ABOUT, ä'bōō', EDMOND FRANÇOIS (1828-85). A brilliant, witty, but uneven French journalist, novelist, and writer of social and political essays. He was born at Dieuze, completed his studies in Paris with Francisque Sarcey, won honors, and was sent in 1851 to the French School at Athens, where he studied little, but observed much in a desultory way. The literary result of his two years' stay in Greece is *La Grèce contemporaine* (1854), and *Le roi des montagnes* (1856), both full of humor and irony. They were popular, often translated, and had influence on what passed for political thought. In 1855 he published *Tolla*, a story of Italy, borrowed in part, and without due acknowledgment, from an Italian novel, *Vittoria Savorelli* (1841). In 1856 he essayed the stage without success, but won popularity by short stories collected under the titles *Les mariages de Paris* (1856) and *Les mariages de province* (1868). His most popular stories are *Trente et quarante* (1858), *L'homme à l'oreille cassée* (1861), and *Le nez du notaire* (1861), often translated. More serious novels are *Madelon* (1863), *L'infâme* (1867), and *Le Roman d'un brave homme* (1880). He had a gift of facile narration, but he did not take his talent seriously and ceased writing fiction with the fall of the Second Empire, of which he was a spoiled child. To politics during these years he had contributed *La question romaine* (1859), *Rome contemporaine* (1861), *La Prusse en 1860*, *La nouvelle carte de l'Europe* (1860), and *Le progrès* (1864). After the fall of the Empire he became editor of *Le XIX Siècle*, and published a bitter book on Alsace (1872). He was made an academician in 1884, but died before his admission. The general characteristics of his work are a kindly humor, a keen irony, a cleanly taste, and a rather shallow skepticism. Consult Wells, *A Century of French Fiction*, s.v. About.

ABOVILLE, ä'bō'vê'y' or ä'bō'vêl', FRANÇOIS MARIE (1730-1817). A French general

of artillery and peer of France. He was born at Brest. During the war of the American Revolution he commanded Rochambeau's artillery at Yorktown (1781). In 1792 he commanded the armies of the North and of Ardennes, and in 1809 was appointed Governor of Brest.

ABOX'. See BOX HAULING.

A'BRA. 1. A character in Prior's poem "Solomon on the Vanity of the World." She appears in the second part of the poem as an obedient concubine of the King and finally captivates him. 2. A character in the mediæval romance of "Amadis of Greece." She is a sister of the Sultan of Babylon and secures his throne after he is killed by her lover, Lisnarte.

ABRABANEL, ä-brä'bä-nël', **ABARBANEL**, ä-bär'bä-nël', or **ABRAVANEL**, ä-brä'vá-nël', ISAAC BEN JEHUDA (1437-1508). A Jewish scholar and statesman. He was born in Lisbon and claimed descent from King David. He was treasurer of Alfonso V, but after that King's death was banished from Portugal and his property confiscated. In Spain he made a fortune as a merchant, and was in high favor with Ferdinand and Isabella in 1487; but the decree of 1492 banished all Jews from Spain, and Abrabanel fled to Naples, where he found royal favor, but was again obliged to fly when Naples surrendered to the French in 1495. He settled last at Venice. He was one of the ablest men of his time and was learned in biblical exegesis and philosophy. He presented the Jewish doctrine of the Messiah in *Sources of Salvation* (1496), *Salvation of his Anointed* (1497), and *Proclaiming Salvation* (1498).

AB'RACADAB'RA. A magical term, according to some authorities derived from Abraxas (q.v.), but more probably mere jargon. It was supposed efficacious against various ailments. The earliest mention of the term is in a poem "Precepta de Medicina," by Q. Serenus Sammonicus, a Gnostic physician of the second century, who considered it efficacious against fevers and agues. The word had to be written in a manner similar to the diagram, then folded in the form of a cross, worn as an amulet for nine days, and finally thrown backward before sunrise into a stream flowing eastward. The use of this formula spread throughout the Empire and was handed down through the Middle Ages. A comparatively modern manuscript in the British Museum relates that a Mr. Banester, by the use of abracadabra, cured over two hundred cases of ague in a year. The term is also applied to any word charm or magical jingle. See ABRAXAS; AMULET; TALISMAN.

ABRADA'TAS. A King of Susa, who at first fought against Cyrus the Great, but who afterward, in consequence of the latter's kindness to Panthea, his wife, when she had been captured by the Persians, yielded to Cyrus and became his ally. Abradatas perished in the war against Cræsus the Lydian. The story of his romantic affection for Panthea and her suicide after his death is told in the fifth book of Xenophon's *Cyropædia*.

A'BRAHAM. The patriarch whose story is given in Gen. xi-xxv. It consists of a series of incidents in his life, put together in a consecu-

tive narrative and emanating from different literary sources. In Gen. xi. 10 the genealogy of the Semites (or sons of Shem) is given, leading up to Terah, the father of Abram, Nahor, and Haran. The home of Terah and his sons is Ur of the Chaldees—a place commonly identified with the site of the mound Mukayyar, in southern Babylonia—but after the death of Haran the Terahites journey northward to Haran and take up their settlements at that place. Terah dies in Haran, and Abram, accompanied by his wife Sarai and his nephew Lot (the son of Haran), quits Babylonia by divine command and proceeds by a circuitous northern route via Damascus to Canaan. He halts at various places, notably Shechem and Bethel, where he erects altars to Yahweh (chap. xii). Leading a pastoral life, we next find him in Egypt, whither he has been driven in consequence of a famine in Palestine. Sarai's beauty attracts the attention of Pharaoh, and but for Yahwe's intervention Abram would have been obliged to give up his wife, whom he had represented to be his sister. Pharaoh obliges Abram to leave Egypt, and he accordingly returns to Bethel with Lot. At this juncture the separation between Abram and Lot takes place in consequence of quarrels between the followers of the two chiefs. Lot chooses for himself the rich pasture-land of the Jordan valley, while Abram remains in Canaan proper, though removing to Hebron. He pursues Chedorlaomer (q.v.) and the kings who were with him in the raid they had made on Palestine as far as Dan, near the sources of the Jordan, and rescues Lot, who had been taken captive. He not only succeeds in this enterprise, but aids in restoring the kings of Sodom and Gomorrah to power, and magnanimously refuses any compensation for his services (chap. xiv). At the time that Abram left Haran he was 75 years old. At Damascus he had been joined by Eliezer, who became his trusted servant, and on whom the succession to Abram's property would fall in the event of Abram remaining childless. This contingency is eliminated by the birth of Ishmael, a son by Hagar, a concubine of Abram, and an Egyptian maid-servant of Sarai. Subsequently, however, when Abram is 99 years old and Sarai 90, a son, who is called Isaac, is born to them (chap. xvii). He becomes the heir of Abram in preference to Ishmael. At the time that this son is promised to Abram and Sarai, through the appearance of Yahwe himself to Abram, the names of the patriarch and his wife are changed by the Lord to Abraham and Sarah, respectively, the former being interpreted as embodying the promise that the patriarch shall become "the father of a multitude of nations." The promise of a son to be born to Sarah is confirmed by a visit of Yahwe accompanied by two angels, all three in human form, who partake of Abraham's hospitality and make a similar announcement. The two angels proceed to Sodom and Gomorrah, while Yahwe remains behind and reveals to Abraham the intended destruction of the cities of the plain because of the wickedness and corruption prevailing there. Abraham pleads with Yahwe to save the cities for the sake of the righteous, and Yahwe agrees to do so provided only ten righteous men are found in the district. As a matter of fact, the cities are destroyed, and only Lot and his family are permitted to escape (chap. xvii), though his wife is turned into a pillar of salt because of her disobedience.

Before Isaac is actually born, Abraham is represented as proceeding to the extreme south of Palestine, known as the *Negeb*, and at Gerar encounters Abimelech. This King takes into his harem Sarah, whom Abraham again passes off as his sister. But Yahwe warns Abimelech, and Sarah is released (chap. xx). The birth of the promised son, who is called Isaac, is then related (chap. xxi). Eight days after his birth he is circumcised—an act which is regarded as symbolizing the covenant established between Yahwe and those descended from Abraham (Gen. xvii. 23–27). Some years later the faith of Abraham is put to a severe trial by the divine command to sacrifice his beloved son (chap. xxii). Abraham proceeds to carry out the decree, but is withheld from doing so by Yahwe himself, who, satisfied with the test, accepts a ram which providentially makes its appearance. The last three chapters of the narrative are taken up with the account of Sarah's death, her burial in the cave of Machpelah at Hebron, purchased by Abraham from Ephron the Hittite, the marriage of Isaac and Rebekah, and the death of Abraham, which, however, does not take place until his marriage to Keturah, by whom two sons are born to him. The death of Abraham takes place when he has reached the age of 175 years, and he is interred by the side of Sarah at Machpelah.

Many modern Bible critics regard this cycle of Abrahamic stories as embodying a mixture of early and late traditions, a recast with a view of presenting Abraham as a type of the pious worshiper of Yahwe. Besides the biblical stories, other tales were current, or became current among the Jews of post-exile days, many of which were taken up into that portion of rabbinical literature known as the *Midrash*. In this way the biblical narrative was supplemented by incidents in the early career of Abraham, on which Genesis has nothing to say. These stories bring Abraham into association with Nimrod. The historical kernel in the Genesis chapters is regarded by these critics as quite insignificant. The genealogical lists seem to them fictitious, the names representing in most cases not individuals but clans, of whom some faint traditions have survived. The name of Abram, however, or Abraham (a dialectical variation), is not that of an eponymous hero, there being no reference to any "Abramites." It is therefore considered to be either the name of a god (*ab ram*, 'exalted Father'), or of the mythical ancestor of a number of tribes, or of an historical personage concerning whom little else can be affirmed with certainty. The home of this figure seems to be in Hebron. If, as many scholars think, Gen. xiv is in part at least drawn from an old cuneiform source, the episode with which Abram's name is connected would fall in the reign of Hammurapi, c.2124–2081 B.C. (see *AMRAPHEL*). The wanderings of the Terahites, among whom Abram is reckoned, reflect the faint recollection of the origin of the Hebrews, or of some of the clans who subsequently formed part of the coalition known as Hebrews. The story of the wanderings of the Terahites along the Euphrates and thence into Palestine is typical of the manner in which nomadic bands in the early and the late days of Babylonian history proceeded from the Arabian desert and, attracted by Babylonian culture, skirted the western borders of the country; some making more or less permanent

settlements, while others passed on to the north. A significant passage in Deuteronomy (xxvi. 5) designates the ancestors of the Hebrews as "Nomadic Aramæans." Aram here is a designation for Mesopotamia, and the chief value of the story of Abraham's wanderings lies accordingly in thus preserving a picture of conditions prevailing at the earliest period of which any recollection survived among the people.

Bibliography. For the rabbinical legends and traditions about Abraham, consult: Beer, "Das Leben Abrahams" in *Lebensgemälden biblischer Personen nach Auffassung der jüdischen Sage* (Leipzig, 1859); Grünbaum, *Neue Beiträge zur semitischen Sagenkunde* (Leipzig, 1893), which also contains the Mohammedan legends about Abraham. For archæological aspects, see Tomkins's *Studies on the Times of Abraham* (London, 1878); Procksch, *Das nord-hebräische Sagenbuch* (1906); Wilke, *War Abraham eine historische Persönlichkeit* (1907); Dhorme, in *Revue Biblique* (1908); Winckler, *Abraham als Babylonier, Joseph als Aegypter* (1903); Nöldeke, in *Im neuen Reich* (1871, 508 pp.); Ed. Meyer, *Die Israeliten und ihre Nachbarstämme* (1906); Gunkel, art. "Abraham," in *Die Religion in Geschichte und Gegenwart* (1909), as well as the histories of the Hebrews by Stade, Kittel, Guthe, Piepenbring; and the commentaries on Genesis by Gunkel, Dillmann, Delitzsch, Strack, Holzinger, Skinner, and Driver.

ABRAHAM, PHINEAS S. A celebrated English pathologist and dermatologist. He was born in Falmouth, Jamaica, and received his education at University College, London, and the Royal College of Science and Trinity College, Dublin. At all these institutions he received high honors. With the degrees of chemical and mining engineer, on the conclusion of his collegiate education, he entered St. Bartholomew's Hospital, London, in 1876. He also studied medicine at the Ecole de Medicine, Paris, and at Clausthal, Germany. In 1879 he was appointed curator of the museums of the Royal College of Surgeons in Dublin and was subsequently elected a member of the Court of Examiners. He was lecturer on physiology and histology at the Westminster Hospital Medical School in 1885 and in 1889 became medical secretary of the National Leprosy Fund. In 1897 he represented the United Kingdom at the International Leper Conference at Berlin. He was one of the founders of the Royal Academy of Medicine of Ireland and of the Dermatological Society of Great Britain and Ireland. Among other important official positions he was chosen to be surgeon-in-charge of the skin department at the West London Hospital, lecturer on dermatology at the West London Post-Graduate College, and, in 1910-11, president of the West London Medico-Chirurgical Society. He became known as one of the most eminent authorities of his day on diseases of the skin. His published writings include *The Journal of the Leprosy Investigation Committee*; *Skin Affections in Syphilis*; articles on leprosy and other diseases of the skin in Allbutt's *System of Medicine*, and many papers on pathological and dermatological subjects in the transactions of medical societies.

ABRAHAM A SANTA CLARA, ā'brā-hām ā sänk'tā or ä'brā-hām (1644-1709). A popular German preacher and writer, whose real name was Ulrich Megerle. He was provincial prior of the Augustinians and court preacher at Vienna.

Uncouth puns, coarse expressions, an original and genuine humor marked his numerous and successful sermons and other religious works. He lashed the follies of all classes of society and in particular exposed the vices of courtiers and court life. He was an honest, faithful, and devoted priest, as was proved, among other things, by his self-sacrificing conduct during the plague in 1679. His collected works aggregate 21 vols. (1835-54). Of these the best known is *Judas der Erzschem* (1686-95) in 4 vols.

ABRAHAMITES, ā'brā-hām-īts; or **BOHEMIAN DEISTS**. The name under which a number of Bohemians, trusting to the edict of toleration issued by Joseph II, avowed themselves (1782) as believers of the doctrine alleged to have been held by Abraham before his circumcision. As early as the ninth century a sect of the same name had arisen in Syria and had denied the divinity of Christ. But the Bohemian deists professed to be followers of John Huss, though they held no Christian doctrine beyond that of the unity of God and accepted nothing of the Bible save the Ten Commandments and the Lord's Prayer. As they would join neither Jewish nor Christian sects, the Emperor refused to tolerate them and in 1783 expelled them from their native land and scattered them in various parts of Hungary, Transylvania, and Slavonia, where many were made converts to the Roman Catholic church, while others died clinging to their simple creed.

A'BRAHAM-MEN'. A class of sturdy beggars in England who feigned lunacy and wandered about the country in a disorderly manner. They were common in Shakespeare's time and, it would seem, existed even as late as the period of the Civil Wars. The term is used rather loosely. "An Abram cove," as Decker, in his *English Villanies*, calls one of those mendicants, meant one who personated a "Tom o' Bedlam." He would "disguise himself in grotesque rags, with knotted hair, long staff, and with many more disgusting contrivances to excite pity," but did not hesitate to live by thieving, too; when detected in pilfering or in any species of depredation, he pleaded the immunities of a Bedlamite. This word originally connoted an inmate of the lunacy ward of Bethlehem Hospital, London, under the patronage of the patriarch Abraham. Wearing a badge for identification, such a person when discharged was formally permitted to roam about the country and solicit alms. Many mendicants took wrongful advantage of this privilege and preyed upon the charitable. The meaning of this term is still preserved in the slang phrase "to sham Abraham."

ABRAHAM, PLAINS OF. A part of the elevated plateau on which stands the city of Quebec, and practically forming the west and southwest boundary of the city. It took its name from a St. Lawrence pilot. It was the scene of the battle on September 13, 1759, in which the English, under Gen. James Wolfe, defeated the French under Marquis de Montcalm, thereby bringing about the capitulation of the city on September 18, and the transfer to Britain of French sovereignty in North America. Both Wolfe and Montcalm were killed in the battle. A monument 40 feet high, erected in 1849, marks the spot where Wolfe expired. Not far distant a monument 60 feet high was erected in 1828 to the memory of Wolfe and Montcalm. In 1908 the jail and rifle factory which stood on the

Plains were removed and the battleground was made a public park. For details of the battle and the surrender of Quebec, see WOLFE, JAMES.

A'BRAHAM'S BOS'OM. A term used to designate the abode of bliss of the blessed, not only among Jews but among Christians. Lazarus reclining in Abraham's bosom was a figurative expression. In Byzantine and mediæval art the souls of the blessed are represented as being taken into Abraham's bosom in the form of little children. Abraham is the central figure in the fore-court of heaven.

ABRAHAMS, ISRAEL (1858—). An English (Jewish) author and lecturer, born in London and educated at Jews' College, London, and the University of London. For a time he was senior tutor at Jews' College, and was then appointed reader in Talmudic and Rabbinic Literature in Cambridge University. He was president of the Jewish Historical Society of England in 1905, and was first president of the Union of Jewish Literary Societies. In 1907 he was honorary president of the University of Glasgow Theological Society. Throughout a period of 19 years (1889–1908), he edited the *Jewish Quarterly Review*. His published writings include *Aspects of Judaism* (1895); *Jewish Life in the Middle Ages* (1896); *Chapters on Jewish Literature* (1899); *Maimonides* (1903); *Festival Studies* (1905); *A Short History of Jewish Literature* (1906); *Judaism* (1907); *Rabbinic Aids to Exegesis* (1910); *The Book of Delight, and Other Papers* (1912). He contributed to Jewish periodicals and became widely known as a lecturer on Jewish subjects.

A'BRAHAM THE JEW AND THE MERCHANT THE'ODORE. A mediæval tale of the conversion of a Jewish money-lender, after occurrences in which figures prominently the miracle-working power of the great image of Christ in the copper market at Constantinople. Theodore, in financial straits, twice borrows money of Abraham on the security of his oath before the statue, and only after repeated losses does he find, while on a foreign shore, means to repay the loan. For lack of other mode of transmission the merchant trusts his box of money to the sea. It is carried by the waves safely home to the Jew, who denies, however, after the return of Theodore, that he has received it. The Christian's prayer before the image, where he has brought Abraham to take oath, leads the Jew to confession of the Christian faith.

ABRAMS, ALBERT (1863—). An American physician, born in San Francisco. He studied medicine at the University of Heidelberg and, after taking the degree of M.D. in 1882, did post-graduate work in London, Berlin, Vienna, and Paris. In 1893 he was appointed professor of pathology in the Cooper Medical College, a chair which he held for five years. The Emmanuel Polyclinic in San Francisco made him its president in 1904. He wrote much on medical subjects, among his published volumes being *Synopsis of Morbid Renal Secretions* (1892); *Manual of Clinical Diagnosis* (1894); *Consumption—its Causes and Prevention* (1895); *Scattered Leaves of a Physician's Diary* (1900); *Diseases of the Heart* (1901); *Nervous Breakdown* (1901); *Hygiene, in a System of Physiologic Therapeutics* (1901); *The Blues* (1904; 4th ed., 1911); *Diseases of the Lungs* (1905); *Self-Poisoning; Diagnostic Therapeutics* (1909); *Spinal Therapeutics* (1909); *Spondylotherapy* (1910; 3d ed., 1912).

ABRANTES, á-brän'tësh. An ancient town in Estremadura, Portugal, situated on the north bank of the Tagus, 70 miles northeast of Lisbon (Map: Portugal, A 3). It is strongly fortified, is surrounded by walls, and is protected by a castle. It is remarkable for the architectural features of its monastery. By way of the Tagus, Abrantes has a brisk trade with Lisbon in grain, olive oil, wine, and fruit. Pottery and spirits are manufactured, and there are iron foundries. Fairs are celebrated in February and May. From this town Marshal Junot took the title of Duke of Abrantes. Pop., 1900, 6500.

ABRA'SIVES (Lat. *ab*, away + *radere*, to scrape, scratch). The natural and artificial substances used in the arts for scraping, grinding, and polishing. The principal abrasives now used are corundum, emery, garnet, quartz, carborundum, diatomaceous earth, tripoli, pumice, rouge, crushed steel, abrasive stones, powdered glass, and sand.

Corundum (q.v.) is a crystalline mineral substance, large deposits of which are mined in North Carolina. The process of manufacturing corundum ore into an abrasive powder consists in crushing and grinding it to a powder, which is mixed with water and fed onto sieves or screens; the properly ground material passes through the screens, and the coarser powder remains on top and is reground. The remainder of the process consists in refining and sizing the powder into eight or ten grades for the market.

Emery is an impure grade of corundum, and is prepared for the market by crushing, screening, and sizing, like corundum proper. Emery is used in the form of powder for grinding metal surfaces to intimate contact, for polishing plate glass and stones, and also as emery paper and as emery wheels. Emery paper or emery cloth is paper or cloth covered with hot glue and dusted with powdered emery. Emery wheels are disks of emery particles cemented by an adhesive cement and compressed under heavy pressure. Powdered emery is used also in the lapping process of grinding cylinders to size and producing a smooth surface. A disk or cylinder of soft metal is made to revolve rapidly and the powder with oil or water fed to the area in contact with the work. The particles embed themselves in the soft metal and abrade effectively. Valves are ground to their seats with powdered emery, to make them air- or gas-tight.

Garnet (q.v.) occurs in segregated masses scattered through other rocks. Formerly the process of production was to separate the garnet masses from the barren rock by hand after the rock had been broken down by picks or by blasting. This method of separation resulted in the loss of a considerable portion of the garnet in the rock, and a process has recently been perfected by which the rock is crushed by machinery and the garnet separated from the barren rock by water. Garnet is harder than quartz, and, unlike quartz, does not wear smooth, but by its cleavage presents new cutting edges. It is used chiefly in the form of garnet paper or as a facing for cylinders, disks, belts, etc., for smoothing and finishing wagons, cars, carriages, wooden parts of bicycles, furniture, etc., and in boot and shoe manufacture for smoothing and polishing the heels and soles.

Carborundum is an artificial product manufactured by a single American company whose works are at Niagara Falls, N. Y. The raw material for carborundum manufacture consists

of 34.2 parts coke, 54.2 parts sand, 9.9 parts sawdust, and 1.7 parts salt. This mixture is smelted by electricity in special furnaces of fire-brick 16 feet long, 5 feet high, and 5 feet wide. In the centre of the end walls are the terminals or electrodes, each of which consists of 60 carbon rods 30 inches long and 3 inches in diameter, into the outer ends of which small pieces of $\frac{3}{8}$ -inch copper rods are fixed. A square copper plate bored with 60 holes holds the carbon electrodes in place. The carbons having been put in place from the inside of the furnace, the spaces between them are tightly packed with graphite, which prevents the oxidation of the carbons and adds materially to their durability. The charge is next thrown into the furnace until it is a little more than half full, when a semi-circular trench about 21 inches in diameter is made the full length of the furnace. Into this trench the core of coke is placed and built up to form a cylinder 21 inches in diameter. Around this core more material is packed to the full height of the side walls, and heaped above their tops, the furnace then being ready for operation. This consists of passing an electric current through the charge between the two terminals, which is maintained for 36 hours, after which the furnace is allowed to cool slowly for 24 hours, when the side walls are torn down and the charge removed. The carborundum forms a layer about 10 or 12 inches thick around the coke core. This is crushed and treated with dilute sulphuric acid for three days at a temperature of 100° C. to remove the iron and alumina. The clean material is then washed with water, dried, and graded according to fineness. Carborundum is used like emery and garnet in the manufacture of abrading cloth, cylinders, wheels, etc., and in the form of powder for polishing stones, steel balls, etc.

Diatomaceous or *infusorial earth* (q.v.) is a natural product consisting of the siliceous framework of diatoms which is ground and used principally in polishing metals and finishing wood.

Tripoli is distinguished from infusorial earth by the mode of origin, it being the porous silica left from a siliceous limestone from which the lime has been leached, leaving the silica. The natural product is ground in a mill and sifted for use in polishing metals, horn, shell, etc., and is also cut out into the form of disks and used in household filters for filtering water.

Rouge as usually sold is made by dissolving iron in sulphuric acid so as to form iron sulphate; this salt is heated and the sulphur driven off, leaving a residue of sesquioxide of iron, which after washing is known as rouge. Rouge is used for polishing plate glass.

Crushed steel and *steel emery* are manufactured preferably from pieces of high-grade crucible steel heated to a temperature of about 2500° F. and then quenched in a bath of cold water or other suitable hardening solution which gives the steel a granular structure. The pieces are then reduced to powder by powerful hammers or crushing machines, after which the steel particles are tempered in the following manner: they are placed in a steel pan or cylinder and heated to a temperature of 450° F., and then cooled by being subjected to cold air in various ways. The final process is the grinding and sizing of the powder. Steel emery is made exactly like crushed steel, but is given an intensely hard temper. Crushed steel ranks close to the

diamond in hardness. Crushed steel and steel emery are extensively used in stone sawing and polishing, in lens grinding, glass beveling, brick grinding, and by lithographers, engineers, and plate glass manufacturers.

Grindstones are cut from a hard sandstone of a peculiar quality, and *whetstones*, *scythestones*, and *oilstones* are quarried and cut from similar natural rocks. *Millstones* or *buhrstones* are cut down or built up from various kinds of rock; the American buhrstone is a quartz conglomerate which is known under various local names; the German buhrstone is a basaltic lava, and that which comes from France and Belgium is a hard, porous material consisting of small particles of silica in a calcareous cement. The foreign stone is brought into the United States in small pieces, which are cut and built up into wheels with cement, but the domestic stone is worked down from quarry blocks into a solid wheel of the required size. Millstones are used for grinding grains, cement, pigments, etc. *Sand* is extensively used as an abrasive in the form of sandpaper and in the sandblast for cleaning castings, structural iron-work, etc. *Powdered glass* or sand is used in sawing stone to size and in surfacing it. *Pumice* (q.v.) is a volcanic ash or tufa which may be ground into powder for scouring and polishing or sold in lumps for similar purposes. For a detailed description of the occurrence and preparation of abrasives, reference should be made to the *Annual Reports of the United States Geological Survey, Mineral Resources of the United States*, which also include statistics of production and importation. See SANDBLAST; SANDPAPER.

ABRAVANEL, à-brä'vá-něl'. See ABRABANEL.

ABRAX'AS, or **ABRAXAX**. A term used by the Gnostic sect of Basilides to designate the multiform manifestation of the Supreme Deity in the universe, because when the word is written with Greek letters, these letters, computed numerically, have the value of 365, which equals the solar year and the number of *eons* or worlds that formed the total Gnostic universe. The word, in harmony with the magical tendencies of the East in the second century, was engraved on precious stones and used as an amulet. These gems often bore strange figures of Gnostic deities, sometimes part lion, or serpent, or cock, some connected with Jewish, some with Egyptian, and some with Græco-Roman worship. They are characteristic of the hybrid religious movement that fought for supremacy with Christianity. In many cases the figure represented has the head of a cock, the body of a man, and two serpents instead of legs, and is armed with a whip and shield, with the inscription IAΩ

(*iaō*), derived from the Hebrew name for God. Other divine manifestations inscribed or represented on the gems are Sabaoth, Adonai, Eloï—Hebrew names for God—Astaphaios, Ialdabaoth, Chnouphis. Others have names or figures of Jewish angels (Michael, Gabriel, Uriel, Onoel); others those of Egyptian gods (Isis, Osiris, Phtah, Neith, Hathor, etc.);

others those of Greek gods and heroes (Zeus, Hecate, Aphrodite, Hercules). It is a fact that the Christian Church and the Christian emperors of the fourth and fifth centuries found it far more difficult to stamp out

ABRAXAS STONE.

magical beliefs and practices than those of official paganism, and of this these stones are the clearest proofs. See ABRACADABRA and AMULET. Consult Barzilai, *Gli Abraxas* (Trieste, 1873); King, *The Gnostics and their Remains* (London, 1887); Kraus, *Real Encyklopädie der christlichen Altertümer* (Freiburg, 1882-86); Dieterich, *Abraxas, Studien* (Leipzig, 1891); Schultz, *Documente der Gnosis* (Jena, 1910).

ABREAST'. See BEARING.

ABRIDG'MENT (OF. *abrigier*, Lat. *abbreviare*, to shorten). A condensation or abbreviation of a book or treatise. In the law of copyright an abridgment, when fairly made, is deemed a new work, and consequently its publication is not an infringement of the copyright. An abridgment is to be distinguished in the law of copyright from a compilation. The former is a condensation of the substance of the copyrighted article, while the latter is a reproduction in part, at least, of the language of the copyrighted article and is held to be an infringement. Abridgments of the rules of law by various writers have been of great importance in the development of the English common law. Before our modern methods of reporting decided cases, the abridgments of Comyn, Viner, Bacon, and others were highly valued as text-books and were the chief repositories of legal learning. They are still valuable as authorities as to the rules of the early law.

ABROC'OMAS AND ANTHI'A. One of the oldest works of Greek prose fiction; also known as *Ephesiaca*, or *the Loves of Anthia and Abrocomas*. It was by an otherwise unknown writer named Xenophon of Ephesus, of uncertain date, supposed to have lived about the time of the Antonines. It is in simple narrative style, but abounds in improbable incidents. The story is the ultimate source of *Romeo and Juliet*.

AB'ROGA'TION (Lat. *abrogatio*, from *ab*, away + *rogare*, to ask, propose a law). In law, the annulling or repealing of a former law by an act of the legislative body. Abrogation may be accomplished by express provision of the later act, which in general terms abrogates all laws inconsistent with the new one, or names specifically the laws to be abrogated, in which case the abrogation is said to be *express*. Abrogation may also be *implied*, as where the new law is necessarily inconsistent with earlier laws. In Scotland, also, though not in England or the United States, when a statute by lapse of time has ceased to be suitable to the times and conditions, it is impliedly abrogated. The repeal of a statute revives any provision of the common law which such statute had abrogated or amended, but does not restore to life a previous statute which it had abrogated. See REPEAL; STATUTE.

ABROLHOS, à-brōl'yōs. A group of islands and shoals, 50 miles off the east coast of Brazil and 50 miles east of Caravellas, belonging to the State of Bahia. The largest island of the group, Santa Barbara, in lat. 18° S., 50 miles from Caravellas, is the site of a lighthouse (Map: Brazil).

A'BRUS (Gk. ἄβρός, *habros*, graceful, pretty). A genus of Leguminosæ, the best-known species, *Abrus precatorius*, being a shrubby climber of the tropics. The seeds, often called "crab's eyes," are bright scarlet with a black spot, and their use for rosaries by Buddhists suggested the specific name. In India the seeds are also used as standards of weight. The

roots have the properties of licorice. This species has also been called "weather-plant," from its imagined power to prophesy the weather, but this property has proved to be a superstition rather than a fact. The seeds are poisonous.

ABRUZZI, à-brōōt'sê, **E MOLISE**, ma'lê-zā. A division (*compartimento*) of Central Italy, situated between the Apennines and the Adriatic Sea, and comprising the provinces of Teramo (Abruzzo Ulteriore I), Chieti (Abruzzo Citeriore), Aquila (Abruzzo Ulteriore II), and Campobasso (Molise) (Map: Italy, H 5). The area is 6380 square miles. It comprises the wildest and loftiest portion of the Apennines. The rent and jagged mountain groups are very picturesque and reach in Il Gran Sasso d' Italia, or 'the great rock of Italy,' the highest of the chain, the elevation of 9584 feet. The highlands are clothed with luxuriant forests and slope precipitously on all sides, but especially toward the northeast shore. The rivers are numerous, but mostly very short, and, with the sole exception of the Pescara, are of little importance. The climate of the Abruzzi is raw in the higher regions; snow rests on the mountains from October to April, and on some of the peaks all the year round. While the mountain slopes provide ample pasture for numerous herds of cattle and swine, fertile valleys yield olives, rice, saffron, wine, and grain in abundance. Animal products form the chief article of export. Silk is produced to some extent, and cutlery is manufactured, but the industries are of little importance. In former times the district was considered of much strategical importance, owing to its inaccessibility, which rendered it especially fit as a protection for Naples. Pop., 1881, 1,317,215; 1901, 1,441,551; 1911, 1,575,084. Consult A. de Nino, *Usi e costumi abruzzesi* (Florence, 1879-91).

ABRUZZI, Prince LUIGI AMEDEO of Savoy-Aosta, Duke of the (1873—). An Italian traveler and Arctic explorer. The son of ex-King Amadeus of Spain, he was born in Madrid, and studied at the naval college in Leghorn. In 1897 he attracted much attention by making the first ascent of Mt. St. Elias. On June 12, 1899, he set out on his voyage toward the North Pole, his plan being to leave his ship, the *Stella Polare*, in harbor, and send northward a series of sledge expeditions. He spent one winter in the Bay of Teplitz, and would have remained a second had not a serious injury to the vessel compelled his return. One of his sledge parties, under Captain Umberto Cagni, attained the latitude of 86° 33', 239.15 statute miles from the Pole. On Sept. 6, 1900, he returned to Christiania. His explorations determined the northern coast of Franz-Josef Land and the non-existence of Petermann Land. The story of this expedition is told in his book, *On the "Polar Star" in the Arctic Sea* (1903). He also wrote *The Ascent of Mt. St. Elias* (1900). He established a new record in mountain climbing in 1909 by ascending Mt. Austen in India to a height of 24,600 feet. It was several times reported and denied in 1908 that he was engaged to Miss Katherine Elkins, daughter of Senator Stephen B. Elkins, of West Virginia.

AB'SALOM (Heb., 'father of peace'). The third son of King David (2 Sam. iii. 3; 1 Chron. iii. 2), whose romantic career makes him a prominent figure in Old Testament history. His mother was Maacah, the daughter of Talmai, King of Geshur (see ARAMEANS). Encoun-

tering the ill-will of David through slaying Amnon, the oldest son of the King, in revenge for an outrage committed by Amnon upon his sister Tamar (2 Sam. xiii), Absalom was banished from his father's court, and more than five years elapsed before he was again admitted into the presence of his father (2 Sam. xiii. 38; xiv. 28). A complete reconciliation, however, appeared out of the question, and Absalom shrewdly laid his plans to ingratiate himself in the hearts of the people (2 Sam. xv. 1-6). When the moment appeared ripe, he organized a rebellion against David, which soon assumed such dimensions as to force the King and his court to leave Jerusalem and fly for refuge to the east of the Jordan. Absalom entered Jerusalem, and the rebellion would probably have been successful but for the crafty intrigues of Hushai, who, while pretending to espouse the cause of Absalom, gave counsel which enabled David and his adherents to obtain time for gathering a following (2 Sam. xv. 17). A decisive battle was then fought "in the wood of Ephraim" (2 Sam. xviii. 6), in which Absalom lost his life. According to the narrative, Joab, chief counselor of David, sent three darts into Absalom's heart while he was hanging from an oak, in the branches of which his flowing locks, while he was riding, became entangled. With Absalom's death the rebellion came to an end (2 Sam. xviii. 7-17). David is represented as having been profoundly grieved at the death of his son; and the author of 2 Sam. ix-xx, probably a contemporary, tells the story in a manner calculated to arouse at least partial sympathy for Absalom, who is described as a youth of extraordinary beauty and attractiveness (2 Sam. xiv. 25-27). The date of Absalom's death may be fixed approximately at 1000 B.C. He was buried near the spot where he died, and the grave was marked by a great heap of stones (2 Sam. xviii. 17). He had set up for himself a pillar in the King's dale near Jerusalem during his lifetime (2 Sam. xviii. 18), like the Phœnician 'Abd Osir (Cooke, *North Semitic Inscriptions*, xvi, 1), and this pillar was shown in the time of Josephus (*Ant.* vii, 10, 3). The remarkable monument in the Kidron valley, now called Absalom's tomb, was assigned to Hezekiah by the Bordeaux pilgrim (333 A.D.), and apparently not before the fourteenth century, in the sources of *The Travels of Sir John Maundeville*, to Absalom. Thrupp supposed that Jesus, in Matt. xxii. 29, refers to this and its companion structures as tombs of the prophets built and garnished by the Pharisees (*Ancient Jerusalem*, 1855, pp. 230). Spiers, in Wilson's *Recovery of Jerusalem*, 1871, called attention to the confused style, the Egyptian cavetto cornice mounted on a Doric entablature, carried by Ionic semi-detached columns, with corner pilasters of the Græco-Syrian type, as indication of late Jewish but pre-Christian origin. Clermont Ganneau has plausibly suggested that the monument is the tomb of Alexander Jannæus, mentioned by Josephus, *Bell. Jud.* v, 7, 3 (*Survey of Western Palestine: Jerusalem*, 1884).

ABSALOM AND ACHITOPHEL, à-kit'ò-fël. The title of a poetical satire by John Dryden, published in 1681. Absalom represented the Duke of Monmouth, illegitimate son of Charles II, whose character is said to have resembled that of the rebellious son of King David. Achitophel, David's disloyal adviser, stood for the Earl of Shaftesbury, against whom the satire

was directed. It was intended to justify King Charles II as against the Whig party. As a political document it was extremely effective, and it has been highly praised for its vigorous literary qualities. The second part, published in 1682, was added by Nahum Tate.

ABSALON, äb'sä-lon (1128-1201). A Danish ecclesiastic, statesman, and general. He was educated at Paris and during the reigns of Valdemar I and Canute VI served as minister and general. In 1158 he was chosen bishop of Roskilde and in 1178 became archbishop of Lund. His highest position was that of papal legate. Absalom aided in the formulation of the code of Valdemar, and to his influence is due the *Historia Danica* of Saxo Grammaticus.

ABSAROKA, äb'sä-rõ'ká. See CROW INDIANS.

AB'SCESS (Lat. *ab, abs*, away + *cedere*, to go, Gk. ἀπόστημα, *apostēma*, distance). A circumscribed cavity, newly formed in the body tissues, containing pus, and due generally to an injury, followed by the invasion of the microorganisms of suppuration. An abscess is thus formed: first, the capillary vessels become overcharged with blood, in consequence of inflammation. The blood current is slowed, and an escape of serum and white blood corpuscles takes place through the thin vessel walls. The white corpuscles endeavor to destroy the invading bacteria by eating them (this process being known as *phagocytosis* and the defending cells as *phagocytes*), while the serum furnishes certain chemical substances which are at once stimulating to phagocytic activity and inimical to the bacteria. Many white cells perish in the combat, and these, together with many still active phagocytes, bacteria, and altered serum (*liquor puris*), are seen, under the microscope, to compose pus. By gradual dissolution of the surrounding tissues, the cavity is enlarged and the pus makes its way ("points") in the direction of least resistance either to the skin surface or to an adjoining natural cavity. A tubercular abscess is called a "cold abscess" because it presents no symptoms of inflammation. Its contents are not true pus, since the tubercle bacillus is not a pus-producing organism. Cold abscesses frequently make their way to regions far removed from their point of origin. In local infections superficially seated—either in or close under the skin—the early treatment consists chiefly in promoting the formation of pus by the application of moist, warm poultices, or limiting the process by the application of ice. The next step is the removal of the pus and provision of drainage. When this is too long delayed, "blood poisoning" or pyæmia may follow. An abscess must be regarded not as a disease in itself, but as the result of disease, or as an effort of nature to remove injurious matters from the system. See BACTERIA; SUPPURATION.

ABSCHATZ, äp'shâts, HANS ASSMANN, Freiherr von (1646-99). A German poet of the second Silesian School. He was born at Würbitz, and studied at Strassburg and Leyden. He was appointed life deputy from the principality of Liegnitz to the Silesian Diet at Breslau in 1679. Patriotic in tone and simple in style, he was well known in his day. He translated the *Pastor Fido* from the Italian of Guarini. His *Poetische Uebersetzungen und Gedichte* were published after his death (edited by Christian Gryphius, 1704). Selections also appear in vol. vi of W. Müller's *Bibliothek deutscher Klassiker*

des siebzehnten Jahrhunderts (1824). Consult C. H. Wegener, *Biographie Assmans von Abschatz* (Berlin, 1910).

ABSCHIEDS-SYMPHONIE, äp'shêts-zêm-fö-nē' (Ger. 'Farewell Symphony'). A symphony composed by Haydn, dated 1772 on the autograph score. It was written as an appeal to the Prince Eszterházy to allow the musicians leave of absence. One after another stopped playing and left the orchestra, and Haydn's object was attained through this delicate hint. See HAYDN.

ABSCIS'SA. See ANALYTIC GEOMETRY.

ABSCOND'ING (Lat. *abs*, away + *condere*, to put up). In law, the act of leaving the state or concealing oneself therein for a fraudulent purpose, such as hindering, delaying, or defrauding one's creditors. It is not a common-law offense for one to go beyond the boundaries of his country, nor to treat his house as his castle, that is, as a place into which an officer has no right to break in order to serve civil process. But if a debtor goes abroad or conceals himself to avoid the service of legal process, the creditor, being unable to employ the usual methods, is entitled, upon resorting to the proper proceedings, to seize the defaulting debtor's property. The rights of creditors against absconding debtors are now generally regulated by statute. See ARREST; ATTACHMENT; BANKRUPTCY; INSOLVENCY; LIMITATION OF ACTIONS.

ABSECON, ab-sē'kon. A bay just north of Atlantic City, N. J. It has a circumference of about 5 miles and has as its principal entrance Absecon Inlet. At the mouth of this inlet, in lat. 39° 22' N. and long. 74° 25' W., is a lighthouse of the first class, 165 feet above sea level.

AB'SENTEE'. A capitalist, especially a landowner, who derives his income from one country and spends it in another. Ireland offers the classic example of absenteeism and its attendant economic and social evils. A large part of the land is owned by members of the aristocracy, who administer their affairs by agents and rarely visit their possessions. This state of affairs dates in the main from the union with Great Britain and the transfer of Parliament from Dublin to London. Under the various land purchase acts, since 1885, many of the estates of absentees, as well as of other large holders, have been broken up and sold to the actual occupiers. See IRISH LAND LAWS.

There is a general consensus of opinion that absenteeism is hurtful to the economic interests of a region. It removes from the country its natural leaders, those whose personal concern in the upbuilding of the country is essential to public welfare. It intensifies the struggle between classes and makes coöperation difficult. It is likely to result in misuse of the land by owners more bent upon securing maximum financial returns than upon maintaining and increasing its earning capacity, while the management of the paid overseer is not tempered by the spirit of *noblesse oblige* which generally prevails when the landlord is a resident.

ABSENTEE, THE. A story by Maria Edgeworth (q.v.), published in 1812. It was one of the series called *Tales of Fashionable Life*, or *Fashionable Tales*.

AB'SHERON, ab'sheron. See APSHERON.

ABSINTHE, äb'sinth (Fr., from the Gk. ἀψίνθιον, *apsinthion*, wormwood). A bitter liquor, the base of which is an alcoholic solution of certain essential oils derived from a number of

plants. The chief source is a form of wormwood, or absinthium (*Artemisia absinthium*). (For illustration, see Plate of ACANTHUS.) The leaves and tops of this plant, together with portions of angelica root (*Archangelica officinalis*), sweet-flag root (*Acorus calamus*), dittany (*Cunila mariana*), star-anise seeds (*Illicium cerum*), and other aromatics, are macerated in alcohol for eight days and then distilled. The product is an emerald-colored liquor, to which anise oil is added, and which constitutes the genuine French *extrait d'absinthe*. Other absinthe of inferior quality is made from various herbs and essential oils, and adulterations are numerous. Two kinds of absinthe are known in commerce, French and Swiss; the latter, prepared from highly concentrated spirits, being the more trustworthy. The chief places of manufacture are Neuchâtel in Switzerland and Bordeaux in France. The product is consumed mostly in France, though large quantities are exported to the United States. Absinthe was first used by the French soldiers in the Algerian War (1844-47), who mixed it with their liquor as a febrifuge, and who later introduced the habit in France.

Absinthe when excessively used gives at first a feeling of exhilarated intoxication. Later the digestive organs are deranged, the appetite destroyed, then thirst, giddiness, ringing in the ears, hallucinations of sight, heavy mental oppression, anxiety, loss of brain power, and idiocy may succeed each other. It induces a condition of alcoholic intoxication plus the poisoning by the essential oils, notably by that known as absinthol, contained in the wormwood. See ARTEMISIA; LIQUEUR; WORMWOOD.

AB'SOLON. A character in Chaucer's *Miller's Tale*. He was a parish clerk, who fell in love with the jealous carpenter's wife, but ludicrously failed in his suit.

AB'SOLUTE (Lat. *absolutus*, brought to a conclusion, final, complete, from *absolvere*, to loosen from, bring to a close, complete). A term employed in philosophy and theology with various meanings, but in every case in direct antithesis to the term *relative*. In logic, absolute terms are (a) those that do not connote (see CONNOTATION) and at the same time do not imply attributes, and (b) those which do not imply the existence of some other term, as, for instance, "buyer" implies seller, such terms being known as relative. It is seen, however, that relativity is almost universal, as it is impossible to define any term without showing it to be relative to some other term. Many theological philosophers speak of God as absolute, meaning thereby that He *need* stand in no relation to anything distinct from Himself. Absolute means here independent of essential relations to other objects. Herbert Spencer speaks of absolute ethics, meaning ethics dealing with a standard that is unchanging, as opposed to the relative ethics of any particular place or time. With the Hegelians absolute means all-inclusive; essential relation is included in such a conception, but merely external relation is excluded: the universe, in the sense of all existence, including all the relations binding everything to everything else, is absolute in this meaning of the word; and the universe alone is absolute. Much of the discussion about the possibility of the absolute has turned upon the ambiguity of the word. So also with the question whether there can be knowledge of the absolute. If by the absolute is

meant something that exists in itself apart from all knowledge, and if knowledge is considered as a relation between two independent things, the knower and the known, then knowledge of the absolute is impossible. This is Sir William Hamilton's (q.v.) contention, and also Spencer's (q.v.). If knowledge means exhaustive comprehension of every objective detail within the unity of a single consciousness, and yet if consciousness and its object are not looked on as independent of each other, then absolute knowledge would be possible on the supposition of the existence of a being that sustains all reality within its unchanging consciousness (T. H. Green). If knowledge is not synonymous with exhaustive knowledge, and yet if the object of knowledge is regarded as essentially related to the consciousness that knows, and if such an object also stands in essential relation to every other object, then all knowledge is partial knowledge of the absolute. Consult W. H. Moberly, *Foundations, a Statement of Christian Belief* (London, 1912), and Roulleaux Dugage, *Théorie des principes de l'absolu* (Paris, 1909). See KNOWLEDGE, THEORY OF; LOGIC.

ABSOLUTE, CAPTAIN. A leading character in Sheridan's *The Rivals*, the son of Sir Anthony Absolute. He is a young soldier, and the lover of Lydia Languish, to gratify whose impractical and romantic temperament he makes his suit in the assumed guise of a penniless adventurer, Ensign Beverley. He thus wins her heart and proves himself his own successful rival.

ABSOLUTE, Sir ANTHONY. A celebrated character in Sheridan's comedy of *The Rivals*. He is a choleric and apparently obstinate old gentleman, who is, however, at bottom entirely kind-hearted. He avows his excessive irritability in the first act: "No, no, Mrs. Malaprop. Jack knows that the least demur puts me in a frenzy." But when finally the lovers in the play are united, he shows himself most jovial and sympathetic.

ABSOLUTE MUSIC. A term denoting music written for its own sake, without encroaching upon the domain of any other art, appealing directly to the emotion without intervention of the intellect. The term came into general use about the middle of the last century, when the adherents of the new school of program music began their propaganda for the symphonies of Berlioz (q.v.) and the symphonic poems of Liszt (q.v.), which at that time were regarded by the more conservative musicians as a spurious form of art. To-day the claims of program music are fully recognized, and the expressions "Absolute" and "Program music" are only generic titles. See INSTRUMENTAL MUSIC; PROGRAM MUSIC.

ABSOLUTE VALUE. In the development of mathematics several artificial number systems have been formed, which are used in connection with the primitive system of natural numbers, e.g., negative numbers, $-1, -2, -3, \dots$ imaginary numbers, $\sqrt{-1}, \sqrt{-2}, \dots$ and complex numbers, $3 + \sqrt{-1}, 2 - \sqrt{-3}, \dots$ The natural number which, multiplied by (-1) , equals a given negative number, is called the absolute value of the negative number; thus, the absolute value of -2 , expressed $|-2|$, is 2. Similarly, the positive value of the coefficient of $\sqrt{-1}$ in an imaginary number is called the absolute value of the imaginary number; thus,

the absolute value of $\sqrt{-3}$ (or $\sqrt{3} \sqrt{-1}$), expressed $|\sqrt{-3}|$, is $\sqrt{3}$. The modulus of a complex number (q.v.) is called its absolute value; thus, the absolute value of $3 + \sqrt{-2}$, expressed $|3 + \sqrt{-2}|$, is $\sqrt{3^2 + (\sqrt{2})^2}$. The name "absolute value" and the vertical rules to denote it are due to Weierstrass.

ABSOLUTION. The remission of sin, or of the punishment due to sin, by the Church. The remission of sin and its penalties may be divided into sacramental and canonical—one relating to the *forum internum*, the proclamation of pardon to the sinner, and constituting the most important part of the sacrament of penance; the other to the *forum externum* and devoted especially to the remission of ecclesiastical censure. Censure is expressed in spiritual punishments imposed by the Church, by which a person is deprived of the use of certain spiritual goods, as the sacraments, until penitent for his sins. Their early history is closely connected, as in the first ages of the Church all grievous public sins incurred the penalty of absolute separation from the assembly of the faithful, and reconciliation could be obtained only by undergoing the penance imposed by the Church. The bishops were the chief ministers of absolution; but the whole body of the faithful were consulted as to the term of the public penance, since they, as well as God, were injured by the sin. With the gradual decrease of severity and of public penances, absolution was pronounced by the priest immediately after confession, if he judged the repentance sincere. Formal excommunication, however, could even in later days be remitted only by public absolution by the bishop or his deputy, and certain sins are still "reserved" to the same authority for judgment. The power of judicial absolution in the name of God is attributed by Roman Catholics to all priests, on the basis of the commission in John xx. 23; the Protestant churches generally ascribe only a declarative power to their ministers, though the Church of England retains the absolute form in the Order for the Visitation of the Sick. The form of absolution, since none was given by Christ, has varied considerably; the Western Church down to the twelfth century, with rare exceptions, and the Eastern churches to the present time employing a deprecatory form ("May Christ absolve thee," etc.), for which the indicative form, *Ego absolvo te*, was definitely substituted by the Council of Trent. The difference in form, however, has implied no change in doctrine. For the Catholic doctrine, see Taunton, *The Law of the Church* (London, 1906). See CONFESSION; DISCIPLINE, ECCLESIASTICAL; PENANCE.

ABSOLUTION, DAY OF. See GOOD FRIDAY (so called from the ancient practice of emphasizing forgiveness upon that day).

ABSOLUTISM (Lat. *absolutus*, complete, unrestricted, from *ab*, away + *solvere*, to loosen, free). That system of government in which the supreme power is vested in a ruler unchecked by any constitution or laws. It characterized all the ancient monarchies (a brief period in the case of the Roman Empire excepted), and has prevailed in all Oriental monarchies, down to Japan of a few years ago. The barbarian invasions replaced the absolute monarchy by feudalism in Western Europe, but with the growth of towns and the rise of the commercial classes came the necessity for a strong central

government to protect the nation against the feudal barons, and the absolute king once more arose, master of a regular army, uniting in himself the different functions of the national life, religious as well as political. A mild form of absolute monarchy is familiar to the student of English history in the House of Tudor, with its strong-willed monarchs; but a representative absolute monarch of modern times is better seen in Louis XIV of France with his famous assertion, *L'état c'est moi* ('I am the state'). There are now no absolute monarchies in Europe. The revolution of 1908 in Turkey and the resultant constitution make the term no longer applicable, even to the Ottoman Empire.

ABSORBENTS. See LACTEALS; LYMPHATICS.

ABSORPTION (Lat. *ab*, away + *sorbere*, to swallow). When certain fluids are brought together, the molecules of one mix intimately with those of the other, and *diffusion* takes place. If certain solids containing fluids are brought in contact with other liquids, some of the liquid passes into the solid, and *absorption* takes place. Gases may also be absorbed similarly. Diffusion acting through an animal or vegetable membrane is called *osmosis*. Much of what is termed absorption in physiology is really osmosis. It is by this process of absorption that the elements of nutrition are taken from the intestines and conveyed to the tissues they are to nourish; the bones absorb much calcareous matter from the blood, cartilages less, and muscles less still; the brain takes more water than does muscle, and muscle more than bone. Most of the tissues of living bodies have the power of absorbing fluids—a property that often continues after death and until decomposition begins. Animal substances differ in absorbing power according to differences in the liquid, notably if they differ in specific gravity and if the fluids in the substances brought in contact are miscible. The following table from Chevreul shows the amounts of liquid absorbed by various tissues in twenty-four hours:

100 Parts of	Parts of Water	Saline Solution	Oil
Cartilage	231	125	
Tendon	178	114	8.6
Elastic ligament	148	30	7.2
Cartilaginous ligament.	319		3.2
Cornea	461	370	9.1
Dried fibrin	301	154	

Absorption of oxygen by the blood in the lungs is apparently instantaneous, the change in color from dark red to bright red as soon as it arrives at the pulmonary vessels showing the action of the gas it has taken from the atmosphere. This rapidity of absorption is due to the fact that in the circulation of the lungs the blood is spread out in the fine capillaries over a very large area, and to the incessant motion of the blood in the capillaries. See LACTEALS; LYMPHATICS.

ABSORPTION, ELECTRICAL. A phenomenon observed in electrical condensers (q.v.), in which the dielectric or insulating material between the conductors is non-homogeneous, e.g., a piece of glass. It is noted that if such a condenser is charged, then discharged and allowed to stand for a short time, there will appear another

charge. If this is discharged, another charge will soon appear. These secondary charges are said to be due to electrical absorption. See ELECTRICITY.

ABSORPTION, IN PLANTS. The process by which substances are taken into the body. A few plants only, being devoid of any external cover to the protoplasm, are able to engulf particles of food, which may then be digested. The most prominent of these are the Myxomycetes (q.v.), or slime molds, which in the period of their vegetative activity consist of a mass of naked protoplasm (called a plasmodium), sometimes as large as one's two hands. These plasmodia, like huge Amœbæ (q.v.), creep about and envelop particles of decaying organic matter, etc., on which they feed. The zoöspores, or reproductive bodies, of some Algæ and Fungi are also microscopic bits of naked protoplasm, but they probably do not ingest solid food during this period. Inasmuch as the protoplasm of most plants forms on its surface, as the first step of development, a thin jacket of cellulose or some similar material, the taking up of solid substances is thereby absolutely prevented. Whether the body consist of one cell or many, it presents to the surrounding medium a continuous membrane with no visible openings. Through these cell walls, therefore, neither solid nor gaseous substances can pass without previously undergoing solution. The organs of absorption are all surface cells in the simpler plants. In larger land plants they include the moist cells bordering the intercellular spaces and the surface cells of the younger roots including the root hairs. (See AERATION and ROOTS.) The materials whose absorption is to be explained are (1) dissolved substances or solutes, and (2) the solvent, water.

1. **Solutes.** Although the protoplasm itself and its surrounding membrane (the cell wall) contain a large amount of water (50–98 per cent), as yet it is not known to what extent the water lies between the particles of the substances named and to what extent it is held as water of hydration or even dissolved in the medium itself. Since a water film wets the outer face of the walls and perhaps even pervades the wall and certain layers of the protoplasm, the solutes must go into solution in the water in order to enter the cell. Two factors are most important in determining the entrance or rate of entrance of solutes; permeable characters of the walls and protoplasm and the steepness of the concentration gradient of the solutes. In multicellular plants the action of these two factors is probably supplemented by circulation of the protoplasm and by the transpiration stream. The former aids diffusion in distributing the solutes, and the latter concentrates the solutes in the leaves or other transpiring parts. Both make the gradient more steep at important regions. The unsuberized walls of absorbing cells generally offer little resistance to the movement of solutes. (See PERMEABILITY.) The protoplasm, or certain layers of it, on the other hand, determines in the main what enters the plant and the rate of the entrance. It entirely prevents the passage of some solutes, permits others to enter only slowly and still others readily. The permeability of different cells of the same plants or of cells of different plants varies greatly; also the permeability of the same cells under different conditions varies considerably with

conditions (temperature, light intensity, presence or absence of anæsthetics, etc.). If any substances be removed from solution through use or storage, they will continue to be supplied from the regions of greater abundance, and consequently of greater pressure, to the regions of lesser pressure, i.e., where they are being used. The fact that different amounts of a given compound enter plants growing in the same soil is explicable in part on this basis and in part on permeability. Thus, wheat and clover may grow side by side; the ash of the wheat will contain 67.5 per cent of silica, while that of the clover contains only 2.5 per cent.

2. **Water.** The plant absorbs and holds water by two main processes: imbibition (q.v.) and osmosis (q.v.). The structures of the plant taking up water by imbibition are wood, cell walls, starch, and protoplasm and its constituents. (See COLLOIDS.) The force involved in imbibition is often enormous. The desiccated starch grain swells in water with a pressure of more than 5000 atmospheres, while air-dry seeds swell with a pressure of about 1000 atmospheres. The force of imbibition falls rather rapidly as the imbibed water increases. It was thought formerly that imbibition is due to the attraction of the surfaces of the composing particles. Now it seems probable that the water may be loosely tied up chemically with the swelling material as water of hydration. The mature living plant cell is a typical osmotic machine. First, there is the surrounding cell wall, which in general permits the free passage of solutes and acts as a bracing apparatus for the protoplasm. Next is the thin layer of protoplasm lining the wall. This is in part a semipermeable membrane permitting the rather free passage of water, but entirely prohibiting the outward diffusion of many solutes of the vacuole and greatly restricting the movement of others. Finally, the vacuole, filled with water bearing various solutes, occupies the central region of the cell. (See GROWTH.) The solution of the vacuole takes up water by osmosis (q.v.), thus stretching the protoplasm and wall and producing turgidity (q.v.) of the cell. The amount of osmotic pressure exhibited by plant cells varies greatly. In many it varies from 3 to 10 atmospheres, in some from 15 to 40 atmospheres, and in a few (leaves of certain desert plants, pollen grains, etc.) it is more than 100 atmospheres. When the cell does not contain enough water to use the total osmotic pressure of the vacuole for stretching the protoplasm and wall, it is said to have a saturation deficit. In such condition it will absorb water from regions where it is held less tenaciously (adjoining cells, soil water, or bathing solution). If the saturation deficit becomes great enough, the protoplasm is drawn from the wall and plasmolysis (q.v.) results. The joint action of imbibition and osmosis accounts for the absorption of water by all parts of the plants, as well as the movement from one region to another. The movement is always from regions where the water is held with less force (imbibition or osmotic) to regions where it is held with greater force. Transpiration, therefore, in any region causes a movement in that direction. The absorption of water by swelling seeds is largely a matter of imbibition, for they bear little soluble material. The absorption of water by roots or an algal filament from its bathing solution is largely a matter of osmosis, though of course involving imbibition by such

structures as walls, protoplasm, and starch grains.

ABSORPTION OF GASES. The phenomenon of the taking up or absorbing of gases by liquids and solids. The number of cubic centimeters of a gas which can be absorbed by one cubic centimeter of a given liquid at 15° C. is called the "absorption coefficient" of the liquid for the gas. The absorption coefficient of water for ammonia is 756; for carbon dioxide, 1.0; for chlorine, 2.4. The mass of the gas absorbed varies directly as the pressure; so, if a gas is forced into a liquid under high pressure, and if the pressure is afterward released, the gas will be evolved. This is what happens in the case of beer and aerated waters. The absorption of gases by solids is called *occlusion*. The most conspicuous illustration of this is the power of palladium to occlude 900 times its own volume of hydrogen.

ABSORPTION OF WAVES. Waves of any kind in any medium carry energy with them; and if the energy decreases, the medium is said to absorb it or to exhibit "absorption." Thus, if white light falls upon red glass, i.e., if ether waves which affect the normal human eye with the sensation "white" are incident upon glass which appears red to the same eye, all the waves except those which produce the sensation red are absorbed by the glass, while the others are transmitted. Bodies differ greatly in the quality and quantity of their absorptive power; but it is a general law that the absorptive power of a body equals its emissive power under the same conditions. (See RADIATION.) Absorption is due to the presence in the pure medium carrying the waves of some portions of matter whose own natural period of vibration is the same as that of the period of the waves, and therefore these portions of matter are set in vibration by "resonance" (q.v.). Thus, if a person sings a pure note near a piano, it may be observed that the particular string of the piano which of itself gives the same note is set in vibration by the air waves sent out by the singer.

If air waves of any length fall upon a soft body, such as a cushion or a curtain, there is absorption, as is shown by the fact that the reflected waves are much less intense than the incident waves. (See ACOUSTICS.) The energy thus absorbed is not spent in emitting other waves, but is dissipated throughout the body producing heat effects. Similarly, if ether waves fall upon an absorbing body, the energy absorbed is dissipated in general throughout the smallest particles of the body producing heat effects. See, however, FLUORESCENCE.

ABSTINENCE. See FAST.

ABSTINENCE SOCIETIES. Associations to promote total abstinence from alcoholic liquors as beverages. See TEMPERANCE.

ABSTRACTION (Lat. *abs*, away + *trahere*, to draw). In logic, the process by which the mind separates out marks or characteristics which are similar in various objects and disregards the marks or characteristics by which the objects differ. It also occurs where characteristics of particular objects, or classes of objects, are replaced by a more general characteristic. The result of this process is also called an abstraction, or, if it appears as a word, a concept. In psychology, the term "abstraction" means the emphasis of certain contents of consciousness and the suppression of others. The abstraction may be the result of frequent and regular associa-

tions (Associative Abstraction). For example, the word "gas," for some persons, habitually means "illuminating gas." The reason is that in past experience this particular kind of gas has been the most frequent and regular associate of the word "gas." Doubtless there have been occasional associations with other forms of gas, but these, in accordance with the law of frequency, are less likely to appear upon the presentation of a stimulus. (See ASSOCIATION OF IDEAS.) The result is that, in the formation of meanings, the frequent associations are unconsciously separated—*abstracted* from those which are merely accidental. The abstraction may also be the result of a determination (Determined Abstraction), as when we pick out only those features in a situation to which our attention has been directed, or to which we are otherwise predisposed, and reject the other features. (See DETERMINING TENDENCY.) The determined abstraction may be either simultaneous or successive. An example of the latter is seen in reaction experiments where the observer, who has perhaps been instructed to react as quickly as possible upon the appearance of a *white card*, gradually and unconsciously changes his instruction so that he reacts to *something white*. In most if not in all determined abstractions two kinds of determination may be observed. The determination may be positive, an instruction to act in a certain way, or a direction of attention to certain aspects of a situation; or it may be a negative determination, which results from a predisposition on the part of the observer to follow the course offering the least resistance. A combination of the associative abstraction and the determined abstraction has also been distinguished. Consult: R. H. Lotze, *Logic* (Oxford, 1888); N. Ach, *Ueber die Willenstätigkeit und das Denken* (Göttingen, 1905); E. B. Titchener, *A Text-book of Psychology* (New York, 1910).

ABSTRACT OF TITLE. A brief and orderly statement in writing of the successive conveyances and other events through which a person claiming to own a parcel of land derives his title. A purchaser or mortgagee of real property is entitled—by law in England, by custom in the United States—to receive such an abstract from the vendor or mortgagor in advance of the consummation of the transaction, and it thereupon becomes the basis of the examination of title (q.v.), which it is the duty of the solicitor or attorney of the purchaser to make. A perfect abstract should furnish a complete history of the title sought to be transferred, showing not only the origin and nature of the vendor's interest, but also all incumbrances and other interests—such as mortgages, easements, recorded judgments, trusts, etc.—which affect his title. In England, where the practice of recording deeds does not generally obtain, the abstract is based upon the title deeds (q.v.), which are carefully preserved and transmitted with each transfer of the estate; while in the United States the public records of conveyances are the principal, but not the exclusive, source of the information upon which the maker of the abstract proceeds. Consult: Warvelle, *A Practical Treatise on Abstracts and Examinations of Titles to Real Property* (Chicago, 1892); Warvelle, *A Treatise on the American Law of Vendor and Purchaser of Real Property* (Chicago, 1902); Comyns, *On Abstracts of Title* (London, 1895). See RECORDING OF DEEDS.

ABSURDUM, REDUCTIO AD (Lat., a reducing to an absurdity). The method of proving a truth by showing that to suppose the proposition untrue would lead to a contradiction or absurdity.

ABYSR'TUS, äb-sir'tüs (Gk. "Ἀψυρτος, *Ap-syrτος*). In the legend of the Argonautic expedition (see ARGONAUTS), the younger brother of Medea. She carried him off with her when she fled with Jason from Colchis, and, according to the common version of the story, deterred her pursuing parent, Æetes, by cutting the boy in pieces and scattering his body on the sea for his father to gather up.

ABT, äpt, FRANZ (1819–85). A German song writer and musical conductor. He was born at Eilenburg and sent to the Thomasschule at Leipzig to be educated. Here he met Mendelssohn, who is said to have persuaded him to follow a musical career. He was appointed kapellmeister at the court theatre of Bernburg in 1841, but soon relinquished this position for a similar one at Zürich, where he remained for 11 years, obtaining great popularity as a teacher, composer, and leader of singing societies. He was called to Brunswick in 1852 as second musical director at the court theatre, was appointed court kapellmeister in 1855, and pensioned in 1881. He came to the United States in 1872 at the invitation of several choral societies, and everywhere met with a cordial reception. Abt was a prolific composer, and at the time of his death had published nearly 600 books (Hefte), some of them containing from 20 to 30 numbers. He belongs to that group of composers which includes Truhn, Kücken, and Gumbert. His vocal compositions are remarkable for their simplicity and clearness of melodic construction. Some of these, as *Wenn die Schwalben heimwärts zieh'n* ('When the Swallows Homeward Fly'); *Gute Nacht, du mein herziges Kind* ('Good Night, My Child'); *Schlaf wohl, du süsser Engel* ('Sleep Well, Sweet Angel') have become real folk-songs.

ABU, ä'bōō. One of the Aravalli Mountains (q.v.), India, 5653 feet high. It is held in high esteem by the Jainas and is celebrated for its two magnificent temples of white marble, supposed to have been built in the twelfth and thirteenth centuries, and considered the finest specimens of Indian architecture.

ABU, ä'bōō. The Arabic word for 'father,' occasionally abbreviated to *Bu*. A man is sometimes known as the father of his son, e.g., Abu Yusuf, Abu Dawud; or he is described as being a father, i.e., acting as one, in his relation to animals, e.g., Abu Bekr, 'the father of a camel's-foal,' nicknamed by his enemies Abu Fasil, 'the father of the weaned calf,' Abu Huraira, 'father of kittens'; or he may be characterized as the father, i.e., the possessor of some quality, e.g., Abu'l Fadl, 'father of grace,' 'the graceful one,' Abu'l Fida, 'father of devotion,' 'the devout one.' In all such instances this is not the real name of the person but a kunya, surname or nickname, which, however, may be so commonly used as to cause the real name to fall into oblivion. Such a *kunya* may also be applied to an object or a place, e.g., *Abu'l hawl*, 'father of terror,' the sphinx at Gizeh, *Abu'l fulus*, 'father of money,' frequently used as the name of a place where treasures are supposed to be hidden.

ABU-BEKR, ä'bōō-bëk'r (his original name was 'Abd al-Ka'bah ibn Abi Kuhafah al Atik)

(570-634). When converted to Islam, he took the name Abd Allah; the origin of his *kunya*, or surname, Abu-Bekr, is not known. That it meant 'father of the camel's foal' seems clear from the nickname Abul Fasil, 'father of the weaned calf,' which his enemies gave him. The first Caliph, father-in-law of Mohammed. He was a man of great influence in the Kuraish tribe. In 632, when Mohammed died, he was chosen as the successor of the Prophet with the title *chalifa rasu 'l allahi*, or representative of, substitute for, the messenger of Allah. After defeating his enemies in Arabia and warring successfully against Persia and the Byzantine Emperor Heraclius, Abu-bekr died (634 A.D.) and was buried at Medina, near the remains of Mohammed and the Prophet's wife Ayeshah (q.v.).

ABU-BEKR MOHAMMED AL-RAZI, ä rä'zè. See RHAZES.

ABU-BEKR MOHAMMED IBN TOPHAIL, ä'bōō-bēk'r mō-hām'mēd 'b'n tō'fā-ēl (1100-85). A famous Arabic physician, mathematician, poet, and philosopher. He was born in Andalusia and died in Morocco. His chief extant philosophical work is entitled *Hai ibn Yaḳzān*, 'the Living, the Son of the Awake.' It depicts the natural progressive development of the human faculties in a Robinson Crusoe born on an island till nature and God are known. To secure this communion, positive religion is valuable for the vulgar, but religious doctrines are only exoteric presentations of the mystic truth. The name of the hero and the subject are borrowed from Ibn Sina (Avicenna), with this difference, that while Ibn Sina's hero possesses a supernatural intellect, that of Ibn Tophail personifies a man of ordinary faculties. Later translations: Francisco Pons y Boigues (Saragossa, 1900), and Léon Gautier (Paris, 1909); also P. Brönnle, *The Awakening of the Soul* (London, 1905).

ABU HANIFA, ä'bōō hā-nē'fā, AL NU'MAN IBN THABIT IBN ZUTA (699-767 A.D.). Moslem jurist, and founder of the school of the Hanafites. (See MOHAMMEDAN SECTS.) He was born in Kufa. His grandfather was brought to this city as a slave from Persia. His vast erudition in canon law drew large numbers of hearers to his lectures. To maintain his independence he earned his living as a clothier, and was averse to holding any public office. As an adherent of the cause of Ali he at first sympathized with the Abbassids, but later became opposed to them, and may have suffered at the hands of the authorities. It is impossible to determine how much of truth there is in the story that he was scourged by al Mansur for refusing to accept a judgeship, and died in prison from the consequences. His decisions and sayings were recorded by his disciples. See Snouck Hurgronje in *Revue de l'histoire des Religions*, xxxvii, 186; Sprenger in *Zeitschrift für vergleichende Rechtswissenschaft* (x, pp. 15 ff.); Brockelmann, *Geschichte der arabischen Literatur*, vol. i (1898, pp. 169 ff.).

ABU-HASSAN, ä'bōō-hās'an, surnamed THE WAG. The hero of *The Sleeper Awakened*, one of the stories of the *Arabian Nights*. He was a citizen of Bagdad who entertained the Caliph unawares and as a result met with several interesting experiences, finally becoming the trusted friend and favorite of the Caliph.

ABUKIR, ä'bōō-kēr'. An insignificant village on the coast of Egypt, about 13 miles northeast

of Alexandria, probably the ancient Bukiris. The important city of Canopus was situated in the near vicinity. The castle of Abukir stands on the west side of the bay of the same name, which is west of the Rosetta branch of the Nile. This bay is celebrated on account of Nelson's victory here gained over the French fleet, Aug. 1-2, 1798, the engagement being frequently called the Battle of the Nile. The French fleet was stationed in a curved line near a small island guarded by a battery; but Nelson, with his usual intrepidity, forced a passage with half of his fleet of fifteen vessels between the island and the French line of battle, while the other half attacked the enemy in front. The French admiral De Bruyes was killed by a cannon-ball, and his flag-ship, *l'Orient*, was destroyed. The French fleet was completely defeated, and only two vessels escaped. Napoleon defeated the Arabs here on July 25, 1799, and Sir Ralph Abercromby (q.v.) repulsed the French near this point in 1801 (the engagement being known as the battle of Alexandria).

ABU KLEA, ä'bōō klā'ā. A place in the Sudan situated on the route between Korti and Metemme, both of which are on the great bend of the Nile below Khartum. It was the scene of a battle fought on Jan. 17, 1885, in which the Mahdi's forces were defeated by the English troops under Sir Herbert Stewart. See MAIDI.

ABU'L ABBAS, ä'bool ā-bās'. The name of the first Abbasid Caliph was Abd Allah, but he was generally called Abu'l Abbas, and gave himself the *kunya*, or surname, Al Saffah, 'the bloodshedder.' His father, Mohammed ibn Ali, was great-grandson of the uncle of the Prophet. On this relation to the Prophet the Abbasids based their claim to the Caliphate. The black flag was unfurled in Khorasan in 747. Kufa was captured, and Abu'l Abbas proclaimed himself there as Caliph in 749. Marwan II was defeated in 750 and soon after killed; and Abu'l Abbas massacred all whom he could find of the family of the Banu Umayya. He died in 754, leaving the caliphate to his brother Abu Ja 'far al Mansur. See Muir, *The Caliphate* (3d ed., 1899, pp. 426 ff.); Wellhausen, *Das arabische Reich* (1902, pp. 338 ff.).

ABU'L ALA, AL MA'ARRI, ä'bōōl ā'lā āl mā-ā'rè (973-1058). One of the greatest of Arabic poets and a profound thinker. He was born at Ma'arrat al Nu'man, a little city in northern Syria, between Aleppo and Emesa. When he was four years of age, he became almost totally blind. He was educated at Aleppo, Tripoli, and Antioch. At first he was strongly under the influence of Mutanabbi (q.v.), but his independent mind did not fit him for a court poet. In the preface to *Sikt al Zand* he says: "I have never tickled the ears of princes with songs of praise nor praised any one of them in the hope of being rewarded." Abu'l Ala lived in Ma'arra until 1010. Then he went to Bagdad, where he apparently met with little success. He returned with his mother to Ma'arra and resided there until his death. He was a vegetarian and an ascetic. The purity and disinterestedness that characterized him, added to his fame as a poet, attracted many earnest persons to his little town. His earliest work was a collection of songs, *Sikt al Zand*, written in the style of Mutinabbi. In his collection, the *Lazumiyat*, he reveals that trenchant criticism of popular religious ideas which marks his maturer years. He deals not only with re-

ABU-SIMBEL
STONE RELIEFS AT ENTRANCE OF ROCK TEMPLE

ligious, but also with social and political questions, always seeking for fundamental truths. In his *Risalat al Ghufuran*, or 'Letters of the Forgiven,' he produced an extraordinary satirical sketch of the life of the forgiven heretics of the past in the other world. Abu'l Ala was neither a Moslem nor a Christian, but a believer in the absolute sovereignty of ethics. See Kremer, *Ueber die philosophischen Gedichte des Abu'l Ala al Maarri* (1888); Nicholson, *A Literary History of the Arabs* (1907, pp. 313); Margoliouth, *The Letters of Abu'l Ala* (1906).

ABU'L ATAHYA, ä'bōol ä-tä'hī-yā. One of the greatest Arabic poets in the Abbasid period. Ismail ibn al Kasim, with the surname Abu'l Atahiya, was born at Anbar, on the Euphrates, in 748 A.D. He lived in Kufa, Hira, and Bagdad, and died in 825 A.D. A simple life, leading to asceticism, moral earnestness, and radicalism, characterizes him as a man. He is the first poet-philosopher among the Arabs and was looked upon as a free-thinker and an atheist. The popularity of his poetry was due to its great simplicity and brevity. A good edition of his poems in Arabic was published in Beirut in 1887. See Brockelmann, *Geschichte der arabischen Literatur*, vol. i (1898, p. 78).

ABU'L FARAJ, ä'bōol-fä-rāj', ALI IBN AL HUSAIN IBN MOHAMMED IBN AHMED AL KURASHI AL ISFAHANI (897-967). A famous Arabic historian. He was a descendant of the Umayyads, but born in Ispahan, Persia. He traveled extensively, and found eminent patrons such as Saif al Daula (q.v.) and the Buwaihid wazirs Isma'il ibn Abbad and al Muhallabi. His chief work is *Kitab al aghani*, 'The Book of Songs,' the most extensive source of our knowledge of early Arabic literature. It gives a large collection of songs, and in addition to each its melody, according to the musical terminology of Al Mausili, and notices concerning the author and often an anecdote concerning some famous male or female singer. The latest edition of the text appeared in Cairo in 21 vols., 1905-06. See Brockelmann in *Enzyklopaedie des Islam* (1908, p. 90).

ABULFARAJ, ä'bool-färāj or fä-rāj'. See BAR HEBRÆUS.

ABULFAZL, ä'bōol-fä'z'l, **MUBARAK - I ALLAMI** (1551-1602). Vizier and historiographer of Akbar (q.v.), the great Mongol Emperor. His chief work is in two parts: the first part (*Akbar Nāmah*, or 'Book of Akbar') is a complete history of Akbar's reign, and the second half (*Āyin-i-Akbar*, or 'Institute of Akbar') gives an account of the religious and political constitution and administration of the Empire. The style is excellent, and the second part is of unique and enduring interest. The Persian text of the *Akbar Nāmah* is edited in the *Bibliotheca Indica* (1873-87), and a translation has been issued by Beveridge in the same collection. The *Āyin-i-Akbar*, edited in the *Bibliotheca Indica* (1867-77), is translated by Blochmann and Jarett (1873-94) in the same series. Abulfazl was at the head of the great literary movement to which we owe the Persian translations of numerous Sanskrit, Arabic, and Hindu works. He died by the hand of an assassin while returning from a mission to the Deccan in 1602.

ABULFIDA, ä'bōol-fē-dä', Arabic Abu Al Fida Ismail Ibn 'Ali 'Imad Al-Din (1273-1331). A Moslem prince and historian. He was born at Damascus and belonged to a side branch of

the Ayyubid family. His father, Al Malik al Afdal, brother of Al Malik al Mansur, the reigning prince of Hama (the ancient Hamath, q.v.), had fled to this city before the Mongolians. During his youth he distinguished himself in several campaigns against the Crusaders, serving under his uncle. But when the principality was not given to him on the death of his cousin, Mahmud II, but to Emir Sankar, he transferred his allegiance to Sultan al Malik al Nasir. In 1310 he bestowed upon Abulfida the principality of Hama for distinguished military services. He was given practically sovereign powers. From 1310 to the time of his death he ruled over the principality and in 1320 was given the dignity of a Sultan and the right to transmit his title to his descendants. He visited Egypt and Arabia and patronized literature and science. Among his important writings were *An Abridgment of the History of the Human Race*, in the form of annals, from the creation to 1328. The work is partly a compilation and partly original. It deals first with pre-Islamic history and then with the history of the world since the prophet down to the year 1329. The text has been published at Constantinople, 1870, and there are several translations. For the period of the Crusades it is particularly important. A part is contained in the first volume of Muratori, *Scriptores Rerum Italicarum*. The part preceding the Mohammedan era was rendered into Latin by Fleischer as *Abulfedae Historia ante-Islamitica* (Leipzig, 1831); the part on the life of Mohammedan into English by W. Murray (London); and the later part by Reiske and Adler (*Annales Moslemici*, 5 vols., Copenhagen, 1789-94). The *Geography* of Abulfida is chiefly valuable for the history and description of the Mohammedan world. A complete edition was published by Reinaud and de Slane in Paris (1840); and a French translation was published by Reinaud (first part) in 1845 and Guyaud (second part) in 1883. See Brockelmann, *Geschichte der arabischen Literatur*, vol. ii (1902, p. 44).

ABUL-HASSAN, ä'bōol-häs'sän. See JUDAH, BEN SAMUEL.

ABULIA, ä-bōō'lī-ä. See PSYCHIATRY.

ABU'L KASIM, ä bōol-kä'sim. Halaf ibn Abbas Abu'l Kasim al Zahrawi, commonly called by earlier writers Abulcasis, or Alsaharavius, a distinguished Arab physician, was born at al Zahra, near Cordova, in the first half of the tenth century. He flourished under the Caliph Abd al Rahman III (912-961) and died in 1009. His great work, *al tasrif*, an encyclopædia of medicine, is of much interest. The treatise on surgery contained in it is the best that has come down from antiquity and is of importance for the history of medical science. A partial Latin translation of *al tasrif* was published in Augsburg in 1529, and a Hebrew translation exists in manuscript. The treatise on gynæcology was published by Caspar Wolf in his *Gynæcia*, 1566, and the section on surgery in Arabic and English by Channing, 1778. See E. Dognée, "Abulcasis, sa vie, son œuvre" in *Etudes dédiées à C. Leemans* (1885, pp. 304 f.); H. Frölich, "Abul Kasem als Kriegschirurg" in *Archiv für klinische Chirurgie* (1884, pp. 364-376).

ABUL KASIM MANSUR, ä'bōol kä'sēm mán-sōor'. See FIRDAUSI.

ABULUG, ä'bu-loog'. A town in the prov-

ince of Cagayan, in the island of Luzon, Philippines. It is situated on the Abulug River in a fertile valley which produces rice, tobacco, and grain. It is 14 miles northwest of Aparri, with which it carries on considerable trade. Pop., about 9000.

ABUL WEFA, ä'bōōl wā'fā. See MOHAMMED BEN MOHAMMED BEN YAHAYA.

ABUMESACKA, äbōō'mā-sä'kā (native name). A large catfish of the Nile (*Charotes laticeps*).

ABUNDA, ä-bōōn'dā. A Bantu people of Angola, living partly on the low-lying coastlands and partly on the terraced escarpments, and hence divided into "highlanders" and "lowlanders." They have long been in contact with Europeans, and there is a considerable admixture of white blood, largely accounting for their enterprise, which travelers praise highly. Most of them speak both Portuguese and Umbunda, a trade language which is current over vast areas. It is said that, with a knowledge of Umbunda and Ki-Swahili, also a Bantu dialect, a traveler can make his way across the continent from Benguela to Zanzibar.

ABUNLON, ä-bōōn'lōn. A name applied to the Negrito mixed-bloods of Zambales province, Luzon. See PHILIPPINES.

ABU NUWAS, ä'bōō nōō'wās, AL-HASAN IBN HĀNI AL-HAKAMI (756-810). One of the most celebrated Arabic lyric poets; born in al-Ahwaz; lived a riotous life in Basra, Kufah, and Bagdad, though under the special favor of Harun al Rashid and al-Amin. His collected poems contain 4900 verses. Those which celebrate wine are best known; but he also wrote love poems, satires (one of which was the cause of his death), poems on the chase and on asceticism, for he became an ascetic before his death. He has been called the Heine of Arabic literature. His *Diwan* has been edited and partly translated by von Kremer (Vienna, 1855) and Ahlwardt (Greifswald, 1861). Compare Brockelmann, *Geschichte der arabischen Literatur*, vol. i (1898, p. 75).

ABU SAID KHAN, ä'bōō säid kän. See MONGOL DYNASTIES.

ABUSE' OF PROC'ESS. The wrongful employment of a regular judicial proceeding. Courts of justice, quite as much for their own protection as for that of the party injured thereby, refuse to lend themselves to the abuse of their procedure, and may, accordingly, stay or dismiss actions and strike out defenses which are manifestly frivolous or vexatious. The jurisdiction to prevent or redress such abuse may be exercised on the motion of the party aggrieved or at the instance of the court itself. While an action will lie at the instance of the aggrieved party for the wrongful use of criminal process, a person wrongfully sued in a civil action has no legal redress, however unfounded, vexatious or malicious the suit may have been, unless it involves arrest or seizure of property. (See MALICIOUS PROSECUTION.) Consult Newell, *Law of Malicious Prosecution, False Imprisonment, and Abuse of Legal Process* (Chicago, 1892).

ABUSHEHR, ä'bōō-shēr', or **BUSHIRE**, bōō-shēr' (Pers. *Bendershehr*). A Persian seaport town on the east coast of the Persian Gulf, about 130 miles by caravan southwest of Shiraz (Map: Persia, D 6). It is situated at the extremity of a peninsula and has an extremely hot and unhealthy climate. Owing to its advantageous position as a terminal of one of the

most important caravan routes of Persia, Abushehr formerly had a very considerable trade, in spite of the fact that its harbor is neither safe nor deep enough for heavy vessels, which are compelled to anchor outside. The exports consist of opium, raw cotton and silk, mother of pearl, carpets, tobacco, and hides, while the imports include cotton goods, tea, metals, sugar, and spices. Abushehr is the seat of several European consuls, as well as of a Persian governor, but its importance has very much diminished, and its population has shrunk from about 15,000 to about 2000.

ABU-SIMBEL, ä'bōō-sim'bēl (IBSAMBUL or IPSAMBUL). A place on the left bank of the Nile in Nubia, lat. 22° 22' N., the site of two very remarkable rock-cut temples. Both were constructed by Rameses II, who dedicated the larger to the gods Ammon of Thebes, Harmachis of Heliopolis, and Ptah of Memphis; the smaller to the goddess Hathor. The larger temple has a façade 119 feet broad and more than 100 feet high, adorned with four sitting colossi, each

SCULPTURE FROM ABU-SIMBEL.

Rameses II slaying his enemies.

more than 65 feet in height, representing the King. Upon these are carved inscriptions commemorating the visit of Phœnician and Greek mercenaries in the service of King Psammetichus II (594-589 B.C.). The interior of this temple, which is 180 feet in depth, contains two large halls and 12 smaller chambers and corridors, all decorated with sculptures and paintings. The great outer hall, 58 by 54 feet, is supported by two rows of square pillars, four in each row, 30 feet high; and to each of these pillars is attached a standing figure of the King, reaching to the roof. The walls of this hall are decorated with representations, in color, of victories over the Hittites and other enemies of Egypt. In front of the smaller temple are six statues, each 3 feet high, representing King Rameses and his Queen. These temples were discovered by Burckhardt. In front of the temple is a wide terrace with a small temple. Across the whole front of the terrace is a row of statues—figures of the Pharaoh alternating with those of the sacred hawk of the sun. In 1892 Captain Johnston, R.E., repaired the front of the larger temple, and built two walls to protect the entrance against the drifting sand. In 1912 the great colossi of the temple façade were repaired by filling the cracks with liquid cement.

ABU TAMMAM, ä'bōō tām-mäm', HABIB IBN AUS (probably 807-846). An Arabic poet,

ABUTILON

1. FLOWERING MAPLE (*Abutilon venosum*).
2. APRICOT (*Prunus armeniaca*).

3. ALLSPICE (*Pimenta officinalis*).
4. BELLADONNA LILY (*Amaryllis Belladonna*).
5. AVOCADO PEAR (*Persea gratissima*).

and collector of poems, the exact dates of whose birth and death are uncertain. He was born in a village northeast of the Lake of Galilee in Syria, and his father is said to have been a Christian by the name of Todus, which Abu Tammam, after he had embraced Islam, represented as having been Aus. At an early age he came to Egypt, where he first became known as a poet. After a vain attempt to gain the favor of Al Mamun (813-833), he went to Mosul, where he spent many years. Al Mutasim (833-842) rewarded him openly for his praise-songs, and the poet accompanied him in his campaign against Amorium (838). He was a great traveler, and many anecdotes are told of his visits to prominent persons in different provinces. Once he was the guest of Ibn Raja in Fars. Accused of having neglected some of the religious practices of Islam, he expressed grave doubts as to the value of these customs, which almost cost him his life. He visited Armenia and Khorasan. On his return he was forced by a snowstorm to seek refuge with Abu'l Wafa ibn Salama in Hamadan, whose rich library was placed at his disposal. He there compiled four collections of Arabic poems. The most famous of these is known as the *Hamasa*—i.e., 'heroic' anthology. Though Abu Tammam achieved high renown as a poet, his reputation rests chiefly upon this anthology. The Arabic text of the *Hamasa* was published by G. W. Freytag in two volumes (Bonn, 1828-47), and an edition has also been published in Bulak (1869) and Calcutta (1856). The German poet Friedrich Rückert published a German translation of the *Hamasa* (Stuttgart, 1846). Consult Brockelmann, *Geschichte der arabischen Literatur*, vol. i (1898, pp. 84 ff.).

ABU'TILON (Ar. *ābūtilūn*), or INDIAN MALLOW. A genus of mostly shrubby tropical or semi-tropical plants of the natural order Malvaceæ, including about 70 species. A number of species, known as flowering maples, are grown like geraniums or fuchsias in pots in greenhouses and in summer planted out in borders. The leaves are long-stalked, often maple-like or vine-like, and generally edged or mottled with white; the flowers are pendant, one, two, or more inches long, varying in color from red to yellow and white and intermediate shades. The more commonly cultivated species are *Abutilon striatum*, *Abutilon Thompsoni*, *Abutilon venosum*, *Abutilon insigne*, etc. *Abutilon avicennæ*, known as velvet-leaf, is a common weed in different parts of the United States. See Plate of ABUTILON.

ABUT'MENT (Fr. *aboutir*, to end in, to touch by the extremity, from *bout*, end, compare Engl. *butt*). In architecture, that part of a wall or pier which takes the thrust of the construction above it, as of an arch, vault, or truss; the terminal piers or supports of an arcade or bridge. An abutment arch is the land arch of a bridge, or one of the terminal arches of an arcade.

ABU UBAIDA, *ābū-bī'dā*, MA'MAR IBN AL MUTHANNA (728-825 A.D.). An eminent Arabian philologist. He is said to have been of Jewish descent and was certainly not a member of the Taimite tribe. He defended bravely the rights of Moslems who were not Arabs. It is possible that he was a Kharijite (see MOHAMMEDAN SECTS), and was regarded as holding heretical views. Abu Ubaida was one of the ablest philologists of his time and knew inti-

mately the Arabic traditions and stories. See Goldziher, *Muhammedanische Studien*, vol. i (1889, pp. 194 ff.).

ABŪ-YŪSŪF YAKUB, *ā'bōo-yōō'suf yā'kōōb*, called AL-MANSŪR or 'The Victorious' (1160-98). The fourth Sultan of the Almohade dynasty in Africa and Spain. His father was killed at the siege of Santarem, 1184, and as soon as he had quelled certain insurrections in Morocco, Abū-Yūsūf Yakūb turned his arms against the Christians and carried off to Africa 40,000 captives. In subsequent expeditions he captured Torres and Silves, in Portugal, and defeated the Christians under Alfonso III, near Valencia. He died in Morocco. See ALMOHADES.

Ä'BY, *ä'bu*, CHRISTOPH THEODOR. See AEBY.

ABY'DOS (Gk. *Ἄβυδος*). 1. In ancient geography, a town of Asia Minor, situated at the narrowest part of the Hellespont, opposite Sestos. It is celebrated as the place near which Xerxes and his vast army passed into Europe in 480 B.C.; also as the scene of the story of Hero (q.v.) and Leander. The people of Abydos were proverbial for their effeminate and dissolute manners. 2. A city in Upper Egypt (Thebaïs), on the left bank of the Nile, on the main route of commerce with Libya. It is mentioned in the earliest Egyptian inscriptions, and, especially under the nineteenth dynasty, was a city of considerable extent and importance. Later it declined, and in the time of Strabo (q.v.), about the beginning of the Christian era, it was in ruins. This Abydos was celebrated as the burial place of Osiris (q.v.), and the bodies of pious Egyptians were brought thither for interment from all parts of Egypt. Magnificent temples, dedicated to Osiris, were built in this Abydos by Seti I and by his son Rameses II. In the temple built by the latter was found, in 1818, the first of the two famous tablets of Abydos, containing a list of Egyptian kings. The second and more important tablet was found in 1864 in the temple built by Seti I. The tablets are now in the British Museum. In recent years excavations conducted at Abydos by Amélineau and Flinders Petrie have brought to light important remains of the first Egyptian dynasty. See PETRIE, F., and also EGYPT.

AB'YDOS, BRIDE OF. A narrative poem in two cantos, by Lord Byron (published 1813). The heroine, Zuleika, is an Oriental character of ideal purity and beauty.

AB'YLA AND CAL'PE. See HERCULES, PILLARS OF.

ABYS'MAL ACCU'MULA'TIONS. Deposits which gather upon the bottom of the abysmal depths of the ocean. They consist chiefly of red and gray clays and the so-called ooze, which latter are combinations of the clays with the shells of minute organisms such as Radiolarians, Foraminifera, and Diatoms. For a more detailed description of these abysmal accumulations and other forms of deep-sea deposits the reader is referred to the article on OCEANIC DEPOSIT.

ABYSS' (Gk. *ἄβυσσος*, *abyssos*, bottomless, from *ἀ*, *a*, priv. + *βυσσός*, *byssos*, depth, bottom). A designation applied in the Greek translation of the Old Testament to the primitive "chaos" as described in Gen. i. 2. The Hebrew term—*tehôm*—occurs some 30 times, and was modified in the course of time to convey the notion of the "watery deep" in general surrounding the earth, on which, according to what ap-

pears to be a later conception, the earth was supposed to rest, and from which springs and rivers were fed. The situation of Sheol being, according to primitive Semitic ideas, in the depths of the earth, the term "abyss" is used in the New Testament (Rom. x. 7) as the designation for the abode of the dead, and then more specifically for the prison in which evil powers are confined (so in seven passages of Revelation, ix. 1, xi. 7, etc. See also Luke viii. 31). In the Revised Version of the New Testament the Greek term is rendered by "abyss," but in the Authorized Version and in both the Authorized and Revised Versions of the Old Testament expressions like "deep" and "bottomless pit" are employed.

ABYSSAL FAUNA. See DISTRIBUTION OF ANIMALS.

ABYSSINIA. A country in East Africa, situated between the Red Sea and the Anglo-Egyptian Sudan, and extending from about 3° to 15° N. lat., and 35° to 43° E. long. (Map: Africa, H 4). It is bounded by the Italian colony of Eritrea on the north, French, British, and Italian Somaliland on the east and south-east, British East Africa on the south, and the Anglo-Egyptian Sudan on the west; but its boundaries heretofore could hardly be drawn with precision on account of the changes caused by foreign treaties and frequent wars. Since 1908, however, there has been an agreement between England, France, and Italy to preserve, so far as possible, the boundaries existing at that date in this territory, which they designate as "Ethiopia," the ancient title. It comprises the kingdoms of Tigré, Amhara, Gojam, and Shoa, with Kaffa, and Galla land, and Central Somaliland and Harrar as territorial dependencies. Its area is approximately 432,600 square miles. The western half of Abyssinia is a plateau region with ranges of mountains rising from it, and it is in this part that the controlling kingdoms lie. The altitude averages from 7000 to 7500 feet, with a deep central depression at Lake Tsana (q.v.).

Of the numerous mountain chains in this region only a few can be clearly traced. The Simen group, situated at the northern end of the country, and inclosed by the bend of the Takazzé, has an average altitude of about 10,000 feet and rises in Ras Dashan (Dajan), over 15,000 feet above the sea. South of the Simen group is another chain, the Talba Wakha, surrounded by the upper course of the Atbara (q.v.) on its emerging from Lake Tsana. This chain is inferior in height to the Simen, its greatest elevation being only about 9000 feet above the sea. The southern part of the plateau is less mountainous, but abounds in so-called "ambas," isolated rocky hillocks, most of them very precipitous and difficult of ascent. Although at present it includes no active volcanoes, the country in its entire aspect bears evidence of violent volcanic eruptions in some remote age. Even to-day numerous extinct volcanoes are to be found, with their craters half obliterated, and there are several hot springs in the vicinity of Mount Entoto, some of them with a temperature of 170°.

Among the rivers the most important are the Abai, or Blue Nile (q.v.), the Atbara, or Black Nile, the Takazzé, the main head-stream of the latter, and the Hawash. With the exception of the Abai, none of these rivers is navigable, and all are liable to sudden rises, often accompanied

by great disasters. The largest lake is Tsana, called also Dembea.

In regard to climate and flora, the country may be divided into three zones. The first, embracing all the districts lying below the altitude of 4800 feet above the sea, and called Kollas, has an annual temperature ranging from 70° to 100° F., and an exceedingly luxuriant vegetation, including cotton, indigo, bananas, sugarcane, coffee, date palms, and ebony. The second zone, Woina Dega, includes all the country between 4800 and 9000 feet above the sea. It is characterized by a moderate temperature, ranging from 60° to 80° F., and its vegetation includes many of the grasses and cereals which flourish in Europe, besides oranges, lemons, olives, tobacco, potatoes, onions, the bamboo, the turpentine tree, etc. The third zone, Dega, which comprises all of the country situated above 9000 feet, has a temperature of 45° to 50°. It affords excellent grazing grounds, and its soil is well adapted for the cultivation of the hardier cereals.

The rainy season on the coast lands lasts from December to May. In the interior of the country there are generally two rainy seasons, one from April to June and the other from July to October. The climate is generally healthful.

The fauna is not inferior in variety to the flora. It includes, among other animals, the lion, the elephant, the rhinoceros, the giraffe, the leopard, a species of wolf (the kaberu), the hyena, hippopotamus, zebra, and several forms of antelopes. Consult Blanford, *Geology and Zoology of Abyssinia* (London, 1870). Among the domestic animals may be mentioned the horse, mule, donkey, camel, ox, sheep, and goat.

Geologically the surface of Abyssinia is composed mainly of sandstone, together with granite, basalt, trachyte, and other varieties of igneous rocks. The minerals include gold, which is found mostly in the streams, and also iron, coal, silver, and rock salt. For further information about the geology of Abyssinia, see AFRICA and GREAT RIFT VALLEY.

Industries. The soil of Abyssinia is very fertile, yielding two and sometimes three crops a year, and agriculture, especially in the north and among the Gallas, is the leading industry. The land is divided, not among individuals, but among families, and is subject to imperial or ecclesiastical control. The agricultural methods employed are of the most primitive kind. Various cereals are produced, the most important being barley, teff, and wheat. Numerous vegetables are raised, and coffee is a valuable crop, the fine Harrar-Mocha variety coming from the Harrar highlands. Different kinds of fruit, such as oranges, lemons, bananas, etc., are found in abundance. The raising of live stock, including sheep, goats, horned cattle, horses, and mules, is a very important industry. Most of the sheep are not wool-bearing. There are no manufacturing industries.

Trade. Foreign trade is entirely in the hands of foreign merchants, and is not considerable, as, until recently, the buying was done almost exclusively by the Emperor and his court. The increased security of life and property, however, which the Abyssinians enjoyed under Emperor Menelek, prompted an increasing number of them to part with their buried treasures of gold and silver in exchange for all kinds of goods. The value of the foreign trade is unknown, but is variously estimated at between \$5,000,000 and

\$10,000,000 a year; imports and exports about balancing each other. Jibuti forms the chief avenue of trade. Great Britain and the United States are the two leading sources of imports. France and Germany come next. The leading articles of import are cotton, silk, and arms. The chief articles of export are coffee, gold, ivory, skins, wax, and butter. Coffee is exported chiefly to Arabia, gold to India. The chief obstacles to trade are the primitive means of communication, resulting in slow and expensive transportation. A railway from Jibuti to Dire Dawa, 187 miles (of which 111 miles are in Abyssinia) was opened in 1902. Dire Dawa is about 25 miles from Harrar. The line is to be extended to Addis Abeba, and reached the Hawash River in 1912. It is constructed entirely by French capital. There are more than 1000 miles of telegraph line, connecting Addis Abeba and other towns with Jibuti, Massaua, and Harrar. The capital is also connected with Harrar by telephone.

The chief medium of exchange until about the beginning of the present century was the Maria Theresa dollar. Salt bars of uniform size and cartridges also circulate. A new currency introduced by the Emperor in 1894, with the Menelek dollar, or *tabari*, worth about 50 cents, as the standard, has gradually come into use. The Bank of Abyssinia, which was chartered in 1905 and has a capital of £500,000, was granted the privilege of minting the Abyssinian coinage, of issuing legal tender bank notes, and of engaging in all commercial, industrial, and financial transactions. The capital of the bank was mainly provided by the Egyptian National Bank, and it was expected to offset the influence acquired by France through the construction of the railway from Jibuti.

Government. In its form of government Abyssinia may be considered a sort of feudal monarchy. Menelek, the Emperor, or *negus negusti* ('king of kings'), was undoubtedly the real ruler of Abyssinia; but this position he owed more to his personal qualities than to any traditional rights. In 1907 a ministerial cabinet was established. Certain parts of the country are ruled by princes, or *rases*, some of them appointed by the Emperor, while others are sufficiently strong to defy his authority and may throw the country into a state of disorder at his death. The *rases* have retinues of supporters. This class of professional warriors, whose usefulness lasts as long as there are any insubordinate tribes to pacify, is a great hindrance to the development of the country. The revenue is derived from import duties, tithes paid in kind, and taxes on commodities, especially gold and ivory sold in the market. The collection of taxes is intrusted to the governors of the villages or *shums*, who are practically unrestricted as to the methods used or amounts collected. The legal system is supposed to be based on the Justinian code. Punishments are of barbaric severity. Blood feud still prevails. The Abyssinian army, numbering about 150,000, is largely composed of cavalry and is very well adapted for swift movements, as it is not encumbered by any commissariat, its maintenance being obtained from inhabitants of regions through which it passes. This system naturally makes for abuses. The regular army may be supplemented by irregular and provincial troops in case of need.

The political divisions of the empire, which

are subject to alteration, consist of provinces, or kingdoms, and dependencies; the following are the most important: (1) The kingdom of Tigré, occupying the northern part of the country north of the river Takazzé or Bahr-el-Aswad ('Black River'). Its chief towns are Antalo and Adowa. (2) The kingdom of Amhara, extending on the west of the Takazzé and including Gojam, which lies within the great curve of the Abai (upper course of the Blue Nile). The capital, Gondar, is situated in the northeast of the plain of Dembea or Gondar, at an elevation of about 7500 feet. (3) The kingdom of Shoa (including Efat), lying southeast of Amhara and separated from the Galla tribes by the Hawash. This is, by all accounts, the best organized and most powerful state now existing in Abyssinia.

Addis Abeba, founded by Menelek in 1892 as the capital of the country, has 60,000 to 80,000 inhabitants. The residence of Menelek was at Addis Alam, 20 miles west of Addis Abeba.

Population. The population is unknown; the estimates ranging from 3,500,000 as high as 8,000,000. The location of the people between the Nile and the Red Sea permitted the comingling of Hamites from the north, Himyaritic Semites from Asia, and negroes from the south. The Abyssinians are of medium stature; in color they vary from brunette to translucent black. The principal language of the upper classes is the Amharic, closely allied to the ancient Geez (still used in ritual), and is written in a syllabary resembling that of the old inscriptions in Yemen, Arabia. The Amharic is the language of the court. (See AMHARIC LANGUAGE.) Of the same stock are the Tigré and Tigrinya tongues. The language of the common people throughout a great part of the country is the Agao, or Agau, a Hamitic tongue. The Gallas, who form an important element in the population, likewise speak a Hamitic language. The Abyssinians are in the hand epoch of the iron age. Polygamy prevails extensively. They have little that deserves the name of literature. Education is in the hands of the clergy. The national religion is a perverted Christianity, introduced into the country in the fourth century. The tribe of the Falashas profess Judaism. The Gallas are Mohammedans.

History. Approximately the northern half of modern Abyssinia is a part of the ancient and vaguely defined Ethiopia. (For its ancient history, see the article on ETHIOPIA.) The people still call themselves Ethiopians, the name Abyssinians, by which they are generally known outside their own borders, being a Portuguese form of the Arabic *Habsh* or *Habesh*, signifying 'mixture,' and referring to the diverse tribes which compose the population. The traditions, customs, and language point to an early and intimate intercourse with the Jews; and the Book of Kings professes to record the rulers down from the Queen of Sheba and her son Menelek by Solomon, King of Israel; but this book is not to be depended upon unless corroborated by independent evidence. Greek influence was introduced through an invasion by Ptolemy Euergetes (247-221 B.C.). In the fourth century Christianity was introduced, and Frumentius, who had been instrumental in its introduction, was consecrated as a bishop by Athanasius, patriarch of Alexandria, about 341, and became, as Abuna Salamah ('our father of peace'), the head of the Abyssinian church, with his seat at

Axum, then the capital. The Coptic rite, older than that of Rome or Moscow, has prevailed in Abyssinia to the present day, in spite of efforts to introduce other forms of Christianity made by the Jesuits in the sixteenth century and by representatives of Protestant churches in later years. The head of the church is still the abuna, who is sent from Alexandria; but he shares his ecclesiastical authority with the native Echegeheh, or head of the monastic bodies. Monasticism of the Oriental type was introduced about the year 470, and became a permanent feature of the life of the country. The monks number about 12,000. In the sixth century the King of the Homerites, an Arab convert to Judaism, began a persecution of the Christians, and King Elesbaas, or Caleb of Axum, invaded Arabia, and conquered Yemen, which was ruled as a province of Abyssinia for 67 years.

This was the most flourishing period of Abyssinia; its influence then reached farthest and it was most in touch with the outside world. In 590 the overthrow of Abrahah, the last Abyssinian ruler of Yemen, left Arabia open for the spread of Mohammedanism, which soon isolated Abyssinia from the outside world and from the influences that had been urging it forward. Its civilization was thus left in a primitive, half-barbarous condition. A line of usurpers took the place of the ancient sovereigns in the tenth century and reigned until about 1300. In the reign of Naakweto Laab, the last of this line, Tekla Haimanot, an ardent patriot, who possessed great influence because of the dignity of his character and the unselfishness of his life, succeeded in negotiating a treaty between the King and the representative of the old line, which still held the government of Shoa, by which Naakweto Laab agreed to abdicate, receiving in return a certain mountainous province as a hereditary possession and the right of sitting on the same kind of chair as that used by the sovereign. By the same treaty one-third of the kingdom was granted to the clergy, and it was provided that no native should ever be abuna, but that the office should be filled by appointees of the Patriarch of Alexandria. This was an attempt to renew some connection with the outer world and shows that the more intelligent Abyssinians keenly felt their isolation. The rise of the Mohammedan power cut Abyssinia off from the coast; the invasion of the rude Gallas from the south in the sixteenth century introduced an alien race into the country, which has always been a disturbing element. The true Abyssinian type was produced probably by a mingling of the African Hamitic and the Asiatic Semitic stocks, which here came into contact.

Portuguese Jesuit missionaries came into the country in the sixteenth and seventeenth centuries, and Portugal took much interest in Abyssinian affairs, assisting the negus against his enemies, the Turks. The attempt of the Jesuits to supplant the old faith with that of Rome was intensely displeasing to the Abyssinians, who have always clung loyally to their national church. The Jesuits were expelled in 1633, and Abyssinia relapsed again into practical isolation until the nineteenth century. Occasional African explorers entered Abyssinia from the fifteenth to the nineteenth century (see BRUCE, JAMES), and some remained, voluntarily or constrained by the laws of the country, which at times were hospitable to the admission of

travelers, but did not allow their departure. In the middle of the nineteenth century the power was in the hands of Ali, a *ras* or prince of the barbarous Gallas, when it was seized by Lij ('Mr.') Kasa, an adventurer who was crowned as negus with the name of Theodore in 1854. He was at first very friendly to the English, and acted to a great extent under the advice of the English consul, Mr. Plowden; but meeting difficulties in his task of imposing unity upon the disorganized country, he became morose, and taking offense at the neglect by the British government of a letter sent by him to Queen Victoria, he imprisoned Mr. Cameron, then British consul, and his suite, and followed this by seizing and holding the members of the mission sent by the British government under Mr. Rassam to negotiate for freeing the consul. After prolonged and useless attempts at negotiation, an army of English and Indian troops, under Sir Robert Napier, invaded the country and, in a vigorous campaign, captured Magdala, Theodore's chief stronghold, and released the prisoners (April 13, 1868). Theodore at once committed suicide. He was succeeded by John, *ras* of Tigré, who proved unequal to the task of quelling rebellion. He fell in 1889 in battle with the dervishes of the Sudan, his body was captured, his head was cut off and raised on a spear and with the heads of his generals and ministers was sent to the Kalifa. Menelek II, *ras* of Shoa, who claims to represent the old line of kings, obtained the crown.

Italy, eager for lands, began to look in this direction as early as 1870 and, having occupied several hundred miles of the Red Sea littoral about Massawa (1881-85), commenced aggressions upon Abyssinian territory, which would have resulted in open war but for the intervention of England, through the friendly mission of Sir Gerald Portal. The Italians claimed a protectorate over Abyssinia by virtue of a clause in the treaty of Uchali (1889), which read differently in the Amharic and Italian versions. Menelek denounced this treaty in 1893, and when the Italians occupied Kassala in the following year, as an outcome of the Anglo-Italian agreement of 1891, defining the spheres of influence of the two nations, Abyssinia renewed hostilities (1895). After sustaining a terrible defeat at Adowa, March 1, 1896, Italy was compelled, in the treaty of Addis Abeba (Oct. 26, 1896), to recognize fully the independence of Abyssinia. In 1897 Great Britain ceded a portion of Somaliland to the Abyssinian government, and in the following year the equatorial province of Kaffa was erected. The boundary towards Eritrea on the north and northeast was fixed by agreement with Italy in 1900, 1902, and 1908, and in May of the latter year the boundary between Abyssinia and the Sudan, down to about 6° north latitude, was regulated by agreement with Great Britain, the Emperor agreeing at the same time to permit the construction of a railway through his territories connecting the Sudan and Uganda, a valuable concession in view of the difficulties that would be connected with an attempt to carry the Cape-to-Cairo Railway through the swamp lands of the Upper Nile. A treaty of commerce was concluded with the United States in December, 1903 (negotiated by Robert P. Skinner, U. S. Consul at Marseilles), and with Germany in March, 1905. In order to end the rivalry between claimants to the succession, Menelek in 1908 proclaimed as

ACACIA, ETC.

1. ALOE (*Aloe vera*).
2. ACONITE (*Aconitum napellus*).

3. ACACIA (*Acacia arabica*; var. *nilotica*).
4. ARNICA (*Arnica montana*).

his heir his grandson, Lij Yasu (born 1897), who soon thereafter, on account of the Emperor's illness, assumed direction of the government.

AB'YSSIN'IAN CHURCH, THE. The church founded about the middle of the fourth century by Frumentius (q.v.), whose titles Abuna ('our father') and Abba Salamah ('father of peace') are still used by his successors. The abuna, the head of the church, is never an Abyssinian, and is appointed by the Coptic patriarch of Alexandria, now resident at Cairo. He is bishop of Axum. In Christology the church is separated into three divisions, one of which is monophysite, while the others hold that Christ's divinity was a special gift of God to the man Jesus. The secular priests are allowed to marry once; circumcision, the Sabbath, and the Levirate law are adhered to. Baptism (of adults by trine immersion, infants by aspersion) and the Eucharist (in which grape juice is exclusively used) are accepted; but confirmation, transubstantiation, extreme unction, purgatory, crucifixes, and image worship are all forbidden. There are 180 festivals and 200 fast days. The Scriptures are read in Geez or Ethiopic, which is now a dead language. The church contains a very large amount of pagan survivals, in the cult of spirits and of the dead, and in magical practices. Its Christianity is perhaps the most corrupt of that of any existing church. See the *Publications of the Princeton Expedition to Abyssinia*, edited by Enno Littmann (Leyden, 1910); Dowling, *The Abyssinian Church* (London, 1909).

ABYSSINIAN MEAD'OW GRASS. See MEADOW GRASS.

ACACIA, à-kā'shà (literally, thorny, Gk. *ákis*, *akis*, point, splinter, thorn). A genus of plants of the family Leguminosæ, by some referred to the family Mimosaceæ, differing from Mimosa in the greater number of stamens (10 to 200) and the absence of transverse partitions in the pods. There are about 450 species of acacia, 300 of which are indigenous to Australia and Polynesia. The others are found in all tropical and sub-tropical countries except Europe. The flowers are small and are arranged in globular or elongated clusters. The leaves are usually bipinnately compound; but in many of the Australian species the leaflets are greatly reduced and the leaf blades correspondingly enlarged and flattened into what are termed phyllodia. Most of the species having phyllodia inhabit hot, arid regions, and this modification prevents too rapid evaporation of moisture from the leaves. Many of the species are of great economic importance; some yield gums, others valuable timber, and

still others food products. The African species, *Acacia gummifera*, *Acacia seyal*, *Acacia ehrenbergiana*, *Acacia tortilis*, and *Acacia arabica*, yield gum arabic, as do the Asiatic species, *Acacia arabica* and the related *Albizzia lebbek*. A somewhat similar gum is produced by *Acacia decurrens* and *Acacia dealbata* of Australia and *Acacia horrida* of South Africa. Gum senegal is the product of *Acacia verec*, sometimes called *Acacia senegal*. The drug "catechu" is prepared from *Acacia catechu*. The astringent bark of a number of species is extensively used in tanning, especially the bark of those known in Australia as wattles. For this purpose *Acacia decurrens*, the black wattle, is one of the best, the air-dried bark of this plant containing about four times as much tanning extract as good oak bark. The cooba (*Acacia saligna*) is another of the important wattle trees. The most valuable timber tree of the genus is probably the blackwood (*Acacia melanoxylon*) of Australia. The tree attains a large size, and the wood is easily worked and takes a high polish. The koa (*Acacia koa*) is one of the important timber trees of Hawaii and is highly prized for cabinet work. A number of the acacias have been introduced into cultivation in Europe and America, where they thrive. The California experiment station recommends planting several species for tanning extract and for timber. A number of species are grown in mild climates and in greenhouses as ornamentals, partly because of the fragrance of their flowers. The common American Robinia or locust (*Robinia pseudacacia*) and the *Robinia hispida* are known as acacia and rose acacia in Europe and elsewhere. Fossil forms of acacia are abundant in the Tertiary beds of Aix in France, and an allied genus, *Acaciæphyllum*, has been described from the cretaceous beds of North America. Consult: F. von Mueller, *Iconography of Australian Acacias* (Melbourne); L. H. Bailey, *Cyclopædia of American Horticulture* (New York, 1900-01); G. Nicholson, *Illustrated Dictionary of Gardening* (London, 1884-89).

ACACIANS, à-kā'shī-anz or à-ka'shanz. See ACACIUS.

ACACIUS, à-kā'shī-ūs, Bishop of Cæsarea (340-365). He founded a sect, named after him, which maintained that the Son was like the Father; not of the same or of similar substance, but that this likeness was in the will alone. Thus he differed from the general Arian party. His doctrine was actually accepted by a synod at Constantinople, which he manipulated (359), which gave rise to Jerome's famous saying: "The whole world groaned and wondered to find itself Arian." Yet in the end, as formerly, it was condemned, and he was exiled. See Gwatkin, *Studies in Arianism* (Cambridge, 1900).

AC'ADE'MIA (Gk. 'Ακαδήμεια or 'Ακαδημία, *Akadēmia*). See ACADEMUS.

AC'ADEM'IC LE'GION. A name applied particularly to an armed body of students who participated in the uprising of 1848 in Vienna; also more generally to similar student companies elsewhere in the revolutionary disturbances of that year.

ACADEMIE DES BEAUX ARTS, à'kà'dà'mé' dâ bō'zär'. See ECOLE DES BEAUX ARTS.

AC'ADE'MUS (Gk. 'Ακάδημος, *Akadēmos*). A mythical hero of Attica. When the Tyndaridæ invaded the Attic land to rescue Helen (q.v.) from the hands of Theseus, Academus revealed to them the place where their sister was hidden.

In return for this act the Lacedæmonians then and thereafter showed the hero great honor. The Academia was thought to have received its name from Academus, though the earlier form of its name, Hecademia, seems to point to an original Hecademus. The Academia was in early times a sacred precinct of Athena, 6 stades northwest of the Dipylon gate of Athens (q.v.), itself on the northwest side of the city. Later, a gymnasium was built in the precinct, and still later the spot was made a public park, being planted with many kinds of trees, adorned with statues, watered by the Cephissus, and laid out in walks and lawns. Here, in the gymnasium and the neighboring walks, Plato conversed with his pupils and held his first formal lectures in philosophy. Later, having purchased in the neighborhood a piece of land and built thereon a temple to the Muses and a lecture hall, he transferred his school thither. This spot was also called Academia and gave its name to Plato's school. See ACADEMY.

ACAD'EMY (Gk. *ἀκαδήμεια*, *akadēmeia*, or *ἀκαδημία*, *akadēmia*). Originally the name of a public garden outside of Athens, dedicated to Athene and other deities and containing a grove and a gymnasium. It was popularly believed to have derived its name from its early owner, a certain Academus, an eponymous hero of the Trojan War. It was in these gardens that Plato met and taught his followers, and from their place of meeting his school came to be known as the Academy. The later schools of philosophy which developed from the teachings of Plato down to the time of Cicero were also known as academies. Cicero himself and many of the best authorities following him reckoned but two Academies—the Old, founded by Plato (428–348 B.C.), and including Speusippus, Xenocrates of Chalcedon, Polemo, Crates, and Crantor; and the New,—founded by Arcesilaus (241 or 240 B.C.). Others have, however, reckoned the latter as the Middle Academy and added a third, the New Academy, founded by Carneades (214–129? B.C.). Others again have counted no fewer than five, adding to the three just mentioned a fourth—that of Philo, and a fifth—that of Antiochus. (See PLATO; ARCESILAUS; CARNEADES; PHILOSOPHY; and references under the last.) From its use in the sense of a school the word “academy” has come to be applied to certain kinds of institutions of learning; from its use in the sense of a body of learned men it has come to be applied to various associations of scholars, artists, literary men, and scientists organized for the promotion of general or special intellectual or artistic interests. Not only was the name applied particularly to the followers of Plato, but it soon came to be given also to general societies of learned men unconnected with a philosophical school. In the Middle Ages the name and institution survived not merely among the Arabs, particularly in Spain, but, passing over the fable of Alfred's foundation of an academy at Oxford, we find such an institution under the name of academy among the group of scholars whom Charlemagne gathered around him.

At the Renaissance the academy sprang into sudden prominence as a favorite form of intellectual organization, taking its place as an intellectual force beside the universities. From these it differed, however, as it still does, in being not a teaching body but a group of investigators, who, generally under royal or state patronage,

encouraged learning, literature, and art by research and publication. Laying aside the claims of Alost to a society of scholars in 1107 and that of Diest to a society of poets in 1302, academies of this type seem to have first appeared in Italy and to have been devoted to literature, art, and architecture. The Academy of Fine Arts, founded at Florence about 1270 by Brunetto Latini; that of Palermo, about 1300, by Frederick II; and the Academy of Architecture of Milan (1380?), were among the first of these. Language and literature were not far behind. The so-called Academy of Floral Games (*Académie des Jeux Floraux*), founded at Toulouse about 1325 by one Clemens Isaurus as a part of the great Troubadour movement, was probably the earliest of these literary academies and has had an almost continuous history till the present day. With this exception the earliest academies rose in Italy, and found their prototype in that brilliant group of scholars, critics, and *literati* gathered at the court of Lorenzo de' Medici, the Magnificent, and Cosmo de' Medici in Florence, the so-called Platonic Academy which, founded about 1474, was dissolved in 1521. It was succeeded in Florence by the Academy of Florence, formed in 1540 especially for the study of Tuscan, particularly Petrarch. Before the Platonic Academy of the Medici only Naples boasts an earlier academy—that founded by Alfonso V about 1440. But the sixteenth century was rich in academies devoted to literature. The *Intronati* of Siena, 1525; the *Infiammati* of Padua, 1534; the *Rozzi* of Siena, later suppressed by Cosmo de' Medici, 1568; and the *Accademia della Crusca* or *Furfuratum*, founded at Florence in 1582 and still in existence, the most famous of them all, are perhaps the best known of that astonishing burst of academic vigor which produced in the sixteenth century in Italy a number variously estimated from 170 to 700 of this form of organization. In these, under curious names but with a common purpose, the Italian aristocracy especially, barred from political interests by tyrants and republics alike, found vent for their activity.

One academy of distinction alone devoted to science appears in this period, the *Accademia Secretorum Naturæ*, founded at Naples in 1560, but after a short existence suppressed by the Church. It was succeeded by the *Accademia de' Lincei*, founded by Prince Chesi in 1603, counting Galileo among its members and still existing in Rome after many changes. The foundation of this society heralded that great burst of interest in sciences of the seventeenth and eighteenth centuries which to some extent replaced the purely literary activity of the sixteenth. The Reformation had destroyed or altered much of the ecclesiastical power which had served to check investigation earlier, and the foundation of several societies indicated a new interest in science. Of these the *Accademia Naturæ Curiosorum*, Leipzig, established by Dr. J. L. Bausch in 1651–52, still exists under the name of *Cæsareo-Leopoldinia*, in honor of the Emperor Leopold I, who patronized it liberally. Since 1808 it has had its headquarters at Bonn. The Royal Society (q.v.) in England, the Academy of Sciences in Paris, the Academy or *Collegium Curiosum* established by Professor Sturm of the University of Altdorf, and similar institutions brought about an astonishing increase of interest and consequent advance in scientific pursuits and methods. Indeed the importance

of these academies to science can hardly be over-estimated.

This was maintained in the eighteenth century, when the establishment of academies was further stimulated by the influence of Louis XIV, as important in this as in so many other intellectual and political interests throughout Europe. In this, however, as in so many other ways, he and his ministers but carried further the plans of their predecessors. In 1635 Richelieu established the most famous of all such organizations, the old French Academy, which had its inception six years before in the minds of eight men of letters. It consisted of 40 members, with a director, a chancellor, and a secretary, and its avowed purpose was to control the French language and regulate literary taste. Its constitution provided for the publication of a grammar, a treatise on rhetoric, and one on poetry, besides a dictionary of the French language. Though its condition has been somewhat changed, it is the same in all essentials to-day as it was at its foundation. In this plan Richelieu was copied, as usual, by his successor, Mazarin, who established the Academy of Painting and Sculpture (the present Academy of Fine Arts) in 1648. It was opened in 1664 by Colbert, who in 1671 founded the Academy of Architecture, later merged into the Academy of Fine Arts. Colbert founded also the Academy of Inscriptions and Belles Lettres in 1663, as a committee of the old academy to draw up inscriptions for monuments and medals to commemorate the victories and glories of Louis XIV, the Academy of Sciences and the Academy of France at Rome in 1666. The Academy of Inscriptions was remodeled in 1706. All these, save the last, together with the Academy of Moral and Political Science, founded in 1832, came to form the Institute of France (q.v.). To Louis XIV other cities in France, notably Montpellier in 1706, owed the charters of their academies.

Owing largely to these two causes, that is to say, the interest in science and the fashion of royal patronage set by Louis XIV, the foundation of academies reached its height in the eighteenth century, especially in Germany and the north and east of Europe. Frederick I of Prussia founded the Royal Academy of Sciences in Berlin in 1700 on a plan drawn up by Leibnitz, its first president. That savant, too (together with Wolff, his great German contemporary), aided in drawing up the scheme adopted by Peter the Great and carried out by Catharine I in the foundation of the Imperial Academy of Sciences at St. Petersburg in 1725. In 1739 the Academy of Sciences of Stockholm was established, with Linnæus as a most distinguished member, and was incorporated in 1741 as the Royal Swedish Academy. In 1742 Christian VI founded the Royal Academy of Copenhagen. In 1750-51 the Göttingen Academy of Sciences was established; in 1754 came the Electoral Academy at Erfurt; in 1755 the Academy of Sciences of Mannheim was founded by the Elector Palatine, Karl Theodor, and in 1759 the Electoral Bavarian Academy of Sciences was founded at Munich. In Italy the Royal Academy of Sciences of Turin originated in 1757 as a private society, receiving royal recognition in 1783. Not merely were academies founded in the broad field of science, embracing in its earlier sense all human knowledge, but they were established for all imaginable special purposes. In surgery the

Surgical Academy of Paris, 1731, and the so-called Academy of Surgery at Vienna, 1784, more properly a college, are the most prominent examples. In archæology and history we find the Royal Academy of History established at Madrid in 1738, the Archæological Academy of Upsala founded in 1710, that of Cortona in 1727, and that of Herculaneum at Naples in 1755. In literature the Royal Spanish Academy, founded by the exertions of the Duke d'Escalona in 1713 or 1714, and the Royal Academy of Savoy, founded by Charles Felix in 1719, are the most prominent of numerous similar institutions, including those of St. Petersburg of 1783 (later a part of the Imperial Academy) and Stockholm in 1786. In music and the fine arts, the departments to which the name has been especially applied in England, the Royal Academy of Arts was founded in 1768, with Sir Joshua Reynolds as its first president, the Academy of Arts at Milan, that of painting and sculpture and architecture at Madrid by Philip V, the Swedish Academy of Fine Arts by Count Tessin in 1733, and the Academy of Painting and Sculpture at Turin in 1778.

During the nineteenth century a smaller number of such organizations were founded, partly because the field was already well covered, partly because other forms of activity or the same form of institution under a different name took their place. (See SOCIETIES; ADVANCEMENT OF SCIENCE, ASSOCIATIONS FOR THE.) The Royal Hibernian Academy, founded in 1803, the English Royal Academy of Music, founded in 1822 and incorporated in 1830, and the Royal Scottish Academy, founded in 1826 and chartered in 1838, represent the English activities in this field. The Philadelphia Academy of Sciences, founded in 1812 and incorporated in 1817, and the Vienna Academy of Sciences, founded in 1846, are among the most important scientific foundations of the last century. The Celtic Academy of Paris, founded 1800 to 1805 and merged in 1813 into the Society of Antiquaries of France, and the Academy of History and Antiquities of Naples, founded by Joseph Bonaparte, represent the Napoleonic period. The Academy of Medicine of Paris, founded in 1820 for research into matters affecting public health, has rendered excellent service to the community generally. But the most important event in academic organization of that century was the reorganization of the French Academy into the Institute of France (q.v.). The French Academy, as now constituted, represents the old academy of Richelieu, though it is reckoned officially as the highest of the five divisions of the Institute. Its membership in 1914 was as follows, in order of seniority:

Alfred Mézières	Alexandre Ribot
Comte Othénin d'Haussonville	Maurice Barrès
Charles de Freycinet	Maurice Donnay
Julien Viaud (Pierre Loti)	M ^{is} de Ségur
Ernest Lavisse	Francis Charmes
Paul Bourget	Jean Richepin
Jules Lemaître	Raymond Poincaré
Anatole France	Eugène Brioux
Comte Albert de Mun	Jean Aicard
Gabriel Hanotaux	René Doumic
H. E. L. Lavedan	Marcel Prévost
P. E. L. Deschanel	Mgr. L. Duchesne
Paul Hervieu	Henri de Regnier
Emile Faguet	Henry Roujon
Marquis C. J. Melchior de Vogüé	H. R. D. Cochin
Edmond Rostand	Hubert Lyautey
Frédéric Masson	Emile Boutroux
René Bazin	Henri Bergson
Etienne Lamy	Alfred Vincent Capus
	Pierre de la Gorce

It remains to notice in detail some of the other more important existing academies. The Royal Academy, Burlington House, London, the association of English artists, founded in 1768, holds an exhibition each year open to all artists of distinction and corresponding to the French Salon. It consisted in 1912 of 40 Academicians (R.A.) and 30 Associates (A.R.A.), the prescribed number. Sir Edward John Poynter has been its president since 1896. In 1902 the British Academy for the promotion of historical, philosophical, and philological studies was founded at London. Its maximum membership is 100, and it is divided into four sections—history and archæology, philology, philosophy, jurisprudence and economics. The Royal Academy of Sciences at Berlin, founded under another name by Frederick I in 1700, owes its present statutes to the year 1881. It consists of two sections—physics-mathematics and philosophy-history. It has 67 regular, 20 foreign, 200 corresponding, and a number of honorary members. Its publications have appeared since its foundation. The Imperial Academy of St. Petersburg, founded in 1725, has three divisions—physics-mathematics, Russian language and literature, history-philology. It is richly endowed and offers yearly prizes for contributions to learning. It has a very large library and controls a number of museums. The Royal Swedish Academy of Sciences, founded in 1739 and incorporated under its present name five years later, has 100 native and 75 foreign members, and its work is divided into nine classes. The Royal Bavarian Academy includes theology, law, finance, and medicine among its activities, and has three classes—philosophy-philology, mathematics-physics, and history. The Imperial Academy of Sciences of Vienna, founded in 1847, comprises two classes—philosophy-history and mathematics-science—with frequent meetings and especially numerous and important publications. It is well endowed by private and State benefaction and is enabled to send out many scientific expeditions. The Kaiser Wilhelm Society for the Promotion of Science, founded by Kaiser Wilhelm II at Berlin in 1911, is the newest addition to the long list of scientific societies having governmental sanction and support.

In the United States there are fewer such societies. The earliest founded was the American Philosophical Society, organized in 1743 through the efforts of Benjamin Franklin, who was its first secretary and later, until his death, its president. The interests and the activities of this society covered the whole range of pure and applied science and of philosophy. The publication of its *Transactions* began in 1771 and of its *Proceedings* in 1838. At present the society has 200 resident and 300 non-resident members. The American Academy of Arts and Sciences was chartered by the Legislature of Massachusetts in 1780, largely through the influence of John Adams. Its attention was devoted to the study of the antiquities and the natural history of America. It has published a series of memoirs since 1785 and *Proceedings* since 1846. The Connecticut Academy of Arts and Sciences was founded in 1799 and the Philadelphia Academy of Natural Science in 1812. The latter has a very valuable library and museum, especially rich in conchology and ornithology, and has published *Journals* since 1817 and *Proceedings* since 1841, besides the *American Journal of Conchology*. The New York Academy of Science was

founded in 1818 as the Lyceum of Natural History, receiving its present title in 1875. It is organized into the following four sections: Astronomy and physics, geology and mineralogy, biology and anthropology, psychology and philology. These sections hold monthly meetings, while the Academy holds general meetings and gives an annual exhibit of scientific progress that is of great value. Similar scientific academies have been organized in most of the large cities in the United States, but their influence is chiefly local. Such societies usually cover the entire field of the exact and the natural sciences, while special societies for particular sciences are now commonly formed. In recent years Washington has become the centre of scientific interest in this country. In 1898 its various scientific societies combined into the Washington Academy of Science. Other national scientific associations have been formed. In 1863 Congress chartered the National Academy of Sciences, which was designed to investigate scientific questions and to report thereon to the government. As a matter of fact, however, the Academy has not been frequently employed by the government. It holds two meetings annually and issues reports and memoirs. The membership of the Academy originally was limited to 50 members, but in 1870 this limitation was removed. In 1907 its resident membership was limited to 150, not more than 10 to be elected in a single year, and the number of foreign associates to 50. In 1912 the Academy had 124 regular and 42 associate members. The American Association for the Advancement of Science was organized in 1848 and is the most active and the largest of such associations. It now has 8100 members. In fine arts both Philadelphia and New York possess institutions under the name of academies, founded in 1805 and 1828 respectively, having schools of design and annual exhibitions. Many other such associations, under various names, exist in this country for the promotion of research and publication along literary and scientific lines. Of these the American Academy of Political and Social Science, of Philadelphia, is perhaps the most important. It was founded in 1889 and incorporated in 1891. It has a membership of over 6100, and its publications, under the title of *Annals*, are of unusual importance. See SMITHSONIAN INSTITUTION.

In the sense of a school or an institution of learning, the term "academy" has come to be applied particularly in the eastern part of the United States, to an educational institution ranking between the elementary school and the college. But the term is occasionally used elsewhere. John Milton, for instance, in his *Tractate on Education*, calls his ideal educational institution an academy. In England the term is applied to those institutions of secondary rank established by the dissenting religious bodies during the latter part of the seventeenth and in the eighteenth centuries to provide for the general education of their youth, especially those intended for the ministry, since such education could not be obtained in the existing public schools. In the United States the term was first applied to the institution founded in Philadelphia in 1749 under the leadership of Benjamin Franklin. This Academy and College of Philadelphia was chartered in 1753 and in 1779 became the University of Pennsylvania. The typical academies were those founded during the Revolutionary War period at Exeter, N. H., and

Andover, Mass., largely through the generosity of John Phillips, after whom they are named. Such academies became very numerous and took the place of the old Latin grammar schools, which had lost their popularity and serviceableness on account of the economic and political changes of the eighteenth century. They are controlled by trustees, usually of some one religious denomination, and are not dependent upon state support. Their place has been largely taken up by the modern high school; such as still exist have for the most part become college preparatory schools.

The term is also used much more widely in a looser sense, to indicate places where special accomplishments such as riding, dancing, or fencing are taught. A more restricted use is that in connection with schools preparing for particular professions, as the United States Military Academy at West Point. In France and the United States it is occasionally applied also to buildings devoted to particular arts, especially music (hence an opera house is often called an academy of music), and occasionally, by analogy, even to theatres.

Robertson, *The French Academy* (New York, 1910); *Minerva*; *Official Year-Book of Scientific and Learned Societies of Great Britain and Ireland*; *Whitaker's Almanack*; *Almanach National*; Steeves, *Learned Societies and English Literary Scholarship in Great Britain and the United States* (New York, 1913); Ornstrin, *The Rôle of the Scientific Societies in the Seventeenth Century* (New York, 1913); Mahaffy, J. P., "On the Origin of Learned Academies in Modern Europe" (Royal Irish Academy, *Proceedings*, Dublin, 1913, vol. xxx, Sec. C, pp. 429-444).

ACADEMY OF ARTS AND LETTERS, AMERICAN. A body founded in 1898 by the action of the American Social Science Association, which, at its annual meeting in that year, nominated a small group of authors and artists to constitute a National Institute of Arts and Letters. The qualification for membership in this body was to be a notable achievement in art, music, or literature. The membership was at first limited to 150, but was afterwards increased to 250. When the institute had included in its membership a large proportion of the most notable artists and writers of the United States, it proceeded to organize an Academy of Arts and Letters, the members of which should be chosen from the membership of the Institute. In 1904 the first seven members were chosen, and provision was made for the progressive responsibility of the choice of those elected later. The first seven were William Dean Howells, Augustus Saint Gaudens, Edmund Clarence Stedman, John La Farge, Samuel Langhorne Clemens, John Hay, and Edward A. MacDowell. These were empowered to elect more members, and the 15 thus chosen five more. This method of election continued until the entire membership of 50 was completed.

The constitution of the Academy declares that its aim is to further and represent the interests of fine arts and literature. In 1909 was held the first of a series of public meetings to be held annually in different cities.

The living members of the Academy in 1913 were as follows:

William Dean Howells
Henry James
Henry Adams
Thomas Raynesford Lounsbury

Theodore Roosevelt
John Singer Sargent
Alfred Thayer Mahan
Daniel Chester French

John Burroughs
James Ford Rhodes
Horatio William Parker
William Milligan Sloane
Robert Underwood Johnson
George Washington Cable
Andrew Dickson White
Henry van Dyke
William Crary Brownell
Basil Lanneau Gildersleeve
Woodrow Wilson
Arthur Twining Hadley
Henry Cabot Lodge
Francis Hopkinson Smith
Edwin Howland Blashfield
William Merritt Chase
Thomas Hastings
Hamilton Wright Mabie
Brander Matthews
Thomas Nelson Page

Elihu Vedder
George Edward Woodberry
Kenyon Cox
George Whitefield Chadwick
Abbott Handerson Thayer
John Muir
Charles Francis Adams
Henry Mills Alden
George deForest Brush
William Rutherford Mead
John W. Alexander
Bliss Perry
Abbott Lawrence Lowell
James Whitcomb Riley
Nicholas Murray Butler
Paul Wayland Bartlett
George Brown Post
Owen Wister
Herbert Adams
Augustus Thomas

The following, now deceased, were members of the American Academy of Arts and Letters: Augustus Saint Gaudens, Edmund Clarence Stedman, John La Farge, Samuel L. Clemens, John Hay, Edward MacDowell, Charles Follen McKim, Charles Eliot Norton, John Quincy Adams Ward, Thomas Bailey Aldrich, Joseph Jefferson, Richard Watson Gilder, Winslow Homer, Carl Schurz, Joel Chandler Harris, Daniel Coit Gilman, Donald Grant Mitchell, Julia Ward Howe, Francis Marion Crawford, Henry Charles Lea, Bronson Howard, Edwin Austin Abbey, Thomas Wentworth Higginson, William Vaughn Moody, Frank Davis Millet, Horace Howard Furness, John Bigelow, and Edward Everett Hale.

Two vacancies existed. The officers were William Dean Howells, president; William Milligan Sloane, chancellor; Robert Underwood Johnson, permanent secretary.

ACAD'EMY OF DESIGN', NATIONAL. See NATIONAL ACADEMY OF DESIGN.

ACA'DIA (Fr. *Acadie*, *L'Acadie*, or *La Cadie*, from the Micmac Indian word *ākāde*, abundance). See NOVA SCOTIA.

ACA'DIAN SE'RIES. See CAMBRIAN SYSTEM.

ACAJUTLA, ä'ká-hōōt'lá. A seaport in the department of Sansonate, Republic of Salvador, Central America, situated on the Pacific Ocean, 10 miles south of Sansonate and about 1000 miles from Panama (Map: Central America, C 4). It is the second port of Salvador in importance and is the outlet for most of the coffee and sugar export trade of Santa Ana. It is the seat of a consular agent of the United States.

ACALEPHÆ, äk'ä-lē'fē (pl. of Gk. *ἀκαλήφη*, *akalēphē*, a nettle, a kind of jellyfish). A group of free-swimming, discoidal, or bell-shaped medusæ, the lobed jellyfishes, with downwardly directed mouth, gastro-vascular pouches, and numerous radial canals, and having, as a rule, the margin of the umbrella lobed; called Discophora by Huxley. See JELLYFISH.

AC'ANTHA'CEÆ (for derivation see ACANTHUS). A family of dicotyledonous plants embracing about 130 genera and 1600 species. It is found chiefly in the tropics, but also occurs in the south of Europe and the United States. The species are mostly herbs and shrubs, although a few become trees. Plants of this family frequent almost every situation, from marshes to the driest of conditions where plants are able to survive. The leaves are usually thin and entire, the flower parts in fours or fives, stamens often two, and styles two. The fruit is a two-celled capsule, upon the explosion of which the seeds are thrown out, aided by peculiar outgrowths from the base of their stalks. The chief genera are *Nelsonia*, *Thunbergia*, *Strobilanthus*, *Ruellia*, *Blepharis*, *Acanthus*, and *Justicia*.

ACANTHITE (Gk. *ἀκανθα*, *akantha*, thorn). A silver sulphide that crystallizes in the orthorhombic system. It is iron-black in color and has a metallic lustre. It occurs with argentite and stephanite at various localities

near Freiberg in Saxony and is named from the peculiar shape of its crystals.

ACAN'THOCEPH'ALA (Gk. *ἄκανθα*, *akantha*, thorn, prickle + *κεφαλή*, *kephalē*, head). A class of parasitic roundworms belonging to the phylum *Nemathelminthes* and distinguished by an elongated cylindrical body and a proboscis armed with horny hooks. The class contains three families, viz., Gigantorhynchidæ, Neorhynchidæ, and Echinorhynchidæ. (*Echinorhynchus*) *Gigantorhynchus gigas* is parasitic in the small intestine of swine, and is said to be common in man along the banks of the Volga. Other species are found in ducks, aquatic birds, fish, etc.

ACANTHOPTERYGII, *āk'an-thōp-tēr-ij'i-i* (Gk. *ἄκανθα*, *akantha*, thorn + *πτερύγιον*, *pterygion*, wing; pl., fins). One of the primary divisions of the osseous fishes (Teleostei). It includes many families, among which are largely the most specialized forms of fishes. They are characterized by the possession of spines in the anterior portion of the dorsal fin or in the first dorsal when two are present, and by the usual absence of a pneumatic duct connecting the air-bladder with the œsophagus. The ventral fins are generally thoracic, i.e., fastened to the shoulder. The acanthopterygian fishes include the perch, bass, mackerel, and similar forms.

ACAN'THUS (Lat., from Gk. *ἄκανθος*, *akanthos*, bear's breech). A genus that gives name to the family Acanthaceæ, and whose 25 or more species are found in southern Europe, tropical and subtropical Asia, Africa, and Australia. *Acanthus spinosus*, of southern Europe, is the species whose leaf is said to have suggested the ornamentation of the Corinthian column. In cultivation the acanthus is only semi-hardy and needs protection in England and in the United States north of Virginia.

In Architecture. The Greeks early applied the conventionalized *Acanthus spinosus* to decorative use, at first merely to mask the branch-

ACANTHUS.

a. *Acanthus mollis*. b. *Acanthus spinosus*. c. Greek acanthus architectural. d. Roman acanthus architectural. e. Acanthus scroll-nest or cauliculus.

ing of carved anthemion-scrolls, later to form highly decorative nests from which sprang the scrolls and anthemions on carved stele-heads (fourth century); and finally, as upright leaves with a slight outward curl, to decorate the bell of the Corinthian capital. The early examples resemble a thistle or cactus as much as a true acanthus. The Romans adopted the acanthus

and Corinthian capital, and developed both into splendid types which have influenced nearly all subsequent styles. They greatly extended the applications and varied the forms of the acanthus, which in their hands resembles rather the *Acanthus mollis* than the *Acanthus spinosus*. It is thinner, more flexible, and more elaborately detailed than the Greek type, with more strongly accented ribs, "pipes," and "eyes," and with leaflets less acutely pointed. It became in Roman hands a purely conventional type, to whose variations the names "olive," "palm," etc. have been fancifully applied. The Romans of the Empire elaborated the Corinthian capital and the combination of the acanthus with branching scrolls which the French call the *rinseau*; they applied the leaf to countless uses, including the decoration of friezes, pilasters, and moldings, fresco painting, the ornamentation of table feet, of vases, candelabra, furniture, goldsmith work, and embroideries. It naturally passed into post-classical ornament, together with the Corinthian capital, and we find it in early Christian, Byzantine, and Romanesque art. In certain parts of Italy it preserved its purity until the Renaissance—especially in central and southern Italy—and in southern and central France it was superseded only by Gothic foliage, in which its influence is, however, often traceable. It was revived by the artists of the Renaissance, treated with remarkable richness of fancy, and has ever since been one of the most prolific and acceptable of ornament motives. See COLUMN; RINCEAU.

A CAPELLA, *ä kâ-pěl'lâ* (It., in the church style). Music for voices without accompaniment, like the early Church compositions. The term is also used when the accompaniment is octaves or unison. As an indication of time it is equivalent to *alla breve* (q.v.).

A CAPRICCIO, *ä kâ-prêt'chō* (It.). At the caprice or pleasure of the performer, regarding both time and expression. A musical term.

ACAPULCO, *ä'kâ-pōōl'kō* (a corrupted abbreviation of the Latin name [*Portus*] *Acquæ Pulchræ* [Port of], beautiful water). A town on the Pacific coast, in Guerrero, Mexico, 231 miles southwest of the City of Mexico, of which it was formerly the Pacific port, on account of the excellence of its harbor (Map: Mexico, J 9). A remarkable engineering feat, the cut known as the Alera de San Nicolas, forms a passage-way through the nearby mountains. It was the chief centre of commerce with the Philippine Islands, as well as China and India, until the railroad between the City of Mexico and San Blas robbed it of most of its trade. It exports copper, fruit, and hides. Acapulco is 1437 miles from Panama. Pop., 1900, 4932; 1910, 5900.

ACARIASIS, *āk'ä-rī'ä-sīs*. See MANGE.

ACARINA, *āk'ä-rī'nä*. See MITES.

AC'ARNA'NIA (Gk. *Ἀκαρνανία*, *Akarnania*). A mountainous, wooded country of ancient Greece, separated from Epirus on the north by the Ambracian Gulf, now the Gulf of Arta, from Ætolia on the east by the river Acheloiüs, and washed south and west by the outer Corinthian Gulf and the Ionian Sea. Its oldest inhabitants were of Illyrian stock. In the seventh century B.C. the Corinthians established colonies in Acarnania, at Leucas, Anactorium, and Ambracia. Thenceforth the civilization of Acarnania was Dorian in character. In the early years of the Peloponnesian War the Acarnanians sided with Athens; later they fa-

ACANTHUS, ETC.

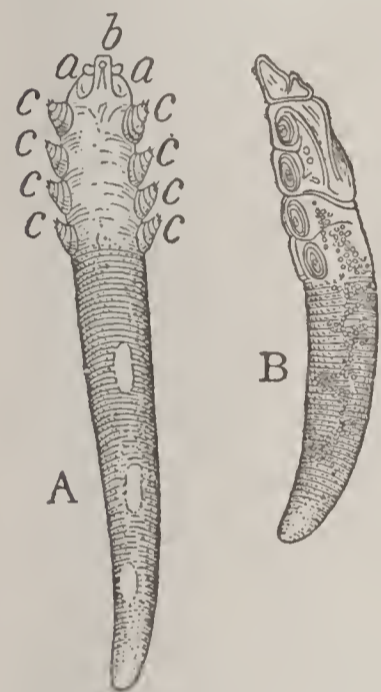

1. ACANTHUS (*Acanthus mollis*, var. *latifolius*).
 2. AFRICAN LILY (*Agapanthus umbellatus*).
 3. LOVE-LIES-BLEEDING (*Amaranthus caudatus*).
 4. ALMOND (*Prunus Persica*).

5. WORMWOOD (*Artemisia Absinthium*).
 6. ROCKY MOUNTAIN ADDER'S TONGUE (*Erythronium grandiflorum*).
 7. PHEASANT'S EYE (*Adonis autumnalis*).

vored the Macedonians. They were naturally hunters and herdsmen and long remained behind the rest of the Greeks in culture. Along with Ætolia, Acarnania now forms one of the nomes or departments of the modern kingdom of Greece, with an area of 3013 square miles and a population of 141,405 in 1907. The western part of Acarnania—from the mouth of the Achelous or Aspropotamo to Cape Actium in the northwest—is occupied by a mass of rocky and thickly wooded mountains, rising abruptly from the indented coast and culminating in the summit of Berganti. A considerable part of Acarnania is overgrown with wood—a rare feature in modern Greece. It has no town of importance, though naturally the territory is not destitute of resources. Consult Oberhammer, *Akarnanien, Ambrakia, Amphilochien, Leukas im Altertum* (Munich, 1887); Swoboda, *Zur Geschichte von Akarnanien* (Klio, Leipzig, 1910, vol. x). See the first ALCMÆON.

AC'ARUS FOLLIC'ULO'RUM, or *Demodex*, or *Steatozoön folliculorum*, the comedo mite. A microscopic parasite residing in the sebaceous glands and hair follicles of the human skin. It

(A) ACARUS FOLLICULORUM.

(B) DEMODEX MORNINIS.

was first described by Dr. Simon of Berlin in 1842. The title *Acarus folliculorum* was suggested by the zoölogist, Erichson of Berlin. According to Professor Owen, who gave it the name of *Demodex*, it represents the lowest form of the class Arachnida, and represents a transitional stage between the Annelids and the higher Articulata. They are met with in almost every person in varying numbers in the skin follicles of the nose, face, and less often in those of the back, breast, and abdomen. They vary in

length from 1/50th to 1/100th of an inch. The accompanying figure represents the magnified parasite. The head is always directed inward. The animal possesses eight rudimentary thoracic appendages (*c, c*) each terminating in three short setæ. The integument of the abdomen is finely annulated. The mouth is suctorial or probosciform, consisting of two small spine-shaped maxillæ (*b*), and an extensive labium capable of being elongated or retracted; it is provided on each side with a short, thick, maxillary palp (*a, a*), consisting of two joints with a narrow, triangular labrum above. The sexes are distinct, but the differences between the male and female are ill defined. Ova are frequently seen in the body of the female or in detached masses. Acari may be examined by collecting between two pieces of thin glass the expressed fatty matter from a follicle and moistening it with a drop of olive oil before placing under a microscope. Identical animals have been found in the skin of dogs, hogs, and cattle. They damage cowhides in some instances. No treatment is requisite since no causative relation exists between them and human skin diseases.

ACASTE, á'kást'. One of the characters in Molière's *Misanthrope* (q.v.); a self-satisfied young marquis who easily consoles himself when scorned as a suitor by Célimène.

ACASTO, á-kás'tò. In Otway's tragedy of *The Orphan* (q.v.), a nobleman retired from the court who is the guardian of Monimia, the heroine, and father of Castalio and Polydore.

ACAS'TUS (Gk. "Ακαστος, *Akastos*). A son of Pelias, King of Iolcus; one of the Argonauts and of the Calydonian hunters. He avenged the murder of his father (killed by his daughters at the instigation of Medea) by driving Jason and Medea out of Iolcus. See ARGONAUTS; JASON; MEDEA.

AC'ATHIS'TUS (Gk. *ἀ*, a priv. + καθίζειν, *kathizein*, to sit down). A hymn in honor of the Virgin, sung standing in the Greek church on Saturday of the fifth week in Lent, when the repulse of the Avars from Constantinople is celebrated.

AC'CAD (Hebrew 'Akkad'). One of the cities in the land of Shinar (q.v.), or Babylonia, mentioned in Gen. x. 10. It is identical with the city of Agade, or Akkad, the capital of Sargon (q.v.) and Naram Sin (q.v.), which was still in existence in the days of Nebuchadnezzar I (c.1130 B.C.). The modern site has not yet been found. Bereshith Rabba, Jerome, and Ephraem placed it at Nisibis. But it is more likely to have been located opposite Sippar (the modern Abu Habba). Among the titles of the kings of Babylonia and Assyria "king of the land of Shumer and Akkad" frequently occurs. It implies rule over all of Babylonia with its Sumerian and Akkadian inhabitants. The Akkadians were the earliest Semitic settlers in Babylonia. As the city of Agade, which may be the earlier Sumerian name, became their first great centre, they became known as Akkadians, and the name Akkad was extended to the northern part of Babylonia, while the south was called Sumer. Ethnically and linguistically they are distinct from the Sumerians who spoke the *lishan Sumeri*, or 'Sumerian language,' referred to in an inscription published by Bezold. It is generally supposed that they came into Babylonia from East Arabia, that they found the Sumerians already in possession of the land, and that the district they first occupied was called Akkad like the city. See Weissbach, in *Zeitschrift der deutschen Morgenl. Ges.* (1889, p. 661); C. F. Lehmann, *Shamash-shum-ukin* (1892); Louis Ginzburg in *Monatschrift für jüd. Wissenschaft* (vol. xliii, p. 468); R. W. Rogers, *History of Babylonia and Assyria* (1900); Ed. Meyer, *Geschichte des Altertums* (3d ed., I, 2, Stuttgart, 1913); King, *A History of Sumer and Akkad* (1910).

ACCA LARENTIA, äk'ä lá-rën'shī-ä, **ACCA LARENTINA**. In the story of primitive Rome, the wife of Faustulus, shepherd of Amulius, King of Alba Longa, who found the twin infants, Romulus (q.v.) and Remus, and carried them to her to be nursed and brought up. But this is a later legend. In the primitive Latin mythology Acca Larentia was the cultus-heroine of the festival Larentalia, held in honor of the spirits of the dead—perhaps of the dead of the original Rome on the Palatine—on December 23, in which the pontifices and the flamen Quirinalis took part. The name of the festival, Larentalia, points to a goddess Larenta, perhaps identical with a Sabine goddess Larunda. Beside the Romulus-

Remus tale various other stories were attached to the name of Acca Larentia; one made her the beloved of Hercules, another described her as a *lupa*, or 'prostitute,' who bequeathed her profits to the people for the establishment of *ludi*, or 'public games.' It has been thought that to a confusion of *lupa*, 'harlot,' with *lupa*, 'she-wolf,' the story that Romulus and Remus were brought up by Acca Larentia was due. See Theodor Mommsen, *Römische Forschungen* (vol. ii); G. Wissowa in Müller's *Handbuch* (vol. v); W. W. Fowler, *Roman Festivals* (1899) and the "Year's Work" in *Classical Studies* (1907).

ACCAULT, á'kô', MICHEL. A French explorer. He was a lieutenant of La Salle, at whose request he accompanied Louis Hennepin in the exploration of the upper part of the Mississippi in 1679. See HENNEPIN.

ACCELERANDO, *It. pron.* ät'châ-lâ-rän'dô. In music, with gradually increasing velocity of movement.

ACCEL'ERA'TION (from Lat. *ad*, to + *celerare*, to hasten). In theoretical mechanics, a term which denotes the rate of change of velocity at any instant with respect to the time, that is, the change of velocity in the next second of time if the rate of change is uniform; in other words, the change which would take place in the velocity in the next second if during that time the change were to continue at the same rate as at the instant considered. An example of acceleration is furnished by a body falling freely toward the earth. Its numerical value is about 981 centimeters, or 32.2 feet, per second in one second. Hence a body freely falling from a position of rest will, at the end of the first second, be moving with a velocity of 32 feet per second, at the end of the second second with a velocity of 64, at the end of the third second with a velocity of 96, and so on, provided, of course, it is falling in a vacuum, so that the presence of the air causes no retardation. In mathematical language, the acceleration is the limiting value of the ratio $\Delta v/\Delta t$, where Δv is the actual change in the velocity in the interval of time Δt seconds, as this interval is taken shorter and shorter. There are two kinds of acceleration, linear and angular, corresponding to the two kinds of motion, translation and rotation, and there are two types of each of these. See MECHANICS.

AC'CENT (Lat. *accentus*, from *ad*, to + *cantus*, singing, chant). A special stress laid upon one syllable of a word, by which it is made more prominent than the rest. In the Indo-European languages two kinds of accent are found, varying in quality—the musical, or pitch, and the expiratory, or stress. The first is found in Sanskrit and Greek (though in modern Greek it has changed to a stress accent), the second in Teutonic. In literary Latin, according to M. Vendryes (*Recherches sur l'histoire et les effets de l'intensité initiale en Latin*, Paris, 1902), there were both pitch and stress accents. The stress accent, to which is ascribed the elision of final syllables in Latin scansion, finally prevailed and became the accent of the vulgar tongue. It is thus that the loss of unaccented syllables and endings is explained in the transformation of Latin into French (Lat. *liberare* > Fr. *livrer*). In the modern Romance tongues (French, Spanish, Italian, etc.), the stress accent of vulgar Latin has changed again into a pitch accent. In the Celtic, Germanic, and

Slavic languages the accent is, and probably always has been, a stress accent, which accounts for the numerous contractions common to those tongues (Ger. *pferd*, bor. fr. Low Lat. *paraveredus*). In the modern Scandinavian languages, especially Swedish, the tendency is toward a pitch accent. The accent may also be distinguished by its position, as free in Greek and primitive Teutonic and fixed in later Teutonic. In English the general tendency is to throw the accent back. In compound words the accent is usually on the first part, as in *court-yard*, *highway*. When the first part is a prefix, it receives the accent if the word be a noun or adjective; the root is accented if the word be a verb. This rule applies also to some other words, as *pres'ent* and *pres'ent'*. Borrowed words usually adopt the English accent, as *orator*, *presence*; but some recently borrowed French words retain the original accentuation, as *parole*, *caprice*. The absence of stress on final inflectional syllables has played an important part in the leveling of inflections. (See ENGLISH LANGUAGE.) Besides word accents, there is a sentence accent, by which some word in the sentence is given greater stress than the others. This is always a free accent, the position of the accent depending upon the meaning. In the sentence, "Where is he?" three different meanings can be given by shifting the position of the accent. The effect of sentence accent is often seen in the development of doublets, or words with a common origin, but a different form and meaning, as *to—too*, *of—off*. (See PHONETIC LAWS.) Accent is also the essential principle of modern verse. (See VERSIFICATION.) For the primitive Indo-European accent and its effect in connection with conjugation, see PHILOLOGY. Consult: Rippman, *The Elements of Phonetics* (London, 1910); Hirt, *Der indogermanische Akzent* (Strassburg, 1895); De la Grasserie, *De l'accent comparé dans les diverses langues* (Paris, 1909).

In Music, the term is analogous to accent in language, the stress or emphasis given to certain notes or parts of bars in a composition. It may be of three kinds: grammatical, rhythmical, and rhetorical or æsthetic. The first always falls on the first note of a bar, long or compound measures of time having secondary accents—only slightly marked. The rhythmical accent is applied to the larger component parts of a composition, such as phrases, themes, motives, etc., and marks their entrance, climax, end. The rhetorical accent is irregular, and is marked by the composer by special signs (*sf*, <, ^) over notes which otherwise would bear no accent. In vocal music well adapted to words, the words serve as a guide to the right use of the rhetorical accent. See SYNCOPATION; RAGTIME.

ACCEN'TOR (Lat., one who sings with another, from *ad*, to + *cantor*, singer). A book name for a group of European warblers, of which the misnamed British hedge-sparrow (*Accentor*, or *Prunella modularis*) is a type; and also for the American water-thrushes, wood-warblers of the genus *Seiurus*.

ACCEPT'ANCE. The act whereby a party assumes a legal obligation tendered to him or takes title to real or personal property. Every contract involves an offer and its acceptance by the one to whom the offer is made. Every transfer of title involves a delivery of a deed, a bill of sale or a chattel, and no delivery is complete

without acceptance of the thing offered. See **CONTRACT**; **DEED**; **GIFT**.

This acceptance is sometimes implied where the delivery is made to some one else for the benefit of the grantee or donee, but the presumption of acceptance in such case may be rebutted. Thus an heir or devisee under a will is presumed to accept the inheritance or devise, but he may reject it, and his rejection nullifies the transaction and leaves him as though it had never taken place.

Specifically in the law of negotiable paper, acceptance signifies the assent of the drawee of a bill of exchange to the order drawn upon him and binds him to its payment. It is usually effected by writing the word "accepted" across the bill, with the signature of the drawee, who is then known as the "acceptor" of the instrument. An accepted bill is also commonly known as an acceptance. See **BILL OF EXCHANGE**.

ACCEPTANTS, APPELLANTS. The names given, respectively, to those among the French clergy who accepted the bull *Unigenitus* condemning Jansenism (1713), and to those who did not, but appealed to a general council to settle the controversy.

ACCEPTILATION. In the Roman law, a release of a debt made by a creditor to his debtor without receiving consideration therefor. As distinguished from the release (q.v.) of English and American law it could be made informally. See **ACCORD** and **SATISFACTION**.

ACCESS, RIGHT OF. A legal incident of the ownership of property abutting on the sea or other navigable waters or on a highway or other public lands. In addition to the general right to the use of such waters and lands, which he shares with the public at large, the adjacent owner has a right of free access which is considered a special property right, and of which, in this country, he cannot be deprived, even by the State, without due process of law and compensation. The existence of such a right as against the State was long disputed, but is now, as the result of recent decisions, firmly established. Peculiar applications of this right are to be found in the common-law rights of mooring vessels and of wharfing out in navigable waters. Its infringement has usually taken the form of a grant of the shore or of land under water for railroad or wharfing purposes, whereby the access of the riparian owner was cut off. The right is not to be confused with that of the abutting owner in a highway or private stream subject to a public use where the fee of the highway or stream is vested in such owner. See **HIGHWAY**; **RIVERS**; **RIPARIAN RIGHTS**; **WATER RIGHTS**. Consult Gould, *Treatise on the Law of Waters* (Chicago, 1900); Farnham, *Waters and Water Rights* (Rochester, 1904).

ACCESION (Lat. *ad*, to + *cedere*, to go, move). In the law of property, a mode of acquiring title to land or goods by their annexation to the real or personal property of another, whereby the thing annexed loses its separate identity. It occurs where land is gradually increased by *accretion* (q.v.) or *alluvion* (q.v.), where a tenant or stranger erects a building or attaches a fixture (q.v.) to land, and where a chattel belonging to one is improved by the addition of materials or labor of another, as in the repair of a wagon by adding a wheel or by painting it, or in the conversion of leather into shoes. The legal effect of the annexation is to

transfer the title of the thing annexed to the owner of the property so improved or increased, the identity of the former having been merged in the latter; the wheel, the paint, and the labor, in the examples given above, having disappeared as separate articles and being now inseparable parts of the wagon and the leather. The rule governing accessions is that the ownership of the principal thing carries with it that of the inferior thing. But, as the question of superiority or inferiority is not always one of price or value, the rule is sometimes difficult of application. Thus, additions and improvements to land, however extensive and valuable they may be, always accrue to the owner of the soil, and a chattel may be doubled or trebled in value by the expenditure of skill and labor without changing its ownership. But where the identity of a chattel is completely changed by the labor expended upon it, as by the conversion of malt into beer, or where it is enormously increased in value, as by the manufacture of pig iron into watch-springs, the product belongs to the person whose money and labor have effected the transformation. Of course the owner of anything which has by wrongful accession become the property of another is entitled to recover its value from the wrongdoer, whether the taking and accession were innocent or willful. See **CONFUSION**; and consult Schouler, *Treatise on the Law of Personal Property* (Boston, 1896).

ACCESSORY. At common law, a person who was not the chief actor in a crime, nor present at its performance, but was concerned in its commission, was an accessory. Treason and misdemeanors, however, did not admit of the distinction between principal and accessory, all parties to the crime being in these cases treated as principals; the former, Blackstone says, because of the heinousness of the crime, and the latter because the law does not descend to distinguish the different shades of guilt in petty offenses. An accessory before the fact is one who counsels or procures the commission of a crime, but who is neither present nor engaged in furthering the transaction when the crime is committed. An accessory after the fact is one who, knowing a felony has been committed, receives, relieves, comforts, or assists the felon. At common law an accessory before the fact could not without his consent be tried and convicted before the trial and conviction of his principal, and the acquittal of the principal operated as a bar to the trial and conviction of the accessory. The tendency of modern legislation is to convert accessories before the fact into principals, and to permit the trial and conviction of an accessory, whether the principal has been tried and convicted or not. Consult the authorities referred to under the title **CRIMINAL LAW**.

ACCHO. See **ACRE**.

ACCIDENT (Lat. *ad*, to + *cadere*, to fall, happen, occur). In the law of torts, a transaction in which one is harmed by another while the latter is acting lawfully and in the exercise of due care adapted to the exigency of the case. For example, A's and B's dogs are fighting; A beats them in order to separate them, and, as he raises his cane, unintentionally and without negligence hits B, who is standing behind him. B has no cause of action against A, as the injury was accidental. This is now the undisputed law both in England and in the United States, although formerly there was much apparent

authority in England for A's liability in such a case. See the authorities referred to under the title TORT.

In insurance law the term is defined in the more popular sense as an event happening by chance and not according to the usual course of things. See ACCIDENT INSURANCE.

In equity *accident* denotes an unforeseen event, loss, act, or omission, not the result of negligence or misbehavior in any of the parties; such as the loss of negotiable or other papers, or the accidental omission of some part of a document. In the latter case the court can require its insertion. In penalties and forfeitures, where the injury caused by omission of duty can be reasonably compensated, as in case of failure to pay rent on a given day, the court may relieve the offending party against the penalty of forfeiture. Where there has been neglect or omission through want of information or through negligence to defend a suit, the court may permit the proper steps to be taken. But as a rule, a court of equity will interfere only in favor of persons paying a consideration; so if a seal should be omitted from a conveyance made without consideration, or a clause should be left out of a will, no relief would be extended. It is also ruled that no relief will be granted against a purchaser who has acquired legal rights in good faith for a consideration of value. Consult Bispham, *Principles of Equity* (7th ed., New York, 1907). See TORT; CRIME; CONTRACT.

ACCIDENT (in insurance and philosophy). See ACCIDENT INSURANCE; PREDICABLE.

AC'CIDEN'TAL. In music, any sign outside of the regular signature calling for the chromatic alteration of any note in a composition. See FLAT; NATURAL; SHARP; MUSICAL NOTATION; KEY.

ACCIDENT INSURANCE. A form of insurance which indemnifies the insured in case of disablement or death as the result of bodily accident. Under the usual contract of accident insurance the only injuries insured against are those caused by violent, accidental, external, and visible means. It does not therefore cover cases of intentional injuries, whether self-inflicted or not, nor cases of injury or death resulting from surgical operations, where the operations were themselves rendered necessary by natural disease or weakness and not by external accident. The fact that the accident was incurred through the misconduct or negligence of the insured will not, in general, affect his rights under the policy, though some companies seek to protect themselves by stipulations that they shall not be liable in cases where the accident was due to the intoxication of the insured, or was incurred while willfully exposing himself to unnecessary danger. The number of companies that write accident insurance reporting to the New York Department of Insurance in 1911 was 45. Of these only 9 restricted themselves to accident insurance. The aggregate premiums on accident business for the year were \$20,982,099; the aggregate losses paid were \$8,876,006. Where employer's liability has been extended to cover most industrial accidents, the employer may insure his employees against accident. This is in some jurisdictions compulsory. See EMPLOYER'S LIABILITY; WORKINGMEN'S COMPENSATION; INSURANCE; ACCIDENTS, INDUSTRIAL, *Bibliography*.

ACCIDENTS, INDUSTRIAL. One of the most serious problems of modern industry, es-

pecially in the United States, arises from the wide prevalence of accidents. The railway industry has long been noted for its heavy accident rate. In the year 1912, 3625 railway employees were killed, or about 3 per thousand employed in positions exposing them to risks, and 142,442 were injured. In coal mining the fatal accident rate is even higher, $3\frac{1}{3}$ per thousand. There are no statistics for the United States as a whole giving the death rate from accident in other industries. The mortality statistics based on the census of 1910 throw some light, however, upon the problem. In the registration area, representing 56.1 per cent of the population of the United States, 22,652 males 10 years of age and over, classified by 148 groups of occupations, met death through accident; 881 females of the same age grouped in 140 occupations perished through accident. Among male deaths in the occupations studied, 1 out of 10 was accidental; of female deaths, 1 out of 30. The ratio of accidental to total deaths in the general occupations varied widely. Among teachers there was 1 death by accident to 31 by all causes; among clergymen, 1 to 30; among lawyers, 1 to 23; among salesmen, 1 to 18; in agricultural pursuits, 1 to 15.5; among carpenters, 1 to 10.8; among manufacturing laborers, 1 to 8.4; among street railway employees, 1 to 3.2; miners and quarrymen, 1 to 2.5; steam railway employees, 1 to 1.9. Over half the deaths in the last-named occupation are by accident. The ratio of deaths by accidents to total deaths was even more striking in the case of the lower age groups of railway labor. For the age group 20-24 it was 1 to 1.33; for the group 25-34 it was 1 to 1.47.

A computation of the excess of mortality in the various industries over the rate of deaths by accident in the safe trades indicates that the total number of deaths through industrial accident in the United States must be somewhat in excess of 35,000. Exact comparison with statistics of foreign countries is impossible, but it is commonly agreed that the American accident rate is far heavier than the various European rates, if number of persons engaged in an industry serves as the basis of comparison. In coal mining the American figure of $3\frac{1}{3}$ fatal accidents per thousand may be compared with the Prussian rate of 2 per thousand, the British rate of $1\frac{1}{4}$ and the Belgian rate of 1. If output serve as a basis, the comparison is not so unfavorable to the United States. There are more men killed in the United States per 100,000 tons of coal mined than in Great Britain, but not so many as in Prussia or Belgium. In consequence of wide differences in conditions, however, such comparisons are of little value, and the same thing is true of comparisons of accident rates on the railways.

Statistics of non-fatal accidents are even less complete than statistics of fatal accidents. The number of railway employees in the United States injured through accidents is very near 150,000 per annum. In round numbers, 40 are injured to 1 killed; of those injured, it is estimated that 1 out of 10 is either partly or wholly disabled for life. Similar proportions seem to obtain in industry: In New York 2.4 per cent, in Wisconsin 2.1 per cent, in Massachusetts 2.46 per cent of industrial accidents are fatal, according to F. L. Hoffman's calculations. Assuming these ratios to hold for the general industry of the United States, it appears

that industrial accidents cost annually, besides 35,000 lives, 1,400,000 injuries sufficiently severe to deserve reporting, 140,000 of which represent permanent disabilities.

That a large proportion of industrial accidents is preventable is generally recognized. All modern States have enacted statutes requiring the employer to fence dangerous machinery and to introduce other measures for the protection of employees. Such laws are enforced through factory inspection, which, however, in many American States is so inadequate that the laws are practically without effect. In the Wisconsin law creating an industrial commission, it is provided that the employer shall take reasonable precautions against risk, and it is left to the industrial commission to determine what safety devices the employer shall be required to install. It is the duty of the commission to keep itself informed as to all improvements in safety devices and to secure their adoption by employers so far as may be practicable.

The effectiveness of safety devices is conclusively established by a report published in 1913 by the Department of Labor on *Accidents and Accident Prevention in the Iron and Steel Industry*. In 155 steel plants, with 158,604 employees, which were studied, the accident rate for all the plants was, per thousand, 1.86 fatal accidents, 2.72 permanent disabilities, and 240.6 temporary disabilities. A number of the plants were grouped into three classes, according to the comprehensiveness of their systems of accident prevention. In the first class the general accident rate was 167.1 per thousand; in the second, 272.4; in the third, 507.9. The records of one of the best mills (employing about 8000 men) show a decline in the accident rate from 370 per thousand in 1900 to 109 in 1911.

