 □ Quadrature; — indicating a difference of 90° in longitude, or right ascension.
 △ Trine; — indicating a difference of 120° in longitude, or right ascension.

II. CHEMICAL.

• One equivalent of oxygen; — written above a symbol representing an element, and repeated to indicate two, three, or more equivalents; thus, Fe denotes a compound of one equivalent of oxygen with one of iron; S a compound of three equivalents of oxygen with one of sulphur.

• One equivalent of sulphur; — used in the same manner as the preceding; thus, Fe denotes a compound of two equivalents of sulphur and one of iron.

☞ A dash drawn across a symbol having either of the foregoing signs above it denotes that two equivalents of the substance represented by the symbol are joined with the number of equivalents of oxygen or sulphur indicated by the dots or commas; thus, Fe represents a compound of two equivalents of iron and three of oxygen, forming sesqui-oxide of iron.

+ indicates, in organic chemistry, a base or alkaloid, when placed above the initial letter of the name of the substance; as, M⁺, morphine;

‡, quinine.

— indicates, in organic chemistry, an acid, when placed above the initial letter of the name of the acid; as, C[—], citric acid; T[—], tartaric acid.

☞ Every elementary substance is represented, in chemical notation, by a symbol consisting of the initial or abbreviation of its Latin name; as, H for hydrogen, O for oxygen, Ag (from *Argentum*) for silver, and the like, each symbol, when used singly, always indicating a single atom or equivalent of the substance represented by it; thus, O stands for one atom or equivalent of oxygen, C for a single equivalent of carbon, and the others in like manner. A compound body made up of single equivalents of its constituents is represented by the two symbols of the respective constituents written side by side; as, HO, a compound of one equivalent of hydrogen with one of oxygen, forming water. To express more than one atom or equivalent of a substance, a number is used, either prefixed to the symbol, or, more commonly, written after it, below the line; as 2O, or O₂, two equivalents of oxygen.

A secondary compound, as a salt, is indicated by writing the symbols of the constituent compounds one after another, with the sign + between them, the symbol of the base being al-

ways placed first; thus, $\text{CaO} + \text{CO}_2$ represents carbonate of lime. A comma is frequently used instead of the sign $+$, commonly to express a more intimate union than would be expressed by that sign. The period is also sometimes used to indicate a union more intimate than that denoted by the sign $+$, but less so than that implied by a comma. A number written before the symbol of a compound designates a corresponding number of equivalents of that compound; as, 3SO_3 , three equivalents of sulphuric acid. When the formula of the quantity contains several terms, those to which the figure applies are included in parentheses or brackets, to which the figure is prefixed; as, $3(\text{CaO} + \text{SO}_3)$, three equivalents of sulphate of lime.

III. MATHEMATICAL.

THE RELATIONS OF QUANTITIES.

$+$ Plus; and; more; — indicating addition; as $a + b = c$; — used also to indicate that figures have been omitted from the end of a number, or that the latter is approximately exact; as, the square root of 2 is 1.4142136+.

$-$ Minus; less; — indicating subtraction; as $a - b = c$.

\pm , or \mp Plus or minus; ambiguous; — indicating that the number or quantity to which it is prefixed may have either of the signs $+$ or $-$; as, $a \pm b$.

\times Multiplied by; times; into; as, $a \times b = ab$; $6 \times 4 = 24$.

\cdot Multiplication is also often indicated by placing a dot between the factors, or by writing the latter, when not numerals, one after another without any sign.

\div or $:$ Divided by; as, $a \div b$; that is, a divided by b ; $6 \div 3 = 2$.

\overline{b} Division is also very often indicated by writing the divisor under the dividend, with a line between them; as $\frac{a}{b}$; that is, a divided by b ; $\frac{3}{6} = 2$.

$=$ Is equal to; equals; as $(a + b) \times c = ac + bc$; $6 + 2 = 8$.

$>$ Is greater than; as, $a > b$; that is, a is greater than b ; $6 > 5$.

$<$ Is less than; as, $a < b$; that is, a is less than b ; $3 < 4$.

\approx Is equivalent to; — applied to magnitudes or quantities which are equal in area or volume, but are not of the same form, or capable of superposition.

\sim The difference between; — used to indicate the difference between two quantities without designating which is the greater; as, $a \sim b$.

\propto Varies as; is proportional to; as, $a \propto b$.