The late development of safety devices in industry is explainable partly by the conservatism of employers, but chiefly by the cost. In the period 1906 to 1912 the United States Steel Corporation expended over \$4,000,000 in installing safety devices, and its annual expense for maintaining its safety system amounts to three-quarters of a million. The results of the system have been a reduction of nearly 45 per cent in fatal and disabling accidents, and a still greater reduction in less serious accidents.

A great impetus has been given to the invention and installation of safety devices by the extension of the principle of employer's liability. Where employers are forced to insure themselves against the liability for injuries to their employees, differential insurance rates place the employer with inadequate safety devices at a serious competitive disadvantage. Consult: Adams and Sumner, *Labor Problems*, with bibliography at end of chap. 12 (New York, London, 1905); Seager, *Social Insurance* (New York, 1910); L. D. Clark, *The Law of the Employment of Labor* (New York, 1911); *Report of the Commission (New York) on Employers' Liability and Other Matters* (1910); Frankel and Dawson, *Workingmen's Insurance in Europe* (New York, 1910); *American Labor Legislation Review*, vol. ii, no. i, part i; Henderson, *Industrial Insurance in the United States* (Chicago, 1909); Commons (editor) *Trade Unionism and Labor Problems* (Boston, 1905) and Tolman and Kendall, *Safety: Methods for Preventing Occupational and Other Accidents and Diseases* (New York, 1913). SATION; INSURANCE, *Employer's Liability Insurance*; RAILWAYS, *Accidents*.

ACCIPITRES (Lat. pl. of *accipiter*, the common hawk), or RAPACES, or RAPTORES. See BIRD OF PREY.

ACCIUS, äk'shī-ūs. See ATTIIUS.

ACCLAMATION (Lat. *acclamatio*, a calling to, from *ad*, to + *clamare*, to shout, call). An expression of opinion, favorable or unfavorable, by any assembly by means of the voice. Among the Romans acclamation was varied in both form and purpose. At marriages the spectators would shout "Io Hymen," "Hymenæ," or "Talassio." A victorious army or leader was greeted with "Io triumphe" or "Imperator." In the theatre approbation for the play was asked for by the actor who spoke the closing words and added "Plaudite." In the senate opinions were expressed and votes passed in such forms as "Omnes, omnes," "Æquum est," "Iustum est," etc.; and the praises of the Emperor were celebrated in certain prearranged sentences which seem to have been chanted by the whole body of senators. When a Roman died, his eyes were closed by one of those present; all then raised a cry (*acclamatio*, or, more properly, *conclamatio*): his name was called three times, perhaps to recall him to life if possible, perhaps, rather, in lamentation. Authors who recited their works in advance of publication were greeted by various cries, such as *bene*, *sophos*, *rursus*. At first the acclamation at recitations was genuine; but the modern *claque* was early introduced by rich pretenders to literary ability, who kept paid applauders not only for themselves, but lent them to their friends (indeed there had been a *claque* in the theatre as early as the second century B.C.: there was a *claque*, too, in the courts). Nero caused 5000 chosen knights and commoners at a given signal to chant his praises in the theatre; they were called "Augustani" and were conducted by a regular music-master. In the early times of the Christian Church it was not uncommon for a congregation to express its approbation of a favorite preacher during the course of his sermon, and in this manner Chrysostom was frequently interrupted. In ecclesiastical councils voting by acclamation is very common, usually with the formula "placet" or "non placet."

ACCLIMATIZATION. The adaptation of a species or race to a climate different from that to which it has previously been accustomed. Acclimatization is often confused with naturalization (q.v.), but naturalization is rather the establishment of a species in a new country, and does not necessarily imply a slow adjustment to conditions that are at first injurious, as is the case in acclimatization. Naturalization may take place without any real acclimatization, as when the new country is climatically like the old. This case is illustrated by the large number of plants which have spread eastward or westward along parallels of latitude. Again, acclimatization may occur without naturalization. This is well illustrated by the large number of plants that are hardy and yet rarely, if ever, run wild; probably the struggle for existence is so keen that such plants fail to establish themselves spontaneously. Still again, naturalization may accompany acclimatization, as in the case of plants that migrate along meridians.

The term "acclimatization" is employed by the zoölogists in a somewhat broader sense, especially when referring to the adaptation of

marine organisms to new conditions of existence. In the latter case climatic changes are relatively unimportant factors. The changes in the character of the water, as respects temperature, contained food supply, marine currents, and pressure as determined by depth, are the influential factors.

In Plants. The most obvious examples of acclimatization are found in cultivated plants. While the original stock as well as the home of most cereals is not definitely known, it is believed that most of them have come from warm, temperate, or semi-tropical countries. They have now become fully acclimatized in far northern regions; indeed, some varieties of wheat, barley, etc., flourish even better in cold, temperate districts than in their original home. The peach is believed to grow farther north now than in the days of the ancient Greeks. Evidences of acclimatization apart from man's influence are not wanting; for example, it has been shown that plants grown from seeds that mature at high altitudes are hardier than those grown from seeds that mature at low altitudes.

One of the most interesting results of acclimatization is the change of the plant periods. In Finland and northern Norway barley ripens in 89 days, while 100 days are required in southern Sweden. Varieties of corn which ripen in New York in 93 days require 105 days in Texas. Interesting but not altogether harmonious results have been obtained from deciduous plants taken from temperate into tropical evergreen regions. In most plants the leafless period is shortened, and in some cases (notoriously in the peach tree) it is eliminated altogether, the plant becoming an evergreen. Schimper has observed another change, viz., the gradual loss of rhythmic growth; trees of temperate climes becoming in this respect more and more similar to native tropical trees.

In some cases the capacity for acclimatization is incomplete, i.e., plants are unable to adjust all of their structures and functions to a new climate. This lack of adjustment is seen in some plants of warm regions which, when transported to cool regions, vegetate well but fail to ripen wood. Many plants that can perform all their vegetative functions may still be unable to mature seeds; this is true not only of plants taken into cooler climates, but also in some cases of plants transported into warmer climates. Some species occurring naturally in Spitzbergen are said never to ripen seed; since their reproduction is now wholly vegetative, their original appearance in that region probably was at a period when the climate was much warmer than at present.

Darwin and others have discussed the influence of individual variation as compared with variation through offspring on the acclimatization of a species. There can be but little doubt of the gradual adaptation of a race through the natural selection of the hardiest individuals of each generation. Darwin also believed in the power of an individual to become acclimatized. The Wyoming experiment station reports that potatoes from the same stock endure in the uplands frosts that would destroy them in the lowlands. This favors the idea of individual acclimatization. Oranges, however, propagate hardier forms by seeds than by grafts, which shows that gradual acclimatization through offspring may be more important. Northern-grown seeds are preferred by farmers, partly

because plants grown from them mature sooner than from home-grown seeds. In a few generations, however, this hereditary peculiarity is lost, and a new supply becomes necessary. It should be borne in mind that many of the above statements are based on imperfect observations, and that there is the greatest need for careful experiment in this field.

In Animals. The capacity of adapting themselves to changed environment is not possessed to the same degree by different species of one genus or by the individuals of any species. It varies with the hardihood, with the capacity for resistance, both of the individual and of the species. Just what the changes are, whether chemical or physical, that go on in the protoplasm of the body during the period of acclimatization, we do not, in many cases, know. In the acclimatization of fishes to denser media it is apparent that some solids are taken into the body, for the fishes sink when transferred again to fresh water. Some organisms possess a remarkably high degree of acclimatization. Thus, few animals can resist a temperature of over 115° F., while 105° F. is the death-point of whole groups. Yet certain organisms live in hot springs in water of much higher temperature, although they may be similar in kind to, or even identical with, those that live in cooler waters outside, and probably were acclimated to the high temperature by slow degrees as they made their way up the outlets into the springs. We know from experimentation that organisms can resist an amount of heat, of density, or of poison when accustomed to it by slow degrees, that would have been fatal had they been subjected to it suddenly. We owe the fact that certain domestic animals, such as the horse, cattle, dog, cat, fowls, rats, and mice, have spread with mankind over nearly all the world to the great capacity for acclimatization of these forms, most of which have originated in warm climates. Likewise the ubiquity of such food-plants as the potato and cereals, as well as certain weeds, is due to their great capacity of adaptation; for those plants and animals that have a limited amount of adaptation have likewise a limited range of distribution. The quality and the strength of some animals seem actually to improve in a new climate. Thus the merino sheep imported into Silesia and Pomerania from Spain seem to be superior in those lands to their Spanish ancestors, while the fleece of the Syrian sheep becomes finer in Spain; but in such cases it is difficult to say just how much is due to climate and how much to the breeder's skill and care. Many of our domestic animals have been so long in the countries in which we now find them that we can never hope to know anything about the history of their importations; but the silkworm is comparatively so late an importation into Europe that we can follow its progress. It was brought from China first into Italy, and now it is acclimated not only to southern France but even to the coast of the Baltic Sea, and it is able to live in some parts of the United States.

Of late years numerous acclimatization societies have been formed (the best known of which is the Société d'Acclimatation of Paris), having as their object the transference of seemingly desirable animals from their native lands to other parts of the world where they may thrive to human advantage. This has been found feasible in many instances, so far as the

ability to become acclimated is concerned, but in many cases the expected benefits have turned to evils through overmultiplication or other means of becoming a local pest, and such experiments are now rarely attempted. The introduction of salmonoid fishes from the Pacific to the Atlantic side of the United States, and from Europe to New Zealand, of bumble-bees into New Zealand, and of several insects, such as ladybirds, as enemies of agricultural pests, are instances of the more beneficial sort. The European house-sparrow in North America, the mungoos and agua-toad in the West Indies, the rabbit in Australia, and a great host of more or less accidentally introduced insects destructive of plants, etc., are cases of an opposite character. For particulars in respect to these, see accounts of the respective animals.

In People. This treats of the ability of men to maintain themselves in a country with radically different climatic conditions from those from which they migrate. At present the inevitable tendency of European and American peoples to spread over the major part of the earth gives the question many practical bearings. Can a race and a civilization from the temperate zone be transplanted to the tropics? The question is a double one: (1) Can individuals from the temperate zone live in the tropics for a few years and maintain their health and vigor? (2) can they work at their usual occupations, maintain their customary vigor, energy, and ability, rear families and propagate their kind for several generations? On the first point most authorities agree in the affirmative, provided reasonable provision for sanitation is made, and temperance and thrift prevail among such emigrants. On the second point authorities differ, with the balance in the negative. Races differ in their ability to adjust themselves to new climatic conditions. The individual or the race may not succumb at once when transferred to a very different climate, and yet the acclimatization may be only partial. Certain organs only of the body may be affected by the changes, so that "diseases of acclimatization" may be induced. Thus Europeans are liable in tropical countries to suffer from diseases of the liver, while natives of the tropics are subjected to pulmonary troubles in temperate zones. The African in the United States has a high death rate from lung affections. On the other hand, loss of hardihood induced by climate may express itself mainly in deterioration in size, as is the case with the Shetland pony. So far as the human races are concerned there seems to be a direct ratio between intelligence and capacity for acclimatization. The Anglo-German race is able to endure climatic changes with less loss of vigor than any other European race, and for this reason has been able to surpass all the others as colonizers. High moral qualities are needed. Home-sickness is a frequent cause of failure. Temperance and thrift are excellent qualities for success, as evidenced in the history of Jewish and Chinese emigration. Mankind is tolerant of great extremes of climate, -97° F. to 154° F. being the greatest extremes recorded as having been endured by human beings, though no such range of variation has ever been endured by one people or in any one place. Not only temperature but also meteorological conditions have an effect, and moisture is, next to temperature, the most important element.

Bibliography. The best general treatment of acclimatization may be found in Semple, *Influences of Geographic Environment* (New York, 1911); J. Hann, *Handbuch der Klimatologie* (Stuttgart, 1897); Darwin, *The Variations of Animals and Plants under Domestication*, revised ed. (London, 1875); Pavillard, *Eléments de biologie végétale* (Paris, 1901); Schimper, *Pflanzengeographie auf physiologischer Grundlage* (Jena, 1898); Hollick, "Relation between Forestry and Geology in New Jersey," *Geological Survey of New Jersey, Annual Report* (Trenton, 1899); Wallace, *Island Life* (London, 1880); Heilprin, *The Geographical and Geological Distribution of Animals* (New York, 1887); Wallace, *The Geographical Distribution of Animals* (2 vols., London, 1896). A popular treatment of acclimatization of peoples is given in Ripley, *Racial Geography of Europe* (Boston, 1899), in which book there are also excellent bibliographical references; also A. Ireland, *Tropical Colonization* (New York, 1899); Peschel, *The Races of Man and their Geographical Distribution* (London, 1878); Ward, *Climate Considered Especially in Relation to Man* (New York, 1908); and Heilpach, *Die geopsychischen Erscheinungen Wetter, Klima und Landschaft in ihrem Einfluss auf das Seelenleben dargestellt* (Leipzig, 1911).

ACCO, or ACCHO, äk'kō. See **ACRE**.

ACCOLADE, äk'kō-lād' (Fr. an embrace, kiss, from Lat. *ad*, to + *collum*, neck). A part of the ceremonies of conferring knighthood in the Middle Ages. The sovereign or other superior embraced the aspirant around the neck (*ad collum*). The term is sometimes applied to the later ceremony of giving a slight blow on the shoulder with the flat of the sword.

AC'COLON. In Sir Thomas Malory's *Morte d'Arthur*, a knight of Gaul, who obtained possession of King Arthur's sword Excalibur through the treachery of Morgan le Fay. He died after his fight with the King (book iv), which had led to the discovery of the trick and the recovery of the sword.

ACCOLTI, äk-kōl'té, **BENEDETTO** (1415-66), called the Elder. An Italian jurist. He was born at Arezzo, Italy, and died at Florence. At first a professor of law at Florence, he afterward became chancellor of the Republic, and occupied this position until his death. He was gifted with a marvelous memory, and is said on one occasion to have repeated word for word a Latin discourse which the Hungarian Ambassador had addressed to the magistracy of Florence. His historical attainments were considered inferior to his knowledge of law. Accolti's principal publications are *De Bello a Christianis contra Barbaros Gesto pro Christi Sepulchro et Iudaea Recuperandis Libri Quatuor* (Venice, 1572; Florence, 1623, with a commentary by Scoto), which furnished the material for Tasso's *Jerusalem Delivered*; and *Præstantia Virorum sui Ævi* (first published at Parma in 1689 and frequently reprinted). Consult Potthast, *Bibliotheca Historica Medii Ævi*, vol. i (Berlin, 1896).

ACCOLTI, BERNARDO (1465-1536). An Italian poet, a son of Benedetto Accolti (q.v.). He was born at Arezzo and is said to have enjoyed so much popularity as a poet that the shops were closed and multitudes (composed of the most learned statesmen and divines, as well as of the unlettered masses) flocked to hear him recite his verses. But although styled by his

contemporaries "The Unique," such portions of his works as have come down to us scarcely justify so high an estimate of his ability, although as an improvisator he may have excelled. His poems were first published at Florence in 1513 under the title: *Virginia, commedia, capitoli, e strambotti di Messer Bernardo Accolti Arcino*. They were republished at Venice in 1519 and have since been frequently reprinted.

ACCOMMODATION (Lat. *ad*, to + *modus*, fit, suitable). The power of altering the focus of the eye so that rays coming from an object nearer than 20 feet are brought together on the retina. This is brought about by changes in the convexity of the crystalline lens (q.v.). The latter possesses a degree of elasticity which tends to make it assume a spherical form. The lens being suspended by a ligament extending around its periphery, the ciliary muscle is so attached that when it contracts it causes a relaxation of the suspensory ligament. This diminishes the tension upon the latter and allows the lens to become more spherical, chiefly on its anterior surface. At the same time the pupil contracts, and the visual lines of the two eyes converge. The *range of accommodation* is the distance between the "far point" (*punctum remotum*) or the farthest point of distinct vision and the "near point" (*punctum proximum*), or nearest point at which the eye can distinctly see objects. As age increases, the power of accommodation gradually diminishes and the near point recedes. At 10 years the mean or average range of accommodation is 14.2 inches; at 20, it is 11.6 inches; at 30, 8.6 inches; and after 45 it diminishes rapidly (the onset of *presbyopia*) until at 70 its range is only 1.1 inch. At 75, accommodation is practically lost.

Paralysis of Accommodation may accompany diphtheria, syphilis, gout, brain tumor, locomotor ataxia, and poisoning from alcohol or tobacco. Complete and permanent loss of accommodation occurs after the removal of the crystalline lens for cataract. **Spasm of accommodation** follows excessive use of the eyes, particularly far-sighted or astigmatic eyes, for near work. See VISION.

ACCOMMODATION (IN THEOLOGY). 1. The adaptation of Scripture texts to other than their original meanings. 2. The theory that Jesus Christ, while possessing complete knowledge, did not correct the errors of his time, e.g., belief in demon possession, and so *accommodated* himself to the limitations of his contemporaries in scientific and historical knowledge.

ACCOMMODATION BILL OR NOTE. A draft, bill of exchange or promissory note, one or more of the parties to which has signed it without receiving value therefor, and for the purpose of lending his credit to some other party thereto. Such a bill is a valid, negotiable instrument, and the accommodation party, whether known to be such or not, is liable thereon to a holder for value. But, as between himself and the party accommodated, he is only a surety, and is, as such, exonerated by the giving of time to the principal debtor without his assent. See PRINCIPAL AND SURETY; BILL OF EXCHANGE; NEGOTIABLE INSTRUMENTS, and the authorities therein referred to.

ACCOM'PANIMENT. The additional instrumental part which, in music written for a solo voice or instrument, gives harmonic and rhythmic support to the solo part or melody; as the pianoforte part in a song, the orchestral

part in a concerto, etc. An *ad libitum* accompaniment is one that is not a part of the structure of the composition, and may therefore be performed or omitted at pleasure. An *obligato* accompaniment, on the contrary, forms an integral part of the music and is indispensable. In the scores of the old masters, especially those of Handel and Bach, the accompaniments were not written out in full. A single bass part was given, and the accompanying harmonies were indicated by figures over the notes. This species of musical shorthand became known as figured or thorough bass, and also *basso continuo*. (See FIGURED BASS.) The accompanist at the organ or harpsichord translated these figures at sight into their equivalent harmonies, and with them improvised, with runs, trills, and various ornaments, the sort of accompaniment that the music needed. The musicians of the time became very expert at this difficult accomplishment, both Handel and Bach being renowned for their wonderful polyphonic accompaniments. Many of these old scores have been worked out by skilled musicians, who have filled out the missing parts and arranged the accompaniment for the modern orchestra. Among the scores to which "additional accompaniments" have been written are those of Handel's *Messiah*, by Mozart; *Israel in Egypt*, by Mendelssohn; and the great edition of Bach's works, by Franz. Beginning with Schumann, the accompaniment of songs has steadily become more elaborate and expressive, until in the songs of Richard Strauss and Hugo Wolf the instrumentalist is now the real interpreter, since the most important themes are frequently allotted to the piano. The relation is very much the same as that between conductor and singer in Wagner's music-drama. Consult Apthorp, *Musicians and Music Lovers* (New York, 1894).

ACCOM'PLICE (through confusion with *accomplish*, for earlier *complice*, companion, especially in crime, from Lat. *complex*, closely connected, confederate). One whose participation in a crime renders him liable to punishment, either as a principal or as an accessory. Hence a person who acts only the part of a detective is not an accomplice, although he may pretend to be the criminal's confederate, for his act, not being done with criminal intent, is not punishable. The term is most frequently used in cases where one of several criminals has turned state's evidence. As his testimony against his fellows is apt to be given in the hope of securing immunity for himself, the court usually charges the jury that it is open to suspicion, and many modern statutes declare that a conviction cannot be had upon the testimony of an accomplice, unless he be corroborated by such other evidence as tends to connect the defendant with the commission of the crime. Consult the authorities mentioned under the title CRIMINAL LAW.

ACCORAMBONI, ak'kō-rām-bō'nē, VITTORIA (?-1585). An Italian woman remarkable for her beauty and her tragic history. She was sought in marriage by Paolo Giordano Orsini, Duke of Bracciano, who was supposed to have murdered his wife, Isabella de' Medici, but her father gave her to Francesco Peretti, nephew of Cardinal Montalto, afterward Pope Sixtus V. The husband was assassinated in 1581, and the widow fled from her father-in-law's house to that of the Duke of Bracciano, the supposed murderer. Pope Gregory XIII opposed her marriage to the Duke so far as to keep her a prisoner in

the castle of Sant' Angelo nearly a year, but that did not prevent their union. Not long afterward the Duke died, leaving nearly the whole of his fortune to the widow. This so incensed Ludovico Orsini, a relative, that he caused the widow to be murdered in her home in Padua, Dec. 22, 1585. Her history has been made the subject of novels and plays, among others, of Webster's tragedy, *The White Devil*. Consult Gnoli, *Vittoria Accoramboni* (Florence, 1870).

ACCORD' AND SATISFAC'TION. In the law of contracts, a mutual agreement entered into by the parties to a contract by which one party agrees to discharge the other from his obligation under the contract, in return for the other party's promise to do or give something. The satisfaction is the performance of the promise to do or give something. At common law it was early held that an accord with satisfaction was a good defense to an action founded upon simple contract, but that a mutual agreement to discharge a pre-existing contract, being mere promise given for promise, was an accord only and not a valid defense at law. This was either because mutual promises, not being good consideration for each other, were not regarded as binding, or because the law would not enforce an agreement which merely substituted one cause of action for another, or for both reasons. The first, owing to the changed conception of consideration, has ceased to exist, and the second is now generally disregarded, most jurisdictions holding that a mere accord without satisfaction is a valid discharge of a simple contract, though the decided cases are not altogether harmonious on this point. Agreements never to sue on the earlier contract were regarded as a good accord or accord and satisfaction and a valid defense, but agreements not to sue for a limited time were not admitted as a defense at common law; but equity might enforce them by enjoining action on the earlier contract. In the case of contracts under seal, before breach, accord, and accord and satisfaction were not admitted as valid defenses at common law, but after breach of the obligation under seal, it was regarded as a mere right of action for damages, of no higher nature than a simple contract and subject to the same defenses. Equity under proper conditions would enforce the accord even when entered into before breach of the contract under seal by enjoining all action upon the latter; and in most jurisdictions where equitable defenses may be pleaded at law, accord or accord and satisfaction may now be set up as a defense to an action on the instrument under seal. An accord must always be an agreement founded on good consideration. Thus, a mere agreement founded upon a promise to do or give something which the promisee was already bound to do (for example, an agreement to pay a lesser sum in lieu of a debt for a greater) is not valid as an accord. An apparent exception to this rule exists in cases where the precise amount or character of the obligation under the earlier contract was uncertain, in which case an accord by way of a compromise agreement is regarded as made upon valid consideration. A real exception to the rule was allowed in case of compromise agreements in which a debtor agreed to pay a smaller sum in lieu of a greater to his creditors in return for their promise to release him from his debts to them. In a num-

ber of the States, notably New York, a written receipt given by the creditor to a debtor without consideration and with intent to release the debts is allowed to be a valid discharge of the debts. This is anomalous. See the authorities referred to under CONTRACT.

ACCOR'DION (Fr. *accorder*, to accord, be in harmony). A musical instrument which produces its tones by the vibration of metallic tongues of various sizes, while wind is supplied by the action of a hand bellows. Two sets of tongues make it possible to produce the same tones either by pressing or pulling the bellows. It was invented by Damian of Vienna in 1829. See CONCERTINA.

ACCORSO, ak-kôr'sò, MARIANGELO (c.1490-1544). Italian critic, born at Aquila, in the kingdom of Naples. He is perhaps better known by his Latin name Accursius. Charles V, at whose court he lived for 33 years, employed him on various foreign missions. In his extensive travels he discovered and collated important manuscripts. He published *Diatribæ in Ausonium, Solinum, et Ovidium*, and brought out the first edition of the *Variæ Epistolæ* of Cassiodorus (q.v.). He edited also, better and more fully than had been done before, Ammianus Marcellinus. See Sandys, *A History of Classical Scholarship*, vol. i (Cambridge, 1911).

ACCOUNT' (Lat. *ad*, to + *computare*, to sum up, reckon, compute). In its broadest sense, a catalogue of items, debit or credit, arising out of contracts, as in the case of merchants; or out of a fiduciary relation, as in the case of principal and agent; or from a duty imposed by law, as in the case of an administrator or public officer. A mutual account is one containing reciprocal demands or charges against the parties; as the account between two merchants, or between a merchant and a customer, each of whom has sold goods to the other. Before an account is rendered or adjusted, it is spoken of as "open" or "current." A *stated account* is one which has been accepted as correct by the party against whom it states a balance. The debtor's assent to the correctness of the account as stated may be implied from his retention of an account rendered without an objection to it within a reasonable time. The acceptance of an account stated, or, to use the ordinary legal phrase, the stating of an account, is said to be in the nature of a new promise; and the creditor suing upon such an account need not set forth the subject matter of the original debt. Originally an account stated was confined to transactions between merchants; but in England and in most of our jurisdictions its scope has been extended to accounts between all creditors and debtors. In some States, however, stating an account between others than merchants does not create a new cause of action, but is available to the creditor only as an admission by the debtor. Even after an account has been stated it may be corrected for fraud or mutual mistake.

The action of account at common law has fallen into disuse, partly because it was difficult, dilatory, and expensive, but chiefly because a court of equity possessed more extended authority and better machinery in cases involving an account. Equity will entertain an action for an accounting where a fiduciary relation exists between the parties, such as that of principal and agent (q.v.), trustee and *cestui que trust*, guardian (q.v.) and ward; or where there

is a mutual account between plaintiff and defendant; or where there are circumstances of complication, as in partnership (q.v.) accounts. So an accounting may be had as incidental to the exercise of other equity jurisdiction, as in mortgage foreclosures.

ACCOUNTING. In consequence of the increasing magnitude of business operations, both private and public, accounting, or the art of exhibiting such operations in their true financial significance, has undergone a notable development in the last half-century. In the small individual or partnership enterprise, especially in the field of commerce, the accounting function is represented by book-keeping (q.v.); and the modern art or science of accounting is sometimes described as merely a broad application of the principles of book-keeping. Book-keeping, however, is a mechanical function, requiring only accuracy and observance of the rules of a clearly defined system. Accounting, while employing book-keeping methods, is concerned, above all, with problems of classification of uncertain items and with problems of valuation. The accountant is expected to command a wide knowledge of business in general, as well as special knowledge of the particular field of business in which his services are employed. Accounting and book-keeping have become differentiated, in practice, as profession and trade. The profession of accounting is comparatively new, but it has already developed an extensive literature, a specialized form of training, and a vigorous professional organization.

The profession of accounting, as more or less distinct from book-keeping, was given its first impetus by the extension of joint stock or corporate enterprise. To protect the interests of the various classes of security holders, as well as those of new investors, it was necessary to make public from time to time statements showing the true condition of each important enterprise. In the case of trading companies this is a comparatively simple matter, assuming absence of fraud, since the assets of such companies consist chiefly in cash, bills and accounts and mercantile stocks that may properly be entered at cost price, and since the liabilities consist of items readily reducible to money terms. The problem is far more difficult in the case of companies engaged in manufacture, mining, and transportation. In these fields a relatively large part of the assets of the company consists in lands, buildings, machinery, etc., which are subject to depreciation or appreciation. The true net profit of the company is determined only after allowance has been made for changes in valuation.

In Germany, Austria, France, Switzerland, and Belgium all corporations are required by law to set apart a special account to cover depreciation of plant or to deduct an amount representing depreciation from the book value of the depreciating asset. In England and the United States there are no legal regulations requiring this, but the rule is observed by many corporations and is imposed by law upon certain classes of public service corporations. The observance of the rule is gradually extending through the influence exerted by professional accountants.

It is a general rule of accounting that the land used in a business shall be kept on the books at its original cost price, since increase or decrease in its selling price can be of no interest

to the company as a going concern. Buildings and machinery inevitably deteriorate or become obsolete; but the rate of depreciation differs widely in different enterprises, and can in no case be determined accurately. Accordingly even the best accounting practice is more or less arbitrary in its disposition of such value changes. The rule is to overestimate rather than underestimate depreciation. Changes in value of stocks of finished goods or materials in store or in process of manufacture are commonly ignored, if in the direction of appreciation; but allowance is made for them if they represent depreciation. This is the rule followed in the main by the German law; Austrian law requires both appreciation and depreciation to be taken into account. Securities held for investment are commonly kept on the books at their original cost, unless market quotations indicate depreciation, in which case the market price is substituted. This also is the rule of German law, while Austrian law requires the book values to follow the market value in case of either appreciation or depreciation. As the foregoing instances indicate, it is a general principle of accounting, both in America and England, where it is free from legal regulation, and in Germany, where it is strictly regulated by law, to err, if at all, on the conservative side.

A closely related problem of accounting is the treatment of good-will. A successful business enterprise develops a clientèle which enables it to dispose of its goods at better prices or with lower selling expenses than can its competitors. Such a standing with its customers is a valuable asset and upon the winding up of the company would command a price. It is the best accounting practice, however, to make no allowance, or merely a nominal allowance, for good-will, except in cases where it has been acquired at a definite outlay. In such cases good-will is entered at cost. Accounting practice in this respect is explained by the fact that good-will, as an asset, is more or less evanescent, and its inclusion in the capital account opens the way to excessive inflation.

The replacement of buildings, machinery, etc., that have become worn out or obsolete presents no serious accounting problem when the new buildings or machinery are essentially of the same cost and technical efficiency as the old. Such replacement, in a properly constructed system of accounts, is treated as a revenue expense. When old plant is replaced by plant of a superior order and at an advance in expense, the problem arises whether the expense should be charged to revenue or should be met out of the capital account. This problem has assumed serious proportions in American railway accounting. It has been the practice of some roads to charge to revenue not merely improved rolling stock and betterments in track, such as reduction in grades and substitution of iron for wooden bridges, but also extension of main line and construction of branches. The practice has been defended on the ground that under conditions of railway competition the railroad which does not steadily improve its equipment will lose business; hence a normal degree of improvement must be regarded as a current expense, essential to the protection of the current revenue. This view is not, however, accepted by the Interstate Commerce Commission, which is authorized by the law of 1906 to prescribe a uniform set of accounts for rail-

ways engaged in interstate commerce. In the view of the Commission, all improvements that increase the value of the plant should be charged to capital.

In the case of ordinary business enterprises the chief public function of accounting is to aid creditors in determining the probable value of its securities. In the case of public service corporations accounting assumes an additional function. Where the public authority regulates the charges of such corporations, it is of the utmost importance to determine the actual magnitude of the capital upon which interest and dividends may be paid. It is equally important to determine the true net profits, since the relation between capital and profits indicates whether charges fixed by the corporation are excessive, or whether charges fixed by the public authority are confiscatory. In this field there is a strong tendency in American state legislation to regulate narrowly the form of accounts, to prescribe rules for allowances for depreciation and for the disposition of betterment and extension charges.

The accounts of States, municipalities, and counties in the United States are as yet almost universally in a primitive condition. Account is kept of revenue and appropriations, but as a rule only with a view to checking peculation. There is no uniformity among the several States and cities in the classification of either revenues or expenditures; the same State or city is likely to make frequent changes in its system of accounts. As a result comparative study of costs with a view to throwing light upon the problem of administrative efficiency is almost impossible. In consequence of the growing public interest in municipal affairs a number of cities, among them New York, have recently introduced scientific systems of accounting.

Cost Accounting. Since 1885 the principles of accounting have found increasing application to the control of production. The manufacturer of an earlier period reckoned his profits or losses upon an enterprise as a whole; whether particular operations were profitable or not seemed to admit of no exact determination. This still remains true in a wide field of industry. Recent studies in agricultural economics have shown that on many farms which are on the whole profitable, certain crops or certain classes of live stock are produced at a loss. It is the object of cost accounting to assign to each article produced or to each operation performed its proper share in the costs of the enterprise as a whole, in order to direct the labor and capital of the enterprise to the most productive channels. In some fields, as in agriculture, the problem presents no serious difficulties, as the value of the labor, materials, and use of land make up practically the whole cost and are determinable with fair accuracy. In the case of a factory or machine shop general costs, such as charges for power, light, depreciation, expenses of supervision and management, are not strictly assignable to the several units of product. In practice cost accountants distribute such charges according to somewhat arbitrary bases, such as the amount of wages paid on the several pieces of work, the number of hours of labor required by it, the cost of labor together with the cost of material entering into the product, etc. One authority on cost accounting assigns to each unit of product not only the estimated labor and material charges it occa-

sions, but also a machine charge, representing the interest and depreciation on the machine used, power required by the machine when in operation, lighting, rent and taxes on the building assigned to each machine in proportion to floor space occupied. Some general charges remain unassigned, but these make an inconsiderable addition to unit costs. The system is in practice extremely cumbersome, and, in spite of its appearance of accuracy, is hardly less arbitrary than the simpler systems. No scheme of cost accounting succeeds in determining exactly what margin of profit a given price represents. It does, however, frequently indicate what one among several lines of production is the more profitable. Comparison of cost accounts through a period of time often serves to detect wastes that would otherwise have remained unnoticed. In the case of a corporation controlling several factories producing the same commodity, comparative cost accounts serve as an effective check upon careless or wasteful management, or indicate when it would be profitable to dismantle one factory and concentrate business in another. Cost accounting has been widely advocated as a principle of control in business undertaken directly by the public authorities, such as street cleaning and garbage disposal, as a means of indicating changes in administrative efficiency.

AC'CRA. See AKKRA.

ACCRETION (Lat. *accretio*, an increase, from *ad*, to + *crecere*, to grow). In law, the gradual extension of the boundaries of land at the expense of the sea, or of a neighboring owner, by the imperceptible action of natural forces, as by the recession of the ocean, the deposit of silt and earth by a stream, the drying up of a pond, etc. The word is sometimes, though improperly, used to include the various kinds of accession (q.v.) and as the equivalent of that term; but it is in its legal sense properly applicable only to that form of accession in which land is added to other land by the process above described. Where the land so gained is washed up by the sea, or deposited by a running stream, or left bare by the gradual drying up or retirement of the water boundary, it is known as alluvion (q.v.). As above indicated, the process must, in order to result in an accretion, be so slow as to be imperceptible in its progress. If sudden, no change of ownership results, the land so exposed remaining the property of the sovereign or of the neighboring pro-

prietor affected thereby. Thus a boundary stream may, by changing its course gradually, little by little transfer the ownership of the land on one side to the opposite proprietor, whereas a sudden change of course would not affect the boundaries of the two parcels of land in the slightest degree. Consult: Gould, *Treatise on the Law of Waters* (Chicago, 1900); Angell, *Treatise on the Law of Watercourses* (Boston, 1877).

AC'CRINGTON. A manufacturing town in Lancashire, England, situated in a deep valley, surrounded by hills, 23 miles by rail north of Manchester and 5 miles east of Blackburn, on the banks of the Hindburn (Map: England, D 3). Among its notable buildings are Christ Church, a fine Gothic edifice, erected in 1838, and the town hall, a handsome building in the Italian style. The town was incorporated in 1878. The inhabitants are mostly employed in cotton factories, dye-works, chemical works, weaving, and calico-printing. Accrington is considered the centre of the cotton-printing industry. There are coal mines in the neighborhood, in which many of the people find employment. Accrington is advantageously situated in regard to communications, being a station on the Lancashire and Yorkshire Railway. To this last it owes much of its growth, which has been very rapid. With a population of less than 9000 in 1841, it rose to 38,603 in 1891, and in 1901 to 43,122. The 1911 census returned 45,031.

AC'CUBA'TION (Lat. *ad*, to + *cubare*, to lie down). The reclining posture of the Greeks and the Romans at table. Among the Greeks a low table was placed beside each couch; on each couch usually two persons reclined, resting on the left arm, which was supported by cushions. Among the Romans three couches were placed about a table, so as to form three sides of a square, and three persons reclined on each couch. The middle couch was the most honorable. In later times, especially under the Empire, round tables were used, and the couches were arranged in crescent form, and were then known as *sigma* (one form of the Greek letter sigma was **C**). Respectable women, however, did not recline at table until the time of the Roman Empire.

ACCUM, äk'kum, FRIEDRICH (1769-1838). A German chemist. He was born in Westphalia, went to London in 1793, and became professor of chemistry there in 1802. He was known chiefly on account of his work, *A Practical Treatise on Gaslight* (1815), which had the effect of introducing the illuminant in England. The book was translated into several languages. In 1822 he became professor in a technical institute in Berlin. He is also author of *Chemical Amusement* (1818) and *Culinary Chemistry* (1821).

ACCU'MULA'TIONS (Lat. *ad*, to + *cumulare*, to pile, heap). In law, the accumulated interest and income of property held in trust upon a trust created for the purpose of effecting such accumulation for the benefit of the *cestui que trust* (q.v.). The law relating to accumulation is closely related to the rule against perpetuities (q.v.) as now defined by modern statute. It was the common law rule that any disposition of real estate which postponed a vesting of any interest in the estate for longer than a life or lives in being and 21 years additional thereafter was absolutely void. This rule was deemed to be violated by the creation of a trust for accumulation for any greater period.

This continued to be a rule of decision until the passage by the English Parliament of the so-called Thellusson Act. (See *Thellusson v. Woodford*, 4 Ver. p. 227.) This act placed several limitations on the common law rule as to accumulation. The rule relating to accumulation is now regulated wholly by statute in most jurisdictions, and generally the power to create trusts for accumulation is limited to the creation of a trust for the life of the grantor only or for 21 years or during the minority of the beneficiary. See the authorities referred to under TRUST and PERPETUITY.

ACCU'MULA'TORS. Apparatus for equalizing pressure or for the storage and accumulation of energy for intermittent use. The storage battery and the Leyden jar and all forms of condensers in coil or other shapes are electrical accumulators. (See STORAGE BATTERY; CONDENSER.) Hydraulic accumulators are extensively used in connection with hydraulic machinery for operating cranes, punching and riveting machines, presses, etc. As water is practically incompressible, no volume of it can be drawn from a pressure system for the use of any machine without an instant fall of the pressure, unless an equal volume is supplied from somewhere else in the system. The simplest way of storing up water for pressure purposes is to erect a tank at a sufficient height to give the required pressure by the weight or head of the water column alone. This arrangement is generally adopted for hydraulic elevators in warehouses and lofty buildings. (See ELEVATORS.) Where very high pressures are required, however, it becomes impracticable to adopt a tank or water tower, since the elevation required to give the necessary pressure would be impracticable; to obtain 700 pounds pressure, for instance, requires a tank 1610 feet high. Hence a pump capable of giving the required pressure and of maintaining it is required; but its capacity would have to be that of the maximum demand for water. This would keep it idle when the machines were not at work, and to secure economy in such cases accumulators are employed. They generally assume the form of a vertical cylinder resting on a firm base and having a plunger working through a stuffing-box at the top. This plunger has at its upper end a yoke which carries by means of suspension rods a heavy weight of cast iron or other heavy material. The power pump forces water into the cylinder at a pressure a little above that desired in the system, which is therefore sufficient to lift the weighted plunger to the top of the cylinder, but as the cylinder fills, the power is gradually shut off from the pump, until the pressure of water just balances and supports the weighted plunger on its top. As water is drawn off from the cylinder to supply the crane, press, riveter, or other machinery, the weighted plunger descends, always keeping a pressure on the top of the water column equal to the pressure per square inch required to balance the combined weight of the plunger and its load and supplying a mass of water greater than the capacity of the pump in the time consumed in the descent of the plunger. As soon as the plunger descends the pump resumes work and raises it again. By this combination of operations the water pressure is always kept constant for supplying the hydraulic machinery. Sometimes steam or air pressure acting on the outer end of the plunger is substituted for the more common suspended

weights, and if more convenient such plungers may be then arranged to work horizontally. Hydraulic accumulators are built to give pressures ranging from five pounds to ten tons per square inch. Consult: Lyndon, *Storage Battery Engineering* (New York, 1911); and Morse, *Storage Batteries: The Chemistry and Physics of the Lead Accumulators* (New York, 1912).

ACCURSIUS, a-kūr'shī-ūs. See ACCORSO.

AC'CUSA'TION. A legal term which signifies either the act of charging one with a crime or the charge itself. When the charge is made outside of a judicial proceeding, it may subject the accuser to an action for defamation (q.v.), while if made in the course of a judicial proceeding it is generally not actionable. A threat or a conspiracy to accuse another of a crime is an indictable offense. See BLACKMAIL; EXTORTION; MALICIOUS PROSECUTION.

ACCU'SATIVE CASE. See DECLENSION.

ACELDAMA, ā-sēl'dā-mā, or **AKELDAMA**, ā-kēl'dā-mā (R. V.). According to Acts i. 19, "the field of blood." The evidence of the manuscripts is decidedly in favor of the form *Akeldamach* in the Greek text. This may indeed represent Akeldama in Aramaic, as *Seirach* (Seirach) represents Sira. But it has been suggested by August Klostermann (*Probleme im Aposteltexte*, pp. 1-8) that the second element, *damach*, is the Aramaic word "to sleep," so that the real meaning of the term is "field of sleep." The same word is used, in the Syriac version of Dan. xii. 2, of those who sleep in the dust, i.e., the dead. Such a name would have been appropriate for a field which, according to Matt. xxvii. 8, was bought by the priests of Jerusalem for a cemetery in which to bury strangers, with 30 pieces of silver which Judas Iscariot received as a reward for betraying Jesus, but which in the hour of his repentance he returned to the priests. In Acts i. 18 f. we are told that Judas obtained this field with the reward of his iniquity and, falling headlong, he burst asunder in the midst. Different traditions seem to have developed in Aramaic-speaking Christian circles, attaching themselves to Zech. xi. 13 and the existence of this cemetery in the potter's field. The designation of Aceldama as a "potter's field" in both of the passages of the New Testament referred to connects the place with the "potter's house" mentioned by Jer. xviii. 2; xix. 2. It would appear, therefore, that Aceldama is older than the story told of it in the New Testament, and its designation as a "field of blood" is but a play upon the word, introduced to add color to the narrative of Judas Iscariot. Consult Tobler, *Topographie von Jerusalem* (1854, pp. 260 ff.); Schick in the Quarterly Statement of the *Palestine Exploration Fund* (1892, pp. 288 f.); Melander, *Jerusalems dolda tempelskatter* (1907). See HINNOM, VALLEY OF.

ACEPH'ALI (Gk. ἀ, a, priv. + κεφαλή, *kephalē*, head; i.e., headless). A name given (1) To metropolitans and bishops who have no ecclesiastical head over them. (2) To certain ecclesiastical parties: (a) those bishops at the ecumenical council of Ephesus in 431 who refused to join either the party of Cyril or of John of Antioch; (b) those who rejected the doctrinal decision of the ecumenical council held at Chalcedon in 451 upon the nature of Christ (see CHRISTOLOGY); (c) the Eutychian adherents of Peter Mongus, who refused to subscribe to the Henoticon in 482, designed to end

the Monophysite controversy. (3) To clergy belonging to no diocese. (4) To the Flagellants (q.v.).

ACEPH'ALOCYST (literally, a cyst without a head; Gk. ἀ, a, priv. + κεφαλή, *kephalē*, head + κύστις, *kystis*, a bladder, bag). An encysted larval tapeworm (*Tænia echinococcus*). See HYDATID CYST.

A'CER. See MAPLE.

ACERACEÆ, ās'è-rā'sè-ē. A family of dicotyledonous plants embracing the genera *Dipteronia* and *Acer*, with one species of the first genus in Asia and about 120 species of *Acer* in the northern hemisphere. See MAPLE.

ACERBI, ā-chēr'bè, GIUSEPPE (1773-1846). An Italian naturalist, born at Castel Goffredo. He studied at Mantua and became proficient in natural science. He was the first Italian to reach North Cape (1798). In 1816 he founded the *Biblioteca Italiana*, a literary review published at Milan, and from 1826 to 1836 was Austrian consul-general in Egypt, where he made important archæological collections for the museums of Vienna, Padua, Milan, and Pavia. He published (in English) *Travels through Sweden, Finland, Lapland* (2 vols., London, 1802).

ACERENZA, ā'chā-rān'tsā. A town in the province of Potenza, Italy, 16 miles northeast of the city of the same name. It is situated on the Bradaceo River, 2730 feet above sea level and is the seat of a bishop. The principal building is a cathedral dating from the thirteenth century, on the gable of which is a bust, supposedly of Julian the Apostate, but which is more probably a likeness of one of the Hohenstaufen. Acerenza is the Aceruntia, or Acherontia, of the late Republic and is mentioned by Horace in his poems. It was regarded as a post of great strength. The surrounding region is noted for its excellent wine. Pop., 1901, 4499; 1911, 4757.

ACERRA, ā-chēr'rā, the ancient ACERRÆ. An episcopal city in Caserta, a province of south Italy, 9 miles northeast of Naples and opposite Mount Somma, from which there is an excellent view of Vesuvius (Map: Italy, J 7). It has a cathedral and a seminary. The country is fertile, and there are sulphur and mineral springs in the vicinity. Until recently, when the marshes were drained, it was extremely unhealthy, owing to the inundations of the Agno, which is the *Clanias non æquus Acerris* of Vergil. Pop., 1901, 16,443; 1911, 16,939.

ACER'RA. An incense box used by the Romans in sacrifices; the incense, taken from the *acerra*, was burnt on the altar. More often, however, the incense was burnt in the *turibulum*, the thurible. The word *acerra* was also applied to a small altar on which incense was burnt before the dead. See INCENSE.

ACET. A combining form used in various chemical terms, and ultimately derived from Lat. *acetum*, vinegar; as in *acetal*, *acetanilid*, etc.

ACETAB'ULUM. Among the Greeks and the Romans a small, shallow vessel, properly used for holding vinegar (called, in Latin, *acetum*) or other condiments, but employed also for holding other things, such as salads, wine, or honey.

ACETAL, ās'è-tāl, CH₃CH(OC₂H₅)₂. A colorless liquid of agreeable odor and taste. It is readily obtained by heating a mixture of aldehyde and ordinary alcohol. It has been used to improve the flavor of wine. See ALDEHYDES.

ACETAMIDE, as'ēt-ām'id or -īd. See AMIDES.

ACETANILID, ās'ēt-ān'i-līd. A crystalline powder made by the action of acetic acid on aniline. It is odorless, slightly bitter, sparingly soluble in water, but freely so in alcohol, ether, and chloroform. Chemically, it is phenylacetamide, $\text{CH}_3\text{CONHC}_6\text{H}_5$. It is known also by the trade name antifebrin. Its action and uses are similar to those of antipyrine (q.v.), but the dose required is much smaller. Acetanilid is a common ingredient of "headache powders," and when taken habitually it is apt to cause serious cardiac symptoms, cyanosis of the mucous membranes, albuminuria, anæmia, œdema of the feet and ankles, heart failure, and death.

ACETATES, ās'ē-tāts. The salts of acetic acid, which are generally prepared by the action of acetic acid on metallic carbonates or hydroxides. Most acetates are soluble in water. To prove the presence of an acetate in a solution, the analytical chemist adds to the solution some strong sulphuric acid and a little alcohol and heats the mixture for a few seconds; by this treatment of an acetate solution ethyl acetic ester is produced, which is readily recognized by its pleasant and characteristic odor. Some of the acetates are: (1) *Aluminium acetate*. This has been obtained only in its aqueous solution, which is used as a mordant under the name of "red liquor." (2) The *acetate of iron*, known as "black liquor," is likewise used as a mordant in dyeing and printing cotton. The acetates of (3) lead, (4) ammonium, and (5) potassium are much used in medicine. *Lead acetate*, commonly known as "sugar of lead," is used for external applications as an astringent. *Ammonium acetate* is used to promote perspiration; it is prepared best by passing an excess of gaseous ammonia into strong acetic acid. *Potassium acetate* is very largely used as a diuretic. Other metallic acetates are mentioned under the names of the metals (q.v.).

ACETIC, ā-sē'tik, **ACID**, CH_3COOH . The sour principle of vinegar, an acid composed chemically of carbon, hydrogen, and oxygen. The commercial acid is largely used in the manufacture of acetates, dye-stuffs, etc. Concentrated acetic acid burns the skin, and is therefore applied as a caustic to remove small warts and corns. Like any other acid, if taken internally for any length of time, dilute acetic acid impairs the digestion and absorption of food.

Acetic acid occurs here and there in the organic world. It is found ready formed in sweat and other animal secretions, as well as in the juices of various plants. It is manufactured either by the oxidation of ordinary alcohol through fermentation (see VINEGAR), or by the destructive distillation of wood. The aqueous product obtained in the latter process is subjected to fractional distillation, and the fraction constituting impure acetic acid (called *pyroligneous acid*) is neutralized with soda or lime. In this manner a solution of sodium or calcium acetate is obtained; this solution is evaporated to dryness, and the remaining salt is freed from water and organic impurities by heating above 400°F . Pure acetic acid is prepared by distilling the acetates thus obtained with strong sulphuric acid. The pure anhydrous acid is known as glacial acetic acid; at temperatures below 62°F . it is solid and crystalline; above that temperature it forms a colorless liquid readily known by its pungent, penetrating odor. Since carbon is one of its constituent elements,

it is, of course, classed with the compounds of organic chemistry. It is comparatively weak acid. (See ACIDS.) Besides the methods just mentioned, acetic acid can be made by synthesis from the constituent elements. When electric sparks are passed between carbon poles in an atmosphere of hydrogen, acetylene gas is produced; and when oxygen (furnished, say, by chromic acid) is made to act upon acetylene in the presence of water, the acetylene combines with oxygen and water, forming acetic acid.

ACETO-ACETIC (ās'ē-tō-ā-sē'tik) **ESTER**, $\text{CH}_3\text{COCH}_2\text{COOC}_2\text{H}_5$. A colorless liquid organic substance obtained by the action of metallic sodium on the ester formed by the union of acetic acid and ordinary alcohol (i.e., ethyl acetic ester). Aceto-acetic ester mixes in all proportions with alcohol or with ether, but is only sparingly soluble in water. It boils at 180°C . One of the two hydrogen atoms of its CH_2 group is readily replaced by sodium, and the resulting compound, in turn, readily reacts with the halogen substitution products of the fatty hydrocarbons, such as CH_3I , $\text{C}_2\text{H}_5\text{I}$, etc. The result is the production of such derivations of aceto-acetic ester as $\text{CH}_3\text{COCH}(\text{CH}_3)\text{COOC}_2\text{H}_5$, $\text{CH}_3\text{COCH}(\text{C}_2\text{H}_5)\text{COOC}_2\text{H}_5$, etc. In these, the hydrogen of the CH group can again be replaced by sodium, and the resulting compounds can again react with CH_3I , $\text{C}_2\text{H}_5\text{I}$, and similar substances. This time the result is a series of *di*-substitution derivatives of aceto-acetic ester. Now, aceto-acetic ester itself and its *mono*- and *di*-substitution products are split by the action of potassium hydroxide, and that in two distinct ways, depending on the strength of the alkali used: aceto-acetic ester will yield either acetic acid or acetone and, similarly, the *mono*- and *di*-substitution products of aceto-acetic ester will yield *mono*- and *di*-substitution products of either acetic acid or acetone. In this manner a great number of acids and ketones have been synthesized with the aid of aceto-acetic ester, whence the great importance of this substance in organic chemistry. Aceto-acetic ester further reacts with aldehydes, with aldehyde-ammonia, phenyl-hydrazine, aniline, and other substances, the result being a further series of valuable syntheses. See MALONIC ESTER.

ACETONE, ās'ē-tōn, or DIMETHYL KETONE, CH_3COCH_3 . A colorless organic liquid boiling at $56^\circ.3\text{C}$., and having at 20° a specific gravity of 0.792. It is volatile and inflammable, has a pleasant ethereal odor, dissolves various organic substances such as fats and resins, and mixes in all proportions with water, alcohol, and ether. It is separated from its aqueous solutions by calcium chloride. It dissolves considerable quantities of acetylene gas (q.v.), and absorbs a very large amount of sulphurous anhydride. It is used as a solvent as well as for the manufacture of chloroform, iodoform, etc. Acetone is produced when various organic substances are subjected to destructive distillation; it is thus found in pyroligneous spirit (see METHYL ALCOHOL) obtained by the dry distillation of wood. It is separated from wood spirit by distilling over calcium chloride. It is usually prepared by distilling barium acetate at a moderate heat, according to the following chemical equation:

The somewhat impure product obtained either from wood spirit or from barium acetate may be readily purified and dehydrated by the use of the acid sulphite of sodium, with which it combines to form a crystalline solid compound. Pure acetone is obtained from the latter by distilling with sodium carbonate. When acted on by chlorine in the presence of alkali, acetone is converted into chloroform. Iodoform is similarly produced by the action of iodine (in ammonium iodide solution) and ammonia upon acetone, the reaction forming the most sensitive test for acetone that is known to chemists. The action of acids transforms acetone into mesityl oxide $\text{CH}_3\text{COCH}:\text{C}(\text{CH}_3)_2$, phorone, and isophorone, by "condensation," or dehydration. When acetone is distilled with strong sulphuric acid, mesitylene is produced; this reaction has been of great value in determining the chemical constitution of a vast number of benzene derivatives allied to mesitylene. Acetone occurs in small quantities in the blood, and is present in the liquid passing over when urine is distilled. It has long been known to chemists as a product of distillation of acetates; its composition was first determined by Liebig and Dumas in 1832. See KETONES.

ACETYL, äs'ë-tîl, CH_3CO . A univalent atomic group or radicle in organic chemistry. See CARBON COMPOUNDS.

ACETYLENE (from *acetyl*), $\text{HC}\equiv\text{CH}$. A colorless gas composed chemically of carbon and hydrogen. It is present in small quantities in ordinary illuminating gas and has a characteristic disagreeable odor somewhat resembling that of garlic. Its "critical temperature" is 37°C . (about 98.6°F .); that is to say, no matter how great the pressure to which it may be subjected above 37° it will remain gaseous, while at 37° a certain pressure, called the "critical pressure," is necessary and sufficient to liquefy it; the critical pressure of acetylene is 68 atmospheres. Acetylene burns with a brilliant flame and is used as an illuminant. It is best made for scientific as well as for industrial purposes by the action of water on the carbide of calcium (q.v.). It is thus produced, for instance, in automobile lamps. The various apparatus devised for the manufacture of acetylene produces it either in the gaseous state or, by immediate compression, in the liquefied state. We will distinguish two types of apparatus. In the first the *carbide is contained in an appropriate reservoir, into which water is introduced at a required rate*. Such apparatus is rather inconvenient and somewhat dangerous, for the reason that in the mass of carbide considerable rise of temperature may occur at the point immediately attacked by water; besides, a crust of lime may form on the surface of a lump of carbide, and when the water at last penetrates to the core of the lump a sudden and more or less violent reaction may ensue; all of which would naturally result in uneven generation of gas, variations of pressure, and, perhaps, the explosive inflammation of the gas. In the second type of apparatus, on the contrary, the *carbide is thrown into a considerable mass of water*, whereby undue elevations of temperature and irregularity of action are completely avoided. As the presence of impurities in acetylene adds considerably to the danger of using the gas, various methods of purification have been proposed. Now, the nature and quantity of im-

purity in acetylene depend entirely on the composition of the carbide used in its manufacture, and a very pure acetylene has been produced on quite a large scale simply by employing a pure carbide. With air or oxygen acetylene forms extremely explosive mixtures; mere external friction of a vessel in which such a mixture is contained may cause an explosion. But acetylene is explosive even when isolated and pure, if kept *under pressure of more than two atmospheres*; and it is very dangerous indeed when preserved in liquid form. It has, instead, been stored in solution in ordinary acetone, which absorbs considerable quantities of it. If the pressure under which the gas is dissolved in acetone is not very great, explosion can occur only in the gaseous volume above the surface of the liquid; the dissolved portion of the gas does not take part in the explosion. Under any circumstances, sudden compression of a volume of acetylene may cause an explosion. Acetylene is slightly, if at all, poisonous; it is certainly much less poisonous than ordinary illuminating gas.

Acetylene contains a high percentage of carbon, and the amount of heat generated in its combustion is very large. These are the causes to which its high illuminating power is due; for, in order that a flame may be luminous, it must contain a large amount of carbon particles, and its temperature must be high enough to keep those particles in a state of incandescence. In order that acetylene may yield a large amount of light, it must be properly burned. The numerous burners devised for this purpose are constructed with a view to burning either pure acetylene or mixtures of acetylene and other gases, such as nitrogen, carbonic acid gas, and especially marsh gas. We reproduce here the Perrodil burner,

which, while adapted for use with pure acetylene, allows it to be sufficiently mixed with air before it reaches the point *a*, where it begins to burn.

Acetylene is one of the cheapest illuminants. It has, besides, the important advantage over other illuminants of being easily produced and requiring no special establishment for its manufacture.

In the opinion of eminent experts, the danger connected with storing it even in large quantities is not great enough to justify a verdict against its introduction into common use.

We will mention a few other uses to which acetylene may be applied:

1. If calcium carbide were cheaper, acetylene might be used as an enricher; i.e., to increase the illuminating power of coal gas and of other combustible gases.

2. When acetylene is passed into an alkaline solution of iodine, the substance *di-iodoform* (C_2I_4) is produced. This substance possesses the antiseptic properties of ordinary iodoform without having the strong and annoying odor of that substance. Di-iodoform has been manufactured on an industrial scale.

3. Under the influence of electric sparks acetylene combines directly with nitrogen to form *prussic* (hydrocyanic) *acid*. It might, therefore, be used in the cyanide industry.

4. A process has been patented in Germany for the manufacture of *sugar* from acetylene.

5. When heated with hydrogen, acetylene is converted into ethylene, and by the action of sulphuric acid and water the latter yields ordinary *alcohol*. It has been argued that if pure alcohol, manufactured by this method, could be substituted as an article of commerce for the highly toxic liquors so freely sold at the present day, a great deal would be accomplished toward diminishing the evil of alcoholism. Under the present conditions, however, the process would be too expensive.

Chemically, acetylene is an unsaturated compound, the first of an important series of hydrocarbons. It is said to be "unsaturated" because it combines with bromine and the other halogens without at the same time losing any of its own elements. It combines in a similar manner with hydrogen. By heating a mixture of acetylene and hydrogen, ethylene gas may be obtained, and this can be further transformed into ethane gas by the action of hydrogen in the presence of "platinum black" (finely divided platinum). Berthelot effected the interesting synthesis of acetylene by passing electric sparks between carbon poles placed in a vessel filled with hydrogen. Under such conditions the carbon of the poles combines directly with hydrogen to form acetylene.

In conclusion, another important property of acetylene may be mentioned. When acetylene is passed into a solution of a cuprous salt (say, cuprous chloride), containing some ammonia, a curious and characteristic compound of acetylene and copper is obtained, called *copper acetylide*. When a chemist is called upon to determine whether acetylene is present or absent in a given mixture, he tests it with a solution of cuprous chloride containing some ammonia; the formation of copper acetylide proves the presence of acetylene. It is currently believed that the explosive compound of copper and acetylene will form whenever acetylene comes in contact with metallic copper or its alloys. This idea has, however, been proved positively false; there is no danger whatever in storing acetylene in metallic vessels of any kind.

Consult: V. B. Lewes, *Acetylene: a Handbook for the Student and Manufacturer* (New York, 1900); Caro, Ludwig, and Vogel, *Handbuch für Azetylen in technische und wissenschaftlicher Hinsicht* (Braunschweig, 1904); Scheel, *Das Azetylen* (Hanover, 1907); Holbeger, Betke, and Nolte, *Azetylen und seine technische Verwendung* (Berlin, 1909); Leeds and Butterfield, *Acetylene* (Philadelphia, 1910); Vogel, *Das Azetylen* (Leipzig, 1911). A technical journal devoted to the acetylene industry (*Zeitschrift für Calciumcarbid-Fabrikation und Azetylen-Beleuchtung*) was established at Suhl in 1897 and has, since 1900, been published at Berlin.

ACHÆA, à-kē'á (Gk. Ἀχαια). 1. The south-east part of Thessaly, the legendary home of Achilles (q.v.). 2. The northern part of Peloponnesus, bordering on the Corinthian Gulf. The land, which rises gradually from the coast to the hills of the interior, was famed in ancient times for fertility in production of oil, wine, and fruits; the wooded mountains contained much game. In the modern kingdom of Greece Achæa forms a nome, or department, in the extreme northwest of the Morea, and its chief town is Patras (ancient Patræ). Except the west coast, the land is fertile and produces grain, wine, and oil.

In early times the Achæans (q.v.) held more or less aloof from participation in the affairs of the rest of Greece. There were 12 principal towns, the names of which, according to Herodotus, were Pellene, Ægeira, Ægæ, Bura, Helice, Ægium, Rhypes, Patræ, Pharæ, Olenus, Dyme, and Tritæa; they formed a confederacy, with Helice at the head. After the destruction of Helice by an earthquake in 373 B.C., Ægium took its place as the chief city of the confederacy. The wars and rivalries which prevailed after the death of Alexander the Great brought about the complete dissolution of the ancient bond, but a new union was formed in 280 B.C., which gradually extended itself, and in a few years comprised 10 cities, Patræ, Dyme, Pharæ, Tritæa, Leontium, Ægeira, Pellene, Ægium, Bura, and Ceryneia. This second confederacy was known as the Achæan League. It first came into prominence as an important factor in Greek and Hellenic politics in 249 B.C., when Aratus (q.v.) joined thereto his native city, Sicyon. The aim of the league from this time was to free the Greek peninsula from Macedonian rule. In 242 B.C. the Macedonian garrison was driven from Corinth, and this city was brought into the confederacy. Before the last quarter of that century the league had reached its most flourishing period of development. It included the whole of northern and middle Peloponnesus except Sparta, and many cities in other parts of Greece.

The government of the league affords perhaps the best example in antiquity of the federal system. In foreign affairs the league acted as a whole, but in internal affairs each city was a unit, and had equal rights with every other city. Also, each state still preserved its entire independence. There was a public assembly which met regularly twice every year, in spring and in autumn, and was attended, not by deputies, but in person by all male citizens of thirty years of age or over. The vote was by states, each state having voting strength according to its population. The meeting-place of the assembly was at first a grove near Ægium, but later Philopœmen (q.v.) instituted a change, whereby meetings were to be held in rotation at the various cities belonging to the league. In this council the affairs of the league were brought up to be discussed and passed upon, and a record was kept of the proceedings. The chief officer of the league was the *strategos*, who had as subordinates a *hipparchos*, the commander of the cavalry, and a *nauarchos*, the admiral. There was also a secretary. The *strategos* was commander-in-chief of the army and general executive officer. He was assisted in the duty of calling together the assembly and presiding thereat by a board of ten *demiurgi*. For some years the league maintained its independence against all enemies. Something of the old power of Greece seemed to return, and there was a promise of permanent union; but it soon appeared that the league was bent on its own destruction. Instead of presenting a firm front against the common foes of Greece, its members were divided by continual discords. The Ætolian League was a formidable rival (see ÆTOLIA), and the Spartans, led by King Cleomenes III, pressed the confederacy so hard that Aratus was finally compelled to seek the alliance of the Macedonian King, Antigonus Doseon.

This act was nothing less than the beginning of the dependency of the Achæan League on the Macedonian power. Another dangerous enemy was Rome. Led by the wise and energetic policy of Philopœmen, the Achæans held out against enemies at home and abroad for a number of years, but in 198 B.C. they were induced to ally themselves with the Romans. In 192 B.C. Philopœmen appeared at Sparta and compelled that city to join the league, and by the following year the whole of Peloponnesus had come over to the union. This situation, however, lasted but a short time. The hostilities of Sparta, the intrigues of the Romans, and internal dissensions combined to bring about the fall of the confederacy. In 167 B.C. a wholesale deportation of leading Achæans to Rome as hostages took place. In 146 B.C. the Achæans were defeated at Corinth by the Roman general Mummius (q.v.). This defeat not only dissolved the league, but destroyed the political independence of Greece. Southern and central Greece, under the name of Achæa, became a Roman province. Polybius (q.v.), who was one of the Achæans taken to Rome as hostages in 167 B.C., has given an extended account of the league in his history of the period between 220 B.C. and 146 B.C. Consult: Schorn, *Geschichte Griechenlands von der Entstehung ætolischen und achæischen Bundes* (Bonn, 1833); Drumann, *Ideen zur Geschichte des Verfalls der griechischen Staaten* (Berlin, 1811); Hertzberg, *Geschichte Griechenlands unter den Römern* (Halle, 1875); and Freeman, *History of Federal Government* (2d ed., London, 1893).

3. Under the Romans the province containing all Greece except Thessaly and Macedonia.

ACHÆAN LEAGUE. See ACHÆA.

ACHÆANS, ä-kē'anz (Gk. Ἀχαιοί, *Achaiōi*). One of the races of ancient Greece. In Homer the name sometimes includes all the Greeks. The Achæans inhabited the southeastern part of Thessaly and much of the Peloponnesus. By the Dorian invasion they were crowded into the northwestern corner of the Peloponnesus, where they later formed the Achæan League. (See ACHÆA.) In mythology their ancestor was Achæus, son of Xuthus and grandson of Hellen (q.v.).

ACHÆMENES, ä-kēm'ê-nēz (Gk. Ἀχαιμένης, *Achaimenēs*), **ACHÆMENIDÆ.** The names respectively of the progenitor and of the dynasty of ancient Persian kings, Cyrus, Cambyses, Darius, Xerxes, Artaxerxes, and their successors. The rule of the Achæmenidæ over Iran lasted 558–330 B.C. In the old Persian inscriptions Darius proudly traces his lineage back to *Haxāmanisiya* (in Greek, Ἀχαιμένης), as the founder of the royal line, and states that from him the family received the name Achæmenidæ.

ACHAGUA, ä-chä'gwä. An Indian tribe of Arawakan stock, which formerly inhabited the forests of the upper Orinoco region in northeastern Colombia. They were prominently mentioned in the last century, but were entirely uncivilized, practicing tattooing, polyandry, and the destruction of female infants. About 500 were said still to exist on the Rio Muco about the year 1850.

ACHAIA, ä-kä'yä, mod. Gr. pron. ä-kä'a. See ACHÆA.

ACHAMOTH, äk'ä-möth. In the theological system of Valentinus (q.v.) the Gnostic, a personification of a form of wisdom inferior to the

pure *sophia*. She is the mother of the world-maker, Demiurge. See DEMIURGE.

ACHARD, äk'ürt, FRANZ KARL (1753–1821). A German physicist and chemist, born in Berlin. He is remembered chiefly as the founder of the beet-sugar industry. He devoted several years to investigating the best methods of raising sugar-beets and of producing sugar on an industrial scale. Finally, at the instance of the King of Prussia, experiments were successfully carried out in Berlin about 1800, and as a result Achard was enabled to establish near Kunern in 1801 the first sugar manufactory. He wrote *Die europäische Zuckerfabrikation aus Runkelrüben in Verbindung mit der Bereitung des Branntweins* (1812). Achard was for a time director of the class of physics in the Berlin Academy of Sciences, and published four volumes of *Vorlesungen über Experimentalphysik* (1790–92).

ACHARD, ä'shär', LOUIS AMÉDÉE EUGÈNE (1814–75). A French novelist, born in Marseilles, where he was at first a merchant. He entered newspaper work in his native city, continued it in Paris, went as a reporter to Spain with the Duc de Montpensier in 1846, and followed the French armies in 1870. He is chiefly known as a novelist, his romances being numerous. Among them are *La belle rose* (1847); *Les misères d'un millionnaire* (1861); and *Histoire d'un homme* (1863). He also wrote several plays, among them *Histoire de mes amis* (1874).

ACHARNIANS, ä-kär'nī-anz, THE (Gk. Ἀχαρνείς, *Acharneis*). A comedy of Aristophanes (q.v.) produced in Athens at the festival of the Lenæa, 425 B.C., under the name of *Callistratus*. The title comes from the fact that the chorus is composed of men of Acharnæ, an Attic deme near Mount Parnes. The play is in opposition to the democratic policy of war with Sparta. Dicæopolis, the hero, is an honest farmer who is tired of the fighting and his losses thereby and finally makes a private treaty with the Lacedæmonians. This leads to a farcical but brilliant display of the contrasts between the discomforts of war and the joys of peace. The play has been well edited, with translation, by Starkie (London, 1909); there is an admirable translation by John Hookham Frere.

ACHATES, ä-kä'tēz (modern Dirillo). 1. A river in southern Sicily that gave its name to the agate (*achates*) which was found there, according to Pliny (37, 139). 2. A faithful companion of Æneas in his wanderings (Vergil, *Æneid*, i, 188, etc.), called by Vergil *fidus Achates*. The name *fidus Achates* has long been applied to any faithful friend.

ACHELOUS, äk'ê-lō'ūs (Gk. Ἀχελῷος, *Achelōos*, now called Aspropotamos, i.e., White River, from the cream color of its waters). The largest river in Greece (Map: Greece, C 5). It rises in Mount Peristeri of the Pindus range, flows southward, separating the modern *eparchiæ* Artta and Báltos on the west from Tríkala and Evrytania on the east, and falls into the Ionian Sea. It is over 100 miles long and unnavigable.

ACHENBACH, äk'en-bak. The name of the two most celebrated landscape painters of the Düsseldorf School (q.v.).—ANDREAS (1815–1910), the elder, was born at Cassel and studied at Düsseldorf with Schadow and Schirmer. His art represents a realistic reaction upon the romanticism of the Romantic School and was influenced

by the Dutch. Although he traveled much and painted every variety of landscape, he is particularly known as the painter of the northern ocean. His vision was clear and sober, but he lacked appreciation of the sentiment in nature. His principal works include "The Sinking of the President" (Karlsruhe), "Hardanger Fjord" (Düsseldorf), "The Pontine Marshes" (Munich), and "The Fish Market at Ostend" (1866, Berlin). His works are numerous in all important German and many American galleries, such as the Metropolitan Museum, New York, and in the Pennsylvania Academy at Philadelphia.—OSWALD (1827–1905) was born at Düsseldorf. His journey to Italy in 1850–51 determined the character of his subjects, which are Roman and south Italian, representing some folk scene as part of a brilliantly colored landscape. His style is more romantic than his brother's, but less powerful. His principal works include "A Funeral at Night in Palestrina" (1859, Düsseldorf), the "Gulf of Naples," and other subjects (1880, Dresden). His paintings are also numerous in the United States, and he was represented at the World's Fair in St. Louis by "Sea at Sunrise," "The Arch of Constantine," and "Lake Nemi." Consult C. Achenbach, *Andreas Achenbach in Kunst und Leben* (Cologne, 1912).

ACHENE, à-kên', also ACHENIUM and AKENE (Gk. *â*, *a*, priv. + *χαλιν*, *chainein*, to gape). A seed-like fruit such as is characteristic of the great family of Compositæ, to which belong sunflowers, thistles, dandelions, etc. The pits of the strawberry and the small fruits forming a head in the centre of a buttercup are also achenes. The seed-like appearance arises from the fact that the wall of the seed-vessel hardens and invests the solitary seed so closely as to seem like an outer coat. See FRUIT.

ACHENSEE, äg'en-zä. A lake in north Tyrol, Austria, 20 miles northeast of Innsbruck. It is 5½ miles long and half a mile broad and is 3018 feet above sea level. Its picturesque shores dotted with hotels and villas are much frequented as summer resorts. Steamers ply on its waters.

ACHENWALL, äk'en-väl, GOTTFRIED (1719–72). One of the most influential German economic and political scientists of the eighteenth century. Besides works on natural law, history, and political science, he was author of an important treatise entitled *Staatsverfassung der heutigen vornehmsten Europäischen Reiche* (1752), in which he treated not only the political constitutions, but the economic and social condition of the principal nations. His method was statistical, and the effect of his work was to popularize the use of statistics in Germany. Certain of his disciples claimed for him the title of founder of statistical science; but such a claim cannot be defended in view of the priority of Petty, Conring, and other writers in the use of this method.

ACHERON, äk'ë-rön (Gk. *Ἀχέρων*, *Acherōn*). The name given by the ancients to several rivers. The best known is the Acheron in Thesprotis, in Epirus, which flows through the lake Acherusia and pours itself into the Ionian Sea. According to Pausanias (q.v.), Homer borrowed from this river the name of the river Acheron in the underworld. In the later poets and mythographers Acheron is the name of a river or lake in the lower world across which the souls of the dead were obliged to pass. (See STRYX.) The lake Acherusia in Thesprotis was regarded

as an entrance to the lower world, and the name was also applied to a walled inclosure near a temple at Hermione in Argolis, in the Peloponnesus, and a promontory near Heracleia in Pontus, Asia Minor.

ACHESON, äch'e-son, EDWARD GOODRICH (1856–). An American chemical inventor. He was born at Washington, Pa., and received only an elementary education. At the age of sixteen he was compelled to seek employment as time-keeper at a blast furnace; yet the very next year he invented a usable drilling machine. Subsequently he found routine employment in the petroleum industry and in ore mining. In 1880 he became Thomas A. Edison's assistant, taking part in the development of the incandescent lamp, and in 1881–82 installed the first lamp plants in Europe. In 1891 he invented the now widely used abrasive *carborundum*, a carbide of silicon, and between 1895 and 1899 he worked out a process for making artificially a graphite ("Acheson-graphite") that far surpasses the natural product in purity and industrial usefulness. In 1906 and 1907 he succeeded in reducing his graphite to an exceedingly fine state of subdivision ("deflocculating" it), in which state it remains permanently suspended in water ("Aquadag") or in oil ("Oildag"). These suspensions possess great practical value as lubricants. The honors bestowed upon Acheson in recognition of his services to art and industry include the Rumford Medal of the American Academy and the Perkin Medal for the most valuable work in applied chemistry. In 1909 the University of Pittsburgh conferred upon him the honorary degree of Doctor of Science, and in 1913 he was made an honorary member of the Imperial Technological Society of Russia.

A CHEVAL (à'she-väl') **POSITION** (Fr. *à cheval*, on horseback). A military term to denote the position of an army astride a river or other obstacle preventing effective coöperation of the wings of the army. When the perpendicular to the front is formed by a river, possession of bridges is necessary in order to provide communication for supporting troops.

ACHIKAR, à-chë'kär. The hero of a romance widely read in antiquity. He is represented as a wise wazir of the Assyrian kings Sennacherib and Esarhaddon. Through the intrigues of his ungrateful nephew Nadan, whom he has brought up, he is condemned to death, but is saved by the executioner, who substitutes for him a eunuch, and after some time, when Nadan's crime is found out, restored to his position. The culprit is left to the mercies of Achikar, who only keeps him in confinement, treating him daily to wise counsels until he dies. The sayings of Achikar occupy a large part of the work. The earliest form of the story is found in papyrus fragments coming from the archives of the Jewish military colony in Elephantine. (See ELEPHANTINE PAPYRI.) This copy of the text was written about 407 B.C. in Aramaic, which probably was the original language. It is very defective. When the story was first written is not known; but it is supposed to go back to the beginning of the fifth century. It is of great interest in showing how early stories of this kind began to cluster about the later monarchs of Assyria and how gnomic literature in such a fictitious setting of pagan origin was cherished among the Jews. Before this remarkable discovery the story was generally thought to have been written either about 200 B.C. just before the

Book of Tobit, in which Achikar, or Achiacarus, is mentioned (i. 21, 22; ii. 10; xi. 18; xiv. 10, 11), or some time later to satisfy curiosity in regard to this personage. The Arabic version, which was first made known through a translation in Chavis-Cazotte, *La suite des mille et une nuits*, ii, 1788, was derived from the Syriac, and this, like the Ethiopic, Armenian, Slavonic, and Rumanian, from the Greek, of which some parts remain. A Greek translation may have been known already to Theophrastus (300 B.C.), who, according to Diogenes Laertius (v, 50) wrote a book called *Achikaros*, and to Posidonius (c.100 B.C.) in Strabo, xvi, 2, 39. A pictorial representation of Achikar is found in a mosaic at Treves. Consult: Sachau, *Aramäische Papyri und Ostraka* (1911, pp. 146 ff.); Conybeare, R. Harris, and Agnes Lewis, *The Story of Achikar* (1898); Smend, *Alter und Herkunft des Achikar-Romans* (1908); F. Nau, *Histoire et Sagesse d'Achikar l'Assyrien* (1909); Ed. Meyer, *Der Papyrusfund von Elephantine* (1912).

ACHILL, äk'il, or **EAGLE ISLE**. An island off the west coast of Ireland, in the county of Mayo. It is about 20 miles long and has a mean breadth of about 4 miles. It has several mountains composed of mica slate, about 2000 feet high. There are several villages. Pop., 1911, 1721.

ACHILLEA, äk'il-lë'ä (Lat. *achillëos*, milfoil, yarrow, whose "virtues" are said to have been discovered by Achilles). A genus of over 100 species belonging to the family Compositæ. Most of the species belong to the Old World, only four or five species occurring in North America. The common yarrow or milfoil (*Achillea millefolium*) is a very cosmopolitan species, occurring throughout the northern hemisphere. The flat-topped cluster of white flowers with stiff branches, the finely dissected leaves, and the bitterish aromatic taste and odor make this species easily recognizable. Both leaves and flowers are used in medicine as a powerful stimulant and tonic. The leaves were formerly much used for healing wounds, and are still so employed by the common people in the Highlands of Scotland and in some parts of the Continent of Europe. Such old names as "sanguinary," "nosebleed," and "soldier's-woundwort," suggest the uses to which the plant was put. The expressed juice is a popular spring medicine in Germany. *Achillea moschata*, called musk milfoil, is cultivated as food for cattle in Switzerland. *Achillea moschata*, *atrata*, and *nana*—all natives of the Alps—are very aromatic, and bear the name of genipi or genip. The inhabitants of the Alps value them very highly, and use them for making what is called Swiss tea. *Achillea nana* is said to be used in making chartreuse. Sneezewort (*Achillea ptarmica*) is a native of Europe, and somewhat introduced into the United States, with lanceolate leaves and much larger flowers than the common milfoil. The root, which is aromatic, is used as a substitute for pellitory of Spain, and is often called European pellitory.

ACHILLES, ä-kil'lëz (Gk. Ἀχιλλεύς, *Achilleus*). The hero of Homer's *Iliad*, and the type of glorious youth. In the Homeric poems his story is simple. The son of King Peleus and the sea-goddess Thetis, he was brought up at his father's court in Phthia, in Thessaly, Greece, until he was induced to take part in the Trojan War; when he learned that he could have either a long but inglorious life or a short and

famous career, he preferred an early death with fame. This fate gives Achilles a tinge of melancholy characteristic of the Greek mind. While the Greeks were in camp before Troy, Achilles plundered the surrounding country and secured as his booty the beautiful maiden Briseïs. The *Iliad* narrates the wrath of Achilles because Agamemnon deprived him of Briseïs, whom he had come to love, to replace Chryseïs, whom Agamemnon had been forced to restore to her father Chryses, priest of Apollo, to avert the wrath of Apollo from the Greeks. In the absence of Achilles, who in his rage refuses to fight longer for the Greeks, the Trojans drive the Greeks to their ships; the complete destruction of the Greeks is averted only when Achilles allows his friend Patroclus to lead his Myrmidons to the rescue. Pursuing the Trojans to their walls, Patroclus is slain by Hector, and Achilles, overwhelmed with grief, becomes reconciled with Agamemnon, that he may hasten to obtain revenge. He returns to the fight, and after driving the Trojans within the city, slays Hector and drags his body to the ships. After celebrating the funeral of Patroclus with great pomp, he yields to the command of Zeus and allows Priam to ransom the body of his son Hector. In the *Odyssey* we have allusions to the death of Achilles, his splendid burial, and the renown of his son Neoptolemus. Later epic poems and other compositions add many details. According to some, his mother renders him invulnerable by dipping him in the river Styx; but his heel, by which she held him, was not immersed, and here he received his death wound from an arrow. He was educated by the centaur Chiron, and was afterward hidden, robed as a girl, by his mother at Scyros, among the daughters of Lycomedes, that he might escape the temptation to join the expedition against Troy. He was needed, however, in the expedition, and was detected by the craft of Odysseus, who, disguised as a peddler, offered a sword, as well as trinkets, for sale to the maidens. When a trumpet suddenly sounded a call to arms, Achilles at once seized the sword and, being recognized, was then easily induced to join the Greeks (Ovid, *Metamorphoses*, vol. xiii, 162 ff.; Statius, *Achilleis*, vol. i, 207 ff.). His combats with Penthesilea, Queen of the Amazons, and with Memnon (q.v.), who came to aid Priam after the death of Hector, were favorite subjects with Greek artists. He met his death at the hands of Apollo and Paris before the Scæan gate, or in the temple of Apollo, whither he had gone to meet Polyxena, daughter of Priam, whom he was to wed. To appease his spirit she was slaughtered on his grave after the capture of Troy. After his death he was transported to the Islands of the Blessed, where he was united with Medea. Achilles was worshiped in Laconia and other parts of Greece, and it is probable that, like other Greek heroes, he was originally a god, honored especially by the Achæans of Phthiotis. See HOMER; TROJAN WAR.

ACHILLES TATIUS, tä'shī-üs (Gk. Ἀχιλλεύς Τάτιος, *Achilleus Tattios*). A Greek writer, a native of Alexandria, who lived probably in the fifth or sixth century A.D. He was the author of a romance in eight books, entitled *The History of Leucippe and Clitophon*, in which he borrowed freely from the work of his predecessor Heliodorus (q.v.), by whom alone he

was surpassed in popularity. While his work is graceful in style, it is inferior to that of his model; for us it is marred in passages by the grossest pagan immorality. It was, however, freely imitated by later writers, especially by Eustathius and Nicetes Eugenianus in the Byzantine period. Suidas says that the author became a Christian and gained the office of bishop, but this is doubtful. The work has been edited with commentary by Jacobs (Leipzig, 1821); Hirschig, in Didot's *Scriptores Erotici* (Paris, 1856); Hercher (Leipzig, 1858). Consult Salverte, *Le Roman dans la Grèce ancienne* (Paris, 1894); Rohde, *Der griechische Roman und seine Vorläufer* (Leipzig, 1900) and Wolff, *The Greek Romances in English Prose Fiction* (New York, 1912).

ACHILLES TEN'DON (Lat. *Tendo Achillis*). A tendon (*a*) which attaches the soleus

ACHILLES TENDON.

(*b*) and gastrocnemius muscles of the calf of the leg to the heel bone. It is estimated to be capable of resisting a force equal to 1000 pounds weight, and yet is occasionally ruptured by the sudden and violent contraction of these muscles. The name was given with reference to the death of Achilles by a wound in the heel.

ACHIMENES, á-kím'è-nēz (probably from Lat. *Achæmenis*, Gk. ἀχαιμενίς, *achaimenis*, an amber-colored plant in India used in magical arts). A genus of plants of the family Gesneraceæ (q.v.), much grown in pots in greenhouses. The species are numerous—natives of tropical America. Achimenes is propagated either by the natural increase of the

rhizome or by cuttings. If the rhizomes are potted by April 1, the drooping plant comes into blossom by the last of May and continues to bloom without cessation for four or five months. After growth starts the soil should never be allowed to become dry. The corolla tube is cylindrical, and the limbs are spreading. The blossoms are red, blue, and white, with all intermediate shades.

ACHIN, á-chēn', or **ATCHEEN**. The Dutch Atjeh, a dependency at the north end of Sumatra, about 20,000 square miles in area, with a population which numbered approximately 580,000 in 1905. The country is mountainous, being intersected by the northwest-southeast trending ranges which form the axis of Sumatra, some peaks attaining 12,000 feet. The famous Gold Mountain, 5660 feet high, is at the extreme northern point, overtowering the city of Kotaraja or Achin, the seat of the Dutch government. For the geography of the southern part of the dependency, consult W. Volz, *Nord-Sumatra* (vol. ii); *Die Gajoländer* (Berlin, 1912).

The shorter stature, darker color, etc. of the aborigines of Achin has led some authorities to separate them from the Sumatrans in general, and their language is by others held to be at bottom Polynesian rather than Malay.

While undoubtedly Malays, the Achinese, like several other peoples of the East Indies, may have a strain of Arab blood. In the seventh century the Hindu missionaries introduced civilization, and many emigrants from India settled here. In the thirteenth century the people were converted to the faith of Islam, the sultans of Achin claiming descent from the first Mohammedan missionary. When in the sixteenth century Europeans reached Achin, they found astonishing wealth. The Achinese sent an embassy to the powerful Dutch republic, and the envoys had audience of Prince Maurice in his camp before Grave in 1602. The Dutch kept up intermittent trade intercourse with them. In 1819 they concluded with the government of India a treaty which excluded from residence in Achin Europeans other than British. When in 1824 the British settlements in Sumatra were ceded to the Dutch, Great Britain stipulated that the Dutch should not conquer the little kingdom. The piratical instincts of the Achinese, however, led them into conflicts with the Dutch, who found it necessary to chastise them. In 1871, by the Hague Treaty, the British withdrew their reservation, and the Dutch sent an expedition in 1873 to capture the chief city and invade the country. They were beaten in this, as well as in other expeditions, and the country was not pacified until 1880, when a civil government was instituted. Outbreaks resulting in serious fighting occurred in 1896, 1898, and 1901-04. The Achin wars have cost the Netherlands 12,000 lives and nearly \$100,000,000 for blockade and naval and military operations, and the country is yet practically unsubdued in the interior. There are numerous works in Dutch treating of Achin, and there are in Holland many monuments and trophies of the war. Besides the historical work of Veth, *Atchin* (Leyden, 1873), the standard treatise on the Achinese is that of Christiaan Snouck-Hurgronje, *De Atjehers* (2 vols., Batavia, 1893-95).

ACHISH, ā'kīsh. A Philistine king of Gath, son of Maoch (1 Sam. xxvii. 2). When David fled from Saul, he took his refuge with Achish and became his vassal, receiving from him Ziklag in fief. Unwilling to fight against Judæans, Jerahmeelites, and Kenites, David made raids upon the Geshurites, Girzites, and Amalekites, while persuading Achish that he had been fighting the former tribes. Achish stood by his vassal when the Philistine confederacy began the war against Saul which ended with the battle of Mount Gilboa; but the other princes distrusted David and refused to have him take part in the expedition. The story in 1 Sam. xxi. 10-15 that David feigned madness when he first appeared before Achish is evidently out of place in the present context, but such a ruse is not impossible. The editor of Ps. xxiv. believed the story, but, thinking of Gen. xx. 2, wrote by mistake Abimelech for Achish. The name itself is of interest, as it is one of the few non-Semitic Philistine names that have been preserved.

ACHMET, äk'mët. See AHMED.

ACHMET, äk'mët, or **AHMED**, ä'mëd. The name of three sultans of Turkey, of whom Achmet III (reigned 1703-30) was the most famous. It was this sovereign who sheltered Charles XII after his defeat at Pultowa in 1709. He wrested the Morea from the Venetians in 1715. Having invaded Hungary, he was de-

feated by Prince Eugene at Peterwardein in 1716, and later near Belgrade, and compelled to cede to Austria, by the treaty of Passarowitz, 1718, Belgrade, the Banat, and other territories. The soldiers drove him from the throne in 1730, and he died in prison in 1736.

ACHOMAWI, ä'chō-mä'wë. A Shastan tribe in California. See SHASTA INDIANS.

ACHOR, ā'kōr. A valley which forms the northern boundary of Judah (Josh. xv. 7) near Jericho. Its identification is uncertain, though Wady-el-Kelt has been suggested, which, however, is not broad enough to become "a place for the herds to lie down in" (Isa. lxxv. 10).

ACHORION, ä-kō'rī-ōn. See FAVUS.

ACHRAS, äk'räs. See BLACK BULLY.

ACHROMATIC, äk'rō-mät'ik. See TELESCOPE.

ACHRO'MATISM (colorlessness, from Gk. *ἀ*, *a*, priv. + *χρῶμα*, *chrōma*, color). The property by virtue of which certain combinations of lenses and prisms refract a beam of white light without producing dispersion of certain colors. (See DISPERSION.) Newton, misled by imperfect experiments, concluded that dispersion could not be annulled without annulling refraction. Hall, in 1733, and later, Dollond (independently), found that certain media have large powers of refraction with small dispersion, while others give small refraction with large dispersion; so that the dispersion of two colors produced by one medium can be corrected by that due to another, while the deviation of the light from its original direction is not entirely annulled. For example, by properly combining a convex lens of crown-glass with a concave one of flint-glass an "achromatic lens" can be produced which will have the same focus for the two selected colors, while the foci for the other colors are at neighboring points along the axis of the lens. It is thus seen that the achromatism in the above arrangement is not perfect.

FIG. 1.
ACHROMATIC PRISM.

In Fig. 1 a beam of white light having the direction *cd* meets the crown-glass prism and is refracted. Dispersion also takes place, and the beam as it emerges is separated into its component

colors. Adjacent to the prism of crown-glass is one of flint-glass, whose action is to bring together the rays so that they emerge parallel, with the desired deviation. The reason is that prisms of different media do not give exactly similar spectra, the colors being dispersed according to different laws for different media. Fig. 2 shows achromatic combinations of lenses where the flint and crown glasses are combined with the same effect as in the achromatic prism illustrated. A combination of three lenses, or prisms, gives a better approximation to absolute achromatism than a combination of two.

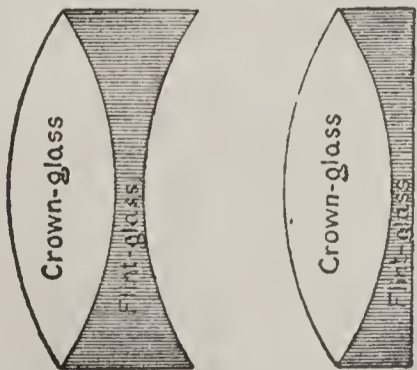

FIG. 2.
ACHROMATIC LENSES.

If a lens is to be used for visual observations, it is "corrected" generally for a definite wave-length in the yellow and one in the bluish green, i.e., these two colors

are brought to the same focus; but if it is to be used for photographic purposes, it is "corrected" for two wave-lengths, which include those radiations possessing the greatest photographic action. There are two defects which a lens may have, owing to chromatic aberration (q.v.), in that the colored images may be at different distances from the lens and that they may be of different sizes. The second of these defects is insignificant if the lens is thin; and the first may be "corrected," as just described, by combining two thin lenses. If the lens is thick, or if the lenses of the lens system are some distance apart, the second of the above-mentioned errors becomes serious. It may, however, be corrected.

A CHULA, ä-shōō'lä (Portug.). A dance similar to the fandango (q.v.).

ACHURCH', JANET (1864-1916). The stage name of Janet Achurch Sharp, an English actress, the wife of Mr. Charles Charrington. She was born in Lancashire, Jan. 17, 1864, and first appeared in London at the Olympic Theatre in January, 1883. In 1887 she joined Beerbohm Tree's company, and June 7, 1889, she took the management of the Novelty Theatre and created in English the part of Nora Helmer in *A Doll's House*. This was the first presentation of an Ibsen play to the English public. She has since toured with a company in India and Australia and appeared in the United States with Richard Mansfield (1895) and independently. In June, 1897, at the Olympic Theatre, London, she took the Shakespearean part of Cleopatra, and she appeared later in some of Bernard Shaw's plays. She appeared in the parts of Hermione in *Andromache* at the Garrick, February, 1901, and of Queen Katharine in *King Henry VIII*. In January, 1911, she played at court as Merete Beyer in *The Witch*.

ACHZIB, äk'zīb. 1. A Phœnician city claimed by Asher (Josh. xix. 29), but not conquered (Judg. i. 31); the modern Ez-Zib on the promontory of Ras-en-Nakurah, 9 miles north of Accho. Achzib is mentioned by Sennacherib. 2. A town in the Shephelah of Judah (Josh. xv. 44). Possibly the modern 'Ain-el-Kezbeh.

ACIDASPIS, äs'i-däs'pīs (Gk. *ἀκίς*, *akis*, spine + *ἀσπίς*, *aspis*, shield). A peculiar genus of trilobites found in rocks of Silurian and Devonian age in nearly all parts of the world. The individuals are, as a rule, small and are remarkable because of the spiny ornamentation of the dorsal shield or carapace. The lobation of the head shield is rather peculiar and quite unlike that seen in any other genus of trilobites, the trilobite division being obscured by a number of supplementary furrows and by the strong development of two longitudinal false furrows between the normal dorsal furrows. The thorax contains nine or ten segments, and the tail shield is of rather small size. In some species a row of slender spines is developed upon the sides of the head shield and a long spine projects from each posterior angle. Besides these there are often two long straight or curved spines directed upward and backward from the middle posterior edge of the head. Each segment of the thorax is produced laterally into long spines, and there are also two short spines on the raised median portion of each segment. The tail shield is in nearly all species likewise furnished with spines, so that on the whole these animals must, though of small size, have presented a rather formidable aspect to

larger animals which sought to prey upon them. A few species of the genus are of particular interest on account of the abnormal development of the eyes, which are placed at the summits of highly elevated, slender, though immovable, stalks, which arrangement enabled the animal to command a view in all directions. This elevation of the eye recalls the stalk-eyes of some modern crabs and lobsters. For illustration, see Plate of TRILOBITES.

ACIDIM'ETRY AND AL'KALIM'ETRY.

Terms applied in analytical chemistry to the determination of the amount of acid or of alkali, respectively, contained in a given solution, or to the volumetric determination of the relative strengths of acid and alkaline solutions.

ACIDS, *ās'idz* (Lat. *acidus*, sour). A large and important class of chemical substances. They all contain hydrogen, part or all of which is replaced when the acids are brought in contact with a metal as a base. (See **BASE**.) The compounds formed by substituting metals for the hydrogen of acids are termed the salts of those metals, and therefore the acids themselves may be regarded as salts of hydrogen.

Most acids have a sour taste and change the blue color of litmus to red. These properties, however, are not strictly characteristic of acids, silicic acid, for instance, possessing neither, though—like a true acid—it combines with metallic hydroxides to form salts.

According to the maximum number of their hydrogen atoms replaceable by metals acids are termed mono-basic, di-basic, tri-basic, etc. No matter how great the excess of potassium hydroxide employed, only one hydrogen atom of acetic acid, $C_2H_4O_2$, can be replaced by potassium, the only resulting salt having the formula $C_2H_3KO_2$. Acetic acid is, therefore, said to be a mono-basic acid. By the action of a limited amount of potassium hydroxide on sulphuric acid (H_2SO_4) a salt called the acid sulphate of potassium ($HKSO_4$) may be obtained; this salt is formed by substituting the metal potassium for one of the hydrogen atoms of sulphuric acid. But if an excess of potassium hydroxide is used, both of the hydrogen atoms of sulphuric acid are replaced by potassium, and the salt known as the neutral sulphate of potassium (K_2SO_4) is produced. Sulphuric acid is therefore said to be a di-basic acid.

Acids containing carbon among their constituent elements are called organic acids, because some of them were originally found in the organic world. Most organic acids are found to contain one or more carboxyl groups ($COOH$); it is the hydrogen of these groups that is replaceable by metals. These acids are called carboxylic acids, and their basicity is determined by the number of carboxyl groups they contain. The carboxylic acids are subdivided into carbocyclic and fatty acids, according as their molecules do or do not contain those rings of which the so-called aromatic benzene-nucleus is the most important. Thus benzoic acid, C_6H_5COOH , is a carbocyclic acid; acetic acid, CH_3COOH , is a fatty acid. An interesting group of substances belonging to the aromatic series and, like acids, combining with metallic hydroxides, are not included among the true aromatic acids because they do not contain the carboxyl group. These substances, called phenols (q.v.), are found to be weaker than the weakest carboxylic acid known, viz., carbonic acid.

The specific strength of an acid depends, natu-

rally, on its composition and chemical constitution. But the precise nature of that relation is as yet unknown. The correctness of the very methods of measuring the strength of acids is, according to some eminent authors, still subject to doubt. It is, however, remarkable and cannot be denied, that the different methods employed yield very nearly coincident results.

One of those methods consists in determining the avidity of acids for a metallic hydroxide, as shown by the proportion in which the latter is distributed between two acids when brought in contact with a mixture of the two, the amount of metallic hydroxide employed being insufficient to saturate both acids completely. For example: sodium hydroxide, sulphuric acid, and nitric acid are weighed out in such quantities that the sodium hydroxide is just sufficient to neutralize either one of the two acids. When the three substances are now mixed together in aqueous solution, it is found that two-thirds of the sodium hydroxide have been taken up by the nitric acid and only one-third by the sulphuric acid. The conclusion is drawn that nitric acid is twice as strong an acid as sulphuric acid. It is similarly found that hydrochloric acid, too, is twice as strong as sulphuric acid, and hence possesses the same strength as nitric acid. Acetic acid is found to be very weak.

Another interesting method of determining the relative strength of acids consists in measuring the rapidity with which various acids are capable of effecting the inversion of sugar; that is to say, the decomposition of sugar into dextrose and levulose. For example, if equivalent quantities of nitric and hydrochloric acids are added to two equal portions of a solution of cane-sugar, it is found that, under the same conditions of temperature and concentration, the inversion takes place with equal rapidity in both cases; the conclusion is drawn that nitric and hydrochloric acids are equally strong acids. It is similarly found that these acids are about twice as strong as sulphuric acid, while acetic acid is found to be very weak.

When an acid is dissolved in water, its molecules are assumed to become dissociated into ions, some of which are charged with positive, some with negative, electricity. Thus acetic acid is supposed to break up according to the following equation:

The dissociation is usually incomplete; that is to say, only a fraction of the amount of acid in solution is dissociated into ions, the rest remaining undissociated. So that a solution of acetic acid, for instance, contains three kinds of particles, viz., (1) positive hydrogen ions, H ; (2) negative ions, CH_3COO ; and (3) electrically neutral (undissociated) acetic acid molecules, CH_3COOH . The magnitude of the fraction dissociated, or, as it is called, the degree of dissociation of an acid, depends (*a*) upon the amount of acid in solution; (*b*) upon the temperature; and (*c*) upon the nature of the acid. Under the same conditions of concentration and temperature the number of free ions in solutions of different acids depends upon nothing but the nature of the acids. And as according to the electrolytic theory the capacity of an acid for conducting electricity depends upon nothing but

the presence of free ions in its solution, the electrical conductivity of the solution may be taken as a measure, so to speak, of the nature of the acid.

Now, when the acids are tabularly arranged in the order of their electrical conductivity, it is found that the order is the same as when they are arranged according to their avidity for metallic hydroxides, or when they are arranged in the order of the rapidity with which they can effect the inversion of cane-sugar.

A remarkable relation is thus seen, to exist between three phenomena having apparently no connection with one another. The common cause of these phenomena is assumed to be the presence of free hydrogen ions in an acid solution. Furthermore, on this assumption the neutralization of acids by metallic hydroxides is explained in the following manner. The fact that pure water is a non-conductor of electricity proves that its molecules are not dissociated into ions. If ions formed by the elements of water meet in a solution, they must immediately combine to form undissociated molecules of water. Now, while the solution of an acid contains electro-

positive hydrogen ions, $\overset{+}{\text{H}}$, the solution of a metallic hydroxide contains electro-negative hy-

droxyl ions, OH^- . When the solutions are mixed, these ions combine into neutral molecules of water, according to the following equation:

The disappearance of free hydroxyl and hydrogen ions as such causes the simultaneous disappearance of the properties both of the basic hydroxide and of the acid; and the acid and base are said to have neutralized each other.

ACINE'TA. A genus of protozoans, more particularly suctorial infusorians, with cilia only in the young state, lacking mouth and arms and absorbing food through tentacles. The body is fixed and stalked, and the tentacles are knobbed and retractile.

ACIREALE, ä'chè-râ-ä'lâ (Sicil. *Iaci*). A city in Catania, Sicily, 530 feet above the sea, at the mouth of the river Acis, which descends from Mount Etna to form a small harbor here, 9 miles northeast of the city of Catania (Map: Italy, K 10). The broad streets, spacious houses, and high towers rest on beds of lava, from which many of them were constructed after the earthquake of 1693. The climate is considered very healthful, and in summer the Terme di Santa Venere offers baths of tepid mineral water containing sulphur, salt, and iodine. There are pleasant walks and drives to neighboring villages on the slopes of Mount Etna, and the grotto of Galatea and the cave of Polyphemus are in the neighborhood. The coast south of Acireale is steep, and has risen more than 40 feet during the historical period. In the sea nearby rise the Scogli de' Ciclopi, the rocks which according to tradition were hurled after the wily Ulysses by the blinded Polyphemus. The most beautiful of them is about 230 feet high and 2300 feet in circumference, and consists of basalt containing wonderful crystals and covered with hard limestone with imbedded fossil shells. The city has a gymnasium and a technical school, and one of the old families possesses a splendid collection of Sicilian coins. The

manufactures are silk, linen, and cotton goods, knives and shears, and there is an important commerce in flax and grain. Pop., 1901, 35,203; 1911, 35,587.

A'CIS (Gk. "Ακίς, *Akis*). A small stream flowing from the foot of Mount Etna in Sicily, famous for its cold waters. Legend derived the name from Acis, son of Faunus and Symæthis, beloved by the nymph Galatea. The Cyclops Polyphemus, jealous of the boy, crushed him under a rock, and his blood, gushing forth, was changed into the river. See GALATEA.

ACK'ER, CHARLES ERNEST (1868—). An American inventor and manufacturer, born in Bourbon, Ind. After receiving a baccalaureate degree at Cornell University in 1888, he began the practice of electrical engineering in Chicago, where he remained until 1893. He originated the Acker process of manufacturing caustic soda by the electrolysis of molten salt and was the first in America to manufacture carbon tetrachloride. Works were built by him at Niagara Falls for the preparation of these and other products. He was granted many patents for inventions pertaining to chemical and electrochemical processes and was awarded the Cresson gold medal by the Franklin Institute. He became a member of many chemical and other scientific societies.

ACKERMANN, äk'ër-mân, JOHANN CHRISTIAN GOTTLIEB (1756–1801). A German physician, born at Zeulenroda in Saxony. He began the study of medicine in 1771 at the University of Jena under Baldinger, and was professor of medicine at the University of Altdorf from 1786 until his death. He is the author of *Institutiones Historiæ Medicinæ* (1792); *Institutiones Therapiæ Generalis* (1784–95); *Bemerkungen über die Kenntniss und Kur einiger Krankheiten* (1794–1800).

ACKERMANN, KONRAD ERNST (1712–71). One of the founders of German dramatic art. He began his career as an actor with the famous Schönmänn company at Lüneburg in January, 1740. Upon the outbreak of the disastrous Seven Years' War he sold a theatre he had erected in Königsberg, and the loss thus entailed compelled him thenceforth to lead a wandering life with his troupe. On July 31, 1765, he opened a new theatre at Hamburg, which, according to Lessing, eventually set the standard for theatrical performances in Germany. Besides the members of his own family, the companies organized by Ackermann included some of the ablest talent in Germany. The theatre was conducted by him until 1767, when it passed into the hands of twelve citizens of Hamburg, and was thereafter known as the *Deutsches Nationaltheater*. Ackermann's representations were models of freshness and vigor, and although he lacked qualifications requisite for heroic and emotional parts, his acting of many character rôles was remarkable.

ACKERMANN, LOUISE VICTORINE CHOQUET (1813–90). A modern writer of French poetry, who was born in Paris. In 1838, while studying German in Berlin, she met the linguist Paul Ackermann, whom she married (1843) and with whom she lived happily for some two years, when he died. Retiring to Nice, she published a number of charming and light-hearted poems under the title of *Contes en vers*. Seven years later, a morbid introspection at the thought of human suffering seemed to grow upon her, and she began to write poems that were remarkably

forceful in their thought, but gloomy and with a depth of despair which excited the attention of many readers. These were put forth under the titles *Poésies*, *Poésies premières*, and *Poésies philosophiques*. For a long time she wrote no more verses, but removed to Paris, where she became known for the distinguished people who frequented her salon. Her last book is *Pensées d'une solitaire* (Paris, 1874), containing a short autobiography. She died at Nice in 1890, having made a reputation that is likely to be lasting and that has been the theme of many criticisms. Consult the appreciation of Madame Ackermann written by the Comte d'Haussonville (1882), and Citoteux, *Mme. Ackermann d'après de nombreux documents inédits* (Paris, 1906). Anatole France has written of her in the fourth series of his *Vie littéraire* (1892).

ACKERMANN, RUDOLPH (1764-1834). A German-English inventor and publisher. He was born at Schneeberg, Saxony, and followed the occupation of coach builder and saddler in various German cities, as well as in Paris and London. He established an art school in London in 1795. In 1801 he patented a method of rendering paper, cloth, and other fabrics waterproof, and for this purpose erected a factory at Chelsea, England. He also contributed greatly to the development of lithography. It is, however, as a publisher of fine-art subjects that Ackermann is best known. His greatest achievement in this field was the *Repository of Arts, Literature, Fashions, Manufactures, etc.*, a publication which was continued regularly until 1828, when 40 volumes had appeared. Many of the plates were supplied by Rowlandson and other eminent artists. Among his other numerous illustrative works is *The World in Miniature* (43 vols., 1821-26).

ACKNOWLEDGMENT. 1. An admission by a person that he owes a debt or is subject to a liability which, but for such acknowledgment, would be barred by the statute of limitations. It need not be in any set form of words, but it must be a clear admission of an identified liability, and modern statutes often require it to be in writing. (See **LIMITATION OF ACTIONS**.) 2. The term is also applied to the formal act of declaring, before a notary public or other proper officer, that a written instrument executed by the declarant is his act and deed. It is applied also to the certificate of the officer setting forth the facts connected with such declaration. An acknowledgment is not essential to the validity of an instrument, unless made so by statute, although by recording acts (q.v.) it is generally required in order that the instrument may be lawfully recorded. In England and in many of our States a deed of conveyance or release of dower by a married woman is declared invalid by statute, unless, upon an examination apart from her husband, she acknowledges that she executed the deed of her own free will. Such a conveyance has taken the place of the conveyance by fictitious suit, known as a fine (q.v.). The object of this legislation has been declared by the United States Supreme Court to be twofold: not only to protect the wife by making it the duty of the officer taking the acknowledgment to certify that she has not acted under compulsion of her husband or in ignorance of the contents of the deed, but also to facilitate the conveyance of the estates of married women, and to secure and perpetuate evidence upon which innocent grantees as well as subsequent

purchasers may rely that the requirements of the statute necessary to give validity to the deed have been complied with. Such an examination and certificate is a quasi-judicial act, and can be impeached and invalidated only for fraud. Judges, clerks of courts, mayors, notaries public, commissioners of deeds, and justices of the peace are authorized in most States to take acknowledgments. The laws of the State in which the acknowledgment is to be used determine its sufficiency. For forms of acknowledgments consult Hubbell, *Legal Directory for Lawyers and Business Men* (New York, revised annually); Abbott's *Forms* (New York). See **DEED** and the authorities referred to.

ACLAND, CHRISTIAN HENRIETTA CAROLINE (1750-1815). Commonly known as Lady Harriet Acland, the wife of John Dyke Acland, an English officer in the American Revolution. She was married in 1770, and in 1776 accompanied her husband, then commander of grenadiers, to America, and with him endured most of the hardships of the Burgoyne campaign. Major Acland became dangerously ill in Canada, but was nursed back to health by her, and was again tenderly cared for by her after being wounded in the battle of Hubbardton (July 7, 1777). In the second battle of Saratoga (Oct. 7, 1777) he was severely wounded and became a prisoner in the hands of the Americans. Lady Acland, hearing of this, bravely entered the American camp, where she was received with the utmost courtesy. She rejoined her husband at Albany, and nursed him until his wounds had healed, when she returned with him to England. Major Acland died in 1778, as the result of a cold contracted while fighting a duel, and Lady Harriet, contrary to the usual accounts, did not marry again. Consult Stone, "Sketch of Lady Harriet Acland," in *Ballads and Poems Relating to the Burgoyne Campaign* (Albany, 1893).

ACLAND, Sir HENRY WENTWORTH DYKE (1815-1900). An English physician. He was born at Exeter and was educated at Oxford. He was one of the founders of the Oxford University Museum, and in 1859 published, with Ruskin, an account of the aims of that institution. He accompanied the Prince of Wales to America in 1860. He was knighted in 1890. In 1894 he tendered his resignation as regius professor of medicine at Oxford, which position he had occupied since 1858. His more important publications include the *Memoir on the Visitation of the Cholera in Oxford in 1854*, and *Village Health* (1884).

ACLAND, JOHN DYKE. See **ACLAND, CHRISTIAN HENRIETTA CAROLINE**.

ACLIN'IC LINE (not inclining, from Gk. *ἀκλίνας*, *aklinein*, to incline). This is an imaginary line around the earth between the tropics where the magnetic needle has no inclination; that is, where, when balanced free to turn in any direction, it places itself horizontal. It is called the magnetic equator, and is about 90° from the magnetic poles. The line is variable and irregular. In 1913, in the Western Hemisphere, it was south, and, in the eastern, north, of the geographical equator. Consult charts giving isoclinical lines for the world, published from time to time by the British Admiralty and for the United States by the Coast and Geodetic Survey. See **MAGNETISM, TERRESTRIAL**.

ACMITE (Gk. *ἀκμή*, *akmē*, point, edge). A sodium-iron silicate of the pyroxene (q.v.) group

that crystallizes in the monoclinic system, has a vitreous to resinous lustre, and is red to brown and green in color. It occurs in the older rocks in Sweden and Greenland, and in the United States minute crystals have been found in northwestern New Jersey, while fine prismatic crystals, frequently 8 inches in length, occur at Hot Springs and Magnet Cove, Ark. It is called acmite from the sharp-pointed extremities of its crystals.

ACCLITIC LINE.

ACNE: ACNE VULGARIS. Pimples (probably from Gk. ἀκμή, *akmē*, a point). An inflammatory disorder of the sebaceous glands of the skin (q.v.), characterized by the formation of papules, pustules, or tubercles, and running a chronic course. An acne lesion is a folliculitis due to the retention and decomposition of the sebaceous secretion, set up primarily by the acne bacillus, and later invaded by the pus-producing organism, *Staphylococcus pyogenes*. Predisposing causes of acne are puberty, a period of great and often perverted glandular activity; chronic indigestion and constipation, anæmia, uterine disorders, and general debility from whatever cause. Certain drugs, notably the iodides and bromides, produce the eruption. Pimples are most frequently found on the face, particularly about the nose, chin, and forehead, but also occur on the chest, shoulders, and back. Comedones, or blackheads, are usually associated with, and may produce, acne pustules. They arise from the sealing of the mouths of the follicles by dust or sebaceous matter, and when squeezed out appear as a spiral, white mass with a black point, resembling a worm, for which they have been mistaken. In the expressed matter a parasite, *Acarus folliculorum* (q.v.), may be found. *Acne indurata* is a pustular form of the disease, resulting in the production of large, irregular, deep-seated lesions, tender to the touch and exceedingly resistant to remedial measures. Treatment must include the correction of the underlying causes above enumerated, and the administration of tonics, of which arsenic, iron, sulphur, and calcium sulphide are most beneficial. A diet free from highly seasoned foods, alcoholic beverages, tea and coffee, is a necessary adjunct to the cure, together with hygienic measures such as outdoor exercise and

cold baths. Locally, hot bathing with soap and water, followed by a cold douche, cleanses and tones up the skin. Mild antiseptic lotions containing sulphur, mercury, salicylic acid or ichthyol are useful in freeing the skin from germs and reducing inflammation. Of late years light therapy (see PHOTOTHERAPY) has been employed with success, especially the Roentgen ray; and vaccines, prepared from the acne bacillus and various strains of staphylococcus (see SERUM THERAPY; VACCINE THERAPY), have given brilliant results in many cases.

Acne rosacea is a chronic hyperæmic disease of the face, more especially of the nose, characterized by hypertrophy, redness, dilatation of the blood vessels, and acne. In one form acne papules and pustules are abundant, and appear on a background of bright red, infiltrated skin. In another form of acne rosacea there is in addition a hypertrophy of the nose or chin. If the hypertrophy becomes excessive, the term acne hypertrophica or rhinophyma is applied. The causes of rosacea are in the main similar to those of acne vulgaris, but the disease appears late in life, and is often due to the excessive use of alcohol in men, and tea in women.

ACOCK'BILL. See ANCHOR.

ACEMETÆ, äs'è-mè'tè (Gk. ἀ, *a*, priv. + κοιμάσθαι, *koimasthai*, to sleep). A class of Greek monks called watchers, who chanted service continuously day and night, dividing, like sailors, into three watches. They originated about 400 A.D. on the Euphrates, later appeared in Constantinople, and established many monasteries, the chief one being the Studium in Constantinople itself, erected by the consul Studius in 471. They were excommunicated in 534 by Pope John II for opposing the formula, "One of the Trinity suffered," and thus placing themselves on the Nestorian side.

ACOIN, ä-kō'in. A white crystalline substance, soluble in water, derived from guanin, and closely related to caffeine and theobromine. Chemically, it is di-para-anisyl-mono-phen-ethyl-guanidin-chlor-hydrate. Experiments have shown that it is less toxic than cocaine (q.v.), and it was formerly employed as a substitute for that drug to produce local anæsthesia in the eye.

ACOLLAS, ä'kō'lä', EMILE (1826-91). A French jurist and publicist. He was born at La Châtre and was educated at Bourges and Paris. He was one of the most conspicuous representatives at the Congress at Geneva in 1867, when the formation of a general European democratic confederation was advocated and upon his return to France was condemned to one year's imprisonment for his active participation in the deliberations of that party. In 1871 the Paris Commune nominated him, during his absence in Switzerland, president of the legal faculty, and in 1880 he was appointed inspector-general of the penitentiaries. Among his numerous publications, all of which emphasize the principles "Droit et Liberté," the most important is *Cours élémentaire de droit*, a work consisting of seven volumes, published in the form of manuals.

ACOLYTES, äk'ō-lits (Gk. ἀκόλουθος, *akolouthos*, a follower). A name occurring first about the third century, and applied to functionaries who assisted the bishops and priests in the performance of religious rites, lighting the candles, presenting the wine and water at the communion, etc. They were considered as in holy orders and ranked next to sub-deacons.

These services have since the seventh century been performed by laymen and boys, who are improperly called acolytes; but in the Roman church aspirants to the priesthood are still at one stage consecrated as acolytes and receive candles and cups as the symbols of the office. See **ORDERS, HOLY**.

ACOMA, á'kō-mà. An Indian pueblo in Valencia Co., New Mexico, about 70 miles west of Albuquerque (Map: New Mexico, E 2). Pop., 1900, 492; 1902, 650; 1910, 828. With Isleta it has the distinction of occupying its sixteenth-century site, and is the oldest continuously occupied town in the United States. It was visited (1540) by members of Coronado's expedition, by Espejo (1583) and Juan de Oñate (1598). Espejo named it Acoma; previously it was known as Acus, Acuco, and Coco. In December, 1598, Juan de Zaldivar, of Oñate's force, visited Acoma and, with half his party of 30, was killed by the natives. In the next month his brother Vicente killed half the Acoma population of 3000 and partly burned the pueblo. Franciscans labored here before 1629 and later established the San Estevan Mission. The Acomas successively occupied many village sites in prehistoric times, the last before Acoma being Katzimo, the enchanted mesa, 3 miles distant. Water in the Acoma mesa is obtained from natural cavities in the rocky summit (357 feet high). The Acoma reservation comprises 95,792 acres. Consult: H. H. Bancroft, *History of Arizona and New Mexico* (San Francisco, 1889); Lummis, *Land of Poco Tiempo* (New York, 1893); and Hodge, "The Enchanted Mesa," in *National Geographic Magazine*, vol. viii (Washington, 1897).

ACONCAGUA, ä'kōn-kä'gwä; Span.-Amer. pron. kä'wä. An extinct volcano in the southern part of the Andes, situated in lat. 32° 39' S., long. 70° W., on the boundary line between Chile and Argentina, and belonging to the latter (Map: Chile, C 10). It is usually considered the loftiest mountain in America, its estimated height being about 23,000 feet. A river of the same name rises on the south slope of the mountain and enters the Pacific after a course of over 200 miles. Consult: E. Fitzgerald, "The First Ascent of Aconcagua," in *McClure's Magazine*, vol. xi (New York, 1898); Sir M. Conway, "Aconcagua and the Volcanic Andes," *Harper's Magazine*, vol. c (New York, 1899).

ACONCAGUA. A central province of Chile, lying to the west of Mt. Aconcagua (q.v.) about in lat. 32° S. Its most fertile part is the valley of the Aconcagua River, after which it is named (Map: Chile, C 10). It covers an area of 5487 square miles. The mountainous regions which occupy the larger part are mostly barren, while the valleys have rich soil and produce different kinds of fruit, hemp, grain, and wine. The province contains considerable deposits of copper, silver, iron, lead, etc., and mining is the principal industry. Pop., 1895, 113,165; 1903, 132,670; 1910, 132,730. Capital, San Felipe (q.v.).

ACONITE, ACONITUM (Lat. *aconitum*, Gk. ἀκόνιτον, *akoniton*, wolf's-bane). A genus of about 70 species belonging to the family Ranunculaceæ, and mostly found in mountainous regions of northern latitudes. The large, showy flowers (usually blue), with their large and hooded or helmet-shaped sepal, have made them common ornamental plants. The characteristic hood of the flower is responsible for the common name "Monk's-hood." The roots, and sometimes

the flowers, are very poisonous, containing a number of alkaloids. The best known and most poisonous species is *Aconitum napellus*, which yields the officinal aconite. A number of species are cultivated for ornament, some of them having white or yellow flowers. There are comparatively few native species of aconite in the United States, three belonging to the eastern United States and several others in the Rocky Mountains and on the Pacific coast.

ACONITINE, a-kōn'ī-tīn or -tēn. See **ALKALOIDS**.

ACONTIUS, ä-kōn'shī-ūs (Gk. Ἀκόντιος, *Akontios*). The hero of a classic love story contained in a lost poem of Callimachus (q.v.) and also given by Ovid (*Heroides* xx, 21). He is a youth from Ceos, who, being at Delos and in love with Cydippe (q.v.), throws at her feet an apple on which he has written, "I swear by the sanctuary of Artemis to marry Acontius." Inadvertently she reads the words aloud, and in spite of her inclination to have nothing to do with the youth, is held by the goddess to her vow thus made. Consult Morris, "The Story of Acontius and Cydippe," in *The Earthly Paradise*, part iii (London, 1872).

ACORN, ä'kōrn or ä'kērn (properly, fruit of the field, AS. *æcer*, a field). The nut-like fruit of different species of oak. It consists of the nut proper and the cupule, or saucer or cup. The acorns from different species differ much in size, form, color, and taste. A few kinds of acorns are sweet and not unlike chestnuts in flavor, but most are bitter and more or less astringent in taste, owing to the presence of quercin, or some similar bitter principle, and tannin. On an average, the flesh of fresh acorns has the following percentage composition: water, 34.7; protein, 4.4; fat, 4.7; nitrogen, free extract, 50.4; crude fibre, 4.2; and ash, 1.6. The shell makes up 18 per cent of the total fruit, the flesh 82 per cent. Acorns are a favorite food of wild hogs and have been used since earliest times as feeding stuff for domestic animals, especially pigs. It is customary to let the pigs gather this food. Acorns and beechnuts are commonly spoken of as mast. The agreeable flavor of the pork, ham, and bacon of the razor-back hog of the southern United States is attributed in no small degree to its being fed on acorns. On the other hand, an excess of acorns may produce a soft, spongy flesh and an oily lard. This, however, is usually obviated by feeding corn for two or three weeks before slaughtering. Acorns have been successfully fed to milch cows and to poultry, but numerous cases of acorn poisoning in cattle are on record. In the United States acorns are not much eaten by men. Under the name "Biotes," the fruit of *Quercus emoryii* is used as food in the southwest. Sweet acorns are eaten occasionally in different regions, mainly by children. The Indians of the Pacific coast region from northern California to Mexico use acorns in considerable quantities. Dried and pounded, they are made into a sort of mush and also into bread. The acorn meal is usually leached to free it from tannin and whatever bitter principle is present. When the meal is used for bread, a kind of clay is sometimes mixed with it. In several regions of Italy, notably Umbria, Tuscany, Emilia, and the Marches, acorn meal made into a sort of bread with the addition of two-thirds ground grain is a common article of diet. The bread is black and heavy and not readily digestible.

Dried acorns ground are sometimes used as a substitute for coffee. See OAK.

ACORN-SHELL. A sessile barnacle of the family Balanidæ. See BARNACLE.

ACORUS (Gk. *ἄκωρος*, *akoros*, sweet-flag). A genus of two species belonging to the family Araceæ. (See ARUM.) One of the species, *Acorus calamus*, is widely distributed in the north temperate regions, while the other species is restricted to China and Japan. The range of the species is in swamps or along streams from Nova Scotia to Minnesota and southward to Louisiana and Texas. The very long horizontal rootstock sends up sword-shaped leaves and also a leaf-like stem which bears on one side a cylindrical cluster of small greenish-yellow flowers. It is the long aromatic rootstock (an underground stem) that is used and is called "calamus root." It is a powerful medicine of transient tonic effect, occasionally used, especially in cases of weak digestion. In many places on the Continent of Europe it is found in confectionery shops sliced and prepared with sugar. It is also used to correct the empyreumatic odor of spirits and to give them a peculiar flavor. In Great Britain it is chiefly employed by perfumers in the manufacture of hair powder.

ACOSTA, à-kōs'tà, GABRIEL, later URIEL (1594?-1647). A Portuguese philosopher, descended from a Jewish family. He was born at Oporto. After being educated in the doctrines of the Roman Catholic church, when 25 years of age he became skeptical, and then adopted the Jewish faith; but as the profession of such was not allowed him in his own country, he fled to Amsterdam, where he was formally received into the Jewish community, and changed his name, which had been Gabriel, to Uriel. But what he conceived to be the Pharisaism and spiritual pride of the Amsterdam Jews disgusted him, and he opposed many of their ideas and especially denied that the doctrine of immortality had any Mosaic sanction. Hence he became involved in a controversy with his rabbinical teachers. On account of his work, entitled *Examen dos tradiçoens Phariseas conferidas con a ley escrita* ('Examination of Pharisaic Traditions Compared with the Scripture'), 1624, he was charged with atheism by the Jews before the city magistracy and fined. He was also excommunicated and so remained for seven years, when he recanted after ignominious treatment. He died in 1647 by suicide. His autobiography was first published by P. Limborch in Latin, 1687; English translation, London, 1740; Latin and German edition, H. Jellinek, Leipzig, 1847. He is the hero of an effective tragedy, *Uriel Acosta*, by Gutzkow, and of a sketch by Zangwill in *Dreamers of the Ghetto* (Philadelphia, 1898). Consult: Klaas, *Uriel Acosta. Leben und Bekennntnis eines Freidenkers vor 300 Jahren* (Berlin, 1909).

ACOSTA, JOAQUIN (1799-1852). A South American geographer. He was born at Guaduas, Colombia. In 1834 he made a tour with the botanist Céspedes through the valley of the Socorro as far as the Magdalena, and seven years afterward traveled from Antioquia to Anserma for the purpose of studying the history and customs of the native tribes. Besides an excellent map of New Granada, Acosta published the following interesting and valuable works: *Compendio histórico del descubrimiento y colonización de la Nueva Granada en el siglo décimo sexto* (1848);

Semenario de la Nueva Granada, Miscellánea de ciencias, literatura, artes e industria, with portraits and map, published in conjunction with Laserre under the direction of Francisco José de Caldas (1849).

ACOSTA, JOSÉ DE (1539-1600). A Spanish Jesuit. He was born at Medina del Campo, Spain. He entered the Society of Jesus and went as missionary to Peru, where he labored for many years. Upon his return home he became superior of the Jesuit Seminary of Valladolid, and afterward rector of the University of Salamanca, where he died. His fame rests upon his work on the natural history of the New World and the efforts put forth for its evangelization, published in Latin at Salamanca in 1589 and in Spanish (Seville, 1590). The last-named publication was under the caption *Historia natural y moral de las Indias*, and was several times reprinted and translated into French, Dutch, and English (*The Naturale and Morale Historie of the East and West Indies*, London, 1604).

ACOUCHEY, à-kōō'shê, or **ACUCHI**. See AGOUTI.

ACOUMETER, à-kōō'mê-têr or à-kou'-, or **AC'OUSIM'ETER** (Gk. *ἀκούειν*, *akouein*, to hear + *μέτρον*, *metron*, measure). An instrument used to determine the acuteness of hearing. It is a small steel bar which, when struck by a hammer, gives a uniform sound.

ACOUSTICS, à-kou'stiks or à-kōō'- (Gk. *ἀκουστικός*, *akoustikos*, relating to hearing, from *ἀκούειν*, *akouein*, to hear). The name applied to the science of the phenomena of sound. The name "sound" is given to the sensation perceived by the auditory nerves, and it is a matter of everyday experience that the immediate cause of the sensation is some vibrating body, e.g., a violin string, a drum-head, a hammer when striking a nail. This was early recognized, and, so far as acoustics is considered as a science dealing with the vibrations of matter and with the waves produced in the air by this motion, the history of its development is identical with the progress of mathematics and dynamics from the time of Galileo and Newton to the present. Few dates can be assigned to definite discoveries. The laws of vibrations of a stretched string were first deduced mathematically by Brook Taylor in 1715 and by Daniel Bernoulli in 1755, although they had been discovered experimentally by Mersenne in 1636. Longitudinal and torsional vibrations of bars were first investigated by Chladni (1756-1827). Daniel Bernoulli was the first to attack the problem of the lateral vibrations of bars; but the mathematical treatment of the question is still of interest. Poisson (1829) was the first to give a correct mathematical solution of the free vibrations of a membrane, and good experimental work on the subject has been done by Savart, Bourget, and Elsas. The vibrations of plates have been studied mathematically by Poisson, Kirchhoff, and more recent writers, and experimentally by Chladni, Savart, and Wheatstone. A full account of the history of the mathematical side of acoustics will be found in Rayleigh's great work on the *Theory of Sound*.

The history of that portion of acoustics which considers the phenomena of the sense of hearing, harmony, discord, pitch, etc., begins undoubtedly with the earliest days of civilization. It was known to Pythagoras (sixth century B.C.)—and to whom before him no one can tell—that sounds were in harmony when produced by two

stretched strings of the same material, cross-section and tension, provided their lengths were in the ratio of 1 : 2, 2 : 3, or 3 : 4. Mersenne discovered in 1636 that the frequencies of such vibrating strings varied inversely as their lengths, and so proved that for two notes to be in harmony it was necessary for their frequencies to bear simple numerical relations to each other. No explanation of this fact was given until the great research of Helmholtz, begun in 1854, the results of which were published in 1862 in his classical work on the *Sensations of Tone*. Helmholtz was the first to discover the existence of summational tones, although the differential tones were discovered probably by Romieu in 1743, and certainly by Sorge, the court organist at Lobenstein, in 1745. Helmholtz's theory of vowel sounds is still under discussion. Most interesting work on audition has been done in recent years by Rudolf König of Paris and Professor Bevier of Rutgers College.

Many of the physical properties of sound are matters of common experience and can readily be appreciated. In the first place, it is well known that an interval of time elapses between the vibration of the body and the perception of the resulting sound if the vibrating body is at a considerable distance; thus the flash of a gun is seen before the sound is heard. It was shown by Otto von Guericke that if a bell is set ringing in a glass jar from which the air has been exhausted no sound is heard; so that the presence of some material medium between the vibrating body and the ear is essential for the production of sound. This medium need not be air, but may be water, or, in fact, any gas, liquid, or solid which can carry waves. The whole mechanism is, then, as follows: The vibrations of the body, e.g., a drum-head, produce waves in the medium in contact with it, e.g., the air; these waves spread out through the medium and, after a certain interval of time, reach the ear; in the ear the waves produce motions of the ear-drum and corresponding effects in the internal ear where the auditory nerves have their endings. It should be noted that not every vibration will produce waves in a fluid medium; because if the number of vibrations per second is too small, the fluid will simply flow around the body as it vibrates, and so will not be compressed; consequently, in order to produce waves in a fluid, the frequency of the vibrations of the body must exceed a certain number, which depends upon the viscosity and density of the fluid. Further, it is evident that, since fluids can carry only compressional (i.e., longitudinal) waves, the production of the sound-sensation is due to waves of this kind. The difference between the longitudinal and the transverse wave can be appreci-

FIG. 1.

ated by reference to the accompanying diagram, Fig. 1. In this illustration 1 represents a row of particles at rest; these particles displaced to form a simple transverse wave are shown in 2, while a longitudinal wave is shown in 3.

Here each particle moves to and fro in the direction of the line of propagation of the wave, and the amplitude of the wave is the distance that each particle moves from its position of rest, while the wave-length is the distance between similar points of condensation and rarefaction, as from 4 to 4. Although sound is produced by longitudinal waves, there is no reason for believing that all compressional waves will produce sounds; some may be too long or too short to affect the nerves of the ear.

Our sense of hearing distinguishes between two great classes of sounds: noises and musical notes. A noise is recognized as being abrupt, discontinuous, and exceedingly complex; a musical note is smooth, continuous, and with a definite, regular character. We distinguish, further, between different musical notes as being simple or complex, meaning, by the latter, a note in which we can recognize the presence of several simple tones. Thus, if a piece of paper is torn, or two blocks of wood struck together, we call the resulting sound a noise. The vibrations of a tuning-fork cause a simple musical note; while if a banjo string is plucked we hear a complex note. Complex notes differ greatly in their character. They are said to have "quality" or "timbre"; thus, a sound produced by an organ-pipe has a quality entirely different from one produced by a piano or by a drum. Simple notes may differ in loudness and in shrillness or "pitch"; thus, a note of a definite pitch may be loud or feeble, and the pitch of a piccolo note is quite different from that of a note produced by a flute.

Waves and Vibrations. Since the direct cause of a sound is the reception into the ear of waves in the air, it is necessary to analyze the nature of these waves. We may have an irregular, isolated disturbance, which is analogous to a "hump" passing along a stretched rope, or to the effect of dropping several stones at random intervals into a pool of water; or we may have a regular continuous succession of waves identical in all respects, which is called a "train of waves." The simplest kind of train of waves is what is called a "simple harmonic" train, such as is produced in any medium by a simple harmonic vibration of the body which is causing the waves. (Vibrations of a pendulum are simple harmonic.) Such a train of waves is characterized by its "wave-number" and "amplitude"; the wave-number being the number of individual waves which pass a given fixed point in one second, while the amplitude is the extent of the path of vibration of any particle of the medium through which the waves are passing. The velocity of waves of a definite character, e.g., compressional ones, in any definite homogeneous medium depends upon the properties of the medium itself, not on the wave-number or amplitude of the waves. So, if λ is the wave-length, i.e., the distance from one point in the medium to the next point, measured in the direction of advance of the waves, where the conditions are identical with those at the first point, and if N is the wave-number, the velocity of the waves V is given by the formula

$$V = N \lambda$$

Consequently, if N is known, λ can be calculated, and vice versa; and the characteristics of the simple harmonic train of waves may be said to be its wave-length and its amplitude. If several

trains of waves are passing through the same medium at the same time, the resulting waves—called a “complex” train—is simply the sum of the individual waves, the motion of any particle of the medium being the geometrical sum of the motions which it would have, owing to each of the separate trains of waves. (This is rigidly true only if the amplitudes of these separate trains are very small compared with their wavelengths, as in general they are.) This is shown

FIG. 2.

in Fig. 2, where *A* and *B* are two sets of simple harmonic waves which form the resultant wave *C*. This wave is obtained by taking the algebraic sum of the motion of the particles. The point *b''* is obtained by taking *a''b''*, equal to the sum of *a b* and *a'b'*, *c'' d''* is the sum of *c d* and *c'd'*, the latter, as it occurs below the axis, considered as having a negative sign. Conversely, it may be shown that any complex train of waves may be analyzed into simple harmonic trains. Therefore complex trains of waves may differ in several ways: 1. The number of the component simple harmonic trains. 2. Their wave-numbers and amplitudes. 3. Their relative “phases,” for two waves are in different phase if the maximum displacement due to one train does not coincide in position with that due to the other; or, looked at in another way, the component trains may have been started at irregular intervals. Since waves are due to the vibrations of some elastic body (e.g., a tuning-fork, the air in an organ-pipe or horn), it is necessary next to analyze the nature of vibrations. We may have an irregular vibration, consisting of only a few to and fro motions, then a sudden change into another vibration of a different character, the whole motion lasting only a short time, e.g., when a piece of stiff paper is torn or when a scratching pen is used in writing; or we may have a regular continuous periodic vibration. The simplest possible periodic vibration is like that of a simple pendulum, and it is called “simple harmonic.” It is characterized by a definite number of vibrations per second, i.e., its “frequency,” and by the extent of the swing, i.e., its “amplitude.” If a second pendulum is suspended from the bob of the first, and a third from the bob of the second, the vibration of the third and lowest bob is no longer simple harmonic in general. Its vibration is called “complex,” and it is evident that it is the sum of the vibrations of the separate pendulums. Complex vibrations may, therefore, differ in the number of the component vibrations and in their frequencies, amplitudes, and relative phases.

Sound Sensation. It would be expected that there should be some connection between the nature of the vibrations of the vibrating body, that of the waves produced, and that of the sound heard. Such is the case. A noise is al-

ways produced by an irregular, disconnected disturbance in the air; and this in turn is due to an irregular succession of vibrations, each lasting for a brief interval. A simple musical note is always due to a simple harmonic train of waves, and this to a simple harmonic vibration. The loudness of the note varies directly with the amplitude of the waves; whatever increases the amplitude of the waves increases the loudness of the sound, and vice versa. It is increased, therefore, by an increased amplitude of the vibration; and it decreases as the distance from the ear to the vibrating body is increased. (It should not be thought, however, that numerical values can be given the loudness of a sound, or that there is any fixed numerical relation between the amplitude of the waves and the intensity of the sensation.) The pitch of the note depends upon the wave-number of the waves entering the ear; whatever increases the wave-number “raises” the pitch, and vice versa. Therefore, if the ear and the vibrating body are at a fixed distance apart, and at rest with reference to their positions in space, the pitch will vary directly with the frequency of the vibrating body; thus we often use the expression, “a pitch of 300,” meaning the pitch of a sound produced by a vibrating body which makes 300 complete vibrations in one second. If, however, the vibrating body is approaching the ear, or if the ear is approaching the vibrating body, the number of waves entering the ear is greater than it would be if there were no such motion; and so the wave-number is greater than the frequency of the vibrating body, and the pitch of the sound is raised. Similarly, if the distance between the ear and the vibrating body is increasing, the wave-number is less than the frequency of the vibration, and the pitch is lowered. This change of pitch, due to the relative motions of the ear and the vibrating body in the surrounding medium, is known as Doppler’s Principle (q.v.), and is illustrated by the sudden drop in pitch if one stands on the platform of a railway station and listens to the whistle of a locomotive passing at a high speed.

A complex musical note is always due to a complex train of waves, and this, in turn, to a complex vibration, if there is only one vibrating body. Further, two notes which differ in quality may be shown to be due to complex trains of waves which differ in complexity. But it should be noted that all experimental evidence points to the idea that differences in relative phases of the component trains of waves do not cause differences in the quality of the sound heard. In other words, two complex trains of waves made up of the same simple waves will produce the same sound, regardless of the phases in the two trains. This may be explained by saying that the ear automatically resolves a complex train of waves into its simple harmonic component trains, hears the simple tones due to each of these, and therefore has a complex sensation. This statement is called “Ohm’s law for sound-sensation.”

Fundamental, Partial, and Combinational Vibrations. Musical instruments may be divided roughly into two classes, wind and string instruments. In the former class are included organ-pipes, horns, flutes, etc.; in the latter, pianos, violins, harps, etc. In all wind instruments a column of air inclosed in a metal or wooden tube is set in vibration by suitable means, and this vibrating mass produces the waves in the surrounding air. In string instru-

ments flexible strings are stretched between pegs fastened to a solid frame—in general a wooden board—and they are set in transverse vibration by bowing, plucking, or striking. As a result of the vibration of the string, the frame holding the pegs is itself set in vibrations of the same frequency, and it, as well as the string itself, produces the waves. The importance of the so-called sounding-board is at once evident. A

FIG. 3.

stretched flexible string, $A B$, can vibrate in many waves: as a whole, with its middle point its point of greatest amplitude, as in 1 (Fig. 3); in two parts, with its middle point, b , at rest, and the two halves vibrating like separate strings in opposite phases, as in 2 (Fig. 3); in three parts, with two points, c and b , at rest, dividing the string into three equal vibrating segments, as in 3 (Fig. 3), etc. The frequencies of these different modes of vibration are in the ratios of $1 : 2 : 3 : 4$, etc. The vibration of the string as a whole is called the "fundamental"; the others, the "upper partials." The frequency of the transverse vibrations of a stretched flexible string is given by the formula

$$N = \frac{1}{2L} \sqrt{\frac{T}{m}}$$

where T is the stretching force or tension, m is the mass of each unit length of the string, L is the length of the vibrating segment. Thus, in the fundamental, L is the length of the string; in the first upper partial it is one-half the length of the string, etc. When the string is set vibrating by a random blow or bowing, it will make complex vibrations, resulting from the combination of the fundamental and some of the upper partials, the number and relative intensities of these depending largely on the point where the blow is struck, or the bow applied, and on the character of the impulse. So, whenever a musical tone is produced by a string instrument, the ear can recognize in the complex sound simple tones due to the fundamental and the upper partials; and differences in the quality of sounds caused by different string instruments, which have fundamentals of the same

fundamental and upper partials whose frequencies are in the ratios of $1 : 2 : 3 : 4$, etc. The frequency of the vibrations of the fundamental in an open organ-pipe is given by the formula:

$$N = \frac{V}{2L}$$

where V is the velocity of waves in the gas which fills the pipe, and L is the length of the pipe approximately. The similar formula for a "stopped" pipe is:

$$N = \frac{V}{4L}$$

(In stopped organ-pipes the vibrations are in the ratios $1 : 3 : 5 : 7$, etc.) In other instruments than wind and string ones, such as drums, cymbals, etc., there are upper partials besides the fundamental; but there is no simple mathematical relation between their frequencies. When two organ-pipes on the same wind-chest are "sounded" loudly, the resulting waves in the air are not due simply to each fundamental and its upper partials, but also to certain extra vibrations due to the combined action of the two vibrating columns of air on the surrounding air. Thus, if the fundamentals of the two pipes have frequencies 1000 and 600, there will be present waves showing the existence of vibrations whose frequencies are $1000 + 600$ and $1000 - 600$. The sounds heard owing to these vibrations are called "summational" and "differential" tones, or, in general, "combinational" tones; they are often difficult to hear. The existence of both partial and combinational vibrations may, however, be established by means of resonators (q.v.).

Harmony and Discord. If two organ-pipes whose frequencies do not differ much are sounded together, the ear observes a fluctuation in the loudness of the resulting sound. It is first loud, then weak, loud and weak, etc., giving rise to what are called "beats," the number of beats per second being equal to the difference in the frequencies of the pipes. Thus, two pipes of frequencies 280 and 285 produce 5 beats per second. The explanation of the phenomenon lies in the superposition of the two resulting trains of waves; for, if the wave-number of one train exceeds that of the other by five, it will happen five times in the course of a second that when one train of waves reaches the ear in a certain phase, the other train will reach the ear in an exactly opposite phase; and so the two waves will tend to neutralize each other's action and thus make the sound weak; whereas, in between these instants of weakness there will be

FIG. 4.

frequency, are due to differences in the number and character of the upper partials, which depend in turn on the material of the string, the point where the impulse is applied to set the string in motion, and the character of this impulse. Similarly, the vibrating column of air in organ-pipes, horns, etc., can vibrate in different ways; and in a complex vibration there is a

others when the two waves reach the ear in the same phase, and so reinforce each other and thus make the sound loud. This is shown diagrammatically in Fig. 4, where there are two trains of waves of unequal wave-number which interfere and produce beats. The wave-length of one set is $A d$, which is four-fifths of $A l$, the wave-length of the other. The two waves at A are in

the same phase, and there is increased sound; but as the motion progresses, one train loses with respect to the other, until they are in opposite phase, as at *C* and *D*, where silence ensues. Beats are disagreeable to hear, for the same reason that a flashing light is unpleasant to see, or a tickling feather to feel, namely, the nerves being first stimulated, then allowed to recover partially, then again stimulated, etc., are disagreeably affected. The degree of unpleasantness depends in part on the number of beats, but also on the pitch of the note, whose intensity is fluctuating. Beats can be formed by the interference of the upper partials as well as by the fundamentals, and by the combinational vibrations also. Thus, if two organ-pipes of frequencies 500 and 252 are sounded together, the first upper partial of the pipe whose fundamental is 252, i.e., a note of frequency 504, will beat with the other fundamental whose frequency is 500. If, however, two organ-pipes are sounded whose fundamentals are such that there are no beats except between the upper partials of high orders, the sensation should be a pleasant one; and such is observed. To secure such a condition it is evident that the ratios of the frequencies of the fundamentals must be simple fractions, 1 : 1, 1 : 2, 1 : 3, 2 : 3, 1 : 4, 3 : 4, etc. Such combinations of two notes produce what is called "harmony." On the other hand, whenever beats can be expected between two notes or their partials, or their combinational notes, an unpleasant sensation called "discord" is observed, it being possible to predict the degree of the discord from the number of beats which most occur. This explanation of harmony and discord is due to Helmholtz. The explanation of "melody," that is, the pleasant sensation perceived when notes, suitably chosen, are sounded consecutively, is not known definitely. (See, however, a paper by Sabine, American Association for the Advancement of Science, 1907.) For the discussion of the formation of musical scales based on these simple harmonies, see MAJOR; MINOR.

Limits of Hearing. Aerial waves of all wave-numbers do not affect the auditory nerves of the normal human ear, it being found by trial that wave-numbers less than 30 do not produce a musical tone, and wave-numbers exceeding about 20,000 do not produce sound at all. For musical purposes the extremes are about 40 and 4000. To study waves whose wave-numbers exceed 10,000 (and in fact for those of much less number) the best instrument is the "sensitive flame," which consists ordinarily of an ignited jet of gas escaping from a small circular orifice under high pressure, thus giving a more or less cylindrical flame about a foot high. When waves of a great wave-number fall upon such a flame, they break through the inclosing envelope separating the gas from the air, thus causing the jet to "flare" out like a fan.

Velocity of Sound. The waves produced in the air by vibrating bodies are often called "sound waves," although the name is not a good one. Similarly, compressional waves in any medium, solid, liquid, or gas, are called "sound waves" in these media. These waves spread out from the vibrating body into the surrounding medium with a velocity called the "velocity of sound," which depends alone upon the elasticity of the medium with respect to a compression and upon its density, if the medium is homogeneous. Like all waves, they may experience reflection, e.g., echoes; refraction, as when pass-

ing from cold air to hot air, or dense air to rare; dispersion; interference. Reference should be made to a paper by Prof. R. W. Wood in the *Philosophical Magazine*, vol. xlvi, p. 218, 1899, for a description of a most interesting series of experiments on these properties of aerial waves.

The best determinations of the velocity of these waves are given in the following table:

<i>Gases at 0° C.</i>			
Air (dry)	331.36	meters	per second
Hydrogen	1286.	"	" "
Oxygen	317.	"	" "
Carbon dioxide	262.	"	" "
<i>Solids and Liquids.</i>			
Aluminium ..	5104.	"	" "
Steel	4990.	"	" "
Glass, about ..	5500.	"	" "
Water	1435.	"	" "

The velocity of compressional waves varies greatly with the temperature. For a gas the velocity at t° C. equals that at 0° C. multiplied by

$$\sqrt{\frac{273 + t}{273}}$$

When waves pass from a region where the air is cold into one where it is warm, reflection takes place at the bounding surface, and thus the entering waves are not only refracted but also weakened in intensity. The presence of fog by itself in the air has very little effect upon the waves, unless there are currents or layers of hot or cold air. The velocity of waves in air is practically independent of the intensity of the vibration, although the waves produced by a sudden explosion travel at first slightly faster than do ordinary waves.

Acoustic Properties of Halls. When an organ-pipe or any elastic body is sounded in a room and then suddenly stopped, it is noticed that the sound does not instantly cease, but continues for several seconds. This is called reverberation; and the acoustic success of a room depends largely upon its duration. It should not exceed two seconds by more than a few tenths of a second if the room is to be used as a music hall or opera house. It is found that the reverberation in a given room is practically independent of the place where the vibrating body is situated, or of the position of the hearer; it depends upon the volume of the room, upon the material of the walls and floors, upon the cushions, the audience, etc., and to a certain extent upon the intensity of the sound. The following approximate formula has been developed by Professor Sabine of Harvard University:

$$(a + b_1 x_1 + b_2 x_2 + \text{etc.}) t = 0.164 V$$

Where a is a constant depending upon the absorbing power of the walls of the room.

b is a coefficient of "absorption" for one square meter of a definite material put anywhere in the room, the standard of comparison being the absorption of one square meter of open window.

x is the number of square meters of the material.

t is the duration of reverberation.

V is the volume of the room in cubic meters.

The absorption coefficients for some substances are as follows:

Hard pine wood sheathing	0.061
Plaster on wood lath	0.034
Plaster on wire lath	0.033
Audience (per square meter)	0.96
Isolated woman	0.54
Isolated man	0.48
Carpet rugs	0.20
House plants	0.11
Upholstered chairs	0.30
Hair cushions (per seat)	0.21

The duration of reverberation in certain music halls and auditoriums is as follows:

Old Music Hall, Boston, Mass.	2.44
Symphony Hall, Boston, Mass	2.31
Gewandhaus, Leipzig, Germany	2.30
Sanders Theatre, Cambridge, Mass.	3.42

Bibliography. Rayleigh, *Theory of Sound*, 2 vols. (London, 1896), a mathematical treatment, but with several descriptive chapters; Helmholtz, *Sensations of Tone*, translated by Ellis (London, 1895), the standard authority on harmony and music; Sabine, *Architectural Acoustics* (Boston, 1900), which contains the only satisfactory treatment of this important question; Thompson and Poynting, *Sound* (London, 1900), a text-book for schools and colleges and a storehouse of accurate information; Barton, *A Text-Book on Sound* (London, 1908); Sabine, *Architectural Acoustics* (Boston, 1906); Saeltzer, *Treatise on Acoustics in Connection with Ventilation* (New York, 1908), and Hamilton, *Sound and Its Relation to Music* (Boston, 1911).

ACQUI, ä'kwê (ancient *Aquæ Statiellæ*). An episcopal city of Piedmont, in north Italy, on the left bank of the Bormida, 37 miles north-west of Genoa (Map: Italy, C 3). Every winter more than 6000 persons take the cure at the hot and cold sulphur springs that gave it its name and for which it has been famous since ancient times. It has a Gothic cathedral of the twelfth century, a seminary, a college, and the ruins of a Roman aqueduct. The chief trade is in silk, lace, rope, and wine. Pop., 1901, 13,786; 1911, 17,000.

AC'QUISITION. In law, a term which has the double meaning of the acquirement of territory by the state, and of title to real or personal property by the individual. In the case of the state it is effected in three ways: (1) By occupation, (2) by treaty and convention, and (3) by conquest (q.v.). As referring to the origin of title to lands or goods, acquisition is either original or derivative. The former comprehends occupation, accession, and prescription or limitation (qq.v.); the latter, the more usual modes of acquiring title, as alienation by gift or sale, exchange, inheritance, and transfer by will (qq.v.). In the English and American law of real property the whole subject is dealt with under the head of **TITLE**. Consult Blackstone, *Commentaries on the Laws of England*; Kent, *Commentaries on American Law*.

ACQUIT'TAL (OF. *aquiter*, from Lat. *ad*, to + *quietare*, to quiet). In criminal law, the judicial discharge of the accused. It may result from some technical defect in the proceedings, or from a verdict in the accused's favor on the merits. In the former case it is not a bar to a second prosecution for the same offense; in

the latter case it is a bar, as well by common law as, in this country, by constitutional provision. See **AUTREFOIS ACQUIT** and **JEOPARDY**.

ACRA'NIA (Gk. *ἀ*, *a*, priv. + *κράνιον*, *kranion*, skull). A group of vertebrates having no skull or heart and represented only by the lancelets. See **AMPHIOXUS**.

ACRA'SIA (Gk. *ἀκρασία*, *akrasia*, intemperance). A beautiful enchantress in Spenser's *Faerie Queen*. Her name denotes her character. She dwells in a "Bower of Bliss," on a floating island of sensuous delight, and the fairy queen sends Sir Guyon to make an end of her seductive abode.

ACRA'TES (Gk. *ἀκρατής*, *akratēs*, intemperate). A male character in Spenser's *Faerie Queen*, typifying intemperance in the pursuit of pleasure.

ACRE, ä'kēr or ā'kēr. A word identical with Lat. *ager*, Gk. *ἀγρός*, *agros*, a field, and the Ger. *Acker*, which means both a field and a measure of land. Most nations have some measure nearly corresponding; originally, perhaps, the quantity a yoke of oxen could plow in a day; hence the word has a variable meaning.

The English statute acre consists of 4840 square yards. The chain with which land is measured is 22 yards long, and a square chain contains 22 × 22, or 484 yards; so that 10 square chains make an acre. The acre is divided into 4 roods, a rood into 40 perches, and a perch contains 30¼ square yards. The Scotch acre is larger than the English, and the Irish than the Scotch. One hundred and twenty-one Irish acres = nearly 196 English; 48 Scotch acres = 61 English. The following table shows the values of the more important corresponding measures compared with the English acre. The German *Morgen* below are becoming obsolete. The German Empire, Austria-Hungary, Spain, and Portugal have adopted the French metrical system.

English acre	1.00
Scotch "	1.27
Irish "	1.62
Austria, joch	1.42
Baden, morgen	0.89
Belgium, hectare (French)	2.47
Denmark, tönde land	5.05
France, hectare (= 100 ares)	2.47
France, arpent (common)	0.99
Holland, "	2.10
Naples, moggia	0.83
Portugal, geira	1.43
Prussia, little morgen	0.63
Prussia, great morgen	1.40
Russia, desiatina	2.70
Saxony, morgen	1.36
Spain, fanegada	1.06
Sweden, tunne land	1.13
Switzerland, faux	1.62
" Geneva, arpent	1.27
Tuscany, saccata	1.22
United States, English acre	1.00
Württemberg, morgen	2.40
Roman jugerum (ancient)	0.66
Greek plethron (ancient)	0.23

ACRE, ä'ker or ā'ker, or **ST. JEAN D'ACRE**. A seaport on the coast of Syria, a few miles north of Mount Carmel (Map: Turkey in Asia, F 6). It has about 11,000 inhabitants. The harbor is partly choked with sand, yet is one of the best on this coast. Acre is the *Accho* of the Bible, and has been known at

different periods as *Acco*, *Akka*, *Acon*, *Accaron*, and in Roman times *Ptolemais*. The town is of great antiquity; there is mention of it in hieroglyphic inscriptions as early as 1500 B.C. It was taken by the Assyrians under Sennacherib and given by Esarhaddon to the King of Tyre, with which it came subsequently into the possession of the Seleucid kings of Syria. The Romans made it a colony. In 638 the town was captured by the Arabs. In 1104 it was taken by the Crusaders; in 1187 it was recaptured by the Sultan Saladin, and in 1191 fell once more into the hands of the Crusaders, and became the seat of a bishop and of the Order of St. John. It was the last stronghold of the Crusaders in Palestine, being surrendered to the Saracens in 1291, after an obstinate defense by the crusading orders. In 1517 it was captured by the Turks. In 1799 it was besieged by the French under Napoleon Bonaparte for 61 days, but was successfully defended by the garrison, aided by a body of English sailors and marines under Sir Sidney Smith. In 1832 it was stormed by Ibrahim Pasha, son of the Viceroy of Egypt, and continued in his possession till it was bombarded and taken in 1840 by a combined English, Austrian, and Turkish fleet. See EGYPT; SELEUCIDÆ.

ACRE, ä'krä. A territory of Brazil, formerly belonging to Bolivia. See BOLIVIA; BRAZIL.

ACRES, ä'kërz, BOB. A character in Sheridan's *Rivals*. He appears as a somewhat rustic gentleman, of bombastic manners and ludicrous cowardice, noted particularly for what he calls his "oath referential" or "sentimental swearing."

ACRI, ä'krè. A city in Calabria, south Italy, 13 miles northeast of Cosenza (Map: Italy, L 8). The neighboring country is beautiful, healthful, and fertile, and produces olives, fruit, and cotton. Pop., 1901, 13,132; 1911, 13,306.

ACRID'IDÆ. See GRASSHOPPER.

ACRISIUS, ä-krish'ï-üs. See DANAÆ.

ACRO. See HELENIUS ACRO.

AC'ROBAT (Gk. one walking on tiptoe, from *ἄκρος*, *akros*, highest + *βαίνειν*, *bainein*, to go). Originally it was doubtless used to denote the acrobatic feats of the rope-dancers, but in the course of centuries its meaning has extended so that it includes many things which were unknown to the Greeks and Romans as familiarly as were the rope-dancers, who, as Terence in his prologue to *Hecyra* complains, distracted the attention of the republic from his play; and so does history repeat itself, a writer in the *Tatler* expresses his surprise at finding so small an audience at the opera, because the rope-dancer was not in the bill that night. The most recent celebrated exponent of the original art was Blondin (q.v.), who crossed Niagara Falls on a rope, carrying a man on his back. But this was no unheard-of feat, for when Isabel of Bavaria, Queen to Charles VI of France, made her entry into Paris, says Froissart, who was an eyewitness, a cord was stretched from the highest house on the bridge of St. Michael to the topmost gallery of the Church of Our Lady and an acrobat carried two boys holding lighted candles over it. From being a rope-dancer, or rather balancer only, the acrobat gradually added to his exhibits other balancing and tumbling acts. Vaulting and juggling and contortions became part of the entertainments of the Middle Ages. Edward III paid jugglers handsomely for exhibiting their acrobatic skill

and the flexibility of their bodies. The austere Queen Mary even relaxed at their pranks; and when Queen Elizabeth attended the revels at Kenilworth Castle, which Sir Walter Scott has immortalized, she was vastly entertained by acrobatic tumblers. Even the wonderful balancing feats of the Japanese with ladders at right angles, up and down which a second man climbs in apparent defiance of the laws of equilibrium, had their prototypes, if not equals, among the European acrobats of 200 years ago, while modern somersault-throwing and leaping through hoops are illustrated in manuscripts as far back as the fourteenth century. The more liberal interpretation of the word now includes performances on the trapeze, the horizontal bar, and the other pieces of apparatus usually found in gymnasiums for the development of the suppleness of the body. Consult Le Roux and Garnier, *Acrobats and Mountebanks*, translated by A. P. Morton, illustrated (London, 1890); Lamb, *Hand Balancing and Tumbling* (Springfield, Mass., 1912); *Tumbling for Amateurs*, "Spalding Athletic Library" (New York, published annually).

AC'ROCERAU'NIA (literally, 'Thunder-Heights,' from Gk. *ἄκρος*, *akros*, highest + *κεραυνός*, *keranos*, thunderbolt). The north-western promontory of Epirus, which forms the termination of the Ceraunian, or Acroceraunian, Mountains. It was a dangerous point for sailors, on the regular route from Brundisium to Dyrrachium (Horace, *Odes*, i. 3. 20), and was named from the frequent thunderstorms that occurred there. It is the modern Cape Glossa.

AC'ROCORIN'THUS (Gk. *Ἄκροκόρινθος*, *Akrokorinthos*). A steep hill about 1900 feet in height which was the citadel of ancient Corinth, and is still crowned by ruined Byzantine fortifications. The hill commands a superb view, famous even in ancient times, of the mountainous districts on both sides of the Corinthian Gulf. See ACROPOLIS; CORINTH.

ACROLEIN, ä-krö'lè-in (Lat. *acer*, sharp + *olere*, to smell), C₂H₃CHO. A colorless liquid having an extremely irritating odor. It is produced in the incomplete combustion of fats and when ordinary glycerin is distilled with sulphuric acid or other dehydrating agents. Some acrolein is produced when fats are overheated in cooking, and when the wick of a candle just blown out is left smoldering. Its reactions show that it contains the atomic group CHO; it is, therefore, classed with the aldehydes. Bromine adds itself directly to acrolein, forming an "additive product" of the composition, C₂H₃Br₂CHO; which shows that acrolein must be classed with the *unsaturated* organic compounds. By the action of barium hydroxide solution upon this acrolein dibromide, Emil Fischer (q.v.) and Tafel obtained glycerose (glyceraldehyde with some dioxy-acetone), and the latter in turn was changed by lime-water into a mixture of sugars. From this mixture Fischer and Tafel were able to obtain inactive fructose (*α*-acrose), one-half of which is identical with ordinary fructose or fruit-sugar. This is celebrated as one of the earliest cases of the synthetic reproduction of a natural sugar.

AC'ROLITHS (Gk. *ἄκρον*, *akron*, extremity + *λίθος*, *lithos*, stone). Greek statues, of which the head and extremities were of stone and the draperies of wood, either gilded or otherwise adorned. They did not belong exclusively to the earliest period of Greek sculpture, as has

been supposed, but were also made during the best periods of the art. They were a less expensive substitute for chryselephantine (q.v.) sculpture.

AC'ROMEG'ALY (Gk. *ἄκρος*, *akros*, highest, extreme + *μέγας*, *megas*, great). A rare chronic disease, characterized by a gradual and permanent enlargement of the head, hands, and feet associated with disordered function of the pituitary gland. It was first described in 1886 by Marie. It occurs in both men and women, beginning generally in the third decade of life. Some pains and functional disturbances, as well as anæmia, accompany its onset. Both soft tissues and bones are enlarged, the lower jaw, tongue, lips, and nose being very greatly hypertrophied. The hand sometimes reaches 8 inches in length, the foot 12 inches, while the circumference of the head may reach 26 inches. Acromegaly is now known to be due to overgrowth of the hypophysis or pituitary gland. In autopsies the gland is found either merely hypertrophied, or the seat of a malignant tumor, or a cyst. The disease has an interesting association with gigantism. According to Sternberg 40 per cent of giants are victims of acromegaly, and 20 per cent of acromegalics are over 6 feet in height when the symptoms begin. See article by Dock, in Osler's *Modern Medicine*, vol. vi (New York, 1910).

A'CRON (Gk. *Ἄκρων*, *Akrōn*). A physician of the fifth century B.C., native of Agrigentum in Sicily. Tradition says that he successfully combated the great plague in Athens in 430 B.C. by building large fires to purify the air. The Empiricists claimed him as the father of their school. His medical works are wholly lost.

ACROP'OLIS (Gk. *ἄκρος*, *akros*, highest + *πόλις*, *polis*, city). Originally the fortified refuge of a district, usually containing the palace of the chief. For this purpose a natural stronghold was selected and strengthened by artificial defenses. Around the acropolis a city frequently arose. When this was defended by a wall, the acropolis sometimes lost its military character and was given over to temples, as having been the centre of the oldest cults. The acropolis of Athens is the best example of this change and is also the most celebrated. (See ATHENS.) Other noteworthy acropolises were the Larissa at Argos, Acrocorinthus at Corinth, Mount Ithome in Messene, and the Cadmea at Thebes. In the older sense the name was frequently applied to any fortified hill commanding an ancient site, as at Troy, Mycenæ, Tiryns, Pergamum, Priene, etc.

AC'ROPOL'ITA, GEORGIUS (1217-82). A Byzantine historian and statesman, born at Constantinople. He was trusted with important diplomatic missions at an early age, and in 1244 he was made great *logothete* ('chancellor'). Having been sent to Pope Gregory X in 1282, he brought about the reconciliation of the Greek and Latin churches. His principal work is his *Annales*, comprising a history of the period from the capture of Constantinople in 1204 to its recovery by Palæologus in 1261. A complete edition of his works was published in 1903. Consult Karl Praechter, "Antikes in der Grabrede des Georgios Akropolita," in *Byzantinische Zeitschrift*, vol. x (1905).

ACROS'TIC (Gk. *ἄκρον*, *akron*, extremity, end + *στίχος*, *stichos*, line, verse). A Greek term for a number of verses, the first letters of which follow some predetermined order,

usually forming a word—most commonly a name—or a phrase or sentence. Sometimes the final letters spell words as well as the initial, and the peculiarity will even run down the middle of the poem like a seam. Sir John Davies composed 26 *Hymns to Astrea* (Queen Elizabeth), in every one of which the initial letters of the lines form the words Elisabetha Regina.

In the acrostic poetry of the Hebrews the initial letters of the lines or of the stanzas were made to run over the letters of the alphabet in their order. Twelve of the psalms of the Old Testament are written on this plan. The 119th Psalm is the most remarkable. It is composed of 22 divisions or stanzas (corresponding to the 22 letters of the Hebrew alphabet), each stanza consisting of eight couplets, and the first line of each couplet in the first stanza beginning in the original Hebrew with the letter *aleph*, in the second stanza with *beth*, etc. The divisions of the psalm are named each after the letter that begins the couplets, and these names have been retained in the English translation. With a view to aiding the memory, it was customary at one time to compose verses on sacred subjects after the fashion of those Hebrew acrostics, the successive verses or lines beginning with the letters of the alphabet in their order. Such pieces were called *Abecedarian Hymns*. Acrostic verse, however, has never been highly regarded by the great men of letters, many of whom actually despised it.

AC'ROTE'RIUM (Gk. *ἀκρωτήριον*, *akrōtērion*, the summit or extremity). A plinth or base

ACROTERIUM.

for an ornamental appendage above any one of the three angles of a classic pediment or gable; also the ornament or appendage with its base. The most common form of ornament for acroteria was the anthemion; in early Greek and Etruscan examples painted on terra cotta or marble, in later and more perfect buildings carved in relief in marble, a full anthemion at the apex of the gable, a half-anthemion at its extremities. Occasionally figure-subjects in relief and even groups of figures, and symbolic forms like griffins, occur in place of the anthemion ornaments. See ANTHEMION.

ACT (Lat. *actus*, the doing or performing of a thing; *actum*, a public transaction, record). A term of law applied to the written expression of the will of the legislature formally declared. As commonly employed, it is synonymous with statute (q.v.). The term is derived from the *acta* of Roman public life, which comprehended all public official procedure as well as the official record thereof. An act of one legislature cannot tie the hands of its successors, unless it amounts to a contract, so that its repeal would come

within the constitutional prohibition of legislative acts which impair the obligation of contracts. In England even this exception does not exist, each Parliament being an absolutely sovereign legislature. Still, certain acts of Parliament have been passed in the hope, if not with the intention, of arresting "the possible course of future legislation"; and some of them have commanded a respect almost equal to that accorded in this country to written constitutions. To this class belong the Bill of Rights (q.v.); the Act of Settlement (12 and 13 Will. III, c. 2) fixing the descent of the crown; the Acts of habeas corpus (q.v.); the Acts of Union with Scotland (1 James I, c. 1), and with Ireland (39 and 40 Geo. III, c. 67); and the Septennial Act of 1716 limiting the life of a Parliament to seven years. "Act" is used in connection with other words in a number of familiar phrases. For example, *act of honor*, the acceptance by a stranger of protested paper for the honor of some party thereto; *act of God*, an inevitable accident resulting from superhuman causes, such as lightning, tempest, or floods; *act of state*, act done or commanded by the government of a foreign state, for which the person injured has no redress in the courts of his own country, but must seek redress through the diplomatic agencies of his government.

ACT. In the drama, the name for one of the principal parts of a play. In performance the acts are commonly separated by intervals, during which the dropped curtain conceals the stage. An act which may in turn be subdivided into scenes should be in a certain sense complete in itself, and at the same time should form an essential part of the whole drama. As every dramatic plot naturally divides itself into three parts—the exposition, the development, and the conclusion or catastrophe—a division into three acts seems most natural; but practically this would often require undue condensation, and the well-known classic custom defined by Horace in his *Ars Poetica* is that a play should be in five acts. Normally, the first act indicates the general nature of the drama, introduces the characters, and begins the action. The second act leads up to the third, which develops the crisis of the plot. In the fourth the conclusion or catastrophe is prepared, but should by no means be anticipated so as to weaken the effect of the *dénouement*, which is reserved for the fifth act. The Greeks, who always strictly observed the unities, did not make the formal distinction of acts in their drama, but their tragedies are subjectively capable of division into parts or episodes, which are practically separated by the lyrical parts of the performance. (See CHORUS.) In modern drama the requirement for five acts began early to be neglected, especially in comedy. (See MOLIÈRE.) On the present stage plays are common in any number of acts below five. The four-act play is most common. Consult: Archer, *Play-Making: A Manual of Craftsmanship* (London, 1912), and Matthews, *A Study of the Drama* (Boston, 1910).

ACT, or CEREMONY OF "INCEPTION." The commencement or degree-taking exercises generally carried on in mediæval universities and, in modern times, in most German universities and at Oxford and Cambridge. The ceremony was completely abolished at Oxford in 1856, while Cambridge still retains a much modified form of it. In both, however, various phrases associated with this mediæval custom—such as

"Act Sunday" and "Act Term"—are still in use. In America *the Act* was practiced in colonial days. The student or "respondent" who "keeps the act" reads a thesis in Latin which he defends against three "opponents" named by the proctors. In a quaint pamphlet on *New England's First Fruits*, published in 1643, there is an account of the late commencement at Harvard in which the word "acts" is familiarly employed, as one may see from the following extract: "The Students of the first Classis that have beene these foure yceres trained up in University-Learning for their ripening in the knowledge of the Tongues and Arts, and are approved for their manners, as they have kept their publick Acts in former yearcs, our selves being present at them, so have they lately kept two solemne Acts for their Commencement, when the Governour, Magistrates, and the Ministers from all parts, with all sorts of Schollars, and others in great numbers were present, and did heare their Exercises."

All that now survives of this complex ceremony in American educational institutions is but the faintest suggestion in our commencement exercises, held by secondary and even elementary schools as well as by colleges and universities. See COMMENCEMENT.

ACTA. Among the Romans the public acts or orders of a magistrate, as distinct from the doings of a general, which were called *gesta* or *res gestæ*. (See ACT.) At the close of a magistrate's term, his *acta* were submitted to the Senate for approval or rejection. After the death of Julius Cæsar the triumvirs swore, and compelled all other magistrates to swear, to maintain all his *acta*. Each new Emperor swore to respect the *acta* of his predecessor, unless the latter had been branded with infamy after death. On January 1st each magistrate, on taking office, swore to maintain the *acta* of the reigning Emperor. The term *acta* came in time to be synonymous, in effect, with the English "Records"; for the word in this sense, see ACTA DIURNA; ACTA MILITARIA; ACTA SENATUS. The various *acta* were much used by the Roman historians.

ACTA DIURNA, POPULI, URBANA, URBIS, or PUBLICA (acts daily, popular, municipal, or public). A sort of daily chronicle of events published in ancient Rome, giving summaries of the principal legal and political orations, the decisions of the courts, news from the army, and the latest official gossip of the town. They seem also to have contained extracts from the *Acta Senatus*, accounts of the transactions of the assemblies of the people, news of all sorts relating to the Imperial family, accounts of births, deaths, marriages, and divorces, accidents, prodigies, and the like, all of which were preserved as sources of future history. When Antony offered Cæsar a crown on the feast of the Lupercalia, Cæsar ordered it to be noted in the *Acta Diurna*. The *Acta* are frequently said to have been introduced by Julius Cæsar (Suetonius, *Cæsar*, 20), but others believe them to have existed long before Cæsar's time, and to have supplanted the *Annales* (see ANNALS), which fell into disuse about the year 131 B.C. The Latin scholar Hübner advanced strong arguments in support of the former view, although it was the practice before Cæsar's time for scribes to compile a manuscript chronicle of public events in the city of Rome, which was often forwarded with private letters to absent friends. In any case, Cæsar gave added importance to the *Acta*

Diurna; they were thenceforth published more or less under the authority of the government and with its aid: in imperial times they were under the control of a bureau directed by a *procurator*, or imperial agent. The *Annales* took note only of the most important events, whereas matters of far less importance were included in the *Acta Diurna*. The material for the *Acta* was gathered by reporters called *actuarii*, and the *Acta* were exposed in public places to be read or copied by any who chose to do so. (See ALBUM.) After a reasonable period of time they were taken down and preserved with other public documents. Persons in Rome were accustomed to keep their friends who were sojourning out of town informed of the progress of events and of the news generally, as gathered from the *Acta Diurna*. A passage in Petronius (cap. 53) gives an imitation of the *Acta*. From this it would appear that the style was very simple and that only the bare facts were stated. Consult Le Clerc, *Des journaux chez les Romains* (Paris, 1838), a treatise to be read with caution, and Hübner, *De Senatus Populique Romani Actis* (Leipzig, 1860). See also ACTA; ACTA MILITARIA; ACTA SENATUS.

ACTÆ'A (Gk. ἀκτέα, *aktea*, elder tree). A genus of six species belonging to the family Ranunculaceæ, three of them occurring in the United States. *Actæa rubra* is the "red baneberry" or "black cohosh," while *Actæa alba* is the "white baneberry." They are perennial herbs, with large compound leaves, small white flowers in terminal racemes, and red or white berries. *Actæa spicata* of Europe has purplish-black berries and is often called "herb-Christopher."

ACTÆ'ON (Gk. Ἀκταίων, *Aktaiōn*). A mythical personage, a grandson of Cadmus, trained as a hunter by Chiron. Having offended Artemis, he was changed by her into a stag and torn in pieces by his own dogs. The sin by which Actæon offended Artemis is variously stated. According to Euripides, in the *Bacchæ*, Artemis was jealous because Actæon had boasted that he excelled her in hunting. The most popular version in later times was that he had come upon the virgin goddess while she was bathing.

ACTA E'RU'DITO'RUM (Lat. Proceedings of the Learned). A Latin monthly and the first German literary serial (117 vols., 1682-1782). It was founded by Prof. Otto Mencke of Leipzig, and was owned by his family till 1754, after which it rapidly deteriorated. The series contains a record of the progress of science to 1776. Consult Sandys, *A History of Classical Scholarship*, vol. ii (Oxford, 1906), and Ornstein, *The Rôle of the Scientific Societies in the Seventeenth Century* (New York, 1913).

ACTA MAR'TYRUM (Lat. Acts of the Martyrs). A name given by the ancient Church to the records of the trials and deaths of the martyrs which were kept for the edification of the faithful. The oldest extant refer to the death of St. Ignatius of Antioch, who died about the year 107. St. Augustine (fifth century) speaks of these records as being read to the people on their festival days. Eusebius, the Church historian (died about 340), collected the *Acta Martyrum* in his two works, *De Martyribus Palæstinæ* and *Synagoge Martyrum*, the latter of which has perished, but the former is the appendix to the eighth book of his *Church History*. See McGiffert's trans. (New York,

1890); Delehaye, *Legends of the Saints* (English trans., London, 1907).

ACTA MIL'ITA'RIA. A record of the duties, numbers, and expenses of each legion and of the property owned by each soldier, kept by soldiers, who are mentioned in inscriptions as *libraii legionis*, *actuarii legionis*, or *tabularii legionis*.

ACTA PILA'TI (Lat. Acts of Pilate). An account of the trial and death of Jesus Christ, purporting to have been written by Pontius Pilate or under his direction. Although Justin Martyr (Apol., i, 76-86), Tertullian (Apol., v, 21), and Eusebius (ii, 2) allude to some account rendered by Pilate to the Emperor Tiberius, the *Acta* now extant in the Vatican library, as well as the so-called *Report* of Pilate to the Emperor and the alleged *Epistolæ Pilati* describing the resurrection, are admittedly spurious. Consult Lipsius, *Die Pilatusacten* (Kiel, 1871). Various English translations have been published, e.g., *Acta Pilati* (Shelbyville, Ind., 1879), and also one in the Ante-Nicene library.

ACTA SANCTO'RUM, or **MAR'TYRUM** (Lat. Acts of the Saints or Martyrs). The collective title given to several old writings respecting saints and martyrs in the Greek and Roman Catholic churches, but now applied especially to one extensive collection begun by the Jesuits in the seventeenth century, and intended to serve as a better arrangement of the materials found in ancient works. This great undertaking, which was commenced by the Jesuit Heribert Rosweyde, of Antwerp, has considerable importance, not only in a religious and ecclesiastical point of view, but also with regard to history and archæology. After Rosweyde's death in 1629, Johannes Bolland was commissioned by the order of the Jesuits to continue the work, and with the assistance of Godfried Henschen he prepared two volumes, which appeared in 1643. After the death of this editor (1665) the work was carried on by a society of learned Jesuits, who were styled "Bollandists," until 1794, when its further progress was prevented through the invasion of Holland by the French. In recent times the undertaking has been resumed, and in 1845 the fifty-fourth volume was published at Brussels. Many additional volumes have appeared since. The lives are arranged in the order of the calendar. A new edition of the first fifty-four volumes appeared in 1863-69. The sixty-fifth volume appeared in 1892. For notices of other and similar collections, see SAINTS; MARTYR; MARTYROLOGY.

ACTA SENA'TUS, or **COMMENTARII**, kôm'en-tā'rī-ī, **SENA'TUS**. A record of the transactions of the Roman senate, including the opinions of the chief speakers, and the final decision of the senate. From an early time the proceedings of the senate had been written out by a committee of senators, under the direction of the magistrate who had presided; these records were deposited in the *Ærarium* (q.v.). They were regularly published after 59 B.C., every day, under governmental authority, from notes of short-hand writers. Augustus forbade their publication, but the records were, of course, still kept by one of the senators selected by the Emperor.

ACTIAN, äk'shan, **GAMES**. See ACTIUM.

ACTINIA'RIA (Gk. ἀκτίς, *aktis*, ray). A group of anthozoan cœlenterates comprising the sea-anemones. They differ from all other anthozoans in the complete absence of a skeleton

and in the large size of the individuals, which rarely form a colony. See ANTHOZOA and SEA-ANEMONE.

FIG. 1.

FIG. 2.

ACTINIARIA.

1. Vertical aspect of an Actinarian, showing mouth and tentacles. 2. Sectional view: *a*, simple digestive sac; *b*, structure of the body-wall, showing septa.

ACTINIUM. A radioactive element discovered by Debierne in 1899. It occurs along with other radioactive substances in pitchblende and is chemically very similar to thorium, but is characterized by its high power of emanation. In 1902 Giesel discovered another substance, likewise possessing a high power of emanation, but chemically similar to lanthanum; he called it *emanium*. The question has since arisen whether actinium and emanium are not identical. Investigations carried out by Debierne, Miss Brooks, and Hahn and Sackur seemed to indicate that the two substances are identical. But a careful study led Marckwald, in 1905, to the remarkable conclusion that actinium and emanium are not identical, but are closely related to each other, inasmuch as *actinium is being continually produced from emanium*. Perhaps the most interesting fact about actinium is that, like radium, it is decomposing with the formation of the element helium, although actinium and radium are chemically very different substances. See RADIOACTIVITY.

ACTINOGRAPH (Gk. *ἀκτίς*, *aktis*, ray + *γράφειν*, *graphein*, to write). An instrument for recording automatically the chemical effects of radiations from any source, especially the sun. The simplest forms of actinograph are those that expose standard photographic plates or films (iodides, chlorides, or bromides of silver) to the sun's action for short, definite periods of time. Those that utilize the union of chlorine and hydrogen under the influence of light, or the precipitation of gold from a solution of gold chloride and oxalic acid on exposure to light, cannot be readily employed for automatic registration. See SUNSHINE RECORDER.

ACTINOLITE (Gk. *ἀκτίς*, *aktis*, ray + *λίθος*, *lithos*, stone). A calcium-magnesium-iron amphibole (q.v.) that includes the varieties nephrite, asbestos (q.v.), smaragdite, and uralite. Actinolite varies in color from a bright green to a grayish green, and usually occurs in the form of long, slender crystals in metamorphic rocks, commonly in talc.

ACTINOLITE-SCHIST. See AMPHIBOLITE.

ACTINOMETER (Gk. *ἀκτίς*, *aktis*, ray + *μέτρον*, *metron*, measure). An instrument for measuring the effect of the sun's rays in producing chemical, i.e., actinic effects. As originally devised by Sir John Herschel, this title was applied by him to a thermometer whose bulb was filled with a blue solution of ammonia and sulphate of copper; the expansion of this solution by absorbing the sun's rays was supposed to measure the quantity of blue light or

chemical rays in the beam of sunshine. The name has since been loosely applied to two distinct types of apparatus. In one of these the sensitive element acts like a black body and absorbs practically *all* the radiation of whatever wave-length; in the other type selective absorption takes place, and therefore partial effects due to radiation of only certain particular wave-lengths are measured. It is desirable that instruments of the first class, measuring the gross radiation of all wave-lengths, be called pyrheliometers. Instruments sensitive to certain selected radiations, such as cause photographic, chemical, and other like changes, should be called actinometers, since these changes are commonly designated as actinic effects. In this case the radiation selectively absorbed does molecular work of a chemical nature and is measured by these effects, as when a mixture of chlorine and hydrogen is converted into hydrochloric acid and the quantity of acid that is formed in years of time is the measure of the intensity. This includes the basis of the methods of Draper and Bunsen and Roscoe. When a mixture of ferric-oxalate and chloride of iron dissolved in water is exposed to sunshine, it gives out carbonic acid gas; this is the basis of Marchand's apparatus. A photographic plate exposed for a short time receives an impression whose intensity may be measured on a scale of tints or shades and made the basis of a determination of the intensity of the sunshine. This method has been worked out by Bigelow and others. In general, any apparatus for measuring the chemical effects of radiation from any source constitutes an actinometer, properly so called. See PYRHELIOMETER.

ACTINOMETRY. The general subject of the measurement of either the relative or the absolute effect of solar or other radiation. A consistent usage would restrict the word to measurements of only actinic effects, i.e., chemical, photographic, and other like reactions. Nevertheless both thermal and visual phenomena are sometimes comprised under this title. See ACTINOMETER.

ACTINOMORPHY (Gk. *ἀκτίς*, *aktis*, ray + *μορφή*, *morphē*, form, shape). In botany, a term of symmetry used chiefly in connection with flowers. In an actinomorphic flower the members of each set are similar and arranged about a common centre, as are the parts of a radiate animal. If there are five petals, they are alike and are evenly distributed about the centre of the flower, as are the spokes of a wheel about the hub. Technically defined, an actinomorphic flower is said to have as many planes of symmetry as there are members in a cycle. This means that if an imaginary plane be run through each sepal or petal or stamen and the common centre, the two resulting halves of the flower will be similar. More commonly such flowers are spoken of as "regular." See FLOWER.

ACTINOMYCOSIS (Gk. *ἀκτίς*, *aktis*, ray, beam + *μύκης*, *mykēs*, mushroom, fungus, excrescence), LUMPY JAW or BIG JAW. A specific, infectious disease produced by a parasitic micro-organism known as the ray fungus (*Actinomyces bovis*). The micro-organism causes the formation of deep subcutaneous tumors or swellings, which break down and suppurate. The disease is usually of sporadic occurrence, but sometimes becomes epidemic. It is most

frequently found in cattle, but affects also horses, pigs, sheep, deer, llama, guanaco, and man. Actinomycotic tumors in cattle have been recognized since 1825, although they have frequently been mistaken for cancerous, tuberculous, or syphilitic tumors. The disease was first definitely described in cattle by Böllinger in 1877, and in man by James Israel. It occurs in all parts of Europe and North and South America. The ray fungus is found in all tumors and abscesses of this disease, wherever situated, and its presence may be detected by examining the small yellow masses discharged in the pus. These consist of aggregations of the ray fungus, readily detected under the microscope. In cattle the seat of the disease is usually in the inferior maxillary bones, submaxillary salivary glands, in the tongue, pharynx, and œsophagus. The common names, Big Jaw, Lumpy Jaw, Big Head, and Wooden Tongue, are descriptive of the most frequent forms of actinomycosis in cattle and horses. In hogs actinomycosis is found in 80 per cent of cases in the udder. In a small percentage of cases the lungs and intestines are affected. Maxillary tumors in cattle are almost invariably due to the ray fungus, and therefore actinomycosis may be readily diagnosed.

Considerable difference of opinion prevails regarding the systematic position of the ray fungus. It has been supposed that the organism has a plant host on which it passes part of its life cycle. The agency of various grasses (especially such as have sharp-pointed awns) in transmitting actinomycosis can hardly be questioned. Many cases of this disease in man have been reported, the greater number having occurred as a result of eating raw meat.

The most effective treatment is the internal administration of potassium iodide, advocated by Thomassen in 1885. Abscesses, where accessible, must be opened and drained, and treated with antiseptics. Actinomycosis follows a slow, chronic course.

The relationship of the disease to the public health has been much discussed. Apparently infection most frequently takes place in man and cattle through diseased teeth or abrasions of the mucous membrane of the mouth. The identity of actinomycosis in man and cattle is admitted, but most authorities hold that its direct transmission to man through eating the meat of affected animals is of rare occurrence. Whether an animal affected with actinomycosis should be used for human food is a question. It may be safely asserted that animals in which the disease has become generalized should be condemned. For details concerning actinomycosis, consult D. E. Salmon, "Investigations Relating to the Treatment of Lumpy Jaw, or Actinomycosis, in Cattle," *U. S. Department of Agriculture, Bureau of Animal Industry, Bulletin 2* (Washington, 1893); D. E. Salmon and others, "Special Report on Diseases of Cattle and on Cattle Feeding," *Report of U. S. Department of Agriculture for 1904, Bureau of Animal Industry* (Washington, 1904); "Tumeurs des mâchoires observées dans l'espèce bovine," *Journal de Médecine Vétérinaire* (Paris, 1826). A full description of human actinomycosis is found in Osler's *Modern Medicine*, vol. i (New York and Philadelphia, 1910).

ACTINOTHERAPY. The treatment of disease by means of actinic or chemical rays. It is now known that the entire spectrum, from

the long wave-length and slow frequency of the infra red to the short wave-length and high frequency of the rays beyond the violet, produces chemical changes. The action on the organism varies with the wave-length and the frequency of the ray employed, but the short high frequencies beyond the violet are the ones most active therapeutically. See PHOTOTHERAPY.

ACTINOZO'A. Same as ANTHOZOA (q.v.).

ACTION (Lat. *actio*, a doing, performing, an action, suit, process). A term which, in its broadest sense, includes every lawful proceeding in a court of justice for the enforcement or protection of a right, the redress or prevention of a wrong, or the punishment of a public offense. Formerly the term was confined, in English law, to an ordinary proceeding in a common law court, while the word "suit" was applied to a proceeding in equity. By the reformed procedure in many of our States, all distinction between actions at common law and suits in equity, as well as between the different forms of common law actions, have been abolished, and only a single civil action is recognized. The earliest classification of common law actions was: (1) real actions, or those based on the plaintiff's right of property in specified lands, so called because the *res*, or property itself, was sought to be recovered; (2) mixed actions, such as those in ejectment or for waste, in which not only the possession of the land but damages also for its wrongful use or abuse are sought; (3) personal actions, or those against a particular person for a money judgment. The distinction between real and personal actions is the foundation of the classification of property as real and personal. (See PROPERTY.) This third class was subdivided into actions *ex contractu*, such as debt (q.v.) and covenant (q.v.), and actions *ex delicto*, such as trespass (q.v.) and detinue (q.v.). Again, actions are divided into local and transitory, according as they must be brought in a certain county or State, or as they may be brought wherever the defendant is found. An action for trespass to land is local, and it must be brought in the State where the land is situated; while an action for slander of title (q.v.) to that land is transitory. (See the authorities referred to under the various titles above named.)

ACTION. In psychology, a term used broadly to cover all forms of muscular movement. We speak, e.g., of the action of the heart, or reflex action, etc., as well as of impulsive or voluntary action. There is, however, a growing tendency to reserve the word "action" for such bodily movements as have conscious antecedents and concomitants (movements for which there are conscious motives, and of which we are conscious, as they run their course in time), and to employ the general term "movement" for movements which are of an unconscious, purely physiological, character. We shall therefore speak in this article of impulsive and voluntary *action*, but of reflex *movement*.

The problem which action sets to psychology is twofold. We have, in the first place, to trace the genesis and development of action; and in the second to analyze the active consciousness, to determine the constituent processes in the various forms of motive.

1. There are two opposed theories of the genesis of action. The first asserts that all conscious actions have developed from reflex movements. The reflex movement is the direct

and definite response of the organism to a particular stimulus. A frog whose brain and medulla have been removed will draw up its leg if the foot be pinched; the pupil of the human eye contracts under the influence of light, and expands again as the light is diminished. Mechanical and unconscious movements of this kind are, the theory holds, older than consciousness. When mind appears, it finds such movements ready to its hand; it avails itself of them for conscious purposes. So the animal's movements, at first automatic and simple, grow more and more complex, and have more and more of the element of consciousness imported into them. The main arguments for the position are as follows: (a) Spontaneous movements are to be observed in children and young animals: movements that are neither reflex movements nor voluntary actions, but random discharges of the excess of energy stored in the healthy organism. These movements furnish a varied supply of active experience, certain items of which must, by the law of chance, prove to be positively pleasurable, while others will at least be less unpleasant than the experiences preceding them. Whenever active experience and pleasure are thus coincident, attention is drawn to the movement, which is elaborated into voluntary action. (b) From the physiological point of view, the movements of the lowest organisms, as well as the movements carried out by means of the lower nerve-centres of higher organisms, are of the reflex type. And even the most complex of voluntary actions can be assimilated to this type on the neural side; for the physical correlate of such action is simply the reflex arc, with its central portion made longer and more circuitous.

Neither of these arguments is, however, free from objections. In the first place, different observers differ as to the range and scope of the spontaneous movements of infancy. Some restrict them within very narrow limits, where the play of chance coincidence would be inconsiderable; others assert that they can, one and all, be reduced to incipient voluntary actions and imperfect hereditary reflexes. Moreover, the theory presupposes that the sensations and perceptions aroused by moving appear, in point of time, before the pleasure achieved by the movement or the voluntary impulse toward it. But this means that mind is built up piecemeal, whereas there is reason to think that consciousness is a single tissue, every strand of which is given with every other. Again, it is difficult to understand the mechanism by which pleasurable movements are selected. Granted that a movement chances to bring pleasure, how is its repetition brought about? Can we form any clear idea of the way in which a motive is prefixed to the sensation series? Against the second argument, it is asserted as evident that the simplest form of sensory-motor coördination need not be the earliest. There is a primitive simplicity, but there is also a simplicity of reduction and refinement. Again, the statement that the movements of the lowest organisms are reflex in character is said to beg the question: the original theory assumes outright that there is a strict parallel between the growth of the race and the growth of the individual, between phylogeny and ontogeny, and does not take into account the fact that the individual comes into the world endowed with a rich inheritance of neuro-muscular coördinations. And, lastly,

even if the neural substrate of voluntary action be in structure no more than a highly complex reflex arc, still the opponents of the theory point out functional differences: the reflex is unconscious, while the functioning of the central cells of the voluntary arc is accompanied by consciousness. So we come face to face once more with our original problem.

The alternative theory, which we may now examine, affirms that the earliest organic movements are, in principle, voluntary actions. Mind, according to this theory, is as old as life, and the first movements of living matter are impulsive actions, i.e., actions prompted by a single determining motive. The arguments which this position brings into the field are as follows: (a) All reflex and instinctive movements show signs of adaptation; they subserve a particular end or purpose; they are definite and appropriate responses to certain circumstances of the animal's environment. Now, in the first place, primitive movements should be vague and purposeless; it is not easy to conceive of a movement that should be at once rudimentary and economical. And, in the second place, it has been argued that the presence of mind in a living creature is the creature's capacity of adaptation, of learning. The reflex, pointing as it does to a process of adaptation in the past, points also to the existence of a past mind. In a word, reflex movements appear to be degenerate, mechanized impulsive actions. (b) There can be no doubt that such mechanization is possible. We are constantly in the course of our every-day life reducing voluntary actions to "secondary reflexes": our pen dips itself in the accustomed inkstand, our coat buttons itself, our bicycle balances itself, without any of the conscious attention that we gave them when the movements were new. Further, what we see happening here in the course of a few days or weeks has happened also in the life of the race. We wince when we are ashamed, and jump when we are startled; and the jump and wince are inexplicable unless they are the degenerate descendants of voluntary actions, the last reflex remnants of the cowering and shrinking and leaping aside of the frightened animal.

The only question which this second point of view leaves unanswered is the mode of origin of the first impulse. How and under what conditions the primeval organism became conscious of the impulse to move, and organic movement appeared in the natural world, we cannot say. But neither is psychology called upon to say. No science explains its own data; it takes them for granted. As, therefore, the physicist assumes the mechanical universe, and the biologist the phenomena of life, so may the psychologist assume without cavil the existence of mind. A theory, however, has recently been proposed which not only resolves this difficulty, but also affords a possible reconciliation of the two opposed theories outlined above. Both of these presuppose, at least by implication, that the organism had no past. In fact, while we must believe that life is derived from the non-living, organic from inorganic, we are yet not bound to believe that the transition was abrupt. On the contrary, it is probable that nature made many essays at life before a stable, self-sustaining life was struck out; that there were many intermediate stages between the vital and non-vital, many imperfect modes of half-life or part-life which were in-

stable and therefore transient, but which none the less bridged the gulf between the inanimate and the animate worlds. Hence the first living thing may have had a past, a half-vital ancestry; and this past would have done for it, in a crude way, precisely what our ancestry does, in an infinitely more complicated way, for ourselves. In other words, when life was finally achieved, the organism had a background of "experience" both for the reflex movement (tropism) and for the conscious impulse, and the first movements were therefore both tropic and conscious. This theory does not conflict with the general doctrine of organic evolution; it avoids the postulation of an abrupt break between organic and inorganic life; and, finally, it allows the advocates of the first theory a tropic explanation of many primitive movements and, at the same time, admits of the presence of consciousness at the first moment of what we now know as life.

Whatever be the truth in these speculations, the psychologist has the right to his conscious starting-point, from which the rest follows easily enough. For psychology the first organic movement is an "action upon presentation," an action whose motive (the impulse) is given with the presentation to the animal of a pleasantly or unpleasantly toned stimulus. Out of this grows impulsive action proper, an action whose motive is blended of three ideas: that of the stimulus, the original motive-idea; that of the result of movement, of pleasurable accomplishment; and that of the moving itself, the "active experience" of the first theory. The course of development beyond impulsive action takes two directions. Upward, toward greater mentality, it rises to the more complex forms of voluntary action: to selective action, in which there is a conflict of impulses, a period of deliberation, resulting in the victory of some one (the actual) motive over other less strong (potential) motives; and to volitional action in which the conflict is not between impulse and impulse, but between an impulse to movement on the one hand and a group of ideas prompting to no-action on the other. Downward, toward less mentality, the impulsive action degenerates into the reflex movement. Selective and volitional action, as we have seen, may also degenerate; choice and resolve become automatic; the complex action slips back, first of all into an impulsive act, and finally into a secondary reflex. Note the light which this view of the development of action throws upon the problems of animal psychology (q.v.). Bethe thinks that ants and bees are automata, while popular psychology dowers them with all sorts of conscious motives and purposes. Now, ants and bees prove, on trial, to be unintelligent; they cannot learn to make new adaptations. On the other hand, the adaptations which they have already learned are of an extremely complicated character. It has been assumed, therefore, by certain authorities that these creatures represent the final stage in a retrogressive development from a fairly high level of mentality. According to this theory popular psychology is right, in that ants and bees once possessed a good deal of mind; it is wrong in interpreting their present movements as voluntary actions. If it be objected that the unicellular organisms, the most primitive forms of life, should (on the present theory) show signs of rudimentary impulsive action, and that

they prove, on trial, to be as automatic as Bethe's ants, the reply may be that these protozoa, simple as they are, have as long a line of ancestry as we have ourselves; and that the less mind there is to start with, the less will be the fall from impulse to the reflex. But many qualified observers deny this total absence of mind. In general, then, it is asserted by the supporters of this hypothesis that if a sound view of mental evolution is to be attained, the investigator must accept the idea that all animals have had mind. Whether or not they have it now depends upon the direction which their development has taken—upward, toward physiological adaptability and elaboration of mental process, or downward, toward specific adaptation and the lapse of consciousness.

2. We have already said something by way of analysis of the "typical" motive to action, the impulse. The essential thing, however, in every action-consciousness is its predetermination in the sense of an idea of end. (See DETERMINING TENDENCY.) If, now, we attempt a further analysis of the impulse, we get something like this: a preliminary phase in which the prominent things are kinæsthesia and the idea of end or result—either of which may carry, in consciousness, the determination; a central phase in which some object is apprehended in relation to, or in the sense of, the idea of end, i.e., the apprehension of the object releases the determining tendency and the movement occurs; and a final phase in which the perception of result is set on a background of kinæsthesia, of the sensations aroused by the actual movement. The affective accompaniment of all this group of ideas may be pleasurable or unpleasurable, but must always be the one or the other; we may jump for joy or from fright, but we do not jump when our mood is that of indifference. The essential thing in the active consciousness, however, is an apperception of (attention to) some one of the ideas contained in the motive. (See APPERCEPTION; ATTENTION.) (a) In the case of primitive action (action upon presentation) we must suppose that the idea of object is the idea that stands in the focus of attention; the impulsive action is indistinguishable from the movement that expresses emotion. (See EXPRESSION; EXPRESSIVE MOVEMENTS.) "The universal animal impulses—the impulses of nutrition, of revenge, of sex, of protection, etc.—are indubitably the earliest forms of emotion" (Wundt). The hungry animal perceives food: its attention is held by this perception; it is pleasurable moved by the perception; and bodily movement toward the food-supply results. (b) As the organism grows in experience of movement, the impulse becomes more complex, and the focus of attention shifts to the idea of our own movement (action upon representation); so that we may lay it down as a law of analytical psychology that the condition of voluntary action is an apperception of the movement-idea. We think of ourselves as moving, and find that we have moved. (c) At a still later stage, when the voluntary action is taking the downward path toward the secondary reflex, the idea of movement fuses with the idea of result into an indissoluble whole. It is now the idea of result that holds the attention. We feel a draught, and rise at once to close the window, thinking neither of the object of movement, the window, nor of the muscular move-

ments that take us to it, but simply of the result of the action, the avoidance of a cold. So the emphasis shifts from term to term of the threefold complex; from idea of object to idea of movement, and from that again to idea of result. But the motive remains in principle the same thing: an affectively toned group of sense-material, given in the state of attention.

The conscious antecedents of the higher forms of voluntary action are naturally more complicated. In place of the triad of simple ideas we have, in the conflict of impulses that precedes volitional and selective action, elaborate systems or constellations of ideas, representations of the total "situation" in which we find ourselves. In place of the simple pleasantness or unpleasantness of the impulse, we have equally elaborate affective formations—emotions and sentiments; the feelings of obscurity, of contradiction, of resolve, of decision; the characteristic oscillatory emotion of doubt; the emotions of relief, of satisfaction or dissatisfaction, of hope, of disappointment; the sentiments of power, of pride, of æsthetic fitness, of moral rightness. (See EMOTION.) And in place of the passive attention which the single impulse-motive commands, we have an active, effortful attention divided among the various potential motives contained in the "situation." It is the business of descriptive psychology to unravel the processes of these motive-consciousnesses, and to trace the single pattern (the impulse pattern) that runs through them all. It is the business of experimental psychology to examine the impulse under standard conditions; to build it up from the given elements, and to construct artificial, selective and volitional actions from a number of simple impulses. This task it accomplishes by aid of the reaction experiment. Consult: A. Bain, *The Emotions and the Will* (London, 1899); H. Spencer, *Principles of Psychology* (New York, 1890); W. Wundt, *Vorlesungen über die Menschen- und Tierseele* (5th ed., Leipzig, 1911; trans. as *Human and Animal Psychology*, London, 1901); id., *Grundzüge der physiologischen Psychologie* (6th ed., Leipzig, 1910-11); N. Ach, *Ueber die Willenstätigkeit und das Denken* (Göttingen, 1905).

ACTIUM, äk'shī-üm, now AKRI. A town and promontory on the west coast of Greece at the entrance of the Ambracian Gulf, now the Gulf of Arta. It is memorable for the sea fight which took place near it Sept. 2, 31 B.C., between Octavius (afterward the Emperor Augustus) and Marcus Antonius. These two had for some time ruled the Roman world jointly, the former in the west, the latter in the east. It now came to a struggle for the sole sovereignty. The two armies were encamped on the opposite shores of the gulf. Octavius had 80,000 infantry, 12,000 cavalry, and 260 ships of war; Antony, 100,000 infantry, 12,000 cavalry, and 220 ships. Antony's ships were large and well provided with engines for throwing missiles, but clumsy in their movements; Octavius's were smaller and more agile. Antony was supported by Cleopatra (q.v.), Queen of Egypt, with 60 vessels, who induced him, against the opinion of his most experienced generals, to risk a naval engagement. The battle continued for some hours undecided; at last Agrippa, who commanded Octavius's fleet, succeeded by a skillful manœuvre in compelling Antony to extend his line of battle, the compactness of which had hitherto resisted all attempts of the enemy to

break through. Cleopatra, whose ships were stationed behind Antony's line, apprehensive that his line would be broken, took to flight with her auxiliary fleet, and Antony recklessly followed her with a few of his ships. The deserted fleet continued to resist bravely for some time, but was finally vanquished; the land army, after waiting in vain seven days for Antony's return, surrendered to Octavius. As a memorial of the victory that had given him the empire of the world, and out of gratitude to the gods, Octavius enlarged the temple of Apollo of Actium, dedicated there the trophies he had taken, and instituted games (*Ludi Actiaci*) to be celebrated there every five years. He also built on the spot where his army had been encamped the town of Nieopolis ('City of Victory'), near where Prevesa now stands. The battle of Actium is described in Greek by Plutarch (*Life of Antony*) and by Dion Cassius (book i). See ANTONIUS, MARCUS; AUGUSTUS; CLEOPATRA.

ACT OF FAITH. See AUTO-DA-FÉ.

ACT OF PARLIAMENT, pär'li-mënt. A resolution or law passed by all the three branches of the English legislature, the King (or Queen), lords, and commons; or, as it is formally expressed, "by the King's Majesty, by and with the advice and consent of the Lords Spiritual and Temporal, and Commons, in Parliament assembled, and by the authority of the same." An act of Parliament thus made is the highest legal authority acknowledged by the constitution. It binds every subject, and, with a few exceptions, every alien in the land, and even the sovereign himself, if named therein. And in England it cannot be altered, amended, dispensed with, suspended, or repealed but in the same forms and by the same authority of Parliament. In Scotland, however, a long course of contrary usage or of disuse may have the effect of depriving a statute of its obligation; for by the Scotch law a statute may become obsolete by disuse and cease to be legally binding. It was formerly held in England that the King might in many cases dispense with statutes, especially such as were of a penal character; but by the statute 1 W. and M., st. 2, c. 2, it is declared that the suspending or dispensing with laws by royal authority without consent of Parliament is illegal.

An act of Parliament is either public or private. A public act regards the whole Empire or one of its main subdivisions, in which case it is *general*; or a subordinate part, in which case it is *local*; but the operation of a private act is confined to particular persons and private concerns. As the law till lately stood, the courts of law were bound *ex officio* to take judicial notice, as it is called, of public acts, i.e., to recognize these acts as known and published law, without the necessity of their being specially pleaded and proved; but it was otherwise in regard to private acts, so that in order to claim any advantage under a private act it was necessary to plead it and set it forth particularly. But now, by the 13 and 14 Vict. c. 21, s. 7, every act of Parliament is to be taken to be a public one, and judicially noticed as such unless the contrary be expressly declared.

An act of Parliament begins to operate from the time when it receives the royal assent, unless some other time be fixed for the purpose by the act itself. The rule on this subject in Eng-

land was formerly different, for at common law every act of Parliament which had no provision to the contrary was considered as soon as it passed (i.e., received the royal assent) as having been in force retrospectively from the first day of the session of Parliament in which it passed, though in fact it might not have received the royal assent, or even been introduced into Parliament, until long after that day; and this strange principle was rigidly observed for centuries. The ancient acts of the Scotch Parliament were proclaimed in all the county towns, burghs, and even in the baron courts. This mode of promulgation was, however, gradually dropped as the use of printing became common, and in 1581 an act was passed declaring publication at the Market Cross of Edinburgh to be sufficient. British statutes require no formal promulgation, and in order to fix the time from which they shall become binding it was enacted by 33 Geo. III, c. 13, that every act of Parliament to be passed after April 8, 1793, shall commence from the date of the indorsement by the clerk of Parliament stating the day, month, and year when the act was passed and received the royal assent, unless the commencement shall in the act itself be otherwise provided for.

Acts of Parliament are referred to by the year of the sovereign's reign, and the chapter of the statutes for that year. They were first printed in the reign of Richard III, originally in Latin, but since the fourth year of Henry VII in English. The collective body of such acts constitute the Statutes of the Realm. See STATUTE; PARLIAMENT, and the authorities there referred to.

ACT OF SETTLEMENT. The second chapter of statute 12 and 13 William III of Great Britain (1701), which provided that the crown, in default of issue to Anne Stuart, William's presumptive successor, should descend to the House of Hanover, and which excluded Roman Catholics from the throne. See ELIZABETH STUART (Queen of Bohemia).

ACT OF UNIFORMITY. The English statute of 13 and 14 Car. II, c. 4 (1662) which provides that the Book of Common Prayer, as then recently revised, should be used in every parish church and other place of public worship in England, and that every school-master and person instructing youth should subscribe a declaration of conformity to the liturgy, and also to the effect of the oath and declaration mentioned in the act of 13 Car. II, st. 2, c. 1. It further enacted that no person should thenceforth be capable of holding any ecclesiastical promotion or dignity, or of consecrating or administering the sacrament, till he should be ordained priest according to Episcopal ordination, and with respect to all ministers who then enjoyed any ecclesiastical benefice it directed that they should, within a certain period, openly read morning and evening service according to the Book of Common Prayer, and declare before the congregation their unfeigned assent and consent to the use of all things therein contained, upon the pain of being deprived of their spiritual promotions. Two thousand of the clergy who refused to comply were deprived of their preferments. Acts to secure uniformity were passed under Edward VI (1549) and Elizabeth (1559). See PRAYER-BOOK, COMMON.

ACTON, ăk'ton. A residential suburb of London, England. During the civil wars it was one of the strongholds of Puritanism, and has been at various times the place of residence of

many famous personages, such as King Henry III, the great jurist Sir Matthew Hale, the novelist Henry Fielding, and the actress Mrs. Barry. Pop., 1891, 24,200; 1901, 37,744; 1911, 57,523.

ACTON, JOHN EMERICH EDWARD DALBERG, first BARON (1834-1902). A distinguished historian and the foremost Roman Catholic layman of the nineteenth century in England. Acton was born in Naples—his father an English baronet, his mother a German heiress, his maternal grandfather a prominent French diplomat. He was educated under Dr. (afterward Cardinal) Wiseman at St. Mary's Oscott and, since Cambridge as yet refused degrees to Roman Catholics, at the University of Munich. Here Acton, escaping the deadening influence of English classicism, steeped himself in French, German, Italian, and Spanish literature and history; here also he formed a lifelong friendship with Dr. Döllinger, the distinguished leader of the liberal Catholic party in Germany. The first of these circumstances made Acton a great modern historian; the second caused him to become the head of the Liberal Catholic movement in England. Acton now traveled; visited America, France, and Russia; returned home; entered Parliament, and represented Carlow in the House of Commons for six years.

It was, however, as an editor and historian that Acton became distinguished. In 1858 he succeeded Newman as editor of *The Rambler*, a brilliant Catholic review. Written by laymen for laymen, the journal was both bold and critical. "I am sick of men who are afraid of a scandal," wrote Acton at one time, and *The Rambler* under his direction developed a fearlessness that was highly displeasing to many of the English Roman Catholic clergy. Acton was an enemy of ultramontanism, a foe to papal infallibility, an enthusiastic supporter of Döllinger and the Old Catholic movement in Europe; and in history he found his armory for the conflict. Book reviews and contributed articles poured forth from his pen, scientific, scholarly, truthful. In 1862 *The Rambler* was changed into *The Home and Foreign Review*, a quarterly. Two years later it was discontinued—the reason, a papal rescript aimed at Döllinger and the German Liberals. This pronouncement of the Pope Acton could not approve. "If it is accepted by *The Home and Foreign*," he wrote, "the review loses its identity and the very breath of its nostrils." On the other hand, he would not oppose the edict of the Holy See. The journal, therefore, abruptly ended. Acton, like Erasmus, whom he resembled in many ways, preferred to work from within the church. He retained his independence, refused to bow the knee to Cardinal Manning, and in 1874, in a series of letters to *The London Times*, contended vigorously against papal infallibility.

As he grew older, he turned more and more toward the study of history. Here he was indefatigable, as upward of 500 book reviews, 50 special articles and essays, and numerous published lectures bear ample witness. From 1895 to his death he was regius professor of modern history at Cambridge and while there planned the well-known *Cambridge Modern History*. "Our scheme," he wrote in regard to this work, "requires that nothing shall reveal the country, the religion, or the party to which the writer belongs." And this advice to others was exemplified in the impartiality and fairness of

his own writings. Among them, published since his death, are *Lectures in Modern History* (1906); *The History of Freedom and other Essays* (1907); *Historical Essays and Studies* (1907); *Lectures on the French Revolution* (1910). A complete list of his writings may be found in a bibliography edited by W. A. Shaw for the Royal Historical Society (1903).

Consult *Letters of Lord Acton to Mary Gladstone* (1904); James Bryce, *Studies in Contemporary Biography* (1903).

ACTON, Sir JOHN FRANCIS EDWARD (1737-1811). Prime Minister of Naples under Ferdinand IV. He was born at Besançon, France, the son of an English physician. He served in the Tuscan navy, commanding a frigate in the expedition against Algiers in 1775. He showed such ability that he was invited to reorganize the Neapolitan navy, and soon became commander-in-chief of the sea and land forces, then minister of finance, and finally prime minister. His measures were intolerant, and ultimately caused a reaction against the royal family of Naples and in favor of the French party and the Carbonari. When the French entered Naples in 1806, he fled to Sicily, where he died.

ACTON, THOMAS COXON (1823-98). An American financier and administrator. He was born in New York City and served as assistant deputy county clerk (1850-53) and as deputy register. He was a police commissioner of the New York metropolitan police in 1860-69, and during the last seven years was president of the board. His most valuable service while in that office was during the draft riots in 1863, when for a week he personally commanded the entire police force of the city.

ACTORS' CHURCH ALLIANCE OF AMERICA. An organization founded in 1899 by Walter E. Bentley, a Protestant Episcopal clergyman who had been an actor. Its purpose is the establishment of closer relations between the church and the theatre. It provides chaplains of all denominations to minister to the needs of the dramatic profession, and agitates against Sunday performances and other evils of the stage. The Alliance is affiliated with the Actors' Church Union of England, an organization with similar purposes. The membership of the Alliance is about 5000. It has on its rolls about 1500 chaplains in over 400 cities.

ACTS, SPURIOUS or APOCRYPHAL. See APOCRYPHA, *New Testament*.

ACTS OF HOSTILITY. Acts which may involve nations in war. In international law the term is also applied to the acts of force, authorized by the laws of war, employed by one belligerent against another, during the continuance of war. Acts of hostility may be of a diplomatic, commercial, civil, or military character. The angry nature of the French Ambassador's (Count Benedetti, q.v.) interview with the King of Prussia at Ems in 1870 is an example of a hostile diplomatic act. The French embargo on British ships after the Peace of Amiens (q.v.) is an example of the commercial phase; the firing at an armed vessel of a friendly nation, or the invasion of territory, is a military example; and the detention of non-belligerents, citizens of a friendly nation, as in the case of France and England (1803), is an example of a civil act of hostility. See INTERNATIONAL LAW.

ACTS OF PILATE. See ACTA PILATI.

ACTS OF THE APOSTLES (Gk. Πράξεις

τῶν Ἀποστόλων, *Praxeis tōn Apostolōn*). The fifth book of the New Testament, the composition of which is ascribed by tradition and by the general consent of critics to the same author as that of the Third Gospel, to which book it forms a sequel. As the Gospel was written after the destruction of Jerusalem (70 A.D.), the date of Acts is still later, being not before 75 A.D., and possibly not after 95 A.D., though, if the author of the Gospel was acquainted with the *Antiquities* of Josephus (written 93-94 A.D.), the composition of Acts must be dated somewhat after 95 A.D. In view, however, of the rather doubtful argument for such acquaintance, a date for Acts in the neighborhood of 80 A.D. is not unlikely. Its place of composition is not possible to determine. Its purpose is apparent from the plan on which its material is selected and arranged, when compared with the declared purpose and evident plan of its antecedent book. (See LUKE, GOSPEL OF.) It is to place before Theophilus, who was either a convert from paganism, or, if yet a pagan, well on the way toward an acceptance of Christianity (see THEOPHILUS), the successful extension of the religion of Jesus from its old life in Judaism to its new life in Gentilism as providentially directed and so originally intended by its divine founder. Six stages in the Church's life and work are disclosed, each marked by a summarizing statement (vi. 7; ix. 31; xii. 24; xvi. 5; xix. 20; xxviii. 31). There may have been a secondary purpose, to show, by the favorable reception and treatment which this religion received from Roman officials, that there was no disposition on the part of the government to consider Christianity in a hostile light. Such a secondary purpose would be the more likely if Theophilus were yet himself a pagan and the book were composed in the early Flavian period, when Christianity was under imperial suspicion (see PERSECUTIONS OF THE CHRISTIANS), and would serve an additional purpose by placing in strong contrast the blind hostility of Judaism against the Church.

The abrupt ending of the narrative (xxviii. 30, 31) would seem to imply that it was in the author's mind to write a third book, describing Paul's release and subsequent labors until his death, or perhaps the fortunes of the other apostles.

The material of the book is derived partially from outside sources, both oral (e.g., the information derived from Philip, at Cæsarea) and written (e.g., the speech of Stephen), the presence of which is specially evident in the first twelve chapters, which treat of the experience of the early Church in Jerusalem and Judæa, and partially from personal notes of the missionary experiences of Paul and his companions (e.g., as given in the diary sections xvi. 10-17; xx. 5-15; xxi. 1-18; xxvii. 1-xxviii. 16). These notes were taken, as the critical facts in the case would seem to make clear, by the author himself, who thus becomes a companion of Paul. As to the identity of this companion there would seem to be no valid reason against the uniform tradition from Irenæus downward that he was Luke, mentioned in Paul's Epistles as standing in close relationship to the apostle. (See Col. iv. 14; 2 Tim. iv. 11; Philem. verse 24.) This is the opinion of Harnack in his recent work, *Luke the Physician*, Eng. trans. (London, 1907) and is coming to be more generally the judgment of modern

scholars. From the New Testament references it is apparent that Luke was a Gentile, though not a Roman citizen, of probable Macedonian origin and Antiochian residence and a physician by profession.

Two schools of criticism have attempted to disparage the credibility of Acts—the Tübingen School (1845), which held it to be a tendency writing, so manipulating the narrative in the interests of the union movement of the Church in the second century as to destroy all accuracy of facts, and the Documentary School (1890), which held it to be a complex composite writing, made up of such variant documents, of such varied origins, and of such differing degrees of reliability as hopelessly to obscure the actual facts of the history. Neither of these attempts has proved successful. Later there has been an effort among critics to subject it to the same process of literary criticism as has been so largely employed in the Old Testament. This presents it as a writing which not only gives us a history of the early times of which it tells, but in the way in which it gives that history so reflects the later times in which it was written as to give us a picture of its own age. By these critics it is held to be a composite writing of not earlier origin than the reign of Domitian (81–96 A.D.), compiled by a Gentile Christian, not Luke nor any companion of Paul, and, outside of the personal diary sections in the latter half of the book, which may have come from Luke, of no necessary historical accuracy.

Present criticism, however, is disposed to assign a higher historical value to the narrative of the book. The peculiar accuracy with which the author uses his political terms, especially in view of the frequent changes which took place in the political relations of the provinces to the Emperor and the senate, the preciseness of his knowledge of localities, his intimate acquaintance with the development of the early Church, both internal and external, and his apparent familiarity with the life and work of Peter and Paul, as disclosed in the undesigned agreement in his narrative with the Epistles—all these contribute to the conclusion that the author was writing in first-hand contact with the events which he records, and more than offset the difficulties which arise from the uncertainty of his reference to Theudas (v. 34–39) and from the confusion as to his statement of the terms of the decree of the Apostolic Council (xv. 28–29).

Professor Blass of Halle has suggested that it was written originally in two texts—a longer and a shorter one, the former being the earlier and represented in the text of the peculiar Codex Bezae (D), the shorter being the later and represented in the canonical text of the Testament. But the smoothness of the Bezan text of Acts would suggest that it represents a later (second century) revision of the original text by one who was intimately acquainted with the Asia Minor localities described.

ACTUARIAL SOCIETY OF AMERICA.

An organization for the promotion of actuarial science. It was founded in 1889 and in 1912 had 140 fellows and 110 associates.

ACTUARY (*Actuarius*, in ancient Rome, meant a clerk who recorded the *acta* (q.v.) of the senate and other public bodies, and also an accountant). In recent times, a term applied to officers of life insurance companies and cognate enterprises who supply the calculations as to the probable duration of life upon which insurance contracts, annuities, etc. are based. See INSURANCE; PROBABILITIES.

ACUNA DE FIGUEROA, FRANCISCO. See FIGUEROA, FRANCISCO ACUNA DE.

ACUPRES'SURE (Lat. *acus*, needle + *pressura*, pressure). A mode of arresting hemorrhage from bleeding vessels, now obsolete. A

needle is passed through the tissues on either side of the vessel, so as to cross over and compress it, just as in putting a flower in the lapel of one's coat one crosses over and compresses the flower-stalk with a pin pushed twice through the lapel.

AC'UPUNC'TURE (Lat. *acus*, needle + *punctura*, a pricking). A very ancient remedy, practiced extensively in the east, for the relief of pain, swelling, or dropsy. Steel needles about 3 inches long, set in handles, are used. The surgeon passes one or more to the desired depth in the tissues, and leaves them there from a few minutes to an hour. The relief from pain afforded by this simple operation is sometimes astonishing, and the wounds are so minute as to be perfectly harmless if the needles are aseptic. The needles are sometimes used as conductors of the galvanic current for the destruction of moles, birthmarks, etc., and are sometimes made hollow to permit the injection of a small quantity of some sedative solution into the tissues, by which pain may be almost immediately relieved. See NEURALGIA.

ADA. A city and the county-seat of Pontotoc Co., Okla., about 75 miles (direct) southeast of Oklahoma City, on the St. Louis and San Francisco, the Missouri, Kansas, and Texas, and the Oklahoma Central railroads (Map: Oklahoma, E 4). It is the seat of the State normal school. Its principal industries include the manufacture of cement and asphalt, and cotton raising. Ada is situated in an agricultural and mineral region and produces a large amount of hardwood timber. The municipality owns its water works and has adopted the commission form of government. Pop., 1900, 3257; 1910, 4349; 1913 (est.), 6000.

ADA, öd'ö. A town of Bacs-Bodrog, a county of the Kingdom of Hungary, situated on the Theiss, about 30 miles south of Szegedin (Map: Hungary, G 4). The inhabitants are engaged chiefly in the cultivation of grain and in raising cattle. Pop., 1900, 12,112; 1910, 12,500.

ADAD. See HADAD.

ADAGIETTO, ä'dä-jët'tö. See ADAGIO.

ADAGIO, ä-dä'jō (It. slowly, leisurely, from *adagio*, at ease). In music, primarily a slow tempo intermediate between *largo* or *grave* and *andante*. The term is further applied to the slow movement (usually the second) of a musical composition, as, e.g., of a symphony, sonata, concerto, or overture. It serves as a contrast with the rapid and energetic preceding (*allegro*) and following (*scherzo*) movements of the work and affords scope for a flowing and expressive slow melody with a gracefully varied accompaniment, which breaks up the monotony of the adagio and heightens its effect. A clear and expressive execution of an adagio is an unfailing test of the artistic standing of a performer, as it demands a pure and beautiful tone and calls for variety of tonal color. The diminutive *adagietto* is no longer used as denoting a tempo slightly more animated than adagio, but as a generic title for a short adagio movement.

ADAIR, ä-där', JAMES (1735-75). An Indian trader and author. He lived for almost 40 years among the southern Indians, chiefly among the Chickasaws, and in 1775 published a valuable work entitled *The History of the American Indians, Particularly Those Nations Adjoining the Mississippi, East and West Florida, Georgia, South and North Carolina, and Virginia*. Though

impaired in value by the author's zealous advocacy of the Jewish origin of the Indian race, this book gives one of the best first-hand accounts ever written of the habits and character of the native tribes, besides containing an incomplete but valuable vocabulary of various Indian dialects. Adair's theory of the origin of the Indians was adopted and elaborated by Dr. Elias Boudinot in his *Star of the West, or An Attempt to Discover the Long-Lost Tribes of Israel* (1816).

ADAIR, JOHN (1759-1840). An American soldier. He was born in Chester Co., S. C., but removed to Kentucky in 1787. He served as major in General St. Clair's Indian expedition of 1791 and was defeated by "Little Turtle" in November. He was a member of the Kentucky Constitutional Convention (1792) and was a United States Senator from 1805 to 1806. He served as volunteer aid to General Shelby in the battle of the Thames (Oct. 5, 1813) and, as brigadier-general of militia, commanded the Kentucky troops at New Orleans in 1815. He was Governor of Kentucky (1820-24) and a member of Congress (1831-33).

ADAIR, ROBIN. See ROBIN ADAIR.

ADAL, ä-däl'. A narrow tract of land in East Africa extending along the Red Sea from the Gulf of Tajura to Massawa. The larger part is included in the present Italian colony of Eritrea (q.v.), while the southern end, bordering on the Gulf of Tajura, is under the protectorate of France. Its inhabitants are the Danakil, a warlike people of dusky complexion, crisped hair, and professing Mohammedanism.

AD'ALBERT (?-1072). A German prelate. He was made Archbishop of Bremen in 1043 by Henry III, whom he accompanied to Rome, where he declined the proposed candidacy for the papacy when he might have been elected. Leo IX made him his legate in the North. During the minority of Henry IV Adalbert and Archbishop Hanno, of Cologne, usurped the administration of the Empire; but he became obnoxious to the princes, and they succeeded in separating him from the Emperor. He soon after regained his influence, however, and kept it as long as he lived. His dream was to unite Germany, England, and Scandinavia into a patriarchate independent of Rome.

ADALBERT (?-997), SAINT. A Bohemian prelate improperly styled "the apostle of the Prussians," whose original Bohemian name was Voitech ('comfort of the host'). He was educated at Magdeburg, and in 983 was chosen Bishop of Prague, but soon wearied of the perpetual strife with the essentially heathen Bohemians and retired to a monastery near Rome. He went back to Prague in 992, but again retired in discouragement and finally went as a missionary to the Poles and Prussians and was murdered by a heathen priest April 23, 997. He was first buried at Gnesen and then transferred to Prague and put in a vault, where his bones were discovered in 1880 and deposited in the cathedral. For his life, consult C. Heger (*Königsberg*, 1897), H. G. Voigt (Berlin, 1898).

ADALIA, ä-dä'lē-ä (ancient Attalia). The chief seaport of the Turkish vilayet of Konieh, situated on the southern coast of Asia Minor, in lat. 36° 52' N., long. 30° 45' E., about 200 miles southeast of Smyrna (Map: Turkey in Asia, D 4). The streets rise like the seats of a theatre up the slope of the hill and are studded with beautiful gardens of orange, fig, and mul-

berry trees. It has a considerable trade in timber, wheat, and other agricultural products. Modern steamers cannot enter the harbor, and for this reason its importance has been greatly lessened. Pop., about 30,000, including about 7000 Greeks.

AD'AM. The name given in the Book of Genesis to the first man. The word *Adam* is originally a common noun applied both to a single human being and to mankind in general; hence, as a designation for the first man the Old Testament almost invariably attaches the article to *adam*, which thus becomes *ha-adam*; that is, 'the man.' There are two accounts in Genesis of the creation of man—one in i. 20-30, and another in ii. 5-24. According to the former, male and female are created at the same time (i. 27). The passage is somewhat ambiguous, so that it is not certain whether only a single human pair is referred to or mankind in general, just as according to this version the animal world in general is created at the beginning. In the second version, however, a single male individual alone is formed by God, who molds a man out of the "dust of the ground" and breathes into the mass the "breath of life" (ii. 7). The word used for "ground" is *adamah*, and in the mind of the writer there is evidently a close connection between this word and *Adam*. A common meaning for the Hebrew root *adam*, from which *adamah* is derived, is 'red'; but while this furnishes a satisfactory explanation for the word "ground," it does not follow that the implied etymology for *adam* as man is correct. The root *adam* occurs in several Semitic languages and exhibits a variety of meanings, such as 'pleasant,' 'to make,' 'to attach one's self' (hence, 'to be sociable'), and scholarly opinion vacillates between assuming one or the other of these significations as furnishing the explanation of the name "Adam." If any conclusion may be drawn from *ben* or *ibn*, which is the common Semitic word for 'son' and 'child,' and which is derived from a root signifying 'build,' the weight of evidence would be in favor of connecting *adam* with 'to make.' In Assyrian we have a word *admu* (the equivalent of the Hebrew *Adam*), which actually occurs as one of the synonyms of 'child' (see Delitzsch, *Assyrisches Wörterbuch*, p. 25). Of more importance, however, is the similarity of the name to that of the Babylonian hero Adapa. It is possible that the last sign *pa* also had the value *ma*, or that Adama was a Palestinian variant of Adapa. (See ADAPA.) The two stories of creation in Genesis differ in many respects (see CREATION), but it is by the combination of the two that we obtain the views held by the Hebrews regarding the first man. In the first version, where the work of creation is distributed among six days, humanity is created on the last day. Man is made in the image of God, and given dominion over all the animals and, indeed, the entire earth. In the second version it is stated that man was placed in a garden situated in Eden (Gen. ii. 8), known as the "Garden of Eden," in which all manner of trees were planted. (See EDEN.) Man is put there to till the ground and to keep guard over it. He is permitted to eat of the fruit of all the trees with the exception of one, known as the "tree of knowledge of good and evil," which he is not to touch under penalty of death. A woman is created as a helpmate to Adam out of one of his ribs. She is called Eve, a name subsequently explained as "the mother of all living."

The close attachment between Adam and Eve (see EVE) is emphasized, and, although not distinctly stated, the narrative implies that she is included in the prohibition not to eat of the one tree singled out. Through the serpent, who assures the woman that she and Adam will not die, the woman is beguiled into eating of the fruit and gives of it to Adam. The first consequence of the act is that the pair recognize their naked state and make loin coverings of fig leaves. Adam pleads in extenuation that the woman gave him of the fruit, and the woman pleads that the serpent beguiled her. All three are punished, the serpent by becoming the cursed one among the animals, the woman by increase of her troubles and pain, particularly in child-bearing, and the man by being obliged henceforth to secure his sustenance by the sweat of his brow in tilling the ground. God makes garments of skin for the pair, and in fear lest they eat also of the "tree of life" which is in the garden and whose fruit imparts immortality, he drives Adam and Eve out of their first habitation and places cherubim (q.v.) with flaming swords to guard the way to the tree of life.

In the continuation of the narrative (chap. iv, 1-2), the birth of two sons, Cain and Abel, is recounted; but beyond that we learn nothing further of Adam and Eve until we reach a passage inserted in chap. v from a work called *Sefer Toledoth Adam*, or 'The Book of the Generations (or History) of Mankind.' It contains a genealogical list in which, after a restatement of the creation of humanity and the assigning of the name Adam (Gen. v. 2) to *mankind in general*, the birth of Seth, in the 130th year of Adam's life, is recounted, no mention being made of Cain or Abel. Adam is said to have died at the age of 930 years, after having begotten sons and daughters. This genealogical list appears to be in reality a list of dynasties, drawn up on the basis of a tradition which belongs to the same category of semi-legendary lore as the lists preserved by Eusebius and Syncellus of early Babylonian rulers who lived before the Flood (see Rogers' *History of Babylonia and Assyria*, vol. i, p. 328), and one of Sumerian origin that has recently been discovered among the tablets from Nippur in the museum of the University of Pennsylvania by Dr. Arno Poebel. On the other hand, the story of Adam and Eve in the first three chapters of Genesis is a composite production embodying various popular tales or myths, some elements of which probably go back to Babylonia. Having passed through an independent development among the Hebrews, they have been interpreted in the light of the monotheistic conception of the universe and preserved as an effective means of explaining the toil and ills with which human existence is filled, by the manner of man's creation, his first disobedience, and his failure to attain immortality. It is this distinctly theological conception of Adam which becomes uppermost as the religious ideas of the Old Testament spread beyond the boundaries of Israel. The story of Adam becomes, with the growth of Christian theology, the most important source for the doctrine of the origin of sin, and over against him is put the second Adam—the first being the fountain of sin, the second the source of salvation. This conception is fully brought out in the teachings of Paul (see especially Rom. v. 12-21; 1 Cor. xv. 22 and 45-49). The perfection of Adam, the protoplast, in wisdom,

goodness, and power, is increasingly emphasized, but also the exceeding heinousness of his sin, involving all the race in its guilt and baneful consequences. Both find perhaps their fullest and most impressive expression in Milton's *Paradise Lost*. In Jewish theology the doctrinal development in general is arrested after the separation from Judaism of the new sect made up of the followers of Jesus. The predominant position henceforth occupied in Judaism by obedience to the Law brings about a concentration of Jewish thought on its various requirements. In place of doctrinal elaboration we have the homiletical interpretation of the narrative in Genesis, which leads to numerous additions in rabbinical literature to the biblical narrative of Adam and of the creation in general. These stories about Adam are collected in the so-called Midrash Rabba to Genesis, a German translation of which was published by Wünsche (*Der Midrasch Rabba zu Genesis*, 1882). (For further legends, telling of the repentance and death of Adam and Eve, see ADAM, BOOK OF.) From the Jews the stories made their way to the Arabs, and snatches of them are embodied in the Koran. Consult Sale's translation of the Koran and notes (London, 1877), especially to suras 15 and 17. The relations to Babylonian thought may be seen in Zimmern's edition of Schrader, *Die Keilschriften und das Alte Testament* (1902); Jeremias, *Das Alte Testament im Lichte des alten Orients* (1906).

ADAM. In Shakespeare's *As You Like It* (q.v.), an old servant who follows the fortunes of Orlando. His age, he apologetically says, "is as a lusty winter, frosty but kindly" (Act II, Scene 3). The part is one which Shakespeare himself is traditionally said to have played.

ADAM. A family of important Bavarian battle and animal painters.—ALBRECHT (1786-1872), the ancestor of the family, was born at Nordlingen and studied at Nuremburg and Munich. From 1809 to 1812 he resided at Milan as court painter to Eugene Beauharnais, Viceroy of Italy. In this capacity he took part in many of the Napoleonic wars, of which he painted many well-known pictures. His representations of the Russian campaign, not only in paintings, but also in an interesting series of 100 lithographic plates (1827-33), are graphic and interesting. After the downfall of Napoleon he was active in the service of Kings Maximilian I and Ludwig I of Bavaria, William of Württemberg, and the Emperor of Austria. In 1848 he took part in the Italian campaign, on the staff of General Radetzky. He was an excellent soldier, sharing in all the hardships of the service. His battle pieces are painted with objectivity and with the fidelity of a historian, but the color is hard and lacks harmony. They are chiefly in the possession of royal and imperial families of Bavaria, Württemberg, Austria, etc., and in the public collections of Germany.—His eldest son, BENNO (1812-92), is known chiefly as a painter of animals, both wild and domestic, and especially by his hunting pieces. Like the rest of his family, he resided in Munich, the gallery of which is rich in his works.—His younger brother, FRANZ (1815-86), assisted his father in all his later works and is especially known by his pictures of the Franco-Prussian War of 1870. The galleries of Berlin, Munich, Frankfort, and other cities are rich in his works, which excel in color those of all

other German battle painters of his day.—EUGEN (1817-80), the third son of Albrecht, likewise accompanied and assisted his father. His best independent works are the battles of the Italian campaign of 1859 and the Franco-Prussian War of 1870, in both of which he took part. He is also known as an illustrator.—EMIL (1843—), the eldest son of Benno Adam, was a pupil of his father and his uncle Franz, and is known especially as a painter of thoroughbred horses. His pictures are much prized by the titled sportsmen of England, France, Germany, and other countries. Consult the Autobiography of Albrecht Adam (Stuttgart, 1886), and for reproductions *Das Werk die Münchener Künstlerfamilie Adam*, with text by Holland (Nuremburg, 1890).

ADAM, a'dän', ADOLPHE CHARLES (1803-56). A French composer of operas. He was born and died in Paris. Though originally intended for a scientific career, he entered the conservatory in 1817 and studied composition under Boieldieu, mainly writing transcriptions for the piano. In 1829 his one-act opera, *Pierre et Catherine*, was produced with success, and 52 more followed, of which *Le chalet* and *Le postillon de Longjumeau* (1836) are the most famous. His chief merits are the characteristic French daintiness and finish. He was made professor of composition at the conservatory in 1849. His autobiography and souvenirs were published (Paris, 1860). Consult A. Pougin, *Adolphe Adam, sa vie, etc.* (Paris, 1876).

AD'AM, ALEXANDER. A Scotch classical scholar, born near Forres, in Morayshire. In 1757 he entered the University of Edinburgh. Later he held various posts as a teacher of the classics with great success. He published *Principles of Latin and English Grammar* (1772), *Roman Antiquities* (1791), *A Summary of Geography and History* (1794), and *A Compendious Dictionary of the Latin Tongue* (1805). His *Roman Antiquities* passed through many editions and was translated into German.

ADAM, BOOK OF. More or less extensive recensions of works dealing with Adam and Eve are extant. One of them is of Jewish origin, the other two are clearly Christian. Of the first, which was probably called *The Life of Adam and Eve*, we possess a Greek text published by Tischendorf in *Apocalypses Apocryphæ* (1866) under the misleading title "Apocalypses of Moses" because in the introduction the story is said to be recorded to Moses and later by Ceriani in his *Monumenta sacra et profana*, v (1868). An Armenian version of this work has been made known in an English translation by Conybeare in *Jewish Quarterly Review* (1895), and an Old Slavonic version has been published with a Latin translation by Jagić in *Denkschriften der Wiener Akademie der Wissenschaften* (1893). We also have a Latin *Vita Adæ et Evæ*, of which the best text is that published by Meyer in *Abhandlungen der Bayerischen Akademie der Wissenschaften* (1878). This work tells the story of the creation of Adam and Eve, their fall, penitence, restoration to divine favor, death, and burial. It seems to have been written originally in Hebrew or Aramaic and may come from the first century B.C. The original form is difficult to recover, and the present texts have here and there suffered in transmission, but there are very few Christian interpolations.

The Conflict of Adam and Eve is a Christian

work. It has been preserved in an Ethiopic version made from the Arabic. The Ethiopic text has been published by Trumpp in *Abhandlungen der Münchener Akademie der Wissenschaften* (1881). Translations were published by Dillmann, *Das Christliche Adamsbuch des Orients* (1853); Migne in *Dictionnaire des apocryphes* (1856); Malan, *Book of Adam and Eve* (1882). Of the Arabic text there is a manuscript at Munich. An earlier form of this work is *The Treasure Cave*, published by Sachau first in German, *Die Schatzhöhle* (1883), then in Syriac, 1888. The Arabic text was published by Mrs. Gibson in *Studia Sinaitica* (1901). Another Christian work is *The Testament of Adam* in Syriac, published with a French translation by Renan in *Journal Asiatique* (1853). Of this book Bezold published Arabic and Ethiopic versions in *Orientalische Studien Nöldeke gewidmet*, ii (1906, pp. 893 ff.). Renan proved that the original was written in Greek. See Fuchs, in Hennecke, *Neutestamentliche Apokryphen* (1904); Ginzburg in *Jewish Encyclopædia*, art. "Adam, Book of"; Schürer, *Geschichte des jüdischen Volkes* (1901, pp. 396 ff.).

ADAM, Sir FREDERICK (1781-1853). An English general. He was educated at Woolwich Military Academy and greatly distinguished himself in the Peninsular campaign. Although severely wounded at the battle of Alicante, he reentered the service upon his recovery. He repelled the last charge of the French guards at Waterloo.

ADAM, GRAEME MERCER (1839—). A Canadian author and editor. He was born at Loanhead, Midlothian, Scotland. After some experience with the Blackwoods, he emigrated to Toronto, where he became a partner in a successful publishing house. In 1876 he opened, in conjunction with John Lovell of Montreal, a branch house in New York. Returning to Toronto in 1878, he subsequently edited the *Canadian Bookseller*; founded, in conjunction with Goldwin Smith, the *Canadian Monthly* (1872); started the *Canadian Educational Monthly* (1879); and was for several years connected with the *Bystander* as assistant to Goldwin Smith, and contributed extensively to other periodicals. Coming again to New York (1892), he became identified with several publishing houses as "reader," wrote reviews, and compiled several books. In 1896 he removed to Chicago to become editor of *Self-Culture*. Among Adam's numerous separate publications are *The Canadian North-West* (1895); *Outline History of Canadian Literature* (1886); topographical and descriptive books of Canada, encyclopædias, and school books. In collaboration with Ethelwyn Wetherald, he wrote a successful historical romance entitled *An Algonquin Maiden* (1886). See MacMurchy's *Handbook of Canadian Literature* (1906); and Burpee, "Recent Canadian Fiction" in the *Forum*, August, 1899.

ADAM, JAMES (1860-1907). A Scotch classical scholar and educator, born in Aberdeenshire and educated at the University of Aberdeen and at Caius College, Cambridge. In 1885 and after, while classical lecturer at Emmanuel and Girton colleges, Cambridge, he was engaged in preparing an edition of Plato's *Apology* (published in 1887). Made classical tutor in Emmanuel College in 1890, Adam began work on his most important undertaking, an edition of Plato's *Republic*. In the same year that this was published (1902), the author was chosen to

deliver the Gifford Lectures at Aberdeen University. His subject, "The Religious Teachers of Greece," remained as the title of the lectures in book form, printed after his death. In 1903 he received the degree of Litt.D. from Cambridge University, where he was one of the most popular of lecturers during his service at Emmanuel College.

ADAM, JEAN (1710-65). A Scotch poet. She was born near Greenock. In her earlier life she was a teacher, but, compelled to give up her school, she became a street vendor. She lived a joyless life and died in the Glasgow poorhouse. She published a volume of religious poems in 1734. By some she is believed to be the author of *There's nae Luck about the House*, a beautiful lyric. (See MICKLE, WILLIAM JULIUS.) Consult *Ward's English Poets* (London, 1880).

ADAM, à'dän', JULIETTE (1836—). A Parisian writer making use of the pseudonyms Juliette Lamber and Comte Paul Vasili. She was born at Verberie, Oct. 4, 1836. One of her first books, *Le siège de Paris, journal d'une Parisienne* (1873), is an account of her experiences in 1870-71, when her husband was prefect of police. Her *Nouvelle Revue*, founded in 1879, and her salon have both been politically influential. She has written much for periodicals on politics, literature, education, and the position of women, as to which she agrees with George Sand and Madame d'Agoult. Her fiction, e.g., *Laide* (1876), *Grecque* (1877), *Païenne* (1883), is militantly hedonistic, a passionate protest against the anti-natural, or supernatural, in Christianity. She published volumes of reminiscences, as *Le roman de mon enfance et de ma jeunesse* (1902) and *Mes premières armes littéraires et politiques* (1904); also: *Mes sentiments et nos idées* (1905); *Mes illusions et nos souffrances durant le siège de Paris* (1906); *Mes angoisses et nos luttes* (1907); *Nos amitiés politiques avant l'abandon de la revanche* (1908); *Après l'abandon de la revanche* (1910); *Impressions françaises en Russie* (1912).

ADAM, ad'am, LAMBERT SIGISBERT (1700-59). The principal representative of a well-known family of French sculptors. He was born at Nancy, studied there with his father, a mediocre sculptor, and under unknown masters at Paris, and won the *Prix de Rome* in 1723. At Rome he received commissions from Cardinal de Polignac, whose antiques he restored, and from Pope Clement XII. He modeled his work after Bernini. In 1733 he returned to Paris. His works include the colossal figures of the Seine and the Marne upon the cascade of St. Cloud; two marble groups, "La Chasse" and "La Pêche" at Potsdam (Prussia); and the colossal fountain of Neptune at Versailles (1740), his masterpiece. In this work he was assisted by his brother, NICHOLAS SÉBASTIEN (1705-78), a pupil of his father and himself, whom he joined in Rome. His works are in Paris and at Nancy, the best being the tomb of Queen Catherine Opalinska in the latter city. Frederick the Great summoned him to Berlin as court sculptor, at the princely salary of 4000 livres, but, through the mistake of the Prussian servitor, he obtained instead the youngest and least important of the brothers, François Gaston (1710-61). During an activity of 13 years the latter adorned the gardens of Potsdam and Sans Souci with numerous sculptures. Consult Thirion, *Les Adams et Clodion* (1885); Lady Dilke,

French Architects and Sculptors of the Nineteenth Century (London, 1900).

ADAM, ä'dän', PAUL (1862—). A French author born in Paris. He participated in the Boulangist movement (1889), and was an unsuccessful candidate for a seat in the Chamber of Deputies. His earliest appearance in literature was made with *Chair molle* (1885), which shows the influence of the realist Zola. Five years later, however, the author signed the *Manifeste des cinq*, which favored a return to the idealistic novel; and thereupon began historical investigations and a study of contemporary French society. His novels dealing with present-day life are collected under the title *L'époque*, while those having an earlier time as background the author has grouped as *Le temps et la vie: histoire d'un idéal à travers les siècles*. His stories, chiefly in the manner of the symbolist school, include: *Robes rouges* (1891); *Le mystère des foules* (2 vols., 1895), and *La Bataille d'Uhde* (1897). He also published a cycle of four romances dealing with the period from 1792 to 1830: *La force* (1898; new ed., 1910); *L'enfant d'Austerlitz* (1902), *La ruse* (1903); *Au soleil de juillet* (1903). With J. Moréas he wrote *Le thé chez Miranda* (1887). He wrote the dramas *L'Automne* (1893, with G. Mowrey), and *Le cuivre* (1896). The tenth edition of *La ville inconnue* was printed in 1911. His problem novel *Stéphanie* (1913) upholds the "arranged" marriage.

ADAM, QUIRIN FRANÇOIS LUCIEN (1833–1900). A French magistrate and philologist. He was born at Nancy. Among his numerous works on philology, some of which deal with the languages of the native tribes of America and the dialects of Lorraine, the following are the most important: *Grammaire de la langue mandchoue* (1873); *Esquisse d'une grammaire comparée du Créé et du Chippéway* (2d ed., 1876); *Etudes sur six langues américaines* (1878); *Les patois lorrains* (1881); *Les idiomes négro-aryens et maléo-aryens* (1883). His *Langue mosquito*, a work on a language little studied at that time, won the Loubat prize in 1891.

ADAM, ROBERT. See FURNITURE.

AD'AM, TESTAMENT OF. See APOCRYPHA, *Old Testament*.

ADAM, WILLIAM (1751–1839). A British lawyer. He was born in Scotland and in 1774 entered Parliament, where he attached himself to the party of Lord North. Four years afterward he fought a duel with Fox (1778), in which Fox was wounded. He took an important part, however, in effecting the coalition between Fox and North and Shelburne and was one of the few to maintain his allegiance to his former adversary at the time of the French Revolution. He was one of the managers appointed by the Commons to conduct the impeachment of Warren Hastings (1788). He presided over the Civil Jury Court in Scotland from the time of its establishment (1816) until his death. Consult his *Life*, by G. L. Craik, in the *Dictionary of the Society for the Diffusion of Useful Knowledge*.

AD'AMANT (Gk. *ἀ*, *a*, priv. + *δαμᾶν*, *daman*, to tame). The name of any substance of extraordinary hardness. The name was applied to a supposed stone or mineral, the properties of which were long unknown. It was confounded by early writers with the lodestone or magnet. This confusion ceased with the seventeenth century, but the word for a long time had currency among scientific writers as a synonym for dia-

mond. The use of the term to denote the lodestone seems to have been due to the early Latin medical writers, who erroneously derived the word from the Latin *adamare*, 'to have an attraction for.'

AD'AMAN'TINE SPAR. See CORUNDUM.

ADAMAWA, ä'dä-mä'wä, or FUMBINA. A former native African state, mainly in what is now German Kamerun. It extended from about 9° to 4° N. lat. The name is generally applied to the region which lies between the Upper Benue and Logone rivers (Map: Africa, F 4). The country is elevated in its southern part, where some of the mountains reach an altitude of about 8000 feet. Its soil is very fertile, and climate, flora, and fauna are tropical. Politically, Adamawa is more or less autonomous and is ruled by a native sultan. The principal settlements are Yola, with a population estimated at from 12,000 to 20,000; Banjo, the centre of the ivory trade; and Nganudere. Cereals, vegetables, and cotton are grown, and there is considerable trade in ivory and rubber. Silk, sulphur, salt, and cloth are imported. The population is estimated to be over three million. The predominant part consists of Fulbe. (See FULAHS.) The first European to visit Adamawa was Dr. Barth in 1851. Consult Passarge, *Adamawa* (Berlin, 1895).

AD'AM BEDE. The title of a novel by George Eliot (see ELIOT, GEORGE), first published in 1859. The name is that of its principal character, a young English workingman of intellectual tastes and a keen conscience. He is the lover of Hetty Sorrel, but in the end marries Dinah Morris.

AD'AM CU'PID. A name applied to Cupid in Shakespeare's *Romeo and Juliet*, Act II, Scene 1. According to Upton there was an archer named Adam, whose skill was famous in Shakespeare's time, so that the significance of the epithet is evident. Upton cites in confirmation, *Much Ado About Nothing*, Act I, Scene 1: "And he that hits me let him be clapped on the shoulder and called Adam." Other critics maintain that the original was "Abram," a corruption from *Auburn*, since the early folios and quartos give "Abraham" in the passage.

ADAM DE LA HALLE, ä'dän' de lä ä'l' (c.1240–87). One of the early founders of the French drama. His *Play of Adam*, or *Le jeu de la feuille*, as it was also called, written for citizens of his native Arras for popular performance, is the earliest French comedy. Adam de la Halle was also a musician, and his *Robin et Marion* is the first European comic opera. His musical compositions, chiefly songs and motets, form a connecting link between the work of the French *déchanteurs* and the Flemish contrapuntists. His works are edited by Coussemaker (Paris, 1872). Consult: Ambros, *Geschichte der Musik*, vol. ii (Leipzig, 1892); H. Guy, *Essay sur la vie et les œuvres littéraires de Adam de la Halle* (Paris, 1898); E. Langlois, *Le jeu de Robin et de Marion* (Paris, 1896); F. Helfenbein, *Die Sprache des Trouvère Adam de la Halle aus Arras* (Strassburg, 1911).

ADAMI, ä-dä'me, FRIEDRICH WILHELM (1816–93). A German author, critic, and publicist. He was born at Suhl, studied medicine, then philosophy and history, in Berlin. He was a regular contributor to the *Kreuzzeitung*, translated, recast, and reviewed plays. Among his best original works are *Ein ehrlicher Mann* (1850) and *Der Doppelgänger* (1870). Among

the collections of his historical tales are *Fürsten- und Volksbilder aus der vaterländischen Geschichte* (1863) and *Aus den Tagen zweier Könige* (2 vols., 1866). His works are marked by a clear style and a thoroughly patriotic tone.

AD'AMI, JOHN GEORGE (1862—). An English pathologist. He was born at Manchester; was educated at Owens College, Manchester, and Christ's College, Cambridge, and studied also at Breslau and Paris. He became house physician to the Manchester Royal Infirmary, and demonstrator of pathology at Cambridge in 1887. In 1891 he was elected fellow of Jesus College, Cambridge, and in 1892 professor of pathology and bacteriology at McGill University in Montreal, Canada. He was also chosen advisory pathologist to the Montreal General and Royal Victoria hospitals, and in 1896 became Middleton Goldsmith lecturer to the New York Pathological Society. He was president of the Association of American Physicians in 1911-12. He published numerous papers on pathological topics, and articles on inflammation for Allbutt's *System of Medicine*. In addition, he wrote the following books: *The Principles of Pathology* (1908); *Inflammation: An Introduction to the Study of Pathology* (1910).

AD'AMITES. 1. An obscure and probably non-existent sect mentioned by Epiphanius (*Hær.* 52) as extant in the middle of the fourth century, and so called because they imitated Adamic simplicity in going without clothing while at worship. They are said to have practiced absolute continence. 2. A sect of fanatics founded by a certain Picard, which became numerous in Bohemia and Moravia in the fifteenth and sixteenth centuries, but had no connection with the Hussites. Picard styled himself Adam, the son of God, rejected the sacrament of the supper and the priesthood, and was charged with advocating the community of women. After his death his followers increased in Bohemia under several leaders. They even fortified themselves on an island in a tributary of the Moldau and committed various depredations. They were detested as much by the followers of Huss as by the Catholics. Ziska made war against them and slew great numbers, but they were never entirely rooted out. In fact, it is said that in 1849 a similar sect appeared in Austria.

AD'AMNAN, SAINT (625-704). An Irish abbot, properly Adam, of which Adamnan is a diminutive. He was born at Drumhome, southwest Donegal, the extreme northwest county, about the year 625, but entered the monastery of Iona. His father, Ronan, was the great-great-grandson of the uncle of St. Columba and also claimed kin with many Irish kings. The paternal grandfather was Tinne, from whom came the patronymic *Ua Tinne*, or 'grandson of Tinne,' an appellative which is occasionally found coupled with Adamnan's name. Ronnat, the mother of Adamnan, was descended from Enna, son of Niall, whose race, the Cincl Enna, possessed themselves of the tract lying between the channels of the Foyle and Swilly, which was called the Tir Enna, or 'Land of Enna,' and answers to the modern barony of Raphoe. In the year 697 he was elected abbot of Iona. His rule over that community was not, however, destined to be peaceful and fortunate. The Irish church then held the Oriental views about dates for observing Easter and the form of the tonsure. In his intercourse with the Saxon church, Adamnan had adopted the Roman or orthodox views, as

they are termed, and endeavored to put them in practice in his own community. He was thwarted in this object, and it is said that mortification at the failure caused his death. He died in Iona, Sept. 23, 704. He left behind him an account of the Holy Land, containing matters which he says were communicated by Arculfus, a French ecclesiastic who had lived in Jerusalem, which is valuable as the earliest information we possess of Palestine in the early ages of Christianity. But far more valuable is his *Vita Sancti Columbæ*, his life of St. Columba, the converter of the Piets and founder of Iona. Along with miracles and many other stories palpably incredible, this book reveals a great deal of distinct and minute matter concerning the remarkable body to which both the author and his hero belonged. The standard edition of the book is that of William Reeves, D.D., edited in 1857 for the Bannatyne Society of Edinburgh, and the Irish Archæological Society (Dublin, 1857), which, with an English translation, forms the sixth volume of *Historians of Scotland* (Edinburgh, 1874), reissued with additional notes by J. T. Fowler (Oxford, 1894). Nearly all the information to be had about the early Scoto-Irish church is comprised in that volume.

AD'AM OF BREMEN. A German historian. He was born, probably, at Meissen, Saxony (the date uncertain), and came to Bremen in 1067 from Magdeburg and became a canon of the cathedral and in 1068 principal of the cathedral school. He won perpetual fame by writing (between 1072 and 1076) from all available sources, including the oral testimony of Svend Estridson, King of Denmark, to see whom he made a special journey, a history of the Hamburg Church, which is one of the most precious of mediæval histories. The best edition of this great work, *Gesta Hammaburgensis Ecclesiæ Pontificum*, is by Lappenberg (Hanover, 1876). The third edition of the German translation, by J. C. M. Laurent, appeared in the series *Die Geschichtschreiber der Deutschen Vorzeit* (Berlin, 1893). As the appendix to the third and last book Adam gives a general account of the lands belonging to the Danes and Swedes and of Norway. In it occurs this interesting passage referring to America: "Besides this he [Svend Estridson, King of Denmark] told of still another island that had been found by many in that ocean [the Atlantic]. It is called Wine-land, because vines spring up there spontaneously, producing excellent wine. I mention this confidently, for I have learned from no fabulous rumor, but through definite information from Danes, that crops also grow there in abundance without having been sown." (Cap. 247, or § 38.) In his book Adam quotes from preceding chroniclers, from Cicero, from the Latin poets, Vergil, Horace, Lucan, Juvenal, and Persius; from the Latin Fathers, Jerome, Ambrose, Gregory the Great; from Bede, Cassiodorus, and Paulus Diaconus. But the style is defective and the Latin difficult and faulty, notwithstanding that he took Sallust as his master. Although the day of his death, October 12, is known from the church record of Bremen, the year is not, but probably it was about 1076.

ADAM OF ST. VICTOR (?-c.1192). A monastic poet of France. Nothing is known of him except that he died in the abbey of St. Victor in Paris. Yet he was "the most prominent and prolific of the Latin hymnists of the Middle

Ages." His works—complete as far as discovered, but doubtless far from being really so—were edited by Léon Gautier (3d ed., Paris, 1894; Eng. trans., London, 1881, 3 vols.). Consult: Julian, *Dictionary of Hymnology* (1888), French, *Sacred Latin Poetry* (1874), and Duffield, *Latin Hymns* (1888).

ADAMS. A town, including the villages of Renfrew, Maple Grove, and Zylonite, in Berkshire Co., Mass., 16 miles north of Pittsfield, on the Pittsfield and North Adams branch of the Boston and Albany Railroad and on the Hoosac River (Map: Massachusetts, A 2). Within the town limits is Greylock Mountain (3535 feet), the highest point in Massachusetts. The town has a public library, a statue of McKinley, a Quaker meeting-house, and churches of almost every denomination. Cotton and woolen goods, paper, foundry, and lime products are manufactured. Laid out and settled as "East Hoosuck" in 1749, Adams was incorporated under its present name (in honor of Samuel Adams) in 1778. It originally included both North and South Adams. The government is administered by town meeting. Pop., 1890, 9213; 1900, 11,134; 1910, 13,026; 1913 (est.), 13,500. Consult J. G. Holland, *History of Western Massachusetts* (Springfield, 1855).

ADAMS, ABIGAIL SMITH (1744–1818). The wife of John Adams, second President of the United States, and daughter of Rev. William Smith, minister of the Congregational Church at Weymouth, Mass. She was born at Weymouth, Mass., and died at Quincy, Mass. Through her mother, Elizabeth Quincy, she was descended from the Puritan preacher, Thomas Shepard of Cambridge, and though of defective education, delicate health, and nervous temperament, she was among the most influential women of her day, and one of its most vigorous of stylists, owing little to teaching but much to influence and environment. There are in her writings both originality and a remarkable idiomatic unconventionality, especially rare in the authors of her time. During and after the Revolutionary War she was at times separated from her husband, who was a delegate to Congress and who was afterward engaged in diplomatic business in Europe. Joining him in France in 1784, she accompanied him to London, where she had unpleasant social experiences. From 1789 to 1801 she lived at Washington, naturally enough, and then till her death at Braintree, in what is now Quincy. *The Familiar Letters of John Adams and his Wife*, published with a memoir by C. F. Adams (1876), show her to have been a woman of keenness, sagacity, and geniality and they throw very valuable light on the history and social life of her time.

ADAMS, ALVIN (1804–77). The founder of Adams Express Company of America. He was born at Andover, Vt., and in 1840 established between New York and Boston an express route which, subsequently extended, led in 1854 to the incorporation of the Adams Express Company. Consult Stimson, *History of the Express Business* (New York, 1881).

ADAMS, ANDY (1859—). An American author, born in Whitley Co., Ind., and educated in the public schools. After an early youth spent on a farm in Indiana, he removed to Texas, where for ten years he lived the life of a cowboy. During the excitement following the discovery of gold in Cripple Creek, Colo., he went to that State and engaged in mining. Shortly

afterward he began to write. His first book, *The Log of a Cowboy* (1903, 1912), showed a thorough knowledge of the conditions which he described and a considerable gift of vivid and graphic description. It was followed by *A Texas Matchmaker* (1904); *The Outlet* (1905); *Cattle Brands* (1906); *Reed Anthony, Cowman* (1907); *Wells Brothers* (1911).

ADAMS, BROOKS (1848—). An American lawyer and social essayist. He was born at Quincy, Mass., a son of Charles Francis Adams (q.v.). He was educated in Quincy, in Washington, and in Europe, according to the changes of his father's residence. He graduated at Harvard in 1870, was admitted to the bar, and practiced law till 1881. His writings include many magazine articles and the following books: *The Gold Standard; The Emancipation of Massachusetts* (1887), a study in the evolution of religious freedom; an historical essay, *The Law of Civilization and Decay*, and *America's Economic Supremacy* (1900); *The New Empire* (1902); *Railways as Public Agents* (1910); *Charles Francis Adams, an American Statesman* (1912); *The Theory of Social Revolutions* (1913); *Economics and Public Affairs* (1913).

ADAMS, CHARLES BAKER (1814–53). An American naturalist. He was born at Dorchester, Mass. He graduated at Amherst; assisted Prof. Edward Hitchcock in geological field-work; became tutor at Amherst, 1836; professor of chemistry and natural history in Middlebury College, Vt., 1838 to 1847, and was professor of astronomy and zoölogy at Amherst from 1847 till his death. From 1845 to 1847 he was State geologist of Vermont. He went several times to the West Indies in the interest of science; wrote on conchology, and with the assistance of Prof. Alonzo Gray, of Brooklyn, published an elementary work on geology.

ADAMS, CHARLES DARWIN (1856—). An American philologist and educator. He was born in Keene, N. H., and in 1877 graduated from Dartmouth College. After post-graduate studies at that institution he studied at the Andover Theological Seminary from 1879 to 1881. In the latter year he was appointed instructor in Greek at Cushing Academy. After remaining here until 1884, he became professor of Greek at Drury College. In 1893 he was appointed to the chair of Greek language and literature at Dartmouth College. In 1891 he studied at the University of Kiel, where he received the degree of Ph.D. In 1908 he became editor of *The Classical Journal*, and in 1906 and 1907 was president of the Classical Association of New England. He edited *Lysias, Selected Speeches* (1906).

ADAMS, CHARLES FOLLEN (1842—). A humorous dialect poet. He was born at Dorchester, Mass., and was educated in the common schools. He served in the Civil War and was wounded and captured at Gettysburg. In 1872 he began poetic production, cultivating the ballad in German dialect. His verses are collected under the titles *Leedle Yawcob Strauss and Other Poems* (1878) and *Dialect Ballads* (1887). His complete poems were collected and published together in 1910.

ADAMS, CHARLES FRANCIS (1807–86). An American diplomat and statesman, the son of President J. Q. Adams. He was born in Boston; spent the years 1809 to 1817 with his father in Europe, chiefly in Russia and England; prepared for college at the Boston Latin

School, and graduated at Harvard in 1825. He then spent several years in Washington and later studied law in the office of Daniel Webster (at Boston) from November, 1828, to January, 1829, when he was admitted to the bar, though he never practiced. During the next ten years he devoted himself chiefly to literary pursuits, contributing many papers to magazines, writing an able political pamphlet entitled *An Appeal from the New to the Old Whigs* (1835), and editing the *Letters of Abigail and John Adams* (1840-41). From 1841 to 1846 he was a member of the State Legislature, serving three years in the House and two in the Senate; and from 1846 to 1848 he was editor of the *Boston Whig*, and as such was the leader of that wing of his party called the "Conscience Whigs." In 1848 he presided over the Free Soil Convention at Buffalo, and was unanimously nominated for vice-president, but after the election retired to Quincy, Mass., and spent several years in editing the *Works of John Adams* (10 vols., 1850-56). In 1858 he was elected to Congress as a Republican and served with marked ability until May, 1861, when he was sent as United States Minister to England. Here he remained for seven years and during the Civil War rendered invaluable services to his government. In face of the pronounced sympathy for the South manifested by the aristocracy and the upper social classes generally and of the favoritism at times of the British government itself, he preserved throughout a dignified demeanor and performed his duties with such ability as to earn for himself a place second only to that of Franklin in the history of American diplomacy. Indeed, many years later Lowell said: "None of our generals in the field, not Grant himself, did us better or more trying service than he in his forlorn outpost in London." He returned to America in 1868 and was elected to the presidency of Harvard in the following year, but declined to serve. In 1872 he barely failed of a nomination to the presidency at the hands of the Liberal Republicans. He was the arbitrator for the United States at Geneva in 1871 and 1872 (see ALABAMA CLAIMS) and to him is due in great part the credit for the successful settlement of all difficulties with England growing out of the controversy of the Civil War. On his return he was engaged for several years in editing the *Memoirs of John Quincy Adams* (12 vols., 1874-77). Both in politics and diplomacy Mr. Adams was austere, dignified, eminently sincere, and independent to a fault. As an authoritative biography consult C. F. Adams, Jr., *Life of Charles Francis Adams* (Boston, 1900), in the American Statesmen Series.

ADAMS, CHARLES FRANCIS (1835-1915). An American soldier, publicist, and historian. He is a son of Charles Francis Adams and was born in Boston, Mass., May 27, 1835. He graduated at Harvard in 1856, studied law in the office of Richard Henry Dana, Jr., and was admitted to the bar in 1858. He entered the Union Army as first lieutenant in a Massachusetts cavalry regiment in 1861, became a captain in 1862, served as chief of squadron at Gettysburg, and at the close of the war was in command, as colonel, of a regiment of colored cavalry. In March, 1865, he was brevetted brigadier-general of volunteers, and in August retired from active service. From 1884 to 1890 he was president of the Union Pacific Railroad Company. From 1893 to 1895 he was chairman of the Massachu-

setts Park Commission and as such took a prominent part in planning the present park system of the State. After the year 1874, he devoted much of his time to the study of American history and in recognition of his work in this field was chosen president of the Massachusetts Historical Society in 1895 and of the American Historical Association in 1901. In 1913 he lectured at Oxford University on American History. His writings and addresses both on problems of railway management and on historical subjects are marked by a singular clarity of statement and a degree of intellectual independence that has frequently given rise to widespread controversy. His works include: *Railroads, Their Origin and Problems* (New York, 1878); *Notes on Railway Accidents* (New York, 1879); *Richard Henry Dana: A Biography* (Boston, 1891); *Three Episodes of Massachusetts History* (Boston, 1892), a work which gives an account of the settlement of Boston Bay, of the Antinomian controversy, and of church and town government in early Massachusetts; *Massachusetts: Its Historians and Its History* (Boston, 1893); an excellent *Life of Charles Francis Adams* (Boston, 1900), in the American Statesmen Series, and *Lee at Appomattox, and Other Papers* (New York, 1902). With his brother, Henry Adams, he wrote *Chapters of Erie, and Other Essays* (Boston, 1871).

ADAMS, CHARLES KENDALL, LL.D., J.U.D. (1835-1902). An American educator and historian, born in Derby, Vt. He graduated at the University of Michigan in 1861, where he was assistant professor of Latin and history from 1863 to 1867 and full professor of history from 1867 to 1885. Having studied abroad in 1867 and 1868, he established (1869-70) an historical seminary which proved of great value in promoting the study of history and political science. In 1881 he was made non-resident professor of history and Latin at Cornell and in 1885 succeeded Andrew D. White as president of that university. From 1892 until 1902 he was president of the University of Wisconsin. In 1890 he was president of the American Historical Association. From 1892 to 1895 he was editor-in-chief of Johnson's *Universal Cyclopædia* (now the *Universal Cyclopædia*). Among his publications are *Democracy and Monarchy in France* (1872); *British Orations* (1884); *Higher Education in Germany, a Manual of Historical Literature* (1889); *Christopher Columbus, his Life and Work* (1892); a *History of the United States*, with W. P. Trent (rev. ed., 1913).

ADAMS, CHARLES R. (1848-1900). An American dramatic tenor. He was born at Charlestown, Mass. He studied in Vienna and sang for three years at the Royal Opera, Berlin, and for nine years at the Imperial Opera, Vienna. His reputation, especially as a Wagnerian singer, was earned chiefly abroad. In 1879 he took up his residence in Boston, where he was highly esteemed as a teacher.

ADAMS, EDWIN (1834-77). An American actor. He was born in Massachusetts and first appeared at the Boston National Theatre, Aug. 29, 1853, as Stephen in *The Hunchback*. He played Hamlet with Kate Bateman and J. W. Wallack at the New York Winter Garden in 1860 and then starred in all the principal cities; reappeared in New York in 1866, as Robert Landry in *The Dead Heart*; was in the company when Booth's Theatre opened, Feb. 3, 1867, and played Mercutio, Iago, and Enoch Arden in that

house. It was in the latter character that he attracted the most attention.

ADAMS, EPHRAIM DOUGLASS (1865—). An American educator, born in Decorah, Iowa, and graduated from the University of Michigan in 1887. He took a post-graduate course also at his alma mater, receiving the degree of Ph.D. in 1890. In the same year he was appointed special agent in charge of street railways for the eleventh census. His earlier work as teacher was done at the University of Kansas, where he became assistant professor (1891) and associate professor (1894) of history and sociology and in 1899 professor of European history. He was made associate professor of history in Leland Stanford Junior University in 1902 and, four years later, full professor. His published writings include *The Control of the Purse of the United States Government* (1894); *The Influence of Grenville on Pitt's Foreign Policy* (1904); *British Interests and Activities in Texas* (Albert Shaw Lectures, Johns Hopkins University, 1910).

ADAMS, FRANK DAWSON (1859—). A Canadian geologist, born in Montreal. He was educated in McGill, Yale, and Heidelberg universities and became a member of the Geological Survey of Canada in 1880. Having been appointed lecturer in geology in McGill University in 1889, five years later he became dean of the faculty of applied science and Logan professor of geology. His publications include *Iron Ore Deposits of Bilboa* (1901); *The Monterey Hills* (1903); *On a New Nepheline Rock* (1904); *An Investigation into the Elastic Constants of Rocks* (1906); *Geology of the Haliburton and Bancroft Areas* (1910).

ADAMS, FRANKLIN PIERCE (1881—). An American writer of humorous prose and verse, born in Chicago and educated at the Armour Institute and the University of Michigan. After two years (1903-04) of newspaper work on the *Chicago Journal*, he went to New York to become a member of the staff of the *Evening Mail*. For this paper he began to write, daily, a column of miscellany of a kind sufficiently defined by its caption, "Always in Good Humor." "F. P. A.'s" "Diary of our own Samuel Pepys" is a clever parody of the famous Englishman; while his verses, especially those in which he imitates certain odes of Horace, show considerable skill and felicity of expression. At the beginning of 1914 he went over to the *New York Tribune*. His writings in book form include *Tobogganing on Parnassus* (1911); *In Other Words* (1912).

ADAMS, FREDERICK UPHAM (1859—). An American author and inventor. He was born in Boston, but removed to Elgin, Ill., and was educated in the schools of that city. He practiced the profession of mechanical engineering from 1882 to 1890, during which period he invented (1886) an electric lamp-post which became the standard throughout the United States, and (1887) a form of electric light tower. From 1894 to 1897 he was chief smoke inspector for Chicago. Adams constructed, in 1900, an experimental passenger train for the Baltimore and Ohio Railroad which broke the speed records made up to that time. An active interest in social problems induced him to found a periodical called *The New Time*, which he edited from 1896 to 1898. He wrote several works on engineering and social topics as well as a number of novels. These publications include: *Atmos-*

pheric Resistance and its Relation to the Speed of Railway Trains (1893); *President John Smith* (1896); *The Kidnapped Millionaires* (1901); *John Burt* (1903); *How Cities are Governed in Great Britain* (1904); *John Henry Smith* (1905); *The Bottom of the Well* (1905); *The Revolt* (1907); *The Vegetarians*, a comedy, and *Ramley*, a drama (1911).

ADAMS, GEORGE BURTON (1851—). An American historian, born at Fairfield, Vt., and educated at Beloit College (class of 1873), at the Yale Divinity School, and at the University of Leipzig. He became professor of history at Yale in 1888; was president of the American Historical Association (1907-08), and member of the board of editors of the *American Historical Review* (1895—). His original works include: *Primer of Mediæval Civilization* (1883); *Civilization during the Middle Ages* (1894); *The Growth of the French Nation* (1896); *European History* (1899); vol. ii. in Hunt and Poole's *Political History of England* (1905); *The Origin of the English Constitution* (1912).

ADAMS, HANNAH (1755-1832). One of the earliest American women writers. She was the author of *Views of Religious Opinions* (1784), *History of New England* (1799), *Evidences of Christianity* (1801), and a *History of the Jews* (1812), all of which brought fame but little money. Her home was in Brookline, Mass.

ADAMS, HENRY (1838—). An American historian, third son of Charles Francis Adams (q.v.). He was born in Boston and graduated at Harvard in 1858. He was private secretary to his father when the latter was Minister to England, assistant professor of history at Harvard from 1870 to 1877, and editor of the *North American Review* in 1875 and 1876. One of the fruits of his original methods of instruction was a volume of *Essays on Anglo-Saxon Law* (1876), of which he wrote the first, on *Anglo-Saxon Courts of Law*. The others were by H. C. Lodge, E. Young, and J. L. McLaughlin. He subsequently made his home in Washington and devoted himself to a study of the administrations of Jefferson and Madison, the results of which appeared in nine volumes as a *History of the United States from 1801 to 1817* (1889-90; new ed., 1909), a work of original research. He previously edited the writings of Albert Gallatin (3 vols., 1879) and wrote a life of John Randolph (1882; 2d ed., 1898) for the American Statesmen Series. He is also the author of a volume of *Historical Essays* (1891), and of a *Life of George Cabot Lodge* (1911).

ADAMS, HENRY CARTER (1851—). An American economist. He was born in Davenport, Iowa, and was educated at Iowa College and Johns Hopkins University. He was statistician to the Interstate Commerce Commission from 1887 to 1911; special agent of the eleventh census, in charge of the department of transportation; and after holding several less important educational positions he became (1887) professor of political economy and finance at the University of Michigan. In 1913 he accepted a position as adviser to a Chinese commission appointed to standardize railway records. His publications, besides reports, include: *Taxation in the United States, 1789-1816* (1884); *Public Debts* (1887); *Relation of the States to Industrial Action* (1887); *Relation of American Municipalities to Quasi-Public Works* (with others, 1888); *Economics and Jurisprudence* (1897); *The Science of Finance; an Investigation of Public Expen-*

ditures and Public Revenues (1898); *Regulation of Railway Rates* (with H. T. Newcomb, 1906).

ADAMS, HENRY CULLEN (1850–1906). Congressman from Wisconsin, 1903–06, and author of the Adams Act of 1906, under which the state experiment stations receive \$720,000 per annum for original research in agriculture. Most of his life was spent in Wisconsin, where he engaged in dairying and fruit-growing and filled numerous state offices, notably that of Dairy and Food Commissioner from 1895 to 1902. His interest in agricultural matters continued in Congress, and he took a prominent part in the passage of the food and drug act of 1906 and the meat inspection legislation of that year. His efforts to aid the experiment stations by an enlarged federal appropriation began in 1903, and despite feeble health he was indefatigable in support of his bill until its passage in 1906 without a dissenting vote. The Adams Act is among the most important ever passed in encouragement of American agriculture, and its author is regarded as one of its principal benefactors.

ADAMS, HERBERT (1856—). A prominent contemporary American sculptor. He was born Jan. 28, 1856, at West Concord, Vt., and was educated in the public schools of Fitchburg, Mass., and in the Institute of Technology at Worcester. He studied art in the Normal Art School of Boston, but principally with Mercier in Paris, where he remained five years. On his return to the United States he was instructor in the art school of Pratt Institute, Brooklyn; he was elected to the National Academy of Design in 1899 and became vice-president in 1906. Important exhibitions of his works were held at the Chicago World's Fair in 1893 and the St. Louis Exposition in 1903, in both of which he received highest awards. He is a member of the National Institute of Arts and Letters. Adams is especially known among American sculptors for his beautiful busts of women. Perhaps the best of such productions is the exquisite bust of Miss Pond, his future wife, carved at Paris in 1887. Other examples are "Primavera," the tinted busts of "St. Agnes," of "A Young Lady" in pink marble (Metropolitan Museum, New York), of "The Rabbi's Daughter," and the marble bust of Miss Julia Marlowe. The same qualities of refinement and grace are seen in his other works, such as the "Angel" in the Emmanuel Baptist Church, Brooklyn; the Hoyt Memorial (1895) in the Judson Memorial Church, New York, and the more solemn Welch Memorial in the Auburn Theological Seminary. His contribution to the Vanderbilt memorial entrance of St. Bartholomew's, New York, consists in two bronze doors and a beautiful marble tympanum of the "Madonna with Angels" (1902), reminiscent of early Florentine sculpture. For the Congressional Library, Washington, he modeled two bronze doors and a statue of Professor Channing. His other works include the bronze Jonathan Edwards Memorial in a church at Northampton, Mass.; bronze statues of Richard Smith, the typefounder, in Philadelphia, of William Ellery Channing in Boston, and William Cullen Bryant (1911) in New York. Of all American sculptors, Adams stands nearest to the Early Renaissance in his fresh and refined realism and in his technical skill in marble cutting, yet he is none the less modern and original. Consult Taft,

History of American Sculpture (New York, 1904).

ADAMS, HERBERT BAXTER (1850–1901). An American educator and historian. He was born at Amherst, Mass., and educated at Amherst College. He took his doctor's degree at Heidelberg and then became connected with Johns Hopkins University on its inception in 1876. He was made associate professor of history in 1883 and professor in 1891. Owing to ill health, he resigned in 1901. He edited the valuable *Johns Hopkins Studies in History and Political Science* from the beginning, and an important series of monographs on American educational history published by the United States Bureau of Education. Besides many monographs, he wrote *The Life and Writings of Jared Sparks* (2 vols., 1893). Dr. Adams's influence upon historical studies in America, especially through the numerous pupils whom he trained, was very beneficial. He took great interest in university extension and in the work of the American Historical Association, of which he was secretary from its founding in 1884 until 1900, when he resigned and was made its first vice-president.

ADAMS, JOHN (1735–1826). The second President of the United States. He was born at Quincy, Mass., Oct. 30, 1735, of a family descended from Henry Adams, a Puritan emigrant who settled in Massachusetts about 1640. He graduated from Harvard in 1755 and, after an interval of teaching, studied law and was admitted to the bar in 1758. In 1764 he married Abigail Smith, daughter of the minister at Weymouth, a woman who herself became conspicuous, and whose influence and assistance were important factors throughout the entire career of her husband. (See ADAMS, ABIGAIL.) Soon after he went into politics and, although not a resident of Boston, was selected to act as counsel with Gridley and Otis in presenting to the Governor a memorial against the Stamp Act (q.v.). Adams then took the bold stand that the act was void because Parliament had no right to tax the colonists, and that such statutes could have no possible force over persons who had not consented to the passage thereof. In 1768 he moved to Boston, and soon after was offered and declined the position of advocate-general in the Court of Admiralty, an office which would have greatly increased his professional opportunities, though it would have placed him under embarrassing obligations to the Royalist politicians. Two years afterward he was able, without prejudicing himself among the patriot party, to render the unique service of defending Captain Preston in the Boston Massacre case and securing his acquittal. He had already written on taxation for the *Boston Gazette*, and he again published articles at the time of the controversy over the independence of the judiciary, collaborated in the authorship of the reply to Hutchinson in 1773, and later produced the "Novanglus" articles in reply to the Tory, Leonard. He was closely associated with Samuel Adams in the political leadership of Massachusetts, especially in the legislative crisis of June, 1774, and then was chosen by the House of Representatives as one of their five delegates to the Continental Congress. In that body his energy was devoted to the adoption of a comprehensive program having three distinct elements—the organization of commonwealth governments on an independent basis, the formation of a national confederate government, and the establishment of diplomatic

relations with foreign powers. The first victory was gained when the Congress passed the resolutions of May 10 and 15, 1776, recommending to all colonies the formation of State governments on a basis such as to serve them if permanently independent. This made natural, if not inevitable, the formal Declaration of Independence (q.v.), the original motion for which was seconded by Adams, who now was placed on the committee which drafted that document.

While a member of the Second Continental Congress it was Adams who, on June 14, 1775, suggested that George Washington be selected to command the continental forces. And for three years he worked arduously in perfecting the details of the new national government, serving on numberless committees, and being placed at the head of several important ones at a time when the congressional committees were the heads of the undeveloped executive departments. Especially in the War Department, and to a considerable extent in the Navy Department, was his influence great and his work attended with quite permanent results, while his membership of the Committee on Foreign Relations enabled him to become equipped for the service by which later he attained distinction. In 1778 he was sent to France to supersede Silas Deane; but his stay was brief, the treaty between that country and the United States having been concluded just before his departure from Boston. During his attendance upon the Continental Congress he continued to be an active counselor of the leaders in Massachusetts, although he declined the office of Chief Justice of the State. He was an active member of the committee of three which drafted the first constitution of Massachusetts. To that work he came almost directly from his first mission to France, and from it he proceeded at once to undertake his further duties of securing from Holland support for the national finances and of negotiating, with the other commissioners, terms of peace with England.

His success in effecting a loan in Holland was preceded by several months of difficult diplomacy, the result of which was that in April, 1782, the Dutch government formally recognized Adams as the minister of an independent nation. Stimulated by this notable accomplishment and by the realization that upon his exertions depended the New Englanders' rights in the Newfoundland fisheries, Adams entered upon the negotiations at Paris with a spirit of independence and of determination which, although seeming to occasion rather than to allay embarrassments, contributed much to the successful issue.

The post of minister to Great Britain was next occupied by Adams, but the relations between the countries were still such as to make the life irksome to one of Adams's temperament, especially as his desire to be recalled was strengthened by his belief that the service he was rendering was bringing no particular benefit to his country. Accordingly, in the spring of 1788, he returned, having already shown in detail his views on American affairs in his elaborate *Defense of the Constitution of the United States* (3 vols., London, 1787). He was elected Vice President at the first election under the new constitution and served for two terms, exercising, in the formative years of political parties and in the time of nearly equal division of the Senate between them, a power seldom possessed by a vice president. Where matters

of foreign policy raised the questions at issue, Adams sympathized with England and thus was thrown into opposition to the friends of France, led by Jefferson. In matters of internal policy, also, he supported the program of Hamilton, and where party lines were finally drawn he was recognized as one of the leaders of the Federalists. By them he was advanced to the presidency at the same time that, under the system then prevailing, the leader of the opposing party became Vice President. Jefferson's success in 1800 was made possible, however, largely by the developments of Federalist policy and of factional controversy within the party. Upon Adams's accession to office, relations with France had been complicated by the Directory's refusal to receive Pinckney, and when finally the joint mission of Pinckney, Marshall, and Gerry met with highly questionable treatment, the prospect seemed dubious. (See X Y Z CORRESPONDENCE.) War seemed imminent, and indeed there were hostile encounters on the water. Preparations for the struggle were coupled with the effort to repress the violent opposition to the policy of the administration through the harsh means of the Alien and Sedition Acts (q.v.). While Adams's attitude toward France was the most criticised act of his administration, yet he himself felt that it was his best public service, as is evidenced by the epitaph he wished placed over his body: "Here lies John Adams, who took upon himself the responsibility of peace with France in the year 1800."

War having been averted, it was at once recognized that the Federalists in these statutes had gone too far in restraining the rights of the individual and in encroaching upon the jurisdiction of the States. Certain it was that in his thoroughness Adams had given his opponents a very welcome and a very powerful means of attack, of which they promptly and vigorously took advantage, and at once began, by such steps as the Virginia and Kentucky resolutions (q.v.), the campaign which finally established the party of the opposite doctrine. This establishment was made easy also by the internal weakening of the Federalist party in the bitter fight for leadership between Adams and Hamilton. The retirement of Adams thus occurred amid the hostility of his enemies and the hatred of those who were his party associates. Nor was it possible to expect any relief from the painfulness of such a situation when the defeated one possessed a manner and a temperament such as were Adams's. Consequently, aside from intermittent criticism and counter criticism, and aside from service in the Massachusetts Constitutional Convention of 1820, this retirement continued unbroken. He died July 4, 1826, on the same day as Jefferson. President John Quincy Adams was his son.

Consult: His *Works*, with a biography, edited by C. F. Adams, 10 vols. (Boston, 1850-56); also his biography, J. T. Morse (Boston, 1885); *The Letters of Abigail and John Adams* (Boston, 1840-41), and *Familiar Letters of John Adams to his Wife during the Revolution; With a Memoir of Mrs. Adams*, edited by C. F. Adams (New York, 1876), and Chamberlain, *John Adams* (1898).

ADAMS, JOHN (1760-1829). The assumed name of Alexander Smith, one of the mutineers of the English ship *Bounty*. With eight sailors and some men and women from Tahiti he landed on Pitcairn Island and formed a government, of

which he was the head. In 1800 he was the only surviving Englishman. He established worship and such a school as was possible. In 1808 Captain Folger, an American, landed there and brought the world the first news of this strange settlement. Adams had not heard a word from civilized countries for twenty years. England never sought to punish him, and he died in peace, leaving a prosperous and religious people. See PITCAIRN ISLAND.

ADAMS, JOHN (1772–1863). An American teacher. He was born in Connecticut, graduated at Yale in 1795 and, after teaching for fifteen years in secondary schools in New Jersey and his native State, became principal of Phillips Academy, Andover, Mass. That place he filled for 23 years, resigning in 1833. Besides having built up one of the historic schools of New England, Dr. Adams is remembered as the schoolmaster of Oliver Wendell Holmes and the subject of the lines:

“Uneasy lie the heads of all that rule—
His most of all whose kingdom is a school.”

He wrote numerous pamphlets on education. Consult M. E. B. and H. G. B., *The Story of John Adams, a New England Schoolmaster* (1900).

ADAMS, JOHN COUCH (1819–92). An English astronomer and mathematician. He was born near Launceston, in Cornwall, and early manifested an aptitude for mathematics. After the usual amount of school training he was sent to St. John's College, Cambridge, where he attained the honor of senior wrangler and became a mathematical tutor. In 1843 he attempted to ascertain by mathematical calculation whether certain observed irregularities in the motion of Uranus could be explained on the hypothesis of perturbation (q.v.) exercised by an exterior planet. The problem at issue was the inverse of the usual perturbation problem. Instead of computing the effect brought about by a planet of known mass pursuing a known orbit, it was required to determine the unknown cause of a known effect. By 1845 Adams had solved this new problem and was able to assign to the hypothetical planet, the now well-known Neptune, a position differing less than two degrees from its actual place in the sky. But a careful telescopic search was at the time postponed or neglected, so that the honor of the great discovery completing Adams's mathematical researches by an observational verification was lost to Great Britain. Leverrier, of Paris, had been making an independent investigation, and by Aug. 31, 1846, he too had determined Neptune's place in the sky. He wrote to Galle at Berlin, and the latter found the planet on September 23d of the same year. This mathematical discovery of Neptune is justly counted among the greatest triumphs of science. To commemorate it, the Adams Prize, which is awarded biennially for the best essay on some subject in pure mathematics, astronomy, or other branch of natural philosophy, was founded at the University of Cambridge in 1848. In 1858 Adams became professor of mathematics at St. Andrews, but was recalled to Cambridge before the end of the year to assume the Lowndean chair of astronomy, which he held until his death. In 1861 he succeeded Challis as director of the University observatory. He was awarded the Copley Medal of the Royal Society in 1848. His collected papers were published in two vol-

umes at Cambridge under the editorship of his brother, Prof. William Grylls Adams, and R. A. Sampson, the first volume appearing in 1896, the second in 1901.

ADAMS, JOHN QUINCY (1767–1848). The sixth President of the United States and son of the second President, John Adams. He was born in Quincy, Mass., July 11, 1767. In 1778 he was taken abroad by his father when the latter visited Paris on a diplomatic mission, and only three years later, after studying for brief periods at Paris, Leyden, and Amsterdam, the youth was appointed private secretary to Francis Dana, the American Minister to Russia. As Dana was not received by the Russian government, Adams rejoined his father in Paris and served in a secretarial capacity to the American commissioners who were negotiating the treaty of peace with England. At the conclusion of that important work the elder Adams was rewarded with the English mission; the younger Adams returned home and entered Harvard College, graduating in 1787.

Upon his graduation he began the study of law with Theophilus Parsons (q.v.) and was admitted to the bar in 1790. He contributed to the political literature of the time, discussing the theories of Tom Paine, and especially the Genet incident (see GENET, E. C.), and our relations with France. His unusual opportunities and training were readily recognized, and in 1794 Washington sent him as Minister to The Hague. Later he was appointed to the Portuguese mission, but before he had entered upon the duties of that office his father had become President, and the son, upon the recommendation of Washington himself, was transferred to the more responsible post of Minister to Prussia. His father recalled him in 1801, in order that his successor in the presidency might be under no embarrassment. In the year following his return Adams was sent to the State Senate, and in 1803 the Massachusetts Legislature sent him to the United States Senate in preference to Timothy Pickering (q.v.).

While in the Senate he gave his support to the purchase of Louisiana (q.v.), although he disagreed with the administration upon some of the ensuing problems, and also approved the policy of the embargo and the non-importation acts. The support of these measures so unpopular in New England caused him to be hated by the Federalists there and finally cost him his seat in the Senate. His successor was chosen several months before the usual time of filling the vacancy and Adams at once resigned. He was, however, so identified with the party in power that in 1809 President Madison appointed him Minister to Russia. While there he was named as one of the commissioners who were to act in connection with the mediation proposed by Russia, but which was made impossible by the declination of England. He was soon appointed, however, one of the five negotiators who concluded the Treaty of Ghent (q.v.) at the close of the War of 1812.

From that work Adams proceeded to London, where he served as Minister to England until his varied and remarkable diplomatic career was ended in 1817 by his appointment by President Monroe to the post of Secretary of State. His work as Secretary was concerned with the difficult negotiations which in 1819 ended in the purchase of Florida, the more delicate relations with England with reference to the fisheries

convention of 1818 and the conflicting claims in the Columbia River basin, and the more far-reaching steps taken to counteract the encroachments of the Holy Alliance, in connection with which was announced the Monroe Doctrine (q.v.), so that some credited the latter to Adams. As a member of the cabinet, aside from matters of diplomacy, he took a unique position in upholding General Jackson for his conduct in the Florida War, and in rendering a highly valuable service to his later antagonist.

By virtue of his position, the friends of Adams expected that in 1824 he would be advanced in the same manner as Madison and Monroe, who had each in turn passed from the State department to the presidency. The nominations, however, were still made by the congressional caucus, which at this time was controlled by Crawford. Moreover, the newly formed trans-Alleghany States were pressing their claims for recognition, so that the revolt against the old nominating system and the crystallizing of the various factions within the one great party alone remaining active led to the candidacy of four Republicans in 1824. Of these Jackson received 99 electoral votes, Adams 84, Crawford 41, and Clay 37. When the vote, according to the Constitution, was thus given to the House of Representatives, choosing from among the three highest, the Clay interests joined with those of Adams and effected the defeat of Jackson. Adams, upon his accession, made Clay his Secretary of State, and not only brought upon himself charges of corruption, but also secured the vigorous enmity of the rapidly increasing Jackson wing of the Republican party. To offset this, Adams was not qualified to exert the influence usually attaching to a political leader, nor was he able so to make use of his office as to build up an Adams faction that could hope to wage a successful warfare with the embittered Jacksonians. It was natural, therefore, that after four troublous and not particularly profitable years, Adams should be overwhelmed in the election of 1828. Instead of going into retirement, he adopted the unprecedented course of returning to Washington as a member of the House of Representatives, and in that capacity rendered still further and conspicuous service to the nation from 1831 until his death. Being practically above party restraints, he was free to do a work which made notable the later years of "the old man eloquent." The slavery issue appeared in Congress in two forms, involving the question of the right of the government or of its officials to exclude abolitionist literature from the mails, and involving the question whether petitioners to the House of Representatives might demand that their petitions should be read, even if not considered. The former problem provoked a long and severe dispute, while the second controversy was made acute by the introduction of the "Gag Rules" (q.v.), which, Adams contended, substantially destroyed the right of petition, and against which he labored vigorously and in the end successfully. Late in 1846 he was stricken with paralysis, and early in 1848 he was again stricken, while in his seat in the House, and died two days later, on Feb. 23, 1848.

Adams followed the example of his father in keeping an extensive diary, which is included in his *Memoirs*, edited by C. F. Adams (12 vols., Philadelphia, 1874-77). For his biography consult W. H. Seward, *Life of Adams*

(Auburn, 1849), and Quincy, *Memoir* (Boston, 1858); or, for the most recent work, Morse, *John Quincy Adams* (Boston, 1882 and 1899).

ADAMS, JOHN QUINCY, 2D (1833-94). An American politician. He was born in Boston, the grandson of President J. Q. Adams and son of Charles Francis Adams. He graduated at Harvard, 1853, and became a lawyer. He served three terms in the Massachusetts Legislature, and was an unsuccessful candidate for governor on the Democratic ticket in 1867 and 1871. In 1872 he was nominated for the vice-presidency on the ticket with Charles O'Connor by those Democrats who would not support Horace Greeley. He became a member of the Harvard Corporation in 1877. Two years before his death he declined a seat in President Cleveland's cabinet.

ADAMS, JULIUS WALKER (1812-99). An American civil engineer. He was born at Boston, Mass., studied for two years at the United States Military Academy, and from 1833 to 1869 was connected as engineer with various railways and public works. From 1869 to 1878 he was chief engineer of the Brooklyn board of city works, and from 1878 to 1889 consulting engineer of the board of public works of New York City. A suggestion of his led to the formation of a company which eventually had charge of building the first bridge over the East River at New York. During the Civil War he for a time commanded the First Long Island Volunteers and during the New York draft riots of 1863 commanded the troops at Printing House Square.

ADAMS, MAUDE KISKADDEN (1872-). A popular American actress. She was born at Salt Lake City, Nov. 11, 1872, the daughter of James and Annie Adams, both actors. She first appeared on the stage in the West, in children's parts, when very young. At 16 she joined E. H. Sothorn's company in New York, and played in *The Midnight Bell*. Afterward she was a member of Charles Frohman's stock company. With John Drew in *The Masked Ball* (1892) she made an extraordinary advance in public favor. She became a star as Lady Babbie in *The Little Minister*, produced in New York (1898), where in 1899 she played Juliet to the Romeo of William Faversham. In 1900 and 1901 she won another popular success as the Duc de Reichstadt in Rostand's *L'Aiglon*, and the next season she played Miss Phoebe in Barrie's *Quality Street*. She played in Mrs. Burnett's *The Pretty Sister of José* (1905), and in 1906 was successful in Barrie's *Peter Pan*. She has taken the Shakespearean parts of Viola in *Twelfth Night*, June, 1908, and of Rosalind in *As You Like It*, June, 1910. During the year 1909-10 she also appeared in *What Every Woman Knows*, and in 1911 she took the title rôle in a translation of Rostand's *Chantecler*. In 1913-14 she starred in Barrie's *The Legend of Leonora*. Consult Clapp and Edgett, *Players of the Present*, in Dunlap Society Publications (New York, 1899).

ADAMS, NEHEMIAH (1806-78). An American Congregational clergyman. He was born in Salem, Mass., graduated at Harvard in 1826, and three years later at Andover Theological Seminary. He then became pastor in Cambridge, Mass., and from 1834 was pastor of the Essex Street Church, Boston. After a winter spent in Georgia for his health, he published *A South Side View of Slavery* (1854). His praise of the effect of slavery on the religious character of the

negroes provoked much hostile criticism. He published several controversial works and a *Life of John Eliot*.

ADAMS, OSCAR FAY (1855—). An American editor and author. He was born at Worcester, Mass., was educated in secondary schools, taught classes in English literature and, beginning in 1880, wrote much for periodicals. He edited *Through the Year with the Poets* (12 vols., 1886), and published *The Story of Jane Austen's Life* (1891; 2d ed., 1897); *The Archbishop's Unguarded Moment, and Other Stories* (1899); *A Brief Handbook of English Authors* (1884; 7th ed., 1893); *Dear Old Story Tellers* (1889; new ed., 1911); *A Dictionary of American Authors* (1897; 5th ed., 1905); *Sicut Patribus and Other Verse* (1906); *A Motley Jest—Shakespearean Diversions* (1909).

ADAMS, PARSON ABRAHAM. A leading character in Fielding's novel, *Joseph Andrews*. He is a country curate, a very learned scholar, skilled in dead and living languages but excessively simple-minded and unfamiliar with the ways of the world. In spite of his poverty, his generosity and native dignity command respect; his oddities, however, and his absence of mind bring him into many quaint adventures.

ADAMS, SAMUEL (1722–1803). One of the leading men in the promotion of the American Revolution. He was born in Boston, Mass., Sept. 27, 1722, of an aristocratic family and, like John Adams, the second President of the United States, was descended from Henry Adams, a Puritan emigrant. He fitted for college at the Boston Latin School and entered Harvard in 1736. On leaving college in 1740, he entered a law office; but the law proving distasteful, he next entered a counting-house, and soon became a merchant himself, but failed. Subsequently he became a partner with his father in a brewery and failed after the latter's death. As a business man, he seems throughout to have been a complete failure; and the burden thus thrown on the other members of the family was increased later by the complete absorption with which he devoted his time and energy exclusively to political affairs and public service. When a candidate for the degree of A.M. at Harvard College, he had maintained in his thesis the affirmative of the question: Whether it be lawful to resist the supreme magistrate, if the commonwealth cannot be otherwise preserved.

He was early engaged in the activities of town politics in Boston; and the overthrow of the Land Bank, with the incidental destruction of his father's estate, brought him into contact with provincial affairs and decisively influenced his general attitude toward the home government. His formal entry into politics was in his election as a tax collector of Boston in 1763, an office which he held for two years. His careless, or at all events unsuccessful, performance of the duties of that office soon afforded his opponents the basis for a vigorous though ineffectual attack, but both his personal integrity and political uprightness remained above suspicion. By him were drafted the important instructions given by the town of Boston to its representatives in the assembly in 1764, and in these was put forth one of the earliest protests against the ministerial plan of Colonial taxation.

Likewise in 1765 Adams drafted the Boston instructions to representatives, and in the same year he himself was sent to the Legislature, and remained a member until 1774. Being

elected clerk of the House in 1766, and also serving on many committees, it was natural that he should be the author of many of the most important state documents of the pre-revolutionary period. Instructions to the political agent in London, addresses to the Governor, appeals to the ministry, and proposals or exhortations addressed to fellow colonists, in great number issued from the Massachusetts House of Representatives, and in many instances from the pen of Adams. Thus the very influential circular letter of February, 1768, as well as the *True Sentiments of America*, issued in the same year; and the widely read *Appeal to the World* of 1769, have been traced to the authorship of Adams. Later, in 1772, he prepared for the town of Boston the very telling pamphlet on *The Rights of the Colonists as Men, as Christians, and as Subjects*. Very important as were all these contributions to the movement toward revolution, the most effective literary work of Adams was, undoubtedly, the great number of newspaper articles, under various pseudonyms, in the patriotic *Boston Gazette*. In these he made plain the cause of the colonists, exposed the impracticability of any reconciliation, converted the hesitating and inspired the Radicals, and exerted a very far-reaching influence in preparing the popular mind for revolution and in hastening the approach of the crisis. In practical politics as well, he was recognized as a leader not only in Massachusetts but in the other colonies. He bore the burden of the long series of controversies with the governors of Massachusetts over the presence of troops, the salaries of judges, and the place of meeting of the Legislature and, at the time of the Boston Massacre of March, 1770, headed the committee which demanded from Hutchinson the immediate withdrawal of the troops. He was conspicuous in planning the local "committees of correspondence"; and when finally, in June, 1774, the Massachusetts Legislature bade defiance to Gage and issued the call for the Continental Congress, it was Adams who directed the movement.

He was naturally sent to the Continental Congress (1774–81), and when that body finally declared for independence, it may be said that the real life work of Adams had been completed. He had been the ideal representative of the town-meeting system, the extreme defender of the "natural" rights of man, and the irrepresible advocate of independence. His work during the Revolution was less noteworthy and was at times open to criticism. Thus, he was one of the strongest supporters of the committee system of national administration, and one of those who delayed unnecessarily and unfortunately the organization of executive departments under single heads. In the politics of his native State he always took an active and effective interest. He was one of the committee which prepared the present constitution of the State, the only constitution of the Revolutionary period still in force. He served on the Executive Council of the State, was for several years Lieutenant-Governor (1789–94), and three times was elected Governor (1794–97). He was considered an opponent of the Federal Constitution in 1788, but on his finally giving his voice in favor of adoption, with the proposal of amendments, its ratification was assured. He died in Boston, Oct. 2, 1803. For his biography, consult: W. V. Wells (3 vols., Boston, 1865); J. K. Hosmer (Boston, 1885); H. A. Cushing (ed.), *The Writ-*

ings of Samuel Adams (4 vols., New York, 1904-08).

ADAMS, SAMUEL HOPKINS (1871—). An American author, born at Dunkirk, N. Y. Having graduated from Hamilton College in 1891, he spent the next nine years as reporter and special writer on the *New York Sun*. He was managing editor of McClure's syndicate in 1900-01; advertising manager of McClure, Phillips & Co., 1901-02, and a member of the staff of *McClure's Magazine*, 1903-05. Becoming interested in the evils of some phases of the patent medicine business, he contributed to *Collier's Weekly* in 1906 and later, a remarkable series of articles on quack medicines. The exposures which he made resulted in the correction of many of the abuses described, even driving several manufacturers of patent medicines out of business. Adams wrote also *The Mystery* (with Stewart Edward White, q.v., 1905); *The Flying Death* (1906); *Average Jones* (1911); *The Secret of Lonesome Cove* (1912); *The Health Master* (1913).

ADAMS, SARAH FULLER FLOWER (1805-48). An English poet. She was born at Great Harlow, Essex, and married William Bridges Adams in 1834. Her longest work is *Vivia Perpetua, A Dramatic Poem* (1841), having as its subject the early life of the Christians. It is a fine lyrical drama. Vivia's monologue on forswearing Jupiter is especially impressive. Mrs. Adams was the author of several beautiful hymns, among which are "Nearer, my God, to Thee" and "He sendeth sun, He sendeth shower." She was a Unitarian.

ADAMS, SUZANNE (1873—). An American lyric soprano. She was born in Cambridge, Mass., Nov. 28, 1873. She studied with Marchesi in Paris, and made her debut at the Paris Opera in 1894 as Juliette in Gounod's *Roméo et Juliette*. She remained at the Opera three years, then went to Nice. In the summer of 1898 she appeared at Covent Garden, London, and during the season of 1898-99 at the Metropolitan Opera House, New York. In 1898 she was married to Leo Stern, the violoncellist, who died in 1904. Her rôles include Juliette, Marguerite, Gilda, Queen in *Les Huguenots*, Queen of the Night in the *Magic Flute*, Mimi, and Micaela. Her voice is of beautiful quality and great compass, but is rather slender.

ADAMS, THOMAS (1612-55). An English preacher, called by Southey "the prose Shakespeare of Puritan theologians . . . scarcely inferior to Fuller in wit or to Taylor in fancy." He was minister at Willington, Wingrave, and London, and "observant chaplain" to Sir Henry Montague, the Lord Chief Justice. Adams was a Puritan within the Church of England, as distinguished from the nonconformist Puritans who left the church. He published a large number of sermons, the quaint titles of two of which are *Heaven and Earth Reconciled* and *The Devil's Banquet*. It is likely that John Bunyan read and was influenced by these writings. They have been republished in Nichol's *Puritan Divines* (3 vols., 1862).

ADAMS, THOMAS SEWALL (1873—). An American economist and educator, born in Baltimore, Md. He received a bachelor's degree from the Baltimore City College in 1893, and the degree of Ph.D. from Johns Hopkins University in 1899. After a year as clerk in the census office at Washington, he resigned (1900) to become assistant to the Treasurer of Porto Rico.

He was made associate professor of political economy in the University of Wisconsin in 1901 and full professor in 1908. The chair of political economy in Washington University was offered him in 1910, and he accepted it, resuming his former position at the University of Wisconsin, however, the next year. In 1911 he was tax commissioner of Wisconsin. His published writings include: *Taxation in Maryland* (1900); *Labor Problems* (with H. L. Sumner, 1905); *Mortgage Taxation in Wisconsin and Neighboring States* (1907); *Outlines of Economics* (with R. T. Ely, 1908).

ADAMS, WALTER SYDNEY (1876—). An American astronomer, born in Antioch, Turkey. After graduating from Dartmouth College in 1898 he did advanced work at the University of Chicago and in Munich. In 1901 he was appointed assistant in the Yerkes Observatory. In 1904 he was made assistant astronomer, and in 1909 astronomer, at the Mt. Wilson Solar Observatory. For two years (1910-11) he was acting director of the observatory. Adams became a member of several astronomical societies. He wrote numerous papers on solar and stellar spectroscopy and on the rotation of the sun. Among his more important published works is *Investigation of the Rotation Period of the Sun by Spectroscopic Methods* (1911).

ADAMS, WILLIAM (c.1575-c.1620). The first Englishman in Japan, whose romantic story is closely connected with the opening of that Empire. He was born in Kent, near the mouth of the Thames. Having entered the service of some Dutch merchants, he sailed, in 1598, for the East, from the Texel, as the chief pilot of a fleet of five small ships. After a severe voyage the *Charity*, in which Adams was sailing, anchored off the coast of Bungo (Kiushiu). Iyéyasu had recently come to power, and Adams, after a brief imprisonment, was taken into his favor and employed in the government service, to its great advantage. He built vessels and gave helpful information in respect to the intrigues of the Spanish and Portuguese. At a later day he received the revenues of the village Hemi, near Yokosuka, the modern imperial dockyard in Yeddo Bay. In 1613 the *Clove*, an English ship, brought other Englishmen to Firando, and, with Adams, they proceeded to establish a factory, of which Richard Cocks was chief. In 1616 Iyéyasu died, and foreigners soon fell into disfavor. Not being allowed to return to his wife and children in England, Adams married a Japanese wife, and their descendants are still living. He died May 16, 1620. A street in Yeddo was named after him, and a celebration is still held in his honor. Letters of Adams may be found in *Purchas his Pilgrimes* and in the publications of the Hakluyt Society. Consult: *The Diary of Richard Cocks, 1615-22* (London, 1883); Hildreth, *Japan as It Was and Is* (Boston, 1855); and Diósy, "In Memory of Will Adams," in *Transactions and Proceedings of the Japan Society*, vol. vi, pp. 325-353 (London, 1905).

ADAMS, WILLIAM (1814-48). An English allegorist. He was educated at Eton and at Merton College, Oxford, where he became tutor and fellow in 1837. Appointed vicar of St. Peter's-in-the-East, Oxford, in 1840, he resigned because of his ill health, and passed the last four years of his life at Bonchurch, Isle of Wight. Adams was the author of several popular religious allegories, most of which were written during the years when he was slowly dying.

They comprise *Silvio*, *The Shadow of the Cross*, *Fall of Cræsus*, *The Old Man's Home*, and the *King's Messengers*. They are all of interest, and *The Old Man's Home* is likely long to survive, because of its natural grace and charm. Adams is also the author of a boy's story entitled *Cherry Stones*, reprints of which are still frequent.

ADAMS, WILLIAM (1807-80). An American Presbyterian clergyman. He was born at Colchester, Conn., graduated at Yale in 1827, and at Andover Theological Seminary in 1830. He became pastor of the Congregational Church, Brighton, Mass., in 1831, and of the Broome Street Presbyterian Church in New York City in 1834 (out of which the Madison Square Presbyterian Church was formed in 1853), and there he ministered till in 1873 he became president of Union Theological Seminary (New York) and professor of sacred rhetoric. He died at Orange Mountain, N. J., Aug. 31, 1880. He was moderator of the New School Presbyterian General Assembly in 1852. He published several volumes of discourses.

ADAMS, WILLIAM DAVENPORT (1851-1904). An English journalist and author, the son of W. H. Davenport Adams. He was educated at Edinburgh University and began newspaper work in 1870. He became literary editor of the *London Globe* in 1885 and was also well known as a dramatic critic. He published *Famous Books; Sketches in the Highways and Byways of English Literature* (1879); *Byways in Bookland* (1888), and edited a *Dictionary of English Literature* (1877) and a *Dictionary of the Drama* (1899).

ADAMS, WILLIAM GRYLLES (1836-1915). An English physicist. He was born at Lanest, Cornwall, and was educated at Cambridge University, where he was made a fellow of St. John's College. In 1863 he was appointed professor of natural philosophy and astronomy in King's College, London, where he carried on many investigations in addition to giving instruction, until his retirement in 1906. Professor Adams served as vice-president and president of the Physical Society of London, as president of the Society of Electrical Engineers, as president of the mathematical and physical section of the British Association, and is a member of the Royal Society. He devised a new form of polariscope which could be used to measure the optical axes of crystals. Among his more important investigations which have been published are those on *Simultaneous Magnetic Disturbances*, *Action of Light on Selenium*, *Alternate Current Machines*, and the *Testing of Dynamo Machines*.

ADAMS, WILLIAM TAYLOR (1822-97). An American educator and writer of juvenile fiction, popularly known as "Oliver Optic." He was born at Medway, Mass. For 20 years he taught in Boston public schools; for 14 years he was a member of the Dorchester School Committee; and he was once elected to the Legislature. His first book, *Hatchie, the Guardian Slave* (1853), was followed by more than 100 volumes of juvenile fiction, contributed in large part to *Oliver Optic's Magazine*, of which he was the editor. These stories appeared in series, of which the most popular were *The Boat Club*, *Young America Abroad*, *The Starry Flag*, *Onward and Upward*, and *The Yacht Club*. He published also two novels, *The Way of the World* and *Living Too Fast*. His books of the *Young America Abroad* series had a lasting in-

fluence in creating and perpetuating a system of education at sea and under naval discipline.

ADAM'S APPLE (Lat. *Pomum Adami*). The projection seen on the front of the neck nearly midway between the summit of the breastbone and the chin. It is particularly visible in males, but rarely noticeable in females and then only at a late period of life. Its name originated from the superstition that a portion of the apple given to our first parent stuck in his throat and that the enlargement thus caused has been transmitted to the race. It is produced by the convergence of the two quadrilateral plates of the thyroid cartilage of the larynx. See LARYNX.

ADAM'S BRIDGE. A chain of islands extending across the Gulf of Manar, between Ceylon and the peninsula of Hindustan (Map: India, C 7). It is cut by several channels through which small boats can pass.

AD'AMSON, PATRICK (1537-92). A famous Scotch prelate and writer, originally known as Conston, Constant, Consteane, or Constantine. He was born at Perth. He studied law at the University of St. Andrews and in 1566 went to France as a tutor, where he underwent six months' imprisonment for referring to the son of Mary, Queen of Scots, as King of France and England, in a Latin poem he wrote on the occasion of the prince's birth. He narrowly escaped death during the Paris massacre, and, obliged to live in concealment for seven months, he employed his time in writing Latin poetical versions of the Book of Job and of the tragedy of Herod. In 1573 he returned to Scotland, took orders, and became minister at Paisley. In 1576 he received the appointment of Archbishop of St. Andrews from his patron, the Earl of Morton, Regent of Scotland, and entered into frequent polemics with the Presbyterians concerning episcopacy. In 1588 he was excommunicated on various charges and died in great poverty and affliction at St. Andrews, Feb. 19, 1592. Consult: P. Adamson, *Poemata Sacra* (London, 1619); Baillie, *The Recantation of Patrick Adamson* (Glasgow, 1646).

ADAMSON, ROBERT (1852-1902). An English educator and philosophical writer. He was at one time professor of logic and mental philosophy at Owens College (Victoria University) and in 1895 was appointed professor of logic and rhetoric at the University of Glasgow. He is regarded as an important representative of the so-called Neo-Hegelian movement in English philosophy. Among his writings are *The Philosophy of Science in the Middle Ages* (1876); *On the Philosophy of Kant* (1879); the article on Kant in the *Encyclopædia Britannica*, and *Fichte* (1881). Following his death various volumes were published from the lecture notes of his students, edited by W. R. Sorley: *The Development of Modern Philosophy, and Other Essays* (2 vols., with memorial introduction, 1903); *The Development of Greek Philosophy* (1906); *A Short History of Logic* (1911).

ADAM'S PEAK (native, *Samanhela*). A mountain in the south of Ceylon, 7350 feet high, terminating in a narrow platform, in the middle of which is a hollow 5 feet long, having a rude resemblance to a human footprint (Map: India, D 7). Mohammedan tradition makes this the scene of Adam's penance, after his expulsion from Paradise; he stood 1000 years on one foot, and hence the mark. To the Buddhists the impression is the *sripada*, or sacred footmark, left by Buddha on his departure from Ceylon; while

the Hindus claim it as the footprint of their god Śiva. Over the sacred spot stands a wooden canopy, and multitudes of devotees, Buddhist, Hindu, and Mohammedan, frequent it.

ADANA, ä'dä'nä. The capital of the Turkish vilayet of Adana (15,400 square miles; pop., 422,400) (Map: Turkey in Asia, F 4). It is situated in the southeast of Asia Minor on the Seihan River (ancient Sarus), about 42 miles northeast of the seaport of Mersina, with which it is connected by rail. Its position near the passes of the Taurus gives it strategical importance. The river is deep, and in 1912 plans were consummated to irrigate 1,200,000 acres in the plain. Adana is the seat of considerable trade in emery, cotton, wool, grain, and wood. Iron is found in the vilayet in the vicinity of Adana, and the output is 40,000 tons a year. The town has a large steam spinning-mill. The population is about 49,000, including a large number of Armenians and Greeks. There was a massacre of Christians here in 1909. Adana was an important place in the time of the Romans. After a period of decline its prosperity revived under the Caliph Harun-el-Rashid.

ADANS LE ROI. See ADENEZ.

ADANSON, ä'dän'sôn', MICHEL (1727-1806). A French naturalist and physicist. He was born at Aix, in Provence. He studied the natural and physical sciences under Réaumur and Jussieu in Paris and journeyed to Senegal in 1749, where, during a period of five years, he engaged in researches in botany, electro-physics, and meteorology, and made collections of plants and animals. He was one of the first to recognize the electrical nature of the lightning stroke, and he demonstrated also the similarity of the shock from the electric eel (*Gymnotus electricus*) to the discharge from the Leyden jar. He was also one of the earliest to describe the mode of transportation and deposit of beach sands along oceanic coasts. On his return to Paris from Senegal he was elected a member of the Academy of Sciences. His most important work, however, was in botany, and he published many important monographs on various groups of plants and devised several schemes of classification, none of which latter has, however, received any considerable amount of recognition. Among his more important works are *Histoire naturelle du Sénégal* (Paris, 1857; German ed., Leipzig, 1773); *Familles des plantes* (2 vols., Paris, 1763); *Histoire de la botanique et plan des familles naturelles des plantes*, a posthumous work edited by his son, A. Adanson, and by Payer (2 vols., Paris, 1864). For further particulars concerning his life and works, consult Cuvier, *Eloge historique* (Paris, 1819).

AD'ANSO'NIA. A genus of about four species belonging to the family Malvaceæ and named by Linnæus in honor of the botanist Adanson (q.v.). The best-known species, *Adansonia digitata*, the baobab, also called the monkey-bread tree, is a native of tropical Africa and the East Indies. It is one of the largest known trees—not, indeed, rising to a very great height, but exceeding most other trees in the thickness of its trunk (20 to 30 feet). Even its branches (60 to 70 feet long) are often as thick as the trunks of large trees, and they form a hemispherical head 120 to 150 feet in diameter, their outermost boughs drooping to the ground. The leaves are 5 to 7-parted; the flowers are white and extremely large, on drooping peduncles of a yard in length. The

fruit, monkey-bread, is of the size of citron. The bruised leaves (Lalo) are mixed with the food of the inhabitants of tropical Africa, and Europeans in that country employ them as a remedy for diarrhœa, fevers, and diseases of the urinary organs. The pulp of the fruit, which is slightly acid and pleasant to the taste, is eaten with or without sugar; and the expressed juice mixed with sugar is much esteemed as a beverage, being very refreshing, effectual in quenching thirst, and regarded as a specific in putrid and pestilential fevers. The bark is said to be powerfully febrifugal. The other species occur in East Africa, Madagascar, and Australia.

ADAPA, ä'dä-pä. The hero of a Babylonian myth known to us through a tablet from the reign of Amenhotep IV (c.1377-1361 B.C.) found at Tel el-Amarna (q.v.) and three tablets from the library of Assurbanipal (668-625 B.C.) in Nineveh. Adapa, whose name may perhaps also be read Adama (see ADAM), is the son of Ea, endowed by his father with wisdom but not with immortality. His home is at Eridu, once situated on the Persian Gulf. Fishing in the sea, his boat is overturned one day by the south wind. He is called to account for this by Anu (q.v.). But his father, Ea, warns him, when he shall appear before Anu, not to eat the food of death or drink the water of death set before him and tells how by mourning apparel he is to secure the sympathy of Tammuz and Gishzida. In heaven, however, food of life and water of life are finally placed before him. That had not been expected by Ea, and the son, following his advice, lost immortality. Adapa is distinctly said to be a human being (*Zir ameluti*, 'offspring of men'); this phrase likewise shows that he is not the first man. Yet he is also called "the son of Ea." He is the priest and representative of this god in Eridu and possibly identical with one of the antediluvial kings. These lived for thousands of years, but finally had to die. The point of the myth is the failure to attain immortality, though almost within grasp. This it has in common with the story of Adam in Genesis. It is of great interest to observe that such Babylonian myths found their way to Egypt as early as in the fourteenth century B.C. In the Tel el-Amarna copy the divisions of words are marked by small dots in red ink, showing that it was intended for use in teaching the Babylonian language in Egypt. This renders it probable that the myth was also known in Palestine at that time. See Jensen in *Keilinschriftliche Bibliothek*, vi. 1 (1900); Zimmern, in Gunkel's *Schöpfung und Chaos* (1895); *Keilinschriften und das Alte Testament* (1902); Rogers, *Cuneiform Parallels to the Old Testament* (1912).

AD'APTA'TION (Lat. *ad*, to + *aptare*, to fit). In plants, the adjustment of an organ or an organism to its environment or surroundings, as shown in its structural form; e.g., a thick-skinned leaf is an adaptation to a dry environment. The state of a perfectly adapted plant is sometimes called "epharmony," but this condition is rarely found, and the adaptations of most plants may be regarded as more or less imperfect. See ECOLOGY; NATURAL SELECTION.

A'DAR. The twelfth month of the ecclesiastical, and the sixth month of the civil, Jewish year, coinciding with February-March of the common year. The 7th of Adar became a fast for the death of Moses; the 9th another on

account of the dissension of Hillel and Sham-mai; but more important is the 13th, which is called the fast of Esther, in memory of the fasting of Mordecai, Esther, and the Jews, whose destruction was threatened by Haman (Esther iv. 15-16). The fast is followed by the feast of Purim, celebrated on the 14th and 15th, in commemoration of the escape of the Jews of Persia from the fate designed for them by Haman, the cruel counselor of Ahasuerus. See ESTHER.

ADDA, äd'dä (Lat. *Adua*). A tributary of the Po (q.v.), rising in the Rætian Alps, on the northern borders of Italy above Bormio (Map: Italy, D 2). After traversing the Valtellina, it flows, or rather expands, into the Lake of Como. Below Lecco it traverses the plain of Lombardy in a direction south-southeast, passing Lodi, and falls into the Po about 8 miles above Cremona. Total length, about 180 miles; navigable for 75 miles.

AD'DAMS, JANE (1860—). A social settlement worker. She was born at Cedarville, Ill., Sept. 6, 1860. She graduated at Rockford Female Seminary in 1880, and the following year, when the seminary became a college, received the degree of A.B. After two years of study in Europe, and a year at the Women's Medical College at Philadelphia, she decided to devote her life to social work among the city poor. Together with Miss Ellen G. Starr, she established (in 1889, at Chicago) the Hull House, the leading social settlement in the United States, of which she became the head worker and guiding spirit. Miss Addams has less sympathy with theoretical studies of the social problem than with every-day experience with all sorts and conditions of people. Her practical common sense, great executive ability, and fine unselfish spirit have made her the natural leader of the settlement movement in this country. She has taken an active interest in city administrative problems and served for three years as inspector of streets and alleys in the district around Hull House. She took a prominent part in the formation of the National Progressive Party in 1912. She has been a frequent contributor to current periodical literature on the nature of the social settlements, their relation to the labor movement and to philanthropy, and various other topics, and published *Democracy and Social Ethics* (1902), *The Spirit of Youth and the City Streets* (1909), *Twenty Years at Hull House* (1910), *A New Conscience and an Ancient Evil* (1912). See HULL HOUSE; SOCIAL SETTLEMENTS.

AD'DAX, or **AD'DAS** (Lat., of African origin). A hippotragine antelope (*Addax nasomaculatus*) of northeastern African deserts, related to the oryx. It is about 3 feet in height at the shoulders, robust in form, nearly white in color, tinged with reddish brown forward, and having a white blaze upon the nose, and black hoofs, large and rounded for treading upon the desert sands. It has long ears, a long, tufted tail, shaggy forehead and throat, and both sexes have high, spirally twisted horns, alluded to by Pliny when he described the antelope under the name strepsiceros. Its habits are similar to those of the oryx, and it is hunted by the Arabs with greyhounds. Consult A. E. Pease, *Proceedings Zoölogical Society of London* (1896, p. 810), who says that it is called by the French of Algeria "antilope du sud," by the Arabs, "begra el Oouash" or "meha," and

by the Tuaregs, "tameeta." See plate of LARGE ANTELOPES, in vol. i.

AD'DER (an adder by mistake for a nadder, AS. *næddre*, Goth. *nadro*, Ger. *Natter*, a snake). A common name applied both to certain poisonous snakes, mostly of the family Viperidæ, and to certain harmless snakes of the family Colubridæ. In the former case it is practically a synonym of viper (q.v.). Several venomous serpents are known as puff-adders and death-adders, under which names they will be found described and illustrated elsewhere. Various harmless snakes of the genus *Tropidonotus* are known as adders both in Europe and America, as well as the American copperhead (q.v.), the water adder (see MOCCASIN SNAKE), and the spreading or blowing adder (see HOGNOSE), which, under provocation, assumes somewhat the appearance of a viper. Specifically, in English literature, the word usually means the common viper (*Vipera berus*) of Europe, the only venomous snake of Great Britain.

AD'DICKS, JOHN EDWARD (1841—). An American capitalist and politician, born in Philadelphia. Through the construction of gas plants and the financing of gas companies he acquired a considerable fortune, which he vastly increased through the organization of the Bay State Gas Company of Boston in 1884, and the purchase in 1892 of a controlling interest in the Brooklyn Gas Company. In his later years he gave himself up largely to the pursuit of political ambitions and established himself in the State of Delaware with the belief that it would be possible to win a United States senatorship from that State. In 1895 he entered upon a campaign for the senatorship which has scarcely been paralleled in persistence, factional bitterness, and charges of political corruption, in the whole history of senatorial elections. In the election of 1895 Addicks was able to prevent the election of his rival, H. A. Dupont, although unable to win the election himself. In 1898, in consequence of the schism between the Addicks and Dupont factions in the Republican party, then the majority party, the Legislature was deadlocked and the senatorship remained vacant. Again, in 1901, with two senatorships vacant, the Addicks candidacy deadlocked the Legislature and left the State unrepresented in the United States Senate. In 1903 Addicks procured the election to the Senate of one of his followers, J. Frank Allee, with the understanding, according to common report and intimations from Addicks himself, that Allee would later resign, in order that the Governor, another supporter of Addicks, might appoint the latter for the unexpired senatorial term. Allee, however, refused to recognize the supposed obligation to resign, and in 1905 Addicks again entered upon a campaign for election by the Legislature. After a long deadlock Addicks was defeated in 1906 by Dupont.

The great fortune of Addicks was seriously impaired by the expenses, legitimate and illegitimate, of his long senatorial campaign. It suffered further impairment by a court order in 1907 which compelled Addicks to pay over to the receiver of the Bay State Gas Company, bankrupted largely through Addicks's mismanagement, \$890,000 of profits unlawfully drawn from the concern.

ADDING MACHINES. See CALCULATING MACHINES.

AD'DINGTON, HENRY, first VISCOUNT SID-

MOUTH (1757-1844). An English Tory statesman. He was born at Reading. He graduated at Brasenose, Oxford, in 1778, studied law, and was admitted to the bar in 1784. Persuaded by his college mate and friend, the younger Pitt, he entered Parliament in 1783. Subsequently he filled the positions of Speaker of the House of Commons, 1789-1801, and Premier and Chancellor of the Exchequer, 1801-04. Owing to the opposition to his war policy, he resigned in 1804, but the King raised him to the peerage as first Viscount Sidmouth and made him President of the Council (1805). He was Lord Privy Seal in 1806, and again President of the Council in 1806 and 1807. He was Home Secretary from 1812 to 1822, and member of the cabinet from 1822 to 1824. Addington was an extreme reactionary. As Home Secretary he approved heartily of the Manchester massacre (1819). He was also the author of four of the infamous "six acts" (q.v.), and the instigator of the state trials for sedition and blasphemy that made his government ridiculous. He died at Richmond Park, Feb. 15, 1844. Consult G. Pellet, *Life and Correspondence of the Right Hon. H. Addington, first Viscount Sidmouth* (London, 1847).

AD'DIS, WILLIAM E. (1844—). An English clergyman. He was born at Edinburgh and was educated at Merchiston Castle School, Glasgow College, and Balliol College, Oxford. He became a Roman Catholic in 1866 but returned to the Church of England in 1901. He was parish priest of Sydenham from 1878 to 1888, an assistant clergyman at Melbourne from 1888 to 1892, and minister of the High Pavement Chapel (Unitarian), Nottingham, from 1893 to 1898. In 1898 he became professor of Old Testament criticism in Manchester College, Oxford. He was appointed curate of St. Martin and All Saints, Oxford, in 1909, and in the following year he became vicar of All Saints, Ennismore Gardens, London. He is the author of the following works: *Catholic Dictionary*, written in conjunction with Thomas Arnold (new ed., 1903); *Documents of the Hexateuch* (new ed., 1906); *Christianity and the Roman Empire*; *Hebrew Religion to the Establishment of Judaism under Ezra* (1906).

ADDIS ABEBA, äd'dès ä-bä'bä. The capital of Abyssinia, situated in the province of Shoa, in about lat. 9° N. and long. 39° E. (Map: Africa, H 4). It occupies an extensive area and is picturesquely situated at an altitude of nearly 10,000 feet. In its general appearance it resembles more a camp than a capital city. The town is absolutely without any streets and is intersected in several parts by deep ravines. The royal palace is situated on an eminence and consists of a number of buildings of cheap and flimsy architecture surrounded by several walls. It is the seat of the only Abyssinian school in the country. Of recent years there have been several projects undertaken to better the railway and telegraph facilities of the capital. The permanent population is estimated at 50,000, and the floating population at from 30,000 to 35,000. Addis Abeba was the scene of the signing of the treaty of peace between Italy and Abyssinia on Oct. 26, 1896, in which Italy resigned her claim to a protectorate over Abyssinia. See ABYSSINIA.

AD'DISON, DANIEL DULANY (1863—). An American clergyman and writer, born in Wheeling, W. Va., and graduated from Union College in 1883. After studying at the Episco-

pal Theological School, Cambridge, Mass., he was ordained to the priesthood of his denomination, becoming assistant rector of Christ Church, Springfield, Mass., in 1886. Three years later he was chosen rector of St. Peter's Church at Beverly, Mass., where he remained until 1895. He then became rector of All Saints Church, Brookline, Mass. A member of many church societies, and with varied interests, he gave especial attention to conditions in Liberia. He was made a trustee of the College of Monrovia and in 1904 was knighted by the government of Liberia in recognition of his services. Among his published writings are *Lucy Corcoran, Life, Letters, and Diary* (1894); *Phillips Brooks* (1894); *Life and Times of Edward Bass, First Bishop of Massachusetts* (1897); *All Saints Church, Brookline* (1896); *The Clergy in American Life and Letters* (1900); *The Episcopalians* (1904).

ADDISON, JOSEPH (1672-1719). An English poet and essayist. He was the son of Lancelot Addison, a clergyman of the Church of England, and was born at Milston, near Amesbury, in Wiltshire, May 1, 1672. After attending the Charterhouse and other schools, he entered Queen's College, Oxford, in 1687. Two years later he passed to Magdalen College. At Oxford he was distinguished for the ease with which he wrote graceful Latin verse. By 1697 he was receiving high compliments from Dryden. He won the favor of Montagu (afterward Lord Halifax), and Lord Somers, through whom he obtained, in 1699, a pension of £300 a year. The pension was probably intended to enable him to prepare himself for diplomacy by foreign travel. At any rate he left England toward the close of 1699 for a continental tour. While in France he became familiar with the language of that country. On the outbreak of the Spanish War of the Succession he went to Italy, where he wrote the most successful of his poems, the *Letter*, addressed to Lord Halifax. In the autumn of 1703 he returned home by way of Switzerland and Germany; but in his expectations of place he was disappointed, for the Whigs were out of office. The battle of Blenheim, however, which occurred the next year, presented a brilliant opportunity, which he did not fail to make the most of. The ministry wished the victory commemorated in verse, and Addison was appointed to do it. Lord Godolphin, the Treasurer, was so pleased with the first half of the poem that before *The Campaign* was finished he made Addison a Commissioner of Appeals.

The poet was now fairly involved in politics. He became Under-Secretary of State in 1706, accompanied Halifax to Hanover the next year, and in 1709 went to Ireland as Secretary to the Lord-Lieutenant, where he also obtained the office of Keeper of the Records, worth £300 a year. In the same year Sir Richard Steele began the *Tatler*, to which Addison soon became a frequent contributor. He also wrote a number of political articles in the *Whig Examiner*. On March 1, 1711, appeared the first number of the *Spectator*, which continued as a daily till Dec. 6, 1712. In 1714 it was revived as a tri-weekly. In 1713 appeared the *Tragedy of Cato*, the popularity of which, considering its total want of dramatic power, is amazing, though it contains some fine lines that have become almost proverbial. It was generally understood to have a political as well as a poetical inspiration; but so skillfully had Addison expressed himself that both parties, Whig and Tory, received its decla-

mations with rapture. It was translated into several European languages; and even the prince of French criticism, Voltaire, held Shakespeare a barbarian in tragedy compared with Addison. In 1716 Addison married Charlotte the Dowager Countess of Warwick. The marriage is said to have been "uncomfortable," but this legend is based upon no definite information, though it is generally accepted, and will be found in Thackeray's study of the poet. He reached his highest political position when he was appointed Secretary of State in 1717. For this place he was not at all suited, and he resigned the next year. Addison's health had been poor for some time, and, after an illness of a few months, he died at Holland House, Kensington, on June 17, 1719, three years after what Thackeray calls "his splendid but dismal union."

Thomas Tickell, whom Addison had appointed his literary executor, published his works two years later in four volumes, including, besides those already mentioned, papers Addison had written for the *Guardian* and the *Freeholder*, a play entitled *The Drummer*, *Dialogues on Medals*, and several poems. The most delightful and original of Addison's productions is that series of sketches in the *Spectator*, of which Sir Roger de Coverley is the central figure and Sir Andrew Freeport and Will Honeycomb the lesser ones. Sir Roger himself is an absolute creation; the gentle yet vivid imagination, the gay and cheerful spirit of humor, the keen, shrewd observation, and fine raillery of foibles which Addison has displayed in this character make it a work of pure genius. In prose, Addison is always excellent. He gave a delicacy to English sentiment and a modesty to English wit which it had never known before. Elegance, which in his predecessors had been the companion of immorality, now appeared as the advocate of virtue. His style, too, is admirable. There are many nobler and grander forms of expression in English literature than Addison's, but there are none comparable to his in propriety and natural dignity. "Whoever wishes," says Dr. Johnson, "to attain an English style, familiar but not coarse, and elegant but not ostentatious, must give his days and nights to the volumes of Addison." His various writings, but especially his essays, fully realized the purpose which he constantly had in view, "to enliven morality with wit and to temper wit with morality." He also did more than any other man of his time toward creating a wide public for literature. Consult: Johnson, *Lives of the Poets* (many editions); Macaulay, "Essay on Addison," *Edinburgh Review* (1843); Aiken, *Life of Addison* (London, 1843); Courthope, *Addison* (New York, 1884); and Beljame, *Le public et les hommes des lettres en Angleterre* (2d ed., Paris, 1897). The *Spectator* is edited by H. Morley (1868), and in eight volumes by G. Smith (1897-98). Addison's complete works are published in Bohn's *British Classics*.

ADDISON, JULIA DEWOLF (GIBBS) (1866—). An American art craftsman and author, born in Boston. After an early childhood spent in England, where she was privately educated, she returned to Boston in 1878, to study art. Further training in her profession she obtained in England and Italy. In 1889 she married Daniel Dulany Addison (q.v.), becoming widely known subsequently as a designer of ecclesiastical ornaments, metal work, mosaic, etc., and as an illustrator on vellum. Besides composing the

music for many songs and writing several Christmas carols, Mrs. Addison published the following: *Florestan the Troubadour* (1903); *Art of the Pitti Palace* (1903); *Classic Myths in Art* (1904); *Art of the National Gallery* (1905); *Arts and Crafts in the Middle Ages* (1908); *Mrs. John Vernon* (1908); *The Boston Museum of Fine Arts* (1910); plays, *A False Note* and *Blighted Buds*; *The Spell of England* (1912).

ADDISON'S DISEASE. A disease characterized by pigmentation of the skin and by degenerative changes in the suprarenal glands. The pigmentation of the skin varies from a light yellowish brown to a dark brown or blackish color. Various changes have been noted in the suprarenals, the most common being tuberculous inflammation. Fatty and waxy degenerations and carcinoma have also been described. The suprarenal glands, or adrenal bodies, were little understood till 1855, when Dr. Thomas Addison, of Guy's Hospital, London, published his work *On the Constitutional and Local Effects of Disease of the Suprarenal Capsules*. The leading symptoms of Addison's disease are anæmia, general languor and debility, feeble heart action, irritability of the stomach, and the peculiar bronzing (melasma) to which reference has been made. It is a rare disease, more common among the poor, more frequent in males than in females, and generally occurs between the ages of 30 and 50 years, although no age is exempt. There may be profuse diarrhœa, also rheumatoid pains in the loins and abdomen, and the temperature, as a rule, is subnormal. The bronzing is more pronounced on the face, neck, and backs of the hands and upon points of pressure. The disease lasts from 18 months to a few years. No curative treatment is known. Tonics, generous diet, proper climate, and the internal administration of suprarenal extract or the dried glands of sheep are beneficial and will often prolong life. See SUPRARENAL CAPSULES.

ADDISON'S WALK. In the grounds of Magdalen College, Oxford, a tree-bordered walk to which Joseph Addison is said to have frequently resorted when he was a "demy" in that college.

ADDITION. The process of uniting two or more number groups into a single group. In elementary arithmetic, which deals with natural numbers, the process of addition is simply counting all the units of two or more collections into a single collection. The different groups added are called the *addends*, and the result is called the *sum*. Since there is one and only one unit in the sum for every unit in the addends taken together, there is said to be a 1 to 1 correspondence between the sum and the addends. From this it appears that the sum is the same in whatever order the addends are taken or in whatever groups they may be placed. The former fact is expressed by saying that addition is commutative, and the latter by saying that addition is associative. See article ASSOCIATIVE LAW.

ADDLED PARLIAMENT, pär'li-ment, THE. A name given to the second Parliament of James I of England, 1614, because it did not produce a single statute. It holds, nevertheless, a noteworthy place in the history of constitutional liberty. Its members were chosen at a contested election, the first which had occurred for many years. The principle at issue was the right of

JOSEPH ADDISON
AFTER PAINTING BY KRAEMER

Parliament to grant all supplies. It is significant that 300 members, or about two-thirds of the entire number, were then elected for the first time. Among these new men were John Pym and Sir Thomas Wentworth, each destined to take a leading part in the coming struggle. After a two-months' session the Parliament was dissolved by the King, because it declined to grant him a supply of money without a proper settlement of the question of the imposts.

ADDRESS', FORMS OF. See **FORMS OF ADDRESS.**

ADE, ād, GEORGE (1866—). An American humorist and playwright, born at Kentland, Ind. He graduated at Purdue University in 1887 and was in newspaper work in Lafayette, Ind., and Chicago from 1887 to 1900. His first mark as a writer was made in a column of the *Chicago News*, known as *Stories of the Streets and the Town*. He succeeded to Eugene Field's department in that journal. In *Fables in Slang* and other similar volumes, he showed considerable cleverness as a satirical humorist. In a somewhat similar vein he afterward wrote such plays and sketches as *The Sultan of Sulu* (1902); *Peggy from Paris* (1903); *The County Chairman* (1903); *The Sho-Gun* (1904); *The College Widow* (1904); *Just Out of College* (1905); *The Slim Princess* (1907); *The Fair Co-ed* (1908); *The Old Town* (1909); *Knocking the Neighbors* (1912).

A'DEE, ALVEY AUGUSTUS (1842—). An American official. He was born at Astoria, N. Y. In 1870 he was appointed Secretary of Legation at Madrid, and in 1878 chief of the Diplomatic Bureau at Washington. He served from 1882 to 1886 as Third Assistant Secretary of State, and in the latter year was promoted to be Second Assistant. He became known in diplomatic circles for his skill in writing diplomatic papers. It was he who drew up the points on which the Treaty of Paris was built after the war with Spain. He was acting Secretary of State during the Chinese trouble in 1900.

ADELAAR, ä'dē-lär (Norw. The Eagle). An appellation of Curt Sivertsen (1622-75), one of the greatest naval commanders of the seventeenth century. He was born at Brevig, in Norway, and in his twentieth year was employed in the naval service of Venice against the Turks. On one occasion he broke through a line of 67 Turkish galleys which surrounded his ship, sank 15, and burned several others. Frederic III engaged him as Admiral of the Danish fleet; and in 1675, under Christian V, he took the command of the whole of the Danish naval force against Sweden, but died suddenly at Copenhagen before the expedition set out. See Brunn, *Curt Sivertsen Adelaar* (Copenhagen, 1875).

AD'ELAIDE. The capital of South Australia, on the Torrens, 7 miles by rail from its port, Port Adelaide, on Gulf St. Vincent, and 508 miles northwest of Melbourne (Map: Australia, F 5). It has a large trade in agricultural produce and wool; lead and copper are mined in the vicinity, and its manufactories include iron foundries, potteries, tanneries, breweries, and woolen, starch, and soap factories. The Torrens, artificially converted into a fine river, spanned by several bridges, traverses a strip of park land which divides the town into North Adelaide, largely residential, and South Adelaide, the business portion. The streets are broad and regularly laid out. It is the seat

of a United States consular agent and the see of Anglican and Catholic bishops and contains numerous churches, a university, several colleges, a meteorological observatory, and extensive botanical gardens, including a museum of economic botany. Adelaide University, founded in 1872, had, in 1911, 642 students; and a library of over 25,000 volumes. There is a school of mines and industries. The town is almost surrounded by the reserved park lands half a mile wide. Large water works and reservoirs, from 6 to 7 miles distant, and the cemeteries, are the property of the South Australian government. There are municipal abattoirs. Area, 3700 acres, of which 1751 acres are public parks. Founded in 1836, the city was named after Adelaide, queen of William IV. Pop., 1911, 42,294; including suburbs, 189,646. Port Adelaide, its port, protected by two forts, has a safe and commodious harbor, with a dock for ocean steamers, and extensive quays; pop., 3386 (local government area, 24,015). Consult G. T. Ellery, "Greater Adelaide," in *Municipal Extension* (Adelaide, 1899); "City of Adelaide," in *Municipal Journal*, ix, 237 (London, 1900).

ADELAIDE, ä'dä'lä'éd', EUGÉNIE LOUISE (1777-1847). Princess of Orleans, sister of Louis Philippe. Proscribed in the Revolution as an *émigrée*, she sought refuge in the Netherlands, Switzerland, and Germany (1793). Ten years later she met her brother in Spain and was with him until the Restoration, using her influence to induce him to accept the crown. From 1830 to 1847 she played an influential part in politics.

AD'ELARD, or **ÆTH'ELHARD**, OF **BATH.** An English philosophical writer who lived about the beginning of the twelfth century. He is said to have studied at Tours and Laon. He traveled extensively in southern Europe, Asia Minor, and North Africa, and it was during these travels that he acquired the great knowledge of Arabian philosophy shown in his writings. His works include *Perdifficiles Quaestiones Naturales* (printed toward the end of the fifteenth century); *De Eodem et Diverso* (before 1116), an allegory in which worldliness and philosophy are represented as endeavoring to win the soul of man; and a Latin translation of *Euclid* (printed 1482), made at a time when that work was almost unknown in western Europe. He also translated and wrote several other treatises on mathematical and medical subjects which are to be seen in MSS. in the libraries of Corpus Christi and Trinity colleges, Oxford.

AD'ELBERT COL'LEGE. See **WESTERN RESERVE UNIVERSITY.**

AD'ELOCHOR'DA, äd'è-lô-kôr'dä, or **HEM'ICHOR'DA**, hēm'i-kôr'dä (Gk. ἄδηλος, *adēlos*, unclear, invisible + ἡμι-, *hēmi-*, half + Lat. *chorda*, a cord, a dorsal nervous cord). A subclass of the Chordata, including *Balanoglossus* and its allies. See **BALANOGLOSSUS**, and Plate of **ASCIDIANS.**

ADELPHI, ä-děl'fī. The latest of the six extant comedies of Terence (q.v.) It was produced in 160 B.C. at the funeral games of L. Æmilius Paulus, and was derived chiefly from the *Ἀδελφοί*, *Adelphoi* ('Brothers') of Menander, but also in part from the *Οἱ Συναποθνήσκοντες*, *Hoi Synapothnēskontes* ('Those who Die Together,' 'Comrades in Death') of Diphilus. Terence's play gets its name from two pairs of brothers who figure in it—the old men, Micio and Demea, and the young men, Æschines and Ctesiphon.

The two old men differ widely in character. The young men are sons of Demea, but one is adopted by Micio. Each father is sure he is bringing up his son aright, and that his brother is all wrong; the play proves both in the wrong. Molière is said to have owed to it the idea of his *Ecole des maris*.

ADEL'PHI, THE (from Gk. ἀδελφοί, *adelphoi*, brothers). A locality in London between the Strand and the Thames Embankment, a little distance east of Charing Cross. The name came from the fact that the Adelphi Terrace, which lies in it, was laid out in 1768 by the brothers Adam, whose names appear in Adam Street, James Street, William Street, John Street, and Robert Street.

ADELPHI COLLEGE. An American college, formerly Adelphi Academy, situated at Clifton and St. James Places and Lafayette Avenue, Brooklyn, N. Y. It was incorporated in 1896, and until 1912 admitted both men and women students as candidates for the degree of A.B. It grants also the M.A. degree. The college now consists of (1) a college for women; (2) a normal department for the training of kindergarten teachers; (3) an extension department, including courses in the entire college curriculum, for teachers in the public schools; (4) a summer session; (5) an art department. It has a library of 15,000 volumes; faculty, 1913, 34; students enrolled in regular college courses, 467; students in extension courses, 734. President, Charles H. Levermore, 1896-1912; acting president, S. Parkes Cadman, D.D., 1912.

ADELPHI THE'ATRE. A theatre on the Strand, London, more fully designated the Royal Adelphi Theatre. It dates from 1806, but was rebuilt on a larger scale in 1858. It was known chiefly for its melodramas and farces.

ADELSBERG, ä'dels-běrk (Sloven. *Postojna*). A small market town of the Austrian crownland of Carniola, 22 miles east-northeast of Trieste by rail (Map: Austria, D 4). It is a popular summer resort, but is famous principally for its wonderful stalactite cavern, the largest in Europe and one of the finest known. It may be explored for more than 2 miles, and is penetrated for about 800 yards by the river Poik, which then disappears in the bowels of the earth. The cavern consists of several different chambers. The largest is the Franz Josef and Elisabeth grotto, 223 yards in length by 214 yards in breadth. The stalactite and stalagmite formations are particularly notable for their beauty and variety. Pop., 1910, 3900.