$::$ Is to; the ratio of; } — used to indicate geometrical proportion;

$as, a : b :: c : d$; that is, a is to b as c is to d .

\therefore Hence; therefore; on this account.

∞ Because.

∞ Indefinitely great; infinite; infinity.

0 Indefinitely small; infinitesimal; — used to denote a quantity less than any assignable quantity; also, as a numeral, naught; nothing; zero.

\sphericalangle Angle; the angle; as, $\sphericalangle A B C$.

\lrcorner Right angle; the right angle; as, $\lrcorner A B C$; that is, the right angle $A B C$.

\square Rectangle; the rectangle; as, $\square A B C D$; that is, the rectangle $A B C D$.

$\sqrt{\quad}$, or $\sqrt{\quad}$ Root; — indicating, when used without a figure placed above it, the square root; as, $\sqrt{4} = 2$; $\sqrt{4a^2} = 2a$. This symbol is called the *radical sign*. To denote any other than the square root, a figure (called the *index*) expressing the degree of the required root, is placed above the sign; as, $\sqrt[3]{a}$, $\sqrt[4]{a}$, $\sqrt[6]{a}$, etc.: that is, the cube root, 6th root, 10th root of a .

$\sqrt[n]{\quad}$ The root of a quantity is also denoted by a fractional index at the right hand side of the quantity and above it, the denominator of the index expressing the degree of the root; as $a^{\frac{1}{2}}$, $a^{\frac{1}{3}}$, $a^{\frac{1}{5}}$; that is, the square, cube, and fifth roots of a , respectively.

\bigcup Vinculum, } indicate that the
() Parenthesis, } quantities to which
[], or { }, Brackets, } they are applied, or
| Bar, } which are inclosed
by them, are to be
taken together; as, $x + y^2$; $2(a + b)$; $a \times (b + c[e + d])$; $x | z$.

d Differential; as, $d x$; that is, the differential of x .

δ Variation; as δx ; that is, the variation of x .

Δ Finite difference.

$\frac{d}{dx}$ Differential coefficient; derivative.

$\frac{d}{dx}$ The letters d , δ , Δ , D , and sometimes others, are variously employed by different mathematicians, prefixed to quantities to denote that the differentials, variations, finite differences, or differential coefficients of these quantities are to be taken; but the ordinary significations are those given above.

\int Integral; integral of; — indicating that the expression before which it is placed is to be integrated; as, $\int 2x dx = x^2$; that is, the integral of $2x$ is x^2 .

\int It is repeated to indicate that the operation of integration is to be performed twice, or three or more times, as $\int \int$, $\int \int \int$, etc. For a number of times greater than three, an index is commonly written at the right hand above; as, $\int^m x dx^m$; that is, the m th integral, or the result of m integrations of $x dx^m$.

\int_a^b denotes that the integral is to be taken

between the value b of the variable and its value a . \int^a denotes that the integral ends at the value a of the variable, and \int_b that it

begins at the value b . These forms must not be confounded with the similar one indicating repeated integration, or with that indicating the integral with respect to a particular variable.

METRIC SYSTEM OF WEIGHTS AND MEASURES.

SCALE, $\frac{1}{20}$ of the Exact Size.

N. B. The edges of this cube are each 1 Meter, or 10 Decimeters, or 100 Centimeters, in length.

1 sq. Centimeter,
Exact Size.

Dry
Milliliter.

Liquid
Milliliter.

In the Metric System, the Meter is the base of all the weights and measures employed.

The Meter was intended to be, and is very nearly, one ten millionth part of the distance measured on a meridian of the earth from the equator to the pole, and is about 39.37 inches. The Meter is the primary unit of length.

Upon the Meter are based the following primary units: the Square Meter, the Are, the Cubic Meter or Stere, the Liter, and the Gram.

The Square Meter is the unit of measure for small surfaces; as the surface of a floor, table, etc.

The Are is the unit of land measure; this is a

square whose side is 10 meters in length, and which contains 100 square meters.
 The Cubic Meter, or Stere, is the unit of volume; this is a cube whose edge is 1 meter in length.
 The Liter is the unit of capacity; this is the capacity of a cube whose edge is 1-10th of a meter in length.

The Gram is the unit of weight; this is the weight of distilled water contained in a cube whose edge is the 100th part of a meter in length.
 From these primary units the higher and lower orders of units are derived decimally.