ADELUNG, ä'de-lung, FRIEDRICH VON (1768-1843). A German philologist. He was born at Stettin, studied philosophy and jurisprudence at Leipzig, went later on to Russia, and was tutor to the Grand Duke, later Czar Nicholas. In 1824 he was appointed director of the Oriental Institute at St. Petersburg, and in 1825 president of the Academy of Sciences. He is chiefly known for his researches respecting foreign sources for Russian history, the most important results of which are embodied in the *Kritisch-litterarische Uebersicht der Reisenden in Russland bis 1700* (1846). He also wrote on Sanskrit language and literature such volumes as *Versuch einer Litteratur der Sanskritsprache* (1830), translated into English under the title *An Historical Sketch of Sanskrit Literature* (1832).

ADELUNG, JOHANN CHRISTOPH (1732-1806). A distinguished German linguist and

lexicographer. He was born at Spantekow, Pomerania; was a journalist and author at Leipzig from 1761 to 1787, and from 1787 until his death chief librarian of the Electoral Library at Dresden. He is principally known for his historico-critical studies of the German language and of Low Latin. His chief works are his *Grammatisch-kritisches Wörterbuch der hochdeutschen Mundart* (Dictionary of High German, 1808), in which he took Dr. Johnson as his model, and his *Ueber den deutschen Stil* (1785; 4th ed., 1800). His *Ueber den Ursprung der Sprache und den Bau der Wörter* (1781) is an important landmark in the early history of comparative philology. From 1784 to 1787 he was the continuer of Jöcher's *Allgemeines Gelehrten-lexicon*.

ADEMP'TION (Lat. *adimere*, to take away). The cancellation or reduction of a legacy either by voluntary act of the testator or by loss or destruction of the thing bequeathed. The term is properly used only in connection with legacies, although it is sometimes used interchangeably with advancement (q.v.), and some courts also treat the term as synonymous with satisfaction (q.v.). If a testator *in loco parentis*, before his death, made a gift to his legatee of the same kind as the legacy, the presumption is that the gift was made as part of, or in place of, the legacy; and it is, therefore, deemed *pro tanto*. Specific legacies may be deemed by the sale or alienation by the testator of the property bequeathed, or by its loss or destruction, and general legacies are deemed by lack of sufficient assets to pay them. See LEGACY.

ADEN, ä'den or ä'den. A peninsula and strongly fortified town near the southwestern end of Arabia, situated in lat. 12° N., and long. 45° 5' E., and connected with the mainland by a narrow sandy isthmus (Map: Asia, O 7). In a broader sense the name of Aden is applied to the whole British territory in that part of Arabia, which includes, besides the peninsula and the isthmus, a small strip of territory on the mainland, with a total area of 75 square miles, or with the island of Perim 80 square miles. Politically this is a part of the Bombay presidency, British India. The peninsula proper is of volcanic origin and reaches in the peak of Jebel Shan-shan an altitude of 1775 feet above the sea. The climate of the region is healthful, but the scarcity of rain makes cultivation of the soil impossible, so that all the necessaries of life have to be imported. Water is obtained partly from the wells within the crater in which the town of Aden is situated and partly from the hills. The town of Aden is strongly fortified. The most populous settlements are Steamer Point and Shaikh Othman on the mainland. There are two harbors, but only one of them, Aden Back Bay, on the western side of the peninsula, is of any commercial importance. Owing to its favorable location, Aden was of considerable importance already in Roman times, when it was an entrepôt for the trade between the Roman Empire and the east. In the beginning of the sixteenth century it was taken by the Portuguese, who were succeeded by the Turks in 1535. From the seventeenth century until the British occupation, Aden was under the rule of the Sultan of Sana and some native chiefs. In 1839 it was captured by the British as a punishment for the maltreatment to which the crew of a shipwrecked British vessel had been subjected by the natives in 1837. The great importance of Aden as a

coaling station and port of call began with the opening of the Suez Canal. The population, which in 1839 was less than 1000, was 43,974 in 1901 and 46,165 in 1911. The trade is principally one of transshipment. Exclusive of government stores and specie, imports and exports in the year 1911-12 were valued at £2,643,276 and £2,318,595, respectively. The chief articles of commerce are coffee, gums, hides, skins, piece goods, and tobacco. The territory is administered by a political resident, who is also the military commander. A territory of about 9000 square miles in Arabia, officially reckoned a British protectorate, Socotra, and the Kuria Muria Islands, are administered from Aden. An agreement defining the boundaries of the protectorate was concluded with the Turkish government in 1902, and the delimitation of the frontier was completed in 1905. Consult F. M. Hunter, *Aden* (London, 1877), and Lucas, *Historical Geography of the British Colonies* (Oxford, 1906-07).

ADENEZ, àd'nâ', or **ADANS LE ROI**, àdân' le rwä', also written ADENÈS and ADENET. A trouvère of the thirteenth century. He is first known as a minstrel at the court of Henry III, Duke of Brabant, whose reign ended in 1261. Later he was for a time in the service of Guy de Dampierre, Count of Flanders; then he went to France, where he was in high favor with the royal family. His surname of *le Roi* is commonly understood to have come from the authority which he exercised as leader of the minstrels at the Brabantine court. His greatest work is the *Cléomadès* (of which an edition was published in 2 vols., Brussels, 1863-66), a long poetical romance. Previously he had written a number of *chansons de gestes* from the epic cycle of Charlemagne, *Les enfances Ogier* (edited Brussels, 1874), and *Berte aus grans piés* (edited Paris, 1832), and also *Buèves de Commarchis* (edited Brussels, 1874). Consult: Comfort, "Adenet le Roi; the End of a Literary Era," in the *Quarterly Review*, vol. cexviii (London, 1913).

ADENIS-COLOMBEAU, àd'nè'kô'lôn'bô', JULES (1823-1900). A French dramatist. He was born at Paris and was educated at the College Bourbon (Lycée Condorcet). He wrote a large number of comedies and vaudevilles, as well as libretti for comic operas and operettas. Among his independent works are *Philanthropie et repentir* (1855); *Une crise de ménage* (1857); *Les chasseurs et la laitière* (comic opera in one act, music by Gevaert, Opéra Comique, Paris, 1865); *Les trois souhaits* (comic opera in one act, music by Poise, Opéra Comique, 1874). In collaboration with Plouvier, Decourcelle, Tourte, Granvallet, Rostaing, and others, Adenis-ColombEAU produced works, of which the following are the more important: *Madame Pygmalion* (Bouffes Parisiens, 1863); *La jolie fille de Perth* (opera in four acts, music by Bizet, Théâtre Lyrique, 1867); *La czarine* (drama in five acts, Ambigu, 1868); *La fée des Bruyères* (Brussels, 1877); *Les templiers* (opera in five acts, Brussels, 1886).

ADENITIS, àd'è-nī'tis, or **LYMPHADE-NITIS**, lim'fād- (Gk. *ἀδὴν*, *adēn*, gland; Lat. *lymphā*, water). An inflammation of the lymphatic glands. Lymphangitis is inflammation of the lymphatic vessels which lead into and bind together these glands. In both structures the inflammation may assume an acute or chronic form. Acute lymphadenitis and lymphangitis usually take their origin from a wound or from some form of sore on the skin or a mucous mem-

brane. The inflammatory process extends from the initial lesion along the chain of lymphatic vessels, and its presence is indicated by bright red lines over the course of the lymphatic vessels leading from the wound, and by heat, swelling, pain, and tenderness in the glands with which these vessels communicate. If infective microorganisms, bacteria, are present at the time of the injury, or subsequently find their way into the tissues, a suppurative inflammation results, and pus is formed in and around the affected glands. Where the inflammation is severe, or the infection intense, such general symptoms as fever, headache, vomiting, and prostration are present. The chronic forms of adenitis are usually due either to tuberculosis or syphilis. In addition to the local enlargement of the glands, and the softening and suppuration that often follows, are found the general symptoms of the two diseases named. The treatment of acute adenitis consists in putting the affected part at rest, using such bandages and supports as may be necessary, the application of moist antiseptic dressings, the use of a non-stimulating diet and of laxatives. If suppuration ensues, an incision must be made and the pus allowed to escape. The chronic forms of adenitis are met by tonic and constitutional treatment, and, when this is unsuccessful, surgical removal of the enlarged glands is indicated.

AD'ENOID, ADENOIDS (Gk. *ἀδὴν*, gland; *εἶδος*, resemblance); also called POST-NASAL or ADENOID VEGETATIONS, NASO-PHARYNGEAL TONSIL, LUSCHKA'S TONSIL. A term now generally applied to an excessive growth of spongy tissue in the naso-pharynx, that region lying above and back of the soft palate. This growth begins in early infancy, often being well developed at the age of three months, and continues, if not removed by operation, until puberty. During the first few years it is of a soft, spongy nature, prone to bleed easily, but becomes harder and more fibrous as adult life approaches. It is frequently accompanied by enlarged tonsils and swollen cervical glands, but is not confined to the tubercular.

Adenoid tissue is present in the normal child and becomes detrimental only when it takes on an unusual growth. This enlargement, or hypertrophy, is due to various causes, among which heredity undoubtedly plays an important rôle. Bad hygienic surroundings, improper feeding, poor ventilation, dust-laden air, and indeed any condition causing a lowered systemic resistance predisposes to its development, but it is common in all classes and in all climates. Adenoids cause such a narrowing of the air passage that breathing through the nose is difficult or impossible. This, in aggravated cases, gives rise to a characteristic facial expression with open mouth and a drawn, vacant, semi-idiotic look. The difficult nasal respiration prevents symmetrical growth of the facial bones, so that the upper jaw may become narrowed, the teeth misshapen, and the hard palate unduly arched. Mentally the child is sluggish, inattentive, and unable to concentrate his attention on anything for more than a few minutes. This condition is termed *aproxia*. By preventing proper inflation of the lungs the chest becomes flat and deformed. And because the indrawn air is not purified of dust and germs by passing through the nose, the child is subject to colds, bronchitis, tuberculosis, and pneumonia. Asthma is not infrequently associated with adenoids. In the

nursing infant sucking becomes difficult. Sleep is impaired and is often interrupted by attacks of smothering. In older children mouth-breathing is the rule, especially at night, with snoring and "night-terrors," the latter due to semi-suffocation.

Adenoids cause a swollen, congested condition of the mucous membrane lining the nose and throat, thereby producing an excessive secretion of mucus, or catarrh. The "snuffles" in young children, and cough or hawking in the older, are usually due to this disease. There is a tendency to nosebleed and to bleeding from the mouth. The voice becomes thick and unmusical, with a nasal quality. An important and common complication is the blocking up of the eustachian tubes. These tubes, one on either side, lead from the naso-pharynx to the ear, and maintain an even air pressure within the ear drums. Any impairment of them causes deafness, earache, or abscess. In this way, by preventing proper ventilation of the drums, adenoids become the main cause of deafness and of "running" ears. Digestive disturbances, vomiting and catarrh of the stomach and intestines, may be caused by the constant swallowing of mucus. During the infectious diseases this growth adds a serious menace. Indeed the presence of these vegetations hinders the entire mental and physical development of the child.

Except in cases of deformed palate adenoids cannot be seen by direct vision. Rough or granular masses of tissue appearing on the back wall of the throat are suggestive, however, and the medical examiner can easily confirm the diagnosis with his finger or, in older children, by means of a small mirror.

Treatment consists in the early and complete removal of the growth, preferably under a general anæsthetic. Any other treatment is useless and often means a serious loss of time. If the diseased condition is sufficient to cause any of the symptoms mentioned, then the sooner surgical aid is invoked the better. The operation in skilled hands is practically without danger, the slight risks being from the anæsthesia and from possible hemorrhage. The latter is serious only in bleeders, on whom no operation should be attempted. Many cases undoubtedly get well without treatment, but always at a serious risk to the child.

Recurrence of the disease is frequent under the age of four years, especially following measles and whooping-cough, and in children with nasal obstruction.

The timely removal of adenoids causes, in the great majority of cases, a marked mental as well as physical improvement. The child's mind becomes more active, and he increases in weight and strength. If, however, operation be delayed until bone development has largely progressed, the benefits are not so great, and mouth-breathing may become a fixed habit. In the older children and young adults, however, it is important to remove the growths if for no other reason than in the hope of preventing deafness.

Although little was known of this disease until recent years, it has probably always existed in the human race. See THROAT.

ADERBAIJAN, ä'dër-bi-jän', or **ADERBIJAN**. See AZERBAIJAN.

ADERNÒ, ä'dër-nò'. A city of Sicily, 23 miles northwest of Catania, southwest of Mount Etna, and 1905 feet above sea level (Map: Italy, J 10). The ancient Hadranum was founded by Dionys-

ius I about 400 B.C. Among interesting ruins near by are fragments of the Sikelian temple of Hadranos, reputed to have been guarded by 1000 dogs, and remains of the Ponte Carcari, an aqueduct. Roger I founded, in 1157, the convent of Santa Lucia. A Norman castle, also erected by him, still stands and is used as a prison. Fragments of frescos still extant represent Adelasia, Roger's granddaughter, taking the veil. In 344 B.C. Hicetas of Syracuse was defeated here by Timoleon. Adernò is the market town of a flourishing agricultural district. Pop., 1901, 25,689; 1911, 30,190.

ADERSBACH ROCKS, ä'dërs-bäk. A group of sandstone rocks near the village of Adersbach, on the northeastern frontier of Bohemia. They are about 4 miles long and over 1 mile in width, and rise in some parts over 200 feet. They are remarkable for their fantastic form, which has been produced by the rain, frost, and other atmospheric agencies. During the Thirty Years' War the miserable people of Bohemia often found refuge in this locality.

ADHEMAR DE CHABANNES, ä'de-mär' de shä'bän' (c.998-1034). French monk and author. He was born at Chabannes, now in the département of Haute Vienne, and was educated at S. Martial in Limoges. He wrote several works concerning S. Martial; but his chief production was a chronicle in three books, extending to 1028. This work was formerly unjustly condemned because of fabulous additions by later copyists; the last of the three books is a very useful historical source. For the value of the various editions, see Molinier, *Les Sources de l'histoire de France*, vol. ii (Paris, 1902). His other works are published in Migne: *Patrologia Latina*, vol. cxli. Adhemar died, in 1034, at Jerusalem while on a pilgrimage.

ADHER'BAL. Eldest son and one of the heirs of Micipsa, King of Numidia, who died 118 B.C. He was killed by order of Jugurtha (q.v.) six years after his father.

ADHE'SION (Lat. *adhesio*, a sticking to, from *ad*, to + *hæerere*, to stick). The phenomenon observed when two bodies are brought into close contact, viz., they become so attached to each other that it requires force to separate them. Adhesion is seen in the case of two solid bodies when their polished surfaces are pressed together, as in the case of the two

ADHESION.

lead disks shown in the illustration; but it is more evident between solids and fluids, owing to their intimate contact. We have instances of this in the film of water adhering to a piece of glass which is dipped in water and then removed. The adhesion of gases to the surface of solids plays an important part in many processes. A condensed atmosphere of gases surrounds every body, and every particle of a powdered or porous body has its own surface layer of gases. This property of powdered bodies to retain gaseous atmospheres in a state of great condensation is called adsorption.

ADHESION, IN PATHOLOGY. The term sometimes refers to the closing of a wound. If two granulating surfaces (see GRANULATION) be kept in contact, they may fuse and the wound unite by secondary adhesion—"second intention."

Serous membranes, such as the pleura, pericardium, and peritoneum, when inflamed often become adherent. After operation involving any of these membranes similar inflammatory adhesions may occur. In inflammations of the appendix vermiformis (see VERMIFORM APPENDIX) and the pelvic organs (see UTERUS; OVARIES; FALLOPIAN TUBES), more or less extensive adhesions are apt to occur, interfering with the free motion of the organs or actually drawing them out of proper position.

ADHESION, IN PLANTS. The term is sometimes applied to an apparent coalescence of adjacent cycles; e.g., stamens which seem to be borne upon the tube of the corolla are called "adherent." The term is now passing into disuse.

ADIABATIC, äd'i-ä-bät'yk. Without transfer of heat. See THERMODYNAMICS.

ADIABENE, ä'dê-ä-bē'nê. An ancient kingdom, originally the territory between the Tigris and its two tributaries, the Upper Zab (Lycus) and the Lower Zab (Caprus), called by the Aramæans Hadyab, but later including all of Assyria proper as well as temporarily the Mesopotamian province of Nisibis and the district of Ecbatana to the southeast. Before he came upon the throne of Persia Artaxerxes III Ochus (359-336 B.C.) bore the title "King of Hadyab." To judge from the names of the kings in Arsacid times, the dynasty must have been Macedonian. At the end of the first century B.C. Monobazus I reigned over Adiabene. His wife, Helena, became a convert to the Jewish religion. About 25 A.D. their son Izates, who succeeded his father, also became a Jew. Helena moved to Jerusalem about 43 A.D. Izates died 55 A.D. and was succeeded by Monobazus II, who also was a Jew. He erected a mausoleum north of Jerusalem to his mother and other members of the family. It has been identified with the so-called "Tombs of the Kings," where two inscriptions have been found, one giving the name "Zaddan, the Queen," in Estrangelo and square Hebrew, the other "Helena" in square Hebrew. In 61 Monobazus II assisted Tiridates against Tigranes. Meharaspes was King of Adiabene in 116 A.D., when the country was conquered by Trajan, who made it a Roman province under the name of Assyria. Hadrian, however, allowed it to resume its semi-independence under Parthian suzerainty. Septimius Severus conquered Adiabene in 195 A.D. and assumed the title "Adiabenicus." After the war of 297 Diocletian and Maximian assumed the title "Adiabenicus maximus," and as a result of the war of 338 Constantius II claimed the same title. The capital of the kingdom was Arbela (q.v.). Consult Grütz, *Geschichte der Juden*, vol. iii. 2, pp. 403, 783 (4th ed., 1888); Marquardt, *Römische Staatsverwaltung*, vol. i, pp. 435 (1881); Schürer, *Geschichtedes jüdischen Volkes*, vol. iii, p. 169 (4th ed., 1909).

AD'IAN'TUM. See MAIDENHAIR.

AD'IAPH'ORISTS (Gk. *ἀ*, *α*, priv. + *διάφωρος*, *diaphoros*, different). The name given to Melancthon and those who agreed with him in submitting, in "things indifferent," to an imperial edict. When, in 1548, Charles V issued an edict called the Augsburg Interim, relating to disputed religious doctrines, Melancthon drew up the Leipzig Interim, in which he yielded several doctrinal and liturgical points as *adiaphora*, "things indifferent." This stirred up a vigorous controversy, which lasted till the adop-

tion of the Formula of Concord (1577), which lays down the law on the matter.

ADI-BUDDHA, ä'dê-bud'dä (Skr. the primordial Buddha). A conception of the supreme deity which arose about the tenth century and prevails especially among the northern Buddhists. He is the spiritual source out of whom through successive emanations of the five Dhyani Buddhas (q.v.) and their less perfect Bodhisattvas (q.v.) came all the visible creation. The similarity of this view to certain Gnostic theories has suggested that it may have been indirectly affected by contact with Eastern Christianity. See BUDDHISM.

ADIGE, ä'dê-jä (ancient *Athesis*). A river of Austria-Hungary and Italy, rising in the Rhetian Alps of Tyrol (Map: Italy, F 2). It is formed by the union of numerous streamlets near Glarus, where it is called Etsch, a name by which the entire river is known in Germany. It flows in a general southerly direction past Meran and Trent, entering Italy midway between Rovereto and Verona. A few miles above the latter town it turns to the southeast and subsequently enters the Adriatic north of the mouth of the Po. Its total length is 250 miles, for 180 of which it is navigable, although not without difficulty, owing to its swift current. It is connected with the Po by a small navigable canal called Adigetto. Its most important tributaries are the Eisack and the Avisio. The Adige is a transit river for the trade of Germany and Italy.

ADI-GRANTH, ä'dê-gränth, primal book. The Bible of the Sikh religion (see SIKHS). It consists largely of poems and legends originating with Nanak (1469-1538 A.D.), the founder of the sect, and the *gurus* ('divine revealers') who immediately succeeded him, its materials having been collected by Arjun (1584-1606), the fourth of these successors. Many of its passages show a very elevated conception of the deity and deal with such problems as predestination, the freedom of the will, etc. Its ethical teachings are notably such as combat the sins of personal selfishness and attachment to the pleasures of the world. A second granth ('book'), known as the "Granth of the Tenth Reign," was composed in 1696 under the direction of Govind Singh, the last of the ten *gurus*. This more especially exalted the martial virtues and added further legends of the incarnation of God. The sacred books are treated with great veneration in the assemblies of the Sikhs.

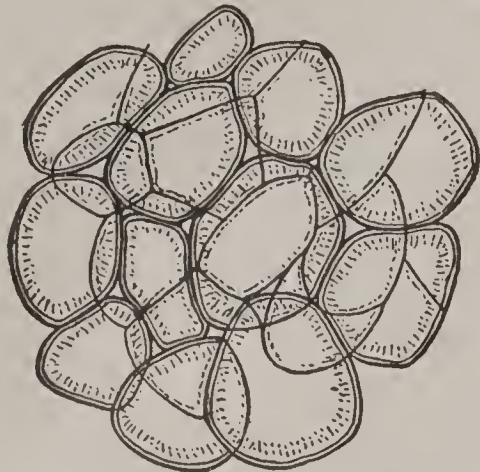

ADIPIC, ä-dip'ik, **ACID** (COOH)CH₂CH₂CH₂CH₂(COOH). A dibasic acid similar to oxalic acid. It is often obtained in the oxidation of fats by nitric acid. Its derivatives, the stereoisomeric tetra-oxy-adipic acids (COOH).CHOH.CHOH.CHOH.CHOH.(COOH), are close relatives of the simple sugars (mono-saccharides).

ADIPOCERE, äd'i-pô-sēr' (Lat. *adeps*, fat + *cera*, wax). A peculiar mixture of fatty acids resulting from the decomposition of animal bodies buried in moist places. Its formation has been supposed by some investigators to prove the change of nitrogenous tissues into fats, but this has been much disputed.

ADIPOSE SUBSTANCES (Lat. *adeps*, fat, grease). Same as fats (q.v.).

ADIPOSE TISSUE. A variety of animal tissue consisting of an aggregation of vesicles filled with fat or oil and supported partly by areolar tissue, but chiefly by a fine network of capillary blood-vessels. Each droplet of fat is

contained within a delicate protoplasmic envelope thickened at one part, where a flat nucleus is found. The vesicles are round, oval, or, when closely packed, polyhedral, from mutual compression. The supporting tissue is organic and vital, the vesicles secreting fat from the

ADIPOSE TISSUE (MAGNIFIED).

capillary blood-vessels; the secreted product—the fat—is unorganized and devoid of vitality. Adipose tissue differs from cellular tissue in having the vesicles closed, so that the fat does not escape even when fluid. There is a considerable layer of adipose tissue immediately under the skin; also around the large vessels and nerves, in the omentum and mesentery, around the kidneys, joints, etc. See FATS.

AD'IPO'SIS DO'LORO'SA, See OBESITY.

AD'IRON'DACKS. A group of mountains in northeastern New York. They lie west of the main axis of the Appalachians, as represented in the Green Mountains of Vermont, and constitute quite an independent mountain system. The name Adirondack is applied in a wider sense to that area embracing about 12,500 square miles contained between the valley of Lake Champlain, the St. Lawrence, and the Mohawk rivers. The counties of Essex, Clinton, Franklin, St. Lawrence, Lewis, Herkimer, Hamilton, and Warren lie partly or wholly within its limits. The more mountainous portion is on the east, and the higher peaks are chiefly within Essex County. From northeast to southwest the individual mountains become less pronounced, and the surface grades into a plateau of 1500 to 2000 feet altitude. Two peaks, Mount Marcy (5344) and Mount McIntyre (5112) are the highest in the State, while several others, Whiteface, Dix, Giant, Haystack, Skylight, and the Gothics, are but little lower. The mountains are grouped in minor ranges, which run a little east of north, and which are separated by deep, often narrow, valleys, as the depressions of Lake George, of the Schroon-Boquet rivers, of the Boreas-Ausable, and other rivers. The ranges approach Lake Champlain, *en échelon*, and produce on the lake shore a succession of bold, rocky headlands and open, receding bays and valleys. As a rule, the mountains are dome-shaped in their outlines; but some sharp peaks, like Whiteface, exist. Precipitous escarpments over 500 feet high are common. Thus picturesque passes occur which are a delight to travelers. The best known are Wilmington Notch, Indian Pass, and Avalanche Pass. Deer's Leap and Roger's Rock on Lake George are similar.

Drainage. The mountains constitute the water-shed between the Hudson and the St. Lawrence drainage systems, but the actual divide is a very irregular line that is due to the glacial drift. Thus Lake Champlain and Lake George

rise far to the south and discharge into the St. Lawrence; small ridges of drift alone separate them from the Hudson, which rises a hundred miles to the northwest of the heads of their basins and flows around their southern ends. In the heart of the mountains rocky divides of older date separate the streams. The main tributaries of the Hudson are the Sacondaga, Schroon, Boreas, and Indian rivers. The Mohawk receives East and West Canada creeks. The Black River carries to Lake Ontario the contributions of the Moose, Beaver, and several minor streams. The Indian, Oswegatchie, Grass, Raquette, St. Regis, Salmon, and Chateaugay flow into the St. Lawrence. The Chazy, Saranac, Ausable, and Boquet discharge into Lake Champlain. In the eastern portion all these streams follow the northeast-southwest structural lines until they can break across the ridges to the great lines of drainage.

Lakes. The region has many lakes. The largest are lakes Champlain and George, but hundreds of smaller ones add an indescribable charm to the scenery. The greater number are due to barriers of glacial drift that block the streams. Often they run in chains, apparently indicating former great lines of drainage. The Fulton chain, Raquette, Forked, Long, and Saranac lakes are strung out in a northeast and southwest series and are familiar summer resorts.

Geology. The Adirondack region is formed almost entirely of ancient Pre-Cambrian crystalline rocks. Gneisses and coarsely crystalline igneous varieties abound, and many smaller areas of crystalline limestones and quartzites are present. The gneisses and crystalline limestones are without doubt equivalents of the Grenville series of Canada. The most abundant igneous rocks are anorthosites, or labradorite rocks, and syenites. All the higher peaks are formed of the labradorite rocks. Basaltic and trachytic dikes, usually but a few feet wide, often intersect these older rocks. On the borders of the ancient crystallines, and on the southeast, as rare exposures from 25 to 40 miles from their edges, are the Paleozoic sediments, beginning with the Potsdam sandstone of the Cambrian system and terminating with the Utica slate of the Ordovician. All the Paleozoic rocks dip at low angles, and while small folds may be sometimes seen, the strata usually appear in faulted blocks. No rocks are found between the Utica slate and the glacial deposits of the Pleistocene period, so that the geological history of this long space of time can only be imperfectly inferred from the physiography. The great ice sheet moved from the northeast to the southwest and covered the highest summits. It spread a mantle of sand and boulders all over the region. On its melting many temporary lakes were formed, of which beaches and deltas are often found. During the Champlain submergence clays were deposited in great quantities in the Champlain valley.

Flora. The flora is of a pronounced northern character as compared with that of southern New York, but it naturally varies with the altitude. On the higher summits many small boreal plants remain as relics of the glacial epoch. The tree distribution is significant. Chestnuts penetrate only the southern and lower and more open valleys, whereas the spruce is found only at 1000 feet and more above the sea.

Fauna. The animals are likewise those of the north. Moose, though once abundant, are

now exterminated. Black bears are frequent, and deer are numerous because protected by game laws. The smaller animals are those characteristic of the north. Of fish, black bass and brook trout are most sought, and in the larger lakes lake trout are frequent. Salmon are now extinct.

Resources. The Adirondacks contain vast deposits of iron ore, chiefly magnetite, which is extensively produced near Port Henry, on Lake Champlain, at Lyon Mountain on the north and at the Benson mines on the west. The region was once the home of the bloomery process, but almost all the old forges are in ruins. At the head waters of the Hudson on Lake Sanford there are immense bodies of titaniferous magnetite not as yet utilized. Building stone in the form of green granite has been quarried near Keeseville, and a highly prized sandstone is produced near Potsdam on the northwest. Marble is found near Gouverneur on the west, and to some extent in the Champlain valley. Talc is extensively mined near Gouverneur. Graphite occurs in the vicinity of lakes George and Champlain.

The products of the forests form the most important industries. For lumber, the pine trees have been practically exhausted; spruce is the chief wood sought. The paper-pulp mills, however, consume much more than do the saw-mills. They take either spruce or poplar. The former is stripped from the mountains, where it may not grow again, but the latter rapidly renews itself upon the sandy barrens. After the timber has been cut off, and more especially in earlier years, when the outer mountains were stripped for charcoal, the owners often allowed the taxes to remain unpaid until the tracts were sold by the State at public auction. The State itself has at these times acquired extensive possessions, to which it adds yearly, with a view of preserving the waterways and forming a great public park for the people, and now possesses a million and a half acres. Enormous tracts are also held by private individuals and clubs as recreation grounds. Forestry has received much attention from the State authorities, and the denudation of the mountains by lumbermen has been materially checked.

Summer Resorts. The Adirondack region is one of the most important places for summer recreation for the dwellers in cities of the northeastern United States, and many thousands turn annually to it. Lake George, Schroon Lake, Lake Placid, the Saranacs, the Fulton chain, Long Lake, the Keene valley, and dozens of other localities attract their habitual visitors. The climate is especially adapted to the treatment of pulmonary complaints, notwithstanding extremely low temperatures in winter, frequently reaching -30° or -40° F. Saranac Lake, with its well-known sanitarium, is the chief resort. The establishment of State sanitariums has received favorable consideration from the State government.

Bibliography. For geology and mineral resources, see *Reports of the New York State Geologist*, and *Bulletins of the New York State Museum*, especially those since 1888, containing papers by J. F. Kemp, C. H. Smyth, Jr., H. P. Cushing, and others. For botany, see *Reports of the State Botanist*, and especially *Bulletin 28 of the State Museum*. For forestry, see *Reports of the State Forestry Commission*. All these are published at Albany.

AD'IT (Lat. *aditus*, access, approach). A

nearly horizontal passage opened for the purpose of prospecting, entering, draining, or ventilating a mine or mining district. If the opening is driven across the formation, it is called a *cross-cut adit*. In the United States these passages are usually called tunnels, though the latter term, strictly speaking, applies when the opening passes through the hill and is opened at both ends. Very few adits warrant the expense of driving unless they are for drainage purposes where water from the ground above can be intercepted or the water from the ground below can be raised to the adit and discharged through it, thereby saving the extra cost of raising the water from the adit level to the top of the shaft. In the rich silver mines of Japan, before the invention of power pumps, as many as 1500 men were employed at a single property for handling the water, which later was drained by the driving of an adit. The adits to drain the Sado Mine in Japan were started in 1629 and completed in 1639; the length was only 2880 feet. Numerous other short adits were driven in Japan about this time for drainage and ventilation which required many years to complete. An adit in Cornwall opens at the level of the sea, and extends inland about 30 miles, draining the district of Gwennap. It meets some shafts at the depth of 400 feet. The Ernst August adit in the Hartz Mountains is 13 miles long. The Joseph II adit at Schemnitz, in Hungary, is 10 feet high, $5\frac{1}{4}$ feet wide, extends 10 miles to the valley of the Gran, and is used as a canal and railway passage. The Sutro Tunnel, driven for the purpose of draining and ventilating the Comstock Mines in Nevada, is a cross-cut adit, 4 miles long. The water and air of these mines were so hot that it was difficult to keep labor at work more than one or two hours at a time. The Roosevelt Tunnel at Cripple Creek, Colo., which is also a cross-cut adit, was driven for the purpose of prospecting the formation and draining of the entire district. The New-house Tunnel at Idaho Springs was driven to prospect the ground, drain the upper workings, and serve as a means for entering and conveying ore to the railroad. For a description of early adits, consult vol. xliii of the *Transactions of the American Institute of Mining Engineers*; also, *Handbook of Mining Details*; compiled from the *Engineering and Mining Journal* (New York, 1912).

ADIVE, à-div'. The Tibetan fox. See Fox.

ADJECTIVE (Lat. *adjectivum*, from *ad*, to + *jacere*, to throw, add, literal translation of the Gk. *ἐπιθετικόν*, *epithetikon*, something added). One of the parts of speech in grammar, a word joined to a substantive to extend its meaning and to limit its application. When *tall* is joined to *man*, there are more properties suggested to the mind by the compound *tall man* than by the simple name *man*; but *tall man* is not applicable to so many individuals as *man*, for all men that are not tall are excluded. Adjectives are variously classified. The following classification is simple and sufficiently complete: Descriptive adjectives, or adjectives of quality and of quantity, and pronominal adjectives. The articles (q.v.) are sometimes included in this class. Nouns, or names of things, are often used in English as adjectives; thus, we say a *silver chain*, a *stone wall*. In such expressions as "income-tax assessment bill," *income* plays the part of an adjective to *tax*, which is, in the

first place, a noun; the two together then form a sort of compound adjective to *assessment*; and the three, taken together, a still more compound adjective to *bill*, which, syntactically, is the only noun in the expression. Languages differ much in their way of using adjectives. In English the usual place of the adjective, when it is not in the predicate, is before the noun. This is also the case in German; but in French and Italian it may follow. In these languages, again, the adjective is varied for gender and number, and in the German for case also. In English it is now invariable, and in this simplicity there is a decided superiority; for in modern languages these changes in the adjective serve no purpose. The only modification of which the modern English adjective is capable is for degrees of comparison.

ADJECTIVE COLORS. Those colors in dyeing which are fixed by a base or mordant to render them permanent, as distinguished from *substantive colors*, in which the dye in its natural hue is fixed without the use of a mordant.

ADJECTIVE LAW. The term applied to the rules of law relating to procedure, as distinguished from substantive law (see **SUBSTANTIVE LAW**), which is the term applied to the common law rules of right which courts are called upon to enforce. Thus, the rule that the owner of real estate is entitled to recover damages for trespass upon it is a rule of substantive law; but the rules determining to which court he should apply for relief and the method he should adopt to obtain it are rules of adjective law. Adjective law thus comprehends the law of the forum, including the conflict of laws, pleading, evidence, rules regulating admission to the bar, and rules for the conduct of cases in and out of court. Consult Holland, *The Elements of Jurisprudence* (9th ed., London, 1900; New York, 1910).

ADJOURNMENT (Lat. *ad* + Fr. *jour*, belonging to the day). In law, the suspension or winding up of a term or session of a court, as distinguished from the suspension or postponement of a pending cause, which is technically known as a continuance (q.v.). Adjournment may be to a designated time, as from day to day, or it may be indefinite, in which case it is said to be "without day." The suspension of a session to be resumed on the same day is not called an adjournment, but a recess. An adjournment is in the discretion of the court and cannot ordinarily be inquired into by any other tribunal unless the discretion has been abused. The power of adjournment is an inherent attribute of judicial tribunals. Ordinarily the suspension of a judicial sitting at the close of a day to be resumed the next day does not call for an order of adjournment, the session being deemed continuous until the end of the term.

ADJU'DICATION (Lat. *adjudicare*, to adjudge). In the most general sense the judicial determination of a controversy. Specifically, in English and American law, the term is used to denote the final determination of a proceeding in bankruptcy. In the Federal Bankruptcy Act of 1898 it is defined as "a decree that the defendant, in a bankruptcy proceeding, is a bankrupt." The phrase "former adjudication" is often used, the rule being that persons shall not relitigate a matter which has been the subject of a former adjudication between them. See **JUDGMENT**; **RES JUDICATA**; and the authorities there referred to.

ADJUNTAS, *ád-hōon'thás*. A mountain resort in Porto Rico, one of the healthiest and most pleasant towns on the island. It is in the central part, 15 miles northwest of Ponce, and is about 2400 feet above sea level. It is surrounded by coffee and fruit farms. Adjuntas was visited by a disastrous hurricane in 1899. Pop., 1899, 1963; 1910, 1406.

ADJUSTMENT. In the law of insurance, the act of ascertaining the exact amount of indemnity which the party insured is entitled to receive under the policy and of fixing the proportion of the loss to be borne by each underwriter. The nature and amount of damage being ascertained, an indorsement is made on the back of the policy, declaring the proportion of loss falling on each underwriter, and on this indorsement being signed by the underwriters the loss is said to have been adjusted. There has been some difference of opinion as to the nature of the obligation incurred by the underwriter upon agreeing to and subscribing to the adjustment; but it is now settled that the act is not absolutely conclusive upon him, but creates only a contract obligation, from which he may free himself upon proof of fraud, mistake, misrepresentation, etc. For the particular applications of the doctrine to marine insurance, where it is of most importance, see **AVERAGE**. Consult Arnould, *On Marine Insurance* (London, 1901; Boston, 1909). See **INSURANCE**.

ADJUTANT (Lat. *ad*, to + *jutare*, to assist, help). A staff officer. In the United States army, generally a regimental officer of captain's rank appointed by the regimental commanding officer to assist him in the training, discipline, and duties of his command, together with the general supervision of its interior economy. Squadron and infantry battalion adjutants appointed from the lieutenants and field artillery battalion adjutants appointed from captains have similar duties in a more limited degree and sphere. Post, garrison, artillery district, brigade and division adjutant majors have similar relationship to their respective commanding officers. The duties of the position are practically the same throughout the armies of all the great powers. In the United States the regimental adjutant is appointed for a term of four years and the squadron or battalion adjutants two years. Such officers are not eligible for re-appointment, except under certain specified conditions. The application of these regulations was modified by the detached service law of 1912 ("Manchu Law"), which provided that all line officers below the grade of field officer must actually serve two years out of six with a troop, battery, or company of the arm of the service in which they are permanently commissioned. For a description of their duties, consult the *United States Army Regulations*.

ADJUTANT (for origin of name, see above). A large East Indian stork (*Leptoptilus argala* or *dubius*), about 5 feet high and 5 feet in length. It is chiefly white, but the back and wings are slate-colored, and the head and neck bare and flesh-colored, marked with black. From the front of the neck hangs a long pouch, which is connected with the respiratory system and possibly serves as an air-reservoir under special conditions. "Adjutant" is really a nickname given to these birds, because of an absurd resemblance at certain times to a self-important army officer. The adjutant is very voracious, and though it is especially fond of fresh meat,

its chief source of food is in carrion and offal. It is, therefore, an efficient scavenger, and since it also eats many of the smaller noxious animals, it is protected by law in India. Although so large a bird, its powers of flight are considerable, and it soars to great heights, mingling with vultures in its search for food. The adjutant is found in India and southeastern Asia, a smaller species (*L. javanicus*) occurring in the East Indies. A closely allied species, the marabou (q.v.), inhabits Africa. All three furnish the marabou feathers of commerce, their lengthened under tail and under wing-coverts being of unusual beauty.

ADJUTANT-GENERAL. A military staff officer with the rank of colonel, one of the assistants of the commanding general of a field army in the execution of his military duties, as in issuing and executing orders, receiving and registering reports, regulating details of the service, and so forth. In the United States army there is also a department known as the *Adjutant-General's Department*, all the officers of which are above the grade of captain and who have, in addition to the title of adjutant-general, the specific title of brigade adjutant or division adjutant when serving as such with a brigade or division in the field. The chief of the adjutant-general's department has the rank of brigadier-general and the title of "the adjutant-general." The adjutant-general is an important officer of the War Department (see ARMY ORGANIZATION), having the rank of brigadier-general. His duties include the management of the recruiting service, the collection of military information, the preparation of annual returns of the militia, the custody of all records, etc. Most of the individual States also have adjutant-generals, performing similar duties with respect to the militia of their several States.

ADLER (*Ger. pron.* äd'lër), CYRUS (1863—). Founder of the American Jewish Historical Society. He was born at Van Buren, Ark., graduated at the University of Pennsylvania (1883), became associate in Semitic languages at Johns Hopkins, and in 1892 librarian of the Smithsonian Institution. As special commissioner for the World's Columbian Exposition at Chicago, he spent fifteen months in Egypt, Turkey, Servia, and Persia in 1890-91, and obtained most of the Oriental collections for that exhibit. He was chosen one of the editors of the *Jewish Encyclopædia* and, in 1899, editor of the *Jewish Year Book*. In 1905 he became assistant secretary of the Smithsonian Institution and, in 1908, president of Dropsie College for Hebrew and Cognate Learning. Among his publications are *The Shofar, Its Use and Origin* (1893); *Told in the Coffee House* (with Allan Ramsay, 1898), a series of folk tales collected in Constantinople; *International Catalogue of Scientific Literature* (1905); *Jews in the Diplomatic Correspondence of the United States* (1906).

ADLER, FELIX (1851—). A German-American educator and reformer. He was born Aug. 13, 1851, at Alzey, Germany, and came in 1857 to the United States, where his father had been called to the ministry of Temple Emanu-El at New York. After graduating at Columbia College in 1870, he studied philosophy and economics at the universities of Berlin and Heidelberg, receiving the degree of Ph.D. in 1873. On his return to New York he was appointed professor of Hebrew and Oriental literature at

Cornell University and held this position from 1874 to 1876, when he organized in New York the Society for Ethical Culture (q.v.), with which his name has since been identified. He became widely known as a lecturer and writer, serving as an editor of the *International Journal of Ethics*. In 1902 Dr. Adler was called to the chair of social and political ethics created especially for him in Columbia University. He was also Roosevelt professor at the University of Berlin for the year 1908-09. He took a conspicuous part in the agitation against child labor and other evils. His principal literary works are *Creed and Deed* (New York, 1877); *The Moral Instruction of Children* (New York, 1898); *Marriage and Divorce* (1905); *Life and Destiny, or Thoughts from the Ethical Lectures of Felix Adler* (1905); *The Religion of Duty* (1905; 2d ed., 1912); with W. H. Maxwell, *What the Ethical Culture School Stands for* (1910).

ADLER, FRIEDRICH (1827-1908). A German architect and art historian. He was born at Berlin; studied at the architectural academy there and later traveled widely. He was appointed professor in the Berlin Academy in 1863, and from 1877 until his retirement in 1903, he was consulting architect to the Prussian Minister of Public Works. He designed several church structures, including Christ Church and St. Thomas's at Berlin, St. Paul's at Bromberg, and the Church of the Redeemer at Jerusalem (1898). He made an extensive study of the architecture of ancient times and of the Middle Ages, and took an active part in the excavations at Olympia. Besides contributions to official reports, he published *Mittelalterliche Backsteinbauwerke des preussischen Staats* (1858-98); *Die Baugeschichte von Berlin* (1861); *Baugeschichtliche Forschungen in Deutschland* (1870-79); *Das Mausoleum zu Halikarnass* (1900); *Zur Kunstgeschichte* (1906).

ADLER, GEORG (1863-1908). A German economist and author, born at Posen. He lectured as extraordinary professor of sociology at the University of Basel, Switzerland, and afterward became professor of political economy in the University of Freiburg, Germany. In 1900 he was made professor of political science in Kiel University. His writings on economic and sociological questions, in which he usually advocates moderation as opposed to revolutionary agitation, include *Karl Marx'sche Kritik* (1886); *Internationaler Arbeiterschutz* (1888); *Social-Reform und Theater* (1891); *Staat und Arbeitslosigkeit* (1894); *Die Social-Reform im Altertum* (1898); *Geschichte des Socialismus und Communismus* (1900); *Ueber die Epochen der deutschen Handwerkerpolitik* (1903); *Die Bedeutung der Illusionen für Politik und sociales Leben* (1904); *Stirners Anarchist* (1907); *Hauptwerke des Sozialismus und der Sozialpolitik* (1908-09).

ADLER, GEORGE J. (1821-68). A German-American philologist. He was born in Germany, and at the age of 12 came to New York. He graduated at the University of New York in 1844 and in 1846 was appointed professor of German in that institution, which position he held until 1854. His last years were clouded with insanity. He published *German-English Dictionary* (1848; frequently reprinted); *German Grammar* (1868); *Wilhelm von Humboldt's Linguistic Studies* (1868), and a translation of Fauriel's *History of Provençal Poetry* (1860).

ADLER, GUIDO (1855—). An Austrian

writer on music. He was born at Eibenschütz (Moravia) and attended the gymnasium at Vienna, where he conducted a chorus of the pupils. At the same time he received his musical education at the conservatory (under Bruckner and Dessoff). In 1880 he received the degree of Ph.D., his dissertation being *Die historischen Grundklassen der christlich-abend-ländischen Musik bis 1600*. From 1881 to 1885 he was lecturer on the science of music at the University of Vienna. In 1885 he became professor of music at the German University of Prague. After the retirement of Hanslick (q.v.) he returned in 1898 to the University of Vienna as professor of the history and theory of music. Together with Chrysander (q.v.) and Spitta (q.v.) he founded in 1884 the important *Vierteljahrsschrift für Musikwissenschaft*, to which he subsequently contributed many valuable articles dealing with the history and the theory of music. In 1884 he began the monumental publication *Denkmäler der Tonkunst in Oesterreich*, published by Artaria in Vienna and Breitkopf and Härtel in Leipzig, which is subsidized by the Austrian government. Up to 1913, 19 double volumes appeared containing works of the old Austrian composers and such masters as spent the greater part of their life in Austria. Many of the historical introductions were written by Adler himself. During the International Exhibition at Vienna in 1892 he acted as chairman of the historical section. His essays, dealing chiefly with the history of music and embodying the result of original research, were published in various musical periodicals. An important contribution to the æsthetics of music is his book *Der Stil in der Musik* (1911).

ADLER, HERMANN (1839–1911). Chief rabbi of the United Hebrew Congregations of the British Empire. He was born at Hanover, Germany, and was educated at London, Prague, and Leipzig, receiving the degree of Ph.D. in 1862. In 1863 he was appointed principal of the Jews' College, London, where, notwithstanding his appointment as minister of the Bayswater Synagogue in 1864, he remained as tutor of theology until 1879, and upon his unanimous election as chief rabbi of the United Hebrew Congregations of the British Empire in 1891 he became president of the college. Afterward he became minister of the Cathedral Synagogue in Duke's Place. He wrote many essays, such as *Ibn Gabirol, the Poet Philosopher, and his Relations to Scholastic Philosophy* (1864); *Can Jews Be Patriots?* (a reply to Goldwin Smith, *Nineteenth Century*, 1878); *Anglo-Jewish Memories, and Other Sermons* (1909).

ADLER, NATHAN MARCUS (1803–90). Chief rabbi of the United Hebrew Congregations of the British Empire. He was born in Hanover and educated at the universities of Göttingen, Erlangen, and Würzburg. He was appointed chief rabbi of Oldenburg (1830), of Hanover and the provinces a year later, and, in 1845, chief rabbi of the British Empire. He was one of the organizers of Jewish schools in London and the provinces; he joined Sir Moses Montefiore in his appeal for the Holy Land, by which £20,000 was raised; was one of the founders of the "United Synagogue," and was founder and first president of the Jews' College, London. He published several important Hebrew works, among them *Netinah la-Ger* (1875), a commentary on the Targum of Onkelos, besides volumes

of sermons, including *Sermons on the Jewish Faith*.

ADLER, SAMUEL (1809–91). A German-American rabbi and author, born at Worms, Germany. He studied at the universities of Bonn and Giessen, was rabbi of congregations in Alzey and vicinity (1842–56), and rabbi of the congregation Emanu-El of New York City (1857–74). He was a learned Talmudic scholar and an earnest progressionist. His works include *Jewish Conference Papers* (1880); *Benedictions* (1882); and *Kobez 'al Yad (Collections, 1886)*.

ADLER, VICTOR (1852—). An Austrian Socialist leader, born at Prague, and educated in the Vienna University. After visiting England, he wrote a book on factory inspection there. He founded at Vienna a Social Democratic weekly journal, which was suppressed by the government. Afterward he founded and became editor-in-chief of the *Arbeiter Zeitung*. He was a member of the lower Austrian diet, and in 1907 of the Imperial Council. His publications include *Die Arbeiter Kammern und die Arbeiter* (1886).

ADLERBERG, äd'lër-bërk, VLADIMIR FIODOVICH, COUNT (1790–1884). A Russian statesman, born in St. Petersburg. In 1817 he was Adjutant to the Grand Duke Nicholas, and later, for his devotion during the Decembrist revolution in 1825, became Major-General, accompanying the Emperor during the Turkish campaign in 1828. He soon became Director of the War Department and in 1841 was made Postmaster-General, distinguishing himself by many reforms in the postal service. He was made General of Infantry in 1843, Count in 1847, and in 1852 Minister of the Imperial Household, in constant attendance on the Emperor, and kept the position under Alexander II, retiring in 1872.

ADLERCREUTZ, äd'lër-kroits, KARL JOHAN, COUNT (1757–1815). A Swedish general and statesman, born in Finland. He was defeated in Finland by the Russians in 1808, and his estates were confiscated. With Georg Adlersparre he brought about the overthrow of Gustavus IV, who was succeeded on the Swedish throne by Charles XIII. Later the two generals quarreled, and Adlersparre was disgraced, while Adlercreutz remained in favor.

ADLERSPARRE, äd'lërs-pä're, GEORG, COUNT (1760–1835). A Swedish general and statesman; educated at the University of Upsala; entered the army, took part in the war against Russia in 1788 and in the campaigns against Norway. After the death of Gustavus III he devoted himself to the study of political economy. He reëntered military service in 1808 and fought against Russia; and the next year joined with Adlercreutz in the movement to elevate Charles XIII to the Swedish throne. In 1810, finding himself succeeded in the new King's favor by his rival Adlercreutz (q.v.), he withdrew from court. In 1831 he was fined for publishing secret state papers, including his correspondence with Charles XIII.

AD LIBITUM (Lat. at will, It. *a piacere, a piacimento*). In music, a term indicating that the part, accompaniment, embellishment, or instrument may be omitted at will. Thus, a song written with 'cello accompaniment *ad libitum* may be sung to the piano accompaniment alone or with the 'cello added. The term also denotes liberty in tempo and rhythm. See ACCOMPANIMENT.

ADMEASUREMENT. See MEASUREMENT OF SHIPS.

ADMEASUREMENT OF DOWER (Lat. *ad, to + measurement*). In English law, an ancient writ by which an heir could obtain redress against the widow of his ancestor in case the heir or his guardian had, during the heir's minority, assigned to her more land as her dower than she was entitled to. The writ has been superseded by simpler forms of action; but the remedy, often under the same title, still remains wherever the common law principle of dower (q.v.) is recognized, as is still generally the case in this country. Consult Scribner, *Treatise on the Law of Dower* (Philadelphia, 1883), and Roper, *Treatise on the Law of Property Arising from the Relation between Husband and Wife* (Philadelphia, 1841).

ADME'TUS (Gk. Ἄδμητος, *Admētos*). A mythical King of Pheræ, in Thessaly. He was in the Calydonian hunt and the Argonautic expedition. By the aid of Apollo, who was his herdsman during a year of banishment from Olympus, he won for his wife Alcestis, daughter of Pelias. Apollo also procured for him a prolongation of life, if another would die in his stead. Alcestis consented, but was sent back from the lower world by Persephone, or, according to Euripides, was rescued by Hercules from death at the tomb itself. The story forms the subject of a celebrated drama by Euripides (q.v.), *Alcestis*. Compare Browning, *Balaustion's Adventure* (London, 1871).

AD'MI. Cuvier's gazelle. See GAZELLE.

ADMIN'ISTRA'TION (Lat. *ad, to + ministrare, to attend, manage*). In general, the management or conduct of any business; especially, in politics, executive government. In its broadest sense, in public affairs, it means the full activity of the government engaged in the practical exercise of its authority in conformity with the constitution of the nation. But, usually, administration refers only to those functions of the government exercised through the executive and, in some cases, through the judicial department, designed to carry into execution the laws enacted by the legislature. The organization of administration may be divided into two kinds, centralized and localized. In France the administration is highly centralized, every official being held to a strict account by those of a higher order. In the United States the national administration is centralized; state administration is, in general, decentralized, or localized. In the case of most of the States not all, if any, of the chief executive officers are subject to the control of the governor; the execution of State laws is often left to local elective officials who are not subject to central control. Current tendencies in the States are, however, in the direction of centralization. In a broader sense the administration includes the whole executive organization of government.

In American national politics the administration, in its narrower sense, signifies the president and his cabinet; in State and local politics, the governor and his chief executive officials, or the mayor and his department heads. This is the sense in which the term is used in England and on the Continent. In England the administration, represented by the premier and his cabinet, is always composed of members of the party having the legislative majority. See GOVERNMENT; MUNICIPAL GOVERNMENT; CIVIL SERVICE; also *Government* under UNITED STATES, FRANCE, GERMANY, ETC. Consult Goodnow, *Principles of the Administrative Law of the United*

States (New York, 1905); id., *Comparative Administrative Law* (New York, 1893); Fairlie, *The National Administration of the United States* (1905); Freund, *Cases on Administrative Law* (St. Paul, 1911).

Administration, in Law. A term applied to the management and disposal of a deceased person's estate. It includes payment of debts, getting in of credits and choses in action belonging to the deceased person, and the distribution of his personal estate to his legatees or next of kin. Anciently, the king as *parens patrii* administered decedent's estate through his officers. By the statute of Westminster II this duty was delegated to the ordinary, and by later statute he was directed to grant administration to the husband or wife or next of kin of the decedent. To-day the jurisdiction over decedents' estates is committed in England to the Court of Probate, and in the United States to courts variously known as probate courts, surrogates' courts, and orphans' courts. The officer of administration, if appointed by will, is called an executor; if not nominated by will and appointed by the court having jurisdiction over decedent's estates, he is called an administrator. An administrator may be *temporary*, when he is appointed pending litigation upon the question as to who is entitled to administer upon the estate; or *with the will annexed*, when the will failed to name an executor, or the executor named fails to qualify for his office; or *de bonis non*, that is, to administer upon the goods not administered by a prior administrator, who no longer retains his office because of death or removal. Administration may also be ancillary, in which case the officer of the administration is said to be an ancillary executor or administrator. The distinction is a consequence of the rule that the place of administration is the domicile of the decedent, and that the administrative officer has no authority outside the jurisdiction where he is appointed or confirmed. Thus, when a decedent leaves property in two jurisdictions, his estate should be administered in the jurisdiction of his domicile, and the administrative officer, in order to act in the other jurisdiction, should obtain an appointment ancillary to his appointment in the domiciliary jurisdiction. It is then his duty to transmit the assets to the jurisdiction of domicile, to be there administered. By the canon law the administrator or executor becomes vested with title to the decedent's personal property. This is still the rule by statute in most jurisdictions. In addition to the duties already referred to, special duties might be imposed upon an executor by the will. In most jurisdictions the administrator, and in some the executor, is required to give a bond for the faithful performance of his duties. He remains bound on his obligation, and subject to the direction of the court, until his final accounting and discharge by order of the court. See Schouler, *Treatise on the Law of Executors and Administrators* (3d ed., Boston, 1901); Woerner, *Treatise on the American Law of Administration* (2d ed., Boston, 1899); Williams, *Treatise on the Law of Legal Representatives* (London, 1899); Woerner and Wizenous, *Law of Decedents' Estates Including Wills* (Boston, 1913).

ADMINISTRATION, MILITARY. A form of government which takes the place of the civil governing powers in regions placed under martial law. The city of Paris, during the war with

Germany, 1870-71, and Cape Colony, South Africa, during the recent Boer War, are cases in point. The term "military administration" is also used to designate the system which regulates the government of the military establishment both in peace and war. See **MARTIAL LAW**.

ADMINISTRATION OF ESTATES. The settlement of the estate of a decedent or a bankrupt. Administration of the estates of deceased persons was formerly in England committed to the ecclesiastical courts, acting through an administrator, appointed by the court, or an executor designated by the last will and testament of the deceased. It is now under the jurisdiction of the Divorce, Probate, and Admiralty Division of the High Court of Justice. In the United States it is usually the function of special tribunals, known variously as probate or surrogate's courts, but is often committed to the ordinary tribunals, as county courts. For the principles governing the administration of decedents' estates, see **EXECUTOR AND ADMINISTRATOR**. The administration of the estates of bankrupts is committed to a trustee in bankruptcy. See **BANKRUPTCY**.

ADMINISTRATIVE LAW. That part of the law which regulates the enforcement of the will of the State as expressed by the authorities which are permitted by the governmental system to express that will, particularly the legislature. Since it is necessary under all governmental systems that authorities be formed for the purpose of enforcing the law, administrative law treats, in the first place, of the organization of the administrative authorities, both those having jurisdiction over the entire State (who are known as central administrative authorities), and those having jurisdiction over only a portion of the State, who are known as local authorities. In the United States, e.g., the administrative law treats: of the President; the heads of the Federal executive departments and their subordinates (both at Washington and in the districts into which the country is divided for purposes of Federal administration, such as the customs and internal revenue districts); or the State governor and State officers generally; or the county, town, and city officers. Since no administrative officer may legally take any action which he is not authorized by the law to take, the administrative law treats, in the second place, of the powers and duties of administrative officers; in other words, of administrative functions. Finally, since there is no use in delimiting by law the powers and duties of administrative officers, unless some means is provided of preventing them from exceeding their powers and forcing them to perform their duties, administrative law treats of the remedies afforded in case of an excess of power or violation of duty. American administrative law thus embraces certain well-defined minor branches of the American law, such as the law of officers, the law of municipal corporations, the law of taxation, the law of public nuisances (whether common law or statutory), the law of extraordinary legal remedies (such as mandamus, prohibition, certiorari, quo warranto, and habeas corpus), as well as the law of equitable remedies, so far as they are applicable to public authorities.

cipal Corporations (Boston, 1881); High, *Extraordinary Legal Remedies* (Chicago, 1884).

ADMIRABLE CRICHTON, kri'ton. See **CRICHTON, JAMES**.

ADMIRABLE DOCTOR. A translation of the Latin, *Doctor Admirabilis*, a title given to Friar Roger Bacon (1214-94) on account of his extensive knowledge.

ADMIRAL. The title of a naval officer of the highest rank. The word is derived from the Arabic *amir*, or *amir al-* ('lord,' or 'chief of the'), forming the first part of many compound words, such as *amir al-mu'minin*, 'commander of the faithful'; *amir al-umarā*, 'commander of the forces'; *amir al-bahr*, 'commander of the sea'; *amir al-umarā 'asākir*, 'commander of the troops, marshal.' The term appears to have been introduced into Europe during the Crusades and to have been first used in a definite sense by the Sicilians and afterwards by the Genoese. In French the word is preserved without change, as *amiral*; in Spanish and Portuguese it has developed into *almirante*, and in Italian into *ammiraglio*. The early English form was doubtless similar to that of the French, as we find it spelled *amyrell* and *admyrall*. It was Latinized in England as *admiralius*, and as early as the time of Edward III was Anglicized as *admyrall*. The first English "admiral of the seas" of whom there is any record was William de Leybourne, 1297. His office, however, was not that of a commander of sea forces, but embraced those general and extensive powers afterwards associated with the title of lord high admiral of England; that is, both the administrative functions now vested in the lords commissioners of the admiralty (five in number) and the judicial authority belonging to the present high court of admiralty. The office of lord high admiral was last filled by the Duke of Clarence, afterward William IV. Upon his resignation in 1828 it was put in commission, reverting to a previous practice. The duties of the office were administered by a board of commissioners from 1632 to about 1650, from 1685 to 1702, and from 1708 to 1827, while under the Commonwealth they were performed by a committee of Parliament.

In the United States navy the grades of admiral, vice-admiral, and rear-admiral were established by act of Congress, primarily for the purpose of conferring exceptional distinction upon the great naval commander Capt. David Glasgow Farragut (q.v.). The lowest of these grades, that of rear-admiral, was established in 1862, as was also that of commodore; though the latter had previously existed as a courtesy title without authority of law. The number of rear-admirals on the active list was limited to nine. In 1864 the President was authorized to appoint one of the rear-admirals a vice-admiral. Under the laws, Captain Farragut became the first commodore, first rear-admiral, and first vice-admiral. In 1866 Congress provided for an active list of one admiral, one vice-admiral, and 10 rear-admirals. Farragut was promoted to be admiral, and Rear-Admiral David D. Porter to be vice-admiral. On the death of Farragut (1870), Porter became admiral and Rear-Admiral Stephen Clegg Rowan was promoted to be vice-admiral. With the death of Porter (1891) and Rowan (1890), the grades of admiral and vice-admiral became extinct. In 1899 the grade of admiral of the navy was established by act of Congress. This is a grade above admiral and corresponds to "admiral of the fleet" in the

British navy and a similar one in other naval services. Rear-Admiral George Dewey was promoted to this grade in recognition of his services in the battle of Manila Bay and of his judicious management of the difficult international situation following the defeat and destruction of the Spanish fleet. In 1882 Congress reduced the number of rear-admirals on the active list to six and the number of commodores to 10; but in 1899 the number of rear-admirals was increased to 18 and the grade of commodore on the active list abolished. In addition, the chiefs of the bureaus of the Navy Department have the rank of rear-admiral during their term of office. Under the original act of Congress (Nov. 15, 1776), looking to the establishment of the ranks of admiral, vice-admiral, and rear-admiral, the first named ranked with the general of the army, the second with a lieutenant-general, and the last with a major-general. Since 1862 various acts have confirmed these provisions; but the act of 1899, which abolished the rank of commodore, provided that the first nine rear-admirals should rank with major-generals and the second nine with brigadier-generals. The pay of flag officers is as follows: admiral of the navy and admiral, \$13,500; senior nine rear-admirals, \$8000; junior nine rear-admirals, \$6000. All officers on sea duty or on shore duty beyond seas receive 10 per cent in addition to foregoing amounts. The pay of officers on the retired list is 75 per cent of their active pay at time of retirement. The number in 1913 on this list was 145. The flag of the admiral is a rectangular blue flag with four white stars and is flown at the main; that of the vice-admiral, flown at the fore, is a similar flag, with three stars. The flag of a rear-admiral, flown at the mizzen, is similar in shape, has two stars, and is usually blue in color, but in case two or more rear-admirals are in company the senior flies a blue flag, the juniors fly red flags. For illustration see Plate of United States Flags accompanying FLAG.

In the British navy the admirals are distinguished into four classes: admirals of the fleet, admirals, vice-admirals, and rear-admirals. In former times each grade was sub-divided into three sections, known as admirals (or vice or rear-admirals) of the red, of the white, and of the blue, respectively. The flag hoisted by the admiral (thence called a flag officer) agreed in color with his section; and all the ships under his command carried ensign and pennant of the same hue; but the distinction was otherwise without practical effect and is now abolished. Admiral of the fleet is a higher rank, conferred at the will of the sovereign. The rates of full or sea pay of flag officers are as follows: admiral of the fleet, per day, £6; admiral, £5; vice-admiral, £4; rear-admiral, £3. An admiral commanding-in-chief receives £3 a day additional at home and £4 10s. abroad, as table money. In 1913 there were 92 flag officers on the active list in the British navy: viz., 3 admirals of the fleet, 12 admirals, 22 vice-admirals, and 55 rear-admirals; and on retired and reserved pay, 6 admirals of the fleet, 99 admirals, 13 vice-admirals, and 18 rear-admirals. The admiral of the fleet takes rank with a field marshal, admirals with generals, vice-admirals with lieutenant-generals, and rear-admirals with major-generals.

ADMIRAL. 1. In entomology, any of several nymphalid butterflies, ordinarily the "red" admiral (*Pyrameis* or *Vanessa atalanta*), com-

mon throughout North America, Europe, northern Asia, and Africa. It has an expanse of about 2½ inches and is brown, the hinder wings broadly margined with red, including a row of four dark dots; the same color forms a curved diagonal band across the fore wings, beyond which the angle of the wing is spotted with white and edged with purple. (See Plate of AMERICAN BUTTERFLIES.) The caterpillar is 1½ inches long, brown and spinous; the chrysalis is brown, naked, and suspended to the food-plant upon which the larva has fed, usually some species of nettle, hop, or related plant. Butterflies of the related genus *Basilarchia* are called white admirals. 2. In conchology, a cone (*Conus ammiralis*) whose shell was formerly rare and valuable.

ADMIRALTY, THE. In England, the state department which exercises the administrative functions of the lord high admiral, and which, accordingly, has the management of all matters concerning the British navy and the royal marine. These functions of the lord high admiral have been transferred to and vested in a board of commissioners. (See ADMIRAL.)

The board of admiralty, as at present constituted, comprises five lords commissioners of the admiralty, who decide collectively on all important questions. Besides this collective or corporate action, each commissioner has special duties assigned to him. There are two civil or political lords, and three naval or sea lords. The first lord, who is always a cabinet minister, besides a general control, has the management of naval estimates, finance, political affairs, slave-trade prevention, appointments, and promotions. The first naval lord manages the composition and distribution of the fleet, naval discipline, appointment of inferior officers, commissioning ships, general instructions, sailing orders, and the naval reserve. The second naval lord attends to armaments, manning the navy, the coast-guard, the marines, marine artillery, and naval apprentices. The third naval lord has control over the purchase and disposal of stores, victualing ships, navy medical affairs, transports, convicts, and pensioners. The junior civil lord attends to accounts, mail-packets, Greenwich hospital, naval chaplains, and schools. Naval architecture, the building and repairing of ships, steam machinery, and new inventions are superintended by the comptroller of the navy, who is not a member of the board, but is directly responsible to the first lord. Under the lords are the first secretary (parliamentary), the second secretary (permanent), and the naval secretary (professional), who manage the daily office work. The lords all resign when the prime minister resigns, and those who have seats in Parliament are replaced by others.

ADMIRALTY INLET. The central and main passage of Puget Sound (q.v.), forming in its southern part the eastern branch of the arm of the sea which here penetrates the State of Washington. The width varies from one to 10 miles, and the channel is obstructed by relatively few islands. The coast line is marked by a succession of projecting points of land and receding minor inlets, which render the form as a whole exceedingly irregular. Seattle, Tacoma, and Port Townsend are the chief cities on the Inlet. The channel has usually a depth of several hundred feet and thus offers valuable facilities for transportation.

ADMIRALTY ISLAND, íland (Map: Alaska, J. 4). An island about 80 miles long well wooded and watered, included in Alaska (q.v.).

ADMIRALTY ISLANDS. A group of about 40 islands, constituting a part of the Bismarck Archipelago (q.v.), lying to the north-east of New Guinea, between 2° and 3° S. lat. and 146° 18' and 147° 46' E. long. (Map: East India Islands, L 5). The largest is about 60 miles long from east to west and is covered with rich tropical vegetation. They abound in cocoanut and rubber trees and are inhabited by savages. They were discovered by the Dutch in 1616 and became a German protectorate in 1885.

ADMIRALTY LAW. The system of law and procedure relating to maritime transactions. It owes its name to the fact that originally it was administered in England by the lord high admiral. Not only its rules of substantive law but its procedure were adopted from the civil law and from such sea codes as those of Rhodes (q.v.) and Oléron (q.v.). This fact, and its adaptability to new causes of action, which led suitors to resort to the admiralty rather than to the common law courts, aroused the hostility of the common law bench and bar. The contest between the partisans of the two systems which followed resulted in contracting the jurisdiction of English admiralty courts to very narrow limits. Modern statutes have extended it, and have also made the Court of Admiralty a part of the High Court of Justice, forming it, with the courts of probate and divorce, into the Probate, Divorce, and Admiralty Division. At present the ordinary jurisdiction of English admiralty courts embraces actions to recover possession of a ship, to recover damages for injuries to shipping, to recover seamen's wages, for salvage, for necessaries supplied to a ship, for bottomry, respondentia, and mortgage, for pilotage and towage, for restoration of goods taken by pirates, and for assaults or batteries on the high seas.

By the United States Constitution (Article III, §2), the cognizance of "all cases of admiralty and maritime jurisdiction" is granted to the Federal judiciary. The limits of this grant of judicial authority were in doubt for many years. On the one hand it was insisted that the admiralty jurisdiction of the Federal courts was confined to the cases cognizable by the English admiralty when our States separated from the mother country. On the other hand, it was argued that the broad language of the Constitution extended this jurisdiction to all cases of maritime law. The latter view has prevailed, and to-day the Federal courts of admiralty have cognizance of all maritime cases arising, not only on the high seas and great lakes, but on almost all navigable rivers and canals within the United States. While the United States have no court whose duties and jurisdiction are confined to admiralty cases, the district courts possess exclusive original jurisdiction over all admiralty and maritime cases. From their final decisions appeals may be taken to the Circuit Court of Appeals and to the Supreme Court. The Federal courts sitting in admiralty have criminal as well as civil jurisdiction; but their practice in criminal cases is similar to that of common law courts, including trial by jury. The State courts of

this country have no admiralty jurisdiction. Consult: Benedict, *The American Admiralty, Its Jurisdiction and Practice* (Albany, 1900); and Roscoe, *Treatise on the Jurisdiction and Practice of the Admiralty Division of the High Court of Justice* (London, 1882).

ADMIRALTY SOUND. A southern extension of the Strait of Magellan near its middle part, penetrating Tierra del Fuego to a distance of nearly 100 miles. Its mouth is partially blocked by Dawson Island. In the upper 50 miles of its extent its width varies from 5 to 10 miles. The coast land is elevated.

ADMIS'SION. In the law of evidence, a confession or acknowledgment of a party to an action, made at any time, as to the existence of a fact in issue. An admission is valid evidence against the party making it at the trial of the action, but, on the other hand, is never permitted to operate in his favor. While admissions admissible in evidence are most frequently made by a party to the action, they may be made by one acting by his authority or by one identical in interest with him. Thus, admissions made by an agent, or servant, or by the husband or wife of a party, will be received in evidence against him if actually or impliedly authorized by him. Admissions made by one claiming under the same title or interest as the party are also admissible in evidence against him. For example, admissions made by a deceased person during his lifetime are admissible against his executor or administrator, and admissions made by the owner of real estate with reference to his title are competent evidence against his grantee, when the grantee is a party to an action in which his title is in issue. In England and the United States, excepting New York and the Federal courts, the doctrine of admissions made with reference to title to real property has been extended to apply to cases of admissions made with reference to title of personal property and negotiable paper transferred after maturity.

In criminal law admissions of guilt by one accused of a crime are technically known as *confessions*. At common law, confessions were held not to be competent evidence against the prisoner when obtained by threats or promise of favor, and modern statutes have generally still further limited the admissibility of confessions in criminal cases.

Admission should be distinguished from *admission against interest*, a term which embraces a distinct class of evidence. Admissions against interest are statements or book entries made by one against his financial or proprietary interest, and are admissible in evidence in any action in which the truth of the matter stated in the admissions is in issue, provided the person making the admission be dead at the time it is offered in evidence. The person making the statement need not represent or be in privity with a party to the action or have acted by his authority. See the works referred to under EVIDENCE.

ADMONI'TIONISTS. A name applied to the partisans of *An Admonition to the Parliament*, published in 1572 by two Puritan clergymen, and of the *Second Admonition to the Parliament*, by Thomas Cartwright (q.v.), the leader of the sect.

ADOBE, á-dō'bě (Spanish). A Spanish-American name applied to sun-dried bricks made from any suitable material which becomes

hardened on exposure to the sun. Such bricks, employed largely in the arid and semi-arid districts of North America, are usually made in two sizes, the approximate dimensions of which are 18 by 9 by 4 inches, and 16 by 12 by 4 inches. Those of the latter size when laid alone are used as "headers," i.e., with the greatest dimension crosswise to the length of the wall, though a much stronger wall results from a combination of the larger size as headers, with the smaller as "stretchers," or lengthwise to the direction of the wall. The process of baking consists in first exposing the newly moulded adobes to the direct rays of the sun for a day, then turning them for exposure of the under face and continuing the exposure for from seven to fourteen days, eventually stacking the finished product under cover till required for use. Because of the lack of coherency, adobes can be employed only in regions of limited rainfall. Many of the bricks made in ancient Egypt, Assyria, and Babylonia were made of clay mixed with straw and baked in the sun.

Adobe Soil. A term applied to certain clay soils in the western portions of the United States, which, when moist, are of exceeding plasticity, and when dry are of such coherency as to prohibit easy tillage. They are composed of quartz, clay, and other minerals in extreme state of fineness. These soils may be rendered more docile by plowing into the moist clay considerable quantities of sand loam. They cover thousands of square miles in the arid region of the West, principally in the States of Utah, Nevada, Colorado, New Mexico, Arizona, Texas, and California. Under irrigation they show astonishing fertility, yielding undiminished harvests of grains, alfalfa, and other crops year after year. The origin of adobe soils has been something of a puzzle, but it is likely they are of complex derivation, formed in some places by streams that head in the mountains and in other sections by accumulation of wind-blown materials. They may also have been formed by the disintegration in place of clay shales or slates.

ADOLESCENCE. The period of life extending from puberty (q.v.) to the age of 21 in females and 25 in males. It is marked by active growth, especially in the osseous and muscular systems, and certain vascular tissues. The reproductive organs reach their full maturity during the latter part of the period, at which time there is a partial cessation of the exaggerated nutritive activity prevailing throughout the earlier part. During adolescence the mind becomes conscious of new capabilities; self-assurance and constructive and originating tendencies become apparent. In the boy, extravagant plans, conceit, and egoism are prominent characteristics; in the girl idealizing, reverie, and romantic imagination. It is apparent that the sexual and mental development occurring during this period render proper training and influence during adolescence of the utmost importance. Consult: G. Stanley Hall, *Adolescence* (2 vols., New York, 1907); *Youth: its Educational Requirements and Hygiene*, by the same author (New York, 1912); and for the sexual aspects, Havelock Ellis, *Psychology of Sex* (Philadelphia, 1910).

ADOLF, ä'dölf. King of Germany. See ADOLPHUS.

ADOLF I (?-1220). Archbishop of Cologne from 1194 to 1205. He was one of the foremost opponents of the Hohenstaufen dynasty, and, despite his oath of fealty to Frederick II, and in defiance of the will of the majority, he nominated Otto IV of Brunswick and crowned him at Aix-la-Chapelle, June 9, 1198. He forestalled the papal influence upon the imperial election, and when finally Otto revealed his inability to protect his adherents against Philip of Swabia, Adolphe crowned his opponent (1205). He was excommunicated, and deposed in 1205.

ADOLF I (1353-90). Archbishop of Mainz. In 1371 he was appointed Bishop of Speyer and two years later, after the death of his rival, John, succeeded to the see of Mainz. When, at the instigation of Charles IV and with the consent of the Pope the Landgrave of Thuringia sought to bring about his deposition, Adolph firmly maintained his ground and upon the outbreak of a schism in the Church obtained the papal sanction of Clement VII (Antipope) and Urban VI.

ADOLF, WILHELM AUGUST KARL FRIEDRICH (1817-1905). Grand Duke of Luxemburg, previously Duke of Nassau, the eldest son of Duke William of Nassau by his first wife, Princess Louise of Saxe-Hildburghausen. He succeeded his father, as Duke of Nassau, Aug. 20, 1839. His anti-progressive policy led in 1848 to a revolt which, however, was speedily suppressed. In the first Schleswig-Holstein War he commanded a brigade of German troops. In the war of 1866 he sided with Austria and as a result was deprived of his territory. During the illness of King William III of the Netherlands, Adolf, as next of kin, succeeded as Grand Duke of Luxemburg, the ruler of which he became upon the death of William III (Nov. 23, 1890). He died Nov. 17, 1905, and was succeeded by his son Wilhelm Alexander (born 1852).

ADOLPHE, ä'dölf'. An important novel by Benjamin Constant de Rebecque, published in 1816. In the hero, Adolphe, is found a realistic presentation of the author's sentimental experience with Madame de Staël.

ADOLPHUS, or **ADOLPH**, OF NASSAU (c.1255-98). King of Germany. He was the son of Walram, Count of Nassau. He was elected to succeed Rudolph of Hapsburg, and was crowned King of the Romans (June 24, 1292). Adolphus agreed to assist England in her war with France for a large subsidy, but failed to fulfil his agreement. For certain high-handed acts he was summoned before the college of electoral princes. He refused to appear, and was formally deposed in May, 1298, the crown being transferred to Rudolph's son, Albert. Adolphus took the field and was killed in the first battle. Consult: Preger, *Albrecht von Oesterreich und Adolf von Nassau* (Leipzig, 1869); Roth, *Geschichte der römischen Königs Adolf I* (Wiesbaden, 1879); Gebhardt, *Handbuch der deutschen Geschichte*, vol. i (Berlin, 1901).

ADOLPHUS, JOHN (1768-1845). An English historian and lawyer, born in London. He was celebrated in criminal practice and gained much credit in the defense of Arthur Thistlewood, charged with treason in the Cato Street conspiracy in London, 1820. His best-known work is the *History of England from the Accession of George III to the Conclusion of Peace, 1783* (7 vols., 1802-45). He also wrote *Bio-*

graphical Memoirs of the French Revolution (1799) and a *History of France* (1803).

ADOLPHUS FRED'ERICK (1710-71). Duke of Holstein-Gottorp and, later, King of Sweden. He was elected successor to the Swedish throne in 1743 and became King in 1751; but, owing to fierce wrangling between "The Hats" and "The Caps," as the political cliques in the Riksdag were known, he found himself but a nominal king. Urged on by his wife, he attempted to better his position and in consequence nearly lost his throne.

ADONAI, ăd'ô-nā'ī or ă-dō'nī (Heb. my lord). A term employed in the Old Testament over 100 times in direct address to the deity. It is often used before Yahwe, forming the expression "my lord Yahwe." When the pronunciation of the sacred name (see JEHOVAH) was forbidden, which was before the third century B.C., Adonai was substituted for it. This was already done in the Greek translation of the Pentateuch, which renders it Kyrios (κύριος): hence the Latin *dominus* and the English "The Lord." See Dalman, *Der Gottesname Adonaj und seine Geschichte* (1889).

AD'ONA'IS. The title of an elegy written by Shelley in 1821 upon the death of the poet Keats, who is therein likened to Adonis in his untimely end.

AD'ONA'I SHO'MO. See COMMUNISTIC SOCIETIES.

ADO'NIA. See ADONIS.

ADO'NI BE'ZEK. See ADONI-ZEDEK.

ADON'IC VERSE. A dactyl and a spondee (— — — | — —), or dactyl and trochee (— — — | — —), adapted to light, lively versification, as in the famous hymn:

"Plaudite cœli;
Rideat æther," etc.

It forms the last verse of the Sapphic and the Adonic stanzas.

ADONIJAH, ăd'ô-nī'jă (Heb. Yahwe is Lord). A son of David and Haggith (1 Kings ii. 21), born at Hebron. After Absalom's death he was the natural heir to the throne and was supported by Joab and Abiathar. He called together his sympathizers at a sacred stone near Jerusalem (1 Kings i. 9), but Benaiah, the captain of the body-guard, Zadok, the priest, and Nathan, the prophet, succeeded, by the aid of Bathsheba, in getting the King's consent to the immediate enthronement of Solomon. Adonijah sought refuge at the horns of the altar. Solomon saved his life, but when he afterward demanded Abishag, David's concubine, for a wife, it was considered a plot for the throne, and Solomon ordered Benaiah to kill him.

ADO'NIS (Gk. Ἄδωνις). A youthful hunter, beloved by Aphrodite, but slain by a boar sent, according to one version, by the jealous Ares, husband of Aphrodite. Aphrodite descended to the lower world and won from Persephone permission for her favorite to return to the light for a time every year. Another and seemingly older myth makes Aphrodite and Persephone quarrel for the possession of the beautiful infant. Zeus finally decided that he should annually spend four months with each of the goddesses and four months as he chose. The legends about Adonis have sprung from the rites of the Adonia, a two-day festival celebrated in midsummer. On one day the loving union of Aphrodite and Adonis was represented, and on the other the sorrow caused by his death. All

the funeral rites were performed by women about little images of Adonis. A special feature was the "gardens of Adonis," potsherds, filled with earth, in which quick-growing plants, such as lettuce and fennel, were sown. After the burial these were thrown into springs. The Adonia was a woman's festival and seems to have been celebrated chiefly by courtesans and others associated in the worship of Aphrodite. It is obviously the worship of a spirit of vegetation, who is believed to have a short life, to die, and then to rise again to renewed life for a season. These rites were widely spread throughout Greek lands; for the rites as celebrated at Alexandria, see the fifteenth Idyll of Theocritus. In Phœnicia they were associated with Thanmuz or Tammuz (q.v.). The theory that the name and worship of Adonis are Semitic is not proved.

ADONIS. A genus of about five species belonging to the family Ranunculaceæ. All of the species are natives of Europe and Asia, but the European *Adonis autumnalis* (sometimes called *Adonis annua*) is cultivated for ornament in the United States and has escaped from cultivation. It is an annual herb, with dissected leaves and showy yellow or red flowers. The orange or red petals with a dark-colored base have suggested the common name "pheasant's eye" or "bird's eye." Its bright scarlet petals have also obtained for it the name of "Adonis-flower," their color having been fancifully ascribed to their being stained with the blood of Adonis. It is a well-known ornament of our gardens, in which also *Adonis œstivalis* frequently appears, and *Adonis vernalis*, a perennial species common upon the lower hills of the middle and south of Germany, with early and beautiful flowers. See Plate, ACANTHUS, ETC.

ADO'NI-ZE'DEK (Heb. Zedek is lord). A King of Jerusalem who opposed resistance to the invasion of southern Palestine by tribes afterward forming a part of the kingdom of Judah. Zedek was a god worshiped in Syria and southern Arabia. The account in Judges i. is more credible than that in Joshua x. Adonibezek is probably a scribal error for Adonizedek. No place called Bezek has been found, and 'Lord of Bezek' would not be a natural name. No god by the name of Bezek is known. On the other hand, Adoni-zedek reminds one strongly of Melchizedek, 'Zedek is king,' another ruler of Jerusalem (Gen. xiv.).

ADOPTIAN CONTROVERSY, THE. An echo of the Arian controversy. It originated toward the end of the eighth century in Spain, the country in which the doctrine of Arius had longest held out. Elipandus, Archbishop of Toledo, and Felix, the learned bishop of Urgel, advanced the opinion that Christ, in respect of his divine nature, was doubtless by nature and generation the Son of God, but that as to his human nature he must be considered as only declared and "adopted" through the divine grace to be the first-born son of God (Rom. viii. 29), just as all holy men are to be adopted as sons of God, although in a less lofty sense. The flame of controversy thus kindled spread into the Frankish Empire, the special domain of "Catholic" Christianity, and gave occasion to two synods—one held at Ratisbon (792), and another at Frankfort (794), in which Charlemagne took part in person and which condemned Adoptianism as heresy. The Catholic doctrine of the unity of the two natures of

Christ in one divine person and the consequent impossibility of there being a twofold Son—an original and an adopted—was upheld by Alcuin and the other learned men of Charlemagne's court. At the synod of Aix-la-Chapelle (799) Felix, yielding to compulsion, recanted his opinions without, as it would seem, being convinced. Elipandus adhered fanatically to his views, which were in after times defended by Folmar (1160), Durandus (died 1334), and the Protestant divine Calixtus (died 1656). Adoptionism was charged against Abelard and also erroneously attributed to Duns Scotus. See Harnack's *History of Dogma* (Eng. trans., New York, 1905).

ADOP'TION (Lat. *adoptio*, a taking or receiving of one in place of a child, from *ad*, to + *optare*, to choose, select). A legal institution of much importance in early society, because of the importance attached to the perpetuation of household worship, particularly the worship of deceased ancestors; also because before the introduction of testaments an heir could, in the absence of natural children, be created only by adoption. In Roman law there were two forms of adoption, viz., *adrogation* and *adoption* in the strict sense. Adrogation was the earlier form. It was possible only where the person to be adopted was an independent person (*sui juris*), i.e., was not under the authority of a father or grandfather. It took place originally in the patrician assembly (*comitia curiata*) with the coöperation of the pontifices. Under the Emperors it was effected by an imperial rescript. Adoption in the strict sense was the transfer of a person from the authority of his father or grandfather into the paternal authority of the adoptive father. It was accomplished by formal acts in the presence of a magistrate. It was usually requisite, alike in adrogation and adoption, that the adoptive father should have no children at the time, and no reasonable prospect of having any. He was also required to be 18 years older than the person adopted. Females could not be adrogated, nor, until the third century, could they adrogate. They could be adopted, but they could not adopt. The effect of adrogation was to place the adopted person in the same legal position for nearly all purposes as a child born in wedlock. The same results originally attached to adoption, but Justinian introduced important restrictions. Adoption was unknown to the law of the Teutonic nations; and though most of the States of the Continent have borrowed it, with some modifications, from the Roman law, it has never existed as an institution in England or Scotland, either at common law or by statute. The theory of the English law is that the parent, as legal guardian, cannot be permitted to abdicate his parental responsibility, though he may by abuse or neglect forfeit it, and in such case the Court of Chancery may transfer the custody of the child to a proper guardian.

Adoption is permitted and regulated by statute in most if not all the States of the American Union. While State legislation upon this topic differs in detail, its characteristic features are as follows: Any inhabitant of the State, of legal age and competent to contract, may adopt a child, provided that the husband or wife of such person, if married, the living parents of the child, and the child, also, if above a certain age (usually 12 or 14 years), consent in writing to the adoption. Only chil-

dren are capable of adoption and in most of the States only minor children. In some States the transaction is consummated by an order of court, in others by a deed duly acknowledged and recorded. As the claims of an adopted child are in derogation of the common law rights of the heirs and next of kin of the adopter, our courts are disposed to put a strict construction on these statutes, and to treat as invalid an adoption which has not been made in a manner which conforms to every statutory requirement. As a rule, the legal relation between adopting parents and adopted children is that of natural parent and child, including the powers of parental control, the duties of filial obedience, and reciprocal property rights by inheritance. In a few States, however, the adopting parent does not inherit from the adopted child. Consult Stimson, *American Statute Law* (Boston, 1886); Schouler, *Treatise on the Law of Domestic Relations* (Boston, 1900); and see PARENT AND CHILD.

AD'ORA'TION. A term originally applied among the Romans to an act of homage or worship performed by raising the hand to the mouth (Lat. *ad os*, whence the word), kissing it, and then waving it toward the object of reverence. It was natural to extend to great men the formal adoration at first paid only to deities, and the Roman Emperors were saluted by bowing or kneeling, touching the imperial robe, and kissing the hand that did so. In eastern countries the form of adoration was to fall on the knees at a prince's feet, strike the forehead on the ground, and kiss the floor. On this analogy both the modern practice of kissing a sovereign's hand and the custom at Rome of kissing the cross embroidered on the Pope's slipper may be said to be forms of adoration. While the term "adoration" is very generally employed nowadays to express a mental attitude toward God, it may be well to remember that both it and the similar term "worship" had a much more limited sense: thus, in the English marriage service the bridegroom says to the bride: "With my body I thee worship and with all my worldly goods I thee endow." Thus, too, as a matter of theological terms, the Roman Catholic church makes a distinction between *latría*, the worship due to God alone, and *dulia*, that given to the angels and saints.

ADORATION OF THE IMMAC'ULATE LAMB, THE. A celebrated altar painting in the cathedral of Ghent, Belgium, by the Flemish artists Hubert and Jan van Eyck. It represents Christ surrounded by the saints, and on the lower panels the sacrifice of the lamb.

ADORATION OF THE MAGI. See MAGI, ADORATION OF THE.

ADORE, ä'dôrf. A manufacturing town of Saxony, 72 miles by rail southwest of Chemnitz (Map: German Empire, E 3). It is situated 1450 feet above sea level in the valley of the Weisse Ester and is at the junction of the Leipzig and Eger railroads. Pop., 1905, 7079.

ADOUR, ä'dôor'. A river of southwestern France, rising near Tourmalet Pass in the department of Hautes-Pyrénées (Map: France, E 8). It flows through the department of Gers and the fertile part of the department of Landes and enters the Atlantic below Bayonne, after a course of 200 miles. It receives several tributaries and is navigable to the extent of 80 miles. Bagnères-de-Bigorre, celebrated for its hot baths, is situated on the Adour.

ADOWA, ä'dō-ä, or **ADUA**, äd'û-ä. The capital of the Abyssinian province of Tigré, situated in lat. 14° 12' N. and long. 39° 3' E. (Map: Africa, H 3). It has an excellent climate on account of its elevated location (nearly 6500 feet) and was, prior to the Italian campaign of 1896, the capital and one of the best-built cities of Abyssinia. During the wars which ended in that year the town was razed several times. Its importance as a commercial centre suffered a decline in consequence, but the development of railway facilities has revived industrial activity. Its population was formerly about 3000, but is probably less now. Adowa was the scene of the defeat of the Italian troops under General Baratieri by the Abyssinians on March 1, 1896. Consult Scetini, "La bataille d'Adoua: Etude tactique," in vol. ix and x, *Journals des Sciences Militaires* (Paris, 1901), and Berkeley, *The Campaign of Adowa and the Rise of Menelik* (London, 1906).

ADRA, ä'drä. A seaport town of Spain, in the province of Granada, 49 miles southeast of Granada. It is situated on the shore of the Mediterranean, at the mouth of the Adra (Map: Spain, D 4). The ancient Abdera, founded by the Phœnicians, was on a hill, at the base of which the modern town stands. The location is unhealthy because of near-by swamps. The port is much exposed to the wind, and the absence of railroads is a great drawback to commercial development. Lead mines in the neighborhood give employment to many of the inhabitants. Among other exports are grapes, wheat, esparto, almonds, wine, and sugar-cane. Spirits, wool fabrics, and sugar are manufactured. Pop., 1900, 11,246.

ADRAIN', ROBERT (1775-1843). An Irish-American mathematician, born at Carrickfergus. During the Irish rebellion of 1798 he was wounded and escaped to America, where he became a teacher of mathematics and occupied chairs at Rutgers (1810-13), Columbia (1813-25), and the University of Pennsylvania (1827-34). He was editor of the *Mathematical Diary* (1825-29) and prepared an edition of Hutton's *Mathematics*. His original work includes papers on the shape and size of the earth and on gravity.

ADRAMMELECH, ä-dräm'e-lëk. 1. A god worshiped by the inhabitants of Sepharvaim after they had been deported to Samaria by Sargon (2 Kings xvii. 24, 31). Sepharvaim is, no doubt, the Babylonian Sippar (q.v.) and not, as has been conjectured, the Sibraim of Ezek. xlvi. 16, a city in northern Syria. The similarity of *r* and *d* in the old script has probably, here as elsewhere, led to the change of Adad and Hadad into Adar and Hadar. Shamash was the chief god of Sippar, but Adad was undoubtedly also worshiped there. (See HADAD.) Adad is frequently connected with Shamash, both being gods giving oracles. Human sacrifices were not offered in Babylonia. The identification of Adad with Melek, who demanded such, may have led the colonists who sought the favor of the gods of the land to resort to such means, or the statement may be due to prejudice on the part of Jewish writers.

2. A son of Sennacherib who, together with his brother Shar-ezer, killed his father, while he was worshiping in the temple of Nisroch, his god, and then fled to Ararat (2 Kings xix. 37). The Babylonian chronicle (*Keilinschriftliche Bibliothek*, ii, 281) mentions only one son. It

is possible that a letter to "Shar-itir-Ashur, king of the world," gives us the throne name of this son, abbreviated in the Hebrew as Sharezer, who held the throne from the 20th Tebet to the 2d Adar, 681, and that Adad-malik, corrupted Adar-malik, was his private name. The murder undoubtedly took place in Babylon, according to a statement of Assur-banipal, and the temple was then the I-zagila of Marduk, the name of this god having been intentionally distorted, as in the case of Abd-nego for Abd-nebo. Consult Winckler, in Schrader's *Die Keilinschriften und das Alte Testament* (Leipzig, 1902).

ADRAR, ä-drär'. An oasis in the western part of Sahara, east of the Spanish possession of Rio de Oro, of which it formerly constituted a part (Map: Africa, C 2). Its area is estimated at about 30,000 square miles, and it contains a considerable portion of fertile land on which grain and dates are grown. Ostriches are raised for their feathers, and salt is mined. Its position on the caravan route of Morocco gives it considerable commercial importance. The inhabitants are mostly Berbers. In accordance with the agreement of 1892 it forms at present a part of French Sahara. The chief town is Wadan, with a population of about 4000.

ADRASTE, ä'drast'. The hero of Molière's comedy *Le Sicilien, ou l'amour peintre*, from whose disguise as an artist comes the sub-title of the piece.

AD'RASTEI'A (Gk. Ἀδράστεια). In Grecian mythology, the Cretan nymph by whom the infant Zeus was cared for in the cave on Mount Dicte, at his mother's request. The name is also applied to Rhea herself and to Nemesis.

ADRAS'TUS (Gk. Ἀδράστος, *Adrastos*). King of Argos, who gave his daughter in marriage to Polynices, son of Œdipus (q.v.) and led the expedition of the "Seven against Thebes" to restore Polynices to the throne. As was predicted by Amphiaraus (q.v.), Adrastus alone escaped alive. A later story makes him die of grief at the death of his son in the war of the Epigoni against Thebes. Adrastus was worshiped at Sicyon, Megara, Athens, Argos, and in the Troad. See EPIGONI; ETEOCLES AND POLYNICES.

ADRE'NALIN. An active principle of the adrenal glands or suprarenal capsules. It is the most powerful hemostatic and astringent known, being from 600 to 1000 times as active as the extracted gland. The substance was simultaneously discovered by Aldrich and Takamine, a Japanese chemist in 1901. It occurs as a light brown finely crystalline powder, having a bitter taste. See SUPRARENAL CAPSULES.

ADRETS, dá'zà'drě', FRANÇOIS DE BEAUMONT, BARON DES (1513-87). A French Protestant soldier, from 1562 prominent for persecuting the Catholics of Dauphiné and Provence. He was born at the Château de la Frette, Dauphiné, early entered the army, and during the wars of the League achieved a reputation for cruelty on the Huguenot side corresponding to that of the Duke of Guise or the notorious Monthic among the Catholics. His acts, however, appear to have been dictated less by religious fanaticism than by predilection for the career of brigand and bravo. Having assumed the style of Lieutenant-General of the King, he organized pillage and murder on a large scale, and, as Martin (*Histoire de France*) testifies,

he left among the simple peasantry a name repeated for centuries as synonymous with destruction. Many interesting tales regarding him are still preserved. Ultimately he accepted the Roman faith. For a detailed account of his doings, consult Beza, *Histoire ecclésiastique des Eglises Réformées* (edited by Baum, Cunitz, and R. Reuss, Paris, 1883-89, 3 vols.).

ADRIA, ä'drê-à (ancient *Adria*, *Atria*, *Hadria*, or *Hatria*). An episcopal city of Italy, province of Rovigo, on the Canal Bianco, 16 miles southwest of Venice in the province of Rovigo (Map: Italy, G 2). It was originally an island and in the time of the Romans was a naval station and a flourishing port. After the fall of the Empire frequent inundations of the Po and the Adige, caused by the bad state of the dikes, brought down alluvial soil and gradually extended the land until Adria attached itself to the continent. It is now 14 miles from the Adriatic and in spite of the canal connecting it with the sea its commercial importance is declining. The ruins of the ancient city that was sacked and burned by the Venetians in the fifteenth century are south of the present city and several meters below the surface. The chief trade is in wine, cattle, grain, silk, linen, leather, and pottery. Pop., 1901, 15,678; 1911, 17,878.

A'DRIAN. A city and county-seat of Lenawee Co., Mich., on the Raisin River, at the intersection of the Wabash, the Lake Shore, the Detroit, Toledo, and Ironton, and the Toledo and Western railroads, 59 miles southwest of Detroit (Map: Michigan, E 7). It was settled in 1825, incorporated as a village in 1828 and as a city in 1853. It is the seat of Adrian College, a Methodist Protestant institution, St. Joseph's Academy (Roman Catholic), and of the State Industrial Home for Girls. Adrian has important industrial interests, including large factories for the manufacture of wire fence, steel posts and castings, pianos and organs, cotton goods, razor strops, condensed milk, electrical appliances, etc. It is governed by a charter, granted in 1861, and revised in 1897, which provides for a mayor, elected annually, and a city council of 12 members. Adrian maintains its public works by city labor under city supervision. Pop., 1890, 8756; 1900, 9654; 1910, 10,763; 1913 (est.), 11,500.

ADRIAN. Roman Emperor. See **HADRIAN**.

ADRIAN. The name of six popes, two of them of considerable interest.—**ADRIAN I**, Pope, 772-795, invited Charlemagne to enter Italy. His letters are in Migne, *Pat. Lat.*, xcvi.—**ADRIAN II**, Pope, 867-872. His letters are in Migne, *Pat. Lat.*, cxxii and cxxix.—**ADRIAN III** (Agapetus), Pope, 884-885. He was the first occupant of the papal chair to change his name on election.—**ADRIAN IV** (Nicholas Brakspere), Pope, 1154-59. He was by birth an Englishman, the only one of that nation who ever sat in the papal chair. His father became a monk in the Benedictine monastery of St. Albans, and so Adrian was in early life thrown on the world. He became first a lay brother or servant in the monastery of St. Rufus, about 50 miles south of Lyons, France, then successively regular monk, prior, and in 1137 was elected abbot. His zeal for strict discipline raised a combination to defame his character, and he had to appear before Eugenius III at Rome. Here he not only cleared himself of all charges, but gained the esteem of the Pope, who appointed him Cardinal-bishop of Albano in 1146 and, later,

delegate to Scandinavia. On the death of Anastasius IV, in 1154, he was raised to the papal see. Adrian had great trouble with the Romans, who disliked his pretensions and were influenced by Arnold of Brescia, whom he caused to be put to death. He was on friendly terms with the Emperor Frederick I, until his high notions of the papal supremacy, which he carried as far as did Gregory VII, led to the beginning of that long contest of the popes against the house of Hohenstaufen which ended in the destruction of the dynasty. He was living away from Rome in practical exile and was about to excommunicate Frederick when he died at Anagni, Sept. 1, 1159. His most remarkable pontifical act was giving, in 1154, Ireland to Henry II, which he claimed he had the right to do because all islands which had been Christianized belonged to the Holy See. Consult S. Malone, *Adrian IV and Ireland* (London, 1899). His letters are in Migne, *Pat. Lat.*, clxxxviii.—**ADRIAN V**, Pope, July 12-Aug. 18, 1276 (Otto buono de' Fieschi), and a cardinal-deacon when elected; he died before he had been consecrated a bishop.—**ADRIAN VI**, Pope, Jan. 9, 1522, to Sept. 14, 1523. His family name was (probably) Dedel, his birthplace Utrecht (1459), his first teachers the Brothers of the Common Life; his professional studies were made at Louvain, and there he became professor of theology. He was appointed tutor to Charles of Hapsburg (the future Emperor Charles V), 1507; was made Bishop of Tortosa, Spain, 1516; cardinal, 1517. Charles made him regent of Spain, 1520, but the Spaniards resented the rule of a foreigner and embittered his life. His troubles did not cease when elected Pope, but he inspired respect by his uprightness. He confessed to serious corruptions in the Church, but died before he could do anything for its reform. Consult the *Lives* by H. Bauer (Heidelberg, 1876) and by A. Lepître (Paris, 1880).

ADRIAN COLLEGE. One of the oldest co-educational institutions in the country, at Adrian, Mich., organized in 1852. The school is under the control of the Methodist Protestant Church. It has property valued at \$250,000, five buildings, including dormitories, and a library of 7000 volumes. The students in 1913 numbered 200 and the faculty 22. Connected with the school are a conservatory of music and a department of fine arts. President, B. W. Anthony, D.D.

A'DRIAN DE CASTEL'LO, or **ADRIANO DI CASTELO**, ä'drê-ä'nô dê kâs-têl'lô (c.1460-c.1521). An Italian scholar and ecclesiastic. He was born in Tuscany and went to England in the reign of Henry VII, who made him his agent at Rome and gave him the bishopric of Hereford (1502), whence he was translated to that of Bath and Wells (1505). He was made cardinal by Pope Alexander VI (1503). In 1517, however, he was implicated in the conspiracy of Cardinals Petrucci, De Sauli, and Riario to poison Leo X and was deprived of his cardinalate and dignities in England (1518). What became of him afterward is uncertain. It is thought that he lived in retirement at Venice and was murdered while on his way to Rome after the death of Leo X in 1521. His writings include *Venatio*, a poem (1505); *De Vera Philosophia* (1507); and *De Sermone Latino et Modo Latine Loquendi* (1513).

A'DRIANO'PLE (Gk. Ἀδριανόπολις, *Hadria-*

nopolis, the city of Hadrian, Turk. *Edirneh*) (Map: Balkan Peninsula, F 4). The capital of the Turkish vilayet of Adrianople, in ancient Thrace. It is situated on the Maritza (the ancient Hebrus), where that river is joined by the Arda and the Tunja, 137 miles by the state railway northwest of Constantinople. Its position at the confluence of three navigable rivers and at the meeting of several routes made it a place of considerable commercial importance, but its economic condition declined after the Russo-Turkish war of 1877-78, and, upon the cession of eastern Rumelia to Bulgaria in 1885 and the consequent adverse tariff, the city lost the greater part of its foreign trade. It was formerly fortified by a strong wall, of which only a few fragments are left. The place is now defended by an extensive circle of forts. In appearance the city is Oriental and for the most part mean and irregular. It has two fine bazaars, a palace, numerous inns, churches, mosques, and schools. The population is about 81,000, about half of whom are Turks and the remainder Bulgarians, Armenians, and Jews. It is the seat of several European consuls. A very ancient town of Thrace, it was rebuilt by the Emperor Hadrian, who gave it his name. It was the scene of an important battle between the Goths and the Romans in 378 A.D., in which the former were victorious and broke through the Roman frontier, effecting a settlement within the limits of the Empire. The city was conquered from the Byzantines by Amurath (Murad) I in 1361, and was the residence of the Turkish sultans from that time until the capture of Constantinople in 1453. The Russian General von Diebitsch occupied Adrianople in 1829. By the treaty signed here on September 14 of that year Russia forced Turkey to relinquish to her the northeastern coast land of the Black Sea and to allow her to establish her sway over the tribes of the Caucasus, to cede to her the district of Akhaltsikh, to accord to her a protectorate over Moldavia and Wallachia, and to recognize the independence of Greece. After the capture of the Turkish army defending the Shipka Pass, in January, 1878, the Russians entered Adrianople unopposed. The occupation of the city was followed by the cessation of hostilities and the conclusion of the Treaty of San Stefano. In the Balkan War of 1912-13 (q.v.) the Turkish garrison valiantly defended the city until forced by starvation to surrender. The city was first attacked Oct. 22, 1912, and within ten days its investment was practically complete, but it did not capitulate until March 26, 1913. By the Treaty of London, signed May 30, 1913, the city and that portion of the vilayet of Adrianople lying west of a line drawn from Enos to Midia were ceded by the Turks to the Balkan allies, but the subsequent outbreak of hostilities among the allies (see BALKAN WAR) obliged Bulgaria to withdraw her garrison from Adrianople and enabled the Turks easily to re-occupy the city on July 20. By the Treaty of Constantinople, Sept. 29, 1913, Bulgaria formally restored to Turkey Adrianople together with the outlying circle of fortifications and sufficient territory to give Turkey control of the railway to Dedeagatch. The vilayet of Adrianople, which, previous to the Balkan War, comprised an area of about 14,822 square miles and a population of about 1,028,200, and extended from the Black Sea and eastern Rumelia to the

Sea of Marmora and the Ægean Sea, was cut in twain by the Treaty of Constantinople, approximately the part west of the Maritza going to Bulgaria and that to the east remaining in Turkish possession.

A'DRIAN'S WALL. See ROMAN WALL.

ADRIATIC SEA, ā'drī-āt'ik or ād'rī- (from the Etruscan city Hatria, modern Adria, at the mouth of the Padus or Po). A large arm of the Mediterranean Sea, separating Italy from the Balkan peninsula and communicating with the Ionian Sea by the Strait of Otranto. It is 500 miles long and about 130 miles in its greatest width (Map: Italy, J 4). Its depth varies from over 4000 feet in the southern part to about 500 feet in the north. Its west coast is almost unbroken, while the east is lined with numerous rocky islands, belonging to Istria and Dalmatia. The main gulfs of the Adriatic Sea are Manfredonia on the west, Venice and Triest on the north, and Quarnero on the northeast. The only considerable rivers emptying into it are the Adige and the Po, and that accounts for the great salinity of its water. The most important commercial points are Triest, Venice, Fiume, Ancona, and Brindisi. The navigation of the Adriatic is generally safe, although there are some dangerous points off the eastern coast. The commercial importance of the Adriatic Sea was greatly impaired by the opening of the sea route to India; but with the opening of the Suez Canal it has regained some of its former commerce. Consult: Jackson, *Shores of the Adriatic* (London, 1906); C. E. Yriarte, *Les bords de l'Adriatique* (Paris, 1878).

ADRIENNE LECOUVREUR, ā'drī-ēn' le-kōō'vrēr'. The title of a five-act French drama by Scribe and Legouvé, based on the tragic history of the noted actress. (See LECOUVREUR, ADRIENNE.) It was produced April 14, 1849.

ADRIFT'. Floating at random. The state of a boat, vessel, buoy, or other floating object which has parted or lost its lines or moorings and is driven about by the tide, sea, or wind; also the condition of a sail, gun, or other object which has broken loose from its fastenings.

ADSORP'TION. The condensation of a gas on the surfaces of solids, or of solutes on the surface of solid or colloidal particles suspended in a solvent, brought about in each case by a reduction in surface tension, or in some cases by chemical union. See COLLOIDS; SURFACE TENSION.

ADUA, ād'ū-ā. See ADOWA.

AD'UAT'UCI, or **AD'UAT'ICI**. A people of Belgic Gaul, dwelling in Julius Cæsar's time between Eburones and the Nervii, near the river Sambre, and conquered by him 57 B.C. They were descended from survivors of the Cimbri and Teutones after their defeat by C. Marius, 102-101 B.C. (Cæsar, *De Bello Gallico*, ii, 29).

ADULARIA, ad'ula'ria. See ORTHOCLASE.

ADULE, ā-dū'lē (Gk. Ἀδούλη, *Adoulē*). An ancient Ethiopian town on the Red Sea, near the modern Zula. It was an important trading post, especially for fine ivory. It is noted chiefly on account of two inscriptions of some importance relative to the ancient geography of those regions, known as the Monumentum Adulitanum, one celebrating the victories of Ptolemy Euergetes, the other the much later conquests of a native king. Both are of value for ancient geography, and were first published in the sixth century in the *Topographia Christiana* of Cosmas Indicopleustes.

ADUL'LAM. A city in the lowlands of Judæa, which was the abode of a Canaanite king before the conquest of the country by the Israelites (see Josh. xii. 15) and continued to be an inhabited town at least as late as the Maccabees. Its locality has been identified by some scholars with that of the modern Dier Dubban, some distance west of Bethlehem, and by others with that of Aid-el-ma, a few miles northeast of Hebron.

ADULLAM, CAVE OF. A cavern in southern Judæa, noted as a retreat of David while he was in hiding with his band of 400 outlaws from King Saul (see 1 Sam. xxii), and later when as king he was fighting the Philistines (1 Chron. xi. 15). It was perhaps near the town of the same name, some 10 miles northwest of Hebron.

ADUL'LAMITES. A term applied in English history to those seceding Liberals who voted with the Conservative party when Earl Russell and Mr. Gladstone sought to extend the elective franchise in 1866. The designation of *Adullamites* was fastened on the new party by Mr. Bright, who, in the course of debate, likened them to the political outlaws who took refuge with David in the cave of Adullam (1 Sam. xxii. 1, 2). The comparison was taken up by Lord Elcho, who humorously replied that the band congregated in the cave was hourly increasing, and would succeed in delivering the House from the tyranny of Saul (Mr. Gladstone) and his armor-bearer (Mr. Bright). The group of seceders was also known as "The Cave," and as "The Cave of Adullam."

ADULT'. A person of full age and therefore of full legal capacity, according to his status in point of sex or condition of servitude. The age at which one becomes an adult is generally fixed at 21 years for men and women alike, but in a few of the American States women are classified as adults on attaining the age of 18, and both men and women upon marriage. See AGE.

ADUL'TERA'TION (Lat. *adulterare*, to defile, to falsify). The act of intentionally debasing articles offered for sale, by abstracting from them some valuable constituent, or by adding to them some worthless, more or less deleterious, foreign substance. Adulteration has been practiced throughout the civilized world since early in the Middle Ages, and unfortunately the methods and devices used by unscrupulous men of commerce in adulterating commodities in common use have kept pace with the progress of the useful arts.

According to the Federal Food and Drugs Act of 1906 and the laws of many of the States a food is declared to be adulterated under the following conditions: "First, if any substance has been mixed and packed with it, so as to reduce or lower or injuriously affect its quality or strength; second, if any substance has been substituted wholly or in part for the article; third, if any valuable constituent of the article has been wholly or in part abstracted; fourth, if it be mixed, colored, powdered, coated, or stained in a manner whereby damage or inferiority is concealed; fifth, if it contains any added poisonous or other added deleterious ingredient which may render such article injurious to health . . . when such products are ready for consumption; sixth, if it consists in whole or in part of a filthy, decomposed, or putrid animal or vegetable substance, whether manufactured or not, or if it is the product of a diseased animal or one that has died otherwise than by slaughter."

The term "adulteration" is to be distinguished from "misbranding," which is usually applied to false or misleading statements on the package or label as to the contents of the package, its weight, place of manufacture, qualities, etc.

The sale of a spurious article under the name of the genuine article for which it is intended to pass is a common law cheat, and modern legislation is extending the scope of this crime with a view to the protection of health and the promotion of honest and fair business dealings. The common law cannot be depended on, however, to protect the community from adulterated goods, since the amount at stake is not sufficient to warrant the consumer in bringing action against the vendor who has sold him such goods. Since the middle of the last century the subject of food adulteration has attracted a constantly increasing amount of attention, and specific legislation intended to correct its evils is now widespread. In 1883 the first practicable food-inspection law in the United States was enacted in Massachusetts. Other States have gradually followed the example of Massachusetts, and, in 1913, all but two States had taken serious steps toward regulating the character and quality of their food products by enacting pure food laws, though their enforcement in three others was practically nullified by failure to grant appropriations. Food legislation has received much attention abroad, and the more highly civilized foreign countries have efficient food laws and enforce them with a degree of thoroughness which we in this country have not always attained. In this, as in so many other matters of national concern, the several States, with their varying standards and divergent interests, cannot be relied upon entirely to afford efficient protection against adulteration, and for this reason the legislative power of Congress was employed in 1906 to fix a standard for the whole United States. This could under the Constitution be effected only indirectly by the exclusion of foods falling below the legislative standard from foreign and interstate commerce, but though limited in scope these provisions are from their very nature comparatively easy of enforcement. For an analysis of this legislation and its provisions, see PURE FOOD LAW. See also HEALTH, PUBLIC.

The following are some of the more common forms of adulteration and sophistication, many of these, however, not being illegal if the products are properly labeled:

Wine. The cheaper grades of wine are sometimes colored artificially and chemically preserved. If made by the addition of water and sugar to the partially expressed pomace of grapes and then fermented, a qualifying term, such as "pomace wine," should be used. Carbonated wines, prepared by dissolving in ordinary wine carbonic acid gas under pressure, are sometimes sold as champagne.

Non-alcoholic beverages, such as ginger ale and fruit syrups, are often preserved with salicylic acid and benzoic acid, and colored with coal tar derivatives. These products are sometimes altogether artificial in their nature.

Canned vegetables, contrary to the general impression, are relatively free from adulteration, except that more water is sometimes used than is necessary. Being hermetically sealed, no artificial preservative is necessary, and, generally speaking, none is used. In this class of goods artificial color is sometimes employed with tomatoes, and some imported products, such as

peas, were formerly colored with salts of copper, but this is now prohibited. Vegetables, such as peas and beans, which have reached a relatively mature state, may be soaked for some time, canned, and placed on the market as high grade materials. Such products are not unwholesome, but should be labeled "Soaked." In the preparation of sugar corn a small amount of cane sugar is sometimes added, but must be declared. The use of saccharin for this purpose in place of sugar is rare, and is now prohibited in all foods.

Breakfast foods. In connection with the question of food adulteration, a word may be said as to the claims of breakfast-food manufacturers. These products are wholesome and convenient foods, but in nutritive value are in no way superior to the ordinary cereal products from which they are made.

Flour and bread are comparatively free from adulteration. The adulteration of flour with ground mineral matter and with alum was probably never practiced in this country. Its adulteration with corn-meal was quite prevalent at one time, but has now been discontinued in the United States. The bleaching of flour with nitrogen peroxid to whiten it prematurely was formerly practiced on a large scale, but prohibited under the Federal law in 1908. So-called "Graham flour" is frequently prepared by mixing low-grade white flour with bran.

Cocoa and chocolate preparations have been mixed with starchy cereal products and other starchy ingredients, such as wheat, rice, maize, arrowroot, and potato starch. An excess of cocoa husks is also reported in such preparations, showing that the husks have not been completely removed in the preparation of the product, or that an actual addition of husks has been made.

Coffee, when sold in the ground state, is easily adulterated. Chicory was formerly used almost entirely for this purpose, also ground peas, wheat, beans, barley, and other materials. Attempts have repeatedly been made to adulterate unground coffee with artificially molded pellets made to resemble the coffee bean, and composed of the constituents mentioned above. Such attempts have apparently not been successful, however, as products of this nature are no longer found in the market in this country. The principal offense in the coffee trade is misbranding in regard to country of origin; for example, the sale of Brazilian coffee, as Java or Mocha.

Catsups are commonly colored and preserved artificially. Some manufacturers prepare tomato pulp in large quantities when tomatoes are most plentiful and store it in barrels, using chemical preservatives to keep it and coloring matter to restore the loss of color.

Butter is frequently renovated after it has become stale, and much inferior country butter is treated in the same manner. The product is first washed with alkali to remove rancidity and the fat is churned with fresh milk. The practice of selling the product as fresh butter has been greatly lessened by Federal legislation, but "Renovated Butter," when labeled as such, may be manufactured and sold under Federal license. The sale of oleomargarin as butter is also much less common than formerly, as a result of Federal and State legislation.

Cheese was formerly adulterated by removing the cream from the milk from which it is made and replacing the cream by fat of other origin.

This "Filled Cheese" when so labeled may be manufactured and sold under Federal license. Another fraudulent practice consists in soaking the cheese curd in water to increase the moisture content and improve the texture.

Cream is sometimes preserved artificially and given a fictitious appearance by means of "thickeners," such as gelatin. A somewhat similar result is obtained by forcing cream through a "homogenizer," which breaks up the fat globules. This practice has some advantages, especially for ice cream making, but the product should be labeled "homogenized cream."

Milk lends itself very readily to adulteration. Considering the fact that a large portion of the milk supply is consumed by infants and invalids, its purity is a matter of greater importance than that of any other food. Milk is commonly adulterated by dilution with water or by removal of cream, and the water used may be a source of typhoid fever and other dangerous diseases. Skimmed milk contains a large amount of protein, and when sold on its merits is a most useful food, but of course it is unfit for infants and often for invalids. Milk is still frequently treated with chemical preservatives, chiefly formaldehyde. This enables the vendor to keep the milk at a higher temperature and to ship it over considerable distances without the use of refrigeration, and eliminates to an extent the necessity of cleanliness in the dairy. The addition of preservatives to such an article as milk, however, is almost universally considered to be inexcusable and is steadily decreasing.

Lard. Most of the States in this country have enacted specific laws governing the manufacture and sale of this product, and the adulteration of lard is now unusual. Cooking fats are commonly prepared by mixtures of cotton-seed oil, beef suet, etc., but they are usually sold as "compound lards" or "lard substitutes," and not represented to consist of lard alone. In order to correct the excessive softness of lard, high-melting stearin from beef fat is frequently added to it. The percentage of stearin added is higher in the summer than in the winter, and in the product consumed in hot climates than in that consumed in cold climates.

Salad oils. The substitution of cheaper oils for olive oil has always been far too common. A cheap adulterant is cotton-seed oil, although some sesame and peanut oils are imported for the purpose of adulterating cotton-seed oil. The enforcement of the pure food law has practically stopped the importation of adulterated olive oil in bottles, but the oils may be still imported in barrels and mixed in this country.

Flavoring extracts are easily adulterated with cheaper products. An extract of the tonka bean is frequently substituted for vanilla extract, and a still cheaper product is prepared in the form of a solution of artificial vanillin colored with caramel. Lemon extract is sometimes substituted by an extract prepared from lemon grass. Lemon oil is sometimes distilled with steam, the non-volatile product used for the preparation of the so-called terpeneless extract, and the terpenes obtained by this method of distillation used in the preparation of a product in which the non-volatile portions of the lemon oil are absent.

Jellies, jams, and marmalades are often adulterated with glucose and artificially colored and preserved. In the cheapest forms of these products no fresh fruit is employed, the product

consisting entirely of an extract prepared from dried apple peelings and cores and glucose, artificially colored and sometimes artificially flavored. As a result of recent legislation it is not uncommon for articles of this nature to be labeled with a declaration regarding their nature. Sometimes, however, these declarations are misleading.

Meat preparations occasionally contain preservatives and are adulterated by the substitution, in the case of comminuted articles, as sausage and chopped meat, of a cheaper article than that supposed to be present. Fresh meat is probably never subject to adulteration except on the block of butchers who are not equipped with storage facilities. Oysters, when kept in bulk after shucking, are sometimes treated with preservatives, and their bulk increased by absorption of water.

Spices are usually sold in the ground state and for that reason are easily imitated. They are frequently adulterated with ground cereals, coconut shells, almond shells, sometimes parched, and sawdust. Even the whole spices are sometimes distilled with steam to remove the essential oil and then placed on the retail market.

Sugars, both high and low grade, are practically free from adulteration, although at one time indigo was used in white sugar to counteract a yellow tint due to imperfect bleaching.

Syrups, strained honey, and similar preparations are often mixed with glucose, or corn syrup. Maple products may contain large amounts of cane sugar and should be properly labeled.

Vinegar in the United States is understood to be a product in the acetic fermentation of apple juice without any addition whatever, the products made from the juice of grapes, malt, sugar-house residues, glucose, etc., being properly qualified by these terms. The addition to natural vinegar of water, boiled cider, or coloring matter is regarded as adulteration unless they are labeled as imitation products. Diluted acetic acid and pyroligneous acids are not vinegar and should not be so sold.

Confectionery is deemed adulterated under the Federal law and that of most of the states if it contains terra alba, barytes, talc, chrome yellow, or other mineral substance or poisonous color or flavor, or other ingredient deleterious or detrimental to health, or any vinous, malt, or spirituous liquor or narcotic drug. The quality of cheap candies has been improved in recent years, particularly by the decreased use of injurious coloring materials, but the use of materials of inferior nutritive value is still possible.

Drugs are sometimes adulterated by the addition of substances resembling the genuine articles in outward appearance but having none of their valuable physiological effects. The practice cannot be denounced too strongly or punished too severely. The fraud can usually be detected only by careful chemical examination.

Chemical Preservatives. During the last half-century the practice of using chemicals to preserve food has been widely extended. By means of such chemicals foods may be preserved with much less desiccation than is possible otherwise, and the taste of the fresh article is retained practically unchanged. The substances most commonly employed have been formaldehyde with milk, borie acid with butter and with meat preparations, sulphites with beer, wine, dried fruits, molasses, and meat, and salicylic and benzoic

acids, and benzoate of soda with beverages of all kinds and fruit preparations. Fluorides have also been employed with many varieties of foods. Preservatives may cheapen the production of prepared foods, as with their use it is possible to transport and store products in a partially prepared state until it is convenient to complete the manufacture. It is possible, in making tomato catsup, for instance, to prepare the pulp, by cooking and straining off the insoluble material during the growing season and preserve it with salicylic or benzoic acid for working up later, so that a small plant can be kept in operation throughout the year. They also, however, sometimes make possible the use of inferior materials, and there is danger that they may be employed as a substitute for cleanly methods. The question as to the wholesomeness of some of the preservatives has not been definitely settled. It is conceded, however, that most of them are injurious to health, that they should not be employed where it is practicable to dispense with their use, and that wherever they are employed a plain statement of that fact should be made on the label. The Federal authorities permit the use of benzoate of soda, when its presence and amount are stated on the label, and of ordinary quantities of sulphur dioxide when its presence is stated.

Coloring Matter. The objection to the use of coloring matter with foods is from the standpoint of fairness and honesty and also from that of wholesomeness. In the adulteration of foods with articles of less value it is frequently found impracticable to select substitutes of the same color as that of the substances supposed to be employed. To remedy this defect and make the adulterated product more nearly resemble the article it simulates, coloring matter is added. Formerly coloring matter was obtained from vegetable sources. At present artificial colors are almost exclusively employed. The use of coloring matter has already been referred to above in connection with several articles of food. In addition to those mentioned, fruit jelly, prepared from glucose and apples, is frequently colored artificially to be sold as currant, strawberry, or grape jelly. Cane sugar is colored and flavored to resemble maple sugar. Glucose is colored and sold as honey, or as syrup of different origin. Canned tomatoes, which would bring a relatively low price because deficient in color, are frequently treated with an aniline dye. Flour is sometimes added to spices, such as pepper, and the natural coloring matter of the spice is replaced with charred coconut shells. Many colors which have been used with foods are admittedly unwholesome, and, furthermore, from the method of their manufacture, they may contain small amounts of poisonous metals, such as arsenic. Although, in general, the amount of coloring matter required is very small, it is believed that the use of those which are unwholesome should be prohibited. The United States and several European countries now forbid the use of certain colors, but specifically permit the use of others.

The enactment of Federal and state pure food legislation has already brought about great improvement in food manufacture and sale. Most of the grosser forms of adulteration are now comparatively unknown, and while many imitation products are found on the market, they are now required to be properly labeled and sold on their merits, thereby protecting the dis-

criminating consumer and the manufacturer of high grade goods.

Consult: In English, Wiley, Richardson, Crampton, and Spencer, *Foods and Food Adulterants*, 7 parts (Washington, 1887-92); Wedderburn, *Report on the Extent and Character of Food and Drug Adulteration* (Washington, 1894); Bower, *Simple Methods for Detecting Food Adulterations* (London, 1895); Blythe, *Foods, their Composition and Analysis* (London, 1903); Leach, *Food Inspection and Analysis* (New York and London, 1904, 1909, 1913); Leffmann and Beam, *Select Methods of Food Analysis* (2d ed., Philadelphia, 1905); Winton, *Microscopy of Vegetable Foods* (New York, 1906); Wiley, *Foods and their Adulterations* (Philadelphia, 1907, 1911); Walker, *The Food Inspector's Encyclopedia* (London, 1912); also the Bulletins and Reports of the Bureau of Chemistry, United States Department of Agriculture, and of the agricultural experiment stations and food commissions of various States. See FOOD.

ADUL'TERY (Lat. *adulterium*, the violation of another's bed, from *ad*, to + *alter*, other). "The voluntary sexual intercourse of a married person with a person other than the offender's husband or wife." By the canon law, the husband and wife were placed on the same footing; and this view has been adopted by all the nations of modern Europe. In America it has never been doubted that the offense necessary to found the sentence of divorce is committed by unlawful sexual intercourse equally whether the *particeps criminis* were married or single. In Rome, the Julian law, enacted in the time of Augustus (17 B.C.), revised the previous legislation on the subject, and imposed special penalties, consisting of forfeiture of goods and banishment, both on the adulteress and the paramour. The husband, in certain cases, was permitted to kill the latter, and the father might sometimes kill both. A constitution of Constantine, the authenticity of which has been doubted, made adultery a capital offense on the man's part. Whatever Constantine's law was, it was confirmed by Justinian, who further condemned the wife to be whipped, and imprisoned in a convent for the rest of her days, unless relieved by her husband within two years (*Novel.*, 134, c. 10). The offense was visited in Athens with punishments closely resembling those of the earlier Roman legislation. In many Continental countries adultery is still treated as a criminal offense, but in none of them does the punishment now exceed imprisonment for a limited period, which is frequently accompanied with a fine. Lord Coke says that by the law of England in

early times adultery was punished by fine and imprisonment. During the Commonwealth it was made a capital offense, but this law was not confirmed at the Restoration. In Scotland the records of the Court of Justiciary show that capital punishment was frequently inflicted. At the present day it is punishable in Great Britain only by ecclesiastical censure, and even this may be regarded as in desuetude. But when committed by the wife it is regarded as a civil injury, and forms the ground of an action of damages for criminal conversation (commonly known as an action of *crim. con.*) by the husband against the paramour. No corresponding action was allowed the wife, either in England or America, until recently, and her only remedy consisted in obtaining a separation or divorce. In some of the States of the United States adultery is made criminal by special law; in some the act itself is not a crime, but open and continued adultery, amounting to a public nuisance, is. Some statutes define the crime, some only state the punishment; and this leaves a wide margin for interpretation by courts, giving rise to great diversity of opinions and decisions. Some hold that if only one of the parties be married, the other does not commit criminal adultery; some that a married man with a single woman does not commit criminal adultery, because the act cannot impose spurious issue on a husband or wife. See DIVORCE, and the authorities there referred to.

AD VALO'REM (Lat., according to the value). A phrase used in customs legislation to designate taxes levied upon goods in proportion to their value. The valuation which serves as a basis for the tax is commonly the fair selling value in the country of origin. When this is indeterminate, as in the case of goods produced solely for export, a more or less fictitious value is deduced from data as to cost, prices in the country of import, etc. Such duties, inasmuch as they fall with just proportion upon the different grades of goods, cheap as well as expensive, are in theory the most satisfactory. They involve, however, a cumbrous and often inefficient machinery for the ascertainment of values, and from the standpoint of customs administration are deemed inferior to specific duties, which levy a definite tax upon a given unit of measure (pound, bushel, gallon, etc.) of the imported articles. The tariffs of the United States embrace both kinds of duties and sometimes combine them. See TARIFF.

ADVANCE' GUARD. A detachment of troops which precedes the main body of the command for the purpose of insuring its safe and uninterrupted advance. Troops on the march are in a formation in which they cannot fight effectively. When they come upon the enemy they must first deploy. This takes time, especially in large columns; consequently such columns require detachments to protect them against surprise. The detachment placed at the head of the column is called the advance guard. Good reconnaissance by the independent cavalry in front of the army affords some protection, but this cavalry may at any time be beaten by the enemy and forced off to one flank, or it may have been drawn off in pursuit of the enemy's cavalry; hence immediate protection for the heads of the columns is still a necessity. The strength and composition of the advance guard depends on the tactical situation, but should be the least required, on account of the

arduous duty it demands. The strength of advance guards varies between one-ninth and one-third of the entire command, but seldom exceeds the latter, and in large commands is usually composed of all arms. In making details for advance guard duty the integrity of tactical units should be preserved. The larger the force the larger in proportion should be the advance guard. In open country it should be strong in cavalry and field artillery, but artillery is seldom assigned to the advance guard of a command not larger than a brigade. In difficult

country it may be formed of infantry alone. Machine guns are valuable with the advance guard. Engineers are usually present to remove obstacles, repair roads, place bridges, etc. The signal and sanitary troops required may also be attached. The field trains usually accompany those of the main body. The independent cavalry is a body of cavalry with an independent mission and precedes the advance guard by a day's march or more. The advance guard is composed of the advance *cavalry*, the *support* and the *reserve*. Communication between these parts is maintained by wire, messenger service, or signals. The strength, composition, designation of parts, and distribution of the troops composing the advance guard of a normal division of about

18,000 men, are indicated in the accompanying diagram. The advance guard is here assumed to consist of two regiments of infantry, one squadron of cavalry, one battalion of artillery, one company of engineers, and a detachment of sanitary troops.

If the main column halts for a considerable time, the advance guard takes up temporarily the duties of outposts, but must keep up reconnaissance. Every column of march must also be protected on the flanks by patrols, and when these small bodies are not sufficient a flank guard must be organized.

In a retreat a rear guard is formed, and since the latter cannot, as a rule (like the advance or flank guard), count on the immediate support of the main body, it must be stronger than either of the others, and requires more artillery, and also cavalry, the latter playing the part of mounted infantry in this case. All European armies, except the German, have a small rear guard besides the advance guard in an advance. France and Russia have very strong advance guards and send them far out to the front. See **OUTPOSTS; RECONNAISSANCE; BATTLE; TACTICS, MILITARY.**

ADVANCEMENT. In law, a gift by a parent to a child of all or a portion of the share of the parent's personal property to which the child would be entitled upon the death of the parent intestate. An advancement has the effect of reducing by its amount the distributive portion that would come to the receiver upon the death of the parent. The doctrine of advancement is applicable only to gifts from parent to child, but has been extended to gifts to others by statute in some States. An advancement is not required to be made in any particular form. Any such gift is presumptively an advancement, but the contrary may be shown. The subject is now generally regulated by statute, and in many jurisdictions real estate may be given by way of advancement to the heir. Consult Thornton, *Law Relating to Gifts and Advancements* (Philadelphia, 1893). See **ADEMPMENT.**

ADVANCEMENT OF SCIENCE, ASSOCIATIONS FOR THE. Important bodies of scientific men in America, Great Britain, France, and other countries. The purpose of these associations is to emphasize the solidarity and unity of interests among workers in all branches of science, to give a stronger impulse to scientific research, both theoretical and practical, and to gain for scientific achievement a more immediate recognition and a wider usefulness, through the means of financial bequests, the publication of *Reports*, and the offering of special facilities for the prosecution of original and difficult scientific work. The organization of the societies was one of the numerous manifestations of the scientific spirit of the nineteenth century; and the continued growth of this spirit was shown at a joint meeting of the British and French associations in September, 1899, when plans were formulated for an international association for the advancement of science, art, and education. The first meeting of this international association was held in Paris during the exposition of 1900. The American Association for the Advancement of Science, now one of the most noted scientific societies of America, was founded in 1847 as an outgrowth of the association of American geologists and naturalists. The association is organized in 11 sections, each of which holds its own convention at the annual

meeting of the association during the summer. The sections embrace the following departments of science: *A*, mathematics and astronomy; *B*, physics; *C*, chemistry; *D*, mechanical science and engineering; *E*, geology and geography; *F*, zoölogy; *G*, botany; *H*, anthropology and psychology; *I*, social and economic science; *K*, physiology and experimental medicine; and *L*, education. The association also serves as a centre for the meeting of a number of important special scientific societies which have become connected with it. The association publishes annually a volume of *Proceedings*, and in 1901 became affiliated with the journal *Science*, making it the semi-official organ of the society. The membership of the society is about 8100. The British Association for the Advancement of Science was founded in the city of York in 1831, under the leadership of David Brewster and with the coöperation of many of the most prominent men of the time. The annual meetings of the association are held for a week each summer and consist mainly of papers read before the several sections of the society and of conferences following them. The society is divided into 10 sections, each having its own president and governing committee. The society sets aside yearly a large sum for the prosecution of scientific researches which require special apparatus and the employment of assistants. The membership of the association is about 5500. Reports have been published since 1831. The French Association for the Advancement of Science (*L'Association Française pour l'Avancement des Sciences*) was formed in 1865 at Lille. The work is carried on through general meetings, publications, and the bestowal of prizes for brilliant scientific work. The four sections into which the society is divided are those of the mathematical, the physical and chemical, the natural, and the economic sciences. Records of its proceedings and of the scientific work accomplished under its guidance have been published since its organization. The Australasian Association for the Advancement of Science was formed in 1886 and the South African Association in 1903.

AD'VENT (Lat. *adventus*, the approach, coming), or **TIME OF ADVENT**. A term applied by the Christian Church to certain weeks before Christmas. In the Greek church the time of Advent comprises 40 days; but in the Roman church and those Protestant churches in which Advent is observed, only four weeks. The origin of this festival as a church ordinance is not clear. A synod at Saragossa, Spain, in 380, enjoined that every one must attend church from December 17 to Epiphany; but not till the sixth century was Advent fully adopted as a church season. The four Sundays of Advent, as observed in the Roman Catholic church and the Church of England, were probably introduced into the calendar by Gregory the Great. It was common from an early period to speak of the coming of Christ as fourfold: his "first coming in the flesh"; his coming at the hour of death to receive his faithful followers (according to the expressions used by Saint John); his coming at the fall of Jerusalem (Matt. xxiv. 30), and at the day of judgment. According to this fourfold view of Advent, the "gospels" were chosen for the four Sundays, as was settled in the western church by the Homiliarium of Charlemagne. The season of Advent is intended to accord in spirit with the object celebrated.

As mankind were once called upon to prepare themselves for the personal coming of Christ, so, according to the idea that the ecclesiastical year should represent the life of the founder of the Church, Christians are exhorted, during this season, to look for a spiritual advent of Christ. The time of the year when the shortening days are hastening toward the solstice—which almost coincides with the festival of the Nativity—is thought to harmonize with the strain of sentiment proper during Advent. In opposition possibly to heathen festivals, observed by ancient Romans and Germans, which took place at the same season, the Catholic church ordained that the four weeks of Advent should be kept as a time of penitence; according to the words of Christ, "Repent, for the kingdom of heaven is at hand." During these weeks, therefore, public amusements, marriage festivities, and dancing were prohibited, fasts were appointed, and sombre garments were used in religious ceremonies. The Protestant church in Germany has also abstained from public recreations and celebrations of marriage during Advent. In the Greek church the observance of the season dates from a period much later than in the Latin, perhaps not till the tenth century.

AD'VENTISTS. A family of religious denominations which, accepting the inspiration of the Scriptures, taking the Bible as their rule of faith, and holding to the fundamental doctrines of the Christian churches generally, expect the near approach of the end of the world and the personal second coming of Christ. They arose from the preaching of William Miller, who taught, from 1831 on, as the results of his studies of the prophetic books of the Bible, that the end of the world would come in 1843, and be followed by the coming of Christ and the installation of the millennium. When 1843 had passed, the date was changed to October, 1844. Mr. Miller was joined by other preachers, and several thousand followers were gathered from many churches. The Adventists now, as a rule, simply await the second advent without attempting to fix a date for it. A declaration adopted at Albany, N. Y., in 1845, set forth a belief in the visible personal coming of Christ at an early but indefinite time; the resurrection of the dead, both the just and the unjust, and the beginning of the millennium after the resurrection of the saints; but denying that there is any promise of the world's conversion, and that the saints enter upon their inheritance at death. The Adventists baptize by immersion; and, except the Seventh Day branch and the Church of God, are congregational in polity. Carroll, *The Religious Forces of the United States* (New York, 1912).

1. **The Evangelical Adventists**. The American Millennial Association was formed in 1845 for the publication and circulation of denominational literature. The Evangelical Adventists began to call themselves by that name in 1845. They believe that all the dead will be raised, the saints first, to the enjoyment of the millennial reign with Christ and eternal bliss after the judgment, and the wicked last, to be sent into everlasting punishment, and that the dead in Hades are conscious. They had, in 1913, 8 ministers, 18 churches, and about 1150 members. Literature: H. F. Hill, *The Saints' Inheritance* (Boston, 1852); D. T. Taylor, *The Reign of Christ* (Boston, 1889); J. Litch, *Discussion on the Millennium* (Boston, between 1860 and 1865).

2. **Advent Christians.** The general association of this body was formed in 1861. The Advent Christians believe that man was created for immortality, but forfeited it through sin and can become partner of the divine nature and live forever only through faith in Jesus Christ; that death is a condition of unconsciousness to all till the resurrection at Christ's second coming, when the righteous will receive everlasting life and the wicked will be punished with complete extinction of being; and that salvation is free to all who will accept the conditions. They have, in the United States, 528 ministers, 550 churches, with about 26,800 members, and a Bible institute. The principal publication society is in Boston. The missionary society sustains missions in England, the Cape Verde Islands, India, and China. In home missions it is aided by the Eastern, Western, and Southern Boards, and by the woman's society called "The Helper's Union." It also has charge of a church extension fund. The leading periodicals are *The World's Crisis*, and Sunday school publications (all Boston). Literature: J. G. Wellcome, *History of the Second Advent Message* (Yarmouth, Me., 1874); Charles L. Ives, *The Bible Doctrine of the Soul* (Philadelphia, 1877); E. A. Stockman, *Our Hope* (Boston, 1884); Mrs. L. C. McKinstrey, *The World's Great Empires* (Haverhill, Mass., 1887); Rev. H. Constable, *Hades or the Intermediate State of Man* (Boston, 1885).

3. **Seventh-Day Adventists.** The doctrine of the obligation of the seventh day as the Sabbath was adopted by a body of Adventists at Washington, N. H., in 1844. The Seventh-Day Adventists believe that Christ's closing work as priest—the cleansing of the sanctuary and the investigative judgment—are events marked in the prophecies as beginning in 1844. They hold that the dead sleep until Christ's second coming; that the righteous dead are raised to life and with the living righteous are made immortal; that the wicked are destroyed by the glory of Christ's presence; and that the second resurrection, that of the wicked, takes place at the end of a thousand years. During this millennium the righteous are in heaven, the earth desolated, and empty of its inhabitants. They believe that Christ's coming is near, but set no time for that event, maintaining that it is hidden from all mortals. They believe in the restoration in the Church of all the gifts of the Spirit, bestowed by Christ, including the gift of prophecy, believing the writings of Mrs. E. G. White to be special illuminations of the Spirit, though adding nothing to the doctrine of the Holy Scriptures, which are held to be the sole and sufficient standard of faith and doctrine. They believe that the whole Bible is inspired and look to Christ alone for salvation and righteousness.

The chief governing body is the General Conference, having headquarters in Washington, D. C. The General Conference is divided into 23 Union Conferences, embracing practically the entire world. Union Conferences are composed of a group of local conferences, of which there are 126, and 100 mission fields. At the close of 1912 operations were being carried on in 86 countries, by 863 ordained ministers, 492 licensed ministers, and other evangelistic workers, making the grand total of evangelistic laborers approximate 6000. The number of evangelistic laborers in non-Christian and non-Protestant

lands is 1481, thus constituting this denomination the sixth in point of total missionaries in foreign service of all the missionary societies in the United States. Over 500 missionaries have been placed in service in foreign lands during the past five years; the contributions for foreign missions from the membership in the United States during 1912 were \$619,826.85, a per capita of \$9.40. Missionary work is conducted in 91 languages. The total funds raised annually for evangelistic purposes approximate \$3,000,000. In 1912 the denomination had 2874 churches and 114,206 communicants. The denomination has 69 sanitariums; 90 colleges and intermediate schools, 573 primary schools; total investment in denominational institutions exceeds \$13,000,000; 123 periodicals are regularly issued in 31 languages. The leading weekly periodicals are *The Advent Review and Sabbath Herald* and *The Youth's Instructor* (Washington, D. C.); *Signs of the Times* and *Our Little Friend* (Mountain View, Cal.); *The Present Truth* (Watford, England); *Signs of the Times* (Warburton, Australia); *The Gospel Messenger* (Danish), (College View, Neb.). The monthlies include *Liberty, Life and Health*, and *Protestant Magazine* (Washington, D. C.); *The Watchman* (Nashville, Tenn.); *South African Sentinel* (Cape Town, South Africa); *Herald of Truth* (German), (Hamburg, Germany); *Signs of the Times* (Glarus, Switzerland); *Signs of the Times* (Shanghai, China); *Oriental Watchman* (Lucknow, India); *West Indian Watchman* (Riversdale, Jamaica).

The literature of the denomination is issued from 37 publishing houses, in 75 languages, in the form of 350 bound books, over 300 pamphlets, and about 1200 tracts, and annual literature sales approximate \$2,000,000. Among the leading works may be mentioned *History of the Sabbath and First Day of the Week*, by J. N. Andrews and L. R. Conradi; *The Great Controversy between Christ and Satan, Desire of Ages*, and *Patriarchs and Prophets*, by Mrs. E. G. White; *Thoughts on the Book of Daniel and the Revelation*, by Uriah Smith; *The Great Second Advent Movement*, by J. N. Loughborough; *Heralds of the Morning*, by A. O. Tait.

4. **The Church of God.** This was formed after a division among the Seventh-Day Adventists, 1864-65, concerning the acceptance of the revelations of Mrs. E. G. White as inspired and the application of Rev. xii. 11-17 to the United States. It holds to the mortality of man and unconsciousness in death; resurrection of the righteous to everlasting life and of the wicked to judgment and final extinction; observes the seventh day and practices tithing. The general conference is the head of its work, and the State conferences are subordinate to it. It has 32 ministers, 20 churches, and about 600 members, with a publishing house at Stanberry, Mo., and a sanitarium at White Cloud, Mich. Periodicals: *The Bible Advocate*, *Herald of the Coming Kingdom* (Stanberry, Mo.). Literature: A. P. Dugger, *Bible Sabbath Defended* (Marion, Iowa, 1881); Jacob Brinkerhoff, *Kingdom of Heaven upon Earth* (1882); W. C. Long, *The End of the Ungodly* (1886).

5. **Life and Advent Union.** Organized 1860. The distinctive feature of its belief is that those who die in sin have no resurrection, but are doomed to sleep eternally, while the righteous rise to immortality. A general conference meets every year, and quarterly conferences have been

instituted in some places. Four camp-meetings are held every year—in New England and Virginia. The missionary work is carried on, in the home field only, by two societies, one of which is organized among the young people. The Union has in the United States 12 ministers, 12 churches, and about 500 members. Literature: O. S. Halstead, *The Theology of the Bible* (Newark, N. J., 1860); *Discussion between Miles Grant and J. T. Curry* (Boston, 1863); W. N. Pile, *The Doctrine of Conditional Immortality* (Springfield, Mass.); *The Coming Kingdom of God* (Springfield, Mass.); Wm. E. Brown, *The Divine Key of Redemption* (Springfield, Mass.); "A Disciple," *Redemption* (Springfield, Mass.).

6. **The Churches of God** (Age-to-Come Adventists) believe in the final restitution of all things; the establishment of the kingdom of God on the earth, with Christ as King of kings and the immortal saints joint heirs with him; the restoration of Israel; the final destruction of the wicked, and eternal life only through Christ. The journal, *The Restitution*, was begun in 1851, and a general conference representing 13 States was formed in 1888. The Churches have 56 ministers, 62 churches, and about 2100 members in the United States, and churches in Canada. Periodical: *The Restitution* (Plymouth, Ind.). Literature: J. P. Weethee, *The Coming Age* (Chicago, 1884).

ADVENTIVE (Lat. *ad*, to + *venire*, to come). A plant which is but incompletely naturalized (see NATURALIZATION) is said to be adventive. Most adventive plants are spontaneous for a few years and then disappear, while a few species become more and more numerous and ultimately become naturalized.

ADVENTURES OF AN ATOM, THE. A satire by Tobias Smollett (q.v.) published in 1769 and treating, under a Japanese disguise, of English politics during the preceding 14 years.

ADVERB (Lat. *adverbium*, from *ad*, to + *verbum*, word, verb, "the word" of a sentence *par excellence*. A literal translation by the Roman grammarians of the Gk. *ἐπιρρημα*, *epirrhēma*, from *ἐπί*, *epi*, at + *ῥῆμα*, *rhēma*, word, verb). As an adjective is joined to a noun, so is an adverb joined, for analogous purposes, to a verb, an adjective, or another adverb. From the frequency with which adverbs are joined to verbs, only the adverbs of degree modifying other parts of speech, they get their name. An adverb cannot be the subject, the copula, or the predicate of a proposition, and is, therefore, a secondary part of speech, logically speaking. According to their signification, adverbs may be divided into (1) adverbs of place and direction, as *where*, *towards*; (2) of time, as *ever*, *immediately*; (3) of degree, as *very*, *almost*; (4) of manner, as *thus*, *wisely*; (5) of belief or doubt, as *perhaps*, *no*, etc. It is commonly said that "some adverbs admit of comparison," as if in this respect they differed from adjectives. The truth is that adverbs admit of comparison under the same limitations, neither more nor less, that restrict the comparison of adjectives. Thus, *soon* is compared as naturally as *hard*. If *now* or *thus* cannot be compared, neither can *woolen* nor *circular*; and in both cases for the same reason—the sense forbids it. The laws of euphony prevent alike *miserable* and *miserably* from being compared grammatically, i.e., by the addition of *er* and *est*; but both admit of logical comparison by the use of

more and *most*. A large class of adverbs in English are formed from adjectives by annexing the syllable *ly*, which is derived from the word *like*. Most languages have some such means of distinguishing the adverb from the adjective, but in German they are alike. Adverbs in general may be looked upon as abbreviations of phrases; thus, *here* = *in this place*, *then* = *at that time*, *wisely* = *like a wise man*. Combinations of words that can thus be represented by a single adverb, and all combinations that are analogous, though they may have no single word equivalent to them, are called adverbial expressions.

ADVERSE POSSESSION. The possession of lands under a claim of title inconsistent with that of the true owner. It originates in the disseisin (q.v.) or ouster of the freehold tenant and, if continued for the statutory period of limitation, results in the acquisition of a complete title by the adverse possessor or disseisor. In order to constitute a good adverse possession there must be an actual occupancy (*pedis possessio*) of the premises claimed and an exclusion of the rightful owner from the whole thereof. The possession must be open and notorious and continued without interruption for the requisite period. It need not be continued by one and the same person, however; a subsequent occupant who claims by descent, devise, or grant from a former occupant being entitled to tack his possession to that of his predecessor in order to make up the requisite period of adverse holding. In some of the United States it is not even necessary that the subsequent occupant shall show a legal transfer of the property to him so as to connect his possession with that of the original disseisor in order to tack the two periods. The claim of title required of the adverse possessor is not an assertion of a legal right, but only an obvious intention to hold as owner. This may be innocent, as under a will or deed which proves to be void or unintentional, as by the accidental inclusion of another's land with that of the occupant, or it may be with the deliberate intention of gaining for one's self land belonging to another. The existence of the requisite intention, or claim of title, is a question of fact to be determined from the circumstances of the occupancy. In some of the United States certain acts (as fencing, improvement of the premises, or actual residence) have been prescribed by statute as requisite to prove the intention. In general the claim of the adverse possessor is limited to the land actually occupied; but where the claim is under color of title (i.e., under a deed, will, or other instrument describing a definite parcel of land) the actual occupation of a part may be extended by construction to the whole parcel so described. This doctrine of "constructive adverse possession" is a modern addition to the law of disseisin and is peculiar to the United States. The period of time required to ripen an adverse possession into a valid and indefeasible title varies greatly, but it is usually fixed by statute at 20 years. (See LIMITATION OF ACTIONS.) The subject is fully considered in all the leading treatises on real property. Leake and Williams are the modern English authorities. For the American doctrine see Tiffany, *The Modern Law of Real Property* (St. Paul, 1903).

ADVERSITY HUME. A nickname given to the parliamentarian Joseph Hume (q.v.), who was noted for his attention to financial

abuses in the government, and whose predictions of a crisis were justified in 1825.

ADVERTISEMENT, ăd-vēr'tiz-ment or ăd-vēr-tiz'ment. In legal phraseology, a process resorted to whenever actual notice is necessary but is legally or physically impossible (as by reason of a want of jurisdiction of the parties to be notified, or ignorance of their whereabouts). Publication must be made in a newspaper published at or as near as possible to the place where the persons to be affected when last heard of resided. Such advertisement in law is construed to have the same effect as actual service of the notice, as, for example, in proceedings brought to foreclose a mortgage or other lien on real property. An attempt to notify personally all parties affected would often only result in delay, if not miscarriage, of justice. For advertisement in business, see **ADVERTISING**.

ADVERTISEMENTS OF ELIZ'ABETH.

A series of enactments issued by Parker (q.v.), Archbishop of Canterbury, in 1566, for the purpose of establishing "due order in the public administration of Common Prayer and using of Holy Sacraments." Enforcing as it did the wearing by the clergy of the surplice and college cap, and of the cope in cathedrals and collegiate churches, it was in harmony with Elizabeth's love for decency and order in public worship; but after waiting more than a year for her official sanction, and long correspondence with Cecil, Parker was obliged to issue it on his own responsibility. During the latter half of the nineteenth century there was much controversy as to the exact force of the advertisements, which came to a head in the Ridsdale ritual case of 1877. Lord Selborne held that they were an absolute and authoritative prescription of the vestments to be worn, contending that they were the "other order" mentioned in the Act of Uniformity as to be taken later; while the High Church party, ably represented by James Parker, considered them as merely archiepiscopal injunctions intended to enforce a minimum of ritual. Consult Strype, *Life and Acts of Matthew Parker* (Oxford, 1821).

ADVERTISING (Lat. *advertere*, to turn [the mind] to, to notice). The method by which the producer of commodities disseminates information regarding them. For the producer it has the value of an automatic process, since it makes it possible to reach thousands of people through printed words, where formerly the seller was limited to his vocal organs. For the consumer it has the value of a system of education, since it keeps him in touch with the invention of new commodities, the improvement of old, and the constant advance in industry.

In tracing back the history of advertising, signs and criers are found in Palestine, Greece, and Rome, where they were used for public announcements and a few private purposes. Pompeii has furnished us with many wall inscriptions in red and black, as well as the familiar Roman signs, the amphora and two slaves for a wine shop, a goat for a dairy, or a boy being whipped for a school. Quaint signs prevailed throughout the Middle Ages, and the public crier was an important institution in towns. It was, however, the advent of printing and later of the newspaper which provided an adequate medium for advertising, although it was not until the industrial changes of the nineteenth century had revolutionized production,

creating innumerable new commodities and stimulating new wants, that advertising could become an important feature of commercial life. In the seventeenth century small advertisements appear in the newspapers for books, tea, coffee, or medicine. The chief advertisements for a hundred years or more are curiously illustrative of the crude social customs. A heavy stamp tax hampered the growth of newspapers and advertising in England until 1855.

America is par excellence the country of the advertiser. In the Colonial papers advertisements furnish material for history. Brief notices tell of new goods just imported from England, coffee, slave sales, runaway slaves and servants, or lost cattle. Advertising has grown with the newspapers. In 1795 there were 200 newspapers in the United States; in 1850, 2526; and in 1913, 24,381. Newspaper advertising on a large scale dates from the establishment of the *New York Sun* in 1833, followed shortly by the *New York Herald*, the *Philadelphia Public Ledger*, and the *New York Tribune*. According to census reports the sums paid for advertising in newspapers and other periodicals were, in 1899, \$95,861,127; in 1904, \$145,517,591; in 1909, \$202,533,245. Receipts from advertising represented 55 per cent of the total income of newspapers and other periodicals in 1899; 56.6 per cent in 1904; 60 per cent in 1909. The amount annually spent on advertising in the United States is variously estimated at from \$300,000,000 to \$500,000,000. The mediums for advertising are as follows: (1) the newspapers, magazines and trade journals; (2) occasional literature, such as catalogues, booklets, circulars, almanacs, calendars, or handbills; (3) street advertising, including bill-boards (see **POSTER**), stereopticons, signs, and street-cars; (4) salesmen; and (5) personal advertising.

As early as 1850 there existed in New York agencies whose function it was to arrange rates with newspapers, to gather information as to the extent and character of newspaper circulation, etc., for the guidance of the advertiser. At that time advertisements consisted commonly of plain statements of the character of the things offered for sale. With the enormous development of the patent medicine industry after the Civil War advertising assumed a more complicated technique. Illustrations were required, and a nice adjustment of character of advertisement to territory covered. In the 80's and 90's there was a great development of advertising through illustrated catalogues. Examples of businesses built up through such advertising are the "mail order houses" and the garden seed concerns. After 1890 there was a vast increase in the production of trade-marked articles of personal and household use which were wholly dependent upon advertising for a market. The "advertising campaign" became a characteristic feature of American business. The management of such campaigns made necessary the development of a new type of advertising agency, well supplied with capital, having at its command a corps of highly trained writers and illustrators and possessing a complicated technical apparatus in the form of records of advertising experience, etc.

Advertising methods are still essentially empirical. Whether a given form of advertising will be profitable is left to the judgment of advertising experts, and in many cases an elaborate and expensive campaign proves fruitless.

A business advertising in many newspapers and other periodicals of various classes usually attempts, through direct or indirect means, to ascertain how much business is secured through each medium or through each form of advertisement. In this way wasteful and ineffective advertisements are gradually eliminated. Since, however, novelty is an important factor in securing public attention, this process of experimentation must go on continuously. It has been urged that by the employment of experimental psychology much of the waste of ineffective advertisements could be avoided. Experiments have been carried on in the laboratories of Professor Münsterberg at Harvard and Prof. W. D. Scott at Northwestern University with a view to establishing the effectiveness of scientific methods in advertising. Practical advertisers, while admitting the value of such studies, are generally skeptical as to the possibility of reproducing in the laboratory the conditions which the business advertisers must meet.

Efforts to Prevent Abuses in Advertising. The choice of farmers' barns and fences and more especially of rocks and prominent scenic effects for the placing of advertisements has led to various efforts to stop such abuses. A number of London societies interested in preserving historical sites or beautiful places incidentally make efforts in this direction. The Society for Checking Abuses in Public Advertising—now generally known as "Scapa" (q.v.)—is the leader in this work. It publishes circulars and asks for parliamentary action. Dr. G. Alder Blumer, Superintendent of the State Asylum at Utica, N. Y., started a crusade in 1898 to preserve the rural scenery in that vicinity. He obtained farmers' addresses from the Good Roads League and sent them Scapa circulars. The New York Central Railroad has made an effort to get rid of unsightly advertising along its line. The nuisance of circulars has been met in some cities, as in Philadelphia, by ordinances forbidding their distribution. The city of Chicago attempts to regulate advertising on the streets through restrictions upon the size of bill-boards, etc. A tax upon bill-boards, graduated according to area, has been employed in some European cities and has been urged upon various legislatures in the United States.

Bibliography. Quarterly publications of American Statistical Association, vii, New Series, No. 52 (Boston, 1900); Chauncey M. Depew, *One Hundred Years of American Commerce* (New York, 1891); W. D. Scott, *The Theory of Advertising* (Boston, 1903); Id., *Influencing Business Men* (New York, 1911); Calkins and Holden, *Modern Advertising* (New York, 1909); T. D. MacGregor, *Pushing Your Business* (New York, 1911); H. Münsterberg, *Psychology and Industrial Efficiency* (Boston, 1913).

ADVICE. See BILL OF EXCHANGE.

AD'VOCATE (Lat. *advocatus*, one called to aid, from *ad*, to + *vocare*, to call). In the time of Cicero the term *advocatus* was not applied to the patron or orator who pleaded in public, but rather, in strict accordance with the etymology of the word, to any one who in any piece of business was called in to assist another. Ulpian defined an advocate to be any person who aids another in the conduct of a suit or action (Digest 50, title 13), and in other parts of the Digest it is used as equivalent to an orator (see also Tacit., *Annal.*, x, 6), so that the word would

seem gradually to have assumed its modern meaning. The office of the advocate or barrister who conducted the cause in public was, in Rome, altogether distinct from that of the *procurator*, or attorney, or agent who represented the person of the client in the litigation, and furnished the advocate with information regarding the facts of the case. The distinction between these two occupations is still observed in Great Britain, but in many of the States of Germany, in Geneva, in the United States, and in some of the British colonies, as, for example, in Canada, they are united in the same person. In England and Ireland advocates are called barristers, under which title will be found a statement of the duties and responsibilities which the advocate undertakes to his client and of the state of the profession in these countries. In Scotland, as in France, the more ancient name has been retained. In France the *avocat* and *avoué* correspond very nearly to the barrister and attorney in England. The French advocate is simply a free man who has graduated in law and possesses the privilege of addressing the tribunals. The advocates who practice in each court form a separate college, admission to which can be obtained only with the approval of those who are already members. The French advocate possesses the same privileges as to irresponsibility for his advice, and for the facts contained in his instructions, which belong to members of the corresponding branch of the legal profession in Great Britain. As he has no action for his fees, they are required to be paid in advance. His functions correspond to those of the counsel, as distinguished from the attorney-at-law, in the United States. In Belgium, in Geneva, and also in those of the German States in which the Code Napoléon has been adopted, the organization and discipline of this branch of the legal profession are similar to those which prevail in France. In the other German States, with the exception of Saxony, the formation of the advocates into a body has been perseveringly resisted by the governments. See ATTORNEY.

ADVOCATE, LORD. The public prosecutor of crimes in Scotland, senior counsel for the crown in civil causes, and a political functionary of great importance in the administration of Scottish affairs. He may issue warrants of arrest and imprisonment in any part of Scotland, is entitled to plead within the bar, and possesses many other discretionary and indefinite powers. He is a member of Parliament and, as first law-officer of the crown for Scotland, is expected to answer all questions relating to the business of Scotland and to take the superintendence of legislation for that portion of the United Kingdom. The corresponding office in the English system, that of the king's or queen's advocate, once of equal dignity and importance, has lately become obsolete, and its functions devolve upon the attorney-general and the solicitor-general (q.v.). In some of the English colonies and in the Indian presidencies, however, the title "advocate" is retained to describe the chief law officer of the crown. Consult Bell, *Dictionary and Digest of Law of Scotland* (Edinburgh, 1890).

AD'VOCATES, FACULTY OF. An incorporated society in Scotland, composed of about 400 lawyers who practice in the highest courts. Applicants for admission are required to pass an examination following a prescribed course of study. From the membership vacancies on the bench are supplied.

ADVOCA'TUS DIAB'OLI, dī-āb'ō-lī (Lat. the devil's advocate). In the Roman Catholic church, when it is proposed that a sanctified person shall be canonized, an examination of his past life takes place. In this process one party holds the office of accuser, or *advocatus diaboli*, and it is his duty to bring forward all possible objections against the proposed canonization; while, on the other side, the *advocatus Dei* (God's advocate) undertakes the defense. Hence the term *advocatus diaboli* has been applied to designate any person who brings forward malicious accusations. See CANONIZATION.

ADVOW'SON (A. Fr. *advœson*, OF. *avoesson*, patronage, from Lat. *advocatio*, legal assistance). In English law, the right, as patron, to present or appoint a curate to a church or ecclesiastical benefice. Advowsons are either appendant or in gross. Lords of manors were originally the only founders and the only patrons of churches, and the advowsons, when created, were usually made an incident or appurtenance to the manorial estate, which would pass with it upon alienation. So long as the advowson continues annexed or appended to the manor, it is called an advowson appendant. Such rights are conveyed with the manor as incident thereto by a grant of the manor only, without adding any other words. But where the advowson is created independently of the manor, or has been once separated from the property of the manor by legal conveyance, it is called an advowson in gross or at large. It is thus no longer incident to the property of the manor, and may be conveyed and disposed of independently of it. Advowsons are classed by Blackstone as the first of the incorporeal hereditaments, and they still constitute in England an important class of property interests. They do not exist in the United States. Consult Stephen, *New Commentaries on the Laws of England* (13th ed., London, 1899); Phillimore, *Ecclesiastical Law of the Church of England* (2d ed., London, 1895); Addy, *Church and Manor* (London, 1913).

ADY, ā'dī (Mrs. HENRY) JULIA (CARTWRIGHT). An English writer and art critic. She was born at Edgcott, Northamptonshire, and was educated privately. In 1880 she married Rev. W. H. Ady. Her published writings include, besides numerous novels and contributions to reviews and magazines: *The Pilgrim's Way* (1892); *Sacharissa* (1893); *Madame: The Life and Letters of Henrietta, Duchesse of Orleans* (1894); *Life and Work of Sir Edward Burne-Jones* (1894); *J. F. Millet: His Life and Letters* (1896); *Life and Letters of J. G. F. Watts* (1896); *Bastien-Lepage* (1895); *Christ and His Mother in Italian Art* (1897); *Beatrice d'Este, Duchess of Milan* (1899); *The Painters of Florence* (1901); *Isabella d'Este, a Study of the Renaissance* (1903); *Sandro Botticelli* (1904); *Raphael* (1905); *Hampton Court* (1909), *The Life of Christian of Denmark* (1913).

ADYE, ā'dī, Sir JOHN MILLER (1819-1900). An English soldier. He was educated at the Royal Military Academy, Woolwich, entered the Royal Artillery in 1836, and was Assistant Adjutant-General of the Royal Artillery in the Crimean War. He also served during the Indian mutiny in several important actions and in various other Indian campaigns. He was Director-General of Artillery from 1870 to 1875, and from 1875 to 1880 Governor of the Royal

Military Academy at Woolwich. He was promoted in 1879 to be Lieutenant-General, and in 1882 was Chief-of-Staff of the expedition to Egypt. He was Governor of Gibraltar from 1883 to 1886, when he retired from active service. He published *The Defense of Cawnpore* (1858); *Sitana: a Mountain Campaign; On the Borders of Afghanistan in 1863* (1867); *Recollections of a Military Life* (London, 1895); and *Indian Frontier Policy* (1897).

AD'YTUM (Lat. from Gk. ἄδυτον, *adyton*, the innermost sanctuary, from ἀ, *a*, priv. + δύνειν, *dyein*, to enter). The most sacred part of a building, usually associated with secrecy and darkness, because in Greek and Egyptian temples, with which the term originated, it designated a furthestmost recess not accessible to the people. See TEMPLE.

ADZE. See AXE.

ÆACIDES, ē-ās'i-dēs (Gk. Αἰακίδης, *Aiakidēs*). A patronymic of Achilles, as the descendant of Æacus, his grandfather.

ÆACUS, ē-ā-kūs (Gk. Αἶακος, *Aiakos*). The fabled son of Zeus and Ægina, and King of Ægina; the father of Telamon and Peleus. He was so renowned for justice that not only men but the gods sought his decisions. After death Pluto made him one of the judges in Hades.

ÆEBY, or **ÄBY**, ě'bě, CHRISTOPH THEODOR (1835-85). A Swiss anatomist and anthropologist, born near Pfalzburg, Lorraine. He studied medicine at Basel and Göttingen. In 1863 he was made professor of anatomy at Bern, and in 1884 at the University at Prague. He is best known for his contributions to anthropology, which include a new and valuable craniometric method. He also demonstrated the influence of atmospheric pressure on the several joints of the human body. His published works include *Untersuchungen über die Fortpflanzungsgeschwindigkeit der Reizung in der quergestreiften Muskelfaser* (Brunswick, 1862); *Eine neue Methode zur Bestimmung der Schädelform von Menschen und Säugetieren* (Brunswick, 1862); *Die Schädel formen des Menschen und der Affen* (Leipzig, 1867); *Ueber das Verhältnis der Mikrocephalie zum Atavismus* (Stuttgart, 1878).

ÆCIDIOMYCE'TES, ē-sīd'i-ō-mī-sē'tēz (*æcidium*, see below + Gk. nom. pl. μύκητες, *mykētes*, mushrooms, fungi). A group name formerly used to include the "smuts" and "rusts," and referring to the appearance of an "æcidium" in the life history of many rusts. See UREDINALES.

ÆCID'IUM (dimin. of Gk. αἰκία, *aikia*, injury), or CLUSTER CUP. One form of spore cluster ("sorus") of the parasitic fungi called "rusts." See UREDINALES.

ÆDIC'ULA (Lat., a small building, dimin. of *ædes*, building). In Roman literature, a designation for a small house or for part of a house; in modern usage, applied to chapels, shrines, or free-standing niches containing statues, and to sepulchral monuments in the form of little temples or chambers. In the large temples this name was given to architectural apses or niches containing statues, and even to little portable models given as votive offerings. During the Middle Ages the founders of churches were often represented in sculptures or paintings holding the model of the church; such models were termed "ædiculæ." The term may also be used to designate almost any small structure of a decorative or votive character.

ÆDILES, ē'dilz. In ancient Rome, a sort of commissioners of public works, with general

supervision over the public buildings (*ædes*), the cleansing and paving of the streets, the public games and spectacles, the water-supply, the inspection of weights and measures, and the market regulations. In connection with the public games, baths, taverns, and the like they had also police duties. At first, from 494 B.C., there were only two ædiles, both plebeians, elected by the plebs; their name, Ædiles Cereales, was derived from their headquarters, the Ædes Cereris. Afterward, two others, styled Ædiles Curules, were chosen at first from the patricians (366 B.C.), but later in alternate years from the patricians and the plebeians. Julius Cæsar appointed a new order of Ædiles Cereales to take charge of the public granaries. See A. H. J. Greenridge, *Roman Public Life* (1901); J. E. Granrud, *Roman Constitutional History* (1902); F. F. Abbott, *Roman Political Institutions* (1901); Botsford, *The Roman Assemblies* (New York, 1909).

ÆDUI, or **HÆDUI**, ěd'û-ī or hed'û-ī. A people of Gaul, between the Saône and the Loire, the first Gallic tribe that formed an alliance with the Romans, who therefore called them "Brothers of the Roman People" (Cæsar, *B. G.*, i, 33). Their chief town was Bibracte (Mont-Beuvray), which they later abandoned for Augustodunum (Autun).

ÆGA'DIAN ISLANDS (ancient ÆGA'TES). A group of three small islands situated directly off the west coast of Sicily and forming a part of the Italian province of Trapani (Map: Italy, G 10). They consist of the islands of Favignana, the largest and best populated of the group, Maritimo, and Levanzo. The total area is about 16 square miles. The island of Favignana is very fertile and has good tunny fisheries. The population of the group is about 6000, of whom nearly 5000 are found on the island of Favignana. In 241 B.C. the Romans, under Lutatius Catulus, achieved a great naval victory over the Carthaginians off these islands, which brought the first Punic War to a close. The islands belonged to the Pallavicini family of Genoa from the middle of the seventeenth century until 1874.

ÆGÆON, ê-jě'ōn (Gk. *Αἰγαίων*, *Aigaiōn*). In Greek mythology, the name by which, according to the *Iliad*, i, 403, Briareus (q.v.) was known among men.

ÆGA'TES, or **ÆGA'TES IN'SULÆ**. See ÆGADIAN ISLANDS.

ÆGA'TIAN ISLANDS. See ÆGADIAN ISLANDS.

ÆGEEAN ISLANDS. The islands of the Ægean Sea (see ARCHIPELAGO). They comprise the following: Thasos, in the extreme north, off the Macedonian coast; Samothrace, Imbros, and Lemnos, near the Dardanelles; Eubœa, the largest of all, lying close along the east coast of the Greek peninsula; the northern Sporades, including Skiathos, Skopelos, and Skyros, near Eubœa; Lesbos, Chios, Samos, and the large group of other Sporades, such as Rhodes, Cos, and Patmos, adjacent to the coast of Asia Minor; and, finally, the large group, the Cyclades, extending southward from Eubœa toward Crete and including Andros, Delos, Naxos, Paros, and Melos. The islands are of volcanic origin, have a healthful climate and beautiful scenery, and are peopled mainly by Greeks. In ancient times they played a conspicuous part in the course of Greek history, giving to the world poets and philosophers. In the fifteenth and sixteenth centuries all the islands passed under Turk-

ish dominion. In 1832 Eubœa, the northern Sporades, and the Cyclades were united with the independent Greek kingdom, and in 1835 Samos, while remaining under Turkish suzerainty, was erected into an autonomous principality under the joint protection of France, Great Britain, and Russia. In the course of the Turco-Italian War of 1911-12 (q.v.) the Italians seized 12 of the Sporades, including Rhodes and Patmos, but promised by the Treaty of Lausanne (Oct. 15, 1912) to surrender them on condition that the Porte should accord effective reforms to the Christian inhabitants. During the Balkan War of 1912-13 (q.v.) the Greeks occupied all the Turkish islands in the Ægean except those held by the Italians. The Treaty of London (May 30, 1913) left the final disposition of the islands in the hands of the European Powers. For a more detailed description, see CYCLADES; SPORADES; and individual islands.

ÆGE'AN SEA. See ARCHIPELAGO.

ÆGE'ON. In Shakespeare's *Comedy of Errors* (q.v.), the merchant of Syracuse.

Æ'GERI'IDÆ. A family of moths. See CLEARWING.

ÆGEUS, ē'jūs or ē'jě-ūs (Gk. *Αἰγέως*, *Aigeus*). King of Athens, son of Pandion. He was the father of Theseus (q.v.) and by the latter was restored to the throne of Athens, of which he had been deprived by his brother Pallas. When Theseus set out for Crete to deliver his country from the tribute of Athenian lads and lasses it had to pay Minos (q.v.) for the Minotaur (q.v.), he put black sails on his funeral ship, but agreed in case he conquered the Minotaur to exchange these black sails for white. On approaching the coast of Attica he forgot his promise, and Ægeus, believing his son lost, threw himself into the sea, which, according to tradition, was named "Ægean" after him. Ægeus is supposed to have introduced the worship of Aphrodite into Athens, where he himself was honored with a *herōōn*, or shrine.

ÆGIDI, ā-gě'dě, LUDWIG KARL (1825-1901). A German jurist, politician, and author, born at Tilsit and educated at the universities of Königsberg, Berlin, and Heidelberg. He was editor of the *Konstitutionelle Zeitung* until January, 1851, and extraordinary professor at Erlangen from 1857 to 1859. During the Italian war he published, while in the service of the Russian ministry, the famous anti-Austrian pamphlet entitled *Preussen und der Friede von Villafranca* (1859), which was followed by *Suum Cuique: Denkschrift über Preussen* (1859) and *Der deutsche Kern der italienischen Frage*. Afterward he was a professor at the universities of Hamburg, Bonn, and Berlin, and served as a member of the Prussian Chamber of Deputies (1867-68, 1873-93), and as Councilor of Legation in the Foreign Office. He published numerous writings, among which the following is perhaps the most important: *Das Staatsarchiv, Sammlung der officiellen Aktenstücke zur Geschichte der Gegenwart* (in collaboration with Klauhold, Hamburg, 1861-71; afterward continued by Hans Delbrück, and since 1894 by G. Roloff).

ÆGIDIUS, ê-jid'ī-ūs. See GILES, SAINT.

ÆGI'NA (Gk. *Αἴγινα*, *Aigina*). Now EGINA. An island forming part of the kingdom of Greece, about 33 square miles in extent, in the ancient Saronic Sinus, now the Gulf of Ægina, between Argolis and Attica. It is mountainous, with deep valleys and chasms, and the coast af-

fords only one haven, on the northwest. The modern town of Egina stands on the site of the ancient town, at the northwest end of the island. The island contains about 8200 inhabitants, who are chiefly occupied in trade, navigation, and agriculture. The soil produces the best almonds in Greece, with wine, oil, grain, and various fruits. An ancient legend derived the name of the island from the nymph Ægina, daughter of the river god Æsopus, who was brought to it by Zeus, by whom she became the mother of Æacus, famed for his justice. The ancient Achæan population was driven out by Dorians from Epidaurus, who built up one of the richest trading cities in Greece. It was said that money was minted first on Ægina. The Æginetans took a prominent part in the defeat of the Persians at Salamis, but with the growth of the Athenian power they were first forced to become tributary to Athens and in 431 B.C. were expelled from the island. They were later restored by Lysander, but the island never recovered its old position. See ÆACUS; ÆGINETAN SCULPTURES; TALENT.

ÆGINA, or **AIGINA**, GULF OF (the ancient SARONIC GULF). An arm of the Ægean Sea, between the Peloponnesus and Attica, and separated from the Gulf of Corinth by the Isthmus of Corinth (Map: Greece, D 6). In the Gulf of Ægina are the islands of Salamis and Ægina.

ÆGINETA, ěj'i-nĕ'tā, PAULUS (Gk. Παῦλος) (latter half of seventh century, A.D.). A Greek physician, born in the island of Ægina, from which he took his name. Of the details of his life little is known, save that he was a great traveler; his medical works were highly prized, though they were little more than compilations from earlier writers. The chief of these is still extant, *De Re Medica Libri Septem*, last edited by Briau (Paris, 1855). This work was translated into Arabic; there is an English version by Adams (London, 1834). See Krumbacher, *Byzantinische Litteraturgeschichte*, pp. 614, 616 (Munich, 1897).

ÆGINE'TAN SCULP'TURES. The small island of Ægina holds an important position in the history of early Grecian art, as the seat of a famous school of bronze workers, whose

which indicate that the temple was not dedicated to Athena, as had been believed, but to an Æginetan goddess, Aphæa, of whom little is otherwise known; her name appears in full on two inscriptions, in part on two others, all found within the sanctuary. By some scholars, however, the ascription of the temple to Aphæa is still questioned. The temple was built in the earlier part of the fifth century B.C. New fragments of the pedimental sculptures were found, which throw light on the groups represented in the pediments. The statues in the pediments are somewhat under life size. In the centre of each pediment stood Athena, with groups of fighting warriors about her. It is probable that in the eastern pediment was represented the Trojan expedition of Hercules, in the other that of Agamemnon. In both pediments the figures were symmetrically arranged. These sculptures are among the best works of archaic Greek art, of which they were for a long time almost the only examples. The figures are carefully modeled, and the anatomy is in general good, but the treatment is somewhat dry and hard, in spite of an evident effort to give a realistic character to the groups. The sculptures of the eastern pediment show a decided superiority in this respect, and in particular have nearly lost the "archaic smile" which appears in the companion group. Both groups testify to the high quality of Æginetan art as early as 480 B.C. For an account of the excavations consult Cockerell, *The Temples of Ægina and Bassæ* (London, 1860), and more especially, Furtwängler, *Ægina. Das Heiligthum der Aphæa* (1906). For a convenient discussion of the latter book, see *American Journal of Philology*, xxviii, 329-335. For an account of the sculptures, see Furtwängler, *Kurze Beschreibung der Glyptothek* (Munich, 1900), *Sitzungsberichte der Bayerischen Akademie* (1901), and *Ægina. Das Heiligthum der Aphaia* (1906). For illustrations, see Furtwängler, *Ein Hundert Tafeln nach den Bildwerken der Kgl. Glyptothek zu München* (1903).

ÆGIR, ě'jir or â'jir. A Norse deity who presides over stormy oceans and entertains the gods with foaming ale. His wife is Ran, who tries to

WESTERN PEDIMENT OF THE TEMPLE OF PALLAS AT ÆGINA.

most celebrated artist was Onatas (about 490-460 B.C.). The school was especially noted for its statues of athletes and seems to be connected with the Peloponnesian art. On an eminence in the northeastern part of the island stand the ruins of a temple, where in 1811 excavations conducted by Cockerell, von Haller, Foster, and Linckh brought to light fragments of sculpture, which were bought by the Crown Prince, Louis of Bavaria, and, after restoration (not always correct) by Thorwaldsen, set up in the Glyptothek at Munich. In 1901 Prof. A. Furtwängler began new excavations on this site in behalf of the Prince Regent of Bavaria. These excavations have yielded a number of important fragments of the pediment sculptures, as well as of other statues and some inscriptions, four of

catch voyagers in her net and wreck their ships. They have nine daughters, the waves of the sea, whose names suggest the different appearances of the ocean.

Æ'GIS (Gk. αἴγῖς, *aigis*, a rushing storm, from ἀίσσειν, *aïssein*, to move violently, or αἴγῖς, *aigis*, a goat-skin). In the Greek epic, sometimes the shield of Zeus, which had been fashioned by Hephæstus, sometimes the whirlwind that drives the storm-cloud, ascribed to Zeus as his shield because he was god of the weather. Later writers explained it as the skin of the goat Amalthea (q.v.), which had suckled Zeus, with the Gorgon's head in the centre. (See GORGO.) In works of art it is sometimes borne by Zeus and is a regular attribute of Athena.

ÆGIS'THUS (Gk. Αἰγισθος, *Aigisthos*). The

son of Thyestes and adopted son of Atreus. During the absence of Agamemnon at Troy he seduced Clytemnestra, wife of Agamemnon, and helped her murder Agamemnon after the latter returned from Troy. Ægisthus was subsequently killed by Agamemnon's son Orestes. The story forms the subject of the Oresteian trilogy of Æschylus. See ÆSCHYLUS; ATREUS; AGAMEMNON; CLYTEMNESTRA; ORESTES.

ÆGIUM (Gk. Αἴγιον, *Aigion*). A town of Achaia, near the coast, west of the mouth of the Selinus River. According to one legend it was the birthplace of Zeus, who was the principal divinity of the place. After the destruction of Helice, Ægium became the chief city of the Achæan League (see ACHÆA), and the delegates of the league had their place of meeting in a grove near the town. The modern town is Vostitza, but it is officially called by its ancient name.

ÆGLE, ē'glê (Gk. Αἴγλη, *Aiglê*, Radiance, a Greek divinity). A genus of two or three species belonging to the family Rutaceæ, very nearly related to *Citrus* (lemon, orange, etc.), from which it is distinguished by the gourd-like rind of the fruit and the woolly seeds. *Ægle marmelos*, of tropical Asia, is the tree whose fruit is called "elephant apple," "Bengal quince," "bhel fruit," etc. The fruit is delicious, fragrant, and nutritious. In an imperfectly ripened state it is an astringent of great effect in cases of diarrhœa and dysentery, and as such has lately been introduced into English medical practice. The root, bark, and leaves are also used as medicinals. The Dutch in Ceylon prepare a perfume from the rind of the fruit, and the mucus of the seed is employed as a cement for many purposes.

ÆGOSPOTAMI. See ÆGOSPOTAMOS.

Æ'GOSPOT'AMOS (Gk. Αἴγός, *Aigos*, gen. of αἶξ, *aix*, goat + ποταμός, *potamos*, river). A river and town on the eastern coast of the Thracian Chersonese. (See CHERSONESUS.) The Lacedæmonians under Lysander here surprised and captured the Athenian fleet in 405 B.C., and thus brought the Peloponnesian war to an end. The name is also written Ægospotami. The ancient town was near the modern village of Jumaliköi.

ÆGYPTUS (Gk. Αἴγυπτος, *Aigyptos*). In Greek legend, a brother of Danaüs and King of Arabia, who conquered the region to which he gave the name of Egypt. His 50 sons followed their 50 cousins, the daughters of Danaüs, to Argos and married them; on the wedding night all, with the exception of Lynceus, were murdered by their brides. See ÆSCHYLUS (in the account of "The Suppliants"); DANAUS; EGYPT.

ÆHRENTHAL, â'ren-täl, ALOIS LEXA, COUNT VON (1854-1912). An Austro-Hungarian statesman. He was born Sept. 27, 1854, and was educated at the universities of Bonn and Prague. In 1877 he entered the diplomatic service, and after occupying subordinate positions in the Austro-Hungarian embassies in Paris and St. Petersburg and in the Foreign Office in Vienna he was, in 1888, appointed Minister to Rumania. He showed such skill in diplomacy that in the following year he was given the important post of Ambassador to Russia. After serving in St. Petersburg until 1906 he was in that year appointed Premier and Minister of Foreign Affairs. His influence in European affairs soon began to be felt. Before two years had passed Austria had, largely through his efforts, and in the face of strong opposition in the European

capitals, annexed the Turkish provinces of Bosnia and Herzegovina (q.v.), which, since the Treaty of Berlin in 1878, had been under an Austrian protectorate. The seizure of these provinces was said to be the conception of the Archduke Franz Ferdinand, the heir-apparent, and he found a strong and skillful ally in Von Aehrenthal. In 1910, however, the latter broke away from the aggressive party in Austrian politics and placed himself at the head of the peace party, insisting especially on a pacific attitude toward Italy, which was then on the verge of the war with Turkey for the possession of Tripoli. Franz Ferdinand became bitterly offended with Von Aehrenthal. The quarrel between the two was laid before the Emperor Franz Joseph for adjudication, and the Premier placed his resignation in the Emperor's hands. The latter gave unqualified support to the peace policy, and this marked a great triumph for Von Aehrenthal. It was, however, his last success. His health already had been broken, and the strain of his struggle with the Archduke completed the wreck. He died Feb. 17, 1912. See AUSTRIA-HUNGARY.

ÆLFRIC (äl'frik) **THE GRAMMA'RIAN** (c.950-c.1021). The author of some of the best Old English prose extant. The only material—and it is slight—for constructing the life of this scholar is contained in his own works. The place of his birth is unknown, but the date of it must have been somewhere between 950 and 955. After studying with a poorly educated "mass-priest," he entered the Benedictine school at Winchester (about 972), where he remained "many years." In 987, then "a monk and mass-priest," he was summoned to rule over the abbey of Cernel in Dorset. There he was engaged in preaching and in giving instruction to monks and to young men. Afterward, probably in 1006, he was made abbot of Eynsham, in the valley of the Thames above Oxford. It is conjectured that he died between 1020 and 1025. Ælfric is best known by his *Homilies*, written in pure and vigorous English. Among his other works are *A Treatise on the Old and New Testaments*, the *Heptateuchus*, an abridged translation of the first seven books of the Old Testament, a Latin grammar and glossary, written in English for the boys of England, and the *Colloquium*, which was designed to teach them to speak Latin correctly. Because of these last two books he is accorded the title of grammarian. For the best account of Ælfric and a bibliography of his works and of critical editions, consult C. L. White, *Ælfric*, a new study of his life and writings, in *Yale Studies in English* (Boston, 1898); Westlake, in *Cambridge History of English Literature*, vol. i (1907); Gem, *An Anglo-Saxon Abbot, Ælfric of Eynsham* (Edinburgh, 1912).

ÆLFTHRYTH, älf'thrith (Latinized *Elfrida*) (c.945-1000). An Anglo-Saxon queen, mother of Æthelred II. Her first husband was Æthelwald, the ealdorman of the East Anglians, and after his death she married King Eadgar, the father of Æthelred II. She is said to have instigated the murder of her stepson, Eadward, at Corfe, in order to secure the accession of Æthelred II. Consult Erich Schmidt, *Elfridedramen* (1886).

ÆLIA CAP'ITOLI'NA. The name given to Jerusalem by the Emperor Hadrian (Ælius Hadrianus), who expelled the Jews after the insurrection of 132-135 A.D. and colonized the

city with Romans. The name continued until the time of the Christian emperors.

ÆLIA GENS. One of the plebeian gentes (see GENS) at Rome, to which belonged Ælius Sejanus, and the emperors Hadrian and the Antonines. It included also, among others, the families of Gallus, Lamia, Pætus, and Tubero.

ÆLIA LÆLIA CRISPIS. The subject of a very celebrated enigmatical inscription preserved at Bologna. It has been puzzled over by many learned men, but never solved. The inscription begins:

Ælia Lælia Crispis,
Nec vir, nec mulier, nec androgyna;
Nec puella, nec iuvenis, nec anus;
Nec meretrix, nec pudica;
Sed omnia. . . .

'Ælia Lælia Crispis,
Neither man, nor woman, nor hermaphrodite;
Neither girl, nor youth, nor grandmother;
Neither vicious nor virtuous
But all [of them].' . . .

ÆLIA'NUS, CLAUDIUS. A writer who was born at Præneste in Italy and flourished in the latter part of the second century A.D. He wrote exclusively in Greek in an entertaining fashion, but the information contained in his writings was drawn most uncritically from the works of his predecessors. His extant writings are *On the Nature of Animals*, in 17 books, filled with curious accounts of the nature and ways of animals, and with moral reflections on the same, very valuable for its many excerpts from earlier writers, and his *Miscellanies* (*Varia Historia*), in 14 books. The latter is preserved only in an abbreviated form, and is almost wholly a collection of anecdotes and marvelous tales relating to men. The 20 *Rustic Letters* current under his name are generally reckoned spurious. His works are best edited by Hercher (1858 and 1864); the best annotated edition is by Schneider (1784). The editions of the *Varia Historia*, by Perizonius (1701), and *De Animalium Natura*, by Jacobs (1831), also deserve mention.

ÆLIANUS TACTICUS (Ἀλιανὸς Τακτικός). A Greek writer, who, about 106 A.D., wrote a work entitled *Τακτικὴ θεωρία*, *Taktikē Theōria*, 'Review of Tactics,' a treatise on Greek (Macedonian) military tactics as practiced by the successors of Alexander the Great. The work has great value, not merely for its detailed account of matters of drill and tactics, but also because Ælianus gives a careful account of the writings of his predecessors in this field. Chief among his sources was Polybius (q.v.). Ælianus's work enjoyed a high reputation; it was much used by the Byzantines, and about 1350 was translated into Arabic. In the sixteenth and the seventeenth centuries it was closely studied by professional soldiers, and much of its material was incorporated in works on tactics. It was translated into Latin by Theodore Gaza (see *Veteres De Re Militari Scriptores*, Venice, 1847); into French, by Machault, in *Milices des Grecs et Romains* (Paris, 1615); into German, on the basis of Gaza's rendering (Cologne, 1524); into English, by Bingham (London, 1616) and by Viscount Dillon (London, 1814). The text was edited, with translation, notes, and reproductions of the original illustrations, by Rüstow and Köchly, in *Griechische Kriegsschriftsteller* (Leipzig, 1855). Consult Rüstow and Köchly, *Geschichte des Griechischen Kriegswesens* (1882); P. Serre, *Etudes sur l'histoire militaire et mari-*

time des Grecs et des Romains (1887); A. de Lort-Sérignan, *La Phalange* (1880).

ÆLLO, ā-ēl'ō (Gk. ἄελλω, storm-swift, from ἄελλα, *aëlla*, whirlwind). In Greek mythology, the name of one of the Harpies (q.v.).

ÆLRED, āl'rēd, SAINT, **AILRED**, **ETHELRED** (1109-66). An English ecclesiastic and historian, born at Hexham, Northumberland. He was educated at the Scotch court, became a Cistercian monk in Rievaulx Abbey, Yorkshire, then abbot of Revesby (1142), then of Rievaulx (1146), remaining so till his death, Jan. 12, 1166. He was canonized in 1191. He was the author of many historical and theological works, the former of little value owing to their unlimited credulity. Leland says he saw Ælred's tomb at Rievaulx adorned with gold and silver ornaments. His works are in Migne, *Patrol. Lat.*, vol. cxcv.

ÆLST. See ALOST.

ÆLST, älst, **WILLEM VAN** (1626-83). A Dutch painter of still life. He was born in Delft and studied with his uncle Evert van Aelst. He passed four years in France and seven in Italy, where he attained great reputation and was known as Guglielmo d'Olanda. He finally settled and practiced at Amsterdam, devoting himself to game, fish, fruits, and flowers and employing crystal and porcelain vessels, the surfaces of which he painted with rare skill. Two of his paintings are in the Museum at The Hague, others are at Dresden, Munich, Copenhagen, and Karlsruhe. His uncle **EVERT VAN ÆLST** (1602-58) painted in a more detailed and careful manner, but with less excellence. His work is very rare.

ÆLUROIDEA, ē'lū-roi'dē-ā. See CARNIVORA.

ÆMIL'IA. A division of Italy. See EMILIA.

ÆMIL'IA GENS. A famous patrician gens at Rome (see GENS), to which belonged the family of Æmilius Lepidus, Mamercus, Paulus, Scaurus, and other well-known men.

ÆMIL'IAN WAY (Lat. *Æmilia Via*). A national highway in ancient Italy. It was built by the consul Marcus Æmilius Lepidus, in 187 B.C., to afford easy communication with Transpadane Gaul, as a part of the great centralizing schemes of Rome in her imperial march northward. It began at Ariminum (Rimini) by the Adriatic Sea, where the Flaminian Way terminated, and ran through Bononia (Bologna) to Mutina (Modena) and Parma, crossed the Po at Placentia (Piacenza), and ended at Mediolanum (Milan). Its total length was about 185 miles.

ÆMILIA VIA. See ÆMILIAN WAY.

ÆMIL'IUS PAULUS (second century B.C.). A Roman general, son of the consul Æmilius Paulus, who fell in the battle of Cannæ, 216 B.C. He inherited his father's valor and enjoyed an unwonted degree of public esteem and confidence. In 168 B.C. he was elected consul for the second time, and intrusted with the war against Perseus, King of Macedon, whom he defeated in the battle of Pydna, which left Macedonia a Roman province. Henceforth he was known as Æmilius Paulus Macedonicus. See AGNOMEN.

ÆNE'AS (Gk. Αἰνείας, *Aineias*). The hero of Vergil's *Æneid*. He was, according to Homer, the son of Anchises and Aphrodite (Venus) and was ranked next to Hector among the Trojan heroes. The traditions of his adventures before and after the fall of Troy are various and discordant. Vergil (q.v.) gives the following version: Æneas, though warned by the ghost of Hector in the night when the Greeks entered

Troy to take his household gods and flee from the city, remained in the contest until Priam fell, when, taking with him his family, he escaped from the Greeks to Mount Ida, near Troy, but in the confusion of his hasty flight lost his wife, Creüsa. Having collected a fleet of 20 vessels, he sailed to Thrace, where he began building the city of Ænos, but, terrified by an unfavorable omen, he abandoned his plan of a settlement there. A mistaken interpretation of an oracle of Delphi now led him to Crete, but from this place he was driven by a pestilence. Entering the Adriatic, he passed the promontory of Actium and came to Epirus. Later, he retraced his course and continued his voyage to Italy and round Sicily to the promontory of Drepanum on the west of the island, where his father, Anchises, died. When he set out again for Italy, a storm drove him to the coast of Africa. Landing near Carthage, he was hospitably received and entertained by Queen Dido. His sojourn with Dido was cut short by Jupiter, who sent Mercury with a command to Æneas to proceed to Italy. Accordingly, he sailed away to Sicily again, leaving the disappointed Queen, who committed suicide. During this stay in Sicily, while he was celebrating with games the anniversary of his father's death, the wives of his companions and seamen, weary of long voyages without certainty of finding a home, made an attempt to burn his fleet; four vessels were in fact burned. To provide for those for whom he had no room now in his ships and for others who were unwilling to journey farther he built in Sicily the city of Acesta and then sailed for Italy. On landing there, near Cumæ, he visited the Sibyl at Cumæ. She conducted him into the infernal regions, where he saw Anchises and received intimations of his future destiny and of the history of the Roman race. Then, sailing along the coast of Italy, he soon landed at the mouth of the Tiber and found himself in the country of Latinus, King of the Aborigines (q.v.). Lavinia, the daughter of Latinus, had been destined by the oracles to marry a stranger, but her mother had promised to give her in marriage to Turnus (q.v.), King of the Rutuli. She married Æneas, and war ensued, which terminated in the death of Turnus. Æneas Silvius, the son of Æneas by Lavinia, as the ancestor of the kings of Alba Longa, and hence of Romulus and Remus, was regarded as the founder of the Roman State. See H. Nettleship, "The Story of Æneas' Wanderings," in Conington's edition of *Vergil*, vol. ii; and Gaston Boissier in *Revue des deux Mondes* (1883). See ROME.

ÆNEAS SILVIUS. See PIUS II.

ÆNEAS TACTICUS (*Αἰνέας Τακτικός*). A Greek, who, according to Ælianus Tacticus (q.v.) and Polybius (q.v.), was among the first to write on the art of war. We still have a short Greek work, written about the middle of the fourth century B.C., which deals with the attack and the defense of strongholds. A superscription in the manuscripts ascribes this book to "Æneas or Ælianus." Casaubon (q.v.), who first edited the text, in 1609, as an appendix to his edition of Polybius, disregarded, on chronological grounds, the reference to Ælianus, and ascribed the work to the Æneas mentioned by Polybius. This Æneas he identified with Æneas of Stymphalus, in Arcadia, a general mentioned by Xenophon as fighting at Mantinea (362 B.C.). This identification has been generally accepted. But in

1904 T. Hudson Williams, in the *American Journal of Philology*, vol. xxv, not only challenged this identification, but held that the treatise cannot have been written by the Æneas named by Polybius. The work is of great value and interest, full of anecdotes, and enriched by illustrations from Thucydides and Xenophon. The text has been edited by Hercher (Berlin, 1870), and, with elaborate prologomena, by Hug (Leipzig, 1874). Consult: Beausobre, *Commentaires sur la défense des places d'Æneas* (Amsterdam, 1757); Rüstow and Köchly, *Griechische Kriegsschriftsteller*, vol. i (Leipzig, 1853); Lange, *De Æneæ Commentario Poliorcetico* (Berlin, 1879); and the bibliography attached to Williams's paper, referred to above.

ÆNEID (Lat. *Æneis*). Vergil's great epic, in which he tells the story of the Trojan Æneas (q.v.), founder of the Roman race. See VERGIL.

ÆNESIDEMUS, ē'nēs-ī-dē'mūs (Gk. *Αἰνῆσιδῆμος*, *Ainēsidēmos*) (?80-60 B.C.). A Greek philosopher of Alexandria, a contemporary of Cicero. He was born at Cnossus, in Crete. He is well known as the probable author of *Pyrrhonian Principles*, the first part of which deals with the *Ten Tropes*, which Sextus Empiricus enumerates, saying that they had become traditional property of the skeptics (q.v.) of his day. Tropes (Gk. *τρόποι*, *tropoi*) are methods of proving the validity of skepticism. These arguments are based (1) on differences in the constitution of sentient beings, which involve differences in perceptions and conceptions of the world; (2) on differences of human beings; (3) on differences of sense-organs; (4) on differences in circumstances under which perception occurs; (5) on differences of location and distance of objects perceived; (6) on the confusion of one object with another; (7) on differences in a sensation due to different combinations in which it appears; (8) on the relativity of knowledge in general; (9) on differences in perception due to familiarity or unfamiliarity with the object; (10) on differences observed between the civilizations, morals, laws, superstitions, and philosophical theories of different peoples. The second part of Ænesidemus's above-named work contained an attack upon the principle of causality and on the attempt to attain truth, the latter being shown to be variable. His argument against causality is that it exists only in the mind that perceives, for the reason that the external relation between cause and effect is inconceivable. Two things are either simultaneous or successive, and, if simultaneous, causality is inoperative; if successive, cause must precede effect, and a moment of time is to be supposed when cause does not effect anything or virtually is non-existent. The latter part of his book disposes of morality and all good. He is the prototype of the skeptic attitude of mind. Consult E. E. Saisset, *Le scepticisme* (Paris, 1865); Schultze, *Ænesidemus* (Berlin, 1911). See RELATIVITY, LAW OF.

ÆNIA'NES. An Achæan tribe of Thessaly, in northern Greece. In historic times they lived in the mountains west of Thermopylæ. They were members of the Delphian Amphictyony and of the Ætolian League. See AMPHICTYONIC COUNCIL; ÆTOLIA.

ÆNOBARBUS (Lat. *æneus*, bronze, *barba*, beard, bronze-beard). A cognomen (q.v.) borne by some members of the Domitia Gens (q.v.).

ÆNON (explained in the New Testament as

“many springs”). A locality mentioned in John iii. 23 as a place where John the Baptist was baptizing. It is characterized as being “near Salim” and as having an abundant water supply. Three sites have been proposed as complying with this description: (1) A town called Ainun, in the valley that leads up toward Shechem, about 7 miles from the ancient town of Salem, where there are extensive ruins and many springs; (2) on the basis of statements in Eusebius and Jerome, a place called Silvia (= Salem?), about 8 Roman miles south of Scythopolis, the old Bethshean; (3) a spot in the *Wady Fâr'ah*, some 6 miles northeast of Jerusalem, containing beautiful pools of water, within 2 miles of which is another valley called by the Arabs *Wady Saleim*. The last identification seems the best, in so far as it locates the place of the Baptist's ministry in Judæa rather than in Samaria.

ÆOLIAN ACCUMULATIONS (from *Æolus*, the god of the winds). Dust, fine particles of soil, and even sand grains of a diameter of two millimeters are transported by the wind and brought together in sheltered places, in much the same manner as these particles are transported and deposited by water. Such æolian accumulations occur in both humid and arid regions, though they attain a more pronounced degree of development in those regions of little rainfall, where the scant vegetation permits the usually powerful winds to exert a considerable erosive action upon the much weathered rocks and dry soil. In humid regions deposits of this nature may be found along the coasts of seas and ocean and also upon upland plains, where the superficial layers of the earth's crust consist of loose sand that may be easily blown away, to be accumulated elsewhere as sand-dunes. In arid regions, dust and sand are being continually transported and deposited in distant places, there to form æolian deposits which are often of considerable geological and also of economic importance. Desert sands traverse wide areas, burying vegetation that may be in the way, even sometimes destroying forests. On the other hand, the fine calcareous dust blown over the prairies of the West settles in the grass and adds to the fertile covering of soil. The fertility of many regions of the Missouri valley is undoubtedly due to these wind-deposited soils, which are known under the name of “loess”; some of the loess is, however, of aqueous origin. Æolian accumulations have been recognized also in ancient rock formations of various geological systems, notably the Cambrian, Devonian, Jurassic, etc. For description of the erosive and transporting power of wind, and for the characters and distribution of the various kinds of æolian deposits, see the articles on **DESERT**; **DUNE**; **SAND**; **WIND**; and **GEOLOGY**, paragraph on *Wind Work*.

ÆOLIAN HARP. A musical instrument, consisting of a number (usually 8 or 10) of catgut strings of varying thickness tuned to produce the same fundamental tone and stretched over a narrow, oblong box. When placed in a current of air, the Æolian harp produces full chords, composed of the harmonies of the common fundamental. The sounds change from a breezy, fairy-like pianissimo to an imposing forte, which again dies away with the passing of the gust. For illustration, see **MUSICAL INSTRUMENTS**.

ÆOLIAN ISLES. See **LIPARI ISLANDS**.

ÆOL'LIANS (Gk. *Αἰολεῖς*, *Aioleis*). The name of one of the three great divisions of the Hellenic race, borne especially by the Greeks of the island of Lesbos (q.v.) and of the coast of Asia Minor north of Cyme and north of the Ionians (q.v.). Their territory was known as Æolis. They traced their descent to a mythical Æolus of Thessaly, son of Hellen (q.v.), the mythical common ancestor of the Greeks. Later writers extended the name so as to include all Greek races not Dorian or Ionian. It has been maintained that the stories of the *Iliad* originated among the Æolians. At the end of the seventh century B.C., among the Æolians, on the island of Lesbos, in the poems of Alcæus and Sappho, the personal lyric reached its highest development. The Æolians shared the fate of the other Grecian colonies in Asia Minor. First tributary to the Lydian kings, then subjected to the domination of the Persians, they became a portion of the great Empire founded by Alexander the Great, and, after passing through a stage of subjection to the dynasty of the Seleucidæ, were ultimately absorbed in the Roman Empire. See **ÆOLIS**; **ÆOLUS** (2); **HOMER**; **LYRIC POETRY**; **SAPPHO**.

ÆOL'PILE, or **ÆOL'IPYLE** (commonly explained as from Lat. *Æoli pila*, the ball of Æolus). An invention of Hero of Alexandria, often described as the first steam engine. It consists of a hollow metal sphere mounted on trunnions, through one of which steam is introduced. Short bent tubes issue from this ball at diametrically opposite points, from which steam escapes and causes the globe to revolve. A similar device can be used when the globe is filled with water or alcohol, as a blow-pipe for lamp flame. Consult: Gerland and Traumüller, *Geschichte der physikalischen Experimentierkunst* (Leipzig, 1899), for a description of this and other early apparatus; also W. Schmidt, *Heron von Alexandria* (Leipzig, 1899). It is also described in R. H. Thurston's *Growth of the Steam Engine* (New York, 1878).

HERO'S ÆOLIPILE.

ÆOLIS (Gk. *Αἰολίς*, *Aiolis*). A district on the west coast of Asia Minor, extending from the Hellespont to the river Hermus. There were about 30 Greek cities in this district, of which 12 in the southern part formed a league in early times. See **ÆOLIANS**.

ÆOLUS (Gk. *Αἰόλος*, *Aiolos*). 1. A friend of the gods and controller of the winds. In the *Odyssey* he rules a floating island. In the *Æneid* he keeps the winds confined in a cave and releases them as he wills, subject to laws imposed on him by Zeus. He was also supposed to dwell in a vast cave in the Æolian Isles (q.v.) north of Sicily, keeping the winds in bags and letting them out as demanded by Poseidon. 2. Son of Hellen (q.v.), brother of Dorus and father of Sisyphus. He ruled in Thessaly and is said to have been the founder of the Æolic branch of the Greek race.

Æ'ON (Gk. *αἰών*, *aiōn*, an age, long space of time, eternity). A term used by the Gnostics, in a peculiar sense, to designate powers that had emanated from God before the beginning of time and existed as distinct entities or spirits. They were called æons either as partaking of the eter-

nal existence of God or because they were thought to preside over the various ages and transformations of the world. See Gnostics.

ÆPINUS, ê-pī'nūs, or *Ger. pron.*, â'pē'nūs, FRANZ MARIA ULRICH THEODOR (1724-1802). A German physicist, born at Rostock. He first studied medicine, but afterward devoted himself to physics, of which he became professor in St. Petersburg in 1757. He discovered the electric properties of the mineral tourmaline, improved the microscope, and performed numerous original experiments in frictional electricity and magnetism, devising the method of magnetizing known as "double touch." He, in common with Benjamin Franklin, held the single fluid theory of electricity, in opposition to many men of his time who believed that there were two kinds of electricity. He published *Tentamen Theoriæ Electricitatis et Magnetismi* (1759). Catharine II, Empress of Russia, made him teacher to her son Paul and inspector-general of the normal schools which she proposed to establish.

ÆPYOR'NIS (Gk. *αίπυς*, *aipys*, high + *ὄρνις*, *ornis*, bird). An extinct group of ratite birds which inhabited Madagascar within recent but undetermined geological time, and 10 species of which are known from fossil remains; no evidence exists that it survived to the time of man, although it is frequently referred to as the "roc." It resembled an ostrich in general structure and appearance, but was perhaps taller, and had no wings suitable for flight, resembling in this respect its close, still living ally, Apteryx, and the extinct Dinornis and Megalapteryx, of New Zealand. Many of its huge eggs have been exhumed from the drifting sands of southern Madagascar. They measure about 9 by 13 inches, and are very large proportionately, since they are double the dimensions of ostrich eggs and much exceed those of the moa. For a circumstantial account of the collecting of its bones and eggs in Madagascar, see *Proceedings Zoological Society of London* (1894).

ÆQUI, ê'kwī, or **ÆQUICU'LI**. An ancient warlike tribe in the mountains of Central Italy, obstinate enemies of the early Romans, against whom they made alliances with the Volsci (q.v.). They were defeated by Camillus, 389 B.C., and in 304 B.C. were finally subdued. Mount Algidus was one of their strongholds, whence they made raids on Rome.

ÆRA'RIANS (Lat. *ærarii*, persons pertaining to the *ærarium*, 'the treasury,' i.e., paying taxes). A class in early Rome having no social position now definable and having no civil rights beyond the mere protection of the State. Here belonged the inhabitants of conquered towns which had been deprived of their local self-government. Since Cære was the first town to occupy such relation to Rome (about 353 B.C.), the terms *Cærites* and *ærarii* became synonymous. (See CERVETERI.) For bad conduct any citizen might be degraded to this condition, but not for life. Persons declared infamous became members of this class, and it probably included itinerant retail merchants. They were taxed, but were not subject to military service.

ÆRARIII. See ÆRARIANS.

ÆRA'RIVM (Lat., from *æs*, bronze, money). The public treasury of ancient Rome, containing the money and the accounts of the State, as well as other treasures such as the standards of the legions, the laws, graven on bronze tablets, decrees of the Senate, etc. The temple of Saturn,

at the foot of the Capitol, at the western end of the Forum (q.v.), was the place of deposit; hence this treasury was called *Ærarium Populi*, or *Ærarium Saturni*. Besides this common treasury, replenished by general taxes and charged with ordinary expenditures, there was in the same temple a reserve treasury, maintained by a tax of 5 per cent on the value of manumitted slaves, which was not to be resorted to or even entered except in extreme necessity. In addition to these treasuries, the property of the Roman people as represented by the Senate, the Emperor had a *fiscus*, or separate exchequer. To the *fiscus* went the revenues from those provinces which were assigned to the Emperor and from conquered territory, as well as from gifts by various towns in Italy and the provinces, etc. The chief charges against the *fiscus* were for the maintenance of the army and the navy, the administration of the provinces, the grain and water supply, and the care of the Tiber. Augustus established a military treasury to contain all money for the maintenance of the army; one source of revenue for this treasury was an inheritance tax of 5 per cent. Later emperors had separate private *ærariums*, containing the moneys appropriated to their private use.

AËRATED, ā'ēr-ā'tēd, **BREAD**. See BREAD.

AËRATED WATERS. Waters impregnated with carbon dioxide gas and frequently containing mineral salts. Such waters, extensively used to quench thirst, are commonly called soda waters, on account of the use of sodium bicarbonate in the original method of manufacture. Dr. Joseph Priestley (q.v.), the celebrated chemist, is credited with first producing publicly a glass of drinkable aërated soda water, and in 1806 the manufacture was undertaken in the United States, where the familiar soda-water fountain was developed. A few years later in Philadelphia the combination with fruit syrups was made popular. The carbonic acid used in making the common artificial aërated waters is prepared by treating a mineral carbonate, as chalk or lime-stone, with dilute sulphuric acid. The gas thus obtained is forced into bottles or siphons containing water, yielding a brisk, sparkling liquid with a pungent but pleasant acidulous taste. Artificial waters, similar to seltzers, vichy, and other well-known mineral waters, are produced by dissolving the known ingredients of the mineral water in distilled water and then impregnating them with carbon dioxide gas. The carbonic-acid water mixed with fruit syrups is the ordinary soda water of the pharmacy. Formerly carbonic-acid water was made on a small scale in an apparatus called a gazogene or seltzogene, in which sodium bicarbonate was decomposed by tartaric acid in the presence of water. A more recent invention was the use of capsules containing liquefied carbon dioxide. The liquid which it is desired to impregnate with the gas was placed in a specially constructed bottle, the top of which was provided with a receptacle for the capsule containing the liquefied gas; the covering of the capsule was then ruptured, setting free the acid, which was absorbed by the liquid in the bottle. Aërated waters may also be said to occur naturally, for water taken from a spring contains gases, such as oxygen, nitrogen, and carbon dioxide, dissolved in it. Similarly, running waters, such as rivers and rain waters, absorb gases

from the atmosphere, which may be expelled by boiling. Consult *A Treatise on Beverages*, by C. H. Sulz. See CARBONATED OR ACIDULOUS WATERS; MINERAL WATERS; SODA WATERS; also BOTTLING.

A'ËRA'TION (Lat. *aër*, air). In botany, the exchange of gases between living plant tis-

FIG. 1.

Diagrammatic cross-section of a leaf, showing the intercellular spaces in the interior, *i*, and in the epidermis (= stomata), *s*.

sue and the surrounding medium. This exchange is manifested by two processes. In one of these, viz., the manufacture of certain foods (see PHOTOSYNTHESIS), carbon dioxide is required by the plant and oxygen must be eliminated. On the contrary, in the other process, viz., respiration (q.v.), oxygen is necessary, and

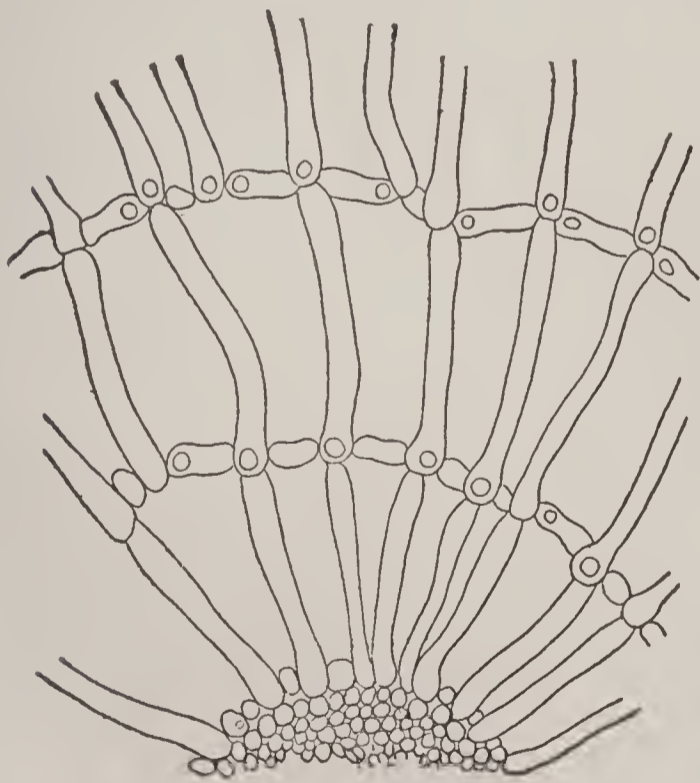

FIG. 2.

Part of a cross-section of the root of *Jussiaea*, showing aërenchyma, with enormous intercellular spaces, the cells being a mere scaffolding between the surface (not shown) and the central cylinder (at the lower margin).

carbon dioxide must be eliminated. The former process is confined to green plants; the latter is essential to all except a few of the lowest and simplest type (anaerobic bacteria). Among the smaller plants, and those whose bodies are made up of interwoven filaments (Fungi), the

gaseous exchanges can take place directly, since almost every part of the body is in contact with the air or with water. In the former case the outside gases dissolve in the constituent water of the cell-wall and are then free to enter; or, arising within the cell and being already dissolved, they pass off into the air. In water plants the free inward or outward migration of dissolved gases depends on the relative amounts inside and outside the body. (See ABSORPTION.) In the larger land plants the greater number of cells and the more compact structure make it impossible for the cells more distant from the surface to conduct the necessary changes at an adequate rate. Such plants have therefore developed an extensive aërating system (Fig. 1), consisting of irregular passages, *i*, between the interior cells, which communicate with the outer air through microscopic openings, *s*, between the surface cells (see STOMATA), or through larger breaks in the corky layers of tissue on the surface of the stems (see LENTICELS). The intercellular passages and stomata are formed by the partial separation of the cells as they mature. In land plants they are most abundant, and largest in the green parts, because the gas exchanges in food-making, photosynthesis, exceed those in respiration. In water plants, however, whose opportunity for securing gases from the air is more limited, the aërating system reaches its highest development. (See HYDROPHYTES.) The tissues may present to the eye a spongy appearance, and in some cases the canals in stems and leafstalks may even be large enough to be easily seen with the naked eye (Fig. 2). The internal atmosphere pervading these canals is voluminous enough to permit both considerable exchanges between it and the adjacent tissues and the freer diffusion of gases entering from the restricted area of organs exposed to the air. The composition of the internal atmosphere is generally different from that of the outer and varies from time to time. During the day the internal atmosphere contains less carbon dioxide and more oxygen than the external atmosphere, at night the reverse being the case. At all times the internal atmosphere contains a larger amount of water vapor, because the wetness of the cell-wall, which is necessary for gaseous exchanges, permits evaporation. The pressure of the internal atmosphere may also vary considerably from that outside. It is generally greatest in illumination and least in darkness. See TRANSPIRATION.

A'ËRA'TOR (literally, 'airer,' from Lat. *aër*, air). In dairying, an apparatus for aërating milk to remove the animal and barn odors. The milk is usually caused to run or ripple in a thin layer over an exposed surface immediately after milking, being, in most forms of apparatus, cooled at the same time by the use of ice, ice water, or cool water from wells or springs. Where aëration is combined with cooling, which removes the animal heat and thereby renders the conditions less favorable to the growth of the micro-organisms which cause souring and other changes, the keeping quality of the milk is increased. Aëration alone, however, has been found of much less benefit, and unless carried on in surroundings free from dust may even increase the opportunity for bacterial contamination. Aërotors should be simple in construction and easily cleaned.

AËRENCHYMA, *ā'ēr-ēn'kī-mā* (Gk. *ἀήρ*, *aēr*, air + *ἔγχυμα*, *enchyma*, infusion, in the

sense of a tissue). In plants, a loose, spongy tissue, which is especially common in water plants (see HYDROPHYTES), and which is supposed to facilitate aëration—whence the name. Aërenchyma is typically composed of more or less radially arranged arms of thin-walled cells inclosing large air spaces. For illustration, see AËRATION, fig. 2.

AËRIAL FAUNA, ā-ē'rī-al fā'nā. See DISTRIBUTION OF ANIMALS.

AËRIAL LAW. See NAVIGATION, AËRIAL, LAW OF.

AËRIAL PLANTS AND ROOTS. See EPIPHYTES; ROOTS.

AËRIAL POISONS. See MIASMA.

AËRIANS, ā-ē'rī-unz. A Christian sect founded in the fourth century by Aërius of Pontus. He opposed prayers for the dead and the keeping of Easter and all set fasts and asserted the equality between a bishop and a presbyter. John Glas (q.v.) wrote a scholarly monograph on the so-called heresy of Aërius (Perth, 1745), which so strikingly antedates Reformation doctrine. The original source is Epiphanius, *Adversus Hæreses*.

AËROBES. See RESPIRATION.

A'ËROCLI'NOSCOPE (Gk. ἀήρ, *aēr*, air + κλίνειν, *klinein*, to incline + σκοπεῖν, *skopein*, to watch, examine). An instrument invented by Buys Ballot and used in Holland and elsewhere as a storm signal. It consists of a vertical axis, turning on a pivot and carrying at the top a horizontal arm whose inclination can be varied. One end of this arm is painted red and the other white, and when weather conditions are normal it rests at a horizontal position. In case of falling barometer the arm is rotated so that the red end points in the direction of the storm, the amount of inclination indicating the degree of change in the barometer.

AËRO CLUB OF AMERICA. See AËRONAUTICS.

A'ËRODYNAM'ICS (Gk. ἀήρ, *aēr*, air + δύναμις, *dynamis*, power). That branch of science which treats of the properties of air and other gases in motion, and specially of the effect of the air upon solid bodies in motion through it. It is, therefore, a branch of pneumatics.

AËROLITE. See METEORITE.

A'ËROL'OGY (Gk. ἀήρ, *aēr*, air + λογία, *logia*, discourse). An old term, formerly used as applying to the physics of the atmosphere in general, recently revived by meteorologists, notably Köppen, as the name of that science which studies the physics of the higher strata of our atmosphere. The study of aërology is carried on by means of self-recording instruments attached to special kites, to manned balloons and to small free balloons called sounding-balloons. See METEOROLOGY.

A'ËROMAN'CY. See SUPERSTITION.

A'ËRONAU'TICS (Gk. ἀήρ, *aēr*, air + ναύτης, *nautēs*, sailor). The art of aërial navigation. It is of comparatively recent development, although it figures in classical mythology. A more comprehensible tale than the mythological legend of Dædalus related by Ovid, but yet one which is based entirely on tradition, is that told by Aulus Gellius in his *Attic Nights*, of the wooden dove invented by the Greek mathematician Archytas of Tarentum (400 B.C.), which could maintain sustained flight and was set in motion by

“hidden and inclosed air.” Archytas is also reputed to have invented a kite. Passing to the Middle Ages, there are recorded a few actual and usually disastrous attempts at gliding flight, but, generally speaking, the consideration of the problem of flight by human beings was confined mostly to surmise and speculations which in many cases were nearly as fanciful as the earlier Grecian fables. The thing which placed the art of aërial navigation upon a more practical basis than mere speculation was the invention of the balloon.

AËROSTATION

Balloons. The germ of the invention of balloons is to be found in the discovery by the English chemist and physicist, Henry Cavendish, in 1766, of the remarkable lightness of hydrogen gas, then called inflammable air. Professor Black, of Edinburgh, seems to have been the first who conceived the idea that a light envelope containing this gas would rise of itself; but for some reason or other the experiment was never made. The first practical attempts were made by Tiberius Cavallo, an Italian philosopher living in England, who in 1782 published an account of experiments in which he succeeded in raising soap-bubbles inflated with the gas.

The invention of the balloon is due to Etienne and Joseph Montgolfier, two wealthy paper-makers of Annonay, in France. It occurred to them, on reading Cavendish's *Different Kinds of Air*, that the air could be rendered navigable by inclosing a light gas within a covering of inconsiderable weight. They first attempted to make balloons of paper filled with inflammable air, but finding that these emptied themselves almost as soon as they were filled, instead of abandoning the paper as an unsuitable covering for the gas, they sought after another gas more suited to the paper. They thought that the gas which resulted from the combustion of slightly moistened straw and wool would answer the purpose, since it had, as they imagined, an upward tendency, not only because it was hot, but also because of its supposed electrical properties, which caused it to be repelled from the ground.

It is hardly necessary to say that this Montgolfier “gas” possessed no advantages for raising balloons other than that possessed by heated air of any kind; in fact, the abundant smoke with which it was mixed, by adding to its weight, rather detracted from its merits. At Avignon, in November, 1782, Etienne Montgolfier first succeeded in causing a silk paralleloiped, of about 50 cubic feet, to rise to the ceiling of a room. Encouraged by this success, the brothers made experiments on a larger scale at Annonay, 36 miles from Lyons, and finally, on June 5, 1783, they raised a balloon 35 feet in diameter to a height of 6000 feet. This balloon, nearly spherical in shape, was made of pack-cloth, covered with paper, and was heated by a small iron grate placed beneath it, in which 10 pounds of moist straw and wool were burned.

A commission was appointed by the Academy of Sciences at Paris to report upon the experiments of the Montgolfiers. A subscription was raised to defray the expense of repeating the Annonay experiment. The construction of the balloon was intrusted to the brothers Robert, famous philosophical instrument makers of the day, and to Professor Charles, a young but experienced physicist. As the detailed account of the Annonay ascent had not reached Paris, and

as nothing was therefore known of the Montgolfier gas, Charles fixed upon hydrogen as the gas most likely to insure success. It was, however, a formidable undertaking to produce it in abundance for a balloon, as it was at that time prepared only in small quantities in the lecture room and laboratory. He, however, succeeded in filling, in the course of four days, a silk globe 13 feet in diameter. This balloon was transferred to the Champs de Mars, where, on Aug. 27, 1783, it ascended in the presence of over 50,000 spectators. This was the first time that a hydrogen balloon ascended from the earth. At the instance of the commission already referred to, Etienne Montgolfier constructed a fire-balloon 72 feet high and 41 feet in diameter. It ascended before the commission on Sept. 12, 1783, but being held captive it was much injured by a violent wind which blew at the time, and after it descended it was finally broken up by heavy rains. Another was made, of nearly the same dimensions, which ascended on the 19th of the same month at Versailles, the King and royal family witnessing the spectacle. This ascent is worthy of note, from the fact that a sheep, a cock, and a duck were placed in a wicker basket attached to the lower part of the balloon and that these first aerial voyagers reached the ground again in safety. An interesting contemporary chronicle of these events is preserved in the letters of Benjamin Franklin, then in Paris.

The balloon was now an accomplished fact, and it began to be discussed whether it might not be serviceable as an airship for bearing men aloft as passengers. All doubt was dispelled by Pilâtre de Rozier. In a "montgolfière," as the heated air-balloon was called, 85 feet high and 48 feet in diameter, supporting at its base a gallery of wicker-work, he, in company with the Marquis d'Arlandes, made the first aerial voyage, Nov. 21, 1783. They remained in the air 25 minutes and sailed across the Seine and over a considerable part of Paris.

The year 1783, so fertile in the annals of aeronautics, witnessed an additional and even greater triumph. On December 1st Professor Charles, accompanied by one of the Robert brothers, rose from the Tuileries gardens with a hydrogen balloon—then called a "Charlière"—made with the proceeds of a public subscription. This balloon was made of alternate red and yellow gores of silk sewed together and coated with caoutchouc varnish, an invention of the Roberts. It was covered with a net which supported the car and was furnished with a valve, a barometer, and sand-ballast, and was, in fact, a complete aerial machine. In consequence of the danger attending the use of fire-balloons, and the demands made on the aeronaut's attention, hot-air balloons soon gave way to hydrogen balloons. They have now entirely given way to the hydrogen or coal-gas balloons for long voyages. Before montgolfières became obsolete several remarkable voyages were made in them. The same Pilâtre de Rozier made 30 leagues in one of them, the longest voyage ever executed in a montgolfière.

Among the names of the first professional aeronauts, those of Jean-Pierre Lunardi, Vincent Blanchard and A. J. Garnerin deserve special note. Lunardi made the second ascent in Great Britain, rising from London in 1784 in a hydrogen-filled balloon. The first ascent had been made in the same year by James Tyler; and Blanchard, along with an American, Dr. John Jeffries,

crossed the English Channel from Dover to Calais in circumstances of almost unparalleled danger, Jan. 7, 1785. Garnerin first descended from a balloon by a parachute (q.v.), Oct. 22, 1797. Pilâtre de Rozier, in an attempt to outvie Blanchard, constructed a compound machine, consisting of a hydrogen balloon above and a montgolfière below, and started from Boulogne, accompanied by a young physicist named Romain, on the morning of June 5, 1785. He had not ascended many minutes when, on attempting to open the valve of the hydrogen balloon by the rope attached to it, he caused a rent of several yards in it, so that it emptied itself almost immediately and fell on the montgolfière beneath. The fire in the latter not being kindled, the whole machine fell with a frightful rapidity to the earth, and the ill-fated aeronauts perished on the spot whence they had arisen.

Briefly described, the passive balloon, or aërostat, as it is commonly employed to-day, is a large pear-shaped or spherical bag, made of any pliable cloth, usually alpaca or cotton (though silk is the best), covered with a varnish, made by dissolving caoutchouc in oil of turpentine, to render it air-tight. Modern balloons have bags made of a special fabric formed of several layers of cotton or silk cloth by vulcanizing thin layers of rubber between them. The common size of the bag varies from 20 to 30 feet in equatorial diameter, with a proportionate height. The mouth or neck of this bag is just large enough to enable a man to get inside to make any necessary repairs and is, of course, turned downward when the balloon is inflated. A network of hempen or cotton twine is accurately fitted to the balloon, and the ends of the separate cords, of which it is formed, are tied to a circular hoop placed a few feet below the neck. The car, generally a large wicker-basket, is suspended by ropes from this hoop and hangs at a considerable distance below, so that the aeronaut may be removed from the vicinity of the gas. The network serves to distribute the weight of the car and its charge equally over the whole upper surface of the balloon. One of the most important requisites in the construction is the valve, which is introduced into the top of the balloon. It consists of a wooden or metal clapper, from 1 foot to 3 feet in diameter, opening inward, and kept closed by springs. A rope attached to this valve descends through the neck into the car, where, to prevent accidental opening, it is allowed to dangle freely. There is also a long ripping panel which extends from the equator to the summit of the balloon. This ripping panel can be torn open by a cord extending to the car below. This device, invented in 1844 by the American aeronaut, John Wise, serves to deflate the balloon quickly and to prevent its being dragged or bumped along the ground upon landing, should there be wind.

The equipment of the car comprises ballast, in the form of sandbags, by emptying which the balloon may be lightened; barometers or corresponding apparatus for indicating the height attained at any given moment; thermometers and hygrometers for determining respectively temperature and moisture; maps and a compass for showing the direction of the voyage; a grappling iron attached to a long rope for anchoring the balloon when it nears the ground; a long rope known as a guide or drag rope which may be trailed over land and water, serving to keep the balloon at a constant height without ex-

penditure of ballast and to check the speed on landing; photographic cameras and such additional instruments as may be needed.

During his flight the aëronaut has at his disposal the means of guiding his balloon only in an upward or downward direction, the motion of translation being wholly dependent on the wind. But he can take advantage of the air currents traveling in different directions at various heights by ascending or descending. If he wishes to ascend, he throws some of the ballast over the side of the car, and if to descend, he pulls the valve-rope, so that, the gas rushing by virtue of its specific lightness through the passage made for it by the open valve, the buoyant material may be lessened. It is evident that the power of thus directing his machine becomes more limited after each discharge of ballast or gas. In ordinary flights the mouth of the balloon is left open, so that there is no danger of explosion from the expansion of the gas in the rarer regions of the atmosphere.

The gas most commonly used for balloons is coal gas, first employed for this purpose by George Green in England in 1821. To-day hydrogen is generally available. It is either generated on the spot or drawn from steel tubes into which it has been compressed for convenient transportation.

Long Distance Balloon Voyages. Thanks to atmospheric researches and to the improved construction of balloons, venturesome aëronauts have made long journeys in spherical balloons or aëostats. Year by year the distances covered have increased, and annual international contests have stimulated interest in such flights. The first notable achievement occurred in 1836, when, on November 7th, Green, Mason, and Holland made a trip in *The Great Balloon of Nassau*, of 85,000 cubic feet capacity, from London to Weilburg, Germany, 500 miles in 18 hours. In 1859 the celebrated American aëronaut John Wise made 809 miles from St. Louis, Mo., to Henderson, N. Y., in 20 hours. In 1870 one of the balloons escaping from Paris during the siege sailed to Norway, about 1000 miles. An unofficial record of 1032 miles from Leipzig to Wilna in 24½ hours was made by M. Godard. At the Paris Exposition of 1900, on October 9th, the Comte de la Vaulx in the balloon *Centaure*, starting from Paris reached Korostichev, in Russia, 1193 miles, in 36 hours and 45 minutes. The extreme altitude attained on the trip was 18,810 feet. The *Centaure* was a balloon of 1650 cubic metres (58,000 cubic feet) capacity and on the trip was filled with a mixture of hydrogen and common illuminating gas.

This record stood for a number of years, though it was approached in 1910, when Augustus Post and A. R. Hawley in the spherical balloon *America* during the James Gordon Bennett balloon race of that year drifted 1173 miles from St. Louis, Mo., landing at Lake Chilogoma, near Peribonka, Quebec, several days distant from civilization. In 1912 a world's balloon record of 1211 miles was made on January 7th-8th by M. Emile Dubonnet and M. P. Dupont in *Condor III*, starting from La Motte-Breuil, France, and landing at Sokolowska, Russia, and in turn was supplanted in the Gordon Bennett cup race of the same year when of 20 balloons leaving Stuttgart, Germany, the *Picardie* with M. Maurice Bienaimé as pilot and M. Rumpelmayer as aide, landed near Moscow two days later after a trip of 1361½ miles. On March

24, 1913, Rumpelmayer made a trip of 1492 miles from Paris to a point near Kharkov, Russia. The James Gordon Bennett cup referred to is competed for annually by spherical balloons without motive power and has served to increase interest in this branch of aëronautics. The race is started from some city in the country holding the cup for that year.

Balloon Altitude Records. High ascents in balloons have been made by a number of aëronauts. On Sept. 5, 1862, two English aëronauts, Messrs. James Coxwell and Henry Glaisher, starting from Wolverhampton, England, ascended to a point calculated by them as 37,000 feet, or fully 7 miles. This ascent, however, is now generally estimated at less than 6 miles. At a height of 5½ miles one of the aëronauts became insensible and the other very nearly so; at the height of 4 miles railway trains could be heard, but at a height of 6 miles there was perfect silence. On April 15, 1875, M. Gaston Tissandier and two companions, MM. de Sive and Crocé-Spinelli, rose from Paris in the spherical balloon *Zenith*, a height of 5⅓ miles. M. Tissandier alone survived the trip, his companions dying in mid-air, and he himself being rendered unconscious. In later years, by the use of oxygen in the rarefied higher atmosphere great heights have been attained with more facility. On July 31, 1901, Professor Berson and Dr. Süring, two German aëronauts ascending from Berlin in the balloon *Prussia* of 300,000 cubic feet volume, reached a height of 35,600 feet, which has remained as the world's record. On May 28, 1913, this record was approached by MM. Bienaimé, Jacques Schneider, and Albert Lenorique in the balloon *Icaré*. Ascending from Lamotte-Breuil in France, they attained a height of 10,081 meters (33,074 feet), or approximately 6¼ miles. They were provided with oxygen respiration apparatus and aside from the extreme cold suffered no inconvenience.

Captive Balloons, as the name signifies, are balloons which are held captive to the earth by means of a cable. The cable is usually arranged to be let out and hauled in by means of a windlass or drum operated by hand or by mechanical power. Although they will eventually be supplanted by dirigible airships and aëroplanes, captive balloons have been much used for military observations (see MILITARY AËRONAUTICS) and for amusement purposes, as Giffard's famous balloon of 45,000 cubic feet capacity carrying 40 passengers, which was a feature of the Paris Exposition of 1878. Captive balloons are employed to some extent for scientific observations. At the Lindenberg Observatory, Feb. 20, 1913, three such balloons were sent up to a height of 7180 meters (23,556 feet), but more often the *ballons sondes* (sounding balloons) are used.

Exploration and Research. Scientific research by means of balloons has been undertaken in a number of instances, the most notable attempt, perhaps, being that of the Arctic explorer Andrée to reach the North Pole in the summer of 1897. The explorer and his companions perished. With the development of the dirigible balloon, its availability for exploration was at once suggested. In 1906 and 1907 preparations were made for a trip to the North Pole in an airship constructed for the Wellman *Chicago Record-Herald* Arctic Expedition. This airship was to start from a base

in Spitzbergen and was designed to make a speed of about 15 miles an hour on a 10 days' trip. The contemplated duration of inflation was from 15 to 20 days, and the two motors were of 50 and 25 horse-power respectively. Unsuccessful attempts were made to use this airship in 1906 and 1907. Subsequently active steps were being taken in Germany to organize an expedition to the North Pole making use of a Zeppelin airship.

Aërological Research. The first ascension of any value for scientific observations was that of Gay Lussac, in 1804, from Paris. The balloon rose to 23,000 feet, and the fall in temperature was 67° F., or 1° in 340 feet. Specimens of air collected at the highest point showed precisely the same composition as at the earth. The magnetic force did not exhibit any sensible variation at different heights. The next ascent of importance was that of Barral and Bixto in July, 1850. At 19,700 feet the aëronauts observed a temperature in a cloud of 15° F., and at 23,000 feet above the cloud a temperature of -38° F. The ascent of James Glaisher in 1862, previously referred to, is famous for its extreme height, and there have been several other ascents of less height from which fruitful scientific results have been obtained. On March 21, 1893, a balloon 19.7 feet in diameter, carrying a self-registering barometer and thermometer, was sent up from Paris. The records made by these instruments were examined when the balloon descended and appeared to show that the balloon rose to a height of 45,920 feet, when the ink froze at a temperature of -32° C., and the record was discontinued until at a height of 52,490 feet the ink was thawed by solar radiation and the record was resumed. The correctness of these figures has been seriously questioned, but if they are accurate the balloon reached a height of nearly 10 miles.

All scientific aëronauts keep careful records of atmospheric conditions during their ascents, but they are limited in the altitudes they attain because of their physical limitations as human beings. This has led to the extensive use of small india-rubber unmanned balloons, *ballons sondes*, which carry recording apparatus to considerable heights and thus enable a study to be made of atmospheric conditions. This method of research was developed in France by P. E. Teisserenc de Bort, in Germany by Dr. Richard Assmann, and in America by A. Lawrence Rotch. The balloons, some of which have gone as high as 18 miles, are filled with pure hydrogen gas, which enables them to reach considerable altitudes, at which the pressure of the gas bursts the envelope of the balloon, while the meteorograph (a combination of instruments, such as a barometer, thermometer and hygrometer), which is attached to a parachute or second balloon, falls to the ground without injury. The instrument is sufficiently conspicuous to attract attention, and it is picked up and forwarded to the station from which the balloon was dispatched. While this has been a favorite method of research in France and Germany, it was not tried in the United States until 1904, in connection with the St. Louis Exposition. Regular observations with *ballons sondes* are now made by the United States Weather Bureau. Such is the importance of these studies that many aërological observatories have been established all over the civilized world. In addition

to their routine work, ascents with kites and *ballons sondes* are made at these observatories on dates agreed upon at international conferences.

The first important test of *ballons sondes* at sea was made in the spring of 1905, by P. E. Teisserenc de Bort and A. Lawrence Rotch, with the aid of the Prince of Monaco's yacht. These experiments settled all doubt regarding the direction of the counter trade winds and proved their existence conclusively.

Pilot Balloons. These small unmanned balloons are sent up from aëronautical and meteorological stations, and their course and elevation are watched with a theodolite so that the direction and strength of the air currents can be determined. These pilot balloons reach an average height of 2½ to 5 miles. Their function is different from that of the *ballons sondes*, as they enable the observer to ascertain at once the direction of the air currents and their intensity. Hence they are employed at aërological observatories to determine the direction which a more expensive *ballon sonde* will take after it is released. For example, just before a Zeppelin airship sets out, several of these balloons are released, and their behavior in the air observed.

Aëro Club of America. In 1905 considerable interest began to be manifested in ballooning in the United States, and the Aëro Club of America was formed in the summer of 1905 by men for the most part interested in motor cars, but to whom the balloon appealed. The club was an original member of the Federation Aeronautique Internationale founded in 1905. In 1913, 45 pilots for spherical balloons in the United States had been licensed by that body. Of these two were deceased. In January, 1906, it held its first exhibition at the Sixth Annual Automobile Show in New York. The Aëro Club did not restrict itself to aërostation, but all forms of aërial navigation were included in its activities, and in particular its members have exhibited the greatest interest in aviation and the development of aërial navigation.

DIRIGIBLE BALLOONS OR AIRSHIPS

Dirigible Balloons. It was early suggested that balloons could be arranged with steering apparatus and propelling machinery, by which the direction of their flight could be regulated at will. Such pioneer aëronauts as the Robert brothers endeavored to paddle or row their balloons through the air with silk-covered oars worked by hand. Instead of spherical or pear-shaped gas bags, pointed envelopes of elongated form were early suggested. The design for a very elaborate power balloon operated by muscular effort was in fact worked out in great detail in France by General Meusnier. Lack of an efficient source of power in the form of a light-weight engine hindered attempts in this direction, and despite Julien's torpedo-shaped model of 1850, it was not until Giffard, the inventor of the steam injector, in 1852 constructed a spindle-shaped gas bag, 143 feet in length by 39 feet in diameter, driven by a 11-foot propeller screw connected with a 3-horse-power steam engine, that the idea was realized. After a successful dirigible had also been constructed by Dupuy de Lome in 1872, Gaston Tissandier in 1882 built a balloon, 91 feet long and 29 feet in diameter, in the shape of a very thick cigar, with both ends pointed. The envelope was made

of thin cloth covered with an impermeable varnish, and from it was hung by means of the usual netting and suspenders a car containing an electric battery supplying current to an electric motor which operated a two-bladed screw propeller $9\frac{1}{4}$ feet in diameter. A triangular silk rudder was fitted above the propeller in much the same relative position as the rudder of a steamship and arranged so as to be operated from the car. The total weight of the propelling machinery, the car and the appurtenances, exclusive of 850 pounds of ballast, was 1200 pounds, while the balloon itself weighed 600 pounds. With the propeller making 180 revolutions per minute this balloon was able to maintain its position against a wind blowing 6.8 miles per hour, and when traveling with the wind to deviate to one side or the other with ease.

This balloon was followed in 1884 by one of the French government, also driven by an electric battery and motors, the construction having been suggested by Tissandier's experiments. The craft was designed by MM. Renard and Krebs on similar lines to, but somewhat longer (165 feet) in comparison with its diameter (27.5 feet) than Tissandier's. Seven ascents were made during 1884-85 with this airship, which was named *La France*, with the following practical results: In five of the ascents the voyagers were able to return to their starting point, and an average speed of 14.5 miles per hour was attained independently of the wind.

Such efforts and experiments, however, may be considered merely as preliminary to the more practical work of the development of the dirigible, which towards the close of the nineteenth century was made possible in a large part by the evolution of a suitable light-weight internal combustion motor to drive the propellers. But there were other questions besides motive power. To be driven economically and efficiently through the air, a gas bag must be kept inflated. Hence, to preserve the shape of the envelope, two systems of construction have been developed. One of these depends entirely on inflation for preservation of the envelope shape, any deformation or sagging caused by loss of gas being overcome by internal ballonets inflated by air from a pump. This type has been brought to great perfection by Major Parseval in Germany. The second system, with which the name of Count Zeppelin is linked, depends on a rigid fabric-covered frame for maintaining the shape of the airship, the gas being stored in separate compartments within the frame. Midway between these two systems stands the French semi-rigid construction, in which a collapsible envelope, with internal ballonets, is stiffened by means of a rigid keel extending beneath the envelope.

Zeppelin Airships. In 1900 Count Zeppelin brought out his first and notable airship, introducing the rigid form and serving as the prototype for many subsequent dirigibles, although a few years previously (1897) Schwartz, an Austrian, had constructed a rigid metal-framed balloon driven by an internal combustion motor and propellers. Count Zeppelin's 1900 model consisted of a row of 17 balloons, confined like lozenges in a package, in a cylindrical shell 416 feet long and 38 feet in diameter, with pointed ends and having a capacity of 399,000 cubic feet. These balloons served to lift the structure in the air, where it was driven forward or backward by means of large screw propellers. A pair of rudders, one forward

and one aft, served to steer the airship. The crew and passengers occupied two aluminum cars suspended forward and aft, below the body of the balloon shell. From these cars, which were connected by a speaking tube, all the machinery of the airship was operated. The Daimler benzine engines, one in each car, were of 16 horse-power capacity each, and weighed 715 pounds each. The screw propellers, two for each engine, had four blades and were $3\frac{3}{4}$ feet in diameter. At the first trial of the Zeppelin airship on July 2, 1900, with five persons in the cars, it rose 1300 feet above Lake Constance and traveled $3\frac{3}{4}$ miles in 17 minutes in the direction desired. In 1905 Count Zeppelin made extensive trials of a new and much improved airship. Thus the two engines of the 1905 airship were able to supply 170 horse-power at an increase in weight of only a few pounds, the entire machinery weighing but 880 pounds. Furthermore, the length of the new airship was decreased to 410 feet, and the number of gas compartments was made 16 instead of 17. The cubical contents of the balloon were diminished to 367,120 feet, while the weight to be lifted was smaller by 2200 pounds, amounting to about 19,800 pounds. The propellers, on the other hand, were of increased size. In 1908, with the improved but short-lived *Zeppelin IV*, 260 miles were accomplished in nine hours. Count Zeppelin next proceeded to rebuild his older airships, and in 1909, with *Zeppelin III*, made a flight from Friedrichshafen to Berlin and return, a total distance of 800 miles.

To the Zeppelin airship must be given credit for first establishing a commercial means of regular passenger travel in the air. On June 22, 1910, the *Deutschland* made a successful trip with passengers from Friedrichshafen to Düsseldorf, a distance of 300 miles at an average speed of 33 miles an hour. On the third trip the craft was caught in a severe storm and wrecked in a forest.

In 1911 the *Schwaben*, slightly smaller than the *Deutschland*, but with accommodations for 24 passengers and improved mechanical features, was brought out and put into regular service, where its 165 horse-power motors, developing a speed of 43 miles an hour, were able to insure runs on schedule time. The *Schwaben* was destroyed June 28, 1912, at Düsseldorf while moored during a severe gale. It had made 364 successful trips aggregating 28,000 miles and had safely carried 6045 passengers. The *Viktoria-Luise*, an airship of slightly greater speed, was brought out in 1912 and also succeeded in passenger service. Other large airships were built, and on June 9, 1913, the *Sachsen*, the seventeenth Zeppelin airship, under the direction of Count Zeppelin himself, made a trip from Baden-Baden to Vienna, a distance of 435 miles in 8 hours, or an average speed of $54\frac{1}{3}$ miles an hour. Twenty-four passengers were carried on a visit to Emperor Francis Joseph of Austria, and the journey was accomplished in about one-half the time required by the express train between the two cities.

In 1913, 10 Zeppelin airships were in service, several of which had a gas capacity of between 600,000 and 700,000 cubic feet, and it was planned to construct 20 more of the same type. Tourist tickets entitling the holder to passage on the regular trips of these airships were sold in the leading cities of the world.

The huge gas bag with the rigid frame of the Zeppelin airship makes possible great lifting capacity amounting in some cases to five or six tons, which affords accommodations for 24 passengers with substantial cabin conveniences, yet it presents an enormous surface to the wind so that its structural strength is often severely tested. These features, which of course are common to all large airships, are not ordinarily a serious matter when the dirigible is in the air with engines in motion, but may become so, as was evidenced by the loss of the German military dirigible *L I* in 1913 off the coast of Heligoland when 14 of the officers and crew perished. It was but a few weeks after this accident that the military dirigible *L II* was wrecked, on Oct. 17, presumably by an explosion, and totally destroyed at a height of 900 feet, 28 officers and men of the crew perishing. The explosion was thought to have taken place in a partial vacuum space behind a wind shield in front of the centre car, where escaping gas was drawn and exploded by a spark from the motor.

The exposure of a large surface to the wind becomes a serious source of danger when the airship is held to the earth by mooring cables with the gas bag inflated. It has been under such conditions that most of the serious accidents to the Zeppelin airships have occurred. Nevertheless the airship with its powerful engines has a wide sphere of usefulness, and its importance in military operations early was recognized, as will be found discussed elsewhere. (See MILITARY AËRONAUTICS.) The crew of these airships are regular trained men, with a view to their possible use in time of war, and for their protection from attack it has been planned to provide them with armor and machine guns.

Airships of Santos-Dumont. In striking contrast with the large Zeppelin dirigible with its rigid frame were smaller airships built about the same time by M. Alberto Santos-Dumont, a Brazilian gentleman resident in Paris. To him is due the credit of having first successfully employed the internal combustion motor on an airship. This aëronaut, whose experiments at the time excited widespread interest, built his first airship in 1898, but previously, in 1880, Wölfert, a German, had attempted to drive a dirigible balloon by an internal combustion engine with benzine for fuel. Santos-Dumont's earliest airship was in the form of a cylinder, terminated at each end by a cone, and was 82 feet long and 11½ feet in diameter, with a capacity of 6400 cubic feet. A basket suspended from the balloon carried a 3½ horse-power gasoline motor, which operated a screw propeller. Another balloon, shorter and very much thicker, was completed in the summer of 1899, and with this M. Santos-Dumont was able to circle around the Eiffel Tower. On July 11, 1901, M. Santos-Dumont navigated an enlarged and improved balloon from Saint-Cloud to and around the Eiffel Tower in an attempt to win a prize of 100,000 francs offered by Henri Deutsch de la Meurthe, and was approaching the starting point in the teeth of a strong head wind when the motor stopped, and the whole structure, with its operator, was precipitated into a chestnut tree. Another attempt to win the prize on Aug. 8, 1901, in the repaired airship, ended in the destruction of the craft, because of a defective valve. On Oct. 19, 1901, in his sixth balloon Santos-Dumont succeeded in making a trip from Saint-

Cloud to and around the Eiffel Tower and then back to the starting point in 30 minutes 40¼ seconds. The trip won the coveted prize of 100,000 francs offered to the aëronaut who should make the journey in 30 minutes.

In rapid succession the Brazilian aëronaut constructed balloons, each embodying some new feature, and in the main marking an advance over its predecessors, but finally gave them up in favor of the aëroplane.

French Dirigibles. Following Santos-Dumont's airship came the larger and more practical dirigibles of the Lebaudy brothers. The 1903 airship, called the *Yellow (Le Jaune)*, consisted of a long and finely pointed balloon, containing 80,000 cubic feet of gas and with its lower surface flat. Around the balloon was a frame of steel tubing, from which the car was suspended. The balloon for this airship was made of two thicknesses of cotton cloth colored yellow to protect the India-rubber placed between from the actinic effects of the sunlight, and, while reasonably light, was quite impervious to the gas. Both in the framework and in the machinery there was a solidity and rigidity of construction, and throughout, all details were developed with a careful consideration of the best engineering principles and practice. The car was of steel and contained a Mercedes engine of 40 horse-power, driving steel propellers which rotated at a rate of 1000 revolutions a minute. The weight of this airship, including its passengers, was 5700 pounds. In 1903 it traveled on one trip 61 miles and was in the air 2¾ hours. The best speed recorded was 25 miles an hour, and were it not for the untimely destruction of the airship in a fierce gale, while resting on the ground, much more could doubtless have been accomplished. In 1904 a new airship, the *Lebaudy*, was built, embodying essentially the features of the former. In this a motor was used whose weight was about 7½ kilograms (16½ pounds) per horse-power, and the consumption of fuel was but 315 grams per horse-power. The *Lebaudy* was cigar-shaped, with its rear end rounded. It was 57.75 meters (189.5 feet) in length; its maximum diameter was 9.80 meters (32.5 feet), and it had a volume of 2666 cubic meters, which afforded a sustaining capacity for more than three tons. In the experiments with this airship it was demonstrated conclusively that it could be controlled in windy weather and could maintain its equilibrium satisfactorily. In 1905 a new Lebaudy airship was constructed, which had about the same length but greater transverse dimensions and capacity of volume of the envelope than that of the previous year, besides having a more powerful motor. This balloon was turned over to the French army and furnished an excellent account of itself. In 1906 the MM. Lebaudy were commissioned to construct a new airship which was named *La Patrie* and was used successfully until carried away in a storm and destroyed in 1907.

La République, built on very similar lines but in some respects an improvement on the Lebaudy airships, was also acquired by the French army, but was destroyed in 1909 in an accident caused by the breaking of one of the propeller blades, which cut through the gas bag. The crew, consisting of four officers and men, was killed. Since that accident it has become the general practice to follow the Zeppelin plan of storing

the gas in more than one compartment, so that all of it may not be lost when the envelope is pierced in a single spot.

In the development of the dirigible balloon for military purposes and in its operation the officers of the French army worked most assiduously, and despite accident and misfortune they persevered in their efforts. Details of design and construction were improved, aëronauts and air pilots were trained, and aided by considerable private interest the air-fleet was continually augmented. Preference for the semi-rigid flexible as typified in the *Ville de Paris, France*, and *Clement-Bayard*, rather than for the Zeppelin form of construction, was manifested, and it was not until 1912 that the *Spiess*, a rigid dirigible with a wooden frame, was added to the French air fleet. This airship, with a capacity of 11,500 cubic meters (371,000 cubic feet), in 1913 was the largest French dirigible, yet it was considerably smaller than several in Germany. In addition to Lebaudy, the Zodiac and Astra companies had built notable airships along the lines of the German Parsevals. In 1913 the French air fleet included some excellent airships, of which the *Adjutant-Vincenot*, the *Adjutant-Reau*, and the *Dupuy-de-Lôme*, each of about 9000 cubic meters (318,000 cubic feet) capacity and 55 kilometers (34 miles) per hour speed, are worthy of mention, as is also the smaller but speedier *Fleurus*. All of these were of the non-rigid type and were built in 1911 and 1912. Of their military value, however, more extended discussion will be found under MILITARY AËRONAUTICS.

German Dirigibles. In Germany, through the efforts of Major von Parseval, of the Bavarian army, who had also been one of the inventors of the kite balloon, there was developed a form of dirigible balloon without a rigid frame which could be transported readily by an army in the field and inflated from portable gas cylinders or generating apparatus. This type of airship proved one of the most successful to be developed in Germany, and by 1913 17 had been constructed for military and commercial purposes, several having been designed for passenger traffic—one, the *Parseval*, having been operated about Berlin with notable success. The 1913 type of Parseval had a more slender envelope and was driven by two motors placed to the right and left above the suspended car. Each propeller had four blades of elastic steel $\frac{1}{25}$ of an inch thick and driven by a 6-cylinder motor. In some cases increased stiffening was being given, but the framing was of wood instead of aluminum as in the Zeppelin airships. In addition, among the dirigible balloons that were adopted by the German army, were several Gross airships designed by Major von Gross of the balloon section which, while supplied with a stiffening frame, were neither as large nor as well equipped as the Zeppelin craft, but were well suited for many military purposes. Another important type of German airship was the Schütte-Lanz, with a rigid framing of wood and large gas capacity. Mention also should be made of the Suchard airships, the first of which, completed in 1912, was designed for a long ocean voyage, but never even attempted the journey. Aside from the Zeppelin airships most of the aëronautical developments with dirigibles have taken place in connection with the military and naval services. See MILITARY AËRONAUTICS.

American Airships. In the United States flights have been made by airships, but little has been accomplished in any way comparable with European achievements. A dirigible balloon of limited size, representing the best American and foreign practice at the time, was constructed for the United States Army Signal Corps by Thomas S. Baldwin and was turned over to the government after satisfactory tests in August, 1908. It had a spindle-shaped gas bag 96 feet in length and of 20,000 cubic feet capacity and was driven by a 20 horse-power water-cooled gasoline motor of the Curtiss type. The lifting capacity of the balloon was 1350 pounds, and of this 500 pounds was available for passengers, fuel, and ballast. The speed developed on the trial trip over a measured course was 19.61 miles an hour. A few small rather crude airships were built for exhibition purposes, but the only really notable American airships were those built to make a transatlantic voyage. On Oct. 15, 1910, Walter Wellman, who in 1906 and 1907 had made unsuccessful attempts to reach the North Pole from a base in Spitzbergen, set out from Atlantic City, N. J., in an attempt to cross the Atlantic Ocean in a dirigible 228 feet in length and having a lifting capacity of 23,650 pounds. This airship, the *America*, designed by Melvin Vaniman, was cigar-shaped. The engines and propellers were designed to give a speed of 26 miles an hour with both engines working, and a crossing in six days was planned. The airship embodied a number of new features, among which was a so-called "equilibrator" corresponding to the drag rope of an ordinary balloon and consisting of some 30 cans of gasoline strung together to form a cable, the idea being that as the fuel was exhausted the lessened weight would compensate for the escaping gas of the balloon proper. The *America* drifted out to sea on Oct. 15, 1910, and within five hours met with a failure of the engine which was followed by other misfortunes, including unfavorable weather. The crew was compelled to abandon the airship and take refuge on a passing steamer after having been in the air $71\frac{1}{2}$ hours and after having drifted or sailed a distance of 1008 miles, both of which were records for dirigibles. Despite her failure the *America* was the first airship that was a credit to the United States in originality of design and construction.

Melvin Vaniman, designer and chief engineer of the *America*, decided to make another attempt on his own account. He designed a new and larger airship which embodied original ideas as well as the results of European experience. This vessel was built in the following year. It had powerful engines. Like the *America*, the *Akron*, as the new craft was called, compared favorably with the large dirigibles of Europe. On July 2, 1912, the *Akron* left its quarters at Atlantic City on its initial trip and within less than half an hour was totally destroyed by an explosion, due to fire or other cause not definitely determined. Vaniman and his crew of four perished.

AVIATION

Mechanical Flight. All devices for mechanical flight may properly be classed as passive and power or dynamic flying machines. The passive fliers in turn can be divided into machines intended for gliding flight, or, as the modern aviator terms it, *volplaning*, and those designed for

soaring or moving through the air, without loss of altitude, by the force of the wind. Obviously experiments with passive fliers and those with dynamic machines are intimately related, and the development of the latter has depended in large measure upon investigations with gliders and soaring devices.

There are on record a few more or less authenticated early instances of persons who by some parachute-like contrivance attempted to imitate the flight of birds. Some of these antedate the balloon by centuries. There is the story, for example, of Elmerus, a monk, who is said to have flown more than a furlong from the top of a tower in Spain, a distance probably much exaggerated. Leonardo da Vinci made a serious proposal to beat a pair of mechanical wings and also considered the use of an aerial screw, as sketches in his notebooks testify. An interesting paper by him on *The Flight of Birds* was published in 1505. In the seventeenth century Allard, a tight-rope dancer, attempted a flight with artificial wings in the presence of Louis XIV, while in 1678 Besnier, a locksmith of Sable, France, built a pair of oscillating wings with which he was reputed to be able to leap safely from very elevated positions and to pass over rivers of considerable breadth. There is no evidence that he ever accomplished such feats, and whatever he did was probably the result of dexterity in the use of the wings rather than of any inherent virtue they possessed. The first properly authenticated account of an artificial wing was that given by Borelli in 1670, and despite fundamental errors his experiments and conclusions were the basis for such investigations as were undertaken for many years.

Perhaps the first to make substantial and original contributions to the modern science of aviation was an Englishman, Sir George Cayley, who in 1809 and 1810 described in *Nicholson's Journal* experiments with aerial gliders in the form of large models. He took into consideration the placing of the wings at an angle of incidence, the use of a tail to steady the machine, and even calculated the energy necessary for propulsion from an engine. Realizing that the steam engine of his day was out of the question, he even suggested the use of an internal combustion engine. In 1867 Prof. J. B. Pettigrew, an English scientist, published the results of an elaborate and careful series of studies made by him upon the flight of birds, which wrought a revolution in the construction of flying machines.

Previously, in 1842, William Samuel Henson, of Chard, England, had designed and patented a flying machine which had a single supporting surface and two aerial screws driven by a steam engine. It was of course impossible at that time to construct a full-size machine, but it was the earliest commercially designed aeroplane and contained many principles later embodied in present-day machines, notably the system of control which was substantially that of the early Voisin monoplane. Some of these early features were cited in the litigation on the Wright patents 70 years afterwards.

F. H. Wenham, also an Englishman, in 1867, thinking to improve upon Henson, invented what he designated as a multiplane or aeroplane with two or more supporting superposed surfaces to secure increased sustaining power without increasing the general plan. In his design we have the forerunner of the modern biplane. John Stringfellow, who was originally

associated with Henson and had constructed the first successful flying model aeroplane in 1848 (for it flew about 40 yards), built a second model in 1868 in which Wenham's aeroplanes were combined with aerial screws. This model was on view at the exhibition of the Aeronautical Society of Great Britain, held at the Crystal Palace, London, in 1868. It had three superposed and parallel planes and was remarkably compact and light, obtaining the \$500 prize of the exhibition for its engine, which was the most powerful for its weight ever constructed. The aeroplane was not successful and later was purchased by Prof. S. P. Langley for the United States National Museum in Washington, where it is now on exhibition. In 1873 a tandem monoplane with two lifting planes was invented by D. S. Brown, and in 1874 Thomas Moy invented an aerial steamer, consisting of a light powerful skeleton frame resting on three wheels, a very light and efficient engine which was built on a new principle and which dispensed with the old-fashioned cumbersome boiler, narrow horizontal aeroplanes, and two very large aerial screws. This engine, which weighed with its boiler 80 pounds, developed fully 3 horse-power. In its general features Moy's machine resembled that of Stringfellow.

Mention might here be made of the invention and design of model aeroplanes, wings, and screws by M. Pénaud in which twisted india-rubber furnished the motive power. He constructed models to fly by three different methods: (1) by means of screws acting vertically upward; (2) by aeroplanes propelled horizontally by screws, and (3) by wings which were flapped in an upward and downward direction. These models were so far successful as to mark a considerable degree of progress and offer hints for future guidance by investigators and inventors. Indeed they may be regarded as the immediate stepping-stones to Langley's first successful work.

Various experiments with flying-machine models of many forms and occasionally with full-sized machines were carried on by inventors. The most satisfactory results, as will be seen, were secured with flat or slightly curved supporting surfaces; but, before proceeding to their consideration, brief mention can be given of other classes of devices suggested and employed. Vertical screw machines, or helicopters, have much to recommend them, but they present drawbacks which more than counterbalance the advantages. The ability to rise directly into the air from any given spot is exceedingly desirable, and hence a great many attempts have been made to develop a successful vertical screw machine. The greatest stumbling-block to success has been that when the surfaces which form the blades of the screws are revolved over one spot they do not give lifting effect commensurate with the power consumed. The beating wing machines, or ornithopters, are subject to the same disadvantages in regard to the enormous power required as those of the vertical screw type. In addition to this, the problem of maintaining equilibrium in windy weather still further complicates matters. Moreover, any combination in a single machine of the salient features of two or more of the classes of machines described tends to complicate rather than to improve the situation.

Both theory and experiment early indicated that a practical machine for artificial flight could be best secured by the use of the principle of a sustaining surface advanced through the air, or, in other words, an aeroplane or aërocurve.

When a thin surface is drawn through the air and is slightly inclined to its path, the equivalent of a pressure is developed on the side which is exposed to the air current—that is, the under side—which is much greater than the driving force which is necessary to produce it. If a surface arched in the line of the motion be substituted for the plane, we have an aërocurve, whose chief advantage is that it has a higher efficiency, as was successfully demonstrated by Horatio Phillips in England in 1884. Latterly, however, there is a tendency to employ rather flat surfaces, particularly on high-speed machines.

The earliest systematic experiments to apply this principle of the supporting plane were those of Sir Hiram Maxim of England, Prof. S. P. Langley of the United States, and Otto Lilienthal of Germany. These pioneer workers experimented not only with models but with large devices capable of carrying a man, and their results have proved of the greatest value in the development of the art. In a paper written in 1896 Sir Hiram Maxim summarizes some of the principal results of his experiments which, begun in 1889, dealt in much detail with the atmospheric resistance of sustaining surfaces and the thrust of screw propellers. Maxim's ideas found expression in 1893 in a gigantic twin-screw multi-plane flying machine, the largest ever built. A propos of its construction and his investigations he wrote: "My experiments have certainly demonstrated that a steam engine and boiler may be made which will generate a horse-power for every six pounds of weight, and that the whole motor, including the gas generator, the water supply, the condenser, and the pumps may be all made to come inside of 11 pounds to the horse-power. They also show that well-made screw propellers working in the air are fairly efficient, and that they obtain a sufficient grip upon the air to drive the machine forward at a high velocity; that very large aëroplanes, if well made and placed at a proper angle, will lift as much as $2\frac{1}{2}$ pounds per square foot at a velocity not greater than 40 miles an hour; also that it is possible for a machine to be made so light and at the same time so powerful that it will lift not only its own weight but a considerable amount besides, with no other energy except that derived from its own engines. Therefore there can be no question but that a flying machine is now possible without the aid of a balloon in any form."

The machine was mounted on rails so that it could rise, but was prevented from flying freely by an upper guard track. Several runs were made during which the machine rose from the lower track. On a gusty day in 1893 the machine during a test carried away part of the upper track and was damaged. In the light of later achievements it is not likely that the machine would ever have flown freely for any length of time. Nevertheless its construction is a milestone in the history of aviation; for Maxim had hit on much that present-day experience and knowledge endorse.

In 1891 Professor Langley published his now famous memoir entitled *Experiments in Aërodynamics*, and in 1893 his equally celebrated book on the *Internal Work of the Wind*. The experiments upon which many of the statements in these books were based were begun in 1887, and from 1891 to 1896 Professor Langley was more or less constantly at work perfecting a model flying machine which he termed an "aërodrome." It

may be said, in passing, that unfortunately this name later was applied with far less accuracy to the special ground or park from which flying machines made ascents. Professor Langley's small model, which was driven by a steam engine using naphtha as fuel, made its first successful flight on May 6, 1896. It was flown several times and came down when the fuel gave out. The average distance accomplished was about three-quarters of a mile. This was the first time in history that a motor-driven aëroplane accomplished a sustained flight.

By the aid of an allotment of \$50,000 from the Board of Ordnance and Fortification of the United States War Department, a full-sized man-carrying aërodrome was constructed by Professor Langley and his assistant, Charles M. Manley, and tested in 1903. Its failure, due to defects in the launching mechanism, was a source of keen disappointment to many who had believed that in the aërodrome Professor Langley would solve the problem of mechanical flight. The aërodrome had a sustaining surface of 1040 square feet and with the aëronaut weighed, when ready for flight, 830 pounds. The gasolene engine, which was able to furnish 52.4 brake horse-power, weighed, without fuel or water, 2.2 pounds to the horse-power approximately. The engine to this day remains a marvel of lightness. The unsuccessful character of two trial flights made in 1903 did not demonstrate that the engine was unable to lift the machine, as the mishaps on both occasions were due to the apparatus catching on the launching apparatus, and this in the second instance resulted in the wreck of the machine.

According to Professor Langley, the ability of the aërodrome to fly was still unsettled, though it could not be considered a failure in this respect. The government refused to extend further aid. Hence no further developments of the aërodrome were made by Professor Langley before his death. The correctness of his reasoning and deductions, as well as his fundamental ideas, has been shown in subsequent work, and his studies and experiments have become recognized aëronautical classics.

Critical examination of Professor Langley's plans in the light of modern knowledge and experience has shown that his aëroplane "had every equipment needed for a steady flight of many hours in fair weather." Thus wrote Dr. A. F. Zahm, a recognized authority in aviation, and he added: "Professor Langley had, in 1903, a dynamic aëroplane quite the peer in many respects of the best that were developed during the first decade of aviation, and a mere accident, which should be expected in such complex experimentation, deprived him of the credit of the first man-flight on an adequately controlled and powered machine."

In this connection the work of Clément Ader, a French inventor, also should be mentioned, for by Frenchmen he is sometimes given the credit of having been the first to navigate the air in a dynamic flying machine, although at the time his man-carrying bird failed either to arouse much interest or to gain recognition in France. This ingenious worker first studied the anatomy of birds. In 1890 he completed a bird-like monoplane driven by a 40 horse-power steam engine with a screw propeller in front of the machine. On October 9 he is said to have risen in the air and flown for a distance of 150 feet with this machine and with a second and similar aëroplane to have made a flight of 300 feet on

AÉROPLANES

one occasion. In 1897 a larger machine was completed in the form of a bat with folding wings, spreading 270 square feet. It was driven by a 40 horse-power steam engine driving twin screws in front. The engine weighed about 280 pounds, or 7 pounds to the horse-power produced. In preliminary tests the aëroplane and engine worked satisfactorily, but the machine was able merely to leave ground. On the final test the aëroplane operating in the face of a severe wind was seriously damaged, and the able inventor was then unable to find the further support which his experiments clearly merited. Subsequently this machine was resurrected and was honored by exhibition at the Aëronautical Salon of 1908 at Paris. It has since been given a permanent place in the Conservatoire des Arts et Métiers.

Aside from the work of Maxim, Langley, and Ader, valuable experiments with large aërocurves and aëroplanes capable of carrying one man but without propelling motors and screws were conducted by Otto Lilienthal of Germany, Octave Chanute, an American engineer, and subsequently by the Wright brothers, of Dayton, Ohio.

With the machine shown in the illustration Lilienthal, starting from a height, was able to sail several hundred feet—the flight in some instances being against a wind of 24 miles per hour—and to make turns to the right or left with considerable certainty. Lilienthal began his flights in 1891. After making 2000 flights he was killed in 1896 in a biplane glider. Although he was an engineer, the trussing between the wings was very weak. Mr. Chanute's experiments were conducted first with a machine like Lilienthal's but with one pair of wings only; later, with a machine having five pairs of wings, one above the other, and a sixth pair forming a tail, and finally, with a machine consisting of two wings, one above the other, and without any break in the middle, as shown in the first of the two illustrations of his apparatus. His last model was a large bird-like structure of the form shown in the illustration. The greatest success, perhaps, must be credited to the double-decked machine, which made numerous flights, some of them against winds of from 10 to 31 miles per hour. The longest flight made was 359 feet, from a starting point 62 feet higher than the point of landing. This was in 1896 and showed that a trussed biplane used as a glider was reasonably safe. Mr. Chanute in the construction of this biplane glider was assisted by A. M. Hérring.

The curved surfaces of Lilienthal and his contemporary experimenters were found less satisfactory than planes, and the most efficient arrangement proved to be a pair of narrow superposed rectangles. Superposition of surface was first practiced by Wenham in the early sixties and copied by Lilienthal and Chanute. Working with apparatus similar to that tested in gliding flights by Chanute, whose advice and assistance they enjoyed, Messrs. Orville and Wilbur Wright, of Dayton, Ohio, in a long series of practical experiments by which great dexterity of manipulation was obtained, were able to construct a machine with a front rudder, in which the operator occupied a horizontal position. After many glides and after testing many forms and designs, a machine eventually was devised, to which a 16 horse-power four-cylinder gasolene motor and twin propellers were fitted. In this

a movable or elevating rudder was placed in front, and the wings could be warped for transverse control. This machine, which weighed a little over 200 pounds, was tested on Dec. 17, 1903, at the Kill Devil sand hills near Kitty Hawk, N. C., and four successful flights were made, in one of which the aëroplane rose of its own power, was in the air 59 seconds, and traveled a distance of 852 feet. This is the first instance where a person has been carried from ground in actual flight by mechanical means without artificial aids. Such success naturally led to other experiments, and on Oct. 5, 1905, the aëroplane made a flight of 24¼ miles, remaining in the air 38 minutes and 3 seconds. It was able to carry fuel for an hour's run and was able to move at a speed of about 38 miles an hour. It was maneuvered readily and was entirely under the control of the operator, being brought back to the starting point without difficulty.

Field trials of the Wright aëroplane were then suspended while the patent rights were being exploited and protected. In the summer of 1908, the Wrights having sold the patent rights for France, Wilbur Wright gave in that country a number of public exhibitions in which the superiority of the Wright biplane over contemporaneous French machines was clearly demonstrated. Simultaneously in America, Orville Wright demonstrated before the Signal Corps of the United States army an aëroplane consisting of two superposed main surfaces aggregating about 500 square feet and spaced 6 feet apart. The two planes had a spread of 40 feet and were 6½ feet front to rear. A horizontal rudder of two parallel planes was placed in front, while a vertical rudder was carried at the rear. A 4-cylinder gasolene water-cooled motor developing about 25 horse-power when working at 1400 revolutions per minute drove two wooden propellers, each 8½ feet in diameter and making 400 revolutions per minute.

Successful trials of this machine at Fort Myer, Va., were interrupted by an accident, Sept. 17, 1908, in which Orville Wright was injured and Lieut. T. E. Selfridge, U. S. A., was killed. One flight at these trials lasted for 1 hour 14 minutes and 20 seconds, and an estimated speed of 40 miles an hour was obtained. In the following year the aëroplane was duly delivered to the United States army and accepted. Its use was taught to several officers. See MILITARY AÉRONAUTICS.

In France Wilbur Wright aroused the greatest enthusiasm by the duration and speed of his flights, securing one prize and record after another. Such demonstrations, involving flights up to 77 miles in extent and 2 hours and 20 minutes in duration, proved that mechanical flight for machines heavier than air was assured, and the training of aviators proceeded at a rapid rate. From this time on improvements in design and construction of the Wright machines were effected. In 1910 the front rudder was done away with, because it was found that it caused pitching. Instead of starting the machine on an inclined rail, bicycle wheels were employed so that ascents could be made from the ground—a method long before adopted by others.

The first patents awarded to the Wrights were sufficiently broad in their scope to protect the invention. Infringements followed giving rise to extensive litigation. In a decision handed down by Judge John R. Hazel in the United States

District Court on Feb. 27, 1913, the Wright claims in the main were upheld, the Court holding that while the elements in the Wright aëroplane were conceded to be old the inventors were the first to discover that the vertical rudder of a flying machine must be used in conjunction with wing-warping devices, or ailerons, to prevent the machine from spinning on a vertical axis in straight-away flight. Decisions in favor of the Wrights were made also in Germany on February 26, and in France on February 28, of the same year in which their claims were largely sustained.

The announcement of the first successes of the Wright brothers, as well as an increased interest in aëroplanes among disciples of Lilienthal and others, gave rise to much experimentation. In England Horatio Phillips, in 1904, a few months after the initial success of the Wrights, flew across a field in a gasoline-driven multiplane mounted on wheels. But it was in France that there was the greatest enthusiasm, and this led, in 1906, to activity among French workers in this field, and valuable cash prizes and trophies were offered for flights. In France, especially, the light-weight gasoline motor of high efficiency and power, as used on motor cars and motor cycles, had been highly developed so that no longer experiments in gliding flight from elevations were in order, as there were available sufficiently powerful motors to operate aërial propellers.

In 1906 Santos-Dumont turned from his dirigible balloons to a new form of aëroplane which was the first practical aëroplane publicly to be shown. This machine consisted of a frame carrying a cellular structure with a box rudder in front at the end of a vertical vane. On Aug. 22, 1906, he made a successful though short trial flight, but in the following month the machine collapsed, and the aviator narrowly escaped. In subsequent tests on November 12 a flight of 215 meters (715 feet) was made, thus gaining the prize of 1500 francs of the Aëro Club of France for the first public flight of 100 meters. Santos-Dumont in 1909 evolved a monoplane with the least weight (242 pounds) and the smallest supporting surface (115 square feet) of any machine constructed up to that time. Its low centre of gravity, however, caused it to oscillate like a pendulum and made it hard to control. The type was soon abandoned.

Sharing the early honors with the Wright brothers' aëroplane, was the biplane of Glenn H. Curtiss, who had been an inventor and manufacturer of motor cycles and held several speed records with machines of his own design and construction. After making several aëroplanes during the spring of 1908 Mr. Curtiss developed a type of biplane driven by one high-speed propeller which depended for its stability on movable ailerons or tips placed at the extremity of the supporting plane. This machine on July 4, 1908, won for the first time the *Scientific American* trophy with a flight of over a mile. A second machine improved this performance, and in 1909 a Curtiss machine was entered in the great international competition at Rheims, France, and won the Gordon Bennett aviation prize for the fastest time (15 minutes 56½ seconds) over a distance of 20 kilometers (12.42 miles). In 1910, on May 29, he flew from Albany to Governor's Island, N. Y. Harbor, a distance of 142 miles, stopping but three times to replenish oil and fuel, at an average rate of

about 49 miles an hour. Charles K. Hamilton in the same year, using a Curtiss aëroplane, made an even more noteworthy flight from Governor's Island to Philadelphia and return, doing the air-line distance of 74.7 miles, or over 82 miles as flown, in 1 hour and 45 minutes, or about a rate of 45 miles an hour.

The Curtiss aëroplane was now recognized as a standard type, and its manufacture on a large scale was undertaken. Its usefulness was increased, however, by its application to over-sea flight in the form of the hydroaëroplane devised by Curtiss in 1910, described a few paragraphs below. In 1912 Curtiss was voted a "Langley Medal," the second to be awarded, by the Regents of the Smithsonian Institution for "specially meritorious services in connection with the science of aërodromics." He also received the medal of the Aëro Club of America.

The success of the Wrights in France was followed by that of Henri Farman, who in 1907 had flown a Voisin cellular biplane with two curved parallel surfaces. In construction the machine resembled both the Chanute glider and the box kite of Hargrave (see KITE) which had exerted considerable effect on aëroplane design. It was the first machine to be fitted with wheels for convenience in rising and landing. It was the first machine in France to fly a sufficient distance to win various prizes offered for practical flight. Later Farman struck out as a designer himself and gave the world a biplane which, while it owed much to the Wright brothers, nevertheless displayed considerable originality of design. It was for some time a leading type.

Other notable French biplanes were those of Breguet and Sommer, to mention but a few of the different types that were soon developed. In England there were the biplanes of Cody and Dunne and others patterned more or less closely on French and American models, although Dunne's system of inherent stability is distinctly original. Later in the United States the Burgess biplane, a modified Wright type, was developed in the form of a so-called Military Tractor, and in 1913 four machines were constructed for the Signal Corps of the United States army. It was the first enclosed body tractor to be built in the United States, a covered fuselage containing the motor, aviator, and observer.

Monoplanes. By 1908 it was realized that a successful aëroplane with a single supporting surface was possible, and for some purposes preferable, and one designed by Louis Blériot on Oct. 31, 1908, made a successful flight from Chalons to Rheims, a distance of 17 miles. It also figured in the international competition at Rheims. This type of machine had made the first flight for an aëroplane across the English Channel from Baraques to Dover on July 25, 1909. The success of the Blériot machine established the type, and it soon became but one of a number of machines of this type which flew with success.

Blériot's monoplane, as finally brought to a successful point of development in 1908, consisted of a long central trussed structure or spine, mounted on wheels and carrying at the front the propeller and motor and at the rear two of the rudders for direction and elevation. The direction of the machine to right or left was effected by a vertical rudder at the rear, while a horizontal rear rudder served to control

elevation and pitching. The lateral rudder was placed at the wing terminals, and lateral stability was obtained by warping or bending the edges of the main wings, after the Wright principle. The supporting surface was firmly attached to the central frame, which was covered to diminish the atmospheric pressure against the framing and engine as well as the body of the aviator. The monoplane, as thus developed by Blériot, straightway became a competitor of the biplane and served as a point of departure from which much successful designing was done, involving of course more or less radical variation from the original model. The power of the engine was materially increased, and this naturally involved increase of structural strength.

But Blériot was by no means the only successful designer of monoplanes. Immediately there were a number of machines with greater or less divergence in design and construction among themselves, but in the main embodying in common most of the essential characteristics. Nevertheless different designers and makers had often secured individual features that worked for efficiency, so that there were evolved a number of types. Thus the *Antoinette* brought out in 1909 by Levavasseur and flown by Latham, was a monoplane with a polished inclosed body or fuselage, so shaped that it bore a striking resemblance to a fish. Despite its graceful form, it ultimately gave way to the more efficient models of other makers. The Nieuport machine (extraordinarily successful in 1911), the Deperdussin (a machine of high mechanical excellence despite the subsequent misfortunes of its ill-fated promoter), the Hanriot, the Esnault-Pelterie, the Morane-Saulnier, and other monoplanes developed in France figured in various flights and competitions and acquitted themselves with merit. In Germany, Austria, Great Britain, and to a less extent the United States, other monoplanes were developed, but, save for that of Igo Etrich, the Austrian, whose machine has a bird-like tail, the differences for the most part were minor.

At first it was claimed that the monoplane, while speedier for short distances, was less stable and incapable of sustained flight or ability to endure varying conditions of the air. This, however, was soon disproved, and many notable distance and endurance records were made with monoplanes. The biplane, however, seemed to have greater lifting power and was used in the various types of hydroaëroplanes.

All aëroplane construction became an engineering matter, based not only on experience and originality of conception, but on technical study to evolve safer, more powerful, and generally more efficient machines. Careful attention to sound principles and details figured more than ever in design and construction, and from the mechanical standpoint few departments of engineering have ever boasted more rapid or satisfactory progress.

The year 1909, which has been mentioned for several achievements, was an important one in aviation. Up to this time America and France had enjoyed practically a monopoly of the design and construction of aëroplanes, but now other nations and especially their armies became aroused at the wonderful developments of mechanical flight and its future possibilities. From this time other countries were represented at the various aviation meets, and aëroplanes were purchased, chiefly from France and Germany,

for use in nearly all of the European countries. At the famous meeting held at Rheims, France, in August, 1909, 36 aëroplanes competed, and notable speed and endurance records were made. Aviation meets and exhibitions soon became general, and wonderful performances which aroused wide interest took place, as the aviators secured increased command of their machines and engines and planes were perfected. In the following year came increase not only in speed but in distance and duration. Cross-country records and flights now began to take the place of the shorter speed contests, the general process being much the same as in the case of the automobile, where track racing was succeeded by long-distance road competitions.

Thus Farman, who in Jan. 12, 1908, 19 months previously, had won a prize of \$10,000 for a flight of 1 kilometer (.621 mile), now won the same amount by doing 190 kilometers (118.06 miles) in 3¼ hours in his biplane. The speed record for 10 kilometers, 15 minutes 50¾ seconds, or an average speed of 47.04 miles an hour, went to Curtiss, who in a biplane defeated Blériot in a monoplane. In short, the development of the aëroplane was now rapid and pronounced. The number of aviators increased, valuable prizes were offered for long-distance flights and for competitions, and various improvements suggested by the practical experience of the aviators no less than of a mechanical character were made.

It is true there was a long annual record of accidents and fatalities, resulting for the most part from defective construction or unskilled operation or to extra-hazardous performances at public exhibitions. At the same time, considering the length and duration of flights in the aggregate and the number of aviators, there was a striking decrease in the relative number of accidents from time to time. This was due in large part, not only to improved machines, but to great skill on the part of the aviators. Indeed, during the opening years of the development of aviation this personal element of the pilot was most important in successful flight.

Nevertheless it was soon recognized that automatic stabilizing devices must be provided to secure greater safety and to diminish the difficulties of control. Many accidents were attributed to faulty stability. Maxim early suggested the use of the gyroscope (q.v.) for this purpose of relieving the aviator of the strain of maintaining stability; and various inventors endeavored to use the same principle in one form or another. Elmer A. Sperry, who had attacked the problem of the stability in ships by the use of various forms of gyroscope, developed an automatic control for aëroplanes in which the elevator and ailerons were moved by compressed air valves controlled by two small gyroscopes weighing but 2¼ pounds each and operated electrically from a dynamo connected with the engine. This form of control served to keep the aëroplane on an even keel automatically and also acted to secure automatic banking in making turns while in flight. It was used with considerable success in 1913 on the Curtiss biplane.

In addition to the gyroscope the pendulum principle was also utilized, and a pendulum seat worked well under certain conditions in an aëroplane of the Moreau brothers and also in a Sommer machine, both of French construction. The Wrights had patented a pendulum control

for their biplane and had confident hopes of its success. Interesting, too, is Doutré's device for controlling fore and aft stability.

Aside from securing stability automatically by such mechanical devices, attention was being paid to the design of the planes themselves with this end in view and in methods of operation in flight. Thus Igo Etrich, an Austrian inventor, whose monoplane was brought out in 1910, used flexible wing tips and trailing sides like a bird's tail, while Lieutenant Dunne in England, in a notable self-balancing biplane finally brought out in 1913, secured great stability—in fact, sufficient, it was claimed, to make flights of an hour or more without human control—by building his aëroplane of a V-shaped plan with the apex in front. There was no rudder or tail, the wings sloping towards the rear in an inverse curve and maintaining a constantly varying camber from the apex of the V to the ends of the wings, which were set at a dihedral angle. Another plane that afforded stability was that of Drzwiecki, developed as a result of tests and experiments made in M. Gustav Eiffel's laboratory. This went back to the original Langley principle and consisted of an aëroplane with two sets of wings arranged tandem, the following surfaces as well as the forward planes being set at a dihedral angle.

In the development of the aëroplane, and particularly of the monoplane, every element has been and must be carefully considered. In the construction, wherever possible, steel and aluminium have taken the place of wood. The newer alloy steels with their greater strength and lightness were employed as soon as their usefulness was demonstrated on test.

It did not take aëroplane engineers long to depart from the early motor-cycle or automobile type of motor and develop a machine specially suited to their special needs; and in fact on its ability to run for long periods without attention and with absolute reliability depend such future achievements as a transatlantic trip. Aëroplane motors may be either rotary, as the Gnôme, a famous motor which has figured in many successful aëroplanes, or some form of motor with from four to eight or more cylinders where the pistons, arranged vertically, opposed, radially, or at an angle, work directly on the crankshaft. These are either air-cooled, as in the case of the Gnôme and Esnault-Pelterie, or water-cooled, as in the Curtiss and Wright.

With a fuller knowledge of the conditions naturally it was possible to design motors and planes for specific uses. Thus a machine to develop a speed of 100 miles an hour and over would be differently engined and designed from one where long-distance flying was the main object and all conditions of weather were likely to be encountered. It is in this latter respect that the most notable achievements have been secured and where further progress is likely to arouse the greatest interest as well as work for the greatest good. Consequently more important than mere speed records are those for cross-country flights, a noteworthy example of which was that of Brindejone des Moulinais, started on June 10, 1913, and lasting until July 2, in the course of which over 3000 miles were accomplished. This trip, extending from Paris to St. Petersburg and return, was made in a Morane-Saulnier monoplane equipped with a Gnôme 80 horse-power motor.

Brindejone's entire trip, as an achievement

and as illustrating the state of the art at the time it was made, is worthy of consideration aside from its first stage. The complete schedule was as follows:

June 10	Paris to Warsaw	875 miles
15	Warsaw to Dvinsk	344 "
16	Dvinsk to St. Petersburg .	281 "
23	St. Petersburg to Reval . .	219 "
25	Reval to Stockholm	250 "
29	Stockholm to Copenhagen .	344 "
July 1	Copenhagen to The Hague	449 "
2	The Hague to Paris	240 "
		—
		3002 "

It will appear from the above itinerary that the aviator traveled across long stretches of water and many kinds of country. His stays were often of several days' duration, so that the time of flight could have been reduced materially.

Speed Records. The increase in speed developed by the aëroplane in successive years already has been indicated, but it is best shown in the records of the Bennett cup competition, which began in 1909. In that year the trophy was won by Glenn H. Curtiss with an average speed of 47.04 miles an hour in a biplane. In 1910 Grahame-White with a Blériot monoplane made the 100 kilometers in 1 hour 1 minute $4\frac{3}{4}$ seconds, or at a speed of 61 miles an hour, which represented a gain of 30 per cent over the average of Curtiss; and while these were not the best records of the two years, yet they show very well the proportionate gain. In 1911 the 150 kilometers were accomplished by C. Weymann in a Nieuport monoplane in 71 minutes 36.5 seconds, or 78.728 miles an hour, or an increase of 29 per cent over the previous year. In 1912 Jules Védrines in a Deperdussin monoplane won over a 200-kilometer course with a flight of 1 hour 10 minutes 56.85 seconds, or at an average speed of 105.04 miles an hour, a gain of 33.2 per cent over 1911. These also were not necessarily the best speed records of the years mentioned, but they stand on a comparable basis. The best official speed record of 1912 was made, however, by Védrines at Chicago on September 9, after the Bennett cup competition, and was 107.4 miles an hour. In 1913 Maurice Prevost in a Deperdussin monoplane at the aërodrome at Rheims made a notable flight at the Bennett cup competition on September 29. He went over the 200 kilometers (124 miles) in 59 minutes $45\frac{3}{5}$ seconds, or an average speed of 124.5 miles an hour, making new records for all distances from 10 to 200 kilometers. All four competitors in the 1913 event flew at a rate well in excess of 100 miles an hour.

Altitude Records. The ability of the aëroplane to ascend to extreme heights of the atmosphere is of considerable significance, as it is more than a feat of mere daring on the part of the aviator and his ability to withstand cold and rare atmosphere. For the engine there is required more power to advance and raise the plane in the rarer atmosphere than at lower levels, while to ascend to great heights the machine must be carefully maneuvered. Consequently increase in altitude indicates progress in aviation, and this was strikingly illustrated in the progress from the year 1909, when the record stood at 1473 feet, to 1910, when, on January 7, Latham in an Antoinette monoplane rose at Bethény Plain to a height of 3445 feet.

On December 9 of the same year this record was raised by Legagneux in a Blériot monoplane at Pau to 10,499 feet. But this was by no means the end for the spiral soaring aviators, and by Dec. 11, 1912, Roland Garros at Tunis, Africa, went up to a point 19,032 feet, while, March 14, 1913, Perreyon in a Blériot monoplane went to a height of 19,650 feet. Various other records have been made with passengers in addition to the pilot, and this ability to soar is of particular value in the military use of the aëroplane, for it enables the machine to remove itself from range of fire on the earth.

Aëroplane Carrying Capacity. In 1908 Delagrangé, who had been in competition with Farman, carried the latter aloft and thus made the first ascent on record of two men in an aëroplane. In the following year Farman made an ascent with three passengers, and since that time the weight-carrying capacity of aëroplanes has been greatly extended, so that as many as 12 passengers have been carried for short periods. Passenger-carrying machines are even made with inclosed cars, and adequate protection for aviator and passengers has become a feature of even the smaller cars.

HYDROAËROPLANES

An important development of the aëroplane, and one destined widely to extend its use, was the hydroaëroplane designed to rise from the surface of water and to alight thereon. Not only is this type virtually a flying boat, but it is one that is reasonably safe. The idea, which had been suggested in patent specifications by Hugo Matullath of New York in 1899, had its practical origin in Curtiss, who added to the aëroplane with which he was experimenting at Lake Keuka in 1908 floats placed under each wing so that in case of accident the machine would not sink but could be reached and saved readily with a boat. In fact, it will be recalled that Langley and other inventors for like reasons made their experimental flights over bodies of water. Probably the first to add the floats as an integral part of the machine with the express idea of rising from the surface of the water was Fabre, who on March 28, 1910, made the first flight with a practical hydroaëroplane at Martigues on the Seine, France. His machine was a monoplane to which were fitted three floats, so that he was able to ascend and descend at will on the surface of the water. In the meantime Curtiss, who had been working at San Diego, Cal., on aëroplanes for the United States navy, developed a hydroaëroplane which was shown on Jan. 26, 1911. This was a biplane with floats instead of the usual landing skids, but provided, however, with wheels for use on land. Various arrangements of floats were tried, and the machine straightway commended itself to navy officers and a number of yachtsmen. Curtiss eventually abandoned floats and used a true boat body. Other designers are tending to follow in his footsteps. For this development of the hydroaëroplane Curtiss received the Aëro Club of America trophy in 1911, and in 1912 for the flying boat. The hydroaëroplane has aroused much interest, both in Europe and America.

By 1912 there was sufficient interest in the hydroaëroplane to warrant holding an international competition, and such a meeting duly took place at Monaco in March, seven biplanes

competing. The conditions of this competition as well as those of 1913 and succeeding years laid special stress on seaworthiness and practical performance and handling, not merely the development of high speed and the ability to rise from and above a perfectly smooth expanse of water. In other words, a distinct type of craft was being developed that would perform satisfactorily both above and on the surface of the water, that could be moored at anchor in fairly rough water, and that could be hoisted in or out of the water with an ordinary crane tackle in addition to traveling distances of as much as 300 miles in the air. This required a strongly built and framed aëroplane, well engined and embodying the best features of aëroplane construction, together with a suitable hull or floats. Another notable American machine was the Burgess-Curtiss hydroaëroplane, which was brought to a high degree of perfection and secured recognition in the American military and naval service. The Wright company in 1913 also brought out types of hydroaëroplane developed from their standard aëroplanes.

The hydroaëroplane presented nautical possibilities and problems almost as important as those of an aërial nature. Thus, by the use of a drag in a rough sea, as was done at the Mediterranean competition, the position of the aëroplane may be maintained. The attention that was paid to the hydroaëroplane by naval authorities showed how important an aid it was in various schemes of offense and defense. Furthermore, the possibilities of such a machine for sport similar to yachting and motor-boating were considered as far more appealing than the smaller and more rapid aëroplane.

The hydroaëroplane had also an effect on aëroplane construction and design by bringing about even stronger construction and greater power. It was early realized by aëroplane designers that once the practical aëroplane was secured extreme lightness at the expense of strength or other essential features was in no way desirable, and with the increased use of metal naturally came increased weight. Now with the hydroaëroplane, in which the principle of safety was carried even further than in previous aëroplane construction, there was added the desire to secure carrying capacity. All the American and European hydroaëroplanes are more and more designed for carrying capacity as well as strength both of the planes and of the hull or floats. Several other points in this connection could be mentioned also, but reference should be made to the compact arrangement of the engine in the cockpit with an accessible starting device and the placing of the propeller behind the pilot.

Crossing the Atlantic. The status of aviation was indicated in the spring of 1913, when Lord Northcliffe, of the *London Daily Mail*, offered a prize of \$50,000 for the first transatlantic flight from the United States, Canada, or Newfoundland to Ireland or Great Britain by an aëroplane in 72 hours. The conditions permitted alighting on the water or taking in fuel on the way, so that obviously some form of hydroaëroplane would seem the most promising. Were an aviator absolutely sure of the performance of his motor and suitable or at least constant weather conditions, there would have been little difficulty in accomplishing the feat, even at the time the prize was announced, and with the development of the hydroaëroplane

which could rest on the surface of the waves such a feat would seem to be possible. Thus the aëro-yacht biplane of M. Deutsch de la Meurthe had a carrying capacity of over 6000 pounds, and showed a speed of 68 miles an hour. If the place of the six or eight passengers ordinarily carried was occupied by fuel, the craft would have considerable radius of operation. Some such machine, even in the present state of aircraft, surely can be designed to overcome the difficulties.

Applications. Although the aëroplane, both as regards its design and construction, has progressed rapidly, outside of military and sporting purposes there has been but little application or even indications of its general and practical utility. For military uses the aëroplane is indeed a valued aid, and its utilization for scouting and reconnaissance as well as for offensive purposes followed almost immediately upon its construction in a practical form. (See MILITARY AËRONAUTICS.) In fact, it was in such demand after the first excitement attending aviation exhibitions as a novelty had worn off that an aëroplane-manufacturing industry was established, an industry which flourished in proportion to the interest taken in military aëronautics. For the rapid delivery of mail or express parcels, especially over long distances and mountains, there was believed to be a field for the aëroplane, and it was specially recommended for Alaska, but, all things considered, this is naturally restricted. Whatever mechanical triumphs have been scored with the aëroplane as yet, none have been economic. So far it has failed to develop commercial uses or even indicate clearly commercial possibilities. In large measure this is due to the fact that there is no demand for more rapid communication or transportation than can be supplied by modern railways and steamships supplemented by the telegraph and telephone. The limited carrying capacity of the aëroplane compared with the dirigible, for example, further restricts its use, and the desire for flight now able to be gratified does not seem to be widespread and general, largely because the machine cannot be regarded as a very safe form of vehicle. Nevertheless aircraft undoubtedly has a bright future, and with economy and efficiency will come increased carrying capacity that may soon bring about the aërial age.

Aëronautical Institutes. It was early realized that aërial navigation involved theoretical study and calculation as well as careful and elaborate experimentation no less than any other branch of physics or engineering. Accordingly there were established laboratories where experimental facilities were available and where technical researches could be carried on effectively. The first aëronautical laboratory was organized in France by Capt. (later Col.) Charles Renard at the Central Establishment for Military Aëronautics at Chalais-Meudon, near Paris, about 1884, when the experiments with the balloon *La France* were in progress. Later, experiments were undertaken with lifting screw propellers. In more recent years another French aëronautical laboratory was that founded by the French civil engineer, Gustav Eiffel (q.v.), who became interested in problems of aërial resistance by experiments with falling bodies released from the top of the famous tower he had designed and built. This work, carried on in 1903 and 1906, led to his building

a well-equipped laboratory, one feature of which was an elaborate wind chamber. Several volumes involving the results of M. Eiffel's notable investigations in this field have been published. A third French aëronautical institute is that founded by M. Deutsch de la Meurthe at Saint-Cyr with an endowment of \$100,000, and known as the Aërotechnical Institute of the University of Paris. In Germany there is an aëronautical laboratory and special department in the University of Göttingen, under the direction of Professor Prandtl, while in Russia there is the Aërodynamic Institute of Koutchino, founded in 1904 in connection with the University of Moscow by M. Raboutschinski. The British National Physical Laboratory at Bushy Park near London has an aëronautical department with extensive experimental facilities. In the United States authorization was given by the Board of Regents of the Smithsonian Institution on May 1, 1913, to reopen the Langley Aërodynamical Laboratory and to appoint an advisory committee and to arrange additional laboratories and to form them and other existing agencies into a special bureau. It is the function of this bureau to carry on theoretical and experimental investigation to increase safety and effectiveness of aërial locomotion for the purpose of commerce, national defense, and the welfare of man. The advisory committee was appointed and approved by the President of the United States, and for the first year of the work there was available an appropriation of \$10,000 to be followed by \$5000 annually for five years. The United States Bureau of Standards, the United States Weather Bureau, and the War and Navy departments were all represented in the advisory committee and will put their facilities at the disposal of the workers in the bureau.

Bibliography. As most of those who made systematic balloon ascents and carried on experiments in aërial navigation and aviation have been either scientific or military men, there is a valuable literature which is available for reference. A complete *Bibliography of Aëronautics* by Paul Brockett was published in 1910 by the Smithsonian Institution, Washington. Some of the more important works generally accessible are: Hatton Turnor, *Astra Castra: Experiments and Adventures in the Atmosphere* (London, 1865); Glaisher, *Voyages aëriens* (London, 1871); Tissandier, *Les ballons dirigibles* (Paris, 1872); *Histoire de mes Ascensions* (Paris, 1879); *La Navigation Aérienne* (Paris); Coxwell, *My Life and Balloon Experiences* (London, 1888); Pettigrew, *Animal Locomotion* (New York, 1872); S. P. Langley, *Aërodynamics and Internal Work of the Wind*, Smithsonian Institution (Washington, 1891); id., *Smithsonian Reports* for 1903 and 1904 (Washington, 1904-05). The *Smithsonian Reports* contain valuable summaries of important aëronautical experiments; Lilienthal *Der Vogelflug, als Grundlage der Fliege Kunst* (Berlin, 1889), trans. *Bird Flight as the Basis of Aviation* (London, 1911); Octave Chanute, *Progress in Flying Machines* (New York, 1894); *Proceedings of the International Conference on Aërial Navigation*; Santos-Dumont, *My Airships* (New York, 1904); *The Aëronautical Annual* (London, 1895-97); *the Proceedings of the Aëronautical Society of Great Britain*; the *Balloon Society of Great Britain*; *Académie d'Aérostation* of France and the *German Aëronautical Society*; Hildebrandt (Eng.

Lanchester, *Aërial Flight*, vol. i, "Aërodynamics" (New York, 1908); vol. ii, "Aërodonetics" (New York, 1909); Loughheed, *Vehicles of the Air* (Chicago, 1909); R. P. Hearne, *Aërial Warfare* (London and New York, 1909); The Aëro Club of America (collection of timely papers) *Navigating the Air* (New York, 1907); Sir Hiram Maxim, *Artificial and Natural Flight* (London, 1908; New York, 1912); Loening, *Monoplanes and Biplanes* (New York, 1911); Kaempffert, *New Art of Flying* (New York, 1911); Zahm, *Aërial Navigation* (New York, 1911); Rayleigh, *Mechanical Principles of Flight* (Manchester, 1899-1900; Curtiss and Post, *Curtiss Aviation Book* (New York, 1912); Turner, *Romance of Aëronautics* (New York, 1911); Hayward, *Practical Aëronautics* (Chicago, 1912); Grahame-White and Harper, *The Aëroplane, Past, Present, and Future* (Philadelphia, 1911); Brewer, *The Art of Aviation* (London, 1910); Duchêne, *The Mechanics of the Aëroplane* (Eng. trans. by Lederboer and Hubbard, London, 1912); Eiffel, *The Resistance of the Air and Aviation* (2d Eng. ed., trans. by J. C. Hunsaker, U. S. N., Boston and New York, 1913); Brewer, *The Art of Aviation* (London, 1913); Alexander, *Account of the Progress of Aviation* (London, 1913); Bauman, *Mechanische Grundlagen des Flugzeugbaues* (Munich, 1913); Berriman, *An Introduction to the Elements of Flight* (London, 1913).

Periodicals. Among the periodicals devoted to aëronautics whose files are most satisfactory sources of information on this subject, the best known are: *Flying and the Aëro Club of America Bulletin* (New York); *Aëronautics* (New York); *Aircraft* (New York); *Fly* (Philadelphia); *The Aëronautical Journal* (London); *Aëronautics* (London); *Flight* (London); *The Aëroplane* (London); *L'Aëronaute* (Paris); *L'Aërophile* (Paris); *Revue Generale de l'Aëronautique* (Paris); *La Technique Aëronautique* (Paris); *Encyclopédie de l'Aviation* (Paris); *Deutsche Luftfahrer Zeitschrift* (Berlin); *Bolletino Della Societa Aëronautica Italiana* (Rome). See NAVIGATION, AËRIAL, LAW OF; MILITARY AËRONAUTICS.

AËRONAUTICS, MILITARY. See MILITARY AËRONAUTICS.

AËROPHAGIA, ā'ēr-ō-fā'jī-ā, AIR SWALLOWING. A habit associated with gastric affections of the neurotic type, with lack of tonicity of the stomach walls. It is a common symptom of hysteria. No specific treatment is required apart from that of the disorder with which it is associated.

A'ËROPLANE. See AËRONAUTICS.

A'ËROSTAT'IC PRESS. A machine used for extracting the coloring matter from dye-woods and other materials. A vessel is divided by a horizontal partition pierced with small holes. Upon this the substance containing the color is laid, and a cover, also perforated, is placed upon it. The extracting liquid is then poured on the top, and the air being drawn from the under part of the vessel by an air pump, the liquid is forced through the substance by the pressure of the atmosphere. This instrument was used in place of the modern hydraulic press.

A'ËROSTAT'ICS (Gk. ἀήρ, aēr, air + στατός, statos, standing). That branch of science which treats of the weight, pressure, and equilibrium of air and other gases and of the equilibrium

of solids immersed in them. It is, therefore, a branch of pneumatics.

AËROTHERAPEUTICS, ā'ēr-ō-thēr'ā-pū'tiks. A system of treating diseases by subjecting the patient to varying degrees of atmospheric pressure, sometimes also by changing the composition of the air. Pulmonary tuberculosis is the disease most usually treated by this method. The air inhaled may be filtered, cooled, warmed, moistened, or dried, or impregnated with vaporized medicinal substances. The characteristics of different climates may thus be imitated very closely. Pneumatic cabinets of various types are employed, all being so constructed that the air within them can be condensed or rarefied to the desired degree. The *absolute* method is carried out by means of a chamber resembling the diving bell, in which the patient remains for a considerable time under pressure gradually increasing up to 1½ or 2 atmospheres, which is then gradually lowered. The *differential* method, that in most common use, is carried out by means of two separate kinds of apparatus. In the gasometer type the patient remains under ordinary atmospheric pressure and inhales or exhales, or both, into cylinders containing either condensed or rarefied air. In the cabinet type of apparatus the patient is surrounded by either condensed or rarefied air, while he breathes into ordinary air. Thus, it will be seen, a considerable number of combinations may be made. For example, the patient, surrounded by condensed air, may breathe into the unaltered atmosphere, or into condensed air, or into rarefied air; or, being in rarefied air, he may exhale into rarefied, condensed, or unaltered air, etc. Certain definite and constant phenomena are observed in each of these combinations. It is found that the inhalation of condensed air slows and deepens respiration, giving better ventilation to the lungs and increased vital capacity. The heart beats more slowly and powerfully, and the pulse is fuller. With the increased absorption of oxygen there is correspondingly increased metabolic activity. Exhalation into rarefied air facilitates expiration by making chest contraction easier. The heart is more thoroughly emptied of blood, and pulmonary congestion relieved. Thus, by a combination of inhalation of condensed air and exhalation into rarefied air, the benefits of climate and exercise are attained. The lungs are used to their full capacity, the appetite is increased, nutrition improved, and sleep promoted. It is to be noted, however, that this form of treatment is not safe when active inflammation of the lungs is present. Patients must be selected with great care and judgment. The beneficial effects of fresh, moving air in treating many diseases is now well recognized and appreciated. The various phases of the subject are more fully noticed under CLIMATE; TUBERCULOSIS; PNEUMONIA; ETC. (qq.v.).

A'ËROTROPISM (Gk. ἀήρ, aēr, air + τροπή, tropē, a turn, turning). The sensitiveness of certain plant organs which enables them to orient themselves with reference to the movements of gases—usually oxygen—dissolved in the medium in which they are grown. Aërotropism is a special case of chemotropism (q.v.). The pollen tubes of many plants are negatively aërotropic: when grown in sugar solution, they grow away from the surface of the medium which is in contact with air and from which oxygen molecules are diffusing. Various roots are also positively aërotropic in nature, though it is

doubtful whether aërotropism has a great part to play in the distribution of roots in the soil.

ÆSCHINES, ës'ki-nēz (Gk. *Ἀσχινης*, *Aischinēs*) (389–314 B.C.). An Athenian orator, second only to his great rival, Demosthenes (q.v.). He was born at Athens in humble station, served as a soldier, then became a clerk to some of the lower magistrates, and for a time was an actor in smaller parts. Finally, he became secretary to two distinguished statesmen, Aristophon and Eubulus, through whose influence he twice obtained election to a government secretary's office as clerk of the Ecclesia (popular assembly). Then, through his eloquence, grace, and legal knowledge, he rapidly became one of the leading men in the State. Sent as a member of the embassy to Philip of Macedon in 347 B.C., he was won over to favor the Peace of Philocrates (346), and then became the leader of the peace party at Athens as against Demosthenes, who headed the party which believed that Philip was to be opposed at every point and at any cost. In 345, because of his part in the embassy, he was charged with treason by Demosthenes and Timarchus, but, with the aid of powerful friends, defended himself so successfully that Timarchus disappeared from public life. Again, in 342, Demosthenes revived the charges in his famous speech *On the False Embassy*. Again Æschines answered successfully in a speech having the same title. He continued to favor Philip actively and no doubt contributed to the spread of Macedonian supremacy. His fall was due, however, to his hatred of Demosthenes, whom Ctesiphon had proposed to reward with the public gift of a golden crown in recognition of his services to the State. Æschines thereupon charged Ctesiphon with making an illegal proposal, and at the trial in 330 attacked him in his brilliant oration, *Against Ctesiphon*, really directed against Demosthenes. He was completely defeated by Demosthenes's speech, *On the Crown*, and so failed in his suit against Ctesiphon, suffered *atimia*, or loss of civil rights, and was condemned to pay 1000 drachmas fine. He went into exile at Rhodes, where, tradition says, he opened a school of oratory. He died at Samos. Æschines's posthumous fame is due to his three extant speeches, *Against Timarchus*, *On the False Embassy*, and *Against Ctesiphon*, which, according to Photius, were called in antiquity "The Three Graces." An anecdote often repeated shows the esteem in which the third was held. On one occasion, when he was reading to his audience in Rhodes his oration against Ctesiphon, some of his auditors expressed their astonishment that he should have been defeated in spite of such a powerful display; he replied: "You would cease to be astonished if you had heard Demosthenes." The speeches are edited by Schultz (1865); Weidner (1872); and in all collections of the *Attic Orators*. Consult especially, Jebb, *Attic Orators* (London, 1876–80); Blass, *Attische Beredsamkeit* (Leipzig, 1887–98); Norden, *Die Antike Kunstprosa* (Leipzig, 1909). The 12 letters which bear his name are spurious.

ÆSCHINES (*Ἀσχινης*). An Athenian philosopher of the fifth century B.C., intimate friend of Socrates. He was for a time a seller of perfumes at Athens, but unsuccessfully. Thereafter he lived in Syracuse, at the court of Dionysius the Younger, till the latter was expelled. He returned to Athens, and, unable to

rival Plato and Aristotle, taught philosophy privately; he ranked high also as an orator and as master of a pure Attic style. He wrote *Orations*, *Epistles*, and at least three Socratic *Dialogues*. The titles of the Dialogues were *On Virtue*, *On Riches*, and *On Death*; they sought to determine whether virtue can be taught, whether riches are good, and whether death is to be feared. We have treatises bearing these names, ascribed to Æschines, but they are not his, at least in their present form. See Gomperz, *Greek Thinkers*, vol. iii, Eng. trans. (London, 1905).

ÆSCHYLUS, ës'ki-lūs (Gk. *Ἄσχυλος*, *Aischylos*) (?525–455 B.C.). The first of the three great Athenian tragic poets. He was born in Eleusis and was of noble descent, being the son of Euphorion. He fought against the Persians at Marathon (490), Salamis (480), and Plataea (479); his epitaph celebrated his bravery on the field. He early turned to tragic composition and, according to tradition, appeared first in 497 as a rival of the older tragedians, Pratinas and Chœrilus. His first victory, however, was not won until 484. We hear also that he wrote in unsuccessful competition with Simonides an elegy over those who fell at Marathon. He undertook, apparently, three journeys to Syracuse; one about 476–475, when he composed a play, *The Ætneans*, 'The Women of Ætna,' for King Hiero (q.v.), in honor of the new city, Ætna, just founded by Hiero on the site of ancient Catana. He was back in Athens apparently in 472, but seems to have been again in Sicily between 471 and 469, when he had his play, *The Persians*, repeated there at Hiero's request. Soon after 458 he left his native city for Sicily for the last time and died at Gela in 456–455. The story that he was killed by the fall of a tortoise from the talons of an eagle, which had mistaken the poet's bald head for a rock on which it could crack the shell of its prey, is probably only a popular tale applied to Æschylus, although it may owe its origin to a misinterpretation of a scene on his monument. The citizens of Gela erected a splendid tomb to him; by a decree of the Athenians a chorus was granted for his plays alone after his death, and, about 330 B.C., at the proposal of the orator Lycurgus, a bronze statue of him, as of Sophocles and Euripides, was erected in the theatre at Athens.

The productiveness of Æschylus lasted for more than 40 years, during which he is said to have written 90 plays, of which 20 were satyr dramas. These tragedies were produced in groups of three, "trilogies," bound by a connecting thread of motive or interest, and each trilogy was followed by a satyric drama, of which genre Euripides's *Cyclops* is the only extant representative. (See SATYR.) We know 79 titles in all, among them 13 satyric plays. Only 7 tragedies are extant, *The Suppliants*, *The Persians*, *The Seven against Thebes*, *Prometheus Bound*, and the trilogy, known as the *Oresteia*, *Agamemnon*, *Choëphori*, and *Eumenides*. Æschylus won 13 victories during his lifetime; that is, he was successful with over half the trilogies he presented.

The Suppliants, or *The Suppliant Women*, is, in form, the earliest of the extant tragedies; the date of its presentation is unknown. The chorus is still the principal feature, the choral parts standing to the dialogue in the approximate relation of 1:2. The name is taken from the chorus, which is composed of the 50 daughters of Danaüs (q.v.), who have fled from Egypt

to Argos in their attempt to escape their suitors, the sons of their uncle Ægyptus, and there beg for protection from the Argive King. The odes set forth the violence of the sons of Ægyptus, the unholy character of the union which they wish, and the maidens' fears. The actors only interrupt these odes and carry the action forward but slightly in our modern sense. Yet the play has dignity, adequately expresses noble sentiments, and contains choral songs of great beauty. It was apparently the first play of the trilogy; the other tragedies were *The Egyptians*, which had for its theme the marriage of the sons of Ægyptus (q.v.), and *The Danaids* (see DANAÛS), in which the murder of the bridegrooms was accomplished, and Hypermnestra was brought to judgment for disobeying her father in sparing her husband.

The Persians was presented in 472 and is also very simple in its structure. It has great interest for us, since it is the earliest extant attempt of the Greeks to treat in the drama contemporary history. The subject is the battle of Salamis, in which Æschylus took part. The scene is laid, however, at the Persian court, where the dowager Queen, Atossa, is awaiting the return of Xerxes. The chorus consists of Persian elders, who give their name to the play. The story of the Persians' defeat is dramatically told by a messenger; then, at the advice of the chorus, Atossa summons the shade of Darius, in the hope that his wisdom can save the State; but he can only prophesy the defeat at Plataea. The appearance of the defeated Xerxes and an ode of sorrow for him and his subjects close the play. This was the second play of a trilogy; the first was *Phineus*, the third *Glaucus*, but the plots of both are unknown to us. This trilogy won the first prize.

The Seven against Thebes handled a favorite subject drawn from the cycle of Theban myths. It was the third of a trilogy, the first two being *Laius* and *Œdipus*; the satyric play was *The Sphinx*. This trilogy was presented in 467 and also won the first prize. The extant play represents the conflict between Eteocles and Polynices for the throne. Œdipus, ill-treated by his sons after he had blinded himself, prayed that they might divide the kingdom with the sword. To defeat the purpose of that prayer, the brothers agreed to reign alternate years; but Eteocles, the elder, once upon the throne, refused to surrender control at the expiration of the first year. Polynices, having raised a large army at Argos, where he had married the daughter of King Adrastus (q.v.), came to besiege Thebes; he and six other chieftains arrayed themselves each before one of the seven gates. A messenger relates to Eteocles the preparations of the seven and their oath to die rather than leave Thebes and then describes the appearance of each chief; when Polynices is reached, Eteocles can no longer control himself and rushes forth to slay his brother and be slain himself. See ETEOCLES AND POLYNICES; LAIUS; ŒDIPUS.

The Prometheus Bound, produced about 470 B.C., was the first of a trilogy, of which the *Prometheus Loosed* and probably *Prometheus the Fire-Carrier* were the other plays. In punishment for his rebellion in stealing fire from heaven for mortals' use, Prometheus (q.v.) is chained to a crag on the confines of the world, where a vulture sent by Zeus is to feed continually on his liver. He declines the proffered assistance of Oceanus, boasts of his services to

men, condoles with Io, who comes to him in her mad wanderings, and prophesies her future, and, finally, when visited by Hermes, the messenger of Zeus, bids defiance to him and amid whirlwind and earthquake disappears from view. In the following play Hercules shot the vulture and released Prometheus, and in the third the story of Prometheus was probably brought into relation with a local Attic cult of the hero.

The remaining three plays, *Agamemnon*, *Choëphori*, and *Eumenides*, formed the *Oresteia* trilogy. In the first play Agamemnon returns from Troy to his home, where his unfaithful wife, Clytemnestra (q.v.), is living with her paramour, Ægisthus (q.v.), by whom Agamemnon is treacherously murdered. This tragedy is not only the greatest of Æschylus' extant works, but rivals, in the minds of critics, even Sophocles' *King Œdipus* for the first place among all Greek tragedies. The *Choëphori* ('The Libation Pourers') is named from the chorus of women who offer libations at Agamemnon's tomb. In this play Agamemnon's son Orestes returns to Argos to avenge his father's murder and under a disguise obtains entrance to the palace, where he slays his mother and Ægisthus. This impious act of matricide was punished by the Furies. In the *Eumenides* Orestes is pursued by these avenging powers until he is cleansed from his blood guilt and set free through the aid of Athene, by the ancient court of the Areopagus (q.v.). This trilogy represents the maturest work of Æschylus, and we may well doubt whether a greater literary masterpiece was ever written.

The best critical edition of the text is by Wecklein (1885). There is an edition with English notes by Paley (4th ed., 1879), and many annotated editions of single plays; among these may be named Verrall's *Septem* (1887), *Agamemnon* (1904), *Choëphori* (1893), *Tucker's Suppliants* (1889), and *Choëphori* (1901). For complete translations consult Potter, Blackie, and Plumptre; for translations of separate plays, Browning, *Agamemnon* (London, 1887), Fitzgerald, *Agamemnon* (London, 1876), E. B. Browning, *Prometheus* (4th ed., London, 1856), and Warr, *Oresteia* (1900).

ÆSCULA'PIUS (Lat. form of the Gk. Ἄσκληπιός, *Asklēpios*). Among the Greeks and the Romans, a god of healing. No fully satisfactory derivation of the name has been presented. Æsculapius' worship seems to have originated in the valley of the Peneus in Thessaly and to have had an important centre at Tricca. From this region it was probably carried by the inhabitants, as they were forced southward by invading tribes, and thus appears in Phocis, Bœotia, and Peloponnesus, where were celebrated sanctuaries of Æsculapius at Titane and Thelpusa, in Eleusis (q.v.) in Attica, Pergamum (q.v.) in Asia, Cyrene in Africa, and, above all, at Epidaurus in Argolis, whence the worship of this god was introduced into Athens in 420 B.C. At Athens the worship spread rapidly because Æsculapius was taken under the protection of Dionysus. Colonists carried the cult of Æsculapius far and wide; at Cos, Cnidos, and Pergamum were famous temples. In consequence of a plague the god was brought to Rome in 293 B.C. and his temple established on the island in the Tiber. Æsculapius had temples in nearly 200 places. His sanctuaries were sought by the sick, and his priests undertook the cure of disease. The patient, after certain religious ceremonies, slept in a hall near the temple (the

sleep was often induced by narcotics), and during the night the god was believed to manifest himself in a vision, which, when interpreted by the priests, furnished directions for the treatment. After the cure the patient left an account of his case and an offering for the god—often a representation of the part of the body cured, eyes, hands, or feet, with liberal fees. (See Aristophanes, *Plutus*, 653 ff.) Records of cures at Epidaurus and at the shrine in Rome have come down in great numbers. It seems likely that the priests had acquired considerable medical knowledge and skill in treating the sick and that the sacred sleep was merely a device to preserve the credit of the god. Greek medicine was thus intimately connected with the worship of Æsculapius.

It should be said that in the *Iliad* Æsculapius is not spoken of as a god, and his sons Machaon and Podalirius differ from the other heroes only in their superior skill in treating wounds. It seems evident, however, that he was originally a divinity who later became subordinate to the great Apollo cult. Much points to Æsculapius as a chthonic god, though many regard him as connected with the light. Whatever his nature, Æsculapius early became fixed as a god of healing, perhaps losing his other functions through association with Apollo. His sons Machaon and Podalirius play a considerable rôle in heroic legend and were claimed as ancestors by the Asclepiadæ (q.v.). His daughters, Hygeia (health), Panacea (all-healing), Iaso, Aigle, and others, bear names that show them to be merely personifications of abstract ideas connected with healing.

The myths connected with the life of Æsculapius varied in different localities; but the one which has become canonical appeared in a lost Hesiodic poem (the *Eoœœ*: see HESIOD), and is known to us from a poem by Pindar and some scattered allusions in other writers. Apollo loved Coronis, daughter of Phlegyas, but she proved faithless and wedded the Lapith, Ischys. The news was brought to Apollo by the raven; the bird was punished for its message by being changed from white to black. Apollo slew Ischys, and Artemis killed Coronis; but, while Coronis' body was on the funeral pile, Apollo rescued his yet unborn son Æsculapius, and took him to the centaur Chiron, who trained him in the healing art, in which he became so expert that he even raised the dead. For this presumption Zeus slew him with his thunderbolt. In art, Æsculapius is usually represented as a bearded man, wearing a mantle which leaves the right shoulder and the breast bare; a snake usually attends the god. A beautiful head from Melos in the British Museum is probably an Æsculapius of the Praxitelean school. Consult: Walton, *The Cult of Asklepios* (New York, 1894); Wilamowitz-Möllendorff, *Isyllos von Epidaurus* (Berlin, 1886); Farnell, *Cults of the Greek States* (Oxford, 1896-1907).

ÆSCULUS. See HORSE CHESTNUT.

ÆSIR, ē'sir or ä'sir (pl. of As, Icel. *áss*, god, demi-god). The gods of the Northmen of Scandinavia and Iceland. There were 11 chief gods or Æsir besides Odin (the 'all-father'), viz., Thor, Balder, Ty or Tyr, Bragi, Heimdal, Höd, Vidar, Vali, Ull, Forseti, and Loki or Lopt. To these may be added Njörd and his son Frey, who were not originally Æsir. The naming of the gods differs in different parts of the *Younger Edda* (see EDDA). The chief goddesses

of Asgard, the Scandinavian Olympus, were Frigga, Freyja, Nanna, Sif, Saga, Hel, Gefjon, Eir, Hlin, Lofn, Vör, and Snotra. These names, considered in the primary old Norse signification of the words, in most instances allude to some characteristics; yet it is impossible to determine whether they personify merely certain physical powers of nature or were originally the names of individuals in the prehistoric period. Probably they have a mixed origin and combine real names with physical powers. The principal source of information concerning these gods is the *Eddas* (q.v.), collections of the oldest songs and traditions of the people of Scandinavia.

Thor, son of Odin and Frigga ('the vivifying'), is the chief god next after Odin and is the strongest of the Æsir. He seems to have been a god of that Phœnician form of nature worship which was superseded in Scandinavia and northern Germany by the faith of Odin. From Thor's hammer flashed lightning, and his chariot wheels made thunder as he went through the air, cleaving mountains, loosening frozen streams and pent-up rivers, and slaying giants and monsters. He was seldom in Asgard with the other Æsir, but dwelt in his mansion Bilskirner, in the densest gloom of the clouds. With his hammer he consecrated the newly wedded, and the sign of the hammer was made by Northmen when they took an oath or any serious obligation. Thor was the god of thunder, the destroyer of evil spirits, the friend of mankind, and the defender of the earth, the heavens, and the gods against the giants. The early Christian missionaries in Scandinavia, finding the faith in Thor too strong to be suddenly uprooted, tried to transfer many of his characteristics to their zealous convert, St. Olaf, who was said to have resembled the old Norse god in his comeliness of person, his bright red beard, hot temper, and personal strength; while some of the monks of a later period tried to persuade the Northmen that in Thor their forefathers had worshiped Christ and that his mallet was a rude image of the cross. Slaves and thralls killed in battle were believed to be under the protection of Thor, who, as the god of the Finns before the spread of the As religion, was honored as their special guardian against the tyranny of their old masters.

In Balder, the son of Odin and Frigga, the Norsemen honored the beautiful, the eloquent, the wise, and the good, and he was the spirit of activity, joy, and light. His name signifies the 'strong in mind.' His wife Nanna reflected these attributes in a less degree. On his life depended the activity and happiness of all the Æsir except Loki, the 'earthly fire' or incarnation of evil; and hence Loki, from envy of the beauty and innocence of Balder, accomplished his death and afterward hindered his release from the power of Hel, the goddess of death. As the death of Balder was to be followed by the fall of all the Æsir, the gods had caused all things to swear not to injure him. But the insignificant mistletoe was overlooked or thought unimportant. Loki secured an arrow of mistletoe, and when the gods were amusing themselves by shooting at the invulnerable Balder, Loki gave his arrow to Höd, the blind god, and directed his aim so as to hit Balder, who was killed. The death of this beneficent god, for he was the symbol of the summer sunlight, signifies the fading of summer before the blind and fierce winter, her preordained destroyer. The myth

continues: After Balder's death the gods captured Loki and shut him up in a mountain, where he will remain until the earth and all therein and the gods themselves shall be destroyed by fire (the powers of evil). The companion and liberator of Loki, Odin, alone will survive, and then a new and purer world will arise in which Balder will again appear, and Loki, or evil, be no more heard of.

At first Loki, under the name of Lodhur, or 'flame,' and as the foster brother of Odin, had united with the all-father in imparting blessings to the universe. Afterward he left the council of the gods and wandered into space, desolating and consuming with flame all things that came in his way. In the under-earth, where volcanic fires attest his presence, he consorted with evil giantesses and became the father of Hel, 'pallid death,' of Angerboda, 'announcer of sorrow,' of the wolf Fenrir, and of the Midgard serpent, who ever threatens the destruction of the world. Loki assumes any shape at will. As sensuality he courses through the veins of men, and as heat and fire pervades nature and causes destruction. After the establishment of Christianity the attributes of Loki were transferred to Satan; but in Iceland an *ignis fatuus* is still known as "Loki's burning."

Njörd and his children, Frey or Fricco and Freyja, appear to have been honored in the North before the time of Odin. Njörd is said to have lived in Vanaheim, and to have ruled over the Vanir, or elves of light, long before he became one of the Æsir. He is the god of oceans and controller of winds and waves, and to him seafarers and fishermen raise altars and make prayers. Frey, his son, is the god of rain and fruitfulness, and his worship was accompanied with phallic rites. His sister Freyja, who holds a high rank among the Æsir, is the goddess of love, but her influence, unlike her brother's, is not always beneficent and varies with the form she assumes in operating on the minds of men. Her chariot is drawn by cats, who are emblems of fondness and passion; and a hog, implying fructification or sensual enjoyment, attends upon Frey and herself. The Swedes paid especial honor to Frey, while the Norwegians worshiped Thor.

Ty (Tyr), the Mars of the Norsemen, is wise and brave, giving victory, and fomenting strife. He is also a son of Odin, and is the most daring and intrepid of all the gods. His name lives in our Tuesday (Ty's day), as does the name of Odin in Wednesday (Woden's day), Thor in Thursday (Thor's day), and Freyja in Friday (Freyja's day). Tyr's name signifies 'honor,' and his worship was widely spread in the North. Bragi, the son of Odin, was the god of eloquence and wise sayings, the originator of the Skaldic poems; and when men drank Bragi's cup they vowed to perform some great deed worthy of a skald's song. Bragi's wife was Idun, who guarded the casket of apples that gave to those who ate them perpetual youth. She was abducted by the giant Thiassi, and by Loki's craft removed to the other world. Her release in spring seems analogous to the myth of Proserpine. Heimdal, personified by the rainbow, is the god of watchfulness, the doorkeeper of the Æsir. Vidar, the strongest of the gods except Thor, is the personification of silence and caution. He is the brother of the gods, being the son of Odin. Vali is the brother of Balder and a great marksman. Ull decides issues in single

combat; Forseti settles all quarrels; lovers find protection in the goddesses Lofn and Vör, of whom the former unites the faithful and the latter punishes the faithless; Gefjon keeps a watch over maidens and knows the decrees of fate; Hlin guards those whom Frigga, the Queen and mother of heaven, desires to free from peril. The Queen herself, as Odin's wife and mother of the Æsir, knows but does not reveal the destinies of men. Saga is the goddess of narration and history; her home is in Sökvabek, the abyss, an allusion to the abundant streams of narrative, from which streams Odin and Saga daily drink and pledge each other. Snotra is the goddess of sagacity and elegance, from whom men and women seek good sense and refined manners. The Norns, the weird sisters, and the Valkyrias are closely connected with the gods. The principal Norns are Urd, past time; Verdandi, present time, and Skuld, future time. They twist and spin the threads of destiny and make known what has been decreed from the beginning of time. They preside at the birth of every man and cast the weird of his life. The Valkyrias, a troop of goddesses, of whom there are over a dozen, are sent by Odin to the battle-fields to choose the slain.

It remains to add that in the gods here mentioned the Northmen recognized the makers and rulers of the world that now is, from whom emanated the thought and the life that pervade and animate nature. With Odin and Æsir the intellectual life of the northern people began; and although they ascribed to them human forms and acts, these were seldom without something higher and nobler than pertains to mortals; and while they recognized the existence of a state of chaos and darkness before the world began, they anticipated the advent of another state in which the gods, like men, would receive their reward at the hands of a supreme All-father. Consult Anderson, *Norse Mythology* (Chicago, 1901). See the article on SCANDINAVIAN AND TEUTONIC MYTHOLOGY, and the separate articles on the gods, such as FREY; LOKI; ODIN, ETC.

Æ'SOP (Gk. Αἴσωπος, Aisōpos). The name of a famous Greek writer of fables, who is said to have been born a slave in Samos late in the seventh century B.C., but to have gained his freedom by his cleverness. We may, however, well doubt whether he ever existed; we have the most varied accounts of him, many of which on their face are pure inventions; and the fables which passed under his name were certainly not written until long after the period in which he is supposed to have lived. Socrates in prison turned some of the current Æsopic fables into elegiac verse; and about 320 B.C. Demetrius of Phalerum made a prose collection of the fables known to his day. Whatever the facts as to Æsop's existence, it is certain that his soon became a generic name attached to those beast fables which are part of the common property of the Indo-European peoples. The collection which now bears his name consists for the most part of prose paraphrases of the collection of fables made, in choliambic verse, by Babrius (q.v.), edited by Halm (2d ed., 1860). Consult Jacobs, *Introduction to the Fables of Æsop* (New York, 1896); Keidel, "The Editio Princeps of the Greek Æsop," in *American Journal of Philology*, xxiv, 304-317 (1903). See PHÆDRUS.

ÆSOPUS, è-sō'pūs, CLODIUS, or **ÆSOP**. A great Roman tragedian, contemporary with Quintus Roscius (q.v.), the comedian. Cicero put himself under the direction of these two to perfect his own elocution, and Æsop did many friendly services to Cicero during the latter's banishment. Æsop was noted for sinking his own personality in the character he represented; grave and sedate, he acted best the less vehement tragic rôles. He made his last appearance in 55 B.C. at the dedication of Pompey's theatre, after which his voice failed him. He left a fortune to a worthless son—the Æsop who, according to a well-known story, dissolved in vinegar a pearl valued at \$40,000, to have the satisfaction of swallowing the most expensive drink ever known.

ÆSTHESIOMETER, ès-thē'sī-ōm'è-tēr or ès-thē'zhī-. See PSYCHOLOGICAL APPARATUS.

ÆSTHETICS, ès-thèt'iks (Gk. τὰ αἰσθητικά, *ta aisthētika*, or ἡ αἰσθητική, *hē aisthētikē*, the science of the beautiful, from αἰσθητικός, *aisthētikos*, perceptive, sensitive, αἰσθάνεσθαι, *aisthanesthai*, to perceive, apprehend by the senses). The name now generally given to the science of the beautiful, the sublime, and the ludicrous. The history of this science furnishes us with a striking illustration of the truth that theory always follows practice. It was not till the noblest period of art in Greece had passed its zenith that any serious attempt was made to ascertain the nature of the beauty which art presents. The Sophists and Democritus seem to have made some essays in this direction, but we know practically nothing of the results they reached. It is only when we come to Socrates that we are on secure historical ground; and even in his case we know only enough to make it possible to begin our sketch of the history of æsthetics with his name. He seems to have taught that beauty is one with utility—a doctrine which is thoroughly in keeping with his ethical utilitarianism, but which gives no distinctive recognition to the beautiful as in any way differentiated from the good. Plato, in one respect, follows in his master's steps. While we cannot say that he identified the æsthetic and the ethical, yet in his most serious discussions he so completely subordinated the former to the latter as to make it a mere handmaid of morality. This attitude is unintelligible to any one who does not remember that Plato lived in an age of decadence in art and in art appreciation. The great poets in the Hellenic world were not in his time appreciated so much for their beauty as revered for their infallibility as guides in faith and practice. A quotation from Homer would definitely settle a question in policy or morals, and a "Thus saith Simonides" was a *ne plus ultra* of debate. This dogmatism in the interpretation of poetry was responsible for the degradation of the poets from their places as artists charming and inspiring mankind to the position of pedantic pedagogues, whose deliverances were open to question on the ground of fact by any one who had the temerity to deny their popularly conceded inerrancy. Such a one was Plato, who proceeded to meet this dogmatization of poetry by a demand for its moralization. Homer, he claimed, must be expurgated in the interests of a more worthy view of God and man. Other arts suffered a like fate. For instance, only such music as could directly fit a man the better for a life of courage and temperance was to be tolerated in the ideal

Platonic State. But this insistence upon the right to judge art by moral standards alone, though very prominent on the surface of Plato's thought, does not represent his best philosophy of the beautiful. Remembering that music was for Plato a general term for all the human interests over which the Muses presided, and that training in music was for him a cultivation of a proper habitual attitude toward the good, and that a scientific education in moral values was to follow the musical education and so bring habitual attitude to insight, one might almost say that with Plato the beautiful is the form in which the good appears to a properly trained but unreflective consciousness, a view quite like that of Hegel, 2200 years later. And as the good is the supreme principle of unity in the universe, beauty is itself a relatively simple unity in variety. This variety, however, must not be too complicated. It must have a very narrow range, or it would break over the bounds of unity. Hence only those works of art which are severe in their classical simplicity were considered as true embodiments of the principle or "idea" of beauty. Such an embodiment was technically called an "imitation." This term, without doubt, meant more for Plato than it would naturally mean for us. Imitation was symbolization as well as copy. But, for the most part, Plato was unable to free himself from the conception that second-hand reproduction was characteristic of all art. Hence art is further from reality than nature, which is the first embodiment of reality. But no definite statement of Plato's æsthetic views would do justice to the unsystematic many-sidedness of his thought on the subject. His dialogues contain many stimulating suggestions as to the nature of beauty, but no explicit æsthetic theory, built on the basis of these suggestions, could be fairly attributed to Plato.

Aristotle, being himself less artistic than Plato, was in a better position to make a more scientific study of æsthetics. His works on rhetoric and poetics, and, in a more desultory way, many of his other writings, were the first inductive studies we know of the principles of art. He differentiates the good from the beautiful: the good is dynamic (*ἐν πράξει, en praxei*), the beautiful may be static (*ἐν ἀκινήτοις, en akinētois*). The good, being thus always connected with action, appeals to consciousness in the form of desire for possession. We are interestedly concerned in the good; our concern in the beautiful is disinterested. For Aristotle, as for Plato, a beautiful object is a unity in variety, but Aristotle gives a wider scope to the variety than his predecessor. Under the proviso that a thing be not too large for easy apprehension, a considerable multiplicity in its organization was regarded as conducive to beauty, and, other things being equal, the greater the size the greater the beauty. Among these other things were propriety in the arrangement of parts, symmetry, and clearness of outline. Aristotle followed Plato also in making art an imitation of inartificial beauty, but he refused to follow Plato when the latter depreciated art for this reason. While Plato put the fine arts far below the works of the artisan, Aristotle put poetry, in one passage, above theoretic philosophy. This position, however, does not accord with the rank given in his *Ethics* to the life of philosophic contemplation. The value Aristotle attributed to art, especially to the drama, was

due to the fact that it "effects, by means of pity and fear, the purgation (*κάθαρσις*, *katharsis*) of such emotions." The meaning of this has been warmly debated. If purgation is taken in a moral sense, then Aristotle has relapsed into the Socratic position that art is not differentiated from morality. But a more plausible interpretation is that purgation is used in its physiological significance. This would make the meaning to be that drama gives free and healthy discharge to the passions of pity and fear and thus prevents emotional congestion. Greek speculation on æsthetic theory comes to a close in Plotinus (q.v.), who explains beauty by referring it to the work of an objective reason, which gives a form to dead matter so as to make it become an expression of itself. This creative reason is the transcendently beautiful; matter transformed by it is the empirically beautiful. Artistic production is not, however, necessarily limited to the copying of the natural products of the supreme reason. The human reason, by virtue of its participation in the divine, may so transform objects that they shall become more beautiful than they are in their naturalness. Art is thus raised from the stage of imitation to that of idealization, although idealization is taken mystically.

No important æsthetic speculations come from mediæval writers. Mr. Bosanquet, in his *History of Æsthetic*, has satisfactorily explained this comparative barrenness of the Middle Ages in æsthetic theory. It was not due, as the traditional view of mediævalism would seem to imply, to the deadness of that period in things intellectual and spiritual, but to the enormous tension of the higher life, which busied itself so absorbingly in practical creative activity as to leave no leisure for reflection upon its own work. Mediævalism was engaged in the problem of building the foundations for a new life and, therefore, for a new art. The art of classical antiquity was comparatively simple; the perfection of its form was made possible so early by its limited ambition. In general, it sought to do justice merely to the beauty of form. It was a successful criticism of life, only because it criticised one aspect of life, leaving the richness and variety of its contents to the one side. But Romanticism as a creative principle in art began to work early in the Middle Ages. The wilder, more turbulent spirit of the Teutonic barbarians would not brook confinement within the narrow lines drawn by classic masters, and for a whole millennium was wrestling with the practical problem of making art richer by the incorporation within it of all the phases of nature and of human life, which classic art, with true instinct for its own essential limitations, had ignored; and just as ancient æsthetic theory was not constructed until the returns from ancient practice were all in, so modern æsthetic theory could not be supplied with its data till modern art had become to a great extent a completed achievement, challenging reflection to concern itself with the discovery of the principles involved. Mr. Bosanquet is, perhaps, right in representing Shakespeare as being the last of the great artists in the long succession that began with the architect of St. Sophia; Shakespeare succeeded in the great common endeavor to render into art life and nature in all their infinite complexity, and yet to make the rendition as unitary in its effect as were the art products of the golden age of Æs-

chylus and Pheidias. In him the wheel of artistic creation had come full circle, and after him, therefore, the wheel of æsthetic theory could begin to turn. But there was another reason why, after the time of Shakespeare, æsthetic theory should have become a great need. Not only did all the richness of mediæval and modern artistic achievement challenge the theorist to study it, but the art of classical times had come to life again in the great archæological discoveries of the eighteenth century. The literary renaissance of antiquity in the fifteenth century was now followed by the resurrection of the plastic arts of Greece and Rome. The striking contrast between the formal severity of the antique and the freedom of the modern demanded that an inquiry should be instituted which should succeed in correlating, and, by correlating, succeed in justifying, the two strikingly different types. This demand that theory should do injustice to the principles of beauty incorporated in art was reinforced from the side of philosophical speculation.

The seventeenth and eighteenth centuries were a time of tremendous philosophical energy; and as the idealism of modern philosophy became more and more concrete, it was inevitable that æsthetic questions should force themselves more and more upon the attention of philosophy. Thus, as we find Lessing and Winckelmann representing predominantly an interest in art for art's sake, so we find Baumgarten and Kant representing an interest in art for philosophy's sake. These two tendencies united in working out a modern æsthetic theory, which was finally to be based on solid scientific grounds with the aid of experimental psychology. The appreciation of the æsthetic significance of all these contributions cannot be attempted here. Suffice it to say that Lessing made an important addition to æsthetic theory by marking off the boundaries of poetry from the plastic arts. The medium of the former is time, and that of the latter is space. The former can represent action and is, therefore, capable of expressiveness, whereas the plastic arts are limited to the treatment of formal beauty and of the beauty of colors. The ugly is out of place in the plastic arts, because, once represented in painting or statuary, it gets a permanence that becomes revolting. This thought might be illustrated by referring to a line of Keats's *Ode on a Grecian Urn*, "Forever wilt thou love and she be fair." There is a subtle but powerful delight ministered by this insistence upon the immortality of youth and love, caught and made perpetual by the ceramic art. But change the *motif*; let it be: "Forever wilt thou loathe and she be foul," how quickly the thought of the abidingness of the unpleasant creates disgust with the pottery, however skillful may be the representation of this phase of life! Baumgarten's significance was more that of a pioneer and name-giver than that of an important contributor. Carrying out the Cartesian idea that sense is confused thought, he added to the Wolffian (see WOLFF) philosophical encyclopædia, which included ontology, cosmology, ethics, and psychology—all sciences of clear thought—a new discipline dealing with obscure thought; and he gave to the work in which he treats this new subject the title *Æsthetica*. This was the first time that the term was employed to designate the science which has since Baumgarten's day quite constantly been called by this name. But great as

is the convenience of having a name to give to a science, an advance in the way of a satisfactory handling of this science could hardly be expected from a thinker who appreciated beauty only as an imperfect imaging of what is intellectual.

Kant (q.v.) has been an important factor in determining the speculations of modern philosophical æsthetics, although what he calls æsthetics in his famous *Critique of Pure Reason* is something entirely different from what to-day passes under that name. He strikes, in his *Critique of the Faculty of Judgment*, a distinctly modern note in emphasizing the affective or emotional side of æsthetic appreciations, thus exalting the artistic consciousness from the position of being an imperfectly developed logic and metaphysics. But Kant's views are too completely determined by the idiosyncrasies of his philosophy ever to have become generally acceptable. His philosophy is dominated by the thought of a great breach between noumena and phenomena. (See APPEARANCE.) The datum of philosophy is this apparent breach, but the problem is in large measure the healing of it. But this Kant could never succeed in effecting. In his first two *Critiques*—those of Pure Reason and of Practical Reason—he deals with phenomena and noumena in their antithesis and separation. In his *Critique of the Faculty of Judgment* (1790) he attempts to bring about a connection and synthesis. In his definition of beauty he follows his division of categories into those of quality, quantity, relation, and modality. Qualitatively, the beautiful is the disinterestedly pleasing; quantitatively, it is the universally pleasing; relationally, it is that which has the form of purposiveness without the reality of purpose, and, modally, it is the necessarily pleasing. Thus, disinterested, universal, and necessary pleasure in simulated design is for Kant the essence of beauty. The sublime is that which pleases because of a reaction, after an inhibition of vitality—a reaction which gives rise to a higher degree of vitality. The ridiculous is also a reaction against tension, being “the sudden change of a tense expectation into nothingness.” As in the case of Kant, so in those of Schelling (q.v.) and Hegel (q.v.), the philosophy of the beautiful has its part assigned to it in accordance with a comprehensive view of the universe. Schelling's absolute was one of utter indifference of subject and object. Therefore, in artistic appreciation it is this ultimate unity of absolute indifference which is perceived as the beautiful. In Hegel the absolute is not the indifferent, but the differentiated unity of subject and object, and art is a form of the absolute consciousness, i.e., it is such an attitude of consciousness toward its objects as does not eject them into an existence independent of itself; yet it does not fail to observe the distinction between consciousness and objects. There are three forms of absolute consciousness, of which art is the first. In the art-consciousness the unity of subject and object is relatively simple. Although subject and object are not reflectively identified, they are not held apart, as in scientific knowledge. The beautiful is thus the absolute idea immediately perceived. Hegel's followers, Rosenkranz, Schasler, and Vischer, worked along these lines and elaborated a very detailed æsthetics. Schiller (q.v.) returns to Kant and differentiates the material and the formal impulses which, working in conjunction, produce the beautiful.

In England Shaftesbury (q.v.) worked in a Platonic spirit, and Hutcheson (q.v.) makes “all beauty relative to some mind perceiving it.” The mind has a faculty, “an internal sense,” which is capable of receiving ideas of beauty from all objects in which there is uniformity in variety. Reid (q.v.), on the contrary, gives an objective value to beauty, claiming that it exists apart from our perception of it. Henry Home calls beauty the pleasure connected with sight and hearing. Hogarth (q.v.) makes a great advance in paying attention to details. He went back to the ultimate sensitiveness of the mind to certain geometrical forms and colors, and in this respect was the forerunner of recent psychological æsthetics; while Burke (q.v.) goes further and looks for the explanation of beauty in certain physiological effects produced by the beautiful object. The relaxation of nerves by appropriate stimuli has a soothing effect, which is the basis of æsthetic pleasure. Hence the beautiful must be *petite*. Alison (q.v.) is distinguished by the thoroughgoing way in which he applies Associationism to the explanation of pleasing æsthetic effects. The delight we take in a beautiful object is due to its delightful suggestions. Bain (q.v.) elaborates this Associationism and differentiates the æsthetic pleasures from others by their disinterestedness, purity, and sympathetic value, as being sharable in a way in which others are not. Spencer (q.v.) introduces Evolutionism into æsthetics and thus accounts for the æsthetic pleasures that in the individual seem to arise from congenital dispositions, by claiming that these dispositions are the survivals by heredity of associations formed in the history of the race. ÆSTHETICS, EXPERIMENTAL. Experiment made its way into the field of æsthetics from psychology on the one side and from philosophy and mathematics on the other. About the middle of the last century, while experiment was young in psychology, a dispute arose among theoretical writers concerning the æsthetic value of simple space-forms. A. Zeising, professor of philosophy in Munich, urged that formal beauty demands a simple proportionality; and while others saw, in both nature and art, a preference for equality, balance, or the relations given by the vibration ratios of consonant musical intervals, or the heptagon, or the square, Zeising carried out his theory most methodically of all. He meant by proportionality the division of an object in such a way that the smaller part, the minor, stands to the greater, the major, as the greater to the whole. This division is called the Golden Section. Zeising made the most extravagant claims for the importance of his law. He maintained that it furnished the pattern for the human body, the structure of plants, the forms of crystals, the arrangement of planetary

systems, and that it determined the proportions of buildings, sculptures, and paintings.

It occurred to G. T. Fechner (q.v.) to test the claims of Zeising and his opponents, in so far as æsthetical preference was concerned, by observing series of divided lines and of simple forms—rectangles, ellipses, and crosses—under experimental conditions. He made use of a large number of persons, asking each to state his preference within each series. Fechner also performed an important service in discriminating between the associational factors in the æsthetic judgment (those furnished by the use, purpose, rareness of objects) and the direct effect produced upon the feelings by the form or the color or the rhythm itself. It is to this latter non-associational element that experiment has directed its attention. It offers the advantages of simple and constant conditions and of a direct appeal to the undivided judgment. It has confined itself thus far to the elements which are common to all individuals. Within this limited field it may fairly be said to have been successful.

Methods and Results. The result of Fechner's work was to modify the assertions of Zeising and other theorists. A decided preference for the proportion of the Golden Section was found with certain figures, particularly the rectangle. For the simple sectioning of a line, on the other hand, preference was shown for the division into halves and thirds. Fechner is justly called the founder of experimental æsthetics. He laid out the field, distinguished the direct and the associative factors, gave the methods, and applied them successfully. There are three chief methods now used in experimental æsthetics: (1) choice, (2) construction, and (3) use. In the method of choice, series of simple figures, tones, or colors are presented to the observer, who selects the one most pleasing in its own right. The objects may be given in pairs (method of paired comparisons), or in a progressive series (serial method), or promiscuously, according to the material used. In the method of construction the individual is given elements, e.g., two narrow strips of cardboard, and is asked to make from them the most pleasing figure (cross) that he can. The method of use or application consists in collecting the dimensions of simple, common objects, as visiting or playing cards, envelopes, vases, newspapers, books, windows, façades, in order to discover the usual or most common proportions. The value of the last-named method rests on the supposition that the proportions most used are the most agreeable. This is true only in part: fitness, cost, use to which an object is put, and custom play a large part; for these reasons the method requires caution. The second method suffers from rather narrow limitations. Both it and the third, however, are of value as checks upon the method of choice, which is the most trustworthy and has been most successfully employed.

The methods named have been used chiefly with spatial forms: rectangles, crosses, lines, angles, circles, ellipses, and triangles. They have succeeded best with the simpler figures. Fechner's early results have been, for the most part, confirmed. We know now that certain divisions and dimensions are æsthetically pleasing for their own sake, that is, with no specific association attaching to them. The most agreeable are expressed by the ratio 1:1 and (approximately) 3:5, the last-named ratio standing near the relation for the Golden Section given above.

For example, the grand average from 23 series in which various forms (lines, angles, crosses, and ellipses) were used, with a number of observers, gave as the most pleasing ratio 1:1.635, with an extremely low fluctuation for the different series. We conclude, then, that the most satisfying combinations are those in which the parts are alike and those in which they are moderately similar. One is tempted to point to the mathematical relation of the Golden Section as an explanation of the æsthetic enjoyment found in proportion. But the relation is in itself no explanation, and, even if it were, the deviations from it which many individuals show would invalidate it. A recent explanation of the æsthetic feelings connected with space forms points out that man involuntarily invests spatial objects with the activities—strains, resistings, tensions—which he himself feels in his own body. According as an object—a pillar, a statue, or a block of stone—gives evidence that it is capable or incapable of holding its own, supporting its load, and maintaining its own integrity does it awaken a feeling of satisfaction or dissatisfaction in the observer. This tendency shows itself, it is argued, even where the object is reduced to a mere outline. The argument gains part of its weight from the fact that it also gives a reason for a host of illusions connected with our perception of spatial relations. A true mathematical square is not seen as a square at all, but as a rectangle whose height is greater than its breadth; a bisected vertical line looks longer above the point of division than below, and so on. The allowance made for these illusions is probably the most important advance in method since the days of Fechner. It is to be noted that the explanation, which we may call a dynamic one, brings in the associational factor. Yet this is not a fatal objection, for the associations assumed are generic, so to speak, and thus constant, within limits, for all individuals. The theory must, however, share honors with a psychophysical one, which accounts for the elementary æsthetic feelings in terms of the simplicity and complexity of psychophysical processes underlying them. It is probable, that is, that the facility with which certain proportions are cognized affects directly the excitability of the nervous system in such a way as to produce pleasure.

The method of choice may be adapted to the determination of the æsthetic value of elementary musical combinations. We obtain thus a graded series of pleasantnesses for tonal intervals both when the constituent tones are given simultaneously (see FUSION) and when they are given successively. There is afforded in this way an opportunity to compare directly the result of experimentation and the elements of musical composition established by generations of practice. It must be added that simple musical combinations offer a particularly good field for experimental exploration of the æsthetic feelings, because the direct, sensuous factor plays a much more important rôle here than in spatial form, and the associative factor is correspondingly less prominent. This is especially true of rhythm.

Finally, æsthetic preference in the realm of color, saturation, and brightness has been determined by the method of paired comparisons—the observer comparing in turn a red, then a green, then a blue, etc., with each of the other members in a series of colors, and also by passing judgment on those visual sensations taken singly

The chief results are these: (1) the most saturated colors are usually preferred; (2) given likeness of saturation, individual preferences vary from color-tone to color-tone, and (3) with colors which are equally pleasing, the combination of any two gives greater satisfaction the more unlike (contrasting) the colors.

A beginning has been made in the experimental investigation of the comic. The methods of comparison and choice, and certain modifications of psychophysical methods have been applied to comic pictures. The results show that the comic impression decreases with repetition of the stimulus, while it increases with an increase in the size of the picture. Other factors which determine the nature of the impression are: the disposition of the observer, the effect of the preceding picture, and the facial expression of the subject of the picture. It has also been found that the degree of exaggeration which produces the comic effect can be measured.

Finally, various forms of the method of expression have also been used. (See AFFECTION.) The most promising of these methods is a photographic registration of mimic and pantomimic movements. (See EXPRESSION; EXPRESSIVE MOVEMENTS.) A picture is shown; and a photograph, taken of the observer at the same time, reveals characteristic differences in bodily posture, facial expression, position of the hands, etc. The photographic method has also been employed in the study of an observer's eye movements while he is regarding graceful curves and symmetrical forms. The results seem to disprove the theory that our pleasure in such forms is due to the ease and smoothness of the eye movement. This movement is, in fact, interrupted, jerky, and unlike the outline of the figures.

Consult: G. T. Fechner, *Zur experimentalen Aesthetik* (Leipzig, 1871); *Vorschule der Aesthetik* (Leipzig, 1876); T. Lipps, *Raumästhetik und geometrisch-optische Täuschungen* (Leipzig, 1897); George Santayana, *The Sense of Beauty; Outlines of Aesthetic Theory* (New York, 1896); O. Külpe, "Der gegenwärtige Stand der experimentellen Aesthetik," in *Bericht ü. d. II Kongress f. exp. Psychol.* (Leipzig, 1907).

ÆSTIVAL, ɛs'ti-val or ɛs-ti'val, or **ESTIVAL** (Lat. *æstivus*, of summer, from *æstas*, summer). Plants whose conspicuous functions, especially the blooming of the flower, occur in summer, are said to be æstival. Prairie plants, especially of the composite family, are largely æstival and contrast strongly with the vernal plants of the woods, such as many members of the lily family.

ÆS'TIVA'TION. See FLOWER; HIBERNATION; and ESTIVATION.

ÆËTA, ä'ä-tä. The woolly-haired, dark-colored, dwarfish aborigines of the Philippines. See NEGRITO.

ÆTHEL, äth'ël. A combining form which occurs as the first element in many Anglo-Saxon names. It is derived from AS. *æfel*, noble, and is akin to Ger. *Adel*, nobility, *edel*, noble; compare Engl. *atheling* (q.v.), an Anglo-Saxon prince or nobleman, and *ethel*, noble. The names in which this combining form occurs (e.g., *Ethelbald*, 'Noble Bold,' *Ethelwulf*, 'Noble Wolf,' etc.), when given in the present work, are generally to be found under the more modern spelling *Ethel*, which is that adopted in Leslie Stephen's *Dictionary of National Biography*.

ÆTHELBALD, äth'ël-bald. See ETHELBALD.

ÆTHELFLÆD, äth'ël-fläd. See ETHELFLÆDA.

ÆTHELHARD, äth'ël-härd. See ADELARD.

ÆTHELING, äth'ël-ing. See ATHELING.

Æ'THIO'PIS (Gk. *Aithiōpis*). The name of a Greek epic in five books by Arctinus of Miletus, one of the Cyclic Poets (q.v.). It relates the events of the Trojan War immediately succeeding those described in the *Iliad*, the heroine of the poem being the Amazon queen, Penthesilea, slain by Achilles.

Æ'THRIOSCOPE (Gk. *aithria*, *aithria*, clear sky + *σκοπεῖν*, *skopein*, to observe, watch). An instrument to measure the temperature effects produced by radiation, invented by Sir John Leslie in 1817, and described in the *Transactions* of the Royal Society of Edinburgh for the following year. It consisted of a concave metallic mirror, or cup, containing a differential thermometer, and was so finely constructed as to be influenced by a passing cloud. With it Leslie hoped to discover the effect of the clouds upon atmospheric conditions and to explain other meteorological phenomena.

ÆËTION, ä-ē'shī-on, or **ËËTION**, ee'shion (Gk. *'Aetion*, *'Eetion*). A Greek painter and sculptor who flourished in the latter half of the third century B.C. He was highly praised for his technique and was classed with such painters as Nicomachus and Apelles. His most famous painting represented the wedding of Alexander and Roxana. Scarcely anything is known of his life.

ÆËTIUS, ä-ē'shī-ūs. Called "the ungodly." A Roman theologian who lived in the fourth century. He was born in Antioch and sold into slavery; when liberated, studied medicine and theology at Antioch, became a deacon, and developed the doctrines called the Aëtian heresy. This was an extreme Arianism, holding that the idea of sonship was incompatible with the idea of Deity, and so Christ could not be "of the same substance" with God. Under the Emperor Constantius he was banished (360), but recalled in 361 by Julian and shortly after made bishop. He died in Constantinople, 367.

ÆËTIUS. A Roman general, born about 390 A.D. He long defended Gaul from the barbarians; with Theodoric he compelled Attila to raise the siege of Orleans; he followed the Huns to the plains of Châlons and defeated them in a great battle, in which 300,000 men are said to have been slain. The Emperor Valentinian III became jealous of Aëtius and slew him with his own hand, 454 A.D. Consult *The Cambridge Mediæval History*, vol. i (New York, 1911).

ÆTNA, ɛt'nä. A Latin poem, in 646 hexameters, describing Mount Ætna and one of its eruptions, with a theory as to their cause. The writer was well informed in natural science. The work used to be attributed to Vergil, but was probably written by Lucilius Junior, a friend of Seneca the philosopher (q.v.), who was a procurator in Sicily. The author's views agree strikingly with those found in Seneca's *Quæstiones Naturales*; probably the latter work was used by the writer of the "Ætna," so that the work was written between 65 A.D. and 79 (the great eruption of Vesuvius in 79 is not mentioned in the poem). Consult: Munro, *Criticisms and Elucidations of Catullus*; also *Ætna; Revised, Amended and Explained* (New York, 1905).

ÆTNA, MOUNT. See ETNA, MOUNT.

ÆTOLIA, ɛ-tō'li-ä (Gk. *Aitōlia*, *Aitōlia*). A district of ancient Greece, lying on the north coast of the Gulf of Corinth. The ancient Ætolia was

divided from Acarnania on the west by the river Acheloiis, and extended as far east as the river Daphnos, where it was bounded by Locris and Doris; on the north it bordered on Thessaly and Epirus. In later times these boundaries were extended considerably to the north and the east. The country now has few cities and is generally wild and barren, though the southwest portion (old Ætolia) contains two marshy but fruitful plains—one on the coast, the other north of Mount Zygos, largely occupied by the lakes Apokuro (Trichonis) and Zygos (Hyria). This was the Ætolia of the Heroic Age; in that age the Ætolians play a conspicuous part; it was in Calydon that, according to the legend, Meleager (q.v.) slew the boar. When the Ætolians next appear in Greek history, at the time of the Peloponnesian War, they are described by Thucydides as rude and barbarous. The Ætolian confederacy, first mentioned in 314 B.C., but of unknown, though undoubtedly much earlier, origin, became important in the time of the Achæan League. (See ACHÆA.) The supreme authority was the general assembly of all Ætolians, which met yearly after the autumnal equinox at Thermon and elected the general and other officials. During the third century B.C. the league steadily increased its power, in conflict with the Achæans and Macedon, and, finally, in pursuance of its characteristically selfish policy, entered into alliance with the Romans, about 200 B.C. As this did not yield all that was expected, it afterward joined Antiochus and Perseus in their wars against Rome. The political influence of Ætolia was destroyed in 189 B.C. by the Romans, though the league existed nominally even to the time of Sulla. With Acarnania, Ætolia now forms a province (nomarchy) of the modern kingdom of Greece. The chief rivers of Ætolia are the Aspropotamo (Acheloiis) in the west, the Phidaris (Euenos) in the centre, and the Marnos (Daphnos) in the east. The people in the plains are employed in agriculture and fishing; in the mountain districts some traces of the rude and martial character of ancient Ætolia may still be found. The chief towns are Mesolonghi (where Byron died), Lepanto, and Agrinion. Consult: Oberhammer, *Akarnanien, Ambrakia, Amphilochien, Leukas im Altertum* (Munich, 1887). For the language of ancient Ætolia, see Collitz, *Sammlung der Griechischen Dialectinschriften*, vol. ii, 1409–1428 b; W. J. Woodhouse, *Ætolia* (Oxford, 1897).

ÆTO'LIAN LEAGUE. A confederacy of the tribes of Ætolia and afterward including also parts of Acarnania, Locris, Thessaly, etc. Its executive officers were chosen at a yearly meeting called Panætolicum. It was formed after the battle of Chæronea (338 B.C.) to resist the encroachments of Macedon, to which, after the death of Alexander, it proved a serious antagonist, as well as to its rival, the Achæan League. (See ACHÆA.) Later, for a time, it was in alliance with the Romans, but, having taken part with Antiochus III against them, it lost its power upon his defeat, 189 B.C.

AFANASIEFF, ä'fä-nä'syëf, ALEXANDER NIKOLAYEVICH (1826–71). A famous student of Russian folklore and national poetry. He received a good education at the Moscow University, where he pursued the study of law with great credit and success. Thus, on completing his course, he at once entered the Department of Foreign Archives at Moscow—a position for which he was eminently fitted by taste and

training. This was in 1849, when he was but 23. At 30 Afanasieff became the head of his department. Soon the supervision of the government's Bureau of Printing also fell to his lot. It was during these years—and he remained in these positions till 1862—that most of his literary work was done. Besides scores of essays and historical articles contributed to the foremost Russian periodicals, Afanasieff has to his credit several monumental works, among them *The Ancient Slav's Poetic View of Nature* (3 vols., Moscow, 1866–69), *Russian Tales and Fables for Children* (3 vols., Moscow, 1870). In 1862 he seemed to have incurred the government's displeasure by his political activities and had to give up his lucrative posts. The struggle for existence that followed proved unfavorable both to his health and literary activity. He died at the age of 45, but little appreciated in his own land.

AFAR, ä'fär. See DANAKIL.

A'FER. See ARNOBIUS.

AFER, CN. DOMITIUS. A Roman orator, teacher of Quintilian. He was born at Nemausus (Nîmes) in Gaul, about 15 B.C. and died 59 A.D. He was made a consul by Caligula.

AFER. See TERENCE.

AFFEC'TION, AFFECTIVE PROC'ESSES (Lat. *affectio*, a state of mind produced by some influence, from *afficere*, to do something to one, *ad*, to + *facere*, to do). For many centuries psychologists have discussed the phenomena of the human mind under the three headings of Intellect, Feeling, and Will. (See PSYCHOLOGY.) One of the chief aims of modern psychology is to analyze the experiences thus designated into their simplest component processes and so finally to reach the mental elements, the ultimate and

AFFECTIVE PROCESSES.

Wundt's Scheme of the Affective Processes. *P, U*, Pleasantness, Unpleasantness; *E, D*, Excitement, Depression; *S, R*, Strain, Relaxation. The curved line represents the course in consciousness of an actual feeling.

irreducible constituents of mind. The various forms of intellectual experience (perception, idea, association of ideas, etc.) reduce, on such analysis, to the sensation (q.v.); the various forms of feeling (emotion, passion, mood) to the affection; while the simplest will-processes are found to contain both sensational and affective elements.

Affection, then, is the mental element which characterizes all varieties of our emotional life. It is the last result of the analysis of joy and sorrow, love and hate, anger and fear; it forms the common basis of the sense-pleasures of eat-

ing and drinking, and of the highest æsthetic appreciation of music and painting. Like sensation, it is the product of scientific abstraction; it is never experienced singly, but always in connection with other processes. And, like sensation, it cannot be reduced to anything simpler than itself. Many attempts have been made, in the interests of scientific economy, to derive it from sensation, which would then remain as the only mind-stuff, the sole material of which the mind is built. Stumpf, for example, identifies affection with a certain kind of sensation; pleasantness, he says, is a diffuse sensation of tickling, or a weak sensation of lust; unpleasantness is a low intensity of cutaneous or organic pain. The principal objections to this theory are that both tickle and pain have each a quality of its own, so that to describe either by the term "pleasant" or "unpleasant" is not to describe it at all. Furthermore, the affective quality which accompanies these sensations may change while the specific quality which characterizes them remains unchanged; for example, tickle, with change of circumstances, may be either pleasant or unpleasant, while the specific quality which distinguishes tickling from itch, pain, or any other sensation remains the same.

As to the different kinds or "qualities" of affection, modern psychology is divided. Some psychologists maintain that the manifold forms of affective experience are traceable, in the last resort, to the two typical processes of pleasure and pain, or, in the better phraseology—since pain (q.v.) is a sensation, with a definite organ in muscle and skin—to pleasantness and unpleasantness. Relief, despair, hope, satisfaction, anxiety, resentment would then be, as pure feeling and at any given moment of their course, either simply pleasant or simply unpleasant. There are two principal objections to this view: (1) that it does not do justice to the immense complexity and variety of the emotions; and (2) that it confuses the lower with the higher, the pleasure of a good dinner with that of Beethoven's *Ninth Symphony*. The latter point is very differently taken by different psychologists. One says, e.g., that the unpleasurableness of a toothache, of an intellectual failure, and of a tragical experience is so patently diverse that assertions to the contrary require no criticism. Another declares as positively that there is no qualitative difference discoverable between the pleasantness of a color and that of a successfully concluded argument, when careful abstraction is made from the very wide differences in their attendant circumstances. And so the matter rests. The former objection, however, has suggested a more elaborate classification of the affective qualities.

According to this second view, the number of affective qualities is as large as, if not larger than, the number of sensations. We have, it is true, no names for the great majority of them; but that is because language has been developed, not for the sake of a scientific psychology, but for purposes of practical intercourse, and for all practical purposes the discrimination of the main emotional types (anger, fear, and the rest) has been sufficient. We can, however, distinguish three main trends or directions of the affective consciousness, within each of which a long series of ultimate qualities is ranged between opposed extremes. These directions are those of (1) pleasantness-unpleasantness; (2) excitement-depression (tranquilization, inhibition); and (3) tension-relaxation (resolution). The first series

of qualities comprises the affections of the present time; our affective state, as determined by the occurrence of any given moment, is one of pleasure or displeasure. The second series contains all the shades and tints of our affective anticipation of the future; we are aroused or subdued by what is to come. And the third series represents the effects of experiences just past; we are kept on the stretch, or relieved from our tension, by what has just happened. Or—to put the differences from another point of view—we are pleased or displeased by the *character* of our experience; we are excited or tranquilized, according as it is more or less *intensive*; and we are held on the strain of expectation, or relieved from this strain, according as it lasts a longer or a shorter *time*. Affections of all three types are, as a rule, combined in the concrete feeling, in "real" affective experience. Suppose, e.g., that one is looking forward to a pleasant event. One has, at first, a feeling of tension, to which are soon added, in succession, feelings of unpleasantness and of excitement. All three affections increase gradually in strength until the expected event occurs. At that moment the unpleasantness changes to pleasantness, and the strain to relaxation, while the excitement is still continued. Presently the excitement dies away. Then the feeling of relaxation or satisfaction fades out; and finally the effect of the event passes off altogether, with the fading of pleasure to its indifference-point.

It would seem, then, that expert opinion could hardly be more sharply divided. On the one hand, we have the belief in two and only two affective qualities, homogeneous throughout the affective life; on the other, the suggestion that there are many thousand feelings, each of which is unique in quality, though the whole number fall roughly into three great groups. It should, however, be said that these conflicting views are held tentatively, not dogmatically. It is generally agreed that we do not as yet possess the data for a scientific theory of affection. The appeal lies to experiment; and the application of experimental method in the sphere of feeling is extraordinarily difficult. Nevertheless, the problem stands to-day in the forefront of psychological inquiry, and much may be expected from the near future.

We have, as things are, two principal methods for the study of affection: the method of impression and the method of expression. The former we owe to Fechner (q.v.); the latter to the Italian physiologist A. Mosso. (1) The method of impression in its original form is also known as the serial method or the method of selection. (See *ÆSTHETICS, EXPERIMENTAL*.) A long series of graded stimuli (colors, textile fabrics, ovals, or crosses) is laid before the observer, who notes his preference for particular terms in the series. From these preferences a curve may be constructed, showing the relative feeling-value of dull and brilliant colors, of rough and smooth surfaces, etc. In its later form the method is known as that of paired comparisons. The stimuli are here presented to the observer two at a time, so that every term in the series is compared with every other term. The experimenter records the number of preferences that each term receives, and a curve is platted from the results. It is found, e.g., in work with colored impressions that saturated colors (red, blue) are as a rule preferred to unsaturated (pink, brown, sky blue, navy blue), but that

there is a curious uncertainty as regards yellow—some observers ranking this color very high, while others as decidedly prefer orange (yellowish red) and yellow green. (2) The method of expression, on the other hand, seeks to reconstruct the affective consciousness from a study of its bodily symptoms or manifestations. It is a matter of common knowledge that men blush with shame and tremble with fear. The bodily indications of affection are, indeed, both widespread and easily observable, while at the same time they appear to reflect the most subtle and delicate phases of affective process. Their common cause is to be found in changes of muscular innervation; the whole muscular system, voluntary and involuntary, answers to those changes of nervous excitation which correspond, on the physical side, to changes in our state of feeling. Recourse has therefore been had to the various physiological instruments which register the systemic effects of such excitatory changes. Appeal has been made to the sphygmograph, which records the height and frequency of the pulse (change in the innervation of the heart); to the pneumograph, which records the depth and rate of respiration (change in the innervation of the respiratory muscles); to the plethysmograph, which records the volume of a limb or member, of arm or finger (change in innervation of the superficial blood-vessels, and therefore of the amount of blood contained in them); and to the dynamometer or dynamograph, which records the grip or pull exerted by the voluntary muscles. In spite of the attention which this method has received, psychologists are as yet far from unanimity as regards its value or its results: the simple correlations between the physical and the mental, made out for pleasantness and unpleasantness by the earlier workers, have not been confirmed by more recent researches. A correlation does, perhaps, obtain with some definiteness in the case of involuntary movement. If the hand is laid upon the plate of a planchette while our mood is one of indifference, the pencil will make a little ragged spot upon the paper, but will take no definite direction. Let a pleasant stimulus be given and the arm travels away from the body, as though the organism were reaching out after the pleasing object; the pencil traces a steady line outward. Let an unpleasant stimulus be given, and the arm comes in toward the trunk, as if the organism were shrinking from the displeasing object; the pencil traces a steady line inward.

There are, however, four reasons why this method of expression has not determined the number of affective qualities. In the first place, the method is still very young, and the technical difficulties involved in the giving of stimuli have not yet been fully overcome. Several of the instruments ordinarily used are too crude for the tasks imposed on them. Secondly, the method presupposes that the subject of the experiment is in a normal, indifferent state, and the regulation of this state is exceedingly difficult. Thirdly, knowledge of the physiological mechanism of the curve variations is at present incomplete: we have reason to believe that a particular feeling must always be connected with a particular change of innervation, although such a change may be wrought wholly within the physiological sphere. Fourthly, the expressive method gives us the expression, so to say, not only of affection but also of sensation; the organic reaction consequent upon the applica-

tion of a sensory stimulus, as such, is both complicated and far-reaching. Hence, so long as introspection gives no decided verdict, the bodily symptoms may and will be differently interpreted. The correlation of physical and mental in pleasantness and unpleasantness has not yet been satisfactorily made out. An elaborate correlation has been suggested by those who hold the alternative theory, of a large number of ultimate affections. On this view, pleasantness is indicated by strong and slow, unpleasantness by weak and rapid, heartbeats. We must suspend judgment until further evidence is submitted.

It remains to consider the nature of the physiological processes that underlie the appearance of an affection in consciousness. Sensations are conditioned directly upon the excitation of a determinate sense-organ. Affections, in all probability, are conditioned by excitatory processes which arise indirectly, by way of reaction, from these first processes. The secondary excitations may be supposed to originate within the cerebral cortex, though some psychologists have referred them to the medulla, or even to the sympathetic system; but whether they are localized (Wundt) or diffused (Meynert), we have no means of deciding. The English school have found a biological sanction for their traditional doctrine of pleasure-pain in the law that whatever is pleasurable tends to further and perfect life, and whatever is painful to disturb or destroy it. The law appears to be substantially true. Expressed in psychological terms, it would run somewhat as follows: A pleasant stimulus is a stimulus of moderate intensity, permitting the full exercise of attention, and connecting with the organic sensations set up by "anabolic" bodily processes; an unpleasant stimulus is one the intensity of which is adverse to maximal attention, and which connects with the organic sensations set up by "catabolic" bodily processes. Pleasantness and unpleasantness would then be conditioned, in the last resort, upon the *intensity* of stimulus: a result which accords well both with the results of experiment and with the notion of a diffused cortical reaction as substrate of the affective process. On the other hand, as we have seen, later theory connects pleasantness and its opposite with the quality, excitement-depression with the intensity, and tension-relaxation with the duration of stimulus. No one has yet attempted to work out these correlations upon the biological or teleological side. Here, as before, we must look to the future for a settlement of the questions at issue.

Consult: for the theory of the three affective directions, W. Wundt, *Outlines of Psychology*, translated by C. H. Judd (Leipzig, 1897, 3d ed., 1907); for methods, O. Kuelpe, *Outlines of Psychology* (London, 1909); E. B. Titchener, *Feeling and Attention* (New York, 1908); for the teleological law, H. Spencer, *Principles of Psychology* (New York, 1890), and *Principles of Ethics* (New York, 1892).

AFFIDAVIT (perf. of Low Lat. *affidare*, 'he has made an oath,' from Lat. *ad*, to + *fides*, faith). A written declaration, or statement of fact, made before a magistrate or other person legally authorized to administer an oath, the truth of which is confirmed either by an oath sworn or a solemn affirmation. The name and designation of the party making the affidavit are written at length, and he usually signs it

at the foot. When the paper is shown to him, he is required to swear or affirm that its contents are true, and that the name and handwriting are his, and it is thereupon attested by the officer before whom it is made. Affidavits in all the English courts must be taken and expressed in the first person of the deponent. In the United States, all judges, justices of the peace, notaries, commissioners, and some special officers have authority of law to take affidavits. All the States appoint commissioners, residing in other States, to exercise the power. Generally the authority of foreign officials to take affidavits must be certified or verified in court. When a judge takes an affidavit in court, his signature must be authenticated. American ministers and consuls abroad have power to take affidavits, and so have British consuls and nearly all similar officers. No particular form of affidavit is prescribed. An *affidavit of merits* is one made by a defendant in an action which sets forth that he has stated his case to counsel and is by him advised that he has a good defense to the pending action on its merits. This is required in certain cases to protect plaintiffs from delay by frivolous shows of defense, but does not always effect the purpose.

AFFIL'IA'TION (Low Lat. *affiliatio*, adoption as a son or daughter, from Lat. *ad*, to + *filius*, son, *filia*, daughter). In the civil or Roman law, the ascertainment of the parentage and determination of the descent of a person, either through the mother or the father. In our law the term is commonly used to designate the proceeding for the judicial determination of paternity, especially of the paternity of bastards. (See **BASTARD**.) In cases where the person seeking to establish his paternity was born during coverture, i.e., in lawful wedlock, there is a presumption of law that the husband was the father, which cannot be rebutted by direct evidence to show that there was no cohabitation, but only by proof that, owing to absence abroad, or in prison, or on the high seas, no cohabitation could have taken place or that it was physically impossible, or establishing beyond a reasonable doubt that the husband could not have been the father. In French law, the term "affiliation" refers to a customary mode of adoption prevailing in some parts of France. See **FILIATION**.

AFFIN'ITY (Lat. *affinitas*). The relationship created by marriage between the husband and the blood-relations of the wife, and between the wife and blood-relations of the husband. It is to be distinguished from consanguinity, which signifies relationship by blood. There can be no inheritance by legal succession from a relation by affinity. The relations of the wife stand to the husband in the same degree of affinity in which they stand to the wife by blood or consanguinity, or vice versa. But between the relations of the two parties by affinity there is no affinity. Thus, there is no affinity between the husband's brother and the wife's sister, and, by our law, there is no impediment to their marriage. The question as to whether those who are related by affinity stand in all respects in the same position as regards marriage as those who are connected by blood is one on which some difference of opinion at present prevails. Marriage between a man and the sister of his deceased wife was until recently forbidden in England by statute, but is permitted in the United States and the British colonies, as well as in most

continental countries. See **CONSANGUINITY**; **MARRIAGE**, and the authorities there referred to.

AFFINITY, CHEMICAL. A term used to denote, on the one hand, the cause or "driving power" of chemical reactions and, on the other hand, the force that holds in combination the constituent elements of chemical compounds. Considering chemical reactions, the questions suggest themselves: How are we to measure the amount or intensity of their chemical affinity? Since most reactions are accompanied by the evolution of heat, are we to conclude that affinity is proportional to the amount of heat evolved? Or, since some reactions proceed with explosive rapidity, while others are extremely sluggish, are we to assume that the affinity of a reaction is proportional to its velocity, and therefore measure affinity by measuring velocity? But speculation on the subject is to-day no longer necessary, for thermodynamics furnishes us here with a definite and indubitable principle. It teaches, namely, that any process or change whatever which takes place of itself, as does a chemical reaction, can be harnessed to do mechanical work; that any system in process of transformation must contain energy available for such work—"free energy," as it is called; and that this free energy is the obvious cause of the transformation itself. The affinity of a reaction can thus be measured with certainty by measuring the maximum mechanical work that could be furnished by it. Van't Hoff (q.v.) has shown that the maximum work or affinity of a reaction can be calculated from the relative concentrations of the reagents and reaction-products present together when the reaction has reached equilibrium. (See **REACTION, CHEMICAL**.) On the other hand, J. Willard Gibbs (q.v.) and Helmholtz (q.v.) have shown independently of each other that the maximum work or affinity of a reaction is equivalent to the electromotive force of a galvanic cell whose working depends on the given reaction. (See **ELECTRO-CHEMISTRY**.) And so we have to-day two independent methods for measuring the affinity, or driving power, of chemical reactions, and both are capable of great experimental precision. This phase of the affinity question is thus freed from its old-time mystery.

Still, it may be asked further: But what is the *form* in which free energy is contained in mixtures undergoing chemical change? Hydrogen and oxygen gases combine to give water; a mixture of hydrogen and oxygen must therefore have free energy not possessed by their compound. Is it that the atoms vibrate faster within the molecules of the free gases than they do in the water molecule? Or is the free energy still more deeply hidden as "potential energy" in the ether itself, as energy is hidden when a weight is suspended above ground?

That atoms move within the molecules is more than a plausible assumption. Unfortunately, no one has yet succeeded in correlating any such assumption with experimental facts, and nothing is scientifically known regarding that motion. The potential energy idea, too, remains in the realm of speculation. In recent years, however, attempts have been made to impart a practical aspect to such speculations, with the aid of assumptions concerning the nature and mode of action of the forces that hold atoms together within the molecules of chemical compounds. Such attempts are by no means

novel in chemistry. Borelli and Lemery imagined that the ultimate particles of matter are supplied with minute hooks, the shape of which determines the capacity of a particle for combining with certain other particles. Newton, Bergman, Berthollet, and others, have thought that chemical affinity might be identical with the force of gravitation. Berzelius sought to explain all chemical phenomena on the hypothesis that chemical combination is caused by the mutual attraction of electrically different particles. This last idea was abandoned before the middle of the nineteenth century. Yet now, a century after Berzelius first advanced it, the electrical hypothesis of the nature of affinity is struggling into life again—in more or less modified form, to be sure.

A strong impulse to the revival of the electric hypothesis resulted from Arrhenius's theory of electrolytic dissociation, in the 80's of the past century. Then, in the early years of the twentieth century, J. J. Thomson ingeniously developed the hypothesis that the atom itself is made up of particles of negative electricity revolving with great speed within a positively electrified sphere; and that a negative particle from one atom may attach itself to another atom, the result being a "tube of force" by which the two are bound together. Thomson gave practical value to his hypothesis by showing that a number of known but obscure phenomena, including the periodic law itself, were easily explained by it. On the other hand, organic chemists have felt more and more distinctly that their formal working-theory of valency (q.v.) has been used almost to exhaustion, and that much practical good might result from the birth of a new guiding-idea. No wonder, therefore, that speculations concerning the nature and mode of action of the affinity forces are again uttered, and even listened to, by practical investigators.

Farrell, Baltimore, 1809); C. M. Guldberg and P. Waage, *Studien über die chemische Affinität* (original ed., Christiania, 1864; French trans., Christiania, 1867; German trans., Leipzig, 1879); Pollitzer, *Die Berechnung chemischer Affinitäten* (Stuttgart, 1911). See bibliography of theoretical chemistry under CHEMISTRY. See also ACIDS; NERNST'S HEAT THEOREM; and especially ELECTRO-CHEMISTRY.

AF'FIRMA'TION (Lat. *ad-firmare*, to make secure). A solemn declaration, not under oath, made by a witness in open court or before an officer authorized to administer an oath in a like case, that he will tell the truth. Formerly oaths were required of all witnesses and affiants in all cases, but many exceptions are now allowed in England and in the United States. Generally all persons who declare that they have conscientious scruples about taking an oath are permitted to make an affirmation instead. The affirmation has the same effect as an oath, and for a false affirmation a witness is punishable as though he had been sworn. See OATH; PERJURY.

AFFOR'ESTA'TION (Lat. *ad*, to + Low Lat. *foresta*, a wood, forest). The converting of open or partially wooded ground into forest or woodland. See FORESTRY.

AFFRAY' (Fr. *effroi*, fright, terror, compare

Eng. *afraid*). The fighting of two or more persons in a public place in such a manner as will naturally cause terror to other people. It differs from assault (q.v.) in that it must occur in a public place, and from a riot (q.v.) in that only two persons are necessary for the commission of the offense. Two persons engaged, although in a public place, must each be guilty of unlawfully fighting the other or there is no affray. No matter how publicly, or in how terror-breeding a manner, A may attack B, if the latter does not go beyond the limits of self-defense in repelling the attack, the occurrence is not an affray, but an assault. An affray which did not develop into a higher crime, such as homicide or an attack upon a public officer, was punishable at common law by fine and imprisonment. In some of our States it is not recognized as a separate offense from assault and battery (q.v.). Consult Wharton, *Criminal Law* (Philadelphia, 1896).

AFFRE, âf'r', DENIS AUGUSTE (1793–1848). An archbishop of Paris. At the time of the Restoration he was professor of theology at the Seminary of Saint Sulpice and on account of his prudent and temperate character was made Archbishop of Paris by the government of Louis Philippe in 1840. Though not yielding a blind submission to all measures of the government, he abstained from all offensive opposition. During the insurrection in Paris in June, 1848, he climbed upon a barricade in the Place de la Bastille, carrying a green bough in his hand as a messenger of peace, and sought to persuade the insurgents to lay down their arms. He had scarcely uttered a few words, when the insurgents and the troops commenced firing again, and he fell, mortally wounded by a musket-ball. He was removed to his palace, where he died, June 27. He was the author of several theological writings and of a work on Egyptian hieroglyphics. Consult Alazard, *Denis-Auguste Affre, archevêque de Paris* (Paris, 1905).

AFFREIGHT'MENT (Lat. *ad*, to + Eng. *freight*). The contract of a shipowner for the carriage of goods in his ship for compensation, or freight. The shipper is technically known as the *freighter*. Where the freighter ships his goods in the ordinary way, without acquiring any control over the ship, the contract is a bill of lading (q.v.), and the rights of the parties are mainly determined by the laws relating to common carriers. (See CARRIER, COMMON.) Where the freighter charters the ship, the contract is known as a charter-party (q.v.) and has certain features and is subject to certain rules peculiar to the law of shipping. A complete treatment of the subject will be found in Scrutton, *The Contract of Affreightment, as Expressed in Charter Parties and Bills of Lading* (London, 1899).

AFFRONTE, â'frôn'tâ' (Fr. p.p. 'face to face,' from Lat. *ad frontem*, to the face). In heraldry, a term applied to animals represented as facing the spectator directly, as the lion in the royal crest of Scotland.

AFFU'SION, or POURING, BAPTISM BY. See BAPTISM.

AFGHAN, äf'gan, or PUKHTU (North Afghan), or **PUSHTU** (South Afghan). A modern Iranian dialect which is spoken by about 3,000,000 people. The Afghan language is divided into two great dialects, the southern and the northern. The differences between these two dialects are mainly phonological; thus, North Afghan *kh, j*, and

initial *c* = South Afghan *sh, zh, k*. The Afghan is undoubtedly an Iranian language, although it has suffered many corruptions, especially in its vowel system. The dialect has many foreign loan-words, chiefly from the Persian, and through this from the Arabic, and from the Indian, particularly Sindhi. The alphabet is a modification of that of the Arabs. The Afghan literature is scanty and dates only from the sixteenth century. The poetry is copied closely after Persian models, although there exists a great mass of popular Afghan songs of true Oriental beauty. The French scholar J. Darmesteter (1849-94) made a collection of these. Reference may be made to Geiger, *Sprache der Afghanen*, in Geiger and Kuhn's *Grundriss der iranischen Philologie*, vol. i, part ii, pp. 201-230 (Strassburg, 1898), and works cited. Consult: J. Darmesteter, *Chants populaires des Afghans* (Paris, 1888-90), which contains an historical sketch, a grammar, texts, and translation; Lorimer, *Grammar and Vocabulary of Waziri Pashto* (Calcutta, 1902); Cox, *Notes on Pushtu Grammar* (London, 1911).

AFGHANISTAN, äf-gän'i-stän'. A country in Central Asia, between British India and Persia. It is situated between lat. 29° and 38° 30' N., and long. 61° and 75° E. (Map: Afghanistan, J 4; Asia, F 5). It is bounded by Russia, Bokhara, and the Pamir on the north, British India on the east, Baluchistan on the south, and Persia on the west. Its total area is estimated at 245,000 square miles. It is generally divided into five parts: (1) The northeastern part, comprising Badakhshan, Kafiristan, and a portion of the Pamir; (2) Afghan Turkestan, in the north; (3) Kabulistan, or the region of Kabul, in the east; (4) Southern Afghanistan, which comprises Kandahar and the country south, down to the Baluchistan boundary line; (5) the province of Herat, in the west. The political divisions of Afghanistan, however, are far from coinciding with its ethnographical or geographical divisions, as there are still numerous independent khanates and tribes which do not fully recognize the authority of the ameer. Persian is spoken by a large part of the people, though the common language is mainly Pushtu—a language of the Iranian group of the Indo-European family.

Physical Features. The surface of Afghanistan is exceedingly mountainous, a great part of it being covered with the mighty chain of Hindu-Kush and its offshoots. The Hindu-Kush extends in a northeast and southwest direction for about 400 miles to the Irak and Shibar passes, where it assumes the name of Koh-i-Baba. Its highest peaks are 24,000 feet above the sea, and the passes of Irak and Shibar on the route from Afghan Turkestan to Kabul are 12,000 feet and 8000 feet high respectively. The Koh-i-Baba chain branches off into two ranges, the Safed-Koh and Siah-Koh. Another branch is sent off by the Hindu-Kush above the Sirak Pass, which is called the Paghman Mountains. They run in a southwestern direction and eventually unite with the Suleiman Mountains, which traverse the eastern part of Afghanistan. Besides the above-mentioned principal chains, there are many secondary ranges and single mountains too numerous to describe.

The principal rivers of Afghanistan are the Hari-Rúd, which flows through the Herat valley; the Helmand, the largest river of Afghanistan, which rises near the Bamian valley and flows in a general southwestern direction, entering the Lake of Hamun; the Kabul, a tributary of the

Indus, and the Amu-Daria (Oxus), which forms the northern boundary of Afghanistan.

The climate is generally healthful and dry, although there are great variations of temperature, depending largely on altitude, rising in the same place as high as 120° F. in the summer, and falling as low as -15° F. in the winter. At Kabul, with an elevation above sea level of 6500 feet, the thermometer (F.) marks 90° to 100°, while correspondingly on the higher lands the cold is intense; and the difference between summer and winter is extremely wide in all places, while at the same time the daily range is extraordinary, especially in summer. The rainfall is very scanty, even during the rainy season, and for agricultural purposes a system of irrigation, called *karez*, is maintained. It consists of subterranean channels connecting the springs with one another, by which the water is brought to the surface.

The mineral deposits of Afghanistan are supposed to be very rich, but so far the expectations have not been realized. Iron, lead, and sulphur are worked on a small scale, and gold is found in small quantities in some of the hills and rivers, while precious stones are known to exist in Badakhshan. Extensive coal beds lie in the north.

The flora is very rich in the valleys, while the mountains are all barren, except those in the north, which are covered with forests to an elevation of 10,000 feet. The main products are wheat, corn, rice, grapes, sugar, tobacco, and cotton. The country is especially famous for its fruits, which include apples, pomegranates, and peaches of an excellent quality. Vegetables are also grown to a considerable extent, and a very important product is the asafoetida, a resinous gum exported in large quantities to India.

The fauna includes the leopard, wolf, bear, cheeta, hyena, jackal, various gazelles, and wild asses. Among the domestic animals may be mentioned the horse, the dromedary, ass, cow, two kinds of sheep, and the goat.

Agriculture and Trade. The soil of Afghanistan, where it is fit for agriculture, is generally very fertile and in most cases yields two crops a year. Wheat, barley, peas, and beans are sown late in the fall and ripen in the summer, while rice, millet, corn, turnips, beets, and tobacco are sown in the spring and harvested in autumn. Fruits, melons, and madder are also of importance. The breeding of domestic animals is carried on extensively, and wool forms one of the chief exports to India. Owing to the practical absence of any manufacturing industries, the exports of Afghanistan are confined largely to raw products, such as wool, cattle, silk, and dried fruit. Some rugs, felts, and silk articles are produced on a small scale. The trade is chiefly with India and Bokhara. There is no accurate system of trade registration. Indian statistics show imports from Afghanistan valued at £570,459 and exports to Afghanistan £764,274 in the fiscal year 1909; in 1912, £652,665 and £877,096. The mountainous character of the country makes the use of wheeled vehicles in most cases impossible, and merchandise is usually carried on camels or ponies.

Ethnography. The Afghans, or Pathans, speaking a language called Pukhtu, or Pushtu, form three-fifths of the population of Afghanistan. They are of mixed ancestry, although the Indic affinities of their language indicate a preponderance of Aryan blood of the Mediter-

ranean stock. They are not Semite, as some authorities have believed, their national claim to an Israelitish descent being an afterthought, based upon the occasional appearance among them of Jewish traits. Besides a dash of Semitic blood, they have in all probability inherited some of a different sort from the earlier inhabitants of the country, who may have been akin to the Dravidians of India. Among the principal tribes are the Duranis of the west and south, Ghilzais in the east, and the Yusufzais and Afridis on the Indian frontier. Less important Afghan tribes are the Swatis, Waziris, Kakars, Khostis, etc. Some other peoples of Afghanistan, such as the Tajiks, Hindkis, Jats, Aimaks, and Hazaras (Mongolians), are not Afghans, while the Kizilbashs are largely Persianized Turks. The Afghans were already well established in their present habitat when the Greeks reached India in the fourth century B.C. Most of the Afghan and allied peoples are agriculturists, but the dominant tribes compel the inferior ones to do the work. Physically the Afghans are well developed and are of a very warlike disposition. Nearly all the tribes scattered along the east of Afghanistan and the northwest frontier of India are within the sphere of British influence. The population, according to statistics available, is about 5,000,000. See, concerning Afghan peoples and their culture: Oliver, *Across the Border, Pathan and Biloch* (London, 1890); Darmesteter, *Chants populaires des Afghans* (Paris, 1888-90). See also the excellent article on Afghanistan in *The Encyclopædia of Islam*, vol. i, pp. 146-172 (London, 1913).

Government. The government of Afghanistan is an absolute monarchy, under an ameer, an hereditary ruler whose actual power varies with his personality. The country is divided for administrative purposes into six provinces, under governors: Afghan-Turkistan, Badakhshan (including Wakhan), Herat, Kandahar, Farrah, and Kabul. The provinces are subdivided into districts, where, up to the time of the ameer Abd-ur-Rahman (d. 1901), members of the royal family and nobles ruled in feudal fashion. Abd-ur-Rahman centralized governmental authority and power at Kabul, reducing the powers of the provincial governors, and established legal codes which have been continued under his successor. Some of the tribes, however, still maintain a more or less turbulent and independent existence. The depredations of the border tribes on Indian territory have afforded the Indian government excuse and opportunity for pushing forward the military frontier. The warlike Afridis and a considerable proportion of the Pathan tribes are now under British control. Frequent conflicts have occurred between the British troops stationed on the northwest frontier, particularly those of the Peshawar district in the northwest frontier province, and the Pathan and Afridi tribes of Afghanistan. The latter are of greater political consequence because of their location, the importance of the Khyber pass to India, and the necessity of maintaining a clear road from India to Kabul.

The State revenue is probably between 120 and 130 lakhs of rupees (13,000,000) a year, of which 18 lakhs are a subsidy paid by the Indian government. Revenue consists largely of payments in kind calculated on an average year's produce. There are many arbitrary exactions and other abuses of taxation, which press heavily on the people.

Afghanistan has a regular army modeled after European fashion. Its strength is not accurately known, but it is estimated at between 50,000 and 60,000 men, including 16,000 cavalry. There is an arsenal, and an ammunition factory at Kabul is equipped with English machinery. The medium of exchange is the rupee. There is a mint at Kabul under the supervision of an Englishman, but its operation is very limited. Instruction is supplied by the Mohammedan schools. The chief cities of Afghanistan are Kabul, Kandahar, and Herat. Among the towns are Balkh, Kunduz, Maimana, Andkhui, Tashkurghan, Akcha, and Mazar-i-Sharif, Faizabal, and Jelalabad.

History. The country now known as Afghanistan was embraced in the ancient Aria. It was a part of the conquests of Alexander the Great, who, it is supposed, founded Alexandria Arion, the modern Herat, the modern Kandahar and a settlement near Kabul. Its masters changed many times in the waves of conquest that rolled over Asia. On the decline of the Bagdad caliphate it was included in the domains of the Samanides, one of the many independent dynasties that then arose in the Mohammedan world. The Samanide princes were overthrown by a Turkish tribe, who founded the Ghaznevide dynasty, and Afghanistan was a part of their realm until the fall of the Ghaznevites in 1186. It was overrun by the conquering Mongols of Genghis Khan in the first quarter of the thirteenth century, and in the last quarter of the fourteenth it was subjugated by the great Tatar conqueror Timur. In 1504 Baber, a descendant of Timur and founder of the Mogul Empire, made Kabul his first capital, and Afghanistan remained a part of that Empire until its decline. In 1722 Mahmud, an Afghan chieftain, invaded Persia, captured Ispahan, and dealt a permanent blow to the prosperity of that famous capital; but a few years later the Afghans were defeated and driven out by Nadir Kuli, a Persian soldier of fortune, who became by his great ability Shah of Persia and the last of the conquerors of Afghanistan. After the assassination of Nadir Shah (1747), one of his officers, Ahmed (see AHMED SHAH), founded the Durani dynasty in Afghanistan, and that country has since maintained an independent existence. Ahmed made considerable conquests in India and maintained a mastery over the Sikhs and Mahrattas, but established no permanent sovereignty. The Durani dynasty fell in 1809, and Shah Sujah, the grandson of Ahmed, became an exile.

Upon the fall of Shah Sujah anarchy ensued, a condition not unfamiliar to the warlike and restless Afghan tribes. The statesmanlike Dost Mohammed succeeded in establishing his authority over the eastern part of the country, with Kabul as his capital. Shah Sujah from his asylum in India carried on intrigues for the restoration of his sovereignty and succeeded in making an alliance with Runjeet Singh, the Sikh ruler. A small subsidy was also obtained from the Anglo-Indian government, and Afghanistan was invaded. The only result was to involve the Afghans and the Sikhs in unprofitable warfare, while Sujah soon returned to India. When Lord Auckland became Governor-General of India, he declared a policy of non-interference in questions concerning the native States; but in direct contradiction of this declaration, in 1838 his government actually undertook to re-

store Sujah, alleging that Dost Mohammed had attacked Great Britain's ally, Runjeet Singh—an attack, it may be noted, for which there had certainly been reason enough. It was further alleged that the military operations of the Afghans had betrayed a hostile purpose toward India; and that Shah Sujah, as the rightful heir to the Afghan throne, had placed himself under British protection. Furthermore, Dost Mohammed, unable to win recognition from Great Britain, was intriguing with Russia. A primitive expedition was determined upon. The British forces entered the country in March, 1838. Some stiff fighting was encountered, but Kabul was finally captured, Aug. 7, 1839, and the conquest was regarded as complete.

In this, however, as in all their dealings with the Afghans, the British showed an entire misunderstanding of the nature of the country and the character of the people. The land had been invaded, but was by no means conquered. Dost Mohammed had surrendered to the English; but his son, Akbar Khan, was actively engaged in a conspiracy, of which the British envoy, Sir William Macnaghten, and his successor, Sir Alexander Burnes, were not aware until it was too late. Early in the winter of 1841, when help from India was impossible, the outbreak took place at Kabul. Burnes, Macnaghten, and several British officers were slain. It was then agreed that the invaders should leave the country; while, on the other hand, Akbar Khan and his confederates stipulated to provide an escort and make other necessary arrangements for the retreat. Depending on these promises, the British army left Kabul on Jan. 6, 1842, in order to return by the Khyber pass into India; but neither escort nor provisions were supplied by the Afghan leaders, and the severity of the season increased the misery of the retreat. The fanatical tribes of the districts harassed the flanks and rear of the army. To escape total destruction, the women and children, together with the married men, surrendered to Akbar Khan, and out of the 16,000 souls that had set out from Kabul, only one man (Dr. Brydon) escaped to carry the dismal tidings to General Sale, who still held his position at Jelalabad. Almost against his own will, the new Governor-General, Lord Ellenborough, sent other forces into Afghanistan. General Nott held out at Kandahar, while General Pollock, at the head of the invading army, forced the Khyber pass, relieved General Sale, and effected a victorious march to Kabul, which he entered in September. The English officers and the women who had surrendered as prisoners to Akbar Khan were restored to liberty, and soon afterward the troops marched back to India. It was believed that the Afghans were deprived of all power to confederate against the government of India; but this conclusion was too hasty, for in 1846 they formed an alliance with the Sikhs against the British, Dost Mohammed being released and permitted to reoccupy his throne. After the decisive battle of Gujerat (Feb. 21, 1849), the Sikhs were forsaken by the Afghans, and Dost Mohammed, with about 10,000 men, fled over the Indus. After this period Dost Mohammed devoted his attention almost exclusively to the consolidation of his dominions, governing well and always seeking to maintain friendly relations with the Anglo-Indian government. He died in 1863, appointing Shere Ali, one of his younger sons, as his heir. At first the choice

was acquiesced in by the 16 sons of Dost Mohammed, a large number of whom were governors of provinces; but disputes followed, which for many years kept Afghanistan in a state of anarchy. (See KABUL.) The British government of India had recognized Shere Ali at his accession, and it was the policy of Lord Lawrence's administration in India to abstain from any interference with Afghan affairs. Lord Mayo assumed a like attitude. The claims of Shere Ali's son Yakub to share in the government were ignored, and in 1870 he headed a rebellion against his father; but in the following year a reconciliation was effected through the intervention of England. In 1869 it was settled between England and Russia that all the territory between the Amu-Daria and the Hindu-Kush should be treated as part of Afghanistan. The British conservative government which came into power in 1874 was totally opposed to the policy of non-interference; Russia had already annexed Bokhara and Khiva, and her influence was predominating at Kabul. The Indian government therefore was ordered to insist upon the reception of a British resident at Kabul. This demand was made imperatively in 1878, when a Russian mission had been received. The Afghans were bitterly opposed to any more British residents, and the refusal of the ameer to receive the mission led to the second Afghan war, which in many ways was a repetition of the first, although the disasters were somewhat mitigated. The British invading columns forced the Khyber pass and were victorious at the Peiwar pass, and occupied Jelalabad before the end of 1878. In January, 1879, they entered Kandahar. A few weeks later Shere Ali died, and his rebellious son, Yakub, whose cause had been taken up by the British, was proclaimed ameer and concluded the Treaty of Gandamak with them in May. It was provided that there should be a British resident at Kabul, and that Great Britain should defend Afghanistan against foreign aggression, the ameer receiving a subsidy. The Kuram, Pishin, and Sibi valleys became British territory, and the Khyber pass came under British control.

The peace did not last. In September of the same year there was a revolt in the capital, the British resident, Sir Louis Cavagnari, and his suite were murdered, and the British troops, which were on the point of withdrawing from the country, were compelled to renew the campaign. The Kabul army under General Roberts was the strongest column and held the key to the situation. General Burrows was defeated by the Afghans in July, 1880, and compelled to retreat to Kandahar, which seemed likely to be captured. It was saved by the brilliant march of General Roberts with a strong force from the main army, a march which won for him a peerage with the title "Lord Roberts of Kandahar." Abd-ur-Rahman (q.v.), having been accepted as ameer by the Afghan chiefs, was recognized by Great Britain, which abandoned its claim to maintain a permanent mission at Kabul and agreed to pay to the ameer an annual subsidy of 12 lakhs of rupees (about \$400,000). Abd-ur-Rahman established his government firmly and maintained a good understanding with Great Britain while not antagonizing Russia. In 1893 he concluded the Durand agreement with the Indian government, in which he recognized the Chitral, Bajaur, and Swat as within

the sphere of British influence and withdrew his pretensions to Waziristan. Great Britain in return abandoned its claims upon Kafiristan, which was subsequently occupied by the Afghan forces, and increased its subsidy to 18 lakhs (about \$600,000). Abd-ur-Rahman died Oct. 1, 1901, and was succeeded by his son Habib Ullah (q.v.). The treaty with Great Britain was renewed, and in 1907 an Anglo-Russian compact was drawn up whereby Great Britain acknowledged Afghanistan's independence. In 1910 the Indian government and Afghanistan agreed to leave their disputes to a joint commission.

AFIUN-KARA-HISSAR, ä'fê-ōn'kā-rä'hīs-sär' (Turk. Opium Black Castle). A city of Anatolia, Asiatic Turkey, 170 miles northeast of Smyrna (Map: Turkey in Asia, D 3). It is surrounded by rocky hills, on one of which are found the ruins of a castle. The town contains several mosques and Armenian churches. It manufactures saddlery, woolen carpets, and opium, the latter being one of the chief articles of commerce, from which the town derives its name. The trade is considerable because of its situation on several caravan routes and its railway connection with Smyrna, Constantinople, and Konieh. Pop., about 20,000.

AFRAGOLA, ä'frä-gō'lä. A city in south Italy, 5 miles northeast of Naples, noted for the manufacture of straw goods. Pop., 1881, 19,000; 1901, 22,438; 1911, 22,822 (comune).

AFRA'NIUS, LUCIUS. A Roman poet and playwright, who lived about 100 B.C. He was praised by Cicero and Quintilian for the excellence of his plays, which were known as *fabulæ togatæ*, i.e., comedies on Roman subjects, laid on Roman soil; only the titles and a few frag-

ments survive. They are collected by Ribbeck, *Comicum Romanorum Fragmenta* (Leipzig, 1898).

AF'RICA (Lat. *Africa*, from *Afer*, inhabitant of Africa; of uncertain derivation, possibly of Phœnician origin. It seems to have been originally the designation of Carthage, as the colony of Tyre, and later extended to the whole continent. It is certain that the name "Africa" was first applied to the neighborhood of Carthage—the part first known to the Romans—and *Afrygah*, or *Afrikiyah*, is still applied by the Arabs to the land of Tunis). A continent of the eastern hemisphere, and in point of size the second of the great land divisions of the globe, with an area of about 11,262,000 square miles, exclusive of islands. Africa is an independent continent in even less degree than is either of the two Americas, for it forms the southwesterly extension of the Old World land-mass, and it lies in close proximity to Asia and Europe, with both of which continents it has, during long periods of past geological time, been intimately united by broad isthmuses. In form Africa consists of two parts—a northern ellipsoid, with an east and west longitudinal axis, comprising the Sahara-Sudan region, and a southern triangular limb attached to the southern side of the eastern half of the northern portion, and consisting of the Congo region and the South African highlands. Somewhat north of the middle point of the eastern side of the continent, a massive triangular projection, the Somali Peninsula, extends almost 1000 miles toward the Indian Peninsula of Asia. The extreme length of Africa from Cape Blanco in Tunis (lat. 37° 20' N.), its most northerly point, to its southern termination, Cape Agulhas (lat. 34° 51' S.), is about 5000 miles in an almost north and south direction; and its greatest width from its western outpost, Cape Verde (long. 17° 30' W.), to its eastern apex, Ras Hafun, on Cape Guardafui (long. 51° 28' E.), is about 4500 miles in an almost west and east direction. The northern and southern points of the continent are almost equidistant from the equator, so that Africa, compared with South America, has a greater proportion of its area situated in the torrid zone.

At its northeast corner, by the Isthmus of Suez, Africa has a geographic union 90 miles wide with Asia. Until a comparatively recent period it had a much closer union, for the Red Sea and the Gulf of Aden now occupy the deep, narrow basin of a rift valley that has been formed since Pliocene time. On the north the Mediterranean Sea separates Africa from Europe by a wide and deep basin that is restricted at its western end, so that the shores of Spain and Morocco approach to within about 9 miles of each other. Africa and Europe were once united at this point, but were later separated by the continental fracture now occupied by the Strait of Gibraltar. This northern Mediterranean coast is broken only by the broad and shallow embayment that holds the gulfs of Gabes and Sidra. The western extension, from Gibraltar to Cape Palmas, projects into the Atlantic Ocean with a regularly rounded coast line that is almost unbroken by bays or peninsulas, capes Blanco and Verde being inconspicuous projections. From Cape Palmas the coast runs eastward along the north shore of the Gulf of Guinea for about 1200 miles to Kamerun and thence in an undulating line, slightly east of south, for nearly

3000 miles to Cape Agulhas at the southern extremity of the continent, where the Atlantic and Indian oceans meet. The eastern coast of the southern limb, washed by the Indian Ocean, extends from Cape Agulhas with gentle curves for 3600 miles to Cape Guardafui at the apex of the Somali Peninsula.

The coast line of Africa is peculiar in that it presents a remarkably even front, almost unbroken by bays and peninsulas, contrasting strongly in this respect with the coast lines of Europe, Asia, and North America, but resembling that of South America. The length of the coast line of Africa, 18,400 miles, bears a smaller proportion to the shortest possible periphery of a regular figure of its own area (the proportion is 1.8 to 1) than does that of any other continent. It is so compact in shape that with an area about three times that of Europe its coast line is about 1000 miles shorter. The only irregular portion of the coast line is on the northern edge, where the Atlas Mountains send spurs into the Mediterranean Sea. This regularity of the shore line is undoubtedly due to the plateau character and the stability of the larger part of the continent, which during great periods of geological time has stood emerged at approximately the same level above the ocean.

Islands. In connection with the regularity of the coast line, it is of interest to note the small number of islands adjacent to this continent, and also the small proportion of these that have any physical relations with the mainland. Madagascar, off the eastern coast, is the only large island near the continent; it was at a distant period of geological time an integral part of the mainland, but it is now separated from it by the Mozambique Channel, which appears to be a rift valley analogous to that of the Red Sea. The Seychelles, the islands in the vicinity of Zanzibar (Mafia, Zanzibar, and Pemba), and Socotra, off the apex of the Somali Peninsula, may be considered as fragments of the continental mass, while many of the small islands along the east coast, including those in the Red Sea, are of volcanic and coral reef origin and rise apparently from submerged portions of the continental plateau. On the Mediterranean coast the islands of Jerba and Kerkenna in the Gulf of Gabes were formerly united to the mainland, and in past geological times even the island of Sicily was part of a chain of folded mountains that extended from the Tunisian highlands north-eastwardly across the Mediterranean Sea. Off the western extension, the Madeira, Canary, and Cape Verde archipelagoes are of volcanic origin, and appear to lie on the outer submerged slope of the continent, perhaps marking lines of folding and fracture that are extended under the ocean level. The Bissagos group, thirty in number, lying a short distance south of Cape Verde, are small fragments of the mainland. From the Bissagos group, the coast is free from islands as far as the head of the Bight of Biafra, where four volcanic islands, Fernando Po, Principe, St. Thomas, and Annabon, extend in a southwestward direction from Mount Kamerun on the coast. Southward from this point the coast has but few islands, and these of small size, all the way to the Cape of Good Hope; and this same condition, in even more marked degree, is continued along the eastern coast for 2500 miles to the island of Mafia. The small extent of Africa's island territory is expressed

by its proportion to the mainland area, which is as 1 to 48.

Topography. The typical expression of African topography is that of a plateau that rises here and there by successive terraces to increasing elevations up to and beyond 4000 feet, which altitude is the general level of the highland region that covers a large part of the southern and eastern portion of the continent. The edges of the continental mass are, as a rule, somewhat more elevated than is the interior, and the plateau rims approach close to the sea. Only along the eastern part of the Mediterranean shore and along that part of the Atlantic seaboard between Cape Juby, near the Canaries, and Freetown, can there be said to exist a coastal plain that extends for any considerable distance toward the interior. Swampy districts of limited extent are found along the upper Guinea shore and on the east coast about the mouths of the Zambezi River, and a lowland borders the south side of the Somali Peninsula. The mean elevation of Africa, obtained by a reduction of all irregularities of the surface, has been computed by Prof. H. Wagner to be 2130 feet, which is 160 feet more than that of South America and 170 feet less than that of North America, while it is greatly exceeded by the mean elevation of the Eurasiatic continent.

The topography of the interior presents over large areas a marked uniformity of expression, though different regions exhibit distinctive features. The general plateau character of the surface is broken in the interior of the continent by four areas of depression which in the south and north are occupied by basins of internal drainage. In the southern highland is the Kalahari-Ngami Desert (altitude 2250-3000 feet); the central plateau falls toward its middle to form the Congo Basin (altitude 600-1600 feet); in the central Sudan the Lake Chad (altitude 900 feet) and Bodele (altitude 500 feet) depressions receive the drainage of a great interior region that has no outlet to the sea; and in the northwestern Sahara several inclosed basins lie at altitudes of from 400 to 600 feet above the ocean.

Africa is divided topographically into the following regions: (1) the elevated Southeastern Highlands, (2) the Sahara and Sudan plateau of lower level that covers the entire central and most of the northern part of the continent, and (3) the narrow, comparatively small area of the Atlas Mountains on the extreme northwest coast. On the whole, the general slope of the surface is from the southeast to the northwest.

The highest portions of the continent, called the Southeastern Highlands, lie near the eastern coast and in the lower end of the southern limb. They are limited on the north by an irregular line that may be drawn from Loanda on the west coast, at the mouth of the river Kuanza, eastward to Ankoro on the Upper Congo, thence northward to Daruma, and through Lado and Kassala to Suakin on the Red Sea. Northward from Suakin the eastern highland is continued as a narrow ridge of lower elevation along the western shore of the Red Sea almost to Cairo. This great highland region may be topographically considered to form the backbone of the continent, though it is scarcely that in a geologic sense, for the rocks of which it is composed lie generally horizontal, and the differences of topography are the result of long-continued erosion and denudation rather than of mountain-

making forces. This highland has an elevation of over 4000 feet, and above this height rise numerous isolated and grouped peaks to altitudes of 10,000 feet and over. The majority of these high peaks are remnants of a dissected plateau of still higher level, while others are volcanic mountains that rest upon the tableland and rise above it to still greater heights of from 12,000 to 19,000 feet. The central depression of the Kalahari Desert and Ngami Basin in the southern part of the highland, and the deep valleys cut by the rivers that drain this interior basin, serve to divide this southern region into four well-marked isolated plateaus. The most southerly plateau occupies the Cape of Good Hope, Natal, Transvaal, and Orange Free State, provinces of the Union of South Africa and their seaward edges, known as the Roggeveld, Schnee, Zwarte, and Drakensberg mountains, which rise in single peaks of 9000 to 11,000 feet. North of the Transvaal, between the Limpopo and the Zambezi valleys, is the less extensive plateau of Matabeleland, with an average level of 4500 feet and a single peak (Panga Mountain, 6967 feet) near its eastern edge. On the western side of the continent, between the Kalahari-Ngami Basin and the Atlantic coast, is the plateau of German Southwest Africa, covering Damara and Great Namaland. This plateau rises to somewhat lesser single heights than does the plateau of British South Africa: Karas (6570 feet), Awas (6988 feet), and Omatoka (8972 feet). Northward of all these, and extending from west to east through Angola and British Central Africa to the vicinity of lakes Nyassa and Tanganyika, where it joins the great eastern highland, is a broad plateau 750 miles wide from north to south and 1500 miles from west to east, with a general elevation of 3000 to 6000 feet. This forms the divide between the Ngami and Zambezi basins on the south and the Congo waters on the north, and has its highest points on the west end in the plateau of Bihe (Lovili Mountains, 7800 feet), and at the eastern end in the plateau mountain of Chitane (6500 feet) near Nyassa Lake. Toward the south it slopes gradually to the Ngami and Zambezi basins, and toward the north it falls more abruptly to the Congo region. Near the eastern end are two lakes, Moero or Meru (3188 feet) and Bangweolo (3700 feet), that drain into the Upper Congo River.

Stretching northward from the Zambezi River to the Red Sea is that great eastern highland which attains its most extensive development just south of the equator in the region about the Victoria Nyanza. Through a large part of its extent this highland maintains an elevation of over 5000 feet, which in Abyssinia rises over considerable areas to heights of 6000, 8000, and 10,000 feet. The main highland extends northward nearly to Suakin, and a narrow, interrupted spur reaches eastward from lakes Abba and Zuway to the apex of the Somali Peninsula, with peaks declining in height from Mount Mulata (9840 feet) to Godobb (4875 feet) at Cape Guardafui. The surface of this eastern highland is traversed longitudinally by a great system of so-called rift-valleys that constitute the most important feature of East African topography, and with which is associated a system of great lakes. These rift-valleys mark the course of parallel cracks in the earth's crust, between which the surface has sunk for thousands of feet, forming narrow, elongated depres-

sions, or broad cañons, with precipitous walls that rise to the broken edges of the high-level plateau. In these rift-valleys lie the majority of the great African lakes, most of which, consequently, are of elongated form. The longest of these rifts has its northern end in Palestine, in the Jordan and Dead Sea valleys; it forms the Red Sea Basin southward to the straits of Bab-el-Mandeb, where it is joined by a broader rift that comes from the east, forms the Gulf of Aden, and continues southwestward through French Somaliland and the Galla country into British East Africa to lakes Stephanie and Rudolf. At this point the rift-valley divides. One branch continues southward to beyond Lake Manyara, and another trends westward from Lake Rudolf to Lake Albert, and then southward to Lake Shirwa at the southern end of the eastern highland. In addition to these great rift-valleys there are many smaller fracture lines throughout the entire highlands that exercise considerable control over the smaller drainage features.

In the vicinity of the rifts are found the highest mountains, and in general the courses of the great rifts mark the location of volcanic peaks. The massive, snow-topped Ruwenzori range, with its culminating peak, Mount Stanley, rising to 16,800 feet, is among the most important of African mountain ranges, and it appears now to be entirely due to an uplift of a part of the Archæan floor of the continent. South of Lake Edward, on the eastern side of the western rift-valley, is a group of volcanic mountains, some of which are active, culminating in Mount Kirunga (11,194 feet). The most extensive volcanic district, however, lies along the eastern rift-valley and on the Abyssinian highland. Kilimanjaro (19,728 feet) and Kenia (17,191 feet), two isolated, snow-clad, volcanic peaks, rise from the eastern margin of this rift-valley near its southern termination. About the southern half of Lake Rudolf is a series of volcanic peaks, where several active cones rise 2000 feet above the plains, the best known of which is Teleki. Several very high mountains lie between Lake Rudolf and the Victoria Nyanza, the highest of which is Mount Elgon (14,206 feet). The Abyssinian highland is topped by massive fields of ancient lava, from which rise extinct volcanic peaks to heights of about 15,000 feet (Ras Dashan, etc.).

The great topographical feature of West Central Africa is the Congo Basin, surpassing in area the basin of the Mississippi by 175,000 square miles, and stretching from lat. 12° S. to lat. 8° N. and from long. 13° to 31° E. The whole of this area is an elevated plain, sloping gradually from all sides toward the middle west, where the vast outlet debouches, in lat. 6° S. It presents no elevated regions worthy of mention, except about the borders. The southeast watershed is not high, nor is that on the south, which separates the Congo waters from those flowing into Lake Ngami or collected by the Zambezi. North of Lake Tanganyika the high mountains form a lofty watershed between the northeastern sources of the Congo and the sources of the Nile. The basin of the Kotto River, a tributary of the Ubangi, supplies the most northern waters of the Congo system. The high ranges of Adamawa and the coast mountains separate the Congo's more westerly northern tributaries from the Ogowe and other coastal rivers. The mountains which separate the Congo

Basin from the coast are rather the broken eroded margin of the continental plateau than true mountains, and few if any peaks exceed 5000 feet in height.

The topographical division of Sudan covers the equatorial area between the watershed of the Congo and the Sahara Desert, from the head-waters of the Bahr-el-Ghazal, a tributary of the Nile, to the mountains of the coast—that is, the drainage basins of Lake Chad and of the Niger. The basin of Lake Chad is an inclosed area almost in the centre of the continent, its southern margin being removed but a few hundred miles from the head of the Gulf of Guinea. The lake itself has no outlet, and lies about 850 feet above the sea. The eastern border of this basin is separated from the Nile waters by a line of highlands which continue northward across the desert and which culminate in Darfur in the Jebel Marra, rising some 6000 feet above the sea and forming a watershed for eastern Sudan. The western border of the Chad Basin is formed by rocky plateaus, which constitute a divide between this and the Niger Basin; and a uniform plain, diversified by rocky hills, stretches westward to the coast mountains. Large portions of the Chad Basin are dry and open, while other extensive areas are forested or swampy, passing northward into desert. At the head of the Gulf of Guinea are high mountains culminating in Mount Kamerun, which rises to an altitude of 13,368 feet. Farther westward along the coast of Upper Guinea there are mountains, but of no great height, the supposed "Kong Range" of old geographies having been proved non-existent. The irregularly distributed heights in the hinterland of Sierra Leone, Liberia, and the Ivory Coast that mark the edge of the plateau and the descent to coastal plains do not exceed 3500 feet, except in the Peak of Kommono (4600 feet). The coast of Senegal is flat; that more southerly, except in Liberia, swampy; all the rivers, and especially the Niger, form extensive deltas.

The region of arid waste lands called the Sahara lies between the Sudan on the south and the Atlas Mountains and the Egyptian coast on the north. It is a part of an arid belt extending eastward to Baluchistan, the entire area measuring about 4,000,000 square miles. Of this area at least two-thirds lies west of Suez and is known in general as the Sahara. It is all an elevated plain, into which many valleys have been eroded by the ancient drainage systems which are now the most marked topographical features of the region. The whole area may, therefore, be divided into certain regions, limited by natural features. First, the so-called Arabian or Nubian Desert, the area between the Nile, the only living river that crosses the arid zone, and the Red Sea. This is marked in its southern portion by the continuation of the volcanic uplands of Abyssinia, which lessen in height toward the north, but border the Red Sea in a line of jagged mountains, many of which exceed 4000 feet, and one, Jebel Soturba, reaches 6900 feet. In the south is the great rift of the Wady Mahall, probably an ancient Nile channel; and in Lower Egypt are the rifts occupied by the Kharga, Dakhla, and others, forming a line of notable oases. West of the Nile rises the desolate plateau of the Libyan Desert, which covers the whole region from Central Darfur to the Mediterranean (long. 18° to 30° E.), excepting the few oases above mentioned. Its general

altitude varies from about 1500 feet in the south to 500 on the Mediterranean, where it breaks down in hills. A line of elevations extending northwestward from the Marra Mountains in Darfur to the Algerian Atlas forms a sort of boundary to the Libyan Desert and makes possible the thinly inhabited oasis regions of Tibesti and Murzuk. Farther west there are wadies, or dried-up river valleys, of which one, with numerous branches, is traceable from the Tropic of Cancer north to the "shots," or swampy lakes, which occupy the large, low plain (in places below sea-level) west of the Gulf of Gabes. It is believed that within 2500 years this valley was occupied by a flowing river, but now only a few pools and springs exist through the dry season. West of this more broken region between Algeria and Lake Chad there stretches an enormous space of waterless waste land, with shifting sand dunes, broken by lines of rugged and naked elevations having a general northeast and southwest direction. This waste extends to the Atlantic coast all the way from about lat. 18° to 28° N., that is, from the hills of Senegal to the western extremity of the Atlas. The elevation of the Sahara throughout the greater part of its extent exceeds 1000 feet, diminishing gradually from the south toward the north in the Libyan Desert, and from its centre in the western half of the desert toward the Lake Chad Basin and the Niger, and toward the coast of Tunis and Tripoli. Only very small and irregular areas along the northern border are below the level of the Mediterranean.

The elevated district called the Atlas Region, with its littoral margin along the Atlantic Ocean and Mediterranean Sea, is a part of the great Alpine system of Europe, to which it is linked by the mountains of Spain and the Pyrenees. Unlike other African mountains, the Atlas have a folded structure and an Alpine character, and present many parallel zones. These ranges extend in a nearly straight line from Cape Nun, on the Atlantic, northeast to the headlands of Tunis, where they are broken through by the narrows of the Mediterranean. Along the Mediterranean coast the elevations are volcanic and descend very abruptly. Toward the interior, irregular ranges form a long line of heights of Paleozoic rocks, which is sometimes called the Tell Atlas; but this is more prominent in Algeria than in Morocco, where the seaward side is a rough plateau. The Atlas stretches over a distance of about 1400 miles and attains its greatest elevation in the western portion, where it rises to a height of nearly 15,000 feet.

Geology. The geological structure of Africa, in its broad features, may be said to exhibit great simplicity and uniformity. The entire lower limb, with the Sudan and the western portion of the Sahara Desert, has a basal complex of crystalline rocks supporting sediments of Paleozoic and Mesozoic age. Strata of more recent deposition, with but one exception (Lower Egypt), occur only along the sea coast and the rivers. The greater part of the land surface, therefore, was formed in early geological times and has remained above sea-level during succeeding periods. Owing to this uniformity, Africa cannot be divided upon a strictly geological basis into more or less distinct units; such a division, however, has been made from a combined geological and geographical standpoint, separating the entire area into three provinces. The first of these comprises South

Africa, Madagascar, and a large portion of Central Africa, which in late Carboniferous time was united with India by an easterly land extension through the area now occupied by the Indian Ocean; the second includes the Sahara Desert and Egypt and is a continuation of Arabia and Syria; the third comprises the Atlas Mountains and is really a part of the Eurasian continent and of the great system of upheaval that is represented in Europe by the Alps and the Apennines.

The most ancient rocks found in South Africa are granites, gneisses, and schists, which lie below all fossil-bearing rocks and may therefore be classed as Archæan. Above these are tilted and eroded beds of sandstones and slates, which form the rampart along the southern extremities of Cape Colony and extend around to the west and north, spreading out over large areas in Namaqualand, Griqualand, Rhodesia, and regions to the north, and which have special economical importance, as they include within their limits the rich gold deposits of the Transvaal. These rocks are mostly of Paleozoic age. Higher up in the series are the Kimberley shales and the Karoo formation of sandstones and slates, which attain great development in British South Africa. Immensely thick deposits of this sedimentary material were laid down on the floors of the vast lakes that then extended through South Africa and the Congo Basin. No remains of a sea fauna have been found in the Karoo beds, but they are rich in amphibian and reptilian fossils that bear a striking similarity to the Triassic (Gondwana) life-forms of India, and also to those of Australia. They were probably deposited during the Permian and Triassic periods. Underlying them unconformably in places are the Dwyka conglomerate, a peculiar rock that often has the appearance of a volcanic breccia, and the Ecca mudstones and sandstones, constituting a group some 4000 feet in thickness. Volcanic rocks are represented by diabase and basalt, which are spread out over the surface in large sheets, being especially prominent along the eastern edge of the Drakensberg Mountains in the Transvaal. The diamond mines of South Africa are located in the vents of old volcanoes through which a basic rock (peridotite) was erupted. On the other edge of the plateau, along the sea coast, are small detached areas of sediments, more recent in origin than the foregoing.

Livingstone mentioned the presence of sandstones and coal seams along the Zambezi River (lat. 16° 40' to 15° 50' S.), and somewhat farther south crystalline rocks of Archæan type appear, as also along the shores of Lake Nyassa. The Rovuma River flows for a considerable distance (about lat. 11° S.) over sandstone beds that rest upon granite. The sandstones are found as high as 2500 feet above sea-level and extend from near the coast to long. 39° E. North of the Rovuma River sandstone strata, possibly of Carboniferous age, are developed on a large scale along two general lines—one extending northwest beyond the shores of Lake Tanganyika and the other extending north to near the equator. Between the diverging areas of sandstone crystalline rocks predominate, inclosing Lake Victoria Nyanza and reaching northward nearly to Lado on the Nile. They have been broken through and are overlaid by volcanic rocks, especially around Lake Rudolf, where volcanoes are still in eruption, and in

the region east of Victoria Nyanza, where there are many inactive cones. Volcanic action has been accompanied here by great vertical displacements, to which allusion has already been made. (See also article on GREAT RIFT-VALLEY.) The west side of Central Africa, from the Kunene River to the Gulf of Guinea, appears to be similar in structure to that of the eastern coast. On the shores of Angola there is a narrow fringe of Cretaceous sandstones, and in the interior crystalline rocks, mostly granite and gneiss, and fossiliferous sandstones of undetermined age predominate. These formations extend into the interior toward the Congo Basin, and they may reach also northward into the Sudan. In the Congo Basin there comes into prominence a peculiar superficial deposit called "laterite," which also covers wide areas in Sudan and the Sahara Desert. It is a porous yellow or reddish rock, formed by the disintegration and weathering of the underlying strata.

The plateau of Abyssinia has been found to consist of gneisses and granites as a basal formation, with overlying sandstone strata in nearly horizontal position. This region is especially characterized by the enormous development of volcanic rocks, which at different times have spread out over the surface. Westward, between Khartum and Fashoda on the Nile, there is a large area of Paleozoic sediments, extending on the eastern Nile bank as far south as Lado, where it sweeps around to the west. In Central Sudan crystalline rocks have been found along the Benue River and in the region between this river and the Niger. In the extreme western Sudan sedimentary strata with Devonian and Carboniferous fossils prevail; they are also developed to a lesser extent on the Gold Coast, where they overlie gneisses and schists. The interior of Liberia and Sierra Leone is supposed to be composed largely of crystalline rocks. The Sahara Desert presents a monotonous stretch of horizontal eroded beds of Paleozoic age resting upon eruptives and gneisses. After Carboniferous times, the whole Sahara region appears to have been elevated above sea-level and to have maintained this position until the beginning of the Cretaceous, when there was a subsidence, and the eastern part of the Sahara, including Egypt, was formed. Volcanic rocks are found in certain parts of the interior, but they are relatively unimportant. In Lower Egypt the ridge that forms the western border of the great rift or fault of the Red Sea is made up of gneisses, granites, and basic igneous rocks, with a sedimentary cap called the "Nubian" sandstone. The last-named constitutes the banks of the Nile at Assuan and also extends for a considerable distance into the desert region. To the north the Nubian sandstone is succeeded by Cretaceous and Tertiary limestones.

The Atlas region of Morocco, Algeria, and Tunis offers a striking contrast to the remainder of Africa, in that it is the only present representative of a mountain system formed by crustal folding. It is composed of eruptives, including trachyte and basalt, along the northern edge, with interfoliated gneisses, schists, granite, limestone, and sediments of Carboniferous, Jurassic, and Triassic age. Suess divides the region into parallel zones; the first is composed of volcanic rocks on the coast; the second consists of granite, gneiss, and schist; the third is a belt of sandstone and limestone, reaching southward into the Sahara Desert.

The continental islands, including the Canary, Madeira, and Cape Verde groups, and many isolated islands, are mostly of volcanic origin. Madagascar, however, is an exception and represents the remnant of a larger area that once extended from southern Africa to lower India. The central part of Madagascar is made up of granites and gneisses similar in character to those found on the mainland, while the western shore is formed by Jurassic and Tertiary sediments. See also articles on countries of Africa.

Hydrography. The great river systems of Africa, excepting the Niger, have their sources in the mountains of the south and southeastern parts. At the Gulf of Suez a line of highlands crosses to Africa from Syria, which follows the coast line of the Red Sea to its southern extremity, then bends to the south and southwest, passes the equator, and joins the broad plateaus that extend over South Africa. As there is no prominent interior mountain range, this long line of coastal highlands forms the most important water-parting of the continent. Within its bounds are the upper courses of the Nile, Congo, and Zambezi, as well as of the Orange and of most of the smaller streams. The Nile, Niger, and Congo rivers have their origin on the interior slopes of the highlands, and therefore discharge into the Atlantic Ocean, while the Zambezi drainage basin, lying largely on the outer slopes, falls off toward the Indian Ocean. The longest river system is that of the Nile, whose head stream is the Kagera River rising on the plateau of Ruanda to the east of Lake Kivu and west of Victoria Nyanza. After issuing from that lake on the Nile proper, the river flows northward through the mountainous divide to the plateau region of eastern Sudan, where it receives an important affluent from the west in the Bahr-el-Ghazal, and is joined farther north by the Sobat, the Bahr-el-Azrek (Blue Nile), and the Atbara, all from the plateau of Abyssinia. In the northern third of its course the Nile practically completes its vertical descent by numerous cataracts, after which it flows through a valley that is but little above the level of the sea. The drainage basin of the Nile includes an area of about 1,600,000 square miles. Next to the Nile in length and superior to it and to all other rivers of the world excepting the Amazon in volume is the Congo, which rises in the headwaters of the Lualaba tributary near the boundary between the Belgian Congo and Rhodesia and drains an area estimated at 1,170,000 square miles. The Congo flows a little west of north, then describes a great arc, with its chord formed by the equator, and finally turns southwest, and pierces the coastal barrier of Lower Guinea to enter the Atlantic. The tributaries of the Congo include many great rivers, such as the Ubangi, Kassai, Kuango, Sanga, and Aruwimi. The Lukuga River drains Lake Tanganyika to the Congo; and the Malagarasi tributary of the lake extends a narrow wedge of the Congo basin to within 500 miles of the Indian Ocean. South of the Congo are the drainage basins of the Zambezi and Orange rivers, which extend nearly across the lower limb of the continent and have an eastward and westward slope respectively. The great land-mass composing the western limb of the continent is poorly watered, the Niger being the only river of first importance lying wholly within the area. This river drains the northern slopes of the coastal highlands of Guinea, through which it breaks

after being joined by an important tributary from the east, the Benue, and enters the Gulf of Guinea. Of lesser rivers may be mentioned the Limpopo, Rovuma, Sabi, Tana, and Jub, which enter the Indian Ocean, and the Kunene, Kuanza, Ogowe, Volta, Gambia, Senegal, and Draa on the western coast. Owing to the mountainous barrier through which they must pierce to reach the sea, the smaller rivers of Africa generally are unnavigable in their lower courses.

Between the drainage basins of the Nile, Niger, and Congo, and west of the north and south range of highlands of Sudan, is the interior basin of Lake Chad. This lake is fed chiefly by the Shari and Waube, and is subject to great variations of level. It is a shallow body of fresh water, varying in area from 10,000 to 20,000 square miles, according to the amount of its water receipts. In 1902 it was at a low stage and had for years been decreasing in size. In 1911-12 it was again slowly enlarging. This phenomenon of sudden variations in level and consequently in area is peculiar to all the rivers and lakes of Africa within the equatorial regions and is due to the seasonal distribution of rainfall. Between Abyssinia and the Zambezi River and within the bounds of the north and south highland region there is another inland drainage basin with several large lakes, which together constitute one of the most striking physiographical features of Africa. The lakes lie along a line of rifts or fissures which have been formed by sudden displacements of the earth's crust. Some of the lakes are, Margherita, Abaya, Stephanie (in 1912 completely dried up), Rudolf, Manyara, Natron, Baringo, Eyassi, and Leopold (Rikwa), all but Rudolf being small bodies of water. Lakes Victoria, Albert, Albert Edward, Kivu, Tanganyika, and Nyassa drain into the Nile, the Congo, or the Zambezi, and are fresh water bodies. Victoria, Tanganyika, and Nyassa rival in extent the great lakes of North America. For further details, see articles on CONGO; VICTORIA NYANZA, etc.

Climate. Of all the great land divisions of the globe, Africa is characterized by the greatest uniformity of climate. It stretches into both the north temperate and south temperate zones, but the greater part of its area is included within the tropics; there is consequently a successive decrease of average annual heat northward and southward of the equatorial belt, but the regularity of the decrease is modified by certain other factors, so that the region of greatest average heat for the year is located not at the equator but considerably north of it, between the parallels of 10° and 20°. These modifying factors are mainly the direction of the winds and the distribution of the mountains. It is, of course, cooler here in certain seasons than in others; but the average temperature of any given season shows little fluctuation. In summer the isotherm of 80° F. incloses the whole of the Sahara Desert, and over a considerable portion of this area the average summer temperature is 97° or more. This region of extreme heat, which is the largest in the world, may be delimited by a line drawn from Khartum west to Timbuktu, thence north to El-Golea in the Algerian Sahara, thence southeast to Murzuk and thence to Berber on the Nile. The mountain regions of Algeria and Morocco and parts of British South Africa and of German Southwest Africa have a subtropical or temperate climate. Throughout a large portion of Africa, especially

in the mountains of the east and in the Sahara and Kalahari deserts, the temperature varies widely between summer and winter and between day and night, as is characteristic of all desert regions. (See DESERT.) In the Kalahari Desert the extreme seasonal fluctuation reaches 113° , and in the Sahara Desert the temperature during the night often approaches the freezing point. In general, the western coast of Africa is cooler than the eastern coast, owing to the conditions heretofore stated and to the influence of the drift northward along that coast (south of the equator) of the cool water from the Antarctic Ocean. (See article on CLIMATE.) *Winds.*—Trade winds are characteristic of nearly the whole continent. The Sahara Desert is a region of high barometric pressure during the winter months, thus causing outward blowing winds, while in the summer season the pressure is lowered, and there is an indraught from the surrounding territory. In the western part of the Sahara Desert and Sudan, north and northeast winds prevail during the greater part of the year, alternating with northwest and west winds for a few months in winter. The eastern Sahara region and Egypt have prevailing north and northeast winds. A devastating wind called the "khamsin" blows from the southeast across this region at times, carrying dust and sand and causing sudden rises of temperature. A similar dust wind, but usually cooler, blows from the interior of the Sahara over Senegambia and Upper Guinea and is called the "harmattan." During the summer, in the lower limb of Africa, an area of low pressure occurs in the interior, and the prevailing winds are from the east and southeast on the eastern border, and south and southwest on the western. In winter there is a shorter period in which the winds blow outwardly. (See article on WIND.) *Rainfall.*—The principal factors governing rainfall are evaporation, direction of winds, and distribution of mountains. A combination of these factors most favorable to a large rainfall is found on the west coast of Africa near the equator. Here the humid atmosphere from the Atlantic is carried landward by the winds and, becoming cooler, deposits the greater part of its moisture before passing the highland region. The maximum limit of precipitation is probably attained in Kamerun, where the total rainfall in the year may exceed 350 inches, while the Niger Delta and the coasts of Sierra Leone and Liberia also are excessively humid. On the east equatorial coast the winds from the Indian Ocean deliver considerable moisture, but not in such abundance as on the west coast. As they pass into the interior, the winds from both the Atlantic and Indian oceans are deprived of their humidity, especially in the mountains, which act as precipitating agents. Equatorial Africa, as a whole, is thus characterized by a heavy rainfall. North and south of this region, however, the conditions exhibit a striking contrast. In the north is the Sahara Desert, the largest arid region in the world, where the prevailing winds are from the northeast and are hot and dry, while the humidity of the southerly winds that may penetrate into the interior is diminished by the heat and seldom falls as rain. A second arid region, the Kalahari Desert, is found in the southern limb of the continent, between the Zambezi and Orange rivers and the eastern and western coastal highlands. It has a small spasmodic rainfall, which is usually insufficient to support

a constant growth of vegetation. The Mediterranean coast region and the extreme southern extension have a dry climate that is tempered by rains during certain seasons. Besides the continental distribution of rainfall, there is a seasonal variation in the amount received in different latitudes. In the regions near the equator rain may fall during every month of the year, but the periods of greatest precipitation occur when the sun is nearly vertical, in spring and fall. Away from the equator there is generally but one wet season. See articles on countries of Africa.

Flora. The vegetation of Africa is very diversified on account of the well-marked topographic districts and the varied climatic conditions. The three zones of tropical, north temperate, and south temperate climate have their peculiar types of vegetation, the distribution of which in each zone is determined by the immediate physiographic features. Forest, steppe, savanna, and desert floras are found in each zone. The flora of the Mediterranean slope of the northern temperate zone has a general resemblance to that of southern Europe, with forests of oak and of smaller trees, as olives and figs, with also the vine and the same cereal grains. The desert regions (typified by the Sahara in the north temperate zone and the Kalahari Desert in Bechuanaland of the south temperate zone) support a scant xerophytic vegetation, which, contrasted with the flora of the North American deserts, has for its most prominent types quite leafless, thorny and fleshy euphorbias and acacias instead of cactuses. In the Sahara Desert the date palm grows often in extensive groves in the oases, and its wide distribution is probably due in large part to the dispersion of its seeds by the nomadic tribes, for whom its fruit serves as an important article of food. Bordering the Sahara and the Kalahari deserts are extensive semi-arid steppe or prairie regions, where the slight rainfall permits of the existence of a somewhat more varied flora, which combines certain of the desert and forest types. The steppe region of the southern temperate zone has, by reason of its isolation, developed a flora peculiarly its own, which is characterized both by the abundant presence of many members of the heath family (which often grow to a height exceeding 10 feet) and also by the general brilliancy of color of the flowering plants.

Those portions of Africa which have a moist climate are divisible into the savanna and forest regions. The forests are found mostly in the equatorial districts, where they are of enormous extent. Here the trees grow to great heights (often 200 feet) and, being close together, support numbers of parasitic vines, forming over vast areas a dense, tangled covering of foliage, through which the direct rays of the sun seldom penetrate. The savanna districts are uniform plains of both high and low land. On the damp lowlands, reeds, especially the papyrus, abound (as, for example, in the marshy regions of the Nile and Congo valleys); on the drier high grounds good pasture grass with euphorbias forms the dominant vegetation, together with forest growths in the river valleys. The more important trees are the baobab (*Adansonia*) and the wine and oil palms (*Raphia* and *Elæis*). In conclusion, it may be stated that the flora of Africa is characterized by the extensive development of acacias and euphorbias over the

entire continent, with the date palm in the northern (particularly in the arid) regions, and the papyrus in the marshes. See DISTRIBUTION OF PLANTS.

Fauna. The fauna of Africa is remarkable for its homogeneity, for the continental range of a great number of its groups and species, due to the absence of extensive mountain barriers, and for its remarkable alliance with the fauna of the other divisions of the southern hemisphere. Africa—apart from the northwestern corner (the Atlas Mountains, in which live the aoudad and certain other European forms)—is now regarded as forming, together with Arabia and Palestine, a single zoögeographical prime division called Ethiopian. Surveying its principal groups of animals, it is seen to be characterized in respect to the mammals by the preponderance of hoofed animals and the great size of many, such as the elephant, hippopotamus, and rhinoceros, by the originally vast numbers of gregarious grazers, and by their distinctive forms. Thus, there are no true oxen, but a buffalo is abundant; no camels nor llamas; no sheep nor goats; no deer (except the aberrant chevrotain) nor true swine. But it has exclusively several species of the horse family, the zebra, quagga, and wild ass; a giraffe, once ranging all the southern plains, and the okapi (q.v.); the tribe of hyraxes, and almost 100 kinds of antelopes and gazelles, few of which range outside of Africa and Arabia. Of apes, the chimpanzee and gorilla belong to the equatorial forests alone; but more widely distributed, though exclusively African, are the baboons, various kinds of monkeys, and nearly all the lemuroids. Among the carnivora, bears, wolves, and foxes are wholly absent, and several feline, viverrine, and canine forms are peculiar, although the characteristic lion and leopard are not restricted to Africa. The lesser mammals are mainly the same as or allied to southern Asiatic and Oriental forms. Resident birds display similar unlikeness to Europe and Asia, and suggestive resemblances to those of the Australian and Neotropical regions. Thus, the ostrich, so widespread and characteristic of Africa, is unknown elsewhere, but its allies are the extinct and modern ratite birds of the Australasian archipelago and the rheas of Argentina. Africa is rich in reptiles, but few are peculiar, chiefly terrestrial venomous snakes and the chamasaurid lizards; and the affinities of this group, as of the fishes, are Oriental, though some of the fishes are remarkably related to ancient American families. Similar remarks apply to the invertebrates, where many genera even are the same as those of either Australia, the Malayan region, or America. For particulars as to the various faunal sub-regions, Madagascar, West-coast, etc., see DISTRIBUTION OF ANIMALS.

Population. Recent authorities roughly estimate the population of Africa at about 140,000,000, or 12.4 to the square mile—a density slight when compared with that of Europe, but much greater than that of the American continent. According to the nature of the soil and of the climate, the population is distributed very unevenly over the surface, being very dense in the Nile delta and massed somewhat densely in the Upper Nile valley, and generally throughout the Sudan, less thickly over the southern plateau, and very thinly in the outlying regions of Morocco and Tripoli; while large tracts, especially

in the western Sahara and in the Libyan and Kalahari wastes, are absolutely uninhabited. Of the inhabitants of Africa, only a small portion are recent immigrants from Europe, settled chiefly in the extreme north (Algeria) and in the extreme south (Union of South Africa).

Ethnology. The yellow, the brown, and the red varieties of the human genus have no representatives in Africa, with the exception of some of the Polynesian tribes in Madagascar and the intrusions of eastern Asiatics in recent times. The 140,000,000 inhabitants of the continent represent the white and the black varieties of man, or mixtures of these. Northern and northeastern Africa have been occupied in historic times by white races, while equatorial and southern Africa were the home of black races; but the white Africans have from remote antiquity forced themselves into the black man's territory, and negro blood has mixed with that of Hamite and Semite across the Sahara; hence, especially on the border line, the ethnic stocks are intermingled.

Various schemes of classification have been proposed for the people of Africa, one of the best-known being that by Deniker. Deniker's scheme (*Races of Man: an Outline of Anthropology and Ethnology*, London, 1900) is as follows:

I. Arabo-Berbers, or Semito-Hamites — (1) Jjerba subrace; (2) Elles type; (3) Dolichocephalic Berber subrace; (4) Jerid or Oasis type.

II. Ethiopians, or Kushito-Hamites, sometimes called Nuba, or Nubians.

III. Fulah-Zandeh group. Mixture of Ethiopians and Nigritians or Sudanese Negroes.

IV. Nigritians—(1) eastern Sudan, or Nilotic Negroes; (2) Nigritians of central Sudan; (3) Nigritians of western Sudan and Senegal—Hausas, Mandes or Mandingans, Toucouleurs or Torodos, Yolofs of Senegal; (4) Littoral Nigritians or Guineans—Krus, Agnis, Tshis, Ewes; (5) Yorubas.

V. Negrillos.

VI. Bantus. In central and southern Africa, divided into western, eastern, and southern Bantus.

VII. Bushmen-Hottentots.

VIII. Hovas, Malagasies, and Sakalavas of Madagascar.

This classification is not altogether based on physical difference, for the term "Bantu" has a purely linguistic significance. Thus, some Pygmy tribes, at least, speak Bantu dialects, though their physical type differs widely from that of their taller Bantu-speaking neighbors, and the same applies to some of the East African peoples whose appearance suggests a mixture of Negro and Asiatic blood. Disregarding relatively recent immigrants into the continent and also tribes of obviously mixed blood, we may distinguish the following racial types: (1) Pygmies, now scattered in small groups over the Congo and neighboring areas; (2) Bushmen, sometimes classed with the Pygmies, but hardly on quite convincing grounds; (3) Hottentots; (4) Negroes. The last-mentioned are often subdivided into Sudanese and Bantu Negroes, but, as already stated, this is not a racial but a linguistic distinction. The Pygmies and Bushmen are commonly assumed to have been the oldest aborigines of Africa and to have been pushed back into more and more undesirable habitats by stronger immigrant peoples.

The northern Africans are Hamitic, and were

ZANZIBAR TYPE EAST AFRICA

preceded (1) by Stone Age peoples; (2) by the kindred of Iberians, Silurians, and other tribes of southern and western Europe. The monolith builders apparently merged into the Berber Hamite intruders, who, in turn, were encroached upon by Phœnician Semites; then followed Romans and Teutonic Vandals, though the chief ethnic element continued Berber until the coming of the Arabs (100–200 A.D.) and the irruption of the Moslems (from 639 A.D.). The Arabs are now in the ascendancy, but the Hamitic tribes continue in the uplands (Keane, 1895).

There are among the African peoples examples of the lightest and the darkest races. There are also examples of the smallest and the largest of mankind, as the measurements in metric standard from Deniker will show: Akka, 1.378 meters; Bushmen of Kalahari, 1.529; Mzabite Berber, 1.620; Batekes of the Congo, 1.641; Algerian Arabs, 1.656; Danakils, 1.670; Kabyles, 1.677; Bechuanas, 1.684; Mandingo, 1.700; Kaffirs, 1.715; Somali, 1.723; Wolof, 1.730 (many are over 6 feet); Fulah, 1.741. The Wahuma of Ruanda, East Africa, average not less than 1.80 and are probably the tallest people in the world; statures of 2 meters (over 6 feet 6 inches) are said to be relatively common among them. Compare with these the Aeta of the Philippines, 1.465; Eskimo, 1.575; Lapps, 1.529; Cheyennes, 1.745; Sikhs, 1.709, and Marquesas Islanders, 1.743. The range of cranial index is quite as wide. Among the Congo tribes the index is 72°.5, the Fijuan Negroes have an index of 67°.2; the Sara of the Chad Basin have an index of 82°.41, but many peoples in Oceanica, America, Asia, and Europe range between this ratio and 88°.7.

The development of the native African cultures forms one of the most fascinating problems for the ethnologist because of their established or suggested relationship with the cultures of other areas. In the north and east, Asiatic influences have demonstrably been at work. Ruins discovered in Rhodesia have suggested to some scholars the theory of an ancient migration from southern Arabia, but latterly these structures are believed to be of mediæval origin and to have been reared by Bantu Negroes (see Randall Maciver, *Mediæval Rhodesia*). Quite recently Frobenius has advanced the hypothesis that the older civilization of Yorubaland on the west coast was imported ready-made from ancient Etruria. The art of smelting iron is supposed by Foy and others to have been brought in from Asia, while Von Luschan argues for an African origin of metallurgy. Frobenius and Graebner note a number of really striking resemblances between Negro and Oceanian culture and regard the former as in large measure derived from the latter.

While many of the questions just raised have not been definitely decided, it is clear that the theory of extraneous influences has been considerably overdone. Negro culture, to which that theory is largely confined, bears many characteristic features that indicate independent origin, or at least independent remodeling of imported elements. Moreover, archæological finds within the last 10 or 15 years establish the existence of a stone age over the greater part of Africa and thus suggest a probable beginning for the observed Negro cultures on African soil. It is interesting to note in this connection that there is no evidence for an African copper or bronze age, the natives having apparently taken the

step directly from stone to iron implements (granting that the iron technique is of African origin; see above).

A few essential traits of African culture may now be noted. Economically, the three principal modes of securing food are all represented. The Bushmen and Pygmies are hunters and gatherers of wild roots and small animals; the Hottentots and a number of East African tribes, such as the Wahuma and Masai, are primarily herdsmen and in a subordinate way hunters; all the Bantu (with the exception of the Herero) and the Sudanese Negroes are, above all, tillers of the soil, though cattle-raising looms large among the Kaffir and a number of other peoples. Apart from the Bushmen, Pygmies, and Hottentots, the industrial life of the Africans has for its most distinctive feature the practice of the blacksmith's art, for while pottery, weaving, and basketry are extensively cultivated, they are not peculiar to the Negroes as compared with the natives of other continents. Politically the Negroes show a striking tendency towards the formation of powerful monarchies under the sway of absolute despots—a tendency that is strongly contrasted to the essentially democratic spirit displayed by the North and South American Indians. The social organization of relatively few tribes has been determined, so that it is not practicable to generalize on this subject. In many localities, however, a definite clan system has been noted with descent traced either on the father's or the mother's side. The social and political life is often dominated, especially on the west coast, by a secret society that terrorizes the uninitiated; this is one of the cultural elements that lend some support to the theory of Oceanic influence (see above). The existence of markets for the intertribal exchange of goods is highly characteristic of a large part of Africa, as is also the adjudication of legal cases by an ordeal to which the accused is obliged to submit. In the discussion of African native religions such little-understood catchwords as "fetichism" have generally taken the place of sound information. According to recent publications by Pechuel-Loesche and the Congo Museum at Tervueren, Belgium, fetichism, which is especially well developed along the west coast and its hinterland, is at bottom not very different from the manitou beliefs of the American Indians. The carving of a human image, which is usually emphasized in popular accounts, is really unessential; a leaf, or some other inconspicuous natural object, may become a fetich provided it has exerted a peculiar psychological effect on the beholder. What is important is that the object, whether natural or artificial, should be endowed with mysterious qualities by means of magical rites and substances. Amulets, whether produced in this or other ways, are used extensively all over the continent. In some regions, e.g., Yorubaland, divination by the casting of lots, plays a very important part. The Yoruba also worship a very large number of deities, each presiding over some definite department of nature or human activity. What corresponds in Africa to the literature of written languages takes the form of mythic tales about the gods, and more particularly that of animal fables and proverbs, the latter often revealing great shrewdness in the affairs of every-day life.

On the whole, then, the African native cultures must not be underestimated. In many directions, e.g., political organization and cer-

tain forms of artistic endeavor, the Negroes have achieved very creditable results, and if Von Luschan's theory should hold they would have to be honored as the originators of the iron technique.

Religions. Fifty-eight per cent of the population, according to the estimate of H. P. Beach, are devotees of the native religions, which are characterized by features noted in the preceding section.

Imported Religions.—(1) Mohammedanism. Of the religions imported into the continent, by far the most important is Mohammedanism, the faith of 36 per cent of the population. It came thither in the seventh century and overran all North Africa in a hundred years, so completely overturning the Christian churches which had been planted there that they have never been revived. Mohammedanism retains its conquests in Egypt, Barca, Tripoli, Algeria, and Morocco, and it is to-day one of the greatest missionary religions. It presents a one-sentence creed, "There is but one God and Mohammed is his prophet," and has the simplest methods. The missionary is unpaid and usually a native. There are no mission boards, or expenses for salaries and printing. There is usually no special training, although in Cairo there is a Mohammedan university, attended by thousands of students, and from this many of the missionaries go forth. They have been remarkably successful in spreading their faith among heathen populations in Central Africa. In this way Mohammedanism has exerted an influence which counteracts the native religions and so improves the condition of the peoples it reaches. (2) Christianity; (a) Copts, the descendants of those original Christians who in the fifth century adopted the theory that in Jesus the human and divine make one composite nature (monophysitism) and so are reckoned among Christian heretics. They are found in Egypt and number about three-quarters of a million. (b) Abyssinian Christians, who trace their faith back to the Coptic missionaries of the fourth century, but present a curious mixture of Christianity and Judaism. (c) Roman Catholics. The first missionaries of this faith to penetrate the Dark Continent were Jesuits, and they began work in the middle of the sixteenth century. Indeed St. Francis Xavier came to Mozambique as early as 1541, but he did not stay more than six months. The result of the work, carried on continuously ever since, has been that now $1\frac{2}{5}$ per cent of the population are Roman Catholics, living in all parts of the continent. Livingstone bore testimony to the value of the work of these missionaries. (d) Protestants. The first who came to Africa were Moravians. This was in 1792. Since then all branches of Protestantism have labored there, and their converts now number $1\frac{9}{10}$ per cent of the population, and they are found in every part. Roman Catholics and Protestants, especially the latter, carry on missionary work among the Coptic and Abyssinian Christians. South Africa is to a considerable extent a Christian country of the modern civilized type. (3) Judaism. About $\frac{3}{10}$ of 1 per cent of the population of Africa are Jews.

Social Conditions. Slavery is still "the open sore of Africa," as Livingstone said, and nowhere is it more cruel, bloodthirsty, and destructive. The ivory trade is a constant source of trouble, setting tribe against tribe in war. Polygamy is widespread. The tribal government,

the absence of central authority, the usual conditions of savage life, in bondage of superstition and terrors of every kind—these disturb life over great stretches of territory. Yet it is the testimony of travelers that peace and a certain kind of prosperity are found in many villages in the very heart of the land. Consult: F. P. Noble, *The Redemption of Africa* (2 vols., New York, 1899); A. P. Atterbury, *Islam in Africa* (New York, 1899); H. P. Beach, *Geography of Protestant Missions* (New York, 1901).

Early History and Exploration. In the earliest historic times, when civilization centred around the Mediterranean, Libya, as Africa was known to the ancients, was one of the three great divisions of the earth, of which Europe and Asia were the other two. The details of its history are to be found in the history of Egypt, still the earliest recorded civilization, and of the other States of northern Africa, as well as of the Roman Empire, which absorbed them all. The brown-hued Berbers seem to have been the fundamental race stock throughout northern Africa, with perhaps Aryan and Semitic infusions, due to the contact of Egypt with Asia and Europe. Whether the Hamitic peoples of Africa were or were not autochthonous is a problem for the settlement of which no sufficient data exist. The knowledge possessed by the ancients of the continent as a whole, so far as we have accounts of it, can be briefly stated. The rulers of Egypt, as subsequently those of Carthage, attempted to extend their influence toward the south and west; but the physical and climatic conditions and the savage tribes encountered presented an effective bar to extended progress at that time. An inscription assigned to the period of the Eleventh (Theban) Dynasty tells of a voyage made by command of one of the rulers of that dynasty to the land of Punt, probably Somaliland. Recent discoveries also seem to increase the credibility of traditions which assigned the biblical lands of Ophir to the eastern coast of Africa. About 30 centuries ago the enterprising Phœnicians planted Utica (c.1100 B.C.), Carthage (826 B.C.), and other lesser colonies along the Mediterranean coast, and Greek colonies were founded in Egypt, in Cyrenaica, and just east of Carthage, during the period of Greek colonization, which began in the seventh century B.C.

The known explorations of the Dark Continent may be said to begin with the famous voyage made by Phœnicians about 600 B.C., an account of which is preserved by Herodotus (iv, 42). There are no sufficient reasons for doubting the general accuracy of the account, which describes the voyage as made by command of Necho, King of Egypt, who had just completed a canal from the Nile to the Red Sea. The expedition sailed down the Red Sea and along the coast of Africa, until the sun for many weeks "rose on their right hand." After a long absence the explorers returned to Egypt through the Pillars of Hercules, so that they must have circumnavigated the continent. A hundred years later, also according to Herodotus (iv, 43), a Persian of noble birth, Sataspes, started, with a Carthaginian crew, down the west coast of Africa, but was compelled to turn back. It is doubtful if he went far beyond the Phœnician settlements, which, beginning at Gades, just without the Pillars of Hercules, already extended well down the coast of Morocco, along which Hanno, about 480 B.C., planted a series of colonies. The "Islands of the Blessed" also (the Madeira and Canary Islands)

were probably within the scope of the sea-going trade of the Phœnicians and Carthaginians. Carthaginian traders trafficked by sea with the Gold Coast, and by land along the caravan routes which communicated with the flourishing regions of Upper Egypt and the Niger. It is probable that almost contemporaneously with the Phœnician settlements in northern Africa, Arabs entered the country south of the Zambezi and, going inland, found and worked the gold mines which have been recently rediscovered. The Greeks began to colonize northern Africa in the seventh century B.C. After the conquest and destruction of Carthage by Rome (146 B.C.), all northern Africa was gradually drawn into the growing Empire; but Rome's interest lay in the known and organized regions, upon which she strengthened the hold of civilization, ignoring all that lay beyond her well-defined boundaries, a policy which was accentuated as the Empire tended toward decay.

Christianity was introduced into Africa in the earliest days; the North African church was a recognized division of the Christian Church in the second century, and when a synod of this church was held in 258 it was attended by 87 bishops. Its chief city was Carthage. Three names in this church are prominent: Tertullian (third century), the first to employ the Latin language in the service of Christianity; Cyprian (third century), Bishop of Carthage, and one of the great ecclesiastics of the early Church; and Augustine (fifth century), Bishop of Hippo, the greatest of the Latin fathers. The earliest translation of the Bible into Latin was made in North Africa, and it was the battle-ground of the famous fights with heretics and schismatics, such as Donatists, Pelagians, and Montanists. But the church was destined to have a short life. Undermined by formalism and apathy, it fell beneath the Mohammedan onslaught in the seventh century. During the Germanic invasions the Vandals grasped the African provinces, and in the early mediæval period much that had been known to Ptolemy and the geographers who preceded him was forgotten. The maps of Ptolemy, representing the knowledge of the second Christian century, indicate the course and sources of the Nile and the mountains of west Central Africa more accurately than they were again shown on maps before the middle of the nineteenth century. What Europe was forgetting, the Arabs, in the advance of the Mohammedan power, rediscovered. From Arabia the new faith spread rapidly westward along the southern shores of the Mediterranean and inland across the desert. It took such deep root in northern Africa that the Christian religion, which in many places was then well established, has never been able to regain a real foothold among the native races.

Northern Africa became a battle-ground during the later Crusades and all the succeeding struggles on the Mediterranean between Cross and Crescent and was the scene of changes and strife among rival Mohammedan dynasties; but ignorance of the rest of the continent only deepened with the centuries, except among the Arabs, who occasionally pushed their expeditions southward. If traditions may be believed, Norman vessels from Dieppe visited the Gold Coast as early as 1364, and in 1413 the Normans built a fort at Elmina. There is neither inherent improbability in this story nor satisfactory evidence to prove it, but it is probable that Norman

voyagers found their way to the West African coast at a very early period. In 1402 Jean de Béthencourt sailed from La Rochelle and established a settlement on Lanzarote, one of the Canary Islands. During the next three years he extended his sway over the natives of the neighboring islands. Although his expedition is sometimes spoken of as the beginning of modern African discovery, the accounts of it show conclusively that the islands were already comparatively well known. Indeed, Béthencourt seems to have started with some sort of grant from the King of Castile. Long before, in 1344, the Pope had granted the islands to a scion of the royal house of Castile, Don Luis de la Cerda, who had taken the title of Prince of Fortune, i.e., of the Fortunate Islands. This same year, 1344, is given as the date for the discovery of Madeira. In that year, so the tale goes, a young Englishman, Robert Machin, eloped with Anne d'Arfet, or Dorset, a woman of noble birth, and sailed away with her for France, but contrary winds carried them to the island of Madeira. There the lovers died; but one of the company returned to Portugal, and the report of his adventures served to guide the captains of Prince Henry, who rediscovered the island in 1419.

The real opening of Africa to the knowledge of the modern world began with Prince Henry of Portugal (q.v.), called the Navigator. In 1415 he participated in the victorious campaign of Portugal against the Moorish citadel of Ceuta, and his interest was awakened by the enigma of the unknown continent. On his return he devoted himself to the task of sending expedition after expedition down the African coast to determine the extent of the continent and to find, if possible, a way to the east around it. These expeditions crept farther and farther southward. In 1434 Gil Eannes passed beyond Cape Bojador, the "bulging cape," off which the Atlantic currents ran so strong as to bar all previous attempts at progress. In 1441-42 Antão Gonçalves and Nuño Tristão passed Cape Blanco and reached the Rio d'Ouro, whence they brought back 10 negro slaves and some gold dust; and the demoralizing trade which was to characterize West Africa for nearly four centuries was fairly begun. In 1445 an exploring party started from the mouth of the Rio d'Ouro and spent seven months in the interior. In the same year Diniz Dias passed the mouth of the Senegal, discovered Cape Verde, and returned to Portugal with four negroes taken from their own country, previous importations having been secured by exchange with the Moors. The next year Nuño Tristão reached the Gambia, where he was killed, with most of his followers, by the natives. Ten years later, 1455 and 1456, Cada Mosto (q.v.) explored the river and discovered the Cape Verde Islands. In 1448 the Portuguese built a fort on the Bay of Arguin, south of Cape Blanco, and soon after formed a company for carrying on trade in slaves and gold with the Guinea Coast. The impulse given to exploration by Prince Henry continued after his death, which occurred in 1460. Pedro de Cintra, in 1462, added the coast as far as Sierra Leone and Cape Mesurado to the Portuguese claims. In 1471 Santarem and Escobar carried the Portuguese flag across the equator. Commerce, meanwhile, was familiarizing pilots and the makers of sailing charts with the details of the West African Coast. In 1482 Diogo Cão passed the Congo and heard from the natives tales which seemed to confirm the old

story of Prester John (q.v.), a Christian king ruling somewhere beyond the wall of Mohammedanism with which Europe was surrounded. It has been supposed by some that the King of Abyssinia was the subject of this legend. The Portuguese King determined to communicate with this unknown Christian brother, and in July, 1487, sent Bartholomeu Dias (q.v.) with two ships of some 50 tons and a smaller tender to carry his message. From the Congo, Dias beat down to Cape Voltas, near the mouth of the Orange River. Thence he was driven by storm southward for 13 days, after which he steered north and east in the hope of regaining land. He sighted the southern coast of Africa, near the Gouritz River, at Vleesch Bay. Keeping on toward the east, he landed on an island in Algoa Bay, still known as Santa Cruz, or St. Croix, from the cross which he set up there. When he reached the mouth of the Great Fish River, long the boundary of Cape Colony, the patience of his crews gave out, and they forced him to put about for home. On the return journey he sighted, first of modern sailors, the great landmark which has appropriated the generic name of The Cape. Dias christened it the Stormy Cape (Cabo Tormentosø), but on his return in December, 1488, the King (or, according to Christopher Columbus, Dias himself) gave it the more cheering name of the Cape of Good Hope.

While Dias was rounding the Cape, the King, fearing lest his vessels might fail to reach Prester John, sent another message to that potentate, overland, by Pedro de Covilhão and Alfonso de Payva. From Aden, in Arabia, Payva made his way to Abyssinia, where he was killed, while Covilhão went eastward to India. From Goa Covilhão sailed to Sofala, in eastern Africa, where he gathered news of Madagascar, and satisfied himself that it would be possible to go around to the western side of Africa by water. His report reached Portugal in 1490, but it was seven years before Vasco da Gama (q.v.) proved its correctness, in November, 1497. Starting from Lisbon, he doubled the Cape and, after encountering storm and tempest and the southern sweep of the Mozambique current, sighted, on Christmas Day, 1497, the land which still bears the name he gave it in honor of the day—Natal. After touching at Mozambique and Mombasa, he arrived on Easter at Melinda, where he found a pilot who took him across to India. The land was sighted on May 17, 1498, and three days later Da Gama anchored off Calicut.

Modern Exploration. Thus far the Portuguese had been almost alone in the exploration of Africa, but in the second half of the eighteenth century a new era of discovery began—an era in which men of several nationalities have had a share, and by the results of which several nations have sought to profit. The new line of explorers is headed by James Bruce (q.v.), a Scotchman who had been British consul at Algiers from 1763 to 1765. While in Egypt in 1768 he conceived the plan of seeking for the sources of the Nile. After crossing the Red Sea to Jiddah, he entered Abyssinia by the way of Massawa and proceeded to Gondar, where he won the favor of the negus. After some delay he succeeded in reaching the headwaters of the Blue Nile, and believed that he had found the true source of the main river. He arrived in Cairo in 1773. His account of his journey and the increasing interest in the slave traffic led to the organization, in 1788, of the African Associa-

tion, expressly intended to promote the exploration of the unknown parts of the continent. In 1795 the association dispatched Mungo Park (q.v.) a young Scotchman, to the mouth of the Gambia, to explore the interior and to find the Niger, on which was supposed to be the negro city of Timbuktu. Passing up the Gambia, Park, after many adventures, reached the Niger, which he traced for a considerable distance along its middle course. He returned to England, but again set forth in 1805, intending to travel overland to the Niger, and by sailing down that stream prove his theory that it was identical with the river which was known at the mouth as the Congo. He was drowned at Bussa, with one of his companions, and all the other members of the party succumbed to fever.

Meanwhile, the Portuguese Brazilian F. J. de Lacerda in 1797 started from the Zambezi to cross the continent from east to west, but died near Lake Moero. Other Portuguese explorers traversed this region from both sides during the next 35 years. The stories that Park had heard and published about the mysterious city of Timbuktu aroused great curiosity. The city was reached in 1811 by a British seaman named Adams, who had been wrecked on the Moorish coast and carried inland as a slave, but was ransomed by the British consul at Mogador. In 1822 Major Denham and Lieutenant Clapperton (q.v.) attempted the trans-Saharan route to Timbuktu. From Murzuk, the capital of Fezzan, they made their way to Lake Chad and thence to Bornu, adding, in a second trip by Clapperton from Benin to the Niger, some 2000 miles of route to the known geography of West Africa. In 1826 Timbuktu was reached by Major Laing (q.v.), who was murdered there. In 1828 René Caillié reached the far-famed metropolis, and his report aroused widespread interest, one sign of which was the prize poem with which Tennyson began his public career. The doubtful geographical problem of the course and mouth of the Niger was finally solved, 1830-34, by the Lander brothers. At this time the exploration of the Nile was carried on under the auspices of Mehemet Ali, its course being traced almost to the equator. In 1847 the German missionaries Krapf and Rebmann discovered the peaks of Kilimanjaro and Kenia.

The middle of the nineteenth century marked the introduction of the distinctly scientific spirit into African exploration. Heretofore the thirst for adventure, the desire to develop a profitable trade, and a somewhat sentimental humanitarianism had been the chief motives of the expeditions. The era of systematic scientific exploration was ushered in by Dr. Heinrich Barth (q.v.), a German in the English service. The primary object of his activity was the opening of trade with Central Africa. He left Tripoli early in 1850 with James Richardson, who died soon after leaving Bornu, where the party had separated. Overweg, another of the leaders, was the first European to sail on Lake Chad, and died in 1852. Barth, for four years, conducted extensive explorations in the heart of Africa. From Lake Chad he crossed Hausland to the Niger, thence across country to Timbuktu, thence back to Say on the Niger, to Sokoto, to Kukawa in Bornu, and across the desert to Tripoli, whence he returned to England with the most valuable contribution yet made to the geographical knowledge of interior Africa. His voluminous works are of the highest value. Before

Barth started from the north, another of the greatest of African explorers, David Livingstone (q.v.), had unostentatiously begun his remarkable career. He had settled in 1841 in Bechuanaland and, gradually pushing northward, discovered Lake Ngami in 1849. In 1851 he arrived at the Zambezi. He prepared himself thoroughly for more extended work and went to the Zambezi again in 1852, followed up the river almost to its source, crossed to Angola, and then returned and followed the Zambezi to its mouth. He went to London in 1856. Burton (q.v.) and Speke (q.v.) explored Somaliland in 1854 and in 1856 led an expedition under the auspices of the Royal Geographical Society, which discovered Tanganyika and the southern shore of Victoria Nyanza, which Speke and Grant explored from 1860 to 1864. Numerous Austrian, Italian, German, and English explorers had been working in the Nile region. Sir Samuel Baker explored the Abyssinian branches of the Nile, met Speke and Grant in 1864, and discovered the Albert Nyanza and its connection with the Nile. Livingstone, between 1858 and 1864, explored the river Shire and discovered Lake Nyassa. He renewed his work in 1866, going from the Rovuma River to Nyassa, Tanganyika, Moero, the Luapula River, and Bangweolo, where he arrived in 1868. Thence he went to Tanganyika and Nyangwe on the Upper Congo, which he called the Lualaba. At Ujiji a relief expedition sent by the New York *Herald* under H. M. Stanley (q.v.) met him in 1871. Livingstone soon returned to Lake Bangweolo, where he died in 1873. Another relief expedition sent out by the Royal Geographical Society in 1873 under Lieutenant Cameron, starting at Zanzibar, learned of Livingstone's death, but went on, mapped Lake Tanganyika, found that the Lualaba was really the Congo, and reached Benguela in 1875, having crossed the continent.

While the solution of the problem of the sources of the Nile was being achieved, important accessions were made to the knowledge of the geography of western Africa. Du Chaillu explored the country back of the Gabun and the region of the Ogowe, and Burton in 1861 scaled the peak of Kamerun.

Dr. Gerhard Rohlfs (q.v.), a German serving in the foreign legion in Algeria, began to make explorations in Algeria and Morocco about 1860 and in 1866 succeeded in making the journey across the desert to the Gulf of Guinea. Another German, Dr. Nachtigal (q.v.), intrusted by the Prussian government with a mission to the Sultan of Bornu, started from Tripoli in 1868, explored the mountains in the central Sahara, and the whole of the eastern Sahara and Sudan. In 1875 Stanley circumnavigated the great lake, Victoria Nyanza, crossed to the Congo, embarked upon that river at Nyangwe in 1876, and followed its course to the Atlantic, which he reached in August, 1877. In 1882 E. C. Hore circumnavigated Lake Tanganyika, and his survey was long the basis of its map, later modified, however, by more scientific measurements. Schweinfurth (q.v.), a native of Riga, ascended the White Nile in 1868, discovered the Welle River, and returned to Egypt in 1872, having accumulated a large amount of information. Leopold II, King of the Belgians, took an active interest in the work going on in Africa and in 1876 organized the International African Association, in which most of the European countries were associated. Several geographical and scientific expeditions

were the product of this organization, and stations were opened from Zanzibar to Tanganyika. In 1879 Stanley was sent into the Congo country, supported by funds furnished chiefly by Leopold, and worked for five years in that region in the name of the association. Several thousand treaties were made with native chiefs, by which territorial rights of more or less value were acquired, and permanent posts, with regular routes of trade and travel, were established along the course of the river. The purpose was to found a state which should be a civilizing centre in the heart of Africa. For a time there was some international interest in the project; but for several years those European powers which had been active in African exploration had been looking forward to possible political results, and the institution of such a state, with a territory comprising about one-eleventh of the whole continent, seems to have been the signal for the rise of territorial claims on all sides. Interest in the international enterprise died out, and the King of the Belgians was left free to develop the Congo State into a Belgian dependency. The English hoped to make it an English possession, and the attempt of Great Britain to come to an agreement with Portugal, whose territory in the southwest touched that of the Congo State, led to the assembling in 1884 of the Berlin Conference, called to bring about an international agreement in African affairs. The results of this conference are described in a subsequent paragraph. The State was annexed to Belgium in 1908 and is now known as the Belgian Colony of the Congo (Belgian Congo).

Of the long list of African explorers up to this time only those have been mentioned whose work marked a distinct advance in the knowledge of the continent. There may be added to the number, prior to 1885, the Portuguese Serpa Pinto (1877-79), and Capello and Ivens (1884-85), who made valuable explorations in South Africa; Junker (1880-83), a traveler, whose examination of the western watershed of the Nile was of great value; Joseph Thomson (1883-84), who made thorough studies of the mountainous country between Mombasa and the lakes and likewise in West Africa and the Atlas Mountains; Wissmann (1881-82), who crossed the continent and returned through the southern side of the Congo basin; Oscar Lenz, who in 1879-87 went from Morocco to Senegambia by the way of Timbuktu, ascended the Congo, and traveled to the Zambezi by the way of Tanganyika; Brazza, who explored the country between the Ogowe and Congo; and Emil Holub, who added greatly to the knowledge of the natural history of South Africa.

Much has been done in the way of exploration since 1885, the object generally being to perfect geographical and scientific knowledge of the different regions. Of such expeditions, the best known and one of the most noteworthy was Stanley's mission, undertaken in 1887, in search of Gordon's lieutenant, the German Schnitzer, better known as Emin Pasha, who had retreated into the interior after the fall of Khartum. Stanley went up the Congo and crossed to Zanzibar. On the journey he traversed the dense and vast forest inhabited by diminutive savages, and thus confirmed ancient accounts of African Pygmies. The predominance of the British in Egypt and in South Africa, and the fact that the territory under British influence stretches with but one break (German East Africa) from the mouth

of the Nile to Cape Town, has given rise to the project of a trunk line railway "from the Cape to Cairo," a project which is likely to be carried out at no distant day, with far-reaching consequences in the development of the continent. This plan led to the crossing of the continent from south to north by Ewart S. Grogan and Arthur Sharp in 1899. This journey was productive of much valuable information regarding the country which the transcontinental line is expected to traverse in the volcanic region around Lake Kivu and on the eastern shores of Lake Albert Edward and the Upper Nile. A host of scientific investigators and explorers have in the last 20 years done useful work in various African fields. Among such, special reference should be made to Donaldson Smith in connection with explorations in Somaliland. Two notable expeditions of recent years were those of Marchand, who in 1896-98 traversed the continent from Loanga in French Congo to Fashoda on the Nile, and Foureau, whose journey in 1900 across the Sahara from Algeria to Lake Chad marked an epoch in African exploration. The Chad region and the Sahara have received the particular attention of French explorers. Between 1902 and 1904 Loeffler and Lenfant established the existence of a channel between the Shari and the Binue rivers, thus showing a possible water connection between Lake Chad and the Atlantic. Chevalier in 1902-04 explored the region south of Wadai and Darfur constituting the watershed of the Congo, the Shari, and the Nile. Between 1900 and 1904 Ch. Pierre crossed the continent, following the same general route as Marchand. The western Sahara was crossed in 1904 for the first time since Caillié's journey of 1828 by Laperrine and Théveniaut, who, setting out from Ain Salah and Timbuktu respectively, met at Timiaouine in 21° north latitude. In 1904-05 an expedition under Alexander and Gosling was active in the Chad region. In 1905 Gautier crossed the Sahara from Tuat to the Niger. Among other great explorations were those of Dr. F. Stuhlmann, who studied part of the region to the west of Victoria Nyanza late in the last century, and Dr. Hans Meyer, the first to ascend Mount Kilimanjaro. About 1890 the era of great explorations began gradually to be superseded by the present period of the detailed study of Africa's geography, peoples, and resources. The colonial powers began to give great attention to surveys and map-making. This work advanced so rapidly in nearly all the colonies that there were in 1913 good economic maps of most of them showing topographic and climatic variations, the distribution of great forests, swamps, dry areas, plains, highlands, minerals, and other export products, the development of railroads and navigation, etc. Such maps were of prime importance in the shaping of all kinds of enterprise. The intensive study of many parts of Africa had thus far revealed several large areas within the tropics where the white race might live and toil in comparative comfort. Selected white immigrants were invited to make new homes in some of these regions, as in British and German East Africa from 5500 to nearly 8000 feet above sea level and on the high plateau of Katanga in the Belgian Congo. Thousands of white settlers were then engaged in farming and mining on the plateau of southern Rhodesia. Agricultural experiment stations, supported in all the colonies, discovered many facts that helped to

develop farming on a practical basis for the supply of commodities both for home and foreign consumption. The development of railroads had been remarkable. In 1913 the great copper field of Katanga (Belgian Congo) was connected by rail with Capetown, over 2100 miles to the south; the line from Cairo extended to Senaar on the Blue Nile, and a branch had been built across the White Nile to El Obeid, the capital of Kordofan; the Belgian Congo had nearly completed the construction of railroads around all the rapids in the Upper Congo so as to connect the Congo mouth with Katanga by rail; both Victoria Nyanza and Lake Tanganyika were joined with the Indian Ocean by rail; and the Upper and Middle Niger were connected at three points with the sea by rail, the most southern of these roads extending to Kano, the leading commercial centre of the Central Sudan, passing through the great cotton area of northern Nigeria. The volume of trade relations between all the colonies and the home countries was steadily increasing. Many enterprises in Africa depend upon the development of a sufficient supply of native labor. All the colonial governments were carrying out wisely devised plans for industrial training; and the natives were selling to the whites a tremendous total of manual service and more of it every year.

The Partition of Africa. The partition of Africa among the European powers may well be dated from the Berlin Conference of 1884. Before that date, it is true, settlements and conquests had been made, but they were more scientific and commercial, as a general rule, than political, with ill-defined and uncertain boundaries, unsanctioned by international agreement. The Conference was called to determine the status of the Congo territory held in trust for civilization by the African International Association. This it accomplished by establishing the Congo Free State with the King of the Belgians at its head. (See BELGIAN CONGO.) It also defined the general spheres of influence of the powers in Africa so that the series of African boundary treaties and agreements since that date are virtually executory provisions added to the Berlin Convention. Three such treaties were concluded by Great Britain in 1890. The first of these, by far the most important, was the Anglo-Saxon agreement, signed in Berlin, July 1. It was a diplomatic stale-mate: Great Britain, by securing Uganda, thwarted the German dream of an east to west connection across the heart of Africa on German soil; Germany, on the other hand, by the extension of German Southeast Africa to the boundaries of the Belgian Congo, prevented effectually the erection of a Cape-to-Cairo railway under the British flag. The second treaty, the Anglo-French agreement, signed in London, August 5, recognized a British protectorate over Zanzibar and Pemba, a French protectorate over Madagascar, and a French sphere of influence extending from Algeria southward to a line from Say on the Niger to Lake Chad. The third treaty, the Anglo-Portuguese agreement, August 20 and November 14, determined the respective territorial rights of Great Britain and Portugal in the dark continent. Two larger problems now remained unsettled—the control of the upper valley of the Nile and of Morocco. The first of these regions, as a result of the Fashoda incident (q.v.), fell to Great Britain, the second to France. Twice since then, in 1905 and in 1911, Germany has

blocked the French program (see MOROCCO), but in 1912 the independence of that country formally came to an end, and the French protectorate was recognized. In the meanwhile, the Orange Free State and the Transvaal lost their independence in the Boer War (q.v.), Belgium annexed the Congo Free State and Italy seized Tripoli, so that Abyssinia and Liberia remain the only independent nations in Africa. The United States has made arrangements for the supervision of Liberian finance.

The partition may be summarized thus: In the northeast, Egypt, nominally under Turkish suzerainty, is really under British control, while Egypt and Great Britain exercise a joint sovereignty over the eastern Sudan. Tripoli is now Italian. Tunis and Algeria belong to France, whose influence reaches down across the Sahara to the upper waters of the Congo. On the west coast, below Morocco, lies the small Rio de Oro possession of Spain. Then come French Mauritania and Senegal, British Gambia, Portuguese Guinea, French Guinea, the British Sierra Leone, Liberia, another block of French territory, the British Gold Coast and Ashanti, German Togoland, French Dahomey, the extensive British Niger territories, and German Kamerun. Off the coast of Kamerun lies the Spanish island of Fernando Po, to which are attached some other small islands and a small district on the mainland cut out of the French Congo territory. Below the latter lies the wedge of territory owned by Portugal called Kabinda. Then comes the French Congo, followed in succession by Portuguese Angola and German Southwest Africa. The Union of South Africa is then reached, which comprises the federated British colonies of Cape of Good Hope, Natal, the Orange Free State, and the Transvaal. North of the Union of South Africa on the east coast lies Portuguese East Africa. Between it and German Southwest Africa, on the opposite or west coast, lie the British protectorate of Bechuanaland and the British colony of Rhodesia. North of Portuguese East Africa is German East Africa, which occupies the east coast north of Lake Nyassa and the Rovuma River. Still farther north is British East Africa (western portion Uganda), which touches on the north the British sphere of influence in the Sudan, Abyssinia, and, on the coast, Italian Somaliland. West of the latter on the Gulf of Aden is the British Somali Coast Protectorate, then French Somaliland, Italian Eritrea, the four territories last named shutting off Abyssinia from the coast.

The area of Africa was estimated in 1904 at about 11,500,000 square miles, inclusive of islands, and the population at about 140,000,000. The political distribution of area and population according to the latest available figures is approximately as follows:

UNDER EUROPEAN CONTROL

COUNTRY	AREA SQUARE MILES	POPULATION
British Empire.....	3,700,000*	52,325,000*
France.....	4,641,000†	29,577,000†
Germany.....	931,000	13,420,000
Portugal.....	794,000‡	8,244,000‡
Italy.....	593,000	1,579,000
Spain.....	88,000§	660,000§
Belgium (Belgian Congo).....	909,000	15,000,000

* Including Egypt and the Sudan.

† Including Madagascar.

‡ Not including Madeira and the Azores.

§ Including the Canary Islands.

INDEPENDENT STATES

Abyssinia.....	432,000	8,000,000
Liberia.....	40,000	1,800,000

See WAR IN EUROPE.

Bibliography. For general works, consult: Keane, "Africa," in Stanford's *Compendium of Geography and Travel* (London, 1895), a general treatise on the geography, ethnology, etc., of the African continent; Sievers-Hahn, *Afrika, eine allgemeine Landeskunde* (Leipzig, 1901); Reclus, *Physical Geography*, translated by Keane and Ravenstein (London, 1890-95); Lanier, *L'Afrique* (Paris, 1895); Chavanne, *Afrikas Ströme und Flüsse* (Vienna, 1883); Fischer, *Mehr Licht im dunkeln Weltteil* (Hamburg, 1885); Hartmann and others, *Der Weltteil Afrika in Einzeldarstellungen* (Leipzig, 1883-85); Johnston, *Africa* (London, 1884); Ratzel, *Völkerkunde*, vol. i (Leipzig, 1885); Junker, "Wissenschaftliche Ergebnisse von Reisen in Zentral Afrika," in *Petermann's Mitteilungen, Ergänzungsheft*, vol. xx (Gotha, 1888).

For history and colonization, see Graham, *Roman Africa* (London, 1902); Brown, *The Story of Africa and its Explorers* (London, 1892-95); Roskoschny, *Europas Kolonien*, vols. i-iv (Leipzig, 1885-86); Keltie, *The Partition of Africa* (London, 1895); Johnston, *History of the Colonization of Africa by Alien Races* (Cambridge, 1899); Peters, *Das deutsch-ostafrikanische Schutzgebiet* (Munich, 1895); "British Africa," in *British Empire Series* (London, 1899); Herbertson, *Africa* (London, 1902); Leclercq, *L'Afrique chrétienne* (Paris, 1904).

Ethnology and archæology: Keane, *Ethnology* (Cambridge, 1896); Deniker, *Races of Man* (London, 1900); Edwards, *A Thousand Miles up the Nile* (London, 1891); Hartmann, *Die Völker Afrikas* (Leipzig, 1879); *Natives of South Africa, their Economic and Social Condition*, edited by South African Native Races Committee (London, 1901).

On the flora of Africa, consult: Engler, *Ueber die Hochgebirgs-Flora des tropischen Afrikas* (Berlin, 1892); Sim, *The Ferns of South Africa* (Cape Town, 1892); *Catalogue of African Plants Collected by Friedrich Welwitsch in 1853-61* (London, 1896-1901); Steiner, "Flechten aus Britisch Ostafrika," in *Kais. Akad. d. Wissenschaften, Sitzungsbericht der mathematisch-naturwissenschaftlichen Klasse*, vol. cvi, part i (Vienna, 1897); Oschatz, *Anordnung der Vegetation in Afrika* (Erlangen, 1900). On the fauna, consult: Smith, *Illustrations of the Zoölogy of South Africa* (5 vols., London, 1849), which includes mammals, birds, reptiles, fishes, and invertebrates; Drummond, *Large Game and Natural History of South and East Africa* (Edinburgh, 1875); Kolbe, *Beitrag zur Zoogeographie West Afrikas* (Halle, 1887); Trimen, *South African Butterflies* (3 vols., London, 1887-89); Distant, *A Naturalist in the Transvaal* (London, 1892); Kingsley, *Travels in West Africa* (London, 1897), which contains Dr. Gunther's report on reptiles and fishes and Kirby's report on the Orthoptera, Hymenoptera, and Hemiptera collected by Miss Kingsley; Sturnay, "Katalog der bisher bekannt gewordenen süd-afrikanischen Land- und Süßwasser-Molusken," in *Kais. Akad. der Wissenschaften. Mathematisch-naturwissenschaftliche Denkschriften*, vol. lxxvii (Vienna, 1899). Valuable works on the African climate are: Hann, *Handbuch der Klimatologie* (Stuttgart, 1897); id., "Atlas der Meteorologie,"

in Berghaus, *Physikalischer Atlas* (Gotha, 1888); Ravenstein, "The Climatology of Africa," in *Reports of the British Association for the Advancement of Science for 1897 and 1899* (London, 1898, 1900); Bartholomew, *Physical Atlas*, volume on "Meteorology" (London, 1901). The volumes of the *Zeitschrift der oesterreichischen Gesellschaft für Meteorologie* (Vienna, 1866-85) and of the *Meteorologische Zeitschrift* (Berlin, 1884 et seq.) contain many reports of meteorological observations made at places in all parts of Africa.

On geology, consult: Neumayr, *Erdgeschichte* (Leipzig, 1885-87); Suess, *Das Antlitz der Erde* (Leipzig, 1888-1901); Chavanne, *Afrika im Lichte unserer Tage: Bodengestalt und geologischer Bau* (Vienna, 1881); Thomson, "Notes on the Geology of East Central Africa," in *To the Central African Lakes* (London, 1881); Mouille, *Mémoire sur la géologie générale et sur les mines de diamants de l'Afrique du Sud* (Paris, 1885); Schenck, "Geologische Skizze von Süd Afrika," in *Petermann's Mitteilungen*, Tafel 13 (Gotha, 1888); Blanckenhorn, "Die geognostischen Verhältnisse von Afrika," in *Petermann's Mitteilungen, Ergänzungsheft*, vol. xx (Gotha, 1888); Höhnel, Rosiwal, Toula, and Suess, *Beiträge zur geologischen Kenntnis des östlichen Afrika* (Vienna, 1891); Scott and Gregory, "The Geology of Mount Ruwenzori and Some Adjoining Regions of Equatorial Africa," in *Quarterly Journal of the Geological Society*, vol. li (London, 1895); Moolengraff, "Die Reihenfolge und Correlation der geologischen Formationen in Süd Afrika," in *Neues Jahrbuch für Mineralogie* (Stuttgart, 1900).

Among the numerous books dealing with African travel and exploration, may be mentioned: Burton, *First Footsteps in East Africa* (London, 1856); Livingstone, *Missionary Travels and Researches in South Africa* (New York, 1858); id., *Narrative of an Expedition to the Zambesi and its Tributaries, and the Discovery of the Lakes Shirwa and Nyassa, 1858-64* (London, 1865); Rohlf's, *Quer durch Afrika* (Leipzig, 1874-75), a journey from the Mediterranean Sea to Lake Chad and to the Gulf of Guinea; Cameron, *Across Africa* (New York, 1877), a journal of a journey from Zanzibar to Benguela, and a valuable record of the habits of the natives; Stanley, *Through the Dark Continent* (New York, 1878); Holub, *Seven Years in South Africa*, translated by Frewer (London, 1881); Pinto, *How I Crossed Africa*, translated by Elwes (Philadelphia, 1881); Drummond, *Tropical Africa* (New York, 1888); Junker, *Reisen in Afrika* (Vienna, 1889-91), translated by Keane (London, 1890-92); Stanley, *In Darkest Africa* (New York, 1890), an account of the quest, rescue, and retreat of Emin Pasha; Casati, *Ten Years in Equatoria*, translated by Clay and Landor (London, 1891); Peters, *New Light on Dark Africa*, translated by Dulchen (London, 1891), the narrative of the German Emin Pasha expedition; Johnston, *Livingstone and the Exploration of Central Africa* (London, 1891); Bryce, *Impressions of South Africa* (New York, 1897); Foureau, *De l'Alger au Congo par le Tchad* (Paris, 1902); Lenfant, *Le Niger* (Paris, 1903); id., *La grande route de Tchad* (Paris, 1904); Pierre, *Du Stanley-Pool à Khartum* (Paris, 1904); Gibbons, *Africa from South to North through Marotsland* (London, 1904); Colquhoun, *The Africander Land* (London, 1906). For archæology, see EGYPT, CYRENE, ZIMBABWE, etc.

AFRICAINNE, L', là'frè'kàn' (Fr. The African). A French opera by Giacomo Meyerbeer (q.v.). The words are by Scribe, and it was produced in Paris, April 28, 1865, a year after the composer's death.

AF'RICAN'DER. See AFRIKANDER.

AF'RICAN HAIR. See CHAMÆROPS.

AFRICAN IN'TERNA'TIONAL ASSO'CI-A'TION. In 1876 the King of Belgium called a conference at Brussels of geographers and explorers to consider means for the opening up of Africa to civilization, and there the African International Association was formed, with the object of establishing stations for scientific purposes in eastern Africa. When H. M. Stanley in 1877 revealed the magnitude and importance of the fertile Congo basin, a second conference was assembled at Brussels, at which the African International Association made plans which extended its field of operation over the newly explored territory. But the greed of the different nations, awakened by the dazzling territorial and commercial prospects the Congo basin afforded, brought about endless disputes, until at length it was decided, by the mutual consent of all the great powers, including the United States, to leave the final adjustment of the difficulties to an international conference in Berlin. The conference opened at Berlin, Nov. 17, 1884, with Prince Bismarck in the chair, and ended its labors Feb. 26, 1885. Fifteen States were represented. As a result of mutual compromises, it was declared that the immense regions forming the basin of the Congo River and its tributaries shall be neutral territory, that perfectly free trade shall exist there, that citizens of any country may undertake every species of transportation within its limits, that the powers exercising sovereign rights over neighboring territory are forbidden to exercise monopolies or favors of any kind in regard to trade, and that they shall bind themselves to suppress slavery. The King of Belgium was made sovereign of the new State. See AFRICA; BELGIAN CONGO; STANLEY, H. M.

AFRICAN LAN'GUAGES. Of the numerous classifications of African languages, that which best represents our present knowledge is the following:

1. **Semitic.** Arabic; the Abyssinian languages derived from Geez (the so-called Ethiopic), i.e., Tigré, Tigriña, Amharic, Harari, Gurague. The languages comprised in this division were brought into Africa by Semitic immigrants or invaders.

2. **Hamitic.** Libyan dialects; ancient Egyptian (whence Coptic, now extinct), Bishari (Beja, Bedaue), Saho, Afar, various Agau dialects of Abyssinia (Chamir, Quara, etc.), and of the highlands south of it (Kaffa, Kullo, etc.), Galla, and Somali, Haussa in the west of the Sudan. Quite recently Meinhof has included Ful, Masai, and Hottentot among the Hamitic tongues, but the theory has not yet been under fire for a sufficiently long time to estimate its value. So far as the Hottentot is concerned, it is certainly not convincing, though Von Luschan has tried to prop it up with cultural evidence, such as the pastoral life of both Hottentot and Hamitic tribes.

3. **Hottentot.** For the reasons given above, this language must for the present be considered distinct from the Hamitic stock, the most significant trait shared with members of that family being the category of sex gender. Im-

portant as this feature is, it hardly suffices to establish genetic relationship even of a remote kind.

4. **Bushman.** As there is no anthropological, so there is practically no linguistic, justification for uniting Bushman and Hottentot in a single group. One reason for so classifying them has been a phonetic one. Both Bushmen and Hottentot use "clicks" as normal elements of speech combined in the same words with other elements, while we employ clicks only as interjections, in urging on horses, expressing anger, sympathy, etc. It is a fact, however, established by North American data, that phonetic peculiarities do not necessarily coincide with linguistic boundaries. Some African scholars have suggested that the clicks were originally peculiar to the Bushman language and adopted by the Hottentot. Indeed, such a process of borrowing has almost certainly occurred in some South African Bantu dialects, notably Zulu, which also employ clicks, though these are lacking in the majority of Bantu languages.

5. **The Bantu Family,** which embraces, roughly speaking, all Africa south of the equator. A characteristic type is represented by the language of the Zulu Kaffirs and their nearest relatives. To what extent corrupt Bantu dialects are spoken on the western coast has not yet been determined.

6. **The Sudanese Family.** North of the Bantu-speaking Negroes and south of the Hamitic and Semitic tribes of North Africa there dwell Negroes whose speech showed until recently a bewildering number of distinct languages, even within relatively narrow territories. This diversity stood in marked contrast to the uniformity of language in the Bantu area. Quite recently, however, Westermann has advanced the important theory that many of these supposedly distinct tongues, including some of the eastern as well as the western Sudan, were related and might thus be classed together as the Sudanese family. Among the traits common to all, the monosyllabic character of the root words is laid stress upon. It cannot be said that this theory, however valuable and suggestive in bringing order into what was once chaos, has already been definitely established. It represents, however, the latest thought of one of the best of African linguists and has secured the support of so eminent an ethnographer as Professor von Luschan (in Buschan's *Illustrierte Völkerkunde*, art. "Afrika").

The line of demarcation between the Sudanese and Bantu has not yet been accurately determined throughout its entire course. It certainly passes through the Kamerun, within which both Bantu and Sudanese populations are found, and through the northeasternmost part of the Congo. A tentative linguistic map has been published by Westermann. See BIBLIOGRAPHY.

The Malagasy language, spoken on the island of Madagascar, belongs to the Malay family of speech. By reason of its geographical position it need not be considered here.

Writing. The use of writing and the necessity for it imply a degree of civilization to which the majority of the inhabitants of Africa have never risen. It is, therefore, almost exclusively the white race, represented by the Hamites and the Semitic immigrants, which comes into consideration here.

Semitic. In the Semitic family we have the Phœnician alphabet, used by the Carthaginians

along the northern coast. The Punic and later Neo-Punic characters were modifications of the Phœnician and are distinguished by special characteristics. The Arabic character is now used wherever Islam has become the prevailing religion; but it is mainly employed for writing the Arabic language, which forms the general medium of religion, commerce, and social intercourse. The use of the Arabic character for African languages is not very frequent (e.g., among the Berbers, the Suahelis). The Malayan immigrants, however, and the Mohammedan Kaffirs use it as far south as Cape Colony; and the Mohammedans of Shoa as well as the inhabitants — also Mohammedans — of Harrar sometimes write their respective languages, Amharic and the closely related Harrari, in Arabic letters. On the other hand, in and around Abyssinia a number of languages are regularly written in the Amharic modification, or rather amplification, of the old Ethiopic or Geez alphabet. Unlike most of the other Semitic languages, Ethiopic and its modern descendants are written from left to right. The vowels are expressed graphically by modifications of or slight additions to the consonants, thus forming a kind of syllabary. We can trace this peculiar system of writing as far back as the fourth century A.D., through some ancient monuments in the old capital of Axum (consult D. H. Müller, *Epigraphische Denkmäler aus Abessinien*, 1894). The development of those peculiarities took place on African soil, though the consonantal characters are derived from the old South Arabian writing (wrongly called Himyaritic). See ETHIOPIC WRITING.

Ancient Egyptian. From the Egyptian hieroglyphic writing was developed a cursive form, the Hieratic, and this in turn gave rise to the still more cursive Demotic. All these have long since passed out of use, though Coptic, which survives only as the ritual language of the native Egyptian church, retains in its alphabet a few characters derived from the Demotic.

Ethiopian. The ancient Ethiopians of Napata and Meroë had, beside the Egyptian systems of writing, which they used almost exclusively for the Egyptian language, a cursive system of their own for the native idiom. As the few inscriptions in this character which have been preserved have not yet been deciphered, it is not possible to say anything positive about it. It is even doubtful what language these inscriptions represent, although it is perhaps nearer to the (negroid) Nuba than to the Hamitic Beja or Bishari. The alphabet was evidently borrowed from outside sources, though whether Egyptian or South-Arabian elements underlie it cannot at present be determined.

Libyan or Numidian. The old Libyan or Numidian writing, a very imperfect system, goes back to the ancient alphabet of South Arabia (as Euting has clearly shown), and not to Punic. It is represented by many inscriptions in Algeria and Tunis. The first decipherment, on the basis of the famous bilingual inscription of Tukka, is due to Blau (see also Halévy, *Essai d'épigraphie Libyque*, 1875, a collection by Faidherbe, 1870, etc.). It is worthy of note that the ancient funeral inscriptions in this character read from below upward. This system is similar to the *tifinaghen* or alphabet of the modern Sahara tribes (or Tuaregs). Oudney is said to have been the first who observed and called attention to their peculiar system of writing

(1822). The best description of the alphabet is to be found in Hanoteau, *Grammaire de la langue Tamachek* (1860).

Negro. Only one Negro language has developed a writing of its own, the Vei, on the west coast near Cape Mount. Doalu Bukere, a native who knew something of the Roman character, invented it about the year 1834. The writing was afterward used for Mohammedan missionary work. It is a clumsy syllabary with complicated forms sometimes suggestive of hieroglyphics, and quite distinct from European or Arabic writing. A number of books have been written in it, but the Christian missionaries have declined to use it, and it is dying out. It has received considerable attention from linguists, as the only case known in which the actual invention of a system of writing, in popular use, can be clearly shown. The idea, however, was certainly borrowed from the Europeans. Consult Steinthal, *Die Mandé-Neger-Sprachen* (Berlin, 1867).

Bibliography. For the classification of languages, the highest modern authorities are Meinhof and Westermann, whose most significant results have appeared in the *Veröffentlichungen des Hamburgischen Kolonialinstituts*; the reviews, and some of the articles, in the periodical *Anthropos* (St. Mödling, Austria) will also prove helpful. The older standard works are: F. Müller, *Grundriss der Sprachwissenschaft* (Vienna, 1876-88), also his *Ethnographie* (2d ed., Vienna, 1870); also Cust, *A Sketch of the Modern Languages of Africa* (London, 1883), which is based on these works. Lepsius, *Nubische Grammatik* (Berlin, 1880), presents somewhat different views. Consult also Lepsius, *Standard Alphabet* (London, 1863). As preparatory works may be mentioned: Koelle, *Polyglotta Africana* (London, 1854); Bleek, *Comparative Grammar of South African Languages* (London, 1862-69); *The Library of Sir G. Grey* (London, 1858-63).

In recent years it has become more and more customary to record the myths, tales, proverbs—in other words, what had formerly been the unwritten literature of primitive tribes—in the original by means of phonetic writing. Of the numerous African publications of this sort only a few can be here referred to. Callaway's Zulu works form a pioneer effort for the Bantu tongues. Spieth's *Die Ewe* is perhaps the most noteworthy collection of Sudanese texts. A splendid series of Hottentot fables and other tales will be found in Schultze's *Aus Namaland und Kalahari*; and some of Bleek's long-delayed Bushman material, revised by Miss Lloyd, has at last appeared in book form. Hollis's *The Masai* represents the possibly Hamitic tribes of East Africa.

AFRICAN METH'ODIST EPIS'COPAL CHURCH. See METHODISM.

AFRICAN METH'ODIST EPIS'COPAL ZI'ON CHURCH. See METHODISM.

AFRICAN MIL'LET. See SORGHUM, NON-SACCHARINE.

AFRICAN OAK. See TEAK.

AF'RICA'NUS. An *agnomen* (q.v.) borne by two of the Scipios. See SCIPIO.

AFRICANUS, SEXTUS JULIUS. A Christian writer. He was born in Libya, and made his home in Emmaus, near Jerusalem, from 195 on till after 240, but traveled extensively through Asia Minor. He is remembered for his chronology from the creation to 221, of which frag-

ments are preserved. These and portions of other writings are printed in Migne, *Patrologia Græca*, x, 51-108, xi, 41-48; Eng. trans., *Ante-Nicene Fathers* (New York ed.), vi, 123-140.

AF'RICAN WAR, THE. In Roman history, the war between Julius Cæsar and the members of the Pompeian party who, after the battle of Pharsalia, renewed the conflict in Africa and were defeated at Thapsus, 46 B.C. The account known as the *Bellum Africanum* attached to the works of Cæsar is of uncertain authorship.

AFRIDI, à-fré'dê. See INDIA, *History*.

AFRIDIS, à-fré'dêz. One of the Afghan or Pathan peoples of the Indo-Afghan border who have of recent years come into hostile contact with the British authorities. In their somewhat savage yet intelligent semi-independence they represent, perhaps, ancient Aryan society of an early type. A brief account of them by Holdich appeared in the *Journal of the Anthropological Institute* (London) for 1899; see also the same author's *The Indian Borderland* (London, 1901).

AF'RIKAN'DER. The Dutch form for "African," used of white persons born in South Africa, especially the Boers.

AFRIKANDER BUND, bunt, or BOND. An association in South Africa designed to consolidate Afrikaner influence and eventually to form an independent union of the South African States. With its present name it dates from 1880. As a political party in Cape Colony it for a time supported the policy of Cecil Rhodes, but after the Jameson raid (1895) it separated itself from him. In 1898 it secured a majority in the colonial legislature. While it urged President Kruger to a more liberal policy, it favored the Boers in the war with Great Britain. On Dec. 6, 1900, an Afrikaner congress was held at Worcester, Cape Colony, which demanded Boer independence and condemned the war. After the war (December, 1902), the Bund was reorganized to further the federation of the South African colonies under the British crown, and became largely identified with the South African party, which represented the interests of the Afrikanders without assuming an exclusively Dutch character.

AFRITE, àf'rêt. A powerful spirit, or jinn (Lat. *genius*), figuring in the stories of *A Thousand and One Nights*.

AF'TER-GLOW'. See TWILIGHT.

AF'TER-IM'AGES. Retinal images which appear after the eye has been removed from some illuminated object. When we light our lamp in the evening, we are distinctly conscious that the illumination has a reddish-yellow tinge. As time goes on, however, we lose the color; the paper on which we write seems to be as white as the same paper seen in diffuse daylight; our eyes have become adapted, or have grown used, to their surroundings (*general adaptation*). The law of adaptation is that all brightnesses tend toward a middle gray, and all colors toward neutrality. Adaptation leaves an after-effect, which is termed *disposition*. A yellow-adapted eye is disposed to the complementary color, or blue-sighted: all the yellows that it sees tend toward gray, and all other colors take on a tinge of the complementary blue. See CONTRAST; VISUAL SENSATION.

Adaptation may be *local*, as well as general. Suppose, e.g., that I fixate steadily a green disk seen upon an extended white background. The part of the retina upon which the green falls will become green-adapted, and therefore red-

disposed or red-sighted. Hence, if I presently remove the green disk, I shall see a subjective red disk in its place. This red, the after-effect of local adaptation, is termed (1) the *negative after-image*. The color and brightness of the after-image are always complementary to the color and brightness of the preceding stimulus; a dark-blue stimulus gives a bright yellow after-image, and a bright yellow stimulus a dark-blue after-image. If one stares for half a minute at a window that gives upon a bright gray sky or a snowy landscape, and then turns one's eyes upon a gray screen or wall, one sees an after-image window with white bars and black panes. In general, the vividness and duration of the negative after-image depend upon the intensity and duration of the stimulus which evokes it and on the brightness of the surface upon which the after-image is projected for observation. It is probable, although the point is still disputed, that the course of the after-image is intermittent, not continuous. Theoretically important is the fact that a contrast-color (see CONTRAST) set up in the neighborhood of the stimulus is effective in the after-image; thus, a disk of red paper seen on a gray background, and giving a narrow green ring of marginal contrast, appears in the after-image as a green disk surrounded by a distinct reddish halo. (2) If the original stimulus be very strong and of brief duration, it may give rise to what has been called the *positive after-image*, a subjective phenomenon in which the stimulus-sensation is reproduced, only with diminished brightness and saturation. (See VISUAL SENSATION.) Thus, a flash of brilliant red light would be followed, first, by a brief but noticeable blank interval; then by the positive after-image, a duller and pinker red; then by a second interval, somewhat longer than the first; and, finally, by the dark-green negative image. The usual explanation of this positive image is that the physiological effect of stimulation persists for some time after the physical stimulus itself has ceased to operate; the sensation, therefore, outlasts the stimulus, remaining the same in kind throughout its course. This account is, however, as inadequate as is the theory which would account for the negative after-image on the score of retinal fatigue. It is disproved by the single fact that the short interval which elapses between stimulus and positive image (the first interval described above as "blank") may, under certain circumstances, be filled by a *positive and complementary image*. Thus, if a glowing red point be moved slowly to and fro in the dark, one sees first a trail of red light (due to the stimulus and its direct after-effect), and then a bright (positive) green streak. Then should follow, if the series is complete, the positive image proper, a dull red, the second blank interval, and the negative green image. The dull red is, evidently, not a direct continuation of the red of the stimulus. No satisfactory theory is as yet forthcoming.

Especial interest attaches to the colored images obtained from intensive stimulation with white light. Close your eyes and keep them closed until there is no trace of previous stimulation (no colored after-image) on the dark field. Then fixate for some 20 seconds the middle bar of a window which looks out upon a brilliantly white sky. Close your eyes again, and note the development of the after-image on the dark field. You see a color sequence, which

is known technically as the *flight of colors*. The current explanation of the phenomenon is that the white light of the sky is broken up into its physical components, in somewhat the same way as a ray of light passing through a prism is broken up into the series of spectral colors; and that the retinal excitations corresponding to the red, green, and violet stimuli (the part-stimuli contained in the white light) are not exactly coincident, but overlap in time, so that now the one and now the other shows itself in the after-image. It is, however, noteworthy that the flight of colors, under conditions of exact observation, shows unmistakable evidence of two overlapping complementary series. The sequence is: a momentary positive image; then, after fluctuations, a blue, a green, a yellow, a red (at this stage the image becomes negative), a blue, and a green image. We have, that is, the series blue-yellow-blue and the series green-red-green laid over one another; there is clear indication of antagonism or complementarism, but none of a general breaking up of the white light into its spectral components. We must remember, also, that "white" light is never quite colorless; there is always some tinge of color in diffuse daylight. The facts point to the validity of an "antagonistic" theory of visual sensation (q.v.). (3) We may note, finally, the existence of a *binocular* or transferred after-image. If one eye be stimulated, under suitable conditions, a faint, positive image appears in the field of the other, unstimulated eye. Lay a bright red-orange disk upon a sheet of white paper and fixate it monocularly for 5 or 10 seconds. Then blow away the disk, close the stimulated eye, open the unstimulated one and fixate the white ground. You see at first a pale-yellowish image. Then the field darkens and a blue negative image makes its appearance. Presently the ground clears and the yellowish patch comes once more. Then the white darkens again and the blue image recurs. The darkening is due to retinal rivalry: the dark field of the closed (stimulated) eye is superposed upon the bright field of the open (unstimulated) eye. The blue image is the negative after-image belonging to the dark field, i.e., to the originally stimulated eye; its appearance requires no explanation. On the other hand, the faint yellowish image belongs to the unstimulated eye, is an after-effect of the orange stimulation, but an after-effect that differs entirely from the after-effect in the stimulated eye, and that has been transferred to the eye which was not exposed to the stimulus. Its existence points to a close functional inter-relation between the two halves of the visual apparatus. Consult H. von Helmholtz, *Physiologische Optik* (Hamburg, 1909-11); E. Hering, *Zur Lehre vom Lichtsinne* (Vienna, 1878); O. Kuelpe, *Outlines of Psychology* (London, 1909); E. B. Titchener, *Experimental Psychology* (New York, 1901).

AFZE'LIUS, *Sw. pron.* áf-sā'li-us, ADAM (1750-1837). A distinguished Swedish botanist who resigned the chair of Oriental languages at the University of Upsala to pursue the work that was more congenial to him. After some years spent in arduous study, he founded the Linnæan Institute at Upsala (1802) and later wrote the standard biography of Linnæus (1823).

AFZELIUS, ARVID AUGUST (1785-1871). A Swedish poet and antiquary. He translated the *Elder Edda* (see EDDA), and, with Geijer, edited a noteworthy collection of old Swedish popular

songs (1814-17). He is esteemed for his poetical *Romances* and for his studies in Norse history and literature, writing a history of Sweden to the time of Charles XII.

AGADES, ä'gä-dez. An African city, the capital of the oasis kingdom of Air (q.v.), situated in lat. 16° 30' N. and long. 8° E. (Map: Africa, E 3). It is built on the edge of a plateau about half a mile high and was formerly an important stronghold with a population estimated at 50,000. Although still on the caravan route between Sokoto and the Barbary States, its commercial importance has disappeared, and its population has dwindled to about 7000.

AGADIR, ä'gädēr'. A seaport in the southern part of Morocco, North Africa, situated in lat. 30° 27' N. and long. 9° 36' W. (Map: Africa, D 1). It was founded in the beginning of the sixteenth century by the Portuguese, but was soon taken by Morocco and for a considerable period was an important shipping centre because of its location at the mouth of the Sus River. It is now closed to commerce, and is used as a customs station on the caravan route connecting the northern and southern parts of Morocco. It became the object of international attention in 1911, when Germany announced that the gunboat *Panther* had been sent to the port of Agadir for the protection of German interests. For an account of the crisis that followed between the German and French governments, see MOROCCO, *History*. Its population is about 1000.

A'GAG (Heb., Gk. 'Αγάγ, in the Septuagint). 1. The name, or possibly title, of a king of the Amalekites conquered by Saul, and preserved alive contrary to the command of Jehovah. He was afterward hewn in pieces by Samuel. (See 1 Sam. xv.) 2. In Dryden's *Absalom and Achitophel*, a character standing for Sir Edmund Berry Godfrey, the justice of the peace who was assassinated shortly after disclosing the revelations made to him by Titus Oates.

A'GAGITE. A name applied to Haman (Esther iii. 1, 10; viii. 3). It is a term of contempt, designating him as a worthy descendant of Agag, the Amalekite whom Samuel hewed to pieces as a sacrifice to Yahwe at Gilgal (1 Sam. xv. 33). This "Amalekite" is opposed to Mordecai, a descendant of Kish, the father of Saul (Esther ii. 5). The Greek translator understood that this was a mere fiction setting forth the struggle between Jew and Gentile, when he rendered the term "Macedonian."

AGALACTIA, äg'ä-läk'shī-ä (Gk. want of milk, from *á*, *a*, priv. + *γάλα*, *gala*, milk). A deficiency, either of quantity or quality, in the secretion of milk after delivery. It may be due to exhausting diseases such as pulmonary tuberculosis or syphilis; to severe hemorrhage, emotional disturbances, or a poor diet. Syphilitic or phthisical mothers should not nurse their infants, for obvious reasons. The secretion of milk may often be encouraged by a generous diet, including an abundance of milk and cream. Malt liquors (porter, stout) in small quantities are popular galactagogues. Drugs are of little or no value. (See MILK.) Agalactia is a contagious disease in sheep and goats, characterized by inflammatory foci in the mammary gland, eyes, and articulations. The disease has been known since 1816 and is especially frequent in Italy, France, and Spain. In the acute form there is high fever accompanied by complete, or almost complete, failure of milk. Death

takes place after 20 days in about 15 per cent of cases.

AG'ALMAT'OLITE. A hydrated aluminum and potassium silicate of variable composition corresponding to the minerals pinite, pyrophyllite, and talc, (q.v.). It occurs massive, and in color is gray, to green and yellow, brown and red. It is regarded as an alteration product of iolite, and is found in Transylvania, in Saxony, and especially in China, where, owing to its softness, it is carved into images and various ornamental designs, in which advantage is taken of the different shades to bring out special portions in different colors.

AG'AMA (Caribbean name). A genus of more than 40 insectivorous ground-lizards allied to the iguanas, and confined to the warm climates of Africa, Australia, Asia, and southern Russia. The handsome armed agama, or toque (*Agama armata*) of South Africa is strikingly adorned and reaches 20 inches in length. Another very brilliant species is the spiny *Agama colonorum* of the Gold Coast. One of those of southeastern Europe best known is the stellio (*Agama stellio*), which is commonly tamed and kept in captivity by Arabic jugglers in Egypt, who call it *hardun*. This little reptile has the habit of running a short distance, stopping suddenly and solemnly nodding its head up and down several times. Mohammedans look upon this as a conscious travesty on their devotional attitudes and often kill the lizard on sight.

AGAMEDES, äg'ä-mē'dēz. See TROPHONIUS.

AG'AMEM'NON (Gk. 'Αγαμέμνων). Son of Atreus and brother of Menelaus. Agamemnon is a prominent figure in Greek heroic legend, though the details of his story differ. He ruled at Mycenæ and exercised lordship over much of the Peloponnesus. Therefore, when Paris carried off Helen (q.v.), the wife of Menelaus, Agamemnon was the natural leader of the expedition made against Troy to recover her. His quarrel with Achilles (q.v.) is the starting-point of the *Iliad*. Later writers told of the sacrifice of his daughter Iphigenia (q.v.) at Aulis to secure favorable winds for the voyage to Troy. In his share of the booty of Troy he received the prophetess Cassandra (q.v.), daughter of Priam. On his return to Mycenæ he was murdered by his wife Clytemnestra (q.v.) and her paramour, Ægisthus (q.v.). His son, Orestes (q.v.), aided by his daughter Electra, subsequently avenged his father. This tragedy of the house of Atreus was a favorite subject of the Greek dramatists. Consult especially the play of Æschylus (q.v.) called the *Agamemnon*, the first play of the trilogy commonly known as the Oresteia.

AG'AMEN'TICUS, MOUNT. A hill in York Co., Me., 4 miles from the coast, and the summit 673 feet above sea level. It lies in lat. 43° 13' 25" N. and long. 70° 41' 33" W. (Map: Maine, B 5) and is a noted landmark for sailors.

AG'AMOGEN'ESIS. See PARTHENOGENESIS, *Metagensis*.

AGAÑA, ä-gän'yä, or SAN IGNACIO DE AGAÑA, sän äg-nä'tē-ō dä ä-gän'yä. The capital of Guam (q.v.), one of the Ladrões, belonging to the United States (Map: Guam, U. S. and Dep. Ter., B 3). It is situated on the western coast of the island on Agaña Bay. It has wide, clean streets, and is traversed by a shallow stream crossed by two stone bridges. The bay is unsafe and the landing is obstructed by reefs. The town contains an arsenal, barracks,

churches, schools, and a college. During the Spanish régime in the Philippines it was the seat of government for the Ladrones. Pop., about 7000.

AG'ANIP'PE (Gk. Ἀγανίπη, *Aganippē*). A fountain in Bœotia, near Mount Helicon, which flowed to the river Permessus. The water was sacred to the Muses and was supposed to give poetic inspiration.

AGAO, á-gä'ô. See AGAU.

AG'APÆ (Gk. nom. pl. of ἀγάπη, *agapē*, love-feast). Love feasts, or feasts of charity, usually celebrated by the earliest Christians in connection with the Lord's Supper. The rich Christians presented their poorer brethren in the faith with gifts, and all ate together, in token of their equality before God and their brotherly harmony. The meetings were opened and closed with prayer, and during the feast spiritual songs were sung. At first a bishop or presbyter presided, who read a portion of the Scripture, proposed questions upon it, and received the various answers of the brethren. Afterward whatever information had been obtained regarding the other churches was read—such as the official letters of overseers, or private communications from eminent members; and thus a spirit of practical sympathy was engendered. Before the conclusion of the proceedings money was collected for widows, orphans, the poor, prisoners, and those who had suffered shipwreck. Then the members gave one another the holy kiss, and the feast was ended with a "philanthropic prayer." Generally the feast of the agape preceded the celebration of the Lord's Supper, but during the period of the persecutions, when the Christians had often to hold divine service before dawn, the agapæ were, for the most part, delayed till the evening. Later, a formal separation was made between the two rites. In the third and fourth centuries the agape had degenerated into a common banquet, where the deaths of relatives and the anniversaries of the martyrs were commemorated and where the clergy and the poor were guests; but with the increase of wealth and the decay of religious earnestness and purity in the Christian Church, these agapæ became occasions of great riotousness and debauchery. Councils declared against them, forbade the clergy to take any share in their celebration, and finally banished them from the Church. At the same time it must be admitted that the heathen ignorantly calumniated the practices of the Christians in these agapæ, and that the defense made by Tertullian, Minucius Felix, Origen, etc., is eminently convincing. In the present Moravian church, love feasts are held on various occasions, differing somewhat in different congregations. They are religious services of praise and prayer, accompanied by a small portion of food and drink, the whole expressive, as were the ancient agapæ, of brotherly love in the membership of the congregation. See LOVE FEASTS.

AGAPEMONE, äg'ä-pēm'ô-nē (modern compound from Gk. ἀγάπη, *agapē*, love + μονή, *monē*, a staying, stopping-place). A conventual establishment of a singular kind, consisting of persons of both sexes, founded at Charlynch, near Bridgewater, England, by Mr. Henry James Prince, formerly a clergyman of the Church of England. The inmates belong to a religious sect originating with Mr. Prince and a Mr. Starkey, also a clergyman, and are sometimes called Lam-

peter Brethren, from the place where Prince was educated and where he formed a revival society. Community of goods being insisted upon, the leaders acquired considerable property, and fitted up in luxurious style a dwelling near Charlynch. Prince, who was styled "The Lord," affirmed in his publications that he was sinless and was sent to redeem the body, "to conclude the day of grace, and to introduce the day of judgment." See Hepworth Dixon, *Spiritual Wives* (London, 1868), and the article by Miss Edith Sellers in *The Newbery House Magazine* (London, November, 1891), reprinted in *Magazine of Christian Literature* (New York, December, 1891).

A society similar in its aims and character, though not conventual in its form, existed in England in the sixteenth and seventeenth centuries. It was called "The Family of Love." Its founder is generally supposed to have been Heinrich Nikolaus, who was born at Münster, in Westphalia, Jan. 9 or 10, 1501 or 1502, but who lived a considerable time in Holland. He held himself to be greater than Moses or Christ, for the former only taught men to *hope*, and the latter to *believe*, while he first announced the doctrine of *love*. He founded his sect, "The House of Love" or "The Family of Love," in Emden, East Friesland, about 1540 and died in 1570. In the reign of Edward VI the sect appeared in England. By 1578 they had apparently increased in numbers considerably, for in that year one John Rogers published a work against them, entitled *The Displaying of an Horrible Secte of Grosse and Wicked Heretiques, naming themselves the Familie of Love, with the Lives of their Authors, and what Doctrine they teach in Corners* (2d ed., 1579). In 1580 Queen Elizabeth issued a proclamation for the hunting out and punishing of the "damnable sect." The family of love—"or lust, rather," as old Fuller has it—tried to insinuate themselves into the good graces of King James by presenting a petition casting aspersions on the Puritans. It had a brief prosperity, and was revived in the seventeenth century, but quickly died. Its name in New England in the seventeenth century was applied to some dissenters, but there is no evidence that there were any Familists there. Their doctrines seem to have been a species of pseudo-spiritual sentimentalism resulting in gross impurity. Consult Thomas, *The Family of Love*, "Haverford College Studies," No. 12 (Boston, 1893). See MUCKERS.

AG'APE'TÆ (fem. form of *Agapeti*). Early Christian virgins who lived, generally in all purity, in the same house with men bound to strict celibacy. See AGAPETI.

AG'APE'TI (nom. pl. of Gk. ἀγαπητός, *agapētos*, beloved). Early Christian men who lived in the same house with deaconesses, both being celibates. The growth of ascetic notions in the Church led to the supposition that all contact between the sexes, except in marriage, must lead to immoral conduct, and so in the fifth and sixth centuries the practice was condemned by the Church and by the civil power.

AG'APE'TUS. The name of two popes.—AGAPETUS I. Pope of Rome from 535 to 536. He was the son of Gordianus, a Roman priest who was killed in the riots under Pope Symmachus. The fear of an invasion of Italy by Justinian led Theodatus, the King of the Goths in Italy, to send Agapetus to Constantinople in 536 to sue for peace from the Emperor. Though

unsuccessful in this mission, Agapetus persuaded Justinian to depose Anthimus from the patriarchal see of Constantinople. He died at Constantinople. His festival is celebrated on the 20th of September by the Roman Catholic church.—AGAPETUS II. Pope of Rome from 946 to 955; a Roman by birth. His first act was to establish his political rule over the churches of the Empire. Against Berenger II, King of Italy, who was a troublesome neighbor to the little pontifical state, he invoked the aid of Otto I.

AGAPIDA, ä'gä-pē'dä, FRAY ANTONIO. The imaginary monkish chronicler from whose papers Washington Irving professed in his first introduction to that work to have compiled his *Conquest of Granada*. He was intended, Irving later explained, as a type of the piously prejudiced religious zealots of the time.

AGAR, ä'gär'. The stage name of Florence Léonide Charvin (1836-91). A French actress. She was born at Sedan, and went to Paris in 1858, where she made her début as a singer in cafés-concerts. Following the example of Rachel, she adopted the biblical name of Agar (Eng. Hagar). She scored her first great success in the title-part of Racine's tragedy *Phèdre*. In 1870 she was engaged at the Comédie Française, where, during a representation of the play *Le Lion Amoureux*, she sang the Marseillaise in the key of A, as Rachel had done in 1848. She appeared from 1872 to 1876 in many French classic dramas, chiefly tragedies. She was remarkable for her beauty, her mobile and expressive countenance, eloquence of gesture, and perfect diction.

AGAR AGAR. VEGETABLE GELATIN. A substance derived from a number of East Indian seaweeds. It is made principally in China and Japan and is marketed in thin transparent sheets, shreds, or sticks. One variety furnishes the characteristic ingredient of the Chinese dish, "bird's-nest pudding." Japanese agar agar is used chiefly as a culture medium for bacteria in the laboratory. Of late years the substance has found favor as a laxative. Given to the patient in a dry form, it absorbs moisture as it passes through the intestinal canal and by its bulk stimulates peristalsis. Otherwise it has no medicinal properties.

AGARDH, ä'gärd, JAKOB GEORG (1813-1901). A Swedish botanist, son of Karl Adolf Agardh. He was professor of botany at Lund during 1854-79. He increased his father's large collection and wrote several works on algæ. He also published *Theoria Systematis Plantarum* (1858).

AGARDH, KARL ADOLF (1785-1859). A Swedish botanist. He was educated at Lund and devoted himself chiefly to the study of algæ. In 1807 he became lecturer on mathematics at Lund, and in 1812 was appointed professor of botany and rural economy, lecturing at the same time on general economy. He became a priest in 1816; went into politics in 1817 and was elected to the Diet, where he exercised considerable influence, became a leading liberal, and succeeded in improving and raising the standard of education in Sweden. His work, *Systema Algarum* (1824), was an important contribution to the science of botany. He also wrote *Essai de reduire la physiologie végétale à des principes fondamentaux* (1828). In 1834 he was made Bishop of Karlstad. Agardh was author of several books and papers, chiefly on algæ, and a memoir on Linnæus.

AG'ARIC, AGAR'ICUS. See MUSHROOM.

AGAR'ICIN (from Gk. ἀγαρικόν, *agarikon*, a tree fungus). A substance known also as agaric, agaricic, agaricinic, or laricic acid, and obtained from the *Polyporus officinalis*, commonly called white agaric, touchwood, or punk. It is a white powder, slightly soluble in water. Its formula is $C_{16}H_{30}O_5 + H_2O$. It is used as an anhidrotic (q.v.) in the night sweats of phthisis.

AGASIAS, ä-gä'shī-as (Gk. Ἀγασίας). The name of two Ephesian sculptors, kinsmen, who lived at the beginning of the first century B.C. Agasias, son of Menophilus, made several statues of Romans on the island of Delos, to be set up in the Agora there. Agasias, son of Dositheus, was the sculptor of the "Borghese Gladiator" found at Antium (q.v.) and now in the Louvre. It probably represents a warrior on foot raising his shield, as if to guard against a mounted adversary. The figure seems derived from a group. It shows the characteristics of Asiatic art of the period.

AGASSIZ, äg'ä-sē, or ä-gäs'iz; French pron. ä'gä'sē', ALEXANDER (1835-1910). An American naturalist, capitalist, and philanthropist. He was born at Neuchâtel, Switzerland, Dec. 17, 1835, the only son of Louis Agassiz. He joined his father in Boston in 1849, and graduated at Harvard College in 1855. He was made a bachelor of science by the Lawrence Scientific School in 1857; became assistant in the United States Coast Survey in California in 1859, and was assistant in the Museum of Comparative Zoölogy at Harvard College from 1860 to 1865. At this time he became interested in coal and later in copper mining, and assisted in the development of the Calumet and Hecla mines of native copper on the south shores of Lake Superior. These mines were then in an unproductive condition, but Agassiz, as superintendent, applied his extensive knowledge of geology, chemistry, and engineering, and so developed them that they yielded to him and his associates great wealth, which he used to advance zoölogical research. After visiting different museums in Europe (1869-70), he was appointed curator (1874) of the Museum of Comparative Zoölogy, which his father had founded. He retained this position nominally until 1897 and was for some time a fellow of Harvard University. His chief interest was in marine zoölogy, where his studies of invertebrate life, and especially of the development of polyps, jellyfishes, and echinoderms, placed him in the first rank of investigators. He explored Lake Titicaca and the coast of Chile during 1874-75 and founded in 1875 a private laboratory and salt-water aquarium near his residence overlooking Narragansett Bay at Newport, R. I. He superintended deep-sea dredging among the West Indies, in the United States steamer *Blake*, from 1877 to 1880, and in successive winters he explored all the oceans, adding greatly to the knowledge of the fauna of the deep sea. His more important works are *North American Acalephs* (1865); *Revision of the Echini* (1872); *North American Starfishes* (1877); *Report on the Echini of the Challenger Expedition* (1881); *Three Cruises of the Blake* (1888); *The Islands and Coral Reefs of Fiji* (1899). The latter includes a philosophical discussion of the whole subject of coral formations. He continued this line of work in 1901-02 by a private expedition to the Maldivé Islands. Mr. Agassiz contributed a million or more dollars toward furthering the

study of zoölogy at Harvard University and elsewhere, always in an unostentatious way, and his abilities have been recognized by many universities and scientific societies in both Europe and the United States, where he was president of the National Academy of Science and of the American Academy of Arts and Sciences. Consult *Letters and Recollections of Alexander Agassiz*, edited by G. R. Agassiz (Boston, 1913).

AGASSIZ, ELIZABETH CABOT (CARY) (1822-1907). An American teacher and writer, born in Boston. In 1850 she was married to Prof. Louis Agassiz, whom she accompanied to Brazil (1865-66) and on the *Hassler* expedition in 1871-72. Her publications include *A First Lesson in Natural History* (1859); *Life of Louis Agassiz* (2 vols., 1885), and *Seaside Studies in Natural History* (1865), in which she was assisted by her step-son, Alexander Agassiz. Mrs. Agassiz's home was at Cambridge, Mass. She became president of the board of control of Radcliffe College and took an active part in promoting the interests of that institution.

AGASSIZ, LAKE. See LAKE AGASSIZ.

AGASSIZ, LOUIS (1807-73). An American naturalist, born at Motier, in the Canton of Fribourg, Switzerland. His father was a clergyman and his mother a woman of education and taste. Following a decided bent toward zoölogy, developed from childhood and fostered by his school preparation at Lausanne, he studied medicine and natural history at Zürich and Heidelberg, where he formed a lifelong and influential friendship with the botanist Alexander Braun. He studied also at Erlangen and at Munich, where he became acquainted with Martius and Spix, and when Spix died (1826), Agassiz prepared a description of his Brazilian fishes which attracted Cuvier's notice. After graduating in medicine and taking a degree in philosophy (1830), Agassiz studied in Paris under Cuvier, whose ardent disciple he henceforth was. From 1832 to 1846 Agassiz was professor of natural history at Neuchâtel and there completed his first great work, *Recherches sur les poissons fossiles* (5 vols., 311 plates, 1833-42). Several visits to England, beginning in 1834, enlarged his acquaintance and reputation and gave material for his *Fossil Fishes of the Old Red Sandstone* of the British Isles. Next he turned to echinoderms, which he studied in both living and fossil forms. Another product of his labors at this period was the *Nomenclatoris Zoölogici Index* (Sotothurn, 1842-46), of which a practical revision, bringing the lists of genera up to 1882, was made by Scudder and published as Bulletin No. 19, United States National Museum (Washington, 1882). From 1836 to 1845 Agassiz spent his summers in examining the glaciers of the Alps, often in company with A. Guyot, and illuminated and confirmed previous generalizations in respect to a former glacial epoch. In 1846 Agassiz was invited to the United States to give a series of lectures in the Lowell Institute course at Boston. These at once established his reputation as a lecturer and led to his appointment, in 1848, as professor of natural history in the Lawrence Scientific School of Harvard University, which chair he held, except a brief interval at Charleston, S. C., until his death, although he relinquished teaching long before that event. Agassiz came to America untrammelled and undertook the mission of teaching and advancing the cause of science in the United States with the utmost enthusi-

asm. His wife had died, but he presently remarried (see AGASSIZ, E. C.), and Mrs. Agassiz established in their house in Cambridge a school for girls, with which Professor Agassiz was identified. He traveled widely and lectured in various cities and in 1848 visited the Lake Superior region with a class of scientific students. This exploration was described in a narrative by Cabot, to which Agassiz contributed chapters on fishes. Similarly, he undertook, in 1850-51, a study of the Florida coral reefs, the results of which were set forth in lectures and in articles contributed to the *Atlantic Monthly* and subsequently gathered into two popular books, *Methods of Study in Natural History and Geological Sketches*. He was everywhere and foremost a teacher, interpreting his facts and theories with such enthusiastic force and persuasive eloquence that he was in constant demand. A series of lectures which he delivered in Brooklyn in 1862 were epoch-making in this direction. They were republished in book form as *The Structure of Animal Life* (New York, 1874). Many of his views were in advance of popular knowledge and opinion and contravened some established religious tenets; yet he rarely excited serious opposition, and no educational influence of his time was so great as that exerted by him. He may be said to have realized at this period the ambition which he expressed in a letter to his father in 1829: "I wish it may be said of Louis Agassiz that he was the first naturalist of his time, a good citizen and . . . beloved of those who knew him."

In 1858 the plans were laid for the great Museum of Comparative Zoölogy at Cambridge, Mass., now one of the most extensive and scientifically useful in the world; and for many years his main efforts were directed to building it up. He secured public appropriations and private gifts for it by his personal influence and kept himself poor by his unselfish labors and liberality toward it. He gathered about him there and trained a body of men who have made for America a creditable record in biology—Alexander Agassiz, his son; J. A. Allen, H. J. Clark, S. Garman, Alpheus Hyatt, D. S. Jordan, E. S. Morse, A. S. Packard, F. W. Putnam, N. S. Shaler, A. E. Verrill, and others.

In 1865 he visited Brazil with his wife and a body of assistants. The results of his researches there he published in his book, *A Journey in Brazil* (Boston, 1868). In 1872 he made a trip to California. In the summer of 1873 he held the first session of a summer school at the island of Penikese in Buzzard's Bay. This set an example that has led to the many summer schools and seaside laboratories since established in all parts of the country. During all these years he was prosecuting a continuous work on a great scale, entitled *Contributions to the Natural History of the United States*, of which four magnificent quarto volumes were published, the first, *An Essay on Classification*, in 1857, the others (monographs of American turtles and acalephs) soon after. The doctrine taught in these was a liberal advance upon the "special creation" views previously in vogue; yet when the Darwinian school of evolutionists arose they found in Agassiz a most earnest opponent, and it was a great grief to him to see that his scientific disciples were almost, without exception, becoming adherents to the new ideas. To stem this tide of scientific heresy, Professor Agassiz prepared

and delivered in Cambridge, in the spring of 1873, a course of six lectures, which attracted very wide attention. This was his final public work, for late in 1873 he was attacked by brain disease and died on December 14. He was buried with extraordinary honors in Mount Auburn Cemetery. His monument is a boulder brought from the glacier of the Aar, where he had made his most enlightening studies of glacial phenomena. Consult: Agassiz, *Life and Correspondence of Agassiz* (Boston, 1886); Marcou, *Life, Letters, and Works of Agassiz* (New York, 1896); Guyot, *Memoir of L. Agassiz* (Princeton, N. J., 1883), and Gilman and other eulogists, *Proceedings California Academy of Sciences*, vol. iv, 1873-74 (San Francisco, 1874).

AGASSIZ, MOUNT. An extinct volcano in Arizona, 70 miles northeast of Prescott and 10,000 feet above the sea level. Another peak of this name in Utah is 13,000 feet high.

AGATE (Lat. *achates*, Gk. *ἀχάτης*, *achatēs*, so named, according to Pliny (*Hist. Nat.*, xxxvii, 54), from the Sicilian river Achates, where it was first found). A variety of quartz (q.v.) composed of successive layers of silica deposited from a silica-saturated water solution. Slight amounts of impurities in the silica solution produce different colors in the agate, giving rise to banded agate in which the successive layers are of different color, clouded agate which has irregularly disposed patches of color, and moss agate which contains sharply defined, moss-like, dark markings due to manganese oxide. Agates are found universally and are much used, when cut and polished, for ornaments and jewelry. The principal supply comes from Uruguay and Brazil, in South America, whence they are sent to Oberstein, in Germany, where their polishing is an important industry.

AGATE SHELL, or AGATE SNAIL. Any land-snail of the genus *Achatina* (family *Achatinidæ*), of which many species are to be found throughout tropical Africa. They are carnivorous, tall-spined, usually tinted and banded in bright colors, and include the largest land-shells known, some being 10 inches long, producing eggs an inch in length, with a calcareous shell. See Plate of ABALONE, etc.

AGATHA, SAINT. According to the legend, a noble Sicilian virgin of great beauty and wealth, who rejected the love of the consul Quintianus, and suffered a cruel martyrdom in the persecution of Sicilian Christians. She holds a high rank among the saints of the Roman Catholic church. Her day falls on February 5. She is the patroness of the island of Malta, and there are churches erected in her honor. It is uncertain whether she ever lived, and if so, whether she died in the Decian persecution (251), or the Diocletian, 50 years later. Legend says that several times the mere carrying in procession of her veil, taken from her tomb in Catania, has averted eruptions from Mount Etna from the walls of that city, and that her intercession saved Malta from Turkish conquest in 1551. Consult A. Butler, *Lives of the Saints*, under February 5 (London, 1847).

AGATHARCHUS, äg'ä-thär'küs (Gk. *Ἀγαθάρχος*, *Agatharchos*). A Greek painter from Samos, who worked chiefly at Athens, between 455 and 415 B.C.; said to have been the first scenepainter in connection with a tragedy of Æschylus (q.v.), and therefore is of importance in the history of art through the development of perspective, in opposition to the school of Polygnotus

(q.v.). He is said by Vitruvius (q.v.) to have left a treatise on this subject.

AGATHARCIDES, äg'ä-thär'si-déz (Gk. *Ἀγαθάρκιδης*). A Greek historian and geographer, of Cnidus, who lived in the earlier half of the second century B.C. He wrote a work on the *Successors of Alexander the Great*, and a treatise, in five books, on *Europe, Asia, and the Red Sea*. From the latter treatise Photius (q.v.) gives extracts, at the same time praising the style of Agatharcides, as modeled on that of Thucydides. See Müller, *Fragmenta Historicorum Græcorum*; Bunbury, *History of Ancient Geography*, vol. ii (London, 1879).

AGA'THIAS (Gk. *Ἀγαθίας*) (530?-580?). A Greek poet and historian, surnamed Asianus. He was educated at Alexandria and Constantinople, studied Roman law and practiced it with success. He wrote love verses and made an anthology of earlier poets; but his most valuable work is a history of the years 552 to 558, intended to continue that of Procopius (q.v.), in which he tells of the overthrow of the Ostrogothic power in Italy by the Byzantines, of the earthquakes of 554 and 557, the beginning of the Greek and Persian war, the rebuilding of St. Sophia, etc. This work was edited by L. Dindorf in *Historici Græci Minores* (Leipzig, 1871). Consult Krumbacher, *Geschichte der byzantinischen Litteratur* (Munich, 1897).

AG'ATHO, SAINT. Pope from 678 to 681. He was more than 100 years old when he succeeded to the papacy. He was a native of Palermo, Sicily, and is remembered chiefly for his efforts in bringing about the Sixth Ecumenical Council, which assembled at Constantinople in 680 and condemned the Monothelite heresy. His festival is celebrated on February 20 by the Greek church, and on January 10 by the Roman church.

AGATHOCLES (Gk. *Ἀγαθοκλῆς*) (361-289 B.C.). A Sicilian despot, ruler of Syracuse. He was born at Thermæ, in Sicily; rose from humble circumstances through the patronage of Damas, a noble citizen of Syracuse, and received under him a command in the expedition against Agrigentum. Afterward he married the widow of Damas and became one of the most wealthy men in Syracuse. Under the rule of Sosistratus (q.v.) he was obliged to flee into Lower Italy, where he collected a band of partisans. Returning to Syracuse after the death of Sosistratus, he secured the supreme power in 317 B.C., strengthened his position by a massacre of several thousand respectable citizens, and took possession of the greater part of Sicily. To establish his power and keep his army employed, he now attempted to expel the Carthaginians from Sicily; but in this undertaking he was defeated. His next plan was to pass over to Africa with a part of his army and there to attack the Carthaginians. This war he carried on with success for more than three years, or until 307 B.C., when disturbances in Sicily compelled him to leave the army for a time. In 305, however, he triumphed completely over his foes in Sicily. He became one of the richest monarchs of the world, and formed an alliance by marriage with the Ptolemies in Egypt. He made raids upon Italy and in 299 conquered the Island of Corcyra. He had Greeks, Etruscans, Celts, and Ligurians in his army. He must have come into touch with the Romans, too; his biographer Kallias was among the first to concern himself much with Roman affairs. It was

his intention to leave the throne to his youngest son, Agathocles; but his grandson, Archagathus, made an insurrection and slew the royal heir. In revenge Agathocles restored the government to the people. He died 289 B.C.

AG'ATHON (Gk. 'Αγάθων) (447?–401? B.C.). An Athenian tragic poet. He gained his first victory at the Lenæan festival in 416 B.C.; this victory is celebrated in Plato's *Symposium*. He was well-to-do and had many friends, among whom were Euripides and Plato. He lived for some time at the court of Archelaus (q.v.) at Pella, in Macedonia. His style was flowery and ornate rather than strong or sublime, and his works were full of the rhetorical figures which marked the style of Gorgias (q.v.) and Prodicus (q.v.). Still, after Æschylus, Sophocles, and Euripides, he was the most important tragic poet of Greece. According to Aristotle, he began the practice of making the chorus songs mere interludes, disconnected in theme from the dialogue. He is ridiculed in Aristophanes' *Thesmophoriazusæ*. About 30 short fragments of Agathon are preserved.

AGATHON. A philosophical novel by Wieland (q.v.), published in 1766. Its hero (Agathon) is a Platonist, and the theme is the proper mean in human life between asceticism and sensuality.

AG'ATIZED WOOD. See CHALCEDONY; FOSSIL FORESTS.

AGAU, à-gou'. An Hamitic people of Abyssinia, supposed to represent the aboriginal inhabitants of the highlands. The Agau tribes are scattered in various parts of the kingdom, one district, in Amhara, southwest of Lake Tsana, being called Agaumed. The Agau language is widely diffused among the common people of Abyssinia.

AGAVE, à-gā'vê (Gk. fem. of ἀγᾶνός, *agauos*, noble, high-born), CENTURY PLANT. A genus of about 150 species belonging to the family Amaryllidaceæ and occurring in the arid and even desert regions of America. The most familiar species in cultivation is *Agave americana*, the 'American century plant'. The plants are characterized by the rosette of stiff, fleshy, and often spiny leaves on or near the ground, from the center of which arises a tall flower stalk (sometimes 20 feet high) bearing a large cluster of flowers. Many species are cultivated as ornamental, but in Mexico they are most useful plants. The leaves yield a coarse fibre used in the manufacture of thread, twine, rope, etc., while one species is the source of the well-known "sisal hemp," extensively used for cordage. The two best-known Mexican drinks, called "pulque" and "mescal," are obtained from several species of agave. Some of the species flower every year, others flower only occasionally, while some flower only once and die. The name "century plant" was given on account of an old fable that the species of agave, at least the cultivated *A. americana*, flowered only once in a century.

AGAVE. The mother of Pentheus (q.v.), whom, according to the Greek legend, she and other frenzied Bacchantes tore in pieces for opposing the new orgies of Dionysus. She was the daughter of Cadmus and the wife of Echion.

AGAWAM, äg'ä-wôm. A town in Hampden Co., Mass., 4 miles southwest of Springfield, on the Connecticut River, and the Central New England Railroad (Map: Massachusetts, B 3). It is situated in an agricultural region, producing tobacco, grain, potatoes and other

vegetables. The distilling of gin and the manufacture of woolen goods and paper are the principal industries. Agawam was settled in 1635 and was incorporated in 1854. It was the scene of some fighting during King Philip's War and Shays's Rebellion. Pop., 1900, 2536; 1910, 3501; 1913 (est.), 3900.

AGDE, ägd. An ancient French town in the department of Hérault, on the river Hérault, 2½ miles from the Mediterranean Sea (Map: France, S., H 5). To the north, under the walls of the town, flows the Languedoc Canal. Agde's commerce with Italy, Spain, and Africa has declined, and its chief activity is in coasting and fishing trade. The general aspect of Agde is sombre, on account of the black volcanic rock of which the houses are built and with which the streets are paved. Its most conspicuous building is the cathedral of St. Etienne, Agde having been the seat of a bishopric since the beginning of the Middle Ages. The town was founded by the Greeks of Massilia, and its first name was Agathe. Pop., 1896, 7007; 1901, 9533; 1906, 8435; 1911, 9265.

AGE. A term employed to designate successive epochs in the history of the human race, physiological stages in the growth of man, literary periods, etc. In the Greek mind the life of the race was likened to that of the individual—hence the infancy of the former might easily be imagined to be, like that of the latter, the most beautiful and serene of all. Hesiod mentions five ages—the Golden, simple and patriarchal; the Silver, voluptuous and godless; the Brazen, warlike, wild, and violent; the Heroic, an aspiration toward the better; the Iron, in which justice, piety, and faithfulness had vanished from the earth, the time in which Hesiod fancied that he himself lived. Ovid closely imitates the old Greek, except in one particular—he omits the Heroic Age. This idea, at first perhaps a mere poetic comparison, gradually worked its way into prose and finally became an element of scientific philosophy. These ages were regarded as the stages of the great world-year, which would be completed when the stars and planet had performed a revolution round the heaven, after which destiny would repeat itself in the same series of events. Thus mythology was brought into connection with astronomy. The Golden Age was said to be governed by Saturn; the Silver, by Jupiter; the Brazen, by Neptune, and the Iron, by Pluto. Many curious calculations were entered into by ancient writers to ascertain the length of the heavenly year and its various divisions. The greatest discrepancy prevailed, as might naturally be expected, some maintaining that it was 3000, and others as many as 18,000 solar years. The Sibylline Books compared it to the seasons of the solar year, calling the Golden Age the spring, etc.; and, on the completion of the cycle, the old order was renewed. The idea of a succession of ages is so natural that it has invrought itself into the religious convictions of almost all nations. It is sanctioned by Scripture, for it is symbolically adopted in the Apocalypse to a certain extent; it also manifests itself in the sacred books of the Hindus. Modern philosophy, at least in Germany and France, has also attempted to divide human history into definite ages or periods. Fichte numbers five, of which he conceives we are in the third; Hegel and Auguste Comte reckon three, placing us in the last. Modern anthropology divides the prehistoric period

man into the older and newer Stone Ages (Paleolithic and Neolithic) and the Bronze Age. Stone and bronze are here not figurative, as in Hesiod's classification, but are indications of the state of man's civilization. In reference to this and other ages, as defined in science, see GEOLOGY, etc. Physiologically, an age marks the span of human life, which is divided into five periods: *infancy* (the first 7 years), *childhood* (the next 7 years), *youth* (up to the 21st year), *adult life* (up to the 50th year), and *senility* (after the 50th year). Literature has had certain distinct ages. Thus, in English literature, we have had the Elizabethan Age, the Victorian Age, etc. History, too, recognizes certain large divisions in the political and social life of man. Hence we speak of the Dark or Middle Ages, the Modern Age, the Age of Steam, etc. The law of every land, too, recognizes certain ages in the growth from infancy to manhood or womanhood, and defines legal rights, duties, and responsibilities in accordance with such classification. Hence, "the age of consent," etc.

AGE. In law, that period of life at which persons emerging from infancy become capable of exercising the rights or become subject to the obligations and penalties of normal persons. As these rights and obligations vary greatly, the age of capacity may vary according to the right or obligation in question. Full age is the period at which a person acquires full legal capacity, and in England and the United States is usually fixed by law at 21 years, for men and women alike. This is considered to be attained on the day preceding the 21st anniversary of birth. In a few States, however, a woman comes of age at 18. Political capacity is usually coincident with the attainment of legal capacity, though greater maturity is usually required in this country of the holders of certain important offices of State. Thus, while one may become a member of the British Parliament at 21, no one can be a Representative in Congress until he is 25, or a Senator of the United States until he is 30, nor become President before attaining the age of 35. In short, full age, a male is 21, a female 18, and become capable of military service at 18 (military age), and become capable of consenting to marriage and the choice of a guardian at 14 (age of discretion). At common law the age of discretion for female infants was 12, and the age of consent to unlawful carnal intercourse was 10, but recent legislation in the United States has raised the age of consent to 14, 15, 16, and, in several States, including New York, to 18 years. (See CONSENT; RAPE.) The term "age of discretion" is also more commonly employed to designate the period (usually the age of 14) at which persons become subject to criminal liability, an infant under 7 years of age being deemed incapable of crime, and one between 7 and 14 being presumed to lack the discretion which such liability assumes; but this presumption is capable of being rebutted by proof. (See INFANT; CONTRACT; CRIME; MILITIA.) For the modern law of infancy, consult Schouler, *Treatise on the Domestic Relations* (Boston, 1870).

AGE, CANONICAL. The age which, according to the canons, a man must have reached for ination. This, in the Roman Catholic church, 2 for the sub-diaconate, 23 for the diaconate, or the priesthood, and 30 for the episcopate. Sensations may, however, be granted from rule. In the Greek church the age is 25 for a deacon, 30 for a priest or bishop; in the

Anglican communion, 23 for a deacon and 24 for a priest.

AGELADAS. See HAGELADAS.

AGEN, a'zhän'. The capital of the department of Lot-et-Garonne, France, situated in a fertile region on the right bank of the Garonne, 73 miles from Bordeaux (Map: France, S., E 4). The town is very ancient and was founded during the Roman occupation, when it was known as Aginnum. It was the capital of the Nittobriges, a Gallic tribe, was later an important city of the Agenois, and was the scene of bloody Huguenot executions. It is the seat of a bishopric, and the cathedral dates from the days of Clovis. Its public institutions include a seminary for the training of the clergy and a library. Standing between Bordeaux and Toulouse, Agen is a market for agricultural products and interchanges trade with both these places. It has, besides, several important home industries. The prunes of Agen are celebrated, and it manufactures other delicacies. Agen is the birthplace of Joseph Scaliger, Lacépède, and Bory de St. Vincent. Pop., 1901, 22,482; 1906, 23,141; 1911, 23,294.

AGENAIS, a'zhe-nā'. A former province of France which included almost the same territory now in the department of Lot-et-Garonne. In the fourth century this was the Civitas Agennensium, in Aquitania Secunda, whence its name. There is little of note in its history until 1152, when it was added to the territory of Henry II of England by his marriage with Eleanor of Aquitaine. In 1196 it formed a part of the dowry of Joan, sister of Richard the Lion-Hearted, when she married Raymond VI of Toulouse. With other lands of the county it was added to France in 1271, but was given back to the English ruler in 1279. In 1453, as a result of the Hundred Years' War (q.v.), it finally became a part of the French Kingdom. See AGEN.

AGENCE HAVAS, a'zhän' sa'va'. See HAVAS.

AGENDA (Lat. things to be done, from agere, to do). A term applied by theologians to practical duties, as distinguished from the credenda, things to be believed, or doctrines that must be accepted as articles of faith. Among writers of the ancient Church the term signified both divine service in general and the mass in particular. We meet with *agenda matutina* and *vespertina*, morning and evening prayers; *agenda diei*, the office of the day; *agenda mortuorum*, the service of the dead. It is also applied to Church books compiled by public authority, prescribing the order to be observed by the ministers and people in the ceremonies and observances of the Church. In this sense agenda occurs for the first time in a work of Johannes de Janua about 1287. The name was especially used to designate a book containing the formulæ of prayer and ceremonies to be observed by the priests in their several ecclesiastical functions. It was generally adopted by the Lutheran church of Germany, in which it is still in use, while in the Roman church it has been, since the sixteenth century, supplanted by the term "ritual" (q.v.).

AGENOR, a-jē'nôr (Gk. Ἀγήνωρ). Originally a mythical personage in the Argive legends, later said to have been a King in Phœnicia or Egypt, son of Poseidon, and father of Europa (q.v.), Cadmus, Phœnix, and Cilix. When Europa was carried off by Zeus, Agenor sent his sons in search, with orders not to return without their sister. As she was not found, Cadmus

founded Thebes, and the other sons settled in the countries which bore their names. See CADMUS.

A'GENT (Lat. *agens*, acting, pres. part. of *agere*, to act). A modern term in English law. As a generic term, it includes every one authorized to act for and represent another; but it is often used in a specific sense to denote one authorized to act for another in making contracts between that other, called the principal, and third persons. Blackstone does not employ it, and it rarely occurs in law dictionaries, digests, or decisions before the nineteenth century. For a time after its appearance it is used interchangeably with the word "servant." During the last century, however, the tendency of judges and law writers has been toward a complete differentiation of the terms "agent" and "servant." A fair illustration of the result is afforded by the following provisions of the California Civil Code: "An agent is one who represents another, called the principal, in dealings with third persons." "A servant is one who is employed to render personal service to his employer, otherwise than in the pursuit of an independent calling, and who in such service remains entirely under the control and direction of the latter, who is called his master." Using "agent," then, to denote a person authorized to act for and represent another in business transactions with third persons, and reserving the rules relating to *master and servant* (q.v.) for a separate article, let us consider, (1) how agency is constituted, (2) the liability of the principal to third parties, (3) the liability of the agent to third parties, (4) the liabilities of principal and agent to each other, (5) the termination of agency.

1. Ordinarily, the relation of principal and agent originates in a *contract* (q.v.) between the parties, but it may exist without a contract, as where A gratuitously undertakes to do an act for B. The relationship may rest upon ratification, instead of a precedent agreement. For example: A does an act avowedly as B's agent, without authority from B. The act does not bind B, unless he accepts it, as done on his behalf. If he does so accept it, his ratification is equivalent in law to a precedent appointment of A as agent. Even without appointing A or ratifying his acts, B may become liable for those acts, because his conduct induces third parties to believe that A is B's agent. In such a case there is agency by *estoppel* (q.v.). Still another form of agency is that which is created by the law, as where the law authorizes a wife to pledge her husband's credit for necessities. In the language of a learned judge, "the law creates a compulsory agency, and her request is his request."

2. A principal who has authorized an agent to do an act for him, or has ratified the act, is liable to third persons precisely as if the act had been done by him. As a rule, the principal is disclosed to the third party, and the latter understands that the transaction is between them, the agent being a mere conduit for the transmission of the principal's consent. But even though the principal is not disclosed, nay, even though the third party may refuse to enter into a transaction with the principal and may insist upon contracting with the agent as a principal, yet upon discovering that the transaction was for the principal's benefit and authorized by him, the third party may hold the principal liable. The principal may be liable to third

parties for his agent's acts which he has never authorized or which he has even forbidden. His liability in such cases depends upon whether the acts were done within the scope of the agent's apparent authority; for the principal will not be allowed to show that he secretly forbade what he appears to have authorized. What is the scope of an agent's authority depends upon the facts of the particular case, including ordinary business usages relating thereto. As the agent is, in law, a mere conduit of the principal's will, and thus identified with the principal, knowledge acquired by, or notice given to, the former during his agency, at least, is imputed to the latter. An exception to this rule exists where the agent acquires the knowledge or receives the notice in a transaction conducted by him in fraud of the principal. In such a case the agent cannot be expected to disclose his knowledge to the principal, and the legal fiction that the principal and agent are but one person will not be pressed so far as to work palpable injustice.

3. An agent who discloses his principal incurs no liability to third parties if his acts are authorized or ratified and are lawful. From liability for unlawful acts he cannot screen himself by proving an express command of his principal, although such command renders the latter liable also. Every wrongdoer is personally responsible for his misfeasance. An agent will render himself liable on a written contract under seal, or on a negotiable instrument, if he executes it in his own name, although he intends to bind his principal thereby. In order to bind the principal, such an instrument must be in his name and purport to be his deed, or note, or bill. In the case of other written contracts, the agent who discloses his principal will not be bound, unless the intention of the parties that he should be bound is apparent from the writing and attendant circumstances. The agent may render himself liable to the third party by assuming to act for a principal without authority.

4. In the absence of express stipulations in the contract to the contrary, the principal is under obligation to compensate the agent for his services; to reimburse him for all proper expenditures on the principal's behalf and to indemnify him against the consequences of authorized acts which he did not know, or which he was not bound to know, were unlawful. On the other hand, the agent is under obligation to act with the utmost good faith toward the principal, obeying his instructions, advancing his interests, and rendering full and true accounts of all transactions. An agent cannot delegate his authority to another, so as to escape responsibility to the principal for that other's acts, without the express or implied assent of the principal. Nor, ordinarily, will a principal be bound by the acts of a sub-agent whose employment he has not authorized or ratified.

5. Agency may be terminated by the agreement of the parties, or by the principal's revocation of the appointment, or by operation of law. If terminated in either of the first two ways, notice must be given to those who have been accustomed to deal with the agent, or the latter will still be able to subject the principal to liability to such persons; for, until notice of revocation, these have a right to suppose that the relation of principal and agent continues. The death of either principal or agent, and the

bankruptcy of the principal, furnish the most common examples of termination of agency by operation of law, and such termination is effective without notice. An agency which is "coupled with an interest" (i.e., a vested property right) in the subject-matter of the agency is revocable only by the mutual assent of both parties.

Doctrines peculiar to special classes of agents are dealt with under the appropriate headings, e.g., ATTORNEY; AUCTION; BROKER; PARTNERSHIP; FACTOR; CRIME. Consult: Evans, *Principal and Agent in Contract and Torts* (2d ed., London, 1888); Huffcut, *Law of Agency* (Boston, 1901); Story, *Commentaries on the Law of Agency* (9th ed., Boston, 1882).

AGE OF INNOCENCE. A celebrated painting by Sir Joshua Reynolds in the National Gallery, London. It depicts a little girl sitting on the ground before a group of trees.

AGE OF REASON. The name given to a certain phase and period of the French Revolution when Christianity was decried, Reason proclaimed as the only true deity, and bishops exchanged their mitres for liberty caps. This movement was fomented by Hébert (q.v.) and his followers, professed atheists, who succeeded in persuading many Christians to renounce their faith. The worship of Reason centred around the ceremonies held in her honor at Notre Dame, Nov. 10, 1793. The Goddess of Reason, typified by a beautiful actress, was placed on the altar and received the homage of her adorers. A schism in the party of the Montagnards, to which the atheists belonged, led to their execution, March 24, 1794. It was not, however, till June 8, 1794, that France, in the Feast of the Supreme Being, again received officially religion, at the hands of Maximilien Robespierre. Consult Aulard, *Le culte de la Raison et le Culte de l'Être Suprême* (Paris, 1892).

AGĒSAN'DER (Gk. Ἀγήσανδρος, *Agēsandros*). A Greek artist of the school of Rhodes who lived in the first century B.C. In conjunction with Athenodorus and Polydorus he executed the celebrated group of Laocoön, which was discovered near the baths of Titus in the sixteenth century. See LAOCOÖN.

AGES'ILAN OF COLCHOS, kōl'kōs. The title and hero of one of the romances in *Amadis of Gaul* (q.v.), books xi and xii.

AGES'ILA'US (Gk. Ἀγησίλαος, *Agēsilaos*) (c.444-360 B.C.). The name of several kings of Sparta, of whom the most important was King about 401-360 B.C. He was the son of Archidamus II and succeeded Agis II, Leotychides, the son of Agis, being set aside through the influence of Lysander (q.v.), on the ground of illegitimate birth. (See AGIS, 2.) In 397 B.C. he was sent to Asia Minor as commander-in-chief of the Spartan forces in the war with Persia, which arose out of the expedition of the 10,000 Greeks with Cyrus the Younger (q.v.). He carried on the war with success and was preparing to advance into the interior of Persia, when in 394 B.C. he was called back to Greece to make head against the coalition which had been formed by Thebes, Athens, and other Grecian States against the power of Sparta. Proceeding by land, he arrived in Greece about a month later and in the same year defeated the allies at Coronea, in Bœotia. In the years that followed, Agesilaus took an important part in his country's politics and

campaigns. In 361 B.C. he undertook an expedition to Egypt, but while on his way home died, in the winter of 361-360. Agesilaus was small of stature and lame. He was simple in dress and in his way of living; blameless in public and private life alike; a patriot, though a party man; a conservative in politics; a successful, though not a great, general. Biographies of Agesilaus were written by Xenophon and Plutarch.

AGGLOM'ERATE. In geology the name applied to a consolidated mass of fragmental volcanic materials, chiefly bombs and rough blocks of lava that fall close to or within the cone. The fragments are of all sizes, the larger reaching several feet in diameter and tons in weight, and lack the sorted or stratified arrangement characteristic of sedimentary rocks, but lie haphazard just as they fell. The spaces between the blocks are generally filled with volcanic ash, which with the action of the atmosphere and of infiltrating waters forms a cement that renders the mass compact and solid. Although the material in an agglomerate chiefly consists of some volcanic rock, like basalt, porphyry, or felsite, scattered pieces of sedimentary nature, such as limestone or sandstone, may occur, these having been torn off from the sides of the chimney in the course of an eruption. Except in very violent outbursts the blocks of lava are not carried any considerable distance away from the vent; for the most part they return to the crater. The finer sizes that range from gravel to dust-like particles and that may be transported many miles from the source form a deposit known as volcanic tuff. There is, of course, no sharp distinction to be made between the two kinds, as they are connected by deposits of intermediate character. When the volcanic fragments have been sorted by water and their angles rounded off by abrasion before their final deposition, the rock is called a volcanic conglomerate. Agglomerates have been described from the very early geological formations, as well as those of recent date. In whatever situation they are found they afford conclusive evidence of local volcanic activity and frequently mark its actual centre. See VOLCANOES.

AGGLU'TINATE LAN'GUAGES (Lat. *ad*, to + *gluten*, glue, paste). One of the chief linguistic groups, characterized by postpositional elements added to roots. These suffixes, ultimately losing their distinct meanings, become integral components of the words, thus forming the transition to inflection (q.v.). Hence, these languages are very numerous, and, for lack of more accurate knowledge, are grouped as yet very loosely. The chief families of agglutinate languages are Ural-Altaic (including Finnish, Turkish, and Hungarian), Dravidian (spoken in southern India), Tibeto-Burman (in Tibet, Siam, and Burma), and Malayo-Polynesian. Consult Friedrich Müller, *Grundriss der Sprachwissenschaft* (4 vols., Vienna, 1876-88). See PHILOLOGY; TURANIAN LANGUAGES.

AG'GREGA'TION, STATES OF (Lat. *ad*, to + *gregare*, to collect into a flock). The three states, *gaseous*, *liquid*, and *solid*, in which matter occurs. Many substances are capable, under certain conditions of temperature and pressure, of existing in any of the three states. Water, for instance, may be gaseous (steam, or water vapor), liquid (as ordinarily), or solid (ice). Other substances, on the contrary, could, by the means at our disposal, be obtained in

only one of the states of aggregation; thus, the element carbon remains solid even at the highest temperatures that can be produced at present, and many of its compounds undergo chemical decomposition before reaching the point at which they might melt.

Under certain conditions matter has been assumed to be capable of existing in other states besides the above three. Thus, Boutigny thought that liquids, when thrown upon glowing hot surfaces, pass into what he called the *spheroidal* state. Crookes thought that, at the instant of the electric discharge, the gases inclosed within a Crookes tube pass into a *radiant* state, which is characterized by certain properties not found in the other states of aggregation. When under the critical pressure and temperature (see CRITICAL POINT), substances are sometimes said to be in the *critical* state. In this article, however, only the three states of aggregation that are generally recognized may be briefly characterized.

1. A gas (or vapor) occupies the volume and assumes the shape of the vessel within which it is inclosed, and its resistance to a change of shape is very small. The amount of work which must ordinarily be expended in diminishing the volume of a gas is also insignificant compared to that required in the case of liquids or solids. Another characteristic property of gases is their capacity of mixing with one another in all proportions. Gases may be said to be matter in a highly rarefied state, their specific gravity being ordinarily very small compared to that of liquids or of solids. According to the molecular theory, the distances between their particles are very great, and therefore the particles exert very little action upon one another. See MOLECULES—MOLECULAR WEIGHTS.

2. The volume of a liquid varies but little with the external conditions; comparatively great pressures, for instance, will cause but a slight diminution of the volume of a liquid. Like gases, however, liquids have no shape of their own, and they readily assume the shape of the vessel containing them. Certain pairs of liquids (for instance, alcohol and water) are capable, like gases, of mixing in all proportions; others (for instance, carbolic acid and water) dissolve in each other to a limited extent; still others (for instance, carbon di-sulphide and water) are practically insoluble in each other. The molecules of a body in the liquid state are much nearer to one another than those of a gas, and consequently are capable of exerting upon one another considerable attraction. In an overwhelming majority of cases liquids are isotropic and have no effect on the plane of polarized light. But substances in the so-called liquid crystalline state, though incapable of assuming a definite shape like solids, act like crystals when introduced between two "crossed" Nicol's prisms and cause light to pass through the prisms. In memoirs published in 1908 and 1909 Bose made an interesting attempt to explain this peculiar state of substances, on the assumption that the molecules arrange themselves in parallel layers. In 1910 Nernst published a thermodynamic study corroborating this view. See LIQUID CRYSTALS.

3. In the case of solids, not only the volume, but also the shape, cannot be easily changed. Very little is as yet known of the molecular constitution of solids. In recent years the distinction between the metallic and non-metallic states has attracted considerable thought.

Metals are characterized by their opaqueness, their complete insolubility in non-metallic solvents, and their extraordinary electrical conductivity. Attempts have been made to explain the conductivity both of pure metals and alloys on the basis of the electron theory. Concerning the mutual solubility of solids, see SOLUTIONS and ISOMORPHISM.

Consult: J. D. van der Waals, *La continuité des états gazeux et liquides* (Paris, 1894; Leipzig, 1899–1900); Ruer, *Metallographie* (Hamburg, 1907); Freundlich, *Kapillarehemie* (Leipzig, 1909); K. Hack, *Das Wesen der Aggregatzustände. Stadtprozelten* (1912). See COLLOID.

AGG'TELEK. See AGTELEK.

AGH'LABIDS. A Moslem dynasty in Kairawan (q.v.). It was founded by Ibrahim ibn al Aghlab in 800 A.D. and was overthrown by the Fatimids in 909. The 11 rulers assumed only the title Emir, and nominally recognized the Abbasid Caliphate, but practically were independent. The hereditary rights were granted by Harun al Rashid. Their territory included all of Ifrikiya, or the ancient *provincia Africa*. In 827 Ziyadat Allah began the conquest of Sicily which was continued by his successors. See the edition and translation by Noël des Vergers of Ibn Kbaldu'n's *Ibar IV*, under the title *Histoire de l'Afrique sous les Aghlabites et de la Sicile* (1891); Amari, *Storia dei Musulmani di Sicilia* (1854); *Bibliotheca Arabo-Sicula* (1857).

A'GIAS (Gk. 'Αγίας). An ancient Greek cyclic poet of Træzen, who lived about 740 B.C. His chief work was *Νοστοί*, *Nostoi*, or the *History of the Return of the Achæan Heroes from Troy*. Only fragments of the poem have been preserved. Consult F. C. Welcker, *Der epische Cyklus* (Bonn, 1849); D. B. Monro's edition of the *Odyssey*, books xiii–xxiv, pp. 378 ff. See CYCLIC POETS.

AGIB, ā'gib. The name of two characters in the *Arabian Nights*. 1. In the *History of the Three Calendars*, the third calendar, whose marvelous adventures began with his shipwreck on the lode-stone mountain. 2. In *The Story of Noureddin Ali and Bedreddin Hassan*, the son of the latter.

AGINCOURT, à'zhān'kōōr', Eng. pron. āj'-in-kort, or **AZINCOURT**. A village in the department of Pas-de-Calais, France, celebrated for the splendid victory over the French gained by Henry V of England on St. Crispin's Day, Oct. 25, 1415. Reviving the ancient claim of the Plantagenets to the French throne, Henry had invaded France and taken Harfleur; but disease and privations in his small army determined him to return to England for reinforcements. Setting out for Calais, he forded the Somme with great difficulty, only to find a French army of about 50,000 men blocking his way. Henry offered advantageous terms, to save his 14,000 men from destruction; but the French were so confident of annihilating the weakened English troops that they would hear of nothing but absolute surrender. Between two woods, near the villages of Agincourt and Tramecourt, the English placed themselves in sullen desperation. The French, mainly Armagnac soldiery and men-at-arms, were drawn up in two lines, cavalry in front, infantry behind. As the English marched forward, the enemy's cavalry, peers and knights of France, charged to meet them. But the loamy ground held their horses' feet, and the rain of English cloth-yard arrows poured upon

rider and horse, broke the front rank, which in confusion retreated on the second line, breaking that too. The English archers, with billhook and hatchet, dashed in among the heavily encumbered men-at-arms and slaughtered them in great numbers, turning the fighting into a butchery. Those of the enemy who could, ran; the rest perished. The French nobility was almost annihilated in this battle; among the 5000 of noble birth being the Constable d'Albret, the commander of the French force, three dukes and very many lords and knights of lesser degree. The English lost very few men, but among them the Duke of York. It is stated that only 13 men-at-arms and about 100 foot-soldiers fell on the English side. Consult Nicolas, *History of the Battle of Agincourt* (London, 1833).

AGIO, äj'i-ò or ä'ji-ò. An Italian word, signifying 'accommodation,' first used in Italy to denote the premium taken by money-changers in giving gold for silver, on account of the greater convenience of gold for transport. The same word is now used in particular to denote the difference in the value of a metallic currency and the paper money representing it; also the variations from fixed parts or rates of exchange. It corresponds very nearly to the English word "premium."

AGIRA, ä-jë'rà, formerly SAN FILIPO D'ARGIRÒ. An ancient city in Sicily, 2130 feet above the sea and 45 miles northwest of Catania (Map: Italy, J 10). The historian Diodorus (q.v.), who was born here, credits it with having been honored by a visit from Hercules, but St. Philip has succeeded the heathen hero as the tutelary genius of the city. To the north is Gagliano, where 300 French knights were ambushed in 1300. The whole vicinity is famous for its fine marble. Pop., 1901, 17,738; 1911, 21,877.

A'GIS (Gk. ἄγῖς). The name of several kings of Sparta. 1. Son of Eurysthenes and founder of the family of the Agidæ. According to one account, he conquered Helos and established the order of the Helots. (See HELOS; HELOTS.) 2. Son of Archidamus II, and King from 427 or 426 to 401 B.C. He was one of the best kings of Sparta and one of the most distinguished men of his time. He took an active part in the Peloponnesian War, several times invaded Attica, and defeated the Athenians and their allies at the battle of Mantinea (q.v.), in 418 B.C. It was said that Alcibiades seduced Timæa, the wife of Agis; in consequence of this report, in reality incredible, Leotychides, Timæa's son, was excluded from the throne in favor of Agesilaus (q.v.). 3. Son of Archidamus III, and King from 338 to 331 B.C. He tried to overthrow the Macedonian power in Europe while Alexander the Great was in Asia, but was defeated and killed in battle by Antipater in 331 B.C. 4. Son of Eudamidas II, and King from 244 to 240 B.C. He tried to re-establish the institutions of Lycurgus and reform the Spartan State, but, being opposed by the wealthy classes, was thrown into prison and put to death. Consult Plutarch, *Life of Agis* and Barran, *Histoire d'Agis IV* (Paris, 1817).

AGIST'MENT (OF. *agister*, Lat. *ad*, to + OF. *gister*, to assign a lodging, from *giste*, Fr. *gîte*, an abode, resting-place). The common contract of bailment (q.v.), whereby a person (called the *agister*) pastures the horses, cattle, or sheep of another. The *agister* is not subject to the extraordinary liability of the common

carrier (q.v.) and the inn-keeper (q.v.) for the loss of the property intrusted to his care, but is, nevertheless, bound, as an ordinary bailee for hire, to take reasonable care of the animals. On the other hand, he is not, like the inn-keeper, the common carrier, the horse-trainer, etc., entitled to a lien (q.v.) at common law on the animals for his charges. Now, however, he has such a lien by statute. Consult: Sir William Jones, *Essay on the Law of Bailments* (New York, 1828); Story, *Commentaries on the Law of Bailments* (Boston, 1878).

AGLA'IA (Gk. Ἀγλαία, splendor, beauty). According to Hesiod, the youngest of the three Graces (q.v.), the wife of Hephæstus.

AGLA'OPHON (Gk. Ἀγλαοφῶν). A famous Greek painter from Thasos, who lived about 500 B.C. He was the father of Polygnotus (q.v.) and Aristophon, also painters and his pupils. Quintilian (12, 10, 3) warmly praises Aglaophon's pictures for simplicity of coloring.

AGLAR, ä-glär'. See AQUILEJA.

AGLAU'RA. A play by Sir John Suckling (q.v.), produced in 1637-38, and first published in 1638, in folio, and again in 1646. It is said that the King was present when the play was acted and was so distressed by its sad ending that the author wrote a new conclusion, making the piece a "tragi-comedy."

AGLIARDI, ä-lyär'dë, ANTONIO (1832-1915). Chancellor of the Holy Catholic Church, Bishop of Albano, and Cardinal. He was born at Cologno and studied law and theology at Rome. He was sent to Canada as a Bishop, and after his return in 1884 Pope Leo XIII appointed him Archbishop of Cæsarea in Palestine, and shortly thereafter he was sent as the apostolical delegate to India to settle the Goa controversy with Portugal. In 1889 he was the Papal Nuncio in Munich, and four years later filled the same position in Vienna. His personal interference with the ecclesiastical affairs of Hungary, in 1895, resulted in his receiving a public reprimand from the Hungarian government, in consequence of which a dispute arose between Bánffy, the President of the Hungarian Ministry, and Kálnoky, the Austro-Hungarian Minister of Foreign Affairs, which culminated in the downfall of the latter. He was created and proclaimed a Cardinal in 1896.

AGLOSSA, ä-glös'ä (Gk. ἄ, *a*, priv. + γλῶσσα, *glōssa*, tongue). A sub-order of anurous amphibia, the frogs, without a tongue and with one pharyngeal opening of the Eustachian tubes. It contains certain fossil forms, but only two recent families—Pipidæ (South American) and Xenopidæ (African). See PIPA.

AGNANO, ä-n-yä'nò. Formerly a small lake near Naples, Italy, situated in the crater of a volcano, now drained on account of its malarial influence. At the southern entrance to Lake Agnano lies the Grotto del Cane, whose floor is covered with a stratum of carbonic acid gas of sufficient strength and depth to kill small animals that are put into the grotto. Nearby are situated the vapor baths of San Germano, used by people afflicted with rheumatism and gout. The volcanoes surrounding the lake have been extinct since 1198 A.D. Immediately to the northwest of Agnano lies the lake of Astroni, which occupies the crater of an extinct volcano and is surrounded by beautiful woodlands.

AG'NATE (Lat. *agnatus*, born in addition to, from *ad*, to + *natus*, born). Agnates, in the law of both England and Scotland, are persons

related through the father, as cognates are persons related through their mother. By the English law of succession, agnates inherit unless the inheritance was received by the deceased person *a parte materna*, i.e., from the mother, or a cognate, in which case it would descend, if he left no issue, to her cognates. In the Roman law both of these terms had a somewhat different signification. Agnates, by that system, were persons related through males only, whilst cognates were all those in whose connection, though on the father's side, one or more female links intervened. Thus, a brother's son was his uncle's agnate, because the propinquity was wholly by males; a sister's son was his cognate, because a female was interposed in that relationship. The reason for having thus changed the meaning of terms manifestly borrowed from the Roman law seems to be that in Rome the distinction between agnates and cognates was founded on an institution which has not been adopted in the Roman sense by any modern nation—that, namely, of the *patria potestas* (q.v.). Roman *agnati* are defined by Hugo to be all those who either actually were under the same *paterfamilias*, or would have been so had he been alive; and thus it was that, as no one could belong to two different families at the same time, the agnation to the original family was destroyed and a new agnation created, not only by marriage, but by adoption (q.v.).

Justinian abolished entirely the distinction between agnates and cognates and admitted both to legal succession. As to the legal effects of the distinction in the modern sense, see SUCCESSION; GUARDIAN. See the works referred to under CIVIL LAW.

AGNES (*Fr. pron.* ān'yēs'). 1. In Molière's *L'École des femmes*, a character who has become proverbial as a type of the *ingénue*. She is a young girl brought up in ignorance of many of the social relations, who innocently makes the most suggestive remarks and without intention cruelly wounds other people's feelings. In English, Wycherley's *Mrs. Pinchwife* is in some respects patterned after her. 2. A character in Lillo's tragedy, *Fatal Curiosity*. 3. Agnes Wickfield, in Dickens's *David Copperfield*. See WICKFIELD, AGNES.

AGNES, SAINT. A Christian virgin, martyred in Rome by order of Diocletian when about 13 years old. The legend is that her beauty excited the desires of wealthy suitors, who, vainly seeking her in honorable marriage, denounced her to the governor as a Christian. Unmoved, she heard threats of torture and was sent to the public brothel, where only one, however, ventured to touch her, and he was stricken with miraculous blindness until his sight was restored in answer to her prayers. She was a little later beheaded. Her day is January 21, and her symbol is a lamb. Her legend resembles that of St. Agatha (q.v.). Consult A. Butler, *Lives of the Saints*, under January 21 (London, 1847).

AGNES GREY. A novel by Anne Brontë, published 1847, under her pseudonym of Acton Bell.

AGNESI, ān-yā'zē, MARIA GAETANA (1718-99). An Italian mathematician, born at Milan. Her family was prominent at Milan, and she had all the educational advantages that wealth could procure. Her linguistic and philosophic powers suggested the title of "oracle in seven languages." She also gave much attention to the

sciences, particularly to mathematics. "Algebra and geometry," she said, "are the only provinces of thought where peace reigns." In 1748 she was made a member of the Academy of Bologna, and in the same year appeared her *Istituzioni analitiche ad uso della gioventù italiana* (2 vols., Milan, 1748; Paris, 1775; London, 1801). In 1750 she was appointed by Pope Benedict XIV lecturer on mathematics at the University of Bologna. Early devoted to religious observances, after the death of her father (1752), she renounced her scientific work and took the veil. Her name is connected with an interesting cubic curve. Consult J. Boyer, "La mathématicienne Agnesi," in the *Revue Catholique des revues françaises et étrangères* (Paris, 1897), and Antonio Francesco Frisi, *Elogio* (Milan, 1799; translated by Boulard, Paris, 1807).

AGNES OF AUSTRIA (1281-1364). A daughter of Albrecht I, Emperor of Germany. She was the wife of Andreas III, King of Hungary, and after the murder of her father (1308) lived at the monastery of Königsfelden, which her mother had erected upon the site of the assassination of the Emperor. She took an active part in the political events of the period and frequently acted as mediator between Austria and the Swiss Confederacy. See Liebenau, *Lebensgeschichte der Königin Agnes von Ungarn* (Regensburg, 1868).

AGNES OF MERAN, mā-rän' (?-1201). A Queen of France, daughter of the Duke of Meran (Tyrol). She was married in 1196 to Philip Augustus (q.v.), who had obtained (through the French bishops) a divorce from Ingeborg of Denmark. The Pope refused to allow the divorce, but the King braved the Papal wrath. In 1200 France was placed under an interdict; but the King, by a feigned compliance, secured the raising of the interdict. Agnes died in 1201, but it was not until 1213 that Philip was reconciled to Ingeborg. Then the Pope legitimized the two children of Agnes.

AGNES OF POITIERS, pwä'tyā' (1025?-1077). A Queen of Germany, daughter of William V, Duke of Aquitaine, and second wife of Henry III of Germany, to whom she was married in 1043. She was much influenced by the ideas of Cluny. After the death of Henry (1056), Agnes became Regent of the Empire as guardian of her son, Henry IV. In 1062 rebellious nobles secured possession of the young Henry, and Agnes went to Italy. She became closely associated with Gregory VII in his contest against Henry.

AGNES'S EVE, SAINT. The night of January 20. In popular superstition it is regarded as an occasion when young women can by various magic arts behold the faces of their destined husbands.

"The Eve of St. Agnes" is the title of an exquisite poem by Keats.

AGNES SOREL' (c.1422-50). The mistress of Charles VII of France from 1444 until her death. She was the first royal mistress in France to receive public recognition as an acknowledged power in the kingdom. She received many gifts and honors and aroused much scandal. Her death was sudden, and it was supposed that she was poisoned by the Dauphin, afterward Louis XI. She had four children by the King. Many legends gathered about her name, and credit was erroneously given her for aiding Joan of Arc in her work. She has been popularly regarded as a virtuous character, using her influence for

good. There is a beautiful monument to her in the church at Loches. See Duquesne, *Vie et Aventures galantes de la belle Sorel* (Paris, 1909).

AGNEW, CORNELIUS REA (1830-88). An American physician. He was born in New York City, and graduated from Columbia College in 1849, and from the College of Physicians and Surgeons in 1852. In 1858 he was appointed surgeon-general of New York State, and during the Civil War was medical director of the New York Volunteer Hospital. He was prominent in the United States Sanitary Commission. He assisted in founding the Columbia School of Mines in 1884, founded the Brooklyn Eye and Ear Hospital in 1868, and the Manhattan Eye and Ear Hospital in 1869.

AGNEW, DAVID HAYES (1818-92). Professor of surgery at the University of Pennsylvania and very widely known by his surgical inventions and by his writings, among which is *The Principles and Practice of Surgery* (3 vols., 1878-83). He was one of the surgeons who attended President Garfield when he was shot.

AGNEW, SIR WILLIAM (1825-1910). An English publisher and publicist. He was born in Manchester and was educated privately in that city. His father, Thomas Agnew, was a printer, with large establishments in Manchester, Liverpool, and London. William Agnew entered the firm and eventually became senior member, a position which he held for many years, the firm name, however, remaining Bradbury, Agnew & Co. Among the publications of this house is *Punch*, the great English humorous weekly. William Agnew was for many years a warm friend and supporter of Gladstone. In 1880 he was elected to Parliament as a Liberal from a Lancaster division. He was reelected five years later, but retired from politics in 1892, after a defeat for reelection. He was a prominent figure in the publishing and art world of his day, and in public activities became known as chairman of the Art Committee of the Manchester Exposition (1887); member of the Royal Commission for the Melbourne Centenary Exposition; and member for the Paris Exposition of 1892. He printed a volume of essays, addresses, and travel notes, which had a private circulation.

AGNI, äg'nê (Skr. *Agni-s*). The fire god of the Hindus, corresponding in name to the Latin *ignis*, Lithuanian *ugnīs*, and Old Slavic *ognī*, fire. Next to Indra (q.v.), he is the most prominent of the gods in the *Veda* (q.v.). No less than 200 hymns celebrate his praise under his three-fold form, as the fire on earth, especially the altar-fire, the lightning in the sky, and the sun in heaven. His birth is of divine origin, as the lightning of the clouds, or he is daily produced by a miracle, the rubbing together of two sticks which are regarded as his parents, and he devours them as soon as he is born. Kindled each morning at the sacrifice, his worship forms one of the most important parts of the ritual. He is especially the messenger between the gods and men, and he rides upon a chariot drawn by two or more steeds. Although an immortal, he has taken up his abode among men, and he is regarded as the most honored guest. He is also the flame of the sacrifice offered by the gods themselves to maintain their sovereignty and assure the persistence of the supreme laws of the universe. In the later literature less is

made, perhaps, of Agni than in the early hymns; but, as one of the most prominent gods, several legends are preserved regarding him in the Hindu epics *Mahābhārata* and *Rāmāyana* (q.v.). The *Harivaṅśa* (q.v.) describes him as clad in black, with a banner of smoke and a javelin of flame. In pictures he is variously portrayed, but his color is red, and he is represented as having two faces, which typify his destructive as well as his beneficent character, and he has three legs and seven arms. Sometimes he is represented as riding upon a ram or as accompanied by that animal. Consult: Macdonell, *Vedic Mythology* (Strassburg, 1897); Hopkins, *Religions of India* (Boston, 1895); Wilkins, *Hindu Mythology* (London, 1900).

AGNO, äg'nō. The second river of importance in the island of Luzon, Philippines, rising near the boundary of the provinces of Banguet and Lepanto. It is about 128 miles long and because of the irregularity of the country through which it flows receives a great many tributaries throughout the lower part of its course. It empties into the Gulf of Lingayen.

AGNOETÆ, äg'nō-ē'tē (Gk. *ἀγνοεῖν*, *agnoein*, to be ignorant). A Monophysite sect in the sixth century, which gave prominence to the statement that, in his human nature, Christ was ignorant of many things, especially of the time of the day of judgment. An Arian sect of the same name in the fourth century denied the omniscience of God.

AGNOLO, dän'yō-lō, BACCIO D'. See BAGLIONI.

AGNOLO. See AGOSTINO.

AGNO'MEN (Lat. *ad*, to, in addition + *nomen*, name). A term used by the ancient Roman grammarians of the fourth century A.D. to denote an additional personal name derived from some exploit, personal characteristic, or important event; as *Cunctator*, 'the Delayer,' given to Q. Fabius Maximus because of his policy of delay in the war against Hannibal. Compare also Pompeius *Magnus*; Æmilius *Macedonicus* (see PAULUS ÆMILIUS). The Romans of an earlier time apparently regarded such a designation as an additional *cognomen* (q.v.). The *cognomen* was inherited or bestowed at birth, and belonged to all members of a *familia*; the *agnomen* was a name won later by an individual.

AGNONE, äñ-yō'nā. A city of south Italy, 22 miles northwest of Campobasso (Map: Italy, J 6). It stands on a hill said to be the site of the Samnite *Aquilonia*. There are sulphur and mineral springs and copper mines in the neighborhood, and the town has cloth, steel, and copper works. Pop., 1901, 9793; 1911, 10,106.

AGNOSTICISM (Gk. *ἀγνωστος*, *agnōstos*, unknown, unknowable, ignorant). A word coined in 1869 by Professor Huxley to express the doctrine that man from his very nature is incapable of forming trustworthy conclusions concerning ultimate reality. The doctrine is by no means new. It is essentially one with the view of Protagoras (q.v.), that the individual man is the measure of the universe, and with the view of the Greek skeptics from Pyrrho onward. (See ÆNESIDEMUS.) Among English-speaking philosophers H. Spencer (q.v.) is the best-known agnostic. The tenability of the agnostic position depends on the justifiability of the dualistic assumption that reality is independent of mind. It argues that knowledge is the result of a mental process which claims to represent an external

reality; that the knowledge that this claim is valid is possible only after a comparison of the representation with the original; but that the original is, by hypothesis, not an object of knowledge; hence, that no comparison is possible for the knower. Knowledge of reality is thus a huge undemonstrable assumption. Consult Sir Leslie Stephen, *An Agnostic's Apology* (New York, 1903) and W. U. Moore, *Glimpses of the Next State* (London, 1911). For a criticism of agnosticism see KNOWLEDGE, THEORY OF; ABSOLUTE; DUALISM; APPEARANCE.

AGNOS'TUS (Gk. *ἄγνωστος*, *agnōstos*, unknown). A characteristic Cambrian genus of blind trilobites distinguished by their small size, the elliptical form of the dorsal shield of carapace, the close resemblance of the head-shield (cephalon) and tail-shield (pygidium), and the presence of only two segments in the thorax. This genus, comprising over 150 species, is abundantly represented in the Cambrian formations of Scandinavia, Bohemia, Great Britain, Spain, and North America; indeed, certain kinds of Cambrian shales are filled with the detached fragments of the discarded moults of these crustaceans. A few species are, in northern Europe, known from the lowermost Ordovician beds. An allied genus, also characteristic of the Cambrian formations, is *Microdiscus*, with four thoracic segments, which seems to be a somewhat earlier form than *Agnostus* and may perhaps be in a certain sense the ancestral form from which *Agnostus* was evolved. For illustration, see TRILOBITA. See also articles on TRILOBITA; CAMBRIAN SYSTEM.

AG'NUS, FELIX (1839—). An American soldier and editor. He was born in Lyons, France, and fought in the war waged by Napoleon III against Austria, and after the battle of Montebello was detailed to the celebrated flying corps under Garibaldi. He came to America in 1860, and enlisted in the Duryea Zouaves (New York Volunteers), upon the outbreak of the Civil War, and at the battle of Big Bethel saved the life of General Kilpatrick. He served as lieutenant-colonel under Sheridan in the latter's famous campaign in the Shenandoah valley (1864), and toward the close of the war, as inspector-general in the Southern Department, he was commissioned to dismantle the Confederate forts in South Carolina, Georgia, and Florida. At the close of the war he was brevetted brigadier-general of volunteers (March 13, 1865), and soon afterward was retired from the service. He then became business manager, and later editor and publisher, of the *Baltimore American*.

AG'NUS DE'I (Lat. Lamb of God). One of the titles of Christ (John i. 29); also the name given to a certain prayer used in the Roman Catholic service of mass. The litanies generally conclude with the same prayer: "O Lamb of God, that takest away the sins of the world, have mercy upon us." The figure of a lamb bearing a cross, stamped upon an oval of wax, silver, or gold, is also styled an *Agnus Dei*. Such medals have been consecrated by the popes since the fourteenth century, and are generally distributed among the faithful on the first Sunday after Easter. In the ancient Church candidates for baptism received similar medals of wax and wore them as objects of devotion. In the Greek church the cloth which covers the cup in the communion service bears the image of a lamb and is styled the *Agnus Dei*.

AGOG'ICS. A musical term denoting the subtle modifications of tempo inseparable from an expressive interpretation. The term was first introduced by H. Riemann (q.v.) in his *Musikalische Dynamik und Agogik* (1884). The author shows that all dynamic variations affect the strict time-value of accented notes, so that in a crescendo the performer almost unconsciously prolongs the actual value of every accented note, whereas in a diminuendo the time-value is lessened.

AGONA'LIA. A Roman Festival. See FESTIVALS.

AGON'IC LINES (lines without angles, from Gk. *ἀ*, *a*, priv. + *γωνία*, *gōnia*, angle). Imaginary lines on the surface of the earth such that at each point through which one passes the magnetic declination is zero; that is, at such a point a magnetic compass needle lies in the geographical meridian and hence points in a "true" north and south direction. There are two agonic lines at the present time (1913). One is a closed curve passing across Hudson Bay, into the Atlantic Ocean east of Florida, across Brazil, through the Antarctic Ocean, near the south pole of the earth, northward through Australia, the Indian Ocean, Russia, near the north pole of the earth, and back again. The other is a much smaller closed curve, called the "Siberian Oval," because it is contained in Eastern Siberia and China. The agonic lines as well as the isogonals and isoclinic lines are shown on special charts of the world published by the British Admiralty, and for the United States by the Coast and Geodetic Survey. See MAGNETISM, TERRESTRIAL.

AGONOTHE'TES (Gk. *Ἀγωνοθέτης*, from *ἀγών*, contest + *τίθημι*, place, arrange). The name of an official at Greek games, serving usually as judge of the contests. Sometimes as giver or exhibitor of them. See FESTIVALS; GREEK GAMES.

AG'ONY COL'UMN. In England, a term applied to that part of a newspaper, generally the second column of the advertisement sheet, headed by notices of losses and disappearances, mysterious communications, etc., corresponding to the American *personal column*.

AGOO, *á-gō'ō*. A town of Luzon, Philippines, in the province of La Union. It is situated on the west coast, about 19 miles south of San Fernando. Agriculture and fishing are the important industries. Cotton, sugar-cane, and rice are produced. Pop., 1903, 10,653.

A'GORA (Gk. *ἀγορά*, an assembly, later, a gathering-place). A part of a Greek city corresponding in general to the Forum (q.v.) of a Roman city. See ATHENS.

AG'ORAC'RITUS (Gk. *Ἀγοράκριτος*, *Agorakritos*). A Greek sculptor of the fifth century B.C. He was born on the island of Paros and was the favorite pupil of Phidias. His works are said to have been so perfect that the ancients were frequently uncertain whether they should be ascribed to him or to Phidias. His chief creation was the colossal figure of Nemesis at Rhamnus, which he is supposed to have developed from his unsuccessful Aphrodite, prepared for the contest with Alcamenes. Fragments of the work were discovered at Rhamnus; part of the head is in the British Museum. Consult Ulrich von Wilamowitz-Moellendorff, "Antigonos von Karystos," in his *Philosophische Untersuchungen*, vol. iv.

AG'ORAPHO'BIA. A symptom of neuras-

thenia, characterized by a fear of open spaces, not necessarily open country, but of streets, squares, or the interior of large buildings, theatres, churches, and the like.

AGOSTA, à-gō'stā, or **AUGUS'TA**. A walled city of Sicily, in the province of Syracuse, 19 miles north of that city. It stands on a peninsula (now an island), jutting into the Mediterranean, and is said to occupy the site of the Megara Hyblæa of the ancients. Agosta, founded by the Emperor Frederick II in 1232, played an important part in the war of the Sicilian Vespers, withstanding Charles of Anjou until betrayed into the hands of William L'Estendart, one of his barons (1286). The city was then sacked and the inhabitants ruthlessly butchered, and many years passed before Agosta was repopled or began to prosper. In 1551 Agosta was taken and burned by the Turks. Earthquakes devastated the city in 1268, in 1551, in 1693, when one-third of the inhabitants perished, and in 1848. In 1676 a great naval battle was fought near here between the Dutch under De Ruyter and the French. De Ruyter himself was killed. The port is spacious, but rather difficult of access. While salt is the chief article of export, oil, wine, cheese, fruit, honey, and sardines are also exported. Pop., 1901, 16,402.

AGOSTINO, ä'gō-stē'nō, and **AGNOLO**, ä'nyō-lō (active 1310-50). Sieneſe ſculptors and architects, of the ſchool of the Piſani (q.v.). They have been erroneouſly called brothers, becauſe they ſometimes worked together; but Agostino was the ſon of Giovanni, and Agnolo the ſon of Ventura. Their ſculptural maſterpieces include the monument of Biſhop Tarlati at Arezzo (1330) and that of the jurist Pino de Sinibaldi in the cathedral of Pistoia; much ſculpture is alſo aſcribed to them in Siena. Documentary evidence ſhows that each deſigned important buildings for their native town. Agnolo deſigned the important out-gates and the Caſtello of Grosſeto, while Agostino worked upon the vaults and the celebrated tower of the Palazzo Comunale, Siena, and the fortress of Maſſa. Agostino was uſually aſſiſted in his work by his ſon Giovanni.

AGOSTINO DI DUCCIO, dē dōōt'chō (1418-c.1481). A Florentine ſculptor and architectural decorator, one of the foremoſt of the later fifteenth century. His maſter in ſculpture is unknown; he probably developed as a ſtonemaſon. At 23 he executed a ſeries of reliefs for the cathedral at Modena (1442). Accuſed of theft, he fled from Florence in 1446, and in 1447 he was placed by the architect Alberti in charge of the ſculptural decorations of the interior of San Francesco at Rimini. Some parts of theſe, ſuch as the tomb of Sigismundo Malateſta, which is attributed to him, are maſterly. But his full capacity was ſhown in his next work, the façade of San Bernardino at Perugia, one of the fineſt pieces of Renaiſſance ſculpture compoſition (1457-61). In the ſpring of 1463 he was again in Florence. To this laſt period belong the beautiful tabernacle of Ogniſanti, Florence, the marble relief of the Madonna in the Muſeo del Opera, two others in the Louvre, and one of terra cotta in the Berlin Muſcum. His laſt-known work is the fine San Pietro Gate in Perugia, upon which he was occupied after 1480. His ſtyle was ſometimes mannered and incorrect, but always excellent from the decorative point of view. His forte was very low relief with evan-

escent effects, poetic female figures with marvelous flowing draperies.

AGOULT, à'gōō', MARIE CATHERINE SOPHIE DE FLAVIGNY, COMTESSE D' (1805-76). A French author, whose pseudonym was Daniel Stern. She was born at Frankfort-on-the-Main, but was educated at Paris, where, in 1827, she married the Count d'Agoult. Afterward she lived with Franz Liszt, and of her two daughters by him the youngest, Cosima, was married to Richard Wagner. After a series of novels, including *Hervé* (1841) and *Nelida* (1845), she published several political works, of which the best known are *Lettres républicaines* (1848), criticising the government of Louis Philippe, and the *Histoire de la Révolution de 1848* (3 vols., 1851-53). Her best work is *Esquisses morales et politiques* (1849), a volume of political and moral aphorisms in the style of the *Maximes* of Rochefoucauld. Though her moral laxity made her the subject of much unpleasant notoriety, the Comtesse d'Agoult's salon was, for many years, the rendezvous of many leading statesmen, poets, critics, painters, and musicians. There Alfred de Vigny, Chopin, Meyerbeer, Heine, George Sand, and Sainte-Beuve were frequently seen; there Ponsard read his tragedy of *Lucrece* for the first time. During the period from 1838 to 1848 her salon had merely a social character. When, however, the fall of Louis Philippe in the revolution of 1848 led her to join the ultra-democratic party and to begin her crusade against "property and capital, orthodoxy and family," society was closed against her, and it was then that such men as Rodrigues, Infantin, Lamartine, and Louis Blanc sought her company. Consult her own reminiscences contained in *Mes souvenirs* (Paris, 1877); and the works of Fleury, *Portraits révolutionnaires*, vol. i (Paris, 1889); also Rochelaure, *Une amitié romanesque: George Sand et Mme. d'Agoult* (Paris, 1895).

AGOUTA, à-gōō'tā. See SOLENODON.

AGOUTI, à-gōō'tē (Fr. through Sp., from the native name). Any of several large rodents of South America and the West Indies, of the genus *Dasyprocta* and family *Dasyproctidæ*. They are 18 or 20 inches long, have somewhat squirrel-like forms, with slender legs and hoof-like claws, and are brownish above and yellowish below. They inhabit woodlands, where they are gregarious and dwell in holes, and whence they ramble abroad, mainly at night, with grunting cries, to feed on vegetables, often doing great damage to sugar-cane. About 12 species are known, as: the "pampas hare," pursued as game in southern Brazil and southward; Azara's, the acouchy (or acuchi) of Guiana and the West Indies; the black and the yellow-rumped, which are West Indian and best known. Also spelled "agouty" and "aguti"; it is to be noted that Darwin (*A Naturalist's Voyage*) applies the name to the Patagonian cavy. See Plate of CAVIES accompanying CAVY.

AGRA, ä'grā. A part (formerly Northwest Provinces) of the United Provinces of Agra and Oudh (q.v.), British India, and a division, district, and city thereof. The area of the Agra portion of the United Provinces is 83,198 square miles; pop., in 1901, 34,859,109; in 1911, 34,624,040, of whom 29,415,419 are Hindus. Agra division, 10,078 square miles: pop., 1901, 5,249,970; 1911, 5,007,921. Agra district, 1845 square miles: pop., 1901, 1,060,528; 1911, 1,021,847. See AGRA (city).

AGRA (evidently from *Akbarabad*, city of Akbar). A city in the United Provinces of Agra and Oudh, British India, in the district of the same name on the right bank of the Jumna, 110 miles southeast of Delhi and 841 miles by rail northwest of Calcutta (Map: India, C 3). As the railway and administrative centre of its district and of the large division to which it gives its name, Agra is a place of great importance. It has an extensive trade in cotton, tobacco, indigo, salt, sugar, and grain, and manufactures of inlaid mosaic work, for which it is famous, gold lace, and shoes. It also has a considerable transport trade by the Jumna and Agra canal. Agra is fortified and has a garrison; there is a military station in the neighborhood of the city. The climate during the hot and rainy seasons (April to September) is injurious to Europeans, but, on the whole, the average health of the city is equal to that of any other station in the United Provinces. The mean annual temperature is 79° F.; January, 60°, June, 95°. The ancient walls of the city embrace an area of about 11 square miles, of which about one-half is at present occupied. The houses are, for the most part, built of the red sandstone of the neighboring hills. The principal street, running northwest from the fort, is very spacious, but the rest are generally narrow and irregular, though clean. The Strand, a thoroughfare on the river banks, is 2 miles long and 80 feet wide.

Some of the public buildings, monuments of the House of Timur, are of striking magnificence. Among these are the fine fortress built by Akbar, within the walls of which are the palace and audience-hall of the Emperor Shah Jehan, and the Moti Masjid or Pearl Mosque, so called from its surpassing architectural beauty. Still more celebrated is the Taj Mahal, situated without the city, about a mile to the east of the fort. This extraordinary and beautiful mausoleum, "the most splendidly poetic building in the world," was built by Shah Jehan for himself and his favorite wife, Arjiman Banoo (surnamed Mumtaz Mahal). Twenty thousand men, says Tavernier, who saw the work in progress, were employed incessantly on it for 22 years. The principal parts of the building are constructed or overlaid outside and in with white marble; and the mosaic work of the sepulchral apartment and dome is described by various travelers in terms of glowing admiration. It is composed of 12 kinds of stones, of which lapis-lazuli is the most frequent, as well as the most valuable. (See **TAJ MAHAL**.) Of British and other European edifices in and near the city, the principal are the buildings of a Catholic mission and episcopal see founded in the sixteenth century, the government house, the college for the education of natives, the Metcalfe testimonial, the English church, and the barracks. A committee appointed by the government administers municipal affairs, derives revenue from real estate and octroi, and operates the water works. This city is held in great veneration by the Hindus as the scene of the incarnation of Vishnu under the name of Parasu Rama. It first rose to importance in the beginning of the sixteenth century, and from 1526 to 1658 it was the capital of the Mogul sovereigns. In the latter year Aurungzebe removed to Delhi; thereafter Agra declined. It was taken in 1784 by Scindia, and surrendered in 1803 to Lord Lake after a bom-

bardment of a few hours. During the Sepoy mutiny of 1857 Agra was one of the places in which the Europeans were confined. They were obliged to abandon the city in June and retire to the fort or residency, to which fugitives also flocked from all parts of the country. Most of the European buildings in the city were burned by the Sepoys. Heroic sallies were made from the fort, until the place was relieved in October by the rapid and brilliant march of Colonel Greathed. Pop., 1901, 188,022; 1911, 185,449. See H. G. Keene, *The Agra Guide* (Agra, 1872), and E. B. Havel, *Handbook to Agra*, etc. (London, 1904). See **TAJ**.

AGRA AND OUDH. See **UNITED PROVINCES OF AGRA AND OUDH**.

AGRAM, ä'grám (Hungarian *Zágráb*, Croatian *Zagreb*). The capital of the Hungarian crownland of Croatia-Slavonia, beautifully situated at the foot of the Agram Mountains, about 2 miles from the Save, and 141 miles east-northeast of Fiume by rail (Map: Hungary, D 4). It consists of the upper, lower and episcopal towns. The chief public buildings are the cathedral, a late Gothic edifice dating from the fifteenth century; the palace of the *ban*, or governor; the National Theatre; the Gothic church of St. Mark; the archiepiscopal palace; the Academy of Sciences, with fine collections of pictures and antiquities, and the palace of justice. Agram is the seat of government of the highest courts of the province and of the archbishop. The city is a great centre of South-Slavic national life. Its educational institutions include the Franz Josef University, founded in 1874, a gymnasium, a high school, industrial school, normal training schools, and several libraries. Its manufactures include leather, linen, porcelain, silk, and tobacco, and it has a considerable trade in grain and wine, the latter made from the vineyards which nearly surround the city. Pop., 1890, 38,000; 1900, 57,690; 1910, 79,038. Probably Roman in origin, Agram became an episcopal see in 1093 and was destroyed by the Tatars in 1242. Rebuilt and made a free royal city, it developed rapidly. In 1880 it was partially destroyed by an earthquake and suffered considerably from another shock in 1901.

AGRAMAN'TE, or **AG'RAMANT**. The King of the Moors in Boiardo's *Orlando Innamorato* and in Ariosto's *Orlando Furioso*. He was the son of Trogano and crossed over into Gaul to ravage the land and avenge himself on Charlemagne for the death of his father. He was slain by Orlando.

AGRAMONTE, ä'grá-môn'tâ, IGNACIO (1841-73). A Cuban revolutionist. He was born at Puerto Príncipe, Cuba, studied law at the University of Havana, and was admitted to the bar in 1867. He took a conspicuous part in the insurrection which broke out against Spain in 1868 and became Secretary of the provisional government in 1869. He commanded the Cuban forces in the Camagüey district and for some time—on the retirement of Quesada, Jordan, and Cavada—acted as commander-in-chief. He was killed in the battle of Jimaguayú.

AG'RAPHA (Gk. unwritten, from *ἀ*, *a*, priv. + *γράφειν*, *graphein*, to write). Since the last part of the eighteenth century this term has been used to denote alleged sayings of Jesus not found in the canonical Gospels and yet deemed worthy of consideration as to their possible genuineness. With the growth of textual criticism

it became customary to put into the same class sayings of Jesus found in some manuscripts or versions of the Gospels, but not sufficiently supported to be regarded as having formed a part of the original text, as e.g., the addition to the Lord's Prayer (Matt. vi. 13b), the reference to exorcism of demons through prayer and fasting (Matt. xvii. 21), the words of the risen Jesus (Mark xvi. 9-20), and those spoken to the woman taken in adultery (John vii. 53-viii. 11). Finally, the term is also employed by some writers to designate alleged quotations from the Old Testament in the New Testament which are not found in our Hebrew text, and other passages in the New Testament, not containing words of Jesus, found in various manuscripts and versions, but not considered as part of the original text. In earlier times such agrapha were chiefly gathered from Acts, the Pauline epistles, the earliest apocryphal gospels, ancient liturgies, and patristic writers. More recently the material has greatly increased by the discovery of new gospel fragments and collections of sayings. The bulk of the rich apocryphal gospel-literature (see APOCRYPHA) has generally been left out of consideration as being too late to contain a reliable tradition. A collection of extracanonical sayings was made by Cotelerius, *Ecclesiae Græcæ Monumenta* (1677-88), who was followed by J. E. Grabe, *Spicilegium patrum et hæreticorum* (1698-1700), and J. B. Fabricius, *Codex Apocryphus Novi Testamenti* (2d ed., 1719). A more complete work on the subject was that of Alfred Resch, *Agrapha*, in Gebhardt and Harnack's *Texte und Untersuchungen*, 1889. His conclusions were criticised by J. H. Ropes, *Die Sprüche Jesu* (1896), who reduced the number of genuine sayings from 74 allowed by Resch to 13. Most critics, however, were unwilling to accept any of them as genuine. Great expectations were aroused by the announcement in 1897 that a papyrus had been discovered at Behnesa, the ancient Oxyrrhyncus, in Egypt, containing a number of sayings of Jesus, each beginning with "Jesus saith." They were published by the discoverers, Grenfell and Hunt, under the title *Logia Jesu: Sayings of our Lord from an Early Greek Papyrus* (1897). The seven distinct sayings proved to be of a very late type, showing a certain kinship to the Gospel according to the Egyptians, and are now generally dated between 150 and 300 A.D. The same applies to the five additional sayings found at the same place some years later and published by Grenfell and Hunt under the title: *New Sayings of Jesus and Fragment of a lost Gospel from Oxyrrhyncus* (1904). The latest and most extensive presentation and discussion of the whole material is the second edition of Resch's book, called *Agrapha: Ausserkanonische Schriftfragmente*, in the *Texte und Untersuchungen* (1906). He there maintains that 36 are genuine. As a rule, however, New Testament scholars hesitate to admit the authenticity of any of them. See Hennecke, *Neutestamentliche Apocryphen* (1904), and *Handbuch zu den neutestamentlichen Apocryphen* (1904); Preuschen, *Antilegomena* (2d ed., 1905); Bernard Pick, *Paralipomena. Remains of Gospels and Sayings of Christ* (1908).

AGRAPH'IA. A variety of aphasia, characterized by inability to write.

AGRA'RIAN LAWS (Lat. *leges agrariæ*). Laws regulating the division or the holding of the public or State lands (*ager publicus*) of the Roman domain. With the name of agrarian laws

was formerly associated the idea of the abolition of property in land, or at least of a new distribution of it. This notion of the agrarian laws of the Romans was not only the popular one, but was also received by most scholars. The French Convention, in 1793, passed a law punishing with death any one who should propose an agrarian law, understanding by the term an equal division of the soil among all citizens. Now, it would have been strange if the Romans, with whom private property was so sacred, could ever have been brought to sanction any measure of that kind. German scholars, Heyne, Savigny, and especially Niebuhr, first explained the true character of the Roman agrarian laws. There are still some disputed points in this matter; but one thing is settled—those laws had no reference to private lands held in absolute property but to public or State lands. Their purpose was to give to the poorer citizens allotments out of the land belonging to the State and to regulate the terms on which such assignments and the rest of the land not so allotted could be held and used.

As the dominion of Rome extended (an extension due for centuries wholly to conquest), a portion of each conquered territory, sometimes as much as a third, was confiscated to the State and became public domain. All laws respecting the disposition of these lands were called agrarian laws, which are therefore of various kinds. What caused these laws to be so long mistaken for an interference with private rights, and excited such opposition to them, was the use which was made of the public domain while it was unappropriated. "It was the practice at Rome," says Dr. Arnold, "and doubtless in other States of Italy, to allow the individuals to occupy such lands, and to enjoy all the benefits of them, on condition of paying to the State the tithe of the produce, as an acknowledgment that the State was the proprietor of the land, and the individual merely the occupier. Now, although the land was undoubtedly the property of the State, and although the occupiers of it were in relation to the State mere tenants-at-will, yet it is in human nature that a long undisturbed possession should give a feeling of ownership; the more so as, while the State's claim lay dormant, the possessor was, in fact, proprietor, and the land would thus be repeatedly passing by regular sale from one occupier to another."

The State, however, was often obliged to interfere with these occupiers of the public lands and to resume its rights. The very idea of a citizen, in ancient times, involved that of a landholder, and when new citizens were to be admitted, each one had to receive his portion out of the unallotted public domain; this involved, of course, the ejection of the tenants-at-will. It appears, also, that the right to enjoy the public lands in this temporary way was confined to the old burghers or patricians. This, taken in conjunction with the tendency, strong at all times, of larger possessions to swallow up smaller, kept up an ever-increasing number of landless commoners, whose destitution and degradation came from time to time to such a pitch that alleviation was necessary to prevent the very dissolution of the State. Hence sprang such agrarian laws as are considered below. It is easy, however, to see what motive the patricians, as a body, had to oppose all such measures, since it was their interest, though not their right, to keep the lands unallotted.

The enactment of agrarian laws occasioned some of the most remarkable struggles in the internal history of Rome. Most of the kings of Rome are said to have carried an agrarian law; that is, to have divided a portion of the public land among those whom they admitted to the rights of citizenship. About 24 years after the expulsion of the Tarquins, the distress of the commons called aloud for remedy, and in 486 B.C. the consul Spurius Cassius proposed an agrarian law, of whose nature we have no real knowledge. The aristocracy, however, contrived to defeat the proposal, and, when the year of his consulship was out, Cassius was accused of having tried to win popularity to make himself king, was condemned for treason, scourged, and beheaded, and his house was razed to the ground.

The first important agrarian legislation of a permanent nature actually passed was that proposed by the tribunes C. Licinius Stolo and L. Sextius, and carried, after a struggle of five (or, according to some authorities, ten) years, in the year 367 B.C. The provisions of this legislation, known as the Licinian Rogations (q.v.), *Rogationes Licinianaë*, were as follows: "Every Roman citizen shall be entitled to occupy any portion of the unallotted State land not exceeding 500 *jugera* (see ACRE), and to feed on the public pasture land any number of cattle not exceeding 100 head of large, or 500 head of small, paying in both cases the usual rates to the public treasury. Whatever portions of the public land beyond 500 *jugera* are at present occupied by individuals shall be taken from them and distributed among the poorer citizens as absolute property, at the rate of seven *jugera* apiece. Occupiers of public land shall also be bound to employ a certain number of freemen as laborers.

This law produced for a time very salutary effects. But before the year 133 B.C., when Tiberius Gracchus was elected tribune, the Licinian laws had been suffered to fall into abeyance; and although vast tracts had been acquired by the Italian, the Punic, and the Greek wars, no regular distribution of land among the destitute citizens had taken place for upward of a century. Numerous military colonies had indeed been founded in the conquered districts, and in this way many of the poorer Romans or their allies had been provided for; but there still remained large territories, the property of the State, which, instead of being divided among the poorer members of the State, had been occupied and brought into cultivation by the rich capitalists, many of whom thus came to hold thousands of *jugera*, instead of the 500 allowed by the Licinian laws. To a Roman statesman, therefore, looking on the one hand at the wretched pauper population of the meaner streets of Rome, and on the other at the enormous tracts of the public land throughout Italy which the wealthy citizens held in addition to their own private property, the question which would naturally present itself was: Why should not the State, as landlord, reclaim from these wealthy capitalists, who are her tenants, as much of the public land as may be necessary to provide little farms for these pauper citizens, and so convert them into respectable and independent agriculturists? This question must have presented itself to many; but there were immense difficulties in the way. Not only had long possession of the State lands, and the expenditure of large sums in bringing them into cultivation, given the wealthy tenants a sort of proprietary claim

upon them, but in the course of generations, during which estates had been bought, sold, and inherited, the State lands had become so confused with private property that in many cases it was impossible to distinguish the two. Notwithstanding these difficulties, Tiberius Gracchus had the boldness to propose an agrarian law, to the effect that no one should occupy or use more than 500 *jugera* of the State land (a father of a family might occupy 500 *jugera* of the State land for himself and 250 *jugera* additional for each of his sons, with a maximum of 1000 *jugera*); in every case where this amount had been exceeded, the State should reclaim the surplus, paying the tenant a price for the buildings, etc., which he had been at the expense of erecting on the lands thus taken from him. The recovered lands were then to be distributed among the poor citizens; a clause was inserted in the bill to prevent these citizens from selling the lands thus allotted to them, as many of them would have been apt to do.

According to the laws and constitution of Rome, there was nothing essentially unjust in this proposal, which was, in private, at least, approved of by some of the most distinguished men of the time. The energy of Tiberius Gracchus carried the measure, in spite of the opposition of the aristocratic party, to whose enmity he fell a victim. His work was taken up a decade later by his brother Gaius, who also met a violent death. (See GRACCHUS.) The attempts to carry out the "Sempronian law," as it was called (from the name of the *gens* to which the Gracchi belonged), were attended with great difficulties, and although not formally repealed, it continued to be evaded and rendered inoperative. Various agrarian laws were subsequently passed, some by the victorious aristocratic party, in a spirit directly opposed to that of the Licinian and the Sempronian laws.

Beside agrarian laws having for their object the division among the commons of public lands usurped by the nobles, there were others of a more partial and local nature, for the establishment of colonies in particular conquered districts; these naturally met with less opposition. Still more different were those violent appropriations of territory made by the victorious military leaders in the later times of the Republic, in order to reward their soldiers and to establish exclusively military colonies (such appropriations, made, e.g., by Sulla and Octavianus, were called proscriptions). In these the private rights of the previous occupants were often disregarded. Consult Botsford, *The Roman Assemblies* (New York, 1909); Hardy, *Six Roman Laws* (Oxford, 1911).

AGRARIAN PARTY. See POLITICAL PARTIES, *Germany*.

AGRAVAINE, Sir. One of the knights of the Round Table. He and his half-brother Sir Mordred hated Sir Launcelot, and, according to Sir Thomas Malory, contrived to surprise him in Queen Guinevere's apartment, after they had sent the King out hunting. Sir Launcelot, however, killed Sir Agravaire and the 12 attendants; only Sir Mordred escaped.

AGREDA, à-grā'dà, MARIA (CORONEL) DE (1602-64). The superior of the convent of the Immaculate Conception, whose monastic name was Maria of Jesus. She was born at Agreda, Spain. She reported that she had had revelations from heaven, and that God had commanded her to write an inspired life of Mary, the mother

of Jesus. The book is entitled *La Mística Ciudad de Dios*, etc. (3 parts, Madrid, 1670; French trans., *La cité mystique de Dieu*, etc., 6 vols., Marseilles, 1695, Paris, 1857; German trans., *Die geistliche Stadt Gottes*, etc., 2d ed., Regensburg, 1893). Pope Innocent XI prohibited its universal circulation, but, at the request of the King of Spain, excepted the Spanish countries. An English translation has recently been made.

AGREEMENT. See CONTRACT.

AGREEMENT, METHOD OF. See INDUCTION.

AGREEMENT OF THE PEOPLE, THE. A remarkable document set forth by the Council of the Army, Jan. 15, 1649, 15 days before the execution of King Charles I of England. It is based upon "The Heads of the Proposals Offered by the Army," Aug. 1, 1647, except that no reference is made to royalty; and it is an outline of a written constitution for a republic. According to its provisions, the existing Parliament is to be dissolved on or before the last day of April, 1649; and thereafter an assembly called the "Representative," composed of not more than 400 members, is to be elected by the people every two years on the first Thursday in May. The members, or "representers," are fairly distributed among the counties of England and Wales, thus remedying the defects in the existing apportionment. The franchise is conferred upon such natives or denizens "as are assessed ordinarily toward the relief of the poor," provided they be men 21 years of age or housekeepers "dwelling within the division for which the election" is held. Servants "receiving wages from any particular person" are excluded; and those who have aided the King are temporarily denied the right of voting or of being chosen members of the assembly. Officials are not eligible, and lawyers are incapable of practicing their profession while serving as representers. There is to be a "Council of State for the managing of public affairs." The Christian religion "is held forth and recommended as the public confession"; but it is to be "reformed to the greatest purity in doctrine, worship, and discipline." Popery and prelacy are not tolerated, and the "teachers" or ministers are to be paid from the public treasury. To the assembly is given the "supreme trust in order to the preservation and government of the whole"; but six important points are absolutely "reserved" from legislative action. With the exception of those of the Connecticut and New Haven colonies, the agreement is the earliest example of a written instrument designed for the government of a commonwealth. But this English constitution was never established, since "The Levelers" who stood sponsor for it were defeated by Cromwell. For the text of the agreement, consult Gardiner, *Constitutional Documents*, pp. 270-282 (Oxford, 1889); for a full discussion, his *History of the Civil War* (new ed., London and New York, 1894-97). See LEVELERS.

AGRICOLA, ALEXANDER (c.1446-1506). One of the most famous composers of the School of the Netherlands. He was of German birth, his real name being Ackermann. The works which have been preserved comprise several masses, motets, magnificats, and about 30 chansons.

AGRICOLA, CHRISTOPH LUDWIG (1667-1719). A German landscape painter. Born at Regensburg, he passed much of his life in traveling and lived long at Naples. He was greatly esteemed by his contemporaries, but his work seems stilted

and unnatural to modern taste. One of the so-called classic or heroic landscape painters, he developed under the influence of Gaspard Poussin and Claude Lorraine. His works are found chiefly in German and Italian galleries.

AGRICOLA (Latin version of his original German name BAUER), GEORG. A German scholar and scientist of wide attainments. Born March 24, 1494, at Glauchau, Saxony; entered the University of Leipzig in 1514; graduated in 1517 with the degree of B.A.; in 1518, vice-principal, and two years later principal, of the Municipal School at Zwickau, during which time he published a small Latin grammar; from 1524-1526 studied medicine, philosophy, and then natural sciences at various universities in Italy; and in 1527 chosen town physician at Joachimsthal, in Bohemia, in the midst of the most active mining centre in Central Europe. While not busy professionally, he studied mining, mineralogy, and geology, and in 1530 resigned his appointment to travel for three years and study mining in different parts of the country, after which he accepted the appointment of city physician of Chemnitz, Saxony, 1533, where he resided until his death, caused by fever, Nov. 21, 1555. For eight years after moving to Chemnitz there is very little record of his activities, but soon after (1544), he began publishing his more important books. His most important work, the one for which he is best known, *De Re Metallica*, consisting of 12 books covering mining, metallurgy, and geology, was begun about 1533, completed about 1550, went to press in 1553, and appeared in 1556, one year after his death. The original publication in Latin was translated into German and Italian, and in 1912 appeared in English, translated by Herbert Clark Hoover and Lou Henry Hoover, and published by *The Mining Magazine* of London. The original publication, together with 10 editions in three languages, served as a textbook and guide to miners and metallurgists for 180 years until the publication of Schluter's work on Metallurgy in 1738. In this book Agricola repudiates with great vigor certain teachings of the Greeks and has no patience with the alchemists. For the first time we receive descriptions of methods and processes based upon research and observation as opposed to speculation. In 1546 appeared *De Natura Fossilium* (revised 1558), which deserves an equal place with *De Re Metallica*. The work comprises 10 books on mineralogy and is the first attempt at a systematic subdivision. *De Ortu et Causis Subterraneorum* appeared in 1546 (revised 1558) and consists of five books on geologic phenomena. In 1530 *Bermannus*, his first work on mining, appeared. Many other books on mining, geological, medical, religious, political, and historical subjects appeared up to the time of his death.

It was not until 1546 that he entered public life in a diplomatic and advisory capacity at the request of Duke Maurice. Although the government was in the hands of Protestants, Agricola, a staunch Catholic and much favored by the Saxon electors, was elected Burgher of Chemnitz and the same year appointed Burgomaster. During the Schmalkaldic War he was sent on various missions from the Duke to Emperor Charles, King Ferdinand of Austria, and other princes. At the close of the war his public duties did not cease, as we read of his attendance at the Diet of Leipzig in 1547, 1549,

and 1553; at the Diet at Trojan, 1550, and again a second time just before his death. In recognition of his scientific investigations and publications on mining and allied subjects, he received a pension from Duke Maurice recorded in a letter dated June 14, 1543, consisting of "a freehold house, the right to brew beer for his household, and that he shall not be summoned before any Court of Justice, but only before us and our Councilor." As Burgomaster of Chemnitz at the time of his death, he was entitled to burial in the Protestant church of St. Jacob. This burial was refused his family at the command of the Prince, as the feeling against the Catholics was high at the time and the Prince probably was afraid of public disturbances. After a delay of four days his body was moved to Zeitz and interred in the cathedral.

We have a record of his marriage, in 1543, to Anna, widow of Matthias Meyner, a petty tithe official. There is reason to believe that Anna was his second wife and that he had several children. Consult: Jacobi, *Der Mineralog Georg Agricola und sein Verhältniss zur Wissenschaft seiner Zeit* (Werdau, 1889). Hoover, trans. of *De Re Metallica*, published by *The Mining Magazine* (London, 1912).

AGRICOLA, GNÆUS JULIUS (37-92). A Roman of the imperial times, distinguished not less by his great abilities as a statesman and a soldier than by the beauty of his private character. He was born at Forum Julii (now Fréjus, in Provence). Having served with distinction in Britain, Asia, and Aquitania, and gone through the round of civil offices, he was, in 77 A.D., elected consul, and in the following year went as Governor to Britain—the scene of his military and civil administration during the next seven years. He was the first Roman general who effectually subdued the island, and the only one who displayed as much genius and success in training the inhabitants to the amenities of civilization as in breaking their rude force in war. In his seventh and last campaign (84 A.D.) his decisive victory over the Caledonians under Calgacus, at a place called Mons Graupius, established the Roman dominion in Britain to some distance north of the Forth. After this campaign his fleet circumnavigated Britain for the first time, proving it to be an island. Among the works executed by Agricola during his administration were a chain of forts between the Solway Firth and the Tyne and another between the firths of Clyde and Forth. Numerous traces of his operations are still to be found in Anglesey and North Wales and in Galloway, Fife, Perthshire, and Forfarshire. The news of Agricola's successes inflamed the jealousy of the Emperor Domitian, and he was speedily recalled. Thenceforth he lived in retirement, and, when the vacant proconsulships of Asia and Africa lay within his choice, he prudently declined promotion. The jealousy of the Emperor, however, is supposed to have hastened his death, which took place at the early age of 55. His *Life*, by his son-in-law, Tacitus, has always been regarded as one of the choicest specimens of biography in literature. For an excellent modern edition of it, see that by Furneaux (Oxford, 1898). See **TACITUS**.

AGRICOLA, JOHANN (1492-1566), also called Magister Islebius (i.e., of Eisleben), but seldom by his patronymic, Schnitter. A zealous disciple of Luther, whom he served as teacher and Preacher at Frankfort-on-the-Main, Eisleben,

Wittenberg, and Leipzig, but with whom he became involved in the Antinomian controversy (see **ANTINOMIANISM**), and withdrew to Berlin in 1540, where, under stress of poverty, he made a recantation, ineffectual and probably not sincere. Joachim II, Elector of Brandenburg, became his protector, and made him court preacher and general superintendent, in which office he labored zealously for the spread of Protestantism until his death at Berlin, Sept. 22, 1566. His share in drawing up the Augsburg Interim (1548) made him unpopular for a time, but did not permanently check the growth of his influence in Brandenburg, which became very great. He wrote several theological treatises, now forgotten, but he will always be remembered for his collection of German proverbs, *Die gemeinen deutschen Sprüchwörter mit ihrer Auslegung* (1592), a work of native humor, morality, and patriotism that has endeared him to the heart of scholarly Germany. His life was written by Kawerau (1881).

AGRICOLA, MARTIN (1486-1556). A German composer and writer on musical subjects, born at Sorau, Silesia. From 1524 until his death he was cantor and musical director in the first Protestant school established at Magdeburg. His books are marked by a forceful style and extensive knowledge, and in his own day passed through numerous editions. His *Musica Instrumentalis* (1528) is, together with Virdung's work, our principal source of information regarding the old instruments. It contains not only numerous illustrations, but also detailed explanations as to the mechanism and the method of playing each instrument. This work was reprinted by Eitner as vol. xx of the publications of the Gesellschaft für Musikforschung. Other important works are *Rudimenta Musicæ* (1529), republished in 1543 under the title *Quæstiones Vulgariores in Musicam; Musica Figuralis Deudsch; Von den Proportionibus*.

AGRICOLA, RODOLPHUS (properly **ROELOF HUISMAN**) (1443-85). An eminent Dutch humanist, born at Bafflo. He studied at the universities of Louvain and Paris and afterward in Italy and by his Latin style and his skill in disputation attained high scholastic distinction. For some time he lectured on classical philology and philosophy at Heidelberg. The most important of his works is the *De Inventione Dialectica* (1467), in three books, in opposition to the scholastic philosophy; but he is noteworthy less for his writings than for his personal influence. He did much to substitute classical Latinity for mediæval barbarisms, to diffuse in Germany the knowledge of Greek; in short, to transmit beyond the Alps the spirit of the Italian renaissance of letters. Of theology, painting, and music he seems also to have known considerable. His writings were collected by Alardus (2 vols., Cologne, 1539). Consult Tresling, *Vita et Merita Rodolphi Agricolaë* (Groningen, 1830), and Ihm, *Der Humanist Rudolf Agricola, sein Leben und seine Schriften* (Paderborn, 1893).

AGRICULTURAL ANT. A species of ant living on the semi-arid plains of Texas that cultivates areas of grass about its dwelling. On this cultivated space, which may have a diameter of 10 to 15 feet, only one kind of grass is allowed to grow, and it is said that the seeds of this grass are even planted by the ants. Roads are laid out radiating from the ant hill across the plain, and all shoots of undesirable plants are promptly nibbled off as rapidly as they appear.

among the crops. When the harvest of the protected grass is ripe, the ants collect the seeds and convey them along the radiating highways to the chambers in the hill. Interesting and wonderful as is the economy of these ants, the insects may, when the colonies are large and numerous enough, do considerable damage to the grain fields in which the mounds are reared and the clearings made. See ANT; INSECTS; and consult McCook, *Agricultural Ant of Texas* (Philadelphia, 1879). Wheeler, *Ants* (New York, 1910), considers it probable that the supposed actual planting near the nest is due to the growth of seeds which have sprouted in the underground stores of grain, and becoming thus useless for food have been carried out and left near the entrance.

AGRICULTURAL ASSO'CIATION. A voluntary association of farmers or other persons interested in agriculture, formed for the purpose of promoting a knowledge of agriculture.

United Kingdom. The movement began with the organization of the Society of Improvers in the Knowledge of Agriculture in Scotland, in 1723, by a company of landholders. This society existed for more than 20 years and did much valuable work. Its *Select Transactions* were published in 1743. The Bath and West of England Society was established in 1777, and the Highland Society in 1784. The latter society afterward included in its operations the whole of Scotland, and under the name of the Highland and Agricultural Society of Scotland has ever since continued its work. The Highland Society has a large income, expended in studying manures, feeding stuffs, seeds, plants, etc.; in holding annual shows of live stock, implements, etc., at which large prizes are offered; and in publishing an annual volume of *Transactions*.

The Royal Agricultural Society of England, founded in 1838, has been an important factor in the development of British agriculture, and, indeed, has undertaken many duties which in other countries are performed by the government. This society has at present more than 10,000 members, holds an annual show of live stock, implements, and machinery, dairy and other products, at which some \$50,000 is distributed in prizes. It issues a quarterly journal, containing information on a great variety of agricultural topics, retains the services of chemical, botanical, zoölogical, and veterinary experts for advice to members, as well as for experiments and research, maintains an experimental farm at Woburn, and a veterinary college at Camden Town, London, and conducts, in coöperation with the Highland and Agricultural Society of Scotland, an annual examination for a national diploma in the science and practice of agriculture.

The Agricultural Organization Society, Ltd., was founded in 1901 to organize in England and Wales agricultural coöperative societies. It has about 400 affiliated societies with a membership of over 20,000. There are also several hundred non-affiliated societies. Similar, but smaller, central societies were subsequently organized in Scotland and Ireland and have a large number of branches.

In Ireland the interests of agriculture are also promoted by a department of the Royal Dublin Society, chartered in 1749, and other agricultural organizations. Agricultural societies are maintained also in Wales, Canada, Australia, and other parts of the British Empire.

United States. In the United States the first society for promoting agriculture was es-

tablished at Philadelphia in 1785. In the same year a similar society was formed in South Carolina, followed by those in Kennebec, Me. (1787), New York City (1791), and the Massachusetts Society for Promoting Agriculture (1792). The movement continued, until in 1809 we have the germ of a national organization in the Columbian Agricultural Society, formed in the District of Columbia. The holding of agricultural shows, or "fairs," was begun in the city of Washington in 1804 and was made a popular movement largely through the efforts of Elkanah Watson, of Massachusetts, who, beginning with an exhibition of two imported merino sheep on the public square at Pittsfield, Mass., in 1807, soon developed the more elaborate and picturesque "cattle shows" which for many years have been popular rural festivals, especially in New England. Shows are now held in different parts of the country by 2740 international, national, State, county, and other local and interstate associations, 1647 being devoted to general agriculture, 801 to poultry, and the remainder divided among horticulture, floriculture, live stock, dairy products, dogs, etc. Societies for promoting different agricultural interests have been organized under many different forms, and many of these are now in a flourishing condition. Many of the States have important agricultural societies, the published reports of which contain much valuable information. There are also national, State, and local associations for the livestock interests (including the breeding of cattle, horses, sheep, swine, and poultry), dairying, horticulture, forestry, irrigation, good roads, bee-keeping, etc. The great majority of farmers' organizations have endeavored to develop some phases of business coöperation, and many have been formed for this specific purpose. In 1908 it was estimated that there were about 85,000 farmers' coöperative organizations with an estimated membership of more than 3,000,000. About 30,000 societies were irrigation associations, and others were coöperative telephone companies, grain elevators, creameries, associations for insurance against fire, hail, loss of live stock, etc., marketing of fruits and vegetables, purchase of supplies, etc. (See COÖPERATION.) In 1913 the United States Department of Agriculture established a rural organization service to assist farmers in forming organizations for bettering agriculture and country life.

Among the general associations which have exerted the most widespread influence in the United States are the Farmers' Alliance, the Patrons of Husbandry (otherwise known as the Grange), and the Farmers' Educational and Coöperative Union. See the separate articles on FARMERS' ALLIANCE and GRANGE.

Germany. The first agricultural society in Germany is said to have been established in 1764. Now there are several thousand societies in the German Empire. The most important of these is the German Agricultural Society, with headquarters at Berlin, which is the largest in the world with a membership of some 15,000. It holds a great annual meeting and fair, at which numerous prizes are given, a winter meeting, and meetings of sections on fertilizers, plant culture, seeds, implements, and agricultural technology and engineering; gives prizes for essays based on scientific investigations, tests agricultural materials, carries on a large amount of experimental inquiry through coöperation with agricultural experiment stations, publishes a

year-book and a journal appearing weekly, and maintains a bureau of information. It also aids its members in the coöperative purchase of fertilizers, seeds, and feeding stuffs.

France. The Society of Agriculturists of France has more than 11,000 members, maintains a library and chemical laboratory, holds meetings at which lectures are given by eminent agricultural experts, gives annual prizes, patronizes the agricultural shows given under the ministry of agriculture in different parts of France, and issues a semi-weekly publication. The National Society of Agriculture of France is another very important French society.

The Royal Danish Agricultural Society, the Central Society of Agriculture of Belgium, the Italian Federation of Agricultural Societies, the Imperial Agricultural Society of Vienna, the Agricultural Association and Union of Hungary, the League of Swiss Peasants, and the Imperial Economic Association at St. Petersburg are among the most active and influential agricultural organizations in Europe.

Agricultural Syndicates. In recent years coöperative unions (see COÖPERATION) have been formed by thousands in most of the countries of Europe, and less extensively in Asia, Africa, and Australia, and have exerted an increasing influence in the promotion of agricultural advancement. These have reached their most complete development, as directly related to agriculture, in France, where they are known as agricultural syndicates. The syndicates are national, regional, or local in their organization and operations. Their number has reached about 5000 and their membership about 800,000, including all classes interested in agriculture. They do an extensive business in the purchase of fertilizers, feeding stuffs, seeds, plants, implements, and live stock (especially animals for common use in breeding), and in the sale of agricultural products. They have also established coöperative dairies, and factories for fruit pulp, olive oil, etc., and have developed numerous forms of coöperative insurance. They have also disseminated much information through meetings and the agricultural press, and have exerted important political influence on legislation affecting agricultural interests. Some syndicates have received financial aid from the government, and others have been aided by private endowments. Otherwise they are supported by fees and brokerage. The organization and spread of the syndicates have been greatly promoted by the assistance of the agricultural societies throughout France.

AGRICULTURAL CHEM'ISTRY. See CHEMISTRY, AGRICULTURAL.

AGRICULTURAL COÖPERATION. See COÖPERATION; MARKETING ASSOCIATIONS, AGRICULTURAL; RURAL CREDIT.

AGRICULTURAL CREDIT. See CREDIT, AGRICULTURAL.

AGRICULTURAL ED'UCA'TION. The modern system of agricultural education in its most complete form includes (1) university courses of instruction and research; (2) general college courses; (3) college courses or schools in special subjects, e.g., dairying, animal husbandry, apiculture, or veterinary science; (4) special secondary agricultural schools; (5) vocational departments and agricultural courses in high schools; (6) instruction in elementary schools; (7) university and school extension, through farmers' institutes, correspondence courses, "movable schools," etc. The term "agriculture," as

related to education, may be used broadly with reference to an institution or course of instruction in which agricultural subjects are taught along with other branches of knowledge. It is in this sense, for example, that we speak of a college of agriculture or a college course in agriculture. Or the term may be restricted to that portion of a course of instruction in which agricultural subjects only are taught, as when we say, "Agriculture is taught in that college."

Technical agriculture has been subdivided by the committee on methods of teaching agriculture of the Association of American Agricultural Colleges and Experiment Stations into (1) agronomy, (2) zoötechny, (3) agrotechny, (4) rural engineering, and (5) rural economics. Agronomy is defined as "the theory and practice of the production of farm crops," and is made to include what is to be taught regarding the structure, composition, and physiology of farm crops and their environment, i.e., climate, soil, fertilizers, etc., and regarding the culture, harvesting, preservation, and uses of individual kinds of crops, as well as the obstructions to their growth from weeds, fungi, bacteria, insects, birds, and other animals. Zoötechny is "the theory and practice of the production of animals useful to man," and includes especially types, breeding, feeding, hygiene, and systems of management of different kinds of farm animals. Agrotechny is "the theory and practice of the conversion of raw materials produced by agriculture into manufactured articles for use in commerce and the arts." In its broadest sense, agrotechny includes such things as the making of butter, cheese, sugar, vinegar, concentrated foods, canned goods, liquors, textiles, leather, etc.; but in the agricultural colleges generally, only dairying is usually taught under this head. Rural engineering is "the science and art of laying out farms, designing and constructing farm buildings and works [i.e., water systems, irrigation works, drains, sewage systems, and roads], and making and using farm implements and machinery." Rural economics "treats of agriculture as a means for the production, preservation, and distribution of wealth by the use of land for the growing of plants and animals."

United States. Probably the earliest record of agriculture as a school subject within the present limits of the United States is found in the account of the early mission schools established by the Franciscan monks in what is now Mexico. The exact date of the establishment of these schools is not known, but in 1629 there were many elementary schools for natives scattered through the pueblos of New Mexico, according to the *Memorial of Benavides to the King of Spain*, dated 1630 and printed at Madrid in that year. The Franciscan fathers were the teachers, and the children were taught, in addition to non-agricultural subjects, "the use of the horse, the cow, and the sheep; they followed the plow and sowed the seed with their own hands, supplemented the primitive practices with the more scientific and fruitful methods of agriculture brought from the Old World."

Agitation for agricultural education in the United States began in the middle of the eighteenth century. In 1751 William Smith issued a prospectus designed as a model for colleges in which he provided for the chemistry of agriculture. His plan was carried out to some extent in Philadelphia Academy, now the University of Pennsylvania. Animal husbandry

and commerce were mentioned in the original prospectus of King's College (Columbia University), dated May 31, 1754, and agriculture and merchandise in the "Laws and Orders" adopted by the governors June 3, 1755. A professorship of botany and agriculture was established in 1792, and Samuel Latham Mitchill, M.D., LL.D., was elected to the position. In describing a summer course in botany Dr. Mitchill says: "An attempt is made by the professor, who is a practical farmer, to elucidate and explain the economy of plants, and affinity to animals, and the organization, stimuli, life diseases, and death of both classes of beings. The physiology of plants . . . is therefore particularly enlarged upon, as connected with garden and farming." In 1801 the Massachusetts Agricultural Society started a subscription which resulted in the establishment of a professorship of natural history in Harvard College in 1804. The Bussey Institution was founded by a bequest made in 1842 to Harvard College for the purpose of teaching agriculture, but was not opened until 1870. Early schools of agriculture include a school established, in 1825, at New Harmony, Ind., by William McClure in connection with the socialistic experiment known as the New Harmony movement. The Oneida Manual Labor Institute at Whiteboro, N. Y., established by George Washington Gale in 1827, gave instruction in carpentry and agriculture until its close in 1834. Dummer Academy, Newbury, Mass., in 1824; the Derby Agricultural School, Derby, Conn., 1826; Andover Theological Seminary, Andover, Mass., 1838; and Westboro Academy, Westboro, Mass., 1856,—all attempted in the years indicated, though unsuccessfully, to include agriculture as a regular part of their curricula. The Farm School, Thompson's Island, Boston, has given instruction in agriculture since 1833. Work of recognized scientific merit was inaugurated at the Sheffield Scientific School, Yale, in 1848, by the establishment of a chair of agricultural chemistry and vegetable and animal physiology, under John P. Norton. His pupil and successor was Samuel W. Johnson, the well-known author of *How Crops Grow*, who for many years was a leader in the movement for agricultural education. Associated with him as professor of agriculture was William H. Brewer, who was also a student under Professor Norton and was identified with agricultural schools established in New York prior to 1860. The Gardiner Lyceum, begun in 1823 in Maine with the aid of a grant of money from the State, especially for the education of mechanics and farmers, had a professor of agriculture, a practical farm, and special short winter courses, and was successfully maintained for many years.

The New York Legislature passed acts in 1853 for a State agricultural college and an industrial school to be known as "The People's College." These institutions never became firmly established, but Amos Brown, the president of the People's College, was largely instrumental in securing national legislation favoring industrial education. Michigan in 1857, and Pennsylvania and Maryland in 1859, established agricultural colleges which grew to be permanent institutions.

Land-Grant Colleges. Scientific instruction in agriculture was put on a permanent basis by the Morrill Act of 1862. On Dec. 14, 1857, Justin S. Morrill introduced into the House of Representatives a bill "donating public lands to the several States and Territories which may

provide colleges for the benefit of agriculture and mechanic arts." Though the bill was reported at first adversely, and after passage was vetoed by President Buchanan, it was reintroduced by Senator Morrill in modified form, passed by Congress, and approved by President Lincoln July 2, 1862. In its final form this land-grant act was a comprehensive measure providing for "the endowment, support, and maintenance of at least one college [in each State] where the leading object shall be, without excluding other scientific and classical studies, and including military tactics, to teach such branches of learning as are related to agriculture and mechanic arts . . . in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions in life." For these purposes there were granted to the several States 30,000 acres of land for each member in Congress, the entire proceeds of the sales of which was to constitute a perpetual fund for the benefit of these institutions. The total amount received by the colleges established under this act was over \$13,500,000 in 1912, and nearly 1,000,000 acres still remained to be sold, valued at approximately \$5,000,000.

In their early history the courses in agriculture in these colleges met with many discouragements. In 1887 a new impetus was given to their development by the act of Congress (Hatch Act) giving each State \$15,000 for an agricultural experiment station (see AGRICULTURAL EXPERIMENT STATION), which must ordinarily be a department of the land-grant college. In 1890 by a second Morrill Act these colleges received an immediate appropriation of \$15,000 per State, increasing by \$1000 each year for 10 years and thereafter \$25,000 a year, to be applied only to instruction in agriculture, the mechanic arts, the English language, and the various branches of mathematical, physical, natural, and economic sciences. In 1906 the Adams Act was passed by Congress, giving each State an additional \$15,000 a year for the experiment station. In 1907 the Nelson Amendment to the appropriation bill for the United States Department of Agriculture provided an immediate appropriation of \$5000 to each State and Territory, an increase of \$5000 each year for four years, and thereafter \$25,000 annually for the benefit of the colleges of agriculture and mechanic arts, with the provision that "the said colleges may use a portion of this money for providing courses for the special preparation of instructors for teaching the elements of agriculture and the mechanic arts." Each State, therefore, receives in addition to the income of the Land-Grant Act of 1862, \$50,000 annually from the Federal government for instructional purposes in agriculture and mechanic arts, and \$30,000 for the experiment stations. The instruction funds are divided in 17 southern States between colleges for white students and institutions for colored students, usually on the basis of the white and colored school population, the negro institutions in these States receiving approximately 30 per cent of the appropriations. Large appropriations are also made to the colleges by the respective States for both maintenance and increase of plant, and the total income of the 67 institutions for the fiscal year ended June 30, 1912, was \$25,967,130.45.

Excluding the separate institutions for the colored race, the colleges of agriculture are of three main types: (1) The Massachusetts Agri-

cultural College, which offers only agricultural courses; (2) the 24 colleges with additional courses in the mechanic arts; and (3) the 25 which are colleges, schools, or departments of State universities. The college course in all of these institutions is four years in length and leads to a bachelor's degree. The requirements for admission and graduation vary greatly, but 35 require as much as the equivalent of a four-years' high school course for admission. The United States Bureau of Education found that in 1912 the average amount of time required during the four years in the various subjects was as follows: English, 227 hours; mathematics, 132 hours; modern languages, 205 hours; social sciences, 162 hours; natural sciences, 815 hours; agriculture, 800 hours; rural engineering, 161 hours; and electives, 535 hours. The electives included options in agriculture, agricultural sciences, natural sciences, and the humanities.

In 1912 there were nearly 11,000 students in the four-year agricultural courses, an increase of 272 per cent in five years. Nearly all of these institutions also offer graduate work in agriculture and in agricultural sciences leading to the master's degree, and 10 of them to the degree of doctor of philosophy. In 1912 there were 109 graduate students working for advanced degrees. Secondary schools of agriculture in addition to the college work are maintained by 17 institutions; 16 maintain one- or two-year courses of college grade; 40 conduct short winter courses at the institution. Practically all of them maintain extension departments giving instruction in agriculture to adults through correspondence courses, farmers' institutes, and "movable schools of agriculture." At least 36 colleges provide opportunity for their students to prepare for teaching agriculture, and summer schools primarily for rural teachers are conducted by 34 of them.

Under the Acts of 1862 and 1890 there have been established one agricultural college in each of the 48 States, Porto Rico, and Hawaii, besides the 17 separate institutions for negroes. Together with the affiliated agricultural experiment stations, the Office of Experiment Stations of the United States Department of Agriculture, and the United States Bureau of Education of the Department of the Interior, these institutions are organized into the Association of American Agricultural Colleges and Experiment Stations. This association was formed in 1887 and has done much to stimulate the development of agricultural education and research. It conducts a Graduate School of Agriculture, this being a four-week summer school for graduate work held every two years. The first session was at the Ohio State University in 1902, the second at the University of Illinois in 1906, the third at Cornell University in 1908, the fourth at the Iowa State College in 1910, the fifth at the Michigan Agricultural College in 1912, and the sixth at the University of Missouri in 1914. Dr. A. C. True served as dean of all six sessions. Special subjects have been featured at different sessions.

None of the separate institutions for the colored race are doing work of college grade. They enrolled nearly 2200 students in agricultural courses in 1912. About one-half of them are giving extension instruction to adults, and three-fourths of them are conducting summer schools.

Several other colleges in the United States

are giving instruction in agriculture. Among them may be mentioned Syracuse University, which in 1912 opened a department of agriculture, and Harvard University, which since 1870 has maintained the Bussey Institution, which gave undergraduate instruction in agriculture until 1908, and is now devoted to graduate instruction and research in applied biology. Approximately one-half of the State normal schools give elementary courses in agriculture, mainly for teachers who will be required to teach the subject in elementary schools. These courses are from six weeks to two years in length.

Special schools of agriculture of secondary or high-school grade other than those conducted by the agricultural colleges are maintained, supported in part by the State, in Alabama, Arkansas, California, Colorado, Georgia, Louisiana, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Nebraska, New York, North Carolina, Oklahoma, Pennsylvania, Vermont, Virginia, and Wisconsin. There are approximately 100 such schools. Departments of agriculture in high schools have been established in many States, although the movement has made most headway where encouraged by a special State aid, notably in Massachusetts, Kansas, and Minnesota. Both the special schools and the agricultural departments in high schools are vocational in purpose. Probably more than one-fifth of all the public high schools in the United States are giving courses in agriculture, varying from four weeks to four years in length. In 1911, 1800 high schools reported to the United States Bureau of Education a total of 37,000 pupils studying agriculture; 831 of these schools reported a one-year course; 360 a course which extended over two or more years.

Instruction in agriculture is required by State legislation in all the elementary schools of Alabama, Arkansas, California, Florida, Georgia, Iowa (after 1915), Louisiana, Mississippi, North Carolina, Oklahoma, Tennessee, West Virginia, and Wisconsin. It is required in the rural schools of Missouri, North Dakota, Ohio, and Texas.

The movement for teaching agriculture through boys' and girls' corn clubs and other agricultural clubs is popular and widespread, especially in the Southern States. The club work is in some instances a definite part of the work of the school, and in other instances it is fostered by other agencies.

United Kingdom. The first institution giving systematic instruction in the theory and science of agriculture was the University of Edinburgh, where a chair of agriculture was established in 1790. A State-supported school of agriculture, the Albert Agricultural College, was established at Glasnevin, Ireland, in 1838. The Royal College of Agriculture at Cirencester, England, was opened in 1845. A professorship of rural economy was established at Oxford University in 1796, discontinued for many years, and reestablished in 1906. Among other institutions of higher education now offering systematic instruction in agriculture may be mentioned the university colleges of Reading, Leeds, Bangor, Manchester, and Aberystwith; the agricultural college of Harris Institute; West of Scotland Agricultural College; Armstrong College; Southeastern Agricultural College; Edinburgh and East of Scotland College of Agriculture; Royal College of Science, Dublin; Munster Institute, Cork; Durham College of Science;

Aberdeen and North of Scotland College of Agriculture, and the University of Cambridge. A professorship of agriculture was established at the last-named institution in 1899, and a special agricultural building, accommodating 100 students, was erected in 1910.

Financial aid for agricultural education is given by the government through the Board of Agriculture and Fisheries. In 1913 aid aggregating about \$95,000 was given to 7 universities and university colleges, 7 agricultural colleges, and 4 special institutions, and about \$35,000 was also available for farm schools under the county councils. There are also brief courses at migratory dairy schools, and day or evening lectures in agriculture, poultry-keeping, bee-keeping, etc. About \$60,000 per annum is expended for advisory work in agriculture, this supplementing the county funds for county agricultural advisers. Grants are also available under the Development Act of 1909 for agricultural education, research, farm institutes, etc.

Canada. The oldest and best known of the colleges of agriculture is the Ontario Agricultural College at Guelph, established in 1874. Other agricultural colleges are as follows: Manitoba Agricultural College at Winnipeg, Nova Scotia Agricultural College at Truro, and the agricultural colleges of the University of Saskatchewan at Saskatoon and the University of Alberta at Strathcona. In the Province of Quebec is the agricultural school at Anne de la Pocatière, a dairy school at St. Hyacinthe, and the Agricultural School at Oka now affiliated with Laval University. Macdonald College at St. Anne de Bellevue, near Montreal, now affiliated with McGill University, gives complete agricultural courses designed to prepare boys for farming. Agriculture is taught in many high and consolidated schools and in rural elementary schools.

Other British Possessions. In India the Imperial Agricultural College of India, endowed with \$150,000 by Henry Phipps of Pittsburgh and receiving financial aid from the imperial treasury, is situated at Pusa and includes a college, experiment station, and cattle-breeding farm. The agricultural school at Cawnpore has been made into a college. The Agricultural College of Coimbatore was established in 1905, and the Agricultural College of Lyallpur, Punjab, in 1910. Agricultural instruction is also given at the College of Science at Poonah and in many institutions of lower grade.

In Australia there are agricultural colleges at Gatton, Queensland; Richmond, New South Wales; Roseworthy, South Australia; and Dookie and Longerenong, Victoria. Agricultural instruction is also given at the University of Melbourne, in agricultural high schools, and by traveling experts attached to the Colonial Department of Agriculture. In New Zealand is the Canterbury Agricultural College at Lincoln; and in Cape Colony a school of agriculture at Elsenburg, as well as other institutions.

Belgium. The system of agricultural education includes the following institutions: *Colleges*—The State School of Veterinary Medicine at Brussels, the Agricultural Institute at Gembloux, and the Agronomic Institute of the University of Louvain. *Secondary Schools*—Three separate agricultural schools located at Carlsbourg, La Louvière, and Huy, and 16 agricultural schools conducted as departments of other educational institutions; courses in agronomy in

royal athenæums; State schools of horticulture at Ghent and Vilvorde, and private subsidized schools of horticulture at Mons, Liège, Tournai, and Carlsbourg. *Agricultural Schools for Women*—One higher agricultural school in connection with the Institute of the Sacred Heart and Immaculate Conception at Heverlé, and 10 secondary schools. In addition popular instruction is given in primary agricultural trades schools, also in itinerant schools for adults.

Denmark. The Royal Veterinary and Agricultural College at Copenhagen is a high-grade college supported in part by the Danish government. There are approximately 45 agricultural schools of secondary grade, one-third of which are separate institutions, the other two-thirds being associated with high schools. Only persons of from 18 to 25 years of age who have had at least one year's experience farming are admitted. Practically all the public high schools have given courses in agricultural science since their establishment. Agriculture is also taught in all the common schools.

Germany. Professorships in the agricultural sciences are maintained at many of the universities, e.g., Königsberg, Breslau, Halle, Göttingen, Leipzig, Rostock, and Jena, and approximately 2 per cent of the students are enrolled in agricultural courses. Other institutions teaching agriculture include the Agricultural High School of Berlin, the Technical High School of Munich, the Forestry Academy at Tharandt, and the Agricultural Academy at Bonn. There are 18 agricultural intermediate schools aided by the State, and many lower agricultural institutions, including farm and winter schools giving practical courses for farmers and farm boys.

France. The head of the French system of agricultural education maintained under the auspices of the national government is the *Institut National Agronomique* at Paris, in which instruction of university grade is given in agricultural science, supplemented by laboratory and field practice. There are three national schools of agriculture in which theoretical and practical instruction are combined, located at Grignon, Rennes, and Montpellier. A large number of secondary agricultural schools provide theoretical and practical instruction for the children of farmers, who at the same time perform all the work necessary to carry on the school farms. In some of the schools general agriculture is taught; others are devoted to special lines, such as viticulture, dairying, etc.

Since 1879 instruction in the elements of agriculture, horticulture, and natural history has been obligatory in the normal and primary schools of France. In each department of the country a professor of agriculture is appointed to prepare a course of instruction in agriculture for the normal schools, to hold farmers' meetings, and to maintain model fields for demonstrations. Chairs of agriculture have been established in many lyceums and colleges throughout France. The University of Toulouse has recently established an agricultural institute, giving a two-year practical and scientific course in agriculture. Special schools include the dairy schools at Mamirole and Surgères, the school of agricultural industries at Douai, the school of horticulture at Versailles, the poultry husbandry school at Gambias, the school of horse breeding at Le Pin, and a school of agriculture at Hennebont.

Other European States. Sweden has agricultural colleges at Ultuna and Alnarp, about 30 secondary schools, several dairy schools, and a corps of traveling instructors. Norway has an agricultural college at Aas and several secondary schools.

In Austria in 1911 there were 219 agricultural and forestry institutions, mainly of secondary and elementary grade or winter agricultural schools. Instruction is given to soldiers, as in several other European countries. Hungary maintains the Royal Hungarian Horticultural School at Budapest and the Agricultural Academy at Magyar-Ovar. Italy has agricultural colleges at Milan and Portici and about 30 general and special schools of secondary grade. Spain maintains educational institutions at Seville, Motril, Valladolid, Saragossa, Madrid, and other points.

The Russian system of agricultural education is organized for the most part under the Ministry of Agricultural and Imperial Domains. It includes agricultural institutes at the universities of Kazan, Kiev, and Moscow, similar institutions at Novoya Alexandria, Riga, St. Petersburg, and Mustiala (Finland), secondary schools, and elementary courses in public schools.

Other Countries. Nearly all the Central and South American countries now maintain agricultural schools, the most comprehensive systems having been developed in Argentina, Chile, and Brazil. Japan has several agricultural colleges, and schools have recently been established in Manchuria, Korea, and the Philippines. In fact, there is hardly a civilized country without provision for agricultural education.

AGRICULTURAL EXPERIMENT STATION. An institution, or department of an institution, devoted to scientific and practical investigations for the benefit of agriculture, the inspection of materials, animals, and plants used in or injurious to agriculture, and the dissemination of information on the theory and practice of agriculture. They grew out of the chemical studies of such men as Liebig in Germany, Boussingault in France, and Lawes and Gilbert in England during the first half of the nineteenth century. Systematic investigations in agriculture were begun by Lawes and Gilbert at Rothamsted, England, in 1843. The first experiment station organized as a public institution was established in 1851 at Möckern, near the city of Leipzig, Germany, and under the influence of Leipzig University. In the United States the first stations were established at Wesleyan University, Middletown, Conn., by the State of Connecticut, in 1875, under direction of W. O. Atwater, and about the same time at the University of California, Berkeley, Cal., by the university, under direction of E. W. Hilgard. Previous to this, agricultural investigations had been carried on at Yale University under Professors S. W. Johnson and William H. Brewer, at the Bussey Institution of Harvard University by F. H. Storer, and at agricultural colleges in several States. Agricultural experiment stations are now maintained in nearly all the countries of the world and are usually under the patronage of general or local governments.

Organization. In the United States Federal aid aggregating \$1,440,000 per annum is divided equally among the States for the maintenance of experiment stations. The Hatch Act of 1887 provides for \$15,000 per State per annum for carrying on original researches or

verification experiments relating to agriculture, and the Adams Act of 1906 a like amount in addition, but restricted to original investigation. For the fiscal year ended June 30, 1912, \$2,628,240.09 was also available from State governments and other sources. The total number of stations was 65, each State having at least one station. They employed 1574 persons in administration and inquiry, and issued that year 719 annual reports and bulletins, which were sent through the mails under frank to nearly 1,025,000 addresses. With few exceptions they are departments of the agricultural colleges established under the land-grant act (Morrill Act) of 1862 and are independent of each other as regards the planning and conduct of their operations. They are united in a national system through the Association of American Agricultural Colleges and Experiment Stations and the Office of Experiment Stations in the United States Department of Agriculture. This office exercises supervision of their expenditures from the national fund and gives them advice and assistance in many ways. It issues a monthly list of their current publications, summarizes the accounts of their work and that of kindred institutions throughout the world in the periodical known as the *Experiment Station Record*, and until 1913 gave popular *résumés* of their investigations in the *Farmers' Bulletin* series of the department, under the general title of *Experiment Station Work*. It also directly manages stations in Alaska, Hawaii, and Porto Rico, for each of which the national government appropriated \$30,000 in 1913, and in Guam, for which the appropriation was \$15,000.

Function. The operations of the stations cover a wide range of scientific and practical work relating to every branch of agriculture and horticulture and including original investigations, verification, and demonstration experiments, studies of natural agricultural conditions and resources, inspection and control service, and dissemination of information. Most of the stations are keeping meteorological records, and several are making special studies of problems relating to meteorological phenomena and climatic conditions. Forty-one are investigating soils, their geology, physics, and chemistry, or conducting soil tests with fertilizers or in other ways. Eighteen stations are studying questions relating to drainage and seepage, or to irrigation in the field or greenhouse, and also irrigation of orchard, garden, or farm crops, and five are taking up other rural engineering problems. All the stations are studying the more important crops, either with regard to their composition, nutritive value, methods of manuring and cultivation, and the best varieties adapted to individual localities, or with reference to systems of rotation.

Forty-eight stations are studying different methods of feeding and breeding animals. Thirty-four stations are investigating subjects relating to dairying, including the chemistry and bacteriology of milk and cream, butter-making, or the construction and management of creameries, and 24 have work with poultry. Forty-six stations are doing chemical work, and often are studying methods of analysis. Bacteriology is taken up by 22 stations. The same number are making investigations in systematic and physiological botany. Forty-three are studying plant breeding, and 41 the diseases of plants and methods for their eradication.

Fifty-one stations work to a greater or less extent in horticulture, testing varieties of vegetables and large and small fruits, and making studies in varietal improvement and synonymy.

Thirteen stations have undertaken operations in forestry. Thirty-nine stations investigate injurious insects with reference to their restriction or destruction. Forty stations study animal diseases and the methods for their prevention or cure. One or more stations have made investigations on miscellaneous subjects, such as the following: Dry farming; economic zoölogy; food and nutrition of man; bee-keeping; technology of wine, olive oil, cider, and vinegar; preservation of fruits and vegetables; the draught of farm implements; road-making; floriculture; the manufacture of beet, cane, sorghum, and maple sugar; home economics; oyster culture, etc.

Many of the stations also have a considerable amount of inspection work, 18 dealing with fertilizers, 14 with feeding stuffs, 5 each with nursery stock, insecticides and fungicides, seeds, and creamery glassware, 6 with foods and drugs, and 1 with paints. All of them give much attention to the dissemination of their results, many of them, in addition to publications, addresses, and correspondence, operating sub-stations and demonstration farms. Five have organized sections to coöperate with farmers.

Latin America. Experimental and demonstration work is under way in most Latin-American countries. Mexico has established 16 stations or test farms, Brazil 28, Argentina 8, and Chile 4. Other countries represented are Cuba, Dominican Republic, Honduras, Costa Rica, Salvador, British Guiana, Peru, Paraguay, and Uruguay.

British Empire. The Development Act of 1909 made available \$2,500,000 annually for five years for economic development, much of which is being used for aiding agriculture. A system of research institutes is being developed by grants to existing institutions. Thus plant physiology is fostered at the Imperial College of Science and Technology, plant pathology at the Royal Botanical Gardens (Kew), plant breeding at Cambridge University and the John Innes Institution, fruit growing at Bristol University, animal nutrition at Cambridge, animal pathology at the Royal Veterinary College, dairying at University College (Reading), economics of agriculture at Oxford University, and plant nutrition and soil problems at the Rothamsted Experimental Station. The Rothamsted station, established in 1843 by Sir John B. Lawes and maintained chiefly by private funds, is recognized as one of the foremost in the world. Agricultural researches are also carried on at most of the agricultural colleges and under the auspices of the Board of Agriculture, the Royal Agricultural Society of England, the Bath and West and Southern Counties Society, and a number of county education committees and councils.

In Scotland similar work is done by the Royal Highland and Agricultural Society of Scotland, the Agricultural Research Association of the Northeastern Counties, the Royal Botanic Garden at Glasgow, Mareschal College of Aberdeen University, and the Glasgow and West of Scotland Technical College; in Ireland, by the Department of Agriculture and Technical Instruction, Royal Dublin Society, Glasnevin Agricultural College, and Trinity College Botanic Gar-

dens (Glasnevin); in Wales, by the University Colleges of Wales and North Wales. In Canada the principal stations are the Central Experimental Farm at Ottawa, with 16 branches in the various provinces, and many sub-stations, test farms, etc., and the station at the Agricultural College of Guelph, Ontario. In the British West Indies stations for the improvement of sugar-cane are maintained on Barbados, Antigua, and Trinidad, and botanical stations on these and several other islands. In South Africa there is a government laboratory and herbarium at Cape Town, and stations at the agricultural school at Elsenburg and in Rhodesia. In India the Agricultural Institute at Pusa is the head of a system of provincial stations and a large number of sub-stations. Australia and New Zealand have about 50 stations.

Other Countries. Germany has over 100 stations, many of which are connected with universities. A considerable number of stations maintain inspection and control of fertilizers, feeding-stuffs, and seeds; others are for investigations in special subjects, such as brewing and distilling, milling, animal chemistry or physiology, veterinary science, dairying, plant diseases, and plant physiology. Among the most important German stations are those at Berlin, Halle, Bonn, Breslau, Darmstadt, Munich, Göttingen, Bernburg, Möckern, Posen, and Tharandt. France has about 100 stations and laboratories, of which the best known are those at Grignon, Juvisy, Montpellier, Paris, and Versailles. Austria, Belgium, Denmark, Holland, Hungary, Italy, Switzerland, Norway, Sweden, Russia, and Japan have from 10 to over 100 stations each. Spain, the Philippines, Greece, Portuguese and German East Africa, Belgian Congo, Gold Coast, and China have organized stations within the last 10 years. In 1910 a station was established by American Jews at Haifa, Palestine.

The total number of stations in the world is about 1000. An account of those in the United States was issued by the Office of Experiment Stations as *Bulletin 80* (1900), and similar data for those in other countries as *Bulletin 112* (1904). Subsequent progress is summarized yearly in the annual reports of the office.

AGRICULTURAL LABORERS. See LABOR PROBLEM; GANGS, AGRICULTURAL.

AGRICULTURE (tilling of land, Lat. *agri*, gen. of *ager*, field + *cultura*, tilling, cultivation). In a broad sense of the word, the science and art of the production of all plants and animals useful to man. More or less intimately connected with agriculture itself has been the preparation of its products for man's use. Again, the spinning of fibres and the weaving of cloth, the tanning of leather, the making of butter, cheese, wines, cider, vinegar, etc., have been largely done by farmers. Gradually, however, these occupations have been specialized and removed wholly or in part from the farm. Thus, the production of forest trees has been specialized as forestry, and the production of fruits, vegetables, and ornamental plants has formed the subject of horticulture. Such occupations as breeding live stock, raising poultry, bee-keeping, and fish culture are often also pursued independently of general agriculture. The term "agriculture" has, therefore, been gradually restricted to the production of a limited group of plants and animals, such as may be brought together on single farms in a system of mixed

husbandry. In the present article the term "agriculture" will be used in a somewhat broad sense, and the sketch will be confined to a brief outline of the historical development of agriculture, general statistics of a few of the more important agricultural products, and references to parts of the more general literature of agriculture. Information regarding particular plants and animals, or special agricultural industries, may be found in other articles in this ENCYCLOPÆDIA.

The Earliest Agriculture. Agriculture began in prehistoric times, when primitive man first began to select particular plants in his immediate environment as preferable to others for his use as food or for making his clothes, and when he first directed his efforts toward promoting the growth of plants. Whether these attempts preceded those to capture and confine animals, with a view to employing them as beasts of burden, or to using their meat, milk, or skins, we do not know. It is, however, clear that while the migratory habits of savage tribes must have tended to hinder anything like systematic cultivation of the soil, they probably did not prevent the domestication of animals.

The practices of some aboriginal tribes at the present time indicate that efforts to promote the growth of useful plants by the removal of other plants growing among them antedates the planting of seeds. Similar evidence points to the beginning of agricultural implements in the use of pointed and forked sticks to scratch the soil or remove obnoxious vegetation. The union of two such sticks with a leathern thong made a rude mattock or hoe, and a larger implement of the same kind formed the primitive plow, which was drawn, very likely, at first by men and afterward by domesticated animals. The great burden of agricultural labors was in those early ages undoubtedly thrown upon woman, as has been the case among the tribes of North American Indians, whose men have devoted themselves almost exclusively to the chase and to war. It is interesting to observe that severe military requirements still necessitate the employment of women in field labor on the Continent of Europe.

Egyptian Agriculture. The records preserved on ancient monuments allow us to trace the history of agriculture in Egypt back to at least 3000 B.C. At that early time various animals had already become domesticated, and the growing of crops for man and beast by a regular system of tillage and irrigation had been united with the feeding of large numbers of animals on the ranges. There was, however, no fixed distinction between wild and domesticated animals, and with certain kinds of animals the limits of domestication had not been definitely settled. The land and live stock were very largely the property of the royal, priestly, and military classes; the care of animals and the performance of farming operations were in the hands of hired laborers or slaves. Agriculture was, however, a more honorable occupation than trading or the mechanical arts. Herdsmen and fishermen were in the lowest class; swineherds especially were despised. Cattle, sheep, goats, and swine were kept, often in large herds and flocks. The cattle belonged to the same species as the present cattle of India. Both bulls and cows were used for labor, but the flesh of the males only was eaten. Sheep were kept for both wool and milk (from which

cheese was made), but do not appear to have been often used for food. Goats seem to have furnished the principal milk supply of ancient Egypt. Swine were raised in large numbers, though they were considered unclean and were forbidden food except on certain days or for the priests. The donkey and camel were the principal beasts of burden from prehistoric times. The donkey was probably first domesticated by the ancient Egyptians, being taken from the wild asses which came from their home at the headwaters of the Nile. Horses were brought into Egypt about 1900 B.C., when the Shepherd Kings from Asia conquered the country. The stallions only were used for war and for shows. They were kept in stables and fed on straw and barley. Water fowls, especially geese, were abundantly raised. Breeding of animals by selection was customary, as well as branding them for identification. "When the Nile overflowed, animals of all kinds were placed upon artificial raised ground and fed upon wheat straw and leguminous fodder raised for the purpose."

Crops were grown with the aid of the alluvial deposits annually made by the overflowing Nile and of irrigation to supply the lack of rainfall. Irrigation water was taken from the Nile and distributed through numerous canals and ditches. The water was raised to the top of the river bank by handsweeps such as are often used on farms to-day for raising water from shallow wells, or by means of a vessel held with straps between two laborers, who pulled against each other in lifting the water. In some cases seed was sown after the Nile flood without preparation of the land and was trodden in by animals. Generally the plow or the hoe was used. The plow consisted of a wooden plowshare, double handle, and draught pole or beam. "The beam and stilt were fastened together by thongs or by a twisted rope, which kept the share and beam at a proper distance and helped to prevent the former from penetrating too deeply into the earth." The plow was drawn by two bulls or cows, yoked by the shoulders or attached by the horns. Generally, one man held the plow and another drove the animals, but sometimes one man performed both duties. The hoe was made of wood and consisted of a rounded or pointed blade attached to a handle by a twisted thong. Other tillage implements sometimes used were the harrow and the roller. The cereals grown were bearded wheat, six-rowed barley, durra (*Andropogon sorghum*, var.), and millet (*Panicum miliaceum*). The seed was sown broadcast; the wheat and barley in November, after the subsidence of the Nile flood, and the durra either at that time or in April. Wheat was harvested in March, barley in April, and spring durra in July. "Wheat and barley were headed with a toothed sickle, or cut lower down and bound into sheaves." The grain was trodden out by donkeys or oxen on earthen threshing-floors constructed in the open field, where the chaff was fanned out by the wind. Granaries, often built of the Nile mud, were used for storage. Durra was pulled up by the roots, and the seed was removed with a comb-like stripper similar to that sometimes used now for removing broom-corn seed. Flax was raised from prehistoric times for its fibre, from which the clothing of the ancient Egyptians and the wrappings of the mummies were largely made. It is improbable that cotton was grown in

Egypt in very ancient times, though it seems to have been introduced there from the East previous to the beginning of the Christian era. Lentils, lupines (*Lupinus ternis*), onions, garlic, and radishes were commonly raised vegetables. The horse bean (*Vicia faba*), chick pea (*Cicer arietinum*), and bitter vetch (*Lathyrus sativus*) were also probably raised. For fruits the Egyptians had grapes, olives, figs, pomegranates, and dates. Other cultivated plants were the watermelon and castor-oil plant.

Babylonia. Of Babylonian agriculture there are few records. As in Egypt, it supported a dense population. The Euphrates overflowed, but did not do the work of the Nile. In all the region irrigation turns desert lands into fruitful fields. Of such fields Herodotus said: "This is of all lands with which we are familiar by far the best for growth of corn. When it produces its best it yields even three hundred fold. The blades of wheat and barley grow there to full four fingers in breadth; and though I well know to what a height millet and sesame grow, I shall not mention it, for I am well assured that to those who have never been in the Babylonian country what has been said respecting its productions will appear incredible."

Palestine. The Scriptures are full of allusions to the operations of the husbandman in Palestine, as well as in Egypt. The operations in the two countries necessarily formed striking contrasts, the crops in the former being dependent on the rains for growth, in the latter upon the inundations of the Nile. The Hebrews, before their sojourn in Egypt, had been a semi-pastoral people, and they must have learned something of Egyptian agriculture during the years of bondage. Their laws were those of an agricultural people. Land was practically inalienable. Extensive plains of fertile soil yielded the finest wheat. The hill-sides were covered with vines and olives, often planted in terraces formed with much labor to afford a large mass of soil in which the plants might flourish in the almost rainless summer. The valleys were well watered and afforded pasture for numerous flocks. Of the smaller cultivated plants, millet was the chief summer crop, but it was cultivated to only a limited extent, being confined to those spots that could be artificially watered. Wheat and barley were the chief cereals, as the winter rains were sufficient to bring them to maturity.

Greece. From the Grecian literature covering the period from 1000 B.C. to the conquest of Greece by Rome, 146 B.C., we get comparatively little definite agricultural information. In addition to the animals used in Egypt, mules were grown and used for labor. In winter, animals were housed. Swarms of bees were commonly kept. Wheat and barley were the cereals, and hemp, as well as flax, was raised. The fruits of Egypt, except the date palm, were grown, and in addition, cherries, plums, almonds, pears, apples, and quinces. The list of vegetables is also lengthened and includes turnips, beets, cabbage, lettuce, chicory, garden peas, and kidney beans. The common lupine (*Lupinus albus*) took the place of the species grown in Egypt and is said to have been used for green manuring. It is asserted that the Greeks introduced the use of manure to promote the growth of crops.

Rome. Roman agriculture has received special attention because so much was written about it by the Romans themselves, and because

they carried it into other countries, where it modified or dominated agricultural customs. When Rome was only a colony on the Tiber, land was divided among the citizens in small allotments. There was a domain of public land, which was continually extended by the conquests of neighboring States and the partial confiscations that followed. Although land in the conquered territory was sometimes granted to the poorer citizens, there were large tracts of public lands that were either cultivated or allowed to remain in pasture. The common conditions were that the occupants paid one-tenth of the produce of the corn lands, one-fifth of the produce of vines and fruit trees, and a moderate rate per head for cattle pastured. The occupants were merely tenants at will, and theoretically the State could resume or sell the lands at any time. Yet the right of possession was good against all until the lands had been resumed; and in process of time there came to be families so long in possession that they could not be dispossessed. Only the wealthy had the cattle or slaves that made such occupation possible. The burdens upon these occupiers of the public lands were much less than those upon the small farmers who owned their farms. Thus, at least two classes of cultivators were in existence, the small proprietors and the wealthy tenants holding the lands of the State. An addition to the strife between these two classes was the pressure brought to bear in the interest of the landless. Even after the Romans became masters of all Italy, little more than four acres was assigned to each citizen, and the domain lands increased enormously. Attempts were constantly made to restrict the extent of land that could be occupied by the wealthy, but generally without effect. (See AGRARIAN LAW.) A great deterioration and a consequent agricultural change took place during the century that followed the first Punic War (ended B.C. 241). The place of the small farmer was taken by the planter, who cultivated a great extent of territory, using slave labor. The small proprietors either sold their no longer profitable farms or were driven from them by the large land-holders. In Sicily, the first province, and in the others successively, the ownership of the land was vested in the Roman people. From these provinces came the tribute of grain that made grain-raising unprofitable in Italy. Hence the large estates were gradually given over to the keeping of flocks and the raising of cattle. Among the Roman writers upon agriculture were Varro, Columella, and Pliny. Earlier than these in time and more celebrated was Cato the Censor (died 149 B.C.), who gives us not only the most minute particulars regarding the management of the slaves on his large Sabine farm, but also all the details of husbandry, from plowing to the reaping and threshing of the crop.

Horses, asses, mules, cattle, sheep, and swine were raised by the Roman farmers, and much attention was given to the breeding of animals for special purposes. Castration was customary, and oxen were the principal work animals used on the farm. Mules were extensively used, especially as beasts of burden. The milk of sheep and goats was generally used for drink and also for making cheese. Columella describes a method of making and preserving cheese and says that the milk used in cheese-making was curdled in various ways, but commonly with a lamb's or kid's rennet. Poul-

try culture was an elaborate industry, and included the raising of hens, geese, ducks, teals, pigeons, turtle-doves, swans, and peacocks. Much attention was also given to fish culture, and such animals as hares, snails, and dormice were raised in considerable numbers. Wheat was the most important cereal crop cultivated by the Romans, and both smooth and bearded varieties were raised. Six-rowed and two-rowed barley, too, was grown to a considerable extent. Millet was grown to some extent. Oats and rye were introduced in comparatively late times. Land given to grain was fallowed for the whole of every alternate year. One-third of the fallow was manured and sown with some green crop as cattle food. Fallow received from four to five furrowings before the wheat was sown in the fall. The crop of wheat ripened about the middle of June, but the summers were too dry for the raising, with certainty, of millet and other summer crops. Alfalfa (lucerne), common vetch (*Vicia sativa*), bitter vetch, and chick pea were grown for fodder. Hemp, flax, beans, turnips, and lupines also are mentioned as occasionally cultivated. To the list of fruits and vegetables produced in ancient Egypt and Greece the Romans added apricots, peaches, melons, and celery. Meadows were carefully prepared, and rotation of crops was practiced to a certain extent. The soil was thoroughly cultivated with the plow and harrow or the hoe and rake; blind and open drains were used; in some regions irrigation was employed. Manures of different kinds were abundantly used, and various methods for their preservation and distribution were elaborated. Wheat and barley were usually reaped with a sickle, but sometimes they were pulled up by the roots, or the heads were cut off with shears. They were threshed with flails or with a board studded with iron spikes or sharp flints, which was drawn over the straw, or by trampling with cattle or horses. The Romans carried their agriculture into the ruder countries conquered by them. The vine growing wild in Sicily was carried into Gaul, where it was acclimated with difficulty. To the rude Britons the Romans taught agriculture so successfully that before the period of occupation was over they were exporting large quantities of grain.

The Dark Ages and the Middle Ages. The deterioration of Roman agriculture was accelerated by the overthrow of the Roman Empire. The conquering nations had advanced but little beyond the pastoral stage. During the following period of the Dark Ages the two influences working for the benefit of agriculture in western Europe were the Saracens in Spain and the religious houses in the other countries. The Saracens irrigated and tilled with untiring industry. They introduced the plants of Asia and Africa; cultivated rice, cotton, and sugar, and covered the rocks of southern Spain with fruitful vines. In general, throughout western Europe land was cheap and many worthless tracts were given to the Church. In some of the religious orders labor with the hands was imposed upon the members. They studied the works of the Roman writers upon agriculture and soon had the best cultivated lands in those countries through which their influence extended. Charlemagne encouraged the planting of vineyards and orchards. On the whole, the Crusades helped the agriculture of western Europe. In the latter part of the Middle Ages the people

of the low countries of western Europe came to be as distinguished for their agriculture as for their commerce and manufactures. They plowed in green crops; the people of Holland developed dairying; the Flemings gained the reputation of being the oldest practical farmers. Also in the plain of northern Italy, watered by the Po, agriculture was in an advanced condition. A large part of it, of great natural fertility, drew forth the praises of Polybius, who visited it about 50 years after it came into the hands of the Romans. In the thirteenth and fourteenth centuries, under the influence of irrigation, the region became a garden, supporting a large population and exporting grain. In the England of the same period the agriculture showed alternations of indolence and bustle, of feasting and semi-starvation. In August, 1317, wheat was 12 times as high in price as in the following September.

By the beginning of modern history, the fruitful lands of western Asia and southeastern Europe, swept by wars and desolated by conquest, had been placed under the ban of the Turk. The conquest of the Moors in Spain and their subsequent expulsion caused an injury to the agriculture of the peninsula which has not been repaired. The discovery of the New World showed two grades of agriculture carried on by those who had never seen the horse and were practically without domestic animals. Even the careful tillage of the ancient Peruvian had no influence upon Europe and little upon the America of succeeding centuries. The great contribution of America to the world's agriculture was the three plants, the potato, tobacco, and Indian corn or maize.

England. In the sixteenth century agriculture in England became more profitable, inclosures were made, and the rights of common were greatly restricted. Turned from the former wool exportation, the farmers began to raise wheat in large quantities to be sent out of the country. A law in the middle of the century practically prevented grain exportation and turned wheat lands into pasturage. The resulting high price of food and the destitution on the part of laborers brought another reaction and a replowing of grazing lands. The sixteenth century saw the end of the villeinage. In 1595 laborers without food during the summer months worked six days for a bushel of wheat, four days for a bushel of rye, and three and one-half days for a bushel of barley. Hops became an important crop. Gardening, greatly neglected in the first part of the seventeenth century, received due attention in the latter part. Deep drainage, too, began to be talked about. From the middle of the seventeenth century to the nineteenth, England looked to Flanders for the perfection of careful tillage. From the Flanders of the seventeenth century Sir Richard Weston brought turnips and red clover, and Arthur Young afterward called him a greater benefactor than Newton. By the end of the century turnips and clover were extensively cultivated in alternation with wheat. The cultivation of grasses was begun in this century with the introduction of perennial rye grass. White clover was introduced in 1700, and timothy and orchard grass came to England from America about 1760. The eighteenth century saw revolutions in English farming. One came when Lord Townsend established the Norfolk system. Under this system of first, wheat; second, turnips; third, barley; fourth,

clover and grass, one-half of the land was constantly under grain crops and the other under cattle-grazing. Large numbers of sheep and cattle were fattened on the turnips, and the consumption of roots on the land increased the yield of the barley. The Norfolk system was a success from the beginning. The rental of certain farms increased fivefold, and farmers in special cases made handsome fortunes. Susceptible of many modifications, it has had much to do with the improved agriculture of England. Beans, peas, and vetches were generally grown, often in mixtures with wheat or oats. Hemp was grown for rope-making. The common vegetables were onions, leeks, mustard, and peas, and among the fruits were apples, grapes, cherries, pears, and plums.

Another revolution came from the breeding experiments of Bakewell, commenced in 1760. To mention a single point, it had taken three or four years to prepare sheep for the market; those bred by Bakewell were prepared for the market in two years. Besides making a reputation and a fortune for himself, he made for others a way since followed in breeding. Jethro Tull, whose book on *Horse-hoeing Husbandry* appeared in 1733, was almost in touch with the methods of the nineteenth century. His theory was that seeds should be sowed in drills, and the spaces between the drills kept thoroughly cultivated. He invented a drill and a horse-hoe. He did not succeed in obtaining phenomenal crops, but successful modifications of the method have since been made.

North America. More agricultural progress had been made prior to the coming of the white man than is commonly supposed. Most of the Indians east of the western plains lived in settled villages and cultivated the soil. Indian corn was the chief food-stuff, and fully 1,000,000 bushels of ear corn were raised annually. Beans, squashes, pumpkins, sunflowers, tobacco, and gourds were among the 25 crops under cultivation. The Indians practiced seed selection, combated weeds, and sometimes manured their land with fish, shells, etc. In prehistoric times agriculture was carried on in the southwest with the aid of extensive reservoirs and dams, from 250,000 to 300,000 acres being irrigated in the Salt River valley alone. Hand irrigation is still practiced by the Pueblo Indians, who have raised cotton for hundreds of years.

The white colonists had much to discourage them as agriculturalists, and progress was slow. The land had for the most part to be cleared of forests. In New England the rigorous winters and stony soil were additional handicaps. From the Indians the settlers learned how to raise corn (maize), breaking the soil with a hoe and manuring with fish. Corn was the great product to be depended upon, although other grains were cultivated, and cattle and sheep increased slowly, fed first upon the native grass, then upon timothy, which was found to be specially fitted for New England soil. Enough flax was grown in 1642 to supply domestic needs in Massachusetts.

The Southern colonists, although more favored by nature, made less actual progress than those of the North. Tobacco for export to England became the most profitable crop, virgin land being cleared and abandoned when its fertility waned. Live stock flourished, and an export trade to New England began in 1640.

Cotton became a marketable product in 1620, although comparatively undeveloped until the invention of the cotton gin in 1793. Then began the reign of cotton, with a reliance upon slave labor, a demand for fresh fields, and a disregard of careful tillage. Early in the century the importation of the Spanish merino sheep changed the farming of the North and greatly increased the production of wool.

The Nineteenth Century. In the nineteenth century the progress of agriculture was profoundly affected by great general causes, some of which exerted a world-wide influence. Among these were: (1) the application of science to the improvement of agriculture; (2) the revolution in transportation methods through the use of steam power on land and sea; (3) the rapid opening of vast areas of new land in North and South America, Australia, and Africa to settlement, cultivation, and grazing; (4) the invention and extensive use of labor-saving machinery as applied to agriculture; (5) the abolition of serfdom and slavery; (6) the specialization of agricultural industries; (7) the organization of the distribution of agricultural products, and their use in manufactures in accordance with the modern business principles governing the organization of other great industries; (8) the establishment of governmental agencies for the promotion of agriculture; (9) the voluntary coöperation of farmers through numerous associations; and (10) the wide dissemination of public documents, and farmers' meetings. Scientific studies and experiments for the benefit of agriculture began early in the century, with its practical applications in the manuring of crops, the use of commercial fertilizers, etc. In more recent years a wide range of successful research on behalf of agriculture has been developed with the aid of the biological sciences, and in the closing years of the nineteenth century investigations in agricultural physics assumed great importance. The marvelous success of scientific effort, largely under government patronage, is one of the notable achievements of that century. Organized scientific research for the benefit of agriculture through experiment stations and kindred institutions became a regular and permanent agency for the advancement of this art.

The vital interest of the whole community in the success of agriculture as the great basal industry was distinctly recognized during the nineteenth century by the widespread establishment of governmental agencies for its promotion. Agriculture has now a definite place in the ministries of almost all the civilized nations of the globe. In the United States the Federal government maintains a Department of Agriculture, whose chief officer has had a seat in the President's cabinet since 1889 as the Secretary of Agriculture. Practically all of the States, too, have departments, boards, or commissioners of agriculture. Great Britain has a Board of Agriculture and Fisheries, organized in 1889, and a Development Commission, appointed in 1910. See AGRICULTURAL EXPERIMENT STATION; AGRICULTURE, UNITED STATES DEPARTMENT OF.

Agricultural Machinery. One of the features of the agricultural history of the past 50 years has been the extensive introduction of machinery. Sowing machines, cultivators, and

all the machines that displace the hoe are of comparatively recent invention. As early as 33 A.D., according to Pliny, the Gauls used a cart with projections in front which cut or tore off the heads of grain; but until recent times little effort was made to invent or introduce labor-saving machinery, owing to popular prejudice. The threshing machine was not invented until 1786, and though an attempt was made early in the century to construct reaping machines, but small success was won until the time of Bell, Hussey, and McCormick. (See REAPERS; REAPING.) In the hay harvest horse power is applied by means of the mowing machine, the hay-tedder, the rake, and machines for loading and unloading the hay. Another class of machines, as, for example, the one for threshing, deal with the gathered crops. The use of a system of machinery like that applied to dairying has made great changes in certain lines of agriculture. From horse power, too, there has been a partial change to power furnished by the steam, internal combustion, or gasolene engine, or, under special conditions, the windmill and electric motor. Even the small modern farm usually has something of the kind available for pumping water, filling the silo, running the cream separator and churn, etc., and the agricultural tractor and power-operated plows and harvesting machinery are becoming common in regions where farming is on an extensive scale. Improved farm machinery in America has made possible the rapid settling of the new States and the successful gathering of their immense harvests. (See HARVEST AND HARVESTING; FARM IMPLEMENTS; IMPLEMENTS, AGRICULTURAL; THRESHING AND THRESHING MACHINES; PLOW, PLOWING.) The Department of Agriculture found that the amount of human labor required to produce a bushel of wheat was on an average only 10 minutes in 1896, as compared with 3 hours and 30 minutes in 1830, and the cost of the human labor required to produce this bushel of wheat declined from 17¾ cents to 3½ cents.

System in Farming. There is a movement in agriculture to provide for local demands, to take advantage of growing centres of population, to strive for excellence and exact system in place of haphazard methods. The evaporator has broadened the fruit market. The canning industry has utilized fruits and vegetables and saved the agricultural balances in sections. Cold storage, rapid transportation, and the refrigerator car have reduced risks and shortened apparent distances. New Zealand is in the markets of London. Canada and the United States have a profitable apple trade with England. The expenses of transportation have been reduced to a fraction of the previous cost, and thus the wheat lands of Saskatchewan have been laid alongside those of both New England and old England, with gain for the one and with loss for the others. In dairying there has been one of the triumphs of recent agriculture. Specialization, with scientific method and improved machinery, has brought excellence without destruction of the market. Carried on largely as coöperative undertakings, creameries and cheese factories (see DAIRYING) have increased in Europe and America. A large industry in England, dairying on the coöperative basis has been on the increase in France. The Netherlands, famous for its careful agriculture, is a leading dairy country. Switzerland and Canada export

large quantities of cheese. Denmark no longer competes for the wheat trade, but has become one of the most successful of dairy countries, exporting immense quantities of high-grade butter to England.

Twentieth Century Agriculture. The census of 1910 showed 6,361,502 farms in the United States, with an average acreage of 138.1 acres, of which 75.2 acres was improved land. The aggregate value of farm property was \$40,991,449,090. Although the acreage increased only 4.8 per cent since 1900, the value of farm property rose 100.5 per cent, and that of land alone from \$15.57 to \$32.40 per acre. On the other hand, the rural population (49,344,883) increased by only 11.2 per cent as compared with an increase in the urban population (42,623,383) of 34.8 per cent. These figures illustrate some of the recent economic changes. With the practical exhaustion of the arable land in the public domain, and the consequent increase in price of farm lands, more intensive farming has become well-nigh indispensable.

The spread of the much-dreaded cotton boll weevil in the South has proved a blessing in disguise by bringing about diversification of crops, and this will be much accelerated when the eradication of the cattle tick allows animal husbandry and dairying to be developed to their full extent. The immense flocks and herds grazing on the open range have been replaced in many regions by fields of alfalfa, durum wheat, and other special crops adapted to irrigation or dry farming conditions, and this with the increase in population has brought about a virtual cessation of the export trade in cattle and contributed to the world-wide increase in the cost of living.

A great amount of intelligent work has been given to securing plants and trees suited to local conditions in different climates. Numerous varieties of all sorts of cultivated plants have been obtained through selection and otherwise, and in this way the areas devoted to different crops have been greatly extended. In the vicinity of the large cities market gardening has been a profitable branch of agriculture and has been the culmination of careful cultivation. Somewhat similar to it has been an industry which has developed in the United States under the name of "truck farming," carried on in places remote from markets. A large part of the vegetables consumed in the large American cities come from places from 500 to 1500 miles distant. According to the census reports of 1910 over 500,000 acres are given to vegetable growing on a considerable scale, and the annual return is over \$60,000,000. The South Atlantic States are especially interested in "truck farming," which, under favorable conditions, is generally very profitable. Other forms of special agricultural industries which have made great progress in recent years are the breeding of animals, fruit culture, poultry raising, and bee-keeping.

In speaking of the agriculture of the United States, besides branches touched upon, reference should be made to tobacco, which is grown widely; to the sugar-cane, grown chiefly on the alluvial lands of the Mississippi, and the sugar beet, to which large areas are given in Colorado, Michigan, California, and other States; to rice, grown profitably in the lowlands of certain Southern States; to the tropical and sub-tropical products of Florida and California; and to the

immense orchards of Oregon and other States of the Northwest.

In the West, since 1880, irrigation has been employed on a large scale in reclaiming land within the arid belt, a region extending from the centre of Kansas and Nebraska to the furthestmost Pacific Coast range of mountains. In that region of scanty rainfall 13,738,485 acres were irrigated in 1909, upon which crops valued at \$181,617,396 were grown. Under the National Reclamation Act reservoirs and other irrigation works are being constructed which will provide water for more than 2,000,000 acres, and irrigation is also being extended by private enterprise. Moreover, improved methods of cultivation are making it possible to grow crops by "dry farming" (i.e., without irrigation) on thousands of acres until recently considered irreclaimable. The success of irrigation in the West has led to a movement in the humid region to reclaim large areas of unproductive land by drainage, and the national government is beginning to assist in these enterprises. See IRRIGATION; ARTESIAN WELL.

The Commission on Country Life appointed by President Roosevelt reported in 1908, after an extensive survey, that in a general way the American farmer was more prosperous than ever before, but found that agriculture was still "not economically as profitable as it is entitled to be for the labor and energy the farmer expends and the risks he assumes." The three great needs were summarized as (1) effective coöperation to put him on a level with the organized interests with which he has to deal; (2) schools which will prepare children for country life, and (3) better means of communication. These conclusions epitomize twentieth-century conditions, and some of the lines along which improvement is being sought. Efforts are being made to increase agricultural credit facilities and to organize farmers for mutual betterment. (See AGRICULTURAL ASSOCIATIONS; COÖPERATION; CREDIT, AGRICULTURAL.) A system of agricultural instruction is being developed to educate the boy and girl back to, rather than away from, the farm. (See AGRICULTURAL EDUCATION.) Rural free delivery of mail and the parcel post, rural telephones, the automobile, and improved roads are decreasing the isolation of country life, and business men, educators, churches, etc., are joining hands with the farmer as never before to promote rural improvement as the foundation of American prosperity.

Other Countries. In Europe rural depopulation has become a most serious problem, and the related world-wide farm labor question has been of scarcely less importance. Efforts have been made in most European countries to remedy the situation by breaking up the large estates into small holdings and selling these under a system of deferred payments. In Great Britain about 200,000 acres have been allotted in this way.

The cultivation of the sugar-beet has become a prominent industry in Germany, Austria-Hungary, and Russia, these three countries growing nearly two-thirds of the world's supply. The vine is of importance in all the Mediterranean region and in favored localities like those along the German Rhine. Italy gives to the vine 10,000,000 acres, and France, with the lowest acreage in 1891, and larger before and since, gives on an average 4,000,000 acres. France,

dating its progress from the Revolution, has become one of the richest of agricultural countries, and previous to 1874 was the greatest wheat-producing country of the world. It is noted for its small farms and thrifty agricultural class, more than half of whom are land owners. Germany, the greatest potato-producing country of the world, is also a country of varied agricultural production. Austria-Hungary, only about half a century from serfdom, has a government that fosters agriculture and presents the sharp contrasts illustrated by the steam cultivator on large estates and the wooden plow on small farms. Russia, only 30 years from serfdom, shows agricultural methods in sharp contrast, with an immense agricultural production.

The garden of Italy is the Lombard plain, with its more than 1,600,000 acres of irrigated land and its careful systems of cultivation. Besides large crops of wheat, maize, grapes, and olives, Italy produces great quantities of lemons and oranges, and has more than half a million people engaged in raising silkworms. In Spain, despite over 3,000,000 acres each in grapes and olives, besides a large production of cereals and oranges, and the possibilities of irrigation and a succession of crops, agriculture looks backward to the time of the Moor.

China, with an agriculture unchanged from legendary times, and Japan are countries in which rude implements are overbalanced by irrigation, garden-like cultivation, and the most scrupulous care to conserve soil fertility and utilize every particle of human or animal wastes or other material of fertilizing value. With rice as a principal food product, they support a dense population, have a great variety of crops, and, together with India and Asiatic Russia, are increasing factors in computing the world's supply.

Egypt, under the guidance of England, is producing great amounts of sugar and a high-grade cotton. In 1913 Great Britain arranged a loan of \$15,000,000 to develop cotton growing in the Sudan.

Australasia has already developed beyond the pastoral stage, and besides cattle and sheep is exporting dairy and other products. Western Canada, with its virgin fields of wheat and oats, is becoming an important source of supply. In South America, Argentina is an important factor in the world's agricultural market, with its wheat, corn, wool, and cattle; and Brazil holds a leading place in the production of coffee. In Central America, including Mexico, the raising of cattle and sheep has become a large industry, and the exports of coffee, cocoa, and bananas are important. The West Indies and the Hawaiian Islands produce large quantities of cane-sugar.

The following table, prepared from the *Yearbook* of the United States Department of Agriculture, shows the amount of the principal agricultural products of different countries for the year 1912. Although these returns are not complete for all the countries, they furnish interesting data regarding the relative agricultural production of different regions. Of the world's wheat crop of about 3,760,000,000 bushels, the United States produces about one-fifth. The other chief wheat-growing countries are Russia, India, France, Austria-Hungary, Canada, Italy, Germany, Argentina, and Spain. The United States produces three-fourths of the world's

maize crop of 4,055,000,000 bushels, and more than two-thirds of the crop of 24,000,000 bales of cotton. Russia leads the world in the production of rye and barley, and in the yield of potatoes it is surpassed by Germany only. Outside of the United States most of the cotton is grown in India, China, and Egypt. Tobacco is an important crop in India, Austria-Hungary, Mexico, Japan, Germany, and France.

time and the year 1800 some 200 British authors wrote on agricultural topics. Among their works are Tusser, *Five Hundred Points of Good Husbandry*, etc. (1573); J. Tull, *Horse-hoeing Husbandry* (London, 1733); A. Young, *Annals of Agriculture* (London, 1813). In the United States few books on agriculture were published prior to 1800. Among these may be mentioned J. Eliot, *Agricultural Essays* (Boston, 1760);

* Yield for 1911.

Bibliography. Only a few works on agriculture have come down to us from ancient literature. Among these the most important are: Hesiod, *Works and Days*; Cato, *De Re Rustica*; Varro, *Rerum Rusticarum Libri III*; Vergil, *Georgics*; Pliny, *Natural History*; Palladius, *De Re Rustica*. *Roman Farm Management* (New York, 1913) gives an English translation of the treatises of Cato and Varro. The modern literature begins with P. Crescenzi, a Bolognese, who at the beginning of the fourteenth century wrote his *Ruralium Commodorum Libri XII*. Walter of Henley, who wrote about the middle of the thirteenth century, is the chief authority for that period. The first English book on agriculture is Sir Anthony Fitzherbert's *The Boke of Husbandrie* (London, 1523). Between that

S. Deane, *New England Farmer, or Georgical Dictionary* (Portland, 1797); B. Vaughan, *Rural Socrates* (Hallowell, 1800). During the nineteenth century the number of English and American works on agriculture greatly increased, and not only did the general treatises become more thorough and scientific, but also a large amount of valuable literature on special subjects was published. Only a few books of more general importance will be mentioned here: J. C. Loudon, *Encyclopædia of Agriculture* (London, 1825); J. C. Morton, *A Cyclopædia of Agriculture* (London, 1850-52); *Handbook of the Farm* (London, 1868); J. Periam, *The American Encyclopædia of Agriculture* (Chicago, 1881); L. H. Bailey et al., *Cyclopædia of American Agriculture* (New York, 1907-09);

C. E. Green and D. Young, *Encyclopædia of Agriculture* (Edinburgh and London, 1907-09); R. P. Wright, *The Standard Cyclopædia of Modern Agriculture and Rural Economy* (London, 1907-10); E. V. Wilcox and C. B. Smith, *Farmers' Cyclopædia of Agriculture* (New York, 1904); *Cyclopedia of Live Stock* (New York and London, 1908); L. H. Bailey, *Rural Science Series* (New York, 1895); Bailey and Miller, *Encyclopædia of American Horticulture* (4 vols., New York, 1900-02); H. Stephens, *Book of the Farm* (London, 1855); R. Wallace, *Farm Live Stock of Great Britain* (Edinburgh, 1885); E. B. Voorhees, *First Principles of Agriculture* (Boston, 1896); *Forage Crops* (New York and London, 1909); W. P. Brooks, *Agriculture* (Springfield, Mass., 1901); F. S. Earle, *Southern Agriculture* (New York, 1908); J. A. Widtsoe, *Dry Farming* (New York, 1911); G. F. Warren, *Elements of Agriculture* (New York and London, 1909); F. H. King, *Farmers of Forty Centuries* (Madison, Wis., 1911); S. W. Johnson, *How Crops Grow* (New York, 1868; London, 1869); *How Crops Feed* (New York, 1870); A. D. Wilson and C. W. Warburton, *Field Crops* (St. Paul, 1912); A. Agee, *Crops and Methods of Soil Improvement* (New York, 1912); J. B. Davidson, *Agricultural Engineering* (St. Paul, 1913); H. C. Taylor, *Agricultural Economics* (New York and London, 1907); T. N. Carver, *Principles of Rural Economics* (Boston and London, 1911); T. F. Hunt, *How to Choose a Farm* (New York and London, 1906); G. F. Warren, *Farm Management* (New York, 1913); G. H. Powell, *Coöperation in Agriculture* (New York, 1913); J. L. Coulter, *Coöperation among Farmers* (New York, 1911); K. L. Butterfield, *Chapters in Rural Progress* (Chicago, 1908); L. H. Bailey, *The Country Life Movement* (New York, 1911); J. M. Gillette, *Constructive Rural Sociology* (New York, 1913); Mabel Carney, *Country Life and the Country School* (Chicago, 1912); W. H. Wilson, *The Evolution of the Country Community* (Boston, 1912). History of Agriculture: G. Rawlinson, *Ancient Egypt* (London, 1887); C. G. B. Daubeny, *Lectures on Roman Husbandry* (Oxford, 1857); C. W. Hoskyns, *Short Inquiry into the History of Agriculture* (London, 1849); W. H. R. Curtler, *A Short History of English Agriculture* (Oxford, 1909); J. E. T. Rogers, *History of Agriculture and Prices in England* (Oxford, 1882); R. E. Prothero, *English Farming, Past and Present* (London, New York, etc., 1912); R. C. Flint, *One Hundred Years' Progress*, Report Department of Agriculture (Washington, 1872).

Several hundred agricultural journals are being published, widely distributed over the world. A few of the most important are the following: United States: *The American Agriculturist* (New York); *Breeder's Gazette* (Chicago); *California Cultivator* (San Francisco); *Country Gentleman* (Philadelphia); *Farm and Ranch* (Dallas, Texas); *Farmers' Mail and Breeze* (Topeka); *Hoard's Dairyman* (Fort Atkinson, Wis.); *Pacific Rural Press* (San Francisco); *Rural New Yorker* (New York); *Southern Planter* (Richmond, Va.); *Wallaces' Farmer* (Des Moines, Iowa). West Indies: *West Indian Bulletin* (Barbados). South America: *Revista Zootecnia* (Buenos Aires). Great Britain: *The Agricultural Gazette* (London); *Farmers' Gazette* (Dublin); *Field, Farm, and Garden* (London); *Gardeners' Chronicle* (London); *Mark Lane Express* (London); *Scottish*

Farmer (Glasgow). Canada: *Journal of Agriculture and Horticulture* (Montreal); *Farmers' Advocate* (Winnipeg). France: *Journal d'Agriculture Pratique* (Paris); *Vie Agricole et Rurale* (Paris). Germany: *Deutsche Landwirtschaftliche Presse* (Berlin); *Fühling's Landwirtschaftliche Zeitung* (Leipzig). Austria: *Wiener Landwirtschaftliche Zeitung* (Vienna). Italy: *Il Coltivatore* (Casale Monferrato). Spain: *El Progreso Agrícola y Pecuario* (Madrid). Australia: *Agricultural Gazette of New South Wales* (Sydney); *Queensland Agricultural Journal* (Brisbane); *Journal of the Department of Agriculture of South Australia* (Adelaide); *Agricultural Journal of the Union of South Africa* (Cape Town); *Indian Agriculturalist* (Calcutta).

AGRICULTURE, UNITED STATES DEPARTMENT OF. The department was established as a separate branch of the government in 1862. It grew out of a voluntary distribution of seeds, begun by the Commissioner of Patents in 1836. In 1839 Congress made an appropriation of \$1000 "to be taken from the Patent Office fund for the purpose of collecting and distributing seeds, prosecuting agricultural investigations, and procuring agricultural statistics." Small amounts were thus drawn from that fund annually (except in 1840, 1841, and 1843) up to 1854, when the whole amount was reimbursed and a separate appropriation was made for the agricultural work of the Patent Office. That year an entomologist was employed, and in 1855 a chemist and a botanist were added to the staff, and a propagating garden was begun. After separation from the Patent Office, the chief officer of the department was styled Commissioner of Agriculture. He was not a member of the President's cabinet until 1889, when he became Secretary of Agriculture. The first Commissioner was Isaac Newton of Pennsylvania, and the first Secretary, Norman J. Colman of Missouri, who was also the last Commissioner. The succeeding secretaries have been Jeremiah M. Rusk of Wisconsin, J. Sterling Morton of Nebraska, James Wilson of Iowa (1897-1913), and David F. Houston of Missouri. In recent years the activities of the department have been widely extended. Its personnel numbers over 14,000 employees, and its funds for the fiscal year ended June 30, 1913, aggregated \$22,656,496. Its main buildings are in Washington, but though augmented by the completion in 1908 of two four-story wings of a proposed huge departmental building at a cost of \$1,500,000, accommodate only a fraction of the employees. Its equipment also includes three farms comprising nearly 1000 acres in Maryland and Virginia, and numerous branch laboratories, etc., in various parts of the country. The department library of over 122,000 books and pamphlets is considered the largest agricultural library extant.

As defined in the act of establishment, the duties of the department are "to acquire and diffuse among the people of the United States useful information on subjects connected with agriculture in the most general and comprehensive sense of that word, and to procure, propagate, and distribute among the people new and valuable seeds and plants." The present functions of the department may be classified as (1) administrative, (2) advisory, (3) investigational, (4) informational, and (5) educational. With the progress of agricultural science the department has become one of the greatest

scientific establishments in the world. Its administrative functions also have been materially enlarged in recent years and reach vitally the daily life of every citizen. Much attention is given to disseminating results. In 1912 the department issued 2110 publications aggregating 34,678,557 copies. Many of these were technical reports of scientific investigations in limited editions for libraries, agricultural colleges, and experiment stations, scientific institutions, and persons coöperating in the work of the department, but also sold by the Superintendent of Documents at cost. The *Year-book* (edition 500,000 copies) and the series of *Farmers' Bulletins* are distributed gratis, largely through members of Congress. Monthly lists of publications of the department and the State experiment stations are sent free to all applicants. Periodical publications of the department are the *Experiment Station Record*, *Monthly Weather Review*, and beginning with 1913 the *Journal of Agricultural Science*, in which are published results of the department's research work. A series of departmental bulletins contains less technical material and has been substituted for the series of bulletins and circulars formerly issued by each bureau. The department also conducts a vast and varied correspondence and is employing a large number of experts to give personal advice to farmers in districts where they are located.

The present organization and main lines of work of the department are shown in the following table:

ORGANIZATION AND WORK OF UNITED STATES DEPARTMENT OF AGRICULTURE, 1913

Division	Scientific and technical work	Administrative work
OFFICE OF THE SECRETARY.		Supervision of all public business relating to the agricultural industry; appointment and supervision of department officers and employees; care of department grounds, buildings, supplies and other property; direction of legal work of the department.
WEATHER BUREAU.	Researches in climatology and meteorology.	Forecasting weather; warning against storms, frosts, and floods; maintenance and operation of seacoast telegraph lines and collection and transmission of marine intelligence.
BUREAU OF ANIMAL INDUSTRY.	Researches on animal diseases, including chemical, bacteriological, and zoölogical investigations. Investigations in dairying, animal breeding, and feeding.	Inspection of import and export animals and vessels for their transportation; supervision of interstate movement of cattle and inspection of live stock and their products after slaughter for food consumption; eradication of Texas fever and other animal diseases; supervision of serums for use with animals; management of experimental farms at Beltsville and Bethesda, Md.

ORGANIZATION AND WORK OF UNITED STATES DEPARTMENT OF AGRICULTURE, 1913—(Continued)

Division	Scientific and technical work	Administrative work
BUREAU OF PLANT INDUSTRY.	Researches in economic botany, physiology, and diseases of plants and forest trees; plant breeding; soil bacteriology; biophysics; acclimatization and adaptation of plants. Farm management investigations; demonstration work with farmers in improved farm practice; studies of agriculture under dry-land, irrigation, and other special conditions. Collection and testing of seeds and plants from foreign countries.	Purchase and distribution of seeds, largely through members of Congress. Testing of imported and domestic seeds. Establishing standard grades of grain and cotton. Care of department park and conservatories. Management of Arlington Experimental Farm.
BUREAU OF CHEMISTRY.	Researches in agricultural chemistry, bacteriology and physiology, especially with foods, drugs, waters, leather, paper, feeding stuffs, insecticides, and fungicides; enology; methods of analysis, etc.	Inspection of foods and drugs imported or entering interstate commerce. Miscellaneous analyses for the department. Testing supplies for other departments.
BUREAU OF SOILS.	Investigation, classification, survey, and mapping of soils; studies in soil chemistry and physics; soil fertility; explorations to discover sources of natural fertilizers.	
OFFICE OF EXPERIMENT STATIONS.	Collection and dissemination of information regarding agricultural education and research in the United States and abroad. Investigations on food and nutrition of man and on irrigation and drainage.	Supervision of expenditures of agricultural experiment stations in the United States; maintenance of experiment stations in Alaska, Hawaii, Porto Rico, and Guam.
FOREST SERVICE.	Researches on natural history and utilization of forests.	Control of National Forests and economic management of forests, including fire protection, timber sales, grazing control, and reforestation. Coöperates with States in fire protection of headwaters of navigable streams.
BUREAU OF BIOLOGICAL SURVEY.	Researches on geographic distribution of animals and plants; mapping of life zones; studies of food habits of birds and mammals.	Administers laws regulating the importation of foreign birds and animals. Protection of game by control of interstate trade. Protection of migratory and insectivorous game birds. Supervision of quarantine to prevent spread of gypsy and browntail moths.
BUREAU OF ENTOMOLOGY.	Researches on insects affecting agriculture and forestry, including means of repression of insects injurious to crops, animals, and man; introduction of beneficial insects; promotion of apiculture.	

ORGANIZATION AND WORK OF UNITED STATES DEPARTMENT OF AGRICULTURE, 1913—(Continued)

Division	Scientific and technical work	Administrative work
OFFICE OF PUBLIC ROADS.	Collection and dissemination of information regarding road management; experiments in road making and road improvement; tests of road materials.	
DIVISION OF PUBLICATIONS.	Editing of department publications, especially the <i>Year-book</i> .	Supervision of department printing and illustrations; distribution of publications.
BUREAU OF STATISTICS.	Collection and dissemination of agricultural statistics, especially crop reports for the United States and foreign countries. Economic studies of agricultural production and distribution.	
DIVISION OF ACCOUNTS AND DISBURSEMENTS. LIBRARY.		Supervision of fiscal affairs of the department. Supervision of department library.
RURAL ORGANIZATION SERVICE.	Researches in problems of rural organization, including studies of marketing and distributing farm products and bettering country life.	
REFEREE BOARD OF CONSULTING SCIENTIFIC EXPERTS.	Researches on scientific questions involved in the food and drug inspection.	
BOARD OF FOOD AND DRUG INSPECTION.		Considers administrative questions in administration of food and drugs act.
INSECTICIDE AND FUNGICIDE BOARD.		Administers the act for inspection of insecticides and fungicides.
FEDERAL HORTICULTURAL BOARD.		Administers the act for inspection and quarantine of diseased or infested plants.

AG'RIGEN'TUM (Lat. name for the Gk. *Ἀκράγας*, *Akragas*). The modern Girgenti, a town on the southern coast of Sicily, in lat. 37° 17' N., and long. 13° 28' E., founded by a colony from Gela (582 B.C.), once one of the most important places in the island. During the sixth and fifth centuries B.C., under various rulers, among them the tyrant Phalaris (q.v.) and Theron (q.v.), it rose to great power and splendor, having a population of 200,000. It was utterly destroyed by the Carthaginians (405 B.C.), and it never fully recovered. In the course of the Punic Wars it was compelled to submit to the Romans. From 825 to 1086 A.D. it was in the possession of the Saracens, from whom it was conquered by Count Roger Guiscard. The modern Girgenti had (1901) 25,024 inhabitants and is the capital of the province of the same name. The ancient walls can still be traced, and there are a number of picturesque remains of temples and other buildings of the Greek period. The best preserved are the temple of Concord and the so-called temple of Hera Lacinia; the largest is the unfinished temple of Zeus. There

are ruins also of an imposing Greek theatre. It was the birthplace of Empedocles (q.v.).

AG'RIMONY (Lat. *agrimonia*, for Gk. *ἀργεμώνη*, *argemōnē*, a kind of poppy). The common name of the genus *Agrimonia*, which includes about 15 species, and belongs to the family Rosaceæ. The common agrimony (*Agrimonia eupatoria*) is a native of Europe, and is represented in the United States by closely allied species growing in borders of fields, on waysides, etc. The plants are perennial herbs, with pinnate leaves, clusters of yellow flowers, and a calyx-tube with hooked bristles in the throat. The original species (*Agrimonia eupatoria* of Europe), like its American relatives, has a pleasant, slightly aromatic smell, and is bitter and styptic. A decoction of it is used as a gargle; the dried leaves form a kind of herb tea, and the root has some celebrity as a vermifuge.

AGRIP'PA. See under HEROD.

AGRIPPA, MARCUS VIPSANIUS (63-12 B.C.). A Roman general and statesman. Though not of high birth, through his own talents he rose to an exalted position. He first married Marcella, the niece, and then Julia, the daughter, of Octavianus (Augustus). He was eminent both in war and in peace; and as a general, counselor, and friend of the Emperor, did good service to him and to the Roman State. As a general, especially by his naval victories between Mylæ and Naulochus, in Sicily, 36 B.C., he laid the foundation for the sole dominion of Octavianus and commanded his fleet in the battle of Actium (q.v.). He was generous, upright, and friendly to the arts; Rome owed to him the restoration and construction of several aqueducts, and the erection of the Pantheon, besides other public works of ornament and utility. By his first wife he had a daughter Vipsania, the first wife of Tiberius, afterward Emperor; by Julia he had two daughters, Julia and Agrippina (q.v.), wife of Germanicus (see GERMANICUS CÆSAR), and three sons, Gaius Cæsar, Lucius Cæsar, and Agrippa Postumus.

AGRIPPA VON NITTESHEIM, HENRICUS CORNELIUS (1486-1535). A cosmopolitan physician, philosopher, and writer, whose genius and learning had a tinge of quackery. He was born at Cologne, Sept. 14, 1486. At the age of 20 he was sent by Emperor Maximilian on a diplomatic mission to Paris. At 23 he was teaching theology at Dôle, in the Franche-Comté. Here he attacked the monks, who replied with an accusation of heresy. In 1510 he reëntered the diplomatic service, and the next year he attended, as theologian, the schismatic Council of Pisa. In 1515 he lectured at Pavia, where he received a doctor's degree in law and medicine; then, after some years in diplomatic service, he became involved once more in controversy with the Church, for his bold defense at Metz of a woman accused of witchcraft. He practiced medicine at Geneva, Freiburg, and Lyons, and, under pressure of poverty, composed a keen Latin satire on the existent state of science, *A Declamation on the Uncertainty and Vanity of the Sciences and Arts, and on the Excellence of the Word of God* (*De Incertitudine et Vanitate Scientiarum*, etc.) (1527), which furnished new occasion for malicious accusation. In 1529 he quarreled with the Queen-mother Louise of Savoy, and left Lyons for the Netherlands, to become historiographer of the Emperor Charles V, of whose reign he wrote a history. His salary was unpaid, and he was imprisoned and finally banished

from Cologne for debt. He found a brief refuge at Grenoble, where he died, Feb. 18, 1535, only to be pursued in the grave by a spiteful epitaph from his Dominican enemies. Agrippa was a man of clear sight and keen wit; but he lacked stability, seriousness, and discretion. Though engaged in controversy with the monks, he remained a Catholic. His *Works* appeared at Lyons in two volumes (1550). They are analyzed in Henry Morley's appreciative *Life of Agrippa* (London, 1856). Noteworthy are Agrippa's *De Occulta Philosophia* (1510), which gives an account of the Cabbala (q.v.) and defends magic; and *De Nobilitate et Præcellentia Faminei Sexus* (1532). The latest life of Agrippa is that of Prost, *Corneille Agrippe* (Paris, 1881).

AG'RIPPI'NA. 1. The daughter of M. Vip-sanius Agrippa (q.v.) and Julia, daughter of Augustus. She was one of the most heroic and virtuous women of antiquity. She was married to Germanicus (see GERMANICUS CÆSAR), whom she accompanied in all his campaigns. Tiberius, who hated her for her virtues and the esteem in which she was held by the people, banished her to the island of Pandataria, near Naples, where she voluntarily died of hunger (33 A.D.). 2. The daughter of the last mentioned (c.15-59 A.D.), and one of the most detestable women that ever lived. In her second widowhood she induced the Emperor Claudius, her own uncle, to marry her and caused his daughter, though she was already promised to another, to be betrothed to her son Nero. In order to bring the latter to the throne, she ruined many rich and noble Romans, excluded Britannicus, the son of Claudius by Messalina, from the succession, and finally poisoned the Emperor, her husband. She then endeavored to govern the Empire through her son Nero, who was proclaimed Emperor; but, her ascendancy proving intolerable, Nero caused her to be put to death (59 A.D.). She enlarged and adorned her native city, Cologne, which received from her the name of Colonia Agrippinensis.

AG'ROPY'RON (literally, field-wheat. Gk. *ἀγρός*, *agros*, field + *πυρός*, *pyros*, wheat). A genus of grasses including about 50 species, most of which are perennials. A number are native to the western United States, where they are commonly known as wheat grasses and are held to be valuable for pasturage. Other species are common to Europe and the eastern United States, where *Agropyron repens*, often called couch grass and twitch grass, is a pest to agriculture. It has a long rhizome that roots at the nodes, and if plowed or harrowed it merely breaks up into new plants. Therefore it is hard to eradicate. Upon the western ranges, however, it is deemed a good hay grass. The habits of the plants enable them to withstand drought, a characteristic that commends them in the large stock regions. Some of the valuable species are *Agropyron caninum*, bearded wheat grass; *Agropyron divergens*, wire bunch grass; *Agropyron pseudo-repens*, western couch grass; *Agropyron spicatum*, western wheat grass; and *Agropyron tenerum*, slender wheat grass. In Australia *Agropyron scabrum* is considered a good winter grass. Some of the species, as *Agropyron repens*, are recommended as binder grasses for railroad embankments and other places liable to washouts. The root stalks of *Agropyron repens*, well known in medicine under the name *Radix graminis*, have diuretic and aperient properties.

AGTELEK, ög'tě-lěk, or **AGGTELEK**. A village of Hungary, in the county of Gömör, about 40 miles west-southwest of Kaschau. It is known for its remarkable stalactite cavern, called *Baradla* (steaming-place), the largest in the world after the Mammoth Cave in Kentucky. It is entered through an opening scarcely 3 feet high by 5 feet wide. It consists of a labyrinth of caverns communicating with one another, whose combined length is more than 5 miles. The largest of them is over 900 feet long and more than 90 feet in height and breadth. Many of the stalactitic formations are of singular and fantastic shape, giving rise to the names borne by some of the grottoes, such as the Cathedral, Paradise, Flower Garden, etc.

AGUA, ä'gwá. A South American toad (*Bufo marinus*) ranging from the Antilles to Argentina. It is the largest toad known, being sometimes 8 inches long, the skin dark brown and rough with warty glands. The voice of the male is a loud, snoring bark. It became a pest a few years ago in Jamaica, where it was introduced in 1844 as an enemy to the rats, which were devouring the sugar-cane. It multiplied excessively and, although it destroyed young rats, became a nuisance by its numbers, nocturnal bellowings, and destruction of ground-birds, chickens, and eggs. It has since become less numerous and troublesome. See illustration on Colored Plate accompanying TOAD.

AGUA, VOLCÁN DE, vól-kán' dā ä'gwá. A volcano in southern Guatemala, Central America (Map: Central America, B 3). It is over 12,000 feet high, and has a crater about 90 feet in diameter, from which streams of hot water are occasionally ejected, whence its name. Northwest of Agua are situated the volcanoes of Pacoya and Fuego. The old town of Guatemala was destroyed in 1541 by the hot-water eruption of Agua.

AGUADA, ä-gwä'dá. A village in the north-western part of Porto Rico near the shore of Aguadilla Bay. It was founded in 1511 and claims to be the oldest settlement on the island. Tradition says that Columbus landed here in 1493. The town contains churches and schools and is surrounded by excellent farm land. The raising of sugar-cane is the most important industry. The hurricane in 1899 wrought great havoc in the neighborhood. Pop., 1910, 909.

AGUADILLA, ä'gwä-dě'lyá. The chief town of the municipality of the same name (pop., 1910, 21,419), situated on the western coast of Porto Rico (Map: Porto Rico, A 2). It has a fine bay, contains an old church and a fort, and is famous for its fruits and flowers. Coffee, cocoanuts, sugar, and tobacco are grown and exported, and rum is distilled. It was founded in 1775 and unsuccessfully attacked by the British in 1797. Pop., 1899, 6425; 1910, 6135.

AGUADO, ä-gwä'dô, ALEJANDRO MARÍA, MARQUIS DE LAS MARISMAS DEL GUADALQUIVIR (1784-1842). A celebrated Spanish financier of Jewish descent. He was born in Seville, and in Paris became one of the wealthiest bankers of modern times. During the Spanish War of Independence he fought with distinction with those who supported Joseph Bonaparte. Exiled in 1815, he went to Paris and engaged in the Cuban and Mexican trade and in banking. Beginning in 1823, he negotiated four Spanish loans, thus saving Spain from bankruptcy. In return, Ferdinand VII ennobled him and gave him mining and other concessions. He was

naturalized in France in 1828, and at his death left a fortune of more than 60,000,000 francs and a splendid collection of pictures.

AGUARA, ä'gwä-rä', or **GUARA**, gwä-rä' (native name). A Brazilian native name confusingly applied in books to various South American animals, perhaps most strictly to the crab-eating dog (*Canis cancrivorus*) of Guiana. In the valley of the Rio de la Plata Azara's fox-dog is called "Aguará chay," and the maned wolf "Aguará guazu." See **FOX DOG**; **MANED WOLF**.

AGUAS BUENAS. An inland village in the east central part of the island of Porto Rico, 14 miles south of San Juan. There are three interesting caves within the confines of the village and excellent coffee and fruit farms in the environs. Pop., 1899, 1309; 1910, 1166.

AGUAS CALIENTES, ä'gwäs kä'lê-ën'täs. An inland State of Mexico bounded by the State of Zacatecas on all sides except the south and southeast, where it is touched by the State of Jalisco. It is one of the smallest States in the Republic (area, 2969 square miles), but its excellent climatic and rainfall conditions make it an important farming and grazing district. Gold, silver, iron, lead, and copper are mined. Pop., 1910, 120,511.

AGUAS CALIENTES (Sp. Hot Springs). The capital of the State of Aguas Calientes, 300 miles northwest of Mexico City (Map: Mexico, H 7). It is situated on a plateau 6000 feet above sea level and is the point of intersection of the roads from Mexico to Sonora and Durango and that from San Luis Potosí to Guadalajara. It is the distributing centre of the State, the principal local manufactures being tobacco and pottery. There are also tanneries, distilleries, and cotton mills, and the National Railway shops are located here. Copper, lead, and silver bullion, and hides are exported to the United States. It is the scene of a great fair, held at Christmas time each year, and lasting two weeks. The numerous hot springs of the surrounding district give the town its name. Pop., 1900, 35,052; 1910, 45,198.

A'GUE (Fr. *aigu*, from Lat. *acuta*, *febris*, acute, violent fever), *Febris intermittens*. The common name for intermittent, or malarial, fever. A paroxysm of ague is composed of three stages. In the first, a cold sensation creeps up the back and spreads over the body; the patient shivers, his teeth chatter, his knees knock together; his face, lips, ears, and nails turn blue; he has pains in his head, back, and loins. During this stage the temperature rises to 102° or even to 105° F. This condition is succeeded by flushes of heat, the coldness gives place to warmth, and the surface regains its natural appearance. The warmth continues to increase, the face becomes red and turgid, the head aches, the breathing is deep and oppressed, the pulse full and strong. The temperature ranges from 103° to 105° F. In the third stage the skin becomes soft and moist, the pulse becomes normal, a copious sweat breaks from the whole body, the temperature falls, and the patient generally sleeps.

These paroxysms occur at regular intervals. The interval between them is called "an intermission." When they occur every day, the patient has *quotidian* ague; every second day, *tertian*; and when they are absent for two days, *quartan*. There is a *double quotidian* form, in which there are two complete paroxysms in

every 24 hours. See **MALARIA AND MALARIAL FEVER**; **INTERMITTENT FEVER**.

AGUE-CHEEK, Sir ANDREW. A delightful old simpleton in Shakespeare's *Twelfth Night*, who fears that "beef hath done harm to his wit." He is, however, "old in nothing but understanding" and joins in the dance and song "Which is the Properest Day to Drink?" with the zest of a young man.

AGUESSEAU, ä'ge-sò', HENRI FRANÇOIS D' (1668-1751). A distinguished lawyer and chancellor of France, pronounced by Voltaire the most learned magistrate that France ever possessed. He was born at Limoges, in the department of Haute-Vienne. He received his earliest education from his father, and, devoting himself to the study of law, became *avocat-général* at Paris in 1690, and at the age of 32, *procureur-général* of the *Parlement*. While holding this office he effected many improvements in the laws and the administration of justice. A steady defender of the rights of the people and of the Gallican church, he successfully opposed the decrees of Louis XIV and the Chancellor Voisin in favor of the papal bull *Unigenitus* (q.v.). During the regency he became Chancellor, but after a year (1718) fell into disgrace through opposing Law's system of finance, and retired to his country seat at Fresnes. Returning to office in 1720 he endeavored to force the *Parlement* to register the bull, but nevertheless he was exiled a second time for his opposition to Cardinal Dubois. In 1727 he was recalled to the office of Chancellor, in which he remained till 1750. His works have been published in 13 volumes (Paris, 1759-89, 1819); *Lettres inédites* (Paris, 1823). Consult Monnier, *Le Chancelier d'Aguesseau* (Paris, 1864); Ingold, *Le Chancelier d'Aguesseau et l'Oratoire* (Paris, 1879).

AGUILAR, ä'gê-lär', GRACE (1816-47). An English writer of Jewish parentage. She was born at Hackney and first became known by two works on her own religion, *The Spirit of Judaism* (first published in America, 1842) and *The Jewish Faith* (1846), in the former of which she attacked the formalism and traditionalism of Judaism and insisted on its spiritual and moral aspects. She also wrote much fiction, more or less of a religious character, of which only the most popular story, *Home Influence* (1847, and about 30 subsequent editions), was published during her lifetime. The further titles include *A Mother's Recompense* (1850), *The Vale of Cedars* (1850), and *The Days of Bruce* (1852).

AGUILAR DE LA FRONTERA, ä'gê-lär' da la frön-tä'rá. A city of Andalusia, Spain, in the province of Cordova, occupying the summits and slopes of four low hills on the left bank of the Cabra, an affluent of the Genil, 26 miles south-southeast of Cordova (Map: Spain, C 4). The surrounding country is very fertile and abounds in vineyards and orange groves. All the houses of the Plaza Nueva, one of the principal squares of the city, are of three stories. Aguilar is remarkable for the whiteness of its buildings and the cleanliness of its streets. It has a fine parish church, a monastic church containing examples of many famous Spanish masters, and a dismantled castle, which was a stronghold on the Moorish frontier. The city has had an interesting history and at present belongs within the domains of the Duke of Medinaceli. The chief trade is in oil, wines,

grain, fruits and garden truck of all kinds. There are factories of brandies, liqueurs, chocolate, wax, chalk, soap, and plaster, and electrical plants. There are pasture lands and salt springs in the neighborhood. Pop., 1900, 13,311; 1910, 12,637.

AGUILAR Y CORREA, ANTONIO, Marqués de la Vega de Armijo (1824-1909). Spanish statesman and diplomat. Born in Madrid, he studied law in the universities of Seville and Madrid, and in 1855 became prominent in politics, associating himself with O'Donnell in the party called the *Unión liberal*. His first official position was that of Civil Governor of Madrid, which he used to make an active campaign against gambling and prostitution. This position he resigned in order to become successively Minister of Public Works and Minister of the Interior, in both of which positions he rendered important service. At the downfall of the *Unión liberal*, June 22, 1866, he worked for the success of the revolution, and when it had succeeded he helped in a monarchical manifestation. The Marqués was a member of the *Cortes constituyentes*, as representative of the province of Cordova. In 1873 he was sent as Ambassador of Spain to the French Republic, where he did important work in frustrating the plans of the Carlists on the frontier. After the restoration he recognized Alfonso XII, and took a seat in the Cortes, in the Centre group, which later affiliated with the Constitutionals. Under the latter he became Minister of State and accompanied Alfonso XII on his journey to foreign countries. In 1883 he passed to the opposition, and in 1884 was elected *Concejal* for Madrid. Upon the death of Alfonso XII his party returned to the government, and Vega de Armijo was elected Deputy for Madrid and for Lucena. In 1889 he was Deputy for Jetafe and became Minister of State for a year, when his party fell from power. Late in 1892, under the Presidency of Sagasta, he received for a third time the portfolio of the Department of State, which he resigned in April, 1893, in order to be elected, in May, 1893, President of the Congress, a post which he held until the fall of Sagasta in March, 1895. In July, 1898, he was elected President of the Congress of Deputies. Aguilar y Correa was a member of the Real Academia de Ciencias Morales y Políticas and the Real Academia de la Historia, and during the last years of his life, despite his great age, he was Director of both of them, while continuing his activities in politics.

AGUILAS, ä'gê-làs. A seaport town of southern Spain (Map: Spain, E 4). It is situated in the province of Murcia, 37 miles southwest of Cartagena, on the Aguilas-Lorca-Murcia Railway. It has a good harbor, and its port forms the chief outlet for the mineral and agricultural products of the surrounding country. It imports coal and contains several smelting works. Pop., 1900, 15,753; 1910, 15,967.

AGUILERA, ä'gê-lã'rã, VENTURA RUIZ (1820-81). A Spanish lyric poet, called "the Spanish Béranger." He was born at Salamanca and in 1843 went to Madrid to study poetry and political journalism. Here he occupied important official positions under the liberal ministries. The journals edited or controlled by him were characterized by bold ideas and keenness of criticism; and in these, as also in his *Satyras* and in the poems entitled *Ecos Nacionales*, he endeavors to arouse the masses to a sense of

their national dignity. His most important works are the collections of poems entitled *Elegias* (1862); *Armonías y cantares* (1865); *La Arcadia moderna*; and *Leyenda de nochebuena* (1872). Several collections of his prose writings, which consist mostly of short novels, have been published. An edition of his complete works appeared at Madrid in 1873, and selections from his poems were published under the respective titles, *Inspiraciones* (1866), and *Poesías* (1880).

AGUINALDO, ä'gê-näl'dô, EMILIO (1870-). The leader of Filipino insurrections against Spain and the United States. A Chinese mestizo of Chinese and Tagalog parentage, he was educated, first, in his native town and afterward at the College of San Juan de Letrán and the University of St. Thomas in Manila. At this institution, which is conducted by Dominican friars, he remained for four years. In course of time he became *gobernadorcillo*, or mayor of Cavité Viejo, and was acting as such upon the outbreak of the insurrection in August, 1896. Owing to his prominent participation in this uprising, he went to Hong Kong, consenting to a permanent exile from the islands on condition of a large payment on the part of Spain. In 1898 he returned to Manila, for the avowed purpose, it was said, of aiding the United States in the war against Spain, and immediately after the battle of Manila organized an insurrection, which soon assumed proportions unparalleled in the history of the archipelago. In this movement he displayed great ability and extraordinary personal magnetism. In 1899 he assumed the offensive against the United States, beginning operations by an attack upon Manila, February 4-5, in which he was unsuccessful. During 1899 there were a number of severe engagements. Finally, the native troops were so hard pressed by the Americans that Aguinaldo, after repeatedly removing his capital, was compelled to flee to the mountains. Here the fighting was continued with varying success until March 23, 1901, when Aguinaldo was captured by Brigadier-General Frederick Funston at Palawan, province of Isabella, Luzon, and brought to Manila. On April 19, 1901, he formally took the oath of allegiance to the United States, and retired from public life. Wildman, *Aguinaldo* (Boston, 1901); Philippine Information Society, *Publications and Facts about the Filipinos* (Boston, 1900-01); Turot, *Les Hommes de Révolution; Aguinaldo et les Philippines* (Paris, 1900).

AGUIRRE, ä-gê'rã, LOPE DE (c.1507-61). A Spanish explorer in Peru, known as the "traitor" and "tyrant." He was born in Oñate, in the province of Biscay, and came to America at an early age. He was in Peru during the period of the insurrections which followed the subjugation of the Incas and took an active part in most of them. The turbulent spirits who survived these repeated uprisings were finally influenced to join an expedition to search for El Dorado under Pedro de Urzúa. They crossed the Andes and started down the head waters of the Amazon in the early summer of 1560. Aguirre brought about the death of Urzúa and gained great influence over Fernando de Guzmán, Urzúa's successor. He then forced his companions to renounce their allegiance to Spain and to recognize Guzmán as King of Tierra Firme and Peru. He determined to abandon the search for El Dorado and return to Peru, con-

quer that country, and establish an independent kingdom there. Shortly afterward the newly made King opposed some of his plans, and Aguirre thereupon murdered him, together with his closest friends. Continuing down the Amazon, Aguirre made his way by one of that river's tributaries to the Orinoco, where he built large vessels, in which he sailed to the island of Margarita. He was forced, however, to abandon the plan of fighting his way across Panama and to Peru. Instead, he landed on the coast of Venezuela, marched inland, and was brought to bay and killed at Barquisimeto, early in November, 1561. His last act was to kill his own daughter with a poniard. In a letter addressed to King Philip II he declared that he had killed 20 persons during the voyage down the Amazon, and the recorded list of those he ordered murdered is more than 60, including women and priests.

Bibliography. Simon, *The Cruise of the Traitor Aguirre*, translated by Markham and Bollaert, chap. xi, Hakluyt Society Publication No. 28 (London, 1861). This account of the expedition was derived from members of the party. Consult also Bandelier, *The Gilded Man* (New York, 1893), and F. J. Vergara y Velasco, *Nueva Geografía de Colombia* (Bogotá, 1902).

AGUJA, ä-gōō'hā (from the Spanish *aguja*, a needle or bodkin). A large, voracious garfish (*Tylosurus fodiator*) of the coast of western Mexico, held in great dread by fishermen. The name (also spelled *agujon*) is extended to various related species of the West Indies and neighboring coasts. See NEEDLEFISH.

AGULHAS, ä-gōō'lyās, or ä-gūl'ās, CAPE. (Portug. needles.) The most southern point of Africa, about 100 miles east-southeast of the Cape of Good Hope, in lat. 34° 51' S., long. 19° 55' E., with a lighthouse erected in 1849 at an elevation of 52 feet (Map: Cape Colony, F 9). To the south of it lies the **Agulhas Bank**, which extends along the southern coast of the province of the Cape of Good Hope for a distance of over 400 miles from the Cape to Algoa Bay. To the south-southeast of Cape Agulhas it attains its maximum breadth, about 180 miles. It abounds in marine life, and its fisheries yield a sufficient supply for export.

AGULHAS CURRENT. A warm current forming the southern continuation of the Mozambique current, an offshot, between Madagascar and the coast of Africa, of the circulatory current system of the south Indian Ocean. As such it is considered to begin at 30° S. lat. off the coast of Natal; it flows southwestward along the coast of South Africa to Cape Agulhas (whence its name), where it is deflected to the southeast by the cold eastward-flowing West Wind Drift.

AGUSAN, ä-gōō'sän. Important river of the island of Mindanao, Philippines. It rises on the north slope of Tagnibay Mountain and flows almost due north. Throughout a total length of 156 miles it drains the valley of Surigao, which is 40 to 50 miles wide. In its flow to the sea it passes through a chain of lakes—Sadocun, Dagon, and Pinayat being the most important—and finally empties into Batuan Bay. The town of Batuan is at its mouth.

AGUSTIN, ä'gōōs-tēn'. See ITURBIDE, AGUSTIN DE.

AGUSTINA, ä'gōōs-tē'nā (?-1857). The "Maid of Saragossa." A *vivandière* in the Spanish army. She distinguished herself during the

siege of Saragossa (1808-09) by heroic participation in several severe encounters with the French. Once she snatched the fuse from a falling cannonier and fired the gun at the enemy, gaining by this act the name of "La Artillera." She was made sub-lieutenant in the Spanish army and presented with many decorations. Byron sings her praises in *Childe Harold* (Canto i, 54-56).

AGUTAINO, ä'gōō-ti'nō. A christianized Malay people living on Agutaya, one of the Cuyo Islands. See PHILIPPINES.

A'HAB (Heb. father's brother). King of Israel, c.872-851 B.C., the son and successor of Omri (q.v.). The story of his reign (1 Kings xvi. 29; xxii. 40) is told at greater length than that of any other monarch in Israel. In the opinion of many students it is derived from two different sources—one representing the prophetic attitude, the other a patriotic admiration of Ahab's courage and vigorous policy by which he succeeded in checking the advance of the Aramaic kingdom of Damascus and even the power of Assyria. Not only did Ahab hold Barhadad (q.v.) at bay, but he retained through half of his reign control over Moab, as the inscription of Mesha of Moab (see MOABITE STONE) testifies. These campaigns were waged against Damascus. In the first two Ahab was successful. In the interval between the second and the third, Ahab joined forces with Barhadad and a number of other Syrian kings to resist the attack of Shalmanezar III (860-825 B.C.). The latter, in his monolith inscription, mentions Ahab and estimates the contingent furnished by him at 2000 chariots and 10,000 soldiers, and the combined forces at 3940 chariots, 1900 horsemen, 62,900 infantry, and 1000 camels. The battle was fought at Karkar on the Orontes, and Shalmanezar III claims to have gained a victory. There is not a word, however, in any of his accounts, of plunder, of tribute, or of extension of Assyrian territory, so that some Assyriologists think that Shalmanezar actually suffered a defeat. Some time after this battle Ahab's relations with Barhadad became again hostile, and he finally combined with Jehoshaphat, King of Judah, in a movement to crush Damascus. But the allies were defeated, and Ahab himself fell in the battle of Ramoth Gilead (c.851 B.C.). He was married to Jezebel (q.v.), daughter of Ethbaal, King of Tyre (see Josephus, *Ant.* viii, 13, 1). Like Solomon, he built for his Queen a sanctuary to her god, Melkart, all the more readily as she had been a priestess herself in Sidon. That Ahab did not regard this act as hostile to Yahwe is shown by the fact that their children bear names in which Yah or Yaho appears as an element (Jehoram, Ahaziah, Athaliah). But in the eyes of a jealous Yahwe prophet like Elijah (q.v.) such conduct seemed reprehensible. The story of the struggle between the King and the prophet (1 Kings xvii-xix) is embellished with many incidents intended to bring out the superiority of Elijah and to present Ahab in an unfavorable light. While it would be unfair to regard him as a wicked king, it must be admitted that he was probably guided by political more than by religious considerations in his various acts. His generosity in dealing with Barhadad after the battle of Aphek (q.v.), so severely censured by a Yahwe prophet (1 Kings xx. 35), was no doubt due in part to his appreciation of the danger to both threatening from Assyria. Whether the severest charge brought

against him, his acquiescence in a judicial murder of Naboth (q.v.), is well founded, may be seriously questioned. There is much that seems highly improbable in the story, notably the part taken by Jezebel and the elders of Jezreel. Naboth having met with a violent death, and Ahab's desire for his vineyard being known, the King was naturally accused of the murder, and the responsibility was subsequently shifted to the foreign Queen. In course of the excavations undertaken by Harvard University at Samaria in 1908-09 the walls of the palace built by Omri and greatly enlarged by Ahab on the west and the south were unearthed. An alabaster vase was found bearing the name of Osorkon II, of Egypt (c.920-891 B.C.), which may have been brought to Samaria in the time of Omri or Ahab. Over 70 potsherds were also found inscribed with ink, dated in various years of the King's reign. They probably come from Ahab's time, but his name does not appear on any of them. Consult the histories of Israel by Stade (1887); Guthe (1899); Kittel (2d ed., 1909-12); Wellhausen (6th ed., 1907); Rogers, *Cuneiform Parallels to the Old Testament* (1912, pp. 288 ff.); Reisner in *Harvard Theological Review* (1900, pp. 248 ff.); Lyon, *ibid.* (1909, pp. 102 ff.; 1911, pp. 136 ff.); Vincent in *Revue Biblique* (1911, pp. 125 ff.); Abel, *ibid.* (1911, pp. 286 ff.).

AHANTA, à-hän'tá. A portion of the British colony of Gold Coast in West Africa, formerly belonging to the Dutch, who founded the settlement of Axim.

AHASUERUS, à-ház'û-ê'rûs. The name of Xerxes (485-465 B.C.) in the Book of Esther. It is the Latinized form of Heb. Achashwerosh, which occurs in Babylonian inscriptions as Akhshiwarsu, Akhshiyarsu, and Khishiarshu. In Dan. ix. 1, it appears as the name of the father of Darius the Mede, who received the kingdom after Belshazzar, the son of Nebuchadnezzar and Chaldean King, had been slain (v. 30; vi. 1). From contemporary inscriptions we know that Belshazzar was not the son of Nebuchadnezzar and not a Chaldean King, but the son of Nabunaid, the last King of Babylon, who was overthrown by Cyrus in 539 B.C. Darius the Mede has no place in history. In Tobit xiv. 15 Nineveh is said to have been destroyed by Nebuchadnezzar and Ahasuerus. Neither of those kings reigned when Nineveh was destroyed by Nabopolassar and Cyaxeres. See XERXES.

AHASUERUS. 1. The name of the *Wandering Jew* (q.v.), according to one legend. 2. The title of a drama by Edgar Quinet (published 1833) based on the same story.

A'HAZ (Heb. he supports). Son of Jotham, and twelfth King of Judah (c.735-715 B.C.). His rule was marked by disturbances, conflicts with surrounding nations, and innovations in religious rites. Early in his reign Pekah, King of Israel, and Rezin, King of Damascus, sought to place upon the throne of Judah Ben Tabel, probably a Damascene prince. They approached Jerusalem and probably laid siege to the city, but did not take it. On this occasion Ahaz was told by the prophet Isaiah not to fear these kingdoms, since the real danger threatened from Assyria (Isa. vii; 2 Kings xvi. 3). Incursions were made by the Edomites, to whom Ahaz was forced to give up the important city of Elath on the Gulf of Akabah (q.v.). Ahaz asked help of Tiglathpileser IV, King of Assyria (2 Kings xvi. 7; 2 Chron. xxviii. 16-22), who drove out the

invaders, but took heavy toll from Ahaz, compelling him to appear at Damascus as a vassal. While there, Ahaz saw an altar and ordered Uriaah, the high priest, to build one like it. On this Ahaz made sacrifices. He also made various changes in the temple service, sacrificed to Syrian deities, and caused his son to pass through the fire. Isaiah (chap. ii-v) furnishes a sad picture of conditions prevailing in Judæa in the days of Ahaz: frivolity, perversion of justice, avarice, oppression, besides infidelity toward Yahwe, being among the charges brought by the prophet against the King and his court. Yet, at the close of his reign, Isaiah contrasts the peace enjoyed by the poor of Yahwe's people with the heavy punishment meted out by Assyria on the Philistine cities. His name appears on the Assyrian monuments under the form Ya-u-ha-zi, from which the conclusion seems justified that the full name of the King was Jehoahaz ('Yahwe supports').

A'HAZI'AH (Heb. Yahwe supports). The name of two kings mentioned in the Bible. 1. The son and successor of Ahab, and eighth King of Israel (c.851-849 B.C.). On his accession the Moabites revolted, refusing to pay tribute, and before he could make preparations to go against them, he fell from a window of his palace. He sent messengers to the god Baal Zebub of Ekron to know the result of his injuries, but the messengers met Elijah, the prophet of Yahwe, on the way, who sent them back with word that the King would surely die (2 Kings i). Upon his death Joram, his brother, came to the throne. 2. Son of Jehoram and of Ahab's daughter, Athaliah (2 Kings viii. 25-27), the sixth King of Judah (c.844-843 B.C.). He is called Jehoahaz in 2 Chron. xxi. 17. Azariah, in 2 Chron. xxii. 6, is an error in transcription, as the Greek version shows, which has Ahaziah. He took part with his uncle, Jehoram, of Israel, in the latter's campaign against Hazael, King of Syria, in which the two kings were defeated (2 Kings viii. 28-29; 2 Chron. xxii. 5). Ahaziah was soon after slain by Jehu (842 B.C.) (2 Kings ix. 27; 2 Chron. xxii. 7-9), after a reign of only one year (2 Kings viii. 26; 2 Chron. xxii. 2).

AHEAD'. See BEARING.

AHENOBARBUS. See AENOBARBUS.

AHIMELECH, à-him'ê-lêk (Heb. brother of the king). A priest who, according to 1 Sam. xxii. 11, was the son of Ahitub. Some scholars are of the opinion that he is identical with Ahijah, who is also spoken of as a son of Ahitub (1 Sam. xiv. 3), as melek, 'king,' being a title of Yahwe, is used interchangeably with *Jah*. When David, warned by Jonathan, fled from Saul, Ahimelech, at Nob, fed him with the shewbread, gave him the sword of Goliath, and assisted him to escape (1 Sam. xxi. 1-10). For this offense Saul put Ahimelech and his whole priestly household to death, only one man, Abiathar, escaping (1 Sam. xxii. 11-20).

AHITH'OPHEL. A native of Giloh, in Judæa; Privy Counselor of David, and probably grandfather of Bathsheba (2 Sam. xi. 3; xxiii. 34). He was trusted implicitly by David, as well as by Absalom, whose revolt he joined (2 Sam. xvi. 23; xv. 12). It was by his advice that Absalom took possession of David's concubines and thereby laid claim to the throne. Hushai, "David's friend," also counseled Absalom, but with a view to helping David (2 Sam. xvi. 16; xvii. 16), and his counsel of delay prevailed over Ahithophel's plan of quick action (2

Sam. xvii. 1-14). Hereupon Ahithophel, in despair, went home, put his household in order, and hanged himself (2 Sam. xvii. 23). The meaning of his name is uncertain, and there is some doubt about the accuracy of its transmitted form.

AHLFELD, ä'fält, JOHANN FRIEDRICH (1810-84). A Lutheran pulpit orator. He was born at Mehlingen, Anhalt; studied at the University of Halle (1830-33); taught and preached in various places till in 1847 he became pastor in Halle, whence in 1851 he went to the Nicolai-kirche in Leipzig. There, till his resignation in 1881, he wielded a great spiritual influence as a leading evangelical. He died in Leipzig. He published several volumes of sermons. Consult his *Life* (Halle, 1885).

AHLGREN, äl'grën, ERNST, pen name of VICTORIA MARIA BENEDICTSSON, née BRUZELIUS (1850-88). A Swedish author. She was born at Domme, near Trelleborg (Scania) and in 1871 married Christian Benedictsson, postmaster of Hörby. In consequence of illness and of great worry, she committed suicide at Copenhagen, whither she had gone in 1888. Her collection of novels, entitled *Från Skåne* (1884), and the satirical narrative *Penningar* ('Money,' 1885; 2d ed., 1889) soon made her name known favorably throughout Sweden, where she was afterward regarded as the most distinguished among the younger woman writers. Her works are characterized by marked simplicity of style and a powerful and artistic description of life. Among them may be mentioned *Fru Marianne* (1887; 2d ed., 1890); *Folklif och Små Berättelser* (1888); *Berättelser och Utkast* (1888); *Romcos Julia*, a drama (1888); *Final*, a drama (in collaboration with A. Lundgård, 1885). Consult Ellen Key, *Ernst Ahlgren, Några Biografiska Middelanden Stockholm* (1889).

AHLQUIST, äl'kvist, AUGUST ENGELBERT (1826-89). A Finnish philologist and poet, professor of Finnish literature at Helsingfors, where he had studied philosophy and philology. He was distinguished for ethnographic investigations, especially of the dialects and races of the Ural-Altai family. In 1847 he started a Finnish journal (*Suometar*). He translated some of Schiller's works into Finnish and wrote poems. He traveled extensively through northern Russia and western Siberia to study the customs and languages of their inhabitants. The results of these observations he embodied in his most important original works: *Wotish Grammar* (1855); *An Attempt at a Moksha-Mordwinian Grammar* (1861); *The Structure of the Finnish Language* (1875).

AHLWARDT, äl'värt, HERMANN (1846-1914). A German politician and anti-Semitic agitator. He was born at Krien, Prussia, and about 1890 joined the anti-Semitic movement. He published a number of writings under the titles of *Der Verzweiflungskampf der Arischen Völker mit den Juden* (1890); *Eid eines Juden* (1891); *Jüdische Taktik* (1892); and *Judenflinten* (1892), in which last-mentioned pamphlet he declared that Ludwig Löwe & Co. had furnished worthless guns to the army and had been hired by the *Alliance Israélite* to cheat the German government. These charges were declared by Chancellor von Caprivi to be false, but the popularity of the agitation steadily increased; and Ahlwardt was elected deputy to the Reichstag in 1892 and reelected in 1893. He visited the United States in 1895, for the purpose of es-

tablishing an anti-Semitic propaganda here, but failed of his object.

AHLWARDT, WILHELM (1828-1909). A German orientalist. He studied Oriental languages at Greifswald, his native city, and at Göttingen, and afterward devoted himself to an analytical investigation of the Arabic manuscripts in the libraries at Gotha and Paris. He became second librarian and professor of Oriental languages at the University of Greifswald in 1861. The following are a few of his more important works on Arabic philology and literature: *Ueber Poesie und Poetik der Araber* (1856); *The Divans of the Six Ancient Arabic Poets* (1870). He also edited the following works by Arabic authors: *Elfachri Geschichte der islamischen Reiche . . . von Ibn Ettigthaga* (1860); *Chalef Elahmar's Kaside* (1859); *Diwan des Abu Nowas* (1861); and *Sammungen alter arabischer Dichter* (3 vols., 1902-03). He catalogued the Arabic MSS. in the Berlin Royal Library (in general catalogue, 10 vols., 1887-1900).

AHMADABAD, ä'mä-dä-bäd' (for derivation, see ABAD). The chief town in the district of the same name, in the presidency of Bombay, India, situated on the left bank of the Sabar-mutti, 309 miles by rail north of Bombay, in lat. 23° N., long. 72° 36' E. (Map: India, B 4). It was founded in the year 1412, on the site of the ancient Ashawal, by Ahmed or Ahmad Shah, and in 1818 came under British rule. It was famous for its manufacture of rich fabrics of silk and cotton, articles of gold, silver, steel, and enamel, industries still carried on, and to which may be added the manufacture of paper shoes and superior pottery. It has recovered much of its extensive trade in indigo, cotton, and opium. It was formerly one of the largest and most magnificent capitals in the East, the centre of Oriental art, and its architectural relics are splendid, even in the midst of decay. The Jumna or Juma'ah Masjid, or great mosque, rises from the centre of the city, and is adorned by two superbly decorated minarets. Its domes are supported by lofty columns, regularly disposed, and the concave of these cupolas is ornamented with mosaic and fretwork. The pavement is of the finest marble. The mosque of Sujaat Khan and the modern Jain temple of Seth Hathi Sinh are extremely beautiful. There is likewise an ivory mosque, so named from the circumstance that, although built of white marble, it is lined with ivory, and inlaid with a profusion of gems, to imitate natural flowers, bordered by a silver foliage on mother-of-pearl. There are also the Fire Temple and the Tower of Silence of the Parsis. Ahmadabad once abounded in gardens, and there were aqueducts, reservoirs, etc. The city walls, built in the fifteenth century, which had become very dilapidated, were repaired in 1834, and a system of water works was installed. There are a number of educational institutions located here, the most important being Rat Guza College. Pop., 1891, 148,400; 1901, 185,889; 1911, 216,777.

AHMADABAD. A district of Bombay (q.v.), British India (Map: India, B 4). Area, 3824 square miles. Pop., 1911, 827,809.

AH'MED, PRINCE. In the *Arabian Nights*, a favorite of the good fairy Pari-banou, by whom he was given a tent which could shelter a whole army and yet could be folded up and put in one's pocket. The same fairy gave him also the apple of Samarcand, which was a cure for all diseases.

AHMED äh'mëd, or **ACHMET**, äk'mët, **VEFIK PASHA** (1818-91). A Turkish statesman, born in Constantinople and educated in Paris. His historical and statistical researches appeared in *Salaamé*, an annual of the Ottoman Empire begun in 1847. He was intrusted by the Porte with many important missions abroad and was President of the Council and Minister of the Interior at the conclusion of the Treaty of San Stefano (1878). He did much to acquaint his countrymen with French literature by his admirable translations of the plays of Molière and others. He also translated parts of Schiller and Shakespeare into Turkish.

AHMED IBN HANBAL. See **IBN HANBAL**.

AHMED KHAN, kân or kân. See **MONGOL DYNASTIES**.

AHMED MIRZA (1898—). A Shah of Persia, who succeeded his father Mohammed Ali (q.v.) on the latter's deposition from the throne on July 16, 1909. He was the second son of Mohammed, and seventh in the Kadjar line of ruling princes. Although not the eldest son, he was nominated heir-apparent by his father because the mother of his elder brother was not of the Kadjar, or royal line. On account of his youth when he ascended the throne, as well as by reason of the troubled condition of affairs in Persia (q.v.), he did not rise to be much more than a figure-head in the government.

AHMEDNAGAR, ä'mëd-nüg'ür, or **AHMED-NUGGUR** (Skr. *nagara*, city). A large town in the presidency of Bombay, India, situated 64 miles northeast of Poona, in lat. 19° 6' N., long. 74° 46' E., on a branch of the Great Indian Peninsular Railway (Map: India, B 5). It was founded by Ahmad Nizam Shah late in the fifteenth century and became a splendid and populous city. Although it was devastated by incessant wars, relics of its former magnificence are to be seen in many fine specimens of Moslem architecture. It was noted for the weaving of carpets, but the manufacture of silks, cottons, brass, and copper utensils has to a great extent superseded this industry. The city is surrounded by an earthen wall, and is guarded by a fort half a mile to the east. The houses are mostly built of sun-dried brick. It has a good water supply, conveyed by means of aqueducts. The city was taken by the British under General Wellesley in 1803 and came under British rule in 1817, since when it has regained much of its former prosperity. Several places in India bear the same name. Pop., in 1901, 42,032; in 1911, 42,940.

AHMEDNAGAR. A district of Bombay (q.v.), British India (Map: India, B 5). Area, 6613 square miles. Pop., 1911, 945,305.

AHMED SHAH, äh'mëd shä (1724-73). Ameer of Afghanistan from 1747 to 1773. He was hereditary chief of the Abdali tribe and held a command in Nadir Shah's cavalry until the latter's assassination (1747), when Ahmed went to Afghanistan, changed the name of his tribe to Durrani, and was accepted as their ruler by the Afghan chiefs at Kandahar. He was a warlike ruler and accumulated great wealth, including the famous Kohinoor diamond. He captured Lahore in 1748 and conquered Kashmir, and in 1756 defeated the Great Mogul and took and sacked Delhi. His conquests introduced rebellion and disorder into the Mogul Empire. He defeated the Sikhs and Mahrattas at Panipat, Jan. 6, 1761, but was finally obliged to yield the Punjab.

AHMED TEWFIK, PASHA (1843—). A Turkish diplomat. He served in the army and then entered the diplomatic service, becoming Minister at Athens in 1882, Ambassador at Berlin in 1884, and Minister of Foreign Affairs from 1895 to 1899. Under the new régime he was again Minister of Foreign Affairs from July, 1908, to February, 1909, and Grand Vizier for a short time in the latter year.

AHMES, ä'mës, or **AAHMESU**, ä'me-söö. An Egyptian scribe, who lived before 1700 B.C. He wrote *Directions for Obtaining the Knowledge of all Dark Things*. This work was not original with him. It was copied from an older treatise, dating from about 2500 B.C. It is important as one of the earliest satisfactory accounts of ancient Egyptian mathematics. It has been translated by Eisenlohr, *Ein mathematisches Handbuch der alten Aegypter* (Leipzig, 1877). See **ALGEBRA**; **ARITHMETIC**.

AHN, än, **JOHANN FRANZ** (1796-1865). A German grammarian and educationist. He was born at Aix-la-Chapelle, was for a time a merchant, but studied mathematics and modern languages, and was for many years a teacher in Neuss. He wrote many manuals for teaching languages, his method of instruction being an extension of that of Seidenstücker. His *Practical Method for a Rapid and Easy Acquisition of the French Language* (*Praktischer Lehrgang zur Schnellen und Leichten Erlernung der französischen Sprache*, 1834) has passed through more than 200 editions and been extensively imitated.

AHNFELDT, än'fëlt, **ARVID WOLFGANG NATHANAEL** (1845-90). A Swedish littérateur, born at Lund. He studied art at Lund and Upsala and was for some time an official in the royal library at Stockholm. In 1881 he was appointed editor of the journal *Ur Dagens Krönika* and was also associate editor of the liberal *Aftonblad*. He published a number of important monographs, such as those on *Almqvist* (1876) and *Crusenstolpe* (1880), a *Verldslitteraturens Historia* (1875-76), and other works.

AHOY' (a + hoy). A nautical form of hail. Its original signification is said to have been "stop," and it still partakes of that meaning in a modified sense. It is used as a hail to passing boats, vessels, and implies that communication with them is desired. The common form of usage is "boat ahoy," "ship ahoy," "steamer ahoy," etc.

AHRENS, CARL (1866—). A Canadian landscape painter. He was born in Winfield, Ontario. He studied art in New York City under William Chase, Edward Elwell, and George Inness and soon won emphatic recognition at various art exhibitions in Canada, some of his pictures being bought by the Ontario government. He was associated with Elbert Hubbard for three years in the Roycroft community at East Aurora, N. Y., after which he went to southern California. His pictures of the ruins of the old Spanish missions there attracted attention. He returned to Canada in 1907. His paintings are distinguished for their atmospheric effects. Among the best known are "Cradled in the Net" (exhibited at Chicago World's Fair), "The House in the Clearing," "Passing Showers," "The Woodcutters," "The Glow in the Woodland," and "The Coming Storm."

AHRENS, ä'rens, **HEINRICH** (1808-74). A German writer on law, philosophy, and psychology. He studied at Göttingen and was concerned

in the political troubles in 1831, by reason of which he was forced to flee to Paris. In 1834 he became professor of philosophy at Brussels. He was a member of the Frankfort Parliament of 1848, and on the committee to draft a new German constitution. In 1850 he was chosen professor of legal and political science at Gratz, and in 1859 was called to a similar chair at Leipzig. For a number of years he represented the Leipzig University in the First Saxon Chamber. Among his works are: *Cours de psychologie* (1837-38); *Cours de droit naturel* (1838); *Die juristische Encyklopädie* (1855-57). The two last-named works have been republished in several languages.

AHRENS, HEINRICH LUDOLF (1809-81). A celebrated German philologist, born at Helmstedt. He studied at Göttingen, where he began his career as *privat-docent* in 1829, but left Göttingen in the following year to accept a position at Ilfeld, where he remained for 14 years. In 1849-79 he was director of the lyceum at Hanover. He devoted himself especially to the Greek dialects, and may be said to have laid the foundation of their scientific study. His chief publication was *De Græcæ Linguae Dialectis* (Göttingen, 1839-43). He published also, in 1855-59, a two-volume edition of the Greek bucolic poets, Theocritus, Bion, and Moschus.

AHRIMAN, ä'rī-mān. The ancient Persian devil, a personification of the evil spirit and principle of evil, the idea which answers in the Zoroastrian religion to Satan in Judaism and Christianity. He is represented as the head and chief of the powers of darkness and sin, and he has legions of demons about him. Next to him are ranged six arch-fiends, the chief of whom is Aēshma, the Daēva, or 'demon of fury,' corresponding, according to the majority of scholars, to the name Asmodeus (q.v.). Ahriman's name appears in the Avesta as *angra mainyu*, or *aisra mainyu*, Persian, *ahriman*—whence our spelling of the word. The term *mainyu* means 'spirit,' and *angra*, 'oppressing'; the title *angra aisra* is uncertain, but it is presumed to signify 'injury, opposition, antagonism.' Ahriman is the spirit of opposition, antithesis, and antagonism to the Persian god Ormuzd (q.v.). The two spirits severally represent the kingdom of light, goodness, and life, and the kingdom of darkness, evil, and death. The relation of the one spirit to the other, especially of Angra Mainyu, as the maleficent spirit, to Sponta Mainyu, or the beneficent spirit, has been frequently discussed. Consult Darmesteter, *Ormuzd et Ahriman* (Paris, 1877), and Jackson, "Die iranische Religion" in Geiger and Kuhn's *Grundriss der iranischen Philologie*, vol. ii (Strassburg, 1896-1904).

AHU, ä'hōō. The name in Persia of the common Asiatic gazelle. See GAZELLE.

AHUATLE, ä'ōō-ät'l (Mexican). A preparation for food of the eggs of a Mexican species of ephydrid fly, which is formed into a paste mixed with hens' eggs and then fried. For further information, see EPHYDRA; FLY.

AHULL' (*a + hull*). A maritime term, used to denote the position of a ship when all her sails are furled and her helm lashed on the lee side; in such a position she lies nearly with her side to the wind, but with the head turned a little toward the direction of the wind, and is said to *lie ahull*.

AHUMADA, ä'ōō-mä'dä, DON PEDRO GIRÓN, MARQUÉS DE LAS AMARILLAS, DUKE OF (1788-1842). A Spanish general and statesman, born

at San Sebastian. He was appointed an officer in the Royal Guards in 1806, and during the war against the French rendered important services as chief of the general staff of the Spanish army. Upon the outbreak of the revolution of 1820 he was appointed Minister of War, but soon retired because of the opposition of the Radicals. He was appointed by Ferdinand VII a member of the Council of Regency during the minority of Isabella, and in 1835 accepted the Portfolio of War under the premiership of Torreno. He soon resigned, and went to Bordeaux in 1836, but subsequently returned to Madrid.

AHURA MAZDA, ä-hōō'rä mäs'dä. See ORMAZD.

AHWAZ, ä-wäz'. A small village, once a residence of the Persian rulers, situated on the river Karun, about 45 miles south of Shuster (Map: Persia, C 5). Near Ahwaz are the ruins of the old town, lying along the river for a distance of over 10 miles. There are still to be seen ruins of an old castle of gigantic proportions, and some other evidences of former splendor. In the third century Ahwaz was the chief city of a province of the same name, and under the subsequent rule of the Arabs it became an important commercial centre, reaching the height of its prosperity in the twelfth and thirteenth centuries. A concession to navigate the Karun from the Persian Gulf to Ahwaz was granted to a British company which runs a steamer on the river, and which has made extensive highway improvements between this town and Ispahan. Pop., about 1600.

AI, ä'i (Heb. *hāai*, the stone heap). A city of the Canaanites, 12 miles north of Jerusalem. It is mentioned in the narrative about Abraham (Gen. xii. 8), where its situation is defined as east of Bethel. When the Israelites came into Canaan, they made an unsuccessful attack on Ai (Josh. vii. 5), but on the second attack the city was taken (Josh. viii) and destroyed. (See ACHAN.) Isaiah (Isa. x. 28) mentions the city under the name of Ayyath, so that it must have been rebuilt. After the captivity it was inhabited by the Benjaminites (Ezra ii. 28; Neh. vii. 32). The modern site is Khirbet Haiyân, also called Khirbet 'el Kudêrah. Ruins of Ai existed in the time of Eusebius and Saint Jerome. The pools, cisterns, tombs, and other ancient remains at Khirbet el Kudêrah have been especially described by Guérin, *Description de la Judée* (Paris, 1869, iii, pp. 57 ff.); Conder, *Palestine Exploration Fund Memoirs* (ii, 372; iii, 20 ff.), and Sellin, *Mitteilungen und Nachrichten des Palästina Vereins* (1899-1900).

AI, ä'i. The onomatopoeic name of the three-toed sloth. See SLOTH.

AI, ä'è, or AHYU, ä'û. A Japanese salmon (*Salmo altivelis*), remarkable for going down some rivers to spawn in the sea, and ascending other rivers annually to spawn near their sources.

AICARD, ä'kär', JEAN FRANÇOIS VICTOR (1848—). A French author born at Toulon. He made his first appearance in literature with the drama *Jeunes croyances* (1267). His works, which are in general distinguished by a finished style, include *Au clair de la lune* (1870), a one-act comedy in verse; *Les rébellions et les apaisements* (1871); *Poèmes de Provence* (1874) and *La chanson de l'enfant* (1876), both of which were crowned by the Academy; *Miette et Noré* (1880); *Lamartine* (1883); *Jésus* (1896, 1912), a lyrical epic; *Tata* (1901, 1910); *L'âme d'un*

enfant (1903), idealistic tales; the plays: *Légende du cœur* (1903); *Benjamine* (1906); *L'illustre Maurin* (1908); *Maurin des Maures* (1908). His most popular play is *Le Père Lebonnard* (1890). In 1913 he published *Hollande; Algérie*. He became an Academician in 1909.

AID (Fr. *aide*, from Lat. *ad*, to + *iuvare*, to help). In feudal times, a term denoting a payment in money made to the suzerain on certain occasions. The term is a translation of the Latin word *auxilium*. In theory it was a free grant made in exceptional cases. But the cases soon came to be fixed by custom. In England "the three chief aids" were paid (1) for the lord's ransom when in captivity; (2) for the expenses of making the lord's eldest son a knight; (3) for the dowry of the lord's eldest daughter. These were levied upon all classes of freehold tenants in England—upon those holding in free and common socage (q.v.), as well as upon the holders of knights' fees (q.v.)—and continued to be nominally due and exigible until abolished by Parliament, 12 Car. II, c. 24 (1660), though they had gradually fallen into disuse and were probably even then practically obsolete. In France a fourth chief aid was demanded for the expenses of the suzerain when he went on a crusade. The obligatory aids varied, however, by custom from province to province on the Continent and might be demanded for various unusual expenses to which the lord might be put. See FEUDALISM; TENURE.

AIDA, ä-ē'dä. An opera by Verdi (words by Ghislanzoni), first played at Cairo, Egypt, Dec. 24, 1871, at the inauguration of the Khedive's new theatre. The scene of it is laid in ancient Egypt.

AIDAN, ā'dan, SAINT (?-651). First bishop of Lindisfarne. He was one of those distinguished monks of the early Scotch-Irish church who were received into the calendar of saints without the ceremony of canonization. In early life he was a monk in Iona, the famous island off the Scotch coast. Oswald, the celebrated King of Northumbria, requested the community of Iona to send to his court one of their brethren who would teach the Christian religion to his people. The first person sent was a certain Cormac, who was too dogmatic and intolerant to be a successful missionary. On his return to report to the synod his failure, Aidan, who possessed the patience, geniality, and popular manners fitted for the task, was consecrated bishop (635) and sent forth. Through his success, he left a great reputation as the earliest promulgator of Christianity in the northern districts. He died at Bamborough, Aug. 31, 651. The day of his feast is August 31. For his biography, consult Fryer, *Aidan, the Apostle of the North* (London, 1884).

AID-DE-CAMP, ād'dè-kāmp' (Fr. camp assistant), or **AID**. A military officer serving on the staff of a commanding general officer. In time of war it is a position of grave responsibility, as shown by the terrible mistake which led to the brilliant but foolish light cavalry charge of the British in the Crimean War of 1854. It is also a position involving much danger, as may be seen from the nature of the duties performed. On active service the aid-de-camp is in close confidential touch with the general officer to whom he is attached, and when necessary acts as his military secretary. On the battle-field he carries all orders from the general in command to the commanding officers of

the various arms, and must of necessity be alert, quick-witted, resourceful, and prompt, giving his message in the plainest and most unmistakable form. Wherever possible, such orders must be delivered in writing. In European nations an appointment of aid-de-camp, particularly if on the staff of the ruler or a member of the ruling family, carries much social as well as military prestige, while in all services it is a much coveted and much sought appointment. In the United States a lieutenant-general is allowed to have two aids (lieutenant-colonels) and a military secretary; a major-general, three aids (either captains or lieutenants); and a brigadier-general, two aids (lieutenants). Before an officer below the rank of major can receive such appointment, he must have served at least two of the six preceding years with his troop, battery, or company. The appointment is for four years and may not be exceeded.

AIDĚ, ä'è'dä', CHARLES HAMILTON (1830-1906). An English poet and novelist. He was born in Paris, the son of a Greek diplomatist. His mother was a daughter of Admiral Sir George Collier. He was educated at Bonn, served seven years in the British army, retired in 1853 with the rank of Captain, and then devoted himself to literature. Among his poems are *Eleanore* (1856) and *Songs without Music* (1882). His novels include *Rita* (1856); *Confidences* (1859); *Passages in the Life of a Lady* (1887); *Elizabeth's Pretenders* (1895), besides about 15 others. As a ballad writer he is known by *The Danube River* and *Remember or Forget*. A volume of his collected poems was published in 1903, and after his death appeared his last novel, *The Chivalry of Harold* (1907). Aidě was remarkable for his versatility; he wrote plays as well as novels and verse, and was an amateur artist.

AIDENN, ā'den. A collateral form of Eden, Paradise, from the Arabic *Adn*, used by Poe in *The Raven*, on account of the rhyme.

AIDE-TOI ET LE CIEL T' AIDERA, ād twä' ā le syël tã d'rã' (Fr. Help thyself, and Heaven will help thee). The cry of certain French political writers to the middle classes about the year 1824. It became the watchword and title of a society having for its object to agitate the electoral body in opposition to the government. This, however, was to be done by means strictly legitimate, chiefly by correspondence and political publications. Most of its founders and active members belonged to the party of *Doctrinaires* (q.v.), as Guizot, who was president for some time, Duchâtel, Duvergier de Hauranne, Dubois, Rémusat, Thiers, Cavaignac, etc. *Le Globe* was the organ of the association, and afterward *Le National*. The society had a great share in bringing about the revolution of July, 1830, and was at first countenanced by the new government; but after a short time it was dissolved (1832).

AIDIN, î-dēn', or GUZEL-HISSAR. An important town in the Turkish vilayet of Smyrna (21,583 square miles; pop. (est.), 2,500,000), in Anatolia. It is on the river Meander, about 56 miles southeast of Smyrna, with which it is connected by rail (Map: Turkey in Asia, B 4). It is picturesquely situated near the ruins of ancient Tralles, and has well-shaded streets, fine bazaars, Greek religious edifices, and a number of Turkish mosques. It has an extensive trade in figs and cotton, and manufactures leather and sweetmeats. In 1899 the town suffered severely

from an earthquake. Its population is about 36,000.

AID'-MA'JOR. An adjutant in the French army. See **ADJUTANT**.

AIGNER, à'nyà', JOSEPH MATTHÄUS (1818-86). An Austrian portrait painter. He was born at Vienna, and during the revolution of 1848 he was Commandant of the students' legion in Vienna, for which he was condemned to death when the city was taken by the imperial troops. Pardoned at the intercession of his friends, he renewed his art studies under Rahl. Until his surprising death by suicide in 1886, he was one of the most popular portrait painters of Austria. Most interesting of his portraits are those of the poet Lenau and the Russian General von Danielos, painted in the madhouse in which they were confined. Other good examples are those of the Emperor Franz Joseph, Empress Elizabeth, the poet Grillparzer, the Wertner family group of nine, and his own portrait. His work is characterized by broad technique and warm color.

AIGRETTE, ā'grèt or â-grèt', French for a small white heron or egret. (See **EGRET**.) Hence, a plume or erect ornament of feathers, originally the long filiform tuft of feathers that spring from the back of the egret in the breeding season, and arranged to adorn the hair, a bonnet, headdress, or helmet, or something similar to this, especially when jeweled. "A small bundle of these feathers has been used among Eastern nations as an ornament, and worn in the front of the turban, caftan, or other headdress by personages of high rank, being occasionally mounted with, or its form imitated by, precious stones; and the gift of an egret so bejeweled has been one of the most distinguished marks of honor that could be bestowed by an Oriental ruler upon a favorite minister or successful leader." The fashion has spread to western nations and given rise to various decorations on military hats and for women's hair and bonnets. The demand of millinery, indeed, during the last quarter of the nineteenth century caused such inroads upon the breeding colonies of white herons in all parts of the world that these birds are everywhere greatly diminished in numbers, and in some regions, as in Florida, are almost exterminated. As the desired plumes grow only during the breeding season, the killing of a bird for their sake usually means the death of a family and the rapid depopulation of the colony. From this point of view, and remembering that great cruelty is likely to accompany the obtaining of the plumes, the statement of the annual sales of aigrettes in London and other great markets is appalling to all persons of a humane mind and delicate taste.

The reduction in the number of birds throughout the world, together with considerable protective legislation in various countries, has greatly reduced the amount of aigrettes annually auctioned at the feather sales and has increased the value of these plumes until a single ounce has brought 225 shillings (\$54) in the London market.

AIGUEBELLE, ěg'běl', PAUL ALEXANDRE NEVEUE D' (1831-75). A French naval officer who entered the Chinese army. He distinguished himself against the Tai-Pings in 1862-64, commanded the Franco-Chinese corps, and captured Hang-Chow-Foo, for which service he was made a mandarin of the first class. He established the arsenal at Fu-Chow-Foo and taught the

Chinese to construct European vessels, the first Chinese man-of-war being launched under his supervision in 1869. In that year he was made grand admiral of the Chinese fleet.

AIGUES-MORTES, ěg'môrt' (anciently Lat. *Aquæ Mortuæ*, Dead Springs). A small town in France (pop., 1906, 3899; 1911, 3900), in the department of Gard, 21 miles southwest of Nîmes (Map: France, S., J 5). It is situated in an extensive marshy region impregnated with sea salt, and is about 3 miles from the Mediterranean, with which it is connected by a canal. There are extensive vineyards in the vicinity, all of which can be watered by means of fire pumps. The town claims to have been founded by Marius, but it is altogether likely that it owes its origin to St. Louis, who sailed from here on his crusades in 1248 and 1270. Philip the Bold, his son, in 1272 began to surround the town with fortifications which are now among the chief points of interest in France, surpassing even those of Carcassonne and Avignon.

AIGUILLE, â-gwêl' (Fr. a needle). The name given to certain sharp mountain peaks in the Alps often covered with ice and snow and so called from their resemblance to needles. Around Chamounix a number of the peaks bear this name. The term is applied also to an instrument used by engineers to pierce a rock for the injection of gunpowder in blasting.

AIGUILLETES, ā'gwil-lêts' (from Fr. *aiguillette*, a point, pointed tag; dimin. of *aiguille*, needle). A detachable portion of the military dress uniform consisting of bullion, silk, woolen or cotton cords and loops, and worn on the shoulder. In the United States army aiguillettes are worn by officers of the General Staff Corps, by officers of the Adjutant-General's department, the Inspector-General's department, the officers of the Bureau of Insular Affairs, the aids-de-camp to general officers, and regimental, and artillery district adjutants, adjutants of engineer battalions, military attachés, adjutant of United States Army, and aids to the President of the United States. By the Chief of Staff and the aids to the President aiguillettes are worn on the right shoulder, by all others on the left shoulder. For commissioned officers aiguillettes are made of gold-wire cord, according to a sealed pattern kept in the office of the Quartermaster-General.

Aiguillettes are worn by naval officers who are acting as personal aids to the President and the Secretary of the Navy, aids at the White House, members of the personal staff of a flag officer, aids to commandants of navy yards or naval stations, aid to the Superintendent of the Naval Academy, and naval attachés. They are worn on the right side by the aid to the President and the aids at the White House; on the left side by all others.

AIGUILLON, â'gwê'yôn', ARMAND DE VIGNEROT DUPLESSIS RICHELIEU, DUC D' (1720-82). A French statesman, Minister of Foreign Affairs under Louis XV (1771-74). He became Governor of Brittany in 1754. Together with Mauplou and Terray, he formed part of the famous and scandalous *Triumvirat*; his despotic administration of his province finally brought upon him the condemnation of the Parliament of Rennes. But Madame du Barry, the mistress of Louis XV, not only saved him from punishment, but finally brought about his promotion as Minister. He was entirely incompetent, and Louis XVI replaced him by Vergennes.

AIJALON, ā'já-lōn. See AJALON.

AIKAWA, i-ká'wá. A town of Japan, on the western coast of the island of Sado (Map: Japan, F 4). It is poorly built, and its importance has greatly diminished because of the lessened production of gold and silver mines situated close to it. The Governor of the island resides in Aikawa. Pop., 1912, about 13,000.

AIKEN, a'ken. A city and the county-seat of Aiken Co., S. C., on the Southern Railway, 17 miles east of Augusta (Map: South Carolina, C 3). It is situated in an agricultural and pine forest region, the dryness and comparative mildness of its climate combining to make Aiken a health as well as a popular pleasure resort. Aiken is the seat of Aiken Institute; St. Angela's Academy, for white students; the Schofield Normal and Industrial School; and the Robertson Training School, for negroes. It was first incorporated in 1835 and is governed under a charter of 1890, revised in 1897, which provides for a mayor, elected biennially, and a city council, composed of a mayor and six aldermen. The water works and sewage system are owned by the municipality. Pop., 1890, 2362; 1900, 3414; 1910, 3911.

AIKEN, WILLIAM (1806-87). An American legislator. He was born in Charleston, S. C., and graduated at the College of South Carolina (1825). After serving in the State Legislature (1838-43), he was Governor of South Carolina (1844-46), and was a Democratic Representative in Congress from 1851 to 1857, during which time he lacked only one vote of becoming Speaker of the House of Representatives. He opposed both nullification and secession and after leaving Congress took no active part in politics, except in 1866, when he was again elected to Congress, but was not admitted to a seat. The town and county of Aiken, S. C., were named after him.

AIKIN, JOHN, M.D. (1747-1822). An English physician and author. He had only moderate success as a physician, but gained considerable reputation as a scholarly writer. With his sister, Mrs. Barbauld, he published *Evenings at Home* (6 vols., 1792-95), together with a number of biographical works, including *General Biography* (10 vols., 1799-1815). He edited the *Monthly Magazine* (1796-1807) and *Dodsley's Annual Register* (1811-15). He wrote also *Essays on Song Writing* (1810); *Vocal Poetry* (1810); and *Memoirs of Oliver Goldsmith*. Consult *Memoirs of John Aikin, M.D.* (Philadelphia, 1824), by his daughter, Lucy Aikin.

AIKIN, LUCY (1781-1864). An English writer, daughter of John Aikin, and his assistant in much of his work. She wrote one novel, *Lorimer* (1814), but her reputation rests on her series of court memoirs, beginning with *Memoirs of the Court of Elizabeth* (1818), and on her *Life of Addison* (1843). She also wrote memoirs of her father and of her aunt, Mrs. Barbauld.

AILANTHUS, ā-lān'thūs, or **AILANTUS**, ā-lān'tūs (Latin form of Amboyna, *ailanto*, 'tree of heaven'). A lofty, spreading tree (*Ailanthus glandulosa*), of the family Simaroubaceæ, a native of China, but now frequently planted to shade public walks in the South of Europe, in England, and in North America. The flowers of the male plant have a disgusting odor. The leaves resemble those of the ash. The tree flourishes on light soils and is hardy enough to endure even the climate of the North of Scotland. It has been somewhat extensively

planted in the United States. The tree is easily propagated by suckers and cuttings of the roots. The wood is fine-grained, satiny, and suitable for cabinet making. *Ailanthus imberbiflora* and *Ailanthus punctata* are among the important timber trees of Australia. Another species, *Ailanthus excelsa*, is common in India. The genus *Ailanthus* has been recognized by fossil fruits and leaves in Tertiary beds of Europe and North America.

AILANTHUS MOTH. A large, hardy, silk-spinning moth (*Philosamia cynthia*), introduced from China into the United States on the ailanthus tree. The caterpillar may be identified by its rows of tufts of white hairs. The moth which has become common near several of our cities has a spread of wings of 5 inches, and is of a general olive-brown ground color, with a whitish lunate discal spot and a white and purplish transverse bar on each wing.

AILETTE, ā-lēt' (Fr. little wing). An appendage to the armor worn by knights on each shoulder. At first they were plates of iron especially to protect the shoulders. Later they were not intended primarily for defense, as is evident from the fact that most of them stood up straight in the air. They came to be made in various forms and frequently bore the heraldic device of the knight. Epaulets are sometimes said to have been derived from these.

AILLY, ā'yē', PIERRE D', or PETRUS DE ALLIACO (1350-1420). A French theologian. He studied theology in Paris, where, in 1380, he became a doctor of the Sorbonne. He was leader of the Nominalists, asserted that the Church rests on Christ, not on Peter, and derives its authoritative teachings from the Scriptures, not from canon law. He became grand master of the College of Navarre, Paris, in 1384, and in 1389 confessor and almoner to Charles VI, and the same year Chancellor of the University of Paris. His defense, two years previous, of the Immaculate Conception won him the epithets "Eagle of France" and "Hammer of Heretics." He became Bishop of Le Puy, 1395, and of Cambrai in 1397. He induced the calling of the Council of Pisa, of which he was an active member. He was made Cardinal by John XXIII (1411), and was sent as Legate to Germany in 1413. He was prominent in the Council of Constance, 1414-18, furthering the condemnation of Huss and Jerome of Prague, but strenuously advocating reform in the Church; maintaining the authority of councils over that of popes, and aiding in the election of Martin V in place of three rival popes. He was afterward made Papal Legate at Avignon until his death. His writings are numerous. Among them is an attempt to harmonize astronomy and theology. For his biography, consult P. Tschackert (Gotha, 1877) and L. Salembier (Lille, 1886).

AILSACRAIG, āl'sá krāg. A small island off the west coast of Ayrshire, Scotland (Map: Scotland, C 4). It is only 2 miles in circumference and rises to a height of 1114 feet above the sea. It terminates in high cliffs on the northwest and contains some springs near its summit. It is well known for its columnar form and has a lighthouse, erected in 1836.

AIMAK, i-māk'. A term of Mongolian origin signifying 'clans,' or 'tribe,' and, with the prefix *char* ('four'), employed as a designation for a number of tribes inhabiting the central and north-western part of Afghanistan. Little is known concerning them except that they are a Mongo-

lian people dwelling in the midst of an Aryan population, and speaking a language that seems closely related to the Kalmuck, though largely influenced by the Persian. According to some authorities the four principal tribes of the Aimak are the Jamshidi, the Firozkohi, the Taimani, and the Hazaras; others make a definite distinction between the Aimak and the Hazaras, characterizing the former as Sunnite Mohammedans and the latter as adherents in the main of the Shiite sect. Macgregor, *Central Asia* (Calcutta, 1871), substitutes the Saidnat for the Hazaras and estimates the total number of the Aimak at 250,000, describing them as semi-nomadic in their habits and excellent fighters. They are supposed to be descendants of Turkish-Tatar tribes which under Hulaku Khan overthrew the Persian Caliphate in the middle of the thirteenth century.

AIMARA, ī-mä'rá. Any of many large carnivorous fishes of South America, especially common in the Amazonian rivers, some 20 species of which form the heterognathous family Erythrinidæ and the genus Macrodon. They are also called trahiras.

AIMARD, á'mär', GUSTAVE (1818-83). A French novelist. He shipped to America as a cabin-boy, spent 10 years among the Indians of the western prairies, and traveled in Spain, Turkey, and the Caucasus. In 1848 he was in Paris and an officer of the Garde Mobile. At the time of the Franco-German War he organized, and for a while commanded, the so-called "francs-tireurs of the press." He is sometimes called "the French Fenimore Cooper." He published many adventure stories, for the most part improbable but interesting. The list, many volumes of which have been translated into English, includes *Les trappeurs de l'Arkansas* (1858), *Le grand chef des Ancas* (1858), *Les pirates de la prairie* (1859), *La forêt vierge* (1870), and *Les scalpeurs blancs* (1873).

AIME-MARTIN, á'má'mär'tän', LOUIS. See MARTIN, LOUIS AIMÉ.

AIMOIN, á'mwän' (c.960-c.1010). A French chronicler, born at Villefranche de Longchapt. He became a monk in the monastery at Fleury. His works include *Historia Francorum* (edited by G. Waitz and published in *Monumenta Germaniæ Historica: Scriptores*, vol. xxvi), his best-known work; *Vita Abbonis, Abbatís Floriacensis*; and *Miracula Sancti Benedicti* (books ii and iii). The two latter works were published by J. Mabillon in *Acta Sanctorum Ordinis Sancti Benedicti* (1668-1701).

AI'MON. See AYMÓN.

AIM'WELL. 1. A character in Farquhar's (q.v.) comedy, *The Beaux' Stratagem*. 2. A character in Shirley's *The Witty Fair One* (q.v.).

AIN, ān. A river in eastern France, which rises in the Jura Mountains. It flows south-southwest through the departments of Jura and Ain, and after a course of about 120 miles falls into the Rhone, 18 miles above Lyons (Map: France, S., K 2). It is used for floating timber and admits of navigation down stream only.

AIN. A frontier department of France, separated from Switzerland and Savoy by the Rhone (Map: France, S., K 2). Crêt-de-la-Neige (5635 feet) and Mont Reculet (5627 feet), the highest peaks of the Jura Mountains, are in the eastern part. In the south and west there are extensive marshes. The soil produces bituminous limestone, from which Seyssel asphalt is made. At one time there were as many as 2000 artificial lakes in this region, where fish breeding

was carried on, but many of these have been drained and the basins turned into farm land. Capital, Bourg. Area, about 2250 square miles. Pop., 1911, 342,482.

AINGER, ān'jēr, ALFRED (1837-1904). An English clergyman and writer. He was born in London and was educated at King's College and at Trinity Hall, Cambridge. He was ordained priest in 1863 and three years afterward was appointed reader of the Temple Church, a position which he held until 1894, when he succeeded Dean Vaughan as Master of the Temple. He became a canon of Bristol and chaplain-in-ordinary to Queen Victoria in 1896 and to King Edward in 1901. As an author, he is best known for his editions of *Lamb's Collected Works* his *Biography of Charles Lamb* (*English Men of Letters* series, 1882); his *Life and Works of Charles Lamb* (12 vols., 1899-1900); and *Crabbe* (1903). Following his death, H. C. Beeching edited a volume of his sermons under the title *Gospel of Human Life* (1904) and his *Lectures and Essays* (2 vols., 1905). Consult Edith Sichel, *Life and Letters of Canon Ainger* (1906).

AINMILLER, in'mil-ēr, MAX EMANUEL (1807-70). A German designer of stained glasses, the principal reviver of this art in the nineteenth century. He was born at Munich, Feb. 14, 1807, and at first studied architecture and decoration in the Munich Academy under Gartner and was then appointed designer in the Royal Manufactory of Porcelain at Nymphenburg. When the Royal Manufactory of Stained Glasses was organized at Munich, he was made inspector of the institution and afterwards became its head. By his technical improvements he revived the ancient art of stained glasses, achieving a variety of color not hitherto attained. He was also the first to design stained glasses on panels, thereby founding an interesting variety of this art. He usually contributed the general design and the decorative features, leaving the figures to important contemporary artists. His principal works include the windows of the cathedrals of Regensburg, Cologne, and Speyer, and of the Aukirche in Munich; also the University Church at Cambridge, St. Paul's Cathedral, London, and the Cathedral of Glasgow—the last being the most extensive of his works. Though excellent for their time, these works are hard and cold in color compared to the best productions of the present day. In many of his works he was assisted by his son Heinrich (1837-92), who was also an artist of note. The elder Ainmiller also painted interiors of mediæval churches, showing minute architectural knowledge, but poor color.

AINO, ī'nō, or **AINU**, ī'nōō (men of Aiona, their reputed ancestor, or possibly a corruption of *inu*, dog, contemptuously applied to them by the Japanese). An aboriginal people, now numbering some 18,000 souls, in northern and eastern Yezo, the southern part of Saghalien, and the southern Kuriles (all but 1500 live on Yezo). They inhabited once a great part, if not all, of the Japanese Archipelago and were the first race to dwell there, unless the so-called "pit-dwellers" of Yezo and Saghalien were, as Hitchcock (1890) suggested, driven out by them when they intruded into this area from their former home on the adjoining Asiatic coast many centuries B.C., as the archæological remains (shell heaps, stone implements, pottery, etc.) in Japan indicate. The retreat northward of the Aino is noted in Japanese chronicles referring to the

“barbarians.” The physical characteristics of the Aino—short stature, flattened humerus and tibia, heavy beards, and general hirsuteness (much exaggerated by travelers), lighter skin, dolichocephaly and brachycephaly, somewhat regular features, and non-savage looks—have given rise to theories of relationship with almost every known race. Brinton (1890) allies them with the Giliaks of the Amur; Deniker (1900) considers them *sui generis*; Keane (1896) and Baelz (1901) believe them to have been originally of the Caucasian (white) race. The last, who has studied the Aino at first hand, is of the opinion that they are the extreme eastern branch of a race related to the Caucasian stock, once occupying much of northeastern Asia, but split into two sections by the inroads of the Mongol-Turkish peoples at a very remote date, a view which has a good deal to commend it. But the Aino are not a uniformly pure type, as the differences between those of Yezo and of Saghalien show. The linguistic, geographical, and mythological researches of B. H. Chamberlain (1887) and Batchelor (1882-94) prove both the uniqueness of the Aino tongue and the great influence upon Japanese life exerted by that people in times past. Driven northward from their ancient habitat in southwestern and central Japan, they have left their names on the natural features of the archipelago. Their language is simple and harmonious and resembles the Japanese in structure, but is quite distinct in vocabulary. It has been reduced to writing only recently. The Rev. John Batchelor has compiled an Aino grammar and dictionary and translated the New Testament into the tongue. The Aino religion, originally a rather primitive nature-worship, with the cult of the bear especially prominent, and their folk-tales, have evidently received some additions from Japanese sources in historical times. In the last few years some of the Tsuishikari Aino have become Buddhists of the Monto sect, and a few others in the region of Piratori have become Protestants. A good account of the Aino (with bibliography) was published by Professor Hitchcock in the *Report of the United States National Museum* for 1890. An important discussion of them is to be found in the anthropological studies of Koganei (1893-94), and Landor's *Alone with the Hairy Ainu* (1893). Baelz, in the *Verhandlungen der Berliner Gesellschaft für Anthropologie* for 1901, considers that the amount of Aino blood in the Japanese outside of Yezo has been much underestimated. He notes also the increasing intermixture of Japanese and Aino and foresees the ultimate disappearance of the latter, not by extinction, but by natural amalgamation with the former. This amalgamation is favored by the gradual abandonment of ideas about their alleged mental inferiority. (See JAPAN, paragraph *Ethnology*.) In addition to the works cited in the text, consult: Griffis, *The Mikado's Empire* (New York, 1876); Siebold, *Ethnologische Studien über die Aino* (Berlin, 1881); Bird, *Unbeaten Tracks in Japan* (London, 1885); Chamberlain and Batchelor, *Aino Studies* (Tokio, 1887); MacRitchie, *The Ainos* (London, 1892); *Transactions of the Asiatic Society of Japan* (Yokohama, 1874-98); Batchelor, *The Ainu and their Folk-lore* (London, 1901); Chamberlain, in *Journal of Race Development* for 1912-13.

AINSLIE, ānz'li, HEW (1792-1878). A Scottish-American poet, born at Bargeny Mains, Ayrshire. While a clerk in the register house at

Edinburgh, he acted as amanuensis to Prof. Dugald Stewart. He emigrated to the United States in 1822, and joined for a year Robert Owen's venture at New Harmony, Ind. (See HARMONISTS.) He subsequently went into business. His numerous dialect poems had extended his reputation to Scotland, where he was enthusiastically received by literary folk in 1864. These poems, many of which were highly esteemed by Sir Walter Scott, were collected and edited by a friend, W. Wilson (1855). Some of them are also to be found in Wilson's *Poets and Poetry of Scotland* (1876). Consult T. C. Latto, *Memoir of Hew Ainslie* (1892).

AINSWORTH, ānz'wūth, FREDERICK CRAYTON (1852—). An American soldier, born at Woodstock, Vt. He was appointed assistant surgeon, United States army, in 1874, and in 1891 major and surgeon. In 1899 he was promoted to be colonel and Chief of the Record and Pension Offices, and in that capacity introduced the index record-card system, by means of which the history of every soldier is made readily available. By his systematic management he saved annually half a million dollars in clerk hire. He was made a major-general and military secretary in 1904, and three years later his rank was changed to that of adjutant-general of the United States army. He was the first man to hold that important office who had not previously served in command of troops. His arbitrary rulings in refusing the use of war records to historical scholars led to his retirement in 1912.

AINSWORTH, HENRY (1571-1623). An English scholar and divine. He was driven from England by proscription in 1593 because he was a Brownist, and lived in poverty in Amsterdam until, in 1596, he became teacher in the church there of the Brownists. Though never forward, he was the most steadfast, resolute, and cultured champion of the principles of civil and religious freedom represented by the nonconformists in Great Britain and America. While fighting for freedom from hierarchical tyranny, Ainsworth pursued his Hebrew studies, and for a long time biographers had two Henry Ainsworths—one the learned rabbinical student, the other the arch-heretic and leader of the Separatists; but the two were one man. His most notable work is *A Defense of the Holy Scriptures, Worship, and Ministry used in the Christian Churches separated from Anti-Christ, against the Challenges, Cavils, and Contradictions of M. Smythe in his Book entitled "The Differences of the Churches of the Separation"* (Amsterdam, 1609). He wrote notes on all the books of the Pentateuch, the Psalms, and Solomon's Song. There is a story, not probable, that he was poisoned by Jews. See W. E. A. Axon, *H. Ainsworth, the Puritan Commentator* (Manchester, 1889); J. H. Shakespeare, *Baptist and Congregational Pioneers* (Philadelphia, 1907).

AINSWORTH, ROBERT (1660-1743). An English lexicographer, author of a Latin dictionary which was once extensively used. He was born near Manchester and taught school in London. He began his dictionary in 1714; it was first published in 1736 under the title *Thesaurus Linguae Latinae Compendiarius*. In it he still rejects the "English" pronunciation.

AINSWORTH, WILLIAM FRANCIS (1807-96). An English physician, geologist, and traveler. He was born in Exeter and graduated in medicine at Edinburgh in 1827. He

then traveled in France and prosecuted geological investigations in the Auvergne and Pyrenean mountains. On his return in 1828 he conducted the *Journal of Natural and Geographical Science* and delivered lectures on geology. In 1835 he was attached as physician and geologist to the Euphrates expedition under Colonel Chesney, and returned home in 1837 through Kurdistan, the Taurus, and Asia Minor, visiting the latter again the following year. He published *Researches in Assyria* (1838). He also published *The Claims of the Christian Aborigines in the East* (1843); *Travels in the Track of the Ten Thousand Greeks* (2 vols., 1844); *The River Karun an Opening to British Commerce* (1889).

AINSWORTH, WILLIAM HARRISON (1805-82). An English novelist, born at Manchester. His creative fancy began early to show itself in ballads and tales, which appeared in the local newspapers and in contributions to the *London Magazine* and other periodicals. He first studied law; but, tiring of that, he began a publishing business in London, which did not succeed. His first novel was *Sir John Chiverton* (1826); his second, *Rookwood* (1834), was very favorably received. *Crichton* (1837) and *Jack Sheppard* (1839) followed soon after. He edited *Bentley's Miscellany* for a time; in 1842 began his own *Ainsworth's Magazine*, and from 1853 edited the *New Monthly Magazine*. Some of his other works are: *The Tower of London* (1840); *Guy Fawkes* (1841); *Lancashire Witches* (1848); *Star Chamber* (1854); *Cardinal Pole* (1863); *John Law, the Projector* (1864); *The Spanish Match* (1865); *Merrie England* (1874); and *Beau Nash* (1880). He wrote 41 volumes in all. All his works, and particularly his earlier ones, were remarkably popular in England. Their publication began when the inane "fashionable novel" was the staple, and they presented an agreeable contrast. The historical element, together with the scenery of his native country, is prominent in most of them. Analysis of character or motives has no place in his works; his strength is in the vividness and directness with which he realizes scenes and incidents, and he is to be reckoned among the so-called picaresque writers, from his admiration of bandits, highwaymen, and thieves, as in *Rookwood*, where Dick Turpin is the hero. Consult Laman Blanchard, *Memoir of William Harrison Ainsworth*.

AINTAB, in-täb'. A town in the Syrian vilayet of Aleppo, Asiatic Turkey, situated about 65 miles north of the city of Aleppo on the southern slope of Mount Taurus (Map: Turkey in Asia, G 4). It is an important military post and is well fortified. It carries on an extensive trade in leather and cotton, and lies on the route leading from Aleppo to Armenia. Much wine is also produced. The city was burned down late in the nineteenth century, but has since been rebuilt. Its population is about 43,000, and consists, to a great extent, of Armenian and Greek Christians.

AI'NU. See **AINO**.

AIR, ä-ēr', or **ASBEN**. A mountainous region in the southern part of Sahara, situated between 17° and 20° N. lat. and 7° and 10° E. long. It is the most important centre of population in the desert. The palm, fig, and mimosa yield abundant fruit; the camel and zebra are raised on the pastures. The mountains are of granite and basalt, and some of the peaks are nearly a mile high. There are no permanent rivers, but the numerous ravines fill with water during

the rainy season and overflow the valleys. The great caravan which makes its annual passage between Belma and Hansa stops at the numerous watering-places in this region. The country is ruled by a native sultan, and the population, estimated at about 100,000, consists chiefly of Tuaregs. The capital is Agades (q.v.), but Tintellust (60,000 inhabitants) is the chief centre of population.

AIR (Lat. *aër*, Gk. *ἀήρ*, *aēr*, from *ἄειν*, *aein*, to blow). The mixture of gases forming the atmosphere of the earth. It consists essentially of 79.03 parts of nitrogen and 20.97 parts of oxygen, with varying small quantities of carbonic acid, ammonia, ozone, argon, helium, neon, krypton, xenon (qq.v.), and aqueous vapor. Certain chemical compounds, as common salt, ammonium nitrate, etc., as well as minute particles of animal, vegetable, and mineral matter, are also frequently found in the air. Early chemists called all gases airs. The chief properties of air and the phenomena they give rise to may be found treated under **ATMOSPHERE**; **AËRODYNAMICS**; **AËROSTATICS**; **AËRONAUTICS**; **BAROMETER**, ETC.

AIR IN MUSIC. A succession of single tones arranged in rhythmical groupings, so that they are readily apprehended by the ear as melody. The term is also used to denote the principal phrase or melody (generally the highest voice) as distinguished from the accompanying voices. In such expressions as "national air," "operatic air," it denotes the entire composition. Composers of all nationalities have shown a decided fondness for employing the French word in such titles as *air de ballet*, *de violon*; *air triste*, *mélancolique*, etc., for compositions in which decidedly melodious phrases are written for a solo voice or instrument, to which the other instruments furnish a mere accompaniment of sustaining chords or figuration. During the sixteenth and seventeenth centuries the term was used in England in a restricted sense to denote a lively, cheerful strain. As a technical term synonymous with "aria" (q.v.) the word is becoming more and more rare.

AIR BLAD'DER OF FISH'ES. See **FISH**.

AIR BRAKE. A brake worked by compressed air, which is extensively applied to railway cars in the United States and also to a less extent in other countries. Air brakes are also used on street railway cars. The air brake in its first form was invented by George Westinghouse, Jr., an American engineer, in 1869 and is known as the straight air brake. This brake consisted of an air pump, a main reservoir, and an engineer's valve on the locomotive, and of a train pipe and brake cylinder on each car. The air pump served to keep the main reservoir filled with air under pressure, and the brakes were applied by throwing the engineer's valve so as to allow the air from the main reservoir to enter the train pipe and thence into the brake cylinders on the cars, thus forcing the pistons out and applying the brakes on each car. The train pipe of one car was connected to that of the next by flexible hose, with a coupling between cars. This form of brake had several objections, the more important of which were that the brakes on the forward cars were applied so much sooner than those on the rear cars that the rear cars bunted up against the forward cars, causing shocks and damage; and in case a hose burst or a coupling parted, the air pressure would escape without setting the brakes. These objections to the straight air brake led Mr. Westing-

house to invent, in 1872, the automatic air brake. In this brake each car was equipped with an auxiliary reservoir and a triple valve in addition to the train pipe and brake cylinder. The triple valve was located at the junction of the train pipe and the two pipes leading to the brake cylinder and to the auxiliary reservoir. The principle of operation of this improved brake is as follows: Air pressure is maintained in the auxiliary reservoirs and in the train pipe at all times when the brakes are not applied, the pressure in the train pipe being exactly equal to that in the reservoirs, and there being no pressure in the brake cylinder, owing to the fact that as long as the train pipe and auxiliary reservoir pressures are equal, the triple valve is held in a position closing the air inlet to the brake cylinder. To apply the brakes, the equilibrium between the train pipe and the auxiliary reservoir pressures is disturbed by allowing air to escape from the train pipe; as soon as this is done, the excess air pressure in the auxiliary reservoir throws the triple valve so that it admits pressure from the reservoir into the brake cylinder and applies the brakes. To release the brakes, air pressure is retained in the train pipes by admitting air to it from the main reservoir on the locomotive. This gives an excess pressure in the train pipe above the pressure in the auxiliary reservoir, which throws the triple valve so as to close the inlet to the brake cylinder and open the inlet to the auxiliary reservoir from the train pipe, thus allowing the two to attain equal pressures again. To permit air to escape from the train pipe and thus apply the brakes, there is the engineer's valve previously mentioned, and also a conductor's valve on each car, the latter being used only in case of emergency. It is evident also that should a break occur in the train pipe, or its hose connections, through any accident, the pressure is relieved and the brakes are applied automatically.

It will readily be appreciated from what has been said that the triple valve is an exceedingly important part of the mechanism of the automatic air brake. It performs three duties: (1) Charges the auxiliary reservoirs; (2) applies the brakes; and (3) releases the brakes. These duties are, moreover, performed automatically, and, as experience has shown, with almost absolute certainty as long as the valve mechanism is kept in good order. The triple valve is, however, not the only automatic feature of the air brake. The operation of the air pump is controlled automatically by a pump governor, which shuts the steam off from the air pump as soon as the pressure in the main reservoir has reached a certain amount, and admits it again when the pressure falls below this amount. There is also an automatic contrivance for closing the ends of the coupling hose when they are disconnected; this valve opens automatically when the hose is coupled.

The plain automatic air brake was obviously a vast improvement over the straight air brake. Its chief objection was that in an emergency application on a long train the forward brakes were applied so much sooner than those in the rear that the slack of the train ran ahead and often did great damage. To remedy this objection Mr. Westinghouse invented, in 1887, the quick action triple valve, by which the application was so much hastened at the rear of the train that the slack had no chance to run ahead. The quick action automatic air brake is a plain automatic brake in which the great improvement is from

an emergency or safety standpoint, and the present quick action automatic brake is equipped with the quick action triple valve. This valve is identical with the plain triple valve as far as service operations are concerned, but differs from it in emergency, in that it automatically vents air from the brake pipe locally on each car. The rapid brake pipe reduction thus resulting is transmitted to the next triple valve, and from it serially in the same manner to all the valves in the train, thereby reducing the time of full emergency application to about one-sixth of what is possible with the plain triple valves on a 50-car train. This also permits of a higher braking power for emergency than for service applications.

The very high passenger train speeds of recent years led Mr. Westinghouse, in 1897, to place on the market a high speed brake. This brake is designed to use very high air pressure when the brake is applied with the train at full speed, which pressure is gradually reduced by an automatic reducing valve on the brake cylinder as the speed diminishes.

The standard form of brake equipment for American railroad trains is the quick action automatic brake for freight cars, the P. C. passenger brake equipment for passenger cars, and the E. T. locomotive brake for both freight and passenger locomotives. Every type of brake equipment on a locomotive, of course, can be used for any type of air brake equipment on cars in a train. The distinctive departure from the quick action type of brake in the P. C. type is a modification of the triple valve known as a control valve. This control valve consists of four elements: the equalizing portion, which is the portion directly affected by variations in brake pipe pressure and controls, either directly or indirectly, the desired charging of the reservoirs, the application of the brake, whether in service or emergency, and the release of the brake; the application portion, which controls the flow of air only from service reservoir to service brake cylinder and the release of the same and has nothing to do with the emergency reservoir or the emergency brake cylinder; the emergency portion, which contains a double piston and slide valve which controls the flow of air from the emergency reservoir to the emergency cylinder and the release of the same to the atmosphere; and the quick action portion, which corresponds in general to the quick action portion of a triple valve and operates only when an emergency application of the brakes is made, vents brake pipe air to the atmosphere locally on each car, and closes the vent to the atmosphere automatically after the desired brake pipe reduction has been made.

The E. T. locomotive equipment consists of an air compressor, the main reservoir, a duplex compressor governor (to control compressor when the pressures for which it is regulated are obtained), a distributing valve, two brake valves (the automatic to operate locomotive and train brakes, and the independent to operate locomotive brakes only), a feed valve (to reduce the brake pipe pressure), a reducing valve and gauges, brake cylinders, dirt collectors, hose coupling and fitting, etc. The differences between the E. T. and the quick action are in general that, instead of a triple valve and auxiliary reservoir for each of the engine and tender equipments of the quick action, the E. T. has the distributing valve which is made to supply all brake cylinders. The distributing valve consists

of two portions, the equalizing portion and the application portion, and is connected to a double chamber reservoir. The equalizing portion and the pressure chamber of the double chamber reservoir are used in automatic applications only. Reductions of brake pipe pressure cause the equalizing valve to connect the pressure chamber to the application chamber and cylinder, allowing air to flow from the former to the latter. The principle embodied in the quick action triple valve, by which it gives a high braking power in emergency applications and a sufficiently lower one in full service applications to provide a protection against wheel sliding, is accomplished by cutting off the application chamber from the application cylinder in all emergency applications, which gives a smaller volume that has to be filled from the pressure chamber and a correspondingly high brake cylinder pressure.

With the introduction of electric locomotives it was necessary at first only to have a motor-driven air compressor instead of the steam compressor in use on steam locomotives. An important development, however, of the air brake, tried out on the Pennsylvania Railroad for application to steam trains, was an adaptation of the air brake equipment used on the Hudson & Manhattan electrically operated trains, known as the electro-pneumatic system. This system consists of a combination of the latest form of pneumatic service and emergency apparatus, with electric control for either operation. While the electric control is used normally, the pneumatic is held in reserve without its efficiency being impaired. Two brake cylinders, a supplementary reservoir, a control valve and the engineer's brake valve, in addition to the usual cut-out cocks, complete the brake equipment. A single control valve performs automatically all the functions of the triple valve, and in addition provides for maintaining the pressure in both brake cylinders constant against leakage. For further and more technical information on this subject, see Blackall, *Air Brake Catechism* (New York, 1911); Synnestvedt, *Air Brake Diseases* (New York, 1900); Dukessmith, *Modern Air Brake Practice* (Chicago, 1904); instruction pamphlets published by the Westinghouse Air Brake Company, Pittsburgh, Pa; also *Proceedings Master Car Builders' Association*.

AIR CELLS, or AIR SACS. See BIRD.

AIR COMPRES'SOR, or AIR PUMP. A machine for compressing air. This may be made more definite by defining compression to be the act of making a greater weight of air occupy the same volume as before; or making the same weight of air occupy a less volume. This must be accompanied in either case by an increase in its elastic tension or pressure. When released from the containing reservoir or vessel, the air tends to resume its volume at the pressure and temperature of atmospheric air.

Compressed air is used for a multitude of purposes in the arts and in manufacturing, and to catalogue all of its uses would require a great amount of space. The simplest form of air pump is the little apparatus for inflating bicycle tires, with which nearly every one is familiar. These bicycle pumps are made both single and double acting, the single-acting pump being the simplest form of air compressor. Compared with the enormous air-compressing machines used in shops and mines, this little device seems almost too trivial to merit notice, but by carefully observing its actions and their effects there are brought

to our attention several phenomena which are important facts in air compressing on a large scale. One of these phenomena is the power required to pump against the elastic resistance or tension of the compressed air in the nearly inflated tire; the second and more important is the fact that a very perceptible development of heat results as the pumping proceeds. The bearing of both these observations will appear in further treatment. For the present it need only be observed that hand air pumps of the simple form indicated are used for a variety of purposes where only a small amount of compressed air is required. Where a somewhat larger volume of air is required, hand pumps provided with fly-wheels and operated by one or more men by means of cranks, are employed. From these large hand pumps the progress to power air compressors is of degree, not of kind.

The air pump was invented by Otto von Guericke of Magdeburg, Germany, about 1654. In 1753 Holl used an air engine for raising water by air pressure on its surface, and in 1788 Smeaton invented a pump for use with diving apparatus. In 1851 compressed air was used by William Cubitt for bridge work, and a little later it was used by Brunel for the same purpose. In 1852 Colladon patented the application of compressed air for driving machine drills in tunnel construction. Sommeiller developed Colladon's idea, and constructed an air-compressing plant for the Mont Cenis Tunnel work. The Sommeiller compressor was operated as a ram, utilizing a natural head of water to force air at 80 pounds pressure into a receiver. The column of water contained in a long pipe on the side of the hill was started and stopped automatically by valves controlled by engines. The weight and momentum of the water forced a volume of air with such a shock against a discharge valve that it was opened, and the air was discharged into the tank. The valve was then closed and the water checked, and a portion of it was allowed to discharge and the space to fill with air, which was in turn forced into the tank. The injection of water in the form of a spray into the compressor cylinder was first introduced on the St. Gothard Tunnel work begun in 1872. The first compressor used in America was developed by Thomas Doane, the chief engineer of the Hoosac Tunnel, and was employed on that work. This compressor had four single acting cylinders and was cooled by the injection of water through the inlet valves into the cylinders. These early compressors are of historical interest only at the present time. As the necessity for compressed air power grew, inventors turned their attention to the design and construction of compressors which would combine efficiency with light weight and economy of space and cost. As the result of this work, the modern air compressor has been developed.

The simplest form of power air compressor is the air brake pump, with which practically every American locomotive is equipped. In this pump, it will be readily understood, the main considerations are economy of space, light weight, and absolute reliability of action; economy of steam consumption being quite a secondary matter. A 9½-inch air brake pump, for example, will give 1.85 cubic feet of air at 90 pounds pressure, with a consumption of 1 pound of steam at 140 pounds pressure, while a two-stage Corliss air compressor will give 13.7 cubic feet of air at 90 pounds pressure with the same steam consumption. 5. SINGLE AND SIMPLE STEAM-DRIVEN AIR COMPRESSOR.
6. COMPOUND STEAM TWO-STAGE AIR COMPRESSOR, with intercooler.

standard air brake has a steam cylinder and an air cylinder of the same size, viz., $9\frac{1}{2}$ inches diameter and 10-inch stroke, set vertically one above the other, with a common piston rod. See AIR BRAKE.

It has been stated above, in referring to the bicycle pump, that air is heated by compression. The equivalent of the mechanical work done in the compression appears in the form of heat in the compressed air in a storage tank and will be given out again when the air expands. As heat causes air to expand, a cubic foot of hot air, at, say, 75 pounds pressure, will decrease in volume when cooled, and thus bring about a reduction in pressure to something less than 75 pounds. Evidently, therefore, a loss of work done in compression results from the heating of the air, unless it is used at once as hot air; and this is usually inconvenient. The amount of the loss is estimated at 21.3 per cent of the total work done in compressing air to 75 pounds pressure. To save this loss, compressors are designed with some form of device for keeping the air cool during compression. Two systems are used, by which it is attempted to keep the air cool during compression, and these systems divide air compressors into two classes, as follows: (1) Wet compressors which introduce water directly into the cylinder during compression, (a) in the form of a spray, and (b) by the use of a water piston; (2) Dry compressors, which admit no water directly into the cylinder, but have the cylinder surrounded by a jacket, into the space between which and the cylinder walls water is forced and kept in circulation. The water piston compressor is now seldom used. Cooling by the water spray injection gives the most efficient results as far as cooling the air is concerned, but it has so many objections, from the moisture which it carries, that it has been found to be the best practice to use the less efficient but vastly more simple water-jacket system and endure the loss of heat which might be saved by using water spray injection. Accordingly, most air compressors are nowadays provided with a water-jacketed air cylinder for cooling the air during compression.

Vertical air compressors have the steam cylinders placed vertically above the air cylinders; horizontal compressors have the steam and air cylinders placed horizontally one ahead of the other. Direct air compressors have the steam and air piston on the same piston rod, so that the thrust of the steam piston gives a direct thrust on the air piston; indirect acting compressors transfer the thrust of the steam piston by means of cranks and gearing to the air piston rod. A single-acting compressor is one which compresses air on the forward stroke of the air piston only, the back stroke doing no useful work; a double-acting compressor compresses air on both the forward and back strokes of the air piston. A two-stage compressor partly compresses the air in one cylinder, from which it is passed to a second cylinder, where it is further compressed. Generally, the air in passing from the first to the second cylinder passes through an inter-cooler, where it is cooled by water. Three-stage and four-stage compressors are sometimes employed for high pressures. A duplex air compressor consists of a right-hand steam and air cylinder and a left-hand steam and air cylinder, each side being capable of being run separately, or the two sides can be run together. A duplex compressor may have

either the air cylinders or the steam cylinders, or both air and steam cylinders compounded. Air compressors may have the steam cylinders replaced by an electric motor driving a crank-shaft, or the crank-shaft may carry a pulley so that they may be operated by a belt, or by a water wheel obtaining power from a head of water.

Whatever the form of compressor which is used, the mechanical action in compressing the air is that of a piston working in a cylinder, exactly as in the case of a bicycle pump. As each cylinderful of air is compressed, it is forced into a sheet-steel tank called a receiver. This receiver is best cylindrical in form, and serves as a reservoir of compressed air for supplying the machine which is operated by air pressure. The receiver is often provided with an arrangement for cooling the contained air by water. While it is advantageous, for the reason given above, to keep the air as cool as possible during compression, heating it is an advantage, as soon as it leaves the receiver, for the reason that by this heating its volume or its pressure is increased. So important is this advantage, theoretically, that devices called reheaters are often employed to heat the air just before it passes to the motor or the tool which it operates. Reheaters are made in many forms, the usual one being a kind of stove or oven through which the air passes by means of a spiral pipe or some other arrangement which allows it to be quickly heated. The utilization of compressed air for transmitting power or available energy from the compressor and reservoir to the point where power or motion is to be developed is as wide as the industries. It is clean, easy to control and manipulate, leakage is innocuous, and there is no danger from fire. It is a rival of the transmission of power by electric wires, where the motion desired is a reciprocating one or to be effected by a pressure over an area, as with a piston working a cylinder. It is reliable and not subject to short circuits or loss of its potential energy. This fits it for train-brakes, switch and signal systems, riveters and rock-drills, and for use in the foundry. It is conveniently, cheaply, and cleanly stored: this fits it for use in mines and other transportation problems; it is free from the danger of sparks in combustible atmospheres. Where air is itself required in the processes, as in aërating, oil and fuel burners, spraying, cleansing, pumping, etc., it has no substitute.

Power cannot be carried in air pipes over the distances possible with the electric system on account of pressure losses by friction, unless a size of pipe is used which is prohibitory from its cost and trouble with its joints. Air can be used in ice-making or the production of cold, by cooling the compressed air at a high pressure and allowing it to expand in an air engine, dropping its temperature as it does so. Air can be liquefied by compressing it at very low temperatures.

For the great majority of industrial uses an air pressure below 75 pounds per square inch is ample, but for charging the tanks of compressed-air locomotives, for liquefying gases, etc., much higher pressures are required. The highest known pressure to which air has been compressed is 4000 atmospheres (about 60,000 pounds) per square inch, but this was a laboratory experiment. The safe limit of pressure for use in the arts to-day is largely determined by the strength of the retaining vessel or reservoir, and has reached its limit at about 3000 pounds per square inch. To obtain these great pressures specially

designed air compressors have to be constructed, and great trouble is experienced from the cold resulting from the fall of temperature in expanding to atmospheric pressure.

For a concise and readable history of air compressors and of the use of compressed air, consult Saunders, *Compressed Air Production* (New York, 1902), or Hiscox, *Compressed Air and its Applications* (New York, 1901); for a somewhat more technical discussion of the production and use of compressed air, F. Richards, *Compressed Air* (New York, 1895); for practical use of compressed air especially in mine service, Peele, *Compressed Air Plant* (2d ed., New York, 1910). Consult also, Harris, *Compressed Air: Theory and Computations* (New York, 1910), and Thorkelson, *Air Compression and Transmission* (New York, 1913). The most thorough work in English on the theories involved in the use of compressed air is Weisbaeh's *Mechanics of Air Machinery* (New York, 1905).

AIR CUSHION, kush'un. A mattress or cushion composed of a bag or sack of air-tight fabric, which can be inflated, and which possesses many advantages of comfort, cleanliness, and portability. Air-beds were known as early as the beginning of the eighteenth century, but, being made of leather, were expensive, and it was only after the invention of air-tight or rubber cloth that they could be constructed at a moderate cost. An air-bed consists of a sack in the form of a mattress, which may be divided into a number of compartments, each air-tight, or it may have a single compartment with the walls tied to each other to preserve its shape when inflated. The bed is supplied with a valve, or valves, through which the air is blown in by a bellows or an air pump. They are especially valuable in many cases of sickness and for use by camping parties. Air-inflated pillows are made to go with the mattresses. The air-cushion is another contrivance of the same kind, the layer of rubber being securely pasted or cemented to a layer of strong cloth, the cloth giving strength and the rubber impenetrability. Air cushions are specially useful on yachts and canoes, where they may be used also as life-preservers on account of the buoyancy. The chief drawback to these contrivances is their liability to being spoiled by a rent or a puncture.

AIRD, Sir JOHN (1833-1911). An English engineer who, after the completion of his education, became associated with his father, a contractor in large undertakings. When he was only 18 years of age, John Aird was entrusted with a considerable amount of important work in connection with the Exhibition of 1857. He afterwards built many large gas and water-works plants in England and elsewhere. His most famous achievement, however, was the building of the great Assuan Dam (q.v.), of which Sir Benjamin Baker (q.v.) was the engineer. The firm of John Aird & Co., which had contracted in 1898 to build not only the dam but also the Assiut Barrage (see ASSIUT) within five years, finished the task in 1902, 12 months earlier than had been stipulated. Aird was returned in 1887 as a member of Parliament in the Conservative interest from North Paddington and held this seat until 1905. He was made a Baronet in 1901, and was decorated by the Khedive of Egypt with the Grand Cordon of the Medjidie, in recognition of his work at Assuan.—Sir JOHN AIRD, his son and successor, was born in 1861. He also was eminent as an engineer

and builder. He took part in the construction of the Assuan Dam and Assiut Barrage and was decorated with the Imperial Order of the Osmanie, second class.

AIRD, ard, THOMAS (1802-76). A Scottish poet of considerable talent. He was born at Bowden, in Roxburghshire, was educated at the University of Edinburgh, and gained the friendship of many distinguished men, especially John Wilson, who always spoke of him in very high terms. In 1835 he became editor of *The Dumfries Herald*, a new journal, started on conservative principles, an office which he filled till 1864. His works are not so well known as they deserve to be, from their intrinsic merit. In spite of very warm praise from Carlyle and others, they have failed to secure a large measure of public approbation. *The Devil's Dream* is perhaps an exception to the rest, for it is both well known and admired. There is something almost Dantesque in the stern, intense, and sublime literalness of the conception. Whether the scenes are on a large scale, as in *The Devil's Dream*, or minute, as in *The Summer's Day*, there is the same clear, vigorous, and picturesque word-painting. In 1827 Aird published *Religious Characteristics*, a piece of exalted prose-poetry; in 1830, *The Captive of Fez*; in 1845, *The Old Bachelor*, a volume of tales and sketches; in 1848, a collected edition of his poems, a second edition of which appeared in 1856, and in 1852 he edited the select poems of David Macbeth Moir (the "Delta" of *Blackwood's*), prefixing a memoir. See his life and poems, edited by J. Wallace (1878).

AIR DRAINAGE. See FROST.

AIRD'RIE (Gadhel. Smooth Height; from *aird*, height). A town in Lanarkshire, Scotland, 11 miles by rail east of Glasgow (Map: Scotland, D 4). The highroad between Edinburgh and Glasgow intersects it and forms its principal street. It has risen rapidly, was incorporated in 1821, and is now one of the most flourishing inland towns in Scotland. Little more than a century ago it consisted of a solitary farmhouse or two, but the abundance of iron and coal found in the vicinity has given its industries an immense impetus. In addition to foundries, there are cotton-weaving establishments and paper mills. When the Free Library Act was passed, Airdrie was one of the first towns to adopt its provisions. Pop., 1891, municipal borough, 19,135; 1901, 22,288; 1911, 24,388.

AIRE, âr, or **AIRE-SUR-L'ADOUR**, âr'sur'la'door'. A town of the department of Landes, France, situated on the slope of a hill on the left bank of the Adour, 112 miles south of Bordeaux (Map: France, S., D 5). It has been the seat of a bishopric since the fifth century, and its cathedral of St. Wolfram is a fine example of flamboyant Gothic, begun by Cardinal Georges Antoine, under Louis XII, but, in restoration and completion, finished in a mean and paltry style. Aire has also a college and a library. Its industries are not considerable, but tanyards and hat factories give employment to most of its inhabitants. Pop., 1896, 2434; 1901, 2247; 1906, 4303; 1911, 4025.

AIRE, or **AIRE-SUR-LA-LYS**, âr'sur-la-lès'. A town of the department of Pas-de-Calais, France, on the Lys and at the junction of three canals, 30 miles southeast from Calais (Map: France, N., H 2). The town is fortified and well built, though situated in a low, marshy region. Its chief buildings are the handsome Gothic

church of St. Peter, dating from the fifteenth century, the Hôtel du Baillage or Corps de Garde of the sixteenth century, the Hôtel de Ville, and extensive barracks. France acquired possession of Aire in 1713. It has flour mills, various domestic manufactures, and a trade in agricultural products. Pop., 1901, 8458; 1906, 7999; 1911, 8247.

AIREDALE TER'RIER, âr'dâl. See **TERBIER**.

AIR EN'GINE. See **AIR COMPRESSOR**; **COMPRESSED AIR ENGINE** AND **CALORIC ENGINE**.

AIR GUN. An instrument somewhat resembling a sporting rifle, designed to discharge darts or bullets by the elastic force of compressed air. As ordinarily made, an air gun consists essentially of an air chamber or reservoir, usually located in the stock; of a condensing syringe for pumping air into the reservoir, and of a valve operated by a trigger, which admits the compressed air from the reservoir to the barrel behind the bullet. In some weapons of this sort a pressure of as much as 500 pounds is secured in the reservoir. Usually only a portion of the air in the reservoir is used for a single shot, and therefore a number of shots may be fired without recharging the reservoir simply by releasing the pull on the trigger immediately and thus closing the valve between the reservoir and barrel after a small portion of the air has escaped. This permits repeating air guns to be made similar in the mechanism for inserting the bullets to repeating fire-arms. Obviously, the pressure in the reservoir decreases with each discharge of air, and therefore each succeeding bullet is discharged with less force than the preceding one. At best, the force with which a bullet is discharged from an air gun is much less than is given by gunpowder. Sometimes air guns are made in the form of canes or walking sticks, which, like sword canes, are carried for purposes of personal defense in sudden emergencies. The range of an air gun of the ordinary kind is from 180 to 250 feet. The air gun was known in France over two centuries ago, and the ancients were acquainted with a device by which air acted on the short arm of a lever, the longer arm of which was used to propel a bullet. In 1886 Lieut. E. L. Zalinski of the United States army invented a pneumatic gun for throwing projectiles filled with dynamite; and later the *Vesuvius* was built for the United States navy and equipped with three of these guns. This vessel was used during the blockade of Santiago Harbor in the Spanish-American War of 1898. During the Brazilian civil war of 1893 the *Nictheroy* was equipped with a pneumatic gun 50 feet long and of 15 inches calibre. The conclusions of experience with both sets of guns was that the range of the gun was too small and the accuracy of its fire insufficient to make it a serviceable weapon on shipboard. The Sims-Dudley pneumatic gun used by the insurgents in Cuba was a field piece having a range of from 2600 to 3600 yards. It consisted of a lower, or combustion, tube 7 feet long and 4½ inches in diameter, and an upper tube, or barrel, 20 feet long and 2½ inches in diameter, mounted on a regular field-gun carriage. A cartridge inserted into the breech of the combustion chamber, and containing a 7 to 9 ounce charge of smokeless powder, is fired; this compresses the air in the lower chamber so that it passes into the upper tube or barrel behind the projectile and forces it out. The projectile was a light

casing filled with explosive gelatine, fired by a time fuse, or by a contact fuse upon striking.

AIR METER. A special form of anemometer designed to measure the flow of air in mine shafts, ventilating ducts, galleries, chimneys, etc. See **ANEMOMETER**.

AIROLO, î-rô'lô (in German, **ERIELS**). A village in Switzerland, in the canton of Ticino, on the Upper Ticino, 3755 feet above the sea, 66 miles south of Lucerne, at the south end of the St. Gothard Pass and of the St. Gothard Railway Tunnel (q.v.) (Map: Switzerland, C 2). On Sept. 17, 1877, it was nearly destroyed by fire, but later was rebuilt in stone. Dec. 27-28, 1898, it was partially destroyed by an avalanche. The town is safeguarded against further disaster of this nature by the erection of embankments and the regulation of the courses of mountain streams. The inscription, "Suvarov Victor," that was carved in the rocks to commemorate the victory here of the Russians over the French, Sept. 13, 1799, is now obliterated. Pop., 1900, 1628; 1910, 1696.

AIR PLANT. See **EPIPHYTE**.

AIR PORT. See **SHIPBUILDING**.

AIR PUMP. An instrument for removing the air from a vessel. These pumps may be divided into two classes, mechanical air pumps and mercurial air pumps. The mechanical air pump was invented by Otto von Guericke about 1654, and a specimen of his early apparatus is shown in Fig. 1 of the accompanying page illustration. In Fig. 2 is illustrated a modern simple air pump whose essential part is a hollow brass or glass cylinder, in which an air-tight piston is made to move up and down by a rod. From the bottom of the cylinder a connecting tube leads to the space which is to be exhausted, which is usually formed by placing a bell-glass, called the receiver, with edges ground smooth and smeared with lard, on a flat, smooth plate or table. When the piston is at the bottom of the barrel and is then drawn up, it lifts out the air from the barrel, and a portion of the air under the receiver, by its own expansive force, passes through the connecting tube and occupies the space below the piston, which would otherwise be a vacuum. The air in the receiver and barrel is thus *rarefied*. The piston is now forced down, and the effect of this is to close a valve placed at the mouth of the connecting tube and opening inward into the barrel. The air in the barrel is thus cut off from returning into the receiver, and as it becomes condensed forces up a valve in the piston, which opens outward and thus escapes into the atmosphere. When the piston reaches the bottom and begins to ascend again, this valve closes; and the same process is repeated as at the first ascent. Each stroke thus diminishes the quantity of air in the receiver; but from the nature of the process it is evident that the exhaustion can never be complete. Even theoretically there must always be a portion left; and practically the process is limited by the elastic force of the remaining air being no longer sufficient to open the valves. The degree of rarefaction is indicated by a gauge, on the barometer principle.

As this air pump only withdraws the air at the rate of one cylinder full for a double stroke of the piston, pumps with two barrels are frequently used, in which case the pistons are each attached to the same handle, but each moves in an opposite direction to the other, the object being to double the work done at each stroke of

the handle. Such a pump is illustrated in Fig. 5 of the page plate. A large number of modifications of this type of pump have been invented, all of which are the same in general principles. There are several reasons why such pumps do not continue the process of rarefaction indefinitely, but after a certain stage their effects cease and the tension of the air undergoes no further change. Leakage at various joints in the pump is one limiting cause to the action of the machine. As the exhaustion proceeds the leakage is faster on account of the reduced pressure in the receiver, and finally a limiting point is reached when the inflow and outflow are equal and no reduction in the tension of the air takes place. Another limit to the action of this machine is caused by the fact that there must always be some space between the bottom of the piston and the lower end of the cylinder, which is untraversed by the piston.

A greatly improved type of mechanical air pump, known as the Geryk, in which the piston and valves are always covered with a quantity of oil, so that the pump has virtually a liquid piston and liquid valves, has recently come into wide use for commercial and laboratory purposes. The oil used in the cylinder must have a very low vapor tension, which requirement is met by oils of high boiling point. With a pump of this sort, having two cylinders working in series, a vacuum of $1/500,000$ of an atmosphere may be rapidly obtained. In the Rose air pump the piston rod is eliminated, as an iron piston moved by electro-magnets oscillating outside of the pump is employed.

For the production of very high degrees of exhaustion, the more slowly working mercurial air pump is used. The principle of the mercurial air pump was first known in the seventeenth century, when Torricelli showed how to produce a vacuum by filling a tube over 30 inches long and closed at one end, with mercury, and then inverting the tube, with the open end temporarily closed, in a vessel containing the same liquid. The mercury in the tube then descends to a height equal to that of the barometer above the level of the mercury in the lower cup, and a vacuum is left in the top of the tube. This is always

alluded to as a Torricellian vacuum, and is found in the ordinary barometer. In 1855 Geissler invented a mercurial air pump in which the vacuum is produced by connecting a receiver with a Torricellian vacuum. The original form of Geissler's pump is shown in the accompanying diagram, which will serve to illustrate the principle of the operation of pumps of this class, though they have received numerous modifications and improvements. In most mercury pumps the parts are made of glass, the connections being made with rubber tubing. In the diagram, *A* is

GEISSLER PUMP.

about 3 feet long, *C* a rubber tube uniting the lower end of *B* with the vessel *D*, which is open

on top. *A* can be connected with either of the tubes *G* or *F*, but not with both at once, or it can be shut off from both. The receiver to be exhausted is connected with *G*, and *F* leads to the open air. Enough mercury is used to fill *A*, *B*, *C*, and *D*, as shown, and the vessel *D* is capable of being raised or lowered. The operation of the pump is as follows: Suppose the vessel *D* is raised a little higher than *A*, as in the figure. The mercury will flow into the bulb *A*, which it fills if the cock *E* is turned so as to connect *A* with the outside air, *F*. The cock is then turned so as to connect *A* through the tube *G* with the vessel to be exhausted, the air in which at this stage is at atmospheric pressure. *D* is then lowered, and the level of the mercury in *A* is lowered in consequence, the mercury running down *B* and *C* to *D*. As the mercury in *A* descends, air is drawn from the receiver through *G* into *A*, so when the mercury has descended below *A* the whole space is filled with the air drawn through *G*, which, having expanded from the receiver attached to *G*, is at less than atmospheric pressure. The cock *E* is then turned so as to cut off communication between *A* and *G*. *D* is then slowly raised, and the mercury flows gradually back into *A*, compressing the air above it until it is at atmospheric pressure. At this point the cock *E* should be turned to connect *A* with the outside air *F*, and as *D* continues rising the mercury continues to drive out all the air at *F*, until the bulb *A* is filled with mercury to the cock *E*, which is then closed so as to cut off all communication with *A*. When *D* is again lowered, the mercury does not begin to fall in *A* until *D* is about 30 inches below *A*. It then begins to descend, leaving a Torricellian vacuum above it, and *D* is lowered until *A* is empty. The cock is then turned so as to connect *A* with the receiver through *G*, and the remaining air in that vessel expands and fills *A*. The cock *E* is next turned off, *D* is raised, and the mercury rising in *A* compresses the air above it until it is let out at *F* by turning the cock. By repeating this operation a sufficient number of times a vacuum is gradually produced in the receiver connected to *G*. When the operation is nearly finished, great care must be taken not to raise the vessel *D* too rapidly, or the impact of the mercury against the top of the bulb *A* will break the apparatus. It will also be seen that when the vacuum is nearly reached the mercury in *A* will be at the top of the bulb when *D* is about 30 inches below. If the valve should be turned to *F* at this point, the inrush of air would drive the mercury down. Therefore no communication between *A* and *F* must be made until *D* has been raised on a level with *E*, and no communication between *G* and *A* must be made until *D* is lowered 30 inches again, otherwise mercury will run through *G* into the receiver which is being exhausted.

The Geissler pump just described may be taken as the type of mercury pumps, which are classified as upward driving, and, while a number of improvements in details have been introduced, making them of a more practical type for factory use, these pumps all operate on the principle of connecting the receiver to be exhausted with Torricellian vacuum.

Sprengel brought out his well-known form of mercury pump in 1865, and the diagram shows it in its simplest form. The Sprengel pump is a general type of what are classified as downward-driving pumps. *A* is a funnel having a stop-cock

AIR PUMPS

 5. MECHANICAL AIR PUMP, with two vertical cylinders.
 6. SELF-ACTING SPRENGEL MERCURIAL AIR PUMP, with auxiliary water pump.

C, and *B* is a tube of small bore, called the shaft or fall-tube. The receiver to be exhausted is connected to the tube *G*, which branches off from near the top of the shaft. The tube *B* terminates very close to the bottom of the vessel *D*, which is provided with a spout *F*, as shown, leading to the cup *E*. The distance from the branch *G* to the top of the mercury in the vessel *F* must be at least 3 feet. *A* is filled with mercury, which flows down the shaft *B*, the rate of flow being regulated by the cock *C*, so that a very small stream is allowed to fall. This mercury in falling breaks up into short lengths, between which are small columns of air which flow in at the junction of *G* with the shaft *B*. The weight of

SPRENGEL
PUMP.

the mercury forces these short columns of air down the shaft *B* to the mercury in *D*, from the surface of which they escape. The mercury as it runs into the cup *E* must be poured back into the funnel *A*. This operation continues until no more air is carried down with the mercury. When the vacuum is nearly completed, the mercury in the fall-tube will fall with a sharp, rattling noise, showing that there is not enough air carried down with it to act as a cushion.

With all kinds of mercury pumps, however, it is necessary to continue the operation for a considerable time after the receiver is apparently exhausted. Even when no more air appears to be carried on by the pump, the vacuum will improve as the operation continues. The reason for this is that the air sticks to the surface of the glass, forming a sort of coating, which is swept off the surface by the pump, but very slowly. The simple form of Sprengel pump is better than the simple Geissler pump, but is not well suited to factory work on account of the slowness of its action. The drawback is overcome, to a great extent, by supplying the pump with a number of fall-tubes, which act together as a single one. For example, if six fall-tubes are used, the work of removing most of the air is done in one-sixth of the time required by a single pump. After the greater part of the air is removed, however, the time taken to produce a good vacuum is not nearly so much reduced, and it is chiefly in the early part of the operation that the saving of time is effected. Another drawback to all mercury pumps is their liability to breakage, even with the most careful usage. In the Sprengel pump, owing to the continual hammering of the mercury, the fall-tubes are very often broken, even after only a very short usage. A method is in use with both of these forms of pumps which consists of exhausting into a partial vacuum instead of into the atmosphere. This is accomplished by inclosing the part of the apparatus where the air is expelled in a chamber which is kept at a partial vacuum by means of a mechanical or water air pump. By this means the mercury pump will work against a pressure much less than the atmospheric pressure, and consequently the fall-tubes and the height to which the mercury must be raised can be very much reduced, while the air is much more readily drawn down and out of the fall-tubes.

In factory work the raising of the mercury from the lower to the upper level of the pumps

is done mechanically and not by hand. It may be raised by a force-pump, or in small buckets on an endless chain, or by air pressure. The latter may be simply atmospheric pressure, and the mercury is raised by being broken up into small lengths with air spaces between, like a Sprengel pump working upward into a vacuum chamber. The illustrations show modern forms of mercury pumps. In an improved form of Sprengel pump designed by G. W. A. Kahlbaum a steel gun-barrel replaces the glass fall-tube. This avoids the electrification of the glass by the friction of the falling mercury, and with the other improvements introduced enables a higher vacuum to be attained than ever previously. In this way, in 1901, he was able to obtain a degree of exhaustion corresponding to a pressure of .0000018 millimeters of mercury, which at that time was considered the best on record.

For much experimental work it is necessary to employ some form of continuous running air pump in order to maintain a satisfactory vacuum, and a rotary arrangement of the mercury pump has been found useful in most cases. Such a device was first developed by Schultze-Berge and underwent numerous modifications; that of Kaufmann, brought out in 1905, while fragile and complicated, was very efficient. Here the mercury is contained in an inclined spiral tube which is rotated so that at each revolution a fraction of the air in the vessel under exhaustion is cut off.

Later important improvements in air pumps were due to Dr. W. Gaede. One of his pumps consisted of an outer and closed drum half filled with mercury, which rotated a second drum divided into chambers connected with the vessel to be exhausted. As the drum is rotated, the chambers are filled alternately with gas and mercury, the former being displaced into the outer space between the two drums and there cut off by the mercury. This machine has been aptly compared to a form of gas meter where the moving gas affects the rotation of the mechanism, only in the rotary pump the gas is set in motion by the rotation of the drum. It is necessary with this pump first to make a rough exhaustion by preliminary pumping, so that the difference of pressure between the outside and inside of the rotating drum is not sufficient to drive the gas back into the drum.

Dr. Gaede also designed a mechanical pump which departs radically from the Guericke principle, as it maintains at all times an open connection between the vessel to be exhausted and the delivery pipe. It is known as a molecular air pump and consists of a rapidly rotating cylinder which serves to drag the gas along by the movement of its surface within a slightly larger cylinder so that a difference of pressure is established between two openings on opposite sides but connected by a slot. In actual construction a grooved cylinder is used with a tongue projecting into the groove, and a number of grooves are employed, the apparatus being compounded so that the low-pressure side of one groove is the high-pressure side of the previous one. Preliminary exhaustion is required with this pump, but it works as well with vapors as it does with gases, and no drying is required. At a speed of 12,000 revolutions per minute a vacuum corresponding to .0000002 (2×10^{-7} millimeters of mercury) was obtained, which at the time became easily the best record for exhaustion. The higher the speed the greater the

exhaustion. The mechanical air pump works ten times faster than the rotary mercurial air pump and puts at the command of the investigator the very highest vacua.

The degree of exhaustion obtained with various types of air pumps may be seen from the accompanying table, compiled by Andrade in 1913 and published in *Nature* with an article on "Modern Air Pumps."

TABLE OF COMPARATIVE EXHAUSTION OBTAINED WITH VARIOUS TYPES OF AIR PUMPS

Pump.	Pressure in millimeters of mercury.
Water pump	10.
Ordinary piston pump	1.
*Older Geissler pump1
*Newer Geissler pump01
*Sprengel pump001
*Modified Toepler pump00001
Kahlbaum's automatic mercury pump	.000002
Geryk oil-filled pump0002
Gaede rotary mercurial pump00001
Gaede molecular pump0000002

The water pump invented by Bunsen is a simple form of apparatus that is found generally in physical and chemical laboratories and adequately answers when too high a degree of exhaustion is not required. It consists of a tube attached to a faucet or other supply of water under pressure, through which water empties into a chamber provided with two outlets. From one of these the water flows out, carrying with it the air from the vessel to be exhausted, which is connected with the second tube. In its original form this piece of apparatus was made of glass and rubber tube, but with metallic parts that allow it to be connected to an ordinary faucet. It is extensively used in laboratories. The page illustration (Fig. 3) shows one form of such a water pump.

Bibliography. Descriptions of air pumps of various forms are to be found in all the large treatises on physics, including those of Ganot, Deschanel, Müller-Pouillet, and Winkelmann (1886), the two last named (in German) giving a complete account of the most important types of apparatus of this class. In the *Journal of the Society of Arts*, vol. xxxvi (London, 1888), there is an interesting and valuable article on "The Development of the Mercurial Air Pump," by S. P. Thompson, in which the various forms of this instrument are described. This has been reprinted in book form. For the most recent achievements in air pumps and high-vacua apparatus the reader is also referred to the columns of the *Annalen der Physik und Chemie*, *Berichte der Deutschen Physikalischen Gesellschaft*, *Physikalische Zeitschrift*, *Zeitschrift für Instrumentenkunde*, *American Journal of Science*, and *Science Abstracts*. For AIR COMPRESSORS, see under that title.

AIRY, âr'î, Sir GEORGE BIDDELL (1801-92). An English astronomer. He was born at Aln-

* These values are taken from Winkelmann's *Handbuch der Physik*, vol. i, and are to be considered rough, but afford some comparison of the degree of exhaustion to be obtained with the various types. The compiler states that it is very doubtful whether Kahlbaum's pump can give better vacuum than Gaede's mercury pump, the figure for which is given by the Physikalisch-Technische Reichsanstalt.

wick, Northumberland, and graduated at Trinity College, Cambridge, in 1823. In 1825 he discovered the optical defect of astigmatism and provided a corrective for it. He was elected to the Plumian professorship at Cambridge in 1828 and intrusted with the management of the Cambridge Observatory, the results of his labors being published in the compilation entitled *Astronomical Observations* (9 vols., Cambridge, 1829-38), which became the model of all analogous works since published in Great Britain. In 1835 he succeeded Pond as royal astronomer of the Greenwich Observatory, where he introduced or perfected numerous astronomical instruments, devised clearer and quicker methods of calculation, and instituted valuable researches in magnetism, meteorology, and photography. One of his most important achievements was the establishment of a mechanical device in the form of magnets and iron, whereby the disturbance of the compass in iron-built vessels can be rectified. It was he, also, who conducted the astronomical observations preparatory to the definition of the boundary between Canada and the United States. Among the works written by this distinguished scientist during his exceptionally long and useful career, the following are especially noteworthy: "Gravitation," for the *Penny Cyclopædia*, also published separately (1885); *Mathematical Tracts on Physical Astronomy* (4th ed., 1858); *Ipswich Lectures on Astronomy* (4th ed., 1858); *Treatises on Errors of Observation* (1861); *Sound* (1869); *Magnetism* (1870); "Trigonometry," "Figure of the Earth," "Tide and Waves," in *Encyclopædia Metropolitana*.

AISHA. See AYESHAH.

AISLE, il (Fr. *aile*, wing, from Lat. *ala*, contracted from *axilla*). One of the longitudinal divisions in a building divided internally by parallel rows of columns or piers. In strictest parlance, the term should apply only to the lateral divisions on either side of a central division which is usually broader and higher than the others; but in general usage these are called the "side aisles," and the central division the "central aisle." On the other hand, the term "nave," often applied to the whole of the central aisle, strictly belongs only to that part of it west of the chancel or transepts. (See NAVE.) The intersection of the central aisle of the nave and choir with that of the transept is called the "crossing." The hypostyle halls of Egyptian temples offer the earliest examples of aisled construction; that at Karnak having eight aisles on either side of the central aisle. A few of the Greek temples (e.g., the Parthenon at Athens, temple of Poseidon at Pæstum) were three-aisled. It was the Romans, however, who developed a distinctive architectural treatment for aisled structures, in their basilicas or public halls. In these the central aisle was made much wider and higher than the side aisles, and lighted by a row of windows on either side above the side-aisle roofs; this is called a "clearstory," of which the prototype is seen in the hall at Karnak already mentioned. Some of the Roman basilicas were five-aisled (i.e., with two side aisles on either side of the central aisle), as the Julian and Ulpian; more often they were three-aisled. See BASILICA.

The mediæval type of Christian church west of the Byzantine Empire was derived from the Roman secular basilica, both in plan and, in the earlier centuries, in construction also, with the addition of a transept or transverse arm or aisle in front of the sanctuary or chancel. The intro-

duction of vaulting in the Romanesque period (tenth to twelfth centuries), applied at first only to the side aisles, but later also to the central aisle of nave and choir, operated to change completely the aspect, construction, and proportion of all the aisles, but without affecting the fundamental plan. (See CHURCH.) In the Gothic period (twelfth to sixteenth centuries) the height of all parts was greatly increased, and the clearstory, especially in France, made more important; one, and in some cases two, side aisles were continued around the apse to form ambulatories (see AMBULATORY); and the outer aisles of the choir, sometimes also of the nave, flanked with chapels. The cathedral of Antwerp has seven aisles; those of Cologne, Milan, Seville, Paris, Bourges, the great church of St. Sernin at Toulouse, and some others have five aisles; Rheims, Chartres, Amiens, and Beauvais have five-aisled choirs; the great majority of Gothic churches and many Renaissance churches have three aisles. Many transepts are without side aisles; some English cathedral transepts have only one side aisle, as at Salisbury: a few churches carry the side aisle entirely around the transepts, as St. Sernin at Toulouse and San Spirito at Florence.

The side aisles next the central aisle are in many cases two-storied, the upper story forming a spacious gallery on either side, as in Notre Dame, Paris, and in some of the Roman Christian basilicas (Sant' Agnese fuori le Mura). In Bourges Cathedral the inner aisles are of the height of two stories, having clearstory windows above the roofs of the outer aisles, but are without galleries.

The term is often applied, in common usage, to the passages between sections of seats in halls and churches; in this sense it appears to be derived from the French word *allée*, a passage.

AISNE, ān. A river in north France, a tributary of the Oise. It rises in the Forest of Argonne, flows northwest for the first two-fifths of its course, and then west to its junction with the Oise above Compiègne (Map: France, N., J 3). Its length is 170 miles, of which over three-fifths are navigable, either directly or by means of a canal parallel to its course. It is connected with the Meuse and Marne rivers by canals.

AISNE, ān. A department on the Belgian frontier of France (q.v.), formed of parts of the old Picardie, Bril, and Ile-de-France (Map: France, N., J 3). There are many navigable rivers, and the fertile soil is well adapted to agriculture and pasturing. The surface is rolling, and there are some forests. Manufactures are extensive. Capital, Laon. Pop., 1911, 530,226.

AISSE, ä'ê-sá', or **HAIDEE**, MADemoiselle (1694?-1733). A French writer, born in Circassia. She was taken captive by a Turkish marauding expedition and about 1698 was bought at the Constantinople slave market by the Comte de Ferriol, the French ambassador. She was educated at Paris, where she was subsequently a prominent figure in many salons. Her letters to Madame Calandrini were first published in 1787, with notes by Voltaire. In 1847 a critical edition was published by M. J. Ravenel, with a study by Sainte-Beuve. A still later edition is that with a study by Eugène Assé (1873). See also the essay by Edmund Gosse in his *French Profiles* (London, 1905).

AISTULF, is'tulf, or **ASTOLF**, äs'tölf (died 756). A King of the Lombards. He succeeded

Rachis, who entered a monastery in 749. In 751 he seized Ravenna and soon after attempted to capture Rome. The Pope, unable to get aid from the Emperor at Constantinople, went to implore assistance from Pepin (q.v.). The latter, in 754, invaded Italy, defeated Aistulf, and forced him to promise to give up the conquered territory. This Aistulf did not do, but in January, 756, laid siege to Rome. Pepin again went to aid the Pope, besieged Aistulf, who had left Rome on learning of Pepin's advance, in Pavia, and forced him to surrender the Exarchate of Ravenna. (See DONATION OF PEPIN.) The dates, which were disputed, are discussed in Gregorovius, *City of Rome in the Middle Ages*, vol. ii (London, 1896).

AITKEN, ät'kën, ROBERT (1734-1802). A Scotch-American printer and bookseller. He was publisher of the *Pennsylvania Magazine*, or *American Monthly Museum*, in 1775 and 1776, and in 1777 was imprisoned as a sympathizer with the Patriot cause. At a considerable loss he printed the first American edition of the Bible (1782), which since has become very rare. He is supposed to have written *An Inquiry Concerning the Principles of a Commercial System for the United States* (1787).

AITKEN, ROBERT GRANT (1864-). An American astronomer, born at Jackson, Cal., and graduated from Williams College in 1887. He became successively instructor in mathematics in Livermore College, Cal. (1888); professor of mathematics and astronomy at the University of the Pacific (1891); and astronomer at the Lick Observatory (1895). For several years, also, he lectured on astronomy at the summer session of the University of California. He was a member of the Lick Observatory Eclipse Expedition to the Flint Islands in 1898. As a recognition of Aitken's discovery of over 2400 double stars, the Academy of Sciences of France awarded him the Lalande prize in 1906. He became a member of many astronomical and other scientific societies. From 1897 to 1908 he edited the publications of the Astronomical Society of the Pacific, becoming known also as a contributor to American and German astronomical journals.

AITKEN, Sir WILLIAM MAX (1879-). A British capitalist and politician. He was born in Newcastle, New Brunswick, Canada, and educated in the public schools. He began his business career in Halifax, Nova Scotia, but in 1907 removed to Montreal, where his ability as a financier and organizer of industrial combinations soon made him prominent. In 1910 he removed to London, England, where he became a director in several capitalistic enterprises. In Canada he was an ardent Conservative and Imperialist, and he continued his political activity in England, actively supporting the Unionists. He was elected member of Parliament for Ashton-under-Lyne in 1910 and was knighted in 1911.

AITKEN, WILLIAM HAY MACDOWALL HUNTER (1841-). A Church of England preacher, born in Liverpool, Sept. 21, 1841; B.A., Oxford, 1865, M.A., 1867. Since 1877 he has been general superintendent of the Church of England Parochial Mission Society, which he founded in 1876. He is one of the most eminent and successful of revival preachers. His publications consist of sermons. In 1900 he was appointed canon of Norwich.

AITKENITES. In the Church of England,

the partisans of Robert Aitken (1800-73), a clergyman who had been for a time a Wesleyan and who, after 1840, having returned to the Established Church, desired to combine with its ecclesiastical practice certain views of the Methodists, especially in regard to conversion.

AITKIN, ROBERT I. (1878—). An American sculptor. He was born in San Francisco and studied for a year with Douglas Tilden, receiving the gold medal of the Mark Hopkins Art Institute of that city. Though but 18 years of age, at the advice of his teacher, he established a studio of his own. His earliest commissions were the bronze portals of the Charles H. Crocker mausoleum and the spandrel of the Spreckels music pavilion in Golden Gate Park. Among his other works in San Francisco are the Dewey monument in Golden Gate Park and the statue of Hall McAllister in front of the city hall. He afterwards spent several years in Paris, where his "Athlete" (1807) won great success, and where he began his ambitious but still uncompleted composition, "To Those Born Dead." On his return to America he established himself in New York. Among his later works are the busts of David Warfield, George Bellows, Augustus Thomas, and ex-President Taft (1910); "The Flame" (1908) which won the prize for sculpture and made him an associate of the National Academy; "A Creature of God till now Unknown," carved directly from the marble without previous study; "Michelangelo at work upon his statue of the Day" (1912). His latest works include a bronze bust of Professor Shaler of Harvard and the doors for the mausoleum of the late John W. Gates in New York. Aitken is unrivaled among the younger American sculptors in strength and originality of conception and technique.

AITON, ā'ton, WILLIAM (1731-93). A Scotch botanist. He was trained as a gardener, and in 1754 became assistant to Philip Miller, superintendent of the garden at Chelsea. In 1759 he was made director of the royal botanical gardens at Kew, which he rendered the richest in existence, and held the place until his death. In 1793 he published his excellent work, *Hortus Kewensis, or a Catalogue of the Plants Cultivated in the Royal Botanical Gardens at Kew*. This was re-edited by his son and successor in office, William Townsend Aiton.

AIVALIK, i'vá-lék', or AIWALYK. A seaport town on the western coast of Asia Minor, on the Gulf of Adramyti, opposite the island of Mitylene (Map: Turkey in Asia, B 3). It has a large trade in oil and grain, and many of the inhabitants are engaged in fishing. Its harbor is extensive, but the entrance is very shallow. The town suffered terribly at the hands of the Turks at the beginning of the nineteenth century, but has recovered since and is now of considerable importance. Its population, estimated at 25,000, is almost exclusively Greek.

AIVAZOVSKI, i'vá-zöf'skê, IVAN KONSTANTINOVITCH (1817-1900). A Russian marine and landscape painter. He was born in Feodosia, in the Crimea, of Armenian descent, was admitted as an imperial pensioner to the Academy of Art at St. Petersburg, and completed his studies at Rome. He traveled widely, especially in Russian and Turkish dominions, making studies for his 4000 pictures. Best known of Russian marine painters, he constantly enjoyed the imperial patronage, but to present-day criticism his color often seems glaring and violent, his effects

pyrotechnic. His best works include: "Sunrise on the Black Sea" (1850); "Creation," "Deluge," and several others, now at the Hermitage at St. Petersburg (1865); "Sea Fights at Revel, Viborg, and Tchesme," "Wreck of the Frigate Ingermannland," "Peter the Great at Krasnaya Gorka" (all at the Winter Palace, St. Petersburg); "View of Constantinople," "Calm Sea," and "Naples by Moonlight" (Academy of St. Petersburg); "Solar Eclipse" (Geographical Society, St. Petersburg); "Lighted Castle on the Sea" (Peterhof); "Calm Sea by Moonlight," "Monastery of St. George" (Moscow Museum).

AIWALYK. See AIVALIK.

AIX, âks or âs (anciently Lat. *Aquæ Sextiæ*, Springs of Sextius). A town of France, formerly the capital of Provence, now the capital of an arrondissement in the department of Bouches-du-Rhône (Map: France, S., K 5). The principal buildings of the town are the Palais de Justice, the Hôtel de Ville, and the cathedral of St. Sauveur. The cathedral dates from the eleventh century and is a fine example of Romanesque architecture. The Palais de Justice was not completed until 1831 and is in the Renaissance style. The town is very bright and cheerful in appearance, and its many squares and parks enliven every quarter. Aix is famous for its springs and natural fountains. That of the Rotunda is decorated with statues of Justice, Agriculture, and Art; another fountain is surmounted by a statue of René of Anjou, the patron of troubadours. It is the work of David d'Angers. There is a museum of antiquities containing valuable Gallic, Roman, and Christian remains. The town has a university in conjunction with Marseilles (see AIX, FACULTÉS D'), as well as an academy of sciences. Its library is famous in southern France, and contains about 150,000 printed works and over 1200 manuscripts; among the latter are many letters of Mary Stuart. There are also a school of art, and a picture gallery, in which are examples of Granet, the great architectural painter, who was a native of Aix. The industry of the town consists chiefly in the cultivation of the olive, in cotton-spinning, leather-dressing, and trade in oil, wine, almonds, etc. The warm springs are slightly sulphurous, with a temperature from 90° to 100° F., clear and transparent, with a slightly bitter taste. They have the reputation of improving the beauty of the skin.

Aix was in Roman times *Aquæ Sextiæ*, from Caius Sextius Calvinus, who in 123 B.C. headed the Roman colony which had been formed to defend the Greeks of Marseilles against the Salluvii. The field on which Marius defeated the Teutones and Ambrones, in 102 B.C., lies in the plain between Aix and Arles. In the Middle Ages, under the counts of Provence (see RENÉ), Aix was long a centre of art and learning. With the rest of Provence, Aix fell to the French crown in 1487, and from 1501 to 1789 it was the seat of the Parlement of Provence. Communal population, 1901, 29,418; 1911, 29,836, including agglomerated population, 19,462, scattered, 5466, counted aside, 4908.

AIX, or AIX-LES-BAINS, -là'bän' (Fr. the Bath Waters or Springs; see below). A small town of Savoy, France, in a delightful valley near Lake Bourget, 7 miles north of Chambéry and 18 miles by rail north of Marseilles (Map: France, S., K 3). It has an altitude of 850 feet. Its celebrity as the source of medicinal waters dates from its occupation by the Romans, who

gave it the name of *Aquæ Gratinæ* and built splendid baths there. Among its remains are the Arch of Campanus and the ruins of a temple and of a *vaporarium*. The resort was neglected during the Middle Ages, but began to be frequented again in the seventeenth century, and it is now a fashionable watering-place. The two hot springs are of sulphurous quality and of a temperature above 100° F. The water is used both for drinking and for bathing. There are several schools, colleges, and museums. Flour milling and the manufacture of hats, oil, and confections are among the industries of the town. Pop., 1901, 5349; 1906, 8679; 1911, 8934.

AIX, FACULTÉS D', fá'kul'tá' dâks' or dâs', or **ACADÉMIE**, á'ká'dâ'mé'. Schools of law and theology existed at Aix perhaps at the beginning of the thirteenth century. They were organized in 1409 by Papal bull into the University of Aix, which represented Provençal learning, if not literature, during most of its existence from its foundation until its dissolution in 1789 and reorganization under Napoleon in 1806, after which for nearly a century it was an academy of the University of France. The present University of Aix-Marseilles has faculties of law and literature at Aix, and faculties of science, medicine, and pharmacy, and the free faculty of law at Marseilles. There are over 1200 students.
